Seeing the world can also be seen as gaining knowledge about the universe. It is based on individuality and sociality in the process of learning. The language system meets the requirements of the learning process. Conceptual landscapes of the world are observed in different social groups, in different age groups. It is also possible for people to have similar concepts of seeing the world, even though they speak different languages. On the other hand, people who speak the same language may have different levels of concepts. So, the concept of seeing the world is reflected in the connection of universal, national, and individual characteristics.

The concept lives in the human mind and reflects not only the concepts within the range of probabilities but also the historical, social, scientific experience of mankind. In defining concepts, keywords from a particular culture are taken into account. In this article, we focus on the concept of the family, the units that represent it, and the national-mental characteristics of these units.

The family is an integral part of the Uzbek way of life. Every Uzbek child is formed with a sense of the sacredness of the family, the need to honor it, the formation of universal and national values in it. These views are reflected in the language itself, and these concepts have a linguistic expression. There are many units in the Uzbek language that refer to the concept of family, which plays an important role in the daily life of the Uzbek nation.

The Explanatory Dictionary of the Uzbek Language explains the family lexeme as follows: Family [Arabic - children, household; generation] 1 husband-wife, a set of people living together as a couple, their children, and their closest relatives; apartment. United family. The head of the family. 2 one purpose, mobile many people, nations, countries united by a common goal, profession. In Uzbekistan, people of different nationalities live as one family. 3 In plant and animal taxonomy, a group of seeds that are structurally similar and closely related in origin. Legume family. 4 Sister languages group. Altaic language family. 5 Wife, wife. My family is a school teacher [7, 387p].

The Uzbek language has lexical, paremiological, and syntactic devices that refer to the concept of family, which are actively used in the Uzbek communication process. The sanctity of the family, respect for parents and siblings, and family spirit are immortal values for the Uzbek nation.

Lexical units that directly refer to the concept of family in the memory of language owners can be grouped as follows:

1) semantic words:house, home, household.

2) personal units: father, mother, brother, sister, sister, grandfather, grandmother, husband, wife, but, aunt, uncle, uncle, daughter-in-law, son-in-law, mother-in-law, father-in-law, baby, child, relative.

3) Sign words: sacred, great, educated, kind, cultured, childish, childless, cheerful, spotless, sincere, attractive.

4) place-related lexemes: homeland, house, threshold, family, neighborhood, city-dwelling, shelter, dwelling.

5) well-known lexemes meaning place: Uzbekistan, Tashkent, Khorezm, Xonqa, Navruz mahallas.

6) abstract units: love, affection, devotion, fidelity, duty, childhood, patriotism, family breakfast, family traditions, family values, family harmony, family conflict, family disagreement, family peace, family happiness, dynasty, motherhood, fatherhood

7) lexemes denoting action and status: to be born, to cherish, to respect, to cherish, to glorify, to cherish, to love, to struggle, to marry, to divorce, to engage.

8) Portable units: golden cradle, mother's milk, family fortress, family pillar, family angel, white milk, umbilical cord blood, crown on my head, my parents, black and white eyes.

9) words related to word formation: married, unmarried, family, family, family, family.

10) lexemes related to family customs and ceremonies: marriage, aqeeqah, circumcision, marriage, son-in-law.

11) Units related to religious concepts: marriage, dowry, divorce, Muslim, Muslim woman, Islamic.

Of these lexical units, house, house, household, threshold, father, mother, brother, sister, sister, grandfather, grandmother, bride, son-in-law, mother-in-law, father-in-law, baby, child, etc., are at the core of the family concept field, the remaining units are the members of the field after the nucleus.

Syntactic units referring to the concept of family: a loving mother, a strict father, an enlightened grandmother, a happy childhood, a part of society, a place with its own laws, longing for my mother, housework, daily chores, child-rearing, successor, nurture any unit can associatively embody the concept of family in the memory of language owners.

From a religious point of view, the concept of family is also referred to by units such as marriage, dowry, divorce, Muslim, Muslima, Islamic, halal, haram, because for Muslims, the family is sacred.

In addition, there are fixed units that refer to the concept of the family - phraseological units, which are characterized by a more vivid expression of the national-mental characteristics of the Uzbek nation, such as *splitting the head, throwing a sack on the shoulder.*

It is known that the concept of family as one of the main categories of reality in human thinking is one of the other mental essences, such as love, trust, happiness, dignity, conscience, destiny, freedom. In proverbs, a person's attitude to the society in which he lives, his way of life, his state of mind, the positive or negative qualities of his feelings, his ethical-aesthetic and philosophical views are based on the laws of society and life's trials.

In the Uzbek language, the husband refers to the concept of family. There are many proverbs, such as if the husband is the head, the wife is the neck, my house is my bed, the ornament of the house is firewood, the ornament of the house is the wife, the household is the head, the hand is untouched, the father is the wrist, the mother is the heart, the father is the mind, the mother is the intellect, the husband is the husband. the wife is a double ox. Of course, in the national consciousness of the Uzbek people, family and kinship relations play a key role, and this aspect is reflected in the proverbs.

In works of art, especially prose, the concepts of life, death, motherhood, homeland, love, goodness, justice, and woman, which are the basic concepts in linguoculturology, are often used. Since a work of art is a product of creative activity, the expression of a particular concept in such texts, of course, first of all, shows the signs of individuality, figurativeness [2,76]. There are many works in Uzbek literature that reflect and point to the concept of family. For example Woman-flower. Male gardener. If you despise a flower, another gardener will touch it… a male gardener. Woman-flower. If you stab a gardener with a thorn, he will touch another flower… in the middle, your fruit will be an orphan. God forbid! (O. Hoshimov)

In this text, units such as woman, man, your fruit - child, flower, gardener, thorn - serve to more vividly express the meaning of the concept of family.

At the initial point of concept formation, an idea of reality emerges. The same concept becomes a linguistic symbol, and this symbol is the core of the meaning. The mind distinguishes the features of reality that are important to it, and on the basis of them creates a model of the perceived phenomenon [5, 59].

This means that the concept of family is expressed in Uzbek using several levels of units. Lexical units differ from others in that they are subjectively different. Articles referring to the concept of family are an integral part of the Uzbek people's communication process. It is characterized by the active use of the concept of the family, which has a national-cultural character in the folklore, written literature, oral tradition.

ABSTRACT

This article provides information on the Urdu translations of the great compatriot Zahiriddin Muhammad Babur's masterpiece into Urdu, as well as a comparative analysis of the translations of Mirza Nasiruddin Heydar Kuragani's description of Kabul and India. In the process of comparative analysis, we focused on the issue of author style. «Baburnama» has been translated into many world languages, including three translations in Urdu. In particular, the first translation was made by Mirza Nasiruddin Heydar Kuragani from Turki into Urdu. This translation was first published in 1898, after in 1926 in Delhi, after in 1962 in Karachi. The second Urdu translation of the "Baburnama" was made by Muhammad Qasim Siddiqui. This translation was published in 1983 in Delhi (India). The third translation was made from Persian into Urdu by Rashid Akhtar Nadavi. This translation was published in 1991 in edition of Lahore. Finally, the fourth translation was made by indian professor Yunus Jafariy from the Persian version of Abdurahim Khoni Khonon's work. In the work of «Baburnama» there is very valuable information on regional geography. Zahiriddin Muhammad Babur carefully destribed the countries us Movarounnahr, Afganistan, India and also a lot of cities, including in the description of Kabul and India the geographical location of this country.

KEYWORDS: *«Babur-Nama», Urdu Translations, Title, Originality, Commentary, Preface, Manuscript, Description, Image, Comparative Analysis.*

INTRODUCTION

One cannot imagine the cultural relations between the people without relations in the field of literature, especially translation. It is true that the translation is the bridge of friendship and culture. Translation of literary works brings two nations together, plays the utmost importance in developing cultural-literary relations. One of such works is «Baburnama» written by our great compatriot, founder of Baburi sultanate, the ruler and the poet, writer and historian Zahiriddin Muhammad Babur (1483-1530). This work created in XVI century, considered literally as the highest sample of Turkish culture, particularly spiritual values of Uzbek people, which rose great interest among the scholars of the East and the West, is one of the works studied thoroughly.

Egyptian scholar M.S. Makhluf noted that this great work has a worthy place in the history of world culture as a work of immortal historical and literary value and wrote: «Baburnama» is an important work for scholars to study the level of development of historical and social culture in Central Asia and India."[1] The rich literary heritage left by Baburshah is being studied in major oriental centers of the world, including Czech Republic, Turkey, Italy, France, USA, India, Pakistan, Afghanistan and Russia[2].

Main part

In some languages there are several separate translations of the «Baburnama». For instance, it has been translated into Urdu four times.

«Baburnama» was first translated into Urdu by Mirza Nasiruddin Haydar Kuragani[3], a descendant of the Timurids from Turkic Chigatay. According to the sources, this translation was made in 1898 but it was not possible to publish the translation during the author's lifetime. Later, in 1926, Kuragani's children published it in Delhi. This translation was republished in 1962 by "Book-Land" Publishing House in Karachi.[4] The title of the book is written as «Baburnama» in the cover page and «Tuzuke Baburi» at the bottom. The book consists of a total of 426 pages. Ubaydullah Quddusi edited comments, supplemented and wrote the foreword. The author of the foreword Ubaydulla Quddusi highly evaluates the translation saying «... the translation is very fluent and clear, not a single word has been omitted ...»

The same is true of the Urdu translation we see - the total number of headlines is more than 380. The events of 933 AH contain about 60 headlines and titles in A. Beverij's translation, their number in W. Texton's translation is 19 and 18 in this Urdu version. Examples of Urdu titles are *«Birth of Farrukh», «Poisoning», «Escape of Khasan Khan Mevati's son and his rebellion», «Repentance from alcoholism», «Decree of Zahiriddin Muhammad Babur», «Victory around and distribution of lands»,* etc. There are a lot of comments in the translation - the translator compares some words and terms with the Leiden-Erskin's translation. There is a comment about the name of the place named «Sangzor»: «John Leiden» writes in the text «Sangzor» and explains that the word appears several times in the forms «Sangroz» and «Sangzor». It's hard to say which of the two is correct. «Sangzor» is written in Persian translations. In terms of meaning (i.e., "rocky"), this word seems to be correct.

The example shows that the Urdu translator took the spelling seriously.

The second Urdu translation of the «Baburnama» was made by Muhammad Kasim Siddiki from Persian. This translation was first published in 1983 by the "Taraqqi Urdu Bureau" ("Urdu Progress Bureau") in Delhi (India).[5] The title of the book is «Baburnama» in the cover page and

«Tuzuke Baburi» at the bottom. The author of the foreword is professor Fahmida Begum. In 2010, a second, supplemented edition of the translation was published by "Qaumi Counsil Bara-e-Farogh-e-Urdu Zaban" publishing house in Delhi, India.[6] The translation was made from Persian and consists of 101 pages. Professor Muhammad Hamidullah Bhat wrote the foreword. This edition is also divided into headings. Examples of headlines include: *«Description of Samarkand», «Description of Kabul», «Journey to India», «The second attack on India», «Arriving in Delhi and delivering a sermon», «India», «Battle of Panipat», «Animal World»*. The language of translation is fluent. It should be noted that this is a short translation and does not contain notes and comments.

The third translation from Persian was made by Rashid Akhtar Nadavi.[7] This translation was published in 1991 by "Sange Mil" Publishing House in Lahore, Pakistan.[8] This edition of the Baburnama is titled "Tuzuke Baburi" and consists of a total of 287 pages. The book contains a four-page preface and six-page table of contents written by a translator. The work was translated from a Persian edition by Mirza Muhammad Sherozi published by "Chitra Prabha Press" publishing house in Mumbai. This Persian manuscript, in turn, was found in the library of the Udaypur Raja. There is no information about the year of copying this incomplete 246-page Persian manuscript. This edition is also divided into headings. For instance: It consists of more than 230 titles and headings, such as *«Attack on Samarkand», «Return to Kabul», «Towards Agra», «Judgment on the return of Humayun», «Dholpur was also captured», «Decree on the gathering of troops», «Battle of Panipat»*".

One can notice a number of errors and omissions in the translation. There is confusion in the translation of some words and sentences. But the language of translation is fluent and enjoyable.

Both (*Kuragani and Nadavi translations*) were highly appreciated by S. Azimjanova.[9]

The fourth translation of the «Baburnama» from Persian was made by Indian professor Yunus Jafari.[10] The book is called "Vaqaye Babur" and consists of 396 pages in total. The author of notes and comments is Hasan Beg. This translation was published in 2007 in England[11]. Jafari's translation contains a great deal of notes and comments. Notes and comments help to deepen the understanding and study of the work, increase the scientificity of the work.

This translation is also divided into headings like the previous ones. The Maverannahr section is divided into 22 sections, the Kabul section into 23 sections and the Indian section into 27 sections. For instance, *«Amirs of Umar Sheikh Mirza», «Holding the throne», «Execution of Sultan Ali Mirza», «Obedience of Khusravshah», «Bird hunting», «Meeting with Mirzas», «Birth of Humayun»* and so on. There are some errors and shortcomings in the publication. Spelling errors, mistakes in the dates are among them. For example, the original Turkic measure of length is *«qari»* is translated as «gas», the term *«yomchi»* meaning «postman» or «post carrier» as «daak» and *«Juun»* as «Jamna river».[12]

At the end of the publication there are a number of appendixes, sources used, links. The appendix contains the spelling of the name «Babur» and information about the author-commentator's travels in Uzbekistan, Afghanistan, Pakistan and India behind the footsteps of Babur. Besides, there are his observations during his scientific travels. The publication also features many paintings, photographs and color copies of the miniatures from the British Museum, Victoria and Albert Museums.

These four Urdu editions are extremely important. The translators' contribution to the popularization of Mirza Babur and his masterpiece «Baburnama» among the Urdu-speaking peoples is incomparable.

It is known that in «Baburnama» along with the political and historical situation of countries, provinces, cities and villages, also the nature, science, culture and other aspects are perfectly described.

The «Baburnama» focuses on the author's style in Urdu translation on the example of descriptions to Kabul - the capital of Afghanistan and India. Mirza Babur describes Kabul, the capital of Afghanistan, as follows:

In original: *"Кобул вилояти тўртунчи иқлимдиндур. Маъмуранинг ўртасида тушубтур. Шарқи Ламғонот ва Пуршовар ва Ҳашанғар ва баъзи Ҳинд вилоятидур. Ғарби кўҳистонлардурким, Карнуд ва Ғўр ул кўҳистондадур. Бу тарихда ҳазора ва накдарий қавмининг маъман ва маскани бу тоғлардур. Шимоли Қундуз ва Андароб вилоятидур. Ҳиндукуш тоғи воситадур. Жануби Фармул ва Нағар ва Банну ва Афғонистондур"[13]* . *(*Translation by Wheeler M. Thakston)[14].

The translation by Kuragani:

کابل کا علاقہ اقلیم چہارم میں سے ہے اور ملک کے وسط میں واقع ہے ۔اس کے مشرق میں لمغانات پشاور کاشغر اور ہندوکش کے بعض علاقے ہیں ۔مغرب میں کوہستان ہے جس میں کرنو اور غور ہے ۔شمال میں قندز اور اندر اب کا[15] ملک ہے ۔جو ہندو کش پہاڑوں کے بیچ میں ہے ۔جنوب میں فرمل نغر بانو اور افغانستان ہے ۔

Babur's description of Kabul in the «Baburnama», at the beginning of the passage, mentions its geographical location and the names of the provinces surrounding it in the eastern part. If we compare the sentences at the beginning of the passage: «*The province of Kabul is in the fourth clime in the middle of the civilized region*». کابل کا علاقہ اقلیم چہارم میں سے ہے ۔ [Ka:bul ka: ila:qa iqlime chaha:rum meN se he]. In this sentence, the translator translated the geographical location of Kabul as originally stated. If we compare the next sentence: *To the East are Laghman region and Pershawar, in which highlands are Karnu and Ghor."*.The Urdu interpretation of these sentences is as follows:

اس کے مشرق میں لمغانات پشاور کاشغر اور ہندوکش کے بعض علاقے ہیں ۔ ملک کے وسط میں واقع ہے۔

 [Mulk ke vast meN va:qa he. Us ke mashriq meN Lamg`a:na:t Pesha:var Ka:shg`ar aor Hindu:kush ke ba:z ila:qe heiN.] It should be noted that the translation of these sentences was also done accurately and correctly, as well as the provinces around Kabul were given correctly in Urdu as in the original. It can be said that the original meaning is preserved in the translation of the above sentences.

In original: *"Гармсери ва сардсери ёвуқтур. Кобулдин бир кунда андоқ ерга борса бўлурким, ҳаргиз қор ёғмас. Икки соати нужумийда андоқ ерга борса бўлурким, ҳаргиз қори ўксумас, магар аҳёнан андоқ ёз келгайким, қор қолмағай"[16]*. (Translation by Wheeler M. Thakston)[17].

The translation by Kuragani:

گرم سیر اور سرد سیر ملک دونوں یہاں سے قریب ہے ۔ کابل سے ایک دن کے راستہ پر وہ ملک ہے جہاں

ہمیشہ   برف رہتی ہے ۔ شاید کوئی ایسی گرمی کا موسم آ جاتا ہو جس میں وہاں برف نہ رہتی ہو ۔ کابل سے قریب علاقوں میں گرم سیر اور سرد سیر میووں کی کثرت سے پیدا وار ہے ۔

The original phrase «Garmser and sardser» is given in the translation by Kuragani as follows: گرم سیر اور سرد سیر ملک دونوں یہاں سے قریب ہے [Garmser aor sardser mulk donoN yaha:N se qari:b he. Kabu:l se ek din ke ra:ste par vo mulk he jaha:N hamesha barf rehti: he], that is, the translation of the first sentence is as follows: «Garmser (hot climate) and sardser (cold climate) both countries are closer from here". In this sentence, the word «both» was added by the translator and did not distort the meaning. In the second sentence, *If one would go to that place from Kabul in one day, it would never snow* is translated into Urdu as follows سےایک دن کے راستہ پر وہ ملک ہے جہانہمیشہ برف رہتی ہے [Ka:bul se ek din ke ra:ste par vo mulk he jaha:N hamesha barf rehti: he]. The sentence is translated from Urdu as follows: **«There is a land that one can get there in one day, where it always snows.»** We think the translation of this sentence is not correct. Because in his work, Babur states that it is possible to go in one day to a place from Kabul where there is no snow, and in the translation it is translated as «it always snows». In our opinion, the author's intention in this case has not been properly conveyed to the reader.

Description of India

When Zahiriddin Muhammad Babur made first steps into the provinces of India, he saw a completely different from Movarounnahr colorful world - the diversity of mountains, rivers, forests and deserts, and met the amazing world of nature, mountains, rocks, animals and plants and wrote the following:

In original: *"Ҳиндустон мамолики васеъ ва пурмардум ва пурҳосил вилоят воқиъ бўлубтур. Шарқи ва жануби, балки ғарби ҳам Муҳит дарёсиға мунтаҳий бўлур. Шимоли бир тоғдурким, Ҳиндукуш ва Кофиристон ва Кашмир тоғлари била пайваструр. Ғарби-шимоли Кобул ва Ғазни ва Қандаҳор воқиъ бўлубтур. Жамиъ Ҳиндустон вилоятининг пойтахти Деҳли эрмиш. Ҳиндистон аввалғи иқлимдин ва иккинчи иқлимдин ва учинчи иқлимдиндур. Тўртинчи иқлимдин Ҳиндустонда йўқтур. Ғариб мамлакате воқиъ бўлубтур. Бизнинг вилоятларға боқа ўзга оламедур. Тоғ ва дарёси ва жангал ва сахроси, мавозиъ ва вилоёти ва ҳайвонот ва набототи, эли ва тили ва ёмғури ва ели борча ўзгача воқиъ бўлубтур"*.[18] (Translation by Wheeler M. Thakston)[19].

The translation by Kuragani:

ہندوستان وسیع بہت آباد اور سیر حاصل ملک ہے ۔ اس کے مشرق و جنوب بلکہ کسی قدر مغرب میں بھی دریا ے سمندر ہے ۔ شمال میں ایک پہاڑ ہے کوہ ہندوکش کافرستان اور کوہستان کشمیر سے ملا ہوا ہے ۔ اس کے مغرب و شمال میں کابل ، غزنی اور قند ھار ہے ۔ ہندوستان کا دارا لملک   آج تک «دہلی» ہے ۔ ہندوستان اقلیم اول دوم اور سوم میں ہے ۔ اقلیم چھارم میں اس کی کوئی جگہ واقع نہیں ہے ۔ یہ ایک   اجنبی ملک ہے ۔ ہماری ولایت سے دوسری دنیا ہے ۔ پہاڑ دریا جنگل نباتات ۔آدمی ۔ زبان ۔ ہوا اور مینہ سب ا ور ہے۔

Babur, in his description of India, actually writes: *"India is a country with vast and colourful and fertile realm.* In one sentence, the author describes the geographical location of the country, the country's vast, densely populated and fertile land in succinct, concise terms. The Urdu interpretation of this sentence is as follows: ۔ہندوستان وسیع بہت آباد اور سیر حاصل ملک ہے (Hindusta:n vasi: bahot a:ba:d aor serha:sil mulk he). In the translation of this sentence, the translator chose the exact alternatives of the descriptions given to India in Urdu, and as a result the translation of this sentence was done precisely and correctly. The following sentences are given as follows in

the original: . *There is a mountain on the north connected with the Hindu Kush and the mountains of Kafiristan and Kashmir. It is located in the northwest of Kabul and Ghazni and Kandahar.* In these sentences, the author mentions exactly which mountains to the north are adjacent to, as well as which cities are located in the northwest. The above sentences are translated into Urdu as follows: شمال میں ایک پہاڑ ہے کوہ ہندوکش کافرستان اور کوہستان کشمیر سے ملا ہوا [*Shima:l meN ek paha:R he kohe Hindu:kush Ka:firista:n aor Kashmi:r se mila: hua: he. Us ke mag`rib-o-shimal meN Ka:bul, G`azni: aor Qandaha:r he.*] ہے ۔ اس کے مغرب و شمال میں کابل ، غزنی اور قند ہار ہے۔ The translator did the translation correctly without compromising the author's style, and the names of the mountains and cities were clearly given in Urdu. Let's compare the next sentence:

"It is a strange country. It is another world". یہ ایک <u>اجنبی</u> ملک ہے ۔ ہماری ولایت سے دوسری دنیا ہے ۔ [*Ye ek ajnabi: mulk he. Hamari: vila:ya:t se du:sri: duniya: he*] in which the word 'strange' , i.e. 'strange', 'wonderful' is translated into Urdu as ajoyibjnby [foreign:] 'foreign', 'foreigner', which cannot be said to be correct. In the second sentence, Babur compares India with his homeland, emphasizing that it is different in every way, a completely different world, so that in the translation the phrase "in comparison with our lands" is dropped, which in our opinion should have been given as ہماری زمین کی بنسبت [hama:ri: zami:n ki: bani:sbat].

CONCLUSION

On the basis of comparative analysis it was determined that the translation of Mirza Nasiruddin Heydar Kuragani is important in several respects. First, Kuragani translated from the original - the Turkic Chigatay; second, it was the first complete translation in Urdu; thirdly, the preservation of the author's style in the translation is of great importance.

The Urdu translation of «Baburnama» by Mirza Nasiruddin Heydar Kuragani is valuable in popularizing the «Baburnama», a rare example of Uzbek classical literature among the Urdu-speaking people, as it allows the Urdu-speaking people to enjoy this great work.

ABSTRACT

In the article, the yield of leaves, stalks, pure stalks and sap of green plants was studied, and the residue (stump) of the stalks was squeezed from the green pure stalks by means of a press, dried in the open air in the sun until the moisture content was 14-15% in preparing it and preparing a mixture-feed for livestock, to reduce the loss of nutrients in it, the grass flour is granulated, along with the leaves of the experimental plant stalks and 50% grain is added to it to study its chemical composition.

KEYWORDS: *Cereals, Legumes, Grains, Grass Flour, Energy, Protein, Cellulose, Starch, Sugar, Vitamins, Donor (Granules), Rye.*

INTRODUCTION

In recent years, Uzbekistan has been paying increasing attention to the development of the livestock sector. In order to increase meat, eggs, and dairy products from livestock, their daily diet should include nutritious, vitamin-rich foods. At present, many entrepreneurs and scientists are working to prepare nutritious fodder from the green mass of cereals, legumes and cereals. The cultivation of cereals, legumes, cereals, harvesting, drying and crushing of grass flour and granular feed is carried out.

THE MAIN FINDINGS AND RESULTS

Grass flour is a green mass of dried and crushed plant. In terms of total nutritional value, if the grass is properly prepared, 1 kg of grass flour contains - 0.7-0.9 feed units, 8 MDJ energy, 94-132 g of digestible protein, 29-42 g of fat, 136-244 g of cellulose, 18 -27 g of starch, 20-70 g of sugar, 140-230 mg of carotene. Humidity is 8-12% and contains all the necessary amino acids.

In high-temperature equipment, by artificially drying the green mass, it is possible to maintain its nutritional value almost completely. When feeding livestock, grass does not differ much from the green mass, because in green plants due to the rapid evaporation of moisture loses 3-8% of essential substances, and 10-15% of carotene (Table 1).

The digestible nutritional value of grass flour is 10% higher than that of hay made from green mass. Grass flour, made from young, multi-leafed grasses, is not less nutritious than concentrated cereals, but outperforms them in terms of value of protein, vitamins, minerals and other biologically important compounds.

TABLE 1 THE EFFECTIVENESS OF BAITS MADE FROM GRASS USING VARIOUS TECHNOLOGIES

Feed type	1 ha of field product, kg		% Protein loss in green mass	Amount of milk produced per 1 ha, kg
	Digestible protein	carotene		
The green mass of grass	285	0,45	-	2850
Hay	129	0,20	55	1290
Silo	185	0,30	35	1850
Senage	253	0,41	11	2530
Grass flour	269	0,43	5	2690

Grass flour contains essential vitamins C, K, E and almost all B vitamins (except V12), all necessary amino acids, as well as chlorophyll, xanthophyll, choline, thiamine, folic and pantothenic acids, calcium, phosphorus, potassium, magnesium, sodium, iron, manganese, barium, copper, cobalt, molybdenum, nickel, chlorine, iodine and other rich minerals. Therefore, grass is widely used in the food industry as an irreplaceable product.

The main indicator of grass flour is the carotene content in it. The more leaves a plant has, the richer the carotene in the whole plant and the grass made from it. Grass divides it into varieties according to the amount of protein. Depending on the type of flour, the protein and total biological value of vegetable flour varies: in the first variety - 19% protein, in the third - 13%

protein. In addition, in the foliage of annual crops, the nutrients increase during the growing season and reach a maximum in 24-30 days, after which the nutrients begin to decline.

The most important ingredient in grass flour that enriches animal feed is carotene. Carotene is important to preserve not only during drying, but also during storage. When stored in large quantities, a significant portion of carotene is lost under the influence of light and oxygen. Carotene loss after 5 months of storage is 50-75%. To reduce nutrient loss, grass flour is granulated and packed in bags.

Convenience is achieved in granulation of hay flour, transportation, reduction of storage space, mechanized distribution of feed to animals. But even in this form, the amount of carotene in grass flour stored for 6 months without the use of antioxidants is reduced by 50%. The addition of chemicals can significantly reduce carotene loss. The retention of nutrients also depends on the quality of the granules. Good grains should be dense, dry, smooth and shiny, 1.5–3 cm in length, hard to break.

The color of the granules can vary from dark to light green. Grain grass is usually stored in multi-layered paper bags in the same bags (without placing in other containers) in a dry place, at a temperature not lower than 40 ^{0}C - in winter and not higher than 20 ^{0}C in summer, relative humidity 65-80%, in a shady place. If stored in a well-lit place, carotene will break down quickly.

The use of grass flour in the diet of cows has a significant impact on the health and productivity of the animal, without saving 20-25% of concentrate feed. 3 kg of hay flour per day can be added to the diet of dairy cows (1, 2, and 3).

RESULTS AND DISCUSSIONS

An analysis of the literature revealed that grass flour, granular feeds are made from cereals and legumes. Tashkent State Agrarian University, Andijan Institute of Agriculture and Agro-technology and Corn Breeding and Seed Research and Experimental Station, specialists of 7 varieties and hybrids of corn crop Scientific research work was carried out to determine the cost of growing crops. In the first decade of April, 7 varieties and hybrids of corn were planted in the experimental area of the station in Tashkent region, Tashkent district, in the first decade of April, four repetitions, four repetitions, at a rate of 110,000 seedlings per 50 m^2. Agrotechnical measures were taken based on the conditions of Tashkent region. During the germination of corn varieties, 15 plants were selected from each delyanka and the height of the stem, the number of leaves, the length of the stalk, the number of joints, the length of the interval between joints, the circumference of the stem were studied (Table 2).

TABLE 2 MORPHOLOGICAL INDICATORS OF SUGAR CORN VARIETIES

Variety samples Name	Plant height, cm	Number of leaves, pcs	Row length, cm	Number of joints, pcs	Length of joint spacing, cm	Stem circle, cm
Karabosh	269,2	12	31,3	11	21,63	1,64
Uzbekistan-5	202,1	11	25,0	11	16,10	1,93
Daulet	220,9	14	22,0	14	14,21	2,29
Oranjevoe160	227,5	12	23,5	12	18,9	1,90

Uzbekistan pakanasi	114,3	20	29,6	20	57,2	2,95
Uzbekistan 18	242,0	15	25,3	15	16,1	2,34
G-7	232,2	14	-	8	27,3	1,58

During the flowering period, the plant height of Karabash, 18 varieties of Uzbekistan was 9.8 cm to 154.9 cm higher than other varieties, while the number of leaves was 6-12 in other varieties of Uzbekistan, Uzbekistan 18, Daulet, G-7 was found to be relatively large. Along the length of Rovak, Karabash and Uzbekistan sturgeon varieties were distinguished. It has been reported in the scientific literature that the selection of varieties with a large number of leaves in the grass flour prepared for multi-peace feed leads to a high content of carotene in the feed.

The plants obtained for analysis were examined for leaf, rhubarb, pure stem and sap yield on the green stem, and the green pure stems were squeezed using a press and dried in the sun until the residue (tuber) of the stem was 14-15% moisture on the tarpaulin material (Table 3).

TABLE 3 BIOMASS CONSUMPTION INDICATORS OF CORN VARIETIES

Varieties	Plant condition: wet				After the plant dries			
	The total weight of the plant is gr	Net stem weighttrp	Ruvakweightgr	LeafweightGr	Total weight of the plant, gr	Net stem weighttrp	Ruvakweight, Gr	Leafweight, Gr
Karabosh	3,43	2,33	0,39	0,57	1,14	0,78	0,13	0,19
Uzbekistan -5	3,27	2,46	0,32	0,48	1,83	1,37	0,17	0,26
Daulet	6,28	4,01	1,19	1,06	4,80	3,08	0,91	0,81
Oranjevoe160	6,85	4,82	1,10	0,88	2,42	1,65	0,38	0,30
Uzbekistan pakanasi	8,20	5,16	1,40	1,64	6,01	3,78	1,02	1,20
Uzbekistan 18	9,12	6,88	0,92	1,42	3,17	2,39	0,32	0,49
G-7	8,34	6,00	1,09	1,25	3,29	2,37	0,43	0,49

When studying the varieties on biomass consumption, it was found that the dry mass content in all indicators was higher in the varieties of oats belonging to the group of grain oats than in the varieties belonging to the group of sugar oats.

The dried waste leaves, and husks were ground with a grinder until fine. Purely ground mixture and mixtures with up to 50% oat grains were placed in a separate mixer, 99 kg of raw material and 1 liter of cottonseed oil were added, placed in a granular feed machine and granulated feed was prepared. In order to determine the composition of the prepared granular feed, samples of 1 kg each were taken and submitted to the laboratory for analysis (Protocol of the Republican State Center for Diagnosis of Animal Diseases and Food Safety №140, Table 4).

TABLE 4 ANALYTICAL INDICATORS OF CORN VARIETIES

The result of the analysis	Name of corn varieties					
	Oranjevoe160	Uzbekistan pakanasi	Uzbekistan 18	G 7	Daulet	Daulet + 50% crop
Digestible protein	3,71	2,87	3,12	2,94	6,69	7.26
Cellulose	26,00	30,90	30,90	32,14	18,42	18,72

According to the results of the analysis, it was found that the Daulet variety of the corn group and the granular feed prepared with the addition of 50% grain to this variety have a higher nutritional value than other varieties and hybrids. In the sugar corn group, Orange was higher in 160 varieties.

CONCLUSION

Daulet from Oats and Oranjevoe 160 from Oats can be grown in saline, low-water, hot regions of the country, and their green mass can be used as a raw material in the preparation of nutritious, rich in vitamins, carotene, easy to store and transport.

ABSTRACT

A new supramolecular complex of the gossypol derivative containing taurine and glycyrrhizic acid has been obtained. The study of the anti-inflammatory activity of the obtained complex has been conducted. The results of experimental studies were processed statistically using the standard Stat Plus 2009 software. The anti-inflammatory activity of water-soluble supramolecular complex compounds of gossypol derivatives with the monoammonium salt of glycyrrhizic acid in various ratios was studied.

INTRODUCTION

The world health organization notes that the twenty-first century is the age of infectious diseases, and according to who forecasts, the role of infections in the structure of the total morbidity of the World's population will only increase. Infectious diseases are one of the leading causes of death and claim more than 13 million lives a year, according to who, among the causes of death in children, infectious diseases account for about 65% [1, 2].

The leadership of the Republic of Uzbekistan pays special attention to the regular provision of medicines to the population and the development of the pharmaceutical industry [3].

Nowadays the Republic of Uzbekistan has developed laws and regulations aimed at regulating medicines.

Over the past 20 years, more than 30 types of medicinal products developed on the basis of local plant raw materials have been approved for use in medical practice [4].

Therefore, the search for new extraordinary, rational approaches to the prevention and treatment of infectious pathologies using modern methods of chemotherapy, the creation of new effective anti-inflammatory drugs aimed at increasing the effectiveness and reducing the duration of treatment is relevant and meets the modern needs of practical health care in Uzbekistan [5,6].

Among the large number of plant substances that have high biological activities are plant polyphenols - derivatives of gossypol and its model compounds [7,8].

Gossypol itself has a number of disadvantages - poor water solubility, high toxicity and relatively low antiviral activity and, as a result, a low chemical therapeutic index (CTP).

On the basis of gossypol and its derivatives, various antiviral (gossypol liniment), antiherpetic (megosin ointment), immunosuppressive (batriden tablets), antichlamydial (gozalidone tablets) and interferon inducing drugs were created and implanted practice [9].

In this connection, the aim of this research is to synthesize and study the anti-inflammatory activity of water-soluble supramolecular complexes of gossypol derivatives with taurine and monoammonium salt of glycyrrhizic acid.

An experimental model of aseptic arthritis was reproduced by subplantar injection of a 6% dextran solution in a volume of 0.1 ml into the hind leg of rats. The preventive effect of various compositions (1:1; 2:1 and 4:1) and doses of gossypol, taurine, and glycyrrhizic acid compounds (25, 50, and 100 mg/kg) was studied. The abovementioned drugs were preemptively administered intragastrically with a metal probe twice a day and 1 hour before the input of flagogen. Measurement of paw volume of the animals was performed using plethysmometry before and 60, 120, 180 and 240 minutes after injection of flagogen. The value of anti-inflammatory activity (AIA) of drugs was calculated as followed:

AIA $= (V_{кон} - V_{оп}/V_{кон}) \times 100 = \%$.

where,

V_{kon} - the average increase in the volume of the limb in the control cm^3,

$V_{оп}$ – the average increase in the volume of the limb in the experiment cm^3.

The experiments were carried out in accordance with the "Rules for working with experimental animals", as well as the rules adopted in the European Convention for the protection of vertebrates used for experimental research or for other scientific purposes (ETS No. 123, Strasbourg, 18.03.1986).

The obtained results of experimental studies were processed statistically using the standard Stat Plus 2009 software package using well-known methods of variational statistics with an assessment of the significance of indicators (M±m) and differences in the considered samples according to the student's t-test. The difference was taken as significant when the probability level was 95% or more ($P < 0.05$).

A study of the anti-inflammatory activity of complex compounds consisting of gossypol, taurine, and glycyrrhizic acid in various ratios showed that in rats these compounds have a distinct anti-exudative effect on models of dextran-induced aseptic arthritis. At the same time, there is a clear pattern in the height of the pharmacological effect, which depends not only on the dose of the compound, but also on the differences in the ratios of its components. So, a compound in which the ratio of triterpene glycosides in combination with gossypol and taufon 1:1 anti-inflammatory activity was equal to 21.0%, whereas when the ratio was increased to 2:1, it was equal to 24.0%, and in the ratio of 4:1, its value reached 27.3%. Consequently, an increase in the proportion of glycyrizic acid led to an increase in the anti-inflammatory activity of the compounds. Along with this, there is a certain relationship between the administered dose and the pharmacological effect. So, if at a dose of 25 mg/kg, the studied compounds inhibited the exudation process by 21.0, 24.0 and 27.3%, respectively, in a ratio of 1:1; 2:1 and 4:1, then a two-fold increase in the dose led to an increase in the effect, especially in compounds having a ratio of 4:1 (31.0%). In the 2:1 compound, increasing the dose to 100 mg / kg resulted in only a slight increase in anti-inflammatory activity by 26.7% and 4:1 by 32.8%.

TABLE ANTI-INFLAMMATORY ACTIVITY OF VARIOUS COMPOSITIONS OF COMPOUNDS CONSISTING OF GOSSYPOL OF TAUFON AND GLYCYRRHIZIC ACID (IN %)

Doses, mg / kg	The ratio of ingredients		
	1:1	2:1	4:1
25	21,0	24,0	27,3
50	22,5	25,5	31,0
100	23,8	26,7	32,8

Separate series of experiments on the study of the anti-inflammatory activity of glycyrrhizic acid using carrageenin, dextran and other flagogens showed that this drug is clearly inferior to the reference non - steroidal anti-inflammatory drug-diclofenac sodium in its anti-exudative activity. Thus, in carrageenan inflammation, its anti-inflammatory activity is 18%, whereas in diclofenac sodium-67% [10].

Therefore, a complex preparation consisting of gossypol, taurine and glycyrrhizic acid, in its anti-inflammatory activity is superior to glycyrrhizic acid.

Thus, following conclusions are obtained on the basis of the results of experimental studies:

1. For the first time, the anti-inflammatory activity of water-soluble supramolecular complexes of gossypol derivatives with MASHA was studied (in the ratio of 1:1, 1:2 and 1:4);

2. Compounds consisting of a complex of gossypol, taurine and glycyrrhizic acid have a distinct antiexudative activity;

3. Antiexudative activity increases as the proportion of glycyrrhizic acid in the compound.

Studies are conducted to determine the biological activities may be of interest in the development of a new effective anti-inflammatory compound.

ABSTRACT

This article is about creating a versatile bag for babies. Transformational and multifunctional literature and transformational elements used in modern costume collections are analyzed, a comfortable bag is created, and the technological process of making a bag is described. The functions of the bag, designed for the convenience of babies, are described.

KEYWORDS: *Transformation, Innovative Bag, Function, Convenience, Novelty, Technological Process, Backpack, Sofa.*

INTRODUCTION

The process of transformation and change can be endless. Due to its diversity, the product is not disturbed and its service life is extended. The use of different transformations in the design of clothing models allows increasing their versatility, expanding their functional capabilities and prolonging the period of active wear, reducing purchase costs.

If we look at changing clothes from an economic point of view, it will be beneficial for both the consumer and the manufacturer. A consumer who buys a variable product will actually buy several products that are similar in color and materials, but different and designed. The manufacturer, designing and producing garments based on variable materials, brings great benefits by saving material, because in this case there is almost no waste of material.

In addition to economy, changing clothes can have consumer and a number of other positive features. With the help of transformation, a person can change his appearance throughout the day, without changing clothes and returning home to fit in a certain situation. Due to the minimal set of changing items, the style and types of clothing can be changed constantly. Changing clothes are designed for a dynamic lifestyle and life situations, which are characterized by frequent changes in functional processes, rapid changes in events.

THE MAIN FINDINGS AND RESULTS

Transformed clothing is one of the current trends in the creativity of designers from different countries. Modern, fast-changing world clothes should be dynamic, comfortable, and bright. Individuality, the desire for creativity, the struggle against world standards is becoming the hallmarks of today's life.

Transformation (lot.transformasio-change) is a method often used in the design of clothing to transform or change the shape of clothing, to change the shape and size of the item in different ways, to change the location, to change the details [7].

Numerous scientific works and articles have been done on the transformation method, for example, researchers Many researchers have conducted research on multifunctional bags, many other assortments, including: S.SH. Toshpulatov, KMKholiqov, SURakhmatov wrote an article based on the analysis of many modern transformation assortments [1]. .

Researchers Chagina L.L., Smirnova N.A., Pashkova N.V., Komarova A.A., "Transformational pants" can be cited. All seams of the pants are connected by zippers, which are divided into 20 parts when loosened, and when these details are combined, 3 figures are formed: shorts, bag, skirt, [3].

Researchers Chuprova O.V., Gordeeva O.V., Neverova V.A, created a multifunctional coat. This coat has a double collar and is separated from the waist - the upper part of the waist is a suit, the lower part is a skirt, and the pocket is a pocket. [4].

Researchers Rezvanova L.N.,, Prokhorov V.T., Sherbakov N.V., Osina E.M., have developed a book on the types of bags "Leather goods and saddlery technology" [5].

Jeans have always been in vogue, and there have been articles about sewing bags in different looks and functions using jeans.

As a result of our scientific research, we have analyzed many elements, from pillow bags turned into blankets [8], and created a multifunctional bag for babies based on the analysis of multi-purpose bags. This bag is for newborns from 1 month to 1 year old.

The purpose of creating a multifunctional bag for babies:

-creation of comfort for mother and child;

-creation of conditions for the mother to carry the child;

-Ensure that the child is always with his mother;

-create a comfortable environment for the child to rest anywhere;

- constant protection of the child from external influences;

-facilitate the spiritual rest of the mother and child.

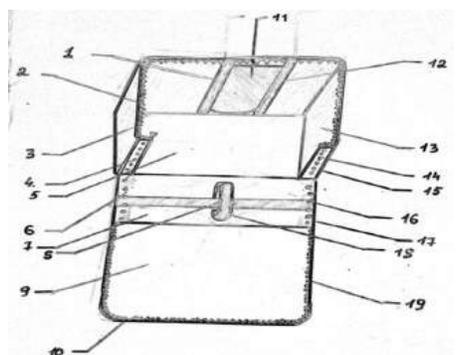
The bag mainly performs 5 functions:

- bag;

- sofa;

- playing chair;

- Bag for carrying the child forward;

- backpack.


This bag is designed to combine both multifunctional and transformation methods.

This bag is designed in combination with both multifunctional and transformation methods, Figure 1.

Figure 1: Multifunctional bag

1- tie, 2- bottom lock, 3- groove part, 4- groove piston, 5- bottom lining part, 6- lining piston, 7- second side lining, 8- middle tie, 9- top detail lining, 10 top detail lining, 11 pockets, 12 straps, 13 side linings, 14 piston pads, 15 bottom pads, 16 medium length straps, 17th second piston in the liner, 18th piston in the middle link, 19th in the upper lock.

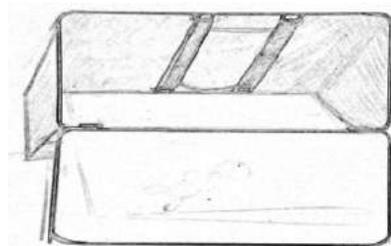
The bag has a strong handle on both sides from the bottom, which can be lifted with one hand and hung back as a backpack, the opening of which is attached with locks. This can be done with household items, children's clothes, going to work, market or travel, Figure 2. This bag is mainly designed for the convenience of those who go to work and rest with the child, so it is a table for children: there is a bobbin that holds the child in the back when sitting, it can be expanded or contracted. Along with the bobbin, it has a part that acts as both a pocket and a pillow, and is attached to the pistons.


Figure 2: Divancha

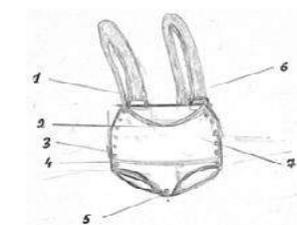
When we release these pistons, the sides of which are attached to the pistons of the table, a sofa is formed, Fig. 2, and the strap in the middle holds the child while he lies down. If you loosen the pistons of the pockets with the strap that holds the baby in place, there will be a bag that will carry the baby forward, Figure 3.


Figure 3: Baby bag

1st tie hook, 2nd top hook, 3rd bottom hook, 4th top liner, 5th piston, 6th tie hook, 7th bottom liner

When choosing materials for a multifunctional bag for babies, we recommend the use of knitted materials on the inside, mainly because the children's skin is delicate; we recommend waterproof materials for

the top.

Technological process;

1. Two auras, two synthafon and two lining materials are cut in width 50 and height 34.

2. Cut two doubloons 47 in width and 30 in height.

3. Place dublin in the middle, leaving 1.5 cm of 4 edges of the avra material.

4. The dowels are ironed and glued together.

5. Avra material glued with dublin with 50-34 tape is placed on top of each other and sewn with a seam allowance 1 cm from the edges.

6. A zipper is sewn on the edge of the lining material with a width of 50 and a height of 34.

7. Iron well on top.

8. The finished side is sewn on 4 sides, leaving 8 cm on each side, and the foot is placed.

9. Take the aura material on the second side and put a dublin in the middle.

10. The dowels are ironed and glued together.

11. With the help of 50-34 syntaphondublin is placed on top of the glued avra material and sewn with a seam allowance 1 cm from the edges.

12. The aura and the liner are stacked on top of each other and sewn together.

13. The finished side is sewn on all four sides, leaving 8 cm on each side, and the foot is placed in the marked places.

14. Avra, lining and synthafon materials are cut in widths of 50 to 28.

15. One dublin is cut in width 24 to length 24.

16. Avra material is covered with dublin and ironed.

17. Avra sews the synthafon together with the material with a seam allowance.

18. Our detail is measured 1.5 cm from the side.

19. Four dots are placed at the marked place from 6 cm.

20. The piston is stuck in the designated place.

21. The finished part is raised by connecting the sides with a width of 50 to 34 cm.

22. One avra, lining and dublin material are cut in 128 widths and 28 lengths.

23. It is sewn with a zipper between Avra and the liner, leaving 3 cm from the edges.

24. The rest of the edges are sewn together.

25. It is marked leaving 1.5 cm from the edges of the detail.

26. The four sides are marked 6 cm from the marked place.

27. The piston is locked in place.

28. The finished part is combined with the remaining details.

29. Cut 2 pieces of material and a doubler, 80 cm long and 7 cm wide.

30. Avra and dublin are ironed on top of each other.

31. Avra folds the material from 3.5 cm and sews from the edge.

32. The place where the bow connects is determined.

33. The bag is sewn in the designated place.

34. Avra and lining materials are cut 50 cm wide and 25 cm high.

35. Lines are connected by leaving 10 cm on the 25 cm side and 10 cm in the middle.

36. These parts are joined together to form a part that holds the babies in place and attaches it to the pistons.

37. Two details are cut to a width of 35, 24 cm.

38. The 24cm side is cut into an arc.

39. It is cut from 7cm on all three sides.

40. The sides of the detail are sewn with a core stitch.

41. Sew 3cm from the top of the detail.

42. Velcro is sewn on the edges of the detail.

43. The piston is attached to the back of the seat.

44. Pistons are sewn together with a tie pocket to hold while sitting.

Materials for the bag: leather, two-thread nachos material, interlock materials are used for the top layer [9], Fig. 4.

 a)   b) **figure 4, a), b).Materials.**

Until this innovative bag is ready, 44 steps will be performed in the technological process. When all the technological processes are completed, the bag shown in Figure 5 is formed.

Figure 5: A versatile bag for babies.

This bag not only creates comfort for children but also creates comfort and ease for their mothers. With this bag, our mothers can easily take their children to work and leisure put them to bed or sits in front of them if they want to do something, and our mothers can carry their children with them when their hands hurt.

CONCLUSION

This multi-functional bag is designed to meet the professional needs of people; the demand for such products is now growing. The transformational bag we have created will be convenient for children, will facilitate people's lives, as well as stimulate changes in the fashion industry.

ABSTRACT

This article deals with the issues of rapid development in Japanese and Gulf Arab literature. The late 19th and early 20th centuries played an important role in the history of Japanese literature. The 20-year period following the Mayji Revolution, which opened the door to a new era, was a time of serious change for Japanese literature. Long-term research on the further development of Japanese national literature has begun to be resolved. Writers of New Japan, who have experienced the rise and fall of the democratic movement for freedom and the rights of the people in the 1980s, have emerged in the country. The most talented of them became masters of Japanese literature of the 20th century. The issue of synthesis of cultures has become one of the most important issues in Japanese literary consciousness. In particular, the aesthetic diversity of the West and the East has created a process of interdependence. The traditions of both cultures, due to the peculiarities of their historical development, required the mutual study of each other, which did not exist. In the late nineteenth and early twentieth centuries, this law was evident in Japanese literature. Japanese literature developed during the late 19th and early 20th centuries with dramatic changes. In the post-Mayji Revolution, a close acquaintance with Western literature led to the emergence, transformation, and the emergence of a new era of Japanese literature as a result of theoretical knowledge of Japanese literature. The formation of Arab Gulf literature took place in the second half of the twentieth century, decades after the development of modern literature in Egypt, Syria, Lebanon, Iraq, and Tunisia. By the end of the 20th century, it joined the world literary process and gained worldwide popularity. Literary revival in Egypt, Lebanon, Syria, and some Arab Maghreb countries began in the second half of the 19th century.

switched to literature. As a result, by the late 21st century Arabic literature had a similar path to the development of advanced Arabic literature, but they were distinctive. This situation has led to the emergence of a "theory of rapid development" in the example of late modern literature. In the Gulf Arabian Gulf, Kuwait, Bahrain, Qatar and other Arab countries have become more complex and controversial in the form of a rapid leap into, or jump to, a new type of modern literature. However, the rapid development of literature in the Persian Gulf has not gone unnoticed either. The emergence of modern literature in Kuwait, Bahrain, Yemen, Saudi Arabia began in the 40-50's of the 20th century and quickly gained popularity in the Arab world and reached the level of Egyptian and Syrian literature. However, in Qatar, Oman and the United Arab Emirates, the process of renewal of literature began much later, in the 60-70s of the 20th century, and there was a rapid movement towards publication of literary activity in other Arab countries.

INTRODUCTION

Japan is one of the countries that has made a significant contribution to the treasury of world literature with its oriental ancient history, high culture and spiritual riches. Writers of the land of the rising sun have been creating spiritually deep and lofty works for centuries. His perfection in terms of his ideas, images of heroes, directions, and art may have made Japanese literature a force to be reckoned with in the world.

The period of the late nineteenth and early twentieth centuries has played an important role in the history of Japanese literature. The 20 years since the Meiji Revolution, which opened the door to a new era, have been a period of significant change for Japanese literature. Long-running research on the further development of Japanese national literature began to find its solution. [2: 5]

During this period, sharp questions arose about the forms in which the spiritual life of the nation developed and which art system should be considered the most important in connection with the worldview. The process of changing the traditional views that began in the 70s and 80s, which determined the structure and order of the old literature, continued. The struggle of the new artistic consciousness and views with the old ones was decided in favor of the former.

THE MAIN RESULTS AND FINDINGS

In the country in the 80s of the twentieth century began to emerge writers who are the peers of the new Japan, who experienced the rise and fall of the democratic movement "for freedom and the rights of the people." The most talented of them became figures of twentieth-century Japanese literature.

The formation of literature depicting the advanced stages of capitalism in Japan began in the 1980s, a little less than a hundred years later than in France or Russia. At the same time, the rapid pace of development in Japan in a short period of time made Japan equal to the countries that had recently overtaken it in some areas, mainly in capitalist development. This led to the fact

that certain stages in the development of Japanese literature lasted until a very short period of time. At a time when romanticism lasted for several decades in Europe, this trend lasted only a decade in Japan (90s). This situation has always led to the inaccuracy of these stages, the incomplete development of the elements that make them up and are unique to them. One direction did not fully develop and gave way to another. [1: 504]

The old literary school and movements, which did not reflect the serious shifts in the whole system of artistic thought, had aroused no interest. In the literary field, the representatives of Romanticism, first embodied as the proponents of the appreciation of individual freedom, united in new literary movements, such as the movement for romanticism, and then the realists and naturalists, who advocated a realistic reflection of all aspects of life.

At the end of the 19th century, more than a hundred socio-literary magazines were published in Japan, which laid the foundation for the development of new literature. In addition to the theoretical production of the rules of the literature, the journals also published translated or original works.

The late nineteenth and early twentieth centuries were a period of active integration of ideas. Japanese literature became intimately acquainted with the various aesthetic currents of the West and began to assimilate them. The great writer Natsume Soseki, who entered the literary field in the early twentieth century, presented the development of world literature in the form of a diagram. In it, Japanese classical literature is marked by a line drawn parallel to European literature, while new Japanese literature is interpreted as a branch of a tree representing world literature. The notion and ideas of the autonomy of Japanese culture, the separation of the path of development, gradually disappeared.

The issue of the synthesis of cultures has become one of the most important issues in the literary consciousness of Japan. In particular, the diversity of aesthetic views of the West and the East has given rise to the process of their interdependence. The traditions of both cultures, due to the peculiarities of their historical development, required the mutual study of their unique aspects. In the late nineteenth and early twentieth centuries, this regularity became apparent in Japanese literature.

Of course, there were also critics who saw the synthesis of different cultures as an alien and alien process for the Japanese people. However, writers like Uchimura Kanzo, who ignored the heritage of national culture, also made up the majority of literary figures who supported the creation of a new literature, only European, European-style.

Japanese literature developed in the late nineteenth and early twentieth centuries undergoing dramatic changes. In the period after the Meiji Revolution, the close acquaintance with Western literature led to the emergence and reorganization of various trends in Japanese literature, the emergence of a new era of Japanese literature as a result of theoretical knowledge

By the way, in the case of the Gulf Arab countries, it should be noted that the formation of the literature of these Arab countries took place in the second half of the twentieth century, decades after the development of modern literature in Egypt, Syria, Lebanon, Iraq and Tunisia. By the end of the twentieth century, it had joined the world literary process and reached the world stage.

The study of the literature of the Gulf Arab countries as a national literature that has been moving away from traditional patterns and joining the world literary process for the last half

century is of particular scientific importance, as this issue is related to the problem of rapid development of literature in the Arabian Peninsula. If in Egypt, Lebanon, Syria, and some Arab Western countries the literary renewal began in the second half of the nineteenth century, in the Arab countries of the Arabian Peninsula the process began a century later, in the second half of the twentieth century, and in a very short time a new type of classical literary tradition. moved to modern literature.

As a result, by the 21st century, the late-evolving Arab literatures have followed a path similar to that of the evolving Arab literatures, but they have differed in their characteristics.

Such a situation has led to the emergence of a "theory of rapid development" in the example of late modern literature. [6: 3]

The rapid transition of Kuwait, Bahrain, Qatar, and other Gulf states to a new type of modern literature, rather than a "jump," has taken on a complex, controversial character.

The reasons for this can be seen in the fact that these Gulf Arab countries have gone through a unique, even unique, unique socio-historical path of development. These countries, which lived a medieval backward life in the first decades of the twentieth century, experienced very drastic economic, social and political changes in the second half of the twentieth century. Such deviations were not observed in countries such as Egypt, Syria, and Lebanon, where the first literary renewal took place.

At the same time, the rapid development of literature in the Gulf countries did not go in the same direction. The formation of modern literature in Kuwait, Bahrain, Yemen, Saudi Arabia began in the 40-50s of the twentieth century, and quickly grew to the level of Egyptian and Syrian literature, well-known writers throughout the Arab world. However, in Qatar, Oman, and the United Arab Emirates, the process of renewal of literature began much later, in the 60s and 70s of the twentieth century.

If we look at the developmental characteristics of the literature of the Arabian Peninsula, they have expanded their capabilities by accelerating the process of approaching and mastering the ideas and art of acquaintance with those literatures, not from Western literature, but primarily from Egyptian, Syrian, Lebanese literature. Another peculiarity is that Arab writers did not go through the process of adapting medieval literary processes to a new type of modern literary genres, nor did they work on creating a new style of narrative. Before them, Egyptian or Syrian literature had 100 years of experience in creating new Arabic literature on the subject. A large number of publications, including works of art and criticism, from Egypt, Lebanon, Syria and other parts of the Arab world, played an important role in the formation of literary tastes.

Originally living in a much more difficult socio-economic environment than the 40s and 50s of the twentieth century, Kuwaiti and Bahraini writers approached the ideas of the Egyptian, Syrian, and Lebanese enlighteners because they saw it as a factor in their knowledge, consciousness, and morality.

The influx of "oil money" as a result of oil production has completely changed the lives of the countries of the Arabian Peninsula. The material condition of the population has increased dramatically, the opportunities to get acquainted with the world civilization through the most advanced technology that has flooded the country have expanded. As a result of rapid acquaintance with and exposure to various literatures, a mixture of several directions was

observed in the literature of these countries, from enlightenment literature to modernist literature. If in the literature of Egypt, Syria, Lebanon it took several decades for the formation and development of one direction, in the literature of Kuwait, Bahrain, Yemen there were cases when the direction of one direction was not formed until the end. However, in the literature of Qatar, Oman, and the United Arab Emirates, enlightenment literature did not develop at all.

In general, in the countries of the Arabian Peninsula there are almost no genres of enlightenment literature - travelogues, historical novels, encyclopedias and philosophical works. They were replaced by a socio-domestic story and a socio-domestic novel. In these works, there was sometimes an exhortation, a more romantic mood ("al-ittijah al-vijdaniya"). The emergence of a romantic mood in these countries was caused by sharp turns, radical changes, calm as a result of the construction boom, feelings of longing for the lost traditions of material life.

However, from the Enlightenment or romantic style, these literatures were initially formed as a realistic style, because the essence of social works required a more accurate depiction of life, events, personalities. By this time, various forms of realism were already predominant in the advanced literature of Egypt, Syria, and Lebanon. It was in the 50s and 60s of the twentieth century that Egypt, Syria, Lebanon, Iraq, the Arab Maghreb-Tunisia, and Algeria became independent from colonial rule, leading to an intensification of relations between the country's intellectuals, especially its writers. The development of these relations was further facilitated by the fact that publishing houses, radio and television became the field of universal news.

Toha Hussein, Mahmoud Teymur, Tawfiq al-Hakim, Najib Mahfouz, Yusuf Idris, Hannah Mina, Jubran Khalil Jubran, Tahir Wattar, Zunun Ayyub and other famous Arab writers were accepted as "teachers" for the writers of Al-Khalij countries, and they were creatively followed. , his works have been carefully studied. The modern fiction genres that emerged in Al-Khalij's literature — essays, stories, novels, short stories — were imbued with the same realistic spirit.

Many Kuwaiti and Bahraini writers went to study in Egypt, Lebanon, and Syria, where they lived in a literary environment.

But it would be a mistake to say that the writers of Al-Khalij imitated the Egyptian, Syrian, and Lebanese masters, because their works had their own national character. This nationality is ensured by the culture, lifestyle, social and political environment of the Al-Khalij countries, the uniqueness of the dialects used in his works.

But despite the fact that the literature of these countries developed mainly storytelling until the 70s, no significant works have yet been created.

In conclusion, we can say that Suleiman Shati, Abdulaziz Sari, Layla Usman, Surayyo Baqsami, Ismail Fahd, Omina Shaib, Bizza Botini, who entered the literary field in the 70s, are from Kuwait, Bahrain's Khalaf Ahmad Khalaf, Muhammad Majid, Muhammad Abdulmalik, Qatar. Writers such as Kulsum Jobr and Kulsum Ghanim have published their first collections of stories. Their works quickly became known in the Arab world and were even translated into Russian, English, French and other Western languages.

Of course, it was not easy to use a realistic style in al-Khalij literature. Although the acquaintance of writers with realist literature was rapid, the development of realism in these countries was hampered by a number of internal socio-political and spiritual-cultural factors. First, religion, politics, and issues that describe the relationship between women and men are a

factor in limiting or prohibiting state and religious control. Second, in the authors themselves, the social consciousness was not yet devoid of tradition, and the ability to think beyond the boundaries of the environment, the community, certain circles, was still insufficient. It was only in the mid-1970s, when works of mature realism began to emerge, that modernist principles also emerged in al-Khalij's literature under the influence of Western literature. As a result, the stories reveal elements of surrealism, absurd literature.

In the 80s of the twentieth century, the literature of "Al-Khalij" was significantly improved, in which works were created based on psychological analysis, which can reflect the inner world of man with the image of the external environment.

CONCLUSION

Thus, we see that modern prose, developed in the Arab countries in the 60-80s of the twentieth century, embodies the features of realism, romanticism ("al-ittijah al-vijdaniy") and modernism. We observe a tendency to didactic in the enlightenment literature.

In conclusion, it should be noted that although times have changed, both the decline and the success of the nation are reflected, first of all, in the literature. Therefore, in the process of studying the literature, the psyche of that nation, its gradual development, is discovered. Therefore, the importance of studying the literature of Japan and the Gulf Arab countries is immeasurable.

ABSTRACT

Uzbek literature is one of the significant components of multinational literature. Uzbek scientists made a great contribution to the study of literary ties. Literary ties of Uzbekistan are evidence of the strengthening of international relations. The translator reproduces the work, i.e. recreates the original already recreated by the author, save and transmit the original. These are the goals that the Uzbek translators set when working on the works of Anna Seghers.

KEYWORDS: *Interconnection, Mutual Influence, Cultural Phenomenon, Analytical Material, Interpretation, Original, Pathos, Works, Structural And Content Aspect, Artistic Images, Character, Fragment Of A Novel.*

INTRODUCTION

The development of modern world literature is unthinkable without interconnections and mutual influence of national literatures.

Uzbek literature is one of the significant components of multinational literature, a cultural phenomenon of the period under review, therefore, the literary ties of the Uzbek people are part

of the overall complex process of literary interaction of this multinational phenomenon known to the world with foreign literatures.

In literary criticism of the 60s-70s of the XX century, and even now, the problems of interaction and mutual influence of national literatures were and remain interesting and relevant.

In the fundamental works of prominent scientists of that period - V. Zhirmunsky, N. Gudzia, R. Samarin, I. Anisimov, I. Nyupokoev and others1, we found a scientific basis for the interpenetration and interaction of national literatures.

THE MAIN FINDINGS AND RESULTS

The collective monographs of authoritative literary critics of the 60s-70s of the XX century contain extensive analytical material, valuable observations and reasoned conclusions on the problems of international literary relations.

Uzbek scientists made a great contribution to the study of literary ties. Many doctoral and candidate dissertations are devoted to these problems. Monographs and articles have been written.

These works by Uzbek scholars are evidence of the great interest in German literature and international literary ties in Uzbekistan.

One of the talented representatives of the German people, Anna *Seghers*, made a great contribution to the development of German literature. Her works are widely known outside Germany, translated into many languages of the world.

During the period under review, the novel "The Dead Remain Young" (translations by A. Abdullaev, Kh. Ruzimatov) and the story "The Story of One Love ("Across the Ocean")" (Translation by Sh. Ismailov) were translated into Uzbek.

The novel "The Dead Remain Young" tells about the revolution of 1918, the actions of the popular masses against internal reaction, the birth of Nazism in the Weimar Republic, the rise of fascism in Germany and the crimes against humanity associated with fascism, as well as the defeat of fascism.

The author of the work calls for the fight against the threat of war, against the arms race, for the strengthening of peace throughout the world.

Simple laborers - peasants and workers, people from the people who need peace and peaceful labor - are the main themes of Anna *Seghers's*works. Defending peace, the German writer exposes the secret and causes of war, its preconditions and causes.

The writer opposes the supporters of Nazism, who dream of its revival. Fighting for peace, for the unity of Germany, A. *Seghers*, like other progressive writers in Germany, persistently puts forward the task of educating the German people in the spirit of internationalism and respect for other nations.

A writer, creating his work, is always based on a fact or fiction, born or interpreted by his life experience, conveys his understanding and assessment of the real or invented world, his ideological and aesthetic attitude to his contemporary or described era. His creation is driven by a concept that, in the process, translates into an authorized final.

The translator reproduces the work, i.e. recreates the original already recreated by the author, fully depending on his author's concept of the world, images, striving to comprehend, preserve and convey the original.

These are the goals the Uzbek translators set themselves when working on the works of A. *Seghers*.

For persuasiveness and clarity, the latter interpreted individual episodes of the novel "The Dead Remain Young" into Uzbek.

Original in German (Anna Seghers. Die Totenbleiben Jung, Aufbau-Verlag, Berlin. 1949.):

"Martin dachtedarübernach, oberdemMädchenerzählensollte was mit Erwin geschehen war. Erhattemit Erwin imSchützengrabengelegen. Erhatteihmauchwieerspätergestand, das Flugblattzugesteckt. Erhatte in der letzten.

Nach seiner Seitegekämpft. Nur seine eigneFlucht war gelungen".

Translation into Uzbek launguage (Zegers A. The Living Dead (novel). Translated by A. Abdullaev and H. Ruzimatov. – Tashkent: State and Art Publishing House of the USSR, 1962.):

"Martin, do'stiningnimabo'lganliginiqizgaaytaymi-aytmaymi, deb uzoqo'yladi. U Ervin bilanokoplardabirgabo'lgandi. Ervinningqo'ligavaraqaqistiribqo'ygan ham Martin edi. U buniErvingakeyinchaliko'ziaytganedi. Hatto u oxirgikechasi ham ularyonma-yon jangqilganlar. Lekin, Martin biramallabqochibqutildi".

Russian translation (A. *Seghers*. The dead remain young. Translation by N. Kasatkina. – Moscow: "Progress", 1971.):

"Martin pondered for a long time whether to tell the girl about what had happened to his friend. They sat with Erwin in the trenches. And it was Martin, as he later confessed to Erwin, slipped him a leaflet. And even on this last night, they fought side by side. But only Martin managed to escape".

This fragment of the novel has been completely equivalently translated into the Uzbek language, and not only some German words "Nach – denken", "das Mädchen", "die Schützengraben" are equivalently translated into the Uzbek language (*o'ylamoq, qiz, okoplarda*), but also whole sentences, such as:

1) "Martin dachtedarübernach, oberdemMädchenerzählensollte was mit Erwin geschehen war".

2) "Erhattemit Erwin imSchätzengrabengelegen".

In Uzbek it sounds like this:1) Martin, do'stiningnimabo'lganliginiqizgaaytaymi-aytmaymi, deb uzoqo'yladi. 2) U Ervin bilanokoplardabirgabo'lgandi.

Translator T. Abdullaev accurately conveyed the peculiarities, coloring of speech of one of the characters in the novel (Martin), which is a great success for the Uzbek translation school.

Despite the complexity of the original work, multifaceted in the structural and content aspect, the Uzbek translator, having penetrated into the essence of the meaning of the original, accurately conveyed the pathos of the work to the reader. This can be seen from the example of the translation of the following passage from the novel.

Original:

"… hatte der Dampferdas Erde des seeumkreist Die dunnegeschweifteSchaumspur war nochnichtvergangen…".

Translation into Uzbek language:

"… paraxodko'lningnarigiqirg'og'igayetgandi. Paraxodketidankelgansuvdagiingichka, oppoqko'piklanganizhamonko'rinibturardi…".

In this passage, the German words "derDampfer", "des See" are very accurately translated into the Uzbek language: "parahod – Steamer" and "ko'l – lake".

Anna *Seghers*creates artistic images mainly through the author's characteristics. One of these images is the image of Mary, a woman who is always accompanied by a life of trouble.

Original:

Marie lag langewach, aber tatneüdeSiehatleinzwischengelernt, was füreinerheblicherTeil des Lebens am Wartenbestand.

Translation by A.Abdullaeva in Uzbek language:

"O'lardaycharchaganlarigaqaramasdan, Mariyauzoqvaqtuxlamasdanyotdi. U anashuyoshgakiribumrningqanchasiintizorlikbilano'tibketishinibilibolgandi".

Translating to Russian language:

"Maria lay for a long time, deathly tired, but without sleep. During this time, she managed to find out what a significant part of her life is waiting".

The Uzbek translator very accurately understood and conveyed the meaning of the original.

As the study showed, translating this work into Uzbek required colossal work, deep and versatile knowledge of the language.

In 1977, the publishing house "YoshGvardiya - Young Guard" released the story "The Story of One Love ("Across the Ocean")" in the Uzbek translation of GulyamIsmailov, which tells about the fighters for peace and the liberation movement of peoples.

Let's analyze one of the fragments.

Original(Anna*Seghers*. Überfaht. EineLiebesgeschichte. Aufbau-Verlag, Berlin, 1971):

"MiteinerAbfahrtistnicht'szuvergleichenkeineAnkunft,   keinWiedersehen. ManläbtdenErdteilendgültighintersichzurück. Und was man dortauchalleserlebt an Leiden und Freuden, wenn die Schiffsbrückehochgezogenwird, dannliegenvoreinemdreireinewochen Meer".

Translation into Uzbek langauge (Zegers A. A love story (narrative). Translated by G.Ismailov. T., Young Guard Publishing House, 1977.):

"Jo'nashkayfiyatiganimayetsin! Safardanqaytish ham ayriliqdanso'nggiuchrashuv ham ungatengkelolmaydi. Qit'anibutunlaytarketyapsan. U yerdaqandayquvonchu-kulfatlarniboshingdankechirganbo'lma, kemako'prigiko'tarildimi, tamomendiuchhaftaokeandanboshqanarsaniko'rmaysan…".

Translator GulyamIsmailov accurately translated this passage of the story. The German words "dieAbfahrt" and "Erdteil" are equivalent to the Uzbek words "jo'nash - leaving" and "qit'a - kontenet". Phrase ... *wenn die Schiffsbrückehoch gezogenwird*is also accurately translated.

"kemako'prigigako'tarildingmi...". "Did you climb the ship's bridge ..."

CONCLUSION

The works of A. *Seghers*are conditioned by the socio-cultural and political situation of her time, the dominant literary direction at that time, in the mainstream of which the writer worked, having managed to create magnificent examples of art, the significance of which is obvious at the present time. Her works teach to see the best qualities in people, teach to live and work according to conscience, to love our Motherland and the land on which we live.

Uzbek translators managed to create full-fledged translations - works of high art on the material of another unrelated language without any deviations and distortion of the author's concept.

Republic of UZBEKISTAN

ABSTRACT

The article examines the factors influencing the probability of accidents at chemically hazardous facilities; the causes of chemical accidents have been revealed. Measures to improve the prevention of chemical accidents are recommended.

KEYWORDS: *Chemical Hazardous Object, Probability Of Chemical Accident, Causes Of Accident, Consequences, Toxins, Evaluation, Planning, Prevention, Improvement.*

INTRODUCTION

The main purpose of protecting the population and the territory from emergent situations is to save lives and health from the negative impact of accidents at potentially hazardous facilities, identify the causes of accidents and prevent environmental pollution.

The country has adopted a number of laws and resolutions of the Cabinet of Ministers aimed at protecting the population and the territory from emergencies which define the powers and responsibilities of the relevant public administration and local authorities [1].

THE MAIN FINDINGS AND RESULTS

Accidents at chemically hazardous facilities (CHFs) are one of the man-made emergencies with severe consequences of technological disasters. Up to several thousand tons of hazardous chemicals are produced, stored and used simultaneously at chemically hazardous facilities [2].

The release of toxic substances into the environment as a result of chemical accidents can lead to mass poisoning and death of people, animals and pollution of air, water and soil.

Accidents at the ICU result in disruption of technological processes, damage to pipes, storage tanks, containers, vehicles, mass release of people and animals as a result of the release of toxic substances into the atmosphere, as well as water and soil poisoning. This creates a zone of chemical poisoning [3]. In such emergencies, the formation of a cloud of poisoned air is observed as a result of the release (spillage) of highly toxic substances (HTS) into the environment. A cloud of poisoned air is caused by the release of highly toxic toxins into the environment or by the evaporation of a spilled substance or by the release of toxic gases from a damaged volume, pipes.

There are production facilities in which the substances used or stored do not fall into the class of highly toxic substances, but as a result of their combustion, toxic substances or highly toxic substances are released. It is necessary to fully assess the consequences of fires at such facilities and to correctly determine the area of poisoning. Thus, it is possible to correctly determine their chemical hazard, classification according to the established levels, as well as to accurately calculate the boundaries of the surrounding sanitary protection zone [4].

Emergencies related to chemical poisoning are common in the world. An example is the 1976 chemical accident at ICMESA in Sevezo, Montsa-e-Briantsa, Italy. As a result of the accident, dioxin was released into the plant area. The poisoning zone is divided into three zones according to the amount of dioxin: Zone A (the most poisoned zone) has an area of 1.08 km^2, with an average of $2.4 \cdot 10\text{-}4$ g / m^2, Zone B has an area of 2.7 km^2. , an average of $3 \cdot 10\text{-}6$ g / m^2, zone Z - 14.3 km^2, with an average of $5 \cdot 10\text{-}6$ g / m^2 It was determined that 200,000 people live in the general poisoning zone, including 27.6 thousand people in zones A, B, C. As a result of the accident, about 1,000 people were injured, 78,000 small animals and 700 cattle were killed, as well as a large amount of grain. As a result of excavation of fertile soil to a thickness of 20 cm, 200 thousand cubic meters of contaminated soil was buried and replaced by other soil. Between 1976 and 1986, 500 deaths were reported in the area. In addition, mild and severe forms of skin diseases associated with dioxin exposure have been observed in more than 200 people. According to the National Cancer Institute in Milan, the main cause of death has been proven to be exposure to dioxide.

In order to protect the population and the territory from such man-made emergencies, theSSE (State system in emergencies) should plan tasks for the organization and implementation of measures in the following areas:

- Measures to prevent natural, man-made and environmental emergencies;

- Protection of employees, population and property of the production facility from the negative consequences of major accidents and natural disasters;

- Early forecasting of emergencies, timely and prompt detection, assessment of their consequences and scale, effective implementation of rescue operations.

Currently, the assessment of the probability of emergencies shows that their number is increasing day by day. The following factors contribute to the increase in the probability of occurrence [6]:

1. Non-uniformity of the activity of most enterprises;

2. Obsolescence of fixed assets;

3. Deterioration of production and technological discipline. Incomplete compliance with the requirements of regulatory documents;

4. Unintentional increase in the volume of production at chemical facilities, the transfer of large chemical complexes to full-scale operation, increasing the amount of storage and transportation of toxic chemicals;

5. Lack of modern control, interlocking and control systems;

6. Low efficiency of control and efficiency of state control bodies;

7. Not to replace chemical compounds and substances with new, less harmful ones as a result of scientific research;

8. Increased risk of terrorism at radiation and chemical hazards.

In addition, according to the Russian scientist V.A.Vladimirov, both other factors affect the likelihood of chemical accidents. These are the density of complex manufacturing plants operating with high-capacity energy and hazardous substances, as well as the large number of people living around potentially hazardous production facilities [7].

In the prevention of chemical accidents, in addition to taking into account the possibility of accidents, it is necessary to know in advance the causes of their occurrence, as well as to take measures to eliminate the causes in the development of protective measures. The following are the main causes of chemical accidents:

-Faults in the production equipment of the enterprise;

-Obsolescence of equipment due to prolonged use;

-Low stability of communication systems, obsolescence of pipes and shut-off devices;

-Errors in the process of storage, transportation and filling of HTS;

-Natural disasters and fires and explosions;

-Failure to comply with safety measures during storage and use of HTS;

-Lack or failure of automatic control system, equipment at the enterprise;

-Lack of skills of employees, low labor discipline.

Preliminary identification of the area of the zone where the probability of poisoning is present in the SCO is important in the effective implementation of measures to prevent and eliminate the consequences of the accident. It is recommended to take into account the following as primary data [8]:

-Distributed amount of HTS - specifically the amount of substance stored in one volume;

-The total amount of toxic and HTS stored in the CHFs located in seismic zones;

-Meteorological conditions - precisely wind speed, air temperature and the state of the environment.

Properly planned, timely organization and implementation of measures to protect the population from emergencies at chemically hazardous facilities allows to reduce such cases and prevent damage [9].

In protecting the population from man-made emergencies, it is important that the population acts properly in such situations. In this regard, it is planned to train the population of the republic in categories, to organize trainings and exercises at enterprises with employees, including those working at potentially hazardous facilities [10].

CONCLUSION

Thus, by studying the probability and causes of accidents at chemically hazardous facilities, it is necessary to reduce the number of people who may be affected by the development of specific measures to prevent them, as well as their consequences, such as material damage and environmental pollution. is of great importance in reducing and preventing.

SUGGESTIONS AND RECOMMENDATIONS

In order to improve the prevention of chemical accidents at chemically hazardous facilities, we recommend the following measures:

-To determine the causes of accidents at chemically hazardous facilities based on the activities and technological status of the enterprise;

-Identification of the zone of possible poisoning in the event of chemical accidents with the help of special computer programs and the location and direction of evacuation of workers to a safe area;

-Revision of the terms of inspection of chemical hazardous facilities and requirements for inspection by state control bodies;

-Enhancing the sustainability of utility systems and strengthening their inspections;

-Development of special programs for advanced training courses for workers working in dangerous areas, workshops and strengthening control over their training;

-Development of protection measures in the plans for the prevention, response and mitigation of emergencies in the CIS, taking into account not only the existing HTS at the facility, but also measures to protect against toxic gases generated by combustion and explosion of toxic substances;

-Replacement of chemical control and intelligence equipment with modern equipment.

By improving the prevention of chemical accidents at chemically hazardous facilities, the risk of accidents is reduced, and timely elimination in the event of an accident is achieved.

ABSTRACT

The role of literary criticism in the study and research of the rich and meaningful literary heritage of the Uzbek nation is invaluable. Representatives of classical literature, including Navoi's personality, rich literary heritage, language and style of his works, served as a creative way, an example for the representatives of the literature of the later periodLiterary critics have studied and covered the rich literary heritage of Navoi's work in different periods, his artistic skills, the diversity of genres, the uniqueness of image creation and the promotion of humanistic ideas. This article presents the views of the critic H. Yakubov, who drew attention to the issue of coverage of Navoi traditions in modern uzbek literature and expressed his views.

KEYWORDS: *Critic, Dramaturgy, Literary Criticism, Review, Literary Theory, Press.*

INTRODUCTION

Along with such literary critics as M.Kushjanov, S.Mamajonov, O.Sharafiddinov in the development of Uzbek literary criticism, H. Yakubov also has a special place. Since the 1920s, Homil Yakubov has created articles and reviews, scientific essays, monographs, textbooks and manuals, programs and pamphlets on various topics. «Creative Way of Hamid Olimjon» (1936), «Short Stories of Abdullah Qahhor» (1946), «Uzbek Literature in the Five Years Before the War» (1953), «Life and Work of Ghafur Ghulam» (1959) «Selection» (two volumes, 1983) are among them. In these scientific works, the achievements of the new Uzbek literature are discussed, and important ideas are highlighted in accordance with the requirements of the time. The genre of critical-biographical essays occupies a significant place in the work of Homil Yakubov. He closely studies the works of Gafur Gulam, Hamid Olimjon, Oybek and applies them ideologically and artistically. The peculiarities of the work of each writer-poet, their place in the literature, show the aesthetic significance of enlightenment. The critic not only studied the creative path of modern Uzbek literature, but also the works of Uzbek classical literature. He

published a number of scientific articles and pamphlets such as «Zahiriddin Muhammad Babur», «The life and works of poet Turdi» (1940), «Uzbek democratic poet Muqimiy» (1953), analyzing the skills of our writers in a unique way. The personality and literary heritage of the great thinker Alisher Navoi have a special place in his scientific activity. Indeed, Homil Yakubov's articles such as Alisher Navoi's Khamsa, Sab'ai Sayyar epic Pride of Uzbek literature, Navoi and new Uzbek literature are among the achievements on Navoi studies.

While literary critics have studied and covered the rich literary heritage of Hazrat Navoi's work in different periods, his artistic skills, the diversity of genres, the uniqueness of image creation and the promotion of humanistic ideas, the critic H.Yakubov draws attention to the coverage of Navoi traditions in modern Uzbek literature.

H.Yakubov said: «... We do not want to talk about all aspects of Navoi and his work in connection with Soviet literature, but about one of the areas that has not yet been well explored - the problem of Navoi traditions.»

Before starting to talk about the traditions of Navoi, the critic explains some concepts of literary criticism. The scholar points out that in some studies the concepts of tradition and literary heritage are often used interchangeably, and goes on to define these two concepts. «Of course, there can be no tradition without literary heritage. But there is a big difference that separates the two concepts. In relation to Navoi, the literary heritage includes the collection, study and examination of all the creative heritage of the great poet and thinker, whether popular or scientific publication, and so on. At the same time, Navoi's own works become a direct means of educating the reader, instilling in his heart the most noble human feelings, increasing his taste and intelligence. Tradition requires the creative re-assimilation of its national heritage, the development of humanistic views, literary experiences, artistic skills in the new works of generations, raising them to a modern, ideological and aesthetic level.»

In this article, H.Yakubov explained with examples that Navoi's works are enriched with folk qualities in the form of moral and spiritual masterpieces, immortal artistic truth, as well as the fact that the works of Navoi live forever. The critic notes that since the 1920s, a number of artists such as H.H.Niyozi, Komil Yashin, Xurshid, Oybek, Hodi Mahmudov, Gafur Gulom, M.Boboyev, Mirtemir, Мақсуд Шайхзода, Ойбек, Миркарим Осим, Уйғун, Иззат Султон have studied Navoi's literary heritage closely, created works based on his immortal heritage, and tried to revive the image of Navoi. The critic notes that since the 1920s, a number of artists have studied Navoi's literary heritage closely, created works based on his immortal heritage, and tried to revive the image of Navoi.

The critic argues that one of the manifestations of Navoi's tradition is that some of his epics, or the stories included in the epic, are to some extent creatively reworked and staged. As a confirmation of the critic's opinion he states that in 1922, the poet and playwright Khurshid staged «Farhod and Shirin» from Alisher Navoi's epics, and in 1925 «Layli and Majnun».

In the eyes of a critic arising from the requirements of the literary science of his time, the idea expressed in the work of art should be covered in a way that is relevant to the time in which the work is created and the life of contemporaries. That is why the critic, while talking about the musical drama «Farhod and Shirin» staged by playwright Khurshid, points out the shortcomings in it. According to the scientist, in the process of reworking the play, the playwright refers to some folk legends and myths, forgets the original essence of the work after the reality.

«..Mehinbonu moved his kingdom to Bekabad, and Shirin had to marry the man who brought water to Mirzachul. However, in the first version of the musical drama, Khurshid could not adequately combine the folk legend about Shirin with the leading idea of Navoi's work - the motives of heroism and justice. In the musical drama, Farhod's struggle for the most progressive ideas of his time, his search for the path of truth and justice, his humanism and his desire to alleviate the fate of the people were somewhat sheltered, and the ideal love line of lovers remained the most. Farhod and Shirin are the epitome of such love.» Such shortcomings of the stage work were corrected and supplemented in subsequent studies. The next version of the work, co-authored by K. Yashin, emphasizes the pursuit of perfection. «..The feelings of love of two young people who love each other infinitely are imbued with the aspirations of humanity and populism: they celebrated the great moral and spiritual power of their love, their ideals over the medieval oppression, bigotry and ignorance against them.» The article says that the playwright, poet Khurshid was the first to take on such a difficult and responsible task as staging two epics «Farhod and Shirin», «Layli and Majnun» of the great humanist poet and worked effectively with K.Yashin.

The second type of continuation of Navoi traditions is to try to create the image of the great thinker, poet and humanist Navoi in Uzbek literature. Of course, the movement to create the image of Navoi has a long history. For five centuries, a literary figure who considered himself a follower of Navoi approached the poet with respect for his personality and works and tried to create a portrait of him. The article explains that some of Alisher Navoi's human qualities were sung and described in the letters, in ghazals, muhammas and poems, memoirs and letters, literary-historical chronicles and commentaries of contemporary poets and fans, and the image of Navoi found a special artistic expression in the examples of Uzbek folklore, myths and legends.

The critic points out that the first poem about Navoi, written under the pseudonym Botu, was written by a young poet, Hodi Mahmudov, in a very simple, light language for children. This poem was published in the second issue of the magazine «Children's World» in 1921 under the title «Navoi». In the article, the critic concludes that this poem is valuable as one of the first works to embody the image of Navoi, even though it was written in woolly verses.

H.Yakubov pays special attention to the work of Oybek, who, as a creator was able to fully create the image of Navoi. It should be noted that Oybek's epic «Navoi» depicts Navoi only in his old age, when he began to write «Lison ut-tayr» (1498). Special attention is paid to the image of the great poet's thoughts and experiences, thoughts and emotions. «Therefore, Oybek selects moments from Navoi's life, internal and external portraits, political-state and public activities that will help to reveal his creative psychology, his nature, which is prone to human beauty.» In the epic, the image of Navoi is described as a comprehensively mature person. Years later, Oybek began to write Navoi, gaining some experience and knowledge of Navoi's personality and creative heritage. The article acknowledges that Oybek created purely textual images based on historical events, including Navoi's image, as well as works that appear only slightly in historical sources, are slightly mentioned, or are based on certain circumstances and events in Navoi's own work. In the process of creating the image of Navoi, he creatively developed his traditions, deepened the ideals of humanism, morality, beauty and justice, and mastered the methods of realism on a historical theme.

Another example of poetry analyzed by H.Yakubov is the ballad «Comrade Navoi» (1939) by

Maqsud Shaykhzoda. In the ballad, the critic praises the portrayal of Navoi and Hussein Boykaro, one as a person who hates life, luxury, and luxury, and the other as a joy of creation, a sacrifice for the future of the nation. Despite the shortcomings of the critique of such a period, the critic emphasizes that the breadth of Navoi's work, the beauty of his spiritual world, the uniqueness of his talent were uniquely described by the Shayxzoda. At the end of the ballad, a lyrical retreat in the style of Navoi, the conclusion of the hero's inner monologue is considered an example of the poet's skill.

In general, in this article H. Yakubov emphasizes the wide range of issues of creative assimilation of Navoi traditions in modern Uzbek literature. Based on the successes in creating the image of the poet, the critic concludes that Navoi's work is a model school for all times.

ABSTRACT

Today, a lot of work is being done all over the world to reduce energy losses and use them wisely.70-80% of processes in manufacturing plants are associated with electric motors. Especially in industries where high power induction motors are used, lower power factor increases power losses. As a result of the analysis, energy-saving modes of operation are considered due to an increase in the power factor of consumers.

KEYWORDS: *Power Factor, Loss, Loss Rate, Electro Energy, Reactive Power, Active Power, Asynchronous Motor, Harmonics, Load Factor, Synchronous Motor, Efficiency.*

INTRODUCTION

The main consumers of reactive power at industrial enterprises are three-phase asynchronous motors, transformers, power lines and gas-discharge lamps. Asynchronous motors consume 65-70%, three-phase transformers in the power supply system 15-25%, power lines, reactors, gas-discharge lamps and other consumers consume 5-40% of reactive power.

Main part

The dynamics of changes in reactive power is expressed by the reactive power factor:

$$tg\varphi = \frac{Q}{P}$$

where $Q = UIsin\varphi$ - reactive power, $P = UIcos\varphi$ - active power, φ - angle between voltage and current vectors.

Although $tg\varphi$ fully describes the modes of production of electricity consumers, in practice a larger power factor is used:

$$cos\varphi = \frac{P}{UI}$$

here $S = UI$ - full power

Power factor is a factor that characterizes how much total power is expended on useful work. If the power factor of the consumer decreases, the total power in the network increases, i.e.:

$$S_T = \frac{P}{cos\varphi}$$

where P is the active power of the consumer

With constant values of P and U

$$I_P = \frac{P}{\sqrt{3} * U * cos\varphi}$$

the reactive current increases, which leads to an increase in operating costs, i.e. increase in the loss of electricity in the network:

$$\Delta P = 3RI_P^2 = \frac{RP^2}{U^2cos^2\varphi}$$

where R is the active resistance of one phase of a three-phase device. To avoid the loss of electricity, it is necessary to increase the cross-sectional area of power lines, which leads to an increase in the consumption of non-ferrous metals.

RESULTS AND DISCUSSIONS

Reactive power compensation and increased $cos\varphi$ are also important for all industries. Low power factor is due to the following reasons:

1. Incorrect selection of asynchronous motors for power and operating conditions. Due to the high leakage inductive resistance of induction motors with a wound rotor, the $cos\varphi$ value is lower than that of asynchronous motors with squirrel cage rotors. The cooling conditions in closed motors are lower than in open ones. Among motors of the same type and power, the higher the speed, the higher the $cos\varphi$ value.
2. This is due to the incomplete and uneven load of production mechanisms and their electrical equipment over time.
3. Operation of electric motors and transformers without load.
4. The use of powerful electric motors and transformers in low-power industries.
5. The use of electric motors with a power higher than the nominal increases the leakage of the magnetic flux and, as a result, decreases the $cos\varphi$.

6. Use of faulty or poorly repaired electrical equipment: for example, when rewinding electric motors, sometimes the stator slots are not filled with the number of conductors that were in the factory winding, reducing the number of windings by 10% increases motor slip by 25%, resulting in a 6-8% reduction in power factor. A 10 mm difference in rotor steel size leads to a 15-30% reduction in cosφ.

7. Due to the presence of rectifiers and the presence of ferromagnetic consumers of electricity operating in a mode close to saturation, the sinusoidality of the voltage in the network is violated. In induction motors and transformers, non-sinusoidal voltages cause an additional drop in power, which shortens the life of the insulation.

$$K_M = cos\varphi_1 K_{C1}$$

where cospφ$_1$ - is the power factor of the first harmonic,

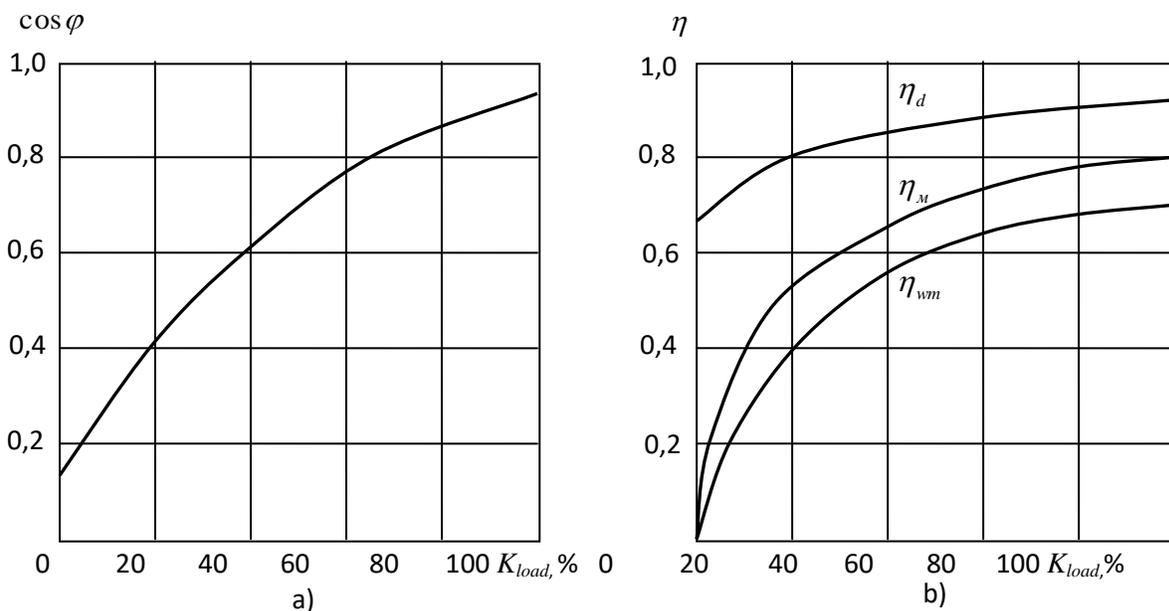
$K_C = \dfrac{I_1}{\sqrt{\Sigma I_i^2}}$ - correction factor, i - harmonic component serial number.


FIGURE 1. GRAPHS OF THE DEPENDENCE OF THE POWER FACTOR OF AN ASYNCHRONOUS ELECTRIC MOTOR (A), AN ELECTRIC MOTOR H_M, A WORKING MACHINE H_{WM} DRIVE H_D EFFICIENCY (B) ON THE LOAD FACTOR

The power factor used in industrial plants ranges from 0.2 to 0.5 (welding equipment, cranes, excavators) from 0.7 to 0.8 (fans, concrete mixers, conveyors), and the power factor is close to unity. synchronous motors, compressors and pumps. However, according to the rules for the operation of electrical equipment, the value of the power factor of the network should be 0.92 - 0.95.

To increase the power factor and reduce power losses in electrical equipment, the following measures will be taken:

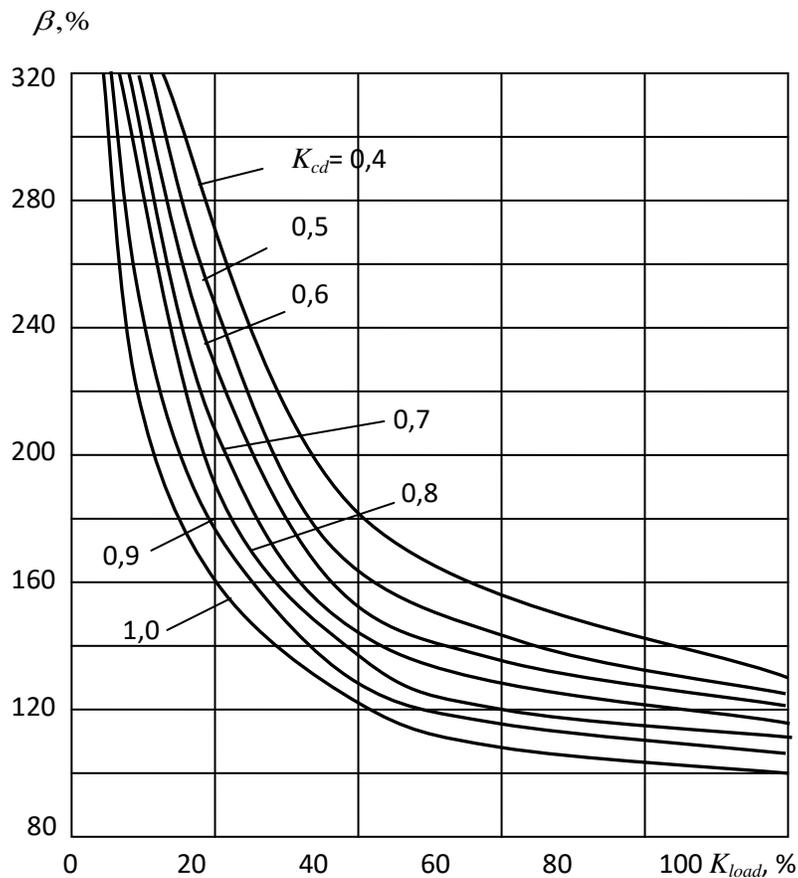
1. Selection of asynchronous squirrel cage motors and the use of open circuit motors that are easy to cool, depending on the capabilities and conditions.


Figure 2. Graph of the ratio of the specific cost of electricity consumed in a running machine to the load factor

Achievement of uniform distribution of the working mechanism at full load and production of electrical equipment.In fig. 1 shows the change in the load factor of the motor $\cos\varphi$ and efficiency, the operating mechanism and drive efficiency depending on K_{load}.

To calculate the energy saved, we first calculate the specific electricity value:

$$\Theta_{CQ} = \frac{1}{\eta_M * K_{locd}}\left[K_{locd} + \frac{\alpha(1 - \eta_M)}{K_{cd}}\right]$$

whereη_M - efficiency at full load of the working mechanism; K_{locd} - load factor; K_{cd} - cyclic duration factor; $\alpha = 0.7 - 0.9$ - is a coefficient depending on the type and design of the working mechanism.

The K_{locd} and K_{cd} coefficients are determined by the following formulas:

$$K_{locd} = \frac{P}{P_N}, K_{cd} = \frac{t_M}{(t_M + t_O)}$$

whereP_N is the rated motor power, t_M - operating time of the mechanism, t_O - idle time.

Since $t_O = 0$ and $K_{cd} = 1$, $K_{locd} = 1$ for the maximum operating mode of the working mechanism, the specific value of electricity is minimal:

$$\Im_o = \frac{[1 + \alpha(1 - \eta_M)]}{\eta_M}$$

To calculate the energy savings due to the increased load on the operating mechanism, the energy savings per hour are calculated using the graphs in Figure 2 and taking into account the coefficient $\beta = \Im_{CQ} / \Im_0$ using the following formula:

$$\Delta\Im = (\beta_1 - \beta_2) * \Im_0,$$

Where β_1, β_2-electric before and after increasing the load coefficients of the relative change in the specific cost of energy.

3.   By improving production technology, proximity to production sites devices limit switches seals and control panels possible to minimize and completely eliminate the gland the course of induction motors and welding transformers.

The use of electricity in the restriction of movement without load economic feasibility diagram in Figure 3 defined by.And is calculated as follows:

$$a = \frac{P_0}{P_N} \text{ and } b = \frac{1}{4t_x}$$

whereP_0 is the average idle power, kW; P_N is the engine power rated power, kW; t_x is the idle time between cycles, s.

The effectiveness of indicators a and b will be found in the chart. Every hour, according to the following formula, energy savings are:

$$\Delta\Im = \varepsilon z P_n t_x / 3600,$$

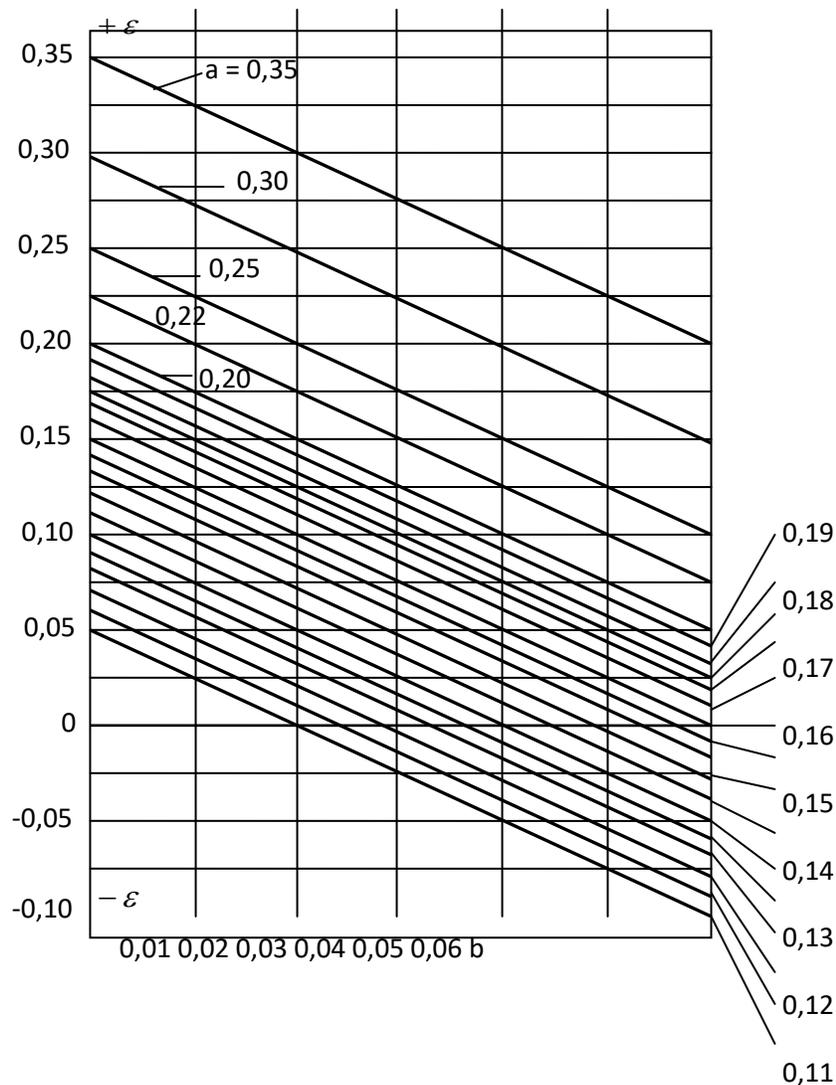
where z is the number of cycles of operation of the mechanism during its production.


FIGURE 3. A DIAGRAM USED TO DETERMINE THE EFFICIENCY OF LIMITING THE IDLE OPERATION OF ELECTRIC DRIVES.

4. Low-power engines that are not fully loaded by the power of the motors; if the degree of loading is less than 45%, then it is necessary to replace it with an undeniably low-power one. if the load level is higher than 70%, then no replacement is needed. If the load is in the range of 45% – 70%, then it is necessary to calculate the active power loss. This power loss is calculated using the following expression:

$$\Delta P_{\Sigma} = [Q_0(1 - K_{load}^2) + K_{load}^2 * Q_n]K_l + P_0 + K_0^2 \Delta P$$

here$Q_0 = \sqrt{3}U_n I_x sin\varphi_0$is the reactive power that the engine consumes at idle, kvar;

$K_{load} = P/P_n$ − the load factor of the engine; $Q_n = \frac{P_n}{\eta_n} tg\varphi_n$ - at rated engine load, reactive power consumption, kvar;$K_l = 0.1$ or 0.15- loss factor;$\Delta P_1 = \sqrt{3}U_n I_0 x cos\varphi$ - active power loss at idling of the engine, kW;

$\Delta P = P_n \left(\frac{1-\eta_n}{\eta_n}\right) * (\frac{1}{1+\gamma})$ -change in active power losses when the load on the engine changes by the nominal value, kW;

$\gamma = \frac{P_x}{(1-\eta_n)-P_x}$ - calculated coefficient depending on the motor design, %; sinφ varies in the range of 0.1-0.2. the average value of the idling current I_o is determined based on the values of P_n and I_n of the motor.

CONCLUSION

Thus, replacing the engine with a less powerful one will reduce the loss of active power in the engine. So in this case, it is advisable to replace the engine with a small power.

If the stator phases of the motor are connected in a triangular way, and the motor load does not exceed 40%, then it will be necessary to connect the stator winding in a star way (Fig.4). As a result, the voltage at each phase is reduced by a factor of 3, which leads to an increase in the power factor.

At low load during engine operation , if this cycle is cyclically repeated, then connecting the stator phases either in a triangular or stellar way using an automatic reconnection device allows you to automatically adjust the engine power factor, which in itself leads to energy savings.

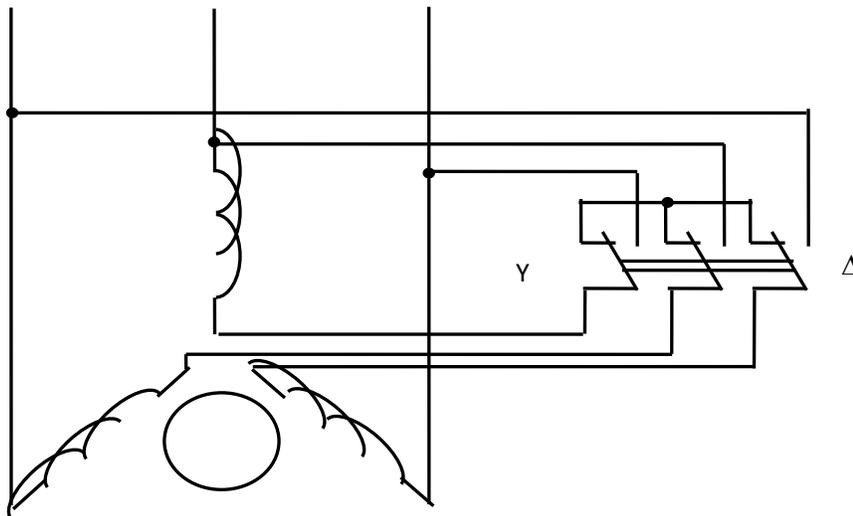
5. Adjustment of the maximum current and thermal relays prevents exceeding the permissible current value in the motor stator winding. If the service life of a Class A insulated motor is 15-20 years, increasing the current by 25% of the rated value reduces the service life of the motor to 1,5 years.


FIGURE 4.CONNECTION DIAGRAM OF THE STATOR WINDING PHASES OF AN ASYNCHRONOUS MOTOR.

6. It is necessary to monitor the quality of repair of the electric motor.

7. Replacing three-phase asynchronous motors, whose speed is not regulated by electric means, with synchronous motors operating in the same supersonic mode, allows you to compensate for the reactive power received from the network.

8.Replacement of asynchronous motors in asynchronous electric drives with unregulated speed by synchronous motors of appropriate power.

Main advantages of synchronous motors:

-when the excitation current is adjusted during operation, the cosφ value changes;

-sensitivity to changes in mains voltage is lower than that of an asynchronous motor;

-the torque is directly proportional to the mains voltage, in an asynchronous motor this ratio is directly proportional to the square of the voltage;

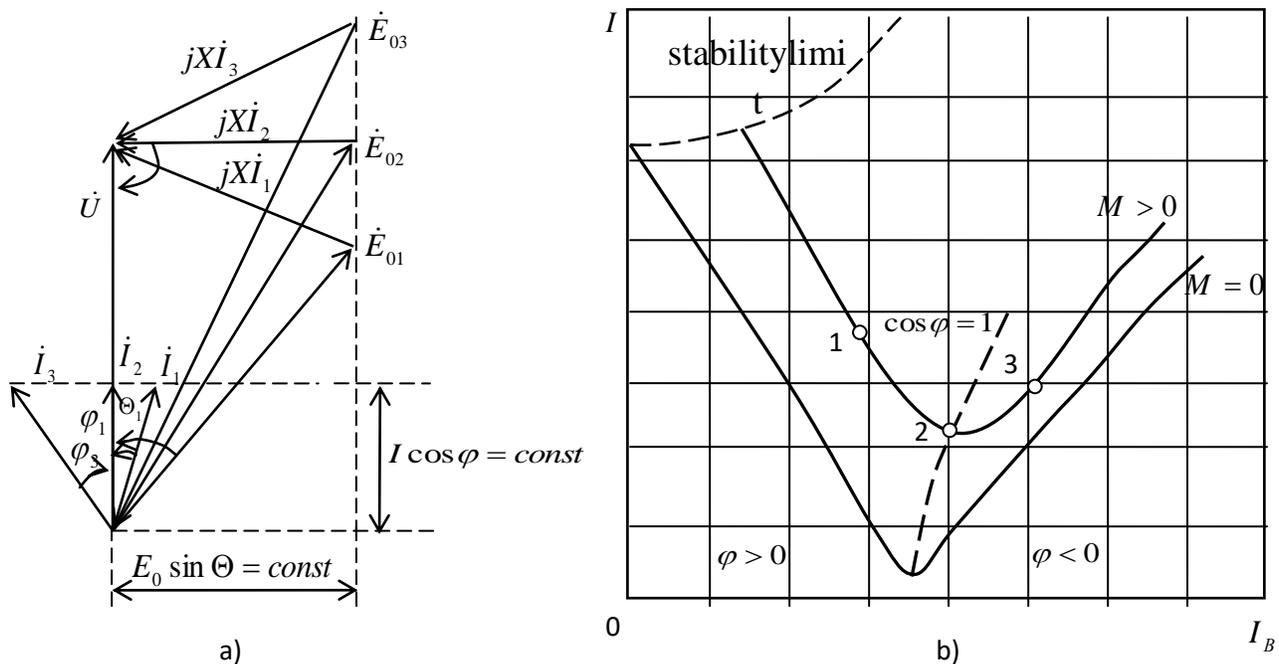
- The efficiency of a synchronous motor will be higher than that of an asynchronous motor.


FIGURE 5. VECTOR DIAGRAM OF A SYNCHRONOUS ELECTRIC MOTOR (A) AND ITS U-SHAPED CHARACTERISTICS (B)

5a, Figure shows a vector diagram constructed for three different excitation current values for a simplified single-phase synchronous motor. Also, for the values M = 0 and M > 0 of the torque at different values of the excitation current, the characteristics of the stator current change, i.e. in the form of u, are shown in fig. 5b. Voltage supplied from the mains to the phase winding

$$U = E_0 + jXI_1$$

where E_0 is the EMF vector formed by the main field of the rotor, X is the inductive resistance of one phase of the motor, I_1 is the phase current vector. If the field of the Rotor generated by the field coil is less than the resulting magnetic field generated by the given mains voltage, then the stator current vector I_1 lags behind the voltage U by an angle φ_1. Then the motor will act as a device with an active inductive load for the network. the excitation current of the field winding

can be increased to such a value that E_{02} will take such a value that the network voltage jX_2 will be perpendicular to u, and the phase I_2 will coincide with u, i.e. U_2= 0 will be damped, and the active load for the synchronous network will be damped(φ_2=0).

A further increase in the excitation current puts the synchronous motor in the active capacitance mode, in which the mains voltage $I_3\varphi_3$ is ahead of U. Thus, the synchronous motor becomes a reactive power generator.

Replacing asynchronous motors with a power of 200 kW or more with synchronous ones always leads to energy savings.

ABSTRACT

The aim of the study is to develop scientific foundations for an effective technology for extracting metals from technological solutions of copper production, ensuring an increase in the production of non-ferrous metals, improving the quality of the resulting product, increasing the degree of metal recovery and reducing processing costs. The paper identified the influence of various parameters on the optimal mode of ion flotation of ions of heavy non-ferrous metals from metal-containing solutions of copper production and the efficiency of flotation extraction of metals from technological solutions depends on the formation of hydrophobic and hardly soluble precipitation at the interaction of metal ions with surface-active substances (diethyldithiocarbamate sodium DEDTC-Na).

INTRODUCTION

Currently, increasing attention has technologies that can efficiently extract metal ions from technological solutions and create closed systems of water recycling. Thus, it is possible to prevent their harmful effects on the environment. Complete extraction of base and precious metals from technological solutions of industrial enterprises is explained not only by the need to protect the environment, but also to the value of the metals. In this regard, research on recycling

solutions and recycling of recoverable metal compounds are actual scientific and practical task. Storage and processing of technological solutions of production are closely linked to issues of environmental protection. Currently, the problem of utilization of technological solutions has acquired a global character. The fact that water resources are used at different stages of metallurgical production. During these processes water is saturated with reagents, particulate impurities and metals. Before you dump such technological solutions in storage or reservoirs is rarely clean them, so this whole "cocktail" of chemical precipitation metallurgy washed away in the waters of the cities. After this, water saturated with these compounds is not something that you can't drink and use for domestic purposes.

MAIN PART

In the world conducts research work aimed at using technological solutions of the industry, in the form of additional raw materials in the production of metals, as due to their great volume, massive amounts of valuable metals exceeds the amount of metals in primary ores. In this regard, processing of technological solutions will allow companies to significantly expand the raw material base, without capital expenditures for geological, mining and processing work. In addition, despite the great theoretical and practical significance, in scientific studies, insufficient attention was paid to methods of isolating and concentrating heavy metal ions, the choice of selective reagents has not been studied the mechanism of interaction of metal ions that does not allow to develop a comprehensive technology for processing of technological solutions, including extraction of valuable components and their reutilization and to environmental issues that is very relevant scientific and an important economic problem [1, 2].

The problem of purification of discharged process water in the production of copper relevant because the accumulation of heavy metal ions in food solutions causes difficulties in the further use in economic activities [3].

Currently, for the treatment of wastewater of metallurgical production use mechanical, chemical, physico-chemical and electrochemical methods. Most of them are energy intensive, difficult to implement and are guided by the imported equipment and scarce reagents. Therefore, in the current economic conditions, priority should be given to effective methods of treatment, the use of inexpensive local raw materials and industrial wastes. Enterprises profitable to go towards the greening of water management. To reduce the volume of wastewater promotes application of new production technology, which requires significant material costs and implementation of highly efficient and cost-effective methods of cleaning polluted water resources.

Industrial process effluents contain particulate impurities, to remove them, apply hydro-mechanical cleaning methods. Widespread filtering [4-5]. It is proved that the establishment of a porous fabric and a mesh filter allows partitions to precipitate on the surface from solutions of ions of heavy metals and increases the degree of purification from them.

In [6] studied the conditions for the use of the multilayer tubular ultra filtration and nano filtration membranes for removal of heavy metals from wastewater, the degree of purity is increased by 25-40% in comparison with traditional membranes.

Advantages the use of mechanical cleanup method is simple equipment, small occupied areas, low sensitivity to changes in process parameters. Disadvantages the process is accompanied by

significant energy consumption, the impossibility of returning water in the circulating loop because of the increased salinity.When physico-chemical treatment method destroys organic and poorly oxidizable substances are removed finely dispersed and dissolved inorganic impurities. The most frequently used coagulation, sorption, flotation, ion exchange. For the purification of electroplating effluents using various mineral coagulants: aluminum salts [7-9], iron salts [10], salts of magnesium, sludge waste and used solutions of individual plants [11-13]. The lack of efficiency of the apparatus is largely determined by such defects coagulants, such as slow hydrolysis and low speed flocculation at low temperatures, insufficient strength of the flakes, their destruction and removal from the apparatus.

Process flotation is used to remove from aqueous solutions of insoluble impurities, which precipitate spontaneously bad [14-15]. The method allows to clear drains to standards for discharges into municipal collectors or to the requirements of recycling water.

For the extraction of industrial water, lead compounds, mercury, copper, cadmium, cobalt, phosphorus, arsenic, chromium, zinc, iron is frequently used in ion exchange method. For wastewater treatment used ion exchange materials of natural origin. Extraction of heavy metal ions is most effective in an alkaline environment [16].

It is proposed [17] a simplified scheme of ion-exchange water purification from salts of heavy metals due to the use of sodium cataniavia. Ion exchange method has the following disadvantages: the formation of secondary waste eluates that require additional processing, high consumption of reagents for regeneration of ion exchangers and processing of resins, the high cost of ion exchangers and resins. Sorption purification of waste water allows you to remove pollution of a different nature to almost any residual concentrations, regardless of their chemical resistance [18].

For deep cleaning use a process called adsorption. The efficiency of the process often depends on the choice of adsorbent. As sorbents using active carbons [19-20]. Researchers view the process of water purification with the use of waste in various industries: ash, sludge ferromagnetic [21-22], which provides the degree of purification of waste water to 95-99 %.

A method of sorption of wastewater treatment with the use of aluminosilicates [23-24]. These adsorbents allow to achieve high purity without additional use of coagulant.

Chemical refining is used, the following methods of neutralization: neutralization reagents, the mutual neutralization of acidic and alkaline wastewater [25-27], filtration through neutralizing materials [28]. The main advantage of chemical methods is the ability to use it to neutralize the acid-alkaline drains of various volumes with different concentrations of heavy metal ions. Its shortcomings: a significant increase in salinity purified from heavy metal ions wastewater by adding reagents that cause the need for additional purification; high consumption of reagents; the need for the organization and maintenance of reagent equipment with a special corrosion-resistant equipment and metering devices.

For water purification from various soluble and dispersed impurities use the processes of the anodic and cathodic recovery, electrocoagulation, the electroflotation and electro-dialysis [29].

Currently the widespread method of wastewater treatment by electrocoagulation [30-31]. Of electrochemical methods of purification of industrial sewage is often used the process of electro-flotation [32]. In this process, cleaning takes place by means of gas bubbles formed during water

electrolysis. At the anode produces oxygen bubbles, and the cathode is hydrogen. For the ascent of the bubbles collide with the particles of dirt and through the actions of molecular and electrostatic forces, is transported to the surface of the solution [33].

Advantages of electrochemical methods is the extraction of valuable water components at a relatively simple technological scheme, compact plants, no need for chemical reagents. The disadvantage is high energy consumption, iron and aluminum. Therefore, the necessity of using this method in each case must be economically justified.However, the economic condition of many companies limits resource opportunities for the implementation of the technology of wastewater treatment, because it requires a significant consumption of reagents. In a market economy, when the value becomes real and significant, the company is economically more profitable use as a reagent of secondary material resources.

Process in many fields of chemistry and metallurgy associated with the use of new efficient processes for the separation of components from solutions. Of great interest is the process of flotation ions and molecules is a promising method of extracting the necessary elements from solutions. The achievements of recent years related to the recovery of surface-active ions, greatly expanded the possibilities of this method [34-35]. Currently, the development of the method of ion flotation for removal of heavy metals from technogenic water of mining enterprises hampered by the fact that the range of reagents is limited to the salts of higher fatty acids, sulfhydryl and nitrogen-containing compounds, which are expensive substances with low values of maximum permissible concentration (MPC). Methods of regeneration of these reagents have not been developed.

The analysis of the reviewed literature and practices of existing enterprises on the processing of extracting metals from metal-containing waste copper production allows to draw the following conclusions: the majority of enterprises for the extraction of metals from solutions and waste waters, using different methods. All research work on the improvement of the process was aimed at finding new, available and cheap reagents and achieved certain successes in this direction. But still in many ways inefficient and do not provide the ability to extract metals from the product; of interest is the possibility of applying the method of ion flotation for the extraction of substances from solutions containing metals.

The aim of the research is development of scientific bases of effective technologies of extraction of metals from technological solutions of copper production, resulting in an increased production of non-ferrous metals, improving the quality of the resulting product, an increase in the degree of extraction of metals and reduction of waste treatment costs.

The object of research is technology-related education in the form of metal-containing waste copper production: the mother liquors of the production plant of rare metals, the acidic effluent of copper sulphate production copper Smelting plant of JSC "Almalyk MMC".

In the process of the study used a range of methods, including theoretical research, generalization experiments, methods of potentiometry, photocolorimetry, atomic absorption analysis methods ft-IR.

The paper identified the influence of various parameters on the optimal mode of ion flotation of ions of heavy non-ferrous metals from metal-containing solutions of copper

production and the efficiency of flotation extraction of metals from technological solutions depends on the formation of hydrophobic and hardly soluble precipitation at the interaction of metal ions with surface-active substances (diethyldithiocarbamate sodium DEDTC-Na).

From the chemical analysis results (table. 1) shows that industrial interest for the recovery of metals present copper, zinc, iron, Nickel and molybdenum. The complexity of recycling wash solution associated with a high acid content.

Changing the pH of the solution was carried out by supplementing the sulfuric acid and calcium oxide. To control the concentration of hydrogen ions was used universal laboratory pH meter stamps LPU-01 silver chloride electrode. Air flow was regulated by changing the speed of rotation of the impeller. The extraction of metals in the foam (foam – product ion flotation, consisting of chemical compounds of the collector with metal ions and of a number not reacted with metal ions) was determined by its residual concentration in solution after flotation. Chamber machine made of organic glass.

Technique of ion flotation technological solutions of copper production. Flotation of metals from solutions was carried out in a flotation machine with a capacity of 200 ml. Fotocamera made of organic glass, and the impeller and a pipe for air suction from the ordinary glass. Air supply was carried out through a tube, inside which the rotating shaft of the impeller.

RESULT AND DISCUSSION

Extraction of metals from technological solutions by the use of ion flotation. The efficiency of flotation extraction of ions of metals from technological solutions depends on the properties of the used reagents-gatherers, forming a solid sublety with extractable colour and heavy metals. Studied the possibility of using DEDTC-Na for ion flotation of metals from simulated acidic metal-bearing sulphate solutions containing, mg/l: cu 200, 150 zinc, Nickel - 150. The reactant was fed to the flotation cell in an amount of 0.5 l and carried out the process of ion flotation at different pH for 5 minutes. Supply of reagent in a quantity in the flotation process allows to extract in sublet from solutions of metalocation metals and suspended particles. Studies have shown that increased consumption of various reagents is observed to increase the degree of extraction of metals (Fig. 1).

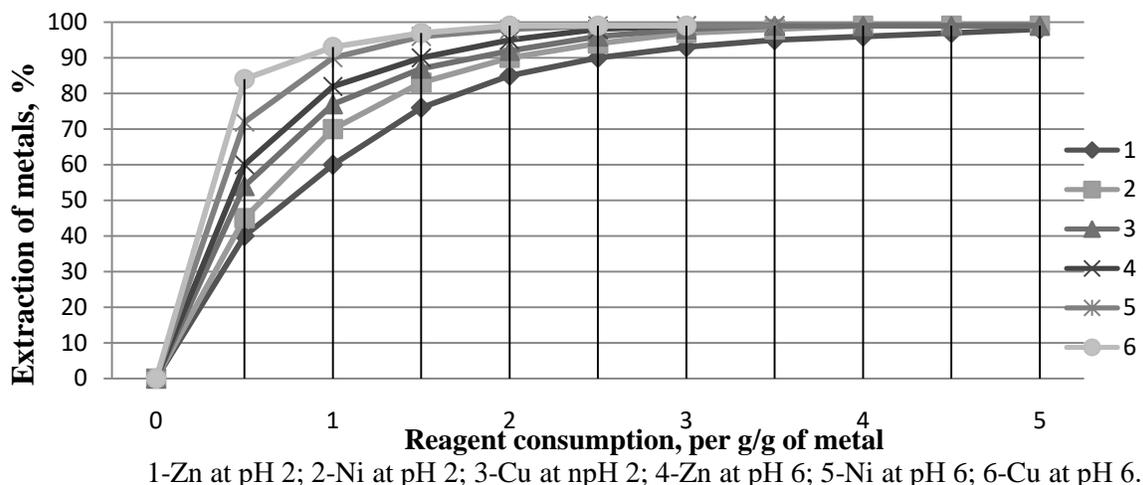
1-Zn at pH 2; 2-Ni at pH 2; 3-Cu at npH 2; 4-Zn at pH 6; 5-Ni at pH 6; 6-Cu at pH 6.


FIG. 1. THE DEPENDENCE OF EXTRACTION OF METAL IONS FROM THE FLOWDEDTC-NA AND PH

On the basis of the conducted researches it was established that metal ions in the form hydrated cationMe$(H_2O)^{+2}$, the formation of which occurs by the following mechanism: with increasing pH the protons (the particle accelerator) hydrating water molecules are attracted to anions OH$^-$, to form water, i.e. the reaction occurs substitution of one hydrated water molecule to the hydroxyl group. Simultaneously with collective properties, reagent DEDTC-Na exhibits and foaming properties, at the interface water–air.

As a result of experiments determined the optimal time of flotation, sour water copper sulphate production (technological solutions) the EMF for the duration 2-8 min (Fig. 2). The data obtained show that when the length of the flotation 4-5 minutes, ions of heavy non-ferrous metals are extracted up to 98 %. The maximum extraction of metal ions in the froth flotation occurs at 20-25^{0}C. Further increase in temperature leads to a decrease in extraction due to the increased solubility of sublata.

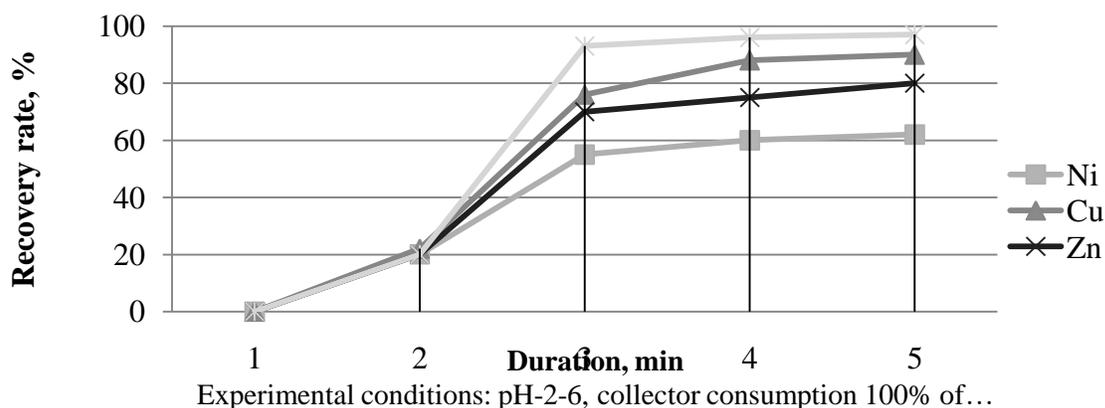
Experimental conditions: pH-2-6, collector consumption 100% of…


FIG. 2. THE DEPENDENCE OF THE DEGREE OF EXTRACTION OF METALS FROM THE DURATION OF FLOTATION, SOUR WATER COPPER SULPHATE PRODUCTION MPAS.

It is revealed that with increasing concentration of the collector is increasing the degree of extraction of metals at low pH values. Studies have shown that the method is effective for metals when the initial concentration DEDTC-Na 25 g/m^3 in a wide range of pH values. Experiments on effective separation of metals from solutions show that the application DEDTC-Na does not give positive results because of the ability of complex formation DEDTC-Na with all metals at the same time, evidenced by qualitative analysis of the products of ion flotation (Fig. 3).

One of the main factors affecting the efficiency of ion flotation is the pH of the medium. The acidity of the medium can influence the process of ion flotation as follows: effect on the solubility of sublata, the change in the ratio of the ion-collector, impact resistant foam.

The results of laboratory studies of ion flotation of stock solutions of CPRM spectra of MPZ and qualitative analysis are given in Fig. 4. The data show that changing the stoichiometric consumption of the collector, it is possible to achieve 60-90% recovery of metals at different pH values.

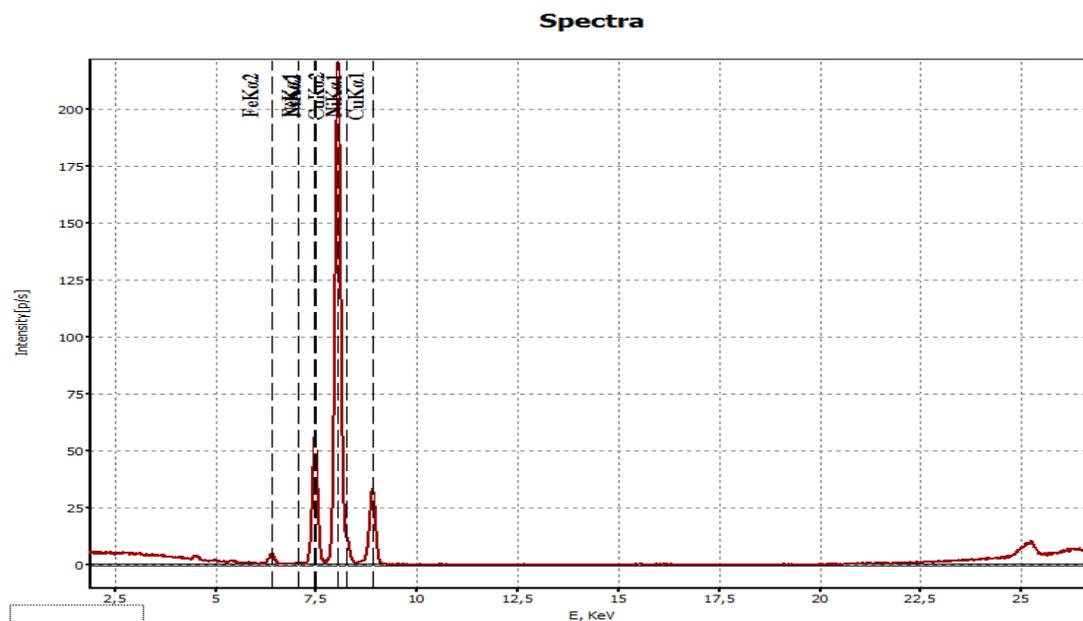
The efficiency of the process of ion flotation technological solutions largely depends on the pH of the treated solution. In all the considered range of values of pH of the solution is deposited DADD metals. The maximum degree of extraction of metals in foam c DEDTC-Na is observed at pH 3-5. The most complete flotation takes place in close environments to find metals in the form of hydroxides. Reduction of extraction of metals by lowering the pH of the solutions associated with the expansion of the collector in acidic media and the formation of hydrophobic precipitation in the interaction of metal ions with cationic surfactants DEDTC-Na, at a pH of 3-5 due to the formation of insoluble precipitate [(C$_2$H$_5$)$_2$NC(S)S]$_2$Me, which extraction of flotation froth is dispersing the air and adhesion to the surface of the foam.


FIG. 3. SPECTRA QUALITATIVE ANALYSIS OF THE SOLUTION AFTER ION FLOTATION, SOUR WATER COPPER SULPHATE PRODUCTION WITH DEDTC-NA MPZ
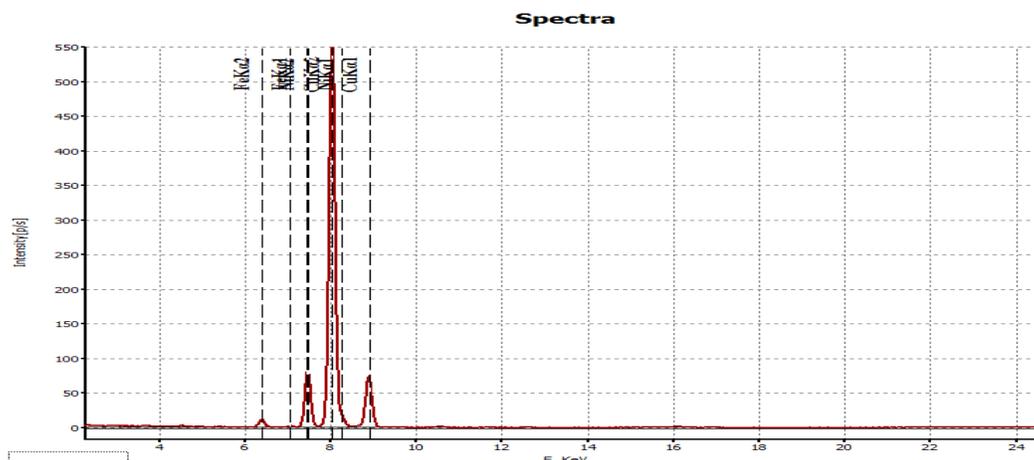

FIG. 4. SPECTRA QUALITATIVE ANALYSIS OF THE SOLUTION AFTER ION FLOTATION OF STOCK SOLUTIONS OF CPRM INVENTORIES WITH THE USE OF DEDTC-NA

The allocation of metals at high pH values there is a decline of their extraction, which is explained by transition metals in other chemical forms that do not interact with the collector in an aqueous solution. Recoverability of metal cations is due to two factors: the energy of hydration and the stability of the formed of sublata. The smaller the radius of the cation and its charge more, the more durable forms sublet and flows flotation process.

Based on the experimental data, it is proposed schematic diagram of the extraction of metals from technological solutions of copper production (Fig. 5). The scheme includes the following main operations:

1. Reducing the acidity by adding Cao to pH=3-5. Collective DEDTC deposition of metals. The deposition is advantageously carried out for industrial masterbatch solutions CPRM mPas at pH values of the solution 3-5, for acidic effluent of copper sulphate production of MPZ and washing solutions SKC CL at pH values of solution 5. The formation of insoluble precipitation of complex metals is more than 98 %.

2. Flotation of sludge in the apparatus of the column type. The optimal time flotation sludge 5-6 minutes. The degree of extraction of metals in foam is up to 99 %

3. Regeneration DDTC-Na is carried out by washing with 0.2 M alkaline solution of NaOH. DEDTC-Na is regenerated by 70 %. Regeneration copper, molybdenum, Nickel, and iron is carried out by sodium sulfide. The consumption of Na_2S is 0.05 kg per 1 kg of sediment. The precipitate obtained after drying can be used as additive for high quality steel.

CONCLUSION

Thus, it is determined that a promising method for extraction and separation of metal compounds present in the solution, is ionic flotation. The method is characterized by high productivity, effectiveness, efficiency and simplicity of operations. Can be used at low concentrations of metals (1 mg/dm^3) in the waste solutions of copper production. The main factors and agents that influence the efficiency of ion flotation. The most appropriate reagent is DEDTC-Na at pH=3-5, allowing for maximum recovery of valuable metals.

ABSTRACT

Currently, one of the most effective means for obtaining temperature images is multispectral Earth surfaces in the thermal infrared (IR) range, obtained from the Landsat-8 satellite. The article presents a method for obtaining and evaluating a temperature image of the Earth's surface according to the 10th band of Landsat-8. The satellite image processing was carried out in the ArcGIS software package. To determine the surface temperature, the emission factor was calculated using the NDVI method. As a result, a temperature image of the Bukantau mountains was obtained. When evaluating the temperature image, it was revealed that the temperatures of massive rocks of the Bukantau mountains are lower than foothill friable rocks.

KEYWORDS: *Infrared Image, Multispectral Satellite Imagery, Remote Sensing, GIS, Land Surface Temperature (LST), Land Surface Emissivity (LSE), Normalized Difference vegetation Index (NDVI).*

INTRODUCTION

All objects on the Earth's surface emit thermal infrared waves, which makes it possible to remotely probe them in the thermal range. Reception of thermal radiation is carried out only in parts of the spectrum with the ranges of 3.0-5.0 micrometers and 8.0-14.0 micrometers, since the atmosphere retains most of the radiation. At present, space systems for remote sensing of the Earth in the thermal IR range have been widely developed. The results of thermal imaging of the Earth's surface are very widely used in various fields: mapping the thermal fields of the Earth (geothermal mapping), determining the temperature of the sea surface, observing volcanic activity, monitoring forest fires, etc.

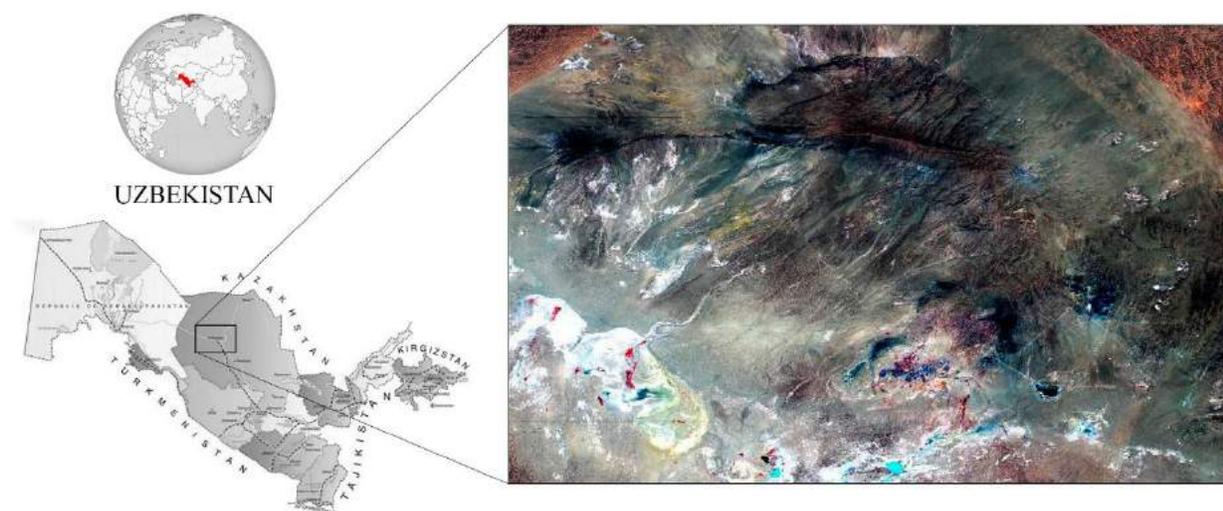
The most spread product from thermal imaging data is a temperature image of the surface showing the global temperature distribution of the area of interest. Currently, one of the most effective means for obtaining temperature images is multispectral Earth surfaces in the thermal infrared (IR) range, obtained from the Landsat-8 satellite. The article presents a method for obtaining and evaluating a temperature image of the Earth's surface according to the 10[th]band of Landsat-8. The object of the study is the low-mountain and desert landscapes of the Bukantau mountains (Fig. 1).


Figure 1. The study area

MATERIALS AND METHODS OF RESEARCH

Earth remote sensing data
The stock of thermal infrared imagery materials has been accumulating since 1982. The collected archive of images makes it possible to analyze the changes that have occurred on the Earth for over 40 years. The American Landsat program began its existence in 1972, since that time seven satellites have been launched. Remote sensing technologies have improved in the quality of spatial and temperature resolution. In February 2013, the modern satellite Landsat-8 was launched, which receives data using two different sensors - Operational Land Imager (OLI) and Thermal Infrared Sensor (TIRS). The TIRS thermal range scanner captures in two bands 10.6-11.2 micrometers(band 10) and 11.5-12.5 micrometers(band 11) with a spatial resolution of 100 m (Table 1), which allows you to analyze the energy of the earth's surface itself, and not the reflection of sunlight.

TABLE 1. MAIN TECHNICAL CHARACTERISTICS OF LANDSAT 8 IMAGERY EQUIPMENT.

Bands	Wavelength (micrometers)	Resolution (meters)
Band 1 - Ultra Blue (coastal/aerosol)	0.435 - 0.451	30

Band 2 - Blue	0.452 - 0.512	30
Band 3 - Green	0.533 - 0.590	30
Band 4 - Red	0.636 - 0.673	30
Band 5 - Near Infrared (NIR)	0.851 - 0.879	30
Band 6 - Shortwave Infrared (SWIR) 1	1.566 - 1.651	30
Band 7 - Shortwave Infrared (SWIR) 2	2.107 - 2.294	30
Band 8 - Panchromatic	0.503 - 0.676	15
Band 9 - Cirrus	1.363 - 1.384	30
Band 10 - Thermal Infrared (TIRS) 1	10.60 - 11.19	30
Band 11 - Thermal Infrared (TIRS) 2	11.50 - 12.51	30

Determination of land surface temperature

The original image was a LandSat-8 multispectral image obtained on August 25, 2017. The data processing of this image was carried out using the ArcGIS software package. The metadata of the LandSat-8 satellite image used to obtain the temperature image are given in Table 2.

TABLE 2. METADATA OF LANDSAT 8 SPACE IMAGE

Termal constant, Band 10	K1	774.89
	K2	1321.08
Multiplicative rescaling factor, Band 10	M_L	0,0003342
Additive rescaling factor	A_L	0,1

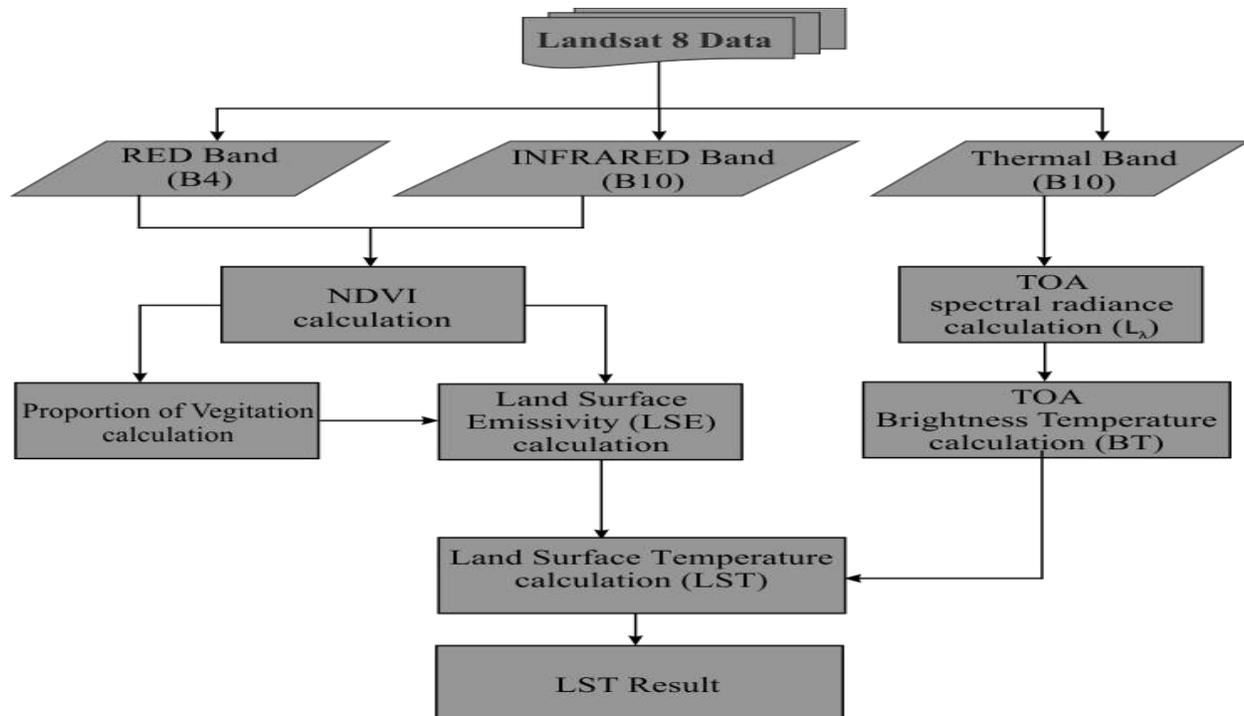
To determine the temperature of the earth's surface, a thermal infrared band (Band 10) was used to obtain a brightness temperature (temperature image) and an infrared band (Band 5) and a red (Band4) band for calculating NDVI. The technology for obtaining a temperature image includes several sequential operations of processing the original satellite image [1-5] (Fig. 2).


Figure 2. Flowchart for Land Surface Temperature imaging retrieval

1. Top of Atmosphere (TOA) spectral radianceCalculation.

Using a luminance scaling factor, thermal infrared digital values can be converted to spectral luminance TOA using the following equation:

$$L_\lambda = M_L * Q_{cal} + A_L$$

Where:

L_λ = TOA spectral radiance (Watts/ (m2 * sr * μm))

M_L = Radiance multiplicative Band (for 10th band equals 0.0003342)

A_L = Radiance Add Band (for the 10th band is 0.1)

Q_{cal} = Quantized and calibrated standard product pixel values (digital value of the 10th band).

2. Top of Atmosphere (TOA) Brightness Temperature (BT)Calculation.

Surface brightness temperature is defined as the average brightness temperature of the underlying surface and objects on it. The surface brightness temperature was calculated using the formula [7, 9]:

$$BT = \frac{K_2}{ln\left(1 + \frac{K_1}{L_\lambda}\right)} - 273.15$$

Where:
BT   =   Top   of   atmosphere   brightness   temperature   (°C)
L_λ =   TOA   spectral   radiance   (Watts/(m2   *   sr   *   μm))
K_1 = calibration constant obtained from metadata (for 10-band K1 = 774.89).

K_2 = calibration constant obtained from metadata (for 10-band K2 = 1321.08).

3. Normalized difference vegetation index (NDVI) calculation.

The NDVI is one of the simplest and most used indices for solving problems based on a quantitative assessment of vegetation cover [10, 11]. It is calculated using the following formula:

$$NDVI = \frac{NIR - RED}{NIR + RED}$$

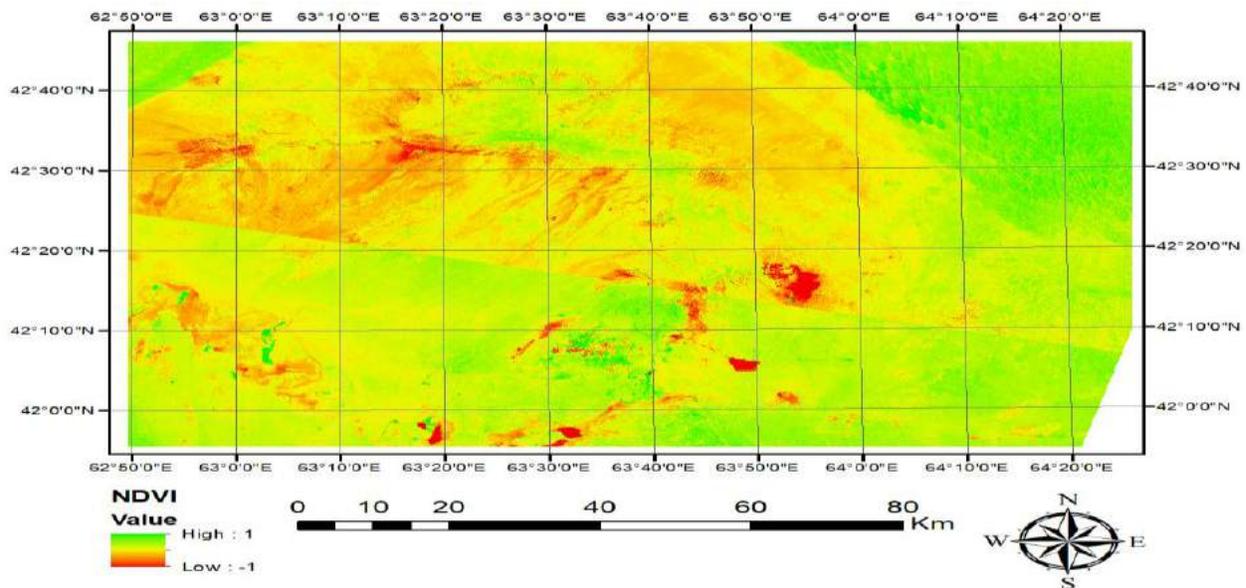
where NIR = near infrared wavelength (0.85-0.88micrometers) related to spectral band 5; RED = red band wavelength (0.64-0.67 μm), refers to spectral band4;
The NDVI value obtained for the study area on August 25, 2017 is in the range from -1 to 1 (Fig. 3)


Figure 3. NDVI – normalized difference vegetation index

4.   Land Surface Emissivity (LSE) calculation.

Estimating LST requires accurate knowledge of the Earth's surface emissivity (LSE), which is an intrinsic characteristic of material composition. Since the earth's surface is not inhomogeneous, its emissivity range is greater than that of the oceans; depends on the type of soil cover, moisture surface, roughness and viewing angle ¬ [6,8].

Land surface emissivity (LSE) is the average emissivity of an element of the surface of the Earth calculated   from   NDVI   values.

$$PV = \left[\frac{NDVI - NDVI\ min}{NDVI\ max + NDVI\ min}\right]^2$$

PV = Proportion of Vegitation
NDVI = DN values from NDVI Image
NDVI min = Minimum DN values from NDVI Image
NDVI max = Maximum DN values from NDVI Image

E = 0.004 * PV + 0.986

Where:

E   =   Land   Surface   Emissivity
PV = Proportion of Vegitation

5. Land Surface Temperature (LST) calculation.

Depending on the emissivity of the surface, LST was calculated by the following formula[10-16]:

LST = (BT / (1 + (λ* BT / c2) * Ln (ϵ)))

Where
BT - Top of atmosphere brightness temperature (°C)
λ - wavelength (for Band 10 = 10.8 mkm)
c2 - 14388 mkm K
ϵ - spectral emissivity image

RESULTS AND DISCUSSION

When solving geological problems, thermal imaging is used for structural-tectonic and litho logical mapping. With an increase in the number of spectral bands in the thermal infrared range, the possibilities for studying the composition of rocks and mapping the features of their distribution in areas with a sparse vegetation cover increase. Solar and endogenous heat heats rocks differently depending on the material, i.e., mineral composition of rocks, their thermal inertia, moisture, reflectivity and other properties. Therefore, on thermal images, lithologically different rocks differ from each other in phototone on thermal images in one band or in color when using multi-zone thermal imaging.

Thermal space imagery can also provide some insight into buried geological structures by examining the distribution of the region's thermal fields. Differences in the heat-emitting properties of surfaces, which are recorded by thermal imaging, are used in prospecting for minerals, identifying elements of tectonics, direct searches for deposits of oil and gas, ores. The presence of a dense vegetation cover is an obstacle to the determination of the heat-radiating properties of soils and rocks.

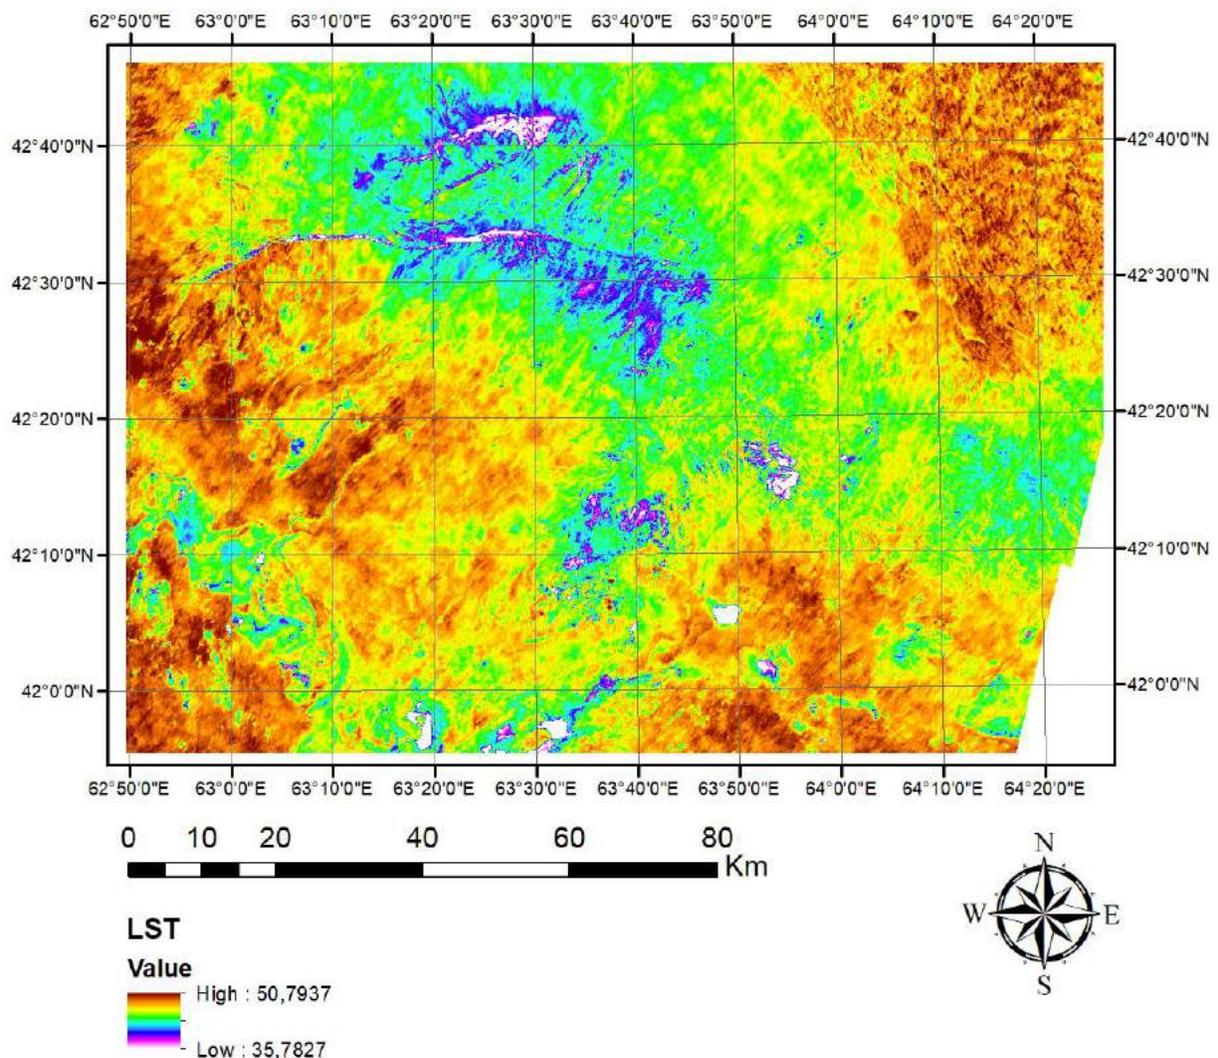
As a result of applying the above-described technique, a temperature image of the Bukantau mountains was obtained (Fig. 4). This image is a raster that characterizes the spatial distribution of temperature on the earth's surface. When evaluating the temperature image, it was revealed that the temperatures of massive rocks of the Bukantau mountains are lower than foothill friable rocks.


Figure 4. Land surface temperature (LST) result

Based on the results of the study, it is possible to make an unambiguous conclusion about the possibility of using multispectral space images, including thermal ranges for determiningtemperature characteristics of the thermal field of various types of rocks.

ABSTRACT

This study aims to identify the impact of internal factors on stock prices of listed firms in Nepal Stock Exchange (NEPSE) using survey method adopting descriptive and analytical research design.. Population size of the study is 226 listed firms in NEPSE and sample size is consists of 60 firms located in Kathmandu. Data were collected using survey questionnaire Likert type questionnaire representing 1 for strongly disagree and 5 strongly agree. The study used random sampling method. The descriptive research design is used for the purpose of facts finding, conceptualization, and description of variables of the study. In this study, stock price is considered as dependent variable and dividend policy, management quality, financial position, firm size, and nature of firms are explanatory variables. This study has applied correlation research design to establish the directions and magnitudes of stock price and its explanatory variables. This study has adopted linear regression models to analyze the impact of independent variables on stock prices in Nepalese stock market. Regression result of the study reveals that dividend policy, financial position and nature of firms have positive and significant impact on stock price but management quality and firm size have insignificant effect. This study is limited to company's internal factor affecting stock price and the possible consequence from it. Hence

the further study is advised to conduct intergrating both internal and external factors affecting to stock price in Nepalese stock market.

KEYWORDS*: Stock Price, Dividend Policy Management Quality, Financial Position, Firm Size and Nature Of Firm.*

INTRODUCTION

Nepalese stock Market is considered one of the emerging markets, which was established in 1974 in the name of Securities Marketing Center (SMC). Then, Securities Exchange Center (SEC) was established in 1976 with an objective of facilitating and promoting the growth of capital market in Nepal. Nepal Government, under a program initiated to reform capital markets, converted Securities Exchange Center into Nepal Stock Exchange in 1993. It was established as a non-profit publicly run institution with legal and financial autonomy. It opened its first trading floor on January 13, 1994 and was run by aboard comprised of members representing different sectors as per Securities Act 2006. Nepalese stock market suffers from many weaknesses such as: economical, legal, political and social conditions. The marketing management issued many regulations to improve the market performance and to solve the problems and stresses that face the market. Nepalese stock market is operated, regulated and managed by three important institutions: SEBON, CDSC and NEPSE. The current paid-up capital of NEPSE is approximately USD 4.5 million. Government of Nepal, Nepal Rastra Bank, Rastriya Banijya Bank and other securities businessperson (brokers) are the shareholders of NEPSE. NEPSE is managed by a seven-member board of directors representing two Members including a chairman from Nepal Government, two Members from Nepal Rastra Bank, 1 from Rastriya Banijya Bank, one is nominated by BOD as an expert in capital market and General Manager of NEPSE serves as a director on the BOD. Most of the stock market related studies have focused on developed countries like the United States and European markets. Few studies have investigated developing and emerging markets like Nepal. However, this study seeks to determine the most important internal factors that affect the stock market prices for the listed firms in Nepal Stock Exchange (NEPSE). Many factors can have an impact on stock market prices. This study examines the impact of some major internal factors on stock market prices for the listed firms in Nepal Stock Exchange.

Many individuals, firms, entrepreneurs, and governments invest large amounts of money in a country's stock market. It is usually believed that the markets in developing and less developed countries are not efficient in strong and semi-strong forms. It is generally assumed that the emerging markets are less efficient than the developed market. The definition of emerging market highlights the growth potentiality as well as rapid growth of size of the market. However, it is possible that the market participants are not well informed and behave irrationally compared with well-organized markets. The causes of lack of financial development, especially in stock markets, are due to certain market imperfection such as transaction costs, lack of timely information, cost of acquiring new information, and possibly greater uncertainty about the future (Goldsmith, 1971; Mason, 1972; Wai and Patrick, 1973). Knowledge of stock prices and their fluctuation is considered a hot issue for investors. Stock market movements are difficult to understand, and forecasting is even more difficult. This creates need for empirical analysis, which can assist in understanding the forecasting of the stock market and potentially assist in forecasting the stock market prices. Most studies on stock markets are done for developed

countries. This study attempted to address the gap in the literature by analyzing the relationships between stock market prices and their influencing internal factors in NEPSE.

LITERATURE REVIEW

According to the researcher knowledge, few studies were accomplished and investigated some factors that influence stock prices in Nepal. There are different studies, scientific papers, and articles dealing in factors that affect stock prices at the global level such as: Salam, Islam and Hasan. (2015) studied the factors affecting the stock price movement for a sample of 30 investors in corporate stocks listed in Dhaka Stock Exchange. The study results indicated that the stock price movement in Bangladesh capital market depends on five factors, such as Industry Performance, Market Influences, Company Performance, Investor's Decisions and Financial Considerations

Another study done by Allahawiah and Amro(2012) investigated the internal factors affecting stock prices of the firms listed in Amman Stock Exchange using survey method. This study was conducted for a sample of 60 companies listed in Amman Stock Exchange. 300 questionnaires were distributed to managers, assistant managers, section chief and other employees and 275 responses were received from the respondents. Analyzing these responses, this study found that dividend policy, financial positions, firm size, quality of management and nature of business have statistically significant impact on stock prices. This study concluded that dividend policy has the highest impact followed by the quality of management, financial position; firm size and nature of business respectively.

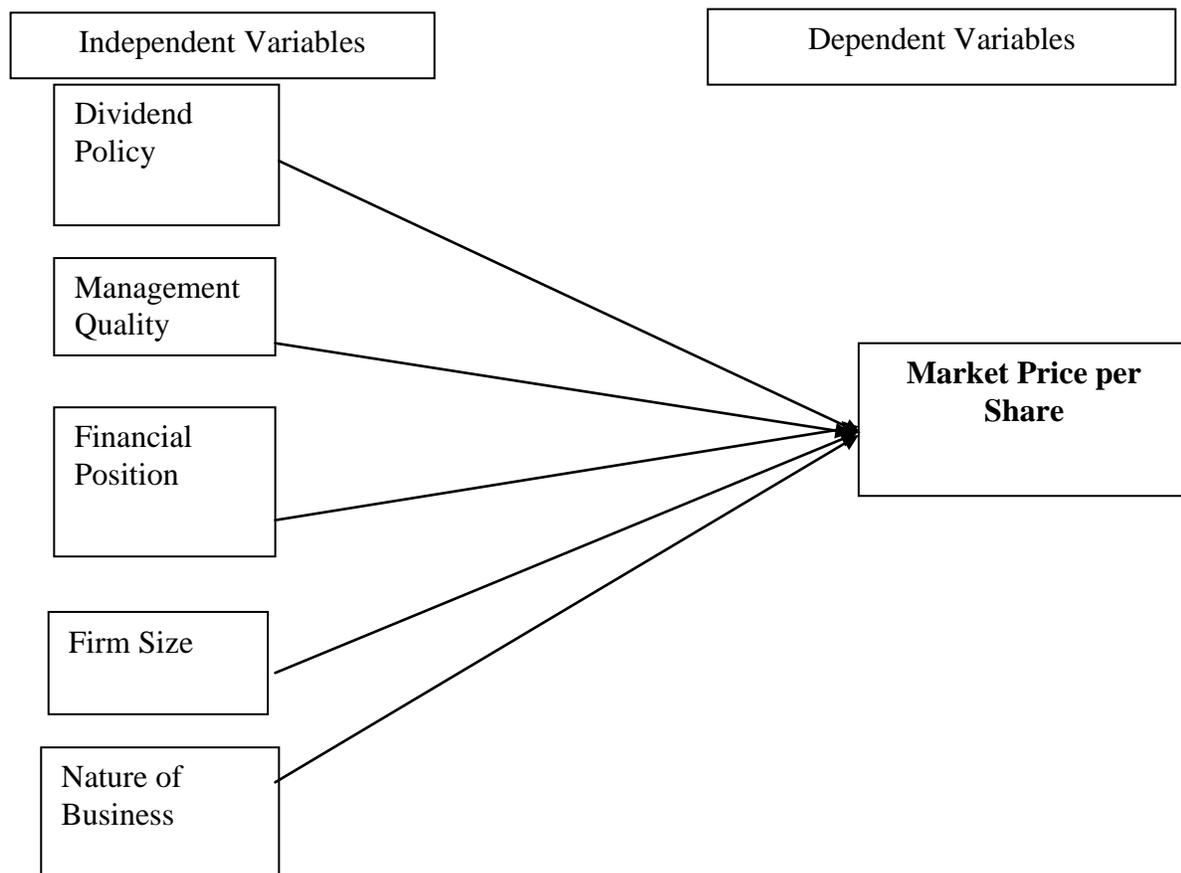
An attempt has been made by Elsheikh (2017) to investigate the most and the least influential factors in stock price at the Saudi Stock Market from the perspective of investors in Najran City using a behavioral approach. Data were collected using a questionnaire that was distributed to 119 respondents. It comprised 34 items covering 5 main categories, i.e. self-image/firm-image coincidence, accounting information, neutral information, advocate recommendations, and personal financial needs. The study concluded that accounting information seemed to be the most important category affecting stock prices at the Saudi Stock Market. It was followed by self-image/firm-image coincidence, personal financial needs, advocate recommendation, and neutral Information. It also indicated that the most influential factors in stock price were the reputation of the firm, feelings for a firm's products and services, religious reasons, while the least ones were the attractiveness of non-stock investment, ease of obtaining borrowed funds, and expected

losses in the international financial markets by order of importance. Similaely,Om and Goel (2017) studied the effect of different determinants on the market price of the share in context of Indian economy for the period 2012 - 2016 in 31 companies listed in Bombay Stock Exchange. Dividend Per Share, Earning Per Share, Dividend payout ratio, Debt equity Ratio, Total asset turnover ratio and Dividend Yield were analyzed to see their effect on Market Price Per Share. The study found out positive relationship between market price per share and all of these exploratory variables. Sharif et al., (2014) analyzed the factors affecting share prices of 41 companies listed in Bahrain Stock Exchange using panel data set collected from the website of Bahrain Stock Exchange for the period 2006-2010 using Ordinary Least Square (OLS) methd. Firm specific variables namely return on equity, book value per share, earnings per share, dividend per share, dividend yield, price earnings, debt to assets and controlled by firm size were studied to infer their impact on market price of shares in the respective market. Study results

indicated that the variables return on equity, book value per share, dividend per share, dividend yield, price earnings, and firm size are significant determinants of share prices in the Bahrain market.

Another study has been made by Grimier and Mishra (2018) to determine the the relationship between stock price and explanatory variables like: DPS, EPS, P-E ratio, BV, Market to BV for the period 2012-2017 using simple and multiple regression analysis with the sample size of 11 financial and nonfinancial firms listed in Nepal Stock Exchange .The study results indicated that the variables like Market to BV, P-E ratio,DPS, and BV are the significant determinants of stock price whereas EPS has minimum influence on the stock price. Thapa (2017) investigated the factors affecting stock prices of commercial banks listed in Nepal Stock Exchange over the period of 2008-2018. The data were collected from questionnaire and analyzed using simple linear regression model. The study concluded that earning per share (EPS), dividend per share (DPS), effective rules and regulations, market whims and rumors, company profiles and success depend upon luck have the significant positive association with share price while interest rate(IR) and price to earnings ratio (PER) showed the significant inverse association with share price.

From the study of several literatures related to factors affecting stock prices in several stock markets, following conceptual framework can be applied for this study.

CONCEPTUAL FRAMEWORK


OBJECTIVES OF THE STUDY

The aim of this study is to determine, analyze, and evaluate the impact of some internal factors on stock market prices of the listed firms in NEPSE. This study would also try to achieve the following objectives:

- To assess the internal factors that may influence stock market prices in NEPSE.
- To examine the most important factors that the investors focus on while taking their long and short investment decisions.
- To investigate the relationships among the internal factors affecting stocks market prices.

RESEARCH HYPOTHESES

Based on the review of several literatures and above-mentioned objectives, the following groups of null hypotheses have been developed.

H01: There is no statistically significant relationship between dividend policy and stock market prices.

H02: There is no statistically significant relationship between the firm's nature of business and stock market prices.

H03: There is no statistically significant relationship between the firm's size and stock market prices.

H04: There is no statistical relationship between the management quality and stock market prices.

H05: There is no statistical relationship between the financial situations and stock market prices.

RESEARCH METHODOLOGY

In this study, we use empirical data from primary sources, mainly by conducting a survey among a sample of managers, assistant managers, branch chief, and employees of 60 companies listed in Nepal Stock Exchange from different sectors of the economy. The questionnaire method is the most common mean of data collection in a survey study. Researchers using Questionnaires have usually got a good idea of the observable fact the study intents to explore. Questionnaires contain the use of fixed questions, batteries of questions, which are presented to respondents in the same way, with no variation in question wording, and with mainly pre-coded response choices. Questionnaires are used flexibly to allow the researcher to test and to enable respondents to raise other relevant issues. The questionnaire was designed to contain two sections. The first section was used to gather data about characteristics of the respondents. The second section was designed to measure the influence of the independent variables on the stocks market prices. The questionnaire was written in both languages English and Nepali and reviewed by professionals to assure the accuracy and the exact meaning of translation. The questionnaire was divided into three major sections. The first part contained the demographic questions, demographic information was collected on the participants, gender, age, educational level, employment level, investment capital volume, and experience. The second part was designed to measure the impact of the independent variables (Internal factors) on the dependent variable (stock market price). The third section was designed to gather general information from the respondents towards stocks market prices. The questionnaire was distributed mainly by hand. The study population

was the listed firms in NEPSE up to the end of 2018.The sample consisted of 60 firms which were commercial banks, Development banks, Finance companies, Micro-finance development bank, insurance companies, Hotels, manufacturing companies, and Hydro-power companies. Financial, industrial, and services firms, continuously listed in NEPSE, and the simple random sample was selected from managers of banks, insurance, industrial, trading, services, and financial firms. The questions were responded by the responsible managers, assistant managers, section chief and other employees in the mentioned companies. A convenient sample was selected from the study population, and included (60) observations, which were distributed to the respondents as the following: commercial banks (15), development banks (10) finance companies (6), insurance companies (10) micro finance companies (5) Hydropower companies (10), manufacturing and processing companies (2), and hotels (2). The total number of usable responses resulting from this process was 275 (91.3%). A total of 300 questionnaires were distributed in different sectors of listed firms in NEPSE. the valid numbers of 275 questionnaires were collected to provide the primary data for this study.

MODEL SPECIFICATION

$MPS = α+β_1DP+β_2MQ+β_3FP+β_4FS +β_5NOB+e_i$

Where,

MPS=Market price per share

DP= Dividend policy

MO= Management quality

FP= Financial position

FS= Firm size

NOB= Nature of business

e_i= Disturbance or error term

This study aims to identify the impact of most basic factors in the market share price of listed companies in Amman Stock Exchange from the respondent's opinions. These factors are: Internal factors and external factors. The population of the study included the (227) listed companies in Amman Stock Exchange. A random sample that of 60 companies was withdrawn. The study adopted descriptive and analytical method. To achieve the objectives of this study the researchers depended on two types of data: Secondary data and Primary data. For the purpose of testing hypotheses the study relied on statistical package for Social Sciences (SPSS) by using appropriate statistical methods. These are: Descriptive Statistic measures and ANOVA analysis test. Results of the study showed that there are impacts of internal and external factors in determining the stock prices of the listed companies in Amman Stock Exchange. The most impact was the inflation rate, while   the least one was the nature of firm business. According to the objectives and results of the study, researcher recommended a several recommendations such as, strengthening the role of companies through their involvement in the drafting of laws and legislations Keywords: stock, market price, stock exchange, bonds market This study aims to identify the impact of most basic factors in the market share price of listed companies in Amman Stock Exchange from the respondent's opinions. These factors are: Internal factors and external factors. The population of the study included the (227) listed companies in Amman Stock Exchange. A random sample that of 6 companies was withdrawn. The study adopted descriptive and analytical method. To achieve the objectives of this study the researchers depended on two types of data: Secondary data and Primary data. study relied on statistical package for Social Sciences (SPSS) by using appropriate statistical methods. These are: Descriptive Statistic measures and ANOVA analysis test.   Results of the study showed that there are impacts of internal and external factors in determining the stock prices of the listed companies in Amman Stock Exchange. The most impact was the inflation rate, while   the least one was the nature of firm business. According to the objectives and results of the study, researcher recommended a several recommendations such as, strengthening the role of companies through their involvement in the drafting of laws and legislations Keywords: stock, market price, stock exchange, bonds market

FINDINGS AND DISCUSSION

The study used a descriptive analysis to describe the characteristics of the respondents. The research hypotheses were presented and tested, ANOVA was used to measure the differences between the sample groups, Pearson Correlation was used to explore the correlation between the study variables (dependent and independent variables), and Stepwise multiple regression and F-analysis were used to test the hypotheses. The distributed questionnaires were (300) that have been responded by the responsible managers, assistant managers, and section chief and other employees in different companies which represented the study population. The answered questionnaires (275) were collected for the aim of this study, and the response rate was 91, 3%. Gronbach Alpha was used to ensure the reliability of answers, and it was more than o.70 for all variables used for this study which reflected a homogenous response of the study sample. The descriptive analysis was presented to describe the characteristics of the respondents. The valid number of respondents was (275) distributed into different categories according to their demographic characteristics. The number and the percentage of the descriptive statistics are presented in the following tables: Table (1) indicated that 32% of the study sample was female, while the male ratio is (68 %). Table (2) indicated that 32% of the study sample was less than 36 years, 48% was between 36-45 year, and 20% older than 45 years. The findings of this table showed that the higher numbers of respondents are from the age group of 36-45 years. Table (3) indicated that 4% of the study sample from school level education, 32% from bachelor level education, 60% from master degree, and only4% from above master degree, such as Phil and PhD. The findings show that a small number of respondents have school level education and the larger number of respondents have master degree education. Table (4) indicated that 28 % of the respondents have less than 6 years of job experience, 40% have an experience between 6-10 years, and 32% have an experience over 10 years. The findings showed that the least respondents are from the job experience group of 1-5 years and the largest number of respondents have job experience of 6-10 years. Table (5) indicated that 8 % of the respondents have small investments less than 50,000rupees, 16% respondents have investments from Rs 50,000 - to less than 100,000 in listed firms in NEPSE, 20% from respondents whom have investments from Rs 100000 - to less than Rs 150,000 and 56% respondents have investments more than Rs 150,000.So, the findings showed that the larger number of respondents have investments over 150,000. Table (6) indicated that 36% of the respondents were managers. 24 % of the respondents were assistant manager, 12% of the respondents were branch chief, and 28% of the respondents were from employees. Therefore, the findings showed that the largest percentage (36%) of the respondents were from managers and the least number of respondents were from branch chief.

Multiple regression model presented in table 7 suggested that all the internal factors were related in a positive relationship with stock market prices based on the respondents' opinions. The findings of the internal factors showed the following:

H01. : There is no statistically significant relationship between dividend policy and stock market prices. As shown in table (7) since t- Sig was less than 0.05, the null hypothesis (H01) was rejected, and the alternative hypothesis was accepted. According to respondents' opinions, the dividend policy of the listed firms in NEPSE as an affective factor in impacting stock market prices. The result suggested that the investors should take care about the dividend policy when they invested in NEPSE and search for the investing in firms which use generally dividend policy. On the other hand, the firms should increase the whole dividends because the positive relationship between dividend policy and stock market prices.

In second hypothesis, H02: There is no statistical relationship between the management quality and stock market prices. As shown in table (7) because t- Sig was more than 0.05 hence it failed to reject the null hypothesis. The management quality in the listed firms in NEPSE has no significant impact on stock market prices in Nepalese stock market. The result suggested that the Nepalese investors do not care about what type of managers are there in companies listed in NEPSE.

Third hypothesis H03 was set as there is no statistical relationship between the financial position and stock market prices. As shown in table (7) because the t- Sig was less than 0.05, the null hypothesis was rejected, and the alternative hypothesis was accepted. The financial position of the listed firms in NEPSE in Nepal as an effective factor in impacting stock market prices for the respondents. The result suggested that the firms should decrease depending on debt, and search for other resources to keep liquidity in order to increase the profitability ratio since it would that improve the stock market prices of firms.

Another hypothesis H04 is set as there is no statistically significant relationship between the firm size and stock market prices. As shown in table (7) because the t- Sig was more than 0.05 and failed to reject the null hypothesis. So, the size of the firms listed in NEPSE has no significant impact on their stock prices. The result suggested that the change in the volume of asset or capital is not the major factor that influence the firms' stock price.

Finally the fifth hypothesis H05 was set to test there is no statistically significant relationship between nature of business and stock market prices. As shown in table (7) because the t- Sig was less than 0.05, the null hypothesis was rejected, and the alternative hypothesis was accepted. The nature of work of the listed firms in NEPSE in Nepal was effective factor in influencing stock market prices of the respondents. The result suggested that the firms should practice different activities to compensate each other to help the firms to achieve its goals, hence the positive impact on the stock market prices of firms. To assure the rejection or acceptance of all null hypotheses that related to the internal factors, table (8) summarized the means and standard deviations of all the questions together that related to dependent variable, and to the internal factors or independent variables. The result of this table indicated that the financial position has the highest mean and that mean the financial position was the most effective factor on stock market price. On the other hand, the size of business has the lowest impact on stock market price. Also, most of the standard deviations of the views of respondents less than one indicating that there was no dispersal of the responses. Table (9) indicated the rejection of null hypotheses

which means most of the independent variables have significant impact on stock price. According to respondents' opinions, F value = 16.773 which was statistically significant at the .01 level. Moreover, the data showed that multiple correlation coefficient square value are R = .800, which mean that the internal factors explained .80 of variance in respondents' evaluations of stock market prices of firms. The correlation between independent variables which represent internal factors in the table no (10) was calculated. The results in this table indicated a positive relationship with a statistical significance between independent variables and stock market price. It aimed at analyzing the results of coefficient correlation of the relationship between the independent variables itself to make sure that there was no co linearity problem between the independent variables before inclusion in the regression equation, which appeared in the event of a significant correlation between independent variables In order to show the relations among the study's variables, table (10) contained Pearson correlation coefficients which revealed a significant positive relationship between stock market price and the independent variables. As shown in table (10), correlation coefficients between each internal factor and the stock market price were ranged from r = -.069 to 0.697. The highest positive correlation was found between the dividend policy and the stock market price. Therefore, this table showed somewhat cause – effect relationship between internal factors and stock market price. According to table no (10) the correlation matrix indicated to the highest correlation between independent variables was the correlation between dividend policy and the management quality (.617) and this emphasized that there was no culinary problem between the independent variables. The findings in the previous table no (7) showed that the independent variables of the study which were: dividend policy, nature of business and the financial position have a statistically significant relationship with stock market prices of firms because the t- Sig for these variables was less than 0.05. The results indicated that there was a positive relationship which has statistical significance between three independent variables (dividend policy, financial position and nature of firms) with stock market prices of firms, which mean that the firm paid more attention to these three internal factors, leading to the rise the firms' stock price upon. The highest impact factors were dividend policy (B= 3.865), Then the financial position of the firm(B= 3.721), the nature of business (B= 2.108), the firm size (B= .797), and the quality of management (B= .690). Moreover, the data indicated that the influencing force in predicting was weak since the Beta value for independent variables was between (0.073 and   0.390).

CONCLUSION AND IMPLICATIONS

From the forgoing results, it is advantageous now to identify the most important points that are related to the results of this work as a useful conclusion. These points can be stated as follows: Stock market price movements in NEPSE depended on many basic internal factors; the results indicated that the internal factors explained the extent of the influence of these factors on stock market prices, and the relatively strong relation between stock market prices and the independent factors. The results of the study indicated the average of contribution of internal factors in the listed companies in Nepal Stock Exchange came agreed degree and the dividend policy has occupied the first rank followed by the financial position and nature of business, then the size of the company and finally the quality of management. This referred to a belief among managers and employees in the listed companies in Nepal Stock Exchange in the impact of these factors in the share market price. The dividend policy could be considered as the most affecting factor on stock market price, which raised the need to increase the dividends to attract the investors.

Financial position of the listed companies would be considered as another important factor affecting on stock market price and it was positively related to the stock market price. Good liquidity management, debt management and asset management made the financial position stronger, and this lead to attract many investors to invest in these firms which was reflected positively on the stock market price. According to survey results, stock price is also affected from the nature of company. Investors have own preferred area of investment. Survey results showed that there is sector impact on stock prices in NEPSE. In the earlier literature there were few studies suggested that there was a relationship between some independent variables and stock market price but some suggested that there was no causality relationship between the stock market price and some independent variables. These findings represented a step forward in understanding stock market price behavior and should prove valuable to portfolio, investment, and top managers in different firms in managing their portfolios and help the managers in making their good financial decisions in firms.

ABSTRACT

This article discusses the human speech studying principles from the point of linguistic expertise view. It provides information on the linguistic expertise branches and its importance in science. It was covered linguistic views on trademark expertise.

KEYWORDS: *Forensic Examination, Linguistic Examination, Forensic Examination, Gender, Trademark, Trademark Examination, Phonoscopic Examination, Homonymy, Synonymy, Antonymy, Capionyms, Rospatent.*

INTRODUCTION

In the new century, the globalization process, which is rapidly embracing all spheres of society, is setting new tasks for both linguistics and language education around the world. The period has made the effective use of language the main task of both science and education. As a result, the world science is moving from a dry theory that describes the internal structure of language to a practical approach to the language and personality commonality[1]. From this point of view, new branches of linguistics have emerged: pragmalinguistics, psycholinguistics, sociolinguistics, neurolinguistics, corpus linguistics, computer linguistics, and so on. There is also the linguistic expertise, which covers a wide range of areas.

Linguistic examination is an independent forensic examination that is effective in the linguistic speech activity study (even if it is recorded in any material medium.[2] According to Y.S. Kubryakova, L.V.Shcherba distinguished the speech about linguistic phenomena, its real basis and the speech process product. The scholar also emphasized the need to understand all the phenomena related to the speech and its perception creation under the term speech activity[3].Of course, this argument matters. This activity results are strictly regulated within the criminal, civil or arbitration proceedings framework and are formalized by a linguist expert (or an expert

linguist's commission) with a written opinion. These conclusions cover issues that require the specialized knowledge application in linguistics. Thus, in linguistic expertise, speech activity has a place as a "trace" that reflects legal significance information. In this sense, linguistic expertise is not the other types opposite of expertise, but their objects are material objects that reflect different fields. Only certain aspects of this material are studied by different fields. Certain texts can be studied psychologically, linguistically, pragmatically, and legally. For example, legal linguistics is the applied linguistics study. This theory originated in Russian linguistics and has been the extensive research subject by L.A. Araeva, L.O. Butakova, N.D. Golev, and A.N. Baranov. Forensic linguistic expertise is one of a wide range components of fields such as psychological and linguistic expertise, linguistic and autonomous expertise, linguistic and phonoscopic expertise, as well as linguistic and "translation" expertise. In addition, I. K. Brinev points out that linguistic theory is not practically enriched, such as the relationship development between practical and theoretical knowledge specific to physics. In fact, the study state in theoretical and applied linguistics should develop at the same time. According to I. K. Brinev, "a theoretical linguistics deal with its own problems, so applied linguistics also has its own studyobject"[4] . At the same time, the theory can fully describe and explain all the facts that occur in the practice.

Tiland as a law crossroads, the linguist N. D. Golev first distinguished three types of relations between language and law[5] :

-- Language acts as a law regulation object;

- Language works as a means of regulating legal relations;

– Language is important when examining the research subject, i.e., the text that has caused controversy in court;

Thus, legal linguistics is an applied linguistics branch that studies the problems that arise in the language and legal conflicts combination.

Thus, legal linguistics deals with a wide range of problems that arise in the language and law combination.Forensic linguistic expertise, in turn, is one of the sub-branches of legal linguistics.Legal linguistics study objects include:the legal language problem, practical developments in the judicial speech, the field called "legal linguistic conflictology",therefore linguistic expertise is an integral part of the linguistic knowledge.It doesn't matter whether you call this component forensic speech, linguistic expertise, or forensic linguistic expertise, the key is to reveal a particular object edges. Today, there is a need for the linguists participation in various litigation types, the legal texts study, the linguistic analysis of the accused speeches, the suspect will be a factor in the objective case consideration. Linguistic expertise requires in-depth knowledge of the specialist. There are certain contradictions in litigation that require the collaboration of psychologists, political scientists, and linguists, as well as lawyers. It is at this cooperation crossroads that a new linguistics, linguistic expertise, emerges branch. Linguistic expertise in Russian linguistics has created a number of studies on its implementation forms and bases. Legal linguistics is based on the forensic materials analysis, study and summarization.

MAIN PART. In the linguistic examination process, the information transmitted by the text in any form or by separate linguistic units is analyzed. The written or oral form of the text must be taken into account.

The following methods help to identify and evaluate the different levels properties of text:

- Auditive perceptive analysis method. Using this method, the conversation content (dialogue, monologue, polylogue) allows you to restore the communication act status during the speech. During the speech, the communication movement allows you to restore the status quo, the number of participants, their relationships and the roles' distribution, registration conditions, and so on. This method provides the basis for solving speaker recognition problems through voice and speech.

- Lexicographic analysis method. The lexicographic information study is an important part of the whole text study, with dictionary sources helping to create the basic idea of truth and the means by which they are spoken.

- Semantic and conceptual analysis methods. It aims to express the word semantic structure, to determine its denotative, signifiable and connotative values. Conceptual analysis is the search for general concepts that are generalized under one sign and predetermine a sign existence as a specific knowledge structure. While semantic analysis is concerned with word interpretation, conceptual analysis leads to the world knowledge. Concepts, as well as the symbols content, are reflected in the consciousness units' images that form the overall conceptual model part of the world[6].

- The semantic-syntactic analysis method is determined by identifying the words, phrases, sentences meaning and the words values in the whole word.

- Component analysis method. This method is used to segment the meaning core of a language symbol to determine the words' semantic content. The component analysis method allows you to determine the certain language units value and their distinguishing features in the micro system. Component analysis helps to extend the competence with respect to the hidden conceptual layer of the analyzed lexeme.

The above examples were a direct form of the information sought. The indirect expression of the appeals is done by hint, that is, by establishing the content equivalence of the meanings that are recreated in a particular way, expressed in the text, and recreated by the recipient, which are regularly updated in a particular cultural thought (knowledge) scheme of the recipient, is done using repetitive expressions. Alternatively, information in any text can be represented in several ways (several forms):

1. An open verbal (oral) form, when the information is given in a separate statement form or interrelated statementschain, and new information is given in the predicative part of the statement (this is a predicate, a logical predicate).For example: (Thief) stole a club from a thief.

2. Anonymous verbal form, when the information is expressed orally, but the information is hidden. It is not visible and is given to them as known - in the subject group. For example, the above information contains not only information about the theft, but also information that the person who committed it was a thief. So while the main idea is about something being stolen, the second message is about who the thief is.

3. The presuppositive (post-text) form, in which the information about certain events is not expressed directly, but is known to both the speaker (writer) and the listener (reader), can understand[7].

In this way, the expert first examines the text in different ways, and then looks at its relevance to the author, its legitimacy, and its pragmatic situation. For example, in text analysis, gender characteristics may also be subject to linguistic expertise. Not all male and female relationships can match the same gender characteristics without exception. Linguists say that a person's gender can be reflected in his or her speech. Even men and women can speak with different intonations, use different means of nonverbal communication, and pronounce words differently[8].Or there are several guidelines for developing a linguistic brand expertise. The expert will consider issues such as who the product belongs to, what type of product it belongs to, and its legality.

Linguistic trademark examination is usually carried out in the case of a trademark registration, judicial proceedings, mainly in case of a trademark registration denial, as well as in case of illegal actions against the registered trademark. The expertise role depends on the nature of the problem.

For example, according to Article 1884 of the FKof the Russian Federation, no one has the right to individualize an illegal trademark, apply it to the same product, or register it. The legal process is carried out by Rospatent, the organization that registers intellectual property, patents and trademarks. The organization has developed criteria for the phonetic symbols use in the brand representation, which includes a reference to the manufacturer name. These criteria can be used in cases of state trademark registration and in cases related to another trademark.

The editorial board has 45 groups of goods and services, each of which combines different products. Defining the brand of one type product is very simple: yogurt and sour cream are one product type. In some cases, it is important for the expert to have his or her own opinion about whether the product is the same or not. For example, expert opinions are important in determining the products group, such as beer and other alcoholic beverages, dumplings and other finished products, clothing and knitwear. Once an expert has formed a group of products or services, he or she must justify the similarities between them.

The linguistic expertise relevance is explained by the fact that the nominal units belonging to the firm are reflected in national and global documents.

A set of letters is created to represent the unique or external product features. (UK,JKX,JEK and etc.)This set of letters can be done without consulting a linguist, but there are some problems with this process. For example, the extent to which the selected letter reflects the relationship between the manufacturer and the product, and how much information this letter can provide about the manufacturer. You will need the help of a linguist when you have these problems.

For example, according to Rospatent, the names "My Home" LLC and "Our Home" LLC are incompatible. Rospatent considers the nomenclature in the form "My child is your child" to be mutually exclusive, as directly inclusion contradictory sentences or words indicates the problem importance being studied. It is based on the language signs asymmetry, the perceived and understood concept.From a linguistic point of view, linguistic categories such as synonymy,

homonymy, and antonymy are at the top of the problematic question that arises in naming disputes.So, in the methodology for experts, there are different nouns-homophones (aygen, aygent), noun-synonyms (sleep music-sleep melody), noun-antonyms.These units are phonetically, graphically, and semantically similar.

The relationship between naming units is based on the similarity or pairing sign (primary naming and secondary naming based on it).

Here we can think of a linguomarketological unit - capionyms. Capionyms are a registered noun unit consisting of similar words association that is in the merging process. They are based on units that represent phonetic, graphic, semantic similarities, with core synonyms, homonyms, and antonyms.

The homonymy peculiarity stems from its ambivalence, which is reflected in linguistics: in some places, nominative homonyms are in the semantic unification process, and in some places, on the contrary, the semantic properties of the lexeme provide the homonyms differentiation. In linguistics, the homonymy phenomenon essence is inextricably linked with the exact boundaries of the polysemy phenomenon. The main solution to this problem is reflected in lexicography. There are many controversial and unresolved issues in Russian linguistics regarding homonymous and ambiguous linguistic units.

For example, "to please" (who?), "to please" - "to fit", "to hang" (to whom? where?).That is, there are differences, but there are different approaches to differences[9]. Homonymy also refers to, as N.D. Golev describes, "misunderstanding," reflects "insufficient understanding", "total misunderstanding" or two-sided understanding.tushunmaslik"[10]. In this case, the homonyms can create a puzzle or, as a result, create serious, court-ordered issues. At this time, the demand for linguistic expertise increases. Linguistic ambiguities can lead to instability in branding. A well-crafted, well-educated professional brand will be free from all objections. There must be a link between the manufacturer and the brand, and it must have a legal basis.

CONCLUSION

As mentioned above, although there is a field of linguistic expertise in Russian linguistics, most experts think outside the practical room of expertise. In essence, perfect knowledge and skills come from practical experience. The evidence found in applied research has not been incorporated into the theoretical linguistics (science) core. Because, despite the practical and theoretical areas diversity they are interconnected. Thus, according to I. K. Brinev, theoretical science cannot ignore any interesting fact revealed as a result of applied linguistic research (for example, the speech emergence in pathological cases - intoxication, etc.).After all, theoretical knowledge is the practice result. If such facts become the linguistic theorystudyobject, it will probably be a real knowledge field for the field, which can ultimately be a tool for practical solutions"[11] .

At a time when various new aspects of linguistics are emerging, the linguistic importance expertise for society is also increasing. This area is primarily important in the human rights interests. It is the basis for the psychological, linguistic, and pragmatic study of any text, whether it is judicial, barter, or scientific, in any speech situation.

ABSTRACT

The article presents tourism, ecological tourism and its significance, the possibilities of ecotourism in Uzbekistan today, the development of ecotourism, features of the effective use of ecotourism, proposals and recommendations for the development of ecotourism in the region. In this regard, the development of scientifically based recommendations and proposals on the main directions and prospects for the development of tourism and ecotourism in the region is one of the most urgent tasks facing the tourism industry in the region. At the same time, in accordance with this decision, on the territory of the Kumushkon makhalla of the Parkent district, it is planned to create a "tourist village of Kumushkon". The development of tourism plays an important role in the further development of the economy, culture of the country, maintenance of national unity and further development of the economy in the preservation of natural attractions, historical monuments and national traditions.

KEYWORDS: *Ecotourism, Tourism Industry, World Tourism Organization (WTO), Chatkal State Biosphere Reserve, Aydar-Arnasay Lake System And Chimgan-Charvak Resort And Recreational Zones.*

INTRODUCTION

In a market economy, Uzbekistan creates favorable conditions for the development of all sectors of the tourism industry, including ecotourism, and further integration of tourism into the country's economy plays an important role in the country's economy. All this attracts the attention of foreign tourists. In addition, as a result of the development of domestic tourism, the fact that citizens of Uzbekistan receive more information by visiting ecotourism sites creates a sense of national pride and pride in the Motherland. Political stability in Uzbekistan also plays an

important role in the development of ecotourism. At the same time, paying special attention to measures to create a modern tourist infrastructure in the regions of the country, we can observe the development of all directions of tourism in the regions. In particular, the huge tourism potential of the Samarkand region plays an important role in the economic, social and cultural life of the country. Unique historical monuments, beautiful nature, as well as tolerant and hospitable people, sweets, fresh fruits, and most importantly convenient infrastructure will allow building more than 40 new hotels and 12 new hotels in the region in the next five years. expansion of the hotel is planned. As a result, the number of rooms in hotels will reach 7 thousand, which is 1.5 times more than now [1]. There are also recreation areas in Khanabad of the Andijan region, five new modern recreation areas on the shores of the Aydar-Arnasai lakes in the Forish and Arnasai districts of the Jizzakh region, four-star hotels in the cities of Shakhrisabz and Karshi of the Kashkadarya region, a hotel complex in the Chimgan mountain range of the Bostanlyk district of the Tashkent region. In the Navoi region, it is planned to organize domestic tourism on the southern bank of the Todakol and beaches for foreign tourists on the bank of the Aydarkol [2].

Development of ecotourism in the Republic of Uzbekistan, i.e. expansion of the flow of tourists will lead to the development of sectors of the economy, construction, transport, trade and others. It is important to pay close attention to the development of ecotourism in the regions. Organization and development of ecotourism in all regions of the country allows to ensure economic growth in all spheres, to solve the problem of employment of a part of the population, as well as reconstruction, repair and expansion of ecotourism facilities [3]. In addition, by a corresponding decree of the President, in order to further improve the tourism management system in the regions, the posts of deputy khokims of Tashkent, Samarkand, Bukhara and Khorezm regions, as well as the cities of Khiva and Shakhrisabz, were introduced. According to the State Committee for Tourism Development, 18 reservoirs in eight regions of Uzbekistan were opened for organizing ecotourism by the decision of the Cabinet of Ministers [4].

Studies show that the development of ecotourism in the regions depends on the diversity of the Republic of Uzbekistan, its status and the potential of ecotourism. For example, the lower Amudarya region of the country, that is, the Republic of Karakalpakstan and Khorezm region, also have their own rich natural resources for the development of ecotourism. Considering that the Khorezm region is an integral part of the Aral Sea region, the ecological situation in the region is one of the most important issues. In this regard, the development of scientifically based recommendations and proposals on the main directions and prospects for the development of tourism and ecotourism in the region is one of the most urgent tasks facing the tourism industry in the region. Decree of the President of the Republic of Uzbekistan dated March 20, 2013 "On the program of tourism development in the Khorezm region for 2013-2015" [5] and the Decree of the Cabinet of Ministers of the Republic of Uzbekistan "On additional measures to develop tourism in the Khorezm region for 2019-2020" All industries tourism in the Khorezm region are developing on the basis of [6]. Khorezm region is rich in its rich history, monuments of antiquity and culture, its location on the Great Silk Road is of great interest to the world community. There is a huge potential for the development of ecotourism in the region, and there are great opportunities for the development of ecotourism and hotel services on the banks of the Amu Darya in Bagat, Khanka and Urgench districts. Ecotourism services can also be launched at the Kyzylkum State Reserve in the region. This reserve is located in the middle reaches of the Amu

Darya, mainly in the Tuprakkala region of the Khorezm region and partially in the Romitan region of the Bukhara region. Taking into account the high potential of ecotourism on the Ustyurt plateau in Karakalpakstan, it is necessary to develop tourist services in Nukus, Elikkalsky, Kungrad, Turtkul, Khojailinsky, Amu Darya districts, to effectively use the potential of hunting, religious, recreational, archaeo-ecotourism. Due to the fact that the ecological situation along the Aral Sea is a critical zone of ecotourism, the ecological crisis in these areas is the main object of ecotourism.

President Shavkat Mirziyoyev said about the situation with the Aral Sea at the 72nd session of the UN General Assembly: "I would like to once again draw your attention to one of the most acute environmental problems of our time - the Aral Sea disaster. Here is a map of the Aral Sea tragedy in my hands. I don't think we should exaggerate. Coping with the effects of the drying up of the sea requires an active combination of international efforts. We support the full implementation of the special program adopted by the UN this year to provide practical assistance to the population affected by the Aral Sea tragedy "[7]. Ecotourism routes in these areas will have to cover areas where the Aral Sea has dried up and at the same time suffered from drought. The number of tourists interested in the current state of the ecological zones of the Aral Sea and the Aral Sea crisis is growing every year. Tourists who have organized and plan to visit the Khorezm region and the Republic of Karakalpakstan will have the opportunity to link historical tourism with ecotourism by introducing additional tours to ecotourism zones of the Aral Sea. The ecotourism area of the Aral Sea and the Aral Sea is also an extreme ecotourism object, because it is an ecotourism zone with an ecological crisis. Ecotourism routes simultaneously cover both arid and affected areas of the Aral Sea. The depth of the Aral Sea in 1960 was 53.52 m. In 1996 - 35.48 m. In the dry part of the sea 5 million. A new "island" desert appeared on an area of 1 ha [8]. Today, the activities of the International Innovation Center of the Aral Sea under the President of the Republic of Uzbekistan have improved the ecological situation by planting desert plants on 1.2 million hectares of land in the Aral Sea, which dried up the Aral Sea. The analysis of the work done shows that the Cabinet of Ministers of the Republic of Uzbekistan adopted a resolution "On measures to accelerate the creation of a" green cover "of protective forests in the arid regions of the Aral Sea" [9]. According to the decree, in 2019, 500,000 hectares of land at the bottom of the Aral Sea were turned into forests as a result of the gradual allocation of 100 billion soums for the creation of protective forests "green cover" [10]. Each natural-geographical complex has unique opportunities for ecotourism, i.e. has its own territorial features. From the point of view of economic efficiency, ecotourism can be combined with historical tourism, including visits to the ancient fortresses of the Republic of Karakalpakstan and visits by foreign tourists to the city of Khiva, where they can see the "products" of nature and man.

There are opportunities for the development of ecotourism in the south of the Republic of Uzbekistan. In particular, the Surkhandarya region of ecotourism is one of the unique regions of the republic, where a zone of dry subtropical climate prevails. Therefore, it is possible to organize eco-tours for many months of the year. More than 20 objects of historical and cultural heritage in the Surkhandarya region serve foreign and domestic tourists. Currently, new routes have been opened on the routes Termez-Denau, Termez-Baysun and Termez-Muzrabad [11]. The existing tourist routes mainly cover aspects of historical and religious tourism. However, the picturesque, inimitable, inimitable objects of the region's nature, medicinal water resources show

that there are enough all the opportunities and conditions for the development of ecotourism. In the Surkhandarya region of ecotourism, in the Kukhitang mountainous area, there is the Surkhandarya state nature reserve, created in 1987 to protect 800 plant species, 290 birds and more than 20 animal species on an area of 53.7 thousand hectares [12].

Much work on the development of tourism and ecotourism in the Jizzakh region is carried out on the basis of the program "Accelerated development of the tourism potential of the Jizzakh region for 2017-2019". Currently, there are 3 specially protected natural areas in the region, the Zaamin and Nurata state reserves, 9 forest departments and the Zaamin national park, which develop very interesting and unique tourism directions, such as ecotourism, agriculture, health, sports and hunting tourism. In 2017, more than 4,000 foreign tourists visited home hotels in the villages of Ukhum, Hayot, Modzhurum, Andijan around the Nurata Nut Reserve, located in the Nurata ridge of the Forish District. Given the proximity of this area to the Aydar-Aranasay lake system and its location on the Jizzak-Navoi highway, the future of the National Park based on the Nurata Nut Reserve will improve the road and other communications in the region, as well as create mountain clusters in the region. created. According to statistics, from 760 to 2000 tons of fish are caught annually in the Aydar-Arnasai lake system [13]. Methodological approaches, scientific and practical conclusions aimed at the rational use and reproduction of water and fish resources for ecotourism in the Aydar Arnasai lake system will enrich knowledge in the field of ecotourism and become the basis for the effective and rational use of water and biological resources in the region.

In the Tashkent region, a number of measures were taken to further develop the tourism industry, attract more foreign and local tourists, improve the quality and volume of tourist services, train qualified personnel for the industry, and ensure the safety of tourists in cooperation with the regional administration and agencies. is currently being done. The number of tourist organizations in the region in 2017 was 6, in 2018 - 20, and the number of currently operating tourist organizations in the region - 46, which is 1.2 times more than in 2017, and 2.3 times more than in 2018. According to the results of the work done in the tourism sector in January-December 2019, 305 thousand foreign tourists visited the region, which is 167% more than in the same period last year.

Also approved by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated December 31, 2019 No. 1053 "On the accelerated development of tourism in the Tashkent region in 2019-2021" "Accelerated development of tourism in the Tashkent region in 2020-2021 and the implementation of the concept of tourism" Golden Ring ". Ensuring the implementation of the "Action Program" is one of the main tasks planned for 2020-2021. In order to create favorable conditions for the smooth travel of tourists, it is planned to create the necessary infrastructure in the areas of Bostanlik, Akhangaron, Parkent, Boca, Chinoz, Zangiota and the city of Angren. At the same time, in accordance with this decision, on the territory of the Kumushkon makhalla of the Parkent district, it is planned to create a "tourist village of Kumushkon". The project of an eco- and agro-tourist complex in the direction of Dir, organized by OK "Corrida Food" in the Bustonlik region. The total cost of the project is 64.0 billion soums, 76 hectares of land have been allocated for the project, 105 deer have been imported by the enterprise. The project is ready to launch, it is planned to create 15 new jobs. At the same time, 12 new jobs will be created in the district due to the work of LLC "Core It Service" on the construction of a fishing and food complex in the direction of ecotourism.

In order to develop the tourism industry in the Namangan region, akim of the region adopted a decree No. 66 of February 16, 2016 "On the program for the development of tourism in the Namangan region for 2016-2017" [14]. A number of positive steps are taken to create

During his visit to the region, President of Uzbekistan Shavkat Mirziyoyev said that taking into account the specifics and capabilities of each region, comprehensive work is being carried out to create new enterprises, create jobs, and additional opportunities for the development of medical tourism and ecotourism in the region. Shavkat Mirziyoyev also instructed to develop tourism and build an ecological city in Chartak, having familiarized himself with the construction of the sanatorium and health resort "Chartak" in the Chartak region [15]. It was noted that in order to turn Chartak into an ecological city, it is necessary to reconstruct the Chartak center within the framework of the Ecological Urban Infrastructure Development Project jointly with the World Bank. The opportunities for ecotourism in the Chust region are also high, and now the ecotourism routes in the Chust region are 1. Chust-Govasai. 2. Chust-Buonamozor. 3. Recreation Park named after Mavlon Lutfi. 4. Transported along the route Tashkurgan-Mashhad. In order to increase tourism in the region, in particular ecotourism, the governor of the Namangan region decided to take measures to further develop tourism and ecotourism in the Yangikurgan region [16]. According to him, the village of Nanai will become the center of ecotourism. This decision, aimed at increasing the tourist potential of the village of Nanai, Yangikurgan region, will create modern tourist facilities on the basis of many abandoned resorts in the region and turn the village into an ecotourism center. The ecotourism center in the village of Nanai attracts local and foreign investors to organize modern recreation areas - campgrounds, campgrounds, guest houses. As a result of this work, many young people in the region will be employed.

In the Bukhara region, ecotourism objects can be found in almost all areas. The innovative ecotourism cluster Bukhara Desert Oasis & Spa is a new thematic tourist facility located in the Romitan region, undoubtedly, will not leave any tourist indifferent. As a result of many years of efforts, a new ecotourism center has been established in the desert, and its projects are gradually being implemented. The center, which includes new tourist routes near the historic Burontepa hill, was created in accordance with the decree of the President of Uzbekistan "On measures to accelerate the development of the tourism potential of Bukhara and Bukhara region in 2017-2019" [17]. Excursion to the Bukhara Desert Oasis & Spa, the ancient Varakhsha massif, the Burontepa archaeological site, the cluster territory and the tent of the Emir of Bukhara Abdulahadkhan, meadows, beach, massage, off-road vehicles, ATVs and camels. services such as a garden, an ecological garden, an innovative greenhouse, staged performances (reception of the Emir of Bukhara), a gift shop and a bar with soft drinks.

The territorial development of ecotourism in Uzbekistan is not only economically beneficial for society, but also an important factor in ensuring the longevity of people, as well as the inheritance of a free and prosperous homeland for future generations. The development of tourism plays an important role in the further development of the economy, culture of the country, maintenance of national unity and further development of the economy in the preservation of natural attractions, historical monuments and national traditions.

Candidate of Economic Sciences,
UZBEKISTAN

ABSTRACT

The article deals with the development of a mechanism for the formation of agro-industrial clusters in the country's economy, the results of which will help individual cluster farms and the training of future specialists - university students.

KEYWORDS: *Cluster, Agro-Industrial Cluster, Cluster Farms, Geographic Localization*

INTRODUCTION

In the Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Oliy Majlis on January 24, 2020, he noted the following. Our research and development to increase the interest of farmers and ranchers in agriculture continues. Advanced technologies and cluster systems are being introduced in the industry.

Analysis of the literature on the subject

1. Marshal A. In the book Principles of Economic Science, we can mention the work "Principles of Economics", in the framework of which he studied the industries of the United Kingdom.

2. Kutsenko E.S. In the article "Zavisimost ot predshestvuyushchego razvitiya prostranstvennogo razmeshcheniya ekonomicheskix agentov i praktika otsenki aglomeratsionnyx effektov" "Cluster" or similar definitions are used in essence, as well as authors who study the problems of technological communication between different industries. .

3. Tolenado J.A. Propos des Filieres industrielles // In the Revue d'Economic Industrielle, in particular, the French economists I. Tolenado and D. Sole introduced the concept of "filer" used to describe groups of interrelated technological industries to describe the relevant technological economic sectors.

4. Dahmen E. discusses development blocks in Enterprise Activity and the Development of the Swedish Industry.

The Republic of Uzbekistan is a practical base and tools for the formation of clusters in the production of cotton and textile products. The subject of the research is the development of a mechanism for the formation of agro-industrial clusters in the country's economy, the results of which will help individual cluster farms and train future professionals, ie university students.

RESEARCH METHODOLOGY

As a result of our research, changes have been studied in the development of cluster introduction in agriculture, increasing the efficiency of cluster use, and scientific conclusions and proposals have been developed for the further development of cluster method in agriculture. Methods such as induction-deduction, abstract thinking, comparative analysis, economic-statistical analysis were widely used in the research.

The results of the analysis

Policy to stimulate cluster development should be pursued by all levels of government, and lower-level government policy often has a decisive impact on cluster development. The creation of a cluster must, of course, be done taking into account the interests of all its participants. In addition, the population needs to understand all the possibilities of cluster development. The main competing sectors of the cluster economy stimulate the development of suppliers and customers through the use of mechanisms of interaction within the cluster. Small and medium-sized businesses are integrated into satellite enterprises. Diversification of production by central enterprises encourages the formation of new industries using the technologies of parent organizations.

The current level of economic development is becoming necessary in the practice of creating and using completely new forms of organization of production. Ensuring the sustainability of economic development of regional systems, as well as increasing the efficiency of business entities through the use of standard methods and management tools.

It is this situation that requires foreign and domestic scientists to define the formation and development of new mechanisms of economic integration that will ensure the achievement of multiplicative and synergistic effects as the goal of their research. Today, economic clusters in individual regions or territories stand out as one of the most effective forms of organizing productive forces.

The theoretical issues of the cluster approach have been considered by a number of domestic and foreign authors, so today we can distinguish different approaches to cluster identification and their classification, scope, direction, and so on. In general, a "cluster" is a specific combination of individual elements that form a whole to ensure the performance of certain functions. The combination of these elements works more efficiently than each element separately.

Significant advantages of economic clusters over other forms of business organization have been noted by a large number of different authors. One of the founders of the development of this field of economic thought was A.S. Marshall is. In particular, his work "Principles of Economics", in which he studied the industries of the United Kingdom. It should be noted that in the context of this study, A. Marshall did not include any specific terms to describe "localized production" or

"industrial zones". However, to describe their characteristics, in this case we are talking about clusters with a high level of division of labor between enterprises. Marshall actually defined the organizational and economic conditions for the formation of clusters as a new form of organization of productive forces that "disperses" multiplicative and synergetic effects. In his works, this author highlighted economic structures based on the concentration of a large number of similar small businesses in a given area with stable activities. He sees it as an "environmental impact" that plays an important role in business development. "Environmental effects" or "external economies," Marshall called unplanned profits, as well as additional products in doing business. As noted in his work, the focus is on the high efficiency of the implementation of ideas aimed at creating new economic benefits, as well as the creation of integrated business structures in the common economic space, resulting from the specialization and merger of business entities. Based on this interpretation, the cluster of enterprises is their geographical or industrial concentration, the interaction with suppliers of equipment, raw materials, provides the effect of "external economy" as a result of the formation of narrow specialized groups of workers. "Cluster" or similar definitions have been used in essence, as well as authors who have studied the problems of technological communication between different industries Cluster brings together companies from different fields of activity to produce a finished product. In particular, to describe the relevant technological economic areas, French economists I. Tolenado and D. Sole introduced the concept of "filer" used to describe groups of interrelated technological industries. The concept of "filer" is an antivirus tool of the concept of "cluster". The main reasons for the formation of clusters are that these researchers call for the creation of the necessary conditions for the establishment of sufficiently close technological links between medium producers and high opportunities to take advantage of clusters of small organizations in interconnected sectors of the economy. In addition, Tolenado and Sole emphasize the high efficiency of clusters in terms of strengthening internal and external industrial technology links.

Prototypes of the concept of "cluster" have also appeared in studies devoted to the development trends of leading Swedish corporations. Thus, E. Discussing the "development blocks" of Daxmen, A.E. According to Shastitko, clusters as a form of organization of economic activity: theoretical question and empirical observations emphasize the importance of establishing a link between the development capability of some sectors of the economy and the high results achieved in others.

Another Swedish researcher, L.G. Mattson, described the interrelationships within the various forms in his works. The study of the relationship between the competitiveness of a region or state and the level of development of a cluster is the focus of M. Porter's work, which refers to clusters as interconnected, regionally adjacent firms and related companies operating in a particular area and complementing each other. There are three main aspects of cluster activity:

1. Relationships between enterprises within a cluster. A cluster is a form of networking with relevant firms, and the deepening of relationships indicates that the level of cluster development has increased. 2. Geographical localization. Clusters can be located in a single city or occupy an entire state, which is often not the case. 3. Technological connections between cluster networks. There may be enterprises in different areas in the cluster area that are technologically interconnected.

Often these are manufacturers of finished products; relevant product manufacturers; factors of production, suppliers of components, machines, services; financial institutions and others. M. Porter devotes an important role in his work to the study of the interdependence of the various branches of a cluster. In the context of the constant competitive struggles of different companies, the main competitive advantages may be not within the company, but in the external environment - between suppliers, partners, subsidiaries. Regional competitive advantages are ensured by the competitiveness of interconnected industry groups.

Each competitive industry creates favorable conditions for the development of another within a mutually reinforcing relationship. A network with a high level of competitiveness can become a driving force for the development of interconnected industries by increasing the demand for the finished product, technological support and the replacement of innovations. The described process is able to move in the opposite direction. An industry with a low level of competitiveness can lead to a decline in other industries if they are the main consumer of their products.

Porter explores clusters at the industry level in his work on regional and national competitiveness. The main analysis tool for Porter is cluster design. The cluster is often produced by geographically localized companies that specialize in a particular manufacturing area. This is in many ways typical of developing countries, where small and medium enterprises are the basis for sustainable economic growth.

A number of economists believe that merging small enterprises into clusters is the only scenario to keep them in the context of globalization of the economy and increasing international competition.

Compared to TPKs, the main distinguishing feature of clusters is the transition from complexity and authorization to cooperation and competition, based on the use of organizational and managerial factors as a basis for creating competitive advantages. Lauren Yang highlights the cluster as a group of firms located close to each other. This author identifies the following characteristics of clusters: geographical proximity to large universities consisting of small private firms, high qualification of employees of cluster resident firms. We believe that this feature is more specific to innovative clusters. Large industrial enterprises can also serve as a core for the growth of economic clusters. Moreover, economic clusters are not always made up of private companies alone. Clusters can include not only similar companies, but also government agencies, educational institutions, large enterprises, public organizations. L.Yang also points to the emergence of a number of advantages that can be seen in the cluster organization of production.

Firms joining the clusters will have a positive effect by improving the quality of the workforce, researching the industry, as well as the rapid development of technology. The positive effects provide a reduction in the cost of primary factors of production due to the high efficiency and effectiveness of innovations provided by the exchange of views between residents of economic clusters and the selection of personnel for enterprises with vacancies.

L.Yang also noted the dynamic characteristics of the cluster and its ability to stimulate the development of innovative ideas. Wolfgang Price argues that cluster formation is "a way to restore mutual trust between government and business and transform fragmented enterprises into a business community". Clustering means, in a sense, a new approach in taking advantage of all the advantages of the industrial location of business entities and a high level of territorial

governance. The cluster brings together representatives of educational institutions, public organizations, local government and business structures.

In our opinion, V. The main advantage of Price Research is that the cluster is studied through the prism of a particular region and the role of the state in the clusters. However, this author has not yet fully clarified the mechanism for establishing the link between business and government within the cluster and the advantages offered by the cluster over other forms of integration associations. D.Jacobs, L.DeMan and S.Rozenfeld expand the concept of cluster. In the early stages of research, scientists use descriptions of vertically and horizontally integrated economic clusters, which served as the basis for the authors 'definitions. D. Jacobs and L. DeMan, S. Rosenfeld noted that there is no single holistic definition of the term "cluster" and that each of the existing approaches is distinguished by a certain scientific significance. Horizontal clusters were used to identify the key factors used in identifying economic clusters.

These authors included the principle of regional integration of economic clusters to increase the efficiency of economic activity, horizontal and vertical connections of different industries, the use of common technologies, the existence of a "core" cluster that can be provided by a large enterprise or research center. S. Rosenfeld includes the following criteria for determining the economic cluster: size, economic and strategic importance, the range of products and services produced.

At the same time, he considers the definition of clusters to be inaccurate only in terms of area scale or employment level, and argues that a number of effective clusters do not have to have a small defined concentration of workers. This author describes the economic cluster as a limited geographical concentration, with channels of sales operations, infrastructure, labor market, and service delivery of related or supplementary companies that can both take advantage of opportunities and share risks together.

The scientist emphasizes the geographical localization of the clusters, but does not analyze their exact spatial boundaries. The clear advantage of this author's research is that it is a sign that relationships are important not only on the basis of common capabilities but also on the basis of joint risks. At the same time, S. Rosenfeld interprets the concept of cluster very narrowly.

In conclusion, it should be noted. the author does not take into account the role of associations, public authorities and educational institutions in determining the cluster structure. This definition is more specific to network associations and includes their characteristics. We believe that sectors will serve as a basis for the formation and further development of economic clusters.

Offer. 1. It is necessary to create the main reasons for the formation of clusters, to create the necessary conditions for researchers to establish sufficiently close technological ties between medium-sized producers and to create high opportunities to take advantage of clusters of small organizations in interconnected sectors of the economy.

2. The cluster approach is an effective tool, the use of which can stimulate regional development, increase the competitive position and stability of regional industry, which leads to increased budget allocations at all levels, lower unemployment, higher wages, etc.

THERE IS A NEED FOR CRITICISM OF CRITICAL LINGUISTICS AND LANGUAGE EDUCATION (IS IT?)

Turdibekov Mominjon Turaevich*

*Associate Professor,
Candidate of Philological Sciences,
UZBEKISTAN

ABSTRACT

This article is devoted to find solution of problems in field of Uzbek linguistics, including in field of teachings modern Uzbek literature. Likewise to answer affirmatively on the questions of critical language study, and creation and importance of center or department that would be able to find and answer problematic questions in field of critical language study.

KEYWORDS: *Social Discussion, Majority Choice, Practice Analytical Description Of Language System, Systematic Structural Explanation Of Language System, Linguistics Science, Language Teachings, Critical Language Study, Critical Linguistics Teachings.*

INTRODUCTION

It is known that in the coming years in the field of Uzbek linguistics the first ideological basis was based on mysticism, but as a linguistic doctrine V. Uzbek synthetic system-structural linguistics, formed in the works of von Humboldt, developed in the research of Baudouin de Courtenay, and in the research of F. de Saussure, formed on the basis of the methodology of structural linguistics, led the way. We believe that at the current stage of development of Uzbek linguistics, including in the anthropocentric paradigm, this linguistics has a worthy place and contribution. This is not in vain due to the fact that the ideological and methodological foundations of synthetic system-structural linguistics are free from dictatorial ideology, not political-class, but objective social life - the need for national independence and mother tongue, the need to create national linguistics and education.[1]

Another important aspect of its development for linguistics is that for the first time with the teachings of synthetic system-structural linguistics developed clear and consistent research principles, methods and dialectical analysis based on the general laws of nature, society, thinking development and consciously engaged

in scientific activity. - how, in what way and on what basis the levels, units, types and types, features of language structure, which differ from the previous - practical-analytical description, they were analyzed and described, were applied to define and illuminate the processes of system formation. And in a relatively short period of time, their synthetic system-structural (paradigmatic, syntagmatic, hierarchical (graduonymic, hyponymic, partonymic)) relations were studied in order to clearly distinguish language and speech, their units, linguistic meanings and functions, to reveal their essence. - Thematic description, performance, mechanism of functioning, linguistic model, structure-type schemes are developed. And a number of fundamental works mentioned, covered in dissertations of both levels, textbooks and manuals, monographs and pamphlets.

MATERIALS AND METHODS:

In these complex theoretical generalization processes that require a high level of scientific potential, A.Nurmonov, H. Ne'matov, N. Mahmudov, A.Abduazizov, Sh.Rahmutullaev, R. Sayfullaeva, E.Begmatov, A.Berdialiev, B.Mengliev, A.Sobirov, Sh. Shahobiddinova, Sh.Iskandarova M.Qurbanova, O.Bozorov, R.Rasulov, M.Abuzalova, L.Raupova, B.Qilichev, T.Bushuy, Sh.Safarov, G.Zikrillaev, Sh.Akromov, T.Asadov, B .Bahriddi-nova, Sh. Bobojonov,, Z.Yunusova, M.Boshmonov, I. Madrahimov, G.Boqi-eva, Q.Muhammadjonova, N.Musulmonova, D.Nabieva, M.Narzieva, C. Nazarova, G.Ne'matova, L.Ne'matova, D.Nurmonova, Sh. Orifjonova, R.Rasulov, R. Sa-farova, H.Saidova, H.Usmonova, B. Yorov, S.Giyosov, N.Shirinova, O.Shuku-rov, Z. Yunusova, N.Yuldasheva, N.Vohidova, G. Toirova, X. Many linguists and scientists, such as Khairullaev, have been active, and we have been able to study in depth the remarkable results of new - synthetic system-structural interpretations of language construction.

In this sense, it can be said that the ideas of synthetic system-structural linguistics and its directions, the results of their scientific-theoretical, practical- methodical activities have played an important role in the development of Uzbek linguistics in the 20 years after independence. However, there is another fact that needs to be accepted as a fact, albeit not undeniably. Below are some thoughts on these two scientific facts.

First of all, it should be noted that the ideological and theoretical basis of this doctrine is the difference between language and speech. This distinction is a scientific fact that is recognized by almost all linguists in Uzbek linguistics today, and, therefore, it is necessary to follow it in scientific, educational and methodological activities.

But, unfortunately, it is still possible to unknowingly ignore this difference in linguistics (sometimes even in linguistics), to be indifferent, to ignore theories of differentiation in thinking. In particular, language, ilison, speech, accordingly, language unit, linguistic unit, speech unit, speech unit; lexeme and word, its types of meaning; morpheme and morphine; linguistic pattern (constructema, syntax) and word formation, formed word, phrase, sentence, compound sentence (combination of sentences); we are unable to fully ensure scientific accuracy and consistency in the level of advances made in our science in distinguishing between text and text; scientific innovations in our science, new interpretations, neglect, indifference, and even indifference to positive changes are observed. In our opinion, there is a lack of a critical view of our practical work in this area. However, the distinction between language and speech, and the units to which they relate, is fundamentally based on a specific scientific basis in all three areas of the synthetic

system-structural approach, and although they have different aspects, they are complementary theories. This can be seen directly in the example of the main and generalized differential theories of the following three directions: "Language (language) ... exists in the minds of members of society and is seen as a set of perceptions about the units and their interrelationships that are ready, common, obligatory for all of them, serve to form and express an idea.

Speech is a form of manifestation, realization, realization of language, which has a material (natural, physical) form, given in direct observation.

Norms are the laws and possibilities of using language units in one form or another of speech, which are defined and defined by society.

"Language units are systems both in terms of the sign of occurrence and in terms of their ontological nature. For example, each morpheme is a system as a generalization, which is manifested in a number of formal and semantic variants (allomorphs, morpheme variants) in direct observation. ... Moreover, all morphemes and higher units are a system consisting of a mutually stable syntagmatic relationship of structural units known as a device (construction) in terms of their ontological nature".

§ 3. Language has a complex structure; initially it is distinguished by two states - language and speech. Language is a wealth of language units and rules of their use in the part of language memory in the human brain. Speech is the process of using that wealth and the product of that process. "

According to the above, in Uzbek linguistics there is an opportunity to imagine and interpret language as a dual functional system in action, consisting of language and speech, their units, rules, dialectical unity of events, and those who have theories of differentiation use this opportunity wisely in their scientific and pedagogical activities. However, as noted above, our work in this area as a whole is not very gratifying. The fact that we are accustomed to thinking without distinguishing between language and speech often gives us an excuse, and it is difficult to move to radically new interpretations. Of course, this is a subjective problem related to the degree to which we, each of us, are formed as a scientific specialist, a modern specialist a scientific and pedagogical staff with a new worldview. It is clear that this problem will not be in the aspirants or will be resolved positively in the near future. However, it is also true that synthetic system-structural interpretations are neglected in practice, which in turn determines the content, the constituents, the internal structure of the two mutually distinct states of existence of language, namely language and speech. , naming, classification and interpretation of each type of linguistic, speech unit on the basis of its specific nature, main meaning-[2]function, function, which is determined on the basis of its own system and higher and lower, as well as systemic-structural relations with the whole, so At the same time, there are many problems, internal contradictions, confusions and uncertainties in the synthetic system-structural views on the scientific substantiation of their dialectical integrity, the complex social-individual mechanism of regular repetitive actions. It should be noted that the shortcomings were caused and are happening.

This, unfortunately, can be observed in all three directions. In particular, in formal-functional and semantic-functional textbooks, the status of a word is defined by a lexeme or morpheme: a lexeme is interpreted as a material appearance or lexical-lexical morpheme that has discovered a definite form, content, and function. . However, the lexeme is also, in fact, a word. The term

lexeme was introduced into Uzbek linguistics to distinguish and generalize the main lexical meaning of a word - lexical word from others, and this has been recognized and accepted by many. So, first of all, it is self-evident that a word is a linguistic unit, and therefore it cannot be a variant of its (one type) speech event (a word is not a phenomenon that occurs with the speech event of a lexeme); second, since a lexeme is a basic type of word, there are other types of it that are not basic, but are words (which have not lost their lexical character). They are studied in analytical linguistics as groups of rhymes, auxiliary words (auxiliary, connecting, loading), separate words (exclamation words, modal words, imitation words). They are linguistic units just like lexemes. Therefore, they can be interpreted as lexeme-type linguistic-emik (-ema element) units with the following types, taking a deeper look at their meanings and functions: lexogram-meme (diamond), grammema (auxiliary, connecting), subject (modal word, load), emotema (exclamation point), mimema (imitation word). These and lexemes are linguistic units in relation to the word gender. It is no secret that the Uzbek language community recognizes and accepts all of them as words. Because in their minds, in the memory of language, all these units have "words" stored in the form of "mental seal", "acoustic image", "neurophonemic symbol". All of them, without exception, are linguistic units that have the essence of being a "common and obligatory, ready, stable combination of specific form and content" for language owners. Such an essence exists only in language, in linguistic units.

At this point, a legitimate question arises: according to the above-mentioned textbooks, the unit of lexicology is divided into lexeme-independent and non-independent lexemes, which include both independent word groups, auxiliary words and individual words, or considered as lexical-lexical morphemes. if it is a word (because it cannot and should not be), then at what level of language does the word belong to the unit? Or is it a hierarchical unit? It is impossible to find a scientifically sound answer to this question in manuals (almost in Uzbek linguistics). True, it is more common to think of it as a lexical-grammatical unit in the literal sense. But there are also interpretations that a lexical-grammatical unit does not mean that it is a morphological unit, i.e., although it is a lexical-grammatical unit, it is not considered a lexical unit.

RESULT:

Due to the fact that the status of the word is not clearly and correctly defined, such confusions are allowed in the textbooks on the substantive and semantic functional directions of synthetic linguistics. Obviously, the authors often did not pay attention to this: they used a mixture of lexemes and words, sometimes words, as we have seen above, and in the following cases: "... among lexemes there are those that cannot take an independent place in speech. Such lexemes (?) Include auxiliary words (?) (Connectors, auxiliary noun, auxiliary verb, auxiliary, loading, relative words (?), Etc .: both, and, but, but, for; with, as, sari, increasingly; tag, bottom, height, front; look, start, send, be; then, newness, nose….). forms. " "The linguistic basis for the separation of hierarchical lines encompasses the semantic factor and the (?) Paradigmatic relationship of words" (Emphasis and Introduction of the Authors. whether it was a speech unit or a linguistic unit, it was carried out and repeated in the same way. As a result, the need for proportionality and regularity, as stated by Prof. N. Mahmudov, increased from issue to issue, from unit to unit.

In the educational literature of the synthetic system-structural direction, it is observed that in the case of morphemes, along with the achievements, serious mistakes were made. In particular, in

the textbook for the teaching of philology and language teaching of the substantive direction, the morpheme was first listed as a linguistic unit, but later it was described as follows: "... Parts of the word (?) Other than the stem ... are not used separately and the meaning. does not mean. Therefore (?) They are called morphemes. For example, the word (for cotton growers) consists of the parts (?) (Cotton), (-kor), (-s), (-ga). ... They live in groups in their "rooms" in the language, so separated. " Of course, living in groups in their own "rooms" is specific to linguistic units, including lexemes. But such a meaning does not follow from the above description. Because, first, the term term was used instead of the word. Second, the use of lexeme, word, and lexical terms is confusing. Thirdly, the morphemes in question from this interpretation are read in the mind in the form of (cotton), (-kor), (-s), (-ga) - in the same sequence: the interpretation is understood, first of all, as follows. Finally, fourth, the definition does not fit the nature of the morpheme, which is a linguistic unit. This is because a morpheme is not called a morpheme because it is not used separately from the root and does not mean anything. This is not why it is called a morpheme. The essence of a morpheme is determined by a different basis, and it can easily be used separately from the word (e.g., -chi is a horse-making suffix. It is not difficult to learn this from this description itself). Furthermore, since a word is a verbal unit (as has been repeatedly emphasized in the textbook), it is self-evident that its independent part is also verbal. Hence, the definition is not actually given to the morpheme, but to its literal variant – the morph. This is because it is not a linguistic unit of speech (for cotton growers) for analysis, and as we have noted above, it is a word, not a word. It is true that researchers have made an introduction to the meaning of words and phrases. It is understandable that there would be such cases in ordinary speech, but here we are talking about the solution of a specific scientific problem related to the same word and phrase. At this point, scientific accuracy and consistency become an extremely necessary factor. A slight mistake distorts the whole description. It is also a logical confusion to knowingly mention the linguistic unity of a morpheme, to interpret it as a speech unit, and to try to reveal its essence on the basis of the verbal unit "(to cotton growers)". In this regard, it can be said that academician A.Khojiev did an excellent job of doing the same thing as the substantialists: looking at the morpheme as a linguistic unit, he described it as follows: In our view, too, the essence of a morpheme is not in its semantic unity, but in its functional-onal unity, in its function, and its function is to construct - to form a new word and form. The morpheme lives and functions in the language system as such a functional unit: it serves to create new words and forms when necessary. In the textbook of Uzbek philology based on the substantive approach, all word groups and types are interpreted as lexemes, while in the textbook "Fundamentals of Systemic Lexicology of the Uzbek language" for the same direction all the smallest linguistic units are divided into morphemes. "However, the units in question are completely different in nature, meaning and function," he said. Consequently, it would be incorrect to evaluate all of them as a kind of linguistic unit, as observed in the above lexeme, and give nothing from a scientific-theoretical and practical point of view. On the contrary, it leads to specific mistakes, excessive debates, which we are currently witnessing.

DISCUSSION:

Such problematic situations, contradictory interpretations, confusions can be observed in some semantic-functional textbooks, even in the "Theoretical grammar of the Uzbek language." For example, we read: "A part of a word without grammatical means is a lexeme. In other words, in any word change paradigm, the part that is common to the members of the paradigm is the

lexeme. " Emphasizing the linguistic (emic) unity of a lexeme of an invariant nature, it is not in line with the principle of logical conformity to call it a part of a word (actually a word-author without grammatical means). , both in the subs-tense and semantic-functional directions, the lexical or lexical morpheme is the lexical or lexical morpheme; contradictory, confusing situations are sufficient. The question arises: are these units words, lexemes or morphemes?

The status of the word is not clearly defined on a scientific basis. Rakhmatullaev-day also had a negative impact on the work of the clever scientist, rich in original, new interpretations. In this regard, it is impossible not to agree with the following statement of academician A.Khojiev: In other works, the lexeme is considered a linguistic unit and the word a speech unit. However, even in these cases, there is no clear evidence of their differences, and so on".

Such problematic, confusing interpretations and inconsistencies in the educational literature created in the synthetic system-structural direction of Uzbek linguistics are attributed to academician A.Khojiev, prof. N.Mahmudov, prof. Leading linguists, such as Yo. Tojiev, have paid attention in due time, expressed their critical views at scientific conferences, and published the main ones in scientific journals. However, unfortunately, the general public, if we are not mistaken, did not officially respond to the synthetic system-structural interpretations and the textbooks based on them, the shortcomings of the various degrees and status of the named researchers (Analyzed research, textbook, textbook) except for the authors, of course. They defended their views and interpretations, and largely rejected the shortcomings noted by A. Hojiev and other researchers.). However, both the conditions and the time were sufficient for this.

However, it should be noted that a new worldview, methodological framework, research, which took the lead and dominated from 1990 to 2010, took the initiative in the context of equal opportunities for all, regardless of such subjective, objective circumstances. Scientific, scientific-methodical researches, educational literature of representatives of synthetic system-structural linguistics, armed with the principles of Uzbek linguistics, have a worthy place in the development of Uzbek linguistics. Their hard work, courageous march and success in such a difficult period as the transition and restoration of independence, we have to acknowledge as a fact, whether we like it or not.

CONCLUSION:

In conclusion, we can say that the work done in the field of synthetic linguistics, no matter how it is developed on the basis of the laws of dialectics in accordance with the development of nature, society, thinking and consciously applied to scientific research, the principles and methods of research It is a completely different matter whether the goal set in the research has been achieved or not. This is determined by the quality of the work itself, their level, the degree of positive impact of its implementation on the effectiveness of education. The last quarter of a century of time has clearly shown that this process does not occur spontaneously, naturally, unless it is organized by an external force - a center, which requires only the majority and has only real power. In this sense, in our view, the time has already come to establish a center in Uzbek linguistics and mother tongue education, which will be tasked with forming the field of critical linguistics and critical criticism of language education. We think this is a constructive way out of the problematic situation that has arisen.Or not? What do you say?

MORPHOLOGICAL FEATURES OF CLINICAL TERMS IN ENGLISH

D. Alibekov*

*Turin Polytechnic University in Tashkent,
UZBEKISTAN
Email id: a_doniyor@mail.ru

ABSTRACT

Investigation of morphological structure of medical terms, namely clinical terminology has always been one of the most interesting and disputable problems among linguists. This article discusses specific features of different ways of clinical terminology formation in English from linguistic angle. The author of the given article tries to analyze specific peculiarities of the formation of the English clinical terminology using different sources of linguistic investigations.

KEYWORDS: *Professional Sphere, Communication, Branch, Designation, Latin, Greek, Medicine, Term, Clinical Terminology, Special Vocabulary, Language Means, Prefix, Suffix, Root, Compound*

INTRODUCTION

The study of different features of special terminology, namely clinical terminology has always been one of the most important and debatable problems of linguistic investigations. The main unit of terminology is the term. The notion term is derived from the Latin language which means "the border, a limit, the end". The word term in linguistics is usually defined as a special word or a word combination accepted in certain professional sphere and used in special conditions. The term represents a verbal designation of the concept entering into system of concepts of certain area of professional knowledge. A set of terms make up terminology of a certain field of sphere, profession, group, etc. as a set of terms terminology makes up an independent sector of any national language closely connected with professional activity like technical terminology, juridical terminology, medical terminology and so on. Terms of each branch of a science, techniques, manufacture form the systems defined, first of all, by conceptual communications of professional knowledge at aspiration to express these communications by language means. A different approach to the study of the main features of special vocabulary was suggested by an outstanding Russian scholar A. Reformatskiy who singles out the terminology as a set of terms of certain branch of knowledge or manufacture, as a system of particular vocabulary units

characterized by their applicability to an area of sciences, technology, industry, manufacturing, engineering, occupations, professions, etc.

It should be noted that modern medicine as a separate field of activity has been investigated from different viewpoints. It is mainly divided into several different successive subdivisions and terminological system of medicine consists of a number of subsystems among which the following three branches are differentiated: anatomical, pharmaceutical and clinical terminology. Anatomical terminology mainly consists of words relating parts of human body which are mostly derived from Latin where pharmaceutical terms denote the names of medications and pharmaceutical equipment. Clinical terminology consists of names of diseases, fields of medicine, pathological processes and states, methods of diagnostics, treatment, etc.

The history development of clinical terminology and its formation is closely connected with Latin and Greek languages which play an essential role in general medicine as majority of medical, particularly special clinical terms consist of root, stem, prefix and suffixes mainly borrowed from these languages. Clinical terms with Greek origin began with Hippocrates, Claudius Galenus and their predecessors, whereas the clinical terms with Latin origin began with the works of Celsus.

Morphological structure of clinical terminology is very complex. Clinical terms are usually divided into simple, complex (derived) and compound terms according to their structural formation. Simple terms can perform certain separate words such as *allergy, diabetes, gastritis* etc. Complex terms perform combination of two, three and more roots (as a rule, these are Greek roots) such as *ophthalmologia* (ophthalmology- science of eye), *encephalopathia* (encephalopathy – disease of brain), etc.   Compound terms are combination of two, three and more words such as **fracture of neck of thigh** – *fractura colli femoris*, **lacerated wound of shoulder** – *vulnus brachii laceratum*, etc

There is another classification according to which the structure of clinical terms are divided into three groups due to the number of words constituting the term such as 1) single-word terms; 2) double-word terms; and 3) multi-word terms. A single-word term is usually a noun which may be a simple non-motivated word: e.g. *pneumonia, infarctus*. However, a single-word term may consist of motivated elements of Greek (rarely Latin) origin: e.g. *nephritis* (**nephr**- a kidney, **itis** – inflammation), *haemostasis* (**haemo** – blood, **stasis**- stoppage). A double-word term may be expressed by the combination of the noun and the adjective which is based on agreement, or noun + noun form: e.g. *osteoarthrosis chronica* (N+Adj); *ulcus gastris* (N+N). Multi-word terms are formed by means of more than two word-terms and originated from both Greek and Latin languages which are inseparable from each other in this case: e.g. *infarctus myocardii transmuralis*.

According to their structure clinical terms can be prefixal, suffixal, prefixal-suffixal and compound. The prefixal clinical term is formed as follows: prefix + root, e.g. pertussis (per – increasing, tussis – cough); dystonia (dys – disorder and tonia – pressure). Prefixes in the formation of clinical terminology can be Latin and Greek prefixes. Latin prefixes are usually added to a Latin root, and Greek prefixes are added to a Greek root. Let us take, for example, the following two terms *hypoglossis* and *sublinguals* which means sublingual in English. *Hypoglossis* has Greek prefix and root, whereas *sublingualis* consists of the Latin prefix and root. However, there are certain cases where Latin prefix is added to the Greek root or vice versa,

for instance the term *retropharyngeus* consists of the Latin prefix and the Greek root, the term *endarteritis* which consists of the Greek prefix *end-* and the Latin root *arteritis*.

Suffixal clinical term has the following structure: root + suffix, e.g. *gastritis* (*gastr* – stomach, *itis-* inflammation), *dermatitis* (inflammation of skin). Structural analysis of clinical terms shows that suffixation in this case is divided into two large groups according to the part of speech the suffix belongs to – a) noun suffixes and b) adjective suffixes. Most widely used noun suffixes are: *-itis, - idis* (inflammation) - *metritis*; *-osis, -is* (chronic disease with non-inflammatory nature) - *neurosis; -oma, -atis* (tumor) - *osteoma*; *-ismus, -im* (disease with non-inflammatory nature or poisoning) *gigantismus, mycetimus*; *-iasis, -is* (non-inflammatory disease) - *nephrolithiasis*. The following adjective suffixes are frequently found in clinical terminology: -*alis, -aris* (pertaining to) *throcalis, capillaris*; *-bilis* (passive possibility of action) – *operabilis*; -*icus, -a, -um* (pertaining to) – *chronicus*; *-osus, -a, -um*, (multitude, similarity) *venosus*; *-ideus, -a, -um* (resembling) *thyreoideus*; *-genus, -a,-um* (producing, having the origin from) *cancerogenes, odontogenes*.

The name prefixal-suffixal means that this kind of clinical terms has the following structure: prefix+root+suffix. There are a number of terms which follow this pattern. Let us take, for instance, the clinical term *intoxication* which consists of the prefix *in-* which means inside, the root *toxicat* which means a poison and the suffix *–io* that means a process or procedure (in+toxicat+io). Another example for the formation of the clinical term according to this pattern can be the term *paranephritis* which consists of *para + nephr + itis* structure (*para* – about, *nephr-* a kidney, *itis-* inflammation).

Compound clinical terms are words consisting of several roots or stems. Here the Greek roots are much more common than the Latin ones. One of the ways of the formation of compound terms has the following form: root + root which is mainly called pure combining. The term *haemophilia* which consists of *haemo* (blood) and *philia* (addiction) can be best example here. Another type of compounding may be root + root + suffix, e.g. *osteoarthriris* (*osteo* (a bone) + *arthr* (a joint) + *itis* (inflammation)). Another pattern of compounding is root + o + root (or final combining form). Here, the linking vowel –o is put in the case where the following root begins with a consonant letter, e.g. *cardi*o*logia* (cardiology), *hydr*o*therapia* (hydrotherapy). Besides that, root + o + root + suffix can also be found in clinical terminology, e.g. *thyreotoxicosis* (thyre – thyroid, linking –o, toxic – poison, osis- non-inflammatory disease). While analyzing structural peculiarities of compound clinical terms it was observed in complex compounding certain types of shortening are also found. One of them is haplology or the elision of a root in compound clinical term. Let us analyze the following term – *leucopenia*, for instance. The full form of this term is *leucocytopenia* (*leuco* – white, *cyto* – a cell, *penia* – deficiency)

Thus, summarizing all above mentioned it is possible to draw a conclusion that the formation of clinical terminology and the study of the specific peculiarities of the English clinical terminology from morphological viewpoint is one of the most actual problems of modern linguistic investigations.

ABSTRACT

The article deals with specific prophylaxis of Viral Hepatitis A. World Health Organization data on the origin, transmission and prevalence of the disease in children, as well as the results of scientific research conducted by several scientists are covered. The article examines the effectiveness of vaccination practices as a measure to prevent the spread of Viral Hepatitis A among the population of Surkhandarya region, as well as the incidence of the disease among vaccinated people. Thus, the role of vaccination in the prevention of Hepatitis A has been shown. Vaccination against Viral Hepatitis A has been proven to have a reliable and long-term protective effect.

KEYWORDS: *Hepatitis A Virus, Vaccines, Prophylaxis, Vaccination, Inactivation, Antibodies.*

INTRODUCTION

The World Health Organization gives the figures that, approximately 7,134 people died of hepatitis A in 2016 (0.5 percent of all cases). According to the State Statistics Committee of the

Republic of Uzbekistan, in 2016 the number of patients with Hepatitis A was 118 per 100 thousand people.

According to the World Health Organization, about 1.5 million people are infected with *Viral Hepatitis A* (VHA) each year, but the true incidence of this infection could be ten times higher. In Uzbekistan, hepatitis A still dominates in terms of the etiological structure of acute Viral Hepatitis. The number of patients with VHA in Uzbekistan in 2013-2018 amounted to 206,126 people. Patients with VHA accounted for the majority among the rural population. During the specified period, 206,126 people were registered with VHA, of which 133,827 were rural residents, which is 65 percent.

Once the hepatitis A virus enters the body, it enters the circulatory system through the epithelial cells of the oral cavity or intestine [1]. Blood carries the virus to the liver, where virus particles multiply in hepatocytes and Kupfer cells (liver macrophages). The virionsare excreted in the bile and excreted in the feces into the external environment. Approximately 11 days before the onset of symptoms or IgM of viral particles, there is a significant release of Hepatitis A virus in the blood. The incubation period lasts from 15 to 50 days, with a mortality rate of less than 0.5 percent.

Hepatocytes emerge from the genome RNA protein layer and transform into the ribosomes of the cell. The RNA virus requires a 4G (eIF4G) factor to change using eukaryotic factor to initiate the change [2].

In May 2016, the World Health Organization for the first time adopted the "Global Strategy for Viral Hepatitis in Health Care for 2016-2021". This strategy includes the concept of eradicating viral hepatitis as a health problem, which is reflected in the global goal of reducing new cases of viral hepatitis by 90% and mortality from viral hepatitis by 65% by 2030 [3].

If in the previous century Hepatitis A was a childhood disease, which was considered a mild disease, nowadays there are severe cases of hepatitis A disease, long-lasting fulminate forms. As a result, the development of acute liver failure and fatalities have been reported in several medical centers [4]. According to several authors, the fulminant form of VHA was 1–6% [5].

The purpose of the study: to study the incidence of Viral Hepatitis A in Surkhandarya region based on the results of epidemiological analysis. Hepatitis A vaccination measures should be studied on the basis of documents and used to determine the incidence of Hepatitis A among the population at different times. To do this, analyze the incidence of morbidity among children of different ages, organized and unorganized. The aim was to assess the effectiveness of the Hepatitis A vaccine work by identifying morbidity among vaccinated individuals.

Materials and inspection methods

According to the analysis of the Surkhandarya Regional Center for Sanitary Epidemiology in 2016-2018, the incidence of Viral Hepatitis among the population of Surkhandarya region has increased in the last 3 years.

In particular, in 2017-2018, a total of 3,661 children were diagnosed with viral hepatitis A, in 2017, 2,027 children were infected with Viral Hepatitis A, a decrease of 2.1% compared to the same period in 2016, 21.8 in Kumkurgan district. per cent, in Termez district by 3.1 per cent, and in Angor district by 2.3 per cent (jad.1).

TABLE 1 AMONG THE POPULATION OF SURKHANDARYA REGION HEPATITIS A VIRUS DISEASE RECORD STATUS

Years	Number of patients
2016	1984
2017	2027
2018	1634
2019	2783

Prophylactic vaccination against Viral Hepatitis A has been organized in the province since 2014, and in 2017, only 441 children under the age of 7 were vaccinated voluntarily in the province, which is 1.0% of the total number of children under 7 years of age.

Today, although prophylactic vaccination against Viral Hepatitis A is mainly required from 16 months of age, we can see that coverage with prophylactic vaccination in the province is carried out among children aged 2-3 years. In particular, in 2018, 12,211 children in the region were covered by prophylactic vaccination, which is 2.7% of the total number of children under 7 years of age. A reduction in morbidity can only be achieved if at least 50.0 per cent of children under 7 years of age are covered by prophylactic vaccination. Of the 12,211 children covered by prophylactic vaccination, 5 (0.04%) were diagnosed with Hepatitis A, who also communicated with the patient and received prophylactic vaccination during the latent period of the disease (Table 3).

TABLE 3 INFORMATION ON THE INCIDENCE OF HEPATITIS A VIRUS AMONG CHILDREN VACCINATED IN 2018-2019 IN SURKHANDARYA REGION

Years	Vaccinated children		
	Number of Vaccinated children	Number of recorded cases	%
2018	12211	5	0,04
2019	26618	9	0,03

In 2019, 26,618 children under the age of 7 were covered by prophylactic vaccination against hepatitis A, of which 9 (0.03%) were diagnosed with hepatitis A. In Denau district of the region in 2019, as a result of prophylactic vaccination of 5286 children under 7 years of age, the incidence in the district decreased by 33.3%.

The fact that 75.0 per cent of hepatitis A cases registered in the province over the past 3 years were reported in the unorganized community and the remaining 25.0 per cent in the organized community is a result of the coverage of children attending kindergarten and school with Hepatitis A prophylactic vaccination.

CONCLUSION

The most important method of prevention is through deep immunization of the vaccine, that is, the delivery of an anti-infective agent to the body. The vaccine consists of inactivated live Hepatitis A virus, which stimulates the production of antibodies in the body's immune system, as well as the formation of immunity against the disease, increasing the body's resistance to the disease. In this regard, vaccination against the disease reduces the risk of its spread and, in severe cases, death.

A pre-made vaccine can save several times the time and money spent on its treatment, reducing the costs of businesses and organizations. Vaccination is required until the disease season, as immunity against the disease is formed within 4 weeks.

Based on the results of the analysis of enameling work carried out in recent years, the following conclusion can be drawn. Vaccination against VHA has a reliable and long-term protective effect. In order to reach as many people (children) as possible with the vaccine, it is necessary to strengthen public awareness of the importance of this work in the prevention of hepatitis A. In the future, it is important to include this vaccine in the list of planned vaccinations.

IBRAHIM HAQQULAS A SCIENTIST OF NAVOI STUDIES

Mukhtorova Mahfuza Shavkatjon qizi*

*2nd Year Master,
Department Literary Studies Uzbek Literature,
Termez State University, UZBEKISTAN

ABSTRACT

This article analyzes the exhaustive work of Ibrahim Haqqul, a diligent scientist who has dedicated his life to art, and his work on the life and work of Alisher Navoi. A person who is cut off from life, who does not look at reality very broadly, greatly underestimates the value of Navoi's works. Doctor of Philology, Professor Abdusayum Abdukodirov from Tajikistan says: "Ibrahim aka did a lot in the last three decades of independence.

KEYWORDS: *Uzbek Literature, Navoi Studies, Classical Literature, Poetry, Literary Heritage.*

INTRODUCTION

The study of Uzbek classical literature, in particular the works of Navoi, began in the 20-30s of the XX century. The Soviet government gave scholars the opportunity to study the history of Uzbek literature, including Navoi's work, but hid the golden key to the box containing the precious specimens. The name of this key was sufism. After the discovery of this key, the study of Navoi's works, and classical Uzbek literature in general, took on a new basis and entered a new stage. One of the pioneers of this new movement, and perhaps the first, is Ibrahim Haqqul.

"Studying and promoting Navoi's work is, first of all, a skill of heart and love, talent and observation. A person who is cut off from life, who does not look at reality very broadly, greatly underestimates the value of Navoi's works. When reading Navoi, it is necessary to take into account that every word, every image, every verse expresses the excitement of understanding, the pleasure of sophistication, which is not available to everyone. So that the language of poetry is the language of thought, the language of beautiful spirituality. It is necessary to constantly learn the culture of meaning, logic, observation from Navoi. The prominent Turkologist Lev Gumilyov wrote in an article that the fate of a scientist is incompatible with that of a "scientist": "A scientist reads a lot, and then expresses the opinion of others in his own way." The vascular record shows how large the scale of success is.

In particular, it should be noted that "Khamsa", the culmination of the great poet's work, laid the foundation for the rise of Navoi studies to a truly new level, having published fifteen volumes of works of the great thinker before independence. After gaining national independence, it was possible to read twenty volumes of the poet's legacy. "Nasayim ul-muhabbat", "History of the Prophet and the Ruler", "Siroj ul-Muslimin", which could not be published in full during the Soviet era. Although the work has not yet been fully scientifically resolved and has many controversial aspects, the issue of mystical interpretation has been on the agenda of the poet's work. This shows that Navoi studies is constantly evolving,"said Ibrahim Haqqul in one of his interviews.

Ibrahim Haqqul worked tirelessly on himself and began to study classical literature more thoroughly. With his scientific articles and books, he boldly entered the literary world of the Republic.

His books such as "Zanjirband sher qoshida", "Abadiyat farzandlari", "Kamol et kasbkim...""Tasavvuf- va she'riyat", "Irfon va idrok", "Tasavvuf saboqlari", "Ahmad Yassaviy"were published,with which he made a great contribution to the study of our literary heritage. They provide an in-depth analysis of our classical literature, which is part of the history and spirituality of our people. The linguistic-artistic, ideological and philosophical features of the works of our great scholars, such as Khoja Ahmad Yassavi, Suleiman Bokirgani, Jaloliddin Rumi, Lutfi, Alisher Navoi, Babur, Uvaysi, who are the leading representatives of Uzbek and Oriental literature, are deeply analyzed. In each of these articles, the author was able to penetrate deep into the work of the representatives of our classical poetry, to discover new aspects of them.

Ibrahim Haqqul is not only a researcher of classical literature, but the one who expressed important views on important issues of modern Uzbek literature of the twentieth century, as well as on the importance of famous writers, which makes him one of our scientists who has created serious articles and research. Such are his works dedicated to the works of Ayni, Fitrat, Cholpon, Oybek, Abdulla Kahhor. In particular, his works on Cholpon and Fitrat, whose works were denounced as nationalistfor many years, sought to give a fair assessment of the works of artists on the eve of independence and the period of independence on the basis of new criteria, and became the first publications, showing, in this regard, that he has the right to be among the first scientists, such as O.Sharafiddinov, B.Kasimov, A.Aliyev, E.Karimov.

Ibrahim Haqqul's scope of scientific research is extremely wide. His books and articles on contemporary literature and poetry are also noteworthy. The scholar's frequent appearances in the press on the poetry of Uzbek poets such as Abdulla Aripov, Shavkat Rahmon, Jamol Kamol, Rauf Parfi, Usmon Azim, Miraziz Azam, Khurshid Davron, and his sharp arguments onsuccesses and shortcomings in roundtable discussions are also important for today's literary process. These points have played and continues to play a positive role in the development of contemporary Uzbek poetry.

The hard-working scholar, who brought up a number of young scholars and rose to the level of a teacher, took an active part in such collective works as "History of Uzbek literature" (in Russian, two volumes), Alisher Navoi's twenty-volume collection of works. The fact that he is one of the main authors and supervisors of the newly created volume "History of Uzbek Literature" is the result of such mobility and speed.

Doctor of Philology, Professor Abdusayum Abdukodirov from Tajikistan says: "Ibrahim aka did a lot in the last three decades of independence. The work "Shohbaytlar", which consists of two books commenting on the shahbayts of Navoi, "Navoiyga qaytish", as well as "E'tiqod va ijod", "Tavdir va tafakkur", "Meros va mohiyat" "Irfon va idrok", "Tasavvuf saboqlari", "Axmad Yassaviy", "Kim nimaga tayanadi?", "Ishq va hayrat olami" co-authored with Ergash Ochilov and dozens of other books and hundreds of articles.

One is amazed and envious that the collection of works written and published by Ibrahim Haqqul alone reveals a scientific treasure that is difficult for even five or ten scholars to accomplish. More importantly, he deserves credit for the fact that a large part of this huge scientific treasury is devoted to Navoi studies. I think that without Ibrahim Haqqul's works on the life and work of Alisher Navoi, modern Uzbek Navoi studies would be flawed."

To conclude, Ibrahim Haqqul, a hard-working scholar who is well known to the public as an intelligent researcher of classical literature and has dedicated his life to the study of Alisher Navoi's life and work, is worth expressing our deep gratitude to the teacher for his scientific work.

ABSTRACT

This article deals with the important role of the famous writer Nosir Fozilov in Uzbek-Kazakh literary relations, mainly in the field of translation. distant and could not read each other's literature. This disrupted our ongoing literary intervention. As a result, there is a need for translators." The Uzbek and Kazakh peoples have always lived side by side and always supported each other by looking closely at each other with a special love. That is why these aspects are clearly reflected in the works of the two peoples.

KEYWORDS: *Uzbek-Kazakh Literary Relations, Translation, Spelling, Alphabet, Tetralogy, Autobiographical Novel.*

INTRODUCTION

Analyzing our history, we can see that millennial ties closely link the Uzbek and Kazakh peoples, like all Turkic peoples. The centuries-old friendship between the two peoples, whose language, religion, customs and profession are the same, has been developing and gaining new content, especially in recent years. This is especially evident in inter-literary relations and literary friendship. The announcement of the decree of the President of the Republic of Uzbekistan on March 13, 2018 "On the study and promotion of the creative heritage of the Kazakh writer Abay Kononbaev" marks the beginning of a new era between the two nations in this regard.

Well-known literary scholar OzodSharfiddinov described the process of cooperation between Uzbek and Kazakh writers as follows: "MukhtorAvezov wrote a lot about the novels created by Uzbek writer Abdulla Kadiri in the early twentieth century that they were also a literary school

for Kazakh writers.... Epics in Kazakh literature, tendency to folklore. Such qualities have made a worthy contribution to the enrichment of Uzbek literature with brighter colors, formed mainly in the spirit of classical literary traditions. Representatives of the two folk literatures can be compared to twins, because MukhtorAvezov and Oybek, GafurGulom and SobitMukanov, Abdulla Tadjibayev and Mirtemir, Abdulla Aripov and UljasSuleymanov wrote in the literary field side by side ....” This description above testifies to how common the literature of the two peoples is.

As it is known, the role of literary connections and creative influence in the development of any national literature is great. This is even more striking when we look at the literary ceremony of fraternal peoples who drank water from a spring during the millennial history. In particular, the writer with deep respect recognizes the importance of Navoi’s work in the emergence of a great epic genre in the works of the famous Kazakh writer Abay.

The decree of the President of Uzbekistan on March 13, 2018 to study and promote the creative heritage of the Kazakh writer Abay Kononbaev was of great importance in the rise of Uzbek-Kazakh literary relations to a new level.

It is well known that the role of translations in the development of literary relations is invaluable. Translations from the literature of both nations also play an important role in strengthening Uzbek-Kazakh literary ties. In this regard, the merits of our writer NosirFozilov, who was awarded the honorary title of "Golden Bridge of the Uzbek-Kazakh people", are invaluable.

The writer, who wasborn in Kazakhstan and raised in Uzbekistantranslated the autobiographical novel “Hayot maktabi” by the famous young Kazakh writer SabitMukanov. In 1956, he translated GabidinMustafin's novel “Qarag‘anda” into Uzbek and published it. Until the thirties of the twentieth century, all Turkic peoples used the Arabic alphabet, so there was little need for translators to understand each other. As a result, even the closest linguistic peoples began to feel the need for translation in understanding their literary heritage. According to NosirFozilov: "After these 'reforms', the Turkic peoples became spiritually distant and could not read each other's literature. This disrupted our ongoing literary intervention. As a result, there is a need for translators.”

In 1958, NosirFozilov's translation of KalmakhanAbdukodirov's short story "Hadjimukan"was published. Hadjimukan, a Kazakh wrestler, was famous not only for his legendary fame, but also for the Uzbek people, so this story was published six times in our country. As a skilled translator, NosirFozilov worked hard to translate SabitMukanov's story “Cho‘loq polvon”, the novel "Cho‘pon bolasi", GabitMusrepov's"Qozoq soldati" and selected works by Abay Kunanbaev into Uzbek.

Nosir Fozilov and Mirtemir also actively collaborated on the translation of Mukhtar Avezov's tetralogy “Abay yo‘li” in Uzbek. "I want to call Nasir a writer who sings the anthem of brotherhood, -Said Ahmad wrote. - Because it is like a bridge between brotherly writers and Uzbek writers. Nasir introduced us to SabitMukanov, GabitMusrepov, GabidinMustafin. We read the novels “Hayot maktabi”, "Qozoq soldati", “Qarag‘anda” in Nasir's translation. He skillfully translated the Karakalpak writer A.Begimov's novel "Baliqchining qizi" and A. Shomurodov's"Yo‘lbarslar orasida". With the above confession, Said Ahmad once again emphasizes Nasir Fozilov as a skilled translator.

In general, NosirFozilov has a sense of brotherhood, which is characteristic of the two peoples, and the main theme of his artistic work is inextricably linked with the common aspirations and lifestyles of these peoples.

Due to his knowledge of the way of life, customs and language of the Kazakh people, the writer is able to reveal the layers of meaning in his translations, while accurately preserving the national color in the works. The Uzbek and Kazakh peoples have always lived side by side and always supported each other by looking closely at each other with a special love. That is why these aspects are clearly reflected in the works of the two peoples. No matter what folklore Nosir Fozilov translates from, the unique language, image and customs of this people are clearly visible, which adds to the quality of the translated book.

In his lifelong creative work, NosirFozilov wrote "Nurli Tosh" by ShakhmetHusainov (1952), "Abay-xalq farzandi" by MukhtorAvezov (1978), "HazratiAyol" by AltynsochJaganova(1987), and "Biz farishtamizmi?"by QaltayMuhammadjanov. (1987), SherkhonMurtaza's"Letter to Stalin" (1988), H.Naimanbaev's"Chaqirilmagan mehmon" (1980), Takhavi Atakhanov's "Ichkuyov" comedy (1987), Sobit Dosanov's "Yovshanisi" He made a great contribution to the spiritual enrichment of the treasury of Uzbek literature. Prominent writer and talented translator NosirFozilov was awarded the Presidential Prize "Tinchlik va ma'naviy hamjihatligi uchun" and the *BayimbetMaylin Prize* of the Writers' Union of Kazakhstan and the International *Alash Prize*. During his lifetime, Nosir Fozilov translated more than forty works into Uzbek, and such translations played an important role in the sharpening of the writer's pen and the restoration of creative perfection. He serves as a literary bridge between the two peoples with his translated works. It is a bridge from heart to heart, from heart to heart. The strong literary friendship created by our beloved writer has not lost its significance today, on the contrary, it has become stronger and has risen to a new level and serves as an important factor in our literary relations today.

THE ROLE AND ROLE OF STATE AND PUBLIC ORGANIZATIONS IN THE SPIRITUAL, SPIRITUAL AND MILITARY-PATRIOTIC EDUCATION OF THE REPUBLIC OF UZBEKISTAN: EXPERIENCE AND PROBLEMS

Rozimova Yorqinoy Yuldashevna*

*Teacher,
Candidate of Historical Sciences captain,
The Department of Humanities of the Academy of the Armed Forces,
Republic of UZBEKISTAN

ABSTRACT

This article focuses on the role and importance of state and public organizations in the organization of educational work with servicemen, cadets of military schools and military lyceums serving in the national army, the formation of army and people's unity in the field of defense.

KEYWORDS: *Border, Spiritual, Patriotic, Community, Peace, Defense, Morality, Cooperation, Combat, National, Professional Army, Region, Selfless, Powerful State.*

INTRODUCTION

The establishment of the unity of the army and the people is of special importance in ensuring the inviolability of the borders of Uzbekistan, the peaceful life of its citizens, and the enhancement of its defense capabilities. We can cite many examples of this from a long history, as well as from the years of World War II. Therefore, the organization of defense, preparation of young people for military service, moral, spiritual and spiritual training of servicemen and their families, military-patriotic education and the participation of state and public organizations in social protection have always been relevant[1].

Given the national statehood of the Republic of Uzbekistan, the military-political situation in Central Asia and around the world, the attack of black forces threatening the independence and constitutional order of the country, attempts to inculcate ideas alien to the national interest in the minds of young people. put forward. Particular attention was paid to the involvement of state and public organizations in the organization of educational work with servicemen, cadets of military

schools and students of military lyceums, who are armed defenders of independence, serving in the national army.

Historically, during the years of independence, we have seen that the establishment of the unity of the army and the people in the field of defense has gone through five stages from 1992 to the present day.

The first stage:

In order to establish cooperation between state and public organizations, local governments and military units and institutions, the Cabinet of Ministers of the Republic of Uzbekistan on September 23, 1992 "On measures to strengthen military discipline and improve educational work in the Armed Forces, Border and Internal Troops of the Republic of Uzbekistan" It began with the adoption of Resolution No.

Based on the decision, the Institute of Deputy Commanders (Chiefs) for Personnel was established. The Ministry of Defense, the Ministry of Internal Affairs and the National Security Service have started training in the field of personnel training in military educational institutions.

Educational work is aimed at the formation of personal commitment to the Republic of Uzbekistan, its people, military oath, duty, deep respect for the history and traditions of their homeland, the formation of high combat and moral qualities, honesty and good conscience in the performance of service and combat missions[1]. A long-term program of training young people for military service and training of national officers has been developed, military science rooms, gyms and other necessary facilities have been set up in all secondary schools, vocational schools and other secondary special educational institutions for practical training in primary military training. organization and coverage of all young people with military education and quality training on the basis of the current curriculum.

The Ministry of Higher and Secondary Education of the Republic of Uzbekistan, the Union of Writers, Composers, Artists of Uzbekistan and the Vatanparvar organization assisting in the defense of Uzbekistan were involved in the organization of spiritual-enlightenment, moral-spiritual and military-patriotic work in military units and institutions. Hokimiyats, organizations, and members of the public have been involved in the adoption of military units and institutions. In order to establish cooperation with state and public organizations, a department for work with state and public organizations was established in the Personnel Department of the Ministry of Defense of the Republic of Uzbekistan (now the Main Department of Educational Affairs).

To coordinate the activities of state and public organizations, a working group headed by the Deputy Prime Minister - Chairman of the Women's Committee of the Republic of Uzbekistan was established to study military discipline and social protection of servicemen in military units and institutions[2]. The work with the Ministry of Defense and state and public organizations was organized on the basis of annual bilateral and multilateral cooperation plans.

The second stage:

In order to carry out effective cooperation with the Armed Forces and civilian institutions, democratize the life of the army and establish civilian control over it, a Presidential Decree of

September 29, 2000 established the Department for Work with State and Public Organizations in the Ministry of Defense. The department serves as a bridge to establish a system of relations between the army and the people, to further expand cooperation, to increase efficiency.

Over the years, in cooperation with the youth social movement "Kamolot" of Uzbekistan, the military-sports games "Shunkorlar" were established among secondary schools, lyceums and colleges. The emblem, flag, march and trophy of the Shunkorlar military-sports games have been introduced. By 2015, the games, which played a special role in attracting young people to mass sports, preparing them for military service and educating them in the spirit of military patriotism, reached more than 200,000 students[2].

At the initiative of the Ministry of Defense of the Republic of Uzbekistan and with the support of the organization "Vatanparvar", which assists in the defense of Uzbekistan, since 2002 from December 14 to January 14 in the country was held a month of mass patriotism, and today it has become a tradition. Within the framework of the month, the Council of Elders of Uzbekistan and the Mahalla Charitable Foundation in cooperation with the Republican Board of Directors have organized "Lessons of Courage" in educational institutions on January 14. At the initiative of the Mahalla Foundation, a scholarship named after Amir Temur was established for the most disciplined cadets studying in military educational institutions, achieving high results in education and service, actively participating in public affairs. Kamolot Scholarships have been established by the Kamolot Youth Social Movement, which supports the Foundation's initiative. The ceremonies of awarding scholarships in educational institutions are organized by the youth social movement "Kamolot"[3].

The third stage:

The process of democratization of society and the building of an open civil society in Uzbekistan, which began on a large scale in 2010, has not bypassed the Armed Forces. The announcement of the Resolution of the President of the Republic of Uzbekistan dated October 24, 2012 "On the establishment of the Public Council under the Ministry of Defense of the Republic of Uzbekistan" has raised organizational work in this area to a new level.

The resolution calls for the formation of an effective civilian control mechanism over the Armed Forces, ensuring the openness and transparency of the Ministry of Defense, as well as the involvement of citizens and public associations in the implementation and development of state policy in defense and military construction. Priorities such as the formation of a system of spiritual and moral and military-patriotic education were identified as the main tasks of the Public Council.

The Public Council has been given great authority to operate actively and comprehensively. These include formal cooperation with government agencies and other types of organizations, the involvement of specialists as needed, conferences, youth forums, seminars, roundtables and other spiritual and educational events.

The Council consists of 28 members, including members of the Senate and the Legislative Chamber of the Oliy Majlis of the Republic of Uzbekistan, representatives of state and public organizations, and scientists. Based on the goals and objectives of the Charter of the Public Council, the following commissions were established in five areas.

- "Commission for the analysis of public opinion on topical issues of state policy in the field of defense and military construction, the organization of systematic monitoring and preparation of proposals and recommendations for further improvement of the Ministry of Defense in the field of conscripts and military service";

- "Commission for public examination of specific legal and regulatory acts in the field of defense and military construction";

- "Commission for the implementation of measures for social and legal protection of servicemen, servicemen of the Armed Forces and citizens discharged from military service, their families";

- "Commission for the organization of spiritual, educational, military and sports events";

- "Commission on cooperation with the media, the promotion of the Armed Forces and the organization of information propaganda."

A number of events organized by the Public Council in military districts, garrisons, associations and military units have played a significant role in enriching the spiritual outlook of servicemen and their families.

The fourth stage:

In his congratulatory message to the Defenders of the Motherland on the occasion of the 25th anniversary of the establishment of the Armed Forces of the Republic of Uzbekistan, President of the Republic of Uzbekistan, Commander-in-Chief Sh.M.Mirziyoev summed up the work done by the Public Council over the past years. In his congratulatory message, he said, "The Public Council under the Ministry of Defense is making great strides in educating young people in the spirit of patriotism. With this in mind, it is necessary to expand the capacity of this council by establishing regional branches within the regional administrations. It is advisable to organize the work of these units in close cooperation with the military district command.[5] Pursuant to the task set in the congratulation, the adoption of the Resolution of the President of the Republic of Uzbekistan on August 23, 2017 "On additional measures to further improve the activities of the Public Council under the Ministry of Defense of the Republic of Uzbekistan" further strengthened the legal framework.

The fifth stage:

On December 12, 2017, the President of the Republic of Uzbekistan signed a decree "On measures to increase the efficiency of the Ministry of Defense and local authorities, educating young people in the spirit of military patriotism and strengthening their responsibility to strengthen the country's defense capacity." The decree played a special role in ensuring the security of the country, strengthening peace and harmony in society, increasing the combat capability and readiness of the national army, and effectively achieving the unity of the army and the people. According to him, military-administrative sectors have been established on the basis of the principle of "National Army - our pride and honor" based on the effective cooperation of local authorities and commanders of military districts.

The main aspects of the military-administrative sector focused on military-patriotic, spiritual and moral education, military-administrative issues, as well as issues of social protection of young conscripts, veterans of the Armed Forces, servicemen and their families. The military-

administrative sectors have provided an opportunity to reorganize the work of military councils that have hitherto operated in military districts[4].

It should be noted that the work of the Armed Forces in cooperation with state and public organizations focused on military-patriotic issues of servicemen and their families, pre-conscription youth, with positive results in coordinating the activities of all levels of state and public organizations[5]. The next task in the field is to focus on solving social problems that arise with family members of servicemen. These issues include: employment of military spouses, vocational training when needed, assistance in placing children in preschools, secondary schools, assistance in concluding a legal lease agreement with the landlord when renting a house until the state provides housing.

Timely and prompt resolution of any social problems prevents the deterioration of the mental state of the serviceman, limits the occurrence of various problems in the performance of military duties.

ARCHAIC BIBLIOGRAPHIC TERMS IN ENGLISH AND UZBEK LANGUAGES

Farkhod Samatov*

*Master,
Termez State University,
Termez, UZBEKISTAN

ABSTRACT

This article deals with the etymology and translation of archaic bibliographic terms related to bibliography in the Uzbek and English languages. Some archaic words in two languages are considered in this article.

KEYWORDS: *Term, Bibliographic, Archaic, Badiz, Calligrapher, Inkpot*

▪ INTRODUCTION

Bibliography, as a discipline, is traditionally the academic study of books as physical, cultural objects; in this sense, it is also known as bibliology [1].Merriam-Webster Dictionary [2] tells us that "term" a word or expression that has a precise meaning in some uses or is peculiar to a science, art, profession, or subject. Learning, researching and practicing bibliographic terms is not only very vital process, but also they help us to find out the culture, history of English speaking countries, thus you are able to investigate the etymology of bibliographic words in your native language through mutual comparison.

▪ RELATED WORKS

There are dozens of definitions reflecting the various forms and emphases. Two major divisions are the study of books as physical objects (analytical bibliography)and the study of books as ideas (enumerative or systematic bibliography). Today these two divisions are concerned with other vehicles of ideas as well as books, Microfilms, motion pictures, tape recordings, phonograph records and other objects can be studied bibliographically [3].There are many archaic bibliographic terms both English and Uzbek language. These terms are not used because of having the characteristics of the language of the past and surviving chiefly in specialized uses. It is hoped that this article will assist to both bibliographers and researchers in a practical way.

(Uzbek) badiz and badizchi [4] –bituvchi, these words are related to carving and decorating in the past. Actually, badizchi deals with writing on stone the speech of khakan (=king).

(Uzbek) musannif –muallif, the author of the book. (Uz) AlisherNavoiyushbug'azalningmusannifiedi. (English) AlisherNavai was the author of this ghazal.

(English) Author is not an English word. It comes from the Latin word auctorem, meaning "founder, master, leader".

The copyright of any original writing belongs initially and properly to its author.

(Uzbek) munshiy –yaratuvchi, yozuvchi, tuzuvchi–a creator, writer. This archaic term was used during the khanate in Central Asia. These people worked as a secretary at the palace of khan.

(English) A secretary, the term is derived from the Latin word secernere, "to distinguish" or "to set apart". A secretarius was a person, therefore, overseeing business confidentially, usually for a powerful individual (a king, pope, etc)

(Uzbek) dovot –siyohdon–an inkpot-a container for ink. It was made of iron or china in Central Asia. Madyormingboshiningmahkamasi: xontaxtaustidaqalamdonlidovot, daftar, qog'ozlar bor.

The legal office of Madyormingboshi(P.S. a hakim of village): there are some papers, notebook, an inkpot (dovot) with pencil-case on the low table.

(Uzbek) xattot –chiroylivaaniqyozadiganodam –a calligrapher –a professional copyist or engrosser.

AlisherNavoiyasarlarimashxurxattotlar tomonidan ko'chirilgan. The plays of AlisherNavai were calligraphed by well-known calligraphers.

(English) calligrapher, this word is borrowed from French calligraphie, from Ancient Greek to the English language(kalligraphia, literally "pretty writing"), from kàllos, "beauty") + gràphō, "to draw".

▪ CONCLUSION

In some historical information and literary books, we may encounter these archaic terms. All in all, despite the fact that the article contains a few obsolete words. It is not so difficult to read. This is due to the fact that many words have historically similar roots, so we should freely translate and research the archaic terms about bibliography in the Uzbek and English language.

CONCEPTUALITY OF OXYMORON IN LITERARY TEXTS

Mustafayeva Sojida Ulashevna*; Panjieva Nasiba Narmaxmatovna

*Termez State University,
UZBEKISTAN

**PhD,
UZBEKISTAN

ABSTRACT

The article deals with conceptuality in where oxymoron as one of the stylistic devices in the literature. As the basic requirement in understanding an expression of oxymoron in which shows the productive in the language through the principles of transformational grammar. On the other hand, in learning or analyzing language, people should consider literature as a way of how language and stylistic construction are used. In this article will show how psycholinguistic investigation suggests that literal texts such as novel, poet, story are processed differently than literal speech, while relatively conventionalized and contextually salient oxymoron is processed more like literal speech. This conceptuality in the view of "cognitive linguists" like George Lakoff that all or nearly all thought is essentially oxymoronically. There are currently a few main conceptuality of oxymoron: juxtaposition, category-transfer, feature-matching, and structural alignment. Structural alignment deals best with the widest range of examples; but it still fails to account for the complexity and richness of fairly novel, poetic oxymoron.

KEYWORDS: *Formation Of Oxymoron In Literary Texts, An Interpretation Of Conceptuality, The Cognitive Approach Of Oxymoron, Analyzing Process Under Psycho-Cognitive Principles.*

INTRODUCTION

Conceptuality of oxymoron in literary texts Nearly not any statements have been made on how the oxymoron is reacted to the readers either reading any sentences belonged to oxymoron or communicating. Actually, there are many dictionaries and handbooks only point out the contradictory or incongruous combination of this poetic use of words; however they do not indicate how the constituents combine the concrete meaning of it, in other words cannot identify the clear of concept in the context. Naturally, there will be a question why it has not been made

any exact interpretation of this two contradicting word – combination yet, still continuing the main object to discover a suitable frame for it in contextual texts. But I have tried to provide some information on oxymoron in variety process how to identify its basic meaning is interpreted to the readers. Firstly, should we identify the oxymoron with lexical stylistic device, how they connected to each other ? Secondly, what is the aim of " concept" term connecting with this part ?

Lexical stylistic – devices have specific meaning in contextual texts which illustrate a certain type of communication in speech. One of them is an oxymoron including its semantics and cognition qualities are used as a main role in the literary texts which abounding with odd peculiarities in sentences. It is known that the term – oxymoron is one of the style devices that involves in stylistics as being a branch of linguistics that plays the various functional styles of speech. *Oxymoron* is one type of absurdity which entails irreconcilable elements of meaning or reference (Leech, 1968, :138). Oxymoron is literary figures of speech usually composed of a pair of neighboring contradictory words (often with a sentence). So each reader should be careful of getting acquaintance of different styles, basically about using oxymoron in the literature and provide them with necessary materials to illustrate information. First, there have been a little awareness of stylistic devices, their functions, expressive means in the stylistics as well stylistic devices which are distinguished into many parts according to its aspects. Stylistic devices calling figures of speech make use of a figurative meaning of the language elements and thus form a vivid image. It is clear that the oxymoron word in literary contexts may acquire additional lexical meanings not fixed in dictionaries, what we have named contextual meanings. To depict it as contradicting agreement between two word of speech and they intensify the meaning in context. Like these agreements in sentences mainly depend on various functional features which is attracted the society to understand deeply what is going in contextual in a group of words. Approaching by an oxymoron device is used in literary textbooks to exaggerate the sense of contents and this process may be unusual situation for the first reader. Taking into all meaningful states, it can create some experiencing conscious for them. Adding to it, oxymoron is separated differently from others under treating extraordinary way as well as it functions by linguistic studies certain categories. Following trails through studying oxymoron reveals some interesting clipped examples its precise techniques in this research paper and can be used as manual note for each reader.

Now we look widely about the " concept " term with oxymoron that is abstract ideas or general notions that occur in the mind, in speech and in thought. Being fundamental building blocks of thoughts and beliefs which play an important role in all aspects of cognition. So, it is clear that concept and oxymoron both connected in an interpretation in this article under linguistics, psychology, philosophy and is also interested in the logical and psychological structure of concepts, and how they are put together to form of thoughts and sentences. It is served as basic tendency on using interdisciplinary approach called cognitive science. Broadening this conceptuality on the combination of two contradictory/opposites in a single sentence, the conceptuality of oxymoron is an entire phrase/ contradictory meaningful word combination but, upon further investigation, could be true or plausible interpretation in the literary context. Another approach of conceptuality of oxymoron to develop its linguistic and cognation process in literary texts withlexical – semantic, lexicon, grammar, phonology. The object of lexical – cognitive characters of anoxymoron device invokes versatile expressive points with various odd

concepts in connecting word sentences in literary contexts which emphasis effect and peculiarities in fiction plays swell as increase the phenomenal character, events and acts. Due to it, it is formed unordinary blooming character involving new information. However, what are principles to be basis its new born sentence structures? Can people catch easily its contradicting polysemous process in using literary texts?

The origin the word of oxymoron (Greek oxys + moros-"pointedly foolish") is a stylistic device the syntactic and semantic structures of which come to clashes. It involves a combination of two contrasting ideas within the same syntactical whole, thus referring some feature to an object incompatible with it. As a rule, one of the two members of oxymoron illuminates the feature which is universally observed and acknowledged while the other one offers a purely subjective individual perception of the object. Kukharenko names three structural patterns that are possible to build lexical word combination through stylistic process which is mentioned in the text- book Stylistics by Galperin.

Most researchers (such as Academician V.V.Vinogradov.) have learnt about language forms of the object of stylistics, synonyms of lexical – grammar, although it is considered as examining the meaning of language patterns, it can be taken into consideration its classification, means of lingua – stylistic and its colored emotional – expressive ways by distinguishing. To develop the article, firstly that demonstrated the origin of word combinations lingua – cognitive means to understanding the language patterns by coordinating it with using characters of oxymoron basically literary prose. Lingua – cognitive or cognitive linguistic concept began in the late 1970s in response to the dominant, generative paradigm in linguistics. Unlike the work in generative linguistics, defined by the Chomskyian revolution, cognitive linguists assume the analysis of the conceptual and experiential basis of linguistic categories and constructs is of primary importance: the formal structures of language are studied not as if they were autonomous, but as reflections of general conceptual organization, categorization principles, and processing mechanisms. [Gibbs, 1994:Lakoff,1990]

Thus, it may another question about coming the term oxymoron. It causes to join word sentences through contradicting sympathy under conflict manner and formulate new ideas than expected situation. Understanding its using in contexts might be a little vague about how to make use of a figurative meaning of the language elements whereas to create a vivid image by communicating each other. Else, the stylistic device and its functional factors according to its treating in various aspects are surveyed and gave his explanations by uzbek scientists A. Sulaymonov " About styles of language" , academician G'.Abdurahmonov. Naturally, to explore oxymoron in the literary texts demands an excessive trying to analyze each individual person plus make authories to combust allegorical stories, poems and plays. All of them are based on polysemantic effect which is created controversial questions in problemitic situationsand the whole process discovers as a lexicology and certain stylistic purposes.Therefore, most of them including lingu-cognitive qualities have been determined all literary texts in a researching paper by providing proof of necessary details and examining examples to manifest and interplay between the primary and one of the derivative meaning we are again with a stylistic device.

An oxymoron combines two seemingly contradictory or opposite ideas to create rhetorical or poetic effect and reveal a deeper truth. Generally, the ideas will come as two separate words placed side by side. The most common type of oxymoron is an adjective followed by a noun,

adverb and verb that build two contradicting word patterns in the readings although they could not fit with each other. Oxymorons are often used in everyday conversation and in a breadth of writing, such as literature, poetry, and songwriting.

One oxymron example is " *How **cheerfully** he seems **to grin**,*

*how **neatly** spreads his **claws**,*

And welcome little fishes in,

*With **gently** smiling **jaws***"

An analysis of these amalgamtions (rhyme from Lewis Carroll " Alice's Adventures in Wonderland " p.27) which describes appearance with incopperative words constructing adverb and verb structures. Well, although that' what *a grin* is just big or wide smile, however, *grin* can have negaive connotation which is an offensive smile, *cheerful* means happy, pleasant and bright attitude, so positive adverb describes the state with negative verb softnessly by overpowering it almost feels pleasantly, or extremely exeggerate – just as an actual look would, *neatly… claws* here neatly one can understand *tidy* and *cheerful* state, claws means *a sharp carved nail of wild animals* sometimes is used *as tool to catch something*, the auther uses here the sharp tool as gently not with violently way, *gently jaws* – jaw is hard physical bone as a part of body by milding the appearance with adverb *gently.*The author chose every word patterns in the rhyme sensetively, the reader has a little confusion if they have to think their cognitive meaning carefully.If we connect like examples with linguo – cognitive tendency, the semantic concept of words will be blossomed on part through the text under two different incombinations.

" *I beg your pardon" said the Mouse, **frowning, but with very politely***" this part is also taken from this story (p.45), " *politely frowning* " the author uses these two contradicting word patterns with gently, *frown*means an angry, unhappy, and disapprove attitiude to someone or something offensively way but the author selected the positive adverb to mild the situation for readers'cognitive concept.

" *He was **a cold man** without feeling*" (phrase from Robert Louise Stevenson, " Dr Jerkyll and Mr Hyde" 2000. p.22) *cold* is low temperature of something not alive but *man*is opposite of it that is alive person here the speaker uses the Donatative Linguistics Component accounts for the contradiction produced by the antonyms.

" *I can remember another time , like a dream without shape or body: a world of eyes, **sweet sad sounds** and silent shadow. I woke up from hat long night, my eyes opened, and I saw the light of day again – here in this room full of thoughts and dreams.*"

An analysis of sweet sad (phrase from Adgar Alan Poe, " The black cat and other stories" 1991. p.19), amalgamatied with adjective + adjective, identifying the emotion by modifier, the readers can be shown the head of this phrase is sounds, semantic marker is sweet sad which reversing emotion. That is, supppse the markers for sounds, sweet, and sad

sounds + (produce sound) vocal   reason + types of feelings (emotion)

sweet

sad

so, the author uses the lexicon politely which the semantic marker connect the relation of grammar structures in the context as better response o the readers, in other words, this expression describes the concept of painful position without deep grief, *sweet sad*word structures indicate oxymoron which requires it like semantic interpretation to exaggrate the state into variety means in the contexts.

In conclusion, the way of analyzing the oxymoron concept in the literary texts show following results: finding proper approaches of method of oxymoron, the result of applied psychological concept in ambiguity words in readings, methods of using different ways of viewing semantic meaning, lexical form, syntax of word patterns. The sources of emotion (empathy) which may come from multiple readings that are possible from a given oxymoron that gives us an illusion of a multiple vision mimetic of the complexity of external and psychological reality of life as we actually experience it or mimetic of the different nuances of feelings of the writer or speaker of the oxymoron. Actually, variety resources of use oxymoron illustrates the richness of content under semantic meaning with grammar structures, especially on rhetorical uses which direct a reader to follow the conceptuality of oxymoron in the texts gently. Susanne Langer says that all literature by the very nature of its language is able to overcome the linear expression of ideas in regular language give a semblance of the simultaneity ideas or feelings, the illusion of an integral picture of life.[1] Naturally, oxymoron show the action intentionally for effect while metaphor is direct similarity, so an oxymoron gives a sense of authentic style to readers accepting clear interpretation of expectation or gratification feelings. In other words, the violations and deviations of literary language not chaotic but it is productive, meaningful, rewarding because of applying to these rules in literature by authors expressly.

FUNDAMENTALS OF IMPLEMENTATION OF INNOVATIVE EDUCATIONAL TECHNOLOGIES

Ashurova Sarvinoz Fahriddinqizi*

*2nd year Master Student,
Termez State University,
UZBEKISTAN

ABSTRACT

The article deals with the application of innovative technologies in education, in the learning process through the use of pedagogical technologies in education. Curricula, narratives and lesson plans, methodological manuals, didactic developments should be developed and submitted to the experimental process in connection with the description of the experiment. In addition, pedagogical technologies should develop methodological bases, clear mechanisms, methods and tools for diagnosing the educational process and the implementation of the developed theories, teaching aids as a pilot.

KEYWORDS: *Pedagogical Technology, Pedagogical Prognosis, Subject Of Education, Method Of Teaching, Method Of Conversation.*

INTRODUCTION

Considering current development of society, the expansion of development needs and opportunities, the acceleration of the flow of information in various areas, it is necessary to undertake the creation of innovative pedagogical technologies, mechanisms for using new forms, tools and methods of pedagogical forecasting. Today, the research aimed at determining the role and level of education in different types of educational institutions requires the extensive use of the potential of pedagogical prognosis. Only then can the results of the educational process contribute to the development of science, industry, culture, economy, and all spheres of society.

Only theories based on pedagogical prognosis can be the basis for pre-designing the stages of the process of continuous education and the content, form and means of its components, the level of impact of educational outcomes on society. This means that only in this way it is possible to reconsider the educational process on the basis of new principles and new ideologies, to carry out reforms in the field of education. In addition, pedagogical technologies should develop

methodological bases, clear mechanisms, methods and tools for diagnosing the educational process and the implementation of the developed theories, teaching aids as a pilot. The mechanism of diagnostics for the educational process should be directed to identify the achievements and shortcomings of this process, the quality of educational outcomes, pedagogical theories applied to the educational process, the ability to develop educational technologies or impede the development of education.

Pedagogical experimentation is of special importance in determining the level of effectiveness of research results. Curricula, narratives and lesson plans, methodological manuals, didactic developments should be developed and submitted to the experimental process in connection with the description of the experiment. If the curriculum is being conducted, it is necessary to ensure that the observed learning process, i.e., textbooks or narrow developments, technical aids, visual aids, and teaching aids, is attained. The focus is not on what method or pedagogical technology the teacher uses, but on determining the effectiveness of the teaching materials provided within the curriculum. Theories involved in the experimental process today require that the results obtained from experimental qualities be processed statistically. The ongoing experimental process and their results without expertise require the involvement of authoritative scientific and pedagogical teams and leading specialists. Extensive experiments should be carried out in accordance with the requirements of the regulations approved in advance by the scientific and pedagogical team, the expert of the process and results of the test.

Pedagogical prognostics selects educational technologies taking into account the age characteristics and developmental dynamics of the student's personality. Offers ways, forms, and tools to provide students with different levels of understanding and integrated knowledge within selected educational technologies. Theoretically based pedagogy of a particular pedagogical technology should provide for the organization of the educational process aimed at ensuring the vital activity of the student and the teacher, the development of his free thinking, creativity.

Any pedagogical technology applied to the educational process, regardless of whether its components pass through the teacher's activity, is required to achieve the rapid development of free and creative activity of the student. At the same time, pedagogical technologies, first, allow each student to freely communicate and exchange ideas with other students, lesson materials and the teacher (educator). Innovative pedagogical technologies should be presented to the student as a form of pedagogical practice that introduces the content of laws, natural and social phenomena, human culture and ethics, the basics of a particular science. It is advisable to rely on well-grounded, well-tested and well-established laws in this area. The essence of pedagogical technology is the formation and development of positive qualities and attributes in each person, based on his needs, interests, abilities and capabilities.

In this case, the content of education is an environment for the formation and development of the individual. Therefore, the content of education should embody humanistic ideas and norms aimed at humanity. Pedagogical technology based on the humanization and democratization of pedagogical relations is radically opposed to the technology of individual domination, and cooperation in the pedagogical process creates a favorable environment for personal development and creativity through respect for the individual student. In traditional education, the teacher is the subject of the content of education, the student is the object of the pedagogical process, while in collaborative pedagogy it is the subject of activity. Therefore, in collaborative

pedagogy, the two subjects of a single taste process work together to solve educational tasks. At the heart of the educational system in this pedagogical technology is the idea ofhumanity, aimed at the formation and development of a harmoniously developed human personality.

Methods are divided into verbal, visual and practical, depending on the description of the transmission and reception of knowledge.

Theoretical method-modeling, analysis, synthesis, comparison, generalization, stratification of pedagogical technology, integration of its systems and identification of the most important legal connections between them.

Pedagogical experiment is a method of scientific and pedagogical thinking, activities that allow to clarify the causal relationship between pedagogical factors, conditions, processes and methodological approaches on the basis of specific plans.

Teaching method is a pedagogical activity that systematizes the interaction between teacher and student in order to impart and acquire knowledge. Teaching methods are a key part of the learning process, without which pedagogical activities cannot be fulfilled.

ABSTRACT

The Indian social structure and cultural pattern are characterized by unity as well as diversity and the culture of each group has undergone a lot of changes over the centuries to become an integral part of Indian mosaic. During the period when Islamic power in India was at its zenith, the political and cultural elites of Islam carried forward its cultural traditions in protective and optimistic environment. Many Muslim scholars and rulers made efforts to reconcile some aspects of the Hindu tradition with Islam. Caste in India has not been only associated with an occupation but has a limited kind of monopoly over it. It is not true that every member practiced the occupation exclusively. Different members of a family may had different occupations. All the women held the responsibility of house-hold and they also took some part in agriculture pursuit. Artisan class women always participated in other crafts. Occupations also classified into high and low. Those participated by high caste being regarded as high and by low caste regarded as low. The existence of a high degree of agreement between caste and agricultural hierarchy meant that the stratification ran deep economic stratification strengthened ritual stratification and vice-versa. An individual in a society lived in a hierarchal world. Generally the village was an aggregated of cultivated holdings with or without some waste area attended to it and usually it had a central site, where the dwelling houses were kept congregated together, with the land of the cultivators spreading around. Most of the villages lived in filth and squalor but inside the houses were kept very clear. Most of the houses were made of mud in the village but the houses in the towns were of baked-bricked. Room of the houses were dark, damp and without ventilation. Sanitation system was not proper and drainage was faulty. It is not only the people who were divided into higher or lower groups but also the food they ate, dress and ornaments they wore and the customs and manners they practiced regarded as high or low. Elaborate rules governed the acceptance of cooked food and water from the other castes the land-owners

exploited the tenants as much as they could. Regarding the food and drink there was similarity all over in the region of Panipat. In this region wheat, gram, rice, bajra, barely, maize, pulses, vegetables, fruits, milk and milk-products. Hindus were mostly vegetarians but some high class Hindu people like Muslims were also non-vegetarians. Khichri was very common food of the masses and was eaten by both rich and poor people. Diet of peasantry was much cheaper. They used to eat mostly cheap and easily available grains, fruits, vegetables and other eatables. Indian dress was prudent of soil and suited to the region. The people of the region used the texture of garments according to their professions and status but neat and well-fitted. The dress of the women left a great part of their body bare which gave more room for personal adornment with ornaments and they bedecked every limb and corner of their body from head to foot with different types of ornaments. The love of ornaments was inherent in the human race and both male and female used to wear the different types of ornaments. But it was not confined to the people of any religion, sect or class. The well-to-do or rich people had great attention to the physical adornment. The ornaments were made of different kind of material, from the cheapest to the most valuable even sometimes studded with pearls and diamonds and used according to their status. Social position of a woman was determined by her ornaments and love of jewellery she used to wear.

INTRODUCTION

In this research paper only some aspects of social life like dwellings, life style of the people i.e. food, drinks, dress and ornaments has been discussed of the people of this region because it is very difficult to discuss all such activities of social life. Social history of a region generally endeavours to present the varied aspect of daily life of the population in the region in the different periods. The Indian social structure and cultural pattern are characterized by unity as well as diversity and the culture of each group has undergone a lot of changes over the centuries to become an integral part of Indian mosaic. During the period when Islamic power in India was at its zenith, the political and cultural elites of Islam carried forward its cultural traditions in protective and optimistic environment. Many Muslim scholars and rulers made efforts to reconcile some aspects of the Hindu tradition with Islam. Caste in India has not been only associated with an occupation but has a limited kind of monopoly over it. It is not true that every member practiced the occupation exclusively. Different members of a family may had different occupations. All women held the responsibility of house-hold and they also took some part in agriculture pursuit. Artisan class women always participated in other crafts. Occupations also classified into high and low, those participated by high caste being regarded as high and by low caste regarded as low. An individual in a society lived in a hierarchal world. It is not only the people who were divided into higher or lower groups but also the food they ate, dress and ornaments they wore and the customs and manners they practiced regarded as high or low. Elaborate rules governed the acceptance of cooked food and water from the other castes. The

inter-caste relations at the village level constitute vertical ties and may be classified into economic, ritual, political and neighboring villages were bound together by economic ties.

In the rural region of Panipat with its largely subsistence and not fully monetized economy, the relationship between the different caste groups in a village had taken a particular form up to the medieval period. The serving and artisan castes generally were paid annually in grain at harvest. In Panipat region there were lack of coherence between the agriculture and cast hierarchies, Brahmins being the cultivating tenants of Jat landowners but agricultural labours came from the Harijan. The existence of a high degree of agreement between caste and agricultural hierarchy meant that the stratification ran deep economic stratification strengthened ritual stratification and vice-versa. Thus, the land- owners exploited the tenants as much as they could. But where the tenant caste was higher than that of the land- owners and particularly when a tenant was a land-owner's priest, exploitation had too much less.

Generally the village was an aggregated of cultivated holdings with or without some waste area attended to it and usually it had a central site, where the dwelling houses were kept congregated together, with the land of the cultivators spreading around and most of the houses were made of mud. The houses of poorer classes had a court yard surrounded by one or two room. There was a porch on the entrance of the houses generally which was ornamented and also used for smoke and gossip. There was also a detached sitting room called baithak or diwankhana. Cattle shed was adjoined the house. Cooking was done in a corner of the court-yard of the house. Room of the houses were dark, damp and without ventilation. Sanitation system was not proper and drainage was faulty. Most of the villages lived in filth and squalor but inside the houses were kept very clean. The houses in the towns were of baked-bricked. The houses of common people were of single-storeyed but two or three-storeyed of well to-do-class. Little space was left in the middle of the houses around which rooms were built. The level of the floor of the houses was sometime lower than the adjacent ground. No suitable arrangements were made for the air and light in the houses but well adopted to the climate.

 Regarding the food and drink there was similarity all over in the region of Panipat. In this region wheat, gram, rice, bajra, barely, maize, pulses, vegetables, fruits, milk and milk-products etc. were consumed by the common people however, wheat was not commonly used by the poor people of this region. Bread made of wheat, gram, bajra, maize was used by the well-to-do classs. The common man used chapati (thin bread) and roti (thick bread). Hindus were mostly vegetarians but some high class Hindu people like Muslims were also non-vegetarians. Meat was very popular among Muslims and mostly consumed by the rich people. They used to cook the vegetables with meat. But in this region workmen knew little of the taste of meat. Muslims used to eat beef, mutton, fish, chicken and meat of different kind of birds. Qima was also the favourite dish of rich Muslims and they took bread and kabab. On special occasions Hindus took puri and Muslims were also showed interest in puri. Rice was popular among the rich people but common man also liked to eat, if they could afford. Khichri was very common food of the masses and was eaten by both rich and poor people. It was cooked with the mixture of rice, butter, pulses and vegetables and was eaten with butter, ghee, milk and butter-milk. Ghee and oils were used for culinary purposes. Grains were also taken either in parched or in the form of pulses. Poor people sometimes satisfied their hunger by perched, boiled or fried grains only. Pickles were used by the people of all the classes. Different kinds of sweets halwa, khir etc. were also popular. In the cities and towns there were big and small shops of confectioners and people used to buy sweets.

The common people could not afford the costly or rich dishes. Different kind of fruits i.e. watermelon, mangoes, lemons, oranges etc. were also taken by the people. The imported and costly fresh fruits and dry fruits were popular among the rich people only. But mostly seasonal and easily available, grew wild and found in forests were eaten by the poor people. Diet of peasantry was much cheaper. They used to eat mostly cheap and easily available grains, fruits, vegetables and other eatables.

Barely and gram was consumed in the form of flour in summer seasons with sugar (jagery) and water called sattu. Aerated water and sharbat were the favourite cold drink of the people in the summer for entertaining the honoured guests. Rose water, sharbat and lemon juice mixed with was used by the rich people. Ice was used only by well-to-do classes and used for cooling water and preparing beverages during summer seasons. Milk and milk products were consumed in large quantities and staple drink of the region was invariably butter-milk in that period and mostly consumed by the people of rural areas. The use of wine and other intoxicants were very common among the people.

 Indian dress was prudent of soil and suited to the region but also varied from place to place and clan to clan. The wardrobe of men in the rural areas comprised dhoti, (payjama) tahmat or majhla as the lower garment and kurta (shirt) as the upper. In the winter season waist coat or a loose coat wadded with cotton and woolen blanket was in use. Some people used dulai (a light quilt) also called razai. The head dress of man was a turban (pagri). Usually a dress of a Hindu woman comprised a ghaghra (lahnga) of cotton and a kurti (shirt) and married woman also wore angiya or choli (bodice). Widows and prostitutes wore only white clothes. The dress of the upper-class Hindu woman and the Muslims were salwar and loose shirt. All the women covered their head with a piece of clothe called dupatta (odni or chunaria). The upper classes spent lavishly on their dresses. They used silk, brocade and fine Muslin according to their financial and social conditions. Due to poverty common people wore simple clothes but rich people used silk stuffs. The dress of soldier was an ungarkha and white trousers and high crowned cap, jubba (ankle-length robe of garment) and they also used kamarband. Sikhs wore short drawers, a tamba and a tuban (pagri). Expect turban the common people used clothes of Khaddar (rough cotton). Boys wore langoti but up-to the age of four or five years they remained without clothes and girls used to wear drawers (petticoat). Thus, the people of the region used the texture of garments according to their professions and status but neat and well-fitted.

The love of ornaments was inherent in the human race and both male and female used to wear the different types of ornaments. But it was not confined to the people of any religion, sect or class. The well-to-do or rich people had great attention to the physical adornment. Wearing of ornaments was not so popular among Muslims, however, men used to put amulets. But Hindu men adorned themselves with ear and hand rings. Common people of Hindu caste wore ornaments; of course they could afford these. The ornaments were made of different kind of material, from the cheapest to the most valuable even sometimes studded with pearls and diamonds and was used according to their status. In the sixteenth centuary Abul Fazl enumerates thirty seven in his list of Ain-a-Akbari. The ornaments wore by the male members were mundran, chhap, Kara and hassi. Indian women in general had always fond of adorning themselves with a great variety of gold and silver ornaments and jewelries. And various kinds of ornaments of gold and silver were also worn by the Muslim women according to their financial and social position. Bangles were made of lac, glass, brass and silver. The dress of the women

left a great part of their body bare which gave more room for personal adornment with ornaments and they bedecked every limb and corner of their body from head to foot with different types of ornaments i.e. for head, for-head, ear, nose, neck, arms, wrist, fingers, waist, legs, ankle-lets and feet etc. Some of the ornaments, wore by the women were i.e. kara, bangles, chhap, ear-rings, ring, hassi, nath, nose- ring, koka, long, pati, necklace, tikka, pazeb and ankle-lets etc. A social position of a woman was greatly determined by her ornaments and love of jewellery, she used to wear. Thus the Indian dresses through the ages, has been chiefly determined by the geographical factor and climatic conditions as well as the socio-religious manners and customs of the different type of people. Greater emphasis was given on the protective requirements of the dressing.

ABSTRACT

The world experience of the last two decades has shown that the practical implementation of public-private partnerships is one of the most effective ways to attract investment in the national economy. Also, the implementation of an objectively clear direction for systemic development requires the use of appropriate legislation. This article analyzes the legislation governing public-private partnerships.

KEYWORDS: *Public, Private Partner, Law, Republic Of Uzbekistan, Concession, Code.*

INTRODUCTION

The relationship between the state and entrepreneurship is an important basis for the development of a modern market economy because the successful realization of the potential of the public-private partnership depends on the readiness of the state to interact with entrepreneurship in a complex market economy.

The role of entrepreneurship in the further development of all regions of the country is very high. Establishing public-private partnerships in business development is one of the most pressing issues today. At present, in the socio-economic development of our country and the modernization of our economy, it is very important to further expand the attraction of domestic and foreign investment and increase the efficiency of their use.

Based on this, one of the most important directions is to modernize the country, to diversify production, to study the features of attracting investment in the economy and to identify ways to increase the efficiency of public-private partnerships.

During the visits of the President of the Republic of Uzbekistan to the regions of the country, special attention is paid to the issues of socio-economic development of each region, and specific measures are taken to find positive solutions to existing problems [1].

These problems are systemic problems, which are the socio-economic development of the regions, employment, real incomes, investment, expansion of production, creation of export-oriented high-tech products, the rapid development of entrepreneurship and the creation of favourable conditions for them.

Public-private partnership is a cooperation between public authorities and private businesses to implement socially significant projects. The state is not the only one providing social assistance. There are proponents and opponents of public-private partnerships around the world.

Proponents of the policy see it as a new wave of privatization as the main argument, and as an option that is under the direct control of the state and that the state will not lose. Proponents of her case have been working to make the actual transcript of this statement available online.

Main part

The Institute of PPP in Uzbekistan is in its infancy. There was no comprehensive legal framework defining the principles and nature of the operation of the PPP. The creation of the legal framework for public-private partnerships in the Republic of Uzbekistan has reached a particularly rapid stage of development over the past five years. In particular, the Decree of the President of the Republic of Uzbekistan dated October 5, 2016 "On additional measures to ensure the rapid development of the entrepreneurial activity, comprehensive protection of private property and qualitative improvement of the business environment" According to the Decree of the President of the Republic of Tajikistan, the idea of developing a draft law "On Public-Private Partnership" was put forward.

Before the adoption of the Law "On Public-Private Partnership" on May 10, 2019[3] as a regulatory framework for PPPs, concessions, product sharing agreements, privatization, natural monopolies, competition and legislation on attracting foreign investment.

Our analysis of the current legal framework for PPPs shows that it did not meet the generally recognized international specifications of PPPs. For example, Article 1 of the Law on Concessions [4], adopted in 1995, and defines the concept of "concession" as follows: a concession is a state grant to a foreign investor to engage in a certain type of economic activity. In order to carry out these activities, the state transfers property, land and underground plots to a foreign investor based on a concession agreement. The concession agreement is concluded for a period of up to 15 years.

It should be noted that the Law on Concessions requires revision for the following reasons. First, the range of concessionaires is limited to foreign investment, which excludes national entrepreneurship from participating in PPP projects. The experience of foreign countries shows that the idea that PPP is carried out only by large enterprises is wrong. For example, based on the experience of foreign countries, small and medium-sized businesses as contractors are actively

involved in the construction of kindergartens, schools, clinics, boilers and large projects. Second, the law limits the validity of a concession agreement to 15 years, while in practice the generally recognized term is up to 50 years, which prevents the conclusion of contracts for large facilities with a long completion period. Third, the law strictly binds the subject of the concession to tangible assets (property, land and subsoil), while the modern views of the concession provide for the state to grant other rights to the business to carry out economic activities. Also, the law is not harmonized with other laws and regulations on the method of state support, methods of setting tariffs for concessionaire services, etc. The above reasons have led to the absence in the practice of full and comprehensive concession agreements since the law was enacted in 1995.

It makes sense to look at the practice of using PPP forms and the opportunities that have been achieved. The most popular form of PPP in Uzbekistan is the PSA, which is based on December 7, 2001, Law on Product Sharing Agreements [5]. This private partnership has shown its effectiveness in attracting foreign investment in mining. Currently, Lukoil and Gazprom (Russia), PETRONAS (Malaysia), Kossor Operating Company (Vietnam), CNPC (China), KNOC and KOGAS (South Korea) and others product sharing agreements have been concluded with.

Free economic zones (FEZs) in Uzbekistan are another actively used form of PPP. Today there are the following free economic zones: Navoi Free Industrial and Economic Zone (2008)[6], Angren (2012)[7] and Jizzakh (2013) Special Industrial Zones[8], "Bukhara agro" (2018)[9], "Namangan"(2018)[10] "Nukus" (2019)[11], "Chiroqchi" (2020)[12] and others. The regulatory framework of the FEZ is well developed and the Law "On Free Economic Zones" [13] and the government's special tax regime in this area, customs benefits and the creation of an infrastructure in the industry to attract investors.

In his speech on the occasion of the 27th anniversary of the adoption of the Constitution of the Republic of Uzbekistan, President Shavkat Mirziyoyev said that 7 months have passed since the adoption of the Law "On Public-Private Partnership", which is an important condition for the rapid development of our economy. We've been working on this long-awaited, life-changing bill for a long time. This document is an effective mechanism for the exercise of the constitutional right of citizens to perform the functions of the state and society.

Public-private partnership projects are currently underway in some sectors. However, in the areas of health, education, transport, road construction, utilities, in most areas, the initiative is still not felt at all.

If the minister or the governor does not understand the essence of the law, if he does not show diligence in its implementation, it will be difficult for our reforms to move forward, to inspire people" [14]. One of the effective methods is the implementation of investment projects on the basis of public-private partnership.

The Law of the Republic of Uzbekistan "On Public-Private Partnership" [15] was signed by the President of the Republic of Uzbekistan on May 10, 2019. Article 3 of the Law sets out the basic concepts. According to it:

Public-private partnership is a partnership between a public partner and a private partner that is legally formalized for a certain period, based on the pooling of its resources to implement a public-private partnership project [16].

According to the adopted law, public-private partnership projects will be implemented in the state's economic, social and infrastructure projects, construction, reconstruction, modernization, operation and maintenance of buildings and structures, as well as the introduction of innovations.

According to the law, the state partner is the Republic of Uzbekistan, and public administration bodies, local executive bodies, as well as other bodies (organizations) or their associations authorized by the Cabinet of Ministers of the Republic of Uzbekistan act on its behalf, private partner - a business entity registered in accordance with the legislation of the Republic of Uzbekistan or a foreign state, which has agreed on a public-private partnership with a public partner and an association of such entities.

According to the Law of the Republic of Uzbekistan "On Public-Private Partnership", the government announces its projects to the public and conducts a tender among investors seeking to implement the project in the form of negotiations, the state can choose a partner. A two-step process takes place before the selection. The first is to prepare a project concept and conduct a feasibility study. In the second stage, a two-stage tender will be held among the bidders who wish to implement the project.

The main purpose of the tender is for the state to partner with a private company that has submitted the lowest cost plan for the project, and negotiations will be held and contracts will be signed. Of course, there are requirements for a private partner: the private sector must have legal capacity, be able to work, have the necessary financial resources, and have the material and technical base and the availability of labour resources.

By law, a public-private partnership is strengthened by a contract that is valid for a minimum of 3 years and a maximum of 49 years. The reason for the term is up to 49 years, which is due to the legal norms related to land ownership. The private partner is expected to use the facility and land for 49 years under the terms of the contract, and then hand it over to the state. This period may be extended in accordance with the law for good reasons for the private partner.

The law does not specify the areas in which public-private partnerships can be implemented. Of course, today it is important to develop public-private partnerships and increase investment flows. However, although the law does not specify the areas of implementation, it is currently being implemented by government decrees in the fields of construction, education, health care and others, and has become widespread in the last two years.

To provide comprehensive support and encouragement of active entrepreneurship, the introduction of innovative ideas and technologies, science and particular attention is paid to creating the necessary conditions for the rapid development of innovative activities.

The main directions of public policy in the field of public-private partnership are:

- to stimulate economic growth and ensure sustainable development of the Republic of Uzbekistan;

- development, approval and implementation of state programs in the field of public-private partnership;

- to promote the formation, restoration, use and maintenance of existing social infrastructure;

- improving the quality of use and maintenance of social infrastructure;

- improving the quality of public services and expanding their access;

- creating conditions for attracting private sector financing, including foreign investment;

- government support for research, the introduction of modern methods and technologies to develop and improve the institutional and legal framework of public-private partnership.

The three-phase evaluation process determines whether the project will be rejected or approved for implementation, and if approved, by whom (public or private). Management and monitoring of the project implementation process will ensure the successful completion of the PPP project as a final step.

Our country has formed a legal framework for the support of entrepreneurship, their development and organization of production. According to the normative legal acts, the laws "On joint-stock companies and protection of shareholders' rights" and "On limited and additional liability companies" - are one of the first main documents of a private partnership. According to these documents, private enterprises and individuals can buy or privatize some or all of the state-owned enterprises. According to the law, since the years of independence, state organizations, enterprises and state-owned shares have been transferred to private ownership. As a result, private businesses and individuals became partners in certain government businesses. The main purpose of the legislation is to attract private investment in the development of entrepreneurship, production and services, the development of social infrastructure of state importance. At the heart of this are joint-stock companies established on the basis of public and private ownership, and corporate relationships in limited liability companies.

Today in the practice of Uzbekistan there are almost all forms of public-private partnership recognized in the world. However, in the last 15-20 years, joint ventures or industry benefits, public-private partnership project form, technical assistance agreements, many types of contracts, agreements such as Greenfield and Brownfield have become rare in practice.

However, in order to use this form of partnership in modern conditions, to increase its economic efficiency and to overcome several shortcomings that may remain very important in modern conditions, the internal institutional environment and, in particular, the legislation on PPP requires some improvement of the system.

Given the possible ways to improve the regulatory framework for the development of PPPs, most scholars and experts emphasize the need to consolidate in the legislation a clear definition of public-private partnership - PPP is only an economic definition, but should also act as a legal category.

Therefore, as a new form of entrepreneurship for local practice, the normative substantiation of the activities of the PPP systems and, accordingly, the financial and economic activities in various sectors of the economy, in cases that are difficult to resolve within the current domestic legislation It is necessary to develop a regulatory framework (primarily budget and tax legislation, as well as legislation governing the activities and powers of local authorities), taking into account its specific features, which will allow finding an effective solution at present.

It is necessary to ensure a very high probability of corruption schemes in the financial and economic activities of the PPP system. Therefore, it is necessary, first of all, to ensure a high level of transparency in the legislative and organizational aspects of the activities of PPP systems

in the decision-making and implementation of management decisions. World experience shows that the severity of this problem can be significantly reduced by legislating the need to introduce audit practices to work with the mandatory publication of results in the open press.

CONCLUSION

Based on the above considerations, it is logical to assume that it is necessary to create a single coherent regulatory framework for the formation of an effective mechanism of public-private partnership in our country. In this case, taking into account the world experience, we consider it natural to draw a similarity between the budget, tax or another legislative system, which corresponds to complex systemic phenomena. In other words, the legal system must sufficiently reflect the economic nature of the PPP as a systemic phenomenon.

By proposing a system of PPP, other documents amending the tax and budget codes, as well as a system to support the regulation of other normative legal acts, we get a harmonious system of formal institutions that organize the functioning of the public-private partnership mechanism.

We propose to consider the hierarchy of normative-legal documents of a public-private partnership at three levels: general, sectoral and regional. At the top of this hierarchy is the Constitution of the Republic of Uzbekistan. The reason is that according to Article 16 of the Constitution of the Republic of Uzbekistan, no law or other normative legal act can contradict the norms and rules of the Constitution [17]. Examples of primary laws are the Law on Public-Private Partnerships, the Budget Code, and the Tax Code. The laws of the secondary sector include the Law "On Concessions", the Law "On Product Sharing Agreements", the Law "On Free Economic Zones", the Law "On Joint Stock Companies and the Protection of Shareholders' Rights". Examples are the laws of the Republic of Uzbekistan and other legal documents. The third level of regional normative legal acts includes a system of normative legal acts regulating the implementation of a public-private partnership at the level of local public authorities. It is in this system of normative legal acts of the third level that there is a gap in the legislation of the Republic of Uzbekistan today. That is, the Law on Public-Private Partnerships does not define the powers of local authorities in this area. Therefore, we propose to add Article 121 to the Law on Public-Private Partnership, which defines the powers of local public authorities in the field of public-private partnership.

In line with all of the above, we propose to adopt a single system of public-private partnership legislation, the "Investment Code" by codifying the general legislation. This will directly generalize the law and the legality of the documents, eliminating the inconsistencies that may arise between them. This legislation should be structured like the budget legislation system. At the national level, the definition of public-private partnership should be defined not only as an economic phenomenon but also as a legal category. For example, on June 22, 2001, the Republic of Belarus adopted the Investment Code [18], which defines the specifics of investment activities on the basis of concessions, as well as the conclusion of investment agreements between the Republic of Belarus and investors.

We conclude from the above considerations that the system of normative and legal documents on a public-private partnership that is being created should consist of three levels, the first of which is the law (or code) on public-private partnership. 'li-shi should. The second should be other normative and legal acts related to the implementation of public-private partnership and its forms

(including as part of separate sectors). The third is the normative-legal documents that ensure public-private partnerships by local public authorities.

THE SIGNIFICANCE OF THE MOTIVES OF TRANSFORMATION

ABSTRACT

In this article, the deep meaning of fairy images is revealed by the methods of Jungian psychology. In Uzbek folklore, the motives of transformation were mainly associated with shamanism and totemism. Totemism gave answers to questions about why heroes turned into a specific species of animals, while shamanism emphasized the possibility of transforming a shaman into an animal, and, in general, the features of shamanism. However, the motives of transformation in totemism and shamanism do not fully capture the meaning of transformation in oral folk art. Since they do not answer such questions as to why this or that hero is being transformed, what was needed for a transformation in a certain plot. In search of an answer to the question of the cause of the transformation, scientific research was carried out. The author compares unconscious mental processes with the dynamics of mythological and fairy-tale images, clarifying much of what was previously inaccessible to our consciousness. The themes of fairy tales are universal, and the fairy tale language is full of symbols typical of the unconscious, therefore the analysis of fairy tales is one of the approaches to working with archetypal ideas and characters of the collective unconscious. We will focus on just one of the explanations that coincide with our opinion.

INTRODUCTION

In Uzbek folklore, the motives of transformation were mainly associated with shamanism and totemism [1]. Totemism gave answers to questions about why heroes turned into a specific species of animals, while shamanism emphasized the possibility of transforming a shaman into an animal, and, in general, the features of shamanism. However, the motives of transformation in

totemism and shamanism do not fully capture the meaning of transformation in oral folk art. Since they do not answer such questions as to why this or that hero is being transformed, what was needed for a transformation in a certain plot. In search of an answer to the question of the cause of the transformation, scientific research was carried out. For example, researcher Birkheiser Oery Sybil in the article "Mother. Archetypal images and transformations" linking transformations in fairy tales with the archetype of the mother, gives various explanations as to the reasons for the transformation [2]. We will focus on just one of the explanations that coincide with our opinion.

MATERIALS AND METHODS

Three important processes in human life - birth, marriage, death in oral folk art are displayed as a transition from one world to another. According to the traditional concept in folklore, with birth, a person makes a transition from one world to another. Marriage is for a girl a transition from the world of girlhood to the world of a woman, for a guy - into a man's world. The physical death of a person does not mean his complete disappearance, but a transition to another world. The original examples of folklore - myths - are also based on death and rebirth, that is, on death (sleep ??) and the awakening of nature. According to traditional folklore concepts, the disappearance of a living creature does not mean death. The real reality in folklore is reflected as the process of birth-death-birth. For example, rituals were formed precisely to reflect this process. The birth of a baby is a transition from one world to another. To celebrate this process, "beshik tuya" ceremonies were invented. Ceremonies of marriage, marriage is also rituals carried out among the people and signifying an important stage in a person's life. The bride crosses the threshold of the groom's house - and for her, this is not the threshold of a new home, but the threshold of a new world. The crying of the bride is not goodbye to her stepfather's house, it is tears of goodbye to the world she leaves behind. With marriage, the girl's world dies for a girl and the world of a woman begins, for a guy the world of youth ends and he enters the world of a man. That is, both the girl and the guy die and are reborn to create a family.

Experts note that it is precisely this worldview of people that was reflected in wedding ceremonies - singing the songs "yor-yor", bowing to the bride, etc.

The essence of wedding rites and ceremonies indicates that the people perceived marriage as a transition from one world to another. Physical death was considered in the same sense both in the religious and in the mythological worldview. That is, with physical death, any creature does not disappear completely, but passes into another world, in mythology, it is reborn and comes to this world in the form of grass, rain, or another natural phenomenon. When my grandmother died, I was surprised by the memorial song "you will rain down" performed by women. This means that the verbal component of funeral rites that still exists today - Marcia - preserves the ancient beliefs of the people. Belief in the degeneration of a deceased person into objects and phenomena without a soul (rain, young growth) is associated with animism - the basis of the mythological worldview about belief in the existence of souls and spirits, the animality of all nature.

Therefore, there is no death in the folk traditional worldview. The same concept is at the heart of the myths about the seasons of the year. Nature awakens (spring, summer), dies (autumn, winter) and then wakes up again. The timing of the wilting and rebirth of nature (sunrise, sunset) was the reason for the formation of seasonal rites.

In general, the wilting and rebirth of nature was a very big event and was considered the main reason that determines everything that happens in a person's life (calendar myths). Obviously, in the mythological worldview, the concept of birth-death-birth was the basis of human life.

However, knowing the essence of a person deeper, one can become a witness of the fact that in addition to the above-mentioned perception of the processes of life and death, there was another concept of transformation. In general, taking into account the initial views and concepts of the people about the world and themselves, it can be said that on the life path of each person, in addition to birth, marriage, death, an important personal transformation took place for him in terms of spirituality. And this could not be ignored by the people. Probably, these transformations represented by a person were a good means for self-realization, and the achieved knowledge served as the basis of folk art. The folklore hero "Bilgamish", in search of the flower of eternal life, may not have dreamed of eternal life on earth.

Search is the foundation of human nature. Search is the path to the goal. And the motive of the search for Bilgamish, as for a modern person, is the essence of his nature, the basis of self-knowledge. A seeker is a person who is alert, keen-sighted, knowing. Bilgamish was looking for a flower of eternal life, which means, we can assume that he was looking for eternal life in this world (not a physical transition from one to another world, that is, not physical death). For a physically living person is located between these two worlds, and therefore cannot remain eternally alive (spiritually). As in nature, there is wilting and awakening, so a person experiences spiritual death and rebirth. The flower of life, which Bilgamish was looking for, is eaten by a snake, this indicates that a person is also not free from life and rebirth.

Exupery said (Antoine de Saint-Exupéry) that life is a gradual birth (through death and rebirth). It is appropriate to recall the opinions of representatives of the school of psychoanalysis about the motive for killing a snake by a herome, which is found in the folklore of almost all peoples [3].

By killing the snake (this motive is also considered as a metaphor for the initiation process), the hero goes through the biggest test of his life. At the same time, this motive is associated with the archetype of the mother. By killing the snake, he seems to be reborn from the mother's womb [4]. Born as a person in terms of spirituality, begins to form as a person. This process is not easy, it can only be passed through difficult trials. By overcoming only one serious test, a person cannot become a person (be reborn, reborn). As long as a person is alive, these tests will meet on his way, and only by overcoming these tests, he is formed as a personality. In this regard, trials constitute one of the important motives in folklore. By overcoming trials, the hero wages a struggle within himself, triumphs over the various fragments of the "ego" of the personality manifested in a person, chaos in the soul (over the archetype of a child) and achieves a harmony of soul, mind and body (the archetype of wisdom), the three pillars that make a person human with a capital letter.

The spiritual death that we intend to talk about is also a kind of test. It can also be viewed as the "inactivity" of the spirit and mind of a person when he is not able to overcome the difficulties that have arisen as a result of trials. This process cannot be assessed as inactivity. On the contrary, the soul, the heart are the most tactful in this process, but at a certain moment, they cannot serve life goals (life needs). The concept of life goals, life force, we can be characterized by the psychoanalytic term "libido". Freud explains libido as a force that controls the physical

needs of a person, his student Carl Gustav Jung considers libido to be the basis of a person's energy in striving for life. In short, libido can be characterized as the energy of love for life. This means not only the physical abilities of a person but also his desire for strength, power (Fromm's theory), the pleasures of life.

A person always lives with a feeling of striving for something, having achieved what he wants, he outlines other goals and uses all the strength and possibilities to achieve it. The force that drives a person to act is concentrated in libido. But just as there are oppositions in the world that manifest themselves when comparing values, so there are oppositions to the energy of the vital force. In fact, these concepts should not be opposed. Both of these concepts are present in the human soul. The only difference is that when the first is activated, the second slow down, and when the second is activated, the first slows down.

Thus, these two concepts throughout life contribute to each other and a person in achieving balance, first in the body, then in the soul of a person. The second force was studied somewhat later in science. It was first studied by Freud's student Sabina Spielrein, later, in 1936, Paul Federn introduced it to science under mortido, which characterizes the death instinct in humans. Libido is the power of creation in a person, mortido is destructive, that is, destructive energy. This theory as a whole corresponds to what is happening in reality - first, it is created, then it is destroyed, then it is created again (the myth of the world egg. Destruction of life skills (breaking an egg), entering (creating) another egg). Mortido is called the death instinct, first of all, it must be understood as the ageing of the human body and spirit and preparation for biological death. Suicide - sometimes a person has a desire to commit suicide, this happens under the influence of mortido. These two processes are the most striking manifestations of mortido, we often meet other manifestations of mortido in the daily life of people. These are aggression, depression, alcoholism, masochism. In other words, such states can be called spiritual death.

As noted, these sources of the above two forces can be activated and weakened, like the change of seasons. Eternal summer or eternal winter is considered abnormal, and in a person, one force cannot lead constantly. Mortido often manifests itself when it is not possible to realize the aspirations and abilities caused by libido. At such moments, in a sense, a person loses the desire for life. Physically he lives as usual, but he loses a lot in his spiritual world. Situations that do not correspond to the libido-directed desires - alienation, loss, death, unfulfilled goals - as a rule, leave a deep mark on the soul of a person and sometimes lead to aggression, contempt, anger, stress, addiction to alcohol, masochism. Such a numb, closed state of a person can be called spiritual death. We want to emphasize that spiritual death, which does not allow a person to live the way he would like it, when he does not have enough strength for this (when libido is weakened), first of all, allows a person to stay alive physically and continue to live by the power of such a mortido.

In other words, a person does not live by the energy of libido, but relying on the energy of mortido, and therefore remains alive. That is, when the libido energy is weakened or inactive, a person does not abstract, does not disappear. It just takes power from another energy. If for trees winter serves as a time of accumulation of strength for future flowering, the period of spiritual death serves as a source of accumulation of strength for a person to recover as a person.

Therefore, spiritual death, firstly, is a necessity in order to remain alive, and secondly, it is a period of accumulation of strength. Spiritual death can also be viewed as a break with the

external environment, lack of strength and inability to respond to the conditions and requirements of the external world with spiritual and physical actions. It can be called both spiritual devastation and withdrawal into oneself, there is no difference in that. But in both cases, it is a kind of lesson for a person. The main thing to learn to float is to try to drown. This is the opinion that took place in the exotericism of the Ancient East. Jung mentioned this in his article on the Soy archetype. After a certain time, a spiritually dead person gains strength, the libido returns him to the full strength of life, and he can no longer remain the same as he was before. During the period of spiritual death, he is transformed into another person (reborn). As already noted, life is a gradual birth, coming from the mother's womb into this world is in itself, the main thing is that a person forms himself. But at the same time, there is a subtle nuance - not everyone correctly learns the lesson of spiritual death, spiritual death becomes a means of renewal, the transformation only for hearts that understand and realize it.

Touching upon the topic of spiritual death and its role in the process of human transformation, we set a goal to draw attention to the importance of the motives of transformation, which cannot be measured by the criteria of totemism and chauvinism in folk tales. For this, we considered it necessary to trace the motives of the transformation in the fairy tale "Sangisopoltosh" ("Stone block"). First of all, it should be noted that the tale appeared at a later stage. This is evidenced by the vital aspects of the content of the fairy tale, the connection with reality (the poverty of the old man and the old woman, the lack of funds for the marriage of a son, the demand for a large kalym from the bride). At first glance, it seems that the events take place not in the epic period inherent in folklore and in epic space (a guy's lack of the opportunity to marry at 25), but in time and space described in fiction. But with the development of events, the tale reveals its mythological layers. First of all, this is manifested by the exit of the peri girls from the chest, their bewitchment by the old woman. Special attention should be paid to how the old woman spins the yarn. Symbols and images associated with the spinning wheel, the mill, as a rule, signify fate. A peculiar meaning lies in the fact that the guy, having passed many roads and trails, nevertheless meets a girl-peri in the house of an old woman who is spinning yarn. But this is not the main thing in the topic we are considering, and therefore we will not focus on this. The guy takes the peri girl to his house to show her parents, the girl is fraudulently declared dumb, thrown into the house and she drowns. From this moment, the motive that we are investigating begins. The dumb girl, having put on the clothes of the peri girl, transforms into her and leaves with the boy, and the peri girl, reincarnated as a camel, follows them.

Thus, she wishes to stay close to the guy. The dumb girl does not allow her to take the camel with her. Then the girl-peri transforms into a gazelle. But the mute again deprive the guy of the opportunity to take the gazelle with him. As noted in Birkheiser Oery Sybil's article "Mother. Archetypal images and transformations ", the true nature of man is instinctive as in the world of birds and animals. This is especially evident during childhood. In literature and folklore, the image of the Velky Mother, reflecting the initial instinctive (unconscious) essence of man, indicates a community with nature, plants, birds. With the transition of a person to conscious life, the emergence of his "ego", this community was lost. "Animals and birds, having no consciousness (ego) in comparison with man, unmistakably carry out their actions. And therefore, the images of animals seen in a dream are positive. In most cases, sleep symbols are interpreted as a contradiction of the soul to the egocentrism of a person, as a response (challenge)

of his inner nature. Images of birds and animals in dreams and fairy tales reflect the inner harmony in a person" [5].

Not without reason in fairy tales, the image of the Mother is associated with nature and the animal world. In most cases, the images of a woman, a mother are presented by nature protectors. At the same time, the image of the Mother, reflecting the physical and instinctive unconscious state of a person, also indicates the harmony of Spirit and Matter. Birds and animals instinctively obey the changes taking place in the world and do not make mistakes. Achieving harmony, integrity is not a process, it is a return to the initial instinctive spiritual state. In fairy tales, the transformation of a person into an animal is a display of superconscious power. Transformation into an animal indicates the loss of a person's human appearance, and above all - a distance from consciousness and his "ego". The transformation into an animal also indicates that a person instinctively begins to live in ignorance, unconsciously, therefore he becomes a victim of the demands of consciousness (Ego). Touching upon the topic of spiritual death, we said that a person loses activity, lives without listening to his own consciousness. That is, he goes into himself (goes into the shadows, lives in ignorance), as a result, his conscious activity is lost, unconscious life leads to uncontrolled actions. Such a spiritual death, as a rule, occurs as a result of dissatisfaction with the needs of the libido, Aueri Sibill also mentions that the transformation into an animal is a victim of human desires. It is known that the archetype of the Mother is not only the initial, instinctive, unconscious state but also the harmony of Man and matter. And therefore, the motive of transformation, together with the states indicated above, also means the protection of the hero from inevitable disasters. In this aspect, Aueri Cybill provides an analysis of the Brothers Grimm fairy tale "Mermaid in the Pond". In a fairy tale, to save a drowning miller and his wife from inevitable death, an old witch turns them into frogs. Thanks to this, the miller and his wife remain alive. OerySibill explains this transformation by the fact that when a person is threatened with danger, the subconscious acts as a help. Here, the transformation of the miller and his wife into frogs indicates that at the moment of the danger they controlled the subconscious.

Consequently, the feeling of the subconscious, strength, control and intuition become the main helpers of a person in the most desperate situations.

Spiritual death can also be viewed as an aid to the subconscious force during a period of decline, a decrease in libido energy, a threat to spiritual and mental activity and, most importantly, when the unity of these three concepts is violated.

In fact, spiritual death is the transformation of a person. In the fairy tale, the transformation of a girl first into a camel, then into a gazelle, into a tree primarily protects her from threatening danger. That is, physically it does not completely disappear, but for a certain time, it lives in a different form. Through this transformation, she preserves her life and looks for an opportunity to achieve her goal - to stay close to the guy (in the form of a tree). Consequently, transformation (as well as spiritual death) occurs at the moment of the danger threatening life, feelings, goals of a person, and, at the same time, serves to preserve his life.

The process noted by Aueri Cybill as the transition of the initial instinct into a spiritual state, we considered as the closure of the soul, withdrawal into oneself.

Inaction in relation to the surrounding world in the process of such a transformation, activation of feelings, opinions and experiences are the cause of a person's renewal. A person who has tried

to return to the initial instinctive spiritual state - to harmony with the cosmos - can no longer be the same as he was before.

Outwardly, he does not change, but changes spiritually become different. In other words, after spiritual death, he is reborn, becomes a different person. What was the reason for the peri girl's reincarnation?

CONCLUSION

At the beginning of the tale, the guy could not marry because of poverty, he was forced to leave the village, and for a certain time, he served in the house of an old witch woman. During this period, the guy undergoes tests (initiation). Overcoming the test to achieve the location of the peri girl was also a gift of fate for the guy (we noted that the old woman is a symbol of fate). In connection with the tricks of the dumb girl's tricks and tricks, the peri girl also overcomes the test, this proves that she deserves this guy. From all this, it follows that overcoming any test reflects transformation, reincarnation into a new person. Such a renewal is an illumination of the mind, an opening of the soul, a change in views, a different attitude towards the world and man.

Through spiritual death and transformation, a person passes into a qualitatively new stage of spirituality. This spiritual stage - in comparison with the previous one - is more conscious, lighter, it is harmony with oneself, other people, the world, space. Through reincarnation, spiritual death and rebirth, a person consciously goes to achieve integrity - an initial instinctive spiritual state, harmony of soul, mind and desires.

ABSTRACT

The technique of petrophysical modelling of granular reservoirs is described, which consists in applying universal (for any litho type, geological age, depth and thermodynamic conditions of occurrence) analytical descriptions of the FES interconnections (effective porosity, residual water saturation) with three characteristic parameters (water holding capacity of the matrix and cement, the porosity of the matrix) according to the analysis of core samples. Characteristic parameters take into account the variety of factors that reflect the conditions of formation, occurrence and epigenetic transformations of reservoirs.

INTRODUCTION

Problem Progress in the development and improvement of geophysical information and measurement systems is taking place in two directions:

- To increase the number of new methods and appropriate tools;

- The use of conventional, well-known methods and technical means in unconventional, innovative ways.

The first direction can be considered almost exhausted of course, and for it, further improvements of methodical, metrological and interpretation-algorithmic support remain relevant. The methods of interpreting these many well logging methods are empirical, corrective (pallet) that have no strict scientific justification, with vague assumptions, limits of applicability and exact characteristics. It is the methodical errors that make the main contribution to the resulting error of the quantitative petrophysical interpretation of the good logging data.

A striking example is the usual integral method of natural radioactivity (gamma method, GR). The oldest of the nuclear-physical methods-method of clay-ism - since the 40s of the last century in the mandatory complex of well logging and widely used in domestic and foreign practice. The thorium and the application of this seemingly well-studied method are devoted to hundreds of publications. However, the method used both here and abroad to interpret the data of the GR is riddled with empirical and unproven provisions - from the way of taking into account the technical conditions of measurement to algorithms of quantitative determination of clay. Until now, the geophysical world defines clay by the "parabola of V.V. Larinov." This dependence was obtained in the laboratory by measuring core samples with several basic violations of the basic condition of obtaining interpretive dependencies to ensure the maximum proximity of the metric conditions of laboratory and real well measurements.

The lack of well-founded petrophysical models in the study of complex collectors had to be compensated by the construction of empirical multidimensional petrophysical bonds based on measurements on core samples in the laboratory. The tool for obtaining such connections was the method of statistical comparisons of "core-core", " well logging -core" requiring a huge number of samples with separation of their age, lithotypes, saturation, depths of deposition, the morphology of capacitive space, granular fractions, the content of clay minerals, etc.

MATERIALS AND METHODS

In studying oil and gas collectors, the interpretation of well logging data is focused on the definition of porosity. But for complex collectors porosity turned out to be a disinformation parameter: a layer with high porosity may not have effective porosity, that is, not to be a collector.

The empirical level of cognition of the properties of complex collectors is reflected in the appearance of terms such as "multidimensional petrophysics" and "multidimensional interpretation" (as well as the names of complex, i.e. incomprehensible ones). One of the main problems of petrophysics is the transition from the study of empirical dependencies to the construction and study of theoretical petrophysical models of collectors to then combine them with the interpretive and petrophysical models of well logging methods.

The unambiguous sign of collectors is the presence of effective (dynamic) porosity. In order to justify the effective parameters of well logging methods, it is necessary to consider the appropriate petrophysical model.

In the paper, models of residual water saturation and effective porosity were proposed. These petrophysical models are an analytical description of the relationship between the various macroscopic filtration-capacity characteristics of collectors and its three synthetic characteristics

of parameters: the water-saving abilities of the matrix, cement and the porosity of the matrix. The issues raised underscore the urgency of conducting petrophysical studies to identify stable patterns that need to be studied to adjust the petrophysical models to the individual characteristics of a particular collector.

Let's consider the rules and ways of determining the characteristic parameters of granular collectors based on core analysis using petrophysical models. Models allow to separately identify and study the properties of the rock cement matrix.

Petrophysical modelling collectors

The dependence of the residual water saturation ratio of collectors on their porosity $k_{rw}(k_p)$ is one of the most important in petrophysics oil and gas collectors. Knowledge of this dependency is necessary for the selection and evaluation of collectors, the calculation of recoverable reserves, drafts, etc. This dependence reveals petrophysical models of effective porosity. The diversity of collector types and their filtration-capacity properties is manifested in different types of dependencies.

Analysis of the fields (polygons) of the correlation of $k_{rw}(k_p)$ (Figure 1, 3) using appropriate petrophysical models allows us to obtain valuable quantitative and qualitative information about the collector and determine the following characteristics:

- The porosity of the M matrix;

- The water-keeping capacity of the matrix is the µ0;

- The water-powering capacity of the cement Δµ.

The full water-holding capacity of collectors, equal to the sum of the water-holding abilities of the matrix and cement (Figure 1):

$$\mu = \mu_0 + \Delta\mu \qquad (1)$$

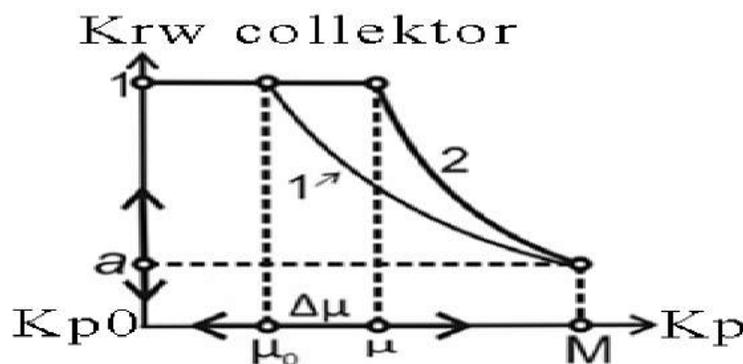
The swollen ability of cement (swell factor)


Figure 1. Scheme of residual water saturation dependence on matrix;

1 - Lower (minimum) enveloping correlation fields or carbonate cement line (Δμ=0);

2 - Upper (maximum) enveloping the mineral component of cement, with maximum water-saving capacity;

a - minimum (non-reducing) residual water saturation equal to a= μ_0/M; μ_0; $\Delta\mu$, μ - water keeping properties of the matrix, cement and collector in general;

M-porosity of the matrix

- Type of cement (carbonate or clay);

- Identify the heterogeneity of collectors in the mineral composition of the matrix and assess the extent of its secondary transformation;

- To identify the heterogeneity of collectors on the mineral composition of cement, as well as the presence of swollen minerals that affect the change of porosity and permeability in the development process (e.g. montmorillonite) even in the absence of X-ray analysis.

It should be noted that the values of the water-holding abilities of the matrix μ_0 and the $\Delta\mu$ of cement are determined independently, and the value of the μ_0 does not depend on the composition of the matrix. Directly according to the core analysis, without the use of a petrophysical model of collectors, the value of the μ_0 cannot be determined.

Collectors with monomineral matrix and cement can be considered simple. For them, the concept of "conditioning" values of petrophysical characteristics, which have fixed values, makes sense; and the dependence of $k_{rw}(k_p)$ and $k_{rw}(k_{p.\ ef})$ are close to functional and with high accuracy are described by analytical models:

$$K_{rw} = (\mu_0 + \gamma M)/K_p - \gamma, eсли M \geq K_p \geq \mu \qquad (2)$$

$$K_p K_{rw} = \mu - K_{p\ ef}\Delta\mu/(M - \mu_0) = \mu - K_{p.\ ef}\gamma/(1+\gamma) \qquad (3)$$

At the current value of the $k_п$, effective porosity is equal to

$$K_{p\ ef} = K_p(1+\gamma) - (\mu_{0+}\gamma M) \qquad (4)$$

where - $K_p \geq \mu$, $\gamma = \Delta\mu/(M - \mu)$.

The characteristic parameters of the models are three independent values: {$\mu_0 \Delta\mu$ and M}. From (3) it follows that the linear regression of the work of $k_{rw}(k_p)$ on the effective porosity throughout the array allows determining the parameters of the μ ($\Delta\mu$ и γ respectively) and μ_0 together with their scattering, due to the heterogeneity of the collector. The maximum value of the effective porosity ($K_{п.\ эф}^{max}$) of the collector is achieved at $K_п = M$, it is equal;

$$K_{p\ ef\ max} = M - \mu_0 \qquad (5)$$

The maximum clay of the collector is equal to

$$K_{clay}^{max} = M - \mu \qquad (6)$$

The B swell factor is defined as the ratio of swollen cement volume to dry cement volume:

$$B = (M - \mu_0)/(M - \mu) = 1 + \gamma \qquad (7)$$

Simple collectors in modern practice do not come out often. For so-called complex collectors, not homogeneous in the composition of the matrix and cement, the values of μ_0 and $\Delta\mu$ are not fixed, but distributed in wide ranges (Figure 1-3), because of which the above comparisons from

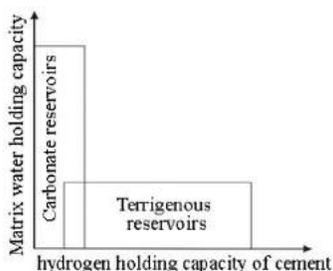
dependencies turn into fields of correlation (polygons) or trends with a very low (insignificant) correlation ratio. Changes in the ratios between the content of clay minerals in the matrix or cement lead to changes in the specific surface, double electrical layer, absorption capacity, cation exchange capacity, swelling indicators, hydrophilicity, etc. The ranges of these changes determine the degree of heterogeneity of collectors, which is manifested in the scattering of points on the correlation graphs of $k_{rw}(k_p)$ (Figure 1) and k_{rw} k_p $(k_{p. ef})$.


Figure: 2. Difference between the properties of terrigenous and carbonate collectors on the plane and the water-holding abilities of the matrix and cement

The highly porous and permeable collectors are defined by a variety of factors that characterize the conditions of formation, layering and epigenetic transformations. This means that porosity and permeability values are defined in a certain configuration space, the dimension of which is determined by the number of influencing factors. We cannot list all these factors (generally speaking, interconnected) and name the exact number of them due to multidimensionality of petrophysics.

The petrophysical models, analytically describing the basic properties of the granular collector, reduce the number of influencing parameters to three synthetic: μ_0 $\Delta\mu$ M. But there is no loss of information, and the completeness of the description of its diversity of the collector's properties is maintained.

Using in (2) the relationship between porosity and relative clay of $k_p = M (1-Ŋ)$, it can be shown that there is a ratio

$$\Psi = 1 - \eta^*, \tag{8}$$

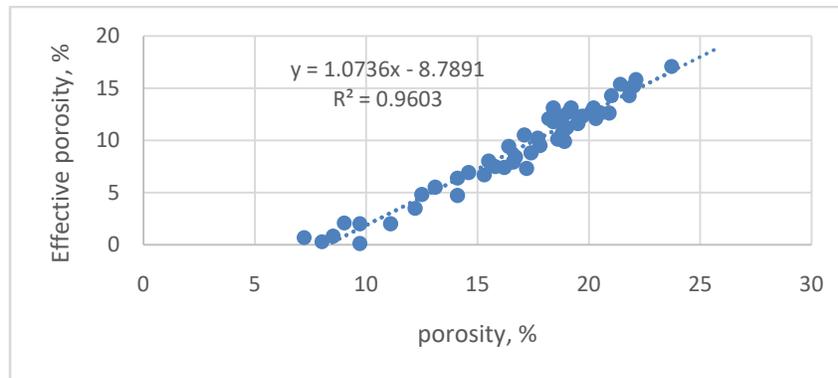
where ψ и η^{*} are the values of effective porosity and relative clay, rationed to their maximum values. Equations (2) - (8) universal in the sense that they are fair to any granular collector and act in the same way as physical laws - regardless of geographic coordinates, geological age, thermodynamic conditions and depth of the environment. Changes in the individual properties of the collector (his "image" in the multidimensional configuration space) take into account not changes in the analytical structure of the models, but changes in the magnitude of the synthetic characteristic $\{\mu_0 \Delta\mu$ и M\} parameters included in them.


Figure.3. Link K_p and $K_{p\,ef}$ for IX-XIII reservoirs in a well of one of the Gasli field.

When we move on to the interpretation algorithms, it turns out that the interpretive parameters of well logging methods are directly expressed through a non-dimensional combination of the current porosity of the $\mu_0\,\Delta\mu$ and M, included in the petrophysical invariants ψ (or η^*), relative to which the interpretation algorithms become one-dimensional. In physics and mechanics, these properties of systems and processes are called likeness or auto-modelling.

For heterogeneous collectors, boundary (or conditioning) parameters do not have fixed values that uniquely characterize collectors, they smear in such wide intervals that they lose physical meaning. The problem of singling out such collectors and quantifying their porosity and permeability still does not have a reliable solution. It is no coincidence that the reserves of the largest deposits are calculated repeatedly.

The fundamental differences between carbonate and terrigenous collectors in the value of the water-holding abilities of the matrix and cement are illustrated by figure. 2. The complexity of the first is due, first of all, to the complexity of the morphology of the capacitive space, which causes the water-keeping capacity of the matrix to vary in a wide range - from-1-1.5% in the granular limestone of the undersea thickness of the Tengezic deposit to 17% in hair-capillary limestones of Chechnya-Ingushetia. The water-keeping capacity of carbonate cement is close to zero.

The complexity of terrigenous reservoirs is due to the complex mineral composition of clay cement, which is manifested by a wide range of changes in the water-keeping abilities of cement - from zero for carbonate to 18% for cement hydro-nuclear-montmorillonite composition. The water-keeping capacity of the matrix is small and varies in a narrow range. The reader will easily generalize the scheme in case of carbonates with clay cement, carbonated sandstones with a complex matrix structure or the most complex case of volcanogenic sediments with mixed properties.

RESULTS AND CONCLUSIONS

The method of qualitative and quantitative analysis of the results of laboratory measurements of good collectors on core samples is described, which provides a significant increase in the informativeness of petrophysical studies. The technique is easily formalized (algorithmized) and can be recommended for inclusion in the daily practice of core study.

Analysis of the correlate fields of $k_{rw}(k_p)$ and $k_п$ k_{rw} ($k_{p.\ ef}$) using appropriate petrophysical models allows to determine the porosity of the matrix; the water-keeping capacity of the matrix, cement and collector in general; the swollen ability of clay cement (swell factor); type of cement (carbonate or clay); to identify the heterogeneity of the collector on the mineral composition of the matrix and to assess the heterogeneity of collectors on the mineral composition of the matrix and assess the extent of its secondary transformations; to identify the heterogeneity of the collector in the mineral composition of cement, as well as the presence of swollen minerals, influencing changes in porosity and permeability in the development process.

The water-keeping ability of the matrix does not depend on the mineral composition of the cement, and the water-keeping ability of cement does not depend on the composition of the matrix.

The combination of factors that cause the heterogeneity of the matrix and cement by composition and properties determines the dynamic ranges of the changes in the parameters of the μ_0 and $\Delta\mu$, which is why on the graph of correlation of the k_{rw} (k_p) there is a scattering of points. Although the $k_{rw}(k_p)$ juxtaposition, like other petrophysical bonds for complex collectors, is a testing ground rather than a functional dependence, it contains a wealth of qualitative and quantitative information about the collector.

We give thanks to the Honorary Academician RANS Prof. V. M. Dobrynin for his interest in work and discussion of the results.

ABSTRACT

This article discusses the issues of wear resistance of gears, the assessment of wear of machine parts. Improving the performance properties of surface layers of machine parts. Calculated dependences for determining the wear resistance of gears of machine units.

KEYWORDS: *Gear Drive, Endurance, Hanging Wear Resistance, Contact Stress, Precision, Coating, Mating.*

INTRODUCTION

Many machines and mechanisms are used in enterprises and industries of the republic, many of them are used in agriculture and water management, in construction, etc. Most of this equipment is operated in unfavourable and severe conditions. At the same time, intensive contamination of power transmission lubricants occurs. Also, the power units of machines experience frequent and periodic heavy loads, which causes wear of parts [1-3]. Gears are one of the main components of machinery and industrial equipment. The number of gears is (1):

- in car transmissions from 25 to 30%;

- in various tractors 35-40%;

- in combines and other low-speed machines 55-60%.

Gears operate in an olive medium with particle concentrations of up to 2%, circumferential speeds of up to 2 meters per second, and contact loads of up to 1500 MPa. As a result of the impact of abrasive particles, about 80-85% of machine parts fail due to wear. In the works of Uzbek scientists, it was determined (1; 2;3:) that during the operation of machines, about 34.2% of gears are rejected due to abrasive wear, discolouration as a result of material fatigue, friction surface scratches, plastic deformation and tooth breakage. To reduce friction, more than 100 million tons of lubricants are consumed annually in the world, including about 40 million tons of lubricating oils [4-7]. The effects of external friction in the dynamic components of the equipment are usually negative. the relative amount of wear, for example, the ratio of the loss of mass of the machine or product to the initial mass, is very small, but the wear of the transmission and rotation of the teeth of the power gears leads to the failure of the entire machine or product as a whole. Losses of funds in the engineering industry of developed countries due to wear and friction reach 4-5 % of national income [8-16]. About 80-90 % of machine failures occur due to wear and tear of their components and parts. For these reasons (2) the number of failures of power transmission units is as much as 43.3% of the total number of failures. And the cost of funds for the elimination of failures is 54.3% of the total cost of repairing machines.

The main part

Operational and technological factors affecting the wear resistance of gears of machines and aggregates. The tendency to strive to increase the productivity of modern machine conditions is to increase their energy saturation, this is due to the operation of individual units and units with high loads and significant speeds. With an increase in the duration of operation, the number of failures occurring in gears, which occur due to wear of the gear teeth, increases. The analysis of defects of parts of 42 motor graders DZ 99 during capital repairs carried out by scientists of TSTU (1) showed the following percentage ratio of the causes of gear failures:

- due to wear on the thickness of the working surfaces of the gears – 34,2%;

- due to fatigue painting – 20,1%;

- because of the setting – 12,5%;

- due to Plastic deformation – 8,7%;

- due to broken teeth – 5,8%;

- due to other types of damage -4,7%;

As can be seen from the analysis, the percentage of failures due to tooth wear is significant. For these reasons, the issue of wear resistance of closed gears of machine units has become one of the main problems of their reliability.

THE MAIN TECHNOLOGICAL TASKS.

Dimensional accuracy. the most accurate element of the gear wheel is the hole, which is usually performed according to the 7th quality if there are no special requirements.

Accuracy of the form. In most cases, there are no special requirements for the accuracy of the surface shape.

Accuracy of relative positioning. Misalignment of the initial circle of the gear wheel relative to the landing surfaces is allowed no more than 0.05–0.1 mm. The non-perpendicularity of the end face to the axis of the hole or shaft (runout of the ends) is usually assumed to be no more than 0.01-0.015 mm per 100 mm diameter. Depending on the operating conditions of the wheel, this value can be increased or slightly reduced.

The hardness of the working surfaces. The teeth of the wheels operate under variable shock loads and are subject to wear, so it is often necessary to increase the hardness of the surface of the teeth while maintaining a softcore. To increase the hardness of the surface layer, the most commonly used:

- cementation – carbon saturation of the surface layer of the teeth of wheels of low-carbon steel (with a content of not more than 0.25% c), layer thickness h=0.1...3 mm. hardness after heat treatment hrce45 ... 64;

– cyanidation is the saturation of the tooth surface with both carbon and nitrogen in molten cyanide salts. Layer thickness h= 0,5...0,8 mm, the hardness after heat treatment HRC 45...53.To obtain the desired structure and properties of the material of the core teeth, normalization is performed (880-900 °C), and for the surface layer quenching (760-780 °C) with low tempering.

the mating surfaces of the gears must have a common normal passing through the engagement pole. For involutes gearing, the general norm is a straight line tangent to the main circles of the gears and any point of contact of the gearing is on this straight line. This straight line is called the engagement line. The extreme points of the working section of the line of engagement K_1 and K_2 are located at the intersection of the straight $B_к$ B_w with the circles of the protrusions of the leading and driven gears (Fig. 1,). The angle between the line of engagement and the perpendicular to the line of centres O_k O_w, restored at the pole of engagement P, is called the angle of engagement. at the point of contact p, the projection of the circumferential velocities of the driving and driven gears on the line of engagement are equal to each other. Projections of the circumferential speeds of the driving and driven gears on the common tangent of the working surfaces of the teeth, perpendicular to the line of engagement, are not equal. At point C, the velocity component of the drive gear V_w tangent to the profile is greater than the similar velocity component of the driven gear V_k. Thus, when friction occurs, the surfaces of the mating teeth simultaneously roll and slide one relative to the other. The total rolling speed of the profiles is equal to the sum of the tangential components of the speeds of the driving and driven gears:

$V_{sum} = V_W + V_k$, m/s (.1)

The sliding speed of the working profiles is equal to the difference between these speeds:

$Vsl = V_W - V_k$, m/s (.2)

The speeds V_W and V_k are also equal to the speeds of movement of the line or contact point relative to the working surfaces of the teeth of the drive and driven gears.

For any point of the engagement line: $V_W = {}_{PW}\omega_{W;}$ $V_{k= Pk}\omega_k$

Where $\omega_{W,}$ ω_k - accordingly, the angular velocities of the driving and driven gears, 1/c;

W_P $P_{k -}$ accordingly, the radii of curvature of the profiles of the driving and driven gears at the point of their contact, m;

Angular velocities can be expressed in terms of gear speeds:

$\omega_W = 2 \pi n_2 \omega_k = 2 \pi n_1$

where n_2 n_1 - the speed of the drive and driven gears; ob/m

Then $V_W = 2_{\pi\, n\, W\, PW}$ м/c; $V_{k=} 2_{\pi\, n1}\, P_{k\,1}$ м/c.

In involute gearing, the circumferential velocities of the gears are the same on both the initial and main circles.

At a constant angular velocity of the gears, the engagement speed Vc (the speed of movement along the engagement line of the tooth contact or point C) is equal to the circumferential speed along with the main circles and is constant along the entire engagement line. Engagement value: Vo = V cos, м/c

Where: V – the peripheral speed of gear wheels in the initial circles, m/s; α – engagement angle, grad.

In the process of wear of gear teeth, the volume of deformed gear material depends on the depth of penetration, the radius of volumetric curvature of the roughness protrusions, the path of relative sliding of the teeth, the number of roughness protrusions located on the contact length and participating in the process of deformation of the friction surfaces. According to the diameter of the contact spot embedded in the friction surface of the counter body, the roughness protrusion and the load acting on it (P) during plastic contact, there is the following relationship(1,2,3):

$$P = \frac{\pi a^2 c N \delta_T}{4}, H,$$

where a is the largest diameter of the contact spot of the embedded roughness protrusion, m;

c – coefficient depending on the shape of the protrusions and the hardening of the material;

N – the number of protrusions of roughness located on the working length of the teeth.

For the calculation, it is assumed that the dimensions of the protrusions of roughness in height and volume radius of curvature are the same. They are arranged sequentially along the length and height of the tooth. During friction, these roughness protrusions are completely embedded in the friction surface of the counter body. According to the specified distribution condition, the number of protrusions of roughness located on the length of the gear teeth is equal to:

$$N = \frac{L}{a_{w,k}}$$

Then the load coming on one protrusion of roughness:

$$\frac{Pa_{wk}}{L} = \frac{\pi a^2 c \delta r}{4}$$

Where p is the load transmitted by the gearing, n;

$бr$ – the yield strength of the gear material is MPa.

The amount of wear depends to a large extent on the pressure of abrasive particles (microparticles of destroyed metal in the gearbox crankcase oil) on the wear surface. This is explained by the fact that with increasing load, the depth of penetration of active abrasive particles that leave scratches on the surface of the gear teeth increases.

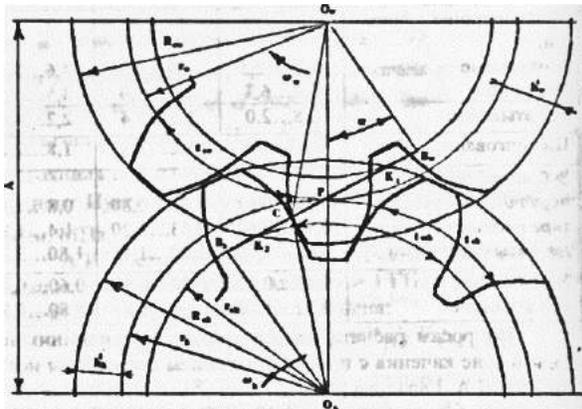
With abrasive wear, with a change in the ratio of the hardness of the abrasive and metal, the nature of wear changes significantly. This ratio is estimated by the Kt coefficient: where K_m is the hardness of the metal; K_a is the hardness of the abrasive.


Figure 1.Scheme Of Calculation Of Geometric And Kinematic Parameters Of Gearing.

The ratio of the hardness values of the wear material and the abrasive, reflected by the K_m coefficient, along with other factors of abrasiveness, determines the physical nature of the interaction of abrasive grains with the surface layer of the material. At K_m< 0.6 - 0.7, there is a prerequisite for direct destruction of the surface layer by cutting or tearing. In the case when K_m> 0,6 - 0,7, the process of destruction becomes polydeformational or fatigue character. In conditions of abrasive wear, the resistance of a material to the destructive action of abrasive particles is the most important factor determining its wear resistance. The higher the material's resistance to breakage or shear, the more reason to expect increased resistance to fatigue and polydeformation processes of destruction, although they are more sensitive to the structural state of the material, to the softening effect of the medium. With the same hardness of the part after heat treatment, double hardening of HDPE with intermediate cooling to 100...200° C in the air increases the wear resistance of friction units compared to nitrocementation with tempering at a temperature of 220±20°C.

Influence of the type and properties of additives to the oil units of machines on the wear resistance of gear gears. High contact loads on the gear teeth are typical for the gears of transport vehicles. The instability of the gear modes creates unfavourable conditions for the development of a hydrodynamic type of lubrication. The study of the issues of wear and jamming of gear teeth, transmission units of machines when they work in oils without additives indicates that hydrodynamic lubrication for these friction units is not typical. Increasing the wear resistance of the gear teeth of transmissions operating under boundary lubrication conditions can be achieved using anti-wear and extreme pressure oil additives(1).

There are several methods of strengthening the teeth of power transmission gears to increase their wear resistance. For example:

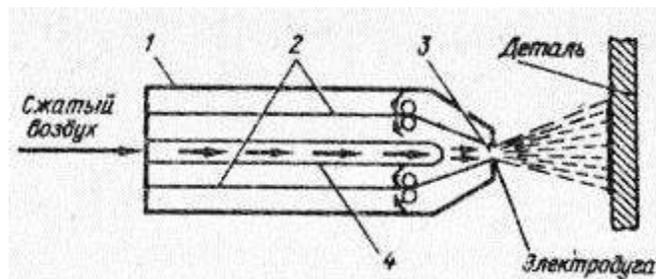
Sputtering (metallization) - the process of applying molten metal to the surface of the product. It can be carried out with compressed air or inert gas. The essence of the method using compressed air is that the particles of molten metal, moving at high speed, together with the airflow hit the surface of the protected metal, adhere to it, forming a metal coating. In electro metallization (Fig. 2) using a special device is wire 2 to the nozzle body 1, where electric arc wire 3 is melted and sprayed metal droplets are picked up by a jet of compressed air flowing along the guide tube 4. Drops of liquid metal that have not had time to solidify stick to the surface of the metallized part. This method has two significant drawbacks. First, the coating turns out to be porous, since the frozen metal droplets lie on top of each other. Secondly, the adhesion of the coating relative to the base is rather weak, since a hot drop of small volume, hitting a cold surface, cools down quickly and strong mutual diffusion does not have time to occur. In this regard, spraying with compressed air in the aircraft industry is of limited use.


Fig. 2. Scheme Of The Metallizer Device.

Plasma spraying-it is formed in the area of an electric arc through which a neutral gas, such as argon, is passed, and argon is fed through the pipeline 3 to the plasma jet 2 coming out of the plasma torch 1. The argon jet is fed through pipeline 4 with the metal powder that we want to spray. Together with the jet 5, this powder is fed to the surface of the coated part 6. The practice has shown that plasma spraying is a very effective method of metallization.

Hot-dip galvanizing of metal structures is the coating of metal with a layer of hot zinc to protect against corrosion. Zinc coating also provides electrochemical protection of the metal, on the surface of galvanized structures, a ferrocene alloy is formed – such protection and the duration of the "life" of the metal is not able to provide any other polymer or metallized coating.

Metal coatings, hot dip. To obtain metal protective coatings, various methods are used: electrochemical (electroplating), immersion in molten metal, metallization, thermal diffusion and chemical (see 52). A zinc and tin coating is obtained from the melt. Most metal coatings are applied either by immersion in a bath of molten metal (hot coating) or by electrodeposition from aqueous solutions of electrolytes. Metallization is carried out using a special gun in which the metal is melted, and small drops of metal are applied to the surface to be coated, while the coating is characterized by porosity. This method can produce layers of almost any thickness and with good adhesion to the base metal. The advantages of such coatings include the ability to apply to assembled structures. In some cases, the pores are filled with thermoplastic resins to increase the corrosion resistance of the coating. In the diffusion coating method, the product is placed at elevated temperatures in a mixture containing metal powder, and the applied metal is diffused into the base metal. In this way, aluminum and zinc coatings are obtained. Metal coatings are hot-applied to the product or work piece by immersing them for a few seconds in a

bath of molten metal. This method is applied to the products zinc (mel. = 419°C), tin (mel. = 232°C), lead (mel. = 327°C), aluminum (mel. = 658°), e.t.c. metals that have a low melting point. Before applying the coating to the product, it is treated with a flux, for example, consisting of 55.4 % ammonium chloride, 6 % glycerol, 38.4 % zinc chloride. The flux protects the melt from oxidation and, also, removes oxide and other films from the surface, which improves the adhesion of the metal to the coating metal. The flux protects the melt from oxidation and, also, removes oxide and other films from the surface, which improves the adhesion of the metal to the coating metal.

ABSTRACT

In the article, in order to increase the efficiency of sawing equipment used in PTK, reduce costs and obtain a quality product, the separation of seed fiber from saw teeth was analyzed and tested using mechanical (brush drum) method instead of aerodynamic (air nozzle) method. Using this method, the expected result was achieved and recommended for production.

KEYWORDS: *Pneumo-Mechanical Spinning, Thread, Twist Holder, Funnel, Roller, Camera, Air Nozzle, Working Chamber, Raw Material Roller, Brush Drum, Saw Cylinder, Seed Cotton, Fiber.*

INTRODUCTION

The raw material of cotton consists of fiber and seeds, and the mechanical process of separating fiber from seeds is called ginning. Intermediate gins are used to separate medium-fiber cotton from seeds. sawing equipment is the main technological machine of the ginnery, whose function is to separate the cotton fiber from the seeds. Arral demons mainly separate medium-fiber cotton from fiber. They are divided into single-chamber and double-chamber (Moss Gordin firm) demons, depending on the number of working chambers.

To separate the fiber from the saw tooth, the gin is mainly divided into upper separation and lower separating gins, depending on the location of the saw cylinder relative to the horizontal axis, using a brush and air, as well as air [1-3].

Cotton fiber and seed husk are capillary porous materials. The bark is mainly composed of wood cells, the thickness of which is $0.3 \div 0.4$ mm. The seed kernel contains protein, carbohydrates and other colloidal-dispersed substances. It can be included in the type of colloidal materials.

MATERIALS AND METHODS

High humidity in raw cotton has a negative impact on the performance of machinery and equipment involved in the production process.

Today, the goal of all manufacturers is to produce high quality competitive products. For this, it is necessary for primary processing enterprises to supply high quality fiber. Therefore, the increase in fiber quality is mainly due to the efficient operation of the ginning department.

The correctness of the process of ginning raw cotton depends on the following indicators:

- fiber length;

- Mechanical damage to fibers and seeds;

- fiber color, etc.

Cotton fiber is the main product of cotton ginning plants, and its quality depends mainly on the condition of production machines and production technology. Non-compliance with the requirements for production machines leads to damage and breakage of the fiber, a decrease in the length of the fiber, mechanical damage, as well as a decrease in strength, an increase in fiber defects, an increase in fiber fluff.

The gin machine is considered to be the main equipment of cotton gins, and the surfaces of its working bodies have a very negative impact on the fiber quality.

The main working part of the saw blades consists of the saw cylinder and the fiber separation equipment. As a result of the interaction of these two working parts with each other, fibers are separated from the saw teeth, i.e. the seed cotton falling into the working chamber of the jinn is carried by the saw teeth rotating on the seed comb and dragged along the saw blade to the working part of the sawmill [4-7]. The fibrous seeds attached to the saw teeth attach to other fibrous seeds and pull them as well, so that as a result of the rotation of the saw and the adhesion of the seeds to each other, the cotton mixture begins to rotate in the working chamber.

Thus, a raw material roller is formed, which rotates in the opposite direction to the rotation of the saw, which continuously provides the saw teeth with fiber.

The fibers attached to the saw teeth are passed between the columns, and the seeds cannot pass through the space between the columns, at which point they are separated from the fiber. The separated fibers pass through the grate hole and into the saw tooth of the air chamber nozzle. Along with the air coming out of the nozzle, the fiber goes to the cleaner, then the fiber goes from the discharge pipe to the condenser.

The seeds separated from the fibers are separated without sticking to the cotton roller and are removed from the machine through the columns and removed from the machine.

The amount and fiber content of the seeds that are germinated are regulated and controlled by the seed comb. The continuous supply of seed cotton to the working chamber, the uninterrupted

removal of fiber and separated seeds from the working chamber, ensures the stable operation of the saw blade.

Today, 4DP-130 (Figure 1) and 5DP-130 (Figure 2) saw gins are widely used in most primary cotton processing plants. In these demons, the number of kolosniks is 131, and among the kolosniks there are 130 saws. Gaskets are placed between the saws, the width of the gaskets ensures that the saws are located between the two columns.

The profile of the gin working chamber is designed to form a rotating working roller (Figure 1.4). The following technological requirements are set for the working chamber:

- When the elements are exposed to cotton, the seeds should not be injured and defects should not be formed during ginning;

-The working chamber profile should have low resistance to the movement of the working roller.

- Barriers to the entry of seed cotton, fiber and seeds into the working chamber should be as low as possible.

Seed fiber separation machines in foreign ginneries. The saw gin-161 (Figure 4), developed by the US corporation Continental Igle, has a unique design. The detachable front apron makes it

easy to inspect and replace the vibrating camera collars of the gin collars and the seed extractor. The vibrating chamber collars ensure a uniform plane of seed fall.

The placement of the sealing roller prevents the cotton from getting stuck in the gin arralisilnder. The seed extractor is easy to remove.

The gin supplier of the Extractor-Feeder Model-2000 (Fig. 5) consists of two cleaning sections, the first section is fitted with pile drums (2) and the second with saw blades (6).

The incoming cotton is fed to the upper section, threshed by moving on top of the pile drum, and then sliding along the mesh surface (3) at the bottom. Finely cleaned cotton is given to the second cleaning section for cleaning from large contaminants. Here the following saw drum is used as a cotton regenerator.

From the cleaned cotton saw teeth, the gin is lowered into the working chamber along the tray (9) using a brush drum (8). The separated dirt is removed through the auger (11).

The mode of operation of the 161-arla jinn. The cotton is fed through the M-2000 tray to the spinning chamber (1). The saw teeth of the grinding chamber protruding between the columns (8) attach the seed cotton to the working chamber (2) and form a raw material roller there.

The fiber saw is pulled by the teeth of the cylinder (8) and attached to the cantilever columns (5) and brought to the working part of the cantilever columns (saws) and the sawed fiber is taken out of the working chamber between the columns. Due to the incompatibility of the seed between the cantilever coils (5), the seed remains on the surface of the cantilever, and the fiber separates and continues to move on the surface of the saw tooth.

Approximately 50% of the seed is passed through the holes of the seed extractor (3) and dumped on the seed conveyor on both sides of the seed using an auger located inside. The rest of the seeds move on the surface of the cantilever columns and fall down. The fiber is separated from the saw teeth by a brush drum (7) and removed from the gin through a hole (12). Dead and

impurities from the spun fiber are removed using special devices (6), in which the fiber is not separated from the saw teeth (at the top) and after the brush drum fiber is separated. A cog roller (9) mounted on the bottom of the vibrating chamber (9) attaches the cotton evenly to the saw teeth and prevents the cotton from clogging.

Analysis of scientific research on fiber extraction from sawdust. In modern technology of the ginning process, the separation of fiber from the saw cylinder teeth is carried out in one of the following ways; mechanical (with brush drum) and aerodynamic (with air chamber). At present, 86 gins of high-fiber gin and 130 gels of low-fiber gins are used in ginneries. In American practice, in the sixties of the last century, the high-fiber separation chamber of the island demons was used, and since 1962, a return to brush fiber separation has been observed. Scientific and practical studies of the process of fiber separation in sawdust have identified the advantages and disadvantages of certain methods of fiber separation. Air fiber separation leads to an increase in power consumption and worsening of working conditions, and when mechanical fiber separation is used, the process leads to a decrease in energy consumption, reliability of fiber separation and an increase in fiber quality.

Analytical results of the operation of existing fiber separation equipment G.I. Conducted by Miroshnichenko, he found such a shortcoming that he suggested bringing the chamber nozzle closer to the saw in a small hole to ensure the separation process.

P.T. Nikitin's work on the separation of fibers by mechanical means, using the laws of hydrodynamics, considered the process of separation of fibers using a brush drum.

Thus, the analysis of the above sources showed that there are reserves for the production of energy-saving technologies of mechanical separation of fiber from the gin saw cylinder. In order to verify the mechanical separation of the fiber from the saw cylinder, a device for mechanical separation of the fiber for twenty saws was developed by design research, which is shown in Figure 6. The fiber separation device includes:

- the brush drum 3 performs the function of separating the fiber from the saw cylinder teeth and transporting the fiber to the outlet;

- saw blade protection device 4, which cleans the fiber in the rear zone of the saw blade, simultaneously directing the air flow at the required angle to the saw cylinder cylinder formed by the brush drum, thereby facilitating the fiber from the saw, directing dead and dirt separated by centrifugal force;

- top 5 and bottom 6 panels of the brush drum casing;

-wrapping barrier 7, which pushes the fiber from the brush and directs the fiber to the fiber outlet 8;

-dead barrier 9, which has the ability to slide up and down along the arc of the bottom panel of the saw and serves to separate heavy compounds and contaminants from the fiber removed from the saw teeth;

- air gap 10, designed to eliminate the return of the fiber along with the air around the drum and adjust the amount of air, adjust the fiber.

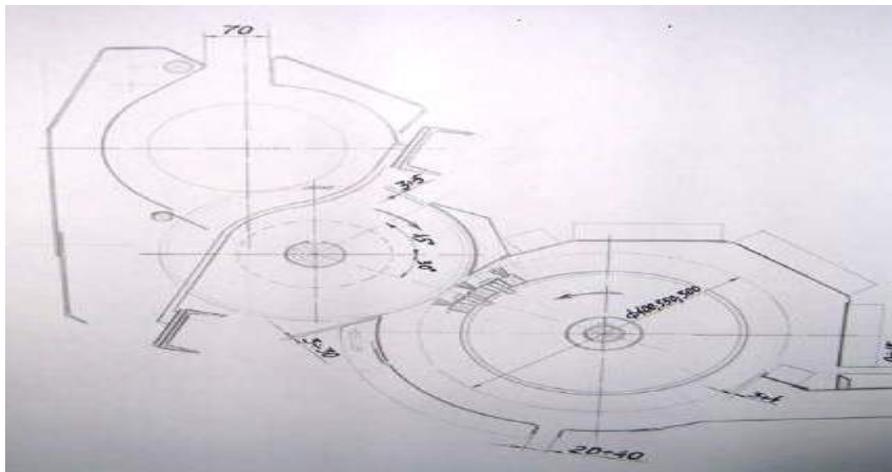
The brush drum with a diameter of 300, 350 and 400 mm was selected as a working body for cleaning cotton raw materials "Mexnat", RX and 1XP (Fig. 5). 3, a series of brush rails are fastened to it with a compression rail 4. The brush rail is made of a 390mm 20x25mm rectangular wooden base and is mounted across the width of the machine.


Figure 5. Schematic Of A 20-Gauge Gin Fiber Brush Separation Device

Methodology for the development and research of the scheme of the mechanical solution for sawing gin. Arrali gin is a brush drum (Figure 2.1) for removing the fiber from the saw teeth, transporting it after unraveling, as well as the body that separates contaminants from the fiber. The separation of the fiber is carried out in zone B under the influence of the air flow generated by the rotating brush drum at a speed equal to the rotational speed of the drum. The fiber separated from the saw teeth is covered with air flow into zone B and the fiber is dropped into the carrier neck. The constant condition of the efficient passage of the fiber separation process and its transport in the throat leading to the fiber is the presence of a certain amount of air and the speed of the brush drum. To explain the purpose of the event that occurs during the operation of the brush drum, we analyze the process of fiber separation by differentiating a fraction of moments of the brush path. To do this, we take and consider some mixed pair of brush drums A and B, in which case we perform a scan of the brush chamber depending on its lower position during its movement. By moving in the direction and direction of rotation of the brush in the air stream, dynamic pressure is created, in which the air is compressed, so that the density of the air flow is slightly higher than that of the outside of the air brush chamber.

A certain amount of air (the barred area in the figure) moves from the space between the brush bars A and B with the rotational speed of the brush drum.

CONCLUSIONS

As a result of the analytical analysis of source data on the technology of ginning of medium-fiber cotton, the following was established:

- In modern practice, two methods are used to separate the fiber from the saw cylinder: aerodynamic (with air chamber) - high energy consumption, simple and mechanical to use (with a brush drum) - low energy consumption and reliable separation of the fiber from the saw teeth, while requiring additional costs for the preparation of the brush elements:

- In foreign practice, there is a widespread tradition of popularization of low-cost brush separation gins in terms of energy consumption of ginning medium-fiber cotton raw materials.

Namangan State University,
UZBEKISTAN

ABSTRACT

The article aims to provide improving the communicative competence of pupils at primary school. It also discusses the significance of this competence in teaching a foreign language. Communicative competence has become an essential skill in this 21st century, and English has been a central language for global communication. Therefore, students need to use English fluently to fit with international communication. In Uzbekistan, many researchers found that primary school pupils usually make mistakes in pronunciation, grammar, vocabulary and sentence structure during speaking English.

KEYWORDS: *Communicative Competence, English Language, Improving Speaking Skill, Communication, Communicative Teaching Methods, Culture.*

INTRODUCTION

English is a world language that is widespread throughout the world and is used in many countries. Historically, English is a Germanic language of the Indo-European family. English is the third most widely used language in the world (after Spanish and Chinese) and is the main language of the European Union [1-3]. Culture is not only a set of material and spiritual wealth created by the creative activity of these people but also represents the level of development of society, that is, the sum of knowledge, criteria and values in society embodied in culture. In the study of culture, it is possible not to use objective laws, traditional notions of causality in events. The term "culture" is expressed in various senses in the modern scientific literature. The terms "culture" and "culture" have the same meaning in the opinion of experts, and in Latin means "cultivation", "care". It was later used to mean "enlightened", "educated", "educated". The term

"culture", which is widely used in Uzbek, means "cultural" in Arabic. Actually. Culture is related to the communicative competence and it is important to develop pupils' speaking skill.

MATERIALS AND METHODS

Communication is the process of establishing and developing communication required by the need for collaborative activity. Interaction of the subject through the system of communication signs. Communication is a multifaceted process of developing connections between people that stem from the need for collaboration. Communication involves the exchange of information between co-operators. This takes into account the communicative aspect of the relationship. The concept of communication should be distinguished from communication. Communication refers to the exchange of information between systems of living and dead nature. The communicative side of communication is the exchange of information between the participants, the interactive site is the interaction of the participants, and the perceptual side is the way the participants understand and know each other in the process of communication. Communication is the main form of interpersonal relationships, through which people interact with each other spiritually, exchange information, interact with each other, feel and understand each other. Therefore, communication as a socio-psychological phenomenon occurs in all spheres of social life, as a need for material, spiritual, cultural, emotional, motivational aspects of cooperation. At the same time, one of the main tasks of the research is to develop a system of intercultural communication competence, generalizing culture, language and communication, deeply studying the specific features of the cultures of many peoples reflected in the social, political, economic and cultural spheres of society [2-4].

The term "Communicative competence" has been developed for many years. Hymes, [5] stated that communicative communicate is the ability to use language or interpreted language correctly in the process of interaction with the social environment such as the use of language in the proper regulation of social practices.

Moreover, Canale and Swain, [3-4] and Celce-Murcia, (2007) also support Hymes' idea that communicative competence is the ability to use language correctly, appropriate to situations and express suitable behavior in the cultural context of communication. Therefore, communicative competence in this present study refers to the ability to use the English language and interpreted language correctly and appropriate to situations and express suitable behavior in the cultural context of communication.

There is evidence that pupils develop language awareness, cognitive and met linguistic skills through their L2 learning in primary school. White and Horst (2012) show that pupils can develop cognate awareness and recognize cognate similarities and differences between languages if they receive cross-linguistic instructions from their teachers, who explicitly compare L1 and L2. The researchers claim that "teaching and practicing abstract cognate rules was feasible in late elementary school" (ibid: 192-193). Fortier and Simard (2008) also show that pupils can formulate met linguistic knowledge. Pupils in their study showed linguistic sensitivity towards error, and reflect on grammatical errors and meanings, by explaining why these constitute a grammatical or syntactical error. According to Fortier and Simard, pupils develop this skill only when teachers' approach is not limited to the communicative approach. Teachers must also draw pupils' attention to linguistic forms, and particularly morph syntactic norms, i.e. drawing pupil attention to words and their spellings, their position in the sentence and their functions. On the

other hand, language competence can sometimes also be achieved through fairly subtle alterations to teaching practice. Kirsch [5], for example, found that even quite young Anglophone pupils were able to develop a range of language learning strategies without receiving explicit strategy instruction from their teacher. In her study pupils deployed "memorizing strategies" (ibid: 390), writing and practicing language (ibid: 394), developed learner autonomy, and reflected on their language processes and strategy use (ibid: 395) when their teacher adopted a supportive role through 'scaffolding' pupils' learning, i.e. by offering them ways to solve problems and evaluate their own learning, rather than openly solving challenges for them and keeping the evaluation of learning as an activity for the teacher alone.

Other studies prefer to discuss language competence in the more traditional four language skills format (speaking, reading, writing and comprehension). Kruk and Reynolds (2012) conclude that "immersion as an educational context that exposes children to an additional language can be beneficial to reading achievement". In their study, young Anglophone "at-risk" readers in primary school grew greater phonological awareness, developed better decoding skills, and reached a higher reading comprehension level by experiencing an L2 immersion school program than did their counterpart control group. Another study [6] showed how pupils developed phonological awareness and strengthened L2 production and reading skills through a computer-based intervention program. Pupils received teacher's L2 pedagogical intervention alongside their participation in educational computer games. According to the researchers, "students need to have good "learning to learn" skills to achieve the best possible results from their learning"; i.e. pupils need to know both how to learn and that they are learning.

CONCLUSION

In conclusion, in today's developing and globalized world, pupils need to become more competent in building relations with people from other cultures. As Fyrstenberg (2010) pinpoints, our goal as teachers is to help to build intercultural competence along with the linguistic and communicative competence as well. Hence, the language class can become the cradle of teaching culture and intercultural communicative competence our pupils need.

ABSTRACT

This article describes examples from the historical experience of formation of pedagogical education of Turkestan, which is revealed with the help of archival materials and the ways that the colonizers used in the system of education of its population. Author tries to reveal the reasons of the poor state of public education in Turkestan. He wants to say that the wrong attitude for public education in the part of Turkestan Khanate is the main cause of formation of colonial territory. The reaction of the tsarist authorities to reform Muslim schools has been analyzed. New method teachers (jadids) who had a good understanding of the role of education in the fight against the colonialists tried hard to reform, primarily public education. In doing so, they greatly helped educators Tatar school pedagogy, which made a significant contribution to the development of new method schools, which contributed to raising the level of education, not only school-age children, but also in the whole of the peoples of Turkestan.

INTRODUCTION

Realization of a purposeful policy in the sphere of education a as priority direction of socio-economic, spiritual and cultural development of a society has logically led to adoption of a National Model and Program on personnel training in the Republic of Uzbekistan. The given model establishes and demands the solution of the specified problem at systemic level, in the interaction and simultaneous responsibility of all entities of management in achieving the

necessary quality of education –starting from the state and society ending with the teacher and the pupil. There form the main objective of the National Program on personnel training of the Republic of Uzbekistan is the continuity of educational system. It's quite natural that each state should be interested in developing education, giving this sphere the priority of the state importance.

But modern education is becoming more and more complicated system; it has to function in a dynamically changing world which is putting forward greater demands. At the same time it is necessary not to forget the historical experience of formation of the pedagogical education. From history it is known that colonists, invaders of all times used educational systems of the population of their colonies in propagation of the state colonial policy. As education is inseparable part of any society, indicator of its culture and basis for its progress.

Religion has strictly normative character, dogmatism is inherent in it. There form religious requirements sooner or later get in conflict with continuous development of free-thinking (freedom and free-thinking are allowed only to such an extent that the religion allows).When freethinking (by freethinking we mean, first of all, creative, fruitful thinking) in Turkestan exhausted all the possibilities of development given to it by Islam the stagnation has begun in artistic and scientific thinking of a society, traditionalism got the upper hand. The strictly normative character of Islam predefined the stability and stagnation of customs and traditions[1; p. 130].

As testified by history in the late of the XIX century among the nations under the influence of Islam started the movement to reform traditional Muslim schools. In tsarist Russia at the end of the XIX century the movement to reform Muslim schools started among Turkic nations of Crimea, Volga region, Azerbaijan and Turkestan. The necessity for this appeared because, first of all, the content of training at these schools no longer met the requirements of the new time, requirements of a capitalist society.

Considerable influence of the revolution of 1905-1907 on the development of public education of the Turkestan native population can be mentioned. The necessity in real knowledge and in the reform of extremely obsolete old method schools started to be felt by a wide circle of society especially under the influence of the given revolution. From 1905 the network of schools opened by teachers of the new method starts to grow rapidly in counterbalance to old method schools. The number of teachers of the new method started to rise also among the native population of Central Asia. At the same time the idea of teaching in a native language of the local population was defined more precisely. It is known that with the popularity of opening new method schools various political and religious movements began to search for their own benefits from the created condition, i.e. first of all, they wanted to define and direct training at these schools towards their own interests.

This also happened to new method schools which to a large extent were enlightening schools. Organizers of these schools tried to reform the whole structure of public education. Besides there were organizers of other types of new method schools, which especially after bourgeois revolution in Turkey in 1908 were under the influence of political dream soft Pan-Turkism.

Thus, the whole range of new method schools of colonial Turkestan should be differentiated between enlightening and Pan-Turkic, due to the fact that the term "jadid" (enlightening)is not definite enough. On this general background there were many shades. Some new method schools

were organized by groups of wealthy people, others especially in private houses opened at the risk teachers. Hence the general direction of some of these schools at first depended on their owners; in other case it was defined only by teachers in these schools.

At the end of XIX and in the first decade of the XX century there were very few teachers who could teach schoolchildren modern knowledge in one of languages of the Muslim nations of Central Asia. At the same time many Tatars of the Volga region lived on the given territory whose language was clear to local nations and in the last quarter of the XIX century there were successful cases in training children.

In these conditions the first teachers of new method schools in Turkestan were Tatars of the Volga region and Crimean Tatar teachers. In new method schools of Turkestan basic textbooks used in general subjects were mainly of Kazan publication in the Tatar language as there were a few corresponding academic books in the Central Asian languages. Orientation to the Tatar language as "general Turkic" originated first of all, from circles of the Tatar bourgeoisie which considered Turkestan as the arena of applying their capitals, and in "unity" of the Turkic nations they searched support for their competition with stronger Russian capitalism.

New method schools were opened usually in cities or in large settlements of commercial and industrial significance. From nationalities of colonial Turkestan before October revolution of 1917 only Uzbek and Tajik people comprised considerable masses of urban population. Thus in new method schools of the Turkestan territory mainly children of Uzbeks and Tajiks could study at Tatar teachers. Small house schools of the new method could be seen in villages (auls) of Kazakh nomads. Two teachers Tatar by nationality who studied at a new method madrasahin Ufa worked as instructors there [2; p.251].

Among the Tatar intellectuals there was a movement of "educators" which saw Central Asia as a place of apply in gets knowledge and forces. Having graduated from new method Tatarmadrasahs the youth goingto educate the people of Turkestan, were convinced of universal suitability of the Tatar language for teaching all Turkic children. Opening of the first new method school in Samarkand (1893) is connected with the name of a well-known teacher enlightener Ismailbey Gasprinsky, who was engaged in publishing and educational activity among the Crimean Tatars. The documents testifying that Gasprinskytried to assure colonizers, i.e. tsarist administration to reform the medieval schools of colonial Turkestan are stored in historical archive of Uzbekistan. When his offer was rejected, Gasprinsky went to Samarkand at the invitation of Uzbek educators and took the initiative on the spot [3].

This is the opinion of the official responsible for organizing public education in colonial Turkestan. From the attitude towards the education of "the subjugated nations" it is not difficult to guess the direction of organizing educational institutions in the region. Besides, for the acceleration of Russifying of the people soft Turkestanhe recommends to strengthen the colonization of Central Asia. In conclusion he advises to treat Gasprinsky with caution. In his opinion Gasprinsky is the leader of "Young-Tatars party" in Russia and endeavors to extend his influence even to Turkestan "indigenes" (native people). He declares that to his regret Gasprinskywas succeeding in this. There were like-minded people even in Tashkent. Without ceremony colonizers considered themselves as full owners of the conquered lands. And the native population of Turkestan was called "indigenes", "foreigners" or "aborigines" on their own land. And the attitude to them was as to non-Russians.

The above mentioned facts show that emerging national bourgeoisie of Central Asia and groups of intellectuals connected with it stood behind new method schools. The new method movement stood up for updating of medieval religious schools, for inserting of modern secular knowledge into them, and for improvement of the organizational-methodical parts. In order to prepare of competent employees of commercial and industrial business for the Uzbek bourgeoisie the establishers of new method schools included in the curricula arithmetic, reading and writing in a native language, elements of natural sciences and geography. However the prior attention nevertheless was focused on religion. Tatars-educators also wanted to teach children of Turkestan region not only secular subjects but also teach them Muslim literacy. There form tsarist officials strongly resisted to opening new method schools by Tatars. Leaders of Fergana region area headed by the military governor of the region gave instructions to the senior inspector of schools that it is necessary not to permit Tatars teach at Muslim schools of Turkestan region and Fergana in particular.

At the end of 1910 the superintendent of Kokand invited the Tatar teachers who taught at Muslim schools and read aloud the order of the inspector of public schools that Tatar teachers have no right to be engaged in teaching in schools at mosques among the population of non-Tatars. Having finished reading the superintendent asked them to sign this order. The teachers refused to sign it asking to explain on the basis of which law the given order was issued. The police official told the teachers: «Make a signed statement that to you this order is read, and you know its content». The Tatar teachers signed it. Then Cossack detachment of fifty was notified that from January the 1st, 1911 the Tatar teachers should close their schools: if they kept them open and continued teaching the detachment of fifty had to close these schools [2; p.280].

There were attempts by tsarist experts in organizing public education who suggested using new method schools established in the region in the system of realizing their colonial policy. One of experts in organizing school matters of the region S.M. Gramen it sky declares that he doesn't see «anything harmful» in these schools. He believes that it is necessary only to develop the rules for opening them, subordinate them to these rules and monitor their execution. In his opinion, the task of the Russian government should consist not in suppressing this natural movement but in the input of general education in Muslim schools, - it is necessary to help them find correct forms and reach the best results.

Hence once again we can see the importance of schools in the governmental structure. According to tsarist officials of the region, the advanced Islamit is by development of new forms of life are dreamingo to return the Muslim religion its former power, provide its progress, revive the faded idea of solidarity and unity both political, and religious; they are perfectly aware in order to realize these aspirations and plans it is necessary to take Muslim people out of ignorance condition.«Therefore reformers of Muslim life also aspire to take schools in their hands and by appropriate arrangement of teaching and education create the strong and educated fighters for ideals…» [4].

Also there were cautions from colonizers about situation created in the region. Having studied the situation some tsarist officials responsible for the organization of public education in the region came to a conclusion that «The school is a basis for creation of the uniform state in the future» (the idea is taken from the notes of the new method school teacher). Officials even believed that Tatar and Uzbek new method teachers (jadids)with the help of new method schools

would definitely create in Russia the Muslim empire if the tsarist government didn't take necessary measures in due time [2; p.274].

The new method movement has led to the reform of obsolete Muslim schools in Turkestan from the grass roots. Over half a century period of tsarist power in Turkestan there was a great deal of talks of general character about the reform from above. One of few specific proposals on behalf of tsarist officials was the project of V. P. Nalivkinthat refers to the first half the 90th. V. P. Nalivkinemphasized on a reform of functioning madrasahs. As a result of colonist policy Turkestan as the majority of Eastern countries in order to ascend a new step of social progress has been compelled to go through sufferings and humiliations of colonialism.

From IX to XV century we were one of the most advanced nations that gave tremendous numbers of great scientists, thinkers and artists, but gradually, within five centuries after the death of Ulugbek, have plunged into such deep crisis, that even the most educated, advanced representatives of our nation –jadids (new method teachers) –at the beginning of XX century perceived the project of Ismail Gasprinskygreat spiritual revolution, that in Muslim madrasahs 20 percent of subjects made up secular sciences, and they faced great difficulties in realizing this project. That was the degree of impoverishment of our culture [1; p.136]. Our spirituality as the practical attitude of consciousness, outlook to the reality from the late of XIX to the beginning of XX century was not oriented to updating society, updating in general, and did not strive for it. As a result we have been doomed to backwardness and got in the grips of colonialism for many years.

The tsarist administration in Turkestan for a long time used to consider madrasahs as the centers of Pan-Islamism. After the Andizhan revolt in 1898 administrative supervision over a network of madrasahs was strengthened. After the revolution of 1905 the attention tsarist secret political police was focused on revolutionary movement and on a network new method schools. At the same time the most far-sighted representatives of colonists reconsider their negative attitude towards old schools and madrasahs and try to find allies in these schools for a struggle against new method schools.

By 1917 the new method direction in Turkestan region widely extended to Muslim schools, but poorly affected madrasahs. None of the new method madrasah was created, as those in Tatarstan and Bashkiria that carried out functions of teachers' seminaries.

During the period of colonialism the strengthened attempts were undertaken to suggest to our people the feeling of national inferiority. With that end in view our national heroes were declared blood-thirsty. The majority of names of the great scientists, writers and other figures of national culture were ignored, and if some of them were mentioned that was done only casually, in a dosed way. The cultural heritage underwent a partial destruction, a partial export, and a partial interdiction for ideological reasons. Onlyfragmentsreached the people. Our national pride was stamped out. The tsarism tried to suggest to usthat4600 years are required for overall illiteracy in Turkestan, and without Russia we couldn't achieve progress [1; p.146].

As a result of the refusal of tsarist authorities to reform Muslim schools most of them kept medieval shape till the downfall of tsarism. Thereby the situation at the beginning of the XX century in Turkestan remained specific to medieval khanates of XIX century: lots of schools - and a small number of literate people. Colonists in order to strengthen the colonist policy in the region tried to use the organization of public education in their own interests. They widely braid

the life of the people of Turkestan with the aim of spiritual enslavement of the exploited. However there was a sound public pedagogy born from the experience of labor families; it is reflected in proverbs and other forms of the folklore which avoided censorship of clergy [5; 134].

Proceeding from the above-stated, it is possible to draw a conclusion that tsarist Russia to stringthecolonial policy in Turkestan used the process of organization of a public education for its own purposes. New method teachers, well understanding the role of public education in the struggle against colonizers took a great pain mostly to reform the whole structure of public education. They were considerably supported by educators of foreign pedagogical school who made an essential contribution to the formation and development of new method schools that promoted to increase not only children's erudition level, but also of the people of colonial Turkestan.

Muslim clergy of Turkestan, closely connected with traditional schools and madrasahs, faced new method schools with a great hostility. Andin due time tsarist colonizers skillfully used the principle of "predestination" to keep the local population in obedience, and in the struggle against national-liberation movement they looked for and found a support among a part of Muslim clergy.

Learning a lesson from history it is possible to draw a conclusion that not only at the end of XIX and in the first decade of the XX century, but also since ancient times and today the development of education is the guarantee of a stable society and a strong state. As education is an inseparable component of any society, an indicator of its culture and a progress basis.As a connecting link it provides unity and continuity of social experience, spiritual and moral and cultural traditions, progressive development of a society. Therefore, today education bears responsibility for the destiny of the country more than ever.

ON THE VALUE OF MUSIC LESSONS IN THE DEVELOPMENT OF A CHILD'S INTELLIGENCE

Kenjebaeva Sabira Saylauovna*

*Senior Teacher of Nukus State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

Often, parents think that music lessons are not particularly important for a child if he is not a professional musician. But scientists still urge to acquaint their children with the world of sounds and harmonies. Recent studies have shown that playing music increases IQ and literacy, improves memory and attention, and activates creative thinking and imagination. Students in music classes are more successful in learning a foreign language than their peers, are less anxious and are able to manage their emotions. But in order to feel the impact of all these useful properties of music, you need to practice it with passion and pleasure. This article discusses the value of music lessons in the development of a child's intelligence.

KEYWORDS: *Classes, Music, Child, IQ, Memory, Attention, Activates Creative Thinking And Imagination, Intelligence*

INTRODUCTION

Modern parents want to teach their child a foreign language as early as possible. Meanwhile, its study will be much more effective for a student familiar with the structure of musical speech. Music lessons develop hearing and improve the ability to distinguish shades of different timbres and pitches. The same is required when learning another language: we must clearly hear the sounds of speech and feel its intonation.

Music and speech have a lot in common, says Tatiana Chernigovskaya, a neuro- and psycholinguist, Doctor of Biological and Philological Sciences. "Music affects the brain extremely strongly ... The main zones that are involved in processing music are very close or completely in the same places where speech ... Music teaches the human brain to concentration, to isolate an auditory signal from a certain general background, to sensitivity to rhythm, to very small changes in the spectra. She does very serious work, more serious, I would say, than speech

... I am sure that every child needs to be taught music, because it is a subtle and sophisticated neural network tuning - and it does not matter whether he becomes a professional or not.

Music serves mutual understanding of people, awakens and maintains feelings of kinship in them, embodies social ideals, helps everyone to find the meaning of life. Music accompanies, influences and shapes the personality of the child throughout his life.

Speaking about the educational value of playing music, as a rule, they mean its role in the aesthetic education of a child - in the formation of taste, artistic culture, aesthetic feelings.

However, as psychological studies of recent years show, the influence of music on child development is not limited only to a narrow sphere of aesthetic education, but affects much deeper layers of the personality - including such aspects as communicative, emotional, volitional, and, at first glance, it can to seem paradoxical - intellectual qualities.

In recent decades, in many countries of the world, massive studies have been carried out that have shown the role of individual music lessons in the development of a child's personality. Moreover, not only its artistic, emotional components, but also, which is especially valuable, intellectual, mental capabilities, in particular, the influence of musical studies (primarily active musical performance, instrumental learning) on the formation of abstract thinking and mathematical abilities. These data have caused new trends in the practice of raising children: in America, Canada, Japan and other developed countries, the system of early musical education of children is gradually being introduced and developed. An example is the school of the Japanese teacher Shinichi Suzuki, who has been practicing teaching to play a musical instrument literally from kindergarten, from 3-4 years old. Strictly speaking, this approach can be called new only with a certain degree of convention, since throughout the history of human development, music has been used as a mandatory attribute of the elite harmonious upbringing of a child.

It is noteworthy that the increase in the role of musical studies usually occurred at the moments of the highest spiritual and cultural flourishing of civilizations, during periods of the rise of general humanistic ideas in society. Thus, in ancient Greece, music - "gymnastics for the soul" - along with "gymnastics for the body" and "gymnastics for the mind" - constituted an integral part of the triune process of education.

In the era of the European Renaissance, playing strings and wind instruments became widespread, and joint music-making became one of the traditional forms of spiritual communication.

Starting from the end of the 18th century, with the flourishing of the era of clavier art, playing the piano, an instrument that has the broadest possibilities in conveying musical texture and subtle nuances of musical speech, becomes dominant, and thanks to this, it gives a unique chance for full-fledged individual creative self-expression of the individual.

Learning to play the piano becomes an important (and mandatory for girls) element of educating a cultured person. A detailed analysis of the results of foreign and domestic studies on the influence of music on personality development is given in the work of DK Kirnarskaya "The Psychology of Musical Abilities" [1]. Speaking about the effectiveness of musical influence on human intelligence, D.K.Kirnarskaya explains it "by that intimate connection that was established between the art of music and the brain throughout the entire process of human evolution" [1, 440]. This gives her reason to consider music the most important factor in the

development of a child's intellect: "Music is the best teacher who changes the way of thinking, and does not present ready-made knowledge; she teaches to think - the brain, brought up by music, will be able to take whatever it needs "[1, 443]

Convincing data on the beneficial effect of music lessons on intelligence have been obtained in the course of numerous experimental studies carried out on a large number of subjects, using reliable and tested methods of psychological research. Thus, large-scale experiments conducted by American scientists from a number of leading universities over ten years with the participation of more than 25 thousand schoolchildren have shown that the part of them who have been engaged in special art programs for a long time, involving systematic music lessons, showed significant growth. school performance and intellectual abilities, which manifested itself in the ability to think creatively, to better generalize information, as well as in the best results of performing mathematical tests [2; 3]. These data are also confirmed by the results of a study by a French psychologist, which revealed a direct relationship between musical and mathematical abilities: the most gifted musicians were also the most gifted mathematicians [4].

The data on heightened abstract perception and spatial thinking of musicians, which is also characteristic of mathematical thinking, have been repeatedly confirmed in experiments.

Let's try to analyze the opportunities created in musical and instrumental teaching for the intensive development of intelligence, and what are the conditions that maximize this process. The amazing general developmental effect of practicing a musical instrument can be explained by the existence of a close relationship between the development of a person's hand and his brain.

It is known that both in phylogeny and in ontogeny of human development, it is the improvement of manual actions, their adaptation to the conditions of labor or play, to certain objects and tools that stimulates the formation and development of thinking. "There are special, most active, most creative parts of the brain," wrote VA Sukhomlinsky, "which awaken to life due to the combination of processes of abstract thinking and subtle, wise work of hands. If there is no such connection, these parts of the brain turn into dead ends "[5, p. 143].

All educators and parents are well aware of the influence of fine motor skills on the development of the child's brain. It is important that the connection between the hand and the brain is two-way. This relationship does not lose its significance in music teaching: "... in any movement training, be it a gymnastic exercise or learning a piano etude, not the hands, but the brain are exercised" - this is the position, according to N.A. Bernstein, who studied psycho physiological the basics of the musician's technique should be well understood by every teacher [6, p. 33]. It is probably difficult to find an activity that places higher demands on precision, flexibility and variety of finger and hand movements than playing the piano.

Mastering this complex and multilevel system of movements requires a lot of intellectual and volitional efforts, concentration of attention and working memory; at the same time, the child's psycho physiological capabilities, the development, "training" of the central motor analyzer, or the brain regions that provide control and management of the sphere of movements, are significantly expanded. The performance of polyphonic, multi-layered musical texture makes special demands on thinking. Here it is necessary to distribute performing attention between two or more melodic lines, the development and logical structure of which is built along its own path and may not coincide. In this case, a musician should be able to think "in parallel", multichannel,

that is, polyphonic, in many respects intuitively, which is close to such forms of thinking that are defined in modern psychological literature by the term milateral ("lateral") thinking (Edward de Bono), divergent ("Divergent") thinking (J. Guilford), fluid (fluid), or "mobile" intelligence (R. Cattel).

It is clear that the performance of polyphony contributes the most to the formation of these forms of thinking, which researchers associate with creative thinking. Considering that piano music is inherently multi-layered, polyphonic, we can talk about the special effectiveness of playing the piano for the development of intelligence.

This is confirmed by the data of experiments that showed that boys who learned to play the piano were in the lead in the competition in mathematics among university students [3]. Of great positive importance is the fact that in musical activity, intellectual processes are closely intertwined with emotional ones, and the emotional component, as you know, is an important component of creative thinking and is included in the motivational structure of cognitive activity.

At the same time, such subconscious elements of mental activity are actively involved in mental activity, which are manifested in the phenomena of intuition, insight (enlightenment), anticipation (premonition-anticipation), etc. It is these forms of mental operations that underlie the perception and understanding of semantic information that makes up the content of musical works - that is, they make up what is commonly called musical thinking.

The latter is defined by musicologists and music psychologists as non-verbal, "emotional" thinking. Thus, we see that it is in musical lessons that all elements of creative thinking are actively practiced, "worked out", including its most valuable, subtle mechanisms that are not always amenable to logical comprehension. So, learning to play musical instruments has enormous potential in the development of the intellectual capabilities of the individual and should take its rightful place in the system of mass upbringing and education of children and adolescents.

"The role of a teacher is to open doors, not to push students through them," said the outstanding German pianist and teacher Arthur Schnabel. This is a deeply fair observation. And therefore, the task comes to the fore so that the kindergarten teaches children to think in music and think morally. And this can only be done by a creative person who does not need to be "pushed" anywhere ...

Modern scientific research shows that the development of musical abilities, the formation of the foundations of musical culture should begin at preschool age. The lack of full-fledged musical impressions in childhood is difficult to make up for later. It is important that already in early childhood there is an adult next to the child who could reveal to him the beauty of music, give him the opportunity to feel it.

Musical development has an irreplaceable effect on overall development: the emotional sphere is formed, thinking is improved, the child becomes sensitive to beauty in art and in life.

In preschool institutions, the musical director is directly involved in the musical education of children. The level of musical development of his pupils to a large extent depends on the level of his musical culture, abilities, pedagogical skills. But, ultimately, the success of the business depends on the entire pedagogical staff of the preschool institution and on the parents, since outside of music lessons there are other opportunities for enriching children with musical

impressions, other various forms of performing musical activities in the daily life of the kindergarten and in the family.

It is important to use artistically valuable music in working with children: first of all, classics and folk works. But for this, the teacher must know it well, love it, be able to present it to children, tell about it.

Thus, under the guidance of a music director and educator, children learn to interact with music. The main role of the educator in guiding the musical activity of children is participation in it and this work must be treated creatively.

And if we manage to introduce our pupils to the musical art, it means that the life of a music director and kindergarten teacher has not been lived in vain.

ABSTRACT

This article describes the research work on the certification of pectin extract isolated from turnip extract belonging to the family Brassicaceae. The classification of turnip pectin to perform a separate code number assignment is described based on an experiment.

KEYWORDS: *Pectin Substance, Turnip Extract, Viscosity Of Solutions, Viscometric Method, Polyelectrolyte Swelling, Turnip.*

INTRODUCTION

Chemical analysis of biologically active substances in plants, the study of their structure and properties, on the one hand, the development of chemistry, it leads to the emergence of new directions in it, on the other hand, leads to the creation of goods based on modern effective drugs and their application in medicine.

One-third of the drugs currently used in medicine are based on plant substances. Herbal medicines have a number of advantages over synthetic substances. Demand for them has been growing in recent times.

Alkaloids, flavonoids, coumarins, lignans, steroids, carbohydrates, polysaccharides, anthocyanins, vitamins and various trace elements found in plants serve as the basis for the formation of medicinal substances.

Turnip plant, which belongs to the family *Brassicaceae,* occupies a special place in the composition due to its richness in biologically active substances. Turnip root is consumed throughout the year due to its high content of essential oils and easy digestion. Turnips are rich in ascorbic acid, vitamins, potassium, calcium, phosphorus, magnesium, iron salts, enzymes, phytoncides, which are necessary for the human body. Turnip leaves contain more vitamins and ascorbic acid than roots.

LITERATURE REVIEW

Turnips belonging to the family *Brassicaceae (*Brassica rapa L.) were collected for research in October in Oltiariq district of Fergana region. Extraction was performed at three different concentrations of the extractant. The root of 100 grams of turnips is dried and crushed. Extraction of turnip tubers in chloroform (1: 3) was carried out at 700S for 2 h, the extraction was repeated 3 times. The chloroform extract was then filtered and the residue was separated. The resulting residue was extracted in 82% alcohol for 2 h. The resulting extract was filtered and the residue was dried. The residue was extracted in cold water for 1.5 h. The extract was filtered and the remaining residue was dried. The resulting residue was extracted twice in a solution of oxalic acid at three different concentrations (1: 3) for 1.5 hours. The extract was filtered and evaporated. The resulting thick residue was dialyzed and evaporated. It was then soaked in alcohol and dried until it reached a constant weight. The mass of pectin was 11-13 grams.

The extraction process was mainly carried out in an oxalic acid environment. The viscosity of aqueous solutions of isolated pectin substances was studied in the presence of aqueous and low molecular weight electrolytes. The results obtained are given in the table below.

TABLE 1. SOME QUANTITATIVE DESCRIPTIONS OF TURNIP PECTIN ISOLATED UNDER DIFFERENT CONDITIONS.

Hydromodule temperature 25^0C, [NaCl] = 0,1 N

Extragent concentration	Ether rate, %	$[\eta]$, dl / g	According to J.Berch	Haggis constant
			MM	$K\eta$
0,3 % $H_2C_2O_4$	41,5	2,21	15848	0,32-0,40
0,5 % $H_2C_2O_4$	43,4	2,44	17906	0,30-0,36
1,0 % $H_2C_2O_4$	46,5	2,51	18106	0,24-0,31

The results of the table show that the isolated pectin samples corresponded to the less esterified pectin substances. An increase in acid concentration may also have led to the breakdown of glycosidic bonds in the protopectin macromolecule and a decrease in the molecular mass of

pectin. The properties of dilute solutions of samples of permanently weighed and purified pectin were studied viscometrically [1-5].

RESULTS AND DISCUSSION

In our next study, pectin extraction from turnips was performed under strongly acidic, neutral, and alkaline conditions. It was found that the uronide content of pectin substances isolated in different media was 68-80% and the value of equivalent weights was close to each other. This means that the composition of pectin samples may consist of arabinan and galactans, which are neutral in nature.

Furthermore, the results of the study of the properties of dilute solutions of pectin showed that pectin macromolecules exhibited polyelectrolytic tumor properties in aqueous solvent. Therefore, further studies were conducted in the presence of low molecular weight electrolytes. The optimal electrolyte concentration was 0.1 normal. Studies of dilute solutions of pectin macromolecules have shown that they interact more strongly with pectin-solvent molecules than with pectin-pectin macromolecule interactions. In pectin samples with high esterification, the value of the Haggins constant is relatively small, in which case the pectin macromolecules may be relatively scattered and swollen.

In practice, pectin certification has been applied mainly to pectin substances derived from apples and citrus fruits.

In order to improve the certification of pectin substances and ensure the safety of their implementation, we consider it expedient to make some changes in practice.

At present, great importance is attached to the study of the composition of goods and certification on this basis [3-7].

In practice, the extraction of pectin is carried out in a strongly acidic environment (nitric and sulfuric acid) and precipitation is mainly carried out using aluminum or copper salts in which the pectin is completely submerged. But getting rid of metals costs extra. In addition, incomplete disposal of metals can be harmful to human health. In addition, in a strongly acidic environment, pectin can be destroyed and result in a decrease in molecular mass. Therefore, the use of a weak acid medium in the extraction of pectin ensures that the precipitation of the pectin with ethyl alcohol is free from the above defects. It is also possible to reuse used alcohol.

CONCLUSION

In view of the above, we recommend precipitating pectin with ethyl alcohol and extracting pectin in a weakly acidic environment, which requires certification of pectin derived from turnip extract belonging to the *Brassicaceae* family. Hence, the pectin isolated from the turnip can be obtained with the desired yield, the desired ether, and the molecular weight pectin, depending on the type and concentration of estrogen and the optimal conditions.

According to the current FEC and NG, pectin substances are located in 13 groups. Position 130220 refers to plant juices and extracts, pectin substances, pectinates and pectates to pectin substances [5-10].

Pectin is present in the fruits of different plants in different amounts and in different compositions. Therefore, we propose to classify turnip pectin as follows to perform a separate code number assignment.

Recommended FEC NG numbers for the classification of pectin substances derived from turnips

FEC NG numbers	Code number on the current FEC NG	FEC NG numbers	Recommended FEC NG code numbers
130220	1302201000	130220	1302201001

ABSTRACT

The article discuss about the problems of the influence of culture to linguistic scenery, which is the product of the development of human thinking and consciousness on language and through its interpersonal relationships. Basically, there is a discussion about the "universe and its linguistic scenery".

KEYWORDS: *Linguoculturology, Linguistics, Scenery, Linguistic Scenery, Concept, Character, Universe, Term, Concept, Category, Representation, Relativity, Object, Terminology, Form ...*

INTRODUCTION

The term "scenery of the universe" was introduced to science by the physicist G. Gerts, who defined the internal images as a landscape of the universe, which serve to make a logical judgment about the behavior of external objects. Over time, the searching scope of application of this term expanded and began to be studied by scholars and researchers such as K.Jaspers, L.Wittgenstein, L.Weiserberg, as well as in the humanitar subjects [1. 38p.].

The first assumptions about the concept of the landscape of the universe were also expressed in the linguistic theory of antiquity. In this situation, basically, Humboldt, E.Sepir, B.L.Worf, A.A.Potebnya, G.Gerder, Ya.Grimm, F.Shlegel, F.I.Buslaev, F.F.Fortunatov, G.A.Brutyans' scientific views and researches serve as the basis for this concept [2. 64p.]. Now the term has begun to be interpreted as a global image of the universe that represents the characteristics of the universe based on the human worldview and is the result of human spiritual activity. In essence, the view of the universe is a subjective image of objective reality. And this image is ideal in itself, although it does not remain an image of reality, but acquires a material character through

the use of symbolic forms. Nevertheless, the worldview cannot have its full expression in any of these forms and concepts. For example, the holistic view of the universe consists of a set of several theoretical (philosophical-scientific), non-theoretical (religious-artistic) and more pre-scientific forms of knowledge.

By the twentieth century, the debate over the worldview had intensified, leading to the formation of two different theories. In the first theory, language found its expression as a mirror of the universe, while the proponents of the second view were in complete opposition to the first theory at the time. They said that: "... it is not logical to call language a mirror of the universe, because the sounds that make up a word do not have the ability to reflect the universe. Concepts and concepts reflect the worldview. Language is connected to reality precisely through definite relativity. However, the Russian scientist AB Serebrennikov said that "language does not reflect reality, but expresses it on the basis of symbols" [3. 58p.].

One of the basic concepts of linguoculturology is the concept of "scenery of the world". This notion arises in the human conceptual apparatus and reflects the real being in the objective world. By nature, the concept of worldview must have a categorical meaning, be consistent with the sum of human knowledge in a particular historical period, and study the processes of cognition and cognition as a specific stage in the infinite development of science and technology and human potential. It is possible to understand that the image of the world should be understood in a relatively limited way, i.e. individual (some person, some society, collective, class, people, society, etc.) only as a part of the whole.

The worldview expresses the essence of the human worldview and reflects the basic and unique features of his way of life. In this case, language is directly and indirectly involved in two processes related to the image of the world:

- The linguistic image of the universe, which is one of the deepest layers of the image of the world in the individual is formed precisely through language;

- Language realizes all the images and images of the world that exist in the human mind and helps to understand and analyze.

This has been recognized in science in the scientific works of such scientists as V.A. Maslova, V.I. Postovalova, E.S. Kubryakova, Yu.D. Apresyan, G.V. Kolshansky, V.G. Gak. However, we encounter different approaches to expressing and interpreting the universe in a unique way. For example, man has the ability to reflect the world around him in different ways. As a result, a colorful picture of the world appears in the minds of people in a particular society. For example, the religious landscape of the universe or the mythological-religious landscape of the universe, the mythical landscape of the universe, the artistic landscape of the universe, the scientific landscape of the universe, the physical landscape of the universe, the linguistic landscape of the universe.

Martin Heidegger, one of the world's leading scientists, also acknowledged in his 1950 article, The Age of the Universe, that "the scenery of the world is not limited to space and nature". In his view, even history belongs to the worldview. The concept of the worldview was introduced by Robert Redfield, the author's distinctive attitude or emotional perception of the people or nation in the perception of the world, taken separately under the concept of "the scenery of the world",

it also summarizes the general perceptions of the members of this society about themselves and their personal behavior, activities, activities, and existence in the universe.

Although the term was born precisely on the basis of philosophical research, over time it has become the object of study of a number of scientific disciplines that study the activities and existence of human social life.

Among the concepts we have listed above, the unique holistic view of the universe is the main categorical concept that studies the relationship of man with the external world and at the same time serves humanity as an integral component of the human worldview, as it is formed as the sum of universal individual knowledge. The categorical concept of the universal worldview works on the basis of evolutionary-empirical and scientific-theoretical material, constant stable views, a system or system of knowledge that is gradually accepted and accepted. The individual worldview is the acquisition and assimilation of knowledge about the universe by humanity, more precisely, not only is it formed in exchange for the accumulation and development of individual experience, but it is also the product of various influences.

We can look at the everyday landscape of the universe as its general and specific description. It reflects the system of natural, social and humanitarian knowledge about nature, the environment, man and society and this system represents things in its own way in its own way and in its own way. In addition, the worldview is formed on the basis of various extralinguistic factors of communicative, cognitive, pragmatic, social, cultural nature, which are directly and indirectly related to man.

The linguistic landscape of the universe expresses images of objects and events in the environment using language. This concept is applied to linguistic consumption. Although introduced by von Humboldt, to this day there is no form equivalent to its exact term (term). According to world-renowned linguists, the notion of a "linguistic landscape of the world" still has a metaphorical character rather than a purely terminological meaning. In addition, it is necessary to separate the concept itself from the adjacent categories of "model of the universe". However, in a number of scientific and theoretical sources, the concepts of "linguistic scenery of the world" and "linguistic model of the world" are equally equated and are considered synonymous. In general, the model is essentially a miniature copy of the existing objects, which has the ability to reflect even the smallest elements of the sampled object. For this reason, the model, in contrast to the landscape, can not only point to a holistic system of elements that make it up spiritually, but also clearly show that the universe is a commonality made up of certain parts.

This landscape consists of a whole set of landscapes, which consists of the interaction of elements that are unique in their composition in different situations and through these situations.

In turn, the view of the universe, unlike the linguistic model of the universe, consists of a set of simple, straightforward, and concise knowledge of the universe. This situation is formed as a result of ethnolinguistic conceptualization of the world. This is the problem of studying the invariant concepts of ethnolinguistic consciousness belonging to this or that culture, which is one of the current problems of linguoculturology. While the model of the universe is the object of study of culturology and philosophy, linguoculturologists study the linguistic model of the universe and the characteristics of the linguistic evolution of the model of the universe. The

linguistic view of the universe, on the other hand, is wounded on the basis of the analysis of linguistic material.

Along with the linguistic landscape of the world, V.I.Karasik recognizes that the landscape of the world in the value system must also be distinguished.

The subject Linguoculturology, on the other hand, derives all the information about the linguistic landscape of the world from linguistic stylistics. If we look at it in a broad sense, the model of the universe is descriptive, and the view of the universe is important in that it includes important characters such as series, description, narration, and emphasis. In both cases, the concept (word) continues to manifest itself as the most important unit of explanation and description.

THE INTERPRETATION OF EASTERN JUSTICE AND HUMAN RELATIONS IN THE SCIENTIFIC WORKS OF LEO TOLSTOY

Dilfuzakhon Khusenova*

*Teacher,
Russian Language Methodology Department of Fersu,
UZBEKISTAN

ABSTRACT

In this article given information about and discuss the first works of the great Russian writer Leo Tolstoy and the unique interpretation of Eastern justice and human relations, which is reflected in the "Letter of Confession".

KEYWORDS*: Russian, National, Literary Heritage, Spiritual Height, Spirituality, Talent, Honesty, Creative Genius, Ideal Spirit, Limited Life, Essence, Faith.*

INTRODUCTION

The writer Leo Nikolayevich Tolstoy, who first entered the field of literature in the 1950sof XIX century with his atobiographical trilogy (three works in a book "Childhood" in 1852, "Boyhood" in 1854 and "Youth" in 1856), for more than eighty years studied not only Russian national literature but also world literature and his great legacy, which contributed to its development, even today, with its unique, immortal works, huge and short works, still causes great interest and debate among scholars and readers.

On January 18, 1851. Great Tolstoy decided to write his own "the history of his childhood". That is why this story has an autobiographical basis. However, in the process of writing this work, a great change took place in the views of the artist, and a novel covering 4 periods of human physical and spiritual development began to come into the world. So, in the process of writing the work, the author's artistic purpose was harmonized autobiographically. In the story, the storyteller and Nikolenka in the play had become very distant and radically different characters from each other.The writer, who aims to reflect the realities of the past, firstly strives for objectivity in his work, and secondly, in a sense, tries to express and evaluate his attitude to the past of his childhood in a unique way.The writer tells us about his childhood, which was alien to him. This event is familiar to our readers and each artist to show the right way in some sense

with his work or the product of his artistic creation,not to waste a given life on unnecessary trifles in vain, but to observe that under any circumstances people should strive for spiritual heights from childhood.

This great writer's "trilogy" about the first childhood, we Uzbek readers believe that there is no big difference between the Uzbek child and the Russian child not only their ordinary life, but also flawless views, interests, and in general, all children always believe in miracles, there is some magical power in the world, it seems to be hinting that he will always fight evil and certainly believe that good will prevail.The bitter fate of the protagonist Nikolenka, the loss of her mother at a young age, the loss of respect for her children by a rich father who was addicted to alcohol,the hesitation of the boy as he grows up, the spiritual superiority of ordinary poor, not poor people,the true love of the ordinary maid Natalya Savvishna for her mistress (who was deeply saddened and mourned when Nikolenka's mother died) is reflected in such scenes.

The direct influence of selfish, boastful, greedy, treacherous people on the psyche of Nikolenka, who grew up among the rich, is not the aristocracy, which is gradually gaining self-awareness, but gradually pursuing material wealth.rather, we are witnessing an attempt to show that the desire to be with simple, naive, humble, and spiritually rich people is growing.He tries to show that such human qualities prevail only in ordinary people ...

Yes, the great Russian writer Leo Nikolayevich Tolstoy was constantly engaged in editing, constantly working on his works, always counting on the opinion of readers and the literary community, and never dissatisfied with himself, he was one of those writers who thought long and hard about the content of his life and works and made deep philosophical observations.

Although Tolstoy was the author of many mature works, he tortured him until the last moments of his life"What is the meaning of human life, why is he or she born, every good and bad deed he does, the ideal spirit - belief in Allah, ...) sought answers to questions.

He read a lot and searched for this questions. He became acquainted with religious beliefs. He was one of the first to realize that there is a great difference between the simple views of one man and another, from one man to another.As the views of man, who was the flower of the universe, improved over time, he realized that religious views and religions would rise to maturity in a certain period of time, and that therefore one religion would take precedence over another.

He decided that the meaning of life was the faith of the Muslims in "Islam", and he preferred the teachings of this religion to others.Leo Tolstoy, in his "Letter of Confession", has been looking for him since childhood:We think it is safe to say that the answer to the question "What is the truth of life?"

"Our life is something that would be better than nothing", he said. Life is evil deed, moving from evil deed to nothing is the only blessing in life", said Schopenhauer.Summarizing the views of great believers and thinkers,In this work, Leo Tolstoy expresses his views on life:"What these great intellectuals have said, said, thought, felt, and felt by millions of people like them.I think and feel the same way.So my wandering in the forest of knowledge not only saved me from the mire of despair, but deepened it.There is no need to fool yourself. It's all in vain.The unborn are happy, death is better than life; that's why life should be chaotic ..." - said the writer[*Letter of*

Confession. –P.34-36.]. "The rational knowledge has led to the recognition of the meaninglessness of life,my life stopped and I wanted to die" - he said.

The writer tries to convey that the whole humanity around them understands that they live because they know the meaning of life, because they know the faith.No matter who or what the faith answers, any answer of faith gives the meaning of something that is not limited to a person's limited life, and that meaning cannot be erased by suffering, need, or even death.Only in faith can the meaning of life and the opportunity to live be found.So it is understandable that the most important meaning of the word is that "Faith" is not the exposition of an invisible object or anything else, it is not just a simple prophecy, it is an image of one of the attributes of faith.

This process is not just a relationship to Allah (you don't have to define faith through Allah, you have to define faith first and then Allah). Faith is the power of life.The play emphasizes that as long as a person lives, he must believe in something. He once again admits that he cannot live without faith. "Letter of Confession" is a work written in the genre of "Khasbi hal".Such works are very rare in world literature. His most famous works are those of writers such as Jean-Jacques Rousseau and Oscar Wilde. Leo Tolstoy's work enters one of the memoirs. The advantage side of the work "Letter of Confession" is that it tries to find a solution to each problem in its own life example.You can be sure that the lines are very sincere: "I killed in the war,I called for a duel with the intention of killing, I lost my magicians on the map, I lived for their labor, I executed them.Lying, stealing, adultery of all kinds, drunkenness, violence, murdering ... There is no crime left that I did not commit ..."

Of course, this passage will amaze any representative of any nation, such as the Uzbek reader. Not everyone can admit their guilt.People are afraid that their guilt will be exposed and their shortcomings will be exposed. However, it is interesting that we and the world-famous writer are not ashamed to reveal their shortcomings. Perhaps this is also one of the oriental qualities in him.

As we know, Tolstoy is a great man,but at the same time he was an ordinary man like everyone else, and in the same way he was close to all other people in heart.It is clear that the "Letter of Confession", with a high degree of sincerity and a ruthless pen-shaking of itself, insists that we must not allow one-sidedness in our thinking of people, teaches us to look at all aspects of this issue with all due attention. Another important aspect of the work is that the author's thoughts are extremely sharp.He could give definitions and look deeply into the problems very carefully and seeks to find a solution to the essence of the problem in a unique way, and leads the Uzbek reader to the world of his worldview as well as others.

The work "Letter of Confession" is a work that the author began to write at the age of 51, but we think that many of them have been confused since adolescence about the moral, spiritual and deep philosophical issues raised in the work.We did not begin our analysis of the works of the great writer with an autobiographical trilogy in vain. The tales he heard from his brother as a child, the mythical evil spirits in the tales, the magic green wand,brothers who love each other as hard-working and friendly ants, the heavy loss and humiliation of childhood, the sufferings of orphanhood, the insensitive attitude of a ruthless father, the domination of serfdom, the compromise between classes, the sharp relationship between master and servant,it all seems to have raised young Alyosha much earlier.

To conclude, we can say easily that,he has been a partner in many hardships and disappointments in life. In fact, he already belonged to the family of counts.He had inherited a

great deal from his descendants, but he still made his unselfish contribution to the education of the children of many poor people. He was not afraid to work. Both mentally, however, he spoke openly and sincerely about his mistakes rather than his own good in the work "Letter of Confession" and was not ashamed of it. There is only one answer to this, and that the writer knew his truth in "faith". This"faith" of the great man did not allow him to lie. In our opinion, this is the result of Alexei Tolstoy's rich knowledge, great faith in universal values as well as his oriental thinking and artistic genius.

UZBEKISTAN TELEVISION: NEW TRENDS AND PRINCIPLES

Ravshan Rayimjanov*

*Dean
Faculty of International Journalism and Public Relations,
University of Journalism and Mass Communications,
UZBEKISTAN

ABSTRACT

This article discusses new trends and principles of modern television. In particular, it analyzes the commercialization of television, its pros and cons, the process of specialization and the introduction of digital technologies on television. It also examines in detail the emergence of private channels on television, their operation on the principles of speed, interactivity and objectivity.

KEYWORDS: *Information, Television, Audience, Internet, Digitalization, Live Broadcast, Interactive Journalism, Communication.*

INTRODUCTION

It is no coincidence that experts call the new century "The Information Age". In the information age, the relationship between information and its consumer has changed.In the past, audience members have sought to assimilate existing media. With the development of audiovisual journalism and the Internet, the concept of a common integrated audience has been abolished. To this day, a person began to look for his consumer of information, not information.The reason is simple: the volume of various information on the Internet has exceeded trillions of trillions. The development of the Internet has given rise to non-traditional media (online newspapers, radio, television).The Internet has become an endless source of information for the viewer. However, this does not mean that other media events are over. The Internet as a partner began to influence the development of the media. In this regard, a number of changes and trends have emerged on television today.

First, commercialization has entered the television industry, and this process continues. Commercialization has both negative and positive effects on the work of the media. That is, information becomes a commodity. The channel and the journalist will be rich.On the other

hand, information is broadcast regardless of how it affects the audience. Popular culture is also defined by the fact that the problems it poses are commercial in nature.[1] Ensuring the independence of televisions, improving the quality of programs and providing the best programs to the audience is the main goal of TV creators.

The second is the television specialization process. The specialization of channels deserves special attention. Hundreds of human channels can be watched through an artificial plate at home. The viewer determines when and what to watch on which channel, which increases competition between channels.

At a time when it is very difficult for TV channels to sell their products in the media market at a satisfactory price and win the love of the public, it is very important to specialize, to focus on a certain segment of the audience. At present, a process of specialization is observed on the TV channels of our country. "O'zbekiston 24"is also a channel specializing in providing fast-paced social news throughout the day.

Third, the introduction of digital technology into international journalism has led to significant changes in social and creative activities. This process took place in different countries at different times. This process took place in developed countries in the 90s of the twentieth century. The most striking aspect of digital technology is the globalization of journalism, which has become one of the principles of the development of journalism in the twentieth century. With the introduction of digital technology, journalism has changed dramatically again. Globally, digital technology has become a truly revolutionary phenomenon in media activity. This process has been called digitalization[2] in journalism (digitization, the transition to digital technologies). Modern nanotechnologies make it possible to bring the speed of information transmission to an absolute level. The media is spreading on unprecedented volumes. The quality of information delivery has improved significantly. Moreover, and most importantly, it is becoming very cheap to disseminate and receive information among the world's population. This has been achieved through digital technology.

The digitization process in Uzbekistan, the transition to digital television, the transition from conventional television to a new, higher quality level - broadcasting digital television from the ground, have led to tremendous changes in this area. The main difference between digital TV and conventional TV is that the picture and sound are very clear, the colors are bright and every detail is clearly reflected.

Uzbekistan was one of the first countries of the Commonwealth of Independent States to switch to digital television. In the process of creating digital TV channels, special attention was paid to the formation and further enrichment of the social package of digital television. In accordance with the Decree of the President of the Republic of Uzbekistan dated July 30, 2012 on increasing the number of digital TV channels of the National Television and Radio Company of Uzbekistan, their full use, quality replenishment and service, two new digital channels - "Madaniyat va ma'rifat" and "Dunyo bo'ylab" channel were established.In July 2017, Uzbekistan 24 TV channel was broadcast.[3]

Fourth, the emergence of private channels. All over the world, the audience is dominated by private channels, not public ones. Non-governmental TV channels create programs based on audience requests and therefore have a good position among the public. In our country, much attention is paid to the activities of private channels.

Fifth, modern television requires a high level of knowledge, broad outlook and skills from the creator. Every sentence in a TV script, screen shot, and even music behind the scenes contributes to the show's popularity and audience. First of all, special attention is paid to the issue of news transmission speed in news programs. This is because the tendency for information to lose its value and importance over time has become especially noticeable in recent times, so the timely delivery of news is of paramount importance."When it comes to writing news directly, journalists writing for television emphasize one criterion - the speed of the news, that is, the timing of the news". What and where is emphasized more in TV news than why and how, that is, TV journalists are more interested in reporting than in explanation".[4]

In the selection of words, the spoken language is often used, more precisely, words that are often used by the people. Scientific or highly artistic words are difficult for the general public to understand. Such incidents undermine both public attention and the credibility of the show. "Good TV journalism presents news in a way that is mostly captivating and clear", commented Bill Small, a US TV journalist.

The second new approach is the resumption of live broadcasting. It is not easy to carry out this process correctly, it requires high professionalism. However, new steps are being taken in this direction on Uzbek TV channels, and this is commendable. As long as the live broadcast is filled with the charm of fast information, sound and melody, the importance of the living word, the urgency of its language problems will never be lost.Modern psychologists have found that only through the voice, tone, intonation, and tempo of a person can the audience understand up to fifty percent of the information content.[5] A journalist who uses live language effectively can achieve the following results.

1. Perception of information by listeners as quickly as possible due to clarity.

2. Avoiding boring sensitive materials.

3. Interesting, emotional speech grabs the audience's attention.

4. Correct use of intonation and rhythm assures fans that the content is authentic. By his speech, a journalist can justify or lose the trust of the audience.

Another feature is the introduction of interactive formats. Interactivity is very important for journalism today. This process has already been reflected in online journalism. At the same time, the audience is not a factor serving the sphere of influence of the media, but the media become a means of reflecting the opinion of the audience.Although interactive journalism has been brought to the attention of the general public, it is capable of reaching all segments of the audience. "Since mass communication is associated with the process of democratization of society, it empowers people to actively participate in the life of various social groups"[6]. It is based on a social communication process.

Interactive journalism differs from regular broadcasting also in that it reflects the inner potential of the audience. When people enter into communication on the air, they naturally satisfy their natural need for information and self-expression. The interactive process is based on communication between two people. Each participant in this conversation can express a new thought, change his point of view, argue, say a word to another. This situation distinguishes interactive media from traditional media.

Interactivity is not just a technical possibility, it is an extremely important social process. It is necessary to understand the history of this process, its significance for the present period. Without understanding them, it is difficult to imagine the development and prospects of interactive journalism, which is rapidly developing today."Receiving letters and phone calls from fans to the media allows us to identify the process of mutual communication. Undoubtedly, this feedback has its own characteristics. This improves mass communication, but does not increase the efficiency of information transfer".

In interactivity, every word of the audience returns to the audience through the air. This is a very important process for the media. The worldview, mood, mentality of the audience determines the degree of improvement of journalism through interactivity. We have people who are not inclined to talk as much as Westerners to show off.They prefer to listen rather than speak. Therefore, the introduction of interactive methods involves not only technical (telephone, radio, equipment), but also overcoming the barriers of tradition and mentality. It is necessary to prepare the audience for interactivity, as well as specialists who are co-authors of the broadcast. In other words, in order to build a new, free society, first of all, it is necessary to increase the activity of citizens, and interactive television does just that.

In journalism, the balance of opposing views is always interesting. This is an indicator of objectivity. Each event broadcast on the screen in the print media must be balanced, that is, the information about the event must be complete and objective.Deliberately hiding "positive" or "negative" aspects is not in line with journalistic ethics. Such information is not objective, truthful, complete balanced information. Life is not only about positive or negative events. A journalist has absolutely no right to distort life.A journalist has absolutely no right to distort life. If a journalist chooses a topic that interests many, and can reveal it in a comprehensive manner, be objective, analyze it from different angles and points of view, this is definitely an achievement. These same principles have been reflected in television programming in recent years and have generated audience interest."It is wrong to think of information as just news, it governs our society, our behavior and our consciousness, and we do not realize it"[7] said Mary Kidmon, a German theoretical journalist. We are not limited to acquaintance with information and news. We think, and as a result we draw certain conclusions. So, the principles of speed and objectivity are one of the sides of modern Uzbek television.

ABSTRACT

In this article given information and analysed the prisoners of war of the First World War in the Khujand district in the Fergana Valley for 5-7 years. The drummer among them was Mishko Yan, in 9 days he received 2 rubles 75 kopecks. In Khujand, many prisoners of war in production workshops, factories, and factories participated in charity events, and many seamstresses from prisoners of war embroidered shirts and rings for the front at the call of the "The House of Ladies". Only, in March 1916, they sewed 161 shirts and the same number of rings for the army in the field. We received 32 rubles for their labor.

KEYWORDS: *Prisoner Of War (POW), Austro-Hungarian Empire, Barracks Town, Hospital, County, Relief Map.*

INTRODUCTION

This city is spread along the banks of the Syrdarya. It is situated in that narrow intermountain passage along which the path to the Fergana Valley has long been running. From the north behind it rise the Mogoltau mountains with the main peak called Muzbek ("King of the Ice"). From the south, the Belesynik mountain range rises, behind which the high snow-capped peaks of the Turkestan ridge can be seen in the distance.

The oldest part of the city is located on the left bank among the green areas of a vast oasis. It has a very long and interesting history.

The works of hand and handicraft production intensively developed here. It is noteworthy that there were quarters in which they were engaged in a certain type of craft, in connection with which they had characteristic names. For example, silk winders and cotton pickers worked in the Pillakash quarter, fine yarn weavers in the Khosabofon quarter, jewelers in the Zargaron quarter,

stone-makers in the Sangburon quarter, and battle shield masters in the Sanjaron quarter. There were also quarters of blacksmiths, foundry workers, skullcaps, etc. It was extremely planned town center [1].

Nowadays, the city of Khujand is a large industrial and cultural center of northern Tajikistan.There is a large silk factory, a cotton ginning plant, a shoe and furniture factory and a plant for breeding grana.At one of the oldest enterprises in the city - a cannery - high quality canned food is prepared from various fruits, including local varieties of very sweet apricots, which are delivered to different parts of the region and to the world market.

In Khujand there is a pedagogical institute, a botanical garden, and a regional music and drama theater.

Those who enter the city from the north - east, for example, from Samgar, as we, from the side of Buston, immediately find ourselves on the street, which runs along the bank of the river, which is called the Syrdarya.

To the right of it passages leading to new microdistricts leave, and on the left a wide river bed opens up, smoothly flowing in green, slightly winding banks.There is a recreation area, a bicycle track is visible a little further, and then a comfortable city beach begins, where you can stop and swim in the warm waters of the river [2].

The city of Khujand was far from the fronts of the First World War, but the tragedies of this senseless war reached as well as near to the city. The mass consciousness has erased the memories of several millions who died on the battlefields of this epoch-making conflict, among whom were hundreds of thousands of prisoners of war of the German, Austro-Hungarian army.

The first group of Austro-Hungarian prisoners of war arrived in Khujand on September 28, 1914.They were met with a convoy from the Chernyaevo station by the head of the guard team, ensign G.Taranenko, and under heavy guard on foot, they went to the right bank of the Syrdarya river.

In order to create a barracks town, a team of prisoners of war and a military garrison of the Khujand district were mobilized. A special commission was set up to outline the construction of a bridge across the river. And in the shortest possible time, a barracks town, an infirmary and a ferry were built. The barracks town was mainly occupied by soldiers and the officers were housed in the town fortress.

The head of the administration of the Khujand district and the head of the military garrison had to work hard to employ 6 (six) thousand prisoners of war, feed them and put shoes on. Thanks to their efforts, a large number of prisoners of war were accepted in many industrial enterprises on the basis of an agreement. For example, at the state-owned cement plant in the village of Khilkovo, on the basis of an employment contract, 295 prisoners of war workshops and workers were accepted, of which about: locksmiths-41, carpenters-25, carpenters-19, masons-24, laborers-165 and clerks-21[3].In the Hungry Steppe, 219 prisoners of war worked, because it was cheap. Thus, 46 prisoners of war worked in the village of Konno-Guards. They received 25 kopecks per day for their labor. The drummer among them was Mishko Yan, in 9 days he received 2 rubles 75 kopecks. In Khujand, many prisoners of war in production workshops, factories, and factories participated in charity events, and many seamstresses from prisoners of war embroidered shirts and rings for the front at the call of the "The House of Ladies". Only, in

March 1916, they sewed 161 shirts and the same number of rings for the army in the field. We received 32 rubles for their labor. According to the report of the head of the prisoners of war of the Khujand prisoner of war town, the second lieutenant of the Mikhalevsky Committee of the Red Cross and the "The House of Ladies", the following of the prisoners of war were encouraged for their good work:Gavril Shvidchenko, Stefan Sanger, Paul Kliment, Franz Vasyash and 30 others with money and linen. Tailors, seamstresses - prisoners of war high wages from 2 rubles 50 kopecks to 3 rubles.

Those years the population of the city was only 30 thousand. They helped in every possible way in the improvement of housing, paid for hairdressing and bathing services and provided clothes. At the direction of the head of the Khujand district, a first-aid post, a butcher's and a bakery were opened. Many prisoners of war were sent to work for local entrepreneurs, for defense plants, the railway, landscaping, construction and irrigation canals.

The prisoners of war were used and guarded for in many volosts and districts of the Khujand district, for example, a guard group was organized from prisoners of war at the Dragomirovo station and a guard team of 45 Auto-Hungarian soldiers and officers was also created in the Ura-Tyubinsky region. A guard team of prisoners of war carried out a guard service on the railway line and at the Ursatevsk, Dragomiro, Skobelev stations and all the way to the city of Tashkent.

The Turkestan military district approved the document "14 working conditions for prisoners of war", which was also adopted in the Khujand district with some additions. In particular, prisoners of war were not allowed to use military uniforms in their workplaces, to engage in trade, and free movement around the city was also prohibited. Permanent public supervision was established, it was strictly forbidden for citizens to receive prisoners of war at their homes without the written permission of the head of the team and it was forbidden to forward postal items without censorship.

In the Khujand district, prisoners of war were employed in various jobs. Among them were doctors, shoemakers, hairdressers, builders and other specialists. Thus, Lieutenant Kober was the first to compile a relief map of Khujand and its neighborhoods. In the field of medicine, worked Dr. Theodore Lanny Fan Maglot, cadet Aldo Smarella, Lieutenant Rudolf Ventruba worked in government agencies. Many of them worked in factories, factories, private enterprises and many others.

For good and conscientious work, many prisoners of war were given the right to walk freely not only in the Russian, but also in the Muslim part of the city.Good specialists enjoyed great prestige and made a significant contribution to the economic and cultural life of the Khujand district.

Thus, a brass band was organized, which took part in all the activities of the county. Of the 95 prisoners of war, for the first time on March, 1915, the notes of "Chardosh" sounded on the banks of the Syrdarya.

The orchestra from the Austro-Hungarian prisoners of war played this wonderful melody, besides "Chardosh", the orchestra's repertoire also included other interesting melodies, marches, fragments from operettas and others.Thus, the orchestra performed such musical works as melodies: "Zaparoj carfor the Dunai", "Hopak", "Little Russian Cossack", "Saratov Latina", a polka concert for two cornetons and "Mazurka" a work by Lewandowski.

The painters taught local residents to whitewash the facades of their houses, and builders began to build beautiful European houses, began to install European doors and windows, some of them have survived to this day. Joiners made desks and boards for the Russian-native school, made doors and frames, wooden spoons, benches, bedside tables in European style. The local population willingly bought these wooden products.

In those years, numerous representatives of charitable organizations tried to provide material assistance. So, on July 29, 1916, a delegation of the Swedish Red Cross arrived in Khujand, which included Vulga Ogagalina Herney, Monera Peterson, Fenger Ramp, Selding Arendrup, accompanied by 6 German and 5 Austrian sisters of mercy. Several more groups of German and Austrian Sisters of Charity arrived in the following months. [4].

After 1917, the prisoners received more freedom of movement and in 1918 they elected the Prisoners of War Council. By the middle of 1918, when the Brest Peace was in effect, the fate of the former soldiers of the Austro-Hungarian and German armies was determined by the agreement on their evacuation to their homeland.

Unhappily, but not all prisoners of war managed to go home. Some of the prisoners even got families. Some prisoners of war were destined to stay here forever. There were also 590 of them in Khujand. During a visit to the burial places of Austrian prisoners of war, it turned out that in 1960, during the construction of a military registration and enlistment office, their remains were reburied in a mass grave in the 18th microdistrict. But, unfortunately, we could not find their graves, since at that time the monuments and corresponding tablets were not installed.

In search of traces of Austrian prisoners of war of the First World War, we found that in D. Rasulovsky district at the railway station (at that time Dolgomirov station) preserved historical sites. According to historians, old-timers, some of the prisoners of war died in carriages. And upon arrival at the station, they were buried not far from it. One of such incidents happened in Khujand. Where the prisoners of war were buried, a plot of land was allocated for the construction of a house, the family built a house, but they touched the monument, on the contrary, family members looked after it. So the monument was preserved. On it in 3 languages (German, Russian, Persian) it was written: "Prisoners of war who died in 1919 from their comrades"[5].

It is known that, most of the prisoners of war stayed here forever, got families, and their children considered Fergana and other settlements of the Fergana Valley their homeland. They took an active part in the economic, social and cultural life, were elected as deputies, built houses, created new enterprises and worked in them together with the indigenous population. All of them have retained the best qualities of their people: law-abidingness, hard work, discipline, loyalty to long-term.

ABSTRACT

In this article given information and covers the problems of the art of oratory in the East, the development of oratory in Central Asia, the uniqueness of oratory in Uzbekistan and the importance of oratory and public speaking today.

KEYWORDS: *East, Oratory, Speech, Man, Orator, Art, Communication, Science, Purpose, Task, Life, Ancient, Greek, Progress, Development.*

INTRODUCTION

The Explanatory Dictionary of the Uzbek Language explains the word East as follows: "East 1 [a. ascending, the side of ascending (e.g., sun)] 1 One of the four sides of the earth; the side facing west, the side where the sun rises; the side of twig light ..." [1. 552-p.].

In the East, including in Movarounnahr, with the development of artistic and scientific creativity, as well as preaching, propaganda of the Holly book Kor'an, by ancient philosophers and researchers Beruni, Abu Nasr Farabi, Ibn Sina, Abu Abdullah al-Khwarizmi, Mahmud Kashgari, Abulqasim Zamakhshari, Abu Yaqub Sakkoki, Alisher Navoi such great scholars as have written works on language, vocabulary, grammar and logic, or have expressed valuable insights on the subject in their works on other fields.

The great encyclopedic scholar Abu Rayhan Beruni, in the introductory part of his work "Geodesy", speaks about the emergence and branching of sciences, saying that each science is born with the necessary needs of human life. In his view, the sciences of grammar, dream, and

logic are also a product of these needs. Human speech, by its structure, material, can express both truth and falsehood. This leads to a lot of controversy. In the course of these debates, man creates a "criterion" that distinguishes truth from falsehood. It was a science of logic. The analogy (logic) of logic has become a means of distinguishing truth from falsehood. If there are suspicious places in human speech, they are corrected using certain "criteria". The scholar marvels at those who rebuke him without studying logic, and feels sorry for them: "If he had given up laziness and read grammar, aruz (the measure of poetry) and logic (logic) connected with speech without resting, the word would have already, He would have known that it would be broken into poetry". [2. 64-p.].

As you see, Beruni put forward the idea of examining human speech not in the context of a single subject, but at the point of convergence of several disciplines (i.e., grammar, expression, and logic).

The great thinker of the East, Abu Nasr al-Farabi, writes of the importance of lexicology, grammar, and logic in the ability to speak correctly, to draw logical conclusions, and to compose meaningful and beautiful speech: "When it comes to how to learn, how to express an idea, how to express, how to ask, and how to respond, I affirm that the first knowledge of this is the science of language, which names objects (substances - things) and accidentials (events).

The second science is grammar. He explained how to arrange the names (callings) given to objects and the location of substance and accident, so he teaches how to compose wise words and speech that express the consequences.

The third science is logic. Teaches how to place sentences according to logical figures to draw certain conclusions. With the help of these conclusions, we learn about reality what we do not know. And we will judge what is right and what is wrong". [3.54-p.].

Abu Abdullah al-Khwarizmi who was a contemporary of Beruni, in his book "Mafotih ul-Ulum" ("Keys of Knowledge") also gives information about some issues of speech culture of that time, office papers, their forms, terminology that we could be used. One of the great works of pedagogy of the ancient East, "Qobusnoma" also contains exemplary ideas about the etiquette and culture of speech, which are still relevant today.

The peoples of Central Asia, including the Uzbeks, have long valued people with eloquence and artistic taste. At that time, the art of oratory was called preaching, orators were preachers, and speech was called preaching. Until the ninth century, kings and caliphs served as preachers. They preached to the community about public policy, the duties and duties of citizens, the situation in other countries, the actions of the enemy, defense issues, and so on. After the ninth century, these tasks were assigned to special professions - preachers.

In Central Asia, the treasury of the art of oratory was first made by such masters of speech as Bahovuddin Valad (XIII century), Jalaliddin Rumi (XIII century), Hussein Kashifi, Muin orator (XV century). Since the twelfth century, many scientific, historical and methodological treatises have been written that interpret and describe the theory and practice of the art of preaching. For example, in the historian Ali Yazdi's "Zafarnoma", Navoi's "Majlis un-nafois", "Mantiq ut-tayr", "Mahbub ul-ulub", "Khamsa", "Chor devon"; Zayniddin Wasifi's (15th century) "Badoe ul-vaqoe"; Khandamir's pamphlet named "Makorim ul-Axloq", discusses the skills, talents, and methods of oratory of famous orators.

The forms of the art of oratory		
Dabir (reading ethical, legal texts of state status)	Khatib (Reading Khutba before Friday praying)	Muzakkir (to keep correspondence at holiday meetings and to read them)

The hero of the Uzbek classical literary language, the great thinker Alisher Navoi, as the standard-bearer of beautiful speech in the Turkic language, with all his creativity discovered the riches of the Uzbek language, its subtle and beautiful aspects. Worked and created in later centuries, Khorezmi, Babur, Munis, Mashrab, Uvaysi, Muqimi, Furkat, Avaz Otar ugli, Fitrat, Behbudi, Sofizoda, Hamza and other great thinkers also expressed their views on the Uzbek communication behavior in their works of various genres. Here we consider it permissible to cite examples from the teachings of the sages of Ancient Egypt, and we bring to your attention some of them.

"Speak once you understand the essence of the matter. The one who spoke on the board was the one who knew. Smart speech is harder than anything. "

"Hide your thoughts; control your words. Say, "How beautiful are the words that come out of his mouth!""

"Do not be proud of your knowledge and do not pretend to be the only knower."

"Advise not only those who know, but also those who do not know. Because just as there are no limits to art, an artist cannot reach the pinnacle of mastery".

"A good word is hidden like an emerald in the depths of the earth, but it is found in a mill turned by slaves."

"If you are the boss, memorize while listening to the interviewer. Don't chase him away until he can tell you what he wants to tell you. "

"Do not slander anyone, big or small".

"Don't repeat slander, don't even hear it ... When you speak, speak what you see, not what you hear".

"If you are a leader who instructs many people, I will strive for any good, so that there will be no evil in your instructions. Justice is powerful and any goodness is eternal. He has been the goddess of justice since the time of Osiris, and those who break the law will be punished".

"The tongue is the sword of the king. Speech is stronger than any weapon".

In Kaikous's "Qobusnoma", we can come across such thoughts and sentences. Be in a conversation with people and also know the conditions of how to speak. O child!, know that there are four kinds of words, and that the people are four kinds. The word is also of four kinds: one, the unknown and the unspoken; the second is said and known: the third is both known and not necessary to know, but can be said, and the fourth is known and unspoken. But the unspoken and the unknown is the word ... the potential of the world depends on it. It benefits both the speaker and the listener. But the guilt of a great man will be known to you. But if you come up with something out of the ordinary, then they have to re-think their position. Because if you say that the wrath of that great man or the annoyance of that friend will arise in you, or you will

cause great sorrow and tumult in your head. This purpose is a word that is known, but it is not known, and it is also spoken. The best of these words are both known and spoken words. [4.47-p.].

An ancient Chinese sage, a great philosopher of his time, a teacher from the teachings of Confucius:

Look at what is not the rule! Don't listen to something that isn't a rule! Don't say anything out of the ordinary! Don't do things against the rules!

They make three mistakes next to a noble man:

-It is easy to talk to him when no word reaches him;

-not speaking when he can listen is a trick;

-to speak without paying attention to his facial expression is blindness.

If they don't speak when they need to - they lose people. If they speak when they don't need to - they lose words.

Not thinking while studying is darkness. Not learning while thinking is a risk.

Tolerance captures people's hearts. Sincerity and honesty inspire people's trust.

Things are done with perseverance and ingenuity. When there is objectivity and justice, all the people around will be satisfied.

You cannot be wise if you do not know destiny, the general rules of nature. If you do not know the rules, that is, the laws of society, the ground under your feet will not be a base. You can't know people if you don't know the words that people use to express their thoughts and feelings.

Even among our Turkologists researchers, the process of human interaction has long attracted the attention of linguists. Scientists such as F.F.Sultonov, N.Djunusov, A.B.Medjidova, T.Aydarov, T.Karakeeva, D.Sidikbekova have conducted special research on this issue.

It can be said that serious work on this issue in Uzbek linguistics has just begun. This is the case with Uzbek linguists S.Ibrohimov, O.Usmanov, E.Begmatov and others in their speeches say about this aspects at the First Republican Conference on the Development of Our Speech in Tashkent in 1969. However, the attitude to the art of oratory and such a statement of the issue should not lead to the conclusion that the problem of speech culture in Uzbek linguistics has not been raised at all. The Eastern rules, which have been called the etiquette of speech, alone show how ancient and peculiar these issues have deep historical roots.

"In addition, it is important to determine the relevance of the huge measures and measures taken in the 20s and 30s to the development of languages of all nations and peoples, called language construction, language policy, to the problem of language culture at that time, now called speech culture" as wrote E.Begmatov. [6. 38 б.] Unfortunately, the theoretical study of the Uzbek language in the field of speech culture is not taken seriously. From Uzbek linguists S. Ibrohimov, E. Begmatov, L. Khujaeva, I. Ibrohimov, B. Urinboev, S. Inomkhujaev, R.Kungurov, S. Karimov, T.Kurbonov, A.Rustamov, A.Abdurahmonov, H.Mahmudov, T.Qudratov, Y.Tojiev, N.Hasanova, Н.Тожиматов, O.Yuldasheva, B.Kh.Rakhmatullaeva, S.Muminov contain a number of theoretical views on the culture of speech.

In conclusion, it is clear from the works of the mentioned authors that in Uzbek linguistics a lot of research has been done on the culture of speech and its theoretical issues.

THE ANCIENT GREEK CULTURE AND UZBEK FOLKLORE

M.Khamidova*; N.Usanova**

*Teachers,
Department Russian Language Methodology Of Fersu,
UZBEKISTAN

ABSTRACT

In this article given information about and discuss the portion of ancient Greek culture to the art of folklore which was the national art and folk of Uzbek nation. They were brave sailors, brave men, and gradually began to live in many colonies along the Mediterranean coast. Greek colonies were also established on the shores of the Black Sea. The comedies of Aristophanes, the tragedies of Sophocles and Euripides are still staged in theaters. The Greeks were especially famous in sculpture. They created statues of gods made of bronze or marble. The gods were portrayed as beautiful, life-loving, and powerful people.

KEYWORDS: *Art, Creativity, Greece, Oral Art, Uzbek Way Of Life, Experience, Culture, Mentality, Myth, Mythology, Fairy Tale, Epic, Art Of Giving, Nation, Upbringing, Civilization.*

INTRODUCTION

From century to century the works of art, created orally by the working masses, performed by talented representatives of the people and passed down from generation to generation, constitute the poetic creativity of a particular people.

And the folklore is the result of people's efforts to organize their work experience in verbal forms, which are verses, proverbs, sayings, ancient myths and legends.

The Uzbek people have their own unique and appropriate customs and traditions of each nation, if necessary, the Uzbek values that have come down from the whole world of humanity to our civilized present, which testify to our distant past, we have a very rich creative heritage that helps us understand ourselves.

At the same time, ethnographic historians are studying the ethnography of a nation's origins, ancient living standards, stages of social formation and in general, they study historical processes

by referring to the example of the folklore of the same people as a means of demonstrating it. Our Uzbek people have not been left out of this process.

It has been loved and sung by our ancestors for centuries, passed from mouth to mouth, from tongue to tongue, from generation to generation, from teacher to student and the samples of folklore, soaked in the blood of all Uzbek nations and people, were formed and raised to the level of art. And at the same time, this art blended into theatrical synthetics and took on a new place in today's professional theater in a new look. The use of folk art and epics in the traditions of theatrical art has long been a tradition.

In particular, the worldview of people, which dates back to the last millennium and is the result of changing times, mature examples of folklore, such as "Alpomish", "Go'ro'g'li", "Oshiq G'arib", oral recitation, all the songs performed at the ceremonies are a priceless treasure that informs about the ancient past and mentality of the Uzbek people.

In these epics glorify such high human qualities as heroism, patriotism, and universal feelings.

This folk art of our people is not only the rich heritage of the Uzbek people, but also the rich heritage of our ancestor, but at the same time, it should be noted that in this process, examples of folklore are important in the upbringing of the younger generation. Folk art simultaneously with the formation of human qualities in the hearts of the younger generation, such as love for the motherland, kindness plays a special role in upbringing as a comprehensively mature, patriotic person. The role of folklore, epics, fairy tales, narrations, sayings, sajas, proverbs and sayings in human development is incomparable.

Folk oral art developed in a unique way in ancient Greece from the earliest times of human origin. However, it is hard to imagine our day without these arts. In particular, art, culture, fine arts are directly related to this science. Of course, we can all use words like "space", "atom", "Olympic games", "marathon running", "gymnastics", "pharmacy" without hesitation even today.

These words, like many other words, came into our language from the ancient Greeks-Greeks. These people lived in the south of the Balkan Peninsula in the 2nd-1st thousands years BC. In the beginning, the Greeks occupied a small territory. They were brave sailors, brave men, and gradually began to live in many colonies along the Mediterranean coast. Greek colonies were also established on the shores of the Black Sea. Near the present-day city of Sevastopol, the Greek city and state of Kherson were founded, and on the site of present-day Kerch was erected the city of Pantikapei. The port of Fedosia on the Black Sea was also founded by Greek sailors.

The Greek land consisted mostly of mountain rocks. It was very difficult to farm in it. But the Greeks were very hardworking and enthusiastic people. However, the main creators of all wealth were slaves, whose living conditions were extremely harsh and they worked from early morning until dark at night. They worked in the fields, in the mines, in handicraft workshops, making swords, spears, shields, clothing, utensils and other items.

The Greeks were one of the most civilized peoples of the time. According to legend, such brilliant Greek poems as the Iliad and the Odyssey, written by the poet Homer, have become masterpieces of world literature. By the 6th century BC, prose had appeared in literature. Novels depicting historical and ordinary people and parables associated with the name of Aesop were created. The advanced period of Athenian culture (5th – 4th centuries) was also a high point for

Greek literature. Dramatic genres developed. Tragedy based on a mythological plot has become the leading genre.

Famous Aeschylus, a great Athenian poet of the Athenian period (who lived in 525-456 BC), wrote on social and moral issues. The playwright Sophocles (who lived about 497-406 BC), a prominent figure in the Athenian democracy, portrayed a free man in his works.

During the period crisis of Athenian democracy, Euripides (approximately, lived about 480-406 BC) emerged. Contrary to the tradition of myths, he brought the image of man closer to life, linking the tragedies of the hero's life not to the divine power, but to his own actions, deeds and deeds. Greek myths and legends are still loved and read by people all over the world. The Greeks built magnificent temples in honor of their gods.

The Parthenon, located on the Acropolis in Athens, was magnificent. It was built in honor of the Athenian goddess. Each of the Greek cities certainly had its own theater. The comedies of Aristophanes, the tragedies of Sophocles and Euripides are still staged in theaters. The Greeks were especially famous in sculpture. They created statues of gods made of bronze or marble. The gods were portrayed as beautiful, life-loving, and powerful people. So many different statues were also created in honor of the winners of the Olympic Games.

There were also many talented scientists and thinkers from the Greeks. The Greek scientist Democritus had already suggested that all beings were made up of atoms. Greek astronomer Aristarchus taught that our Earth and other planets revolve around the Sun. The great Greek scientist Aristotle was both a philosopher, a historian, and a zoologist. The Greeks also laid the foundations for the art of rhetoric. The art of oratory cannot be imagined without Demosthenes, Cicero, Aristotle and Plato.

The orator should know not only what to say but also how to say it. A good speaker is a person who promotes the culture of oral speech and mentors those who are interested in it. As one of the theorists of speech culture said, learning one's mother tongue and using it skillfully is a great work; if one does not know the language clearly, the greatest achievements of human thought, the deepest knowledge, and the most ardent emotions remain unknown to him; therefore, the word is a tool for expressing an idea.

In order to conclude, we want to say, the Greeks created the highest culture, which later passed from them to the ancient Romans, then moved to the Middle East. In this way, Greek cultural achievements have reached the modern people and have been developing in a certain and specific way for centuries.

We can also say that the influence and importance of the ancient Greek literary heritage in the development of not only the folk art of the Uzbek people, but also its unique national culture is incomparable.

ABSTRACT

Perception of organizational politics is an inexorable integral part of organizational life and is seriously hampering the employees and organization. Researchers are not paying attention to the association of employees' demographic aspect and perception of organizational politics. This study was designed to measure the level of perception of organizational politics and the impact of demographic factors on perception of organizational politics. Seven hundred twenty-five employees working in Nepalese commercial bank were surveyed. Quantitative analysis of perceptual cross-sectional data revealed that (a) employees perceived their work-place as political, (b) the same level of perception of organizational politics was measured between male employees and female employees, between temporary employees and permanent employees, and between trade union's member employees and non-member employees, (c) Employees working in unionized organizations perceived higher levels of organization politics than employees working in non-unionized organizations, (d) employees perceived a higher level of organizational politics as an increase in their age, and (e) officer level of employees perceived more organizational politics than their seniors and juniors. Various practical and theoretical implications are suggested.

KEYWORD: *Perception of Organizational Politics, Workplace Politics, Demographic Aspects, Corporate Politics*

INTRODUCTION

Perception of organizational politics refers to the employee's subjective evaluation about their work environment where they perceive the presence of self-serving behavior and practices in the expenses of (Kacmar & Ferris, 1991) or in support of others which may or may not be aligned with other members of the organization and organization itself. These perceptions are particularly seen in the decision-making, resource allocation and accomplishment of individual, team and organizational objectives (Albrecht &Landells, 2012) in circumstances of confusion, ambiguity, and competing interests. Perception of organizational politics reflects a subjective state in which employees see others' no sanctioned actions as self-serving (Ferris et al., 2000). The unavoidability of work-place politics points the phenomenon as a crucial research matter across disciplines (Teimouri et al., 2018). Hence it is a part of every corporate life, and no one can escape from the direct or indirect influences of organizational politics.

A survey of 2,700 people from over 100 countries showed that members of the modern workforce view office politics as one of the main barriers to job performance, demonstrating the continued relevance of corporate politics(Hochwarter et al., 2020). The mainstream of the empirical evidence shows the perceived organizational politics as a harmful component for employee outcomes. Meta-analytic researchers (e.g., Bedi&Schat, 2013; Chang et al., 2009; Miller et al., 2008) have found that perceptions of organizational politics are negatively related to employees' performance, organizational citizenship behavior, affective commitment, job satisfaction, job involvement, and career progress while positively related to both strain and turnover intentions . Therefore, the presence of perceived organizational politics should be minimized as much as possible.

To minimize the perceived organizational politics, proper identification and control of antecedent factors of organizational politics perception are crucial. Ferris et al.'s (1989) model has specified the antecedent of perceived organizational politics as organizational factors, job /work environment factors, and personal factors. Similarly, Vigoda (2001) tested the impact of cultural differences on the perception of organizational politics and its consequences. However, current literature focuses more on the effects of perception of organizational politics and its remedial measures. Source of perception of organizational politics are largely ignored. Scholars are not paying attention tothe uniqueness of employees' demographic aspects and personal factors. These factors are the sources of the perceived organizational politics, but, are volatile across the cultures (Vigoda, 2001). Therefore, in the context of employees working in Nepalese commercial banks, this study aims to measure: (a) the level of perception of organizational politics and (b) impacts of employees' gender, age, job contract, designation, unionization, and membership of the union on the perception of organizational politics.

LITERATURE REVIEW

Perception of Organizational Politics

Organizational politics is a challenging area to study because it involves observers' judgments about the intent behind an actor's behavior (Albrecht &Landells, 2012; Silvester, 2008). Not surprisingly, most organizational psychological research has studied organizational politics as a perceptual and subjective phenomenon. The scientific study of organizational politics as a construct goes back over more than three decades. During this period, apart from interests in different aspects of organizational politics, particular attention began to be paid to perceptions of

organizational politics. Gandz and Murrary (1980) have suggested that politics should be conceived of as a subjective evaluation rather than an objective reality because it is not actual politics (or political behavior) that matters most to organizational consequences. Instead,it is the subjective perception of work-place politics, whether it is real or not. Consistent with this argument, Lewin (1936) has argued that individuals respond based on their perceptions of reality, not necessarily reality per se. That is why it has been argued that organizational politics perceptions are essential to study and understand even if they are misperceptions of actual events (Porter, 1976) at work-place.

Demographic Variables and Perception of Organizational Politics

Bhattarai (2016), Drory (1993), Ferris and Kacmar (1992), Parker et al. (1995) have tested the statistically insignificant difference of perception of organizational politics of male employee and female employee. Davey (2008) has argued that female employees infer organizational politics as irrational, aggressive, competitive and instrumental, leading to individual success not an organizational success. Therefore, female employees would perceive more organizational politics than male employees (Ferris et al., 1989). Drory and Beaty (1991) have tested that male employees are more tolerant of political behavior than female employees which means female employees perceive high politics than male employees. Likewise, Bodla and Danish (2008) have tested that female employees perceive a higher level of politics than male employees. Furthermore, there are theoretical arguments of Drory and Beaty (1991) and Heilman (1983) that male employees are more involved in the political process than female employees. Therefore, male employees would perceive their work-place more political than their female co-workers.

Ferris et al. (1996), Rosen et al. (2014), Stepanski et al. (2000), Yen et al. (2009) have tested that employees perceive the same level of organizational politics, whether their job contract is permanent or temporary. However, Bhattarai (2016), Ferris et al. (1996), Sultan et al. (2015), Donald et al. (2016) have tested that permanent employees perceive higher-level organizational politics than temporary employees. Furthermore, studies carried out by Fedor et al. (1998) and Ferris and Kacmar (1992) have tested that temporary employees perceive a higher level of organizational politics than permanent employees.

As a predictor of political perceptions in organizational environments, individuals have different preferences regarding political behaviors and age (Ferris et al., 1989). As the individuals become older, organizational members' experiences and skill accumulate gradually and they react to change in their environment differently compared to their co-workers with less age (Malik et al., 2009). However, Atinc et al. (2010), Kacmar and Ferris (1991) Parker et al. (1995), Rosen et al. (2014), Valle and Perrewe (2000), Yen et al. (2009) have tested the insignificant differences of employees' age with their perception of organizational politics.

Parker et al. (1995) have tested nonlinear (i.e., inverted Ushape) relationship between employees' hierarchy and perception of organizational politics. There are different theoretical arguments and empirical evidence regarding employees' designation and perception of organizational politics. Ferris et al. (1989) model suggest that employees at higher levels of the organizational hierarchy should perceive more politics than those at lower levels. But Ferris and Kacmar(1992) found no differences between supervisors and non-supervisors in the perception of organizational politics. Moreover, Gandz and Murray (1980) have found that employees at lower levels perceived more politics than their seniors in the work-place.

Considering these empirical evidence and theoretical arguments, this study is motivated to measure the impacts of the employees' demographic aspects on the perception of organizational politics in a different context. Ferris et al. (1966), Parker et al. (1995), and Valle and Perrewe (2000) have tested employees'various personal factors (demographic variables) as the predictor of perception of organizational politics. Hence, this study has raised the question that (a) what are the level of perception of organizational politics in Nepalese commercial banks? (b) are there impacts of employees' gender, age, nature of job contract, designation, unionization, and membership of the union on the perception of organizational politics?

Research Methods

Within business and management research studies, there has been an extensive discussion about quantitative and qualitative methods' merits. The root of the discussion moves within and around the fundamental philosophical assumptions on how humans and their society should be studied (Bryman, 1988). Most positivist philosophical researchers follow the deductive reasoning approach and quantitative method in business and management study. Therefore, in the positivist research philosophy and deductive reasoning approach, this study has adopted the quantitative research method to collect cross-sectional data through a survey. A more scientific approach to social science research is typically considered to be quantitative research (Richard, 2009). Indeed, one of the most outstanding features of quantitative methodology is the ability to make correct predictions. It may be useful to evaluate the theory and test whether, under different circumstances and instances, the theory holds up.

Measures

Demographic Variables

Demographic variables like gender, age, tenure, unionization, union's membership and designation of the employees have been considered as predictor variables in this study. For statistical analysis, demographic variables have been coded as gender (male – 1, female – 2), age in the year (below 30 – 1, 30 to 50 – 2, 50 and above – 3), tenure (temporary – 1, permanent – 2), unionization (yes – 1, no – 2), member of the union (yes – 1, no – 2), designation (assistant – 1, officer – 2, manager -3, others – 4). Others employees under designation include all other employees except assistant, officer, and managers like trainees, intern, etc.

Perception of Organizational Politics

Perceived organizational politics has been measured by a six-item version of perceived organizational politics scale, which was first suggested by Kacmar and Ferris (1991) and re-examined by Vigoda (2001). Vigoda included only those items with the highest loading values from factor analysis and subsequent reliability analysis. In addition to six-item measure refined by Vigoda, this study has added three more items used by Hochwarter et al. (2003) to ensure the content validity of the construct.   Respondents were asked to show their agreement with the items on a scale from 1 (strongly disagree) to 5 (strongly agree). Coefficient alpha of the construct was computed and found .94.

Sampling

The sample was selected in two stages combining the purposive and convenience sampling methods. In the first stage, all commercial banks were purposefully categorized into two groups,

i.e., unionized banks and non-unionized banks. This categorization was made with the notion of taking respondents from both types of banks. Representing both groups of banks, altogether, 17 commercial banks were selected to survey their employees. In the second stage, from the selected 17 commercial banks, 1199 employees were chosen for the survey through the convenience sampling method.

Questionnaire Administration

Among the employees, focuses have been paid for non-managerial employees, because they perceive comparatively more politics than managerial level, as explained by Zhou and Ferris (1995). However, diversified respondents, in terms of gender, age, department, education, designation, etc., were considered while selecting the sample respondents. For the administration of questionnaires, chief executive officers (CEO) of every sampled bank were requested to facilitate the survey. In each bank, on the researcher's request, a referral person was assigned by CEO to facilitate the distribution and collection of questionnaires. With the help of reference person, altogether 1199 questionnaires were distributed to each respondent individually. For every respondent, one week time was given to fill up the questionnaire. Out of the 1199 distributed questionnaires, 927 (77.31%) were filled up and returned. Only 873 (72.81%) questionnaires were found ready to use for the study purposes. Moreover, Confirmatory Factor Analysis (CFA) considered only 725 (83.05 % of usable responses) responses to meet the acceptable measurement model.

Data Analysis

Data analyses have been carried out by using software called International Business Machine (IBM) Corporation's Statistical Package for Social Sciences (SPSS). Firstly, data were screened to refine the further analysis. The respondent who missed to response more than 10% were removed and who missed less than 10% were replaced by the mean value of corresponding construct. Then after, unengaged data were removed from the direct observation as well as calculating the standard deviation. Data with a standard deviation of less than .50 were removed as influential unengaged respondents (Gaskin, 2011). After addressing the issue of missing data and unengaged data, outlier data were extracted. The entire respondent having P1 values of Mahalanobis d-square less than .05 were removed as an influential outlier (Gaskin, 2011). Then, descriptive statistics and mean differences were calculated. Frequency distributions have been estimated to describe the size of the demographic variables of the respondents. Mean, standard deviation, ANOVA, and t-test have been calculated to measure the levels and differences of perceived organizational politics among different groups of demographic variables (gender, age, tenure, unionization, member of the union, and designation).

Description of the Respondents

Table 1 presents the frequency distribution as well as a percentage of the sample according to demographic variables. Table 1 shows the respondent's classification in terms of gender, age, tenure, unionization, membership of the union, and designation.

TABLE 1 FREQUENCY STATISTICS OF THE SAMPLE

	Group	N	Percentage
Gender			
	Male	406	56.00
	Female	319	44.00
Age			
	Below 30 years	283	39.00
	30 to 50 years	395	54.50
	More than 50 years	47	6.50
Job contract	Temporary	101	13.90
	Permanent	624	86.10
Unionization	Yes	515	71.00
	No	210	29.00
Member of the union	Yes	213	29.40
	No	304	41.90
	Not Disclosed	208	28.70
Designation	Manager	71	9.80
	Officer	299	41.20
	Assistant	312	43.00
	Others	43	5.90
N = 725			

As shown in Table 4.1, total respondents (retained respondents after data screening) were 725. Among them, 406 (56%) were male, and 319 (44%) were female. Regarding the employees' age group; age having less than 30 years were 283 (39%), age having between 30 years to 50 years were 395 (54.50%), and age having more than 50 years were 47 (6.5%). Regarding the employees' job contract nature; temporary employees were 101 (13.90%), and permanent employees were 624 (86.10%). Concerning the existence of trade unions in their currently working organization; 515 (71%) employees were from the organization where trade union was present. The remaining 210 (29%) employees were from the organization where trade union was not in existence. Regarding the employees' membership of the trade union; 213 (29.40%) were members of the trade union, 304 (41.90%) were non-member, and employees not ready to disclose trade union membership was 208 (28.70%). Concerning the designation of the employees; the managerial level of employees was 71 (9.80%), officer level of employees was 299 (41.20%), assistant level of employees was 312 (43%), and other employees who were not covered by these levels were 43 (5.90%).

Results

Level of Perception of Organizational Politics

As shown in Table 2, the overall mean perception of the employees' organizational politics working in the Nepalese commercial banks was 2.73 with a standard deviation of .91, measured in 5 points Likert-type scale. Within and among the different

TABLE 2

MEAN AND STANDARD DEVIATION OF THE PERCEPTION OF ORGANIZATIONAL POLITICS ACCORDING TO DEMOGRAPHIC GROUPS

Group	Number of Employees	Perception of Organizational Politics	
		Mean	Standard Deviation
Gender			
Male	406	2.74	.92
Female	319	2.71	.89
Age			
Below 30 years	283	2.43	.67
30 to 50 years	395	2.85	.98
More than 50 years	47	3.43	.94
Tenure			
Temporary	101	2.74	1.17
Permanent	624	2.72	.86
Unionization			
Yes	515	2.87	.91
No	210	2.37	.81
Member of the union			
Yes	213	2.88	.94
No	304	2.75	1.05
Not disclosed	208	2.53	.56
Designation			
Manager	71	2.82	.89
Officer	299	2.84	.99
Assistant	312	2.64	.84
Others	43	2.34	.63
Total		2.73	.91

Demographic groups of respondents, there were different levels of mean values explaining the perception of organizational politics ranging within 2.37 to 3.43 with the standard deviations of .56 to 1.17.

Table 2 depicts the level of perception of organizational politics of a different demographic group of employees. As shown in Table 2, the perception of the male and female employees' organizational politics was represented by the mean value of 2.74 and 2.71 with a standard deviation of .92 and .89 respectively. Employees aged group below 30 years, aged group 30 to 50 years, and aged group more than 50 years reported their perception of organizational politics

as 2.43, 2.85, and 3.43 respectively with a standard deviation as .67, .98 and .94 in the same order. Similarly, temporary employees' and permanent employees' perception of organizational politics were 2.74 and 2.72 with a standard deviation of 1.17 and .86, respectively. Regarding whether employees are from the unionized or non-unionized organization, employees from unionized organizations reported their perception of organizational politics 2.87 with a standard deviation .91 and those from the non-unionized organization reported their perception of organizational politics 2.37 with standard deviation .81. Alike, union member, non-member, and not ready to disclose their membership status were reported their perception of organizational politics 2.88, 2.75, and 2.53 with a standard deviation .94, 1.05, and .56 respectively. Similarly, managers, officers, assistants and others reported their perception of organizational politics 2.82, 2.84, 2.64, and 2.34 with a standard deviation .89, .99, .84, and .63.

Mean Difference in Perception of Organizational Politics

The results presented in Table 2 described mean differences in perception of organizational politics among and between every demographic group. To find out the statistical significance of the mean differences between and within different demographic variables, the Analysis of Variance (ANOVA) test and t-test were computed. ANOVA was calculated for those demographic variables with more than two sub-groups like age group (below 30 years, 30 years to 50 years, and more than 50 years). Likewise, t-test was calculated for those demographic variables with two sub-groups like gender (male and female).

Table 3 depicts the statistical significance or insignificance of the mean differences between male and female employees, between permanent and temporary employees, between employees from unionized and non-unionized organization, and between union's member and non-member employees. As depicted in Table 3, male employees' perception of organizational politics was measured comparatively higher than their female co-workers (i.e., male= .2.74. female = 2.71, difference = .03) but this difference was statistically insignificant (t =.457, p > .05). Temporary employees' perception of organizational politics was measured

TABLE 3
MEAN DIFFERENCE OF PERCEPTION OF ORGANIZATIONAL POLITICS ACCORDING TO GENDER, TENURE, UNIONIZATION, AND MEMBERSHIP

Demographic Variable	Number of Employees	Mean	SD	t - value
Gender				
Male	403	2.74	.92	.457
Female	319	2.71	.89	
Tenure				
Temporary	101	2.74	1.17	.190
Permanent	624	2.72	.86	
Unionization				
Unionized Organization	515	2.87	.91	6.94***
Non-unionized Organization	210	2.37	.81	

Membership

Member of the Union	213	2.88	.94	.134
Non-member of the Union	304	2.75	1.05	

***, significance of t-value at .001 level

comparatively higher than permanent employees (i.e., temporary = 2.74, permanent 2.72, difference = .02), but this difference was statistically insignificant (t =.190, p > .05). Perception of organizational politics of employees from unionized organization was measured higher than employees from non-unionized organization (unionized organization = 2.87, non-unionized = 2.37, difference = .50) and this difference was statistically significant (t = 6.94, p < .001). Perception of organizational politics of union member employees was measured higher than union's non-member employees (union member = 2.88, union non-member = 2.75, difference = .13) and this difference was statistically insignificant (t = .134, p > .05).

TABLE 4
ANOVA OUTPUTS OF THE AGE AND DESIGNATION FOR PERCEPTION OF ORGANIZATIONAL POLITICS

	Perception of Organizational Politics	
Group	F	Sig.
Age	35.64***	.000
Designation	5.33**	.001

***, ** the mean difference is significant at the .001 and .01 levels respectively

Table 4 depicts the statistically significant or insignificance of mean difference of perception of organizational politics among different age groups and designation of the employees working in Nepalese commercial banks. As depicted in Table 4, F-value of age group was 35.64 with the level of significance .000 (p < .001) and designation group was 5.33 with the level of significance .001 (p <. 01). These results indicated that both the age groups and designation groups have statistically significant mean differences. The post-hoc analysis was computed to know which groups have the mean differences of perception of organizational politics within age groups and designation group of the employees.

TABLE 5
MULTIPLE COMPARISONS OF THE MEAN DIFFERENCE OF THE PERCEPTION OF ORGANIZATIONAL POLITICS, ACCORDING TO AGE GROUPS

Groups		Mean Difference	Std. Error	Sig.
Age				
Below 30 years	30 to 50 years	.42***	.07	.000
	More than 50 years	1.0***	.14	.000
30 to 50 years	More than 50 years	.58***	.13	.000

***, the mean difference is significant at the .001 level

As shown in Table 5, a mean difference in perception of organizational politics between age group below 30 years and age group 30 years to 50 years was .42 with the significance level of significance .000 (p < .001). Likewise, the mean difference of perception of organizational politics between the age group below 30 years and age group more than 50 years was 1.0 with the level of significance .000 (p < .001). Similarly, a mean difference of perception of organizational politics between age group 30 years to 50 years and age group more than 50 years was .58 with level of significance .000 (p < .001). These indicated that the mean difference in perception of organizational politics among all employees' age groups was statistically significant.

TABLE 6
MULTIPLE COMPARISONS OF MEAN DIFFERENCE OF THE PERCEPTION OF ORGANIZATIONAL POLITICS ACCORDING TO DESIGNATION GROUPS

Groups		Mean Difference	Std. Error	Sig.
Designation				
Manager	Officer	.02	.12	.882
	Assistant	.18	.12	.132
	Others	.48**	.17	.006
Officer	Assistant	.20**	.07	.007
	Others	.50**	.15	.001
Assistant	Others	.30*	.15	.040

**,*, the mean difference is significant at the .01. and .05 levels, respectively

As shown in Table 6, a mean difference of perception of organizational politics between managers and others was .48 with level of significance .006 (p < .01), between officers and assistant was .20 with level of significance .007 (p< .01), between officers and others was .50 with level of significance .001 (p <.01), and between assistant and others was .30 with level of significance .04 (p < .05). These indicate that the mean difference between managers and others, between officers and assistant, between officers and others, and between assistant and others were statistically significant. Mean differences between officer and manager and between managers and assistant were statistically insignificant (p > .05).

DISCUSSION

This study examined that there was no mean difference in perception of organizational politics between male and female employees. This means employees have perceived the same level of organizational politics, whether they were male or female. This finding is consistent with the prior study findings of Bhattarai (2016), Drory (1993), Ferris and Kacmar (1992), and Parker et al. (1995).They have tested non-significant differences in perceived organizational politics between male and female employees. But, there are theoretical arguments and empirical evidence that female employees perceive high organizational politics than male employees. Davey (2008) argues that female employees infer organizational politics as irrational, aggressive, competitive and instrumental, leading to individual success but against to organizational success.

Therefore, female employees would perceive more organizational politics than male employees (Ferris et al., 1989). Drory and Beaty (1991) have tested that male employees are more tolerant of political behavior than female employees which means female employees perceive high politics than male employees. Likewise, Bodla and Danish (2008) have tested that female employees perceive a higher level of politics than male employees. Furthermore, there are theoretical arguments of Drory and Beaty (1991) and Heilman (1983) concluding that male employees are more involved in the political process than female employees; therefore, male employees would perceive their work-place more political than their female co-workers.

Plausible causes for such inconsistent theoretical argument and findings could result from employees' work-place's unique context because above stated theoretical arguments and empirical evidence are from different contexts. If the country (or organization) has adopted a gender-friendly working environment, there may be the same level of understanding or perception of male and female employees. If the working environment is male-dominated, there may not be paid much attention to female's issues (e.g., flexible time for household commitment, relaxing time and place for an informal meeting, childcare facilities and breastfeeding room for working mother). Naturally, a female employee perceives themselves as overlooked in their work-place. Consequently, they may think that male co-worker's behavior is self-serving, which may cause to perceive their work environment as more political. Such inconsistent findings reveal the incorporation of the context in future research regarding the impact of the employee's gender on organizational politics.

This study examined no mean differences in perception of organizational politics between temporary employees and permanent employees. This means employees perceive the same level of organizational politics, whether their job contract is permanent or temporary. The findings of the study are more similar to several prior studies like Ferris et al. (1996), Rosen et al. (2014), Stepanski et al. (2000) and Yen et al. (2009). However, Bhattarai (2016), Ferris et al. (1996), Sultan et al. (2015), Donald et al. (2016) have tested the positive relationship between employees' tenure and perception of organizational politics. This means permanent employees perceive higher-level organizational politics than temporary employees.

Furthermore, studies carried out by Fedor et al. (1998) and Ferris and Kacmar (1992) have tested the negative relationship between employees' tenure and perception of organizational politics. The negative relationship between employees' tenure and perception of organizational politics means that temporary employees perceive a higher level of organizational politics than permanent employees. Notable causes for such inconsistent findings could be organizational trust and recognition to the employees. Suppose trust and recognition are felt equally by the permanent as and temporary employees, in this situation. There could be an insignificant difference inthe perception of organizational politics between permanent employees and temporary employees. But, considering seniority, if more trust and recognition are given to permanent employees than temporary employees, in such a situation, there would be a negative relationship between tenure and perception of organizational politics. Likewise, considering energy, dynamism, technical update, flexibility, etc. of the temporary employees, if more trust and recognition are perceived by temporary employees (who are newcomers), there would be a positive relationship between tenure and perception of organizational politics. Inconsistent empirical evidence regarding employee tenure and their perception of organizational politics

reveal that impact of employees' tenure on perception of organizational politics cannot be generalized. It requires further in-depth study to have a better understanding.

This study has tested that there were no significant differences in perception of organizational politics whether employees are members of the trade union. Which means employee perceives the same level of organizational politics, whether they have taken membership of a trade union or not. No prior study was found about the union's membership's impact on employees' perception of organizational politics. Plausible causes of insignificant finding can be non-discriminatory and transparent behavior in the work-place between member and non-member of the trade union. Because trade unions are established for the employees' common interest, and it does not work only for their members. As sufficient studies are lacking, further research in different contexts is necessary before generalizing this finding.

This study has examined statistically significant differences in the perception of organizational politics between unionized organizations' employees and non-unionized organization's employees. These mean employees working in unionized organizations perceive a higher level of organizational politics than employees working in non-unionized organizations. Probable causes of such finding can be the enforcement of union in the decision-making process. While making crucial decisions related to employee recruitment, promotion, working conditions, facilities, etc.; union leaders may highlight and interpret the issues differently by different unions or union leaders as their interest and understanding. Furthermore, management may interpret the same issues in different ways than union leaders. In the meantime, employees closely monitor all the movements of both union leaders and managers for an issue. They may feel ambiguity and doubtfulness in dealing the issues that may lead to perceived politics in organizations. Because main source of perception of organizational politics as uncertainty and ambiguity at work-place (Fandt& Ferris, 1990). No prior study was found to compare the impact of unionization on perception of organizational politics; therefore, this finding requires further investigation in different contexts before generalization.

Regarding the employees' age and perception of organizational politics, this study found that employees' perception of organizational politics was significantly increasing in employees' age groups. This means there is a positive relationship between employees' age and perception of organizational politics. This finding did not consist of prior study of Ferris et al. (1996). Individuals have different preferences regarding political behaviors and age as a predictor of politics perceptions in organizational settings (Ferris et al., 1989). As the individuals become older, organizational members' experiences and skill accumulate gradually and they react to change in their environment differently compared to their co-workers with younger (Malik et al., 2009). However, there are large numbers of empirical evidence (e.g., Atinc et al., 2010; Kacmar & Ferris, 1991; Parker et al., 1995; Rosen et al., 2014; Valle & Perrewe, 2000; Yen et al., 2009) that tested insignificant differences of employees' age with their perception of organizational politics. Literature shows the diversified findings regarding the impact of employees' age on their perception of organizational politics. Plausible causes of the diversified conclusions can be the organization's trust and recognition to the employees like in the relationship between tenure and perception of organizational politics (as explained above). Because, employees' age and tenure are correlated, and ageing effects are often confused by the sound effects of tenure, and vice versa (Malik et al., 2009). Such inconsistent findings demand further testing under different context before generalization.

This study finds that the officer level of employees perceives significantly more organizational politics than employees' assistant level. But the manager's perception of organizational politics is insignificantly different with both assistant level of employees and officer level of employees. This means the officer level of employees perceived more politics than their seniors and juniors. This finding is similar to the finding of Parker et al. (1995) where they tested nonlinear (i.e., inverted Ushape) relationship between the hierarchy of employees and perception of organizational politics. There are different theoretical arguments and empirical evidence regarding employees' designation and perception of organizational politics. A model of Ferris et al. (1989) suggests that employees at higher levels of the organizational hierarchy should perceive more politics than those at lower levels. But Ferris and Kacmar (1992) have found no differences in the perception of organizational politics among supervisors and nonsupervisory ones. Moreover, Gandz and Murray (1980) have found that employees at lower levels perceived more politics than their seniors in the work-place.

Plausible causes of contradicting findings on the impact of employees' designation on their perception of organizational politics can be employees' understanding and control (Ferris et al., 1989) in the organizational decision-making process. Transparency, involvement, rational discussion, etc., in the decision-making process, may impact employees' understanding and control in the decision-making process. Such understanding and control may affect their perception of organizational politics. If an organization has adopted the participatory decision-making process, there will be fewer chances to perceive politics by a certain level of employees (e.g., assistant). If decisions are made from the top level, there can be chances of perceiving a high level of organizational politics by a lower employee level. When decisions are made by a single person, without rational discussion with the team, there can be chances of perceiving a high level of organizational politics even by top managers. Therefore, this finding cannot be generalized without further comprehensive study.

Implications for Practice

Firstly, there are no differences in the level of perception of organizational politics between male and female, between permanent and temporary, between member and non-member of the trade union, and age groups. An organization can ignore these demographic aspects while making policy or guidelines or designing the corrective actions to minimize the perception of organizational politics itself or improve its aftermaths.

Secondly, as employees working in unionized organizations perceived a high level of perception of organizational politics than employees working in non-unionized organizations, a unionized organization should pay serious attention to minimize the level of perception of organizational politics and its consequences. For example, an organization can train its employees to develop their political skills and political behaviors which work as antidotes for the detrimental effect of organizational politics on employee outcomes.

Thirdly, as employees' perception of organizational politics was increased with the increase in their age, organizations can make policy and program focusing on older employees to minimize their perception of organizational politics and its consequences. For example, making a policy that ensures the active participation of older people in the decision-making process. Suppose they are involved in decision -making, due to a feeling of understanding and control (Ferris et al.,

1989) in the decision making process. In that case, their detrimental consequences from perception of organizational politics will be minimized (Witt et al., 2000).

Fourthly, officer level of employees' perception of organizational politics was higher than all other levels of employees, therefore, an organization may launch the remedies program for officers to minimize perception of organizational politics as well as its detrimental effects. For example, considering their middle level of position, an organization can redefine and restate their authorities, roles, and responsibilities to minimize uncertainty and ambiguity which are the main source of perceived organizational politics (Fandt& Ferris, 1990).

Fourthly, inconsistent findings regarding the impacts of demographic variables (e.g., gender, age, tenure, and designation) on the perception of organizational politics highlight that the impacts of demographic variables on organizational politics are not universal. Many researchers (Ferris et al., 1989; Ferris et al., 1996; Parker et al., 1995; Valle & Perrewe, 2000) have regarded and tested that demographic aspects could be the predictor of the perception of organizational politics. However, the findings were not similar. For example, this study has tested the positive relationship between employees' age and perception of organizational politics, but a negative relationship was measured by Ferris et al. (1996). Therefore, the researcher should be aware of its contextual implication and requirements for further empirical testing in a different context. Similarly, for the theoretician, this study represents a different cultural context, and it enriches the literature about the impact of demographic variables on the perception of organizational politics.

Finally, this study has tested and found that whether employees are members of a trade union or not their level of perception of organizational politics was the same. But the perception of organizational politics was measured high for employees from unionized organizations than from non-unionized organizations. In the available literature of organizational politics, this study has introduced the impact of membership (of a trade union) and unionization (in the organization) on the perception of organizational politics. These findings will be pioneering empirical evidence and contributing as a foundation stone for future study under different contexts.

CONCLUSION

In general, employees working in Nepalese commercial bank perceive their work-place is somehow political. Employees' gender, nature of job contract and unionization do not impact on their level of perceived organizational politics.   Male employee and female employee have perceived the same level of organizational politics. Temporary employees and permanent employees perceive the same level of organizational politics. Employees perceive the same level of organizational politics, whether they have taken membership of a trade union or not. Likewise, employees' age, membership of the union and designation impact on their level of perceived organizational politics. Employees working in unionized organizations perceive higher levels of organization politics than employees working in non-unionized organizations. Employees perceive a higher level of organizational politics as an increase in their age. Officer level of employees perceives more organizational politics than their seniors and juniors.

THE ROLE OF HISTORICAL MEMORY AND NATIONAL IDEOLOGY IN THE ERA OF GLOBALIZATION OF SOCIO-POLITICAL LIFE OF UZBEKISTAN

Meliboyev Aziz Nizomiddinovich*

*Kokand State Pedagogical Institute,
Kokand, UZBEKISTAN

ABSTRACT

The article highlights the importance of the role of historical memory and national ideology, which are the product of the historical development of our people in the process of globalization, and remains an important condition for the preservation of national identity in the context of globalization.

KEYWORDS: *Process Of Globalization, Historical Memory, National Ideology, Socio-Political Life, Uzbekistan, Worldview, Independence, Destructive Idea.*

INTRODUCTION

The historical past of mankind clearly shows that mankind has been living in the process of exchanging information to the best of its ability in every period up to the present day. This process is intensifying at a tremendous rate today. As a result, the global view of the world is gaining a unique landscape. At this point, the definitions of the concept of globalization are diverse. But the full coverage of its features belonged to the French researcher B.Bandi [1], who described the process of globalization as follows:

• Globalization is an ongoing historical process;

• Globalization - the homogenization and universalization of the world process;

• Globalization is the process of "washing away" national borders.

MAIN PART

The development of societies today cannot be imagined without the impact of globalization processes on the mentality, spiritual world, social behavior of people. The next path of human development in the context of globalization is the social consciousness of the individual, guiding

goals, values, life concepts, worldviews and ultimately depends on what changes are taking place in his relationship with society. Therefore, in the social sciences and humanities, much attention is paid to the impact of globalization on not only the economic, social, political, but also cultural and ideological spheres of society. There are no more remote lands or desolate corners of the world. All regions are becoming part of the global economy and a single information space. The concept of a boundless world, in which regions and distances lose their original meaning, is taking on a real form. After gaining our independence, we have been cooperating with many developed and developing countries of the world in various fields to achieve our goal of building a free and prosperous country, a free and prosperous life, as well as a civil society based on democratic principles. This is one of the main requirements for the development of today's society. But in addition to the new changes that are taking place in our lives today, every conscious member can see clearly with his own eyes that there are all sorts of destructive ideas that are completely contrary to our historically formed traditions, values, mentality and national identity: books, movies, games, toys, images, clothes and so on.

At the same time, our main weapon in defending our country from the negative effects of the globalization process that is sweeping the world today is the national ideology that independence has given us. It is urgent that our young people fully understand the essence of our ideology and realize how powerful it is in maintaining the well-being and peace of our lives, and that no economic or military weapon can give us this power. In order to fully understand our national ideology, we must first of all restore the true history of our ancestors, as well as fully absorb it into the emerging ideological consciousness and spiritual heart of the younger generation. This is because the process of globalization first of all tests the national idea, and then hardens and heals it. As ideological immunity weakens, the national idea becomes a victim of globalization. Well-known American analysts Paul Henze and Enders Wimbush also say that "Uzbekistan, with its unique history, culture and religion, is a priority in Western policy in Central Asia" [2].

Therefore, every citizen of our society must not forget for a moment that this issue is a great threat to our well-being, which is envied by many peoples of the world today.

Indeed, a national ideology is a product of the historical development of a particular nation that cannot be changed or rebuilt in a short period of time. Especially at a time when today's globalization struggle is going on, we must constantly strengthen the ideological immunity of our society. There are many examples in history of how creative and destructive power ideas can be. It is no secret how much the world community's disregard for the spread of Hitler's idea of a "superior race" has claimed the lives of so many innocent people.

However, protection from the negative effects of the globalization process does not mean abandoning the vibrant spirit and innovations of today as a whole, of course, such a existence is not possible. As Mahatma Gandhi, a famous Indian statesman, put it, "I cannot always close the gates and doors of my house because fresh air must enter my house. At the same time, I don't want the air coming in from my open doors and windows to blow up my house and knock me down" [3]

CONCLUSION

From the above considerations, it is clear that the impact of globalization on different countries is also different. This is due to the economic, informational, spiritual potential and policies of the countries of the world. In order to reduce the negative impact of the violent processes taking

place in the world on each country and increase its positive impact, it is necessary to have a deeper understanding of the nature of this phenomenon, a more serious study of its features. We think that it is impossible to adapt to this phenomenon without a thorough study, and, if necessary, to change its direction accordingly.

In conclusion, no other force can replace our historical memory and national ideology in our protection from the negative effects of the globalization process today. Today, this fact cannot be denied by any conscious citizen of our society.

ABSTRACT

The article reveals the issues of the problem, solutions, prospects of pond fish farming in the Republic of Uzbekistan. As well as questions about the features of fish ponds and world experience.

KEYWORDS: *Fisheries, World Experience, Fast-Growing Sector, World Economy, Nutrition, Conservation.*

INTRODUCTION

The oceans are not an inexhaustible reservoir with unlimited fish stocks. There are huge areas in it, which are like water deserts, where there are no suitable conditions for the habitation of a large number of marine organisms. The temperature of the water, the nature of the bottom, depths and sea currents affect the required amount of food suitable for representatives of the marine fauna, which directly determines their reproduction, and therefore in many waters the number of fish and other marine organisms is very limited.

Most fish live in the waters of the continental shelf - an underwater plateau that surrounds the land of all continents. Usually the shelf is considered to be the plateau of the continental shelf to a depth of about 180 m. [1]

It is known that representatives of the herring family make up the majority of the world catch. Herring is a schooling fish; it comes in large schools that serve as a convenient source of cheap food and technical products. Herring fishing has always constituted the main share in the fisheries of Iceland, the Netherlands, Poland, the Scandinavian countries and Russia. Other

herring-like species of primary economic importance include anchovy, sardine and menhaden. The annual production of herring by all countries of the world is about 15 million tons.

Of the fish of the greatest economic importance, one should single out cod, the catch of which has been the basis of intensive fishing in the North Atlantic since ancient times. Once the annual catch of cod only in the area of the Great Newfoundland Bank (in the northwestern part of the Atlantic Ocean) reached 1 million tons, but in the early 1990s it fell by more than 70%. Cod makes up the majority of the fish caught by the UK and Icelandic fishing fleets; her catches were essential for the former USSR, and for Norway they are just as important today. [2]

Of anadromous fish spawning in rivers, salmon is of the greatest economic importance. It is mined mainly in the states of Washington, Oregon, Alaska and California, as well as in British Columbia, the Russian Far East and Japan. Salmon is also caught in Chile, Australia and New Zealand, where some of its species were introduced at one time. The growth of salmon production began thanks to the development of relevant mariculture enterprises, and these products have become an important element of international trade. A record amount of canned salmon was produced in 1936 - 9 million boxes, the total net of which amounted to 238 thousand tons. With the development of the fish market, less traditional fish products of the perch and carp orders began to appear on it. People have been fishing tuna in the Mediterranean Sea and off the coast of Japan for a long time. However, favorable conditions for the sale of products from this kind of fish were created only at the beginning of the 20th century. in connection with the development of enterprises for canning tuna meat, which has created a new market for these fish on a global scale. [3]

In the global economy, fish farming is the fastest growing nutritional sector. Having appeared in the 1950s, aquaculture (fish farming) has become the largest supplier of animal proteins on the table of humanity since the mid-2000s, overtaking livestock and poultry farming in this.

And in our country, the fish industry is one of the most promising areas in the economy of Uzbekistan. Topics

however, despite the presence of vast water resources (ponds, reservoirs, lakes, rivers, canals, etc.), fish production and the introduction of scientific research on fish farming proceeded slowly. [4]

In order to improve the organization of fish farming, increase the volume of industrial production of fish products, rational use of water resources and taking into account the importance of the fishing industry in providing the population with high-protein food, the country has adopted a number of legislative acts, including the Resolution of the President of the Republic of Uzbekistan No. PP-2939 dated May 1, 2017 "On measures to improve the management system of the fishing industry" and No. PP-4005 dated November 6, 2018 "On additional measures for the further development of the fish farming industry." [5]

As a result, there has been a significant increase in the number of farmers who choose to grow fish. The first stages of restoration of the fishery sector in Uzbekistan can be characterized as semi-intensive development of pond fish farming. The capacities of fish farms that have existed since the planned economy have been rehabilitated, a large number (over 2000) of new small-scale fish farms have been created. As a result, fish production in the republic increased from ...

thousand tons in 2006 to 94 thousand tons per year in recent years (up to 83.9 thousand tons in 2017, 201 thousand tons are forecasted in 2019). [6]

Aquaculture has a number of significant advantages over with livestock and poultry farming: a variety of technologies (there are technologies for any type of water bodies) and cultivation objects (more than 100 species are grown). It is in this direction, as experience shows, that it is advisable to develop aquaculture in Uzbekistan.

The most urgent task for the qualitative development of aquaculture is the analysis of the results achieved and the development of theoretical foundations for further development. In this case, one should be guided by such objective prerequisites as: [7] 1) a variety of technologies and objects of fisheries; 2) shortage of water and land resources in Uzbekistan.

Fish ponds are targeted artificial ponds created for fish farming. In all other types of water bodies, fish production is an additional activity for the sake of which no changes in the functioning of water bodies are made. Thus, fish ponds are of particular value for aquaculture, only they create optimal conditions for fish. [8]

The peculiarity of the ponds is that they are flooded in early spring, stocked with fish, fertilized throughout the growing season, the fish are fed and water is constantly added to maintain the level. In autumn the fish is completely caught and the ponds are drained. In other words, water stays in ponds throughout the growing season and is discharged in autumn.

It should be noted that in our republic, where in the old days the fishing industry was the second in the USSR, despite the presence of a number of scientific developments, due attention was not paid to saving natural resources.

Currently, the number of fish ponds in Uzbekistan is significantly and constantly growing, the total area is currently more than 20 thousand hectares. At the same time, their technological level differs both in the quality of construction and arrangement, and in the technology of fish farming. In a number of farms, the arrangement of ponds is the most primitive, which does not allow them to be well flooded and drained. In other farms, fish farmers use very outdated and ineffective fish farming technology. But the profit, albeit insignificant, is received by the farmers, and, unfortunately, they are satisfied with this level. As a result, fish productivity in many fish farms is very low - 5-7 c / ha.

Despite such shortcomings, our state, in which irrigated land is used for growing valuable agricultural crops (cotton, rice, wheat, etc.), still provides farmers with land for fish farming. therefore

At present, the fish farming of the country faces the problem of rational use of the available water and land resources of pond farms. It has two important aspects:

• It is desirable for farms and the state to develop the used technology of pond fish farming, and for different levels of intensification, in order to get more products from ponds.

• The state needs to determine the minimum level of fish productivity in fish production for different regions of the republic, and at the same time establish that farms with fish productivity below the established norm are subject to a progressive tax (following the example of China).

Both of these tasks require specific applied research to be performed. The fact is that the extensive technology of pond fish farming (in which fish feeds on organisms of the natural food base of a fish-breeding reservoir, a fish farmer can use fertilizers to stimulate its development), used in Uzbekistan in the 1970s - 1990s, was created for a planned economy, namely, for lending conditions and subsidies to state fish farms. The standard was the level of 27 c / ha, but in Uzbekistan, on average, 23 c / ha were achieved with planning the application of the appropriate amount of fertilizer and compound feed. The share of carp was almost 50-60% in the harvest. Carp is a more valuable fish than silver carp and grass carp. To grow carp, it is necessary to purchase expensive compound feed, while its sale may not be profitable. This is typical for fish farms with the most competently built production organization. In the planned economy, the sale of carp was not a problem for fish farms; marketing enterprises were engaged in this. [8]

Thus, the fish farms made a profit by growing silver carp and grass carp, which compensated for the losses from carp growing. Growing herbivorous silver carp and grass carp is highly profitable, since only young fish are needed and fertilizers that stimulate the development of the feed base. With the transition to market relations, the cultivation of carp due to feeding with mixed feed in such a large amount became risky and even unprofitable, as a result of which the fish farms spontaneously abandoned carp. More precisely, the development of a natural forage base through the application of fertilizers also makes it possible to grow cheaply a small amount of carp without feeding, but the share of carp in the total mass is sharply reduced. The main object is silver carp, the proportion of which increases to 75-85%. [9]

The increase in fish production and the government's attention to the development of fish farming causes increased competition between fish farms and develops the tendency to increase more valuable fish species, in particular, carp. Therefore, some fish farms begin to increase additional feeding, which increases the proportion of carp to 10-15%. [10]

In addition, local consumers demand the provision of larger herbivorous fish by weight. All this makes it necessary to provide farms with larger fish seed material, theoretical and economic basis for fish farming technology in polyculture. [eleven]

This has become a limiting factor in the development of aquaculture since 2013-2018. Currently, in Uzbekistan, we have fish farms with different levels of intensification of pond polyculture, and therefore it is necessary to develop recommendations for the development of biological standards for the cultivation of fish seed and marketable fish in pond farms of different levels. [12]

Note that the relevance of the topic will not change at all even with a significant development of intensive aquaculture. The fact is that intensive aquaculture does not need a natural food base at all, fish grow entirely due to artificial feeding. But mainly predators are bred this way, and these are expensive types of fish. And the market of any state needs a diverse range of fish, including inexpensive fish, which include silver carp, grass carp and carp, which are produced only by pond farms.

Thus, pond fish farming (maybe, to write - extensive?) And intensive aquaculture do not overlap in objects, they complement each other, and this will be the rational use of water and land resources. Thus, the fish farms made a profit by growing silver carp and grass carp, which compensated for the losses from carp growing. Growing herbivorous silver carp and grass carp is highly profitable, since only young fish are needed and fertilizers that stimulate the development

of the feed base. With the transition to market relations, the cultivation of carp due to feeding with mixed feed in such a large amount became risky and even unprofitable, as a result of which the fish farms spontaneously abandoned carp. More precisely, the development of a natural forage base through the application of fertilizers also makes it possible to grow cheaply a small amount of carp without feeding, but the share of carp in the total mass is sharply reduced. The main object is silver carp, the proportion of which increases to 75-85%. [9]

The increase in fish production and the government's attention to the development of fish farming causes increased competition between fish farms and develops the tendency to increase more valuable fish species, in particular, carp. Therefore, some fish farms begin to increase additional feeding, which increases the proportion of carp to 10-15%. [10]

In addition, local consumers demand the provision of larger herbivorous fish by weight. All this makes it necessary to provide farms with larger fish seed material, theoretical and economic basis for fish farming technology in polyculture. [eleven]

This has become a limiting factor in the development of aquaculture since 2013-2018. Currently, in Uzbekistan, we have fish farms with different levels of intensification of pond polyculture, and therefore it is necessary to develop recommendations for the development of biological standards for the cultivation of fish seed and marketable fish in pond farms of different levels. [12]

Note that the relevance of the topic will not change at all even with a significant development of intensive aquaculture. The fact is that intensive aquaculture does not need a natural food base at all, fish grow entirely due to artificial feeding. But mainly predators are bred this way, and these are expensive types of fish. And the market of any state needs a diverse range of fish, including inexpensive fish, which include silver carp, grass carp and carp, which are produced only by pond farms.

Thus, pond fish farming (maybe, to write - extensive?) And intensive aquaculture do not overlap in objects, they complement each other, and this will be the rational use of water and land resources.

WAYS TO INCREASE MOTIVATION OF PUPILS TO LEARN FOREIGN LANGUAGES

Muminkhujaev Abrorkhuja Muksumkhodjaevich*

*English Teacher,
Boarding School of Internal Affairs Ministry Republic of UZBEKISTAN

ABSTRACT

The article explores pedagogical experience in shaping pupils'interest in learning a foreign language at school and motivational preparation. Teachers who work with pupils who have difficulty learning a foreign language are also given pedagogically justified recommendations to increase the motivation of pupils.

KEYWORDS: *Motivation, Pedagogy, Foreign Language Teaching, Psychology, Learning Process, Loss Of Motivation, Mastery Indicators, Teaching Methods, Assessment System.*

INTRODUCTION

Observations show that when primary school pupils start learning foreign languages, average of 97% of them have a high desire to learn the subject. However, this figure is 86% in grades 5-6 [1, p.125]. Most likely, the motivation of pupils to learn a foreign language in the upper grades will decrease again. There is no doubt that English is one of the most widely taught foreign languages today. Pupils' interest in learning about a foreign country, its culture, cities, customs, then hindered by problems as difficulties in mastering the subject, problems in practical use, immaturity, inconsistency of requirements with their intellectual abilities.

Subject is one of the sciences that cannot be mastered independently. There are several obstacles. However, one of the main obstacles for pupils to master the subject is recognized by teachers as low motivation. Motivation is the cause of human activity. Human activity can be stimulated by one or more motives at the same time: basic, guiding and others. As high motivation in pupils is one of the main means of improving the quality of knowledge, it has become an object of study in psychology and pedagogy. Motivation as one of the most important sources in the process of learning a foreign language, ensuring its effectiveness, should be born in mind that motivation is a part of the subjective world of pupils, which is realized by his needs, his own motives and marked with verses. Therefore, calling out motivation from the outside, is an emergence problem

for even the most experienced educator. The teacher creates the preconditions that can indirectly affect the motivation, and on this basis, the pupil develops a motive through a sense of personal interest in learning. Teacher has to possess an imagine of the whole arsenals of motivation tools, all the big and small types of motivation, their sources before starting teaching a foreign language. Then it will be possible to clearly link the content of the learning process with the types of motivation.

In pedagogy, motivation is interpreted differently. L.M.Friedman identifies two main groups of motives:

1 - Motives related to the educational process

2 - Motives beyond the educational process [2, p. 106]

Loss of motivation ofpupils to learn a subject can lead to the fact that the teacher of science lags behind the planned mastery, and even the quality of pupils' knowledge can come to a standstill. Science teacher does not always have the opportunity to influence the second group of motivation. Therefore, he or she should not allow the loss of motivation, which depends on the learning process.

Decreased motivation in pupils is manifested by the following symptoms:

Motivated pupil: Has a high interest in science and the tasks given in it, considers the tasks useful, tries to perform all tasks independently and in many cases succeeds, mastery indicators are fully self-sufficient. He believes that the indicators of mastery are equal to the ratio of his actions.

Unmotivated pupil: Believes that science and assignments are uninteresting, considers assignments useless, is able to perform tasks only with help of a teacher, is also skeptical of his abilities and knowledge, believes that he can not change the situation to the better, considers the actions to be useless in advance. [3, p. 98].

 The measures that have proved themselves pedagogically in acquisition of foreign languages by pupils are listed as follows:

1. Different types of tasks (one type of task reduces motivation, initiative in pupils);

2. Try to allocate the main time of the lesson topupils (in most cases, the teacher takes the main time in a lesson);

3. Control of the evaluation system (evaluation procedure should be flexible);

4. Taking into account interests of each pupil in organization of the lesson;

5. Adherence to the principle of equality in lessons (uniform assessment of own and pupils' mistakes);

6. Regardless of opinions of other pupils,encourage low-achieving pupils to in their even the smallest successes;

7. Take pupils out of embarrassment and self-doubt (natural abilities of the teacher: the softness of his voice, his acting talent, sense of humor, etc. cannot be replaced by anything else);

8. Show pupils' mastery indicators in the form of tables, diagrams (especially in graphs results will be understandable to pupils);

9. In primary classes, at least 3/1 of the lesson must be allocated for game lessons.

When talking about increasing the motivation of pupils, it is impossible not to mention the order of assessment. Pupils' interest in being praised and not being left behind leads to a creative approach to assignments. According to the observations, during an academic year only 26% of teachers take into account ability of pupils and effort expended to complete tasks. This leads to a decrease in the creative approach of pupils and their emotional excitement that the effort expended and the assessment given are incompatible. Teachers' Such a misguided approach to assessment and the following reduces pupils' motivation:

- Prioritization of pupil assessment over the achieved results;

- More attention is paid to the mistakes made by the pupil than the time and effort spent;

- Loss of inner peace in pupils and the creation of an unhealthy competitive environment.

Taking into account the general mastery of a student in the assessment, focusing the student's attention first on the mistakes and then on tasks without mistakes, to convince him that he can do all the tasks without mistakeshelp to eliminate teacher errors in assessment.

Of course, in addition to this, the teacher must have improved methodological skills. A variety of interesting activities, different organization of lessons gives a great impetus to motivation. Teachers' use communication lessons, fantasy lessons, dramatization lessons, poetry lessons, video lessons, game lessons, quizzes, conference lessons, lesson-tests, and presentations in their practice give good results. Each of these types of lessons has its own advantages in motivating pupils. The organization of various events on the subject of foreign languages is also motivating: foreign language anniversaries, parties dedicated to the holidays of English-speaking countries, song contests in this language, events and more. Usually, all the creative abilities of schoolchildren play a key role in these means.

Teachers who have difficulty in motivating their students to learn foreign languages are recommended to improve pedagogical communication:

- To be the first among those who trust the student's ability;

 - Not to organize competitions with the types of tasks that most students feel difficulty;

- Do not set realistic tasks for students that are beyond their abilities;

- Convincing students that you are only an older pupil than them and that everyone hasskills to learn foreign languages.

To overall mentioned, the teachers should create such an environment for students when planning their lessons, so that the need for personal interest and learning a foreign language prevail in the inner world of students.

COMPLEMENT AND MODIFIER IN [WPm] EXTEND

Akramov Shukur*

*PhD,
Kokand state Pedagogical Institute,
Kokand, UZBEKISTAN

ABSTRACT

This article focuses on the fact that the speech of the section on the syntactic level of the Uzbek language and its position in the construction of the traditional complement to the point of view in the most acute theoretical aspect.

INTRODUCTION

The first step towards "breaking" and "separating" the secondary parts from the cut of the sentence was made by introducing the concepts of "determinants" and "independent expanders of the sentence" in linguistics. In particular, in Russian and Uzbek linguistics, the interpretations of the terms "determinant complements" and "determinant cases" have become quite popular. In this regard, it is appropriate to show the research conducted by Russian linguistics N.Yu.Shvedova, V.P. Malashenko, O.A.Krylovs and in Uzbek linguistics the scientific interpretations of K. Hayitmetov, A. Ahmedov, M. Bashmanov. Determinants are a special form of secondary parts that are a common case and a syntactic phenomenon adjacent to complements.

The usual complements and cases are connected to the verbs by means of conjunctions or control connections, forming phrases and serving to fill them. In this case, the complement or case is subordinate, and the verb comes in the function of the dominant word. However, in the sentences in which the determinants formed in the case or complement form are used, it is not possible to determine, first of all, the phrase, as well as any dominant component of its phrases, in relation to these (determinants). For example, my word in this house is the law (Sh.R.). Loneliness on the road is bad (song). In two-sentence sentences, such as when a decision about discipline is made, secondary parts about discipline are not included in the phrase, and do not form phrases such as

loneliness on the road, bad on the road, decision about discipline, decision about discipline [1]. These passages relate to the whole sentence, to the basis of its holistic predicative, which consists of possessive and participle. They expand the whole sentence, not just one specific word, part of a sentence.

Main part

It can be seen from these comments that the concepts of determinant complement and determinant state are completely different from the concepts of functional non-functional complement or functional non-functional state. If the function of non-functional complementary (or holly) phrases is related to the dominant part of the sentence or the central part of the sentence (adjective, adjective, noun turnover), the determinant nodeterminant to some words (parts) and even the cut directly related to the dependency-non-dependence relationship [2]. If the filler and cases directly subordinate to the cut are evaluated as nodeterminant filler, nodeterminant case, the case not directly dependent on the cut or the fillers are called determinant case, the determinant filler. The importance of the doctrine of determinants in syntactic analysis and interpretation, in the process of survival, is that it separated the secondary parts from the main parts of the sentence and raised the question of the presence of complements and cases that are in the sentence and are not part of the sentence. The formation of the concept of determinants in linguistics makes it necessary to reconsider the interpretation of sentence structure and parts of speech [3].

Another factor that requires the improvement of syntactic interpretations is the lack of a reliable scientific basis for complementary and case differentiation. Despite the fact that in both Russian and Uzbek linguistics dozens of dissertations have been written on complementation and case differentiation, the ability to distinguish whether the word "closet" complements the word form in cases such as "I put the book in the closet" is still a method of questioning. All this necessitates a new perspective on the traditional interpretation of sentence construction, in particular the question of the position of secondary parts in speech construction.

The development of systematic linguistics in the early twentieth century and its day-to-day development are the basis for new ideas about construction.

One of the most basic concepts and foundations of systematic linguistics is the division of speech activity into linguistic and speech stages. In general, systematic analysis focuses on the linguistic and speech basis of the phenomenon. Because the method of studying linguistic phenomena is radically different from the method and ways of studying speech phenomena. When verbal phenomena are observed live, linguistic phenomena are analyzed by means of perception, abstract mental analysis, and the discovery and description of interactions and connections. Therefore, while systematic linguistics first deals directly with the study of speech and its structure, the role of primary and secondary parts in speech, it has previously paid great attention to determining the place of speech and its hidden essence in our traditional linguistics. As a result, it was concluded that the speech described in the teachings of Peshkovsky-Vinogradov in Russian linguistics and Borovkov-Gulyamov in Uzbek linguistics is mainly a speech phenomenon. These issues Sayfullaeva, M.Abuzalova's special works and a group of linguists' theses of collective formal-functional research ", we can not dwell on it in detail. In Uzbek linguistics H.Nematov, R.Sayfullaeva, M.Abuzalova, in Russian linguistics N.Yu. As the followers of Shvedova and VA Beloshapkova unanimously point out, the concept of

"possessive" in the Peshkovsky-Vinogradov-Gulyamov doctrine is mainly related to speech processes and differs from "linguistic speech" because linguistic speech is a necessary and permanent component for millions of speech and It is characterized by an abstract sketch of their relationship, the form of a template (model), and it reflects the common, necessary components for all speech. On the basis of such a view in Russian linguistics N.Yu. Shvedova and her followers structural schemes "and in Uzbek linguistics the notion of" the smallest construction pattern of speech "appeared. The secondary parts of the Uzbek sentence are not included at all in the "smallest construction pattern of the sentence" separated by the linguists. In Russian linguistics, "structural diagrams of a simple sentence" are given as one-component (single-component) and two-component (two-component), while in Uzbek linguistics, "the smallest building blocks of speech" (GKk) consist of only one-component, essentially fragmentary part. Therefore, this template is given by the symbol in world linguistics (WPm). This occurs in the form of cut-off category indicators in the template (WPm) and the smallest verbal expression of the speech linguistic template, potential sentences such as "I went," "I am a teacher," and so on. The removal of secondary fragments from the smallest construction pattern of a sentence is based on the theory of valence, which entered our linguistics in the 1930s.

In such an approach to speech construction, the component of speech construction, i.e., traditional speech passages, shifts to the relationship of speech center and expanders rather than to the interdependence of words based on lexical meanings (contents). Hence, in this case, the parts of speech are graded according to whether they are in direct or indirect contact with the center of speech. The part of speech that is related to the structural part of the sentence (the core) is the part of speech that expands. The expander parts of these parts are the word expanders. In particular, the role of the complement in the construction of the sentence is its role as a word expander in the sentence. Therefore, complements are widely used in speech, mainly expressed by [WPm] verb-lexemes in the center. Hence, the filler is embodied as a part of it rather than the cut in the center: horses enter into a connecting relationship with verbs. In particular, in the sentence I have read the book, the lexeme "read" is the means by which the complement of the "book" is uttered. One of the important conclusions to be drawn from such interpretations is that this approach shows that the scope of the concepts of "non-functional (non-functional) fillers" and "functional fillers" that are prevalent in our linguistics is narrow. After all, the word "book" has the same position wherever it appears in the phrase "read" in the phrase "read a book". The evaluation of a "book" as a functional, governing word, or as an extensible-non-functional part when it is a cut in a completed (read) sentence is the product of a mixture of logical word and sentence extensions.

The direct connection of the filler not with the construction of the sentence, but with the clarification of the meaning of the word, brings it closer to the determinants in essence. Because our traditional linguistics also supports the view that the determiner is included in the sentence structure through its own definition. While the determiner interprets the definition in terms of quantity, quality, and relation, the complement gives the complement the meanings of the source, the weapon.

In the structure of the center of speech there are the meanings of inclination, modality, time, space, the occurrence of which in speech is directly related to the situation. Therefore, cases can be divided into three types according to their position in the sentence structure:

1. Cases of place, time (cases in the position of expanders).

2. Cases of place, time, direction, cause, purpose and result (case-fillers), which can be assessed as a case or complement in the lexical sense.

3. Adverb and a group of meaningful cases close to it. We begin our generalization with a group of cases and the like.

Adverb and a group of similar cases are essentially verb determiners. Their little difference from the determinants can be proved on the basis of the combination of "sharp struggle". This is because it is interpreted as a "sharp" state in the compound. Hence, form cases have an equal position with determiners in sentence construction and can therefore be evaluated as word expanders. This allows us to judge that in our linguistics, in addition to adjectives and adjectives, there may also be adjectives.

The cases of place, time, and location serve as clarifiers of the meanings of time and space in the position of speech expanders.

The role of case-fillers in speech is complex. They are in the case-complementary contradiction of the case system itself, and their essence is clarified in certain speech conditions. Therefore, in Uzbek linguistics, the attempt to sharply differentiate the complement of the case does not yield effective results, and ultimately the basis of the analysis is based on factors such as text and speech meaning.

As noted above, case-fillers are confused with speech expanders at the linguistic stage. This is because one of the basic components of a sentence is to express affirmation or denial, which may have an additional expander. Therefore, cause, purpose, and outcome complements can be related to both the meaning of individual words in a sentence and the content of the whole sentence. At this point, case-fillers encounter another part of our linguistics that is noted, namely, the determinants associated with the general meaning of a sentence.

Determinant, by its very nature, manifests itself in a relatively weak connection with the dominant component, and as an extender of the whole sentence according to its function: For me, teaching is an honorable task [4]. The connection of complements and cases with the lexical meaning of the word at the center creates noderminance. Determinant is determined by the relation to the word expander and non-determinant by the relation to the word expander.

In general, at the universal level, the chain of three parts of speech, such as determiner, complement, and case, can be expressed as follows: determiners - complements, complements, cases. Since a type of case has a lower, complementary, and determinative position than the possessive in the sentence construction of place, time (directional meaning), the case has an intermediate third position between the possessive, which is the primary necessary expander, and the word expanders. Therefore, its interpretation in our traditional linguistics can be said to be determined by conflicting and certain grammatical factors.

Determinant, by its very nature, manifests itself in a relatively weak connection with the dominant component, and as an extender of the whole sentence according to its function: For me, teaching is an honorable task. The connection of complements and cases with the lexical meaning of the word at the center creates noderminance. Determinant is determined by the relation to the word expander and non-determinant by the relation to the word expander.

It has been pointed out above that the verb has a case when it comes as a cut, and that the case of place and time coincides with the expander of space and time. We can see such a situation in the statement that he wrote this sad letter to his brother in a red pen in the evening in Raykhona's room. The center is represented by the verb "wrote", which consists of 11 words, all of which are expanders that are part of the center.

CONCLUSION

1. The systematic direction that has been developing in linguistics in recent years requires the consideration of parts of speech, in particular, complements and cases, in terms of the expansion of the smallest sentence construction base.

2. The results of observations based on the possibilities of expansion show that the position of the complement in the sentence structure is determined by the nature of the accompaniment, which serves to expand certain words. The approach from the point of view of word expanders in determining the nature of the filler and its types is very effective.

3. Certain types of hol come in the position of speech expanders, and some types in the position of word expanders. Cases also form an intermediate third position in the relationship between word and speech expanders.

4. The approach to the components of a sentence from the point of view of [WPm] shows that the difference between complement and case is not in binary opposition as case-filler, but in degree (gradual) opposition as case-filler-filler.

5. Functional / non-functional, determinant phenomena of complements and cases can also be interpreted on the basis of valence theory. In this case, the determinant is complementary and the cases are evaluated as the base parts of the sentence. Phrasal verbs, on the other hand, differ from determinants in that they belong to a particular word. Functional / non-functional types of complements acquire word expanders that do not occupy an independent position in speech.

6. Traditional complements and cases are formed as functional meanings such as agent, object, localis, temporalis in interpretations based on word and speech expansion.

THE IMPACT OF MANAGERIAL PROFESSIONAL DEVELOPMENT ON THE EFFECTIVENESS OF HIGHER EDUCATION INSTITUTION MANAGEMENT

Siddikov Ilyosjon Bakhromovich*

*Teacher, PhD,
Fergana State University,
UZBEKISTAN
Email id: alfargoniy.uz@gmail.com

ABSTRACT

In the article has been examined the impact of the leader and his/her professional development on the effective organization of the activities of higher education institutions and the improvement of their management mechanisms, objective and subjective factors affecting the professional development of the head of the educational institution.

KEYWORDS: *Education, Higher Education, Leader, Profession, Professional Development, Higher Education Institution, Effectiveness, Management, Modern Management , Development Of Effectiveness.*

INTRODUCTION

There is no greater happiness for any person than to gain the trust and respect of the people, and most importantly, to be worthy of this trust in every way and to justify it with practical deeds...»[1]. Educational institutions and pedagogical communities are entrusted with the education of the future youth of our country.

Below we consider the factors and stages thar affect the professional development of such a highly trusted person who the head of the educational institution.

The formation of an innovative educational environment in the world requires the priority of the principles of innovative approach in the management of higher education. The innovative approach is recognized as an important factor in the development of higher education in accordance with the ongoing social, economic and cultural changes in society, improving the quality of education, teaching qualified, strong personnel. Therefore, new trends in the

innovative management of higher education are being introduced such as venture, benchmarking, franchising, out+ source, crowd+ source, branding, philanthropic activity in the United States, Great Britain, Germany, France, Japan, South Korea, Canada, Singapore, Turkey and Russia .

MATERIALS AND METHODS

An analysis of the literature shows that a new direction in management theory is the study of management psychology – the relationship between manager and employee , that is, the culture of human relations . The specificity of this relationship and the importance of educational relationships, the individual characteristics of teachers and the nature of the factors that affect their personal and professional development, as well as the direction of the process of interaction in the team is important in the organization. [2].

S.L.Rubinstein's   research became a methodological basis for buildingtwo models of pedagogical activity: adaptive behavior and personal development [3].

Both models can be used inthe analysis of the activities of the head of the educational institution. The educator is primarily a pedagogical professional.

RESEARCH METHODOLOGY

In the course of the research were used scientifically-philosophical principles and methods such as systematic, theoretical deductive conclusions, analysis and synthesis, history and logic, hermeneutic analysis, inheritance, universalism and nationality, comparative analysis.

ANALYSIS AND RESULTS

The peculiarity of the level of professional self-awareness of the specialist in the model of adaptive behavior of the head of the educational institution requires a high level of skill and certain professional competence in coordinating their activities with activities of others due to the variety of situations.

In the adaptive model of the educational institution, the priority is given to the fulfillment of social requirements, anticipation, of the tasks of higher organizations, the form of adherence to certain norms, the tendency to submit to the external environment. At the same time, the leader's experience in solving situations, usually accumulated through algorithms and turned into a stereotype, follows the principle of power saving.

The model of professional and personal development is characterized by the ability of the leader to deviate from the work he/she does every day, that is, to see his/her professional activity on a larger scale, in a more general way. Such an approach to management allows him/her to construct his/her present and future , to understand the difficulties in his/her work, to feel the contradictions inwardly, to understand and evaluate them in terms of his/her own values, to provide a unique incentive for future development. It allows you to overcome your limitations an challenges.

Understanding the leader's own capabilities, personal and professional development prospects encourages him/her to conduct experiments that are perceived as an opportunity for constant research, creativity, choice. In this situation, the opportunity and necessity of the choice as a decisive element of professional development means, on the one hand, a sense of freedom, on the other hand, responsibility for all that is happening and will happen in the educational institution.

When a leader realizes that he is responsible for all that is happening in the educational institution he leads that personal involvement is needed in the process, he/she must actively resist external negative influences, plan professional activities and set goals for its implementation. It is possible to express an opinion on professional development if it is able to change itself in the situations necessary in order to achieve this goal. This model is more effective in modern leadership activities for a number of reasons. Its successful implementation requires in some cases a strong, intelligent, flexible person who is able to independently set goals and objectives that are different from the usual ones, and who is self-interested in achieving them. Therefore, all the factors that affect the personal professional development of the head of an educational institution expand his/her creative potential as a leader.

Many years of experience show that the behavior of the head of an educational institution is more influenced by external factors. It can be concluded that the activities of the head of the educational institution focus on the contradictions between the requirements of management, on the one hand, and his/her personal abilities, activities, communication, as well as the specific style of pedagogical experience.

In this case, the dynamics of professional and personal development of the leader consist of three stages : adaptation, formation and stagnation.

At the stage of professional adaptation, the growing needs of the society, the pedagogical team do not correspond to the professional description, knowledge and skills of the individual. To adapt to a professional team, a young leader learns from the experience of others, adapts to it.

At the stage of professional formation, the individual style of activity, communication style, professional knowledge and experience developed by the leader himself/herself is in conflict with the need to adapt to the requirements of a higher organization.

At the stage of professional stagnation , the head of the educational institution adapts his/her individual abilities and capabilities to the requirements of the professional environment and acts on the basis of previous experience and universality. In this case, there is a decrease in professional activity and its growth, there are signs of inability to accept the news.

A leader who does not have in his/her mind an idea of the attitude of educators towards himself/herself is more likely to focus on himself/herself and his/her goals. In this regard, Y.N.Klyutkin's comments on the subject are noteworthy. It should allow teachers to evaluate their behavior in the educational process, not only in terms of student characteristics, but also in terms of students in the design of their activities. The same applies to the leader and staff relationship.[4].

The professional self-awareness of the head of the educational institution is reflected in the attitude of teachers, students and their parents towards him. It is the source of professional and personal development of the leader.

Active practical action is required to strengthen internal conflict as a driving force for a leader's professional and personal development. L.M.Mitina pointed out that the spiritual-practical experience of the leader and self-education make the enrichment of traditional psychological knowledge s student[5].

At the same time, a leader with a high level of self-awareness will have the potential to go beyond the routine of professional activity and create the conditions in which the activity should

be organized in a creative environment.

The process of formation of qualities in the head of an educational institution requires a constant choice between the possibilities of retreat or advancement. The resolution of these conflicts depends on two factors. On the one hand, at the heart of realizing his/her potential lies his/her high level of self-awareness. This means that what is formed in his/her mind becomes a source of contradictions in his/her personality and the components of his/her level of professional self-awareness. Ultimately, this factor serves as resource for the professional development of the leader through a perceived process. On the other hand, it allows the leader to overcome obstacles that arise due to the need to update their capabilities. A.Maslow argued that man exists at the same time as who he was and what strived for[6].

Thus, if the leader's inner activity is manifested as a mechanism of self-development, activation of his/ her inner world in the direction of self-expression, the experience of others, experience and universality in his/her work, the criteria of activity and so on. It allows that there are key areas of professional development, such as reliance on indicators.

From the above it became clear that the prospects for a comfortable professional and personal development of the head of the educational institution directly depend on the personal-typological description and the spiritual world.

Below we focus on the criteria and indicators of activity of one of the areas of professional development of the leader.

The practical difficulty of evaluating the performance of the head of an educational institution is that the differentiation of this work is somewhat complicated as a subject of management on the one hand, and as a teacher on the other. Therefore, the assessment should be made not only in general, but also at the level of individual cases.

Special literature in this area contains different approaches to the formation of criteria that affect the professional development of the head of the educational institution, its effectiveness and optimality[7].

At the same time, the activity of the head of the educational institution, the scientific and practical basis for the development of criteria for his/her professional performance has not found its logical solution. Therefore, it is expedient to rely on the main criteria for the classification of indicators and in addition to apply the existing methods of forming criteria and indicators.

Of particular interest is V.G.Zazikin's views on the effectiveness, speed, accuracy, reliability and sustainability of his/her work in individual cases as a criterion for evaluating the performance of a specialist.[8].

The criterion represents the essence of changes in the development of the object and manifests itself in a clear indicator, and it means the scale, completeness of the essence. This criterion is objective, because it represents a defined essence, and its formation is based on the analysis of the activities of the head of the educational institution.

However, the study of criteria has its own complexity. First of all, in addition to the interior, which represents the essence of the object (reality, result, process), there are also random elements, relationships, which are of secondary importance. Such cases may be mistaken for the essence. Second, because the shape of the object under study does not always reflect its true nature, the criteria may be erroneous in determining the objectivity of the results. Therefore, the following question arises. To what extent should events be studied to ensure the validity of the criteria?

Indeed, the very definition of the nature of the activities of the head of an educational institution is a criterion that can be taken as a general criterion.

In the logical course of the study an object (reality, process , result), individual elements are identified in each ofd its contents , which must be considered as part of a holistic structure, on the one hand, and as a separate item, on the other. The latter, in turn, has its own structure and content elements. Therefore, the essence of understanding them can be taken as a higher criterion.

Thus, the hierarchical structure of the criteria of professional activity of the head of the educational institution is formed. Criterion is an evaluation tool, but it cannot be an evaluation in itself. The functional role of criteria is to determine the essence of the object (reality, process, result) or vice versa.

It should be noted that the choice of criteria and indicators of management efficiency by the head the educational institution depends on several factors. In this system of factors, the circumstances that reveal the requirements for the criteria are relevant. Among them are high reliability, adequacy of objective and subjective assessments, accuracy, integrativeness[9].

Another important aspect is that they are directly based on the goals, objectives, content and organizational aspects of the managerial activity as a management entity.

We believe that based on the indicators of the effectiveness of the management of the head of the educational institution, they can be classified as follows.

According to the level of generality, the need to include generalized indicators is related to the following factors: conditionality of decision-making, each of which is assessed by individual indicators through the implementation of certain actions; the need to evaluate conditions as a means of analyzing options; the hierarchy of decision evaluation from different perspectives.

Depending on the level of achievement of the goal, quality indicators describe the fact that the goals has been achieved or not. Numerical indicators are calculated on the basis of a measure of achievement.

Depending on the level of importance, the evaluation of the performance of the head of the educational institution is required to be based on priorities. This means that a number of indicator elements are sorted according to their importance.

It should be noted that the indicators and criteria for the effectiveness of management activities are both objective and subjective in nature, and the choice made in the assessment of these activities stems from their specificity.

The objectivity of the criteria and indicators is that professionalism allows to measure and evaluate a number of indicators of this activity, and they reflect the movement of objective factors and conditions. Subjectivity is mainly related to the self-assessment of the leader's own professionalism.

Various factors influence the choice of criteria for performance indicators of the educational institution: high level of motivation, leadership needs to achieve exceptional results, professional – personal standards, self-development, etc. Specific factors are determined by the purpose and characteristics of the organization of the pedagogical team.

Among a number of the factors that characterize the capabilities and direction of a leader's activity, in our opinion, the age and gender, psychodynamic and cognitive components of the leader are relevant. They are accepted as the exact criteria of the phenomenon under study.

The head of the educational institution acts as an individual in various systems of social relations. That is why his/her thoughts and attitudes represent a set of qualities of a certain social commonality.

The following components can be considered relevant in the creative potential of the leader as a person: striving for professional development and spiritual growth, a constant need to acquire new knowledge, awareness of all innovations, readability and the ability to apply them in educational practice, originality of thinking, the ability to create and design non-standard situations.

The head of the educational institution as a subject of activity in various activities manifests itself both as a subject of the management system and as a teacher. Therefore, the leader's team management and organizational skills, communication culture, knowledge, character are of particular importance. In this case, the manager is a person responsible for the conditions and requirements of the activity in accordance with his/her functional duties.

The head of the educational institution, as a subject of activity, must have the relevant knowledge, skills and abilities in the field of professional pedagogy and management.

Thus, as a criterion, the result-productive and certain style management tools are accepted. The indicators are: the results of practical activities, the success of individual activities, management style.

The activities of the head of the educational institution, their real personal characteristics are studied in relation to the specific conditions of activity.

The process of management and pedagogical activity, which reflects the level of professionalism of the head of the educational institution, was accepted as a technology in the framework of our research.

The choice of management technology is based on the methodological approach formed in the current management system, for example systematic, optimized, active , motivational, situational and reflexive. The application of these methods ensures that each participant in the educational relationship has a high understanding of the activities of each component of the educational institution system that serves to set goals and achieve them.

CONCLUSION

In conclusion, it can be said that, as mentioned above, development on the basis of indicators that are one of the areas of professional development of the head of the educational institution is important. The activity of the head of the educational institution is based on the development and scientific substantiation of the criteria applied to his/her professional performance and the main criteria for typology of indicators and traditional approaches that meet its classification, as well as the existing methods of forming criteria and indicators.

MAIN IDEAS OF NATIONAL DEVELOPMENT OF UZBEKISTAN AND RUSSIA: A COMPARATIVE ANALYSIS

Baratbayev Bekzod Botirovich*

*Kokand State Pedagogical Institute,
Kokand, UZBEKISTAN
Email id: baratbayev_b@mail.ru

ABSTRACT

Similarities and differences can be observed in the approaches of Uzbekistan and Russia in the systematic organization of the main ideas or ideological principles of the national development. It should be noted that in both Uzbekistan and Russia, the idea of "national development" can be approached from the point of view of "social" and "state" ideas. At present, the priority of power in both countries in the formation of national development directions is noted.

INTRODUCTION

When the ideas of national development correspond to the goals and interests of people, they raise the spirit of the society, encourage it to good and creative work, and members of the society also serve as a specific criterion for creative activity [1]. When the ideas of national development are close to the people, any means and methods of their implementation are convenient. But in the end, any effort will be ineffective.

Accordingly, any state in one way or another takes into account the goals and interests of its society, forms the basic ideas of national development, achieves the desired result, convincing the society.

Main part

From the first days of independence in Uzbekistan, special attention was paid to the concept of "national development". Over the years, it has been widely studied from a scientific, theoretical and practical point of view in the context of a number of concepts, such as the "idea of national

independence", "national idea", "principles of development" or "Uzbek model", "path of development", "national spirituality and ideology ". , and is applied in practice [2]. On the basis of these efforts, a system of basic ideas of national development has been formed and is developing in Uzbekistan.

Modern "national development" in Russia is both a concept and an idea, as some experts note, in the 19th century F. Dostoevsky came up with the idea that "neither a person, nor a nation can live without a high idea," and became known as "Russian idea" [3]. Various cardinal changes in the state structure and the policy pursued by Peter I of abolishing the idea of "Orthodoxy, autocracy and the nation" or "quasiscopal (sacred) salvation" [4] subsequently renewed the content of the concept and led to the idea of "unlimited spiritual unity" of social unity (collective)." [5]

In the 1980s, the idea of national development was expressed through the concept of "sociocultural integration" or "the organization of human solidarity based on the principles of moral solidarity". [6] Slavophiles, who unanimously expressed the idea of national development during the years of Russia's independence with the concept of "harmony of theology and love" [7], nationalists, who believed that "power in Russia is in the hands of only Russians", and chauvinists, who linked the need to "assimilate Russian statehood". [8] At the same time, disputes about "the formation of an almost never clear national idea" do not subside in Russia. Some believe that such an idea has never existed and never will be in Russia, but some see the task of the state to create it, while others consider the national idea to be something harmful [9].

However, the "Russian national idea" formed in the 1990s was transformed into the "Russian idea" in the second half of the 1990s, and into the "Russian national idea" in the 2000s. Over the years, his promotion increased the need for him. This helped the state regulate mutual and mutually beneficial relationships, and common efforts were aimed at increasing mobilization. This, in turn, gave Russia the opportunity to systematically build the ideological foundations of national development.

It should be noted that both in Uzbekistan and in Russia the idea of "national development" can be approached from the point of view of "social" and "state" ideas. At present, the priority of the authorities of both countries in the formation of national directions of development is noted. This, in turn, reflects the priority of which political regime.

Similarities and differences are observed in the approaches of Uzbekistan and Russia in the systematic organization of the main ideas or ideological principles of national development. We'll look at this below.

The first framework of the system of basic ideas of national development in Uzbekistan was formed in the 90s. The following ideas took leading positions in its structure due to the requirements of their time:

- to convince society of decline and decay to rebuild and develop as an independent state;

- building a national economic system in the context of an economic crisis;

- strengthening the independence and technical development of the national economy, ensuring the independence of industry, foodstuffs, services, transport and production and production of their funds;

The gradual elimination of religious, nationalist, communist, mass or anarchist tendencies in the worldview of citizens in politics, social order, order, ideology, government, economy and law, national territory in the region, wars for faith or their threat.

- to give and, conversely, to instill in people the idea of a democratic legal secular state;

- eradication of parochialism, tribalism, corruption and open crime;

- strictly control indifference in the implementation of political, economic, legal, cultural and educational programs;

- to disseminate widely the essence of recommendations and plans for the gradual implementation of democratic and economic reforms;

- the formation of harmony in the content of the strategic directions that determine the development of the country, in state structures and employees, the formation of experience in international economic relations;

- gradual modernization of public authorities and the management system, the formation of the ability to work with new government institutions, political parties, non-governmental, non-profit organizations, social structures, civil institutions, private sector structures in the process of interaction between old and new structures.

These ideas reflect the essence of the real processes implemented in the 90s. Apparently, they are mainly aimed at overcoming existing problems and achieving stability, and at the same time are practical in nature. In theory, the main ideas, which at that time were the main priorities for building a democratic state based on the rule of law and civil society in the country, were:

- maintaining peace and stability;

- preservation of interethnic harmony;

- social protection of the population;

- radical economic reform;

- the formation of a national army;

- creating a judicial system on a new basis;

- ensuring the interests, rights and freedoms of a person;

- liberalization of social and political life;

- emphasis on health care, science, education, culture and sports;

- take a worthy place in the world community.

These ideas initially served as the basis for the formation of the "Fundamental principles of socio-economic development of Uzbekistan" - "Uzbek model", which was given greater economic emphasis, and then in the 2000s, the "Ideology of National Independence" was developed.

The idea of national development is still being discussed in Russia. The general opinion is that there can be no idea of national development in Russia, since this opens the way for the

disintegration of the multinational Russian state. In Russia there can only be a "state idea" and the mobilization of all the peoples of the country, regardless of nationality, for national development. According to A.G.Dugin, this may be an idea of national development, but "it requires a universal, comprehensive civilizational character." According to V.V. Mozharovsky, the ideas of national development should cover spiritual issues and be able to influence several generations. Yeah. Mador also stresses that ideas for national development must be "viable for ten, maybe a hundred years, so that they can mobilize people."

Some of the views on this topic are close to Uzbekistan, which means that ideas for national development should serve to plan for the future, as they focus on the main goals and, therefore, reflect the actions that society must achieve, rather than what it has achieved. It was these views that ultimately led to the formation of a system of ideas about national development in Russia, albeit within the framework of certain concepts. Let's focus on one of them at this stage.

The main ideas of national development in Russia until the 2000s, although they did not have the status of a special ideological system, a separate official document, this period is very close to the ideas of Uzbekistan. The same situation is observed in Russia as in the period of independence and the tasks set for independence and a secular democratic rule of law in Uzbekistan. Only in these tasks set by Russia, the principle of "protecting the idea of federalism from too many threats, preserving it in any way and adapting it to new conditions" is as important as the red line.

The decline in production and consumption in the 1990s was reversed. In 2007, the gross domestic product was 110 percent higher than in 1991. At the same time, a stable increase in the share of market industries in the structure of the economy has been achieved.

The data presented show that the main ideas put forward in the national development of Russia in the first 15 years of independence differ from the Uzbek in many respects in terms of goals and interests. Also, the unsystematic nature of the main ideological trends is determined, firstly, by the prevalence of antipathetic views that "the systemic idea of national development leads to totalitarian planning" in society and public administration, and "the result of a very large territory and deep decline." It is also becoming clear that sustainable and coordinated systemic ideological planning is impossible without overcoming the sharp decline in certain areas.

Since 2006, Russia has been focusing on creating a third framework of key ideas for national development. This is due to the fact that the concept, developed in accordance with the instruction of the President of the Russian Federation on planning national development after the meeting of the State Council of the Russian Federation on July 21, 2006, outlines the main ideas of long-term socio-economic development. defined strategies for achieving the set goals, including methods, directions and steps. In this case, as we saw in the example of Uzbekistan above, in the sectoral context, namely:

- forms and mechanisms of strategic partnership between the state, business and society;

- goals, benchmarks, priorities and main tasks of the long-term state policy of structural reforms in the social sphere, science and technology, as well as in the economy;

- Goals and priorities of foreign economic policy.

CONCLUSION

Based on the analysis carried out, it can be said that the conditions characteristic of different periods, and the political and economic tasks set accordingly, play an important role in the formation of the main ideas of the national development of Uzbekistan and Russia. But the ideological foundations of both countries are characterized, on the one hand, by the elimination of existing real problems arising from the same conditions, and, on the other hand, by planning for the future. Accordingly, one can observe certain similarities in the components of the main ideas of national development and in practical measures.

FORMATION OF PRESCHOOLERS' INTEREST IN LEARNING IN THE CONTEXT OF MODERN REQUIREMENTS

Ruziyeva Nargiza Yodgorovna*

*Termez Branch of Tashkent State Technical University named after Islam Karimov, Termez, UZBEKISTAN

ABSTRACT

The article examines the use of advanced pedagogical technologies, interactive teaching methods, and didactic game technologies as an important task in the formation of preschoolers' interest in reading in the context of modern requirements. It is argued that the role of advanced modern technologies in the education of the educated generation is enormous.

KEYWORDS: *Preschool, Education, Educator, Pupil, Technology, Innovation, Modern, Interactive, Didactics, Interactive, Method, Computer.*

INTRODUCTION

An important aspect of shaping the interest of preschoolers in reading following modern requirements is a set of systematic methods that allow determining the interaction of human pedagogical and technical resources in the process of teaching and learning to optimize modern pedagogical technology. Today in our country there are enough opportunities to combine the scientific potential of specialists. Modern pedagogical technology cannot be considered as a separate branch of pedagogical science or as a system aimed only at optimizing educational practice. Modern pedagogical technology reflects the work in the field of combining theoretical and practical research in this area. First of all, what does modern pedagogical technology mean?

1. Modern pedagogical technology is designed for the educational process and is aimed at solving the given goal. Each society clearly defines the purpose of the formation of the individual, and accordingly, there will be a certain pedagogical system. This system is constantly influenced by social order and determines the purpose of education in general. The goal, in turn, raises the need to update the remaining elements of the pedagogical system.

2. Today, with the development of science and technology, the boundaries of human activity are expanding, new technologies are entering. They make modern pedagogical technologies a reality.

3. Modern pedagogical technology, in essence, is on a par with other technologies, because they, like others, have their field, methods, and tools. However, modern pedagogical technology as a field of knowledge related to human mind production and information technology. Its distinctive feature is the integration of educational components.

4. Modern pedagogical technology is constantly enriched with technological processes in other fields. And it takes on new opportunities to influence the traditional learning process, to increase its effectiveness. Technologicalization of the educational process is a historical reality and process. Informatization is a revolutionary turning point in this process and its important stage.

5. The application of modern pedagogical technologies in the educational process requires, first of all, the humanization and democratization of pedagogical relations. Because any pedagogical technology used without the humanization and democratization of pedagogical relations does not give the expected effect.

Modern pedagogical technology Radical reforms carried out based on the Law "On Education" and the "National Training Program" are the main driving force of the main directions. Advanced pedagogical technology is such a field of knowledge that it is the turning point of the 3rd millennium, the thirst for knowledge. Patriotism, humanity, spiritual, and spiritual perfection are systematically formed. The word technology (Greek) "taxnos" - art. profession "logos" science "pedagogue" means manager, leader (education). According to some educators. pedagogical technology is the process by which a teacher uses teaching aids to influence teachers in certain contexts, and as a product of this activity, to intensively shape the personality traits predetermined to them. Pedagogical technology is a set that renews the professional activity of a teacher and guarantees the final result in education. The need to bring advanced pedagogical and information technology into the educational process began in the 60s and 80s (when students' interest in lessons decreased) to change the form and types of teaching methods. It starts with the introduction of innovation. Introduction of information technology in non-standard classes (they are more than 40-50) in classes (computer, film scope, etc.) Innovative educational institutions (gymnasiums, lyceums, colleges, etc.) The transition to technology (Internet, multimedia, e-mail, etc.) continues with the introduction of editorial technology (interactive methods).

There are specific features of teaching different subjects, and the question arises as to whether it is necessary to adopt advanced pedagogical technology to this subject or to adapt science to advanced pedagogical technology. However, as a result of teachers confusing interactive methods with non-standard lessons, they develop a two-dimensional concept, which raises the problem of retraining and improving their skills.

In "Advanced pedagogical technologies" the teacher should know:

– Scientific and methodological bases of advanced pedagogical technologies;
– History of advanced pedagogical technologies;
– Have an idea of the principles of approach to the learning process;
– Didactic laws of pedagogical technologies;
– Designing the didactic process within a certain time frame;
– Explanation of the study of the relevant conditions of the educational process; development of an exhibition, technological and research approach;

When the lesson is conducted interactively.

– The expected results of the training will be announced to students.
– Students learn to work with each other.
– There is enough time to find answers and think.
– Most of the students are actively involved in the training.
– Pupils work together to solve their problems.
– Pupils learn to work in pairs and small groups.
– Learns to work and think independently.

Strategies in interactive methods are divided into 4 parts.

1. Invitation (mental attack, individual, group. Teamwork).
2. Understanding (analysis of new information, ideas, knowledge (critical, comparative), synthesis, understanding of the purpose).
3. Thinking (speech, motive, interaction, thinking)
4. Insert (ready text, mind control, judgment, understanding, basic signal. thinking).

The learner interactively learns the following.

1. Organize what you know
2. Ask what you don't know.
3. Run the memory
4. Increase in the activity.
5. Increase interest.
6. Control their concepts.
7. Independent study and independence.
8. Work with resources
9. Information exchange.

Teaching methods. Advanced editorial technology

The pedagogical process is a key part of the pedagogical system. The pedagogical system, on the other hand, is the creation of new features of several components (parts) that lose their strength when the innovation is introduced (Fig. 1).

Figure1Each component of the pedagogical system can be divided into several elements.

The model shows that the goal, the "result" and their degree of conformity form a small circle, and more or less conformity indicates the effectiveness of the pedagogical process. Management unites all components of the pedagogical system and is an independent component because the pedagogical system has its purpose and structure. is a technology that manages the educational process as a component. As a system-forming component of the pedagogical system is the technology of the educational process and is separated. Therefore, pedagogical technology is a stable organizational and technological complexity, "management of the educational process" is a "technology". The system-forming component of the pedagogical system is education. The technology of the process is and is separated.

Therefore, pedagogical technology is a stable organizational and technological complex, which achieves its goals. According to A. Kushner, the difference between technology and methodology is that methodology is the dissemination of best practices or the invention of a new way of transmitting knowledge, the result of which is not always guaranteed. In this case, didactics, management (like a technologist), the result of the level of time used (known in advance), easy mastery, methods, etc. play a key role. In our opinion, both teaching methods and pedagogical technology have one thing in common - the student's knowledge. but humanity, the improvement of human nature plays a key role, in which the role of pedagogy and information technology is more in line with modern requirements.

Therefore, both advanced pedagogical technology and the use of information technology and interactive methods should pay attention to humanity, consideration, and improvement of human nature, individual approach, differentiated education, democratic approach, psychological-pedagogical approach, etc.

Fundamentals of pedagogical technology

Pedagogical technology is the most complex process - it is the main tool in the education of man, and its basics are the main tool in the study, and its basics are as diverse as the complexity of the person. They include historical, theoretical, social, philosophical, methodological, editorial, didactic, physiological. hygienic, economical. ideological, legal, normative, practical, etc. In general, the emergence of pedagogical technology is considered a scientific process. Educational technology as a subject and science is taking its rightful place in life. "Pedagogical technology" "new pedagogical technology" "Modern pedagogy and interactive technology" "Information and innovative technology" "Educational technology" "Technique" "Skill" "Information technology" "Information communication technology" "teaching methods" "Educational methods" " Terms, concepts, special and elective courses, subjects are formed and their content is changing. In the system of general pedagogical concepts, the scientific approach to the problem of technology is growing.

MATERIALS AND METHODS

Interactive teaching methods

Communication Each student says what he or she knows about a topic (student 1 starts, 2-3-4 continues. The 2nd student says, "I will take water, bread, and salt," and the game continues. Then a conclusion is made.

Working in small groups. In this way, each learner learns to be an active participant in the learning process, a beginner, a learner, and to appreciate different perspectives. How to use:

1. The direction of activity is determined, the interrelated issues from the problem are defined.
2. The necessary basis is created, pupils should have an idea about this problem.
3. Groups are marked
4. Clear instructions are given.
5. Supported and directed.
6. Discussed.

"Discussion Method" This involves choosing a topic that is of interest to the children and the groups responding through a brainstorming session. The tutor writes. The children express their thoughts and ideas on the topic, which are grouped, analyzed, and come to a single conclusion.

There are two ways to use this method for the "cube", which is characterized by the fact that it is easy to think, imagine, think, show, increase activity.

1. Make a cube out of paper and write the questions on the six sides, answering the question on which side the selected cube falls.Before conducting this method, all questions will be recorded on Whatman paper. It is also possible to use several cubes (2-3)
2. Make a cube out of paper to the sides: Describe it! compare it! Connect it! Prove the negative (bad) and positive (good) aspects of this with evidence! Questions are written down. The topic is announced and each child answers according to their understanding.

Zigzag As its name suggests, this method divides mixed groups of children into different groups into 2-3 groups, and each group is given a separate task. in the end, each group defends what they have written.

The Internet method is a local area network of computers that can also be connected to the rest of the world. In Vunda, the teacher is a source of information for interactive methods, reading, learning, improving one's intellect and intellectual level. In this way, a knowledgeable child can play the role of the internet.

The method of "puzzles". This method uses crossword puzzles, chain word puzzles, etc. Puzzles. differs from other methods.

"Roleplay". The role-play method can be used in all types of lessons. In our experience, to guide students to the profession, we divided the students into 3 groups and discussed the professions "Teacher", "Doctor", "salesman".

The "great figures" The scientific research of each science depends on the great figures of the scientists who specialize in science. Applying this method for this purpose, one can learn the contribution of great figures to science.

For example, to collect information about our great poets and writers "Pride of Uzbekistan" and to show their image in the classroom in a theatrical way.

"Differentiated teaching method" This method is the core of the public education system, has long been used, and is divided into the following types:

1. By age.
2. By gender.
3. By interest.
4. By ability.

5. By intellect.
6. According to the level of mastery, etc. this method.

U.K. Varansky fully explained the editorial, psychological, methodological point of view.

"Treasure chest." We want to leave a "treasure chest" for future generations. Where, who wants to leave what kind of treasure (knowledge, advice, etc.)? Were we able to fill the treasure chest?

"On a deserted island". We landed on a deserted island. (Children's concepts are based on knowledge) We want to build a new life, state, society. They talk to children about what they will achieve in the future in their chosen professions, what they dream of, and what kind of state they will build in the future.

The integrated teaching method. The application of such a teaching method in all lessons is aimed at knowing the connection, the general level of knowledge of students is determined, developed, connected with life, leads to becoming a perfect person.

Collaborative lesson method. In this way, active students teach each other, work as a team. In this way, by teaching each other in the form of dialogue, interaction, the class not only achieves a high level of mastery, but also forms a harmonious team.

Fig saw (meaning two sides passing from one side to the other). In this way, the task is given one by one, experts are trained. They explain how to discuss the topic in the participating groups.

6x6x6 method. In this method, 36 students are divided into 6 groups to discuss an issue and find out the views of the majority of group members (6 minutes), then 6 groups are again divided into 6 groups, but this group must have 1 person from the previous group. In this case, the trainees are active and play the role of both participant and speaker.

Every student says what he or she knows about a topic. For example; When the teacher says "I" on the topic of "Sayr", the 1st student says "Mensuv, I will bring bread" and the other children add more.

It is known from the name of the zigzag method that in this method children with different knowledge are divided into 2-3 groups and each group is given a separate task, after the students write the answer, the groups share what they wrote with each other and write more. then each group defends what they have written.

Mobile market method. It is a place where knowledge is sold, a dialogue between buyers and sellers, and mobile is a fair in which children demonstrate their knowledge in several languages (Russian, Uzbek, English, Korean, Tajik).

Experience

Collaborative teaching method. Using the collaborative teaching method, the preparatory group of Preschool No. 9 in Teriz, Surkhandarya region, divided the pupils into 4 groups and instructed them to describe the intervals. ripe fruits) The children in the group helped each other and did their homework very well. For example, they named 4 groups.

- "Golden autumn" for the 1st group
- "Ice cream" for the 2nd group
- "Green grass" for the 3rd group

- "Sunlight" for the 4th group

Group 1 children described the name and appearance of changes in air temperature in autumn, shortening of days and lengthening of nights, yellowing, reddening of color, the ripening of fruits (all fruits ripened by children in autumn) (Tab. 1).

Group name	2-3	4-5	6-7	8-9	10
Golden autumn				+	
Ice cream		+			
Green grass			+		
Sunlight					+

Table 1The rest of the group also described their respective seasons with curiosity and impatience with childish delight.

The number of children in the preparatory group of Preschool No. 18 in Termez, Surkhandarya region, was 15.

15 students took part in interactive training. The interactive method enhances the student's thinking by influencing his or her mind, emotions, and will.

During the lesson, each child was given a task to show 10 of the geometric figures that are close to each other, and after 5 minutes, mix them with 20 figures that were not shown by the children (Tab. 2).

	10%	20%	30%	40%	50%	60%	70%	80%	100%
Satisfactory	+								
Good		+							
Excellent						+			

Table 270 excellent 22 - 10 good children passed in average condition.

"On a deserted island" We landed on a deserted island. (Children's concepts are based on knowledge) We want to build a new life, state, society. All children are actively involved in the idea that we want to build a new life, a state, a society, based on their interests. spoke with delight about his favorite professions and dreams. most of the children chose the professions listed below, and they expressed their excitement about these professions as children (Tab. 3). I will be a soldier in the future.

	Seamstress	Entrepreneur	Teacher	Doctor	The driver	Military
50						
45						
40						
35						+
30						
25					+	
20				+		
15			+			
10		+				
5	+					

Table 3 Career choice schedule.

CONCLUSION

The urgency of the formation, enrichment, and renewal of interest in preschool education following modern requirements, using existing methods and technologies, the development of intellectual abilities of the younger generation through independent age-appropriate methods and training. is to bring up a perfect man who can contribute.

METHODS OF GROWING A POTATO PLANT BY CHANGING THE SOIL TREATMENT PARAMETERS OF AND AGRICULTURAL MACHINERY

Alimnazarov Olim*; Nomozov Jasur**; Abdukholiqov Alisher***; Shamayev Yigitali****

[1,4]Termez Branch of Tashkent State Technical University named after Islam Karimov, Termez, UZBEKISTAN

ABSTRACT

Nowadays, agriculture needs to improve its quality by cultivating the soil and improve the soil fertility of the lands intended for cultivation, because any agricultural machine can produce a specific product soil, seeds, fertilizers, grain, processes agricultural products such as cotton, fruits, vegetables. Of course, before studying tillage machines, it is necessary to study the physical properties of the soil and the technological properties of tillage machines. The soil in which the crop is grown differs from the ordinary soil in terms of soil structure, ie fertility. Agricultural machinery only cultivates fertile soil. The physical properties of the soil for the cultivation of climate-resistant, disease-resistant varieties of Surkhandarya region, such as "Santa" and "Romana" for the effective cultivation of potatoes, the distances of tillage and tillage were studied. The majority of vegetable crops grow in high humidity conditions, and 70-75% of their production is water. Potato tuber contains 25% dry matter, 14-22% starch, 1.4-3% protein, around 1% wood, 0.3% fat and 10.8-1% ash, vitamins C, B, B1, There are B2, B6 and K. Due to the high content of vitamins in the new crop, if 150 quintals of tubers and 80 quintals of leaf stalks are harvested per hectare, 5,500 nutrients will be collected. The root penetrates mainly at a distance of 30 cm, then 50 cm. Potato roots make up 8-10% of the aboveground stem. Potato roots absorb nutrients from the soil. The results showed that the plow penetration angle at 75 ° was more efficient than the plow penetration angle at 90 °, as the tillage distance was effective at 70 cm intervals and the other at 80 cm and 90 cm intervals.

KEYWORDS: *Tillage, Plowing, Ploughshare, Capillary, No Capillary, Soil Porosity, Corpus*

INTRODUCTION

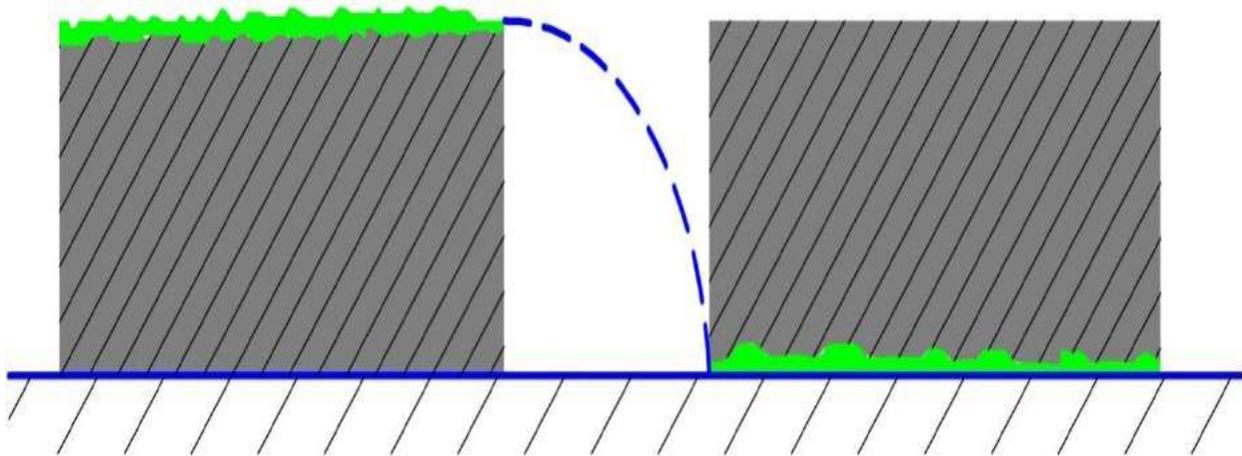
Today, more than 200 different food products are made from potatoes worldwide. Potatoes are eaten in different ways and are also used in processing. For livestock, potatoes are a nutritious fodder, fresh and cooked, 100 kg of fresh fodder, 29.5 silage, 8.5 fresh barley, 4 dry barley, and 52 food units. Alcohol, starch molasses, dextrin, glucose, rubber are obtained from potato tubers (M.Shomurodova, 2018; Ulugov, B. D. 2020, a). Before planting, the land is prepared, for which the fields cleared of winter wheat are well irrigated, plowed, and then plowed, 10-12 tons of mineral fertilizers per hectare, 200-220 kg of amorphous and 100-120 kg per hectare of potato fields. Potassium fertilizer is added. Potatoes receive more minerals than winter wheat, they are not demanding nutrients at the beginning of the growing season, and the demand for nutrients is observed during the formation of surface stems and tubers (M.Shomurodova, 2018; Ulugov, B. D. 2020, b). The optimal rate of application of mineral fertilizers depends on several factors that affect the yield. These factors include soil type and the degree of moisture retention in the soil. The nutritional status of the soil is also important. To increase the yield of any crop, it is necessary to cultivate the soil before planting. When cultivating the soil, the main focus should be on protecting the soil, maintaining its fertility, and if possible, restoring it. For this purpose, traditional and resource-efficient methods of tillage are used. Soil resource is understood as its fertility. When working with any agricultural machinery, it is necessary to choose a machine equipped with a working part that affects the soil conditions in the local conditions (M.Shomurodova, 2018; Bazar Dzhumaevich Ulugov. 2020). Which method to use is chosen according to local conditions. The main village is agro-technical plowing, in which the soil is plowed deep (more than 20 cm). When plowing the soil, the top layer of soil is cut off and moved to the side and turned at a certain angle. As a result of the overturning, the cut stratum is deformed and crushed, the soil structure is restored, weed seeds and remnants and insects are buried, and the bottom layer of soil, ie enriched with hummus, is removed. Using this method, you can plow deep and very deep (27 cm or more) and drastically reduce weeds. Overturning hurts the soil, as organic matter released to the surface can be decomposed by sunlight and other factors, the carbon in the resulting gas can be released into the atmosphere and soil erosion can increase (M.Shomurodova, 2018). This has been proven experimentally to reduce soil fertility. It is the process of turning the soil upside down and shifting the top and bottom layers of the stalks relative to each other. Every year on plowed, ie cultivated lands, the plow body is traditionally turned upside down by 130 ° - 140 ° (M.Shomurodova, 2018; Ulugov, B. 1996). Larger pieces of soil are formed depending on the composition of the soil during tillage with a larger tilting angle. In our Surkhandarya region, this method is not effective in growing potatoes. In the course of the experiment, we changed these values from 120 ° to 130 °, taking into account the presence of abrasive elements in light sandy soils, which, depending on the composition of the soil, cause the erosion of the ploughshare of the plow. In the process, we heat-treated the ploughshare to increase its corrosion resistance. As a result, the ploughshare blade does not wear out quickly. If erosion is observed on the ploughshare blade, different stresses are created during the tractor's agro-technical tillage, which leads to an increase in fuel consumption. The following experiment showed effective results in light sandy soils (Figure 1).


Figure 1 Topsoil collapse

Agricultural tractors play an important role in this process. This is very important to optimize the working efficiency and fuel consumption of all the physical properties of the soil to increase efficiency. Plowing and plowing operations on agricultural machines in the process of agro-technical processing include:

- Treatment of surface soil, which is the main nutrient, returning the used soil to the bottom;
- Apply mineral fertilizers to the bottom of the soil surface, thereby increasing the number of nutrients in the soil.

In agriculture, tractors are used for various purposes. Bringing the soil to the required quality in tillage is widely used to increase its fertility and prepare the sown areas for the process of seasonal sowing (M.Shomurodova, 2018). This is done by tilting the topsoil to a certain depth. In such cases, the fuel consumption of tractors varies depending on the composition of the soil, soil moisture, type, and size of the machine. In this process, the maximum force was observed at an angle of 90 °. This also has a significant effect on the width of the observed variable angles and minimal force is observed in bending (Marie J.A., 2014). Moisture content was also found to be inversely proportional to depth due to soil forces. The condition of the soil, moisture, and depth affect the power consumed by the tractor (Karimi I., 2012). Tillage is the process of creating favorable conditions for planting and germinating crops and improving the quality of the soil so that the soil is nourished with the necessary amount of oxygen to the plant roots. Machine tests showed that the soil conditions were good and that there was a good working area for tillage operations. Cultivation of this crop with the help of a plow has improved the physical condition of the soil, the porosity, and penetration of the soil (Bogunovic I. a., 2017; Fakhriddin Nosirov, Urishev B.U, Bozor Ulugov, et al. 2020).

The main purpose of this study is to study the effect of the plough on the soil penetration angle and tillage distances, as well as on the improvement of some mechanical properties for potato planting.

Method and Materials

The study was conducted in 2019 in the Jarkurgan district of the Surkhandarya region on the soil prepared for the cultivation of potatoes "Santa" and "Romana".

Experimental work was carried out in the cultivation of these potato varieties, taking into account some of the physical properties of the soil (Table 1).

Soil types	Volumetric weight, g / cm³	Specific gravity, g / cm³
Light	1,1-1,3	2,63-2,67
Medium	1,4-1,6	2,60-2,65
Medium	1,7-1,8	2,68

Table 1 Some physical properties of Central Asian soils

One of the properties that determine soil moisture and air capacity is porosity, which is determined by the following (1) (D. Y. Yormatova, 2008).

$$A = \left(1 - \frac{p}{p_1}\right) \cdot 100\% \qquad (1)$$

Where: ρ is the bulk density of the soil; ρ_1 is the specific gravity of the soil.

The density of the solid phase of the soil is equal to the ratio of the mass of the solid phase of the soil in the dry state to the mass of the soil with the same temperature of 40 oC. Its amount depends on the type of minerals and organic matter in the soil. For mineral soils, its value varies from 2.4 to 2.8 g / cm3. The density of solid-phase soils is used to determine the porosity of the soil and its total moisture capacity. The density of the soil is always smaller than the density of the solid phase soil, and its density depends on the density, composition, and porosity of its constituent substances. The density of soils varies from 0.9 to 1.8 g / cm3, depending on the mechanical components. Soil porosity is the sum of the volume of all pores in the soil and is measured as a percentage of the total volume of the soil. Depending on the mechanical components of the soil, porosity varies widely over different horizons. Soil porosity is divided into capillary and non-capillary. Capillary porosity is the volume of space between the capillaries of the soil. Nocapillary porosity is equal to the size of large cavities. The sum of the porosity types makes up the total porosity and is determined by the following (2) (D. Y. Yormatova, 2008).

$$A = \left(1 - \frac{\gamma}{m}\right) \cdot 100 \qquad (2)$$

Where: γ is the bulk density (soil density); m is the solid phase density of the soil.

The mechanical components of the soil studied in the field are determined based on external signs and the approximate amount of sand and mud particles crushed between the fingers. For this purpose, clay rings can be made of sand, sand, loam, or loam. For this reason, we experimented on a simple light sandy soil of these soil types on a tractor MTZ-100. In this tractor, the plowing angle was entered in two stages between 75 ° and 90 °, and the three distances between them were between 70, 80, and 90 cm. The experimental tillage tractor has a working width of 2790 mm, a length of 4120 mm, a height of 1970 mm, and a weight of 3750 kg. MTZ - 100 tractor engine power 100 horsepower, maximum speed 34.3 km / h, engine type Perkins (diesel), 4-cylinder, hydraulic lifting system 30 kN, and fuel tank capacity 156 liters. The tractor engine is economical and has increased its engine resources. The service life of the machine is achieved by increasing the strength of the piston-connecting rod elements and individual parts of the system.

Mechanical characteristics

Fuel consumption- is measured by the amount of fuel consumed to complete the job and is determined by the device in mL (3) for processing length (50 m) (Asharifi, 2009).

$$Q_F = \frac{Q_D \cdot 1000}{W_P \cdot D \cdot 100} \text{ mL} \qquad (3)$$

Where: Q_F- fuel consumption L / ha; Q_D- (100 m) tillage length fuel consumption; W_P- machine width (m); D is the length of tillage (60 m).

Percentage of shift - Measured with practical and theoretical speed (Alsharifi S., 2009).

Practical speed - The depth of tillage and the plowing process that turns the soil with practical speed have been determined experimentally. Moisture and tillage depth was repeated three times within the tillage length (60 m) for the soil and were determined using the following equation (4):

$$V_P = \frac{3,6 \cdot D}{T_P} \text{ km/hr} \qquad (4)$$

Theoretical speed - Without plowing the soil, only the device touches the soil at a speed of 3 km/hr during tillage and the length (60 m) is repeated for both soil moisture and three tillage depths. The calculation of the theoretical speed is determined by the following equation:

$$V_T = \frac{3,6 \cdot D}{T_t} km/hr \qquad (5)$$

Where: V_T- theoretical speed km/hr; T_t − is the theoretical time (hr).

Using Equation (6), the calculation of the percentage of displacement resulting from the practical and theoretical velocities was performed:

$$S = \frac{V_t \cdot V_P}{V_t} \cdot 100 \text{ \%} \qquad (6)$$

Equation (7) calculates the percentage of energy expended as a result of the displacement (Asharifi, 2009).

$$P_S = \frac{F(V_t \cdot V_P)}{270} kw \qquad (7)$$

Where: P_S − is the displacement power (kW)

Machine efficiency - is the ratio of the power consumed by an efficient machine to a given amount of time to the theoretical power consumption of a machine (Alsharifi S. M., 2019).

The theoretical size - of a machine is the speed at which it uses the full width and time of the machine and is determined by (8):

$$T_{FC} = \frac{S \cdot W}{C} \qquad (8)$$

Where: T_{FC} − is the theoretical size of the machine; S - speed is used; W is the sheer width of the device (M) and C is the shear coefficient.

The effective size of the machine is the actual stage of the work and is determined by (9):

$$E_{FC} = \frac{A}{T} \qquad (9)$$

Where: E_{FC} - is the effective machine size; A - distance (hr); T - time. The calculation of machine efficiency is determined by (10) (Oduma, 2015).

$$F_E = \frac{E_{FC}}{T_{FC}} \cdot 100\% \qquad (10)$$

Yield and its components

Sprout percentage - The proportion of seedlings should be five copies at a distance of one meter from the agate, given that the plants are 60 cm wide.

Plant height - The height of the potato is measured from the soil with a ruler or ruler, and this is repeated three times, up to the tip of the plant.

Potatoes weighing 1000 kg - Given that the average weight of one meter of potato taken by random samples for ten plants is 5 kg, theoretically, an average of 20 square meters of land is required for 1000 kg of potato.

Potatoes weighing 1000 kg - Assuming an average of 4 potatoes per seedling, the average number of random specimens per ten bushes is 20.

Potato yield - Random samples The average number of potatoes per sapling was 4, while the average number of random samples per ten bushes per meter was 20, which saved the land and produced more potatoes than the previous planting method.

Physical properties

The physical properties of the soils were determined, and six randomly selected soil samples of 10, 14, and 18 cm were taken by a tractor hydraulic device for the three working depths determined in the experiment. 12-14% of moisture was detected in soil samples of different depths obtained in the experiment (Behzad, 2014).

Samples were taken to measure soil moisture. Topsoil samples, 10 cm, 14 cm, and 18 cm, were taken and dried in an oven at 105 oC. The moisture content of soil samples is determined by the following (11) (Dehroyeh, 2015).

$$W = \frac{W_W}{W_S} \cdot 100\% \qquad (11)$$

Where: W is the percentage of soil moisture; W_W - Weight of wet soil, W_S- Weight of dry soil.

Three different soil samples were collected from the ground to measure the total soil density. The collected samples were dried at 105 oC for 48 h. The mass of the dried soil was weighed, and the density of the soil mass was determined as follows (12) (Langston, 2014).

$$P_b = \frac{M_S}{V_T} \qquad (12)$$

Where: P_b - is the dry mass density (mg / m^3); M_S - Weight of dried soil sample (mg); V_T is the total volume of the soil sample (m^3).

The determination of the total porosity collected for each soil sample was calculated using the following equation, with an approximate particle density of 2.65 mg / m^3. The total porosity of the soil is determined by (13) (Anna, 2010).

$$T_{SP} = \left(1 - \frac{P_b}{P_S}\right) \cdot 100\% \qquad (13)$$

Where: T_{SP} − is the total porosity of the soil (%); P_b − is the dry mass density (mg / m^3); P_S - is the partial density (mg / m^3).

Soil moisture%	Depth of soil to a pan, cm	The mass density of soil mg / m^3	% Total porosity of the soil
	10	1,28	51,69
10-12%	14	1,32	50,18
	18	1,44	45,66
	10	1,34	49,43
12-14%	14	1,41	46,79
	18	1,49	43,77

Table 2 Features of the experimental machine

The effects of soil moisture and tillage depth, mass density, and soil porosity are shown in Table 2. All results are significantly different from the interactions, and given that the best results are 1.28 mg / m^3 and 51.59%, the soil moisture is between 10% -12%, and the treatment depth is between 10 cm. We choose 1.34 mg / m^3 and 49.43% for 12% -14% of soil moisture for the best results of plowing depth of interactions.

Soil moisture%	Depth of soil to a pan, cm	Extremely moist soil	Gil	Sand	Soil tissue
	14	490	360	150	
10-12 %	16	480	390	130	
	18	460	370	170	
		476,67	373,33	150	
12-14%	14	480	380	140	
	16	490	350	160	
	18	450	390	160	
		473,37	373,33	153,33	

Table 3 Analysis of ground minute volume in an experimental machine

1.1.Selection of the design of the tillage plow

Features of the pile and methods of its use. We made extensive use of the pile as a tillage device. N (N perpendicular to the sides of the P) forces N are formed on the sides of the pontoon, which are several times greater than the force P that pushes it forward, and are determined by (14) (M.Shomurodova, 2018).

$$N = \frac{P}{sin\frac{\propto}{2}} \qquad (14)$$

Here $\propto$ is the angle of the pile.

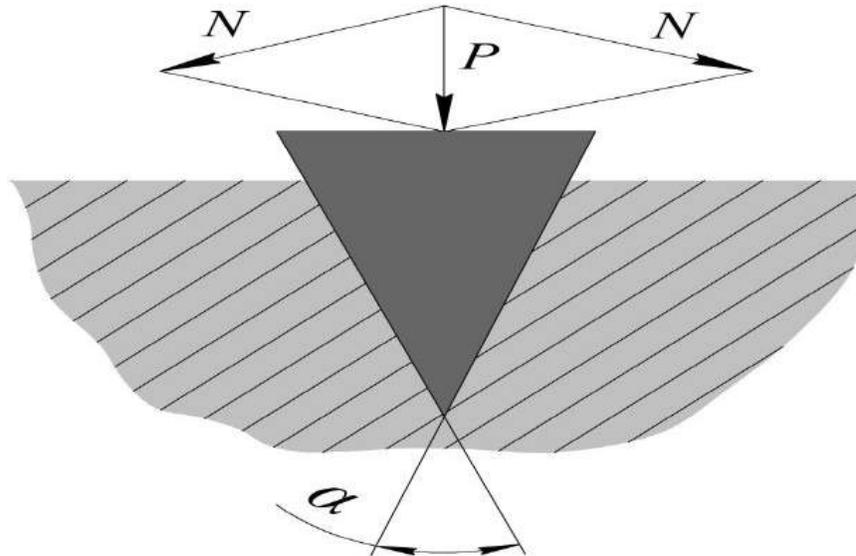
If $\propto = 30°$, then N = 4P, ie the pressure N on the body near the pile is four times greater than the force P moving it. (Figure 2). The pile allows you to penetrate any object with minimal effort and extract the desired part from it. Using the above, the shape of the working parts of agricultural machinery is made to resemble a flat or curved pile.


Figure 2 Angle of entry of the pile into the ground and the forces acting

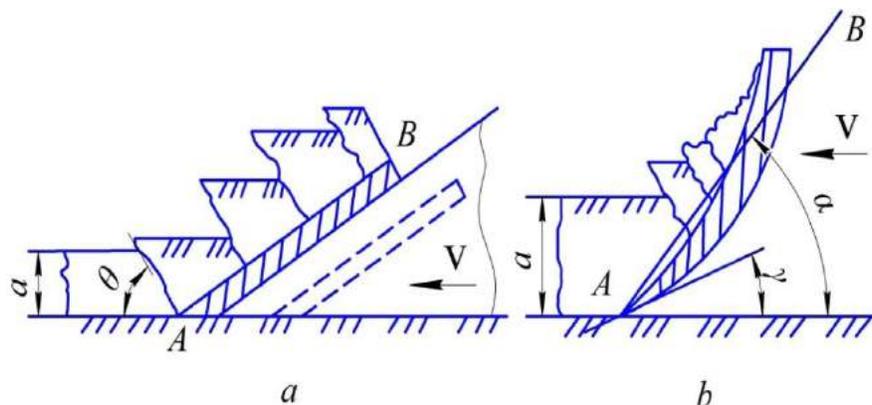
The effect of the pile on the soil surface. The pile can be single, double, or triple sided. The plow ploughshare is a one-sided pile, the harrow is a double-sided pile, the cultivator's softening teeth are a plow, and the plow body is a three-sided pile. According to the following formula, the smaller the pile angle $\propto$, the greater the pressure N it exerts and the force P exists (M.Shomurodova, 2018).


Figure 3 Deformation of soil under flat and curved piles: a - cracking under flat piles; b is the curvature of the curved surface pile

Classification of plows. Plows are divided into different types depending on their function, method of connection to the tractor, construction, number of housings, and the intended working speed. Depending on the design of the plug body can be divided into ploughshare, rotary, and combined. The most common are ploughshare plugs (M.Shomurodova, 2018).

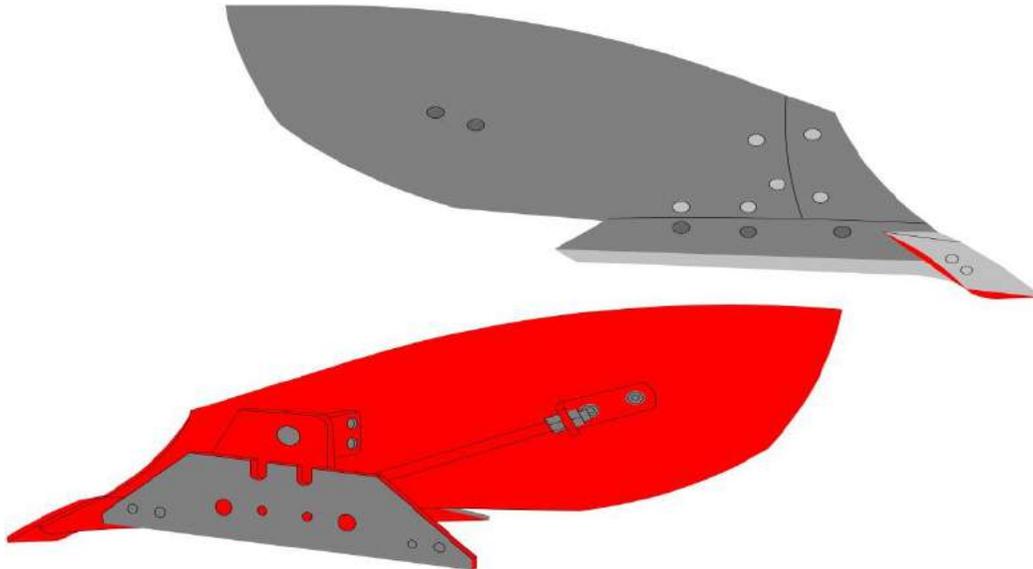
Examples of Ploughshare plugs are simple (widely used) plugs. This group includes plows for annual tillage (M.Shomurodova, 2018).


Figure 4. Housing designed according to the design

The body of the plow is characterized by the width of the cover, the depth of plowing, the angle of inclination of the plowshare blade to the plow wall g, and the angle of inclination of the plowshare to the plow bottom $\propto\_o$ and the shape of the working surface. The width of the body in ordinary plugs can be mainly 30, 35, and 40 cm, in special plugs - 45, 50, 60, 75, and even 100 cm (M.Shomurodova, 2018). The reason for the production of many types of hulls, which vary in width, is the need to cultivate the land at different depths, depending on local soil conditions and the type of crop. The maximum driving depth should not exceed 79% of the body coverage width, ie b = 1.27a_max. Otherwise, the blade will not turn properly. Hence, the studies show that if plowing is assigned at a depth of a = 27 cm, b = 1.27a = 1.27 · 27 = 35 cm, if a = 30 cm is required, b = 1.27 · A body with 30 = 40 cm indicates that a built-in plug should be used.

As a result of experiments on the soils of the Santa and Romana potato fields, the design of Ploughshare plows for agricultural machines used to improve soil quality through agro-technical tillage and prepare it for planting was carried out. As a result of the experiment, it is important to choose the size of the plow body based on the characteristics of the soil to be treated. Because the tillage equipment is selected correctly, the result will be effective, otherwise, this process may lead to an increase in fuel consumption as a result of various straining forces on the tillage machine (M.Shomurodova, 2018). For this process, we designed the dimensions of the plug body based on the composition of the light soil. (Figure 6).

Body parts. The body consists of a plowshare, a tipper, a support board, and a column. Plowshare (pictured) cuts a piece of soil from the bottom, separates it from the ground, lifts it

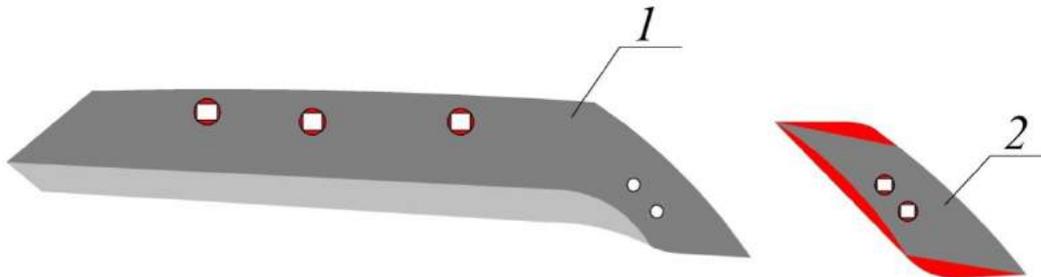
slightly, and passes it to the overturner. As the compacted soil moves along the surface of the plowshare under high pressure, the blade wears out quickly, becoming impenetrable and narrow. The drag resistance of the impenetrable plowshare plug can increase dramatically (up to 30%) (M.Shomurodova, 2018). Therefore, by heating it, the metal stock (magazine) on the back is moved to the blade, as a result of which the original width of its position is restored. The restored blade is sharpened at 250-35o until it is 1.0 mm thick, and the metal stock in the Ploughshare store is enough to stretch the blade 4-5 times. The impermeable plug not only increases the drag resistance of the plug but also makes it difficult to sink to the designated depth and ensures smooth movement. Plowshare is made of special corrosion-resistant steel. The designed plowshare lasts 2-2.5 times longer than a normal plowshare. The shape of the plowshare is selected according to the type of soil to be plowed. Due to a large number of soil types, plowshare also has different shapes: trapezoidal, scaffolding, triangular, interchangeable beak, and others. The replaceable beak plowshare (Fig. 5) is very simple in structure, inexpensive to prepare and repair, immersed in hard soil faster than other types of the plowshare and is resistant to corrosion by abrasive elements in the soil. Therefore, because this plowshare is used in the cultivation of light soils, its strength is increased by heat treatment of the material.


Figure 5. Interchangeable muzzle plowshare: 1 - base; 2 - interchangeable muzzle.

The over turner cuts the soil through the plowshare from the uncultivated land and lifts it and pushes it to the side. Abrasive particles in a sliding blade can cause the agitator to erode quickly and bend and break under the resistance of the soil. The over turner is made of two or three layers of special steel to make it resistant to abrasion and bending of the wing (M.Shomurodova, 2018). The working surface of such a dump truck is resistant to abrasive wear, and the soft layers on the surface that do not touch the middle and soil are bent. Often, the blade of the overturneris made replaceable because it wears out faster (M.Shomurodova, 2018). To reduce the friction of the soil moving along the surface of the over turner, it is sanded very gently. It is known that since the coefficient of friction of the soil with the soil is 1.5-1.8 times higher than the coefficient of friction of the soil with steel, the drag resistance of the plug increases (M.Shomurodova, 2018). The Ploughshare and the turntable are fastened to the pole with special bolts so that the head does not protrude from the surface of the body. The surface of the over turner should not rise above the plowshare.

Plowshares and their materials

Agriculture is practiced in 160 countries around the world and requires high-quality basic processing (Wolf, 2015). Many agricultural enterprises today prefer to purchase imported equipment because they have several advantages over local equipment (Petrovsky, 2015). The most important aspect of improving the technical level of tillage machines is to increase the

stock of their working bodies. When the soil is overturned by agricultural machinery, its parts are eroded due to friction, so they need to be repaired. In the process of studying the durability of working bodies and parts of machines, it is necessary to determine the laws of their wear. There is a need to develop a computational framework for the resilience of the working bodies involved in this process. The relative speed of movement of abrasive particles in the soil and the relative velocity of the working surfaces is determined by the shape and nature of the relative displacement of the particles about erosion. Experiments show that (Severnev MM, 2011), (Blokhin, 2015) the wear characteristics of the parts of the working bodies of agricultural machinery depend on the soil conditions, the specific pressure of the soil at work. In the experiment, the results of determining the abrasive particles in the soil and their wear under the influence of friction with the relative speed of movement showed that plowshare (Blokhin, 2015) is proportional to the specific pressure of the working surface of the soil.

$$I = kN \qquad (15)$$

Where k is the coefficient of proportionality, N is the specific pressure.

Depending on the velocity of the abrasive particle, the wear equation of the ploughshare is expressed.

$$I = \mu V^b \qquad (16)$$

where μ and b are constant coefficients depending on the physical and mechanical properties of the soil.

The results of the study showed that to prolong the service life of replaceable parts of agricultural machinery, it was necessary to increase its resistance to external influences by heat treatment of its surface in terms of achieving surface universality and cost-effectiveness.

Comparing the five variant results of heat treatment of 65G steel flat specimens on the surface layer studied in the experiment, taking into account the high durability, plasticity and adhesive properties for the heavily loaded variable parts of the working bodies of soil cutting machines, The most effective combinations increased the hardness using plasma at a temperature of 300o C.

Due to the very rapid heating rate in the plasma, the transformations take place at high temperatures, and this thermally active process has a strong effect on the kinetics of the formation and growth of new phase nuclei. The relationship between the degree of nucleation of austenite and their growth rate changes, and as the temperature increases, the nucleation process of austenite occurs faster than their acceleration, and the increase is due to a quantitative increase in the rate of nucleation. leads to the formation of rotating fine-grained austenite and turns into highly dispersed martensite with high strength properties.

Agricultural machinery is one of the most energy- and material-intensive industries, and tillage requires up to 45-50% of fuel and lubricant consumption. Due to the high annual consumption of replacement parts for tillage machines in agriculture, it is important to reduce operating costs and increase resistance to external influences and reduce the cost of spare parts and increase the level of competitiveness in the tillage process (Kanaev, 2018). Experiments show that in modern agricultural tillage it is necessary to ensure the strength of the product material at the level of

1500-1800 MPa. The impact force should be at least 0.8–1.0 MJ / m and the maximum possible surface hardness should correspond to values of 60–65 HRC (Shilov I.N. et al., 2010).

Replaceable parts for agricultural machinery are traditionally made of medium or high carbon St6, 65G, U8, and other steels. The plow plowshares, which is included in the replacement parts of the working bodies with increased surface hardness in plasma, is made of 65G manganese steel, the chemical composition and temperature of the critical points are given in Table 4 (Kanaev, 2018).

C	Mn	Si	P	S	Ni	Cu	Ac_1	Ac_3	Ar_1	Ar_3	Мн
0.63	0, 1.2	0.35	0.031	0.029	0.25	0.19	721	745	620	720	270

Table 4 Chemical composition (%) of Ploughshare material and temperature of critical points, ^{o}C

Mechanical properties of heat-treated steel material (hardening to 800-820 ^{o}C). The process after lubrication (air cooling to 340-380 ^{o}C) is shown in Table 5 (Kanaev, 2018).

Test temperature, °C	σ_B, MPa	$\delta, \%$	$\gamma, \%$	$\sigma_{0,2}, MPa$
Hardening in oil at 830 ° C. Cooling in the air at 350 ° C

300	1670	19	52	1220
400	880	20	70	980

Table 5 Mechanical properties of 65G steel depending on the temperature

σ_T, MPa	σ_B, MPa	$\delta, \%$	$\gamma, \%$	HRC, mm
1220	1470	5,0	38	49

Table 6 Mechanical properties of the studied steel

	Sample order number					
	1	2	3	4	5	6
Work surface HRC	48,1	50,1	50,7	49,7	48,9	49,2
Back surface HRC	47,9	50	49,8	46,4	47	46,3

Table 7 Summarizes the measurement results

The hardness of the Ploughshare working surface is 49 ... 51 in the range of HRC values, while the hardness of the reverse side is 46 ... 50 in the range of HRC values. We can conclude that the hardness of working surfaces is related to the abrasive particles of the soil environment and the hardening of this surface under the influence of plastic deformations. At incomplete temperatures of 750 ... 770 ° C, steels are heat-treated with hypereutectoid, followed by an increase in hardness at low temperatures of 150 ... 200 ° C (A.M. Mikhalchenkov, 2004) and (A.M. Mixalchenkov, 2012).

The uneven wear of the Ploughshare working surface is explained by the difference in soil pressure, but this phenomenon may be due to the difference in mechanical properties in certain areas of the working surface.

For L, there is a certain regularity of HRC change. The minimum value of hardness in the area of the Ploughshare blade is explained by the superior effect of abrasive particles on the surface by friction destruction compared to the hardening of the working surface.

Based on the analysis of research and exploration, the most important way to improve the technical level of tillage machines is to increase the stock of their working bodies. This is because strong abrasive elements change the cutting geometry, which leads to the fact that the parts and overall dimensions of the working bodies do not work at the required level, which reduces the quality of tillage and increases energy costs.

RESULTS AND DISCUSSION

Fuel consumption.

The fuel consumption under the influence of soil penetration angles is shown in Table 6. The effect of 75o soil penetration angles on the plow is 9.55 L / ha with minimum fuel penetration by the plow. For potatoes of Santa and Romana varieties, the effect of mechanical properties on some growth characteristics is the effect of 90o soil entry angles on the plow with the plow having the lowest fuel consumption of 11,264 L / ha. Fuel consumption increased due to high pressure during plowing (Alsharifi S. a., 2018). These results show that the following conclusions show that fuel consumption at a processing distance of 70 cm is more efficient than a processing distance of 90 cm. The results showed fuel consumption of 9,958, 10,375 and 10,891 L / ha. Due to the high resistance of the plow to the soil, fuel consumption increased due to increased movement and tillage distances. The most effective results showed that fuel consumption was 9,082 L / ha at a soil penetration rate of 75 ° and a tillage distance of 70 ° (Behzad, 2014).

Percentage of shift

A decrease in the percentage of displacement has led to an increase in tillage distances. The processing distances were 8,935, 9,653 and 10,682%, respectively. This is due to the increased tillage distances and shear coefficient as a result of the tillage resistance of the soil (Alsharifi S., 2009). Table 7 shows the percentage of displacement, which showed that the plow penetration angle was significantly more effective at 75 ° than at 90 °, and was 9.303% and 10.264% (Bogunovic I. a., 2017). These results showed that the soil penetration at an angle of 75 ° to the plow for plowing was effective at a tillage distance of 70 cm.

Machine efficiency

The effect of soil entry angles on the plow is shown in Table 8,% of machine efficiency. has an efficiency of 71.786% in a machine with an angle of soil penetration of more than 75 °. In a machine with a soil penetration angle greater than 90 °, the efficiency required 69.339% on a low machine. The decrease in machine efficiency was due to high pressure, and in the tillage plow during the tillage process, there was an inverse relationship between the plow entrance angles and the tillage distances (Marie, 2014). Demonstrated better machine efficiency at a processing distance of more than 90 cm at a distance of 70 cm. The results were 71,963, 70,598, and 69,127%, respectively. Due to tillage distances and high resistance to tillage, plowing movement and thus machine efficiency are reduced (Sale, 2013). The best result (73.610%) was the tillage distance obtained at 70 cm of plowing and the angle of entry of the plow into the soil was 75 °.

Duration of tillage angles of the soil	Tillage distances cm		
	70	80	90
75°	9,082	9,656	9,915
90°	10,833	11,095	11,866

Table 8 shows the effect of tillage angles and fuel consumption L / hr at tillage distances

Duration of tillage angles of the soil	Tillage distances cm		
	70	80	90
75°	8,715	9,092	10,103
90°	9,155	10,214	11,261

Table 9 Effect of tillage angles and tillage distance on displacement%

Duration of tillage angles of the soil	Tillage distances cm		
	70	80	90
75°	70,816	69,221	68,418
90°	69,213	68,411	67,526

Table 10 Influence of tillage angles and tillage distances on tillage efficiency%

Seedling percentage

The soil penetration and tillage angle with the plow affected the seedling percentage, and the plow penetration angle to the soil at 75 ° and 90 ° resulted in 91,613 and 89,570%, respectively. At 70 cm tillage, the germination rate was higher than 91.810%, and at 90 cm tillage, the lowest germination rate was 89.227%. Low soil fragmentation, tillage distances, reduced physical properties of the soil, and germination rates of potato yields were negatively affected (Jassim, 2007). The best result was 93.113% at a tillage distance of 70 cm and a plow penetration into the soil at an angle of 75 °.

CONCLUSION

As a result of the research, an experimental study of soil fertility in the Jarkurgan district of Surkhandarya region in the cultivation of potatoes of the Dutch varieties "Santa" and "Romana" by changing the parameters of the working bodies of tillage machines and making additions In the process, we achieved the following results: the study area showed significantly more effective results at 75 ° to 90 ° than the plowing angle of the soil under conditions, and the overall tillage length was much better at 70cm, 80cm and 90cm. . It has been shown that the soil penetration angle and tillage distance of 70 cm at 75 ° for potato cultivation are effective. In the process, fuel consumption and the ability to replace the working parts of the tillage machine, in particular the lemex part of the plow, have been extended. Therefore, as a result of this experiment, the cultivation of this variety of potato in light sandy soils has shown effective results.

THE TECHNOLOGY OF SOLVING PROBLEMS ON HARMONIC OSCILLATIONS IN PHYSICS LESSONS AND CIRCLES BASED ON A COMPETENCY APPROACH

Sultonova O.N.*; Jiyanova S.I.; Poyonova F.K.***

[1.4]Associate Professors,
Termez Branch of Tashkent State Technical University named after Islam Karimov,
Termez, UZBEKISTAN

ABSTRACT

The article explains the harmonic oscillations and their equations and explains the technology of solving problems by using the texts of lectures for first-year students and deriving from the teaching of the subject as a whole. This, in turn, is of particular importance in the application of innovative strategies in the teaching of physics in an in-depth school, increasing the activity of students, independent learning, and the widespread application of acquired knowledge in practice. Therefore, the method of solving problems on the topic of harmonic oscillations in the classroom and the classroom is a solution to this problem, which is relevant and fully covered in the article. The use of innovative technologies in the teaching process of all subjects related to physics in the world, thereby ensuring the quality of education, developing students' creative abilities, practical application of physics, solving various types of problems, including harmonic vibrations, is a problem academic covering issues such as career guidance.

INTRODUCTION

There are many forms and types of extracurricular activities, which can be divided into two groups [4]:

1) extracurricular activities;
2) Extracurricular activities.

Extracurricular activities include: physics clubs, physics evenings, physics weekly, quizzes, competitions, posters, and work with additional literature on physics, etc. enters [1, 2]. Extracurricular activities include excursions to various industrial enterprises, power plants, and other facilities, events in student creative houses, the latest types of Olympiads, conferences, through which all the basic competencies are formed [3, 5]. Homework and assignments, extracurricular activities of particular importance.

The most common type of independent learning activity is homework: oral, written, or experimental [6, 7]. Homework is characterized by the fact that students complete their homework without the direct involvement of the teacher. Full independence is manifested only in the performance of homework. It is not good to look at the homework superficially, to treat it as secondary [8, 9]. Coherent homework is an important element of the lesson, which is the main organizational form of teaching, increasing the effectiveness of the lesson to some extent reduces the amount of homework. Students have different types of memory and therefore some of them are not able to fully master the learning material during the lesson [10, 11]. Many of them will need to read the textbook text independently after the teacher explains the topic and see and remember its main idea and structure [12, 13]. Others feel the need for teachers to explain and read the text at home to read the text in class and remember its difficult parts. Even if the student has mastered the material in class, it is useful to give him homework, not only to revise the text of the topic but also to give observations, home experiments, creative assignments [14, 15].

Each student determines an approximate independent work plan, taking into account their ability, work speed, and method content of the assignments, methods of execution, and self-monitoring [16]. The teacher often gives brief or detailed instructions orally, in writing, along with homework. To make it easier for students to solve problems independently of physics, they can be given examples of descriptive problem solving as handouts [17]. A thorough introduction to structured examples of problem-solving will increase the effectiveness of students' independent work in completing homework. Initially, using auxiliary materials, students solve problems based on the principle of analogy [18]. As a result, they can address not only typical issues but also issues that require an independent creative approach. Gifted students stand out from others in problem solving and homework. It is important to prepare them for various competitions and Olympiads and to meet their individual needs [19]. This reveals new perspectives on teacher-student collaboration in classroom and extracurricular situations. It is important to strive for this in the development of a system of homework and homework, which should include not only the consolidation of the studied materials but also the solution of tasks that are difficult to master [20]. Homework should include elements of research that can be done experimentally or at home, where the idea is done. Examples of such tasks include the study of the phenomenon of boiling, evaporation, diffusion, surface tension, as well as the principles of operation of radio communication, electric heating devices. Extracurricular activities can be organized in the following forms [21].

I.   Individually: reading textbooks, manuals, and additional literature, magazines; preparation of abstracts and problem-solving; participation in correspondence Olympiads; perform experimental tasks at home; making hand tools.

II. In groups: physics clubs; physics and technology circle; technical circle; research group; excursion, problem-solving.

III.   Mass: Olympiads in physics, quizzes; physics of the decade; nights; selection of newspapers. Students' interest in physics depends primarily on the organization of the teaching process. At the same time, it is possible to significantly increase students' interest in physics through well-organized extracurricular activities. Students interested in physics will not have enough knowledge acquired in physics class. If the teacher teaches at the level of modern requirements, using new pedagogical technologies, handouts, test assignments, competition lessons, practices, visual aids during the lesson, it will be enough for students to get a piece of full knowledge.

Extracurricular activities are carried out individually

Theoretical and practical work with the student is carried out individually. Some problems of physics or applied physics are studied. During such classes, the student is given a broader and deeper knowledge. The student prepares for the Olympiads or prepares to enter the university. This helps to achieve the intended goal and the student loves to study science.

Extracurricular activities are conducted in public

This type includes parallel auditoriums, schools, inter-school scientific conferences and evenings, Olympiads, young technicians' clubs, quizzes, physics week, film screenings, excursions to a scientific organization or manufacturing enterprise, and so on. The circle is one of the most basic forms of extracurricular activities. Among the extracurricular activities, the circle is more effective and important than others with its long duration and versatility. Students participate in the circle voluntarily. Today, there are clubs in several schools in the country. The work of a physics circle can be varied, as noted above. In the research process, the physics circle has the following: solving physical problems; solving options for entrance tests to higher education institutions; conducting experimental research; study the principles of operation of physical instruments; holding public events; manufacture of physical and technical equipment; construction of electrical circuits; The organization of didactic games in physics, the study of the work of physicists have been tested, due to which students develop basic competencies [22].

The choice of topics for the physics circle is the most pressing issue. The modernity of the themes of the circles is of great importance. In the physics room, electrical circuits are set up, bells ring automatically, a tape recorder is connected, the sound is recorded, and rehearsals are performed. This is a practical novelty for the student, even if the circles create layouts that are already known to the students. No matter how useful the circle sessions are for the student, students should not be overwhelmed. It is known that in most children, interest in physics and technology awakens from kindergarten and later develops in the classroom at school. Based on information from radio and television broadcasts and parents' stories about physics and technology, students will gain some insights. The circle is one of the most basic forms of extracurricular activities. Among the extracurricular activities, the circle is more effective and important than others with its long duration and versatility. Students participate in the circle voluntarily. Today, many schools and clubs operate in the country. Measures to further develop physics education have identified "an in-depth study of important and in-demand subjects such as physics, physics, chemistry, biology, computer science, and foreign languages." In this regard, the teaching of "Harmonic oscillations in physics", which is an integral part of the physical sciences, plays an important role in the development of creative approaches to creative activity, the design of teaching processes, and teaching based on advanced educational technologies.

Scientists such as B.Abdullaeva, S.Alikhanov, M.Barakaev, G.Zlotsky, J.Ikramov, M.Tojiev, T.Tulaganov, D.Yunusova, N.Gaybullaev researched improving the content and teaching methods of the physics course. as well as the importance of graphical issues from physics. In the CIS countries Yu.I.Kolyagin, E.U.Medeuov, V.I.Mishin, V.M.Monakhov, A.G.Mordokovich, M.N.Roganovskaya, R.S.Cherkasov, P.M.ErdnievThe pedagogical and psychological problems of teaching the basics of mathematical analysis in research work, the importance of graphic problems in physics in education are noted. Therefore, clubs in schools, lyceums, and universities play an important role in solving problematic graphic problems. The role of extracurricular activities in improving the quality of education is invaluable. Students' interest in science depends, first of all, on the correct organization of the teaching process. At the same time, well-organized extracurricular activities can significantly increase students' interest in reading, including physics.

Aims and objectives of the topic

To teach the solution of graphic problems by improving the methods of teaching physics in general secondary schools and higher education institutions. Analysis of the current state of physics teaching in academic lyceums; to determine the content of the components of the creative approach to the methodological system of physics teaching (purpose, content, form, tool, and method) (the innovative activity of the teacher, independent learning, comprehension, memory, application, and control) based on dialogue between teacher and student. Below we recommend graphically solved problems in extracurricular activities in physics as a methodological aid to high school students. We explain to them by improving the methodology of their solution.

Mechanical vibrations and waves. We use the following basic formulas

	Formula name	Formula	Unit
	Vibration period	$T = \dfrac{t}{N}$	1 sec
	Vibration frequency	$v = \dfrac{N}{t}$	1 GTS
	Pendulumpotentialenergy	$W_p = \dfrac{kx_m^2}{2}$	1 Joel
	The equation of oscillations	$x = x_m \sin\psi$	1 min
	The mathematical pendulum oscillation period	$T = 2\Pi\sqrt{\dfrac{l}{g}};$	1 sec
	The period of oscillation of a spring pendulum	$T = 2\Pi\sqrt{\dfrac{m}{k}} :$	1 sec

Frequency	$W = \sqrt{\dfrac{g}{l}}$; $W = \sqrt{\dfrac{k}{m}}$ $W = 2\Pi \cdot v$	1 sec
Wavelength	$\lambda = \dfrac{V}{v}$	1 min

Issue 1. Determine the kinetic energy of a pendulum with mass 150 g if the material point oscillates harmonically according to the law x = 0.04sin (5t + 0.6) m?

Given   **Solution**

m=150g=150· 10^{-3}kg $E_k = \dfrac{mv_m{}^2}{2} \to v_m = x_m \cdot w \to E_k = \dfrac{m \cdot x_m{}^2 \cdot w^2}{2}$

x=0.04 sin(5t+0.6) $X_m = 0.04$ CM;   w=5;

————————— $E_k = 150 \cdot 10^{-3}$j; $E_p = \dfrac{k \cdot \Delta x_m{}^2}{2}$;

E_t =? $w = \sqrt{\dfrac{k}{m}}$; $k = w^2 \cdot m$; $K = 25 \cdot 150 \cdot 10^{-3} \approx 4 \cdot 10^{-3}\,\dfrac{N}{m}$

$E_p = \dfrac{4 \cdot 16 \cdot 10^{-3}}{2} = 32 \cdot 10^{-3}$j;

Issue 2. If the material point x = 0.05sin (Pt + P / 3) m oscillates harmonically according to the law, find the period and frequency of the amplitude of the oscillations, the initial phase of the cyclic frequency.

Given: **Solution:**

x =0,05sin(Pt + P/3) $x = x_m \sin(Wt + \psi_0)$ $W = 2P v \to v = \dfrac{W}{2P} = \dfrac{P}{2P} = \dfrac{1}{2}$
                  $x_m = 0,05 M$ $= 0,5 gts.$
————————— $W = P rad/sec$
$x_m - ? : T - ?$ $\psi_0 = \dfrac{\Pi}{3} = 60^0$ $T = \dfrac{1}{v} = \dfrac{1}{0,5} = sec.$
$v - ? : W - ?$
$\psi_o - ?; V_{m-?}$ $x^1 = 0,05P \cos\left(\Pi + \dfrac{\Pi}{3}\right)$
                  $V_m = 0.05P\ m/sec$

Issue 3. Find the period, frequency, and cyclic frequency of the oscillations whose material point oscillates 300 times in 1 min.

Given:
$t = 1 min = 60 sec$
$N = 300$
– – – – – – – – – – – –
$v =? T =? \omega =?$

Solution:

$$T = \frac{t}{N}; v = \frac{N}{t}; \omega = 2\pi\frac{N}{t}$$

$$T = \frac{60c}{300} = 0,2sec$$

$$v = \frac{300}{60} = 5gts$$

$$\omega = 2 \cdot 3,14\frac{300}{60} = 31.4\frac{rad}{sec}$$

Independent performance exercises

1. Find the frequency of the oscillations, the cyclic frequency, the initial phase of the harmonic oscillation according to the law of the material point x = 0.04sin (2Pt + P / 2).
2. If the pendulum is 155 cm long and vibrates 120 times in 5 min, what is the acceleration of free grip?
3. The wave generated in the water by the tuning fork reached the other shore at a distance of S = 200 m from one shore in 125 s. If the frequency of a water wave hitting the shore is 0.4 Gts, what is its wavelength?

The object of the topic - is to determine the content of the components of the creative approach to the methodological system of teaching physics (innovative activities of the teacher, independent learning, comprehension, memory, application, and control of students) based on dialogue between teacher and student, solving graphic problems methodology.

Methods of the topic: In the process of covering the topic, the methods of observation, comparative analysis, experimental testing, modeling, questionnaires, tests, interviews, mathematical and statistical analysis of the results were used.

The scientific novelty of the topic - is as follows: the components of the creative approach to the methodological system of teaching physics (purpose, content, form, means, and methods), (the innovative activity of the teacher, independent learning, comprehension, memory, application, and control) defined based on expanding the structure of mutual dialogue;

The practical results of the topic are as follows: the current state of teaching physics in general secondary schools, academic lyceums, and schools is analyzed, the methodological system for solving these problems is improved based on lesson plans;

Based on the principles and features of improving the methodological system in the teaching of physics with the help of advanced educational technologies, "Harmonic oscillations in physics lessons" was explained and recommended for practice;

The scientific and practical significance of the results of the topic. The scientific significance of the results of the topic is explained by the fact that the improved methodological system and lesson plans developed above can be used in the teaching of physics in the teaching of academic lyceums.

Introduction of topic results.

In general, in the current context at each level of education, "what (general content) can be taught and what can be done to achieve this? and "whom to teach, what exactly to teach (for each

specialty), why teach this (goal), how to teach (method, form, tool, technology)?" The issue of effectively solving the problem is one of the important problems.

CONCLUSIONS

The first category of methods is called "Traditional methods", which are based on the principle of "delivery" of knowledge to students. These include: information and reception or illustrative and explanatory; reproductive; problem statement; heuristic or semi-exploration and study, "storytelling", "demonstration", "demonstration", "reporting", "question and answer", "debate" and so on. The second category of methods is called non-traditional or "interactive methods" and is based on the principle of "activation" when students acquire knowledge. These include "Shatalov's Accelerated Learning Method", "Problem Lesson", "Brainstorming", "Work in Small Groups", "Round Table", "Cluster Method", "B.B. B. "," 6x6 ", (" 3x3 "," 4x4 "," 5x5 ", ...)," Boomerang "," Black Box "," Business Game "," Role Play "," Debates "," Opposite attitudes "," Intellectual "smart", "Zigzag", "Charkhpalak", "Zinamazina" and many other methods.

The third category of methods is called "Advanced or modern methods" and is based on the principle of "Acceleration and efficiency of the learning process." These include Oriented Text, Programming, Routing Method, Modular Teaching Method, Mind Map, and Design Method, as well as Pedagogical Technology, which combines the advantages of all methods. explained by the possibility of using an improved methodological system and educational projects when creating a new generation of educational literature.

THE LEGAL BASIS FOR ASSIGNING RESPONSIBILITIES TO THE PROSECUTOR'S OFFICE IN ENSURING CONTROL OVER THE IMPLEMENTATION OF LEGISLATION IN THE AGRICULTURAL SECTOR IN UZBEKISTAN

Nodirov Davurkhon Ikromovich*

*The Academy of the General Prosecutor's Office,
Republic of UZBEKISTAN
Email id: davurhon@mail.ru

ABSTRACT

The article describes the analysis of the normative and legal acts aimed at ensuring control over the implementation of legislation in the agricultural sector, as well as, deals with the tasks assigned to the prosecutor's office.

KEYWORDS: *Legislation In The Field Of Agriculture, Prosecutorial Control, Control Over The Implementation Of Legislation, Regulatory Body.*

INTRODUCTION

It is known that from the first years of independence in Uzbekistan, special attention was paid to agriculture; the development of market relations in the agricultural sector was a priority, radical reform of the sector, development of agriculture, improvement of legislation in the agricultural sector.

At a time when reforms in the agricultural sector are deepening, their legal support is of particular importance. Today, the Republic has created an important legal framework that can meet the requirements of market relations, which can serve as a basis for the development of a system of rational and efficient land use in this area, and special attention is paid to agricultural development, improvement of legislation in agriculture. Especially, they include the Land Code, "On Farming", "On Agriculture", "On Restoration of Agricultural Enterprises", "On Agricultural Cooperatives", "On State Land Cadaster", "On Veterinary", "On Seed Production", and the law "On Pastureland" and other normative legal acts. In addition, the normative and legal acts adopted by the President and the Cabinet of Ministers of the Republic of Uzbekistan allow for

the rapid regulation of relations in the field of agriculture in a rapidly changing economic environment.

The agricultural sector plays an important role in the economy of Uzbekistan. If we take into account that the provision of the population with food products and industry with raw materials is the responsibility of the agricultural sector, it becomes even clearer how important agriculture is in the socio-economic life of the republic. After all, the population of food products, and industrial enterprises are rapidly rising from the ladder of state development, which is not dependent on anyone in the supply of raw materials. Therefore, under the leadership of President Islam Karimov, large-scale reforms are being carried out in all sectors of the economy, including agriculture.

Actually, the effectiveness of the whole industry is directly related to the introduction of an enforcement system of legislation in this area. For this reason, in recent years, at the initiative of the President of the Republic of Uzbekistan Sh. Mirziyoyev, special attention has been paid to improving the legislation and public administration reform in agriculture and water management.

In particular, Chapter 3.6 of the Program approved by the Decree of the President of the Republic of Uzbekistan dated January 17, 2019 "On the State Program for the implementation of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021 in the Year of Active Investment and Social Development Accelerated development of the sector through the introduction of market mechanisms" in 12 paragraphs they provide for the improvement of legislation in the field of agriculture, a number of decrees and resolutions of the President on improving the legislation in the field of agriculture.

For instance, the Decree of the President of the Republic of Uzbekistan dated March 15, 2019 "On measures to radically improve the system of protection of entrepreneurial activity and optimize the activities of prosecutors" reorganized into the Inspectorate for Control over the Agro-Industrial Complex under the Cabinet of Ministers and transferred to the Cabinet of Ministers, The Decree of the President of the Republic of Uzbekistan dated March 15, 2019 "On measures to organize the activities of the Inspectorate for control over the agro-industrial complex under the Cabinet of Ministers of the Republic of Uzbekistan" defines the legal, economic and organizational activities of the Inspectorate.

According to the decree of the president of the Republic of Uzbekistan "On measures for further development and support of the livestock network" on March 18, 2019, the citizens wishing to engage in livestock production will be provided with permanent or long-term lease of empty, dry and pasture land plots in the reserve of district authorities from 0.5 hectares for each, practical assistance in the allocation of preferential loans within the framework of the program "every family - entrepreneur" was introduced for the introduction of drip and rain irrigation technology and for the purchase of breeding livestock on land plots allocated to these citizens.

According to the decree of the president of the Republic of Uzbekistan "On measures to radically improve the system of Public Administration in the field of Veterinary and livestock" dated March 28, 2019, the State Veterinary Clinic of the Republic of Uzbekistan is reorganized as the state Veterinary and Livestock Development Department of the Republic of Uzbekistan, the Samarkand Institute of Veterinary Medicine and, The Institute of livestock and poultry research of the scientific-production center of Agriculture and food supply of the Academy of Sciences of the Republic of Uzbekistan, the scientific-research institute of Qorakulchilik and desert ecology,

as well as the scientific-research institute of fisheries, as well as the Department of livestock, poultry and beekeeping of the Ministry of Agriculture of the Republic of, On the basis of the Department of Fisheries and their regional divisions, "Uzbekchorvanasl" agency operating under the state agency for veterinary and livestock development of the Republic of Uzbekistan was established.

By the decree of the president of the Republic of Uzbekistan "On measures to improve the system of Public Administration in the field of Agriculture" dated 17 April 2019, the directions of the tasks and activities of the ministry have been re-established, and the scientific and production center of the Academy of Sciences of Agriculture and food supply and its research institutions have, The State Center for certification and testing of agricultural machinery and technologies of Uzbekistan under the Cabinet of ministers is the Center for certification and testing of agricultural machinery and technologies under the Ministry of Agriculture, the Seed Development Center under the Ministry of innovative development and its divisions are reorganized as the Seed Development Center under the Ministry of Agriculture of Uzbekistan,

With the decree of the president of the Republic of Uzbekistan "On measures to increase the responsibility of the heads of enterprises and organizations for timely conduct of calculations in the national economy" dated May 12, 1995, the prosecutor's office has the right to transfer control over the prosecution of officials who are delivering products (carrying out works, services) to consumers who do not have, Together with the Ministry of state property and the Ministry of Justice, it is entrusted with the task of conducting activities on the initiation of work in accordance with the established procedure on the casualty of economic entities that do not have the ability to pay, which is one of the tasks assigned to the prosecutor's bodies in the rural area after independence.

In addition, in accordance with the Decree of the Cabinet of Ministers of the Republic of Uzbekistan dated August 30, 2016 "On improving the mechanism of sales and settlements of cotton fiber" the duty to prosecute officials guilty of violating the established order of settlements is strictly defined by law, up to criminal liability.

According to the Decree of the President of the Republic of Uzbekistan dated September 15, 2017 "On measures for the rational placement of agricultural crops and the forecast volumes of agricultural production" to the prosecutor's office - the Ministry of Agriculture and Water Resources, the State Committee for Land Resources, Geodesy, Cartography and State Cadaster, the Council of Ministers of the Republic of Karakalpakstan, regional and district khokimiyats, farms to control the unconditional implementation of this resolution; Special attention should be paid to the timely and quality implementation of agro-technical measures, if necessary, to take strict measures against the perpetrators in accordance with the law, and even criminal sanctions.

Moreover, in accordance with the Resolution of the Cabinet of Ministers of November 27, 2018 "On additional measures to further stimulate the cultivation of cereals." in order to ensure guaranteed harvest for the account of conducting agro technical activities established on the maintenance of grain crops with spike in its term, to further increase the responsibility of farmer farms in the effective use of land plots and achieving high yields, as well as to introduce a system of their stimulation to the prosecutor's office bodies established that they are personally responsible for the establishment of systematic control over the supply of lubricants, mineral fertilizers and chemical means from agrotechnical cards, in full and on time delivery and quality

provision of services, full fulfillment of the obligations of contracts concluded in this regard, looting of material and technical resources and unreasonable increase of their prices by service.

According to E.K. Gafurniyazov, the development of industrial relations requires improved prosecutorial control in certain areas of law. At the same time, the peculiarity of the agricultural complex is that the activity here is governed by separate norms. Production relations in the agricultural complex, in contrast to other sectors of the economy, the role of natural factors is very large. At the same time, a low level of legal awareness leads to a violation of rights.

J. Vologina The activity of the prosecutor in the field of agriculture is to ensure the protection of the rights of business entities and entrepreneurs (property, organizational, personal) in this area in accordance with the requirements of agricultural legislation. Therefore, success in agriculture cannot be imagined without the work of a prosecutor. Ignoring this neglect leads to a reduction in the effectiveness of prosecutorial oversight, separating prosecutorial activities from current agrarian issues that can be addressed through agriculture and legal norms. It was concluded that it is necessary to organize an independent direction of the prosecutor's office to legally regulate relations in the field of agriculture and to monitor the implementation of legislation in this area.

Although the above-mentioned scientist put forward these views in 2012, in order to ensure the strict implementation of laws and regulations adopted in 2004 to reform agrarian and economic relations in rural areas, as well as to strengthen the prosecutor's office to protect the interests of businesses and the state. Initially, the General Prosecutor's Office, the Republic of Karakalpakstan and the regional prosecutor's offices set up departments to ensure the rule of law and protect the rights of business entities in the agricultural sector, which were allocated 48 additional staff units, including 3 staff units for the central court.

The main tasks of the Departments of regional prosecutors to ensure legality in the field of Agriculture and to protect the rights of economic entities are, control over the timely, complete implementation of the laws on the deepening of economic reforms in agriculture, decrees of the president of the Republic of Uzbekistan and the requirements and rules set out in the government decisions, - to conduct selective inspections of compliance with the obligations of the farmer and company farms, districts and regions, to prevent violations of the order established in the legislation and normative documents on the allocation of land to the farmer and peasant farms, to implement measures of annexes, to prevent abuse of the service position by responsible persons, to prevent the use of relative-seed and, to prevent the withdrawal of irrigated crop areas from circulation, to carry out constant control over compliance with the obligations of the agreement on the cultivation of agricultural products, to protect the rights and interests of farmers and peasant farms, ensuring the purposeful and preservation of their fertility, observance of the norms of ecology, to use water resources with wastage, to steal mineral fertilizers,, in the use of melioration facilities and agricultural techniques, measures were taken to prevent economic failures, prophylactics of violations in the field of agriculture, including prevention of such violations through a wide explanation of legislation.

In order to ensure the implementation of the decree, the 2nd order of the prosecutor general "On additional measures to ensure the implementation of laws aimed at the implementation of reforms in agriculture" was adopted on 15.03.2004, the 160th order "On further improvement of the effectiveness of control over the implementation of legislation in the field of Agriculture" on 07.11.2017, protection of the interests of the state and society protected by law, ensuring the

implementation of the part of socio-economic development programs related to the reform of the agricultural sector without deviations, identifying and eliminating factors and systemic deficiencies that hinder the implementation of reforms, ensuring the targeted and rational use of land, water and other natural resources, as well as compliance with environmental norms, taking measures to ensure strict compliance with the obligations under the contracts concluded between the supplier and the service enterprises, effective organization of control measures aimed at ensuring timely and qualitative implementation of seasonal agro technics and irrigation-melioration measures, comprehensive legal support for the entrepreneurial activity of farmers, farmers, livestock farms, as well as economic entities in the field of cultivation and processing of agricultural, reliable protection of their rights and legitimate interests was established by the prosecution authorities as one of the main tasks for the organization of control over the implementation of legislation in the field of Agriculture.

The criteria for assessing the activity in this area are the systematic analysis, determination of prospects and planning of the activity, the effectiveness of the measures taken to eliminate identified shortcomings, including the development of proposals on improving the activities of the Legislative, law enforcement practice and prosecutor's office bodies in this area, the violation of the rights of citizens, as well as, ensuring the implementation of legislative and state programs in the agricultural sector, as well as the effectiveness of control measures aimed at ensuring timely and qualitative implementation of seasonal agrotechnics and irrigation-melioration measures, monitoring and inspections carried out comprehensively, completely and objectively within the framework of the law, the basis and quality of prosecutor's control documents, the reasons for the origin of, the tasks of processing, timely and complete provision of agricultural crop growers with advance funds, seeds, seedlings, mineral fertilizers, lubricants by suppliers and service organizations, as well as quality systematic study of the services provided, are entrusted to ensure that appeals on violation of the contractual discipline, which causes the suspension or damage to the activities of agricultural crop growers, are promptly considered and

According to the Decree of the President of the Republic of Uzbekistan PR-4643 dated March 18, 2020, the Deputy Prosecutor General of the Republic of Karakalpakstan and the Deputy Prosecutor General of the Republic of Karakalpakstan and Deputy Prosecutors of the Regions, Senior Assistant to the Transport Prosecutor of the Republic of Uzbekistan.

Furthermore, the Office for Supervision over the Implementation of Legislation in the Field of Agriculture of the General Prosecutor's of the Republic of Uzbekistan was renamed the Department for Control over the Implementation of Legislation in the Development of Agrarian and Food Sectors renamed the Development Legislation Enforcement Units and allocated an additional 145 state units.

To conclude with, since the years of independence in Uzbekistan, the development of the legal framework for the prosecutor's office to monitor the implementation of legislation in the field of agriculture can be divided into 3 stages:

Step 1 - in 1991-2004, the prosecutor's office carried out general control over the implementation of legislation in the field of agriculture, with the adoption of normative legal acts adopted by the President and the Cabinet of Ministers of the Republic of Uzbekistan;

Step 2 – In 2004-2019, in order to ensure the implementation of the laws and normative documents adopted on the basis of which is aimed at the reform of relations in the field of

agriculture, as well as to protect the interests of the Commonwealth of economic entities, a separate section of the General Prosecutor's office system was optimized, and then the bodies controlling, Control of technical condition of machinery and equipment State General Administration, general state administration for breeding in livestock, Republican water administration "Uzsuvnazorat", State Center for certification and quality control of seeds of agricultural crops "Uzdavurugnazoratmarkaz" , The state enterprise quality "Center for certification of cotton products of Uzbekistan" of the agency "Uzstandart" has been established in the presence of the General Prosecutor's office with the liquidation of the agro-industrial complex and the control over the provision of food safety, and individual tasks are assigned to control each direction of the agricultural sector;

Step 3 - From 2019 to the present, in connection with the optimization of the prosecutor's office, the activities of law enforcement agencies in the field of agriculture are specialized, the Inspectorate for Agro-Industrial Complex under the General Prosecutor's office and Food Safety Inspectorate under the Cabinet of Ministers was reorganized as an inspection and transferred to the Cabinet of Ministers. Most of the tasks assigned to the prosecutor's office to monitor the implementation of legislation in the field of agriculture have been identified as the main tasks of the newly reorganized inspection. It was also noted that the newly introduced Prosecutor General of the Republic of Uzbekistan, the General Prosecutors' of office the Republic of Karakalpakstan and Deputy Prosecutors of the regions, the Senior Assistant to the Prosecutor of Transport of the Republic of Uzbekistan and the Deputy Minister of Internal Affairs will assist the Deputy Prime Minister.

FAMILY BUSINESS: UZBEKISTAN AND WORLD

Bakhtiyor Abdumutalovich Kholmatov*

*Associate Professor,
Ferghana State University,
Ferghana, UZBEKISTAN

ABSTRACT

The article describes foreign experience in the formation anddevelopment of family businesses in the example of Germany, Holland, Italy, Finland, USA, France and India, as well as its grouped existing types of family business management in different countries of the world, and provides scientific recommendations on the effective organization and management of the activities of the family business.The development of family business in Uzbekistan, the research of foreign experience in this field and consideration of their accessibility are priority.

KEYWORDS: *Family Business, Stockholder, Member Of Family Business, Company, Corporation, Enterprise.*

INTRODUCTION

Historically, the experience of the family business for many years has been an important type of business.Professor William H. Uhara, director of the Smithsonian College's Family Business Institute in Rhode Island, Roddale, USA, wrote in his book "Century of Successes": "Family business existed before the creation of transnational corporations. Family businessarose before the industrial revolution. The family business existed before the Greek and Roman empires ... ". "The Family Business" magazine listed several hundred family businesses with over 200 years of service life[1].

At the same time, family business is a relatively common form of business.According to the data, family business in the world accounts for about 70% of all companies, up to 80% in the United States, and 94% in Finland [2]. The researchers found that 68% of Western small businesses are family businesses [3].

Nowadays, the role of family business in the economy of the world is increasing. The majority of studies have focused on the types of international decisions of family firms, it is also true that

they have focused almostexclusively on the two classic decisions of internationalization: commitment and market selection [4]. In general, in many foreign countries, the role and value of family business is great. For example, today's world-renowned family business is an example of Rotshilds - Bankers' family (France), Opel - Automotive (Germany), Sharl Tisso - Tissot watches, Oral-B, Siemens, Adidas, Samsung Electronics and others [5].

MATERIALS AND METHODS

Theoretical aspects of the organization and development of family business in the economy were studied by scientists from distant foreign countries (Zahra S.[6], Astrachan J.[7], Brenes E.[8], Dascher P.[9], Dewi A.[10] and others).

General aspects of small business and private entrepreneurship development from Uzbek scientists (Yo.Abdullaev, F.Karimov [11], Sh.Yuldashev [12], Sh.Ergashkhodjaeva, B.Goyibnazarov, A.Samadov, R.Khodjaev [13], U.Gafurov [14] and others).

Despite the research work and scientific and theoretical research, the issues aimed at improving the economic mechanism of family business development have not been systematically covered.

RESULT AND DISCUSSION

It is important to consider the role of family entrepreneurship in the economies of the developed economies. For example, family business is one of the most important components of American business. US $ 24 m 62% of all workers are employed in family businesses, and their share in GDP is 64% [1].

In Germany, more than 90% of the business is concentrated in the hands of family businesses. The majority of them are family owned companies, which are managed by several generations.Such firms have permanent customers who have been formed over the years. Recent research shows that small firms are able to shape their markets through narrow specialization and to judge their own. Closure of leading family companies can lead to the stagnation of the entire market.

In Germany, there are about 3,4 million small and medium-sized enterprises, providing 20 million jobs. Family businesses are the backbone of the German economy. It accounts for 85% of all industrial enterprises in the country, and in turn will provide 3 million jobs[16].

Germany is characterized by not larger cities than many other countries in Europe.When the country provides inadequate jobs, this creates difficulties for the government, but small businesses can help in this and succeed.Family business plays a "significant role in the local economy". Moreover, according to statistical research, family business in Germany is based on the "human factor".Traditions in this country are highly esteemed, firms that have been in the market for more than a hundred years are treated with great respect than foreign famous brands[16].

In the Netherlands, small and medium-sized enterprises cover 98.5% of all private enterprises, of which 90% are small businesses. Small and medium enterprises employ more than half of those employed in the private sector.

The Netherlands occupies a leading position among the EU countries in terms of employment in the service sector. In the Netherlands, family businesses are mainly grown in the agricultural

sector. For example, on the farm of William Dexter, an average of two and a half people work - husband, wife and employee. 120 cows on the farm give an average of 1 million liters of milk. William's brother Elohim Dexter has a cheese factory where William delivers the milk. In cheese factory also employs two people, that is, his brother and his assistant. They produce 100 tons of cheese per year.

More than 90% of companies in Italy are owned by one family. In Italy, the number of enterprises employed by up to 50 people accounts for about 90% of the total production.In Finland, 90% of the total business is family-owned microfirms with less than 10 employees.

India is called the country of family business. 95% of all registered companies are family entrepreneurs[1]. According to some analysts, 80% of all small and medium enterprises in certain sectors of the Russian economy (eg agriculture, food industry, textile industry, IT-technologies and trade) are family businesses[17].

As the development of family business in Uzbekistan has been selected as one of the key areas, it is desirable to take into account the practical experience accumulated over the years in the world.Especially, it is important to determine the composition of the family business, that is, the strict approach to employment.A great deal of attention is paid to the issue of family business in developed countries. Despite the fact that business partners or those who want to work there are mostly members of their families, they are very careful and responsive on their choice. It is noteworthy that some foreign family firms require that family members work for 10-15 years in other companies before joining a family business[18].

Usually, there is a personal trust relationship, known as the fiduciary family business. For example, the transfer of property to trust management depends on the existence of personal trust between the parties"[19]. From a legal point of view, fiduciary operations are more reliable and progressive than contractual obligations. In such relations there is no need to sign, promise, collect information about a partner.The mutual influence of the parties is based on trust and close kinship relationships, and not on risk, for example, the obligation between the founder and the trustee executive manager [20]. In the development of the family business in Uzbekistan, mutual trust between family members should become an important source for solving many business problems.

To study the stability of family business is crucial. The research has shown that some scientists and experts have concluded that family businesses often ends their activities very quickly. This is not a straightforward comment, and William A. O'Hara, quoted above, on the question "What is the most robust and long-lasting business?" answers "family business"[1].

Nevertheless, in some cases, statistics show instability in family business activities.In particular, according to the experience of developed countries, despite the fact that the history of several family companies covers several hundred years, only 5% of such companies remain to the third generation.The biggest danger for such companies is the second generation of owners. Because in many cases, heirs who have adopted are less likely to be enterprising and motivated than the founders of the business, but they try to convince them that they will manage their business.When it comes to the third generation, there is a conflict between the individual members of the family and the common seed of the clan. There are many examples, Cargill in the United States, Samsung in South Korea, BMW in Germany, Clarks Shoes in England, and LVMH companies in France [2].

From this we can conclude that in the family business, usually many companies and families are destroyed for the heritage. Therefore, the need to develop and legalize certain inheritance rules is of paramount importance in world practice.

For example, the beer brewing company Bavaria has its own rules of transferring management to a new generation. According to them, if the managerturns 62, he will have to retire and leave the company. After that, he can no longer participate in the company's activities.Because at the age of 40 to 50 years there is a risk that the company's management will be at the age of 70 years and older. It's a little late to hold a position in 40-50 years [18].

Similar rules apply to the world-famous Wall-Mart trading network, theBertelsmann international publishing polygraph, the Canadian train and plane company Bombardier[2].

According to Grant Gordon, Co-founder and CEO of Institute for Family Business, author of Family Wars, one of the major difficulties in bringing the business to the next generation is the disagreement among the generations.This is a frequent problem facing family business owners. The essence of the conflict between generations is usually manifested by the impatience of young people who face the conservatism of older generation.Gordon thinks that in spite of all the negative consequences of the disagreements, they can lead to positive news, new thinking [2].

Michael Sullivan, head of the UK's Credit Suisse Private Banking, explains: "Our research confirms the importance of family business in supporting the UK economy.Despite the fact that this sector is largely ignored by the British government, the role of family companies in other countries' economies can be seen as a good opportunity for regional development and enterprise development.The global financial crisis has highlighted the importance of a long-term economic development strategy, which includes the priority development of regional economics and family business" [19].

Business performance may be affected by the family nature of a company, especially by its ownership structure and corporate strategies. In this sense, governance and resources of family firms are key determinants of outcomes such as the continuation of family involvement and firm survival [20].

It can be seen that in Uzbekistan, through the development of family entrepreneurship, it is possible to effectively address the issues of ensuring the socio-economic development of different regions of the country.

In many countries of the world, family businesses can be grouped into two groups, depending on the structure and location of capital, as well as on the management of the organization and the size of the enterprise(Picture 1).

The first group is a family business, that is, a family and close relatives. As a rule, this small enterprise employs up to 10 employees. At the same time, it is possible to single out individual subgroups in the form of a family (that is, only close relatives - husbands, wives, children).Such firms are family companies in Canada, the USA and Russian Federation [17]. Firstly, these are different types of individual entrepreneurship.

In such companies, duties on positions, subordinate and hierarchical stagesare not defined. Leadership refers only to the head of the family, while others perform their work with their own understanding. Typically, the small shops, consulting companies andprinting houses are

operating on this principle.No job descriptions. Operational replacement of functional positionsoperates.

Another subgroup is the business of families with several relatives. This is usually a family business that has a well-organized and governed structure, and family relationships have become a business relationship, someof the family members become managers, and some of them become their employees.

The second group of family businesses are companies that are inherited from generation to generation, all of whom are family pedigrees. This group includes large and larger companies, usually in the form of international corporations, which include many branches. In this case, the family controls the company only through a package of family shares. Each family must have a share in the family with a different percentage of shares in order to have the right to manage the family business.

For example, in Finland, more than 50% of the shares, about 25% of shares in the United States and Germany are enough to have in the hands of family. At the same time, these shares should be distributed among the majority of shares of this company, which is the largest shareholder of the company, and the remaining shares are on small shareholders.

In many countries, family firms are a leading form of business organization. Family businesses have a high level of crisis tolerance, due to the following factors: poor understanding of losses, not just immediate benefits, but understanding of the development prospects, understanding the capabilities of each participant in the company.

As it is knownthat, the family businesses constitute the basis of almost all the economies of the world. However, many researches show that family companies work better than non-family companies do.

In some countries, these businesses are 158% more productive than ordinary companies. These data were obtained during 10 years of research in theUnited States.

Today, there are two features for the global family business. First of all, it is important to save a large number of small and medium-sized enterprises, which are created by family members. For example, in the United States, such small family businesses have increased to 15 million. These types of family businesses are primarily aimed to save money on employee salaries. Because in Europe and in America, the value of hired labor is sometimes beyond the capability of newly established firms.

The second feature is the existence of large family corporations and holdings with a world-renowned and centuries-old history, which pass from generation to generation on the heritage of 3-6 times.

In England, where almost 16% of all family firms are experiencing more than four generations of generations. Sweden has the largest share of family-owned businesses, with more than 60% of all employed population being occupied in this area. Italy 1.5 million people with a large percentage of family owned companies that have more than an euro turnover [19].

CONCLUSION

The world experience shows that family businesses are successful both in trade and in industrial industry, and in many cases reach the highest levels in the world and rank among the world's top companies.

Based on the above-stated opinion, it is possible to use the following foreign experiences in the development of family business especially on the current pandemic period in Uzbekistan:

1. Creating academic research areas and schools dedicated to family business.

2. Organization of conferences and seminars on this theme in distance.

3. Expand the list of training programs and have the opportunity to legally enforce the business succession and business succession through the activation of the Higher Education Institutions on the introduction of special subjects in family business management.

4. New mechanisms for financial support for innovation - use of innovative vouchers, checks, certificates. These tools are provided by the state for the purpose of paying for scientific research or consulting services by outside organizations (which ensures the proper use of state funds).

ENHANCING PROSECUTORIAL CONTROL OVER THE IMPLEMENTATION OF LEGISLATION IN THE AGRICULTURAL AND FOOD SECTORS

Davurkhon Nodirov*

*The Academy of the General Prosecutor's Office,
Republic of UZBEKISTAN
Email id: davurhon@mail.ru

ABSTRACT

This article deals with the prosecutor's control over the implementation of legislation in the field of agriculture and food, its legal framework, analysis of legislation and practical problems. World experience shows that when states do not adequately meet the food needs of their population, a large part of the population, sadly, mainly young children suffer from hunger. Nowadays, Uzbekistan, which has completely renounced administrative command, is gradually and consistently pursuing the path of building a democratic society based on a market economy with mutual equality of all forms of ownership and free enterprise.

KEYWORDS: *Agrarian And Food Legislation, Prosecutorial Control, Law Enforcement.*

INTRODUCTION

Uzbekistan is confidently moving towards building a new society, so the principle of separation of powers into independent branches is also reflected as the most important condition and sign of democracy. For this reason, it should be noted that the Constitution of the Republic of Uzbekistan has a special chapter (XXIV), which means that this state body is not included in any of the legislative, executive and judicial branches of government.

Although monographs have been conducted in Uzbekistan and abroad on the constitutional legal status of the prosecutor's office and the role of the prosecutor's office in the system of state power, they do not provide a full and detailed analysis of the content of governance in the prosecutor's office.[1]

The need to improve the constitutional and legal framework for the administration of the prosecutor's office is explained by the fact that the rule of law must be ensured in a state that

seeks to be sovereign and independent in its foreign policy and able to positively address its internal problems.

RESULTS AND DISCUSSIONS

At all stages of development of the Republic of Uzbekistan, the prosecutor's office has made a worthy contribution to maintaining the rule of law and stability of law and order, ensuring the protection of legal rights and freedoms of man and citizens, the legitimate interests of the state and society. The prosecutor's office is tasked with ensuring the rule of law, strengthening the rule of law, human rights and freedoms, the legitimate interests of society and the state, protecting the constitutional order of the Republic of Uzbekistan, crime prevention and prevention. Proper and effective organization of administrative activities in the prosecutor's office plays an important role in the implementation of these tasks.

Uzbekistan, which is attracting more and more interest in the world today, is taking a bold step towards the idea of building a democratic state based on the rule of law, based on a market economy, with a unique and appropriate path of development. The formation of democratic institutions, the building of civil society and the rule of law, the strengthening of the state economy began to appear as the highest priorities of state policy. Nowadays, Uzbekistan, which has completely renounced administrative command, is gradually and consistently pursuing the path of building a democratic society based on a market economy with mutual equality of all forms of ownership and free enterprise. [2]

The market economy, in turn, is an economic system based on entrepreneurship. In a market economy, entrepreneurship is the main driving force of the economy. Entrepreneurship development is considered to be one of the most pressing and important issues today, and the strategy of the policy of the republic is the creation and development of these sectors of the economy.

In a word, a solid foundation for the development and growth of the economy will be created only if the necessary legal and organizational conditions are created for the implementation and development of entrepreneurial activity in the country.

In this regard, the role and importance of prosecutorial control over the implementation of laws in the field of agriculture and food, which is one of the areas of business, is to ensure the effective implementation of legislation in this area in the country and creates favorable conditions for independent development. World experience shows that when states do not adequately meet the food needs of their population, a large part of the population, sadly, mainly young children suffer from hunger. To prevent this, of course, it is necessary to carry out extensive reforms in the agricultural sector, to introduce a system of rational use of available resources. This is due to the fact that today the indifference to nature, the growing anthropogenic impact on it, waste, the growing gap in the balance of food between advanced and developing countries, climate change are causing a number of negative factors. Our delicacies, fresh water, oceans, forests, biodiversity are declining rapidly, land fertility is declining, and soil is degrading. As a result, according to the United Nations, 815 million people are currently starving, and by 2050 that number will reach 2 billion. reaches 12.9% of them live in developing countries. Forty-five percent of deaths among children under the age of five are due to malnutrition. Today, 3.1 children die every year as a result. In addition, one in four children on

the planet has been found to be underweight. School age 66 mln. boys and girls come to classes involuntarily hungry. Of these, 23 million live in Africa.[3]

According to United Nations statistics, the world produces about four billion tons of food every year, which, if used wisely and distributed, would actually reach the entire population of the planet. Due to factors such as the above, prices in world food markets are rising. The global financial and economic crisis of the last decade has exacerbated the problem. Its complications are still being felt.[4]

The issue of food security is a guarantee of independence, socio-economic and political stability of Uzbekistan, as well as all other countries. In Uzbekistan, this problem has not lost its relevance. At the same time, the demand for food products is growing, and per capita consumption is increasing as the population grows.

Consequently, over the past three years, the approach to ensuring food security, improving the quality of agricultural products and export potential in Uzbekistan has completely changed, has become a priority of public policy.

Food security depends on a wide range of socio-economic, demographic and environmental factors and is one of the key components of a country's development.

State food safety policy is developed and implemented on the four components of food security (availability of food, its purchasing power, its use and sustainability). Population growth, increasing demand for land, water and energy resources, as well as drastic climate change are key factors influencing food security. As a result of a number of measures taken in recent years to strengthen food security in our country, Uzbekistan has managed to strengthen its position in the world and gradually improve its position in global rankings. State food safety policy is developed and implemented on the four components of food security (availability of food, its purchasing power, its use and sustainability). Population growth, increasing demand for land, water and energy resources, as well as drastic climate change are key factors influencing food security. As a result of a number of measures taken in recent years to strengthen food security in our country, Uzbekistan has managed to strengthen its position in the world and gradually improve its position in global rankings. The priority is to provide the population with safe and quality food products at stable prices. This will serve to achieve the Sustainable Development Goals (SDGs) of the Republic of Uzbekistan, including those set out in UNDP 2 "Ending Hunger, Ensuring Food Security, Improving Consumption and Promoting Sustainable Agriculture."[5]

When we talk about the prosecutor's control over the implementation of laws in the field of agriculture and food, we must first clarify the concepts in the field of agriculture and food security.

According to the expected "National Program for Food Security in the country for 2019-2024", food security is a state of the economy, in which all regions of the country, regardless of external market conditions and other external factors, have enough food for rational nutrition, guaranteed provision of food products and creation of necessary socio-economic conditions.

In order to effectively implement the reforms outlined in the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030, to ensure the rational use of land and water resources, the widespread introduction of market mechanisms in the sector "On measures

to further improve the management system of agriculture and food" According to the Decree of the President of the Republic of Uzbekistan No. PP-4643 dated March 18, 2020, the structure of the Prosecutor General's Office of the Republic of Uzbekistan is responsible for compliance with the legislation in the field of agriculture and food safety and control over their implementation:

Deputy Prosecutor General of the Republic of Uzbekistan;

The positions of Deputy Prosecutors of the Republic of Karakalpakstan and the regions, and Senior Assistant to the Transport Prosecutor of the Republic of Uzbekistan have been introduced.

The Office for Supervision over the Implementation of Legislation in the Sphere of Agriculture of the Prosecutor General's Office of the Republic of Uzbekistan has been renamed the Office for Supervision over the Implementation of Legislation on the Development of the Agrarian and Food Sectors.

The departments of control over the implementation of legislation in the field of agriculture of the Republic of Karakalpakstan and regional prosecutor's offices were renamed the departments of control over the implementation of legislation on the development of agricultural and food sectors, and 145 additional state units were allocated to them.

The newly introduced Deputy Prosecutor General of the Republic of Uzbekistan, the Prosecutor of the Republic of Karakalpakstan and regional prosecutors, senior assistants to the Transport Prosecutor of the Republic of Uzbekistan will assist the Deputy Prime Minister in agricultural and food development in the newly formed executive structure of the Cabinet of Ministers.

According to the Decree, the following are the main tasks of the Deputy Prime Minister for Agrarian and Food Development:

- Organization and ensuring the effective implementation of the reforms outlined in the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030;
- Reform and further development of the system of public administration in agriculture, the introduction of modern management mechanisms, the acceleration of digitization of the sector;
- Transformation of relevant ministries and agencies into clusters, cooperatives and farms into modern service organizations for land surveying, selection of crops, seeds and cultivars, pest control, product market;
- Widespread introduction of market mechanisms in the agricultural sector, the gradual abolition of public procurement in cotton and grain, the full introduction of the private sector in the sector, the development of clusters, cooperatives and farming, reducing state participation in the sector;
- Development of a system of laboratory testing and certification of agricultural products, export promotion, establishment of trade infrastructure and agro-logistics centers;
- Creation of a favorable agribusiness environment, providing for the production of competitive, high value-added agricultural and food products in international markets;
- Improving food safety and rations, ensuring the production of the required amount of food;
- Further development of important sectors of the agricultural sector, such as horticulture, viticulture, greenhouses, vegetables, livestock, poultry;
- Timely financing of agro-technical measures, ensuring the financial stability of agricultural producers and financial support of the state;

- Ensuring the targeted use of funds allocated to the agricultural and food sectors from the budget and extra-budgetary funds;
- Rational use of natural resources in agriculture, widespread introduction of water-saving technologies and re-use of decommissioned lands;
- Assistance in the implementation of investment projects in the agricultural sector, the creation of new jobs, attracting foreign investment, increasing the export potential of the industry;
- Radical reform of agricultural research institutions and science, integration with the production of educational and consulting services, the creation of seed and breeding schools, the widespread introduction of advanced innovations.[6]

In our point of view, it would be appropriate to study the prosecutor's control over the implementation of laws in the field of agriculture and food in two parts:

- The first group is the control over the observance of the legislation by citizens directly involved in this activity;
- The second group includes the control by prosecutors over the implementation of laws in the field of agriculture and food by officials and officials.

Inspections of the implementation of laws in the agricultural and food sectors are carried out on the basis of applications and other information on violations of the legislation in this area, as well as in the manner prescribed by law, provided that the legality requires action by the prosecutor. It is safe to say that the issues of strengthening the rule of law in Uzbekistan, identifying violations, eliminating them and the conditions that led to them, in many respects, depend on the prosecutors working in this area. Because in carrying out their duties under the law, prosecutors are the first to encounter such cases or make decisions based on documents received from other control bodies within their jurisdiction, assessing the legitimacy of the decisions made by these agencies. These circumstances also mean that over the past three years, the approach to ensuring food security, improving the quality of agricultural products and export potential in Uzbekistan has completely changed, making this area a priority of state policy.

In Uzbekistan, all the problems and artificial barriers to reducing food prices, ensuring quality and safety, eliminating bureaucracy, establishing regular dialogue and cooperation with foreign investors and partners are being put to an end.

CONCLUSIONS

To conclude, the goal of reforms in the agricultural and food sectors is to ensure food security and increase the welfare of the people, along with economic benefits. As the President of Uzbekistan Shavkat Mirziyoyev said, "Strengthening the health of our people, deciding on a healthy lifestyle is a vital issue for us. I repeat, if we provide peace and health, we will achieve everything else. The goal of agricultural reforms is to ensure food security and increase the welfare of the people, along with economic benefits. We must never forget that."[7]

ABSTRACT

This article examines the tourism sector, the opportunities for international cooperation in its development, analyzes them based on the given tables, and describes the mechanisms for its implementation. This will help balance the economic opportunities and to prevent the rural population from flowing to cities with all the amenities. Establishing personal relationships about understanding and seeing intercultural features is shaped by the tourism industry.

KEYWORDS: *Tourism, International Tourism, Cooperation, World Tourism Organization, Territorial Division, Hospitality.*

INTRODUCTION

In the XXI century, the tourism industry has created new jobs in many countries and increased foreign exchange earnings. Thus, the tourism industry has become a leader in the fast-growing economic sector. International tourism is an export network in the world and is an important factor in maintaining the balance of payments in many countries. In recent years, tourism has become an important "generator" of employment in the world. It attracts large amounts of

investment in global infrastructure. This will serve to improve the well-being of the local population and visitors.

Tourism provides an increase in tax revenues to the state budget. Many jobs in the tourism sector will be created in areas where tourism enterprises are developing. This will help balance the economic opportunities and to prevent the rural population from flowing to cities with all the amenities. Establishing personal relationships about understanding and seeing intercultural features is shaped by the tourism industry. Tourism opens wide horizons in strengthening international understanding and cooperation between nations. This, in turn, will contribute to the development of international cooperation in the field of tourism.

The rapid development of international tourism relations has led to the establishment of a large number of international organizations. This will create a wide range of opportunities for improving international economic relations and cooperation in this area. The development of international relations will also depend on the country's foreign policy. According to Article 17 of the Constitution of the Republic of Uzbekistan, the Republic of Uzbekistan is a full-fledged subject of international relations. Its foreign policy is based on the principles of sovereign equality of states, non-use or threat of force, inviolability of borders, peaceful settlement of disputes, non-interference in the internal affairs of other states and other universally recognized rules and norms of international law.

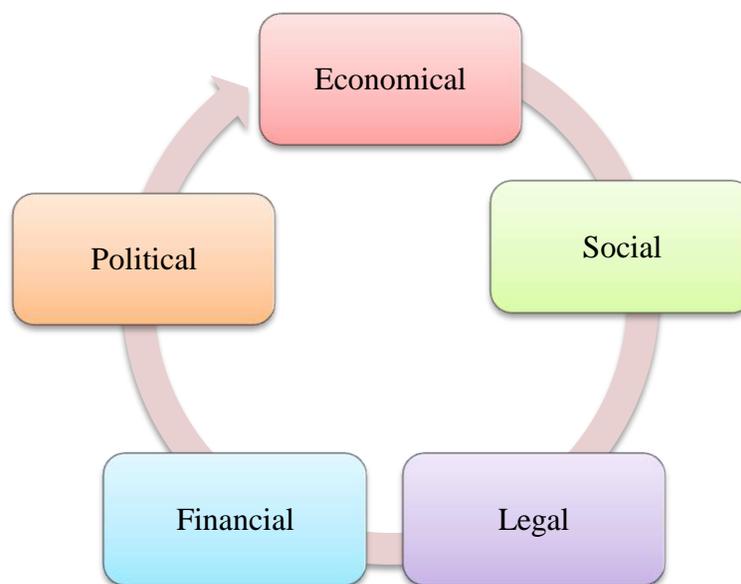
Certain motives must be followed for the establishment of international organizations in the field of tourism. These motives are socio-economic, economic, legal and political motives. Or as mechanisms for the implementation of international cooperation in the field of tourism.


Figure 1. Mechanisms for implementing international cooperation in the field of tourism

In order to implement international cooperation in the field of tourism, the principles of mutual respect and equality of interests, mutual understanding and trust, openness and transparency,

ensuring the safety of tourists, building a safe infrastructure and business voluntariness are followed. International cooperation in this area is manifested in the following forms:

- Integration into the world economy;

- deepening of the international division of labor;

- Improvement of the legislation of the states;

- Development of transnational corporations;

- Improving the mechanisms of international economic exchange;

- Socialization of value through the terms of international trade;

- Development of science and technology;

The World Tourism Organization (WTO) is a leading international organization in international cooperation in the field of tourism. This organization serves as a global forum for discussing tourism policy issues. The organization is also a source of tourism statistics and applied technologies. It is in English - the World Tourism Organization (WTO) was founded in 1975 as the official international union and successor of tourism organizations. The UN General Assembly, in agreement with ECOSOC, recognized the status of the WTO as an intergovernmental organization.

Specialized committees of WTO members organize discussions based on management and program structure. The committees are divided into the following parts:

- Program committee;

- Committee on Budget and Finance;

- Committee on Macroeconomic Analysis of Statistics and Tourism;

- Marketing and Promotion Committee;

- Tourism Development Committee;

- Quality control committee;

- World Committee on Tourism Ethics, etc.

This organization encourages the implementation of the Code of Ethical Information for Tourism in order to maximize the contribution of tourism to the socio-economic development and reduce the possible negative impacts. It also pursues the goals of tourism for the sustainable development of the United Nations, poverty alleviation and the promotion of peace and sustainable development around the world.

WTO generates market knowledge, supports competitive and sustainable tourism policies and tools, promotes tourism education and training, and seeks to create an effective tool for tourism development through technical assistance projects in more than 100 countries around the world.

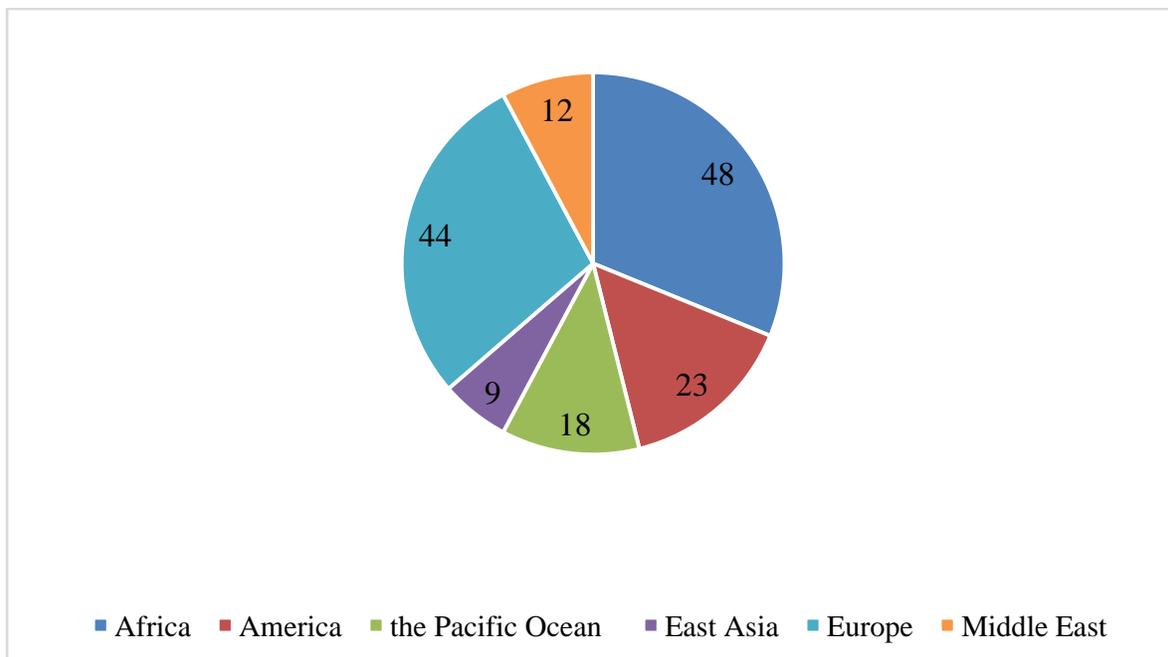
About 200 countries are members of the World Tourism Organization, the territorial division of which is as follows:


Figure 2. Territorial division of the member states of the World Tourism Organization

Due to the territorial division, new technological changes have taken place and, as a result, the process of systematization of the market of tourist services has been accelerated.

In our country, the State Committee for Tourism Development of the Republic of Uzbekistan is a national organization in the field of tourism and plays an important role in the implementation of national and international cooperation.

In order to fulfill the Decree of the President of the Republic of Uzbekistan "On measures to ensure the accelerated development of tourism in the Republic of Uzbekistan" PF-4861 dated December 2, 2016 and to ensure effective organization of the State Committee for Tourism Development of the Republic of Uzbekistan The main tasks and directions have been identified.

The goals and objectives of international cooperation in the field of tourism include:

- Maintenance of international peace and tranquility;

- Protection of human rights;

- Positive impact on the economic development of the world, in particular, the countries whose economies are based on tourism;

- Assistance in solving staffing problems or increasing the number of highly qualified specialists;

- Expansion of tourism while maintaining ecological balance;

- Development of new strategic approaches to the development of tourism with the help of statistics and their application in practice;

- To raise the level of service, which is the key to the development of the hospitality industry;

- carrying out marketing research to produce a competitive tourism product and bring it to the world market in optimal conditions.

In general, there are many international tourism organizations in the field of hospitality, and their main purpose is to implement and further strengthen international cooperation in the field. The World Tourism Organization (UNWTO) is known as the largest international tourism organization, which has its own conditions, structure and function. In addition, there are non-governmental, commercial and national international tourism organizations around the world. As a national tourist organization, the State Committee for Tourism Development of the Republic of Uzbekistan has a defined composition, and today this organization carries out the priorities of the state in the implementation of hospitality relations.

HISTORY AND ADVANTAGES OF RESEARCH OR PROJECT TECHNOLOGY

Abdullaeva Nazokat*

*Researcher,
Urgench State University, UZBEKISTAN

ABSTRACT

The article discusses the history of research or project technology and its advantages. One of the most important tasks facing educators today is not only to provide theoretical knowledge in education, but also to develop the ability to apply the acquired knowledge in practice. Whether the child receives knowledge in school, secondary special education or higher education, and the fact that their application in practice can be used in real-life situations, problem-solving, the subjects studied are not only theoretical knowledge, but also life, professional it must feel that it is an integral part of the activity. Such an organization of education provides an opportunity to bring up a comprehensively developed generation that can meet the requirements of the times. In order to meet these requirements, it is possible to use research or project technology in the education system. The article reveals the history and advantages of the technology of research or projects, which are not yet popular in the education system of the country.

KEYWORDS: *Research, Technology, Project Technology, Method, Methodology, Education, Movement, Pedagogy, History.*

INTRODUCTION

The years of independence have brought about radical changes in all spheres of our life: from government administration to the thinking and lifestyle of citizens. The education system is no exception. The time we live in today is an era of rapid development, information retrieval and information struggle. Today we need a generation that is able to solve the problems encountered in the world, has a deep theoretical and practical knowledge, fully masters the modern means of information and communication technologies and capable to adapt to these changes quickly, to keep up with the times, with critical thinking skills, to make quick and correct decisions, to set

goals and work out ways to achieve them. Only a generation with such skills will be able to bring our country to the ranks of developed countries in the world.

The current reforms in the education system are aimed at achieving these goals. One of the most important tasks facing educators today is not only to provide theoretical knowledge in education, but also to develop the ability to apply the acquired knowledge in practice. While acquiring knowledge in school, secondary special education or higher education, a learner should know and feel that the subjects studied are not only theoretical knowledge, but also their application in practice can be used in real-life and problem-solving situations as they are an integral part of the life and professional activity

Such an organization of education provides an opportunity to bring up a comprehensively developed generation that can meet the requirements of the times. In order to meet these requirements, it is advisable to use research or project technology in the education system.

There are different definitions of research or project technology. E.S. Polat defines the project technology as the unity of teaching and understanding methods and learners' actions. This action is a set of actions aimed at independently studying a problem or topic and presenting its results. If we look at project technology as a pedagogical technology, then this technology is a combination of research, problem-based learning methods, and creative processes.

The technology of projects is not a novelty at all; its history goes back to the XVII century. In 1702, the Royal Academy of Architecture in Paris announced a contest of the projects plans and sketches for construction.

The Academy organized regular contests among students at the School of Architects. The main assignment of the contest was to perform the tasks through creative thinking and collaboration. "Students had to develop creative thinking and imagination in the process of working on projects and come up with their own (original) solution within the framework of classical traditions. "

In the first half of the 19th century, the concept of project technology spread from the territory of France to the German speaking countries. In this area, the technology began to be widely used in workers' job preparation courses and vocational education. Through Europe, this method spread to America. In 1879, a special school was established at the University of Washington in St. Louis. This school was specialized in practical training and was called Manual Training School. It is in this school that project technology was used as the main form of teaching. At this school, students "had to not only develop projects, but also implement them in workshops; they made various shelves, candlesticks and other items with their own hands" The main focus was on three things there: the students, practice and the product.

The project technology method began to be used in the American education system in the late 19th and early 20th centuries. During this period, this method was transferred from vocational schools to general education schools as the main means of teaching to meet the learners' needs. According to American educators, the method of the project technology was a very suitable method for the spiritual-psychological upbringing of the generation that should live in the new era.

The years 1900-1915 were a period of the real Project Technology movement in America. John and Evelyn Dew organized the YSHBU technology at their school, called the School of the Future. By this time, technical, social, creative and other options for projects appeared. In a

sense, all of the independent works done by students could be called a project, so it was necessary to define the term "project" during that period.

In 1918, William Kilpatrick, a professor at Columbia University College in New York, shared his experiences in one of the most popular pedagogical publications in America with an article entitled "Method of Projects" in the journal 'Record of the College of Pedagogy', and announced himself as the author of the method.

In this article, he defines the term Project as in follows: "A project is a set of all goal-oriented actions in the social world. " Then Kilpatrick distinguishes 4 types of projects in order to clarify the term:

- Producer's Project – the projects aimed at designing something

- Consumer's Project - the projects aimed at owning something

- Problem Project –the projects aimed at solving a problem

- Learning Project-the projects aimed at acquiring knowledge.

The idea of organizing education through project technology appeared in Russia at the same time as the Americans. A small pedagogical group led by S.T. Shatsky began to use this method in teaching.

The Project technology was extensively used in Russia until the 1930s, but it was criticized in 1931 by the decision of the Central Committee of the CPSU (b), and later no attempt was made to use it again. During this period the incomplete study of the theory and educational opportunities of this project, as well as the inexperience of teachers in its application led to the out of use of the project technology. However, at the same time in other developed countries, this method has been improved and processed theoretically and practically. Today, the research method is being used again in a modernized form.

Project technology can be successfully applied in all disciplines, as it increases the independent practical activity of students, allows to bring the educational process closer to the living environment in a few ways.

The use of the project technology not only brings the educational process closer to the living environment, but also through its use the learners will be able to

- learn new activities

- Experience in using available resources to achieve a goal or solve a problem

- exclude the educational process from the educational institution (independent study, distance learning, use of additional educational resources, work with information sources, etc.)

- achieve a fun extension of the student's study time.

The innovative teachers who have used this technology in their work will not be able to give it up it later. As this technology makes the learning process easier, more interesting and more useful for the students, it makes the teaching process easier for the teacher and increases the efficiency and the quality of education.

- According to a number of researchers, the use of project technology is very important in achieving the following goals:

1. Each project participant, developed on the basis of project technology, increases self-confidence, acquires the skills of self-study, research. These are due to the following factors:

- By working on the projects in class or out of the class and achieving the final result, he feels successful, he is successful and realizes that he can solve various problems, overcome obstacles in practice.

- The learner grows up as a person with self-awareness, self-assessment, and contribution to the common cause.

2. The role of teamwork, collaborative action, the importance of working together in the creative process to achieve results in the project participants, strengthens their sense of friendship and cooperation. The project technology is more important in everyday life as it teaches the youth to have own opinion on the phenomenon, to be interested in the opinion of others than to be able to express one's own point of view, to be able to hear and understand their point of view, even if it contradicts with one's own view point.

3. By reviewing, summarizing, and presenting the results the learners can acquire research skills and develop assumptions to analyze the situation under study, find problems, the necessary information, work with sources to collect, observe and draw conclusions from similar situations, record and analyze the results obtained.

ABSTRACT

The article focuses on the influence of Coronavirus on the stock exchange in worldwide. We have studied main scenarios and the measures, taken to increase the number of investors in the stock market after COVID-19 in the world and in Uzbekistan.

KEYWORDS: *Scenario On Preventing Crisis, IPO And SPO Practices, Stock Exchange, Stock Market Capitalization, Corona Bonds, ECB, FED .*

INTRODUCTION

The coronavirus outbreak has plunged stock markets, with in some cases a weekly drop similar to that experienced during the financial crisis in 2008. One of the most quoted indices in the S&P 500 market fell 11% in May 2020. Central banks reacted quickly to events in the financial markets. The FED released a very short note stating that the bank is closely monitoring the economic impact of Covid-19 and will act accordingly to support the economy. The FED took action cut interest rates by 0.5%. The ECB has joined the FED and the Bank of Japan with similar statements: it is closely following developments and is ready to take appropriate and targeted measures. US stock markets rallied amid signals that central banks are ready to support the markets and the economy.

Considering the current state of the securities market of Uzbekistan, it is important to mention that there is a need to adapt the fundamental analysis methods to the activities of the National Stock Exchange and to develop relevant research on the problems that arise in this process. In order to attract financial resources to emerging stock exchanges, it is necessary to familiarize the

shares of businesses and organizations traded on it. IPO practice, initial public offering of shares can contribute to this.

This practice provides information about the companies' shares, unknown to investors and thus is attractive. The shares begin trading publicly in one of the stock markets, providing the movement of financial resources from the sale of shares. It also serves to increase the capitalization of the company through its IPO practice and to raise its finances.

The largest stock exchanges are NYSE and NASDAQ, situated in New York. North American Securities Market is the leader in the number and volume of transactions. The second place is occupied by Asian stock markets, where Hong Kong, Shanghai, Tokyo and Osaka are the major securities trading centers.

China is showing the first signs of stabilization, but at the same time it is worrying that the virus is now spreading rapidly outside of China - in Italy, South Korea and Iran, as well as in other countries. Governments around the world are working together to take serious action to control the spread of the virus.

Unlike most other types of risks and crises that have arisen in recent years, this one has a variety of direct financial implications. This is especially the case in China, where much of the economic activity has been curtailed and where very large groups of people have been unable to reach their jobs. Therefore, it is clear that GDP growth will be significantly negatively impacted in the first quarter. Since we are now seeing the outbreak of the virus in other countries, this will also negatively affect the growth of the global economy. Then it is decided whether the recovery process resembles "V", "U" or "L". Scenario "V" means a quick fall, a quick recovery of the economy, that is, the same as in previous outbreaks of the virus. Scenario "U" means that uncertainty persists for some longer period, but that recovery is supported by normalization of the situation. The least likely scenario – "L" - assumes a longer loss of growth.

The authorities in many countries responded quickly to minimize the risks of the spread of the virus. In addition, China has already undertaken economic policy efforts and a number of countries have undertaken fiscal policy measures. Central banks around the world are starting to talk about assessing the situation in terms of rescue measures. On the other side, households are given the financial space to increase consumption in other areas when, for example, their travel is cut.

Financial markets will soon also start focusing on growth performance in 2021, and unless we get a very extended L scenario, it is reasonable to assume that coronavirus will have only a marginal impact on production levels in 2021. This means that a downturn that affects the whole of 2020 will mainly lead to corresponding updates in 2021.

The virus will affect global economic growth during the current year, although it is unclear how large and fast the recovery will be. This means more uncertainty about companies' earnings, which is never good news for stock market sentiment. Many companies will need to revise their earnings forecasts for the first quarter and possibly all of 2020, and some companies have already mentioned this. China is currently the largest market in the world for a wide variety of raw materials and products. At the same time, this country is often called the world factory. The vast amount of goods sold worldwide are manufactured in China, and many companies depend on subcontractors in China to manufacture them in other countries. Since much of China's

economy has been shut down in recent weeks, this has a strong impact on both production and consumption, that is, supply and demand.

However, it looks like the worst is over in China. Jobs are opening up and the economy is starting to recover gradually. The risk of new problems cannot be ruled out, especially when people return to work. However, it is positive news that China's economic recovery has already begun, albeit at a slower pace than many expected. If the company decides to place their shares on the stock exchange, then the underwriting service should be used.

Countries around the world are just beginning to calculate the real losses from the corona virus epidemic. Most national economies will experience a severe recession this year. On a global scale, losses will be about 3%. Unemployment is on the rise and oil prices are at a 20-year low. Against this background, the charts of the stock markets look amazing. For more than a month, the main indices have been showing growth. Macroeconomic indicators are definitely not getting better, only worse.

- Nikkei Index   - FTSE   - Dow Jones Index

Picture 1. Influence of Coronavirus on Stock Exchanges (from January 2020 till May 2020)

The S&P 500 index, having demonstrated the most rapid decline in history at the end of March - by 36% - by the 20th of April regained 26%. Stock indexes in the United States and around the world were hitting unpleasant records.

The specificity of stock markets is that they are not a mirror image of the state of the economy. the peaks of the indices usually happen just before the start of the recession, and the reversal may happen well in advance, before the economy has even begun to recover. Investors' expectations are incorporated in the share price, quotes are very sensitive to the news background. The flow of negative information related to COVID-19 has become habitual during the quarantine. People are trying to get something out of it that at least partially resembles a positive and, probably, overestimate the importance of positive factors.

In the United States, large investment banks and brokerage companies act as insurers. They set a starting price for a stock or bond, attract investors willing to buy on an IPO, and receive a certain

amount of gains from the issuing company for their services, which is usually 7% of the offering price. In terms of COVID-19 situation the United States conducted some reforms. Stock markets appreciated the efforts of the authorities to support businesses and ordinary citizens. The dynamics of the pandemic itself has slightly improved in the countries that faced it back in February. In percentage terms, the spread of the virus is slowing down. There is no exponential increase when the number of cases increased like a snowball.

Many countries have already announced the gradual lifting of restrictions. They talk about the opening of individual cities and states in the United States, public locations in Europe. An idea appeared to do tests for immunity, to identify those who have already been ill, in order to understand who can be released into the economy indefinitely, removed from isolation. There was more certainty and stock markets began to rebound.

In developed countries, interest rates are very low, they always have an impact with a time margin and make the stock market very attractive for investments in the future.

In the US, the Fed has set the rate at 0.25 points, in Europe, rates are completely negative. Even the Central Bank of Russia lowered its key rate to 5.5% for the first time since 2014; few expected such a soft policy from it. This is very good news for the stock market. We may well see the S&P 500 in the next year and a half at 4,000 points. Investors are at a low start, everyone wants to buy while the stock is relatively low.

Considering Twitter's IPO, one of the largest in the US, the company's capital before the IPO was 475 million shares, of which 25% belong to the founders and directors of Twitter. It was decided to sell 70 million shares, which is 13% of the total.The goal was to attract US $ 1 million of investment from IPO practice. On September 13, 2013, Twitter applied for the initial public offering of its shares on the New York Stock Exchange (NYSE). Investment banks Goldman Sachs, Morgan Stanley and Morgan Chase acted as insurers in these transactions. As a result, the initial placement was set at the price of US $ 17-20 and the stock was sold for $ 23-25 due to the increased public interest. This IPO operation was considered successful because investors received high returns.[1] The underwriters' gains were 3.25% and had revenues of $ 59.2 million. They also had rights to buy 10.5 million shares. In total, they received $ 200 million from this IPO operation.

For long-term investors, regardless of the curve of stock market indices, the answer will always be the same: do not try to catch the moment for a successful entry. Theoretically, he is, but it is extremely difficult to guess with him. The optimal strategy for a long-term investor is to gradually add funds to your investment portfolio. Even if you invest just before the fall, on the long horizon the market will still bring you a profit. You can enter the market and not be afraid by choosing reliable companies.

From the point of view of a speculative investor, there is an intermediate phase now. According to the textbook, it was necessary to buy stocks a month ago, when the markets found a local bottom. Considering that stock markets have been growing for almost a month, well ahead of the real state of affairs, such an opportunity is likely to arise.

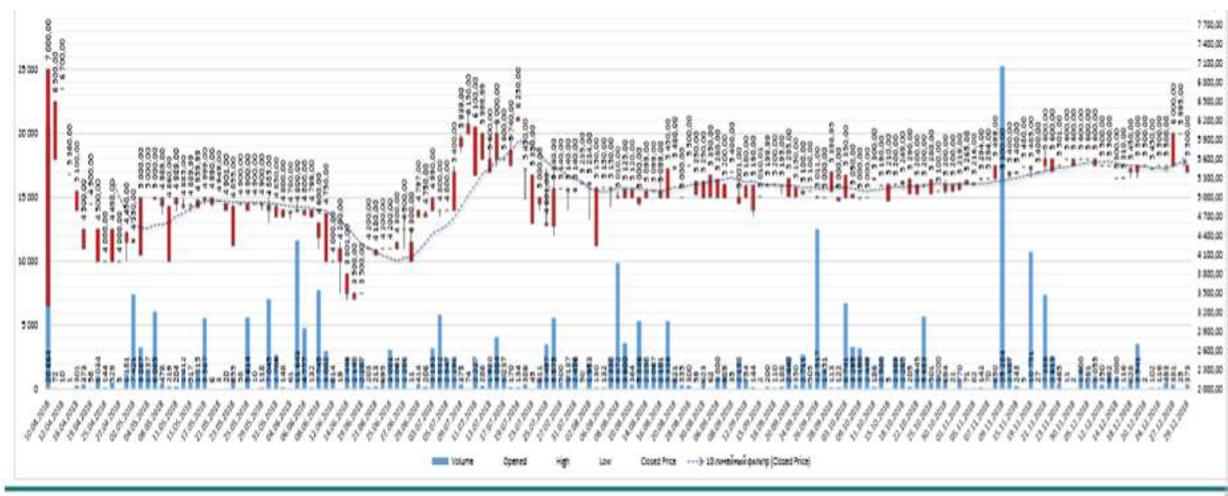
In this whole story with the coronavirus, there is at least one big positive point. The mechanism of global quarantine has been worked out on a global scale. A set of economic and social measures has been developed that are most effective in such a situation.

It is fashionable now to say that the world will never be the same. In fact, humanity has experienced dozens of more terrible mass epidemics in its history. The last plague epidemic occurred in the middle of the 19th century. Back in the 20th century, people were mowed down by local cholera epidemics, when, without medical intervention, the mortality rate reached 50%. We are partly lucky that coordinated global quarantine measures have been worked out on a relatively weak pathogen. Next time, perhaps, states will react more quickly to the threat of mass infection.

In accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated May 10, 2017, from December 5, 2017 to April 3, 2018, it was allowed to purchase shares of "Quartz" (located in Kuvasay, Ferghana region). This practice was called the first IPO in the history of Uzbekistan. The activities of the company are focused on the production of glass, glass products, glass for automobile industry, glassware. Payment of dividends of 31% for 2014, 34% for 2015 and 68% for 2016 was announced for each ordinary share of the enterprise.

As a result, from December 5, 2017, 4,574,944 ordinary shares of JSC "Quartz" were offered for sale on the Republican Stock Exchange "Tashkent". The nominal price of the share was determined as 1,715 soums. The total nominal price of the shares was 7,846,011,810 soums.

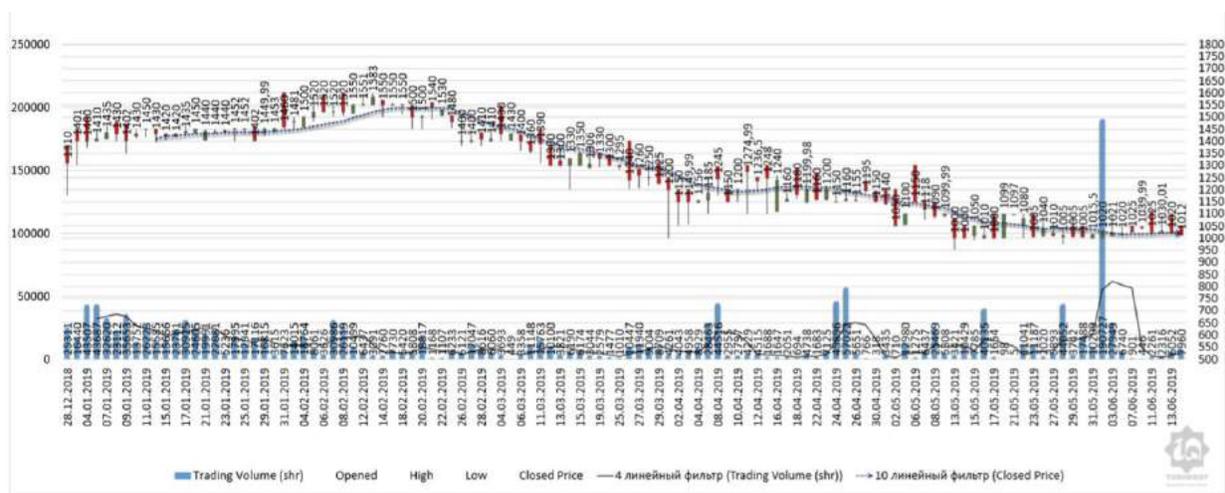
Shares are issued through the underwriter. The National Bank for Foreign Economic Activity of the Republic of Uzbekistan (IPO Practitioner) was the underwriter.

"Dalal standard", which is listed on the RSE "Tashken" acted as an investment intermediary. As of March 24, 2018, "Tashkent" Republican Stock Exchange received 1,747 inquiries to purchase 652 211 shares and invested 3.42 billion soums to depositor. Under the IPO practice, an investor can buy 0.05% of the total number of shares. This includes 2287 shares. Price per share fluctuated between 2300 and 9100 soums. As a result, 54% of the shares were sold for $ 7.5 billion soums. Investors, participating in the IPO, acquired high profit, but 46% of the shares was not sold. The underwriter would have to repurchase the remaining shares, but the National Bank for Foreign Economic Activity of the Republic of Uzbekistan refused.


Picture2. Impact of the first IPO practice on JSC "Quartz" shares sold (10.04.2018 - 31.12.2018 y.)

Firstly, held IPO practice has its advantages and disadvantages. Advantages of the practice encompass announcing the sale of shares of JSC "Quartz" to the public, investors with profit up to 60%, the engagement of stock market participants, while the drawbacks of the IPO include that the majority of shares was not sold, the lack of public and legal awareness on the IPO practice, no Road shows. But overall, the IPO practice has been successful, and many businesses are now planning to implement this practice.

In the meantime, JSC "Kokand Mechanical Plant" conducted its own SPO (Secondary Public Offering). On November 27, 2018, the stock purchase requests were collected. The National Bank for Foreign Economic Activity of the Republic of Uzbekistan (IPO Practitioner) was the underwriter. "Uzneftegazmash", listed on the RSE "Tashkent", acted as an investment intermediary. JSC "Uzneftegazmash" is a part of the national holding company "Uzbekneftegaz" and is the main shareholder of the Kokand Mechanical Plant.

During SPO practice, 2,2 million shares were issued. As a result, the share of JSC "Uzneftegazmash" fell to 64.08% and the share of other shareholders increased by 35.92%. According to experts, the stock price is expected to rise 1.5 times. As a result, 100% of the shares (2.2 million shares) was placed. The number of requests was 2 821 065. 26.14% of requests was not satisfied. Todaytheaveragepricepershareisbetween 1400-1460 soums.


Picture 3. Impact of the first SPO practice on JSC "Kokand Mechanical Plant" shares sold (28.12.2018 - 11.06.2019y.)

Considering the above, it can be noted that SPO and IPO practices play an important role in the development of the securities market. Especially, in the context of Uzbekistan, it is necessary to expand the scale of such practices to increase the interest of investors. In this way, increasing confidence in the stock exchange will lead to the introduction of derivatives.

Despite the low efficiency of the securities market in the Republic of Uzbekistan, the government is taking all measures to develop this sector. Undoubtedly, such measures as capital market development, international stock market activity, IPO and SPO operations, introduction of derivatives, and engagement of investors to the securities market will increase its efficiency.

The development of the securities market also depends on the clearing activity. Modern clearing systems contribute to the qualitative development of the financial market by reducing risks and

transaction costs of stock market participants, improving liquidity and pricing, and increasing the effectiveness of financial instruments. This, in turn, will create new conditions for further stabilization of the existing infrastructure.

The activity of the clearing house is approved by the Law of the Republic of Uzbekistan "On the mechanism of functioning of the securities market" and the Decree of the Cabinet of Ministers of the Republic of Uzbekistan dated 29 April 2003 "On measures for further development of the secondary securities market" decree and other legislative acts.

Another promising trend in the development of Uzbekistan's capital market is its access to trading areas on the world stock exchanges. The first step in this regard was the placement of 1 billion USD of Eurobonds on the London Stock Exchange Market by Uzbekistan. These bonds will be placed in two tranches: 500 million US dollars in 2024 and 2029 respectively. The yield on the five-year securities is 4.7% and the 10-year is 5.3%.

TABLE 1 KEY PLAYERS IN THE PLACEMENT OF EUROBONDS[2]

Tranche	Profitability (%)	Share of British investors (%)	US investors' share (%)	European investors' share (%)	Asian investors' share (%)
2024	4,7	39	23	6	6
2029	5,3	32	31	10	10

This practice was in high demand on the London Stock Exchange Market and received 150 inquiries from institutional investors. The main investors are organizational funds (75% and 78%), insurance companies, pension funds (20% and 16%) and banks (5% and 6%, respectively). The successes of this placement are:

- Uzbekistan achieved its first entry into the international market through a successful deal;
- With the help of investors, modern methods of valuation of the securities were used and the rating of Uzbekistan was increased;
- Uzbekistan plans to issue and place bonds by other state-owned enterprises and organizations;
- In 2019, for the first time in the Commonwealth of Independent States, bonds were placed by Uzbekistan.

On January 17, 2017 the President of the Republic of Uzbekistan signed a Decree "On measures to further simplify and accelerate the sale of state-owned facilities for entrepreneurial purposes". The third part of the Decree focuses on the conduct of IPO operations, which will allow the company to raise its capital.

Occurrence of COVID-19 pandemic case led to drastic changes in securities markets all over the world. A record increase in the supply of social bonds and the use of a new format – corona bonds. Corona bonds, or COVID-19 bonds as they are also called, aim to regulate capital flow to fight the pandemic and its negative social consequences. The International Capital Market Association (ICMA) has put together useful guidance on issuance of corona bonds. Corona bonds offer a relevant and credible way to channel private and public capital towards fighting the COVID-19 crisis.

The International Capital Market Association (ICMA), together with the International Finance Corporation, has developed a collection of case studies to provide guidance and illustrative

examples for the use of proceeds as well as the definition of target population when issuing a corona bond. The examples include projects such as research and development of vaccines and other medications, with the general public as the target group, and loans to small businesses hit by the pandemic, with small businesses and employees as the target population.

Germany and the Netherlands are opponents to the idea of "corona bonds." Another nine EU nations have said this new debt instrument, which would combine securities from different countries, is needed to mitigate the vast economic impact of the coronavirus pandemic. The European Central Bank has announced a massive bond-purchase program, totaling 750 billion euros throughout 2020.

In case of Uzbekistan the negative affect of COVID-19 also is visible in decreasing trend of total volume of operations at the Uzbek Stock Exchange "TASHKENT". As the measurement of fighting against the stocks failure, it was decided to provide IPO of "JizzakhPlastmassa" company and involved 1,5bln. UZS.

The presence of traded stocks in the capital market allows the company to assess its value, which can be used as a tool for managers' performance evaluation for mergers and acquisitions (M&A). The Company's shareholders are able to sell most or part of their shares while at the same time allowing them to capitalize on the company's expected future earnings. The above-mentioned changes in the securities market undoubtedly determine its future development and prospects.

The national stock market is a relatively new and underdeveloped segment of the national economy. The presence of external and internal factors may hinder the development of the national stock market on the one hand. Banks in the financial market can participate in three ways (as issuer, investor and professional participants). With the development of Uzbek banks, they have recently begun to act as intermediaries in the issuance of corporate bonds and their placement, which in turn suggests that they are effectively using derivatives in the securities market.

IPO and SPO operations carried out positive results through the RSE "TASHKENT". A number of shortcomings will be addressed during subsequent operations. These agreements will undoubtedly increase the number and volume of transactions on the secondary market.

In the conditions of Uzbekistan, option contracts of financial instruments available on the securities market are the most appropriate. Legally available but practically nonexistent instrument is very convenient for the investor and can minimize the risk.

Issues related to the creation of consulting services and hedge funds in order to reduce and manage existing risks in the securities market are also crucial and need to focus on.

ABSTRACT

The apparel industry in India is one in all the simplest industries within the world garment market. India have well organized sector, garment makers, suppliers, exporters, stockiest and wholesalers. The textile industries square measure second largest employment supplier when the agriculture sector. Tirupur is one in all the quickest developing cities within the state. Tirupur conjointly popularly observed as "Dollar City" or "Small Japan" or "Banyan City" as a result of its excellence in unwoven clothes. People have moved to across the boundaries for looking out best job opportunities. There have been two hundred million international migrant workers and their families within the year 2010. Workers from varied states like Bihar, Kerala, province and province migrate to Tamilnadu particularly the District Tirupur for developing their family's economy. The ascension of our state economy and accrued infrastructure and construction sectors provides several employment opportunities. Migrated workers area unit better option to the garment makers for establishing producing schedule nearer to merchandising amount totally supported fast response strategy that relates to attire merchandising and producing. The study principally focuses on socio economic factors and issues in apparel industry for migrated workers.

KEYWORDS: *Apparel, Workers, Opportunities.*

INTRODUCTION

Migrate of workers area unit usually treated as an economic issue though non economic factors even have somewhat influence. Workers migration is largely outlined as a cross border movement for the utilization functions and higher living in foreign. Even though supposing that there is no universally accepted definitions for worker migration. The term "worker migrant" will be used significantly for the movement of employment purpose. The workers can move to migrate whereas any work they are in financial condition and insecurity. The migrated workers area unit enjoying necessary role in production of prepared created clothes. The migrant workers have centered the garment industries for his or her continuous job. They need sweet-faced several challenges in their work like practice and discrimination.

IMPORTANCE OF THE STUDY

The study of migration is of most significance for the advance and reconstruction of rural areas in our country. The people have the opinion that the movement from rural to urban places owing to the living condition is healthier in urban. within the rural areas, the people face several crises like economic condition, high population, lack of health care, education, amusement facilities, etc. additionally some reasons like wars, native conflicts and natural disasters. The apparel industry has provided a serious contribution to the Indian economy with migrated workers. Migrated workers facilitate to apparel industry in our country can face robust competition in their export and domestic markets.

STATEMENT OF THE PROBLEMS

The garment industries square measure the main sector for providing employment when agriculture in India. Most of the workers square measure worked in garment industries square measure migrant. The foremost of the migrated workers square measure illiterate and that they came from poor financial gain cluster section within the society. Several of the migrant not having permanent work place and moving from one place to a different ceaselessly. The migrant not have abundant of talks power to fight for obtaining sensible operating condition, appropriate wages, and different work connected rights. Several of the migrant complains regarding the phantasmagorical wages given by garment industry owners.

THE OBJECTIVES OF THE STUDY

➢ To analyze the socio economic background of migrated workers in Tirupur District.

➢ To decide the crisis of migrated workers in Apparel industry at Tirupur District.

➢ To provide higher suggestions for up the life form of migrated workers.

RESEARCH   METHODOLOGY

The primary data is collected through survey technique and secondary data through database. The field survey technique was used to collect the data from the 200 elite sample respondents in Tirupur District. The simple random sampling technique was used to choose respondents for the study. The collected data from primary sources were organized in simple tabular statements. To study the problems faced by the migrated workers, Henry Garret ranking method was employed.

REVIEW OF LITERATURE

Cobus and Daurty (1997) have noted the cultural variations between refugees and native groups in Puerto Rica. This study reflects low level of hostility by the host cluster, as well as, socio-cultural integration of the clean refugees for protects their identity. Bryceson (2003) has found that extremely differentiated the quality patterns as per the financial gain, size and sort of settlement levels wherever they reside. Kundu (2003) in his study on "Urbanization and urban governance: search for a perspective beyond neo-liberalism" expressed that the interior migration opportunities and employment are support migrants workers when looking for work thus lowering the costs and internal migration risks.

LIMITATIONS OF THE STUDY

- The study fully based on availability of the information from the selected sources and data collection also limited by the time factor.

- The study focused only the migrated workers in Tirupur District.

- The study covered only the Tirupur District.

Data Analysis and Interpretation: Multiple Regression Analysis

The following table depicts the relationship between migrants and their satisfaction level in working garments at Tirupur District and seven independent variables which were studied.

Variables	B	Std. Error	t	P
(Constant)	41.230	6.559	6.289	.000
Age	.646	1.107	.585	.561
Education	-2.809	1.195	-2.358	.020
Field Experience	-.804	.364	-2.218	.029
Income per annum	.173	.875	.198	.845
Marital status	-2.145	.963	-2.235	.028
Members in Family	-1.131	.602	-1.884	.062
Knowing the Organization	11.763	5.591	2.106	.038

Model	R	R Sqr.	Adjusted R Sqr.	Std. Error of Estimate
1	.418	.175	.145	7.675

ANALYSIS OF VARIANCE

	Sum of Sqrs.	Df	Mean Sqr.	F	Sig
Regression	2386.788	7	340.971	5.791	.000
Residual	11306.969	192	58.891		
Total	13693.757	199			

It depicts the 5 independent variables involve on the variation in the migrants level of satisfaction in working garment industry at Tirupur District and statistically noted significant at 1% and 5% level.

BENEFITS FOR GARMENT INDUSTRY OWNERS BY APPOINTING MIGRATED WORKERS

Sl.No.	Advantages	Total score	Rank
1	No bargaining in wages	387	9
2	No labour Union	396	8
3	No strike in work place	405	7
4	Lesser leave taken	915	1
5	Increased production	617	4
6	Work Quality	589	5
7	Reducing Wastages	860	2
8	Perfection of measurements	671	3
9	Migrants Availability	554	6

The above table shows the advantage of "Lesser Leave Taken" was ranked first with the overall score of 915. At that time the "Reducing Wastage" was ranked second with the score of 860. On the other hand, "Perfection of Measurements" was in third place with the score of 671. Another blessings of "Increased Production" was in fourth rank with the overall score 617. The benefit "Work Quality" was in fifth position with score of 589. The advantage of "Migrants Availability" visited sixth position with score of 554. The advantage of "No strike in work place" have scored 405 and in seventh rank. Another advantage of "No Labour Union" was in eighth position with evaluation of 396 and "No bargaining in wages" was scored 387, occupied ninth rank.

PROBLEMS OF MIGRATED WORKERS

PROBLEMS IN WORKING PLACE

S.No	Problems	Score	Rank
1	Over work load	440	5
2	Fixing lower wage	724	2
3	Partiality with local workers	763	1
4	Misunderstanding with concern authority	503	4
5	Poor interaction	575	3

The above table depicts that the downside" Partiality with native workers" was the primary and prime problem with the Garret score of 763. The matter of "Fixing lower wages" was in second place with the Garret score of 724. Another vital downside is "Poor interaction" was in third rank with Garret scoring of 575. "Misunderstanding with concern authority" was another downside in fourth place with Garret scoring of 503 and also the downside of "Over work load" was the last downside Garret scoring 440 and in fifth place.

PROBLEMS IN STAYING PLACE

S.No.	Problems	Score	Rank
1	Poor safety	679	3
2	Local people disturbance	670	4
3	Poor water facility	774	1
4	Poor power facility	656	5
5	Insufficient doors and windows in room	767	2
6	Lack of bathroom and toilet facility	580	6

The above table shows that "Water problem" was stratified first with scoring of 774. On the other hand, the matter of "Insufficient doors and windows in room" was second rank with 767 score. And conjointly the issues of "Poor safety", "Local people disturbance", poor power facility" and "Lack bath room and toilet facility" were into the position of third, fourth, fifth and sixth rank with scoring of 679, 670,656 and 580 points severally.

FINDINGS

- The vital edges gained the apparel industry owners by appointing migrated workers were lesser leave taken, reducing wastages and perfection of measurements.

- The most important issues visages by the migrants in work place were partiality with native workers, Fixing lower wages and poor interaction.

- Other issues for migrants in their living place were poor water facility, insufficient doors and windows in room and poor safety.

SUGGESTIONS

1. Most of the migrated workers in Tirupur District area unit relying garment industries for his or her life betterment. However, they are operating in low level satisfaction. So that the apparel industry owners ought to take some necessary steps for fulfilling their satisfaction.

2. The garment industries are enjoying additional edges by appointing migrated workers in their work place. For attracting the migrated workers and retain them, the apparel industry owners ought to give adequate basic facilities in correct.

3. The government conjointly involves protective the rights of migrants in their work likewise as living places.

CONCLUSION

The migrated workers came from nearest states like Karnataka, Orissa, Bihar, Andrapradesh and Kerala to Tirupur District for looking out jobs particularly in garment industries. The migrants are giving preference to garment industries because of continuous job and wage issue. During this study, advantages for apparel industry owners by appointing migrated workers, Crisis of migrated workers in operating places and staying space were discerned when grouping information, analysis and interpretation. The study additionally provides some solutions for the known issues within the Tirupur garments to develop the migrated workers. Migrants are

working with loyal for long period of time because of work recognition, high responsibility and good relationship between the management and co workers.

ABSTRACT

The wooden butterfly is a representative of Cossidae, the order of Lepidotera insects. This pest is a night butterfly, which is mainly widespread in Western Europe, South Africa, Iran, Japan and Central Asia, Uzbekistan, and Tajikistan. In particular, wood butterflies damage pears, apples, plums, quinces, apricots, cherries, walnuts, dates, ornamental trees such as poplar, willow, ash, birch, oak, maple and Ulmus. It is important to carry out control measures against them in the most vulnerable period of life cycle of the pest.

KEYWORDS: *Cossus, Imago, Egg, Mushroom, House, Ash, Poplar, Willow, Butterfly.*

INTRODUCTION

The growing pest attacks on agricultural crops, as well as trees and shrubs, are of concern to the world community. They cause a large part of the crop to be lost during plant development and storage of products. [4].

One of the main factors in increasing the area under orchards and their productivity is the protection of trees from pests and diseases. In particular, more than 150 pests and diseases that

cause damage to orchards are known. The bioecology of such pests and the separate study of pathogenic microorganisms are of great scientific and practical importance.

The wood butterfly (*Cossus Cossus* Linneaus, 1758) is a member of the Cossidae family of insects. In some sources it is also interpreted as a poplar stalk (Khodjaev, 2014). As a result of observations, in addition to poplar leaf beetles (*Mela-soma popules* L.), urban beetle beetles (*Aeolesthes sarta* (Solsky, 1871), poplar shield (*Quadraspidotus slavonicus* Green.) In fruit and ornamental trees, a serious pest of trees is the poplar stalk, Linnaeus Cossosus, 1758). The imago condition of the poplar stalk is the butterfly, mainly, its warms severely damage the stem.In particular, during our field experiments, pests were observed in "European-American I-154" poplars imported from Namangan region (10.04.2017, Fergana). The open paths in the trunk resemble mustache beetles in nature. Laboratory tests showed that they were made by *Cossus cossus*.

According to the scientific sources, this pest is a nocturnal butterfly (*Cossus Cossus* Linneaus, 1758), which is mainly widespread in Western Europe, South Africa, Iran, Japan and the Central Asian republics of Uzbekistan and Tajikistan. About 650 species of butterflies belonging to this family are known, and their developmental generation is directly related to the ecological environment. For example, in the northern regions of Europe and Siberia, the development of one generation takes 2-3 years, in the Crimea and the Caucasus-1 year, and in Uzbekistan - 2 years [1].

This article focuses on the development, biology and damage characteristics of the species Cossus cossus Linneaus, 1758 in Uzbekistan.

Materials and research methods. The research was conducted in 2012-2019 in the city of Fergana, Fergana region, Uzbekistan, Furkat, Kuva, Fergana districts. The study used general entomology and methods suggested by the authors. [3]

Materials were collected in all seasons. In harmony with the natural development of insects, all life stages of individuals were observed in the laboratory. Samples were measured using a digital microscope and flashlights of the Trinocular XSP 500 SM model.

The obtained results and their discussion. Butterfly worms are mainly pests on fruit and ornamental trees with horns and body thickness thicker than 10 cm. They can be observed on apple (*Mallus domestica* L.), pear (*Pyrus communis* L.), plum (*Prunus sogdiana* Vass.), Apricot (*Armeniaca vulgaris* Lam), date (*Diospyros kaki* L.), walnut (*Juglane regia* L.) quince (*Cydonia oblonga* Mill.), cherry (*Cerasus vulgaris* L.), and ornamental trees such as poplar, willow (*Populus nigra* L), poplar (*Salix alba*), birch (*Betula verrucosa*), oak (*Queraus robur* L), maple (*Acer campestre* L.). and slate (*Ulmus pinnato romasa* Dieck). The length of the butterflies is 78-100 mm in females, 65-75 mm in males, and the upper part of the colorless wings is white or grayish-brown. They move actively after sunset. During the day the larvae lie in holes in the tree.

Females and males differ in color and body length. The wing color of the adult butterfly is gray-brown, dark gray, with marble-patterned spots. It also has transverse dark brown wavy stripes on the wings. Leak spots are more common near the chest of the wing. The head is shiny and the mustache is serrated.

Picture 1. The imago state of the foot butterfly

Female and male butterflies do not live long, fertilized female butterflies live 2-4 days, and male butterflies die 3-9 days (30.05.2017, Fergana).

Butterflies are active from late May to early August. The active movement of each butterfly lasts 10-15 days [1]. Female butterflies are fertilized in late March and lay their eggs under the bark of diseased and old trees. The researchs state that they lay around 700-1000 eggs under natural conditions [4]. In the laboratory, this figure is 200-330 when the temperature is +10-34 ° C. Eggs are light brown or light gray in color, rounded on both sides, about 1,5-2 mm long. It seals 10-12 eggs with a special adhesive.

After 27–46 days, the eggs hatch dark worms with a light brown head on the back side of the body dark red bottom. (12.05.2017, Fergana district). The length of the first worms that emerge from the eggs is 85-120 mm, they are first actively fed by the lub and cambium part of the trees. By the end of the month, they move on to feeding on the woody part of the tree. The worms have 12 bulges in the body and special legs on the side of the abdomen and move very fast. It can move around 50-60 cm in a minute. The worm period is 12-16 days (27.08.2017, Fergana). [3].

Picture 2. Eggs and worms of the foot butterfly

In terms of nutrition, the long-eared beetle resembles a worm, but feeds a little faster. In late August, the worms turn into mushrooms. Before turning into a mushroom, a special wrap made of a mixture of sawdust and saliva is placed near the bark of the gnawing tree trunk, forming a dense cocoon-like house with a diameter of 12-15 mm, where it turns into a mushroom. Mushrooms are of the closed type with a length of 69-87 mm. Next year, the developing butterfly will open a special package and fly away (27.08.2017, Fergana).

Picture 3. The worm and moth of the butterfly

Trees infested by such insect worms lag behind in development, grow slowly and become weak, especially if the plant is severely damaged by bark beetles, mustache and poplar stalks, it will break even in light winds. The productivity of fruit trees decreases or there are cases of premature construction.

Picture 4. A poplar tree infested by the caterpillar of the foot butterfly

CONCLUSION

 C. cossus lives in Uzbekistan for 2 years. They cause damage by feeding on trees such as *M. domestica*, *P. Communis*, *P.sogdiana*, *A.vulgaris*, *D. kaki, J. regia C. Oblonga, C. vulgaris,* and from ornamental trees *P.nigra, S.alba, B.verrucosa, Q.robur. A. campestre* and *U. pinnato romasa*. The full life cycle of the pest takes place in the woody parts of the plant.

When developing methods of combating poplar stalks, it is necessary to take into account their egg-laying and flight times. In addition, pest control measures can reduce the population density of trees infested with butterfly larvae by spraying specially prepared, i.e. casein-coated and insecticide-added grease into the holes or sending a strong insecticide solution to the holes, cutting off severely damaged and weakened trees.

DEVELOP A SYSTEM FOR CONVERTING FROM FLAT TO BRAILLE AND USE IT IN SPECIAL LIBRARIES

Bahodirjon Arabboyevich Mullajonov*

ABSTRACT

Blind people face many problems in obtaining information. The solution to these problems is to get devices that work based on Braille. This article explores the principle of operation of a Braille translator as a system, and outlines the block chain architectures of software and Braille displays listed as components of the system. Based on this, the creation and release of hardware and software will greatly facilitate the lives of blind people. At the end of the article, the idea of creating special low-cost libraries for the blind using the hardware and software created was also put forward.

KEYWORDS*: Braille, Blind People, Converter, Convenience, Search Table, Microcontroller, Microprocessor, Chip, Relay, Braille Display, Flat Data, ACSII Code, Signal, Information Technology, Internet.*

INTRODUCTION

Today, there is practically no industry without information technology. Regardless of the field, the development of this industry depends on how well it is integrated with information technology. Information technology is the most promising. However, as the information technology industry develops, people with disabilities are losing access to these technologies.

There is a gap between information technology and the blind. To fill this gap, various devices and applications for the blind and visually impaired are being created around the world. Nowadays, the computer has become an integral part of human life. You are always looking for a computer, both for finding new information and for rest

You will need a view function to read and control the data in the monitor window. If you want to see something on the Internet, open the browser, open the desired website and read the links of interest. Eyesight is a key factor. Therefore, additional devices are needed for blind people to use computers. Without such devices, blind people will not be able to read data. They can't even see the mouse cursor to give the command on the computer. To make it easier for blind people to use a computer, special blind people need to create data retrieval tools and one- and multi-room Braille displays that represent information in embossed Braille.

Blind people are also an integral part of society. However, due to their disabilities, they face major problems in using computers. According to the World Health Organization, "90 percent of the world's blind people are illiterate and 70 percent are unemployed. They are the main reason for the lack of access to technology". [7,74]

THE MAIN FINDINGS AND RESULTS.

Initially, a complex point language was created for the blind. This point language was difficult to use because it contained up to 4,096 combinations. [9,241] Twelve dots were used to represent these combinations. Braille was named after Louis Braille, the creator of the Braille script. Louis Braille was blinded in a childhood accident. In 1829, Louis Braille developed a 6-dot grid system that made it easier for the blind to read and write. The combination of 64 can represent decimal numbers, punctuation and punctuation, all letters of the alphabet. In 1837, a second version with the first digital writing form was published.

One of the main problems for blind people is reading digital data in Braille. The blind cannot read without touching the order of the dots. Over the years, scientists around the world have been working on devices that convert flat texts into Braille. As a result, different room Braille displays were created. The Braille display allows the blind to read. [12,45]

Braille is six points that can be read by the fingers of the blind. Braille language mas. On the contrary, it is the code of many languages. Braille is used by many people around the world in their own languages and is a literacy tool for all. Braille letters consist of a six-dot combination and are placed in a matrix. Each point is flat or convex. The density of Braille is low. An average size of 25 x 29inch paper has 32 characters. A normal point is 1.8 mm in diameter. [3,163]

There is a need to translate plain text into Braille so that blind people can learn. Manual translation is prone to errors and takes a lot of time. Therefore, various automatic translation devices began to be created. Currently, most Braille translators rely on American standard code for data exchange and computer use. (ACSII).

Another solution for converting plain text to Braille is with portable devices. Portable devices are based on the microcontroller used in the application. The translation is based on a search table or dictionary.[2,225]

Microcontrollers (English Micro Controller Unit, MCU) are chips designed specifically to control electronic devices. Microcontrollers typically include a processor, random access memory, non-volatile memory, and other peripherals. Microcontrollers can also be called computers that perform simple tasks.

Today, electronics cannot be imagined without microcontrollers. Unlike microchips, microcontrollers become useless crystals if no software is installed to control them. Unlike microprocessors, microcontrollers have a single-chip ready-to-operate system. [11,97]

The microprocessor must have peripherals connected to external memory and other devices for data exchange. The microcontroller has all the necessary equipment and modules. The advantage of using microcontrollers instead of special-purpose chips when creating new equipment is that the number of external elements is very small. Sometimes there are cases when the external elements are not connected at all. The use of microcontrollers is much cheaper. Because the problem can be solved by making changes to the program in the microcontroller. Again, even if the requirements for the operation of the device change, its circuitry will hardly change.

Today, blind and visually impaired people use many auxiliary software packages and devices such as Braille keyboards, Braille displays, screen readers, Braille writers, and screen magnifiers. Such devices and software packages help them to have a wide range of capabilities. However, such devices are also very expensive. [8,43]

We can make such devices ourselves. The writing we use is called flat writing, regardless of the language we use. The main goal of Braille translators is to convert flat-form data into Braille-based data. Device or software may come as Braille translator. In some cases, both can come. (1-pic.)

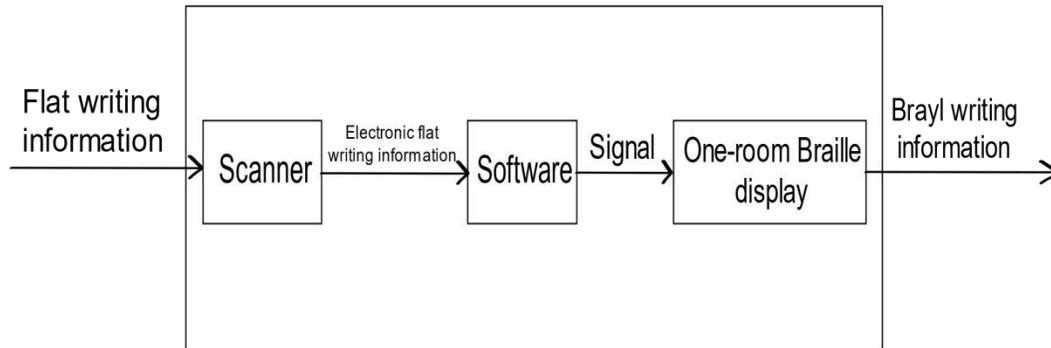
1-picture The principle of a Braille translator

The Braille interpreter shown in thefirst pictureis the simplest operating principle. You can get better results by adding additional devices. For example, as software, we take a program that converts a flat record in electronic form into a signal and install this program on a personal computer. [1,156]As a device, let's take a one-room Braille display that takes data from a program as a signal and converts it into Braille data. Then our scheme becomes much more complicated.

2-picture Software and hardwareBraille translator

Our Braille translator, shown in the second picture can convert all electronic flat data, which understands computer software, into Braille. What if flat data is not available on the computer? What will be done then? natural questions may arise. In this case, we can solve this problem by adding a scanner to the data shown in picture of 2 on above. [4,164]

The scanner allows us to transmit the information in plain text from a book or paper to the software installed on the computer so that our software can understand it. [6,182] Our Braille translator includes a one-room Braille display, software and a scanner. A scanner is a type of

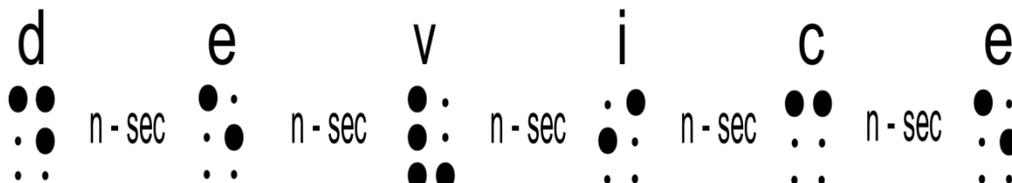
camera that can pick up a piece of paper and send it to a computer. The scheme of operation of our Braille translator will change as follows.


3-picture Brayl translator which functioned a writing conversion system

The Braille translator that comes as a system in the picture third can be expanded with the addition of the necessary additions. This can occur in the process of making a Braille translator.

Let's talk about the software that is planned to be installed on the computer. The principle of operation of this software is the same as that of translators who translate from one language to another on a computer. That is, an electronic detector that is available on a computer or received by a scanner is converted into a set of corresponding points in the record. Once all the letters in each word and sentence are thought of as the sum of the dots, this software sends the sum of all the dots in the form of a signal to a one-room Braille display. In this way, the software transmits the signal to the Braille display and converts it from flat to Braille. These processes take place in a real-time system.

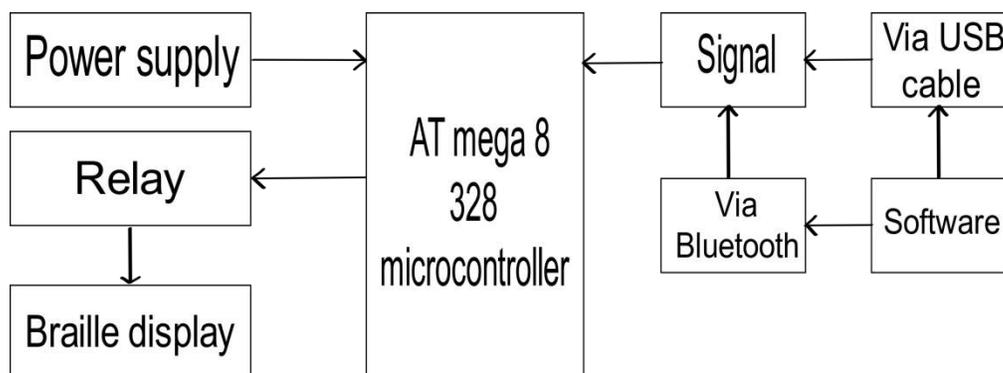
We need a one-room Braille display to display the received signal in Braille. The reason he chose exactly one room among the Braille displays: you don't have to run your finger over that display. The thumb is placed on the display, giving a push from the inside to the finger, which is a combination of dots representing the desired letters. [5,132]

There is one push for each letter. Given the ability to understand the blind, the necessary unit of time is placed between the impulses. For example, the word "device" appears on a one-room display in the picture four below. Given the ability to comprehend, we call the unit of time between the thrusts n-seconds.


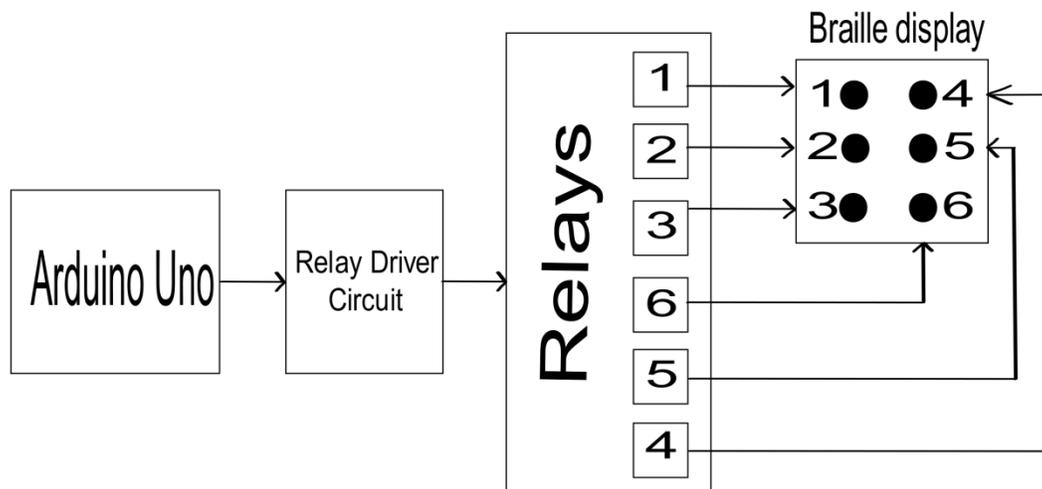
4-picture Single Braille display of the word "device"

The one-room Braille display we make will be connected to a computer with a USB cable to receive signals from the computer software. Bluetooth technology can also be used to receive the

signal. This increases the mobility of the device. Depending on the technology used to transmit the signal, the software will also change. If possible, both technologies should be used.

In the manufacture of the Braille display device, we use the Atmega 8 microcontroller. These microcontrollers have a very wide range of capabilities in creating such new devices. It is also suitable for managing the operation of our device. Another advantage of these microcontrollers is the breadth of choice when choosing a power supply. We can use a 5-volt battery or a self-contained block chain. Figure 5 below shows a block diagram of a Braille display device:


5-picture Block diagram of a Braille display device

In our block diagram in Figure 5, we see a relay not mentioned above. Why do you need a relay? A separate relay is required for each of the six Braille cells in our 2 x 3 display on our one-room Braille display. That is, our device uses six relays.


6-picture perfectly demonstrated relays system architecture

6-picture which above is shows in detail which Braille cell of each relay is involved in the control.

A relay is an electromechanical device that disconnects or connects an electrical circuit when exposed to an electrical signal at a specified value. Examples of electrical signals are current, voltage and power. In our case, the function of the relay is to change the position of the bulges, whether they are bulging or not. The relay itself is a widely used device for performing control,

signaling, control, adjustment and other discrete functions of automatic systems. When the signal entering the relay changes continuously and reaches a certain value, an output signal with a jump characteristic appears in it.

When the input signal decreases and reaches a certain value, the output signal disappears in a jump and returns to its previous state. A system that controls an electrical device or electrical network and ensures its normal operation is called relay protection.

By developing good relay protection, the life of the device can be greatly increased. If the electrical appliance or mains does not work properly, a signal will go to the warning circuit or an automatic power outage will occur. When using a relay, it is possible to control large forces at the output through weak input electrical signals, disconnect electrical circuits, control the deviation of the required parameters from the given value. Depending on the type of physical quantity affected, electrical, mechanical, optical, acoustic, magnetic and thermal relays are used.

We have three different options for making the body of a single Braille display:

1. This view has a handle, in which four fingers except the thumb are held backwards, and the thumb is placed on the panel to be felt. This puts the hand in a position close to the position of the fist.
2. This body has a rubber clamp and only the thumb is fitted with a rubber ring with a sensor. The other fingers and the rest of the hand are free.
3. As an accessory to other devices and apparatus, a rectangular sensor is installed inside the device. Only the sensor is outside to hold the tip of the thumb. It has a large paralapiped-shaped housing, which can accommodate everything from microcontrollers to relays. Place your finger on the top of the case to place the display. The power supply on the microcontroller and the ports to which the USB cable is connected are left open so that they can be connected to the side of the case. [10,187]

We have already seen how to create a Braille display case. It can also be created in any shape and form. The key here is to make the device accessible to the blind.

CONCLUSION

The devices and software discussed above are a much more cost-effective way for blind people to read and communicate, making them easily accessible even to ordinary people. These devices also help blind people connect to computers at work and at home. Such devices are available, but their price is a limiting factor. Blind people face great difficulties in acquiring computer skills due to the lack of low-cost technical support. Braille translators with the software and one-room Braille displays discussed above can create special libraries for the blind. Let these libraries consist of small rooms with a capacity of ten people. If each room has a computer and a librarian, there should be one desk with ten tables and ten chairs. Each table will have Braille displays in the form of a case with a handle. These one-room Braille displays are connected to a computer via special cables. In this case, the software is also created with the function of transmitting data to ten Braille displays.

When a blind person visits the library, he tells the librarian which book he wants to read. The librarian selects the required literature from the software, connects it to an empty Braille display, and shows the blind person the desired location and the desired display. This allows you to serve up to ten people. Given that thousands of e-books can be stored in a computer's memory, we can create science libraries with a very rich collection of books for the blind with such libraries.

From an economic point of view, such libraries are not expensive. For such a room is enough a computer with special software and ten Braille displays. Given that we have our own software and Braille displays, this is a very efficient and optimal operation.

ABSTRACT

This article describes specific features and characteristics of speech art, along with its problems and solutions. Teachers of stage speech are primarily responsible for language and pronunciation. But when an actor goes to the theater stage, of course, the director and leading actors are in charge. Defects and shortcomings in the genre of the work and language are solved only in discussions and debates. If this issue is left aside, other disadvantages will also come to light.

INTRODUCTION

Human development is the development of ideas. Times have changed with the diversity and coherence of ideas, as well as their distinctive advantages over time. Each era has its own new outlook. Then the question of bringing these changes into existence became the next requirement of life for man. No matter how strong and comprehensive the ideas may be, they can remain as ideas for good and all. In order to spread these ideas among the people and to bring them to life

in the process of explaining them in detail, one has to resort to the most modest, if not the easiest, interpretation. This "modest" means was his language ability.

Words can be used for conveying the true value of ideas to the people and then taking action in a manner consistent with the essence of those ideas. It is enough to remember the importance of the national idea and its role in human development. It is the fact that the national idea reflects the centuries-old outlook of the nation's own values; it is clear from the example of the generation's maturity in its system of values that its power is educational.

"Science and art are so intertwined with each other like the heart and lungs that if one of them is broken, the other will not work," wrote L.N.Tolstoy. The method of teaching the speech of K.S. Stanislavsky's system is based on the close connection between science and art, as the great writer put it. For example, the director, the actor and the word master should possess good knowledge of special subjects, processing of teacher methodology and knowledge of speech-oriented disciplines, sciences such as anatomy, physiology, studying the structure and use of sound and speech facilities; psychophysiology of speech creation, working system for correcting human-speech defects, rules of tone, logic, pronunciation and literary pronunciation, orthoepythe, study of gestures, special subjects related to public speaking and provide a foundation for the development of teaching methodologies and a complete mastering of the methods of speech science.

It is well-known that interpersonal relations are carried out through language and speech in all areas of development. This powerful tool, connecting people and society, serves as a backbone for the achievement of high ideals.

The artistic word in this regard is a lively and most effective tool. It reaches the heart of its listener, impresses him/her and makes changes in his/her mood, and inspires him/herto do great things.

Kaykovus praises the word and says, "The greatest amongartsis the word art."

Film and theatrical arts, along with the media and the press are invaluable in promoting the spirituality of society. But at times they are also exposed to non-observance of literary language norms, strange phrases and poetic expressions. It's a sad thing, of course.

Since theater is a place that promotes the spirituality of society, every creator of art must be an example to the public in speech, behavior, dress, and behavior.

As it is known, each theater school has the task of forming and professionalizing the future artists. In addition to acting skills, scenic speech plays an important role in these tasks. When raising a prospective actor, it is a good idea to have them become interested in fiction. The teacher should start this work from the very beginning. The success of "Stage speech" subject is in the study of the mysteries of this subject, reference is made to the various texts and works.

MATERIALS AND METHODS

In this process, some teachers face difficulties. Because most readers rarely read fiction, understanding the meaning of the word may be delayed. For such students, teacher support is a must and a choice in selecting material for the performance. Because they cannot control their abilities. As a result, they are left behind and disappointed. At times, however, there are those who hesitate to give their opinion. Frequent questions and discussions on the topic in individual

sessions are an effective way to teach them to express themselves freely. This is because the reader is forced to express themselves and is encouraged.

The word art that reflects the spirit of the times is the poem of Muhammad Yusuf "Uzbekistan". (This poem is well known to many. So the text of the poem is not quoted.) The reader of this poem must deeply appreciate the innate value and holiness of the native land.

By the understanding the notion "The motherland is as sacred as the holy place," everyone appreciates and praises his father's fort with his whole mind, body and soul.

In the process of working with the text, the students' spiritual world, professional performance skills, commitment to their civic duty, and their love for the motherland and their people, and their hometown are all mobilized. The results of practical work with students show that while they don't possess pure thinking, discipline, curiosity, focus, attention, dedication and perfectly strong diligence, and still they don't have a keen eye, a keen interest, a clear view of the environment and different events, scenes and details, it cannot be expected required degree in performing arts.

Today, as we all know, in the upbringing of a creative and skilled actor, whether in theater, radio, television or cinema, the skills of acting and speaking are "twin" subjects. Stage speech requires students to have a broad and comprehensive knowledge of logical and figurative thinking, to act on word-based behavior. The stage speech is primarily a speech that is declared on the scene. It has methodological principles that have been tested in the original experience of the "Speech", "Acting Skills" disciplines taught more than fifty years in the education of actors. A lot of time is spent by the teacher for speech techniques in stage speech subject , such as articulation, diction, and vocal training. There are many flaws in the speech of future actors. It is the teacher's responsibility to work with them to correct speech deficiencies and improve their skills. At the same time, if the teacher does not pay attention to the first part of science - the technical part, the repertoire, the work on artistic expression - this is a violation of the laws of creativity. The actor must fully be aware of the diction and tone of voice when working on the role, the power of the word, the intonation, and the ways of communicating with the partner in action. Speech culture is a mirror of social culture that reflects the culture of human society. People living in a highly civilized society should also have a high level of speech culture. Therefore, culture can be said to be a reflection of the culture and prosperity of any social system.

At first glance, it became clear that the possibilities of our speech, our tongue that is useful only for dialogue - are so vast. Growth in these same opportunities has expanded over time, and progress has shifted to a time when everything has to do with how effectively the language and word capabilities are used.

Note that we often come across the concept of "leadership" in political conversations or in the flow of information directly related to politics. Today, leadership has become one of the most common words in the world. But there is one important aspect that is often overlooked in this regard - the way people think about direct relationships, their intercourse, and their emergence, or their particular activities, gatherings, and themes. The work of presenter in the art of speech is also responsible for activities that combine certain types of leadership and is a complex activity in its own right.

RESULTS AND DISCUSSION

There are a number of reasons why contemporary Uzbek theaters do not respond to the full extent of their stage performances:

1. Irresponsibility. For example, it is unthinkable that a musician or dancer will perform on a stage without training. These artists regularly practice and develop their own performing techniques. Currently, many of our actors do not work on their own, other than working hours. They do not do any professional training. At the same time, they do not seek to enrich and improve their speech. As a result, the art of speaking continues to grow dull in the actors. As a consequence, devoid of such creative research, artists can also see Hamlet and A. Navoi, Farkhad and Majnun speak the same pronunciation. The only way to prevent such flaws is to prevent irresponsibility and indifference in the arts.

2. Uzbek is also a language rich in dialects. Local dialects are radically differ from each other. Nevertheless, some of our actors speak in their local dialects. Especially nowadays, some of the TV presenters speak in their own dialects. As a result, norms of literary language are violated.

The foundations of presenting are manifested in this civilization and in the continuity of civilization in relation to the importance and significance of a particular person. Today it is not an exaggeration to say that presenter is a human being "grew up and became" a leader as a result of progress of mankind in the eyes of the people. And now that we are "adapting" to the intensity of today's fast-paced times, we can see that the presenting itself is one of the sciences, which has a particular subject of study and obscures all knowledge. Is it possible to learn how, in any case, under any circumstances, it can influence the way people think and learn, as well as any other science, to learn how to start and direct it in certain areas? It seems difficult to fully understand the rapidly changing events of our day. Sometimes this is not a commentary on the perception of events; it is precisely the presenting that is necessary for human relations today. It is becoming increasingly clear that being presenter is not just a mere expression of the word among the people, but a necessity for the majority of people - a science that clarifies important signs for future activities. In this context, it has become clear that the presenters must have their own secrets, or rather; the mysteries of the presenters must have been learnt and are now learning as other sciences.

The above critical approaches allow students to learn the essentials of every artist who are engaged in the theater, television, radio and dubbing sectors, such as microphone skills, accent, intonation, orthoepy, and working on the artist himself.

The information provided will enhance students' knowledge and skills in performing culture and presenting skills.

In a short period of time, our independent Uzbekistan has taken bold steps towards building a democratic state and civil society. Our country is making its own way of development and is moving forward confidently. In almost every book and issue of the First President of the Republic of Uzbekistan, Islam Karimov emphasizes that spirituality is the main decisive force for the development and prosperity of the state, and that the most important task of the state and society is to strengthen the spiritual state of the people. It also emphasizes the need to deeply study and preserve the spiritual heritage of our ancestors, to remember the great images of the past.

It is no coincidence that at this time the issue of national ideology and national macro issues is raised. After all, only those with strong faith, patriotism and national spirit can make economic and spiritual changes in society. These ideas are also detailed in the book by the First President of our independent Uzbekistan "High spirituality is an invincible force".

Undoubtedly, the role of art in the development of spirituality and access to the treasures of world culture and art is indisputable. The Decree of the First President of the Republic of Uzbekistan dated March 26, 1998 "On the Development of theatrical Art of Uzbekistan" promotes the strengthening of the horizons of the performing arts, including the art of speaking and eloquence. The visual arts that have lived in Uzbekistan for centuries cannot be imagined without the presenters and the announcers. Every presenter and announcer should be able to speak beautifully and competently in writing, to have a well-rounded speech, to be aware of the secrets of public speaking, and of course to work on artistic speech. Particularly, today's rapid development of information and telecommunication poses a great challenge for the citizens of independent Uzbekistan, who have mastered the art of speaking in new ways. It is good for every presenter or speaker to become well-acquainted with the art of public speaking.

While the culture of speech and rhetoric may seem to represent almost the same at first glance, it is, of course, interconnected. In this regard, we limit ourselves to the fact that public speaking can elevate one individual's ability to an artistic level, and that the culture of speaking is the notion that society and the public are widely accepted. That is why, in the light of the aims of this article, we begin the speech, first of all, with the art of oratory, which is the most important component of our speech culture.

The art of public speaking is an area where the skills and talents of the individual are developed and mastered and shaped. This art as a science engages the mind, enriches the life of society, provides a predominant wisdom in the management of society, demonstrates the process of personality formation through its words and speech skills and promotes the development of society for the greater good. Speaking has been a unique skill that has been given to a particular person since ancient times as a separate art. In this sense, although there is a connection between the speaker and the culture of speech, each is different in its own specificity.

The culture of speech is truly a language-related phenomenon. Its origin, requirements and criteria relate to literary language and its criteria. Among the speakers are those who do not fully comply with the requirements of the literary language, and those who show true vocabulary in a specific dialect or slang. Rhetoric is determined by the effectiveness of the speech and the art of the speech.

Speaking is an oral form of speech. Public speaking is the art of speaking. Speech culture is a concept both oral and written.

Speech culture of the whole nation envisions the general speech activity of the members of the society. The ultimate goal and dream of speech culture is to culturalize the speech of all people and the entire nation. Classical eloquence refers to the speech skills of individuals. Speaking mainly involves communicating specific ideas and goals to people through speech. In other words, speaking plays a key role in bringing your audience to a specific goal.

The artist's speech is intended for a broad audience, mainly for the majority of the audience. In addition to these, the culture of speech also includes ordinary conversations and individualized

conversations. However, not everyone can become a speaker. But the speaker of the literary language must be aware of the culture of speech.

If there is a deficiency in a part of the speech organ, he may not be a speaker, even cannot speak normally. As K. S. Stanislavsky said, "In a good performer, in the actor, every vowel and consonant must be heard. Only then he can know what the word is and he can love it. If he get used to it, he won't blab much. "

The precise pronunciation of sounds involves the movement of speech organs. The lack of speech organs impedes the creation of a good work of art. To overcome this, the creator must continuously exercise his or her speech to develop specific speaking skills. Given the fact that human speech exists both in written and oral form, the art of public speaking is also closely related to artistic expression. At this point, it is appropriate to comment on artistic expression.

In literature, fiction means the art of written speech. The artistic word as an independent performing genre, with various names such as "One Actor Theater", "Single Word Performance", "Art of Fine Art", has a long and rich history in the Uzbek people's theater. Theater art considers fiction as the most necessary component. While enjoying a range of possibilities, such as theater-music, dance, ornamentation, it lays the groundwork for his speech and elegance.

Because the artistic word plays a crucial role in the realization of the immense spiritual treasures in the playwrights. Television is the only synthetic instrument that combines all the available possibilities in the field of artistic expression, such as theater, cinema, radio, solo art. Radio is a tool based on the art of speech. No network has a large audience, such as radio. Radio speakers and presenters are different from theater actors. The speaker or starter working in front of the radio microphone lacks the ability to gesture, hand-play and eye contact.

As a result, the internal and logical tasks assigned to the performer are strengthened and, of course, only the artistic vocabulary is required.

The speaker is the initiator and the broadcaster, and there are certain rules that, of course, will be useful to know them:

1. First of all public speech, if it is written on paper must be read thoroughly, if not it must be well thought out or prepared;
2. Every thought has a beginning, climax and end. Most importantly, remember how the text you are reading or the speech you are speaking will end;
3. The beginner or the dictator can read official messages, as well as texts that are unfamiliar to him. It is not possible to add additional text to the text at this time. Because even a few additions to a particular text make it difficult to speak. An inexperienced beginner may make mistakes by fear of missing something from the record;
4. It is natural to be very excited. The only way to avoid it is to think of good things before going out and distract yourself from the content of the speech, not to panic about the audience. If that doesn't help, you can stretch your hands with your shoulders wide, then jump back and make a few moves;
5. It is not recommended to drink water before or during the talk. The water becomes an unnecessary burden on the heart and chokes the sound and this prevents them from concentrating;

6. When speaking in public in concert halls, the speaker should be careful about his clothes and his dress. The clothes should not be tight, the shoes should not squeeze the feet, and the tie should not strain the neck. Loose or tight clothing may prevent you from speaking freely and holding your body. The volume should be adjusted as you speak. The talk should be soft and persuasive, but not too long;

7. It is not appropriate to turn the volume up or down on stage, TV or radio. At the same time, the direction of the voice changes, and the attitude of the listener or audience does not produce the expected result. The talk should alternate between words and silence (pause). Keeping quiet means taking time to structure the words and sentences. At the same time, you can understand the mark that your audience gives you. But it is useless to pause, in the wrong place.

We are the descendants of a great nation who preferred humanity, dignity and kindness more than any gold or wealth from ancient times. There is something more that Allah gave them. This is a blessing of word and speech. That is why our great thinkers have said that the word is superior to everything else.

It is the word that gives the dead soul;

It is the word that differs man from beast

Maybe there is nothing more honorable than it.

Said Navai showing the great power of the word, Hussein Baikarah said that he was the "Master of the word".

Hero of Uzbekistan, Abdulla Aripov, with this poem showed the value of the word.

Where Temur couldn't reach with iron ,

With a pen reached easily Alisher

It is a great art to treat sweetness. One greatest thing that is left for future generations by mankind is a nice and sweet word. It is difficult to learn a person and it is hard to find a way to his heart, even when this way is found in the human heart, it is impossible to reach the destination at any speed. The only way to achieve this is through the power of the word. Man always misses a simple and sincere word and lives up to the natural. A good word used by artists is pleasant from young children to great grandparents.

The role and importance of art in the education of future generations is very important. Training of highly educated, cultured, spiritually mature, talented and capable specialists in the art school is one of the most urgent tasks today.

The power of the word is determined by its vibrancy and effectiveness. That is why there is a great demand for the speaker, so that he can always reach his listeners, influence his mind and make a difference in his mood and outlook. This means that all young artists who are involved in the art of word art, language culture, and literary language on stage take great responsibility on them. After all, the wise words, figurative expressions and proverbs that we know and do not know, will continue to be enriched with time, enriched with content and become the spiritual property of our people.

The next task is to revitalize theater and stage art and live performance through words, to convey a deeper meaning to the listener and audience, to achieve a high performing culture that provokes emotion. The stage for the actor not only a means of expressing an idea, but it also plays an important role in the ability to express the inner world of the hero and to use words that can provoke an audience's emotions. Therefore, the role playing requires a great deal of responsibility and a subtle taste from the actor. Our great teacher actors AbrorKhidoyatov, Obid Jalilov, Shuku rBurkhonov, Olim Khodjaev, Sora Eshonturayeva, Abbas Bakirov, Razzak Hamroyev, Lutfihonim Sarymsokova, Sadihon Tabibullaev, Nabi Rahimov, Khamza Umarov paid great attention to the language, pronunciation, clear and fluent word. There is no need to emphasize that any audience even with delicate taste can be charmed by their rhythmic speech, richly polished expressive word content and its magic. That is why these artists were able to become masters of their craft.

CONCLUSIONS

In summary, teachers of stage speech are primarily responsible for language and pronunciation. But when an actor goes to the theater stage, of course, the director and leading actors are in charge. Defects and shortcomings in the genre of the work and language are solved only in discussions and debates. If this issue is left aside, other disadvantages will also come to light.

Our people are rich in talent. The word is original, and if we use it honestly and cleanly, we will achieve our goal. The development of our theaters depends, first of all, on good drama and then on the skills of directors and actors.

Our young actors need to learn about the rich life and creative legacy left by the great artists, and our teachers have to work hard to develop these rich heritage.

In short, when each director or actor takes the text of the playwright in his hands:

1. He should read the text several times without hurry and clear its idea.
2. He must understand that each word has a deep meaning and use his ability to find it.
3. The variety of styles and rich forms of speech should be carefully studied by the reader.
4. He must understand the importance of paying attention to the art of seeing and hearing while mastering the art of speaking.
5. It is also necessary to develop the ability to turn the power of the word into a weapon of influence.
6. The director and actor should master the art of listening and imagining.
7. The talk should be based on a very simple and compelling live speech.
8. He must realize that it is important to master the technique of speech, which includes elements of voice, diction, pause, accent, tone, intonation.
9. It is necessary to learn to work on the word, to use the rich tone of the Uzbek language.
10. It is important to emphasize that the main purpose of the speech is to convey the idea of the work.
11. The actor should not only express the playwright's opinion, but also understand that the word must help the actor in conveying the inner world of the protagonist, and that simple word must be magic in the act of the actor.
12. Whether every word on the stage has magic, it must not be dry and lifeless.

13. The tone of the speech shows how the actor has mastered the text through his emotions. This means that discovering a natural tone to the word must deeply realize that the scene does not accept the spirit of the book.

14. It is useless to try to solve these problems without thoroughly mastering the literary language that is the basis of the talk.

15. Our people are rich in talent. The word is original, and if we use it honestly and cleanly, it is ours. The development of our theaters depends, first of all, on good drama and then on the skills of directors and actors. Our young actors need to learn about the rich life and creative legacy left by the great artists, and our teachers have to work hard to develop these rich heritage.

ABSTRACT

Modern teaching of foreign languages requires new methods and approaches that can make the process of studying faster and better. Studying foreign languages has always been interrelated with mental activities such as thinking. This article discusses the relationship between language and thinking, the impact of this relationship on language learning and teaching, the importance of learning a language, and the role of thinking in a foreign language while studying it.

KEYWORDS: *Language; Thinking; Psycholinguistics; Teaching; Studying; Relationship; Cognitive Approach.*

INTRODUCTION

It has long been known that thinking and language are interrelated as human thought is formalized by language. Language is a system of signs that are used mainly to send and receive certain information. Without language, thoughts appear as obscure motives, gestures and facial expressions that do not fully reveal the emotions and intentions of a person. A voiced thought is speech which is the most typical way of expressing the language.

Main part

The relationship between language and thinking

Since ancient times, scientists have paid attention to the close connection between language and thinking. Currently, the presence of a connection between language and thinking, their relationship, and interaction are recognized in a variety of linguistic and philosophical directions.

It should be noticed that different views on the relationship between language and thinking were largely due to the degree of scientific development of the era in which the concept was created as well as those general provisions that followed the scientific direction. As a matter of fact, any change in the scientific paradigm entails a revision of the image of the world and the elements associated with it. Thus, the relationship between language and thinking had to fit into the framework of the concept that was defended by a certain trend in a certain period of time.

K. Marx and F. Engels emphasized the unity of language and thinking. They declare that "language, like consciousness, only arises from the need, the necessity, of intercourse with other men". Engels pointed out that the cause of appearance of both language and thinking is labor. Thus, language and thinking developed on the basis of labor, they arose and developed simultaneously. Language serves for communication and expresses, materializes thinking. A number of other researchers consider the relationship between language and thought based on the idea of the multiplicity of forms of thinking and the different character of these forms of communication with the language of man. It is considered that there is abstract thinking, which means thinking with abstract concepts, and concrete (in other terms - practical, figurative), which is thinking with concrete images, directly included in the practical activity of a person. B. A. Serebrennikov, in addition to abstract thinking, also identified visual, figurative, practical, exploratory, reduced and other types of thinking. It is clear that there are a lot of questions about the process of thinking, but the question of the relationship between thinking and language concerns mainly abstract thinking, the other types of thinking are not connected with language [1].

The reason for the close connection between thinking and language is explained in different ways. One of the points of view widespread in the West belongs to the American scientists E. Sapir and B. Whorf. According to the authors, a person's picture of the world is determined by the nature of his language. A person mastering a language implicitly separates the fragments that are indicated in the language in the form of separate statements from a single stream of information about the world. There is a categorization of knowledge about the world. They say: "We dissect nature in the direction suggested by our first language. We distinguish certain categories and types in the world of phenomena not because they (these categories and types) are self-evident, but since the world appears before us as a kaleidoscopic stream of impressions which must be organized by our consciousness, which means by the language system stored in

our consciousness. <...>. Thus, we are faced with a new principle of relativity which says that similar physical phenomena make it possible to create a similar picture of the universe only if there are similarities or at least the relativity of language systems"[2].

This concept called linguistic relativity suggest that human thinking is completely dependent on language. It turns out that people who use different languages have different ideas about the world. The concept of linguistic relativity has two versions. According to the first, language determines thinking, and linguistic categories limit and define cognitive categories. According to the second, thinking along with linguistic categories is formed by the influence of traditions and certain types of non-linguistic behavior. In our opinion, the second version is more preferable, since human socialization is carried out not only with the help of language[2].

Language and thinking differ in their functions, as they have different purposes in people's lives. While the main purpose of the language is to transmit and receive information, thinking serves to obtain new knowledge, improve it and develop it. According to V. I. Kodukhov's definition, "the purpose of thinking is to obtain new knowledge, to systematize it, whereas language only serves the cognitive activity helping to shape thoughts and perpetuate knowledge, pass them on"[3].

Language and its importance

Language is the most important means of communication. The current changes in social relations, communication means (the use of new information technologies) require increasing the communicative competence of students, improving their philological preparation. In order they could exchange their thoughts in different situations in the process of interaction with other communicators, using the system of language and speech norms and choosing communicative behavior adequate to the authentic situation of communication. In other words, the main purpose of a foreign language is to form a communicative competence, that is, the ability to carry out interpersonal and intercultural communication between a foreigner to one and native speakers. Educational aspect is an integral part of the educational process. Modern educational technologies that are used to form the communicative competence of a schoolchild in learning another language are the most productive for creating an educational environment that provides a person-oriented interaction of all participants in the educational process. It is obvious that using any one technology of education, no matter how perfect it is, will not create the most effective conditions for the disclosure and development of students' abilities and creativeness of a teacher. Modern technologies of teaching foreign languages accumulate successful information of each of them, enable the teacher to adjust any technology in accordance with the structure, functions, content, goals and objectives of training in the particular group of students [4].

Life in modern society requires from students such important cognitive skills as the ability to develop their own opinion, to comprehend the experience, to build a chain of evidence, to express themselves clearly and confidently. The technology of developing students' critical thinking involves asking students questions and understanding the problem that needs to be addressed. Critical thinking has an individual character, each generates its own ideas, formulates its assessments and beliefs independently, finds its own solution to the problem and supports it with reasonable, valid and convincing arguments. Critical thinking has a social character, since every thought is tested when it is shared with others. The pupil's own active life position is especially evident when comparing previous knowledge and concepts with newly obtained ones.

There are various forms of work that involve the development of students' critical thinking: essays, essay-reasoning, discussion, dialogue, role play, etc.[4]

Times have changed. The Internet has brought about premature death of time and space. The rat race for grabbing the best and to reach the top has made the man slaves of materialism which is considered to be a big issue and this trend, gave them the crave for having the highest status in the society for which one has to possess special capabilities like knowing intercontinentally-accepted languages such as English, Russian, Chinese, Arabic and etc. and IT literacy. Studying English may seem a tremendously time-consuming, arduous task for most people at first sight. However, if the methods that the teacher uses are eminently suitable, this process will take a turn for the immensely interesting for them. Traditional way of doing things, age-old methods, have partly been swept by the current wave of changes in any sphere of the life beginning from the education. The role of the teacher and students in the classroom have changed. It has been observed by the specialists that good students are mostly self-motivated, punctual and autonomous which are the key factors for their success and effectiveness. They are not over dependent on their teacher`s guidance. However, in this point, a common question arises automatically. How can a student progress in the educational field and what are the hidden requirements? Predominantly, as it was stated above, the vital characteristics of a good student is his/her own punctuality which means making plans, schedule considering all necessary points and without any interruptions to follow it. What does actually educational planning mean and how can it be critical for learning foreign languages. In studying any foreign language starting from English, six main skills such as listening, reading, writing, speaking, vocabulary and grammar should be maintained equally while memory and the interest of a student for learning the language are considered to hold a vital position in shaping these skills "Effective learning of a foreign language depends to a great extent on the pupils` memory" [5]. According to researches, the students learning a second language with a strict schedule succeeded tremendously and they informed of their good memory. Initially one has to define the meaning of planning and educational planning in order to excel in the learning process. "Planning is the process of thinking about and organizing the activities required to achieve a desired goal. It involves the creation and maintenance of a plan, such as psychological aspects that require conceptual skills" [6].

The influence of the thinking process on learning and teaching a language

The question of when there are and when there are not language-specific effects has been approached in many different ways, theoretically, methodologically and empirically. This variability in approach is partly the reason why the answers to the questions of whether language influences thought have varied substantially. Another reason why research into language and thought has often produced conflicting results is the fact that language is not a uniform, static phenomenon, but rather a multifaceted, bio-social construct, a system that is complex and adaptive[7].

A significant number of studies have documented that thinking-for-speaking is indeed language-specific, and numerous factors have been put forward in order to specify the exact occasions when its effects are observed, and when they do not appear. Language effects are more likely to appear when experimental stimuli are complex, because the integration of complex information presented in the stimuli may be more susceptible to language-specific lexicalization resources

that would be activated as an aid to memory. Language-specific effects on recognition memory for complex motion events in both monolingual and bilingual speakers[8].

Since language is closely related to thinking, practical experience of the language is impossible without the ability to think in it. therefore, thinking in a foreign language is considered as the main ability which is always brought up or developed in students in the process of learning a foreign language.

Many language educators would maintain that the best way for learners to achieve native-like control of a studied language is to make an effort to think in that language rather to translate or reprocess the material into their first language. Thinking activity can be directly included in the "traditional" types of educational activities of students. For example, in memorizing the vocabulary of a foreign language, in memorizing and reproducing a foreign language text, the process of thinking plays an important role. It is possible to build an appropriate technique in the way that will help to activate, stimulate the thinking of students.

All students need a wide range of linguistic tools to effectively think and communicate in different disciplines. Describing abstract concepts requires complex words and grammatical structures. Many teachers assume students have more skill using language to describe thinking than they actually possess and focus more on teaching content than on fostering language.

RESULTS AND DISCUSSIONS

Here are some cognitive and related to thinking activities which can be effectively used in classes:

1. Using different types of visualizations to improve students' understanding and recalling skills.

Visualization activities are essential while dealing with cognitive teaching strategies. Students transform target information by creating meaningful visual, auditory, or kinesthetic images of the information. For example, they may act out a scene from a reading passage, prepare poster presentations on a certain topic or while analyzing a business report, make mind maps, create association, use mnemonics, underline key words, use color-coding while learning new vocabulary and so on[9].

2. Asking students to reflect on their experience while covering any grammar topic or vocabulary set.

This approach will make the students think in the foreign language learnt before starting to speak. The teacher prepares a set of personal questions that generally deal with the covered topic but are connected with the learners' own experience. For example, if the students have read a text about traveling, the teacher may prepare peer or group discussion questions, like "What was your best/worst traveling experience? What is your dream destination to travel to? Have you ever helped a foreigner in your country? How? What should a traveler know before visiting a certain country?"[9].

3. Assign students problem-solving activities.

This helps them explore and understand how ideas are connected. Part of problem-solving has to do with applying specific skills and knowledge to produce the proper result. Students should be

pushed to rely on what they've learned and figure out ways to succeed through thinking activities [9].

It is essential for teachers to monitor students by observing/conducting surveys/talking to them to reach their needs in a variety of ways and consequently to achieve effective teaching. Students' involvement in the process of the establishing whole-class and individual goals makes these goals more attractive. It is important to give students the opportunity to express their ideas, feelings and experiences by personalizing the tasks. Though they may lack confidence or enough language knowledge, students have an area of strong interest that can be made the focus of their program. Making interest-based learning choice obviously promotes the comfort and confidence of the students and enables a learner to explore some area in depth and in ways that uniquely interest him/her. Actually, such a comprehensive discovery-oriented project can be a useful option when any student wants to learn a great deal more about a topic. Knowing students' personalities helps the teacher to prepare and adapt materials based on a meaningful context for all learners in order to make them relevant to students as individuals, which adds variety to the classroom environment and establishes a positive atmosphere[10].

While researchers in the field of language learning have begun to investigate the strategies that learners use to succeed at language learning, the issue of the language of thought has not received much attention in the language learning strategy literature. There is an intuitively-based assumption that it is beneficial for foreign language learners to think as much as possible through the language that they are learning [11].

The value of the thinking process for learning and practicing a language is great. Everyone thinks using the most comfortable language. Basically, this language is the first language of a person. If learners try to think in the language they are learning, this can make practice and mastering the language much easier and more effective. Each image, each word gradually begins to be associated with a suitable foreign word, and this will affect both the memorization of words and the smoothness of speech.

This phenomenon was studied by Aneta Pavlenko, Doctor of Philology, professor of the Department of Applied Linguistics at Temple University, Philadelphia. Aneta conducted a series of studies and wrote about "multilingualism". Her book on this topic is called «The Bilingual Mind and What It Tells Us about Language and Thought» [12].

 Language serves as a kind of bridge, which connects the learner with the culture, worldview and lifestyle of another nation. An important role in the assimilation of the language and its features is played by immersion in an atmosphere where the language, which is studied, dominates. This is one of the basic requirements for modern methods of teaching a foreign language both in schools and in higher educational institutions. In fact, not every student feels a complete immersion, which affects the effectiveness of classes. Difficulties often arise at the initial stage of learning a language and this causes the language barrier. It can be difficult for learners to switch to a new language (system), which may have rules and sounds that do not match their first language. An important role in solving this problem is played by the process of thinking in the language being studied. A person does not think about possible errors, since there is no audience that would notice them. Thorough introspection is also involved in this process: a person begins to analyze his sentences and tries to correct defects. According to Irina Gross, a clinical psychologist and specialist in the field of transactional analysis and gestalt therapy, the language

barrier has two main reasons: linguistic when there is not enough practice, and psychological. She notes that "when we abandon our language and speak another, we really lose support, part of our identity, confidence and stability therefore webecome a small vulnerable child again"[13]. To overcome this barrier and develop confidence in language skills, it is necessary to think in the language being studied, since this method helps not only in the development of language skills, but also helps to evaluate one's own abilities and correct the mistakes that may appear.

CONCLUSION

The facts given prove that for effective teaching and learning of a language, especially a foreign one, it is necessary to pay due attention to the process of thinking. It is clear that the process of learning a foreign language is connected with the process of thinking. With a thorough analysis of the factors listed above, it can be concluded that for effective assimilation of the material it is necessary to teach not only grammar rules, pronunciation, and spelling, but also thinking in the language studied.

ABSTRACT

This article is devoted to the linguo-didactic aspect of the teaching method of Arabic pronunciation in the Uzbek audience. In the conditions of Arabic-Uzbek bilingualism, the source of phonetic interference is the allomorphism of the phonological systems of the Arabic and Uzbek languages. According to the results of a comparative analysis, it can be argued that a specific feature of allomorphism is the difference in the inventory of phonemes and allophones. The results of the comparative typological analysis of the Arabic and Uzbek languages showed that the consonants have several positional shades, depending on the location in the word. The scientific and practical significance of the research results lies in the scientific substantiation of an effective methodology for overcoming phonetic interference when teaching the Arabic language in the Uzbek audience, as well as in establishing the pronunciation dominants of the articulation bases of the Arabic and Uzbek languages. The results of the research can be used in textbooks, teaching and methodological aids, in practical classes, as well as in classes in theoretical and experimental phonetics. This study contributes to a positive solution to problems in teaching Arabic pronunciation, as well as in improving the educational process of a linguistic university.

INTRODUCTION

At the current stage of development of the Republic of Uzbekistan, teaching foreign languages is one of the priority areas of personnel policy provided for by the National Program for Personnel Training. During this period, there is an urgent need to develop modern methods of teaching foreign languages for the Uzbek audience. At present, a new historical stage has begun in the teaching of the Arabic language in Uzbekistan. This is due to the intensification of the entry of independent Uzbekistan into the world community and the establishment of international relations with foreign countries. In this regard, the need for training in the translation aspect has also increased. The relevance of training highly qualified personnel predetermined the need to develop modern methods of teaching foreign languages, including Arabic, linguistic and linguodidactic foundations of teaching Arabic pronunciation. There is an urgent need for a new generation of textbooks and teaching aids in the Arabic language. Unfortunately, in the previously created textbooks on the Arabic language, there are not enough exercises for practicing Arabic sounds to overcome phonetic interference. To learn the correct pronunciation, it is necessary to take into account the peculiarities of the native language. A comparative analysis of two phonological systems and the identification of pronunciation errors is a means of optimizing and organizing the educational process. The result of this is the development of a linguistic model of emphasis in the speech practice of students studying the Arabic language. In this regard, the relevance of research on the development of overcoming methods is predetermined by the following factors:

- Lack of theoretical and practical works on the research problem in the Uzbek language;

- The undeveloped problem of teaching the pronunciation rules of Arabic consonants in a linguistic university with an Uzbek language of instruction;

- Lack of phonetic material and a set of exercises to overcome phonetic interference when teaching Arabic in an Uzbek audience.

The technique of overcoming phonetic interference when teaching Arabic in the Uzbek audience has not previously been the object of scientific research. Despite the presence of the phonetic part in the textbooks of the Arabic language, special exercises have not previously been developed to overcome phonetic interference when teaching the Arabic language to the Uzbek audience. Therefore, in this study, for the first time, a set of exercises is proposed to help overcome phonetic interference when teaching Arabic to an Uzbek audience.

THE MAIN RESULTS AND FINDINGS

The modern period of development of independent Uzbekistan dictates the need to develop a methodology for teaching the Arabic language in the Uzbek audience. At the first stage of teaching the Arabic language, in order to choose methodological solutions and optimize the content of the process itself, a scientific substantiation of the basic methodological techniques and theories is required, aimed at taking into account the specific features of the Arabic language and its native, Uzbek, language. To achieve this goal, it is important to consider these issues in a complex and interrelation with other sciences. Since the teaching methodology is closely interconnected with pedagogy, linguistics and psychology, when developing certain principles, one should take into account the achievements of these sciences, as well as such a determining factor that teaching should not be universal and abstract, but specialized and concretized, based

on linguo-didactic and psychological the basics of teaching foreign languages. Meanwhile, to create a methodology for teaching the Arabic language, of course, it is necessary to study the features of the Arabic and Uzbek languages, which is of particular importance for the process of teaching Arabic in higher educational institutions, in particular, in the Uzbek audience.

As R.K. Potapova points out, "at the turn of the century, phonetics and phonology are gaining a"second wind", drawing strength from the source of ideas for new theoretical and applied problems, new speech and information technologies, new needs in the study of eternally lively and attractive sounding speech" [1, P. 151]. The method of teaching foreign languages is closely related to other sciences, which mutually enrich and complement each other. The principle of scientific character is especially important in teaching methods. Only relying on the latest achievements is it necessary to plan and differentiate the learning process [2, p. 37].

When organizing the educational process, the achievements of modern sciences should be applied in each lesson. At the same time, the teacher must possess modern knowledge and skills, especially in the field of psychology, psycholinguistics and pedagogy. Moreover, classes should be organized according to the principle of consistency, since only a scientifically grounded, methodically thought-out and detailed teaching process can give positive results. Usually, classes in teaching foreign languages are recommended to be planned and carried out according to the following principles: from general to particular, from simple to complex and from easy to difficult, etc.

In the course of our research, we found that vocalists had similar pronunciation and voice training techniques in terms of effectiveness. According to researchers on the question of voice leading, many singers owe their success to the voice in no small measure. People's judgments about the voice of a politician during the first few seconds, as well as about his appearance, are analogical. Despite the memorable appearance of some famous people, when we represent them in memory, we first of all remember the voice. Voice is as important as appearance, mannerisms, and the content of the speech. This is the most important tool by which the message gets to the audience. Because of this, mutual understanding between the audience and the teacher directly depends on the voice and speech data of the latter. The voice can attract listeners, convince them of something, and win their trust. As voice educators warn, it should always be remembered that listeners expect and deserve to hear a pleasant voice.

Along with the problems of vocalization, the problem of teaching correct pronunciation should be identified, i.e. overcoming phonetic interference when teaching a foreign language, since the methodology for obtaining the final results is the same. The use of the achievements of voice-leading in teaching foreign sounds, in our opinion, will allow achieving positive results. This is evidenced by the results of our experiments in the course of this study. A very important principle in organizing classes is the formation of consciousness among students, since only a conscious approach to teaching languages will give the desired results and speed up the learning process. Therefore, it is advisable at the initial stage of training to determine the goals and objectives of teaching a foreign language. Different teaching methods are used depending on the goal. One of the important principles in the methodology is accessibility, which allows, taking into account the capabilities of students, to distribute topics by lessons, to determine the number of hours of training, taking into account the psychological and age potential of students.

However, in this case, the selected material should not be too light or, on the contrary, heavy. The student in both cases - from lack or abundance of information - will not have good results, "excessively with theorized or complicated learning, interest in the subject decreases. At the same time, the accessibility of learning should not be understood as some kind of facilitated process; learning should be carried out in compliance with the measure of this difficulty, otherwise the student will not develop cognitive activity, will not develop character traits necessary to overcome obstacles" [3, p. 40].

The principle of connection between theory and practice can mean the relationship between language theory and language practice. In this aspect, both the selection of materials for classes and the learning process itself are important here.

Language communication, being the main result of teaching a foreign language, "cannot be", says M. Dzhusupov, "a panacea without a method of teaching a foreign language. Communicative teaching gives lasting positive results when other teaching methods and techniques are used to improve, for example, when teaching Russian correct pronunciation [c, h, v´, v, f´, f, f ...], as well as other soft consonant phonemes of the language and their combinations can be taught only by using the complex methods and techniques of a comparative, training, imitative, visual character, which ultimately contribute to the formation of correct communication skills and abilities" [4, p. 78].

Reflecting on the linguo-typological, sociolinguistic and linguo-didactic problems of teaching a non-native language, M.T. Jusupov notes that "communicative teaching of a non-native language is the main direction of linguo-didactics and methodology. However, such teaching should be based on a solid theoretical basis. In this regard, it is necessary to abandon the more and more spreading teaching method ... when speech perception and speech production are trying to form without sufficient reliance on the linguistic aspect" [4, p. 79].

At the present stage of development of Uzbekistan, teaching foreign languages in higher educational institutions has risen to a qualitatively new level and the development of methods for teaching a non-native language acquires a new understanding, both in terms of the content of education and its forms. Teaching the correct literary pronunciation, as well as overcoming phonetic interference, becomes relevant when teaching the Arabic language in the Uzbek audience.

CONCLUSION

At the present stage of development of Uzbekistan, teaching foreign languages in higher educational institutions has risen to a qualitatively new level and the development of methods for teaching a non-native language acquires a new understanding, both in terms of the content of education and its forms. Teaching the correct literary pronunciation, as well as overcoming phonetic interference, becomes relevant when teaching the Arabic language in the Uzbek audience.

The methodological concept of teaching pronunciation based on the psychological theory of the stage-by-stage formation of mental actions and concepts, in our opinion, solves this problem. The essence of this methodological concept is that the theory should provide a generalized and maximally complete orientation in the phonetic material, followed by the organization of phased

assimilation according to a strictly fixed plan of action, which has four stages of action formation:

1) The formation of an action in a material or materialized form;

2) Formation of action in loud speech without direct reliance on diagrams, tables, records;

3) The formation of action in external speech to oneself;

4) The formation of action in internal speech.

Thus, the main emphasis is on the step-by-step activity of students, guided by the teacher, which excludes the appearance of errors and deviations.

The abundance of gross phonetic and phonological errors does not stimulate interest in communication not only from the listener, but also from the speaker himself, who experiences communication discomfort due to the lack of pronunciation skills. A stable, sufficiently intelligible pronunciation that does not hinder verbal communication is provided by automated, stable auditory-pronunciation skills, which guarantee the correct sound, accent-rhythmic and intonation design of the utterance.

The development of correct pronunciation depends on knowledge and practical assimilation of the most important pronunciation patterns in the target language, especially those that are absent in the native sound system, i.e. of the Uzbek language and are sources of interference.

Mastering the phonetic side of speech is not an end in itself, it obeys the needs and tasks of verbal communication and develops in close connection with teaching listening, speaking, reading and writing, while simultaneously developing lexical and grammatical skills.

The current stage of development of the Republic of Uzbekistan predetermined the transformation of previously formed methodological approaches and directions, as well as the need to develop a special methodology for teaching Arabic pronunciation to Uzbek students. In recent years, with the growing interest in the study of the Arabic language, methodologists have been tasked with improving the quality of teaching Arabic as a foreign language in the Uzbek audience. Professor of the University of Michigan (USA) J. Morley notes in his research on the method of teaching sounds that recently a new trend has emerged in teaching. Instead of the articulatory-phonetic method, which was previously the only one, now the communicative-cognitive approach increasingly prevails. In his opinion, there are 8 training approaches:

1) Communicative-Cognitive-Affective Approach to Speech;

2) A Major Focus on Stress, Rhythm and Intonation;

3) An Expanded Domain for "Pronunciation";

4) InteractivePracticeActivitiesDesignedforSpecificSettingsandSituations;

5) a promising replacement for the role of learners and teachers. In this case, the teacher is a voice trainer, ensuring freedom of speech (Changing Perspectives on the Roles of Learner and Teacher);

6) Selectivity, individual work on the course of each student. The teacher focuses on the student's personality. This means the need for an individual approach, a departure from the principle of "one size fits all": (Selectivity, customized courses work and the uniqueness of each learner);

7) Increased attention to mutual listening. The teacher attaches great importance to the connection between listening skills and speech technique (Increased Attention to the Reciprocal Listing – Speaking Connecting);

8) Exclusive attention to sound-letter relationships. The teacher gives spelling references for orientation (Explicit Attention to Sound-Spelling Relationships); [5, C. 66-67].

After choosing a teaching methodology, the question of determining the "norm" of pronunciation of the target language is important. As V.S.Segal notes, modern literary pronunciation is a product of the interference of the sound structures of the classical Arabic language and the dialect of a particular country (group of countries), arising on the basis of the so-called bilingualism of Arabs. The first of these structures is enshrined in the classical orthopedic tradition, supported by conservative school practice and most fully implemented in the pronunciation of qualified Koran recites; the second - in the pronunciation and communication skills of the Arabs, reflecting the corresponding features of the sound structure of the unwritten spoken language (dialect) of each Arab country. However, literary pronunciation is not the only intermediate link between classical orthoepy and dialectal pronunciation: in fact, there is a very extensive scale of interacting pronunciation styles that are realized in various speech situations [6, p.91].

It should be noted that Russian scientists are conducting experimental phonetic research in this direction in all languages. According to the results of the experiments, P.A. Skrelin notes that "since any solution to phonological problems must be based on reliable facts about speech realizations of the language system, the problem of normative, that is, "correct" speech, is in the focus of the phoneticist. Reliable data on the state of the pronunciation norm at any given moment can be obtained only as a result of a systematic and thorough examination of the speech of those native speakers who can be considered representatives of the normative pronunciation. To determine the norms of pronunciation in almost all languages is determined by the phenomenon that some researchers delicately call the "democratization" of the norm. In fact, this affects the fact that the concept normative speech is blurred: what was previously considered unacceptable becomes accepted - this applies not only to vocabulary, grammar, but also pronunciation, which is characterized by vernacular and dialectal features that were previously not allowed in the norm [7, p.5].

In teaching Arabic pronunciation in the Uzbek audience, the question must be posed comprehensively. Since the tasks of teaching pronunciation and writing are realized at the initial stage, in our opinion, it is advisable to combine teaching the pronunciation of sounds and Arabic writing using the method of developing associative thinking. In recent years, this approach has increasingly become the subject of scientific research on the methodology of teaching foreign languages.

The essence of the associative model is to find a clue, a bridge between the studied rule and life experience. At the first stage, the association is included in the emotional-figurative context of a fairy tale, history, and poem. The visual metaphor stimulates emotional memory ..., activates attention to the object of memorization, and provides a selective focus of his attention. The organic connection of the verbal image with the graphic creates a solid basis for non-violent, active and long-term memorization, since the student can choose between mechanical and associative memorization [8, P.35]. Based on the use of the essence of this technique, it is

possible to organically combine the "verbal image" of the Arabic sound with the graphic image of the letters of the Arabic alphabet. In our opinion, such a visual metaphor will contribute to the development of phonemic hearing and spelling skills among Uzbek students. Due to the presence in the Uzbek language of a huge number of borrowed words from Arabic, there is interference among students with the Uzbek language of instruction. For example, the word / sala: m / is written through the letter / syn /, the word /s.odir / is written through the letter /s.ad/, the word /s.urat/ is written through the letter / s.ad / and pronounced accordingly. At the initial stage, when pronouncing and in the process of spelling such borrowed words, an Uzbek student experiences significant difficulties, due to the fact that these words are very common in the Uzbek language, which is why the "Uzbek" pronunciation is noted. Therefore, a combination of teaching pronunciation and spelling is extremely important.

In modern methodological literature, a worthy place is occupied by the so-called bio-adequate methodology, which is based on a specific image and figurative thinking in teaching a foreign language. The use of bio-adequate methodology sets students on the path of natural thinking in images [8, P.36].

Thus, there is an intensification of students' creative thinking when familiarizing themselves with foreign-language sounds and the process of their adaptation to foreign-language speech and the acquisition of skills and pronunciation skills is greatly simplified. At the initial stage of teaching the Arabic language, the method of applying the system of mental images is used in the form of a comprehensive teaching of pronunciation and writing. This approach significantly reduces the process of learning to write, and the graphic image, on the contrary, suggests the correct pronunciation of the sound. A student studying a complex, unusual for him Arabic script, at the same time will be able to memorize Arabic sounds, and during classes he should remember that the sounds should occur at the beginning, middle and end of words. In connection with the need to instill in students the spelling skills of all types of Arabic letters and all variants of combinations of Arabic sounds, such an integrated approach to teaching in the practice of teaching Arabic will give positive results. Meanwhile, in this case, it is advisable to exclude the use of transcription and we recommend using it exclusively for theoretical purposes. In practical lessons, one should resort to it when performing some special exercises and to control students' knowledge.

The teaching of Arabic as a foreign language has a long history. This problem can be viewed in two ways:

1) Teaching Arabic as a foreign language abroad;

2) Teaching Arabic as a foreign language in Uzbekistan.

With regard to modern approaches to this issue, there are several linguistic schools in all Arab countries and in other countries of the world. It should be noted that in different countries of the Arab East, due to their socio-political position, teaching is carried out at different levels and in different directions.

ABSTRACT

This article discusses the peculiarities of the formation of words of different word groups in modern Chinese on the basis of the verb-object model of word formation. All verb-object structures are divided into three groups by Chinese linguists: 词 ci - words, 离合词 liheci - divisible words (words that can be separated and combined), 词组 cizu- word combinations. It also analyzes the views of various linguists on the verb-object term and draws appropriate conclusions on the subject.

KEYWORDS: *Morpheme, Hieroglyph, Syllable, Semantics, Verb-Object Model, Predicative-Object Model, Word Addition, Word Combination.*

INTRODUCTION

This model is defined by 4 terms: 动宾式 dongbinshi - verb-object model, 谓宾式 weibinshi- predicative-object model, 述宾式 shubinshi- predicative-object model, 支配式 zhipeishi- control model. 动宾式 dongbinshi - Linguists who use the term verb-object model include Lu Zhivei [1, p. 160], Zhang Jin [2, p. 199], Ding Shenshu [3, p. 228], GaoWenda [4, p. 175], and others. Models 谓宾 weibin or 述宾 shubin are called predicative-object by Jen Xuelyan [5, p. 290], Zhu Desi. Most Chinese linguists call it the 支配式 zhipeishi model of management, which includes Zhang Zhigun [6, p. 523], GaoMinkai [7, p. 248], Li Jingxi [8, p. 595], Zhang Shoukan

[9, p. 96], Hu Yushu [10, p. 568]. The mechanism for adding words according to this model is that the first verb base enters into a verb-object relationship with the second equine base, in other words, the verb base "controls" the equine base. However, since some Chinese linguists claim that the first basis of words based on this model may be quality, they call it predicative-object.

THE MAIN FINDINGS AND RESULTS

According to the verb-object model, words belonging to different word groups are made. In particular, words related to the category of horses are among them. For example: 进口 jinkou – to import → import (import + food, feed), 出口 chukou - export → (export + food, feed), 提议 tiyi - offer → offer (promote + idea, offer), 建议 jianyi - offer → offer (advise + suggestion, opinion), 评价 pingjia - evaluate, judge → evaluation, court (evaluate, determine + evaluation, value), 注意 zhuyi - pay attention → attention (summarize, summarize + opinion). Some verbs constructed according to a verb-object model may belong to adjectives or forms. For example: 成功 chenggong - to rejoice → happy, 开心 kaixin - to manage, to succeed → successful.

Chinese and some Russian linguists, in particular N. Korotkov [11, p. 126], admit that horses can be made according to the model under consideration. For example: 司令 siling - commander (steer, lead + command), 司仪 siyi - ceremonial master (steer, lead + rules of etiquette, etiquette), 司机 siji - driver (steer + car), 主席 zhuxi - chairman (charge, steer + banquet, lunch) , banquet), 管家 guanjia - boss, economy (to manage, lead + family), 掌柜 zhanggui - boss, shop owner (to own, hold + box, closet), 将军 jiangjun - general (to command + troops), 枕头 zhentou - pillow (to lay down) + head), 顶针 dingzhen- thimble (push forward + needle), 提纲 tigang - theses, abstracts (advance + program), 结晶 jiejing- crystallization, crystal (solid + crystal), 知县 zhixian - county head (steer + county).

Zhang Shoukan, Jen Xuelyan, and some other Chinese linguists show that adjectives are constructed according to a verb-objective model. For example: 出色 chuse - great, wonderful (to show, to make noticeable + color, tone), 得意 deyi - satisfied, self-satisfied (to receive, achieve + intention, desire), 醒目 xingmu - open, bright, clear, conspicuous (to increase the eye), 差劲 chajin - will is empty (lack + morality, morality), 夺目 duomu- dazzling (take away, occupy + eye), 有益 youyi - useful (to have + benefit), 有趣 youqu- interesting, wonderful (to have + interest).

Jen Xuelyan gives examples of forms and conjunctions based on a verb-object model: 到底 daodi- finally (achieve + low), 尽量 jinliang- as much as possible (lose, spend + power), 因此 yinci- because (to rely, to supported by + this, that) [12, p. 152].

The question of whether derivatives with verb-object relations between their parts are words or phrases is of interest to Chinese language researchers.

This problem has been considered in the works of Russian linguists E. Polivanov, I. Oshanin, B. Isaenko, N. Solntseva, V. Solntsev, N. Korotkov, Yu. Mamatyuk and others.

Possible solutions to this problem are given in the works of Lu Zhivei, Liu Shuxian, Zhong Qing, Zhao Tszimin, Li Qinghua, Shi Tsunchji, Zhang Shoukan, and some others.

All verb-object structures Chinese linguists divide into three groups: 1) 词 ci– words; 2) 离合词 liheci- words that can be divided (exactly words that can be separated and combined); 3) 词组 cizu– phrase. Recently, we see such a separation in many Chinese authors. Here are three examples:

I. Words: 得法 defa- skillful, 发炎 fayan - to be angry, 归罪 guizui- to think responsible, to blame, 回味 huiwei- taste, 拿手 nashou- knowledgeable, master, 失身 shishen- carelessness, 做人 zuoren- attitude to people, behavior, 出身 chushen- origin.

Zhang Shoukan believes that in the following four cases, words made according to a verb-object model can be easily distinguished from other types of verb-object structure.

1. If a horse is formed by the combination of verb and equine bases according to the verb-object model, then the structure should be considered as a word. For example: 戒指 jiezhi- ring, 结合 jiehe- tuberculosis, 失眠 shimian- insomnia, 解毒 jiedu - detoxification. This criterion was met by Lu Chjivey and B.S. It was also used in the works of Isaenko.

2. If a verb-object structure can take an object after itself, that is, if a transitive verb is made according to the verb-object model, it is considered a word. For example: 起草 qicao- drafting, 列席 liexi- participation with the right to vote, 进口 jinkou- introduction, 留神 liushen - self-care, 动员 dongyuan- mobilization, etc.

This feature is evident in the comparison of phrases: a) 列席这次会议 liexi zhe ci huiy- Participate in this conference with the right of an advisory vote; b) 起草讲演稿 qicao jiangyangao- Compose the text of the report; c) 进口成套设备 jinkou chengtao shebei - Import of equipment; g) 留神扒手 liushen pashou - Beware of pocket caesareans. The criterion under consideration is also taken into account by other linguists in distinguishing complex words and phrases.

3. If a compound word contains Venyanism, which has lost its independent function as a word in modern Chinese, then the structure it contains can be called a word. For example: 失色 shise- to turn white, the color of the face fades, 洗尘 xichen- to give a banquet in honor of the visitor.

4. According to Zhang Shoukan, words can include verb-object structures if they do not have a second base horse. For example: 吃紧 chijin - term, strict (there is urgency, urgency), 护短 huduan - to justify mistakes, to hide shortcomings (take sides + short), 取笑 quxiao- to laugh over (take + laugh).

II. 离合词 liheci - distinguishable words.

Among the verb-object structures of modern Chinese, a group of complex structures is distinguished, and Chinese linguists include them in 离合词 liheci, i.e., distinguishable words. For example: 吃苦 chiku - to suffer, 得力 deli- to help, **动身** dongshen - to send, **发言** fayan - to speak, 提议 tiyi - to propose, make an offer, 洗澡 xizao - to bathe, wash, 挂号 guahao - to register, to register, 投票 toupiao- to vote, to nominate a candidate, 做梦 zuomeng - to dream, 担心 danxin - to worry, , **发火** fahuo - to fire.

Zhang Shoukan and Zhang Yuanjen include 洗澡 xizao – to have a shower, to have a bath, 跳舞 tiaowu - dancing, 招手 zhaoshou - shaking hands, and other similar verb-object structures 离合词 liheci, i.e., words and phrases. Such structures have a number of properties of the verb. For example, in a sentence, they can often act as part of a sentence. For example: 我洗澡了 wo xizaole - I washed. These are the 洗澡 xizao verbs in the sentence (洗 xi are predicate, and 澡 zao are not objects). It can also have 洗澡 xizao verb repetitive forms: 洗洗澡 xixizao, 洗一洗澡 xiyixizao. However, these structures also have phrase properties. For example, the horse can be used remotely: 洗了一个**热水澡** xile yige re shui zao - Wash with hot water, 跳了一个集体舞 tiaole yige jiti wu - Collective dance. In the examples given, the equine bases of the 澡 zao and 舞 wu verb-object structures are applied remotely and demonstrate the characteristics of the horse. Since there may be a number of words in front of these components, Zhang Shoukan considers 跳了一个舞 tiaole yige wu and 洗了一个澡 xile yige zao to be verb-object phrases. In recent examples, 洗 xi and 跳 tiao have been predicate, and 澡 zao and 舞 wu have been complementary. On this basis, Zhang Shoukan concludes that if such structures are used together, they are considered verbs, i.e., one word; when separated, and when other words are added between them - there are verb-object phrases [13, p. 144].

III. Phrases.

Zhang Shoukan and other linguists include the following structures in verb-object phrases: 吃**鱼** chi yu - to eat fish, 得**讲** de jiang - to receive a reward, **归国** gui guo - to return home, 回家 hui jia - to return home, 离家 li jia - to leave home, 拿酒 na jiu - to carry wine, 投信 tou xin - to drop a letter, 做菜 zuo cai - cooking, **谈事** tan shi - talking about work, 开灯 kai deng- turning on the lights. These structures do not have word properties, they consist of words that can be used remotely, and they do not accept objects after themselves. Each component of these phrases has the properties of the part of the sentence to which they belong. Thus, Zhang Shoukan also believes that it is possible to distinguish words and 离合词- verb-distinguishable words, word-combinations - from verb-object structures [14, p. 496].

Analyzing verb-object structures, Liu Shusyan points out that there is a contradiction between lexicon and grammar here. For example, from the lexical point of view 睡**觉** shuijiao - to sleep

and 打仗 dazhang - to fight, according to Liu Shusyan, can be considered as words, from the grammatical point of view they can be called as word combinations. Therefore, Liu Shushian proposes to include such word structures in word combinations.

Chinese scholars point out that there are both features and differences that are common to word combinations in 组合词 zuheci, sometimes referred to as 离合词. An analysis of 2533 distinguishable verb-object structures conducted by Zhao Jinming clearly shows this [13, p. 146].

An analysis by Zhao Jinmin showed that most of the distinguishable verb-object structures can be incorporated into words, and only a small part (usually composed of components that can be independent words in modern Chinese) is difficult to incorporate into words.

For example, such structures may include: 办事 banshi - to work, to run a business, 唱戏 changxi - to play opera, 抽水 choushui - to draw water, 种地 zhongdi - to cultivate land, to farm, 讲话 jianghua - to talk, to speak, 怕事 pashi - to be afraid of everything.

CONCLUSION

As a result of the analysis, it can be said that this model can be called 动宾式 dongbinshi -verb-object model or 谓宾式 weibinshi -predicate-object model in modern Chinese. The word addition method plays an important role in the current Chinese word formation system. The lexical layer of the language is regularly enriched with words formed by this method.

ABSTRACT

This article tells about the history of the Uzbek art of maqom, its founders, the important musical layers in the maqom. One of the main reasons why maqoms have not lost their artistic value over the centuries and, at the same time, has taken root in the hearts of millions of people is explained by their beautiful melodies and unique forms, which are full of deep meanings. After all, maqoms are spiritual melodies that awaken pure feelings in people hearts and encourage the soul to rise above the barriers of lust.

KEYWORDS: *Melody, Tune, Musician, Singer, Composer, Music, Shashmaqom.*

INTRODUCTION

The maqoms, a masterpiece of Uzbek music, form a significant part of the classical music heritage of most Muslim Oriental peoples.The art of maqom has a long history. This history can be divided into two distinct periods. The content of the first period consists of the study of the very ancient roots of the maqoms in terms of space and time, the study of the first layers of melody. Of course, at that time there were no literal maqom art asknown today. Because the process of formation of status systems is conditioned by a certain stage of socio-cultural development. After all, maqoms, whose basic sources are very old, "were created by professional musicians and singers on the basis of the unique musical heritage of the peopleand emerged as an

independent music genre in the course of long cultural and historical development.".The culture of the palace also played an important role in this.Thus, in the early days, talented musicians who grew up among the people were attracted to the palaces of khans (houses of officials) to serve as musicians. Consequently, the professional music scene has also begun to take shape since the days of musicians (singers, musicians) who lived in the past, specializing in the art of music.

The term maqom in Arabic (قامَم, – place, voice, tone, level and e.t.c., the plural form-قامائَم) has been used in various senses in the past. "In terms of music, maqomis the place where the sounds that make up melodies and songs are placed on musical instruments, that is, the voice strength ...A maqom is a set of melodies and songs that correspond to a specific background and begin with a specific scene. Until now, maqomhas been used to describe a series of melodies and songs. " It is natural that the musicians of the ancient times, in the creation of musical works in accordance with the "palace aesthetics", used the artistic experience and musical wealth accumulated in the folklore. At the same time, it is logical that they should try to reveal their more complex and perfect appearance by creatively processing certain melodies and sayings that are popular among the people. In turn, the traditions of composition, which began to take shape in this way, were creatively mastered by the next generation of musicians (creative singers and musicians) through the "teacher-student". An example of this is the artistic traditions of Eastern culture. As a result of these processes and other factors, the most powerful and perfect manifestations of classical professional music in the course of centuries of history began to emerge. The history of maqoms in the true sense also begins with the formation of powerful musical systems, which are stylistically and artistically integrated on the basis of different periods and layers of music (ancient and medieval folk music, composition, etc.). The following thoughts of the well-known maqom scholar, teacher IshakRajabov are noteworthy in this regard: "The emergence of the concept of "maqom" in the true sense of the word, both in melody and in style, dates back to the heyday of the musical culture of the peoples of the East."The emergence of maqoms is the result of research conducted by human thought over very long periods of time .The maqom art was arosen at a time when human understanding of music, musical and aesthetic views were well developed, and people's consciousness and level were rising.The formation of the maqomsystem is closely linked with the development of world science. Oriental musicologists have linked music to medicine, philosophy, and mathematics. In fact, the results of scientific research conducted in recent years show that the views of the teacher I. Rajabov are valid. Therefore, the emergence of powerful maqom systems is conditioned by a number of factors that affect a particular stage of development of human society, of which the following five factors are necessary:1. Developed urban culture; 2. Development of exact sciences; 3. The formation of philosophical thinking (mystical doctrine) and its reflection in art,4. Availability of professional music (composition, music, singing).5. Development of music science.It is no coincidence that the first of these items is the presentation of urban culture. Because the achievements of every nation in the field of science and culture are largely due to the conditions in the developed cities. In addition, there will be opportunities for the development of professional music, as well as various areas of crafts. In short, a "developed urban culture" is a convenient cultural space for revealing the factors mentioned in the remaining paragraphs as an important objective entity. It should be noted that the necessary factors for the emergence of status systems in the Eastern world appeared in the IX-X centuries. Over the centuries, new types of cities have emerged, such as Baghdad, Damascus, Samarkand, Bukhara, Urgench, Fergana, and Tashkent, which have united their scientific forces in one place. It should be noted that the

cities of Central Asia were also centers of literacy..There is a social feeling of pride in the city where the population lives, and from this period onwards scientists, artists and poets were given the name of the city where they were born and raised (Bukhari, Termez, Samarkand, Shoshi, Nasafiy). , Like Zamakhshari). Encyclopedic scholars such as Khorezmi, Fergani, Farobi, Beruni, who made a great contribution to the development of world science, came from the land of Movarounnahr.Due to the scientific work of our great compatriots - Abu Abdullah Khorezmi (780-850), Ahmad Fergani (797-865) and Abu RayhanBeruni (973-1048), the exact sciences (algebra, astronomy, geometry) developed, with the philosophy of love among the peoples of the East. the doctrine of the perfect man was widely spread, and its positive influence began to be seen in the fronts of artistic creation as well. It was during this period that the practice of samo (listening to the heart) became widespread among educated people, and music was given subtle definitions by mystics. In particular, the well-known hadith scholar, Sheikh Abu Bakr al-Bukhari (d. 994), who said, The phrase "melody nourishes the soul and the body" has become an important basis for many views on music due to the depth of its content. The phrase is still well-known as one of the most beautiful definitions of music. At the same time, the layer of professional music has risen to a new level, the science of music has been firmly formed as a separate science. By this time, we have seen the rise of professional musicians. In particular, it became common for palaces to feature famous singers and composers from the Orient. There is a lot of written information about the caliphs showing them examples of honor. In particular, Al-Isfahani'sKitab al-Aghani (Book of Songs) states that in the palace of the Caliph Harun al-Rashid (786-809) such famous figures as Ibrahim al-Mawsili, Ishaq al-Mawsili, Ibn Jamihave won many accolades for their unique singing and composing talents.There were also special contests to select the best song during this period.The high status of professional musicians in our country can be seen in the example of artists such as Abu Abdullah JafarRudaki (860-941), AlibekTanburi, AbulabbasBakhtiyor, Abu Nasr Mutrib, who worked in Bukhara in the late ninth and first half of the tenth century. In particular, the talented poet, skilled musician and singer Abu Abdullah Rudaki served in the palace of the governor of Bukhara Nasr II ibn Ahmad Somoni (914-943). . The name of Abu Nasr al-Farabi (873-950), the founder of Oriental music and at the same time a skilled music practitioner, was famous in the major cities of the Eastern world. When Farobi was in Damascus, Amir Sayfuddawla ibn Hamdan treated him well. According to Ibn Khalliqan (1211-1282), Faroobi had a great reputation in the presence of Sayfuddawla ibn Hamdan (916-964), the 11th Emir of Aleppo.The following famous narration is also narrated by Ibn Khalliqan: "Sayfuddavla summons famous performers. Whichever tune the callers practice, Abu Nasr points out that theyhave made a mistake somewhere. Seeing this, Sayfuddawla asked Abu Nasr, "Do you know this art?" "Yes," said Abu Nasr. As he said this, he opened the bag at his waist, took a few sticks from it, tied them together, and then began to play the drums, and those in the circle began to laugh uncontrollably. Then the scientist tied the sticks in a different way and played the another music and the audience burst into tears. The scholar played the sticks in a different order, and everyone from the amir to the guardian fell asleep. Abu Nasr took the opportunity to leave the palace.

During this period, the universal laws of classical music were established in the Eastern Muslim world, and the science of musicology, along with music, played a significant role in its rapid formation. The works of ancient Greek scholars also laid the foundation for the development of oriental music. In particular, the scholars of the Baitul-Hikma. In particular, scholars from the BaitulHikmah Academy in Baghdad have translated a number of works by ancient Greek

scholars on musicology - Aristotle's Kitabur-ru-us, Archai, Kitabul-iyqo (Book of rhythm), Pseudo-Euclid. "Introductio Harmonica", "Sectio canon", Nicomachean's "Opus Major on Music", Ptolemy's "Book of Music" (Harmonica)on the science of musicinto Arabic, which was the language of science at the time.This, in turn, was an important factor in the spread of the musical ideas of the ancients, not only in the Eastern world, but also in the West.So, as mentioned above, the status systems began to emerge in the large (central) cities of the Middle East.

The history of maqomcan be divided into two major periods. The first period consists of the ancient roots of maqoms, the first layers of melody. Of course, there was no real maqom at that time. Indeed, the process of formation of the system of authorities that has come down to us involves a certain stage of socio-cultural development, which is the second stage. There are no special musical pamphlets to help you study the ancient layers of maqom melodies. However, Shashmaqom, Khorezmmaqoms and Fergana-Tashkent maqom styles are important sources. This is because the special "type" structure of maqom melodies allows us to identify the layers of music of different periods that are harmonized in them. Scholars believe that the earliest examples of maqoms were inherited from the prophets.This is stated in the pamphlet "Tuhfat us-surur" by our compatriot, famous musician and scientist Darvish Ali Changi, who lived in the second half of the XVI century and the first quarter of the XVII century. An important layer of music in the maqoms is the ancient examples of folk music. Surprisingly, the maqoms contain "traces" of even the most ancient examples of folk music .In particular, we see these traces in the works of Navruz maqam, Navruzkhoro, Navruzsabo. At the base of the melodies of these works, the melodies of the stream are clearly visible, as they are classified by experts as "the most ancient example of folk music" ("primary line" - G. Schenker).This is not in vain, of course. Many people of the East have long performed certain melodies and songs to celebrate Navruz. It is clear that this category of melodies, which took its place in the traditional life of the people as a kind of seasonal ceremonial music, was later included in the system of maqom and had its own highly developed form. Among the sources of status are noteworthy "goh" (ie in the form of Dugoh, Segoh, Chorgoh, Panjgoh) melodies.Most scholars believe that these melodies are related to the tradition of reading ancient books in certain tones, including the Gothic hymns in the Avesto.It takes into account the fact that the word "Catheha" in the Avesta was later translated into Dari (Persian) as "Gah", and a number of other cases. However, recent findings in the field of ethnomusicology show that the roots of the "goh" melody go back much further than previously thought. In particular, there are two basic curtain melodies based on DugohHusseini I's melody from Fergana-Tashkent maqoms, Segoh instrumental melody, as well as three basic curtain melodies in Shashmaqom's Tasnifi Segoh and Khorezm Segohmaqom's Tani Maqom. Examples of such basic melodies are the first buds of folk musical thinking .Although the statues contain elements of many ancient musical relics, there is no guarantee that they will be revived in their original form. This means that the most ancient history of maqoms is not the history of maqoms in the true sense, but rather the layers of ancient melodies that are their source. The history of classical maqoms begins directly in the period of formation of stylistic artistic integrated maqom systems on the basis of the same different layers of musical samples. We do not know exactly when or what the original maqom systems were. In this regard, the creative heritage of the famous musician Borbad (d. 627), who served in the Sassanid court (during the reign of King KhusravParviz - 590-628), in particular, the system "7 Khusravoniy" attributed to him, attracts attention.Musicologists believe that the system of "7 Khusrawani" later became the

basis for the formation of makomat systems, which influenced the formation of maqoms. Indeed, the emergence of powerful maqomsystemsis conditioned by a certain stage in the development of human society. In particular, the well-known scientist, Doctor of Arts IshakRajabov writes:"Maqoms came into being at a time when people's understanding of music, their musical and aesthetic views, and their consciousness and level of development were high ...The formation of the status system is closely linked with the development of world science. Oriental music scholars have suggested that music is related to medicine, philosophy, and mathematics. "It should be noted that the necessary factors for the emergence of maqom systems in the Muslim world of the East appeared in the IX-X centuries.It was during this period that the exact sciences developed, the great services of our compatriot Abu Nasr Farobi (871-950) in musicology, the foundation of oriental music science, and the practice of professional music rose to a new level.It was under the influence of these factors that the Twelve Status Systems emerged in the major (central) cities of the Middle East.The classification of this system was first developed in the works of SafiuddinUrmavi (1230-1294) and QutbiddinSherazi (1236/37-1310) on musicology. (XV), and creatively continued by practicing and theoretical scholars such as NajmiddinKavkabi (XVI), Darvishali Changi (XVI-XVII).The establishment of the system of twelve maqoms in our country and its first classical manifestations date back to the time of Amir Temur and the Temurids.First of all, it is necessary to emphasize the merits of HazratSahibkiran. After all, HazratSahibkiran gathered teachers, musicians and musicologists from different countries and created the necessary conditions for their creative work.According to Ibn Arabshah's book "Miracles of Destiny in the History of Timur", among those brought to Samarkand was a famous musician and teacher of music Abulqadir al-Maraghi and his son Safiuddin, son-in-law Nasriin, Qutb al-Mousili, Ardasher al-Changi. and others. Consequently, the Twelve Maqom System was the result of many years of scientific and creative work. . The introduction of the term "status" in music was due in large part to the spread of mysticism in the Islamic world during this period, and during the reign of Amir Temur and the Temurids rose to the status of an official ideology and can be explained by its strong ideological influence on the field of professional music.The word "maqom" in mystical terms means the seven main stages of the path of spiritual maturity.Thus, the term "maqom" also means a certain process of movement, the content of which is the journey of the tax (passenger, murid) along the stages of the leech (road) and, at the same time, the spiritual towards its goal. It should be noted that in the system of the Twelve Maqoms, the idea of the "perfect man" took different forms.Inparticular, the spiritual journey to the lover with the fire of love in the heart of the tax is understood in the "chain" of the Twelve maqoms in this system. In this case, the maqomof "Ushshak" is Sufi love, true love for Allah,themaqom of "Navo" – means burning in the fire of love, "The maqom of "Busalik" (referring to the father of Abu Salik-Ahd) means that the lover "makes a covenant" to enter the sectarian path.The next seven verses, Rost, Husseini, Hijaz, Rohavi, Zangula, Iraq, and Isfahan,, the inner growth of the lover in the path of the sect, are subtly likened to the great pilgrimage. For example, "True" - the path of the sect, "Husseini "- pirumurshid (leader),The Hijaz is the border between the cities of Makkah Mukarramah and Madinah Munawwarah and is the main destination of the road., "Rohaviy" – roh–way, road, "Zangula" – a camel's neck bell, "Iroq" and "Isfahon" – traffic and addresses .It is the name of one of the cities that crossed the Iraqi desert on the way to Hajj and Isfahan is the closest cities to Iraq.The last two terms, Kuchak (small) and Buzrug (big) ,can be said, reflect the views of the Sufis on the interdependence of the

small (micro) and large (macro) worlds.It is noteworthy that the names of the Twelve maqoms also appear in mystical literature to mean more of a "journey."

> Gar SifohondaNavotopmasang, eyyor-iBuzrug,
>
> Qilg'asan, azmiIroqaylabohang-iHijoz. (HofizXorazmiy)
>
> Lutfiy, Hiriydaqolmadishe'ringgamushtariy,
>
> AzmiHijozqilki, maqomingIroqemish.(Lutfiy)
>
> EyNavoiy, sendog'iqilsang tama' sayriHijoz, Qil
>
> Iroqohangi, tarkaylabXuroson men kebi. (Navoiy)

In the context of these verses, we see that the aspiration for the pilgrimage finds its subtle expression in the names of the Twelve Places (Iraq, Hijaz, Isfahan, Navo, Buzrug).In the inner sense of this aspiration, it is a spiritual journey to truth and enlightenment. Najmiddin Kavkabi's Kulliyoti Kavkabi also refers to the "road" journey through the names of the Twelve maqoms. As can be seen from the content of the above verses, mystical ideas are also reflected in the music of the maqoms. It is no coincidence that the protagonist of the poems, the lover, has a spiritual need to listen to such figures as Iraq and the Hijaz.Because in these positions there are very good tunes for the human heart and perception - melody structures, which give strength to the soul of the lover. In general, the "soli-suluk" ratio in mysticism can be thought of in the Twelve Maqom System as follows : a) each of the twelve maqoms, classified as perfect music, appears in place of the "suluk" (musical "path"); b) the simple structure (Dugoh, Segoh, Chorgoh, Panjgoh, NavruzBayot, etc.) belonging to the ancient layers of folk music is a unique symbol of the "solik" (passenger) image; v) in the practice of music, subdivisional structures develop to the required (perfect) level of quality, based on the tone stages of a particular maqom.Thus, "status" also means a certain creative style of development in music, "from imperfect to perfect."Summarizing the above, the following can be added to the definition of maqom.1) Maqom - is the wisdoms reflected in the sounds.2) Maqomis a perfect combination of music, which is a unique musical expression of the stages of the sect, and a way to develop the theme of the melody in a certain way (from bottom to top).This additional comment on the maqom applies not only to the Twelve maqoms, but also to the Shashmaqom, Khorezmmaqoms and the Fergana-Tashkent maqom ways of performing.In this case, along with the word "Maqom" in their components, there are also "sam", "gardun", "kalandar", "samandar", "girya", "nola", "charkh", "faryod", " The use of many mystical reforms, such as "saqiynoma", as well as the singing of ghazals with high love (Hafiz, Jami, Sakkoki, Lutfi, Navoi, Mashrab, Bedil, etc.) in the main verses, "pure" music On the other hand, on the basis of perfect veils (as an artistic reflection of the processes of the sect) it is possible to cite such factors as the principle of consistently developing the themes of the melody and showing their peak qualities.But the most important fact is the music of the maqoms, which is full of great love.Because the content of this music reflects the spiritual beauty of the pure soul to the true beauty, to the real truth.Consequently, one of the main reasons why maqoms have not lost their artistic value over the centuries and, at the same time, has taken root in the hearts of millions of people is explained by their beautiful melodies and unique forms, which are full of deep meanings .After all, maqoms are spiritual melodies that awaken pure feelings in people hearts and encourage the soul to rise above the barriers of lust.

ABSTRACT

This article identifies the role of the human factor in the formation of abstract words, their place in the vocabulary. The role of rational cognition in the formation of abstract words has been identified. In order to define the human factor, the naming of abstract concepts in the language of backward peoples was analyzed. Examples were given of the expression of the raw mental characteristics of the Uzbek people in language. In recent years, it has been highlighted that the human factor contributes to the enrichment of the Uzbek language vocabulary.

KEYWORDS: *Anthroconetirism, Abstraction, Emotional Cognition, Mental Cognition, Mentality, Vocabulary, Abstract Words.*

INTRODUCTION

Anthropocentrism is one of the central paradigms of modern linguistics, demonstrating the importance of the human factor in the language. After all, everything in language is man-made, and language itself serves man. When we talk about the importance of the human factor in language, we also mean such issues as the constant change in the linguistic landscape of the world, the appearance in the language of entities that are the product of the human mind. Similarly, one of the units of language that is a product of the human mind, abstract words. The presence of abstract words in the language, including in the Uzbek dictionary, is due to a person, human thinking and his psyche. Abstract words are a product of the process of abstraction, formed at a lower stage in the development of human thought.

The development of a language reflects the development of human thinking and human civilization. People cognized the world, first of all, on the basis of the senses of the organs. A.V. Brushlinsky writes about the importance of the emotional picture of the world, formed with the

help of the senses, but it is not enough for a thorough, comprehensive study of objects and phenomena, their essence, and relationships. Thus, a complex kind of cognition arose, in particular, abstraction. "Abstraction is one of the forms of cognition, which consists in mental distraction, isolation from certain sides, properties or connections of objects and phenomena in order to highlight their essential features.[1] "

THE MAIN PART

Although mastering the world through emotional cognition is one of the greatest achievements and necessary needs of humanity, its shortcomings in understanding the world and oneself began to be felt in the very first period of social society. To get a deeper understanding of the nature and relationship of objects and events, it was necessary to study their specific (specific for knowledge) nature or relationship separately from the subject. At the same time, a complex form of cognition, mental cognition, in particular abstraction, arose. The division implied in abstraction occurs only in thoughts. The types of abstraction and its results are different, as a result of generalizing abstraction, concepts are formed, and as a result of idealization of abstraction, ideal objects are formed. As a result of analytical abstraction, an abstract object is formed - an abstract concept - abstract meanings - abstract words.

Abstract names are properties, relationships, situations that are separated from the object and treated as a separate object. For example, beauty, joy, happiness, consciousness, love, hate. They are the result of analytical abstraction. In this type of abstraction, the properties and relationships of objects and phenomena are separated from the object of thought and understood as a separate substance in the mind. In this case, the object of a given feature or relationship is ignored by the imaginary or mental. For example, good is one of the attributes of a person, and in this name this attribute is separated from an object, that is, a person. In the so-called concept of goodness, a trait that does not exist in the real world separately from a person is generalized as a separate substance, separated from a person.

The lexical structure is the most dynamic, sensitive tier of the language, which reflects all the changes in the life of native speakers, in particular, the development of mental potential, the way of thinking. Based on the data of the history of the language, it can be argued that in the initial stages of the development of the language, the lexical composition mainly consisted of concrete words, later enriching at the expense of abstract ones.

M. Gorsky asserted that: "The history of language testifies to the constant development of the abstractive and generalizing activity of human thinking. The languages of peoples at a relatively low level of social development retained such features that indicate that their abstracting and generalizing activity was significantly different from that of a modern adult.[2] "

These reflections of M. Gorsky are confirmed by the arguments of many linguists. For example, O. Potanina[3], who researched the implementation of abstract concepts in the dialects of the Khanty language, claims that there are very few abstract words in the Eskimo language, but there are more than forty names for types of ice and snow, and O. Pylaeva[4] notes that the language of the Evenki tribe lacks the word , expressing the general concept of the season, while several words are used for their particular types. As the English researcher E. Eyre[5] writes, the names of trees, fish, birds as a species are absent in the language of the aborigines of Australia. They have only separate names for each type of tree, fish, bird.

An analysis of the above languages shows that at the initial stages of language development, words mainly denoted specific concepts with narrow meanings. There were few abstract words in their lexical tier.

However, the presence in a language of many names denoting particular varieties of a certain type cannot be the main factor in determining the level of abstraction of the speakers of a given language. This may be due to the way of life of the given people. For example, the Eskimos live in constant cold, so it is natural that in their language there are many nominations associated with snow. In the Uzbek language, there are dozens of words denoting the types of cattle, which speaks not of the low level of abstraction of the Uzbek people, but a peculiar way of life.

With the emergence of a person's skills for the separate cognition of signs and connections separately from their carriers, the most elementary abstract words began to appear in the language. These are mainly words formed as a result of highlighting important features of the phenomena of everyday life and basic necessities: issiк(hot),qattiк(hard),uzun(long), qisqa(short).Signs highlighted by such primitive abstractions are perceived by the senses; cold, warmth, hardness are felt by touch, and signs of length, brevity are perceived visually. At the next stages of development, the signs and relations of the object are interpreted as a separate substance, therefore, only comprehended signs are distinguished, abstract words with a high degree of abstraction are formed: hayot, umr, oʻlim, tezlik, narh, oʻlchov, baxt, quvonch, gʻazab, sevgi, muhabbat (life, life, death, speed, price, measure, happiness, joy, anger, love, affection).

The transition of humanity's thinking to the level of abstraction can be demonstrated by the example of the transition from pictographic graphics to ideographic ones. Despite the fact that in a pictographic letter a message about a specific object - a phenomenon is conveyed in a primitive form, the use of this writing to convey abstract concepts is no longer possible. Therefore, this type of writing has already ceased to meet the needs of mankind. Thus, ideographic writing systems appeared, in which pictograms do not denote certain objects, but ideas[6].

At the present time, the rapid development of society, a lot of abstract words and meanings appear as neologisms, lose their color of novelty and turn into common vocabulary: globallashuv, mobillik, tezkorlik (globalization, mobility, agility). In the years of independence, the abstract words existing in the language are replenished with new meanings, the semantic development of the words manaviyat, mafkura, ishbilharmonlik, tadbirkorlik, bagʻrikenglik, ogolik, sezgirlik, tashabbuskorlik, ishbilharmonlik, barkamollik, tadbirkorlik(spirituality, ideology, entrepreneurship, entrepreneurship, tolerance, wisdom, sensitivity, initiative, entrepreneurship, perfection, entrepreneurship).

The attitude of girls to their father in the Uzbek people is expressed in the concepts of hayo, the protection of the daughter by the father with the word oriyat. Or the conceptual load of the word sabr is very large, it takes into account not only chidam (patience), but also shukronalik, faith and conviction in goodness. The concept of halollik has both religious and ethnic, educational meanings. It also takes into account the educational component of how not to covet someone else's good, to live in labor. The concept of "tarbia" (education) has national characteristics, which are distinguished by the attitude of the people to this concept. These include beliefs that raising children is a sacred duty, with seven neighbors responsible for one child.

If we pay attention to the complex semantics of abstract words mobile, murosasozlik, which in the first years of independence were considered as a neologism, and now firmly entrenched in

the lexical composition of the language, words kurashchanlik, yaratuvchanlik, subjected to semantic change, we can see cases of saturation of the semantics of these words with a concise proposition, latent predication. For example, the complex structure of the lexeme kurashchanlikcan be clearly seen in the following example: "Kurashchanlik is a striving for noble, constructive and humane ideas, without renouncing the political goals set for oneself".

CONCLUSION

Therefore, the main reason for the constant replenishment of the vocabulary with abstract words is the anthropocentric factor - the human factor. In the process of human civilization, the complexity of abstract thought activity, including the ability to distinguish signs and relationships from an object, the perfection of the spiritual world, the appearance of abstract words in the language and the continuous development of the above, ensures a constant enrichment of vocabulary.

SOME ISSUES IN THE FORMATION OF THE PHILOSOPHY OF LAW

Munira Mukhamadjanovna Kakharova*

*Head,
Doctor of Philosophy,
Department at the International Islamic Academy of Uzbekistan,
Lecturer of the department "Islamic History and Source Studies" IRCICA,
UZBEKISTAN

ABSTRACT

This article analyzes the study of the concept of the philosophy of law and the genesis, formation, relationship to the problems, conceptual approaches to the study of the problem in Russia. However, given the fact that science is now being formed in Uzbekistan, it is useful to study the genesis, formation, attitudes to the problems, conceptual approaches to the study of the problem in Russia. No one now doubts that jurisprudence is a branch of science. The question of whether it is an object, a subject, a field of science - philosophy or law - remains controversial.

KEYWORDS: *Philosophy Of Law, Genesis Of Law, Conceptual Approach, Political Science, Sociology, Anthropology, Pedagogy, Psychology, History, State, Justice, Equality, Idea, Metaphysical Act, Encyclopedia Of Jurisprudence.*

INTRODUCTION

Scientific and theoretical work on the formation of the philosophy of law in the former USSR was carried out mainly in three directions. The first is the formation of the philosophy of law as a separate branch of science with its own object, subject, goals and objectives; the second is a philosophical study of law, government and legal services; the third is research from the perspective of social sciences such as political science, sociology, anthropology, pedagogy, psychology, history. Research in these three directions was tested by the communist ideology that prevailed at the time, and the value and importance of all research were assessed by its correct understanding and proper service.

Main part

Views on the philosophy of law at that time and the processes of their formation were first studied by the scientists such as B.Chicherin, E.E.Pontovich, V.S.Solovyov, N.M.Korkunov,I.V.Mikhaylovsky, F.Shershenevich, P.I.Novgorodsev, S.Nersesyants and S.S.Alekseev.

Therefore, there is no need to re-analyze them in detail. However, given the fact that science is now being formed in Uzbekistan, it is useful to study the genesis, formation, attitudes to the problems, conceptual approaches to the study of the problem in Russia. It should be noted that the research conducted in Russia has given rise to the emergence of the philosophy of law in Uzbekistan as a branch of science, a conceptual thought, a scientific research. Until the end of the XIX century, and even until the 30s of the XX century, Muslim law, of course, accumulated experience of positive significance (there are norms in line with modern views on social existence and human rights and freedoms, honor). However, the study of this experience at the level of a separate branch of science - the philosophy of law - had not yet occurred.

Therefore, the study of philosophical and legal doctrines formed in the Russian Republic is also important for philosophers and lawyers of our republic, because in the former USSR, cultural, scientific, creative ties and cooperation were so expanded and integrated that all science, including philosophical and legal views, were formed in harmony.

RESULTS AND DISCUSSIONS

Although many works on socio-legal phenomena such as law, state, justice, equality were created in Russia, their history and theoretical issues were studied, until the end of the 18th century they did not contain the term "philosophy of law" or science of law. Well-known lawyer N.M. Korkunov, studying the history of philosophy of law, begn his research with the views of ancient Greek philosophers, according to retrospective analysis. At the same time, he noted that in Gegel's philosophical ideas in his "Philosophy of Law", the phenomenon of law was recognized as a "metaphysical act" rather than a legal fact. However, he did not say that the "philosophy of law" existed as a separate theory or field of science, neither in Russia nor in its national territories[1][11]. So, although the philosophers of antiquity were also engaged in the philosophical interpretation and problems of law, the philosophy of law, in our opinion, entered Russia through the work of Gegel. Doctor of Juridical Sciences E.V. Kuznetsov connected this with the XVIII century [1] [25-56]. Even N. M. Korkunov openly acknowledged that the emergence of a "philosophy of law" in Russia was linked to the West [1] [11. P. 233].

Especially, there is no doubt that the teaching of German philosophers, especially those familiar with Gegel's teachings, in Russian schools of thought in law, philosophy, and state theory led to the spread of the author's views on the philosophy of law.

K.A. Nevolin, a professor at the University of Kiev and a lawyer, listened to Gegel's lectures and later expressed his philosophical and legal ideas in his "Encyclopedia of Jurisprudence" [1] [110]. According to V.S Nersesyants, N.V Mikhailovsky, a student of the famous lawyer, statesman B.N. Chicherin, called K. Nevolin "the founder of the philosophy of law in Russia."

The formation of concepts and views on the philosophy of law in the period before the October Revolution of 1917 are connected with the works of the philosophers V.S.Solovyov,

P.I.Novgorodtsev, N.I.Berdyaev, lawyers N.M Korkunov, B. Chicherin, B.A Kistyakovsky, G. F. Shershenevich, LI Petrijevsky, and I.V Mikhailovsky.

According to A. Valitsky, Doctor of Philosophy, in the late XIX - early XX centuries in Russia, liberal-democratic ideas were widespread among intellectuals. It became commonplace for them to criticize the backwardness of feudal-serfdom in Tsarist Russia, to discuss freedom, equality, political issues, human rights. In particular, the ongoing legal reforms in Europe, the importance of the Napoleonic Code (adopted in 1804), the need for liberal-democratic reforms in Russia, aroused the patriotic and liberal aspirations of the Russian enlighteners.

"There was an objective need to change the social order on the basis of liberal laws, which the whole life of the people, the progressive forces, and the enlightened people clearly felt." [1][13-14].

After the October Revolution, both the number and scope of scientific research on the philosophy of law expanded. In the early days of the revolution, it was natural for intellectuals to say that they had achieved freedom of speech. Later, especially with the establishment of Stalinism, philosophical understanding of the phenomenon of law, the study of the state and law did not stop, although free thought, the wills of the people were limited in accordance with the totalitarianism of honor.

Here, scientific and theoretical research of the representatives of social and philosophical sciences such as E.E.Pontovich, N.G.Aleksandrov, A.F.Shebanov, M.S.Strogovich, V.A.Shabalin, G.S.Ostroumov, P.E.Nedbaylo, V .F.Yakovlev, D.A.Kerimov, M.T.Baymaxanov, L.I.Spiridonov, G.B.Galperin, A.I.Korolev, A.M.Vasilev, G.V.Maltsev, A.D. Ursul, V.K.Babaev, Yu.G.Tkachenko, R.Lukich, V.N.Sherdakov, E.Yu.Solovyov, E.V.Kuznetsov, P.G.Redkin should be remembered [2] [100]. Although these studies focused on a variety of topics and problems, they did not aim to study the philosophy of law as a separate science. Even though E.E. Pontovich called his work by the general name "Philosophy of Law", he focused on the study of general theoretical issues of law[2] [18, P.52]. However, at the beginning of the last century in Russia it was decided to look at the philosophy of law not only as a field of theoretical views, but as a field of science. It is true that the book informs that the second volume of the scholar's work "Philosophy of Law" was being prepared for publication, but no information has been preserved as to whether it was published or not. It is possible that his fate was in line with those turbulent times, as the author stated that he was skeptical of Marx's teachings.

Special research of philosophers D.A. Kerimov, E.V. Kuznetsov, P.G Redkin helped to raise the philosophy of law to the level of science.

Articles and works of Professor D.A. Kerimov, Academician of the Russian Academy of Sciences, Doctor of Philosophy, are aimed at philosophical understanding of the phenomenon of law, revealing the systemic features of law [3, P. 140] [4, P. 314] [5, P. 203] [6, P. 442] [13, P. 140] [15, P. 360] [14, P. 5] [1, P. 443], the "positive role" of law in social life, especially in the realization of human freedom. The fact that a person possesses this or that behavior or commits an act "is not only a sign of his will, but also an indication of whether the act is legal or illegal" [3][465]. Hence, the will is a phenomenon that "comes before the responsibility of man" and represents the legitimacy of his actions. All human behavior is related to law, right, or morality and cannot exist outside of this socio-legal entity. Socio-legal existence is affected not only by legal norms, official laws, but also by the wide range of social relations that form the basis of

society, which is difficult to understand and grasp at once. The core of social relations in modern societies is formed by legal and moral norms, imperatives, the individual evaluates and adapts all his actions in accordance with them. It is true that D.A. Karimov did not try to understand a "philosophy of law", but he tried to realize a socio-philosophical understanding of the state and the phenomenon of law. This was an important step towards the philosophy of law, though not exactly itself. He continued this approach in his monography printed in 1986 [4][212].

E.V. Kuznetsov and P.G. Redkin took a different approach. Both of them showed a retrospective analysis of the philosophy of law, studying the doctrines in this area, showing that "philosophy of law is a social, philosophical science that helps to know" law, legal consciousness, legal worldview, implementation of the functions of law, defining the functions of state and political institutions" [5][145]. At the same time, they also revealed that the "philosophy of law cannot remain within its own abstract observation," follow the transcendental, "bypass the legal fact," and distance society from real events in people's lives. There are such approaches in the history of the philosophy of law, and it is rightly noted that this was the effect of the aspiration to turn the philosophy of law into a "pure philosophy." At one time, Gegel criticized Kant for the lack of "legal matter" in his philosophical understanding of law, although in his "philosophy of law" there is a lack of "legal matter", abstraction, idealization of legal reality.

Thus, in the philosophy of law there is an opportunity to deviate in the direction of "pure philosophy", if the "legal matter", the objective form and functions of law are forgotten, or overly generalized, abstraction, idealization occurs. As a result of such an approach, the research moves away from its subject.

At the same time, a number of studies have been published on social relations, the study and interpretation of law in the legal sciences, methodological issues related to the relationship of philosophy and jurisprudence, the perception of legal consciousness, the existence of objective life.
First, to interpret it as superstructure;
Second, to consider it as an area that serves ideology;
Third, to consider it as a single function of the state, which no one else, no subject, can claim;
Fourth, the glorification of the proletarian dictatorship as a means of violence, use of force, punishment;
Fifth, the inculcation of law as a totalitarian reality (in any case, Soviet law is viewed as such) in the minds of people, in their way of life, is based on a socio-philosophical point of view.
For example, Doctor of Philosophy M.T. Baimakhanov correctly interpreted law as the supremacy of society, arguing that the internal contradiction in it was the difference between "legal ideas and advanced, progressive socialist law", which reflects the backward, old bourgeois, feudal remnants.[6] [11-14].

In this way, he interpreted the socialist law of that time as the developer and receiver, the socialist state as the only "legal truth" institution, and socialism as "the most just, developed, humane society" achieved by mankind. Such interpretations can be cited again and again. There are even attempts within them to justify the violence of the proletariat. But covering them takes us off the topic.

Admittedly, the glorification of Soviet law in social philosophy, political science, and jurisprudence had to become a tradition at that time. The whole political system, the state

apparatus, Stalinism was based on the "dogma of violence" that the social sciences and the philosophy of law could not be left out.. It is true that in some socio-philosophical literature there had been certain attempts to break out of this dogma, but this was not a rule, but an exception to it.

The services of lawyers in the formation of the philosophy of law and the study of its conceptual issues are great. In this regard, first of all, it is important to cite the conceptual approaches of researchers such as F.V.Taranovskiy, V.N.Alekseev, E.Pashukanis, A.Stalgevich, Ya.Kantorovich, N.G.Aleksandrov, D.I.Kurskiy, A.A.Piontkovskiy, S.F. Kechekyan, M.A.Arjanov, S.S.Alekseev, O.S.Ioffe, P.I.Stuchka, V.P.Kazimirchuk, G.V.Maltsev, V.A.Tumanov, V.S.Nersesyants, R.O.Khalfina, A.Khaytliev, A.V.Polyakov and V.A. Zetvernin.

According to the purpose and direction of our research, we can distinguish them into the following topics and problems.

1. To look at the state and law as a product of socio-historical development, to approach them as the basis of all norms and norms, as the sole regulator of human and social life. Proponents of this approach (F.V.Taranovsky, M.A.Arjakov, S.S. Alekseev), in fact, rely on the historical-materialist concept, and they do not consider the phenomenon of state and law as a natural or divine blessing, but in socio-historical processes and acknowledge that it arose out of the will of society. The socio-legal being, the philosophical-legal doctrine that studies it, is also a product of this being.

Although these lawyers focus on the philosophical foundations of law, they ignore the fact that it is a reflection of a separate socio-legal entity or a separate subject of the philosophy of law. Sometimes, the goal set, the subject of research, does not allow them to take such a conceptual-philosophical approach.

2. The study of the phenomenon of law itself, its impact on the system of social relations, its regulatory, managerial, directional, communicative and educational functions in society. We observe such an approach in the researches of VN Alekseev, E.B. Pashukanis, A.Stalgevich, N.G.Aleksandrov and S.F.Kechekyan.

Regulatory and educational functions are considered not only by these researchers, but by almost all lawyers in one way or another [7][11].

Indeed, all scholars agree that the phenomenon of law is a general legal problem, the positive significance of which is beyond doubt. However, making them an integral part of social existence, adapting people's behavior to the requirements of law, has never happened by itself. Researchers are interested in this phenomenon, and they create their own recommendations, conceptual ideas.

3.   Approaches to the study of conflicting, sometimes contradictory socio-juridical and spiritual-moral norms, such as morality and law, law and freedom, necessity and coercion. Proponents of this approach do not see that both the socio-legal entity and the legal and moral norms are ready, pre-created. They stem from the conflicting development of social life, human existence, and thinking in their views (E.Pashukanis, Ya.Kontorovich, S.S.Alekseev, G.V.Maltsev, V.N. Kudryavtsev). But researchers believe that the contradictions between them are primarily related to the political system, the nature of social relations, the will of the state.

Indeed, does the conflict between morality and law depend on the state, the nature of social relations? Can the state, political institutions, social relations completely eliminate this contradiction? In our opinion, even in an ideal society and the most powerful state, the contradictions, differences and inconsistencies between them remain. Even the most perfect legal system, societies, are not able to completely resolve such conflicts. It is not a question of eliminating the contradictions between the above socio-legal phenomena and spiritual and moral norms, but of forming in people a sense of obedience to the law, respect for spiritual and moral norms.

4. Research of philosophical and methodological issues of law.

In this regard, the works of such researchers as T.N.Radko, D.I.Feldman, V.L.Plakhov, G.I.Kurdyukov, V.V.Lazerev, R.I.Taller [8] [19: P. 45] can be cited as examples. Research in this area studies the general, methodological issues of law and the state. The conceptual ideas in them can serve to shape the philosophy of law.

5. To study the philosophical and legal problems of the will, rights and interests of the individual.

We observe a sharp increase in interest in the philosophy of law, state, law, legal fact, legal culture, parliamentarism, democracy, justice, civil society, the rule of law, international humanitarian law, national legal systems - in short, all the political, economic,legal and moral matters during the years of independence.

The transition of society to a new socio-legal system required a new approach to all political and legal processes, relations, in terms of the goal of building the rule of law by ensuring the rule of law.

CONCLUSIONS

It is noteworthy that lawyers are increasingly interested in understanding the philosophical essence of law, ensuring that the social-legal entity is in line with the interests of human, democratic development. In fact, philosophers were supposed to be the initiators of the formation of the philosophy of law, to draw the attention of experts, researchers, scientists to the scientific and methodological problems of the philosophy of law. Apparently, the socio-political changes taking place in society have drawn their attention not to the philosophy of law, but to the philosophy of politics, to the problems of democracy. Among Russian scholars, philosophers make up the majority among researchers dealing with political issues.

We witness the participation of philosophers in almost all books on political science, the theory of democracy. It is safe to say that this interest is driving them away from studying the philosophy of law.

No one now doubts that jurisprudence is a branch of science. The question of whether it is an object, a subject, a field of science - philosophy or law - remains controversial. In addition, morality by law, social existence by social law, national legal existence and its conformity to social democratic values, universal norms, human rights and freedoms to democratic principles,the role of state and political institutions in the formation and improvement of the national legal entity also requires philosophical and legal research.

Both the phenomenon of law and the philosophy of law apply to forms of social consciousness and, consequently, to superstructure. What is their relation to other superstructure, such as the

influence of the philosophy of law on religious consciousness or aesthetic thinking? What is the effect of this? On what basis do national ideology and law, philosophy of law, legal consciousness, legal culture, etc. demand and influence each other? Finally, is the relationship between philosophy and law always practical, or under the influence of social or other necessity, only in the minds of individuals, groups, necessitating each other? Does the place of philosophy of law among the social sciences depend on the national legal entity, the national-legal paradigm? In general, what is the role of philosophy of law in shaping the national legal paradigm or in understanding its immanent laws?

It is obvious that the questions and tasks facing the philosophy of law are different, they require in-depth development and study of scientific and methodological issues of science.

ABSTRACT

The article examines the movement for the reformation and modernization of the socio-political and cultural life of Turkestan at the beginning of the twentieth century, which went down in history as Jadidism. The reasons for the emergence of the idea of reformation of the Muslim society, as well as social, economic and cultural transformations in Turkestan are grounded. The activity of the national intelligentsia on the creation of Jadid new-method schools and theatrical troupes, the publication of national newspapers and magazines is disclosed. The process and results of the reformation and modernization of public life in Turkestan are analyzed.

KEYWORDS: *Reformation, Modernization, Jadidism, New Method School, Progressist, Revolution, Bolshevik, Soviet Power, Regional Muslim Council, Democracy, Parliamentarism, Turkestan Autonomy.*

INTRODUCTION

Since the achievement of independence has become actual for the historical sciences of the Republics of Central Asia, the objective learning of the historical problems of the national-liberty movement, in developing process of this movement, goes through the ideas for the struggle of political independence and state sovereignty. Today, the priority of social science is the necessity of remembering old stereotypes and estimations, recreating an objective historical picture of the struggle of Central Asian people for independence.

During the long soviet period the liberation struggle of Central Asian people was either consigned to oblivion or premeditatedly falsified. Today, in conditions of independence where the chance of recreating historical truth exists, the need to decisively review the former orders

about the role and place in the historical process ripen both the national-liberation movement and its separate social-political movements.

Many historians both in our country and abroad were interested and are interested in issues related to spirituality, cultural life of the population of Turkestan, political events, etc. In the works of scientists from Uzbekistan B.Ergashev [1], S. Agzamkhodzhaev [2], N. Karimov [3], D. Alimova [4], Kh.Boltabaev [5], N. Mukhamedov [6] and others, many aspects of Central Asian Jadidism and the process of reformation of the Turkestan society.

MAIN PART

As we know from historical experience, jadidism was one of the notable social-political movements of the past, and if it assisted the growth of national self-consciousness, it had an important role in the creating and developing the reformists' ideology. In other words, jadidism was the movement needed for the reformation and the renovation of the society.

For a long time in soviet history, jadidism was imagined as a "reactionary", a "panturkist", a "panislamic" movement. In our times, thanks to the efforts of native scientists, new methods of approach have been confirmed. Now it becomes more obvious that the jadids movement expressed the most progressive direction in the complicated interweaving of political powers of the Turkestanian society at the end of XIX-XX centuries. It was based on humanitarian and national values. It satisfied the needs of social development and interests of close concern of the region's native population.

The reformist movement went through hard times in a historical multi-faceted way. Jadidism became the arena of struggle of various philosophies and worldly methods of approach to perspectives of social development. It focused on key questions about social development: the conceptual sense of the ideology of braking the basic foundations of feudalism and colonialism.

The first jadid groups originated in Turkestan and Bukhara at the beginning of XX century. The most known representatives were Munawwar Kori Abdurashidhan ugli, Sadriddin Ayniy, Mahmudkhodja Bekhbudiy, Abdullo Avloniy, Zakiy Validiy, Toshpulat Norbutabekov, Abdurauf Fitrat, Ubaydulla Khodjayev.

There is an opinion that at the beginning, jadidism was a cultural enlightening course, working mainly for the reform of Muslim schools and adopted the European educational system. In some aspects we can agree with that. In reality, the ideology of early jadidism was not yet connected with the idea of national liberation. But still it facilitated the national rebirth, and the Central Asian people became acquainted with the achievements of world civilization.

The most direct way of solving the problems which came to a head was via enlightenment. That's why in the beginning, the problem of educational reform was at the center of jadids attention. One of the first new-method schools in the region was opened in Kokand in 1898 by Salohiddin Domla. The jadid school in Tokmak was opened in the same year. In 1899, Mannon Kori in Tashkent and Shamsiddin Domla in Andijan supported the opening [7].By1917, about one hundred new-method schools were registered in Turkistan in which over four thousand children were taught: thirty-nine in the Syrdarya region, thirty in Fergana, and eighteen in the Semirechensk region, five in Samarkand and others [8, p.230.].

There were several basic principles in the ideology of the jadids. First of all, they understood that the progressive development in Turkistan was impossible without educated people. The people needed to know the achievements of Russian and world cultures. That's why they decided that the spiritual liberation must come hand in hand with the improvement of life conditions and the freedom from colonialism.

Second, the leaders of the jadid movement organically linked the fasthistorical progress with the modernization of Islam and forming of social-economic prerequisites of creation of civilized market space. Unlike many thinkers of Europe and Russia, jadids did not reject religions. They were not atheists. They defended the keeping of Islam as a necessary factor, favoring the integrity of high Muslims for the achievement of social progress as a means of cultivating the people in areas such as morality, patriotism, friendship, solidarity and the consolidation of their efforts in struggles in order to save themselves from a crisis condition. Jadids saw in the Islamic religion the most essential means of spiritual purification. They also considered however, that it had to be purified from the scholasticism of the Middle Ages.

At first, the jadids were against the monopoly of confessional education, which was rooted in middle age scholasticism. They proposed the introduction of a new method in teaching. However, to measure the progressive development of their ideology in reforming Islam, they made more conceptual depth and interconnection with the needs of social progress.

The jadids wished to see their people educated and freed from slavery and national reserve. Since the beginning of their existence they offered their own way to link the people of Turkestan to the achievements of world civilization. This did not mean that they refused national and religious values. They wanted, with the help of non-violence, step by step reforms and the elimination of old dogmas and prejudices, which blocked, hindered further development and progress.

These ideas had a real authority among the different layers of the population. Already by the beginning of the 20th century, not accidentally, the jadids movement had conquered almost all the lower area of Syrdarya, Samarkand, the Fergana regions and Bukhara. It was very strong in big cities like Tashkent, Samarkand, Kokand, Andijan, Namangan, Margilan, Bukhara and Kattakurgan.

The first Russian revolution had a noticeable influence on the organization and ideological development of the jadid movement had. During the period 1905-1907, the jadids views began to have growing political peculiarity. The radicalization intensified. The deviation from former mainly loyal positions (with reference to primary feudal political institutions) were identified. The jadid movement in Tashkent became stronger in both organizational and ideological matter. The main index of activating the social-political life was the blunt and sharp animation of the press.

The first national newspaper of the turkestanian jadids was "Taraqqiy" (first printed on 27 June 1906), which was edited by a well-known public benefactor Ismoil Obidov.

At the same time with "Taraqqiy" ("Progress") Turkestan's jadids began to edit in Tashkent such newspapers as "Hurshid" (The Sun), in 1907-1908 "Shuhrat" (Greatness), "Tudjor" (Buyer). Later on in Turkestan several jadids' newspapers and magazines appeared "Osiyo", "Samarkand", "Sadoi Turkiston", "El Bayrogi", "Turon", etc. Most of them were short lived, but they had a big role in disseminating the idea of reforms.

Uzbek publishing and Uzbek national theatres became effective instruments in spreading the enlightenment and the national renaissance. Tashkent and Kokand publishers supported national poets and writers, especially Alisher Navoi. Spiritual philosophy of XVII-XVIII centuries scientists like Khodja Akhmad Yassaviy, Mirza Bedil, Sufi Olloyor were published along with poetry and prose, to underline jadids ideas. They offered their jadids readers publications not only by Central Asian scientists, but also books published in other Muslim countries such as East Persia, Turkey, Egypt and Syria, which were going through the epoch of national renaissance.

In this period, the jadids did not have an exact agenda, which could have united all progressists. Everyone expressed their own views and offered their own model of national development. Thus, we can see different views, sometimes varying from each other with contradictions in jadids expressions and programs, reflecting different influences.

The jadids attentively observed political processes in the metropolis, studied programs of political parties arisen in Russia and adopted experience in their political activities. Proceeding from the specific national mentality and inclination of Uzbek people for peace and experience in Russian democratic forces, they undertook trends during the years of the revolution to achieve concessions from authorities via social petitions, public debates in State Duma and other legal ways in order to create the least minimal conditions requiring objective demands of Turkistans national development. Turkestanian jadids accepted excitingly the news about State Duma being created in 1906. They considered that it was impossible to stop chaos through the death penalty and arrests by cannon.

The only way to end chaos could be with State Duma, which appeared as a constitutional democratic institute and guaranteed liberty, equality and justice for all people [9].Thus, the jadids supported parliamentarism. Of course, the development of the jadids idea of democracy was based on constitutional monarchy. At that time, however, they did not apply radical measures, because they thought tragic results could arrive from this. Their tactics included supporting the democratic process, giving stability to new democratic institutes, creating normal conditions for the government's work, and at the same time, demanding rationally to obtain independent rights in educational and religious fields.

As a whole, during the revolution of 1905-1907, jadidism appeared as a progressive political movement. It assisted in awakening the Turkistan population and forming the ideology of a national liberty movement.

The years between 1908-1916 were characterized by a quantitative and an organizational growth for jadidism. Hundreds of people were members, however, even at that time it had not yet achieved its massive character. The secret groups of jadids appeared thereafter.

According to the police reports, in Tashkent such groups were headed by teacher Akhmedjanov and consisted mainly of national intelligence representatives and educated students [10, p. 274]. The Kokand underground group counted for more than fifty members. The Andijan jadids had an illegal organization named "Taraqqiyparvar", one of the leaders of which was a famous reformer, Ubaydulla Khodjayev [11.

During the interrevolutionary period, political differentiation among jadids continued. At that time the jadids movement began to have clearly expressed political features.

Some external and internal factors made a substantial influence on this. The jadid movement became more organized alter that, when under the influence of the "Mladoturk" (Young Turks) revolution in 1908 and the Persian revolution of 1905-1911.

It should be noted that the "Young Turks" revolution interested intelligent persons and entrepreneurs of Turkistan and Bukhara. It gave the impulse for the growth of national self-consciousness and formed the ideology of national independence. Under its influence in programs of jadids strengthening antifeudal and anticolonial features, ideas of fighting with imperial and local despotism appeared more clearly, constitutional reforming of formed institutions of power.

Experiences of revolutions in 1908 in Turkey and during 1905-1907 in Russia expanded the ideological and practical activities of jadids. Most of them become defenders of "Young Turks", This model became for them like the standard of practical decision-making of social-economic and cultural problems, and for gaining national freedom. As a result, a considerable part of the local national intelligentsia persons saw in Turkey the natural ally in struggling with Russian nationalism. According to the information of the secret Police Department, a notable representative of jadids Obidjon Makhmudov from Fergana, more than once repeated that Turkistan must be liberated from the Russian dominion. According to him it was possible to reach this aim simply with a friendly relationship and assistance from Turkey.

The revolution ofIran (1905-1911) arouse visible resonance in Turkistan. This revolution used slogans of constitutional limitation of absolute monarchy and modernization of the social system.

The first World War assisted the radicalization of the jadids way of thinking. It strengthened the criticism of basic postulates of official ideology and the mechanism of political life. During that time there was a growing interest in democratic, political and legal institutions and mechanisms, which were established in developed countries of Europe.

In particular, they wrote about the parliamentary monarchy and the republican way of governing, president power, democratic rights and freedom of citizens, ways citizens participated in governing the state society, creating state organs and drafting lands.

Understanding the ideology and the tactics of the national-liberation struggle of colonial people became another centre of stable attention of the national democrats. The jadids approached the assimilation of political-law experiences of different countries of Europe, very creatively and learned the experiences of anticolonial movements. From the extensive knowledge of state building and legislation of European countries, ideology and tactic struggles of anticolonial and democratic movements of Russians and people from the East; the jadids chose everything that could satisfy the conditions of their country and they gave up or modified everything that did not satisfy these conditions.

The February Revolution in 1917, had become the transformation period in political thought of the Muslims of Turkistan. The new powers in the political theatre which committed their independence to lead these democratic processes began to appear. The national political parties and organizations were created and the new magazines ("Turon", "Ulug Turkiston", "Najot", "Kengash", "Hurriyat", etc.) reflected ideas and interests of the democratically oriented national intelligentsia and different levels of the local population under its power.

The February Revolution had made it possible to change the directions of the jadids. Most of the former jadid circles already did not act independently - many of their members were united to the organizations "Shuroi- Islamiya" and "Turon" and also "Ittifoq" ("The Union of Muslim Labors").

The jadids began to actively work out the programmer documents, strategies and the tactics of the practical operations.

With the change of a common position in one country, jadids insistently began to bring forth the actual problems of the reformation of the social-political structure along with the high school graduation. They sharply criticized colonialism. They had nominated the idea of conquering the state independence on the first plane, completely opened the former idea of supporting the constitutional monarchy and were for giving to Turkistan the status of national territorial autonomy in Russian Democratic Federative Republic [12].

"Yashasin qushma halq jumhuriyati" ("Long live the Federation Republic") was the slogan of the new jadidistic papers which began to be published in 1917 and it was also the slogan of the Turkistan federal party's newspaper "Turk eli". The slogan meant "The unity of Turkistan with benevolent nations on the rights of national, cultural and territorial autonomy" [13].

Great attention was paid to working out mechanisms of realization of principles of national territorial autonomy. In particular, the organization of the higher body of power, administration and court of Turkistan. These were called to maintain Turkistan's independent power to adopt laws concerning issues referring to the competition of the Turkistan Federative Republic and to create its own state structure and so on. As a basic form of administration, the republican form was chosen. 1'orming a democratic society in which democratic rights and freedom had to be represented and constitutionally guaranteed de-(ined a prioritical goal. The idea of equality of all the nations of Turkistan in all spheres of economic, social-political, legal and cultural lifebefore the law had been the great progress of that time. Turkistan jadids connected the implementation of state independence with peace and accord among different social forces of the country with convection of legal counsel of Russia formed on a democratic basis.

Ideas of the reformation of Muslim society began to deepen. Calling for recreation of former powers of Islam and Islamic nations by means of simplification of customs and termination of everything unbearable fanatics sounded in the theoretical points of view of jadids.

Having no doubts on a religious basis of Muslim society, their reforming idea was oriented for renewing only the structure. They suggested to overlook the public philosophical system of Islam not only by the positions of developing culture, science and education, but also by the framework of ant colonial fighting. The jadids learnt, in particular that "the idea of the power of people is contained in Islamic teaching", based on principles of Islamic democracy. The teaching of reformers, sharply directed against the colonial yoke, for national renaissance was very popular among the Muslim population. They tried to modernize Islam and prepare it for aims regarding the national-liberty of Muslim oriented people as a united factor in the fight against European colonists.

CONCLUSION

Therefore, as a conclusion, we can say that noted in the development and evolution of Central Asian reformism at the beginning of XX century, one can underline several main stages (levels):

1.Reformism on the eve and in the period of the Russian Revolutionin 1905-1907; 2.Reformism of 1908-1916; 3.Reformism in revolutionary events in 1917.

ABSTRACT

This article provides some information on the biology of earthworms and discusses the issues of determining the density of earthworms in the wild. Earthworms also affect soil structure. The special substance secreted by the glands in their gut has the property of neutralizing the acid reaction of the soil. They pass the soil through the intestines and produce fine-grained coprolites. Coprolites are not crushed in water, absorb moisture well.

INTRODUCTION

There are more than 200 species of earthworms (Lumbricidae) on Earth, which are true geobionts according to their habitat, and most species emerge on the soil surface in very humid weather or after rain. According to the diet of earthworms, saprobionts are animals that feed on various fungal organic matters. In their gut, the type of food is broken down by different bacteria to form biohumus. In the process of intestinal polymerization, humic acids are formed from the decomposition products of organic matter. These acids together with mineral components form complex compounds. Earthworms also affect soil structure. The special substance secreted by the glands in their gut has the property of neutralizing the acid reaction of the soil. They pass the soil through the intestines and produce fine-grained coprolites. Coprolites are not crushed in water, absorb moisture well. They contain 10-15% humus. Microorganisms thrive well in coprolites. It recycles the soil throughout the year due to uar feeding. In addition, ammonifying bacteria that live in the intestines of worms mineralize nitrogenous organic matter to ammonia. Therefore, the

reclamation condition of soils with a lot of earthworms is much better than other soils. These soils are water-permeable and air-permeable pores, are less prone to water and air erosion, and have high yields.

THE MAIN FINDINGS AND RESULTS

This paper analyzes the quantitative density of earthworms in different biotopes. To determine the quantitative density of earthworms, the following work was done:

1-biotop: Quantitative determination of earthworms between plant cover. It counted earthworms in the bedding layer under mulberry, apricot, poplar, willow, and maple plants.

In nature, to determine the quantitative density of earthworms, the surface of the soil occupied by the bedding formed by each plant is observed. The topsoil layer is the vegetative-generative organs of the plants collected on the surface of the soil. the leaves of the plant, the bark, the dried twigs are composed of the fruits of the flower. For example, in pine-leaf plants, the litter consists of year-round pine leaves, bark, and dome, while in other plants, a large amount of phytomass accumulates at once due to autumn frosts. In such plants, the bark, flowers and fruits are shed in different seasons, forming the lower layer of the bed (**H**-lower). The remaining layers form the middle (**c**-medium) and upper (**B**-beige) tiers. These are denoted vertically by the top -**b**, the middle **F**-, and the bottom -**H**. These layers have the following properties:

Layer 1 is a favorable layer, where ecologically diverse organisms live. Their activity is seasonal. Epiphytes, non-spore-forming bacteria, fungi, and nematodes are found in this layer. In the B layer, simple carbohydrates, pectin and proteins change.

The middle layer, F, is home to many microorganisms, so basic biological processes take place. Organisms living in this layer differ from other layers by their diversity. Colembolas and thyroid canals are common in this layer of invertebrates. In this layer (in invertebrates) organic substances such as cellulose, pectin, and chitin are broken down.

In the lowest **H** layer, the number of organisms decreases. Here, complete decomposition of organic matter is observed. In the **H**-layer, saprotrophic earthworms are more common. The caterpillars are small and do not exceed 6.5 cm in length. (BabevaZenava 1989).

1. In order to quantify these species in the pavement layer, the surface area occupied by each tree pavement was first identified. For example, if the floor area of a tree is 8 m from north to south and 10 m from west to east, the floor area will be 8x10 = 80 m².

2. A sampling area of 1 m² is selected from 3-5 places on 2 diagonals of the surface occupied by the same wood floor. Then the amount of bedding at the selected location is A; B; The amount of b-layer bedding in area C: The phytomass is determined for layer F and layer H. In this case, Phytomass: $M_1 + M_2 + M_3$ is selected and the average wax at 1 m² is found.

Mum = $M_1 + M_2 + M_3$ is the value obtained

Wax
Fragile =   3

Based on the formula, the average bed phytomass is found. Then if we multiply it by the total area, we get 1 tree. Then, if the number of earthworms in each sample is (N) x (S), multiplying this surface gives the total number of earthworms in 1 tree.

MuWax=Nort x Smaydon

For example, if an average of 1 m² bed contains 5 worms, then an 80 m² bed contains:

Wax = 5x80 = 400 worms.

Given that the average weight of worms detected in the plant bed in the laboratory was 380-420 mg, we obtain the following result.

The Fragile = 400 x 2 gr = 800 gr.

The result will be the biomass of earthworms in the middle-aged broad-leaved vegetation. To determine the amount of earthworms in each soil type, the surface layer (0-10 cm), tillage layer (o-30 cm), deep layer (25-50 cm) in the area from 1 to 5 m 1 of the area should be vertical. We took a cross-section of the soil and counted the earthworms in these layers. In order to separate the worms, a soil sieve (holes with a diameter of 0.5 mm made of aluminum material) was used to separate the soil animals. Each excavated soil sample was passed through a sieve to collect worms and their cocoons. The earthworms in each section were labeled with a soil sample in special salafan bags. This label contains the address, section number and date of the soil section.

For laboratory observation of earthworms, we used 500 cm3 glass jars. For each type of worm, 5-6 boxes were taken and each box was filled with 4-5 cm thick soil and nutrient medium. Sadoks were numbered and recorded in the laboratory notebook. The control (control) worm was filled with natural soil brought from nature; the remaining containers were filled with laboratory-prepared nutrients of different composition and it was determined how long it took for it to become fully coprolite. The relative humidity of the soil was maintained at 80-85% for the experiment to be carried out in moderation, always monitored once a day. Containers with earthworms were stored in a thermostat that could regulate the temperature. Small round cotton balls were placed to retain moisture in the soil.

In the laboratory, food was prepared in the following order and composition to determine the level of absorption of worms in relation to food.

Option I: Up to 70% fermented cattle manure and 10% vegetable husk and 20% wheat straw.

Option II: Cattle and sheep manure 80% and plant manure and wheat straw 20%.

Option III: Horse and rabbit manure 70% and mulberry, poplar and wheat straw 30%.

Option IV: Horse and rabbit manure 100%.

Option V: Horse manure 50% and cattle manure 50%.

Option VI: 70% manure, 20% wheat straw, 10% maple leaves. Option VII: 70% manure, 10% mulberry husk and 20% rice straw.

Option VIII: Horse manure 80% and 20% potatoes, carrot peel.

Option IX: 80% beef manure and 20% potatoes, carrot peel.

1% sugary water, wastewater and clean drinking water were also used to moisten the food prepared for the worms. The relative humidity of the feed was always kept in the range of 70-80%. The temperature changed with the seasons. The experiments were carried out for a period of one month: stored at a temperature of 10-15 ℃ in February-March, 16-20 ℃ in March-April, and 25-30 ℃ in May-June.

We used the following method to determine the reproduction of earthworms. Earthworms collected from nature were placed in wooden boxes 50 cm long, 40 cm wide and 20 cm deep with a thickness of 10 cm. Soil moisture was in the range of 70-80% and the temperature was in the range of 15-20 ℃ in spring and 18-24 ℃ in autumn-August-September. The inside of the box is 25x30 and divided by plywood. Each section was filled with 5 pairs of 20 worms, and the total number of cocoons laid on them per day was calculated.

Earthworms are large and active soil animals, they are part of the soil microfauna, some species even megafauna. Only members of the Lumbricidae family have been found in Uzbekistan.

The rain worm does not have eyes, but it can feel the light well. As a result, the earthworms escape from the light and enter the soil.

Earthworms form 3 ecological groups:

 1. Hemiegaphone species that live on the surface or in the ground;

 2. Species that live in humus;

 3. Evegaphone species that live in the deep layers of the soil.

Micodriluscaliginosus is very common in irrigated lands. It is gray and about 15 cm long. Lives at a depth of 10–15 cm in the plowed layer of soil, almost does not rise to the surface. The worms feed on moldy roots and humus. With the onset of drought, it falls in the dry layers of the soil (up to 0.5 mg), forming a capsule of mucous substance and enters a state of diapause (temporary numbness). Under favorable conditions, the number of worms in 1 m² of soil can reach 400-500. In terms of weight, worms outperform other animals, and in some cases the worm can make up 50-70 percent of the total soil biomass. The number of worms in 1 m² of soil can reach 400-500.

 Where manure and compost accumulates, the red-smelling worm Eisenia is common. Eisenia belongs to the group of earthworms that live on the soil surface. Its average length is 8 cm, and about 1,000 worms can be found in 1 m² of substrate. The developmental cycle of Eisenia is much shorter than that of other worms, lasting 150-160 days. This worm can grow non-stop throughout the year in greenhouse soils and in place of compost.

Soil moisture and temperature have a significant effect on the spread of earthworms. During drought years, when the soil moisture is very low, as well as when the soil freezes, a lot of worms die. High temperatures have a negative effect on them. Earthworms are very important in the soil. Their needles make the soil porous. It improves water absorption and air penetration into it. The plant allows the root system to grow well. Under favorable conditions, the total length of the nests formed by worms in 1 m² of soil can reach 1 km, sometimes 8 km. The walls of the nests are lined with a mucous substance secreted by worms. In heavy soils, the roots of the plants grow mainly in the nests dug by the worms. Due to the activity of the worms, the soil mixes, the lower layers sink to the top and the top layers sink to the bottom. Worms bring plant debris into the soil and enrich the soil with organic matter. Earthworms are good food for a variety of soil animals, especially

wild mammals, rodents, as well as birds. Earthworms are 9-10 cm long and 1 cm in diameter. The end of the head is dark and the tail is blood-colored. The worm's blood has no trace elements, and because it has a red pigment, it glows red. During the day, the worm lives in its nest. This is because ultraviolet light can damage the skin. It therefore rises at night to the surface layer of the soil. The worm's body is filled with a special fluid that makes it tense. In earthworms, there are 5 pairs of "hearts" because the large ring of blood vessels that connect the blood vessels in the shoulder and abdomen act as the heart. Blood flows from the back to the shoulders to the front, and in the abdominal veins from the front of the body to the tail. The earthworms had many rings, and the number of rings exceeded 100. Each trunk has 4 pairs of blades, 2 of which are on the "shoulder" side.

Earthworms do not develop sight or hearing. But he can feel the light, the vibrations in the rock. They breathe from the external environment through their entire skin. The movement of earthworms is carried out by peristaltic movement of muscles. Its longitudinal and curved muscles contract and the body becomes thinner. As the worm's head enters the soil, the longitudinal and flexor muscles contract. The worm's body thickens. In this way, he moves periodically, leaning on the hairs on his body. The earthworm enriches the soil by mineralizing the organic residues that fall into the soil layer. Earthworms, like other earthworms, are hermaphroditic. Two worms are involved in the fertilization process. During the exchange of seeds, the seed-receiving hole of the 2nd worm should correspond to the touch of the worm 1. The girdle of the adult worm is clearly separated from the body: This process takes 25-30 minutes. If the worm is exposed to light or mechanics during this time, the process will stop automatically. Seed exchange is incomplete. At the end of fertilization, a mucous substance forms around the girdle, and due to the movement of the worm, the mucous substance formed from the girdle surrounds the surface of the fertilized egg that comes out of the hole. It is from this fertilized egg that the cocoon is formed from the worm's mucus. The cocoon is initially white and vibrant. Gradually hardens, the color changes to yellowish-brown, pale yellow, the shape is slightly elongated. The size of the cocoons is 3-4, sometimes 5 mm. The subsequent color of the cocoons depends on the development of the cocoon. That is, 5-8 days after laying the cocoon, the tendency to redness begins to be felt. The process of getting the worms out of the cocoon is also different, ie in some it takes 1 hour, in others it takes several days. The number of young chicks depends on the number of eggs laid in the cocoon. The number of seeds can range from 1 to 6, and sometimes up to 8.

The fewer worms emerge from the cocoon, the higher its viability. Also, if 1-2 worms come out of the cocoon, it will be bigger and more active.

Sometimes the cocoons turn dark brown. These cocoons are dead cocoons from which no worms will ever emerge. Any mechanical action can cause the cocoons to become like this. The cocoons are reddish in color and light reddish in color and range in length from 7 mm to 2 cm. It takes 2.5-3 months for a young worm to mature. That is, after 2.5–3 months, they start laying cocoons.

There must be enough moisture and nutrients for the worms to lay their cocoons. If there is enough food and heat, some chicks can lay cocoons even in winter. Conversely, if the soil is dry and there is not enough nutrients, the worms may not lay cocoons during the cocooning season, and will certainly die when the cocoons are planted. Worms are sensitive to light. When a worm in a dark container is exposed to light, it can be observed that it escapes the light and quickly penetrates the soil.

Worms are also very sensitive to mechanical and chemical influences.

To prove this, we can take 1 worm and see that when it is mechanically affected by an object, it pulls out the affected part. When the worm is brought close to the cotton with alcohol (perfume), it pulls on that side. Worms also sense the mechanical effects on the soil. In the process of softening the earth in the spring, we can see that the worms begin to emerge from the places where we have not yet softened.

Earthworms survive in cold conditions. They retain their viability even at temperatures below 0ºC, in frozen soil. On January 2, 2008, the temperature dropped to -5ºC. On this day, the top of the soil was frozen (5 cm). As the air cools, it penetrates the soil towards the lower deep layer.

COCNCLUSION

An area profile of 0.5 m square was taken from the middle part of the ground for the experiment. In the frozen part of the soil up to 5 cm, the worms do not rot at all. Only 3 worms up to 10 cm were found. Eight worms were found 20 cm below. In the remaining 50 cm, 23 worms were found. The worms were not moving at all from the cold. It is also less sensitive and is not affected by mechanical shocks, odors, or light. The body is very loose and stays as it is. This puts the worms in a bowl and puts them at room temperature. After two days, the worms were mechanically exposed to the worms to test their sensitivity to various influences, and the worms gradually pulled out the affected body part. This shows that at low temperatures, the worms are less active and survive in a less sensitive environment. But they are also very resistant to high temperatures and drought. In summary, earthworms have been analyzed for their digestive processes, their role in soil respiration, the importance of nutrients in nature, the biochemical composition of the soil, and their positive effects on micro-fauna.

ABSTRACT

The article discusses phonetic principles – the features of vowel harmony, the way of applying it in Ikan dialect, as well as certain words and forms of the words not following the phonetic principles.

KEYWORDS: *Speech, Harmonious, Vowel Harmony, Palatal Vowel Harmony, Labial Vowel Harmony, Phonetic Principles, Front Vowels, Back Vowels, Dialect.*

INTRODUCTION

The village of Ikan is located on the ancient Silk Road, 20 km south of the city of Turkestan in the Turkestan region of the Republic of Kazakhstan, the population of which is Uzbeks.

Ikan dialect is also a part of the national Uzbek language. Prof. E. D. Polivanovstated that according to the vowel system and a number of linguistic features of this dialectincluded it to 1st type of the group of northern Uzbek dialects of the Oguz dialect (Ikan-Karabulak dialect). V. V. Reshetovalso agrees with E. D. Polivanov's descriptive work on Uzbek dialects and that the interpretation of linguistic facts did not raise any objections, concluding thatIkan dialect belongs to the northern Uzbek group (Ikan- Karabulak dialect) of the Qarluq-Chigil-Uyghur dialect [Reshetov, 1966: 10]. Our observations show that the dialect has more relevance to the Oghuz dialect due to phonetic, morphological and lexical features. Although some information has been provided in the scientific literature on the linguistic features of the Uzbek Ikan dialect [Polivanov, 1929: 526-537], no special research has been carried regarding it.

There are many opinions about the phenomenon of vowel harmony of Turkic languages in the literature, which has been studied in detail in both Turkology and Uzbek linguistics [Abdullayev, 1961; Ashirboyev, 2016; Ibrohimov, 1967; Tenishev, 1984; Mirtojiyev, 2013; Mahmudov, 2006; Muhammadjonov, 1981; Reshetov V.V., Shoabdurahmonov, 1978;].

Vowel harmony is a phonetic law related to the nature of the ancient Turkic language. This law requires that the following syllables be harmonized according to the word stem of the word or the vowel in the first syllable. The applications of the law of vowel harmony to Uzbek dialects are different, and in the basic urban dialects and literary language it has lost its relevance. We will analyze the state of application of this phenomenon in the dialect of Ikan. To begin with, we will focus on palatal vowel harmony.

In palatal vowel harmony, if the first syllable of the word stem contains the back vowels of the tongue, then in the last syllables of the word there are also the back vowels of the tongue, and vice versa, if in the first syllable of the word stem there are the front vowels of the tongue, then in the last syllables of the word there are, accordingly, the front vowels of the tongue. This phenomenon of the vowels is also mentioned in the literature. The scientists have claimed that this case is also appliable with the consonants such as q, g, x, and k, g.

In Ikan dialect, palatal vowel harmony is common and is fully applicable in the second and subsequent syllables. For example: in words such as vowels harmonize according to the feature of the language back, a:ja (oyi), ba:ba (bobo), ba:la (bola), ba:qïr (chelak), ta:baq (tovoq), a:jna (ko'zgu), do:rba(to'rva), ča:lɣï(chovli), ta:mčaq (tomchi), qa:lža(tashqiko'rinish), ča:ɣïr (shag'al), čo:paq (kaltakesak), bolamaq (atala), do:rba, qa:ɣun, ašqultaq(zinapoya), šumɣïla(xasis), ba:šmaltaq (ovqatningturi), qa:vuzɣan (qo'ng'iz), šanɣïllama, qarayla (kuzatibyur), while in such words , vowels are harmonized by the front language feature, bö:bäк (chaqaloq), tö:män (past tomon), кä:рčък, дä:дä (ada, ota), ä:ski (latta), käzäk (navbat), če:čäk (chumchuq), i:čäk, bö:täk (boshqa), ä:päžäk (so'lak), kö:mäkäj (qizilo'ngach), pä:tir (nonningturi), čö:kirtkä (chigirtka), čildirmä (doira), ö:rmäčäk (o'rgimchak), sö:lämäk (sumalak), kä:kirdäk (kekirdak).

In palatal vowel harmony of the dialect, it is commonly observed that according to the hardness and softness of the same vowel, the same harmonization occurs in the words: hä:mä (amma), käzäk (navbat), kä:säk (xomg'isht), ä:šäk (eshak), ä:gär (egar), ä:räzän (ustinikiriarchilmaydigankishilar),ä:ляк (elak), tä:lpäk (telpak), kä:sä (kosa), härrä (arra), zä:väräk (suvarak), ä:säläŋ (esi past), pišik(mushuk), tü:ndük (mo'ri), ta:rma (xaskash), atqar (ado etmoq), da:lbasalab (talvasagatushib), a: ɣarɣan (oqlik), jarɣa:nat (ko'rshapalak), jïbïsqï (pismiq), bultur (o'tganyili), julun(bo'yinso'ngagiichidagioqilik) and etc.

There are also two variations of affixes in the dialect and depending on the hardness and softness of the base vowels and with what sound ends, the one of affixes is applied. For example: plural affixes: -lär//lar, -när//nar:kä:mpirlär, ö:jlär, ba:llar,ča:llar,kä:linnär, je:ŋnär, i:čiŋnär, a:damnar, me:ma:nnar, barïŋnar. Affixes of noun cases: genitive case:-iŋ, -ïŋ, //-üŋ, -uŋ, //-niŋ, -nïŋ: I:šiŋközini bilädi. Tö:mätiŋ tü:bi ja:rïq;Ö:zijo:ɣïŋ,közi joq.Ba:jïŋ ašïnï bajɣuz qo:rɣaptï; Ü:nüŋö:šsi (ovozing o'chsin). Quduɣuŋ ičigä čüšipti.- üŋ, -uŋforms ofaffixes ofgenitive case are not commoni. Accusative form of nouns: -ni//nï: U:rɣa:nï u:n ašï, sö:kkäni sö:k ašï. Dative case:-gä// ɣa // kä//qa // ä// a: Täggängä tägädi, tägmägäŋgä kä:säк atadï. Ö:lmäs ba:lïqqa su:učraptï. Ïmtïlɣan iškä, Tartïnɣan ta:šɣa. I:t i:tkä saladï, i:t qujruɣïɣa. I:timä ha:r, pišigimä na:mïs. Ajaɣïŋa ba:ɣ, jürägiŋä da:ɣ.

Instrumental noun case:-dä//da, -tä//ta: Kä:ndä kältäk jedim, To:xïtqada toqmaq. I:štä kö:rinmäjdi, a:šta birinči.

Prepositional noun case:-din//dïn, -tin//tïn: dä:däsidin örgändi, a:ldïŋdïn aqqan su:, xa:lasïdïn so:radï, i:štin kädi, ba:štïn bašladï.

However, word-formers and other affixes also have their own front and back tongue phonetic variants. For example,-ki, -gi, -qï, -γï: iš-ki, ke:š-ki, kü:z-gi, tü:ŋ-gi, sïrt-qï, qïš-qï, ja:z-γï, baha:r-γï;

-lik, -lïq: kälin-lik, küjöv-liκ, bändä-lik, ba:la-lïq, qarï-lïq, ja:š-lïq.

-lä, -la:1.I:šlägänčišläjdi,i:šlämägän kišnäjdi. 2.Da:lada o:tlap jürgän ma:l žä: köp. 3.Ke:tiŋ o:tïnï otlasaŋ, Še:tiŋ su:ïnï su:lajsa. In all the examples given above, we see that the word-forming affixes are added to syllables according to the front and back vowels of the vowels.

This rule applies not only to word-forming affixes, but also to form-forming affixes, for instance: Bar-a-san-a, käl-ä-sän-ä, se:ŋ iš-iŋ. // Bar-ïš ba:r, käl-iš joq. // Bar-γan-ïŋ balta-sï, kä:gän-iŋ ke:tmän-i. // Bar-γučaj, kä:-güčäj Ši:rin sö:l-lä-di. // A:γïz-lïq-qa söz be:-mä-gän, ∥ A:jaq-lïq-qa jo:l be:-mä-gän.

Hence, the choice of thick-thin variants of affixes in the dialect is based on the nature of the base vowel and some consonant sounds.

In compound words, the parts are combined according to their hardness and softness, for example:a:šqa:zan, alaqa:rγa, aγa:lma, ja:rγa:nat, ja: γaš qa: šïq, a:lačïpar, a:laxoržïn, a:ppar (olib bor), qaraba:š (yolg'iz bosh), su:jïla:n, kö:zä:jnäk, äkkä (olib kel), äččüš (olib tush), be:šigü:rtki, i:tköjnäk, kä:linčü:štü, i:tüzüm, kä:linkö:rdi, tä:mirtikän, bü:rsügün, čä:käče:š (soch o'rish turi).

In the dialect, it can be observed that most of the loanwords from other languages are subject to vowel harmony.Take Arabic loanwords for example, the back vowels in these words: sa:ndïq, a:dam,a:vlat,a:sbap, va:da, a:zap, ma:zarat, Sulta:n, Sa:dïq, qa:dam, qa:ssa:p, sa:daqa, sa:bïr, sa:vda:, a: šïq, a:qïbat, a:datand Persian loanwordsdurus, arza:n, a:rdap, sa:pïn, ba:zar, a:vaz, a:xur, a:jna, ra:sa, da:rï, a:stana, da:rman, pa:da; it tends to be softer in words such as,tö:mät, hö:när, lä:nät, häkim, Rä:hilä, Sä:näbär, ä:häk, kä:pκir, kö:git, nä:zik.

Russian loanwords, the front vowels of the following words are harmonized: ü:tik, lä:mpiškä, tä:liŋkä, bü:lüškä//bö:lüškä, vi:lkä, tö:lkä (faqat), kä:mpit (konfeta), bä:nkä, tiräktir, žimpir, mäši:nä, ä:dris (adres), äspä:lt, gäzi:t, känse:rt, kä:stim, bälni:sä,istö:l.

The words such asO:ddïx, a:rza (ariza),pa:lto, pa:spïrt, po:šta, po:vur, are harmonized in accordance to the features of the back tongue vowels.

As any dialect of the Uzbek language, the Ikan dialect has also some distortions of vowel harmony, it is given in the following:

1. Some loanwords such as kä:läva:t, mä:käro:n, tilvizo:r, Kämra:n, Me:riba:n, küla:l, gü:na:, kita:p, gä:ra:n, me:ma:n, dä:stirxa:n, Za:hit, Va:hit, Ha:sijät, hisa:p, i:ntiza:r, dä:sma:l, Dilša:t do not follow the rule of vowel harmony. The primary long vowel a: (ɔ :) is involved in all these words. It is noted that in the first syllable of words such as Za: hit, Va: hit, Ha: sijät, the back-vowel a: is present and accordingly the consonant sounds tend to be pronounced harshly, and in the following syllables, the vowel and consonant sounds tend to be softly pronounced accordingly.

2. There are cases of disharmony in compound words: qu:mšäkär, kö:kčaj, sü:talma (olmaningnavi), be:šiktoj,küйövta:lat (marosimnomi), jo:lčibin, a:qžögär, ža:nköjnik (kuydirgi), čä:käčandr (tirishqoq), si:rqujruq (ovvoyio't), birätola (biryo'la), qa:jïmbikä, ke:šqurun,qï:ztäkä (ayolsifaterkak), mäkkäqa:baq, bä:tačar, kä:linsala:m, tä:mirqa:šïq, belba:q, qïrqgä:žäk, širin ta:maq, a:ɣöj(oquy – zalma'nosida), bunna:kün (o'tkan kun), a:ldïngün, hämäto:tï (ammasiningqizi), kä:linqï:z (qarindoshgakelinbo'lganqiz), kä:nna:ja (kelinoyi), ča:jišti.In these examples, although the components of a compound word do not match, the front vowel in the first part and the sounds in the second part do. For example, mäkkä+qa:baq, the front vowels in the first component of the compound word and the back vowels in the second component are harmonized. Therefore, it keeps harmony within compound words.

3. Since most of the particles have only single variation, they are not subject to vowel harmonization.

As the particles of - ɣu, -da, -aq, -jaqwith only variant of the back vowel, they do not harmonize with the word stem, only some of them can fit with the words of the back vowels. For example, -ɣu: keldi-ku~ kädi-ɣu, aytdi-ku~e:tti-ɣu, bordi-ku ~ bardï-ɣu, qoldi-ku~ qa:dï- ɣu; -da:keldi-da~ kädi-da, aytdi-da~e:tti-da, bordi-da ~ bardï-da, qoldi-da~ qa:dï-da; -aq: keliboq~ kä:baq, aytiboq~e:dibaq, bariboq~ barïbaq, qoliboq~ qa:baq; -jaq: o'zijaq ~ ö:zijaq.

4. The-dog'on//do:nform of the adjective has only a back vowel variant, such as yotadigan ~ jatadoɣon // jatado:n, boradigan ~ baradoɣon // barado:n, aytadigan~e:dädoɣon // e:dädo:n, biladigan~ bilädoɣon // bilädo:n.

5. The form –iŋki,–niki, used for formation of the meaning of belonging, the front vowel variant of it is appliableonlya:ɣam-iŋki, xa:lam-iŋki, siŋnim-iŋki, öj-iŋki, taɣam-iŋki, qï:zï-niki, oɣlï-niki.

6. The affix -da:ɣï, used to form adjectives, has only a back vowel variant:

i:š-da:ɣï, šä:r- da:ɣï, ba:lalïq-da:ɣï, ta:ɣ-da:ɣï, öj-da:ɣï, xa:na-da:ɣï, siŋnim-da:ɣï.

7. Only the back-vowel variant of the -dek (-day)affix, which is used to form assimilation, is used in the form –daq: pišik-daq, se:n-daq, a:j-daq, qoj-daq, kün-daq.

8. Incomplete verb –äkä (ekan): kä:lädäkä, ba:radäка, ojnajdäkä, jazadäка...

Labial vowel harmony. Although labial vowel harmony is very rare in Ikan dialect, it is still present, for example: tü:ndük (mo'ri), küjöv (kuyov), bultur (o'tgan yili), julun (boyin suyagiichidagi oqilig), tügün, quduq, qoŋur (qo'ng'ir), qojuŋ, qolum, türlük (turli), murun (burun), nuqul (doim), müŋüz (hayvon shoxi), juduruq (musht), köjnük (g'am, tashvish), köŋnü, köзüŋ, örüm and etc.

The examples show that if the first syllable uses the labial vowel, so the vowel with same features will be in the second syllable. As a result, ü-ü, u-u or o-o, o-u, ö-ö, ö-üare harmonized in given forms.

E.D. Polivanov, a scientist who identified several features of the Ikan dialect that differ from other Uzbek dialects, noted that the dialect has more labial vowel harmony features, and that the labial vowel harmony is more pronounced in ikan dialect rather than in the Turkestan dialect, not

only in closed syllables(qol-um), but also,he gives the example of the words qo-lu, o-qu, indicating that it exists in the open syllables too [Polivanov, 1929:536].

The following examples illustrate the accuracy of his claim:: i:šini kör-sü, e:r tur-su(erta tursin), jamannïqtïn qorq-su, qo-lu uzun.

In Uzbek dialects, the nature of labial vowel harmony is characteristic of the first two syllables of words, rarely in the third and fourth syllables [Ashirbaev, 2016: 27]. This form of vowel harmony is not consistent in the Ikan dialect, as in all dialects of the Uzbek language.

F.Abdullayev noted that labial vowel harmony in Oghuz group dialects is very rare, and in the first syllable of words such as ,otir,güniŋ if one of the sounds o - ö or u-ü comes, except for some cases, in the second closed syllable between u with ï there is an indefinite sound pronounced[Abdullayev, 1965: 18]. These views of F. Abdullayevare also supported in our observations. For example, in the words such as, jügür//jügir, sujuq//sujïq, o:dun//odïn, uruš//urïš, uruq//urïq, tüzük//tüzik,kölük//kölik, qulun//qulïn, indeed, it is difficult to distinguish the pronunciation between the sounds **o, ö, u, ü** and the sounds **i, ï**.

Although the labial vowel harmony is rarely observed in in the thirdsyllables, it is present, for example: bürsügün (indinga), juduruq (musht), tuturuq, qušmurun (quduqhamdaqattiqyerlarniqazishdaishlatiladiganuchlitesha), sürgürüš, bulduruq (kishilargaberilganlaqab).

In conclusion, the rule of vowel harmony, which lost its force in the urban dialects due to the historical process, is still well preserved today and used in the Ikan dialect.

THE STUDY ON THE INTERFERENCE OF UZBEK STUDENTS' ACQUISITION OF CHINESE INITIALS

Chi Daojia*

*Teacher,
Chinese Department,
Tashkent State University of Oriental Studies, Tashkent,
UZBEKISTAN

ABSTRACT

At present, there is still no analysis of Chinese language acquisition errors for Uzbek students in China. This paper is the first to study on the analysis of Chinese Initials errors of Uzbek students. According to Corder's "Error Analysis" theory, the article analyzes Uzbek students' Chinese Initials errors. The purpose is to find out the regular pattern of Uzbek students' phonetic errors and provide some reference for teachers to take the most optimized measures in Chinese phonetics teaching.

KEYWORDS: *Phonetic Acquisition, Phonetic Error, Error Analysis, Influence, Comprehension.*

INTRODUCTION

The so-called "error analysis" is to systematically analyze the students' errors in the process of second language acquisition, study the source, reveal the students' interlanguage system, and understand the process and regular pattern of second language acquisition(Liu Xun 2000). Corder divided the mistakes of second language learners into two types: mistakes and errors. The mistakes of the students discussed in this paper are errors, that is, a regular error caused by the poor grasp of the student's target language.

Error analysis generally consists of five steps (Liu Xun 2000):

First, corpus collection. From the second language students' oral and written expression or listening comprehension, choose the corpus for analysis.

Second, error identification. It is necessary to distinguish between regular errors and accidental errors, and to distinguish between structural errors and pragmatic errors.

Third, error classification. According to the influence of mother tongue or the interference of target language, it can be generally divided into inter lingual errors and intra linguistic errors.

Fourth, the source of error. Negative transfer of mother tongue, negative transfer of target language, negative transfer of cultural factors, influence of learning strategies and communication strategies, and influence of learning environment.

Fifth, error assessment. Assess the severity of the error and whether it affects communication.

At present, there is no error analysis on the Chinese acquisition of Uzbek students (students whose mother tongue or first language is Uzbek). This paper is the first study on the error analysis of the Chinese Initials acquisition of Uzbek students. Based on Corder's "error analysis" theory, the article analyzes and studies the Initials errors of Uzbek students. All the erroneous corpus in this paper are collected and statistically analyzed by the author during the teaching process in Uzbekistan.

2. Contradistinction overview of Uzbek and Chinese Initials

Chinese Pinyin and Uzbek letters are written in Latin letters, so some letters are pronounced the same or similar. There are 22 consonant letters in Chinese phonetic alphabet and 23 consonant letters in Uzbek alphabet. According to the author's research, there are 8 consonants with the same letters and the same pronunciation. 1 consonant with different letter but the same pronunciation. 8 consonants with the same letters and similar pronunciations. 4 consonants with the same letters but the different pronunciation. 3 consonants are totally different. In addition, the Uzbek consonants v and y are the same and similar to the Chinese pinyin letters v and y. But among them, the Scheme for the Chinese Phonetic Alphabet stipulates that v is not used as the spelling of Chinese syllables, only as a spelling of foreign languages, minority languages and dialects. The details are as follows:

TABLE 2-1: COMPARISON OF UZBEK AND CHINESE CONSONANTS

No.	Uzbek consonants	International phonetic	Chinese Consonants	Remarks
Same pronunciation				
1	f	[f]	f	Same letters
2	k	[kʰ]	k	
3	l	[l]	l	
4	m	[m]	m	
5	n	[n]	n	
6	p	[pʰ]	p	
7	s	[s]	s	
8	ng	[ŋ]	ng	
9	v	[v]	无	Same as pinyin v
10	x	[x]	h	Different letters
Similar pronunciation				
11	b	[b]	b	Same letters
12	d	[d]	d	

13	g	[g]	g	
14	j	[dʒ]	j	
15	t	[t]	t	
16	z	[z]	z	
17	sh	[ʃ]	sh	
18	ch	[tʃ]	ch	
19	y	[j]	无	Same as pinyin y
Different pronunciation				
20	h	[h]	无	
21	q	[q]	无	Same letters
22	r	[ɛr]	无	
23	无	[ɕ]	x	
24	g'	[ɢ]	无	
25	无	[tʂ]	zh	Different letters
26	无	[tsʰ]	c	

3. Initial error analysis

3.1 Corpus collection

TABLE 3-1: UZBEK STUDENTS' CHINESE CONSONANT ERROR CORPUS

Initials	International phonetic	Error	International phonetic	Example word	Error corpus
j	[tɕ]	q	[tɕʰ]	挤 jǐ	坐车太挤。 zuò chē tài qǐ.
q	[tɕʰ]	j	[tɕ]	骑 qí	骑车去怎么样？ jí chē qù zěn me yàng？
j	[tɕ]	z	[ts]	己 jǐ	大家谈谈自己的爱好。 dà jiā tán tán zì zǐ de ài hào。
z	[ts]	j	[tɕ]	子 zi	你的箱子重不重？ nǐ de xiāng ji chóng bu zhòng？
q	[tɕʰ]	ch	[tʃ]	拳 quán	你会不会打太极拳？ nǐ huì bu huì dǎ tài jí chuán？
ch	[tʂʰ]	q	[tɕʰ]	吃 chī	我喜欢吃苹果。 wǒ xǐ huan qī píng guǒ
s	[s]	c	[s]	司 sī	司机 cī jī
c	[tsʰ]	s	[s]	词 cí	词语 sí yǔ

s	[s]	x	[ɕ]	四 sì	**找您五**块四。 zhǎo nín wǔ kuài xì
x	[ɕ]	s	[s]	喜 xǐ	**喜**欢 sǐ huɑn
h	[x]	x	[x]	汉 hàn	汉字很难。 xàn zì hěn nán
ch	[tʂʰ]	zh	[tʂ]	长 cháng	长城 zháng chéng
zh	[tʂ]	ch	[tʂʰ]	长 zhǎng	这位是我们马校长。 zhè wèi shì wǒ men mǎ xiào chǎng
r	[ʐ]	z	[z]	人 rén	你是哪国人？ nǐ shì nǎ guó zén

3.2 Classification and identification of errors

3.2.1 Error classification

According to the analysis of Uzbek students' Chinese initial errors, there are mainly several groups of errors: j and q, j and z, q and ch, c and s, s and x, h and x, r and z. The intra-lingual errors are j and q, j and z, s and x, and the inter-lingual errors are q and ch, c and s, h and x, r and z.

3.2.2 Identification of errors

The difference between the initials is determined by the location and method of pronunciation (Huang Borong, Liao Xudong, 2011:30). Based on the pronunciation location, the pronunciation method and the similarities and differences of the pronunciation of Chinese and Uzbek phonetic letters, the article makes a concrete analysis of the errors of the above groups of initials (see Table 3-2):

j and q are both tongue-clearing fricative sounds, the difference is that j is Unaspirated sound, q is a aspirating sound, students are easy to confuse the two.

  j and z are both Unaspirated-clearing fricative sounds, the difference is that j is the front sound of the tongue, and z is the tip sound of the tongue. Students are easy to confuse the two.

s and x are both clearing fricative sounds. The difference is that s is the tip sound of the tongue and x is the front sound of the tongue. Students are easy to confuse the two.

q and ch, ch[tʃ] in Uzbek and ch[tʂʰ] in Chinese are similar, but [tʃ] does not use a retroflection tongue, so the pronunciation of Chinese q[tɕʰ] and Uzbek ch[tʃ] is very similar, and students are confused. .

c and s, there is no letter c in Uzbek, and there is no [tsʰ] sound. The reason for the error is that it is influenced by Russian or English letter c[s], so it is easy to produce errors.

h and x, when students write pinyin, they are easy to confuse the two because the pronunciation of h[x] in Chinese and x[x] in Uzbek are basically the same.

r and z, r [ʐ] in Chinese and z[z] in Uzbek are both muted fricative sounds, the difference is that r [ʐ] is the the posterior of the tip of the tongue and z[z] is the anterior of the tip of the tongue.

In addition, the author found in the teaching that multi-phonetic words are also easy to produce errors for beginners, such as 长 (chang/zhang), students easily confused the initials ch and zh.

Table 3-2: Chinese Pinyin Consonant Alphabet Pronunciation Classification Table

Location Method		Lips		Lip tooth	Tip of the tongue	Tip of the midrange tongue		Behind the tip of the tongue		Front of the tongue	Behind the tongue	
		unvoiced	voiced	unvoiced	voiced	unvoiced	voiced	unvoiced	voiced	unvoiced	unvoiced	voiced
Nasal			m [m]				n [n]					ng [ŋ]
Plosive	unaspirated	b [p]			d [t]						g [g]	
	aspirated	p [pʰ]			t [tʰ]						k [kʰ]	
Affricate	unaspirated			z [ts]			zh [tʂ]		j [tɕ]			
	aspirated			c [tsʰ]			ch [tʂʰ]		q [tɕʰ]			
Fricative				f [f]	s [s]			sh [ʂ]	r [ʐ]	x [ɕ]	h [x]	
Lateral						l [l]						

3.3 Source of errors

First, negative transfer of native language or medium language.

Uzbek has ch[tʃ], x[x], z[z], which are similar to q [tɕh], h[x], r [ʐ] in Chinese, so q and ch, h and x,r and z are easy to generate negative transfer of mother tongue knowledge. In addition, there is no letter c in the Uzbek language. The bias is due to the influence of the Russian or English letter c[s], which is a negative transfer of the medium language knowledge.

Second, negative transfer of knowledge in target language.

There are no such pronunciations as j, q, x and z in Uzbek. The reason for these errors is that Uzbek students do not fully grasp the rules of pronunciation of Chinese Pinyin when they study Chinese. Therefore, the errors of j, q, j, z, s and x belong to the negative transfer of target language knowledge.

Third, the influence of local Chinese teachers.

According to the author's survey, most of the Chinese teachers in Uzbekistan are local teachers, and a few teachers from China. Taking Tashkent National Oriental Institute as an example, there are 19 local Chinese teachers and 4 teachers from China. Most of the native teachers graduated from local universities and their pronunciation is not very standard,which has a great impact on beginners.

CONCLUSION

Generally speaking, Uzbek students show different degrees of errors in initials of Chinese Pinyin. According to the author's investigation of students' phonetics, most of the students who produce the above initial errors are beginners and students who have not systematically learned Chinese Pinyin. With the improvement of Chinese proficiency, such errors will gradually reduce. Therefore, in the primary stage of Chinese learning, teachers should aim at the above initial errors in teaching.

THE IMPORTANCE OF NONVERBAL COMMUNICATION IN TEACHING PROCESS

Manzura Jamolovna Isroilova*

*Teacher,
Termez State University,
UZBEKISTAN

ABSTRACT

In everyday life, a person regularly uses verbal and nonverbal speech in the process of interaction; the two types of speech are interrelated and play an important role in making the speech understandable to the listener, while increasing the emotional sensitivity of the speech process. The relationship between verbal and nonverbal speech is even more important in the education system, in the process of explaining the lesson. The main object of the article is the importance of nonverbal communication between teacher and student in the classroom.

INTRODUCTION

Consciousness and thinking are unique to human beings, we exchange information in the process of communication, it is known that there are verbal and nonverbal forms of communication. Almost every job requires workers to use verbal communication skills. That's why verbal skills are highly ranked on the candidate evaluation checklists used by many job interviewers. However, nonverbal communication also plays an important role in enhancing the semantic tone of communication. The research on nonverbal communication began with the 1872 publication of Charles Darwin's *The Expression of the Emotions in Man and Animals*. Since that time, abundant research has been conducted regarding types, effects, and expressions of unspoken communication and behavior. In recent years, the scope of research on nonverbal communication tools has expanded and become an object of a variety of fields including, next to anthropology, psychology, sociology, and linguistics, also medicine, ethnology. As such, a wide range of studies have accumulated a rich body of literature.

The Main Part

According to the study(Dr. Mehrabian 1960s.), communication is 7 percent verbal, 38 percent vocal and 55 percent visual. The conclusion was that 93 percent of communication is "nonverbal" in nature. From our handshakes to our hairstyles, nonverbal details reveal who we are and impact how we relate to other people. It is also essential to pay attention to other cues such as context. In many cases, you should look at signals as a group rather than focusing on a single action. Research on nonverbal communication has addressed both the communication of states in humans and animals – most often emotions – and the communication of state. There are no utterances or speech signals that lack paralinguistic properties, since speech requires the presence of a voice that can be modulated. Some people are visually oriented. They remember and imagine things by what they look like. According to the results of the research, women and children are more receptive to nonverbal communication than men (Alan and Barbara Pease).They store pictures. Some people are auditory—they store sounds. Some people are kinesthetic-they store touch sensations. As you know, the forms and components of verbal communication (written and oral) are language, vocabulary, content, structure, ton, grammar, spelling, punctuation, capitalization and others. Components and forms of nonverbal communication are body language, gestures, eye contact, facial expression, voice; tone, volume, pitch, personal space, appearance etc.   Here are some types of nonverbal communication components:

Types of nonverbal communication (Body language)				
Facial expression	Physical appearance	Spatial behaviour	Paralanguage	Kinesics
Eyebrow position	Hair	Oriantation	Paradigmatic	Gestures
Eye shape	Clothes	Proximity	Disturbancees / Pitch	Posture)voice)
Skin	Adornment	Distance	Prosodic	Body movement
Mouth shape	Face&Skin	Position	Timing	Kneel
Nostril size	Physique	Dimension	Pitch / Loudness	Lean / punch

Nonverbal communication can be divided into the following categories according to the form and condition of use:

- *Supraverbal*-our appearance such as hairstyles, jewelry, and the color of the clothes we wear, give the primary information in communication process. Through uniform, we can identify a student, a doctor, a lawyer, a police officer, etc. "Language is a more recent technology. Your body language, your eyes, your energy will come through to your audience before you even start speaking"(Peter Guber).For example, when we see a woman in a long black dress with no ornaments, we accept an information that she is saddened, someone close to her has died, a phenomenon like that is related to the specific customs of each nation. These aspects allow others to draw conclusions about our social and societal standing.From a distance, when we see a man with a briefcase in his hand, wearing glasses, a watch, holding a book that does not fit in his briefcase, this image of him gives us social information about him. His glasses, briefcase , the watch, the clothes, the book in his hand, the thoughtfulness on his face give us the initial information, so he can be a teacher, a scientist.

- *Paraverbal* communication refers to the messages that we transmit through the tone, pitch, and pacing of our voices. It is how we say something, not what we say. Paraverbal communication is **the way we convey our messages verbally**. It includes things like intonation as well as the speed, volume and pitch of our speech.

- *Infraverbal* communication consists of various signals, as well as various manifestations of the psyche of each individual. The expression of the intonation of a voice, of an expressiveness of the face, expresses a deeper background, the psyche of the real subject. This facet of nonverbal communication includes such vocal elements as:

- Tone
- Pitch
- Rhythm
- Timbre
- Inflection
- Loudness

 For maximum teaching effectiveness, learn to vary these six elements of our voice.One of the major criticisms is of instructors who speak in a monotone. Listeners perceive these instructors as boring and dull.

- *Periverbal*is everything that touches the environment, the place, the place (think of the perimeter), the configuration of the communication space (office, face to face, round or square table , etc.). But it is also all that relates to proxemics, that is to say the proximity between the protagonists, the communication distance that takes place between 2 people. Intimate distance (the size of your forearm), social distance (2 arms, given by shaking hands) or even public space (beyond the 2 arms), different depending on the culture and the relationship that binds the people concerned, this distance will give an indication of the very nature of the communication that takes place.

In the process of teaching, the low tone of voice in explaining a particular topic, the length or brevity of the tone, the compatibility of facial expressions, hand and body movements with verbal communication, define the essence of speech, give it art and teach the student.It plays an

important role in preventing boredom and neglect of fasting. Lectures also depend on the appropriate use of nonverbal forms of communication by the teacher to increase students' interest in science: gestures, facial expressions, body movements, appearance, stillness or speed of sound. Tone of voice reflects psychological arousal, emotion, and mood. It may also carry social information, as in a sarcastic, superior, or submissive manner of speaking. Furthermore, proper use of tone teachers, in the teaching of poetry is very essential and useful and creates interest and curiosity amongst the students. However, when the teacher slowly explain a lesson in the same tone for a long time, the student may experience symptoms of boredom, yawning, staring at a point, increase the tone of voice and increase the tempo of speech. The human brain not only remembers well-concentrated information, but also allows it to re-analyze this information, which in turn leads to a relative increase in the quality of education. In addition, using a certain element of nonverbal communication can save time in the classroom and allow communication to continue uninterrupted in the communication process,teacher conducts the lesson without interruption if he / she gestures with the eyes, eyebrows or hands without repeating the name of a particular student. The students focused more on the symbols, gestures rather than words. Those symbols help to motivate the students in the class during the lectures. Whenever they go out from the lectures or concerning topic teachers engaged them by using the non verbal communication. "The human species value open, engaging eye contact, such as is normally found in a conversation between friends. It is subconsciously taken as an indication of confidence, authority and sincerity[11]". Our body language speaks to listeners through visual elements, such as eye contact, physical distance between the speaker and the listener, gestures, postures, and body orientation. Body language is as much a part of casual communication as it is of formal presentations."Body postures and movements are frequently indicators of self confidence, energy, fatigue, or status. In the classroom, students keen to receive body messages of enthusiasm and boredom about the subject matter being taught can sense confidence or frustration from the unconscious behavior of the teachers. Observant teachers can also tell when students understand the content presented or when they have trouble grasping the major concepts. A student slouching sends a very different message from one leaning forward or sitting erect. Body movements and postures alone have no exact meaning, but they can greatly support or reject the spoken words. If these two means of communication are dichotomized and contradict each other, the result will be a distorted image and most often the nonverbal will dominate [12] " .

The pedagogical skills of the teacher in the educational process, the ability to play a relevant role in the classroom, the ability to organize verbal and nonverbal communication in a harmonious way, create the basis for improving the quality of education.During the lesson, the teacher enters the role of the environment and role in the process of reading an effective work or prose, and gives the meaning of hand gestures, sadness or joy of the look, nervousness, protest through the eyebrows, distance. It is necessary to constantly change, to pay attention to the fact that the tone and tempo of the voice will not remain the same for a long time, as well as to create the appropriate motivation, the right atmosphere. Classroom management requires a good management of the teacher talking time so as to keep lively and energetic. This can only be achieved if there is an instructive use of gestures. In an EFL classroom it is important that the students do most of the talking. The teacher is normally a sort of monitor, guide, or counselor. The teacher should only content himself/herself with modeling, and let the learners do the job. Gone are the days when the teacher monopolized the talk, since most of the new teaching

methods take for granted that the learner should be the center of the teaching/learning process. Apart from managing the teacher talking time, gestures can serve to create a warm and positive atmosphere where learning can take place. The teacher's body movements and postures can communicate interest, fatigue, or encouragement. Moreover, He/she can analyze the students' attitudes and interests through their body movements and postures. A student who fidgets, slouches, or leans backwards usually shows signs of boredom and disinterest. The teachers observed in this study showed different body movements and posture patterns, can be classified into two major categories. The first category is that of teachers who use dynamic and lively body movements and postures. This category, as revealed by the respondents' answers, motivates learners, encourages them, and makes them involved in the classroom work. The second category, on the other hand, is that of teachers who use body movements and postures in a rigid and stiff way. Teachers like these would usually lean on their desk and cross their arm, or put their hands in their pockets for quite a long time. Or else, they may keep one posture during the whole session. No doubt, this makes the students demotivated and, above all, bored. In fact, changing posture may be used as a smooth transition between the different activities of a lesson. This means that when the teacher changes posture, the students, automatically, know that they are about to start a new task or activity. Postures can also be used to present vocabulary items such as: walk, stand, or haste. By and large, body movements and postures are potential means of communication that teachers need to use cautiously and cleverly to show interest in their students' learning and to motivate them [13].

The use of nonverbal communication is very important, especially in the teaching of grammar and vocabulary of foreign languages in primary school. In the process of teaching vocabulary, memorization of words is more effective if the teacher explains the words with movement, such as fly(showing flying movement), sit, stand, jump, walk, be quite etc., children memorize what they see visually faster than they hear, which is the case when hearing and seeing these two skills in one time, they improve the quality of student learning.

As well as the location of the desks in the classroom, the fact that the requirements sit close or far from each other, and the distance between the teacher and the demand are also important in the listener's positive and negative perception of the lesson being explained by the teacher. The physical arrangement of the classroom is considered an important variable in the teaching-learning process, because each activity requires a particular seating arrangement. For example, the seating for a test is usually different from that of a communication-based activity, and is different from the seating for a lecture. The seating arrangement is not done at random, but some rational is supposed to be behind the choice of one arrangement instead of the other. Different options are available for the EFL teacher, who is supposed to choose one arrangement depending on a number of variables. The first of these variables is the nature of the activity to be carried out. The second is the role that the students are supposed to play in the activity. The last, but not least, is the kind of students involved in the activity. These variables will be clarified further when dealing with the types of seating arrangements. What we should bear in mind here is that there is not one possible arrangement for the classroom. If one arrangement works for an activity, it may not suit another activity. And if it suits one type of students, it may not necessarily suit other types of students. It is only the variables mentioned that dictate the kind of arrangement to be used. More interesting is the fact that the teacher may work with different seating arrangements in one class. The traditional seating arrangement adopted in many schools

for a number of reasons. In this arrangement, all the students' desks are arranged in a way that they all face the teacher. This is a perfect arrangement for testing because it minimizes talk between students and obliges each student to work individually. It is also suitable for classes in which the objective is that students receive the same instructions but perform individually. Moreover, it enables the teacher to have full control of his/her class, since it minimizes the students' non-productive talk. Notwithstanding, this kind of arrangement does not allow interaction between students nor does it suit communicative tasks or activities. It is relatively easy for the teacher to attract the student's attention by changing such a position to a circle, pair, or row.

We know that every context of verbal communication in our speech is planned in our minds and the finished plan is lingual zed in our language, and the continuity of the process from that consciousness, from our thinking to our language, It depends on psychological and physiological factors. If the teacher cannot create a friendly atmosphere as soon as he/she enters, if he starts the lesson in a hurry, if he speaks to the student in the same tone and tempo in the process of explaining some topics, without performing any exercises or games for any motivation, standing for a long time or sitting, the passage causes boredom, nervousness, indifference to science in the listener. Student boredom leads to a decline in interest in science, which in turn has a negative impact on the quality of education.

CONCLUSION

Nonverbal communication is used in all areas of our daily lives in the process of communication, as well as ensures that communication is lively, natural and credible, which in turn leads to the signing of a contract with a reliable business partner, in practical psychology the doctor interacts with his patient. It is important for the correct understanding of the information and the correct diagnosis, as well as the form of use of such nonverbal means in the analysis of the speech of a particular speaker in forensic medical examination. In such cases, it is important to pay special attention to the misuse of nonverbal communication. In short, comparing verbal and nonverbal forms of communication to the dichotomy of language and speech can be said to be two sides of the same paper, one important for the effectiveness, attractiveness and comprehensibility of speech when used in communication in an inseparable and mutually compatible manner. It serves to create a favorable atmosphere in the educational process, to allow students to communicate freely and increase their interest in science, to help them improve the process of socialization, as well as to improve the quality of education.

ABSTRACT

This scientific article focuses on the use of euphemisms in Turkish to describe the negative traits of a person. Units used to express negative properties are analyzed. The linguistic possibilities of expressing a person's image through zoonyms are considered. In Turkish, the emphasis is on the language vocabulary, reflecting the negative image of people and revealing their character.

KEYWORDS: *Language, Human Image, Character, Euphemism, Zoonym, Image, Portrait, Positive, Negative, Appearance, Analogy, Image, Alternative, Equivalent, Volume Of Language, Transfer Of Meaning.*

INTRODUCTION

Language is characterized as a bridge between man and being and a bridge between being as the most important means of human perception of the universe. The role of language in understanding one's identity and instilling in it such high feelings as national pride is invaluable. This is due to the fact that in the training of linguists in the field of in-depth study of the comparative system of qualitative lexemes in Turkish and Uzbek languages, the scope of scientific research to determine the general and specific aspects of Uzbek and foreign languages, as well as creates opportunities for further increase in efficiency.

THE MAIN FINDINGS AND RESULTS

There are so many people in the world, each with their own worldview, their own personality. Like good qualities, bad qualities can be formed in a person. This is due to his environment,

family, upbringing, society and other influencing factors. Such negative qualities are reflected in every language based on the worldview and mentality of the representatives of that language.

There are many lexical units in Turkish that give negative features. For example, **Adam sendeci** (given to arrogance), **afal (**scattered, chaotic), **açıkgöz (**selfish), **aferist** (ayyor), **ahmak** (axmoq), **ağzı büyük**(someone who speaks big), **ağzı gevşek** (a man who cannot keep a secret), **ağzı havada** (unaware of the around), a**ğzı kara** (who enjoys delivering bad news), a**ptalaptal** (stupid, stupidly), a**valaval**(fool**),budala**(fool), c**ingöz**(cunning), **yalancı** (a liar), **kaba** (rough), **hasetçi** (jealous) **inatçı** (stubborn), **kurnaz** (cunning), **dedikoducu** (gossiper), **kararsız** (unstable), **katır** (very stubborn), **kıskanç** (mean, jealous), **köşe kadısı** (mesomeone who doesn't want to hnat, who likes idleness), **lakayıt** (careless) va **sinsi** (selfish), **hain**(traitor), **burnuhavada** (burniosmonda), **bencil** (selfish, egoistic), **kinder** (plaintiff), **kavgaci** (quarrelsome), **sahtekar** (hypocrite), **ikiyüzlü** (hypocrite), **cimri** (sneaking), **duzenbaz** (cunning), **dolandirici** (cheater), **hırsız** (thief), **katil** (killer), **uyanık** (cunning), **vurdumduymaz** (phlegmatic), **acımasız** (stony), **açıkağızlı** (stupid), **zalim** (tyrant), **alçak**(small-minded), **kibirli**(arrogance), **inatçı**(stubborn), **bencil** (selfish) and etc.

The negative and positive characteristics of people are also expressed through the quality of their speech, intentions, or body parts.

To express negative stereotypes, zoonyms such as *mandagibi* (cunning, greedy), *tilkigibi* (cunning, lazy) are used.

There are some inappropriate words that use euphemisms to mean something, not themselves.

The term euphemism is derived from the Greek and is considered by many authors to be a substitution of an inappropriate unit for a proper unit. A.A. Reformatsky defines "euphemisms as words that are allowed to be used instead of forbidden (taboo) words" [1, pp. 2-3]

In determining the artistic skill of each writer, the uniqueness of creating a portrait of his hero is of particular importance. Because a portrait created by a writer is the first basis for creating an image of a literary hero. Who is involved in the events described in the play, what they look like, what they look like, and what kind of character they are, is first and foremost portrayed through their portraits.

The main reason why the events in the work are more impressive and attractive than in everyday life is, first of all, due to the heroes who are at the center of the events being written.

Aristotle, in his Poetics, states: It is the character of a person to show his inclination, to prefer or dislike something… A person acquires character if he pursues a goal in his words and deeds. If a person has good goals, his character will be good. It can happen to anyone" [2, pp. 18-331].

Euphemistic expressions denoting a person's physical defects. The euphemistic combination of "*kar-deaf*" means "heavy ear", "*gilay - skew-eyed*" means "one eye in the west" and "one eye" in the east. There are many cases where one word has a euphemistic meaning without other words: saw, rubbish, short (stupid), oven (government), game (trick), wound (pain), heartless (coward), burden (pregnant), skirt less (betaine), speculator (swindler, swindler), hoof (child), brothel (toilet), elder (vodka), obirahmat (vodka), nomad (wife), weak (woman, helpless), prostitute and others.

They can be found in Turkish as well as in all other languages. If the combination of *sağır*, *kulağıtıkalı*in the sense of deaf, is used, the zoononym*devekuşu*(ostrich) can be used instead of the word *korkak*(coward). Or a filthy person who does not adhere to cleanliness, does not adhere to cleanliness, does not wash, and even smells bad from his body, is like *kokarca*(filthy, stinking) animals.

The zoonyms *öküz*(bull), *eşeksıpası*(donkey) and *fil*(the elephant) are used to describe a child who does not understand the brain very well, a very naughty / naughty child, and a very greedy person.

Among the euphemistic units that express defects in the appearance of a person, such as unhappy (cold-blooded), prematurely created (premature birth), the figurative combination "husni Yusuf" also has a characteristic significance: next to it hangs a gray yacht tie, another middle-aged 'husni Yusuf', who adorned his right throat with a handkerchief, appeared (A.Qodiri. "Scorpion from the altar") [3, p. 35]. The same expression, which softens the meaning of "ugly" and "repulsive", is given in quotation marks and has a satirical meaning.

Euphemistic expressions of man's spiritual defects The human mind, which represents the spiritual defects of the human mind, is a bit confused, your mind is a little wrong, you are empty-headed, fat, skinny, oily, angry, simple, naive, half-conscious, euphemistic expressions such as semi-civilized people, raw man are observed in fiction.

Narrow *darkafalı* ,*dibekkafalı* (mentally retarded) compounds are used in the same sense in Turkish. Euphemistic units such as nervous pain (mentally ill, insane), childhood (simple, stupid, raw), lack of courage (cowardice), and lack of credentials (betaine) are also considered in this system.

Greed, bribery, euphemistic units are different: shoulder itching (not greed), wild spending (bribery), mullahing (money; bribe), "debt" (bribe), pickpocket (greedy, money-hungry person)), euphemistic units such as "fees" (money, bribes) shared by envelope. Among the euphemistic units that express defects in the appearance of a person, such as unhappy (cold-blooded), prematurely created (premature birth), the metaphorical combination of "husni Yusuf" is also significant: next to it hangs a gray yacht tie, another middle-aged "husni Yusuf", who adorned his right throat with a handkerchief, appeared. (A.Qodiri. "Scorpion from the altar").

The same expression, which softens the meaning of "ugly" and "repulsive", is given in quotation marks and has a satirical meaning.

Euphemistic expressions of man's spiritual defects The human mind, which represents the spiritual defects of the human mind, is a bit confused, your mind is a little wrong, you are empty-headed, fat, skinny, oily, angry, simple, naive, half-conscious, euphemistic expressions such as semi-civilized people, raw man are observed in fiction.

In Turkish, the compounds *darkafalı* ,*dibekkafalı* (mentally retarded) are used in the same sense. Euphemistic units such as nervous pain (mentally ill, insane), childhood (simple, stupid, raw), lack of courage (cowardice), and lack of credentials (betaine) are also considered in this system.

There are different euphemistic units in the field of greed, bribery: shoulder itching (not greed), wild spending (bribery), mullah's (money; bribery), "debt" (bribery), pickpocketing (greedy, money-hungry person)), euphemistic units such as "fees" (money, bribes) shared by envelope.

There are such negative qualities that they can be given through several synonyms, phrases, lexical combinations. For example, the analogy *geveze, çenesi durmayan, çene kavafı, çeneli, çenesi düşük, çenesi kuvvetli* is used for a person who speaks a lot. There are *çöp arabası, çöp tenekesi* (trash can), *işe yaramaz, değersiz*combinations of expressions that are useless, worthless, and useless.

We can give many examples of such negative synonyms in Turkish. *Avanak*– nickname, slow-witted, *arabozan, arabozucu, ordubozan, fesatçı, fitçi,nıfakçı, münafık, müfsit, müzevir*words mean destructive, provocative. *Beceriksiz*- uneducated, *bön* - ignorant, c*anınadüşkün, bencil*-egoist, selfish, *canısıkkın* -in a difficult situation, *canıtatlı* -self-torture, c*anıtez, aceleci*-hasty, *canlıcenaze* -living corpse, *cahil, cimkarnındabirnokta*-uneducated, illiterate, *ceberut, acimasiz* - ruthless, merciless, and the phrase **cebidelik** is applied to those who are not thrifty, who squander what they find on the streets. *Cefakar, ce*- represents a tormentor, tolerant, hard-hearted, cruel person.

The *cimri, bitli, elisıkı, ekti, hasis, kibritçi, mıhsıçtı, nekes, pıntı, sıkı, varyemez* words are used to describe a lowly, stingy, jealous, naughty person.

Cinçalığı, çirkin in the sense of ugly, rough, rough in appearance, *kaba, dag'adamı* in the sense of unleavened, c*oşkusuz* - careless.

Here is an example:

Or, the idea expressed in sentence *Hűseyin, delişmen bir adamdı. Beni çabuçak sevmişti. Ben de umulmaz ve affedilmez bir vefasızlıkla onun sevgisine mukabele edivermiştim*. (R.N.G., 9), more precisely, the combination *sevgisine mukabele etmek*is expressed in the Uzbek translation by means of expression (*trampling*) and further enhanced the artistic level of this translation: *Hussein was a madman. He loved me dearly. I, on the other hand, trampled on his love and humiliated him with irreparable infidelity* (M.I., 8).

In this example, we see that character traits such as "***delismen***" are insane and "***vefasiz***" is unfaithful are given in their equivalent in translation.

The words "tonkaday – like a stump", "cho'chqaday – like apig", "buqaday – like a bull" are used in Uzbek to describe rude, very fat and lazy people, and "***manda gibi***" in Turkish. used. Manda means wild bull.

CONCLUSION

In general, each language demonstrates its potential with a wide range of vocabulary. The fact that a word is not used more than twice in the context prevents artistic and grammatical ambiguity. Giving negative character expressions in translation through words, phrases, phrases or euphemisms requires a lot of knowledge, experience and understanding from the translator.

After all, a translator is a link between two national literatures. As the author of the original work imagines the flow of events, so he must enter into this flow like the author.

ABSTRACT

This article discusses the preservation, repair and reconstruction of historical monuments of the ancient city of Samarkand. Reconstruction of complexes of historical monuments requires the solution of all sorts of problems, not only architectural or technical issues. Carrying out certain measures in due course, allowing the best possible use of the old centers for the needs of the modern city are the main conditions for saving them from destruction. Therefore, it is necessary to provide the necessary public funds to carry out the work stipulated by the plan, for additional costs for the maintenance of buildings and other purposes. The need to restore and preserve historical monuments is a pressing issue.

KEYWORDS: *Restoration, Conservation, Tourism, Arch, Fortress, Transport, Communications, Infrastructure, Reconstruction, Concentric, Classified.*

INTRODUCTION

The desire to preserve the valuable complexes of historical buildings has been manifested relatively recently. Modern restoration, which originated in the 19th century, was concerned for a very long time mainly with individual architectural objects. It became clear how much a valuable architectural monument could be lost as a result of modern environmental changes, and that well-preserved historical complexes of buildings deserve protection as much as isolated high-class architectural objects. In connection with this evolution of views in various countries, large areas of cities or even entire cities have been recognized as ancient monuments. Finally, the need for protection, along with the complexes of historical buildings, of the surrounding landscape, which includes trees, ponds, and hills, was duly assessed.

Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Oliy Majlis: "Today, one of the areas that bring high income to our national economy is tourism. Uzbekistan is a country with ample opportunities for tourism. There are more than 7,300 cultural heritage sites in our country and most of them are included in the UNESCO list ". [1. 9 st]

In such large cities as *Samarkand, Bukhara, Khiva, Termez, Karshi, historical* monuments and places of pilgrimage were reconstructed and turned into delightful tourist sites that leave a lot of unforgettable impressions for the citizens of Uzbekistan and the whole world.

Another important area is the use of the tourism potential of Samarkand in terms of increasing income and its share in GDP. It is well known that Samarkand is currently one of the recognized tourist centers not only in our country, but all over the world. [2. 186 st]

The Main Part

The collision of two opposite trends, one of which seeks to increase the number of buildings and territories taken under protection, and the other to the construction of new houses in their place, has led to the fact that the problem of historical building complexes has recently become very acute. However, despite numerous warnings and resolutions, the process of destruction of valuable historical buildings continues. In many Central Asian cities, this led to irreparable loss of cultural property. For example, in Samarkand, concentric streets with centers that have preserved a truly local way of life are also in this radius. Radial streets have at their beginning and end centers of urban importance, and in the middle there are such mahalla centers as Yomini and Mirzo Pulod (15th-19th centuries) on the Penjikent street of Samarkand. Radial streets are city transits, duplicated by parallel mahalla pedestrian streets. There are such streets in the northeast, east, south and southwest of Samarkand..[3. 169-170 st].

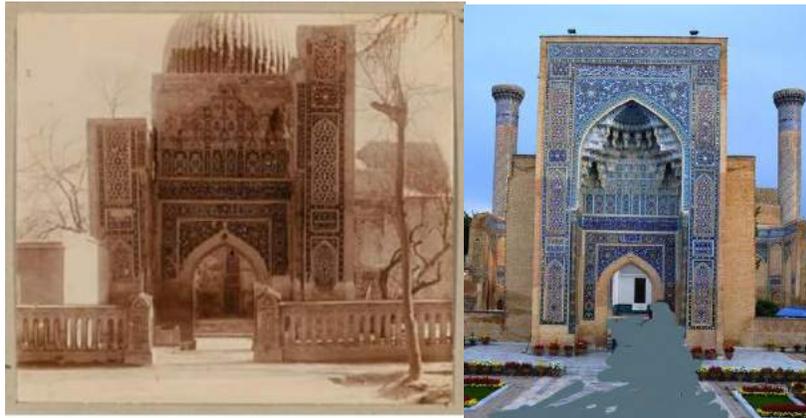
The methodology for the protection of historical Samarkand has been concretized since 1991-1995 including works of the city municipality with the Aga Khan Foundation, which were developed in an international competition in 1992 for the reconstruction of the territory between Registan and the once citadel. The 1992 international competition for the revival of the historic center was initiated by the Aga Khan Foundation for Culture. Several hundred projects were received and, from the awarded, the city received original ideas for the preservation of historical monuments, for types of public and residential buildings and for landscape architecture.

In 1995, international organizations UNDP and UNESCO, together with the architects of Samarkand, explored three mahallas (Bogimaydon -1, -2, -3) north of the Silver Rows. During the Soviet period, the residential buildings surrounding the monuments were demolished here, thereby disrupting the urban planning scale and building random new buildings. In makhallas,(neighborhood) the preservation of buildings, the adaptation of streets to new functions, and their reconstruction were studied. Residential buildings are classified as in good condition, in need of partial or major refurbishment, or recommended for demolition.

The need for a comprehensive reconstruction program and specialized construction units for reconstruction, control, methodological guidance and coordination have been determined recently (13). In 1997, a seminar on the problems of preserving the urban environment was held; in 1998, with the support of the city municipal, the public organization Center for the revival of the historical part of Samarkand was created; in 1999, the Planning Project for the central part of the city was created (jointly with the Union of Architects of the Republic of Uzbekistan, the

Uzshaharsozlik Institute of LITI, GlavAPU of the Samarkand city municipality). As a result, the methodology for the protection of historical Samarkand covered the following:

 - Reorganization of public administration is necessary due to lack of coordination and funding. It is necessary to invest in projects for historical zones and encourage local initiative and small business in them. The committee under the municipality for work with mahallas, a non-profit center for the historic city, coordinates the actions of state and non-governmental institutions.

- Self-preservation of the mahalla by the private sector began around Guri Amir, Registan, Bibi Khanym and Penjikent Street. Under the Soviets, the prospect of demolition discouraged people from investing in renovation. A government decision to grant citizens the right to own land is encouraging homeowners' initiative.


Guri - Amir's mausoleum, 1909. Photos from the album Guri - Amir's mausoleum complex

of Sergei Migailovich Prokudin-Gorsky are kept in

the Library of Congress.

- Improvement of master plans and detailed planning projects.

1 - the removal of citywide functions will leave only those that are inherent in the historical city. Citywide functions invaded the historical core, while the rest of its lands and periphery were not used. Citywide functions - a place on the peripheral highway of the historic city. New poles of development should be encouraged there, remembering that a historic city is a system of different centers within walking distance from each other.

2 - preventing transit and providing the historic city with peripheral parking lots and dead-end entrances. It is necessary to restore the pedestrian historical city and serve it with transport connections. With mini buses and fixed-route taxis, private cars will become unprofitable in the historic city. Terminal stops should be placed on its periphery.

3 - improving infrastructure and population control. Rehabilitation of irrigation and drainage systems, as well as sewerage, depend on the improvement of peripheral collectors. Electricity and gas supply "by air" should be preferred to their underground lines. The historic city is in places deserted, and in places overpopulated - both of these factors threaten its preservation - monitoring, or otherwise constant control, of the population size is necessary.

4 - restoration of mahalla, guzar (street); reconstruction of historic streets, revival of craft centers. The historic city is not chaotic, and its layout is characterized by patterns identified by urban planning science. Urban planning SHNK should take them into account and recommend the preservation of not only monuments, but also the historical city as a whole.

5 - establishment of security levels; control of scale and height, materials and structures; providing a traditional perception of the city. The restoration of the monument develops into the reconstruction of its environment. It is important to respect the protection zones around monuments, to adjust the heights of new objects, to use traditional materials and construction methods.[3.170 st].

On the implementation of the Management Plan for the preservation and rehabilitation of the historical center of Samarkand, it was sent to the World Heritage Center. The report informs: "The clearing of the security zone of the Khazret Khizr mosque has been carried out, the clearing of the security zones of the Afrasiab settlement of low-value spontaneous chaotic buildings will be continued." The general plan of Samarkand until 2020, the central planning district, consisting of the administrative center of the city, the Temurid city, Afrasiab and the Russian city of the colonial period, is surrounded by the ring of the design highway of continuous traffic, which is also a buffer belt along the contour of the historical core. However, both in the middle and in the Aryan, many old urban centers containing real cultural treasures are still waiting in the wings. .[3.171 st].

Hazrati Khizr mosque - early 20th century. Current view of the Khazrati Khizr mosque.

Photos from the album of Sergei Migailovich

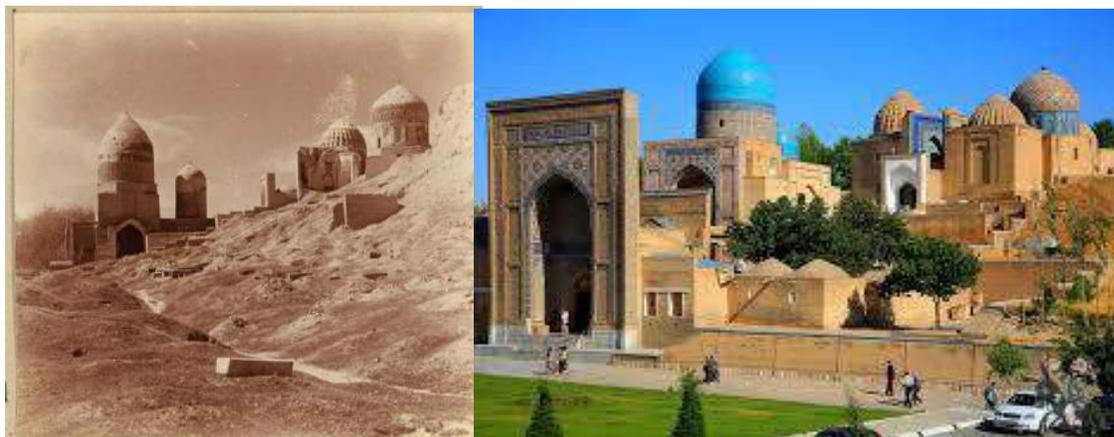
Prokudin-Gorsky are kept in the Library of Congress.

Nevertheless, the growth of interest in historical buildings is often accompanied by an intensified desire to replace it with a new one, adapted to modern needs. Under the influence of the accelerated process of urbanization, technical progress and an increase in the level of equipment of apartments, the complexes of old buildings are being replaced by new buildings. Where the historical core is the center of a rapidly developing city, the situation is particularly difficult.

The first President of the Republic of Uzbekistan was the main initiator of these noble undertakings. A large-scale reconstruction was carried out in Samarkand; the task was set to bring the historical places of the city to their original form. It is remembered that this was a very

complex process - the reunification of modernity and antiquity in one, but even in this a special path was chosen. Scientific and historical concepts were used in the reconstruction of ancient objects, the main goal was to restore the original appearance of each monument, taking into account historical data. As a result, the monuments of the Registan complex, the Chor-su architectural ensemble, the Khoja Akhrar Vali memorial complex, the Jami mosque, the Bibi-khanum mausoleum, the Ulugbek mausoleum, the Nodira Divan-begi madrasah and many other historical sites were restored.

Interest in them today is shown not only by people who are especially sensitive to the beauty of this landscape, this interest has become massive. It is quite obvious that historical centers, attracting tourists from all over the country, and often from abroad, can play a significant role in the economy of the city and the country; that by developing and deepening the aesthetic interests of people, expanding their knowledge, awakening interest in the past of their city or country and respect for the achievements of past generations, important educational tasks can be fulfilled; that historical complexes, which often include buildings that are extremely valuable from a historical point of view and have a unique shape characteristic of a given city, can and should play an important role in shaping its future appearance; that they can significantly enrich and diversify the urban landscape and make its structure more expressive.[4.182 st].

The problems of architectural composition in the territories of ancient cities are not limited solely to the relationship between the new and the old. Reconstruction of complexes of architectural monuments requires solving various kinds of problems, not only architectural or technical. Carrying out certain measures at the right time, allowing the best possible use of the old centers for the needs of the modern city, is the main condition for saving them from destruction. As the standard of living of the population rises and demands on housing and the environment increase, residents will leave the old quarters in poor condition, which are increasingly different from the new ones due to poor living conditions. Therefore, it is necessary to provide the necessary public funds to carry out the work stipulated by the plan, for additional costs for the maintenance of buildings and other purposes. Reconstruction of historic centers is part of a much broader task, that is, planned reconstruction and expansion of the city.


Complex of the Shakhi Zinda mausoleum 1905.Current view of the Shakhi Zinda mausoleum complex.

Photos from the album of Sergei Migailovich

Prokudin-Gorsky are kept in the Library of Congress.

The restoration of historical urban complexes, which requires enormous material efforts and many years of labor, gives good results if society supports this idea. Thanks to this attitude, it was possible to save many unique ancient ensembles of great value from the threat of destruction threatening them, to carry out work aimed at giving these centers full splendor and restoring numerous complexes.

CONCLUSIONS

In conclusion, I would like to note that Uzbekistan has an unusual and irreplaceable historical and cultural heritage for the transformation of our country into one of the world centers of tourism. The places that have been launched since the times of "Shuro" (the historical epoch in which the locality was under the rule of Russian occupation) have now been ennobled and bring a lot of good impressions to tourists and guests of our country and serve the spiritual revival of the nation. Studying the history of holy places, their ennobling helps the memory of who our ancestors were and contributes to the restoration of cultural heritage.

A lot of good and worthy deeds were done, such as restoration, education and dissemination of national and spiritual values, careful storage of cultural monuments, historical sites and shrines and their reconstruction, and the transfer of all this to the future generation, instilling deep respect, love and loyalty to national values ... The historical centers of the most ancient cities - Samarkand, Shahrisabz, Bukhara and Ichan-kala in Khiva are included in the list of UNESCO World Heritage Pearls, and this organization contributes to the popularization of these sites around the world.

ABSTRACT

Purpose- The purpose of this study is the survey of related factors with collaboration and different types of trust and suggestions for promoting collaboration among supply chain partners. Methodology- This research method is correlative- descriptive study. Population- The population of this research is consists of all staff members of West Azerbayjan power management company, electric power transmission and electric power distribution companies. Findings- The results of this study indicate that both affective trust and trust in competency have a significant influence on collaboration three dimensions. The results of the relationship between components of two types of trust indicates that there is a significant relationship between all components of affective trust with business capability ,and also there is a significant relationship between respect and satisfaction with know-how/ speciality. insignificant relationships are detected between the components of affective trust with the other components of trust in competency.

KEYWORDS: *Affective Trust, Trust In Competency, Collaboration, Supply Chain Partners*

INTRODUCTION

Since the mid 1990s, a new concept in the supply chain management (SCM), emphasizes the importance of forming collaboration between suppliers in order to provide an efficient supply chain has attracted attention from both firms and academics. It is a without a doubt that the successful   development of SCM performance of the supply chains can affect customer satisfaction (Ya-Ling Tsai, 2006). Most firms today realize the importance of supply chain

management. Many researchers suggested that supply chain (SC) partners should develop strategic relationship to gain competitive advantages and to improve organizational inter-dependent relationship in which the parties work closely together to create mutually beneficial outcomes for all parties. Chapman reported that true collaboration between SC parties might result in joint knowledge creation, expertise sharing, and understanding of the counterparts intentions and strategic approaches.

Trust in partnerships can be related to contractual trust where the partners, trust in each other is increased by continually delivering on promises of the contract. " Trust is developed by the partners doing what they said they would do"(Paterson,1998).

Trust plays an important role in sharing information through the SC. If SC partners have affective trust, they may be contacting more frequently and less reluctant to share information and it is an important factor that enhances the efficiency.

Many researchers have stressed the importance of relationship between suppliers and buyers. Trust, commitment and collaboration among SC partners results in satisfaction, loyalty and mutual long-run benefits. Attention to both supply and demand side of supply chain has significant impact on efficiency and effectiveness of firms. The situation of demand and supply gap likely to be improved by better collaboration among channel partners and interactive relationships (Banirad ,N,2005).

LITERATURE REVIEW

Conceptions of trust

Trust sometimes understood to be a by-product of norms embedded in social networks.

 The role of trust in the context of business organizations began to evolve in 1980s .The importance of trust to interpersonal and commercial relationships is evidenced by the plethora of research efforts within various disciplines. Such as psychology, economics, social psychology and marketing.

According to management theorists trust is the foundation of interfere alliances and strategic partners.

Despite of this increased interest and the acknowledged role of trust to a company's competitiveness, there has not yet been theoretically and empirically coherent attempts to measure trust in inter- organizational context. Thus, trust remains an under-theorized, under-researched, and, therefore, poorly understood phenomenon(Child,2001).

Misztal indicates that trust is an essential factor in creating stable relationships and maintenance of cooperations.

Currall and Inkpen (2002) indicate that trust is the decision to rely on a partner with the expectation that the partner will act according to a common agreement. Trust between organizations creates environments of a relationship to increase the likelihood of mutual benefits.

In mutual relationships trust improves cooperation and organizational effectiveness(Massey etal, 2007).

Trust in supply chains is not a new topic. However, it continues to garner a huge share of attention from Supply practitioners and academicians. This is certainly not coincidental. Since all supply theory and practice is predicted on better understanding relationships, trust will always occupy a very prominent   in the ongoing quest to comprehend the depth and breadth of variables governing buyer/supplier interactions (Fawcett etal,2004).

Trust is among the most frequently cited dimensions of SC relationships in the literature and has been defined as " the firm's belief that another company will perform actions for the firm, as well as not take unexpected actions that would result in negative outcomes for the firm"(Anderson and Narus,1990).

Two types of trust in the long-term buyer-supplier relationships are suggested by Sako. Competence trust refers to about whether the transaction partner can perform his/her job competently, whereas goodwill trust refers to about whether the transaction partner has good will more than expected (Byoung-Chun Ha, 2010).

Blomqvist(2002), Mollering (2002), and Castaldo (2003), stress the need to take into account cognitive, affect-based and behavioral dimensions of trust to capture the complex and multi-dimensional concept(Seppanen, R et al, 2004).

Affective trust

Affective trust is defined as emotional trust attained from long-term –based inter- personal interaction (Byoung-Chun Ha, 2010).According to Mc Allister(1995), affective trust is the emotional aspect of trust, the type of trust that develops from frequent interactions between parties and comes with familiarity of events. In trust formation, not only will cognitive processes lead to perceptions of trustworthiness, but affective states may also come into play(Schoorman etal, 2007). Moods and emotions are affective states that signal peoples ongoing experiences and reflect their state of being. According to the affect-as- information approach, peoples affective states can be informative in interpreting their surroundings and therefore, people may consult their pre-existing emotion or mood for from judgments at hand.

Trust in competency

Trust in competency is defined as the expectation of trustworthy behaviors as a result of conviction for the knowledge, know-how, and expertise of partners(Byoung-Chun Ha, 2010).

It refers to the partners confidence in the ability of partner organizations to fulfill their role to the required standard. In cooperations it is consists of ability of partner in acting according to agreements (Manteghi et al.,2005).

Dimensions of affective trust

Honesty: the belief that the other person makes good faith agreements, tells the truth and fulfills any promises made.(Panagiota et al, 2002). It has been identified as one of the main factors in building and maintaining trust in supply chain partnerships. According to Simon honesty is one of the key factors in extension of organizational trust(Azadmanesh).Each of the components of trust may occur to varying extents independently of the others, but it appears that honesty exists on a greater stage than the other components(Parsaiyan & Erabi,2010).

Mutual understanding: when supply chain partners adopt a long-term orientation, they tend to rely on understandings and conventions involving fair play and good faith. Such that any agreements between them are enforceable largely through internal processes rather than through external arbitration or the courts. Thus, such an orientation enables the communication and exchange of information and knowledge, lower transaction costs and enhances transaction value through strategic collaboration.(Antony Paulraj et al, 2008).

Openness: Openness in the relations refers to being open in manners, telling the truth, always having positive thoughts about the colleagues, acting respectfully, communicating effectively (Smith, 2005).

Respect: Respect is a fundamental element for developing society. Regarding to its emotive source, it is considered as an important factor in establishing relationships among people or social groups (soleimani,H.,2009).

Functional competencies: Functional competencies relate to actual business experiences and expertise required for general strength. A competency is the capability of applying or using knowledge, skills, abilities, behaviors, and personal characteristics to successfully perform critical work tasks, specific functions, or operate in a given rule or position. Boyatzis (1982) extend this definition to include both internal and external constraints, environments, and relationships related to the job or occupation. Motivations and perceptions of the work and oneself or talent also are reviewed as influential in competency and successfully performing in a position (Danayi fard et al, 2009).

Supply chain

The supply chain encompasses all activities associated with the flow of goods and information from sourcing of raw materials through to the end user (panayides etal, 2009).The importance of trust in the supply chain context is underpinned by the relevant literature which is thoroughly reviewed by Kannan and Tan(2006).Currall and Inkpen (2002) indicate that trust is the decision to rely on partner with the expectation that the partner will act according to a common agreement. Trust between organizations creates an environment where companies strive to exceed the minimal requirements of a relationship to increase the likelihood for mutual benefits. Trust in this study refers to inter-organizational trust. Evidence across multiple theories of organization research suggests that trust is a significant predictor of positive performance within inter-organizational relationships. According to social capital theory, exchange is based on norms of reciprocity or the belief that a firm acting to benefit a partner / organization will be reciprocated favourably for such behavior at a future point in time. To enter into a relationship a certain level of trust must be present between firms(panayides,2009).

Collaboration

Collaboration in the context of the supply chain, is to share the joint objections; an intelligence of commitment; trust and respect; skills and knowledge; and intellectual agility. Supply chain collaboration (SCC) provides benefits to the chain members. That is why SCC has become one of the most talked about topics in business area. Especially in today's complex competition business environment, collaboration is the driving force behind effective supply chain management. However, the argument is that 'collaboration' is more important in the supply chain management.

The supply chain collaborative processes

Regarding the common factors agreed upon by researchers, the essential SC collaboration factors in this study include joint decision making, information sharing, and benefit/ risk sharing.

Decision making processes in SCC

At first, SCC requires strategic decisions to identify the aim between the supply chain collaborative partners. The aim can help the decision and responsibilities are the main requirement for a successful collaboration. The decision management can be defined as the extent to which the chain members are able to arrange critical decitions at planning and execution levels for their supply chain efficiency.

Information sharing

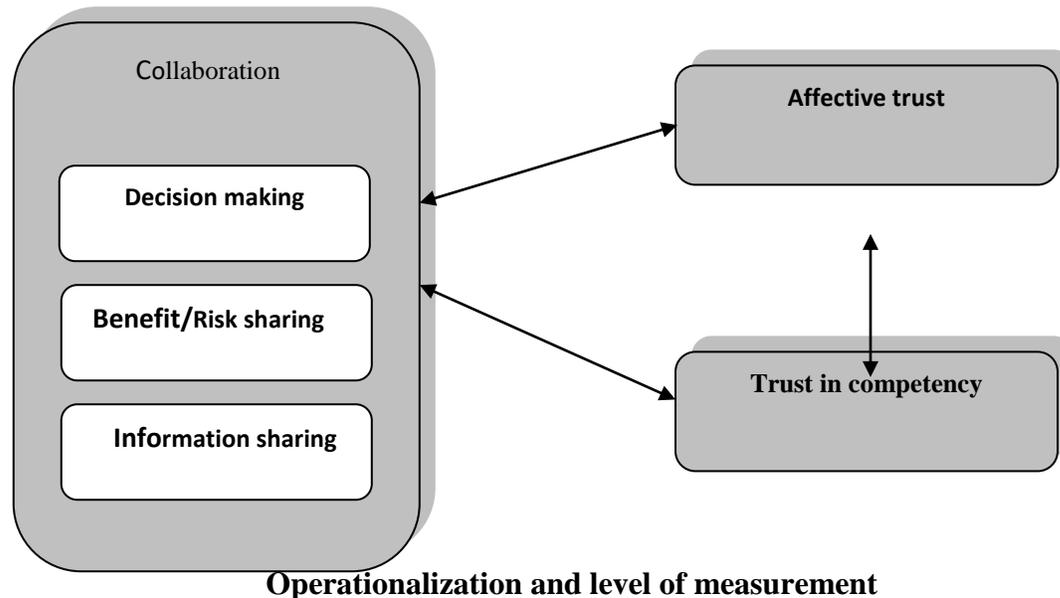
Handfield and Nichols (1999) stated the importance of trusting relationships in the supply chain and how to sharing of information and assets was essential for the success of the strategic partnership. Henriott(1999) pointed that information sharing is a prerequisite for trust. Information sharing refers to the extent to which critical and proprietary information is communicated to one's supply chain partners. Many researchers have emphasized the importance of information sharing in SCM practice. Lalunde considers sharing of information as one of five building blocks that characterize a solid supply chain relationship.

Benefit/ Risk sharing

According to the very principle of collaboration, that is to bring together complementary resources to gain collaborative advantages, different goals are understood as an inherent characteristic of collaboration. Within the network literature there are two different approaches to deal with diverse goals. A first approach understands joint objectives or an agreement on aims as preconditions in order to gain long-time collaborative advantages. A second approach highlights a balance between common and competitive goals instead of consistency (Ingo Winkler,2006).

Close collaboration among SC partners results in benefits such as joint knowledge creation, expertise sharing, and the understanding of partners' intentions, all of which contribute to reducing costs and improving SC values. Strategic collaboration involves inter-dependent relationships in which SC partners work closely to create mutually beneficial outcomes(yang chun ha. 2010).

The research model of the study is shown in Figure 1.

Operationalization and level of measurement


It seems, that all the empirical papers share more or less the same problem: the theory is based on the organizational level trust, while the attempts of measuring trust have taken place on the individual level. Currall and Inkpen (2000), refer to this by nothing that " misspecification of the firm as the level of theory and the person as the level of measurement is common in alliance research"(Currall & Inkpen,2000).

Research hypotheses

Uncertainty among transaction parties may cause trust problems in their transactions. Monczka et al. (1998), and Chandra and Kumar (2001) claimed that trust and collaboration were becoming more prevalent in supply chain relationships because of their ability to reduce uncertainty. However, trust is very difficult to state in SCCs, especially in the complex and changeable business environment (Ya – Ling Tsai,2006).The successful operation of SC relies on the degree of affective trust among partners. Affective trust exist in relationships, and determine the extent of exchange between partners. By understanding the context in which firms find themselves, they can work to improve interpersonal relations, draw a realistic expectation of the results of the collaboration and improve their understanding of their prospective partners (Abiola O. Fanimokun,2005). People tend to organize collaborative networks with those who have been receiving good reputation. Competency is necessary for making generic day-to-day operational decisions regarding order management, inventory management, and transportation management. Competency is also essential for making strategic decisions such as mutual cost management and efficiency improvement problems. Partners work competency might help solve many problems in the SC collaboratively (Byoung-Chun Ha, 2010). Empirical studies supported that the full benefits of a supply chain integration can be obtained if there is close understanding and trustworthy Roy et al., 2004). This is because the parties can understand each other's business better and assist each other in improving the supply chain process via innovative solutions. Hence we hypothesize:

H1. Affective trust has in influence on collaboration.

H1a. Affective trust has an influence on joint decision making.

H1b. Affective trust has an influence on the benefit/risk sharing.

H1c. Affective trust has an influence on the information sharing level.

H2. Trust in competency has an influence on collaboration.

H2a. Trust in competency has an influence on joint decision making.

H2b. Trust in competency has an influence on the benefit/ risk sharing.

H2c. Trust in competency has an influence on the information sharing level.

H3. There is a relationship between components of affective trust and components of trust in competency.

Methodology

This research method is correlative- descriptive study. The population of this research is consists of all staff members of West Azerbayjan power management company, electric power transmission and electric power distribution companies. The questionnaire technique is used for primary data collection. All the questions had measured by summing the scores on a five-point Likert scale.

Data analysis and discussion of results

Our findings indicate that there is a relationship between affective trust and collaboration in power management, electric power transmission and electric power distribution companies staff members, that is H1 is supported and statistically is significant(r=0/317 ; p=0/003).

The results also indicate that there is a relationship between trust in competency and collaboration in power management electric power transmission and electric power distribution companies staff members, that is H2 is supported(r=0/375; p=0/000).

Paths from the two dimensions of trust loaded significantly on all three of cooperative buyer-supplier relationship behaviors of joint decision making, information sharing and benefit/risk sharing. All path loadings were significant at the p < 0/05 level.

 The goal of this paper was to assess the antecedents of trust in SCM. Toward that goal, multiple theories from diverse referent disciples were synthesized to propose a research framework and seven hypotheses were suggested. It is found that information sharing is impacted positively by trust in supply chain partners, and negatively by partners uncertainty. On the other hand, to maximize the effect of collaboration in information sharing , affective trust must be emphasized. Given the parallel investment in people and the emergence of trust risk-sharing behavior is a bit more evident as is a tendency to rely more on virtual rather than vertical integration. Formal reporting relationships and hierarchy are slowly being replaced by alliances where trust viewed as important as a contract. The emphasis for people is on relationship management, where managers consciously look for win/win opportunities. Without a foundation of effective inter-organizational relationship, any effort to manage the flow of information across the supply chain is likely to be unsuccessful. Trust is needed to build long-term cooperative relationships between supply chain partners and it is possible through business process integration.

THE CULTURAL LINGUISTICS ISSUES IN INTERETHNIC AND INTERFAITH RELATIONS IN THE REPUBLIC OF UZBEKISTAN

Abdullaeva E.A.*

*Teacher,
Department of Russian Language Methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

Expansion and deepening of interethnic and interfaith interaction is an urgent problem for a deep and comprehensive analysis. The very position of Central Asia - at the junction of world civilizations - predetermined its unique role in intercivilizational dialogue, in the exchange of cultural values. As a result of the centuries-old interaction of Turkic, Iranian-speaking, Semitic, Slavic and their nations, stable traditions of mutual respect and tolerance have developed on the territory of the republic.

KEYWORDS: *Communication, Interethnic Relations, Interpersonal Relations, Multiethnic Environment, Cultural Linguistics, Tolerance.*

INTRODUCTION

Nowadays, the problems of intercultural communication have become the focus of attention of linguists and methodologists involved in the development of new, modern methods of teaching languages - Russian, native and foreign.

The state and trends in the development of interethnic relations in our country, the dynamics of their changes over the years of independence became the topic of the regular sociological survey conducted by the Center for the Study of Public opinion "Ijtimoiyfikr" in the framework of the implementation of the decrees of the President of the Republic of Uzbekistan ShavkatMirziyoyev"On measures to further improve interethnic relations and friendly ties with foreign countries" dated on May 19, 2017 and "On the Strategy of Actions for the Further Development of the Republic of Uzbekistan" dated on February 7, 2017[1].

The results of the survey show that the Uzbek people are characterized by a stable attitude towards peace and stability, interethnic and civil harmony in society. The absolute majority (99.8 percent) of respondents consider this the most valuable asset and achievement of Uzbekistan.

In the opinion of the respondents, the basis of interethnic and civil harmony in society are: a subtle and well-thought-out state, national and social policy; stability of development of economic and socio-political spheres, as well as generosity, generosity, mercy and benevolence inherent in the Uzbek people.

The results of the study allow us and show us to state today that the public opinion in Uzbekistan (83.4 percent) is dominated by the idea that, in the country, thanks to an effective and wise state policy, there are no prerequisites for conflicts and disagreements on ethnic grounds. Eighty percent of the respondents are confident that the stability of society in the interethnic sense will remain in the future.

The proclamation of state independence by the Republic of Uzbekistan on August 31, 1991 marked the beginning of a new era in the life of not only the Uzbek people, but also all nations and nationalities living in Uzbekistan.

National and cultural centers have been established in the Republic of Uzbekistan, which have the status of independent organizations and operate in accordance with the statutes adopted by the Ministry of Justice of the Republic of Uzbekistan.

In today, there are more than 130 NCCs and associations operating in the country, they make their significant contribution to strengthening interethnic unity in the country.

The most important achievement of this period is interethnic and interfaith harmony, which served as a guarantee of peace and stability and an increase in the effectiveness of reforms.

In order to assist in the preservation and development of original national traditions, customs and rituals of representatives of various nations and ethnic groups living in the country; ensuring the relationship and cooperation of state bodies with national cultural centers and friendship societies; preserving the continuity of the traditions of interethnic harmony, friendship and cohesion in society, the unity and harmony of generations in achieving civil peace and harmony; stimulation, coordination and promotion of social initiatives; expanding the scope and geography of cultural and educational events; rendering assistance in widespread propaganda in foreign countries of the peaceful policy of our state, in the country ¸ in accordance with the Decree of the President of the Republic of Uzbekistan dated on May 19,2017, the Committee on Interethnic Relations and Friendly Relations with Foreign Countries was established under the Cabinet of Ministers of the Republic of Uzbekistan.

For the improvement of interpersonal relations, adaptation in a multiethnic environment, the mastery of the state language by persons of all nationalities living in a particular country has been and still island the solution to this complex and long-term task should not be accompanied by the escalation of interethnic confrontation.

In the modern socio-political and cultural life of the republic, an important place is occupied by the Russian language, which, being one of the 10 largest world languages, is perceived in Uzbekistan as a language that mediates in a multi-ethnic environment and as a language for carrying scientific and technical information, therefore, special attention is paid to it.

Most of the Russians living in Uzbekistan call Russian as their native language, but there are a number of Russians who call Uzbek as their mother tongue, they live either in the countryside or in small provincial towns. The fact that every third of Tatars consider Russian as their native language is also quite understandable: in the urbanized environment, Tatars, especially the younger generation, are strongly Europeanized, often do not know the language of their nationality, and are fully adapted to the Russian-speaking cultural environment. In addition, many Tatars are either in interethnic marriages or are descendants of such marriages, which also affects the linguistic situation. This was noted by researchers at the end of the 19th century. To an even more pronounced degree, the processes of Europeanization covered the Korean ethnic group, especially its urbanized and younger part. This was noted by researchers back in the 70s and 80s of the XX century: "The introduction of Koreans to the Russian language in the 70s was characterized by the fact that in the younger generations the language competence was high. The situation took on an absolute character in the late 20th and early 21st centuries, since modern Korean youth are already the second or third generation of Koreans who speak Russian at the level of their native language. As for the Tajiks, they represent a special case in ethno linguistic terms. If among Uzbeks, Tatars, Koreans and Kazakhs the main alternative to the language of their nationality is Russian, then among Tajiks it is Uzbek.Of 32% of those who call their native language a language other than their own nationality, only 10% consider Russian as such, and 22% - Uzbek. This is also understandable. Ethnoculturally, Tajiks are the closest ethnic group to Uzbeks. Their material (dwelling, clothing, food) and spiritual (beliefs, rituals, customs, traditions) culture, family and household and community relations have a lot in common with Uzbeks. That is why the language competence of Tajiks in relation to the Uzbek language is very high.

In general, the situation fairly accurately reflects the level of proficiency in the language of their nationality. The situation with the Tatars and Kazakhs shows that knowing the language of their nationality (72%) and recognizing it as their native language (66%) does not mean at all that the respondents think in this language (there are only 24% of them).

In general, characterizing ethnolinguistic processes, I would like to note that we can observe the following:

1. Uzbekistan has historically developed as a large polyethnic, polylingual and polycultural center of civilization.

2. The key languages of the population of Uzbekistan are Uzbek (as the state language) and Russian (as the language of interethnic communication).

3. Among the population of Uzbekistan, all its ethnic groups, there is a high level of bilingualism and various forms of polylingualism. The most common forms are national-Russian bilingualism and national-Uzbek-Russian trilingualism.[2].

In this case, the analysis of this problem indicates that the leadership of the Republic of Uzbekistan gives priority to solving issues of ethnic policy in the linguistic sphere, providing equal rights and opportunities to all peoples of the republic.An increase in the network of schools and mass media in various languages, the free activity of national cultural centers to preserve and develop their cultures, interethnic and interfaith tolerance have become a vivid confirmation of

the positive processes in this area. All this contributes to the improvement and harmonization of interethnic and religious relations and strengthens stability in the republic.

THE ARTISTIC INTERPRETATION OF WOMEN'S IMAGE AND CHARACTER

Sh. Khashimova*

*Teacher
Russian language methodology department of FerSU,
UZBEKISTAN

ABSTRACT

This article discuss about the image, behavior, ideological and philosophical issues of the female psyche in fiction, in particular in folklore. This shows that in ancient times, women's rights were relatively high in Central Asia. The girls got married of their own free will. They also set the condition for the young men, who were considered fit for marriage, to be brave and valiant, who would protect the country from various calamities.

KEYWORDS: *Folklore, Word Art, Image, Ideology, Character Creation, Literary Tradition, Educational And Enlightenment Aspects.*

INTRODUCTION

In the the researches of the creation of images of women in the history of world and Uzbek literature, reference to our past literary heritage is of great importance. In this regard, the oral poetry of the people is an important source.

Each period, in turn, is an integral part of human history. At the same time, life is constantly evolving, and the development of society is determined by various changes. The destiny of a woman, who is an integral part of this society, her character, changes in the spiritual world as well as in social life.Women, who are an integral part of human society, have a certain influence on the change of time and environment, just as they are subject to the modern world.As a result, the age-old tradition of good and evil, the fierce struggle between nobility and lowliness, benevolence and selfishness, the triumph of goodness, which is a factor of progress, will lead mankind to new happiness.

"A true work of art, like the wonders of nature, will always be of immense mystery to our minds.In order to achieve this essence, it is necessary to determine the ideal reflected in the

character created by the artist, and the meaning expressed in his actions, as well as to assess the degree to which the external and internal appearance of the images in the work corresponds to the laws of beauty", - said literary critic B.Sarimsakov, "Because a real work of art, when taken separately, is completely independent and closed, which is not easily interpreted in the analysis of others".[4. 90]

In particular, the relationship between the individual and society in the image of women, the problems of human destiny raised through the image of women have led to the emergence of a number of works of art in literature.Even today, despite the diversity of styles and worldviews, conclusions and positions of writers, a new era, new views, modern relations are gaining more and more scope in the examples of word art.

It can be seen that folk epics, which are a unique mirror of social life, also reflect the attitudes and views on the family and women in different periods.In them we see the role of women in social life, both in matriarchy and in feudal society, their rights to choose a spouse, their role in the upbringing of children, their place in the family, their dreams of free marriage.The roots of the events in the epics often go back a long way. In this regard, the role of folk tales and epics is especially great.[2. 43]

In such works, which have been passed down from generation to generation and polished for many centuries, both the life of the people and their dreams for the future are reflected in bright colors. The people have also paid great attention to the role of women in society in their art.He portrays women as a loving mother, a loving husband, a wise, a business leader, a selfless hero who sacrifices her life for the happiness of the people.

In the history books and stories created in ancient times, one can find many images of patriotic, heroic women who fought valiantly against the enemy in the name of national liberation.One of the reasons why women are treated with such respect in their oral poetry is that they have been actively involved in the life of society at all stages of historical development.

There is a custom that dates back to the tribal period. According to him, the girl chooses her future husband. The choice of the groom is mainly based on the strength and perseverance of the groom. To test the strength of the young man, the girl is taken one by one, and if she wins, she is either killed or taken prisoner.If the guy wins, the girl will marry him. This habit may have arisen as a result of the young man's need to endure the hardships of nomadic life.[3.21]

In ancient times, the peoples of Central Asia had a struggle called the "Love hunt". As a rule, the girl ran away on horseback, and the cavalry chased her.The girl whipped the guys who attacked her with a whip and tried to get into the hands of the guy she loved only among them.Such a tradition is still held in some regions of the country during the national elections under the name "Qizquvdi". This shows that in ancient times, women's rights were relatively high in Central Asia. The girls got married of their own free will. They also set the condition for the young men, who were considered fit for marriage, to be brave and valiant, who would protect the country from various calamities.

Such girls, who embodied the lofty dreams and ideals of the people, did not fly to the appearance or wealth of the young men, but rather tested their courage, demanding true heroism in the way of love.That is why their love acquires a rich content. This means that many brave girls, such as Barchin, Zulhumor, Orzigul, Zarina, created in epics and fairy tales, do not lag behind men in

strength and sniping. The images of such women trying to decide their own destiny were certainly not far from real life.Undoubtedly, these sources inspired the author to create the image of a girl known as Lubati Chin (Chinese puppet) in Alisher Navoi's epic "Saddi Iskandariy", who amazed Alexander with his courage and bravery on the battlefield.

In folk epics, the characteristic aspects of the images of women are revealed more in the depiction of various customs and rituals. For example, the long-standing customs of the people, such as "qiz ko'rdi", "beshik ketdi", "quloq tishlatish", "non sindirish", "unashtirish", "eshik supurish"are a clear proof of this.

According to the epic "Yodgor", Oydinoy is determined to decide her own destiny. This girl, who holds human pride high, responds when she hears from her mother the words of violent suitors:

Соларман жафолар тандаги жонга,

Аймоқнинг полвони келса майдонга.

Мен қўрқмайман келадиган душмандан,

Ушласам отарман уни осмонга.

Here, Oydinoy is portrayed in the eyes of the listener-reader as an independent-minded, courageous girl who is able to defend her rights. Oydinoy's courage in the epic "Farhod and Shirin" is famous for Shirin's words to the ambassadors sent by Khisrav:

Менга не ёру не ошиқ ҳавасдур,

Агар мен одам ўлсам ушбу басдур!

reminded such words.

In the epic "Oysuluv", King Dorothy of Iran thinks of handing over Kunbatir, the son of the king of Turan Oysulu, a brave and courageous soldier, to himself.The brave young man is tricked and thrown into prison. In addition to being a wrestler, Kunbatir was a very handsome young man.Oftoboy, the beautiful daughter of Caesar, the warrior of Darius, is also described by him. Oftoboy secretly goes to prison with his maids and falls in love when he sees Kunbatir. The girl frees the boy from bondage.He likes this job not only because he loves it, but also because of justice. The plot of Mas'ud's story in Alisher Navoi's epic "Sab'ai Sayyar" is also reminiscent of this event.

The image of Barchin in the epic Alpomish encourages Alpomish to be heroic in the face of adversity, overcoming hardships and achieving their goals is also a sign of the people's love for their wise and prudent, brave and courageous daughters.There are many examples created under the influence of this heroic image in folklore.The episode of Rano, a brave girl who encouraged Anvar to persevere in Abdullah Qadiri's novel The Scorpion from the Altar, the episode of Gulnor and others, depicted in Oybek's novel "Kutlug Kan", who dared to challenge his lover Yulchi to fight against those who hinder his path of love, can be a proof of our opinion.

Folk epics, stories about women in ancient written sources, depictions of the life of our ancestors in the past,plays an important role in understanding their dreams and worldviews. After all, women had a great place in life even in ancient times.

That is why the people described women as great heroes, patriotic warriors, just rulers.Advanced ideas were widely propagated by the exaggerated representation of such heroes with fantastic colors.Most importantly, the masterpieces of folklore have laid the foundation for a wide-ranging, comprehensive depiction of the images of women in the written literature, the artistic study of the layers of the psyche.

Uzbek literature, which is an integral part of world culture and art, also consistently expresses the gradual development of society, the changes taking place in the minds and consciousness of people.In the new century, the global problems taking place in the world, along with new relationships, women's spirituality, the scenes of the inner spiritual world are also consistently depicted through the art of speech.In particular, social relations, new views of the economic environment and the fate of women, who are its direct participants are firmly rooted in the scope of artistic analysis.

Images of women in folklore and written literature samples we analyzed,in their interpretations of the inner world, it can be said that the influence of time and environment on the minds and consciousness of people, the changes in the psyche of the heroes, the spiritual changes have found their artistic solution.The worldviews of people of different categories and classes, their attitudes to life and marriage, their purpose in life have found a realistic image in the background of the image of women and the environment.

This means that in order for human spirituality, especially female spirituality, to take precedence in any environment and circumstances, human qualities must take precedence, and there must be a sense of compassion and understanding between people.

In short, along with world literature, Uzbek literature is living in harmony with the times and is becoming richer and richer with works in various genres on the theme of the image of a woman and her psyche.Each pen owner artistically expresses his thoughts and views on the social environment and the spirituality of the hero.

ABSTRACT

This article reveals the personal human qualities of Muhammad Rahimkhan, Amir Shohmurod, Amir Haydar and Amir Alimkhan, the emirs of Bukhara from House of Mangit, as well as their contribution to the field of education.

KEYWORDS: *Ruler, Education, Upbringing, Example, Will, Justice, Nationalism, Decree, Homeland, Nostalgia.*

INTRODUCTION

In the middle of the 18th century, the Bukhara Khanate was replaced by the Bukhara Emirate. The Emirate period (1753-1920) began with the reign of Muhammad Rahimkhan, originally from the Mangit clan, who called himself a "khan", and continued to Amir Alimkhan, the last representative of the dynasty. It is known that during the years of Soviet rule, educated on the basis of communist ideology and class theory, the khans and emirs were incapacitated by such unscientific ideas as "illiterate", "butcher", "ignorant", "obsessed with wealth and throne". However, local, original sources, while reviewing the manuscripts, made sure that the rulers also displayed as many positive aspects as possible as leaders and individuals.

In this article, we have tried to somewhat analyze the exemplary aspects of personal, positive qualities in education of the Mangit emirs of Bukhara, such as Muhammad Rahimkhan (1753-1758), Amir Shohmurod (1785-1800), Amir Haydar (1800-1826), Amir Abdullah (1885-1910), Amir Alimkhan (1910-1920). Historians of the Mangit period Muhammad Sharif, MirzoSadiqMunshi, Mir Abdulkarim, Mir Hussein Miri, Muhammad YaqubDaniolbiy, Khumuli, Mirzo Shams Bukhari, Ahmad Donish, AbduraufFitrat, Hashmat, SadriddinAyni, etc., spoke

about emirs in their historical and educational works, one who looks at such works makes sure that there are positive evaluations on the emirs. Although Muhammad Rahim Khan, the first representative of the Mangit dynasty, was not fully aware of Islamic spirituality and enlightenment, he was a strong-willed man, a skilful military commander, and a man of justice. [6.309-310] No matter how much personal initiative Rahimkhan took in the field of religious and secular sciences, he was busy with military operations and public administration for a long time and failed to achieve his goals. He set a personal example in this regard, focusing on the aspects of physical training, showing willpower in human upbringing.

According to his nephew Shahmurad Miri, a historian , at the age of 8 he became the prince of Karmana and later Karshi. He learned the secrets of martial arts from Muhammad Doniyolbi, his otalik . In the first half of the day, he studied jurisprudence (Islamic law), and in the afternoon, he memorized the surahs and verses of the Qur'an. At the age of eight, he fully memorized the Qur'an. [6.321.325. 3.150.162] Amir Shahmurad studied jurisprudence (Islamic jurisprudence) from a young age and after his maturity, he created the collections"FatvoyiahliBuhoro" (Fatwa of the People of Bukhara) and "Ayn ul-Hikma", which contained all the fatwas and rules of the Hanafi school of Islamic jurisprudence. These collections played an important role in systematizing the legal norms of that period. These collections have not yet been studied in terms of the history of statehood and have not been translated from Persian into Uzbek. The conference "Majlisi Amir" organized by Shahmurad played an important role in increasing the legal literacy of the population [9.20-21].

 Amir Abdulahad (1885-1910) was the highest-ranking among the Emirs of Bukhara, who earned the rank of an adjutant general. During his reign, skillful diplomatic relations were maintained with the government of the Russian Empire. Amir Abdulahad paid great attention to creative work. He even managed to build buildings abroad, building a palace in Yalta, a mosque in St. Petersburg, a khanaqah, shops and mills in Mecca and Medina. During his time, "bedilkhanliklar " were organized in the palace, and he wrote poems under the pseudonym of "Ojiz" [10.45,48].

Amir Abdulahad fought against greed, bribery, drug addiction, homosexuality, dovecote, quail, gambling, which were widespread in the society. Deeply aware of the vices of human morality, he issued decrees regulating the judicial system. He fired greedy, corrupt officials. He abolished cannabis smoking, marijuana consumption, homosexuality, the slave trade, executions, and corporal punishment. In 1886 he closed part of the prisons, and the place of execution in Bukhara was buried. During the reign of Abdulahad Khan, the first Jadid schools were opened, where modern education and secular knowledge were imparted. In 1897 the school of MullaJuraboy was opened, in 1907 the school of the Tatar intellectual NizomiddinSobitov, and in 1908 the schools of local JadidsAbduvahidMunzim and SadriddinAlini were opened. Although these schools were closed under the pressure of fanatical mullahs, during the time of Amir Abdulahad, children and youth continued to be educated in private home schools in the evenings [8.14-15].

We found it necessary to dwell on the activities of Amir SayidAlimkhan, the last representative of the Mangit rulers. Amir SayyidAlimkhan notes in his memoirs that until 1896 he received military education at the cadet school in St. Petersburg, the capital of the Russian Empire. The period of study at the military academy was 7 years, and the future emir graduated from this school in 3 years, which means he finished the academy successfully and passed the exams. He

learned the science of governing the state from his father Amir Abdulahad Khan. He managed the principalities of Karmana and Karshi and gained enough experience in this regard. [4.7,8.]

Along with paying attention to landscaping and construction, Amir Alimkhan issued a number of fatwas and decrees on behalf of the government for the economic, spiritual and enlightenment development of the country in 1910-1916. In those days, wealthy officials and merchants held lavish weddings and spent thousands of dollars in the air. The big merchants held a "merchant's wedding" for three days after the wedding, with a special emphasis on the end of the ceremonies of holding kupkari, organizing such events as "clothes sharing" and "distribution of sugar and confectionery", he released a special decree to end such nonsense. On June 5, 1916, he issued a fatwa declaring that extravagance at weddings, in particular the distribution of sugar, was unacceptable. With this decree and fatwa, wedding days were shortened, goat games, distribution of sugar, wearing coats, etc. were stopped, and cooking of 4-5 kinds of meal and "fruit distribution" during the festivities was prohibited. Amir Alimkhan paid special attention to women's health, especially in the field of healthcare. In 1911-1912, a women's workshop and maternity hospital were opened in Bukhara by the direct decree of the Emir. In 1913-1916, outpatient clinics and hospitals were built in dozens of principalities of Bukhara.

Amir Alimkhan received the rank of general from the Emperor of the Russian Empire Nicholas II (1894-1917) as a military official. In many Russian cities, Russian officials and officers repeatedly greeted him with respect and gave him the respect he deserved.

After the overthrow of the Emir's regime in Bukhara by the Bolsheviks in September 1920, Amir SayyidAlimkhan retreated to East Bukhara (now Surkhandarya Province and the Republic of Tajikistan-O.A.) and fought against the Soviets for six months. Defeated in unequal battles, the emir crossed the Chubek tributary, a crossing of the Panj and Vakhsh rivers, on March 4, 1921, with 100,000 men from Tajikistan into neighboring Afghanistan, and arrived in Kabul in May of that year. Then began his 23-year exile. [2.193-196] Amir Alimkhan lived in the Fatuh fortress near Kabul and had 37 sons and daughters. Amir Alimkhan actually lived under house arrest in Afghanistan. He could not go 11 km from Kabul. Every action and activity of the Emir was under the control of both British and Soviet government spies. Amir Alimkhan hired English teachers from British India, HodjaKaromatullah and HodjaRahmatullah, to educate his 16 sons and 21 daughters (12 sons and 10 daughters of the Emir were alive in the early 1990s).There are poets and writers, journalists, medical workers, economists and intellectuals working in the trades professions among currently living children and grandchildren of the Emir in Afghanistan, Turkey, Saudi Arabia, Pakistan, Iran, Germany, USA, (there are relevant data on the fact that the Emir's descendants are 3,000 abroad-O.A.). We are far from claiming that there were no negative features in the character of Amir Alimkhan. However, it is known that there are many qualities that can be learned from him. Amir was a strong, articulate, strong-willed person. In the Afghan capital, Kabul, he celebrated the country's Independence Day (JushanHoliday-O.A.) every year. The Emir of Afghanistan, Amanullah (reigned 1919-1929), had introduced a European dress code for such celebrations. Amir Alimkhan went to the festivities in Bukhara national costume and stood in one word, he liked to walk in national costume, was a strong archer, organized "creative nights" and "bedilkhanliklar" in Fatuh fortress. [1. 410,420,445] Amir SayyidAlimkhan was a fan of the art of national music, skillfully performed classical melodies on the dutar and tanbur, and lived a lifetime of love and longing for the homeland.

To conclude, it is not necessary to look for the identity of the Bukhara Mangit emirs in the interpretation of the literature written during the years of Soviet rule. The real information about them can be understood through a thorough study of the manuscripts of local historians. We hope that in the future new research will be created on the exemplary aspects of these rulers.

ABSTRACT

This article examines the essence, features and improvement of family entrepreneurship from a scientific and theoretical point of view at the new stage of development of our society. We tried to analyze from a philosophical point of view the creation, development, strengthening of social, cultural, economic and legal foundations of family entrepreneurship, as well as its significance in the development of our country.

KEYWORDS: *Entrepreneurship, Family Entrepreneurship, Business, Phenomenon, Philosophical Analysis,Civil Society, Transformation, Legalization.*

INTRODUCTION

The family business is considered the most organized form of business at the new stage of development, as well as one of the important factors of economic growth. Therefore, the study of its socio-philosophical aspects on a scientific basis, increased attention to its legal aspects, analysis of the formation process of one of the important aspects of human activity during the period of transformational changes in society are of theoretical and practical importance.

Also, necessary to study the current content, trends in the formation and development of family business, to analyze its impact on sustainable development. It should be noted that a family business is a phenomenon that is directly related to the development of society, has its own form and characteristics in accordance with the process of its development. In this regard, it should be noted that it depends on the growth of the personality, activity and culture of the person. Family business entities also need laws that play an important role in their development, i.e. the need to

systematically improve its legal framework, organize the legal framework for entrepreneurship, individual entrepreneurship in a modern way, in accordance with a new stage of development.

In the development of our country, developing of a family business is an activity aimed at solving important social and economic problems. Also, the activities of the family business are among the factors that have a positive effect on the competitiveness of goods and services, a decrease in youth unemployment, and a decrease in inflation in the country's economy. So, the family business can play the role of a liaison between government agencies and the business community, small and medium-sized business owners. Family business representatives are also important for resolving organizational and legal issues between government and business.

It should be noted that the activities of a family business should be supported by the state and other businesses, since they have become one of the key factors in its development. In particular, at the stage of innovative development, during the period of turbulent social democratic transformations, the adoption of special programs aimed at attracting each family member to entrepreneurship and their implementation is of practical importance. The Law of the Republic of Uzbekistan "On Family Entrepreneurship" defines "Family entrepreneurship as an entrepreneurial activity carried out by family members who are at risk and under their own property responsibility, in order to generate income (profit). A family business is built on the voluntariness of its participants. A family business can be run with or without a legal entity. The organizational and legal form of a family business carried out in the formation of a legal entity is a family business. In the absence of a legal entity, the family business is carried out in the manner prescribed by law"[1].

As noted above, on March 16, 2012, our country adopted the Law of the Republic of Uzbekistan "On Family Business". Although in the past this law to a certain extent served as legal protection of the interests of entrepreneurs, but did not eliminate all the shortcomings of this phenomenon, society did not realize the potential of the socio-economic system.

The full implementation of this law in the social sphere has not been ensured, its mechanisms for regulating relations in the field of family business have not been worked out. One of the main reasons for this is a lack of understanding of the essence of entrepreneurship, its role in practice, development of the country, legalization of family business, delays in creating a business environment, neglect of the human factor, and the presence of some corruption in some government structures. Therefore, representatives of governmental and non-governmental organizations paid attention to the problem of further development of family business. New approaches, innovative approaches to solving social problems, awareness by state structures of the role of the human factor in the development of society, measures taken to eliminate existing shortcomings, have expanded the scope of legal, organizational work for the development of family business, measures that positively influenced the development of this phenomenon in society. saw. Excellent professional training has a positive effect on the development of a family business. In the "Dictionary of the Uzbek language" the word "profession" is explained as follows: a profession is to make something habitual: to learn, own, make a profit, a profession, an occupation, or an ordinary job in general[5].

Should be noted that,to developing of family business, the process of teaching young people who graduated from secondary special schools has been improved. Measures have been taken to radically improve the activities of secondary specialized educational institutions: vocational

colleges, technical schools and schools. They focused on the formation of professional skills of students in education, revised the curricula of secondary specialized educational institutions, the number and content of subjects.

In professional colleges have created a new generation of educational and methodological literature and textbooks on the subjects studied by students. They are focused on organizing the educational process with the effective use of modern teaching methods, organizing lessons based on new pedagogical technologies, innovative methods in explaining the essence and essence of professions and professions taught to students. The process of training a new generation of specialists, including the development of a family business, as well as a new stage in the country's socio-economic development, increased competition in manufacturing and services, and the announcement of the concept of replenishing the ranks of developed countries. It is necessary to further improve the work of professional colleges, to use their activities on the basis of innovative educational technologies, as well as advanced methods used in training specialists in foreign, that is, in developed countries.

Should be noted that, as a result of a positive attitude towards family business in the country, the need for its further improvement, as well as expanding opportunities for this business, the conditions for starting a family business have expanded, and government support for this sector has increased. In the socio-economic sphere of society, the social and legal environment necessary for a family business has completely changed, that is, relations between government structures, business communities have reached a new positive level in accordance with the requirements of a new era.

RESEARCH METHODOLOGY

The concept of entrepreneurship was first scientifically substantiated by R.Cantillon [6. 73]. Problems of Entrepreneurship and Entrepreneurial Culture Economic, social, culturaland philosophical aspects of the works of such classicsas A.Smith, D.Ricardo, I.Kant, F.V.Hegel, J.J.Russo, S.L.Monteskeareanalyzed. In the development of scientific and theoretical foundations and substantiation of the socio cultural significance of family business in the development of society, or family business in the West, theoretical scientists suc has A.Turgo, J.B.Say, R.Hizrich, J.Schumpeter, W.Adams, G.Gross, J.Phillipsand W. Hoyeralsoput forward their scientifically sound views.

The decree of the President of the Republic of Uzbekistan "On the implementation of the program "Every family is an entrepreneur" was signed on June 8, 2018 in order to create conditions for a family business, craft, home employment and other types of entrepreneurship and to eliminate unemployment [4]. The main goal of the historical document developing this strategic direction should be to radically improve the material conditions, quality and standard of living of the population living in areas with difficult climatic conditions, including lack of water, desert and semi-desert. Support the creative initiatives and desires of young people who want to engage in any type of family business, provide them with repayable loans in banking institutions, that is, concessional loans, for starting and implementing family businesses at the initial stage by government agencies, NGOs. the forms of rendering practical assistance are clearly defined.

The program was designed to be implemented in every region and city of the country, primarily in remote natural and climatic conditions, including in areas with an unfavorable ecological situation caused by anthropogenic human activity. The main reason for this approach to solving

the problem is the provision of employment for the population, as a result of which the employment of young people, able-bodied workers, those who do not have temporary work, reduces internal migration. This is due to the fact that the process of steady growth in population migration creates social difficulties, leading to an increase in socio-demographic problems in certain regions and fast-growing cities. These include the workplace, difficulties in finding a job, the emergence of a competitive environment, difficulties in providing housing, deficiencies in human health, and so on. Also, one of the important aspects of this social problem is the lack of specialists due to the relocation of highly qualified specialists from one region to another. Family business development is also aimed at reducing unemployment among the population. Therefore, along with the local budget, it is envisaged to use financial assistance from international organizations, that is, credit lines from foreign financial institutions.

When allocating funds to family businesses, their potential, the availability of a business plan and justification for the entrepreneur, the future of business projects and the creation of new jobs in the area, as well as the social and economic needs of the citizen, his and public interests. Distributed by commercial banks and districts (cities). This scientifically grounded program is aimed at solving the interests of a person in the new conditions of development, ensuring his socio-economic activity, specific financial sources for its implementation, the formation process, in this process, establishing close interaction between government bodies and family entrepreneurs. It should be noted that in the current policy, that is, aimed at the further development of family business, in this process it is advisable to pay special attention to the role of public organizations, including the community. Public activists are well aware of the social situation and other opportunities of the population living in the area, which positively affects the deepening of this process, provides organizational and legal assistance, is engaged in various forms of entrepreneurship, including home work, crafts, animal husbandry, poultry farming, and gardening, plays an important role in ensuring the expansion of these types of businesses.

The experience of the developed countries of the world shows that the more family business develops in a country, the higher the economic development of this country. In particular, the family business is very developed in the China. "Currently, most of the small businesses in the world operate as family businesses. The family business produces 40-50% of the gross national product in Europe, 65-82% in Asia and about 70% in Latin America. Its share in the USA economy is over 95 percent. In many economically developed countries there are specialized associations that conduct research in the field of family business, defend its interests and create discussion forums to exchange experience of family business. This approach will expand the active involvement of the population in entrepreneurial activities, the formation and development of family traditions, a dynasty of family entrepreneurs"[7].

Analysis and results

At the new stageof development, efforts to ensure the development of family business, which is one of the factors contributing to the socio-economic development of the country, its social need depends on the following factors:

First, a business entity created with the participation of family members is the main source of ownership of private property of a family member. As a result, the idea is formed, which is necessary for the improvement of a person, the attitude towards property, the concept of its formation, development, preservation.

Secondly, to teach a family member to engage in entrepreneurship from an early age, to begin the process of developing these business skills, to nurture an entrepreneurial personality that will make a worthy contribution to the future development of the country, shaping cultural skills and aspects of modern entrepreneurship.

Third, a family business owner will have the skills to resist competition by continually improving the range of products or services provided to the public from an early age. In addition, the idea of working with business partners, teams of entrepreneurs is being formed to ensure the development of family business, regular adherence to its regulatory framework, and the legal culture as a person is growing.

Fourth, the family business makes a person from an early age proud of the results of his work, teaching family members and children to pure work in the future, to be patriotic, family-oriented, and children to be proud of the results of their labor.

Fifth, as a result of the development of family business, the fight against corruption plays an important role in preventing such negative situations as bribery, greed, deception, disregard for other people's work, the desire to live at the expense of others.

Sixth, as a result of the family business, the young entrepreneur will have information about the formation of this type of business, development trends, conversations, discussions that will take place in the family every day. As a result, the family directly monitors the process, financial aspects, sources of business, mistakes and shortcomings in the implementation of the project, the reasons for success, which is important for the development of a family business.

Seventh, an important factor in the development of a family business is the general preparation of the individual, skills that ensure the professional aspects of entrepreneurship, the need for spiritual and moral culture, the family human factor for the success of a family business, its knowledge, modern information, i.e. competitive environment, inflation, job creation. the concept of dependence arises, and such independent, socially significant conclusions are reflected in his practical activities.

Therefore, the Action Strategy identifies five priority areas that are important at the new stage of development of the Republic of Uzbekistan: "Ensuring reliable protection of the rights and guarantees of private property, overcoming all obstacles and restrictions for the development of private entrepreneurship and small business, give them complete freedom. The need to implementthe principe "If the people are rich, then the state will be rich and strong"[3].

It should be noted that the process of further liberalization of family businesses and the development of small businesses has accelerated in recent years on the basis of transformation processes. The principle of innovation, which is being implemented as a result of reforms in the new Uzbekistan, is a set of actions aimed at finding solutions to human, social and economic problems.

If we analyze the scale of reforms in our country, it turns out that the development of family business is one of the main activities of government and non-government organizations. It should be noted that creating favorable conditions for family business in society is a priority task, the main reason for which is that the number of jobs created in the country, to some extent, corresponds to a family business. In this regard, the President of the Republic of Uzbekistan said:

"We must fully support entrepreneurs who create new jobs, and if necessary, carry them on our shoulders"[1].

An important feature of family businesses is the need for family members to regularly rely on innovation to run the business. An innovative approach creates new forms and directions of family business, enriches its content with innovations based on modern requirements and, as a result of this approach, enhances the resistance to competition in society. It should be noted that an important area of family business - the introduction of new, innovative technologies in a family business - leads to the production of quality goods, organized in accordance with the growing interests of those in demand on the global and domestic markets, the content of services is being qualitatively updated.

CONCLUSION

It should be noted that at the new stage of development, the owners of the family business are organized, acting, that is, the business entity created in the family will be aimed at a certain level of profit, ensuring its effectiveness. Society pursues the task of effectively using high technologies, that is, information, communication and electronic methods of work, to ensure a systematic improvement in socio-economic development and, in this regard, the development of family businesses, which play an important role in its maintenance. One of the characteristics of a modern entrepreneur, along with his spiritual, moral, political culture, depends on his culture of effective use of computer technology, modern information. As a result of this process, the ability to use the skills of information and communication culture ensures the commercialization of entrepreneurial activity. At the same time, increasing the opportunities for professional development of the entrepreneur, as well as the effective use of this positive shift will ensure the competitiveness of the entrepreneur.

In the process of mastering the basics of information and communication culture, a representative of a family business, an entrepreneur, not only acquires special knowledge, skills and experience related to practice. At the same time, the business community will have the skills to learn, reflect, and apply the procedures and rules adopted by the community. Also in this process, the entrepreneur gets acquainted with the content of national and universal values, studies advanced foreign technologies, finds partners necessary for the sale of goods produced by his company, analyzes the competitive environment in the domestic and foreign markets.

In a conclusion, an important feature of a family business, that is, its role in the field of qualified entrepreneurship, the main criterion is the professional training of each entrepreneur, the systematic development of this process, his efforts to improve his qualifications. In this context, it should be noted once again that one of the key factors in the development of a family business is knowledge that is associated with an informed society. In this process, it became necessary to use computer technology and the capabilities of telecommunications, nanotechnology. Also, a modern family business depends on the skills of an entrepreneur, because as a result of professional training, an entrepreneur can study socio-economic problems and personal interests in the modern business system and find a solution. In this process, the family entrepreneur must rely on his creative potential, since as a result of such activities, the entrepreneur makes non-standard decisions necessary to solve the problem, which, in turn, creates opportunities for the entrepreneur to act in the system of market relations.

One of the most important factors for entrepreneurship is the need/necessity of the owners of this enterprise for specialized knowledge. At the same time, the expansion, development, modernization of professional opportunities in the activities of entrepreneurs, familiarity with the content of secular knowledge in line with global development is an important indicator of the maturity of an entrepreneur. This process, in turn, provides the formation of professional skills in the system of entrepreneurial education, independent entrepreneurs, acts as a factor confirming the competitiveness of an entrepreneur in social systems.

RESEARCH ON HERITAGE ISSUES IN ISLAM AND THEIR CHARACTERISTICS

Masayitov Saidjamol Yusifovich*

*Independent Researcher,
International Islamic Academy Of UZBEKISTAN

ABSTRACT

In this way, a woman could not be an object of inheritance: "you will not be allowed to inherit women against their will"[8]. Before that, according to the Arab custom, after the death of the husband, his eldest son or other relatives had the right to marry a widowed woman or he could marry another. Modern fatwas can also be considered as a synthesis of Ijtihad and Ijma. The basic principles of Islamic law of inheritance are Justice, humanism and the most important are based on the Qur'an's guidelines. Most researchers have pointed out that many of the jurisprudence, including the norms related to inheritance, also came from the correct interpretation of hadiths.

KEYWORDS: *Inheritance, Interpretation, Jurisprudence*

INTRODUCTION

Through the study of the foundations, sources, norms of Islamic law of inheritance, we can see that the important news in it is the rejection of the Arab custom, which at that time considered a woman an object of inheritance. The main sources of Islamic inheritance law are the Qur'an, Sunnah, the Ijmo[1]. Modern fatwas can also be considered as a synthesis of Ijtihad and Ijma. The basic principles of Islamic law of inheritance are Justice, humanism and the most important are based on the Qur'an's guidelines. Lack of the right to limit the number of heirs by testament to the peculiarities of the Muslim right to inheritance; the priority of men in the right to inheritance; in the place where the Will is contrary to Sharia norms, it is acceptable to change, etc.

The importance of the topic of Islamic law of inheritance lies in the fact that in the legislation of modern secular states it is possible to use some aspects of Islamic law of inheritance, including its structure, the classification of relatives in it, as well as practical solutions to many issues. The

projection of such norms on the right of the secular state to inheritance creates new opportunities in the creativity of the law.

We also connect the importance of research in this area with the possibility of finding optimal solutions to the integration of Islamic law of inheritance from the results obtained into the political, legal and spiritual spheres of multi-confessional states. Today, attempts to do this can be seen as a vivid example of the application of Islamic laws in order to prevent Islamic radicalism in the modern Egyptian experience and the activities of the Malaysian Institute of mediocrity[2].

The main content of the Islamic right of inheritance was developed in the VIII-X centuries. Changes in the sphere of new issues in its composition were due to the fact that the boundaries of the first Islamic State and its pre-Islamic life were increased by the number of Muslims who entered a new religion (neofit), governed by customary laws. With the emergence of Islam on new lands, legal conflicts arose between the fiqh and the old legal systems. If the norms of law do not contradict the Qur'an, it means that it has resolved them by calling them Shari'ah and this is reflected in the rules of jurisprudence[3]. For example, according to the usual laws of the Turkic peoples, the property of the deceased passed to the youngest son. With the accession of these peoples to the Islamic State, one can see that these habits follow as the norm of Sharia. In other Muslims, the inheritance began to be distributed among relatives and persons mentioned in the testament. But the inheritance among the nomadic Muslim Turks was often carried out according to custom, that is, the younger son inherited the property, the remaining children and other relatives simply accepted it. The legal phenomenon that has arisen indicates a new form of resolution of the conflict between the custom and the fiqh. In the science of inheritance, this is called taxoruj[4]. According to him, a decision is made by agreement of the parties[5].

The basic principle of Islamic inheritance law is to comply with the norms of the Qur'an as mentioned before. In Muslim law, the Qur'an is the main source of the right to inheritance, and its norms are recognized as necessary for Muslims. Since the Qur'an is by Allah, its content is to the people in Islam that Muhammad (s.the a.v.) is regarded as a divine instruction delivered through mediation. The authenticity and supremacy of the Qur'anic norms is explained by the fact that Allah is not like the developers of secular norms built on economic and political interests, therefore, according to the fiqh, observance of the Qur'anic norms is an indication of the maximum implementation of the principles of justice and humanism[6].

The Qur'an has described in detail its precepts in the Surah Niso, where many verses are devoted to the rights of women as a source of the right of inheritance of Muslims. It introduced radical changes to the norms that existed in the Arabic tradition, and at the very beginning of these customs it was assumed that a woman did not have the right to inherit the property of her relatives.

The Qur'an abolished this standard. The woman was declared an heir who has her share in the inheritance of relatives: "men have a share in what their parents and relatives leave, and women have a share in what their parents and relatives leave" [7]. In this way, a woman could not be an object of inheritance: "you will not be allowed to inherit women against their will"[8]. Before that, according to the Arab custom, after the death of the husband, his eldest son or other relatives had the right to marry a widowed woman or he could marry another.

It follows that Islam in all things equated men with women: "Men are the protectors of women, because Allah has exalted one of them above the other and because they have spent their wealth." In the former Baccarat Surah, there is also a criminal prosessual norm, which indicates that "two women are equal to one man" [9] when it comes to the provision in court. Later this rule was transferred to the right of inheritance. According to him, the share of the female heir corresponds to 1/2 part (half) of the male heir's share, or, in the words of the Qur'an, a man is given two times the female share [10].

In the Qur'an, there are rules related to the testaments: a) the fact that leaving a testament is Sharia (legitimate); b) the Prohibition of changing the will by an unauthorized third party [11]. His change or complete prohibition is allowed only if the testament is in a destiny contrary to the norms of the Qur'an.

The inclusion in the Qur'an as an heir of women and other persons not provided for in the testament caused an increase in the number of heirs. Therefore, it became necessary to determine the share of each person in the inheritance. In order to determine the priority directions of inheritance, heirs at the level of kinship are divided into three categories:

1. Spouses, parents and children of the heir;

2. Brothers and sisters and sons of brothers;

3. Uncles and their sons.

The share of each of these was clearly defined in the Qur'an [12], which eliminated conflicts among many relatives that could arise from inheritance.

If we pay attention to another feature of the Islamic right of inheritance, which appeared in the VII century, then the presence of inheritance is also the presence of relatives not specified in the testament. The Qur'an states that before the distribution of property among relatives, it is obligatory to fulfill the following conditions: a) to pay the debts of the deceased from the inherited property; b) to give part of the property (less than 1/3) to the persons specified in the will by the deceased . Of course, these are post-spending works, which are allocated from the funds of the deceased to bury him [13].

Islamic scholar O.V.Naumenko drew attention to the fact that inheritance by testament in the Islamic jurisprudence is the secondary importance and includes a number of significant limitations [14]. But at the same time, those who are bequeathed in the distribution of property receive their share earlier than those who inherit Sharia.

The subsequent development of Islamic inheritance law is associated with the emergence of the second most important source of Islamic law – Sunnah [15]. Circumcision is associated with a specific subject Muhammad (s.a.v.) is a collection of hadiths describing the works and words.

There are several hadith collections written by Muslim scholars, most Islamic scholars consider the collections compiled by Abu Abdullah Muhammad ibn Ismail al-Bukhari and Muslim ibn Hajjoj an-Naysaburi in the IX century as the most reliable source, followed by books collected by Abu Dawud as-Sijstani, Abu Isa at-Termizi, Abu Abdurahman an-Nasai and Abu Abdullah al-Qazvini ibn Maja. The interpretation of the Qur'an to Islam religion Sunnah and its norms is based on the principles of Muhammad (peace be upon him).s.a.v.) is considered as an example of what he personally showed in practice. Despite the fact that there are also some unreliable

hadiths in the Sunnah, Islamic scholars have warned Muslims in their place. While C.Berton has been facing the clashes of hadiths in order to"ensure that the scholars interested in theology, law and politics are universally aware of the views and ideas in their small lesson rings", reliable sources say that the Hadiths are almost free of them [16].

Most researchers have pointed out that many of the jurisprudence, including the norms related to inheritance, also came from the correct interpretation of hadiths. For example, there is a rule prescribed in the Sunnah, according to which a Muslim cannot leave his property as an inheritance to a non-Muslim, even if he has a brother or sister. Here they refer to the hadith: "a Muslim can not inherit from a disbeliever and a disbeliever from a Muslim" [17].

Circumcision is thus considered as the main source of Islamic jurisprudence. There are many norms in it that, taking into account practical situations, develop the instructions for the inheritance of the Qur'an, they could not be reflected in the Qur'an because of the abundance. For example, in the Qur'an there is no direct rule indicating the need to determine the legal dignity of the heir. However, such a norm is included in the paragraph, and it says that "the testator must be capable of dispose of his property. In other words, one must be smart, mature, free and have the right to choose[18].

The payment of burial expenses before the division of money inherited between the heirs is also indicated in the Sunnah[19]. Also, circumcision introduces a pledge norm. If the deceased received money as a pledge of something of value, it means that from the inherited money this money will be returned to the beneficiary, and the pledge item will naturally be included in the range of objects of inheritance[20]. Circumcision also complements the Qur'an norm on the need to repay the debt of the deceased[21].

In addition, the testator must indicate in the testament who and how much he owes, as well as write down those who owe him and the amount[22]. If the deceased died because of the committed murder, then the Hadith prohibiting the inheritance of the murderer is also considered reliable. Muhammad (peace be upon him)s.a.v.) those who say:"there is nothing from the inheritance for the killer" [23]. Thanks to circumcision, unmarried children were also removed from the list of heirs. The relationship between an illegitimate child and his biological father is not taken into account in the laws of Islamic inheritance.

An important source of Islamic heritage right today is the fatwa. This is the decision of a competent Muslim scholar. Usually, researchers refer to cases that are not indicated in the Qur'an and Sunnah as a fatwa, but are regulated by scientists. For example, a child born without a marriage, if a marriage was made between his biological parents after his birth, would he inherit the property of his biological father?[24].

How to assess euthanasia, property or life insurance, surrogacy, body parts, blood and sperm donor from the point of view of the right to inheritance? Is it possible to inherit the money collected in the form of interest of the deceased to a Muslim because of the ban on judicial prosecution in Islam? It is necessary to solve such a large number of issues without contradicting the normative norms of Islam. Fatwa is given by a Muslim who has a high level of knowledge in the field of jurisprudence, who perfectly knows the Arabic language, the Qur'an, the Sunnah, the sects and the history of Islam, as well as high moral qualities and piety.

In fact, the emergence of the source of Muslim rights, such as the fatwa, can be viewed as a specific continuation of the Jihad process. It is known that Ijtihad was simultaneously the cause of the emergence of many juristic schools in the issue of Islamic laws. Although each of them only declares its norms to be correct, it is possible that their followers, according to the dictates of the circumstances, accepted the words of the other mujtahidin, among other things, meet in the right of inheritance.

In Islam, it can be argued that the role of fatwas in the creativity of modern law has become much greater. For example, a decree was recently adopted that would allow medical intervention to influence the sex of an unborn child in Malaysia[25]. Some researchers view fatwa as a source of Islamic law, similar to Ijtihad, which is a type of Ijtihad and community synthesis[26]. But not all Muslims in the Islamic world can accept it unanimously. The fate of Ijtihad and Ijmo, the successor of Ijtihad, inherited from them the same problems. In the Arab Republic of Egypt, Saudi Arabia and other Arab and Islamic countries there is a permanent committee with the right to issue a fatwa. Nevertheless, these fatwas were not recognized in Iran as a source of Sharia law. Even in modern Egypt, it is doubtful that it will be accepted without honor. In Europe, too, for more than 20 years the Council of Europe on the fatwa has been operating, it is aimed only at addressing the problems of European Muslims.

A separate study of the science of inheritance among the sharia sciences[27] is also characteristic of the madrasahs of Movarounnahr, which functioned in the X-XI centuries. On these madrasasas and the Sciences studied in our country, the scientist Ziyodulla Muqimov concludes in his treatise entitled "Movarounnahr fiqh school" that the science of inheritance in Muslim law education, which was studied in Movarounnahr madrasas in the X-XI centuries, was studied as a separate science.

A French scientist who studied Islamic law and several of its fields, R. Sharl also devoted the fifth chapter of his book "Musulmanskoe pravo"to this issue and described in it the issue of inheritance as follows:"the basic principles of the right of inheritance of Islam are taken from the Koran Karim. The issue of inheritance in Islamic law is extremely complex, but in turn it is a legal issue that is solved very skillfully in accordance with the legal system than some abstract and complex laws that are currently locked in."

In Islamic law, succession is made according to inheritance and testament. When the succession judgment is carried out according to the law, the heir is treated as a substitute, and not as a continuation of the person who inherited it. Therefore, the heir is not obliged to pay the debts of the deceased, which are in excess of the share he received[28].

As can be seen from the conclusions of the researchers, the right to Islamic heritage is unique in covering issues in this area. We cannot determine whether there are separate inheritance rules for khunasa (germafrodites) in other legal systems. But since the shares of inheritance for men and women in the fiqh are not the same, it will be necessary to determine the sex of khunasa (germafrodites). And such a norm exists in the fiqh[29]. In modern Malaysia, a decree has appeared that allows such individuals to carry out an operation to voluntarily change their gender, after which a person can inherit as a man or as a woman[30].

If we evaluate the law of Islamic inheritance in general, this is the most difficult part of the fiqh. AsA.K.Khalifaeva wrote, "the law of inheritance of muslims is distinguished by its incomparable complexity"[31]. Details of the smallest but occurring categories of heirs in life and their share in

inheritance, even the judgments on the right of the fetus in the mother's womb, are described in the works of inheritance written by the faqihs[32].

Acquaintance with the right to inheritance in general can be useful for the development of the right of inheritance of secular states.

THE ISSUE OF THE ETHICS OF ZIYARAH IN THE BOOK OF "TARIKHI MULLAZADA" OF AHMAD IBN MAKHMOOD

Jurayeva Nafisa Olimovna*

*Senior Lecturer,
Faculty of History and Cultural Heritage,
Bukhara state university,
UZBEKISTAN

ABSTRACT

In the following article the issues of the ethics of pilgrimage in the book Tarikhi Mullozada of Ahmad ibn Makhmood are analyzed. Based on the religious, philosophical reconsideration, discussion and facts the pilgrimage of cemeteries by the men and women being linked to the issue of the responsibility of the human is revealed.

KEYWORDS: *Shrine, Holy Site, Pilgrimage Site, Ethics Of Pilgrimage, World Of Tasawwuf, Cemetery, Graveyard, Site Of Pilgrimage*

INTRODUCTION

In the study of shrines, written sources, manuscripts, rare works, along with improving the field and raising the culture of pilgrimage, serve to introduce the value and identity of the object of pilgrimage, to clarify the historical service of the saints and Sufis buried in this step.

"Kitobi Mullazada" is one of the unique sources that reveals the unknown historical facts about such shrines. This work is known by various names. In particular, "History of Mullazada", "Risola dar fazoili Bukhara", "Risolai Mullozoda", "Kitabi manoqibi mozoroti Bukharayi sharof", "Kitobi Mullozoda Bukhari", "Tazkirai shuyukhi Bukhara", "Tarikhi buzurgoni Bukhara", "Zikri toifai ahli Bukhara and navohiha" , "Tarikhi mozorot", "Mullazoda khoshki bar tajavvali nahv"[1,7].

The significance of the work "Kitabi Mullazada" is that it is distinguished by the presence in this work of information about certain historical figures that are not found in historical or historical-geographical works. In this book, the names of the great scholars and Sufis buried in and around Bukhara, the years of birth and death, their teachers, students, and their works are briefly and succinctly described. It can be said that the work was written in the spirit of "reference".

LITERATURE REVIEW

If there are many sacred sites in Bukhara and most of them date back to the Middle Ages, the worship of shrines (tombs) is very developed, and we can conclude that most of them are associated with the burial place of dignitaries. As Academician W. W. Barthold wrote, the worship of saints developed "under the influence of the growing conflict between faith and truth"[2,389]. Clergymen, on the other hand, at that time sought to control all aspects of spiritual life, including folk customs (holidays, pilgrimages, etc.). We can say that "Kitobi Mullozoda" is the work that put an end to the contradictions that arose during this period. It is in this work that the analysis of the culture of pilgrimage from the point of view of historical-religious, Islamic jurisprudence, as well as the famous works of history and the Islamic world Abul Qasim Mahmud ibn Umar az-Zamahshari's "Rabi'ul-abror", Ata Malik ibn Hajja Baha ad-din Muhammad al-Juwayni "History of Jahangushoi", "Book of Bukhara by Abu Bakr Muhammad ibn Ja'far Narshakhi", Abu Bakr Muhammad ibn Ja'far Narshakhi's "Book of Bukhara News", Abu Abdullah Muhammad ibn Ahmad ibn Muhammad ibn Sulayman Kamil al-Bukhari al-Warraq's "History of Bukhara", Imam Muhyi ad-din Nawawi's "Tahzeeb al-asme wa-l-lugat", Burayda's "Jami 'al-usul, the comprehensive justification of the hadith scholars Muslim, Abu Dawud, and al-Nisa'i on the basis of many works, such as the Kitab al-Sunan, eliminates the contradictory ideas about performing certain actions in the culture of pilgrimage, striking some conservative views, which led to the spread of worldview and spirituality.

As a result, the work probably served as a guide for visitors. The author provides detailed information about each shrine, including the location of the shrine (quarter), topographic objects around the shrine, location, for example, the city gates, proximity to water bodies, building, route and related historical events and happenings, the fact that he served to accomplish the task undoubtedly further increased the value of this work.

MAIN PART

This work consists of an introduction and four chapters: Chapter 1 - On the Permission of Men and Women to Visit, Chapter 2 - On the Rules of Pilgrimage, Chapter 3 - Mausoleums and Description of Mausoleums, Chapter 4 - Description of Mausoleums and Tombs in and around Bukhara dedicated to[3,390]. As can be seen from the title of the chapters, the work is devoted to the description of the culture of pilgrimage, procedures, directions and routes of pilgrimage, the geography of pilgrimage.

Researchers also point out that the author relied on many sources in writing this work. These works include:

1. The work of Abdullah ibn Muhammad al-Harith al-Kalabadi Safidmuni (d. 340/951) "Kitabi kashf";

2. The work of Muhammad ibn Ja'far an-Narshakhi (d. 348/959) "History of Bukhara";

3. The work of Abu Abdullah Muhammad ibn Ahmad al-Bukhari al-Gunjar al-Warraq (d. 412/1021) "History of Bukhara";

4. The work of Abu Hamid Muhammad ibn Muhammad al-Ghazali (d. 505/1111) "Ehyo al-ulum ad-din";

5. The work of Abul-Qasim az-Zamahshari (d. 1144) "Rabi' ul abrar";

6. The work of Abu Sa'd Abu al-Karim ibn Muhammad ibn Mansur as-Sam'ani (d. 562/1161) "Kitab ul-ansab";

7. Muhammad ibn Abu Bakr al-Bukhari-Imamzadeh (d. 573/1177), "Shariat ul-Islam ila dor i-s-salam";

8. The work of Aloud-din Ata Malik Juwayni (d. 681/1283) "Tarihi jahongushai";

9. Muhyi ad-din Yahya ibn Sharif an-Nawawi's (d. 696/1277) book "Tahzeeb al-asma wa-l-lug'at"[1,16].

The sources used by the author of the work "History of Mullozoda" can be divided into three main groups depending on the meaning and theme. The first group includes historical, historical-topographic, historical-geographical, the second group includes historical-biographical, historical-gnesological, philological sources, and the third group includes mystical, religious-philosophical, Sharia literature. As the author himself points out, the information is succinct, concise, and popular. This work is also important in the study of the history of Bukhara and its environs, where scholars, statesmen, Sufis - mullahs, sheikhs, saints, pir, murshids lived. There are also reports that this work influenced the writing of some works. In particular, the author of the book "Tuhfat uz-zoirin" ("Gift to pilgrims") Nosiriddin al-Hanafi al-Hasani al-Bukhari from Bukhara, in his work, wrote that he was influenced by Mu'in ul-Fuqara's "History of Mullozoda".

Some historical figures, as well as historical events related to their lives, also attracted the attention of academician W.W. Barthold, who used the book of Ahmad ibn Mahmud in his scientific works. In particular, as noted above, the well-known scholar W.W.Bartold, who drew attention to the activities of Mullozoda as a serious source in the history of Central Asia and one of its largest cities, Bukhara, was able to identify in this work information not mentioned by other scholars. It is said that he used some parts of his work "History of Mullozoda" in his work "Turkistan during the Mongol invasion". In the section on the history of the Qarakhanid dynasty, we can see that W.W.Bartold relied on the data of this work to describe the activities of the representatives of this dynasty, in particular Shams al-Mulk Nasr ibn Ibrahim (460/1068 - 472/1080) on urban beautification.

The construction of Raboti Malik, built by Shams ul-Muluk Nasr in the Zarafshan oasis, as well as a similar architectural monument in Samarkand and Khojand on his initiative, Information about the existing tomb on the side of the Namazgah of Bukhara, the famous tomb in Ak Kotal, as well as the place of birth and activity of Arslankhan, his construction of the Kalan Minaret in 1127 are taken from the above work.

In addition, in "Turkistan during the Mongol invasion" we can see that the information about the Bukhara sadrs, their origin, the history of the struggle with the Karahitays and Samarkand khans in the 12th century, the founder of the Kubravian mysticism Sheikh Najmiddin Kubro is based on "Tarikhi Mullazada". From this work scientists such as I.I.Umnyakov, V.L.Vyatkin, V.A. Shishkin also used it. We know that I.I.Umnyakov used the work "History of Mullazada" in "Raboti Malik" to clarify the date of construction of "Rabati Malik" [4,17].

V.L.Vyatkin used some information in "History of Mullazada". V.A. Shishkin used information from the book about the construction of a mosque in Bukhara [4,18].

The author substantiates the fact that Bukhara is a holy city with the hadiths and narrations given in the sources of "Rabi'ul-Abrar", "Tarikh-i jahangushai", "Kitab-i akhbar-i Bukhara", "Tarikhi Bukhara", "Tahzeeb al-asma wa-l-lug'at". He also explains the meaning of the names of Bukhara mentioned in the Hadith and the sacred ground with the descriptions given to Bukhara in "Rabi 'ul-Abror" and "Tarikh-i Jahangushai". Mu'in al-Fuqara narrates from Abu Bakr Muhammad ibn Ja'far Narshakhi, the author of "Kitabi akhbari Bukhara", that Hasan al-Basri narrated that the Prophet Ayyub(Job) came to Bukhara and was well received by the people of Bukhara as a guest. The author also cites a similar narration from Abu Abdullah Wahb ibn Munnabih al-Yamani as-Sanani, a narration of the arrival of the Prophet Ayyub in Bukhara. Imam muhaddith Abu Abdullah Muhammad ibn Ahmad ibn Muhammad ibn Sulayman Kamil al-Bukhari quoted al-Waraq as saying that the blessed tomb of the Prophet Ayyub was in Bukhara. The author then summarizes the views of all the authors and concludes that the tombs of the Prophet Job are not in Bukhara. Based on the author's final opinion, Imam Muhyi ad-din Nawawi's book "Tahzeeb al-asmo wa-l-lug'at": The fact that Ayyub (as) lived in the province of Khawran and that his tomb is famous near the village of Nava there is based on the fact that there is a mausoleum and a mosque there, that the village was founded for his benefit, and that there is a clear spring there [1,21].

In general, the shrines of the Prophet Ayyub (Job) are also found in various regions of Uzbekistan, and these shrines are symbolic shrines. The Chashmayi Ayyub shrine near the central market of Bukhara is also a sacred place. Because, according to historical sources, Prophet Job never visited Bukhara.

At the same time, this book describes the burial places of theologians (scholars) and jurists (faqihs), political figures, including the Samanid dynasty and the rulers of the local dynasty - the chairman of Bukhara Ali Burkhan and other famous historical figures.

THEORETICAL BACKGROUND

The work "History of Mullazada" can be said to be important in that it clarifies the issues of pilgrimage, which are important for the pilgrim. The book also includes sections on the possibility of visiting the cemetery by men and women, the etiquette of visiting the grave, the etiquette of pilgrimage.

When it is mentioned in the play that men and women can visit the cemetery, the Companions of the Prophet from "Jami 'al-Usul" say on behalf of Buraydah that the children can visit the graves of their mothers: "I asked the Lord for forgiveness for my mother (to forgive her sins) and she did not allow me to do so, and I asked her permission to visit her grave, and it gave me permission". He also cites as evidence that a similar narration was narrated in Abu Dawud and al-Nisa'i, and Abu Abdullah Muhammad ibn Abdullah al-Khatib al-Shafi'i, better known as Hazib al-Fakhriya, from "Mishkat al-Masabih", discusses the benefits of visiting the graves of parents every Friday.

Imam Wazir Rukn al-Islam Muhammad ibn Abi Bakr Hanafi Bukhari, known as Imamzadeh, narrated from the "Shariat ul-Islam" that the Prophet (peace and blessings of Allaah be upon him) said: I have forbidden you to visit graves, but you should visit them, but there are examples from the hadiths that say, do not say bad words. The words by the Al-Zahidi from his "Sharh al-Quduri" on Imam Abu Hanifa presenting the reminiscences of our Prophet that there is no benediction for those who are praying for the dead people and remembering for the Doomsday are given.

So, it is clear from this hadith that women are allowed to visit graves like men. At this point, another hadith is narrated that contradicts this hadith narrated by Abu Hurayra on behalf of the Prophet.

It is also narrated in the "Jami 'al-Usul" that the Prophet (May peace and blessings of Allah be upon him) was allowed to mark graves with stones, Al-Zahidi's "Sharh al-Quduri" states that it is forbidden to step on a grave, sit, sleep, perform any urination, or pray on and over the grave.

The book also tells about the etiquette of visiting the grave, the prayers recited when visiting the graveyard, that it is not permissible to step on the grave in shoes, that visiting graves is sunnah, that it is expedient to visit at the end of Friday, Saturday, Monday, Thursday before sunrise, and giving information about visiting one's parents gives the reward of Hajj, and with what intentions one should go when visiting the past.

The Etiquette section of the work also discusses whether it is permissible to stand facing the grave during a visit to the grave, and whether it is permissible to touch and kiss the grave. Thus, the author bases his opinion on this question through the answer of Abu Hamid Muhammad ibn Muhammad al-Ghazali in his book "Ihya al-Ulum". There is also information about the prayers to be recited at the entrance to the mausoleum and the sequence of recitation of which verses of the Qur'an.

RESULTS

In this book, Bukhara shrines are described in two parts:

The first part is about the remembrance of the tombs of the saints buried in and around the city, half a mile from each other (in the graves);

In the second part, the tombs of the saints located on the outskirts of the city and on the outskirts of the districts are mentioned, and in the first part, the dhikr of those located outside the territory of the places mentioned.

The first part describes the tombs of Tali Khoja, Saffari imams, Chashmai Ayyub, Salatini Samaniya, Sitajiya, Havzi Miqdam, Sabzamun tombs and Khoja Poradoz mausoleum.

In the second part, he gives descriptions, descriptions and information about the tombs of Fathabad, Tali Sudur Mausoleum, Oli Burhan Nasab series, Tali Bughrobek Mausoleum, Quzoti Saba Mausoleum, Mausoleum of Aqili Imams, Aimai Shahristani tombs.

Based on the above comments, O.A. Sukhareva also notes that the author of "History of Mullazada" describes the tombs in and around the city, but in the book the author did not divide it into appropriate sections and did not follow the order. [5,48].

Indeed, the author states that he describes the tombs in two parts, but we can see in the book that he did not follow a certain order in showing the tombs within the city and half a mile away. For example, instead of including tombs in the first part of the book inside the city, ie inside the castle, we can note that the author made a mistake by including tombs such as Khoja Poradoz Mausoleum and Mausoleum of Samanid Sultans in this category.

The researcher of "History of Mullazada" R.L.Gafurova notes that the author did not make a mistake in this regard, but rather divided the graves into appropriate parts, and according to him,

the author first describes the tombs located in and around the city, and then the more remote parts of the districts attached to the city near the city wall [4,16].

CONCLUSION

In addition, R.L.Gafurova noted that the sequence of descriptions of the tombs deviated from the plan, first the footsteps outside the city wall (first part), and then the holy places in the Central or main part of the city during the years of Mullazada [4,16]. We know that this work has been copied several times by several calligraphers. In our opinion, the sequence and order may have been violated when the work was copied.

In conclusion the book reveals the pilgrimage of the cemetery by men and women, the ethics of paying homage to grave, the necessity of ethics of respect to the grave of such people like scholars, shaykhs, hazrats and its being requirement is substantiated based on the religious, philosophical, historical reconsideration, discussion and facts being linked to the issue of human responsibility.

ABSTRACT

This article describes the democratic principles associated with the election of the chairman of the makhalla - the aksakal in Uzbekistan. In particular, it was noted that the organization of elections of aksakals on the basis of the principles of transparency, alternativeness and equality is based on international electoral law and democratic criteria. In Uzbekistan, the makhalla is the structure closest to the population.

KEYWORDS: *Aksakal, Makhalla, Citizens' Assembly, Election, Democratic Principle, Transparency, Alternative, Equality, Representation.*

INTRODUCTION

In Uzbekistan, there are settlement, village, aul, and also makhalla citizens' assembly in cities, towns, villages and auls. Makhalla is the closest and most popular structure to the population[1; 58-59]. It is headed by a responsible person called the chairman or aksakal. Often an aksakal is chosen from among citizens aged 50 and over. Because the peoples of Central Asia and the Caucasus have a tradition to call elderly people aged 50 to 60 years old with gray hair in their beards - aksakal. An aksakal is both a senior citizen and a chairperson who leads his small congregation. For this reason, the person who leads the makhalla is called "aksakal".

The aksakal has been the leader of the tribe and clan since ancient times[2; 47]. They were distinguished from others by their intelligence, eloquence, potential and superiority in decision-making. In formal negotiations, he was considered a person who could act on behalf of the makhalla or clan[3; 16-17]. The person for such a position was chosen from among several candidates. Based on this, we can say that the election of the aksakal of the makhalla has a long history. Today, elections for citizens' assemblies in Uzbekistan have become an important

process, which in all respects is based on democratic principles. In fact, the makhalla itself is a real democracy classroom[4; 59].

Currently, there is a separate law on the election of the chairman (aksakal) of the citizens' assembly. That is, the Law of the Republic of Uzbekistan "On the election of the chairman (aksakal) of citizens' assembly" was adopted in a new edition on October 15, 2018. In it, relations in the field of organizing and holding elections of the chairman (aksakal) of the town, village, aul, citizens' assembly, as well as citizens' assembly in cities, towns, settlements, villages, auls found a full legal basis[5].

The organization and conduct of elections for the chairman (aksakal) of a gathering of citizens is carried out on the basis of the principles of openness, alternativeness and equal suffrage. Transparency, alternativeness, and equal suffrage are distinguished by their democratic nature. In the process of electing the aksakal, the governing body of citizens' self-government, which is an important institution of civil society, was created a national legal system based on world legal documents on elections. Part of such a system is the principles of elections.

The organization and conduct of elections for the chairman (aksakal) of the citizens' gathering shall be carried out openly and publicly.

When organizing and holding elections for the chairman (aksakal) of a citizens 'gathering, citizens are notified of the date, time and place of the gathering of citizens (meetings of citizens' representatives), they are informed about candidates for the position of chairman (aksakal) of the gathering of citizens, and the results of voting.

Information about the organization and conduct of elections of the chairman (aksakal) of the citizens 'gathering, the date, time and place of the gathering of citizens (meetings of citizens' representatives), candidates for the position of the chairman (aksakal) of the gathering of citizens is posted on the official websites of councils for the coordination of the activities of self-government bodies of citizens of the Republic Karakalpakstan, regions and the city of Tashkent no later than five days before the elections.

The process of organizing and holding the elections of the chairman (aksakal) of the citizens' gathering is covered by the media[5].

During the elections of the citizens' assembly, hundreds of mass media in the country provide information on the progress of this process. Special TV programs are organized about the participation of the population in the elections. The local media analyze the course of the electoral process. All this means that the electoral process is based on the principle of transparency[6; 24].

In November-December 2013, a relative increase in openness and transparency was observed in the elections for the chairman of the citizens' gathering and his advisers. For example, 237 chairmen of the citizens' gathering were re-elected, who were recognized by the population as unworthy for this position. Of the newly elected chairpersons, 80 were up to 40 years old, 87 were up to 50 years old, 232 were up to 60 years old, and 148 were over 60 years. Also, out of 6,718 advisers to the chairman, 2,617 were elected for the first time. Of the total number of elected chairmen in the republic, 4231 had higher education, 2046 - secondary specialized education and 445 - secondary education. The principle of openness and transparency was fully implemented in the elections held in May-June 2019[6; 24].

Another important principle is alternativeness. In world practice, two or more candidates stand for election from any subject. This practice allows the electoral process to be conducted on the basis of democratic competition. At the same time, citizens will have the opportunity to choose a suitable candidate. This important principle also applies to the election of aksakals. That is, the election of the chairman (aksakal) of the citizens' assembly is carried out with the nomination of two or more candidates for the position of the chairman (aksakal) of the citizens' assembly. In May-June 2006, about 10,000 (9941) chairmen of citizens' assemblies and their advisers were elected in the elections. Also, 27,715 candidates were nominated for the election of 8843 chairmen. 97,273 chairmen and advisers were elected. Of the elected 6,016 or 68% of the chairpersons had a higher education, 4,177 (47%) - under the age of 50, and 818 (9%) - under the age of 40. Among them, the number of women has noticeably increased from 734 in 2003 (9%) to 981 in 2006 (11%)[6; 24].

The nomination of candidates for the post of chairman (aksakal) of a gathering of citizens is carried out by a working group, taking into account the opinion of citizens permanently residing in the relevant territory.

The working group prepares documents on candidates for the position of chairman (aksakal) of the gathering of citizens and submits them to the relevant commission for agreement with the khokim of the district or city no later than ten days before the elections. The written consent of candidates for the position of chairman (aksakal) of a gathering of citizens to nominate their candidacy is attached to the documents.

The khokim of the district or city considers the documents of the submitted candidates for the post of chairman (aksakal) of the gathering of citizens and sends to the relevant commissions their substantiated conclusions on these candidates for subsequent transmission to the working groups.

The working group, after receiving the opinion of the khokim of the district or city, no later than five days before the elections, posts information on the approved candidates for the position of chairman (aksakal) of the citizens 'gathering on the building of the citizens' gathering and in guzars[5].

When electing the chairman (aksakal) of the citizens' assembly, citizens have equal suffrage regardless of gender, race, nationality, language, religion, social origin, beliefs, personal and social status. When electing a chairman (elder) of a citizens' assembly, each participant of the citizens' assembly (meeting of citizens' representatives) has one vote. In November-December 2003, the elections to citizens' self-government bodies were assessed as an important socio-political event. 11 million voters (85% of the older generation) took part in the elections. As a result of the elections, about 10,000 aksakals and about 75,000 of their advisers were elected. Citizens' activity in the electoral process was also manifested in the elections in May-June 2019[6; 24].

In order to ensure the participation of the majority in the 2018 elections, the minimum norm of citizens' representation in the territory of the elections - courtyards, houses, streets - has been established. That is, this norm must be at least 12% of citizens eligible to vote. In this case, 240 representatives must vote on behalf of an average of 2,000 voters residing in the assembly[7].

CONCLUSION

As a conclusion, we can say that the election of the aksakals of the mahalla is characterized by the integration of democratic principles and nationality. The election of aksakals is also based on a long millennial tradition of statehood and the most advanced norms of international law. Most importantly, the makhalla is one of the most important institutions of civil society. Its activities are revitalizing civil society. And the aksakal, in turn, is the leader of one of the main structures of such a community. According to historical information, the institution of aksakals has existed for more than five thousand years. So, the election of an aksakal means the election of an institution that has passed a thousand-year path of historical development.

ABSTRACT

This article discusses how textbooks help students to learn some strategies so that they can deal with the new and unfamiliar words easily. There is also given advantages and disadvantages of using textbooks during the lessons, where you can meet unfamiliar words. According to Methodists, book reading increases learners' engagement with the topic. Moreover, they will be able to develop their vocabulary skills and communication in English language is impossible without knowledge of good number of vocabulary. In this case, textbooks are very helpful, if teachers follow the instructions clearly.

KEYWORDS: *Acquisition, Interpretation, Unfamiliar Words, Satisfy, Inadequacy, Irrelevant, Homogeneity, Coherent Syllabus.*

INRODUCTION

We can mention that before we began to learn foreign language at school. Starting teaching foreign language in first grade and creating electronic resources for learning English in primary school get a good result near the future and regular training programs shown in the mass media are giving positive results, not only acquisition of knowledge and skills, but also in motivating Uzbek children to foreign language learning. Only language practice supported by theory can develop language habits and skills in a desirable direction and lead to the mastering of a foreign language. Since learning a new language is connected with acquisition of new concepts by the learner, theory can help in forming these new concepts. One of the ways is an extensive use of translation-interpretation. However, a majority of methodologists does not approve this teaching

technique and teachers because pupils learn about a linguistic item more than they need for practical application.

The skills of English language are the pillars or central part of that language. There are four skills in English language and these four skills are interrelated with each other. It is very rare to see people practice one skill separately. Usually people practice two or more skills together according to Hossain. Textbook is such a source through which students can practice two or more skills together[1].

According to Kit U, book reading increases learners' engagement with the topic. Moreover, they will be able to develop their vocabulary skills. According to Cunningsworth, communication in English language is impossible without knowledge of good number of vocabulary. Therefore, in that case, only textbooks can help students to develop their vocabulary skills. Similarly, Ecclesiae added that, if students read books for their pleasure, they will acquire a good number of vocabulary, they will be able to absorb simple or sometimes complex sentence structure as well without giving any conscious effort. Moreover, she also said that, some of them become "a very good speller (not perfect)". Furthermore, Hossain added that, textbooks help students to learn some strategies so that they can deal with the new and unfamiliar words easily.

MATERIALS AND METHODS

Since the 2010's there has been a movement to make learners the center of language instruction and text books are viewed as the instrument for achieving aims and objectives that have been set according to the learners' need. They are not aims or do not determine the aims but they are at the service of the teachers and learners.

Even with the improvement of technology, textbook is still seen as central to teaching-learning by the majority of teachers in most if not all national educational systems. In EFL situations, the role of the textbook is very crucial. A textbook can serve different purposes for teachers; as a core resource, as a source of supplemental material, as an inspiration for classroom material and as the curriculum itself. For this reason, care should be taken in developing and choosing textbook for EFL classes. Therefore, textbook evaluation and selection plays a significant role in language learning and teaching.

According to the degree about teaching foreign languages from the primary classes in some places, course book is taken for granted. In other places, they are not used at all and in some situations they are used selectively based on the proper parts for the objectives of the course. He names some advantages of course book such as:

1. The course book provides a clear framework for both teachers and learners. Following this framework, they feel progress.

2. Sometimes, it is used as a syllabus in which the content is systematically determined.

3. It provides teachers with ready-made texts and tasks of appropriate level of difficulty and save their time.

4. Large amount of information are presented with the lowest price, then economically a textbook is better than other types of materials.

5. The transportation and use of a textbook is easy and it does not need extra equipment.

6. The course book can be used as guidance for inexperienced teachers and it increases the autonomy of the learners.

He also mentioned some disadvantage of a course book such as;

1. Inadequacy: Individual learners have its own need and a course book cannot satisfy all of them.

2. Irrelevant or lack of interest: not all the topics and activities of a course book may match the interests of the learners.

3. Limitation: Course books establish a confining situation and thwart the creativity of the teachers.

4. Homogeneity: Every course book has its own purpose and approach and neglects the individual differences of the learners regarding the strategies and styles of learning.

5. Over-easiness: Teachers may assume following of the course book is too easy.

Richards's claims depending, how the textbooks are used and their contexts of use, textbooks have some advantages and disadvantages:

1. The structure and the syllabus of the program are provided by the textbook.

2. They maintain standard instruction.

3. They increase the quality of instruction because they are prepared and tested in advanced based on learning principles.

4. They bring a variety of CDs, teachers' guide, cassettes and other learning resources to the learning situation.

5. By using textbooks, teachers have more time for teaching rather than material preparation.

6. They can help inexperienced teachers and provide language input for the learners.

He also mentions some disadvantages for the textbooks. They are:

1. Textbooks contain inauthentic language.

2. The contents of the textbooks are distorted in order to avoid controversial issues.

3. Texts books are not prepared based on the students' needs.

4. The use of textbooks limits teachers and de-skills them.

5. The price of the textbooks may be high for many learners.

DISCUSSION

According to Ansary in the case of ELT textbook selection, the reaction of the scholars are of two types; some of them believe that they are vital, useful and labor saving tools and the others consider them as mass of rubbish and useless goods which are sold skillfully.

Coherent syllabus, satisfactory way of controlling language, offering motivating text and enjoyable accompanying teaching aids are the advantages of a good book. On the other hand, imposing learning style and content on class, stereotyped sequence of presentation, practice and production as their methodology are the main disadvantages and restrictions of the textbooks.

Sometimes course books cause boredom because students and teachers get bored of using the same material and content and there are less opportunities of variation. According to Charalambous, textbook centered teaching cannot make class interesting because it leads to "dull and repetitious classes" and makes students de motivated to learn. Since individual learner has their own learning style, for each student, textbook may not be that much helpful.

Farooq said about individual learning style that according to dictionary of education Individual differences are those differences, which exist among humans and make a single person different from another person. He also added that these differences generally occur based on interest, attitude, values, habits, psychomotor skill, and self- concept. In addition, Wang and Lindvall also proposed that a learner responded to the environment according to his individual learning style and in a learning environment teacher's instruction is an important media to facilitate appropriate responds from a student[2].

We are in need to do other new researches in the dynamic of textbook use. Hutchison and Torres claim that textbooks are the cause of many changes in the field of language learning in the presence of the following conditions:

*The first, when they act as a means of movement for teachers and learners.

*The second, when they help the instructor to control the class and manage it effectively.

*The third, while they clearly show the need and equipment of changes.

They claim that there are three advantages for the textbooks:

 1. Teachers and learners have something to negotiate about,

2. They are accountable for what should be done in class,

3. They are orientation of amount of work to be done in class and they tell us what happen in the outside world. Crawford states that determination of the significance of the textbook and their advantages and disadvantages is a complex task that requires many factors such as pedagogical‖ and pragmatic. Making decision instead of teachers and learners, artificial and non-realistic language, assuming subordinate role to learners and lack of discourse competence are disadvantages of the textbooks on his point of view. He specifies that structuring tool‖ is one of the neglected functions of the textbooks. He argues that communicative classes are unpredictable social events. These events are threatening for the participants. Textbooks reduce or eliminate this threat and anxiety. Although textbooks restrict and limit the power of choice on the side of the learners, they increase autonomy and independence for them. While a teacher decides not to use any textbook, he acts like a dictator who wants to have the control of the class. The question is not whether to use a textbook or not. The question is how to select, use and evaluate them in an appropriate and productive way.

Some proponents of authentic language models argue that many textbooks are too contrived and artificial in presentation of the language material. They claim that it is better that a textbook reveals some real examples of real life both spoken and written. Some of the language textbooks are inappropriate and unreal for communicative and cooperative purposes because they do not reflect natural pieces of language, that is, the real pronunciation, language structures, grammar, vocabulary and conversational strategies in the real communication.

Shafiee Nahrkhalaj notes that the advantages and disadvantages of EFL textbooks and explains two different sorts of textbooks used in Iran; global materials and institutional or in-house materials. This study presents a framework with two-phase scheme for evaluation, which contains whilst-use, and post-use evaluation. To obtain the greater reliability, each norm was analyzed at a time by using planned instruments. It is necessary to pay attention to the values of the materials in process and its actual effects on the users. He chose Top Notch series, which has recently become very popular in main cities of the country to evaluate using a checklist with two phases. The first phase includes the attractiveness and the availability of the materials, the suitability of the exercises and tasks, the practicality of the textbook, the effectiveness in facilitating short-term learning, the clarity of instructions and the comprehensibility of the text and in phase two, long-term effects of the materials on the students were examined. Twenty teachers who had experience in teaching Top Notch series completed the questionnaire, which includes questions about the effects of using the material. With regard to the result of his study, the textbooks helped the learners find their aims to a great extent and it could improve the linguistic proficiency of the learners. Based on the teachers' opinions, it is concluded that all skills are covered in this textbook.

Shafiee Nahrkhalaj believes that the evaluation of the ELT materials highlights some qualifications in EFL/ESL teachers, which are as follows:

a- It shows the disadvantages of the textbook;

b- It helps the teachers acquire knowledge and skill to adopt the suitable book based on the learners' needs;

c- It develops users' experience in adapting the textbook according to the students' needs, to personalize it to a group of learners and to outfit it to the learners interests and skills;

d- It provides skilled qualification in thorough and exact evaluation of the results of the ELT materials;

e- It supplies the teachers to plan their own materials based on different and unaccustomed offer;

f- It provides for hold takers, evaluator and evaluation designer to articulate their theories and realize their tendencies in order to create their criteria for evaluation.

g- It provides the ELT materials as a means of re-skilling themselves. They should focus on using their creative skills and exploring innovative ideas hidden within the framework of the textbook heading off the textbooks to deskill them.

Despite many extensive benefits for using ELT/ EFL textbooks in language classroom, Litz has pointed out that textbooks may play a pivotal role in innovation. Rahimi and Hassani had an argument against textbooks. They indicated that in spite of the values of using textbook in English classroom, using textbooks might have negative effects. Textbooks may recommend the students with inauthentic language, they may provide incorrect content, and they may pay no attention to students' needs or unskilled teachers. Due to these limitations, Grant states that there is no complete textbook, however "the best book available for teachers and their learners does exist". In this regard, Tomlinson stated that the evaluation is still an gorgeous field of study in line with the introduction of technological innovations that changed the development of teaching materials[3].

1. Teaching.

What view of language does the exercise put forward? It has structural, functional and discourse features. Does it reflect their relationship effectively? Is it clear what the difference between the two sentences (a) and (b) is? Does the difference rest on the active/passive distinction, on the personal/impersonal distinction, or on something else?

(b) Do you agree with the statement 'We would not normally write this type of sentence in a report on an engineering experiment?' Is this an accurate statement about engineering discourse? What do you think this statement will mean to the student?

(c) Is it clear from the explanation and examples what the active/passive choice depends on? Does the exercise, in other words, help the learners to understand why a particular form is used? Does it help the learner to establish criteria for making a choice in any given instance between the active and the passive?

(d) Do the examples in the 'Now rewrite ..." section follow the same pattern or rule as the explanation? What would you do, for example, if a student produced for number 3: "This force can be applied in any direction providing the *plane is acted up one component"?

2. Learning.

(a) What is the objective of the whole exercise? Is it to teach the passive/active distinction or to help learners in choosing which to use? Or is it trying to teach something about the nature of technical discourse? Is the focus clear?

(b) The English in Focus series claims to be based on a cognitive view of learning: The whole approach ... is based on the assumption that the students will be people whose minds are directed towards rational thought and problem solving, and the grammar exercises are designed to take this fact into account. Do you agree with this view of learning? Do you think the materials really do treat the learners as rational thinkers?

(c) The explanation of the use of the passive indicates a belief that people learn by having rules and patterns explained to them. Do you think this is true? Do you think it is better to get learners to work out the rules for themselves? Do you think it is better to have no conscious focus on rules?

(d) The 'Now rewrite ..." exercise is a form of written structure drill. It is saying: repetition is important for learning. Do you agree with this? In what way does it help? Does it help learners to discover the rule, because they get more chances to analyse it? Or is it based on a need for reinforcement? Where does the structure drill come within the materials? Does it come after an explanation of a rule to give practice in applying the rule or is it supposed to help the learner discover the pattern in the first place?

(e) What existing knowledge are learners expected to bring to the exercise? Is their knowledge of communication exploited? What about their technical knowledge? Do they need to know what the sentences mean or simply to manipulate the forms? If the former, does the content knowledge help or obstruct in reformulating the sentences? If the latter, is this in accord with the stated functional/discoursal focus of the exercise?

(f) What roles do teacher and learner play in this exercise? What roles are possible? Is the teacher a giver of information, an evaluator of correctness, a manager of learning, a further resource, or a combination of these? Does the exercise limit the possible roles or does it offer potential for a variety of roles to suit the individual situation? What roles are available to the learner: is the learner a decision maker or just a receiver of information?

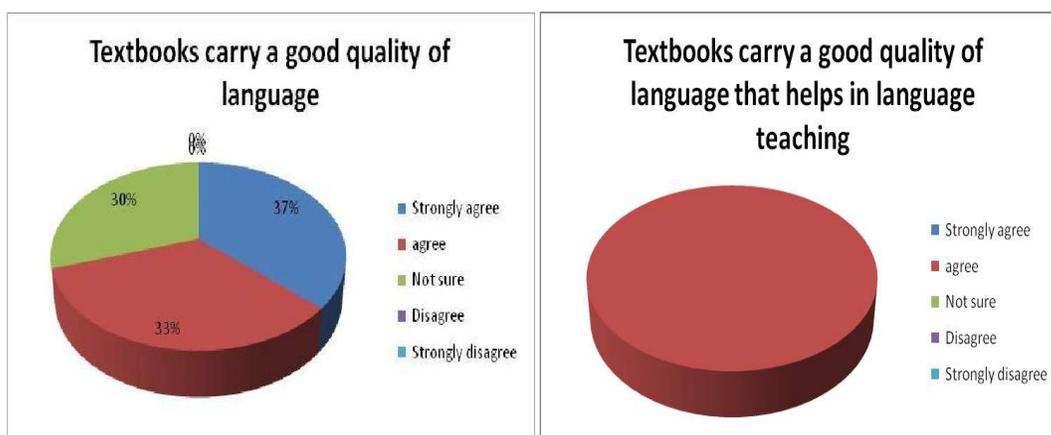
(g) What does the appearance of the book tell you about the view of learning? Is there a regular pattern to the chapters with the same sequence of exercises following each text? Has this been done for ease of layout, or are the authors perhaps saying that regularity is important to learning? Are they thinking of the teacher: a regular chapter structure helps with lesson planning[4]?

Do you agree, or do you think teachers and learners easily get bored with a regular pattern?

Do you think the appearance of a book affects attitudes to learning? If so in what ways?

This list of questions is by no means exhaustive. There is, for example, a whole range of questions to be asked as to the relationship between this exercise and the remainder of the unit, as to the relationship between the units of the whole book. In addition, it is very important to support such an analysis with classroom experience and learner feedback. What you think learners are doing in a particular activity may be very different from what the learners think they are doing. They may well enjoy and find useful something which you consider a poor activity and vice versa.

Asking questions such as those above will obviously help teachers to select the best book: the more information the evaluator can gather about the nature of a textbook, the better will be the choice. But the real value of this kind of materials evaluation goes much deeper. In order to see this we need to consider what is actually happening when we evaluate materials.

In this statement, 37% of the total students strongly agreed and 33% agreed and supported the importance of textbook. 30% student's responded that they are not sure about it. Still the percentage is higher which proves the importance of textbook in foreign language acquisition. On the other hand, teachers" result shows that everyone agreed with the statement. So here also the teachers and students" thoughts are similar.


CONCLUSION

Language Teaching is sometimes treated as a science, with the continual search for objective truth, the relentless research into the nature of language learning, and borrowings from the social sciences. Try as one might to make the evaluation process as objective as possible, there is still very much a subjective element of likes and dislikes. What is appealing and motivating to one person can be turgid and deadly to another. It is in fact these subjective elements that tend to prevail in teachers' preferences, as can be seen in the survey of Oxford TEFL Teachers in the Appendix. There is also the matter of teaching style: one's reactions to materials will be affected by whether one is the restrained, the middle-of-the road or the colourful, communicative kind of teacher.

In conclusion, Uzbekistan is also successfully working on the introduction of innovative pedagogical technologies in the teaching and educational process. The creation of their theoretical and practical foundations has become a state.

THE TRADITIONS RELATED WITH THE FUNERAL CEREMONIES

Nafiddinova X.R*

*Lecturer,
Bukhara state university,
UZBEKISTAN

ABSTRACT

In the following article, funeral ceremonies and related concepts from the foundations of the national values of the Uzbek people are explained through the analysis of the comparative study of the different funeral ceremonies. Also in the content of rituals and ceremonies in the emirate of Bukhara, associated with its conduct is described based on the available data.

KEYWORDS: *Funeral Ceremony, Mourning, Janoza, Cenotaph, A Washer Of Dead, Grave Digger, Donation, Twenty Days' Ceremony, Forty Days' Ceremony, Years' Ceremony*

INTRODUCTION

Funeral ceremony is a very large, solemn and publicly held ceremony associated with the burial of the deceased and the rituals associated with it. Funerals have changed constantly since the dawn of time for a variety of reasons. The funerals are a collection of customs and traditions that are unique to each nation and ethnicity.

The funeral of Uzbeks is a big gathering. First of all the facing the head of the deceased is performed. If the eyes remain open, they are closed, tied to the shoulder, the foot is fastened to the thumb. A special washing clerk is called *murdashui*. A washing clerk always chooses a male washing clerk, if a deceased woman is a woman, and if a man is a man. A special washer of dead (*gassol*) body is washed in sarton (platform), wrapped in a white cloth (special gauze) cage. Among the peoples of Central Asia, the 1th sign of mourning cries loudly. The death penalty also has special requirements for life. For example, when we come to clothes, the closest people of the deceased (women and men) wear the waist as a sign of loss. Of course, duppy is worn on the head.

MAIN PART

Wet sticks from the trees are used as the bastons. Among the people, the term "hassakashlar"(*literally, those with the bastons*) is in circulation. The bastons are held by the intimate relatives of deceased. These rods are placed in the grave of the deceased, when they are buried, they are planted around him. For the sake of women's youth, they wear black, blue, white, depending on the period of the ritual of death. Women do not go to the cemetery. It is undesirable for them to go to the cemetery. Let the deceased be a man, let it be a woman, the last path is followed only by men and buried. Close relatives gather, everyone in the house joins the newly arrived relatives and rest-almonds praise the deceased, talk and cry about his qualities. The funeral ceremony is usually scheduled for the morning, noon or afternoon prayer. After the participants of the funeral gather, the mayor is taken to the coffin. The coffin is removed not from the door, but from the window with the side of the foot. A funeral is held in the mosque or in the courtyard of the deceased. Only men raise the deceased and take out from the yard to the street (if the deceased is young, then his uncles or brothers, if old, sons or closest relatives). On the street, like a shot, put a coffin on a wooden barn, four people raise it over their shoulders (depending on the age and sex of the deceased, the mourning veil — a white surp cloth on the elderly, young people are surrounded by a red or velvet cloth), the rest go behind the coffin immediately to the graveyard. Others assist them.

The coffins are often exchanged and taken to the cemetery at a speed. Before that, the cemetery clerk prepares a grave for the deceased. After going to the cemetery, the prepared grave is taken from the coffin of the deceased in front of it, wrapped in a shroud and transferred to the grave, and the grave digger puts it on the grave with his face facing Qibla (west) to the grave (there is also a tradition of burial of close relatives in a specially allocated place-the When the dead were put into the grave, the people threw a pinch of soil into the hoe, which they had caught in the grave. Grave digger poured the soil under the head of the deceased. Then the mouth of the grave was poured and the soil was pulled. After the end of the funeral, grave digger or another person addressed the participants of the funeral, saying the name of the deceased: "What kind of person was he?", and those who stood now give the answer that "he was a wise and good man." This interrogative and answer is inclined only to men (since the wives are at the disposal of her husband, no one has the right except the husband to judge the wives as good or bad). After that, grave digger, thanks to all those who came, will allow the spread. Sometimes those who come to the funeral are shared money, handkerchiefs, towels, soap, clothes, this habit is called charity. Those who go to the cemetery come to the House of the deceased and read the Fatiha and spread it.

Janaza (funeral)- in Islam, a religious ritual performed before the burial of the deceased. No indication has been given in the Qur'an of a funeral ceremony. In the works on the Fiqh, a detailed description of the funeral is given. In a narrow sense, it is a prayer read before the burial of the body of a Muslim man and a woman who died at the funeral . Funeral ceremonies are different in different Muslim countries, they are associated with the corresponding customs. According to the Sharia instructions, the funeral prayer is read to all the deceased and deceased, regardless of whether they have sinned or not, ranging from an innocent baby born alive. According to the rules expressed in the verses of the Qur'an and hadiths, the corpse is washed, wrapped in a shroud and placed in a coffin and performed under the leadership of the imam with the participation of the Muslim religion. They read the funeral prayer in ranks, turning to prayer.

If for some reason it is buried without a funeral, then a funeral prayer can be read on the grave, while the corpse stands still. Reading the funeral prayer is a sufficient act of duty of the living, and with the recitation of it by a group of Muslims, it is dismissed from the responsibility of other people. According to the Islamic religion, those who do not have a funeral without the opportunity to be buried without a funeral are considered sinners. Funeral prayer 5 time differs in many ways from the read prayer. For example, four takbirs, Sana, salawat, Dua and Salam are sufficient in the funeral prayer. There is no such thing as kneeling, worship, recitation in it.

If the baby at least once cried aloud, the funeral recitals is read to him. "Those who died" are not bathed and in what clothes did they earn, they are buried in the same clothes and the funeral is not read. For those who died in another category, too, the funeral was not read. But this was no longer used as a punishment for the deceased. The funeral was also not read for those who committed suicide in different ways. Because they were considered guilty.

Another of the rituals associated with the funeral are those that took place. This means that no matter how much debt the deceased had after his death, his debt was taken by one of his children to his neck before everyone else.

An inseparable continuation of the funeral is this mourning. Mourning is a ritual that is held in memory of the memory of the deceased in connection with the death of a person. Mourning is also celebrated in all nations, constantly changing. Mourning can be divided into several types. For example, three, seven, twenty, forty and finally yiloshi of the Year" ceremony, related to the account of the days of the deceased's death. In each of these rituals, the deceased was remembered, verses and verses were read from the Holy Qur'an, dedicated to his soul and memory. To those who come to the ceremony, money, a handkerchief, a towel, soap, a handkerchief are shared. In mourning, we witness that in many cases even some elements of primitive religions are preserved. For example, our people remember the ghosts of deceased and ancestors "activating candles", make soot in Eid al-Adha, cook special dishes, climb to the head of the grave, as well as traditions that arise on the basis of animistic imagination, as if the deceased dies, even his soul will continue to live[1].

At the end of the ceremony, the deceased was blessed. On the days of mourning, food is not cooked at home, which turns out to be dead, the soot is not removed. Close relatives take this task on their own. Also, during Ramadan and Eid al-Adha holidays, funeral owner came to the house with relatives, compatriots from the makhallada and read Fatiha in memory of the deceased, who asked funeral owner for their sympathy.

RESULTS

During the period of the reign of emirate, we will also witness a meeting of extravagant and depressing situations in Bukhara, in many cases, exactly at the funeral. About this jadids who lived in the same period and made creativity have described their thoughts burning. In particular, Mahmudkhoja Behbudy in his article titled *"Bizni kemiruvchi illatlar"* (*The stigmas which decay us*) overstated donations, distribution of gifts and Friday soups given for the memory of the deceased, the gods put the deceased family members in a difficult situation. Even the goods and land of the deceased were sold for the performance of these rituals. The property of the women who left the inheritance was also spent on holding ceremonies[2].

The popular poet Sadriddin Ayni also gave information about this in his memoirs. That is, when the plague spread in Bukhara, and his father died, he wrote that the army had borrowed 150 tangas from a merchant named Yusufboy in the village and buried them.

CONCLUSION

In place of the conclusion, it can be said that the funerals are an integral part of people's lives, which are held in each oasis with their own traditions and rituals. We can also highlight the traditions and traditions that are characteristic of the oasis itself, along with the holding of ceremonies that will be held in all Central Asian countries during the funerals of the Bukhara Oasis. There have also been cases of extravagance in burials in the emirate of Bukhara. And this was one of the factors that aggravated the situation of the common people.

THE INTERACTION OF ANCIENT RELIGIOUS BELIEFS ELEMENTS OF NATURE (BASED ON SHAMANIC MATERIALS)

Bakhtiyor Khalmuratov*

* Associate Professor
Namangan State University,
Doctor of Philosophy in History (PhD)
E: mail: baxtiyor_m@mail.ru

ABSTRACT

In this article the ethnographic views related to shamanism, one of the ancient religious beliefs, and the elements of nature in its ceremonial attributes are reflected. The connection of the Shamanic belief with nature, the changes in the ceremonial equipment (whip, ash, water, fire, human hair, etc.) of physicians working in the Fergana Valley are described in it.

KEYWORDS: *Ancient religious beliefs, shamanism, nature, elements of nature, water, fire, ash, hair, physicians, healing processes, "Avesto", Islam, field ethnographic expeditions.*

INTRODUCTION

When we were young, people used to say, "The cure for nature's diseases is in nature." Doctors say that about 70% of diseases are caused by herbs, and the remaining 30% by mineral stones. At the heart of this meaningful wisdom, which has not lost its value for centuries, lies the vital truth that motherhood, which is an integral part of Mother Nature, is embodied in all that surrounds us. You just have to be more discriminating with the help you render toward other people.

The mysteries of nature have been passed down from generation to generation, refined as a result of thousands of years of experience of the people. This is confirmed by the holy book of Zoroastrianism, the Avesta. In all its parts, especially in Vendidod, valuable information is given about the training of doctors, medical operations, the classification of diseases, the causes and factors of their occurrence, and rare medicinal plants [1. B. 14].

Shamanism, one of the oldest religious beliefs, also has its own system of ceremonies, none of which take place without ceremonial means. Shamans use a variety of external aids to increase

their confidence in their spiritual powers, to achieve their goals faster and more easily, or to maintain a certain effect for a longer period of time.

The ceremonial attributes of the Fergana Valley shamans include a childirma, a whip, a rosary, a spinning wheel, a means of mobile communication, a hand, water, a knife, a mirror, various threads, human hair, and a willow branch. With the help of the named equipment, the valley shamans treat the sick. One of the attributes of such a ceremony is the whip.

The whip occupies an important place among the ceremonial accessories of the shamans of the Fergana Valley [2. C. 74–75]. One of the main manifestations of shamanism is the beating and expulsion of evil spirits that have entered the patient's body with the help of a whip. With the help of a whip, the enlightened branch of Kokand mainly treats people suffering from fear. Bakhshi's treatment lasted for three weeks, at the end of which the wound was washed with distilled water [3. Field records. Fergana city, Kokand city. 2009].

It should be noted that during the field-ethnographic expeditions in the Fergana Valley, it was observed that many of the bakhshis operating in this area used the whip as the main ritual tool. When asked about this, reporters said that the changes that take place after the whip is applied to the human body (tremors, pain, etc.) accelerate the process of exodus of evil spirits from the patient [4. Field records. Chuligulistan village of Yazyavan district of Fergana region. 2009].

Among the ceremonial tools of the Shamanic faith, the knife is also important. The knife was widely used by Uzbeks, Kazakhs and Kyrgyz in shamanic ceremonies. In particular, the Izboskan resident said that the Mavluda section also uses knives in the treatment of patients. Bakhshi touches the sharp side of the knife to the patient's face and back, and says, "Whoever you are, whatever you are, whatever you are, whatever you are, I will not let you go" [5. Field records. Yangikishlak village of Izboskan district of Andijan region. 2009]. It should be noted that the ceremonial features of the knife are manifested not only in the shaman, but also in the traditional way of life of the people of the valley. For example, there are prohibitions among the population of Dangara district of Fergana region, such as not blessing the table with a knife, not giving it to another person with a sharp side of a knife, not playing with a knife, not showing a knife in front of pets [6. Field records. Akjar and Abdusamat villages of Dangara district of Fergana region. 2012].

English ethnologist J. According to Fraser, the knife is one of the most magical objects in the world. This household item is also typical for the peoples of Central Asia [7. C. 67–70]. For example, ethnologist G. Snesarev described the magical power of the knife. Fraser commented on the metal objects mentioned in connection with the habit of finding [8. C. 39–40]. This explanation is correct, but it is not complete. It is known that in many nations, metal products are preserved. However, the magical power of the knife is related, on the one hand, to the fact that it is an iron object, and, on the other hand, to its sharpness.

It should be noted that stabbing is one of the most common practices in Shamanism. However, during field research in the valley, when the bakhshis were asked "why are they stabbed with a knife?", They said: This is because the knife has a sharp character and plays an important role in the elimination of the practice, "he said [9. Field records. Madaniyat village of Pakhtaabad district of Andijan region. 2017].

Uzbek, Tajik, and Uyghur shamans also use hivchins made from tree branches in their treatment. B. According to Basilov, strong and well-known shamans used hivchin, while new or weak shamans used ordinary grass [10. C. 80].

Г. Snesarev according to, the method of treatment with a bunch of tree branches goes back to Zoroastrianism. In Zoroastrianism, a hivchin made of willow was considered to be the main means of expelling evil spirits [11. C. 55–57], according to Herodotus, the Scythian shamans used divination with the help of willow branches and performed shamanic rituals under the trees [12. C. 93].

The shamans of the Fergana Valley prepare hivchin in early spring, use it throughout the year, and renew it at the same time every year. Hivchins are tied in a bunch and hung in the corner of the house where the ceremony is held. The number of branches in Khivchin is forty. Bakhshi grabs the lower part of the hivchin and turns it three times from right to left over the patient. It then strikes the patient's head and back. This action is performed in order to expel evil spirits that have harmed the sick person [13. Field records. Kushtepasaray village of Altynkul district of Andijan region. 2010.]. A similar practice existed in other parts of Uzbekistan, where in the late 19th and early 20th centuries, Samarkand doctors sprayed the sick with the help of willow branches. In addition, in Khorezm and Samarkand, fortune-tellers used seven willow twigs to remove demons [14. B. 45].

Academician Karim Shoniyozov noted that in the Kipchaks, shaman hivchi was made from jiida and willow branches, and was mainly used to expel evil spirits that entered the patient's body during the "copying" ceremony [15. C. 329], L. Troitskaya, on the other hand, recorded that the Tashkent and Samarkand shamans, with the help of a hivchin, struck the patient forty times on the head and shoulders and saved him from pain [16. C. 353].

Uzbek and Tajik bakhshis also used mirrors during shamanic ceremonies. The mirror is an ancient ritual object and has been revered as a sacred object in many nations of the world [17. C. 97–105]. It is known that the perceptions of the peoples of the world about the mirror are different. For example, in ancient China, a broken mirror was thought to bring misfortune, while in medieval Europe, windows were to be covered in a mourning house [18. B. 146]. The mirror is often used in magic (especially for meeting spirits) and, according to its properties, resembles a crystal ball used for divination.

B. Litvinsky according to, the Scythian, ancient Chinese, Russian and German shamans used divination by looking in the mirror [19. C. 101]. B. Dyakonova noted that in the Tuvan shamans there was an idea that the mirror fell from the sky. The shamans considered this mirror to be a blessing shown to them by the spirits [20. C. 148].

Among the field-ethnographic researches carried out in the Fergana valley, the use of glass in the treatment and shamanic ceremonies of fortune-tellers of this region was rarely observed. Only the Uktamkhan branch of Dangara uses the mirror in the process of predicting the future of the people who come to it [21. Field records. Soyshildir village of Dangara district of Fergana region. 2018].

Shamans of the Fergana Valley also use a spinning wheel between ceremonies. Bakhshi sit the patient in front of him and start spinning the wheel. The wheel is turned first to the left and then to the right. During the rotation, the patient tells the cause of his illness. In the meantime, the

spirits were coming around the wheel. After about 20-30 minutes, the section stops spinning. In this process, the spirits return to their original state. If the patient has a lot of "action", the wheel is turned backwards. There should always be a cup of water next to it during the rotation of the wheel. Because souls are constantly striving for water [22. Field records. Shamirza village of Kushtepa district of Fergana region. 2017].

The shamans of the Fergana Valley use the hand more effectively in the process of treatment. Because the lake has long been considered a sacred element for the peoples of Central Asia. The divine attitude towards the slave was also reflected in the traditional rituals of the people of the valley. In particular, in Dangara, Uchkuprik, Buvayda and Pop and Mingbulak districts of Fergana region, women who use henna are used effectively. Before treating the patient, a hand is placed in a bowl, salt is added to it, and it is applied to the patient's head and body and rotated three times [23]. Field records. Tumor village of Dangara district of Fergana region. 2019]. It can be seen that the force of the slave and the salt are combined. In addition, in some parts of the valley, in the process of quinine application, if the "look" on a person is more intense, the middle of the ashes will spontaneously pile up. This situation is explained by some sections by the intensity of the "look" at a person [24. Field records. Dolon village, Shahrikhon district, Andijan region. 2010]. Kul has magical powers and uses it to chase kinna.

Water is considered one of the most sacred elements in all world religions and religious beliefs. Valley shamans use water efficiently to treat patients. For example, if a patient is terrified of something, every Wednesday and Saturday morning he is sprayed three times with water on his face, and then three drops are poured on the patient's chest and back. Then the fear of the patient goes away. According to the Holy Trinity, the reason for this work is that it is done early in the morning, when evil spirits are asleep [25. Field records. Qaqir village of Uchkuprik district of Fergana region. 2009]. Or the Danbura Sumbula section uses tasbeeh and water mainly in the process of seeing a patient. Bakhshi sprinkles water on the patient's face and abdomen. Then all the fears and diseases of the patient will disappear [26. Field records. Soyshildir village of Dangara district of Fergana region. 2018].

Researcher D. According to Mingbaeva, in many nations of the world, water is the bearer of the will of the gods, the mediator in communication with heaven and the herald of destiny. For this reason, the interpretation of symbols that appear in water in various divination systems is widespread. Fortune-tellers believed that they could see the future, the past, depending on the surface of the water. This ancient reason explains why shamans used crystal balls, that is, magic crystals. Water-based divination and fortune-telling were common in ancient Europe, North Africa, the Middle East, East and North Asia, and Polynesia. In the Scandinavian peoples, water is valued as a symbol of destiny [27. B. 129].

As a result of the penetration of Islam into Central Asia, the nature of shamanism began to change radically. There was a process of syncretization of the Shamanic faith with Islamic beliefs. While the bakhshis first appealed to the patrons before each ceremony, after the conversion to Islam, the bakhshis turned to God, the prophets and the Muslim saints, and then to their mentors and patrons. Many valley bakhshis have abandoned traditional ceremonial attributes and used the rosary. In particular, the Havokhan branch, the Ergash branch, the Mavluda branch, the Maqsuda branch and the Sumbula branch performed their deeds by glorifying. According to the Uyghur Ergash department, divination through tasbeeh calms the

patient's nerves [28. Field records. Yorkurgan village of Uychi district of Namangan region. 2012].

Another ceremonial attribute of the shamans of the Fergana Valley is the human hair. Hair is one of the most important parts of the human body. In many parts of the world, women's hair is interpreted as a symbol of deception. Opinions about hair go back to ancient times. For example, the ancient Sumerians used hair, artificial hair and beards to protect themselves from evil spirits [29. B. 3]. In addition, in many ethnic groups, fortune-tellers use "hot-cold" plants as a "weapon" that has a powerful effect on the owner. The shamans of the valley consider hair to be a "corridor" through which a person enters the spiritual world [30. Field records. Ingirchak village, Buvayda district, Fergana region. 2009]. It should be noted that in some parts of the valley, some people who perform "hot and cold" practices make good use of human hair, nails, nails, graveyard soil, needles, peppers, small stones, and horsehair [31]. Field records. Dolon village, Shahrikhon district, Andijan region. 2010].

CONCLUSION

In conclusion, it should be noted that the ceremonial accessories of the Fergana Valley shamans are made in connection with the elements of nature. Most of the ceremonial equipment is still used today. It is only under the influence of Islam that some products are squeezed out and new ones are introduced. These changes mean that the essence of shamanism is disappearing. In turn, some of the traditions associated with Islam are intertwined with shamanism, and its roots go back to ancient times. This encourages researchers to do more scientific research.

INTERPRETATION OF THE IMAGE OF MASHRAB IN UZBEK STORYTELLING

Khamidov Mirolimbek*

*Base Doctorate,
Fergana State University,
UZBEKISTAN

ABSTRACT

The article analyzes the specific aspects of the image of Shukur Jabbar in the story "Mashrab". The issues of the influence of folk books on the creativity of this writer are covered. Studied the creative style, skills in the interpretation of the fictional character.

KEYWORDS: *Story, Character, Skill And Style, Hero, Interpretation, Mysticism.*

INTRODUCTION

Through the study of Shukur Jabbar's work "Mashrab", it is aimed to highlight the peculiarities of this interpretation in Uzbek storytelling. In the article, the writer interprets specific aspects of the famous character on the basis of the style of folk books. The insurgent, true poet managed to discuss unique appearance.

The image of Shukur Jabbar in the compelling "Mashrab" story[1:6]is interpreted as a truthful, rebellious person who aspires to the true will.

So, Mashrab life and creation   Машраб ҳаёти ва ижоди "Qissai Mashrab", "Devonai Mashrab", "Devona Mashrab", "Shoh Mashrab", "Gazali Eshoni shoh Mashrab", "Eshon Mashrab", "Eshon shoh Mashrab", "Eshoni shoh Mashrabi devonai Namangoniy", "Muxammasi shoh Mashrab" under such different names as the book was written until the beginning of the XX century, and received attention as one of the most beloved works of mashrabkhans. In the interpretation of the events in the story, the information in the folk books was taken as the basis. As described in the story, those who are passionate about a busy conversation cannot find it anywhere by looking for it. Saying that the Bozor Okhund had seen a peasant who was an admirer, but did not recognize him, he said, "not one, but a thousand sows, sacrificed to my shepherd!" he cries. The incident was like this: "The Mashrab went through the shadows and went into the fields where various berries were planted. He is the owner, who is not now the owner, who is not the owner, came to

pass with caution from the side of the crops, but there is exactly the owner – the farmer's crop, which the poem says, "Here is not! Here if not!"They began to do that damage. Farmer "Hoy, Abnormal! What did you do that?! "That went dragging aside from the field of crop and hit one of the breasts. They fell in tears and said, "I knew for myself if on your face there was no trace of the gaze of Mullah Bozor!"they said. From this sentence the peasant was surprised. Then, standing up from the seats of the crowd, "It will be so to pay someone else's thing! "That left... The peasant realized all this a little later. Abnormal realized that in vain she did not pay tribute to her crop, because she herself said the poem incorrectly, that the owner of this poem Mashrab himself came and correctly said the poem. He understood and went looking for Mashrab. Did not find. The peasant regretted that "Flew as a bird" hit one on the forehead " [1: 6].

On the face of an unfamiliar peasant who sees the first time in the story, the vision of a Mullah Bozor vision is a sign of his extrasensory awareness of the fact that he is a fan of his master. It also shows that this is the case with the teacher and the hormone is very high.

The game explains in which city Mashrab goes to become a lion in the dreams of the glory of that city. He meets with Sofi Olloyor in Samarkand and they argue. Sofi Olloyor told him, "Wherever you go, you make hearts proud and happy! I saw in the incident that a giant lion entered the city. How did the same lion hunt the bait and eat it? All the sheikh in the leeches complain about you. Their savings remain impeded when you arrive. There is a case when the savings do not pass even to their closest ones! I knew it myself when you were not from the review of Ofoq Hoja! What if you broke the walls of the savings?" he insults. And Mashrab in turn to the Sufi Olloyor "Then let them make the wall from the stone, not from the beehive!" that makes the answer. In the image above, it is acknowledged that Mashrab is high in qol and hol science. Sufi Olloyor "The smell of Mansur's work is coming from you" and from you, the smell of Junayd's work is coming!"that makes Mashrab answer. It is known that Ahmad ibn Husayn Mansur Khalloj was one of the saints who lived at the end of the IX century and the beginning of the X century, whose name was the epic in languages. When he went on a trip to Mecca for the third time, he asked God in Arof: "O God! Make damage world me, have begged that" people curse. After returning from the Hajj, a group of scholars from his speeches and vows turn away: "He claims to be a God" and openly begin to threaten him. Frididdin Attor, Hofiz Sherozi said that "the fault committed to him was that he cried out in a state of attraction ("Anal truth"). In mysticism, this is called self-forgetfulness, as if you saw the truth community during the state. His mistake was that he exposed and manifested the mystery in this situation"[2: 112-113]. "Even if the Islamic Enlightenment, which underlies the views of Mansur Hallaj, constitutes a show of animosity on this way of performing the ordained and sunnah with constancy, the opponents drew attention to the apparent side of his words and denied that Mansur Hallaj claimed to be "the Prophet", "The God"[2:113]. In the above discussion, the Sufi Olloyor reacted to Mashrab by referring to these aspects. The acts of abnormal on the fans of worship, which the Prophet himself put forward, his hateful ungrateful behavior is associated with his guilt. The proximity in the views of Mansur Halloj is also noticeable in these aspects.

In his response to the question of Mashrab, the founder of the junaidian sect, Abul Qasim Junaid ibn Muhammad Al-Kawari al-Khazzoz al-Baghdad, which is famous for its "Taj ul-orifiyn"," Sultan ul-muhaqiqiyn"," Ustoz ul-tariqat "in the East, refers to Mashrab. Junaid paid special attention to spiritual purification and adapted the practice of mysticism to Islam. The people of Baghdad called Junaid "Sayyid ut-toifa". In the science of Sharia, sect, enlightenment and truth,

benihaya received a high degree and status... Junaid's words are a kind of document, which in mysticism reached the level of the pole..."[2:100-101].

As explained in the story, the scoundrel of the Sufi Olloyor asked, "what if this abnormal is not so hard on you?! Let's hit it!" they say. Suf Olloyor "people from the people of the world do not have a hit, but if you hit your hand will dry up, it will be paralyzed! At a wedding in the near future, this is beating the poor man so much that when you were there now, your mercy would have come! With the eyes of quality, you talked! When there was a siren in you, you could distinguish gold from copper! Put that breed in its condition! He is the man God! The man is a Lion God! The value of that person is very high in front of the truth and not in front of the people. When speaks of love, he is much greater than me,"they say"[1:6].

In the game it is described that death for saints is not sorrow, but joy: "a man called Eshon Shahid blocked the ways of that person and said: "there are two days when I am on the road from the front, when I see a lion! Be blessed!" they said. In response to the Mashrab also said, "Blessed be you too!" they said. Went back on their backs without saying a word to another. It's good that in such a steppe no one heard their short speech. If not, they would say they were both ignorant. In fact, they were blessed by saying their prophecy that they would die in one day. Especially if they knew this, they would have said"[1: 7]. Both in the story and in the story, Eshon Shahid also sees death as the pursuit of God, seeing the true society.

After following a breed on the road and not following it, the poet gets naked in order to drive it. "I will not be behind you anyway until the turns his face upside down! Because you know your lion!",- he says. When he cannot return him by throwing a stone in the mud, he says," that sun I will go to beauty alone, I do not need a groom!",- he begs. The man will not come again. Finally exclaimed "God bless you! Have mercy on me! Be alone!" that cries.

Show "Mashrab" face to beauty, moths that burn in love..."he goes into the Balkh. The fact that Mahmudhan is the remedy for the recovery of his lonely son from the sick sends his fans back. From this state, she cries with pain. He goes to lose weight. Even in the paragraph of the poem, Show face to beauty, moths that burn in love...total of the show" in the rows"... "It becomes difficult to say the words. Then he only repeats these lines. "I did not have much patience. You brought your stone house (Ka'bah) to the only flirtation of a shepherd (Robiya) From the place, and you do not show me your face! One Nabi'ah (Moses) begged,"you have spoken to me, you do not speak to me." Even going out to a nudity and suffering "show face!" It remains to sit down. Then come to a decision "turn, blind our society!" the voice is heard. The celebration joyfully stands up and the disillusioned wedding echo becomes voluntary to enter a crawling street. Again, there is trouble in love with "Madden! Love is tied to prom! "We put the plagues before the beautiful face!" the voice is heard. "Thousand sacrifice my soul while wandering! I'm not in trouble, I could see face!" that runs whispering. The mistress will enter the wedding of a boy. When approaching the wedding, the number of followers from behind will increase even more. The wedding landscape is described in the story as follows: "This is a rich wedding, and at the table are various blessings, round-built merchants around them. The musicians played music, the singer laughed at the singer. In the middle of the stream, three dancer women with waist, legs open were playing with flirting, shaking their bellies." Then the falls. The curtain falls between the dancers. This veil is neither worn, nor people notice it. The mistress does not even begin to see dancers. In the veil, the face is revealed, and reflected from the community of Allah.

Exultantly admiring exclamation exclaimed: "Oh from your soul! Thousand of my soul sacrifice!!!" oh, he pulls.

Those who follow this state of affairs are astonished. Some are disgusted with it, some are left with a handshake. They think that the veil spoke to the dancers vaguely, who are not aware of it. The moment is not in reality, in the photo this landscape appears so much imagination.

"Your soul until you open your arms while you crawl! Oh, Dear! I'm sorry!" as he aspires to dancers, suddenly the curtain rises. The mistress sees herself under the feet of dancers.

"Taste the balloon now!"

The events of the story will end like this: "a man from the wedding people, having received a concubine, blew the hookah smoke out of his mouth, chewing the immature flesh between his teeth: "take out this abnormal!" he said.

Those who followed him, becoming a fan of the boyars, beat him out and dragged him out. People also turned the beating into a competition. "Sacrifice my soul while laughing while panting! Oh-oh, my dear sacrifice!" they say. This breed did not stop laughing when people hit it... Those who beat were interested in each other. Then he began to beat with those who did what he could..."

CONCLUSION.

Thus, the work is unique in that it interprets the work as an image of a rebel, at the same time a relic of a person who is fixed in his profession, aspiring to a true will. It is worth remembering that the doctor of philological sciences A.Sabirdinov noted that at the beginning of the XX century in Oybek poetry influenced the works of the steppe in the interpretation of the actual themes of the period [3:232]. Naturally, in the formation of the steppe style, the work of such figures of classical literature as masonry occupies a great place.

COLOR AND ITS ROLE IN HUMAN LIFE

Shavkiyev Elyor Rakhmonberdievich*

*Teacher,
Samarkand State University,
UZBEKISTAN

ABSTRACT

The article discusses color and its role in human life, its various effects on psychology, the process of improving the necessary knowledge, skills and competencies and professional skills of a teacher of fine and applied arts in modern times. The effect of color on students is also discussed.

KEYWORDS: *Fine Arts, Applied Arts, Color, Color Science, Warm Colors, Cold Colors, Associative, Pastel, The Effect Of Colors On The Human Psyche.*

INTRODUCTION

Our ancestors left us a lot of spiritual treasures about color and its place in human life, its healing, educational, philosophical and spiritual aspects. Unfortunately, we are not able to take full advantage of this spiritual heritage. In particular, there is a lack of emphasis on these issues in education and training, medicine, technology, agriculture, economics and other areas. However, in the developed world, the role of color in human life is very important.As you know, color education is taught in the education system. However, modern textbooks, electronic versions, etc. are not enough. There is almost no research on the teaching methods of color science.

When we look at the unique masterpieces of applied art left by our ancestors, we see that each object or ornament hags its own shape, color and size. For example, the color of the ornament has a different effect on the human psyche, which has a special symbolic and healing properties.

It is known that a person receives 90% of the information he receives from the outside through the visual organ. The eye, on the other hand, plays a role in 70-90% of human behavior. This means that color is very important in human activities. Therefore, the environment requires a conscious choice of colors, scientifically based and aesthetically pleasing.When we look at beings, we are amazed that the world around us is made up of so many different colors. "What is

the significance of color?" you think. Our ancestors admired this mysterious world of nature and studied it for centuries. Our holy book, the Holy Qur'an, also contains the following philosophical thoughts about the miracles of color: "Is there anyone who gives color better than Allah?" . or "Have you not seen that we produce fruits of different colors?" "There are also different colors among people, animals and livestock."

In fact, although the term "color" consists of four letters, it is natural that man does not have enough time to study its meaning and mysterious world. The science of color was born to study the secrets of color. The science that studies the effects of colors on the human spirit is called color psychology.

Each color has many meanings. "Why is nature created in green? What is the reason for this? If nature were red or yellow, what would that mean? What colors make you feel good? Which one has a negative or positive effect? Can human or animal color determine their health? All of these problems are the subject of research debate in the science of color psychology.For centuries, our ancestors and scientists have been conducting research and experiments in this field. Today, even in some developed countries, specialized color institutes and research laboratories are working effectively in this area.

One of them is the world-famous Color Institute in Tokyo, Japan. Symbolically "speaking" by great scientists because of color; Research is being conducted on the treatment and education of people through color, philosophical thinking through the flow of colors, understanding of the inner world of people through color, as well as the role of color in improving agricultural productivity, the economy and other issues.By great scientistsSymbolically "speaking" because of color; research is being conducted on the treatment and education of people through color, philosophical thinking through color vision, understanding of the inner world of people through color, as well as the role of color in improving agricultural productivity, the economy and other issues.

Since the dawn of time, human life and activity have been closely linked to color and its shades. As soon as a baby is born, it feels light for the first time and is surrounded by a colorful environment. Gradually, he will be able to distinguish between large and small objects, especially color.Learn the ins and outs of color throughout your life. And the world around us is full of different colors. Everything that makes up an object has a specific color. Whichever way you look at it right now, you can see the power of colors. There is no area in our life that is not affected by color.The healing properties of the essential oils, have long been known in ancient times. In particular, modern medicine is widely used to treat children with neurological and mental disorders with warm colors (red, orange, pink), and proves that if the colors are not used properly, a person can suffer from various other diseases.

Therefore, we need to follow the instructions of experienced psychologists when painting and choosing colors for the interiors and other surroundings of residential buildings, universities, schools, kindergartens, kitchens, manufacturing plants, offices and institutions.

The color of an object depends on the spectral composition of the light it receives. You can see it in the theater. This can sometimes lead to accidents. For example, in one of the restaurants in Chicago, the lighting was changed. The red and blue lamps were replaced by the usual ones. After that, the color of the food changed, the meat turned gray, the salad turned reddish-blue, and the milk began to look red. People didn't touch the food.

Summer is a holiday season. Some people go to the sea, others to the mountains, and some people think that sitting by the river and fishing with a hook is the best holiday. Generally, people want to be out of town during the holidays. According to physiologists, this is a natural aspiration. When a person is tired, he involuntarily strives for the conditions that are comfortable for him - the blue forest, the yellow sands, the blue water.The living and working conditions of the people should be the same. One of the most important constituents of this condition is color. That's why Professor Rabkin's lab has identified the most suitable colors for painting living and working areas. These are light yellow, light blue, light blue and orange.But these colors should also be used knowingly. For example, if the floor, walls, doors, and window frames are painted the same color, you can imagine how ugly the landscape will be, and the same color can be harmful. That's why scientists recommend different details.

In one factory, for example, an artist recommends hanging a blue poster on a yellow wall. This turned out to be both aesthetically and physiologically beneficial.The draft standards, developed by scientists, recommend painting walls, floors, ceilings in optimal colors, and small items in eye-catching colors.The choice of color should take into account the intended use of the product or building.

For example, it is not recommended to paint copper pipe parts in yellow, brown or red colors, because in such colors copper parts are not visible, and the worker has difficulty. It is better to paint this machine in green, gray or blue.It takes a different way to paint a school classroom. This is because children "feel" color differently than adults. Also, kids of all ages love different colors. Belarusian scientists surveyed more than 3,000 children between the ages of 7 and 15 and found that young children liked red, pink, and yellow, including warm colors.

And 70% of teens prefer blue. For this reason, it is recommended to paint the lower grades in yellow and pink, and the rooms where teenagers study - in a cooler color - blue.In buildings where mental and physical work is done, it is recommended to paint the walls blue. It reduces eye strain and calms the body. This also applies to hot shops. But the reason is different.

For example, what can be done to prevent heat in the ironing shop? the temperature cannot be lowered: clothes cannot be ironed with a cold iron. Paint helps here. When the walls of the shop were painted blue, the temperature in the room dropped and it became much cooler.Gyms, clubs, cafes, kitchens should be painted in bright, cheerful colors. But you should know the rules. A foreign businessman paints his cafe red so that people can eat more and make more money.

But the excited customers got into more fights, and the cafe was damaged.

Colors should be chosen in such a way that they have a positive effect on a person's ability to work and mood. For example, in some foreign companies, painting the workplace by finding the right color increased productivity by 25 percent and reduced waste of time by 32 percent.

The system of color standards currently being developed by scientists in research institutes allows to create a favorable color climate in every sector of the economy, thereby improving working conditions, increasing labor productivity and improving product quality.

One of the young scientists conducted several experiments to determine the psychological effect of colors on work productivity: he conducted a bizarre experiment in consultation with his supervisors to monitor the work of cargo workers at the seaport. , painted several hundred boxes black without showing them to anyone and asked the workers to take them on a steamer the

workers lazily carried the black-painted box, but instead of carrying it until lunch, they carried it until evening, and when they painted the boxes white again a month later and told the workers to carry them, they were in a good mood transported until lunch.

Thus, a number of experiments have shown that dark, black, sad colors have a big, negative effect on the human psyche, especially young children.

Another example. The protagonist of the film " Conflict of love at work " ("Службныйроман"), the director of a large organization, is rude to her employees, and her clothes are extremely rude, ugly and dark brown. , does not fit. She doesn't look good, she looks old even though she is young, so the staff called her "old woman".

Eventually, the woman realizes her shortcomings and, in consultation with her secretary, changes her clothes, wears a brightly colored dress that suits her, and when she comes to work in the middle, the staff applauds and treats her. people smile, and attitudes toward work change for the better. This is due, firstly, to the attitude of the woman to the staff, and secondly, to the fact that the colors of the clothes are bright and appropriate for her age.Due to the strong psychological effect of color on a person, it is especially important in creating interiors.

Due to the strong psychological effect of color on a person, it is especially important in creating interiors. The color environment of the room includes not only the walls, floors, ceilings, furniture and appliances, but also clothes, various items, visual aids.

Color needs to be understood and used artistically and psychologically. This enhances the comfort of the living environment and demonstrates the artistic and functional advantages of the interior. One gets an associative impression from colors, that is, one perceives each color as an object or a natural phenomenon, For example, fire and sun are associated with red, orange, or yellow in the human imagination. Therefore, we consider these colors as "warm" colors. Compared to water, air, sky blue or blue. These colors are "cool". The green grass is compared to a "soothing" color. It's kind of light, it's boring, it's moving, it's calm such comparisons are also available. The effect of color on the age of the students should also be taken into account. Warm, saturated colors are preferred for toddlers, while cool, medium-saturated complex colors are preferred for adults, and pastel-like, achromatic colors are preferred for older people.

When choosing a color for the school interior, it is necessary to take into account its physical and psychological impact on the person. Purple and red are powerful stimulants of the human nervous system, which impair attention, reduce the ability to work and lead to fatigue. Therefore, it is not recommended to paint rooms (classrooms, cabinets, etc.) where students will stay for a long time in these colors.

When choosing a color for the school interior, it is necessary to take into account its physical and psychological impact on the person. Purple and red are powerful stimulants of the human nervous system, which impair attention, reduce the ability to work and lead to fatigue. Therefore, it is not recommended to paint rooms (classrooms, cabinets, etc.) where students will stay for a long time in these colors. To paint such rooms, it is recommended to use colors that have a positive effect on the nervous system, increase the ability to work, do not reduce vision and improve hearing. These different colors include light green, light blue, brown, white-yellow, natural wood color, and their combinations. In addition, the main color of the room depends on

the climate of the place where it is built and its orientation. Rooms in the north of the buildings should painted in "warmer" colors, and in the south - in "cooler" colors.

Room temperature is also important. Wood and metalworking workshops, where the air temperature should not exceed 16-18 °, are best painted in cooler colors.

№	Colorname	The nature of the tendency to color								
		Warm	Cold	Cold	Severe	Depression	Aspiration	driver	Crushing	Soothing
1	Red	X			X		X	X		
2	Orange	X					X	X		
3	Yellowishgreen	X		X						X
4	Yellow	X		X			X	X		
5	Green		X			X				X
6	Greenishblue		X	X		X				X
7	darkgreen		X	X		X				X
8	Blue		X		X	X				
9	Purple		X		X	X			X	
10	Red	X			X		X	X		

If the room is painted in a cooler color up to the ceiling, and the ceiling is painted in a lighter color, the room will look taller and more spacious. The doors should be the same color as the walls.

The main color is chosen in the interior, and the composition of other accessories and colors combined with it is should built in this primary color. Harmonious color solutions can be created by nuance (subtle contrast) or contrast (sharp change). Small objects that require more attention than others are painted in bright and dark colors in the interior. Color can also be used to convey an message to an observer. For example, red - risk, yellow - caution, green - no risk.

The barrier surfaces of school rooms (walls, ceilings, doors, etc.) are decorated with opaque colors or opaque decoration materials that are not glossy in the students' field of vision. Bright colors quickly lead to eye fatigue and a general decline in performance. Therefore, it is necessary to take into account the gloss properties of the colors used in the interior. For example, white reflects up to 90% of the reflected light, yellow 80%, blue 70%, green 60%, dark green 22%, and black absorbs almost all of the light takes.

Painting upholstery surfaces and furniture in bright colors helps students distribute light more evenly in the field of view. Optimal (optimal) ratio of light for classrooms: notebook - desk 2: 1 - 4: 1; class board - notebook 1: 3 - 1:10. The uneven distribution of brightness often causes the eye to re-adjust, resulting in rapid fatigue.

That's why it's important to preserve these unique masterpieces of color and teach them to students.

ABSTRACT

This article is based on sources about the teachers of Sheikh Yusuf Hamadoni, one of the famous sheikhs of the Islamic world, who enriched mysticism with mystical-philosophical and moral content, and the ideological founder of Central Asian mystical schools. The article also discusses the students of Sheikh Yusuf Hamadani, the spiritual father of the Yassaviya, Khojagon, and Naqshbandi sects.

KEYWORDS: *Sufism, Teacher, Mystical And Philosophical Teachings, Khirqa, "Khurasankaaba", Schools Of Knowledge, Schools Of Thought, Murid, Caliph (Student), Schools Of Mysticism.*

INTRODUCTION

HazratHoja Yusuf Hamadoni, one of the famous sheikhs of the Islamic world, was born in 440/1048 in the village of Buzanjird in the city of Hamadan. Sheikh died in 535/1141 in Bamiyan, Afghanistan and was buried there. His body was later moved to Merv, Turkmenistan, by his murids, according to his will. The mausoleum of the sheikh in Mervwas once called the "Kaaba of Khorasan". Sheikh Yusuf Hamadoni enriched mysticism with mystical, philosophical and moral content on the basis of his unique worldview. According to a number of sources, Khoja Yusuf Hamadoni studied in Baghdad, Isfahan and Samarkand, and mastered the science of mysticism. Shaykh Yusuf al-Hamadani, when he was eighteen years old, went to Baghdad and Abu Ishaq, a faqih, studied jurisprudence and reached to the level of maturity. And they followed the sect of Abu Hanifa (may God bless him and grant him peace) and studied in Isfahan and Bukhara. In Iraq and Khorasan, and in Khorezm and Movarounnahr, they accepted the owner.[1]

In particular, AlisherNavoi in "Nasayimul-muhabbat" said that "Hoja Yusuf Hamadoni was regarded as qaddasallahusirrahulazizkuniyati Abu Yaqub" In particular, the Arif Sheikh reported that he went to Baghdad, learned from Abu IshaqShirazi, participated in scientific circles, heard hadiths in Baghdad, Isfahan and Samarkand, and entered the path of mysticism and became a murid of Abu Ali Formadi. In addition, he was taught by Abu Ishaq al-Shirazi, "Abu Ishaq al-Nazzari, al-Khatib al-Baghdadi, Abu Ja'far bin Muslim, Abu Husayn al-Muhtadi, and other scholars in the fields of jurisprudence, hadith, mysticism, and other areas of spirituality. During his accomodation in Baghdad, al-Sam'ani learned mysticism from al-Sam'ani and Ahmad al-Ghazali, listened to their sermons, and was a servant of al-Sam'ani. [2]Hamadani learned mysticism from holy sheikhs such as Abdullah Juwayni and Hassan Simnani. He also spoke with Abu Ali Formadi, Abdul QadirGilani, and HamiduddinMoltani, and wrote in his treatise "Maqamati Yusuf Hamadoni" dedicated to Abdul KhaliqGijduvani's teacher that he took lessons from mysticism. Abdulkhaliq! Know that the interpretation of zhikr(revising the name of Allah) first reached the heart of Hadrat Abu Bakr, from him to Salman Farsi, from him to Ja'farSadiq, from him to Sultan Bayazid (Bastami), from him to Abul Hasan Haraqani, from him to the great Sheikh Abu Ali FormadiTusi, and from there to us.[3], and "O Abdul Khaliq, may you be our fourth caliph, just as I was the fourth caliph of Hajj Abu Ali (Formadi)."[4] The value of this information in the treatise is that we know which Sufis taught the sheikh in the formation of the philosophical and philosophical views of Hazrat Yusuf Hamadani.Tibyon version of Abdul KhaliqGijduvani'sdescription is written in Persian and kept in Turkey, provides a much more ondetailed account of Yusuf Hamadani's succession to the mystical path. "O Abdul Khaliq, when Hodja Abu Ali Formadi passed away, he left behind him four close people as caliphs: 1.Hodja Abdullah FaromuqiShirazi, 2. HodjaIshaqNasrabadi, 3. HodjaHamiduddinMoltani, 4. And I-Hodja. Yusuf ibn YaqubHamadoni. After the deaths of Hodja Abdullah and HodjaIshaq, HodjaHamiduddinMoltani became the caliph of the murids according to the way order of the sect.HojaHamiduddin traveled to India. After the trip, Imam Muhammad al-Ghazali and his brother Ahmad   al-Ghazali,   YunusSijovandiTusi,   Sayyid   Ahmad   Baydastani, KhojaSulaymanFarobilarkim, who was poor by the fireplace (Yusuf Hamadoni) , called on the people to obey God in the tomb of the great sheikh (Hoja Ali Formadi), to turn away from heresy and heresy, to become a caliph instead of HodjaHamiduddinMoltani. "After the visit of HojaHamiduddinMoltani, I was in the tomb of Hoja Ali KalonFormadi.[5] " In the path of the Sufi order, he tells his caliphs that he is conveying the wisdom and spirituality that has come down to us from the great Hajj Abu Ali Formadi to the taxes of the sect and the needy of the path of truth.

Abdul KhaliqGijduvani wrote about his teacher in his book, "He memorized seven hundred books on tafsir, hadith, fiqh, usul, furu and kalam, and talked to two hundred and thirteen mashayiks. No one knew the number of those who succeeded in converting 8,000 pagans to Islam, and who repented and guided them. "[6] Indeed, the lifestyle of Sheikh Yusuf Hamadani was intertwined with the practical rules of life of mysticism. Yusuf Hamadoni made a living by his honest work. The sheikh's profession was shoemaking. The sheikh not only carried out important activities such as teaching science among the people, instructing them, and educating the murids, but also created works of scientific-enlightenment, mystical-philosophical content on the theory of mysticism. Sheikh Yusuf Hamadoni is the author of such treatises as "Rutbatul-Hayat", "Kashf", "Risolaiodobitariqat", "Risolai fi alalkovnamusaxharunlilinson" and "Risolaidarakhlaqvamunojot". In these works, Yusuf Hamadoni developed the mystical ideas of his holy-teachers and not only enriched the theory of mysticism with mystical and philosophical

content, but also developed this mystical doctrine, which plays an important role in the spiritual maturity, spiritual and emotional education of man. He also explained and taught his students. Analytical approaches show that Yusuf Hamadani's school of mysticism played a key role in the development of mystical teachings in Central Asia. This is because the origins of the "Yassaviya", "Khojagon" and "Naqshbandi" sects, which have a high influence on the development of mysticism and its geographical spread, date back to the school of Yusuf Hamadoni. Below we reflect on the students who studied at the school of the great mystic Yusuf Hamadoni.

In Barthold's History of Cultural Life in Turkestan, he notes that the most widespread mystical teachings in Movarounnahr began with the school of Sufism by the sage Yusuf Hamadani. This explanation of the scientist is exactly the same. In the formation and development of the Khojagon-Naqshbandi, as well as Yassavi sects, which originated in Central Asia, are widespread throughout their development, and still live in a number of Muslim countries, have an important spiritual and enlightenment impact on human and social life. It should be noted that Yusuf Hamadoni's school of Sufism and its mystical-mystical teachings were an important ideological basis.A number of sources, in particular, Abdurahman Jami's "Nafahotul-uns", Fakhruddin Ali Safi's "Rashahotaynul-hayot" ("Drops of Obihayot"), Doroshukuh's "Safinatul-awliyo", A. Navoi's "Nasayimul-muhabbat", Tahir Eshan "TazkiraiNaqshbandiya", "Kandiya" by AbulqasimSamarkandi, "MaqomotiKhojaYusufiHamadoniy" and "Risolayi sheikh ash-shuyukhhazratKhoja Abu YusufiHamadoniy" by Hazrat Yusuf Hamadoni, Khurasan It is written that he lived in Urgench, Samarkand and Bukhara for several years, taught Islam and mysticism to his companions, and called the people to Islam.

The reason for the emphasis on the breadth and high level of influence of Yusuf Hamadoni's school of Sufism is that the Sufis of the Central Asian mystical sects, which have a special place in the history of Muslim religious, philosophical and mystical teachings were formed by Sufis. Although Yusuf Hamadoni, the spiritual father of the Yassaviya, Khojagon, and Naqshbandi sects, has many disciples, four of his caliphs have a special place among them. After Sheikh Yusuf Hamadoni, they will mentor one by one the murids instead of their mentors. In his treatise"Maqamati Yusuf Hamadani", which he wrote about the mentor of Abdul KhaliqGijduvani, he said, "O Abdul Khaliq, you will be our fourth caliph, just as I was the fourth caliph of Hoja Abu Ali (Formadi). I see tears in his eyes. I asked, "Who will be the caliph after you?" The Sheikh said, "We will be replaced by Hodja Abdullah Barraqi, then Hodja Hassan Andoqi, then Hodja Ahmad Yassavi. When Khoja Ahmad Yassavi leaves for Turkestan, you will be the caliph. " [7]The following is a list of the caliphs of Yusuf Hamadani mentioned above. "They are the caliphs before the caliphs of Khoja Yusuf Hamadani Quds al-Sirruhu," [8]said the first disciple of the sheikh, Khoja Abdullah Barraqi, and information about his life is rare in the sources. But if possible, we will try to study the life of Barraqi, based on brief information from specific sources. More information about Khoja Abdullah Barraqi can be found in Tahir Eshan'sTazkiraiNaqshbandi. Rashahot states that Barraqi was originally from Khorezm. Sheikh Abdul Karim Samani's book, Ansab, states that he took the nickname Barraqi from the word barra (author of the sect's reference to subsistence farming). Hoja Abdullah Barraqi learned from his teacher all the moral rules of the sect and propagated his teachings among the people. "The blessed tomb is in Bukhara, on a hill. He is standing near the tomb of Sheikh IshaqGulobadi (may Allah have mercy on him). " . The stories in Rashahot are mostly details that the author has

seen with his own eyes or written by people he trusts. "The second caliphs of HazratHaja Yusuf quddisasirruhu are standing, and their names and names are Abu Muhammad ibn HusaynOndaqi." Khoja Hasan Andoqi (rahmatullahita'ala) was born in 1071 in the village of Andoq in Bukhara. According to sources, Sheikh Yusuf Hamadoni came to Bukhara while Andoki was studying at a madrasah in Bukhara. After hearing the sheikh's description, Andoqi was accepted as a murid by Yusuf Hamadoni.[9] Rashahot states that after a short period of mathematics, Andoqi's career in the path of the sect increased and he reached a high position. Andaki devoted all his energy to the teachings and became one of the learned sheikhs of his time. Before his death (1140), Sheikh Yusuf Hamadani bequeathed, "Let Hoja Abdullah Barraqi perform ghusl on me and put Hasan Andoqi in the grave." It was the teacher's kindness to the student. The third caliph of Yusuf Hamadani was Khoja Ahmad Yassavi, who was born in Yassi, Turkestan. According to Rashahot, Ahmad Yassavi came to Bukhara at the suggestion of his first spiritual teacher, Arslanbobo, and became a murid of Yusuf Hamadoni, from whom he learned the etiquette and teachings of zhikr. According to the sources, after the deaths of the caliphs after Hazrat Sheikh Khoja Abdullah Barraqi and Hasan Andoqi, for some time he was engaged in guiding the people in Bukhara, and then turned to Yassi. "[10]After a while, the signal to the future disappeared and they moved towards Turkestan," [11]he said. At the time of departure, all the Companions were ordered by Hazrat Hoja Abdulkhaliq Gijduvani to the service and obedience of the Holy Sirruh. Then they turned their attention to Yassi. " Ahmad founded the Yassavi sect based on the teachings of his teacher Yassavi.

The fourth student of Yusuf Hamadoni is KhojaAbdulkhaliqGijduvani. In the book Faslul-Khitab, it is stated that the forms of Khoja Abdul Khaliq are a document in the sect. And they were acceptable to all sects. " HojaAbdukhaliqGijduvani describes how he met the sheikh of the sheikhs in the following way: "Whoever wants something and strives, he will surely get it"[12] is the correct ruling of the hadith and "Allah is in His light With the clarity of the verse, "He guides whom He wills" (Surat an-Nur, 35), I placed my head of discipleship at the feet of Sheikh Yusuf Hamadani (may Allah have mercy on him), the leader of the guardianship, the dome of guidance and the murshid of Hamadan. I embarked on this journey with the Etikafs of the Threshold of Will and the officials of the House of Love in that house of truth. At the request of Hizr, he honored the sultan of the saints with the interpretation of the dhikr of the heart. Yusuf Hamadani's teachers taught their murids what they knew about the practical and theoretical aspects of the science of mysticism, which they had learned from the learned sheikhs such as Abdullah Juwayni, Hasan Simnani, Abu Ali Formadi, Abdul QadirGilani and HamiduddinMoltani. , oppose to the reason and two contradictory things that do not come together. Don't be arrogant. Do not give in to the world and do not indulge in worldly adornments. "[13] Yusuf Hamadani, while teaching his students religious, mystical and mystical knowledge, said, , Hodja Abdullah Barraqi, Hodja Ahmad Yassavi, HodjaAliyya called this poor Abdulkhaliq ibn Abduljamil and other serving dervishes to the branch of the Prophet's Sharia.

They protected and warned against the desires of the flesh, from opposing the Shari'ah, from the path of the people of falsehood and conspiracy, and from the imitations of the muqallids, "[14] says the KhodjaiJahon. First of all, Yusuf Hamadoni followed this demand and started his disciples in this way. These aspects of Yusuf Hamadoni's spiritual and moral views are of great educational significance today. Students such as Hasan Andoqi, Khoja Abdullah Barraqi, Khoja Ahmad Yassavi and AbdulkhaliqGijduvani also appreciated their teachers, who guided them to reach the

level of spiritual maturity, as a person who loves and is loved from the bottom of their hearts. Yusuf Hamadoni iseternally remembered and urged by the followers of the sect and the people to follow the path of life like the great figure The spiritual saplings planted by the sheikh turned into crystal trees that emit great light, which gave light to many hearts thirsting for this light.

ABSTRACT

The aim of this paper is to identify gender determining functions of derivational suffixes in Old English. The article tries to answer the following research questions. Such a question maybe raised: according to what principles can derivational suffixes be classified referring to the gender differentiation? Specific features of a) stem-forming suffixes; b) types of stems; c) one, two and three gender differentiation; d) biological gender differentiation; e) semantic functions of derivational affixes are analyzed with a view toward the classification of gender distinctive formatives in Old English.

KEYWORDS*: Classification, Derivative Nouns, Derivational Suffixes, Gender Indications, Gender Variations, Grammatical Gender, Biological Gender, Sema, Stem-Suffixes, One, Two, Three – Gendered Suffixes, Semi-Suffixes, Word Derivation.*

INTRODUCTION

As is known, suffixes in Old English are divided into two groups: stem-forming and derivational suffixes, determining the grammatical and biological gender differences. The derivative and gender indicative functions of these suffixes are variable [3]. In classifying these types of suffixes, we have taken into our consideration their gender distinctive functions.

From the point of view of gender indication, derivational formatives are classified as one-gendered, two-gendered, and three-gendered distinctive suffixes. In old English, the role of the stem –forming suffixes is of great importance in modifying and forming noun genders.

One gender stem-suffix –a modifies only the masculine gender: e.g. wiga m. 'warrior'; merefara m. 'sailor'; flan-boga 'bow'; snaca m. 'snake'; plega m. 'quick action'. The stem-forming affix -ō, is also one gender suffix which indicates only feminine gender of derivative nouns: e.g. wulfō f. 'she-wolf'; strengō f. 'strength, power'; lufuf. 'love'; ōferieldō f. 'old aged'. The number of two-gender stem-forming suffixes is greater than others'. For example, the stem– forming suffix –u is peculiar to masculine and feminine nouns: freoþu f. frið m. 'peace, protection'; wudu m. 'forest'; syntu f. 'prosperity', daru f. 'harm, resentment'. The stem-forming suffix –r is also two-gendered. It is peculiar to masculine and feminine nouns that express the relative, sex and age relationships of people: e.g. fæder m. 'father', broþor m. 'brother', mōder f. 'mother',sweostor f. 'sister'.

Derivational suffixes, which partially change their form depending on the gender "are closely related to the stem-forming suffixes" [1, 98]. So, in Old English gender suffixes are linked with three stem-suffixes - a, - ō, - n; a) a-stems represent masculine gender suffixes - or, - end, - ere, - ist, - ing (ling), - el, - els,   - en, - oþ (aþ); neuter – en, - incel, - ett; b) o- stems represent feminine gender suffix - en, -nis, -ung (-ing), -u/o (-in), -þu, - ðo, -þ, -ð; c) n-stems represent masculine gender -ist, - a and - icge, - estre,- isse (- ysse) indicate feminine gender.

Semi-suffixes are linked with five stem-forming suffixes - a, -ō, -i, -u and root stems: a) a-stems represent masculine gender semi-suffixes - dōm, -cræft, -stafas; neuter -rīce, -lāc; b) ō - stems represent only semi-suffix – rædenn with feminine gender; c) i - stems are connected with feminine semi-affixes - dæd, -sceaft, -scipe, -wist; d) u- stems are linked with masculine semi-suffix – hād; e) root stems are only linked with masculine semi-suffix – mann.

The interaction of derivational suffix with the stem-forming elements sometimes causes variation of noun gender forms. However, in the system of Old English word formation, this phenomenon is weak which is why the stem-forming suffixes have lost their formal expressions in the structure of derivative nouns. It is possible in the case, that derivational suffixes express the definite grammatical gender. For this reason, the noun derivational suffixes can be divided into the following groups according to their gender formation.

One-gender masculine formatives:

 The suffix –a (Germ. - *an, -*jan) derives concrete and abstract nouns and the suffix –ere, - or (Germ.- *ari, -*er, -*or) derives only concrete nouns, denoting the semes('nominaagentis'), 'doer of action'.

The suffix –end (Germ. -*nt or the participial suffix - *ent, - *ant) is used to derive concrete nouns withsemes 'performer, agent'.

The suffix -ing, - ling (Germ. - *ingā, - *ungā) is used to derive concrete nouns denoting 'acting person, endearment and sometimes contempt'.

The suffix –el, - ol, -ul, (Germ. -*il, -*ol) is used to derive concrete nouns denoting 'persons, diminutives'.

The suffix – oc (-uc) derives concrete nouns with semes 'person and non-person'.

The suffix -oþ,- aþ (Germ. - *ōþu, - * ōðu) derives abstract nouns denoting semes 'action, state'.

The semi-suffix –mann (Goth. *manna, OHG.*mann) derives concrete nouns denoting 'doer of action'.

The semi- suffix -hād (Goth. - haidus, OHG. - heit, OIcel. - heiðr) is used to derive abstract nouns that express state, position and collectivity. In other Germanic languages, the semi-suffix-hād is characterized by instability in indication of some grammatical gender. For example, in Old High German, derived nouns with this suffix varies in masculine and feminine genders with the advantage of the latter. The instability of gender distinction is also observed in other formatives. For example, - tuom, -scaft. However, in Old English the certain semi-suffixes maintain their stability in determining gender differencesthat refer to the masculine gender.

The semi-suffix - dōm (Goth. - *dōmis, OHG. –*tūom,OIcel. - *dōmr) is used to derive abstract nouns denoting 'state, position'.

The semi-suffix – scipe (OHG. – *scaf, OIcel.- *scarf) is used to derive abstract nouns denoting 'state, position'.

The semi-suffix – stafas (Goth. – *stags, OHG.- *stab, OIcel. – *stafr) is used to derive abstract nouns denoting action, state'.

One – gendered feminine formatives.

Feminine derivational suffixes – icga, - estre (- ster), (Germ. – *esse, - *issa) derive concrete nouns, denoting a female person.

The suffix – nis, (- nys, - nes) (Germ. - * assi, - * nassu) is used to derive abstract and less often concrete nouns denoting 'state, position, property');

The suffix – ing, - ung (Germ. - *ingā - *ungā) is used to derive abstract and less often concrete nouns denoting semes of 'action, property'.

The suffix – u/o (Germ. - *in) is used to form abstract and less often concrete nouns denoting 'quality, property'.

The suffix -þu, - ðo (- þ, - ð) (Germ. - *iþo, -*iðo) is used to derive abstract nouns that signify 'quality, property, state'.

The semi-suffix - rædenn (Goth. - rēdann, OHG. - rātanOIcel. - raða) is used to form abstract nouns denoting 'state'.

The semi-suffix - dæd (Goth. - ge, -dēþs, OHG. –tāt,OIcel. - raða) is used to derive abstract nouns denoting 'action, position'.

The semi-suffix – wist (Goth.- wisan, OHG. – wesan, OIcel – wist)is used to form abstract nouns denoting 'state, position'.

Neuter one gender suffixes.

In Old English derivational suffixes determining neuter gender are rare represented, with the exception of some suffixes that have a diminutive meaning:

The suffix – incel, - cen is used to form concrete nouns, and – ett derives abstract and concrete nouns.

The semi- suffix – lāc is used to form abstract nouns.

The semi- suffix -rīce (Goth. - reiki, OHG. – rihhi, OIcel. - riki) is used to form abstract nouns. Two gender suffixes.

There are hardly ever two-gender suffixes except for the suffix –els, -elsa, and semi- suffix – sceaft in Old English.

The suffix – els, - elsa (Germ. -*si) the origin of which is not entirely clear, determines masculine and neuter gender of concrete nouns.

The semi - suffix – sceaft (Goth. - scafts, OHG. – giscaft) forms the feminine and neuter gender abstract nouns.

Three- gendered formatives.

There is the only suffix – en (Germ. - *inja, -*unja) in Old English which indicates the masculine, feminine and neuter gender. The reason of this phenomenon is not entirely clear to us. It can be apparently dependent on "weakening and destruction of morphological structures of Old English nouns" [6]. The suffix – en with the neuter gender is used to form concrete nouns, as well as abstract nouns expressing diminutives. This suffix corresponds to the common Germanic suffix – *in, which is found in other Germanic languages with the same meaning. Moreover, the formant – en in Old English derives concrete nouns denoting persons of both feminine and masculine genders.

The suffixes can also be classified according to their derivational meaning. They can be divided into two groups: a) suffixes deriving concrete nouns: - a, - or,- end, - ere, ist, ing (- ling), - el, - els, - en, - incel, - ett, - cen, - oc (- uc), - estre,

- isse, - icges, and the semi – suffix – mann; b) suffixes deriving abstract nouns: -nis(- nys), - ung (- ing), - u/o (-in), - oþ (- oð), -þu, - ðo, (- þ - ð), - en, - ett and the semi - suffixes - dōm, - dæd, - hād, - lāc, - cræft, -rædenn, - rice, - stafas, - sceaft, - scipe, - wist.

Prefix formativesdo not differentiate noungenders and are not related to the gender differences, though they are productive ways of word-derivation in Old English.

CONCLUSION

Thus, in Old English, as we mentioned above, the derivational noun suffixes are characterized by definite ways of classification according to their gender differences. They modify the stemsof words with different genders as masculine, feminine and neutral.Derivational suffixes can be classified according to stem-forming suffixes, types of stems, one, two and three gender formatives, biological gender determination and semantic functions. In noun derivation, gender affixes characterize the following semantic features: masculine gender signifies concretization, activity specifies, feminine gender- abstraction, passiveness and neuter gender – communality, diminutiveness.

APPLICATION OF THE SOLAR COMBINED SYSTEMS CONSISTING OF THE FIELD OF FLAT AND PARABOLOCYLINDRICAL COLLECTING CHANNELS FOR HOT WATER SUPPLY OF THE INDUSTRIAL FACTORIES

J. M. Ibrokhimov*

*Assistant
Ferghana Polytechnic Institute,
Ferghana, UZBEKISTAN

ABSTRACT

In given paper use of solar water heaters for processes of the industrial factories is observed. Besides, the analysis of the results gained on experimental installation is presented. Water from the central water supply system arrives in the bottom part of a storage container, and selection of hot water for processes is carried out from the overhead part of a forecastle. Average degree power concentration $K_3=34$. The results of calorimetry of the installation by a forced flow of water through the receiver at a constant flow rate made it possible to determine the thermal efficiency in various modes, depending on the magnitude of direct solar radiation and other environmental parameters.

KEYWORDS: *Industrial Factories, Cylindrical*

INTRODUCTION

The majority of the solar combined hot water supply of the industrial factories work on the thermal model shown on fig. 1, and consist of following basic components: flat and parabolic cylindrical collecting channels, a storage container, circulating pumps and the doubler of hot water supply, the system is provided with hot water with temperature 60÷100°C.

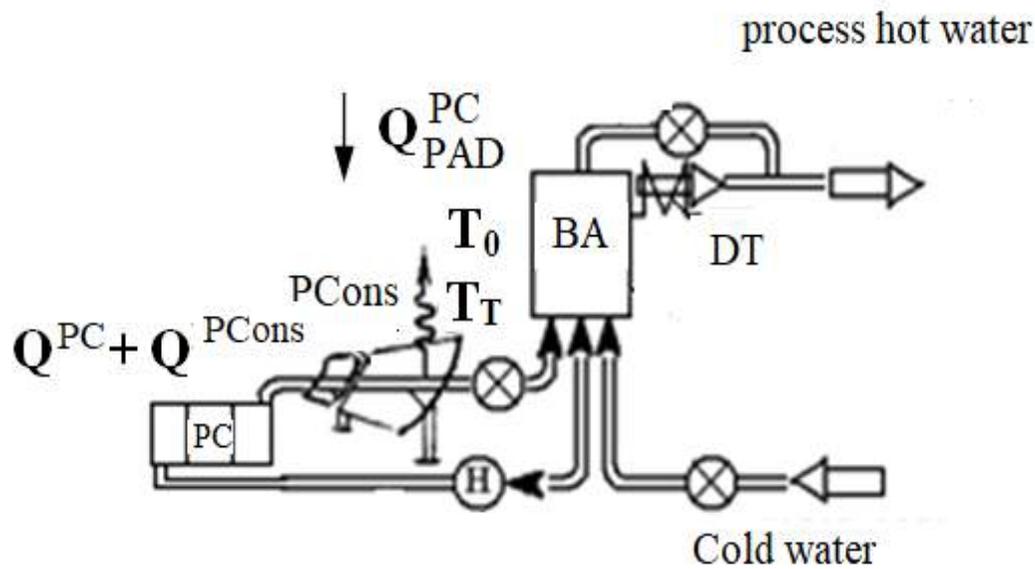
Hot water supply is executed under the one-circuit circuit design, i.e. heated water in flat and parabolic cylindrical collecting channels arrives in a storage container of hot water. Water from the central water supply system arrives in the bottom part of a storage container, and selection of hot water for processes is carried out from the overhead part of a forecastle. Protection against a system solidification is carried out drain waters from collecting channels.


Fig. 1. Thermal model of hot water supply of the industrial enterprises: - for reception of hot water.

temperature drop of water below the demanded working temperature for technological T_g^m process doubler DT who will be warm up the water arriving from a heat-sink tank joins.

System work is carried out as follows. Water circulation through a field of collectors occurs in the event that equilibrium temperature T_∞ of an absorbing surface of a heat receiver of more temperature T_B in the bottom part of a storage container on the size ΔT, caused by difference of temperatures in the main pipelines of this contour

$T_\infty \geq T_B + \Delta T$ (1)

Selection of hot water from the top part of a storage container is carried out by the expense to water m_r fence places. From fig. 2. It is visible that the expense is defined as follows: $m_r = m_G^T$ At $T_B \leq T_G^T$

And from equality

$$m_r \cdot C_P \cdot T_B + \left(m_G^T - m_r\right)C_P \cdot \tau_{x.в.} = m_G^T \cdot C_P \cdot T_G^T \,(2)$$

We define

$$m_r = m_r^T \frac{\left(T_G^T - T_{x.в}\right)}{\left(T_B - T_{x.в}\right)} \,\text{At}\, T_B > T_B^T \,(3)$$

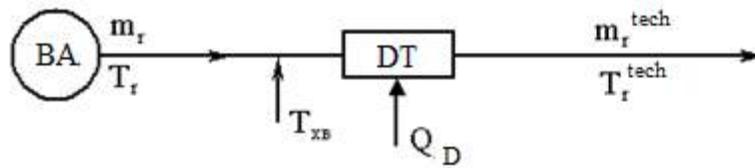
Where: T_G^T, m_r^T - Temperature and the expense of water defined by the production schedule of technological process;


Fig. 2 Scheme for definition m_r

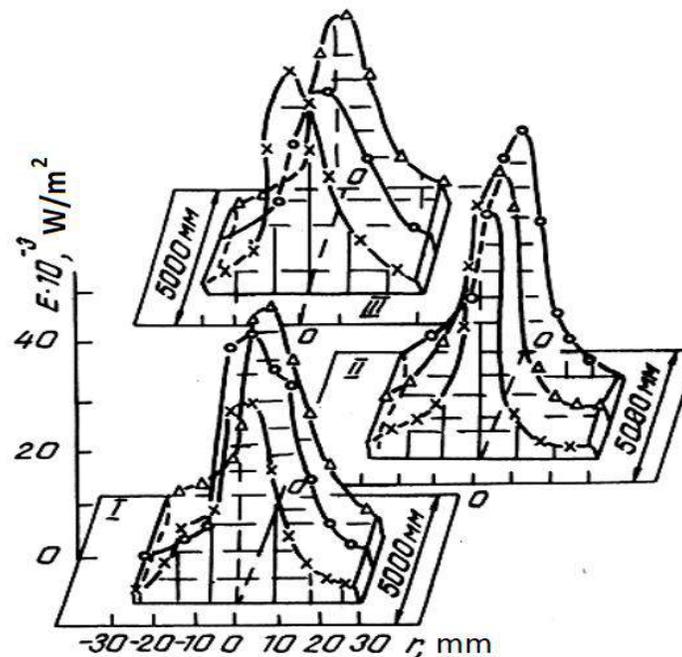
At the description of mathematical model of the solar combined systems consisting of a field flat and parabolic cylindrical of collectors of hot water supply following assumptions have been made: neglect non-uniformity of distribution of a stream of solar energy between collectors; losses of heat from a surface of connecting pipelines are not considered; leaning against results of predesigns, neglect a gradient of temperatures on perimetre and heat losses on heat conductivity to supporting elements of a design of a heat receiver. These assumptions allow to simplify essentially mathematical model of system, and consider flat and parabolic cylindrical collectors as a uniform collector. On fig. 3. Typical curve distributions of the radiant streams reflected from three mirrors, measured microphotosensor are shown. It is visible that the maximum density of radiant stream E_{max} in the centre of the focal image at $E_0=690 \div 730$ W/m^2 is $50 \cdot 10^3 \div 54 \cdot 10^3$ W/r


Fig. 3. Typical curve distributions of the radiant streams reflected from three

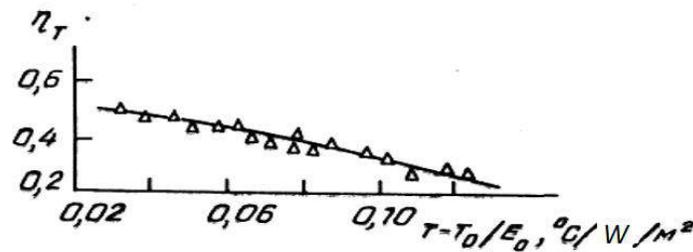
The factor of catching of a radiant stream also is high enough 0,92÷0,96 that confirms choice diameter of the receiver. Average degree power concentration K_3=34. The results of calorimetry of the installation by a forced flow of water through the receiver at a constant flow rate made it possible to determine the thermal efficiency in various modes, depending on the magnitude of direct solar radiation and other environmental parameters. From fig. 4 It is visible that the thermal EFFICIENCY of installation in operating conditions - 42÷43%, can be thus received to 3 kW of heat.


Fig. 4. Thermal EFFICIENCY of the power module solar parabolic
cylindrical installations

It is possible will note that solar installations can be applied additional a resource to the cores resources hot water supply, and to use them in combined to system.

ABSTRACT

Now a day cooperatives act in a very different environments. The need to compete in an open and globalized market has obliged them to rationalize structures and professionalize many boards of directors. The most important reason for the down fall and dormancy state of many multipurpose cooperatives in the region currently is the absence of effective leadership qualities and skills among their cooperative leaders. With this backdrop, the *study investigated the leadership skills among the leaders of multipurpose cooperatives. Out of 31 primary multipurpose cooperatives operating in the town, 16 primary cooperatives were selected purposively as the study units. By adopting census method all the 128 board of directors representing from 16 primary multipurpose cooperatives were selected as study population. The study was heavily dependent on primary data which was collected from the board of directors by administering structured questionnaire. Econometric model viz., binary logistic regression was used to assess the determinants of leadership skill among the board of directors. The results of binary logistic regression analysis shows that variable such as: age, access to training, leadership experience, media exposure, leader member relations and government interference were found to be the major variables that strongly determines the leadership skills. Those variables such as: age, and leader member relations were found to*

have negative significant effect whereas leadership experience, media exposure, access to training, and government interference were found to have positive significant effect on leadership skills. Based on the findings it is suggested that the leaders of cooperatives need to be given training on leadership qualities, skills and on the functionalities of cooperatives.

KEYWORDS: *Board of Directors, Cooperatives, Leadership, Leadership skills.*

INTRODUCTION

1: Background of the Study

In an increasingly globalized world, cooperative organizations are more needed than ever, as a balance to corporate power and as anchor to the grassroots level of society. Cooperatives hold the potential of being a driving force in the developing world; they can operate in a democratic environment. For the poor around the world, cooperatives can provide much needed opportunity for self determination and empowerment (ICA, 1963). Cooperatives are ideal vehicles for democratization and economic empowerment in developing countries: they instil basic democratic values and methods; foster self reliance through collective action; and shape relationship between institutions and civil society that encourage participation and conflict resolution.

Now a day, agricultural and rural cooperatives are facing new challenges in response to institutional restructuring, rapidly changing technology, and the rapid concentration of the agro food industry. Not unlike other cooperative organizations, agricultural and rural cooperatives sometimes fail as cooperatives, disenfranchising their members, even though they may be viable businesses. Members' interests may be increasingly non-homogenous so that leading process becomes more difficult (Fulton M, 2001). At the same time, there is evidence that co-operative conversions are rarely members-driven indicating the need for greater cohesion between members and leadership interests. Generally speaking, agricultural cooperatives face numerous challenges, since they serve more than one purpose, often with a transaction. Multipurpose cooperatives have multi-dimensional objectives and management of diverse, multipurpose organization is that much more difficult (Cook, 1994).

Within this context, leading cooperatives would benefit from innovative strategies that incorporate leadership skill in to different areas decisions. In Ethiopia, Cooperatives are challenged by problems sourced from different angles: low capacity of cooperative leadership and management, inadequate capacity building support by agencies, literacy gap from the cooperative leaders, and low interest of the management committee due to low incentives (Bezabih E.2012). In fact, leading a cooperative is not easy task; it will be challenging and difficult. It involves not only managing resources and business operations, as in other businesses, but also dealing with problems stemming from the cooperative's distinctive characteristics.

Different writers and scholars of the field have justified the cause for the poor performance of cooperatives in Ethiopia from different perspectives. The causes are interventions at local level, rampant embezzlement by the leadership, weak and passive management, and lack of access to credit, illegal and unethical competition from private traders (GRSO, 1990). It is also noted that poor member participation, poor leadership, poor accounting and record keeping system, poor bargaining power are common problems that sluggish Ethiopian cooperative movement (Chogo,

2008). All writers mentioned leadership problem inter alia contributing to low performance and in efficiency of Ethiopian cooperatives. Cooperative leaders in the country were identified as weak, passive and ineffective. Since leadership plays a significant role in voluntary member drive organizations like cooperatives, it is crucial to answer the question why cooperative leaders are inefficient, weak, and passive by identifying different variables associated with cooperative leadership skills. Therefore, the study on determinants of leadership skills among the board of directors of primary multipurpose cooperative societies was initiated.

2: Statement of the Problem

Cooperative organization is one form of social enterprise and considered as a mechanism for country's economic and social development (Prabhu, 1999). The cooperative model is utilized for all kinds of social and economic enterprise. It also agreed by scholars the importance of cooperative as a mechanism for social and economic growth for many countries worldwide. Especially, for country striving to escape from poverty the expansion of cooperative society has dramatic implication in changing the living standards of members and citizens (Befikadu B, 2009). In order to survive and serve their members, cooperative organizations need to have a strong, dedicated and vibrant leadership with basic leadership skills. Because it is believed that above all the successes of cooperative societies depend on the skill level of leadership they possess. But, today's cooperative leaders are facing many competing forces which emanates from stakeholders interest, democratic nature of cooperative organizations, and competitive environment in order to reconcile these competing forces, cooperative leaders should recognize and incorporates cooperative practice with its own professional people centered ethic as core part and with cooperative principles and values as fundamental to its practice.

Cooperative leaders must recognize their leadership role as one of "Servant Leader", whose source of power comes from their superior professional qualification and skill but from the cooperative purpose for which their leadership is exercised (Devis, 2004). In countries where cooperative movement is weak and ineffective, the absence of dynamic leadership is one of the major causes (ICA, 1963). These indicate that there is strong and direct relationship between cooperative leadership skill level and cooperative performance. Because members mobilization, internal harmony, better external relation with the government institutions, key suppliers & promoters and generally overall smooth internal & external relationship of cooperative organizations are depends on leadership skill of cooperative leaders. On the other hand, the issues in cooperative organizations such as board of member's manipulation, weak leadership, poor supervision, mismanagement, financial outrages and failure of democracy have been revealed by scholars (Banishree Das, 2006). As a special purpose of organization, cooperative need effective board members to lead the cooperative and their members. Reflected in the issues, it is suggested to encourage effectiveness and skilled board of directors in managing cooperative. But, what are the effective leadership skills to be practiced for cooperative? What factors determine the leadership skills of board of directors of cooperatives are not yet known owing to dearth of empirical findings in the context of Ethiopia in general and study area in particular? Hence this study was undertaken to answer the intended research questions.

3. Empirical studies on determinants of leadership skills in cooperatives

Franklin (2006) categorized all factors affecting leadership into four major types. They are: leaders related factors, follower related factors, organizational related and external factors. The

leader related factors are those factors originated from the leaders personal characteristics. These are the leader education, Behavior and leadership style (Franklin, 2006). Those factors can determine the cooperative leadership skills. The other factors are follower related factors, are those that out of followers that mean members in cooperatives situation. Member's relationship with leaders can determine the effectiveness of leadership in cooperative organizations. Organizational factors that affect the effectiveness of an organization are significant to organizational characteristics. The nature of task performed, linkage among committee members and incentive policy of the society are the major ones. Every organization has its own internal policies and capabilities up on which the payment and benefit depends. The nature of the task performed in an organization also determines the type of technology needed to perform the task. The degree of the functional interdependence among the different departments of cooperative organization, enhance the extent of exchange of ideas and experiences through training enhances the effectiveness and quality of the task performed and thereby contribute to the quality of the leadership. The External and environmental factors like government interference and extent of competition from outsiders (especially private organizations) can also determine the quality of leadership in cooperative organization, so that part of the factors are included in the study.

Dwaraki and Subburaj (1990) in their analysis of the factors promoting the selection of cooperative leaders in Tamil Nadu (India), identified factors that affect leadership as; size of land holding, social participation, knowledge of cooperatives, participation of cooperative organization and preferred leadership attributes.

Perusal of available literatures on leadership and related aspects, it is understood that there are few studies undertaken in the field leadership skills in general, and in particular to cooperatives, and that too conducted in other countries. No attempt has been done to analyze determinants of cooperative leadership skills in Ethiopian context. The researcher found this research gap, and investigation was made to analyze the determinants of leadership skills level among multipurpose cooperative leaders.

4: Objectives of the Study

The main objective of this study is to assess the determinants of leadership skills among the board of directors of primary multipurpose cooperatives societies in Gambella Town.

5: Methodology

As the study is empirical in nature field survey method was adopted. The study population includes all the board of directors and control committee members of the sample primary multipurpose cooperatives in Gambella Town.

5.1: Sampling design

As far as sampling design is concerned, two stage sampling technique was used. At first stage, primary multipurpose cooperatives in Gambella town were selected purposively as study unit as these cooperatives are found more in number in the Region as well as in the town. At present there are 31 PMCs in Gambella town. But, among these the researchers' selected 16 cooperatives that were only established before or in the year 2005 E.C. These cooperatives are spread throughout 5 major Kebeles (Villages) in the town. At second stage, 128 total numbers of BODs and control committee in these cooperatives that stood to be 80

and 48 respectively (Table 1) had been selected by census basis representing PMCs in all Kebeles of the town.

TABLE 1: SELECTION OF BOARD OF DIRECTORS

No. of Kebele	Sample PMCs	Male BoDs	Female BoDs	Male Control Committee	Female Control Committee	Total Respondents
Kebele 1	02	10	00	06	00	**16**

Total	**16**	**66**	**14**	**43**	**05**	**128**

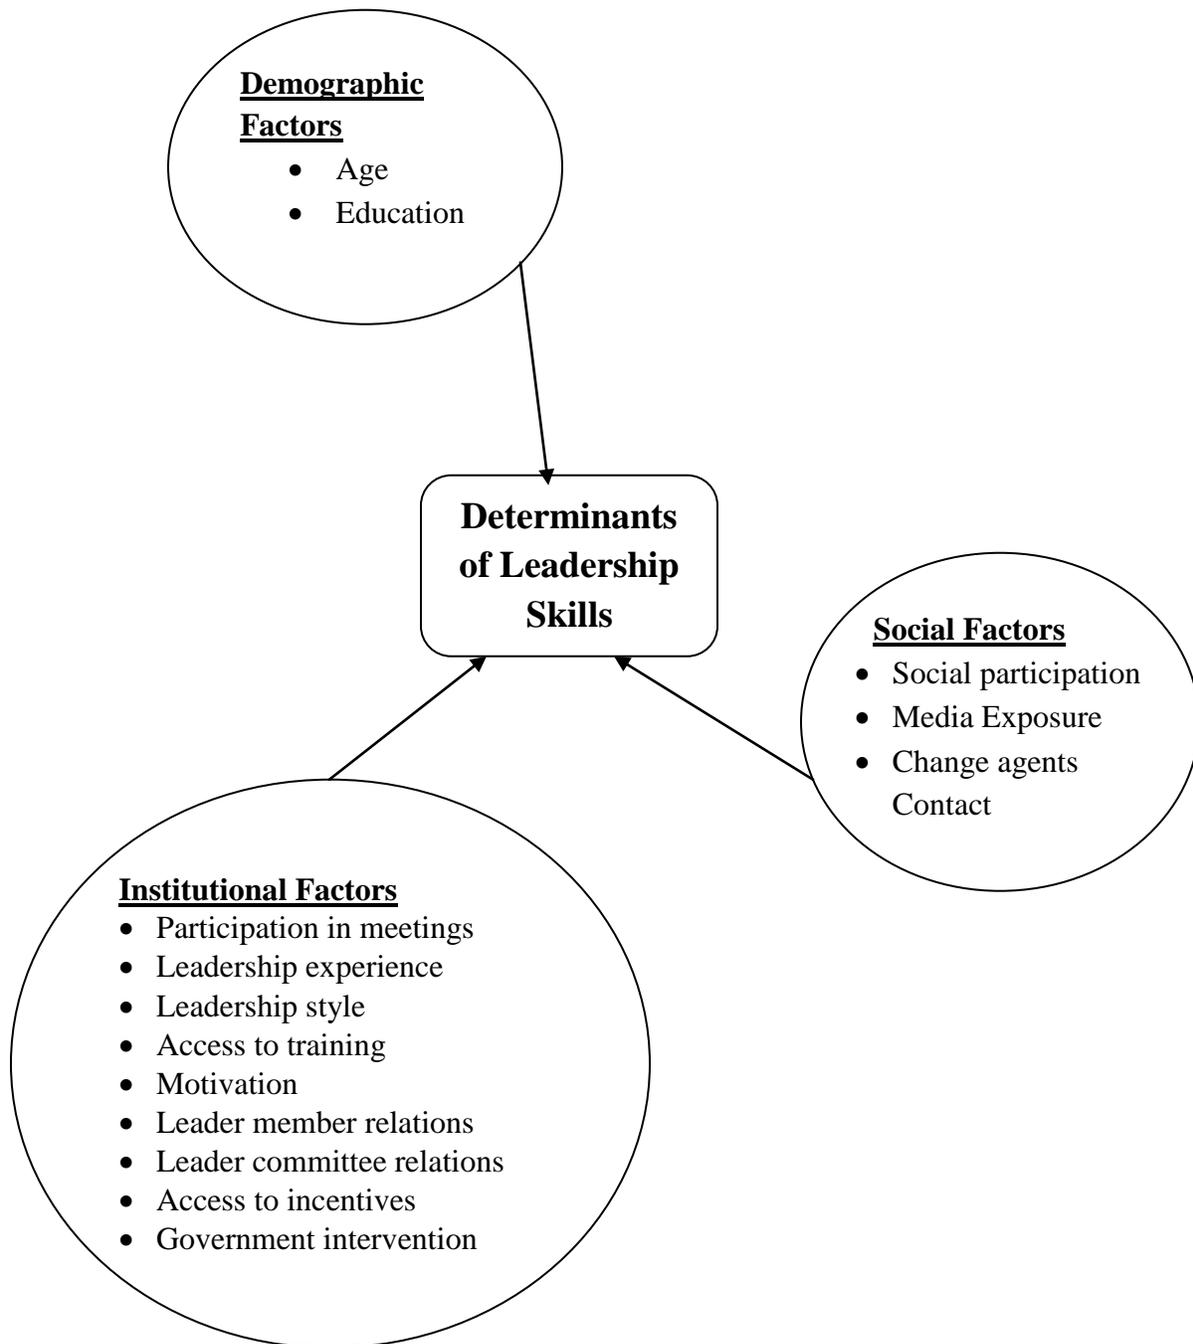
Source: Gambella Town Agricultural Development Office, 2016

5.2: Sources of Data: For this study purpose, both qualitative and quantitative data were utilized from primary data source. Primary data was generated by distributing questionnaire to the respondents.

5.3: Tools and Methods of Data Collection: A well structured questionnaire was used to get the needed information from the board members and control committee members of the selected primary multipurpose cooperatives. The questionnaire was pretested on other cooperatives in the same area to control the clarity of the questionnaire to those leaders for whom the real questionnaire was prepared.

6: Method of Data Analysis

Data collected from selected respondents were organized in such a way that quantitative data were analyzed using descriptive statistics through the use of the statistical software called SPSS. In order to assess the determinants of leadership skills among board of directors, binary logistic regression model was used.

Figure 1: Analytical framework for determinants of leadership skills


7: RESULTS AND DISCUSSION

To assess the determinants of cooperative leadership skills, first the relationship between independent variables and dependent variable was analyzed one by one using *Chi-square* test in order to identify their independent relationship.

TABLE 2: RELATIONSHIP BETWEEN INDEPENDENT VARIABLES AND THE LEADERSHIP SKILLS

Independent variables	Leadership skills	
	χ^2 cal	P value
Age	40.185	0.000
Education	52.193	0.000
Participation in committee meetings	10.966	0.061
Leadership experience	57.587	0.000
Social participation	65.736	0.000
Media exposure	70.282	0.000
Contact with change agents	69.096	0.000
Leadership style	06.875	0.083
Access to training	16.439	0.011
Motivation	10.639	0.065
Leader member relations	91.909	0.000
Leader-committee relations	72.876	0.000
Access to incentives	02.620	0.106
Government intervention	65.987	0.000

Source: Field survey, 2016

It is evident from Table 2 above that the association between each independent variables and dependent variable was conducted by cross-tabulating each predictor variables against the outcome variable. Determining variables were categorized under different factors and they were analyzed one by one using *Chi*-square test in order to identify their relationship with leadership skills. For this purpose fourteen relevant independent variables were identified through review of literature and tested one by one using *Chi*-square test. Among them eleven variables were also found to be significant and further examined their cumulative effect by binary logistic regression.

In order to further examine the relative importance or net effects of each independent variable binary logistic regression was carried out. Before using the model, multicollineority problem among the independent variables was tested using contingency coefficient and it was found that there was no such problem among the variables.

TABLE 3: OMNIBUS TESTS OF MODEL COEFFICIENTS AND MODEL SUMMARY

Chi Square	Df	Sig.	Cox & Snell R Square	Nagelkerke R Square
130.6***	11	.000	.483	0656

Source: Field survey, 2016

The *Chi*-square result (χ^2=130.6, df=11, p<0.001) from the model summary in the Table 3 above indicates that the overall model is significant when all independent variables (age, education, leadership experience, social participation, media exposure, contact with change agents, access to training, leader member relation, linkage between committees, access to incentive and government intervention) are entered. The "pseudo" R^2 estimates indicates that approximately 65.6% of the variance in leaders leadership skills can be predicted from linear combinations of the eleven independent variables.

According to binary logistic regression output in the Table 4 shows that, out of eleven variables which were included in the model, six predictors were found to have significant effect on leadership skills of cooperative leaders. Furthermore, since it has no value to present insignificant variables (education, social participation, contact with change agents, linkage between committees and access to incentive) the following few paragraphs describe only the significant variables.

Age of the Leader: This variable has a significant negative influence on leadership skills at 1%. As the age increases by one year, the probability of giving good leadership skills to the society will decline by 0.449. This is because the older the age of the leader, the less they are active in managing the affairs of cooperative. Even though elder leaders had ample life experience that is beneficial for the societal decisions, the success of modern cooperative management inclined towards leaders who are active in shouldering responsibility and tasks of the organization. It was confirmed that historical background of cooperatives movement in the past regimes that was based on compulsion and coercion also created a "bad image" in the minds of the senior parts of the society (Zemen, 2005).

TABLE 4: THE EFFECT OF INDEPENDENT VARIABLES ON THE LEADERSHIP SKILL

Independent variables	β	S.E	Wald	P Value	Odds Ratio
Age	-0.8000***	0.294	7.400	0.007	0.449
Education	0.496	0.280	3.121	0.077	1.641
Leadership experience	0.713*	0.301	5.615	0.018	2.040
Social participation	-0.349	0.280	1.556	0.212	0.705
Media exposure	0.819**	0.298	7.564	0.006	2.268
Contact with change agents	-0.171	0.301	0.324	0.569	0.843
Access to training	0.764*	0.333	5.254	0.022	2.147
Leader member relations	-1.150***	0.268	18.479	0.000	0.317
Leader-committee relations	0.186	0.315	0.347	0.556	1.204

 *** Significant @1%level; ** Significant @ 5% level; * Significant @ 10% level

Leadership Experience: The number of years leaders worked as cooperative leaders has a positive implication on their leadership skill at 10%. The odds ratio result of the logit model shows that an increase in year of leadership experience will increase the probability of success in leadership skill by 2.040. In line with this finding, Franklin (2006) argue that experience had over guides for decision making through helping decision makers to discriminate and generalize past situations in their process of decision-making. In cooperative organizations, the duration limited to be 3-6 years in the Proclamation (FDRE, 147/1998) would hamper the probabilities of using genuine leaders.

Media Exposure: It has a significant positive influence on leadership skills at 5%. As the

frequency of exposure to mass media increase by one unit, the probability of rendering good cooperative leadership skills marginally increased by 2.268. That means the more the leader has exposure to mass media, the more the leader have information to make conscious decisions. Because mass media create awareness among the leaders about the market price for their products, business opportunities in the environment and other aspects regarding the direction of the government and other aspects that are important to uplift their decision making capacities.

Access to Training: Cooperatives are managed specially at primary level by group of dedicated leaders who are willing to serve their members at free of cost. In relation to this finding, the logit model shows that, access to training has a positive influence on leadership skill at 10%. Thus, getting training would increase the probability of success in cooperative leadership skills by 2.147. This was due to the fact that lack of leaders training in critical areas, such as how the cooperatives perform their role, responsibility, duty, function, business management skills, financial management and general administration would contribute to poor leadership skills.

Leader Member Relations: Leader member relationship has a significant negative influence on cooperative leadership skill at 1%. That means an increase in the level of relationship among leaders and members by ten units; it will decrease the probability of success in cooperative leadership by 0.317. Since, the more the leaders have a close relationship with their followers, the more the chance to depend on existing good relationship rather than on their leadership skills. Therefore, as to the findings of this study only moderate level of relationship is required so as to deliver an effective leadership skills in cooperative enterprises.

Government Interference: This variable has a positive influence on cooperative leadership skill at 1%. That means increasing the degree of government genuine participation would increase the probability of success in cooperative leadership skill marginally by 3.068. Genuine participation of government is important to cooperative especially in the areas of training, financial and administrative assistances although it contradicts.

8. CONCLUSION

Concerning the factors that determine leadership skills, the binary regression model shows that leader's age, leadership experience, media exposure, access to training, leader member relations and Government interferences are the major significant determinant factors that affect the leadership skills in the selected primary multipurpose cooperatives of Gambella Town. The variables such as leader's age and leader member relations have negative influence on leadership skills. While leadership experience, media exposure, access to training and government interventions have positive significant influence on leadership skill.

9: RECOMMENDATIONS

1. The cooperative agency at the Regional and Zonal level need to provide continuous, reasonable and standardized trainings to improve the existed undesired conditions of leadership skills and qualities among cooperative leaders. Besides this, the cooperative change agents need to undertake a serious follow up on cooperatives through inspection, auditing and legal advices.

2. The concerned authority for cooperatives' growth and development must also create strong and continuous trainings for cooperative leaders in order to improve their existed lower understanding levels about cooperative leadership attributes, functions and roles for modern leadership development in cooperatives.

3. For better quality and skillful leadership the multipurpose cooperatives' members must take the age of leaders in to account when they go for election to choose matured and skillful leaders for reasonable decision makings.

4. The multipurpose cooperatives need to take in to account the significance of leadership experience for leadership positions and must elect their leaders based on this criterion.

5. The cooperative change agents need to inform the cooperative leaders seriously about the advantages of regular follow up of media for cooperative business and leadership skills development in multipurpose cooperatives.

6. The cooperative leaders need to understand thoroughly about the importance of strong and close linkages with cooperative members. But, when they relate to the members they should realize that, the more they relate to the members, the more chance for them to lose full confident on their leadership skills during decision making.

FORMATION OF UZBEK TAX AND CUSTOMS TERMS (ON THE EXAMPLE OF MATERIALS ON THE HISTORY OF LANGUAGE)

Habibjonov Ikromjon Toshpolat Oglu*

*Fergana Regional Branch of Uzbek State Institute of Arts and Culture,
Kokand, UZBEKISTAN

ABSTRACT

This article deals with the formation, development and application of Uzbek tax and customs terms. The role and importance of field terms in the system of Uzbek linguistics is briefly described. At the same time, the article describes the ancient ways of formation of Uzbek tax and customs terms.

KEYWORDS: *Terms, Tax, Taxation, Custom, Fine, Lexeme, Language And Speech, Source.*

INTRODUCTION

Language covers all spheres of social life, which it uses as a social phenomenon [1], and at the same time is associated with them by naming and naming concepts of socio-economic, political-cultural and other aspects. "There are words in the possibilities of language that, as a separate semantic field, arise and live in direct connection with science, with the development of science, with innovations and changes in science. It is well known that such words are referred to as terms and serve science. Because the "life", "activity", "creativity" of science is through the term, by the term. The term is a weapon of science's struggle, a weapon of creation, a weapon of life, its existence" [2].

Each language also has levels and sections that are manifested by their own means of expression. In particular, the expressive units of the phonetic level are vowels and consonants, the expressive units of the lexical level are lexemes and phrases. While suffixes that differ in their different functions are a unit of morpheme level, a phrase, sentence, text is a unit of expression of grammatical level.

It is known that lexemes and phrases as the units of the lexical level of a language have been the object of many studies. In Uzbek linguistics, lexical level units are sometimes studied as words, sometimes as lexemes, sometimes as phrases, sometimes as phrases or phraseologisms. In particular, in the system-structural research and linguistic literature it can be seen that the terms

lexeme, phrase or phraseology are used differently instead of words [3]. In another literature, the terms lexeme-shape and phrase-shape are used [4].

Nowadays, when the distinction between language and speech phenomena is recognized, the distinctive study of language and speech units certainly justifies itself, avoiding the confusions that lead one away from the essence of the linguistic object during research. Therefore, in our linguistics, language and speech units are studied with significant differences. In this regard, the terms lexeme and phrasema are used as a unit of language in contrast to a word and phrase that is a unit of speech.

The formation of some terms in linguistics has been briefly discussed above. We conduct research here, distinguishing between the formation of terms and the formation of terminology. It is well known that term formation begins before the formation of terminology. As a particular group of terms begins to take shape, so does the terminology of the industry. Indeed, terminology does not occur with one or two terms. Terminology consists of a set of a certain number of terms that have been named to a defined group of sectoral concepts.

Main part

Other units of language, including terms, have their own history of emergence and formation. In linguistics, terms that are distinguished as scientific and professional terms are also considered lexical level units, which, depending on their structure, consist of one lexeme or two or more lexemes. Tax and customs terms, which are the object of our research, are also specific units of the lexical level of the Uzbek language and have a long history of formation and emergence. From the time of the emergence of trade, law and order, state relations in general, our ancient ancestors began to look for different ways of order, learned to regulate trade and economic relations with certain rules. In particular, as a result of the emergence and development of inter-tribal, inter-ethnic, inter-ethnic trade relations, a large part of the tax and customs terms began to emerge.

The tax and customs terms used in the history of the Uzbek language are khiraj, tanobona, moli bogot, karakonak, honachini (hojayni, uyina), kutvali, korkuboni, koh, zahira, sobun, molu jihat, yasak, olpon (tribute), inonchgiri, harbuza puli, cotton money, koknor (poppy money), muhassal (muhassilona), cocoon, isor, dudi (smoke fee), falijat, madadi, salomona, tuyona, osyobona (and juvozxona), naqarachi, harj, ulufa, alaf puli, muhassali mol, haqqi tavliyat, dahiy yazdah, dahiy nim, jashn, mirabona, aytarchi, narachi, savsan, chodir puli (tent fee), shukurchi, yurtchi, yadachi, tushakchi, chirokchi, karnaychi, jonqari, taghor, dorugali (k), boj, barot, avorizot, etc. possible [5].

Our observations show that some of these terms were created specifically for the concept of taxation, while others were created by specializing the meanings of Arabic, Persian, Arabic-Persian, or pure Turkish words.

One of the researches on the formation of Uzbek tax and customs terms says: "Some sources state that the first appearance of Uzbek tax and customs terms dates back to the VII-VIII centuries. Because the conquest of the territory of Movarounnahr by the Arab caliphate in the VIII century led to a radical change in the socio-economic system here. Islam embraced all aspects of the life of the people of the region, domestic and foreign trade relations. The biggest reform of tax and customs activities after the Arab conquest was the introduction of a single tax

payment - "zakat". Because paying zakat was one of the "five pillars of the religion" in Islam, such as praying and fasting [6].

We can add to this that even before the Arab conquest of Movarounnahr or Central Asia, there must have been tax policy or practice, various duties. Therefore, the roots of the first formation of tax and customs terms should be traced back to the pre-Arab conquest.

After the conversion of the people of Movarounnahr and Khorasan to Islam, the existing tax policy and customs activities began to be adapted to Islamic rules - the rules of Sharia, new forms of taxation or customs were introduced. During the years of the Arab Caliphate, new types of taxes were levied on the population. The term zakat originated in this context. For example, "the population paid taxes to the state - maran and zakat tax - because they grazed their cattle on pastures belonging to khans and beks. ... Over time, this levy has become a mandatory type of property tax, and special officials have been appointed by the state to collect it. Such people are called amil or omil (factors)" [7]. The chief of the omils or zakat collectors was called zakat collector kalon, i.e. the superior zakat collector, and he lived in the ark (castle), i.e. in the capital. Zakat (zakat savoyim) is levied in the form of money or in kind from the areas engaged in animal husbandry. Zakat chana is a non-Sharia tax imposed on local rulers, governors, kings and ministers" [8].

The term khiraj is also a derivative term and has been used since the time of the old Turkish language. A. According to Juvonmardiev, rent was one of the main taxes, sometimes referred to as "goods." The rent tax was a tax levied on the land set by the ruler, and the farmer paid a certain portion of the harvest as a tribute. The rent was taken in the form of one-third (suls), one-fourth (ruble), one-fifth (khums), depending on the level of fertility of the land [9]. The ruble is said to mean "grain, day", "plug" and "currency" in ancient Russian [10].

It is also necessary to calculate the suls, ruble, khums, which represent the appearance of the tax, as a tax-customs term. We were interested to know if these terms were self or self-contained stratified words, and we determined that: Suls is an Arabic word meaning "one-third", while the Arabic type of husnihat is also called suls [11]. A.Ahmadjanov and A.Kasimov wrote about the term Khums: There are 5 types of taxes in Islamic jurisprudence: Khums, Zakat (loyalty), Khiraj, Ushr, Jizya. These types of taxes are levied based on their established norms. We will discuss this in more detail using the source (here we refer to the book "Kitab al-Kharaj"). Khums (Arabic for one-fifth) is one-fifth of the booty seized by Muslim armies in the Islamic tradition. It was first allocated to Prophet Muhammad (saas), then to the treasury of the caliphs, and the rest was distributed among the military leaders themselves and the armies [12].

In general, although the term khiraj (rent) appeared in the Uzbek language long ago, the amount of tax it meant varied according to historical circumstances. In Uzbek, there were also the terms dahi du, nimni, dahi nim, which signify other forms of khiraj. In particular, let's take the Tajik terms dahi du, dahi nim. The term dahi du means that twelve tenths of the harvest from the land, and the term dahi nim means half the tithe of the harvest [13].

Another form of khiraj is the Arabic word ushr, which means "one-tenth" [14]. Ushr is one-tenth of the income [15]. The same tax was called in the Persian-Tajik dahyak in the territory of the Bukhara Emirate, and the term also means "one-tenth". Some Muslim countries still have a tithe tax. In Central Asia, tithes remained until the beginning of the twentieth century: Therefore, giving zakat is under the rule of ushr and khiraj [Burhaniddin Marghinoni, 2001, p. 341] [16].

Another type of duty is tanobona. According to the National Encyclopedia of Uzbekistan and the structural analysis of the word tanobona, the tanob is an Arabic word and the -ona is a Persian-Tajik word. The term is not given in the Annotated Dictionary of the Uzbek Language. The term is found in the decrees of Muhammadalikhan in 1245 AH (1829-30), Sayyid Muhammad Khudoikulikhan in 1282 AH (1865-66), Khudoyorkhan in 1285 AH (1868-69) and Nasriddinbek in 1292 AH (1875). According to the decrees, "tanobona", "bogot and bedazori vajhidan ..." [17], in the XIX century, this tax was levied on gardens and barren lands. However, the amount of this tax is not clear. According to P.P.Ivanov, during the reign of Abdullah (16th century) in Bukhara there was also a tax on gardens [18].

Another tax or customs duty levied on the crop is called a moli bogot. The term has an Arabic-Persian content and is applied to the tax levied on gardens. For example, one source writes about the property garden: "It is found in the documents given by Abdulmuhammad Khan to Sayyid Zahid in 1011 AH (1602-03), and in the documents given by Sayyid Muhammad Khudoyquli Bahadir in 1282 AH (1865-66), Khudoyarkhan in 1285 AH (1868-69) and Nasriddinbek in 1292 AH (1875) to Sayyid Jalalhoja" [19]. As can be seen, this term is an additive compound with Arabic-Persian content. Such Persian and Arabic terms were widely used during the Kokand khanate.

Boburnoma also uses old Uzbek tax and customs terms. For example, there are tax-customs terms such as shaqdar (tax collector), barot (exemption document), doruga, tiyul, tarkhan, ushra [20]. For example, while we were here, we heard that Sultan Ibrahim, who was standing on this side of Delhi, had left and was moving forward, and that Hamid Khan, the ruler of Gissar Feruza, was approaching Gissari Feruza with his army and his army from Gissari Feruza [21]. Or: From here on the eighteenth of the month, Monday night, we sent Tahir to Agra. He took away a bar of money spent on hospitality from Kabul. " The term Barot meant "tax exemption" as well as "a separate tax document issued by the rulers" [21].

The Boburnoma also defines the term mirokhor as "an official who controls rents and other income" [23]. But the term tiyul cannot be considered a tax-customs term because there is no relevance to the concept of tax or customs in the semantics of the word. The term appears in the Boburnoma as follows: Kutlug stayed in Khoja's tiyuli at night, and the next day he reprimanded him for leaving him and repented [24]. O. Tursunova defines the term as "property given for life for service" [25].

According to the historical literature, in the state of Amir Temur there were also taxes or levies called property-khiraj, khiraj, sovarin (peshkash), konalga, shilon puli. For example, "Temur's Statutes" (I also ruled that the emirs and commanders should not demand excessive riding, landing and shillings from the citizens when collecting property) [26] and "Giyosullugat" [27] states that property is a tax paid in cash and in kind, appeared in connection with the naming of the type of tax levied on the property of persons in the history of the language. According to A.Juvonmardiev, the word jihad in this term, which consists of Arabic words, means "side, side", "cause, excuse" and "salary" in Arabic; jihad is the object of taxation. The term is also used in the works of Ailsher Navoi: Solis erur farz adoni zakat, Haq neki bermish sanga molu jihat (Hayratul abror).

CONCLUSION

In short, the roots of the formation of Uzbek tax and customs terms go back to the ancient Turkic language. A significant part of them emerged on the basis of Islamic beliefs during the Arab Caliphate. Therefore, in the structure of tax and customs terminology of the Uzbek language there are Arabic terms. Since the Uzbek people have lived side by side with the Tajik people since ancient times, there are many elements of Persian-Tajik language in our language. A number of lexemes within this lexical richness had specialized meanings as expressions of tax-customs concepts. In turn, the all-Turkic or pure Uzbek tax-customs terms are numerous in number and have existed throughout the historical development of the Uzbek language.

SOME ISSUES OF DIRECTING STUDENTS FOR INDEPENDENT SCIENTIFIC RESEARCH

Husanov Ahmadjon Jurayevich*

*PhD,
Kokand State Pedagogical Institute,
Kokand UZBEKISTAN

ABSTRACT

In today's era of advanced science and technology, the main task of professors and teachers of pedagogical universities is to train highly qualified teachers for the education system of the country. The teacher must be a creative, innovative person who has mastered science and science, values. It is not enough to have a deep knowledge of specialty sciences, pedagogical and psychological knowledge to teach. The teacher must be a person who has the skills to conduct research, has a thorough knowledge of research methodology and techniques, can teach students to think creatively in different areas, modern worldview in science. This article discusses the problems of directing students to independent scientific research and their solutions.

KEYWORDS: *Scientific Research, Independent Thinking, Creative Thinking, Student, Research Methodology and Techniques*

INTRODUCTION

The main task of professors and teachers of pedagogical universities is to train highly qualified teachers for the education system. A teacher is a creative person who possesses the knowledge and values created by man. It is not enough to have a deep knowledge of specialty sciences and pedagogical, psychological knowledge to teach. The teacher must be a person who has the skills to conduct research, well-versed in research methodology and techniques, able to teach students to think creatively in different areas, have a modern worldview in science. In order to form a teacher of this status, it is important to continuously train masters and bachelors of pedagogical schools to conduct research work. Students' research work, in turn, serves as an important factor for them to acquire a comprehensive, deep and solid knowledge. The state is faced with the tasks of further improving the research work of students, creating favorable conditions in universities for the training and development of future teachers, practitioners with higher professional

education and high qualifications. The solution to this problem is especially important in connection with a noticeable increase in the age level of the teaching staff and scientific personnel working in universities, and a violation of the continuity of generations. In recent years, due to a lack of financial resources, higher education has lost a significant part of its teachers, primarily young and promising ones.

Main Part

Research work of students in pedagogical institutes is carried out mainly in the professional-pedagogical, educational and scientific direction. In order to direct students to research work, it is necessary to pay special attention to the implementation of the following tasks:

- Development of students' desire and interest in a creative approach to independent research, research activities, educational work;

- to form the ability to consciously and creatively approach the specialty, ie the programmatic knowledge being studied, and to develop skills in this area;

- Improving the skills of working with and analyzing literature and other scientific sources;

- To teach students to see the problems in the field of educational work, as well as special disciplines, and to improve their skills and abilities to conduct research in these areas;

- To teach students to use research methodologies and techniques for the organization of independent work.

Scientific research is the process of developing new scientific knowledge, the form of implementation and development of science, the assessment of the impact on objects of various factors and, at the same time, the study of the interaction between phenomena in order to obtain convincingly proven solutions useful for science and practice [1].

The goal of the study is defined as the exact mechanism for integrating various actions into the "goal - means - result" system.

Research work carried out by students in pedagogical universities is organized in two directions: a) research work related to teaching, ie teaching and research work; b) research conducted outside the classroom.

Training-related research includes:

- study of research work in laboratory classes;

- Collection of experimental and experimental materials for practical training in academic disciplines;

- To be able to critically approach additional literature on Uzbekistan and abroad;

- Writing abstracts, term papers and lecture notes on the basis of specific topics and research materials;

- have the ability to conduct individual or group research on teaching assignments during pedagogical practice;

- Course, graduation - performance of qualifying work in the field of experimental research.

In the process of teaching students general and theoretical physics courses, they need to form and develop both theoretical and practical thinking [2]. Thinking is done using logical operations such as analysis, comparison, analysis and synthesis, abstraction, generalization and specialization, summarization. Conclusion leads to judgment.

It should be noted that:

- articulate the purpose of the research clearly and definitively;

- development of a hypothesis based on previous theoretical and experimental studies, but with a new idea;

- determination of research methodology;

- identification of key areas of research;

- conduct research in accordance with the identified methodology and structured plan;

- accurate and concise description of the results obtained;

- it is important to remember that the conclusions are consistent and expressive as a system.

In the teaching of general and theoretical physics courses, it is advisable to devote time, albeit briefly, to the topical issues of modern science and technology in lecture classes. On the basis of this method, it is possible to distinguish interesting, intelligent, talented students from the masters and bachelors by focusing on the current issues of the phenomenon under study, organizing the reaction of students to them. For example, the topic of thermocouples can be used to create thermocouples and autonomous power sources from semiconductor thermoelectric films. can be used as sources; When discussing the diffraction of X-rays, it is useful to study the internal structure of the crystal, to calculate the crystallographic size of the crystal with diffract meters and to form students' scientific worldview with information such as its role in science.

It is necessary to involve students in all aspects of work related to teaching in pedagogical universities. The direction of scientific and methodological research includes the analysis of modern disciplines, ie the application of new pedagogical and information technologies and methods of evaluating the effectiveness of these methods on the basis of criteria, preparation and preparation of abstracts, methodical reports, coursework, dissertations.

It is advisable for the teacher to direct the gifted students to the following work in the preparation of theses for the conference. Especially in physics;

1. Orientation of students to the preparation of scientific and methodological articles on the basis of knowledge acquired in general and theoretical physics courses:

- to inform students about the scientific and methodological work carried out to date in the course of the studied specialty;

- provide students with information about the list of scientific and methodological works and journals studied and published in recent years;

- To give advice to those interested in scientific work on how to write scientific and methodological articles.

- 2. Creating conditions for talented students interested in scientific work to participate in scientific, methodological and practical conferences:

- creation of a set of scientific, methodological topics for conferences;

- offering topics to gifted students from the very beginning;

- assist students in making plans for lectures on selected topics;

- to teach the preparation of short reports on the basis of prepared lectures and to give continuous assignments in this direction.

- The development of ways to educate students to carry out the above work is entrusted to professors and teachers of specialty subjects.

Talented students interested in research should be reminded and instructed by their supervisors:

- timely preparation of scientific articles, abstracts for the conference;

- When preparing a scientific article, lecture notes for the conference, students should pay special attention to the relevance of the chosen problem, the theoretical basis, the scientific nature of the topic, its practical application;

- practical application of theoretical knowledge.

CONCLUSION

The main objectives of the directing students to independent scientific research studies are: increasing the level of professional training of students based on the development of their analytical and creative abilities, the formation of scientific systems thinking, as well as the identification of talented and gifted students who are able and willing to engage in research activities in laboratories and other scientific departments of the university with subsequent their transfer to postgraduate studies. When applying theoretical knowledge in practice, students should prepare accurate and complete information on the application of theoretical knowledge in practice. In particular, the practical application of the theoretical knowledge obtained on each topic should be indicated. There are sufficient conditions for the implementation of the above instructions in pedagogical universities.

ABSTRACT

The forces of influence of oil-gas flow on the elements of the device, which transform the structure of the flow, were defined, as well as the mass of pipe socket and geometrical dimensions of the slots of the device, depending on hydro-dynamic parameters of gas-oil flow.

KEYWORDS: *Operation, Research, Implementation, Impact, Water Hammer, Pressure Change, Speed Change.*

INTRODUCTION

Protection of atmospheric air from pollution by industrial emissions is an urgent problem. One of the leading areas of environmental protection work is a detailed study of sources and processes of air pollution. Distinguish between natural and artificial (anthropogenic) sources of atmospheric pollution. Artificial pollution of the atmosphere is typical mainly for cities and industrial areas. [2], [12]

As you know, the development of the oil industry in recent years has been taking place against the background of a noticeable deterioration in the structure of oil reserves, which is mainly associated with the significant development of many unique and large highly productive fields and their water cut. A decrease in the number of deposits with favorable operating conditions forces the use of various methods of artificial stimulation of productive formations, often leading to ineffective well operation. One of the mechanized methods of well operation is gas lift. The gas-lift method of operating wells is more efficient than pumping methods, since the total costs are about 15% lower than with pumping methods. In this connection, studies aimed at finding ways to increase the efficiency (KPD) of gas-lift technology for well operation are relevant.

At present, there is no sufficiently complete and accurate theoretical basis for determining the amount of gas required to raise a certain amount of liquid, taking into account the interaction of

gas bubbles with liquid and therefore calculations are made in most cases by imperial formulas. The amount of gas calculated according to various imperial formulas varies from 15% to 75%, and in practice it is necessary to use a much larger amount of gas, which leads to a decrease in the KPD of the gas-lift method of lifting liquid from wells.

More than 200 types of ingredients are formed in motor vehicles when fuel is burned. Of these, non-toxic elements that are considered: nitrogen, oxygen, water vapor and carbon dioxide (C O 2). From the list of toxic waste, we will mainly provide 3 ingredients, which are: carbon oxide (CO), hydrocarbons that do not have time for complete combustion CnHm, nitrogen oxides NOx. This article shows the calculation of the emission of harmful emissions from cars during heating and idling. [5]

Various devices have been created in the technology of water, oil and other liquids production in order to efficiently use the lifting energy of the gas phase. In recent years, a new imported technology has appeared in this direction, the so-called daisy-chain flow conversion system (GSSP). The use of GSSP at one of the fields of our republic made it possible to extract an additional mass of oil and reduce the gas factor. At this time, due to the high cost of this technology, as well as due to foreign exchange settlements, further implementation has been suspended.

In this work, taking into account the compressibility of the mixture and the walls of the pipeline, relations are established for assessing the maximum increase in the pressure value in H K T, as well as the time for the shock wave to travel twice the distance between the devices and the time for closing the neck of the branch pipe.

Consider the processes that occur when the neck of a pipe with a flange is suddenly fully or partially closed. Closing of the neck of the branch pipe occurs after a salvo discharge of the accumulated gas from the device and the adoption of the upper position by the branch pipe.

In the case of the same assumptions that were made when considering the acceleration process [1,2], ie non-compressibility of the liquid and non-deformability of the pipe walls, from the equation of unsteady motion at the moment of closing $\square$ cm = 0, therefore, hc = 0 it follows

$$\frac{P}{\gamma_{c\,m}} = H + \frac{P_B}{\gamma_{c\,m}} - \frac{l}{g}\frac{d\upsilon_{c\,m}}{dt}\,.$$

Stopping the flow means that for an infinitely small period of time, the velocity from the final value $\square$ cm has decreased to zero, i.e.

$$\frac{d\upsilon_{c\,m}}{dt} \to -\infty\ \text{откуда}\ \frac{P}{\gamma_{c\,m}} \to +\infty\,.$$

Whence it follows that in the case of an incompressible liquid and a rigid pipe, with the instantaneous closure of the throat of the nozzle, the process of deceleration of the mixture particles propagates at an infinite speed and the pressure rises to infinity, which does not correspond to natural processes. Therefore, when considering the process of stopping the mixture in the distance between the devices, it is necessary to take into account the compressibility of the mixture and the deformability of the pipe walls.

If before stopping the mixture was moving at a speed of □ cm, then at the moment of closing the particles of the mixture located near the upper end of the nozzle stop, and the liquid in the tubing between the devices will continue to move forward by inertia. Moving particles, pressing against particles that stop at the upper end of the nozzle, will cause an increase in pressure, due to which the walls of the nozzle and inverted nozzle expand. This process continues until a certain pressure value, after which the particles approaching the valve stop and the deceleration process propagates in the opposite direction at a certain speed. The processes that occur when a sudden change in the speed of fluid movement is called water hammer, and the propagation of this process through a pipeline is called the propagation of a wave of water hammer.

When the throat of the branch pipe is closed with the remainder of the compressed gas in region 5, a water hammer occurs, the pressure near the throat of the branch pipe and in volume 5 increases and the positive wave with speed a propagates down to the lower device, if the lowest device is considered, then the wave of water hammer moves to the bottom.

When the wave propagates towards the lower device, the pressure in HK T rises, when the wave reaches the lower device (or bottomhole), the pressure in them also increases. When the pressure is balanced, the liquid expands, the walls of the pipeline are compressed to their original values, which had before the water hammer, and the volume of liquid released in this case moves to the lower device (bottom) at the same speed with which the water hammer occurs.

A negative wave appears, which propagates from the bottom device (bottomhole) to the top device. Since the nozzle is closed, water hammer occurs. A new cycle begins, repeating from the original position.

If there were no hydraulic resistances and no gas phase in the liquid in the system, the first cycle would be identically repeated all the time. However, due to the resistance and damping of shock waves in the gas phase, in each subsequent cycle, the pressure and velocity become less than in the previous one, and in the end the process dies out.

According to [3,4], the velocity of propagation of a water hammer wave is determined by the equality

$$a = \frac{a_0}{\sqrt{1 + \dfrac{d}{\delta}\dfrac{K}{E}}}, \qquad\qquad (1)$$

and the pressure increase during hydraulic shock

$$\frac{\Delta P}{\gamma_{\text{см}}} = \frac{a \, \Delta \upsilon}{g}, \qquad\qquad (2)$$

where is the speed of propagation of the hydraulic shock wave; a0 is the speed of propagation of sound waves in an unlimited liquid medium; d is the inner diameter of the pipeline;□ - pipeline wall thickness;K is the volumetric modulus of elasticity of the liquid; E is the modulus of elasticity of the pipeline wall material;□ P - pressure increase;□ □ - the amount of speed reduction in the pipeline causing a shock;□ cm- specific gravity of the mixture.

If the speed of propagation of sound waves in a liquid containing a moderate volumetric gas content at normal atmospheric pressure is taken equal to a0 = 1000 m / sec, the volumetric modulus of elasticity K = 2□ 103 kg / cm2, the modulus of elasticity of steel pipes is E = 2□ 106 kg / cm2, a, then for the water hammer speed we get

$$a = \frac{1000}{\sqrt{1 + 100\dfrac{2 \cdot 10^3}{2 \cdot 10^6}}} = \frac{1000}{\sqrt{1,1}} = 953,47 \text{ м/сек} .$$

The pressure rise during water hammer will

$$\frac{\Delta P}{\gamma_{\text{с м}}} = \frac{953,47}{10} \Delta\upsilon \approx 95,4\Delta\upsilon .$$

Whence it follows that when the flow rate changes by 1 m / s, it leads to an increase in pressure by 95.4 m.

Thus, taking into account the negligible deformations of the fluid and pipeline walls reveals the true essence of water hammer and makes it possible to determine the actual values of the wave propagation velocity and the pressure increase in the system.

With the instant opening of the slots 3 of the inverted glass, the excess pressure instantly drops from the value of H static to a certain minimum. Due to this, the pipe diameter decreases, the liquid expands and the volume of liquid released as a result of these deformations flows out of the device into the tubing at a certain speed U, i.e. there is a negative impact wave moving downward with speed.

The pressure drop causing this wave is equal to $\dfrac{\Delta P}{\gamma_{\text{с м}}} = H$ .Since the change in pressure depending on the change in speed has the form

$$\frac{\Delta P}{\gamma_{\text{с м}}} = \frac{a \ \Delta\upsilon}{g} ,$$

Substituting$\Delta\upsilon$ = U here and taking into account the previous equation, we obtain

$$U = \frac{gH}{a} \ .$$

THE ROLE OF PROSECUTOR'S OFFICES IN THE OBSERVANCE OF THE NORMS OF LEGISLATION IN THE EFFECTIVE USE OF LAND AND WATER RESOURCES

Nodirov Davurkhon Ikromovich*

*Independent Researcher of the General Prosecutor's Office,
UZBEKISTAN
Email id: davurhon@mail.ru

ABSTRACT

It is known that today the agricultural sector plays a special role in the economy of country. For that reason, in this article, the author focuses on the rational use and protection of land resources in the development of the agricultural sector, a number of regulations governing social relations to improve the reclamation of land and prosecutorial control over their implementation.

KEYWORDS: *Land Resources, Land Legislation, Law Enforcement, Prosecutorial Control.*

INTRODUCTION

In Uzbekistan, the rights related to the use of land are guaranteed by the norms of various areas of law. Rely on the Constitution of the Republic of Uzbekistan, democratic rights and freedoms are protected by the Constitution and laws (Article 13), the state guarantees freedom of economic activity, entrepreneurship and labor, equality of all forms of property and equal legal protection, taking into account the supremacy of the rights and freedoms of citizens enshrined in the Constitution and Laws (Article 53), land and other natural resources are under state protection (Article 55)[1]. The stated constitutional provisions are general and guiding norms that play a fundamental role in the protection of land use rights and are a legal guarantee in the protection of land use rights of citizens.

In today's economy and social life, and therefore in our politics, the agricultural sector is one of the most important sectors that determine the well-being of our people, the development and growth of our republic. For this reason, agriculture is of special importance in the Republic of

Uzbekistan, and an in-depth study of the relations associated with agricultural production plays an important role.

RESULTS AND DISCUSSIONS

During the years of independence, the Republic of Uzbekistan has adopted a number of normative and legal acts regulating social relations related to the rational use and protection of land resources, improvement of land reclamation. Land Code of the Republic of Uzbekistan, Civil, Criminal, Tax, Labor, Urban Development Codes, laws "About State Land Cadaster", "About Nature Protection", "About Protected Natural Area", "About Protection and Use of Flora", "About Subsoil", "About Forests". "About administrative responsibility", in addition, the Decree of the President of the Republic of Uzbekistan dated October 29, 2007 PR-3932 "About measures to radically improve the system of land reclamation", June 17, 2019 " About measures for efficient use of land and water resources in agriculture", based on the Decree No.5742, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan, as well as other public administration bodies adopted a number of normative legal acts regulating issues related to the improvement of land reclamation and their rational use.

No matter how well our laws are adopted, the number of cases of mismanagement, illegal, misuse of land resources, damage to them, land protection requirements and non-compliance with agro-technical regulations has not decreased in Uzbekistan. The main causes of these cases can be seen in the following:

- Existence of cases of development and use of new lands without regard to the reclamation of lands;
- There are many hectares of land that require crop rotation, for example, cotton, cereals, but the number of cases of insufficient compliance with the rules is not decreasing;
- Inefficient use of irrigation water in the process of land irrigation;
- Empty application of water-saving technologies and techniques in agricultural production;
- Discharge of untreated collector-drainage and sewage into surface watercourses;
- Excessive use of mineral fertilizers, often in their own interests, even if the level of excessive damage is high;
- Imperfect mechanisms of economic incentives for land and water use, etc.[2]

It is difficult to limit the number of reasons, actually. As we can see, our gradually developing economy has led to a variety of forms of ownership, including businesses, officials and citizens. It is good, but on the other hand, it is sad. For instance, the protection of the rational use of land, which is our national wealth, neglect of their reclamation status, and violations of the rules are common in practice. The main reason for this is the lack of qualification mechanisms, legal awareness and culture of today's landowners in the use of land.

Arbitrary use of land plots in violation of the established goals, unfortunately, occurs at every step. I do not think you have to be an expert to understand the unfortunate consequences of such an unfair approach to the land that feeds us, the source of our livelihood. Indeed, the study of practical materials shows that there are cases of illegal use of allocated lands. These offenses can be understood as non-use of the allocated land for the intended purpose. For this reason, the prosecutor's office is paying attention to the processes of careful treatment of the environment, rational use of nature and land resources, which is becoming one of the key issues in the process of general control over the implementation of laws. There are many examples of negative

situations such as inefficient use of nature and land resources. In particular, according to the results of inspections conducted by the prosecutor's office, during the monitoring of misuse of land, district governor and other officials did not establish sufficient control over the targeted use of land, and some farms allowed other crops to be planted.

The productiveness level of irrigated land has decreased and the reclamation condition of the soil has deteriorated. In this regard, prosecutors carried out control measures in all areas of agriculture, took measures to protect the rights of farmers, the timely and quality of agricultural activities, in general, to ensure the rule of law in the field.

Based on the analysis of existing systemic problems in the sector, a draft concept for the development of the agricultural sector until 2030 was developed in collaboration with the relevant agencies.[3]

The protection of the legal rights and interests of farmers, the provision of legal and practical assistance to them was also under the constant control of the prosecutor's office. In particular, in 2018 alone, with the practical assistance of the prosecutor's office, 13,041 hectares of land, 70,496 tons of mineral fertilizers and 29,619 tons of oil products, 583 pieces of equipment, spare parts worth 2 billion sums, loans worth 83 billion sums were allocated to farms. Practical assistance was also provided in the implementation of agro-technical measures on 88,000 hectares.

During the control measures, the wages of farm workers were collected in the amount of 9 billion 392 million sums, receivables in the amount of 3 billion 749 million sums. In addition to this, 1,972 applications worth 54 billion sums were submitted to the courts in the interests of farmers and farms. As a result of the measures taken, the violated rights of 5,574 people were restored.[4]

The above examples also show that the control over the institutions of land law offenses and legal liability in the mechanism of land use and protection is one of the most pressing issues today.

Therefore, the resolution of June 17, 2019 "About measures for the efficient use of land and water resources in agriculture".

Decree PR-5742 assigned a number of tasks to the prosecutor's office.[5]

In particular, strengthening measures of responsibility for inefficient use of land and water resources in accordance with the "Roadmap" for the implementation of the concept of efficient use of land and water resources in agriculture. In this:

- Strengthening measures of responsibility for land users and arbitrary occupation of land plots, which have led to a decrease in land productivity, deterioration of land reclamation as a result of inefficient use of agricultural land;
- Unlawful interference in the activities of users of the land plot put into operation, as well as strengthening the responsibility for unjustified return of the land plot to the reserve of governments;
- To bring to administrative and criminal responsibility the officials who allowed the allocation of irrigated agricultural lands for other purposes;

- The Prosecutor General's Office of the Republic of Uzbekistan has been entrusted with the task of ensuring efficient and effective use of water, strengthening control over the use of water on the basis of strictly defined limits.

According to statistics, more than 20 million hectares of agricultural land, including 3.2 million hectares of irrigated arable land are used to grow food products and raw materials for the economy. Of course, this is the result of our state's policy of rational use of land and water resources. However, we cannot deny that the periodic water shortages and the deterioration of the main part of the internal irrigation networks have led to the deterioration of the reclamation of irrigated lands and their decommissioning over the years. The land, as a part of nature, is also inextricably linked with other objects of nature, because as a result of the land offense, other objects of nature protected by law are also damaged. These objects of nature are subject to the Law "On the Protection of Nature", "On Water and Water Use", "On Protection of Natural Areas", "On the underground resources", "On the Protection of Air", "On the Protection of Wildlife". It is protected by the laws "On the protection and use of plants", "On the forests". The liability provided for in these laws may also apply to land offenses. The current Criminal Code also contains Article 196, entitled "Pollution of the Environment," which states that "pollution or degradation of land, pollution of water or air causes mass illness of people, death of animals, poultry or fish, or other serious consequences shall be punished by a fine in the amount of one hundred to two hundred times the amount of the basic calculation or deprivation of certain right for up to five years, or up to three hundred and sixty hours of compulsory public work or up to three years of correctional labor.

If those acts cause the death of a person is punishable by deprivation of a certain right and restriction of liberty for one to three years or imprisonment for up to three years [6]. These responsibility measures also serve to prevent every citizen from polluting indirect land resources or water and atmospheric air through misuse of land. The prosecutor's office has departments for monitoring the implementation of legislation in the social sphere, which are responsible for ensuring environmental safety and environmental protection, improving environmental safety, preventing the harmful effects of waste on health deals with the implementation of measures.

CONCLUSIONS

As a conclusion we can note that, in order to ensure the protection and efficient use of land resources, which are our main wealth, first of all, law enforcement agencies need to improve our legislation in accordance with modern requirements and establish liability for land violations specified in our legislation, in particular, to increase the responsibility of the prosecutor's office.

The system of civil law measures should be used effectively in the use of land resources. Land lease agreements should not only specify land use and protection as an important condition of the contract, but also through liability measures for breach of it.

It is also expedient to introduce the subject "Organizational and legal framework for the efficient use and protection of land" in the master's program of higher education institutions specializing in law, as well as in secondary special educational institutions. Another recommendation is the protection of land, the rules of their use, the adoption of special laws on its environmental protection, which should reflect the rights and obligations of all individuals and legal entities.

TECHNOLOGY OF CONSTRUCTION AND CARE OF ALMOND GARDENS ON LANDS WITH INSUFFICIENT WATER RESOURCES IN UZBEKISTAN

Yuldashov Yakubjon Khatamovich*; Namozov Jasurbek Mamarajabugli**

*Professor,
Head of the Department of Forestry,
Tashkent State Agrarian University,
UZBEKISTAN

**Assistant
Department of Forestry,
Tashkent State Agrarian University,
UZBEKISTAN

ABSTRACT

The Republic, almonds are mainly concentrated in the foothill and mountain areas. The total area of natural almonds in the Republic is more than 19 thousand hectares. Almond beating, cultural innovations, and interbreeding are eliminated. Almonds are planted in autumn or early spring in a scheme of 8x8m on the ground and 6x6m (5x5m on the south slopes) in the mountains and foothills. Agrotechnical activities such as watering, fertilizing and shaping will be held in the young garden. The cost of building an almond tree will be fully covered and the net profit will be 14,352,000 sums in 5-6 years, with an average annual income of 18,000,000 sums.

KEYWORDS: *Almond Gardens, Cultivation, Climate, Resources.*

INTRODUCTION

Almond is a southern, subtropical plant. It is mainly widespread in the Mediterranean, Central America, Central Asia. Italy, France, Crimea, Transcaucasia and Central Asia, including Uzbekistan, are the leaders in almond kernel cultivation.

In Uzbekistan, almond is an ancient plant that is found in almost all regions. In our country, almond groves are mainly distributed in mountainous and foothill regions. The soil and climatic conditions of these lands meet the requirements of the almond plant.

Increasing the yield of almonds and the creation of new high-yielding almonds is one of the important tasks facing the forestry staff of the Republic and scientists in this field.

Almonds play a unique role in the forest fund. In Uzbekistan, there are such varieties of almonds as Bukhara almonds, common almonds, Kalmykov almonds, prickly almonds. Of these, the common almond (Amygdaluscommunis) is cultivated because of its greater economic importance than others [3, 4].

Common Almond (Amygdaluscommunis) Almond family (Amygdalus) is a plant belonging to the family Rosacea.

There are tens of thousands of hectares of natural lands in the mountains and foothills of the country for growing almonds, mainly in Bostanlyk, Parkent, Ahangaron districts of Tashkent region, Zamin and Forish districts of Jizzakh region, Nurabad and Kattakurgan districts of Samarkand region, mountain and in the foothills of Fergana valley , Dehkanabad, Shahrisabz of Kashkadarya region, Boysun, Denau, Bobotag regions of Surkhandarya region and other regions.

The total area of natural almond orchards in the country is more than 19 thousand hectares, and their average annual yield is from 2-3 to 8-11 centners per hectare [1, 2].

Almonds are superior to other fruits in terms of their taste. That is why it is widely consumed by the population. Almonds are especially in demand in the confectionery industry. In addition, valuable wood is extracted from the almond tree. These trees are widely used in afforestation and forestry, especially in mountainous areas. We do not have enough almond products to meet the needs of industry and the population. However, especially in the mountainous regions of the country, there are great opportunities to develop the production of almond trees in sufficient quantities for industry.

Agrobiological properties. Ordinary almonds belong to the family of almonds. The height of the almond tree reaches 6-10 m, the branches grow in the form of a pyramid or branched. The root system is very well developed, reaching a depth of 6 meters. Therefore, it is resistant to drought and cold. Almonds do not grow well in poorly ventilated, very moist soils.

Almond flowers often do not bear fruit on their own, as most of the flower is self-pollinated, but if pollinated from the outside, it will produce abundant fruit. In order to produce good fruit, they need to be pollinated from the outside, that is, from different varieties. Therefore, almonds grown alone or of the same variety usually do not produce good yields. Almonds ripen in August or September. The fruit is an almond kernel wrapped in a rind, the rind of which dries and cracks when the kernel of the almond is ripe.

One grain of almonds weighs 0.6-4 grams, depending on the navigation, and the kernel is 12-80 percent. The hardness of the shell also varies depending on the variety. The core is sweet or bitter. Sweet kernels contain 40-70% fat, 20-25% protein and up to 6% sugar. Bitter almonds also contain 2-2.5% amygdalin.

Almond seedlings begin to bear fruit in 3-4 years after planting, yield the most at the age of 12-15 years and begin to bear abundant fruit in 34-40 years. The tree lives up to 60-100 years. The average yield of a single almond tree is 8-12 kg, and in some years 25-30 kg. Almond tree is more resistant to frost and can withstand temperatures of 20-250C in a dormant tree. The growth period is long. It wakes up much earlier than other fruit trees and stops growing much later than

them. His rest period is short. For some reason (when there is not enough moisture in the soil, when the leaves are severely diseased, and in other cases) if the almond tree sheds its leaves early in the fall, with warmer weather it may sprout and bloom until the end of winter. Almond plant is very demanding to sunlight, so its fruit is scarce in places where it grows thick.

Reproduction. From almond seeds, and cultivated varieties are propagated by grafting. The varietal quality of almonds propagated from seed is not well maintained. Bitter almonds are the best seeds for propagation, planted in the nursery in autumn or early spring. For sowing in the spring, the seeds are stratified, that is, kept in a mixture of sernam sand for 30-50 days, depending on the hardness of the husk.

For planting, flat or sloping soils, irrigated soils with good air permeability are allocated, the seeds are sown at a depth of 45-50 cm in furrows with a spacing of 70 cm, at a distance of 10-12 cm and a depth of 6-8 cm. 300-350 kg of seeds are used per hectare.

The nursery is watered 8-12 times during the growing season, depending on weather conditions. After watering, the soil is loosened and fired. The thickness of the weld grown for bonding should not be less than 8 mm, the grip of the weld connected to thin seedlings will be much weaker.

Almonds are grafted from August 20 to September 15 at a height of 2-3 cm from the root collar of the seedling using the simple "T" method used in fruit growing. Prior to pruning, the grafted seedlings should be watered and the lower caps should be removed and connected. After two weeks, it is determined whether the graft is held. Those not caught are re-grafted with the same variety of almonds. The bundle is not removed during the winter, only slightly loosened and removed in the spring of next year.

For rapid growth and grafting of seedlings need good care of seedlings in the nursery, in which case the height of young branches reaches 1.5 meters in the fall, completes the growth period normally, is normal for planting in a permanent growth site.

Location selection. A characteristic feature of the almond plant is its very early flowering. For this reason, where the weather is changeable, almond blossoms are often hit by spring black frosts. For the organization of almonds, it is advisable to allocate terraces on the mountains and mountain slopes, where air is well exchanged, where cold air is not trapped.

In the mountainous and foothill conditions of Tashkent region (Bostanlyk district), almonds can be grown without irrigation on all slopes of areas with an annual rainfall of more than 600 mm, located at an altitude of 800-1300 meters above sea level, and in the southern regions at an altitude of 1700-2000 m. In areas with an average rainfall of 400-500 mm, special agro-technical treatment is required.

The best soils for almonds are sandy and gray soils, which do not contain lime and are well permeable to water. Almonds can also grow in less fertile dry soils, but in such soils they grow well and give abundant yields only when high agronomic methods are used. That's why almonds. Therefore, rotten manure should be applied at the rate of 20-30 tons per hectare on the areas planted with almonds.

Planting. Almonds are planted in autumn or early spring on a scheme of 8x8 m on irrigated lands, 6x6 m on mountain and foothill lands (5x5 m on the slopes facing south), taking into

account the light requirements. But sowing in the fall gives good results. After planting the seedlings are buried in a pile of soil 5–10 cm above the root collar, and then watered as much as possible. When the seedlings begin to sprout, the nest is leveled.

In dry lands, the soil is constantly loosened in order to ensure the absorption of rainwater and prevent its rapid evaporation; mulch is formed around the seedlings from straw, straw and other plant residues.

Care. The first agro-technical measures in the young garden are irrigation, which is watered at least 6-8 times during the growing season. It is watered at least once in April, May, June and September, and 2-3 times in July and August. Seedlings planted in sandy-gravel soils require relatively more watering. The area around the seedlings is thoroughly softened and weeded after each watering. In areas where there is a shortage of water in summer, it is also recommended to give 1-2 jacob water in winter.

In dry lands, the soil is constantly loosened after each rainfall in order to collect and store more moisture. To do this, the area around the seedlings is cut in the fall and spring, the soil surface is loosened. Soil loosening is stopped when the spring rains stop.

It will be possible to reduce the amount of irrigation during the growing season up to 4 times from the beginning of the harvest. It is also necessary to irrigate once after harvest. In this case, the growing period of the trees is slightly longer and ensures that the almonds bloom a little later in the spring.

Fertilization. In order to grow a rich harvest, it is necessary to feed almonds with organic and mineral fertilizers. Particular attention should be paid to the timely application of fertilizers, especially in mountainous areas. In the first year, 4-6 kg of organic fertilizer and 60-80 g of ammophosare applied around each seedling in order to ensure good germination and growth of seedlings.

 It is recommended to apply 6-8 grams of pure nitrogen, 3-4 grams of pure phosphorus and 2-3 grams of potassium and 4-5 kg of organic fertilizer per 1m2 to young orchards with low growth rate until full harvest. When organic and mineral fertilizers are applied together, the amount of fertilizer is reduced by 1.5-2 times.

 It is recommended to apply 20-30 tons of rotten manure or humus per hectare, mineral fertilizers, 120 kg of nitrogen per hectare, 90 kg of phosphorus, 40-60 kg of potassium fertilizers per hectare once every 2-3 years.

Organic, phosphorus and potassium fertilizers are applied to the cultivated part of the terraces on arable lands before plowing in autumn (October-November), nitrogen fertilizers are applied under the trees in March-April, May-June as food (on irrigated lands) 12-14 cm, in autumn organic and mineral. The fertilizer is applied to a depth of 30–40 cm.

Shaping. For the first 2–3 years after planting almond seedlings, its branches are shaped in the form of an open cup, while the multi-branched varieties in the form of a changing leader or pyramid. In shaping the branches, care must be taken to maintain the interdependent balance between the central leader node and the branches. The first 3–4 main branches are cut at a height of 60–70 cm from the root collar of seedlings, and the latter are cut in a spiral at an angle of 90–1200 cm every 20–30 cm behind.

It is not advisable to cut the branches of young fruit trees too short for 3-4 years, as this will over-strengthen their growth and delay the onset of harvest. In order to expand the branches of almond varieties (Kolkhozchi, Tungich, Kilichnuskha, Yalta, etc.) with horn-shaped pyramidal shape, it is recommended to bend them in the first place only to turn them into outer side branches and increase the angle of removal. In varieties with broad-leaved branches (Konsoy, Nikita-62, etc.), the first-order branches are transformed into second-order side branches. They will be pointing upwards.

Once the desired main branches have been formed, the pruning action is aimed at preventing the plant branches from thickening i.e. the excess branches are removed.

In the orchards, pruning is carried out to cut the damaged, dried branches, and, if necessary, to thin out the thickened branches.

Rejuvenation work can also be carried out in slow-growing and low-yielding 30-35-year-old gardens. At the same time in early spring (February-March) partially cut the 2–4-year-old branches of the tree and grow new branches from dormant buds. Due to these branches, the branches of old trees can be restored and bear fruit for several years.

Harvesting. Harvesting begins only after the almond peel has dried and cracked. If the crop is harvested early, the quality of the almonds will decrease and it will be more difficult to separate the skin. If the harvest is delayed, the skin will dry out and stick to the seeds, the almond color will turn brown, and it will be damaged by birds. The almond crop is threshed on tarpaulins spread under the tree using long sticks. Damage to buds and fruit branches during pruning should never be allowed. The harvest is taken to drying points, cleaned and sorted and dried in the sun for 3-5 days. Almonds are stored in boxes in a cool (15–200S) place where the air is exchanged. They can be stored for up to a year as seeds and for consumption.

Recommended varieties for planting: from the selection varieties of the Scientific Research Institute of Horticulture, Viticulture and Enology named after Academician M. Mirzaev - Bostanlykkechpishari, Zavetniy, Kolkhozchi, Konsoy, Kilichnuskha (Sablevidnyy), Tungich (Pervenets), Tien-Shan, Chiroyli (Krasnoyarsk) Ertapishar (Rannyy), Ugom and others.

Imported varieties - Crimea, Nikita evening primer, Primer, Nikita-62, Yalta (Crimea), Turkmen aloe (Turkmenistan), Nonparel (France), Dyke (USA) and others.

Pests and Diseases: One of the most serious pests of almonds is peach or almond lice. He was actually a sucking pest, asking for the sap of the tree's trunk, twigs and leaves. As a result, the tree becomes weak, the leaves do not curl, the yield decreases, and young seedlings reach the point of extinction. The pest overwinters during the egg-laying period in clusters on the underside of the body bark and large branches. In March, the larvae hatch from eggs. It leaves 11 generations throughout the season.

Against this pest is sprayed with nitrofen (250g per 10 liters of water) in early spring before bud burst. Carbaphos (200 g per 100 liters of water) or 0.2% solution of donitol (2-2.5 kg per hectare) is sprayed on the trunks and branches of trees.

 The main diseases of almonds are "leaf burn", klyastesporiosis and flour dew.

Almond leaves affected by "leaf burn" appear red spots and they begin to shed prematurely. Klyatesporioz is a fungal, perforated spot disease. It damages the buds, leaves, flowers, branches

and twigs of the tree. Trees whose branches thicken and enter the fruit are more susceptible to this disease.

The disease not only reduces the yield of the tree, but also reduces the quality of the fruit. In the spring on the diseased leaves appear round spots. Holes are formed. Brown swellings appear on the fruit and glue begins to flow. Damaged buds dry out. The bark of the branches closes and releases glue. The flowers and buds fall off.

Trees infested with flour dew appear on the trunks of the branches and on the leaves a white unsightly dust. The fruits and leaves of damaged branches stop growing and fall off. The disease overwinters in infected young branches and develops from April.

Control measures: In early spring, the branches of trees affected by these diseases are cut, the fallen leaves are collected and lost. Treatment with a 1% solution of burgundy liquid (10-15 kg per hectare), Vetra or 0.03% solution of Topaz (300 grams per hectare) gives good results. It is also recommended to give flour with a 1% concentration of colloidal or dispersed sulfur (80-100 grams per 10 liters of water) when the first symptoms of the disease appear.

Economic indicators. To determine the cost-effectiveness of the construction of orchards, it is first necessary to determine the organizational work and the cost of construction.

Before preparing the land for planting orchards, 50 tons / ha of organic fertilizer (manure) is applied in order to increase soil fertility. To increase soil fertility, mineral fertilizers are applied, the total cost of which is 1 million 850 thousand soums. When grafted 2-year-old standard seedlings of almonds are planted in a 6x6 m scheme, 277 seedlings are placed per 1 hectare. The cost of each seedling is 6,500 soums - a total of 1,800,000soums will be spent on the purchase of seedlings. 277 pits are dug per hectare, and before planting, each pit is filled with 10 kg of rotten manure or 300 g of superphosphate, 60 grams of ammonium sulfate and potassium salt, and this measure costs 1 million 300 soums / ha. 5 million 200 thousand soums will be spent for soil preparation and care of seedlings during the growing season. Then, until the almond trees are fully harvested, they will cost about 1,400,000 soums per year (7 million soums in 5 years). The total cost (including 20% of additional costs) is 21 million 420 thousand soums. Almond seedlings are planted between rows for 3 years during the growing season, earning an average of 2 million soums / ha and a profit of 6 million soums in 3 years.

 The average yield of 5-year-old almonds is 5x277 = 1.385 kg / ha, with 5 kg of fruit per species. 1,385x8500soums = 11.772 million soums will be earned from the sale of almonds.

1 – TABLE COSTS AND COST-EFFECTIVENESS OF PLANTING ALMONDS. (FOR 1 HECTARE)

№	Types of work and materials name	Total amount	Total cost mln/soum
	Organic and mineral fertilizers, tons	50	1.850.000
	2-year-old grafted almond seedlings, 6x5 scheme	277	1.800.000
	Dig deep for planting seedlings, put in each hole 10 kg of manure, 300 g of superphosphate, 60 g of potassium salt, 60 g of ammonium sulfate.	--	1.300.000

	Preparation of soil for planting almonds, fertilizing arable land to increase soil fertility, planting seedlings, watering during the growing season, cultivating between rows, pruning around seedlings. Weed cleaning costs for 1 year.	1 ha	5.200.000
	The cost of caring for almond trees before harvest is 1,400,000 soums per year for 5 years.	1 ha	7.000.000
	Disbursement.		**17.850.000**
	20 % Extra disbursement .	--	3.570.000
	Total disbursement		**21.420.000**
	Profit		
	Use for 3 years for agricultural purposes on the land between the rows	1 ha	6.000.000
	277 trees x 10 kg = 1,385 kg Realization of almond fruit at an average yield of 5 kg per tree in 5 years, million soums	1.385x8.500=11.772.000	
	Total income in 5 years, mln	17.772.000	
	Total income for the 6th year, mln	18.000.000	
1	**Profit, million soums**	**14.352.000**	
2	**Profitability%**	67	

This means that the total income in 5 years will be 11,772,000 + 6,000,000 = 17,772,000 million soums, i.e. the cost of planting and maintaining almonds on 1 hectare and carrying out agro-technical measures for 5 years until full harvest will be covered by 14,352,000 soums in 6 years.

The cost of construction of the orchard will be fully reimbursed and in 5-6 years the net profit will be 14,352,000 soums, and in the following years the average profit will be 18,000,000 soums.

Given the annual increase in the yield of almond trees, the yield will be 3-4 tons / ha in 6-10 years, 5 tons / ha in 10-20 years, and the economic efficiency will also increase.

THE THEME OF THE POETIC SYMBOL CREATION IN ZULFIYA'S POETRY

Tajibaeva Dilfuza Erkinovna*

*Senior Lecturer,
Ph.D. on Philological Sciences,
Department of Uzbek Literature,
Namangan State University,
UZBEKISTAN

ABSTRACT

In this article,Zulfiya's poetic symbol creation was discussed by giving examples from her colorful poetry. Besides, Zulfiya's poems were also analyzed and her poetic usage of symbolism was also explained. Zulfiya's poems and legacy have immensely contributed to the modern poetry of women in Uzbekistan and the world.

KEYWORDS*: Symbol, Figurative Speech, Poetry, Artistic Imagery, Modern Poetry, Uzbek Literature.*

INTRODUCTION

Zulfiya was a typical member of Uzbek mothers, one of the talented, unmatched masters of modern, Uzbek poets and she was popular as the symbol of faith and loyalty in Uzbek literature. Zulfiya lived a short and happy life with the poet Hamid Olimjon. Two artists' meaningful life, beautiful lifestyle could serve as an example for everyone. Human is always helpless in the face of the laws of life. Merciless life took Hamid Olimjon from Zulfia's arms very early. The poet raised her two children alone.As a loyal Uzbek woman, she remained faithful to her husband.

Main part

As you go deep into the poet's world, you will encounter the lines filled with great nostalgia. In the poetic exercises polished in the colorful world of the poetic world, the poetic symbols of separation, migration, longing, the duty of humanity, beautiful natural landscapes attract attention.

"The artistic imagery inherent in literature and art is a form of life." [8.31] Indeed, the works of the poet Zulfiya describe the events of her personal life, the memories of women, the artistic expression of a cruel fate.

Zulfiya's work embodies a symbol of living in exile and separation, but keeping it hidden in her heart and not revealing it to others. This emblem is sometimes manifested as a woman, sometimes as a heart, and sometimes as a manifestation of nature. In Poet's poem "Kimnikutasan?" ("Whom will you wait for?"), the heart that is waiting impatiently for someone is not left out of sight. She understands the heart's mishaps. Because the poet knows about both love and separation:

> Ko'zing muncha yo'lda intizor,
>
> Ey, bahordan barkamol husn?
>
> Iztirobing dilimga ozor –

Ishq hijronni bilganim uchun. [4, 96.]

> (Why your eyes are on the road so much,
>
> Hey, beauty nourished by spring?
>
> Your sorrow is the pain of my heart-
>
> Because I know about love, separation).

As literature states: "Figurative expression is a poetic expression that allows expressing figuratively the state of a thing, event, and person in a certain situation, the psyche, thoughts, experiences, and feelings of the lyrical hero." [6,171.].

In the works of the poet Zulfiya, one can observe beautiful examples of this figurative expression.

The poet creates unique appearances for the poetic symbols such as the spring, the sun, flowers, night, breeze, an apple, the autumn, a tree. In Zulfiya's poem of "Daraxt" ("A tree"), the symbol of a tree that couldn't endure the merciless hits of the wind is described:

> Bir daraxt turardi yo'l chekkasida,
>
> Shamol urar edi uni muttasil.
>
> Avval ko'k, so'ng za'far – xazon tusida

Ko'rkini yo'qotdi... Hamon urar yel. [4,41.]

> (A tree stood on the side of the road,

The wind was hitting it constantly.

First green, then in the color of yellow,

He lost his beauty ... The wind still hits.)

The tree could not withstand the blows of the wind, it withered and its trunk was bent. The poet describes the situation as follows:

> Qurg'adi, bukchaydi kurashda tanho,

Zilol qonlaridan qolmadi zarrra

Shamol, shamol savab qoʻymadi, ammo

Ildizlar yiqildi oxir bir zarbdan. [4,41.]

(Alone in the struggle, dried, bent,

Not a speck was left of clean blood

Wind, the winddidn'tstop beating, however

The roots eventually fell off because of the hits.)

The ideas in the next lines of the poem will attract any kind of reader. The wind's cruising in the emptiness in search of the demise of the victim draws the attention of the poet as well. The poet believes that if she needs to fall like the tree, her life won't be empty:

Endi yel boʻshliqda kezar darbadar,

Tanho qurbonining qaqshasin izlab.

Bilaman , daraxtday qulasam agar

Mening hayot bogʻim qolmas huvillab.[4, 41.]

(Now the wind blows in emptiness,

Looking for a lone victim's demise.

I know if I fall like a tree

My life garden won't be left empty.)

In the poem "Emish" ("Quasi") the poet writes about gossips about herself. According to the word of mouthZulfiya's popularity is very high. As if feelings of happiness are gathered in her eyes. In reality, her "incomplete destiny" ("qismatikemtik"), "her bowl of happiness is half full" ("baxtkosasitoʻliqemas").

But because of the poet's sincere lines, people call her a happy woman:

Emish: shuhrat oʻrab kemtik qismatim,

Koʻzlardan uzoqda sirqirab oqar.

Qalbda qoʻrgʻoshinday yotib hasratim,

Koʻzlarim jahonga baxtiyor boqar.

Emish: hayot menga ayol baxtidan

Toʻliq kosasini koʻrmapti loyiq.

Lekin qalbim toʻkkan she'r shuhratidan

Baxtli ayol dermish meni xaloyiq.... [4,82.]

(As if: fame wrapped my incomplete destiny,

Flows slipping far from the eyes.

My sorrow lies in my heart like lead,

My eyes look happily at the world.

As if: life from woman's happiness

Doesn't reward with a full bowl.

Alas, thanks to spilled popularity from the poem,

People think I'm a happy woman…)

Poet doesn't complain of such destiny. She symbolizes her sorrow as the lead. Thus: she asks herself andexplains to others this situation by saying "Tanda qo'rgoshin-la yurganlar ozmi?" ("Are there fewer people who are walking with lead in their bodies?").Just as the lead in a warrior's body has not rusted for a quarter of a century, so the pain in a woman's heart finds a hidden place:

U jangchi tanida, ayol dilida

Qariyb chorak asr zanglamay yotar,

Baxtning ming jilosin bergan elida,

Har bir jon jahonga tole yor boqar. [4, 82.]

(He is in the body of a warrior, in the heart of a woman

Nearly a quarter of a century has passed without rust,

In the hand of a thousand spells of happiness,

Every soul is fortunate to the world.)

The poet says that the heart is flawed, that not everyone knows its sufferings. There were once "golden moments" ("oltindamlar") in the ocean of soul and the heart will never forget it. Love in the soul is living as happiness:

Limmo – lim qismatga bo'lmaganlar yor,

Kemtiklik hasratin bilarmi dardin!

Qalbni bezab ketgan ishqda zo'r baxt bor,

Yurak unutarmi oltin damlarin?[4,82.]

(Countless ones are not fortunate,

Do you know the pain of lacking?

There is great happiness in the love that beautified the heart,

Will the heart forget its golden moments?)

Zulfiya lived happily with the poet Hamid Olimjon. That is why the poetess was able to say out loud that she was happy. After the poet's death, the woman, who had fond memories and was respected by the people, assured herself that even princesses had not achieved such happiness. Just as the poetessZulfiya loved and sang for her mother, her people loved and respected her. Therefore, as he admitted, the people had the right to call Zulfiyakhanim a happy woman:

Ayol baxti!Menday ayol baxtiga

Taqdir malikani ko'rganmi loyiq?

Xalq mehrida, yorman el shuhratiga,

Baxtli ayol desa haqli xaloyiq... [4, 82.]

(The woman's happiness! For the happiness of woman like me

Does fate prefer the princess?

In the love of the people, I'm with the fame of the nation,

People are right when they say I'ma happy woman ...)

Zulfiyakhanum lived among the people all her life. She sang about the dreams and hopes of the people. He was happy to see the Uzbek's happiness and shared his grief. She was grateful for the existence of a great creator called human in the world. She tried to share the joys of life given to herwith people.

"The "secret" of poetic creativity can be found only by the poet himself, and even then only within himself."[7,21] –said the literary critic H. Umurov. Poetess Zulfiyakhanum found the "secret" poetic creativity within herself and she was the person who could also take others into poetry.

In her poem "People close to my heart" ("Yuragimgayaqinkishilar"), the poetess takes all people as close to her heart. They all seem familiar. Even if the creator does not know the name of the people, she can see the strive and the struggle to stay alive within them:

Odamlar daryosi oqar yonimdan,

Qarayman: hammasi - hammasi tanish,

Bilmayman ismin ham, kasbin ham ammo,

Bilaman barida buyuk intilish: [4,133.]

(The river of people flows beside me,

I look: everyone is familiar,

I do not know the name or profession, but

I know: they all have great strive)

As the poetess puts it, "Ertani bugunga keltirmoq uchun Bugundan go'zalroq damga shoshadi." ("To bring tomorrow to today is to hasten a more beautifulday than today.") The poetess Zulfiya was one of the people expressed in the poem, a citizen of the society, a human who was ready to give his life for the motherland, his beloved people, and compatriots.

CONCLUSION

Zulfiya has been striving for goodness all her life. She did not complain about the life given to her. She brought up and nurtured her children to be beloved by the people. She continued Hamid Olimjon's unfinished noble deeds through her creativity and hard work. The poetic symbols

created by the poetess Zulfiya are still familiar to readers and will continue to captivate the hearts of poetry fans for many years to come.

STUDY OF SHAROFIDDIN ALI YAZDI'S "ZAFARNOMA" BY ASOMIDDIN URINBOEV

Burkhonov Ilyoskhon Muhiddinovich*

*Teacher,
History of Uzbekistan department of Fergana Polytechnic Institute,
UZBEKISTAN
Email id: i.burkhonov@ferpi.uz

ABSTRACT

The article deals with the research work of the Honored Scientist of Uzbekistan, Doctor of Historical Sciences, Orientalist A. Urinbaev on the translation of the work "Zafarnoma" by Sharafiddin Ali Yazdi from Persian into Uzbek.

KEYWORDS: *A.Urinbaev, Sharafiddin Ali Yazdiy, "Zafarnoma", Unesco, Amir Temur.*

INTRODUCTION

A unique masterpiece of the rich scientific heritage of the famous Uzbek historian AsomiddinUrinbaev - "Zafarnoma" by Sharafiddin Ali Yazdi is a translation from Persian into Uzbek. This source is devoted to the history of Amir Temur and the Timurids, and although the scholar spent the brightest and most meaningful periods of his life on this study, he was struck by the demands of the time or the blows of the Soviet dictatorship. After A. Urinbaev, many well-known historians conducted research on this source, and all of them cited the research work of A. Urinbaev as a basis. For example, scientific researches and books of O.Buriev, [1.] A.Akhmedov and H.Bobobekov [2.] can be cited.

A.Akhmedov and H.Bobobekov in the preface to the Uzbek translation of the Zafarnoma - "The work begins with a great introduction to the genealogy of the Turkic khans and the history of Genghis Khan. The work is adorned with many poems, which are undoubtedly Sharafuddin's personal creations. It is noteworthy that with the "help" of Sharafuddin, both Timur and his children and military leaders often recited Persian poems in connection with certain events. Sharafuddin also describes some of the soul's experiences as lyrical retreats with long poems. In such places, the author seems to be abusing the reader's attention and time because on such pages the development of military, political events slows down or stops altogether. But regardless of

the style of interpretation, Sharafuddin Ali Yazdi's "Zafarnoma" is the closest and most complete work on the history of Amir Temur. That is why, in the more than five and a half centuries since the work was written, it has been repeatedly copied, translated into various Eastern and Western languages, both in full and in part, and published several times. The most complete of such publications was published in 1972 by A.S. It is a critical text published by Urinbaev, "A. Urinbaev's scientific research was praised. [3.1.]

A.Urinbaev in his article on the scientific heritage of Sharafiddin Ali Yazdi [4.1.] The work "Zafarnoma" was written twice in the genre of the heroic story "Zafarnoma" in the XV and XVI centuries by Lutfi in Uzbek and in Persian by Abdurahmon Jami's nephew Khatifi (death -1521) was sung.

At the beginning of the 16th century, Muhammad Ali ibn Darwish Ali Bukhari translated the Zafarnoma into Uzbek on the instructions of Kuchkunchikhan (1510-1530), one of the first representatives of the Shaybanids   [5.] There is also information in the literature that the work was translated into Turkish by Hafiz Muhammad ibn Ahmad al-Ajami. It is also known that "Zafarnoma" was abbreviated into Uzbek by Khudoiberdi ibn Kushmuhammad Sufi al-Khivaqi in Khiva in 1822-1823.

From the 18th century onwards, parts of the Zafarnoma were translated into French (Peti de la Kroa, 1713), English (J. Darby, 1723) and Russian. The Persian text of the work was published in Calcutta (India) in 1887-88 and in Tehran (Iran) in 1958.

This priceless work tells about the military campaigns of various sultans, the Chigatay nation and Amir Temur. The work was written by Sharofiddin Ali Yazdi in 1420-1425 in Sheroz under the authority of Ibrahim Sultan, the son of Shahrukh.

Academician DiloromYusupova, one of the hundreds of talented students of A.Urinbev, commented on the research work of the teacher on the work "Zafarnoma": "A.Urinbaev's" Zafarnoma "has a unique history, which tells us about the personality and history of Amir Temur in the Soviet era. Teaches that they are in a relationship. [6.b.7.]

In 1969, Samarkand hosted a UNESCO scientific symposium on the study of art from the time of Amir Temur. At this forum, the Organizing Committee of the Republic of Uzbekistan decided to publish Sharofiddin Ali Yazdi's work "Zafarnoma". In this regard, at the Institute of Oriental Studies of the Academy of Sciences of Uzbekistan, A. Urinbaev prepared "Zafarnoma" for publication, which was published in 1972 in Tashkent in 1500 copies in the form of photofacsimile. A copy prepared for this edition is now in the manuscript fund of the Institute of Oriental Studies inv. №4472 is in very good condition. Zafarnoma, published by A. Urinbaev, has an advantage over earlier editions in Calcutta and Tehran, where it does not have an Introduction. The volume of the "Introduction" included in the "Zafarnoma" prepared by A. Urinbaev for publication is large, it is equal to 1/5 of the total volume of the work. In addition, the index of personal names, geographical terms, ethnic terms were also included in the publication by A. Urinbaev, which further increased the value of the work.

The publication of the book "Zafarnoma" by Sharafiddin Ali Yazdi was a great and unexpected event in the spiritual life of the Republic. Its rapid spread among the general public reveals that Amir Temur fought for freedom. The book is also in high demand in the international book trade. Of course, the Soviet government could not ignore these events. Critical articles on the

"glorification of Timur" began to appear in the media. By order of the Central Committee of the Communist Party of Uzbekistan, unsold books were confiscated from bookstores. At the same time, A. Urinbaev banned the publication of Sharafiddin Ali Yazdi's "Zafarnoma" prepared for publication in Uzbek and Russian languages. Academicians I. Muminov and A. Urinbaevwere seriously interrogated and punished by higher authorities for preparing these scientific researches for publication. Due to these events, A. Urinbaev could not defend his doctoral dissertation on Sharafiddin Ali Yazdi's scientific research on the work "Zafarnoma", and academician I. Muminov died unexpectedly. Of course, these events had a negative impact on the health of A. Urinbaev, as well as the fact that he did not defend his doctoral dissertation on the research, which he devoted to the young years of his life with love and affection. [6.b.11.]

AsomiddinUrinbaev studied the scientific heritage of Sharofiddin Ali Yazdi and listed his works other than "Zafarnoma" as follows: "Hulal-imutarrazdar problem and dictionary" ("Decorative shirt on problems and riddles"), "Muntahib-iHulal" (This abbreviated description of the work), "Mawatin or Manazir Narrow Problem" ("Dwelling and Landscapes in the Problem of Problems"), "Qunhuz-zoddarilm-iwaqf-ia'dad" Kitab fi ilm-iusturlob »(« Book on the science of usturlob »), "Devon-iSharaf-iYazdiy" ("SharafiYazdi's collection of poems"), "Haqayiq at-analiz" ("The truth of Tahyail, i.e. Lo ilahailla-l-loh"), "Sharh-i« Qasida-iBurda "(Commentary on Qasida-iBurda), Commentary on Asamo-i Allah (Commentary on the Names of Allah), Tuhfatul-Faqir and Hadyat al-Haqir a gift of a gift and a humiliation "), Munshaot" ("Collection of Letters"), a work that did not have a special title, but narrated the history of Amir Temur in poetry. [4.1.]

According to A. Urinbaev, the work "Zarafnoma" is also called "Fathnomayisahibkiron", "TarihijahokushoyiTemuriy", but in history it is better known as "Zafarnoma". In terms of structure, the work is divided into two parts: the "Introduction", which speaks in general about the history of the pre-Timur period, and the main part, which directly covers the history of the Timur period. In the prefixes, which are written separately for each part and have many commonalities, the author illuminates the writing history of these parts. He points out that both parts were written on the initiative of Ibrahim Sultan, the son of Shah Rukh. [4.2.] This is stated in the Preface: "After comparing the information gathered with the stories of those who witnessed the events with their own eyes, Sharafiddin Ali had to get acquainted with this information and inform Ibrahim Sultan. After the approval of Ibrahim Sultan, Yazdi began to compile the Muqaddima. [4.3.]

Sharafiddin Ali Yazdi himself called the "Introduction" part of the work "Tarihi Jahangir", but in science it is known as "Introduction" and is an integral part of "Zafarnoma". However, probably due to its large size, manuscript copies were also distributed as a separate independent work. It consists of a preface, two chapters, and an introduction. The main part of the work "Zafarnoma", according to the original plan of the author, was to consist of three articles. The first article is dedicated to Timur, the second to his son Shah Rukh, and the third to Ibrahim Sultan, the son of Shah Rukh and the patron of Sharafiddin Ali Yazdi. Therefore, the work "Zafarnoma" was supposed to cover not only the history of Timur, but also the history of the reign of the Timurid princes Shahrukh (1405-1447) and Ibrahim Sultan (1414-1435). However, the manuscripts of Zafarnoma, now known to science, do not contain the next two articles, which have not been written or have reached us.

CONCLUSION

In conclusion, one of the rarest monuments of Oriental historiography and one of the primary sources in the history of Amir Temur, the work of Sharofiddin Ali Yazdi "Zafarnoma" has long attracted the attention of orientalists. Due to the completeness and reliability of the evidence, it still occupies an important place among the sources of that period.

ABSTRACT

The article is devoted to the process of classification assigning the essence of any research and the analysis of basic concepts related to it. Different approaches to classification in linguistics and the steps of linguistic classification are explained.

KEYWORDS*: Classification, Source Of Research, Methodology Of Classification, Philosophy Of Classification, Linguistic Classification, Dichotomy Of Language And Speech, Semema And Version Of Semema, Phonetic-Phonological Level*

INTRODUCTION

In linguistics classification is one of the important processes, it is both the beginning and the end of any research and investigation. It is known, when the researcher starts investigation, he/she begins this action depending on the position of linguistic units in a certain system and places the research results into a certain system too. This process is essentially classification. Because, a scientific conclusion requires giving a certain evaluation about the research being conducted, that is, classifying it. Unfortunately, in Uzbek linguistics the problem of classification hasn't been a special research source up to the present. As a result of it, in the special researches devoted to the classification of different language phenomena in Uzbek linguistics the essence of the methodology of classification, the basis of classification and philosophy of classification have not been revealed deeply yet. Because Uzbek science, in the fundamentals of European sciences, stayed behind from the great East philosophy, which was its basis (also for the European philosophy and methodology), in its developing step in the 40-90s of the last century and in the East in the X century the beginning of classification, linguistic classification of the universe which was considered to be the beginning of scientific analysis, its attitude to the scientific classifications were not absolutely paid attention. As a result, the researchers of the Uzbek language completely forgot the guidance of our great ancestors about it. For instance, the great

"Muallim as-soniy" (Abu Nasr Farabiy) wrote about it: "I will go to prove how the knowledge came out of substance and accident… it is obvious where the knowledge came out. It is known that it occurs by the relation of the position of substance and accident that received by senses and perceived by the mind in detail" [1, 78]. The great scholar wrote suggesting the theory: "Linguistic research and classification is the initial step of studying, investigating the source". "As for how to teach and learn, how to express the idea, how to ask and how to reply, I confirm that the first knowledge about them was the object, that is, the knowledge about the language giving the name to substance and accidents" [1, 17]. These words claim once more that it is necessary to connect any classification, no matter it is scientific or philosophical, with the linguistic classification of this phenomenon.

There are conscious and unconscious approaches to the classification in linguistics. The main point of the unconscious approach is that, any sentence, any definition, whether it is negative, affirmative, adding, separating, equalizing, distinguishing or contrasting, is connected with classification. But we do not often realize that it is a classification and usually we just use it. Simply, if we say "A is a vowel sound", then we would do a particular classification. In the sentence "A is a vowel phenomenon" we classified "a" at first, as a phenomenon, in our mind we noted that it belonged to vowels. This classification is practical, an unconscious classification.

No sentence is apart from classification. Even, a simple affirmative one "It is a book" is not apart from classification, because we added the object which the indicative word "the pronoun It" indicates into the group of "book"; separating it from "other things that are not books", and mentioned that it belonged to the group of "book". Such practical, unconscious, unintentional classification is a necessary practice in order to nominate something or express any idea that the speaker does not consider such situation as classification. And this is not studied in linguistics as classification either.

Classification in linguistics is a type of scientific classification that it is a process of identifying different connections of language phenomena and units with the similar and dissimilar, equal (the same level), bigger (higher level or step), smaller (lower step or level) units, separating paradigms, identifying and distinguishing the relations between the units in the paradigm.

The types of linguistic analysis are various. By linguistic analysis we understand any kind of classification related to the language. If it is necessary to distinguish the two types of linguistic classification, it can be divided as: the first type is the classification of linguistic units – the classification of structural units of the language; and the second type is socio-historical classification of the language.   While the division of the language into levels, the differences and similarities between the particular various groups and units of the language units in the levels are studied in the classification of structural units of language, in the socio-historical classification of the language the genealogical, typological and geographical spread of languages, influences of the languages, their separations and joining, the types of the relations of the language with the society are studied.

Before discussing the problems of pure linguistic analysis a very confusing problem – linguistic analysis and "language and speech" dichotomy should be mentioned. Because classification usually works with generality – categorical phenomena, signs and features. In language generality and privateness, GEOR (Generality, Essence, Opportunity, and Reason) and IPRR

(Individuality, Phenomenon, Realization, and Result) are usually compared in different levels as the units of different levels – language and speech levels.

Because the classification relies mainly on the categorical features – general features, it can be considered to be the practice appropriate only to the units of language levels. It is not true. For instance, the classification of phonemes and the classification of speech sound must not be confused. Or it is not possible to make semantic classification of sentences equal to structural classification of sentence patterns. There arisen a question whether in general, in classification speech results are involved in classification or not? The problem is that the nature of the units of language and speech levels and to make a list of the units of each level. The question that has to be discussed and decided is that what is speech or what is language phenomenon. For example, a derivative word. We remember that this problem was put under discussion again by the academician A.Khojiev after H.Ne'matov, O.Bozorov [2], R.Saloev [3]: which level does the derivative word belong to?

There can be only one base (ground): is there semantic or functional specializing in the derivative word or not? If there is specializing, the derivative word takes place in the dictionary and becomes a language in some degree. The following steps should be separated in being a language:

1. Being specialized.

2. Being consolidated.

3. Being simplified .

4. Stemming.

In being specialized the derivative speaker and the listener are consolidated in the mind of the members of the society and connected with a certain concept and this derivative is perceived by the speakers out of the text too as a symbol. From this point of view let's analyze the words tashkilotchi (organizer) and tafsilotchi (descriptor). Firstly, the word tafsilotchi (descriptor) is noted neither in explanatory dictionaries nor in the spelling dictionaries. The word tashkilotchi (organizer) is noted in both types of dictionary. Why? The answer is very simple: the word tashkilotchi (organizer) is specialized, consolidated, with one meaning for the Uzbek and connected with a certain meaning, information or concept in their minds and therefore takes place in the dictionary, can live in their minds without a text too, remains in the memory. The word tafsilotchi (descriptor) has no such characteristic of being consolidated and specialized. But, isn't the derivative of tafsilotchi (descriptor) particular to Uzbek speech? It is not correct to say that it is not particular or it is impossible. The derivative word tafsilotchi (descriptor) can be easily used in speech in the meaning of a person, a document or a means that gives the detail description of something or an event. It is not unfamiliar to Uzbek speech. But specialization and consolidation don't happen in it. Therefore it can be used only in a certain context or in a certain speech situation and can be clear to the Uzbek only in that speech situation. The word tashkilotchi (organizer) doesn't differ from the word tafsilotchi (descriptor) in structure, but completely differs from it in meaning. The phenomena of specialization and on this base consolidation of the meaning can be observed in it. This consolidation occurs firstly, in one meaning only among the several meanings of the word tashkilot (organization) which is in the function of the base of word formation in the Uzbek language. The Explanatory dictionary of the

Uzbek language gives only the meaning "muassasa" (organization, institution) of the word tashkilot (organization). Whereas, there is also another meaning of the word tashkilot (organization) in our language, such as "organizing, making, creating and establishing". For example, Muhokamaning **tashkiloti** Salimga yuklatildi.(The **organization** of the discussion was on Salim's responsibility)(here it is used in the meaning "organizing"). In the word tashkilotchi (organizer) the base of word formation is used in the same meaning as "organizing" and the lexeme tashkilotchi (organizer) shows the semantic change of the part in the function of the base of word formation as the cause of semantic consolidation which is specialization and its result. In such cases it can be said that the derivative words, which have taken place in the dictionary but the outward, formal structure is obvious, cannot link as a speech unit. Only the derivatives which are formally and semantically divided and haven't taken a place in the mind of the Uzbek as certain wholeness can be evaluated as a speech unit. So, classifying the derivative words into language and speech levels is one of the complicated problems.

Another problem of pure linguistic classification connected with lexicography is to classify the versions of sememas and semas in the word and indicate them in the dictionaries. In Uzbek linguistics this problem was investigated specially in the works of B.mengliev and Sh.Bobojonov [5, 178] and in the works of A. Hojiev, [5], Sh.Rahmatullaev [6], M.Mirtojiev [7], G.Nematova [8] together with the semantic structure of the word and the problems of its description.

In distinguishing the independent versions of sememas and semas in the word the theory "dependent" and "free bound" connectingly "the same bound" should be the base. If one word can realize two or more sememas in the same bound, such semamas are independent semamas and they need to be given and classified separately in the dictionaries. For instance, "Ikkita olmani kesdik"(We cut two apples). In this context does the word apple realize two meanings or one meaning? Because, usually, in the words nominating plants the meanings plant, that's an apple tree, fruit (apple) and harvest occur as different versions of one semema realizing in different contexts (bounds). But in the cases like "Olmani kesdik" (We cut the apple)", "The apricot dried", "The peach rotted" the words apple, apricot and peach are realizing two sememas in the same context and the meaning "harvest" and "plant" of these words should be described as an independent semema.

The problems that tightly connected with classification as in the above can be seen in the units of each level. In particular, in phonetic-phonological level identifying the components of phonemes, for example, is there long "i" or not in the Uzbek language, is the speech phonetic veriant "iy" in the words such as sina – siyna, Samarkandi – Samarkandiy a diphthong or an independent phoneme? Or do the front rows and back rows of the phonemes, allophones belong to language level or speech level? The questions such as in grammatical layer the independence of linguistic-syntactic patterns, identifying if it is a separate LSP (linguistic-syntactic pattern) or a speech form of one pattern, if it is a version of one LSP or synonymy of LSPs are also connected with the problems of linguistic classification. Finding correct answers to them is the actual problem before our linguistics.

CHOOSING THE OPTIMAL RULE OF MONETARY POLICY, TAKING INTO ACCOUNT CHANGES IN THE MAIN MACROECONOMIC INDICATORS

ABSTRACT

The article provides a brief analysis of the main rules (approaches) of monetary policy in the economy. The relationship between the level of monetization of the economy and economic growth is considered.

KEYWORDS: *Monetary Policy, Rule, Monetary Aggregates, Interest Rate, Money Supply, Level Of Monetization.*

INTRODUCTION

One of the most actual monetary policy issues explored in the economic literature today is the question of following certain rules or the freedom of action of the central bank. Many studies devoted to the analysis of monetary policy in developed and developing countries emphasize the importance of implementing monetary policy in accordance with a certain rule, or standard strategy of activity.

To achieve ultimate goals, central banks choose a certain set of intermediate goals that are controlled by the actions of the monetary authorities, for example, such as the interest rate, monetary base or exchange rate. Targets may be explicit as in Canada, New Zealand, Sweden and the UK, or implicit as in the United States or Germany, the inflation rate range or the average inflation rate over a certain level can serve as a benchmark (Taylor 1999) [1].

The key problem here is the choice of the optimal monetary policy in specific economic conditions. Depending on the latter, to ensure the optimality of monetary policy, preference is given to the rules or freedom of action of the monetary authorities. The monetary authorities of

most countries are guided by a pre-established rule, according to which the choice and degree of use of a particular monetary policy instrument is determined based on the current macroeconomic situation and the state of the banking system.

The rule of monetary policy is understood as a systemic response of the Central Bank in response to changes in the main macroeconomic indicators. The most common rules of monetary policy are Taylor's rule and McCallum's rule.

Taylor's rule defines how the central bank can change the short-term interest rate in response to price changes and the deviation of real output from its equilibrium level. Taylor's rule has stabilizing properties, i.e. minimizes cyclical fluctuations in the economy. However, practice has shown that the Taylor Rule has certain disadvantages. Indicators of inflation and GDP gap cannot be all-encompassing informational economic variables; there are also other important indicators, such as monetary and credit aggregates, exchange rate, budget parameters, etc., which must be taken into account for in-depth analysis. Moreover, the GDP gap and the long-run equilibrium real interest rate are unobservable quantities. Different ways of assessing them lead to different results, and accordingly, various recommendations for manipulating the nominal short-term interest rate are formed. In addition, the standard Taylor rule uses the change in the GDP deflator as an indicator of inflation; many researchers reasonably use other price indices in their works (consumer price index, base price index, price expectations, etc.). Taylor used the actual GDP time trend as a potential output. Subsequently, researchers used other techniques to identify this variable: compound trends, Hodrick-Prescott, Baxter-King, Kalman filters, Beveridge-Nelson decomposition, structural models, etc. Each obtained estimate of the output gap is individual, and as a result, the monetary authorities implement different decisions regarding the rate or other instruments.

MATERIALS AND METHODS

Another rule of monetary policy applied by central banks is the McCallum rule, where the main instrument of monetary policy is not the interest rate, but the regulation of monetary aggregates. The essence of the rule is to regulate the monetary base depending on the dynamics of nominal GDP and the velocity of money circulation. In his research works, McCallum,B. showed that if this rule is followed, the dynamics of the main macroeconomic indicators of the US economy will be much better than their actual behavior, especially in the period of the 1930s and 1970s. (These periods in the history of the FRS are marked by the most serious mistakes in the US monetary policy). A factor complicating the use of monetary balances as an instrument of monetary policy is the instability of demand for money due to shocks, which partly explains the preference of central banks to use the interest rate as a monetary policy instrument [2, 173-203]. Empirical studies show that the central banks of most countries at various times have acted in accordance with either the Taylor rule or the McCallum rule. Monetary policy rules and their variations have been empirically evaluated by economists for many countries around the world. Taylor, J.B. was the first to evaluate the monetary policy rule for the United States. Research has also shown that Western central banks, when conducting monetary policy, follow certain types of interest rate targeting [3, 195-214]. McCallum,B. conducted research for the United States, Great Britain and Japan based on the analysis of historical data used by Taylor to compare and study the results obtained according to Taylor's rule with alternative instruments and target variables. The study compares actual values with values according to the rules, including both

the use of the interest rate and the monetary base as an instrument. The study has shown that the results of monetary policy rules depend more on the instrument used than on the choice of the target parameter [4, 49-79]. In the work of Clarida, R., Gali, J., Gertler M., the results of assessments of monetary policy based on the considered rules for the USA, Germany, Japan, Great Britain, France and Italy were presented [5]. The methodology of these authors became the basis for a number of subsequent studies, including for the analysis of the monetary policy of countries with economies in transition (Russia, Czech Republic, Poland, Slovenia, Lithuania, Estonia, Romania, Kazakhstan, etc.). For the Czech Republic, Poland, Slovakia and Slovenia, it was determined that the Taylor rule is suitable for targeting the exchange rate, and the McCallum rule can be used for inflation targeting. Kuzin,V. [6], based on the rules of monetary policy, analyzed measures to regulate inflation for Germany. Esanov,A. [7] assessed the monetary policy of Russia, the results of this study showed that the Taylor rule does not fully describe the activity of the Central Bank in relation to setting the interest rate, and the McCallum rule, on the contrary, explains the actions of the monetary authorities, which, as a target uses monetary aggregates. Drobyshevsky,S. obtained similar results in relation to the monetary policy pursued by the Bank of Russia [8]. P. Xie, P. and Luo, X. [9] first studied the monetary policy of China based on the Taylor rule, another study [10] considered the possibility of using an alternative rule (McCallum) to determine the direction of China's monetary policy.

RESULTS AND DISCUSSION

The choice of the monetary rule. The main instrument of monetary policy in the country is the money supply (aggregate M2). The refinancing rate in Uzbekistan is not a flexible instrument, unlike the regulation of monetary aggregates. Also, it is not possible to use the interbank interest rate to describe the ongoing monetary policy, since the interbank market is currently underdeveloped and does not play a significant role in the financial system. Therefore, in research, it is possible to make (carry out) an analysis of the growth of money supply in order to achieve the set benchmarks for the main macroeconomic indicators.

Calculation method. Formally, McCallum's rule can be represented as follows:

$$\Delta m_t = \Delta \overline{X} - \Delta V_t + \lambda (\Delta \overline{X} - \Delta X_{t-1})$$

Where Δm_t - is the annual percentage change in the money supply;

$\Delta \overline{X}$ - the average target growth of nominal GDP;

ΔV - average change in the velocity of money circulation;

λ - the degree of possible deviation of the actual GDP from its target value (set exogenously equal to 0.5);

ΔX_{t-1} - the rate of change in the actual nominal GDP in the previous year.

Indicator $\Delta \overline{X}$ - is the product of target parameters for the deflator and real GDP growth.

Thus, according to this rule, based on the given target parameters of inflation and real GDP growth, the central bank can set the optimal level of money supply growth.

This model is important both for assessing the effectiveness of the monetary policy already being pursued, and for determining the predicted optimal growth in the money supply in order to achieve the target parameters of the inflation rate and economic growth.

Since 2001, the growth rate of the money supply has exceeded the growth rate of nominal GDP, which has led to an increase in the monetization coefficient. The growth of the money supply, in turn, was influenced by the increase in the money multiplier, as well as factors such as the growth of household deposits in credit institutions as a result of wage growth, an increase in the volume of remittances received and measures taken to stimulate the attraction of household savings to bank deposits.

The low level of monetization indicates a relatively low level of financial intermediation and the existence of potential for further increasing the level of monetization of the economy to ensure stable economic growth. At the same time, it is necessary to ensure a non-inflationary increase in the monetization coefficient.

A non-inflationary increase in the level of monetization is one of the pressing issues for countries with economies in transition. The low level of the monetization indicator can lead to the problem of meeting the growing demand for money on the part of business entities, to a narrowing of investment and consumer demand, to limiting the possibilities for economic growth in the current conditions.

There are many studies confirming the existence of a positive relationship between the level of monetization of the economy and economic growth. Thus, according to the results of the study by King R. and Levine R., obtained from the analysis of the development of 57 countries of the world in the period from 1960 to 1989, the growth in the level of monetization of the economy has a lagging effect on economic activity and determines long-term economic growth for at least 10 years [11]. Similar conclusions were obtained (in relation to the 1980s) in an econometric study conducted by Raghuram G.Rajanand ZingalesL. [12].

A non-inflationary increase in the monetization of the economy is achieved through the provision of effective financial intermediation in the country. If the growth of the money supply is not accompanied by a corresponding expansion of the commodity market, and the financial market is not sufficiently developed to absorb additional emission, then this leads to an increase in the price level in the economy, an increase in the velocity of money circulation, and an insufficient level of financing of the real sector. If the financial sector effectively performs the function of financial intermediation, then the additional emission will be transformed into investments.

Speaking about non-inflationary monetization of the economy, one should take into account the structure of the money supply. The excess of the M1 growth rates compared to the M2 growth rates indicates a high growth in the value of cash and demand deposits, which negatively affect the exchange rate of the national currency, since cash and demand deposits are serious sources of demand for foreign currency. The rapid growth of the nominal money supply accelerates inflation and causes a decrease in demand for the national currency. In this case, the growth of money supply does not lead to an increase in the level of monetization, but, on the contrary, to its reduction.

For countries where the dynamics of money supply growth is determined by a narrow money supply, there is a relationship between the growth of the money supply and the inflation rate, and vice versa. For example, in 2009 in China, the monetization ratio was almost 181%, the share of cash was 7.2%, while the country experienced deflation of 0.7%; in Japan, with 200% monetization, the share of cash - 9.9%, deflation was 1.7%.

CONCLUSION

The table shows that countries with a high level of monetization of the economy are characterized by a low share of cash in the structure of the money supply.

TABLE 1 THE LEVEL OF MONETIZATION AND THE SHARE OF CASH IN THE STRUCTURE OF THE MONEY SUPPLY IN SOME COUNTRIES [13]

Country	Monetization level (%)	Share of cash in M2 aggregate (%)
Czech Republic	69	13.9
Hungary	51	15.0
Euro Zone	88	8.9
United Kingdom	77	4.3
Switzerland	92	8.3
USA	52	10.0
China	146	7.2
Japan	141	9.9

The data presented indicate the need to further increase the monetization of the economy, while the emphasis should be on quality growth (for example, in Ukraine, with a high level of monetization, the highest level of inflation is also observed). Considering the above, it can be concluded that an increase in the level of monetization of the republic's economy will be achieved as the financial system and the level of financial intermediation continue to develop (active transformation of savings into financial instruments, an increase in the efficiency of the process of redistribution of cash flows, etc.), an increase in financial stability and a decrease in non-banking turnover.

In the modern period, the trend of growth in the share of non-material (financial sector) production in the economy continues. The emergence and development of innovations in this sector causes a multiplying effect, expressed in the emergence of new branches of social production of intangible goods [14]. This process requires a deeper analysis, the purpose of which is to identify new rules of monetary policy, material and non-material production, their growth rates and development prospects.

ECOLOGICAL EDICATION OF YOUTH THROUGH THE EDICATIONAL SYSTEM

Ismoilova Gulbaxor Azamovna*

*Kokand State Pedagogical Institute,
Kokand, UZBEKISTAN

ABSTRACT

Nowadays the problem of ecology is increasing quickly. The development of the youth's ecologic behavior through the continuous education system is very essential in the society. This article is devoted to the perspectives of developing ecologic education in every sphere and level of education system.

KEYWORDS: *Ecology, Ecologic Culture, Ecologic Education, Society, Students, Pupils, People, the Earth, the Air, Cleanness, History.*

INTRODUCTION

In order to radically improve public administration in the field of environmental safety and environmental protection, improve the environmental situation, improve the quality of life and protect human health, President Shavkat Mirziyoyev signed a decree "On improving the system of public administration in the field of ecology and environmental protection." The decree of the President of the Republic was published [1]. According to the decree, the tasks include conducting research activities in the field of ecology, environmental protection and monitoring, organization of advocacy and educational work, training and retraining of specialists in the field of ecology and environmental protection. The Decree of the President of the Republic of Uzbekistan dated October 30, 2019 "On approval of the Concept of Environmental Protection of the Republic of Uzbekistan for the period up to 2030" requires the inclusion of issues of education and upbringing. It is also noteworthy that the policy pursued in our country adheres to the principle of "human interests above all else." The work carried out on the basis of this principle also pays attention to the protection of the environment and the improvement of the ecological situation. In this regard, the President of the Republic of Uzbekistan Sh.M.Mirziyoev in his Address to the Oliy Majlis on January 24, 2020 focused on the following priorities: "Fifth,

we must pay more attention to environmental protection and improvement of the ecological situation.

First of all, we must continue the unprecedented work we have begun to mitigate the effects of the Aral Sea tragedy, expand forests on the dried seabed, and establish "green belts" around the cities of Nukus and Khiva. The force that performs these urgent tasks is, of course, man. Especially in today's COVID-19 pandemic, we feel once again that humanity has to be conscious of nature.

Nurturing a harmoniously developed generation plays an important role in building the future of independent Uzbekistan. The development of ecological culture is one of the important problems of education in creating a clean and ecologically clean life for the future of mankind. At the same time, for violating environmental laws, having a certain knowledge and culture in the field of ecology and nature protection, understanding the interaction of nature and society and its consequences, understanding the fundamental unity of natural sciences, environmental law, rational use of natural resources the need to nurture responsible students. Therefore, environmental education should be provided not only in schools, but also in preschool education, secondary special education, higher education on the basis of primary subjects. The role of continuous environmental education in further enhancing the ecological and legal culture of the harmoniously developed generation is invaluable. For its sustainable development, it is necessary to develop a new Concept of Education, covering all aspects of the education system, including the problems of practical environmental education. According to R. Boboyorov, "one of the most important means of preserving the natural resources of our land is to inform the younger generation about the ecological knowledge of nature conservation, environmental education. The goal can be achieved only if the skills and abilities to treat nature with care, use its resources efficiently, improve the environment, prevent its degradation and pollution, and perform morally valuable actions towards nature are developed from childhood "[2, 67]. Indeed, features such as cleanliness and love of nature play an important role in the upbringing of the younger generation, as well as in the upbringing of school-age children. Parenting is more likely to be associated with adolescence. Their simple and stable thinking is in common with their feelings of love for nature. Changes in their upbringing as they grow older do not change their love of nature. The child will remember this feeling for years.

The role of environmental education in the upbringing of school-age children, of course, depends on the knowledge and skills acquired in the preschool period. For example, in the scientific articles of M. Musaeva, "the following pedagogical effect can be achieved if schoolchildren are provided with continuous ecological education:

- Students will have a comprehensive system of knowledge about our planet;
- Students have a stable environmental education, they form a conscious attitude to the environment, nature;
- students will be able to solve any environmental problems "[3, 45].
School-age children are curious, and the fact that they are taught many different forms of education leads to the formation in their minds of all aspects of upbringing. The integration of knowledge on environmental education is one of them. For example, the fact that in the lessons "Stories from History" our generations live in harmony with nature, they are fed only by the blessings of nature, the manifestation of the worship of nature is a clear proof of this. Therefore,

in the formation of environmental education in the Russian state education system, the teaching of subjects such as environmental education, environmental ethics to children from school age was established in 1950-60 [4, 20-32]. In the 9th grade, which is a high school, new types of environmental education, such as environmental problems in the country, are taught as a science. It is important that the ideas of conservation of ecology grow in the minds of students. Textbooks for students in grades 6-7 show the natural forms of human use of the environment in the study of the period from the earliest times to the Middle Ages in the history of the Motherland. For them, the earth, the sun, and the water were sacred, preserving the blessings of the world. Man has instilled in his descendants the inability to live without water, soil, and fresh air in the upbringing of his family, so that man has not destroyed the blessings of the world. While students fully accept such historical foundations, they also keep environmental education in mind.

In science teaching, linking ecological systems to science develops students 'imagination. For example, 10th grade students will be taught World History in the Soviet Union in 1946-1991. The causes of the economic crisis of the Soviet Union are the impact of environmental disasters on the inefficient use of natural resources in all areas: soil, water, air pollution, dangerous diseases for human health, extinction of species in the wild, the negative impact on the economy and its dire consequences. showed interdependence. In this regard, the teaching of environmental culture as a separate course in the environmental education of these high school students is also of great importance in preventing the current environmental problems.

During the educational process in vocational colleges, students fully master environmental courses on the basis of their professional plans. During this period, despite the formation of ecological culture in students, the methods of adapting society-based laws to the laws of nature are poorly formed in students. Therefore, it would be expedient to introduce ecological culture, ecological laws, ecological ethics courses as a separate subject. In the formation of ecological culture, of course, the transfer of ecological knowledge on the basis of science during the lesson increases the spirit of students to love and appreciate nature and the environment. In order to develop the ecological outlook of minors in environmental education, the organization of the teaching process on the basis of environmental laws established by state laws encourages students to quickly feel the factors such as the imposition of penalties for harmful habits that affect nature.

Ecological education in the process of higher education is carried out in isolation from the disciplines, in contrast to itself [5, 41]. This is because all students set a goal to study in their specialties, to quickly introduce the sciences into practice. Environmental education is also carried out in more environmental education processes. In environmental education, the mastery of all disciplines is dedicated to environmental protection, but the goal of improving environmental education in society is still in the forefront. Environmental education can be consciously shaped at the same time as teaching non-specialized subjects to undergraduate students [6, 13]. In 1975, at a scientific conference on the process of inculcating environmental education in students, organized by UNESCO in Belgrade in cooperation with 66 countries, the articles of many researchers from around the world were collected, analyzed and concluded:

1. Linking environmental education with problems in all areas of economic, social and political processes in cities and villages;

2. To create opportunities for everyone to restore ecological traditions and educational relationships while learning their values;

3. Involve the public in improving and protecting the environment;

4. In the field of environmental protection, in addition to individuals and legal entities in society, in the field of education, it is concluded that the criteria of environmental education, the inclusion of laws in a wide range of students.

After that, in 1980, UNESCO developed the "Strategy for the Preservation of the World." According to this strategy, programs have been developed to introduce environmental education and environmental education around the world. A separate section on "environmental education" has been included in the World Saving Strategy. The goal is to develop the ecological culture of the next generation on the basis of environmental education in the system of continuing education.

CONCLUSION

In short, environmental culture is interrelated in all areas of education. Developments in socio-economic systems related to environmental issues in the educational process encourage students of all ages and the next generation to strengthen their environmental culture. Therefore, in the continuous system of education, the inculcation of ecological culture in regular students is of great importance in protecting the environment. This is because environmental education is a means of ensuring that people continue their future with an ecologically clean life in pre-school education, school and secondary special, higher education.

Based on the above research, it is advisable to include the following suggestions in the education system:
- Teaching environmental education to preschool children on the basis of special programs;
- Inclusion of environmental education topics in school curricula and subjects, at least once a quarter;
- Organizing classes and trainings for students on environmental safety and environmental issues in secondary special vocational colleges;
- We hope that the use of youth services in environmental protection will be effective if special courses on environmental law are organized in the higher education system.

THE ROLE OF MONOLOGICAL SPEECH IN LIGHTING THE INNER WORLD OF COMEDY (ON THE EXAMPLE OF A.QODIRI'S WORKS)

Tursunova Faridahon Ganievna*

*Senior Teacher,
Fergana Polytechnic Institute,
UZBEKISTAN

ABSTRACT

The article reveals the importance of monologue in illuminating the inner world of comic character, the writer's skill in using vulgar words to enhance the artistic and aesthetic value of the work.

KEYWORDS: *Humorous Character, Inner World, Irony, Sarcasm, Poisonous Laughter, Drunkenness, Gambling, Filth, Depravity, Playfulness, Puppy, Mochahar, Battola, Sakbachcha, Dog-Eating, Dog-Eating.*

INTRODUCTION

In his comics, Abdullah Qadiri raises socio-ethical issues in illuminating the inner world of the protagonist, identifying the characteristics of nature, creating satirical types of the period, using sarcasm, pitching, sarcasm, poisonous forms of laughter to reveal the truth of life, travels to his inner world through character monologue.

I.Sulton, F.Nasriddinov, A.Aliev, I.Mirzaev, O.Sobirov, M.Abdurahmonova, M.Kushjanov, A.Murodkhon, H.AbdusamatovA.Rahimov, about A.Kodiriy's comedy and his artistic skills in literary criticism Scientists such as S.Makhsumkhanov, U.Normatov, B.Karimov conducted serious research. [1.1.] Abdullah Qadiri's heroes of comics, including the image of Toshpolat, were viewed differently at different times, and his negative features were exaggerated. Literary critic U.Normatov in his chapter "Sergilokulgi" of his work "Garden of Qadiri" asked Abdullah Qadiri's "What does Toshpolattajang say?" While the protagonist of the work reveals Toshpolat's diligence and compassion through the situation in the labor market, we have tried to illustrate his patriotism, justice, honesty, humanity with examples.

"Do you know that kajava belly that happened to be a carriage, sir?" – Well done. Tell me, who is this cripple? How many mosques did he build, how many from madrassas, huh? Or does he store what he has in his stomach? [2.1. 336.]

Toshpolat is a greedy man who thinks not of the people, but of himself, and does not give what he earns to anyone else - he insults the rich with irony, pitching, and hates them. BuvadakhanTora from Tashkent, AzimboyKomir, Saib Maxim, AzimShaytan, Aziz Yakanchi, MirkholiqKishiq, Matishgukur, Yusuf Khoja, ShoolimCholak were angry with such rich people as I said: If your king says that I am an investigator, if I do not take out all these rich people, put them in a pir and I will shout for the sake of God. ” (Page 336)

Although Toshpolat is unemployed, drunk, and a gambler, he cares about the people and is fed up with injustice in society. He is furious when he sees the greedy rich: “Which of these kisses rubs the head of a poor man. - Or do you know that he gave me cotton? ”Shows that the hero is a passionate person, burning with people's pain.

In past observations, an examination of the protagonist’s inner world has been overlooked in determining the factors that led to the protagonist’s fall into this state. Unemployed, Toshpolat "ate a piece of bread instead of bread, drank water all summer, and had a pumpkin on his leg," and "after the crack of summer, you can't even pack three or four packs of cannabis." "When my three hundred and sixty-three veins are in turmoil, may I give this chaldevor to my ward, so that your old lady in the house can open her immortal body!" (P. 343) - he does not have to label himself "free" because he is sorry for his condition and laughs at himself.

Or Toshpolat, who is tired of helplessness and idleness, gathers the unemployed like himself and encourages them to go to the "stable" and tell them: "... your helplessness has hurt. He said, "I'm going to open a cookbook, and we're not going to say I'm going to masturbate you." You will also give us your khums and shops ”(p. 346). Can we not see the bravery of Toshpolat, his concern for the fate of his people, and his humanity ?!

When Toshpolat taxed himself, he said: “Besides, Eshbujir has a habit of taxing his rich uncle nine sums and taxing another uncle who was not his uncle's henchman. It would have been better if he hadn't taken his son and saved his father from death! ” (P. 336), through the monology of protagonisthis abhorrence of filth, his insanity from injustice, his hatred of sons like Eshbujur, who made his father rich in return for his tax revenues, show that his inner world is pure. At the same time, the protagonist, through his speech, denounced the cases of familiarity, injustice, overstatement in the tax issue.

Toshpolat is not free, he suffers from unemployment and goes to the labor exchange to ask for a job: "Oh my God, when I bowed my head for two months and said 'bread' at the door of this khumsang, the piece began to roar." I couldn't even hit your thrombus, bro! "If you find my word a lie, put it in my forty-four years of faith! ..." (p. 339)

He was forty-four years old when he swore, but he could not do anything, he was unemployed, he was helpless, he was a gambler, he was a swindler, he was afraid of swearing by his faith, he said, It is not difficult to understand his sincerity.

The protagonist of "KalvakMakhzum's Memoirs" reveals his inner world through the fact that he had a salty forehead as a child, grew up in his parents' arms like a piece of paper, and "the teacher was involved in madrassas under the protection of his father." The protagonist makes a

joke through the protagonist's speech and objectively reveals how disgusting, ugly, sad his inner world is through the protagonist's monologue.In creating a humorous character, the writer makes appropriate use of rude and insulting words in order to emphasize the character of the protagonist, his inner world and nationality.

In Abdullah Qadiri's comics, especially in Kalvak Mahzum's Memoirs, the vulgarities in Kalvak Mahzum's speech are used to characterize the event, to reveal its character, nature, and awareness of the realities of the time, in the play he reads through the heart of the reader the exaggerated images given by the writer, and becomes one person, that is, a sympathetic body, in feeling the pain of the protagonist and the writer. These factors, in particular, show how appropriate, concise and legitimate the sentences in another language are, and on this basis serve to illuminate the inner world of the protagonist, gaining artistic and aesthetic value.

In comics, vulgar, rude words that undermine the allure of artistic speech are conveyed through the monologue of the characters, and insulting words are often used that undermine the beauty of the speech, which is assessed as a negative phenomenon. Such vulgarisms are used in fiction to "individualize the language of the characters, to create national and social color", [3.1.] To enhance the emotional-expressiveness of speech. In the semantic structure of vulgarisms, expressions such as "discrimination", "disregard", "insult", "extreme negative attitude" are very clear. Through such speech, along with arousing hatred for the hero's behavior, he urges them not to use such words and to fight for their non-prevalence among the people. The rude and insulting words found in the comedies were used in the speech of the protagonists, and the writer was able to fully observe the norm of the level of rudeness. This can be clearly seen in the following examples:

At the screams of the mochahar, the children in the yard ran into the house and tried to save the battalion from my clutches, but the poor man did not give me any strength, and I beat my bloodless husband with this force .... (p. 266) Which dog did he give birth to?Without losing my manners, I replied, "Poor thing!" - (page 267) Mullah Hokim, one of those who spoke the language of the bastard, is still considered to be one of the ashwafs and akobirs of the city of Shosh. (Page 281)

Kalvak Mahzum's words such as filth, depravity, playfulness, dog-eating, mochahar, battola, sakbachcha, dog-eating, dog-eating reveal his negative qualities, such as his lack of Islamic morality and his ignorance.

You don't know yet, Mahkam polvon, last night I went to the "canary" of the hezimkas in the executive committee ... I lie to you, God, I'm so happy, I'm so full ... Woe is me, I'm dying, I'm dying. One naughty one hangs on a horse .. (p. 326)

There are unusual words in Toshpolat's speech.While his mispronunciation of terms such as "canasirt" is a sign of low literacy and social activism in a sense, his use of a single vulgarism in three different situations has served to reveal different aspects of the meaning of the word. That is, he portrayed the hero's attitude to the people of art in bright paint.From the words used in the protagonist's speech, it can be seen that he is in a very strong excitement (Woe is me, save me), and has an extremely negative attitude towards the scene and the people he is describing. The writer leaves it up to the reader to draw conclusions about the protagonist by using unusual words in the protagonist's speech.

Through the vulgarisms found in the speech of the heroes, the Almighty was able to exaggerate such aspects of their character as spiritual and enlightenment poverty, extreme greed, and indifference to the following.

The richness, beauty and endless possibilities of our language are fully demonstrated through the monologue of Abdullah Qadiri's comic hero. The writer plays an important role in the historical development of the Uzbek literary language with his rich, expressive works, which are inextricably linked to the history, traditions, psyche and living conditions of the Uzbek people.

STAGES AND FORMS OF DEVELOPMENT OF SOCIAL ACTIVITY OF PRIMARY SCHOOL STUDENTS THROUGH PEOPLE'S ORAL CREATIVITY

U.Q. Maqsudov*

*Teacher,
Pedagogy Department,
Fergana State University, UZBEKISTAN
Email id: ulugbek_8012@mail.ru

ABSTRACT

This article describes the stages and forms of development of social activity of primary school students through folklore. It was also suggested that the extracurricular learning process and collaborative activities with students 'parents would allow primary school students to develop social activism skills through folklore.

KEYWORDS: *Primary School Students, Folklore, Social Activism, Folk Pedagogy, The Concept Of National Culture, Modern Models Of Education, Humanization Of Education, Extracurricular Education, Cooperation With Parents, Initiative.*

INTRODUCTION

Theoretical research is being conducted around the world on the selection of examples of folklore, which will allow students to develop social skills, ensure personal development. In the pedagogical thinking of the peoples of the world, it is important to identify the historical path and development trends of the education of social activity, the concepts of the formation of a harmonious personality, their impact on the pedagogy of other nations. Identifying, systematizing the means of folk oral creativity, which are the product of the pedagogical thinking of mankind, serves as an important factor in the development of social activism skills in primary school students.

The use of folklore in the development of social activism skills in primary school students is considered pedagogical:

First of all, there will be an involvement of the Uzbek people in oral art, acquaintance with languages and traditions on the basis of oral speech.

Second, the transmission of cultural folk heritage is done.

Third, with the help of examples of folklore, the child develops cognitive processes: memory, attention, imagination, perception, imagination, thinking.

Fourth, the lessons develop the child's personality qualities: will, emotionality, creative activity.

Based on the above, the tasks arise for the development of social activism skills in primary school students through folklore:

1. To acquaint students with examples of Uzbek folklore.

2. To teach students to use simple forms of improvisation on the basis of examples of folklore and others.

3. Achieve social activism skills and competencies in primary school students.

In the selection of samples of folklore in primary education, it is necessary to take into account that they have acquired a specific theoretical and practical knowledge. Primary school students are not able to master all types of folk oral art due to their age and work characteristics. Therefore, the task of the teacher is to acquaint children with the types of folklore, to arouse their interest [1].

Theoretical research, based on practical experience, we conclude that the formation of children's social activities occurs gradually, step by step, so the methodology of working with folklore in the first stage - fun and play, in the second stage - knowledge of science through teamwork - should be based on slow deepening, in the third stage - independent creative activity through improvisation [2; 67-p.].

 Each stage of work corresponds to the child's own criteria of social activity, interest, the formation of personality traits. For example, cognitive activity is characterized by interest, novelty, brilliance, cognitive activity. Children tend to read more, watch and listen to their peers 'performances, collect samples of folk oral art, prepare albums, and so on. This stage allows you to gather impressions that will be useful in your work.

 In the second stage, the creativity of the students plays a leading role. The following criteria are important: emotionality (good mood, satisfaction, sadness, sadness, etc.); creative interest (its strength, duration, expressiveness); intensive development of personality traits and creative abilities.

In the third stage - the people's oral creativity, the criteria of values and attitudes to traditions, the desire and aspiration to express themselves in creativity, to express their skills for other people.

A distinctive feature of primary school students is the creative universality: children sing, dance and perform examples of folklore.

The development of social activism skills in primary school students through folklore is a continuous pedagogical process that cannot be limited to lessons. Any educational activities carried out with students should complement the knowledge they have acquired in the classroom. From this point of view, the process of extracurricular education also plays an important

pedagogical role in the development of social activism skills in primary school students through folklore. Ensuring the continuity and continuity of these educational activities activates the cognitive activity of students, increases their interest, creates opportunities for the manifestation of their talents. Accordingly, the effective organization of these activities is one of the most pressing pedagogical issues [3; 103-p.].

Teachers and parents play an important role in introducing primary school students to folklore genres and works of folklore. For this purpose, it is important to prepare materials on this topic, to hold parent meetings, pedagogical hours to introduce these participants in the pedagogical process in this direction.

"Harvest Festival", "Navruz", "Melon Festival" leave unforgettable impressions in the hearts of children and cultivate a positive attitude to the traditions and customs of folk culture. National seasonal celebrations are a unique opportunity to learn folk songs, dances and traditions every year. Holidays help children to master the large repertoire of folklore without difficulty, and accordingly, children will have great pleasure from meeting specific folk art [4; 47-p.].

 The purpose of the voluntary celebration is to leave a bright impression on the heart of the child. Folklore material is designed to help children express their feelings through songs, dances, poems, proverbs. The beauty of the holiday event, figuratively expressive speech, songs - is a convenient material for fostering creative and social activity in children. Children's participation should be a necessary element of a seasonal event. Children can accompany adult songs or play children's songs directly. On the occasion ofNavruz, children can prepare national dishes together with adults, get acquainted with the history and traditions of the holiday.

 During the preparation and conduct of the holidays, insecure children become enterprising, socially active children. They are involuntarily involved in the process of play, in which the child acquires skills and abilities, develops imagination, imagination, memory, thinking. In this case, his initiative, creative abilities develop spontaneously in the form of a fun game.

Values, cultural and spiritual riches, folk arts, traditions, customs, holidays, ceremonies, examples of folklore serve as an important tool in the development of social activism skills in primary school students. One of the important tasks facing today's education is to organize the widespread and effective use of these tools in the classroom and extracurricular activities, family conditions, public places.

Thus, teaching in the primary grades is built in such a way that it covers not only the mind but also the emotions of the child. Creative research in the classroom, the creation of an environment of high emotional uplift is a necessary condition for the acquisition of knowledge. Acquired knowledge becomes trust.

 In attracting students to the Uzbek epic, the primary school teacher strives to instill in them a love for their homeland, its eternal poet - the Uzbek people, a love of beauty, the development of students' speech, increase the vocabulary.

 Proverbs are a great tool for cultivating moral qualities in children, a set of specific moral rules, rules of conduct.

 When working with folklore genres, the teacher uses expressive reading, selective reading, verbal expression, which develops the aesthetic feelings of primary school students, helps them

to understand the nature of the work of art and the universe and people - their beauty, to feel beauty. All this helps the child to have a deeper understanding of the world of fairy tales, to feel its uniqueness. Folklore jokes help students see funny events in life and express them verbally. Questions, poems and song jokes. At the same time, the humor maintains a serious tone and allows the listener to decide for himself whether it is funny or not [7; 76-p.].

 Folklore - riddles, proverbs, songs, fairy tales cultivate in people a high sense of love for the mother, the understanding of labor as the basis of life, they think about historical events, social relations in society, protection of the Motherland, culture.

Developing the oral speech of an elementary school student - encourages him to think. Thus, the use of elements of folklore helps to open the "worldview" of students, activates their thinking, develops their personal qualities, nurtures their social activity through the formation of self-improvement, self-expression, the need for self-development. . The problem of folklore requires in-depth attention, and the use of folklore in the development of social activism of primary school students is relevant and promising.

SCIENTIFIC ARTICLE ON "AESTHETIC, EXPRESSIVE FUNCTION OF PHONETIC STYLISTIC DEVICES"

Parpiyeva Mokhira Inomjanovna*

*EFL Teacher
Department Of Uzbek Language and Literature,
Ferghana Branch of TUIT UZBEKISTAN

ABSTRACT

The aesthetic, expressive function of phonetic stylistic devices and research and analysis issues of linguists and literary critics. It is also used in the poetry of writers to increase the expressiveness, impact, and impression of a literary text, not only in Eastern literature but also in Western literature.

INTRODUCTION

Extensive research is being conducted in our country on the scientific basis of the study of Uzbek as well as foreign languages. In particular, the issues of methodological analysis of phonetic means are becoming the focus of attention not only of literary scholars, but also of linguists.

A number of stylistic works have been done in Uzbek linguistics.

The idea of phonostylistic means and their use in speech was first expressed by A. Gulyamov. The scientist notes that phonetic devices have a lot of methodological possibilities, and emotional impact is created by changing the tone and phonetic appearance of some words.

Phonetic devices - speech sounds, accents, tones, tones, timbre. Graphic devices - letters, punctuation, their colorful writing.

Phonographic stylistics is an integral part of graphic stylistics, which explores the specific methodological possibilities of written speech as a whole. Graphic stylistics faces two main tasks:

1) reflection of phonetically effective means of oral speech in written speech;

2) to study only the descriptive-emotional means (emphasis, emphasis, attention to the significance of the event, etc.) in written speech. The first of these tasks is studied in phonographic stylistics.

Since the most important features of the language of a work of art are imagery and emotionality, these qualities are revealed by the means of speech. In the process of analyzing a literary text, special attention should be paid to the aesthetic features of phonetic units. In a poetic text, the aesthetic potential of speech sounds is quickly and easily understood. Because the poem has a uniquely attractive tone. This melody is achieved through the methodical use of sounds. In poetry, mainly phonetic techniques such as alliteration (consonant repetition), assonance (consonant repetition), gemination (consonant folding) are used. expressiveness is ensured by means of phonetic methods such as sound gain or sound reduction. However, pronunciation and narrative compatibility can be achieved using phonographic means.

Repetition of certain sounds occurs in all types of speech. Poetic speech regulates these repetitions and enhances the aesthetic effect. This order is partially rigid, becomes a norm, and remains partially free.

According to the linguist G. Abdurahmanov, "each type of style is formed by means of creating a methodological color (emotionality, expressiveness). In all types of artistic speech, tone is a means of creating style. We can group the phonetic devices that play an important role in artistic speech as follows:

1. Melody (Intonation)

2. Stress

3.Pause (Pause)

4. Alliteration

5.Assonance (assonance)

6. Sound repetition (sound rehearsal)

7. Phonetic structure of sounds that mimic the sounds of objects and animals (Onomotopoea).

The emergence, improvement and acceptability of speech also depends on the richness of phonetic methodological means. Phonetic methodological means, prosodic means, etc.) form a specific layer in the richness of speech. The communicative feature of speech is formed differently in different styles of language, at different levels and in its specific layers (phonetic, lexical, semantic, syntactic, etc.).

In recent years, Uzbek linguistics has published a number of works on the stylistic features of phonetic devices in speech and even writing.

The great French linguist Antoine Meye, in a 1925 review, emphasized that an in-depth study of language aesthetics was of absolute importance to general language theory.

The question of what the concept of "aesthetics" in language includes, and how it is characterized, is natural and well-founded. The great linguist RA Budagov is of the opinion that "aesthetics" of language and speech should be understood as a conscious attitude of the speaker or the writer not only to what he says and writes, but also to how he speaks and how he writes. "

"Literary text, unlike any non-fiction text, performs a special task - an aesthetic task, which is manifested in a complex interaction with the communicative task and is a decisive factor in the specific structure of the text." M. Yuldashev says: "In the works devoted to the study of the language of fiction, along with the term" expressive function "of language," poetic function of language "," artistic function of language "," aesthetic function of language " Terms such as However, it should be noted that the term "aesthetic function of language" is used relatively often in the philological literature. This is natural, because the concept of aesthetic task can generalize them, including a number of concepts such as expressiveness, art, poetics. In other words, the scope of the concept of aesthetic function is much broader than these concepts.

"Everything that makes a speech brighter, more moving, more impressive is expression. So, expressiveness of speech is a means of making speech bright, effective, and imaginative. "

What conclusions can be drawn from these two terms? Maybe they are synonymous terms? At this point, we need to comment on the terms "aesthetic function" and "expressive function" of language.

First of all, looking at the lexical meaning of the two terms helps to differentiate ideas. Expressionism is a French "expression". There is also the power of expressiveness. AI Yefimov meant this meaning when he said: "The main feature of artistic style that distinguishes it from other styles is its aesthetic function, imagery and expressiveness." Aesthetics is the Greek word for "feeling."

Hence, both terms do not represent different concepts in relation to the function of language. They reflect two sides of the same concept. More precisely, expressiveness reflects the purpose of the speaker, that is, the owner of the language, rather than the means he uses for this purpose, and aesthetics means the result that the listener feels, that is, expressiveness to arouse aesthetic pleasure serves. Both together mean the same task, so it is more appropriate to use the term "aesthetic" in relation to the function of language, and "expressiveness" in relation to the means of accomplishing that task. The term "expressiveness", which is used in relation to the function of language, is metonymically derived. At this point, we think it would be inappropriate to comment on another term used in stylistics. Talking about the terms expressiveness and emotionality also helps to express what we want to say.

"Some linguists argue that language has an emotional vocabulary in its vocabulary, but no expressive vocabulary. According to them, expressiveness is based on the special use of language units.

Emotionality exists only in language. Expressiveness, on the other hand, can be seen in gestures, facial expressions, and actions, even in work. Expressiveness occurs when any word or other language unit goes out of its way and is used specifically for a different purpose. Expressiveness is usually divided into two groups: expressive-emotional and expressive-subjective assessment. It was customary to divide the meanings of words into such types, given that the signs of expressiveness are not the same in meaning. " "Expressiveness means increasing the power of expression. Everything that makes a speech brighter, more effective, more impressive is expression. So, expressiveness of speech is a means of making speech bright, effective, imaginative. " From this point of view, one can see the infinite possibilities of expressiveness at all levels throughout the hierarchical system of language. Speech sounds are one of the most important units in the formation of speech and serve as one of the most important tools in the

analysis of literary text. Phonetic stylistics studies the expressive-stylistic possibilities of the interconnection of sounds, in general, the laws by which speech sounds can serve as an effective means of language. In the process of analyzing a literary text, special attention should also be paid to the aesthetic features of phonetic units. In a poetic text, the aesthetic possibilities of speech sounds are quickly and easily perceived. Because the poem has a unique melody. This melody is achieved through the methodical use of sounds. Typically, in fiction, more lyrical works, sounds, accents, and tone are important methodological tools in increasing emotional sensitivity. The various forms and methods of melodic discourse, by their very nature and essence, are peculiar to poetic speech. Poetic speech is an exciting rhythmic speech that is organized in terms of tone and emerges as an expression of emotion. Poetry is characterized by the widespread use of certain means of regulating the tone of speech (for example, rhythm, rhyme, radif, band, etc.). Therefore, the structure of the poem stands out as a special branch of phonetic stylistics.

It is known that as a result of aesthetic use of sounds in poetry such phonetic methods as alliteration, assonance, gemination are used. In prose, expressiveness is provided by phonetic methods such as stretching vowels, folding consonants, repeating sounds, mispronouncing words, adding or subtracting sounds. However, the possibilities of individual style are so wide that it can be seen that phonetic methods such as lengthening vowels, folding consonants, repeating sounds, changing the pronunciation of words: increasing or decreasing sound are also widely used in poetic speech. A. Haydarov, a researcher in this field, notes that the "colors" that make up the components of connotative meaning are also strongly expressed in phonetic means, and the different pronunciation of any word in addition to the norm in speech makes it emotionally effective. In poetry, such pronunciation of sounds depends on the condition of the lyrical protagonist and reflects his different attitude to reality. The following are examples of expressions expressed in vowels. Stretching vowels can have the following meanings:

 Emphasize the meaning of the order:

> Ey, g`anim,
>
> Soyam kabi ergashma, qo`y,
>
> Tushsa tashvish kiftima, tirkashma, qo`y,
>
> Do`st bo`lib, do`stday bo`lib yig`lashma, qo`y,
>
> Do`stimga   Tegm-a-a!!!   (Farida Afro'z)

a)
Excess of the symbol:Bu kech yedim tushimda

Sutdek o-oppoq kulchani.   (Anvar Obidjon)

b)   Qolgunicha bir nafas, bir oh,

Hali uz-o-oq yashaymiz birga.   (Farida Afro'z)

Iltijo, yolvorish ma'nosini kuchaytirish:

a)   Ta`malar domidan qutqargin,

Sabrni yaratgan jo-on Xudo!   (Farida Afro'z)

b)   Bir kun kelib

Sundoqqina tiz cho`kasan-da,

o`paverasan, o`paverasan izlarim gardini.

Kechir, deysan, kechir, bir zum ko`ray bir zum, bir zum…

Jonim beray,

uzr, deysan,

uzr, uzr…uzuuur!   (Farida Afro'z)

Inkorni kuchaytirish: Faridam,

                    faridim,

                    farishtam,

                        deding,

Kuldim-u ketdim.

                                        Men seni

                            he-ech kimga

                        alishmam,

                    deding,

Kuldim-u ketdim.   (Farida Afro'z)

Holat tasvirini bo'rttirish:

O`tiribman cho`mi-i-b sukutga,

Aytolmasdan dardim men noshud.   (Anvar Obidjon)

In the English Jungle Book, the I sound is repeated by means of repetition:

"I----I? How was I to guess he would play with such dirt .The monkey People! Faugh!"

TOURIST OPPORTUNITIES OF THE REGIONS FOR THE DEVELOPMENT OF TOURISM IN THE FERGANA VALLEY

Kadyrova Dildora Sobirjonovna*

*Teacher
History of Uzbekistan and social sciences department of Fergana Polytechnic Institute,
UZBEKISTAN

ABSTRACT

The article focuses on the development and prospects of tourism in Uzbekistan and Fergana region, tourist opportunities in Andijan, Fergana and Namangan regions, historical monuments and sites, as well as the state's attention to them. During a visit to the city of Khanabad, which is becoming a tourist center of the Fergana Valley, tour operators noted that Khanabad is indeed a region with great potential for tourism development. The purpose was to turn Khanabad into a tourist center of the Fergana Valley at the initiative of President Islam Karimov, to get acquainted with the work being done in this area, to study the views, experiences and recommendations of experts on developing a separate development concept.

KEYWORDS: *Tourism, Trade, Hotel, Region, Monument, Shrine.*

INTRODUCTION

President Shavkat Mirziyoyev's Decree No. 5781 of August 13, 2019 "On measures to further develop the tourism sector in the Republic of Uzbekistan" sets the task to establish "Tourism mahalla", "Tourism village" or "Tourism Village" on the ground. In order to ensure the quality of this task, a working group consisting of officials of the State Committee for Tourism Development of the Republic of Uzbekistan and its department in Fergana region is studying the organization of "Tourism Village" and "Tourism Neighborhoods" in the region. In particular, on May 26 this year, representatives of the working group went to the field and met with residents of the mahalla "Yorkin" in Margilan. It revealed the existence of handicrafts (weaving, spinning, embroidery, goldsmithing, handicrafts, sewing, carpet weaving, silk, carpentry, wood carving) and bakery, organized on the basis of national traditions in the neighborhood. In addition, the locals expressed interest in organizing family guest houses, guide services and folklore

community activities for prospective tourists. Advocacy work on the establishment of "tourist mahallas" continues in Fergana region.

More than 30 tour operators operating not only in Andijan, but also in Tashkent, Bukhara, Samarkand, Fergana and Namangan regions, specialists of the State Committee for Tourism Development of the Republic of Uzbekistan and regional departments of tourism development took part in the "Tour Operators" campaign organized in Andijan region at the initiative of the regional administration participated. The purpose was to turn Khanabad into a tourist center of the Fergana Valley at the initiative of President Islam Karimov, to get acquainted with the work being done in this area, to study the views, experiences and recommendations of experts on developing a separate development concept.

One of the tourist attractions in Andijan region is the shrine "Khojataksimota" in Pakhtaabad district. This place has a centuries-old history and is a sacred place of worship, where our compatriots ask the Creator to answer their needs.In recent years, large-scale construction and creative work has been carried out here.

The Jome architectural complex in Andijan can also serve tourism. The venue is located on Artisans Street and features samples of national handicrafts, lead and iron processed household goods, national cradles and handicrafts.

The fact that the workshop and sales stalls are located in one place makes a great impression on the guests, as it is possible to produce and sell products at the same time.

There is a mosque "Devonaboy" located in the Old City of Andijan. This mosque is one of the most unique mosques in the country with a closed roof and a large architecture. Khojaabad district and the city of Khanabad, which are eco-tourism areas, can also serve the tourism sector of the region. Visiting the Babur Garden National Park, one of the coolest, busiest and most prosperous places in Andijan, and getting acquainted with the Museum of Babur and World Culture can be of great interest to tourists. The Imam Ota shrine in Khojaabad district is also one of the busiest and most prosperous tourist sites. The beautiful mountain scenery, the cool natural climate of the region, the available waterfalls and springs provide ample opportunities to build a tourist village here. During a visit to the city of Khanabad, which is becoming a tourist center of the Fergana Valley, tour operators noted that Khanabad is indeed a region with great potential for tourism development. It was noted that more than a thousand country houses built in the Khantag region, as well as a number of tourist facilities under construction will further expand the tourist potential of the city.

At the end of the event, in a roundtable discussion with the participation of tour operators, the regional administration, Specialists of the Territorial Department of Tourism Development, entrepreneurs provided detailed information on the tourism potential of Andijan region, in particular, the concept of transforming Khanabad into a tourist center, the construction of new tourist facilities, tourist villages and tourist streets, a number of projects.

It was noted that a number of problems and shortcomings need to be addressed, such as the lack of tourist transport facilities in the region, the lack of hotels in areas other than the regional center, underdeveloped tourism infrastructure, inadequate use of tourist facilities.

Perspective plans for the development of tourism are also being implemented in Namangan region. For example, in the village of Nanay, Yangikurgan district, Namangan region, modern

tourism facilities will be created and turned into a rural ecotourism center on the basis of many inefficient, vacant and neglected resorts that have not been used for decades. This is stated in the resolution of the governor of Namangan region "On measures to further develop tourism and ecotourism in Yangikurgan district," aimed at further increasing the potential of tourism and ecotourism in the village "Nanay", providing local employment and improving living conditions.

ABSTRACT

Currently, nearly every person who is teaching a new language run into some kinds of obstacles. Therefore most learners have difficulty in some cases. One of them problem in both learning and teaching vocabulary. Actually it is not a difficult situation, although it is considered one of the issues in learning as well as teaching a foreign language. If you find the way which is your students are interested in, teaching any kind of vocabulary begins much more easier. Many of the scholars can suggest different kind of ways to make easier grasp new words. In this article, certain issues and their effective solutions are given.

KEYWORDS: *Obstacle, Method, Vocabulary, Remember, Facts, Achieve, Strategy, Fluently, Effective, Word Parts, Acquiring, Language, Dictionary, Context, Communicate, Problematic, Strategy, Teaching.*

INTRODUCTION

Vocabulary is the most vital thing to speak fluently or to learn one specific language in an effective way. Since comprehension is the ultimate goal of reading, the importance of vocabulary development cannot be overestimated. A robust vocabulary improves all areas of communication. For a large majority of learners, the ultimate goal of studying is to be able to communicate in a new language. If you do not wish to lean completely on non-verbal skills, mastering vocabulary is not just important, but crucial in a foreign language environment. No matter what your aim is when learning a new language you need to be fluent to achieve it. It means being proficient in all aspects of your target language such as grammar, vocabulary, writing systems as well as phonetics. Most students feel comfortable with the basics of language, however, when given an opportunity to use their new language skills, they seem to spend much

more time looking up unfamiliar words in the dictionary than actually speaking, reading or writing. It has led to every learner or teacher to think the answer of this question: " What is the solution to the problems of progressing past the initial stages of learning and achieving real fluency in a second language?"

Vocabulary is critical to a child's success for these reasons [1]:

4. Vocabulary growth is directly related to school achievement

5. The size of a child's vocabulary in kindergarten predicts the ability to learn to read

6. Vocabulary helps children to think and learn about the world

7. Expanding a child's knowledge of words provides unlimited access to new information [6]

Traditional linguistic theory suggested that grammar is the most important for achieving fluency. Yet, in recent years a great number of language teachers have begun to believe that gaining is the key to achieve fluency. Also there are some difficulties on the way of raising vocabulary.

Here I tried to give common vocabulary problems for schoolchildren and students. First of all, what kind of problems do schoolchildren run into while learning vocabulary? Do your pupil struggle with reading ? Usually because of having a poor vocabulary, this kind of pupils dislike reading and they avoid it. They may have such kind of dilemmas in learning vocabulary:

- Not knowing prefixes and suffixes;

- In some cases, they may read books or texts above their grade level. Teacher should not ban comic books or graphic novels but also he/she must find out what genre his/her pupils are interested in and encourage them to read books.

- Some pupils may have poor predicting skills, they may have blank gaps when they read and miss a lot of information therefore they cannot tell the meaning of a new word from sentence or paragraph;

- They may be unable to transfer new words to real life vocabulary. In this case new words are easily forgotten and never used

- Using the same words over and over. A lack of descriptive words, adjectives and adverbs means pupils stick to the few words they know.[2]

Instructors as well as parents should apply some kind of tips for solving these problems which their pupils have. We may take an example following ones:

- Pay attention to the learner`s vocabulary. Using new words regularly and adding them to daily conversation is considered the suitable method of teaching vocabulary. In addition, using synonyms are also helpful;

- Correcting mistakes positively and gently by repeating;

- Teaching related words. Teaching words in groups and making connections can be really beneficial;

- Playing vocabulary games. This kind of games are an excellent way to revise the words which they have learnt at the previous lesson. You may improve their vocabulary with the help of funny word games;

- Giving simple friendly definitions. Teachers should try to give the pupils friendly explanations of the new word as much as they can. Such as the may tell the word "enormous" means "very big"

- Using the words in everyday life. By using the words every day pupils may correct their own mistakes in pronunciation and spelling.[3]

These ways can help the pupils and children to remember and improve the vocabulary. What is more many researchers have shown the most usable way to learn vocabulary is to see a word more than once in different ways. Try to apply the word in different situations.

Dictionaries. Although dictionary use is the main feature of most vocabulary instruction, a great number of students do not receive the right instruction they need to learn how to use a dictionary effectively. Many of the students` instruction in dictionary use focuses on looking up new words and apply the information from the translation which they find. Young students also often have difficulty choosing the appropriate meaning from dictionary.[5]

Word parts. Students capability of using word parts for example, prefixes, suffixes, roots can contribute greatly to their vocabulary growth. Nonetheless, word parts are not always reliable. This might be because, they may have different meanings. To illustrate, sign/design, emerge/emergency

Context. Students are able to acquire a lot of vocabulary knowledge as they pick up the meanings of words from context. However the meaning of the one certain context may not reliable in another one. Students always keep in their mind without confusing. [4]

Famous scholars can suggest the applicable ways who need to upgrade their vocabulary skills:

- Reading a lot;

- Memorizing vocabulary;

- Paraphrasing definitions;

- Study synonyms and antonyms;

- Using the words in context;

- Sorting the words into categories;

- Using language study apps;

- Using social media in a foreign language;

Another one of the most effective ways of dealing with the problems of the grasping the new vocabulary is " A concept cube". A concept cube is a great strategy to employ word parts. Students receive a paper   divided into six equal squares. On each of the squares students are instructed to write down one of the following:

- Vocabulary word

- Antonym

- Synonym

- Category it belongs to

- Essential characteristics

- Example [7]

Students then cut, fold and tape the paper to make a cube. Then, with a partner, they roll their cube and must tell the relationship of the word that lands on top to the original vocabulary word.

Teaching vocabulary is seem to be difficult as well as learning vocabulary. Instructors may run into certain kind of difficulties, however, they can solve them with the help of effective and creative methods. Famous scholars can suggest the applicable ways who need to upgrade their vocabulary skills or to teach vocabulary in an efficient way:

- Teacher should always remind the students to read a lot;

- Memorizing vocabulary;

- To instruct paraphrasing definitions;

- Guiding the students apply synonyms and antonyms;

- Using the words in context;

- Sorting the words into categories;

- To encourage them to use language study apps;

- Using social media in a foreign language;

The action verbs which are frequently used in everyday life are great to have some practice during the early childhood since the actions they represent can be easily leaned at home. But there is other words that can learn as they grow up, and start incorporating into their vocabulary. Action verbs can be divided into several different categories, they can talk about organizational actions, critical thinking actions or communication words. Some of them are much more easy to identify and explain than others. Some scholars suggest several interesting activities to young learners who study English language as a second language. The most effective ones are TPR activities. They are really helpful for young learners. Total physical response or TPR was created by American psychologist Dr. James Asher. Indeed, we learn our mother tongue with the help of this kind of activities. Our parents demonstrate and instruct and we respond them. No one demands or requires very small children to speak at all, only to listen and understand, which is to say, to comprehend. The result is that we acquire our mother tongue, therefore, the idea of TPR is to create a neural link between speech and action. So we can teach action verbs easily in this way. Total physical response has a lot of benefits, particularly for the instructors who are teaching beginners and young learners. Such as:

- The pairing of a movement with language is associated with effective learning;

- Pupils actively use the left and right side of their brains;

- It works with both small and large groups;

- It can be very effective to explain difficult actions (slide, launch)

- It can help the teachers with imperatives and classroom language.

There is also basic method which is suggested by teachers for using total physical response in the classroom when the instructor is teaching action verbs:

- The teacher performs an action, both demonstrating and saying it. For instance, I am brushing my teeth;

- Instructor call on the pupils to repeat the action;

- Repeat once more

- Write the verb/phrase on the board;

- Repeat with other verbs and return to them regularly during the class to check retention. [5]

TPR is a major method to teach action verbs and its result will be effective. Total physical response activities can be various, even the teacher can create herself or himself at any time. Here are some samples of TPR activities for teaching action verbs:

Follow the reader. Pupils line up behind the teacher and follows him or her around the classroom. The instructor does an action and shouts out the word for that action. The copy the action and repeat the word. Actions may include : wave hello/goodbye, it is cold/hot, stop, go, run, hop, skip, crawl, walk backwards, jump, sit down, stand up and others.

Exercises. This one is great for over excited students who need to burn off a bit of energy. It is also good for classroom commands and numbers. The teacher stands the pupils in a line and call out instructions: " Jump 10 times", "Turn around 4 times" and others. Other good ones to apply are: run (on the spot), hop, hands up and down, touch your (body part), stand up and sit down and jump. In this case teacher should demonstrate the action verbs which are taught.

Classroom races. Races are fun way to teach a lot of different dynamic verbs as well as adjectives and adverbs. Teacher should line the students up and tell them the action they have to do during the race and then shout go. Actions may include: little steps, skip, jump, giant strides, hop like a rabbit, fly like a bird, walk quickly/slowly, run backwards and so on.

Can you actions. Teacher may use this game teaching action verbs. In addition to this, he or she can teach "Can you…?", "Yes I can", "No I can`t". These actions are really fun: dance, run quickly, skip, hop, do a star jump, touch your toes, cross your eyes, snap your fingers, whistle, sing. To illustrate, the teacher should ask a pupil "Can you raise your hands?" If the pupil replies "Yes I can" then she or he says "Ok go!" and the pupil does the action. If pupil says "No, I can`t" say "Too bad", "Ok can you wiggle?" The activities which are similar to the mentioned ones above are suggested by many teachers. [5]

All things considered, vocabulary is the most significant side of an argument in learning a certain foreign language. Vocabulary is the most required skill when learning a foreign language. It is on vocabulary that all the other skills, reading, writing, speaking, and listening are based and developed. If someone has such kind of problems which I have mentioned above, they should focus on their active vocabulary as well as passive one. When you encounter words while reading and speaking, these words are generally added to your passive vocabulary. Another way which is suitable for everyone is learning new language words with their synonyms, similar words and antonyms. This method is really helpful when you can learn the word easily. If you cannot remember a word, most language teachers give advice you that you can skip the word or

just move on with another sentence. It may come to your mind later while speaking. These are some basic problems and main strategies to deal with vocabulary and most effective ones. By doing these you can enhance your vocabulary as well as decreasing dilemmas while studying. Also never skip doing active vocabulary activities and passive ones. Actually numerous people run into such kind of problematic situations. Given strategies and tips may help and increase their vocabulary, are able to cause the learning of new language efficiently.

Budgam, INDIA

ABSTRACT

This paper is a modest attempt to reflect on the essential message of Iqbal, the poet of humanity and what relevance it has for our contemporary times. We are living at a time in which mankind has made vast strides and progress in almost all fields of life. But with all these advancement in knowledge, science and technology and the information revolution, it is a tragedy to see that this is also the age of crisis, wars and bloodshed, armed aggression, social and economic injustice, human rights violation, alcoholism and drug addiction, sexual crimes and psychological disorders, increasing suicides and the disintegration of the family. All these are symptoms of a sick and decadent society, which is drifting aimlessly like a ship in an uncharted ocean. Modern man has alienated from himself and had lost the meaning and purpose of life. Really speaking, the political problems, the conflict between nations, violence and crime, environmental crisis are external manifestations of the inner crisis of the contemporary societies, manifested in social and economic injustice and the violation of human rights, denial and deprivation of the fundamental freedom of man, social disparity and inequality and in turn are causing social tensions and conflicts in human societies all over the globe. It is in this context, that Iqbal's concept of dignity of man and the sanctity of human personality and freedom assumes significance.

INTRODUCTION

Economic philosophy of Iqbal: Ilmul Iqtisad was the first book on economics in Urdu authored by Allama Iqbal in 1903. During the years in around 1903, books authored by Adam Smith, J. S. Mill, Riacrdo, Alfred Marshall were being taught all over Europe. Consequently, the above publication established him as the first Muslim Economist of the then British Sub-continent. Thus his work served as a beacon light for the next generation of writers on Economics.   He delivered three speeches on Budget in the Punjab Legislative Council of those days, namely,

1927-28 to 1930-31. He also delivered a speech on the resolution regarding application of the principle of assessment of income tax to the assessment of land revenue on February 28, 1928 in the Punjab Legislative Assembly. His two historical presidential addresses of Allahabad (December 29, 1930) and Lahore (March 21, 1932) are of significant importance and present outlines of the strategy for his economic thinking.

The contemporary era of Globalization is in the final analysis, a sparkly exploitative system in the epoch of corporate capitalism with a substantial percentage of international trade in the hands of MNC's much of Iqbal's fears have proved themselves to be true. Iqbal's denunciation of modern capitalism and his profectious of the maladies which this system of economics makes him a real visionary. We would like to trace the development of corporate capitalism in order to see what Allama Iqbal had to comment on this cancerous development. Globalization means shutting out possibilities of economic growth for the third world. It has been creating virtual fences to shut our people of schools, hospitals, workplace, farms even houses & communities. Mass privatization and deregulation have bred armies of locked out people, whose service are no longer needed, whose life style are written off as "backward" whose basic needs must go unmet. Throughout his book Ilm- ul-Iqtisad the first ever effort by an Urdu poet to understand the basic roots of Adam Smith, Ricardo & Marshal who could be called fathers of international capitalism, we come across a basic disagreement of Iqbal towards an economic philosophy which believes in exploitation of weaker sections of the society. He believes that nothing good could come out of a morally bankrupt view of thriving on an economically weak people battling with scarcities of life.

His article National Life & view of Millat i Baiza (A view of the Muslims community) and his Introduction to Asrar-i-Khudi (Secrets of the Self), his first collection of Persian poetry, Allama seems to be concerned with the cause of economic rise of Japan & the West- and the causes of the decline of Muslim society. He thought that the world's view of mystical poetry was mainly responsible for the decline of the élan vitale (soul-energy) which was necessary for the spiritual & material development of a society.

Throughout his poetry Iqbal has hit out western imperialism. In his poem "Gift of Hijaz", he describes, according to Jagan Nath Azad, an Indian scholar of iqbaleen studies, western imperialism "as an idol which must be thrown down the arch of mind, he says:

"You have bowed before Darius and Jamshed; the ignored one,

Don't bring a bad name

to Harerm don't go to western imperialism

For the fulfillment of your desire;

Fell this idol down the arch of your mind, You have dedicated yourself to European idols;

Very unmanly, you have expired in the idol-house

Your intellect is far away from your heart, your heart from warmth.

As you have not tasted wine from the vine of ancestor.

G.P Polinskaya, in her paper, Iqbal and Social Justice, has taken full cognizance of Iqbal's exposure of the evils of social oppression & social injustice. Iqbal wanted to liberate his country from colonial hegemony. He was greatly influened by the Great October Revolution. He composed these lines (Azad, 1977, pp. 145-146):

Let us give new regulations to the magicians & their temples,

Let us overturn the feudatory of strong old tavern.

He went on:

"Now is the time for establishing a new order

Let us wipe the heart's slate clean & begin everything anew

The imperial crown is tarnished it has been cast away

Kuhkun carver came with a chipping hammer in his hands,

And demanded for himself the estate of Parvaiz".

Iqbal thinks that the Quran is a message of death for the capitalist & of course for the destitutes. It forbids accumulation of capital and is opposed to usury & speculation. It stands for the abolition of feudalism in all its forms, because, according to its principles, land is God's state (Polinskaya, G.P, 1977, pp. 149).

Political Philosophy of Iqbal: For Iqbal, Democracy was the most important aspect of Islam as a political ideal. In fact, according to Iqbal, it is Islam which has imported to the people their natural rights, equality, freedom and justice. He writes:

Liberty took its birth from its gracious message,

This sweet wine dripped from its grapes!

It was impatient of invidious distinctions.

Equality was implicit in its being![1]

The above words of Iqbal throw abundance of light on the fact that the modern Western discourse on liberty and equality can be traced back to Islam, particularly from the time of the Prophet Muhammad and the period of Khulfa-i-Rashideen. It was during this period that the real meaning of liberty and equality was translated into practice. In other words, this principle of democracy-liberty and equality are not new to Islam at all. In fact, it is Islam which has presented these concepts to the world to liberate man from all sorts of man-centered authoritarianism and dominations. It clearly implies that Islam is totally against hereditary monarchies, dynasties, empires, military dictatorships and self-imposed rule over the people. Islam does not tolerate any form of despotism, whether it is despotism of single monarch or despotism of some people in power.

Some of the important principles of democracy that are appreciated by Iqbal include 'freedom', 'equality' and 'election'. He finds these principles compatible with Islam to a certain extent. However Iqbal clearly rejects Secular foundations of Democracy and go entirely against it and its important principle i.e. popular sovereignty. Democracy in the West being originated from the economic regeneration of European societies is secular and materialistic by its very nature. It

mainly caters to the material life of a society leaving the spiritual aspect altogether. Consequently, democracy in the West tends to move away from moral and ethical values. He points out the main difference between democracy in Islam and democracy in Europe:

"The Democracy of Europe – overshadowed by socialistic agitation and anarchical fear – originated mainly in the economic regeneration of European societies. ...The Democracy of Islam did not grow out of the extension of economic opportunity, it is a spiritual principle based on the assumption that every human being is a centre of latent power, the possibilities of which can be developed by cultivating a certain type of character".[2]

Iqbal's rejection of the secular and material foundation of democracy is rooted in his comprehension of the Islamic concept of Tawhid, the unity of Allah and the unity of life. Tawhid, for Iqbal, is the unifying force which joins the spiritual and material aspects of life into a single and the united entity of life. Unlike the dualistic concept of life of the West which separates 'matter' from spirit' according to Iqbal, in Islam 'all this immensity of matter constitutes a scope for the self-realization of spirit[3] For Iqbal, distinction between the Church and the state does not exist in Islam as he argues that according to the law of Islam there is 'no distinction between the church and the state'. The state (in Islam) is not a combination of religious and secular authority, but it is a 'unity' in which no such distinction exists. The caliph is not necessarily the high priest of Islam; he is the representative of God on earth. As Iqbal said:

"Jalal-e-paadshahi   ho,   ya   jamhoori   tamasha   ho
Juda ho deen syasat say, tou reh jaati hai chengezi"

John L. Esposito fully comprehends Iqbal's criticism of democracy. He writes:

"He (Iqbal) believed that the success of a democratic system was contingent upon the preparedness of its members.... Thus, Iqbal did not accept the absolute democracy of undeveloped individuals. This is at the heart of his criticism of modern Western democracy: 'Democracy is a system where people are counted but not weighed".[4]

The Social Order of Islam: The development of a child is result of various forces – natural and cultural – that play on him. Allama Iqbal preached the social values of Islam because they constitute the strongest bulwark against racialism and nationalism and because they provide the greatest guarantee and hope of a society based on the principles of equality, social justice and human brotherhood. He gives reasons for his choice that social order of Islam is based on the principle of Tawhid. It demands loyalty to God and not to the throne. It implies the recognition infinite worth of every individual and the rejection of blood relationship. It brings a new sense of freedom and release from various kinds irrational of fears and superstitions. According to Allama Iqbal, the wonderful personality of the Prophet Muhammad (PBUH) provides another important focus of loyalties for the growing polity of Islam and this emotional attitude has proved a powerful mean for transforming the Muslims into a vital and unified community. Prophet Muhammad (PBUH) gave a message of freedom, social equality and human brotherhood. He rejected differences based on caste, color, sex, social and economic circumstances. Islam gave back to the people their natural rights, raised the status of workers and weakened the power of usurpers. Iqbal looks upon geographical and racial grouping responsible for all sorts of political evils, oppressions and conflicts. Islam seeks to establish the community of mankind not on geographical accidents but on belief in one God. Iqbal holds the view that Prophet Muhammad (PBUH) migrated from Mecca to Madina. This migration suggests that mere geographical ties

meant nothing to him and they should mean nothing to Muslims. The prophet migrated from his birth place, and thus revealed the secret of the Muslim's nationalism His wisdom established a world encircling community. On the foundation of the Kalima By the grace of his overflowing bounty, the whole earth became a mosque for us Live in the ocean like the fish Freed from the fetters of locality. He who frees himself from the prison house of directions becomes all pervasive like the sky.

According to Allama Iqbal, it is essential that social order of Islam should actively exploit the forces of modern science and thereby gain effective control of its material environment. Iqbal insisted on it so strongly because he realized that one of the main causes responsible for the decline of Muslim people has been their neglect of science which has arrested their intellectual growth and weakened their political and economic position which, in that age, was mainly dependent on scientific power. According to Iqbal the social order must be a dynamic order, keenly alive and responsive to the basic fact of change. He is of the view that Ijtihad is essential for the healthy growth of religious thoughts in Islam. He disagrees with those people who would deny this right to present day Muslims. A study of history reveals that every social order becomes static and lifeless when intellectual initiative and independent thinking becomes atrophied and people cling to the old & outworn ideas. Iqbal holds the opinion that social order of Islam must always remain responsive to the material and cultural forces that play upon it from time to time.

CONCLUSION: A product of the colonial system, Iqbal not only was criticizing the West from a native perspective but also from within western philosophies. In that critique he exposed the class hierarchies of western liberal democracy and wealth distribution. At the same time, Marxism was also criticized for focusing only in the material world. A modern system should offer the best of all other systems and, for Iqbal, Islam was that true system. So, he was not only fighting against the colonial system but also offering his own political and philosophical system as a solution for the problems of colonial masters. If it is true that Iqbal admired the West's dynamic spirit, the intellectual tradition and technology, he also criticized its excesses: European imperialisms and colonialisms, capitalism's economical exploitation, the atheism of Marxism and the moral bankruptcy of secularism. So, he looked to the Islamic past to rediscover principles and values which could be used to reconstruct an alternative Islamic model for modern Muslim society, resulting in the discovery of Islamic versions of democracy and parliamentary government. Iqbal believed that, through reinterpretation, Islamic "equivalents" of western institutions and concepts could be developed. If applied in letter and spirit we can find the true social order for contemporary societies.

TYPOLOGICAL FEATURES OF THE ARCHAEOLOGICAL SITES OF NORTHERN FERGANA

Rakhmanov Zafar Odilovich*

*Junior Researcher,
National Center of Archeology at the Academy of Sciences,
Republic of Uzbekistan, Tashkent, UZBEKISTAN
Email id: uzacademyzafar@inbox.uz

ABSTRACT

This article is devoted to the study of some typological features of the archaeological sites of northern Fergana. In particular, the processes of the settlement of the nomadic population that penetrated the valley in the early Middle Ages led to an increase in the population in the area and an increase in two-storey settlements. Based on this, the author focuses on the role of early medieval archaeological sites located in the main water basins of Northern Fergana. Also, the author gives the name of several settlements in northern Fergana and examines houses and castles around which the settlements are concentrated, differ both in appearance and location, which makes it possible to distinguish two types of these structures.

KEYWORDS: *North Ferghana, Two-Tier Settlements, "Tepa With A Platform", Castle, Manor, Unprotected Settlements, Koshtepa (Paired Tepa).*

INTRODUCTION

Since the end of the fourth century AD, the penetration of nomadic tribes into agricultural oases and their settling led to a sharp increase in the population and, accordingly, the number of rural settlements around small castles-feudal lords. Because of this, in all regions of Central Asia, there is an increase in the number of two-tiered hills, "*tepa* with a platform". These settlements date from the V-VI centuries AD. In particular, on the territory of northern Ferghana, the number of two-tier rural settlements with a teardrop-shaped, oval or rectangular shape is increasing. However, life is constantly in motion, people in the course of their lives again build additional houses, as a result of which the ancient settlements change a completely different shape, as a result of which they remain a heap of an indefinite configuration. Often some settlements arose in a completely new place and existed until the end of the Early Middle Ages. In such

settlements, we see a sterile culture of early medieval dehkans, traditionally transmitted from generation to generation. Such architectural heritage becomes a reference for comparing cultures of other epochs or regions.

MATERIALS AND METHODS

Here are the main types of settlements identified on the territory of northern Ferghana in the V-VIII centuries AD, located in the main water basins.

1. In the Hawasay-Sumsarsay oasis, on the site of an old early antique settlement of a square shape, a completely different settlement of Kyzyltepa appears, which existed until the end of the early Middle Ages. Yakkatepa (rectangular) has the same fate. Balandtepa together with Munchaktepa (necropolis). From the era of the early Middle Ages, Damaryktepa, Koshtepa I, Koshtepa II appear, having a rounded shape. At the same time, Munchaktepa also, appearing in the early Middle Ages, has a square shape. A characteristic feature of these settlements is that some of these settlements settled down in the developed Middle Ages, and in the rest of the settlements life was interrupted during the Arab conquest.

2. In the Kasansay oasis, in the overwhelming majority of old settlements and cities, life continues in the early Middle Ages. These are Akhsikent, Nogoratepa I, Piloltepa (does not exist at the moment), Mugkala, Munchaktepa, etc.

At the same time, from the III-IV centuries AD, new oval-shaped settlements appear: these are the monuments of Tagizhartepa, Kuyukmazar (Yulgunmazar), Yortepa, Toshboltatepa (does not exist at the moment) and Rovottepa. Among the above-mentioned settlements of the oval type, the only Nogoratepa II has not an oval shape, but a rounded one. As mentioned above, settlements that are square in type become rounded as they are destroyed. So, apparently, since the early Middle Ages, in most places of the Kasansay oasis, the population prefers the construction of new oval-type settlements.

3. In the Podshoatasay oasis, settlements also developed in the early Middle Ages, i.e. life continues in almost all ancient and antique settlements.

These are Kukertepa, Koshtepa I and Koshtepa II, Tukhtamattepa, Chaganaktepa (does not exist at the moment) and Tashtepa (not defined in the 2013, 2017 code).

4. Life continues in the Iskovat-Namangan oasis in the overwhelming majority of old settlements; in these sites, it is impossible to find out at what stage the type of settlement was formed. In particular, Raimbektepa belongs to the early antique period (III-II centuries BC), having a rounded shape, however, among the lifting material, there were ceramic materials of the VI-VIII centuries AD. Another monument is Dumaloktepa, which arose in the III-II centuries. BC. having a rounded shape, ceramic materials of the 8th century were collected from the surface of this hill AD. Both in the previous site and this site it is impossible to know at what stage the rounded type of settlement was formed. Ilontepa is a multi-layered monument on the territory of this irrigation region, which appeared in the early ancient period and life in this settlement developed in the developed Middle Ages. Gaistontep and Chashtep have the same fate. Manifested in the II-I centuries BC, life on this monument develops in the early Middle Ages.

5. In the Chartak oasis, life is resumed in almost all old settlements, but at the same time, several monuments with a rounded shape - Tepabuvamozor, Mazartepa, Yulakmozor, Mashhadmozortepa and Fayzobodtepa appear precisely in the early Middle Ages. It was during this period that Koshtepa I and Koshtepa II appeared. Both of these monuments, located in one place, form an eight-shape. According to NG Gorbunova, such as Koshtepa (paired *tepa*) are cruciform [2, p. 114-146].

Also, a small, apparently fortified castle of Kurgantepa with a square citadel was discovered in this oasis. Probably, the population of Koshtep performed their cult rites on this cult building. In the same oasis, a settlement with a rather complex configuration was discovered, its architecture in the lower part is rectangular, and on the upper layers, it has an eight-shape. Apparently, this type of settlement is also a prototype of double castles and, as N.G. Gorbunova noted, is a cruciform cult object.

6. In the Naryn oasis, a large number of archaeological monuments were found that arose precisely in the era of the early Middle Ages. These monuments include Oktepamozor, which has a drop-shaped (oval) shape. On the territory of this oasis, Tarikmazartepa, Nameless tepa, Yassitepa and Uychitepa were encountered. All these monuments had an oval shape, and often these monuments by archaeologists belonged to the era of the early Middle Ages.

RESULTS AND DISCUSSION

Monuments that appeared only in the early Middle Ages include settlements or castles of drop-shaped or oval shapes. Such castles were usually two-tiered. Archaeologists call such settlements "tepa with a tower" or "tepa with a platform" [5, p. 111]. Apparently, due to the favourable water and land resources, agriculture rises sharply, due to which several new settlements appear at the end of the antiquity and the beginning of the early medieval period. Such monuments include Birlashgantepa, Gultpa, Kushtepa, Naushkenttepa, Norinkapaliklarmozori, Ugriyortepa, Aktepa, Elatan IV and Balandkuprik on the territory of the Uchkurgan oasis. Together with the above-mentioned monuments, life is resumed in old rectangular or square settlements. In particular, there is a settlement Kuyuktepa on the territory of the Uchkurgan region. The basis of this monument is a square settlement of the ancient era. Unlike other monuments, excavations were carried out on Kuyuktepa. Almost the entire site has been fully explored. And this is the only fully studied monument in the Fergana Valley, reminiscent of the Sogdian two-tiered settlements. Among the above-mentioned monuments, a group of monuments of an oval shape, the ovoid shape stands out, they, were small rural settlements. Eight-shaped and Kushtepa, as noted by NG Gorbunova, may have been cult objects [5, p. 109-110, 113].

All these monuments appeared precisely in the early Middle Ages. The rest of the types of settlements that remained from the ancient era continue to exist among the local population, among the architects of the early Middle Ages. Thus, the era of the early Middle Ages is a period of development of agricultural culture, a period of major wars associated with the Chionites, Hephthalites, Turks and Arabs. The earliest settlements recorded on the territory of northern Fergana and dating back to the early Middle Ages are small unfortified settlements of dekhkans. They are concentrated around a fortified house or dehkan castle. The prevailing settlements do not have a clear plan; their topography is subordinated to the terrain. Houses and castles around which settlements are concentrated differ both in appearance and location, which makes it possible to distinguish two types of these structures:

− Type I consists of separate fortified houses, currently hidden under oval-shaped hills;

− Type II is represented by structures rectangular in plan, enclosed by ramparts and ditches and located along the main canals or at the beginning of these canals.

The culture of early medieval Fergana arose based on the cultures of the ancient era. Usually, culture is transmitted primarily in funeral rites, daily customs, military and civil architecture, and in the construction industry. The population of Fergana is always characterized by living, using traditional everyday tools, wearing traditional clothes, even the use of traditional dishes was passed down from generation to generation.

We especially see this tradition in the use of red-embossed ceramics characteristic of antiquity, especially with different scratched ornaments. Usually, a scratched ornament applied to the surface of red-embossed dishes was in the first centuries. AD [3, 4].

Along with this, since the end of the ancient era, life has changed significantly in all sectors. In particular, life has completely disappeared in many large cities.

In particular, the ancient capital city of Ershi ceased to exist at the end of the antiquity era. In many oases, life is dying entirely. According to N.G. Gorbunova, all monuments in the Kerkidon oasis perished after the 4th-5th centuries. The number of settlements in the Isfara region is also decreasing.

A. Bernshtam, who studied this issue in detail, most accurately noted that "After the elimination of the life of the Kushan and Davan estates, they were replaced in the agricultural areas of the foothills by heavily fortified castles and fortresses, which play a dual role: on the one hand, they are the residence of the feudal lords, and on the other - being a fortress, an outpost, they protect the oasis from external invasions. In the valley, on the site of the Kushan castles, cities emerged as centres of oases. Farmers' estates and castles are located around them "[1, p. 248].

A.N.Bernshtam saw the reason for the change in the type of settlement in the change in social relations. We believe that the reason for this phenomenon is the situation after the collapse of the major powers and the penetration of nomadic tribes into the territory of Central Asia - the Chionites, Hephthalites, Turks and Arabs. All this led to the collapse of the old system and required new approaches to improving things. Feudal cities throughout Central Asia date back to the 5th-6th centuries AD. These cities were the economic and administrative centre of oases, small agricultural districts. They united agricultural settlements and were located in the immediate vicinity of the city. Despite this, agricultural tribes are developing all the plain lands and the adjacent foothills.

According to N.G. Gorbunova, "The most common type was houses standing alone or in a group, but there are also fortified settlements. There were few cities, and they are concentrated in the most densely populated eastern part of the valley "[4, p. 133-134].

Yu.A. Zadneprovsky was also involved in the cities of the era under consideration. Making a detailed analysis of written sources and archaeological data, Y.A. Zadneprovsky concluded that the population of Fergana in the Kushan period was 500-600 thousand people. Most of them lived in villages. The urban population was no more than ¼ of all residents of Fergana [8, p. 88-90]. It seems to us that this is a very exaggerated fact. Currently, in the most highly developed countries, such a large percentage of the population does not live in cities. Economic life in

Fergana has been more or less normalized since the beginning of the 5th century. AD, and by the end of the century, socio-economic life is getting better.

As for the entire Central Asia of the 5th-8th centuries, it is characterized by a change in all forms of material culture: settlement, type of dwellings, the topography of cities, becomes a period when all material culture as a whole is renewed. Almost all Soviet publications see the cause of these phenomena in a radical change in the socio-economic system [9].

Somewhat later, other Soviet scientists came to the same opinion - MM Dyakonov [7, p. 253-294], EA Davidovich and BA Litvinsky [6]. The mountainous relief and foothill determined the culture of individual oases of mountain says and rivers, since each valley of these rivers was a kind of micro-oasis. Each oasis is characterized by specific features of culture and direction of the economy. It is the mountainous relief that has determined some of the originality of this region. From ancient times, detached houses, estates and unfortified settlements have been characteristic. People built their houses on mountainous, rocky places at the foothills of the mountains, on the capes of the adyrs, that is, on land suitable for cultivation, they left them untouched for agriculture. This is a characteristic feature of the agricultural settlement structure of the foothill regions of northern Fergana and the entire valley as a whole. All these events, which covered the main regions of Central Asia, could not but leave their mark in the Fergana Valley. On the one hand, Turkish, Arab and even Chinese troops have repeatedly visited the Fergana Valley. All these events have left their mark on the territory of northern Fergana. Currently, more than a dozen settlements of cities are known, left precisely in the VIII century AD.

CONCLUSION

1) The history and culture of early medieval Fergana is a period of history and culture of mass penetration into agricultural oases of famous nomadic tribes, such as the Khionites, Hephthalites, Turks and Arabs. The opinion about whether the Hephthalites were on the territory of Fergana is very controversial.

This issue requires more careful study.

2). The culture of early medieval Fergana is the further development of ancient culture in general. This issue is especially evident in the ceramic industry. In the V-VI centuries AD. In Fergana, the red-angled ceramics of the ancient era are not yet forgotten.

3) The early medieval period in the development of the settlement structure of Fergana differs from other regions in the construction of small unfortified houses, detached estates of a rounded or oval plan, located around rectangular or square fortified castles.

4) The population located in the foothill, adyr zones, for the construction of small houses and estates, chose special stony places or ends of rocks to preserve flat grey-earth soils, for agriculture.

ABSTRACT

The purpose of the latter is to consolidate the formal knowledge of students; the answers to these questions are ready-made in the textbook, and the student must only remember them. In particular, the use of experimental problems develops the ability and skills of students in handling physical devices, models, installations and models. So, at the first stage of studying physics for children, qualitative problems in teaching play a greater role than quantitative ones. Consider a technique for solving simple qualitative problems - qualitative questions.

KEYWORDS: *Consolidate, Installations, Quantitative*

INTRODUCTION

A qualitative problem in physics is such a problem associated with the qualitative side of a physical phenomenon, solved by logical inferences based on the laws of physics, by constructing a drawing, performing an experiment, but without using mathematical actions.

It is necessary to distinguish a qualitative problem from the question of checking formal knowledge (for example, what is called an ampere? How is Ohm's law formulated ?,). The purpose of the latter is to consolidate the formal knowledge of students; the answers to these questions are ready-made in the textbook, and the student must only remember them. The

qualitative problem poses such a question, the answer to which is not contained in the finished form in the textbook. (For example: why is the sky blue. Exactly why?) The student must formulate an answer to a qualitative problem, synthesizing the given conditions of the problem and his knowledge of physics.

Solving qualitative problems contributes to the implementation of the didactic principle of the unity of theory and practice in the process of teaching physics. In particular, the use of experimental problems develops the ability and skills of students in handling physical devices, models, installations and models. Qualitative tasks with production content acquaint students with technology, broaden their horizons, are one of the means of preparing students for practical activity. Thus, the solution of qualitative problems in physics is one of the important methods of polytechnic education.

The use of qualitative tasks contributes to a deeper understanding of physical theories, the formation of correct physical concepts, therefore, prevents formalism in the knowledge of students. Solving qualitative problems calls for the need to analyze and synthesize phenomena, that is, to think logically, teaches students to precise, concise, literary and technically competent speech.

In the process of solving qualitative problems, the skill of observation and the ability to distinguish physical phenomena in nature, everyday life, technology, and not only in a physical office are instilled. The ingenuity, ingenuity, initiative and creative imagination of students develop.

In the process of solving qualitative problems, the skill of observation and the ability to distinguish physical phenomena in nature, everyday life, technology, and not only in a physical office are instilled. The ingenuity, ingenuity, initiative and creative imagination of students develop.

The methodological value of qualitative problems manifests itself especially when studying such sections of the physics course in which there are no physical formulas and phenomena are considered only from the qualitative side (for example, the law of inertia, electromagnetism).

An important role is played by quality tasks in extracurricular activities: in physical circles, evenings of entertaining physics, school, regional and republican Olympiads, in competitions and meetings of KVN teams, etc.

Psychology points to one of the features of students at this age - logical thinking. Concepts based on concrete objects, on tangible visualization, are more accessible to children than concepts based on abstractions. The adolescent understands the inductive rather than the deductive way of establishing a physical law. Qualitative problems associated with specific objects well known to children are easily perceived by students, and they are more willing to solve them than quantitative problems. So, at the first stage of studying physics for children, qualitative problems in teaching play a greater role than quantitative ones. Consider a technique for solving simple qualitative problems - qualitative questions. When solving any problems in physics, analysis and synthesis are inextricably linked. Therefore, we can only talk about a single analytic-synthetic method for solving physical (and, in particular, qualitative) problems.

Example 1. Are the buoyancy forces acting on the same wooden block, floating first in water and then in kerosene, the same?

Decision

The buoyancy force acting on a body immersed in a liquid is equal to the weight of the liquid displaced by it. (A logical premise based on a well-known physical law.) A bar floats in both liquids. (A logical premise based on the condition of the problem.) A body floats if the weight of the body is equal to the weight of the liquid displaced by it. (A logical premise based on a well-known physical law.) Since the same bar floats in both fluids, it will displace the same amount of fluids by weight, therefore, the buoyancy forces in them will be the same ... (A conclusion based on the existing premises.)

So, the answer to the qualitative question could be obtained by synthesizing the well-known law (on the condition of the body floating) and the problem conditions (the body floats in both fluids).

The solution to a qualitative issue can be presented in the form of five stages:

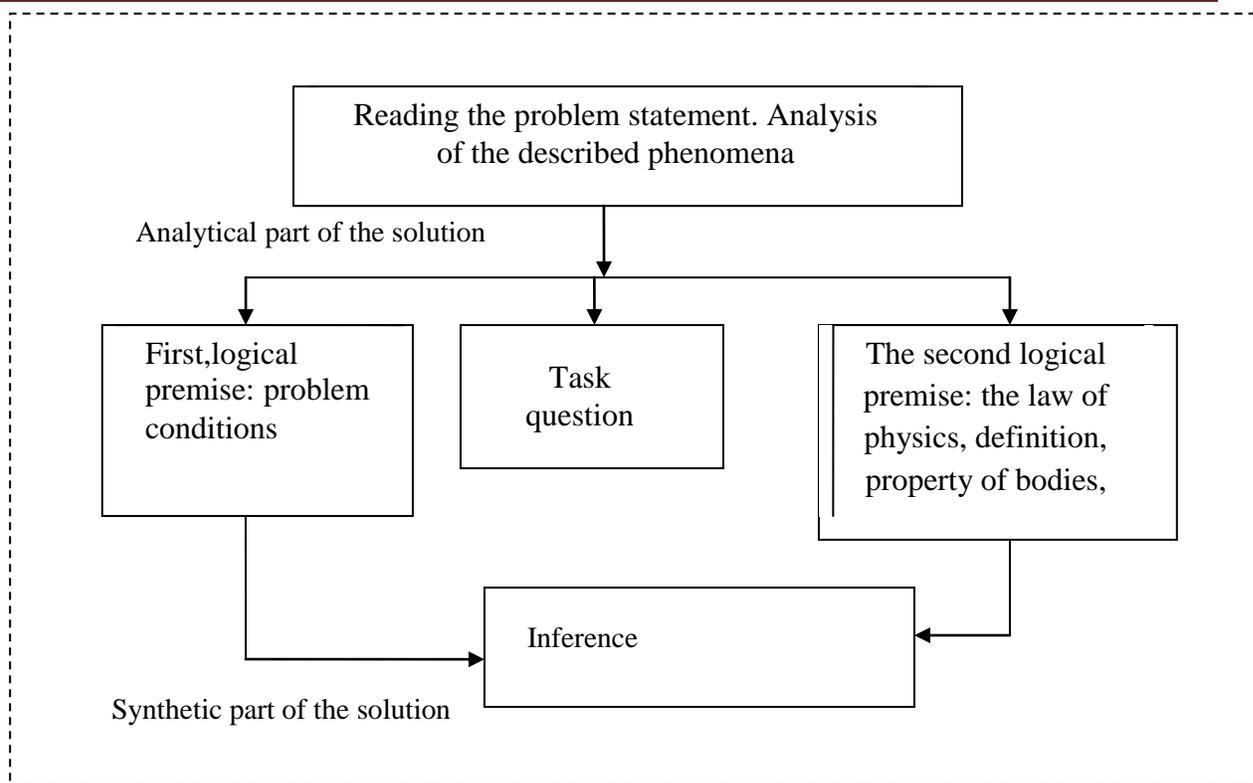
1. Acquaintance with the conditions of the problem (reading the text, parsing the drawing, studying the device, etc.), understanding the main issue of the problem (what is unknown, what is the ultimate goal of solving the problem).

2. Awareness of the conditions of the problem (analysis of the data of the problem, the physical phenomena described in it, the introduction of additional clarifying conditions).

3. Drawing up a plan for solving the problem (selection and formulation of a physical law or definitions corresponding to the conditions of the problem; establishment of a cause-and-effect relationship between the logical premises of the problem).

4. Implementation of the plan for solving the problem (synthesis of the given conditions of the problem with the formulation of a law, getting an answer to the question of the problem).

5. Checking the answer (setting up the corresponding physical experiment, solving the problem in a different way, comparing the answer with the general principles of physics (the law of conservation of energy, mass, charge, Newton's laws, etc.).

Schematically, the technique for solving a quality issue can be represented in the form of a diagram(see figure).


In some cases, students, not possessing the skills of logical thinking, use the technique of hypothesis (intuitive thinking). This way of solving the problem should not be rejected. On the contrary, it is necessary to carefully consider any proposal, any physical idea of solving the problem, to prove either its applicability or inconsistency. At the same time, of course, a discussion will start, which will contribute to the development of the physical and logical thinking of students.

ABSTRACT

In the context of globalization, socio-political changes taking place in society, a huge interest in various fields of knowledge, including Ethnography, has increased. The article deals with the ethnographic vocabulary within the framework of the specifics of material and spiritual culture. The problem lies in the study of the functioning of ethnographic terms, their features, role and meaning in the communication process.

KEYWORDS: *Ethnography, Ethnos, Ethno Linguistics, Etnografizma, Non-Equivalent Vocabulary, Spiritual Culture, Material Culture.*

INTRODUCTION

At all stages of the development of society, language is inextricably linked with the life of the people, their culture, since it reflects the elements of the material, spiritual, and moral culture of society. The language is a storehouse of the history of the ethnos-its carrier, and the vocabulary directly reacts to all changes in the life of the people. Neither phonetics nor grammar of a language can show the conditions of a people's life as fully as vocabulary. Because of this, linguistics has always paid great attention to the compilation of dictionaries, the study of the lexical composition of the language. The study of vocabulary by thematic groups seems to be the most correct in the study of the vocabulary of specific Turkic languages. Following this method, you can get an idea of the natural conditions in which the life of the people took place, about the

main occupations, features of the economy, housing, socio-political structure, features of the oldest beliefs of the people.

Ethnography deals with the study of traditional or folk culture, that is, the layer of national culture that was formed in the middle ages before the emergence of bourgeois national culture. Ethnographic research, in turn, is based on written sources, among which a worthy place is occupied by various dictionaries, including Russian. Ethnographic vocabulary is a set of words intended to describe the specifics of the material and spiritual culture of any nation. In addition, it is possible to divide the ethnographic vocabulary into terms of material and spiritual culture. If the first include the names of clothing, national jewelry, household items, then the second-the names of national traditions and holidays.

As you know, any scientific research, including the study of problems of Ethnology and Ethnography, involves the study of the history of the issue. In this regard, we believe that it is important to refer to the etymology of the concepts of "ethnos", "Ethnography "and " Ethnology".

In the literature the definition of the concept "ethnic group", which has several meanings, meanings, and values "people", given its interpretation: "the crowd that the class of people, foreign tribe, clan, Gentile, etc. The study showed that in science there is also the concept of ethnic group as "Ethnikos" in the local sense and the ethnic group, as ethno-social organism – a position put forward by Bromley Y. V. Academician explains the separation of the concepts of "Ethnikos" and "nation" as follows: "Etnikos and ethno-social organisms — principal ethnic communities. However, the ethnic structure of humanity is not limited to them.

The traditional name "Ethnography" comes from the word "ethnos" and attach the word "graph" (writing), but on the Western model - attach to the word "ethnicity" the concept of "logos" (teaching), which, in turn, "spawned" a new term "Ethnology". Some researchers believe that, in fact, these terms are identical, while others distinguish them. This trend has resonated, which was reflected in a number of renaming. Apparently, the proponents of this renaming did not take into account the fact that the description of the subject already represents its study. So the scientific "grapho" is equivalent to "logos". Russian scientists have written about this that the term "Ethnography" has long been understood not so much as " narodoopisanie (ethnos and grapho)", as "narodovedenie", which in fact is a Russian translation of the term "Ethnology". The well-known scientist D. N. Anuchin also did not avoid terminological confusion, using the concepts as synonyms: "race", "tribe" and "nationality". In a review of A. N. Krasnov's "course of land studies", he wrote: "a Person in all races and tribes has a language..., a well-known technique..., uses jewelry and elementary clothing, has a certain social system, beliefs, etc. A well-known culture is bound to be associated with a person, no matter how low it is " [8, p. 109]

The main findings and results

The study of vocabulary by thematic groups makes it possible to detect lexical units that have not yet been registered in dictionaries, and to organize their study. Depending on this, various thematic groups of vocabulary have recently been intensively recorded and studied in linguistics. Research is being conducted on the study of various layers of vocabulary, socio-political terminology. However, many thematic and lexical-semantic groups of words of the language are still poorly studied. These include the ethnographic vocabulary of the language, which is reflected in the centuries-old history and philosophy, the history of culture and the psychology of

the ethnic group. Ethnolinguistics studies the connections between linguistic and cultural phenomena. In the broadest sense of the word, ethnolinguistics is a science that studies the relationship between an ethnic group and a language in all its diversity. It intersects with such branches of humanitarian knowledge as sociolinguistics and psycholinguistics, Ethnology and Ethnography of communication, folklore studies, mythology and poetics. The subject of ethnolinguistics covers such areas as language and traditional culture; language and ethnic specificity of thinking; ethno-linguistic processes in internal and interethnic contacts. Usually the term ethnolinguistics is used where the concepts of Ethnography and Ethnology are preserved, and as an independent scientific branch it is undergoing a stage of formation. In its narrow meaning, ethnolinguistics is considered as a branch of linguistics that studies the relationship between language and spiritual culture, folk art and folk mentality. It should be noted that in modern linguistics there are few works devoted to ethnolinguistic research, but ethnolinguistics is rapidly developing on the basis of Slavic and other languages. In Slavic linguistics, one of the first founders of this direction is considered to be academician N. I. Tolstoy. In his work "on the subject of ethnolinguistics and its role in the study of language and ethnos", he defines ethnolinguistics as "a branch of linguistics or more broadly-a direction in linguistics that orients the researcher to consider the relationship and connection of language and spiritual culture, language and folk mentality, language and folk art, their interdependence and different types of correspondence. Ethnoliguistic is not a simple hybrid of linguistics and Ethnology, or a mixture of the individual elements of both. This is a science, like a number of other mixed disciplines, which clearly defines the aspect in which language is formed and functions" [6, p.182]. In our case, this aspect is ethnographic vocabulary. According to the academician, language in ethnolinguistics "always remains the main subject of research, regardless of what substance (linguistic or non-linguistic) and what function (ritual, communicative, mythological, etc.) are analyzed" [6, p. 182], the study of language in a cultural and historical context becomes "an additional source, and in some cases, a decisive criterion for the reconstruction of the original meaning of a word and the direction of its semantic evolution" [1, p. 182].

Since ethnolinguistics is a scientific field that borders between linguistics and Ethnology, ethnolinguistic research is impossible without taking into account the data of Ethnography and linguistics. If ethnographers consider the reflection of ethnic features of the material and spiritual culture of the people, traditions and customs in the subject, then linguists need to know what results of scientific search are available to folklorists and ethnographers. The centuries-old history and material and spiritual culture, national traditions and customs, economic and economic way of life is reflected in the language, namely in the ethnographic vocabulary. Nevertheless, it should be noted that it is not yet possible to find a clear scientific definition of the term "ethnographic vocabulary". There are no specific criteria that would make it possible to distinguish ethnographic vocabulary from any other group of vocabulary. In linguistics, there are several works devoted to the study of ethnographic vocabulary [1, 10]. Nevertheless, it seems to us that it is necessary to justify this concept and explain its essence. If vocabulary is the vocabulary of a language, then our understanding of ethnographic vocabulary will expand the definition of"Ethnography". In this regard, we will turn to dictionaries. It should be noted that in different dictionaries this concept is interpreted differently. In the encyclopedic dictionary of F. A. Brockhaus and I. A. Efron (1896) there is this definition of the term "Ethnography": "... the science dealing with the study of culture of peoples outside the terms of reference of history and prehistoric archaeology, i.e. mainly the peoples of the primitive and those layers of cultural

peoples who have preserved the features of the primitive system" [3, p. 180-190]. The compilers of the dictionary defined the task of this science, which pointed to the need to study the way of life, customs and customs of people, especially primitive people, as the closest to nature. At the same time, the following departments of ethnographic phenomena were presented. These are:

"1) material culture (food; methods of obtaining food and the forms of economy generated by them; domestication of animals; tools; utensils; weapons; means of communication; housing; clothing and jewelry);

2) Social order (marriage and family; social unions);

3) Spiritual culture (language and religion; morality; art; poetry; writing)" [3, p. 187].

In the dictionaries of the Russian language [3, p. 942-943; 3, p. 791], two meanings of this science are given:

"1. The Science that studies the material and spiritual culture of peoples, their cultural and historical relationships.

2. The combination of all features of the everyday life, customs, culture of a people, nation".

Thus, the ethnographic vocabulary includes words related to material and spiritual culture, i.e., the peculiarities of everyday life, customs, and cultures of any people. As already noted, ethnographic vocabulary includes: first, the vocabulary of material culture, and second, the vocabulary of spiritual culture. Such phenomena as household items, utensils, food, clothing, and housing are the initial objects of research of material culture. And the vocabulary that reflects the phenomena of material culture and the subject-everyday vocabulary in this case coincide. Rooted and transmitted from generation to generation, the ways of organizing and implementing the everyday life of a certain people form a way of everyday life corresponding only to them, the study of which is the goal of ethnographic research. While words and expressions clothed in the concepts of the way of life of the people are important for linguistic research. It should be clarified that household and ethnographic vocabulary are not the same thing. Everyday vocabulary is considered in different ways, depending on the narrow and broad approach to its ethnolinguistic status and coverage of the material, and the list of names of subject-everyday vocabulary cannot cover all the richness of ethnographic vocabulary. Everyday vocabulary is a narrower area of the vocabulary of the language, and ethnographic vocabulary has its roots in ancient times, reflects a century-old ethno-cultural tradition of the people, closely related to the similar culture of other peoples, close not only in language, but also in way of life. In the linguistic literature, there are such synonymous concepts of the term "ethnographic vocabulary" as "ethnocultural vocabulary", "ethnographic dialectisms", "ethnographisms". Ethnographisms are words that denote objects and concepts related to the peculiarities of everyday life, which are clothed with the concepts of folk traditions and customs. Since folk traditions, customs and rituals are deeply rooted in the spiritual, social and socio-economic life of the people, ethnographisms more specifically Express the national characteristics, character and disposition of the soul of a particular people. It is therefore quite natural parallel use of the terms "ethnographic vocabulary" and "etnografizma". According to the dictionary of linguistic terms by T. V. Zherebilo [7, p. 22], in dialectology ethnographisms are referred to as non-equivalent vocabulary. Such vocabulary has no synonyms in the literary language or in the adverbs of the given language, and cannot be translated. As you know, depending on the scope of use, words

are divided into two lexical layers: words of the national language - the vocabulary of active use; words used by the population of a certain territory. The second group of words is a certain dialect vocabulary that expresses the concepts of objects and phenomena characteristic of the economy, life and culture of the inhabitants of a certain area. Consequently, the ethnographic vocabulary can be divided into the vernacular and dialect. Thus, ethnographic dialectisms are understood as lexical units that are connected in all semantics or external form with the peculiarities of local life. The ethnographic vocabulary of the language can be divided into two large lexicosemantic groups:

1) Terms of material culture;

2) Terms of spiritual culture.

In this case, each group is divided into small subgroups. The vocabulary associated with the material culture of the people includes: 1) names of buildings;

2) ethnographisms denoting household items;

3) Names of clothing and jewelry;

4) Names of food and drinks;

Consequently, the ethnographic vocabulary reflects the centuries-old tradition of the people, which is closely connected with the similar culture of other peoples who are close not only in language, but also in lifestyle. The need to study the vocabulary formed during the long centuries of spiritual and social activity of the people is determined by the fact that it can provide valuable material about the lexical-semantic and structural development of lexical units of the language, contributes to the disclosure of various aspects of economic activity; identification of linguistic, economic and cultural ties of the people with related and unrelated ethnic groups.

CONCLUSION

As can be seen from the works discussed above, the expression "ethnographic vocabulary" means a set of words used to characterize the life, material and spiritual culture of a people. There is no strict boundary between the material and spiritual culture of a certain ethnic group, dividing them into diametrically opposite categories and concepts. On the contrary, the material and spiritual spheres of life of an ethnic group are closely interrelated, they are mutually conditioned in their generation and constant development.

Ethnographic vocabulary includes words that reflect the national characteristics of material culture, specific ethnic properties of spiritual appearance, features of national and ethnic character.

Of course, the spread of scientific knowledge around the world provides an opportunity to improve the theory and practice of mastering the vocabulary of ethnographic plan, the compilation of terminological dictionaries on Ethnography. The study of the question shows that there are a number of unresolved issues on the lexicographic description of the terminological vocabulary of an ethnographic nature. At the same time, it cannot be argued that the creation of such dictionaries in this regard is not conducted. Such dictionaries exist, but, in our opinion, they should be updated, as Ethnography develops along with society, which means that new or

unknown words appear, which should find their place in newly published or modernized dictionaries.

ABSTRACT

243 adolescents aged 12-18 years with clinically and laboratory-instrumentally confirmed dysfunction of the autonomic nervous system were examined. As a result of the study, changes in brain hemodynamics and psychoemotional status were found that significantly differ from the standard indicators. Taking into account the presence of obvious problems in the state of adolescent health, it is necessary to conduct preventive examinations at a qualitatively new level using a screening questionnaire at the first stage and taking into account the presented structure of adolescent morbidity, which will contribute to the timely recovery of the adolescent population.

KEYWORDS: *Dysfunction of the Autonomic System, Adolescents.*

INTRODUCTION

According to several authors, psychovegetative syndrome (PVS) is a functional disease, which is based on disturbances in the neurodynamic autonomic regulation of internal organs and blood vessels. (3,4,6). However, from the methodological point of view, the division into functional and organic diseases is very conditional, since there cannot be only functional or morphological disorders separately. The structure and functions of an organ or system are the same, therefore, functional abnormalities most likely develop against the background of morphological changes, the initial formation of which, possibly, occurs at the molecular, subcellular, or cellular levels (1,2). It is not always possible to identify the latter by existing diagnostic methods. However, for clinicians, such a division is not without grounds, since it allows an objective assessment of the

developing disorders and differentiated treatment and prophylactic measures, taking into account the condition of a particular patient, and not the presence of the disease in general (3,4).

In this regard, researchers are interested not only in the search for ways of early detection of functional changes in the heart and blood vessels even in childhood and adolescence at the stage of "transitional" or "borderline" states, when there are still no manifestations of the disease in its classical form, but also the decision of the question of the advisability of using medication and non-medication means of rehabilitation treatment separately or in combination (5,7).

Despite numerous studies devoted to various aspects of the problem of autonomic dystonia syndrome in adolescence, which is often a predictor of such predictively dangerous cardiovascular diseases as coronary heart disease, arterial hypo-, and hypertension, as well as early atherosclerotic vascular lesions of various localizations, questions of etiopathogenesis, classification, differential treatment using both traditional, and non-traditional means, preventive measures remain insufficiently studied and require further in-depth research and understanding from the standpoint of new achievements of modern medical science and practice. This is all the more necessary since the syndrome of vegetative dystonia is the most common and remains the most unpredictable, in terms of the variety of its manifestations and outcomes, a disease of a young age.

LITERATURE REVIEW

The object of the study was 243 adolescents 12-18 years old with clinically and laboratory-instrumental confirmed dysfunction of the autonomic nervous system, were on outpatient treatment in the Teenage Center of the city of Tashkent. (Table 1) Voluntary informed consent of patients and their parents to participate in the survey

TABLE 1 DISTRIBUTION OF THE SURVEYED BY GENDER AND AGE

Surveyed	Girls	boys	total
n	156	87	243
%	64,2%	35,8%	100,0%
Average age, years	15,3±2,6	14,0±2,2	14,7±3,1

 The average age of the clinical manifestation of ADS in girls was 12.2 ± 1.8 years, in boys - 13.5 ± 2.1 years.

Among the surveyed adolescents with ADS, there were 1.8 times fewer boys than girls. This is probably due to less pronounced physical and hormonal changes in the pubertal period of the development of boys, which contributed to a less pronounced manifestation of this pathology.

Survey Methods

A psychological history was collected in detail. To assess the quality of sleep, a specially developed A.M. Wayne's subjective sleep characteristics scoring questionnaire. Emotional disorders were investigated using the Spielberger test. C. Spielberger's test, modified by Yu.L. Khanin, is designed to determine the level of anxiety and allows you to identify the presence of personal and reactive anxiety.

Assessment of the functional state of the central nervous system includes the determination of the bioelectrical activity of the brain using electroencephalography (EEG) and the assessment of volumetric characteristics of blood flow using rheoencephalography (REG).

Mathematical processing of the data obtained was carried out by the method of variational analysis. The mean values (M) and their mean error ($\pm$ m) differences between the mean values 0) were determined, the criterion of compliance (x2), the probability value (p).

The relationship between the studied parameters was determined using the linear correlation coefficient ($\pm$ r). The results were considered statistically significant at $p < 0.05$. The estimation of the direct correlation was considered: up to ± 0.3 - small; from ± 0.3 to ± 0.7 - average; ± 0.7 to 1.0 large.

The main findings and results

A detailed psychological history was collected. When comparing the main and control groups, it was revealed that with PVS, psycho-traumatic situations were observed somewhat more often (Table 2).

TABLE 2 PSYCHOTRAUMATIC SITUATIONS IN CHILDREN WITH PVS AND HEALTHY PEERS, (%)

Psycho-traumatic situations	Teens with ADS (p=243)	Control group (p=30)
Lack of understanding with relatives	48,9*	26,7
School conflicts: With teachers With friends	13,4 28,6*	13,3

From the data presented in the table, it can be seen that children with PVS had several reasons, which, according to the estimates of the child and the mother, were traumatic situations. The most frequent situations were: lack of mutual understanding with relatives (48.9%), conflicts at school, in particular with friends - 28.6%. Such situations were less common among children in the control group. Thus, the state of adolescents with PVS is characterized by higher internal stress, decreased mood, and determines anxiety and narrowing of contacts.

When assessing the quality of sleep in children of the main group, a decrease in its score was revealed to 16.06 ± 1.18 points, while in the control group the total score was 28.6 ± 1.22 points. When analyzing asthenia using a visual analog scale, a significant decrease in the total score was also revealed in children with PVS (6.69 ± 0.4) compared with the control group ($3,8\pm0,11$).

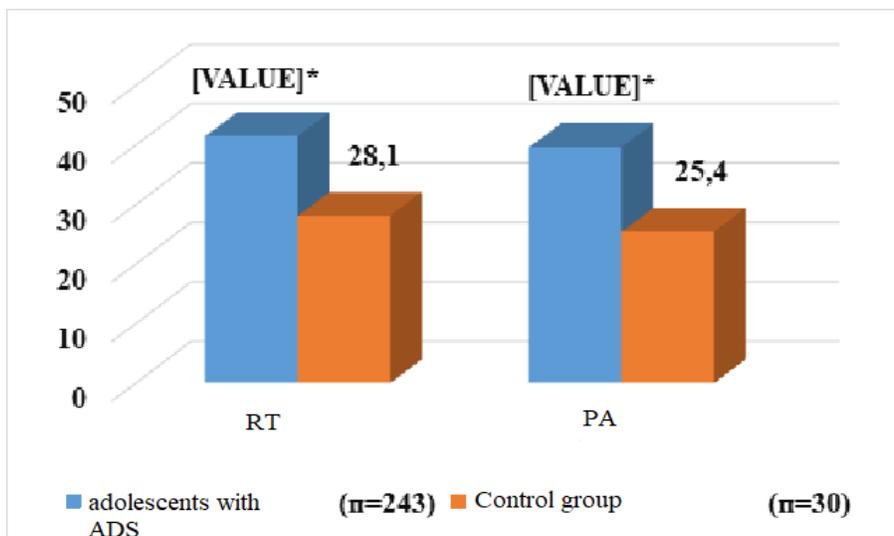
The study of emotional disorders revealed several differences between the two groups.


Figure: 1. Reactive indicators (RT) and personal (PA) anxiety according to the Spielberger test in children with PVS and healthy peers, points.

Situational or reactive anxiety (RT) as a state is characterized by subjectively experienced emotions: tension, anxiety, concern, nervousness. Personal anxiety (PA) has a stable tendency to perceive several situations as threatening, to react to them with anxiety. When studying anxiety according to the Ch.D. Spielberger noted an increase in the total RT score (41.5 ± 3.18) and RT (39.62 ± 2.84) in children in the study group, compared with healthy peers who had RT indices (28.1 ± 1, 1) and PA (25.4 ± 0.9) (Fig. 3). Thus, with PVS, adolescents have a higher level of anxiety, which distinguishes them by increased anxiety, uncertainty, and emotional instability.

According to EEG data, non-gross changes in the bioelectrical activity of the brain were revealed in comparison with the control group. When analyzing the background recording, diffuse changes were recorded with signs of dysfunction of the median brainstem formations in the form of disorganization of the alpha rhythm at a reduced amplitude level. The alpha index also tended to decrease in the group of sick children. The beta activity was characterized by amplitude of up to 21.03 ± 1.02 µV, which was slightly higher than in the control group (16 ± 1.14 µV). The slow-wave activity of theta range was also higher than in the group of healthy peers (Table 3).

TABLE 3 CHARACTERISTICS OF THE AMPLITUDE LEVELS OF EEG RHYTHMS IN CHILDREN WITH PVS PUBERTY AND HEALTHY PEERS, MV.

EEG rhythm	Main group	Control group	Validity criterion
Alpha rhythm	52,01±1,98	84,6±2,44	P<0,05
Beta rhythm	18,03±1,02	16±1,14	P>0,05
Theta rhythm	47,75±1,98	32,84±1,84	P<0,05

From the data presented in the table, it can be seen that the amplitude of the beta rhythm in the main group was slightly higher than in the control group. The severity of the alpha rhythm in sick children was less, which is confirmed by the data of the alpha index, which in children of the main group was 56.6 ± 2.4%, and in healthy children - 64.3 ± 2.4%. Slow-wave activity, on the contrary, in patients with PVS was more pronounced, which characterizes the state of tension

in the functional activity of the brain. Thus, in children with PVS, EEG changes occurred, indicating dysfunction of the diencephalic nonspecific systems of the brain.

When assessing cerebral hemodynamics according to REP data, it was revealed that in patients with PVS, compared with the control group, the pulse blood filling was slightly reduced, the vascular tone was increased, and venous outflow was obstructed (Table 4). Visual examination of the rheographic curves of the main group revealed in 56 (57.7%) people the presence of additional waves in the catacrotic part, displacement of the additional wave to the apex, and a decrease in the severity of incisura, which indicated an increase in vascular tone and obstruction of venous outflow.

TABLE 4 INDICATORS OF RHEOENCEPHALOGRAPHIC STUDY IN SICK AND HEALTHY PEERS.

Groups	Leads	Indicators					
		RI, 0M		DCI,%		DSI,%	
Main	F - M	0,10±0,01	0,09±0,01	74,3±1,3	70,4±1,4	84,5±1,2	82,4±1,6
	0 -M	0,08±0,02	0,09±0,01	74,2±1,1	72,8±1,4	83,1±1,3	83,5±1,7
Control	F - M	0,14±0,02	0,15±0,02	58,8±1,8	53,3±1,7	62,4±1,7	61,1±1,7
	0 - M	0,10±0,01	0,11±0,01	63,4±1,9	64,1±1,9	64,9±1,8	65,1±1,9

Note: the differences are reliable everywhere - p <0.05.

The table shows that the pulse blood filling in children with PVS was almost 1.5 times lower than the values of the control group, which was mostly observed in the system of vertebrobasilar arteries.

Peripheral vascular resistance (DCI), on the contrary, was increased. DSI, reflecting the state of blood outflow from arteries to veins, was also 26% higher in adolescents with PVS than in the control group.

In the study of the modulus of elasticity, which provides additional information about the tone of the vascular wall, it was found that in the group of sick children it was $16.1 \pm 0.5\%$ in the carotid artery system; in the system of vertebrobasilar arteries - $16.9 \pm 0.8\%$. In the group of healthy children, it was slightly lower: in the carotid pool - $15.6 \pm 1.9\%$, in the vertebrobasilar pool - $13.2 \pm 0.53\%$. Thus, in adolescents with PVS, we can talk about an increase in tonic vascular tension. The greatest differences in CA were observed in the vertebrobasilar basin.

CONCLUSION

Thus, in the main group, it was equal to $26.28 \pm 2.1\%$, while in healthy children in the same pool it was $12.13 \pm 1.1\%$. In the system of the internal carotid artery, the differences were less pronounced and did not differ significantly: in the main group, CA was $12.0 \pm 1.6\%$; in the control group - $9.1 \pm 0.9\%$.

Thus, the PVS of the pubertal period is characterized by the presence of complaints of headache, dizziness, irritability, instability of mood, increased fatigue, sleep disturbance; dystonic manifestations of cerebral hemodynamics with a reduced intensity of pulse blood filling and obstruction of venous outflow; dysregulation changes in the bioelectrical activity of the brain; an increased level of reactive and personal anxiety, asthenia.

The initial programs of sick adolescents were distinguished by a flattening of the curve top, a decrease in pulse blood filling, an increase in vascular tone, and peripheral vascular resistance. Most of the children were found to have difficulty in a venous outflow from the cranial cavity.

Taking into account the presence of a clear disadvantage in the state of health of adolescents, it is necessary to carry out preventive examinations at a qualitatively new level using a screening questionnaire at the first stage and taking into account the presented structure of the incidence of adolescents, which will contribute to the timely recovery of the adolescent population.

SOME CLINICAL AND DEMOGRAPHIC FEATURES OF PARKINSON'S DISEASE DEPENDING ON GENDER

Rano Mirkhalilovna Abdujamilova*

*Associate Professor,
Department of Neurology,
Tashkent Institute of Postgraduate Medical Education,
UZBEKISTAN

ABSTRACT

We studied the main epidemiological indicators and assessed the gender impact on Parkinson's disease. The prevalence of PD increases with age, the maximum for both sexes falls on 70-79 years. The PD prevalence ratio was 0.82:1. After 50 years of age men have more PD, and over 60 years of age men to women have a ratio of 1.46:1.

INTRODUCTION

Parkinson's disease is a chronic progressive neurodegenerative disease that selectively affects the neurons of the substantia nigra and is caused by dopamine deficiency [2].

PD is the object of epidemiological research around the world [6]. PD occurs in any population, the frequency of occurrence varies between 100 and 250 cases per 100 000 population, constantly increasing with age and reaches 1700 cases per 100 000 population in the group over 65 years old [13]. According to "The Working Group on Parkinson Disease", in 2007 there were 6.3 million people with PD worldwide, with one in 10 patients under 50

The causes of PD have not been established to this day. A variety of genetic factors and environmental influences leading to the death of dopaminergic neurons of the substantia nigra by the mechanism of apoptosis or necrosis are assumed. The most probable mechanism of the pathogenesis of nigral cell death is considered oxidative stress as a result of dopamine oxidation, increased lipid peroxidation against the background of mitochondrial defect and glutathione deficiency [4,5].

The death of dopaminergic neurons in the substantia nigra leads to disruption of the functioning of the striatal-thalamo-cortical chains that regulate motor functions, which is clinically manifested by hypokinesia, rigidity, tremor, dysbasia and postural disorders. Cognitive dysfunctions are associated with dysfunction of the frontal cortex [7]. Changes in the state of serotonergic, noradrenergic neurotransmitter systems, coupled with dopamine deficiency, underlie depressive, autonomic and motor disorders [3]

Life expectancy has been steadily increasing in recent years, and according to the UN, the world's population over 60 will grow from 737 million in 2009 to 2.1 billion in 2050. Consequently, the number of PD patients will also grow worldwide [1].

Based on the foregoing, the study of BP is of great importance and requires the close attention of scientists from all over the world. At the same time, an important issue is the role of sex and gender in the formation of the clinic and pathogenesis of the disease.

The purpose of the study: to study some demographic indicators and assess the role of gender in PD.

LITERATURE REVIEW

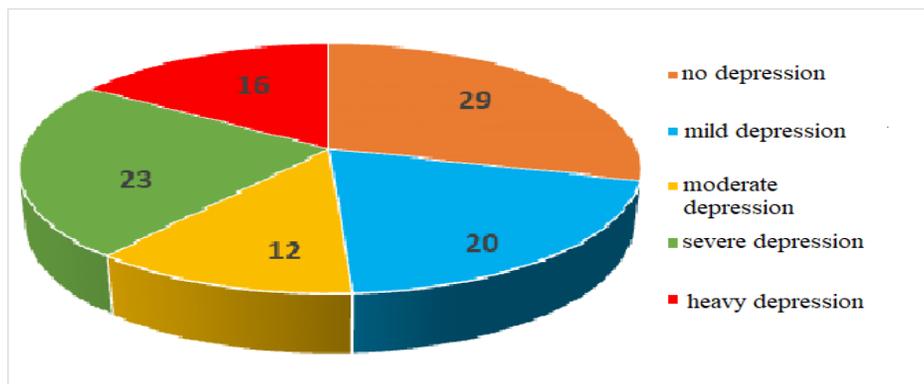
Our study was carried out at the Department of Neurology of TIPME on the basis of the Somatic Regional Hospital in the period for 2017-2019. At the moment, we examined 47 patients with a verified diagnosis of PD. Among them, 18 (38.3%) were men and 29 (61.7%) were women. The age of the patients ranged from 34 to 92 years, the average age was 72.19 ± 8.63 years. PD duration is from 3 to 17 years, the average duration is 6.11 ± 3.97 years. The first symptoms of PD were recorded by patients on average at 63.46 ± 8.49 years in men they manifested themselves on average at 62.37 ± 8.28 years, and in women on average at 64.37 ± 8.71 years. An earlier onset of the disease was stated in men.

An increase in the number of patients with age was revealed. Most patients with PD were aged 70–74 years, after 75 years the incidence of PD decreased.

According to the stages of PD, assessed according to the Unified Hen-Yar Scale for Assessment of PD by the International Movement Disorders Society (MDS UPDRS), the patients were distributed as follows: 1-1.5 stage - 4 (8.5%) patients, 2-2.5 stage - 31 (66%), 3 stage - 10 (21.3%), 4-5 stage - 2 (4.3 %) patients.

The incidence of PD in the ratio of men to women was 0.82: 1, and at the age of 60 years old it was 1.46: 1, which is consistent with literature data [8].

In our study, signs of depression according to the Beck scale were recorded in 71% of patients with PD (more than 9 points), and severe depression (more than 30 points) in 16% of patients (Fig. 1). Moreover, in 64%, severe depression (more than 19 points) was found in female representatives.

Figure 1, Depression in PD patients


We did not find the dependence of depression on the age of the patients and the duration of the disease, but we found a statistically significant dependence (p = 0.05) of the severity of depression on the stage of the disease according to the Unified Hen-Yar scale. Women were more susceptible to pronounced degrees of depression, regardless of the stage of the disease, so of all patients with depression, 62.8% were women. This is consistent with other authors' data on the prevalence of depression in PD [11].

We recorded cognitive impairments in 66% of PD patients, in 32% - moderate cognitive impairment, in 34% - dementia. In terms of the prevalence of cognitive impairments, women slightly predominated (37.3% of 66%), which is consistent with the literature [12].

With disease duration of up to 5 years, dementia was found in 27% of patients with PD, and in patients with PD for more than 10 years - in 52% of cases, and in both groups, gender did not have a statistically significant difference. But the degree of dementia was significantly influenced by the age of the patient, so in the group of 50-59 years, dementia was recorded in 13% of patients, in the group of 60-69 years - in 17%, in 70-79 years - in 36% and over 80 years - in 42 %. An increase in dementia cases was recorded by 3.5 times from 50 to 80 years. Dementia indices in PD patients are shown in Fig. 2.

CONCLUSION

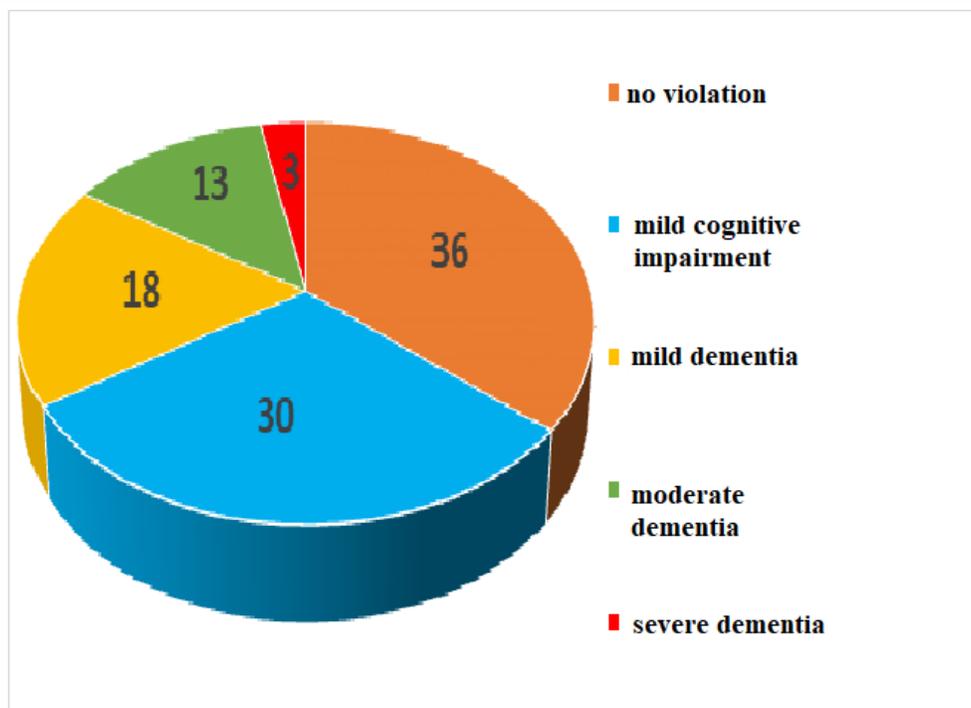
Cognitive impairments increased depending on the stage of PD according to the unified Hen-Yar scale. At stage 1 dementia (MMSE <24 points) was recorded in 5% of patients, at stage 2 - in 23%, at stage 3 - in 42%, at stage 4 - in 63% of patients (p <0.05). We noted an increase in the proportion of patients with severe cognitive impairment from stage 1 to stage 4 PD about 13 times.


Fig. 2 The degree of dementia in patients with PD

Based on the data obtained, we came to the following conclusions:

1. The prevalence of PD increases with age, the maximum for both sexes is at 70-79 years.

2. In general, the ratio of the prevalence of PD by sex (F: M) was 0.82: 1, however, over the age of 60, the proportion changes to 1:1,46.

3. Depression develops in 71% of PD patients, and 42% of them are women.

4. Cognitive impairment occurs in 66% of PD patients (32% - moderate cognitive impairment, 34% - dementia), moreover, in women more often - 37.3%, in men - 28.7%.

The data obtained form the basis of our further studies to elucidate the reasons for the differences in the prevalence and clinical picture of PD depending on gender, which in turn will serve as the basis for the development of differentiated approaches to the diagnosis and treatment of PD, taking into account gender, gender and age.

ABSTRACT

The article is devoted to the analysis of its constructive basis in the description of the portrait of Adam and the ability to express it on a linear constructive basis. It contains the necessary ideas of classical artists and theorists working in academic schools for the professional training of students.

KEYWORDS: *Head Shape, Constructive Construction, Proportion, Methodical Stage, Portrait.*

INTRODUCTION

When describing forms, the student must first have a good understanding of the constructive basis of the form and be able to accurately reflect it in a linear design. When describing a portrait of a person, it is also necessary to analyze its constructive basis and be able to express it on a linear constructive basis. An example of this is the linear-constructive drawing of a human head scheme, developed by the famous German scientist and artist Albrecht Dürer when performing similar tasks.

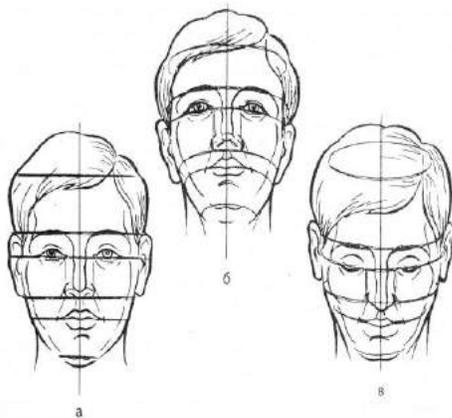
When we analyze the constructive basis of the shape of the head, we need to identify a number of laws and take them into account when drawing. Let us examine these laws using the example described by A. Dürer.

The head shape seems to intersect with the four main parallel-horizontal surfaces: the place where the hair begins to cover, lines on the arches above the eyebrows, the base of the nose and the chin. Perpendicular to these surfaces, they intersect on a vertical surface in an ovoid head that forms a transverse line on the surface. This vertical surface divides it into two equal parts, and the resulting profile line divides the appearance of the head into two symmetrical halves.

On the other hand, horizontal surfaces divide the head into parts and form the base of the hair follicles, eyebrows, nose and chin. Thus, this scheme confirms the law of dividing the basic form into proportional parts.

Due to its exemplary and reliable nature, this scheme is used by many artists and educators in the teaching process today.

The Main Findings and Results

Following in the footsteps of A. Dürer, teachers began to develop their own schemes for expressing the constructive basis of the shape of the head when teaching drawing a sketch, and with their help they helped students to quickly and better assimilate educational materials. For example, the artist-teacher A. Losenko has developed a series of methodological tables in which the diagram of the head, depending on the width and position of the head, clearly demonstrates the patterns of change in the perspective appearance.) directions are indicated in the table by dotted lines. At the same time, Losenko does not actually have such lines, they are conditional, and, depicting the head, the artist tries to emphasize that these are imaginary.


The great artist-teacher of the last century A. Sapojnikov created a wire model of the head (Fig. 1). It helps the artist explain that the constructive basis and perspective of the form is being formed. Well-known Russian pedagogue A. Sapojnikov writes about the purpose of this model: "I have decided to send to the Council of the Empire of the Academy of Arts a copy of the' Primary Drawing Course 'I have drawn up, a box with the appropriate methods and a wire model. I ask you to accept them as part of your blessing. I would be very happy if this model would benefit the Academy's drawing classes. If this model is developed by placing a gypsum head that serves as a model at the

same turn, it will help to understand the perspective change of the self-assembled parts" [1]

Then, developing a method of drawing a human head, each guide author begins to describe the methods of using the constructive scheme as they see fit. Someone would take A. Dürer as a basis for the scheme and immediately recommend mark all the constructive lines. Others preferred the G. Golbyn scheme, while others sought to use both. In the image, all the constructive lines conditionally run along the surface of the shape. The exact location of the constructive lines (where to pass them) is not specified in the manuals. This greatly complicates the work of the student studying. For example, a student wants to describe a profile line, but he does not know where this line should cross. In most applications, the profile line is drawn abstractly as it touches the forehead surface and the tip of the nose. In the picture, such a line cannot be intended when constructing a head shape. We will talk about this again in the chapter on the methodological stage of working on the picture. It is also unknown where the lines of the base of the chin, nose, eyebrows, and eye area are located. The student draws them blindly without understanding the need for these lines to describe the shape of the head.

To shed some light on this issue, we recommend that you consider a linear-constructive scheme of the human skull shape in relation to the anatomical construction laws of each line based on the skull fragments.

Analyzing the shape of the head according to the linear-constructive scheme, we see that the profile line passes through the middle of the hair follicle, the middle of the chin, the base of the nose, the lip joint (bows) and the jawbone. The head shape should be looked for by the fragments of the skull, and not by the surface of the point of contact of the profile line. For example, in a spout prism, the profile line is located on the back face of the prism rather than on the front face. The profile for the nose can be changed depending on the position of the head in width relative to the line. At the base of the jaw, the profile line does not run on the surface of the jaw (although the groove in the jaw is well targeted), but on the jawbone.

When the artist knows where the profile line is, he can also easily determine the position of the head in width. To do this, you need to connect the point where the profile line intersects an imaginary straight line to the point where the profile line intersects the eyebrow and the base of the chin, and determine what angle forms between these lines and the head is vertical, at the same angle.

The profile line also helps the artist draw the head shape. Since the profile line divides the head into two symmetrical parts, the artist can easily see the location of a pair of figures (jaw line, eyecups, corners of the lips, nostrils), which are indicated in the picture in the same way: immediately marking the right line of the jawbone, the edges of the temporal bone are marked equally on the right and left, and so on. The horizontal constructive lines are parallel to each other, dividing the head into proportional parts. The hair follicles, the eyebrows, the bases of the nose, and the chin lines divide the head into three equal parts.

The laws of proportional division of the head were defined by ancient artists. We can also see the laws of the division of the head shape into three parts in Ancient Greek and Roman painters. Renaissance artists came to the conclusion that the front of the head could be divided into three equal parts based on mathematical measurements.

As artists of the next century developed the law of proportions, they came to the same conclusion in various methods of research. For example, A. Losenko in his work "*Drawing a short proportion or academic form of man*" showed the division of the head into three equal parts. V. Shebuev pointed out this in his work "Anthropometry".

However, later the enemies of the Academy of Arts objected to the teaching of rules and laws, they did not recognize the classical norms in art, and therefore the schemes of the head form structure, as well as the proportional division into three equal parts, they were clear about the structure of the head form and reject them on the grounds that there can be no uniform law.

The Albrext Dürer scheme of the construction of the human head shape is not an absolute reality, but it does come in handy in revealing the constructive basis of the unspoken form. Familiarity with the classical laws teaches the painter to correct and correctly determine the proportions and peculiarities of the living head structure. Knowing these laws helps the artist to feel the signs of deviation from the laws observed in nature. Knowledge of the laws of construction of the general shape (even schematic) allows the artist to observe the various characters depicted and immediately make corrections to the image, taking advantage of a wide range of opportunities to clarify and make changes to the intended image. A student who observes nature should use ways that facilitate his work so that the head does not come out crooked and there is no rough distortion between the proportions. He must know the norms, rules, and laws used by the artists who preceded him and assisted in his work.

The scheme of construction of the head shape and its proportional laws are based on the skull, as mentioned earlier. It is therefore necessary to determine the location of the constructive lines in nature. It should be borne in mind that they lie at the base of the skull. If we look for the constructive line of the base of the jaw in nature, then it is necessary to imagine it not on the surface of the jaw, but on the bulge of the jawbone. The line of the base of the nose passes through the nostrils, not through the tip of the nose: the tip of the nose may be located either below or above the line of the base of the nose in the picture. Knowing the constructive scheme of the construction of the human head helps the painter to follow the laws of perspective in the depiction, avoiding blind copying from nature. If the student masters the constructive lines as a whole, it will not be difficult for him to construct the image of the head shape correctly, even in the most complex perspective situations.

Initially, the linear-constructive image of the shape of the human head looks like this: initially, the general shape of the head is depicted with colorless and light shadowless lines. Then a profile line is drawn along the front of the head, which divides the line into three equal parts, and over these lines, constructive hair lines are drawn that cover the arches of the eyebrows, nose and base of the chin. After determining the necessary targets, we determine the main details: - the prism of the nose, the spherical shapes of the eyes, the generalized shapes of the lips and jaws. All of this is illustrated by only a single line where the necessary corrections can be made. The lines that come in handy when depicting the constructive basis

of a shape help the artist to correctly apply the laws of shape construction. As an example, a linear-constructive construction image of Apollo's head is given as a learning task. (Figure 2)

Special assignments on the linear-constructive depiction of the structure of the main shape help students to better master the material, teach them to think and reflect constantly while drawing, turn light-shadow defects blindly, passively. Because with the help of such exercises, the painter realizes that the structure of the form remains constant.

In order to fully and comprehensively study the patterns of the structure of the general form, the student must perform such tasks not only from nature, but also from memory, imagination. He needs to be convinced of the need for such exercises in practice, to feel how much they help in mastering the art of realistic painting on his own experience. Such exercises not only develop the student's skills in anatomical knowledge, but also focus on shaping his or her creative abilities, such as the emotional approach.

The main task of the exercise in performing a linear constructive image of the head shape is: *Increased interest in nature among students.*

1. *Training to work at the methodological stage in image construction.*

2. *Teach them to follow the correctness and expressiveness of drawing.*

3. *Explain the essence of the creative process in realistic drawing.*

4. *Depict nature with high emotion.*

5. *Sharpen observation by increasing efficiency in performing exercises.*

In order for the linear constructive image to look reliable and well constructed, the artist must also master a number of features of the image of the structural diagram of the head of different widths. The process of depicting the structural structure of the basic form requires compliance with certain laws.

CONCLUSION

In conclusion, it should be noted that students who are well familiar with the scheme of constructive construction of the shape of the head can easily draw an academic drawing and a creative portrait of a living head. In order to firmly master the laws of constructive construction of the basic form, it is important for young people to perform only special tasks on linear constructive construction.

PRAGMATICS IN EFLTEACHING: AVOIDING PRAGMATIC FAILURE IN CROSS-CULTURAL COMMUNICATION

Muqaddas Butabayeva*

*Lecturer
Department of English Integrated Course,
Uzbek State University of World Languages,
UZBEKISTAN

ABSTRACT

In teaching process of foreign languages there is a vital role of knowing pragmatics especially in cross cultural communication. teachers should focus on pragmatic awareness of foreign language learners in order not to make false interpretation or face to misunderstandings while communicating with native speakers who have various cultural and social backgrounds. This article states the problematic issues of teaching pragmatics in communicative competence and pragmatic failure of using the target language.

KEYWORDS: *Pragmatic Failure, EFL Classroom, Cross Cultural Communication.*

INTRODUCTION

It is undeniable fact that learning and mastering a language not only includes accumulating a certain amount of language knowledge, but including proper use of language in various contexts, awareness and ability. Teachers should pay attention to guide students learn how to use consciously the language knowledge so that to carry out communication activities. Educators also encourage them to be adopted different communication languages and communication strategies in the context of communication that is productive to enhance pragmatic awareness and improve pragmatic competence. Foreign language teachers should also pay attention to the teaching of cultural knowledge contained in the vocabulary because the vocabulary is the basic unit of language contains rich cultural connotations .Cultivating learners' intercultural communicative competence is one of the main tasks of foreign language teaching. If we analyze this issue deeply, the earliest concept of Pragmatic Failure was proposed by British linguist Jenny Thomas (1983). He refers to pragmatic individuals in cross-cultural verbal communication due to lack of relevant texts, knowledge, thinking patterns, values, social customs, etc. The

resulting communication cannot be completed successfully if there pragmatic failure in speech. Whatsmore, pragmatic failure reveals the deep-seated difficulties in second language acquisition. Thomas divides "Pragmatic Failure" into Pragmatic Language Mistakes (pragma linguistic failure) and social pragmatic failures (sociopragmatic failure) which are two major categories. Pragmatic language mistakes refer to the lack of proper use of individuals' ability to use pragmatic language to express their communicative intentions. In this case pragmatic errors caused by the negative transfer of learners' mother tongue's speech act strategy. For example, When an English expressed gratitude to an Uzbek, he said "*Thank you for your help*." The Uzbek answered "*Never Mind."* Although this statement is in accordance with the English semantic rules, it is not English. The proper expression of the English in the same context is a typical pragmatic linguistic mistakes, the expression "Never mind" is often back when the other party apologizes and comforts to the other person, here the answer should be "*It's my Pleasure, You are welcome" or " Don't mention It* ".

Another pragmatic failure is the social pragmatic failure which refers to the cultural background and thinking of both sides of communication. In this case errors in language expression caused by differences in patterns and cultural values.

For example, an Uzbek student use titles while greeting with English teacher. Dear Ma`mura teacher or Dear Mukaddas opa.

Main Part

This is in full greeting according with the Uzbek values, but according to the Western Society this statement will make people feel that you are hypocritical. In this case, just say "*Dear Mrs Mukaddas*!" Moreover, it is the verbal communication which causes performance and pragmatic failures as pragmatic failures are always accompanied by verbal communication through learners. An empirical study of pragmatic failures, pragmatics in verbal communication there are number of mistakes:

a) Pragmatic language errors

The causes of pragmatic language errors are:

1. There are such things as speech, grammar, thinking between the two languages

2. Lack of attention to pragmatic teaching, ignoring the language of the classroom

3. In the intercultural speech communication, the expression of the target language

or improper use of communication strategies.

b) Pragmatic social errors

Both sides of cross-cultural verbal communication cannot escape from verbal communication. Language learners' have their respective societies and cultures, and therefore they subject to their own social culture, values, thinking patterns and communication that has the profound influence of behavioral strategies. For instance, if one or two people at the party they only pay attention to the correctness of the communicative language form and ignores its own place. Yet, communication context will lead to the emergence of pragmatic failures. This kind of pragmatic failure is called pragmatic social association error.

c) Pragmatic psychological errors.

The subjective psychology of intercultural communication is always affected by society and with a certain degree of influence and constraints, they are always pursuing their own mentality. In order to balance with social psychology, one should always pay too much attention to his communication strategy. Is it appropriate or the language of communication is correct? There is a pragmatic phenomenon, resulting in frequent pragmatic failures. Until the interruption of the normal conduct of communication, this kind of psycho-related pragmatic mistakes are referred to as pragmatic errors.

RESULTS AND DISCUSSION

The evidence study shows that it is necessary to improve students' pragmatic and communicative skills. While imparting language knowledge, teacher must focus on cultivating students' intercultural communicative competence so that learners should fully understand the social language and culture of English-speaking countries and understand cross-cultural language. It is known that verbal communication language environment able to adopt appropriate communication strategies and positive true communicative language to achieve satisfactory communicative effects. Thereby, foreign language teachers are encouraged to guide learners to read frequently newspapers and periodicals of politics, economy, society, culture, history, etc. when reading the books, mostly in association with English-speaking natives, students should pay attention to analysing the similarities and differences of comparative culture. Likewise, teachers can properly play some original film products that allow students to experience exotic cultures and master authentic communication language during their classes. In this way learners' speech and communication strategies constantly improve with cross-cultural communication skills.

Therefore, language teachers must guide students to actively participate in various well-designed tasks or activities that allow learners to be creatively transported in real language environments. Communication through a large amount of language with knowledge of communication strategies enable learners to practice cultivating and improving pragmatic and communicative skills.

There are many types of task-based activities which are very benifecial to enhance pragmatic awareness in EFL classes such as role-playing, class discussions, speech contests, debates, etc. These activities provide learners with truly natural language environment for conducting real verbal communication.

CONCLUSION

As a final note, the importance of the subject is re-enforced by Boz (in Sheffiled Hallam Working Papers, n.d., p.3) that "our shrinking world" may compel more and more people to find ways to avoid intercultural communication breakdown. Hence, so that to increasing awareness of the need for cross-cultural knowledge in communication or to know what is cross-cultural pragmatic failure and its relevance to their L2 learning, language educators and researchers in linguistics should be more willing to support students with more knowledge and instructions to understand of pragmatics during the classes.

FEATURES OF MANIFESTATION OF IDEOLOGICAL THREATS IN THE PROCESS OF GLOBALIZATION

Karimova Saida*

*Teacher,
Gulistan State University,
UZBEKISTAN
Email id: zirapcha_2020@mail.ru

ABSTRACT

The article analyzes the manifestations, features and consequences of ideological threats in the process of globalization. It was emphasized that in the complex situation that arose for developing countries, it is necessary to strictly define the national strategy and take reasonable measures against threats. The importance of developing and improving the specific protection system and technology in this has been shown.

KEYWORDS: *Globalization, Ideology, Ideological Threat, National Culture, Market Economy, Religious Extremism, "Mass Culture", Instability, Complex Approach, Mass Media, Migration, Youth Consciousness.*

1. INTRODUCTION AND RELEVANCE

The rapid development of today's world, the globalization processes taking place in the political, economic, spiritual, ideological sphere, are causing the deepening of the discrepancies between developed and developing countries and the emergence of threats in a specific way. Information, which is a key element of global processes, has an active impact on the life of a person, nation, state, national culture and society at a level that is beyond borders. Now in the instability and turbulence that has arisen in some parts of the world, the influence of ideological centers or "third-hand "is noticeable. The growing number of spiritual and ideological threats has been approaching developing countries from the point of view of the priority of national interests, while the need to develop and improve their own protection system and technology is constantly being dictated.

2. METHODS AND LEVEL OF STUDY

The development of society and the global processes, as well as the threats posed by it, attract the attention of politicians, philosophers, historians and scientists.

The issue of globalism and threats Russian scientists Kuznesov V.N., Mitrexin V.I., Yanovsky R., KravchenkoA.I.[1]. If studied in the research of scientists such as, Uzbekistan scientists S.Atamuratov, U.Saidov, A.Ochilov, B.Umarov and its various aspects were investigated and analyzed by others. From the analysis of this research work it is understood that globalization and nation, personality, culture and values, spiritual and ideological threats were investigated.

In carrying out the study, methods such complex research, induction and deduction of historical, logical, structural-comparative, scientific sources were used.

3. RESULTS OF THE STUDY

Globes turned the world into a big village. Development techniques and technologies have been invented that allow to solve any complex problems. Human labour is forced to spend the day on the whirlpool of threats, addictions and conflicts, on the contrary, toys as if it should be relaxed and pleasurable, and uninformed. The acceleration of information exchange to the extent that it does not know the limit began to exert its influence on political, economic, ideological relations.

The aging 20% of the world's population is young people. Instability in young people, newsletter migraines, the presence of social problems give them the opportunity to use them for various purposes.

In today's dangerous world, under conditions of ideological struggles for the capture of the soul and consciousness of young people, both external and internal risks are manifested in different ways. Understanding and preventing them in time is becoming the most important goal-provision. The period of active struggle against such a disaster, which can cause irreparable damage, cannot be without looking at the hand grip tripod, spending all opportunities against it.

The Internet has penetrated into our lives and has become a part of it, a bum assistant that is close to our distance. But the possibility of spreading any message around the world at the speed of light, and the breadth and immorality of its audience, has become a tool for many evil forces to spread their own merciless, destructive ideas, is evidenced by the fact that it is a perilous threat.

Today, it is possible to achieve the goal by introducing military equipment and troops into any country and subjecting it, not necessarily dependent, but by introducing, distributing information that affects the minds of those people.

Today ideology polygons are embodied in the apartments of each of us, they are: a televidenie connected to a satellite, a computer connected to the internet, a phone that we carry with our child. See, how much of the threat has come into our lives in a close and inconspicuous manner.

Some states are working on organizing information attacks. It is clear to everyone that they are spending millions of dollars on this. Worst of all, 90 percent of young people turn to the internet as their main source of information. At the moment, there are more than 9 thousand sites that promote easy ways to commit suicide, 49 percent of computer games are promoting violence and evil. 41 percent are completely dependent on the pornography exposure that children and

adolescents distribute through online. International experts have found that 38 percent of the world's sites in the spirit of child violence, 26 percent regularly monitor web pages of child nationalism character.

In the conditions of globalization, developed countries are gaining more. In them, science and technology are further promoted, and on this basis, their material strength is gradually increasing. Developing countries, on the contrary, are becoming more impoverished and dependent on the above countries. Threats in the form of "mass culture", along with investment, ideas, technology coming from abroad, are also being exaggerated. The rapid development of Science and technology in developed countries, the rapid development of Science and technology, the aging of developing countries with them, causes complexity in their equalization. Interest in creativity in young people is becoming more and more inclined to take aside the willingness in place.

Uzbekistan has a three-thousand-year history of statehood, is a territory where national cultural values have been formed since ancient times. Globalization undermines national and ethnographic values, making it increasingly accessible to the masses and the same. Will national originality be preserved in the future? –the question is on the agenda.

Today, we see that tools such as radio, broadcasters, mobile phones and the Internet are distributing events at one point in the world to the second point of the world immediately, in minutes, when they are resonating.

There is talk that these tools serve to lighten the pain of the human mind, dressing creativity, discovery. At the same time, it is also permissible to say that these means lead a person into a deep swamp of dirt, trying to absorb vanity, cruelty, tolerance and violence into his consciousness.

Market economy is necessary for progress, for economic prosperity. Private property is a guarantee of human freedom. But in market conditions, human spirituality is surrendered before materialism. Man is experiencing a process of alienation from his own, spiritual values. There is also a saying that globalism is undermining today's modern man in the face of various questions.

Globalization also has a huge impact on population migration. Millions of people from developing or poor countries are moving to developed countries in search of prosperity.

In the 90-ies in the Central Asian countries, the situation became more complicated. The wrong "far-sighted" national restraining policy of the Soviet system can be called a "porched barrel", which was prepared in advance to activate the flame of ethnic conflicts. The problem of borders between these states was also not solved by itself. Evil forces can take advantage of such a "convenient" opportunity when any of the narrow origin. The recent history proves that there were strokes to this.

Another consequence of the restriction is also manifested in the issue of ownership of water reserves. It is not for nothing that the policy of the colonialists "throw and rule cunningly" will serve as an anchor for the initiation and deepening of the conflict between the countries of Central Asia.

It is a pity that the mind, consciousness, intellectual potential of mankind is being spent on the production of techniques, technologies and weapons that cause self-destruction, rather than serving the increase of human well-being and happiness, peace. The fact that there is struggle

between large countries for natural resources and billions of dollars are spent on construction puts the future of mankind at risk. "...those who see the main benefit from globalization, those who try to see, are also admired to it, and in the end, they do not even dream about what this process will bring to themselves either. Because globalism has reached the level of consciousness, worldview and brain of all people, and the view that it is only a factor of progress in the world has risen to the level of priority, and the health of those who do not want to panic about its negative effects is increasing. Indeed wishes all to improve their material life, taking advantage of the ready achievements of science, and technology. Not every country has the opportunity to develop them in their own power. This task is carried out by the globes" [2; 5].

In today's complex conditions, the development and sustainable development of our country is largely dependent on ensuring ideological security.

First of all, Uzbekistan is in a favorable geostrategic position in the Central Asian region, has a rich raw material resources;

secondly, the instability of the army, which has been going on for many years on the territory of Afghanistan, the preservation of the war furnace, the accumulation of forces in a radical mood that threaten the security of the region;

Thirdly, the fact that there are areas in the region where sharp ethnic majors can occur and the threat of aggressive nationalism remains;

Fourthly, there is an active movement of forces trying to bring the ideas of religious extremism and fanaticism into our country;

Fifthly, the globality of the flow of information is manifested in the media in the presence of "hide threats that appear to be harmless in the form of mass culture.

4. CONCLUSIONS

One of the important features of the present era is the idea of the struggle for the possession of the mind and soul of people. In this regard, more and more ideologically – ideological tools, weapons and special technologies are being used, which are now difficult to see and perceive openly. It is for this reason that the ideological threat is a negative phenomenon, and no matter how it looks, it nevertheless has a negative impact on the normal way of life in society.

In this sense, Uzbekistan is also not excluded from this process and problems. And this requires extreme responsibility, sanity and consciousness from every citizen in the conditions of globalism. It gives its positive effect when it comes to technological approach in the fight against ideological threats in the process of globalization. In this it is desirable to focus the main attention on the following aspects:

First of all, attention should be paid to the education of young people in the spirit of national values and traditions, proceeding from the principle of anti-thought, anti-idea, anti-ignorance enlightenment. To do this, it is necessary to preserve and promote the national spirit in the family, to form an atmosphere of mutual respect and kindness, to be proud of the fact that the child is a representative of this nation from youth, to be proud;

Secondly, in order to protect against the threat of "mass culture", it is necessary to take control of the communication of young people with the Internet, to teach them to use the internet

exclusively for the intended purpose, to be in an uncompromising attitude to any situation that negatively affects the formation of their worldview and consciousness;

Thirdly, to attach special importance to improving the quality of education, the proper and effective organization of the leisure time of pupils and students, to broaden the cooperation of Family, School, neighborhood. Protection against the negative effects of social networks, awaken in them the ability to form a positive attitude to work;

Fourthly, on national TV channels, interesting, able to attract people, is able to compete with the TV productions that are presented through the Western media, such as show, film, showcase and etc.;

Fifth, it is no secret to anyone that the continuous increase in the socio-economic potential of our country, at the same time, is improving the understanding of the socio-economic problems of its population, because young people who are quickly given foreign influences, are easily prey to these socio-economic problems.

Sixthly, it is necessary to form an ideological immunity in young people, to take measures to create adequate conditions for their formation as an educated, strong and mature person, to prevent them from easily falling into someone's hands as prey, to study, analyze and to develop their own factors;

Seventhly, the most effective factor in protecting the population from ideological threats is the elimination of unemployment, providing them with permanent jobs, the development of small business and private entrepreneurship, in order to regulate the migration of the population in this way.

ABSTRACT

This article speaks about the commitment of a person and a citizen in a social society. The article analyzes the obligations and civil debts of individuals in the Declaration of Human Rights, the Constitution and laws of the Republic of Uzbekistan.

KEYWORDS: *Constitution, Duty, Obligation, Persons, State, Official, Declaration, Organization Of The United Nation, Responsibility, Development Of The Nation, Law, Principle, Morality, Order Of Society, Prosperity Of Society.*

INTRODUCTION

Man has always fought for his right to life, freedom and freedom in his life. But these struggles have not always yielded results. When we look at the history of all states, the process of development, the state of regulation of social relations of the present day, we see that it is superficial to operate sincerely on the task for which each person himself is responsible. This deficit is clearly noticeable, especially in the attitude of state officials to their duties. On the contrary, while people struggle for rights, they have always been doing their part nationwide.

We will analyze some aspects of how people and citizens react to certain responsibilities, responsibilities and duties in social life. This analysis shows that some officials and some citizens are not committed to their duties and duties at the required level of society and the state.

For the development of society, living rules are established. It is established that these rules lead us to Universal action. In so many events in the world and in the states, the rights of individuals were given priority.

Everyone, every official, would perform his duties on the basis of these norms, but in the laws the rule about duty, responsibility and responsibility is not written down. But as a result of the fact that some individuals do not look faithfully at their task, to put their interests above the interests of society, restrictions are established in the laws.

The assaults on the various otherworldly and community that is happening on earth have united humanity. It has established international cooperation organizations. It led mankind to the creation of documents that defined their rights and duties. Developed giants adopted their own constitutions. In these documents, special attention was paid to duties. But, loyalty to the duties, in this regard, took the opportunity to carry out enlightening and ideological work. In our study we will concentrate on the sources of some duties and the emphasis on them.

To date, it is not an exaggeration to say that the rights and legitimate interests of literally all persons in the independent Uzbekistan have been ensured. But individuals, such as those whose coin is on the 2 side, are required not only to carry out their land and rights, but also to timely fulfill their obligations under the Constitution and the law for themselves. This is stated in Article 29 of the Universal Declaration of Human Rights, which remains only in our Constitution:

1. Everyone has duties to society, only in this case his personality can be found free and full perfection.

2. Everyone must comply with the limitations established by law in order to ensure that the rights and freedoms of others are adequate and respected in a democratic society in the exercise of his rights and freedoms, to meet the Just requirements of morality, public order, general welfare.

3. The exercise of these rights and freedoms should not in any way contradict the purposes and principles of the United nations.

But, as we all have witnessed every individual, whether he is a physical person or an official has always known to demand his rights, but none of them think that the issue of timely fulfillment of their obligations, through which they bring benefits to the people, is problematic.

If we say that they blindly follow or do not follow the obligations laid down in our Constitution, then I think it will also be unfair.

In this regard, I would like to touch upon the obligations of officials and draw attention to Article 2 of our headscarf. "The state-it serves its interests by expressing the will of the people, state bodies and officials are responsible before society and citizens" -is, clearly and understandably, indicating their obligations.

The situation of conscientiously non-compliance with their obligations by officials was assessed by the head of our state from a critical point of view.

In his books titled "Critical Analysis, strict discipline and personal responsibility must be the Daily rule of a chariot leader", the president of our country ShavkatMirziyoyev said: - "First of all-some offices and their leaders have been severed from real life and people's needs to some extent. Secondly, a superficial approach is allowed in the development of promising programs, while remaining in the development of networks and territories. Foras a major drawback, it is natural that many leaders are accustomed to disprove complex problems without leaving the Cabinet, without having a deep study of how the work in the rural areas is in such a situation that

they do not fulfill their abovementioned obligations. Following the failure to fulfill their respective obligations, the common people are suffering, their rights and freedoms are limited to a certain extent."

In our Constitution, the obligations of officials as well as individuals are mentioned. Unfortunately, these are either not fulfilling their respective obligations on time or not paying due attention to the extent. One of the main principles of the obligation of individuals is that - "citizens are obliged to pay taxes and local fees established by law", as established in Article 51 of this Constitution.

But very few citizens fulfill this obligation on time halos, and the rest of the citizens do this without delay in their own time, causing ovulation. It is estimated that the support of the layer in need of social assistance, assistance to them, the timely provision of pension provision to our elderly maternity homes, the provision of people's interests, the development of medical, Energy, Science and education spheres are carried out on the account of timely payment of taxes to the state budget.

We forget to fulfill similar basic obligations on time.

If our Constitution says that citizens are obliged to preserve the historical, spiritual and cultural heritage of the people of Uzbekistan, this is also remembered.

At present, it is certainly a pity that many of our historical monuments remain neglected and neglected. Instead of paying attention to them, we are destroying what we find necessary.

We can also pay attention to Article 50 of our Constitution. This encyclopaedical has strengthened the rule that - "citizens are obliged to treat the environment with caution to the natural environment".

At present, our attitude to nature is not at the norm level, we do not pay enough attention to the environment.

In the laws of the Environmental Protection Network, in particular Article 13 of the law of the Republic of Uzbekistan "on waste disposal", the duties and duties of citizens on the disposal of waste are established. According to him, citizens: "when carrying out work related to the waste, must comply with the established sanitary norms and rules, other requirements; must pay for the use of the services of enterprises and organizations engaged in the collection and disposal of motor vehicle waste in the established order of payment". And in Article 15 of the law "on waste" the obligations of legal entities are stipulated.

My personal opinion is that each individual uses the blessings of nature without exaggeration and without fuss, only for his own benefit, waste is thrown into the place where he encounters it. We cut down trees as far as we know, large factories and factories also poison the atmosphere with the toxic substances that come out of them, damaging the natural environment of the environment.

This means that our commitment in this direction is also sufficiently fulfilled. We say that the traditions, traditions and mentality of our Uzbek people are at a high level, that's for sure.

But every good comes from the saying that there is one bad thing: even in our sacred abode, which is called the family, we do not fulfill enough of the obligations established for ourselves.

There are also a lot of what I say I do. At the same time, those of us who forget this obligation and do not pay enough attention to the education of their children, in turn, this obligation is defined in Article 64 of the Constitution " parents are obliged to feed and educate their children until they reach the age of majority ".

The same task is not effectively pursued by parents, it causes an increase in crimes among young people, and naturally this negative situation is an obstacle to the development of our country. In addition, adult children do not fulfill the obligation to take care of their parents as high as it is prescribed in Article 66 of the Constitution, as a result of which the parents are left alone and in need of support in their old age. The family is considered to be the holy ground and this is also stated in the Hadiths about it.

We can come up with the following hadith of our Prophet Muhammad (s.a.v.) - "each of you are responsible, each of you is responsible for your subordinates. Each leader is responsible over people and is responsible for them. The Earth is responsible and responsible for its people over the woman and under the armpits. The wife is responsible in the House of her husband and is responsible for the subordinates. The slave is responsible for the property of the master and is responsible for him. Each of you is responsible for your subordinates." Apparently, even in the rules of Sharia, the performance of duties is established strictly.

The purpose of studying, analyzing, summarizing the duties of citizens established in the laws is to draw attention to the formation of loyalty to duties. For each person himself, the timely fulfillment of the obligations established by our Constitution and other laws serves as a huge Foundation and foundation for our achievement of new heights.

President ShavkatMirziyoyev put forward the following points in his books"Continueour path of national development with determination",- "Today the time is changing,the task of putting forward his demand is increasing. Here is the time to live in such conditions with the mood that "you-do not touch me, I-do not touch you". The situation is bad, have become accustomed to the search for excuses that the situation is "severe", of course the above statements are not a secret to any of us. But let's ask ourselves the question of who will change this situation and who will leave a trace.If we do not change the situation with our own intelligence, diligence, no one will come from the outside and do this work for us.

We are forced to admit that no matter how heavy these statements are.

A significant change in the situation will arise as a result of the fact that you and we will sincerely fulfill our constitutional obligations in due time. In our people there is a proverb" A friend speaks bitterly". If we understand the critical words spoken against each other in a timely manner and eliminate them and fulfill our obligations, I think we will make a contribution to the development of our country.

THE STATE OF THE FOOD INDUSTRY IN THE FERGANA VALLEY REGIONS DURING THE SECOND WORLD WAR

M. Khujamov*

*Teacher,
Namangan State University,
UZBEKISTAN

ABSTRACT

In this article, changes and problems in the food industry of Uzbekistan during the Second World War were analyzed by the example of the Fergana Valley regions. The main emphasis in the article is on whether the region is a state of the food industry, the problems inherent in the system, the negative impact of the war on the food industry of the Fergana Valley and its solutions.

KEYWORDS: *World War II, Food Industry, Fergana Valley, Agriculture, Sugar Beet, Grain Crops, Taxes, Oilfields, Concerva Factories, Fruits And Vegetables*

INTRODUCTION

Early in the morning of June 22, 1941, fascist German troops began to attack the territory of the USSR. From that day on, the "Barbarossa" plan began to be implemented in practice. Until December 1941, the army of fascist Germany occupied the Baltic republics, the western regions of Ukraine, Belarus, Russia and approached the threshold of Moscow.

The occupation of the western regions of the former Union adversely affected the agricultural situation and food supply. In the occupied areas, 47% of the total crop areas in the USSR, including 38% of wheat, 87% of sugar beet, half of sunflower and others remained [1. p. 22-23]. Also, the territories occupied by fascist Germany had a significant material and technical base. In 1940, 190 thousand tractors (28 %of the total tractors of the USSR), 63,5 thousand combines (35% of the total combines), 16,1 thousand trucks (7% of the total truck park) and 12 mln. horse (57% of the total horses) was present [2. p. 155].

The weight of the losses in agriculture had to be lifted by the regions of the front army, such as Uzbekistan. In the joint decision of the VKP (B) MK and the USSR WPC, which was adopted on November 17, 1941, the main tasks for Agriculture of Uzbekistan were determined on the scale

of the former Union. The decision determined the particular importance of Ural, Cibir, Central Asia and Kazakhstan in increasing the yield of cereals, technical crops and vegetables in providing the front with food and agricultural products [3. p. 168].

The solution of these tasks was complicated by a number of factors. Agriculture of the Republic and especially the regions of the Fergana Valley (Namangan, Fergana and Andijan) was mainly directed to the cultivation of cotton, and food products were brought from other regions of the former Union. For example, in the years before the Second World War, the main cereal products in the consumption of Uzbekistan were transported from the RSFSR and Ukraine. At the beginning of the war, food supply ceased to come, as a result of which it became necessary to find internal opportunities to provide the population with food. From 1942 year Uzbekistan had to provide itself with full grain. This means that the gross crop of grain in the Republic amounted to 5-6 million tons. 12-15 million from the Centner. It was necessary to climb the Centner [4. p. 127].

In addition, the Ministry of Transport of Uzbekistan sent to the Kokand Sugar Factory only 23 cars instead of 65 to serve collective farms in Gorky district. As a result, up to October 1, 450 thousand centners were transported instead of 130 thousand centners to the cocaine sugar plant [5. p. 4] .

As a result of the centralization policy, in the first years after the war, there were also various variations in the regions and districts of the Republic in the production and supply of food products to the population. In particular, the Margilan bread factory in Fergana region has a capacity of 24 tons of bread baking per day for the population, the plan shows 15 tons of bread baking per day, but the bread factory hardly produced 6-7 tons of bread per day. This is due to the fact that the equipment old, the flour and coal allocated to the plant were not transported in due time, the lack of leaven workers caused by the replacement of 7 time directors in the factory within 4 months [6. p. 3].

Uzbekistan was one of the leading food industries in the USSR in the years of war and after the war in the tinned products industry. In 1946, the tinned industry of Uzbekistan fulfilled the annual plan of production two months before the deadline. This situation meant that the positive side for the concerva industry had begun to change, since in the last year of the war, the concerva industry of Uzbekistan, according to the state plan, fulfilled the supply of products to the population less than the planned 14 million Banks.

In 1946, the Fergana and Yangiyul tinned plants were completed in September of the same year, Andijan and Samarkand tinned plants fulfilled the state plan in October [7. p. 4]. In the USSR of Uzbekistan, one of the countries of the Union, the raw materials of the tinned products were mainly based on agricultural products, and the tinned plants were imported and prepared products grown in collective farms and armchairs. But there are also problems in the industry, for example, in Fergana and Andijan tinned factories, which are excessively interested in increasing the number of products, and forget about the state-approved quality as well as the variety of products [8. p. 4].

In addition, many fruits were used in the factory from the established standard for the preparation of products, and there were cases of wasting. While the Namangan tinned plant spent 6 and a half percent of all its fruits, the Yangiyul tinned plant allowed a lot of destruction, the "sickle and

hammer" plant was made of oil, while 38 tons of fruit were rotted at the Fergana tinned plant [9. p. 4].

After the war, trade between cities, districts, villages and towns in the whole Union countries, implementation of measures for the acceleration of food production, the establishment of free trade, the increase and delivery of daily food types with many needs for the population was an urgent issue. On November 9, 1946, the Soviet of Ministers of the USSR adopted a special resolution "on the establishment of cooperative trade in cities and villages with food and industrial goods, as well as production of food and goods of high consumption" [10. p. 1].

The implementation of this decision in the Uzbek SSR imposes a great responsibility on the local craftsmen in the production of a large number of types of food consumed by the population. According to the adopted plan, the cooperative enterprises of Uzbekistan had to produce 480 million soums in 1947. Of these, 400 million sums should have been food and many consuming goods [11. p. 1].

In the post-war years, there will be an increase in the production of food products intended for growth and consumption in the food industry of Uzbekistan. For example, the percentage from 1946 to February 1947 year: the Ministry of food industry 97.9 percent, precipitation 155.1 percent, the industry of cosmetics and cosmetics 108. 110.2 percent of the meat and milk industry, 139.3 percent of the general directorate of fish industry under the Soviet of Ministers of Uzbekistan produced products and fulfilled daily requirements for the most important food products [12. p. 2].

In March 1947, attention was also paid to the intensification of timely planting of cotton, as well as the cultivation of sugar beets, which are the main raw materials in the production of sugar in Uzbekistan. This was indicated as the main reason for the problems in the cultivation of sugar beets in the previous year and the failure to comply with the established state plan. Last year, a series of cotton was harvested in the Ferghana region, where sugar beet was intended for cultivation, 128 centners per hectare, and in other regions even less.

In 1947, when the sugar beet in the Republic say less than a hectare grown yield of 220 Centner, was determined to obtain a total yield of at least 800 thousand tons in all [13. p. 4]. Such a change in the national economy, of course, was envisaged to eliminate the existing food shortage, to increase the range of products necessary for daily living and consumption, to achieve regular supply. But even the fact that the food issue was managed only from the center, the annual state plans were not developed due to the real reserves of the local population, did not allow the situation to find a complete solution, and the shortage of consumer goods remained.

Also, the plan of cultivation of rice to the state the territory of the Republic has been systematically established, it has been developed into sectors on the obligations of all regions and through it the grain products grown in the regions have been adopted on the basis of a plan systematically defined in the process of the season. In particular, the topshirish plan of grain and rice to the state for October 1, 1947 is as follows in the section of regions and sectors: Andijan region 51.7 %, Namangan region 54 %, Fergana region 74.3 [14. p. 3].

In such a process, the center was distracted by the fact that instead of delivering food supplies and types to the country, preventing the shortage of food consumer goods, it was simply tasked with its administrative and command policy. On the contrary, the policy pursued by the union

did not justify itself in practice, on the contrary, the standard of living of the people continued to decline day by day, and Uzbekistan, among all Union countries, found its proof that the idea of building a "socialist prosperous society" in the USSR was only and only a dry nonsense.

WAQF PROPERTIES OF BUKHARA AND ATTITUDE TO THEM (20S OF THE XX CENTURY)

Maxmudov Erkinjon*

*The Lecturer of the Department of "world History",
Fergana State University, UZBEKISTAN
Email id: erkinjonmakhmudov@gmail.com

ABSTRACT

In this article, the author seeks to shed light on the historical aspect of the attitude of the BPSR government to the religious institutions and waqf property belonging to them. The cautious policy of the Soviet government towards the waqf property in the BPSR in the early years, and later the reform of these properties, was shown to be stricter. With the abolition of the BPSR, the policy of the Soviet government on the property belonging to religious institutions changed dramatically. Measures have been taken to gradually liquidate the waqf property in Bukhara. Since 1928, the liquidation of waqf property has been seen as one of the most urgent measures.

KEYWORDS: *BPSR, Religious Institutions, Waqf Property, Waqf Work, Decree On Land, "Land And Water Reform", Waqf Farmer, Mixed Waqf Institutions.*

1. INTRODUCTION

For thousands of years since the Middle Ages, Islam and its role have played an important role in the social, cultural, educational and economic life of the region in which we live. In the second half of the 19th century and the beginning of the 20th century, when historical processes were very sharp, most of the lands and property in the Bukhara Emirate belonged to religious institutions and organizations, and were called waqf lands and properties.

With the spread of Islam, waqf property, such as land, caravanserais, shops, baths, mills, and other similar benefits, became a tradition for waqfs to religious institutions such as mosques and shrines. The waqf property belonged to Allah. Religious institutions had the right to use the waqf properties' income [1].

During the negative atheistic policy of the Soviet government towards Islam in Turkestan in the 1920s, the writing and publication of works on the history of Islamic religious institutions and

organizations was banned. After the independence of Uzbekistan, there was an opportunity to objectively study the history of religious institutions, Islamic education, religious schools.

Over the years, some scientific articles and dissertations on the history of the Islamic education system have been written. However, it is still important to study this topic in the archival documents studied by historians, with a comparative analysis of sources on the history of Bukhara in this period. It is therefore of great scientific importance.

2.   Methods and level of study:

The article tries to cover the waqf property of Bukhara in the early twentieth century, their place and role in the socio-economic life of the country, the policy of the BPSR government towards the religious institutions and waqf property on the basis of historical, comparative logical analysis, impartiality.

We see that in the late nineteenth and early twentieth centuries, research on the subject was conducted by officials working in the administrative system of Turkestan at that time, N.P.Ostroumov, F.M.Kerenskiy, V.P.Nalivkin [2].

The works of these authors, who worked in the administration of the Governor-General of Turkestan, reflected the colonial policy of the Tsarist government. They tried to give a negative assessment of the activities of Islam, its madrasas and schools.

In the early years of Soviet rule, there was no sharp struggle against Islam. Therefore, in the historical research created during this period, an attempt was made to give a positive assessment of the activities of madrasas, shrines and schools. Such a view is also reflected in the works of B.B.Barthold [3].

Publication of major works of T.N.Koriniyaziy, I.Muminov, M.G.Vahobov on the history of culture of Uzbekistan in the Soviet period, and in these works to provide information about madrasas, shrines, schools, their endowment properties due to its limited resources, it was not possible to make an objective assessment of the activities of these institutions [4].

After the independence of Uzbekistan, the restoration of historical truth has risen to the level of public policy. During the years of independence, the history of Muslim schools banned during the Soviet era began to be studied. These results were also described in general in the research work of B.M.Rasulov, G.F.Solijonova, D.A.Ismailova [5].

On the initiative of the President of Uzbekistan Shavkat Miromonovich Mirziyoyev on April 16, 2018, the establishment of the Public Charitable Foundation "Waqf" under the Office of Muslims of Uzbekistan aimed at improving the activities of madrasas, shrines; providing material and moral support to the staff and students who serve them.

3. Research results:

In the second half of the 19th century and the beginning of the 20th century, most of the land and property in the Emirate of Bukhara belonged to religious institutions and organizations and were called waqf properties and lands. At the beginning of the 20th century, Bukhara had 360 mosques, 140 madrasas, 360 primary religious schools and other buildings [6].

Their financial support came from the waqf lands and properties consisting of several hundred thousand tanabs. One of the main issues facing the government after the establishment of the

BPSR was to resolve the issue of land and water, including the issue of waqf lands. On September 14, 1920, at a special meeting of the Bolshevik government on the Bukhara issue, a report on land and taxes was heard. At the meeting, it was decided to assign the task of developing and promulgating the decree on land and taxes, which had not yet been adopted [7].

The draft of the land decree was prepared before the occupation of the Bukhara Emirate. The document was scheduled to be adopted as soon as Soviet power was established in Bukhara. The draft decree was prepared in Russian and Uzbek, and the rules for land and water reform were set out in a separate article, which set out the rules for land and water reform, as well as the issue of reforming the property of religious foundations [8]. On September 20, 1920, the draft of the decree of the Central Executive Committee of the BPSR was discussed, and it was stressed that land and water reform should be carried out immediately, but the issue of waqf property should be resolved a little later, depending on the situation. The government's firm decision on the decree's waqf issue could have angered Muslims and clerics. With this in mind, the members of the Revolutionary Committee, during the discussion of the draft of the land decree of September 24, 1920, put forward a proposal to remove the part of the document relating to the waqf. After discussing the draft, the Revolutionary Committee came to the conclusion that "some parts of the draft do not correspond to the real economic conditions of Bukhara, so they should be postponed until the next meeting of the Revolutionary Committee" [9].

It should be noted that there were certain reasons why waqfs were not temporarily transferred to the state property. The newly formed government of the BPSR was required to treat the waqf property with care. Among the Muslim countries of Central Asia, Bukhara had a special place in the Islamic world and made an invaluable contribution to the development of Islamic culture.

In June 1922, in Bukhara Public Republic, Abdurauf Fitrat developed a special project on "Waqf Works" consisting of 19 articles [10].

The project provided for the exemption of the waqf property from government taxes, the retention of only the tithe tax, the establishment of the Central Waqf Directorate under the Ministry of Education, its division into 5 branches (religious, scientific, rent, finance, economic), the project included the division of asoat waqfs into 6 parts (mosques and mosque works, schools and libraries, courts, kitchens, genealogies, Mecca and Medina waqfs), control over the activities of trustees and the creation of a fund for the waqf administration [11].

 Under the Fitrat project, waqf agencies were required to submit a monthly report to the Ministry of Education. Even on the eve of national-territorial delimitation, it was not possible to fully register the waqf's property in the Republic until the autumn of 1924.

On August 11, 1923, at a meeting of the government of the BPSR, the policy of the CPSU on the issue of waqfs was discussed. In it, the waqf, which belonged the to religious institutions and organizations, made a decision that land and property should now be reformed. The meeting adopted the following resolutions:

1. Lands belonging to mosques should be left at their disposal on temporary terms;
2. A 10% tithe tax should be levied on non-mosque waqf lands and used for educational purposes in coordination with the waqf administration;
3. Tax collection shall be assigned to the Tax Department;
4. To equate the land use rights of endowed farmers with the rights of farmers using state lands;

5. Waqf lands in villages (except for mosques) should be given to the villagers at their full discretion [12].

In the budget year 1924-1925, the amount of land belonging to the Bukhara religious foundations was 161,127 tanabs, which were leased to the foundation farmers, from whom a single agricultural tax of 10% of the harvest was levied. In general, the income of the Bukhara waqf properties during these years was 882889 sums [13].

The number of religious institutions and organizations belonging to the Bukhara waqfs was also significant, including 231 madrassas, 429 old-fashioned religious schools, 133 cemeteries, 199 shrines, 2,306 mosques, 66 special waqfs and 4 mixed waqfs.

With the strengthening of Soviet power in Bukhara, the national-territorial delimitation in late 1924 led to the dissolution of the BPSR as a state. With the formation of the Uzbek SSR, the above-mentioned waqf properties in Bukhara, which had a high share, were transferred to the Ministry of Public Education. Then, step-by-step measures of abolition were taken into consideration.

CONCLUSIONS

In conclusion, it is worth noting the following:

- Due to the cautious policy of the Soviet government towards religious institutions in the early years of the BpSR, waqf lands were excluded from land and water reform.
- As a result of the subsequent events in the BPSR, the policy of reforming the waqfs and religious institutions and organizations became more and more strict.
- With the incorporation of the BPSR into the Uzbek SSR, attitudes toward religious institutions changed dramatically and policies began to be pursued against them.
- With the formation of the Uzbek SSR, the property of the foundation in Bukhara was transferred to the Ministry of Public Education. Later, gradual measures were taken.
- The meeting of the Central Executive Committee and the Council of People's Commissars of the Uzbek SSR, held on September 22, 1928, announced the decision to abolish the property of the waqf. According to this decision, the liquidation of the waqf's property in the Bukhara region was considered as one of the urgent measures.

METHODOLOGICAL SYSTEM OF FORMATION OF INFORMATION AND COMMUNICATION COMPETENCE OF FOREIGN LANGUAGE TEACHERS

Islamova Tohira Rikhsibaevna*

*Senior Lecturer,
Tashkent Institute of Finance,
Tashkent, UZBEKISTAN

ABSTRACT

Questions of formation of information and communication competence of teachers of a foreign language are considered. The methodological system of the process of formation of this competence is developed. The main components of the methodological system for the formation of information and communication competence of foreign language teachers are highlighted.

KEYWORDS: *Information And Communication Technologies; Competence Of A Foreign Language Teacher; Advanced Training Of Foreign Language Teachers; Methodological System.*

INTRODUCTION

From the point of view of the system approach, the methodological system of training is a single integral complex that allows you to model the process of training and education. The main components of the methodological system are the goals, content of training, principles, methods, tools, skills developed during training, as well as the results of the transformation of the educational process with an assessment of the quality of solving the problem. All components of the methodological system are in a certain hierarchical relationship.

The structure of the methodological system for the formation of information and communication competence of foreign language teachers includes:

- Prerequisites that actualize the need for the formation of information and communication competence of foreign language teachers;

- the target block, which is formed under the influence of the environment and influences the choice of approach to learning, principles, content, forms, methods, means of learning, resulting from the chosen approach that implements the learning goals;

- A theoretical block that includes methodological approaches and general didactic principles for the formation of information and communication competence of foreign language teachers;

- a technological block consisting of the content of training, forms of training, pedagogical conditions, teaching tools, methods that contribute to the successful formation of information and communication competence of foreign language teachers;

- Evaluation and performance unit for evaluating the results of the formation of information and communication competence of foreign language teachers, including criteria, indicators and levels of its formation.

The main goal of the proposed methodological system is the formation of information and communication competence of foreign language teachers.

In our work, the development of a methodological system for the formation of information and communication competence of a foreign language teacher will be based on the provisions of competence-based, personality-oriented, personality-activity and system approaches, as well as the concept of informatization of education.

In terms of content, the adopted methodological approaches perform a heuristic function in the knowledge of the selected object of reality and are, therefore, a tool for searching for new knowledge.

Informatization of language education in general is carried out in the same directions as other branches of knowledge. Taking into account the specifics of a foreign language as a subject, the main directions of informatization in relation to language education were identified:

- Determination of the methodological basis for selecting the content of training, development of methods and forms of teaching a foreign language and culture;

- Selection of the content of teaching a foreign language and culture in the context of informatization of language education;

- Selection and development of active and problematic methods and forms of teaching language and culture in the context of informatization of language education;

- Development of innovative methods of using information and communication technologies (ICT) in teaching a foreign language and culture;

- Development of a new generation of educational materials that integrate various types of ICT in the process of learning and mastering a foreign language;

- Development of computer control systems for the development of speech skills and the formation of language skills of students ' speech;

- Organization of the system of training and retraining of teachers in the field of informatization of language education;

- Provision of information security measures for students.

The achievement of the above goal will be based on the implementation of the system of principles, which is the next component of the proposed methodological system. All the principles are closely related to each other and form a single system designed to ensure the achievement of the set learning goals. At the same time, it is possible to identify the principles

that play a leading role in specific learning environments. It should be noted that the principles of training reflect the social needs of people, change and improve under the influence ofthe influence of social progress and the development of basic disciplines for the methodology. The system of principles, being open, allows the inclusion of new principles and the reinterpretation of existing ones.

Within the framework of this work, it is necessary to elaborate on the principles that are most important for the formation of information and communication competence of a foreign language teacher:

1) General methodological principles of teaching foreign languages:- the principle of individualization and differentiation of learning (adaptability);- the principle of visibility;- the principle of accessibility;- the redundancy principle;- the principle of feedback;- the principle of consciousness;- the principle of activity.

2) Principles of teaching foreign languages by means of ICT:- the principle of interactivity [9];- the principle of informatization of training [10].

The principle of individualization and differentiation of education (adaptability) involves the selection of the assignments of reproductive, productive and creative nature allows to accurately take into account the existing level of preparation of foreign language teachers in the use of ICT that enables them to choose the appropriate level of difficulty and sequence of learning tasks in the use of ICT in the process of learning a foreign language and the culture of the country of the target language. The success of learning, rate of mastery, the strength and meaningfulness of knowledge depend not on just the teachers, but also on the cognitive capabilities and abilities of pupils due to many factors, including characteristics of perception, memory, mental activity, physical development.

The principle of visibility consists in computer visualization of educational information, which allows you to make an idea, analyze and draw conclusions about the studied language phenomena and processes. In accordance with this principle learning is based on concrete, directly perceived by learners, and involves the use of various types and forms of clarity: clarity of language (the selection of authentic texts, speech samples, demonstrating functional characteristics of the studied material, etc.), visual (photographs, drawings, cartoons, art illustration, various symbols, films and videos), auditory clarity (audio).

The principle of accessibility is the need to match the content, methods and forms of education to the age characteristics of students and their level of development. Among the main provisions of this principle are the following:

- The need to match the pace of communication of information by the teacher and the speed of assimilation of this information by students;

- Orientation of students, first of all, on understanding of the studied material, but not on memorization;

- Movement "from simple to complex", "from near to far", "from easy to difficult", "from known to unknown", etc.

The principle of redundancy implies a deliberately excessive number of tasks that cannot be completed only at the appointed time. Redundancy is a necessary condition for the organization

of educational activities in the classroom, with different levels of preparedness on the subject: depending on the level of preparedness of the student teacher is able to offer him the job of a difficulty. In addition, redundancy ensures that the teacher has additional tasks that can be recommended to students for additional classes. However, a significant part of the tasks must be completed by all students.

The feedback principle implies a mandatory response to the student's actions in various types of educational activities (for example, correcting errors, receiving and issuing answer options, etc.).

The principle of consciousness is one of the leading didactic principles implemented in language classes. The principle of consciousness manifests itself in two positions. First, following this principle involves relying on a certain system of rules that precede the formation of a skill and together give students an idea of the language system. Secondly, the implementation of this principle in training also means a conscious attitude of students to the learning process itself, which implies mastering the techniques of independent work. It is the second position that seems significant for our study.

The principle of activity involves the speech activity of students in the learning process, which means the intensity of mental processes in the student's activities related to attention, thinking, memory. The main sources of activity are goals, motives, desires and interests. To maintain them, various teaching methods are used, including tasks of a problem nature, and visual aids. Knowledge, skills and abilities are formed in the process of active mental work of students, which is based on a combination of speech activity and thinking.

The principle of interactivity is one of the leading ones in teaching foreign languages by means of information and communication technologies. It consists in the interaction of two or more communicating parties. Interaction takes place through information and communication technologies and involves the communication of several communicants. Information and communication technologies imply the interaction of people in the information space, which means that the application of the principle of interactivity is methodically necessary. Real communication is carried out using forms of telecommunications (e-mail, chat, forum, ICQ, Skype) and on social service platforms (blogs, wikis, podcasts, etc.).

The principle of informatization of training consists in the organization of social and information interaction in the educational environment, the use of information and communication technologies to meet the information and cognitive needs of students. As you know, the purpose of teaching foreign languages is to form a foreign language communicative competence. Competence in the field of information and communication technologies / (ICT-competence) will allow students to use ICT in the development of foreign language communicative competence. For example, social services on the Internet (blogs, wikis, podcasts, etc.) contribute to the formation of ICT competence of foreign language teachers.

The next component of the proposed model is the methods that will be used in solving the tasks set in the process of forming the information and communication competence of foreign language teachers.

In the higher education system, there are various organizational forms of training: lectures, practical classes in their varieties - seminars, laboratory work, practical training, research work of students, independent work of students under the supervision of a teacher. In our work,

preference is given to lectures and practical classes for full-time education and independent work - for distance learning.

The development of skills of using ICT in the process of teaching a foreign language is not an axiomatic phenomenon, but is directly dependent on compliance with a number of pedagogical conditions:

- Orientation of the pedagogical process to the formation of methodological competence of future foreign language teachers to teach language and culture through new ICTs;

- Formation of ICT literacy by the time of training;

- Continuous development of motivation for the use of ICT in professional activities;

- Development of educational and methodological material for teaching a foreign language through ICT;

- Technological support of educational activities of future teachers of a foreign language on the formation of competence in the use of ICT in teaching a foreign language and culture.

ABSTRACT

Nowadays, the issue of child rights in developing countries, especially in Islamic world is becoming more and more concerned topic for many scientific disputes. In particular, the children's right to education and a proper legislation that guarantees it can be considered as one of the most outstanding and important topics in countries such as Afghanistan, Iraq, Bangladesh and the rest of the Islamic world. There have been a number of works published by commonly reputed Islamic scholars in history that assert the duty and the vital necessity of educating children in the light of sacred Islamic sources. As an example, we can consider "Jami' akhkam as-sighar" by Muhammad ibn Mahmud al-Ustrushani, the student of great Central Asian scholar Burkhoniddin Marghinani, who lived in the 12th century. Another prominent work in this area has been published by Shamsuddin Muhammad in his book "Tuhfat al-Mawdudi bi ahkom Mawludi". In this paper we would like to bring these works to the attention of a scientific community for thorough discussion, and in longer perspective build a legislative platform on the basis of which most of the Islamic countries could start implementing corresponding bills that oblige and foster children's right to education.

KEYWORDS: *Islamic Law, Child, Children's Right To Education, Teaching And Job Training Issues*

INTRODUCTION

Along with teaching Islam, and maintaining a good body shape through physical activities such as swimming, horse-riding etc, Prophet of Islam Muhammad (p.b.u.h.) advised to educate children to a modern knowledge and skills[I. Abuzarr, 2008]. Moreover it has been stated in article 9 of the documents of "The human rights in Islam" that trying to gain information is obligatory for each Muslim child, and creating such environment for their education is the

responsibility of the state and Muslim community"[2]. This core literature to Islamic world clearly shows that every child has a right to get an education which should conform with modern world, and governments are responsible for providing such environment that could support and foster this process inside any Muslim community. In this paper, we will review some of the most important works of prominent Islamic scholars who lived in Central Asia in XIIth-XIIIth centuries.

CHILD EDUCATION IN ISLAMIC LAW

Looking at the history of Central Asia, we can see that after the advent of Islam, a new legal system emerged in parallel with the old laws of this land. Legal relations of society, the legal system of Islam, its main principles and stages of development have been deeply studied in sources of Islamic law (*fikh*), as well as in the works of famous scholars and specialists in Islamic Law (fakihes). They wrote many valuable books. *Fakihes*, who lived and worked in different times, did scientific researches to solve legislative problems among people, in order to develop this science. In particular, we can notice that scientists have researched issues of children's right with special attention. Amongst, we can consider "Jami' akhkam as-sighar" of Muhammad ibn Mahmud al-Ustrushani, the student of great Central Asian scholar Burkhoniddin Marghinani, who lived in the XIIth century. Full name of the author is Abu al-Fath Muhammad ibn Mahmud ibn al-Husayn ibn Ahmad al-Ustrushani, he lived in the end of XIIth and beginning of the XIIIth centuries in Mawerannahr, and made a valuable contribution to the development of *fikh*. His period was in the last days of Samarkand school of fikh just before Mongol conqueror. We have only a little information about his life and works[M. Atayev, 2010].

"Jami' akhkam as-sighar" is considered the only source of Islamic law which is devoted to children's rights. The book, which experienced many years of practice, is valuable as a guide to show parents and children their rights. According to researcher M.Ataev, the work of al-Ustrushani "Jami' akhkam as-sighar", written in 625/1228, is the first and only source in its theme.

Almost no books have been written in the Muslim world on children's rights after Majduddin al-Ustrushani. From this perspective, we can conclude that "Jami' akhkam as-sighar" is the only source in the field of *fikh*. However, there is a work, of Shamsuddin Muhammad ibn Abi Bakr ibn al-Qayyim al-Jawziyya (691-751/1292-1350 y.) titled "Tuhfat al-Mawdudi bi ahkom Mawludi". The book is a collection of hadiths, i.e. narrations of Prophet (p.b.u.h.), dedicated to children issues. The work consists of 17 chapters, revealing such subjects as peccability of antipathy against girl babies, announcing birth of the child, reciting *"Adhan"* and *"Iqamah"* to the ears of baby, the *aqiqah* ceremony and practices related with it, also cutting hair of the baby and giving charity equal to its weight (in silver), giving name to a child and its rules, circumcision, feeding the baby, practices related to breast feeding and so on[Al-Jawziyya, 1977].

The peculiarity of "Jami' akhkam as-sighar" is that it collected children related issues from more than hundred books of Islamic Law and sorted them. Studying the book, we learn that Ustrushani studied fatawas and decisions of more than 120 contemporaries and collected them in his book. With these features, the work is the main source for professionals who are studying the history of Islam and Islamic law, and it is important to note that the work is useful for the modern jurisprudence**.**

"Jami' akhkam as-sighar" is mentioned as so valuable source that its manuscript copies are widely spread throughout the world. The book was first published in 1982 by Abdulkholik Abdulhamid al-Bayzali, professor from Iraq. Five copies kept in different libraries were used in performing this publication. They are American Princeton University (№ 1704), "Iraqi National Museum (№ 9626/1) and central waqf (№ 3741/1, № 7460/1) and "al-Ahmadi" central Waqf in Mosul. So far we have known 11 copies of the manuscript of "Jami' akhkam as-sighar", but only 6 of them are well known in scientific world[A. Khalidov, 1993]. It is a pity that there were not enough attention to other 5 copies of manuscript stored in Tashkent funds under numbers 6245, 9634, 10409, 8955 and 12723/II. Therefore, third completed and revised edition of the book was published using copies of manuscripts stored in Tashkent and Egypt.

A completed and revised version of «Jami' akhkam as-sighar» was scientifically studied by M.Ataev. The book includes 1289 fatwas, which can be divided into worship, moral, social, economic and legal categories.

1. The worship category consists of six issues. It is ablution, prayer, charity, fast, Hajj and sacrifice. This chapter consists of 120 fatwas, which is 9.31 percent of the book.

2. The Morality category consists of six issues. They are the oath, apostasy, runaway slave, peace treaty, witness and judgeship. This chapter also consists of 120 fatwas, which is 9.31 percent of the work.

3. The Social category also includes six problems. It consists of 516 fatwas which is 40.3 percent of the book.

4. The Economics and Finance category includes 16 issues. This section consists of 346 fatwas, which is 26.84 percent of the work.

5. The law category includes 10 issues. It consists of 215 fatwas, which is 16.68 percent of the work.

The "Jami' akhkam as-sighar" differs from other books of the same type being more detailed and comprehensive. The work consists of more than one thousand fatwas which were derived from about hundred sources relating to the children's rights according to the hanafite school. Ustrushani was acquainted with almost all hanafi authors before writing this book. That is why, the book is considered as very important source for contemporary scientists on Islamic studies and law.

Most issues given in the book have not lost its importance until know. For instance, we can look at individual tuition system that is widely spread in world education.

It is known that childhood is a period of physical and mental development. Therefore, children must be attracted for gaining knowledge at this period. Prophet of Islam Muhammad (p.b.u.h.) said, *"The knowledge obtained in childhood is like an engraving on the stone. The knowledge obtained in old age is like writing on the water"*.

In the narration of Imam Tabarani, the famous sahaba Ibn Abbas says: "Allah gave responsibility (prophecy) to his messengers when they were young enough to bear that knowledge. Likewise, scholars also obtain most knowledge in young age".

The great Avicenna stressing on upbringing of young generation says, "After giving primary knowledge to the child we direct him to the field he is talented in. If he wants to be secretary, we direct him to philological sciences. Of course, the will of a child is of most importance"[A. Muhammad, 1996].

Learning profession is of main obligations in Islamic legislature. The first book dedicated to rules of learning profession and kinds of professions was written by famous student of Imam Abu Hanifa Imam Muhammad.

Summon of child to work.

Father or grandfather and child's guardian as well have right to give a child to work at a rental (work) services. Father, grandfather and guardians have the right to use child's labor and do not have to pay the child (but it is better to pay) if it is for child to get used to work and to become practiced.

People who can own and spend money which child was given for his labour.

The ones who have the right to make child work at rental job can also own payment which was paid for that job. Because it is the right on this contract, so for that reason this right belongs to organizer of the contract. Nobody has the right to spend child's property but father, grandfather and guardians. As well as, although person who cares child can own property of child but he cannot spend it. Imam Muhammad thought that it is in accordance with the purpose to spend for him if child needs it, because just keeping it instead of using for him is out of meaning and there is no benefit for child.

Not to make child work at a rental job, which is not suitable for the condition and status of child.

If child's father was not weaver, guardian does not have right to make child work at rental work in wearing. Bad side of this skill is that it can influence child's honor and social position.

The right to choose after getting adult.

The child who was put at a rental job by father, grandfather or guardians after recent years, after becoming an adult will have the right to choose: If he wants he continues on his previous job, if he does not want he can cancel the contract. To keep working without getting the right to choose signals that it is to break the rights of child. Abu Hanifa explains it as following: for example although someone is full-grown scholar of Islamic law, even he is suitable for Judge, you let him continue to serve people saying his father led him to this job. It is an awful deed. On the other hand, if there is barrier between him and his property, for example father, grandfather or guardians rent child's household or his slave for certain time and child becomes adult but he cannot cancel that rental contract. Is this right? It is incredibly bad situation.

Hiring of sons by father

If sons do not reach adulthood but grow up enough for working, father can lead them to work for money and give alimony from its profit.

Hiring of daughters by father

If child is a girl, father cannot hire her to work. Because it is not allowed in sharia to hire woman.

Hiring a master or teacher for children to give education or teach skills.

Qadi (the Judge) Imam Fakhriddin in his "Fatawa Fakhriddin", in the section of incorrect rental contracts of the chapter dedicated to standards of rent, writes that, if a person hires someone to his child, servant to teach poetry, literature, writing, counting and others or to teach skills, like sewing, for some period of time for example 6 months or so, this contract is considered true and during this period nevertheless that child studies or not the teacher should be paid for his service.

About payment that master pays to child.

In **"Fawaid sahibil - muhit"** it is said that mentally healthy boy can make a contract with master to learn skill under his father's control. If the boy comes to agreement with his master to work free for 3 years and then to receive 3 dinars payment. And, In the third year he serves for four months and suddenly refuses to work anymore. There is a question if teacher should pay or not. Answer is positive.

About request of payment for his service from inheritors of master by pupil.

In "Fawaid sahibil - muhit" it is said that if someone works for master to learn skill, and master dies after teaching him the skill, does the learner have right to make request from master's inheritors or not. This question is solved according to tradition.

In the book titled "Al-Mutlakat" there's a chapter about lease agreements which indicates if a person gives his child for tutor for 4 years to learn specialty and agreed to pay 100 dirhams for this period, but the father takes his child back before the end of agreed period, tutor has no right to ask for full payment, he just has a right to get his payment in the market's value.

Reasons to call of lease agreement

In the book titled **"Fatawa al-kadhi al-Imam al-Fakhriddin"** it's said that child has a right to call of lease agreement in the case he/she couldn't learn anything after hiring a tutor in one year period.

In the 8th part of the book "Az-Zakhira" which includes the criterias of leasing it's said: If one person gave his child for helping to the tutor and bought for him some clothes, but after some time it's appeared that the child is not doing his responsibilities, such as, one man gave a child silk shirt, tenant has no right to take back this close. This problem is also indicated in the chapter about using others properties without owning them. If tutor gave for his pupil some clothes but he run away from him, but tutor wants to take back this cloth and give it to another he has no right for it. This happens, in the case, if before giving clothes he said that he is giving it only for use, not owing[M. Atayev, 2010].

Nowadays jurisprudence relations existed in ancient times attached firmly with international legislation and civil codex of many states. For instance, all rights mentioned in "The convention on the rights of the child" are guaranteed in Islamic law fifteen centuries ago. Particularly, the right to study of children is guaranteed with chapters 28-29 of the document[The Convention on the Rights of the Child, 1989]. Islamic law, formed centuries ago appreciates education and educated people. Everyone is advised to study hard and even go abroad for study. Looking at

Koran's first verses, it can be seen obviously that Islam pays much attention to education. Holy Koran orders: "**Recite in the name of your Lord who created - Created man from a clinging substance. Recite, and your Lord is the most Generous - Who taught by the pen - Taught man that which he knew not**".

The Koran says that the ones who know are not equal with the ones who know not: "**Say, "Are those who know equal to those who do not know?" Only they will remember [who are] people of understanding**". Also, "**Allah will raise those who have believed among you and those who were given knowledge, by degrees. And Allah is Acquainted with what you do**".

There are many verses in Koran and hadithes where knowledge and bearers of knowledge are praised and their high rank in hereafter is admitted. For instance, we can remember the hadith from Prophet Muhammad (p.b.u.h.) saying that one day prayer of bearer of knowledge is better than 40 years prayer of the ignorant people. Islam orders gaining knowledge for both man and women: "Studying is fardh (obligatory) for every Muslim man and woman"[Ibn Majah, 1187]. In another hadith: "Only three things can benefit the man/women after his/her death. They are: knowledge he left after him, the deeds which are useful for people and children who pray after him for his sake"[Muslim, 1255], "Give knowledge to your children because they are born for the time where you exist no more".

Giving knowledge to children is a responsibility of parents: "The one who do not give advices and improve the knowledge of the ones under his commandment, the Paradise is haram (prohibited) for them"[T. Ahmad, 1985]. Speaking about the method of giving education, it should satisfy the age of a child and not be discriminative. As said by Prophet Muhammad (p.b.u.h.): "The child must be given knowledge easy for understanding and prepared for more complicated ones". Ali ibn Abu Talib also said: "The relations with children must be in various ways", Ali ibn al-Husayn understands it as: "In giving education to children you should be merciful". According to "Jami' akhkam as-sighar" parents or teachers should pay attention to psychology of a child and find out their talents and work on developing it. Teacher should not order him everything in shari'ah. Because, if you order him the work which he is not able to do then he won't do it and lose his talent. If the educator concludes that the child has sharp mind, clear understanding, good memory and eager to gaining knowledge, it means that the boy or girl is ready for gaining further education. But, if he notices that the boy or girl is not interested in studying but is talented in other fields, as riding a horse, military work, martial arts then he directs him to the field the boy or girl has interest in. This is more useful for him and Muslim community. So, if an educator notices that he is not talented even in this then he should direct him to the field of work useful for Muslims[U. Alimov, 2010]. Also, rights of children and protecting their honour is considered as of main importance in the book. So, Ustrushani says that guardian has no right to force a child for work in weaving if his father is not weaver. There the book stresses on the issue of owing the children[U. Alimov, 2010].

CONCLUSION

In conclusion, we would like to state that the most of the Islamic sources oblige the community, especially the families to provide education to their children. It is mentioned in multiple suras of Koran, and in the works of reputed scholars that every parent is responsible for his/her children's education and for creating appropriate environment for their future prosperity. These sources

also assert that these are not only the duty of parents, but any Muslim community where children are being brought up.

Jizzakh State Pedagogical Institute,
Jizzak, UZBEKISTAN
Email id: yaxshiyeva67@mail.ru

ABSTRACT

The features of the organization and conduct of rhythmic gymnastics classes for female students in the conditions of distance learning are considered. The need to improve the effectiveness of the educational process in modern conditions with the introduction of information technologies is determined, an assessment is made of the use of computer technologies that allow organizing the educational process at a higher quality level using materials systematized in the order of their sequential assimilation in accordance with the logical sequence of performing rhythmic gymnastics exercises. The conscious approach of female students to education and self-education is also important, since the effectiveness of using forms of distance learning directly depends on the quality of technical means, and on the speed of data transfer, and on the lighting of the premises, and on the placement of video recording devices.

KEYWORDS: *Rhythmic Gymnastics, Aerobics, Health, Students, Modern Education, Physical Inactivity, Coordination Of Movements, Flexibility, Endurance, Distance Learning.*

INTRODUCTION

Modern education, along with traditional, provides for distance forms. Distance education - education that is fully or partially carried out with the help of computers and telecommunication technologies and means. The subject of distance education is removed from the teacher and / or educational tools and / or educational resources. Online conferences are an opportunity to conduct classes in real time. Videoconferences in "ZOOM", where the teacher at the appointed time, together with the students of the study group, performs a set of exercises. A significant difference

from other types of distance learning is instant (at the time of the task) feedback. Thus, the atmosphere of the lesson is created, as close as possible to the original [2].

At this time, in connection with the transition to distance learning, students spend most of their time at the computer, in a "sitting" position, which entails physical inactivity, eye diseases, curvature of the spine, etc. Therefore, the most acute problem facing modern higher education is the deterioration of health among students.

One of the popular means used for the purpose of health improvement is rhythmic gymnastics - "aerobics" (as the broader name currently accepted), which has conquered the whole world and is very popular among students and students. Its capabilities are not limited to the curriculum and have a wide arsenal of tools and methods available to every student [3,4].

This type of motor activity contributes to the development of many physical qualities, such as: coordination of movements, flexibility, strength, endurance; has a positive effect on the cardiovascular and respiratory systems. Therefore, of particular interest is the development of computer programs, innovative technologies, in relation to this type of physical activity [1,5].

Objevtive-studying the peculiarities of organizing and conducting classes on the subject of rhythmic gymnastics in conditions of distance learning.

Organization of research. In order to determine the opinions of students on issues related to the organization of classes in the subject "Rhythmic gymnastics" in the conditions of distance learning, a survey was conducted. It was attended by 30 second-year students of the University of Physical Culture and Sports (Chirchik).

Preparation and drawing up of a rhythmic gymnastics program for female students included the following stages:

- The formation of goals and objectives of the program;

- drawing up the content of lessons on the subject of rhythmic gymnastics;

- Selection of basic steps and their modifications for classes with students;

- Formation of ligaments and complexes of basic exercises for individual parts of the lesson;

- Determination of the numerical parameters of the program;

- watching videos (presentations);

- implementation of pedagogical control over the implementation of the program.

Due to the lack of the necessary sports equipment during the classes, such exercises were selected that do not require additional equipment. At the first stage, the basic steps were learned (with a description of the technique for their implementation, watching video presentations). The next step is to combine basic steps with hand movements. Further, the learned movements were performed in the form of ligaments, connections, combinations. The student had to not only complete them, but also record the execution on video and send it to the teacher. As a control, it was proposed to compose and perform your own set of exercises, for example, to strengthen the muscles of the back and abdomen, and send a video report.

This form of training provided for an increased number of hours for independent work: selection of exercises, drawing up complexes, video editing, etc.

Research results

The results of the survey showed that 70% of female students have a positive attitude towards rhythmic gymnastics classes conducted in the videoconference mode.

60% of the respondents did not have any problems when performing the program exercises, the remaining 40% faced a number of problems: a small living area, there is no one to take video, relatives interfere, etc.

On the question of the readiness of students to perform exercises through the use of video communication in the "presence" of classmates and teachers, the answers were distributed as follows:

- 60% agree with this form of training;

- 40% of students generally indicated that it was impossible to participate in a scheduled lesson. Some of the respondents at that time were at training sessions or at a training camp.

To the question: "What exercises would you like to perform, but at home it is problematic to do it?" opinions differ: 70% of female students chose sports games and 30% of classes in the gym.

To the last question "What are your suggestions for the implementation of this discipline in the context of distance learning?" 80% of the respondents suggested conducting classes combining practical and theoretical material.

Thus, the use of computer technologies allows organizing the educational process at a higher quality level: the materials used should be systematized in the order of their sequential assimilation in accordance with the logical sequence of performing rhythmic gymnastics exercises. The conscious approach of students to education and self-education is also important.

The effectiveness of using forms of distance learning directly depends on the quality of technical means - data transfer rate, room illumination, placement of video filming devices.

ABSTRACT

The objective of the study is to analyze what is impact of income tax default and arrears collection? And to identify factors influence in defaulting income tax in Sri-Lanka. Major part of the government revenue is collected through the well-defined system of tax administration for the survival of the country. The tax system helps the government to generate the public revenue for the economic development of the country. There are different categories of taxes are charged from various sources of income. Although there are numbers of tax defaults are identified, this study consider the only income tax default and due collection. This area of research did not appear to have been previously studies in Sri-Lanka context and in this respect the research represent an original contribution while research have been conducted in Sri-Lanka.. This study used quantitative component from which numbers of convergent results emerged. The total income tax revenue and income tax defaults as key indicators for a period of twelve years was considered as a secondary data for this study. The findings indicated through test of correlation that the tax revenue and tax arrears collection showed positive correlation and rejected null hypothesis and penalty was not significantly performed.

KEYWORDS: *Income Tax; Tax Default; Tax Compliance.*

INTRODUCTION

The income tax default in Sri-Lanka is central of this article. At the outset it appears that income tax default is an important and constant issue for those who are responsible for its collection. Taxpayers have to furnish their tax obligation on time. However, there are some taxpayers who deliberately do not want to be compliant. At the same time, those charged with the responsibility for tax collection are searching to collect what is correctly due as efficient and effectively as possible. Sri-Lanka has been keeping increase trend in emerging market economies, posting speedy rebound with Gross Domestic (GDP) growth averaging 8 per cent since the country saw an end to its prolong civil conflict in 2009. With an unemployment rate 4.2 per cent and an inflation rate of 6.7 per cent by end of 2011, Sri-Lanka at first glance appears to have weathered the global downturn remarkable well, and positioned itself for sustained growth and stability in medium term. Higher growth, with per capita GDP of US$ 2836 in 2011 has been accompanied by sharp improvement in managing absolute poverty across the country and falling income inequality, keeping with the government's stated development goals of rapid and equitable growth.

Meanwhile, taxation play major role to achieve above target absolutely and to up keep the economic indicator further. But, in developing countries tax compliance is a serious issues faced by government specially tax administration to generate revenue for public expenditure. Although various tax reform strategies undertaken by the government in number of instances, statistical evidence in developing countries has confirmed that the contribution of income tax to the government's total revenue remained consistently low and it relatively shrinking (Nugi Nkwe, 2013). Further, from the all taxes, income tax has remained the most disappointing, inefficient, unproductive and problematic tax system (Nugi Nkwe, 2013 cited in Asada,2005; Kiabel & Nwokah, 2009; Nzotta, 2007;Odusola, 2006; Sani,2005). Sri-Lanka is also not exceptional from this point of view.

Statement of problem:

In Sri-Lanka, the tax revenue to GDP keeps in reducing trend for a long period of time even though, wide reforms undertaken in tax administration to rectify the loopholes in the tax system. There may be many reasons for such a situation. However, the tax default is expected to be one of the specific reasons for that reducing trend. In the total revenue default, the income tax default and arrears collection indicated very poor performance from 2000 to 2012 in Sri-Lanka. Therefore the research focused to investigate in deeply the reasons for income tax default and the factors influences for this increasing trend in income tax system in Sri-Lanka.

Objective of the Study:

The objective of the study is to explore and analyze the factors influence in the income tax default in Sri-Lanka context.

Identify viability to generate more tax revenue to GDP through stabilizing arrears collection in future.

Hypothesis:

Hypothesis for this study has been developed considering percentage of positive attitude towards tax compliance behavior of taxpayers on due time and within one month from the due date for corporate and non-corporate sectors is given as follows.

H$_o$: There is no correlation between gross income tax collection and the default and the arrears collectible.

Methodology

Data used in this study have been collected from Performance Report for various years of Inland Revenue Department considering the total income tax and income tax default and the arrears collectible. These data were gathered for 12 years period from 2000 to 2012 for this study. A correlation analysis was run to test the problem in this study to ensure the influence of income default.

LITERATURE REVIEW

Taxpayers' behavior can be explained in connection with tax compliance behavior of an individual. A study conducted in Malaysia among 1073 respondents of individual taxpayers explored that four underlying factors such as tax rate, probability of being audited, perception of government expenditure and the role of tax administrators are significantly influences on the impact of tax compliance behavior Mohd Rizal Palil, Mohamed Abdul Hamed, Mohd Hizam Hanafiah(2013).

The term tax compliance has been defined many researchers in various situation from many countries. A very simple definition described that the tax compliance is the taxpayers' willingness to pay their taxes Kirchler (2007). In another research, the tax compliance explained that the taxpayers' willingness to obey tax laws to maintain an economic equilibrium in a country Andreoni et al. (1998). Song and Yarbrough (1978) explained about tax compliance that the taxpayers' ability and willingness to comply with tax laws that are determined by ethics, legal environment and other situational factors at a particular time and place. On the basis of psychological and economic point of view as an issue of 'reporting an actual income' and further claim that tax compliance behavior is influenced by enjoying of tax evasion; or paying a penalty tax on the undeclared amount at a rate which is higher than the taxpayer would have paid had the income been fully declared within the specified time Allingham and Sandmo (1972).

As similarly, several tax authorities, including the Malaysian tax authority, define tax compliance as the ability and willingness of taxpayers to comply with tax laws; declare the correct income in each year; and pay the right amount of taxes on time (Mohd Rizal Palil, Mohamed Abdul Hamed, Mohd Hizam Hanafiah(2013), cited IRS 2009; ATO 2009; IRB 2009). Alm (1991) and Jackson and Milliron (1986) define tax compliance as the submission of report regarding all incomes and payments of all taxes by considering laws, regulations and court judgments.

 Another definition of tax compliance is a person's act of filing their tax returns; declaring all taxable income accurately; and disbursing all payable taxes within the stipulated period without having to wait for follow-up actions from the authority (Singh 2003). Furthermore, tax compliance has also been examined from two perspectives: compliance in terms of administration; and compliance in terms of completing (accuracy) the tax returns (Mohd Rizal Palil, Mohamed Abdul Hamed, Mohd Hizam Hanafiah(2013)cited in Chow 2004; Harris 1989).

McBarnet (2001) explained tax compliance in three ways: *committed* compliance, which refers to taxpayers' willingness to pay all the taxes on time; *capitulative* compliance, which describes the situation where taxpayers reluctantly 'give in' and pay taxes; and *creative* compliance is a tax avoidance where taxpayers attempt to reduce taxes by taking advantage of possibilities to redefine income and deduct expenditures within the bracket of tax laws. Spicer and Lundstedt (1976) identify that tax compliance as 'a special form of gambling' where they may involve likelihood of detection and pay penalties and requires the tax authority to understand the factors underlying taxpayers' decision to comply with tax laws

Based on the definition provided in the previous studies tax compliance can be explained as tax payers' willingness to comply with tax law declare the correct income claim the correct deduction relief and rebates and pay all taxes on time Mohd Rizal Palil, Mohamed Abdul Hamed, Mohd Hizam Hanafiah(2013)

However tax payers' behaviors are influenced by tax rates, tax audits, perceptions toward government spending, and the role of the tax authority.

Authority use tax rate as instrument reduces to reduce tax evasion and increase tax compliance behavior Clotfelter (1983). An increase in marginal tax rate will result in encourage the potential tax payers to evade tax (Witte & Woodbury 1985; Ali et al. 2001; Torgler 2007). And also substantiated in a study in US by Tanzi (1980), which uses an econometric model to analyze in an effort to explain the relationship between marginal tax rates and evasion, finds that tax rates are positively correlated with tax evasion. But, the tax compliance behaviors cannot be expected to increase when the tax rate is reduced (Trivedi et al. 2004; Kirchler 2007). However, another study of statistical modelling the existence of relationships between actual income, tax rates, penalties and investigation; and tax evasion by Allingham and Sandmo (1972) concluded that tax rate is insignificant in determining tax evasion.

In contrast to the above arguments, it explores in another economic model that increasing tax rates will increase compliance behaviour (Kirchler et al.2008). At the same time, various studies find that increasing tax rates encourages non-compliant behavior or produces mixed findings (see Pommerehne & Wech-Hannemann 1996; Park & Hyun 2003). But Porcano (1988) explains that tax rates have no effect on tax compliance, while most experimental studies find that increasing tax rates leads to tax evasion (Alm et al.1992; Friedland et al. 1978; Park & Hyun 2003).

Another important point in this scenario is that the government should step forward to build up confidence on their fiscal activities towards the taxpayers. Then when there is a good trust among them, even high tax rate is treated as contribution to the community. Otherwise the tax payers' point of view high tax rate can be perceived as unfair treatment when the trust is low Kirchler et al. (2008).

In summary, evidence suggests that tax rates have a mixed impact on tax payers' behavior on compliance. According to extant studies tax payers' behavior does not depend on the tax rate, decreasing tax rates will not necessarily increase compliance (Kirchler et al. 2008), while increasing tax rates will not necessarily decrease compliance (Allingham & Sandmo 1972).

The second instrument that affects the tax payers' behavior is tax audit experience.

When the government implement proper tax audit then the tax payers will report all their profit and income completely on time and enjoy the available deduction (e.g., Jackson & Jaouen 1989;

Shanmugam 2003;Dubin 2004). But, taxpayers who face first audit may afraid to report less than their actual income and claim false deductions. Further some studies also substantiated that the tax audit practice will increase the tax compliance behavior Butler (1993), and Witte and Woodbury (1985) and Beron et al. (1988). Another research on small proprietor also finds that there is significant evidence among the tax audits and tax payers' behavior in compliance Woodbury (1985). In contrast, another study revealed that the tax   audits do not significantly correlate with evasion for all of the groups examined in the study Beron et al. (1988). Taxpayers use the tax audits as more effective way to claim the available deductions rather than interest in reporting actual income correctly on time (Beron et al.1988). Dubin et al. (1987) find that higher audit rates often have a positive impact on income tax reporting, but audit rates are not always statistically significant. It is advisable to taxpayers; to audit their income statement themselves before compliance otherwise they have to pay more in taxes when audit rates increase. From another point of view, Evans et al. (2005) explores the tax compliance of small and medium size enterprises (SME) in Australia finds that audit history (including frequency of audits), audit outcome and the type of audit of small business owners have a significant indirect impact on tax compliance (in terms of record keeping).

The third point of the tax payers' behavior related to public expenditure. Large tax payers expect whether the government makes wisely expenditure. However, majority of professionals' private earning are not included in the tax net. Lewis (1982) suggests that feelings the tax payers should be considered to the degree to which they are a product of myth and misperception and also claims that misperceptions may play a major role in shaping fairness evaluations. Perhaps the tax payers behavior on tax evasion may be vary person to person Roberts et al. (1994). Meanwhile, if the government is wisely make public expenditure for basic facilities, such as education, health and safety and public transportation, it is to be expected to increase voluntary compliance. In contrast, if taxpayers perceive that the government makes unworthy public expenditure or unbeneficial to them, then taxpayers will feel betrayed and attempt to evade paying taxes.

Finally it is a debatable issue that the tax authority of the government influences on the tax payers' behavior. There are different views from various countries with their experience.

The important role of the tax authority is to minimize the tax gap and increase voluntary compliance behavior. The tax authority, as a principal revenue generating agent of the government must implement efficient administration continuously in order to minimize tax evasion. The government plays a central role by designing the tax system itself, as well as passing relevant bill at parliament for the specific enforcement mechanisms (Hasseldine & Li 1999).

Moreover an economical tax system, respected by taxpayers, which is practicable in order to increase compliance behavior, maximize tax revenue must be adopted by the government to discourage tax evasion and not induce dishonesty. Further, they must avoid the tendency to dry up the source of the tax and should avoid provoking conflict and raising political difficulties; and they should also have a good relationship with the international tax regime Roth et al. (1989).

A recent study also substantiates that the role of the government has a significant positive impact on determining behavior toward tax. Further the government should increase their reputation and credibility in order to gain trust from the taxpayers Richardson (2008).

Another conceptual and empirical economists research on "taxpayers' behavioral responses and measures of tax compliance gaps a critique" analyzed tax gaps in the light of tax rate. It indicates the tax cap analyzing helps to increase the tax compliance rate to generate some amount of revenue Norman Gemmell and John Hasseldine (2013). Further they explained that tax gap is the different between actual tax collected and the potential tax collection under full compliance.

Moreover tax payers' behaviors were analyzed in the light of effective tax rate. Rohaya Md Noor,Nur Syazwani M. Fadzillah and Nor Azam Mustuki (2010).

Generally speaking tax non-compliance is a serious issue and challenge to the tax administration in generating government revenue in developing countries. Although various steps taken by the government of Sri-Lanka in many occasion it could not be achieved its target. It might be reason for the tax amnesty implemented in 2003. However, income tax compliance on time for non-corporate sector shows less than 43 per cent for the last twelve. IRD should consider seriously both sectors to increase compliance on time. The following table indicates income tax compliance both corporate and non-corporate sectors.

Data presentation and analysis

The gross tax in default represents cumulative balances. These balances are in full however not actually due. An arrears or default is created by Inland Revenue Department when as assessment is issued for whatever reasons(viz. non-furnishing a Return, non-payment of tax on the basis of the Return, under declaration etc.) invariably, then, the relevant parties of taxpayers lodge appeals against most those assessments (except on the those assessments made with concurrence of taxpayers) and consequently, settlements are held up as taxpayers have involved their appeals rights, in certain cases up to higher appellate level (Board of Review, Court of Appeal etc.) on the settlement of the appeals, depending on the outcomes, any excess amount assessed has to be discharged. Further, these default amounts include penalties added thereon for delay. It could be observed in the table-1.

TABLE-1

Year	Total Income tax in (Rs)	Gross income tax default in (Rs)	% Gross Penalty	Collectible income tax arrears in (Rs)	Appeal settled	Refund

Source:Performance report for various years

The above figure clearly indicates that the gross income tax revenue was growing very slowly up to 2006, there after there was dramatic increase till 2010. However tax default was reduced after 2010 it may be the reason for systematic collection organized by the IRD. But the arrears collection showed very poor performance.

*. Correlation is significant at the 0.05 level (2-tailed).

Conclusion

The test result shows positive correlation between tax revenue and penalty. It means that when the tax revenue increases the tax penalty also increase. Further it is assumed that large numbers

of people do not compliance on time. The test result showed that the tax penalty has positive correlation with arrears collection. It means that the tax penalty is a good instrument for tax collection. Therefore, we reject the null hypothesis.

Recommendation

The individual taxpayers under the non-corporate sector, includes large numbers of informal sector business organization without registering their firms. Apart from the difficulty of bringing such sectors into the tax net, individual incomes within the sector are low, while costs of collection and overall administrative burden are very high, owing to the large numbers of individual firm and the difficult to monitoring. However, taxation of the non-corporate sector appears to be a potentially important source of government revenue, as in many countries, it show growing share of GDP in long term. Therefore, the government makes necessary steps to bring them into formal organization where they can enjoy many facilities like formal organization. It will help to make them culture of tax compliance. Further corporate income taxpayers systematically delay in making payment. Proper implementation of fine and penalty and having good relationship with taxpayers will make situation favorable in the future tax revenue in optimum level.

Further, it is suggested that the failure of informal sector to pay taxes, can be considered unfair treatment to the formal organization. This may lead to immoral tax behavior and discourage the tax compliance among the corporate sector and the noble taxpayer leading to reduce government revenue. So the government should serious action considering these facts.

ABU BAKR KASANI – THE GREAT FIQH SCHOLAR

Eshonkhon qizi Poshshakhon*

*Teacher,
Secondary Special Educational Institution for female in Tashkent,
UZBEKISTAN

ABSTRACT

This work describes the life personality and scientific importance of the master of Islamic studies, Alloudin Kasani who was one of the largest figures of the Hanafi sect and Hadith science. The article narrates about history of his life in detail and gives information on the best of works of the scientist.

KEYWORDS: *Muhaddis, Author, Usulul Fikh, Halib, Madrasa, Scientific Importance*

INTRODUCTION

Imam Alouddin Abu Bakr Kasani, a Hanafi faqih, muhaddis and methodical scholar from the family of Khalib (Aleppo), who grew up in Movarounnah, is one of our world-famous ancestors. In his time, he was one of the largest figures of the Hanafi sect and Hadith science, besides he was the master of the Hanafi madrasahs in Aleppo and Raqqa. According to Mustafo Zarqo, Alouddin Kasani is the author of the most influential book of the Hanafi sect, Badoe'us-Sanaye'fi tartibi-sharoe'

Alouddin Kasani, from a young age, was strict in his request for knowledge, memorized the Quran, traveled to Bukhara and received knowledge from the great scientists. There he studied science in the presence of his teacher Alouddin Samarkand and studied many of his books, in particular, such works as "Tuhfatul fuqaho", "Sharhi taviltot fi tafsiri Quranil Aziym". He was one of the pioneers in the science of Hadith, as well as achieved great achievements in the science of usulul fikh and fikh.

The activities of Imam Kasani in Aleppo

The great faqih from the land of Movarounnahr, Malikul Ulama Alouddin Abu Bakr ibn Mas'ud ibn Ahmad was born in the city of Kasan in the Ferghana region. With a sharp mind, a passion for science, Alouddin, who is distinguished from others, goes to Bukhara in search of

knowledge, and there Sheikh Alouddin Muhammad ibn Ahmad deeply studies the science of fiqh in the hands of Ahmad Samarkandiy. The interpretpretation called "Badoe'us-sanoe", written to the book of his teacher "Tuhaftul fuqaho" , got worldwide popularity. Alouddin Muhammad ibn Ahmad married Abu Bakr Kasani, to his daughter Fatimah who was incredibly beautiful, well-behaved and intellegent. Alouddin al-Kasani travelled with his righteous wife to the Greece and then to Aleppo. Kasani went to Aleppo as an ambassador to King Nuriddin Mahmud Zanki. As a result of its high scientific potential, Kasani received a special tribute from the king and decided to live in Aleppo until the end of his life.

Imam Kasani carried out his scientific work at the Halaviyya madrasah in Aleppo, in particular, his extensive activity in the field of islamic jurisprudence.

The great scientis was buried to the place of Ibrahim alayhisallam place, next to his wife's grave, after his death in the 587, according to his own will.

Events that took place during the time when Imam Kasani lived in Aleppo

At the time when Imam Alouddin Kosani resigned to Aleppo, from 541th year there was ruling Sultan Nuriddin Abulqasim Mahmoud ibn Zanki ibn Aksunkor. Due to the earthquake, which began in 550 years and lasted seven years, many city-villages of the Sham region were destroyed. After that, Sultan Nuriddin Zanki begunreestablishment of the madrasah and Rabot in Aleppo, attracting people of knowledge and fikh to that area. After the madrasah, belonging to the halawites, was renewed in 543, it was initially offered to Burkhonuddin Abu Hassan Aliy ibn Hasan Hanafi and he was given the rights of managing.

Next Alouddin Abdurrahman ibn Mahmoud Ghaznawi and after his death, his son Mahmoud were leading madrasa. Then the madrasah of Halawi was headed by Roziyuddin Muhammad ibn Muhammad Sarakhsi, the author of the famous fiqhiy work "Al-muhit" in forty volumes, after which Alouddin Kasani held this post. Besides, Nuriddin renewed madrasa Asruniya belonged to the Zanki Shofe'i sect, appointed Sharafuddin ibn Abu Asrun as the leader, repaired the Nafari madrasa, transferred its leadership to the Qutb Niysoburi, separated the Gadoiri mosque from the properties of vaqf. топширган, Ғадоирий масжидига ҳам вақф мулкларидан ажратган.[1] Scientific awakening in the city of Aleppo began with the era of Sayfuddavla Hamadani. Since that time, books and scientific works began to increase in amount in Aleppo.By the time of Nuriddin Zanki, the scale of scientific awakening was further expanded and books in different directions began to be written. This period was a period of prosperity for the people of knowledge and scientists. When Sultan Salahiddin came to the Ayyubid period, his children, grandchildren and relatives, and even slaves followed in his footsteps, the number of madrasahs increased sharply in Aleppo, and in this city there was a rennessance in science, Aleppo became the "mother"of Islamic countries in Science Education.[2]

In conclusion, we can say that the time when Imam Alouddin Kasani lived in Aleppo was a golden age for scientists and scribes.

Historical monuments of Aleppo connected with Kasani

The city of Aleppo is incredibly rich in historical architectural monuments, two of which are directly connected with Imam Kasani. One of them is the halaviyya madrasa. As soon as King Nuriddin Mahmud came to the lands of Imam Kasani Aleppo, he asked him to conduct lessons in

this Madrasah. Imam Kasani was engaged in a wide range of scientific activities in the madrasah of Halawiyya from his arrival in Aleppo till his death.

The second monument is the" Tomb of the righteous", and Imam Kasani and his wife, the famous scientist, faqiha Fatima Samarkandiya were buried in there.

"The Tomb of the righteous»

The Tomb of the righteous is one of the most ancient tombs in Aleppo, dating back to the XIV and previous centuries BC, the Seljukids, the Zangids, the Ayyubids, the Ottomans, including the tombs of many righteous people and scientists. Therefore, it is also called the "Tomb of the righteous" ("mausoleum-righteous").

Since there is a character left from Ibrahim alaihissalom, this mausoleum is also famous for its name "mausoleum Khalil". A big peace of rock there is attributed to Ibrahim alaihissalam.

A group of scholars and righteous people buried in this tomb were mentioned by Sheikh Wafa Ar-Rifu in his address.

Between the gate of the mausoleum and the status of Khalil alaihissalom (i.e.,rock), there were also several tombs, in particular, the Tomb of Kalijiya, and near the gate of the status there was the Tomb of Moses Hadjib. He has a huge gate, next to which there is a pond. The water of this pond was coming from the wing of Aleppo built by Moses ibn Abdullah Nasiri.

This settlement is also called " status Ibrahim alaihissalom".

INTRODUCTION

The events of the last quarter of the last century - the unification of East and West Germany, the end of the system of international relations based on ideological confrontation, the signing of an agreement between the NATO military bloc and Russia - led to changes in Japan's foreign policy. These changes have led to the formation of a new direction in Japanese foreign policy, along with the direction of the Asia-Pacific region - the Eurasian direction.

In the 1990s, US relations with the PRC developed in a unique way. On the one hand, economic reforms in China, the development of bilateral diplomatic relations, in particular, the visit of US President Bill Clinton to China in 1998, on the other hand, the deterioration of China-US relations during the 1996 presidential election in Taiwan; that is, the deployment of the US Independent and Nimitz aircraft carriers off the coast of Taiwan; such processes can be observed [1]. This has alarmed Japanese officials and prompted them to pursue policies independent of the United States. The Prime Minister of Japan, Ryutaro Hashimoto, stressed the need to resolve the

situation through peace and negotiations; Japan has said it can act as a mediator in reconciling the two sides [2].

At a meeting of Japanese and US leaders in April 1996, Ryutaro Hashimoto reiterated the idea of "Both sides need to contribute to improving relations" [3]. Ryutaro Hashimoto said that "both sides need to contribute" and that Japan has its own strategic vision for strengthening diplomatic relations with PRC. It is this situation in the Asia-Pacific region that has given rise to "Eurasian diplomacy".

Japanese Prime Minister Ryutaro Hashimoto has said that Japan will support the U.S. position in the event of a military conflict between the United States and China. At the same time, he says, "It is impossible to ignore the rapid growth of the PRC's economy and power. Therefore, we will use every opportunity to improve relations with China, and Japan will try not to strain US-PRC relations" [4].

Ryutaro Hashimoto The essence of "Eurasian diplomacy" is that the interests of the United States and PRC in the region are intertwined, and Japan uses Russia in this process to expand its capabilities. That is, Russia's involvement in the Asia-Pacific region lies in Japan's favor. In an interview with Asahi Shimbun, Ryutaro Hashimoto said: "I am proud to focus on Russia. This approach should not be viewed solely in terms of the northern regions. I don't want PRC and India to fight for leadership in Asia in the 21st century. "It's very important that Russia is on Japan's side" [5].

In July 1997, Japanese Prime Minister Ryutaro Hashimoto put forward the concept of "Eurasian diplomacy", which includes a system of relations with the countries of the former Soviet Union [6]. The concept includes, firstly, the location of Central Asia and the Caucasus between Russia and PRC, secondly, the region's rich fuel and energy resources, thirdly, the civil wars in Afghanistan and Tajikistan, terrorist attacks in Central Asia, in particular the 1998 UN civilian observers in Tajikistan, political issues such as the assassination of mission officer Yutaka Akino were reflected [7].In this regard, it is stressed that Japan should deepen cooperation with Russia, European countries, India and the Middle East, as well as Central Asian countries, without losing sight of the People's Republic of China and the Republic of Korea [8].

"Eurasian diplomacy" includes 4 important aspects: 1. The concept of "Eurasian diplomacy from the perspective of the Pacific" after the NATO summit in Madrid. 2. Factors of "mutual trust", "mutual interest", "long-term perspective" and their application in discussions on "territorial issues" in Russian-Japanese relations. 3. Promoting the Silk Road diplomacy in relations with Russia and China. 4. Carry out active, targeted work within Japan, the United States, China and Russia [9].

During this period, Japan's "Eurasian Diplomacy" (1997), "Silk Road Action Plan" (1998), "Central Asia + Japan" (2004), "Arc of Freedom and Prosperity" (2006) put forward initiatives [10].

"Eurasian diplomacy" was developed from 1990 to 2000 under three prime ministers. The idea was originally developed by Kazuhiko Togo, head of the European and Asian Bureau of the Japanese Foreign Ministry [11].Speaking about "Eurasian diplomacy", Ryutaro Hashimoto focuses on three aspects: first, the two Eurasian powers - Russia and PRC - began to work together after the end of the Cold War.And to establish warm relations with Japan together.

Second, the implementation of "Eurasian diplomacy" on the basis of the Great Silk Road through Central Asia and the Caucasus. Third, to act on the basis of three principles of diplomacy in relations with Russia –"trust", "mutual interest" and "long-term perspective" [12].

Of course, these proposals will not go unnoticed by Russia. In November 1997, Russian President Boris Yeltsin and Japanese Prime Minister Ryutaro Hashimoto met in Krasnoyarsk and signed a bilateral agreement.

In 1998, Russia participated in the Asia-Pacific Economic Community at the initiative of Japan, and a program of economic cooperation was developed under the Hashimoto-Yeltsin Plan.

The first steps will also be taken on regional issues. The issue of signing a peace agreement on demarcation of borders was also discussed at the Japan-Russia summit in Ito, Shizuoka prefecture, in April 1998. However, the financial crisis in Russia and the deteriorating health of Russian President Boris Yeltsin have led to the failure of plans. However, in 1998, the Liberal Democratic Party of Japan lost the election and Ryutaro Hashimoto was forced to step down.

Obuchi Keizo[13] (小渕恵三), who became Japan's prime minister in July 1998, stems from the fact that Japan could be caught between the U.S. and the PRC [14]. He plans to pursue a policy that does not worsen his relationship with the United States.

In October 1998, President of the Republic of Korea Kim Dae-jung will visit Japan. During the meeting, "Joint Declaration between Japan and the Republic of Korea" will be signed and a statement will be issued stating that "that the two countries have solved historical problems", "Japan and the Republic of Korea have entered a new era", and relations between the two countries have reached a "high" level [15].

Although the Prime Minister of Japan Obuchi paid special attention to the Russian direction, his policy in this direction was not effective enough. During Obuchi's visit to Russia in November 1998, Russian President Boris Yeltsin's health deteriorated and negotiations stalled. The Japanese side refused to sign the "Interim Agreement" proposed by the Russian Ambassador to Japan B. Panovoy, which provides for amendments to the legislation, and the Two-Phase" Agreement, which provides for a further agreement on the demarcation of the border [16].

The Japan-China-Korea trilateral dialogue was held within the framework of the 1999 ASEAN + 3 Summit. In it, Japanese Prime Minister Obuchi wins a diplomatic victory by pushing for an initiative not to raise political issues against China, which opposes a tripartite meeting [17].Although the Japanese government has established relations with Taiwan, Obuchi pursues a prudent policy towards the China. As a result, Obuchi visited the China in July 1999, and in October 2000, Chinese Prime Minister Zhu Junji visited Japan [18].

In April 2000, Obuchi resigned due to illness and was replaced by Yosiro Mori (森喜朗) as Prime Minister, setting Russia's direction as a strategic task for his administration [19].In March 2000, Putin was elected president of Russia and turned his attention to the East, to Japan, to US-Japanese relations, and to the economically growing PRC. From April 2000 to March 2001, Mori and Putin held five high-level meetings.

However, as Japan builds ties with Russia, China and the Republic of Korea, that relationship has not allowed its strategic partner, the United States, to falter. In April 2001, Koizumi

Junichiro (小泉純一郎) was elected Prime Minister of Japan. After the events of September 11, 2001, Japan's "Eurasian diplomacy" lost its significance. This is due to the suspension of Japanese-Russian relations due to the disputed Kuril Islands, the Yasukuni Shrine [20] with China and the Republic of Korea, the Hallyu phenomenon (one of the manifestations of "popular culture" in the Republic of Korea) and the disputed Liankur Islands (see 獨島, Jap. 竹島 Takesima). Relations with the Republic of Korea have deteriorated.

Assessing the new international situation, Taro Aso [21] said Japan should focus on Central Asia and the Caucasus as part of the "Arc of Freedom and Prosperity" initiative, as well as the "South-North Corridor" between Afghanistan and the Arabian Sea and the Central Asia-Caucasus. He says that the East-West Corridor, which is the "crossroads of Asia and Europe", should be introduced. The Great Silk Road today, which connects the continents of Asia and Europe, will enable the movement of people, goods and finances. China, India and Russia will become Japan's most important partners in the implementation of this concept [22].

The process of globalization has led to the spread of the principles of a market economy, the ideas of liberalism. The Japanese economy has grown rapidly and has become one of the important forces not only in the Southeast Asian region but also in the system of world economic relations. The growth of Japan's economic and political potential provides a basis for its active participation in international political processes.

CONCLUSION

In conclusion, until April 2001, Japan's "Eurasian diplomacy" was aimed at specific goals. Socio-political changes in China and Russia and improved relations have not been to the detriment of Japan's relations with the United States. On the contrary, from the current situation, Japan has focused on resolving the disputed border issues, shaping the system of regional economic relations, strengthening its position in the Eurasian space.The events of September 11, 2001 led to Japan's return to the United States.

EXPRESSION OF ATTITUDE TOWARDS ACTION BASED ON THE "SPEAKER-SPEAKER" MODEL IN KOREAN

Gulshoda Dilshadovna Yunusova*

*Department of "Korean Philology",
Tashkent State University of Oriental Studies,
UZBEKISTAN

ABSTRACT

The opinion of the speaker is important to the listener. The attitude of the speaker towards the content of the text of the person receiving the speech has its influence in many ways. How the listener perceives the information also depends on his personality, knowledge, experience, psychological state at the moment of speech, his thinking ability and other characteristics. In this case, the expression of the attitude to the action implies that the speaker speaks to himself. In this article, we will consider how this situation is expressed by the auxiliary verb exactly 싶다 [sipda]. In the verb "speaker + speaker" model of this verb, we analyze the situations in the verb in order to convey in the form of information the person's own desires, the work he wants to do.

KEYWORDS: *Speaker, Listener, Speaker's Speech, Text Content, Information, Speech Moment, Psychological State, "Speaker + Speaker" Model, Expression Of Desire, Prepositional Verb, Auxiliary Verb, Semantic-Functional Features, Connecting Affixes.*

INTRODUCTION

In Korean, 싶다 [sipda] is a case verb [1, p. 1472]. This verb is used to express the action that the narrator wants to perform. 싶다[sipda] connects to another verb using various suffixes. However, not all of these compounds are considered auxiliary verb compounds.

The verb 싶다 [sipda] acts as an auxiliary verb when combined with the leading verb -고[-go] using the connecting affix [2, p. 1472]. 싶다 [sipda] It would be correct to call the auxiliary verb

"auxiliary verb" in Korean. The reason is that the verb 싶다[sipda] is always attached to another verb by a certain suffix. This paper analyzes the form of the auxiliary verb 싶다[sipda] attached to the leading verb -고[-go] using the affix connecting it, more precisely, the semantics of expressing the meaning of desire.

THE MAIN FINDINGS AND RESULTS

싶다 [sipda], the auxiliary verb signifies the desire to perform an action understood from the leading verb. When the subject's attitude towards an object, another person, an event is expressed, that is, when an event occurs, an action is performed, or the opposite is desired, a strong desire is expressed, the elements of a strong ottenka - words and phrases - are used. These are "as much as possible", "whatever", "strong" and so on. For example:

될수만있으면오래살고싶어. *If I had the chance, I* would like to live *long.*

The phrase "if I had the opportunity" expresses the strong desire of the speaker. In the example 싶다 [sipda] the auxiliary verb 살다[salda] expresses the desire of the action in the leading verb "to live" to be in action.

일부러찾아온손님을불편하게하고싶지는않았다. *I* didn't want to intentionally disturb *the guest.*

In the example given, on the contrary, the meaning of not wanting to "disturb" (denial) is strongly understood.

싶다 [sipda], the compound in the auxiliary verb can always be used by the 1st person and the 2nd person. In the 3rd person, the function of [sipda] in 싶다 is used in 싶어하다 [sipohada]:

1. 저는집에가고싶어요. *I* want to go *home.* 2. 민수는집에가고싶어해요. *Minsu* wants to go *home..*

In Example 1 above, 싶다[sipda] for 1 person and 싶어하다[sipohada] for 3 people were used. However, the following example proves that the 싶어하다[sipohada] form of the auxiliary verb is not always used in the 3rd person:

할머니에게많은돈을선물하고싶었던칼레는자기도그런힘있는사람이되고싶었다.*Kalle, who* wanted to present *her grandmother a lot of money,* wanted to be *a man as strong as she was.*

Both the first part and the second part of this sentence use the verb 싶다[sipda]. The person who wants to be both gifted and strong is Kalle, the person in the third person. According to the rules of Korean grammar, the 싶어하다[sipohada] form was to be used in both parts of the sentence. However, this was not the case in the above statement. There are many examples of such cases.

칼레는리머선생님과할머니가무슨얘기를했는지알고싶어견딜수가없었다 [3, p. 69]. *Kalle could not bear to know* what her teacher, Mrs. Lima, and her grandmother were talking about.

In this example, the desire to perform an action expressed by a leading verb belongs to the 3rd person. But the verb 싶다[sipda] was used, not the form 싶어하다[sipohada], which must be used as a rule. Apparently, 싶다[sipda] can also be used for the 3rd person. However, the following example shows the opposite:

그느낌에대해내가말하고싶어하지않는다는걸알면서도디나는직감을발휘해서대답을재촉했다 [4, p. 248].*Although she knew I didn't want to talk about these feelings, Dinah demanded that I respond immediately.*

The auxiliary verb 싶다[sipda] should be used for the speaker, i.e. the 1st person, but in this sentence the auxiliary verb form 싶어하다[sipohada] is used contrary to the grammatical rule. The cited analyzes show that the rules for the use of auxiliary verbs 싶다[sipda] and 싶어하다[sipohada], which express the meaning of desire, are grammatically valid, but exceptions are observed in oral speech and in works of art.

There are 이다[ida] noun-predicate links in Korean [5, p. 151]. In the first chapter, 이다 [ida] is included in the verb type: 나는학생이다. *I am a student.* 친구는선수다. *My friend is an athlete.*

But the suffix 겠[gett] [6, p. 154], which mean planning in Korean, cannot be combined with 이다[ida]. In this case, it would be correct to use the verb 싶다[sipda] instead of the noun-predicate conjunction 이다[ida], for example:

1. 내가기어이교장이겠다. *I am definitely the school principal... .**

2. 내가기어이교장이고싶다. *I am definitely the school principal... I want.**

3. 내가기어이교장이 (되겠다 / 되고싶다). *I am definitely the school principal (I want to be / will be).*

Example 1 shows that 이다[ida] cannot be combined with the 겠[gett] form representing the plan (겠 can be interconnected when it comes to assumptions), and Example 2 shows that 이다[ida] cannot be connected with the auxiliary verb 싶다[sipda] representing desire. In expressing such a plan and desire, as in Example 3, it is used in the form 되다[taeda] and combined with 싶다[sipda] [7, pp. 756-757]. Hence, in 이다[ida] the noun-predicateconjunction 싶다[sipda] cannot be combined with the auxiliary verb.

싶다[sipda] in the auxiliary verb compound the leading verb 보다[herd] is combined in the form 보고싶다[pogo sipda] and is expressed as "I want to see", "I want to see", "I desire to see", 'I missed". Since the desire to see someone or something is understood as the desire to see or miss, the object must be expressed in the infinitive before the auxiliary verb conjugation. However, the following examples show that it is used in violation of the rule:

1. 나는언니가보고싶다(nominative case). *I missed my sister.*

2. 나는언니를보고싶다(dative case). *I missed my sister.*

The phrase "I missed my sister" in the examples is expressed in the same way. However, in Example 1, the noun before the auxiliary verb conjugation came in the main conjugation, not in the infinitive. In Example 2, the future tense is used. So Jong Su emphasizes that the verb 싶다[sipda], which expresses desire, is included in the category of adjectives that express psychological state. The main reason for this is that the word 'sister' is strongly emphasized in sentence 1. In sentence 1, he expresses a desire to see his sister, while in sentence 2; he expresses a strong desire to see his sister.

The analysis of the dissertation materials contradicted the idea that the auxiliary verb combination 보고싶다[pogo sipda], formed from the combination of the verbs 보다[herd] and 싶다[sipda], has only the meanings of desire and longing to see:

할머니와칼레는처음에보고싶은텔레비전프로그램을가지고자주싸웠지만시간이지나면서 문제는저절로해결됐다 [8, p. 104]. *In the beginning, Kalle and her grandmother used to argue a lot about the TV shows they <u>wanted to watch</u>, but over time, the problem was completely solved.*

The meaning of the   보고싶은텔레비전프로그램"TV programs you want to see" in this sentence is not the desire to see because of longing or longing, but the meaning of seeing with your own eyes. Hence, the same auxiliary verb unit can be interpreted in different senses.

싶다[sipda], one of the other semantic-functional features of the auxiliary verb, as mentioned in the first chapter, is that one of the criteria of auxiliary verbs is the sequential use of auxiliary verbs. It was said that no more than 4 auxiliary verbs could be used in the given criterion, no matter how many auxiliary verbs were used in a row, if there were 싶다[sipda] verbs in a row, it would always be at the very end. Although the speaker expresses a number of reactions to the action in the leading verb, the desire to perform that action is expressed at the end of the sentence.

1. 경험해보고싶어요. *Iwould like to try it on.*

2. ...그리고필요할때할머니가칼레를도와줄수있는지한번살펴보고싶었을것이. *... and, if necessary, <u>wanted to check</u> if the old woman could help Calle.*

3. 할머니는편지를<u>열어보고싶어</u>속이다타는것만같았다. *Her grandmother seems anxious to open the letter.*

4. 오래전부터남자한테이런거<u>해주고싶었는데</u> … [9, p. 28]. *For a long time I <u>wanted to prepare</u> this for a man...*

In all of the above statements, several auxiliary verbs are used sequentially, and in all of them 싶다 [sipda] auxiliary verbs are placed at the end of the compound.Also, the 싶다[sipda] auxiliary verb combinations 보다 [poda], which means to try, in the sequential use of several verbs, the auxiliary verb "to see, to look, to look at" was often used before the 싶다[sipda] verb to express "the desire to try something" meanings.

CONCLUSION

Analyzes 싶다[sipda] show that the auxiliary verb is added to the leading verb by the suffix -고[-go], which adds additional meaning to it and performs the action represented by the leading verb.

It should be noted that the meaning of desire is close to the meaning of command. Desire and command are inseparable. There is also an order only when a person is willing to do something. Where there is no desire to take an action, there is no order, no encouragement, and no encouragement to take it.

싶다[sipda], the auxiliary verb can only be used in conjunction with the prepositional verb, and indicates that there is a personal desire to perform the action represented by the prepositional verb. 싶다[sipda], the verb is used by the 1st and 2nd person, while in the 3rd person the functional form of the verb 싶다[sipda] is used in 싶어하다[sipohada]. However, there are exceptions to the rule in oral speech and in works of art.

ABSTRACT

Four different type AMF: M1, M2, M3 and M4 all native to Indonesia were used to study the influence of this symbiotic on olive micro propagated plants cultivar Moraiolo, Canino and three different transgenic osmotin Canino (clones AT17-2, At17-3, and At17-10) which were more resistant to fungi, and transgenic for rolABC Canino, which reduce growth and increase rooting capability. Observations have been made to plant height, number of leaves, root volume and shoot volume, leaf area and chlorophyll content on the leaves. Data were analysed statistically using the R program. In vitro rooted plantlets were cleaned from the agar media and transferred to a sterile pot containing mixed sand and soil (1:1) by volume and inoculated with different type of AMF in order to evaluate this effect on plant survival and growth.

KEYWORDS: Olea Europaea L, *Varieties, Biological Features, Productivity,Agriculture Technology Methods,Yield Capacity*

INTRODUCTION

After 4 weeks, the percentage of survival ranged from 40% to100% (Fig. 4.23). The survival varied according to type of AMF and cultivar of olive. The lowest survival was observed among transgenic plants. It seems that AMF helped theplantlets to resist the environmental stress during transplanting them from axenic conditions to normal cultivation inpots [1-2].

The survival of plants are an important factor for *post vitro* establishment of micropropagated plants, since the most critical step in micropropagation process is transfer of *in vitro* plantlets to *ex vitro* condition. Our result confirmed what was reported before by several authors on the other micro propagated species, such as apple and plum (Fortuna *et al.* 1996), artichoke (Morone Fortunato, *et al.,* 2005) and Origanum (Morone Fortunato and Avato, 2008).

Main part: It is well known that the natural growth and development depend on formation of arbuscular fungi in many woody plants and trees [3].

Therefore inoculations with AMF may help to overcome problems associated with micropropagation of woody and fruit trees as stated by Taylor and Harrier (2003).

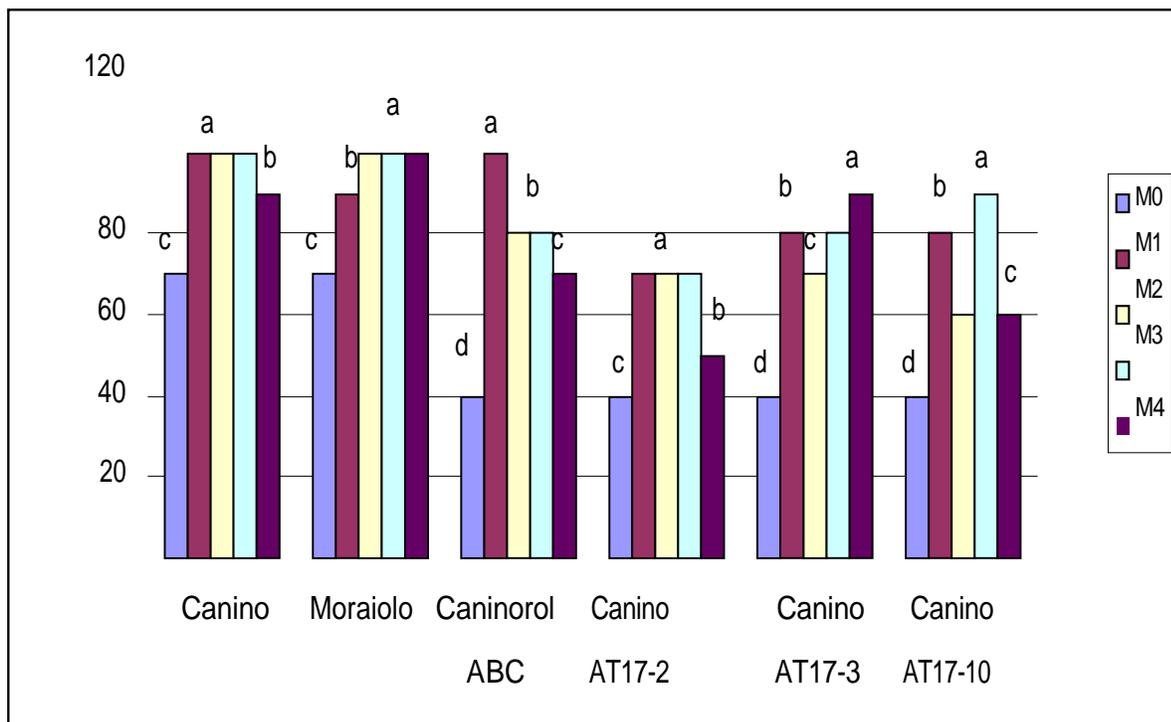

Figure : Survival rate (%) of olive plant after 4 weeks acclimatization stage; different letter indicate statistically different values per P= 0.05
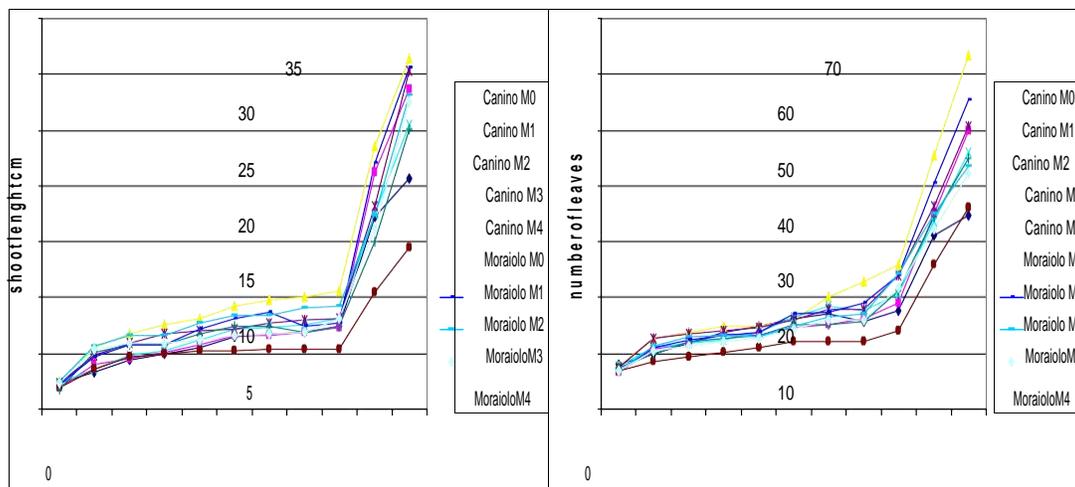

The growth development of olive plantlet cv Moraiolo and Caninowt which treated with AMF showed higher length of shoot and number leaves (Figure 3.26) than untreated with AMF [4].

Figure: The length of shoots and number of leaves of Canino and Moraiolo plants, with different application of arbuscular mycorrhiza (M1, M2, M3, M4) in comparison with untreated(K) [5].

RESULTS AND DISCUSSIONS

The plants have been potted to poor substrate (composed of soil and sand as 1:1 volume) for 15 months, in the attempt of evaluating better all the effect of AMF to olive cultivars considering the adverse condition determined by this substrate composition. In fact, all the plantlets grew very slowly, but those treated with AMF had better adaptation which showing better growth development than non inoculated plant, although several plants were lost, mainly due to the improper substrate. After 15 months, when the plantlets were transferred to 1,5 l pots with a suitable substrate, they grewquickly [6-7].

The olive plant, treated and not-treated with AMF, showed differences on growth development than untreated ones, liked showed in micropropagated Moraiolo (Figure 3.27.) and Canino (Figure 3.28), which were treated with different types of AMF [8-9].

The percentage of roots colonized of all type AMF varied from 3.4 to 70.9 % according to type of AMF and olive cultivar. The highest colonization was observed in cv Canino WT with AMF M4. (Table 3.6). These results confirm what was reported by Calvente*et al.* (2004) in others cultivars of olive plantlets with other type of AMF; in fact they observed big variation of colonization according not only with olive cultivar but also with different type ofAMF [10].

Figure 3.27: Moraiolo plants, with different application of arbuscular mycorrhiza (M1, M2, M3, M4) in comparison with untreated (K).

Figure :Canino plants with different application of arbuscular mycorrhiza (M1, M2, M3, M4) in comparison with control [11-14].

Our result showed that both cv Canino treated with AMF resulted in higher growth development compared with the corresponding transgenic olive plants. The application of AMF increased shoot length for about 1,5-2 times according to cultivar, however less than the length reported by Binet*et al* (2007), which observed 3 fold increase. Our results are similar to those reported by Calvente*et al* (2004) in olive plantlets cv Leccino, where they observed small difference between control and treated plants with mycorrhiza. In addition, they noted that the isolate of native AMF were more effective in improving growth of both olive cvLeccino and Arbequina plantlets than isolate notnative [15-17].

The leaf area was always superior in leaves collected from treated plants with AMF. However, the difference varied according the type of AMF (Table 3.8). This increase is probably due to the improvement of the mineral nutritional status, mainly phosphorus, as reported by Nagarathna*et al.* (2007) in sunflower leaves,by Wu and Xia (2006) in trifoliate orange and by Johnson (1982) in citrus [18-21].

CONCLUSION

The total chlorophyll content (Table 3.9) was generally higher in treated plants with mycorrhiza, although not all the results resulted statistically significantly, in leaves collected from plants treated with AMF. Some variations were registered between in chlorophyll type (A and B) content in cultivars and type of AMF. Our data confirmed that AMF improved the nutrition processes and support higher chlorophyll content, similar like reported by (Paradis 1995) [20-22].

TABLE : MEAN OF CHLOROPHYLL A, CHLOROPHYLL B AND TOTAL CHLOROPHYLL CONTENT IN LEAVES OF OLIVE PLANT AFTER APPLICATION WITH ARBUSCULARMYCORRHIZA.

Cultivars	AMF	Chlorophyll A (mg/g fresh weight)	Chlorophyll B (mg/g fresh weight)	Total Chlorophyll (mg/g fresh weight)

ABSTRACT

We well know that the PRC, as a great country, is one country that directly influences the processes of globalization, and not only political scientists, philosophers, sociologists–linguists and literary scholars are in the spotlight. We know that Chinese literature has a history of nearly three thousand years, and in the course of its long, arduous and glorious development, it has created hundreds of works of art in various genres, presenting works to Chinese and world peoples. One such creator is the storyteller Pu Songling. They base his works on folklore, legends, and myths.

KEYWORDS: *Sociologists–Linguists, Genres*

INTRODUCTION

Main part

In studying Pu Songling's work, it is useful to refer directly to historical data.

History has shown that the situation in the country worsened during the years of Pu Songling's career. During this difficult period, great literary monuments appeared in fiction, such as "Modern and Ancient Strange Tales". In Chinese literature, Pu Songling's Liao Jai's Strange Stories perfected the novella genre[1].

There are 431 Liao Zhai who have come down to us. The novels struggle with the behavior of the Manchus, especially for raising performance. This aspect of Liao Zhai's work has been unanimously expressed in Chinese literary criticism.

After Chinese scholar Yang Jenhai discovered the author's work in 1962 and published three volumes of Liao Zhaizheyi with commentaries and commentaries, which contained more than 70 stories than those published in the Ching-keting bookstore, Ching-keting "Published a bookstore in 1766 and worked on restoring the original text of a number of short stories in the author's manuscript[2].

Yan Zhenay, who was the first to compare the two layers of the collection, can focus on two differences between individual words or sentences that may have been accidentally dropped due to the book's carelessness. In his view, the omission of 23 hieroglyphs, even when they were deliberately removed (as a result of censorship), did not undermine the overall meaning of the story of the Girl in the Green Dress.

Since only two (or even one) "exchange" hieroglyphs in Van Chen's story have been replaced by a homonymous auxiliary load, the meaning of the word Ma is "how can one benefit from appearance?" changes in shape.

The first part of the story tells of hypocrites from among the Chinese: "They changed their appearance and began to serve the invaders, accepting their dress, customs, and even hairstyles." In this story, the meaning of the sentence is modeled by replacing the two hieroglyphs.

The savagery of the invaders, which was brief but explicit, was removed from the collection as "Informed Devils," "Little Coffins," "Woman of the Soul Family," "Separation during the Uprising,"[3] and other stories.

We should note we find the stories written against the Manchus not only in the stories they did not write, but also in animosity of the ones they liked, which did not ignore or hide the hidden meaning in them. It is, of course, written like Aesop's fables in the style of "half a cup under a bowl" that Pu Songling skillfully used, requiring additional commentary. It is at this point that we can see what tricks he used in the fox's story, "The Cunning of the Fox", 捉狐 *Zhuōhú*[4] He turned his attention to a hero named Sung Wong 孙翁 *Sūnwēng* who couldn't catch the fox no matter what. In Pu Songling's work, he has publicly exposed animals as animals without exposing his protests during his lifetime.

During his lifetime, Pu Songling caused a wave of popular uprisings across the country.

Pu Songling could not help but sympathize with the rebels and enjoy their heroism. The author skillfully describes the ruthlessness of the Manchu rulers in suppressing these uprisings. In her novels, a woman kills a Manchu soldier, preferring to kill herself rather than be ashamed when the century falls. ("A woman from the Jan family").

In his works, the author condemns those who oppose the state. For example, in "The Great Piti of the Three Dynasties," "General She," and "The Man Has a Child," he accuses the traitors who left the Min family and defected to the enemy, and so on[5].

Scholars who study Liao Jai's Strange Stories categorize these short stories. In particular, W. Eberhardt criticized the plots of Buddhism; criticism from the bureaucracy; critique of the

examination system; criticism of the judiciary; divides into categories such as the critique of the Manchu (including Chinese) aristocracy.[6]

Chinese researchers have identified the subject of this collection of short stories as love; ruling class comedy; criticism from officials; classify them into five categories, such as novels that criticize the examination system and reveal anti-Manchu sentiments[7].

Classifications given by Chinese researchers doc. M.X. Mahmudhojayev and Ph.D. We see that it is reflected in the collection "Legends of Liao Jai" translated by JT Ziyamuhamedov[8].

The repetition of the main, themes and plot scenes in one collection led all experts who studied the "strange stories", including VMAlekseev, to divide the plots into categories. In his preface, he follows Liao Jai's collection of short stories in separate independent collections, including "The Fox's Trickery," following the same principle of selection of short stories. "I wanted to publish under the names Magic Monks, Fortune-tellers, Spirit-Gods, Judge of the Dead, Animals and People, People of Heaven, and Prophetic Dreams," he wrote[9].

In turn, the name of the great Russian Chinese scholar VM Alekseev (1881-1951) should be noted in the study of Pu Sungling's work. He has translated about 150 short stories and published them with detailed commentaries. He published a collection of four short stories by Pu Sungling, The Fox Magic (1922), The Magic Monks (1923), The Unusual Stories (1928), and Stories About Strange People (1937). did. These books were reprinted in the 1950s.

By this time, Pu Songling's stories had been translated into several Western languages, including English and German. The English translation by Herbert Allen Giles, a well-known Chinese scholar, was considered a Chinese classic in the West. According to Chinese scholars, the work by V.M.Alekseev is of great importance. After all, his translations reflect the spirit of originality in the face of Herbert Allen Giles's semi-amateur translations[10].

Italian writer De Guara also translates Pu Songling's works into Italian. He praises Pu Songling's works, calling them significant works of China[11].

Recent translations include Byanwen on the Reward for Donations (translated by LN Menshikov), The Story of Shen Fu (translated by KIGoligina), The Story of Pu-min (translated by E.S.Stulova), and Pu Songling Stories (NM In Ustin's book), a collection of short stories and others[12].

In Pu Songling's work, we can find the style of expression found in the stories of the six dynasties in many places. An example is the narrative of Liao Jai's story"雨钱$Y\check{u}$ $qián$" ("Money from Heaven")[13]. In it, as in the ancient collections, spirits and demons act as beings of the material world, and when confronted with them, man behaves as if he were seeing something ordinary daily.

Pu Songling also states in this narration that even among the learned, there are people who can commit crimes for their own gain and criticize them. As an example, the sentences in the story are:"You have called me to sin in order to carry out your evil intentions… "[14].

Now, let's talk about Pu Songling's love stories - there are less than 20 love stories in the world, but most of them are about a man's intimacy with a witch or a dead girl. For example, we can say the love between A Shyu and Liu Zige to have led to a happy life thanks to the "Fox Spirit" girl who always did well for them[15].

CONCLUSION

In short, the storyteller raises the mood of the people, raises the literacy of the population, encourages the population to struggle in some stories, and also fights social injustice with his stories about creative noble robbers and various other topics.

In society, it gives some people power and wealth, while it gives others lawlessness and poverty. While this category of individuals strives to maintain their status, the latter which seeks to improve their situation has become a love story that has been translated into many world languages to this day.

ABSTRACT

The article is about the ancient monument Axsikent, the article provides detailed information about the geographical location of the monument Axsikent, the history of the study of the monument. The study presents future proposals and projects for the Akhsikent monument.

KEYWORDS: *Archaeological culture, arc, agriculture, animal husbandry, chust culture, trade, cultural communication, museum, shahristan, ark alo, material culture, rabod, irrigation, religious center, kingdom.*

INTRODUCTION

On the site of the old Aksi monument in the III century BC was founded the city of Fergana (Akhsikent), the capital of the ancient Fergana state, which occupied more than 40 hectares. It consists of 3 parts in terms of topographic notation, originally consisting of two shahristans (Axis IA, Axis IB) and an arch. By the 2nd century BC, a settlement of craftsmen (Axsi II) - rabod appeared on an area of   about 10 hectares outside the shahristan [1].

From ancient times to the first half of the ninth century Fergana was called Fergana, from the second half of the ninth century to the middle of the eleventh century Fergana-Akhsikat, and from the second half of the eleventh century until the Mongol invasion Akhsikat. After the Mongol invasion, the city relocated to Central Asia's largest cities, such as Samarkand, Termez, and Urgench, to replace the New Aksi monument near the present-day village of Aksi. The city functioned here until the 1620s, when a strong earthquake struck, and in the sources it is called Axsikat, Axsi is sometimes called Axsikent [2]. Nowadays, the name of this city is preserved among the local people as Axsi or Axsikent, and its remains are called Old Axsi and New Axsi. The city was built in the 3rd century BC and originally consisted of two parts: an arch (castle) and a shahristan (Axis IA, Axis IB), and later in the 2nd century BC, the city of craftsmen "rabad" (Axis II) on an area of   about 10 hectares.) appears. As a result, the city, which

consists of 3 parts, covers an area of   more than 50 hectares. In the early Middle Ages, it expanded to the east, covering an area of   about 70 hectares. In the developed Middle Ages, its area exceeded 400 hectares, becoming the "megacity" of its time. Today, more than 70 hectares of land are preserved. At the crossroads of the Great Silk Road, it served as an important link between East and West. The city of Akhsikent has its own history and legends as an integral part of the history of the Uzbek people and its statehood.

Main part. At the initiative of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, an "open-air museum" was established at one of the objects of the Akhsikent monument (VIII). The President of the Republic visited the Aksikent monument on February 28, 2019, got acquainted with the work done and gave new instructions. On this basis, in May 2019, the Uzbek delegation visited Rome and returned to study the Italian experience. According to the order of the President of the Republic, the open-air museum will consist of three parts: an exhibition of archeological objects, the Museum of Archeology and the School of Archeology, the venue of the International Festival "Journey to the Past". The defensive structures in the area of   the Aksikent monument, the city gates, the neighborhood of master blacksmiths and jewelers, the dwellings and the underground waterways will be gradually opened and turned into an "open-air museum". Because the monument has a cultural layer of 10-15 meters and has a history of 1.5 thousand years. Therefore, the research is carried out primarily on the top layer of the monument, and the initial exhibition is organized mainly on the basis of objects known to science. There are 24 such objects in the territory of the monument. First of all, these objects need to be covered with new materials and modern technologies, and then preparations for the exhibition will be made. A portion of each covered object is left unexplored. Later, archeological research can be conducted here, with the participation or observation of foreign tourists interested in archeology. There are relevant proposals of tour operators operating in the field of Uzbektourism.

Due to its geographical location and favorable natural conditions, agriculture and animal husbandry have been widely developed since ancient times. Here you can find everything from the sand dunes of Central Fergana to the Alps in the Pamirs and Tianshan Mountains. It was formed by the confluence of the Naryn and Karadarya rivers. The Syrdarya flows from east to west towards the "gate" of Khojand, dividing the valley into two, southern and northern Fergana. In the south, from the Turkestan-Alay mountains, and in the north from the Chatkal-Qurama mountains, several large and small rivers flow into the Syrdarya, some join the Syrdarya, while others remain between the hills due to lack of water. . This, in turn, creates oases with unique natural conditions (microclimate). Karadarya and its basin should be mentioned here. Starting from the eastern ridges of the Tianshan Mountains, the Karadarya passes through the flat mountains and hills and reaches the Uzgen oasis. More than 100 km from the Uzgen basin to the confluence with the Naryn River, several beautiful oases can be observed in the Karadarya basin. In one of these oases, near the village of Oyim in the present-day Andijan region, lies the ruins of Dalvarzin, one of the first cities of Fergana, about 30 hectares. Its arched exterior, the "Shahristan" surrounded by defensive walls, is clearly visible. Archaeological research over the past 30 years has provided new material on the formation of small states from the Lower Bronze and Early Iron Ages (second half of the second millennium BC to the beginning of the first millennium BC) on the territory of Uzbekistan. As the centers of such small states, the first cities, such as Jarqotan (Surkhandarya), Dalvarzin (Fergana), Kozalikir (Khorezm), Koktepa, and

later Afrosiyob (Samarkand), distinguished themselves from agricultural settlements. The arch of the first such city was found to be a "shahristan" surrounded by a defensive wall.[4]

The Bronze Age in the Fergana Valley has a unique historical development, in which archaic elements have been preserved for a long time. The agricultural culture, known as the Chust culture, was interpreted as belonging to the Bronze Age and sometimes to the Early Iron Age. (Zadneprovskiy, 1962,1978,1998; Koshelenko, 1985). Lenin, as a result of research conducted with the help of natural sciences, including radiocarbon analysis (Zadneprovsky, 1997) and spectral analysis of bronze objects (Ruzanov, 1999), covered a very long period of Chust culture from the XVI-XV centuries BC. Archaeological and paleogeographic research in recent years in the Shohmardon-Margilansay and Kosonsoy basins, which lasted until the 7th century, brought a number of clarifications to the history of irrigated agriculture in the Fergana Valley. For example, in the lower reaches of the Kosonsoy, the main part of the territory of Akhsikent was developed in the X-IX centuries BC, and it was found that it was in the territory of the Old Akhsi monument. Dalvarzin seems to have been the capital of several dozen such cities in the Fergana Valley, which means that Dalvarzin was the capital of the first state in the Fergana Valley as the first city. According to the data, intensive artificial irrigation began to develop in the river and river basins of the Fergana Valley in the X-XI centuries BC. Fergana, including its south-western part, was one of the first cradles of humanity, as it was difficult for dehkan communities to dig canals in the river and river basins of the Fergana Valley, which had a complex relief. Numerous Paleolithic and Mesolithic sites have been identified in the region. In time, people descended from the tops of rivers and mountains to the lower reaches, occupying lands suitable for agriculture. Naturally, the population of sedentary communities is growing and rural areas are gradually expanding. In recent years, a comprehensive study of the monuments of the Late Bronze Age of Fergana revealed that first the peasant settlements, then urban fortresses, and then the first cities appeared.bc. From the last quarter of the second millennium, the first cities and urban fortresses in the valley were formed. The first cities were undoubtedly formed on the basis of the first irrigation facilities. The existence of irrigation networks and the development of handicrafts are undoubtedly among the main features of the early statehood. The traditions of agricultural culture continue in Fergana in the Early Iron and Antiquity (VI-IV and IV centuries BC). Like other parts of Central Asia, there were two types of economy: agriculture and animal husbandry. bc From the 4th to the 3rd centuries, agriculture in the valley further developed, the number of cities increased, and handicrafts and trade increased. It was in antiquity that the ancient kingdom of Fergana-Davan was formed, and an important branch of the Great Silk Road began to operate from this land. Thanks to trade and cultural ties along the Silk Road, ancient Fergana began to take an active part in interregional economic relations. The Chinese ambassador to Fergana, Zhang Xiang, who arrived in Fergana in the 2nd century BC, said that there were more than 70 large and small towns in the valley, each with four independent systems of government. confesses [5]. The Hephthalites, who entered Central Asia in the 5th century, entrusted the administration of the valley to local authorities. Although it is believed that during the Hephthalite period in the life of small property in the region (Khorezm, Sogd, Bactria, Chach, Fergana) there was no such economic growth, the sources say that during this period, Central Asia was not economically active. shows that it has developed in its own rhythm. Sources mention Fergana's regular contacts with China. At the end of the 6th century, the Turkish Khanate established its dominance in the valley. After the conquest of Fergana, the Turks left the rule to the local dynasties for some time.

However, according to a Chinese source in Tan-shu, the Turkic khagans abolished the rule of local dynasties in the early 7th century and began to appoint representatives of their dynasty. Archaeological excavations in the Fergana Valley over the last 70 years have concluded that the eastern part of the valley was the site of the first agriculture and the first cities. It is estimated that 60-70% of the main agricultural monuments are located in this area [6]. However, this is not due to the fact that south-western Fergana is less developed, but rather less studied.

Because farming in the valley is based directly on an artificial irrigation system, people have mostly settled near water bodies. This situation, formed under the influence of the geographical environment, later led to local peculiarities in cultures. One of the centers of such culture is the culture formed in the Sokh basin, which covers the general and specific aspects of the whole of Fergana.

Preliminary data on the history of the Fergana Valley in antiquity avv. Zhang Jian, a Chinese who came to Central Asia in the second half of the 2nd century, is mentioned as Davan in his accounts. According to him, the Davan state, along with the neighboring Kanguy state, is recognized as one of the most powerful states that can withstand Chinese troops. According to written sources, there are hundreds of cities besides the capital, Ershi. This information can be explained, firstly, by the Chinese concept of the city, and secondly, by the large number of settlements in the Fergana Valley of this period [7].

Chinese sources provide valuable information about Davan's legendary flying horses. It is even known in history that the Chinese were able to resist for some time by launching a military campaign to capture the horses. The scientific study of the archeology of the ancient period of the Fergana Valley began in the 30s of the XX century. Monuments have been erected in different years by B.A. Latinin, T.G. Archaeologically studied by Obolduyeva, Yu.A. Zadneprovskiy, NG Gorbunova, DF Brikina, A.Anorboyev, B.Matboboyev and other scientists [8].

CONCLUSION,

The scientific study of the archeology of the ancient period of the Fergana Valley began with the research conducted by B.A. Latinin in the 30s of the XX century. Due to the construction of the Fergana Canal, the scope of archeological research is expanding. Archaeologists such as ME Masson, Y. Gulomov, Yu. The scientific research carried out since the second half of the last century is a new stage in the study of monuments, the study of archeological monuments with material sources that testify to the rich history and culture of this period. Yu.A. Zadneprovsky, N.G. Gorbunova, D.F. Brikina, B. Abulgaziyeva, and later A.Anorboyev, B.Matboboyev, F.Maksudov join in their study. Scientific research conducted during the years of independence is based on a new methodological approach to the existing data, as well as the expansion of research.

Yu.A. Zadneprovsky divides the monumental complexes of antiquity into Shurabashat (IV-I centuries BC-Shurabashat and Qoratepa stages) and Marhamat (Khojambog and Marhamat stages of I-IV centuries BC) [9] .

NG Gorbunova believes that the new archeological complex created on the site of Elaton was inhabited by the Kogai-Karabulak culture (II-VII centuries BC). According to this chronology, its first two stages (first-bc . II - AD I, second stage I-IV) belong to the ancient period.

The largest and best-studied monument of the Shurabashat period is the settlement of the same name, located on the banks of the Yassi River. The total area is 70 ha. and consists of. Except for the river, all sides are surrounded by walls (shafts) consisting of piles of soil. The arch is located to the east of the location. In addition, archeological excavations were carried out at the Karadarya site. Its area is 10 ha. and consists of. Among the samples of material culture were found ceramics, quilts, stones, urchukbosh and others. Pottery is made by hand and wheel. Their surface is decorated with patterns.

Monuments of antiquity are studied in the period of Shurabashat (IV-I centuries BC) and Marhamat (I-IV centuries). The largest and best-studied monument of the Shurabashat period is the settlement of the same name, located on the banks of the Yassi River. The total area is 70 ha. and consists of. Except for the river, the citadel is located to the east of the settlement, surrounded on all sides by walls (shafts) consisting of piles of soil. In addition, archeological excavations were carried out at the Karadarya site. Its area is 10 ha. and consists of. Among the samples of material culture were found ceramics, quilts, stones, urchukbosh and others. Pottery is made by hand and wheel. They are decorated with patterns.

By the time of blessing, all areas of the valley will be developed by the population. During this period, the number of cities increased and villages of various shapes appeared. The welcome address is 40. In mil.avv. It was formed in the III-II centuries and reached its development stage in the I-III centuries. In the construction of cotton used raw bricks. The pottery of this stage is made of thin ceramic wheels with a red angob on the surface. During this period, all areas of the Fergana Valley were occupied by the agricultural population, which is associated with the further development of irrigated agriculture and irrigation in the valley. The Fergana Valley is mentioned in medieval Chinese sources as "Lona" and "Polona". In different years with the early medieval archeology of the valley AN Bernshtam, B.A. Latinin, Yu.A. Zadneprovsky, NG Gorbunova, G.A. Brikina, V.A. Bolatova, B. Abdulgaziyeva, A. As a result of scientific researches of archaeologists AA Anorbaev, BH Matboboev and others the archeology of the first medieval period of the country was studied. The region was archeologically divided into 7 economic districts of the early Middle Ages, in which more than 250 different archeological monuments are recorded. Of these, 22 are urban monuments.[11]

During this period, the cities of Kuva, Akhsikent, Andijan, Osh, Uzgen, Kokand and others developed in the country. The works of later medieval authors such as Ibn Khurdadbek and Qudama ibn Jafar provide valuable information about the cities of the Fergana Valley and their location.

Akhsikent, one of the largest city centers of the early Middle Ages in the Fergana Valley, was formed in antiquity in the northern part of the country, on the right bank of the Syrdarya. By the early Middle Ages there was a residence of local rulers. becomes one of the major city centers. The settlement consists of Shahristan and the arched parts inside it. Both parts of the city are surrounded by strong defensive walls and fortified with defensive towers built adjacent to them.

70 hectares of the old city. It has a rectangular shape. It consists of three parts: arc, shahristan (Axis I a, Axis I b) and wide rabods. A.N. Bernstam traces the formation of the city to the Kushan period, and its development to the VI-VII centuries. A.Anorboyev Axsikentni mil. avv. It is believed that it was formed in the early II century. The cultural layers of the city of the early Middle Ages are not well studied. Written sources state that it was the residence of the ruler.

The ancient city of Kuva is located on the eastern edge of the present city and has a square area of 12 hectares. address consisting of. In the north-eastern part the height is 10 m. consisting of two tiers of 2 ha. located in the arc that occupies the area. 7-8 m. The high part of Shahristan is 1.5 km on three sides (north, south and east). surrounded by a rabod part of radius. The defensive wall was built in the II-III centuries, as evidenced by the material evidence in it. This wall has a total thickness of 14 m, which surrounds all sides of the city. and consists of. There are four construction periods of the wall. Initially the thickness of the wall is 5-6 m. was The base is made of cotton, the top is made of large bricks, dating from the V-VI centuries. The third wall is made of striped cotton and raw bricks. This wall belongs to the beginning of VI-VIII centuries. The wall was also made of cotton and mud bricks and functioned until the Mongol invasion. Miles from the lower cultural stratum of the settlement. avv. VI-V centuries patterned pottery was found. From this, pottery was also found under the original wall. In the western and eastern parts of Shahristan, the place of residential and commercial buildings around the defensive walls has been preserved. At the bottom of some houses there are baked bricks.

During the early Middle Ages, the population was dense. In the middle of the house there are sofas along the hearth wall. The roof is flat and rests on wooden pillars. The columns are carved. The area around the city in the early Middle Ages is well studied. It is located to the west of the city. This part consists of densely built quarters, separated by small streets. The houses consist of living and production rooms. Near the place there was a Buddhist temple complex. Destroyed in the VII century. In Arabic sources, Kuva was considered the residence of the heir to the throne in the early Middle Ages. Later it was the second largest city on the Great Silk Road, connecting east and west.

The first defensive wall in the lower layer is made of straw, the upper part is made of large-sized raw bricks. A thin wall two meters thick was built over it. The third wall is made of striped straw. During this period, the wall thickness reaches 4 m.

In the Fergana Valley, the early Middle Ages were one of the most important lands in the Great Silk Road, and urban culture was highly developed. The large city was a center of trade, industry and culture. In short, the first complete medieval archeological monuments of the Fergana Valley were fully registered and mapped. Irrigation zoning and classification of monuments on the basis of water sources allows us to make the following final conclusions: at about 250 points materials related to the V-VIII centuries were taken into account. Archaeological monuments of this period were located in the oases in groups according to water sources. As a result of our research, the following hierarchical system was proposed for the location of monuments, that is, the group of monuments by water source formed oases, and several oases formed irrigation areas (water source, oasis, small oasis irrigation area). Based on the external signs and dimensions, a central monument was identified for each irrigation area. The monuments are located in 14 irrigated oases and small oases.

The typology of the first medieval archeological monuments was developed for the first time and they were divided into 6 groups according to their defined features: city and its equivalents (22), villages (92), castles (13), fortresses. villages (27), single-family housing estates (29), cemeteries (23). Each group was described functionally. In the V-VIII centuries the population of the valley was 250-300 thousand, of which 65-70 thousand lived in cities (23-26%). The number of cities will increase slightly, with archeological data showing that in ancient times 16

cities were identified, while in the early Middle Ages their number reached 22. The towns served as the handicraft, trade, and religious centers of some of the acquired oasis or irrigation district. 80% of the monuments are located in the eastern and south-eastern part of the valley, and the population is mainly engaged in agriculture. This situation was observed in ancient times, and the fact that the monuments were collected in this part of the valley leads researchers to conclude that the kingdom of Davan is located here.

INFLUENCE OF SOWING DATE IN REPEATED CROPS ON THE YIELD OF SOYBEAN VARIETIES

Nigora Sadirdinovna Umarova*

*Associate Professor,
Candidate of Agricultural Sciences,
Tashkent State Agrarian University,
UZBEKISTAN

ABSTRACT

In this article, it is provided materials on the study of the sowing date of soybean varieties in repeated crops. In Uzbekistan, winter wheat covers an area of more than 1 million hectares, repeated sowing of soybeans and other crops is practiced on the dewatered areas. The sowing time had an impact on the growth, development and yield of soybean varieties. When sowing in late sowing dates, all indicators decrease. In conclusion, it is determined when sowing in late period all results were lower than other variants.

KEYWORDS: *Sowing Date, Crops, Soybean, Sown Areas, Humus, Nitrogen, Phosphorus, Potassium.*

INTRODUCTION

Soybean culture in Uzbekistan is currently not widely introduced into the structure of agriculture, although it has quite useful qualities, such as a high content of edible protein and oil. Various varieties of soybeans contain up to 57% dietary protein, 27% easily digestible polyunsaturated oil and up to 30% carbohydrates (mainly mono and disaccharides), it contains vitamins and biologically active substances: A_1, B_1, B_2, B_3, B_6, E, C, D, K, PP, etc., as well as microelements: Mn, Mo, Mg, B, Fe, etc. All of them are necessary in our daily life and for the diet of animals, as they contain essential amino acids [2,3] .

Due to the biological property of soybeans in symbiosis with nodule bacteria [Rhizobium Japonicum] to accumulate nitrogen in the soil, soybeans are classified as nitrogen-fixing plants, and as a result, financial savings on nitrogen fertilization for subsequent crops can be obtained. In addition, biological nitrogen created in this way is environmentally friendly and cannot have a

detrimental effect both for the soil, without being washed out into the groundwater, and for consumers, without accumulating in the fruits.

As a result of this diverse application, the interest of farmers in the production of soybean grain has increased. The most important task in this case is to identify the optimal variety capable of producing a high grain yield in repeated crops at different sowing periods and planting density.

It is advisable to develop a technology for cultivating soybean varieties in repeated crops after the fields are vacated from wheat for the rational use of irrigated lands in the republic, to identify the optimal feeding areas and sowing dates and to give recommendations to the production for wide familiarization of farmers with the research results.

LITERATURE REVIEW

Soybean is an ancient culture. During studying the variety of species and forms of soybeans, scientists believe that they were formed mainly in three centers: Southeast Asia, Australia and East Africa. But most scientists are leaning towards the Chinese center of plant origin - China, Korea, India, Japan [2].

For many centuries, soybeans and its products served as the main source of protein for the population of eastern countries. The first evidence of soybean appeared in 2838 BC. And since then it has been constantly mentioned in the literature. In China, soybeans were introduced into cultivation 6-7 thousand years ago. It has long been cultivated in Japan, India, Indonesia, Vietnam and other regions of Asia. From China, soybeans penetrated the Far East in 3 thousand years BC. On the territory of the former Soviet Union, soybeans began to be sown for a long time in the Amur Region, Khabarovsk and Primorsky Territories, where there were favorable natural and climatic conditions for its cultivation. Later, soybeans came to Georgia, Ukraine, Kuban, Northern Caucasus [11].

It is sown in more than 60 countries around the world on all continents. About half of soybean crops and more than 60% of world production of its seeds are in the United States. Soybeans occupy significant areas in China, Brazil, as well as in South America, Canada, Australia, Western Europe [4].

Soybeans have been widely cultivated since the 1950s as a fodder crop for enriching corn silage and other types of feed with protein. Currently, the sown area of soybeans in Uzbekistan is more than 10 thousand hectares, the yield is 10-20 c / ha, although the biological characteristics of the seed yield are much higher. Under irrigation conditions in Uzbekistan, seed yields reach 30-40 c / ha [5].

Soybeans are currently cultivated in many countries around the world. The sown areas are expanding, and the yield increases from year to year.

Long-term research has established the advantage of a later sowing period and a higher density of agrocenosis for early-ripening varieties compared to mid-ripening ones. The choice of the optimal sowing date for soybean varieties is multifaceted, because it allows you to increase the yield of seeds by 1.4-2.0 times compared with early or late terms [10]. According to G. D Batwal, R. N., Sabale, Varshneya [14], H. Sh. Nematova [8] the optimal date for sowing soybeans is determined when the soil at the sowing depth warms up to 12-14 ° C. In the European part of Russia, this coincides with the third decade of April - the first decade of May.

In the Far East, soybeans are also sown when the soil warms up to 10-12 ° C. In the Khabarovsk and Primorsk Territories, the best sowing period is in the second decade of May, in the Amur Region - in the second half of May. You shouldn't be late with sowing soybeans, as this leads to a decrease in yield. Sowing timing also significantly affects the quality of seeds [58]. These terms are set taking into account the biological characteristics of field crops and environmental factors of each zone: the sowing date of winter crops should provide favorable conditions for their autumn development and preparation for overwintering; for early spring crops, flax is most preferable, perhaps the early sowing time - when the sowing maturity of the soil; for late spring crops - when the temperature of the sowing layer of the soil is optimal for each crop and when the danger of cold weather returns [13]. The main indicator of the onset of sowing date is the warming up of the sowing layer to the minimum temperature for seed germination [6-7 ° C]. Earlier sowing leads to disease damage to seeds and therefore seedlings are uncooked and thinned out. Late sowing leads to a decrease in the period of flowering - fruit formation, which leads to a decrease in yield [31]. The latest sowing dates are applicable to soybeans. In recent years, the popularity of soybeans has skyrocketed thanks to the rise in poultry farming and the increased effective demand for soybeans.

In our conditions, when many field crops are not allocated areas in the main crops, it is necessary to look for reserve opportunities. One of these reserves is repeated summer crops after harvesting winter grain crops. In this case, late sowing dates are very risky, since the grain may not ripen. But due to the variety of biological properties of field crops, the task is set - to determine the possible latest sowing date in repeated crops, i.e. what crops and varieties can be sown rather late and get full grain [7].

Study location and soil characteristics

Field studies were carried out at the Experimental Station of the Tashkent State Agrarian University. The experimental station is located near Tashkent in the upper part of the Chirchikriver in the Kibray district of the Tashkent region, at an altitude of 481 m above sea level. The experimental station has the following coordinates: 41°2'Northern and 38°31'Eastern. The relief of the site is uneven, slightly wavy, with a general slope towards the Salar Canal. Water from Bozsuv canal was used for irrigation.

The soil of the experimental site belongs to typical sierozem soils of old irrigation, non-saline, with a low content (along the soil horizons 0-30 and 30-50 cm) of humus 0.925-0.715%, nitrogen 0.082-0.066%, phosphorus 0.153-0.139%, potassium 2.3 -1.8%, as well, the supply of nutrients to the soil is low. The soil has a weak structure, good water permeability with high capillarity.

TABLE 1 NPK CONTENT IN THE SOIL OF THE EXPERIMENTAL PLOT AVERAGE OVER 3 YEARS

№	Soil horizon,cm	total content,%				Mobile forms, mg / kg		
		humus	nitrogen	phosphorus	potassium	$N-NO_3$	P_2O_5	K_2O
1	0-30	0,925	0,082	0,153	2,3	4,8	30,0	180,5
2	30-50	0,715	0,066	139	8	3,2	15,0	141,0

The reaction of the soil solution is slightly alkaline. Irrigation causes soil compaction. Another unfavorable property is the tendency to form a soil crust after irrigation or precipitation.

Object of research. In this research, the object of research is the soybean varieties **"Orzu" and "Uzbek-2".**

"Orzu" is a variety developed by a team of scientists from the Rice Research Institute. Authors: A.I.Rakhmanov., B.K.Yunusov., N.Tulaganov.,O.V.Burygin.

In 2005, it was included in the State Register for sowing in the regions of the republic under irrigation conditions.

Plant height is 95 - 100 cm, Green, pubescent plant. Foliage is 45-55%. The flowers are small, white, the beans are dark brown, pubescent. The grain is large, ovoid, yellow, shiny, smooth, with a black scar. The mass of 1000 seeds is 175.6 g. During the years of research in the SVTP system, an average yield of 24.9 c / ha was obtained. During this period, no diseases and pests were observed. The variety is resistant to lodging and shedding. The growing season is 130 days. Good taste [4].

"Uzbek-2" - the variety was bred by selection from local green soybeans at the Rice Research Institute. Authors: M.M.Saltas, T.L.Yugai, O.V.Burygina, M.T.Kogai. In 1981, it was included in the State Register for sowing in the republic under irrigation conditions.

Height is 115 cm, leaves are compound, trifoliate, pubescent, serrated edges. The stem is yellow-green, white. Pods are elongated, flat, yellow - brown, strongly pubescent. The grain is ovoid, shiny, yellow, sometimes green. The mass of 1000 pieces of grains is 170.4 g.

During the years of research in the SVTP system, an average yield of 22.7 c / ha was obtained. During this period, no diseases and pests were observed. The variety is resistant to lodging and shedding. The variety is mid-season. The growing season is 145 days. The protein content in the grain is 17-39%, the oil content is 20.2%. The variety is convenient for mechanized harvesting [4].

RESEARCH METHODOLOGY

The research was carried out by field and laboratory methods. Field experiments were carried out in four repetitions at the Experimental Station of the University. The arrangement of the options is 4-tiered, the arrangement of the plots is randomized. Plots are four row, of which two middle rows are accounting, and the outer ones are protective. Plot length is 20 m, width is 2.8 m, area is 56 m^2. The number of counting plants is 20 from each plot.

The total number of experimental options is 6, the number of plots (taking into account 4-fold repetition) is 24.

TABLE 2 EXPERIMENTAL SCHEME

№	Variety	Sowing period	Planned density standing, thousand/ha	Sowing norm, kg/ha	Nutrition area plant/cm^2	Sowing scheme
1	Orzu	June 15	500	88	200	70x3-1
2	Orzu	July 1	500	88	200	70x3-1

3	Orzu	July 15	500	88	200	70x3-1
4	Узбекская-2	June 15	400	68	250	70x4-1
5	Узбекская-2	July 1	400	68	250	70x4-1
6	Узбекская-2	July 15	400	68	250	70x4-1

In sowing studies, phenological and biometric measurements were carried out, photosynthetic and symbiotic activities of soybean varieties were studied.

EXPERIMENTAL AGROTECHNICS

Agrotechnical measures on experimental crops were carried out in accordance with the adopted zonal soybean cultivation technology for the Tashkent region. The crops were placed after harvesting winter wheat. For sowing, elite seeds obtained from the Rice Research Institute of Uzbekistan were used. Sowing was carried out manually in a wide-row method with a row spacing of 70 cm, the depth of seeding was 5 cm, the seeding rate of seeds for varieties was 400, 500 thousand pieces per 1 hectare. Furrow irrigation, distance between furrows is 70 cm, irrigation rate is 800 m^3 / ha for 1 irrigation.

Before sowing soil cultivation included the following measures: plowing with a seam rotation to a depth of 25 cm, harrowing with a disc harrow to a depth of 10-12 cm, surface leveling of the site.

Sowing was carried out in three terms according to the research program. Simultaneously with sowing, fertilizers were applied (granular superphosphate at the rate of 100 kg / ha P_2O_5 and potassium chloride at the rate of 60 kg / ha K_2O), as well as nitrogen at a starting rate of 30 kg / ha (urea was used). Then irrigation furrows were immediately cut and irrigated.

RESEARCH RESULTS

The sowing date influenced the development time of soybean varieties. In the Orzu variety, the vegetation period decreased by 6-8 days, in the Uzbek-2 variety by 4-7 days, with later sowing dates.

TABLE 3 INDICATORS OF THE FORMATION OF THE YIELD OF SOYBEAN VARIETIES DEPENDING ON THE SOWING DATE (AVERAGE FOR 2007-2009)

№	Options		Indicators				
	Variety	Sowing dates	Vegetation period, day	Stem height, cm	Leaf area, thousand м^2/ha	Number of tubers, piece/plant	Weight of tubers, gr
1	Orzu	15.06	89	72	60,1	101,3	2,01
2	Orzu	01.07	83	61	57,4	88,7	1,81
3	Orzu	15.07	81	53	53,7	78,3	1,71
4	Uzbek-2	15.06	108	96	53,4	134,7	2,92
5	Uzbek-2	01.07	104	72	49,4	126,3	2,54
6	Uzbek-2	15.07	101	54	49,1	111,0	2,08

The height of the stems decreases in both varieties at late sowing dates by 11-21 cm for the Orzu variety and by 24-32 cm for the Uzbek-2 variety. The leaf area also decreases at later sowing dates than June 15. The symbiotic activity of soybean varieties is better when sowing on June 156, the number of nodules is higher and their weight is higher when sowing in mid-June.

Sowing dates influenced the size of the grain yield and its quality, as you can see from the data in the table

TABLE 4 PRODUCTIVITY AND GRAIN QUALITY OF SOYBEAN VARIETIES DEPENDING ON THE SOWING DATES

№	Sowing dates	Orzu			Uzbek-2		
		Yield c/ha	Protien, %	Oil %	Yield, c/ha	Protein,%	Oil, %
2	15.06	23,7	26,25	23,11	24,7	27,65	24,41
5	1.07	22.3	25,40	26,16	21,0	25,60	25,11
8	15.07	17,0	24,35	26,75	16,5	24,38	26.30

The grain yield of the Orzu variety decreased from 23.7 to 17.0, and the Uzbek-2 variety is from 24.7 to 16.5 c / ha with the later sowing after June 15. The protein content decreases at later sowing dates in both varieties. The oil content increases by grade to 26.75 and 26.30

CONCLUSIONS

1. In repeated sowing of soybean varieties, the indicators of yield formation: plant height, duration of the growing season, leaf area, number and weight of nodules decrease when sowing after June 15 in both varieties;

2. The grain yield of the studied varieties significantly decreases in the July sowing dates.

3. The quality of grain changes with different sowing dates: at late sowing periods, the protein content decreases, while the oil content increases.

4. It was revealed that the most latest possible sowing date is the middle of July.

ABSTRACT

The author of the article, based on written sources and historical research, summarized the state of secular and religious science in the Bukhara Emirate at the end of the 18th - first half of the 19th century. The role of the city of Bukhara as a center of enlightenment throughout Central Asia and the spiritual capital of the region is revealed. This paper describes special characteristics of the works written in Bukhara in the 18-19th centuries in detail as well as it studies the historical environment of that time on the basis of manuscript sources.

KEYWORDS: *Central Asia, XVIII-XIX Centuries, Bukhara, Manuscripts, History, Culture.*

INTRODUCTION

The city of Bukhara is considered the center of enlightenment throughout Central Asia and is recognized as the spiritual capital of the region. Students from Khiva, Kokand, Samarkand, Kazan, Orenburg and other cities of the Muslim world came here to study theology. In Bukhara in the second half of the XVIII century - the first half of the XIX century, the national traditions in the field of science and culture, created by talented scientists, theologians and masters of art, were preserved and creatively developed. This ground played an important role in the recognition of such great scholars as Imam Bukhari, Ibn Sina, Narshahi, Naqshbandi, Gijduvani. The works they wrote became masterpieces of world spiritual property. In particular, Imam Bukhari's Sahih Bukhari and other works, and Abu Ali ibn Sina's Law of Medicine, are recognized as gems of the Islamic world and world science.

THE MAIN FINDINGS AND RESULTS

In the XVIII-XIX centuries in Bukhara lived many scientists and sages, who inherited works that included both religious and secular sciences. During the Mangit period, the Bukhara Emirate attached great importance to the writing of historical works. Historical works were often written by order of the rulers-mangits. If we look at these works in chronological order, the first work written during the Mangit period was written by VafoiKarminagi. This work is a historical source and is called "TuhfatUl-Khaniy" ("Gift of the Khan"). This work is sometimes referred to as the "History of Rahimkhan" ("History of Muhammad Rahimkhan") [1:87] and is the oldest historical manuscript of the Mangits. This work covers the socio-political history of the Bukhara Khanate between 1722-1782.

"TuhfatUl-Khani" is a rhyming prose, written with saj, but it is one of the first sources with full and wide coverage of events, richness of socio-economic, political, geographical and ethnic facts. The economic and political tensions in the Bukhara Khanate since the 1920s have been exacerbated by the growing socio-political fragmentation and consequent weakening of the central government, the relentless wars waged by the Mangit rulers to subdue the methods and tribes, and the destruction of many towns and villages. is overwhelmed with evidence-based information that can help determine the aggravation of the lives of working people and its root causes. "TuhfatUl-Khaniy" has a rich ethnographic material. The play contains not only the names of the seeds, but also their place of residence and population.

"TarjimaiahvoliamironiBuxoroyisharifaz Amir Doniyol to asri Amir Abdulahad" ("The state of translation of the amirs of Bukhara Sharif. From Amir Daniel to Amir Abdullah") is also a historical work written in Bukhara, the author of which is known as Ahmad Donish or Ahmad Kalla. From an early age he studied history, classical literature, mathematics, astronomy, music and medicine, as well as the secrets of calligraphy and painting.

The works of the scientist are of great scientific importance in the study of the socio-political life of Uzbekistan in the XIX century. The scholar briefly described the events that took place during the reigns of Amir Daniel (1758-1785), Shah Murad (1785-1800), Haydar and Amir Nasrullah, after discussing the importance of the planets in human destiny, religion and its role in society.

The largest and last part of the work is dedicated to Amir Muzaffar. This section describes in detail the socio-political situation of the Bukhara Khanate in the second half of the XIX century, as well as the events of the occupation of Jizzakh in 1866 and Samarkand in 1868 by the troops of Tsarist Russia.

Manuscripts of the book "Biography of the Emir of Bukhara Sharif" are available in the libraries of Tashkent, Samarkand, Bukhara, Dushanbe [2:83]. The text of the work was published by A. Mirzoev. In 1960, an abbreviated Russian translation of the book was published in Dushanbe.

Works such as *"Nawadirul-Waqoe", "Risolai MuxtasareAz Tarixi Saltanati Xonadoni Mangitiya"* also belong to Ahmad Donish. It is dedicated to the history of the rule of the Mangit dynasties in the Bukhara Khanate and covers the period from the reign of Amir Daniel (1758-1785) to the reign of Amir Abdullah (1885-1910). The most important work of Ahmad Donish is Nawadirul-Waqoe. Many socio-ethical issues are considered in this play.

He covered the history of Bukhara and wrote unique information, studied religious and secular sciences. Another historian who inherited several valuable sources was the statesman

MirzoSalimbek (1850-1930), who in his work "*Tavoriximuttakadiminvamuttaaxirin - Monotonous reflection and discussion*" wrote valuable information about the history and emirs of Bukhara. He briefly described the reign of Amir Hussein as follows: "After the death of Amir Khaydar, Mir Hussein Tora succeeded his father as king and reigned for seventy-eight days and died. He lived for thirty years. " According to MirzoSalimbek, Amir Umarkhan did not have much prestige among the people, and even during his reign he was mainly given to luxury and life. There are conflicting sources in various sources about Umarkhan's later life and his untimely death. According to G.Vamberi, Umarkhan died of plague in Kokand shortly afterwards. This event took place in 1245 AH (1829 AD).

Historian and statesman MirzoSalimbek states in his book "*Tavoriximuttakadiminvamuttaaxirin - Monotonous reflection and discussion*" that Amir Nasrullo exiled his four surviving brothers: Mir Zabir, Mir Hamza, Mir Safar and his youngest brother. Other sources (works by A. Byrns and G. Vamberi) state that Amir Nasrullo secretly killed his three brothers, who were sent to one of the estates on the banks of the Amudarya.

Mirza Salimbek is the author of several major historical works. "KashkuliSalimi" ("Kashkuli of Salimi" - a boat-shaped pumpkin (wooden) that dervishes carry around their necks or carry by hand to collect alms), "Jami'ul-Gulzor" ("Flower Complex"), "Story Abdullah ibn Mubarak" and "TarihiSalimi" are among them [4: 184].

During this period, along with secular sciences, religious sciences also developed in Bukhara. In their works, historians have not only covered history, but also their religious views. Among such works is the work "FathnomayiSultoni" ("Sultan's conquest – victory"). The author of this work was Mir Alim Bukhari, who was in the service of Muhammad Olimbek, the ruler of Guzar during the reign of Amir Nasrullah (1826/27 - 1869/79) and wrote on his behalf. "FathnomayiSultani" covers the period from the reign of Amir Shah Murad (1785/86 to 1800) to the early years of Nasrullah's reign in the Bukhara Emirate, but the reigns of Shah Murad and Amir Haydar are brief [5]. The Nasrullah period is described in detail. This manuscript was the first volume of the work, and the second was left unwritten for reasons unknown to us.

The first part of "FatkhnomayiSultoni" was translated into Russian by the late O.D. Chekhovich. The translated manuscript is kept in the library of the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan. There is a single copy of the work numbered №1838. The work is written in Persian, hard cover, local paper, letter Nastaliq, 194 sheets, size 26x15 cm. Copied in 1256 A.D. (1840). The work begins in the traditional way, going to the goal on page 5a and explaining the reasons for writing. Page 8 b speaks of the weakening of control in society during the reign of Amir Danielbi, the arbitrariness of officials, the rise of corruption, the rise of taxes, and the suffering of the people. When Shah Murad came to the top of the state, he began to strengthen state control and put an end to all riots. He introduced a "behavioral tax" and taxes were abolished for a specified period.

Page 56 b of the work narrates the events leading up to the accession of Amir Nasrullah to the throne. Recent historical events date back to 1248 AH (1832). Since the period of Amir Nasrullo is not fully covered, most researchers believe that the work is incomplete.

Importantly, the work has great historical significance. It contains important information about the personality of Amir Nasrullah and the historical figures gathered around him, the relationship of governors of different regions with the central government. Many of the positive aspects of

the emir, who was portrayed as an executioner, evil, and tyrant during the Soviet era, also stand out. Information about his tireless struggle for the unification of the country, the work done on the tomb of BahovuddinNaqshband, the construction of a madrasah near the tomb of his father Amir Haydar and the allocation of foundations for him, the construction of a magnificent coffin in the tomb of Ayyub, have changed our attitude to history.

In the XVIII century in Bukhara we can see that not only historical works, but also mystical works were written. One of such works is "Bahr al-Ulum", the only copy of which is kept in the manuscript treasury of the Academy of Sciences of the Republic of Uzbekistan in the collection number 2406. This volume contains three Arabic works –"Bahr al-Ulum", "PisandiZikriJahr" and one anonymous treatise. "Bahr al-Ulum" is the first work in this manuscript and consists of (№2406 / 1) 984 pages (1a - 984b).

The fact that various corrections were made to the text and that it was mentioned in the introduction (9846) that this manuscript was a draft of "Bahr al-Ulum" can be considered as the author's signature.

The internal structure of "Bahr al-Ulum" is as follows: first (pages 76-21a) is a commentary on the work. That is, each chapter and its chapters (called "narratives") are named from which page they begin, and a sentence or two is also given about their subject.

It can be said that the main reason for the writing of "Bahr al-Ulum" was the popularity of the Naqshbandi sect at that time, and the conflict between the sheikhs of this sect and the followers of the yassavi sect.

It should be noted that in the second half of the 18th century, Sheikh Khudoydod had a high scientific status among the followers of the Yassavi sect, and therefore he was asked to comment on Sheikh Sukhravardi's treatise "Irshad al-Muridin".

As noted in the Colophon (End) of "Bahr al-Ulum", this work is a commentary on Shahabuddin Abu Hafs as-Suhrawardi's treatise "Irshad al-Muridin". This work by Suhrawardi is in fact a short treatise on mysticism, consisting of 47 chapters [7], and Sheikh Khudoydad commented on them one by one in "Bahr al-Ulum", resulting in a much larger (about 50 times) large work, consisting of 47 chapters.

"Irshad al-Muridin" is a short treatise (22 pages), and "Bahr al-Ulum" is a major work (984 pages). So, "Bahr al-Ulum" was written according to a certain plan. In other words, the commentary is much broader. For example, the second chapter of both works is devoted to the interpretation of mystical terms. The second chapter of "Bahr al-Ulum" is 95 pages (138-233) and is one tenth of the total volume. Hence, Sheikh Khudoydod also considered it necessary to know the terms of mysticism.

CONCLUSION

To conclude, the historical works created in the school of cultural life and historiography in the Emirate of Bukhara are an important historical source that contains information on almost all areas of political, socio-economic and cultural life of the Emirate of Bukhara. It should be noted that these primary sources have not been sufficiently studied to date, and today it is a huge task to put the information in these sources into a broad scientific circulation in the study of the history of international relations in Central Asia.

Also, the Bukhara School of Historiography and the works created in it are of special theoretical and methodological significance for today's historical research.

LEGAL BASIS OF MASS MEDIA IN UZBEKISTAN

Sadokat Kasimjon kizi Makhsumova*

*PhD Student,
Journalism and Mass Communications University,
UZBEKISTAN

ABSTRACT

The article deals with the legal framework for regulating the activities of the media in Uzbekistan. The history of the right to information is studied; its reflection in the legislation of Uzbekistanis analyzed. Attention is paid to the aspects provided for in the existing legislation. The peculiarities of the forms of ownership of the media organization, their definition in the norms of the law, their peculiarities are studied.

KEYWORDS: *Mass Media, Law, Norm, Legal Entity, Individual, Editorship, Founder, Private Enterprise, Limited Liability Company, Joint Stock Company, Unitary Enterprise.*

INTRODUCTION

Today, the information that has become a daily human need is being updated every second. Its area is so wide that if you can't find what you need, you're bound to be looking for a traveling star. At the same time, it has the power to rule the world - information has also gone through certain periods of development. Among them, the conscious dissemination of information by man took place in the fifth stage. In doing so, people went through morphological creation and achieved the results of real thinking and creativity. Conscious creation, on the other hand, was not limited to the collection and processing of information, but also encouraged the search for ways to disseminate it to the masses. The result has been pre-journalism scenes, including meetings, announcements, correspondence, lithography, and other forms of mutual information exchange.[1]

Sources say that drastic changes in the field of information have occurred three times. The first took place when a special mechanism for recording and distributing time, by region, emerged. The second change is related to the beginning of book printing. It consisted of copying documented information using a special typewriter. The third is characterized by the invention of

electronic computers. This change is significant as the transfer of work in human activity to technology.

Now they are assessing how democracy works by ensuring freedom of information and speech. In particular, this is one of the important directions in the current stage of democratic renewal in our country, which focuses on ensuring freedom of information.

If we look to the past, we will see that the right to freedom of information and speech, one of the most important hallmarks of democracy, also has its own history. In particular, in 1945 inMexico City was held a conference of American states on strengthening the right to information at the international level, where the slogan "freedom of information" was first raised by the United States.

The first session of the UN General Assembly in 1946 adopted Resolution 59 (1), entitled "Convening an International Conference on Freedom of Information", which stated that "the right to information consists of the right of a person to collect, transmit and publish information without hindrance", was pushed.

It should be noted that in a number of European countries, the idea of freedom of the press and speech has developed a long time ago. In particular, in Sweden in 1766 the Law "On freedom of the press and speech" (in the new edition of April 5, 1949) was adopted, which strengthened the right of citizens to information.

It is noteworthy that freedom of information and speech is recognized as one of the basic personal rights of citizens around the world, and every year 3rd May is celebrated as World Press Freedom Day.

The adoption of national constitutions in many countries has led to the emergence of the right of citizens to information in the system of rights and freedoms and the strengthening of this institution on the basis of constitutional provisions. In particular, Article 29 of the Constitution of Uzbekistan contains a provision guaranteeing the right to information, according to which "Everyone has the right to freedom of thought, speech and religion. Everyone has the right to seek, receive and impart information of his choice, except for information directed against the existing constitutional order and other restrictions established by law.

In accordance with this constitutional principle, a number of laws and programs aimed at ensuring public awareness of the necessary information have been adopted. These include the Law on Informatization, the Law on Principles and Guarantees of Freedom of Information, and the Law on Mass Media.

In this regard, it is necessary to provide information on the mechanism for exercising the right to information. This process consists of three stages:

- the first is the existence of a regulatory framework that serves to ensure the emergence, provision and guarantee of the rights and obligations of citizens related to access to information;
- the second is the relationship between information subjects;
- the third is to prevent violations of citizens' rights to information and, if so, to restore their legitimate interests and rights.[2]

In all countries of the world, the media play an important role in the socio-political life of society. In the world experience, there are laws regulating the organization, conduct, termination of media activities, as well as all actions in the system as a whole. In particular, these laws play a key role in the policy of media management in Uzbekistan. The Law on Mass Media, which was revised on January 15, 2007 and contains a total of 40 articles, contains a number of articles regulating the activities of the media, organizing the editorial office, and conducting management policy in accordance with the laws of economic management.

The law strictly defines the management policy of the media. In particular, Article 8 states that the right to establish mass media is vested in legal entities and individuals. Articles 9-10-11 provide a general description of the founding document and the memorandum of association between the founder and the editorial board, as well as the charter of the editorial office.

Articles 12-13-14 specify the agreement between the founder and the editorial board, the rights and obligations of the founder. For example, Article 15 defines the activities of an editorial office as follows: "An editorial office is a structural unit of a legal entity or an individual who publishes a media outlet. The editorial office can be organized in any form provided by the legislation. The editorial office is independent in its professional activities. It consists of the editor-in-chief and the editorial staff. The editorial office can start its work after the registration of the mass media. " Distribution of mass media can be carried out directly by the editorial staff, individuals and legal entities on a contractual basis. Distribution of printed media products is carried out through the organization of subscriptions to them, as well as through the retail network. The number of registered periodicals through the retail network, including manual sales, is carried out by state distributors of publications or by legal entities that own the network, individual entrepreneurs in the manner prescribed by law.

Laws "On Protection of Journalism", "On Advertising", "On Principles and Guarantees of Freedom of Information", "On Informatization" and a number of other legal acts regulate the activities in the field.

These legal documents define the legal boundaries that must be followed in the organization and conduct of editorial activities. The team, from the editorial manager to the youngest employee, must follow them. Failure to comply with the norms will result in liability before the law.

The following main directions of the activity of the editorial office and the printed edition issued by it in such special laws regulating the activity of the system:

✓ the legal status of the editorial office and its print publication, the conditions of their establishment, their relations with government agencies and other structures of society;
✓ subjects of editorial activity and their interrelation;
✓ The legal status of the journalist as a member of the editorial staff, as well as the author of articles in the newspaper and his relationship with the editorial staff;
✓ Defines the relationship of the editorial office and its journalist with the readership of the print media.

Under current law, a media outlet can also be established by several founders.

The following may not be founders of the media:

✓ a person under the age of eighteen;

✓ a person whose criminal record has not been completed or conviction has not been expunged or who has been declared incompetent by a court for an intentional act;

✓ a non-governmental non-profit organization whose activities are prohibited by law.

Also, the establishment of mass media by legal entities with a share of foreign investment in the charter capital of thirty percent or more is not allowed.

The Law on Mass Media also provides for the provision of financial support to the media and the procedure for conducting it.

Thus, in accordance with the second part of Article 15, the editorial board of the media can be formed in any organizational and legal form established by law. The decision to choose the organizational and legal form of the editorial office is made by the owner of the property as a legal entity. The editorial office of a print media may be established and registered with the status of a legal entity, private enterprise, limited or additional liability company, unitary enterprise, open or closed joint stock company, as well as other organizational and legal forms.

Private enterprise. A commercial organization established and managed by a single individual owner is recognized as a private enterprise.[3]

Private enterprise is an organizational and legal form of business entities.

A limited liability company (LLC) is a limited liability company established by one or more person, the charter capital (authorized capital) of which is divided into shares in the amounts specified in the constituent documents. within the value of their contributions.[4]

Joint-stock company (JSC) - a joint-stock company (hereinafter referred to as a company) is a commercial organization divided into a certain number of shares, which confirms the rights of shareholders to the joint-stock company.[5]

Unitary enterprise. A unitary enterprise is a commercial organization that has not been granted the right of ownership by the owner of the property. The property of a unitary enterprise is indivisible and cannot be divided into shares (shares, stakes) (including among the employees of the enterprise). The property of the unitary enterprise shall belong to it on the right of economic management or operational management.

The choice of organizational and legal form of the editorial office depends on:

➢ type of business and its scale;

➢ the number of future business partners, the level of participation and responsibility of each of them;

➢ the amount of available funds and the statutory fund established by law;

➢ the amount of the share of each of the partners in the charter capital;

➢ characteristics of each of the listed legal forms.

In the practice of organizing print media in Uzbekistan, the most commonly used organizational and legal forms are private enterprises, limited liability companies and closed joint stock companies. Each of these forms has its own characteristics.

The right to information is also closely linked to the right of citizens to apply to public authorities.

The Law "On transparency of public administration" adopted on March 11, 2014 is expected to be a guideline for ensuring the effectiveness of activities in this area. The legal norm consists of 24 articles, which cover important aspects of the direction. In particular, Article 4 of the Law sets out the basic principles of transparency of public administration, according to which:

The main principles of transparency of public authorities are:

* The information provided by them is accessible to all, its timeliness and reliability;

* Openness and transparency of their activities;

* Freedom to seek, receive and disseminate information on the activities of public authorities;

* observance of the rights and legitimate interests of citizens to protect their honor and dignity from aggression, intrusion into their private lives, as well as the rights of citizens and legal entities to protect their business reputation when providing information on the activities of public authorities.

It is noteworthy that the law includes a special clause on the conduct of the media, which guarantees access to information on the activities of public authorities and administration.

In conclusion, ensuring freedom of information and speech is even more important today.

After all, the issue of ensuring the rights and freedoms of citizens in the field of information embodies the human right and freedom to receive information, disseminate information and personal opinion, which is a key factor in the formation of a democratic society in Uzbekistan.

ABSTRACT

The article describes the role of electronic resources in ensuring the quality of higher education and the methodical model of using EER proposed is substantiated. The types of e-learning resources, stages of their introduction, function in the learning process, didactic capabilities, and the level of effectiveness of experimental and control groups as a result of research were analyzed.

KEYWORDS: *Quality Of Education, E-Learning Resources, Model, Automated Learning System, E-Textbook, Web Quest, Computer Business Game, Multimedia Presentation, Tutor, Virtual Laboratory.*

INTRODUCTION

The concept of development of the higher education system of the Republic of Uzbekistan until 2030, developed in pursuance of the Resolution of the President of the Republic of Uzbekistan dated July 11, 2019 No PQ 4391 "On measures to introduce new principles of governance in higher and secondary special education" Based on the needs of the social sphere and the economy, a number of priorities have been identified, such as improving the quality of education, training competitive personnel, effective organization of scientific and innovative activities, development of international cooperation based on the integration of science, education and industry[1].To accomplish these tasks, it is important to constantly work on the use of new teaching methods and innovative technologies that provide interactivity.

One of the most advanced areas of interactivity in the modern education system today is the EERs, which are a relatively new didactic tool. Psychological and pedagogical research[12-26] in this area shows that the use of EERs in the learning process allows to the implementation of

innovative ideas in the pedagogical activities of teachers, individualization and informatization of education, setting individual educational trajectories for each student, the introduction of competent approaches to the learning process and increase the activity of students.

E-learning resources are a set of software, information and technical, educational and methodological systems that provide a purposeful learning process.

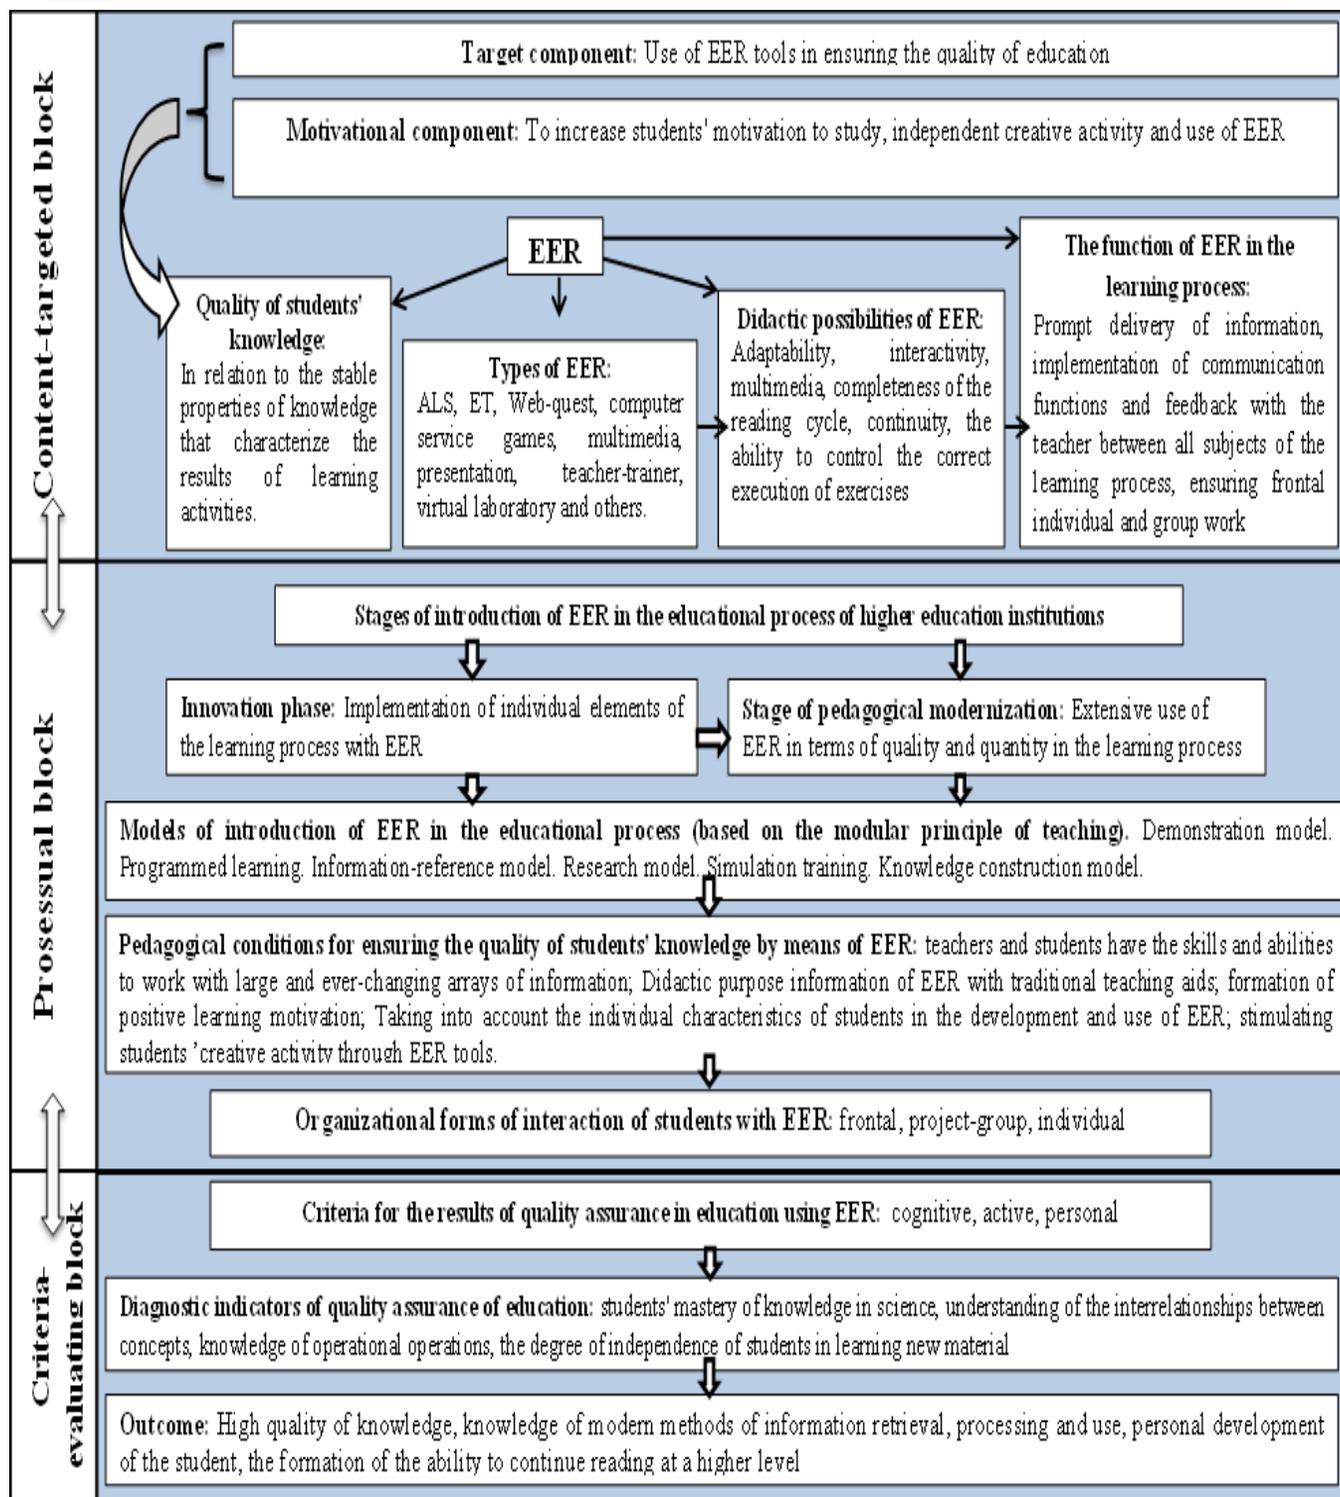
METHODS

The main changes taking place in modern education - the change of educational paradigms, the person-centered approach to learning, the introduction of information technology - make improving the quality of students' knowledge an urgent task.

With the introduction of EER in the educational process of higher education institutions, there is a need to develop a learning model that uses these resources to improve the learning process and improve the quality of students' knowledge.

A model is a pattern that is artificially created in the form of diagrams, physical structures, definite shapes, or formulas. Like the object (or event) under study, it expresses and repeats the structure, properties, interactions, and relationships between the elements in a much simpler and rougher view[2].

When we say the model of improving the quality of students' knowledge in the educational process in technical higher education institutions on the basis of EER, we understand the description and theoretical basis, pedagogical conditions, as well as didactic opportunities to improve the quality of technical education with EER. Based on the research, we identified the following components of pedagogical modeling: goal setting and planning of the learning process, development of teaching methods, techniques, organizational forms of enrollment and teaching, as well as criteria for assessing student learning. The model proposed by us, in a narrow sense, has a pre-defined goal and methods and tools designed to achieve it, as well as tools that include parameters for evaluating actions and understanding performance.

The model we propose has, in a narrow sense, tools that have a predetermined goal and methods and tools designed to achieve it, as well as tools that include action and performance evaluation parameters.


Picture 1. Methodical model of using electronic resources in ensuring the quality of education.

Thus, the proposed model scheme includes three interrelated blocks: content-target block - includes targeted identification of the use of EER as a tool to improve the quality of student

knowledge, description of knowledge quality and a complete description of the tasks and didactic possibilities of EER types in the learning process takes; it, in turn, has the stages and models of application of EER in the educational process of higher education, pedagogical conditions for improving the quality of students' knowledge in the educational process on the basis of EER, as well as organizational forms of student interaction with EER; Criteria-assessment block consists of criteria for improving the quality of students' knowledge, diagnostic indicators of improving the quality of knowledge and results.

Based on the structural scheme of the model, a complex pedagogical model has been developed, which includes specific goals of pedagogical activity - the goals of improving students' knowledge in the educational process of higher education on the basis ofEER.

The use of EER in the educational process of higher education is carried out in accordance with the important socio-pedagogical goals of modern education, which include:

a) to form and develop the abilities of the individual, which are necessary for himself and society;

b) activation of socially valuable activity of the person;

c) Providing opportunities for effective independent study and independent learning.

It should be noted that based on the goals of modern education, the individual is the center of the education system. The use of any pedagogical system, including EER, is aimed at cultivating a person-centered, creative personality.

Regardless of the subject characteristics, the EER should perform the following basic functions:

– expeditious delivery of educational information;

– implementation of communication tasks between all participants of the learning process and in the feedback with the teacher;

– Providing frontal, individual, and group work[3].

EERs based on information technology have the following didactic capabilities:

Openness-is the ability to use an unlimited amount of EER, modify EER, and create personal EERs.

Adaptability -refers to the adaptation of the EER to the individual capabilities of the student, while interactivity refers to the student's interaction with the EER in the learning process.

Multimedia-is the sharing of several types of information in a single product, such as text, animation, graphics, and sound, allowing a person to interact on multiple receiving channels simultaneously. Also, to ensure the completeness and continuity of the reading cycle, work with information technology in a single session (for this purpose, designed electronic textbooks that perform several didactic functions simultaneously), the ability to perform all parts of the EER didactic cycle, various controls for gradual increase of knowledge means the need to create an opportunity to perform the exercises.

We have developed a model for improving the quality of student knowledge in the design of the educational process in higher education using EER tools, which includes the following types of electronic resources:

1. Automated Learning System (ALS)- is a computer-aided pedagogical software designed to provide new information, skills and competencies, to organize intermediate and final tests, with a reliable support system for both the program itself and the subject.

It has the ability to adapt to the learner (his knowledge, speed and path of movement on the studied material, etc.), an advanced system of collecting and processing (including gathering information about the mistakes students often make in the subject or subject being studied) statistical information on each student, group and student flow. In his research, GK Selevko highlights the following advantages of ALR:

- access to individual learning benefits;

- training intensification;

- the possibility of individual adaptation of the training course to the requirements of students or teaching conditions;

- the opportunity to use and replicate best practices;

- opportunities to improve the quality of knowledge and education;

- have independent work skills[4].

2. Electronic textbook (ET)- is a hypertext document that contains electronic information, structured theoretical teaching materials, glossary, practical work topics, science assignments and recommendations for its study, as well as test assignments. The main quality indicators of the electronic textbook include a complete and uninterrupted description of the material, the implementation of new didactic schemes using modern information technology tools, the integrated use of information technology and navigation capabilities.

According to Q.T. Olimov, e-textbooks must meet the following requirements:

☑ detailed description of the material;

☑ that students are allowed to use the textbook in their study and that it is visual;

☑ The ability to obtain information quickly[5].

The e-textbook as a didactic tool has a wider range of functionalities than traditional textbooks. Their superiority over traditional textbooks and manuals, According to V.M. Zelenev, it consists of:

➢ ability to provide multimedia information;

➢ quick search for information;

➢ ability to communicate with other electronic applications;

➢ dynamism, ie the ability to quickly change and replenish information;

➢ interactivity;

➢ compactness;

➢ Accessibility and affordability[6] .

To date, the process of creating e-textbooks has been greatly simplified, which in turn increases the ability to involve teachers and students in the creation of e-textbooks.

3. Web quest- is a specially organized type of research activity in which students search for EERs at designated addresses on a network. A feature of web quests in the education system is that to work with information independently or in groups, part or all of it will be located on different websites. In the learning process, the data of Web quests are developed to maximize the integration of EER into the subjects at different levels of learning. They are designed to help students make the best use of their time, use the information they receive for practical purposes, and develop critical thinking, analysis and synthesis skills, as well as information evaluation.

This type of activity was developed in 1995 by researchers at San Diego State University Bernie Dodge and Tom Marchem. The quest can be done individually, but it is preferable to work as a team when solving a web quest. There is a growing interest in students, they perceive the task as somewhat "real" and "useful", which inevitably leads to an increase in the quality of knowledge. In the process of creative work, students do not receive "ready-to-eat" knowledge, simplified formulas, but go into research activities themselves. Naturally, the learning quest does not have to be separated from the learning process as a whole, it feels the need to communicate directly with students 'previous and subsequent learning activities[7].

The following types of assignments for a web quest have been identified by Bernie Dodge and Tom March:

❖ Narration of EER in new formats (in the form of presentations, posters, stories) using various sources - demonstration of understanding of the topic;

❖ planning and design - development of a plan or project on the basis of the given conditions;

❖ Independent understanding of the voluntary aspects of personal research;

❖ Compilation-transformation of information format from various sources ofEER: creation of a virtual exhibition, time capsule, culture capsule;

❖ creative task - creative work in a certain genre - creation of personal EERs;

❖ analytical problem - search and systematization of EER on a particular topic;

❖ detective, puzzle, mysterious event - drawing conclusions based on contradictory facts;

❖ come to an agreement - develop a decision on an acute problem;

❖ evaluation - substantiation of a certain point of view;

❖ journalistic searches - objective presentation of information (separation of opinions and evidence);

❖ persuasion - persuasion of opponents or neutrals;

❖ scientific research - the study of various phenomena, discoveries, evidence on the basis of unique on-line sources[8].

Real-world placement of web-tables allows students to significantly increase their motivation to achieve the best learning outcomes.

According to the quality assessment criteria developed by T. March, a quality education quest should have an engaging introductory part, a clearly articulated task that encourages high-level thinking, a distribution of roles that provides a different perspective on the problem, and use of Internet resources[8].

4. Computer business game. There are many definitions of the concept of "business game" in the pedagogical literature, a detailed analysis of which is given in the work.

Following E. Berne, we derive the following definition of a business game, a game that is "a process of step-by-step identification of the necessary factors, decision-making and decision-making in the context of analyzing additional information coming and going in the course of the game"[9] . In the concept of business play, it is important to take into account its elements and conditions, such as: didactic issue, educational-game issue, the presence of roles, differences in role goals, the (conflicting) state of the game, the rules of the game.

Among the features of the business game, as well as the presence of a problem-content imitation model of the object or event, it is possible to distinguish the diversity of solutions, its implementation in the process of sequential solving of intermediate problems.

A business game is a specific exercise aimed at forming clear learning problems on the one hand, and business qualities that are important in performing a profession, interacting with each other, establishing relationships with each other, maintaining a certain level of communication. Computer didactic games allow each subject of the vocational training process to individualize the process by moving along a specific educational trajectory at the level of solving a specific practical problem and developing an individual style of professional activity.

Before introducing any of the many available games into the educational process, it is necessary to assess its compliance with the curriculum and the direction of education, paying attention to the following methodological questions:

– selection of appropriate educational material with the help of computer business games;

– identify a contingent of students who can use the game as a teaching element;

– determine what parameters of the selected game are selected to fully reveal the topic under study;

– When conducting a "game", the correct allocation of time to "fit" it into the scope of training.

5. Multimedia presentation- allows optimizing the process of teacher-student interaction due to the visual representation of the information expressed. The most appropriate tool for creating multimedia presentations is Microsoft Power Point, which is part of the Microsoft Office suite. Its advantages are quick preparation of individual frames, as well as the whole electronic presentation, convenient sorting, temporary non-use of some slides, the presence of built-in effects, the ability to use audio information processing (background sound, speech input).

Power Point allows you to combine text, graphics, numeric data, and diagrams created with other Microsoft Office applications (such as Microsoft Word or Microsoft Excel) in a single

presentation. Multimedia lectures and presentations are very useful for learning: students learn to express their ideas, structure the collected data, create a lecture plan, independently select the necessary material for the selection of adequate comments and illustrations.

According to E.V.Ospennikov, on the basis of multimedia presentations to create a set of didactic, methodical and organizational materials in electronic form on the subject of training - educational-methodical package (EMP) is an important step.The EER will be the basis of the EMP in the form of a presentation (or Web site) with a visual accompaniment to the lecture or basic teaching material used for students 'independent learning. The EMP provides the organization of the training and then allows the experience of conducting it to be shared with others. It is recommended to create a sequential EMP for all types of training. Gradual collection of EMP data on the basis ofEER will form a "methodical fund", which will be used by other teachers and students, the "methodical fund" can be placed on the Internet, which will allow to disseminate pedagogical experience and find like-minded people.

When creating a personal presentation and OMP, the student should:

– Gather detailed information on the topic and achieve a complete understanding of the information presented in the presentation;

– Out of all the collected materials, the most important and necessary to reveal the topic;

– Familiarity with the available hardware and software capabilities that will help you to successfully complete the task;

– find ways to effectively deliver information to listeners using different EERs;

– Presentation of the presentation to the audience[10].

6. Tutorial-tutor. The main task of the trainer-tutor is to strengthen knowledge, for which a variety of test programs are used. Many modern multimedia tutors not only export the tests available in their database to another shell, but also create their own personal tests by supplementing and developing certain skills and abilities. In general, modern simulator and test systems provide the educator with the ability to adjust the management scenario according to different methodologies and individual characteristics of the student. E-tutors are gradually "enriched" with rich reference books, and sometimes with lecture materials that allow not only to check knowledge, but also to acquire knowledge, and thus "move" in the direction of educational complexes. In parallel, there is a reverse process, and as a result, e-textbooks are increasingly equipped with different control blocks. This block of EER can also include virtual labs that allow the user to model any experiments or processes.

7. Virtual laboratories. Provide the ability to visualize the progress of modeling processes and modeling results, to build arbitrary models of a given industry.

A.A. Andreev suggests that students explore two aspects of the learning process using EER[11]:

a) use of ready EERs in the study of this or that science.

b) EER, developed independently by students, focused on the goals and objectives of the courses and disciplines.

Thus, our model of improving the quality of students' knowledge in the educational process of the university by means of EER provides unity and integrity of objectives, learning content and technology, improving the quality of knowledge, modern methods of information retrieval, processing and use, independent learning and serves to shape professional competence.

CONCLUSIONS

It can be concluded that high efficiency in ensuring the quality of higher education has been achieved through the organization of the teaching process of sciences using electronic resources. Based on the established requirements, our research on the use of e-learning resources along with traditional teaching technologies in the teaching of science has shown that the design and organization of lessons based on such integrated technologies has increased students' motivation to master the subject, as well as their professional competence. gave a positive effect on the formation.

ABSTRACT

Distribution and treatment of moniesiosis in goats in the Turtkul district of the Republic of Karakalpakstan was studied. Furthermore, the anthelmintic effect on moniesiosis pathogens was investigated by adding 1 ml of vamonezole to 10 kg of body weight of albendazole mixture to goat's milk.

KEYWORDS: *Anoplocephalidae, M.expanza, M.benedeni, cestode, helminth, moniesia, monezol, albendazole.*

INTRODUCTION

Despite the fact that several types of intestinal cestodes are widespread among goats in Uzbekistan and cause some economic damage to livestock, the special study of them and the cestodes they cause has been completely excluded from the attention of researchers in recent years.

In goats infected with M.expanzava and M.benedeniare distinguished by four different clinical forms of the disease - *severe and mild toxicity, intestinal obstruction (obturation) and nervous manifestations.* In the feces of animals 10–15 days before the appearance of mature joints of moniesia, sick cattle show signs of *lethargy, weight loss, loss of appetite.* The sick animal bleeds and stops growing, and as a result of worsening heart activity, blood clots appear in the lower parts of the body. As a result, the kids start to die from *May to June.* The mildly toxic clinical manifestations of moniesiosis are observed in young cattle and early lambs, which become

emaciated, and the feces become fluid. Moniesi joints are separated for 20-30 days, and after the organism gets rid of all cestodes, the condition of the animal can be relieved. If an animal is also infected with acute intestinal infections, its condition worsens and moniesiosis develops. Intestinal obstruction is more common in 2-4 month old goats, which is more common in the first half of spring and summer. The sick animal suddenly falls around and begins to kick with his feet. The animal dies of spontaneous poisoning as a result of intestinal obstruction in one of these seizures. In Uzbekistan, drugs of 1-2% copper sulfate, phenasal, panacur (fenbendazole), rintal, albendazole have been used against intestinal cestodes of small and large horned animals. Later, a number of drugs against these cestodes were developed in foreign countries. In Russia and some CIS countries, various forms of *anthelmintic* drugs belonging to the group of albendazole against moniesiosis, tizanieziosis, avitellinosis are currently used.

Phenasal is applied individually in the form of tablets or 5% suspension to lambs and kids in the amount of 0.1 g / kg, in the group method in the amount of 0.2-0.25 g / kg with compound feed or crushed grain. A 1% solution of copper sulphate in water is given to lambs 20-25 ml at the periods of 1.5-2 months, up to 30 ml at 2-3 months, up to 35 ml at 3-4 months, up to 40 ml at 4-5 months, up to 45 ml at 5-6 months, Up to 50 ml at 6-7 months, up to 60 ml at 7-8 months, up to 80 ml at 8-10 months, up to 100 ml for adult sheep, a small amount for goats, up to 60 ml for adult goats. Copper sulphate is dissolved in distilled or boiled (cooled) water in a glass vessel. In addition to these drugs against moniesiosis in the territory of Uzbekistan were also used drugs such as **arsenic tin, panacur (fenbendazole), rintal** *and some other sources.*

At present, medicines developed by various companies for the treatment of moniesiosis and other intestinal cestodes are delivered to the territory of Uzbekistan through private veterinary pharmacies. These include *albene, albendazole (2.5 and 10 percent), albazen (2.5 and 10 percent), brontel plus (50 mg of clozantel in 1 ml, 50 mg of praziquantel), albene-praz (50 mg of albendazole in 1 ml, 50 mg praziquantel), iver-praz (2 mg ivermectin 50mg praziquantel in 1 ml), monezol (2 mg ivermectin in 1 ml, 40 mg praziquantel) and others.* According to our recent research *(B. Salimov, T. Taylakov, Sh. Kurbanov, 2016, 2017, 2018)*, the occurrence of new species in sheep and goats, in addition to monieziosis and avitellinosis Moniezia expanza, Moniezia benedeni, Avitellina centripunctata. With this kept in mind, it is time to step up the fight against them, develop new and improved methods and put them into practice.

RESEARCH MATERIALS AND METHODS

Scientific research was carried out in Ruzim caravan farm of Turtkul district of the Republic of Karakalpakstan, in the territory of Namuna aul citizens' assembly and in the scientific laboratory of the department of "Parasitology and veterinary work" of the Faculty of Veterinary Diagnostics and Food Safety of Samarkand Veterinary Institute. Based on the above, we tested some drugs in goats infected with moniesiosis under production conditions.Our research work was carried out on goats of Ruzim Korvon cattle farm and Namuna aul in Turtkul district and a total of 40 goats were dewormed. Our research work was carried out on goats of Ruzim Korvon cattle farm and Namuna aul in Turtkul district and a total of 40 goats were dewormed.

The results of the research

In order to determine the level of infestation of goats with monesiosis in Rozim caravan farm and Namuna aul, 40 heads of goats were isolated and dewormed with 1% copper sulfate solution.

Manure (dung) from goats was collected and examined by serial washing and cleaning methods. The results of the study are presented in the *first* table.

TABLE1 THE RATE OF INFECTION OF GOATS WITH MONIESIOSIS

The groups of experiment	The name of the agricultural unity	The number of the cattle	In the method of washing one after another	
			The number of infected goats with moniesiosis joints and offspring	%
1st group	Ruzim Korvon livestock farm	40	4	10,0
2nd group	Namuna aul livestock farm, neighborhood unity	40	3	7,5

As can be seen from Table 1, when 40 goats were dewormed on the Ruzim caravan farm, the pathogens of moniesiosis were found in 4 heads and the incidence rate was 10%. When 40 heads of goats were examined, the incidence of moniesiosis and eggs in 3 heads was 7.5%. In order to determine the effectiveness of anthelmintics in goat moniesiosis, feces samples were taken from goats and tested using sequential washing serially methods. 20 naturally infected goats were isolated and divided into 2 groups of 10 based on analogous rules. the monezol suspension was ingested through a sieve to the live weight of the animal. Anthelmintic drugs were given to goats on an empty stomach in the morning. The results of the study are presented in Table 2.

TABLE 2 EFFECTIVENESS OF ANTHELMINTIC SOURCES IN THE MONIESIOSIS OF GOATS

Groups	The number of animals	The name of the medications	The dosage	The effect of the medication on the elements	The effectiveness of drugs in percentages
1st group	10	Albendazole powder	In the amount of 15 mg/kg	joints and eggs of moniesi pathogens were not found in 7 goats 70%	70 %
2nd group	10	Monezol suspension	In the amount of 1ml per 10 kg body	joints and eggs of moniesi pathogens were not found in 7 goats 70%	100 %

As can be seen from Table 2. As can be seen from the table, the first group of goats was bagged for 10 h after 24 h and the collected manure was examined. The effectiveness of the albendazole anthelmintic was 70%. No joints or eggs of intestinal cestodes pathogens were found in goats

treated with monezol suspension in the second group of goats. the effectiveness of the monezol anthelmintic was 100%

CONCLUSIONS

1. The results of scientific research showed that the prevalence of moniesiosis among goats of Ruzim Korvon farm and Namuna aul in Turtkul district was 10% in farms and 7.5% in private goats.

2. Monezol suspension for goat moniesiosis (1 ml contains 2 mg of ivermectin and 40 mg of praziquantel) at a dose of 1 ml per 10 kg of body weight in the morning on an empty stomach was found to be 100% effective against pathogens of moniesiosis.

National University of Uzbekistan named after Mirzo Ulugbek,
UZBEKISTAN

ABSTRACT

The article deals with the reforms carried out by the Western Turkish Khanate in Chach. It is devoted to the history of the study of some issues related to the changes in the form of government of Chach in the early Middle Ages, in which the given sources and archeological and numismatic materials give specific insights based on research on the history of governance in the oasis in recent years. In particular, some controversial opinions among researchers on the dynasties that ruled the Chach oasis during this period and their origins have been considered. The article also provides a detailed analysis of the titles introduced by the Western Turkish Khanate to the Chach administration and the methods and tools used.

KEYWORDS: *Turkish Khanate, Oases Koshgar, Oqsuv, Amudarya–Syrdarya Middle Ages, Archeological Research, Defensive Walls, Urban Planning, Written Sources*

INTRODUCTION

In historiography, western Turkish Khanate , which emerged mainly as a branch of the kingdom referred to as "Turkish Khanate", "Great Turkish Khanate" and "Eastern Turkish Khanate", manifests itself as a state containing dozens of large and small rulers in more extreme oases, unlike a number of other nomadic-based States of Central Asia. In this regard, it will be necessary to familiarize yourself with the system of management of all this fraud and its essence.

Main part

Although the researchers did not agree on a settled point of view in this regard, some researchers engaged in the history of Western Khanate found that the vassals in Khanate divided the rulers into several regions in political and administrative terms, thus it is necessary to classify them:

I. The central region of the western Turkish Khanate is the country close to the seventh:

1) 6 rules of East Turkestan: 1. Koshgar, 2. Oqsuv, 3. Karashahr, 4. Kucha, 5. Turfon (Gaochan), 6. Hutan, 7. Kumul;

2) Reigns of the oasis in the Syrdarya Basin: 1. Fergana, 2. Khujand, 3. Choch, 4. Otror, 5. Isfijob;

II. Reigns of the oasis between Amudarya and Syrdarya: 1. Ostrushana, 2. Sogd: Samarkand, Panch-Maymurg, Kabudon, Ishtikhon, Kushaniya, Kesh, Nakhshab, 3. Bukhara, 4. Toad: chagrin, meme, Balkh, Guzgon, Shibirgon, Garchistan, Beaver, Rub, mustard, Copadion, Kumed, Badakhshan, etc. Five. Non-durable;

III. Khorasan: 1. Merv, 2.Dekhiston, 3. Gurgon, 4. Herat;

IV. North India-Afghanistan (North-East and central parts): 1. Kabulistan, 2. Zabolistan, 3. Kandahar, 4. Gandhara, 5. Kashmir

The total number of rulers subordinated to the listed western Turkish Khanate actually exceeds 40-50. In particular, close to 10 in the Sugd Oasis, each of the 27 large and small rulers of the Tokhoristan were separate states at this time. Therefore, the Chinese tourist Xiuan Szan writes about the existence of more than 62 "states" in the composition of the Khanate at the time when in 6459- 60 years most of these territories were located . A second Chinese tourist, Huy Chao (726), also passes the name of dozens of rulers in the Khanate.

On the issue of hoaxes and vassals, the researchers expressed a number of different opinions, and basically classified them into the following groups:

1-group. The vassals management of the khanate is relative and they believe that "the khanate did not interfere in the internal affairs of the local rulers, limited to taking tribute from them, they did not develop a specific management system for them". This group includes many researchers;

2-Group. Hoax actively intervened in the management of vassals, established a particular system in this regard, used several methods and tools productively. To this group, the American researcher J.K. Skeff, Uzbeks G'. Baboyorov, M. Xatamova, F, Jumaniyozova and others possible to add.

The first group of researchers did not deal directly with this topic, but made a brief comment during a general discussion on the history of the peoples of Central Asia or the history of the Khanate. Such thoughts, thrown in the middle from the beginning of the last century, have almost reached the present without changing. For Example, A. "In the VI century, there were more than a dozen Oasis authorities in the Chirchik, Zarafshan, Kashkadarya and Amudarya basins. Their economic and political management is left in the hands of the rulers of the local dynasty, and the Turks are limited only by the BC and the ban levied on them", stated the opinion in the content .

In fact, such an approach to the issue is outdated today. On this issue on the same place J. K. Skeff. The following points of view, which put forward, are noteworthy: "the Western Turks and the tribes in their composition, as well as the descendants of turghash, ruled the more prosperous oases of Turkestan from the 6th to the 8th centuries.

Despite the fact that these Turkic peoples were mainly inhabitants of the steppe region, engaged in livestock farming, they paid extreme attention to the control of the agricultural oasis of

Turkistan. Only the reasons for their desire to dominate Turkistan and the issue of governance, formed by them for this purpose, have not yet been adequately covered." According to him, the khakanate ruled the oases in Turkistan in the following 2 ways: 1) Direct (direct) management; 2) indirect management. The researcher believes that direct management is observed in the appointment of representatives of the ruling dynasty of Khanate to the management of an oasis; this can be cited as an example of Toghoristan, Fergana and Choch. Skeff, who argued that such a form of management is not connected with one specific rule, but an exception, describes the indirect management of disloyalty as follows: "the most acceptable method during this period is that the local elite is allowed to maintain their previous positions in the overhanging oases that are owned by them. The local rulers had taken on themselves the role and service of the intermediary to deliver the taxes and tributes that fell from his OT tabaa (population)to the ruling settlers. A clear example of such a system is "tan shu", which refers to the activities of tun yabg-Khakon, "gave the title of eltabar to the rulers of the Western countries and sent a separate tudun to each of them to check the collection of control and taxes" visible in the content."

It is worth noting the views expressed by Uzbek researchers in the following years on the issue of the management of khanate. In particular, the opinion on the content "first, that our country is also subjected to a generally hostile system of governance and, secondly, that the local (traditional) method of governance has been preserved" in relation to the management of the loss , is also an important consideration. Boboyorov's views on the fact that in the management of various relics of the reigns, mainly two methods: the use of direct and indirect methods, as well as the effective use of the means of establishing marriage relations, attract attention.

The fact that G'. Baboyorov with a deep focus on this issue gradually improved the management of vassals, involving source information in various languages, such as Chinese, Sogdian, Arabic-Persian, Greek, Armenian, Tibetan, ancient Turkish-Run, bactriian, Pahlavi, the establishment of the direct Ashina dynasty in Choch, Fergana, Takharistan, Kobulistan, Samarkand, Marv, established marriage relations with several rulers in Eastern Turkistan, and made local rulers groom .it goes without saying that traitors have strengthened control in places with this tool.

One of the characteristic features for the Central Asian Oasis States was that most of them sought to maintain their relative independence even at the time when they were part of a large clan, while the local rulers, whose management of their dynasty aimed at ensuring inviolability, were on the way to reconciliation with their new masters. Although they are relative, among the arguments that show their semi-independence, at least free in internal management, in the first place undoubtedly stands the coin-coins. In particular, a number of factors such as the East Turkestan, the Amudarya–Syrdarya range and some of the existing Oasis rulers from the beginning of BC to the minting of their own coins suggest that they are independent in a certain sense in their internal management.

From the information in the Chinese chronicles, when the khanate troops entered the territory of Amudarya-Syrdarya, the ruling dynasty of the majority of the Oasis States here belonged to the House of Zhzhaovu, An (Bukhara), Tsao (kabudon), Shi (Choch), Mi (Maymurg), Hye (Kushaniya), Khosyun (Khorezm), Maodi (Vardona), Shishi (Kesh) was divided into such branches as Kan (Samarkand), among which the Samarkand dynasty was considered the Central House . However, the founders of these dynasties did not belong to the indigenous indigenous population of these Oasis States, but in Chinese chronicles it was noted that these lands were

migrated from the Tsil-Yan mountains (the north of East Turkestan), and it was not sufficiently determined when and as a result of which ethno-political processes they came to these lands.

The "system of rudeness" will benefit in covering the relationship of khakash-vassals. The title of Eltabar is found in Chinese' Sogdian' Bactrian and other language sources in relation to the management of the Oasis' and this is evident from the fact that piracy gives them a different status. In particular, it found its confirmation on the basis of the information in the Chinese chronicles that "from the Western Turks gave the title of eltabar to the rulers of the night yabgukh vassal (Oasis)", S. G. Klyashtorniy's on the basis of this information, interpretation of the form "the granting of Turkish titles to the rulers of the subordinate Oasis is an expression of the fact that the Khanate introduced them into its administrative hierarchy" is relevant. This means that while the khakis affirmed their inclusion in their administrative hierarchy by giving the title of eltabar to the rulers of the OASIS, who were their vassals, they saw them on a par with the heads of large and influential nomadic tribes in terms of position.

So it is possible to assume that the vassals of the detachment consisted of relatively strong and weak groups in terms of position. The first were "eltabarlik " s' each having its own ruling dynasty' mainly were Oasis rulers and partly nomadic political associations.

East Turkestan (central part)' Amudarya–Sirdarya range and adjacent territories' northern India' horosondaki O'troq Oasis rulers' as well as' Black Sea' Northern Caucasus and Volga – Ural semi-nomadic tribal associations (Alan' Bulvar' Caspian, etc.) the G.) was composed of.

The "system of tribute" also took a special place in the management of the western Turkish Khanate. Although the issue of tribute is not covered in detail in the sources, it can be assumed that on the basis of some information the vassals send their masters in a year, while the collection of tribute is controlled by the tudun-rank representatives sent from the center by the traitors. Tuduns, whose main task is to "control over subordinate countries and organize the collection of taxes", are actually representatives of the khakans appointed over their vassals – the Nomads, and it is not clear exactly when such a tradition was introduced. In Chinese chronicles , it is based on the recording that tun yabg-haqon (618-630) gave the title of silifa (eltabar) to their vassals and sent smoke (tudun) from one person to their control, many researchers agree that the method of tudun - noib was established from the same 620 – ies, although it is believed that in fact' there is also evidence that the Khakon began to use this method This can be evidenced by the fact that in a Chinese document about Gaochan (Turfon), compiled in 577 year, along with Chinese and local titles related to this rule, the title of Turkish tudun also comes across.

The content of information, mainly in Chinese chronicles and partly in other sources, suggests that when it came mainly to the beginning of the VII century, directly the western Turkish khanate destroyed the ruling dynasties in a number of oases, and instead they began to appoint representatives of their own household. Just as the western Turkish khanate are on the Cross, they begin to interfere closely with the management of their central territory – the Ferghana principality, which is an army from the south-west to the seventh. In particular,"tan shu" states that during the Zheng-Guan period (627-649) Moxedu (*Toad Bahadur), Boxanna (Fergana)killed her ruler named ningkibi, and the authority passed into the hands of a person named Ashena (Ashina). A number of researchers consider this person to be a Prince belonging to the western Turkish Khanate . The Chronicle quoted Ashena that after her death her son Yebochji seized power and was appointed as the ruler of the deceased Kibi's relative Aliaosan. In

the city of yebochzhi Gyesay (Koson), and in the city of Alyosan-Xu-min (Cuba?) get up in the city and start operating. After that, it is noted that 656 year Yebochji sent an ambassador with gifts to China . So, at this time in Fergana was formed a dynasty whose origins date back to the khakanate, and the khakanate did not end the activities of the local dynasty, as well as the beginning of the Valley directly through its representatives.

As it turned out, representatives of the Ashina dynasty in the Valley retain their status to the anchors. In particular, the Chinese traveler Khoy Chao (726) said that there are two authorities in Ferghana, one in the north of Sirdarya (center of Kasan) Tukyue (Turkish)s authority, and in the south it provides information about the existence of the management of Dashi (Arabs). As it turned out from the Chronicle" Tan shu", the decree is headed by a Turkic ruler named dagan-Chju (Lion Tarhan-çor), who hung for 738-751 years . It is also noteworthy that before him and after him several Ferghana rulers met the title of the Tsar, characteristic of the Khanate as a component of the name. In particular, Tabari wrote in his work about the Balaza, the heir to the throne, whose residence is located in Isfara, noting that he was the father of Jur, who later became the Ruler of Fergana . This name can actually be attributed to the title of the Turkic khanate.

Even if the Ashina dynasty was decided in Fergana, as it was on the cross, it seems that the Khanate used other means to keep this land in control. It is also possible that the rulers of Fergana with the rank of tarragon , without direct contact with the Khanate, belonged to another Turkic tribe, which is indirectly related to it. In the A-14 digital Sogdian document, the occurrence of the phrase ssry'n'k twttk ("Fergana tutuğ") is associated with the fact that the khanate used the service of detainees in the function of more Naib than representatives of his household in the management of this land. It turns out that in order to keep the title of prisoner in control of the Ashina dynasty and the local dynasty in Fergana under control, the arrest service was introduced in the valley, provided that the title was used mainly in relation to the head of the military administration in the system of Khanate. This is a proof that they are directly related to the khakans, the official finds its confirmation on the basis of the information in this Sogdian document in the form of "I handed over the name written to the Khakon and the Ruler of Fergana to the Fergana prisoner".

Another of the reigns of the Oasis, which were directly ruled by the Khanate, was the Taqistan, which included a much wider territory than the others. In the Chinese chronicles, Tukholo (Tukhoristan) was formed from 27 May principalities and all of them were in the residence of Kho (Beaver), the origin of which is Shehu (Turkish) of the Ashina dynasty. yabgaki) it is emphasized that the title is subordinated to the ruler . The Turkish yabglar administration of the Ta'huristan, which consists of semi-independent rulers such as Balkh, Termez, Chaghaniyon, huttal, Kumed, Voxon ,nnon, Qubodiyon, Vakhsh, Shuman, Axarun, Karron, Rub, Samingon, Shuburgon, Guzgon, Garchistan, Badgis, is also mentioned several times in Arabic sources . The political centers of the former Eftalites of the Khanate become the base cities of Qunduz and Balkh Khanate, and the khakans from the early years begin to place their nibs here. Around the 590 - ies, tardu khaqon (576-603), the son of Tegin rank, was sent to the management of the Taqxor, while in 620 - ies night yabgish-khaqon sends his own son, tardu Shad. Representatives of the dynasty, which ruled the Tughuristan from 620 - IES to 750-ies, will rule for about 150 years under the name of the yabgular dynasty . At this time, unlike the Choch and Fergana, which were directly ruled by the dynasties of the Ashina dynasty, the reigning posts of the rulers

of the Ta'khoristan with the title of yabgaki mean that this land is of particular importance for the sake of the Khanate. The emergence of dynasties, directly and indirectly related to treason, in the vast majority of the existing small rulers in tokhoristan, must also be attributed to this. In particular, the Termez, Chaghaniyon, Balkh, Badgis, khuttal, Voxon, Vakhsh, Shuman, Axarun, Kumed, Qubodiyon, etc. the Turkish dynasties standing in the administration of the city .

CONCLUSION, Shabolo gyelifa in the chronicles (Turkish. Business eltabar) as the Ruler of Voxon in 656-660 years, and gyelifa (eltabar) as the ruler of the huttal in 730 - th years, it is noted that he sent an ambassador to China . Also, Shuman and Axarunni were also ruled by the Turkic dynasty, and Syuan Szan wrote that they belong to the Turkic xisu tribe, the mountain Muğ' of the Sogdian documents (720 y. y.) based on the fact that several of them are talking about a rank official, such as Lyppyr, δyttpyr (eltabar) or xisu eltabar, this information is called F. Grene and E. de la Vesiers are associated with these regions . In addition, one of the May rulers of the south of the Ta'khoristan in several documents with the Bactrian language, compiled between the years 639-757 in Rub, the title of ìλιτοβηρο (eltabar) is threeraydi . In particular, Bactrian documents (Doc), compiled in different years, such as' 639, 678, 682. N ' R ' Q) at χαγανο ταπααγλιγουιλιτοβηρο (pact. Turkish. "eltabar (servant of the Khan)") or a document on the gift of the Bactrian established in 710 year (Doc. T)compared to the Turkish Angel χοτολογοταπαγλιιοβιλγαυοσαβουουο (Turkish. The phrases" kutlug' tapug'lug bilga sebuk/sebig") have been used and the words "tapug'lug'lug" in their lexical meaning" servant' served". From the contents of the documents it becomes clear that the Ruler of the Rub is recognized as the "servant" of the eltabar Khan. And the title of Tudun is encountered in a document about 702 year on the topic close to the center of Tudunistan, in which the phrases σηροτορκο ("ruler of the Turks") and yazo ταδονο ("gaz tuduni") come side by side . Also, in the Turkic coins belonging to the VII–VIII centuries with a Bactrian inscription, the title of ταδονο tapkhavu ("tudun-Tarkhon") is encountered, the Tabari original writes about the khuttal ruler tudun Tarkhon (737).

This makes it possible to assume that the Takhor yabgoligi is somewhat similar to the western Turkish khanate, and the higher-level titles such as yabgol, shad, Tegin are introduced in its central administration, while the lower-level titles such as eltabar, tudun, Tarhan, Ergin are introduced in the hierarchy of khanate. At the same time, they continued to apply local Iranian titles such as the governing God, the King, The Lion.

Being the most remote area of the south-west of the western Turkish Khanate, the reign of Kobulistan was also ruled by a dynasty called Tekin-Kings or Kobulshahs, directly related to the Khanate ruling dynasty . This country was included in the composition of the Khanate at the end of the VII century, until 630 years was ruled by the means of the Ta'xor yabgoligi. Around 660 years, a Turkic dynasty was founded here, which it ruled until the middle of the IX century . Representatives of this dynasty of Kobulistan, which included Gandhara, Peshawar, Udabandapur (Ohind), Udyana (Svat), Lampaka (Lamgan), Kapisa regions, which were historical lands in northern India, received the title of Tekin throughout its entire history and this title was reflected in their coins of Bactrian, ancient Indian and pahlavian languages.

The governors of Zabulistan, whose center is the city of Gaza, which is subordinate to Kabul and includes such authorities as Ruhkhaj, Seiston, Davar, Bust, received the title of eltabar. In particular , the rulers of Zabulistan met in Arabic sources rutbil, hitivra in coins with brahmi

inscriptions, silifashaks in Chinese chronicles, many researchers equate them with the title of Turkish eltabar .

At the same time, it seems that the choch and the Tokoristan formed a system of Dynasty Management, which was not so mixed, directly adjacent to the Turkish Khanate in terms of origin, as characteristic of Khanate management. In particular, in addition to the series of titles such as Tekin/shad–tudun–Tarkhon on the Cross, there are also Turkic names and epithets such as tun, Bahadur, kul, Inal, Chabish, in the Taghistan yabgiliğinde titles yabgli-shad–Tekin–tudun–Tarkhon in the unity of tardu, Ishbara, kutlug, tun, Boğra, and in this respect, both rulers have embodied the traditions inherent in you know what?

In Arabic, Persian and Armenian sources , it is noted that one of the Turkish khakans transmitted his daughter faqim(Qaqum/Kayen)to Khusraw Anushirvon (531-579), the King of the Sassanids (568-576), the researchers equated him with Istami yabgish-Khakon (568-576), the co-founder of khakum. For his birth from this Turkish Queen, the nickname of the IV Hormuz (579-590)was "turkzoda". Another Sassanid King Khusrawiziz (591-628), according to the Arab historian Johiz, marries the daughter of the Turkish Khan . In any case, this Khan should be the western Turkish ruler tun yabg-Khak (618-630), who ruled in the first quarter of the VII century. From these sources it is clear that these princesses occupy a special position in the Palace of the Sassanids, during their stay at the royal palace, the administration of power in Iran entered the sphere of influence of Khanate. After all, in the Chronicle of" tan shu " it is noted that in 620 years Basi (Persian)became a subject of betrayal, which in this case becomes evident during the reign of Chile (Sheruya; 628-629)

It was also the establishment of a marriage relationship between the rulers who were subject to it and the reigns, that is, the relics that had been part of the relics since the 560 years, but had kept their traditional internal management. In particular, the Chinese chronicles indicate that two of the Samarkand rulers, one of the khakans, married to the Daughters of the western Turkish khakans. In particular, the wife of Shifubi from the rulers of Kan (Samarkand) in" Bey shi "and"soy shu" Turkish Khakani Dadu (tardu; 576-603) it is said that the daughter of the Khan, while in "tan shu"it is noted that she married the daughter of the western Turkish Khan Shehu kehan (yabgi-Khakan)during the soy dynasty (581-618) of the Samarkand ruler Kyuymuchji, and it is noted that "she has been subject to the Turks since". The researchers equate this yabgaki with the famous western Turkish Khakani yabgaki-Khakon at night. As well as Suvd of VI-VII centuries (Samarkand) among the coins are coins with a double portrait – coins with the image of the ruler and Queen, but these coins can be minted on behalf of the daughter of the Turkish Khan, who is the local ruler of the land and her woman . Especially noteworthy is the fact that on the back of these coins Turkish X'otun – the title "wife".

Although it is part of the western Turkish Khanate, the data on the marriage relationship between Khakanate and Oasis states such as Turfon, Karashahr, kucha, Koshgar and Khotan in Eastern Turkistan, which have preserved their traditional management system, are many three in Chinese sources. In particular, the wife of the ruler Kyuy Gyan, who ruled Gaochan until 590 years, was the daughter of one of the Turkish traitors, and this ruler was subordinated to the Turks. According to information encountered in the Chronicle" Bey shi", when the Gaochan ruler Kyuy Gyan died, his son bo-ya was on the throne instead of his father, and the Turks wanted that they

would marry their stepmother according to their customs. Because bo-Yan's stepmother was the daughter of the Turkish Khan.

It is also noted in the Chronicle "tan shu" that in the middle of the VII century, when Zhen-Guan (627-649) married the daughter of the Khan of Sule (Koshgar) ruler Amochji tukyue (turk), the wife of Khali Bushibi, who was the ruler of Kuysi (kucha), was the name of Ashina . According to E. Shwann, from this female name it becomes clear that she belongs to the ruling dynasty of tukyue (Turks) – the household of Ashina.

Hence, marriage relations have played an important role in the foreign policy of betrayal, which is mainly used in the management of vassal principalities. In this regard. Skeff 's opinions expressed by are noteworthy. In his opinion, "the best way of proportionate (acceptable) means to keep in motion was to establish marriage relations between the Nomads and the post-rulers. In Chinese chronicles, I found six examples of this method. Not taking into account one, this method in all events was in the style that the Turks transferred a noble woman to a postmaster for marriage. In this regard, it is also necessary to note that the settlers usually stipulate that basically the side that gave the bride was superior to the side that the bride received .

Although it is known from sources that the rulers of the western Turkish Khanate, such as Marv, Samarkand, Gaochan, kucha, Koshgar, Karashakhr, were married to the Daughters of the khakans, the rulers of the khakans' rulers such as Choch, Fergana, Tughuristan, Kabul, etc., do not have information about this. How can this situation be explained? In our opinion, this must be connected with the mediation and direct (direct) management of subordinate rulers. It seems that this method is not needed in the management of such principalities as Choch, Fergana, Buglaristan, Kabul, if the origin of the Turkish Khanate was caught by the local dynasty rulers who were not related to the Khanate in their by the groom. The reason should be when the origin of these rulers was ruled by dynasties, which went to betrayal. Here it is possible to see that exogam marriage, characteristic of the ancient Turks, was a priority.

The tradition of the khakans giving girls to their vassals' subjecting them to themselves lies in a certain system of pronouns. A clear expression of this can be seen on the example of the Genghis Khan empire, which was one of the largest steppe empires after the Khanate. In particular, the Genghisian dynasties granted special privileges to some allied tribes or vassal rulers by transmitting the girls belonging to the ruling household' i.e., as the groom'. This tradition in the Mongols is called the "system of blindness" by researchers . These traditions of piracy can also be considered' related to this system.

In addition to the G'. Boboyorov's opinion of prisak, the following arguments, which allow us to look at the Turkish Khanate as a "system of visibility" with a wider coverage:

"First of all, the Ashina dynasty, unlike the genghisians,' not only did the Allied nobility establish a qudaandry with the seeds' but also extended their daughters to the gentile vassals' that is, it gave them the privilege of 'Garagon'. The reason for such a saying is that' the status of the rulers of the OASIS, who are the bridegrooms to the Turkish khakans, in comparison with other rulers around him, is somewhat higher,' in any case, this is due to the fact that they have obtained certain "privillages" by becoming the bridegroom to the khakans.' In particular, it is noted in the Chinese chronicles that the local rulers who ruled Samarkand in 690710 years after the groom became a son-in-law of the western Turkish khakans . Interestingly' at the same time Samarkand rulers are mentioned as rulers above the rulers of the remaining rulers in Suvd. It seems that the

'traitors' have chosen 'the blind' to focus on the rulers of the OASIS more influential than the others. Because such vassals as Gaochan 'Koshgar' Samarkand 'Marv were known as major Oasis rulers at that time' in turn they were located in strategically important regions"

This means that 'if the traitors guaranteed their subordination on the one hand by transferring their daughters to the vassal rulers' on the other hand, by linking the bonds of kinship with them', the reindeer created the opportunity to become a "member"of their Ashina household and thus acquire some "privileges".

According to G'. Boboyorov, the western Turkish Khanate used the following methods in the management of its vassals, that is, mainly the Oasis States:

1) Direct. Send Prince – tags to the control of the vassals. This method, which is attributed to the more early periods of disloyalty, has not yet gained sufficient consistency and has not been introduced to all of the vassals. Apparently, an attempt was made to make a change mainly in the management of strategically important oases, and the place of the local ruler was occupied by the representative of the House of Ashina. In particular, the Choch' Fergana ' passes to the representatives of the ruling Ashina household in Toghoristan and Kabul;

2) indirect. Control over the local ruling dynasty of the oasis principality is the assignment of the title of eltabar to the local ruler and the appointment of tudun (supervisor noib). This method is widely spread and has apparently been introduced to all OASIS rulers and is in harmony.

Apparently, these methods have always used similar tools in the management of treason vassals in a way that did not give the expected result:

1) Establishing a marriage relationship with a relatively strong oasis of rule – groom the vassal ruler' that is, the system of " curation»;

2) build an army storage or garrison in strategically important areas;

3) The appointment of a Turkic tribe or clan that has its place in the political life of the Khanate to the management of a relatively small oasis of rule;

4) The founder of the Khanate is the appointment of the tribe of ashina or representatives of the Allied Tribes and seeds to the vassal Oasis .

In short, the western Turkish Khanate, as a major one, has resorted to various methods and tools that come from the need in the process of managing several dozen relics of rulers. In the early days, without any interference in the internal affairs of the vassals, in many places left the local dynasties in their place and was largely limited to the carrying of tribute. But the traitors put an end to the local government of some of the rulers, instead of appointing representatives of the Ashina household, and to some of them sending "tudun" as a controller, giving the Turkish title of "eltabar" to the representatives of the local dynasty, while the relatively high-ranking vassal rulers were in control of them using such methods and means as.

ABSTRACT

The adoption of e-business at the microeconomic level of retail, wholesale, and labor market transactions has an enormous impact on the performance of firms and the economic welfare of consumers and workers. This article reviews, in broad outlines, the economics of e-business, focusing on empirical research. The fundamental notion that e-business and adoption of ICT lowers the cost of transferring, storing, and processing information is used to organize the examination. E-business spheres of impact covered in- clude B2C and B2B e-commerce, the labor market, and the productivity of firms. This article covers both the predicted impacts of e-business on the economy suggested by eco- nomic theory and evidence on their empirical magnitude, building a framework to under- stand why e-business has proliferated and what the economic benefits are. The article concludes with some of the new policy challenges accompanying the rewards from e- business in the economy, touching on issues of price discrimination, competition, and some disadvantages of new markets.

KEYWORDS: *Discrimination, Competition, E-Commerce*

INTRODUCTION

The use of information and communications technology (ICT) in business - the most expansive definition of e-business—is transforming the world economy. E- business at the microeconomic level of retail, wholesale, and labor market transactions has an enormous impact on the performance of companies and the economic welfare of consumers and workers. The gains in efficiency and economic benefits at the microeconomic level exert influence all the way up to the macroeconomic level of GDP and fiscal and monetary phenomena. However, new policy challenges accompany the rewards from e-business in the economy.

The economics of e-business are shaped by the way that ICT lowers the cost of transferring, storing, and processing information (Borenstein & Saloner, 2010). When the cost of information falls, there are profound consequences for how firms conduct business with each other, with consumers, and with workers. This article covers both the predicted impacts of e-business on the economy suggested by economic theory   and their empirical magnitude, building a framework to understand why e-business has proliferated and what are the economic benefits. The economic gains from e- business not only stem from using existing resources more efficiently, but also from increasing growth and the creation of new products.

The main section of the article deals with the principal arenas in which the impacts of e-business on the economy play out. The arenas are defined by the type of interaction between economic primitives. The interactions are transactions in the case of economic actors or transformations in the case of economic goods. First is the business-to-consumer (B2C) channeling, focusing on retail and financial transactions. Interactions among firms come next, both business-to-business (B2B) e-commerce and competition in the output market. A closer look at the market for one key input firms use, labor, provides a look at how

E-business changes transacting between business and its workers.

The main section concludes with the effect of e-business on firms' productivity—how efficiently the firm transforms its inputs into outputs. The next section looks at directions for future research, covering some of the new policy questions that e-business raises for the economy. Throughout, the emphasis remains on the microeconomic effects of e-business (see the companion article by Heil & Prieger (forthcoming) for the macroeconomic impacts.

BACKGROUND

Information is the key component of the modern economy. While pure knowledge is disembodied, transferring, storing, and processing information is costly for firms and consumers. E-business has such a great impact on today's economy be- cause ICT lowers the costs associated with information (Borenstein & Saloner, 2001). For businesses, information can be an output itself of the firm (e.g., a financial trans- action involving no physical product), a direct input used to produce an output (e.g., data incorporated into geographical software), or an indirect input that is complemen- tary to other inputs (e.g., communications technology that makes outsourcing of pro- gramming tasks feasible). For consumers, information flowing from businesses helps define both the set of products available and their attributes, and information flowing back to firms reveals customers' preferences. For workers, information is also a two- way channel. Workers want to reveal information about their capabilities to poten- tial employers, and firms want to advertise openings and job characteristics.

Viewed through the lens of cost reduction, transformations of the production process enabled by e-business such as outsourcing, just-in-time inventory systems, and e-banking not only make sense but become predictable. Similarly, given the im- portance of information in search and matching markets such as consumer purchasing and the labor market, the advent of electronic intermediaries such as auction sites and online resume exchanges makes sense. Wherever the costs involved with transacting information are high, the gains from adopting e-business practices are highest and the market will naturally implement ICT there first.

Reduced informational costs can not only facilitate given transactions, but can expand the set of transactions included within a specific market. By lowering the costs of bringing together geographically distant buyers and sellers, e-business in- creases the size of any given market. Larger markets make the trade of goods and ser- vices more reliable and efficient, in part because bigger markets often have lower av- erage costs associated with them. However, the aggregation of information in larger markets is beneficial in its own right, especially compared to the bilateral negotiation between economic agents that e-business may replace. The inefficiency of bilateral negotiation—that some mutually beneficial trades may not occur—is due to the asymmetric information (e.g., on the reservation prices) held by the parties. Thicker markets mitigate such inefficiencies (Vulkan, 2003).

THE MICROECONOMIC IMPACTS OF E-BUSINESS

Interactions between consumers and firms

B2C interactions allow better matching of consumers to products and services (Santarelli & D'Altri, 2003). Search tools for buyers, shopbots, retail auction sites such as eBay, and online brand communities such as websites for aficionados of Japa- nese manga comics (Jang, et al., 2008) all lower the consumer's cost of searching for goods and prices. As the cost of search falls, consumers response with a substitution effect and search more (Su, 2008), improving the quality of the match to a product. On the seller's side, e-commerce allows the collection of more information about cus- tomers than is provided by "old economy" retail channels. Such information is valua- ble for firms, allowing them to price discriminate, differentiate their product, push tailored marketing messages to consumers based on past behavior, and offer mass customization of their product lines (e.g., Dell's system of allowing buyers to choose fea- tures of their computers) (Vulkan, 2003).

B2C e-commerce over the Internet has grown steadily since its inception in the 1990's. Official estimates in the US peg e-commerce at $135 billion in 2008, which is 3.4 percent of total retail sales (US Dept. of Commerce, 2009). The official estimates are likely to be lower than the actual figures because the census misses many small "e-tailers".

Improved matching of customers to products has two impacts on market out- comes. In some markets e-commerce primarily lowers prices, while in others it spurs product differentiation and price discrimination (Bakos, 2001). Prices fall in some markets, particularly those for homogeneous goods, for two reasons. When it be- comes cheaper for consumers to search among the prices of competing retailers, de- mand for any one seller's product becomes more elastic, retailers must compete more directly with each other on price, and prices fall. Ellison and Ellison (2009) find striking evidence that lower search costs due to Internet search technologies can make demand highly elastic. The computer parts online seller they study faced de- mand elasticity of as high as 33 for certain of its memory products.

Prices also drop due to disintermediation. When e-commerce cuts middlemen out of the sales channel, such as when a customer directly buys books from Amazon or computers from Dell without visiting a physical store, then costs arising from wholesaling are avoided. While B2C e-commerce trades lower wholesaling costs for increased shipping costs (since firms must individually transport products to the con- sumers' sites), often the savings are large. B2C practices reduce labor costs through elimination of retail floor sales help, reduce the need to carry inventory at multiple retail sites (which also reduces theft from inventory), and reduce real-estate rental costs (Brynjolfsson & Smith, 2000). Prices for some goods have fallen greatly due to e-commerce. Brynjolfsson & Smith (2000) find that prices for books and CDs purchased on-line (inclusive of deliv- ery charges and taxes) average 9-16 percent lower than prices at traditional stores. New product markets created by e-commerce, such as those for mp3 music down- loads, electronic book sales, and software applications for smart phones, can be thought of as an extreme form of price decreases.[2]   New goods potentially cause large economic benefits for consumers, although empirical measurement is scarce.

B2C e-commerce affects perhaps no other area more than the financial sector. The financial services sector provides a good example of how adoption of ICT enables entirely new retail business processes and methods (UNCTAD, 2007, ch. 5). E- banking and to a lesser extent e-trading have become the norm for many customers. The convenience of e-banking and e-payments for households and firms is matched by the cost reductions and efficiency gains on the other side of the transactions. Dis- intermediation in the securities brokerage industry, in which computers have replaced employees for many transactions, lowers costs and therefore puts downward pressure on the price of service. While the percentage of trades conducted online probably peaked during the dot-com boom in 2000, as of 2003, 10 to 20 percent of eq- uity trades in the US are still executed online (RocSearch Ltd., 2006).

Interactions among firms

E-business has greatly changed how firms transact with each other as they purchase intermediate goods. Business-to-business e-commerce—interaction be- tween firms that takes place electronically, including electronic data interchange (EDI) and Internet based auctions and exchanges—dwarfs the B2C sector. More than 80 percent of e-commerce worldwide and about 93 percent of e-commerce in the US   is B2B.[3]   Firms have enthusiastically adopted B2B e-commerce because of its great po- tential to lower the costs of procurement (Lucking-Reiley & Spulber, 2001). Cost sav- ings come directly from freeing labor from the time-consuming process of non- electronic procurement methods, from the greater ease of finding suitable vendors and prices, and from the greater control that e-commerce lends to a firm's spending strategy (Vulkan, 2003). Phillips & Meeker (2000) estimate that processing a purchase order manually costs 8-18 times what online procurement costs. By lowering search costs, B2B e-commerce strengthens a business' control over its spending by reducing the cost of going "off contract" to procure inputs not available from its approved suppliers. Vulkan (2003) claims that such maverick buying makes up 40 percent of pro- curement spending in the US, and that Internet-based automation of procurement should greatly reduce that amount.

Cost savings from B2B also come from a transformation of intermediation, as in B2C e-commerce. Brokers, content aggregators, auctioneers, dealers, and exchang- es[4] are able to link larger markets via e-commerce—and to do it more efficiently— than can catalog-based or other

non-electronic systems. Thus, in markets in which information plays a key role intermediation becomes more important (Lucking-Reiley & Spulber, 2001; Vulkan, 2003). In a study of a large sample of German firms, Bertschek, Fryges, & Kaiser (2006) find that B2B is more likely to be adopted by firms that use a knowledge-intensive production process, and by firms engaged in interna- tional business. The lower cost of effective intermediation can also change the struc- ture of the firm through vertical disintegration, as it becomes more feasible to out- source some tasks of the firm that formerly were provided in-house (Lucking-Reiley & Spulber, 2001).

However, intermediation dealing with managing physical inventory becomes less important, as adoption of ICT improves inventory management (Bakos, 2001). Indeed, the manufacturing sector, where inventory costs can be large, is the largest adopter of B2B in the US, with e-commerce composing about one-third of the value of total shipments (US Dept. of Commerce, 2008).

In summary, B2B e-commerce can improve a firm's productivity in many ways, and empirical studies bear this out (although one must always be wary of publication bias).[5]   Bertschek, Fryges, & Kaiser (2006) find that investment in ICT improves labor productivity, but only for firms engaged in B2B e-commerce.[6]   We return to the im- pact of e-business more generally on productivity in a later section. The economic benefits of B2B adoption can be significant for firms. In terms of the bottom line, Efendi, Kinney, & Smith (2007) find that firms adopting buy-side B2B systems in- creased average return on assets by nearly three percentage points and the average profit margin by 2.7 percentage points, relative to a matched sample of non-adopting businesses.

Interactions between firms and the labor market

Since information is of preeminent importance in labor markets, it is no sur- prise that e-business is profoundly transforming the labor market. The primacy of information stems from the matching aspects of the labor market: firms try to find capable employees without being able to observe their productivity before hiring, and workers search for jobs without knowing all possible openings and all job characteristics. Given that e-business fundamentally lowers the cost of information, it has dra- matically changed the process of matching workers to firms (Autor, 2001).[7]   Infor- mation is also important in the labor market once a match is made. Reduced costs of transmitting information allows many labor services to be delivered to the firm over the Internet that were formerly required to be produced in house.

First generation e-business phenomena such as passive online resume ex- changes, job postings, and applications for positions, as well as later generation services such as front-end e-recruiting websites married to back-end automated infor- mation processing, improve the efficiency of matching in the labor market (Autor, 2001; Nakumura et al., 2009). More than two-thirds of workers look for jobs online now (Stevenson, 2009), and the relatively low cost of finding and screening applicants means that higher quality matches are possible (which raises labor productivity as well).[8]   While direct evidence on how e-business improves matching quality is scarce, one study looking at an electronic labor intermediation program in Italy found that it increases the chance that an individual finds a job and improves matching quality, as evidenced by higher wages and worker satisfaction (Bagues & Sylos Labini, 2009).[9] This is in contrast to

offline centralized clearinghouses, which have not been found (in at least one case study) to increase wages (Niederle & Roth, 2009).

Whether Internet searching directly reduces the length of unemployment spells is currently an open question. Kuhn & Skuterud (2004) conclude that workers using the Internet to look for jobs are unemployed for just as long, and maybe even longer, than others. The authors suggest that searching on the Internet for jobs may send a negative signal about the worker, although such an effect is likely to lessen as Internet searching becomes ubiquitous. Stevenson (2006) notes that the analysis of Kuhn & Skuterud (2004) does not include workers who switch directly from one job to another (i.e., those with unemployment durations of zero). Truncating the zero- length unemployment spells in the data artificially skews their sample, since Steven- son (2009) finds that Internet users are more likely to change jobs directly. Stevenson (2009) provides a final bit of evidence that online searching leads to better matching: even after controlling for sample selection bias, workers who use the Internet to search are 15 percent more likely than non-users to have moved to a new job within a month.

Cheaper and more efficient communications between workers and their em- ployers creates expanded opportunity to outsource labor tasks. Call centers located off site (and perhaps offshore), remote monitoring of equipment, and telecommuting are all made possible by ICT (Autor, 2001). Görg, Hanley, & Strobl (2008) find from plant-level data for Irish firms that international outsourcing increased the firms' productivity, even after controlling for factors causing firms to choose outsourcing. Kaiser (2004) finds that telecommuting in the manufacturing and trade sectors leads to large increases in labor productivity (measured by firms' profits, value added, and revenue per worker).

Productivity at the firm level

How efficiently a firm produces a good or service depends on interactions among the firm's inputs and outputs. E-business can increase productivity by chang- ing how the firm transforms inputs into outputs, as the previous section on labor shows. For example, the use of ICT reduces the cost of coordinating workers assigned to different tasks, enabling firms to intensify the specialization of labor celebrated by Adam Smith in the pin factory.[10] Use of ICT and adoption of e-business has measura- bly increased labor productivity, and we turn to some of the available evidence now. The estimates here are from firm-level studies, and are necessarily specific to the in- dustry and technology examined.[11] The companion article by Heil & Prieger (forthcoming) on the macroeconomic impacts of e-business covers the general macroeco- nomic impacts of e-business on productivity.

The use of computers and other ICT increases productivity in the short run by deepening the capital available to workers, and in the longer run by increasing total factor productivity (Brynjolfsson & Hitt, 2002).[12] Maliranta & Rouvinen (2003), look- ing at Finnish firms, find that equipping all employees with computers in particular increases labor productivity by 18 percent in manufacturing and 28 percent in ser- vices. Adopting computers also spurs firms to invest in complementary intangibles (Brynjolfsson & Yang, 1999), such as software, new incentive systems, training, pat- terns of interaction within the firm, and other new business practices. In fact, Ko- ellinger (2006) argues that the productivity-enhancing effects of ICT are contingent upon firms investing in these additional complementary intangibles. Increasing the

stock of such "organizational capital" related to ICT adoption is one reason that total factor productivity increases in the long run from e-business. Matteucci et al. (2005) investigate the dynamic payoffs from investing in any form of ICT, finding that it in- creased the average productivity of German manufacturing firms over the next three years by 36 percent (but had no effect on service industry productivity).

A business typically uses computers to communicate within and without the firm via networks. Evidence from a US manufacturing sample shows that the use of computer networks such as LANs, EDI, and the Internet in a firm increase labor productivity by five percent (Atrostic & Nguyen, 2005). The Finnish study men- tioned above finds that granting an employee Internet access at work increases his productivity by three percent in the service sector, but has no significant effect in manufacturing (Maliranta & Rouvinen, 2003). Perhaps the dominance of EDI over Internet-based e-procurement in the manufacturing sector accounts for this result. Other studies that examine Swedish firms find that access to broadband is associated with increases in productivity of 3.6 percent for manufacturing and services firms (Hagén & Zeed, 2005) and 62 percent for ICT firms (Hagén, et al., 2007).

A final, smaller collection of studies looks specifically at the impact of e-commerce on the productivity of workers. Several studies find that when firms buy inputs online they have higher productivity, and that when they sell output they have lower productivity (Criscuolo & Waldron, 2003; Farooqui, 2005). Criscuolo & Waldron (2003) measured the size of the productivity change at an increase of seven to nine percent for buying online and a decrease of five percent for selling online.

However, the negative results for selling online may merely reflect a price effect,since these studies measure output in monetary value, online sellers have lower prices, and the impact is identified by comparing adopters and non-adopters of e-commerce.

FUTURE RESEARCH DIRECTIONS

Much of the available research regarding e-business and the economy dates from the expansionary years of the dot-com bubble.[13]   Consequently, some of the ear- ly rosy expectations and prognostications for e-business in general (and B2C e- commerce in particular) have not been borne out. For example, new intermediaries in the online air travel booking industry have not been as successful as the earliest research foretold (Klein & Loebbecke, 2003). Furthermore, despite the potential for—and demonstration of—e-business to lower the costs of information in ways that greatly enhance economic welfare, the benefits come mixed with issues that future research must address to inform public policy.

Price Discrimination and Obfuscation

E-business allows firms to price discriminate as never before. Price discrimi- nation can run counter to the impetus for prices to fall created by increased consumer price-searching and cost reductions from disintermediation. With no physical price tags or postings available for all customers to see, it is inexpensive for a firm to offer different prices to different consumers. In a notorious episode from the dot-com boom years, Amazon offered differing prices to consumers for identical products, claiming after discovery and negative publicity that it was randomly adjusting prices in order to estimate the elasticity of demand (Streitfeld, 2000). By collecting

information on past customer behavior, or through creating switching costs for consumers through lock-in to a particular e-tailer, targeted differential pricing also becomes an   option.

While evidence on online price discrimination is rare, research is available on the closely related phenomena of price dispersion among firms. Clemons, Hann, & Hitt (2002) find that airfares vary by as much as 18 percent among online travel agents. Brynjolfsson & Smith (2000) find even greater dispersion of online prices for books and CDs, and Walter, Gupta, & Su (2006) show that price dispersion is present across a broad range of e-commerce goods. However, recent evidence indicates that as online markets mature, price dispersion may decrease (Bock, Lee, & Li, 2007).

While charging customers different prices is not illegal in itself, the antitrust laws in the US limit companies from using price discrimination as an anticompetitive device. While some commentators do not believe that e-business raises new policy concerns regarding price discrimination (Edwards, 2006), research on whether any given discriminatory practice enabled by e-business is anticompetitive will be an ac- tive field, evolving as business employ ever newer methods to eke out more profits from consumers.

Price discrimination is one reason that price levels in some online markets have remained higher than simple theories of search costs and e-commerce predicted. Obfuscation, the deliberate attempt by online sellers to confuse buyers and defeat price search technology, is another reason (Ellison & Ellison, 2009).[14]   Through obfus- cation, which includes complicating product descriptions, creating multiple product versions, and hiding the cost of add-ons, an e-tailer can raise search costs, decrease consumer learning, and raise profits. Ellison and Ellison (2009) document that online retailers successfully obfuscate to raise markups on computer parts. Future research should seek to document the prevalence of obfuscation and the evolving arms race between consumer search technology and sellers' increasingly sophisticated attempts to obfuscate.

New Markets: Always a Good Thing?

When e-business opens entirely new markets the potential for value creation can be large. However, not all new markets opened by e-business provide benefits unalloyed with any disadvantages. Bakos, et al. (2005) find that financial trades per- formed online are cheaper but of lower quality (i.e., result in worse transaction prices) than those executed by traditional brokers. Additional research is needed to monitor whether the performance gap between full and discount service brokers (and in other markets) persists as online trading markets become more sophisticated and efficient.

E-trading, by giving an individual greater control over the information, timing, and execution of trades, can also imbue some traders with an illusion of control over random outcomes in the market (Barber & Odean, 2001). Similarly, providing more information to investors can create an illusion of knowledge. Barber & Odean (2001) cite research showing that giving consumers more information causes their forecast- ing confidence to improve much more rapidly than their actual forecasting accuracy. Problems arising from consumers having too much information are much less com- mon—or at least less commonly recognized—than the opposite case where consumers lack information about a product's characteristics or dangers, and raise thorny issues

for public policy. More research is needed on the impact of the illusion of control on households' ultimate welfare before it can be known whether policymakers should be concerned.[15]

E-Commerce, Competition, and the Structure of Industry

While B2B changes how firms collaborate in the buying and selling of inputs from and to each other, e-commerce also affects how businesses compete against each other (Lucking-Reiley & Spulber, 2001). E-commerce can increase the economies of scale in intermediary markets, because many online markets such as auction sites re- quire large fixed costs to set up but nearly no marginal transaction costs since the product (information) is intangible. Economies of scale can lead to domination of a market segment by a few large actors. Internet-based markets such as platforms for content aggregation and exchanges also exhibit network effects: having many traders   on a platform increases market liquidity, which attracts even more traders to the platform. The positive feedback in market share due to network effects often leads to "winner take all" outcomes in platform markets. Indeed, DIW Berlin (2008) finds that ICT use is associated with higher market shares in the chemical, retailing, and transport services sectors. Lucking-Reiley & Spulber (2001) point to the commodities futures market in early 20$^{\text{th}}$ century as an example of how economies of scale and li- quidity concerns led to market dominance.

Even when economies of scale and network effects are less important, as may be the case in the retailing of physical goods, e-business adoption may still have anti- competitive effects (OFT, 2000). ICT lessens the cost of sharing information among competitors, which can facilitate (tacit or explicit) collusion. For example, competi- tors can use shopbots to check each others' prices to ensure no firm deviates from a tacit agreement to maintain high prices. Vulkan (2003) points out that since e-tailers often must explicitly allow shopbots to search their sites, opting in can constitute a commitment not to cut prices for competitors to observe. There is little solid empiri- cal research yet that ascertains the importance of the competitive implications of e- business.

CONCLUSION

Information is the linchpin holding together today's worldwide economy. Anything facilitating the processing and flow of information is therefore supremely important. E-business, by lowering costs of transferring and storing information, now affects nearly every aspect of commerce. This article has reviewed the main type of interactions that e-business affects: those between firms and consumers, those among firms, those between firms and labor, and the transformation of inputs into output (productivity). Available empirical evidence shows that the microeconomic impacts of e-business and ICT have often been large. The transformations of economic inter- actions wrought by e-business at the microeconomic level, in aggregate, have im- portant implications for macroeconomic phenomena such as taxation and other fiscal policy, monetary policy, international trade, and national economic growth. Evi- dence regarding macroeconomic effects of e-business is reviewed in Heil & Prieger (forthcoming).

KEY TERMS & DEFINITIONS

Disintermediation: The reduction or elimination of the use of market intermediaries that match producers to ultimate buyers in product markets or employers to employees in the labor market.

Elasticity of demand: A characterization of the sensitivity of the quantity demanded of a good to changes in price (in percentage terms).

Illusion of control: A term from psychology for the finding that people behave as if they can affect the outcome of random events.

Network effect: The effect whereby an economic agent's valuation of a product (e.g., a trading platform) increases with the number of consumers of the product (e.g., the number of other traders on the platform).

Off-contract procurement: A firm's purchase of inputs or materials from a source other than the approved supplier with which the firm has negotiated volume discounts or other concessions.

Price discrimination: The practice of charging different customers different prices, where the price differentials are not explained merely by differing costs of serving the customers.

Total factor productivity: Productivity growth not explained by increases in inputs such as capital and labor. TFP, as a residual, captures all other factors influ- encing growth, such as improved uses of the measurable inputs, general tech- nological progress, and changes in policy and institutions.

DYNAMICS OF PHYSICAL TRAINING OF STUDENTS OF HIGHER EDUCATIONAL INSTITUTIONS

Khidoyatov Shukhrat Sharipovich*

*Teacher,
Bukhara Medical Institute,
Named after Abu Ali Ibn Sino,
UZBEKISTAN

ABSTRACT

This article analyzes the characteristics of a healthy lifestyle of students of higher education institutions, the state of physical fitness of students and by analyzing the physical fitness of students of higher education institutions, describes the pedagogical principles and conditions of a healthy lifestyle.

KEYWORDS: *Health, Healthy Lifestyle, Physical Development, Higher Education Institutions, Pedagogical Principles, Physical Training.*

I. INTRODUCTION

The importance of physical culture and sports in the upbringing of a harmoniously developed generation can be seen in the fact that today our government cares about sports and has risen to the level of public policy. In particular, the Decree of the President of the Republic of Uzbekistan Sh. Mirziyoyev dated 30.10.2020 PF-6099 "On measures for the widespread implementation of a healthy lifestyle and further development of mass sports" today serves as a program for the further development of physical culture and mass sports in our country.

II. LITERATURE REVIEW

Now it is necessary to carry out serious selection work on the selection and upbringing of talented adolescents and girls in the next processes. This places a tremendous responsibility on sports organizations, educational institutions and parents. Advanced pedagogical experience in the selection of gifted boys and girls, their testing and development of advanced sports skills, innovative technologies, spiritual and material support (selection network) is necessary to further strengthen the high-quality medical services.

Of course, the achievements and successes to date are our own, and now one of the most pressing issues facing educators working in the field of physical culture and sports is to take education to a new level and further improve the teaching process with the widespread use of modern educational technologies are calculated.

III. Analysis

The results of the analysis of the existing scientific and methodological literature testify to the fact that in recent years there has been an increase in the number of students with different levels of physical fitness. This trend is typical of many higher education institutions in Uzbekistan. Many students are not fully prepared to perform the loads provided for in the standard curriculum. It is difficult for students of this type to follow the curriculum developed within the training regimens (according to physiologically based standards for a given age group). This is due to the mismatch between the physical fitness of a significant number of students and the normative tests performed by them. The situation is exacerbated by the fact that many students do not have the necessary motivation for physical education and sports. In many cases, such students are inactive in practical training, do not perform basic exercises, avoid physical exertion, as well as lack of determination to achieve the result required for the optimal functioning of all systems of the body. Activation of physical activity of such students remains an important issue. The methodology and organization of this process of teaching students has its own characteristics. Numerous studies have been devoted to the problem of health and healthy lifestyle. However, so far, there are many uncertainties, including methodological considerations [11,12].

There is no developed diagnostic base that allows students to identify the various components of a healthy lifestyle, without a quality diagnosis, it will not be possible to form a goal-oriented [7,9,10].

There is a lot of information in the scientific and methodological literature about the significant role of physical education in the development of the human body, physical development and the decision of a healthy lifestyle [13,14,15]. At the same time, it is noted that in higher education institutions there is almost no data describing the actual state of implementation of curricula for physical education students with different levels of physical fitness.

The object of research: a healthy lifestyle of students studying in higher education institutions.

The subject of the research: the process of forming a healthy lifestyle in students of higher education institutions in physical education.

The purpose of the study is to study the pedagogical principles and conditions for the formation of a healthy lifestyle in students by analyzing the physical fitness of students of higher education institutions.

Based on the purpose, object and subject of research, the following tasks are formed:

1. Analysis of scientific sources on the topic;

2. Identify the characteristics of a healthy lifestyle for students of higher education institutions.

3. Determining the state of physical fitness of students of higher education institutions;

4. Development and demonstration in practice of pedagogical methods of formation of a healthy way of life of students in the course of physical training of higher education institutions.

A comparative analysis of the data shows that in the selection of first-year students engaged in physical education within the experimental methodology, the values of all parameters of their physical fitness increased (Table 1).

TABLE 1 DYNAMICS OF THE LEVEL OF PHYSICAL FITNESS OF FRESHMEN IN THE EXPERIMENTAL GROUP (N = 28)

№	Physical fitness parameters (times)	Before the experiment	After the experiment	Differences	
		$X \pm \sigma$	$X \pm \sigma$	t	p
1.	Pull-ups while hanging on a low bar	7,28±0,82	11,72±1,21	2,9	≤0,01
2.	Lifting the body in the supine position for 1 minute	35,33±3,6	40,15±4,73	2,82	≤0,01
3.	Bend and adjust the arms at the base while lying down	10,07±1,1	12,25±1,36	2,58	≤0,05
4.	Long jump from a standing position (cm)	168,2±8,46	171,11±9,2	2,21	≤0,05

The number of pull-ups while hanging on a low horizontal bar and lifting the body in a lying position for 1 minute increased the most significantly (99% confidence level). In general, in accordance with the standards, the indicators of physical fitness of students of the experimental group changed during the academic year as follows:

- Pulling while hanging on a low bar: at the beginning of the year did not reach even the lowest level of the norm, and at the end - to the level of "good";

- Lifting the body in the supine position for 1 minute: before the experiment, the values were moderate, and at the end - high;

- Bending and adjusting the arms at the base in the supine position: at the beginning of the year - the lower level, and at the end - the middle level;

- Long jump without standing: before the experiment - the lower level, and at the end - the intermediate level;

No significant changes in physical fitness were observed in the control group of students engaged in physical education in the traditional way.

IV. Discussion

All parameters of physical fitness also increased in the selection of boys engaged in experimental methods of physical education (Table 2), no significant changes in the indicators of physical fitness of boys in the control group engaged in traditional methods of physical education were noted.

TABLE 2 DYNAMICS OF THE LEVEL OF DEVELOPMENT OF PHYSICAL FITNESS OF FRESHMEN IN THE EXPERIMENTAL GROUP (N = 34)

№	Physical fitness parameters (times)	Before the experiment	After the experiment	Differences	
		$X \pm \sigma$	$X \pm \sigma$	t	p
1.	Bending and straightening the arms at the base of the ankles	9,89±0,91	13,5±1,2	2,95	≤0,01
2.	Pull-ups while hanging on a horizontal bar	9,33±1,11	14,21±1,32	3,15	≤0,01
3.	Long jump from a standing position (cm)	221,49±10,5	230,56±11,23	2,2	≤0,05
4.	Raise the legs while hanging	10,38±0,97	11,68±1,14	2,39	≤0,05

The values of the number of bends and adjustments of the arms at the base and the number of pulls on the horizontal bar at the base increased the most significantly (reliability level 99%).

In general, in accordance with the norms, the indicators of physical fitness of boys in the experimental group changed during the school year as follows:

- Bending and adjusting the arms at the base of the legs: before the experiment - the lower level, and after the experiment - the upper level;

- Pull-ups on the horizontal bar: at the beginning of the academic year - a low level, and at the end - a high level;

- Long jump without standing: before the experiment - the lower level, and at the end - the intermediate level;

- Raise the legs in a hanging position: before the experiment - the lower level, and at the end - the middle level.

By transferring the values of the physical fitness parameters to the wall (on a 10-point scale), the values of the physical fitness level integral indicators for all selections were determined (as the arithmetic mean values of the 4 indicators transferred to the wall). The results of the analysis of the physical fitness of the students who participated in the study in all selections (Table 3) indicate that there were significant positive changes in the experimental selections.

TABLE 3 THE DYNAMICS OF THE OVERALL LEVEL OF DEVELOPMENT OF PHYSICAL FITNESS OF FRESHMEN ENGAGED IN VARIOUS MODELS OF PHYSICAL EDUCATION

№	Level of physical development	Before the experiment	After the experiment	Differences	
		$X \pm \sigma$	$X \pm \sigma$	t	p
1.	Boys, PG (n = 34)	5,15±0,62	7,28±0,73	2,81	≤0,01
2.	Boys, CG (n = 35)	5,11±0,67	5,28±0,49	1,05	-
3.	Girls, PG (n = 28)	4,64±0,48	6,85±0,58	2,85	≤0,01
4.	Girls, CG (n = 32)	4,7±0,41	5,04±0,77	1,16	-

In the control group, there was also a certain (insignificant) increase in performance, which is probably the result of traditional physical activity. The results are illustrated in Figure 1.

At the beginning of the school year, the physical fitness index of students, whose values could be interpreted as "below average", changed significantly for the better and reached values ranging from "average" to "high".

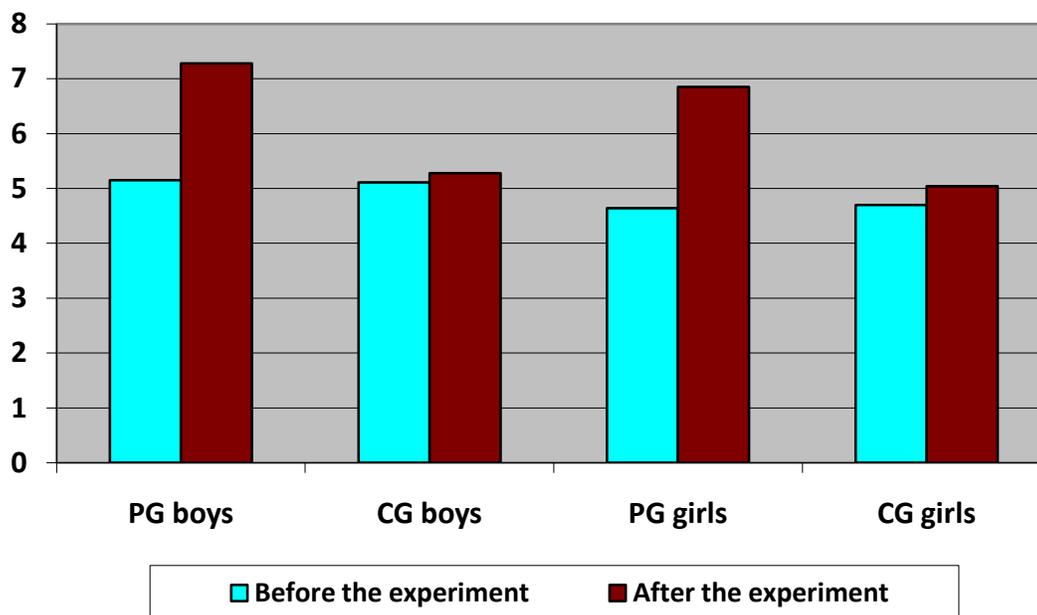
The boys already had an average level of physical development, but by the end of the school year in the experimental group, it had reached a value that could be interpreted as high.


Figure 1. Dynamics of general physical fitness of experimental and control group students

First of all, the level of endurance of first-year students of both sexes can be assessed as "satisfactory" in accordance with the norms - low (Table 4). However, students engaged in experimental methods of physical education have shown a significant increase in this indicator by the end of the academic year, reaching a normative level corresponding to a "good" grade.

TABLE 4 DYNAMICS OF THE LEVEL OF ENDURANCE DEVELOPMENT OF FRESHMEN (RUNNING 2 KM)

№	Level of physical development	At the beginning of the academic year	At the end of the academic year	Differences	
		$X \pm \sigma$	$X \pm \sigma$	t	p
1.	Boys, PG (n = 34)	9,07±0,9	8,16±0,7	2,28	≤0,05
2.	Boys, CG (n = 35)	8,33±0,8	8,18±0,9	1,03	-
3.	Girls, PG (n = 28)	11,47±0,9	9,4±0,7	2,14	≤0,05
4.	Girls, CG (n = 32)	11,5±0,9	11,04±1,1	1,07	-

The control group students, on the other hand, did not initially show a positive change in their significance at a convincing level, unlike them. Thus, it can be said that this methodology has a positive effect on the level of endurance of first-year students.

V. CONCLUSION

Thus, the obtained data allow emphasizing that the introduction of pedagogical methods of HLS formation in the process of physical education leads to the improvement of various levels of physical fitness of freshmen studying in higher education.

Also, the level of physical fitness of first-year students studying at a higher education institution is considered average at the beginning of study in accordance with the standards. By the end of the school year, the students in the control group were found to have small positive changes in them. The students of the experimental group showed a strong positive dynamics ($r \leq 0.01$), the parameters of physical fitness reached the values corresponding to the "good" sign. The level of endurance was also significantly increased in the experimental group students ($r \leq 0.05$).

THE ROLE OF BUSINESS ENTITIES IN THE DEVELOPMENT OF MAKHALLA AND SELF-GOVERNMENT INSTITUTIONS

Shamsiddinov Burkhon Jakbrovich*

*Kokand State Pedagogical Institute,
Kokand, UZBEKISTAN

ABSTRACT

In Uzbekistan, the mahalla dates back to ancient times as a powerful seat of culture, an effective citizens' self-governing body, the entity closest to the people and a unique civil society institution. The role and significance of mahallas has always been invaluable in carefully preserving the multi-ethnic Uzbek people's national and universal human values, culture, way of life, thoughts and spirituality that have been passed down for generations. Financial support of small business and private entrepreneurship through the "Mahalla" Charitable Fund to all mahallas of the Republic, the population living in them, especially families in need, the disabled and the elderly, accounts for more than 60% of all expenditures, such assistance continues today in a consistent, voluntary manner. The economic and financial support of small business and private entrepreneurship to the community is important, of course. The market economy forces every social activity to be measured by money and profit. Especially a person who is engaged in entrepreneurial activity deeply feels the power of money, does not scatter them in the opposite direction. However, in the heart and spirit of the Uzbek people, there is a tendency to look at the situation of those around them and, if necessary, to help them and show them kindness. He inherited this quality from the neighborhood, the family, so he considers it a real humanity and nobility to return this quality to the neighborhood, to his family. This article discusses the role of business entities in the development of the institution of the mahalla.

KEYWORDS: *Mahalla, Citizens' Self-Governing Body, "Mahalla" Charitable Fund, Entrepreneurship, Economic and Financial Support, Small Business*

INTRODUCTION

The fact that the majority of the world's employed population is engaged in small business and private entrepreneurship has created the need for rapid development of this system. In particular, in developed Eastern and Western countries (USA, France, Germany, Japan, China, South Korea, Singapore and others), the development of civil society has been identified as a key goal in the development of small business and private entrepreneurship. Especially during the current pandemic in the world, supporting the activities of business entities has become a global problem. UNDP in cooperation with the Chamber of Commerce and Industry of Uzbekistan has launched the project "Business Clinic" for small business and private entrepreneurship. "Business Clinic" provides free advice to entrepreneurs facing financial difficulties during the pandemic on all issues related to the restoration of business and the benefits and preferences provided by the state [1].

The Action Strategy for the Development of the Republic of Uzbekistan for the next five years has been adopted. The principle of the supremacy of human interests and the noble idea that "People should not serve government agencies, government agencies should serve our people" have been identified as the main criteria in the activities of government agencies. The integral continuation of such significant work can be seen in the fact that 2018 has been declared in our country as the "Year of Active Entrepreneurship, Support of Innovative Ideas and Technologies." In this regard, based on the purpose of our study, we need to pay special attention to the comments of the President of the Republic of Uzbekistan Shavkat Mirziyoyev on the concept of "active entrepreneur": rather, we understand business people who benefit society as a whole" [1].

The permanent features of social development show that the society has such historical and cultural values, riches, people's experiences that even revolutions cannot do, and only when they are based on them, reforms become a positive reality. Such historical and cultural richness of the Uzbek people, centuries-old experience is embodied in the mahalla institute.

According to researchers, the peoples living in the territory of Uzbekistan have used the terms "ku", "guzar", "neighborhood" in the sense of neighborliness [2]. The word "neighborhood" is Arabic and means to move, to settle. In the twentieth century, the word "neighborhood" was used as a term for a particular social unit. Thus, "during the long historical development of the mahalla, which is a traditional form of community existence, not only territorial unity, but also the social structure, has become the most acceptable form of self-democratic governance" [3].

Main part

Today, there are about 10,000 mahallas, villages, auls and towns in the country - institutions of self-government. In accordance with the Decree of the President of the Republic of Uzbekistan dated September 12, 1992, the Republican Charitable Fund "Mahalla" was established. In September 1993, the Law on Citizens' Self-Government Bodies was adopted, and on August 30, 2003, a new version was adopted. The purpose of these laws and decrees is to involve the population in the management of a wider range of state and public affairs, on this basis, the transfer of some functions of the state to the lower levels of mahalla and self-government. Therefore, "the lower levels of the representative bodies of state power in the Republic of Uzbekistan have abolished people's deputies in auls, villages, towns, districts and urban districts, and replaced them with institutions of self-government. Building a civil society means

transferring the various functions of governance directly to the people as the state develops, that is, further developing self-governing bodies" [4].

Indeed, during the years of independence, for example, in Tashkent, 445 mahallas were beautified, more than a hundred modern and prosperous guzars were built, they were telephoned, drinking water was supplied to more than 100 km, about 350 km of sewerage and 440 km of gas were supplied. More than 20 mahalla activists, who are leading the Tashkent mahallas and multiplying their good deeds, have been awarded the highest awards and titles of our government. Among them are Saidnabi Saidkarimov, Abdusalom Atamatov, Sayfulla Akmirzaev. There are such people as Muborak Yunuskhodjaeva, Egamnazar Kadyrov, Tohir Muslimov, Yuldosh Abdurahmonov, Davron Shorahmedov, Tukhtakhoja Eshkhodjaev, Mahmudjon Tursunov, Khairulla Muminov, Marat Gulomov [5].

At the same time, the community and self-government institutions face a number of challenges. At this point, it is appropriate to cite the results of a sociological survey conducted by the Public Opinion Monitoring. "Which of the problems does the neighborhood committee help your community, family members, and you personally solve?" Respondents to the question "to take measures" (89.5% in 1998, 86.8% in 1999, 82.1% in 2000, 87.9% in 2001), "to resolve conflicts between neighbors" (85 in the same order). , 9%. 79.9%, 85.1%, 83.2%), "moral education of the younger generation" (74.7%, 71.9%, 73.5%, 74.7%), " to increase legal knowledge "(62.1%, 67.4%, 64.3%, 63.2%)," to support physical fitness and sports "(51.2%, 49.5%, 56, 7%, 52.3%), "assistance to law enforcement agencies in the prevention of drug addiction and crime" (43.7%, 46.8%, 44.3%, 46.9%), "environmental issues, clean to provide drinking water "(37.2%," no ", 40.7%, 42.7%)," to provide material and moral assistance to low-income families "(38.5%, 49.3%, 48.4%, 38.5%), "fuel (gas, coal, firewood)" (36.1%, 49.1%, 36.2%, 38.4%), "assistance to sick citizens" ("no") , "No", 32.5%, 35.5%), and "employment" (22.2%, 29.6%, 16.8%, 23.1%). Having scientifically analyzed these indicators, Sh.O. Mamadaliev rightly emphasizes and recommends the need to take a number of measures to improve the activities of mahallas and self-government institutions.

The way to increase the activity of neighborhood and self-government institutions in the democratic renewal of society is to turn them into centers for the development of small, family business and private entrepreneurship.

In recent years, as a result of the support of the mahalla institute by entrepreneurs, more than 7.5 thousand barbershops, about 15.2 thousand grocery stores, retail outlets, about 6,000 shoe workshops, more than 4,000 bakeries, 4,700 medical services service points, more than 9,000 consumer service centers, firms and micro-firms were opened [6]. In 1014 mahallas of Fergana region alone, more than 29.7 thousand grocery stores, rastas, workshops and firms engaged in the above business and providing various services to the population have been established [7].

It is no secret that today small businesses and private entrepreneurs sponsor public events in the mahallas, such as Navruz, Eid al-Adha, Independence Day, Coaches' Day, weddings of our great ancestors, the restoration of folk traditions and spiritual heritage.

Today, there are more than 2 million disabled people in the country who are unable to support themselves for various reasons [8]. Therefore, experts say, "today's society is not conducive to creating the normal and comfortable life that people with disabilities need. Low-income people with disabilities do not have access to highly qualified education, employment in modern and

high-paying jobs required for the labor market, and election to public authorities or self-government bodies. As a result, people with disabilities are forced to live in a limited environment, which creates additional problems and challenges ... "Therefore, it is exemplary that young entrepreneurs and business people of Uzbekistan are doing a great job in supporting people with disabilities and their participation in community life [9].

It is important that the Mahalla Charitable Foundation provides sponsorship, practical and financial support to small businesses and private entrepreneurs in carrying out organizational, spiritual and educational work, participation in the implementation of state programs. These are not just forced assistance, but the correct understanding of the social functions of the entrepreneurial movement, its duties to society and the population. For example, in 2002, the Mahalla Charitable Foundation organized 65,931 public events with the help of 24 public organizations, NGOs, political parties, the Kamolot youth social movement and entrepreneurs. Of these, 14,672 were dedicated to the implementation of state programs "Respect for the Elderly", 6,875 - "Healthy Generation", 13,999 - raising the political and legal culture of the population, 9,712 - the upbringing of minors and mass sports, 7,591 - weddings and other ceremonies.

Financial support of small business and private entrepreneurship through the Mahalla Charitable Fund to all mahallas of the country, the population living in them, especially families in need, the disabled and the elderly, accounts for more than 60% of all expenditures, [11] such assistance continues today in a consistent, voluntary manner. The economic and financial support of small business and private entrepreneurship to the community is important, of course. The market economy forces every social activity to be measured by money and profit. Especially a person who is engaged in entrepreneurial activity deeply feels the power of money, does not scatter them in the opposite direction. However, in the heart and spirit of the Uzbek people, there is a tendency to look at the situation of those around them and, if necessary, to help them and show them kindness. He inherited this quality from the neighborhood, the family, so he considers it a real humanity and nobility to return this quality to the neighborhood, to his family.

CONCLUSION

Entrepreneurs also carry out such activities as vocational training of young people, training in foreign languages, the basics of marketing, creating jobs and attracting housewives to socio-economic life. They will open training centers, workshops, marketing service courses in the neighborhoods. Provide assistance in acquiring cultural, educational, legal and economic knowledge in accordance with the needs and requirements of the population. These services do not bring them extra money and income, the salaries are only enough to cover staff salaries, rent, transportation and raw materials. However, entrepreneurs seek to bring these activities to the benefit of the people, to meet their needs and requirements for this or that type of service. It is true that 60-70% of small businesses and private entrepreneurs are engaged in production activities, but this does not prevent them from discriminating against the provision of socially useful services to neighborhoods and families, such as landscaping.

Neighborhoods and families also need to evoke positive thoughts about entrepreneurs and provide them with moral support. Involving entrepreneurs in community life without creating various barriers requires management skills, elders of citizens' assemblies with such a quality, homeowners can count on real practical help from entrepreneurs and business people.

ABSTRACT

Clinical trials were conducted in 50 patients with upper and lower jaw cysts. The aim of the study was to increase the efficiency of surgical treatment of patients with odontogenic cysts of the jaw with justification of osteoplastic preparations choice. Filling the cystic cavity with osteoplastic material with antibiotic addition provides good immediate and long-term results of surgical interventions. The processes of formation of newly formed bone tissue are more active. The use of bone replacement materials allows you to completely close the large cavity, while the degree of reparative osteogenesis is not reduced.

KEYWORDS: *Osteogenesis, Biomembrane, Bone Plastics, Bioceramics, Bio Glass, Osteoplastics.*

INTRODUCTION

Jaw bone tissue differs from any other segment of the skeleton in that it begins to be dominated by resorption processes as soon as the functional loads are redistributed or lost. [1]. Such processes often develop in inflammatory periodontal disease, as well as in systemic pathology, in particular - diseases of the endocrine system, gastrointestinal pathology, nephrological diseases, tumor processes, resulting in complete destruction of bone tissue with loss of teeth [10]. Also, bone defects can develop with large defects of the tooth hole left uncovered,

and it is believed that the fibrinolytic system of saliva in such conditions prevents its rapid healing, which again leads to violations of reparation and bone resorption with the formation of a defective jaw [13].

The use of various bone materials and their substitutes for bone defects creates more, favorable conditions for the solution of the problem of replacing the lost parts [5, 11]. Today, cell technologies are actively used to create materials for osteoplastics [3, 4]. Both isolated synthetic materials and combinations with biological tissues are being used [6, 11].

However, the filling of bone defects in the jaws showed low clinical effectiveness of a number of plastic materials [3,7]. Common methods of surgical treatment of bone defects of the jaw under the blood clot often produce a negative effect and, as a consequence, difficulties in prosthetics appear [3,6].

Today, many countries are working on the use of calcium-phosphate ceramics, bio-glass, satales, hydroxyapatite, both in pure form and in combination with other materials. Many of the proposed plastic materials have good biocompatibility and inertness to the tissues of the human body, as well as price availability, which makes their use attractive [2, 10, 11].

By the properties that osteoplastic materials have on bone tissue, they are divided into osteoconductive and osteoinductive. The foundations of this division were laid in the fundamental works of Casado P.L., Duarte M.E., Carvalho W., Esmeraldo da Silva L., Barboza E.P., (2010) which showed that the success of bone repair depends on the biologically active molecules that make up the bone tissue. They were the first to propose a code designation for biomaterials used to stimulate bone growth as osteoconductive and osteoinductive. It is believed that there are four ways to influence osteogenesis:

-osteoblastic (transplantation of autogenous spongy bone transplants of deterministic osteogenic prodromal cells with bone tissue formation potential);
-osteo-conductive (associated with the transplantation of allogenic bone grafts, as well as their synthetic bone analogs, in which they become the basis for the germination of blood vessels, the germination of cells from the bone bed through the activation of their own deterministic cells and further resorption of the transplant with the replacement of new bone tissue);
-stimulated or in other words, osteostimulation (exposure to various factors that can enhance existing osteogenesis processes; one of them can be called a growth factor).
At present, there are different ways to influence reparative osteogenesis, each of which has its advantages and disadvantages. There are several main ways to influence reparative osteogenesis:

-healing of the wound under the blood clotting;

-application of osteoplastic materials;

-application of platelet concentrate;

-application of biomembranes (targeted tissue regeneration);

-application of cell cultures (bone marrow, osteocytes, osteoblasts, mesenchymal cells);

-physical method of influence on bone tissue;

-combination of different ways.

From synthetic materials as carriers for cell transplantation are now widely used ceramics, which is an artificial hydroxyapatite, obtained by treating tricalcium phosphate at high temperatures. Thus, the use of hydroxyapatite ceramics has given a positive effect of stimulation of osteogenesis in the treatment of periodontal disease and the use of direct implants [5,8,10].

The use of preparations from lyophilized spongy bone of cattle, for example, "BIOOS", "Osteo-gray", "Interpos", "Biomatrix" and their analogs, has faced an insurmountable obstacle because of insoluble problems of virulence of prions - carriers of Creutzfeldt-Jacobs disease. In the U.S. and EU countries, all drugs derived from bone marrow, spongy bone, pituitary gland and cattle epiphysis are prohibited.

One of the promising trends in OMS is the emergence of glass crystalline materials - satals with different ratios of vitreous and crystalline phases (mono and polysostavs), used as substitutes for bone fragments.

Sitalls are one of the types of glass crystalline materials, which have their history only since the 50s of the last century, when the first patent was granted for them. During directional crystallization, glass turns into a fine crystal substance with a fully adjustable structure, perfectly defined crystal sizes, and a ratio of crystalline to vitreous phase. These materials have found wide application in other fields not related to medicine, such as space industry, electronic equipment, astronomy, etc.

The presence of such additions is quite understandable: bioceramics from TKF has no properties of osteoinductivity and is not characterized by high sorption activity in relation to proteins-inductors.

Midy A.G. and others. In 1998 it was found that the presence of PO_4 and CO_3 groups on the non-stoichiometric carbonate hydroxyapatite - bone tissue biomineral - can cause sorption of FGF (fibroblast growth factor), stimulating the proliferation of all types of mesenchymal cells, including osteoblasts [12].

Today's existing bioceramics is divided into inert (based on aluminum oxide AL_2O_3), surface-active (bio-glass) and resorbable, ie. The last type of bioceramics is the most popular and often used in traumatology, orthopedics, NHL, cranioplasty for replacement of bone defects of different origin.

Biosytalles (bioactive crystallized glasses) are single-phase or polyphase crystalline materials with adjustable properties, have controlled surface solubility accompanied by chemical reactions and physical and chemical processes associated with the formation of new bone tissue on the border of the implanted and bone surfaces. When they are obtained, their properties can be planned in advance.

For the first time, Z.Z. Hench (1988), investigating bioactive glass crystalline substances "Bioglass", for the first time created the theory of the mechanism of connection with bone at the border of the implanted "Bioglass" and bone. These circumstances do not allow us to classify Cerasorb by Curasan as the most effective osteoplastic material combining price and quality [9].

The aim of the study is to improve the efficiency of surgical treatment of patients with odontogenic cysts of the jaw by a reasonable choice of osteoreparation means and platelet-enriched blood plasma for the plasty of bone defects.

Materials and methods of research

Own clinical trials were conducted in 50 patients with upper and lower jaw radiocular cysts. We used autogenic blood plasma (a blood fraction consisting of leukocytes and fibrin proteins in addition to platelets) as a means of stimulating osteogenesis. The basis of plastic material was bioactive glass with antibiotic. Surgical treatment included dissection of a radiocular cyst of the jaw - cystectomy, with resection of the tooth root tip and plastic closure of the defect by bioactive glass with antibiotic on the "pillow" of autogenous blood plasma. The study was carried out in 50 patients aged 19 to 45 years, while in 30 patients - bone cavity diameter was from 0,5 to 1 sm, in 20 patients - more than 1sm.

Clinical examination was conducted according to the generally accepted standard scheme. Anamnesis data were read out, including complaints, development of the present disease, presence and absence of concomitant pathology.

All patients were divided into 3 groups according to the osteoplastic material used to fill the postoperative bone defect after cystectomy (Table 1):

1 - Comparison group - 12 patients in whom the postoperative bone cavity healed by transformation of the blood clot.

2 - Main group - 21 patients, the course of operation as in classical cystectomy, postoperative bone cavity (bone cavity diameter from 0,5 to 1 sm) was filled with bioactive glass with antibiotic.

3 - Main group - 17 patients in whom the postoperative bone cavity from 1 to 2 sm was filled with microgranular osteoplastic material - bioactive glass on the "pillow" of autogenous plasma.

Dynamic control of reparative osteo-regeneration processes was performed by X-ray examination for 1-2 days after the operation and further in 3, 6, 9, 12 months.

TABLE 1

Distribution of patients according to the type of osteoplastic material used

Research results and their discussion

1 group of investigated - 12 patients were operated on: men - 5 and women - 7, aged 19 to 55 years. 8 operations were performed on the upper jaw and 4 on the lower jaw. In total, 10 pericorneal and 2 follicular cysts were removed. Of them small cysts up to 1 cm in diameter were removed in 8 patients, and 4 patients over 1 sm in diameter. There were 11 resections of the tops of the roots. Postoperative wound healed by primary tension in 10 (83%) patients. The sutures were removed on 7-8 days after the operation. Spacing of the sutures with subsequent suppuration of the postoperative wound in patients with cysts up to 1 sm was noted in 1 (8%) people, in patients with a cyst diameter greater than 1 sm - in 1 (8%) cases. In total, complications in traditional treatment of cysts - 16%.

Patients with postoperative complications were prescribed antibiotics, daily wound irrigation with antiseptic solutions and enzymes, physiotherapeutic procedures were performed. As a result of intensive complex treatment, wounds healed in all patients with secondary tension. Patients did not complain during the control examination, the postoperative scars were inconspicuous and painless. X-ray inspection was carried out in 1, 3, 6 and 12 months, according to the results it was found that bone regeneration in the postoperative cavities is intense, the defect contours become blurred. In 6 months the newly formed bone in postoperative defects in cysts up to 1 sm in size approaches the normal surrounding bone tissue in its structure. If the defects are more than 1.0 sm in X-ray images of the newly formed bone areas, the increased spongyness with air areas is determined, centers of darkening are preserved, the structure of the bone has a fine-shaped pattern, after 12 months - a significant reduction in air areas is noted, but complete replacement of the cavity is not observed. with defects up to 1 sm.

On the basis of the treatment results of the control group cysts, in which healing of the bone cavity occurs under the blood clot, quite satisfactory not only for cysts up to 1 sm in diameter, but also more than 1 sm. At the same time, it should be noted a significant number of complications (16%), as well as delayed and imperfect regeneration of postoperative bone defects.

The second group of the study includes 21 patients: men - 5 and women - 16, aged 19 to 59 years. The operation was performed using the traditional method, after which the postoperative bone defect of 0,5 to 1 sm was filled with bioactive glass with antibiotic. There were performed 16 operations on the upper jaw and 5 operations on the lower jaw. In total, 20 near root and 1 follicular cyst were removed. Twenty-one resections of the tops of the roots were performed. In the postoperative period the patients were prescribed symptomatic treatment, physiotherapy and rinsing with antiseptic agents.

The postoperative wound in all operated patients healed by primary tension. The sutures were removed on the 7-8th day after the operation. Spacing of the sutures with subsequent suppuration of the postoperative wound occurred in 1 patient. Patients with postoperative complications were prescribed antibiotics, daily wound irrigation with antiseptics, enzymes, physiotherapy treatment was carried out. As a result of intensive, complex treatment, the wound healed by secondary tension. Patients did not complain during the control examination, postoperative scars were inconspicuous and painless. The results of treatment were traced in 18 patients within the period from 1 month to 2 years. Dense bone tissue was determined at the defect site. The teeth within the defect are stable. X-ray examination found that the active regeneration of bone tissue at the

site of the former defect begins in the second month and after 3-6 months, the contours of small defects to 0,5 sm become inconspicuous. In 6 months after the operation, the local status without any special features, dense bone tissue is palpated. On the X-ray the postoperative cystic cavity is filled with newly formed bone.

With defects of more than 1.0 sm - there is a thinning of the area of the implant inserted along the edges, in some places, the incomplete merging with the border of the actual bone fragments of the jaw in terms of 12 months, 24 months later the picture remains unchanged - in this case, the visual defect is not visualized incompletely filled, but such a state of bone on the X-ray does not allow for dental implantation at the defect site.

Thus, cystic cavity filling provides good immediate and distant results of surgical interventions. The processes of forming newly formed bone tissue are more active. However, the full recovery of cystic defect in cysts over 1 sm in diameter does not occur even within a year after surgery.

The third group of patients undergoing cystectomy with simultaneous filling of the postoperative bone cavity with bioactive glass on the "pillow" of autogenic plasma was performed in 17 patients: 6 men and 11 women aged 20 to 56 years. A cyst up to 2 sm in size was made in 13 patients, more than 2 sm - in 4 patients, 1 patient had a "causal" tooth removed. Due to the large diameter of the cyst, the tooth located in the cavity of the cyst is mobile and cannot be cut, its removal is performed. The nearest results of the operation in all patients were satisfactory. The sutures were removed on day 7-8. In terms of 1 month to 2 years, the results of treatment are traced in all patients.

At examination after 1 month patients did not complain. Blurred contours of the bone defect are determined on R-grams. In 3 months after the cysts were removed, the defect decreased by 1/3. Defect contours are blurred. Newly formed bone tissue is clearly defined at the defect periphery.

In 6-9 months the average bone cavity of the defect is filled by 2/3. The newly formed bone intensively develops towards the root tip of the adjacent teeth and to the center of the cavity. By the 9-10th month, most of the medium size cysts had a complete recovery of bone defects.

Final recovery of bone defects with small areas of thinning in patients of this group was noted in 1 year after the operation, in 24 months - in the area of defects - is determined by the dense tissue of the bone structure without air areas of sufficient density for X-rays transmission, At the same time, the newly formed bone tissue with coarse trabecular pattern, the boundaries of the alveolar ridge are smooth and clear, its overall height is not reduced, the structure of bone tissue coarse throughout.

Based on the results of this study, the use of enriched autogenic plasma and bioactive glass allows to completely close the large cavity, while the degree of reparative osteogenesis is not reduced. Two patients (11,7 %) had incomplete bone cavity recovery (cyst size more than 2 sm) during control examination in 1,5 years. In 1 (5,8 %) patients the development of inflammatory complications of the postoperative wound at control after 6 months was noted.

Comparison of bone tissue regeneration terms in the defect area allowed to establish the osseointegration level after each drug use, severity of the postoperative period. Use of stimulating bioactive material allowed to optimize the healing process of bone wounds, identify new opportunities to increase their regenerative capacity and tissue recovery.

CONCLUSIONS

The use of biocomposite material of bioactive glass promotes the more active flow of regeneration processes in bone defects, causing the energy formation of connective tissue in them and on its basis - bone structures. Filling the postoperative defect with composite material has a positive effect on the course of the postoperative period, which is expressed in a significant reduction of postoperative soft tissue edema, the absence of pain syndrome, lower temperature reaction. Large bone cavity, bone defects cannot be replaced by a conservative treatment or simple surgery, so to restore lost bone tissue should use a combination of synthetic materials that can replace the lost bone or have an inducing effect on the regeneration processes.

ABSTRACT

The article focuses on the research work of orientalist A. Urinbaev, as well as the scientific activity of the first student of the scientist D. Yusupova. D. Yusupova is a doctor of historical sciences, academician, working at the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan and mentoring many young people.

KEYWORDS: *Orientalist, A.Urinbaev, Student, D.Yusupova, Khandamir, Work, Manuscript, Arabic.*

INTRODUCTION

One of the most pressing issues is the in-depth study of the scientific heritage of the Honored Scientist of Uzbekistan, Doctor of Historical Sciences, winner of the State Prize named after Abu Rayhon Beruni Asomiddin Urinbaev and its introduction to science around the world. Because A. Urinbaev devoted his life to the history of Uzbekistan, he devoted himself to the circulation of manuscript sources that serve the development of science in our country and the world.For example, Abu Ali ibn IbnSina's "Qanun fit-tib", Muhammad SalihKhoja's "Tarihijadidiy Tashkent", "Unknown manuscripts about the history of Kokand khanate", Sharofiddin Ali Yazdi's "Zafarnoma",According to the letters of AlisherNavoi and Abdurahmon Jami - "Majmua-imurosalat", Mirza Muhammad Khaydar's "History of Rashidi", Abdurazzaq Samarkandi's "Matlaisadayn and majma-ibahrayn". It is possible to list his scientific researches on similar works. [1.1.]

Well-known Uzbek historian A.Urinbaev, in addition to leaving a rich scientific legacy, has created a school of science that is worth envying, and from this school are emerging talented

scientists who have made a significant contribution to the field of history and oriental studies in Uzbekistan.

The example of DiloromYusupova, a graduate of A. Urinbaev's scientific school, in her own words, a "skilled source scholar", is a testament to the level of educational potential of A. Urinbaev's scientific school.

DiloramYusupova devoted all her scientific and creative activity to the difficult, at the same time very important and honorable work, such as the study of written sources, their introduction into scientific circulation and their introduction to the general public.Today, DiloromYusupova is an academician, doctor of historical sciences, professor, major researcher of written sources in Oriental languages, a well-known scholar who has a place not only in our country but also abroad as a demanding teacher of many students.

D. Yusupova was born in 1941 in Tashkent in a working class family. From 1958 to 1963 he studied at the Faculty of Oriental Studies of the Central Asian State University. In 1963 he began working at the Institute of Oriental Studies of the Russian Academy of Sciences named after Abu RayhanBeruni. Academician of the Academy of Sciences of the Republic of Uzbekistan A.Askarov in an article published in the book dedicated to the 75th anniversary of D.Yusupova wrote that Diloromkhon worked with the well-known orientalist, profound scholar of Persian manuscripts AsomiddinUrinbaev in the department headed by him.Personal character, as a unique teacher, Asomiddin aka was a bright figure who was radically different from others.Convinced that she is also a teacher who respects DiloromkhonYusupova and respects her from the bottom of her heart,I am glad that DiloromkhonYusupova is not only happy in family life, but also in science and in choosing a teacher, "said A.Urinbaev, emphasizing the traditions of the scientific school. [2.1.]

Doctor of Historical Sciences, Professor U.Uvatov, who studied with D.Yusupova during her student days .He noted that "DiloramYusupova was lucky to become a student of AsomiddinUrinbaev, a great source scholar, who devoted his life to his profession and devoted his whole body to it."[3.1.]

Indeed, under the guidance of teacher AsomiddinUrinoev, D. Yusupova studied the written sources of Amir Temur and the Temurids, defended her PhD and doctoral dissertations, and became a great scholar in the field.

D.Yusupova's scientific heritage is as rich and unique as the scientific heritage of her teacher A.Urinbaev. More than 300 scientific research works, more than 20 editorial works are unique and important.

In the early days of her career, D. Yusupova was given a serious task on the work "History of Bukhara" by Abu Bakr Muhammad ibn JafarNarshahi. This work was translated from Persian into Uzbek by a well-known scholar A. Rasulov on the basis of Arabic grammar. D. Yusupova translated this translation into Cyrillic and explained the geographical terms and indicators. [4.1.] The editor-in-chief of this book was a young and well-known scientist A.Urinbaev, and in a short time he was able to fulfill such a responsible task, drawing attention to the subsequent research work of D.Yusupova.Sometimes, young researchers who are thirsty for knowledge do not have to work hard and face various artificial obstacles.A.Urinbaev has always tried to support young people who are interested and eager to conduct research.

At that time, A. Urinbaev was preparing a catalog of Abdurahmon Jami's manuscripts for publication. At that time, computer services were not popular, and all the work was manual, so the process required labor and time. D. Yusupova was a great help to her teacher in completing the work on this catalog. After making sure that the first student was ready to work independently, A. Urinbaev commissioned Sayyid Ahmad Haji Naqib to translate the work "Sayokhatnoma-iSayyid Ahmad Haji" from Persian into Russian. This work is kept at the Institute of Oriental Studies under the number inv.№4292, consists of 79 pages.The translation was made by D. Yusupova, and later in 1969 was published as a scientific article on "Information about the Khiva khanate in the middle of the XIX century by the Naqib of Bukhara Sayyid Ahmad Haji." [5.1.]

A.Urinbaev's next task for his student was to work on the work of Imam Abu Fazl Muhammad ibn Abduljalil as Samarkandi "Kandiya-ikhurd". Although she completed the full translation of this work from Persian into Russian, D. Yusupova was able to complete her work here, as the well-known scientist VL Vyatkin conducted research on this source. However, his work was not wasted, at the initiative of A. Urinbaev at the Institute of Oriental Studies was prepared a thematic catalog of manuscripts, which was worked on by D. Yusupova, R. Jalilova, and the above research work was included in this catalog.

During the preparation of A.UrinbaevAbdurazzaqSamarkandi's work "Matlaisa'daynvamajma-ibahrayn" ("The rise of two blessed stars and the junction of two seas") for publication, D.Yusupova helped her teacher with the preparation of the text. [6.1.]

D. Yusupova's subsequent scientific research was based on clear and historically considered "royal works" sources. At the beginning, the Herat historian FasihKhawafi translated "MujmaliFasihi" from Persian into Russian with a scientific commentary. In this play, the events from the creation of Adam to 1442 are briefly described in chronological order, and D. Yusupova translated the last two parts - the part belonging to the period of Amir Temur and the Temurids. It covers the political life of Amir Temur from birth, his 3-year, 5-year, 7-year military campaigns, his relations with others, his managerial skills, and the details of his death.

Based on this research, D. Yusupova defended her dissertation in 1974 at the Institute of Oriental Studies of the Russian Academy of Sciences. [7.1] At that time, scholars conducting research on the history of Amir Temur and the Timurids, such as academicians IM Muminov and A. Urinbaev, faced strong political opposition to the idea of glorifying Timur and were punished in a sense.D. Yusupova was ready for such resistance when she was preparing to publish MujmaliFasihiy as a book, and, surprisingly, there were no obstacles for her.[1.2.]When the book was published, letters of thanks began to arrive in writing from Uzbek, Russian and European scholars. Among such letters were writers EvgeniaBerezikova, Muhammad Ali, scholars O.F.Letters from Mants and others are still kept in D. Yusupova's personal library. All these events and A. Urinbaev's teachings supported D. Yusupova and encouraged her to continue studying the history of Amir Temur and the Temurids.

The scientific work "Pismo Giyas ad-Din Koshi from Samarkand to Kashan to his father" was translated from Persian into Russian in 1975 with the help of mathematician GP Matvievsky "From the history of science of the Ulugbek era".In 1979, this source was translated into Uzbek by D. Yusupova, and only in 1996 this research work was included in the collection "In memory of contemporaries of Amir Temur and Ulugbek."[8.1.]

Since 1987, D. Yusupova began to study the scientific heritage of Khandamir. KhandamirMirkhand's grandson was born in 1445 in Herat, and died in 1535 in India in Mandu.She has 13 historical scientific works, D. Yusupova found 8 of them and conducted excellent research with each of them.In 2001 he defended his doctoral dissertation on "The creative heritage of Khandamir - as a source on the history of culture of Central Asia and North India in the 15th-16th centuries."[9.1.]

Today, the name of D. Yusupova is well known to the world scientific community because she was thoroughly healed in the unique scientific school created by A. Urinbaev, regularly followed the lessons and teachings of her teacher, and worked patiently and willfully in the world of science, which only achieves small results "digging a well with a needle". . Dilorom-opa's unquenchable scientific status, which is rarely achieved by women, is due to her tireless work, research, hard work and the fact that A.Urinbaev showed his first student the right path in the world of science. First of all, A. Urinbaev was able to be a personal example to all his students, and the scientific school he created prepared worthy students for its further development.

As a result of AsomiddinUrinbaev's kindness and dedication to his students, the scientific school he created is still developing.In the case of DiloromYusupova, A.Kilichev, H.Turaev, Sh.Uljaeva defended their doctoral dissertations, M.Khamidova defended her doctoral dissertation, B.Usmanovdefended his doctoral dissertation, O.Mahmudov , Talented young people like R.Khudayberganov received PhD degrees. [1.3.]

The conclusion is that D.Yusupova, as the first student, is still a loyal and worthy student of her teacher AsomiddinUrinbaev and a devoted teacher have been teaching by mass of personal examples. The scientific school created by AsomiddinUrinbaev will continue to expand and develop in its new and innovative directions, as it has many students like Diloramapa.

DETERMINATION OF MOLECULAR AND GENETIC FEATURES AND PREVENTION OF GASTRIC AND DUODENAL ULCER

Tursunova M. U*; Boboyev Q.T**; Abdullaev U.S***

[1,3]Research Institute of Hematology,
Tashkent Medical Academy,
UZBEKISTAN

ABSTRACT

To evaluate the molecular and genetic parameters of patients with gastric and duodenal ulcer.100 patients with gastric and duodenal ulcer were examined. Of these, groups with complications (n = 49) and without it (n = 51) were selected, which were examined for polymorphic variants of the IL10 (G1C82A) and PGC-1A(G/A) genes by PCR. The IL10 (G1C82A), PGC-1A(G/A) are markers of the development of duodenal and gastric ulcer. Identification of candidate genes for peptic ulcer disease provides prevention of this pathology and plays an important role in the development of new approaches to the diagnosis and treatment of peptic ulcer disease.

KEYWORDS: *Molecular Genetics, Gastric And Duodenal Ulcer, Polymorphic Variants Of Interleukin Genes.*

INTRODUCTION

Due to the high incidence and mortality from peptic ulcer disease, the problem of this pathology is not only medical, but also an important medical and social problem [1]. Gastric ulcer (GU) and duodenal ulcer (DU) is a chronic recurrent disease, the mechanism of which is the most complex changes in the nervous, genetic, hypothalamic – pituitary-adrenal and local gastro duodenal processes that lead to changes in trophic processes in the mucous membrane of the stomach and duodenum. The development of this disease depends on the impact of specific environmental factors acting on specific genotypes [6]. Currently, despite a slight decrease in the incidence, there is a persistence and increase in complications such as bleeding and ulceration. According to numerous studies, it is known that predisposition to ulcer is genetically determined, and there are many candidate genes whose protein products are involved in the pathogenesis of ulcer. In most cases, ulcer is a genetically determined disease and is inherited by an autosomal recessive type

[4]. Some scientists believe that ulceris more often transmitted through the paternal line, but other authors believe that ulcer is transmitted via the X-linked chromosome [8]. Cases of family ulcerative process are described, when in one family five generations or a mother and four of her sons born in two marriages, as well as monozygotic twins, suffered from peptic ulcer disease [5]. The study of the molecular and genetic basis of ulcer is a prerequisite for developing new approaches to its diagnosis and optimal therapy.

Materials and methods of research

The results of laboratory and instrumental (FGDS) and molecular genetic studies were used in the verification of ulcer. The research was conducted on the basis of a sample of patients aged 20 to 84 years with gastric and duodenal ulcer in 2019-2020. The number of patients was 100 (with complication 49, without complication 51). The patients were being treated in hospitals at the Tashkent Medical Academy. The control group consisted of healthy individuals (n=85). Patients were recruited at the Department of internal diseases No. 2 of the Tashkent Medical Academy. The diagnosis of GU was based on endoscopy (FGDS) is the examination of patients. Polymorphic genetic markers of genes were determined in the Department of Molecular medicine and cell technology at the Republican scientific and practical medical center of Hematology of the Ministry of health of the Republic of Uzbekistan (Tashkent, Uzbekistan). To perform molecular genetic analysis, venous blood was taken in an amount of 3 ml in a 5 ml vacutainer (EDTA). DNA isolation was performed by the standard method using a set of reagents "Ribot-prep". Detection of molecular markers for the PGC-1A and IL10 genes was performed by standard polymerase chain reaction on programmable thermal cyclers SG-1-96 "Corbett Research"(Australia) and 2720 "Applied Biosystems" (USA), using test systems, according to the manufacturer's instructions. The deviation of the genotype distributions of the studied DNA polymorphisms from the canonical Hardy-Weinberg distribution (HVD) was estimated using the genepop (Genetics of Population) computer program for analyzing genetic data.

RESULTS AND DISCUSSION

As a result of research, gender differences in laboratory-instrumental and molecular-genetic data were not revealed. As a result of fibrogastroduodenoscopy (FGDS) in the main observation group, most patients had ulcers localized in the duodenal bulb, without significant difference from the comparison group, and mainly erosive and ulcerative mucosal lesions were noted.

Analysis of polymorphic variants of the anti-inflammatory cytokine IL10 gene showed the presence of a homozygous mutant genotype A/A among patients with peptic ulcer disease ($\chi 2$=0.02; P=0.9; RR=0.94; 95% CI 0.39-2.28; OR=0.94; 95% CI 2.42-0.36). Our studies show that the polymorphic variant of the anti-inflammatory cytokine IL10 may be associated with the development of peptic ulcer disease. Also, according to the literature, it is known that cytokine genes are among the main candidate genes for peptic ulcer disease and play an important role in the pathogenesis of ulceration, which is confirmed by the result of our study [7]. Polymorphisms of genes encoding cytokines, such as interleukin 10 (IL-10) and interleukin 1 receptor (IL-1RN), affect cytokine secretion levels and appear to contribute to the risk of gastroduodenal diseases [3]. Cytokines have a pleiotropic effect on immune and epithelial cells, regulating cell proliferation and differentiation and modulating the secretion of other cytokines, as well as the type and degree of inflammation. Chronic long-term unregulated inflammation of the gastric

mucosa is recognized as the main driving mechanism that causes tissue and DNA damage that can lead to stomach cancer [9]. Analysis of the polymorphic variant of the PGC gene revealed its Association with the risk of developing ulcer.

The mutation variant of the PGC polymorphic gene was detected in the main group of patients, in particular in patients with complications and was ($\chi2$=0.92; P=0.4; RR=1.49; 95% CI 0.75-2.94; OR=1.57; 95% CI 3.92-0.63). The PGC gene belongs to the genes encoding digestive Pro-enzymes, is localized on chromosome 6 (6p21.1), 10,690 BP in size, and consists of 9 exons and 8 introns [2]. The concentration of pepsin proenzymes of the PGC gene in blood serum correlates with the level of peptic secretion of the stomach and is associated with the severity of damage to the gastric mucosa [10]

CONCLUSION

Erosive and ulcerative lesions of the stomach and duodenum are characteristic of peptic ulcer disease in fibrogastroduodenoscopic examination during the molecular genetic study, the relationship of polymorphisms of the IL10 (G1C82A) and PGC-1A(G/A) genes with peptic ulcer disease was revealed. Identification of candidate genes for ulcer provides prevention of the development of this pathology and plays an important role in the development of new approaches to the diagnosis and treatment of ulcer. For a deeper and more reliable assessment of the role of these genes, further molecular genetic studies are recommended in various populations of the world.

ABSTRACT

This article discusses the importance of the role of expressing the use of language in the theory of speech. Functions of the speech process through the language, the role of language consumption in the evaluation logic.

KEYWORDS: *Language Consumption, Functions Of The Speech Process, The Unity Of Language And Thinking, The Differences Between Descriptive And Evaluative Functions.*

INTRODUCTION

In today's processes of development of social sciences, and of logics, the importance of evaluative logic and deontic logic is becoming of more interest for not only scientific circles, but also for wide public. The sphere of implementation of norms is very wide, and it is expressed as norms, rules, technical regulations, traditions, and moral principles.

As we are aware, the logics is one of the most complex spheres of human intellect. Each person, in possession of logical reasoning, starts to analyze meticulously the phenomena occurring in the environment. First of all, the science of logic seeks to relieve us of the faulty reasoning patterns conflicting ideas. Certainly, this type of reasoning is important in the development of all theoretical and practical spheres. In this article, we attempt to show some problems and irregularities in the process of development of evaluative logical reasoning.

All the things, phenomena, and events which are important for humans: liberty and goodness, equality, peace, truth, enlightenment, culture, material and intellectual heritage are the values. Therefore, the values and the duties, just like other moral categories, are of moral importance. Various social speculations, associated with them cannot exist without logical grounds, premises and conclusions.

It is known, that the study of the forms and the laws of the science of logic, and their usage in everyday life raises one's reasoning ability, forms a skill of proper reasoning; it facilitates for our

critical attitude towards our and other's opinion, and enables us to be able to reveal irregularities in others' threads of argument[1].

Today, there are two main directions of logic: formal and the modern formal logic, and of the two, the modern formal logic is one of the broadest logical directions. In early 20th century, the logic served as a tool for the justification of mathematics. So, it is sometimes called "metamathematics" or "the theory of mathematical proofs". This is now regarded as major tasks of the science of logic.

It must be said, that over the years the new directions and branches of logic, which is not directly related with mathematics, such as philosophical, moral, political, legal, economical and sociological logical directions started to appear[2]. The logical theory of evaluative speculations, in its turn, started to form as a new direction of formal, modal logic. The first attempt to create a logical theory associated with the theory of total evaluation belongs to the German philosopher Edmund Husserl. He, in his book "Logical Studies" tried to explain the existence of logical relations in public or social evaluation and counted down a number of prime laws of total evaluation logic. However, this type of logic was first thoroughly described by the Russian thinker A. A. Ivin in his 1968 book "On the Evaluative Logic". The further information on the evaluative logic is described in detail in "Basics of Evaluative Logic". The book serves as a convenient toolset for the beginners of evaluative logic.

In some of the achievements that economists have made with the study of formal criteria, this has led to the formation of a logical analysis of comparative evaluation.

The logical revolution of the late nineteenth and early twentieth centuries paved the way for the emergence of a logical theory that over time became known as classical logic. In this process, the British logician George Bull, the American philosopher and logician Charles Pierce, and the German logician GottlobFrege conducted their researches as well. In their works, the idea of transforming the methods commonly used in mathematics was applied into logic. The need to resort to a philosophical interpretation of evaluation is explained by the fact that the sciences serve as a particularly clear guide for the development of philosophy. It should be noted that in the history of the development of philosophy, there is almost no philosopher who has not paid more or less attention to the concept of evaluation.

Preference logic as an independent branch of modal logic began to develop after the scientific work of the Finnish scientist G.H. Wright. The methodological problems discussed in the social sciences contributed to the gradual formation of the logic of evaluation. Because the logic of evaluation has created a comprehensive platform in itself. Criteria categories such as "condition", "good", and "bad" suggest that society explores different opinions and conflicting views only within a value system. These issues have become the object of logical research.

The logic of evaluation begins with the study of the relation of evaluative considerations and its structure. It is not long before evaluation logic and deontic logic have emerged. Yet the logic of norms was developed in 1953 by G.H. von Wright, the logic of comparative evaluation in 1948 by D. Davidson, J. McKinsey and P.Sapps, Absolute Evaluation Logic in 1968-1970 by A.A.Ivin[3],in 2010 Deontic Logic Issues studied by researchers such as E.N.Lisanyuk and others.

Value is a philosophical-sociological and axiological concept used to show the universal, universal, socio-ethical, cultural and spiritual significance of certain events in reality[4].

As mentioned above, the value category is an integral element of any activity and has an important place in human life, regardless of which form it takes. The concept of value is the main source of evaluation. The concept of evaluation has been attracting the attention of thinkers from ancient times to the present day. For the process of evaluation is formed in line with the basic spiritual achievements of humans, including religion, morality and philosophy itself.

The theory of values has become the subject of philosophical, open debate. Value is a philosophical and sociological concept, first of all, the positive or negative value of an object; second, it expresses the normative determinant-evaluative aspect of social consciousness (subjective values or values of consciousness). Accordingly, the values of objective and subjective consciousness differ from each other[5].

Man not only understands things and events but also their properties, evaluates their value, that is, reveals the axiological aspect of consciousness. The subjective aspect of consciousness requires a person to be accountable for processes like practical activities: selection, planning, evaluation. This process is related to the concepts of evaluation.

The concepts of evaluation are widely used as axiological categories in determining the absolute and comparative nature of an object. The subjective nature of evaluation has been explored in various theories to express the world's ideas of humanity.

It is well known that axiological categories comprise important structural components of evaluation considerations. Scientific research of such processes is carried out through the logic of evaluation. This process is similar to modal concepts in terms of its logical properties.

Modality is the process of evaluating social thought in one way or another. For example: logical ("necessary", "possible", "rejected"), from an epistemological point of view ("clear conviction", "doubt", "rejection"), etc.

The process of various debates related to value has led to the formation and development of logical research on social evaluation. Knowledge of the logical features of evaluation will be necessary to study the interrelationships, evaluation, and norms in descriptive considerations. The standard direction of current logic begins with determining whether a sentence is true or false. In this case, evaluation and normative considerations will be necessary to determine the value of authenticity. While evaluation feedback tends to be judgments and conclusions of specific ideas, its main goal in the evaluation logic is to define a "description of feedback" and a "logical sequence" in sentences and terms.

It is well known that social goodness and evil in social phenomena; progressive and reactionary significance of historical events; useful effect or theoretical significance of scientific truth; distinguishing moral categories such as good and evil in people is one of the tasks before the value system. In turn, the science of logic explores the solution of certain social values: through various social, logical assessments, formal-logical considerations, deontic norms. Some ethical philosophers try to reject evaluation in any descriptive sense.

Evaluation logic is a branch of logic science that studies the logical structure and logical connections of evaluative considerations. The principles of axiological completeness and

axiological inconsistency apply in the logic of evaluation. According to the principle of axiological completeness, an object is evaluated as good or insignificant or bad. On the principle of axiological inconsistency, however, contradictory situations together are not good (bad). This principle requires an internal inconsistency of the accepted evaluation system, whereas in fact the evaluation is often biased[6].

The formation of evaluation logic is related to the consistent analysis of judgments and conclusions about evaluation in society. In philosophical and methodological scientific directions, the study of public opinion, the evaluation of a particular object, the need to describe it also led to the formation of the logic of evaluation. Because the assessment helps to form a clear idea of the object and methodology of science, to systematize the process of learning about social procedures, using the existing social, philosophical, ethical, legal considerations.

It is natural that there might be a debate in society about the contradiction of basic moral categories such as good and evil, good and evil. At the same time, it seems difficult or impossible to conduct a logical assessment and scientific research of norms through open and clear considerations. Even Socrates faced difficulties with the opportunity to explain the value between truth and evaluation in a single comment. In his view, a truthful, just man cannot commit unjust acts, otherwise he will not meet the criteria of fairness. It should be noted that in the process of transition from one historical period to another, from one social thought to another, evaluation and norms can be subjective and variable.

The question is: Can people who talk about issues related to the criteria of "good" or "conditional" disagree with each other? Of course, it is possible that such cases are common in society. Science is a system which is connected with the concepts of reality and ensures that it corresponds to its subject and does not change them. Only a correct, firm, and reasoned response will be the basis for the formation of a clear, important system of feedback. The clash of judgments about goodness and obligation, in turn, leads to the creation of a theory of logical reasoning. In philosophy, some scientific research related to value has led to the development of evaluation logic.

Evaluation logic is one of the branches of modal logic, which includes the absolute evaluation logic formed by the concepts of "good", "bad", "insignificant" and the comparative evaluation logic formed by the concepts of "better", "worse", "equally valuable" (the same). The logical theory of evaluation includes the logic of comparative evaluation and the logic of absolute. The logic of evaluation began with evaluation and reflection of norms. Of course, it assumes the study of descriptive and affirmative assessments of events in society, along with the social sciences, using logical methods without going beyond the bounds of logic. The method of expressing evaluation in language is diverse, and evaluative considerations are expressed in the form of a particular social standard, rule, pattern, convention, request, and promise in expressing the nature of evaluation.

Appraisal judgment is a judgment that establishes an absolute or comparative evaluation of a particular object that is specific. Evaluative feedback not only shapes public opinion about a particular object, but also provides an assessment of it. Assessment represents the appearance of language in the value relationship between thought and object.

Appraisal judgment is a judgment that expresses the absolute value of an object. Evaluative feedback is neither true nor erroneous. Evaluative feedback is explored in the logic of evaluation

and preference logic. The evaluation includes: the evaluating entity; subject of assessment - an object being evaluated or whose value is being compared; type of assessment - absolute and comparative; the basis of evaluation is how it is evaluated. All of this is not explicitly stated in the evaluative review. But without any of them, there will be neither evaluation nor evaluative feedback. For example: "The student answered better today than yesterday." The subject of assessment is the student's answer, the type of assessment is better (comparative), the basis of assessment is time (from yesterday to today)[7].

In the logic of evaluation, there are concepts such as theoretical forms and formal relations of evaluation, which are used in the categories of "contradiction", "image-evaluation". In this case, the descriptive idea comes in the opposite form to the evaluative idea.

Description (Latin: Description) is a linguistic expression that serves to define the properties and relationships of a particular object in relation to other objects. A description is a descriptive expression, not a name[8].

Sometimes, depending on the content of the sentence, social considerations are divided into theoretical (descriptive, indicative, declarative, etc.) and evaluative. In this case, the theoretical considerations describe the state of the event. In evaluative considerations, it is expressed through the concepts of "good", "bad", "indifferent", which are valued by man and society.

For example, the laws of nature or physics are descriptive reasoning. Sayings such as "It is good to give alms to the poor on a regular basis in all the peoples of the world" or "the law is made and enforced is irrelevant to some individuals" are examples of evaluative considerations. Evaluative reviews not only describe the existing reality, but also confirm or criticize this or that social situation.

In general, the theory of evaluation logic includes comparative and absolute evaluation logic. The late formation and slow development of absolute evaluation is due to the widespread perception that evaluation depends on preferences. The definition of comparative valuation concepts is partially encountered in absolute valuation, where the positive and negative aspects of preferred valuation concepts are compared. In a comparative evaluation, it is determined that one thing is superior to another.

The logic of preferences is the logic of comparative evaluation, which determines whether one thing is superior to another. The logical study of comparative evaluation began in the 1940s. In the logic of preferences, "good" and "bad" are considered to be mutually definable concepts. M: The considerations of "straightness is better than curvature" and "straightness is worse than curvature" are mutually definable. Equality means that an object is neither good nor bad. Like items that are rated as good, items that are rated as bad can be equally valuable. In the logic of preferences, the following is the law:

- Nothing is better than itself;

- If the former is better than the latter, it is incorrect that the latter is better than the former;

- One thing can be neither better nor worse than another;

- If the former is better than the latter, and the latter is equal to the third, then the former is better than the latter;

- Everything is equally valuable;

- If the first is equal to the second, the second is equal to the third, then the first is equal to the third.

The principle of axiological completeness is used for comparative evaluation in the logic of preferences. This principle does not apply in some areas (arithmetic, geometry). In some types of preferences the law of transitivity is manifested: if the first is better than the second, the second is better than the third, then the first is better than the third. The logic of preferences means choosing wisely - choosing the most valuable of the available alternatives. Therefore, the law of transit remains a necessary condition for rational choice[9].

The formation and development of the evaluation text is related to the logical theory of practical ideas. Aristotle also mentioned the existence of practical considerations as well as theoretical ones. He understood that practical ideas can be actively acted upon in practice and expressed in rational grounds.

Researchers of philosophy and ethics have also argued that it is expedient to use the methods of formal logic in the study of the ethical processes associated with dignity and evaluation. For example, the German philosopher Edmund Husserl, one of the founders of phenomenology, says: "Formal logic gradually expands, and as a result it reflects formal axiology and methodology. This process, in turn, leads to the development of evaluation logic. Each social sphere has its own "syntactic" categories, its own basic modal concepts, deductive forms and, consequently, its own "formal logic"[10].

Thus, it is no exaggeration to say that the logic of evaluation is the result of scientific ideas and methods of expression of moral, economic, political and legal opinions in society through the prism of modern formal logic. This is because the logical theory of evaluation considerations allows the judgments about evaluation to expand the formal criteria of rationality. The formation of the logic of evaluation ultimately proves that judgments about value are irrational and not far from logical. The formation of a logical theory of evaluation considerations, on the other hand, created a certain conceptual schematic process in the study of the solution of certain problems in society.

Another factor in the formation of the logic of evaluation is related to such concepts as "choice", "benefit", "probability", "obligation", and the widespread discussion in the social sphere forms scientific theoretical concepts. As a result, the logical features of evaluation, the role of evaluation in scientific knowledge, encourage research in evaluation logic to form a clear idea of their relationship to norms.

Swedish scholar Gunnar Myrdal points out: "Not much is being suggested to resolve the debate in the social sciences. In this case, it is necessary to look only at the basis of a specific assessment, which is clearly formed assessment. When we define evaluation, we can develop our thinking in a rational way. " Myrdal argues that there is no science without evaluation, and that evaluation has significantly expanded the field in which it is inevitable. Of course, such approaches also help to shape the logic of evaluation within the science.

In the 60s and 70s of the last century, the so-called "historical school" in the methodology of science, "neo-positivism" significantly changed the attitude towards values and evaluation. That is, components of evaluation patterns or "paradigms" that govern "normal" science began to take

shape in the existing and evolving context of scientific theory, and in logic science to explore concepts such as "evaluative feedback," "evaluative feedback structure," and "different aspects of evaluation and description." became the basis for the study of the process and the development of evaluation logic.

In this article, we have only analyzed some aspects of the issues related to the process of formation of evaluation logic. Many issues related to this issue are still pending.

ABSTRACT

This article explores anthropocentric linguistics, the role of language in the formation of the knowledge system in the process of knowing the objective world, the conditioning of logical (mental), mental, linguistic (speech) phenomena, and their specific features, linguistic abilities and activities and their connection with other activities. issues such as the creation of artificial intelligence (thinking) using language tools are current problems of anthropocentric linguistics. Of course, anthropocentric linguistics, which deals with the units of the language system, their features, the possibilities of organizing the system, the linguistic system at the center of the problem, the linguistic system at the center of the problem, the language system and the external factor relationship do not deny each other. further enriches.

KEYWORDS: *Anthropocentric, Linguocentric, Intensification, Deintensification, Intensifiers, Privative, Gradual, Equipollent, Binary Opposition, Phonetic Paradigm, Lexical Paradigm, Morphological, Syntactic Paradigm.*

INTRODUCTION

The development of world linguistics in the following decades is particularly significant in that many scholars have taken a consistent approach to language from the point of view of direct anthropocentrism; as such an approach focuses primarily on the human factor, i.e. language speakers/writers. In this regard, new interdisciplinary scientific directions are being formed in modern linguistics, such as psycholinguistics, sociolinguistics, linguocognitology, linguoconceptology, linguoculturology, lingcopragmatics, linguostilistics, in which language studied in organic connection. Thus, on the one hand, cognitive linguistics is as relevant as the

study of the close connection between language and thought, that is, the realization of a set of cognitive knowledge about the objective being in thought through different types of verbal means in language, and the problems of systematic study of linguistic and cultural aspects of these verbal means. makes finding a solution to the problems its main goal.

From the point of view of general linguistics, the semantics of intensification/ deintensification based on conceptual opposition is a semantics that exists in the concept sphere of the speaker/writer in every language, and it has a universal nature. Like a number of other universal semantics, the conceptual semantics of intensification/deintensification is, on the one hand, "strengthening (like a mountain), enlarging (like a giant), increasing (full), multiplying (thousands, millions, more than a hair)", on the other hand, it is a macro-conceptual semantic category based on the opposition of conceptual microsemantics, such as "weakening (barely), shrinking (like a particle), reduction (four-day world), reduction (hard to swallow a drop of water), which is the subject through objective language units. the event (human, animal) is realized in order to strengthen or weaken in a certain way the level of description of the semantic features such as quantity, quality, action, process, state, etc., which are realized [10; 137]

It is well known that intensification/deintensification, like any linguistic phenomenon, has been studied using various methodologies and techniques throughout the development of linguistics. It should be noted that language units will exist as a system in the memory of its users. Each language owner of a particular society has its own linguistic system based on their life experience, place of residence, vital and scientific knowledge needs. Each speaker distinguishes the linguistic units memorized in the process of speech and the methods of their use from the linguistic system in his memory, with the help of which he composes speech units - sentences, text. Speech units in the status of this variant are taken as the subject of study of linguistics. Hence, the linguist studies the linguistic system stored in his memory through its units of specificity, variability in external speech. For example, we are not able to study the meaning or function of the "very" intensifier while it is in memory, in the system (as if it were very, very. Therefore, in the process of speech formation, we take the intensifier "very" from our memory, our linguistic system, and apply it in speech, and thus try to determine its meaning (function) when combined with other words.

Intensification/deintensification phenomena, the intensifiers that generate them, and the deintensifiers were initially studied on the basis of a formal (simple) logic methodology. The third of formal logic, the law of exception, as a methodology, recommends that the researcher initially take only two things to study, and compare them on the basis of similarities and differences. For example, when we begin to study the system of very-most-extremely-incomparable intensifiers, we divide this system into binary (like very-most, very-very, very-unique, most-unique) and so on. It is said that a comparison should be made on the basis ofthe binary opposites here are called binary oppositions. There are privative, gradual, and equipollent types of binary opposition. In the private opposition, the sign of contradiction is complete and clear in one of the opposing members, and vague (inaccurate) in the other, in other words, the two linguistic units are compared in terms of whether they have a particular sign. For example, the words too and horror, which are present in the combinations of "very good place" and "terrible place," are intensifiers representing different levels of reinforcement. If this very horrible opposition is viewed (compared) in terms of affectiveness (emotionality), then this contradiction is a privative opposition. Because the "very good" member has no emotional seme,

and the "terrible" member has. In the equipollent opposition, which is the second type of binary opposition, the question of the existence of a sign is not raised. These so-called equipollent oppositions have a looser bond than privative oppositions. Relative independence is strong here. Contradictions that reflect different levels of a character are called gradual oppositions: like very-little, often-average. Privative oppositions lead in the study of intensification/deintensification based on the third exceptional methodology of simple logic methodology.

The third of formal logic is that the method of analysis takes precedence over the method of synthesis when dealing with exceptional methodology or binary oppositions. Because the method of analysis is a way to separate the whole (system), to divide it into parts. Only after the system is divided into parts (elements), the components, two of them can be taken and compared, put in opposition [4; 38-42].

 In general, the study of the system of intensifier/deintensifiers in human memory from the linguistic macrosystem, the amplifying / weakening microsystem from this system, the separate intensifiers from this microsystem was carried out on the basis of the third exceptional methodology and its binary oppositions (privative, equipollent).

 The third conditional law of dialectical logic is the law that recognizes the existence of a third thing or an intermediate third between two things (event, sign, relation) that are comparable by simple logic as an exception. In other words, the dialectical methodology based on the intermediate third is in fact the third of the formal logic, a continuation of the work done on the basis of the exceptional methodology. In this case, the linguistic units studied earlier on the basis of binary oppositions obtained separately are interconnected on the basis of similar features, and thus the problem of the system of linguistic units is considered. For example, while intensifier words such as very on this basis an attempt is made to determine how the system is formed. More precisely, it is noted that these words are connected in a certain order of gradual increase of character reinforcement: very → most/very → extremely → unparalleled (where the words most and most are equally valuable, synonymous, they differ stylistically: very neutral, very, applied in an artistic style. We must admit that the study of any linguistic unit, in particular intensive words, on the basis of a formal logic methodology is less complete than the study on the basis of a dialectical methodology. In particular, we have found in the descriptions of the two members (binary) that both the very word and the ultimate word have a reinforcing meaning. But we will find out in what state, in what quantity (degree) each of the five words has a reinforcement in the study based on the existing methodology of the third of dialectical logic. In particular, the very → most/very → extremely → unparalleled line mentioned above is expressed in the sense of the specific reinforcement of each word: the meaning of much is lower than most/very, the meaning of very much is very low, like strong. Determining the meaning of the five intensifier words shown on the basis ofgraduality (intensification/dein-tensification) is crucial for the creation of explanatory dictionaries and language learning.

In linguistics, when studying any language unit, especially intensive and intensifier units, work is done with the scientific concepts of category, paradigm, field. It is therefore important for the linguist to understand their differences. This is because the study of amplification/attenuation units also has to deal with these scientific concepts [1; 4-16].

It is well known that the concept of category has passed from philosophy to linguistics, meaning "general concept". In particular, the concepts of object category, subject category, space category in philosophy reflect a high degree of generality. In linguistics, too, the word category retains its common meaning: as a number category, as a category of agreement. In order to be a linguistic category from a linguistic point of view, there must be a general meaning, specific types of this general meaning, and forms of these. In other words, special types of a common meaning must form a mutual contradiction and on this basis form a whole category. For example, the intensifying/weakening (intensification/deintensification) of meaning is a generality, and this general (categorical) meaning is branched into its specific types, i.e., amplified on the basis of words, amplified on the basis of morphemes, amplified on the basis of semantic component (seme) all of which constitute an intensification/deintensification category. Hence, when we say the category of intensification/deintensification, we mean that the phenomenon of strengthening-weakening of a sign is considered from the point of view of generality-specificity.

The system of units of intensification/deintensification event is also considered as a paradigm.

As B. Mengliyev noted, the system of linguistic units, united on the basis of a common sign and requiring each other, but each with its own sign, is called a paradigm (paradigm means paradeigma in Greek - example). This implies an associative connection between them, that is, the recollection of one when the other is said, forming a "nest" set based on the uzual similarity of the intensive/ deintensive units. Just as a word belongs to the same cell (gender), it can communicate about each other for a paradigmatic word because it has a common semantics [7; 49]. In particular, when we say "very" we remember the words "most", when we say "most" we remember the words "very" and so on.

Examples of semantic paradigms are synonymous series, semantic groups of lexemes, and semantic fields. However, both paradigmatic and hierarchical relationships are observed between lexical-semantic group, semantic field elements. Lexemes to lexical paradigms, more precisely, their semantics are combined with integral semantics. But each member of the paradigm has differential semaphores in addition to integral semaphores. These differential semaphores cause paradigm members to oppose each other.

The paradigm is divided into large and small, internal and external paradigms, according to their scope. These paradigms are derived from each other. For example, the paradigm of consonants (large or external) in languages is divided into paradigms of voiced and unvoiced consonants (small or internal) [7; 51].

The paradigm is related to the concept of system, which is also used in other sciences as a linguistic concept. A system is defined as the formation of a whole based on the necessary connections of two or more things (elements). We can also see this within the units of intensification/deintensification. In particular, the words extremely, very, unparalleled, extremely, most amplifying form a series of necessary connections, such as very → most/very → extremely → unparalleled, based on the sign of the gradual increase in character level, and on this basis form a whole or system. A system of phonemes is a phonetic (phonetic-phonological) paradigm, a system of lexemes combined into a series of synonymous, antonymic, graduonymic forms lexical paradigms, a morphological category (system of morphological forms) is a morphological paradigm, and a system of syntactic patterns is a syntactic paradigm. The syntactic paradigm is divided into speech and phrase paradigm. The speech paradigm is further

divided into simple and compound speech paradigms. (We will discuss in more detail in the following sections of our work how the semantics of intensification/deintensification form the paradigms of the units of levels mentioned above).

Ferdinand de Saussure in his time divided linguistics into two types, internal and external. He recalls that while internal or pure linguistics deals with issues of the language system, external linguistics deals with issues of the language system that are adjacent to it. In particular, language and psyche (psychology), language and thinking, language and biology/anatomy, language and sound phenomena are among them. With the study of the relationship between language and related phenomena, mixed disciplines such as psycholinguistics, mental linguistics, and sociolinguistics emerged.

At the end of the twentieth century, anthropocentric linguistics emerged, which differed from system-structural linguistics. This linguistics began to study the language system that had been studied before him, the issues of man, human activity, his needs, and their impact on this language system. On the other hand, anthropolinguistic linguistics, which focuses on human activity, has had a major impact on the process of science integration.

In modern anthropocentric linguistics, the role of language in the formation of the knowledge system in the process of knowing the objective world, the conditioning of logical (mental), mental, linguistic (speech) phenomena, and their specific features, linguistic abilities and activities and their connection with other activities. issues such as the creation of artificial intelligence (thinking) using language tools are current problems of anthropocentric linguistics [2; 3-4].

Another problem of anthropocentric linguistics is to explain why language units and systems are made in such a way, the need for it on the basis of external factors, other types of human activity. Since this requires an interpretation of the language system in relation to the types of activities inherent in man, the linguist must be acquainted with the content and achievements of all the humanities and some natural sciences.

Of course, anthropocentric linguistics, which deals with the units of the language system, their features, the possibilities of organizing the system, the linguistic system at the center of the problem, the linguistic system at the center of the problem, the language system and the external factor relationship do not deny each other. further enriches.

Of course, many problems of linguocentric linguistics are waiting to be solved at the present time. The main task of the analytical flow is to study the semantics of language units. It is well known that the morpheme, word, phrase, and sentence structure, which are linguistic units, have not yet been fully studied in terms of semantic structure. Therefore, the system-forming capabilities and pathways of language unit semaphores have not been thoroughly and thoroughly investigated. Therefore, the semantic basis of paradigmatic, syntagmatic connections of language units is not fully explained. It is also not disclosed that all general concepts are formed at different hierarchical levels, and that they are located in the form of a field relative to each other. This linguocentric problem also applies to intensifiers/deintensifiers, which are full language units. So far, the semantic analysis of the intensifier/deintensifierhas not been conducted, their ability to form a system, the acquisition of certain values (properties) in the structure of the system, changes in semantic structures in speech have not been studied. All this suggests that traditional, linguocentric linguistics also has current problems [2; 3-6]. Therefore, this paper

discusses the possibilities of intensive/deintensive semaphores to form language units and paradigms, the characteristics of the occurrence of intensification/deintensification at different levels, and the micro and macro paradigms associated with them. As mentioned above, leading anthropocentric linguistics in contemporary linguistics argues that extralinguistic factors (such as speaker, listener, speech conditions) that are inextricably linked with language should be considered in the study of the nature of language/speech phenomena.

Hence, the issue of looking at the phenomenon of intensification/deintensification in language from this perspective is now relevant.

When approaching the phenomenon of intensification/deintensification from an anthropocentric point of view, the study of what external needs, probabilities, the influence of external factors on the formation of intensification/deintensification is studied, and this serves to enrich our previous knowledge.

Another anthropocentric problem of intensification/deintensification semantic units is their conceptual (conceptual) study. Now the anthropocentric concept is understood as a mental unit related to the federation of mixed sciences, such as logical-psychological, logical/ psychological/ linguistic/ linguoculturological. Each private science is trying to analyze its unity only on the basis of this mental system. If we approach this issue from the point of view of the semantic unity of intensification/deintensification, we will have to define a system of associations related to these concepts, from the grammatical meaning of the definition of a particular, for example, "very" intensifier. Linguistic, logical, psychological methods are involved in this analysis.

It is obvious that the study of the "iceberg" under the semantics of intensification/ deintensification and, on this basis, the description of the unit of intensification/deintensification is a very difficult task. Current linguistics does not have sufficient experience and research results in this field, research in this field is ongoing.

ABSTRACT

This article attempts to review the chronological problems of the initial settlement of Central Asia using the example of archaeological sites in the Angren River basin. Paleolithic monuments of the southeastern slopes of the Chatkal ridge, in particular Kolbulak and the Akhangaran complex of monuments, are being investigated. On the basis of absolute dating, it was concluded that the early periods of settlement of this region date back to 1,500,000 years ago, which makes it possible to include this region in the area of the most ancient focus of anthropogenesis.

INTRODUCTION

In archeology studying the Paleolithic era of Uzbekistan, the issue of chronological determination of the period of the initial settlement of this unique region of the Eurasian continent is key. Until recently, a number of researchers believed that the duration of the anthropogen was approximately 800,000 years. It included periods of continental ice sheets. However, the results of studying the Paleolithic eras in Uzbekistan over the past decades show how many seemingly effective and convincing schemes and constructions break down. How

plausible were the teachings about the ancient paleoanthropes of the Acheulean era, who were engaged only in gathering plant food and hunting animals that did not know either fire or life in caves. And with the onset of the great glaciation, the paleoanthropes switched to hunting large animals and settled in caves. But numerous facts, step by step, refuted these propositions, and as a result, it was firmly proved that the most ancient people of the Sinanthropus type knew fire, lived in caves and hunted large animals [1].

In recent years, there have also been fundamental changes in views on the antiquity of the human race and not its ancestral home. East and North-East Africa, where the remains of the most ancient hominids were found, was considered one of the generally recognized centers of anthropogenesis. But hominid finds were also discovered in the Neogene deposits of Southeast and Central Asia. These facts, in turn, raised the question of the possible inclusion of this region in the area of the most ancient focus of anthropogenesis.

The complexity of solving the problem of the settlement and adaptation of the earliest man is associated not only with the difficulty of obtaining new factual data due to the small number of populations that lived in huge spaces, but also with the level of development of science studying the Anthropogenic period. Therefore, the main attention in our research was directed to the study of stratigraphy, absolute and relative chronology.

MATERIALS AND METHODS

The accumulation of extensive material obtained from the unique site of the early anthropogenesis of Selungur makes it possible to proceed to generalizing the regularities of the conditions of the initial habitation of this region of the paths and chronological stages of the formation of the most ancient culture of the Stone Age. The remains were discovered by archaeologist U. Islamov in 1985, at the same time he dated this find to the early Paleolithic era, that is, approximately 700-650 thousand years BC. Thus, all this once again confirms the current opinion of the historians of the republic that the territory of modern Uzbekistan was one of the centers of the emergence and development of the most ancient man.

In recent years, quantitative methods, a typology of stone tools, and mathematical modeling have been successfully developed. As a result of studying the stone inventory of the Acheulean multilayer site Selungur according to archaeological periodization based on a certain typological sequence in the development of material culture in time, it was established that this site belongs to the early stages of the ancient Paleolithic. This relative periodization was supplemented by the results of paleobotanical, paleozoological, lithofacies, geological and geomorphological, and a number of other studies. Comprehensive studies have shown that the periods of habitation of the Selungur site by the cave belong to the early Pleistocene [2].

Archaeological studies of the problems of early anthropogenesis are closely related to the branches of natural sciences, the results of which made it possible to draw relative chronological conclusions. But absolute dating has always been one of the most difficult problems. The most common and universal method is radiocarbon dating, which allows you to determine the age of wood, coal, and bone. Samples can be dated by this method only up to 50,000 years. In addition, it is known that the radiocarbon dating method does not give exact calendar dates, but determines the time interval with a certain probability. A number of methods for determining age from thorium isotopes are also known, but its reliability depends on a number of conditions. The

thorium method can be used to determine the average bone mineralization time. But how long the mineralization process lasted is even more difficult to determine.

In connection with the above, the introduction into practice of archaeological research in Uzbekistan on the initiative of academician B.S. Yuldashev's most promising method of potassium - argon dating is an outstanding event. As a result of a chronological study of the teeth of the archanthropus from the second cultural layer of the Selungur cave, carried out in the analysis and information department of the nuclear chemistry sector by professor Sh. Khatamov, analysts N. S Osinskaya, TP Rakhmanova, an absolute dating was obtained for the first time. The performed determinations of absolute dating showed that the earliest periods of habitation of this region date back to 1,500,000 years ago.

Due to the constant improvement of the methods of archaeological research, the significant expansion of the available information base on the Paleolithic objects of Uzbekistan and the creation of broad generalizing cultural and chronological schemes for the development of stone industries in the region, all this forces, at a new, modern level, to analyze materials from monuments that have already become classic. In this regard, the upper layers of the classical for the whole of Central Asia are of great interest for Paleolithic studies, according to Academician V.M. Masson, Kulbulak monument. The Paleolithic monuments of the Angren River valley attract an increased interest of specialists in the ancient history of anthropogenesis. Opened by O.M. Rostovtsev here in the 60s of the last century the Kulbulak site from 1963 to 1988 was studied by MR Kasymov.

The Paleolithic team of the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan has repeatedly examined the southeastern slopes of the Chatkal ridge. As a result of field work, the Kulbulak site and several flint-working workshops were discovered. The latter are located on the right bank of the Angren River near the Paleogene and Cretaceous rocks in those places where the outcrops of raw materials are cut by mountain streams - Kyzylalmasay, Gyshtsay, Karabagsay, etc. In these workshops, a large number of stone products were found that characterize the activity of primitive man, including , Late Paleolithic [3].

In modern literature, there are several rather contradictory opinions about the nature of sedimentation processes and the possible redeposition of both lithological horizons identified in the stratigraphic sections of Kulbulak, and the stone artifacts contained in them. According to M.R. Kasymov, the essence of the Kulbulak site is that it is a multi-layered monument containing the Acheulean, Mousterian and Late Paleolithic cultural layers, located one above the other and marking the transition period from the Ogachel to the Mousterian and from the Mousterian to the Late Paleolithic [4].

Research has shown how unique this monument is. In 1994 - 95, a joint expedition of the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan and the Paleolithic Department of the Institute for the History of Material Culture of the Russian Academy of Sciences conducted new research here. In 2001, reconnaissance studies were carried out in this area by employees of the Department of the History of Material Culture of the Institute of History of the Academy of Sciences of the Republic of Uzbekistan, the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan and the University of Colorado (USA). In 2001, a new Paleolithic monument was unveiled, located 5 km to the west of the Kolbulak site, called "Akhangaran".

In the study of the history of the Paleolithic era, including the Late Paleolithic, in many cases, the main source of information about our distant past are stone tools processed by man. Thanks to the efforts of archaeologists - researchers, these artifacts inform about the life of our ancestors, distant from us at intervals of several tens of millennia. Techno-typological study of the Paleolithic industries is one of the most important moments in the study of primitive history. Moreover, it is in their solution that lies the cultural and material state, the level of conceptual thinking, economic and economic activity of the people of the Paleolithic era. The results of this kind of research largely depend on the research methodology. Recently, in Uzbekistan, a technical and typological research methodology developed in France and accepted in world practice has been successfully used [5]. Dialysis of the paleogeographic situation in the area of the Akhangaran locality made it possible to restore the spatial position of the uneven-aged complexes of the dissected relief. The results were used as the basis for the reconstruction of the main stages of the morphological formation of the valley of the Angren River basin and its mountain frame, which is characterized by the presence of three parts of different ages: 1) the ancient watershed surfaces of the main Chatkal and Kurama ridges; 2) the Pradolin of the Angren River embedded in them; 3) the narrower modern valley of the Angren River.

The ancient surface is slightly dissected and strongly inclined to the south. Below is the vast pradolin of the Angren River, within which two incisions stand out. The relief of the entire valley of the Angren River and its separate incisions forms the middle Angren stage. Further, the modern valley of the Angren River is located asymmetrically in relation to the ancient praradolin. The ancient relief belongs to the middle Angren stage. The late valley of the Angren River is expressed by two incisions; upper - high terraces of the Middle Tien Shan complex; lower - low terraces and floodplain with wider and gently sloping surfaces of the Late Tien Shan and Holocene complexes [6].

The Paleolithic monument "Akhangaran" was discovered on the surface of a relief belonging to the late Tien Shan and Holocene complex. The industry of this locality does not differ from the industry of the upper layers of Kolbulak. Of the 85 items discovered at the site, cores are distinguished. All specimens were processed according to the principle of disc-shaped splitting and worked. Blade blanks are very rare (for 5 cut pieces, there are 9 pieces with a radial cut of the back, 16 pieces of small flakes and blades).

A complex of tools is characteristic, in which many methods of secondary processing are presented. On the basis of a typological study, the tool complex of the Akhangaran locality is subdivided into two large groups: 1) side-scrapers 2) retouched flakes. However, the most characteristic of this complex are small flakes processed along the perimeter with steep and retouching. These tools are usually in the range of 3-5 cm. This new location is most likely a short-term camp of the inhabitants of the base camp located on Kolbulak.

It is possible that the industry of the Akhangaran locality, like that of Kolbulak itself, should be attributed to the recently actively discussed microindustrial direction of the Lower Paleolithic technique of stone tools processing. Despite the fact that the Kulbulak tool complex contains a number of pebble tools and side-scrapers that do not belong to small tools, the general habitus of the tool complex is determined by small retouched flakes [7].

A large number of Paleolithic monuments have been studied in the Angren River basin, significant material has been obtained on the most ancient history, in which specialists from

different countries of the world show interest. In recent years, historians, archaeologists, anthropologists, geologists, as well as specialists in the study of the ecological situation in the region from ten countries of Europe, America and Asia have visited the monuments of the Stone Age. First of all, this concerns the complex of Kizil olma monuments, which were studied in the late 60s of the last century. In recent years, on the surface and natural outcrops, a group of researchers led by K.Krakhmal collected lifting material represented by numerous stone items, including cores and tools, which was identified as Mousterian [8]. This locality is located 1 km northwest of the Kolbulak site at the foot of a limestone rocky ridge stretching in a narrow strip from east to west. The collected material is extremely interesting and gives a more complete picture of the Paleolithic of the Angren River valley and the development of the historical process of the formation of the most ancient material cultures of Eurasia.

Stone products are found throughout the entire weight layer, as well as in the roof of the red earth. Stone products from the upper part of the loess had not significant patina, but a noticeable chandelier of the surfaces, as well as gray lime incrustations. Flint products from the upper levels of the loess strata collected in the destruction zone of the site were represented by relatively numerous tools, cores, flakes, and blades. Nuclei represent different stages of cleavage and are characterized primarily by disk-drive and coarse-prismatic shapes; typical prismatic nuclei are rare. There are few blades in the collection; flakes, including Clectonianones, predominate, accounting for up to a quarter of all spalls. Among the numerous items with secondary processing in good series, there are a variety of side-scrapers, scrapers, notched and notched tools, punctures, and retouched plates. The industry of this level, in terms of the totality of technical and typological indicators, is very close to the industries from the Late Paleolithic layers of the Kolbulak site.

Stone products from the middle and lower levels are few in number. They are represented by wild-type and triangular single-platform cores with prepared striking platforms, as well as single tools, including a leaf-shaped tool, the sharp upper end of which is broken off. In the collections of these levels, the Levallois technique is prominently represented, primarily flakes and cores. Similar industries throughout Eurasia existed over 250,000 years ago. Apparently, the Neanderthals, who appeared 100,000 years ago on the territory of Western Europe, moved gradually along the shores of the Mediterranean and it took 40-50 thousand years until they reached the territory of Uzbekistan. If this is true, then developed Neanderthals lived on the territory of Uzbekistan.

The early assemblage originating from red-colored deposits is of particular interest. The study of this monument seems to be very promising. This place was convenient for Paleolithic sites. There was flint here, a good view of the river valley provided control of the area, although it can be assumed that in the early Paleolithic there was a different landscape: the area was a foothill plain overlooking the plains.

CONCLUSION

1. The available archaeological material gives grounds to conclude that the Paleolithic sites of the Angren River basin are a multilayer monument with cultural layers of varying preservation.

2. The finds of Selungur are similar to the samples of the sites of the Early Paleolithic complex Kizilolma and Kolbulak, belonging to the typical Mousterian.

3. New research in the Angren river basin has shown the promise of research that is not limited to excavation of one monument, but extends to all known sites. This material makes it possible to obtain more diverse and comprehensive information about the Paleolithic of a particular region.

Results

The use of the potassium-argon method in the practice of archaeological research in Uzbekistan will make it possible in the future to improve, develop and supplement the results of studies of the early anthropogenic. This method made more complete the historical information that we sought to obtain from the archaeological site.

Thus, the method of absolute determination of chronological periods will make it possible to more reasonably cover history with a human eye, to understand its direction and humanistic content. As a result of the introduction into scientific circulation of the data of analytical studies of absolute dating, all grounds were obtained in determining the early periods of settlement of Uzbekistan.

ABSTRACT

The article discusses the pedagogical features of the organization and management of the education of the Russian population of the Turkestan territory, their sociological, economic and political significance. As a result of the planned organization of educational affairs, the massively resettled Russian population to the Turkestan territory, especially since 1865, there is a sharp increase in Russian schools and the number of their pupils.

KEYWORDS: *Education, Schools, Interests, Superiority, Education, Forcibly, Peasant, Pupils, Private, New Method Teachers, Muslim Schools.*

INTRODUCTION

Education has always been and will be one of the main criteria by which the level of development of the country, the well-being of the people and their cultural achievements are determined. Therefore, when studying the past of each nation, its history, the indicator of the development of public education is of no small importance. It is necessary to teach people to better understand what is happening to our environment, economy and society and find the best ways to solve problems in the interests of all members of society and nature today and in the long term. Since today, the world`s economies are actively preparing for the upcoming global digitalization and robotization, which will require completely different skills and a significantly higher level of human capital.

I would like our Uzbekistan and other Central Asian countries not to miss the opportunity to improve the quality of education, giving the younger generation the knowledge and skills that will help young people to succeed in life, and allow the countries of the region to keep pace with the advanced states of the world.

Studying the state of modern education, it is important to remember the historical path of public education of each state. When studying the history of the formation of the peoples of Turkestan, we note the political, sociological, economic situation in the region. Our native land attracted many invaders. The Iranian Achaemenids, Alexander the Great, the Arabs, Genghis Khan, the Russian Empire in one way or another left their mark on our spiritual and cultural life. Towards the end of the 19th century, among the peoples under the influence of Islam, a movement began to reform the traditional Muslim schools, the content of education in which developed in the Middle Ages. School reforms to one extent or another were carried out in countries such as Turkey, Egypt, where the government patronized Muslim schools. In tsarist Russia at the end of the 19th century, the movement for the reform of Muslim schools manifested itself among the Turkic-speaking peoples of the Crimea, the Volga region, Azerbaijan and Turkestan. This need was necessary, first of all, because the content of instruction in these schools no longer met the requirements of the new time, the needs of capitalist society [1].

Education in Turkestan has deep genetic roots. Strengthening of the philosophy of enlightenment in the nineteenth century is associated with the objective reasons for the lagging behind the development of the Central Asian khanates. After the conquest of Turkestan by the Russian Empire, opportunities opened up for the penetration of democratic ideas from both Europe and Asia, communication with the world, which contributed to the development of liberation ideas in the region. These were the first steps in the formation of the philosophy of national freedom. Its supporters were far from leading, organizing or supporting popular uprisings that broke out in different parts of the region.

It is known that tsarism, in order to strengthen its position in Central Asia and to own the region forever, began to pursue an active policy already in the 60-70s of the XIX century to Russify the local population of Turkestan. On the march 1870, the Ministry of Public Education adopted a decree on measures to organize the education of foreigners living on the territory of the Russian Empire. It was noted that, firstly, to increase the literacy of the Russian population of the region, secondly, to organize educational institutions that replace local traditional educational institutions, and thirdly, to control the state and direction of education in these educational institutions, to organize them within the interests of the tsarist power. To achieve these goals, long-term plans have been developed.

Providing education for the children of Russian officers, officials and businessmen in Turkestan was the primary school concern for the regional administration. In the first years of the conquest of Turkestan, children of privileged Russian families from Turkestan went to study in European Russia, mainly to Orenburg, where the 2nd cadet was created especially for Turkestanis.

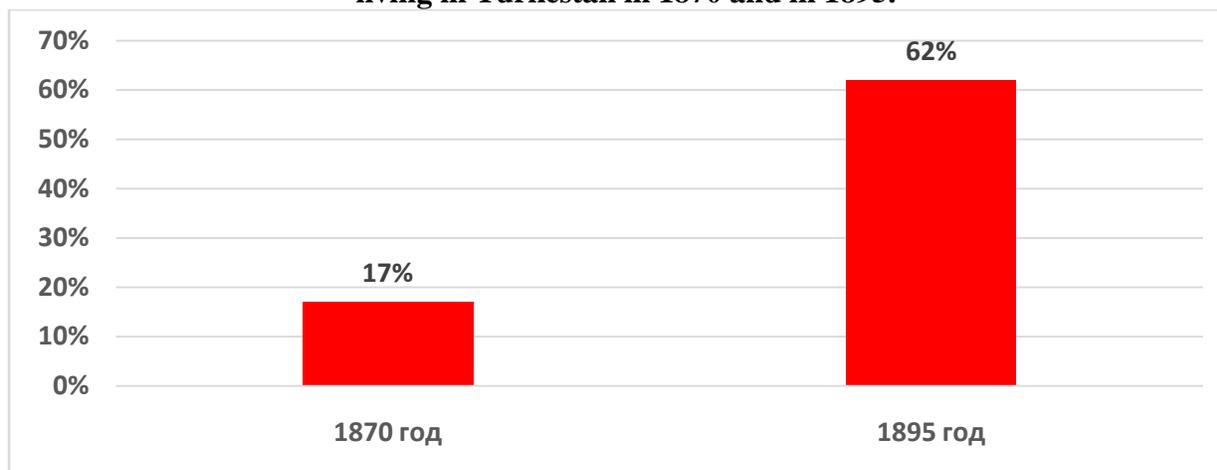
In the Semirechensk region in 1878, N.P.Ostroumov, who was then an inspector of schools, found that the region`s schools were "really overcrowded with students".Ostroumovexplained this feature of the Russian schools of Semirechye by the fact that by order of the military governor Kolpakovsky, "all children of the Cossacks under 17 must attend schools". 20 years later, the "Semirechensk regional news" citedthe following reasons for the need for compulsory

education:"Our immigrants, cut off from the European centers of Orthodoxy, being exposed to various unwanted influences from the surrounding Muslim environment, begin to largely lose both the purity of the Orthodox faith, and the Russian people become obsessed"[2;1898, №30]. The question is posed much more sharply in another newspaper article of those years, entitled "Compulsory education". The question is posed much more sharply in another newspaper article of those years, entitled "Compulsory education". The author of the article demands strict law against parents who do not send their children to school [2; 1899, №88].

In the Trans Caspian region, the military governor Kuropatkin issued an order on the fining of peasant parents from the 1895/96 academic year for not sending children to school without good reason [2; 1898, №73].

By the time the Regional Educational Institutions Directorate was opened in 1876, there were already 25 primary schools, in which there were 1,074 students of both sexes, mainly children of the Russian population. By that time, there were 48,358 Russians population in the Turkestan territory, 1,074 people make up approximately 17% of all Russian school-age children from 8 to 11 years old.But it should be borne in mind that among the 1,074 students there were also a small number of children of the indigenous population. Since 1876, the Turkestan administration began to open schools in accordance with the statutes of the Ministry of Public Education in order to serve the Russian population. In 1879, the first governor-general, Kaufman, suggested that military governors set up commissions in each district to discuss the issue of compulsory education for the Russian population and determine measures that would need to be taken to ensure that "no one evades compulsory education".The question of universal education was again raised in 1895 due to the fact that Russian peasant settlers were reluctant to send their children to schools and did not want to financially support their schools [3; C.108-109].

According to the director of public schools in the Syr-Darya region, Gramenitskiy, in 1895 in this region the coverage of school-age children of the Russian rural population was 62,2% [4; P.43]. Compared to the then school enrollment of children in central Russia, this was a very high percentage, much higher than in the most literate provinces of the empire.

The state of the involvement of children of the Russian population from 8 to 11 years old, living in Turkestan in 1870 and in 1895.


In 1904, a draft law on compulsory education for children of Russian peasants in the Turkestan territory was discussed in the council of the governor-general. From a newspaper article informing about this project, we learn interesting details. Russian schools in Turkestan, it turns out, were supported by local funds, "which, as you know, are exclusively obtained from the main payment forces of the region – the local Muslim population".The author of the note concludes that this measure, "perhaps not entirely fair in relation to the local population, should nevertheless induce the peasants to appreciate the importance of schools and instill in them the consciousness of the need to develop and strengthen the school business". Further, a certificate is given about the low cultural level of the Russian peasant and the opinion is expressed that only compulsory school "can raise the local immigrant above the level of the local population" [5; P.113].

The management of educational institutions, in addition to schools maintained by the treasury and at local public funds, was in charge of private schools. Education in Tashkent began with private primary schools in the 60s of the XIX century. There were no private Russian schools in Tashkent until 1887. In the same year, a private primary school was opened, which existed until 1891. In 1892, two private Russian primary schools were opened in Tashkent, on the basis of one of them in 1905 a private women`s gymnasium was organized by O.P.Mikhailovskaya. From a private elementary school, opened in 1903, L.F.Gorizdro`s private women`s gymnasium developed. Other Russian private primary schools were opened in Tashkent in 1900, 1902, 1903 and they existed from a year to 7 years [6; P.206-211]. These schools usually prepared children of both sexes for admission to secondary education. On the edge in 1904, there were 5 private schools (179 students).

The growth of Russian educational institutions and students in them in 1896 and 1905 years

Name of educational institutions	By January 1, 1896		By January 1, 1905	
	institutions	students	institutions	students
Men`s gymnasiums	1	327	5	1 623
Women`s gymnasiums	1	377	5	1 922
Real schools	1	102	1	367
Teachers seminaries	1	46	1	75
City schools	10	878	19	2 800
Primary schools	90	3 047	269	13 933
Private schools	2	72	5	179
Total	106	4 849	305	20 899

The table shows that as a result of purposeful work to forcibly attract the Russian population of the region to Russian educational institutions, over 9 years the number of Russian schools has almost tripled, and the number of students has increased more than 4 times.

At the beginning of the 20th century, the Turkestan administration continued to expand the school network for the Russian population with even greater persistence. In a report to the chief inspector of the schools of Turkestan dated March 12, 1902, the director of the public schools of the Syr-Darya region, Gramenitsky, writes about the introduction of compulsory education for schoolchildren in those Russian villages where there are schools. He believes that, in addition to

the obligation to study, it is also necessary to establish the obligation for children to attend classes properly throughout the school year. At the same time, Gramenitsky repeats the thesis put forward by Kaufman: "The question of the need for literacy for the newcomer Russian population of the Turkestan territory, settled among the mass of the unfaithful local population, tightly united by the unity of faith, age-old traditions and foundations of social relations and soil, and moreover, to a large extent literate, – there is no doubt" [7; LL.286-287].

In the early years of the organization, representatives of local peoples met in Russian educational institutions, although rarely. Of the first eleven graduates of the Tashkent men`s gymnasium (1883-1893), there was only one local – kazakhSadykbaevDzhienbai, who graduated from the gymnasium and then entered the Kiev military school. In the future, it was rare that among the graduates there was at leans one Kazakh or Uzbek. S. M. Gramenitskywrote: "In the lower grades of the gymnasium, many local students were distinguished by their zeal and jealousy of studies and did well in the sciences, and only in the middle grades, from IV – V, their number was rapidly decreasing". In his opinion, gymnasium students from local nationalities in grades IV – V "came to such an age when they began to feel longing for their native life and surroundings, and then intensive studies weakened their energy and strength". Meanwhile, the life of the pupils of the pupils` apartment was built "exclusively in the interests of the Russian pupils and nothing was done to adapt the situation to the habits of local pupils inherited in childhood" [3; P.229].

Based on the foregoing, we can conclude that the tsarist government tried to provide the Russian population of Turkestan with education so that they would have a clear advantage in comparison with the local population, would work in managerial posts of the tsarist administration in colonial Turkestan.

ABSTRACT

According to world statistics, thyroid diseases occur almost in 30% of the world's population, among thyroid diseases the most common is diffuse goiter (mainly in regions with iodine deficiency), nodules, and nowadays also noted an increase of autoimmune thyroid pathology. According to the WHO, about 2 billion people on Earth live in conditions of iodine deficiency, which leads to the development of diseases such as endemic diffuse and nodular goiter, mental and physical retardation of children, cretinism, miscarriage. In conditions of iodine deficiency,

the risk of radiation-induced diseases of the thyroid gland (thyroid gland) in the event of nuclear disasters also increases hundred times [1,9]. Iodine is a microelement necessary for the making of thyroid hormones. The daily requirement for iodine depends on age and physiological state and ranges from 100 to 250 μg / day [2, 4,6]. Lack of iodine intake into the body leads to the start of a chain of sequential adaptive processes aimed at maintaining the normal synthesis and secretion of thyroid hormones. But if the deficiency of these hormones persists for a long time, it causes of breakdown of adaptation mechanisms with the subsequent development of iodine deficiency diseases (IDD) [2,9].

KEYWORDS: *Goiter, Euthyroid, Diffuse, Gut Microbiota, Intestine, SIBO, Thyroid Gland, Iodine.*

INTRODUCTION

The term "diffuse euthyroid goiter" (DEG) refers to a visible and/or palpable enlargement of the thyroid gland. DEG is a general diffuse enlargement of the thyroid gland without disfunction of the gland [6,12,13]. The main reason for the DEG is the insufficient content of iodine in the environment, which leads to less consumption by the population with the natural food products. Depending on the prevalence of DEG, sporadic and endemic goiter are distinguished in the population. A goiter is considered endemic if in the surveyed region the incidence of goiter in children of primary and secondary school age is more than 5%. DEG - pathology of young people. In more than 50% of cases, it develops before the age of 20, and in women, goiter develops 2-3 times more often than in men, while, as a rule, during those periods when organism requires more intake iodine (puberty, pregnancy, lactation). [10,12] At the same time, hypertrophy and hyperplasia of the thyroid gland are caused by compensatory mechanism and aimed to produce enough quantity of thyroid hormones. How do mechanisms of such adaptation to insufficient iodine intake work?

First, the absorption of iodine by the thyroid gland increases due to the amplification of its active capture.

Secondly, there is a predominant synthesis of triiodothyronine (T3), which is the more active thyroid hormone,T3 requires not 4, only 3 iodine atoms for synthesis.

Thirdly, the secretion of iodine by the kidneys decreases, the reusing of endogenous iodine increases, which increases the efficiency of the biosynthesis of thyroid hormones.

Fourth, the iodine content in the colloid is decreases (due to the predominant synthesis of monoiodotyrosine, rather than diiodotyrosine) and thyroglobulin in the colloid also decreased(due to increased proteolysis).

In the early stages of goiter development (i.e., in children, adolescents, and young adults), compensatory hypertrophy of thyrocytescan be found. The thyroid gland is represented by a mass of small follicles that practically do not contain colloid. Such a goiter is called parenchymal; it is the result of successful adaptation [13].

Another morphological variant of DEG is a colloid goiter. It consists of large follicles containing a huge amount of colloid. In process of formation of this type of goiter, some mechanisms

disturb the optimal functioning of the thyroid gland. An imbalance arises between the synthesis and hydrolysis of thyroglobulin, the degree of iodination of thyroglobulin decreases. There is a leakage of iodine from the thyroid gland and a decrease in the synthesis of iodothyronines [1,2,3,4,6,8].

In general, the development of DEG depends on many factors that are not fully learned. In addition to iodine deficiency, other factors related to the development of goiter include smoking, taking certain medications, emotional stress, and source of chronic infection. Sex, age, hereditary predisposition also does matter. The clinical picture of DEG depends on the degree of enlargement of the thyroid gland, whereas its function remains normal. The fact is that a slight increase in the thyroid gland with its normal function practically does not affect the work of other organs and systems. In the majority of cases, under conditions of mild and moderate iodine deficiency, a small increase in the thyroid gland is detected only with a targeted examination [5,8].

A goiter indicates an increase in the thyroid gland. Following the currently accepted standards, if the thyroid volume more than 18 ml in female and 25 ml in male can be considered increased, when measured by ultrasound [6,7,12]. There are currently no generally accepted clinically adapted reference thyroid volumes for children since the standards proposed by WHO that take into account the surface area of the child's body are recommended only for epidemiological studies, in which the prevalence of goiter in children is considered as an indirect indicator of the intensity of iodine deficiency.

The gut microbiota plays an important role in gastrointestinal homeostasis and maybe an additional factor for developingof thyroid disease [11,14,15]. The influence of microbiota on depression, neurodegenerative diseases, heart disease, obesity, diabetes, immunological disorders, inflammatory bowel disease, and cancer are well learned [21,22]. Microbiota may explain why the prevalence of goiter, which is associated with inadequate iodine intake, does not correlate with low iodine excretion in southern India, and why hypothyroidism in Japan is more common in iodine-rich areas than in iodine-deficient areas [16,17,18].

In recent years, the microbiota has been involved in numerous chronic diseases, from obesity to inflammatory bowel disease and multiple sclerosis [22]. Indeed, it should come as no surprise that it also has profound effects on endocrine organs such as the thyroid gland.

Lipopolysaccharide, or LPS, is a component of the cell walls of gram-negative bacteria. With increased intestinal permeability, often as a result of intestinal dysbiosis, LPS can leak into the bloodstream. This can lead to the destruction of the thyroid gland for a variety of reasons. As stated above, an inactive T4 must be converted to an active T3. Approximately 20 percent of this conversion occurs in the gastrointestinal tract. Commensal gut microbes can convert inactive T4 to T3 sulfate, which can then be reduced as active T3 by an enzyme called intestinal sulfatase [17,22]. Bile acids represent another interesting link between gut bacteria and thyroid function. Primary bile acids are produced in the gallbladder and released into the small intestine after fat is consumed. The metabolism of primary bile acids by intestinal bacteria leads to the formation of secondary bile acids. These secondary bile acids increase the activity of iodothyroninedeiodinase (the main enzyme that converts T4 to T3) [18, 20].

Thyroid function is also closely associated with small intestinal bacterial overgrowth (SIBO). In a healthy person, most microbes are concentrated in the large intestine. In SIBO, some bacteria

and archaea can colonize the small intestine and multiply, causing bloating, gas, and other unpleasant symptoms [19,22].

The link between SIBO and the thyroid gland is underestimated. Since thyroid hormones help stimulate intestinal motility, it is also possible that low motility and constipation can make an environment in the small intestine that promotes bacterial overgrowth. The microbiota affects the digestion of iodine, selenium, and iron, and the microbiota can change the accessibility of L-thyroxine and the toxicity of propylthiouracil. Microbes recognize some different host endocrine molecules, including adrenaline, norepinephrine, sex hormones, and thyroid hormones, and may even alter aspects of their metabolism and virulence in response to these signals [17,22]. Besides, microbe-free rats raised under sterile conditions and completely bare of gut bacteria have smaller thyroid glands than normally raised rats, suggesting a critical role for these microbes in thyroid health. The link between the gastrointestinal tract and the thyroid gland, called "thyrogastric syndrome", was already postulated in the 1950s [22]. More recently, anti-thyroid antibodies have been reported in patients with pernicious anemia, synonymous with autoimmune metaplastic atrophic gastritis. The coincidence of both diseases can be explained by the common embryonic origin of thyroid follicular cells and gastric mucosal cells since the thyroid gland develop from primitive intestinal cells [19, 20, 21]. Both cells also share the ability to absorb iodine and they express similar peroxidases (gastric peroxidase and thyroperoxidase). On the other hand, the specific composition of the microbiota can predispose individuals to both diseases. A specific compound may be decreased number of lactobacilli and bifidobacteria or the absence of only one genus in the family. Inflammatory bowel disease with impaired motor function is also a common cause of iodine malabsorption, suggesting that the upper GI microbiota plays a role in the uptake of the trace element iodine [22].

In this regard, the purpose of this study is the interaction of the intestinal and thyroid microbiota in individuals with diffuse euthyroid goiter.

MATERIALS AND METHODS

This study was conducted during 2017-2019. We examined 47 patients who were diagnosed with diffuse goiter of 1-2 degree according to WHO, patients which did not take thyroid hormone replacement therapy, who had complaints of gastrointestinal disorders, who asked advice from the consultative polyclinic at the 3-clinic TMA. Among them, 12 are male and 35 are female. The duration of goiter ranged from 1 year to 5 years, the average age was 28.7 ± 9.8 years. The study did not include patients with nodular and autoimmune diseases, as well as with impaired thyroid function. Also, the exclusion criterion was patients who took antibiotics in the last 6 months, with severe and chronic diseases of the gastrointestinal tract, autoimmune and severe somatic diseases, and patients which taking long-term drug therapy. We also examined 10 apparently healthy individuals with no thyroid enlargement.

The diagnosis of goiter by palpation was carried out according to the WHO classification (2001): grade 0 - no goiter, grade 1 - goiter is determined by palpation, while the size of the palpable lobes does not exceed the size of the distal phalanx of the examiner thumb, and grade 2 - the goiter is visible in the normal position of the neck and well palpable. The most accurate method for diagnosing goiter is thyroid ultrasound, which was performed on a SONOSCAPE SSI 6000 scanner, a 7.5 MHz linear sensor.

The total thyroid volume was calculated according to the formula J. Brunn (1981): SV = [(W· D ·L) right + (W· D ·L) left] ·0.479, where W, D, L - width, thickness, and length (mm) right and left lobes of the thyroid gland; 0.479 is the coefficient of ellipsoidity.

Goiter (thyreomegaly) - an increase in the thyroid gland in female> 18 ml (cm3), in male> 25 ml (cm3).

Laboratory determination of the level of free thyroxine - T4, thyroid-stimulating hormone - TSH, and antibodies to tireopyroxidase anti-TPO in blood serum was carried out using ELISA on an automatic Rayto analyzer (RT-2100C, China). The reference values were respectively: 10.3-24.5 pmol / l, 0.3-4.0.6 mIU / L and 0-30 IU / ml.

The quantitative and qualitative composition of the microflora of the large intestine was determined based on the methodological recommendations of A.Z. Smolyanskaya, G.I. Goncharova [23]. The feces of the patients were taken into sterile tubes, which were delivered to the laboratory within 2 hours.

The total number of asporogenic anaerobes, including bifidobacteria, lactobacilli, and the total number of the aerobic group of microbes: staphylococci, Escherichia coli, streptococci, Candida fungi, etc. were determined.

For distinguishing aerobic microorganisms5% bloody agar, Endo, Sabouraud media, and yolk-salt agar were used. To distinguisha sporogenous-anaerobic and microaerophilic species, feces were sown on "Blaurock"environ for bifidobacteria and the total number of anaerobes, on MRS-4 for lactobacilli and lactic acid streptococci.

Asporogenic anaerobes and lactobacilli were distingueshed by the method of "sealed" polyethylene bags filled with main natural gas. Aerobic and facultative anaerobic microorganisms were distinguished by conventional methods using selective and differential diagnostic nutrient environ. Plates with sowings on MRS-4 were placed in a desiccator with a candle in a thermostat at 370C for 48 hours, bags filled with gas, with sowings on Blaurockenviron- at 370C for 2-3 days. After the specified time, based on microscopic data of smears dyed according to Gram, growth on selective and differential diagnostic environ following official guidelines, the species and group affiliation of isolated colonies of microorganisms were determined.

While working with modified method, the result was taken into considerationaccording last dilution in which the growth of bacteria was obtained. Their number was calculated using the following formula:

K = A x 200 x P (CFU / g),

where: K - the number of colonies of a certain type;

A -is the number of colonies per plate in the last dilution, where presented microbial growth;

200 - coefficient leading to sowing in a loop (volume is 0.005 ml) by 1 ml;

P is the degree of dilution.

The number of bacteria of each species was expressed in Lg CFU / g [23].

Assessment of dysbacterial deviations in the intestine according to the degrees of dysbiosiswas carried out according to the classification of N.M.Gracheva [23].

Additionally, the motor activity of the gastrointestinal tract of patients was estimated using fluoroscopy, which was carried out in the X-ray department of the 3 TMA clinic using the PHILIPS DUODIAGNOST apparatus. A patient on an empty stomach swallows a portion of an aqueous suspension of barium sulfate. As it moves from the oral cavity into the pharynx, and then into the esophagus, stomach, and duodenum, as well as into the jejunum and ileum, these parts of the alimentary canal are successively contrasted and clearly visible on the screen for transillumination. The contrast agent then passes into the colon. After 6-9 hours of taking the barium suspension, the cecum and the ascending intestine are filled, and after 24 hours, the entire colon and rectum is filled.

Statistical processing of research materials was carried out using a package of standard statistical programs such as "Excel" with the inclusion of the analysis of descriptive variation statistics, as well as correlation analysis. Differences were considered significant if the level of statistical significance was 95%, that is, $p < 0.05$.

Results

In general, the clinical and anamnestic study revealed that 23 (48.9%) patients consulted an endocrinologist for the first time, the remaining 24 (51.1%) noted taking iodine preparations from 6 months to 2 years. The average dose of potassium iodide was 133.3 ± 15.6 μg / day. Patients indicated that they did not take iodine preparations regularly and for a long time, referring to some improvement in their general condition, and stopped taking the drug on their own. The main complaints of patients were:cosmetologicaldiscomfort in 40 (85.1%) patients, feeling of a clot and compression in the thyroid gland area 35 (74.4%), nervousness 32 (68.0%), dizziness - 20 (42.5%), constipation - 28 (59.5%), burp - 25 (53.1%), flatulence - 32 (68.0%) patients. It should be noted that the majority of patients were from Tashkent and the Tashkent region - 16 (34.0%), 11 (23.4%) from the Kashkadarya region, 9 (19.1%) from the Fergana Valley, 6 (12.7%) from the Khwarezm region, 5 (10.8%) from the Republic of Karakalpakstan.

On palpation of the thyroid gland and according to ultrasound of the thyroid gland, 34 (72.3%) had grade 1 DEG, 13 (27.6%) had grade 2 goiter according to WHO.

As shown by ultrasound examination of the thyroid gland, all patients were diagnosed with a diffuse goiter, without nodules and cystic inclusions. The average volume in male exceeds the control values by 75%, in female by 66%, compared with the control, which once again confirms the presence of goiter in the examined patients. As you know, the severity of iodine deficiency is determined by the prevalence of an enlarged thyroid gland (TG) in the population [24].

TABLE 1 THYROID VOLUME IN EXAMINED PATIENTS, ML

Control n-10	Male n-12	Female n-35	P
12,3±3,8	47,2±9,4*	35,7±7,8*	<0,05

Note: n — number of examined patients;

* - reliability is available

The results of hormonal studies showed that all patients had a state of euthyroidism. The data on hormonal changes differed from those of the control group, although they were within the normal range. Thus, TSH in the group with grade 1DEG was increased by 59%, and in the group with grade 2 DEG by 35%, respectively (P <0.05).

TABLE 2 DATA OF HORMONAL STUDIES IN THE EXAMINED PATIENTS, (M ± M)

Serum hormones	Control n-12	DEG 1 degree n-34	DEG 2 degree n-13	P
TTH, mIE/l	1,2±0,04	2,9±0,8*	2,6±0,9*	<0,05
free.T4, pmol/l	17,4±3,8	14,9±7,0	15,7±7,1	
antiTPO,IE/ml	19,4±7,8	16,8±9,1	21,3±5,5	

Note: n — number of examined patients;

* - reliability is available

According to the literature, hypertrophy and hyperplasia of the thyroid gland and the state of euthyroidism are compensatory in nature and are aimed at providing the body with thyroid hormones. At the same time, the absorption of iodine by the thyroid gland increases due to the amplification of its active capture, the predominant synthesis of T3 occurs, which is the most active thyroid hormone, while for synthesis of T3 requires not 4, but only 3 iodine atoms, the secretion of iodine by the kidneys decreases, and the reutilization of endogenous iodine, which increases the efficiency of thyroid hormone biosynthesis [22].

Also, we studied the state of the intestinal microflora in patients with DEG due to the presence of gastrointestinal disorders.

When analyzing the quantitative composition of microflora (Table 3) of feces in patients with grade 1 DEG, attention was given to the decrease in the number of bifidobacteria to 6.23 ± 0.39 Lg KOE / g (P <0.05), which also affected the total number of anaerobes, which amounted to 7.73 ± 0.2 Lg KOE / g, while in healthy people this indicator was 10.15 ± 0.25 Lg KOE / g.

TABLE 3 THE STATE OF INTESTINAL MICROBIOCENOSIS IN PATIENTS WITH DEG, (M ± M)

Microorganisms	The number of microbes in 1 g of feces, Lg CFU / g		
	Control n-10	DEG 1 degree n-34	DEG 2 degree n-13
The total number of anaerobes	10,15±0,24	7,73±0,25*	6,07±0,4*
Bifidobacteria	9,72±0,24	6,23±0,39*	5,23±0,45*
Lactobacillus	7,22±0,17	6,95±0,28	5,95±0,2*
Total number of aerobes	7,64±0,17	7,81±0,18	7,7±0,21
Escherichia: LP (lactose positive)	7,1±0,15	6,71±0,25*	5,9±0,31*
LN (lactose-negative)	1,35±0,05	2,02±0,17	2,67±0,1
HM (hemolytic)	1,06±0,02	1,24±0,36	1,36±0,32
Mushrooms of the genus Candida	2,24±0,19	2,54±0,25	2,68±0,23

Note: n is the number of examined patients;

* - the presence of reliability (P <0.05) compared with the control;

The number of lactobacilli also decreased to 6.95 ± 0.28 Lg KOE / g. Consequently, bifidobacteria were the most sensitive in the patient's body. The most typical for this category of patients was a slight decrease in the number of lactose-positive strains of E. coli (LPPC) to 6.71 ± 0.25 Lg KOE / g, against which the lactose-negative (LNCH), hemolytic strains of E. coli increased, respectively, to 2.02 ± 0.17 Lg KOE / g and 1.24 ± 0.36 LgKOE / g. At the same time, fungi of the genus Candida remain within the normal range of 2.54 ± 0.25 Lg KOE / g.

Patients with grade 2 DEG show the same changes, for example, a decrease in the number of bifidobacteria to 5.23 ± 0.45 Lg KOE / g (P <0.05), which also affected the total number of anaerobes, which was $6.07 \pm 0, 4$ Lg KOE / g, while in healthy people this indicator was 10.15 ± 0.25 Lg KOE / g. The number of lactobacilli also significantly decreased to 5.95 ± 0.2 Lg KOE / g (P <0.05). Therefore, in patients with DEG 2 stage in the body, the most sensitive were bifidobacteria and lactobacilli. Also, there is a slight decrease in the amount of LPPP to 5.9 ± 0.31 Lg KOE / g, against the background of which LECP and hemolytic strains of E. coli increased, respectively, to 2.67 ± 0.1 Lg KOE / g (P <0, 05) and 1.36 ± 0.32 LgKOE / g. Fungi of the genus Candida remain within the normal range of 2.68 ± 0.23 Lg KOE / g. This means that there is a relationship between the severity of dysbiosis and the volume of the thyroid gland.

According to the literature, uptake of iodide occurs mainly through the sodium/iodide Symporter (NIS), which is regulated and processed in a tissue-specific manner and exhibits variable cellular localization. Expression of the functional protein NIS has been demonstrated in the salivary gland, stomach, and breast tissue [21]. Although NIS is localized in the apical part of the plasma membrane in the cells of the gastrointestinal tract, it is localized on the basolateral side in cells of all other tissues. The gastrointestinal uptake of iodide through the NIS is regulated by intracellular iodine concentrations. In the intestine, the sodium-dependent multivitamin transporter, which is bound to NIS and binds to iodine with a lower affinity, also transports iodine. Another mechanism of iodine accumulation involves the cystic fibrosis transmembrane conductance regulator (CFTR), which transports Cl^- along the gradient of chloride ions [22] but promotes iodine transfer in a small rate. Both cells also share the ability to absorb iodine and they express similar peroxidases (gastric peroxidase and thyroperoxidase). On the other hand, the specific composition of the microbiota can predispose individuals to both diseases. A specific composition may be a decrease in the number of lactobacilli and bifidobacteria or the absence of only one genus in the family [20,22]. This explains the increase in the thyroid gland in patients with intestinal dysbiosis against the background of iodine deficiency.

When assessing the severity of intestinal dysbiosis according to N.M. Gracheva [23] grade I dysbacteriosis was detected in the majority - 38 (80.8%) patients, grade II - in 9 (19.2%), grade III-IV dysbiosis was not detected in the examined patients.

In 32 patients who had complaints from the gastrointestinal tract, fluoroscopy was performed to study the motor-evacuation function of the gastrointestinal tract. At the same time, hypotension of the esophagus and stomach was found in 14 (43.7%) patients, and after 24 hours hypotension and large intestine were detected, in 4 (12.6%) patients there was hypermotor dyskinesia of the esophagus, stomach, and large intestine. In 14 (43.7%) patients, no disorders of gastrointestinal tract motor function were registered during X-ray examination of the gastrointestinal tract.

As noted above, the intestinal microflora and the thyroid system have a mutual influence. In this case, the course of the underlying disease depends on the severity of dysbiosis and gastrointestinal disorders.

We have studied the correlations (CS) between the thyroid volume and some parameters of the intestinal microbiota.

Thus, the thyroid gland volume directly correlated with lactose-negative colibacilli (r = 0.53) (P <0.05), inversely correlated with the total number of anaerobes (r = -0.67), bifidobacteria (r = -0.60), lactobacilli (r = -52). It should be noted that the analysis of the CS between the thyroid volume and some indicators of the intestinal microflora once again confirmed the relationship between the intestinal microflora and the increase in the size of the thyroid gland.

CONCLUSIONS

1. According to the study, 34 (72.3%) had grade 1 DEG, 13 (27.6%) had grade 2 goiter. Among patients with DEG, female prevail in comparison with male - 3: 1. The main complaints of patients were:cosmetological inconveniences in 40 (85.1%) patients, feeling of a clot and compression in the thyroid gland 35 (74.4%), nervousness 32 (68.0%), dizziness - 20 (42.5%), constipation - 28 (59.5%), burp - 25 (53.1%), flatulence - 32 (68.0%) patients.

2. When assessing the severity of intestinal dysbiosis, grade I dysbacteriosis was detected in the majority - 38 (80.8%) patients, grade II - in 9 (19.2%), grade III-IV dysbacteriosis was not detected in the examined patients. At the same time, in patients with grade 1 DEG, attention is drawn to the decrease in the number of bifidobacteria to 6.23 ± 0.39 Lg KOE / g, in patients with grade 2 DEG to 5.23 ± 0.45 Lg KOE / g. There is a more pronounced decrease in lactobacilli in patients with grade 2 DEG to 5.95 ± 0.2 Lg KOE / g compared with patients with grade 1 DEG - 6.95 ± 0.2 Lg COE / g.

3. The results of correlation analysis showed that thyroid volume directly correlated with lactose-negative E. coli (r = 0.53), inversely correlated with the total number of anaerobes (r = -0.67), bifidobacteria (r = -0.60), lactobacilli (r = -0.52). It should be noted that the analysis of the CS between the thyroid gland volume and some indicators of the intestinal microflora once again confirmed the relationship between the intestinal microflora and the thyroid gland volume in patients with DEG.

ABSTRACT

Within the framework of the reforms carried out in the republic to stabilize food supply and increase the export potential of the agricultural sector, the development of meat and dairy products production and the provision of services for the livestock industry is of great importance. At the same time, an increase in the level of consumption of livestock products per capita, the development of the processing industry and the service sector for animal husbandry is of urgent importance. At the same time, these measures can produce positive results only if the necessary conditions are created for the effective functioning of farms of various categories. Despite the growing number of livestock in the republic, low productivity of livestock does not allow for intensive development of the industry and ensure expanded reproduction of herds. The analysis shows that low dairy productivity of livestock in most cases is associated with insufficient feed supply, poor feed quality, and depends on the level of organization of veterinary and breeding services in the industry. At present, the increase in the number of livestock along with a decrease in the area of forage crops, their low yield, unsatisfactory feed supply is one of the reasons for low productivity of livestock.

KEYWORDS: *Agricultural Sector, Meat and Dairy Products Production, Services For The Livestock Industry, Small Farms, Dehkan Farms, Animal Husbandry, Livestock Products.*

INTRODUCTION

The "Strategy of Actions" for 2017-2021 on the five priority areas of further development of the country, approved by the Decree of the President of the Republic of Uzbekistan dated February 7, 2017; the main task is liberalization and development of the economy. Today, the Republic of

Uzbekistan is an integral part of the international community and the global financial and economic market. This is evidenced by the ever-expanding relations with the outside world, the implementation of programs for the development, modernization, technical and technological re-equipment of economic sectors with the support of developed countries, the successful implementation of the five priorities for further development of the country for 2017- 2021. possible. In the context of globalization, increasing the country's competitiveness, increasing its economic potential, the widespread introduction of innovations and the rational use of resources on this basis is a guarantee of sustainable development and improving the living standards of the population.

As a result of the global climate change taking place on our planet, the reduction of water resources, and the increase in the population, the issue of food supply to the population of the world's countries is becoming more and more urgent only if we develop services for the livestock industry that allow us to provide the population with high-quality meat and dairy products in sufficient volume.

Currently, a large proportion of livestock products produced (90-95%) is accounted for by small farms (personal subsidiary and dehkan farms) and a low share is accounted for by larger farms (5-10%), which include farms and private livestock complexes. In both cases, the main problem in organizing the activities of the livestock sector is that the subjects of the livestock industry solve the issues of feed supply mainly at the expense of their own limited capabilities. However, the problems of providing the livestock industry with highly nutritious combined feed, improving the breeding and productive properties of different breeds of livestock, carrying out preventive measures to combat animal diseases, treatment and other similar services are issues that are difficult to solve only by the forces and capabilities of the producers themselves. These issues should be addressed by specialized service providers. In this regard, it becomes relevant to develop scientifically based methods, proposals and practical recommendations for the development of the system of providing services for the most important branch of animal husbandry.

Analysis of the relevant literature

The development of the livestock industry, production, procurement, processing, sale of meat, milk, eggs and other livestock products, the development of the system of livestock services, the development of healthy economic competition between producers and service providers are engaged in many of the world's leading scientific research, higher educational institutions and research centers.

Recommendations that have theoretical and practical significance on the development of the system of providing services to the livestock industry, improving the economic efficiency of production, deepening integration processes in the activities of livestock farms, attracting investment in the system of production and processing of milk and meat, creating livestock complexes are reflected in the scientific works of foreign scientists-economists F. Amersdoffer, A. Zhebit, N. Zavodchikova, D.Romer, L. Andrianova, A. Mysik, O. Tretyakova.

However, the accelerated development of legal and regulatory framework, organizational and methodical mechanisms and economic relations associated with the development of the livestock sector in the Republic, change the requirements to farms and dekhkan farms livestock areas, which today are expanding diversified production, producing not only meat and milk production,

but also other activities in the system of value added creation, development of agro-industrial clusters leads to the emergence of new problems.

RESEARCH METHODOLOGY

The agrarian policy aimed at building the capacity of entities providing services in the livestock sector and increasing the share of services in the agricultural sector should cover the following main areas: - stimulating investment in the production, transportation, processing and sale of livestock products with the corresponding development of the service sector with the widespread introduction of modern information technologies and elements of the digital economy; - provision of material and technical resources for the production, storage and processing of livestock products, ensuring the implementation of mechanisms to stimulate the import of modern equipment and technologies directly and in the service sector; - implementation of comprehensive programs in the field of production and processing of livestock products, including the development of various types of services in the livestock industry, along with measures to introduce the achievements of agricultural science and advanced agricultural technologies; - stimulating the development of both state property and private business entities with effective use of the principles of public-private partnership and taking into account regional specialization in the organization of service providers; - in the territorial and geographical location of infrastructure facilities, it is necessary to take into account the possibilities of providing information to regions when purchasing resources for livestock, owning breeding cattle, using services and selling products; – when implementing effective incentive support measures to ensure the economic sustainability of service providers, it is necessary to take into account the fragmentation of livestock farms in the regions and geographically disparate location in relation to markets and service centers; – in creating healthy economic competition in the market of veterinary services, it is necessary to develop specialized services based on knowledge-intensive complex developments and technologies to expand the range of services, taking into account industry specialization, changes in the number of livestock and production volumes; – due to the fact that the system of sales of meat and dairy products does not correspond to the specifics of livestock farms, there is a risk of non-return of investments involved in production. The development of infrastructure entities should take into account the problems in the activities of product sales entities, which can create financial risks for both producers and service providers, especially in areas with low production density; – the organization of entities providing services to the livestock industry, one must also consider the conditions created for the free economic activities of producers and the degree of administrative interference of the government in the operation of farms; – in the development of services are appropriate, improving the quality of services through effective use of outsourcing in cooperation with research centers in countries where livestock development; - it is advisable to expand the scope of leasing services or develop a system of entities providing such services to provide vehicles, feed equipment, equipment necessary for the primary processing of milk, delivery to retail outlets.

Based on the methodical approaches to definition of the size of market demand for services, creating a methodology for determining the market demand for services for farms within regions should consider the following: – in determining the market demand for services in process selection the most important types of services in animal husbandry should take into account those services that can be provided by the farms (e.g., accounting, agronomic services, business

planning); – when determining market demand livestock farmers for services are considered skilled services provided by digital means and state-regulated (licensed) and services whose implementation and dehkan farms are not economically justified; – in the structure of services provided by entities specialized in the relations associated with production by households, considered important, and the provision of veterinary services; – when determining the market demand for services in the settlement process considers the costs of working time, depending on the number of specialists such as livestock specialists, veterinarians, the number of which is determined based on the existing livestock; – market demand for services in livestock farms are determined by the level of marketability of products through the main production; – market demand for services is also determined taking into account the level of pedigreed livestock in farms and it is assumed that the demand for services will increase in accordance with the increase in the level of pedigreed livestock; – when determining the value of market demand for services, special attention is paid to the level of equipment of the production process in livestock farms with modern equipment and technologies; - the state of development of the product market is taken into account, which determines the financial situation of farms (the availability of infrastructure related to the sale of meat and dairy products, processing enterprises).

Analysis and results

The widespread use of modern innovative technologies, technical means, zootechnical methods, livestock feeding rations, digital technology and information technologies in the livestock industry objectively leads to an increase in market demand for modern services. Consequently, with the increasing use of innovative technologies in animal husbandry, the demand for services in the regions will grow.

Analysis of the research results shows that as a result of the reforms carried out in animal husbandry, there is an increase in the number of cattle and the volume of production of livestock products in all categories of farms of the republic.

Meeting the needs of the country's population for milk and dairy products is directly related to measures for the development of dehkan and farm farms, which, in turn, is associated with increasing the productivity of livestock, creating a sustainable feed base, improving the quality of service and establishing the production of finished products. The total number of cattle imported from foreign countries in 2006-2010 was 17963 heads, and in 2018 18419 heads of cattle were imported. However, an important issue is the organization of the activities of entities that provide services for their care. So, in 2008-2018, the number of veterinary points in the republic increased by 31.9% and by 2018 amounted to 2851 units instead of 2162 units in 2008.

As the analysis shows, the share of areas for fodder crops in the structure of sown areas is sharply reduced. So, if in 1990 the share of forage crops in the structure of sown areas in the republic was 23.0 percent, by 2018 this figure has decreased to 7.1 percent. This, in turn, becomes one of the causes of low livestock productivity and partial manifestation of the genetic potential productivity of livestock bred cattle. In this regard, in livestock farms it is necessary to " adjust the planning of livestock, taking into account the possibilities of growing forage crops."

CONCLUSIONS

The main reason for low productivity of livestock is the mismatch of feed security and quality of feed needs a low level of breeding cattle, insufficient use of the genetic potential of livestock.

Studies have confirmed that the subjects providing services do not have the ability to fully meet the demand of all dehkan and farms for veterinary services. This is mainly due to the following: 63-due to the geographical dispersion of livestock farms in the regions, problems of distance (transport costs), time and transport communications hinder the effective provision of services to the relevant departments; – since sheep and goats make up the main part of the livestock industry in steppe and mountain livestock areas, and the improvement of sheep and goat breeds in the private sector has traditionally been carried out by dehkan farms, and this process is still ongoing, the demand for service points in these regions, of course, remains relatively low; - low market demand for services in remote areas prevents the formation of the material and technical base of service units, the provision of qualified personnel; - the lack of a full understanding of the traditions in livestock areas, modern livestock breeding, awareness of the need for widespread and widespread use of artificial insemination of livestock and the use of services reduces the economic efficiency of service sector entities.

LEGAL ASPECTS OF IMPOSING ARTIFICIAL INTELLIGENCE IN UZBEKISTAN AND FOREIGN EXPERIENCE IN AI

Ikromov Dostonbek Akhmadjonogli*

*Student,
University of World Economy and Diplomacy,
Tashkent, UZBEKISTAN
Email id: dostonikromov96@gmail.com

ABSTRACT

AI technology is crucial for humanity as it has various facilities including human capabilities – understanding, reasoning, planning, communication and perception – to be conducted by software increasingly effectively, at low cost. On top of that general analytical tasks, including finding patterns in data, that have been performed by software. Creation of new opportunities in most business sectors and consumer applications is the result of digitally advanced technologies. AI has numerous use cases today that are causing corporate revenue growth and cost savings in existing sectors. While AI has myriad positive outputs in society, there is a urgent need for governments to set compulsory measurements to deter economy and society spheres from possible threats that can be deleterious for humanity. Properly prepared and planned regulations should be consistently reviewed as instant changes of digital technology may be uncontrollable if prior preventing steps are not taken. Throughout this essay, the legal features of imposing artificial intelligence are discussed by examples of Uzbekistan and foreign countries.

KEYWORDS: *Regulation, Digitalization, Privacy, Commercialization, Copyright, Fair Implementation, Compulsory Measurements, Intellectual Property, Conventional Legal Mechanisms, AI Policy.*

INTRODUCTION

Uzbekistan is one the first countries in Central Asia which is enthusiastically moving towards digitalization. Different ministries are promoting digitalization in the areas of telecommunication, information technology, government and foreign investments. The

government has approved "Smart city" concept: implementation of technology solutions in education, medicine, housing and communal services and territorial management.

The Cabinet of Ministers of the Republic of Uzbekistan has approved the concept of implementation of "Smart city" technologies with an exclusive decree. The goal of the document is "creation of favorable conditions for improving the standard of living, solutions of citizens' issues, improving of social infrastructure and regional development". The decree mentions that the country is currently at initial stages of implementation of "Smart city" technologies – pilot projects regarding the systems "Safe city", "Smart enumerators", "Smart transportation" and "Smart medicine" are realized in Tashkent.[1]

Poor infrastructure of information and communications technology and datedness of city infrastructure are the main intricacies on imposition of such technologies, which requiring modernization of telecommunication networks and investing capital in reconstruction. The approach for solving such issues, in congruence with world practice is allure of private sector in dealing with significant challenges.

The issues related to Block chain Mining and regulation of Crypto currency are thought to solved efficiently by recent presidential decrees. Moreover, IT startups through IT parks and innovation centers are being awarded and supported enthusiastically by the authorities.

Nevertheless, there can be challenging tasks for the Ministry of Justice to correlate with the digitalization projects of the government. Its provisions on the all the basic areas of private and public laws should spread by covered by new regulatory acts such as Civil Code. In Uzbekistan, wave of digitalization requires market related reforms to meet the demands of 21st century model government as well as to make it relevant with the upcoming development of communication technologies in the country.

According to Resolution of the President of the Republic of Uzbekistan dated April 13, 2018(№ UP-5415), "On measures of radical improvement of the activity of justice bodies and institutions in implementation of state legal policy", the preparation of a new version of the Civil Code has begun. The imposition of new economic reforms revealed significant shortcomings and gaps that negatively affect further market reforms, harm favorable investment climate and business environment, including absence of sufficient legal ground for artificial intelligence regulations. Pressing need for new legal ground encompasses improvement of existing articles and introduction of new principles of civil legal relations, reviewing of the old and introduction of new (terms), measures and means aimed atguaranting appropriate and fair implementation of civil rights and digital technology development. Even if the legal basis exists, further regulation process can lead society to the improvement in digital technologies.

The straightaway step for Uzbekistan is to contemplate the work on draft of artificial intelligence policy for the country. Involving stakeholders in investment procedures from all the domains can be initial push for reforms. It should be kept on the highest strategic right-of-way of the legal system of the country. Necessary guidelines to industry and other features interacting with the economy may be provided by AI policy. Certainly, this policy should plan ahead possible consequences and failure in case of unexpected response by society and global impact. Uzbekistan has already introduced the concept of "Smart" City, which can be further extended to "Smart Products". Furthermore, "Electronic Government" system development Center was

established under the State Committee for communication, informatization and telecommunication technologies of the Republic of Uzbekistan on the basis of the government decision[2] (The concept and development of Electronic Document Management (EDM) systems in public administration, 2006) aiming to guarantee effective governance by authorities and determining the main directions of interagency collaboration between state agencies and the population of the country through the creation of an integrated information system on the basis of modern information technology, improving the functioning of government. Objective of the Concept is to determine the main directions of interagency collaboration between state agencies, and between government agencies and the population of the country through the creation of an integrated information system on the basis of modern information technology, improving the functioning of government, improve the quality and timeliness of their information systems.

The reforms in curse of electronic government showed its shades in public service and online platforms dealing with submitting documents. What is more, the introduction of non-human legal personalities or the concept of "digital personhood" in the new Civil Code is subject to be considered. Of course, it should solved priorly that networking and mobile systems need to be modernized in accordance with the demands of 5G technology and it will help in incorporating the digitalization in overall legal system.

AI systems can also generate new works protectable by copyright, such as creating new artwork or music. However, most copyright statutes do not yet clearly define who owns machine-generated works. It is currently a point of contention in respect of some such works whether the work is generated by a machine, and or the role played by the humans in creation of the work. To this end, agreements should attempt to clarify ownership when possible. Further, an AI system may act or operate autonomously in a manner that infringes third-party IP rights. If existing laws do not extend liability to a machine, then a related stakeholder (such as the owner, developer, operator or another supply chain participant) may be responsible.[3] There are some crucial steps to be taken such as introduction of more technology-based laws or to incorporate AI regulations in current laws. For example, including the regulations for "self-ruling production of AIs" in the grounds of intellectual property laws of the country. Artificial intelligence,simply,can be named the basis of fourth industrial revolution driver. Compilation of AI policy draft may be challenging for legal community especially for scientists. Proper critical review and evaluating the current issues of enforcing legal regulations regarding AI should be followed as instant steps. On international scale, AI is the on the limelight of almost every country in the world. In recent years, some of them drastically implemented new generation of digital technology to enhance their development. Simultaneously, the imposition of AI resulted in new regulatory reforms in legal grounds. Copyright, trademark, privacy issues, personal data use are becoming agendas of government tasks relevant to legal amendment of laws. In the EU, some critical steps have already taken. Article 22 of GDPR provides for the right not to be subject to a decision based solely on "automated processing, including profiling" with legal or significant impact.[4] AI laws may also refer to driverless vehicles. These legal definitions of AI determine whether the law applies to the particular AI process or system.
The current legal framework for AI can be grouped as follows:
(1) Unique regulation to AI technology (automated decision making, facial recognition)
(2) Distinct regulation to a use case or industry application (education, finance, health);
(3) Legal liability for (unwanted) consequences by use of AI (criminal, civil); and

(4) Voluntary ethics codes;[5]

Regulations are being introduced or proposed specific to AI technology such as those directed to facial recognition software. For example, cities and regions of the world which had already utilized some kinds of digital technology such as Japan, Canada, and Singapore propose to ban use of facial recognition technology by police and other municipal agencies. Respectively, implementation procedures of AI regulation are defined with detailed information below.

JAPAN: ON THE WAY TO "SOCIETY 5.0" WITH AI

"Abenomics", Premier Minister of Japan Shinzo Abe's aspiring economic programme, has two vital targets. One is gaining in sustainable growth. The other is the "super-smart society 5.0.".The central role is played by humans in "Society 5.0"programme which harmonizes economic development with the proper solution of social problems through a system that leads cyberspace and physical space to a very high degree. It is undeniable that machines are increasingly taking over people's jobs is less cause for concern in Japan than for hope. For the population is aging and shrinking, especially in rural areas. Furthermore, immigration process is very limited for some reasons. Artificial intelligence is expected as to help as a cure for a shrinking working population. As a result, the focus is on practical fields of application which fundamental research is intended to serve: 1) productivity, 2) health, care and well-being, 3) mobility and 4) security. Abe and his party are on the same page regarding implementation of "Society 5.0". The development plans of most authorities and ministries encompassed references to AI, such as the Integrated Innovation Strategy and the Japan Revitalization Roadmap. The framework conditions for research and development of innovations as well as the allocation of budget and personnel are being set by the "Council for Science and Technology and Innovation" (CSTI). Prime Minister monitors CSTI and the individual sector ministries follow the guidelines of the CSTI. Already in April 2016, the "Strategic Council for AI Technology" was founded on the instructions of Abe. These were the urgent actions. The Council worked on AI strategy and presented in March 2017.

From January 2019, an already resolved extension of copyright law is applying, which through three new articles permits the use and further processing (text and data mining) of protected contents by commercial and non-commercial AIs even without the consent of the authors (fair-use principle)[6]. As to improve the self-learning capabilities of machines it is crucial to have access to large amounts of data. The Act on the Protection of Personal Information, which was adopted in May 2017, wasintended to promote the collection and sharing of data while at the same time decoupling them from personal data and processing them anonymously. Generally, the revised version has various resemblances with the EU GDPR, the EU has put Japan on a "white list" of countries with data protection standards comparable to the high standards of the EU, though. This raises global integration of the country, unlike China, allows its AI products to be exported to the EU. Further development of AI in Japan seems to be more mind-blowing basing on the recent releases of new robot generation.

SINGAPORE: HOW TO BE LIKE A STARTUP

In recent years, promoting AI has became agenda for the government of Singapore. In 2017, the National Research Foundation (NRF), an agency reporting to the Prime Minister, launched the

national AI Singapore initiative with the great ambition of establishing a firm staging area on the global prospect of AI aiming creation of digitally advanced society. Comparing to international standards, it is no doubt that Singapore may become an AI leader merely through an AI support programme and 130 million Euros. Simultaneously, in China an industrial investment fund of 15 billion Euro represents a single AI promotion instrument.

AI Singapore has been designed in particular to contribute to strengthening the correlation between industry and research field to assure that AI research market and inventions meets the needs of industry. The initiative refers to the Digital Government Blueprint, the Digital Readiness Blueprint and the Digital Economy Framework for Action. The Smart nation initiative, being the highest political ambition, is being supported by the Smart Nation and Digital Government.

Specifically, the Initiative consists of Foundation Research, Grand Challenge, 100Experiments, AI Apprenticeship, AI For Industry and AI For Everyone programmes. In 2018,the Minister of Communications and Information S. Iswaranput several tasks to enforce a progressive regulatory ground for the ICT sector in the country. This also meant that Personal Data Protection Act of 2012 is prone to be reviewed and amended for necessary regulations. This act legitimised the needs of companies to collect and use personal data, and administers the responsible coping with data efficiently. The law has also established the Personal Data Protection Commission of Singapore (PDPC), which monitors the law itself and its implementation.

The PDPC adopted a guideline in July 2017 for data exchange to define why the Data protection acts published. In addition, a framework for the agreement on the exchange of data within a regulatory-sandbox will be established that releases companies from certain obligations to test and promotes innovative uses of personal data. As text and data mining are essential for the development of AI, this topic was part of the public consultation on amendments of the Copy Right Act in 2016. In it, the Ministry of Justice proposes an exception in the Copy Right Act which allows copying of copyrighted documents and data for the purpose of data analysis. Current flow of AI promotion in Singapore is about flourish drastically ensuring the privacy and constant improvement in all spheres of societal life.

AI IN CANADA: FROM LONG RESEARCH HISTORY TO REAL EXISTENCE.

In November 2017, Canada's Prime Minister Justin Trudeau with Eric Schmidtgave a speech discussing the significance of AI as a basic driver of economic progress. It is hard to consider but the real situation was striking that social sectors, such as healthcare and social welfare are not clearly included– unlike many other national AI-related strategies.Nevetheless, the following objectives were announced: 1) to stave AI gift off moving to the USA, 2) to create compulsory conditions for the commercialisation and economic growth of the country. As to attain these goals, the authorities allocated approximately 430 million Euros.Butthe history of AI research goes far more than 30 years by now.Three famous AI researchers Dr. YoshuaBengio, Geoffrey Hinton and Richard Sutton, were pioneers in the development of Deep Learning, neural networks and reinforcement learning. It is worth noting that they continued to operate during the last "AI hibernation" of the 1990s and 2000s.[7]

The Canadian federal government adopted the guidelines for provincial regulation since existing regulations are not sufficient to elevate the use and application of AI, in particular in the

regulation of intellectual property, copyright and ownership of inputs (data) and outputs (decisions or actions of robots) and thinking machines that using AI). The main focus is on company-industry collaboration, data privacy and ethics. Because the ethic side of AI has its undeniable role to maintain proper and safe development of digital technologies. The regulations also entail how startups, enterprizes and companies can be able to use data in their AI models and projects. Beyond that, the governing body of the Canadian capital market, Canadian Securities Authority (CSA) has established regulatory sandbox to find and promote new business models with innovative products in the science fields, such as the use of AI for communication. Generally, while Canada's current regulations remain insufficient and overall cautious with regard to AI applications, they are not too strict to discourage companies. Thus, companies and startups are aware of what is allowed or not, the opportunity to participate in the discussions on future regulations is provided and business entities have a good command of understanding the further regulation steps. Direct support of commercialization of technology and innovation on larger projects and companies including smaller ones is being accelerated by the government. The Strategic Innovation Fund of Canada (SIF), a program aimed to boost technology transfer and the commercialisation of innovative products, is hoped to ensure grants for companies and their projects, which will cover up huge amount of the expenditure. This fund is also available to foreign companies intending to do business in Canada. Overall, the regulatory condition for AI development is becoming more apt to meet the compulsory needs of economy and social life, to main advanced technologies serving humanity favour.

To recapitulate above mentioned arguments, today humanity are bound to encounter excellency and at the same time, deficiency of artificial intellect in any part of activity. To deter society from its possible harm, some sophisticated regulatory measures should be implemented. It is clear that advantages of digital world cannot be ignored. Almost any sphere of human activity is prone to be influenced by such technologies. For instance, copyright is anvital intellectual property asset for AI because it protects any new original work from unauthorized use and reproduction.

The difficulties of seeking redress via the courts are magnified in the AI space by the challenge of detecting the harm and determining and proving causation, to say nothing of the serious practical obstacles and disincentives faced by individuals in invoking the judicial process. At the same time, it is important to mention that, in addition to conventional legal mechanisms of redress via the courts, there are many other institutional governance schemes that could serve secure responsible human rights-compliant development and implementation of advanced digital technologies. As we are taking steps to globally networked digital age, the need to protect human rights and the underlying value commitments is of paramount importance. This phenomenon may lead us consider that whether our current conceptions of human rights and the mechanisms are suitable for purpose in this socio-technical period. Digital technologies based on powerful network have emerged in recent years make possible practices and actions that were previously impossible and thereby create threat sources that need to be paid proper attention.

VERBAL EXPLICATION OF DISCURSIVE PERSONALITY IN THE LIGHT OF ANTROPTHENTRISM

Nozliya Normurodova Zarilovna*

*DSc, Associate Professor,
AlisherNavo'i Tashkent State University,
Uzbek Language and Literature,
UZBEKISTAN

ABSTRACT

The relevance of this topic to the problem of verbal markers of anthropocentrism stem from the general orientation of modern linguistics to the study of the human factor, based on the cognitive-discursive features of its implementation in literary discourse, as well as insufficient knowledge ın the linguistic representation of the discursive personality of the author and character. This work is based on the principles of anthropocentrism and interdisciplinarity and is at the intersection of such disciplines as linguo-personology, cognitive linguistics, in particular, cognitive stylistics, linguoconceptology, linguo-pragmatics, linguoculturology.

KEYWORDS: *Literary Discourse, Antropothentric Paradigm, Verbal Markers, Author's Modality, Intentions.*

INTRODUCTION

Linguistics at the present stage of its development is characterized by an anthropocentric approach to the study of language. The category of anthropocentricity involves the study of the motives and intentions of the speaker based on various types of texts, in particular, fiction. In this regard, the classification of language markers of the categories of the author and the personage and their representation in surface and underlying structures of the text seems to be the task of paramount importance [1,2,3,4,5,6,7].

In the light of the anthropocentric paradigm, which includes the "human factor" in the study of language, the consideration of linguistic phenomena through the prism of peculiar triads "language-person-communication", "language-person-thinking", and "language-person-culture" seems to be very relevant. This is due to the fact that, on the one hand, the language in all diversity

of its functioning is predetermined by a person, his knowledge and experience (a person in a language); on the other hand, language is a means of knowing a person, his thoughts, consciousness and intellect (language in a person). It should be noted that the principle of anthropocentrism naturally presupposes an interdisciplinary approach, going beyond the limits of "internal linguistics" into the space of a person and his activities [4, P.56]. The anthropocentric approach, being especially significant in the study of a literary text, involves its complex, interdisciplinary analysis from the standpoint of such areas as linguistic personology, text linguistics, communicative linguistics, cognitive linguistics, linguoconceptology, and linguoculturology.

The most significant characteristic of the discourse for our research is anthropocentrism, which involves researching the discourse in the close trinity of author-text-reader. However, it must be emphasized that the distinctive feature of literary discourse is the peculiar, complex nature of communicative activity: external - author-reader and internal - personage-personage.

The development of linguistic personology, discourse, and the disciplines of critical discursive analysis correlated with it expanded the concept of a linguistic personality. The concept of "linguistic personality" was further developed and, in relation to discursive analysis, was transformed into a new term - discursive personality (DL) [5]. The use of this term results from the fact that in the process of communication the concept of a linguistic personality expands and is enriched with discursive practices owing to the intersection of communicative and cognitive factors.

DL is understood by us as a combination of human abilities and characteristics that determine the production and perception of discourse by them. The structure of the DL of the author and the character differ in: a) the degree of semantic-stylistic language complexity; b) the nature of the linguistic representation of communicative-pragmatic factors; c) the depth of reflection of the intellectual sphere; d) the degree of expression of universal and nationally specific cultural values; e) reflect the psychological, individually personality characteristics of the character, representing a certain psychological type.

The main conceptual part

Anthropocentrism of literary discourse is primarily manifested in the discursive personality of the author and character. The author's DL manifested in the author's modality and intentionality is determined by the entire system of language tools used in the CD, which is reflected in the selection of lexical tools, in the semantic, pragmatic and compositional structure of the discourse. At the same time, some fragments of the discourse express the DL of the author and the character with the greatest degree of obviousness, which allows us to consider them as verbal markers of anthropocentrism. The verbal explication of the author's DL is manifested in such fragments and units of text as: a) author's mediations; b) titles and epigraphs; c) linguistic concept; e) descriptive contexts; e) citations. The character's DL is a complicated structure and includes the characteristics inherent in the DL of the character and the author. The verbal markers of the character's DL are a) literary discourse; b) represented speech; c) graphical means characterized by the expression of the author's modality and aimed at characterizing the character's image in communicatively pragmatic, cognitive, cultural, and psychological aspects.

In order to disclose discursive personality of the author, a multi-stage analysis procedure has been developed, including:

• Identification of the most significant language units verbalizing the discursive personality of the author;

• Analyzing author's thoughts, their distinction, from the standpoint of author's modality and intentionality;

• Identification of the conceptual significance of the title as a complex of implications, reflecting individually the author's picture of the world;

• Determination of the conceptual significance of descriptive contexts in the representation of the author's discursive personality;

• analyzing linguistic and cultural concepts from the perspective of anthropocentrism of artistic discourse;

In terms of the character's discursive personality, the analysis procedure includes the following steps:

• Consideration of the artistic dialogue and determination of the character's discursive personality, manifested in the interaction of semantic-stylistic, communicative-pragmatic, cognitive, cultural and psychological characteristics;

• Analysis of improperly direct speech aimed at representing the character's discursive personality;

• Identification of discursive characteristics of graphic means as an expression of the discursive personality of the author and character;

The author's mediations, being a verbalizer of the author's DL and an expression of the author's modality aimed at representing the individually author's worldview, are characterized by the following features: a) autosemanticism manifested in structural completeness, relative semantic independence and functional significance; b) stylistic marking, manifested in the convergence of stylistic means that contribute to the promotion of the most significant information; c) the conceptual significance of expressing the concept of the whole work.

Citation is the author's sayings, characterized by brevity, semantic capacity and reinterpretation. The maxim is also considered as a small form of a text, a component of an individual author's and conceptual picture of the world, as a cultural model that translates the most conceptually significant information. The analysis of author's maxims, their distinction signs, from the standpoint of author's modality and intentionality revealed the following signs: a) stylistic marking, manifested in the convergence of stylistic devices; b) an entity that can be taken out of context as an independent judgment and used in other texts; c) national-cultural specifics verbalizing linguistic concepts, certain knowledge of the world, emphasizing figurative and value components containing culturally significant information; c) intertextuality, characterized by a double reference correlation due to the interaction of two texts.

A significant role in representing the author's conceptual picture of the world is performed by the title. By entering into a complex semantic interaction with the whole text, it becomes the most important element of its semantic and aesthetic organization and represents a kind of complex cognitive structure and cultural model. The essential features of the title are: implicit; stylistic marking; symbolism; conceptual significance. By the nature of implicitness, two types of titles are

distinguished, characterized by deep implicitness, decoding of which requires an analysis of the whole text and dark implicitness to decode which only the knowledge of the text is not enough, and additional background knowledge of a historical, cultural and sociocultural nature is required. The stylistic labeling of the title is represented by a wide range of stylistic devices, which we consider as conceptual structures that incorporate all the information presented in the text, as well as certain structures of knowledge about the world, and as a cultural model that translates the conceptual meanings and cultural values that are most significant for text interpretation. One of the essential characteristics of the title is its symbolism, which we consider as a cognitively significant artistic image or a combination of knowledge structures. The most significant in terms of author's modality are such features of the title symbolism as imagery and ambivalence. The conceptual essence of the title lies in the fact that it, being the highest conceptual unit, serves to express the superconcept of the entire work, a semantic focus combining many different conceptual meanings.

Descriptive contexts, including an artistic portrait and nature-describing contexts, are one of the language means representing the author's DL, which is manifested in his subjective modality and intentionality. They are characterized by the following features: descriptive contexts are a two-level structure, including linguistic (explicit) and conceptual (deep) levels. The correlation of linguistic and conceptual level contributes to the generation of new conceptual meanings. A distinctive feature of the description contexts is the phenomenon of anthropomorphization i.e. attribution of animated and human signs to natural phenomena and animals. Literary discourseis characterized by the widespread use of anthropomorphization processes, which allows us to consider them as relevant means of manifesting the principle of anthropocentrism in literary discourse. A characteristic feature of descriptive fragments is their stylistic marking, manifested in the widespread use of stylistic and expressive means, as well as the convergence of the joint venture. A sign of stylistic marking, which determines the expressiveness, emotionality, imagery and value of descriptive contexts, contributes to the expression of the subjective modality of the author and his linguo-artistic thinking. One of the most significant forms of representation of the author's DL is the linguistic concept and the features of its functioning in artistic discourse. From the perspective of anthropocentrism, linguistic concept is considered as a cognitively propositional structure, the components of which are the subject, object, predicate and attribute

CONCLUSION

The following can be noted as prospects for further research of the complex linguistic nature of the language of the author and the character and anthropocentrism of literary discourse:

• The research of verbal markers of DL in comparative terms based on the material of single-system and multi-system languages;

• Comparative typological study of DL based on the material of different languages;

• ethno psycholinguistic description of DL in various types of discourse;

• linguodidactic principles of DL analysis in the process of interpreting literary, political, media discourse.

PRINCIPAL DIRECTIONS OF DEVELOPMENT OF THE ADMINISTRATIVE LEGISLATION IN THE REPUBLIC OF UZBEKISTAN

Erkin Khozhiev*

*The Academy of the General Prosecutor's Office,
Republic of UZBEKISTAN

ABSTRACT

The article deals with the main directions for the development of administrative legislation of the Republic of Uzbekistan, as well as reveals the tasks of reforming administrative legislation and outlines the most actual problems of the functioning of administrative legislation, the successful solution of which will significantly increase the efficiency of legal provision for public administration and bring it into line with the requirements of the current stage of development of the country.

KEYWORDS: *Concept, Law, Reforms, Legislation, Society, Economy, Tasks, Competence, Responsibility, Delict.*

INTRODUCTION

Today's socio-economic and political and legal transformations which are carried out in Uzbekistan and the consistent implementation of the principle "From a strong state to a strong civil society", ensuring the priority of human and civil rights and freedoms as the most important constitutional obligation of the state put forward a number of new and urgent problems of the development of the national legal system, which require their adequate permission. In this case we are not talking about making certain individual acts, but on the need to improve efficiency and deepen a systematic approach to the development of the national legal system in the context of the further development of our society.

As the first President of the Republic of Uzbekistan I.A. Karimov highlighted in his report at a conjoint meeting of the Legislative Chamber and the Senate of the Oliy Majlis, "There is no need to talk about how important it is for the formation of the rule of law state that we are building which requires how serious changes by law enforcement practice and the rapid elimination of those gaps and "white spots" in the legislative and regulatory framework and the improvement of

the work of law enforcement and judicial bodies in compliance with the Law, and again the Law. As well as, we must clearly understand that ensuring economic growth, in achieving a high standard of living for people, solving other problems in the socio-economic, socio-political sphere will depend on the successful solution of one most important task - on how quickly and we will effectively move along the path of deepening democratic reforms and liberalizing the economy, building a strong civil society."[1]

Moreover, we need to develop a new modern concept for the development of the national legal system, which will make it possible to foresee the dynamics of the development of national legislation and the correlation of its branches and institutions in the long term, and also to determine the legislative and institutional development of the national legal system in the medium term, based on the interests of citizens, the needs of the economy, social and political spheres. The preparation of such a concept should be carried out taking into account all the useful that has been accumulated by our legal science and practice and the generally recognized principles of international law with the involvement of a wide range of scientists and the public.

An essential condition for preparing a concept for the development of the national legal system is the preparation of concepts for the development of sectoral legislation, in particular, administrative legislation. On the other hand, the concept of the development of administrative legislation should contribute to a stricter alignment of administrative legislation with ongoing reforms, the achievement of the goals of economic, political and social development and it should ensure the integrity and clear structure of this legislation, the mobility and sustainability of its subsectors and institutions.

The purpose of the concept is to create a system of administrative legislation in the country that would ensure both current and strategic tasks of increasing the effectiveness of legal impact on public relations based on the norms of administrative legislation in the context of reforming and modernizing the country, expanding and deepening the processes of economic liberalization and developing institutions of civil society.

The foremost objectives of the concept are:

- Valuation of the current state of administrative legislation and its compliance with the needs of cardinal transformations in all spheres of life of the state and society;

- Determination of the main directions and traditions of improving administrative legislation;

- Expansion of proposals and recommendations for the development of administrative legislation.

The concept of the development of administrative legislation as a set of key ideas and provisions gives a holistic idea of the priorities for the development of administrative legislation, expresses specific mechanisms for its improvement.

Administrative legislation is one of the huge and mobile branches of the legal system of our country. This is due to the fact that its norms regulate relations arising in the most diverse areas of society. The range of the sphere and the variety of regulated public relations determines the completeness of normative material that constitutes administrative legislation.

Administrative legislation as an independent branch of the legislation of Uzbekistan is a set of legal acts regulating public relations in the field of public administration. The variety of forms of

management activity is the main factor that determines the measurements, consequences and variability of administrative legislation. Administrative legal norms determine the statuses of all government organizations establish the procedure for the creation, reorganization and abolition of government bodies, organizations and institutions.

Administrative legislation acquires many rights of citizens, establishes single rules for the activities of organizations, the behavior of officials and citizens (licensing, trade, environmental protection, sanitary rules, traffic safety rules, etc.) provides for administrative liability for violation of these rules.

The peculiarity of administrative legislation is its dependence on changes in the general management system in the course of economic and political reforms. It is no accident that during the years of independence, the norms of the administrative legislation of Uzbekistan have been significantly updated and this is natural, since the economic functions of the state, the system and functions of government bodies at all levels have radically changed.

Despite the intensification of lawmaking in the field of administrative legislation, due to the lack of clear concepts, there are contradictions between legal acts, unclear legal characteristics of the new status of executive bodies, their administrative relations and management methods. There is no balanced scientific approach to the legislation on civil service, on administrative responsibility and administrative procedural legislation.

In this regard, it is necessary to identify the most pressing problems of the functioning of administrative legislation, the successful solution of which will significantly increase the efficiency of legal support for public administration and bring it in line with the requirements of the current stage of the country's development.

1. At first, one of the main tasks of administrative legislation is to improve the organization of executive power, to more clearly define the legal status of government bodies, both in the center and at the local level.

The process of realization of the system of legislation on public administration bodies is influenced by two main factors: delimitation of the subjects of jurisdiction between the republic as a whole and local government bodies; ensuring unity in determining the legal status of bodies of the same type in terms of functions and increasing the degree of controllability in different spheres of state and public life.

According to these factors, the foundations of the legal status of public administration bodies were determined by decrees of the President of the Republic of Uzbekistan [2], as well as laws on the Cabinet of Ministers of the Republic of Uzbekistan [3], and on local government [4].

On the other hand, these legal acts did not solve all the problems related to the form and legal status of these bodies. This relates to such bodies as republican agencies, state inspectorates, which currently belong to republican government bodies. Additionally, in terms of their legal status, they differ significantly from ministries. Despite the fact that they are formed by the President of the Republic of Uzbekistan, like ministries, their leaders are not part of the Government.

Ministries and state committees occupy an important place in the system of governing bodies. Historically ministries have been established as bodies exercising sectoral management. Most

state committees are characterized by inter sectoral governance, activities on the implementation of coordination, normative regulation of issues referred to the competence of these bodies.

Determination of the competence of these bodies has its own characteristics, due to the specificity and nature of their management activities. At the same time, there are many common points that require single regulation for each group of these government bodies.

2. Accelerated development of the norms of substantive administrative law with all its acuteness requires further development of administrative procedural legislation.

The existing normative and legal material, which makes it possible to unite any managerial actions under the auspices of the administrative process, is extremely fragmented and there are no single rules for such actions in most cases, although their significance is indisputable. There should be single rules for the implementation of various kinds of administrative actions for the implementation of prohibitions, permits, permits and direct instructions, control and supervisory, licensing, registration, coordination and other powers exercised by the subjects of executive power.

Certainly, such rules exist, but they are formulated in relation to specific managerial actions of specific executive bodies (officials), and not in all cases. They are contained in scattered legal acts of various purposes and different legal force.

Here, the major point is departmental approach to the formation of such rules. All this is evidence that the administrative procedural legislation in its perfect and universal version is still absent.

3. Legal regulation of the relationship between the state and the individual through administrative procedures is one of the most important characteristics of the rule of law.

The principles of the rule of law require clear and predictable behavior of administrative bodies, which must be fair and transparent for participants in administrative proceedings. This is the manifestation of the constitutional and legal significance of administrative procedures. The authorities should use the state power given to them exclusively in the interests of society and the individual. The development of legislation on administrative procedures will ensure the implementation of this principle in practice.

The Republic of Uzbekistan does not have single, legally established rules governing the procedure, stages and rules for the adoption of individual legal acts. This gap in legislative regulation is to some extent filled by separate acts of different legal force: departmental instructions, regulations, etc. As a result, there is a real danger of violation of the rights and interests of citizens, since the existing administrative procedures are more focused on protecting departmental interests than on ensuring the rights and freedoms of citizens and stimulating their active legal behavior.

The theory of administrative procedure is a new phenomenon for the administrative-legal science of Uzbekistan. Nevertheless, scientists of our country presented no interest on it. Apparently the lack of theoretical studies on the problems of administrative procedure is due to the shortcomings of the current administrative and procedural legislation of the Republic of Uzbekistan.

In the structure of legal regulation of administrative and procedural activities, by-laws play the main role, and laws contain only provisions of a general nature, accompanied by numerous references.

4. The effective activity of the state, its successful solution of economic, political and social tasks largely depends on the state of the legislation on public service.

The legislation on state service regulates the procedure and conditions for staffing executive bodies, as well as the apparatus of representative and judicial authorities. Its tasks are to create a legal basis for the civil service, ensure its professional nature, determine the requirements for employees of these bodies, prevent bureaucracy, recruit personnel solely for business qualities, create appropriate conditions for the fruitful activity of civil servants, and ensure their legal and social protection.

The current legislation on public service does not meet these objectives. It consists of a significant number of disparate regulations from many government agencies.

There is no legal act in the Republic of Uzbekistan, which would regulate the whole range of basic issues of public service. It is carried out in accordance with the Constitution of the Republic of Uzbekistan and other legal acts of the Republic of Uzbekistan.

Special legal acts and norms regulate many issues of civil service in paramilitary and law enforcement agencies, as well as in bodies whose employees, due to their official duties, come into contact with the population, the activities of various enterprises, institutions and organizations, carry out special control and managerial functions.

In the norms of the legislation on the state service, the activities of state personnel and the mode of their implementation were identified, which has serious consequences. Misunderstanding the true meaning of the set of state service rules as a special administrative and legal regime reduces the possibilities for effective organization of the activities of state personnel and does not make it possible to fully use the levers and methods of organizing management.

5. The significance of the task of reducing the number of administrative offenses and eliminating the causes that give rise to them, as well as proper protection of the rights and legitimate interests of citizens and organizations requires a lot of work to improve the legislation on administrative responsibility.

This work is associated with the development of a draft of a new edition of the Code of the Republic of Uzbekistan on administrative responsibility.

The conceptual basis of the ongoing legal reform was the provisions of the Constitution of the Republic of Uzbekistan on the highest value of human rights and freedoms and on attributing their protection to the most important duty of the state. This fully applies to the legislation on administrative responsibility, which includes, adopted on September 22, 1994 and entered into force on April 1, 1995, the Code of the Republic of Uzbekistan on administrative responsibility [5].

The Code of 1994 year retained in the interpretation of the scope of administrative responsibility the traditional approaches of the previous Code of Administrative Offenses. It does not regulate the liability of legal entities. Formally, it applies only to the administrative responsibility of individuals (citizens and officials).

Additionally, acts of national regulation of the institution of administrative responsibility (the code and other legislative acts), the legislator also allows regional regulation, maintaining the traditionally narrow limits of the competence of local authorities.

The content of substantive and procedural regulation, carried out by the current edition of the code, testifies to the insufficiency of the existing level of codification of legislation on administrative responsibility.

In the development of administrative legislation at the present stage, it is necessary to highlight the following main priorities of their implementation:

1) The creation of a legislative basis for the formation and operation of government bodies.

State administration receives a regulatory and legal framework that meets the needs of its effective functioning in the conditions of democratization and renewal of society, reform and modernization of the country, expansion and deepening of the processes of economic liberalization.

Enhancing the legislation on government bodies will allow: to clearly define the scope of competence of each of these bodies, to ensure a specific area of their responsibility for the decisions made; streamline the interaction of republican and local government bodies; to systematize and unify the norms defining the legal status of the same type of government bodies.

2) The consistent development of the norms governing the administrative process, as well as the system and competence of the administrative jurisdiction bodies.

Improvement of the legislation on administrative procedures will: significantly reduce opportunities for arbitrariness, abuse, corruption and other negative phenomena; improve the effectiveness of protection of rights and legal interests of citizens and legal entities; ensure the expediency and reasonableness of any administrative action; create conditions for impartiality and impartiality when making an administrative decision; ensure the transparency of the administrative process.

3) Further improvement of the legislation governing judicial control over the activities of the administration (administrative justice).

Improvement of the legislation on administrative justice will make it possible to: significantly increase guarantees of ensuring genuine and real protection of the rights and freedoms of citizens and their legitimate interests; create a clear, transparent and effective system of administrative justice through judicial supervision of administrative decisions and acts.

4) Eloboration and implementation of a set of legislative acts regulating the state service.

Improving the legal support of the civil service allows: to introduce a strict typology of state service positions with the necessary organizational, professional, legal and methodological support; strict definition of job responsibilities; selection, promotion and retention of the most qualified personnel in the civil service, creation of a regime that ensures, on the one hand, the tough responsibility of civil servants, and on the other, their legal protection from arbitrariness and incompetence; to orient civil servants to assist, first of all, the realization of the rights and legal interests of citizens.

5) Formation of a new legal framework for administrative responsibility based on accelerating the adoption of the Code of Administrative Responsibility in the new edition.

Reforming the legislation on administrative responsibility allows: significant reduction the range of sources of administrative-delict law of the Republic of Uzbekistan and eliminating its reference nature; clearly defining the list of subjects of administrative offenses, reconsider the status of an official as a subject of an administrative offense; extend administrative responsibility to legal entities; eliminate inactive, consuming offenses, as well as introduce new ones corresponding to the current stage of the country's social, political and economic development; make significant changes to the rules governing the procedure for resolving cases of administrative offenses, significantly increasing the guarantees of the observance of the rights of persons brought to responsibility.

CERTAIN ISSUES AND ITS SOLUTIONS OF CURRENT EDUCATION

Djabborova Nodira Mukhtorovna*

*Teacher,
Department of the world Language,
Kokand University, UZBEKISTAN
Email id: jabborovanodiraxon@gmail.com

ABSTRACT

Education is the most important thing all over the world. It is considered as a weapon of every country. Currently, in every country there are some kinds of problems as well. During the pandemic all countries run into certain difficulties as well as education systems also. Lessons have to be conducted from the certain distance as an online system. This article will give information about the issues and the solutions of the education during the lockdown.

KEYWORDS: *Education, Key, Issue, Current, Pandemic, Problems, Solution, Activities, Internet, Methods, Lesson, Difficulties, Educate, Conduct, Teacher, Student, Campus, Lockdown*

INTRODUCTION

Education is the process of facilitating learning, or the acquisition of knowledge, skills, values, beliefs, and habits. Educational methods include teaching, training, storytelling, discussion and directed research. Education frequently takes place under the guidance of educators, however learners can also educate themselves. Education can take place in formal or informal settings and any experience that has a formative effect on the way one thinks, feels, or acts may be considered educational. The methodology of teaching is called pedagogy. Educating pupils is somehow difficult situation but there are creative ways of overcoming these difficulties. Formal education occurs in a structured environment whose explicit purpose is teaching students. Usually, formal education takes place in a school environment with classrooms of multiple students learning together with a trained, certified teacher of the subject. Most school systems are designed around a set of values or ideals that govern all educational choices in that system. Such choices include curriculum, organizational models, design of the physical learning spaces (e.g. classrooms), student-teacher interactions, methods of assessment, class size, educational activities, and more.

In informal learning, there is often a reference person, a peer or expert, to guide the learner. If learners have a personal interest in what they are informally being taught, learners tend to expand their existing knowledge and conceive new ideas about the topic being learned. For example, a museum is traditionally considered an informal learning environment, as there is room for free choice, a diverse and potentially non-standardized range of topics, flexible structures, socially rich interaction, and no externally imposed assessments.

While informal learning often takes place outside educational establishments and does not follow a specified curriculum, it can also occur within educational settings and even during formal learning situations. Educators can structure their lessons to directly utilize their students informal learning skills within the education setting. **Non-formal education** includes adult basic education, adult literacy education or school equivalency preparation. In non-formal education someone (who is not in school) can learn literacy, other basic skills or job skills. Home education, individualized instruction (such as programmed learning), distance learning and computer-assisted instruction are other possibilities.

When it comes to speak about the issues of the education all over the world, we can say these ones:

School reform

- What are your views on all schools becoming academies?
- How successful are Free Schools?

Related issues include:

- the curriculum - what is it and how do we teach it
- class sizes
- School funding reform.

Health and child development

- How can we better support pupils' mental health?

Education and the curriculum

- How important are arts and drama education in secondary schools?
- How much early years education should be provided for free?
- What are your views on the flipped classroom?
- What is your approach to mainstream education for deaf and hard of hearing students?

To tackle certain issues, every country should create its own way in education system. A study conducted by the UNESCO International Institute for Educational Planning indicates that stronger capacities in educational planning and management may have an important spill-over effect on the system as a whole. Sustainable capacity development requires complex interventions at the institutional, organizational and individual levels that could be based on some foundational principles:

- national leadership and ownership should be the touchstone of any intervention;

- strategies must be context relevant and context specific;

- plans should employ an integrated set of complementary interventions, though implementation may need to proceed in steps;

- partners should commit to a long-term investment in capacity development while working towards some short-term achievements;

- outside intervention should be conditional on an impact assessment of national capacities at various levels;

- a certain percentage of students should be removed for improvisation of academics (usually practiced in schools, after 10th grade).

When it comes to speak about the solutions of the issues in education, we can offer followings:

1. "Only educated people should be university students!" The principle of equality disrupted the distribution of teachers across regions. For example, in some areas there are many teachers of mother tongue and literature, while in others there is a great need for a science teacher. The distribution is uneven, the situation is ups and downs! The reason for all this is that the need for a specialist in terms of regions is not taken into account in advance. At the same time, this principle continues in the admissions process related to education. If this continues, the number of teachers in a given area will continue to grow and employment will remain a problem. Given that the majority of teachers are women, it is practically impossible to move specialists from one area to another. The temporary solution to the problem, which will last for five to ten years, is to leave schools to graduate graduates. Every school will have excellent graduates who will be recognized by all teachers and students and parents. According to the decision of the school supervisory board, they must be admitted to the first year of the relevant higher education institutions. Everyone knows how your graduate went to school for 11 years. Therefore, the Supervisory Board cannot be unfair in its decisions. This is not possible in school life or in the area where it is located. Following this path, the best graduate of the school will return to that school as a knowledgeable teacher, and the inequality of distribution will disappear. In addition, this way reduces the costs associated with the admission process and exams, and saves a lot of time.

2. The situation in schools today is so complex that it is not justified to reduce the budget of a school where the graduate is not enrolled in a higher education institution and to transfer the withheld funds to the school where the graduate became a university student, especially during a pandemic. If a graduate has not entered a university this year, it is not appropriate to blame the teachers of that school this year. Applying financial penalties without at least another year will fill a teacher's patience. Moreover, the teacher is not the only one to blame. He is responsible for all the students in the class. If he is tasked with admitting the best students to the university, that is, if his salary is increased in the same way, then who else will start the race, most students will be ignored and will think only of the best. Obviously, it is illogical to require a tutor to do the work of a tutor today. Because the tutor works with students who want to study and pay for it. The school teacher does not have such an opportunity. He has to work with every student in the class. 50-60% of the students in the class are illiterate. It is superfluous to talk about knowledge. More precisely, the teacher himself needs a tutor. This is due to the fact that the curriculum is far removed from school life in higher education. It is the duty of advanced intellectuals to help him.

However, when enrollment is not at the discretion of the school, it is difficult to solve the problem to the end.

To sum up, all the issues in education can be tackled with the help of the government. Education is the most vital part of the country, with the help of educating population any country can be wealthy and prosperous.

ACTIVATION OF THE HUMAN FACTOR BY INCREASING THE PROFESSIONAL AND PSYCHOLOGICAL COMPETENCE OF THE LEADER OF THE EDUCATIONAL INSTITUTION

Saidova Hilolakhon Rashidjon kizi*

*Kokand State Pedagogical Institute,
Kokand, UZBEKISTAN

ABSTRACT

The article discusses the development of the professional and psychological competence capacity pursued by the general education institution, the methods of quantitative assessment, and the importance of psychological knowledge of self-defense in the management of human life in the context of social life.

KEYWORDS: *General Education Institution, General Education Institution Head, Management, Innovation Activity, Professional Competence, Competencies, Leadership Potential, Human Factor, Psychological Competence, Diagnostics.*

INTRODUCTION

Reforms in the education system of the country are aimed in many respects at improving the content of education, teaching methods, technology, teacher competence and mechanisms of student learning. But in our view, the competence of the head of the educational institution, which is another participant in the educational process, plays an important role in improving the quality of education. One of the modern requirements is the formation of promising innovative schools and the development of creative potential in schoolchildren. Therefore, its leader must be ready to innovate and be at the forefront. This requires the head of the educational institution to be able to promote innovative ideas, to see the mechanisms of implementation and to organize the work properly. In order to carry out this work, the head of the institution must have sufficient professional competence [1].

To this end, from November 1, 2017, the updated Classifier for the main positions of employees and occupations of employees was approved. However, to date, no clear assessment (diagnostic) mechanisms have been developed to ensure the objectivity of the requirements for a modern leader [2].

Diagnostic methods are always of great interest to researchers in terms of pedagogy and psychology. Each of them (interview, survey, portfolio, test, rating, etc.) can be considered as a method of quantitative assessment of the development of professional and psychological competence of the head of the general education institution [3, 65-67]. However, from the point of view of problem solving, it is advisable to choose test methods.

Based on the above, it can be said that the main problem is to bring up the younger generation as the creator and successor of radical reforms in the country, their education at the level of modern requirements, personal development, vocational training, independent and effective participation in labor. is on the agenda of the educational process. To do this, the heads of educational institutions, educators must have psychological knowledge, that is, take into account the age, individual, specific professional, physical and mental development characteristics of students. The main types of activities that are specific to humans are communication, play, reading, and work activities [4,161]. Activity is a high manifestation of a new quality, originality, the acquired behavior, arising on the basis of activity, a set of actions that apply only to man [5,51]. A person influences, changes, develops, improves himself and the environment by realizing the realized goal and mental-physical activity in the beginning of activity. Among these types of activities, it is labor that lasts the longest and is carried out by the person concerned, which has a strong influence on his full development as a person. As a result of labor activity, the human mind developed, made changes in nature and society, and led to its development. At the heart of this activity is the opportunity to live in person, to meet their material and spiritual needs, to secure their future. Improperly chosen profession, type of work, unhealthy work team and management skills, low level of productivity, poor quality of work, dissatisfaction among employees, an increase in the incidence of occupational diseases are observed in the team of a manager who does not know the psychology.

To prevent the above, it is necessary to equip the head of each educational institution with psychological knowledge, to ensure personal, mental, physical maturity, to teach him to manage emotional and mental processes.

RESEARCH METHODOLOGY

In the course of the research were used scientifically-philosophical principles and methods such as systematic, theoretical-deductive conclusions, analysis and synthesis, history and logic, hermeneutic analysis, inheritance, universalism and nationality, comparative analysis.

DISCUSSION

One of the requirements for a modern leader is his professional competence [6, 34-39]. Professional competence structurally includes the following competencies (qualities):

1) Scientific and methodological;

2) Innovation and creativity;

3) socio-economic;

4) Psychological and pedagogical;

5) Enlightenment and ideology;

6) Organizational and management;

7) Communicative;

8) Aesthetics;

9) Ethical.

It is proposed to implement the following three forms of continuous professional development of the head of the educational institution. For a closer look at their structure and composition, we conditionally refer to them as the first, second, and third forms.

The first form includes a time component (duration of training courses), didactic components (subject study programs, subject teaching aids, educational banks, classroom and extracurricular activities, etc.), diagnostic component (forms and means of quality control of teaching), organizational component (grouping by different criteria, with or without separation from the main activity, distance learning, etc.).

The second form is the activity of self-development and improvement of professional competence of the leader. "Self-development is a continuous creative process of using one's own capabilities and means, provided by the external environment" [7, 48]. It is necessary to objectively assess the level of professional competence of the head of the educational institution, which contributes to the continuous development of the processes of self-development and self-improvement, and to ensure the interdependence of motivating factors.

The considered form of professional competence development of the head of the educational institution will be effective if the leader embodies social and psychological personal qualities (initiative, activity, dedication, professional honor and dignity).

The third form of professional competence development of the head of an educational institution is the adoption and analysis of advanced learning experience (innovation). An analysis of the management experience and training practices of general education institutions shows that the adoption and analysis of innovations depends on the level of professional knowledge, personal qualities, research ability and availability of information sources.

A high level of professional knowledge allows the manager to find learning innovations and ways to effectively incorporate them into the existing learning process.

Innovative activity occurs only when the personal qualities of a leader are formed the qualities of initiative, perseverance, social and psychological courage, aspiration to new things and acceptance of them. This, in turn, increases the level of use of various online information sources, educational resources, professional modern literature, newspapers and magazines; participation in conferences, seminars and symposiums with presentations.

Psychological knowledge - protects a person from various negative experiences, prevents, directs all available abilities and capabilities, the realization of clear and positive goals, achieves perfection, perfection as a person through self-awareness, control, independent thinking. Psychological knowledge calms the nervous system, creates a healthy, warm psychological environment in the environment, society, interpersonal relationships, prevents conflicts. This will greatly help the heads of educational institutions in self-analysis, the proper organization of the educational process, the selection of personnel. A person with psychological knowledge is able to consciously control their behavior, choose the right actions to achieve the goal, have the

ability to control themselves and others, to follow, to educate, to influence the personality of others without touching.

Psychological knowledge has a positive effect on the human psyche and teaches a person to self-control, self-command, self-re-education, self-control, self-awareness, ability to correctly estimate and use their potential.

A leader who is aware of individual psychological characteristics, cognitive processes, will have the temperament, character and abilities, intuition of each employee in the team under his command. Ignorance, arrogance, stubbornness, greed, pettiness are observed in a leader who is unable to properly assess his own capabilities and does not realize himself. The climate in the community affects the quality of education. This leads to non-compliance with the requirements of the state and society to educational institutions, causing significant economic damage to the state budget.

Because psychological knowledge protects a person from negative influences, directs opportunities and abilities, ensures success in various fields, achieves spiritual, spiritual, mental perfection through independent and deep thinking. Self-improvement in the person, training to understand helps to realize the inner reserves of spiritual energy. When a person is able to control himself, he will have the potential to control others. A person who is able to evaluate himself correctly, who is able to control and manage himself, can see and analyze his shortcomings and achievements. This helps a person to think independently and freely, to make the right decisions, to move towards the chosen goal, no matter where or under what circumstances. To do this, a person must know exactly what he wants, his purpose, and take the first step with confidence. After all, a journey of a thousand miles also begins with taking the first step.

When a person has knowledge about himself, he realizes himself, uses his opportunities correctly, and serves for the stability, peace, and prosperity of his homeland, people, and family. As a result of self-government, a person can improve his life, reach the peak of perfection. In managing the human factor, the head of an educational institution must be able to properly assess, value, and employ each person's knowledge and capabilities with the right choice. That is, to be a leader, to be able to control the human factor, one must develop in oneself qualities and skills that are not present in the average person. Because everyone must use a large part of his true potential, to understand that he is a great, high being. Everyone has priorities and ideal dreams, life principles that inspire him, motivate him to move forward. As a result of dreaming of great and mature things, a person realistically increases his self-esteem. As a result, self-esteem, inner self-esteem, self-confidence and self-awareness increase. This, of course, requires clear goals and a well-thought-out plan, will and determination.

His consciousness plays an important role in managing a person. Consciousness is the highest level of the psyche, and it belongs only to man. Consciousness is the result of constant interaction with other people through language in the formation of human labor activity in the socio-historical context [8, 119]. The human mind is a substance with a highly organized psyche, that is, a property of the brain [9, 57].

As a child grows, he or she develops physiologically and psychologically. As a result of physiological development, body structure, organ quality, quantity change. Brain development also physiologically continues until the age of 20, sometimes even later. As a result of

psychological development, a person's worldview, psychological processes, situations, characteristics develop, and he expresses his attitude to himself and others. As long as everyone is alive, he is a member of some community or group and interacts with people. Words are a powerful weapon that affects the mind, using it in the right direction. Society is made up of communities and groups. These communities and groups are led by specific individuals. If the head of the educational institution has a clear goal, the right direction, he can succeed with will, discipline, determination. The leader must work on himself regularly so that he does not get embarrassed, his work does not go backwards, he must master the field, psychological and legal knowledge, follow the rules of etiquette recognized by the world in relationships and be humble. Because learning and repetition are the foundation of life. Socio-economic, political and psychological knowledge of a person serves to establish any relationship, to increase his position in society.

There are horizontal and vertical aspects in management. For example, horizontal will be based on this mental knowledge, while vertical will be based on legal documents. The basis of management is social, legal, psychological and theoretical knowledge. Management is an art in itself, and art is ability [10, 211-212]. In a pedagogical team led by a leader with such fundamental knowledge, the work is productive, the environment is healthy and the team is harmonious. There are many different ways to move up the career and service ladder, but acting as a leader, reaching the top in this field, managing the human factor as a resilient, confident leader requires hard work.

The high culture, clear strategic goals and honesty, the desire to achieve perfection in the head of the educational institution play a fundamental role in self-esteem, the rise of personal pride, a sense of dignity and dignity. Self-management is only for a mature team. Indeed, as Confucius said, society should be governed not by laws, but by morals, good deeds, and customs [11, 12].

Competitive personnel with strong psychological and legal knowledge, proper management of the human factor in the development of the state, ensuring the welfare, health and independence of the population, the country through the effective organization of its labor, the formation of leadership qualities in the younger generation ground preparation. To do this, it is necessary to identify and develop in the child the qualities of intuition and perception, types of attention, intellectual, emotional, volitional states, thinking ability, temperament and character qualities in leadership activities. In this regard, parents and educators are required to be aware of the disciplines of general psychology, psychophysiology, social psychology, psychology of youth, psycho diagnostics. After all, it is his education that makes a nation a nation. As our wise people say, a tree that has nothing to do with its roots dries quickly, and where there is a spiritual famine, there will be no economic prosperity [12, 66-68]. The education of the younger generation, without regular monitoring of their potential, without informing them of the past and history, can never develop in them the ability to see the present and the future.

One of the key personal qualities that ensures the effectiveness of a leader is his or her thinking process. Regarding the process of thinking, our great-grandfather Amir Temur said: "Thinking - a person with the ability to think and observe, a strong memory can find a way to make any problem easier" [13, 59]. Because only a leader with an independent mind, perfect, absorbed in the minds of the ideas of independence, new thinking and national pride, self-awareness can be an example to others, socio-political changes in the hearts and minds of everyone, confidence in

the future, patriotic feelings. Perfection distinguishes weakness from weakness, respect with flattery, courage with cruelty, and joy with lightness.

The main problems in the formation of psychological knowledge in the heads of educational institutions are:

● Ignorance of management psychology;

● Lack of master classes, trainings that increase psychological knowledge;

● Lack of time to work on themselves due to the abundance of meetings, paperwork;

● insufficient attention is paid to psychological knowledge in the development of job descriptions for managerial positions;

● Lack of services of image makers;

● spend more time on psychology to improve the skills of managers;

● disregard for team opinion when analyzing managerial performance;

● Failure to acknowledge mismanagement of the educational institution due to shortcomings and poor quality of education;

● Injustice in motivating and punishing employees in the team, cases of self-interest, etc.

Active use of all available opportunities (organizational, informational, scientific, socio-psychological, etc.) helps to constantly increase the professional and psychological competence of the head of the educational institution.

CONCLUSION/RECOMMENDATIONS:

To assess the professional and psychological skills of the head of the educational institution allows you to solve the following diagnostic tasks:

- The task of determining the current level of professional competence of the head of the educational institution at a certain stage of his activity;

- The task of determining the level of professionalism of the head of the educational institution in certain areas of the expected activities (targeted use of certain parts of the test);

- Tasks for self-diagnosis of certain groups of professional competence;

- Tasks to determine the level of professionalism of candidates for leadership positions;

- The task of determining the professional qualifications of teachers in order to optimally select and appoint staff.

Solving the tasks of professional and psychological diagnostics of the activities of the head of the educational institution will help to develop clear scientific and practical recommendations and guidelines:

● Measures to improve the curriculum of advanced training courses for heads of secondary schools;

● Innovative approaches to the organization of advanced training courses and teaching technology of the head of the educational institution;

● Individual recommendations for further improvement of the professional competence of the leader;

● Measures aimed at improving the professional skills of the teaching staff of the educational institution;

● Measures for the application of effective methods of management of educational institutions.

Based on the above, the modern leader in today's education system:

● make accurate and targeted strategic plans;

● be able to use management methods correctly;

● Spiritual and psychological maturity;

● in-depth knowledge of the specialty, a broad outlook;

● be legally literate;

● be able to create a healthy, creative, socio-psychological environment in their work team;

● To be able to correctly assess the mental and physical capabilities of each person under his control, to create conditions;

● have a culture of communication, be able to communicate with people;

● work on their own culture, image;

● Fluency in foreign languages;

● Must be enterprising, innovative.

Leadership is the management of the human factor, through it, its activities. The basis of leadership psychology is legal, psychological, social, theoretical knowledge.

In the image of a leader who is fair, modern, disciplined, able to feel personal responsibility, the people see the state, the head of state, and form in themselves a sense of responsibility, duty.

A STUDY OF MANPOWER DEVELOPMENT THROUGH RELEVANT TECHNOLOGY EDUCATION CURRICULUM FOR SUSTAINABLE POVERTY ALLEVIATION

S.T.Puyate*

*Faculty of Technical and Science Education,
Department of Science and Technical Education,
Rivers State University of Science and Technology,
Port Harcourt, Rivers State, NIGERIA

ABSTRACT

The purpose of this study was to investigate whether the present curriculum being used to the development of technological manpower in our technical colleges is relevant, adequate in content, effective and enough to make the recipients self-employed for sustainable poverty alleviation. A total of 50 respondent comprising 20 technical teachers and 30 final year students from technical colleges formed the sample of the study. A set of questionnaire was used for data collection while the target population was all teachers and students. A total of three research questions were and simple percentage was used to analyze the data collected. The findings revealed that, the currently used curriculum in technical colleges is inadequate, not very relevant, no enough time for practical and cannot earn the products self-employment for sustainable poverty alleviation.

KEYWORDS: *Investigate, Self-Employment, Relevant*

INTRODUCTION

No meaningful progress can be made by any aspiring nation to become a technological giant without the initial step of developing an efficient and reliable labour force. During the colonial era when Nigeria was in the hands of her colonial master, a lot of notable establishments were put in place for the training of able- bodied Nigerians for manpower development in special trade areas. Such private sectors include among others, the then Electricity Corporation of Nigeria (ECN) which metamorphosed into National Electric Power Authority NEPA), the Post and

Telegraph now Nigeria Telecommunications Limited (NITEL) just to mention but a few (Akaninwor, 1992).

It is also worthy of note that in 1895, the Hope Waddel Training Institute in Calabar, Nigeria was established primarily for the training of men for employment in the society. In addition, the Yaba Trade Centre, which is now Yaba College of Technology, was established in 1984 including several others in Nigeria for the development of middle-level manpower for the world of work.

As a follow up, the Federal Government of Nigeria through Decree No.47 established the Industrial Training Funds (ITF) as an organ of government for the purpose of training students on the job-training and re-training of both students and staff of various training Institutions. In 1977, the Federal Government established the National Board for Technical Education (NBTE) through Decree 9 for the purpose of co-ordinating technology education programmes in Nigeria.

Nigeria as a developing country with over 100 million people, one cannot definitely ascertain the number of unemployed graduates or school leavers. As the growing uncertainty in the labour market continues, unabated with more and more graduates without the necessary employable skills being turned out yearly, one then tends to ask the question, where and when would these graduates be employed?

It is a fact that, the now so-called developed nations in the world today did pass through this hectic situation for some decades before arriving at a reasonable lasting solution but when will that of Nigeria come (Puyate, 2002)?

According to Agbionu (1991), education being a social service is prone to modifications and constant review if it is to bring about the desired change.

Manpower development generally is a factor, which no serious nation can afford to ignore. A sound skilled manpower based development is the bedrock for sustainable poverty alleviation. Both Federal and State governments at different times made serious efforts to engender the development of manpower necessary to enhance the nation's industrial aspirations.

According to Tudunwada (1984), Nigeria is naturally endowed with tremendous human and material resources, but there is no gainsaying of the fact that the country has not yet got all that is necessary to make her fully developed industrially".

Technology education covers the process of producing skilled manpower, craftsmen, technologists and scientists. The International Labour Organization (ILO), defined technology education as that which involves all activities which essentially aims at providing the skills, knowledge and attitudes required for employment in a particular occupation, group of related occupations or a function in any field of economic activity inducing agriculture, industry, commerce, catering, tourism, engineering, public or private services etc.

According to Ukaha (1986), for technological education; manpower development, and self-reliance, Nigeria requires essential skills for survival in the 21st Century. For Nigeria as a developing nation to survive in the light of the above, she needs to develop a strong employable, skilled manpower development programme different from the present orientation for sustainable poverty alleviation. Poverty can only be alleviated when there is a means to sustain it. Thus, the only means is to empower the citizenry is through employable skills' acquisition programme in the formal way through the proposed suggested skills acquisition innovation.

In his opinion Puyate (2002), stated that for any nation to develop technological and industrially, she must have well trained and capable manpower and that this training ranges from craftsmen to engineers.

Curriculum has been defined as the total learning experiences presented to the learner as a deliberate, systematic and planned attempts by the school to change his behaviour (Onwuka, 1981).

In this paper, curriculum is specially limited to the area of technology education. As earlier stated, it is an area of education in which the recipients acquire a level of applied and manipulative skills, and basic scientific knowledge that will enable them understand the world of technology and the society better.

According to Aremu (1986), the effectiveness of any curriculum can be evaluated in terms of its suitability, relevance and adequacy. A technology education curriculum is ascertained useful and relevant if it meets the needs and aspiration of the trainer and trainee. Hence, the relevance of the technology education according to Aremu (1986), is that of practicability, applicability and functionality if manpower development through relevant technology education for sustainable poverty alleviation is to be achieved.

PURPOSE OF THE STUDY

The purposes of the study are to:

1. Ascertain the degree of relevance of the present technology education curriculum for manpower development and sustainable poverty alleviation.

2. Investigate the adequacy of the present technology education curriculum for employment and sustainable poverty alleviation.

3. Determine the effectiveness of the products of the present technology education curriculum in employment for sustainable poverty alleviation.

RESEARCH QUESTIONS

For the purpose of this study, answers to the following research questions were sought.

1. What degree of relevance exists in the present technology education curriculum for manpower development and sustainable poverty alleviation?

2. What level of adequacy exists in the present technology education curriculum for manpower development and sustainable poverty alleviation?

3. What level of effectiveness exists in the products of the present technology education curriculum for employment and poverty alleviation?

RESEARCH METHODOLOGY

POPULATION OF THE STUDY

In this research study, two groups of respondents formed the target population;

i)   Teachers of technology education in Technical Colleges, in Rivers State.

ii)   All final year students of technical colleges in Rivers State

SAMPLE OF THE STUDY

From the target population a total of 20 technology teachers and 30 final year students were sampled for the study.

INSTRUMENT OF THE STUDY

The instrument used for the study was a simple questionnaire, which comprises four sections. The first section requested for the personal data of the respondents while the second section comprised items, which sought to find out the degree of relevance of the present technology education curriculum. The third section also consisted of items that deal on the adequacy of the curriculum while the fourth section dealt on the effectiveness of the curriculum as it relates to employment.

TECHNIQUE FOR DATA COLLECTION AND ANALYSIS

The questionnaire was administered personally to the respondents.' A total of 50 copies of the instrument were filled and returned which represents 100 percent return. Simple percentages were used to analyze the data collected.

RESULTS AND FINDINGS

TABLE 1: DEGREE OF RELEVANCE OF CURRICULUM FOR MANPOWER DEVELOPMENT

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very relevant	6	4	10	20
Relevant	2	6	8	16
Not relevant	0	8	8	16
Enough practical	4	2	6	12
Little practical	8	2	10	20
No practical	-	8	3	16
Total	**20**	**30**	**50**	**100**

Source: Field Report, 2012

The above figures in Table I show that 12(20%) of the 50 respondents indicated their opinion that, the present curriculum is very relevant, 8(16%) indicated relevant, 8(16%) indicated not relevant, 6(12%) indicated that there is enough practice, 10(20%) indicated little practical work is done while 8(16%) finally indicated that no practical is conducted. This means that, the present curriculum is relevant for manpower development but enough time is not given for practical. Thus, the implication of this is that, students do not gain enough employment skills for sustainable poverty alleviation.

TABLE 2: LEVEL OF ADEQUACY OF TECHNOLOGY EDUCATION CURRICULUM

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very adequate	4	-	4	8
Adequate	10	2	12	24

Inadequate	6	28	34	68
Total	**20**	**30**	**50**	**100**

Source: Field Report, 2012

Results from Table 2 above indicate that 4(8%) out of 50(100%) indicated that the curriculum is very adequate, 12(24%) indicated adequate while 34(68%) indicated inadequate. The above findings therefore suggest that, the presently being used technology education curriculum is inadequate in content and cannot meet the demands in manpower development for sustainable poverty alleviation.

TABLE 3: EFFECTIVENESS OF THE CURRICULUM PRODUCTS AND SELF-EMPLOYMENT

Response Options	Number of Respondents		Total Respondents	Development Percentage %
	Teachers	Students		
Very adequate	2	-	2	4
Adequate	9	4	12	24
Inadequate	10	26	36	72
Total	**20**	**30**	**50**	**100**

Source: Field Report, 2012

Results from Table 3 above indicate that 2(4%) out of 50(100%) respondents strongly accepted that the current curriculum being used for instruction is very effective while 12(24%) indicated effective and 36(72%) vehemently opined that the curriculum is ineffective thus not for self-employment.

CONCLUSION

From the study, it is evident that, the presently used curriculum for the production of technical manpower for the nation is relevant as indicated by the overall result in Table 1 but that there in little or no time for effective practical. The results also indicated that, the content of the present curriculum is inadequate in content as regards practical or skills acquisition aspect with 34, (68%) out of 50(100%) response while in Table 3 the respondents strongly affirmed that the curriculum is ineffective as 36(72%) indicated their response. Manpower development is a very important aspect, which any meaningful administration cannot overlook or ignore. ft is the wheel that moves the progress of the nation. The problem associated with the present curriculum is lack of enough time for practical, which is the bedrock for self-employable skills in manpower production for sustainable poverty alleviation.

RECOMMENDATIONS

Based on the findings of the study, the following recommendations are made:

1. As a matter of urgency, the time for practical work should be increased weekly as to enable students acquire more practical skills.

2. Government should enact a policy called College — Industry Link Policy which will enable each student each day to spend half of his/her time in the school for theoretical work while the remain half time should be utilized in the students' proposed employment environment for enough practical skills acquisition.

3. Federal Government should urgently urge ITF to carry out its functions for both teachers and students alike.

4. Colleges should adopt students' projects teaching method in instruction for more skilled manpower development.

5. Government should provide more equipment, materials, and funds to schools for practical as obtainable in the industry so that the learning environment will look the same as the working environment.

Department of Preschool Education,
Faculty of Preschool and Primary Education,
Tashkent region Chirchik State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

This article examines some of the specifics of clarifying the concept of "Education" in the study of the course "Methods of educational work". The practice of specifying the category "education" in the structure of training future teachers in physical culture is described, the peculiarities of using pedagogical modeling are visualized in the products of determinations built during the course "Methods of educational work".

KEYWORDS: *Critical Thinking, Thought, Education, Pedagogical Modeling, Upbringing, Pedagogical Methodology*

INTRODUCTION

In accordance with the law "On Education" during the working hours of teaching staff, depending on the position held, educational (teaching) and educational work is included.

The law defines the concept of "education". "Education is an activity aimed at personal development, creating conditions for self-determination and socialization of a student on the basis of sociocultural, spiritual and moral values and rules and norms of behavior adopted in society in the interests of a person, family, society and state."

In addition, the rights, duties and responsibilities in the field of education of parents (legal representatives) of students are determined, - "parents (legal representatives) of underage students have a priority right to education and upbringing of children over all other persons.

They must lay the foundations for the physical, moral and intellectual development of the child's personality. "

Thus, the educational process in a modern school cannot be carried out without cooperation with parents (legal representatives). In addition, in the modern world, this implies focused work with parents, going beyond the traditional school-parent relationship.

State policy and legal regulation of relations in the field of education are based, inter alia, on the principle of the humanistic nature of education, the priority of human life and health, individual rights and freedoms, free personal development, education of mutual respect, industriousness, citizenship, patriotism, responsibility, legal culture, respect for nature and the environment

Education as a category of pedagogy in the modern preparation of a future teacher is a unique resource and product that reflects the capabilities of the modern theory of education in defining and solving theoretical and empirical problems directly related to the system and norms of traditional and innovative education. In this understanding, the importance of organizing scientific work on pedagogy in the structure of the study and productive solution of the determined problems of the theory of education are based in our practice on a set of scientific and pedagogical works that determine the features of solving problems of personality development in the model of modern education and the technology of system-pedagogical modeling [1-7].

Education in a broad sense is the process of determining the possibilities for solving problems of personality development at the state level in the model of lifelong education, using the practice of forming social experience through social relations and roles, methods of reproducing values, goods, products, the formation of universal values, ideals, ways of solving problems, forming the need for recognition, achievements, optimization of all links of social educational and professional-labor relations, allowing in detail in future relations to trace the objectivity and regularity of situational ideals and ideas of self-development and self-preservation of the individual and society in a unique combination of opportunities and requirements that realize the field of meanings, values, culture, science, etc. Education in the narrow sense is the process of verifying the quality of assimilation of procedural and activity characteristics and resources of modern education, realizing a holistic understanding of socialization and self-realization tions in a multicultural educational space as a guarantor of stable development and self-affirmation of a person, systematically disposing a person to a multidimensional formulation and solution of problems of intrapersonal and multicultural genesis, determining the quality of further relationships and activities.

Upbringing in the local sense is the creation of conditions for the formation of a specific character trait, value, development and formation of a certain ability, quality, competence, providing the individual with further full-fledged coexistence and self-realization in a dedicated field of opportunities and priorities, abilities and methods of reproduction of standards and products of culture, science, arts, sports, etc.

The highlighted definitions are a continuation of the realizable possibility of the student's personality and the teacher's personality to be included in the system of problems and tasks of modern education, which guarantees the relevance and competitiveness, flexibility and humanistic orientation in the ideas, models, technologies and systems being implemented.

Three directions represent the unity of three realizable features of the multicultural space - 1) the implementation of the pedagogical process at the state level, 2) the implementation of ped. process at the regional level in meaning-forming activities, 3) the implementation of ped. process in a specific life situation, defined within the framework of the two previous levels and the ability to localize, personify and detail the conditions of the problem being solved.

The form of organization of education is a way of organizing the educational process. The child develops, forms his skills, behavior patterns, values, feelings in the process of joint activities with people and in the course of communication with them. Therefore, in order to achieve educational goals, the class teacher must be able to organize various activities of children, taking into account their age characteristics. As a class teacher, I build my work with the children in accordance with the class's educational work plan. The purpose of the educational work of the class for the current academic year is to create conditions for the development of a creative socially active personality as one of the areas of socialization of students (the formation of a close-knit team, moral qualities of the individual, creative abilities of students) The tasks of educational work of the class: Fostering a sense of patriotism, love and respect for the Motherland , to the original culture of our region. Work on team building, fostering an attentive attitude to each other, mutual assistance.

Creation of conditions for the education of the moral qualities of the individual on the basis of the assimilation and practical application of moral norms. Deepening and systematization of knowledge about the rules of personal hygiene, about a healthy lifestyle. Directions of educational activities of the class: Direction "Health" Direction "Interaction" Direction "Morality" Direction "Intellect" Direction "Leisure" Direction "Family" Holidays, games - travel, class hours, competitions, excursions, educational games, quizzes and many other educational activities create a special educational environment for students. Collective affairs become events not only for students but also for parents. Holidays and joint affairs bring joy, create a mood, remain in the memory of every child.

In the first grade, educational work during the school year is aimed at introducing children to school life in a team. On the development of a sense of camaraderie in children, the ability to culturally communicate with each other, the need to speak the truth, to observe the basic rules of behavior at school, in the classroom, in the family. This is facilitated by the class hours: "What is good and what is bad", "School of courtesy". Through conversations, role-playing games on classroom hours, I try to teach children the rules of behavior in public places, when crossing streets and roads, adherence to healthy lifestyle rules, involvement in sports and physical education: a competition for the best athlete in the class "My sporting achievements", the project "From the history of the Olympic games "," Club of attentive pedestrians "(cognitive game)," Visiting the traffic light "(training exercises)," We go to the cafeteria "," Travel to the country of Health "(class hour), etc. It is important that children also take participation in the preparation of class hours: they picked up books on the subject in the classroom or home library, learned poems, drew pictures, prepared memos, useful tips, etc. Themed folders - drives help in preparing events. I practice developmental activities aimed at developing colloquial speech, creativity, a sense of kindness and responsiveness: self-presentation "This is Me", competition "Me and LEGO." Traveling to the natural world, quizzes, reading books, participating in the actions "Feed the birds in winter", "Give your hand to your paw" and others contribute to the expansion of children's emotional and sensory experience of interacting with nature,

environmentally competent behavior in nature. Love for native nature is one of the surest signs of love for the Motherland.

Work in the moral-aesthetic and spiritual-moral directions determines the possibility of forming in children more complex feelings and concepts, such as love for their native land, Motherland, humanity. I try to bring up patriotic feelings in children, the desire for peace on the whole planet, a negative attitude towards war; I conduct extramural excursions, lessons of "Courage" on the issues of patriotic education of children using the state symbols of the Republic. The guys constantly take part in actions, a letter to a veteran, a book of memory, participate in reviews of formation and song, a patriotic song competition. Excursions contribute to the study of the history and traditions of the native land. Work is underway to develop the emotional and sensory sphere of the individual. "Day of kindness and respect", "The closest and dearest person" - for Mother's Day; participation in the holidays "Day of the birthday man", "Farewell to primary school." The team laid the foundation for self-government - responsibilities are distributed, which brings up responsibility, independence, organization in children. Children are on duty in the classroom, take part in labor landings, take care of indoor plants, create projects about professions, participate in the "Clean City" campaign. One of the important areas in the work of the class teacher is working with parents. Taking children to grade 1, I designate for myself the main stages of pedagogical relations between family and school: - Creation of a social class passport; - Questioning of parents; - Visiting children at home; - Pedagogical guidance of family education through parenting meetings, individual and group consultations; - Organization of parental self-government; - Revealing the positive experience of raising children in the family. By the end of the first year of study, there are such actual changes as the orderliness of the life of the class, an overall positive psychological climate, an increase in the level of education of children. Parents also notice these changes. As a result, they show mutual understanding, cooperation, help and support. Spiritual and mental qualities that determine behavior are necessary for a person in society, in addition, the result of the entire educational process depends on them.

Parents also notice these changes. As a result, they show mutual understanding,

cooperation, help and support. Spiritual and mental qualities that determine behavior are necessary for a person in society, in addition, the result of the entire educational process depends on them. And I wanted to end my speech with the words that every person has a sun, just let it shine. The task of the class teacher is to see individuality even in the smallest person, to find a special approach to each student. "A real teacher is not the one who knows the most, but the one who inspires others to do good things!" The class teacher's commandments: Be demanding of yourself Have a competent speech Show an example in everything Do not be indifferent Trust, but check Promised - do Do not be annoyed, be patient and persistent Be kind, but not kind Be good, but not kind Be good at putting yourself in the child's shoes Remember: maximum encouragement, minimum punishments Do not have favorites Do not demand more from your child than he can. Give the pupil feasible tasks. Be able to look in the same direction with your parents. Lovechildren, whateverthecost.

ABSTRACT

The article talks about the role of visual activity in the formation of the personality of a preschool child, the formation of the fundamental qualities of the psyche. It provides the rationale and characterization of the author's program "We play, depict, fantasize", built on the basis of the principles of art pedagogy, aimed at developing, first of all, the aesthetic abilities of the child. The program was developed taking into account the need to create psychological and pedagogical conditions for the implementation of the main functions of children's art, and the main role is played by the nature and characteristics of practical tasks.

KEYWORDS: *Visual Activity, Art Pedagogy, Educational Functions Of Children's Visual Activity, Aesthetic Abilities.*

INTRODUCTION

Preschool age, as you know, is the "golden time" in the development of various kinds of child's abilities, including the aesthetic "hearing" of the personality, which provides an opportunity to join the treasury of the human spirit - art. "In art, mankind has accumulated such an enormous and exceptional experience that any experience of domestic creativity and personal achievements seems miserable and scanty in comparison with it.

Therefore, when talking about aesthetic education in the general education system, one must always bear in mind this introduction of the child to the aesthetic experience of mankind: it is necessary to bring close to the monumental art and through it to include the child's psyche into

the general world work that humanity has done over the millennia, sublimating your psyche in art. This is the main task and goal ... ”[1].

The essence, ways and methods of aesthetic education of preschool children have been studied by many scientists, including N.A. Vetlugina, E.A. Fleerina, R.M. Chumicheva, E.M. Torshilova and others. These authors considered the artistic and aesthetic development of the child as a fundamental component of overall development.

Special merit in this direction belongs to N.A. Vetlugina, who developed the theoretical foundations of the aesthetic education of preschool children. She believes that bringing up a child aesthetically means developing his aesthetic perception, aesthetic feelings, artistic and aesthetic taste, artistic and creative abilities [2].

Most researchers agree that all types of art, the beauty of nature, and involvement in artistic activity are aesthetically educated.

Art is one of the most mysterious and mysterious phenomena of our reality. L.S. Vygotsky believed that art is rather an organization of our behavior for the future, an attitude forward, a requirement that may never be fulfilled, but which makes us strive over our life for what lies behind it [3]. A person, in addition to his material needs, always had spiritual needs: the desire for communication with the beautiful, for beauty and moral purity, self-knowledge and self-expression. The task of art is to satisfy the spiritual needs of people, to bring joy, to experience vivid emotions and to awaken love for the world and its beauty. All of the above can be given by art, provided that it enters the life of a child and becomes his companion for many years.

Visual activity is understood as artistic and creative activity with the help of visual arts materials. For both an adult and a child, it is aimed not only at reflecting the impressions received in life, but also at expressing their attitude towards the depicted. The visual activity of children in various aspects has been studied by many famous researchers.

As noted by A.V. Bakushinsky, N.B. Vetlugin, V.S. Mukhina, E.A. Flerina and others, in addition to being one of the most attractive activities for a child of early and preschool age, visual activity has a special biological meaning for the formation and improvement of the most important psychophysiological functions of the body. In the first years of life, the child actively develops vision, assimilates the concepts of vertical and horizontal, mastery of forms, acts of perception and motor skills are coordinated, which is directly facilitated by visual activity.

L.S. Vygotsky, P. Ya. Galperin, V.V. Davydov, A.V. Zaporozhets, A.N. Leontiev, M.I. Lisin considered pictorial activity as the basis and condition for the development of the child's psyche. Visual activity is associated with fine movements of the hand and fingers, directly controlled by the brain and, according to V.A. Sukhomlinsky: “The origins of the imagination and talent of children are at their fingertips. From the fingers, figuratively speaking, the finest threads go - rivulets that feed the source of creative thought. In other words, the more skill in a child's hand, the smarter the child is ”[1].

At present, the visual activity continues to be in the focus of attention of the psychological and pedagogical sciences. This is explained, on the one hand, by the importance of the role played by visual activity for the development of the fundamental qualities of the child's psyche and, on the other hand, by the fact that “... the development of a child's visual activity is a more complex and confusing process than the development of speech. All people, one way or another, master

speech and achieve, ultimately, comparable results. All people, one way or another, mastered the visual activity, however, the results here are clearly incomparable "[2].

In the pedagogy of art, a direction of science that emerged in the 60s of the 20th century, the changes that have occurred in art education by this time are substantiated, and new approaches to understanding the role that art can play in the development of a child, the nature and meaning of children's visual activity are fixed. ... The pedagogy of art proceeds from the idea that "throughout the history of the development of civilization, art is a unique way of transmitting the spiritual experience of generations and is an irreplaceable way of socializing a person in terms of the power of influence. Education in the field of art and education through art contribute to the development of a child's cognitive abilities ... the formation of an integral personality, the formation of a creative individuality "[3].

Education in the field of culture and art, aesthetic upbringing is gaining special relevance in the context of increasing rationalization, pragmatization of social reality, contributing to the replenishment of the emotional component of the educational process that is often absent in a sufficient measure.

The development of individual abilities involves the formation of interest in artistic creation from a very young age, its encouragement and strengthening. Thanks to the research of scientists - founders of art pedagogy: B.M. Nemensky, Yu.P. Yusova, A.A. Melik-Pashaev, contemporary authors: E.M. Torshilova, I.A. Lykova, T.A. Koptseva and others, the goals and objectives of visual activity in the preschool educational institution were reoriented.

Currently, in the developed requirements for the "First Step" of the DO on artistic and aesthetic development, the main goal is: "Formation of interest in the aesthetic side of the surrounding reality, an aesthetic attitude to objects and phenomena of the surrounding world, works of art; fostering interest in artistic and creative activities ". In this case, artistic and creative activity is understood as an activity that occurs in a child under the influence of a literary, musical work or a work of fine art [4].

Artistic and aesthetic development, noted in the same document, includes:

1) The experience of the emotional and moral experience of the child's attitude to the surrounding reality, embodied in music, visual arts and works of art;

2) experience of artistic and creative activity [4].

The goals of children's visual activity as one of the types of artistic and aesthetic activity, formulated in "The First Step", are difficult to implement in practice, primarily due to persistent stereotypes among teachers, their orientation towards teaching children technical visual skills.

So, G.R. Akramova writes that the results of a survey of 1250 teachers showed that only 7% of the respondents are aware of the importance of the aesthetic attitude to the world for general and artistic development and associate it with the child's visual activity [5]. We have developed the author's program "Play, Imagine, Imagine", aimed at the development of senior preschool children in visual activity from the standpoint of art pedagogy on its nature and meaning. Let's consider the main conceptual provisions of our program. When developing it, we took into account the educational functions of children's visual activity, identified and substantiated in

connection with the active formation and development of psychological science at the beginning of the 20th century.

The educational functions of children's drawing are understood as the role that different types of visual activity can play in the formation and development of the qualities of a child's personality, taking into account the physiological and age characteristics. We have focused on such educational functions of children's visual activity as aesthetic, diagnostic, therapeutic (psychoregulation function) [6].

The leading role in children's art belongs to the aesthetic function, which is realized under the condition of its certain organization. This is how we formulated the main goal of our program: "To form the aesthetic abilities of older preschool children through the development of interest in various types of visual activity." The goal, formulated in this way, means the orientation of the child's visual activity on his aesthetic development and submission to this most important task of teaching children technical visual skills. Under aesthetic abilities it is customary to understand the totality of personality traits that ensure the success of the implementation of aesthetic activity, aesthetic perception and experience of the phenomena of reality. Imagination, creativity, imagery, empathy are considered components of aesthetic abilities [7].

Researchers are unanimous that aesthetic abilities are determined by natural inclinations, but they develop successfully in appropriate psychological, pedagogical and socio-cultural conditions. "A developed aesthetic sense ... is capable of transforming the world of every person, making it brighter, more colorful, richer, more perfect. The loss of the sense of beauty is tantamount to the loss of happiness """ Beauty is the ultimate goal of world and human life "[8].

The world around us is infinitely beautiful and changeable: the seasons alternate, the day follows the night, and not a single moment of life repeats itself. "The sun rises and sets, light, translucent clouds float into the blue heights, leaving elusive shadows on the ground, flowers smell and wither, stars twinkle, snow falls, frosts triumph, but the sun's warmth again and again breaks the cold shackles, turning the dormant ice kingdom into life-giving waters ... ". However, "... the perfection of being invariably slips away, remains unclaimed, closed to a one-dimensional personality. The dying out of empathy, aesthetic perception entails the fading of beauty, rejection from the general consonance, which grew at the turn of the 21st century into a global problem ... "[8, p. 35].

Preschool age, when a child is open to the world and lacks the stamps of an adult's worldview, is the most favorable time to gain experience of aesthetic perception of the world and an impulse for the development of aesthetic abilities. Artistic activity, having a potential that has not yet been realized in the practice of modern education, can be a means for achieving these most important tasks of the formation of an aesthetically developed, spiritual personality. It is obvious that pictorial activity is directly related to the visual perception of the surrounding world and is impossible without the ability of children to develop the ability to observe the world around them, to perceive the form of the surrounding world, to perceive a special, imaginative, poeticized one.

The First Step program has a block-thematic structure, which means repeating certain topics, but at a higher level of complexity. Blocks "Paints of the Earth", "We are at home", "Winter's Tale" and "What color are spring and summer" are repeated in all four age groups of the program: the second junior, middle, senior and preparatory. Thematic blocks are aimed at creating conditions

for poeticized perception and experience by children of the states of nature in every season. So in the fall, the attention of children is drawn to the unusually bright heavenly blue against the background of gold foliage, in winter - the state of sleep of Nature and expectation of the miracles of the New Year, in the spring - the awakening of the world from sleep and the joy of flowering, etc. Children not only get acquainted with the characters: the Artist, the Fairy of Good and the Fairy of Evil, the Winter Blizzard, etc., but also participate in their creation (decorate, sculpt, draw, carve, etc.).

Below is a system for the development of children's graceful and aesthetic skills, taking into account the age stages of training in preschool education:

● 4th year of life (2nd junior group) - activation of the child's interest and attention to the most diverse forms of sensory contact with the world, the inclusion of different senses as the basis for the sense of form;

● 5th year of life (middle group) - development of the ability for imaginative perception based on the combination of visual and auditory, tactile and visual information (the ability to synesthesia);

● 6th year of life (senior group) - development of the ability to animate the perceived, to "feel" in it (the ability to empathy); the appropriation of elementary knowledge about the aesthetic organization of form and the development of one's own abilities to organize the form (a sense of rhythm, rhyme, structure, color scale, modal feeling, etc., the development of aesthetic ideas, knowledge and creativity);

● 7th year of life (preparatory group for school) - expansion and complication of knowledge and ability to perceive aesthetic and artistic form (ability to grasp style, "sense of style").

The guiding principle of the program "We play, we portray, we fantasize" - its emotional and imaginative nature, demanded the involvement of related arts in the visual activity classes, reliance on such types of it as theatricalization and artistic expression. In our classes, a conversation with children often begins with the reading of poetic lines, a theme is indicated that the children embody in visual materials. Grandfather Tree has Kind people. Big, big Kind hands ... Some kind of bird fusses in the hands, Some bird sits on its shoulders.

Before portraying, children transform: into a flower, only blossoming or wilted; in sad birch, willow or slender poplar; into the Blizzard or Spring-Red; walk like a fearful Bunny or a cunning Fox, etc. All these "transformations" make it possible to "try on" one or another image, to feel it, to feel it. As an example, let us give a block of classes "Colored fairy tales", consisting of a number of topics: "Magic rug of mood", "What's in the jug of the Fairies", "House of the good and evil Fairies", "Portrait of a Fairy" The general goal of the "Colored Fairy Tales" block: development of children's color associations, the ability to perceive color as an image of good or evil; activation of children's skills to convey mood through color and movement, development of creative imagination through attempts to fantasize, compose. The first lesson in the "Colored Mood Mat" block begins with a conversation that each color, paint has its own character. Children are shown a table we have developed, called the "Palette of Feelings" and which is an important visual aid for this block, a support for associations of color with various emotions: joy, anxiety, sadness, loneliness, anger, despair, guilt, etc.

The following lessons are also devoted to a continuation fairy tale, which we compose with the children. The beginning of the tale may be like this: "In one fairy forest there lived two sorceresses, two Fairies. One lived on one edge of the forest and was very kind: she treated all the animals, helped everyone, the other Fairy lived on the opposite edge, and was, on the contrary, very evil - she harmed everyone, took revenge, conjured. And then one day ... ". Further, the attention of the children is drawn to the fact that the things of the Fairies correspond to their character: each of them has a "good" and "evil" carpet of an airplane, a beautiful or terrible house, each planted a tree that grew and became like the Fairy herself. The lesson "What's in the Fairy's Jug" develops the theme of "spiritualization" of the subject environment of sorceresses and the embodiment of their characters. The task involves filling a jug with color so that it is clear what is poured in it: a healing balm or poison. When developing the program, we also took into account such an important function of children's visual activity as art therapy. Since the time of Aristotle, the healing effect of art and artistic activity has been known, in other words:

"Art is always therapy." At present, the main condition has been identified under which the art-therapeutic function of children's artistic activity is manifested most fully:

- this is her spontaneous, creative nature. All tasks in our program are structured in exactly this way, for example: "We draw the mood", "How Autumn is sad", "What does Spring wear", "The transformation of color spots", etc. The diagnostic function of children's visual activity is closely related to the therapeutic one , merged with it, in fact, into a single whole. Any children's work in this or that visual material, in principle, reveals the psychological qualities, the level of artistic development and much more of its author. There are so-called. drawing tests or projective techniques that allow you to do this to the maximum extent, having both diagnostic and developmental meaning.

We included this kind of tests-tasks in the final classes of each block, these are: "Beautiful drawing", "Draw the mood", "What color is the New Year", "Smell of Autumn", etc. Completing the description of our program, it should be noted that it the essence, like any other program, is determined by practical tasks and from how they are formulated, what kind of visual materials and pedagogical conditions for implementation involve, and the set goal of the program as a whole will be achieved.

ABSTRACT

The article is devoted to the structuring and systematization of contemporary art works of art depending on the environment of their creation, technologies and materials. *The possibilities of pictorial art have been especially vividly revealed by easel painting since the 15th century, from the moment of the massive use of oil paints. It is in it that a special variety of content and deep elaborations of form are available. The element of color and paints comes along with the sensations of transparency of streams of watercolors flowing freely along the sheet, viscosity and density of gouache, velvety and fragility of pastels, giving many delicate shades.*

KEYWORDS: *Graphics, Painting, Sculpture.*

INTRODUCTION

Fine arts are historically established forms of creative activity that implement visual-conceptual images and differ in the ways of their material embodiment.

As you know, types of arts can be grouped into the following groups: plastic, temporary and synthetic. Plastic arts are spatial arts, works are objective in nature, are created by processing material and exist in real space.

The plastic arts include: visual arts (graphics, painting, sculpture), architecture, decorative and applied art, design, as well as works of folk art of a visual and applied nature.

All types of art master the world in a figurative form. Works of plastic arts are perceived visually, and sometimes tactilely (sculpture and arts and crafts). In this way, they differ significantly from works of temporary art forms.

Painting is one of the main types of fine art; is an artistic image of the objective world with colored paints on the surface. Painting is divided into: easel, monumental and decorative.

Easel painting - mainly represented by works made with oil paints on canvas (cardboard, wooden planks or bare). It is the most widespread type of painting. It is this kind that is usually applied to the term "painting".

Monumental painting is a technique for painting on walls when decorating buildings and architectural elements in buildings. Fresco is especially widespread in Europe - a monumental painting on wet plaster with water-soluble paints. This painting technique has been well known since antiquity. Later, this technique was used in the design of many Christian religious temples and their vaults.

Decorative painting - (from the Latin word for decoro - to decorate) is a way of drawing and applying images to objects and interior details, walls, furniture and other decorative items. Refers to arts and crafts.

The possibilities of pictorial art have been especially vividly revealed by easel painting since the 15th century, from the moment of the massive use of oil paints. It is in it that a special variety of content and deep elaborations of form are available. At the heart of pictorial artistic means are colors (possibilities of colors), in an inseparable unity with chiaroscuro, and line; color and chiaroscuro were developed and developed by painting techniques with a completeness and brightness inaccessible to other types of art. This determines the perfection of volumetric and spatial modeling inherent in realistic painting, lively and accurate transmission of reality, the possibility of realizing the plots conceived by the artist (and methods of constructing compositions) and other pictorial advantages.

Another difference in the differences in the types of painting is the technique of execution for the varieties of paints. General characteristics are not always enough to define. The border between painting and graphics in each individual case: for example, works made with watercolors or pastels can relate to both areas, depending on the artist's approach and tasks assigned to him. Although drawings on paper are related to graphics, the use of different ink painting techniques sometimes blurs the distinction between painting and graphics.

The artist creates a unique world by painting means that surprises and pleases us, makes us worry and gives food to the mind, introduces to the secrets and secrets of mastery.

Color can sculpt the shape of an object, depict the beauty of the surrounding world, express feelings, moods, a certain emotional state.

Color can be perceived in different ways, color can be thought and designed. You should study the basics of color science, distinguish between the concepts of "color" and "paint". The required color for painting is usually achieved by mixing paints on a palette. Then the artist turns the paint into color on the plane of the picture, creating a color order - coloring. The word "color" is one, but defines many qualities of the painting process, so color is rightfully the basis of this kind of art.

Imagine that all colors have disappeared from the surrounding world, and we see it only in gray-white. What a dull, monotonous and unusual picture you get! It turns out how much color means in our life!

Any item has its own color. We recognize some objects only through color. Color helps us know if the berries are ripe, or that autumn has already come, because the green leaves of the trees have turned yellow and red.

Even the air colors the distance of forests or mountains in different ways, helps us to navigate in space. At different times of the day, depending on the color of the light, the shades of the sky, earth and water change.

At dusk, green appears to be the brightest. With the onset of darkness, the red-violet colors darken, and the green-blue colors lighten.

The whole world in all its beauty, shape and material, space and lighting, we see thanks to the variety of colors.

Color is one of the signs of objects we see, a conscious visual sensation.

But the color can not only please, but also cause irritation, anxiety, feelings of longing or sadness. In other words, color has an emotional impact on us.

Some colors calm the nervous system, while others, on the contrary, irritate. Green, blue, blue have a calming effect. Exciting - purple, red, orange, yellow.

It is known that a person who needs physical rest, emotional peace, instinctively chooses dark tones. If the body needs to release energy through outward activity or intellectual creativity, then the natural response will be to choose bright bright colors.

The effect of colors is due to both the direct influence on the human body and the associations that cause colors based on all previous human practice.

For a long time, people have attached special importance to color. In the Middle Ages, purple meant strength, power, dignity; azure color - beauty, greatness, softness; black in combination with red - death, etc.

The role of color in rituals and festivals is great. So, for example, red means solemnity, greatness; black - grief, death, sadness; white - purity, innocence; green - hope, etc.

One of the first who began to investigate the effect of color was I. Goethe, who, as a poet, was able to convincingly feel that green contains kindness, peace, the ability to calm the eye and soul, blue evokes a feeling of coldness, and red acts intimidating.

I. Goethe liked to look at one and the same landscape through glasses of green, yellow, red and other colors and observe how the perception and emotional state of a person change in this case.

In the visual activity, it is generally accepted that the red color rich in associations is exciting, warming, revitalizing, active, energetic; yellow color - warm, invigorating, cheerful, attractive; orange - cheerful, joyful, fiery, kind. Green is also rich in associations, it creates calmness, pleasant and peaceful mood.

But the blue color is characterized as serious, sad, dreary, sentimental, calm. The color purple combines the emotional impact of red and blue - it is both attractive and repulsive, full of life and at the same time causing longing and sadness.

The perception of color is very individual. The peculiarities of children's perception are that the child's visual apparatus is not yet sufficiently formed, and assessments of the psychological and aesthetic order are on an equal footing and are closely merged with moral ones.

A child, mastering the world around him, the culture of society, including color culture, must master certain standards of color, that is, learn to see the world in all the variety of colors and systematize what he sees and what he acts with.

Obviously, the more definite the set of color standards (green grass, blue sea, yellow sun, red flower, etc.), the longer the child, as he grows up, will be within the "child's perception". And vice versa, the wider and more variable the set of color combinations, the wider the choice, the thinner the analytic properties of perception.

Painting lessons help develop a sense of color. Direct contact with paint, comparison of paint color with surrounding objects and nature, obtaining shades with white and water, mixing paints to obtain a new color - all these are processes in which there are many pleasant sensations. The element of color and paints comes along with the sensations of transparency of streams of watercolors flowing freely along the sheet, viscosity and density of gouache, velvety and fragility of pastels, giving many delicate shades.

Combining colors plays an essential role in painting. Usually those colors that are equal in lightness and that are close to each other in color tone are combined with each other.

When colors are tonally united with each other, then a qualitative change is noticed, which is manifested in their special sonority. A color that falls out of the general tonality, is not consistent with it, seems alien, destroys the integrity of the painting.

An artistic canvas is built on the interconnection of all colors of a painting, that is, when no color spot can be changed in brightness or saturation, increased or decreased in size without compromising the integrity of the work.

Harmonious combination, interconnection, tonal combination of different colors in a picture is called color.

Color reveals to us the colorful wealth of the world. It helps the artist to convey the mood of the painting: the color can be calm, joyful, anxious, sad, etc. Colorcanbewarmandcold, lightanddark.

Painting by old masters allows you to trace the development of color in the following main stages. The concept of color began to take shape at the end of the 15th century, flourished in the Baroque era, and became more acute in Constable and especially in the Impressionists.

Essays by the remarkable Russian art critic B.R. Wipper help to learn the history of color in painting.

In the 15th century, paints on the canvases of Italian, French, German artists existed, as it were, independently of each other.

The first changes in color appear at the end of the 15th century. At this time, paints began to be applied not separately, but to merge smooth color transitions into semitones. Color and shape merge into one whole, paint becomes inseparable from light and space. The path from Bellini to Titian and Tintoretto is the transformation of local color into tonal.

If in the 16th century color in painting means life in general, then further it is more and more concretized. New shades appear: in Caravaggio - tomato red, olive green, brown-yellow, cornflower blue, in Velazquez - elusive transitions around black, gray, white, pink.

Rembrandt limits his palette to dark tones, but his color acquires new properties - spirituality and mystery.

Renaissance painters such as Titian use color as a manifestation of the life of nature. In the Baroque era, color is more an element of pictorial fantasy, performing primarily aesthetic functions.

The painting of the old masters was built on exquisite colorful transitions, mixed colors, and complex technical techniques. They used strong tonal and color contrasts. To get the desired tone, old craftsmen often used glaze techniques.

In the 18th century, this aesthetic play with paint becomes even more sophisticated, complex and virtuoso. Artists use the finest nuances of the same color for face, hair and clothing. Colors come to the fore - white, light yellow, coffee brown.

The 19th century is characterized by the struggle of various trends, the contradiction between color and form. At this time, color is mainly used for optical experiments.

Painters of the 19th century, especially the Impressionists, learned how to recreate the sunshine, highlighting the light against the light. They moved on to using pure paints using optical color mixing effects, with more emphasis on color contrasts.

Matisse, Gauguin, Van Gogh have clear contours and full-sounding, large spots of paint. Matisse found his palette in the realm of local colors. He invented a way to draw not with paints, but to cut out the necessary color spot from paper and place it on a plane without a preliminary drawing. Stickers made of Matisse paper form a single whole in color, they can be easily turned into tapestries, patterns on fabrics, book decorations.

Color in Gauguin's paintings plays a role not so much a pictorial as a decorative, symbolic one - you can see red sand, pink horses, blue trees.

Van Gogh's paintings are based on contrasting color combinations, but here the paints are no longer decorative, but a psychological factor, convey the mood.

The sense of color is a very valuable gift. Outstanding Russian colorists were I. Repin, V. Surikov, K. Korovin, M. Vrubel, F. Malyavin, V. Borisov-Musatov and others.

An example of a vivid expression of color in painting can be the work of I. Repin, who painted in a warm golden-yellow-red color. V. Surikov's favorite color consisted of bluish-blue, cold colors. Many works of V. Serov were written in gray-silver color, and M. Vrubel preferred gray-blue colors. Many of F. Malyavin's paintings are distinguished by their fiery red color.

Color is often the main means of conveying national characteristics, nature, way of life, people. In this case, they speak of "national flavor". An example is the works of M. Saryan. Quite often the color of the artist is evidenced by his palette.

The art of painting is the art of color and light relations.

When depicting reality with paints, it is necessary to take into account the influence of colors on each other, that is, to write with color relations.

It is important that color relations correctly found in the picture help to see the beauty of reality and the beauty of the work itself.

In decorative work, artists also take care of the harmonious balance of colors, and the real colors of objects can be changed to symbolic ones. The coloristic unity of all ornamental elements is achieved with the help of color contrasts or nuances.

When choosing color relationships in decorative work, the size of the parts of the drawing, their rhythmic arrangement, the purpose of the thing and the material from which it is made are taken into account.

In design, great attention is paid to ensuring that color is interconnected with the shape and purpose of the object, giving it brightness and elegance.

DIGITAL PEDAGOGY IS A FACTOR IN IMPROVING THE QUALITY OF EDUCATIONAL SERVICES

Ishanova Mukhayyokhon Mukhtarovna*

*Senior Lecturer,
Department of General Pedagogy,
Andijan State University,
UZBEKISTAN

ABSTRACT

The article is devoted to the study of digital pedagogy as one of the main factors in improving the quality of educational services in the Republic. The role of information and communication technologies in the development of professional activities of teachers, as well as their impact on students, is analyzed. The importance of the competent use of such technologies in practice is substantiated, and the specificity of digital pedagogy is determined. The article concludes that digital technologies will definitely occupy a niche in the educational process of the state, will be used in conjunction with traditional forms of education due to their versatile and comprehensive specifics, according to which the latest information and communication technologies have a positive effect on all indicators of the quality of education. This approach will help teachers achieve the dynamics, efficiency and effectiveness of professional activities.

KEYWORDS: *Digital Education, Digital Pedagogy, Information Society, Education System, Educational Services, Quality Of Educational Services.*

INTRODUCTION

The education system is known to play a key role in determining the vocational guidance of a student. The development of the local and global economy, information and technological progress, the development of new areas and facilities - all this directly depends on the quality of educational services and dictates new rules for the state labor market, which now needs dynamically trained specialists who are constantly improving their qualifications and improving their skills. as well as applying modern digital technologies in practice.

Thus, a high-quality educational process and a specialist as a result of this process are interconnected links in one chain and must develop simultaneously and rapidly.

The educational process is through innovations and digital pedagogy, and the specialist through the educational process.

The theoretical foundations of improving the quality of educational services using digital pedagogy are discussed in the works of such domestic scientists as D. Bardach, I.V. Sergeeva, E.I. Yaroslavtseva and others [1 - 6]. A scientific approach to the study of any problem begins with the development of a conceptual apparatus. In order to understand how digital pedagogy affects the improvement of the quality of educational services and what technologies are involved in this, as well as what the concept of "quality of educational services" consists of, it is necessary to consider these phenomena in more detail.

So, digital pedagogy is a pedagogical process that includes various digital technologies (computers, gadgets, software, etc.) and, as a result, provides a higher quality of educational services.

S. D. Ilyenkova notes that "the quality of education is the relevance of the knowledge gained in the specific conditions of its application to achieve a specific goal and improve the quality of life. The quality of knowledge is determined by their fundamentality, depth and demand for work after graduation"[3].

The quality of education is primarily a multidimensional and complex structure. Based on the approach to understanding this system, S.D. Ilyenkova identifies the following blocks of quality indicators [3]:

1. The quality of the teaching staff.

2. The state of the material and technical base of the educational institution.

3. Motivation of the teaching staff.

4. Quality of training programs.

5. The quality of the students.

6. Quality of infrastructure.

7. Quality of knowledge.

8. Innovative activity of the management.

9. Implementation of process innovations.

10. Demand for graduates.

11. Competitiveness of graduates in the labor market.

12. Achievements of graduates.

Of course, these indicators are inextricably linked and interact within the system. Based on this, it can be said that any impact on the educational system and improving the quality of educational services, respectively, affects all of the above elements. This article examines the influence of information and communication means and identifies the specifics of this influence. Often the

concept of "digital pedagogy" is put on the same synonymous row with the term "online pedagogy", which is not entirely correct, since digital is a much broader and technologically equipped sphere. I.V. Sergeeva believes that "the essence of digital pedagogy is not so much the direct use of digital technologies in teaching, but rather the use of these tools from the point of view of critical pedagogy" [4, p. 113].

The use of a computer in the educational process may not always refer specifically to the above concept, since the traditional form of education often allows the use of various information technologies, that is, the educational process remains familiar (traditional), does not deform and does not transform.

An example is text editors that are used to write messages, reports, essays, etc. The learner may not need to use the computer, since there are traditional material media designed to receive, edit and store information (textbook, notebook, paper).

The digital approach to learning provides for the availability of information and communication technologies that transform the educational process itself and create new opportunities for learning. In this case, the student and the teacher "depend" on the Internet, since the tasks are directly connected to the global network.

For example, unlike text editors, there are such programs, without the use of which it is impossible to create a multimedia project (programs for modeling, creating presentations, etc.), publish scientific papers in electronic form, keep accurate statistics and have a frequently updated database.

Modern realities not only presuppose the use of new means of communication in various spheres of public life, but even impose them and force them to turn to them. This is facilitated not only by progress in information technology, but also in the development of the educational process and the training of competent personnel in this area.

Electronic media at the moment are quite justifiably the main tool in the learning process, since the education system is focused on continuous development and includes the task of not only giving the student knowledge, but also developing creativity in him, identifying his strengths and weaknesses, helping to find and to join the sphere of his interests and contribute to the holistic development of the individual.

In addition, digital pedagogy greatly simplifies the learning process (but does not lead to its primitivization, does not simplify and does not devalue the knowledge itself), reduces the time of both the teacher and the student. Based on this, we can conclude that the teacher spends more time on the development of his teaching skills, gains new experience and motivates students. He does not waste time on household items and monotonous work with checking assignments and tests, since computer technologies provide for this post-processing, but focuses exclusively on professional activities. Students, in turn, receive more voluminous and diverse tasks, which include not only basic types of work (testing, exercises, solving examples, plotting graphs), but also additional ones that affect the expansion of horizons (creating projects, presentations, video and audio files, analysis of various multimedia elements). Tasks can be differentiated in accordance with a level, hierarchical system: after, for example, testing at the beginning of the year, all students receive assignments in accordance with their level of knowledge, which has a beneficial effect on the educational process and supports the students' aspirations. Thus, they are

involved in the educational process, increasing the level of knowledge and training, general academic performance, and acquire practical skills. It was mentioned above that digital learning is not the same as online learning.

Thus, the first is more suitable for universities, where the student and the teacher themselves build a model of the educational process and form a general plan of work.

It also saves time, as assignments can be completed whenever and under any circumstances, and later emailed directly to the teacher. The practice of such relationships has been observed for a long time and is now not considered an innovation.

For example, most term papers and theses are processed in this way, when a student and a teacher, communicating via e-mail, make changes to the text, agree on the structure, etc.

Speaking about digital pedagogy as a factor in increasing educational services, one cannot fail to mention its mobility and the speed of data updating. Currently, there are a large number of applications and services in the Republic, with the help of which it is easier for teachers to track the dynamics of solving problems and identify the most difficult ones, evaluate their implementation and instantly enter the data obtained into public databases. Certain algorithms can analyze the student's progress and even make some "predictions" about his future studies. Thus, digital learning has a positive effect on both student performance and their motivation to learn.

In the course of this study, the specificity of digital pedagogy was determined as one of the main factors in improving the quality of educational services. It consists, firstly, in the absolute influence on the entire learning process through the involvement of various aspects that make up the main indicators of the quality of educational services.

Secondly, the digital teacher is partly a student himself, since he constantly acquires new knowledge, if not in the field of pedagogy, then in the field of information technology, which indicates the progressive use of this approach.

The teacher himself organizes the process of teaching and upbringing in the field of education using technologies that reflect the characteristics of the subject area and correspond to the age and psychophysical characteristics of students, including their special educational needs.

And, thirdly, this type of pedagogy, in addition to creating comfortable conditions for the interaction of all participants in the educational process, provides information security through closed databases. Many scientists are addressing the question of the need to introduce digital education. Their opinions most often differ, and it will most likely never be possible to come to something common.

So, for example, E.I. Yaroslavtseva believes that "total distancing is the exclusion of a person from the direct educational process, isolation, and not increasing the availability of education," and D. Bardach is convinced that "ICTs are a driving force, since teachers understand that the combination of digital technologies and resources provides more opportunities to broaden horizons and improve the quality of teaching, teaching and preparation than all previous educational technologies from the blackboard to television "[1].

From a pedagogical point of view, this approach to professional activity is also rather ambiguous.

Innovations are always perceived with great caution, but they cannot be avoided. Therefore, now teachers are increasingly turning to digital technologies, successfully mastering them and significantly improving their professional skills, which results in improving the quality of educational services.

Based on the foregoing, it can be noted that the quality of education is a key aspect in the development of the professional and personal qualities of students, their competence and ability to learn. Its increase is facilitated by modern information technologies, in particular, electronic information and educational environment. This leads, firstly, to the training of a competent specialist, and secondly, to the formation of a personality with high information competence and developed critical thinking.

The use of digital educational resources expands the possibilities of the educational process, while remaining only a tool in the hands of competent specialists.

It should be noted that digital technologies will definitely occupy a niche in the educational process of the state, they will be used in conjunction with traditional forms of education due to their versatile and comprehensive specifics, according to which the latest information and communication technologies have a positive effect on all indicators of the quality of education. This approach will help teachers achieve the dynamics, efficiency and effectiveness of professional activities.

UZBEKISTAN

ABSTRACT

The article shows the role of the educational cluster in the innovative development of the region. The need for the development of regional educational clusters as an important competitive advantage of the modern economy is proved. The issues affecting the efficiency of educational clusters in compliance with the requirements of professional standards are considered. The priority directions of increasing the efficiency of educational clusters are highlighted.

KEYWORDS: *Educational Cluster, Regional Development, Innovative Development.*

INTRODUCTION

An ever-increasing demand for innovations is being formed in the world - new knowledge and original technological solutions. "Knowledge has become a key economic resource and the dominant, if not the only, source of competitive advantage." Ensuring success in the struggle for economic growth rates, new knowledge (innovations) becomes one of the internal reserves of national economies and states.

Realizing the opportunities inherent in innovative growth requires a transition to a "knowledge society" and a knowledge-based economy. In accordance with the concept of such an economy, the quality of economic growth is ensured through investments in "intangible" economic assets: research and development; stimulating innovation; education and professional development of the economically active population [2].

A necessary condition for such investments is the creation of national innovation systems, which are characterized by the recognition of the special role of knowledge in economic development, the approval of innovation and scientific research as the main factors of competition and economic dynamics.

The English economist K. Freeman, who in 1987 introduced the concept of a national innovation system, emphasized that it is a network of institutional structures, whose activity and interaction initiates the creation of innovations (new technologies) and promotes their diffusion. These institutions include not only the institutions responsible for conducting research, but also the way of organizing and managing the available resources, both at the enterprise level and at the national level [9].

The very concept of "cluster" (literally - "grow together", "bunch, cluster") means the union of several homogeneous elements, which can be considered as an independent unit with certain properties.

The modern definition of the concept of a cluster, which is quite applicable to the education system, was formulated in the late 1980s by the American economist Michael Porter. In his opinion, "a cluster is a group ... of interconnected organizations operating in a certain area and characterized by common activities and complementary to each other" [6, p. 207]. It is formed from specialized suppliers, main producers and consumers connected by the technological chain.

This point of view is supplemented by the definition of A. A. Migranyan, who understands the cluster as the concentration of the most effective and interrelated types of economic activity, as a set of interconnected groups of successfully competing organizations that ensure the competitive position of the state in the markets [4]. This is possible only by creating an innovative product within the cluster, the focus on which is the main characteristic feature of any cluster.

Thus, a cluster as a group of organizations and types of activities is an economic phenomenon that allows you to create an innovative product and thereby increase your competitiveness, it is a powerful incentive for national and regional development. Accordingly, the cluster approach can be defined as a direction in science and practice associated with the search and implementation of new opportunities for the development of society, increasing its welfare and competitiveness through activities to create and manage clusters.

One of the industries where the development of clusters and the cluster approach seems to be very promising is education. Here the cluster approach can be implemented at several levels: state and regional, a specific educational organization, a separate academic discipline. In connection with the objectives of this article, we will leave out of our consideration the clusters formed within the framework of the academic subject and educational institution.

Education as a system is a set of institutional structures, the main purpose of which is to educate students in them. In this sense, it is the core of the educational cluster, which is a set of educational institutions of all levels within a given geographic territory, enterprises - suppliers of resources and employers, as well as coordinating bodies and authorities, whose activities are interconnected with the nearest industries and aimed at developing an innovative product ...

However, this understanding of the cluster approach in education is realized only at the level of the state or its subject.

Here are some of the most striking examples of clustering in the education system at the federal level. It is worth noting the implementation of the Concept of profile education (profile as a cluster; profile schools as a cluster; profile schools and the surrounding social space as a cluster, etc.) and the priority national project "Education" (creation of a cluster of innovative schools and a cluster of the best teachers). To this list can be added the desire to present in the form of a

cluster the interaction of institutions of additional (postgraduate) pedagogical education with leading republican publishing houses [5].

However, we can talk about the existence of other grouping options with the participation of educational organizations that reveal all the main identification features of a social cluster:

- The network structure of specialized (educational) organizations;

- Concentration of these organizations in one place, competition and cooperation between them in activity and territory;

- A well-developed infrastructure that ensures the exchange of knowledge and technologies between the elements of the cluster;

- Flexible (plastic) composition and structure of the cluster;

- the openness of the cluster as a system.

Due to the exceptional relevance of the topic under consideration, it is necessary to consider some issues that affect the efficiency of educational clusters.

The first area of activity is associated with the relative novelty of this phenomenon in Russian reality. The main characteristic feature of the activity of the educational cluster is its orientation towards the constant development of an innovative orientation and the quality of scientific and educational activities. The introduction of cluster education in the process of training specialists requires the development of new pedagogical, organizational, technological and economic conditions for the implementation of professional educational programs.

Speaking about the pedagogical conditions for the implementation of educational programs, the primary task is to train the teaching staff capable of producing innovative goods. To this end, it is advisable to develop and implement new additional educational programs for advanced training and professional retraining, developed on the basis of professional standards with the obligatory involvement of practitioners who are well aware of the content of this professional activity [5]. To achieve this goal, it is necessary to radically change the existing system of advanced training of the teaching staff of most educational institutions, moving away from unified additional professional educational programs in general pedagogical or industry-wide areas, focusing on programs that correspond to the profile of teachers' pedagogical activities. This becomes not only a wish, but also a necessity if we turn to the professional standard "Teacher of vocational training, vocational education and additional vocational education", which in the near future will have to be applied by employers in the formation of personnel policy and in personnel management, in the organization of training and certification of workers, the conclusion of employment contracts, the development of job descriptions and the establishment of remuneration systems [6]. In accordance with this professional standard, the requirements for the education and training of an assistant, teacher, senior teacher and associate professor are higher education (specialty and higher), the focus (profile) of which, as a rule, corresponds to the taught course, discipline (module). If the profile of education does not match, the employee needs to have additional professional education based on higher education - professional retraining, the focus (profile) of which, as a rule, corresponds to the taught course, discipline (module). The professional standard also recommends training in additional professional programs in the profile of pedagogical activity at least once every three years.

Most educational institutions have a fairly large experience of cooperation with leading enterprises and organizations in the region, within which the latter become the bases of students' practice. Now it is necessary to bring this cooperation to a fundamentally new level, at which the future employer would have a real opportunity to participate in the development of educational programs and in the formation of the competencies of the future specialist on its own production and research base. Only in this case, the learning process will take into account the actual needs and prospects of individual regions.

A review of publications and information and analytical materials on the topic under consideration showed that at the moment there is a fairly large number of works devoted to the problem of both clusters in general and educational clusters in particular. Despite a sufficient number of theoretical developments containing the patterns and principles of the development of educational clusters in modern conditions, and practical reviews devoted to highlighting the experience of the development of innovative educational clusters in different regions, the question of the methodology for testing the effectiveness of the formation of a competent graduate of an educational cluster has not been properly developed. To confirm the relevance of the existence and development of educational clusters, such an experimental test is needed not only in individual clusters, but also in comparison with the effectiveness of forming a competitive graduate of a classical university.

The next important question is dictated by the fact that the effectiveness of educational clusters is possible only if there is a strong social partnership, and this is possible if certain conditions are met.

Firstly, within the framework of one cluster, it is necessary to create a successive subordination of all levels of education in one industry. In modern conditions of integration of educational institutions, the need has long been ripe for the development and implementation of mutually agreed educational programs. Multilevel professional education should be implemented by the participants of the educational cluster, which ensure continuity, interconnection of different levels of education, as well as organizational and subject unity. A number of authors indicate the principles on which multilevel professional education should be based - continuity, openness, completeness and integrity [2].The continuity of educational programs at different levels allows you to optimally shorten the training period, thereby ensuring the right of a student or listener to study according to an individual curriculum for accelerated learning, within the framework of the educational program being mastered in accordance with the article of the Law on Education. Compliance with this condition also helps to minimize the adaptation time of the student during the transition from one level of education to another, as well as the graduate in the workplace. Based on the research of psychologists, the minimum period of adaptation of a young specialist to a new workplace, sufficient for an employee to be capable of both promptly solving standard tasks and participating in the adoption of strategic tasks, is 6-7 months. Compliance with continuity within the educational cluster will reduce this period to 3-4 months.

Secondly, the educational programs of the participants of the educational cluster must be developed strictly in accordance with the requirements of professional standards. At the same time, programs of different levels of education should be coordinated in their structure and agreed in content.

Third, the principle of corporatism in the interaction of enterprises and teams of educational clusters. Compliance with this principle will avoid the repetition of the content of read disciplines. According to research data, in the implementation of individual basic educational programs of full-time education and programs of additional vocational education, the average percentage of conjugation of these programs reaches 83% [8]. The time that is freed up due to the observance of the principle of corporatism is proposed to be spent on filling gaps in the education of students and (or) on better training of future personnel for a specific industry, by introducing courses developed jointly with potential employers.

In accordance with the above and in order to improve the efficiency of educational clusters as a resource for innovative development of the region, it is now necessary to highlight priority areas of development, such as: development of a methodology for assessing the effectiveness of educational clusters; ensuring the effective organization of the educational cluster environment by creating conditions that will ensure healthy competition of cluster members not only with other educational clusters, but also with each other; providing conditions for sustainable development of existing cluster education initiatives and stimulating the emergence of new initiatives; formation of a system of training and retraining of qualified teaching staff for regional educational clusters; stimulating the attraction of businesses to co-finance innovative educational projects; development of public-private partnerships with the aim of more intensive involvement of private business in the process of choosing directions for educational, innovative and scientific activities of educational clusters; improvement of legal regulation in the field of cluster education.

At the moment, it is indisputable that in the modern conditions of globalization, those regions that maximally show their innovative activity have a competitive advantage [7]. A regional educational cluster can play a significant role in regional innovative development. A properly built model of the educational cluster allows us to take into account the constantly changing needs of the regional labor market and creates conditions for the training of a competitive and competent specialist. This is achieved due to the independence of educational clusters in the choice of professional educational programs and the implementation of cross-cutting curricula that cover the main areas of training for a particular region.

ABSTRACT

In this article, the author tried to identify effective pedagogical and psychological conditions for the formation of organizational abilities and leadership qualities of a person in the educational process, by means of studying, analyzing and generalizing psychological, pedagogical and other methodological literature on the topic under study. the formation of leadership qualities and organizational skills in the ontogenetic development of a person, in particular during primary school age. The relevance of this article, on the one hand, is due to an increase in the level of social need for the formation of these qualities and skills in a growing person, and on the other hand, a low level of attention to these issues in the modern educational system, on the part of the teaching staff, as well as a low level of education in given questions.

KEYWORDS: *Leadership Qualities, Organizational Skills, The Phenomenon Of Leadership, Scientific And Technological Progress, The Specifics Of Leadership At Primary School Age, Personality Formation, The Fundamental Functions Of A Leader*

INTRODUCTION

In a constantly changing world, modern society is characterized by social instability. Based on this, the problem of the ability of society and the individual to self-organization is actualized. Education is the social institution that can bring orderliness into the life of society, creating conditions for the upbringing of a personality, the characteristic features of which are high organization, initiative in decision-making, the ability to work in a project mode and manage their own life and the activities of others.

Organizational skills are characterized as readiness for consistent, orderly, timely implementation of practical actions with competently selected means to achieve a positive result. The study of the process of forming organizational skills is in the context of both didactics and the theory of education. An important aspect in the study of these skills is the conditions that contribute to the formation of a stable-positive attitude to collective activity, based on the values of self-determination, self-realization, freedom, mutual understanding and understanding, cooperation, support. The orderly development of the children's team largely depends on the formation of organizational skills at each age stage of the child's development. Older adolescence (13-15 years old) is sensitive for the systematic and planned formation of organizational skills, since an older adolescent has theoretical thinking, acquires the value meanings of life and projects his life path. The formation of organizational skills provides an older adolescent with the opportunity to successfully adapt to any group that implements common goals, thereby ensuring a comfortable state and readiness to solve problems in the process of collective life.

The formation of organizational skills occurs in various activities. But, given the fact that the leading activity of a teenager is communication, the content of which is aimed at finding mutual understanding, interaction with peers, the inclusion of older adolescents in the process of school student self-government becomes an effective condition for the formation of these skills.

Student self-government is aimed at the independent organization of the life of students, it is a space for the eventful life of schoolchildren, based on both formal and informal relationships that contribute to an understanding of responsibility for the results of their activities. The process of developing student self-government is effective when guided and supported by educators. However, as shown by surveys of teachers and representatives of the administration of educational institutions in the Tula region, studying the experience of other regions, analyzing the literature, participation in school self-government, support of student self-government are 'professional tasks so far only for deputy directors for educational work and educational organizers. Modern requirements imply the active participation of all subjects of the educational process in the management of an educational institution. This contradiction gives rise to a number of difficulties in the process of the formation of student self-government, associated, on the one hand, with the position of teachers who cannot adequately perceive students as subjects of school life management; on the other hand, the position of students who are not ready to act as organizers of their own activities.

Nevertheless, theoretical and practical prerequisites have been formed for the formation of organizational skills in older adolescents in the process of student self-government. A.C. Makarenko initiated the study of the problem of educating an organizer in a children's collective, his ideas were developed by I.P. Ivanov, A.N. Lutoshkin, M.I. Rozhkov, A.C. Chernyshev and others. Organizational activity and organizational skills became the subject of research by psychologists L.I. Umansky and A.N. Lutoshkin.

One of the age characteristics of a younger student is a lack of will. The child does not have a lot of experience in overcoming 18 difficulties and obstacles in achieving the goal. At the slightest failure, an elementary school student can give up, lose faith in himself and his strength, as a result of which he quit achieving the goal. Also at this age, stubbornness and whims are very often observed. The frequent cause of their occurrence is the features and disadvantages of family education. Very often the child does not know the word "no", all his desires are satisfied

on demand. And when a child finds himself in a new environment for him - the school collective, he begins to show some kind of protest against the rules and requirements that the school puts forward, therefore, as a result, the student becomes stubborn and capricious. Younger students are very emotional. This is due to the fact that, firstly, usually their mental activity is colored by emotions. Literally everything that children observe or do evokes emotions in them. Secondly, students of primary school age do not know how to control their feelings and emotions. Children are very outspoken in expressing various emotions such as grief, sadness, joy, fear, pleasure or displeasure. Thirdly, children of primary school age are emotionally unstable. Their mood changes very often, they may begin to be happy or upset about an event that an adult considers insignificant. Such emotionality disappears over the years, the ability to manage your feelings and emotions develops. Collectivist relationships are easiest to cultivate in early school years. During his studies in elementary school, the child accumulates very important experience for him - work in a group and for a group. Collective tasks or activities, such as preparing for a school holiday, staging a play, and so on, are very effective means. It is here that the child begins to successfully build relationships in the team, which are simply necessary for his future future.

One of the problems facing the primary school teacher is the development of leadership skills in junior schoolchildren. An experimental study of the leadership qualities of young schoolchildren, which we conducted, showed that the majority of second grade students (70%) need additional work to develop leadership qualities. Children with low need special attention 0 2 4 6 8 10 12 14 16 Razavites strongly Developed medium Developed weakly "I am a leader" Indicators of functional leadership in small groups levels of formation of positive leadership qualities (15%), since in the modern world the ability to lead yourself and organize the activities of the group so that everyone is busy, very much in demand. Based on the research data, a set of exercises was developed aimed at increasing the level of development of leadership qualities. One of the main conditions for the successful formation of a leader's personality in a primary school student is the creation of an environment that will be aimed at showing the student's activity and independence. And these conditions must be created by the teacher, who is the main authority of the younger student. For a student of grades I-IV, school begins with a teacher who is for him the organizer and bearer of values, their guide. Attitude towards the teacher is one of the most important indicators of the state of the emotional sphere of a younger student [9]. The primary school teacher should use a democratic style of communication in working with children, which will allow them to show the proper activity and independence. The younger student must learn to organize his own activities, and not act according to the strict plan of the teacher. In the modern elementary school, a systematic activity approach is being implemented. In this case, it is assumed that the student of the initial level takes an active interest in the activities he is engaged in, and also realizes the importance of gaining knowledge, is able to formulate a problem and look for short but effective ways to solve it, analyzes his activities, evaluates successes and determines the causes of errors ... In the course of such training, the child is faced with a "difficulty", that is, with a problem situation that the teacher put him in the classroom. In the course of searching for a solution to this situation, the younger student organizes his own activities, learns to extract information from various sources, analyze it and process it [5].

Such activities are aimed at developing the child's abilities such as organizational. Most often, the search for an answer to the question posed goes in groups or pairs, and not individually, so the younger student organizes not only his own activities, but also the activities of his comrades.

Therefore, it is important that the teacher uses a democratic communication style, otherwise the implementation of this approach will be impossible, and, therefore, the development of leadership qualities in children of primary school age will be difficult. Building the foundations for positive leadership can be done during the weekly classroom hours. Especially for this, we have developed thematic planning of class hours, reflecting the content of the work on the formation and development of leadership qualities of younger students.

The purpose of the class hour is to create conditions for the formation of the foundations of positive leadership qualities, as well as their development. Such class hours should be held once a month to achieve the result on the assigned task. The topics are arranged in such a way that by the last school hour, children should highlight for themselves the main characteristics of a leader, understand what they already possess, and what else needs to be developed and conclude that each of them can become a natural-born team leader. We also developed assignments and exercises for these classroom hours, which the teacher can use ready-made, or can modernize and take only as a basis.

You and I. And the work should begin by explaining to children how to communicate correctly with both peers and elders. To do this, it is proposed to conduct a class hour called "Me and you", during which children will be explained the importance and significance of interpersonal communication. Communication of younger students should be fruitful. Organization and regulation of communication of children in a team is one of the ways of pedagogical management of children as an object and tool of education. Not all communication, however, contributes to the enrichment of the social experience of students and their correct self-awareness.

The specificity of the problems of elementary school students in communication lies in the fact that most of them have an inadequately overestimated self-esteem (which corresponds to the age norm). Pupils are convinced that they should do well, including their relationships with classmates. Therefore, they greatly experience their failures.

Therefore, the teacher needs to structure the work in such a way that students learn to communicate with each other in such a way that there are fewer failures in communication. But if difficulties in communication between schoolchildren do arise, every effort should be made to resolve these difficulties. It is also possible to implement a program called "Me and You", during which children will learn to build interpersonal relationships within the team. The main task of the program is to form a culture of communication. Children will have to learn to listen to each other's opinions, be able to organize work in a group, and not only their own, but also the rest of the team members. The program provides for a wide choice of types and forms of activity of primary schoolchildren, concretizes the results of each year of upbringing, allows students to reveal their abilities, inclinations, individuality.

Leader - who is this? The next class hour can be devoted to who is a leader? What qualities does he possess? This work can be built in the course of the game, where children, completing tasks, gradually learn about who is the real leader in the team. To begin with, children are divided into several teams. Each team receives a sheet of paper on which they need to write a definition of the concept of "leader". This task is given 3 minutes. After that, all definitions are read out, compared, and by joint efforts one definition is created that most fully reveals the 43 concept of "leader". Next, the children perform an exercise called "Tower". It is necessary to build a high

tower from the materials given by the teacher. Before that, one rule is announced: only 1 person can speak in a group. Students need to choose someone who can organize the actions of all team members. The winner is the team in which only 1 person spoke, and whose tower turned out to be high and stable. The next step is to identify the qualities of a true leader. The lesson ends with a reflection on who the real leader is.

To foster positive leadership qualities in children who do not believe in their success as a leader, it is possible to create a chain of different situations that, ultimately, will lead the student to success and make him believe in himself. To begin with, the child needs to be given smaller tasks, gradually moving on to more complex ones, up to the appointment of him as a leader in group tasks. The attitude of peers to this student is also important. The teacher must provide all the conditions for the successful implementation of the situation of success. Also, the teacher should give children more independence. In the development of independence, modern information technologies can have an effective impact as a means of increasing the cognitive interest of primary schoolchildren in educational activities. Such types of independent work as the creation of presentations on subjects, natural science research projects, media essays, various types of tests, the creation of animations and videos, the development of creative projects, the creation of various computer programs for all academic subjects, etc. contribute to the process of increasing the cognitive interest of younger students in the educational activities. It is possible to give children more independence with the help of self-government, during which students independently organize activities that are meaningful to them, manage it, exercise control, evaluate, i.e. self-government provides great opportunities for the development and implementation of leadership qualities. Can you imagine a modern school without self-government? Of course not. Self-government is a dynamic phenomenon in which the main indicator of changes occurring in the team during self-government is the development of students' independence in decision-making and implementation of an action plan drawn up to achieve the goal. At school, it is necessary to create conditions under which each business will awaken and support the activity and initiative of children. A distinctive feature of self-government at school is that the majority of children participate in it, and not a narrow circle of active members. It is carried out with the support and cooperation of teachers and allows 45 to see the result of social activities, which inspires children to continue their activities. The benefits of student self-government become apparent from the very first attempts to "share authority" with children. The teacher offers to choose a business, divide into groups, develop, implement it. Interest arises. All students are included in the process. This is exactly how, with the help of a teacher, a child comprehends the first skills of self-government. Participation in student self-government provides a unique opportunity for each student to develop leadership, communicative qualities, gain experience in organizational and managerial activities. The task of the teacher is the need to help each student to assert themselves, to seek and find their own ways of obtaining an answer to the question of the problem. All work with children should take place in a friendly, cheerful microclimate of the class. It is necessary to take into account the influence of external means of attracting younger schoolchildren to learning: play, visual aids, entertainment, to constantly check and evaluate the work of students. The use of game techniques in the classroom is an important means of developing cognitive interest. Often, as a result of such classes, unsuccessful students begin to show interest and do better, they develop a need to express their point of view, which is very important in elementary grades. Many children show great abilities, initiative, ingenuity.

Game technologies play an essential role in the educational process, namely: train memory, help to acquire new skills and abilities; stimulate mental activity, develop thinking. The knowledge gained by students in the process of a game or competition increases the level of development of the cognitive interests of schoolchildren. During the game activity, the student sets tasks for himself and 46 chooses ways and means of obtaining a solution. Learning various kinds of games, the student becomes more active, purposeful and developed. In the classroom, it is possible to conduct a didactic game, the rules for which will be developed by the teacher in accordance with the topic of the lesson. In the course of such a game, the younger student will be able to show his personal qualities, including the qualities of a leader. After all, each group that will participate in the game must have a leader who will explain the rules to the participants and help resolve disagreements that arise during the game. Today there are many didactic games, among which the teacher can choose the one that is suitable for the students of his class. By analyzing the learning process that proceeds with the help of play activities, the teacher will be able to draw a conclusion about which type of play helped to most effectively obtain the desired result.

Didactic play is a necessary element of the learning process, which develops imagination, thinking, memory in children, gives the younger schoolchildren psychological stability, forms orientation in life situations, and serves to create and unite the children's team. This multifaceted work creates conditions for the development of leadership qualities in children of primary school age. Thus, as a conclusion, we can say that the development of positive leadership qualities in primary school students is an important component of the teacher's work. Correctly organized work in educational and extracurricular activities contributes to the gradual development of leadership qualities in younger students. Undoubtedly, elementary school students must believe in themselves and in their success, then they will be able to achieve their goals. And the recommendations we have developed will help teachers form positive leadership qualities in a younger student, which will only develop in the future.

The development of a younger student as a positive leader depends on many factors, including biological and social. In the second paragraph, the age characteristics of primary school students are detailed. It was concluded that it will be easiest for a child of primary school age to form the qualities necessary for a leader, because it is at this age that a noticeable formation of the personality of a younger student begins. He has not yet formed standards of behavior. A child at this age is like a mass for sculpting, so you should never miss such an opportunity. If a younger schoolchild has noticeable inclinations of a leader, then they should be properly developed so that in the future the child will become a real leader, and not a "player" who will always hide behind a mask.

ABSTRACT

The article provides an overview of scientific concepts and approaches that characterize modern preschool education. The essence of the concept of "intrinsic value of preschool childhood" in modern academic science is shown. The necessity of creating conditions for a full-fledged living of the preschool period of childhood is substantiated. The content and features of the social situation of development in preschool age are analyzed, the key positions of modern preschool pedagogy on the specificity of human development in preschool age are highlighted.

KEYWORDS: *Amplification Of Child Development, Humanization, Preschool Childhood, Educational Process, Social Situation Of Development, Socio-Cultural Conditions, Intrinsic Value, Specifically Children's Activities*

INTRODUCTION

At present, significant changes have occurred in the pedagogy and psychology of preschool education, taking into account the requirements of the time. One of the leading directions of scientific research today is the development of a model for the process of integral development of the personality of a preschooler child.

This problem is multifaceted and involves such areas as the study of the mechanisms of mental development of preschoolers and the design on this basis of psychological and pedagogical support for their personal formation and development.

The scientific interests of modern pedagogy and psychology are aimed at studying the inner world of a child, the mechanisms of his self-knowledge, the subject position of the future student, the laws of socialization processes in the modern information space.

It is known that all cultural values accumulated by mankind are the result of creative activity, which means that the future will be determined by the creative potential of the younger generation.

Modern progressive trends in child psychology and pedagogy define productive activity as a condition for personality creativity. Moreover, the approaches and techniques differ among themselves.

So, some researchers (V. Glotser), (Bu Jefferson) believe that any interference in the process of a child's creativity harms the individual expression of the personality, because creativity is a spontaneous process. The role of the educator then is to protect the child from external influences, thereby preserving the originality of creativity.

Other researchers, such as A.V. Zaporozhets, N.A. Vetlugina, T.G. Kazakova, without denying the importance of intuition and originality, consider the necessary intervention of an adult. It depends on the teacher in the kindergarten whether the child will be able to fully reveal his creative abilities, since he has to make his choice in favor of one method or another, create his own methods and techniques of interaction in accordance with the situation and the individual psychological characteristics of the child. It should be borne in mind that the creativity of children can be neither compulsory nor compulsory.

Moreover, according to L.S. Vygotsky, the principle of freedom must be observed, which is a prerequisite for any creativity.

The experience of the teacher's work convinced me that for the child, it is not so much the result that is important as the process, as the opportunity for self-expression and self-discovery as a person. The intuition acquired during the period of work in a child care institution helps me to navigate whether the child needs support, approval at one time or another of his creative creation. It depends on many factors, such as individual psychological characteristics of the personality, working conditions, the child's well-being, etc.

However, the presence of the caregiver, his own personal qualities are always very significant for the child. It is also important that the teacher is most often a woman.

In this regard, as well as the urgency of the problem, gender education, it should be taken into account that the conducted diagnostic examination to determine the level of formation of sex-role socialization of children revealed an average and low level of knowledge on this issue.

A serious gap has formed in the family and in pedagogy, which must be closed. That is why preschool children's institutions have created the necessary conditions for gender socialization of children at an early age.

New effective pedagogical technologies have appeared in the field of gender education of children. I believe that gender education should permeate the entire system of preschool education, be present in one way or another in any occupation. Then these concepts will be fixed in the child at the subconscious level and persist throughout life. Elements of gender education can take place in a game, a walk, any process or action, in actions.

I have developed a competition game "Boys are strong, girls are skillful", prepared a report for the parent meeting "Games for boys and girls", since for the full upbringing of a child it is important that parents are literate in matters of gender education.

In the conditions of joint education of boys and girls, it is considered a very important pedagogical task to overcome the disunity between them and the organization of joint games.

During play, children act together, but in accordance with gender characteristics. Thus, having studied modern methodological literature, as well as in the course of acquiring my own experience, I came to the following conclusions.

Among the modern principles of psychology, the most important in the upbringing of preschoolers are the following: humanity, individualization, self-development, variability and harmonization. Guided by these principles, I have developed a set of games and exercises that contribute to the development of skills and abilities necessary for the child's social adaptation to rapidly changing living conditions. It is important to develop in children, in the course of psychological and pedagogical support, such qualities as self-confidence, flexibility of thinking, creativity, commitment, kindness and honesty.

To make the child's life as comfortable as possible, to provide conditions for the self-development of all spheres of his personality through the most significant ways of activity, to stimulate creative activity and initiative, to ensure the realization of his basic needs and interests - these are the main conditions for the full development of a preschooler's personality.

The concept, opposite in meaning, is intensification, acceleration, that is, artificial acceleration of child development through the introduction of early school teaching in reading, counting, writing, a foreign language, etc. and the forced "coaching" of children. Supporters of this concept are convinced that super-early education will ensure further success in the development of the school curriculum by children and professional self-determination. However, as studies of scientists show, the practice of compulsory education of children too early leads to a loss of educational motivation and cognitive interest and, as a consequence, to the emergence of school maladjustment and neuroses.

Standing firmly on the position of amplifying child development, domestic preschool pedagogy proclaims the priority of specifically children's types of activity: play, cognitive research, artistic and aesthetic, etc. in personality development, because, as you know, human development is impossible outside of activity. It should be emphasized that the presence of knowledge in a child is not a guarantee of successful learning, the ability to independently acquire and apply them in practical and cognitive activities is much more important. Scientists place special emphasis on the assimilation of culturally developed means by the child in the process of education, which regulate the process of child development. Independent and creative in nature, the process of mastering these means by a child must be specially and competently organized. A developing effect is achieved only when the activity remains self-directed and creative. On this basis, one should not use a role-playing game to teach children new knowledge and skills - these functions are successfully performed by didactic games.

A preschooler is an intensively developing organism, and it is this feature that largely determines the significance of the preschool period of life. The specificity of preschool age lies in the fact that the achievements of children are determined not by the totality of formed knowledge,

abilities, skills, but by the system of personal qualities that ensure positive socialization and, above all, the success of school education.

Today, it is necessary to introduce such forms of work with children that will allow preschoolers to be taught in a non-directive entertaining form and at the same time will contribute to the development of their cognitive motivation.

The social situation of development is one of the central concepts of "First step", which is understood as the existing system of the child's relationship with the surrounding social world.

The social situation of development provides the dynamics of the mental development of the preschooler, determines the conditions and ways of its development in various types of children's activities, acquired psychological neoplasms.

It is important to realize that in each age period there is a special specific social situation of development, the study of which provides an understanding of the dynamics of age development and the prerequisites for the emergence of psychological neoplasms. The most important neoplasms of preschool childhood, according to domestic scientists, are visual-figurative thinking, the ability to substitute, arbitrariness of behavior and cognitive processes, creative activity, etc.

In each social situation of development, a certain leading type of children's activity arises and develops. The social situation of the development of the modern preschooler is characterized by a number of features. Thus, the great openness of the world, the availability of various sources of information, often negative and / or not appropriate for age, makes it difficult for a preschooler to select adequate models of behavior in a given situation. The complexity and variability of the surrounding world, the intensity and inconsistency of the flow of information lead to early maturation of children, the mastery of a complex toolkit for understanding the world already at the stage of preschool childhood.

The development of a preschooler child does not take place in a vacuum, but in a certain socio-cultural space, understood in preschool pedagogy as a specific social environment immediately surrounding the child, ensuring his interaction with social culture.

The creation of an optimal socio-cultural environment that ensures the full and harmonious development of a preschooler is designated as one of the fundamental principles: "familiarizing children with sociocultural norms, traditions of the family, society and the state, taking into account the ethnocultural situation of children's development." The standard puts forward the task of familiarizing preschoolers with spiritual, moral and sociocultural values, socially approved rules and norms of productive interaction with adults and peers.

The modern socio-cultural space of a preschooler is, first of all, a family, his parents and relatives around him. Studies have shown that in order to create an optimal social situation for the development of children, taking into account the specifics of preschool age, it is necessary to ensure the interaction of public preschool education with family education, to actively involve parents in the educational activities of a preschool organization. Moreover, this should not be a simple visit by parents to holidays and meetings in kindergarten, but an interactive interaction between two subjects of the formation of a child's personality, based on dialogue, the creation of educational projects, taking into account the study of the needs of the family and support of its educational initiatives. Preschool education aims at organizing an educational environment in

kindergarten that will ensure the creation of conditions for maximum participation of parents in the educational process as its active subjects.

THE MAIN FEATURES OF THE COLLOQUIAL STYLE OF MODERN RUSSIAN

Sidirova Janar Umirbekovna*

*Lecturer,
Department of Russian Language and Literature,
Navai State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article is devoted to the main features of the conversational style of the modern Russian language. The article is to examine the features of the colloquial style of the modern Russian language. The definition of style depends on understanding the language. In linguistics, such features of language as its social essence, communicative function, reflective and cognitive ability, and systemic character are definitely distinguished.

INTRODUCTION

Conversational style (colloquial speech) is used in a wide range of personal, that is, informal, off-duty relationships. This style is often called colloquial and everyday, but it would be more accurate to call it colloquial, since it is not limited only to the everyday side, but is used as a means of communication in almost all spheres of life - family, industrial, socio-political, educational, scientific , cultural, sports.

The function of the conversational style is the function of communication in its "original" form. Speech is generated by the needs of direct communication between two interlocutors or more and acts as a means of such communication; it is created in the process of speaking and depends on the response of the interlocutor - speech, facial expressions, etc.

Intonation, logical stress, tempo, pauses play a huge role in sounding speech. In conditions of easy communication, a person, to a much greater extent than in the presence of official relations, has the opportunity to show his personal qualities - temperament, emotionality, sympathy, which

saturates his speech with emotional and stylistically colored (mainly stylistically reduced) words, expressions, morphological forms and syntactic constructions.

In colloquial speech, the function of communication can be supplemented by the function of the message or the function of influence. However, both the message and the impact are manifested in direct communication, and therefore occupy a subordinate position.

The most common factors in conversational and everyday style are the personal, informal nature of the relationship between the participants in communication; their direct participation in communication; continuation of speech in the process of communication without preliminary preparation.

Although these factors are closely related to each other, their role in the formation of the proper linguistic features of the spoken style is far from homogeneous: the last two factors - direct participation in communication and unpreparedness of communication - are closely related to the oral form of speech and are generated by it, while the first factor is the personal, informal nature of the relationship - also applies in written communication, for example, in personal correspondence. On the contrary, in oral communication, the relations between its participants can be official, official, "impersonal."

Linguistic means used during personal, everyday, informal relations between speakers are characterized by additional shades - ease, a sharper evaluative moment, greater emotionality compared to neutral or book equivalents, i.e. these language means are spoken.

Such linguistic means are widely used outside of colloquial speech - in artistic and journalistic, as well as scientific texts.

The norms of the colloquial and everyday style in oral form differ significantly from the norms of other functional styles, for which the written form is the determining (although not the only one). The norms of the colloquial-everyday style are not established and are not officially regulated, that is, they are not subject to codification, which gives rise to the illusion, very widespread among non-specialists, that colloquial speech does not have a norm at all: whatever you say, okay. However, the very fact of automatic reproduction of ready-made structures in speech.

Phraseological turns, all sorts of stamps, i.e. standardized linguistic means, corresponding to certain standard speech situations, testifies to the imaginary or, at least, limited "freedom" of the speaker.

Colloquial speech obeys strict laws, has its own rules and norms, as evidenced by the fact that the factors of the book and in general written speech are perceived in colloquial speech as alien. Strict (although unconscious adherence to ready-made standards is the norm of unprepared oral speech.

On the other hand, the unpreparedness of the speech act, its attachment to the situation, along with the lack of a clear idea of the norm, determine a very wide freedom in the choice of options. The boundaries of the norm are becoming unstable, vague, the normativity itself is sharply weakening. Spontaneous everyday speech, consisting of short replicas, dialogical speech allows significant deviations from generally accepted norms due to its inherent impulsive nature.

Colloquial vocabulary. Colloquial vocabulary is divided into two large groups: 1) common colloquial words; 2) colloquial words, socially or dialectically limited.

Common vocabulary, in turn, is divided into colloquial-literary (bound by the norms of literary use) and colloquial everyday (not bound by strict norms of use), common language adjoins the latter.

The vernacular vocabulary is also heterogeneous: 1) vernacular, which is on the verge of literary use, not rude in its essence, somewhat familiar, everyday, for example: *картошка*instead*картофель,смекалка*instead*сообразительность,сделаться*instead*случитьс я,проштрафиться*instead *провиниться;*2)colloquial non-literary, rude, for example: *подъезжать*instead*добиваться,шлепнуться*instead*упасть,плести*instead*говоритьнесуразно е,таскаться,шляться*instead*ходитьбездела;*this includes the actual vulgarisms and swear words: *бельмы(глаза),околеть,подохнуть;хлыщ,холуй*etc. Such words are used for purposes – usually when depicting negative phenomena of life.

Colloquial vocabulary, social lyordialecticallyrestricted, includes lexical groups such as colloquial profession alisms (for example, thenamesofvarietiesofbrownbear:*стервятник,овсяник,муравьятник*идр.), диалектизмы*(гуторить—говорить,векша—белка,стерня— жнивьё},*slangvocabulary*(плезир—удовольствие,забава;пленер— природа),*argot*(расколоться—предать;салаги,салажонок— молодой,неопытный;корочки—ботинки).*Many jargonisms arose even before the revolution in the speech of the ruling classes; some argotisms survived from the speech use of declassed elements. Slang vocabulary can also be associated with the general age of generations (for example, in the language of youth: *шпаргалка,пара(двойка).*All these categories of vocabulary have a narrow sphere of distribution, in expressive terms they are characterized by extreme snowiness. The main lexical layer of the colloquial style is made up of commonly used words, both colloquial and vernacular. Both of these categories of words are close to each other, the line between them is unsteady and flexible, and sometimes even elusive, it's not for nothing that in different dictionaries many words are supplied with different marks

In the "Dictionary of the Russian Language" the boundaries of the colloquial vocabulary have been expanded: many words marked in other dictionaries as colloquial are classified as colloquial. Some colloquial words in dictionaries have a double label - colloquial and regional, since many common dialectisms pass into the category of simple words. The colloquial style is characterized by the predominance of words with an emotionally expressive coloring, labeled "affectionate", "playful", "abusive", "ironic", "diminutive", "contemptuous", etc.

In a colloquial style, words with a specific meaning are usually used *{кладовка,раздевалка),*names of persons *{болтун,лежебока)*and much less often - words with abstract meaning*{верхоглядство,похвальба,бессмыслица).*In addition to specifically colloquial words*(крохобор,огорошить),*there are words that are colloquial only in one of the figurative meanings, and 8 others are perceived as stylistically neutral (for example, the verb to unfold in the meaning "to lose the ability to restrain"). Colloquial words, as a rule, are synonymous with neutral and relatively rarely - with books. Sometimes there is also a complete correspondence of stylistic opposites (for example: *очи—глаза—гляделки).*

The morphology of the conversational style. Distinctive features of the morphology of the colloquial-everyday style are associated with the peculiarities of the functioning of the parts of speech in it. The relative activity of morphological categories of words and individual word forms in colloquial everyday style is different than in other functional styles. Verb forms such as participle and gerunds are practically not used in colloquial speech. The absence of gerunds can to some extent be compensated for by the second predicate expressing the "accompanying" sign: *«Аясижупишу»;«Унихнаказывают,аяжалеюненаказываю»;«Вижу:идетшатается».* The well-known analogy (but, of course, not identity) with turns of the type *«Достань,пожалуйста,плоскогубцы,которыележатнаполке»*(or:*«лежащиенаполке»}*make up the construction: *«Достань,пожалуйста,плоскогубцы...вонтамнаполкележат»*(or:*«вонтамнаполке»).*

In colloquial speech, the forms in -a (-ya), (-v) shi (si), reminiscent of the gerunds, are used: "I lay all Monday without getting up", "go further without turning to the store." Such forms are considered adverbs of the adverbial type. Forms of the type: "Is he a knowledgeable specialist?" - of course, are adjectives.

Different than in other styles is the ratio in colloquial style of full and short adjectives. Short forms of most qualitative adjectives are not used, preference is given to short adjectives of the type grateful, faithful, satisfied, needed, for which full forms are not characteristic, as well as adjectives meaning the discrepancy between the measure and the quality, such as "Dress is short for you".

In the colloquial-everyday style, non-significant words (pronouns, particles) have become more common; significant words are used less often. With the situational attachment of colloquial speech, pronouns with their generalized semantics are used instead of nouns and adjectives: "Be kind, get me that ... well ... what's on the top shelf ... on the left" (book), "And what is he? - Yes, such ... you know ... "," Hello ... it's you ... and where is he? " and so on. Almost in 25% of cases, non-significant words are used not so much to express some shades of meaning as to fill in the pauses forced in colloquial speech: "Well ... if you came ... well ... be, well ... consider yourself a guest "; "Well ... I don't know ... do as you want"; "But Pavel is right ... and after all, he ... he found ... it means ... he solved the problem."

According to E.A. Stolyarova, nouns in colloquial speech are on average 142 per 1000 words, while in artistic speech - 290, in oral speech - 295, in written scientific speech - 386; there are 39-82-114-152 adjectives per 1000 words, respectively.

Among the case word forms of a noun, the most active form is the nominative case, which is explained by the peculiarities of the colloquial syntax, i.e. the prevalence of designs with a "nominative theme" ("buy there ... well, kefir, cheese ... yes ... here's another ... sausage ... don't forget it"; "And the Palace of Congresses ... did you get there? "), As well as the use of nouns in the nominative case with all sorts of additions, clarifications (" And you go straight, right ... there is such a house ... so you are by ";" Well, you can't remember everyone ... Umida .. I know her ").

In colloquial speech, a certain group of real nouns is used in counting form in the meaning of "a portion of this substance": two milk (two bags or bottles), two sour cream, two borscht, etc.

The feminine gender is also activated when designating a profession, position: cashier (instead of the official "cashier"), librarian (instead of "librarian"), doctor (instead of "doctor").

Colloquial style syntax. The most peculiar feature of the colloquial style is its syntax. And this is not surprising: the unpreparedness of colloquial speech is especially strongly reflected in its syntax.

Direct contact of the participants in a speech act, instant accounting of the interlocutor's extra-linguistic reaction (facial expressions, gestures, etc.), communication in the form of a dialogue, attachment to the situation cause various kinds of incompleteness and incompleteness of the message.

In colloquial speech, in particular, are widespread

Structures capable of performing functions and missing parts

Statements - for example, the so-called main independent and subordinate independent. So, at the end of a conversation that touches on complex, conflict issues, the solution of which turned out to be problematic, or even after a considerable time after such a conversation, the person says: "Oh, I don't know, I don't know." Due to its special intonation, this structure performs the function of not only the main, but also an unsubstituted subordinate clause: "... what will happen next (... what will come of it)". There are even more reasons to talk about the main independent, when the sentence uses such a pronoun or an adverb like this, that is, indicative words, after which, however, in this case there are no subordinate clauses: "Your hands are not so dirty ...", "I can sew this way ..."

Sentences are used as "independent subordinate clauses" only in those cases when the content of the unsubstituted principal included in them finds expression in intonation and union or union word or is prompted by the very structure of the sentence: what is it, what is not it (instead of "It does not matter what is she, that she is not ").

In colloquial speech, there is no strictly fixed arrangement of the components of a phrase, therefore, the main means of actual division is not word order, but intonation and logical stress. This does not mean at all that in colloquial speech the order of words does not play a role at all in the expression of actual division. There are certain tendencies here: the informatively important part of the statement is located as close as possible to the beginning of the sentence; there is a tendency to preposition that part of the syntactic union that is more strongly accented (while book-literary speech is characterized by the opposite principle, corresponding to the rhythmic-intonational structure of book-literary speech - the postposition of the member that is more emphasized). For example: I like this theater very much (in a neutral written speech it would sound like this: I like this theater very much); In Sochi ... no ... I won't go to Sochi; It was a difficult year, difficult; Oddly enough, but he gets tired more than two hundred meters after a hundred meters. The active means of the actual division of colloquial speech are special excretory words and repetitions: And what about the teachers' council? Will not be today ?; For how many years he has been resting every year in Gelendzhik ... in Gelendzhik.

ABSTRACT

The article provides a definition of spatial thinking, lists the skills for the formation of students' spatial imagination, as well as defines the levels of the formed spatial representation. The technologies that allow mastering a greater amount of knowledge and skills in much less time and improving the quality of the results of educational work are presented.

KEYWORDS: *Spatial Thinking, Detail Analysis, Image Creation, Spatial Image.*

INTRODUCTION

The development of spatial thinking occurs in the process of mastering the knowledge accumulated by humanity by the child and is one of the essential characteristics of the ontogenesis of the child's psyche. A high level of development of spatial thinking is a prerequisite for the successful assimilation of a variety of general and special technical disciplines at all stages of training, thereby emphasizing the relevance of this research topic.

Spatial thinking is the highest mental function, its formation is carried out through the person's mastery of objective activity, as well as in the learning process.

Spatial thinking is an essential component in preparing for practical work in many specialties.

According to many researchers, the practice of teaching constantly reveals a weak development of the spatial thinking of students, from elementary school to university.

In addition, the experience of teachers of secondary and higher educational institutions, as well as psychologists and educational researchers (Episheva O.B. and Krupich V.I., Volodarskaya I.A.) shows that students often do not cope with tasks as theoretical, and of a practical nature, requiring for their solution a formed specific type of mental activity that provides an analysis of spatial properties. Deficiencies in this area of education affect student performance in various school subjects such as technology, visual arts.

All this indicates that the secondary general education school does not create sufficient conditions for the development of spatial thinking, since school instruction is structured in such a way that verbal-logical thinking is predominantly developed. Although this corresponds to the tendencies in the development of children's thinking, it impoverishes the intelligence of the child.

Spatial thinking is a specific type of mental activity that is necessary for solving problems that require orientation in space (both visible and imaginary) and is based on the analysis of spatial properties and relationships of real objects or their graphic images. We can say that spatial thinking, as a component in solving practical tasks related to orientation on the ground, in the world of things and natural phenomena is formed much earlier than figurative thinking. This is especially pronounced in early ontogeny. Based on the theoretical provisions of S.L. Rubinstein, I.S. Yakimanskaya implemented an approach to the study of spatial thinking as a dynamic unity of subjective and objective, their close and indissoluble mutual enrichment in the process of activity [5].

It is shown that the forms and levels of spatial thinking are determined, on the one hand, by the objective content of the material (by the nature of its visibility, convention, generalization), and, on the other hand, by the cognitive activity of the subject, which is realized in the process of solving problems that require the creation of spatial images and their operation. ... The level of this activity depends on the subject's mastery of the means of activity, i.e. ways of presentation.

The main content of this type is the operation of spatial images in the process of solving problems (geometric, graphic, constructive, technical, technological, etc.) based on the creation of these images by perceiving (or imagining) the spatial properties and relationships of objects

The whole variety of cases of manipulating spatial images can be reduced to three main ones:

1) Cases leading to a change in the position of an imaginary object;

2) Changing its structure;

3) a combination of these transformations.

Let's dwell on the description of each type of operation:

The first type of operation is characterized by the fact that the initial image, already created on a visual graphic basis, is mentally modified in the process of solving the problem of movement in accordance with the conditions of the problem.

These changes concern mainly the spatial position and do not affect the structural features of the image.

Typical cases of such an operation are various mental rotations, displacements of an already created image of an object, as a result of which it significantly changes. It turns out, as it were, a new image, different from the one that was created on the basis of a conventional image that

remains objectively unchanged. Such an initial operation (leading to a change in its spatial position) is used in the process of solving various geometric and graphic problems.

An example of a task for this type of operation: "specify several symmetrical letters, words, sentences".

The second type of operation is characterized by the fact that the original image under the influence of the task is transformed mainly in terms of structure. This is achieved due to various transformations of the original image by mentally rearranging its constituent elements using various techniques of overlaying, combining, adding (truncating), etc. In the second type of operation, the image changes so much that it becomes little similar to the original.

Here is an example of a task for this type of operation: "In trapezoid ABCD, point K - the midpoint of side AB - is connected to point C. Imagine that the trapezoid is cut along line KC and triangle CBK is rotated around point K so that the segments KB and KA coincide. What shape has the trapezium become? Draw it. "

The degree of novelty of the created image in this case is much higher than that observed in the first type of operation, since the original image undergoes a more radical transformation here. Mental activity is also much higher, since all transformations of the image are carried out, as a rule, in the mind, without direct reliance on the image. All the transformations made and their results have to be kept in memory, as if to see them with the mind's eye.

The third type of operation is characterized by the fact that the transformations of the original image are performed for a long time and repeatedly. They represent a whole series of mental actions, successively replacing each other and are aimed at transforming the original image simultaneously both in spatial position and in structure.

Three types of manipulating with spatial images can be considered as specific levels of development of spatial thinking, since in one case the problem is solved only by simple transformation of the image, and in the other - by creating a fundamentally new image, and the degree of this novelty and the mechanism of its formation may be different. The development of tasks that provide for the main types of operating in the initial way in the process of solving a problem can therefore serve diagnostic purposes. Students are sharply differentiated in the ability to quickly, accurately and correctly operate with images that differ from each other in generalization, abstractness, schematicity, in the degree of freedom and ease of transition from one graphic image to another; in the ability to "recode" them, regardless of the extent of their clarity, graphic ways of displaying.

In the process of activity, a person identifies spatial relationships in the perceived space, reflects them in representations or concepts, but he often has to not only fix them and accordingly regulate his activities, but also predict new relationships that were not previously perceived. On the basis of sensory cognition of given spatial relationships with the help of a complex system of mental actions, a person creates new spatial images and expresses them in verbal or graphic form (in the form of a diagram, drawings, drawings, sketches).

Image formation is an active purposeful process of solving a certain cognitive task. The image captures the sides and properties of objects that are necessary for human activity.

Spatial thinking is a complex mental formation that has an independent line of development at all stages of ontogenesis. Arising in the depths of practical activity (when orienting on the ground, when performing measuring work), it gradually turned into an independent type of theoretical activity in the process of human historical development.

However, spatial thinking is characterized not only by the creation of appropriate images, but also by their operation, "re-coding", which occurs on the basis of representation.

A meaningful analysis of spatial thinking as a special type of mental activity that provides the creation of spatial images and their operation in the process of solving various practical and theoretical problems.

Where the image captures the sides and properties of objects that are necessary for human activity; action is a necessary condition for the formation of practical generalizations, situational meanings, comprehension of learning situations and the transfer of new forms of behavior and actions into a new situation. The concept is viewed as a product of mental actions, which is formed, developed and expressed by a person using words.

The spatial images used by thinking should be dynamic, mobile, and operational. These qualities follow from the conditions for their creation and operation. The mobility, dynamism of images is due to the fact that in the process of solving problems, a constant transition from volumetric (three-dimensional) images to planar (two-dimensional and vice versa, from the perception of real objects to their graphic images) is required.

The initial visibility is only the primary basis for creating an image. In the process of solving the problem, the image is repeatedly transformed. Its transformation is closely connected not only with the preservation of the image in memory, but also with the use of the conceptual apparatus that determines the ways of transforming the image in the logic of the problem. The creation of images ensures the accumulation of ideas, which in relation to thinking are the initial base, a necessary condition for its implementation. In general, in psychology, representations are understood as images of events, objects or phenomena that arise on the basis of their recollection or active imagination.

The transition to the formation of an image according to representation is characterized both by the complication of the forms of perceptual activity themselves, and by a change in the conditions for its course. The productivity of the process takes on new features here. This is due to the fact that the creation of an image by representation is carried out mainly in the absence of an object and is provided by transformative activity aimed at mentally modifying the object of perception (or data from past sensory experience). The implementation of these mental transformations is achieved by a special activity of representation, consisting in the deliberate and voluntary reproduction of the image and mental operation with it in solving the task. The activity of the presentation is considered as a psychological mechanism of spatial thinking, which ensures the recoding of images, the use of different reference systems, the operation of various properties and attributes in the process of solving problems: shape, size, spatial relations of objects. All this activity is carried out mainly in a figurative form, as well as as a basis for spatial thinking, distinguishing it from figurative thinking and proceeding in various forms and at different levels.

As a more independent activity, the activity of representation appears in the process of creating an image by means of a mental transformation of its visual basis. It has a clear structure, expressed in a certain system of actions, the sequence of their implementation. Its result is the creation of a view.

This activity is characterized by:

Special conditions for creating an image (abstraction from the visual basis);

The content of the performance of the presentation (transformation of existing images);

The level of complexity of its implementation (transformations are carried out in the mind according to the idea, they are repeated transformations, a whole system). It is a prerequisite for solving design and technical problems.

The above provisions define the activity of representation as "the basis of interrelated processes - the creation of spatial images and their operation, but the structure of this activity, the conditions for its implementation, are different in both cases. In the first case, this activity is aimed at creating a spatial image. In the other - for its processing (mental modification, transformation) in accordance with the task at hand (cases of simple operation of an image that do not lead to its change are not considered here).

From all of the above, it follows that spatial thinking is a specific type of mental activity aimed at solving problems that require orientation in practical and theoretical space (both visible and imaginary).

In its most developed forms, this is the operation of generalized images and relations both between them and between the elements within them, in which spatial properties and relations are fixed.

Operating with the initial images created on a different graphic basis, thinking ensures their transformation and the creation of new images that differ from the original ones; shape, size and spatial relationships; spatial images in visible or imaginary space (on a plane).

In the image, as the main operational unit of spatial thinking, the spatial characteristics of the object (shape, size, mutual position of the constituent elements, etc.) are presented. By its structure, spatial thinking is a multilevel formation. Which includes elements of different content and level of development.

The structure of spatial thinking depends on the content of visual (graphic) material, the specifics of the task, the nature, activity of the representation (methods of creating spatial images and operating them).

INDIVIDUAL TYPOLOGICAL FEATURES OF STUDENTS' MEMORY IN THE CONTEXT OF LEARNING FOREIGN LANGUAGES

Ikromov Oybek Ibragimovich*

*Lecturer,
Department of Pedagogy and Psychology,
Navai State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The problem of using individual psychological characteristics of students is considered, namely the development of linguistic abilities. In the process of teaching a foreign language. Age features of students' thinking processes are considered. Various points of view on the issue of linguistic abilities are analyzed. As a result of the analysis, the author makes a conclusion about the possibility of developing language abilities at a student age. Examples of tasks that contribute to the development of attention, memory, perception, which form the basis of linguistic abilities, are given.

KEYWORDS: *Age and Personal Characteristics Of A Student; Cognitive Processes; Special Abilities; Linguistic Ability; The Course Of Interdependent Mental Processes; Motivation, Communication.*

INTRODUCTION

Student age is also characterized by the fact that during this period the optima of the development of intellectual and physical forces are achieved. But there are often "scissors" between these possibilities and their actual implementation. The time of study at the university coincides with the second period of adolescence or the first period of maturity, which is characterized by the complexity of the formation of personality traits [1]. A characteristic feature of moral development at this age is the strengthening of the conscious motives of behavior. The qualities that were lacking in full in the senior grades are noticeably strengthening - dedication, determination, perseverance, independence, initiative, and the ability to control oneself. Interest in moral issues (goals, lifestyle, duty, love, loyalty, etc.) increases.

At the same time, specialists in the field of developmental psychology and physiology note that a person's ability to consciously regulate his behavior at the age of 17-19 is not fully developed. Frequent unmotivated risk, inability to foresee the consequences of their actions, which may not always be based on worthy motives. So, V.T. Lisovsky notes that 19-20 years is the age of selfless victims and complete dedication, but also of frequent negative manifestations.

The formation and functioning of mental processes at the age of 17 to 22 years largely depends on how the contradiction between the level of educational activity, which has developed and consolidated among young people during their studies in secondary school, and the requirements that educational activity makes at the university are overcome. ... If this contradiction is resolved taking into account the patterns of development of mental activity, then students cope with the requirements that are presented to them.

Perception at the student age is manifested mainly in its arbitrary form - in the form of observation, wholly subordinating itself to the tasks of educational activity. Thinking activity is characterized by a high level of generalization and abstraction, the ability to argue, prove the truth or falsity of individual provisions, link them into a system. The student's mental activity fulfills a new, personal function. The formation of theoretical thinking leads to the fact that it begins to mediate the attitude of a young person to the world. It is thanks to this that a worldview is formed. Features of memory and attention at this age are associated with a general tendency towards purposefulness, arbitrariness and self-regulation of all mental activity.

An essential feature is the great selectivity and differentiation of both attention and memory, their conditioning by the goals, tasks, interests and attitudes of the personality of young people.

The individual characteristics of a person that have developed by student age - from the manifestations of the basic properties of the type of temperament to the breadth of associations, flexibility of mental activity or the volume of working memory - can have a significant impact on the dynamics and success of work.

Individual differences in speech activity in a foreign language, associated with the characteristics of the student's memory, are numerous and varied. Memory is traditionally called one of the main components of linguistic abilities and the most important process for the success of language acquisition. The research results indicate a significant outstripping of memory development in senior school age, and in the student years, that is, in the third decade, there is a decline in the productivity of short-term memory. Differences in the preservation of logically related material appear in both age characteristics and types of memory. For example, mechanical retention slows down towards college age.

An individual approach to teaching is one of the urgent problems of the methodology of teaching foreign languages at school. This problem is not new. However, the whole variety of its aspects, its entire significance in solving the whole variety of tasks in the learning process, is probably not fully disclosed. The term "individual approach" itself is understood as a system of didactic means of organizing the educational process in a foreign language, which includes changing the form of the lesson, purpose, content, and process. An individual approach to teaching a foreign language is considered as a complex pedagogical phenomenon that determines the effectiveness of teaching a foreign language and assumes an active role of the subject of educational activity.

An individual approach to teaching is one of the urgent problems of the methodology of teaching foreign languages at school. This problem is not new. However, the whole variety of its aspects, its entire significance in solving the whole variety of tasks in the learning process, is probably not fully disclosed. The term "individual approach" itself is understood as a system of didactic means of organizing the educational process in a foreign language, which includes changing the form of the lesson, purpose, content, and process. An individual approach to teaching a foreign language is considered as a complex pedagogical phenomenon that determines the effectiveness of teaching a foreign language and assumes an active role of the subject of educational activity. The main conditions for the implementation of an individual approach are differentiation, which is expressed in the assessment of the student's initial language training, setting goals that are personally significant for him, developing the skills of independent work and the ability to implement a systematic approach to mastering new knowledge. At first glance, this seemingly simple problem causes great difficulties for almost every second teacher who works at school. The main difficulty lies in the inability to find the optimal combination of frontal, individual and group forms of work when teaching a foreign language. The rest of the difficulties are associated with the determination of the individual characteristics of the student's personality and the organization on this basis of the teacher's activities, which should be aimed at developing the mental abilities of each student.

One of the most important points in studying a foreign language at school is, of course, the development of oral speech skills, listening skills. But one should not overlook such an important aspect of learning a foreign language as writing. The programs devote very little time to learning grammar and spelling. What should a teacher do in such conditions? Apply the method of individual assignments, which is of great importance for the effective assimilation of new material by different groups of students. With the help of individual assignments, the teacher can fill the gaps in the knowledge of students, conducting a more thorough control of the assimilation of the studied.

Students complete individual assignments in the lesson. Typically, 3-4 students receive assignments written on cards and work on them for 5-10 minutes. The student who has completed the assignment hands over the notebook to the teacher and immediately receives a grade. The assignments can be the same for all students or completely different. However, do not forget that the main task of teaching foreign languages at school is to teach students to speak the target language. The level of development of the speech skills of their students should be assessed by individual types of speech activity. When completing the task of listening to the text, students encounter many difficulties: a large text, a lot of speakers. Experience shows that understanding the content of the text and the ability to show the teacher what is understood (that is, the content is revealed) is a significant difficulty for many students in completing the listening task. Therefore, strong students can be offered the performance of one exercise, and the weak another, then at the second listening, students can accordingly be offered the exercise given during the initial listening to the students.

Also, the individual characteristics of students are taken into account when determining homework. For example, well-performing students are given the task to retell the text, those who are poorly performing - the detailed answer to the question, the outline of the text, etc. Workbooks are especially helpful with a differentiated approach to the textbook, since there are exercises of different types and different complexity. Of course, the question of whether to use

individual assignments and in which lesson is up to the teacher. The nature of the assignments depends on the material that the students studied in previous lessons. To implement an individual approach in teaching a foreign language for more effective achievement of goals, it is the possibility of using digital technologies. Interactive exercises, that is, interactive learning, can help students avoid ineffective and tedious cramming and stimulate independent work outside the classroom. In conclusion, I would like to draw your attention to the fact that the implementation of an individual approach in teaching a foreign language requires great art from the teacher. He must take into account the real conditions prevailing in the classroom, and the capabilities of each student, in no way infringing on the dignity and interests of each of them.

PSYCHOLOGICAL INFLUENCE OF ARTIFICIAL INTELLIGENCE ON PERSONALITY SOCIALIZATION

Bakhtiyorov Rafail Marsovich*

*Teacher of Psychology, Faculty of Pedagogy,
Chirchik State Pedagogical Institute,
Tashkent Region, UZBEKISTAN

ABSTRACT

The interpretation of artificial intelligence from the standpoint of philosophical factionalism made it possible to discuss the conditions for the technologization of education as a process of increasing the level of the discursive power of students' thinking. Artificial intelligence has received a broad interpretation as the embodiment of a literary image, which has no unambiguous connection with the field of logical formalisms and mathematical algorithms of action and communication.

KEYWORDS: *Artificial Intelligence; Fiction; Factionalism; Values; Education; Information And Telecommunication Technologies; Functional Approach To Word Formation; Artificial Languages; Methodological Culture.*

INTRODUCTION

Artificial intelligence is a technology, or rather a direction of modern science, which studies ways to train a computer, robotic technology, and an analytical system to think intelligently like a person. In fact, the dream of intelligent robotic assistants arose long before the invention of the first computers.

A huge problem in the field of ethics for artificial intelligence is the lack of a single conceptual framework. Since there is no formal or at least constructive description of the main provisions of ethics in technical research, moral aspects are often limited to their everyday, intuitive understanding. Moral philosophers themselves do not always have a clear understanding of advances in AI technology. There is a gap between developers, researchers and philosophers.

The phrase "artificial intelligence" refers to both a complex of technologies and science. We use both meanings in this talk.

According to the National Strategy for the Development of Artificial Intelligence, artificial intelligence is "a complex of technological solutions that allows to imitate human cognitive functions (including self-learning and search for solutions without a predetermined algorithm), and to obtain, when performing specific tasks, results comparable at least to the results of human intellectual activity." The complex of technological solutions includes information and communication infrastructure, software (including the one that uses machine learning methods), processes and services for data processing and finding solutions.

On the other hand, "artificial intelligence is a science and technology that includes a set of tools that allow a computer, based on accumulated knowledge, to answer questions and draw expert conclusions based on this, that is, to obtain knowledge that was not put into it by developers. The field of "artificial intelligence" is interdisciplinary and is part of the complex of computer science, and the technologies created on its basis belong to information technologies. "

At present, the development of science and technology is unthinkable without cybernetics. Being an important factor in the acceleration of scientific and technological progress, the science of management is acquiring an ever-increasing role in solving the problems of intensifying production, in developing optimal strategies for social management. Directly connected with the processes of automation of mental labor, cybernetics has put the problem of creating artificial (machine) intelligence on a new theoretical and technical basis. This avant-garde problem has, however, a long history and prehistory - a centuries-old path of development of control devices and systems in physiology and technology. The urgency of the problem of natural and artificial intelligence and their relationship is due, in particular, to the cybernetization and cosmization of science and technology as cardinal trends in scientific and technological progress. The cybernetic approach is aimed at studying the phenomena of reality that depend on a person, created by his mind and activity.

The process of cosmization of science and technology expresses the need to expand the sphere of life and mind, to go beyond the terrestrial and "anthropocentric" gravitation, up to the possibility of detecting these external manifestations of the progress of matter in other places in the Universe.

Cybernetics in the form of machine intelligence provides a criterion for the artificial reproduction of thinking. This circumstance acquires decisive importance in understanding the specific mechanisms of the natural (human) mind. The need for work on the creation of artificial (machine) intelligence is caused primarily by the imperfection of human thinking - a small amount of memory, a low speed of information processing, slow learning, difficult recollection and selection, distortions are inevitable. In addition, all types of biological limits of intellectual abilities have been identified, ranging from a limited number of elements in the brain to a short human life span and the limit of direct information perception. There is no reason to believe that such restrictions will apply to future computing machines. Artificial intelligence can be devoid of these "flaws" of the human brain. The difficulties that arise on the way to artificial intelligence are often methodological in nature.

This includes the question of the correlation of this direction in cybernetics with the traditional approaches of psychological science. Often, psychologists reproach cybernetics for not using the data of psychological science systematically enough to build a theory of artificial intelligence. The works devoted to artificial intelligence are unequal and heterogeneous in their

methodological significance. The criticism of the methodological foundations of artificial intelligence contained in them often deserves criticism. In some works, methodological problems of artificial intelligence are solved on the basis of the real development of theoretical and technical cybernetics. And this is the most correct approach. However, there are publications in which the problems of artificial intelligence, in essence, dissolve. The problem of cybernetics is discussed in the philosophical literature. At the same time, various interpretations of it are proposed. The use of this concept is considered, for example, quite justified along with the concept of natural (human) intelligence, but the former is defined from the standpoint of systemic determinism with an emphasis on the functional aspect of the system. On another consideration, it is noted that this concept is nothing more than a metaphor, the literalization of which generally raises the question of the advisability of retaining the name "artificial intelligence". When comparing artificial and natural intelligence, the opinion is expressed that "attempts to characterize the mind within the framework of purely cybernetic categories are bad, first of all, because the mind is not a cybernetic or even a psychological category, but rather a philosophical one".

The above points of view express attempts to comprehend this problem, at least from three sides - natural-scientific, psychological and philosophical. In the literature, no clear definition of the concept of "intelligence" has been proposed. Therefore, it is advisable to carry out a comparative analysis of the characteristic properties of artificial and natural intelligence on the way of its development. With this approach, it is noted that if we imagine many different systems that perform the functions of thinking, then it is the identification of the invariant aspect of these systems that will reveal the structure that underlies the processes of thinking. When identifying the invariant aspect of thinking systems, their comparison is justified in terms of structural and functional properties, since the substrate characteristics (in humans and computers) are obviously different. The ontological basis for such a correlation of processes belonging to qualitatively different forms of motion of matter is the universal property of reflection, the structural and functional "kinship" of the levels of which is proved by the development of philosophy and natural science. The significance of the principle of reflection also lies in the fact that it allows solving the problem of the relationship between man and machine not only philosophically and speculatively, but also from the standpoint of natural science and mathematics, that is, from both the qualitative and quantitative aspects. The success of quantitative cognition of complex phenomena (such as the intellect) depends on how much it is possible to formalize them. The work of an artificial intelligence system always takes place in close interaction with a person, therefore it is correct to consider artificial intelligence as a mixed (hybrid) system, in which it is sometimes difficult to determine who made the greatest contribution to the formation of a solution - a person or a machine. Consequently, it is not a metaphysical separation of a person (thinking) from a machine and not their identification, or even the advancement of a machine to the fore, but a real interaction that needs optimization, the goal of which is a person, his more complete and comprehensive development. This representation of the role of technology in general, cybernetic in particular, allows artificial intelligence to find an adequate place in scientific, technical and social progress, to determine its specifically social functions, which are objectified in technical devices. The main goal of research on this problem is not to replace a person with a machine, but to imitate human mental activity to transmit to computers an increasing number of routine and complex machines of imaginative tasks, increase the validity of decisions made by a person, and release a person for truly creative activity. Until now, the

problem of artificial intelligence, despite its relevance, fundamental nature and fundamental general scientific nature, has been little occupied by professional philosophers, even from among specialists in the field of philosophical problems of cybernetics and informatics. Those philosophers who dealt with this problem focused on a purely philosophical (and sometimes psychological) way of proving the impossibility of creating artificial intelligence, or, relying on the data of cybernetics, tried to prove the possibility of its creation using limited scientific material.

However, its implementation is largely determined by what is meant by "ethical law". In such an abstract formulation, this question (as well as some other ethical questions) is marked by uncertainty. As complex scientific and technical areas, informatics and cybernetics have successfully and fruitfully united in solving the problem of artificial intelligence, which focused the specific and at the same time the most significant needs and factors of the further development of human society. It seems that in the age of electronics and informatics, computers and robots, one of the primary tasks of science is to provide worldview clarity and lay a reliable methodological foundation for problems working for restructuring, the purpose of which is to accelerate the scientific, technical and socio-economic development of society.

INTERROGATIVE CONSTRUCTIONS AND INNOVATIVE TEACHING METHODS IN RUSSIAN LESSONS IN AN UZBEK SCHOOL

Kamalova Dilafruz Tuimurodkizi*

*Lecturer,
Department of Russian Language and Literature.
Navai State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article discusses interrogative constructions used in innovative teaching methods in Russian lessons. Interrogative sentences always stimulate and direct the process of verbal communication. Observations have shown that schoolchildren experience certain difficulties in using interrogative sentences when innovative teaching methods are used in the lesson. This phenomenon requires clarification of the causes of these difficulties and their overcoming.

KEYWORDS: *Innovative Teaching Methods, Interactive Methods, Active Methods, Educational And Business Games, Speech Activation, Educational Process, Interrogative Constructions, Communication, Motivation.*

INTRODUCTION

Currently, innovative teaching methods include interactive teaching methods, active teaching methods, non-standard teaching methods, educational and business games, i.e. non-traditional teaching methods.

In all of the above teaching methods, interrogative sentences and answers to them are actively used, which will hereinafter be called question-answer constructions.

Question words and sentences are remarkable in that they force students to think, make decisions and act, i.e. talk. This factor is the most important goal of the Russian language lessons and literary reading in the Uzbek school.

The transition to an innovative path of development of the country determines the modernization and implementation of innovative pedagogical technologies in the educational process by

increasing the level of competence of teachers and the use of modern educational technologies of foreign experience, including Russian.

In this regard, knowledge of the Russian language and other foreign languages has become one of the most important conditions for the success of any specialist.

Currently, teachers of the Russian language and literature in schools with Russian and Uzbek languages of instruction have begun to actively introduce innovative teaching methods into the educational process.

In our opinion, innovative teaching methods are both interactive and educational and business games, and various active teaching methods that are used at any stage of the lesson.

In the educational and methodological complex for advanced training of teachers according to the module "Modern approaches and innovations in teaching the Russian language and literary reading" it is noted that the curriculum is developed in accordance with the priority tasks outlined by the Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No.UP-4947 " On the Strategy of Action for the Further Development of the Republic of Uzbekistan ", as well as by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated April 6, 2017 No. 187" On Approval of State Educational Standards for General, Secondary Specialized and Professional Education ", provides for the improvement of the content of advanced training for teachers of the Russian language and literature, as well as increasing their professional competence.

In connection with these documents, it is recommended to use interactive teaching methods, such as the Delphi method, Graphic organizers, Venn diagram, Cluster, ZHU in the lessons of the Russian language and literary reading in the school, in the educational and methodological complex of advanced training of teachers. "," Debates "," Spinner "(Slavin's Method)," Flight Journal "," Brainstorming "," Basket of Ideas "," Bloom's Chamomile "," TRIZ "," Role Play "," Learning in Collaboration "technology, method of "Projects", "Sinkwine", method "Case analysis", method "Case-stages", "Mosaic (openwork saw)", "Thick and thin questions", "Fishbone" and other very effective methods of enhancing the speech activity of children, which can be used not only in the senior, but also in the lower grades of the national school.

The listed innovative educational technologies of teaching allow for personality-oriented training of students, the main task of which is to reveal the intellectual, cognitive and creative potential of all participants in the educational process. Innovative teaching methods are being introduced into the educational process in order to provide society with competent specialists with a logical mindset, capable of applying innovative methods in professional activities.

The use of game elements in innovative teaching methods in the lessons of the Russian language and literary reading is very close to children from an early age.

In innovative teaching methods, there are many motivations for the manifestation of the child's personality. The competitive elements of the tasks make children sociable and active participants in the educational process, which has a positive effect on the overall performance of schoolchildren. Games and tasks for them are important for the rational and productive organization of the learning process, including in the methodology of teaching Russian and literary reading as a foreign language in the national school.

Knowledge of the problem. The problem of using gaming technologies in the learning process in pedagogical theory and practice is not new.

L.S.Vygotsky, A.N. Leontiev, D.B. Elkonin and others were engaged in the development of the theory of the game, as well as its foundations, the definition of its social nature, and the clarification of its significance for the development of students in pedagogical science.

D.B. Elkonin and L.S.Vygotsky considered play as one of the main forms of development of mental functions and means of a child's cognition of the surrounding world of adults and nature, noted that play is an activity inherent in people from birth to old age, through which a person learns the world; preliminary training before a serious matter that lies ahead of a person in life; recognizing and testing oneself; a necessary part of the culture.

The game forms of classes in the Russian language and literary reading lessons not only support students' interest in the subject, increase the motivation for learning the Russian language, but also contribute to the activation of thinking. The use of game techniques in teaching children contributes to the consolidation of linguistic phenomena in memory by ear and visually.

Thus, the game can be considered a full-fledged part of the educational process, a link between the learning process and the real world.

One of the significant achievements in the use of active teaching methods is the development of communication skills in school-age children. Indeed, the teaching of speech communication is the core of the implementation of the considered teaching methods. At the same time, an important element of the considered innovative teaching methods is the collection and recording of the necessary information. This means that the student must have the skills of correct oral and written speech, which undoubtedly creates certain difficulties in organizing any educational and business game.

The study of the methodology for the application of innovative pedagogical technologies in the form of educational and business games with the use of cases shows that students are involved in a conversation by using interrogative constructions such as: "What would you do in this case?", "What do you think about this?", " What decision will you make? "," What are you doing? "," What are you thinking? " etc. These examples are used both to clarify the circumstances and to involve in the discussion those who, for one reason or another, do not dare to join the discussion. Question-answer constructions are actively used in the lesson when organizing "Brainstorming". Typically, two groups of students are created for brainstorming. The first group includes generators of ideas, and the second group consists of student members of the commission, engaged in the processing and selection of proposed ideas.

Processing and selection of material is carried out by posing a question to the proposed ideas.

The "Projects" method cannot be used in educational situations without the use of interrogative constructions, with the help of which the teacher helps and directs the project participants in the necessary direction.

In the "Aquarium" method, the teacher uses problematic questions, and the children must understand the question and complete the task.

Thus, the educational goal of the lesson is realized. Educational and business game "Thick and thin questions" consists only of questions and answers. Thick questions require detailed, detailed answers.

For example, "What do you know about birds?" Subtle questions require unambiguous, short answers. For example, "What's your favorite holiday?"

From the point of view of the use of question-answer constructions, there is some interest in Bloom's Daisy or Question Daisy, where the six petals represent six types of questions: simple questions, clarifying questions, interpretation questions, creative questions, evaluative questions and practical questions.

All these questions require the use of certain constructs in the answer, which can be very short or very large. From the examples given, it is clear that any linguistic communication in written and, above all, in oral form is realized through monologue and dialogical speech.

In the organization of both the first and especially the second form, interrogative words and sentences play a large role, which always stimulate and direct the process of verbal communication in various life situations, when the goal of practical language acquisition is considered as the leading one that determines the content of the academic subject "Russian language and Literary Reading "in the Uzbek school.

Conclusions and offers. Thus, we came to the conclusion that all types of active teaching methods, along with positive incentives, can have difficulties that can inhibit the active participation of children in communication due to the inability to use certain interrogative constructions and answers to them in educational situations.

In addition, certain difficulties or errors in the use of interrogative constructions in educational situations may arise under the influence of the native language of students of the national school.

To identify the reasons that give rise to errors in the Russian speech of students of the national school, the linguistic characteristics of grammatical categories and forms to be learned at school, in comparison with the native language of students, is of great importance.

It is interesting to note that educational situations and the pronominal interrogative constructions used in them have a stable repetition during the entire educational period at school.

So, for example, the interrogative sentence "Who is on duty today?", "What is the date today?", "What was asked at home?", "How many sounds and letters are there in the word ...?" etc. often used in both senior and junior grades.

All this suggests that interrogative constructions familiar to children from educational situations can be usefully used in speech situations using active teaching methods. At the same time, the determination of the range of question-answer structures characteristic of a particular educational situation will allow predicting the speech content of the educational situation when using active teaching methods.

It should be noted that interrogative constructions are very productive not only for activating dialogical speech, but also for teaching students monologue speech. To do this, you can use constructions with a request for information about a predicative feature. For example, "What is life?", "What is art?", "What is talent?"

Through such questions addressed to schoolchildren, it is possible to develop mental activity in children, because these questions call a person to think and reason aloud and to himself. In some speech situations, not all interrogative constructions allow you to achieve detailed answers. In this case, it is effective to use additional means such as: tell, explain, state, retell, etc. For example, "Children, tell us what you did in the garden?", "Leader, explain what your team members should do?"

In order to achieve detailed answers, sometimes questions are combined with other constructions or supplemented by them. For example: "Who and why is this question and the answer not satisfied in this situation?", "Who was included in the team? What caused this? "

In a situational way, you can tell high school students the missing statements of a complex sentence. For example, the subordinate part of the response complex sentences is contained in a question of the following type: "What did you do in the summer when you had a vacation?" - "In the summer, when we had holidays, we came to school to look after the garden."

In this regard, there is a need for a careful approach to the study and use of question-answer constructions in the lessons of the Russian language and literary reading in the national school in order to increase the speech abilities of children to use them accurately in innovative teaching methods, which is planned to be done in future studies.

Thus, we can conclude that the modernization and implementation of innovative pedagogical technologies in the educational process ensures the country's transition to an innovative path of development through the use of modern educational technologies that are familiar to us from foreign experience. Therefore, knowledge of foreign languages, including the Russian language, is becoming the most important necessity for any modern person. In this regard, at present, innovative teaching methods are actively used in the lessons of the Russian language and literary reading at the national school.

Question-answer constructs are often used in innovative teaching methods. Observations have shown that at the same time, students of the national school experience certain difficulties in Russian when using interrogative sentences and answers to them.

Presumably, this happens under the influence of the students' native language. The influence of the native language is especially noticeable when children must use such parts of speech as nouns, adjectives, pronouns, numerals, participles and verbs that change in gender in the question-answer constructions of the Russian language. This is, in our opinion, due to the fact that there is no concept of the category of gender in the Uzbek language. In the future, the authors plan to pay special attention to the study of interference phenomena in the lessons of the Russian language and literary reading in the Uzbek school.

Department of History, University of JAFFNA

**Senior Lecturer
Department of History, University of JAFFNA

ABSTRACT

Agambadi is one of the backward community among the Tamil Nadu Communities now a days they are mostly live in Ramanathapuram, Sivagangai, Viruthunagar and Madurai districts in Tamil Nadu. Marudu brothers were one of the members in this Community when there was trouble in political in Sivagangai, these brothers turned as leaders of people and safe guarded their dignity. The period between AD 1780-1801 was seemed that Battle against British. They administered the government well among many problems. They accompanished economy, art and literature work. They were not only good heroes but good rulers and patriotic. Giving importance to some leaders is seen in Indian history. Some of the liberation hero'es history is seem to unknown . So the purpose of this research is to focus the world about to omit such short comings and to show these heroes with the availability of sources. Observing, interviews, newspapers, books are used to conduct this research and analyzed the basis of approach of history

KEYWORDS: *Local rulers, Palayakarar, Kalayar kovil temple, Battle of Kalayar kovil*

INTRODUCTION

Birth and Younger Periods

Europeans came to Eastern countries for trade and cunningly interfered those countries politics and fulfilled their aims by created conflicts among the rulers. British was important among these Europeans. They were ready to do anything to safeguard their dignity in Indian territory (*Mahrada,2013*). So their inland rulers took actions against English to control their activities. Those who were against whites were punished without any sympathy by the British in their early period. Tamil Nadu was not exceptional though the Inland rulers were all over the countries Maruthu Pandians ruled the country for twenty one years and they were challenged with British.

The persons Mokkai Pahaniappan from Alagapuri Mukkulam in Virudunagar district married to Anathai who was called as ponnaththal. She gave birth Periamaruthu in A.D 1748. He was called as Vellai Marudu he was fair and by this reason he was called. After five years Sinnamarudhu was born.

He killed a tiger in the forest with bare hand, used a weapon called as Valari and thrilled the neighbors, when the king governs period, made people governs, constructed temples, followed religious activities (*Maareeswaran,A., 2010).* Declared war against British as first time. Produce liberation union all over places of Tamil Nadu and cornered the British were some of quotes for their brave and records of their regime.

Both were very good in education and war training when they were young, their brave and records were spreeded all over the places. Peria Marudhu bent Arcadu one rupee coin with his fingers. Sinna Marudhu also talented. Arcadu Navab Sent a pigeon. When It was flying in the sky, Sinnamardudhu shot it by a weapon vallari. Vallari is made by wood and used to attack a soldier. When one who throw this weapon to a foe, It attacks the foe and returns to the same person. To handle this weapon good practice must be needed. Otherwise it will kill the same person *(Kalaiventhan, M.,2009).*

Sinna Marudhu had some special characters. He could understand the weakness of foe – and used those weakness for his own benefit. What he thought was correct thing, then he accomplished it. Every his deeds made the British as fearful. His foes thought the people were disagree and they got fear when they saw his activities. Ramanathapuram forts incharge Colonel Martins was attached by Sinnamarudhu's brave deeds and became his friend.

Colonel Wesley learnt to handle Vel, Vallari Sward as Tamils war weapons from him. It was mentioned in his diary. When they were young they entered to the place without knowing and body and touched those weapons and return home and play with kitchen utensils as in battle.

Become Ministers

MuththuVadugathan was a king of Sivagangai who was the one of the person who appreciated their brave deeds. Like him, his wife Velu Nachchiar also a heroine. She had own history. So the king and queen gave ministers post to Marudhu brothers in their government. When Muththu Vadule Nathan went for hunting a tiger appear suddenly then these brothers fhought with tiger and saved the king and won the respect from the king got appointed as leader of forces *(Mangaiyatkarasi,K., 2011).*

As many people of Palayam against for British Marudhu Pandiars were only declared war against British Colonel Wolles mentioned that these brothers used rocked in battle at temple forest. Whites got surprised about their gorillas attacks. Colonel Agniwa started that they were defeated in this battle.

Tanjour king took war against Ramanathapuram in A.C1770. At that time, Thamotharampillai was minister and who managed the situation and chased away the Tanjour king. Arcadu Navab saw this and feared then wrote a letter to British requesting to send forces to fight against Tanjour king. British accepted his request and asked Kernel Smith in Trichy to help Navab *(Mangalaruby,S., 2015).* Continuously Nawab's son Umathul Umara joined with the army of British and marched towards Tanjour and won the battle.

The Invasion at Ramanathapuram by the British and Navab's Forces

Navab requested the British to send the forces, and said false information that Ramanathapuram king and sivagangai king prepared for war and they won't give ransom. By this A regime led by Joseph Smith moved to Ramanathapuram in A.D.1772 *(Mangalaruby,S., 2015).* King of PuthukoodaiVijaya RagunathaThondaiman also sent his forces as support. By the end British easily conquered Ramanathapuram and put into jail a boy who was 9 years old and rules the place at that time and his mother and relatives.

The Invasion at Sivagangai by the forces

An their victory at Ramanathapuram gave a path to sivaganagai. Strengthen forces of British and Navab engaged in this battle. The King of Puthukoddai also sent his troops. This coalition forces attacked Kalyar temple which was as fort to Sivagangai. This battle is called as Kalayar temple battle in history. This coalition forces faced a big challenge Marudhu brothers confident and courage in battle came out in this battle. They were actively participated against coalition force Vellaimarudhu and Sinnamarudhu were ministers in those days, it was started before too. Ruler Muththuvaduganathan and Velunachchiar also took part in this battle *(Mangaiyatkarasi,K., 2011).* However enemies were strong enough hence Muthuvadagunathan sent his wife and Marudhu brothers then he thought with them only. Finally he was killed by British brutelly. After cutting his two hands and legs he was shot by canon.

After the war British were engaged in looking and got 50,000 Pagodas valued gold *(Ravikumar, N., 2009).* Sivagangai tell into the hands of Navab. From that day Sivagangai name was changed as Usain Nagar. Ramanathapuram change as Ali Nagar. People's lands were snatched and handed over to government supporters.

Marudhu brothers as rulers of Sivagangai

Navab divided Sivagangai as many unite and left it for lease. This practice was not longer. People did not pay tax for lease. As the result violence broke out all over the country. Navab could not control the violences and he escaped and thought to hand over the country to Velunachchiar. He did what he thought opponent of British Hither Ali's activities, son Thippu sulthan's activities are remarkable. As Velunachchiar doesn't has son, Marudhu brothers comes from *Servaikarar* family and they have heroism and ability to rule the country, she thought that it was better to hand over the country to Marudhu brothers, and did like that. In later Vellai Marudhu stated in his death declaration the power of ruling was handed over to him because he married *(Sanjeevi,N., 2014).*

However, Marudhu brothers' thankfulness unity in Velunachiar matter was considerable when she was at Virupachchi with her son for 8 years they safe guarded her and son carefully. When they took the ruling powers, they did many common works for the people. They thought that they could win people support like doing these works. People considered them not only rulers but god too *(Tamilarasan, S., 2007).* They ruled sivgangai for 20years from A.D.1780 Velunachciar died in A.D 1800.

Invasion again at Sivagangai by British

After Velunachchiar death create troubles at Sivagangai as the key of cash. He placed question that how can became ruler from *Servaikarar* family among people .This made people to provoke

against the government. At that time Kaddapomman thought against British. Hence they decided to take action against Kadapomman then to look into this matter.

After Kaddapomman was hang to death, his relative as brother named Oomathurai escaped from the prison and refuge to Marudhu brothers (*The Hindu*, 5 November 2008). As they gave refuge to him, anger of British against Marudhu brothers increase. As this is the background British marched towards Sivagangai in A.D.1801. They were thought at Kamuthi and Marudhu brothers won the battle.

After sometimes British attached Sivagangai freely. When this battle was going on, before falls the capital Siruvayal of Sivagangai to the hands of British Marudhu brothers destroyed it and stayed beak at Kalayer temple with their soliders. In this stage British took the benefit of cash appointed Udayathevam as king of part of Sivagangai.The Friends of Marudhu brothers and well known people went to the British and turned as their agents. so, Marudhu brothers annoyed (*The Hindu*, 5 November 2008).

The British knew the secret that Marudhu brothers were hid in Piram mountain and attack so they rounded up. British were up in this battle. Hence Marudhu brothers reached Kalayer temple. Heavy battles took place in this place. British used modern weapons and captures Kalayer temple. But Marudhu brothers and Oomathurai escaped from there and reached Sangarapthik fort. But agent of British showed them.

Hang to Death

English people attacked at marudhu brothers in the midnight. They thought that they would not falls into the hands of British and escaped to the forest. Their government informed that to pay 4000/= Rs to the person who will capture the brothers. However nobody seen them. Once they saw the three persons were going in the woods, and they attacked them. Periamarudhu got injured in the leg and other two men lifted him. At that time British captured them *(Mangaiyatkarasi,K., 2011).* They were imprisoned in Thiruppaththur fort. Then they were hanged to death. Oomathurai was taken to Panchalangkuruchchi and hanged. They didn't stop. Relatives of Marudhu brothers, friedns were taken to the prison and given punishments.

Work of Tamil Language

Even Marudhu brothers faced many problems; they did their work as the people. Their work for Tamil is great. There were 21 poets in their regime. Sawathu poet, Muththuvel poet,, Vethantham Muththuvel poet, Vethantham Subramaniampillai, Muththuparathy, Second Sakkarai poet, Muththumari poet are some of them. The songs were written about them are now in use. Marudhu brothers gave village for the poets as present. As the three kings regime, not only Sward and Valari rise up but books and pen too *(Mangalaruby,S., 2015).*

Once Periamarudhu decided to construct a food house at Kalianagari and came there. Sargarai poet from Sirugambai heard this and decided to write a poes "Adda Nagapantham" and to give him. His son also wrote a poem and kept inside his father's book. When father gave his poem to king him read poet son's poem then he called that boy and praised. Then he gave a place in the poets lobby – and named as Santhup poet.

Lord Kundrakudy Murugan cured Peria Marudhu's *Pilavai* illness. Hence he constructed boundary wall halls and pond. He asked poet Shanthu to produce Mauragiri kovail of lord

Murugan and staged in A.D.1799 *(Ravikumar, N., 2009).* He gave clothes and jewelry and presented a village Maruthankuddi near Kalayer temple. In these 14 songs it tells glory of lord Murugan and Marudhubrothers' contribution.

> *"Valli Mayilser Mayinmalaike Maruthaiyan Seitha*
>
> *Velli Mayilai Virumbum Kuganarul Venthan"* (Tamil Poem)

Poet Shanthu was happy of Marudhu brothers' love not only he was well in poet but engaged in battle too. After British destroyed Marudhu brothers' he also died.

Once, Muththu poet and his wife from the country Kamuthy were coming to meet Marudhu brothers, thief stole wife's chain. Poet was coming with crying face to the palace. Then Marudhu brothers gave him a new chain and asked him to wear it to his wife. Their fame was in history.

Arcadu Navab sent a spy named Kalaiman towards Marudhu brothers. But he was affricated by Periamarudhu's behavior. He was a friend with them later as he changes his mind. Periamarudhu was attracted by Kalaiman's heroism. the Kalaiman sent a message through a pigeon of Arcadu Navab. Sinna Marudhu was suspicious about this; finally Kalaiman was killed by Sinnamarudhu. When Periamrudhu heard this, he felt sad. Even he was enemy's man, he praised his heroism and made a school for him *(Kalaiventhan, M., 2009).*

General Services

In their 21 years services, they constructed many temples during 10 years which was seem quiet period. Kuntrachkuddy temple Kalayer temple, Thirumogurperumal temple, two temples at Narikuddy, temple at Veerakudy, Thirupaththur temple, Thirukoddiur temple, Thiruppachethtur temple, Memble Alah temple, Sarugani made temple were some temples repaired by them. They constructed temples without show any difference or cash and religion. They constructed 151 feet tall tower at the entrance of Kalayer temple. Marudhu brothers also were fond of art like morals. They dug well and ponds. Ponds in rural areas called Pandiankulam nowadays to. Considering the safety of the region they constructed fort too.

They constructed public houses and handed over to poor people. We can mention the rest houses at Narikuddy, Pampan, Kadiyoor, Mana Madurai. Their glory spreaded not only in Tamil Nadu but all over India by their deeds. Some of Kannathasan's poet lines describes about Marudhu brothers regime.

> *"Sivakangai Valrtha Dhevar*
>
> *Thirukkovil Kattik Kaakka*
>
> *Navamani Vilaiyum Boomi*
>
> *Nalkinar Thunaijum Ninrar"* (Tamil Poem)

In the beginning regime of British kings made many struggles against them. When considering Tamil Nadu, who were in power in powers in Southern parts such as Ramanathapuram, Thooththukuddy, Madurai, Thirunelveli were big challenge for British. Marudhu brothers are among them. They thought against British until last not only they thought, they cindered the plan of work of welfare. They gave support to Tamil and Poets. Maintained understanding among religions.

CONCLUSION

Marudhu brothers work and contribution is respectable at Sivagangai in the history. They changed a small region as respectable in history. From the beginning of join with Muththuvdangantham and till hang to death their activities were in struggle. They were the join to work against the British and they were able to work as a plan and compare with the British. However they were beaten by British, their instinct to liberate as not to give tax, not cooperate was not beaten. They had the chance to continue their government with the support of British; in any situation they didn't get their support. As they needed freedom, they opposed British. Hence they considered British not as their foe, but common enemy. They were an example for cooperate with religious. The Political aims were seen only some of Palayam people. Marudhu brothers were the first in those. In any situations, foreigners could not win them, then they selected cast as an arrow of last weapon. Their attempt was successful. TamilNadu government released a stamp of their heads and gave them a glory was remarkable.

ABSTRACT

This article provides information on the essence of the modern concept of terrorism, which is becoming increasingly dangerous today as a result of globalization, what are its features, peculiarities, and what negative consequences it can have. It also examines the manifestations of modern terrorism in the Central Asian region, the factors that cause it, the measures taken by influential international organizations and leading countries in the fight against terrorism. At the same time, based on the experience of foreign countries, proposals and conclusions are made to increase the effectiveness of the fight against modern terrorism in the Central Asian region.

KEYWORDS: *Terrorism, Modern Terrorism, Threat, Security, Region, International, Organization, Strategy, Agreement.*

INTRODUCTION

Terrorism, which is one of the most serious threats to the stability of Central Asia today, is urging the countries of the region to remain vigilant and vigilant. Indeed, President Shavkat Mirziyoyev said: We all understand that the most important condition and guarantee of a peaceful life"[1. - B. 46] in vain.

It is well known that the word terrorism is derived from the Latin word "terror," meaning "fear," "horror," and was originally used in reference to the Inquisition of the Catholic Church. According to some sources, it was first introduced into scientific circulation in France as a result of the great revolution that took place in the eighteenth century. However, over time, the essence of this concept began to take on a new form and content in terms of social phenomena.

There are different forms of terrorism in the world today, and each country has its own approach to the term. The analysis of terrorist attacks in different parts of the world shows that the tactics of terrorists in achieving their goals, the number of forces and means, their quality have changed more than before. This necessitates the development of a single definition of the concept of terrorism that covers all its aspects. The existence of a single definition is of great importance in developing the legal framework for the fight against modern terrorism, which is the last stage of evolution in its history, and in further improving the effectiveness of measures taken to combat it.

To date, the concept of modern terrorism can be conditionally called civilized, taking into account the socio-economic, regional, ideological-political, religious-ethnic and other goals, including global goals, which are constantly studied by experts and taken into account the conclusions of the analysis. can be described as an illegal, violent act aimed at intimidating and discouraging competitors using modern technology. It is also a form of organized social resistance, one of the forms of warfare in terms of military-political goals, means, methods and results of influence, and reflects the anti-social activities of highly aggressive, organized, ideologically trained subjects.

Today, modern terrorism is complex, multifaceted, multi-faceted and manifests itself as a problem in ensuring the security of the individual, society and the state in a timely manner. The fact that this problem is interpreted differently in the legislation of the states, and as a result of research in scientific circles and analysis of existing descriptions on the basis of a specific approach, suggests that it is changing as a socio-political phenomenon.

A number of expert scholars and researchers have expressed sound opinions about modern terrorism, its emergence and its negative consequences. In particular, the expert V. Shestakov notes that the emergence of modern terrorism is associated with the rapid development of scientific technologies and the emergence of technological systems and networks on a global scale. According to him, the electronic form of mass media plays a key role in the globalization of modern terrorism. [2. - B. 9]

Russian scientist D.B. Levin also noted that modern terrorism can lead to the death of diplomats and political figures in order to aggravate international relations and confuse political and military conflicts. [3. - B.810-815]

Today, modern terrorism is characterized by the following features:

- first, it has a mass character, that is, if in the previous stages it was aimed at a specific target, today it is aimed at injuring and intimidating many people;

- Secondly, the fact that terrorists use modern means of struggle and intimidation in their activities - weapons of mass destruction, the Internet and the media;

- Third, modern terrorism can complicate international relations, undermine regional and global security through armed conflict.

The problem of modern terrorism has become a sharp manifestation of the current global problems related to the field of international relations, and today it is assessed by the world community as a global threat against humanity. It is disrupting the domestic political and socio-

economic situation in a number of countries and causing tragic damage to humanity. The reasons for this are as follows:

- The fact that modern manifestations of international terrorism are becoming more widespread on a global scale than other global problems and are reflected in conflicts in various regions, and even the most economically developed countries of the world are not protected from it;

 - The rise of modern terrorism is a serious threat to the security of individual states and the world community, and more than a hundred terrorist acts are carried out in the world every year;

- Today, terrorism has a modern infrastructure, effective use of the world media, the most advanced achievements in science, stable sources of funding, as well as a strong material and technical base;

 - The fight against the modern threat of terrorism requires the collective cooperation of the peoples and nations of the world.

The threat of modern terrorism and its manifestation in various forms, its intensification and its more anti-humanitarian orientation is one of the important challenges facing the international community.

At present, the following can be noted as specific features of modern terrorism: [4. - B.17-20]

1. Ideological validity and potential in the field of propaganda. The interrelated processes of globalization and regionalization are leading to further escalation of contradictions today.

 2. Clearly expressed transnational features. The process of globalization of modern terrorism leads to more concentration and activation of terrorists in countries without strong statehood.

3. The relationship of modern terrorism with the criminal world. Currently, the sale of drugs, weapons and other illicit products is one of the main sources of funding for terrorist organizations. [5. - B-309]

4. Equipped with modern equipment. This case is markedly different from the terrorists of the past, that is, it is equipped with weapons, transport, communications and other material and technical means.

5. Confidential support by some states. This is the most sensitive issue, as there are a number of global and regional treaties and conventions on supporting, financing or refusing to hide terrorists on their territory.

The dynamics of terrorist acts in the region is important not only for the analysis of the modern concept of terrorism and approaches to it, but also for the study of the dynamics of terrorism.

Today, in the Central Asian region, there are various terrorist organizations that have their own strategies, ie structural-functional model. Examples of extremist and terrorist organizations under the guise of Salafism in Kyrgyzstan include the Islamic Movement of Turkestan, the East Turkestan Islamic Party, Hizb ut-Tahrir, Jihadists, Salafis, and Islamic Jihad. Union. Taking advantage of the religious sentiments of the local population, their dissatisfaction with the current social situation and the weakening of their moral values, the representatives of "political Islam" are not only strengthening their position among the population and switching to active forms of struggle, including terrorism. In particular, the terrorist attacks on the Batken region of

the Kyrgyz Republic in 2000, March 29, 2004 in Tashkent and April 1, 2004 in Romitan district of Bukhara region, March 30, 2004 in Kibray district of Tashkent region, July 30, 2004 in Tashkent. innocent people were killed as a result of their actions.

Most members of terrorist organizations arrested in Kyrgyzstan over the years have been found to have undergone combat training at terrorist bases in Pakistan and Afghanistan. As a result of the active influx of Salafist ideas into Kyrgyzstan, radical extremist movements such as Tablighi Jamaat (Jaish Jamaat al-Mahda) and Hizb ut-Tahrir have become widespread in recent years and are still spreading their destructive ideas among young people.

Since May 2011, terrorist organizations have become more active in Kazakhstan. On May 17, 2011, a terrorist blew himself up in front of the Department of the National Security Committee building in Aktobe, Kazakhstan, in order to avoid punishment for his participation in the activities of an organized criminal group. [6]

Experts say that the terrorist attacks of 2012-2013 can be described as "rings of a chain." Because most terrorist operations are carried out in the "order" of arresting terrorists and actions against them. This is evidenced by similar incidents in Astana, Atyrau, Almaty and Taraz regions.

Emissaries from the Middle East, who arrived in Tajikistan in 1992, played a major role in the formation of terrorism in Tajikistan. Members of various fundamentalist organizations in Sudan, Afghanistan, and Saudi Arabia have trained Islamic opposition militants in the methods of waging a war of subversion, and in many cases they themselves have served as the main driving force of the armed opposition.

In particular, according to the Ministry of Internal Affairs, in 2010, 50 members of the terrorist organization "Islamic Movement of Turkestan", 8 members of the extremist organization "Al-Qaeda", the religious extremist organization "Hizb ut-Tahrir"

135 people and more than 20 members of the Tablighi Jamaat and Salafiya extremist movements were detained. [7]

A group of terrorists belonging to the Jamaat Ansarullah terrorist organization, who planned to carry out an act of terrorism in the run-up to the 2013 presidential election in Tajikistan, have been arrested. In their instructions, they state that they are affiliated with the Islamic Movement of Turkestan.

A statement issued by the Ministry of Foreign Affairs of the Republic of Uzbekistan on the unrest in Kyrgyzstan following the announcement of the preliminary results of the parliamentary elections in Kyrgyzstan on October 4, 2020, called for the annulment of the election results. The course of events is a matter of serious concern in the Republic of Uzbekistan ... The stability and sustainable development of Kyrgyzstan is an important factor in the security and prosperity of the entire Central Asian region. ”[8] If such incidents in the region are not addressed in a timely manner and strict measures are not taken to prevent them, the situation could become more complicated and lead to many negative consequences.

Factors influencing the manifestation of terrorism at the modern stage Along with the analysis of the dynamics of modern terrorism, it is important to study the manifestation of terrorism, terrorist

activities in the region and the factors and conditions leading to its spread. In particular, the tactical tasks of terrorist organizations in the Central Asian region are as follows:

- Large-scale "Islamization" of the region's population;

- Destabilization of the socio-political situation;

- Establishment of reliable links between interstate and foreign terrorist organizations in the region;

- Creation of permanent financial support channels of these organizations.

It should be noted that terrorism is of global importance and attracts the attention of influential international political organizations and leading states that have a say in the world community, regardless of where they are active in the world. In particular, the experience of foreign countries in the fight against terrorism The need to increase the effectiveness of the fight against terrorism at the universal level increased in the first half of the last century. The qualitative and substantive improvement of the process of creating universal legal mechanisms for combating international terrorism began with the establishment of the United Nations (UN). In those days, terrorism was seen only as an act of some kind, and it was considered not difficult to reach an agreement on the issue. Because of this, terrorism existed only theoretically at that time. Later, in the UN documents, the concepts defining terrorist attacks were formed, the form, type and purpose of terrorism were revealed. Based on this, the events of September 11, 2001 demanded that the world community pay more attention to the problem of international terrorism. After these events, many countries around the world reviewed their legislation and realized that they do not have a special basis for the fight against terrorism, or that these laws do not meet today's requirements.

In order to prevent the appearance of modern terrorism in the world, a global anti-terrorism strategy was adopted by 192 UN member states on September 8, 2006, and was put into practice after a high-level meeting of the General Assembly on September 19 this year. This is the first strategy that reflects the common approach of the world's countries in the fight against terrorism. [9]

Measures to strengthen the capacity of the UN in this area have been proposed. The following elements are the basis of this strategy:

- Measures to eliminate the conditions conducive to the spread of terrorism;

- Measures to prevent and combat terrorism;

- Measures to strengthen the capacity of states to prevent and combat terrorism and the role of the UN system in this area;

- Measures to respect human rights and ensure the rule of law as a fundamental basis in the fight against terrorism.

Various international associations and organizations are also actively involved in the fight against terrorism within the Council of Europe. The political direction in the fight against such crime is included in the final documents of the meetings in Helsinki, Madrid, Vienna and Paris. There are currently three regional agreements in place:

1. The 1991 Convention on the Prevention and Punishment of the Crime of Terrorism against Persons, if it is of an international nature.

2. European Convention for the Suppression of Terrorism, 1976.

3. Convention for the Prevention of Terrorism, 1987, approved by the South Asian Association for Regional Cooperation. Political and legal documents on the fight against terrorism and its elimination have been signed between the member states of the Commonwealth of Independent States, the OSCE, the Shanghai Cooperation Organization. Including:

1. Treaty on Combating Terrorism, signed by the CIS members on June 4, 1999.

2. Convention for the Suppression of Terrorism, Separatism and Extremism, signed in Shanghai on 15 June 2001.

3. The Agreement on the Regional Counter-Terrorism Structure, signed between the members of the Shanghai Cooperation Organization on June 7, 2002 and other documents, states that terrorism, separatism and extremism threaten international peace and security, friendly interstate relations and fundamental human rights and freedoms. it was stated that they should cooperate in the struggle. The Regional Anti-Terrorist Structure of the Shanghai Cooperation Organization, which has been fully operational in Tashkent since January 1, 2004, was opened in June 2004 to train highly qualified specialists, establish strong cooperation between special services and law enforcement agencies, leading international counterterrorism centers (UN, Interpol, ASEAN).) was established.

There are differing opinions among scholars and researchers on the effectiveness of the established mechanism in the fight against international terrorism. In particular, the terrorist IV Kormushkina writes that the mechanism of the existing conventions on combating international terrorism is extremely inefficient and does not meet modern requirements. One of the main reasons for this is that the lack of a unified approach to the imposition of penalties in the conventions has created favorable conditions for terrorists to escape responsibility. It is emphasized that the types of jurisdictions defined in the conventions are another shortcoming in these conventions. That is why the jurisdiction of the state that has suffered the most from terrorist acts should be determined. [10. - S. 13-15]

In response, researcher I.I. Karpets stated that "international terrorism is a special type of crime of international significance, involving extortion, torture, degrading treatment, forcible deprivation of liberty, and murder of international or national significance. is to create special organizations and groups to take people hostage for the purpose of inflicting bodily injury, violence, and compensation. "[11. - P. 29]

Foreign experience shows that in the current situation, the main form of combating terrorism is special operations. That is why many Western countries have followed the path of forming separate units and special services equipped with modern equipment, weapons and transport. They are formed in more than 15 Western countries, but their actions are within a clear state system, and special units are fully supported by other institutions, structures (legal, informational, ethical-psychological, etc.).

Currently, most countries in the West have two types of special units designed to fight terrorism:

1) Divisions directly subordinated to special services and consisting of employees of these services;

2) "Commandos" units, consisting of servicemen of special forces and transferred to the special services during a certain operation.

Examples of such units include the SAS in the United Kingdom, the GSG-9 in Germany, the R Squadron in Italy, the French National Gendarmerie Intervention Group (GIGN), the Israeli 269th General Intelligence Unit, the US Delta Force, and others. [12. - S.392]

Practice shows that these units are often used when terrorists take people, vehicles and other objects hostage, and start the operation from the moment of the conflict. Special units are rarely involved in the release of abducted people, and terrorists take action from the moment the victim's whereabouts are determined. Government agencies (ministries, special committees, headquarters, etc.) are responsible for directing the actions of special units. [13. - S. 24]

In the current situation, according to experts of the Federal Border Service of the Federal Republic of Germany, it is important to expand cooperation and communication between special units of different countries in the fight against terrorism. For example, it communicates with the Delta Force in the United States, the SAS Brigade in the United Kingdom and the Cobra Special Forces in Austria. In France, the fight against terrorism is set up a little differently. The actions of the Ministry of Internal Affairs, army units and all interested services that can contribute to the prevention and suppression of terrorism will be mobilized and coordinated. To this end, on October 8, 1984, under the direct leadership of the Director General of the National Police, an agency called the Counter-Terrorism Coordination Unit (UCLAT) was established. In addition, France has a unit that coordinates the activities of German, Spanish, Italian and British counterterrorism services and the activities of French police units in countries with bilateral agreements on cooperation in the fight against terrorism (Germany, Italy, Spain, UK). . There is also an anti-terrorism system in the United States under the auspices of the National Security Council, which unites about 20 agencies and ministries. Although the coordination of these activities is entrusted to the FQB (FBR) under state law, the Ministry of Defense and the Military Intelligence Agency have a special place in the system. We can also see that the Ministry of Defense occupies one of the key positions in the anti-terrorist system of the Russian Federation, which includes ministries and agencies such as the Federal Security Service, the Ministry of Internal Affairs, the Foreign Intelligence Service, the Border Troops of the Federal Security Service.

Experts point out that the state of Israel's anti-terrorism system deserves special attention. The country's counterterrorism system consists of military intelligence (AMAN), the army (TsAHAL), the Foreign Intelligence Service (Mossad), and the country's General Security Service (NSS). [14]

The data studied and the analysis carried out show that an important aspect of the problem is that as human development progresses, so do the needs of the countries of the world. At the same time, the need for energy resources today is leading to increased efforts among the world's leading countries to bring energy-rich regions (Middle East, Caucasus, Central Asia) into their sphere of influence. It should be noted that the existence of modern terrorism, primarily due to its activities associated with violent organizations, its scale, the number of victims and its interaction with political and political extremist forces, can be considered a separate form of war.

It should be noted that the assimilation of oppression and fear is a central link in modern terrorism. The scale, subject, object, means and forms of terrorist acts of violence are constantly improving, while the tactics of actions are rapidly changing. In particular, it is known that the manifestation of terrorism in the Central Asian region has its own peculiarities. Terrorist organizations are openly pursuing their goals in Tajikistan and Kyrgyzstan, while in other countries they are pursuing them secretly. It can also be seen that the attacks carried out by terrorist organizations today are manifested differently in the countries of the region, and their main goal is not to establish democracy or a caliphate, but to seek power. It is obvious that all the terrorist acts are aimed at unconstitutional political goals. Analysis of the factors and conditions leading to the emergence of modern terrorist acts and the impact of all countries in the region on various areas will lead to the elimination of existing shortcomings, as well as strengthening interstate cooperation, strengthening regional security and creating effective mechanisms to combat threats. , it can be said.

In short, terrorist organizations operating in the Central Asian region do not rely on a particular segment of the population, so they do not want ordinary citizens to be in a mood against them. Because they see all categories of Muslims as their "social base." As an ideological basis, the "necessity" of the struggle against the current government based on secularism is based on the existing socio-economic difficulties, through which the main goal is to gain the support of the local population, to attract new members.

President of the Republic of Uzbekistan Shavkat Mirziyoyev said: - B. 10], while calling on all of us to be vigilant once again, shows that the necessary priorities must be developed to prevent the existing terrorism in the region.

In this regard, in the prevention of terrorism, first of all, it is necessary to pay attention to cooperation between the entities fighting it. It is expedient to implement this cooperation conditionally at the following four levels:

a) co-operation between internal services, ie services and units within the system of counter-terrorism agencies;

(b) Interagency co-operation, ie between counter-terrorism agencies;

c) Cooperation with the public;

g) International, ie co-operation with other States, their counter-terrorism authorities and international organizations.

This cooperation should be carried out in the following areas:

- implementation of political, economic, legal, educational and preventive measures to identify and eliminate the causes of terrorism, to increase their role in ensuring public safety, first of all, by ensuring close ties with communities;

- implementation of comprehensive measures to detect the smuggling of drugs, weapons, ammunition, as well as items that can be used in the commission of terrorism from the state border and customs posts;

- Carrying out operative search operations to identify those who are secretly operating in the society, promoting terrorism and preparing for it;

- Implementation of comprehensive measures to protect the administrative, industrial and economic centers of the country, important military and other facilities from air strikes.

In conclusion, it should be noted that as long as systemic measures to prevent modern terrorism in the region are strictly implemented, any potential threat will lose its validity. As a result, the security of Central Asian countries will be ensured and peace and tranquility will be achieved.

IMPLEMENTATION OF ROLE-PLAY AND SIMULATION ACTIVITIES WHILE TEACHING ESP STUDENTS

Sayfullaeva Yulduz Erkinovna*

*Tashkent State University of Law,
UZBEKISTAN

ABSTRACT

Teaching English interactively is a challenge many people face nowadays and promoting interactivity in ESP (English for Specific Purposes) classes is even more daunting task as it requires considerably more creativity. This article analyses the differences between simulation and role-play activities and then looks into the ways such activities can be utilized in ESP classes. Moreover, it provides information about research carried out in ESP lessons to identify the difficulties that can be encountered while teaching. In addition, there will be information given about the results of the above mentioned researches and their implications. Finally, the article will suggest the ways to encourage learners to be more active users of the language as well as to promote collaborative learning in ESP classes.

KEYWORDS: *Simulation Activities, Collaboration, Interactivity, ESP, Role-Playing, Constructive Feedback, Evaluation.*

INTRODUCTION

Translating texts from one language to another, learning words by heart, doing plenty of exercises to memorize certain grammar structures and forms – these all were the ways languages were learnt back in the 19th century and before. However, starting from the late 19th century the methods of teaching languages have been constantly changing, new methods appearing at least every decade. The Communicative Language Teaching (CLT) which was one of those new methods that developed in 1970's was quite different than previous ways of teaching as unlike previous methods, CLT focuses on meaning rather than form. In addition, this approach to teaching is learner-centered that is students learn by doing various tasks such as project work, creating Power Point presentations, developing their case studies, actively participating in class discussions, debates and performing role plays and simulation activities. With the introduction

of CLT teaching, task-based instruction also developed like never before because in this method of instructing teachers mainly guide their students, correcting their mistakes, giving them feedback while learners keep discovering new information independently. As it was mentioned in the book "Teaching by principles" (H. Douglas Brown, 1994) in CLT class interactivity is highly essential and communication is constantly encouraged. Thus, as communication and persistent use of language is the main focus of the lesson, role-play activities are indeed applicable in achieving necessary results.

As for using appropriate methods in conducting ESP lessons, it is highly practical to apply CLT method because it is certainly possible to adapt it to the needs of learners. Below there is a table presenting the differences between EGP (English for general purposes) and ESP textbooks provided by Vianaetal   (Teaching English for specific purposes, 2018):

TABLE 1 THE DIFFERENCES BETWEEN ESP AND EGP TEXTBOOKS

	EGP	ESP
Topics	General life (e.g., identity)	Specific to the occupation (e.g., financial industry)
Skills	Focus on all four skills	Selective emphasis (e.g., writing is not dealt with in the first two units)
Texts	Interactive, social, and informal (e.g., discussions, telephone conversations, introductions, arguments)	Informative (e.g., financial industry development), transactional (e.g., arrangements), and formal (e.g., professional and customer)
Language content	General knowledge of English (e.g., adverbials, order of adjectives)	Key aspects needed for the target professionals (e.g., words related to banking products/services)
Activities	Games, anecdotes, songs	Role-plays

As can be observed, in ESP classes, instructors create or select materials based on their field of work and it is vital to have individual approach to every student's needs and concentrate on the practical use of a language in class. To encourage more authentic use of language, role-playing and simulation activities are very effective as learners are constantly expected to put their theoretical knowledge into practice.

Before moving on to the next chapter, it is highly necessary to put forward the questions which will clarify the main idea of this research:

  i.   How different are role play and simulation activities?

 ii.   What are the benefits of using role-play and simulation activities in ESP classes?

iii.   What are some difficulties that instructors face while implementing such activities in their practice?

The differences between role-play and simulation activities

As it was mentioned above, simulation and role play activities play a vital role in maintaining interactivity in class as well as in assisting learners to apply their knowledge into practice

especially in ESP classes. Before we investigate the considerable impact of such activities in ESP classes, let us first analyze the differences between role-play and simulation activities.

According to Huff (2012), role play activities imply using various situations in order to stimulate using a language in a communicative language teaching environment. Moreover Qing (2011) believes that role play activities help to deal with real-life situations, preparing them to have suitable "repertoires of behaviors" when they use a certain language at their workplace or education institution.

In a nutshell, the main purpose of role-play activities is to engage learners in various situations where they have to communicate only in the target language and improve their speaking competence doing so. Mark Chesler and Robert Fox highlight the importance of sequencing role play activities (Role-playing Methods in the Classroom, 1966). Based on this information, we can see that the first step includes preparing a task and instructing learners on what to do. In the second stage learners work collaboratively and prepare their dramatic action by coming up with a plan on how to do it, assigning the roles and discussing the content of what they are supposed to role play. The last stage is evaluation part, instructors are required to provide feedback, be it positive or negative, preferably in a very constructive way.

Simulation activities, which are almost the same as role play tasks, have been gaining tremendous popularity in CLT-based classes as well. The main difference between role play and simulation activities is the latter one is more authentic that is they perform only real-life situations whereas in role play activities learners' fantasy is not limited in any way, they can act out any role, be it fictional or science-fictional. The simulation system is an artificial environmental situation in which learners perform their duties in the real world scenarios (Gredler, 2004; Jones, 1998).

Both simulation and role-play activities are helpful in developing learners' critical thinking as well as problem-solution skills. They get involved in team communication and collaboration helping each other, discussing everything solely in the target language. Such kinds of activities are especially helpful in ESP classes preparing learners for authentic use of language in real-life situations.

MATERIALS AND METHODS

Simulation and role play activities in ESP classes are highly suitable to use as learners can be familiarized with the language they are going to use in the real context. As it was mentioned in the article by Gill Sturtridge (Using Simulation In Teaching English For Specific Purposes, 1999) simulation activities give learners a chance for "both training and rehearsal in using the language he will later need". According to Gill Sturtridge, there are three main phases of conducting simulation activities. **(Table 2)**

As can be seen, in the initial stage, learners are expected to comprehend their task, their roles and responsibilities. It is vital that learners have some background information about the situation they are about to simulate. To illustrate, if lawyers are learning English and they are assigned a simulation activity where they have to perform a trial taking place, instructors first have to make sure that they know how to do, they have to be informed about the stages of carrying out a trial as well as the use of language in the mother tongue. In case they are not knowledgeable about it,

their awareness can be risen by first showing a video or reading a trial stages in the form of a dialogue so that they are well aware of what they have to do.

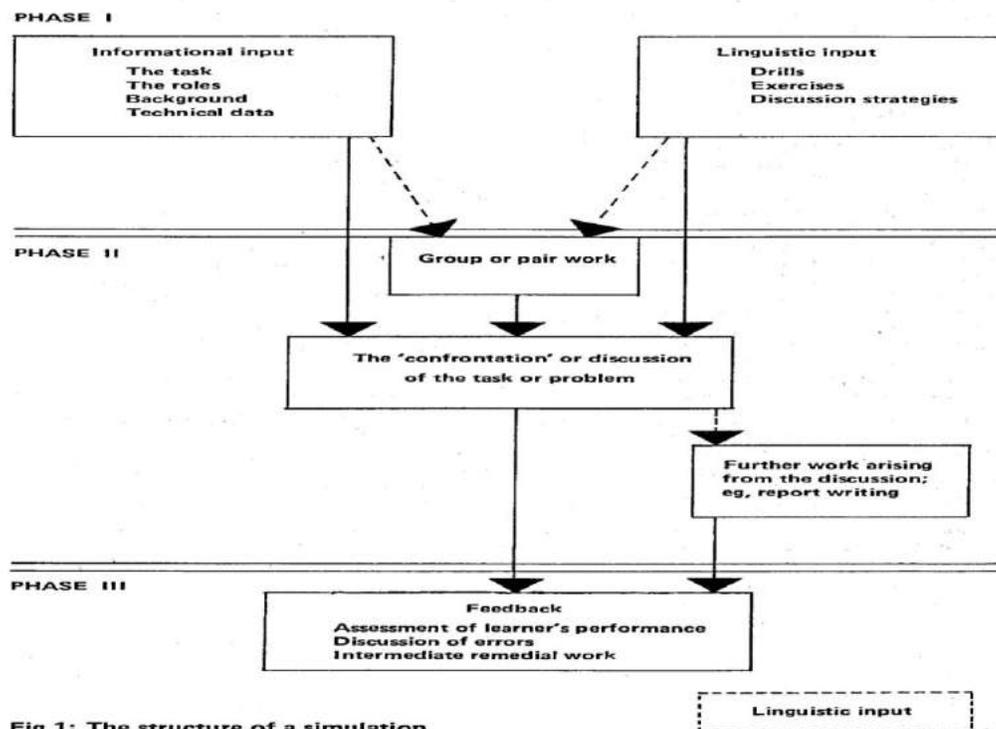
The next phase is the discussion of the problem. The learners are now expected to discuss what they are going to say and what vocabulary they are going to use together with their team members. The discussion part has to be held only in the target language, not in their native language as it is vital to develop their speaking competence.


Fig 1: The structure of a simulation

Finally, the last stage includes teacher's feedback and evaluation. It is utterly vital to provide suitable constructive feedback which is aimed at correcting learners' errors and assessing their work according to certain criteria of assessment. What is the final outcome? First of all, learners are exposed to authentic language use; secondly, learners are prepared for using their acquired knowledge and skills in practice immediately and finally, such performances are a good way to keep learners interacting with one another and involved in the lesson.

As a very valuable illustration of the use of role play and simulation activities in class, we can mention the research that has been carried out by Ramlah A. Ampatuan (Role Play As An Approach In Developing Students' Communicative Competence, 2016) in which 14 freshman students doing their bachelor's degree were involved. The research was conducted in the form of an interview where students answered certain questions regarding their views on their achievement after role-play activities. 78 % of the students claimed that their speaking skills were considerably improved after the role-play activities and 20 % of the students stated that they were more participative and felt more eager to take part in the dialogue as they seemed to be

fun. 10% of the students mentioned that role-playing was an effective way of boosting their confidence.

DISCUSSION

Based on the above provided information and research results, it can be concluded that role-playing and simulation activities are highly effective in developing learners' language skills and preparing them for real-life language use in their career. The results of the research also show that role play and simulation activities are highly productive in helping learners as they boost learners' confidence and develop their team-working skills. In addition, it is possible to create learner-friendly environment with the help of such activities. These tasks are helpful in motivating learners to be more eager users of the language as a significant number of learners believe that this method of practicing is really enjoyable for them. Role playing gives learners ample opportunities to fully demonstrate all their language competence and communicative skills making them proficient speakers in their field of work.

CONCLUSION

Taking into account all the research results and the performance of learners, it can be concluded that both simulation and role play activities are considerably useful in creating a learner-friendly atmosphere where ESP students can easily practice their language skills, use their acquired knowledge in a proper context. Answering the questions brought forward in the introduction part, first of all, role play and simulation activities are rather different as in the simulation activities learners are encouraged to perform a real-life situation as opposed to role-play activities which include performing events which are not real.

Regarding the second question, the benefits of using such interactive are: firstly, they enable learners to be more fluent speakers; secondly, students can get accustomed to using their specialty-related terms and phrases in an authentic environment and finally learners are more interactive and involved in their learning process.

As for the difficulties, instructors face while implementing these activities, one of them is teachers may find it hard to equally involve all the students and second challenge is to direct learners in a way which gives them more freedom and reduced tension. When teachers are too authoritarian, learners may feel less confident and interested in what they are doing.

LEXICAL CONCEPTS IN PRIMARY SCHOOL STUDENTS METHOD AND GENERATION OF THE SYSTEM TECHNOLOGIES

Kholikova Parvina Abdumalik qizi*

*II Year Master's Degree,
Education Theory and Methods of Education,
Primary Education, Termez State University,
UZBEKISTAN

ABSTRACT

Primary education plays an important role in the future development of students. Primary education is constantly stored in the mind of the student, and its effectiveness depends on how effectively the education is absorbed into the mind of the student. Incorporating lexical concepts into a child's mind is like a mother teaching her child her first words. Although it is difficult to imagine a system of lexical concepts in primary education, it can be done through a variety of methods and technologies.

KEYWORDS: *Lexical Concepts, Method, Technology, Education, Teacher, Student, Result, Primary Education, Fun Games, Life Events*

INTRODUTION

Teaching a system of lexical concepts in primary education requires great skill from the teacher. Not only lexical concepts, but every stage of primary education requires great skill from the teacher. It places a great responsibility on teachers. Teachers need to have a clear understanding of these children's little psychology, and all of this can be communicated to children without disruption. Great educational work should be done with children, parents, the community, as well as defectologists, psychologists. It also needs the support of all leaders. The teaching of lexical concepts in primary school, in addition to developing the main types of speech activities in students, involves addressing the following important issues: knowledge of the morphemic structure and word formation of words, the lexical-semantic group of words, the rules of correct spelling of the Uzbek language and the use of punctuation. This knowledge imparted serves to enhance students 'speech. The content and methods of mother tongue teaching should help

students to acquire thorough knowledge, skills and competencies to the extent required by the program.

It requires teaching the student, enriching the content of each lesson, incorporating interesting lessons into the teaching process. Psychologists have found that elementary school teachers are less likely to meditate on a variety of mental experiences and retain the knowledge they have acquired through independent work than they have been through a teacher's simple explanation. Because the student works on independent exercises and imagines a lot of learning materials based on his previous knowledge. Compares similar events. Makes little judgment and makes independent judgments. According to the teachers, the student's thinking activity reduces the correct answer without starting to work. When faced with similar events, it becomes difficult to put into practice the knowledge imparted by the teacher.

The organization of lessons on the basis of pedagogical technologies teaches primary school students to have a conscious attitude to the activities they do less. The student uses his / her voluntary attention during each lesson, strives to progress in the lesson, to win. School plays an important role in a child's life. During this period, he acquires knowledge about the environment, society and human labor, school education. It is not easy for a child who has been busy for a month yesterday to suddenly adapt to the internal rules of the school, to attend classes in a timely manner in accordance with the established procedure. As a result, small school-age children are very active in moon-related classes. We, the teachers, should take this into account and include the elements of the moon in the lessons and use them effectively for educational purposes. It is necessary to rely on and nurture them in order to achieve the reduction of knowledge intended for primary school students. In this regard, the role of modern pedagogical technologies is very important. "Imagine a child becomes a schoolboy after a certain practical and mental preparation. His mission will change. He trains an average of 4 hours a night. Yesterday's more playful child will be interacting with the teacher today, concentrating for 40-45 minutes. Accepts and comprehends learning information. At that time, if the teacher is careless and irresponsible, if this situation is in line with the situation of the parents, if the parents are unable to help, if they "do not have time" to control, then those students become confusing, disorderly students. A selfless teacher, who is a master of his profession, captures the students at this time, earns their love and trust: arouses interest in the lessons.

 The use of modern pedagogical technology in the primary school answers the question of how and in what ways students will be effective in teaching. It has its own system, which preserves the sequence, interdependence, integrity of the components. In short, a new approach to the educational process, the introduction of creativity, the effectiveness of education will rise to a new level. It awakens in the student the inner confidence and desire to know that I need it and that I am able to apply it to life.

The use of different methods in the teaching process not only increases the effectiveness of the lesson, but also increases the activity of students. It encourages them to think independently for creativity. For example, in the process of creating an idea of a system of lexical concepts, the use of the following Excess Exercise will help students to reinforce the lesson.

river	sea	lion
world	giraffe	tiger
sky	ground	journal

Students find and mark words that are not relevant. This will further strengthen the topic of lexical structures.

Educational game of remembering words and events

The students are divided into small groups and each group chooses one word.

- The game begins with the word tree, cotton. There are words beginning with the letters d, p, such as dovuchcha, danak, drum, circle, hawthorn, cotton, bowl, desk, tomato.

- To form a word by adding da-, pax-syllable to the first syllable of the words tree, cotton: dali, dada, pakhtakor, pakhtazor ....

- Find words that match the given words: cotton, board, mine, time, tree, cork.

- Remember all the words related to the given words: cotton, down, seeds, cotton, cocoon; Tree, leaf, flower, fruit, seed, bud, root, root

- Choose one of the given words: cotton, letter, tree, danger

- Remembering an event related to the given words, trying to weave a story, a fairy tale, an adventure.

Founder game

8. Fox, mouse, delicious, bread, shower, escape, tail, walnut

9. Palm, brown, hair, bow, dream, sadness, river, sky

10. Taxi, movie, money, page, ticket, embarrassed, scene

11. Hunter, ice cream, wolf, zoo, cage, tree

12. Shoes, ball, man, mirror, fairy tale, stone

In the presence of the given words and find the title to it.

The teacher must be creative, keep pace with the times. We need to enrich each lesson with news and awaken in students a sense of belonging. Only then will we, the teachers, be able to increase the effectiveness of our lessons.

 In short, in the process of applying advanced technologies, interactive methods to primary school lessons, we fill in the gaps in students' knowledge, skills and abilities. Since primary education plays an important role in student development, we need to pay special attention to its effectiveness. Primary education determines the future of the student.

ISSUES ON JUDICIAL PROTECTION OF THE RIGHT OF MIGRANT CHILDREN

Erkin Khozhiev*

*The Academy of the General Prosecutor's Office,
Republic of UZBEKISTAN

ABSTRACT

The article discusses the history of the migration of children, the peculiarities and socio-legal foundations of child migration, the protection of the rights of the child in court. In recent years, the country has further improved the protection of the rights and interests of participants in labor migration, providing them with the necessary legal, social and material support. Nowadays, the protection of the rights of migrant children remains one of the constant challenges. In particular, according to 2019 data, about 13 million international migrant children around the world live in Asian countries.

KEYWORDS: *Migration, Child Migration, Migrant, Legal Representative, Work Migration, Trading Of Children, Children's Rights.*

INTRODUCTION

While the process of globalization is developing in the world, the need for radically improve the institutional and legal framework for the protection of the rights and legitimate interests of children and their development into a harmoniously developed generation is growing. Every state strives to protect the rights of children and ensure that they receive an education and live in peace and without violence.

Child labor, especially in the process of migration, is being developed around the world to attract them as free labor. This requires serious attention to adult migration. During child migration or the migration process, child movement usually consists of children between the ages of 3 and 18 (usually between the ages of 7 and 10) who move across borders within or outside the country with or without a parent or legal guardian. These actions are carried out with or without official documents.

Child migration is not one of the problems that arises today. Historical sources testify that child migration began to develop in the UK in the early 17th century.

From 1618 to1967, 150,000 poor children were sent abroad without parental supervision to begin a new life through British colonies under the care of guardians or charities.[1]

Most of them were children between the ages of 8 and 14 years. Some were even younger. For the use of children as labor, they were sent mainly to the United States, and later to countries such as Australia, New Zealand, and Canada. Children were given to white-collar households as low-paid servants and engaged in other activities.

In Britain, where child migration flourished, there were more than 50 charities at the time. Some of them were only set up to collect orphans or street children and send them abroad. For example, from 1832 to 1841, the Friends of Children charity sent more than 1,150 children to the United States (to the city Cape Cod) as a labor force.[2]

Charities have funded child migration at great expense and have also partnered with some government agencies. The Poverty Act of 1850 allowed guardians in England and Wales to finance the departure of their dependent children as migrants. All activities related to child migration are organized by charitable agencies and these agencies are provided with children and funds by guardians.

Victims of child migration consisted of consistently low-income, undisciplined, abandoned, or orphaned children, as well as children from poor families. The neglect of children has also led to an increase in crime among them. In 1853 alone, about 1,500 boys and girls over the age of 7 were convicted. Later, after the middle of the twentieth century, the British government began to combat child migration. However, at this time, child migration was well developed in other European countries, Africa and Asia. At the same time, the international community began to pay more attention to the protection of children's rights.

The development of child migration can be linked to several factors. These include the fact that children do not fully understand their rights, that their labor is easier to use than that of adults, and that they are a cheap labor force, that the costs to children are not high, and so on.

There were also many cases of labor migrants not registering and not having citizenship when their children were born. This has led to their undocumented movement and many problems with the law. For example, when they are arrested for an offense or crime, they are separated from their parents. In practice, in some cases, children were sent home alone.

Children need legal protection both before and after birth. It is also easy for them to become victims of crime because of their vulnerability. Due to the presence of mass, irregular migration across the country, along with its political, demographic and economic consequences, the sanitary-epidemiological situation is deteriorating. Unfortunately, the main stakeholder in this situation is children.

Internationally, the countries receiving migrants are the United States, European countries, Latin America, Southeast Asia, South Africa, Israel, and almost 70% of the labor force in these countries is met by migrants. India, Pakistan, Algeria, Mexico, Ireland, Turkey and the CIS are the largest suppliers of labor to the global labor market.[3] It is pity that 38 millions of children are becoming active participants in this process.[4]

Nowadays, the protection of the rights of migrant children remains one of the constant challenges. In particular, according to 2019 data, about 13 million international migrant children around the world live in Asian countries. While this represents about 40 per cent of all migrant children, the proportion of migrant children in Africa is around 20-26 per cent.[5]

Unfortunately, migrant children face many challenges in education, health and other areas. In particular, it can be observed that they are subjected to various negative consequences as a result of sexual violence, poor working conditions, and neglecting.

As an equal member of the International Organization for Migration, our country has undertaken a number of obligations aimed at protecting the social rights of migrants.

In particular, in order to protect the rights and interests of children and combat child migration, the UN adopted the International Convention on the Rights of the Child on November 20, 1989. It sets out the personal and socio-economic rights of children, the principles of their provision and protection. States that have ratified this Convention have a number of international legal obligations to ensure the rights and freedoms of the child. In particular, independent Uzbekistan ratified the Convention in 1992 and assumed international obligations in this area. In accordance with the provisions of the Convention, the Republic of Uzbekistan also regularly reports to the UN Committee on the Rights of the Child on the implementation of the Convention.

The growing scale of migration processes requires improved protection of the interests of migrants and their families, especially children. On December 18, 1990, the UN General Assembly adopted Resolution 45/158, the International Convention for the Protection of the Rights of All Migrant Workers and Members of Their Families.

The Law [6] of the Republic of Uzbekistan "On Guarantees of the Rights of the Child" adopted on January 7, 2008 is of special importance in this area. The law strengthened the basic concepts of child protection. According to it, the "child"- a person under the age of eighteen (adulthood), and the legal representatives of the child - parents, adoptive parents, guardians, trustees.

In addition to this, the current legislation provides for the protection of the rights, freedoms and legitimate interests of the child, protection of the life and health of the child, prevention of discrimination, protection of the honor and dignity of the child, equality of rights and opportunities, ensuring, promoting the physical, intellectual, spiritual and moral development of children, the formation of legal consciousness and legal culture in the child, and so on.

The priorities of state policy in this area fully comply with the requirements of the International Convention on the Rights of the Child. In particular, in accordance with the norms of international law, every child has the right to liberty, security of person, inviolability of the home, and they must be protected from encroachment on their honor and dignity, from unlawful interference in their private life.

At the same time, according to the law of the Republic of Uzbekistan "on the inclusion of the Republic of Uzbekistan in the Convention on the rights of the Child, trade in children, prostitution and child pornography (New York, May 25, 2000)" [7] dated December 11, 2008 of the Republic of Uzbekistan in the Convention on the rights of the Child, trade in children, prostitution Convention on the rights of the child, in accordance with the law" on the inclusion of children in armed conflicts in the Optional Protocol to the convention on the rights of the Child " (New York, May 25, 2000), [8] Uzbekistan joined the Optional Protocol to the Convention on

the rights of the child on the sale of children, child prostitution and child pornography (New York, May 25, 2000).

These rules are mandatory for Uzbekistan, and according to Article 10 of the Law on Guarantees of the Rights of the Child, the state must ensure the inviolability of the child's identity, home, correspondence and protect the child from all forms of exploitation and violence, including physical, mental and sexual abuse, to protect them from torture or other cruel, inhuman or degrading treatment, sexual harassment, delinquency or engaging in antisocial behavior.

Every child is guaranteed the right to judicial protection of his rights, freedoms and legitimate interests, the right to appeal against illegal decisions of state bodies, citizens' self-government bodies and non-governmental non-profit organizations, illegal actions (inaction) of their officials.

The protection of the rights, freedoms and legitimate interests of the child is carried out by his parents; person's acting as parents, and in cases provided by law, the guardianship and trusteeship authority, the prosecutor, the court.

Comprehensive implementation of the requirements of the Convention on the Rights of the Child, guaranteeing the rights of children under the Constitution and laws of the Republic of Uzbekistan, their development into a physically, intellectually, spiritually and spiritually mature generation, actions on five priority areas of development of the Republic of Uzbekistan in 2017-2021 In order to ensure the implementation of the tasks set out in the strategy, the President of the Republic of Uzbekistan adopted Resolution [9] No.PR-4296 of April 22, 2019 "On additional measures to further strengthen the guarantees of the rights of the child". This Resolution guarantees the provision of all social services to children, regardless of their place of registration and citizenship, guarantees full consideration of children's direct appeals to public authorities and does not allow such appeals to be dismissed on the grounds that the child is incapacitated. The plaintiff who applied with the application was exempted from paying state duties and other charges.

In recent years, the country has further improved the protection of the rights and interests of participants in labor migration, providing them with the necessary legal, social and material support. On August 20, 2019 the President of the Republic of Uzbekistan signed a decree [10] "On protection of citizens of the Republic of Uzbekistan and their families." This document, in addition to effectively ensuring the protection of the rights and interests of citizens going abroad for temporary work, also sets a number of tasks to create decent living and working conditions for migrant workers and their families.

At the same time, the Resolution [11] of the President of the Republic of Uzbekistan dated July 5, 2018 No PP-3839 "On additional measures to further improve the system of external labor migration of the Republic of Uzbekistan" under the Ministry of Employment and Labor Relations - A fund was established to support and protect their rights and interests.

The Fund provides legal and social protection, as well as financial assistance to citizens who have suffered from violence, forced labor and discrimination, labor and other rights violations, severe financial difficulties and lack of identity documents, living expenses during their employment abroad;

To provide medical services to citizens in need of medical care due to injuries or accidents during labor migration, provided that these citizens are reimbursed in the event of inability to pay for medical services at the expense of migrant workers;

To bring the bodies of citizens who died during labor migration outside the republic, as well as citizens who were injured or seriously injured during work abroad, in cases approved by the relevant institutions of the state of employment;

Citizens who were previously sent abroad for work in an organized manner and deported from the territory of the country of employment in violation of the legislation of the country of employment, provided that the funds paid at the expense of these citizens, as well as agreed working conditions by foreign employers return of unsecured citizens and perform other duties. At the same time, the fund must provide comprehensive social and legal protection not only for senior citizens, but also for children.

If the rights, freedoms and legitimate interests of children are violated, their interests will be protected by the court in any case. If the rights and interests of children are violated as a result of illegal decisions (actions) of state bodies, citizens' self-government bodies and non-governmental non-profit organizations, in such cases they shall apply to the administrative courts to protect their rights is guaranteed by the Code (MSIYutK). [12]

Rely on Article 36 of the Code of Civil Procedure, a minor may legally exercise his procedural rights and fulfill his procedural obligations in court if he is legally married before the age of eighteen - from the time of marriage, as well as if he is declared legally competent (emancipation). In additionally, the rights, freedoms and legally protected interests of a minor between the ages of fourteen and eighteen, as well as a citizen with limited legal capacity, are represented in court by their legal representatives that is parents, adoptive parents, guardians, educators, medical institutions or others are protected by the administration of similar institutions. If necessary, the court may involve the juvenile himself or a citizen with disabilities in such cases.

Under civil procedural law, minors are guaranteed the right to personal protection of their rights and legally protected interests in court in cases of alimony from parents, as well as in cases arising from employment-related legal relations and agreements on the management of wages or other income.

Moreover, the rights and interests of children are protected not only by administrative or civil courts, but also by the relevant authorities in criminal courts in cases of trafficking in persons.

To conclude, in order to protect the rights and interests of children and combat child migration, based on the International Convention on the Rights of the Child, Uzbekistan has introduced the principles of personal and socio-economic rights of children and their protection.

Furthermore, Uzbekistan has created a legal framework for the harmonious development of children, protection of their rights and interests as well as, adopted a wide range of legislation defining the mechanisms for its implementation, and effective control over the activities of responsible state bodies and non-governmental organizations and citizens in the protection of children's rights has been established.

ABSTRACT

The most common form of joint damage is osteoarthritis caused by an imbalance in the processes of repair and degradation in the particular cartilage. In the structure of osteoarthritis, a special place belongs to the defeat of the joints of the lower extremities, in particular the knee joints, which bear the main weight load. The use of hyaluronic acid preparations for intra-articular injections has a positive effect on synovial homeostasis. Provides restoration of lubricating and shock-absorbing properties of synovial fluid.

KEYWORDS: *Deforming Osteoarthritis Of The Knee Joint, Hyaluronic Acid, Renewal Fluid.*

INTRODUCTION

Diseases of the musculoskeletal system and connective tissue are considered all over the world as one of the most common pathologies in modern society, leading to temporary and permanent disability [1,2]. The most common diseases of the musculoskeletal system are degenerative lesions that affect both the structures of the joint itself (hyaline cartilage, subchondral bone) and periarticular structures (entheses, tendons, bursa) [3,4]. The most common form of joint damage is osteoarthritis [5] due to an imbalance in the processes of repair and degradation in the articular cartilage. Osteoarthritis causes a deterioration in the quality of life, leading to early disability. In the structure of osteoarthritis, a special place belongs to the defeat of the joints of the lower extremities, in particular the knee joints, bearing the main weight load. According to literature data, 80-97% of the population over 60 years old suffers from osteoarthritis. In older age groups, the incidence of osteoarthritis increases. So, according to the Framingham and a number of other studies, among the population over the age of 26, symptomatic gonarthrosis occurs in 5%, at the age of 45 and older - in 16.7%, at the age of 60 and older - in 12.1%. at the age of 70 years and older - in 11%, and in all age groups the disease develops in women 1.2-1.4 times more often

than in men [6]. The demand for medical help in patients with osteoarthritis (OA) is due to: severe pain syndrome and the presence of functional disorders. The appearance of pain in OA can be due to various reasons: synovitis, trabecular microfractures, within medullary hypertension, pressure on the exposed subchondral bone, spasm of the periarticular muscles, degenerative changes in the intra-articular ligaments, the presence of osteophytes [3]. Progressive movement disorders are mainly associated with knee and hip joint involvement. The main link in the pathogenesis of OA is cartilage degeneration. In this case, the "wear" of the cartilage occurs as a result of an imbalance between anabolic and catabolic processes in the cartilage tissue under load. Despite the proven effectiveness of the systemic use of slow-acting chondroprotective drugs (chondroitin and glucosamine), no less important is the method of intra-articular administration of hyaluronic acid (HA) drugs directly into the affected joint, which allows the effect to be carried out directly in the internal environment of the joint. aimed at hyaline cartilage [7]. Treatment of articular syndrome in OA is aimed at reducing pain and suppressing active inflammation in the joints, reducing the risk of exacerbations and involvement of other joints in the process, reducing trophic disorders, improving local blood flow, preventing muscle wasting, deformation and destruction of joints, reducing the severity of functional insufficiency, slowing down and prevention of its progression and disability of patients. Local methods of treatment: application therapy with ointments and gels, local treatment with physical factors, local injection (intra-articular and periarticular) therapy - directly affect the lesion, reduce the need for systemically prescribed drugs and are well combined with systemic treatment. The use of hyaluronic acid preparations for intra-articular injections has a positive effect on synovial homeostasis. Provides restoration of lubricating and shock-absorbing properties of synovial fluid, protection of articular cartilage from mechanical damage, restoration of the ability of the joint to produce endogenous hyaluronate.Hyaluronic acid derivatives slow down the destruction of articular cartilage, have a rapid symptomatic effect: they reduce pain and expand the range of motion [1].

Purpose of the study - To study the results of treatment with a preparation of hyaluronic acid for gonarthrosis of I-II degrees.

Materials and research method

One of the promising drugs for the treatment of gonarthrosis is HyalurChondro, which is a gel with PH 6.8-7.2 and sodium hyaluronate concentration - 1%, molecular weight> 3.0 million DA, viscosity 500 mlPa / s, T degradation 150 h. Contraindication for its introduction is osteoarthritis III-IV X-ray stage according to Kellgren-Lawrence.

Fig. 1. Intra-articular hyaluronate injection technique

The therapeutic effect of hyaluronic acid is provided only when administered strictly into the joint cavity. Figure 1 shows the technique of intra-articular administration of the drug into the knee joint: anterolateral or anteromedial administration of GC preparations is preferred, the risk of trauma to the articular cartilage decreases, the risk of developing reactive synovitis decreases, and reliable intra-articular administration of the drug is achieved, however, the administration of glucocorticoids by anterior approach is not desirable. The main active ingredients of the gel "HyaluromChondro" are sodium hyaluronate 60 mg and sodium chondroitin sulfate 90 mg.

Results and its discussion

The analysis of 232 cases of intra-articular injection of HyalurChondro into the knee joints was carried out. In all patients, the diagnosis of gonarthrosis was reliable and corresponded mainly to the second and third stages according to the Kellgren-Lawrence criteria. The study group included patients with primary and secondary OA as a result of inflammatory diseases of the joints and injuries. The ratio of men and women is 1: 5. HyaluromChondro was injected into the target joint once a week at a dose of 3 ml, the full course consisted of 3 injections. The tolerance of therapy was assessed and undesirable effects were detected when using the drug. Treatment efficacy was assessed using the WOMAC index, visual analogue scale (VAS) for pain at rest and during movement, as well as on the basis of the subjective conclusions of the doctor and patient. Dynamics of pain in knee joints according to VAS at rest and during movement before the start of therapy, after 1, 2 and 3 injections and 8 weeks after the end of therapy is shown in Fig. 2. After the first injection with HyalurChondro, the decrease in pain intensity corresponded to 17%, by the third injection, according to the patients, the pain decreased by more than 60%. This indicates an increase in the therapeutic effect with an increase in the total dose of the administered drug. A decrease in pain syndrome leads to an increase in the range of motion and an increase in patient activity. In 32 cases, the patients included in the study used walking aids (canes, crutches with elbow support). After 8 weeks of observation, it was reported that 14 people stopped using orthoses, which indicates an increase in functional capabilities during treatment with HyalurKhondro. The use of HyalurChondro led to an improvement in indicators on all WOMAC scales (Table 1). Objective data on the effectiveness of the treatment with

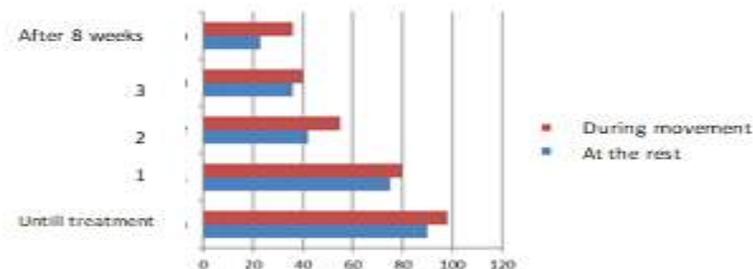
HyalurChondro were confirmed by the subjective assessment of patients. 8 weeks after the end of treatment, they were asked to retrospectively assess the dynamics of pain syndrome immediately after the therapy and after two months. In 83.4% of cases, patients highly rated the long-term results of the treatment (Table 1).


Fig 2. Dynamics of pain in the knee joints at rest and during movement, assessed by the VAS.

Table 1

Dynamics of the WOMAC index indicators.

Index	Beforetreat	Afterthe 3rd	After 8 weeks
Pain	187.5	62.53	65.25
Stiffness	83.55	33.86	34.28
Functionaldisorders	826.76	342.50	361.20

Table 2

Long-term results of treatment, according to the subjective assessment of patients.

The degree of pain change	Numberofpatients, n - 90
Painscompletelyregressed	13
Painshavedecreasedsignificantly	60
Painshavedecreasedslightly	10
Painspersisted	5
Thepainsintensified	2

It should be noted that HyalurChondro was used in patients with severe chronic long-term pain syndrome caused by inflammatory and degenerative diseases of the joints. In most patients, the pain syndrome was characterized by resistance to NSAID and paracetamol therapy. During the study, no serious adverse reactions were reported. Local secondary events in the form of pain at the injection site were recorded in 8 cases, redness was noted in 3 cases after injection. These side effects regressed on their own. In one case, synovitis developed after 1 injection, the patient dropped out of the study. In 4 cases, after the second injection, the occurrence of local swelling and increased pain was noted, which was regarded as synovitis and was stopped by the

appointment of NSAIDs, further therapy was continued. A general assessment of the tolerability of treatment with HyalurChondro is presented in table. 3.

Table 3

Evaluation of the tolerability of treatment with HyaluromChondro according to the doctor and the patient.

Portability	Patientscore, n-108	Physicianassessment, n-108
Excellent	54	72
Good	28	21
Satisfactory	22	12
Unsatisfactory	4	3

The discrepancy between the doctor's and the patient's assessments of tolerance by HyalurChondro is explained by the patient's vigilance before any invasive manipulations, as well as by the fact that local anesthesia was not performed with intra-articular administration of the drug. Pain relief when using hyaluronate is not recommended due to the possibility of its destruction.

USE OF MODERN MARKETING CONCEPTS IN AN INNOVATIVE ECONOMY

Umurzakova Kommuna Khursanovna*

ABSTRACT

The rapid introduction of modern innovative technologies in the economy, social and other spheres with the widespread use of scientific and technical achievements is an important condition for the rapid development of the Republic of Uzbekistan. Therefore, this article discusses the use of modern marketing concepts and their effectiveness.

KEYWORDS: *Economics, Marketing, Concept, Innovation, Information.*

INTRODUCTION

The rapid development of all spheres of society and state life requires the implementation of reforms based on modern innovative ideas, developments and technologies that will ensure rapid and quality progress of our country on the way to becoming one of the leaders of world civilization. [1]

Extensive work has been done in the country in the short term to create an innovation-oriented economy and create conditions for the widespread introduction of innovations.

One of the important steps in this direction was the establishment of a single state policy body in the field of innovation and scientific and technological development of the Republic, under which the Fund for Support of Innovative Development and Innovative Ideas was formed. [2]

The innovation process is closely related to a number of modern marketing concepts. These concepts are relationship marketing, internet marketing, and value creation together. Let's take a look at each of them and show the connection to the innovation process.

Communication marketing is global as an economic concept. This globalism is based on an objective fact - no two are the same buyer (regardless of market type: consumer or industry).

Ideally, the product should be created for individual requests. In the past, this was almost impossible. With the development of the productive forces, this task has become urgent.

Of course, when creating a new product, the company takes into account the average needs of one or more groups of customers. However, by creating a basic model, a firm should immediately see the prospect of product differentiation for the needs of small groups and individual customers. Relationship marketing for a company is, first of all, a new concept - individual marketing. Table 1.5 shows data comparing the characteristics of mass marketing and "individual" marketing [1].

Comparison of mass marketing with individual marketing

Mass marketing	One-on-one marketing
The average buyer	Single buyer
Customer privacy	Characteristics of buyers
Standart buyer	Special marketing offer
Mass production	Special production
Mass distribution	Individual distribution
Mass advertisement	Private appeal
Mass stimulating	Individual privilege
One-way communication	Two-way communication
Large-scale economy	Target economy
Portion of market	Customer share
All buyers	Potentially beneficial customers
Attraction of buyers	Customer retention

The need for the emergence of individual marketing stemmed directly from market demands - ever-increasing competition, a fierce struggle for every potential customer, customer demands

(in many respects, service growth from service provider to service quality) - these and many other factors have led to the creation of a customer-oriented business strategy.

In an avalanche-like growth environment that allows data storage and processing, it is critical to make a qualified choice to serve customers at the right time and in the right place in the chosen market area. An enterprise that does not have a monopoly in the market will inevitably face the problem of retaining customers. In modern market conditions, this task is becoming increasingly difficult, which means that the planning of real volumes and turnover is becoming a very serious problem. A well-structured, well-thought-out database that contains the most complete and detailed information about the client and the range of services provided to him, as well as tools for analyzing and planning the relationship with this client without a system, the retention function (other things being equal to competitors) is almost impossible.

One-on-one marketing is becoming really effective with the advent of modern information technology. The basis of modern information technology is the Internet. The Internet is especially important for companies. On the one hand, the Internet and information technology are the most important objects of entrepreneurship. In many countries around the world, a whole network of firms specializing in the production of software products has grown at different levels in relation to the Internet. On the other hand, information technology and the Internet have become tools of economic policy of firms, significantly increasing their competitiveness. The development of information technology, among which the Internet occupies one of the leading positions, the emergence and rapid growth of e-commerce has become the basis for a new direction in the modern marketing concept "

The term **"Internet marketing"** refers to the theory and methodology of organizing marketing activities in the hypermedia environment of the Internet.

The Internet has unique features that are significantly different from traditional marketing tools. One of the key features of the Internet environment is its hypermedia feature, which is characterized by high efficiency in presentation and assimilation, which significantly increases marketing opportunities in strengthening the relationship between businesses and consumers.

However, the role played by the Internet is not limited to communicative functions, but also includes the ability to make transactions, make purchases and make payments, which gives it the characteristics of the global electronic market.

Considering the prospects for the development of the innovation process leads to an interesting conclusion. In the near future, the buyer, the consumer of a new product, will play a significant role in the innovation process. One of the modern concepts of innovative marketing - co-creation of value - focuses on the role of the buyer as a co-producer, a co-producer of a new product. The practice of leading high-tech companies in the most developed markets demonstrates the growing importance of using this approach.

Examples include many Internet companies, such as the Google search engine, the social networking sites Facebook and MySpace, the electronic encyclopedia Wikipedia, the Amazon.com online store, and their analogues around the world. In many cases, these companies care not about the customer's role as a customer, but about the customer's role as a user. Most of these companies allow you to design a consumed product or service independently, while others involve customers in the process of co-creating the product. For example, users are the creators

of Wikipedia pages themselves; Using Amazon.com's Kindle, users can download any of the 290,000 books in real time, and many of Google's services are set up automatically and manually for a specific user. Such companies create business models. Many examples can be found in the real sector of the economy, although this process is most clearly expressed in the service sector.

Creating value together with consumers is the process of creating, developing a product or service in which the customer plays an active role, forming an offer or even creating a product on its own, based on its needs, preferences, goals and objectives.

We highlight several levels of consumer engagement in the process of co-creation or co-production. The first level is self-service, when a part of the production process is transferred to the consumer, such a step is positively evaluated (for example, the customer assembles the necessary computer configuration from the provided blocks and nodes). One of the best examples of furniture production and manufacturing is the Swedish company IKEA. Many new furniture models have been offered by the buyers themselves. The firm specializes in self-service, self-delivery, self-assembly of furniture, and so on. actively promotes his ideas. The second level is the consumer's independent choice of options offered by the manufacturer to solve a particular problem (for example, the choice of the passenger car buyer or the call center of a large bank where consumers work with an automated system). The third level is the participation of the consumer in the creation (development) of the product (for example, direct ordering of the options (parameters) required by the consumer or customization of the service provided in real time). This degree is fully implemented in the **Quality Function Deployment (QFD) methodology.**

According to leading researchers, value creation should be actively used in identifying the needs and desires of the consumer in co-creation. This approach does not contradict the general rule, that is, consumers have always chosen the offer that is most valuable to them. The logic of innovative marketing is based on the logic of improving important and valuable features for smaller and smaller segments of an increasingly evolving product. Creating value together means that the consumer creates what he or she wants, and the cost of producing that product can be lower because typically buyers want less than they receive and companies don't have to include all possible features. Constantly adapting and improving features for an increasingly small segment requires an expectation from an innovative marketing manager.

The business models of innovative companies aimed at gaining a competitive advantage in the future should involve consumers in creating shared value.

The economic model of the society of the future should work on the principles of the concept of value creation, which should be as innovative as possible.

The general scheme of operation of the new economic model is as follows:

1) Universities, scientific organizations create a scientific basis for the production of new products;

2) large companies with maximum productivity produce the main components of future goods (parts, blocks, assemblies, etc.);

3) many small firms that employ a large number of people adapt (complete) the product to the needs of small groups of buyers (small market segments);

4) each individual is engaged in the delivery of the product to personal needs, making maximum use of their creative potential;

5) state institutions ultimately coordinate and encourage the activities of the creative innovation process of all other participants aimed at the formation and development of the personality of each individual.

According to this scheme, the main labor costs occur in the field of small business and individual labor activity. The main goal will be the maximum individualization of goods for the needs of each individual, which will provide broad employment of the population, the creative nature of labor. The product is designed so that everyone has the maximum opportunity to participate in the creation of the final version of the product in accordance with their physiological characteristics, tastes and preferences. Such an approach to production will certainly affect the volume indicators, but the quality of the finished product will increase dramatically, the consumption of non-replaceable natural resources will decrease, and the level of environmental pollution will decrease.

The situation described in terms of the three-spiral theory of innovative development allows us to draw conclusions about the emergence of the fourth spiral in the new economic environment. And this spiral becomes the creative activity of the human consumer in co-creation, co-production for individual needs. The classical model includes three elements: universities (science), business, and government. Universities create ideas, the government creates the regulatory framework, provides business resources. The concept of the fourth spiral is schematically presented in the table.

TABLE 1.6 THE CONCEPT OF THE "FOURTH SPIRAL"

Country	Big bussiness	Small bussiness	Customer
Science + education	Science +education	Science	Private creativity
Fundamental research and global innovation. Encouraging innovative processes at all levels	Development of innovations at the level of basic models. Serial production of basic elements for high-tech products	The first type of small innovative enterprise: the development of successful innovations. The second type of small innovative enterprise: a) customer needs study (B2B; B2C); b) an individual	The object of research is this need. Consciously formulate the query. Product improvement for personal needs.

		Analysis of goods for the needs of small segments and individual buyers; c) after-sales service that is not available to the consumer	Co-production of goods. Perform possible service functions

As you can see, small innovative companies play a big role in the proposed scheme. There are two types of small innovative firms. The first round focuses on developing the highest level of innovation. They are called small innovative enterprises of the first type. They deal with developments that precede the customer's expected need. It will be necessary to shape the need for the created product. But there are many other companies whose development is characterized by a low level of innovation, individualization of key innovations (involvement of technology) for small segments of the market and the needs of individual buyers. They can be called the second type of small innovative enterprises. The main functions of this type of enterprise are:

1) Study of customer needs;

2) individualization of goods for the needs of small segments and individual buyers (low level of innovation);

3) after-sales service that is not available to the consumer himself.

The work of a small innovative firm based on the principles of the concept of co-creation of value means:

• a dialogue that combines interactivity, mutual understanding and a willingness on both sides to act (firm, client);

• access of consumers to information, resources and technologies at various points of interaction;

• assessing risks and informing consumers about them so that they can consciously take some of the risks for themselves;

• Transparency of information needed to build trust between individuals and organizations.

These conditions ensure a high quality of stakeholder interaction in creating value together. Using this approach, a small company can:

• Involvement of marketing participants in the process of creating an "ideal" product for the consumer (buyer);

• Involve shareholders in the process of formulating the company's strategic goals and decision-making, revealing what is really important for its owners;

• minimizing risks by using the powers (knowledge, skills and experience) of all participants in the marketing network;

• Gain experience in creating value in the operational activities of participants in the marketing network.

There are a number of reasons why small companies operating in a technically complex product market work together to create value for the consumer who acts as both a buyer and a participant: the uncertainty and variability of the external environment, which tends to globalize.

The peculiarity of the sale of technically complex products is that their design, production and commissioning is carried out with the direct participation of consumers (customer), which can be directly or indirectly (through the general contractor).) interacts with many counterparties. Thus, a marketing network is formed around the customer company, which is characterized by a large number of contacts between its participants and a high level of active, constructive interaction within the process of creating value together. Each network participant is both a value consumer and a value-added producer for the other participant in the network, up to the consumer. At the same time, the resources of each company are used to develop key competencies related to the formation of unique value added for consumers.

Thus, we can conclude that the market of new technically complex products is a marketing network of companies, which is characterized by a large volume of interactions between participants at all stages of interaction in the process of creating joint value. Depending on the level of joint investment, the collaboration between companies can be a partnership or a contract to jointly create value added to the marketing network. If the client-company performs the functions of the general contractor, then the efficiency of joint value creation will increase due to the intensive communication between the participants of the marketing network. This means that large innovation-oriented companies should not manage the use of value-added concept tools.

ABSTRACT

The article is devoted to certain moments of Indian-Uzbek relations in the field of culture, in particular, music, memories of the attitude of the people of Uzbekistan to Indian cinema, love for Indian actors, music and dance. History of friendly relations between the two countries, cultural influences, importance in the development of these relations; The great silk road and interest in this topic at the present time. The authors talk about individual events that took place in the capital of Uzbekistan, Tashkent, in which they themselves took part.

KEYWORDS: *The Great Silk Road, Historical And Cultural Ties, Cooperation, Friendship, Art, Music, Indian Cinema.*

INTRODUCTION

Uzbekistan and India are linked by long-standing and constantly developing historical and cultural ties, common customs and traditions. Since ancient times, the peoples of Central Asia and India have had stable economic and cultural ties, they have always been in close contact, in direct communication. For a long time, the mutual influence of the cultures of Central Asia and India can be clearly seen in literature, ethics, philosophy, etc.

The friendly ties between our peoples go back millennia. As a result of the passage of the Great Silk Road through the territories of Uzbekistan and India, not only trade and economic, but also

cultural exchanges took place. During the years of independence, these relationships have been filled with new content. Our peoples proudly talk about the history and heritage received from the Baburids, the current fruitful cooperation.

Main part

The authors of this article are from different generations, but interest in Indian cinema, music, literature, fine and applied arts remains unchanged. The older generation watched Indian films with fanatical interest, memorized the names of the actors who starred in them, collected their photographs and never stopped singing Indian songs. It loved the great actors of Indian cinema such as Nargis, Raj Kapoor, Vijantimala, Dilip Kumar, and still does. The younger generation has more temptations, information horizons have expanded, the vectors of interests have somewhat shifted, but the love for Indian cinema, which was passed down from generation to generation, remained.

Our people loved and love to read the works of Indian poets and writers, and our poets and writers, the best representatives of our culture and art, wrote and write with enthusiasm about this legendary country. In the 60s of the last century, the famous Uzbek poetess, winner of the Jawaharlal Nehru Prize Zulfiya, inspired by her impressions of India, wrote the poem "Mushoira":

<div align="center">

When night falls on Indian soil

Having rest during the day

Passionate poetry will continue

In the circle of close friends ...

..... Oh beautiful, charming Indian evenings,

What magic was in your blue?

The thrill of the poet and listener

Merged into one soul in a tidal wave.

</div>

We ourselves, especially as people involved in music, listen to Indian melodies with love and interest. Unique: sometimes humorous, sometimes funny melodies in Indian songs give pleasure, take you into the arms of dreams. If until the 1980s we met with Indian artists only on the screen, then in 1982, thanks to the International Film Festival of Asia, Africa and Latin America held in Tashkent, one of the authors (Sharipova A.) had the opportunity to work directly with Indian artists.

We were amazed by the warm, friendly relations between the artists of the countries. The life-giving power of art inspired all performers. At the grand opening of this festival, performers from both countries performed a work by the great composer I.S. Bach.

It was at this festival that Amitabh Bachchan attended, who, thanks to the magic and power of his art, has today become an invaluable film star of Indian cinema and has taken a firm place in the hearts of millions of fans. At that time, he came to our capital with his wife and little son Abhishek, who today has become a favorite actor for many.

Amitabh Bachchan at that time was very popular with fans, playing noteworthy movie roles. But it was not known what miracles his son would perform as he walked alongside him. Yet his bright eyes, his penetrating gaze, gave hope for much. Today these hopes were justified, and Abhishek continues his father's work with dignity.

So, within the framework of the festival, a meeting with A. Bachchan took place on television. Until now, I am proud to remember my participation in this meeting as a musician and conversation. During the meeting, the actor spoke about himself, about the art of Indian cinema, and also sang a song. A. Sharipova accompanied him on the piano. Of course, Bachchan was not a great singer, but the slightly muffled voice coming from the depths of his heart was able to captivate anyone. In my opinion, it is no coincidence that it is called the "Voice of India". Then he asked the musician to accompany a simple peasant song. But even this simple music had the character and spirit of the Indian people. A. Bachchan managed to show during one program that he is extremely hardworking and a master of his craft. The actor took every detail seriously and made sure that even the smallest episode was filmed at an artistic level.

Today, in spite of the fact that so many years have passed, I still remember with excitement that meeting and conversation!

From left to right: Abhishek Bachchan, Amitabh Bachchan, Edward Kalandarov and Adiba

Sharipova during a rehearsal in Tashkent. 1982

During the period of independence, relations between Uzbekistan and India have reached a new level, and now our cooperation has expanded in all areas and has great prospects.

In 2006, the State Conservatory of Uzbekistan hosted "The GREAT SILK ROAD:yesterday, today, tomorrow" International Forum-Festival, the program of which consisted of the conference, the exhibition and the concert.

Within the framework of the Forum-Festival, the conference "The GREAT SILK ROAD as times go by" was held, in which representatives of Egypt (M.M. Mursi "Civilization of Ancient Egypt: from Laws to Art"), Armenia (Hamdamyanova J. "Life and Work of Komitas"),

Indonesia (A.H.Astapradja "Angklung"). Uzbekistan at the conference was represented by an archaeologist, academician of the Academy of Sciences of Uzbekistan Edward Rtveladze ("The Great Silk Road"), who in his speech spoke about the phenomenon of the Great Silk Road (GSR) and shared plans to create a book "The Great Indian Road: From the History of the Most Important Trade Roads of Eurasia" [4] and the musicologist I. Galushchenko ("Contemporary composer creativity of Uzbekistan in the context of the Great Silk Road").

At the conference from India, Dr. Joatsna Bakhshi (University of World Economy and Diplomacy, Tashkent, Republic of Uzbekistan) made a presentation "Culture and Traditions of the Great Silk Road: Study of Indo-Uzbek Relations" (J. Bakshi "Culture and Trade on Historic Silk Route: a stady in Indo-Uzbek ties").

The concert program included a dancer of the classical Indian dance "Kathak" - Dr. Ranjana Sarkar.

There were a lot of events held by the joint forces of the two states or dedicated to them, but we focus on those in which the authors were directly involved and were especially close to them in accordance with their professional interests.

On August 15, 2007, on the Day of the 60th anniversary of Indian independence, the musical and choreographic composition "TREE OF LIFE" was presented on the stage of the State Conservatory of Uzbekistan. The composition sounded the music of India and Uzbekistan. The concert program consisted of three parts:

"Cradle of Wisdom";

"The Birth of Beauty";

"Path to Truth"

The music "Dedication to Tagore"was commissioned to the Uzbek composer Mustafo Bafoev especially for this project (earlier M. Bafoev wrote music for R. Tagore's play "Mail", which was staged at the Uzbek Theater of Musical Drama and Comedy named Mukimi). The following performers took part in this composition: Adiba Sharipova (piano), Mustafo Bafoev (vocals), Kakhramon Bazarov (qashgar rubab), Alisher Sayfullaev (nai) and Stas Borisevich (percussion instruments). The choreographic component of the performance was attended by Lilia Sevastyanova's "Lik" troupe, puppet theater actors. A review of the event was presented in our leading, authoritative journal of the Academy of Arts of Uzbekistan "SAN'AT" (ART, ИСКУССТВО) that comes out in three languages - Uzbek, English, Russian.

Very often there are meetings of art workers of Uzbekistan, interested spectators with guests from India. One of these meetings was an evening at the Memorial Museum of the composer Mukhtar Ashrafi in Tashkent. The wife of the Ambassador Extraordinary and Plenipotentiary of India to Uzbekistan Kusum Tayal made a presentation "Museum - Ambassador of Peace". By the way, the meeting place was not chosen by chance - Mukhtar Ashrafi in 1971 for the ballet "Amulet of Love" was awarded the Jawaharlal Nehru International Prize. Communication, exchange of views, accumulated experience became the expected result for the organizers and participants of this evening. The presentation of the book "INDIA. Moods and Memories"with a dedication to one of the authors (A. Sharipova).

Discussion

The International Forum-Festival "GREAT SILK ROAD: yesterday, today, tomorrow", the musical and choreographic composition "TREE OF LIFE", an evening at the Memorial Museum of the composer Mukhtar Ashrafi in Tashkent were widely discussed in newspapers, journals and on the radio.

CONCLUSION

The cultures of India and Uzbekistan closely interact and complement each other. Interest in India, its outstanding people, culture is our steady trend. It seems to us that knowledge about science, culture, art of India is necessary for enlightenment and, in particular, musical education of the modern young generation of Uzbekistan. We have no doubt that there will be many more unforgettable meetings, joint events, for which we are always ready, and we are waiting with great interest and pleasure.

International cooperation in the field of science, culture and art is extremely necessary for the exchange of views, the development of the breadth of the outlook of the young generation, and acquaintance with the new achievements of colleagues from different countries. Festivals, conferences, concerts, exchange of delegations - the forms can be completely different and the main thing is not in the form, but in the content of the events. All cataclysms and unforeseen difficulties will sooner or later become history, and achievements in the field of science and art will remain for a long time.

PHRASEOLOGICAL UNITS OF "POLITICAL MEMORY" DESCRIBING THE STATE STRUCTURE OF FRANCE

Djafarova D.I.*

*PhD,
Head of the Department of French Philology,
Faculty of Foreign Philology, NUUz,
UZBEKISTAN

ABSTRACT

This article is devoted to the analysis of phraseological units representing "historical memory" and "political memory" in French. As a component of "historical memory," political memory includes people's knowledge of old forms of government. "Political memory" arises in the formation and development of the state style, government officials, political institutions and political relations.

INTRODUCTION

The life, creativity and activities of great historical figures in the history of the country play an important role in the formation of "historical memory". However, in the scientific literature, especially in the field of social and pedagogical research, practically no special attention has been paid to the effective use of this opportunity. Despite this, in historical literature they are recorded only as a chronological event of the past. We all know that "historical memory" and "political memory" are very close to each other and these two concepts complement and enrich.

As a component of "historical memory," political memory includes people's knowledge of old forms of government. "Political memory" arises in the formation and development of the state style, government officials, political institutions and political relations. The French philosopher and psychologist P. Nora argues that "among all the ancient European peoples, the French state is the oldest and most important in terms of domination" [Nora, 1999: 59].

According to the scientist, "France belongs to the type of nation-state", since the role of the engine in the creation of French unity belongs to the state [Nora,1999: 6].

According to V.K. Crisco, "the modern French are carried away by other peoples - this is one of the features of their national character." This is not surprising, since ambition usually develops in countries that have easily achieved many goals, including the French [Crisco, 2004: 200].

Psychologist P. Nora also includes "royal memory" in the types of national memory. According to him, "it is precisely the concepts of "political memory" that relate to the royal family, the way of life of kings, their ways of governing the state" [Nora, 1999: 6].

It is known from history that the period "The Forty Kings Who Created France" began in 987 with the death of Ludwig V and the accession of Hugo Capet, the beginning of the third and last dynasty like a the Capetian dynasty, which was considered the "backbone of the French monarchy" [Rois de France, 1989: 26] In addition, France has five republics and is currently ruled by the president of the fifth republic. France is truly a hotbed of historical facts, political governance, power and one of the countries that have experienced most of the processes of "political memory". However, in accordance with their memories of them for the last generation, it was the names of several French kings that were included in French phraseological units.

The first dynasty to rule in French history was the Merovingian dynasty, of which Clovis was the first king. He ruled from 481-511. In linguistics, there is a phraseological phrase "fils de Clovis" named after Clovis. The phrase translated means "son of Clovis", literally meaning "native French".

The second dynasty that ruled France was the Carolingian dynasty, and Charlemagne was one of the most famous representatives. The French refer to this king as Charlemagne. Charlemagne left a significant mark on French phraseology. This Frankish king ruled over an area of 1 million square kilometers, during his reign the Frankish state reached its peak of development, and the name of the state - France - arose during his reign [Rois de France, 1989: 16].

In French, there are many phraseological units associated with the name of Charlemagne. For example, etre sorti de la cote de Charlemagne in translation means "to get out of the ribs of Charlemagne", and the expression means "to be arrogant", "to be high-ranking".

The phrase Faire Charlemagne means "leave the game after defeat." Charlemagne conquered many lands, and his worst case was to return home in a state of despair, because it was a shame for the king to return home after such a situation. [Nazaryan, 1978: 49].

Among the French, people with large heels say that his legs are similar to those of Charles, that is, they very often use the phraseological unit il a des pieds de Charlemagne. In this phraseological unit, the phrase "his foot reached everywhere" was used. Because Charlemagne conquered many countries and visited many places.

The term Ecole De Charlemagne translates to "Charlemagne's school" and literally means "compulsory free school for the aristocracy." It is known that by order of Karl, schools for boys of all grades were created, and these schools had all the conditions, and they were free. Because

Karl repeatedly mentioned in his speech the role of youth in the development of the state [Bologna, 2007: 102-104].

The third dynasty in French history was called the Capetian dynasty, and this dynasty ruled from 978 to 1328. This dynasty is called the Capetian dynasty because it was founded by Hugo Kape. The last king of the empire was Charles IV, who was historically known by the nickname the Beautiful. It was later transferred from the Capetian dynasty to the Valois dynasty, and the members of this dynasty ruled from 1515 to 1547. In 1589, Henry IV was the first of the Capetian-Bourbon dynasty to ascend the throne. The royal Capetian dynasty was overthrown in 1848 after Louis Philippe.

Since the 10th century, the lily flower has been the symbol of the Capetian dynasty, therefore France is also called the "Kingdom of the lilies" - royami des lis [Kurasov, 1990: 33]. The phrase **Fleur De Lys**, a lily flower is a distorted version of the phrase Fleur de Luce, that is, Fleur de Louis is called the flower of Ludwik, the flower of Clovis [Hibou, no. 68:36]. Even today, the lily is considered very sacred to the French, and this flower is one of the most popular in France. In addition, the lily on the coat of arms embodies a yellow iris (iris pseudacorus) of a certain shape. Thanks to the iris flower, Chlodwick crossed the river to Vienna and in 507 won the Vuiet War of the Visigoths led by Allaric II. The name Chlodwick is called Hlodowig in French, and it has two bases: chlod means "glorious," "great," "great in rank," and wig, meaning war. Thus, Clovis means "one who receives glory in battle." Later, the name came from the name Ludwig Louis, which was usually called the kings of France.

In the course of our research, we witnessed that "political memory" is reflected in the phraseological units of the French language, as well as in the attitude of the French to national statehood and their participation in the formation of criteria in past and present politics.

In our opinion, phraseological units include concepts related to the reflection of political memory, political values and attitudes towards political leaders, authorities, politicians and political systems.

ABSTRACT

The development of the molecular theory of the liquid state of matter contributes to the solution of applied problems in many branches of science and technology. However, the molecular theory of the liquid state of matter lags far behind in its development from a similar theory of gases and solids. Acoustic studies of binary solutions in a wide range of concentration and temperature can make a great contribution to the study of the liquid state. This is important both from the point of view of the development of the molecular theory of the liquid state of matter, and with the constantly growing practical application of mixtures in a number of industries. We have investigated the hyperacoustic and thermodynamic parameters in solutions of aniline + nitrobenzene at various concentrations and temperatures using the Mandelstam - Brillouin light scattering spectra. It was found that in aniline + nitrobenzene solutions, with an increase in the proportion of aniline in the mixture, the hypersound velocity as a function of viscosity increases. In thermal studies, this relationship is also preserved. As the temperature rises, the viscosity of the liquid decreases and, accordingly, the speed and frequency of hyper sound decreases, and the adiabatic compressibility increases. The change in these values can be explained by a change in the structure and intermolecular interaction in the studied solutions with a change in the state parameters.

KEYWORDS: *Hyperacoustics, Hypersound, Dispersion, Isotropic Solution, Mandelstam-Brillouin, Temperature, Viscosity, Adiabatic Compressibility Frequency.*

INTRODUCTION

Depending on the thermal motion of the molecules in a liquid, density fluctuations and anisotropy arise. In addition, concentration fluctuations also appear in solutions. Fluctuations of anisotropy from fluctuations of deformations and fluctuations of orientations of anisotropic molecules [7,8].

The main characteristics of the scattered light - intensity, depolarization, spectral composition - essentially reflect the properties of the scattering medium [7, 8].

The intensity of the scattered light in liquids is proportional to the sum of the mean of the squares of fluctuations of the dielectric constant caused by fluctuations in pressure (or density p0), entropy s (or temperature T), anisotropy tensor s $_{ik}$, and in solutions and fluctuations in concentration

$$I \sim [\Delta\varepsilon^2(\rho) + \Delta\varepsilon^2(\varepsilon) + \Delta\varepsilon^2(s_{ik}) + \Delta\varepsilon^2(\sigma)] \qquad (1)$$

Light scattered by density and concentration fluctuations is completely polarized, and scattered light caused by anisotropy fluctuations is partially depolarized [7, 8].

Fluctuations of density, anisotropy, concentration are statistically independent. Laws changing various fluctuations in time are different, so these fluctuations, differently alter the spectral composition of the scattered light.

Light scattering due to concentration fluctuations and isobaric density fluctuations leads to the appearance of an unbiased line with a frequency ω_0 in the spectrum.

The development of the molecular theory of the liquid state of matter contributes to the solution of applied problems in many branches of science and technology. However, the molecular theory of the liquid state of matter lags far behind in its development from a similar theory of gases and solids.

Acoustic studies of binary solutions in a wide range of concentration and temperature can make a great contribution to the study of the liquid state. This is important both from the point of view of the development of the molecular theory of the liquid state of matter, and with the constantly growing practical application of mixtures in a number of industries. [1].

We have investigated the hyperacoustic and thermodynamic parameters in solutions of aniline + nitrobenzene at various concentrations and temperatures using the Mandelstam - Brillouin light scattering spectra.

According to spectroscopy, the selected liquids have intense isotropic Rayleigh scattering, which is the main criterion for Mandelstam-Brillan spectroscopy.

Investigations of the central part of the line of isotropic light scattering in solutions were carried out on an installation assembled on the basis of a scanning Fabry-Perot interferometer with a dispersion region of 0.625 cm^{-1}. A He-Ne laser with a wavelength of 628.8 nm was used as a light source.

It was found that in solutions of aniline + nitrobenzene, with an increase in the proportion of aniline in the mixture, the hypersound velocity increases as a function of viscosity.

The relationship between viscosity and the speed of hypersound propagation at 293 K can be expressed by the following expression [2]

$$V_{гз} = \sum_{i \neq 1}^{n} v_i \prod_{i=j} \frac{\eta - \eta_i}{\eta_i - \eta_j} \qquad (2)$$

Where η_i and η_j are the viscosities at which the hypersound velocities v_i are known, η_j is the viscosity at which the unknown hypersound velocity is.

The results of calculating $v_{gz}(\eta)$ on a computer system with a special program are shown in Fig. 1.

Table e 1. shows the results of measurement of hyperacoustic parameters in solutions of aniline + nitrobenzene in the ratios 1.0:0.0; 0.75: 0.25; 0.50: 0.50; 0.25: 0.25; 0.0: 1.0 at various temperatures.

TABLE 1 HYPERACOUSTIC PARAMETERS OF NITROBENZENE (X_I) + ANILINE (X_2) SOLUTIONS AT DIFFERENT TEMPERATURES AND CONCENTRATIONS.

T. K	$X_1 : X_2$	$v_{гз}$,м/с	$f_{гз}$, 10^9 Гц	$\beta_s 10^{11}$,Па$^{-1}$
293	1.0: 0.0	1435	4 , 9	40
	0.75: 0.25	1481	5.2	38
	0.50: 0.50	1520	5.5	37
	0.25: 0.75	1574	5.8	36
	0.0: 1.0	1658	6.1	34
323	1.0: 0.0	1400	4.7	42
	0.75: 0.25	1444	5.1	39
	0.50: 0.50	1489	5.4	37
	0.25: 0.75	1540	5.7	36
	0.0: 1.0	1600	5.9	35
348	1.0: 0.0	1370	4.5	44
	0.75: 0.25	1405	4.8	41
	0.50: 0.50	1445	5.1	39
	0.25: 0.75	1480	5.5	38
	0.0: 1.0	1536	5.7	36
373	1.0: 0.0	1307	4,3	46
	0.75: 0.25	1338	4.7	44
	0.50: 0.50	1380	4.9	41
	0.25: 0.75	1410	5.1	38
	0.0: 1.0	1480	5.5	37

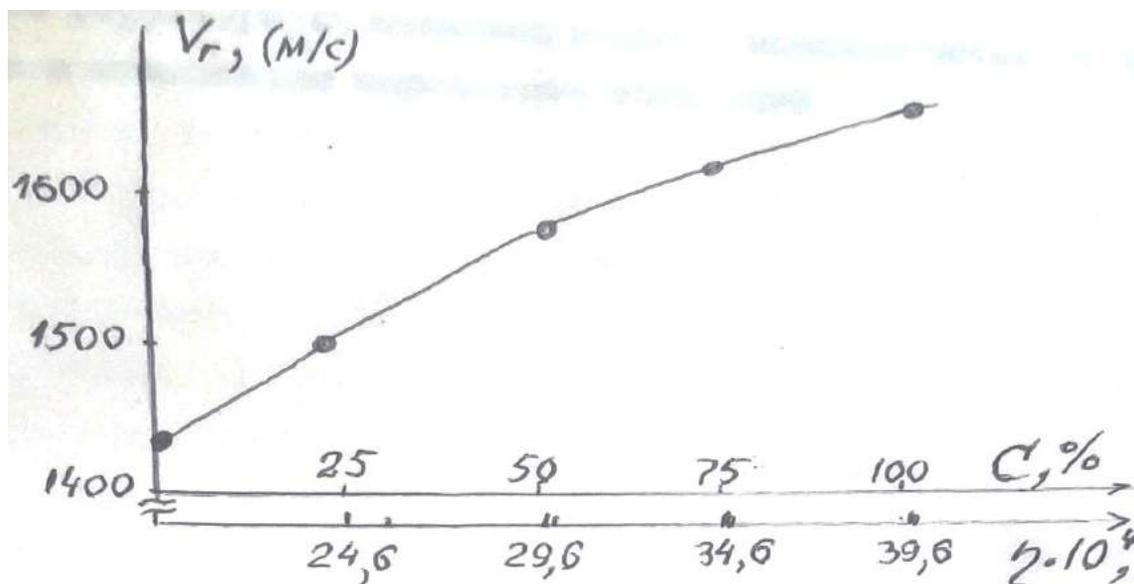
As can be seen from the results obtained, with an increase in temperature in solutions, the velocity (v_{gz}) and the frequency (f_{gz}) of hypersound decrease, and the adiabatic compressibility calculated by the formula β s = 1 / ρ v2 gz increases. As we have noted, the relationship between propagation velocity and concentration is characterized by a change in viscosity. In thermal studies, this relationship is also preserved. As the temperature rises, the viscosity of the liquid decreases and, accordingly, the speed and frequency of hypersound decreases, and the adiabatic compressibility increases.


Fig. 1 Dependence of the speed of hypersound on concentration and viscosity for a solution of aniline + nitrobenzene.

As can be seen from the data obtained, with an increase in the proportion of aniline in the solution, the hyperacoustic parameters change as a function of the viscosity described by formula (2).

Changing these parameters, can explain and Changing structure and the intermolecular interaction in the test solutions with varying th parameter condition [3] .

MAKHMUD KASHGARI'S ROLE IN THE ART OF PUBLIC SPEECH

Rashid Shukurov*

*Professor,
Candidate of Philological Sciences,
Department of Primary Education, Faculty of Primary Education
UZBEKISTAN

ABSTRACT

In the article has analyzed Mahmud Kashgari's «Devonu lugat it-turk», Yusuf Khas Hajib's «Qutadgu bilig» works and determined their role in the history of oratory and art of speech, including giving them a scientific-theoretical assessment. Since the writers directly dealt with both theoretical and practical issues of speech, they have also made great strides in this regard. And the samples of literary they had created are invaluable masterpieces of the art of speech. The analysis also provides a great opportunity to determine the role and importance they hold in the history of the art of world oratory. The comparative analysis of the writers' opinions with folklore materials and other written sources allows us to identify their peculiarities in this regard and to determine their significant contribution to the development of not only Uzbek and Turkish, but also world oratory. This reflects the peculiarities of the dialogue of different types of cultures. These cases provide rich material for drawing appropriate scientific and theoretical conclusions from them.

KEYWORDS: *The Art Of World Oratory, «Devonu Lugat It-Turk», «Qutadgu Bilig» The Speaker, Preacher, The Rhetoric.*

INTRODUCTION

The east scientists Mahmud Kashgari, Yusuf Khas Hajib, Ahmad Yugnakiy, Alisher Navoi and their huge scientific heritage have been discussed since 11th century. But researching their role and serious mark in the history of the Turkic environment, including in the history of the Uzbek rhetoric by view of subject art of speech is a new scientific problem beside of philosophers. It is noteworthy in this series that individual artists have used many rhetorical techniques extremely effectively in creating their works. The article proves that one of the main tasks of our methodist

scientist is to elucidate the essence of these methods and use them in the practice of rhetoric subject.

Mahmud Kashgari

We are well aware of many of the great orators who had left a significant mark on the history of world rhetoric science. The weight of the scientific literature on this subject is much greater. However, no special research had been conducted directly on the Turkish environment, including the specific services of Uzbek speakers. Such works not only cover the history of our national rhetoric science, but also make a serious contribution to the definition of its role and importance in the history of the world public speaking art. Accordingly, we decided to search the samples of creative heritage left by some of them. Among them, undoubtedly, the oldest example is the work of Mahmud Kashgari's «Devonu lugat it-turk» (Dictionary of Turkish vocabulary).

Mahmud Kashgari was a great thinker and creator. His «Devonu lugat it-turk» work is an encyclopedic research which described turkic people's life, history, traditions, geography, earth science, flora and fauna. The most important aspect for us its richness of observations on linguistics, including the culture of speech and the art of oratory.

Mahmud Kashgari was a subtle connoisseur and tireless promoter of the Turkish language. He described: «races with the Arabic language as equal as two grazing horses and raises the Turkic language», skillfully demonstrating its distinctive features.

Acquaintance with the pages of «Devan» reveals Mahmud Kashgari beside us as a geographer, botanist, zoologist, linguist, folklorist, literary critic, historian. That is why we call him an encyclopedic scientist.

Mahmud Kashgari is a true devotee of the nation, a great person who has always lived with pride in belonging to this nation. He wrote in the introduction at his work. «God created the State Sun in the constellation of the Turks. He also made the sky suitable for their property. He called them Turks, made them property, raised them as the kings of our time. He gave the reins of the will of the people of the time into their hands, led the people, and enabled them to be in the correct way. He made winner the people who belonged to them. Those who care for them will reach their goals and get rid of the destruction of the bastards. To keep away from the arrows of them (Turks), to hold their actions tightly is worthy and worthy of every intelligent person. The most important way to be close to them is to speak at their language, because they listen well to those who speak this language, keep themselves close, and do not harm them. They even forgive the sins of others who take refuge in them» [1].

Mahmud Kashgari refers to the public language as evidence and basis for his views. He put it this way: «I have quoted from the poems used in the language of the Turks, from the wise sayings and proverbs used in the days of joy and mourning, so that those who use them may convey them to the narrators (listeners) and the narrators, in turn, to the speakers» [2].

The scientist also showed the features of each sound, the use of the letter, the possibilities of pronunciation. Explaining the word «irra», he said: «irra - *izza*, "shame": this word is also pronounced as «irra» with two «rr» and «ira» with one «r» [3].

In Mahmud Kashgari's dictionary, the meaning of each word is explained in a memorable way, connected it with rare events from the history of the Turkic people. For example, he explains the

word «Og'a» (aka, "brother") as follows: «O'ga – is an experienced, intelligent, long-lived person». A degree lower career than Tekin rank... When Alexander The Great arrived to China, the Turkish Khan sent a group of young soldiers to fight. The minister told to the king: «You called all the youth, in fact (o'galarni "brothers") it was necessary to send people who are older, who have experience in the affairs of War, when he used word «o'ga» in the sense of experienced, an adult. Then king said «right» and sent older people (to war). At night they attacked and defeated the soldiers of Alexander from the front line» [4].

Mahmud Kashgari brings many folk proverbs in his work. For example:

Atasi achchig' alimla yesa, o'g'lining tishi qamar. (While the father eats a bitter apple, his son's teeth grinds).

Ach ne yemas, to'q ne demas. (What does not eat hungry, what does not speak full). *Bir qarg'a birla qish kelmas.* (Winter does not come with one crow). *Bir tulku terisin ikila so'ymas.* (One Fox's skin have not shelled twice). *Buzdan suv tamar.* (Water is dropping from the ice). *Yig'ach uzin kes, timur qisg'a kes.* (Cut the wood long, cut the iron short).
Yig'ach uchina yel tegar, ko'rklik kishiga so'z kelar. (The wind touches the end of tree, the attention comes to the handsome person). *Qanig' qan bila yumas.* (Blood is not washed with blood). *Qo'sh qilich qinga sig'mas.* (A double sword does not fit into a single scabbard). *Qish qo'nuqi – o't.* (Winter feast – is the fire).
Ko'zdan yirasa, ko'ngildan yema yirar. (

The farther from the eye, the farther from the heart). *Kunga baqsa, ko'z qamar.* (If look at the day (The Sun), eyes will be blinked).

The importance that, he was not limited to interpreting the meaning of proverbs, he also commented and explained on how often they are used in life situations. Bring forth some examples:

 «*Ag'ilda o'g'laq tug'sa, ariqda o'ti unar*. – When a calf is born in a barn, grass (his food) grows in the ditch. This proverb is said to mean that there is no need for excessive attempts and grief for food or sustenance» [5].

«*Ikki bug'ra igashur, o'rta ko'kagun yanchilur*. – Two masculine animals fighting, among them fly is milled. This proverb is used in the sense that among two princes fighting the weaker is crushed» [6].   «*Anasi tevlug yuvqa yapar, o'g'li tatik qo'sha qapar* – If his mother baked thin bread as a trick, the child cleverly puts it in his mouth in double (in pairs). This proverb refers to the fact that the resistance of two vigilantes is equal» [7].

«*Ko'kka suzsa, yuzga tushur.* – The saliva of the one who spits into the sky falls on his face. This proverb is said as a sign that a person who harmed to somebody will return evil to himself».

CONCLUSION

In the development of rhetoric the works of Mahmud Kashgari who are considered to be outstanding artists, have a wide range of possibilities. Acquaintance with them expands the imagination and knowledge of students in this area, creates a worthy basis for the formation and improvement of their skills and abilities.

1. Studying the text of the great works of these great writers from the point of view of the art of rhetoric serves as the most appropriate tool and factor for both future professionals and young students to make their speeches rich and beautiful, to achieve speech perfection.

2. Mahmud Kashqari cited some stories and narrations, the main reason for which is the author's desire to make his speech convincing and effective.

3. Noteworthy that the rhetorical methods are used very skillfully by Mahmud Kashgari. The author first gives a summary of the events, after which shows the lists their individual parts. This serves as the main factor in attracting the attention of the listener, in their complete and holistic understanding of the essence of the event to the internal divisions.

GENRE PROBLEMS IN MODERN UZBEK ART FILM

Khafiza Khakimovna Niyazova*

*Junior Researcher,
Institute of Art History of the Academy of Sciences,
Department of Cinematography and Television,
Republic of UZBEKISTAN

ABSTRACT

This article examines how the harmony of theme, genre and form is expressed in films created in the new era of Uzbek feature cinema. The article reflects the selection and study of several films in order to identify trends in the creation of modern Uzbek feature films. The selected films were analyzed from the point of view of cinematography, in which the specific findings of the directors were identified.

KEYWORDS: *Theme, Genre, Form, Interpretation, Drama, Comedy, Tragedy, Mixed Genre, Film, Director, Actor, Cameraman.*

INTRODUCTION

In the art of cinema, the choice of subject, genre, and form has developed under the influence of literature. Each author chooses a genre that suits the work as well as a theme. The work of art he creates creates a unique shape according to the style of writing. Interestingly, authors can cover a topic in a variety of genres (drama, comedy, tragedy, or mixed genres). In doing so, they use a variety of forms.

In the examples of fiction, content and form are interrelated, concepts that are related and relative in nature. What is considered content in relation to one element of a work can serve as a form in relation to others.

Hafiz Abdusamatov in his book "Drama Theory" describes the genres as follows:

The difference between drama and tragedy is that it depicts life events in a dramatic way, not a tragic one. What sets it apart from comedy is that it expresses life events in a serious way, not through laughter. It should also be noted that the drama reflects life in its own way.

Tragedy is known to represent tragic events. The conflict in it is based on difficult, confusing, intractable, strong conflicts, contradictions.

Through comedy, diseases, vices, vices, defects, rotten things, mistakes in people's activities, misguidance, flaws in their character - ignorance, stubbornness, rudeness, laziness, bureaucracy, bribery are revealed and exposed through laughter.

A work of art written in a specific genre will serve as the basis for the film to be created. Because the director is preparing to make a film based on a written source. To this end, it brings together an ensemble of actors appropriate to the character of the heroes. It is necessary to pay attention to other aspects.

There are no clear boundaries of genres in feature film. Typically, the genres are applied mixed together or separately. Each genre, in turn, is also divided into sub-genres. As a result, a single film can be made in one or more genres.

It should also be noted that if one director likes to create in exactly one genre, another may have the ability to create a film in all genres. To do this, the creator must have a broad outlook.

Genres are a historical category that goes through a process of movement, development and change. In the artistic process, some form can undergo qualitative changes or develop, or end its life, and at the same time some new form emerges. ... It should also be noted that the change of dramatic types and genres took place in accordance with the requirements of social life, the enlightenment, aesthetic needs of people, the demands of the time. For this reason, at some point, one genre moved forward and the other genre was pushed into second place. This is a law of artistic creation, a proof that the dramatic genre is a historical category.

During the development of the art of cinema, cinematographers created films in a separate genre, but later a mixture of genres emerged as the scope of the subject expanded. The diversity of directors methods of creating heroic images proves that the concept of form also applies to the art of cinema.

There are different types of them in almost every genre. Comedy is a separate genre with its own characteristics, it can be musical (Y.Azamov's "I'm fascinated"), everyday (director Sh.Abbosov's "Mahallada duv-duv gap"), comedy (E.Ryazanov's "Garage"). Situation comedies (Chaplins first films) are also available. In the early days of cinema, "pyroxene" comedies were popular, in which the heroes, of course, threw cakes at each other. "

Each era has its own theme, its own heroes. You can even follow the gallery of images that the directors take individually. They try to reveal the subject more deeply through this interpretation of the image. That is why directors pay special attention to the perfection of the images they create.

A creator can express a theme differently. The most important emphasis is placed on the heroes and the events associated with them. Although love has been a centuries-old theme, artists - writers, artists, directors, actors, composers - interpret it differently according to their time, way of thinking and worldview. To do this, creatively sought. The result is a new interpretation of the old theme.

"The theme of the films" Tohir and Zuhra "(scripted by S.Abdulla, A.Speshnev) and" Maftuningman "(1958) based on the screenplay by Y.Agzamov, T.Tula and M.Melkumov, shot

in 1945, is the same. that is, about love. But they are not completely similar to each other. The events in them take place in different historical periods. While the first film is dedicated to the distant past, the events of the second film take place in the 50s of the last century. In the first film, love is a test, a torment that ends with the death of the protagonists, while in the second, the young people in love step into a happy life. Finally, it should be noted that these films and their scripts vary by genre. "It's clear that Tahir and Zuhra are in the genre of tragedy, and I'm fascinated by the genre of musical comedy."

The director chooses a screenplay based on his ability to create a film. In this responsible process, he takes into account the theme of the film, the genre, his worldview, as well as his creative potential. He thinks about how to create it. Some directors will have the ability to create a unique film in the genre of drama, some tragedy, and some comedy.

The genre chosen by the filmmaker for his screenplay and film clearly expresses both the artists attitude to the material and his style and interpretation. In the genre, his worldview, artistic thinking is reflected. The fact that the screenwriter, the director chooses a certain genre for his work, the development of the material based on the dramaturgy of this film in a certain way, is to determine the artistic dimension of this work. Thus, the genre determines the choice of means of expression necessary for the director to realize his intention. Choosing a genre is one of the responsible aspects of the work of both the screenwriter and the director. Well-known scholar V.Ya. Propp, who studied the morphology and genres of fairy tales, said: "The genre to which a work belongs is not a superficial feature, but a quality that determines the whole artistic texture of the work."

The development of genres, on the one hand, ensures its diversity and confusion, and on the other hand, leads to the withdrawal of some from consumption. In the history of Uzbek cinematography from 1920 to 1990 there were films in the genres of propaganda films, historical revolution, historical biography, film-concert, film-ballet, film short story, film story, screenplay, drama, comedy, tragedy, detective and fairy tale. By the new era, the genres of propaganda films, historical revolutions, film-concerts, film-ballets, and short stories have disappeared. They were replaced by mixed genres such as mystical drama (M.Boymuhamedov and R.Turaev's film "Fazli"), fantasy comedy (Z.Musakov's film "Dedicated to Abdullajon or Steven Spielberg") and tragicomedy (Yu.Rozikov's film "Comrade Boykenjaev"). . A number of new separate genres have also emerged. For example, melodrama, fiction, thriller, musical, and so on.

In the Uzbek cinema of the XX century there were no films in the genre of melodrama. Because, according to the nature of the past, first of all, the images are reflected not as human interactions, but as heroes who benefit society. In the center of the melodrama film "White, white storks" (directed by A. Hamroev) there is an image of a girl and two boys. But this film is recognized as a drama genre.

Melodrama is a genre of three people in conflict, with a girl, two boys, or two girls, a boy at the center. It is a favorite genre of Indian cinematographers. The influx of Indian films into Uzbekistan in the 1960s and 1970s aroused great interest. Because the audience was bored with ideological films. The young people who were constantly changing the movie theaters were, most importantly, very charming because of their attitude towards the heroes. The artists, who noticed the interest of the audience in watching films of this genre, later began to work in the genre of melodrama in the Uzbek cinema.

In 1991-1996, there was a development in the comedy genre. This genre has even come to the fore in the theater and in some television shows. Most of the comedies created in those years were of a domestic nature, based on absurd events (I. Ergashev, "Iron Man") or paradoxical facts (Z. Musakov "Bomb"), or based on word play (I. Ergashev "Sharif and Ma'rif", "Sharif and Ma'rif in Tashkent").

The genre in a sense defines the audience. For example, fairy-tale movies are mostly watched with interest by children. Adventure and science fiction films are very interesting for teenagers. Because it is during adolescence that children become imaginative. Drama and comedy are genres suitable for everyone. Especially comedy movies are loved and watched by people of all ages. If a film is made in full compliance with the requirements of this genre, even viewers of other nationalities will see it without translation.

The cinema of 1991-1996 has little to do with the real events of those years. Speaking of these years, two films come to mind - "Dedicated to Abdullajon or Spielberg" and "Until Dawn". These two works are distinguished by the seriousness of the idea, the ideological content of the plot and the cinematic qualities. ... The novelty of feature films of 1997-2006 was that the art of cinema of this period turned to the times. Themes, ideas, images of heroes began to emerge on the basis of new realities of the time and life.

The work of Zulfiqor Musakov, who is constantly researching the art of Uzbek cinema, is unique. His protagonists in "Dedicated to Abdullah or Steven Spielberg" (fantastic comedy, 1991), "Bomb" (comedy, 1995), "Little Doctor" (fantastic drama, 1998), "Melon" (comedy, 2013) the unconventional character found its expression. Although it is a drama genre, the protagonist of "Little Doctor" also has actions, monologues and dialogues that make the audience laugh. It can be said that the director's skill in creating textual images, his ability to adapt it to the characteristics of the genre is a key factor in the positive perception of the protagonists by the audience.

Zulfiqor Musakov's drama "Lead" (2011) is a feature film that expresses the broad outlook of the artist. The images in this screenplay evoke a feeling of hatred for the events of the past in the mind of the viewer. The screenwriter and director recreates the events of the Soviet era in the image of the heroes with the change of time. This is not the first time the director has addressed the subject. His previous drama, Vatan (2006), also chronicles the life of the Soviet people. Such films have ideologically entered the art of independence as a new subject in the art of cinema. As a result, new heroes have emerged.

Z. Musakov is not only a contemporary, but also the creator of the author's film, which creates modern images. The characters in his film "Lead" are also modern characters. This scenario is based on a very short period of time - from November 5, 1952 to the death of Stalin, that is, until March 5, 1953. The events that the two friends have encountered over the past period have found their perfect solution in the cinematic interpretation.

Each frame in "Lead" serves to vividly express the changes in the character of the heroes. For this purpose, cameramen Abdurahim Ismoilov and Azizbek Arzikulov shot the protagonist in close-up in many places. Also, because the events depicted in the film, by their very nature, took place in the last century, they filmed the film in black and white.

It is noteworthy that at the beginning of the film "Martyrs' Square" will be shown in color. At the end of the picture, the same frame is shown again in black and white. The fact that one frame is used twice throughout the film is symbolic. The place, which the director is now beautifying and depicting a beautiful landscape, points to the fact that he actually witnessed such horrible events.

The use of musical works by Mozart, Beethoven, Wagner, Kreimer, Grieg throughout the film served to reveal the inner world of the characters, their feelings more vividly. Rather than keeping the tempo-rhythm of the film, the director intensifies the events in such a way that the viewer develops an attitude towards him and the past as he observes the events taking place in the life of the protagonist.

The author did not use the name "Lead" in vain for the film. Lead is a soft metal by its nature. The name is applied to the film's protagonist Umar Kadyrov (played by Bobur Yuldashev). Because this hero is a gentle man by nature. But his work portrays this image as an angry man. It is at this point that the secret, the value, of this name is hidden.

Bobur Yuldashev has created many images in films of various themes and genres. However, his role in "Lead" is arguably the brightest hero in the art of cinema. It is clear that creating the image of Umar Kadyrov was difficult for this actor. The reason is that the screenwriter and director Zulfiqor Musakov carefully thought out the material, which in turn made a strong demand on the ensemble of actors. The essence of the image is revealed in the way it expresses facial expressions, plasticity and inner feelings. The dialogue between the protagonists in the film is very short and succinct. This is, firstly, a demand for the art of cinema and, secondly, a characteristic of employees working in public administration.

The role of Umar Kadyrov's friend, Colonel Rome-Marlene, was played by Temur Musakov with great skill. In his performance, it is not plastic, but the fact that his big black eyes look meaningful, speak at a point, and observe. Despite its body, its heaviness added to the artistic value of the image.

The image of the plant director Piskunov is a very cowardly person by nature. His character, on the one hand, makes the audience laugh, and on the other hand, creates a feeling of sadness. The character of the secretary, played by Otabek Musaev, is revealed mainly in dialogues.

This can be seen in the images of filmmaker Zulfiqor Musakov, who created a serious work with actors. For example, Otabek Musaev, Bobur Yuldashev and Rano Shodieva have previously created their own characters in his film "Vatan", and Temur Musakov in "Children in Heaven", "Children in Heaven-2". These characters are radically different from the heroes of the film "Lead" in terms of content and function.

The director pays special attention to each image in creating the protagonist as he intended. In particular, the image of Gulbahor, played by Nigora Karimbaeva, who has been waiting for her husband for ten years, suffers not only from her appearance, but also from her inner experiences.

The essence of the image of Obid (Gulbahor's wife) performed by Fahriddin Shamsimatov has been interpreted in a completely new way. He writes the experiences of a decade of the soul on his body, not on paper. When his wife complains that she has not received a letter from him in the past, Obid says that instead of a letter, she takes off her yacht and reads several lines of writing on her body.

It has never been possible to write a letter in the past, and such separation and hardship cannot be avoided by pouring it out on paper. Only the human body can bear such pains. This episode is one of the most moving scenes of the film. It is also a unique invention that the director has used to express years of separation.

The costumes of the heroes, their service rooms, the streets, the cars and the lifestyle of the people are in common with the environment of the past. Also, the inclusion of chronicles in the film provided a vital outline of the events. In this regard, the director was able to express the new theme in the old interpretation. Typically, creators try to reinterpret a new theme. Creating a new theme in the old interpretation is a very complicated process. This film by Z. Musakov brought a unique form to the modern art of cinema.

The creative pursuit of this artist in the creation of a contemporary image also acquires a special relevance. The image of Daniel (played by Dilshodbek Kattabekov) in the film "Little Doctor" (1998), created in the genre of fantasy drama, is a modern hero. At first glance, this film seems to be intended for children, in fact it is dedicated to adults and the problems of life associated with them.

The director uses a great find in this regard. An evil spirit reigns in the house of Shukhrat Shodmonov (played by Murod Rajabov), who has devoted his entire life to wealth and career. That is why his grandson Nigora is sick. She is ready for anything to fix her granddaughter. To this end, he brings home the most famous doctor. But he can't alleviate the girl's pain.

Shukhrat Shodmonov, who heard about the little doctor, also brought Daniel to his house. But he also says that he cant fix the girl because there are evil spirits in this house. Explains why they came in. Only then does the grandfather realize his mistake. At the end of the film, the doctor manages to correct the girl. When she gets sick, the girl comes to her aid ...

Explaining the problem of adults with the help of children's images is fully reflected in this film. But the average viewer may not understand this. The reason is that in the process of watching the film, the image of Daniel is played as the main protagonist of the film. This style is proof that the director was able to find a unique form. In fact, it is an old form, but the modern lifestyle depicted in the film is a new theme.

Hojiakbar Nurmatov, Munavvara Abdullaeva, Murod Rajabov, Rajab Adashev, Karim Mirkhodiev, Fotima Rejametova are invited to the film "Little Doctor". The director has achieved twin success in the art of cinema through this film. One was the creation of a new hero on a new subject, and the other was the discovery of a new actor, Dilshodbek Kattabekov.

Admittedly, the little doctor - Dilshodbek Kattabekov and Shodmonov - Murod Rajabov raised the level of the film with his unique style of performance. The most delicate aspects of this film, as well as the most dangerous problems, are solved through these heroes. Importantly, this film brought thousands of viewers to the cinema.

In the new era, directors such as Zulfiqor Musakov, Yusuf Rozikov, Sabir Nazarmuhamedov, Rixsivoy Muhammadjanov, Yolkin Toychiev, Akbar Bekturdiev are the ones who are working on their scripts. In their films, they try to shed light on a topic they have been thinking about and intending for a long time. Based on their creative abilities, they base their work on a genre appropriate to the script. Based on this, the film form is formed.

Yusuf Rozikov's drama "The Preacher" (1999) is a historical film based on a historical gallery of its protagonist. The creator manages to create his own heroes based on the events that took place during 1917-1937. Expressed in the old interpretation of the new theme, the film is told in the language of the protagonists grandson.

The "preacher" introduces a new direction in the coverage of the historical theme, expanding its genre-style range. It turned out that it is possible to say goodbye to the recent past through light humor, but with respect. Because that period is also a part of our history, and our ancestors did something worthwhile to remember them fondly.

Pari is a very young girl. Iskandar (played by Bahodir Adilov), an ordinary charioteer who was sorry that his brothers were oppressing him, bought it. After the death of Alexander's brother, the two wives of the deceased - Mastura and Aydin - fall in love with the protagonist Alexander. Pari's arrival in this apartment coincides with such a day. Alexander becomes three wives in one day. At the end of the film, he loses all of them in one day.

Even though they are friends, women understand and respect each other. In time, Iskandar fell in love with another woman, Maryam Fozilovna (played by Asal Alikhodjaeva). The protagonist's three wives are honorable, shy, and thoughtful. The image against them - Maryam Fozilovna - is interpreted as a restless image until she does what she says. In the film, issues such as polygamy, veil throwing, literacy are revealed in the interpretation of the protagonists.

Alexander is the son of a modern man. That is why he has a penchant for the art of public speaking. He turns himself into an executor of government affairs because of the applause of the people. He devoted his entire life to promoting the ideas of the Soviet era. He rises from ordinary chariot driver to preacher. But then he becomes lonely and useless to anyone.

Alexander is a complex psychological figure, and the role of Maryam Fozilovna and Askar in its dramatic transformation is enormous. He takes the impact of drastic changes in society on his family as normal, and encourages others to do the same.

Alexander becomes the best propagandist of the revolution. This activity of his is reflected in the performance of Bahodir Adilov. His appearance and behavior, his expressive views are embodied in the same way as the whole essence of the image.

It is not surprising that the director set himself the goal of penetrating the psyche and hearts of the people of the past through this image. The image of Alexander sees himself not as a person needed for his family, but first and foremost for society. So he makes a big mistake. In revealing the subject, the director, first of all, writes the script perfectly.

In the film The Preacher by director Yusuf Rozikov, the cameraman U. Khamroev, based on the possibilities of colors, managed to deepen the dramaturgy of each frame, to create a dramatic background. This is evident in the scene of the meeting of the protagonist Iskandar (B. Odilov) with Maryam Fozilovna (A. Alikhodjaeva). Their departure in the car is given against the backdrop of a fiery red-yellow horizon. This encounter is symbolic of a time when brutal class struggles were going on. At the same time, this coloring of the horizon was a sign that their fate was tragic. "

Due to the sharp twists in the plot line, a change in the character and worldview of the protagonists is clearly felt. It should be noted that the genre was chosen on the basis of art. When

making a film, the director chooses the form of telling it in the language of the protagonists grandson. Because the narration of past events on behalf of the narrator is important in connecting history with the present. That is why the narrator sometimes remembers the events with sadness and sometimes with irony.

Hotam Fayziev found an important aspect in the creation of the image of the protagonist in his drama film "Summerless Year" (2011). The protagonist of the film, a young ranger, Sabir (played by Yigitali Mamajonov), is disabled in a car accident. The mother of the young man, Bugul (played by Malika Ibrahimova), is devastated. Sabir took care of Marvarid (played by Sevara Solieva), the most beautiful girl in the village. They should have a wedding soon. The girl loves the guy too. But the girl's father (the doctor), who is aware of what happened to Sabir in the car accident, stops the wedding. Mamatkul, the eldest son of Bugul's mother (played by Fahriddin Shamsimatov), refuses to go to the groom for his brother.

Director Hotam Fayziev, who has found a new interpretation of the old theme of love, focuses on revealing the inner world of the protagonists. It can be observed that his camera profession helped him a lot in this regard. The proximity of the protagonists in many places leads to his inner world. Created in the drama genre, this feature film focuses on each character individually. Their incarnation in accordance with the genre proves that the director also took a responsible approach to the ensemble of actors.

Film director Shukhrat Abbasov: I always choose actors for the film on a trial basis. It's good to believe in the actor's skill, but the test shows the actor'sfigurative state. In fact, the audience sees the fruits of the director's work in the performance of the actor. If he is skilled, he will fulfill the role assigned to him.

Film director Tamara Kamalova reinterprets the old theme in the drama genre "Let there be a way" (2005). The theme of love is expressed by each director from his own point of view. As a female director, she approaches the subject with a delicate taste. Based on the script of Shomirzo Turdimov, the director presents the theme of love in a completely new form in the layer of ancient traditions of the Uzbek nation, singing folklore and ethnographic traditions.

In the past, in the Uzbek people, a fetus born out of wedlock in the mother's womb was the fault not only of the girl, but also of the boy. So the girl was asked to make a puppet and take it to the boys house and confess his guilt. During the plot of the film, Aziz (played by Aziz Rametov) pleads not guilty. Muhabbat (performed by Zarina Nizomiddinova) is helpless. Wherever he goes, the image of the puppet invented by the director continues to grow. It threatens his peace everywhere. The director simply expresses the rumored scene in this way through artistic, analogical means.

The wonderful shots of the cameraman R.Ibragimov became more artistic after the editing. The relentless movements of the protagonists and the puppet develop in his pictorial solution. Especially the footprints of the snake trail among the apples floating in the water evoke a great aesthetic pleasure in the viewer. The success of the director can be traced back to when he was able to find the right solution in the visual world of this film.

Meliboy (performed by Muhammad Isa Abdulkhairov) marries her in spite of all rumors to make love happy. The film ends with a scene where Love gets on the train, pushes himself behind the wagon, and moves forward. At the heart of this figurative frame are philosophical ideas. In the

film, it is worth noting that the work of the costume designer and artist, who worked side by side with him in finding an artistic solution to the work of the cameraman, was successful.

The director was able to find a whole new form in the production of this film. For the first time in the new era, the theme of love and happiness is embodied in a purely national spirit, based on Uzbek customs and traditions. Tamara Kamalova entrusts the film's protagonists with the task of expressing emotions and experiences through plasticity, facial expressions, and actions, rather than word games. The inner feelings of the images are further enhanced by the beautiful melody of the composer M. Bafoev, as well as by Uzbek folk songs.

Another love-themed film, Yolkin Toychiev's drama "Spring" (2006), is based on old principles. In the past, the form in which the protagonist draws his own conclusions as a result of walking has been used. The remarkable aspect of this film is that the encounter of Orzibi (performed by Nigora Karimbaeva) with each character is like a little story. Importantly, the realities are interconnected in a logical sequence. Such a finding is judged by the director's ability to find a unique individual form.

The image of Orzibi, played by Nigora Karimbaeva, keeps her partner and audience secret from her influence on her meetings with women of different destinies. Finally, when he reaches the fountain, he takes all the memories given by the women he meets on the way from his knot, puts them in the water, and sobs. It was not a simple cry. He weeps over the fate of women in general, because he is overwhelmed by the pain of unhappy women along the way, by his sincere compassion for them.

Orzibi gets up after bathing in the spring water, but does not take the souvenirs out of the water. Apparently, he wants the souvenirs, which are a symbol of the unhappiness of the women he meets on the road, to be washed away by this spring water and flowed into the distance. This is the most important episode in the film. That is why the author did not call it "Spring" in vain.

The form of the drama film "Zabarjad" (2007) by director Bahodir Adilov is old-fashioned. The protagonist of the film is Zabarjad (played by Ilmira Rakhimjanova). The actresss performance encourages the audience to follow the plot line. His unique character, his attitude to the realities that are happening is mysterious. Thats why the audience sometimes doesnt understand why he is behaving this way. The fact that he is always dating a person makes the viewer feel negative about this hero.

Zabarjad is a precious stone. The name of the protagonist of the film is the same. He is 30 years old, but still unmarried. These are usually called "old girls". Zabarjad looks like a rude and stubborn girl. In fact, he is a wise and gentle man. He always behaves like that. Even in the love chapter. Zabarjad is cared for by a young graduate student and a neighbor, and the director of the institute teases him. But she loves only one man - a married man. "

Rather, Zabarjad gave his heart to a man greater than himself. But the shot of him running away from the girl is not shown during the film. In one episode, Zabarjad says he always wants to see this man because he looks like his father. Only then will it be clear that a girl who feels guilty about her father's death will always long for her. Zabarjad should only see the appearance of this man. Only then will it be as if he had seen his father. Such a mysterious puzzle can be said to be a unique solution in the direction of the film "Zabarjad".

In conclusion, it can be said that the Uzbek cinema of the new era has been updated in terms of themes. The heroes are also important because they are the people of this period. In addition, a number of modern images have been created due to their reference to historical themes. Cinematographers have done a lot of creative research in this regard.

The most painful point in ensuring the harmony of theme, genre and form in modern Uzbek feature film is related to the issue of scripts. The number of scripts written in new themes and new genres is very small. The lack of an artistic basis of its own original style leads to the creation of similar images.

In order to create the image of the protagonist, it is possible to find a new form and feel the individual attitude in the director. But there is not much news about new genres and their compatibility with mixed genres.

Unfortunately, although the topics are diverse, there are still problems in this area. Because the successful release of the film is not just about choosing a theme. It is very important to choose a genre that suits him and show it on a professional level on the screen, and most importantly, to be able to find a new form for this purpose. In order to prevent the creation of a film in the old form, we think it would be useful to form a new worldview on the issue of the new form, to study the world experience in this regard.

NON-PHARMACOLOGICAL METHODS OF CONTROLLING THE CHILDREN'S BEHAVIOR AT THE DENTAL APPOINTMENT

Ortikova Nargiza Khayrullayevna*

*Samarkand State Medical Institute,
UZBEKISTAN
Email id: giza1003@mail.ru

ABSTRACT

Patient behavior during dental treatment depends to a large extent on his mental state. Depressive disorders also contribute to the progression of dental diseases. The individual treatment plan and the features of interaction with the patient should be determined depending on the psycho-emotional state of the patient, which will allow us to establish the relationship between the patient and the doctor, and improve the quality of dental care provided, as well as minimize the risks of developing conflict situations. In order to determine the psycho-emotional deviations of patients, various scales and questionnaires are used, which have certain advantages.

KEYWORDS: *Dentistry, Dentophobia, Music Therapy, Relaxation, Psychological Literacy.*

INTRODUCTION

Patients behavior wile dental curing depends on his mental condition. Depressive disorders also promote progression dental diseases. An individual plan of treatment and features of cooperation with patients must be defined depending on psycho-emotional condition of sick. That lets to cooperate patient with doctor and raise the quality of dental help end also minimize risks of development conflict situations. On purpose to define psycho-emotional deviations of sick dentists use different scales and questionnaires that have certain benefits.

PURPOSE OF RESEARCH

Knowing as many non-pharmacological behavioral management techniques (NBCM) as possible allows the clinician to use them as needed, thereby contributing to a positive dental experience in children.

OBJECT AND SUBJECT OF RESEARCH

We have developed our own "child language" to describe treatments, materials, etc. (see table 1). It is clear that it should be adapted depending on the patient's level of understanding. For example, a 15-year-old boy with an average understanding is unlikely to be told that his teeth will be «tickled» while a 5-year-old girl with an average understanding is unlikely to understand the term "local anesthesia". It is important that the doctor and the assistant use the same "child language"; parents should also be encouraged to use the same "child language" when talking about dental procedures with their child.

RESULTS AND DISCUSSION

Non-verbal communication is essential for all interactions with the child. For young children, it may be helpful to mimic non-verbal communication skills similar to those of a child TV presenter, such as smiling, cheerful tone of voice, and sitting, so that the doctor is at eye level with the child.

Appropriate physical contact with the patient, such as light patting on the arm, can also be used to enhance positive behavior [15]. Non-verbal communication generally provides support and enhances the effectiveness of all non-pharmacological methods of managing behavior.

TABLE 1. EXAMPLES OF CHILDREN'S LANGUAGE FOR USE IN THE DENTAL ENVIRONMENT

Term	Children's words
Turbine hand piece	Dental shower
Mechanical hand piece	Tickler
30-40% phosphoric acid for etching	Blue Teeth Shampoo
Dental vacuum cleaner	Mini vacuum cleaner
Saliva ejector	Juice straw
Local anesthetic	Magic sleepy juice for teeth
Puster (pistol) 3 in 1	Washing and drying machine (magic dryer)
Light lamp	Magic torch
Filling	Dental plaster
Crown	Princess crown (soldier's helmet)
Matrices	Shield for other teeth
Cotton rolls	Cheek ticklers
Rubber dam	Dental cloak
Clump	Shiny Teeth Ring
Forceps	Tooth hug
Fluoride varnish	Superhero toothpaste
Fissure sealants	Happy faces for happy teeth

If it is necessary to conduct local anesthesia in children at the dental appointment, we have developed a scheme to facilitate its implementation (see Table 2).

TABLE 2. SCHEME FOR NLCM TO FACILITATE LOCAL ANESTHESIA IN A 6-15 YEAR OLD CHILD AT THE DENTAL APPOINTMENT

NLCM	Manipulation	Prepare everything you need for local anesthesia in another office.
	Before injection	It is necessary to honestly describe the process, sensations (prick, bursting), time frame and time during which the area will feel "numb, funny, different". Ideally, provide this information at your appointment before you administer the local anesthetic, using age-appropriate, positive language, allowing the patient to be informed.
		Make sure the parent also understands the process to ensure they can help their child prepare for the local anesthetic.
	Abstraction	Ask the child to open his eyes wide, hold his chin. You can listen to music
	Tell-Show-Do	If your child asks how they will get the injection, be honest and use age appropriate language to explain the process.
Coping strategy	Relaxation	Ask the patient to focus on their breathing, 3 breaths, hold and 5 breaths, while exhaling, local anesthesia can be administered.
Pharmacological method	Anesthetic ointment	Effective when used for at least 2-5 minutes after drying the injection area [8].

CONCLUSIONS

This article contains the NMAP that we use at the pediatric dental outpatient appointment. Knowledge of these methods will allow pediatric dentists to improve interaction with patients, prevent them from developing a negative impression of dental treatment. It is known that negative dental experience acquired in childhood affects the attitude towards this type of medical care throughout the entire subsequent life of a person, leading to delayed or even delayed visits, and thereby worsening dental status.

LEXICO-SEMANTIC PROPERTIES OF PREDLOGS IN FRENCH PHRASEOLOGY

Nasimova Dilbar Baxodurovna*

*Teacher of Samarkand State Institute of Foreign Languages,
Samarkand, UZBEKISTAN

ABSTRACT

This article discusses the relationship of French prepositions in speech and the meaning of expressions. The types, lexical and semantic features of prepositions are explained. The structural structure of the prepositions is also analyzed schematically. In addition, the nature of the de preposition, one of the polysemous prepositions, is revealed.

KEYWORDS: *Preposition, Etymology, Lexical And Semantic Relations, Preposition Structure.*

INTRODUCTION

It is well known that each word group is involved in the construction of sentences that have a specific function and semantic meaning. The role of prepositions in auxiliary words in expressing grammatical relationships is also invaluable. The term preposition comes from the Latin word praepositio, which means "prae" and "positio". Prepositions are words that cannot be used as an independent part of speech, but as auxiliary meanings. They can connect words that are independent parts of a sentence or give them a grammatical, syntactic description.

The role of literary Latin in the development of modern French is invaluable. Many words, word patterns, syntactic structures and prepositions have been learned from it. In Latin, prepositions are used to describe certain relationships. French prepositions perform a similar function.For example, in Latin Eo ad patrem (I go to my father); in French Je vais chez mon père; Therefore, it is not surprising that some features of the French language have their roots in the distant past.In French grammar, the preposition is an auxiliary word, which, like auxiliaries, serves to connect words in a sentence and show their relationship to each other [1,5]. since there are no consonants in the language, the meaning of adverbial affixes is expressed using prepositions. Therefore, we have some difficulties in using prepositions in French. In order to clarify these aspects of prepositions, in this article we would like to consider some aspects of the relationship between prepositions and their use in speech.

French prepositions are divided into simple and compound prepositions. Simple prepositions: de, à, par, après, avec, avant, chez, contre, dans, depuis, dès, en entre, sauf, sur, sous, pour, près, vers and others. Compound prepositions or prepositional phrases are more common in French than simple prepositions. They are formed by the prepositions de, par, en, à and in conjunction with a noun. For example, à cause de, à côté de, à l'égard de, avant de, par, de peur de, en dedans de, par - dessous, par rapport à, près de, sauf à, en face de, vis - à - vis de and others.The category of simple prepositions in French is not the same. They appeared differently at different stages of evolution. Over time, the semantic properties of the material change. For example, the verb songer (to dream) has been used in French historical dictionaries for centuries with various prepositions. To date, it has been used only with the preposition à (songer à - to think, to think) [2,1976].

The same thing happens with other verbs. For example, in the literary style exhorter de (+ verbe) is used in speech with prepositions such as exhorter à (+ verbe / nom), acheminer à - acheminer vers, concorder à - concorder avec. can be understood more clearly:

Before	Today
*Armande, prenezsoind'envoyer**au** notaire.(Molière)*	**chez**
*Vousdevriezleurmettre un bon exemple**aux** yeux. (Molière)*	**sous**
*Quelque petit savant qui veutvenir**au** monde.(Molière)*	**dans**

In addition, such changes occur not only in verbs but also in adjectives. For example, contemporain à - contemporain de; but spécifique à or spécifique de; particulier de or particulier à. Given their role in solving this problem, it makes sense.

When language is used as a means of communication (for speaking, writing, and reading), the function of using prepositions arises. They allow you to build a relationship between two words. For example, 1. Elle s'arrêta pour se tamponner les yeux avec le mouchoir brodé. 2. Jétais assez avisé pour me rendre compte qu'une anxiété véritable se cachait sous ce déluge de mots. The following is an analysis of these examples:

Preposition	Nature	Between two words
pour	*but*	*s'arrêta et se tamponner*
avec	*manière*	*s'arrêta et mouchoir*
pour	*moment du passé*	*avisé et me rendrecompte*
sous	*subordination*	*uneanxiété et cedéluge*

The process of analysis has shown that prepositions serve to establish the relationship between two elements in a sentence. Therefore, it is useful to study prepositions in a language based on models. We can see their structure in the form of a diagram. For example, C + P + R; C - complémenté (complement), P - préposition (preposition), R - régime (control); This scheme represents the CPR preposition structure and the PR preposition syntagm. The R - (régime) in a structure can serve as a function of various grammatical categories in a sentence. This situation is reflected in the following table:

Categories	Examples
Noun(nom)	*moulin**à**farine*
pronoun (pronom)	*son style **à**lui*

Adverbe(adverbe)	*partir **pour**toujours*
Adjective(adjectif)	*mesure **à**deux temps*
Verb(verbeinfinitif)	*jupe**à**nettoyer*
Verb(verbegérondif)	*réussir**en**étudiant*
Preposition(préposition)	*sortir**de** chez soi*
Sentence(proposition)	*fidèle**à**ceque'il a toujourspromis*

However, these three elements in the structure of prepositions cannot always come in a given order. For example, in the example of Je parle avec un ami, the four possible sequences are:

1. *Je parle**avec** un ami.(C+P+R)*

2. ***Avec** un ami je parle.(P+R+C)*

3.*Un ami je parle**avec.**(R+C+P)*

4. *Un ami**avec** je parle.(R+P+C)*

The examples given show that the first formula is grammatically correct. But can others be wrong? the question arises. To clarify this, let's look at each one separately:

1.   The order of the elements C + P + R is the most common in a simple sentence. For example,

*Le chat +**de**+Nicolas; Fidèle + **en** + amour; prendre +(quelqu'un) **pour** + époux; Il arrivait + **avec** + (danssa maim) + un bouquet;*

2. The order of the elements P + R + C is also correct, but they are less common than C + P + R. They are mainly found in interrogative and relative pronouns. In this case, R may be the interrogative pronoun or the interrogative quality that comes with the horse. For example,*À + <u>la quelle</u> + des employés l'as – tu – donné ?*

   Pour + <u>quelles raisons</u> + es – tusirapidementvenue ?

In relative pronouns, this order is a characteristic of the verb phrase. For example, the following are examples:

   Celui chez(P)+ qui(R)+ je suisentré(C).(intransitif)

   Celui à(P)+ qui (R)+ je doisobéir(C).(transitif)

   La route sur(P)+ laquelle(R)+ la voitures'estengagée(C).(pronominal)

The order of the elements R + C + P may be grammatically incorrect, but it is common in sentences. For example, le gars que jetravailleavec .

A component of a sentence constructed in this way can also be called Englishism. Such formulas are very common in English. This situation can be clearly seen in the following table:

R+	**C+**	**P**
Whom do you want	*to talk*	***to**?*
Where	*are you*	***from**?*

   4. The order of the elements R + P + C is very unlikely to occur in sentences.

It is well known that the richness of a language is measured not only by the words and phrases, but also by the lexical meanings of the words. Polysemy is one of the many meanings of words.

Polysemy is important in any language. French is no exception. The effective use of prepositions in speech is manifested in the various functions that the preposition can express. Prepositions can be very different - they can create different sets of relationships. It is therefore important to note that each syntactic analysis is interrelated with the lexical semantics of the prepositions.

In French, the prepositions à, de, par are one of the polysemic prepositions. This situation can be more clearly understood from the following table with the preposition de:

Examples	Relationship
venir<u>de</u> Vichy	origine
punir<u>qqnde</u> son crime	cause
avancer<u>de</u>quatre pas	mesure
regarder<u>d'un</u> air bizarre	manière
être aimé<u>deses</u>enfants	agent
protéger<u>de</u> la main	moyen
membres<u>del'</u>assemblée	contenant
verre<u>del'</u>eau	contenu
robe <u>de</u> soirée	genre, espèce

In addition, prepositions sometimes form a syntactic pile before certain epithets, attributes, infinitives, and complements. The syntactic function of prepositions is, firstly, their main feature, and secondly, the problems with their category. In this case, they have no meaning or relationship and remain empty prepositions. For example, La ville de Lyon, j'aime à lire, mon but est de vaincre, elle est retue pour coupable; In French, it is useful to study not only the semantic but also the syntactic aspect of such prepositions.

There is no consensus in linguistics on the meaning of prepositions. Some scholars believe that prepositions have only a grammatical meaning, that is, they have only a syntactic function and are devoid of semantic function (lexical meaning). However, from another point of view, prepositions, like any phrase, have a lexical meaning that distinguishes one preposition from another. In this case, the lexical meaning is understood as the meaning inherent and used in each preposition of one language [3,290]. Even the prepositions à and de, which are abstract and empty, can determine the semantics of a phrase. For example, une tasse de thé - a cup of tea, une tasse à thé - a cup of tea;

Prepositions reflect the relationships and connections of the objective world. As mentioned above, they show the relationship between sentences and sentences [4,284]. However, just as prepositions can express different relationships in a sentence, the same relationship can be expressed in different prepositions. This is especially true of the prepositions à and de. For example, time (temps) is characterized by the following prepositions: à, de, vers, pour, avant, après, depuis, pendant, etc. Maqsad (but) - en vue de, dans l'intention de, dans le but de, afin de, pour ...

Ammo bu har xil predloglar bir – birining o'rnida bo'lishini anglatmaydi. Shuning uchun predloglardan to'g'ri foydalanish uchun ularning ma'no xususiyatlarini bilish yoki predloglarga ta'sir qilishi mumkin bo'lgan ma'no o'zgarishini taxmin qilishimiz kerak.

Thus, the study of the meaning of expressions in French prepositions and their relation to speech shows that there are a number of peculiarities. Each of these features plays an important role in the formation of separate groups of prepositions and can be the primary basis for their lexical-semantic classification. In order to fully understand their linguistic nature, it is necessary not to neglect the internal and external relations of the French language.

THE USE OF MOTHER LANGUAGE IN FOREIGN LANGUAGE TEACHING AND STRATEGIES OF AVOIDING IT

Shakhnoza Omonova*

*3 rd year Student of Classical Oriental Philology,
At International Islamic Academy of Uzbekistan,
Tashkent, UZBEKISTAN

ABSTRACT

For many years, the principle of not using the intermediate language, either mother tongue, has prevailed in the process of teaching foreign languages to teachers, but its use is allowed only as a last resort. However, research shows that teachers make extensive use of the intermediate language. This article tries to identify the root causes of the difference between principle and fact and to address the issue. The development of guidelines for maintaining the norm between the languages being taught and the intermediate language used in the course and some strategies for teachers to make full use of the foreign language without abandoning the intermediate language are suggested.

KEYWORDS: *Use Of Intermediate Language, Foreign Language Teaching, Organization Of Teaching Process, Native Language.*

1. INTRODUCTION

The process of learning a foreign language is complicated, and every mistake is repaid over time. Compared to mathematics or chemistry, a mistake made in an example or chain reaction is far from a solution to the problem, but when thought through carefully, noticing and correcting the error leads to a solution. However, the consequences of making mistakes in the teaching of languages, which are part of the social sciences, are long overdue because you will realize that the wrong path has led you astray after a long distance. The use and quantity of language in teaching foreign languages has always been a contentious issue.

As the German writer Jean Paul Friedrich points out, in any educational process, the mother tongue is used as the primary means of conveying information, so it can also be called the "mother of languages". After all, every new language is built on it ... " Learning a foreign

language is a process that can take place at different stages of a person's life. The language studied not only serves as a linguist, but also as a means of communication with the whole world in the field of his interest and desire. The key to learning is to know how to learn. In the process of teaching a foreign language, it is not possible to remove the mother language from the minds of learners only by using target language, but to build the first steps in learning a foreign language on it, which will serve as a solid foundation.

The mother language is used in language teaching as an element to help in the process of explaining or learning something that is not clear and difficult. In fact, the main reason for the shortcomings is not how much the language of the intermediate is used, but the fact that the target language is rarely used in the classroom. In the same way, there is a constant need for the original speakers of the language. However, there are cases when the teacher does not use the mother language of students at all because of not knowing the learners` native language. History has shown that the policy of "using only the target language of instruction in the teaching of foreign languages", which has dominated education for centuries, was aimed at raising the profile of neo-colonialism and language. (Phillipson 1992; Auerbach 1993). However, the main focus of this article is to look at when teachers can use intermediate language in teaching foreign languages and what strategies can be used to achieve effective results.

2. TEACHER`S KNOWLEDGE AND BELIEFS

American linguist Eric Hawkins (1987: 97–98) likens teaching foreign languages to the process of "sowing seeds in a storm," the teacher sows the seeds, but they constantly "fly" between two lessons; therefore, it is important to achieve maximum language acceptance by learners during a time-limited lesson process. If we look at the UK education system, we see that the use of intermediate language was banned in the National Program in the 1990s. However, in recent years, this issue has been reconsidered, and within the established limits, it has become possible to use a mother tongue that is understandable to students (Meiring & Norman 2002: 28). Also, in the People's Republic of China, the language of instruction has begun to be used only in the interpretation of difficult phrases and structures as an exception in the teaching of English. (Ministry of Education of the PRC 2000) ...

Based on the data, the analysis of the amount of use of the medium language in the process of teaching a foreign language by the teacher can lead to the following indicators:

 - Turnbull (reported in Turnbull 2001; Turnbull & Arnett 2002), who served as president of the Canadian Foreign Language Teaching Association, reported a 28% increase in the use of English as an intermediate language in teaching French in his Canadian schools by analyzing French lessons. He says it was up to 76%. The following facts are given as factors:

• Non-professional organized educational process;

• "Acknowledging" that the teacher cannot use a foreign language (Mitchell (1988: 28));

• Maximum use of language is not the main goal (Turnbull & Arnett's (2002: 211)

At this point, "When and why does a teacher need to use mother language? The answers to the question can be divided into three main categories:

1. Establish constructive social relations;

2. Explain complex structural meanings to provide understanding and or save time;

3. Provide control over the learning environment.

Meiring & Norman, based on a series of studies on foreign language teaching (2002: 32), noted that a teacher's use of the mother tongue in the classroom provides students with a "sense of comfort" and "psychological support."

S.-H. Kim & Elder (2005) distinguish between 'core goals' (teaching the target language) and 'framework goals' (managing the classroom situation) and Pennington (1995) differentiates between teachers' 'compensatory use' of the L1 (responding to a perceived problem) and 'strategic use' (serving a pedagogical purpose). While Atkinson argued that mother language would be the greatest risk if it dominated the foreign language teaching process, Butzkamm argued that using it "regularly, selectively, and in reasonable amounts" could be the best solution in foreign language teaching.

3. THE METHODOLOGY OF USING MOTHER LANGUAGE

While teaching foreign languages various methods are always used depending on the purpose of the lesson. Considering that there is no need to use a intermediate language in the Audio-lingual and Direct methods, and that it is not possible to replace a intermediate language in the Grammar-Translation method. Grammar Translation and Communicative Language Teaching are opposite to each other totally. The classroom is often the only place that foreign language learners receive L2 input, as they live in a country where their L1 is spoken. As a result, one major argument for not using the L1 in the foreign language classroom is to maximize L2 input, given that the students have no other source from which to get this input (Cook, 2001; Ellis, 2008). Therefore bilingual teaching methods are introduced and implemented such as using the "sandwich technique" (foreign language - native language - foreign language) in organizing and presenting dialogues to help students clearly see the differences between their native language and a foreign language; (this technique was introduced by linguist Dodson (1972)).

On the other hand, teaching languages is not only consists of grammar and lexis but also non-linguistic contexts are very important in delivering meaning such as metaphor, allegory, weather and mood of the speaker.(Hilal Abdul-Raziq Sadiq, Omonova Shakhnoza)

As students' level of language awareness increases, so does the amount and style of intermediate language use. Recognizing that intermediate language use strategies must be based on language and its characteristics to achieve the goal, the following suggestions can be made:

• Recognize that the use of intermediate language can serve as a bridge between new and already familiar knowledge, increasing students' general awareness;

• Always determine the amount of intermediate language to be used, depending on the language teaching methods;

• Emphasize that the Bilingual Method should be used primarily by the teacher, not by the learners.

4. CONCLUSION

Some teachers don't allow mother language to "enter" the lesson but actually it is in minds. The target language is a part of mother language, postman is a man who carries letters with him in

English and in Arabic or in Uzbek meanwhile we can use pictures and gestures instead of mother language. This issue should be explored thoroughly determining the effects of L1 use on L2 acquisition but one thing for sure that we don't need to change our L1 but our attitude to using the target language.

SOCIETY AND HUMAN PHILOSOPHY

Aripova Zulfiya Solijonovna*

*Associate Professor,
Andijan Institute of Mechanical Engineering,
Candidate of Philosophical Sciences,
UZBEKISTAN

ABSTRACT

Achieving the harmony of the tasks of building a free and prosperous society in Uzbekistan through the acquisition of modern knowledge and high human qualities is the main criterion of all our educational work and the important task before it.

KEYWORDS: *Society, Development. Uzbek model. Society and family. The social structure of society. Man. Human. Person. Social space. Human interests. Social needs. Democratic needs. Reforms and man*

INTRODUCTION

There are words for community, community, and community in our language. It is a phrase that means everyone is gathered together. For example: church jam. People are gathered. A total of ten people. The word jam is also used in the sense of addition. A community is a group of people in a neighborhood, a village, an institution, an organization, or an enterprise. The term community differs from church in meaning. There are people in the church who have different views, and in the community there are people who have the same goal, the same interests. For example, a congregation is a group of people who pray in the same mosque. The word community is public, literary community, student community, and so on.

Society is a set of social relations that are formed at a certain stage of human historical development. The most important of the social relations is the economic relations, which determine the forms of social consciousness, which are the real basis for political and legal supremacy. It is true that the development of a society is a natural-historical, legal development.

Society is the most general scientific and philosophical term for a social association of people who consciously have language and speech on the basis of the division of social labor, and who feel the need for each other's social support.

There are various definitions of society as a part of nature, that is, a social being, a special form of human association, a collection of many relationships that exist between people. Society is a complex system that is constantly evolving and improving. In each new era, there is a need to know the essence of society. National independence has created a need for a new understanding of society. In a number of works of the first President Islam Karimov, the methodological basis for a new understanding of the essence of society has been created. Society is a union of material and spiritual factors. Until now, material and spiritual life have been very different in the literature. However, the essence of society is inextricably linked with the human nature that makes it up. Just as the human body cannot be separated from its spirit, so it is illogical to separate the material and spiritual aspects of society from one another and to put one of them above the other. Man's material needs include food, clothing, shelter, transportation, self-defense, and procreation. Spiritual needs include knowledge of the world, self-awareness, worldview, striving for wisdom, striving for knowledge, art, ideas, ideology, beauty, and spiritual maturity. The essence of man is manifested in the satisfaction of material needs in cultural forms. Man, as an intelligent being, seeks to know the essence of nature and society in order to satisfy his material needs in cultural forms, to harmonize the material and spiritual worlds, and to change nature and society in accordance with his goals. Science and technology serve as an important tool for meeting the spiritual and material needs of man. It is only through high spirituality that man is able to satisfy his needs rationally and fully in cultural forms.

That is why our country pays special attention to spirituality. The material and spiritual life of a society is inextricably linked with the material and spiritual needs of the people.

Society, like macro and micro bodies, is a self-organizing and self-governing system. As a result, the system exists and evolves according to certain laws.

The transition of two man to a family based on monogamy, the formation of clans, tribes, ethnic groups (peoples, nations and the satisfaction of their material and spiritual needs in these units) are legal processes. production relations, each society has its own base and superstructure, market economy relations (which are studied in detail in economic theory and sociology) - these social phenomena are, of course, historically formed spontaneously under the influence of social laws. The application of the laws of society is linked to the conscious activity of the people and their associations. The laws of society can be divided into the most general, general and special (partial) laws. The interrelationships that are reflected in the laws and categories of philosophy are also reflected in social life. Consequently, knowledge of the most general laws, categories, and principles makes it possible to govern society scientifically. Laws that are equally valid in the historical development of mankind, in social, economic, and national conditions under similar conditions can be called general laws. For example, the law of proportionality between material production and the creation of spiritual wealth refers to the relationship between the two roofs of market relations or between needs and interests. In order to have a clear idea of the specific stages of development and decline of a particular society, it is necessary to understand the specific (partial) social laws. The degree to which such laws apply is limited to a particular place and time, and they differ in the expression of the connections inherent only in certain stages of the development of society.

For example, in the former Soviet Union, the so-called planned proportional law was blocked with the end of the state. Or the fact that general laws, such as the law of proportionality

between supply and demand, competition-based relations, are unique in the context of Uzbekistan, which makes them special. The five principles of transition to a market economy in Uzbekistan, founded by the first President Islam Karimov, make all laws unique. In general, the most general, general, and special laws are dialectically related to each other, and they both recognize and exclude each other. There are various theories in the history of philosophical thought about the nature and development of society. We know that in ancient Central Asia, the sacred book of Zoroastrianism, the Avesto, which originated in ancient times, advocated the establishment of a moderate society, and the state in such a society was called the ideal state. Ancient Turkish mythology also has a remarkable view of a just, prosperous society and state. The ancient Greek philosopher Plato believed that it was necessary to build an improved human society, an ideal state. Abu Nasr al-Farabi, who grew up in Central Asia, in his book The City of Noble People created a doctrine about the origin, purpose and tasks of society. Thinkers such as Abu Rayhan al-Biruni and Abu Ali Ibn Sina explained the reason for the emergence of human society with the development of a sense of solidarity with man's weakness over other beings. There are various theories in the history of philosophical thought about the nature and development of society. In particular, the German philosopher I. Kant explained the formation of society by the formation of morality. G. Gegel linked the reasons for the formation and development of society with the development of the absolute spirit, L. Feserbach linked religion with the development of religious consciousness. The French thinker O. Kant explained the reasons for the development of society with three stages of human spiritual development (geology, metaphysics, positive stages). K. Marcas connected the causes of the development of society with the class struggle and revolutionary changes, explained all social phenomena and processes from a class point of view. He artificially generalized social conflicts and proposed a social revolution and the abolition of the property class as the main way to resolve conflicts. Social practice shows that such a theory is one-sided. The origin, nature, and place of man in society play an important role in the system of philosophical problems. Different philosophical teachings have different interpretations of these issues. It was natural, too, because man, as an essentially socio-historical and cultural being, strives for a deeper understanding of himself in every new historical context, for the realization of his human nature.

Socrates' wise saying, "Know thyself," takes on a new meaning in every historical period. Man is also one of the main themes in the history of Eastern philosophy. For example, in Pharoah's philosophy, man is interpreted as the product of the development of the whole being. The thinker shows that all the noble qualities of man are due to science, that the meaning of human life is to be happy and to strive to be happy, and that this can only be achieved through knowledge and enlightenment. Beruni and Ibn Sina tried to prove that the superiority of man over other beings is due to reason and thinking. In contrast, Abu Hamid al-Ghazali shows that this superiority is not in the mind but in the human heart; the perfect man was one of the main ideas in the teachings of mysticism, which sought to prove the limitations of the mind. It is said that this perfection is manifested mainly in spiritual perfection, spiritual uplift, and the ability to control one's physical desires. In Eastern philosophy, views on man developed inextricably linked with Islamic ideas, oriental thought and way of life. Eastern thinkers viewed man as part of a general philosophical problem. In contrast, in Western philosophy, man was viewed primarily as a biological being, the product of evolutionary changes in nature. According to the teachings of the Russian naturalist V.A. Vernadsky, the human mind as a great geological factor accelerated the development of nature, the fate of all life depends on human intelligence and

morality. E. Fromm, one of the great representatives of modern philosophy, considered pure and sincere love for man as an important factor in establishing relations of peace, harmony and cooperation among the peoples of the world; the ability to love as one of the most important human abilities shows that the most important of the arts is the art of love. According to the philosopher, a person can cultivate and improve the ability to love others.

The conclusion of modern anthropological philosophy about the nature of man is as follows:

1. Man is unique and universal in nature. He is a great product of the development of nature, a possessor of unique abilities. Man is endowed with instinct, delicate taste, majesty and creativity.

2. In man, the inner and outer worlds are integrated. The inner world of man is manifested in various forms of activity - labor, communication, art, behavior, and so on.

3. Man is a whole made up of many parts. Every human being has a naturalness, a sociality, an intelligence, an emotionality, a morality.

4. Man is a historical being. It is with this quality that he creates his future. One is always anxious about the future, because it is always followed by crises and failures.

5. There is no escaping the sense of responsibility. He can only get out of this situation by combining a humanistic position and individuality.
