ABSTRACT

Currently, most developing countries are facing the critical issue of under-performance of the public sector in their development process due to the lack of resources in the government. Therefore, the main purpose of this study is to discover the relationship between managerial characteristics and entrepreneurial orientation, and the factors that are affecting to enhance the effectiveness of the public sector in Sri Lanka via using the concept of managerial characteristics

and entrepreneurial orientation of the executive level employees based on the case study of the Ministry of Education, rather than increasing public funds. In this research, factors such as Innovativeness, Risk Taking and Pro-activeness are used to assess the Entrepreneurial Orientation, and Participatory Decision Making, Performance-based Rewards and Managerial Autonomy used to evaluate the managerial characteristics. Further, this study was used mix method and collect both quantitative and qualitative data. Meanwhile, 94 educational administrative officers filled the structured questionnaire, and participated to the interviews in the data collection process. Moreover, the authors followed both SPSS 20 version, and 'conversation-based content analysis' to analyse the collected data. Finally, as findings of the study, the authors revealed that, still, the Sri Lankan public sector consists of employees who are willing to contribute to the development of the country, but they do not have a space, and the Sri Lankan public sector can develop by changing the attitude of the public officers and managers in Sri Lanka rather than increase the public resources.

KEYWORDS: *Entrepreneurial Orientation, Participatory Decision Making, Performance-Based Reward, Managerial Autonomy*

INTRODUCTION

According to the Reforming Public Institutions and Strengthening Governance Report (2000) published by the World Bank, before 1990s, South Asia had an effective public sector due to the good governance, public institutional reforms, the consolidation of the democracy between South Asian countries and etc... However, unfortunately after the 1990s, some salient characteristics of the South Asian region such as poverty have acted as a barrier for this process. As a result, all countries in the South Asian region including Sri Lanka, are now encouraging the reduction of this poverty level by allocating more resources and money in order to increase the living standard of the people. Due to this reason, the effectiveness of the public administration system in Sri Lanka is continuously declining as consequences of the lack of resource, poor public management and etc... (Fernando, 2005: Reforming Public Institutions and Strengthening Governance report, 2000).Therefore, the factor of ineffectiveness of the public sector is remaining as the main barrier to provide quality public services in Sri Lanka (Fernando, 2005).

Hence, in terms of eliminating the ineffectiveness of the public sector in Sri Lanka, it is necessary to find alternative strategies to enhance the effectiveness of the public sector while widening access to resources rather than totally depending on the government. A deep analysis of the current public sector in Sri Lanka, indicates that Sri Lanka can increase the skills and attitudes of public administrative officers by using the concept of public entrepreneurship as an alternative option instead of allocating additional investment on the development of the public sector (Fernando, 2005; Algewatte & Weerasinghe, 2015).

LITERATURE REVIEW

Public Entrepreneurship

When transforming the concept of public manager into public entrepreneur, initially Roberts &King stated that 'public entrepreneurship is the process of introducing innovation' (1991, 147).

However, again in the same year this concept was extended by Roberts & King, mentioning that the Public entrepreneurship combination of introducing innovation as well as generating, translating, and implementing new ideas into the public sector. Moreover, prior to1984, Polsbystated that a public entrepreneur is the person who is responsible for identifying the problems and finding technical solutions in the public sector. According to Polsby (1990) and Kingdon (1984), perspectives such as, mainly discovering the problems, defining and exploring the answers for those issues, preparing the proposals by including their ideas and establishing those ideas as public policies are the key duties of public entrepreneurs.

Apart from that, after the year 2000, the concept of public entrepreneurship wasshaped as a value creation process. For example, in 2005, Fox stated that public entrepreneurship is a process of creating values to the community by combining limited and unique resources to satisfy the requirement of the society, and in 2007 Bernier, Hafsi & Schnellenbach explained that public entrepreneurship is increasing the value of the public services and it can create new political paradigms. Further, Zampetakis & Moustakis (2010) stated that a pubic entrepreneur is a civil servant who creates a value to the social system, and Klein et al. (2011) mentioned that the main purpose of public entrepreneurship is to achieve social objectives by utilizing limited resources. Hisrich & Al-Dabbagh (2012) enriched all the above ideas by explaining that public entrepreneurship is adapting, innovating, and taking risk in terms of the wellbeing of the society.

Entrepreneurial Orientation (EO)

Fox (2005) claims that Entrepreneurial Orientation (EO) in the public sector is an employee's commitment to the intensity of the entrepreneurial actions such as taking new challenges, getting involved in risky projects and completing the projects in an innovative manner, and actively participating in the organizational development. The concept of EO is associated with risk taking, handling economic uncertainty, planning, innovation, coordination and control. Most of the time, researchers have considered three dimensions to interpret EO, namely, risk taking, innovativeness and pro-activeness (Kim, 2010). Hence, EO is a process that motivates employees to innovate, take a risk and be pro-active towards the achievement of goals of the organization.

Basically, innovation is "an idea, practice, or project that is perceived as new by an individual or other unit of adoption" (Rogers 2003, 12). From the public entrepreneurship perspective, innovativeness mostly involves resolving the emerging problems in the government or a public organization by converting government organizations into self-sustaining or profit making organizations (Fox, 2005). Further, it provides the existing services and performs its management processes in an innovative manner and by re-conceptualizing existing resources even though not oriented to income generation. Despite this, Generally, public sector employees are risk avoiding decision makers. They do not encourage with the logic of the greater the risk, the greater the reward. Considering the factor that public sector pro-activeness, the public sector requires to search for creative solutions, introduce changes to the organizations and respond rapidly to the challenges (Morris et al, 2002). Despite to this, Kelman (2008) mentioned that more rules, controls, and constraints are acting as a barrier for the innovations, risk taking and pro-activeness, but overall these above three concepts help to satisfy the stakeholder expectations, and innovativeness that directly affect to create the public value (Moore, 2014).

Managerial characteristics of the public administrative officers

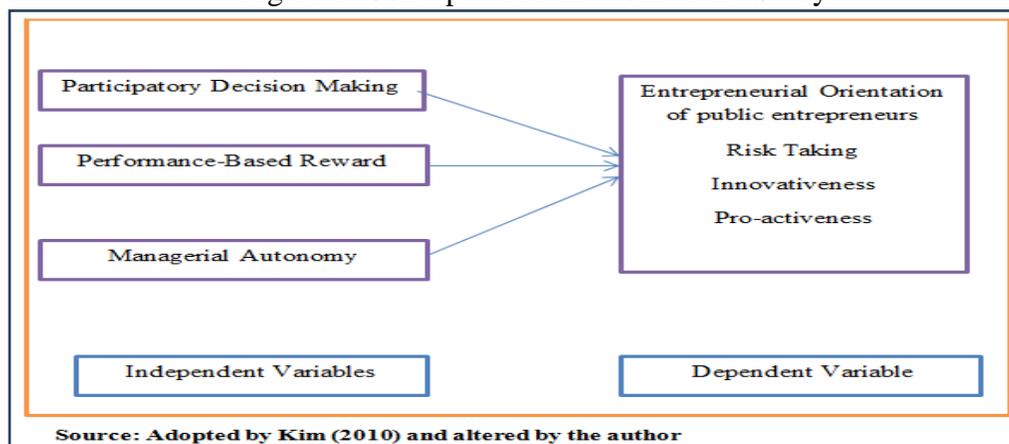
On the other hand, this study mainly focuses on improving managerial characteristics of public administrative officers and aligning with the concept of Entrepreneurial Orientation. Gupta & Govindarajan (1989) mentioned that managerial characteristics are always linked with the requirements of the job, and Liu & Ravichandran (2007) have indicated that organizational practices and policies determine the capabilities and knowledge that surround executive level employees of the organization. Accordingly, the authors of this study selected the three organizational practices and policies Viz: 1) Participatory Decision Making, 2) Performance-Based Reward system and 3) Managerial Autonomy as determinants of public sector entrepreneurship.

The participatory decision making provides the chance for all employees to contribute in the decision making process and take part in all the decisions. The process of participatory decision making is always balancing ideas between the managers and subordinates. Further, participatory decision making directly influences to make innovative decisions (Andrews et al, 2007). Gati & Atambo (2017) explained that performance-based reward system is a good concept in terms of motivating and controlling employees, but in the real world the applicability of a performance-based reward system into public organizations are at a low level. Public institutes can offer financial as well as non-financial rewards such as employee recognition and emotional rewards for encouraging participatory decision making (Kim, 2010). The presence of a performance-based reward system supports to generate the entrepreneurial behaviors among the employees via improving their innovative and proactive orientation. Autonomy is the freedom for independent actions. Employees have the freedom to make their own decisions related to their duties and responsibilities under the workplace autonomy (Kim, 2010).

METHODOLOGY

The main focus of this research is to find the relationship between the managerial characteristics and EO (Entrepreneurial Orientation) of the executive officers in the educational service, Ministry of Education, in Colombo district. Therefore, the authors of this study followed the Kim (2010) conceptual framework as below in Figure 1.

Figure 1: Conceptual Framework of the Study

Source: Adopted by Kim (2010) and altered by the author


According to the above conceptual framework, managerial characteristics of the executive level employees and EO are the independent and dependent variable respectively. The authors used three managerial characteristics in terms of assessing the independent variable namely, participatory decision making (PDM), performance based reward (PBR) and managerial autonomy (MA). On the other hand, EO is measured by using the innovativeness, risk taking and pro-activeness of executive officers in Ministry of Education, Sri Lanka based on the literature review of previous scholars.

However, this study is an exploratory research, and authors used both quantitative and qualitative research methods in order to find the relationship between Managerial characteristics and EO of the executive level officers in Ministry of Education, Sri Lanka, and to identity the factors those are effecting to EO of the officers in the public sector in Sri Lanka respectively.

Therefore, this study has three hypotheses which derived through the conceptual model of the study.

Hypothesis 01:

There is a relationship between PDM and EO of executive officers in the educational service

Hypothesis 02:

There is a relationship between PBR and EO of executive officers in the educational service

Hypothesis 03:

There is a relationship between MA and EO of executive officers in the educational service.

Population, Sample and Data Collection of the Study

The both population and sample of this study consisted of 94 officers in the educational administrative service of the Ministry of Education in the Colombo District, Sri Lanka, because currently, 94 executive officers are working under the Ministry of Education.

Apart from that, authors distributed a structured questionnaire among the executive officers in Ministry of Education in terms of collecting the quantitative data. However, when filling the structured questionnaires authors realized that there are some hindering factors within the Ministry of Education which are effecting to the performance of the officers. Therefore, as same time, authors conducted interviews with those officers. Further, the Table1 represents the structured questionnaire of this study.

TABLE 1: STRUCTURED QUESTIONNAIRE USED BY AUTHORS

Innovativeness	
IN1	Do you get new innovative ideas when working in the organization or not?
IN2	Do you tell those innovative ideas to the top management or not?
IN 3	Does your department encourage you to implement those new ideas or not?
IN4	Do you give your creative ideas to introduce new services for the education sector or not?
IN5	Do you support the management by proposing innovative strategies to improve the process and procedures or not?
Risk Taking	

RT1	In dealing with high risk, do you believe that risk taking adds value to your career life or not?
RT2	In my peer-grouIf you are in a peer group, when the management gives a challenge to you, do you accept that challenge or not?
RT3	Are you involved with high risk activities to complete the achievements for your career life or not?
RT4	Do you always take responsibilities and accountabilities in high risk projects or not?
RT5	Do you always take the challenges of changing according to the situation or not?

Pro-activeness

PA1	Do you use creative solutions to solve problems or not?
PA2	Do you have an environment sensitivity to identify the environment changes before they happen or not?
PA3	After you identify the opportunities in the public sector, do you inform those opportunities and quickly take actions to get benefits out of the identified opportunities or not?
PA4	Do you always closely monitor the new trends in the public sector and identify future needs of community or not?
PA5	Do you always deal with change, introduce new services, process as an initiator when compared with the your peers or not?

Participatory – Decision Making

DM 1	She/he prefers o Do you always take decisions by collaborating all the ideas given by employees or not?
DM 2	Do you ask for employees' ideas after you make the decision or not?
DM 3	Do you conduct separate meetings with employees to get their ideas or not?
DM 4	Do you maintain an effective communication process to get the decisions or not?
DM 5	Do you get the support from all the employees when making a policy or not?

Performance – Based Reward

RS 1	Do you get salary increment based on your performance or not?
RS 2	Do you get promotions based on your achievements or not?
RS 3	If your performance is good, does your department give rewards to you or not in the organization?
RS 4	Does your government give awards to you when you are engaging with innovativeness in the public sector or not?

Managerial Autonomy

MA 1	Does your department give duties and responsibilities to you to complete or not?
MA 2	Do you have an ability to complete the given task successfully or not?
MA 3	Do you have political interference in your work or not?
MA 4	Does your organization provide a chance to you for accessing important information within the government?

Moreover, this structured questionnaire was developed by the authors based on the literature review and the well-established questionnaire in quantitative researches, relating to public entrepreneurship and entrepreneurial orientation. After collecting both quantitative and qualitative data, the authors used SPSS 20 version software in terms of measure KMO and Bartlett's test value, Factor Analysis, Cronbach's Alpha value and correlation coefficient to find the validity, reliability and relationship between the independent and dependent variable respectively. On the other hand, authors followed conversation-based content analysis in terms of analyzing the case by case interviews.

RESULTS AND DISCUSSIONS

When analyzing the quantitative data, Table 2, Table 3, Table 4 presents the result of Kaiser-Meyer-Olkin value and Bartlett's Test of Sphericity value, Factor Loadings for Each Variable, Cronbach Alpha for the Variables and Pearson Correlation between Independent and Dependent Variables respectively.

Below

TABLE 2: RESULTS OF KAISER-MEYER-OLKIN VALUE AND BARTLETT'S TEST OF SPHERICITY

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.746
Bartlett's Test of Sphericity	Approx. Chi-Square	1.157E3
	Df	325
	Sig.	.000

Source: Based on Survey Data

TABLE 3: FACTOR LOADINGS FOR EACH VARIABLE

Variable	Validity
Entrepreneurial Orientation	0.757
• Innovativeness	0.802
• Risk Taking	0.751
• Pro-activeness	0.786
Participatory Decision Making	0.673
Performance Based Reward System	0.729
Managerial Autonomy	0.536

Source: Based on Survey Data

TABLE 4: CRONBACH ALPHA FOR THE VARIABLES AND DIMENSIONS OF THE STUDY

Variable	Reliability
Entrepreneurial Orientation	0.809
Innovativeness	0.770
Risk Taking	0.792
Pro-activeness	0.751

Participatory Decision Making	0.681
Performance Based Reward System	0.719
Managerial Autonomy	0.540

Source: Based on Survey Data

TABLE 5: PEARSON CORRELATION BETWEEN INDEPENDENT AND DEPENDENT VARIABLES

Independent Variable and Dependent Variable	Pearson Correlation Value	Significantly positive / Negative	Strong/ Moderate/ Weak Relationship
PDM and EO	0.565	Significantly positive correlation	Moderate Relationship
PBR and EO	-0.069.	Significantly negative correlation	Weak Relationship
Au and EO	0.076	Significant positive correlation	Weak relationship

Source: Based on Survey Data

According to the above tables, the sample adequacy of this study is 0.746, the factor loading values of this variable all are above 0.5, and the values of Cronbach Alpha for all variables are above 0.6. Further, this analyzed data presents the significantly moderate positive correlation between PDM and EO, significantly weak negative correlation between PBR and EO, and significant positive correlation but week relationship between Au and EO regarding the Pearson Correlation values.

FINDINGS

After analyzed the quantitative data, the authors discovered that,

- There is a significant positive relationship between Participatory Decision Making and Entrepreneurial Orientation of the Educational Administrative Service officers, Ministry of Education in Colombo District, Sri Lanka. The findings of previous research done by Fernando (2005), Alagewatte and Weerasinghe (2015) proved that participatory decision making result supports Entrepreneurial Orientation.
- There is a significant weak negative relationship between Performance- Based Reward and Entrepreneurial Orientation of the Educational Administrative Service officers, Ministry of Education in Colombo District, Sri Lanka. According to the research results of Fernando (2005) proved that Performance-based Rewards System has a negative, significant relationship with public entrepreneurship. Further, Kim (2010) found that performance-based reward was not significantly related to the entrepreneurial orientation of the public entrepreneurship.
- There is a significant positive relationship between Managerial Autonomy and Entrepreneurial Orientation of the Educational Administrative Service officers, Ministry of Education in Colombo District, Sri Lanka. The previous researchers stated that managerial

autonomy boosts the entrepreneurial orientation. In the studies of Fernando (2005), Alagewatte and Weerasinghe (2015) mentioned that there is a positive association between the Managerial Autonomy and Entrepreneurial Orientation.

However, these quantitative results are not representing the actual problems which are affecting to the employee's performance at Ministry of education, Sri Lanka. Therefore, the following facts were revealed by the authors by analyzing interviews given by employees in Ministry of Education.

UNDER INNOVATIVENESS:

- When conducting the interviews with the education administrative officers at the Ministry of Education, those officers indicated that they get the new ideas when working in their organization as a result of their education background and the experience of the public sector, and most of the time they found the efficiency and effective methods to provide better services to the society via internet.
- However, those officers have a limited chance to express their innovative ideas to the top level management, since they meet their top level management at the formal meetings and those formal meetings are well-structured, and they discussed points that they pre- decided.
- As a result of that, some officers explained the generated new ideas into their peer groups, and some use the informal discussion with the top level management to describe the new idea.
- Although, most of the administrative officers who participated in the interviews are more supportive, and they like to improve the process, procedure and the performance of the public sector, they are also fed up with the current system. Hence they prefer to implement those new ideas, but they do not have the opportunity for that. In addition to that, when the interviewer asked about the reasons as to why they cannot implement their new ideas into their organization, most of the officers indicated that they do not have enough time and space to express their ideas, and, that a lot of employees in the top managements are working according to their private agendas; and some officers mentioned that there were some political influences as well.

Next, the interviewer moved to the variable of risk taking.

- Overall, the officers do not have a positive attitude towards risk taking, but when asking questions, they believe that risk taking shapes the life of people, creates entrepreneurs, and adds value to their career life too. Some officers also related stories of successful people who take the risk and win in their life.
- Moreover when asking the question related to the acceptance of the challenges, all the officers stated that they like to take challenges that are only related to their duties and responsibilities.
- Similarly, the administrative officers do not like to accept responsibilities and accountabilities in high risk projects. However, some asked the question as to why they need to take high risks to lose their jobs.
- However when asked the question 'Do you always take the challenges of changing according to the situation or not?' all the officers said that they are accepting the challenges, and they

change according to the situation also, but with those types of challenges they only take calculated risks.

Then, according to the, concept of Pro-activeness:

- The interviewed officers accepted that they have environment sensitivity to identify the changes that happen in the education sector, and they are using creative solutions to provide the answers for those changes.
- Then in the next question relating to the opportunity identification of the public sector and inform and quickly take actions to get benefits out of the identified opportunities, the officers stated that they identify the opportunities and inform those in the top level management, but after that those officers are not taking the responsibility and they do not even know about what happens after that. However, some officers mentioned that due to the rigid rules and regulations, and the long hierarchy of decision making process in the public sector, they cannot take a quick decision regarding the opportunities that they recognized. As a result of that some officers did not even express opportunities that they understand.
- This situation is similar to the next questions which is 'Do you always closely monitor the new trends in the public sector and identify future needs of the community or not?, since most officers said that they closely monitor the new trends and future needs but the implications of strategies into those new trends are questionable.
- Then, into the last question of 'Do you always dealing with change, introduce new services, process as an initiator when compare with your peers or not?' the officers accepted that and explained some examples that they implemented in their departments.

Thereafter, with the theme of Participatory – Decision Making:

- The officers explained that they conduct weekly, monthly scheduled meetings at department level, and in those meetings, all the officers and employees get together and discuss their department matters and finally get the collaborative decisions. Sometimes, when conducting these meetings the officers asked the ideas from their subordinates about the decisions he or she had already taken, and improved those further with their ideas.
- However, they are not separately conducting the special meetings to get the employees' ideas at the department level, but the officers have meetings with the top level management and provide their views. Here, some young respondents said that those ideas and expressions totally depend on the seniority of the services.
- Other than that, all the officers accept that the Ministry of Education has a good communication channel, but similar to the other public organizations, the speed of decision-making is slow.
- Except for these points, the officers mentioned that most of the time, top level management is the group who is responsible for policy making and they also contribute to that process if there is a necessity.

Then, the interviewer moved to the Performance – Based Reward:

- The officers accepted that they did not get the salary increments and promotions based on their performance and achievements respectively. In addition to that most of them mentioned that the promotions they get are by considering the seniority, not the work that they have done.

- On the other hand, they stated that they did not get any formal rewards or awards for their service, but they get the informal, individual appreciation from the top level management. However, it also depends on the top management preferences.
- Thereafter, all the officers expressed that the government does not give any awards to them, but some officers said that they get the foreign training as a government award. Nevertheless, most of the officers rejected that idea, and mentioned that foreign training is not an award.

After that under the final theme of Managerial Autonomy:

- The officers disputed that the department and top level managers both provide the duties and responsibilities to them to complete, and all the officers believe that they have ability to complete the given task successfully.
- Next, especially with the question of 'Do you have political interference in your work or not?' most of the officers did not like to disclose the information regarding politics, but some senior officers mentioned that the effect of political influences are changing according to the importance of each and every department. For example, the department which is giving admission to the school children has more effect, but the department that is responsible for the entertainment subjects in schools has few political influences.
- Finally, into the last question 'Does your organization provide a chance to you to access important information within the government?' the officers mentioned that they have full authority to access and search for the information.

However, in addition to the interview guild line, the authors realized that there are special officers who have completely different attitudes and beliefs on these interviewed concepts.

If one were to delve deep to find reasons for this issue, within in the Ministry of Education, there is an answer. In the Ministry of Education, there are two categories of officers. There are limited and opened officers, and the limited officers started their career life as a teacher, and they worked at several schools under different conditions and finally they became a principal or vice principal. While they were in the school teaching, they sat for the education administrative officers' examination and got the appointment at the Ministry or Education as education administrative officers. Nevertheless, the opened officers have never ever worked in the school and they directly completed their bachelors and sat for the education administrative officer examination and were selected to the Ministry of Education.

Therefore, when talking with those limited education administrative officers, they explained their experiences when working as principals, and how they work in the school. With those stories they mentioned that they work using more innovative and pro-active ways when working with the students, especially with the limited resources and under the supervision of the Ministry of Education. Then, one of the officers explained that she took lots of risks during her time and now she is satisfied with what she did for that school. In contrast, some officers indicated how they took the decisions with the teachers, students and their parents. Finally, all of the limited officers expressed that they had more autonomy as a principal and they worked hard, but they are more satisfied with those works when compared to their present position.

Nevertheless, with all these ideas, all the education administrative officers accepted that the concepts of innovativeness, risk taking, pro-activeness, participatory decision making,

performance based reward system, managerial autonomy are impacting to enhance the entrepreneurial orientation of the public administrative officers.

Results

When summarizing the above findings:

Entrepreneurial Orientation		
Innovativeness	IN1	Executive level employees in the Sri Lankan public sector have new innovative ideas
	IN2	Officers tell those innovative ideas to top management
	IN 3	Department is encouraging employees to implement those new ideas but process is slow
	IN4	Officers provide those creative ideas to introduce new services
	IN5	Officers support the management by proposing innovative strategies to improve the process and procedures
Risk Taking	RT1	Officers know that risk taking is adding value to their career life
	RT2	Officers like to take the challenges to complete their responsibilities and duties
	RT3	Officers hesitate to take risky projects
	RT4	Officers do not like to take on responsibilities and accountabilities in the high risk projects
	RT5	Officers take the challenges of changing according to the situation
Pro-activeness	PA1	Officers use creative solutions to solve problems
	PA2	Officers have a high level of environment sensitivity
	PA3	Officers identified the opportunities but cannot take the advantages through that
	PA4	Officers are closely monitoring the new trends
	PA5	Officers are dealing with changes.
Managerial Characteristics		
Participatory Decision-Making	DM 1	Officers are taking decisions by collaborating all the ideas
	DM 2	Officers are asking for the employees' ideas after they take the decision
	DM 3	Departments do not conduct the separate meetings
	DM 4	Ministry has effective communication process
	DM 5	Officers support to make the policy
Performance – Based Reward	RS 1	Officers do not get salary increment based on their performance
	RS 2	Officers do not get promotions based on their achievements
	RS 3	Departments do not give rewards to officers
	RS 4	Government does not give awards to officers

Managerial Autonomy	MA 1	Departments give duties and responsibilities to officers
	MA 2	Officers have an ability to complete the given task successfully
	MA 3	Officers have political interference
	MA 4	Ministry provides a chance to officers for accessing important information within the government
However, officers accept that innovativeness, risk taking, pro-activeness, participatory decision making, performance based reward system, managerial autonomy to enhance their attitudes and skills.		

CONCLUSIONS AND RECOMMENDATIONS

The concept of "Public Entrepreneurship" is an alternative option for solving most problems associated with the government ineffectiveness and resource inadequacy (Fernando, 2005: Algewatte & Weerasinghe, 2015).Therefore, Sri Lankan public sector should develop an entrepreneurial culture within their organization by changing the current attitudes of the public officers. Except for that, to adopt the public entrepreneurship and enhance the entrepreneurial orientation among the executive level employees in public service in Sri Lanka, public managers need to develop an innovative culture within their organization by encouraging the officers in terms of implementing their innovative ideas into the real situation, and public managers should provide the chances to their subordinates to improve the existing process, procedures in their organizations by using their new ideas. Bernier, Hafsi, & Deschamps (2015) mentioned that innovation is vital to provide effective services to the society.

On the other hand, top level management of the public organization should be visionary leaders who can see the unseen future and public managers should be good listeners to their employees. Then the officers become more pro-active and they are encouraged to share their thoughts with the top level. Parallel to this process, the top management needs to take quick decisions in order to gain the benefit out of the identified new opportunities by the officers. As a result of this the public organizations can increase their performances, and indirectly, this will support the increase in the level of participatory decision making within the public sector. Kim (2002) stated that through the participatory style, public organizations can develop the individual productivity, reduce the cost of absenteeism and employee turnover, improve quality of work life and job satisfaction.

Further, the Sri Lankan public sector needs to modify the existing reward systems in to performance based reward system and public sector managerial officers are really dissatisfied with the existing rewards. Especially, those officers are now expecting non-financial rewards such as reputation, image, and appreciation rather than the financial rewards. As evidence, Gati & Atambo(2017) proved this idea through their research by stating that the public sector needs to implement the performance-based rewards in terms of public service motivation. Other than that the government needs to appreciate honest public officers. Then other officers also become honest and public servants withintegrity.

Finally, with the support of all these changes, gradually the public officers can change their attitudes towards their jobs and pubic officers and public managers can convert to public

entrepreneurs. As a result of that, the public officers try to create more value to the existing public sector as well as Sri Lanka in future.

ABSTRACT

This article describes the process of adsorption purification of paraffin using ultrasonic sounding, which coincides and meets the requirements of explosion and fire safety of this production. Descriptions of the researches conducted on assembled ultrasonic magnetostrictive installation on the basis of UZG-10 M generator are provided. During the experiments, the effects of the time-frequency and the intensity of ultrasonic sounding on the parameters of the purified paraffin were studied. The results of the study of the effect of the ultrasonic exposure frequency on the physicochemical indices of purified paraffin and the change in the qualitative indices of purified paraffin depending on the ultrasonic sounding time are presented in the form of tables.

KEYWORDS: *Paraffin, the Contact Cleaning Method, Adsorbent, Generator УЗГ-10 М, PMS-6 Magnetostrictive Emitters.*

INTRODUCTION

It is known that molten paraffin in the industry is cleaned by contact method using polar and non-polar adsorbents. These adsorbents have different pore sizes and volumes, which are filled more intensively in the presence of ultrasonic cavitation than in the case of conventional phase mixing. There are optimal modes of ultrasonic influence on the molten paraffin, beyond which can intensify the processes of desorption, etc. Therefore, an experimental method requires

determining and investigating the optimal modes of the paraffin cleaning process on a specific type of adsorbent using ultrasound exposure.

MATERIALS AND METHODS

At a laboratory installation equipped with an ultrasonic emitter, we conducted studies of the process of cleaning paraffin obtained from the Fergana refinery. Experiments were carried out at a temperature of 80-90 °C for 1 hour and in the presence of 4 -% adsorbent of the total weight of paraffin. The ultrasonic frequency was maintained at 25 kHz. The results are shown in Table 1.

TABLE 1. INDICATORS OF THE PROCESS OF ADSORPTIVE CLEANING OF PARAFFIN BY CONVENTIONAL STIRRING AND ULTRASONIC EXPOSURE

№	Type of adsorbent	Colour in cond. piece.	The mass fraction in paraffin, %	Content of aromatic hydrocarbons, %
The usual (traditional) ways:				
1.	Carmine opoka clay	10,5	1,92	0,65
2.	Navbahar carbonate palygorskite	10,0	1,80	0,60
The proposed (ultrasonic) exposure:				
1.	Opoka clay Carmine	8,9	1,75	0,54
2.	Navbahar carbonate palygorskite	8,1	1,67	0,41

As can be seen from Table 1, the use of ultrasound has significantly improved the quality of the resulting paraffin. For example, the colour of the paraffin is reduced by 1.2-1.9 cm compared to the conventional method. the unit, the mass fraction of residual oil in paraffin decreased by 0.13-0.17 % and content of aromatic hydrocarbons - by 0.11-0.19 %. This once again confirms the effectiveness of ultrasonic exposure to improve the quality of purified paraffin. Regardless of the type of mineral used, i.e. the adsorbent, the ultrasonic effect improves the quality of the paraffin to be purified [1-3]. Moreover, the smaller the size of the pores in the mineral, the higher the role and value of the ultrasonic effect on the intensity of the adsorption purification process of paraffin. Ultrasonic action along with the main process of sorption purification of paraffin by the adsorbent can be used in their separation, i.e. filtration. Under laboratory conditions, we studied the effect of ultrasound on the rate of separation (filtration) of paraffin from the adsorbent. The results are presented in Table 2.

TABLE 2. CHANGE OF PARAFFIN FILTRATION RATE BY CONVENTIONAL AND PROPOSED METHODS

Type of adsorbent	Filterability with the addition of 1% adsorbent, ml / 5 sec.
Filtration in the usual way (control):	
Opoka-like clay Carmine Navbahar carbonate palygorskite	13,5 14,3
The proposed (ultrasonic) exposure:	
Opoka-like clay Carmine Navbahar	17,2

carbonate palygorskite	18,5

As you can see from the table. 2, regardless of the type of adsorbent used, when using ultrasonic action, the rate of paraffin filtration is accelerated. This has a beneficial effect on the quality of the resulting filtrate, i.e. refined paraffin. Consequently, the studies carried out to make it possible to recommend ultrasonic action for intensifying the processes of sorption cleaning of paraffin and their filtration, i.e. separation from the used clay adsorbents. Much attention is paid to the quality of the produced paraffin and the expansion of their assortment since the demand for this type of goods is greatly increasing. One of the "bottlenecks" in the production of paraffin (unit No. 43) is the process of their purification using activated adsorbents. In recent years, local activated clays of various qualities have been used at the Fergana refinery for the purification of mineral oils and paraffin. Unfortunately, not all of the produced paraffin meet the current standards, which forces us to look for new ways and ways to improve them [4,5]. Recently, ultrasonic technology has found its necessary application in various industries, moreover, it is often used to intensify technological processes and increase their productivity. In our case, along with the pursuit of the above goals, we decided to study the effect of such an impact on the quality of the obtained paraffin, since this indicator is considered more important for consumers [5-7]. It is known that low-frequency ultrasonic vibrations are more than 16 kHz, and high-frequency ones - up to 10 Hz. Of course, there is no need to study such ranges of ultrasonic action for the paraffin cleaning process.

The problem lies in determining the optimal frequency range of ultrasonic treatment, at which paraffin with a high degree of purification will be obtained. Cavitation is considered an important factor of ultrasonic action on a liquid, in particular, the value of the sound pressure in a liquid depends on it. Taking this into account, we, using an ultrasonic unit USV, conducted a study of these indicators when cleaning paraffin using an activated adsorbent. The results obtained are presented in the table. 3.

TABLE 3. CHANGE IN SOUND PRESSURE VALUES DEPENDING ON THE TYPE OF WAX TO BE CLEANED

Types of paraffin	Density, p, g/cm^3	Sound speed, s- 105 cm/s	Pressure, Ra, atm.
High-sulfur 1	0,789	1,488	4,1
High oil 2	0,780	1,473	3,7
Regular (raw)	0,775	1,469	3,2

[1]Sulfur content 0.22% of the total mass. [2]Oil content 2.0% of the total weight. From table 3 which shows that the composition of the purified paraffin plays an important role in the propagation of ultrasound, i.e. the formation of cavitation. Change in sound pressure values depending on the type of wax to be cleaned.

RESULTS

The results obtained once again prove the importance of determining the optimal values of ultrasonic action on the process of adsorption cleaning of paraffin of various quality. We have studied the main quality parameters of paraffin obtained by adsorption cleaning using ultrasonic

action at a frequency of 20 kHz. The results are shown in Table 6. Qualitative parameters of paraffin obtained with and without ultrasonic treatment.

TABLE 4. QUALITATIVE PARAMETERS OF PARAFFIN OBTAINED WITH THE IMPOSITION OF ULTRASONIC EXPOSURE AND WITHOUT IT

Type of adsorbent	Melting point, °C	Colour conv. units	Mass fraction of oil, %	Moisture content, %	Flashpoint, °C
Without ultrasonic exposure (control)					
Opoka clay Cermine	53,1	12	2	0,21	170
Navbakhor alkaline bentonite	52,6	10,8	1,6	0,17	175
With ultrasonic action at a frequency of 20 kHz.					
Opoka clay Cermine	54,5	8,4	1,4	0,13	181
Navbakhor alkaline bentonite	55,1	6	1,1	0,09	187

As can be seen from Table 4, the use of ultrasonic action on the process of adsorptive cleaning of paraffin has a beneficial effect on improving their quality, and, regardless of the type of clay adsorbents, an increase in the depth of paraffin cleaning is observed. Thus, the studies carried out show that the proposed intensification method is promising in the process of adsorption purification of paraffin of various qualities.

ABSTRACT

The article proved that the Aceriaerinea and Aceriatristriatamites, which have not yet been studied in the territory of the Republic of Uzbekistan, cause a lot of damage in existing walnut groves. A. erinea mite has been found to cause damage only ordinary walnut trees in mountainous and foothill areas. A. tristriataN. mite causes damage to ordinary walnut trees in the lowlands, in addition to mountain and foothill areas, and the effectiveness of chemicals used in their control has been reported.

KEYWORDS: *Common Nut, Gall, Bulge, Mite, Damage, Low Plain, Front Of Mountain, Pause, Semi–Variable, Nymph, Metamorphosis, Drug, Biological, Chemical, Efficiency.*

INTRODUCTION

The main pests that damage fruit trees can be divided into sucking and rodent groups depending on the type of their nutrition. [10; B. 282–283]. Several species of fruit trees' harmful insects and canals, plant saplings, shield beetles, flower buds and spiders that are widespread in the country and can cause serious damage to orchards, are destroying up to 50-60% of today's harvest. In some areas, under the influence of these pests, large areas of gardens are drying up. This is very dangerous for newly established intensive orchards and existing orchards, where high-yielding varieties are imported.

RESEARCH METHODS

Field and laboratory experiments were conducted using the following methods: Gar K.A. «Ispytanieeffektivnostiinsektitsidov v prirodnyx i polevyxusloviyax», Nurmatov Sh., Mirzajonov Q., Avliyoqulov A. andat all. "Methods of conducting field experiments," De Millo A.P. «Definitions of potent agents and diseases», Rokitskiy P.F. «Biologicheskayastatistika», Littl T., Hillz F. «Selskoxozyaystvennoeopytnoedelo», Dospexov B.A. «Metodikapolevogoopyta», Vasilev V.P. and Livshits I.Z. «Vrediteliplodovyxkultur».

The results of the study: The article illustrates the negative impact of two species of mites, the family *Acariformes*, spiders–*Arachnoidea* class, mites–*Acari* subspecies, *Trombidiformes* (Red-bodied mites), *Prostigmata* subgenus, which cause damage to nut yield of *Juglandaceae* family, walnuts–*Juglans*, common nuts–*Juglans regia* L.

The gall (or woolly) mite of walnut is *A.erinea*, a member of the family *Eriophyidae*, synonyms: *Eriophyeserineus*Nalepa, *Phytoptuserineus* N., *P. tristriatus* Var. *Erineus* N., *Eriophyestristriatus* Var. *Erineus*Nalepa, *Aceriaerineus*Keifer.

The warty mite of the walnut is *A.tristriata*, belonging to the family *Eriophyidae*, synonymous with: *Eriophyestristriatus* N.

This *A. tristriata* mite begins to multiply massively by mid–summer. In our experiments, it was found that when walnut trees were damaged for more than 50% by*A. tristriata* mite, the occurrence of next year's crop buds decreased sharply. In addition to leaves and buds, these mites were observed to infect nuts (Fig. 1).

Annual branches of strongly damaged walnut trees do not exceed 10–12 cm. If more than 80% of walnut trees are damaged, their branches will grow in the fall. As a result, the general condition of walnut trees deteriorates, they won't be ready for the winter dormancy period, and most of them dry out.

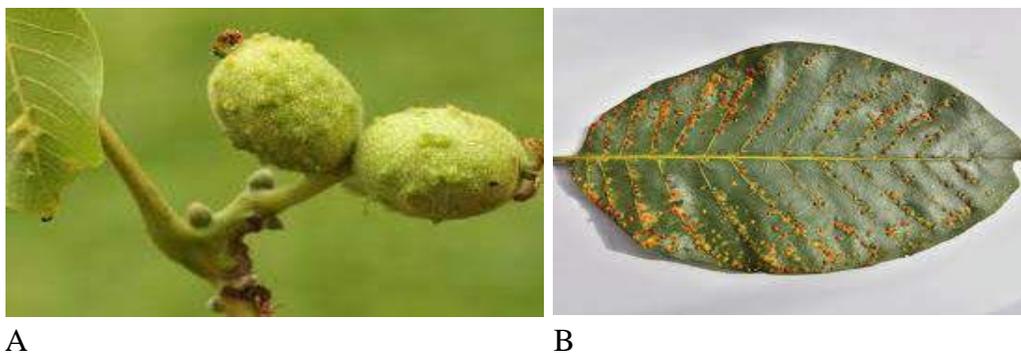
A   B


Figure 1. A-damaged walnut fruit, B- damaged walnut leaf

The body length of *A. erinea* is very small, 0.1–0.3 mm., covered with hairs. The eyes do not exist, the development is incomplete metamorphosis, to be more accurate, the larvae emerge from the egg and they later turn into a nymph and finally a mature mite. The mites positioned mainly at the underside of walnut leaves. A specific substance in the salivary glands of *A. erinea* causes the leaf cell to break down, deform, and rapidly grow the leaf surface where *A. erinea* is located (Fig. 2).

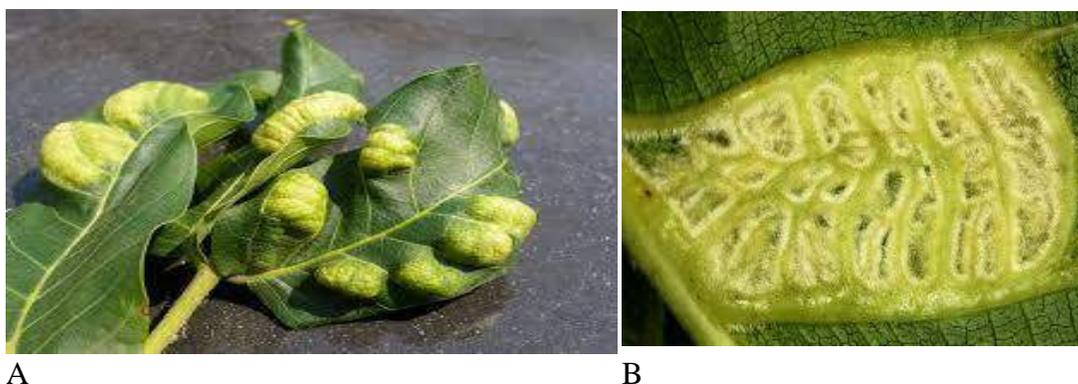
A   B


Figure 2. A- damaged walnut leaf, V- view from the underside of the damaged walnut leaf.

As a result, long fibrous tangled folds will be formed on the leaf surface. These folds form foliage on the upper side of the leaves, and in turn are the feeding chamber of *A. erinea* These areas protect *A. erinea* from wind, rain, and acarifagpests. *A. erinea*.hibernates in cracks and branches in the body of an ordinary walnut tree [9; S. 75–77.]

In our years of research, it has been observed that walnut orchards when infested with *A. erinea* and *A. tristriata* mites for 100%, a significant impact on their yields over the next two years was noted.

According to research, ordinary walnuts are less susceptible to brown spot disease, precisely, disease-resistant varieties. The development and reproduction of pests is more active in disease–unresistant varieties. In the leaves, fruits and twigs of disease–unresistant walnut varieties develop and multiply brown spots, as a result the leaves wither and fall off. In such cases, there is no food for the nourishment of the mites. Disease-resistant varieties, on the other hand, always have enough nutrients during the season to feed the mites. It is obvious that the disease-resistant

varieties of walnuts create a favorable environment for the development and reproduction of pests.

In 2017-2019, the average yield in the observed areas was 48.8–105.2 cen/ha. In 2017, Bostanlyk district, in "Scientific Research Institute of Horticulture, Viticulture and Enology named after Academician M. Mirzaev" 1.0 ha of walnut orchards (Kazakhstan variety) when were infsted with 32.2% of *Aceriaerinea* and *Aceriatristriata* an average yield was 105.2 cen/ha. per 1 hectare of walnut orchard and in 2018, 100% of the walnut orchards in the observed areas were infested with *A. erinea* and *A. tristriata* mites, resulting in a yield of 75.6 cen/ha, 30.4 cen/ha. less than the previous year . In our observations in 2019, the infestation of walnut orchards with *A. erinea* and *A. tristriata* mites was 9.4%, but the yield did not exceed 48.8 cen/ha. per hectare. This is 56.4 cen/ha less than in 2017, that means 2 times less than in the first year. (Table 1).

Table 1. Swelling in nuts–*Aceriaerinea* and warts.Decreased productivity under the influence of *Aceriatristriata* bugs.

(Tashkent region, Bostanlyk district, Scientific Research Institute of Horticulture, Viticulture and Enology named after Academician M. MirzaevBostanlyk mountain scientific experimental station, Kazakhstan variety 2017-2019).

Years of observation	Damage rate,%	The average yield is 1 ha, cen/ha		Average annual fruits, kg	
		in the year of observation	The difference from 2017	in the year of observation	The difference from 2017
2017	32,2	105,2	-	28,8	-
2018	98,6	75,6	30,4	11,6	17,2
2019	9,4	48,8	56,4	21,4	7,4

In conclusion, 2 mites *A. erinea* and *A. tristriata* belonging to the family of 2 pairs of legs (*Eriophyidae*) are prone to damage ordinary walnut trees.

Only one of these pests, *A. erinea* mite, is found in walnut trees in the mountainous and front regions of mountains of our Republic. *A. tristriata*mite ismonophagous and has been found to occur only in species of the family *Juglandaceae*. When walnut orchards were infested with 100% of *A. erinea* and *A. tristriata* mites, a decrease in yield was observed by 30–50 cen/ha.

Walnut trees have been found to severely reduce yields not only this year but also over the next 2 years when seriously damaged by mites mentioned above that have a significant impact on tree growth too.

It was observed that the development and proliferation of canals in disease-resistant walnut varieties was significantly higher than in disease–unresistant varieties.

In April-June 2019 in Tashkent region Bostanlyk district at "Scientific Research Institute of Horticulture, Viticulture and Enology named after Academician M. At the Mirzaev", chemical control measures against walnut mites were carried out at the Bostanlyk Mountain Scientific Experimental Station (Table 2).

In our experiments, the biological efficacy obtained on the 14th day of calculation when Difen super 55% of the drug was used in the range of 0.15 and 0.25 l/ha. reached 89.2-90.0%. The other variant, Roskypso OD, was 87.0–88.6% effective on day 14 when used with the amount of 0.5 and 0.6 l/ha. Carat Gold 5% em.k.was used in the amount of 0.4 and 0.8 l/ha the efficiency reached 86.9–88.9% on the 14th day. Vertimayk Duo k.e. was 92.9% effective on day 14 when administered at a dose of 16 l sus.k. 0.2 l/ha. The Nurell–D 55% k.e. when used1.0 l/ha in our template variant, efficiency was 89.6% on day 14 of the variant.

6.	Control		-	39,7	44,3	50,9	58,7	67,4	-	-	-	-

CONCLUSION

In Uzbekistan, in addition to common pests of nuts, phytophagous canals–*Acariformes* family, arachnids–*Arachnoidea* class, canals–*Acari* subspecies, *Trombidiformes* (Red-bodied canals), belonging to *Prostigmata* subspecies, walnuts–*Juglandaceae* family, walnuts–*Juglans* family, common (Greek) walnut–*Juglans regia* L. two types of mites that cause damage have been identified; when walnut orchards were 100% infested with *A. erinea* and *A. tristriata* canals, a decrease in yield was 30-50 ts/ha; the highest biological efficacy in the chemical control of walnut canals was shown on day 14 with 92.9% by chemicals Vertimayk Duo k.e. (*Abamectin60 g/l +Spirodiklofen 120 g/l*) at a dose of 0.2 l/ha.

ABSTRACT

The article highlights the role and effectiveness of standardization, technical regulation and certification in ensuring the quality and competitiveness of agricultural and food products. The work and measures to ensure the quality and safety of agricultural and food products are considered and analyzed. Recommendations were developed to improve the work to assess and ensure the quality and safety of agricultural and food products.

INTRODUCTION

It is known that food contains more than 650 substances necessary for normal life. Each of these substances has its own place in the chain of biochemical processes. 96% of organic and inorganic substances obtained with food have certain medicinal properties. According to the data of the World Health Organization (WHO), more than 500 thousand chemical compounds are used in industry, of which 40 thousand are harmful and 12 thousand are toxic. For many compounds, maximum permissible levels have not been established, including for food products.

Ensuring food safety is a complex process that starts at the farm and ends at the consumer's table. Consequently, the quality and safety of products and services is the most important factor in the implementation of national interests in the broadest spheres of activity.

In this regard, an urgent task is to control the quality of food products, the purpose of which is to protect the consumer from low-quality and dangerous products. Consider and analyze the work carried out and the effectiveness of measures to ensure the quality and safety of agricultural and food products in the Republic of Uzbekistan.

MATERIALS AND METHODS

In Uzbekistan, grown vegetables, fruits, grapes and melons are considered unique in their consumer properties. In order to widely familiarize foreign partners with the produced fruits and vegetables, increase the volume and expand the range of supplies for export of fresh and processed products, develop new markets for its sales, as well as ensure the quality and safety of fruits and vegetables and food products, planned and purposeful work is being carried out.

Consider the basic terms and definitions for quality assurance and safety.

The quality of food is determined by three components:

– organoleptic indicators;
– quality indicators
– compliance with the requirements of regulatory documents for a specific product;
– safety indicators.

Quality - a set of properties and characteristics of a product that gives it the ability to satisfy conditioned or implied needs.

Quality system - a set of organizational structure, responsibilities of procedures, processes and resources that ensure the implementation of overall quality management.

Food safety - absence of toxic, carcinogenic, mutagenic or any other adverse effect on the human body when consumed in generally accepted amounts.

Quality assurance is a set of planned and systematically carried out activities necessary to create confidence that the product meets certain quality requirements. An important role is given to the appearance, organoleptic characteristics, packaging, information for the consumer about the quality and direction of use of the product.

Classification of food products and chemical compounds: Depending on the purpose, food products are divided into 3 groups:

1st group - products of mass consumption, developed according to traditional technologies and intended for nutrition of the main population groups.

2nd group - medical (dietary) and therapeutic and prophylactic products, specially created for therapeutic and prophylactic nutrition. This group includes fortified, low-fat (reduced fat by 33%), low-calorie foods (less than 40 kcal / 100 g), with a high content of dietary fiber, reduced sugar and cholesterol.

3rd group - baby food products specially created for the nutrition of healthy and sick children up to three years of age.

Food products are complex multicomponent systems made up of hundreds of chemical compounds. These compounds are conventionally classified as follows:

1. Compounds with alimentary value. These are the nutrients necessary for the body: proteins, fats, carbohydrates, vitamins, minerals.

2. Substances participating in the formation of taste, aroma, color, precursors and decomposition products of the main nutrients, other biologically active substances. They are conventionally non-alimentary. This group includes natural compounds that have anti-elementary toxic properties, such as solanine in potatoes, fazin in beans, or interfere with the metabolism of nutrients, such as antivitamins.

3. Alien, potentially hazardous compounds of anthropogenic or natural origin. They are called contaminants, xenobiotics, or foreign chemicals. These substances can be of both organic and inorganic nature, including microbiological origin.

In Uzbekistan, a regulatory and technical base has been formed, all conditions and legal foundations have been created for the effective organization of production, as well as for assessing the conformity of the quality and safety of food products. The laws "On standardization", "On metrology", "On quality and safety of food products", "On protection of consumer rights", "On technical regulation", "On certification of products and services", "On conformity assessment" were adopted.

In the last three years, significant changes and additions have been made to these existing laws in order to maximize the approximation of the stated requirements to international norms and rules.

In the next decade, the legal basis for certification was formed. There was a transition from certification as an activity carried out by a third party to a more general safety control - assessment and confirmation of conformity. The main form of conformity assessment is the control of the quantitative and (or) qualitative characteristics of products.

The transition to a new meaning of the concept of certification was necessary, since a condition for preparing Uzbekistan's accession to the World Trade Organization (WTO) and the elimination of technical barriers to trade is the harmonization of domestic rules of standardization, metrology and certification with international rules.

The next step on this path was the adoption on April 23, 2009 of the Law of the Republic of Uzbekistan "On Technical Regulation". The essence of the law is to partially replace mandatory

compliance with the principle of voluntary certification. This does not override the mandatory certification.

Mandatory confirmation of product quality must be made only in relation to safety requirements established in a new form of legislative acts - technical regulations.

The rules for certification of food products and food raw materials operate within the framework of the regulatory document. The object of certification is any food product intended for sale on the domestic market.

For specific groups of homogeneous food products, a certification procedure is being developed. Certification of food products is carried out according to a certain scheme, the choice of which depends primarily on the guaranteed shelf life of the product.

The work on confirmation of conformity is carried out by certification bodies, the competence of which is confirmed by the accreditation procedure. Any form of conformity assessment provides for product testing. The accreditation of Testing Laboratories and Certification Bodies is carried out by the State Unitary Enterprise "Accreditation Center" under the agency for Standardization, Metrology and Certification "Uzstandard".

According to the Certification Rules, only an accredited testing laboratory (AIL) is allowed to test specific products, which tests specific products and issues test reports for certification purposes.

AIL is responsible for the compliance of its certification tests with the requirements of regulatory documents, as well as for the reliability and objectivity of the results.

In the Republic of Uzbekistan, there are a total of 456 accredited testing laboratories, for the purpose of certification of food and fruit and vegetable products, 95 testing laboratories and 25 certification bodies have been accredited.The testing laboratories are re-equipped with modern measuring instruments and equipment every year. In laboratories that test agricultural and food products, modern test methods are mastered in accordance with the requirements of international standards, norms and rules.

Annually, in the National Certification System of the Republic of Uzbekistan, from 34 000 to 36 000 certificates of conformity are issued for food and fruit and vegetable products, including through the recognition of certificates of foreign countries.

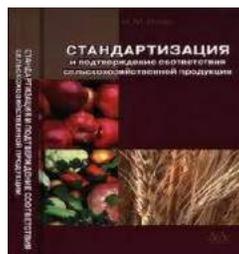
The testing laboratories are re-equipped with modern measuring instruments and equipment every year. After the re-equipment of the laboratories, the testing time was reduced from 14-16 hours to 3-4 hours, and the cost of services was reduced by 4 times, it becomes possible to conduct tests for compliance with international ISO standards. Urgent tests of various substances, preservatives, color and flavor additives in food products are carried out, the laboratory has the ability to conduct short-term accurate rapid tests.

In the near future, certification will develop in the following areas:

− Harmonization of domestic orders and rules with international rules. The need for harmonization is caused by the development of trade cooperation, preparatory work for accession to the WTO, the introduction in the EU of mandatory confirmation of product conformity as a prerequisite for the admission of goods to the European market.

− Improvement of certification methods and schemes, convergence of certification schemes with European ones. Increasing the variety of schemes will allow the applicant to choose the most acceptable of them, both from the point of view of costs and taking into account the degree of danger of the product, the volume and nature of its production, circulation and use.

One of the main tasks of the ongoing work on standardization is to update and harmonize the requirements of national standards with the requirements of international ISO standards and standards of industrialized countries. This will ensure the quality of food products in accordance with the level of development of science and technology, international experience.

To date, the State Fund of Normative Documents for Standardization of the Uzstandard Agency has registered 2623 existing standards that determine the requirements for the conditions of production, preparation, processing, delivery, storage, transportation of food products, of which:


- 612 international standards (ISO);
- 654 interstate standards (GOST);
- 330 State Standards (O'zDSt);
- 1027 standards of organizations (Ts).

In 2018-2019, 682 standards were registered, developed and approved by ministries and departments, organizations and enterprises.

With the adoption of the Law of the Republic of Uzbekistan from 23.04.2009. "On technical regulation", the economy of Uzbekistan is switching to a fundamentally new system of establishing requirements for products and services.

The transition to a new meaning was necessary, since the condition for the preparation of Uzbekistan's entry into the World Trade Organization (WTO) and the elimination of technical barriers to trade is the harmonization of domestic rules of standardization, metrology and certification with international rules.

In accordance with the adopted State Programs, work is being carried out to develop general and special technical regulations. At present, 36 General technical regulations and 10 Special technical regulations have been developed and adopted in the technical regulation system. The following technical regulations have been developed and adopted for the food and processing industry:

General technical regulations:

1. General technical regulation "On grain safety"

2. General technical regulation "On the safety of alcoholic beverages"

3. General technical regulation "On the safety of milk and dairy products"

4. General technical regulation "On the safety of packaging in contact with food"

5. General technical regulation "On food safety in terms of its labeling"

6. General technical regulation "On the safety of fat and oil products"

7. General technical regulations "On the safety of meat and meat products"

8. General technical regulations "On tobacco products"

9. General technical regulation "On the safety of drinking water packaged in containers"

10. General technical regulation "On the safety of fruit and vegetable juice products"

11. General technical regulations "On the safety of soft drinks".

Special technical regulations: the following special technical regulations were adopted by the resolutions of the Uzstandard agency:

1. Special technical regulation "Safety requirements for gossypol resin";

2. Special technical regulation "On the safety of grain processing products";

3. Special technical regulation "On the safety of bakery and pasta products";

4. Special technical regulation "On the safety of bakery and pasta products" - new edition (MTR.008-2020).

Today, there are 33 Technical Committees for Standardization in the republic, of which 4 are Technical Committees in the field of food, processing and agricultural products:

-TK "Grain Products";

-TK "Oil and Food Products"; -

TC "Wine and wine products";

-TK "Meat and Milk".

These Technical Committees carry out work on organizing the development and examination of projects of national, interstate and international standards, implementation, formation of the Program for the development of national standards, updating and harmonization in accordance with international requirements and best practices of developed countries, analysis of standards for their updating and further use.

Raising the quality and safety of agricultural and food products, further expanding the volume of export of agricultural products and its geography in our country to a new level, requires special attention to the system, the implementation of the results of scientific research, innovative approaches, best practices, the introduction of the requirements of international standards in the agro-industrial sector ISO, Organic and Global GAP.

Based on the analysis, the current system of standardization, technical regulation and quality assessment of the republic, it is recommended to carry out the following measures to improve work for a high-quality and safe organization of food production:

- Compliance with republican and international requirements of legislative acts on quality and safety assurance;
- Development of the necessary regulatory documents and modern infrastructure for growing, processing, manufacturing, evaluating and selling, as well as the consumption of agricultural and food products, ensuring its quality and safety;
- Organization of permanent training and practical courses, master classes to improve the qualifications of executives and engineering and technical workers, specialists;
- Search for new methods and forms to improve educational processes of training highly qualified personnel, ensuring effective integration of education - science - production;
- Periodic equipping of production technological processes with modern technological lines and equipment, provision of production with the latest control measuring and testing means;
- Harmonize and update regulatory documents with the level of requirements of international standards, the use of international best practices;
- Together with sectoral ministries and departments, as well as national bodies of other countries, create technical committees for the main types of agricultural and food products, comprehensively considering and studying problems in terms of standardization, technical regulation and certification in the development of new standards, special programs for the development of the industry, assessing the quality assurance and competitiveness of products;
- Acceleration to implement in agricultural industries, farms, agro-clusters, as well as food and processing manufacturing enterprises of the requirements of international standards Global

G.A.P. and Organic, ISO 22000 food safety management system, quality management system management.

- To formulate special sectoral and state scientific and technical programs (SSTP) for conducting fundamental, applied and innovative research on priority and top-priority tasks and problems to ensure the quality and safety of agricultural and food products.

CONCLUSION

Carrying out systematic work and taking appropriate measures to establish and organize quality control and safety of agricultural and food products based on the requirements of regulatory documents using modern methods and means ensures the welfare and satisfaction of consumers and the health of the population of the republic.

The enterprises of the food and processing industry of the Republic of Uzbekistan have high capacities and are equipped with modern technological equipment, testing and measuring instruments that allow to fully satisfy the needs of the population and export high quality products.

THE KNOWLEDGE OF MUSIC AND ITS IMPORTANCE IN STUDENTS' MUSIC ACTIVITIES

Najmetdinova Nigora Irkinovna*

*Teachers of the Department "Music Education",
Urgench State University, Urgench,
UZBEKISTAN

ABSTRACT

The article describes some of the problems associated with teaching the subject "Musical culture" in general education schools and ways to solve them, as well as some methodological recommendations for teaching lessons.

KEYWORDS: *Musical Perception, Art, Aesthetic Education, Listening To Music, The Song, Creative Activity, Repertoire, Harmony.*

INTRODUCTION

Music perception plays an important role as a leading activity in the classroom. Understanding music increases students 'interest in music, takes them into the mysterious world of music, nurtures a sense of beauty, and shapes their musical tastes. This will help in the formation of mature people in all respects in the future. At a time when all genres of music are intertwined, and television and radio broadcasts are overflowing with "musical works" in different directions and styles, it is very important to form students' musical tastes through music lessons. In this case, the importance of properly organized various musical activities in music lessons is incomparable.

In a music lesson, all activities are logically interconnected based on a specific topic, resulting in the logical integrity of the lesson.

It is important to note that musical perception leads to the practice of all other activities with an integral connection.

In secondary schools, works for listening, singing, dancing and other activities are provided with the demand. At the same time, the teacher has the right to use a wide range of new works that are

not included in the program but are artistically high, educationally important and suitable for students' cognitive practice, forming musical tastes in them.

One of the important tasks in the development of students' listening to music (musical comprehension) is their musical upbringing, which is carried out during all activities. For example, when studying a song, it is important to listen carefully to its melody, and when singing, it is very important to pay attention to the purity and clarity of the melody. Children need to listen to the changes in the music as they accompany the melody on the musical instruments, perform the rhythmic and dance movements characteristic of the music, and express their attitude to it through the movements. At the same time, listening to music (music perception) is an independent activity in music lessons. It is referred to in methodological literature as listening to or perceiving music. During this activity, students listen to more complex music samples from works they can perform. But the process should not consist of getting acquainted with musical works [1-4].It is very important to form in students the skills and abilities to understand musical works, to develop in the musical, creative abilities and, most importantly, musical tastes and interests.

The basis for the formation of musical taste in students is a high level of musical works and active musical activities aimed at mastering them. A properly organized process of listening to music helps to develop students' interest and musical taste in various ways of developing musical comprehension (e.g. performing actions appropriate to the music, playing children's instruments and also singing the themes of the work).

MATERIALS AND METHODS

Music perception is a complex process, based on the ability to hear, to understand the content of music as a reflection of existence. The listener feels as if he is entering the world of musical images in a piece of music. However, to feel the mood in music is not all, the most important thing is to grasp the idea of the work.

Music affects a person through a complex of means of expression - timbre, dynamics, mode - harmonic set and meter - rhythms, which express the mood of the work, human inner experiences, life events.

Perception of musical images goes through a specific creative activity in the listener. Because it includes his personal (musical listening and life) experiences. As a result, the idea of the work is accepted as something sacred. That is why musicologists say that listening to music as you hear it is a great work for the heart, mind and creativity.

As long as music affects a person, it can excite him, arouse his interest. Joy and sorrow, dreams - hopes, joys and sorrows - these are all a collection of emotions that music can express. The teacher needs to help the children understand and comprehend all of this. It is also important to create all the conditions for students to show an emotional attitude towards music. This is often due to the piece of music you listen to in class. These works should be of a high level, close to children in terms of content.

Every child has a world of interests that depends on his or her inner world. At the same time, they also have common unifying moments at a certain age. Small school-age children love to listen to cheerful, lively music. They are fascinated by lively, figurative, easy-to-understand music that represents the world of children. For example, music works that are simple to

understand in terms of student content in music culture classes in secondary schools: S.Abramova's "Autumn", Uzbek folk song "Andijan regiment", GafurKadyrov's "Walking march", Uzbek folk songs "Doloncha", "As bolaman", "Oqterakmi - kokterak", D.They listen to songs like "Jamalagim" reworked by D.Zokirov.

The pieces of music recommended for listening become more complex from quarter to quarter, year to year. In the second grade, children learned Uzbek folk melodies "Dutorbayoti", "Kashkarcha", "Qarinavo", "Oromijon", "Qoshtor", "Chamandagul", "Norimnorim", "Khorezmlazgisi", A.Muhammedov's "Shahisozana", "Fergana", Uzbek folk song "I shot an apple", M.Mirzaev's "Spring Waltz", Uzbek folk song "Boychechak", you M.Glinka's "Polka", Uzbek folk song "Rohat";and in the third grade, D.Zokirov's "Holiday March", H.Abdurasulov's "Algeria", Uzbek folk song"Lolacha", "Ferganachatanovar", G. Husseinli's "Chickens", They listen to B.Umidjanov's melodies and songs such as "Humokushim".Through these works, students get acquainted with Uzbek folk melodies and selected samples of the works of composers, they develop a sense of respect for folk music and the work of composers, the formation of musical taste [5-9].

When referring music material to listen to students 'attention, it is important to consider how long they can listen to music. For example, children from 6 to 7 years old can sit quietly and listen to music for up to three minutes.

Fourth graders are more interested in musical works with themes of courage and heroism.

Adolescents are interested in works that represent the complex inner world of a person, representing modern problems with the language of music. They especially feel the unique rhythmic music of the 21st century.

Preparing students to perceive music emotionally can be done in a variety of ways and methods. These include the teacher's introductory conversation, the use of other works of art, and the singing of the main themes of the musical melodies.

It is a very difficult job to tell a story about music. It is necessary to find bright phrases, figurative comparisons for the introductory conversation.

Works of art - poems, poems, excerpts from stories - also help to create an emotional mood in the classroom. In some cases, works of fine art are used. For example, to listen to the second quarter of 2nd-grade music culture lessons, Ik. Akbarov's "Spring", M. Works such as Mirzaev's "Spring Waltz" and the Uzbek folk song "Boychechak" are recommended. In the process of listening to these works can be used landscapes, paintings depicting the awakening spring, reproductions [6-11].

It is also possible to use other types of art in the process of listening to music (music perception): works of fine art, excerpts from paintings, sculptures. They help to create certain moods in children, the formation of musical tastes. But in music lessons, you have to be very careful when referring to other types of art. Because, as mentioned above, they have their own means of expression, their ability to be overused in the process of listening to music can be useless, or even detrimental, distracting students from perceiving music, breaking the connection between music and the reader, making the piece of music second. level. That is why it is necessary to use technical means and visual aids very carefully in the process of listening to music, the use of which should not become the main goal.

A music teacher should have sufficient knowledge of other arts.

The teacher's introductory conversation before starting to listen to music is of particular importance. In his introductory conversation, he can give specific directions for children to understand the music. For example, a teacher might address a 4th grader: From traditional musical melodies: "Listen to the trumpet melody; listen to the trumpet expressing the melodies of Uzbek folk music". Giving students the direction to fully comprehend musical works not only directs them in the right direction but also helps them to fully comprehend the musical works.

One of the most invaluable ways to activate an emotional relationship to music is to sing the main themes of musical instruments that children enjoy.

A music teacher needs to be a great musician. About this "The most important thing a teacher needs to know is how well he or she masters musical instruments," D.B.Kabalevsky said.

Of course, it's hard to imagine music lessons without mechanical recordings when children need to hear a choir or orchestral performance. But they should not replace the teacher's live performance, only complement it. A teacher's live performance is important in at least three ways: first, the live performance creates a lively, lively mood in the classroom; second, the teacher may stop to re-play any part of the piece of music, or even return to the beginning of the piece; third, the teacher's performance serves as an example to show students how interesting and important live music performance is in practice.

Classroom equipment can vary aesthetically, but they need to help create the environment needed for music lessons.

It is very difficult to imagine modern music lessons without audio-video tools. To listen to music, music recordings should be widely used on television, video recorders, DVDs, computer equipment. They allow students to be introduced to a variety of performances (orchestra, choir, ensemble).

In the process of teaching each subject in school, the teacher must link education directly with upbringing. The possibilities of music lessons in this work are enormous. Music has an impact on the human spirit and mental development and activates his aesthetic sense.

Creative activity promotes the growth of students' thinking, the development of memory, the conscious perception of music. At the same time, it is necessary to choose a repertoire that suits the age and abilities of students, to increase their creative activity. The repertoire should be rich in content, colorful, relevant to students' perceptions and have educational value.

The effectiveness of music lessons is also directly related to increasing the creative activity of students in the classroom. Enhancing the creative activity of students requires the teacher to have the skills of speech, the art of communication.

The teacher draws children's attention to the content of the work, musical images with an interesting story and conversation. By quoting excerpts from the story and interesting stories about the creative biography of composers, telling the history of the creation of any work, the teacher increases the cognitive ability of students, enriches the scope of knowledge about music with new information.

The melodies and songs performed by the teacher in each music lesson should be performed in a pleasant, beautiful, harmonious way. Because the teacher's impressive performance is a living tool to engage students in the work. In particular, the widespread use of Uzbek music and national instruments will make the lesson more lively and interesting. Along with Uzbek music, studying the music of fraternal and foreign nations helps to educate students in the spirit of patriotism and internationalism. In order to increase the creative activity of students, it is important to organize debates on topics such as "My favourite melody and songs", "My favourite composer", to give students interesting homework, to invent puzzles, to encourage advanced students.

Taking into account the age and individual characteristics of the students, the use of game elements in music lessons, which are performed with different actions, helps to make the lesson more effective.

Enhancing the creative activity of students requires the teacher to have the skills to be responsible, highly inquisitive, creative, resourceful, that is, to evoke creative pleasure in children.

There are three interrelated areas in preparing students for creative activity. One of them is to enrich children's lives and musical imaginations. For example, knowing fairy tales, poems, folk traditions, book heroes will be the basis for holding this or that musical game.

The second direction introduces students to the tools of creative action. For this purpose, they are asked to compare simple melodies and songs. Samples of musical creativity are given. For example, the creation of rhythmic input is assigned.

The third direction involves mastering the methods of creative action. Initially, the educator himself demonstrates them: after analyzing the song or melody together, he proves that his performance plan will turn out as desired as he or she performs this or that creative task.

It is explained to children that it is possible to create different musical images from the combination of the same stages of the mood through well-known songs and that the character of the music is formed as a result of the combination of different means of expression. As a result of future experiments, children begin to "create" themselves. Preparing students for creative activities is of great importance. For example, they need to have enough melodic rhythmic experience to invent melody options. It is formed in a certain sequence. Therefore, before solving such tasks, it is necessary to study the rhythmic, form, melody structures of the musical text.

An active means of developing creative activity in students is to give them creative tasks. Their successful solution largely depends on the teacher, his personality, curiosity, participation in the creative process.

The teacher creates certain situations and encourages them to be creative. To activate creative initiatives in small school-age children, it offers creative tasks in the form of games.

The rules of the game and the content of the plot, which he explains, greatly contribute to the correct performance of the tasks. The games in the classroom create an emotional atmosphere, a free environment. This is very important because the creative potential of children is fully realized in such conditions.

The gradual complication of the conditions and content of games helps students to enrich their musical experiences and creative potential.

In the process of creative activity, the independence of students expands. If the game is first led by a teacher, then it is led by students. Sometimes they invent their own games or turn simple games into musical games.

All creative tasks are performed in a certain sequence. For example, in order to find expressive movements, children first listen to a piece of music, identify its character and the means of musical expression. They then identify possible options for this or that action.

What is thought, intended, is discussed as a group or individually. The result of the creative solution is an expressive performance of the work.

In assessing the task performed, the level of understanding of musical symbols should be taken into account, such as the effort to polish the composition, the expressive repetition of the work by the "author" himself.

In the early stages of music education, expressive methods are important to create songs in limited stages. Then the student can easily work with the clear impressions received in the process of listening to music, singing songs, playing musical instruments.

Creativity helps to enrich the musical imaginative imagination. This is an important condition for the general musical development of students. The process of creation is not without improvisation.

The teacher should pay special attention to the creative development of students in the process of various musical activities: listening to music, singing, playing children's musical instruments, performing dance movements. At first, small school-age students easily solve creative tasks related to dance movements, performance on simple musical instruments. They think, polish, and expressively repeat their creations in every way.

The creative difficulty (an incompatibility of hearing with voice) that comes to children when singing is gradually disappearing. 'on-singing' children can express their creative potential in their actions while children singing in the performance of children's musical instruments can demonstrate in singing.

The main thing is that the teacher should use different tasks for different abilities in music culture lessons. Thus, in mastering the characteristic tones of the lad, it is necessary for students not only to create the characteristic motifs on the steps but also to make them musical. These singing skills are deepened while working on the song material. And it can have all sorts of creative tasks. For example, the invention of rhythmic adventure and so on.

Students will gain an understanding of the means of expression of music as they perform simple rhythmic scores selected by the teacher for works selected for listening to music. Tasks that provide insight into music genres are of great importance. Regularly performed creative tasks help students to successfully solve the tasks set before them. Tasks of varying complexity should be integrated into music lessons from 1st grade onwards.

In a music lesson, every child should be allowed to express themselves creatively. Students' creativity in music lessons is certainly not an art, it is just a learning-research musical practice.

Pupils' creativity is so valuable that children learn things they have never known before in the world of music.

The educational value of children's creativity is highly valued. Its educational value is that it is manifested in this very process. Because it allows the teacher to follow the direction of the student's musical thinking. The creative look in students can be manifested in the singing of simple melodies, in the creation of melodies to a given text, in the performance of percussion instruments, as mentioned above.

Preparing students for creative activities is so important. For example, in order to invent a variety of tones, students must have sufficient into national tone experience. The importance of children's musical creativity in the state educational standards for the first time included in the program of primary school music culture is very high, it, first of all, meets the general requirements of music education, allows children to develop musically and creatively.

Secondly, this activity will be included in the process of music education, bringing the system of music education in secondary schools of the Republic of Uzbekistan closer to the world education system. Because in many countries, the music system of general education pays great attention to children's creativity. It is gratifying that the musical works selected for children's musical creativity in the primary education program of the State Education Standard are familiar to children, they are works that they regularly encounter in everyday life. This makes it easier for students to engage in musical creativity activities in music culture classes.

CONCLUSION

To conclude, musical creativity activities included in the lessons of the music culture of primary school are so important in the musical development of students and the formation of their musical tastes, along with activities of singing, listening to music, playing children's musical instruments.

CAPITAL MARKET AS AN ALTERNATIVE SOURCE OF BUSINESS FINANCING

Otabek Narziev*

*PhD,
Head of International Private Law Department of Tashkent State
University of Law, UZBEKISTAN
Email id: otabeknarziev@tsul.uz;

ABSTRACT

This paper aims to analyze the reasons behind the high discrepancy in bank and capital market financing of business in Uzbekistan and to work out solutions for balancing the sources of business financing. Currently, Uzbekistan's capital market is not providing a real competitive source of business financing, an alternative system of mobilizing savings and allocation, and providing a reliable means of attracting foreign investment. This article mainly discusses the competitive neutrality problem in business financing between the banking sector and Uzbekistan's equity market. In this country, both the banking sector and the capital market participate in business financing. However, due to different regulative approaches, bank credits dominate in providing finance to businesses. Banks enjoy considerable state support, subsidies, guarantees, and privileges. Significant differences in regulation not only create the monopolistic situation in favour of banks in business financing, but also indirectly restrain an institution in its infancy, as is the capital market, to develop and provide relatively affordable, long-term, and stable funding to business. The root of the problem lies in the disparity between the regulatory approaches on the part of the state towards the banking sector and the capital market. Therefore, it seems unlikely that any plausible solution to the above problem could be achieved without a comprehensive examination of its causes. This paper is an attempt towards such a review. It provides an analysis of the bank-based and market financial systems' main features, attempts to examine the notions of debt and equity financing, and explores the main regulatory differences of banking and capital market financing.

INTRODUCTION

This study focuses on developing one of the critical institutions of the market economy – namely, the capital market in terms of its role in promoting competitive conditions in the financial services sector. Due to various objective and subjective factors, banks have become the most dominant institutions in accumulating and redistributing financial resources. One of the leading market institutions capable of competing with banks in the financial sector is the capital market. Despite almost three decade's worth of transitional reforms, the capital market remains underdeveloped. As a result, companies and investors do not have access to alternative and competitive business financing sources and have no option but to deal with the monopolized banking system.

Well-functioning capital markets enable and facilitate the mobilization of financial resources by bringing together those who need capital to innovate and grow, with those who have the funds to invest. More importantly, capital markets promote good corporate governance amongst their listed issuers by encouraging transparency, accountability, and respect for shareholder's rights. The dramatic growth of stock exchanges from 50 to 160 in the last four decades alone demonstrates the critical role capital markets play in developing economies. In the case of CIS members, it is essential not only to improve the understanding of the role and function of capital markets but also to create environments that ensure well-functioning exchanges.

MATERIALS AND METHODS

Accordingly, reviewing and enhancing the capital market's business financing capacity by balancing the regulatory framework is a core issue of current research.

1. Bank-based and market-based financial systems: does financial structure matter?

There are several causes of the high divergence between the role of banking and capital market in business financing. Financial structures, financial instruments, and the regulatory framework are the most influential among them. This part of the paper seeks to clarify the reasons behind bank dominance in business financing from a financial structure viewpoint.

Financial systems are divided into bank-based and market-based, according to banks or capital market's role in accumulating and directing funds to sectors of the economy. The state involvement level in the allocation of credit also plays a significant role in categorizing the financial system. In general, in bank-based systems, most financial assets and liabilities mainly consist of bank deposits, loans, and credits. Contrary to market-based systems, securities are the dominant form of a financial instrument. Bank-based systems rely on relationships and collateral, while effective investor protection laws, clear disclosure standards, good faith, and investor trust mainly drive market-based systems. Market-based countries generally have better-developed markets for equity finance [1], whereas bank-based systems are based on a powerful and dominant banking system.

A significant part of the literature on bank-based and market-based financing of business discusses the link between financial structure and economic growth. The findings and results of these studies are diverse. The majority of research took a balanced approach mentioning the

importance of both bank-based and market-based systems to economic growth, [2-4] while some studies conclude that financial structure per se does not matter, it is the overall provision of financial services (banks and financial markets taken together) that is important for growth. Other research emphasizes a country's economic and financial development level, mentioning that the relationship between financial structure and economic growth is more complicated. [5-8] The latest studies on financial structure and growth favour market-based systems. Their findings include post- crisis research results, [9,10] where banks overstretch and misdirect credit in economic expansions and share credit in financial recessions more than markets. Another study concludes that financial structure matters from the systemic risk viewpoint. Authors argue that bank-based financing generates systemic risk, while market-based financing reduces it. They conclude that countries could increase their resilience to systemic risk by reducing bank financing share and increasing market-based funding [11].

In general, what is essential is not whether a financial system is bank-based or capital market-based. Instead, it is how developed and efficient the financial system is and whether companies can access actual alternative financing sources. Imbalance in business financing causes serious micro-and macro-level concerns. At the micro-level, the predominance of either form in business financing limits the company to attract finance from alternative sources. At the macro level, as the analysis indicates, bank-based financing generates systemic risk. The dependence of a country's economy on either form of financial structure does not refrain from achieving the balance between bank-based and capital market-based financing[12].

2. The notion of debt and equity financing

The debt and equity financing issue is the logical supplement to the bank-based and market-based financial structure issue. In general, bank-based countries have a dominant debt financing economy, and market-based states have prevalent equity financing [13, 14]. Also, this part of the paper aims not to try to change this phenomenon but to understand better the notion and specifics of debt and equity financing to identify the implications useful for regulatory remedies in Uzbekistan [15].

Overall, any business in any stage of its activity needs to fulfil its short-term or long-term financial needs. There are two ways for a company to attract outside funds: via debt-based (loan) financing and equity-based financing. Each method has its advantages and disadvantages, and each is a better fit for some situations than others are. Factors that distinguish these two types of business financing include fundraising terms, process, size, period, aim, and usage methods [16].

In general, so-called debt and equity financing are two different business financing systems based on other principles. The central tenet of debt financing is based on borrowing funds from a lender with the obligation of returning these by the prearranged date at a fixed interest rate stipulated from the outset. Primary forms of debt financing are lending and the sale of bonds. The structure itself does not change the transaction principle: the lender retains a right to the money lent and may demand it back under conditions specified in the borrowing arrangement [17].

The important point here to mention is that debt financing is not limited only to the banking industry. Debt (bonds) is also an active financial instrument in the capital market. So, the main difference in debt and equity financing is not based on institutional factors but also funding terms

and principles. The active participation of banks in capital markets is another critical point. For instance, in Uzbekistan, bank's average share in the capital market is more than 70 per cent [18].

The notion of pure equity financing is based on investment goals rather than lending for the interest, as in debt financing. Inequity financing provides ownership and managerial rights to investors. Companies involving this investment without any collateral are required to share their profit and disclose appropriate information. Yield or return to equity financing is highly risky than in debt financing, where the interest rate and time of recovery are preliminarily established before lending. Inequity financing, an investor might not get any revenue if the company did not make any profit. However, on the other hand, the level of an investor's gain is not limited, as in the case with debt financing where the interest rate is predetermined and fixed. If the company is successful, there will be more dividends, and consequently, more investment flow. Increasing investment is a decisive factor for the company rather than growing its debt balance. In other words, investors tend to look with caution at a company with more debts and seek to finance the company with a high investment flow. The following table (Table 1.) describes the fundamental differences in debt and equity financing [19].

TABLE 1. COMPARISON OF DEBT AND EQUITY FINANCING

Criteria of comparison	Debt financing	Equity financing
Ownership status	No	Yes
Profit	Guaranteed and fixed	Not guaranteed and not fixed
Level of profit	Low	High
Management possibility	No	Yes
Return form	Interest	Dividend
Collateral	Generally essential	Not required
Risk of lost	Relatively low	Relatively high
Duration	Limited	Unlimited

In the end, some researchers found that firms tend to turn to banks for financing, mainly because banks are good at helping them through times of financial distress. [20] Another reason is connected with a company's desire – whether it wants to share ownership, profit, management, and information. The research has concluded that & quot; the riskier firms prefer bank loans, the safer ones tap the bond markets and the ones between them prefer to issue both equity and bonds. & quot; [21-25] the last point is that loan or debt-based fundraising is the most common and relatively more convenient business financing method in developing countries and among SMEs. [26] This is because bank's infrastructure, regulatory support, and corporate conduct are relatively advanced in developing countries than the capital market. And not only SMEs but also larger companies not eager to use equity financing due to factors including the complicated procedure of securities issuance, strong corporate governance and disclosure information standards, and relatively less state encouragement [27].

3. Regulation as a tool for striking a balance

Regulatory policy and state support of bank and equity financing have a significant impact on the real economy's development. Research on bank competition in access to finance suggests that the institutional and regulatory framework is essential in improving business financing's

competitive and regulatory environment. [28] The authors underline the importance of regulations, institutions, and ownership structure for policymakers interested in easing financing obstacles. [29] Later, other studies examined this issue more in- depth and found several factors that have a high impact on finance access. These factors include decent property rights protection, substantial shareholder rights, high quality of corporate information, and less government interference in corruption and political interference. Usually, in developing countries above mentioned factors that assist financial access are underdeveloped or partially developed [30].

One example of the regulation's impact on the development of the banking sector would be large-scale state support of the banking industry, which has created an unfair business financing situation in CIS countries. For instance, in Uzbekistan, direct government intervention through specialized institutions, subsidized financing programs, and tax incentives preserve the banking sector&'s role as a channel for planned financing. [31] On the contrary, the nascent capital market does not have such care. By this, we are far from stating that the government should always support all forms of market institutions. We do not favour excessive administrative regulation of market relations. Instead, we argue for ensuring a balanced approach regarding state attention and care to the banking sector and the capital market. Balancing here is necessary for guaranteeing regulatory neutrality. It does not mean reducing bank privileges, but providing at least the same state support to the capital market and its development. As bank participation (as issuer, shareholder, and intermediary) in the capital market is more than seventy per cent, the banking industry will likely lose very little if anything from this reform. Instead, it is expected to enjoy any privileges given to the capital market indirectly [32].

The levels of investor rights protection in financial services and investors show another feature of regulation. For instance, one of the institutional measures of investor rights protection – guarantee (compensation) funds – in all CIS countries mainly focuses on payment of insurance compensation in the case of a bank's financial insolvency. However, none of the CIS countries has established guarantee (compensation) funds to cover the losses of investors in case of illegal actions or bankruptcy of participants of the capital market. Capital market regulation of most CIS countries provides the rule of guarantee or insurance fund based on which capital market intermediaries (traders and brokers) should create their insurance deposit fund for covering their liability. For instance, in Russian and Kazakhstan law, the rules on the foundation of such funds seem milder, as opposed to Uzbekistan law, where market intermediaries should form a guarantee fund to compensate the investor for losses. [12] The guarantee fund is a useful mechanism that provides some guarantees of investor rights. However, this is an individual and limited system, and cannot be compared to the nationwide measures such as those concerning a guarantee fund for bank deposits or some other centralized institution [33].

In Russia and Kazakhstan, there are established institutions of the financial ombudsman that are authorized to protect investor's rights and of consumers of financial services. However, their effect did not cover all aspects of the financial market and is limited to banking. Uzbekistan also founded several country-level institutions to protect investor rights, however, these foundations mainly focused on the banking industry and its clients, as is the case with its neighbours [34].

One more issue that requires a balance between banking and the capital market is connected to the mechanism of creditor/investor rights protection. In general, all CIS country's legislation

introduced creditor/investor protection rules for banking and capital market relations. However, there is a high divergence between credit and investment status and legal interpretation, respectively, creditor and investor, in comparatively in the countries under review. The tendency is towards the view that law better protects bank credits and creditor rights than shares and shareholder rights. Different regulatory approaches and special preferential packages to bank credits and creditors raise concerns regarding the competitiveness of debt and equity financing in CIS countries [26].

The present author is far from stating that the government is intentionally discriminating between debt and equity financing – the existence of competition between the banking industry and the capital market is beneficial both for state and companies. The presence of separate state initiatives on fostering the capital market (albeit, not equal with bank-supporting measures) is indisputable evidence on this point. The reason for the difference in the level of support and outcomes is mainly based on bank concentration and state ownership issues. Concerning the countries reviewed here, bank concentration is relatively high. For instance, in Russia and Kazakhstan, the five largest banks own more than 50 per cent of assets. [12] In the case of Uzbekistan, this figure is more than 70 per cent. [35] According to Beck and others, in low-income countries bank concentration increases financing obstacles, with a more substantial effect on small and medium compared to large firms. In countries with high government interference in the banking system and a higher share of government-owned banks, the effect of bank concentration has deteriorated. The research's overall results suggest the importance of institutional and regulatory policies for the relationship between banking market structure and firm's access to finance at any economic development level [36].

State ownership is also one of the critical reasons for differentiated policy in banking and capital market financing. This is based on the statement that the state supports banks and bank financing, as most banking industry shares belong to the state. Recent research also suggests that firms with state participation in most developing countries had better access to bank financing due to implicit or explicit guarantees from the governments and other government interventions.

In all of the countries under review in this thesis, state banks possess over half of the banking sector's assets, capital, and loan portfolio. In the case of Uzbekistan, this figure exceeds 80 per cent. At this point, it is not argued that state ownership may necessarily influence the different regulatory policies between banking and capital market financing. Because in the countries examined here the state holds almost the same level of share in SOEs too. However, banks enjoy considerable state support, subsidies, guarantees, and privileges rather than other SOEs. This weakens any argument that the government supports banks because of the ownership issue. Equally, however, by this, the author does not deny the nature and various effects of state ownership concentration in this matter [37-40]. This matter requires a more detailed analysis of the character of state ownership, which we would like to fulfil in the next paper.

CONCLUSION

In this paper, we tried to offer an analysis of the reasons behind the disparity between banks and the capital market share on business financing in CIS countries. For this purpose, central financial structure systems, which are bank- based and market-based, were reviewed to identify solutions by analyzing the notion of debt and equity financing. Lastly, the regulatory framework, both as a reason and explanation of the problem, was considered.

The findings indicate that financial structure matters in the origin and development of either industry (bank or securities market), but dependence on one economic structure does not restrict the development of the other. Therefore, no matter which type of financial system dominates a country's financial system, the regulatory framework should provide sufficient room and create a climate for real and fair competition among banks and capital markets.

In CIS countries, bank financing is relatively developed, so there should be a supportive regulatory framework for fostering equity financing to achieve fair competition between these two financial institutions. Concerning the financial instruments, we found that there are principal differences in debt and equity financing. They should be taken into account while balancing the share of bank and capital market financing. And lastly, this paper aimed to provide an overview of the regulatory framework that, on the one hand, is a contributing reason behind the problem discussed, and on the other, could be the appropriate solution to it.

ABSTRACT

The article highlights the theoretical and methodological foundations for ensuring the quality and safety of agricultural and food products. It will be argued that quality assurance is a complex problem that requires a lot of effort and responsibility on the part of all participants in the production process. It is recommended that one of the ways to solve this problem is the implementation of the Global GAP standard, the creation of a quality and food safety management system based on the requirements of HACCP, the international standards ISO 9000 series and ISO 22000 series.

INTRODUCTION

The problem of the quality and safety of agricultural products and foodstuffs is a complex problem that requires many efforts to solve it, both on the part of suppliers of raw materials, components and materials, farmers, agronomists, scientists - biochemists, microbiologists, nutritionists, and on the part of manufacturers, technologists, engineers, sanitary and epidemiological services, government authorities and of course consumers.

The urgency of the problem of the quality and safety of food products is increasing every year since it is precisely ensuring the quality and safety of agricultural food raw materials and food products that is one of the main factors that determine human health and the preservation of the gene pool.

MATERIALS AND METHODS

Product quality in modern economic conditions has become the most important factor in the competitiveness of the enterprise. Naturally, in market relations, the manufacturer strives to achieve a stable quality of its products, to use all the tools developed by the world and domestic practice. The most important of these is the quality assurance system (quality system).

Quality system - a set of organizational structure, responsibilities, processes and resources, ensuring the implementation of overall quality management.

By the nature of the impact at the stage of the product life cycle, there are three directions in the quality system:

− quality assurance;

− quality control;

− quality improvement.

Quality assurance is a set of planned and systematically carried out activities for the implementation of each stage of the "quality loop" so that products meet quality requirements.

Quality management includes the methods and activities of an operational nature. These include process management, identification of various kinds of defects in products, production and elimination of these shortcomings and the causes that caused them.

Quality improvement is a constant activity aimed at improving product quality, reducing costs for it, improving production.

Food safety is understood as the absence of danger to human health when consumed, both in terms of general negative effects (food poisoning and food infections) and in terms of the danger of the consequences of poisoning (carcinogenic, mutagenic and teratogenic effects).

Food products that do not have a harmful, adverse effect on the health of the present and future generations are considered safe. Therefore, the state and manufacturers are facing acute problems associated with increasing responsibility for the effectiveness and objectivity of quality control of products that guarantee their safety for consumer health.

The assessment of the state of food safety of the population is determined by:

- **physical availability of food** - availability of food throughout the country at any time and in the required range;

- **economic accessibility of food** - the level of income, regardless of the social status and place of residence of a citizen, which allows you to purchase food, at least at the minimum consumption level;

- **Food safety for consumers - prevention** of production, sale and consumption of low-quality food products that can harm public health.

Important problems of product safety are, on the one hand, the prevention of contamination of raw materials for food production, which is ensured, in particular, by a system for monitoring the state of the environment, and on the other hand, careful hygienic control over production and finished products.

Ensuring the structure, safety and quality of food is the most important strategic task of the state at the present stage of development of the Republic of Uzbekistan. The upcoming membership in the World Trade Organization (WTO) brings significant advantages for the economy of Uzbekistan, but there are also problematic issues.One of these critical issues is ensuring food safety in connection with the spread of genetically modified products in the world market, solving the problem of quality and competitiveness of domestic products in the world market.

It is known that the competitiveness of products is traditionally determined by several factors, such as the cost of production, operating costs, service, credibility and supplier status. However, one of the main indicators of the products was and remains the high quality of the offered goods.

The modern market economy makes fundamentally new requirements for the quality of products. In the modern world, the stability of manufacturing food companies, their stable position in the market of goods and services are determined by the level of competitiveness.

In turn, competitiveness is associated with two indicators - the price level and the level of product quality. Moreover, the second factor is gradually coming to the fore. Labour productivity, saving all kinds of resources give way to product quality.Consequently, the quality and safety of products and services is the most important factor in the implementation of national interests in the broadest spheres of activity.

In this regard, an urgent task is to control the quality of food products, the purpose of which is to protect the consumer from low-quality and dangerous products.

Quality is a complex concept, and its provision requires the combination of scientific forces, from creativity to the practical experience of many specialists. In our country, the problem of quality is not only important but also must be solved by the joint efforts of the state, national government bodies, heads of collectives of enterprises, scientists, every engineering and technical specialist and worker involved in the technological chain of production.

At each enterprise, regardless of the form of ownership, various factors, both internal and external, affect the quality of products.

Internal factors - associated with the ability of the enterprise to produce products of proper quality, i.e. depend on the activities of the enterprise itself. They are numerous, they are classified into technical, organizational, economic, socio-psychological.

Technical factors - affect the quality of products, therefore the introduction of new technology, the use of new materials, better raw materials - is the material basis for the production of competitive products.

Organizational factors - associated with improving the organization of production and labour, increasing production discipline and responsibility for product quality, ensuring production culture and the appropriate level of qualifications of personnel.

Economic factors - due to the costs of production and sale of products, pricing policy and the system of economic incentives for personnel for the production of high-quality products.

Socio-economic factors affect the creation of healthy working conditions, loyalty and pride in the brand of your company, moral incentives for employees - all these are important components for the production of competitive products.

External factors - contribute to the formation of product quality. External or environment is an essential condition for the existence of any enterprise and is in relation to it an uncontrollable factor.

The goals and objectives of ensuring the quality of products are determined by the state - represented by its competent authorities, and at the level of enterprises and organizations - by their top management. Since 2017, the problems of ensuring the safety and quality of agricultural products are becoming more and more relevant for farms, agricultural clusters, as well as food industry enterprises in connection with the country's transition to new political and economic relations.

At the enterprises of the republic, it is not always possible to ensure unconditional food safety in the absence of a modern system of quality control and safety of food raw materials, respectively, and finished types of food products.

The factors that influence the development of this problem include:

- new production systems increased mass production and lengthening of food chains;

- new substances that pollute the environment, changes in ecology and climate;

- new food products, processing technologies, ingredients, additives and packaging;

- changes in the health status of the population or a particular group of the population;

- changes in diets and an increase in demand for foods with minimal processing;

- a change in the way of buying food, an increase in street consumption and eating outside the home;

- New methods of analysis that allow detecting hazardous factors that were not previously known.

New directions in the processes of food production and storage allow, on the one hand, to expand the range of food products, to increase the shelf life and to ensure the satisfaction of consumer requirements, on the other hand, they form new factors hazardous to human health.

In our opinion, the Strategic approach to resolving the issue of quality should be as follows: it is necessary to have a food safety system in terms of functional indicators of food quality, which makes it possible to exclude the risk of obtaining low-quality products.Tactically, it is necessary to solve the following tasks:

- to develop quantitative criteria for assessing technological systems of food production in terms of their quality parameters, which give an objective characterization of the state in the field of product quality management;

- To develop methods of qualitative and quantitative analysis of the risk of malfunctions of technological systems, causing deterioration in the quality of products.

One of the ways to solve this problem is to introduce the requirement of international standards, including the Global GAP standard, on agricultural and farm enterprises, agricultural clusters. Creation of a quality and safety management system for food products at food industry enterprises based on the requirements of HACCP, as well as international standards ISO 9000 and ISO 22000.

The HACCP system is aimed at implementing control measures to prevent the emergence or development of hazardous factors, managing the causes of their occurrence at all stages of the food chain. It removes dependence on the results of sampling of finished products, shifting emphasis on the controllability of production and service processes.

The ISO 9001 standard, containing the basic principles of general management and focused primarily on the needs and expectations of consumers, serves as the basis for building a quality management system.

The ISO 22000 standard contains 12 stages for the implementation of HACCP and the requirements of the ISO 9001 standard and can be used as follows: independently as a basis for the development of an organization's security management system and together with ISO 9001 for the development of a system aimed at managing both safety and quality.

To ensure the quality and safety of food products, an effective and efficient management system regulated by international standards is required.

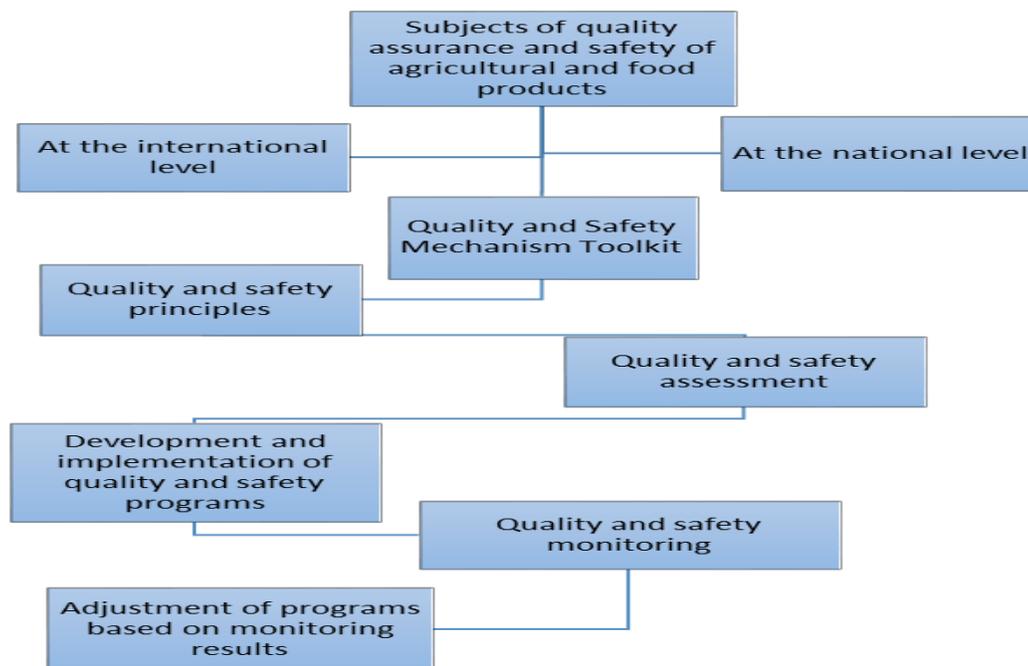
The Republic of Uzbekistan is in the final stage of intensive negotiations on the country's accession to the World Trade Organization (WTO). To join the WTO, one of the main requirements is that the republic must bring its international trade policy in line with the requirements of the WTO Agreements.

First of all, this concerned the elimination of "technical barriers to trade", which include:

- divergence of legal requirements for goods, processes, services;
- conformity assessment procedures and mechanisms;
- Level and content of standards requirements.

The advantages of WTO membership are the provision of expanded access to international markets, balanced obligations to conduct trade within the framework of agreed instructions and provide access to legally produced products of other members of organizations to the domestic market, as well as the protection and implementation of their national interests in world markets.

The basis for reforming the system of requirements for the quality and safety of products in the Republic of Uzbekistan was the Law of the Republic of Uzbekistan "On Technical Regulation", adopted on April 23, 2009, which establishes the legal framework for the state system of technical regulation aimed at establishing, implementing and ensuring the safety of products, services, processes in the Republic of Uzbekistan.

The reform of technical regulation carried out in accordance with the Law, is of particular practical importance for ensuring the national security of the country, for the innovative development of science and production, and for expanding the market for science-intensive products. The law is aimed at further expanding the rights of manufacturers and consumers of products in terms of determining its quality and the maximum limit of imperative methods of quality regulation. Analyzing the existing picture and summarizing the existing framework for ensuring and assessing the quality and safety of food products, the necessary mechanism for ensuring food security, consisting in a set of organizational forms and economic methods, mutually linked at the international and national levels into a single regulated by legal norms, allowing the state to stabilize the level of quality and security can be shown as a diagram:


From the structure of the mechanism for ensuring quality and safety, it is clear by what stages, methods and tools it is possible to ensure the quality and safety of food.

CONCLUSION

Thus, the rise in the standard of living has led to a change in the attitude of the consumer to food products. The consumer is becoming more and more demanding of his diet, he wants not only to eat well and avoid any risk to his health but also to have products that meet his requirements. Proof of quality becomes a necessary selling point in contracting, and quality becomes a determining factor in the competitiveness of products.

Quality improvement is an ongoing process, and it should be managed by a well-organized system, the strategy of which is to extend quality management to all structural divisions, and tactics - a combination of new progressive technology with professional training of personnel.

The enterprises of the food and processing industry of the Republic of Uzbekistan have high capacities and are equipped with modern technological equipment, testing and measuring instruments that allow to fully satisfy the needs of the population and export high-quality products.

It should be noted that one of the main tasks of the work carried out in the republic on standardization is the updating and harmonization of the requirements of national standards with the requirements of international ISO standards and standards of industrialized countries. This will ensure the quality of food products in accordance with the level of development of science and technology, international experience.

In the republic, purposeful work is being carried out to equip testing laboratories with modern instruments, equipment and testing and measurement tools in order to assess the quality and safety of agricultural and food products, in accordance with the requirements of international

standards, which is the key to improving, preserving the life and health of the population of the republic.

THE IMPACT OF ARABIC BORROWED WORDS ON THE FORMATION OF THE UZBEK LITERARY LANGUAGE

Khashimova Khurshida Djorakhanovna*

*Teacher of Native Language and Literature,
Namangan Region Namangan City Academic Lyceum Nammti,
Republik of UZBEKISTAN

ABSTRACT

This article describes a brief overview of the influence of the Arabic language in the fields of grammar, phonetics, and usage of some words in the Uzbek language. It also states the high value of the Arabic language in the literature of Uzbek. There can be found some information about explanatory dictionaries. Along with the Arabic conquest in Central Asia the language was to spread throughout the land, it made people use it in their literary language.

KEYWORDS: *Arabic, Vocabulary, Lexicology, Dialect, Turkish, Persian, Annotated Dictionary.*

INTRODUCTION

In the historical development ofwe can see that Uzbek literary language, neighbouring words and forms arose in different periods for different social reasons. Words in the dictionary of the Uzbek literary language are historically unique not only for the Turkic languages but also for the Persian language through the Persian-Tajik, Arabic, Mongolian, Russian, Uyghur languages.

There is no language in the world whose vocabulary consists only of its own words. Words derived from other languages either retain their form in that language as they are, or adapt to its nature, grammatical structure, word formation, spelling and pronunciation.

Words that have entered the Uzbek literary language and dialects from other languages are still learned through the spoken language and the biblical language.

If we apply this idea to Arabic words, we will see that Arabic words entered our literary language more through the biblical language and the Persian-Tajik language, as well as through oral speech. The Uzbek dialects were represented mainly through oral communication.

Some of the words we have learned are so ingrained in our language that it is very difficult to determine which language they are from. For instance,the words such as *lab(lip),gul((flower),shot (ladder),fe'l(behaviour),sinf(class)* are of Arabic origin.

MATERIALS AND METHODS

The dictionary of the Uzbek literary language also contains words borrowed from the Arabic language. The process of assimilating these words is associated with the actions of the Arabs.

In the 7th century, the Arabs, led by the Caliph Abu Bakr, an associate of the Prophet Muhammad, conquered the Arabian Peninsula, the Near and Middle East, North Africa, Spain, Central Asia and the Caucasus under the banner of Islam. they put. This caliphate was ruled by the Mongols until 1258.

The Caliphate is difficult to govern because it unites a vast territory of different ethnic groups. Islam has spread over such a large area. Arabic, the language of religion, has become the language of science. Thus, in addition to the Arabs, non-Arab peoples also played an important role in the formation and development of the culture known throughout the world as Arab culture.

Along with Islam, which was introduced by the Arabs, the Arabic script gained popularity, and the role of the Arabic language in schools, madrassas and religious affairs increased.

After the arrival of the Arabs in Central Asia, the local Turkic, Runic, Uyghur, Khorezm and Sogdian scripts were suppressed, and the Arabic script was used instead. This further expanded the sphere of influence of the Arabic language and writing. The peoples of Central Asia were forced to continue living under the influence of their literature and culture.

The Arabic language became the language of science, in this language Khorezmi, Beruni, Farobi, Ibn Sino, Kashgari wrote their works. Alisher Navoi in his book Muhokamat ul-lughatayn described the features of the Arabic language as follows:

"Of all these languages, the Arabic language is distinguished by its elegance and wonder with its decoration, which does not have a cure for any language ..."

The Arabic language belongs to the southern branch of the Sami language.The peoples who speak this language live in Egypt, Syria, Iraq, Lebanon, Tunisia, Libya, Algeria, Saudi Arabia, Sudan, Yemen, Morocco.

The most developed period of the classical Arabic language, which influenced the languagesof the peoples of Central Asia, was the 8th-9th centuries when many scientific and artistic works were created in this language, but now it is no longer used. According to S. Usmanov: "Just as Latin was once the international language of science in Europe, the Arabic language has occupied a similar position in Asia for three hundred years. The role of Uzbek and Tajik scholars writers is very important in this ... through religion through the Tajik language ".According to some experts, 20-25 years ago, Arabic words in the modern Uzbek literary language accounted for 13% to 20% of the vocabulary. Thenumber of Arabic borrowed words in Uzbek has increased since the adoption of the Uzbek language as a state language. Thewords that were forced to be out of use were reaccepted,for example,*riyozat,(mathematics), riyosat (praesidium) mufty,hayit(Eid)*, etc.

The Arabic words used in the Uzbek language belong to different fields and are used phonetically, morphologically and semantically in accordance with the Uzbek language. For instance, the sound –ayn loses its features at the beginning of a word. Only two words ___-*hayit*and__-*hassa* have this feature that they are pronounced like e(e) butthey aren't written with an apostrophe('), at the end ofthe words *mone*,*tobe*it is pronounced longer and these words are written withan apostrophe('),in the words like *ta'na,ma'no, ya'ni* it is in the middle of a word. And if two consonants arefollowed with *ayn* it is missed in the words like *shom, naf, jam.*

Some Arabic words are not only used with their original meaning but also they got their meaning widened, shortened or changed. For instance, the word *gassol*means cleaner in Arabic. The phonetic and grammar elements of some Arabic words are clearly explained in the article "Tadjik, Persian and Arabic words in the Uzbek language" by professor Usmonov .S

The Arabs, like other sciences, studied linguistics. The creation of Arabic linguistics is also associated with the existence of written literature. Because without careful phonetics and grammar, it is impossible to create perfect writing rules.

The achievements of other peoples, including the peoples of Central Asia and many other peoples, also contributed to linguistics and its development. Arabic linguistics has influenced all areas of Uzbek linguistics. In particular, this led to significant changes in lexicology. The following important factors led to the introduction of the Arabic language into the Uzbek language.

Arabic was the state language, the official language. This factor increased the influence of the Arabic language on the speech of the local population. Officially, Arabic was the language of fiction. Reading Arabic literature is one of the factors that influenced the influence of this language on the Turkic languages.

The Arabic language became the language of science and culture for the peoples of Central Asia and the East. Scientific works, brochures and collections on science and culture were written in Arabic.

Arabic was the language of the day. Arabic was the predominant language, the official obligatory language. Arabic was the language of religion and sharia. The Arabic and Turkish settings contradicted each other. The Arabic language has dominated for nearly 300 years.

For the above reasons, many Arabic words appeared in the Uzbek language. For example, the socio-political system, the words of the law, in particular, in the works of our great poet Navoi, we can observe Arabic terms. Yuldashev's article, entitled "The terms of fiqh in the works of Alisher Navoi," discusses several legal terms such as akida, akida, muazzin, bolig, mu'takid, muazza.

Words related to the concepts of literature and art, gazelle, dream, literature, story, weight, etc.

Terms related to religious concepts are also fully mastered in the Uzbek language.Under the influence of Arabic linguistics, Uzbek lexicography achieved great success, many rare works were created. Mahmud Kashgari is the founder of the science of lexicography. Back in the 11th century, he created an annotated dictionary of the Turkic languages, based on the traditions of Arab linguists.

Even though the relationship between Arab and Turkish languages has been investigated for many years,it is not fully studied between Arabic and Uzbek languages. The two main reasons for this are lacking the full versions of the explanatory dictionary of the Uzbek language and the weak impact of Arabic on the Turkish languages in Central Asia. As a result, no sound of an Arabic originis accepted into Uzbek alphabet.

Arabic lexicography has dictionaries that are dictionaries of synonyms for a specific subject (M: five hundred words for a sword, five hundred words for a lion) based on the last letter.Under the influence of these dictionaries, thematic dictionaries were created in the history of Uzbek linguistics.

Arabic linguistics, like all branches of linguistics, influenced grammar. Words related to nouns and verbs were memorized from Arabic to Uzbek: discipline (horse), notebook (horse), discovery, science and so on.

Several grammatical features learned from Arabic to Uzbek, including -iy, -viy, -ot, -an, etc., are used in the same way as words in the same language. animal, ability, etc.

Syntactically, the Arabic language also influenced the history of the Uzbek literary language. Take, for example, the article by M. Abzalova "The Use of Syntactic Arabicisms in A. Navoi's Prose."

Arabic phrases are used after a preposition and with a conjunction. "And Abu Usman al-Qiri praised him, saying: "All Ahl al-Mashaya belong to the Aryan nafs and ofati-la-mali."According to the Navoi tradition, syntactic Arabicisms were also used effectively, and such expressions enriched his work. Together with the phrases, they formed a compound sentence followed by a sentence that, in particular, complements the sentence.

Such scenes can be found in many other works, such as "Boburnoma", "Shajaray Turk", "Shajaray Tarokima".

Lexicography is both a practical and theoretical area based on lexicography, methodology, phonetics, as well as the history of the language, the study of the grammatical structure of the language. For example, the Annotated Dictionary of the Uzbek Language explains many Arabic words, of which the word ABJAD is explained as follows:

1. The name of the first of eight words and a set of these eight words, composed of the letters of the ancient Arabic alphabet and designed to memorize the numerical value of each letter from one to a thousand and the order of the ancient Arabic alphabet.
2. The ABC of elementary education is taught in old-fashioned schools.

In short, under the influence of Arabic linguistics, there have been great changes in the grammatical department.

CONCLUSION

The Arabic language has been in contact with Turkish for many years. He not only learned words from the Arabic language, but also voiced many words from Uzbek to an infinite number of Arabic words. It is known that many rare works in the history of linguistics are based on Arabic traditions and language. However, some of our talents, such as Zamakhshari and Ibn Sina, do world-class work in Arabic grammar and Arabic phonetics. According to Kashgari,

"like two goats," these languages have always developed uniquely, with their beauty and richness.

ABSTRACT

The article examines the implementation of innovative processes and their impact on the process of business renewal. Also, the characteristics of innovation management, new management principles, factors that block and support innovation are considered as the most important components of the entire market strategy of an entrepreneur.

KEYWORDS: *Management, Innovation, Innovation Process, Characteristics Of Innovation Management, Management, Profitability.*

INTRODUCTION

Management is, first of all, management based on constant innovations. the most important part of management is innovation – the process of constant renewal in all areas of entrepreneurship. Innovation includes not only technical and technological development but all changes that improve the activities of the firm (new products, new services, new favourable conditions for customers, including prices, etc.).Innovation process-improving the balance of various areas of activity of the enterpriseI am responsible for monitoring the profitability of each link. All innovations are based on a systematic, comprehensive analysis of various aspects of the company's work, the main thing in which is to compare the results obtained not with those already achieved, but with the potential (capacity) of the market that is available at the moment[1,2]. The purpose of this analysis is to determine how fully the firm uses market opportunities in each period.

MATERIALS AND METHODS

A comprehensive analysis of various aspects of the firm's work should include:

a) Assessment of the desired position for the entrepreneur in the market of goods and services offered by the company at present;

b) The entrepreneur's preferred position of current products in new markets;

v) Evaluation of products that provide for a decision to stop production of any goods or services due to a drop in demand for them;

g) Opportunities to produce new products and services for new markets;

d) Changes in the sales system and other changes in the work to form and implement innovations.

In the field of innovations, the entrepreneur faces the following tasks: mechanization, automation of secondary work; attracting more highly qualified employees to the company's team and creating better material conditions for employees.

To solve these problems, the entrepreneur must:

– be a follower of new ideas;

– provide each employee with a fairly wide field of activity, providing him with short instructions rather than a detailed plan that restricts the initiative; encourage innovative ideas that arise from subordinates; organize a special information fund for innovations in the company;

– ensure continuous training and professional development of employees both centrally and, more importantly, individually.

– Innovation in the current environment is the main means of survival of the company in the market. Innovations should be introduced as the market needs them, but the entrepreneur must anticipate their necessity and expediency. As part of the work in this area, it is recommended that:

– identification of those types of goods and services, production and sale of which will provide the desired market share;

– identification of goods and services that replace outdated ones;

– Introduction of innovations in all other areas of the company's activity (office management, advertising, etc.);

– balancing short - and long-term innovation programs (how to increase profits, how to use available funds more effectively, etc.).

Constant innovation is also needed in the organizational structure of the company, which must meet the changes taking place in the market. The company structure should be simple and clear; provide the company with maximum profitability; contain a minimum number of intermediate links; provide training for managers for the company, taking into account the prospect and competition between managers.

In modern market conditions, the constant transformation of the work of the company and its employees on a new, more advanced basis is becoming increasingly important, so we should focus on it in more detail and, above all, on the role of scientific and technological progress.

In market conditions in the era of scientific and technological revolution, the growth of scientific achievements, expanding the technical and production potential of the industry and increasing the productive power of labour, has an important impact on the economic activity of enterprises. The intensification of research and development is evidence of the company's desire to maximize the available scientific and technical capabilities to expand the scale of production and increase profits.

Like any other form of capital application, scientific research aims to increase the profits of a given firm. At the same time, the ultimate goal, scope and nature of research are determined mainly by the immediate needs of the sales markets served by the firm and the severity of competition, as well as the capabilities of the relevant divisions of the firm [3,4]. The expansion of research on the development of new types of technologies, goods and services has led to the development of a special sphere of intra-firm activity for the creation of innovations. It is well known that innovation is understood as a complex set of different activities, starting from the idea and subsequent stages of research, development, and designing, making new sample, and analysis of the market to new products in the field of marketing. From a purely economic point of view, innovation is the profitable use of scientific, technical and other achievements through the production of new consumer value. Innovations have now become one of the main reserves for ensuring the economic growth of the company, maintaining and strengthening its competitive position in the sales markets. Acceleration of the process of creating and marketing new types of goods is considered as an essential component of the entire market strategy. it is quite obvious that at present the preservation of a specific sales volume by a firm is possible only with the continuous introduction of new goods and services to the market [5].

Characteristics of innovation management

The importance of innovation is now recognized, but this does not mean that it is being properly implemented. Often innovations do not even find the necessary economic motivation. The process of updating all aspects of the company's activities is unrealistic without innovative management.

In order to characterize innovation management not only in the field of research, but also in practice, the following list of the most urgent problems that are usually solved within the framework of product innovation management is given: market research for new products; forecasting the activity, nature and stages of the life cycle of a new product; determining how to sell a new product (selling the product on their own or through intermediaries); research of the market situation of resources; finding subcontractors (subcontractors) for the development and supply of equipment and software products required for a new service; exploring possible options for cooperation with competitors on the development and development of a technically complex and risky product; performing a comprehensive analysis of costs, prices, production volumes and sales of a new product in order to plan optimal (in the short and long term) production volumes, sales prices and control figures for the purchase prices of resources and operating costs; evaluation of the effectiveness and planning of innovation as an investment project (using the criteria of innovation value, return rate and payback period of capital investments); risk analysis, determination of methods for their minimization and insurance [6,7].

New management principles

New management principles are based on the recognition of the continuity of the innovation process as system-forming elements, but at the same time disordered, and low predictability of results. The reorganization of innovation management involves the creation of such organizational relationships that would allow more full use of the creative potential of the team.With all the variety of modern specific forms of such links, it is possible to identify several common characteristics: unconditional support for innovation activities from the management; support to the experimentation on all levels and in all sub-divisions of the organization; high level and continuous improvement of communications; the use of integrated motivational systems, including various forms and methods of material incentives to

innovation; the application of the style, called participation in management; continuous enrichment of employees' knowledge.

Factors that block and support innovation

The factors that block innovation usually include managers ' distrust of new ideas put forward from below and the need for many approvals on them; immediate criticism and threats of dismissal due to mistakes; interference of other departments in the evaluation of innovative proposals and behind-the-scenes decision-making on them; control over every step of the innovator; the transmission of instructions to lower managers accompanied by threats; the emergence of the "all-knowing expert syndromein higher managers.

Factors that support innovation are considered to be: providing the necessary freedom when developing innovations, providing innovators with the necessary resources and equipment, support from top management; conducting discussions and exchanging ideas "without anger or fear"; maintaining effective communication with colleagues, other departments, universities and external scientific organizations; deepening mutual understanding between employees.

Factors that enhance innovation include support for the desire of employees to constantly learn and improve their skills, the combination of special knowledge and multidisciplinary training in the education system; the ability to express their own opinion about the changes being made; encouraging the combination of professions, overcoming barriers and "blurring the boundaries" between different types of work and the functioning of responsibilities; providing meaningful business information, even if it is negative; holding regular meetings of working groups; a logical argument for the need for changes and reorganizations; constant support for an atmosphere of trust and receptivity to change.

Encouraging experimentation in different divisions of the company is important for creating a favourable innovation climate. Management experts assess the importance of this factor for the innovation process as follows: "Those companies that have extensive support systems for their pioneers receive the most from enthusiasts. If there are no support systems, there are no enthusiasts. No enthusiast – no innovations". Today, management theorists and practitioners generally agree that the traditional approach, in which the generation of new ideas was the prerogative of brilliant individuals or separate research departments, is too narrow. With the number of new products on the market increasing and their life cycle shortening, a high flow density of innovative ideas is needed to maintain the efficiency of the organization. Therefore, management sets the task of constant and universal "brainstorming" for the majority and, ultimately, for all employees.

In organizations that focus on innovation strategies, special attention is paid to creating conditions for intensive communication," end-to-end» interactions of employees in the process of innovation. This is determined by the following circumstances. First, there is a complication of communication networks in connection with the expansion of the powers of employees and the revision of labour functions. Secondly, the attitude towards informal contacts as an important source of effective cooperation of employees, as well as groups and functional units, is changing.

CONCLUSION

With traditional, rationalistic approaches to management, the areas of responsibility of various departments are outlined very clearly: exceeding the authority is usually prohibited by the relevant instructions. On the contrary, supporters of an innovative management style consider the partial intersection and overlap of areas of activity even useful for the organization, since this encourages

informal communication between employees of various services and increases the likelihood of innovative ideas emerging as a result of such contacts.

CHANGES IN THE RHYMED STRUCTURE OF TAJIK POETRY AT THE BEGINNING OF THE 20TH CENTURY AS AN IMPORTANT FACTOR IN THE FORMATION OF LYRIC GENRES

Khujaqulov Sirojiddin Kholmahmatovich*

*Associate Professor,
Candidate of Philological Sciences,
Department of Tajik Language and Literature,
SamSU, UZBEKISTAN

ABSTRACT

The article examines the socio-political realities of the second half of the XIXth century, historical conditions and economic situation, existing aesthetic principles, innovations in the literary process based on some changes in literary and cultural life.In the second half of the XIX - early XX century, the principles of the formation of poetic works, the synthesis of traditional literary genres based on the emergence of new poetic forms in art, the principles of tradition and renewal in the system of rhyming genres and the emergence of new types of poetry were studied.

KEYWORDS: *Lyrics, Genre, Rhyme, Literary Process, Principle, A New Poem, Gazelle, Kasida, Masnavi, Tarje'bands, Gradualness, Tradition And Innovation.*

INTRODUCTION

The question of the principles of genre renewal and the formation of literature at the beginning of the twentieth century is a unique process that, regardless of the continuation of literary traditions, to one degree or another influenced the development of classical forms based on certain objective and subjective factors. The continuation of traditional classical genres in the literary process of this period, the formation and renewal of their content is a common and typological phenomenon for the literature of the peoples of Iran, Afghanistan, Turkey and Central Asia. It is also true that the basic principles of these changes in the literary process took place on the basis of the historical, social, political, economic and spiritual-educational events of that period. In this sense, Parviz Notili Khanlari notes that "the tendency and the need to change poetic patterns in Iranian educational literature arose at a time when artists wanted to act in a broader context, that is, the object of the artist's performance moved from a special narrow circle to a whole nation"

[7,117].In Iran, this feature is explained by the dynamics of social changes and national constitutionalism (reformism) and echoes the rich changes in the events in the Tajik literary process of the second half of the 19th - early 20th centuries.This situation is undoubtedly closely related to changes in the social, political and spiritual life, the evolution of the ideas of the Enlightenment.

MATERIALS AND METHODS

In the article "Stages of the evolution of SadriddinAini's poetry" A. Maniyazov talks about the features and directions of Aini's work, analyzes it from the poetry of the madrasah period to sermons and revolutionary marches, the evolution of traditional genres (*gazelle, rubai, whale, muhammas, musaddas*), renewal of the *mastod*, maintenance of swamp, *tarona, rubai* and *mustazads* for new revolutionary content and other aspects. The scientist rightly states that "at this stage of his poetic activity, Aini began revolutionary, political poetry in Tajik poetry, introduced new varieties of poetry into it and created a new direction in the poetry of his century" [3, 87].

In this regard, MuhammadjonShukurov notes that "the same poetry (poems written in the first two decades of the twentieth century) as educational realism is close to the early stages of European realism" [8, 56].Not only in the poetry of Aini, but also the verses of other representatives of the literature of the second half of the XIX - early XX centuries, elements of speech found their place in the constituent parts of folk oral speech.These new folk discoveries are just one example that explains the common features of early twentieth-century poetry: "*aglotiurfiya*" and "*mustalihotilurfiya*" (popular words in folklore and tradition).In any case, in the literary process of that period, artists strove to simplify the stylistics of their works, bringing the language of a work of art closer to folklore. According to MuhammadzhonShukurov, "simple elements of speech did not detract from the tenacity and priority of the poets' speech.A new poem (a new style, a new style of expression in poetry) is not a decline in poetic and poetic skill, but the emergence of a new aesthetic quality in literature" [9,117].The new aesthetic quality of literature of this period is the harmony of form and content in works of art, the relationship of verbal art with other spheres of socio-cultural life, the importance of works of the past and present, discussion of socio-political, moral and spiritual problems and their solutions in the literature.

This shows that in the poetic literature of the early twentieth century there was a partial disintegration of the traditional framework of lyric genres, which led to the emergence of a "new poem" in the language of that time. The shift in the structure of the poem manifested itself primarily in rhyme. This phenomenon can be seen in some poems by ShamsiddinShahin, Savdo, MirzoSiroj, AbduraufFitrat, Munzim, AhmadjonMahdumHamdi, SadriddinAini and other progressive poets.According to A. Shukurov, this form of formal transformation was transferred to Tajik poetry from Russian and European literature [9,127].Based on observations and comparative analysis, we would like to emphasize that the researcher's opinion on this issue is close to reality. On the other hand, new themes and tones required a renewal of the genre structure, and this was natural. In any case, a new style in the rhyming system of Tajik poetry, new formulas, inter-genre synthesis in rhyming, new terms that came in the form of rhyme led to the emergence of new genres. A striking example of this can be seen in the poem "Balkan War" by AbduraufFitrat, which is also quoted in Sadri Ziyo's "TazkoriAsh'ar".Here it seemed

appropriate to quote a more complete quotation from the poem to better visualize the changes in the structure of the form of the poem.

> *Eyhama, eyrafiqisadoqatqarini man,*
>
> *Eyyovarguzidavuyoriguzini man,*
>
> *Eychashmdar du didaiotashfishoni man.*
>
> *Eyqalbig'amrasidaiotashnishoni man,*
>

> *V–eyyorig'amgusorishabidiltapidagem.*
>
> *To man–manambadahrnabudastjuzshumo,*
>
> *Yak kasmarorafiquhamohangug'amzudo...[5, 18].*

This poem belongs to the musical genre in the book by academician M.Shukurov "*Sadri Bukhara*". The main theme of the poem is political. The main idea in it is a call to self-awareness, the struggle for truth, justice, historical pride and eternal value. However, in our opinion, it belongs to the genre of composition, since the connecting byte in these verses differs from the previous ones both in content and in rhymes. Indeed, this poem by Fitrat is, in fact, one of the most poetic discoveries of the literature of the early twentieth century, with a high rebellious spirit and a unique style of propaganda. The new structure and form of poetic rhyme are one of its important aspects. It is difficult to distinguish this genre of poetry by rhymes. After all, this form of 11-byte rhyme in a poem is similar to a *masnawi* rhyme. However, it is easy to see that in this poem the poet changed the traditional order of rhyming Masnavi. As if traditional rhymes had undergone a qualitative change in a new historical context. These changes were caused primarily by the need for a new political theme. Since the theme of poetry is a new era and a vital topic, and its main issue is a political issue, a system of free rhyme was used in the poem. In the order of the poem and its rhyme, a look at the synthesis of classical poetry and rhyme of world poetry arises. The rhyme seemed in tune with the tone of the poem, the rhythm and percussion were new, each word took on an intense tone, with a distinctive tone of speech, call, call, march and mobilization. If you can exclude the rhyming of the first 11 bytes of the poem, this can be attributed to the genre of the composition based on individual poems of the poem. In this regard, Fitrat's poem reveals a serious crack in traditional genre patterns. After all, each of his poems rhymes in the form *aa,bb, vb,gvav, bv,* and so on. It is not hard to see here that Fitrat has innovated the structure of poetry. This proves that through the efforts of some enlightened poets since the beginning of the twentieth century, new combinations of rhymes have arisen in poetry. AbduraufFitrat showed in practice that new combinations of rhymes (based on the rhymed form of rhymes) open up great opportunities for the poet. First of all, poems have a strong spiritual, logical and syntactic connection with each other. Secondly, the

verse, free from rhyme in verse, formed a single semantic pattern, creating a feature of expressing a certain meaning, concretized together with rhymed verses in verse. In the poem quoted by Fitrat, it can be noted that the fifth verse of each verse served such a function. In other poems of the poem, the general meaning of bytes and verses constitutes the entire content of the verse. However, the fifth verse of each verse shows that the poem has a particular rhyming style, as mentioned above. This poem by Fitrat is based on the synthesis, a combination of masnavi and a compositional sequence of rhymes, which can be divided into two parts, that is, 2 + 4. An important aspect of such rhyming in the poetry of the early twentieth century is that it is a new form of rhyme based on the phenomenon of literary synthesis or the study of spiritual and logical expressions in Persian-Tajik literature, Russian and European literature, the Turkish period, Iranian constitutionalism. It was formed on the basis of the influence of the works of representatives of literature, which gave rise to new cases, changes, formal-semantic, logical, thematic-meaningful exchanges in the traditional system of genres of Persian-Tajik poetry (for example, the order of rhyming).This indicates that Fitrat, as a poet-innovator, used a unique style and special forms of creating poetry for new logical and spiritual expressions, and this is his new aesthetic taste. Since enlightened and modern creators have their creative principles, these principles fall short of any normative standard of classical literary poetics. As noted by researcher Sh. Rakhmonov, "Rhyme and its combinations arose from the synthesis of spiritual and logical expressions of world poetry, creating a new system of genre expressions, thereby shifting the subject content. In new combinations, the nature of the genre did not suffer, but new ways of expression were discovered and creative possibilities expanded "[4,50].Complementing the opinion of the literary critic N. Afokova, we can say that in the work of AbduraufFitrat there is a synthesis or combination of free poetry (the term "Sarbast poem") and traditional forms of *khijali* poetry. In particular, Fitrat's Uzbek poems demonstrate not only a decrease or increase in the number of syllables but also a clear and free change in the weight of a syllable in new free forms of poetry [2,22].According to the researcher, only three of the 30 verses (verses 3, 7, 13) in the poem "Yana was burnt out" followed the law of the integrity of the number of syllables in the poem, and the rest of the verses were written in free form, in a unique tone and rhythm [2,22]To prove the above considerations, we also found it necessary to cite one poem in its entirety.

Biroq u

Mengasiraboqmadi,

Yig'ladim,

Kuldim,

Yolindim,

Tushundim.

Bittasi ham mijozigayoqmadi.

Yig'labirozo'ksuzlangantilagim,

Men ham sendaybaxtsizlikkatutindim.

Umidsizlikoratushibyo'qsuljonimo'rtandi[6,29].

This style and style of poetry is repeated many times in the Uzbek poems of Fitrat, not one or two. In particular, the same situation is observed in the poem "*Shark*". In Uzbek literature of the early twentieth century, not only Fitrat, but also Cholpon, A. Majidi, Hamza and several other poets resorted to this style of poetry, and we can say that this literature laid the foundation for the first samples of the so-called "free and new" poetry. Indeed, Cholpon's poems "*Night*", "Judgment Day" (1919), "*Poem of Mansur*" by Hamza (published in 1914 in the newspaper "*SadoiTurkiston*") and "*KutlugBolsun*" (1927) are new in form and content. Distinguishes and carries the poetic form of Western literature - verslibre [2, 22–23].This new form of poetry is a symbol of the emergence of "New Poem" or "Free Poetry" in the literature of the national awakening, and this phenomenon occupies a special place in determining the general direction of the literature of the studied period.

Thus, if one of the important conditions of "new poetry" and "free poetry" is the deciphering of rhyming combinations, we can conclude that the starting point for the emergence of Tajik "new poetry" is the literature of the early twentieth century. Poems of this type that caught the attention of MuhammadjonShakuriBaharai were written by SadriddinAini in 1324 or 1907. It looks like this:

> *Subhonolloh,*
> *Imro'z ba mo hodisae sa'b rasid,*
> *gashtem xarob*
> *Az xohishi charxi falaki do'lobiy.*
> *Ohi bepoyon kash, pursand chi hol?*
> *Bargo'y: bad hol!*
> *Jangidani g'ijduvonivu ko'lobiy,*
> *in ast javob[1,167].*

(Meaning: SubhanahuwaTa'ala, today by the will of fate we have a difficult task, and we are ruined. If they ask about your condition today, answer with a deep sigh, my condition is bad!

This passage clearly shows the author's novelty in the form of a poem. Indeed, according to the scholar's credible comments, "It is noteworthy that the weight of the poem is specific to the chopping, and the order of rhymes is specific to the continental genre. Although it is written in *hajj musammaniahrabimakfufiabtar* (and required), it is not hacked, because its rhyme is characteristic of the continent. The learned part also contains an unknown rhyme, the second verse not learned (*mustazad*), or rather the learned part - the previous "Subhanallah", that is, the rule of mustazad (getting half a verse) was broken and became unnatural. It is clear here that Teacher Aini showed great courage in destroying traditional forms "[8,49].In our opinion, this poem is based on the phenomenon of artistic synthesis, a combination of the advanced traditions of classical literature and new principles of the literary process of that time, and is one of the first examples of free form poetry in Tajik literature. Its appearance is not directly related only to the traditions of Western literature. Because the traditions and principles of classical literature prevail here. In other words, the weight of the poem is hack, the rhyme order is continental, and the structure is similar to the mustazad genres. This poem itself confirms that at the beginning of the twentieth century, in the development of Tajik poetry, there was a break with traditional patterns, a desire for innovation in the order of weight and rhyme of the poem, and the founders of this movement were SadriddinAini and AbduraufFitrat.If you look deeper, the novelty of the

poem manifests itself not only in the system of rhyme and weight or its "ladder" but also in the style of expression, the psyche of the lyric hero, the harmony of metaphorical thinking in the poem, the logical and rhythmic power of words. Therefore, it is understandable that the real meaning and critical tone of the poem increased.

Based on this, we can say that at the beginning of the twentieth century in the development of Tajik poetry, there was a gap in traditional forms, the weight of the poem and the desire for innovation in the order of rhyme, and the founders of this movement were representatives of the enlightenment and modernity.

CONCLUSION

Thus, the changes and updates of form elements that have arisen in the lyric genres of Tajik Jadid literature in connection with the need for new content and ideas can be listed as a generalizing conclusion from the above opinion: significant changes in the structure of poetry, architecture. In the example with Aizi, Hamdi, Mirza Siroj, Fitrat, Asiri, Aini, gazelles;updating the weight and tone of the poem; updating traditional genres in terms of content, ideas and content, including *gazelle, masnawi, tarje'band, musaddas, mustazad*, etc.;updating poetic symbols and artistic images in poetry; the emergence of new combinations of the order of rhyming; discoveries in the application of art; The emergence of "new poetry" as a new art form; The predominance of "national poetry" over "romantic poetry";-synthesis of traditional classical structures of Eastern and European poetry; simplicity and change in the style of expression of the poem; aggravation of events in the verses of enlightened poets and the influx of folk melodies in the verses of the Enlightenment and Jadidism.

These changes and reformulations show that the new historical conditions in the literature of the late nineteenth and early twentieth century's, a product of political and social life, are the product of general changes in various aspects of life. The period of its emergence coincided with a new historical, economic, political and cultural period of the peoples of Central Asia. The introduction of new social meanings into the literature of that period was a serious step forward, and the formation of this literary process served as an important factor in its evolution.

ABSORPTION CAPACITY OF LOCAL ADSORBENT COMPOSITIONS OF OIL AND PARAFFINS

Anorov R.A.*; Rakhmonov O.K.**; Abdurakhimov S.A.***,

*Fergana Polytechnic Institute,
Tashkent Institute of Chemical Technology,
UZBEKISTAN

ABSTRACT

The article mainly discusses the results of using various imported adsorbents. At the same time, the use of local adsorption compositions in the country should be widely used in the processing of mineral oils and paraffin at oil refineries. The lowest oil absorption and the ability to absorb paraffin were observed in Navbakhor alkaline bentonite (from the Navoi region). With such local adsorbents, the loss of valuable mineral oils and paraffin was relatively low. Also, these minerals differ in porosity, dispersion, etc. Today, one of the important tasks of industrial enterprises that pollute the environment is maintaining the ecological balance in nature.

KEYWORDS: *Adsorbent, Oil, Paraffin, Purification, Absorption, Composition, Petroleum Oils.*

INTRODUCTION

Currently, the country has achieved results in improving the characteristics and quality of mineral oils, paraffin in accordance with technological processes carried out in accordance with the requirements of the standard. Basically, various adsorbents imported and local ADS orbenty in our country. For the introduction of a variety of compositions and methods of use provide a series of opportunities.

Alumina adsorbents show their properties depending on the region of production. One of their main indicators is the volume of sorption, which determines the loss of mineral oils and paraffin. At present, oil refineries use oil- containing adsorbents obtained from various non-metallic raw materials for the purification of mineral oils and paraffin. With this in mind, local adsorbent compositions can be formulated with different compositions to determine their performance ratios with high oil content and wax absorption. In this regard, the results of previous studies of adsorbents used in the Fergana refinery and some local adsorbents are known as oil capacity

results and the wax capacity of oil- containing adsorbents [1-5]. The absorption capacity of mineral oils in imported adsorbents is 58.5%, the absorption capacity of paraffin is 56.1%. Taking into account the results of local film adsorbents, the absorption capacity of mineral oils was 41.9 ÷ 57.9%, the absorption capacity of paraffin was 41.3 ÷ 55.2%. In this case, the analytical work to determine the rate of absorption of film adsorbents is carried out on the basis of approved regulatory requirements.

MATERIALS AND METHODS

In terms of the oil-absorbing and paraffin- absorbing capacity of the selected adsorbents, the component capacity is lower than the control values of imported adsorbents supplied to the enterprise. The lowest oil absorption and the ability to absorb paraffin were observed in Navbakhor alkaline bentonite (from the Navoi region). With such local adsorbents, the loss of valuable mineral oils and paraffin was relatively low. Also, these minerals differ in porosity, dispersion, etc. Therefore, at an oil refinery they are classified and processed separately, that is, they are disposed of separately. Above are the comparative indicators of lubricated and waxed adsorbents obtained from various mineral alumina in. It is known that in the case of contact cleaning of mineral oils, the degree of sorption of the obtained adsorbents varies depending on the type of mineral. The chemical composition of the adsorbents is important in terms of the components.

Table 1. Information on the general chemical composition of Navbakhor alkaline bentonite in Navoi region No. Composition of chemical compounds amount % Explanation

1 SiO_2 54 , 2 2 not less

2 Al_2O_3 11.7 6 no more

3 Fe_2O_3 9.2 8 no more

4 Na_2O 3.3 7 not less

5 K_2O 2.5 2 not less

6 MgO 1.7 9 not less

7 CaO 1.3 2 not less

8 P_2O_5 0.1 6 no more

9 TiO_2 1.3 5 no more

10 FeO - no available

11 nn n-other connections 14.2 3 no more General content 100 For example, the degree of sorption of an adsorbent oil obtained from bentonite by montmorillonite by acid activation is 55%, while the Navbakhor carbonate palygorskite obtained by this method (in the Navoi region) is 40%. This once again confirms the effectiveness of using local adsorbents in the contact cleaning of mineral oils and paraffin. The proposed adsorbent contains a large number of substances that can be obtained from refined products.

Reasonable use can be determined based on the capacity of the adsorbents relative to the component layer. That is, it is used in oil and mineral adsorbent, it is high-temperature alumina for combustion or environmental treatment, economic efficiency. For example, waxed film

adsorbents have a relatively slow swelling rate than lubricated film adsorbents, as evidenced by the numbers in Table 2. Table 2. Refractive index of the processed, i.e. oiled and waxed films No. Name alumina Absorbance, cm 3 / g

Gilmoyannye and adsorbent with oiled oils :

1. Pocket opogi alumina 1.123

2. Navbahar alkaline bentonite 1.174

3. Navbahar white carbonate palygorskite 1.122 Paraffin- coated alumina adsorbents:

4. Pocket opoka alumina 1.091

5. Navbahar alkaline bentonite 1.097

6. Navbahari white carbonate palygorskite 1,082 Incineration of adsorbents used in accordance with the rules and requirements of environmental protection or processing at high temperatures is prohibited due to the release of toxic substances and gases that pollute the atmosphere from the combustion of organic substances. Therefore, the development of an environmentally friendly technology for the disposal of adsorbents used in oil refining is urgent. In recent years, various adsorbent compositions have been used for deep purification of mineral oils and paraffin. We prepared compositions in mixtures of various adsorbents and analyzed their composition.

CONCLUSION

According to our results, the use of the compositions reduces oil absorption and paraffin absorption of the used adsorbents. The alkaline bentonite components of Navbahor in a 1: 1 ratio with Karman opoga clay had an oil content of 54 % and a paraffin content of 51.3 %. However, due to the nature of the compositions made from local gold-plated adsorbents, they served to reduce losses in the separation of mineral oils and paraffin. Today, one of the important tasks of industrial enterprises that pollute the environment is maintaining the ecological balance in nature.

KBC, INDIA'S MOST FAMOUS GAME SHOW: AN ANALYSIS

Dr B Karunakar*

*NMIMS Hyderabad,
INDIA
Email id: Karunakarb@nmims.edu; bkarunakar@yahoo.com

ABSTRACT

Today, there are more than a dozen reality shows on air across all kinds of channels, from general entertainment to youth channels to the regional, all on prime time. These reality shows offer a wide scope for brand visibility. In this context, Kaun Banega Crorepati as a reality show was studied for its impact and the economics involved. The attempt of this article is to provide insights on the working of the TV channels, production houses, marketers & advertisers that provide the sponsorship, the general comparison of reality shows with serials and the overall impact created.

KEYWORDS: *Sponsorship, Reality Shows*

INTRODUCTION

Amid the COVID-19 lockdown, 'Kaun Banega Crorepati' (KBC) Season 12, hosted by India's famous actor Amitabh Bachchan caught the attention of audiences as millions logged in to participate in the show during May 2020. The broadcasting channel Sony TV claimed that the registrations grew by 360% from last year. In general, digital platforms with content on streaming platforms has experienced significant growth during the pandemic unlike most industries that faced a slowdown amid the lockdown (Joel Kurian, May 2020)

Brief History

KBC, an Indian TV game show based on the British programme 'Who wants to be a Millionaire' first aired on Star Plus for the first seasons from the year 2000 to 2007. Since 2010, produced by production company Big Synergy Productions, it has been airing on Sony TV. The reality show has changed the face of not only the participants but also the host of the show, Amitabh Bachchan. The participants are asked questions one by one, four options are given for each

question from which the correct answer must be chosen. In the game, the contestant is aided by four lifelines that one can exercise in case of difficulty in answering the question.

The series which aired on StarPlus for three seasons is the first show that took the channel's viewership to a greater height, being one of the top viewed Hindi GEC show in that time. KBC1 was the most watched television program and pushed StarPlus into number one position for the first time then and also reinvented Amitabh Bachchan's career. In its next two seasons, it continued to hold its number one position.

The fourth season which began airing on Sony Entertainment Television ended with an average rating of about 4 TVR as also the fifth season. It consistently claimed the largest primetime-viewership share among Hindi GECs, sweeping nearly 50% viewership share of the genre's highest watched slot between 8 pm – 12 am.

Overall, KBC has been the most-watched Hindi GEC occupying first position (Wikipedia, 2020).

Impact

What impact did the show have on India's larger TV viewing landscape across major geographies? Had it changed how people watch Hindi GECs in general, or does it extend to other genres on Television? Here are a few insights based on Zapr's unique fingerprint-based analytics for KBC's reach over 40 million unique profiles in India.

Sony TV's primetime viewership went up significantly by 69.1% in just one month after KBC 9 aired on TV in 2017. Nearly one-third of KBC's initial viewers remained loyal who stayed from the first to the last episodes. Further, every person who ever tuned into KBC impressively watched it almost halfway through the episode.

There was audience migration from other channels, shows and genres which aired during the *same* time as KBC on Television. Results revealed highest movement from other top watched shows like *Sa Re Ga Ma Pa Lil Champs* (22.90%) on Zee TV; *Khatron Ke Khiladi* (22.40%) on Colors TV; *Dance+3* (18.70%), *Yeh Rishta Kya Kehlata Hai* (17%), and *Ishqbaaz* (16.40%) on Star Plus.

KBC drew in massive audiences from Hindi Movies channels (59%) such as Sony Max, Star Gold, Zee Cinema, and Hindi News channels (46.5%) such as Aaj Tak, India TV, Zee News. Interestingly, the quiz show drew in 25.10% viewers of Kids channels such as Nickelodeon, Disney Channel, Hungama; and 34% of Sports viewers across channels such as Star Sports, Sony Six, Ten Sports.

KBC topped Primetime hours, 44.4% share of all Hindi GEC viewers between 8 PM - 12 AM on both weekdays and weekends.

Coming to KBC's penetration in major cities across India, Delhi, Mumbai and Ahmedabad had the highest penetration among metropolitan cities, while Indore, Lucknow and Bhopal topped cities with above 1 Million populations.

The highest section of viewers belonged to mid-end section (58.3%) using phones prices between Rs. 7,000 - Rs. 16,000, followed closely by low-end phone users (41.1%). However high-end phone users formed a negligible minority of 0.6%, suggesting strongly that KBC's TV audiences

were mainly comprised of lower and middle income groups with average purchasing power (zapr, blog)

KBC got adapted into other indian regional versions in Tamil, Bhojpuri, Bengali, Kannada, Marathi, Malayalam and Telugu (i) Koteeshwaran in Tamil aired on Sun TV from October 2000-June 2001 an later in 2012 for three seasons on Star Vijay (ii) Ke Bane Crorepati in Bhojpuri on Mahuaa TV in 2001, hosted by Bollywood actor Shatrughan Sinha (iii) Key Hobe Banglar Kotipoti in Bengali on Mahuaa Bangla in 2011 and later in 2018, hosted by Indian cricketer Sourav Ganguly (iv) Kannadada Kotyadhipati in Kannada on Asianet Suvarna in 2012 and later on Colors Kannada for four seasons (v) show was remade in Marathi on Colors Marathi in 2012 (vi) Ningalkkum Aakaam Kodeeshwaran in Malayalam on Asianet in 2012 (vii) Meelo Evaru Koteeswarudu in Telugu on MAA TV in 2014 for four seasons

Oscar winner, Slumdog Millionaire, Danny Boyle's 2008 film, where the movie's host was portrayed by Bollywood actor Anil Kapoor, was loosely based on the KBC show (Wikipedia, 2020).

KBC has also provided the space for NGOs to grace the hot seat where they could share their inspiring work and stories that change the lives of the less fortunate. KBC provided a platform for NGOs across the country to raise funds for themselves. Many NGOs have participated in the KBC show like Apna Ghar Ashram, Kalinga Institute of Social Sciences, Cuddles Foundation etc (giveindia, blog).

Economics

KBC turned out to be a money spinner and a profitable venture that explains for its repeated hosting by Sony Pictures over several seasons. For instance, in KBC 9 of 2017, Sony is estimated to have spent around Rs 200 crores and earned about Rs 400 crores in advertising revenue according to several brand experts and media buyers. Reliance Jio as the presenting sponsor paid close to Rs 100 crores that was more than three times the Rs 30 crores that chocolate brand Cadbury paid in KBC 8 (Lata Jha, Sept 2020)

The "powered by" sponsorship deals for Vivo and Ching's Secret cost was Rs 50 crore each, again an increase of three times form what the brands paid in 2014. Associate sponsors including brands such as Raymond, Datsun, Axis Bank, Aakash Institute, Big Bazaar and Quick Heal have come on board for around Rs10-15 crore each, again a rise from the Rs5 crore the show demanded for associate sponsorship the previous season.

Sony is estimated to have spent Rs 120 crores as remuneration to the host Amitabh Bachchan, a brand in himself, building lot of brand equity for the Sony Channel and the Game Show Concept. As KBC rolls, one wonders whether the format is bigger or the host? It has become increasingly clear that the celebrity host is the biggest pre-requisite.

The reason brand association rates had more than doubled is that the reach of the show, including digital platforms, has increased consumer awareness and engagement. It is difficult to seek people's attention when there is so much clutter and only a show like KBC can demand a premium as it caters to the aspirations of the common man.

One of the biggest challenges for any entertainment brand is to continue to find relevance in the same format. According to the creative producer, Siddharta Basu, KBC stayed relevant by not

being just another quick quiz show. Rather, it's closer to life and its drama where one could see a life changing in the span of an episode. The prize money for the contestant has risen from Rs 1 crore under STAR TV in 2000 to Rs 5 crore in 2010 when Sony took over.

For marketers & advertisers like Reliance Jio, Vivo, Oppo etc which look for reach and certainty with clear objective of gaining dominant market share, it would make sense to pay handsome money to be associated with entertainment brands like KBC, IPL, Big Boss, Kapil Sharma Show etc. KBC is a high profile show and sponsors get tremendous visibility. A mass brand like reliance Jio seeks connect with the heartland of India as title sponsor (Nandini Raghavendra et al, Nov 2011).

Comparison with Serials

According to TV-audience measurement agency TAM, reality shows commanded 14.7% share of the viewership in 2010 on the top 5 Hindi channels, second only to serials' 64% share.

These shows are highly popular, particularly among the youth, and offer a wide scope for brand visibility including co-branding, prize sponsorship, business partnership and guest appearance.

Reality shows are particularly popular among the youth. Reality as a format appeals and connects well with the youth.

Reality shows are cheaper to produce and easier to sell to marketers because they give brands a wider scope to participate than family dramas.

Cadbury's chocolate is exchanged in Kaun Banega Crorepati, the fourth edition of the popular quiz show now running on Sony channel, while General Motors give away Chevrolet Cruze sedans to the winners of Bigg Boss, which makes various celebrities live in the same house for three months and viewers choose the best resident.

Reality shows also offer scope for promotion of films or cross-promotion of shows. Madhuri Dixit, for example, appeared on Kaun Banega Crorepati as a participant, and also announced Jhalak Dikhala Jaa, another reality show on Sony channel in which she is a judge.

It's in line with the developed markets such as the US and UK. Reality shows dominated ratings among viewers aged 18 to 49 in the US last summer. A New York Times report said that 15 of the top 20 highest-rated TV programs among younger adults were reality shows such as America's Got Talent, Big Brother, The Bachelorette, So You Think You Can Dance and Survivor. All of these shows have been remade in India. Unlike fiction shows, where actors are paid, most participants in reality shows come free, in search of their five minutes of glory on TV and to become famous (Omkar Sapre, Feb 2011).

Also, none of the content produced during a reality show shoot goes waste. Auditions, behind-the-screen happenings are shot, and broadcast before the actual show goes on air. Controversies and fights between participants create a buzz and the show becomes a talking point in the press or on social media.

Production firm UTV Television's CEO Santosh Nair says TV channels buy reality shows at three times the price they pay for fiction shows. UTV Television has produced reality shows Dance India Dance for Zee TV, Cash Cab and Emotional Atyachaar for Bindass, Rakt Sambandh and Rakhi Ka Insaaf for Imagine TV, and Maa Exchange for Sony TV.

Channels pay more because there are many ways to attract advertisers and marketers and earn extra income. SMS votes are a big draw for game shows and talent competitions, and also generate revenues for the channels.

CONCLUSION

Reality shows are highly popular, particularly among the youth, and offer a wide scope for brand visibility including co-branding, prize sponsorship, business partnership and guest appearance.

Today, there are more than a dozen reality shows on air across all kinds of channels, from general entertainment to youth channels to the regional, all on prime time.

In conclusion, Channels like Sony TV take on shows like KBC to build a time slot, leverage on its success and ride that time slot with other fiction shows to leverage higher margins.

ANALYSIS OF TEACHING ENGLISH FOR ARCHITECTS

Kambarova M.M*

ABSTRACT

The intention of this research is to inspire a discussion about the changes in architecture terminology with the revolution in communication and representation forms as a result of digitalisation. The blurred boundary between the virtual and the analogue worlds, the misunderstandings and the confusion that appear with the interaction of these two worlds nowadays form the major problems facing architectural design, education and research. The researchers in this field are focused on the interface, the meeting and the transformation point between the digital and analogue worlds in order to prevent those problems and confusions. One of the main reasons of this ambiguity is the architectural terminology that changes according to the changing status of architectural representation i.e. new forms of representation; new forms of communication i.e. the new role of the architect and researcher. Whenever and wherever information and knowledge specialised is created, communicated or transformed terminology is involved in a way or another. An absence of terminology is combined with an absence of an understanding of concepts. Therefore with the new information and communication technologies; new and developing subject areas the existence of terminology and its update is indispensable. Thus the changing status of the terminology must be analysed. As architecture terminology is essential to improve today's challenging, multidisciplinary communication in order to clarify the problems of ambiguity and unawareness (as a result of shift of specific architectural vocabulary) it is necessary to analyse the changes in the architectural terminology which will form the discussion point of the following paper.

KEYWORDS: *Architectural Terminology, Building, Ancient, Innovative Technologies*

I. INTRODUCTION

Every field has a distinction and features which differentiate one from another. Likewise, the field of Architecture has its own uniqueness and terminologies in the world. English for architects is perhaps the most neglected kind of ESP (English for Specific Purposes). Architects need English for all kinds of reasons, and your first job as a teacher and/or course designer will be to work out what they are and which are priorities.

Architectural terminologies are not used only for describing buildings, but also it plays crucial role in describing deep meaning, function, social and constructive aspects of those buildings. Modern architectural terminology has been derived from Greek and has roots from Latin language. However, it is difficult for one to understand the meaning of those words at once. Because of the industrial development, all the nations including Egypt, China, India and Arabic countries used their own up-to-date terminologies that are formed according to language, religion and culture, which is quite obvious. For instance, "Arka" is - "Ravoq" in Arabic language but the meaning of this word and its usage in the building is the same.

The history of Uzbek architecture dates back to millennia. An example of this is the preservation of historical monuments of Bukhara, Khorezm, Kashkadarya and Samarkand regions. The fact that the architectural monuments in Bukhara are about 2500 years old means that the architecture of the country and the high building quality.There are specific difficulties in learning foreign languages, as is every other field. Due to in every specialty has its own history, its present and future. Without knowing the history of the subject or science that is being studied, it is difficult to understand the current day or to develop ideas for its further development. Likewise, the student who is studying this field must know the same terminologies or specific words according to this subject as foreign languages. Today's development in the highly developed century is not limited that every one of us perfectly well in his sphere, but also should speak in several foreign languages exactly.

II.MAIN PART

These architectural monuments have been used in the construction of unique architectural monuments that are distinguished from other architectures by Uzbek architecture. The monuments are mainly used in national traditions, and we can see patterns, Arabic inscriptions, verses, and examples. Because, Islamic culture has been reflected in all the fields in our country and at the same time in our architecture.

For example: *Ravak* - a type of mountain; a moon-mounted device on the top of windows and doors in the building's walls. Ravak is made from natural, artificial stones, concrete, wood and steel. The basal part is composed of a base, a central ponasimon brick, or a thumb is called a lock. According to the shape of cranes: single-center, half-shaped, high-center cradle, a few centered pearls, ovulating. In order to reduce internal stress in modern buildings, the rugs are designed as 2-3 corners. The backbone is the same size and shape as the back of the arches.

The Peshtoq (roof)- is a front part of the medressa, mosque, tomb, caravan and other buildings. The roof of the roof is a luxurious high, ornate architectural part, typically slightly exaggerated by the building wall. The central point is the center of the ravine and its two sides and the two triangles at the top of it are wings and rocks. The most ancient example of the remains in Central Asia is Arabot mausoleum. Roof tiles and rags are decorated with magazines and books of

religious and philosophical nature. The Ulughbek madrasah, Sherdor madrasah, Tillakori madrasah, and Abdulazizkhon madrasahs are decorated with unique national architecture.

Qanos -Blood (chest) - architectural part; The tumor on the top of the roof. The wing is limited to the upper horizontal, vertical and lower curve lines (linga). The bricks are tilted in the radial direction while horizontally in the groove area. Drawing attention to the style of grooming is an emphasis on architectural writing. In the 9th-12th centuries, the upper corners of the flank, mostly curly-shaped, have been the method of separating the ends of the neck with a specific node. The Samonids Mausoleum also features small square squares that have a dynamic square angle of 45 degrees.

Moreover, Thinking about how you can use all the information above, in a rather idealised ESP approach you would design a needs analysis to find out what their priorities are (probably along with a placement testing system to test their level and strengths and weaknesses). You would then use that to design a syllabus based on those needs. If all those needs were in the future this could be a graded step-by-step syllabus similar to textbooks, but if they were already using English every day it would probably be based much more on doing the most important things first. In any case, the syllabus would change as the course progressed, based on feedback from the students, changing job roles, emerging weaknesses, etc. The two main approaches that help cope with these more realistic situations are:

- Add one or more architecture-themed stages to a more general lesson

- Base a lesson around suitable and interesting materials you can find, e.g. a topical news story about architecture, and try to bring relevant language into it

Interesting topics related to architecture include:

- Celebrity architects

- Health and safety in construction site

- Resistance to particular materials in certain countries, e.g. trying to sell wooden houses in the Russia or brick houses in Turkey

- The most beautiful and ugliest buildings, e.g. in one city

- The influence of one country on another or on the world

- Cultural differences, e.g. differences in status of thatch in different countries

- Cultural similarities, e.g. disguising the material used to make a house with fake bricks in USA and pebbledash in the UK

- Identifying historical influences on postmodern buildings as Azerbaijan

- Explanations for why buildings are a certain way, e.g. why certain traditional features originally came about

- The revival of traditional architecture in one country

- Resistance to modern architecture, e.g. British domestic housing

- How much your neighbours should be able to comment on what you do with your own house (planning regulations)

- Positives and negatives of the protection of old buildings and towns, e.g. Battersea Power Station

III.CONCLUSION

In general, the peculiarities of Uzbek architecture are many, and as we can see from the above-mentioned terms, we can know how ancient architecture is.

Nowadays manufacturing of modern raw materials in developed countries in the field of architecture and building premises is becoming one of the reasons of apparition of new terminologies. It must be emphasized that country that is producing new or modern raw materials is tend to name new good in their own language. Although this product is used for the same purpose, as its mentioned above, different cultures and nations are likely to change reform it in order to make it easy use and pronounce. If we take in to consideration new innovative technologies, new architectural terminologies are not difficult to gather and make one.

For that reason, it is necessary to gather all terminologies and create one big encyclopedia to enhance understanding of architecture and contribute for its development. It would be very helpful for students, researchers and professionals who are in this field and would like to improve their knowledge of modern architecture. Architectural terminology plays important role on aforementioned progress of architecture.

SCIENTIFIC MUSICAL VIEWS OF THE GREAT SCHOLAR ABU ALI IBN SINA

U. Khamidova*

*Teacher,
Department "Training of Teachers of vocal and instrumental performance",
State Conservatory of UZBEKISTAN

ABSTRACT

This article analyzes the scientific musical considerations of one of the great thinkers Abu Ali Hussein ibn Abdullah Ibn Sina, who brought the culture of Central Asia to the forefront of world civilization in the Middle Ages. According to some sources, he wrote works such as "Introduction to the Art of Music" and "A Book on Attributes" on music theory. However, these works were lost due to migration from city to city, wars, palace riots, and various disasters. In this way, enlightenment throughout the East and Europe will have a great impact on the development of culture. In his time, he was awarded the greatest titles in the East and Europe, such as "Sheikh ur-Rais", "King of Doctors".

KEYWORDS: *Culture, Science, Doctor, Theory Of Music, Sound, Logic, Mathematics, Physics, Metaphysics.*

INTRODUCTION

In connection with the implementation of the "Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021", today the country has a process of innovative development. In this process, measures are being taken to develop the cultural sphere at a new stage.

In this regard, it should be noted that the following practical work was carried out in 2016-2018:

first, significant strengthening of the material and technical base of cultural and art institutions;

secondly, the implementation of comprehensive measures to support the representatives of this field (housing for theater actors; provision of the full payment of pensions to retirees working in the field of culture);

thirdly, establishment of the "Ilhom" Public Fund for Support of Artists of Uzbekistan, the Fund for the Development of Culture and Arts under the Ministry of Culture of the Republic of Uzbekistan, the Association of Composers of Uzbekistan, the Fergana branch of the Uzbek State Institute of Arts and Culture (Kokand);

fourth, the creation of a system for the preservation and development of unique examples of Uzbek classical and musical art, their unique schools and traditions of performance;

fifth, the establishment of the Uzbek National Research and Practice Center for Maqom Art and the Maqom Museum (in Shakhrisabz), and the holding of the International Maqom Art Festival every two years.

This work, carried out in a short period of time, has set the direction for the development of the cultural sphere on a new basis. In this regard, the "Concept of further development of national culture in the Republic of Uzbekistan in 2019-2021" [1.1.] Is a comprehensive program of work in the field of culture [2.2.]. It should be noted that as a result of the Concept, from 2021, the next "Road Map" will be developed and implemented. In this regard, we have a medium- and long-term comprehensive program in the field of culture of the state in relation to the Concept.

Also, the adoption of the Resolution of the President of the Republic of Uzbekistan dated November 17, 2017 No PD-3391 "On measures to further develop the art of the Uzbek national maqom" laid the foundation for the further development of our national culture. "The art of national maqom, which is an integral part of the cultural heritage of our people, with its ancient history, deep philosophical roots, unique artistic style and rich creative traditions, occupies a special place in our spiritual life" [3.3.].

One of the great thinkers who brought the culture of the peoples of Central Asia to the forefront of world culture in the Middle Ages was Abu Ali Husayn ibn Abdullah ibn Sina, better known in Europe as Avicenna.

Ibn Sina was born in the village of Afshona in Bukhara, in the month of Safar, 980, in the family of an official. In 986, Ibn Sina moved with his family to Bukhara, and from that time on, the young Hussein began to receive primary education, to study science. His youth dates back to the last years of the reign of the Comanis, especially the reign of Noah 2 ibn Mansur Somoni [976-997].

Ibn Sina was talented, had a strong memory, and was quick to master the sciences known in his time. At the age of 10, he fully memorized the Qur'an. From the age of 13 he began to study mathematics, logic, and philosophy. Despite his young age, Ibn Sina studied philosophy under the guidance of Abu Abdullah Notili and medical science from Hasan ibn Nuh Qumri. Gradually, he also became a doctor.

Ibn Sina studied the works of Eastern thinkers before him, as well as the natural-scientific, philosophical heritage of ancient Greece, in particular, the works of Aristotle, Euclid, Ptolemy, Galen, Hippocrates, Pythagoras, Porphyry. At the age of 16-17, Ibn Sina became known as a famous physician.

In 1000, Ibn Sina left Bukhara and went to Khorezm, one of the centers of culture. There he was admitted to the academy of Khorezm governor Ali ibn Mamun, which united the leading scholars of his time. Ibn Sina became acquainted with such mature scholars as Beruni, Ibn Miskawayh, Abu Sahl al-Masihi, Abul-Khair Hammar, Abu Nasr ibn Iraq.

Ibn Sina, who came to Jurjan through the cities of Abivard, Tus, Nishapur, lived as a famous physician in the palace of the governor Qaboos ibn Vashmgir. There he met his future student Jurjani.

In 1023 he went to Isfahan and devoted his entire life to writing scientific works. Ibn Sina's famous works, such as "Kitab al-Qanun fit-tibb", "Kitab un-najot", and "Kitab ul-insaf", speak of geometry, astronomy, plants, and the animal kingdom. The great philosopher Abu Ali ibn Sina was not only a naturalist, the lord of medical science, but also a poet and music theorist. There is a special section on music in his book "Kitab ash-shifo". He also wrote a special pamphlet, "Risolai fil-muzika". According to some sources, he wrote works such as "Introduction to the Art of Music" and "A Book on Attributes" on music theory. However, these works were lost due to migration from city to city, wars, palace riots, and various disasters.

Ibn Sina was not limited to writing music. He included his works on music in his books on medicine. Of course, this was no accident. In his works, he gave a proper evaluation of the emotional impact of music, emphasizing its great importance in the treatment of mental illness. In particular, the scientist has a separate section in his book "Laws of Medicine", which explains the theory of music, which is described as a program of treatment of mental illness.

He also introduced musicology to the mathematics department, such as Abu Ali ibn Sina al-Farabi, and at the same time attached great importance to the study of sounds. A study and comparison of the theoretical issues of music commented on in the sources proves that Abu Ali ibn Sina further developed Abu Nasr al-Farabi's musical aesthetic views and elevated him to a higher level. In his autobiography, Ibn Sina notes that he diligently studied and widely used such important treatises as Farobi's "Purposes of Metaphysics" and "Fususul Hikam."

The total number of Ibn Sina's works exceeds 450, but only about 160 of his works have survived. Ibn Sina is primarily interpreted as a physician, whereas medicine is one of the most important of his scientific fields. Most of Ibn Sina's works were written in Arabic, which was the scientific language of the Near and Middle East at the time, and some in Persian. His best-known work "Kitab ash-shifo" (Book of Healing) consists of 22 volumes, 4 major sections of which are devoted to logic, mathematics, physics, metaphysics.

Ibn Sina was able to combine the high cultural upsurge in the countries of Central Asia and the Middle East, the spiritual achievements of the cultural awakening. In this way, enlightenment throughout the East and Europe will have a great impact on the development of culture. In his time, he was awarded the greatest titles in the East and Europe, such as "Sheikh ur-Rais", "King of Doctors". As a famous coach, Ibn Sina brought up such students as Abu Ubayd Jurjani, Umar Isfahani, Muhammad Sherazi, Ahmad Masuri, the famous Azerbaijani thinker Bakhmanyar ibn Marzban, Yusuf Ilaki, the great scientist and poet Umar Khayyam.

Ibn Sina was so respected among the people that he became a folklore hero. There are various stories, legends and myths about the scientist. World scholars have long been conducting research on the works of Abu Ali ibn Sina and his activities. Various works about Ibn Sina have

been created in almost all languages of the world, and there is no doubt that new works will be created by the creators.

ABSTRACT

The article provides an overview of the rhythm, syllables, pauses, weights, stanzas, rhymes of finger-weight poems in the Primary Reading Book and analyzes them through poetic passages. In the system of finger poetry, the division of the syllables in the verses into specific groups is called standing. "Pause is a common custom common to the poetic systems of all peoples and nations of the world. The weight of the finger is based on the number of joints in the verses, the grouping of the same stops in a specific order. It was easy to count the number of joints in the verses with the fingers, so it was a picture of the weight of the fingers.

KEYWORDS: *Poem, Verse Systems, Dream Weight, Finger Weight, Free Weight, Prose Poem, Weight, Standing, Rhyme.*

INTRODUCTION

Poetry is based on emotions and thoughts. Poetic works differ from other literary genres by their musicality and charm.

Poetry is an exciting, rhythmic speech that is organized in a certain order in terms of melody and emerges as an expression of emotion. In the science of literature, this form of speech is called weight or poetic system. Poetry systems vary depending on what is the basis for this patterned speech. In Uzbek poetry, depending on the form, the poem has many weights, such as aruz, finger, freelance (free), prose.

Observations have shown that primary school textbooks contain mostly poetry written at finger weight.

The weight of the finger is based on the number of joints in the verses, the grouping of the same stops in a specific order. It was easy to count the number of joints in the verses with the fingers, so it was a picture of the weight of the fingers. A verse written at finger weight can consist of five, six, seven, eight, nine or more syllables. The strict grouping of syllables in verses is called turak. These internal divisions create a unique melody.

In finger-weight poems, as mentioned above, the amount of joints in the verses is the main measure. The weight of the joints in the verses is the order in which they are placed. Weight does not live on its own. It, too, "resurrects" only when it works to bring out the ideological and aesthetic content, that is, when it measures words, syllables, and stanzas, becomes a necessary tool, reveals the legitimacy of poetry.

> Guppa-guppa / yog'ar qor,
>
> Go'yo ko'kda / ini bor.
>
> *(Guppa-guppa / heavy snow,*
>
> *It looks like a sack / encloses with a drawstring.)*
>
> Tomlar oppoq, / yer oppoq,
>
> Shox, novdalar / arg'imchoq….
>
> *(The roofs are white, / the ground is white,*
>
> *Horns, twigs / swings….)*
>
> (Shuhrat. 3rd grade. 83-p)

The order of 4 + 3 in the first verse of this verse is repeated in the same way until the end of the poem. That is why the weight of this poem is the weight of a finger with 4 + 3 = 7 joints.

There are two types of weights on the finger: normal weight and combined weight. If the number of syllables in the verses is the same from the beginning to the end of the poem, it is called a simple weight. For example, consider Anvar Abidjan's poem "Good Intentions" (Grade 1, p. 53):

> Hammada ham bor havas,   – 7 joints
>
> *(Everyone has a passion,)*
>
> Mana, kichkina Avaz   – 7 joints
>
> *(Here is the little Avaz)*
>
> Ko'kka boqar uxlamay,   – 7 joints
>
> *(Can't sleep looking at the sky,)*
>
> Men dedim, qani, so'ray.   – 7 joints
>
> *(I said, come on, ask.)*

Talib Yuldash's poem "Love the Craft" (Grade 3, p. 181) is another example of simple weight:

> Hunarni sev, hunarni!   – 7 joints
>
> *(Love the craft, the craft!)*

Hunar senga asqatar.   – 7 joints

(Craft will help you.)

Hunar otin soni yo'q,   – 7 joints

(No job title,)

Sanasang, qator-qator.   – 7 joints

(Count, row by row.)

If the number of joints in the verses is in two or three different forms, it is considered the total weight. A certain order of verses in which the number of syllables in the joint weight is not the same is strictly observed until the end of the poem. For example, Abdurahman Akbar in the 3rd grade Reading Book

Kechagina yoz edi,   – 7 joints

(It was summer yesterday,)

Endi bo'lsa kuz.   – 5 joints

(Now it's autumn.)

Xohla, bog'da uzum ye   – 7 joints

(If you want, eat grapes in the garden)

Xohla, anor uz.   – 5 joints

(If you want, eat pomegranate.)

In the poem "Autumn" (p. 50), which begins with copper lines, the number of joints in all single lines (7 joints) is the same and the number of joints in all double lines (5 joints). in) has a different appearance.

Shukhrat's poem "The Pain of the Pen" (Grade 3, p. 171) is also an example of compound weight:

Qalam deydi: - Meni chizma   – 8 joints

(The pen says, "Don't draw me".)

Devor, toshga.   – 4 joints

(To the wall, stone.)

Axir mening xizmatim bor   – 8 joints

(After all, I have a service)

Bundan boshqa.   – 4 joints

(Other than that.)

Yaxshi niyat, orzu bilan   – 8 joints

(With good intentions, with a dream)

Qo'lingga ol,	– 4 joints
(Take it,)	
Qog'ozga yoz, gar istasang,	– 8 joints
(Write on a piece of paper, if you want.)	
Suratlar sol.	– 4 joints
(See pictures.)	
Husnixat yoz, xizmatingga	– 8 joints
(Write a note, at your service)	
Men hozirman.	– 4 joints
(I am now.)	

The means of regulating the poetic speech in terms of tone are rhythm (consistent and uniform repetition of similar small passages) and rhyme (melodic words at the end of verses).

In the system of finger poetry, the division of the syllables in the verses into specific groups is called standing. "Pause is a common custom common to the poetic systems of all peoples and nations of the world. Because there can be no poetry without rhythm. So there is no poetry without a pause. The reason for this is that only the repetition of parts of speech to a certain extent creates a rhythm, and repetition does not occur without regular pauses, that is, without pauses…..

There is a pause after each punctuation mark. This is a simple pause. But the pause at the end of a line, a line, a stop, a column is different. This pause is also determined by the content, experience, syntactic-into national structure. It does not exist in prose because it is a measured, equal, and parallel phenomenon of poetic speech. That is why it should be called a rhythmic pause" (4.170).

The way in which the syllables are divided into stanzas gives rise to the rhythm and tone of the poem. For example, in the analysis of Iskandar Rahmon's poem "Motherland - the Fortress of Mercy" (6.83):

       4   3

Er kishining / ko'nglida

Egarlangan / ot bo'lar

Ona Vatan / sevgisi

Diliga jo, /yod bo'lar.

      Vatan – mehr / qo'rgoni,

      Iymon uning / qalqoni.

      Er yigitlar / Vatannning

      Mard-u maydon / posboni.

(The husband is in the heart

It will be saddled

His homeland / love

It will be in your heart.

Homeland - love / fortress,

Faith is his / her shield.

Husband guys / Homeland

Courageous man - he field / keeper.)

Hence, the order of these verses is 4 + 3 = 7.

The pause between lines, lines, or verses in a poem is called a pause. There is usually a very short pause between stanzas and lines, and this is called a short pause. The pause between bands is relatively large and is called a large pause. Sometimes the amount of pauses between verses can vary depending on the content of the poem and the specific rhythm. In the following example, there is a very short pause between the first and second paragraphs, resulting in a much longer pause between the second and third paragraphs:

Ona Vatan ko'rkidir,

Iftixori – yigitlar!

El boshiga ish tushsa,

Xaloskori – yigitlar!

Omon bo'lsin hamisha

Jasur o'g'lon, yigitlar!

Qadamidan o't chaqnar,

Ko'ksi qalqon yigitlar!

(Motherland is the beauty,

Pride - guys!

If you have a job,

The savior is the boys!

May you always be safe

Brave boy, guys!

Fire flashes from his feet,

Chest shields guys!)

Understanding the weights of a poem will help you read and understand the poem.

Rhyme is one of the main elements of poetry. It provides the musicality and charm of poetry. The rhyme is vivid in the text and differs from other words in its sound. That is why poets try to convey the main idea in their works in rhyme. Let's analyze this in the example of Mirtemir's poem "Bird's tongue" (1.140):

Qushlar, hey, ketmang *uzoq,*

(Birds, hey, don't go *far*,)

Qo'ymayman sizga *tuzoq.*

(I will not set a *trap* for you.)

Bo'zto'rg'ay *bo'zlashaylik.*

(Let's *break* the ice.)

Turumtoy, *so'zlashaylik.*

(Turumtoy, *talk* to soon.)

The words *long, trap, break, talk* in the poem are rhyming words.

The connection of the rhyme with the content creates an impression and makes it easier to memorize the content of the poem. Because these qualities are embodied in proverbs, anyone who hears them will remember them for a lifetime:

O'zga yurtning *gulidan*

O'z yurtingning *cho'li* yaxshi (3.18).

Daryo suvini bahor *toshirar*,

Odam qadrini mehnat *oshirar* (3.70)

(From a foreign flower

The desert of your country is good (3.18).

The river overflows in the spring,

Labor increases human dignity (3.70).)

It seems that the rhythmic arrangement of the words in the verses creates the rhyme, and the rhyme creates the music in the poem.

The main activity in poetry reading lessons is expressive reading. Only when the student understands the main content of the poem can he read it expressively.

Reading and analyzing lyric poetry requires great skill on the part of the teacher. Although poetic systems are not studied in primary education, the teacher emphasizes the specificity of content and form in a poetic work, such as rhythm, syllable, stanza, weight, pause, rhyme. a deeper understanding of the properties and functions of the elements will help students to feel the poetic tone, to fully understand the words of the text.

ABSTRACT

The problem of the spiritual world of man has always been in great importance. The characteristics of human behavior, inner experiences, thought, talent, and creativity have been analyzed and studied by thinkers of each period based on the level of development of their time and their vision of the future. In fact, man has always understood his own life and the life of society. He tried to understand the essence of what was happening around him and expressed his attitude.

KEYWORDS: *Manaviyat, Human Mind, Intellect, Interests, Inner Spiritual Experiences, Imaginary World, Generosity, Perfection, Perfect Man, Self-Knowledge, Knowledge, Honesty, Tolerance, Perfection.*

INTRODUCTION

In fact, man has always understood his life and the life of society in his own way. He tried to understand the meaning of what was happening around him and expressed his attitude. He categorized what he was learning by imagination or intellect, and grouped, analyzed, and generalized similar things. He gave them a common name, class and degree. In this process, different concepts and terms have been emerged. This is because, first of all, some of the most important things in a person's life are related to his living and material needs. Secondly, no matter how important material things are, people's attitudes towards each other, loyalty, support, cooperation, as well as the human mind, intellect, interests, inner spiritual experiences, imaginary world, etc. realized the immense need.

Personality, in the process of developing his mental, spiritual, emotional world, faith, expressed it in different ways. While some of these concepts were more general and broader, some of them expressed specific aspects, or specific states of the human inner world. One of the most common concepts is "ma'naviyat"[1]. In turn, various aspects, status, stages of spirituality are reflected in

science, literature and philosophy. For instance: greed, lust, modesty, devotion, fidelity, faith, belief, generosity, perfection, perfect man, self-knowledge, knowledge of Allah, enlightenment, striving for truth, etc. Along with the concepts of goodness, the concepts of evil, dishonesty, immorality, ignorance, wickedness, greed, etc., which are alternatives to it, were also important[2]. Because without these concepts, man would not be able to study virtue and spirituality in depth.

All of the above concepts reflect different aspects of the human spiritual world. Man has analyzed specific concepts based on general concepts and determined that some of the laws in them are manifested in their own way. At times, the analysis of specific concepts has further concretized and enriched the general concepts in the study process. This is especially specific for researcher-scientists and writers. The concept of "ma'naviyat" is the spiritual qualities of a perfect person and defines the requirements and qualities on them. In turn, research and conclusions about the perfect man have enriched the concept of "ma'naviyat". The same can be said about the relationship between the concept of "ma'naviyat" and other concepts. For example: spirituality and sophistication, spirituality and morality, spirituality and faith, spirituality and religion, spirituality and politics, spirituality and law, and so on. Many dictionaries and some articles emphasize that the concept of spirituality refers to the word "meaning". However, in classical literature, semantic phenomena are used not in the form of "spiritual" but in the form of "meaningful" ("scientific meaning" - secular, mainly natural sciences and logic). For example, DavlatshohSamarkandiy described Mirzo Ulugbek as "yulduzlarilmidaosmonqadaryuksalibbordi, maoniyilmidaqilniqirqyordi".

In ancient philosophy, spiritual life was studied in separate areas, and this tradition was gradually reflected in Western philosophy. In the East, in Islamic philosophy, spiritual life is studied in common. Concepts such as "morality", "will", and "spirit" that are inherent in the spiritual world of man are embodied in spirituality. The formation of the concept of "spirituality" as a term was strongly influenced by Islamic philosophy, theology - the science of interpretation of the Qur'an - "ilm at-tafsir", and later mysticism reflected deeply.

We gain a deeper understanding of the features, means, and concepts that help to illuminate the spiritual world of man through the lofty ideas, philosophical views, and classical literature of our thoughtful ancestors. For example, the famous poet and sage, the great scholar of theology and mysticism, Jalaliddin Muhammad Rumi, is a philosopher who brought the concept of spirituality to its peak. An example of his profound thought is the book"Ma'naviyMasnaviy", which discusses human reality and its inner, spiritual world.

There is also a belief that the term "spirituality" is popular because of the work of Jalaliddin Rumi. Rumi's" Ma'naviyMasnaviy" was popular in the Middle East, Iran, Central Asia, and northern India.

In Rumi's view, spirituality is the basis of Sufism. Jalal al-Din Rumi, in the foreword to his book, "Ma'naviyMasnaviy", infused it with various ideas and gave it meaning. First of all, he interpreted the concept of "ma'naviyat"(spirituality) in the religious sense as "the methods of religion, the method of the methods, the pioneer of the secrets of attaining the Truth and Truth." Continuing his thought, Rumi supplemented his book with "The Garden of the Soul, the Springs of Wisdom and Enlightenment." The word "garden of the heart" here refers to the heart and meaning (ma'naviyat meant"mind" in Sanskrit). "This book is a cure for the mentally ill, a remedy for sorrows, a companion of secrets, a pioneer of mysteries, a revealer of Qur'anic truths,

an exponent of sustenance, including spiritual sustenance, and a protector of morals from all kinds of evil and filth." Rumi, "expander of spiritual sustenance," meant spiritual nourishment, spiritual sustenance - the enjoyment of truth, goodness, justice, beauty, and pleasure.

Jalaliddin Rumi began the work by referring to the nay. In the image of the nay, the inner world of the perfect man, through the melancholy melody, the perfect man groans from the hardships of this world; Just as the path of knowledge is filled with the love of an empty, lonely pipe, so the path of knowledge is straight, just, its character is exemplary, and knowledge is free from oppression and ignorance, and described as its heart is filled with divine love.

In Rumi's view, spirituality is the essence of God and Truth, which is attained by man's liberation from lust, self-denial, death, and union with him. People are incapable of understanding the vision and essence. Therefore, in many cases, they make judgments based on visible external signs, images, and cling to customs, rituals, and beliefs. It is impossible to acquire the secret of monotheism, the light of faith, and knowledge without understanding the essence. Perceptions of God are varied and incomplete. In his book, Rumi explained that only those who perceive with the eyes of the heart can approach this essence, and those who love photography cannot understand the essence of God.

> "*Peshima'niychistsuvrat, bas zabun*
>
> *Charxroma'niyashmedoradnigun*"[3].

In the verses quoted in the book, it is stated that the meaning of man is not in his body but in his spiritual, inner world, and that man's destiny depends on Allah's will and judgment, just as life is created by Allah.

It is appropriate to recognize Jalaliddin Rumi's works and views as a way to raise human spirituality to perfection, a treasure trove of meanings. In Rumi, spirituality is honesty, tolerance, perfection and generosity. The Mavlaiya sect, which he founded, differs from other sects in its religious tolerance, religious-philosophical, sectarian and sectarian. For this reason, Rumi takes a very broad and comprehensive view of any issue, including the issue of spirituality, as well as the perfect man who has risen to the level of a true spiritual person.

Alisher Navoi's Nasayimul Muhabbat narrates: "One day Rumi said to Mawlana Sadriddin Qazvini, 'I am one with seventy-three sects.' Qawzwini considered his statement to be blasphemous and said to one of his disciples, "Ask Rumi in a large crowd if you have said this. If he confesses, insult him as much as you can. " When a student asks a question in a meeting, Rumi admits, "Yes, I did." The disciple then began to insult Rumi with obscene language. But Jalaliddin Rumi did not get angry and smiled and said, "I agree with what you said." MawlanaSadriddinQazvini's student will leave the meeting ashamed. "For Rumi, no matter what denomination a person belongs to, if he has true love in his heart, if he is humble and honest, if he is generous, he is a true spiritual person and a perfect person. For Rumi, even what religion a person belongs to is not crucial. It doesn't matter what your profession is or whether you are a religious scholar or a dervish. Rumi also criticized people who did not have true love in their hearts, hypocritical sheikhs and dervishes for some of their incompetence.

Jalaliddin Rumi's idea of religious tolerance and perfection has not lost its relevance today. The post-Rumi classical geniuses of Eastern literature, including AlisherNavoi, continued his above

traditions. They sang of true love, honesty, humility, generosity, tolerance, and, conversely, criticized falsehood and hypocrisy.

Alisher Navoi's Lisonut-tayr also uses the term to describe Sufism:

> Mundafoniybo'lmayishbo'lmastamom,
>
> Foniyondintoptinazmimixtimom.
>
> Ham budaftarichraShayxima'naviy
>
> Kim, demish qushlar tilidan masnaviy
>
> Garchi bu ikki tanosib yer edi,
>
> Nazmimabutaxallusboredi.[4]

Here, when AlisherNavoi called him "Sheikh of Spirituality", he was emphasizing the teachings of Sufism by Fariduddin Attar.

> *Chun riyozatrafetibruhoniyat,*
>
> *Salbbo'lg'ochkimsadinnafsoniyat.*
>
> *Qolmag'ayruhoniyatdino'zgahech,*
>
> *Sentaxallufdinbuma'niichrakech*[5].

Navoi interpreted the concept of spirituality in a narrow and broad sense. In a narrow sense, the term refers to a system of Sufi views, or the views of a particular sheikh. The above quote is an example of the use of the term in a narrow sense. Navoi uses the concept of spirituality in a broad sense as a perfect person who embodies these qualities, the system of qualities that characterize the path of Allah, the human being in general. Chapter V of the epic Farhod and Shirin, dedicated to the legacy of Muhammad, contains the following lines:

> *Tushibandinbiyikchunittifoqi,*
>
> *BoribandoqkitebranmayBuroqi.*
>
> *Samandintashlagachulma'naviyganj,*
>
> *Samandidektutubpaykindog'iranj*.[6]

The term "Spiritual ganj" is referring to the Prophet Muhammad.

Alisher Navoi's Mahbubul-Qulub is also dedicated to the spirituality of man and society. This work mainly consists of three parts. The first part "Xaloyiq ahvol va a'fol va aqvolining kayfiyatida," that is, on the condition of the people, their behavior, and the importance of speech, consists of forty chapters. The second part, "Hamida a'fol va zamima xisol xosiyatida", is about taxshi verbs and bad qualities, and is mainly devoted to moral issues. This section consists of ten chapters. The third part is called "Mutafarriqa favoyidvaamsolsurati", which means "Various useful tips and articles" and contains various useful tips and wisdoms.

Navoi'sMahbubul-Qulub directly addresses the necessary spiritual qualities of almost all social groups, classes and professions of his time - the qualities that make up the perfection of man, the

justice of kings, human qualities that are spiritual or incompatible, and shortcomings, which of them are good or bad, and which one is good or bad for humanity, the people, the country. At the same time, by criticizing bad behavior and qualities, Navoi showed the spiritual factors of society. He described the spiritual qualities of a righteous king as follows: The property of the administrator of the property garden is abundant and the love of the property owner is bright. The people of other lands are in his dreams, and the oppressed of the country are in his words of justice. The work of a good horseman is to compose a hymn for the sake of the Prophet's order and a good quality of poetry, to compose a hymn for the occupation of the singers, and to sing a melody in the prayer of the proverb of the musannifs.

(The food of the hungry is from the table of the righteous king with mercy and grace; the garment of the naked is from the treasure of his bounty. The people dream of him; the oppressed of other lands pray for him because of his justice. Scholars write pamphlets describing his good name; poets write poems praising his good qualities. Composers compose melodies for him; sings from the heart).

He cares about the well-being of the people (the stomach is full, the idol is on top, the country is prosperous). His generosity is like a cloud of rain. He cares for everyone to be enlightened and enlightened along with a prosperous life (the sun that shines on the world in the eyes of the people of the country).

Although we do not find the concept of "spirituality" in Mahbubul-Qulub, we do read the interpretation of the qualities and characteristics that reveal the spiritual world of man. AlisherNavoi, in describing "vafo", begins with the fact that it is an abstract quality that has disappeared in his time: "Vafo is a quality and mercy have been seen by the people without it, and human property has gone to ask for it… Mahbubedur - There is no pure creature, no pure soul. And in that pure heart there is no power or misfortune. "(Karam and Mercy - they saw the people deprived of a good quality like fidelity and went to the world of non-existence to find it… Faith is such a pure-hearted lover that he is kind and generous to someone who is not pure in heart and nature. Fidelity is such a purity that it does not approach or encourage a person whose nature is pure and whose nature is not pure).

"Kimga qildim bir vafokim – yuz jafosin ko'rmadim?

Ko'rguzub yuz mehr, ming dardu balosin ko'rmadim?"[7]

(I showed loyalty to everyone, I did not get rid of it until I saw a hundred infidels; I was in a loving relationship with everyone, I did not get rid of it until I suffered a thousand afflictions).

The concept of "spirituality" is not used in a narrow religious context. Navoi's naming of the work "Mahbubul-Qulub" - "Lover of Hearts" shows that it is not a one-sided approach to spirituality. Navoi's approach can be seen in the development of ideas in Farobi's"City of Noble People".

Abu Nasr al-Farabi, "City of Noble People", explained the essence of spirituality with the concept of virtue. Farobi used the term "noble" instead of "spirituality." Unlike others, Farobi uses "fozillik" not in a religious sense, but in a secular sense. In Rumi, Navoi, and other thinkers, the term "spiritual" was used in a more religious and mystical context. "Fazil" - "Fazila" - is an Arabic word, which is synonymous with the word "perfect". It can be seen that Farobi meant perfect people when he said "noble people". The people of the city of virtuous people strive for

happiness: "The longer and better each person engages in activities that lead to happiness, the more perfect and virtuous his mood will be. Through perfection, the heart of the one who strives for happiness will be purified and he will be glad that he has done good deeds."

The twelve attributes bestowed on the mayor of the city of the nobles constitute the essence, concept, and category of spirituality. The mayor of the city of the nobles is healthy, intelligent, sensitive, broad-minded, intelligent, fair, nationalistic, quick to understand, comprehend and reflect on things and events around him, strong-willed, inquisitive, creative, honorable, courageous. And he is said to be able to restrain his desires, not to indulge in wealth, not to be pragmatic, not to be ambitious. Farobi included "the city of the ignorant, the city of the dishonest, the city of the exchangers, the city of the lost, the city of the lost, the city of the people" among the cities that contradicted the city of the nobles. "Representatives of these cities - some people are the opposite of the nobles."

The formation of the concept of ma'naviyat in Islamic philosophy depends on several factors. First of all, Allah is based on the creation of man as a conscious, intelligent being, the flower of nature, the owner of nature and all living beings. In this sense, spirituality is the abilities, talents, creativity and creative potential given to man by God.

Secondly, man is even a small universe within the universe. Therefore, Sheikh AziziddinNasafi divides the world into two: the world of sugra and the world of kubra. Nasafi calls man "the world of sugra" ("small world"), the divine world and the material world together as "the world of kubro" ("great world"). He says that all things and features in the big universe exist in the small universe. Thus, man is an enhanced version of the higher world - the "world of Kubro".

Thirdly, the purpose of human existence is divine love, and through this love one can atone for oneself and attain the truth. This view is not based on Islamic theology but on mysticism. Love is the power that leads to enlightenment, the sacred fire that purifies and frees man from materialism. Love burns the body and purifies the soul, and in taxation there is tajrid and tafrid (purification, isolation). That is why lovers withdraw from the people, because their souls do not like worldliness, long for solitude, and always want to be with their master, Allah.

Alisher Navoi in his book "Mahbubul-qulub" divided love into three parts: the first part - the love of ordinary people, the second part - the love of those with special qualities, and the third part - the love of the sincere. "It simply came to our notice then. And in his observation, in his absurdity, he became alarmed. His witnesses have reached the Istig'roq, and it has created the status of the Istig'roq. " (Purpose: The righteous live in the hope of seeing the beauty of the truth openly, and are thus despised).

Fourth, in Islamic philosophy, there are different approaches to the issue of the spiritual qualities of the perfect man. The concept of the perfect man and the attributes given to his spirituality were first used by MuhyiddinIbn al-Arabi (1165-1240), known as the Sheikh of the Grave. According to Ibn al-'Arabi, the image of a perfect man on earth is that of the Prophet Muhammad (peace and blessings of Allah be upon him). His body was full of mental, spiritual maturity, worldly and divine knowledge. According to Ibn al-Arabi, the perfect man is a soul with a divine power. From this it can be concluded that a perfect man is a mediator between God and ordinary people, and that this concept cannot be applied to ordinary people.

In the views of Sheikh Omuliy and AbdulkarimGeloniy, the perfect man seems to be a celestial being, whose qualities are not like those of the mortal people on earth. It is as if we are observing a whole set of supernatural forces. However, Sheikh AziziddinNasafi's treatises "The Perfect Man", "The Purpose of the Aqsa", "Zubdatul-Haqiq" and others treat the concept of the perfect man and his spiritual qualities in connection with the emergence, development and career of man.AziziddinNasafi's conception of the perfect man reflects the characteristics and moral qualities of a living person. "It is known that a perfect person is a person who is mature according to the Shariyat, the teachings and the truth, and if you do not understand this phrase, I will say in another phrase: Know that a perfect person is such a person, then the following four things are perfect: good words, good character, good morals and education".

These qualities, which Nasafiy considered to be good words, good deeds and good behavior, are derived from Zoroastrianism. In Zoroastrianism, good thoughts, good words and good deeds are the ideas that have become universal moral values, the main factor and the essence of the moral image of man.

The term "ma'naviyat" is not a gradual expression of the teachings of Sufism but are being used widely as the ability, moral, legal, philosophical, scientific, artistic, religious ideas and concepts. In philosophical dictionaries and dictionaries of various interpretations, especially in post-independence dictionaries and in explanatory, popular dictionaries on spirituality, the concept of "ma'ni" and its core "ma'no»", "spirituality" are revealed, and its content as a scientific concept is enriched.

HARMONY OF UNIVERSAL VALUES AND NATIONAL SPIRITUALITY

Akhrorova Sevar Akhmedovna*

*PhD Associate Professor,
Philosophy and National Ideology,
Tashkent State Technical University,
UZBEKISTAN

ABSTRACT

"There is no future for a nation that does not know its history and forgets its past.""The international community recognizes that our ancient and beautiful land is one of the cradles not only of the East, but also of world civilization. No great people, scientists, scholars, politicians and commanders have emerged from this sacred land, and secular and religious sciences, especially those related to Islam, have become an integral part of universal civilization and culture. It gives us great pride and pride that the services of the great scholars who have matured are incomparable. "

KEYWORDS: *Incomparable, Civilization, Politicians*

INTRODUCTION

(From the book "High spirituality is an invincible force") Today, the organization of national values in the Republic has become one of the most pressing issues. The reason is that it is difficult to analyze their current state and think about their future without organizing the history of our rich national values. The infinite number of things and events that surround a person, including those within a national spirituality, that have a special significance or value for a particular person or social group, or a particular nation, or for all of humanity, are called values.

National values are the customs, traditions, virtues, morals and ethics, way of life, holidays, constructions, national costumes, household items, and behavior of a certain people, which are worthy of respect by the majority of this people. For example, the Uzbek national values are hard work, hospitality, kindness and gentleness, diligence and obedience, solidarity with different categories of people, forgiveness, thoughtfulness and peace.

Spiritual values are the product of people's spiritual activity, the product of knowledge, attitudes and skills that emerge as a result of a complex process of cognition. The pricing of these values ultimately depends on a person's mental needs, interests, and types of activities. Spirituality in such cases is not opposed to materiality. On the contrary, they are interdependent. Examples include various holidays, national customs and traditions, beautiful morals and etiquette, music, paintings, fiction, and so on.

Spirituality is a concept that represents the spiritual and mental world of man. It includes people's philosophical, legal, scientific, artistic, moral, and religious ideas. The term "meaning" underlies the term M. It is known that man has an external and an internal world. The external world includes his stature, appearance, dress, demeanor, and so on. His inner world includes his purpose in life, his thoughts, desires, aspirations, and emotions. This inner world of man is M. While food gives a person physical strength, Spirituality gives him spiritual nourishment and strength. Spirituality is related to enlightenment and culture. Spirituality does not come into being in a ready-made way in people. It can only be achieved through continuous study, study and experience. The richer the spirituality, the more prosperous the society and the nation. A spiritual person knows exactly what the purpose of life is, finds a way to live a meaningful life, acquires a culture of communication, and approaches every issue from the point of view of honesty and justice. What is conscience, what is false and true, what is honor, what is honest and what is impure - all of this can be distinguished from each other, it refrains from actions that lead to evil in life, it does deeds that lead to good. In short, Spirituality reflects the meaning of human life. Patriotism, patriotism is one of the main factors determining human spirituality. In societies where spirituality is mature, the possessors of talent are the face, the pride, the prestige of that society, the nation. In a spiritual society, reason, common sense, justice and good behavior are paramount. In such a society, the people's confidence in the future will be strong, and various inhuman vices will be eliminated. It is hard to imagine Spirituality without the nation's centuries-old roots, its historical experiences, and its sociocultural development. "Spirituality is the power of a person, a people, a society, a state. Without it, there will never be happiness," said the First President of the Republic of Uzbekistan IA Karimov. Therefore, in Uzbekistan, raising M., making the people M. has risen to the level of state policy. Independence has opened the way for the study of the centuries-old rich historical, scientific, cultural and religious heritage of the Uzbek people and its use as a common and invaluable property of the people. Our spirituality has been formed, enriched and developed along with universal values from the Avesto and Zoroastrian teachings to the present day. The Republican Center for Spirituality and Enlightenment was established in Uzbekistan to raise, promote, enrich and spread spirituality and enlightenment to a wide range of the population. The subject "Fundamentals of Spirituality" is taught in the republican education system. Scientific research is being conducted in the field of spirituality.

Spirituality is one of the main criteria for the development of society, the maturity of the nation and the perfection of the individual, because only when spirituality develops, there is economic and socio-political stability in society, and the country and the nation develop. This, in turn, serves as a necessary basis for the harmonious development of the individual.

Man is created in such a way that from an early age he seeks answers to the many problems that arise in nature and society, seeks to understand the essence of various events in life. He is interested in knowledge, imagination and concepts that explain the mysteries of the world in a

simple and clear way. Thus he is constantly striving to know the truth, discovering something and living in search of news. From time immemorial, man's efforts to create ideas and ideologies in accordance with his aspirations have also stemmed from his need to know the real truth, to move forward, to live up to his dreams, because ideas and ideologies it clarifies the purpose, expresses it in accordance with the spirit and thinking of the individual, the people and the nation, and strengthens the efforts in this direction. When the goal is clear, it is easier to move forward, to understand the meaning of life, and to understand the truth.

Thanks to independence, the restoration and modernization of national and educational values has become a universal need. In particular, one of the important changes that have taken place in the years of independence in our country is the spiritual renewal, the enrichment and expansion of people's consciousness, thinking and worldview, as well as the acquisition of freedom. In particular, to understand the interests of our people, country, people, nation and homeland, to further enhance their glory, to promote science, culture and art, to ensure the security of the country, to organize the rich heritage, history, religion and values of our ancestors. , their work on proper evaluation is particularly pleasing. From time immemorial, the Uzbek people have had their own unique methods of upbringing, in particular, admonishing young people, setting an example of good people, respecting adults, respecting the little ones, kindness to parents, and a number of other virtues.

The essence of the radical reforms being carried out in Uzbekistan is aimed at educating the younger generation as a spiritually mature, intellectually gifted generation. Reforms in the political, socio-economic and spiritual spheres aimed at strengthening independence are aimed at building a democratic and civil society that protects human rights and freedoms. The main purpose of the changes is to protect the material and spiritual interests of man. There are exemplary life lessons of our parents, grandparents, ancestors, who will always be a beacon for us on such a difficult and complicated path, illuminating our path. These include the restoration of national values, the promotion of spirituality, especially the strengthening of attention to the traditions of Eastern morality. In our country, grand plans and creative work are carried out intelligently, based on historical traditions and experiences.

The scientific distortions given to culture in modern times have come about as a result of an understanding of the uniqueness of the spiritual, spiritual process that has been created and continues to be created by humanity. There was no doubt, or more precisely, no scientific analysis, that in the days when mankind lived on the basis of a "natural" way of life, in the days of hunting, fishing, early cattle-breeding, and agriculture, they thought of culture as they do today. In a simple, rapidly evolving society, man lived with little culture. Traditions, beliefs, material and social forms of life were inseparable as a separate form of culture.

Human society is constantly evolving and changing and improving. In different historical periods and in different cultures, people have a different understanding and acceptance of changes in society, forming a unique imagination and knowledge. We go to the organ and ask the sixties questions about how people in the eighties overcame barriers that are similar to the current problems. Less than sixty of us find the answer, and as a result there is a constant communication between the sixties, the present and the future. Of course, the cultural concepts or processes in each period play an important role in linking historical stages or periods.

FEATURES OF THE USE OF THE INNOVATIVE METHODS IN TEACHING AND DEVELOPING SPEECH

Khudoyberdieva Asila Khomidovna*

*Shakhrisabz Branch of TSPU Named after Nizami,
Shakhrisabz, UZBEKISTAN

ABSTRACT

This article is about innovative methods and its specific features at the present stage of teaching, as well as promising methods and approaches that can be used to teach the Russian language and the development of speech. Technologies and innovations, with all the differences in the target, content, and organizational aspects, are ultimately aimed at increasing the productivity of educational activities, turning the student into an active subject of their own learning. To implement the above-mentioned paradigm for the formation of a teacher, it is possible only with the help of fundamental psychological and pedagogical research and the development of a new direction in pedagogy: innovative education.

KEYWORDS: *Innovation, Methods, Pedagogy, Activity, Native Language, Ability, Innovation, Formation.*

INTRODUCTION

Recently, there is a growing desire to introduce new technologies in the educational process. In General, the process is logical and reasonable. There are many innovative types of teaching Russian and speech development, and they use the most basic techniques. "Improving the methodology of teaching the Russian language is unthinkable, as I rightly noted N. M. Shansky, without constant updating of the teaching content concerning the language competence of students, the development of their oral and written speech and speech culture." [1] the Connection of methodological searches with the novelty of the content is mutually reversible: the new requires different methodological approaches, original forms and methods of presenting the material.

The traditional training system is somewhat behind the needs of society, so what is "innovative training" and whose features are it? The definition of "innovation "as a pedagogical criterion is

often found and is usually reduced to the concept of" innovation", "novelty". Meanwhile, innovation in the exact translation from Latin does not mean "new", but "into the new". At the end of the last century, J. R. R. Tolkien put this semantic load into the term "innovative". Botkin. [2] He outlined the main features of the "didactic portrait" of this method, aimed at developing the student's ability to self-improve, independently search for solutions, and work together in a new situation. The concept of modern education has defined the goal of the teacher's professional activity – to form students ' ability to successfully socialize in society and actively adapt to the labor market.3] this Results in the development of innovative technologies in training. Innovative methods are characterized by a new style of organization of educational and cognitive activity of students. Modern teachers recognize that in the development of creative abilities and intellectual activity, the maximum opportunities are provided by the technology of problem-based learning.

One of the key tasks of the education system at the present stage is to form a thinking, creative, active, highly qualified specialist based on modern educational programs. Such a specialist can only be trained by a creative, professionally competent teacher who has pedagogical skills and is armed with modern innovative technologies. Technologies and innovations, with all the differences in the target, content, and organizational aspects, are ultimately aimed at increasing the productivity of educational activities, turning the student into an active subject of their own learning. Innovative approaches to teaching Russian are primarily associated with changing the role of the teacher. In modern conditions, it is very important that the teacher does not give students ready-made knowledge, but points out the way to acquire knowledge, teaches them to get knowledge. This is especially important when the teacher teaches Russian as a non-native language. [4]

Traditional and innovative teaching methods need to be constantly interconnected and complement each other. These two concepts must exist on the same level. Innovative approaches to teaching Russian in a multi-ethnic environment are based primarily not only on awareness. Russian language teaching and speech development innovative approaches include translation from Russian into the native language reverse translation building an associative series verbal (graphic) image of the word pronunciation, and so on. Modern teachers recognize that the technology of problem-based learning provides maximum opportunities for the development of creative abilities and intellectual activity. [5] Innovative technologies allow us to realize one of the main goals of teaching Russian language and literature - to make it possible to move from studying the subject as a system-structural education to studying it as a means of communication and thinking, and to transfer educational and cognitive activity to a productive and creative level. At the lesson, you should use promising methodological techniques for developing students ' creative abilities: clusters, insert (when studying theoretical material independently), filling out tables, two-part diary, reading with stops, joint search, cross-discussion, round table; apply elements of TRIZ (technologies for solving inventive problems of developing techniques and causing great interest from students is the use of Internet resources as an innovative approach to learning.[6]The main goals of innovative training are:- development of intellectual, communicative, linguistic and creative abilities of students; - formation of personal qualities of students;-development of skills that affect educational and cognitive activity and transition to the level of productive creativity; – development of various types of thinking; – formation of high-quality knowledge, skills and abilities. These goals also define the tasks of innovative learning: - optimization of the educational process; - creating an environment of cooperation between

students and teachers; – development of long – term positive motivation for learning; – inclusion of students in creative activities; - careful selection of material and methods of its presentation. Innovative learning is based on the following technologies: – developing learning; – problem – based learning; – developing critical thinking; - differentiated approach to learning; - creating a situation of success in the classroom. The main principles of innovative learning are: - creativity (focus on creativity) – - assimilation of knowledge in the system; - non-traditional forms of lessons; - use of visibility. When using innovative technologies in teaching Russian language and literature, the following techniques are successfully applied: – associative series; – reference abstract; – INSERT (interactive recording system for effective reading and reflection); – brainstorming; –discussion; – reading with stops and bloom Questions; – clusters; – cinquain; – "Advanced lecture"; – essays; – key terms; – mixed logical chains; – media projectors; – didactic game; – linguistic maps; – linguistic allusion (hint); – text research; – working with tests; – non-traditional forms of homework. But in order for innovative education to become a mass phenomenon in education, as the existing traditional one, it is necessary to solve a major scientific problem of mass training of teachers in innovative ways – creative type, capable of designing, constructing and modeling new educational (training and nurturing) models, systems and technologies, to create original innovative and didactic systems that provide motivation for knowledge and self-knowledge, as well as creating such mechanisms of interaction with the student's personality that will create conditions for productive activity (SPD) and involve him in co-creation. To implement the above-mentioned paradigm for the formation of a teacher, it is possible only with the help of fundamental psychological and pedagogical research and the development of a new direction in pedagogy: innovative education. The subject of his research should be the innovative activity not only of an individual teacher, Manager, but also of any kind of educational institution as a whole, as a self-learning educational system.

THE IMAGE OF THE NATIONAL WORLD IN PHRASEOLOGY (IN THE INTERPRETATION OF FRENCH AND UZBEK FOLK PROVERBS)

Aliyeva Gulzoda Tulkinovna*

*A Trainee Teacher at The Samarkand,
State Institute of Foreign Languages,
Samarkand, Republic Of UZBEKISTAN

ABSTRACT

This article discusses the methods of translation of phraseological units representing nationality in French and Uzbek. It is the translation of Uzbek folk proverbs into French that should not lose its main content and essence. The article takes into account the fact that Uzbek folk proverbs, which represent nationalism, express different themes in terms of ideological content, and from this, the proverbs have their own unique national vocabulary.

KEYWORDS: *Uzbek Folk Proverb, National Vocabulary, National Worldview, Rhyme And Melody, Complete Idea, National Values.*

INTRODUCTION

The fact that the cultures and national worlds of different peoples are represented by phraseological units is a kind of figurative, and the use of such expressive units belongs to any nation. This makes it difficult to understand the content of phraseological units in a foreign language. Phraseology expresses figurativeness and vividness in any language, they characterize the national characteristics of a people, they embody a variety of expressive colors, and it is difficult to imagine without additional meaning and proverbs under the influence of that context. Consequently, proverbs and sayings are the richest and most diverse source of the phraseological system of language. Proverbs are interpreted by A.V. Kunin as a phraseological unit. A.V. Kunin also describes proverbs as phraseological units with a communicative character. Proverbs are the most basic example of the communicative phenomenon inherent in the system of phraseology, as well as a reference point. Learning French proverbs is also important in learning and teaching French. In particular, it can be of great help in the process of reading and understanding literary texts, in translating them, as well as in teaching the language to the reader or students. At the same time, in-depth study of proverbs plays an important role in the development of our oral

speech. When we say proverbs, first of all we see rare examples of folk wisdom. They cover different areas of social and domestic life. After all, proverbs artistically express in short lines the experience, socio-political, moral and philosophical views of the people accumulated over the centuries. In the process of analyzing French articles, we came across articles that cover a number of different topics. In particular, Homeland and patriotism, diligence and greed, honesty and selflessness, righteousness and stealing, good and evil, good word and bad word, friendship and enmity, peace and restlessness, bravery and cowardice, wisdom and ignorance, decency and rudeness, hospitality and hospitality, generosity and greed, beauty and ugliness, humility and pride, happiness and unhappiness, dexterity and impatience, patience and impatience, love and infidelity, greed and greed, hope and insecurity, destiny and life, possibility and impossibility, caution and carelessness, and so on. It is well known that the term "paremiology" refers to proverbs and sayings, wise sayings, riddles, and quick sayings that are translated in the form of a stable compound, but in contrast to phraseological units, have a relative completeness. In monologue, dialogic forms of speech, in the translation of works of art, of course, we have to use such paremiological units. It goes without saying that the interpretation of such linguistic units in translation requires great skill on the part of the translator. Because most of these paremiological units cannot be translated verbatim. The translation of such units also requires a semantically correct approach to them, based on the national traditions, spirituality and culture, and lifestyle of each country. In particular, in the translation of proverbs in works of art, in our opinion, the literal translation does not give any good results. When translating proverbs from one language to another, it is important to use another proverb that matches the meaning of the given proverb in the language being translated. Learning other language articles will help you get acquainted with the life and culture of that country. They also teach the similarity of thoughts and ideas in different situations in life. Because many proverbs are rhyming, figurative, and rhythmic, they are easily remembered and reflected in all forms of language. At the same time, the variety of articles makes them highly effective for people of any age, any level of development. The in-depth content of these short ideas not only develops students' thinking, but also has a greater educational value. Proverbs are, of course, a little easier to remember because they give a single general lexical syntactic meaning and almost all of them have their alternatives in another language. We have already mentioned the translation of the articles and their alternatives. Let's talk about it in more detail. We know that every nation is different from other nations with its own national world. Sometimes we come across proverbs and wise sayings that cannot be translated into another language exactly as they were originally. Because the elements mentioned there belong only to this nation. Here are some examples of Uzbek folk proverbs.

TABLE 1

Andishaningoti-qo'rqoq.	Le respect n'est pas la peur.
Bir mayizni qirq kishi bo'lib yebdi.	Il faut savoir partager un seul raisin sec entre quarante personnes.
Pichoq o'tkir bo'lsa ham , o'z –sopini kesmaydi.	Le couteau bien aiguisé ne doit pas couper son étui.
Bozor ko'rgan echkidan qo'rq.	Méfie-toi de la , chévre qui a vu le marché.
Oti-ulug', suprasi-quruq.	Son titre est supérieur, sa table est maigre.
El og'ziga elak tutib bo'lmas.	On ne peut pas fermer la bouche du peuple avec un tamis.

The above proverbs are Uzbek national proverbs and the elements mentioned in them may not be found in any folk proverbs. For example, the words raisin, andisha, sop, supra, sieve in the proverbs correspond to the Uzbek language and are words that denote nationality. From proverbs one can learn not only morals but also the customs and culture of this people.

TABLE 1

Mehmon-otangdan ulug'.	L'invité est plus respecté que ton père.
Qariboruyningzari bor.	La maison où vivent les vieux possède le trésor.
Osh- kattadan, suv-kichikdan.	Quand on mange c'est le vieillard qui commence, quand on sert de l'eau c'est le jeune qui commence
Ovsinlar inoq bo'lsa, og'a-inilar chinoq bo'lmas.	Si les belles-soeurs s'entendent bien, les frères ne se battront pas.
Otalar so'zi-aqlning ko'zi.	Les paroles des pères sont les yeux de l'esprit.
Onasiga qarab, qizini ol.	Avant d'epouser une fille, fais connaissance avec sa mère.

Proverbs that reflect the mentality of the people, are an integral part of culture and an important part of the language, are considered invaluable spiritual wealth, have been polished on the basis of life expériences and passed down from generation to generation by various means. After all, the scientific and cultural traditions of the Uzbek people have golden pages that reflect the high language culture of the people since ancient times. Proverbs on kinship occupy a significant place in the Uzbek and French proverbs. Articles in this group can be divided into subclasses according to various aspects. One such class is class based on kinship. According to it, the following can be distinguished: Parents and children (sons and daughters, brothers):

The majority of articles in Uzbek on the topic of parents and children. This is because proverbs are inextricably linked with parenting. Because upbringing means, for the first time, parents and children: Avant d'epouserunefille, faisconnaissance avec samère.(Onasini ko'r qizini ol), Si les belles-soeurs s'entendent bien, les frères ne se battront pas(Ovsinlar inoq bo'lsa, og'a-inilar chinoq bo'lmas),La belle fille sansmère est obéissante, celle qui a sa mère est indocile.(Onasiz kelin-yuvosh, onali kelin bebosh) kabi.

Such proverbs point to the importance of the parent's upbringing of the child, the proverbs refer to the fact that the child follows in the footsteps of the parents, and the bird does what it sees in its nest.

There are hundreds of Uzbek proverbs about the relationship between parents and children.

The relationship between the couple has always been the focus of proverbs and sayings. From parenting to parenting, parent-child relationships are closely intertwined. Even aboveAvant d'epouser une fille, fais connaissance avec sa mère. (Onasini ko'r qizini ol), can also be added to a couple of articles on the topic.For example, Si tu achètes une marmite frappe la bien d'abord, si tu prends une femme regarde la comme il faut d'abord (Qozon olsang qoqib ol, xotin olsang boqib ol) In his teachings, he emphasized the importance of building a decent family for a man, that is, choosing a wife who will live with him for the rest of his life. The fact that a man should think before he marries and is responsible for his wife after marriage is reflected in this article.

Or, La maison bien propre, c'est la maison des fées, (Sarishtali uy-farishtali uy),The article argues that the maintenance of the household and the prosperity of the man's possessions are in the hands of the woman.

The article, which are an important part of the language and the invaluable spiritual wealth of the people, vividly reflect the rich historical experience of the people, their work, cultural and everyday life. The correct and appropriate use of proverbs and phrases, which are an important step in mastering the language and improving the culture of speech, gives clarity, uniqueness and expressiveness to speech.

Many of the folk sayings on kinship focus on the relationship between parents and children.

Everyday speech is a short, stable, melodic sentence, a complete sentence (simple or compound sentence) that reflects the centuries-old life experience of the people.

The experience of the people plays an extremely important role in the creation of spiritual values. "People have experiences because of their memories: the same thing, a series of memories about an object, and finally an experience. And experience is almost the same as science and art. Science and art come from experience.

To distinguish a proverb from other aphoristic units, it is necessary to describe its primitive, specific features.

Populism. The proverb reflects the wisdom that has been tested over the centuries. "No one doubts that you have to go to the people for proverbs and sayings."

"The collection of proverbs is a complex of experienced wisdom of the people, myths, laments, tears, joys and sorrows, sorrows and pains, consolation; Proverbs

"The color of the people's intelligence, the truth of the people, a unique judge that no one can question." It is the nature of populism that shows that the essence of a proverb is not always fully understood.

The sign of populism distinguishes a proverb from a wise saying. An aphorism (Greek aphorismos - proverb, wise saying) is a generalized, profound thought of an author that is concise, concise, clear, and unexpected. The aphorism does not prove like a proverb, does not show clear evidence, and affects the mind with the original definition. The aphorism contains more than that. An aphorism differs from a proverb in the accuracy and clarity of the author. Proverbs have been around for hundreds, thousands of years. Man observes the phenomena of the environment, learns the laws of its development, understands social and economic relations. The results of such creative activity of human intelligence are summarized in short, succinct sentences called proverbs. Proverbs are not learned by individuals, but by all speakers of the language (which clearly shows the popularity of proverbs. "But this is not the most important thing in its history. What matters is the generations that created the proverb, their way of life and thinking. In eternal metaphors. hidden proverbs live for centuries, when necessary, like a seed, it sprouts with the advent of spring, blooms beautifully, and then spreads to future generations, sows seeds in hearts, spreads wings like a compressed spring, an immortal bird in the folk fantasy. Although ancient in origin, proverbs can never be printed. If the proverb is used in its proper place, its use will always be relevant, because the proverb can contain a wide text.

The meaning of proverbs "does not arise directly from the meaning of the components (words) that make them up, it is connected by a separate image". For example: "Le melon prend sa couleur d'un autre melon" (qovun qovundan rang oladi). Folk words (proverbs) are derived from a figurative sense, or a combination of words with a figurative meaning. In either case, the

figurative meaning is unusual in folk proverbs. Their meaning is different from the meaning of everyday speech, only proverbs.

Proverbs serve not only as a means of expressing the fact between them and the relationship between these facts, the rules of life, but also the attitude of people to them. Proverbs express different emotions,for example: L'homme ne renonce pas à ses paroles, ni le lion à ses pas (Er so'zidan qaytmas, sher-izidan)-hukm ; Fait ce que le mollah te dit, ne fait pas ce que le mollah fait (Domlaning aytganini qil, qilganini qilma) - tasdiq.

Intersections are also common in proverbs, for example: Celui qui mange une fois par mois est rassasié, celui qui mange tous les jours ne se rassasie jamais (Oyda yegan to'q bo'lur, kunda yrgan suq bo'lur), La fille de riche choisit son fiancé, bien qu'elle ait une bouche déformée (Og'zi qiyshiq bo'lsa ham, boyning qizi kuyov tanlaydi).

The emotional-expressive relationships expressed in the proverbs are fully consistent with the everyday-oral style of language. This quality distinguishes proverbs from proverbs.L'eau qui coule est toujours propre (Oqar suv harom bo'lmas) – hikmat, Rêver n'est pas un péché (Orzuga ayb yo'q) – hikmat, L'épée ne coupe pas une tête baissée (Egilgan boshni qilich kesmas), Si je dis les choses, ma langue se brûle, si je ne les dis pas, mon coeur brûle (Aytsam tilim kuyadi, aytmasam dilim) maqol.

"Words are beautiful," our people say. Look, the people also described the importance of the proverb in the proverb. Proverbs are the cream of speech, the essence of conversation, the essence of what is said in large and small circles, in meetings. Ideologically, proverbs are very diverse and varied. Folk proverbs cover all aspects of multifaceted life. In folk proverbs about the Motherland, the idea of devotion to the Motherland is embodied in a very concise, rich and melodic form.

In folklore, labor is described as the basis of material and spiritual wealth, the beauty of man.

DEVELOPMENT AND FORMATION OF RESEARCH ACTIVITIES IN PRIMARY SCHOOL STUDENTS IN RUSSIAN LANGUAGE CLASSES

Ataev Ulmas Ergashevich*

*Shakhrisabz Branch of TSPU Named after Nizami,
Shakhrisabz, UZBEKISTAN

ABSTRACT

The article is devoted to the method of research activity as one of the most effective pedagogical technologies. The article discusses the concept of research methods for primary school students, its tasks, and the principles of organization that allow students to develop their own skills and apply them to develop creative and cognitive abilities in Russian language lessons.

KEYWORDS: *Project, Method, Research Activity, Skills, Observations, Experiment.*

INTRODUCTION

Since ancient times, teachers have identified two main ways of teaching: "passive teaching" - through teaching - and "active teaching" - through their own experience (terms Of K. D. Ushinsky). Despite the fierce debate about the possibility of dividing teaching into "passive" and "active", it is impossible not to notice that we are talking about two fundamentally different ways of obtaining education. At various times, the ratio of them in the practice of education has changed significantly. One or the other came to the fore. It is no secret that children's need for research is biologically determined. Every healthy child is born a researcher. An insatiable thirst for new experiences, curiosity, the desire to observe and experiment, and independently search for new information about the world are traditionally considered as the most important features of children's behavior. Constant research activity is a normal, natural state of the child. He is determined to know the world and wants to know it. It is this inner drive to learn through research that generates research behavior and creates the conditions for research learning. In today's dynamic world, it is fundamentally important that the child's mental development unfolds at the very first stages as a process of self-development. The main goal of research training is to develop the student's ability to independently, creatively master and rebuild new ways of working in any sphere of human culture. We must understand that design is not creativity in full,

it is creativity according to a plan, within a certain controlled framework. And, consequently, the way of education of true creators. Design initially sets the limit, the depth of the problem solution, while research is built in a fundamentally different way. It allows for infinite movement in depth.

The proposed method allows you to include the child in their own research search in any subject classes during the main training. It can be widely used in extracurricular and extracurricular activities, in the second half of the school day.It is designed not only to teach children observation and experimentation, but also includes a full cycle of research activities-from identifying the problem to presenting and protecting the results. In order to introduce children to the method, you will need 1-2 frontal training sessions. For conducting frontal, training sessions, the class is best divided into subgroups (10-13 people each).Cards with drawings indicating the topics of possible children's research Cards included in this set will be enough for training sessions. But for further work, you will need to prepare an additional set of cards with topics focused on the material being studied by students. In addition, you need to prepare pens, pencils, markers and small pieces of paper for children to record the information received during the study.

CONDUCTING A CLASS: Let's put the class in a circle so that the children can see each other's faces and the space inside. This requires a simple design of ordinary training tables. We will announce to the children that today we will learn to conduct independent research in the same way as adult scientists do.

In order to show children how to behave at each stage of the research search, it is necessary to select a couple of the most active children on a voluntary basis. It is advisable to choose children who are energetic, active, and have a well-developed speech. They, together with the teacher, will perform the main work of researchers from the first to the last stage, all other children will participate in the first classes as active assistants. After a short discussion directed by the teacher, children usually stop their choice on any topic-choose a particular card. When choosing a topic, it is necessary to fix the children's attention on the fact that if we have the opportunity, we need to choose something especially interesting. This can be the characters of any story or fairy tale, which will allow the teacher to apply most of the methods.

- For example, we can take the topic " elephant Behavior "or" Development of a spacecraft for intergalactic flights", this will allow us to use the observation method. We will explain to researchers that their task is to get as much new information as possible about what or who is the subject of their research, and prepare a message about it - a small report. In order to do this work, you need to research everything you can, collect all the available information and process it. For children, this is a complex, new business. Experience shows that children often call methods: "Observations", "Experiment", "Read in a book", "Look in a computer", and even "Ask questions to a specialist", but often forget, for example, that "you need to think for yourself". This is natural and normal. At this stage, pedagogical skills such as the ability to lead children to the right idea - to make them Express what is required in this situation-are especially important. Cards with the designation of research methods, lying in front of us on the table (on the carpet), are nothing more than a plan for our future research. But we laid them out haphazardly, as random offers from children came in. Now we need to make our plan more rigorous and consistent. Let's start with the usual problematic questions, for example: "What should we do

first?"," what do you think the scientist starts with? " Naturally, these questions are not only for the selected pair of children. They are addressed to all children participating in the class. A teacher who is prepared to solve the problems of research training must have a number of characteristics. They also need to mast A teacher who is prepared to solve the problems of research training must have a number of characteristics. They also need to master a set of specific skills. The main ones are those that are characteristic of a successful researcher.er a set of specific skills. The main ones are those that are characteristic of a successful researcher. In addition, special abilities and skills are required, specifically pedagogical, such as: to have an over-sensitivity to problems, to be able to see "the amazing in the ordinary"; to be able to find and set real educational and research tasks for students in a form that is understandable for children; be able to engage students with a didactically valuable problem, making it a problem for the children themselves; be able to serve as a coordinator and partner in the research search. Helping children to be able to avoid the policy guidance and administrative pressure; Be able to be tolerant of students ' mistakes when trying to find their own solutions. Offer your help or address the necessary sources of information only in cases when the student begins to feel hopeless in their search; Practical implementation of ideas and modernization of provisions, development of curiosity, creativity, and cognitive independence in every schoolchild, only then will the student develop cognitive independence as a quality of a socially active person – the country has the right to expect from him a creative attitude to work in any industry, responsibility for his own well-being and the welfare of the state.

Practical implementation of ideas and modernization of provisions, development of curiosity, creativity, and cognitive independence in every schoolchild, only then will the student develop cognitive independence as a quality of a socially active person – the country has the right to expect from him a creative attitude to work in any industry, responsibility for his own well-being and the welfare of the state.

ABSTRACT

The article describes the poetic functions of folklore in the poems of Azam Oktam. In particular, it describes the poet's skill in using folklorisms through the analysis of poems of Azam Oktam using simple and complex (analytical, stylized, synthesized) folklore. The fact that the title of the poem, which is related to the text, is called a song, and the commentary under the heading "On the Way of the People" means that it was created in the tonality of folk songs.

KEYWORDS: *Folklore, Simple Folklorisms, Analytical Folklorism, Folklore Synthesis, Stylized Folklorisms, Genre Stylization, Image Stylization, Motif Stylization.*

INTRODUCTION

Azam Oktam's poems were formed on the basis of the traditions of folklore, the traditions of classical literature and the best practices of world literature, developing them on the basis of new principles. In this article, we want to talk about the relationship between Azam Oktam's work and folklore, in particular, about the features and poetic functions of folklore in the poet's work.

MATERIALS AND METHODS

First, in the literature of all periods, folkloristics had a great influence on the work of artists. The creators used folklore to explain the experiences of the realities of their time to the reader, to highlight the problems of their time. These features also apply to the work of Azam Oktam. The use of folklore in written literature, the creation of works under its influence - folklore. Azam

Oktam skillfully uses simple and complex folklore studies in revealing his ideological and aesthetic goals.

Ordinary folklorism is "... the use of folk proverbs and parables, closed phrases, expressions and expressions for oral speech in the work of a writer or poet"   , "Blind", "Sorry", "Gentle Freak", "Beware of Yourself", "Brave", "Treatment", "Sparrow", "Panic", "Hospitality", "Understand", "Adverse Effects", Proverbs, sayings and phrases in his poems, such as "Trust", "Thoughts on the Island" - simple folklore - served to express the ideological goal of the poet and enhance the aesthetic impact of the poem. In the poem "Forget" the poet expresses the poetic meaning of the transience of life through the international phrase "this is a five-day peace" and the proverb "glory to the guest - three days":

> You are a guest in a five-day world,
>
> Respect for three days.
>
> Host Izmidasan
>
> even in these three days

The title in the form of a command alone tells the reader that the content of the poem is very relevant, and urges the reader to remember that the five-day world is a guest, and the three-day honor is a "great host".

In Azam Oktam's poems, proverbs, parables, phrases, curses, and applause, which are simple folklorisms, are used not in the traditional form, but in a modified form, infused with the author's paradoxical and ironic attitude. In the poem "Experience" the proverb "If you hit, the flesh hurts, if you curse, the face hurts" is used with a change:

> From the blows
>
> our flesh hardened.
>
> From the words
>
> our faces hardened:
>
> Now we too.

The three-line poem, the verses of which are given in a separate line, expresses the poet's sarcastic attitude to the people of the society, who "were hardened by beatings and hardened by words", but did not achieve any results in terms of responsibility.

In the poem "Commentary on the proverb" the poet uses simple folklore, which is the proverb "the wheat of the near is better than the wheat of the far". The title of the poem itself suggests that it is a commentary on a folk article by the poet. In a short poem of two verses, the poet gives a paradoxical approach to folklore. The commentary on the article is also very short. It consists of only one verse. This verse expresses the vital truth that the poet wants to convey to the reader - that a person who wants to achieve something in any field has to go and live in distant lands if necessary.

In the poem "At the Blind," the simple folklore of "putting a wave in the mouth" and "kissing the face when the face is crooked" were poetic means of expressing the experience of a lyric subject who could tell the truth in any situation:

I didn't put it in my mouth

to be afraid of the person I am afraid of.

Don't be upset - don't laugh lightly

Even if you break it

Easy from me -

I play

Your face is crooked.

In the poem "Gentle Freak" oxymoran the proverb "do not go beyond the untested horse", and the phrases "sleep" and "lack of sleep" express the feelings and satire of a lyrical subject who has experienced the anxiety of so many people:

Untested horse:

sleeps without waking up

How many people lack sleep

aji-buji - the same inscription.

In the poem "Take care of yourself ..." the proverb "You dig a well - you will fall" is built into the entire poem. In the poem "Sparrow", through simple folklore and the symbolic image of a sparrow, the poet creates an image of people who live in fear of others in society, but nobody cares. Wahimachi's poems include "If the camel is carried away by the wind, you will see a goat in the sky", "Hospitality", "Bow down to the place where salt is eaten for forty days", "Even if our house is narrow, our hearts are wide" and proverbs and sayings are applied accordingly ...

The poet's poem "Understand" also mocks traditional ideas. The first paragraph of the poem describes the situation of the lyrical subject, which is criticized by the proverb "to the mouse's nest, to the tail of the squirrel gardens." The second verse of the poem expresses the critical and sarcastic attitude of the lyrical subject to it. This proverb is traditionally used to refer to people who are wasting their time on hard work, regardless of their condition. Rejecting this traditional attitude, the poet gives a new view that a person should strive for great dreams and great goals in any case. The poet expresses through the lyrical detail of the proverb how pleasing the enormous goal the lyrical subject has set for himself.

I understand:
It has something to do with me.
But what does that mean to you -
Oh, how beautiful it is,
drag it -
how enjoyable.
Every poet uses folk proverbs, simple folklorisms in general, only in a unique style. Poets such as Rauf Parfi, Usman Azim, Muhammad Yusuf used the proverb "The sky is long, the earth is hard, if you want to die, the soul is hard" to express the feeling of despair vividly. But Azam Oktam uses this proverb in a completely opposite form (in the sense). His poem "Trust" is based entirely on the principle of paradox. In the poem, the poet contradicts such simple folklore as

"the sky is long, the earth is hard", "the spoiler does not wear a belt", "youth does not return", "the journey is old", and re-observes them on the basis of his own truth:

The sky is close and the ground is soft

Youth will not return, it will last forever.

I'm torn - I tie my belt every day,

My journey is old and hidden.

For the poet, the sky is very close to a person with a sense of confidence, the earth is soft, youth never leaves him forever, even if he is a simple spoiler, he wears a belt every day, and the journey of such a person does not get old. The proverb and folk expressions used in the paradoxical form of the poem served the poet's poetic purpose.

Azam Oktam's poem "Thoughts on the Aral Sea" is directly devoted to the problem of the Aral Sea, which describes the experiences of a lyrical plot caused by the drying up of the Aral Sea. In the final last verse of the poem, the prayer of wise people "save from the ulcers of fire, from the ulcers of water" - using simple folklore, gives a philosophical generalization that not only man, but also nature must be protected from the evil of nature:

People who know everything

"Save me from the flood!" if they say;

the water should never dry out.

You have to take care of this,

from troubles is it salty too?

In fact, the Aral Sea cotton monopoly in the former Soviet era is to blame.

The next type of folklore in the work of Azam Oktam is analytical folklorism, which is considered analytical folklorism if a line or a separate verse belonging to folklore is quoted exactly in a written poem . The poet's poem "Song" is based on analytical folklore and stylization of the genre and rhythm of the song. The fact that the title of the poem, which is related to the text, is called a song, and the commentary under the heading "On the Way of the People" means that it was created in the tonality of folk songs. The poet forms the first verse of the poem on the basis of an excerpt from a folk song - analytical folklore:

I come from Fergana,

you go yor-oh, you go yor?

I love you

you know yor-o, do you know yor?.

The poet also uses popular expressions in his poems such as "dig a hole for someone," "one death for another," "one and a half gods," and instills in his poetry the idea that the choice of people full of evil in society is wrong.

There are people in the world

Cunning, spotted, cunning -

Dig a hole in the shade

Ready to bury, ready to bury .

The poem by Azam Oktam "The Old Legend" is based on the stylization of the legend genre. The poet also stylized images of kings and shepherds in folk legends, highlighting the problems of his time. The poem is the narrator, and the events are covered based on the questions and answers between the righteous king and the mountain shepherd. In the poem, as at all stages of the development of society, the rulers do not receive the will of the people, and the decrees of the ruler are not transmitted to the people independently, therefore the idea of defending their rights is expressed in the details of snow and water:

And my decrees ".

firmly and faithfully in this palace.

Until it reaches you

maybe water!

Therefore, be always vigilant

be a little belligerent, savage.

If they catch you in water

do not give up

Demand for "snow" ...

 He also uses an updated version of the poem "If you're a thief, eat your head, if you're right, eat your head" (simple folklore), revealing the problems of the times, the root causes of society:

Now there is a new adage

the old one is gone

"You're a thief?"

    You are right - chop your head off!

In the poem "Awakening of Nizamiddin" Azam Oktam synthesized the features of the folk genre of God and gave originality to the composition of the poem:

You convinced yourself

Young man, I am a witness, my child, Alla.

The angels will wash your face

The maid is also an innocent child, Alla.

The human race doesn't understand your words,

His interlocutor is Allah, my child, Allah

At first glance, the reader is surprised that the title, which is the adjacent text of the poem, and the plot of the poem are contradictory. When the reader understands the idea behind the poem, we can be sure that the word "awakening" is being used correctly. According to tradition, allah is usually sung to put a child to sleep. The idea that the poet wants to express in the poem is completely different: it should be said that God does not lull a child, but brings him up, awakens human feelings.

We see a continuation of this view in the poet's poem "My Fairy Tale". In this poem, the poet tells a story and uses a motive to put his child to sleep. In the poem, the poet also expresses the idea that the tale is told not in order to lull a child, but in order to express the courage of Temur, Navoi, Babur, Jaloliddin, Mukanna, Kodiri, Usman Nasir and raise him as a real man:

If you can't sleep, it's a long story. Listen, if you want to be a real man.

When you think about tomorrow for your gardeners, tell a fairy tale so your son doesn't fall asleep!

Another form of complex folklore is synthesized folklore, which "arises as a result of assimilation of the plot of myth, legend, folk tale and story by written literature, joins the plot created by the writer and is absorbed." The poem by Azam Oktam "Munozar" contains the plot of the folk legend "Alexander has horns". In the first stanza of the poem, the poet enters into an argument with the legendary character - the barber. In the next paragraph, he looks with skepticism at the reality of the existing plot and expresses it in the form of a question. The last verse of the poem, consisting of three verses, describes the existence of despotic rulers at any time:

The king I know has no horns,

 But a fat bull.

 (Left unread from the tale.)

CONCLUSION

In short, Azam Oktam used folklore to express his experiences based on the realities and problems of the period. The poet expresses the satirical attitude of the people to the existing social environment by using proverbs, proverbs and sayings exactly, modified or paradoxically, which are part of ordinary folklorisms. The poet was able to increase the ideological and aesthetic impact of his poems on the basis of analytical, stylistic and synthesized folklorisms.

SURKHANDARYA THEATER: STAGES OF FORMATION AND DEVELOPMENT

Faxriddin Abduvohidov*

*Doctoral Student of the Institute of Culture,
Uzbek state art, UZBEKISTAN

ABSTRACT

The article explores the long-term creative activity of the Surkhandarya Regional Musical Drama Theater, its research experience, achievements in directing and acting. The dissatisfaction in the team, the frequent change of directors, the lack of musical drama actors and skilled musicians, the lack of living conditions for those who came from far away affected the creative process. The psychological approach to the performance of the actors, expressed in accordance with the director's figurative findings and symbolic means of expression, led to the complex appearance of the performances.

KEYWORDS: *Theater, Dramaturgy, Actor, Director, Composition, Artistic Idea.*

INTRODUCTION

It is no coincidence that in the context of renewed Uzbekistan, the state pays serious attention to the further development of theatrical art, as well as in all areas. The reason is that in the hearts of the younger generation there is a special place, importance, tasks and responsibilities of theatrical art in the development of true human feelings, the expansion of worldview, the formation of aesthetic taste and culture.

In recent years, the scope of scientific research aimed at studying specific aspects of theatrical art in Uzbekistan is expanding. In this sense, it should be noted that efforts to study the activities of regional theaters, which have long been neglected, have been revived. In fact, it is difficult to fully imagine the history and essence of professional Uzbek theatrical art, which has been formed and developed for more than a century, without the creative processes taking place in all theatrical communities in the country.

Founded in the 1930s as a socio-cultural event in the southern border of Uzbekistan, the Surkhandarya Regional Musical Drama Theater has performed hundreds of performances in

Uzbek and Russian for almost 85 years. Through the introduction, it has been working effectively for the formation of a sense of goodness, beauty, humanity, cultural consciousness and aesthetic taste in the hearts of several generations of viewers.

In 1933, the first collective and state farm theater was established in Surkhandarya region in Jarkurgan district, adjacent to the city of Termez. Art-loving people from the people gathered at the theater. The first repertoire consisted mainly of small scenes, melodies and dances. Due to the inability of the amateur troupe to create a holistic performance, the plays were shortened. Later, G.Zafari's "Halima" and K.Yashin's "Tor-mor" were published. These performances were one of the first, serious creative works of the theater.

In 1935, a professional district theater began its work in Termez. The core of the Surkhandarya district theater was formed by the creators of the Jarkurgan collective and state farm theater. The curtain of the Surkhandarya district theater was officially opened on November 5, 1935 with the play "Victory" by A.Ismailov.

Until the Second World War, the repertoire of the Surkhandarya theater included G. Zafari's "Halima", U. Ismailov's "Rustam", K. Yashin's "Gulsara", Khurshid's "Farhod and Shirin", NV Gogol's "Marriage", K. Yashin's "Honor". and love ", Z.Fathullin's" Gunchalar ", Hamza's" Maysara's work "," Boy ila khizmatchi ", U.Hojibekov's" Arshin mol olon ", N.Safarov's" Awakening ".

Over the past five years, the troupe has formed a diverse, diverse character cast. This situation led to the revival of the creative process in the theater. When the Surkhandarya region was formed in 1941, the theater was transformed into the State Musical Drama Theater. The outbreak of World War II changed the theatrical repertoire. Naturally, the theme of patriotism, national heroism came to the fore. "Border Guards" (VN Bill-Belotserkovsky), "Kurban Umarov" (S.Abdulla, Chustiy), "Kozibulak" (Lope de Vega), "Front" (V.Solovyov), "Death to the invaders" (K. Lightning) were staged. The repertoire also includes performances such as "Boy ila hizmatchi" (Hamza), "Uygonish" (N.Safarov).

In the first years after the war, many actors left the theater due to the severity of the situation, the hardships of life. The rest were added to the Kashkadarya, Samarkand and Bukhara theaters in 1948. Some were forced to continue their activities in folk theater, ensembles and various clubs. At the same time, the Surkhandarya theater ceased its activities for some time.

Surkhandarya Regional Musical Drama Theater was reorganized in 1957. Along with musical dramas, pure dramatic works began to be staged in the theater. This situation expanded the audience. Works dedicated to hard work, patriotism, improving rural conditions, opening new lands, developing cotton growing, educating young people were among the leading themes during this period.

The influx of young directors who graduated from the Tashkent State Institute of Theater and Art into the Surkhandarya Theater in the early 1960s had a significant impact on the enrichment of the theater's repertoire and the improvement of directing and performance skills. In particular, the young director A. Kasimov's presentation of the play "Dili-dili Zaynab" in Uzbek and Russian languages was a novelty in the life of the theater. This was due to the demands and proposals of the Russian-speaking population of the city and the soldiers of the Termez garrison. A.Kasimov's play "Suymaganga suykanma" (S.Khojaniyazov) staged in 1958 was also popular

with the general public. The works of H. Bobokhonova, O. Olimova, H. Muhiddinov, Z. Solieva should be especially noted. In the late 50's "Vatan ishqi" (Z.Fathullin), "Singillar qissasi" (Sh.Tamkin), "Orzigul" (T.Sobirov, N.Mahmudov), "Sevganidan ayrilmasin" (Sh.Kiyamov), "Kholishon" (Hamza), "New Land" (A. Qahhor), "The Story of Fergana" (Hamid Ghulam) and other performances on various topics and genres took the stage.

The first half of the sixties was the beginning of specific reforms to expand the repertoire. Post-war scenes of life, social relations between people played a key role in the performances. "Tahir and Zuhra" (S.Abdulla, T.Jalilov), "The case of Maysara" (Hamza), "Three heroes" (T.Sobirov), "Wedding" (Ganiev), "Boy and servant" (Hamza), " Zarafshan qizi "(D.Fayzi)," Toshbolta oshiq "(H.Gulam)," Do'stlar "(Uygun)," Birinchi muhabbat "(H.Voxit)," Ko'z ilgamas soyalar "(A.Jamol)," Ravshan va Zulhumor "(K.Yashin, T.Jalilov)," Two boys for one boy "(K.Galdoni)," Nurkhan "(K.Yashin)," Layli and Majnun "(Khurshid)," Dear girls "(K.Shangitbaev , K.Boyseitov) (1964), "Alpomish" (S.Abdulla, T.Jalilov), "Yoriltosh" (Sh.Sa'dulla), "Qotil" (Uygun), "Guli siyoh" (S.Jamol), "Yoshlikda (Z.Fatkhullin), "Dangerous meeting" (I.Stadnik), "The dead will not forgive" (O.Umarbekov).

The creative path of the Surkhandarya theater from the time of its reorganization to 1974 was not smooth. The dissatisfaction in the team, the frequent change of directors, the lack of musical drama actors and skilled musicians, the lack of living conditions for those who came from far away affected the creative process. However, the team did not stop creating, clubs were organized under the theater, there were attempts to train new artists and bring them to the stage. Theatrical repertoire included performances based on folk epics.

The creative activity of the Surkhandarya theater in 1970-1990 was rich in research. A new era in theatrical activity began on April 22, 1974, when the theater team moved to a modernly equipped building. M.Abdukunduzov, T.Ergashev, graduates of the Tashkent State Institute of Theater and Fine Arts (now the Uzbek State Art and Culture) named after AN Ostrovsky at the initiative of the director U.Zufarov With the addition of a group of young talents such as K.Burhanov, Z.Otaboeva, D.Solihova, N.Saidova, H.Azamatullaeva, F.Hasanova, T.Abdukadirov, the creative process was in full swing. Director Mansur Ravshanov's return to the theater after studying at the two-year higher director's course in Moscow with great masters of the stage A.Popov, M.Knebel, A.Goncharov, B.Rovenskikh, A.Efros, and the beginning of work in the theater by the talented artist V.Mikhaylichenko a bold step was taken.

The activity of the theater in the new building began with a number of creative and organizational changes. Aminjon Karimov has been appointed director, Mansur Ravshanov director and art director, and V. Mikhailichenko chief artist of the theater. In order to sharpen the skills of young actors, to create conditions for them to show their talents more widely, a "Youth Section" was organized at the theater. Additional training in stage movement, stage speech, acting skills and fencing was conducted in the section.

As the creative potential of the theater team expanded, so did the potential of the repertoire. This situation is reflected in the process of staging the best examples of national classics and world classical drama. As a result, the audience of the region had the opportunity to get acquainted with the works of such famous classics as Shakespeare, Schiller, Moler, Goldoni, Gogol, Ostrovsky. "Cunning and Love" (Schiller), Skapen's Tricks, Tartuffe (Moler), Two Boys and a Malay (Goldoni), "Sarviqomat Dilbarim", "White Ship", "Momo Er" (Ch. Aitmatov), "Sepsiz Qiz" (A.

Ostrovsky), "Inspector" Gogol "Living Death" (V. Vishnevsky), "Arshin mol-olon" (U. Khodjibekov)

- The philosophical, psychological and romantic style was reflected in these performances. The directors paid great attention to the thoughts and experiences of the protagonist, as a representative of the great statesman, thinker or scientist, creative people, as well as to the idealization of the images. The psychological approach to the performance of the actors, expressed in accordance with the director's figurative findings and symbolic means of expression, led to the complex appearance of the performances. The close-up of the image of historical ancestors, the psychological and poetic approach to the interpretation of the image played an important role in the director's research. In creating the image of historical heroes, the directors sought to portray the concept of the world and man, life, people suffering from heartache, realizing the true nature of corruption, betrayal, depravity, bigotry, oppression, hypocrisy, endless wars.

- In the conditions of independence, the Surkhandarya theater team, feeling the changes in the consciousness of society and people, began to bring to the stage the people of the new era, that is, the images of our advanced contemporaries. The performances focused on the glorification of true human feelings, such as patriotism, duty, loyalty, love, and the idea of combating evils such as terrorism, drug addiction, human trafficking, and bribery. In this process, a number of plays were created in collaboration with such authors as Usmon Azim, Shafoat Termizi, Khaliq Khursandov, Kilich Abdunabiev, Muhammad Boboev, Isomiddin Otakulov, Mamatkul Hazratkulov, Nizomjon Parda, Shavkat Pardaev, Turgunpolat Yuldashev. "The Return of Alpomish" (U.Azim), "My Fate of Love", "My Boy Who Did Not Dard" (H.Khursandov), "The Ring of Death", "The Unquenchable Lamp", "The Unquenchable Lamp" (M.Boboev), "Back to the World "(M. Hazratkulov)," House without Sky "(Sh. Pardaev)," Crime on Holiday "(J. Khudoiberdiev)," Sultan of Love "(H. Rasul).

- Due to the geographical location of Surkhandarya on the borders with Afghanistan, Turkmenistan and Tajikistan, patriotic themes related to the activities of the country's guards, as well as to the fight against any destructive ideas that threaten the peace and tranquility of the people, poison the minds of children. "Adolat" (J.Mahmudov), "Sleepless Nights" (R.Orifjanov), "A Boy Without Pain" (Kh.Khursandov), "People Wearing Pagons", "Courage", "Sound of Bells" (M.Boboev) , "Hazon olan umrlar" (A.Azizkhodjaev, O.Rizaev), "Jannat izlab" (T.Mahmudov, D.Mahmudova), "Alvido, bolalik" (T.Malik), "Ona" (Sh.Rizaev), Such performances as "Aydin" (R.Muhammadjanov), "Border Guard" (R.Orifjanov, A.Ergashev), "Ziyo Qalasi" (K.Hakimov) are among them.

- During this period, along with dramatic works with a sharp plot, comedies on social themes were also staged. They reflect the folklore and ethnographic features of traditional folk art, especially the folk art of the Surkhandarya oasis, and the educational and moral motives are exaggerated.

- The stages of historical formation and development of the Surkhandarya regional musical-drama theater can be described as follows:

• In 1933, the first collective and state farm theater for the general public was established in Jarqurghon district, adjacent to the city of Termez. The amateur theater repertoire consisted mainly of small performances, songs and dances.

• In 1935, on the basis of the Jarqurghon collective and state farm theater, a district theater was established in Termez. In 1939, a group of young people who had graduated from the Lohuti Theater College joined the community.

• After the formation of Surkhandarya region in 1941, the theater was transformed into the State Musical Drama Theater. During the Second World War, the theme of patriotism and national heroism came to the fore. With the evacuation of the Kharkiv Operetta Theater to Surkhandarya during the war years, conditions were created for studying the experience of Ukrainian theater.

• In 1948, the Surkhandarya Theater ceased to exist for some time. The troupe was disbanded and added to the Kashkadarya, Samarkand and Bukhara theaters. The rest continued their activities in the folk theater, ensemble and various clubs.

• In 1957, the theater was reorganized. Along with musical performances, pure dramatic works also began to be staged. This situation expanded the audience. He was the leader of works dedicated to hard work, patriotism, improvement of rural conditions, opening of new lands, development of cotton growing, education of youth.

• The influx of young directors who graduated from the Tashkent State Theater and Art Institute into the Surkhandarya Theater in the early 1960s had a significant impact on the enrichment of the theater's repertoire and the improvement of directing and performance skills. This period was the beginning of specific reforms in the field of repertoire renewal. Post-war scenes of life, performances that reflected social relations between people, emerged.

• In 1974, the theater team moved to a modern building. The activity of the theater in the new building began with a number of creative and organizational changes. Skilled director Aminjon Karimov has been appointed director and general director, Mansur Ravshanov director and art director, V. Mikhailichenko chief artist of the theater. The creative process was revived with the addition of a group of young people who graduated from the Tashkent State Institute of Theater and Fine Arts (now the Uzbek State Institute of Arts and Culture) named after AN Ostrovsky, the establishment of a "Youth Section" at the theater. The weight of musical dramas in the repertoire has increased.

• The growth of creative potential in the team allowed to stage the best examples of national classics and world classical drama. Classics such as Shakespeare, Schiller, Moler, Goldoni, Gogol, Ostrovsky were staged and presented to the general public.

• In 1978, the theater was renamed Mannon Uyghur. Soon, the theater continued the tradition of staging works in Russian and added a number of new performances to its repertoire. The team overcame the difficulties encountered in performing in the Russian language and managed to expand the audience.

• In the second half of the 1980s, a new era began in the Surkhandarya Regional Musical Drama Theater. In this period of history, called "reconstruction", there was a tendency to look at art in a new way, to be open to the problems of society. Efforts to discover local playwrights are intensifying. U.Azim's "One step way", I.Otakulov's "Closed eyes", "Return to the world", N.Hayitkulov's "The star is gone", H.Maksadkulov's "Faithful ghost", M.Khairullaev's "The world is yours" were the products of this period.

• With the proclamation of Uzbekistan as an independent state, the attitude to history, to our nation has changed radically, there is an opportunity to speak objectively about our great figures. A number of performances dedicated to the life of Amir Temur, Alisher Navoi, Umar Khayyam, Sabir Termizi, Hakim At-Termizi, Imam Bukhari, Jaloliddin Manguberdi, Tomaris, Spitamen, Amir Temur, Babur, Mashrab, Nodirabegim, Ogahiy, Zebunniso saw.

• Attempts have been made to bring to the stage the images of the people of the new era, our advanced contemporaries. Performances reflecting the idea of patriotism, duty, loyalty, glorification of feelings of love, the fight against such evils as terrorism, drug addiction, human trafficking, bribery.

• During this period, along with dramatic works with a sharp plot, comedies on social themes were also staged. They reflect the folklore and ethnographic features of traditional folk art, especially the folk art of the Surkhandarya oasis, with special emphasis on educational and moral motives.

CONCLUSION

In short, the Surkhandarya theater in its nearly a century of activity has matured in the huge creative and organizational processes that took place not only in the region but also in the country, created a unique laboratory for discovering playwrights, finding young people, conducting creative experiments. He made a worthy contribution to the development of the Uzbek school of acting and directing. It is a scientific study of the multifaceted creative and organizational activity of this theater

PERFORMANCE MEASUREMENT PRACTICES IN SERVICE INDUSTRIES (A CASE STUDY OF NEPAL TELECOM)

Naba Raj Adhikari*

*Associate Professor,
Central Department of Management,
Tribhuvan University, Kathmandu, NEPAL

ABSTRACT

The main aim of this study was to examine the existing performance measurement practices in Nepal Telecom. For this purpose a case study survey was conducted and the primary data have been collected through structured questionnaire and telephonic interview using five point Likert scale. The major findings of the study revealed that Nepal Telecom has used financial and non-financial measures for performance measurement and performance measurement has been considered as a key managerial tool. The company has often modified its performance measure when there are changes in the organization's strategic objective. Financial measure has got significant use and importance but non-financial measure has got moderate use and importance. Balanced scorecard has not been used in NTC but expressed view that balanced scorecard can be implemented in Nepal Telecom as the strategic performance measuring tool.

KEYWORDS: *Performance measurement: Financial measures; Non-financial measures; Service industries.*

INTRODUCTION

Performance measurement plays important roles in translating strategy into desired behaviors and results, communicating these expectations, monitoring progress, providing feedback, and motivating employees through performance-based rewards and sanctions (Chow &Stede, 2006). It provides a set of mutually reinforcing signals that direct managers' attention to strategically important areas that translate to organizational performance outcomes and guides managers' behaviour toward key organizational outcomes (Dixon et. al., 1990). The traditional financial performance measures worked well for the industrial era (Kaplan & Norton 1992). Achieving superior organizational performance both in the financial and non-financial aspect is the ultimate

goal of most organizationsand the performance measures should be multi-dimensional and balanced (Kennerley & Neely 2002, Atkinson, 1997)). Furthermore a performance measurement and management system is a balanced and dynamic system that enables support of decision-making processes by gathering, elaborating and analyzing information (Neely et. al., 2002). The concept of ''balance'' refers to the need of using different measures and perspectives(Kaplan & Norton, 1996).Superior organizational performance reflects the firm's sustainable competitive advantages (Fleming et. al, 2009; Joiner et. al., 2009) and organizational excellence (Moullin, 2007).

In general, performance measurement can be viewed as the process of quantifying the efficiency and effectiveness of purposeful action and decision-making (Neely et. al., 1995;Waggoner et. al., 1999).Maintenance of an effective performance management system is a fundamental issue which includes translating strategy into desired behaviors and results, communicating these expectations, monitoring progress, providing feedback, and motivating employees through performance-based rewards and sanctions (Chow &Stede, 2006).Performance measurement makes communication more precise and ensuresthe managers to adopt a long-term perspective and itmust be easy to understand and to use (Kaplan &Norton, 1996).The immediate role of any performance measurement system is to check progress towards the established goals (Kanji, 2006).

Traditionally, organization's performance was assessed on the basis of its financial performance. In the 80s and early 90s, many organizations and industries began to criticize the use of financial measures to evaluate organizational performance and have started to work towards implementing other aspects of performance including quality considerations (Vukomanovic et. al., 2007).By the late 1980s, studies had shown that historic financial data is not enough to satisfy the performance measurement in the new economy because of the increasing complexity of organizations and the markets in which companies compete (Kennerley &Neely 2002).A performance measurement system should be aligned with the organization's strategy (Kaplan & Norton, 1996). The financial and non-financial measures should be viewed as complementary to each other (Chow &Stede, 2006).The shortcomings of traditional measurement systems have triggered a performance measurement revolution (Pun &White, 2005).According to Bourne et.al., (2003) the summary of changes in performance measurement are as follows:

TABLE 1 CHANGE IN PERFORMANCE MEASUREMENT

Changes in	Traditional performance Measurement	Balanced performance Measurement	Corporate performance Measurement
Focus	Internally focused	Internally and externally focused	Focused on the need of relevant stakeholder
Dimensions	Single dimension	Multi-dimensional	Less focus on dimensions and greater emphasis on assumptions and links across dimensions
Drivers	Cost	Innovation and learning	Improving process capabilities through the development of underpinning resources
Targets	Financial	Financial and nonfinancial	Comparative – external and against the competition

Desired benefits	Cost control	Communication of strategic direction	Sustainable performance improvement through focused business process improvement

Nepal Telecom

There is no log history of organized business services of telecommunication in Nepal. The formal communication services was started after the establishment of Mohan Akashwani in 1948. The telecommunication department was established in 1959 and it was converted into the telecommunications development board in 1969. After the enactment of communications corporation act 1971, it was formally established as a fully owned government corporation called Nepal Telecommunications Corporation (NTC) in 1975 for the purpose of providing telecommunications services to the Nepalese people. It was transformed into Nepal Doorsanchar Company Limited from 2004 exploring its market on the brand name of Nepal Telecom as registered trademark. The nationwide reach of the organization, from urban areas to the economically non- viable most remote locations, is the result of all these efforts that makes this organization different from others (Nepal Telecom,2019). The goal of Nepal Telecom is to provide cost effective telecommunication services to every nook and corner of country. The monopoly of Nepal Telecom was ended when private sector participants were allowed to enter the telecom space in 2004. It introduced the private sector operators such as United Telecom Limited (UTL), Ncell, STM Telecom Sanchar Pvt. Ltd, Smart Telecom and Nepal Satellite in Nepalese market.

Statement of the problem

Increasing competition, changing external demand as well as roles of business forcing the enterprises to improve, and ultimately to achieve, business excellence, is to develop and implement a system for performance measurement (Kanji, 2002). Kaplan & Norton (2001) suggested performance measurement as a basis for defining strategic objectives, for continuous improvement as well as a vehicle for cultural change. With the liberalization and internationalization in telecommunication, service quality has become an important means of differentiation and path to achieve business success. Faced with a growing market and increasing competition, companies in the telecom business in Nepal are adopting to new technological imperatives in order to outperform their competitors. Uyar (2009) identified that Turkish companies utilize non-financial measures more frequently than financial measures; and Turkish managers perceive non-financial measures to be more effective than financial measures. Wang et. al. (2004) explored that quality-related factors have got less importance on performance measurement in China's telecommunication industries. Kuhi (2015) viewed that constant performance evaluation of network industries enables their more effective and efficient lifecycle management. In this scenario the survival of Nepal Telecom triplet today is how to manage its product/service cost, quality, and performance. However, the survival of a company does not depend on profitability alone; managers in practice have learnt the hard way that an unequalled focus on the financial health of the organization results in several irreparable adverse consequences (Pandey, 2005).The survey of Iranian telecommunication industries indicated that outsourcing could lead to reduce cost, improve quality, increase flexibility, better financial and non-financial performance and services (Khakia & Rashidi, 2012).

The study identifies the problem that it seems to be a lack of an integrated performance measurement system in the telecom industries that could improve their processes and practices to better meet the expectations of their customers for higher quality, lower production cost, and improved service for its long term success. At this phenomenon the developments in Nepalese economy, it is interesting to examine how far the Nepalese companies have updated their parameters of performance measurement? The present study is an endeavor in this direction and the following questions were sought:

1) Which measures are used to measure the financial and non-financial performances in Nepal Telecom?
2) Whether Nepal Telecom has been actually measuring non-financial factors?
3) Does balanced scorecard has been introduced in Nepal Telecom for performance measurement?

Objectives of the study

The main objective of the study is to examine the existing performance measurement practices in the service industries in Nepal. For this purpose a case study of Nepal Telecom has been conducted. The other specific objectives of the study are:

(i) To examine the use of financial and non-financial performance measures in Nepal Telecom.
(ii) To identify the importance of balanced scorecard performance measurement as an appropriate performance measurement model.

DATA AND METHODOLOGY

The case study survey was conducted during 2018. Nepal Telecom has been selected, for the study of performance measurement practices in service industries, due to its significant contribution in Nepalese economy and communication sector. Purposive sampling technique has been employed selecting the respondents from the employee of accounts/finance/internal audit, operation/ technical, business/customer and other general administration departments from various branches of Nepal Telecom including the head office. The primary data to be used in this study has been collected by means of self-administered structured questionnaires and telephonic interviews. Five point Likert scale questionnaire was used having 1= strongly disagree to 5=strongly agree. The questionnaire survey has been gathered qualitative as well as quantitative data pertaining to profitability, customer satisfaction, employees' satisfaction, operations, and product quality measures of the Nepal Telecom. Descriptive statistics has been employed to analyze the data. Financial and non-financial measure has been defined as performance measuring variables. Some of the indicators like customer, internal business process and learning growth of employee has been taken as non-financial measures.

TABLE 1

Financial measures	Non-financial measures
Revenue Growth	Customer satisfaction
Liquidity	Market share
Profit margin	Customer retention percentage
Earnings per share	Time taken to fulfill customers' request
Return on investment	No. of customer complaints

Economic value added	No. of new products or services
Cash flow	New product development time
Return on assets	Yield, defect rate
Residual income	Time taken to deliver product/service to customers
	Percentage of on- time deliveries
	Time taken to repair defective products/ services
	Time taken to repair defective products/ services
	Hours of customer training for using product/ services
	Quality and process-related
	Employee education and skill levels
	Employee satisfaction scores
	Employee turnover rates
	Percentage of employ suggestions implemented

TABLE 2 RESPONDENTS PROFILE BY DEPARTMENT

	Frequency
Accounts/Finance/Internal audit	21
Operation/Technical	7
Marketing/Business/Sales/Customer	7
General Adm./HR/LW/R&D/Other	5
Total	40

Majority (75 percent) of the respondents have been taken having more than 5 years of service experience in Nepal Telecom those who have the knowledge about performance measures (financial and non-financial) used by the organization.

Results

Financial measures

TABLE 3 USE AND IMPORTANCE OF DIFFERENT FINANCIAL MEASURES IN NEPAL TELECOM

	Sales growth rate	Cash flow	Liquidity	Profit margin	ROI	EPS	ROA
Mean	4.84	4.88	4.91	4.91	4.91	4.88	4.91
Std. Deviation	.369	.336	.296	.296	.296	.336	.296

Table 3 indicates that financial measures such as sales growth rate, cash flow, liquidity, profit margin, return on investment, earning per share and return on assets has been significantly used by the organization. Mean value, of different financial indicators of table 3 reveals approximately near to five, shows the strong significance and use of these measures. Financial indicators like residual income and economic value added has not been used. Cronbach's Alpha of the financial measure has 0.624 and indicates the reliability and consistency.

Non-financial measures

TABLE 4 USE AND IMPORTANCE OF DIFFERENT CUSTOMER RELATED MEASURES IN NEPAL TELECOM

	Customer satisfaction, complains and perception	Customer retention	Customers wants and expectations on product quality, service and price	Market share relative to competitors	Time taken to fulfill customer's request
Mean	4.23	4.45	3.83	4.57	3.93
Std. Deviation	.762	.506	.461	.504	.258

Table 4 highlights the customer satisfaction, complaints, retention, wants and expectation on product quality, service and price, market share relative to competitor and time taken to fulfill customer's request as the performance measures used in Nepal Telecom. Market share relative to competitors has 4.57 mean values shows the significant use and importance of this measure. Customer's wants and expectations on product quality, service and price, time taken to fulfill customers' request, customer satisfaction, complaints and retention has also been significantly used.

TABLE 5 USE AND IMPORTANCE OF OPERATIONAL AND PROCESS RELATED MEASURES IN NEPAL TELECOM:

	Time need to produce new product/services	Time taken to deliver products/services	Percentages of on time deliveries	Quality /cost and process related	Time taken on repair defective product/services	Hours training for using product services
Mean	3.97	3.77	3.39	4.35	3.65	3.27
Std. Deviation	.180	.990	.495	.486	.486	.450

Table 5 revealed the mixed results. The mean value of quality /cost and process related measure 4.35 indicates significantly use and importance of this measure in Nepal Telecom. Hours training for using products services and percentages of on time deliveries has given moderate importance in use. It also revealed that other indicators such as time taken on repair defective product/services, time taken to deliver products/services and time need to produce new product/services related measures have been moderately used.

TABLE 6 USE AND IMPORTANCE OF DIFFERENT LEARNING, GROWTH AND EMPLOYEE RELATED MEASURES IN NEPAL TELECOM:

	Employee satisfaction score	Continuous on job training	Employee benefits and rewards	Employee turnover rates	Employee education and skill levels	Employee suggestions implemented
Mean	4.20	4.53	4.37	4.10	4.10	3.47
Std. Deviation	.407	.507	.490	.305	.746	.761

Table 6 revealed the significant use and importance of continuous on job training, employee benefits, incentives and rewards, employee turnover rates, employee education and skill levels. The implementation of employee suggestions as performance measure has not been significantly used and it has got less importance. Employee satisfaction score, employee education and skill levels, employee turnover rates, and employee benefits, incentives and rewards measures are significantly used. The Cronbach's Alpha of non-financial measure .662 shows the consistency of the measures used on the study.

Performance measurement has been considered a key managerial tool in Nepal Telecom. Normally the company prepares performance reports monthly, quarterly, half-yearly and yearly in a regular basis. Majority of the respondents (88 percent) expressed that it a crucial job of the organization. Approximately 86 percent of the respondents have given their view that performance measures are often modified when there are changes in the organization's strategic objective. The company has used different financial and non-financial measures as the performance measuring indicators. Balanced scorecard as the performance measuring system have not been used in Nepal Telecom but the company has positive in the use of balanced scorecard.

CONCLUSIONS

Nepal Telecom has used financial and non –financial measures for performance measurement but financial measure has got significant use and importance rather than non-financial dimensions. Current emphasis on selected financial measures and nominal emphasis on non-financial measures leads to the 'unbalanced" situation with regard to other perspectives.For long term success balance should be made between financial and non-financial performance measures while designing the performance measurement system. The company has not used the balanced scorecard as the performance measurement tool but it has often modified its performance measure when there are changes in the organization's strategic objective.

ABSTRACT

The article deals with the issues of prevention of conflicts arising from family-legal relations in the Republic of Uzbekistan, socio-legal protection of the family, as well as the Institute of media, its importance, advantages, as well as improvement in the pre-trial settlement of family disputes.

KEYWORDS: *Family, Family Code, Family-Legal Relations, Dispute, Media, Mediation, Marriage, Underage Children, Family Disputes, Mediator, Legal Protection, Legal Culture, Court.*

INTRODUCTION

It is known that in recent years great work has been carried out on strengthening the Family Institute in the Republic of Uzbekistan, developing new laws and norms for its development and improvement, making changes and additions to its existing ones based on the requirements of today, paying attention to the Family Institute of society.

In this regard, in the fourth direction of the decree of the president of the Republic of Uzbekistan "on the strategy of actions for the further development of the Republic of Uzbekistan", one of the priorities of the development of the social sphere is the strengthening of the socio-political, legal protection of the family, increasing the social political activity of women and, on this basis, the adoption of the «concept of strengthening the Family Institute in the Republic of Uzbekistan " also proves that great attention is paid to the Family Institute.[1]

Also, taking into account the complex nature of family disputes in recent years, the increase in disputes in the modern Uzbek family, the increase in cases of dissolution of marriage, the consequences arising from it, incomplete families, the fact that children remain "alive orphan", the cases of living with an informal marriage without registering a marriage, the birth of a child from official extramarital relations, family conflicts, provides.

In this regard, on June 12, 2018, the law" on media of the Republic of Uzbekistan" was adopted [2] and the law came into force since 1 January 2019.

One of the most important features of this law, along with other disputes, is to help in the resolution of disputes arising from family legal relations by the implementation of medias a. The law consists of Chapter 4, Article 34, in which the general rules, the rights and obligations of the participants in the media, the rules for the application of the media and the implementation of the media procedure, the final rules are laid down.

In this place, let's dwell on the concept of "media". Media (visual media) mediation - mediation) is an alternative (pre-trial) method of resolving disputes, in which the mediator helps the parties to agree on a mutually acceptable settlement, but he does not have the right to make a decision on the dispute and to advise none of the parties.

Sources say that the Institute of mediaeval is the land in ancient Greece.AVV. It was used at the beginning of the II century. Media has been used for several centuries as a method of peaceful settlement of disputes in international relations. His current appearance appeared and developed from the 70 years of the last century in countries where the US and other Anglo-Saxon legal system is in practice. It is also used in European countries at the beginning of the 1990s. [3]

Also, today, in most of the USA, Austria, Germany, India, China and the CIS, the legislation of the Baltic states provides for this institution, 30 percent in China, 75-85 percent of the US contestants apply to the Institute of media and 90-95 percent of them are resolved positively.

One of the positive aspects of the media is that it allows the parties to save time and resolve the dispute at a lower cost than applying to the court, promotes the preservation of mutual respect and friendly relations between the parties, serves to prevent various overburdening.

World experience shows that the Institute of media is usually well-established in cases where both parties want to compromise on a particular dispute, but can not do it in different ways. Therefore, the main task of the mediator (mediator) is expressed in ensuring mutual reconciliation of the parties in this regard, as well as in helping them to come to consensus (compromise).

It should be noted that this institution is of great help in improving domestic family and personal relations, in particular, relations between parents and children, husband and wife, mother-in-law and the bride, in this regard, in terms of improving family conflicts and difficult living conditions, practical solution to them.

It is known to us that in family legal relations usually the absence of a culture of hearing each other by the parties, negotiation, ambitiousness of the parties to the conflict, demonstratively showing their strength to the second party, the desire to humiliate or morally lose each other usually leads to the appeal of the parties to the dispute to the court.

Usually practice shows that achieving a settlement of disputes arising from family legal relations on the basis of mutual agreement will have a positive effect on the preservation of family ties, on the interaction in the upbringing of children, than on the decision of the court in the mandatory order. After all, mediators help each other to understand each other better, to come to a mutual agreement, to approach their positions, to come to a standstill, a solution that is effective for both parties. Also, according to the materials of the practice, in the process of media, the parties experience discomfort of a kamrok mental character, in contrast to court proceedings.

According to the above, the following conflicts arising from family legal relations can be the basis for the implementation of the media, they are expressed in the following:

1. Disputes related to the annulment of marriage: annulment of marriage by the court; finding the marriage invalid.

2. Property disputes: finding as a common property; dividing the property; determining its share in the property; annul or change the marriage contract; finding that the marriage contract is invalid, etc.

3. Conflicts related to the education of children: the right to see with the child of parents living separately; the determination of the place of permanent residence of the child; cases of illegal detention of the child, etc.;

4. Related to parental rights and obligations: disputes related to deprivation of parental rights, restoration of this right, restriction.

5. Assignment of paternity, alimony obligations.

The peculiarity of the Institute of media on the above disputes is that in the future it will help to find a solution, while maintaining good friendly relations between the parties, for example, it is possible to preserve the opportunity to bring up children together. With this, even in the event of the dissolution of the marriage, the "living orphan", which directly affects the spiritual and physical development of the child, is eliminated the negative consequences of the "incomplete family".

So, the peculiarity of the relationship in the family is that its participants are interrelated and have a long-lasting relationship, the niozos in the family are formed on the basis of negative emotions, and these emotions kuchaytiradi; for example, marriage and the dissolution of marriage negatively affect all members of the family, especially children. And the use of media in this regard, in turn, positively affects the environment in the family, serves to prevent long-standing disputes and judicial proceedings.

Of course, the media in this regard – the resulting dispute can be resolved with the support of the mediator on the basis of their voluntary consent, so that the parties can reach a mutually acceptable decision.

The mediator is considered to be a person who is attracted by the parties to carry out the mediation. In the implementation of the media, secrecy, volunteerism, cooperation and equal rights of the parties, the independence and impartiality of the mediator are carried out on the basis of printsips.

According to the law, the media is used on the basis of the desire of the parties. The media can be used in an extra-judicial procedure, in the process of viewing the dispute in a judicial procedure, until the court enters a separate room (consultation room) for the receipt of a court document.

It should be noted that the Institute of media is radically different from the judicial debate. The competence of the mediator is limited, especially in relations with the interests, rights of children. The mediator can not take any actions in this regard, he can not hear the instructions of a child like a judge or conduct a conversation with the child with the participation of a psychologist. That is, the media requires a special careful approach, so as not to violate the rights and interests of the child. Taking into account the fact that conflicts in the family can harm the rights and interests of children, the mediator is required to take it into account in full. Therefore, these issues must find their solution separately in the law.

According to the above, the Institute of media plays an important role today in ensuring family cohesion, in reconciling family members in a peaceful way, in preventing the dissolution of marriage, in the peaceful settlement of property relations before the court and in resolving disputes within the framework of other family legal relations. Therefore, it is on the subject of expropriation and development of this institution:

- in our opinion, the law"on media of the Republic of Uzbekistan" stipulates the application of media to disputes arising from family legal relations, taking into account its uniqueness, its complexity and attachment to the future of the whole family, children, and not on general grounds, such as other relations, in a separate order, strengthening of specific rules and improving the norms of;

- the advantages of the media institute to the population in terms of raising the legal consciousness and legal culture of family members should be explained correctly and clearly;

- it is desirable to give shows, documentaries about the next lives of families who, through the Press, Television, have reached mutual agreement on family relations related to the media in this regard;

- The activities of mediators in the effective resolution of disputes arising from family legal relations should be analyzed and encouraged;

- it is desirable that advertising roles are given without interruption when it comes to where and how to apply for media, how to get help in resolving disputes arising from family legal relations between the population.

THE ROLE OF NOMINAL SENTENCES IN A SYNTACTIC THEORY

Ergashev Muhammadjon Rakhmonovich*

*PhD in Philological Sciences,
Lecturer of Kokand State Pedagogical Institute, Kokand,
UZBEKISTAN

ABSTRACT

In linguistics, neither a clear definition nor the role of nominative sentences in the language system, which includes a set of specific features, has been resolved. In this article, I will determine their role in the language system through defining nominative sentences in a syntactic theory.

KEYWORDS: *Nominative Sentence, Language System, Ellipsis,   One-Member Sentence.*

INTRODUCTION

There are more than 300 definitions of "Sentence" which is called linguistic reality in the world of linguistics. These include simple, compound, complex, follow-up sentences, as well as nominative sentences. However, the sentences that are characterized by predicativeness, modality, tone and other features do not have functional, differential features that are common and universal for all languages.

Firstly, it is a controversial problem in syntax and secondly, it is a problem with language structure related to sentence construction. In linguistics, neither a clear definition nor the role of nominative sentences in the language system, which includes a set of specific features, has been resolved. We know, linguistic literature also testifies that nominative sentences which have several definitions. These definitions are based on the goals that the researchers have set for themselves. Therefore, there are few definitions that reveal the essence of nominative sentences.

Hence, it seems that our task is to develop principles of nominative sentences which differ from the definitions given to other sentence categories.

MATERIALS AND METHODS

Professor I. Rasulov categorizes nominative sentences into one-sentence sentences and defines them as follows: Nominative sentences are the main type of uncut sentences divided according to

the nature of the main part. In this type of statement, an object is called the name of an event, and that object is expressed by affirming the existence of an event. "[1:87]. According to G. Abdurahmanov, "sentences that indicate the existence of a particular object or event are called nominative sentences" [2: 123]. A group of Russian linguists consider nominative sentences to be a compound sentence consisting of a combination of a noun or a noun in the form of a general agreement, which can be complicated by the meaning of an emotional assessment, command, or wish, confirming the existence of an object or event. [3:87].This means that nominative sentences can consist of a single word and can be expanded with adjectives. For example: *Universitet. Yoshligimning oltin davri shu dargohda o'tdi.* (the university. The golden age of my youth was spent there). Nominative sentences are, at first glance, uninterrupted, but are thought to be sentences consisting only of the possessive. In fact, if we put these statements in the paradigm of time, the following picture emerges:

1. *Keng sahro-Keng sahro edi.* (The vast desert - It was the vast desert).

2. *Tun-Tun edi.* (Night - It was night.)

3. *Bahor- Bahor keldi.* (Spring - spring has come.)

"Such units, equal to the names of events, are called nominative," says Sh. Rahmatullaev [4: 167]. The above words only name reality, in which none of the grammatical categories that make up the cut (sentence) are involved. For example: *Kech kuz. Hosilni to'la –ko'kis yig'ishtirish fasli.* (Late fall. The season of full harvest).

RESULTS AND DISCUSSIONS

It is clear from the above definitions that there is no similarity between Russian and Uzbek linguists in defining the essence of nominative sentences. Therefore we turn our attention to Indo-European language sources. English grammarians view nominative sentences as a variant of one-syllable structures. The main or main component of such structures consists of horse or riding elements. (gerund, number, etc.). The function of nominative sentences in the communication process is to make a dynamic representation of an event. A group of statements refers to the time of an action or event, its location, the circumstances in which the event occurred and the participants in the communication process. For example:

London. Buyuk Britaniyaning poytaxti, minora, ko'prik, Trafalgar maydoni, Britaniya muzeyi, parlament binosi va albatta, Temza daryosini ko'z oldimizga keltiramiz; hammayoqda tuman - Buyuk Britaniya poytaxtini kuzda tumansiz tasavvur qilolmaysiz; qovog'i soliq noyabr havosi. Kech kuzda Buyuk Britaniyaing ob-havosi ko'proq quyoshsiz bo'ladi.

(London. We imagine the capital of Great Britain, the tower, the bridge, the Trafalgar Square, the British Museum, the parliament building and of course the River Thames. Fog is everywhere - you cannot imagine the capital of Great Britain without a fog in the autumn; Nasty November weather. In late autumn, the weather in the UK will be more sunless.)

The examples cited from the English language and their pragmatic interpretation suggests that in the development of languages, nominative sentences also had two or more compound sentences. The absence of the required components in nominative sentences may also explain their inclusion in the category of elliptical sentences. In fact, it is an elliptical sentence; in nominative sentences, in most cases, one of the main parts must be present. So what are the features of

nominative sentences that differ from elliptical sentences? In our view, although there is a tone in nominative sentences, there is no modality, just as there is no predicative, but according to I.I. Meshaninov, predicative may be hidden.

Nominative sentences have been used at all stages of linguistics, including syntax, as evidenced by the linguistic literature, sometimes as a noun phrase, sometimes as a nominative sentence, and sometimes as a compound sentence. Now, the term nominative has been completely abolished by all linguists and researchers.

The cognitive features of nominative sentences are clearly visible. For example, if we take the concept of "love", the word is derived from the meanings of words such as "who is not in love", loved ones or "не любимых женшин нет, ест невстреченные"" in Russian.

Some German scholars argue that the function of nominative sentences (function, function) is to confirm the presence of the possessor in a compound sentence, or to bring the reader into the space where the event or action takes place. For example: *Malay camp. The row of streets crossing another row of streets. Mostly narrow streets. Mostly dirty streets. Mostly dark streets (P.A).* When the one pays attention to the system of sentences, it conveys to the reader all the features of the scene, including the appearance of the place and the attitude of the character involved in the event to the place.

So, if we agree with the opinion of most linguists that nominative sentences belong to the category of one-syllable structures, they consist only of nouns. From both a semantic and communicative point of view, it is an independent syntactic device that determines the existence of an event, phenomenon, or appearance of a nature, its place, time. As for isolated sentences, they never fall into the category of one-syllable sentences and these sentences rely on context to perform a specific semantic function and they are probably called ellipsized sentences.

In short, nominative sentences are one-syllable sentences that indicate the existence of an object, event during the speech (which may be outside the speech function). They can be represented by a single word or by several interconnected words. For example: *Subhidam. Quyosh yotog'idan bosh ko'tardi; Winter. It is the coldest season of the year; Toshkent. Bir paytlar urush ketayotgan yillari non shahri bo'lgan. Hozir tinchlik shahri.*

(Dawn. The sun rose; Winter. It is the coldest season of the year; Tashkent. It was a city of bread during the war years. Now, it is a city of peace.)

Nominative pronouns are possessive pronouns in the modern sense. For example: *Sehrli ohang. Mumtoz qo'shiqlar. Yuraklarni lahzaga soladi.* (Magic tone. Classical songs. It makes hearts feel it)

CONCLUSION

In conclusion, we would say that we will focus on the role of nominative sentences in the language system in further articles devoted to the study of the lingvopragmatic, lingvostylistic and cognitive features of this category of speech.

ABSTRACT

The article is devoted to the problem of increasing interest in teaching a school geometry course through the use of new pedagogical technologies and elements of entertainment in the classroom.

KEYWORDS: *Pedagogy, Technique, Geometry Lesson, Elements Of Entertainment, Quadrangles, Classification.*

INTRODUCTION

The school course of mathematics is becoming more and more important in the system of general education of students.The math teacher must solve problems every day to make the most of every minute of the lesson.It is necessary to look for effective ways to solve this problem.At each lesson, the teacher faces a number of tasks: how to bring all the necessary information to the consciousness of the student, how to achieve the assimilation of theoretical and practical

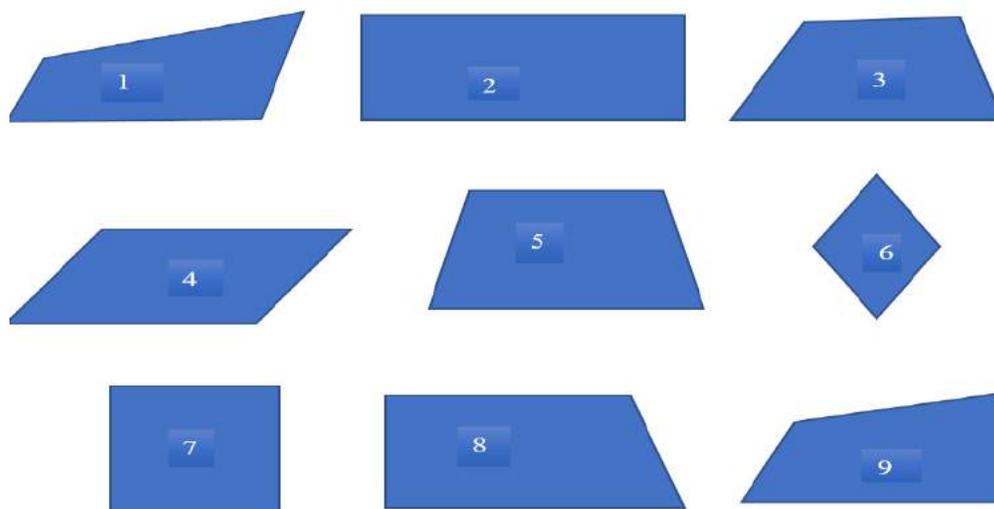
material, how to generate and maintain student interest in learning math. After all, mathematics is a science that requires a lot of mental stress, the development of logical thinking and creative abilities. Therefore, in order to awaken students' interest in mathematics, to keep them active throughout the lesson, it is useful for the teacher not to miss the opportunity to make the lesson more interesting. The elements of entertainment also contribute to the development of students' creativity. The growth of interest in knowledge, the activity of students in the classroom, the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, math quizzes, tests, elements of historicism, tables, posters, as well as the use of drawing tasks, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal, etc. Information and communication technologies can play a special role. Below we will give a lesson on the topic "Quadrangles" using elements of entertainment.

LITERATURE REVIEW

A quadrilateral is called convex if it is located in one half-plane relative to containing any of its sides. In this case, the straight line itself is considered to belong to the plane.The rest of the quadrangles are called non-convex. You may notice that non-convex quadrangles have an angle greater than a flattened one.

We will only study convex quadrangles. (The guys draw convex and non-convex quadrangles in notebooks).

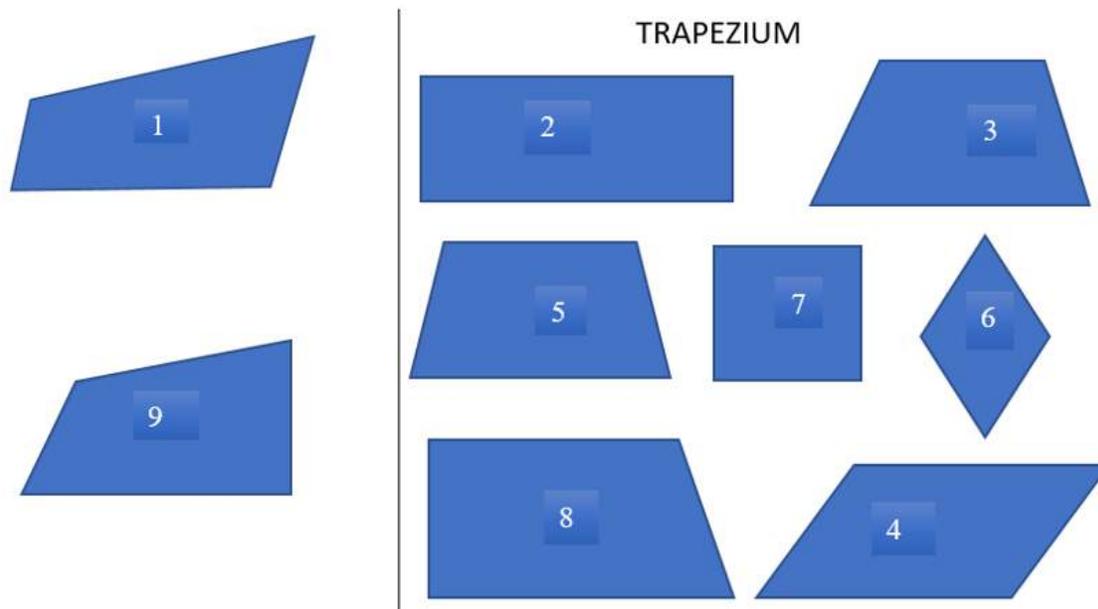
"Classification of quadrangles".

The presentation of the material is carried out in the form of a fairy tale.The teacher has prepared in advance various types of convex quadrangles, which are attached to the board.


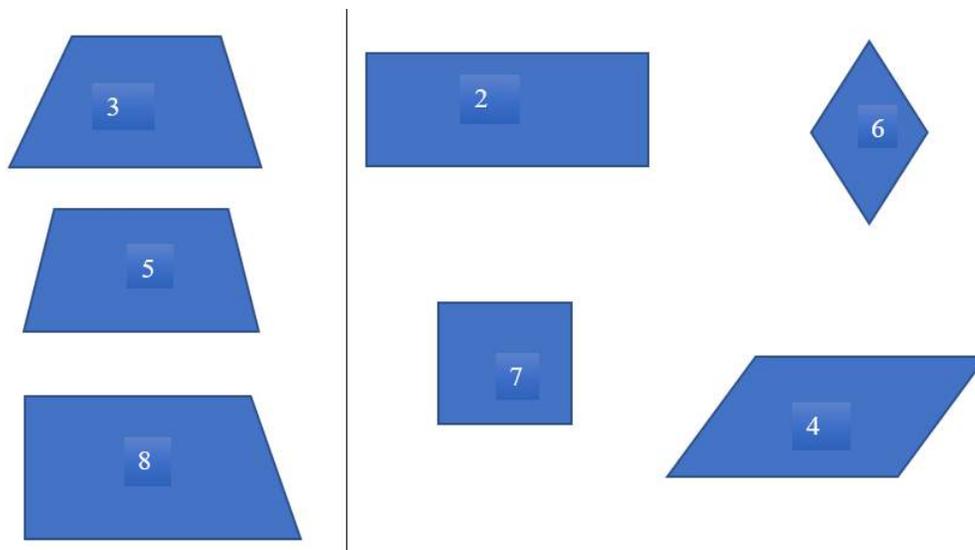
Teacher: Guys, now I will tell you an interesting story about how the quadrangles lived and what happened to them.

In the course of the story of the tale, the teacher moves the quadrangles in accordance with how they are classified.

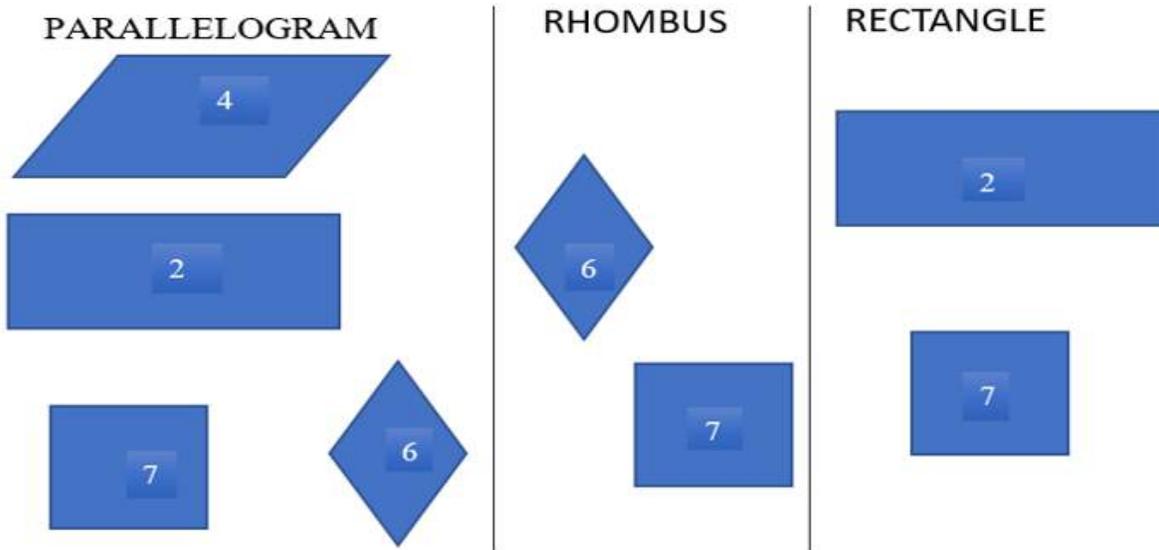
Teacher: In a certain khanate, called Geometry, there were Quadrangles.

They lived peacefully and amicably, visiting each other. Once, at a beauty show, it turned out that among them there are Quadrangles with parallel sides.They began to ask themselves terribly, to brag about their properties. They decided to call themselves Trapezes and separate from everyone.


TRAPEZIUM

But later it turned out that among the Trapeziums there are those in which the other two opposite sides are parallel. What an honor for them, they split up and called themselves parallelograms. And they began to praise themselves, are proud of their properties and wiped their nose with Trapezium. Parallelograms told them: "Just think, you have one pair of parallel sides, and we have two, and we have more properties than yours, we do not want to live with you". And the Parallelograms were separated into a separate society. And they began to live separately.


The long-awaited peace has come in the khanate. But on Friday, when everyone was resting, Parallelograms began to look closely at each other. And suddenly it turned out that some have all

the sides equal, while others have all the angles, and still others have only two pairs of parallel sides. Each of these groups took pride in their properties. And they decided to split-up. Some remained Parallelograms, others were called Rhombuses, and still others - Rectangles. It would seem that everything was settled, because everyone was divided by family characteristics. In all societies, they only said that they were similar to each other. Until one day they noticed the Rhombuses that among them there are Quadrangles with equal angles. "Get out of the way", said the Romans.


But the Rectangles didn't accept them either. Seeing. That among them there are quadrangles with equal sides, they were terribly indignant and invited them to leave. So they had to become separate and called Squares. This is how new khanates were formed, which began to be called the Khanates of the Quadrangles. Trapeziums, Parallelograms, Rhombuses, Rectangles, Squares, i.e. there was a classification of quadrangles and peace reigned forever in the geometric khanate.

So, we got acquainted with the classification of quadrangles.

Teacher: You see, guys, the closest "relatives" of a square are a rhombus and a rectangle, which, in turn, have parallelograms, etc. We will further study in detail all these quadrangles and their properties.

Supply of new materials

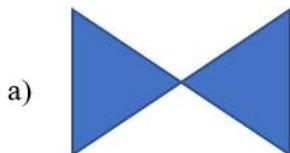
Questions from students

1. What kind of shape is called a quadrangle?
2. What are rectangles?
3. Which vertices of the quadrilateral are called adjacent, which are opposite?
4. What is the angle of a quadrilateral? Which corners in a quadrilateral are called adjacent?
5. Which sides of the quadrilateral are called adjacent, which are opposite?
6. Which segment is called the diagonal of a quadrilateral?
7. What groups and types are quadrangles divided into?

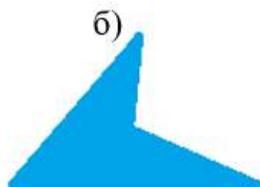
8. Students answer the test questions (tests are written on sheets and distributed) and the questions below the picture ("yes" or "no").

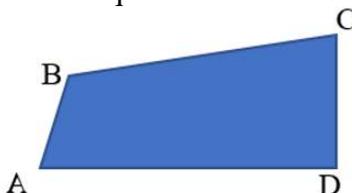
Tests:

1. Can this figure be called a quadrangle?

а)   б)


2. Is this a convex rectangle?

а)   б)


Are the sides AB and CD of the quadrilateral ABCD: a) holdb) the opposite?


CONCLUSION

So, guys, today we got acquainted with the concepts of "quadrangle", examined its types, learned about their classification. We have studied in detail the adjacent and opposite vertices, corners and sides of the quadrilateral.

One of the main tasks of teaching geometry in a general education school is the development of students' ability to reasonably, take a detailed approach to each geometric educational material and competently solve geometric problems. The use of elements of entertainment in geometry lessons instilling interest in the study of the subject, increases the efficiency of the learning process.

CHARITY AND SPONSOR INITIATIVES IN TURKEY IN THE LATE XIX AND EARLY XX CENTURIES (ON THE EXAMPLE OF LOCAL RICH AND JADID ENLIGHTENERS)

Abdulaziz Utkirov*

*2nd year student of the Faculty of History,
Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

In this article, based on an extensive analysis of archival documents, historical sources and literature, the charitable and patronage activities of local rich people, merchants and entrepreneurs in the second half of the XIX - early XX centuries in the Turkestan region were investigated. Although the period of the history of the Uzbek people in the late XIX-early XX centuries was historically short, it is interpreted as a period of significant significance in the historical fate of the Uzbek people.

KEYWORDS: *Turkestan Region, National Values, Patronage, Generosity, Charity And Sponsorship, Local Rich People.*

INTRODUCTION

The issues of charity, compassion, generosity, sponsorship in the system of social protection, which are the national values of our people with historical roots, have been formed in different periods of the history of Uzbekistan on the basis of different views and approaches. This process is one of the qualities inherent in the mentality of our people and is reflected in the behavior, lifestyle and behavior of our ancestors. The traditions of charity and sponsorship have been named and developed differently in different periods of our history. For example, in the early Middle Ages, the emergence of private property led to the misuse of surplus funds, in the Middle Ages and khanates in the system of foundation property, in the colonial system in Turkestan in the life of artisans, as well as in charitable societies, institutions, mutual tolerance in the Soviet era. It is no secret that during the years of World War II) [1, 159 p.].

The main results and findings

The fact that Turkestan underwent political, cultural and economic decline in the late 19th and early 20th centuries as a result of colonial policies reflected the negative aspects of the period. The advanced intellectuals of the country laid the foundation of the enlightenment movement in order to get rid of the oppression of the Russian Empire, to awaken the nation, to pave the way not only for economic but also for spiritual and enlightenment development, to spread enlightenment to the people. With this move, a new era of awakening began in Turkestan. This was the positive, successful side of the era.

In Turkestan, local volunteers have invested in the construction of mosques, schools, bridges and roads. For example, Mirazam Mirohunov, one of Tashkent's richest men, donated 2,500 gold silkworm seeds to the population, another city merchant, Ishakhanboy, spent 1,000 rubles on the construction of a Muslim part of Tashkent. 500 thousand r for the construction of a Russian-style school, a hospital and 2 baths for 100 students. donated [2, p. 215]. Such events were widely organized not only by representatives of local investors, but also by Jadid enlighteners, who were prominent scientists and intellectuals of the time. Such a representative of the intelligentsia, a serious enlightener, an example for all of us, one of the most famous representatives of the Uzbek national culture of the late XIX and early XX centuries, the conscience of the nation, the famous enlightened poet, playwright, journalist, scientist, statesman and public figure, craftsman Abdulla Avloni.

Abdulla Avloni was born on July 12, 1878 in Mergancha mahalla of Shaykhantahur (Shaykhantavur) district of the old city of Tashkent in a simple family. Abdullah's father's name was Miravlan, his mother's name was Fatima, and his father was a weaver and a weaver at the Yarmanka market [3, p. 287]. In 1885-1890, he studied at Avloni Primary School and learned his first letters from Akromkhan, a teacher in Oqchi mahalla. In his autobiography, Avloni recalls the period of poverty and hardship in his youth: "... at that time (when I was 11-12 years old) my father married me, lost everything he had and became poor. ... When I was 13, poverty affected me. I worked in the summer, helped my parents a little, and studied in the winter ... "[3, p. 288]. When Avloni was 14 years old, he came to Abdumalikboy Madrasah in Shayhantahur and started teaching Mullo Umar Akhund. From 1894 he began to write poetry. At the age of 18, Avloni got rid of the laborer, attained a master's degree, and engaged in trades such as bricklaying, plastering, stove-making, and carpentry. After the death of his father, he married in 1900 and doubled his responsibility to work when he became the head of the family. It was at this time that the poet, growing up in labor, began to write poems against the rich and the mullahs. He was forced to leave the madrasa without completing it completely but continued to pursue his education. Various newspapers became acquainted with the periodicals and magazines published in different cities of Russia at that time. At that time, when the term antiquity (jadid-antiquity) was formed among the indigenous peoples, Avloni joined the ranks of the Jadids and in 1904 began to work in the Jadid community. On his own initiative, he opened the Jadid School and began teaching. In 1906, when the Taraqqiy and Khurshid newspapers ceased their activities for several years, in 1907, at the initiative of Avloni, the Shukhrat newspaper was published on Sapyorny Street. Rafiq Sobirov, a Tatar from Kazan, assisted him in the editorial work. The newspaper was later shut down after 10 issues after numerous pressures. Avloni did not stop there, that is, in 1908 he obtained permission for

the newspaper "Asia" in the name of his partner, the writer Ahmadjon Bektemirov, and continued to work again, setting up a newspaper office in his home. Unfortunately, the newspaper was shut down by the government after 6 issues. Undeterred, Avloni opened a new methodical school in Mirabad in 1908 and continued teaching. The enlightened Jadid organized a society not only through science, lessons, and educational work, but also through good deeds such as helping the needy, the poor, the needy, and helping to send young people to study abroad in enlightenment. For example, according to Abdullah Avloni in his autobiography, we see that he opened a "Charity Society" on May 12, 1909 with several friends to ensure the unity of the people of Turkestan and the enlightenment of the younger generation [4, p. 102]. After the establishment of the society, lawyers such as Ubaydulla Khodjaev, Toshpulatbek Norbotabekov developed a charter of the society consisting of 41 articles [2, pp. 22-23]. It is noteworthy that the main tasks of the "Charity Society" include the establishment of schools for all segments of the population, sponsorship of poor children and orphans, the organization of various orphanages, assistance to students. According to the sources, the actual members of the society are 6 r. Per year, and the members-employees are 1 r. 50 kop. paid. As of July 1, 1910, the number of members of the society was about 300. At that time the public fund was Rs 4,000. exceeded. At the time of its first establishment, 500 r. spent up to and 200 r to the poor. given. The amount of benefits is 2 r. and 5 r. up to 50 kop per month for students and teachers to pay for education. Given [5, p. 520]. The society also sponsored the teaching of students abroad. With his help, young people were sent to study at universities and madrassas in St. Petersburg, Saratov, Kazan, Ufa, Orenburg, as well as in foreign cities such as Istanbul and Cairo. For example, in 1910, with the help of this society, a group of young people became "Oliya" in Ufa [6, p. 28]. He studied at the "Husseiniya" madrasah in Orenburg. In his autobiography, Avloni notes that in 1915, when he was the editor of the Tashkent-based newspaper Sadoi Turkiston, he re-established a charitable society on the basis of the charter and helped schools, orphans and strangers [3, p. 206]. In 1903, a theater was established for the benefit of the Charity Society. collected, 313 r. to the theater troupe, 589 r. handed over to the community [2, p. 206]. While covering the creative work of Abdullah Avloni, he entered the field of theater in 1913 in order to make the people civilized, and as a leader he visited several cities of Turkestan and sought to develop the field of theater. For example, the enlightener translated and staged about 10 Azerbaijani poems into Uzbek, as well as wrote 3 poems and founded the Turon Theater Charity Society.

In the course of our research, we studied the work of several artisans, such as Abdullah Avloni. One of them, a trader Ishakhanboy, spent 1,000 rubles (r) on the construction of a Muslim part of Tashkent; donated [2, p. 215]. In Namangan, Ibrat domla worked as a judge of the Turakurgan district of Namangan district, in June 1907, at his own expense. was used to open the "School of Isaac" school for 50 students [8, p. 168]. In 1914, Ishaqjon Mirsolihboy, a rich man from Namangan, in consultation with merchants for the circumcision of his son, received 2,000 r from the money spent on the wedding. decided to create a fruit orchard for school children and spend it on school needs [9, p. 168]. A similar good deed was done by Munavvar Alifkor, who reduced the cost of holding a circumcision ceremony for his son and built a school with this money. Among the people who are not indifferent to the future of the people are Saidkarim Saidazimboy ogli, Orifkhoja Azizkhoja ogli, Maqsudkhoja Otahoja ogli, Abduvali Abdukomilboy ogli, Mirzo Abdulloho khoji Muhammadboy ogli, Mahmudjon Shokir khoji ogli, Orifkhoja Eshon, Amhoqboy Abdualiev and other local investors. gave gifts in favor of orphans, as well as

sponsored charities established in the country with their own funds. It also sponsored the establishment of special schools for merchants in the early twentieth century. Another example is the opening of a school of traders in Tashkent on August 30, 1907 [11, 71 p.]. Of course, in the Turkestan region, these traditions were widely continued by local intellectuals, Jadids, wealthy people, traders and businessmen, and served as an important factor in the development of this or that sphere of society.

CONCLUSION

In short, the values of charity and sponsorship have been formed from time immemorial, and the history of its development reaches to the present day in new forms. The sources analyze the charitable and sponsorship activities carried out in the Turkestan region in the second half of the XIX - beginning of the XX centuries in the fields of science, culture, economy, beautification.

INTERPRETATIONS OF SHARIA AND SECT (THE PATH OF SUFISM) IN UZBEK LITERATURE

Shakhnoza Abdimuminovna Kakharova*

*Associate Professor,
Candidate of Philological Sciences,
Karshi State University,
Karshi, UZBEKISTAN

ABSTRACT

This article examines the role of Sharia in the spiritual development of a person, the question of its role as the basis of the sect (the path of Sufism), scientific and enlightenment views in mystical literature and issues of its artistic interpretation in Uzbek classical literature was analyzed.

KEYWORDS: *Sharia, Sect (The Path Of Sufism), Enlightenment, Truth, Fano, Consent, Patience, Strangeness, Poverty, Knowledge, Gentle Nature, Piety, Generosity, Gratitude, Sincerity, Fidelity, Love, Mystery*

INTRODUCTION

Sufism encompassed all spheres of cultural and spiritual life, as it arose as a result of spiritual, spiritual necessity at a certain stage of human development.At the same time, as a result of the continuous creative activity of man, mysticism developed historically.At the same time, it also influenced the way of mental and artistic activity.

Sufism, as a truly humane doctrine, has served for the perfection, the spiritual upliftment of man.Art and literature are the greatest forces influencing the human psyche, spirituality.That is why the soul and blood of mysticism is Islam and the way of life is fiction.

Alisher Navoi gives the following description of mysticism in his 306th gazal in the "Favoyid ul-kibar" divan, which is a part of "Khazayn ul-maoniy":

Tasavvuf rizo ahlidin yaxshi axloq,

Erur istilohoti zebu takalluf.

...Qilib haq vujudida mahv oʻz vujudin,

Navoiy, muni bil tariqi tasavvuf.[7;311]

The good morals of the people of Sufism

The term is a blessing.

By destroying the body in the body of truth,

Navoiknows thisSufism.

By the beginning of the ninth century, the theoretical foundations of sufism were developed, and practical, spiritual and psychological self-education and training of Sufis were formed.In the history of sufism, the stages of spiritual maturity: concepts such as sharia, sect(the path of Sufism), enlightenment, truth emerged, and sufism was seen as a separate doctrine.[5;37]

The Main Findings and Results

In the early days of sufism, the development of the foundations of the maqam and the sect(the path of Sufism), the definition of the instructions and tasks of sufism, and the dissemination of divine truths among the people Zunnun Misri (796-861), Boyazid Bistomi (died 875), Junayd Baghdadi (died 910), Hakim Termizi (died IX century), Mansur Halloj (858-922) had a great service.Later Abu Sa'id Abul Khair (967-1049), Abdullah Ansari (1006-1089), Imam Muhammad al-Ghazali (1059-1111), Ahmad Yassavi (died 1166), Yahya Suhrawardi (1155-1191), Ibn al-Arabi (1165-1240), Najmiddin Kubro (1145-1221) and Bahauddin Naqshband (1318-1389) enriched the science of sufism with new ideas and views.Several pamphlets and books on the theory of sufism"Kitabal Luma" by Abu Nasir Sarraj (d. 988), "Kitab Ta'arruf" by Al Kalabozi (d. 990),"Qutal Qulub" by Abu Talib al-Makki (d. 998),"Risolatal Malomatiya" by Saulami (d. 1021), "Risala fit Sufism" by Qushayri (d. 1072), "Kashf ul Mahjub" by Abulhasan Ali bin Usman al-Jullabi (died 1076) and "Tazkiratul Awliya" by Farididdin Attar (1119-1222) were created.In addition, the commentaries on the works of Rumi, Hafiz Shirazi, Shabistari also play an important role in determining the Sufi profession, gestures and parables.The monographs and pamphlets of Said Nafisi, Said Jafar Sajjodi, Qasim Ghani Abdulhusayn Zarrinkob, E.E Bertels, Ahmad Abdullaev, Najmiddin Kamilov, Yakubjon Ishakov, Ibrahim Hakkulov also contain valuable information about the stages of spiritual and spiritual development, the concept of status given.

In these literatures, the essence of sufism teaching, its external, internal actions, levels of the sect(the path of Sufism), and its functions as a philosophical category are defined.

Morality itself is not a science, but morality is the product, the essence of all sciences.It is a very serious matter, born of the sciences, and exalted as the fruit of all sciences.Morality is the rule of law, that is, the development of criteria that determine the cultural level of the social environment.All science pays attention to this. A similar mysticism brings moral issues to the forefront.

In the XXI th century "Kashf ul-Mahjub", the "building" of sufism consists of "eight qualities": *generosity* to the prophet Ibrahim, *consent* to the prophet Isaac, *patience* to the prophet Ayub, *reference* to the prophet Zikriyo, *strangeness* to the prophet Yakhyo, *travel*to the prophet Isa , *pure dress* to the prophet Mosesand finally it is emphasized that poverty is a *quality* and virtue that belonged to Muhammad Mustafa (s.a.v.).Thus, the tax, which entered the path of mysticism before the XXI century, had to possess these eight qualities.Hence the "building" of mysticism

until the time of Mawlana Husayn Waz Kashifi (1442 \ 46-1505)*knowledge, gentle nature, piety, generosity, gratitude, sincerity, fidelity, consent, purity, love* except for ten arcs like *case, mystery, memory (mind) and reference* are noted that there are also such corners.Husayn Waz Kashifi points out three more requirements for attaining perfection in mysticism.They are*tajrid, tafrid* and*tavhid*. It is also noteworthy that the scholar interpreted the letters of the words of sufism and dervish. The letters "Sufism" are interpreted as follows: "T" is tajrid, that is, abandoning appearances. "S" - safo, that is, the inner - to illuminate the inner world,"V" - fidelity, that is, fidelity to the covenant and love. "F" is to be a fan, that is, to observe oneself, drowning in the sea of divine beauty. The "S" in the word "Sufi" is the preservation of the solitude of the soul, that is, the survival of the soul, that is, only a friend should be aware of his secret from such a soul."U" is the protection of the secret, that is, to protect it from the devil's robbery.The goal of this career is sincerity."F" - to receive and give interest, that is, to enjoy those who are superior to him in enlightenment, and to convey this enlightenment to those who are inferior to him:enjoying the seeds and benefiting from the imperfections is a prerequisite for the world of education to be both graduating and accepting.And finally, the "Y" - to achieve a close, that is, unconditional confidence[6;30].

When we look at the history of sufism, there are four levels of spiritual maturity:each of the rules, such as the Shariat, the teachings, the enlightenment, and the truth, has a special definition, and with its contents it expresses the Sufi spiritual ascension and purification, leading the tax to the highest status - fano, and then to the bako.

Zunnun Misri "*First, the man made up the link and said the word from history*", Jonayd Baghdadi "*it arranged and summarized this knowledge*". Then there is Sheikh Abubakr Shibli, a small contemporary of Jonah*he ascended the pulpit and revealed this knowledge to the people*. The first to lead his murids were the sheikhs named above[8,17].

In the "Faqrnama" attributed to Ahmad Yassavi, first the word Sharia, the word Tariqat, the word enlightenment, the word truth, and then the ten statuses of the Sharia:to believe, to pray, to fast, to perform Hajj, to speak politely, to learn knowledge, to performof the Prophet (s.a.v.),to carry out the commandments, nahyi munkar (propaganda of the Sharia); The ten statuses of the Sect(the path of Sufism): repentance, giving hand to the pir, danger and rijo, fulfilling the vird-avrod,to give up pleasure and lust, to be in the service of the pir, to speak with the permission of the pir, to listen to exhortation, tajrid, tafrid; Ten statuses of enlightenment:accept fanaticism, dervishs, endure everything, demand honesty, educate, establish Sharia and teachings, leave the world, choose a future life, know the status of existence, know the secrets of truth;10 statuses of truth: to be humble, to know good and evil, and not to touch the bite of the nose, or to be content with virtue, to breathe one's own bite into the soul, spoke about leeching, keeping secrets from everyone, knowing and following the Sharia, the teachings, and the status of truth [12;108-109].

Hazrat Alisher Navoi in his work "Nasayim-ul-muhabbat": "*Allaah says :We have created the children of men with dignity, and have brought them forth by land and sea.Again, Allaah says: We have recommended this trust (Shariat) to the heavens, the earth and the mountains, but they have turned away from it and feared it.And the man took it upon himself.*

By this destiny, I have found out that the true subhanahu and ta'ala does not make a human being more honorable and higher than man in the creation, because he is the trustee and mahram of the treasury of the enlightenment"[8;7].In this way, the poet emphasizes that man is

the most sacred of all created beings because he has undertaken to perform the deeds of the Shariat.

The Sharia is a conditional deed, deed, and action for Muslims, and the Truth is Allah's protection.Therefore, the truth is supported by the Sharia and the Sharia is supported by the truth.The relationship between these is similar to the relationship between body and soul.The body without the soul is dead, and the soul without the body cannot live in this world. A living person must have both body and soul.

The basis of Islam is the five pillars (faith, prayer, fasting, almsgiving, and pilgrimage), which, if Allah requires the fulfillment of these pillars through the Qur'an, is not only a requirement of the Sharia, but also a prelude to Sufism.The Shari'ah is not only an external knowledge, but also an internal knowledge of the inner world of a person.

"Zunnun q. s. dedikim, uch safar qildim va uch ilm keturdum. Avvalqi safarda ilme keturdumkim, xos qabul qildi va om ham qabul qildi. Ikkinchi safarda ilme keturdumkim, xos qabul qildi va om qabul qilmadi. Va uchunchi safarda ilme keturdumkim, ne xos qabul qildi va ne om (qochoq, quvg'in va yolg'iz bo'lib qoldim). Shayx ul-islom q. s. dedikim, avval tavba ilmi erdikim, oni xosu om qabul qildilar. Ikkinchi, tavakkul va muomalat va muhabbat ilmi edikim, xos qabul qildilar va om yo'q. Uchunchi, haqiqat ilmidurkim elning ilmu aqli toqatidin tashqari erdi. Xaloyiq anglamadilar va ani inkorg'a qo'ptilar".

"Zunnun q. s. I said, I did it three times and I did three sciences.On the previous trip, I took the loop, the original accepted, and the om also accepted.The second time I took the loop, the original accepted did not accept. And on the third trip, I was hooked, neither accepted nor (I was a fugitive, persecuted, and left alone).Sheikh ul-Islam q. s, I said, "I used to repent, and my mother accepted me "Second, I was a science of risk and treatment and love, accepted. Third, the knowledge of the truth was beyond the reach of the people's knowledge and intellect. The crowd did not understand and immediately refused [8;104].

The first knowledge mentioned by Zunnun is the knowledge of the Sharia, because the Sharia applies to both the individual and the common people.The second science is the Sect(the path of Sufism) or treatment, the science of love, and the third is the science of truth, that is, the science of understanding the Truth.

Hakimus-Sir Abu Yazid al-Bistami says: *"Bir odamning havoda uchadigan darajada karomat sohibi ekanligini ko'rsangiz hamki, aning Allohning buyruq va ta'qiqlariga naqadar amal qilish-qilmasligini, hayotning shariat qonun-qoidalariga to'g'ri kelish-kelmasligini o'rganmaguningizcha, anga aldanib qolmang"*."Even if you see that a person has the ability to fly in the air, do not be deceived by him until you learn how he obeys the commands and prohibitions of Allah, and whether life is in accordance with the rules of the Sharia"[2;20].

Khoja Abdulkhaliq Gijduvani in his work "Maqomati Yusuf Hamadoni"also spoke about the external and internal actions:"Then they said to me: "*O Abdul Khaliq! Know that the path of the Truth, that is, the leech is of two parts: the leech is visible and the leech is inside.The first is the appearance of the leech, which in any case is to obey the divine commands and prohibitions, to observe religious norms as much as possible, and to avoid lustful desires.It is to protect its members from the lusts and desires of the Shariat. The second part, the leech boot, is to strive to purify the soul and to eradicate the evil qualities of the soul.Inner ablution is the earnest*

endeavor of dhikr so that the soul becomes as if it is with the remembrance of the Truth.This interpretation of dhikr was first conveyed to the heart of Abu Bakr, from him to Salman al-Farsi, from him to Ja'far al-Sadiq, and from him to Sultan Bayazid (Bastami),from him to Sheikh Abul Hasan Kharakani, from him to the great Sheikh Abu Ali Formadi Tusi and from him to us".

At the same time, the sharia is a necessity for the Sufi as well, and he cannot move on to the next stage without passing this stage.Only after mastering the requirements of the sharia, that is, the basic tenets (rules) of Islam, the next stage for taxation - the teachings - is opened.

Ahmad Yassavi says so in one of his wisdoms:

Tariqatga shariatsiz kirganlarni,

Shayton kelib imonini olur ermish.[13; 166]

Those who entered the Sect(the path of Sufism) without Sharia,

Satan comes and melts his faith.

Alisher Navoi in the epic "Hayrat ul-abror":

Istar esang maqsadi aslig'a yuz,

Joddai shar'i Muhammadni tuz.[10;283]

If you want to achieve your goal,

Compos Joddai shar'i Muhammad

In this by te,that is, if you want to achieve the original goal, the Prophet Muhammad (s.a.v.) says, follow the path of sharia.

In the lyrics of Hazrat Navoi, a figurative interpretation of this issue is also given a wide place.This can also be seen in the following byte:

Shar'siz xoshok aro xoshokdekdur, ey hakim,

Ko'kka chiqsang jaybing ichra subhayi parvin solib[9;75].

It is like a haystack without a ball, O judge,

When you go up to the sky, you put a parvin in your pocket

In this verse, the poet describes the owner of the "prophecy" who ascended to heaven, even if he did not follow the path of the Sharia, as a trivial straw, and the rosary in his pocket as a poppy seed.Of course, such extraordinary things as flying in the sky and swimming in the water can happen to those who are not on the right way.

Or:

Shar'din ayru riyozatdin safo kasb aylagan,

Uyladurkim sof o'lur taskin bila murdor su[9,536]

It became a pure believer in the Shariat,

That's the decent thing to do, and it should end there

At this point, finding purity in riyadh, which is not prescribed by the Shari'ah, is interpreted as a ridiculous act, such as trying to purify oneself by purifying filthy, filthy water through the art of parables. The situation described in this verse may be found in other religious and philosophical teachings that do not belong to Islamic law.For example, in yoga, Buddhism, etc., as in Islamic sufism, there are practices similar to murakaba, riyazat.However, these actions cannot be a means of spiritual maturity in the true sense of the word, because they are based on the will and conspiracy of the servant, not as commanded in the Qur'an and Sunnah.Therefore, it is explained that in order to keep the nature given to man pure, he must follow the path it has ordained.According to Junaid Baghdadi, "only a person holding a holy book in his right hand and circumcision in his left hand can cross the path of the Sect(the path of Sufism)".

Alisher Navoi reads the title of the XXII Previous article of his epic "Hayrat-ul-abror" In the commentary on Iman, when you say, "Al-iman an tuminu billahi wa maloikatihi wa kutubihi wa rusulihi wa bil-yawmil-akhiri wa bil-qadari khairihi wa sharrihi", the meaning is not a word, and if the people of the outside say it is faith, the people **do not mean it**. The meaning of the poet is that the people of faith fly to the true essence of the soul "...*to fly to the river of divinity, to flutter a few wings in the air of an angel, to fly a few letters on a book, to run a few steps on the path of the apostle, and to stand up on the day of judgment, and to compose a taran*", -Sufism recognizes that the inner interpretation of the ideas of Islam as a doctrine, and as a practice, consists of the practical, spiritual upbringing and hardening of the Sufis.

Chapter XXIV The second article is entitled "On Islam ..." and it explains the five fards of Islam: the word martyrdom, prayer, almsgiving, fasting, and pilgrimage to the Ka'bah:

Far'budur ulki, deduk oni asl,

Qilmoq erur borchasidin o'zni fasl.

Maqsadi aslig'a shuru'aylamak,

Har ne aning g'ayri ruju' aylamak[10;98].

Far is such a thing, we called it the original,

It's time to dump her and move on.

The goal is to become real,

It's a strange thing to do.

Or:

Foni o'lub kimki niyoz ayladi,

Tengri ani koshifi roz ayladi.

Forig' etar bodiya qat' ahli mol

Ahli fano qat'ida bor o'zga hol.

Ne topib ul ne'matu nozi bila,

Oncha topib yuz bu niyozi bila[10;102].

Who needs a dead back ground

The discoverer of God agreed.

It saves the body of wealth

It's one thing to be a fan, it's quite another to be a fan.

What do you find?

Find out how much you know about this gift.

Huseyn Voiz Kashifi in his work "Futuvvatnomayi sultoniy" pays special attention to the etiquette of sufism, noting its features, qualities and practical direction.In particular, he writes: *The essence of the* Sect(the path of Sufism)*is three: rest (breath), step and generosity. That is, not resting on things that should not be said, not stepping on things that are forbidden to be done, striving for what is necessary.The status of the* Sect(the path of Sufism) *is embodied in four things: repentance, danger* (from sin and unlawful deeds), *jihad* (fight with lust*), patience* (expect a goal). *The rules of the sect are six: enlightenment, generosity, trust, contemplation, sincerity, closeness (trust).The forbidden deeds of the sect are six: abstinence from lust, wealth, lies, adultery, wine, and betrayal*[6;24]Here, Huseyn Waz Kashifi enumerates the special conditions and requirements set for the levels of the Sect(the path of Sufism);commands their execution, tells them to pay attention. Thus, once a Sufi is completely free from the requirements of the Sharia, he will encounter these statuses at the level of the Sect(the path of Sufism)and will have to fulfill them unconditionally. That is, he pays attention, first of all, to his words, deeds, manners and strives to be completely free from sins, to eliminate them, and to be honest.

CONCLUSION

From this it is clear that the Sharia is the first step to the heights of spiritual and enlightenment perfection, the foundation of the Sect(the path of Sufism).The limitation of any degree achieved without the Sect(the path of Sufism) and without it is reflected in both the views of Sufis and in Sufi poetry.Therefore, in both sufism and the literature under its influence, the view that "the Sharia is the torch, the sect is the way, and the truth is the destination" [11, 14] is a general and unchanging rule.

THE SKILL OF USING COMPARISONS OF A HUMAN AND THE BODY PARTS, AS WELL AS PSYCHOLOGICAL STATE IN THE STORIES OF ABDULLA KAKHAR

Shakhnoza Almamatova*

* Senior Teacher,
Candidate Of Philological Sciences,
UZBEKISTAN

ABSTRACT

The analogy serves as a basis for drawing scientific, philosophical, social, spiritual and enlightenment conclusions. Simulation is extremely important in the development of human thinking. This article discusses the skill of analogy and its role in the polishing of human speech, especially the skill of using analogy in Abdulla Qakhor's stories, based on the analysis of the stories.

KEYWORDS: *Native Language, National Values, Analogy, Speech, Language, Style, Style Of Speech, Artistic Creation, Linguistic Features Of Stories.*

INTRODUCTION

If we look at human activity, we will see that the mysterious world that surrounds us involves mastering things. This is, of course, through a grateful, unpretentious language. The whole mystery, potential, charm, subtle understanding and expression of emotions of our language is revealed through words. The external aspect of words is as important as the changes in phonetic structure and system, as well as the internal aspect of language units.

Semantic differences imposed on language units are distinguished by analogy, comparison, generalization. In a word, this mysterious world is transformed into certain concepts through analogy andcomparison.

The analogy is formed in the means of sight (external comparison), in the means of hearing (imitation of the image, the voice without seeing oneself), in thinking (simulation on the basis of generalization of inner similarities and features in things) and becomes stable. This means that the various symbols will become stagnant. They found their artistic expression in folklore and

later in written literature. The analogies reflect the spiritual world of people (a person). There is no family that does not compare its child (boy, girl) to some great person and seeks from him the aspects of greatness, and so on. The result is reflected in stable symbols of simulation. For example, a baby is purity and innocence; a lion is braveness, courage; wolf-courage, bravery, savagery, fox is cunning character; rabbit is cowardice; deer is agility, vigilance, etc. This way they reached the level of symbolism and began to be interpreted as a symbol. The term "ukhshatish" (see something similar with another thing) is formed by the verb "Ukhshamok", "ukhsha" - the accusative suffix of the verb "-t" and the action name on this basis (uksh + t) "Is an Uzbek word formed by adding the affix (ukhsh + t + ish). In this context, we can see Abdulla Kakhor's mastery of the use of metaphors in his stories.

Abdulla Kakhor's stories are thematically diverse. Uses different forms of simulation in creating an artistic image as required by the theme. In some places it resembles a human being, in other places it resembles body parts. For example, my old mother was born and planted a human being ("Mahalla", book 1, page 308). In the condolence of an old woman, the participation of the people of the neighborhood ends with the parable of the man who sows (usually the grain is planted in the ground without counting and sprouts beyond measure). When you think about it, there is no need to exaggerate everyone's services in this world. His identity (services and prestige) can be known in his absence by following the last path. This axiom is simply expressed by the phrase **"planted a human"**. What was said sixty years ago about the responsibility and spirituality of the neighborhood and the people who live in it has not lost its relevance today. The neighborhood and its role in social life is growing day by day. It is only to be praised that the clever creator foresaw the future.

The meaning of the term **"pigtail"** is clear to everyone: where, to whom it applies. The meaning of this word is similar to the appearance mark. There is a symbolic aspect to its application to the inner and outer world of people:Kamolkhanov, waiting for the answer to his request, yes, the phone rang while he was a pigtail as a question mark. ("Two halves one single", book 1, page 149). The combination of "being a pigtail" reveals the clear faces of the flatterers. Again, it is clear that there is no difference between a flatterer: a person flatters without a choice and then takes it back. It is clear that man has no value for him (the flatterer).

Sweat is a clear liquid that comes out of the body (sweat glands). Sweat glands sweat from the body in different situations. Its natural state is associated with an increase in body heat. In most cases it is a stressful process of the body. Tension can be both physical and mental. Mental stress is the result of intense fear (something - from an event, the image of a demon, death, a graveyard, the darkness of a lonely place). Abdulla Kakhor likens this situation, the fear of the cemetery, to **cold sweat**. In most cases, cold sweat occurs on the exposed part of the body. The protagonist of the "Horror" story, Olimbek, gives a measure of how scared Dodkho is a cold sweat on his tongue. It was impossible to express his mental state by saying that he was so frightened,... especially when a prophet like dodho, who was over the age of a prophet and put his shroud in a box, thought he could get cold sweat on his tongue rather than death. ("Horror", book 1, book 42). The fear expressed by analogy cannot be overstated.

Let's look at other examples: But Unsin looked straight ahead with the energy of a person who is fed up with living ("Horror", book 1, page 44). The word courage is a lexeme that stands in a series of words that signify the emergence of the opportunity in itself in a synonymous nest, such

as zeal, courage, bravery, strength, power, perseverance. It occurs in such a way that it is the punchline of the course of events. He looks like a man who gave his life to make it more violent (there is another version of it as "an ox which is destined to die does not resist an ax"). This indicates the severity of the situation. Continuing the story of the tragedy and drying up the poverty, the plight of the poor is exacerbated by the image of Sotiboldi in the Horror story. This picture is depicted in a direct analogy: Every time he (the patient) groaned, Sotiboldi would panic like a person with a twist on his temple(head). ("Sick person (patient)", book 1, page 57). The sky is far away, the earth is in a difficult time, the sympathy of the patient-wife, the pain can not be expressed in a shorter, more beautiful way. The light nature in the story of Women creates the image of Umri through a very beautiful simulation. It doesn't make much of a fuss, but it's a joke that not all the women who did all the work during the Great Patriotic War are like in the brochure: various slanders were spread ("Women", book 1, page 266). To liken a slanderer to a thief pushed by a growd makes the reader think, even, that it is difficult to understand what the purpose is. In fact, the crowd is majority, the thief is one, and at the same time he has the right to be one of the crowd. There were many women left alone during the years of the Patriotic War. Among them are "thieves"for whomthey say there is no rice without weed. That is why the great Shakespeare said, "O women, be women! Do not overdo it, otherwise the charm will go away. It will be useless for you."

However, I wanted to show him the true face of Umri, saying that the mind of a bachelor is in the senses (in every eye) ("Women", book 1, page 265). This is the ingenuity of Abdulla Kakhor, his artistic invention. It is thought-provoking, it is playful. Will the mind be playful too? How is the mind in sight? It is known that the eye distracts people from playfulness. This will definitely cause a lot of mistakes. The likeness of the mind to the eye is also described as a sign that some young people do not think more deeply. At the same time, this wisdom has not lost its relevance today. The resemblance to human body parts was also very original: They are: beard, mustache, feet, palms, tongue and so on.

In the story "Grandfather Asror", he describes the grandfatherAsror's vigor in a striking analogy of overcoming his mental anguish: His age-inappropriate behavior, likening unusual walks to a beard grown on a young guy, is generally an emergency. At the same time, it is clear that grandfather Asror is not able to walk with vigor and speed. Here is another unusual analogy in another story, The Golden Star. It should also be noted that the purpose of some of the analogies used by Kakhor can be predicted: of course, either the writer is critical of the image, or the protagonist is not sympathetic to it (the image). For example, near the window (wagon window - our comment), a young man with a **reversely made brow**, who had just started to flourish, was singing a song to the wheel of a wagon ("Gold star", book 1, page 121). A mustache that has just started to grow is usually beautiful. But the character created by Abdullah Kakhor resembles the mustache which has just started to a reversly made brow. (Is the eyebrow made upside-down? If it is made like this, imagine what kind of beauty it is). At the same time, the writer's antipathy to the image is obvious. The **reversely made brow** of the "young man" with a mustache, which was set against the protagonist of the story, Akhmadjan, was an assessment of his character. It was more appropriate to give such an analogy than to give ling descriptions. War engulfs everyone, both the gentle nature and the whimsical.

The linguistic features of the author's stories show that he can be an example to all in the direction of modern linguistic research.

In the stories of Abdulla Kakhor, he used all aspects of the meaning of the word appropriately and showed the greatness of our language. For example, through the subtleties of the meaning of the word "side"('yonbosh' in Uzbek) both jokes in extreme conditions and represents a short-term decision: The opponent came to the side, now it is necessary to raise his head and hit him to the ground ("Gold star", book 1, page 226). "Side" is a term of pure national wrestling. The action in the fight is to make a sharp decision without missing an opportunity when it comes to the side, otherwise the opponent will balance himself. One attack is enough to defeat the the enemy, the victory is in the striker. It applies it to the enemy on the basis of the correct meaning of the word(side) in consumption.The significance of this analogy is that, in fact, the phrase is also used when the enemy is retreating. Such an analogy is exactly in line with the fact that life is applied in the main sense of the word.

The writer, who felt the whole existence of our people with a very delicate taste, meticulously, felt the national values of the people, the shame, the embarrassment, the shame, the honor, makes a wonderful analogy when he speaks with great care about the flaws that we encounter in our lives from time to time: There is such silence that this kind of silence is undescribable and occurs at a time when the name of the person who died in a horrific tragedy that is not encouraging to remember is accidentally mentioned ("Women", book 1, page 257). It is not uncommon in the work of any artist to liken the silence that is heavier than the silence of a great tragedy to that of the tongue does not move. Such an analogy can only be found in an artist who is virtuous, dignified, honorable, and knows his honor.It was a heavy silence, an unspeakable silence behind the front, an unspeakable, unspeakable silence of some women who were indecent and light-hearted where the lands went to the front.

As noted above, the title of each story informs the events described in it. For example, in the story "Horror" the events are described more horribly than in the title. In doing so, the writer makes appropriate use of analogies. In the analogy, he uses the "-day" (as, as if), an Adverb forming suffix: The fire roars in a rush, the smoke in the wind flashes in the red light of the mixed flame, darkness flickers, and nearby boulders move, as if someone is taking out the sand ("Horror", book 1, page 47). Imagine the psychological state (fear state) that is going on in the person. Olimbek Dodho's house, the treatment of people in it, forces the protagonist to go to the cemetery "heroically" in the middle of the night. Going to the cemetery during the day is scary for one person. He went boldly in the dark of night, but he (Unsin) panicked, as if someone were lifting the earth (grave). The reader who reads this will also panic. It is true, the resemblance to a graveyard, a grave, exists elsewhere, but the panic that raises the soil of the ground is unique to Abdulla Kakhor.

The analogy created by the writer is felt by the reader to such an extent that it is as if he is experiencing the situation himself. The power of such emotional-expressive influence shows how expressive our mother tongue is.

ABSTRACT

Linguoculturology also has a special terminological apparatus in accordance with the specific object of study, goals and objectives, which demonstrates the ability of this paradigm to work independently. These include cultural sema, cultural background, cultural concept, cultural heritage, cultural tradition, cultural process, cultural environment, linguocultural paradigm, mentality, mentality, cultural tradition, cultural fund, type of culture, cultural language, cultural institution, cultural value lingvokulturema, cultural text, cultural context, cultural context, subculture, linguocultural paradigm, precedent horses of culture, basic horses of culture, cultural universality, cultural competence, ritual, tradition, cultural sphere, civilization, linguistics, etc. have a special place.

KEYWORDS: *Terminological, Mentality, Mentality, Cultural Tradition,*

INTRODUCTION

National-cultural sema (the category of national-cultural sema is often used as an alternative term to the concept of cultural sema) occupies a central place in this terminological apparatus system and shows that linguoculturology is a linguistic paradigm. "Cultural sema is a small and relatively universal semantic unit, a semantic sign, relative to the word. For example, the following cultural semantics can be distinguished in the words samovar, lapti, shchi: lapti - Christian shoes woven from a ticket; samovar - a pot of hot Russian tea; Shchi is a Russian dish made from shredded cabbage. " Hence, it is clear that the cultural sema indicates the national identity of the meaning of the word. In this sense, the Christian semaphore in the sense of the above lapti cannot be replaced by the Uzbek peasant word: in the form of a farmer's ticket-knitted shoes. It is not clear what nationality the word belongs to - it

undermines the cultural background. The semantics of "Russians" in the semantics of the word samovar and "Russian food" in the semicolon have the same character.

It should be noted that it is not possible to translate proverbs, idioms and sayings from one language to another. Because they are the wealth of a people or a nation formed over a long period of time, and it is in them that the national mentality, the attitude to existence, becomes clear.

All the meanings of words that exist in the Uzbek language, say, are not alternatives in the Russian language, are evaluated as national-cultural semantics in the process of comparison of the Russian and Uzbek languages. We are convinced of this on the basis of the fact that the translation of Uzbek words into Russian is given with a phrase:

AVZH 1 highest point; 2 is the highest note in the melody.

AVRA-ASTAR top and lining

ABRAT is a part of the body (for men - from the waist to the knees, for women - from the hands to the neck and from the neck to the feet), which, according to Sharia, should be covered;

AVRATPSh clothes that cover parts of the body, according to Sharia, should not be exposed

BEVA-BECHORA 1 widows and orphans; 2 deprived of help, in need

BEVATAN 1 homeless, homeless, shelter, permanent place of residence 2 homeless

BEDANAVOZLIK passion for quails and quail fights

BEDAPOIA clover or alfalfa field

BEDONA 1 seedless grape variety; 2 local goat leather.

BEIGE not in place

BEZAVOL 1 who does not know the sunset; 2 not knowing decline, eternally enlightening

DO NOT lose the hunt; feel disgust

VALAKISALANG is an extremely careless, lax person

VANFILLAMOĶ 1 to flow with a strong stream

VARAI puff pastry with meat filling, fried in oil

VASSA semicircular blocks laid across the main beams of the ceiling and forming the ceiling in buildings of local type

VATANLI having a house, a shelter; homeowner

VAT-BEMAXAL on time and at the wrong time; at a later time; when necessary

Apparently, their meanings are explained when translating words that exist in one language and are not an alternative in another language in dictionaries. Without giving an alternative, only the interpretation of the meaning, the description shows that these meanings are national-cultural meanings. It is true that some words can also be national-cultural words for multiple languages. For example, the words bevatan, varaqi, vasiqali, waqfnoma are available in, say,

both Uzbek and Persian-Tajik. These words are common to these languages, where the meaning is devoid of national character. For both languages, the meanings of these lexemes relative to Russian will have the status of national-cultural meanings.

Hence, the concept of national-cultural sema has a relative nature, which is manifested in the relation of language to certain languages.

In Uzbek and Russian, the words read and read are relatively alternative lexemes, and there are national and cultural differences in their spiritual structure.

"Explanatory dictionary of the Uzbek language"	Russian-Uzbek Dictionary	The national-cultural sema in the Uzbek language
1 Word, sentence, sentence, text, etc. to express in writing or orally the written form of. **2** Memorize a poetic or prose text. **3** Carefully analyze and review; to read. **4** Saying words or phrases that express the word or its specific meaning. **5** When used with some words denoting religious concepts, it means to say a sentence, a sentence, etc. in the presence of this word, to relate to it, to perform a ceremony. **6** portable "Speaking in your own language" (in relation to things other than the person). **7** To comprehend, to know, to comprehend, to comprehend a meaning from the appearance of a person or thing. **8** Study in educational institutions. **9** portable To make persuasive, misleading statements, to infuse into the brain.	**1** to know what is written **2** to know the inner world of peren according to its appearance **3** memorization **4** to exhort To teach **5** lessons	**3** Carefully analyze and review; to read. **4** Saying (cursing) the words or phrases that express the word or its specific meaning. **5** Used with some words to express religious concepts, it means to say a sentence, a sentence, etc. in the presence of this word, to relate to it, to perform a ceremony. **6** portable "Speaking in your own language" (in relation to things other than the person). **8** Study in educational institutions.

The 3rd, 4th, 5th, 6th and 8th meanings of the Uzbek word to read do not exist in its Russian equivalent chitat. It should be noted that some portable meanings in one language may also exist in an alternative lexeme in another language. Indeed, as mentioned above, there are cases when some portable meanings do not have a national-cultural character.We can see this in the read-read (Russian) pair. For example, the 9th meaning mentioned in the "Explanatory

Dictionary of the Uzbek language" ("persuasive, misleading words"), the 4th meaning in the "Russian-Uzbek dictionary" ("pand-nasihat"), 7– meaning ("to understand, know, comprehend, understand a meaning from the appearance or condition of a person or thing") 2 - as a meaning ("to know the inner world of a person or thing according to its appearance") - meaning ("memorization"). So, although these meanings are portable meanings, they cannot be assessed as a national-cultural semantics for the Uzbek language in terms of the comparison of Russian and Uzbek languages.It should be noted at this point that a particular meaning exists in one word, and its alternative in another language may not exist in the semantic structure, but may be present in another word. Nevertheless, these meanings can be national-cultural semantics.

ATTITUDES OF TSARIST AND SOVIET GOVERNMENTS TO ISLAM (ON THE EXAMPLE OF SCHOOLS)

Abdukhalikov Safar*

*Professor of the Military Technical Institute,
Doctor of Philosophy,
National Guard of the Republic of UZBEKISTAN

ABSTRACT

The article shows the similarities and differences between the attitudes of the Tsarist and Soviet governments towards Islam on the example of Muslim schools. They attended Otin-bibi's house. For example, According to the documents in P.P. Arkhangelsky's personal fund, in 1899 there were 1721 primary schools in the Samarkand region, where 373 girls as well as 14,175 boys attended. In order to implement this policy, Russian businessmen have tried to weaken the position of the people, the foundation of our culture - Islam, including Muslim schools, which have conveyed geniuses around the world.

KEYWORDS: *Freedom Of Conscience, Church, Decree, Islam, "Non-Interference", "Separation", Muslim Schools, Madrassas, Governor-General Of Turkestan.*

INTRODUCTION

In the former Soviet Union times, the decree of the Soviet government's of January 23, 1918, "On the Separation of Church from State and School from Church," served as the legal basis for Soviet law on state policy on religion and religious worship in ensuring the right to freedom of conscience on the basis of communist ideology and policy. The draft decree, prepared by a special commission, was entitled "On Freedom of Conscience, the Church and Religious Communities." V.I. Lenin changed the descript in name to "On the Separation of the Church from the State and the School from the Church." He also amended Articles 3 and 13 of the draft Decree. Therefore, the decree was later renamed in his name. The content of this decree was analogously reflected in the Constitution of 1918 in TASSR, and then in the decrees on the separation of religion from the state and the school from religion.

According to this decree, religious organizations were separated from the state (Article 1) and schools from religious organizations (Article 9). However, this policy in our country was initiated by the Tsarist government under the guise of a policy of "non-interference" in the separation of Islamic organizations from the state and Muslim schools from Islamic organizations. Because the real state was not the khanates, but the Tsarist government: its decrees and acts were real, and the Shari'a norms issued and recognized by the khanates that had been in force until then were recognized as illegal, that is, contrary to the laws of the Tsarist government. Hence, the Tsarist government's policy of "non-interference" in Islam meant their separation from the state through state law. When the khanates disappeared as a state, it was self-evident that its laws would not be recognized either. As the ruling state was the Tsarist government, its laws operated inviolably in all its places, including the metropolises. However, the Governor of Turkestan developed a special legal policy - the policy of "non-interference", which began the separation of Islamic organizations from the state. The administration of Tsarist Russia also systematized the norms of Sharia and custom in accordance with the colonial policy, as a result of which a number of systematized collections were created. And aan example for that can be the Tsarist government's legal measures against Muslim schools in Turkestan. Muslim schools have been its main source as an integral part of Islamic culture. Therefore, the Tsarist government began to dismantle Islamic culture in order to disintegrate the whole people of Turkestan and make them morally disabled for life by eliminating Muslim schools. Prior to the October Revolution, Muslim schools consisted of old and new schools and madrassas.

The old-fashioned schools, in turn, consisted of a primary school (literacy and religious instruction), a school, a workshop, and a daloikhona. Many of them were opened at the initiative of the people in buildings near mosques and cemeteries in towns and villages. The imam of the mosque or the muezzin was invited to teach the school. Muslim schools were considered places of enlightenment.

Wealthy people also opened private schools in their homes. For example, in 1901, the 47th fund of the Turkestan State Administration of Educational Institutions of the State Archives of Uzbekistan noted that 28 out of 142 schools in the old part of Tashkent were private. In 1875, there were 1709 schools in Andijan, Kokand, Margilan, Namangan and Osh districts, where 28,278 students were educated.

Almost all the boys were in school. Girls did not have to go to school like boys. They attended Otin-bibi's house. For example, According to the documents in P.P. Arkhangelsky's personal fund, in 1899 there were 1721 primary schools in the Samarkand region, where 373 girls as well as 14,175 boys attended. Or take another example: in 1908, there were 902 boys in 39 schools in Kokand and 188 girls in 15 otin bibi schools. There were also old-style Muslim primary schools in Central Asia, such as the Qorikhana and the Daloilkhana. In the first of these schools, most of the students were blind children, where the Koran was taught by heart. The study period lasted up to 3-4 years, as the kori-teacher dealt with the kori children individually. In 1908 there were 373 qorikhanas, in which 2306 qori studied. The second school mentioned above is called the Daloilkhona because they taught the Arabic book Dalail-ul-Hayrat. There were only a few such schools in the Fergana region, where 5 to 35 students were enrolled. In 1896, 5 auditoriums accommodated 36 students, and in 1908, 96 students. The korikhona and daloilkhana were in a special building at the expense of the vakf-income.

The Tsarist government pursued a policy of Russification in order to prevent the development of Islamic culture. But for the first time since the eighties of the last century in the Fergana Valley began to appear a new school – "sovtiya school". In the old-style Muslim schools, the khijo method of literacy, e.g., letter-to-letter teaching, was preserved, while in the new school, the sound method ("sovtiya method") was used. The new-style Muslim schools were linked to the Jadid movement that had emerged in the Russian colonies. The Jadids believed that the main way to be liberated was to enlighten the masses. The first school of the new method appeared in 1884 in the Crimean town of Bakhchisaray.

In the school opened by the founder of Jadidism, Ismail Gaspirinsky, 12 children studied four hours a day and were literate for forty-five days. For this reason, the attitude of the parents to school changed radically. The Usuli Sovtiya schools were first opened in Fergana in 1880-1890 by Tatar enlighteners. They came to be known as the 'nogai school' in the local vernacular. The schools of the new method grew rapidly: in 1908 their number increased from 30 to 63 in 1911. The number of students increased from 1,300 to 4,106. Along with "scientific religion", they also paid great attention to secular sciences.

There were also middle and high-end Muslim schools in the Turkestan region, known as madrassahs, which trained imams (chief priest), kozi (judges), and mudarris (teachers). They also taught secular sciences along with Islamic sciences. Madrasas were not only a spiritual culture, but also a center of defense and propaganda against colonialism. Let's look at the facts: in 1908, there were 204 madrassas in the Fergana Valley, where 7227 students studied. Madrassas are divided into small, medium and large madrassas depending on the size of the building and their income. Depending on the construction of the madrasa and the provision of the necessary funds, it was divided into khan, eshan and private madrasas.

In the second half of the 19th century, after Russia's bloody invasion of Turkestan, it set itself the goal of breaking Islamic culture, a process that continued until the present period of independence. In order to implement this policy, Russian businessmen have tried to weaken the position of the people, the foundation of our culture - Islam, including Muslim schools, which have conveyed geniuses around the world. The madrassas, as the center of Islamic culture, were also the "headquarters" of the defenders against the Russian invasion. For example, in 1868, on the orders of Kaufman, 200 mullahs were shot in the courtyard of the Tillakori madrasa. The Tsarist government also pursued a policy of "non-interference" in Islam, that is, it did not follow the path of persecution for fear of openly opposing Islam, but instead tried to undermine its status among the people by illegal means, as if ignoring Islam. The policy of "non-interference" allowed the tsarist generals to neutralize the intellectuals the mullahs of that time in solving military and administrative issues. If we look at the attitude of Tsarist Russia to Islam on the example of Muslim schools, we can see three periods of its policy.

a) Businessmen and generals of the Tsarist government were very hostile to Muslim schools in colonial Turkestan from 1860 to 1898, e.g. from the time of the occupation to the national liberation movement in Andijan in 1898 (historically known as the "Andijan uprising"), but the Muslim people's revolt (they are harmed by taking a series of measures in illegal ways).

By the decree of the Tsarist government of July 11, 1867, the Governor-General of Turkestan was established. The city of Tashkent has become an administrative center. In 1875, the "Department of Educational Institutions of the Turkestan region" was established under the

Ministry of Education of the Russian Empire. The case was postponed due to military and administrative issues in the country and difficulties in ideologically influencing the Muslim population. Governor-General K.P. von-Kaufman, School Affairs Specialist Together with N.I. Ilinsky, they began to develop policies to apply to Muslim schools. The Minister of Public Education, D.A. Tolstoy, in his plan to increase the number of primary schools in the colonial countries, put forward the following idea: Kaufman, on the other hand, took the Minister of Education's blind sale as the main idea in the "Plan for the Organization of Public Education and Training in Turkestan" submitted to the tsarist government in 1873: "The development of public education in the country must be in Russia's interests. But at the same time, the religious beliefs of non-students should be kept away from any aggression, and schools should not be strictly religious in nature. Co-education of local children with Russian children will help to eliminate the basic contradictions in the culture of non-native children, and the assimilation of the occupied territories will be of great benefit."

Kaufman chose a policy of 'non-interference' in Islamic culture. "All that remains is to follow the path gained in the treatment of all Muslims. That's the decent thing to do, and it should end there. According to Kaufman, attention must not be paid to Muslim schools because it was dangerous to close them by force, so they would close on their own without the help of the government. Therefore, he first abolished the administrative position, the chairmanship. During the khanate, the chairmanship was a position that controlled the performance of rituals, ceremonies, and whether parents sent their children to school. At the same time, the chairman would prosecute those who did not follow our traditions. After the chairmanship was abolished, most parents stopped paying for school on time and did not send their children to school.

By the 1980s, the Tsarist government's transformation of Turkestan into a raw material base had become an obstacle. At the same time, vakf property allowed Muslims to be economically independent. Therefore, Governor-General von Kaufmann also abolished the post of muta-vallibashi, as a result of which control over the vakf ceased and the looting of his income by the mutavalli increased. The colonialists immediately liberated the obscure lands from the vakf and established control over the inviolable foundations. In the 90's, many vakf lands were taken away under various pretexts. During the khanate period, documents such as vakf and grace were issued to formalize vakf lands. The khan's seal was exempted from the khan's tax. The colonialists, without realizing the difference between the two documents, demanded the seal of the khan from those responsible for the endowment, and declared the lands of the endowment to be illegal without the seal of the khan. As a result, madrassas became unprofitable and neglected.

In the time of the khanates, there was a position of control over the mudarris. Kaufman's dismissal of the post caused madrassa teachers to be indifferent to their work. All administrative positions were transferred to Russian officers. Only those who graduated from the madrasa were allowed to lead and teach as they do now. The judges, on the other hand, were approved by the county chiefs as illiterate and politically incompetent as possible.

The colonial policy of "non-interference" has justified itself in eroding Islamic culture. Kaufman was not limited to these administrative measures either. He raised the issue of reforming madrassas in line with Russian interests, in particular the teaching of Russian language and Russian history. Muslim-Tatars were appointed to this work. But the case stalled because Kaufman saw them as dangerous Islamic propagandists.

From 1890 to 1896 the position of special inspector for Muslim schools in the Turkestan region was introduced. V.P. Nalivkin, who was fluent in Muslim traditions and the Uzbek language, he was appointed to this position. He carried out many 'non-interference' measures in resolving the internal affairs of Muslim schools.

In 1896, control of Muslim schools was handed over to district school inspectors. The administration was in charge of the foundation.

b) In 1898, an anti-colonial uprising took place in Andijan. The government described the uprising as the work of extremist Islamic organizations, particularly Muslim schools, poisoned by "pan-Islamism". For this reason, members of all Muslim organizations, the names of eshons and the number of murids, the names and numbers of tombs and other sacred places were gathered in the office of the Governor-General of Turkestan. From this period, the second stage in the Tsarist government's policy towards Islamic organizations began: the mudarris, mullahs, and servants were elected only after a review of their political credibility with the participation of the district administration. And, after the election, it was approved by the academic leadership for being 'trustworthy'.

c) After the first Russian revolution of 1905, Russian businessmen began a third phase in their "non-interference" policies by tightening control over Islamic organizations in Turkestan. Repeated audit commissions were formed. Representatives of the Tsarist government were mostly wary of the new, emerging Muslim schools. They saw these schools as a way to develop Islamic culture and become a threat to Russia. Tsarist officials acted secretly for fear of forcibly banning the new-style schools. Initially, Tatar teachers were persecuted from January, 1911, demanding that the teacher be a representative of the people with the students. But they were replaced by local teachers. Thus new method schools emerged. When this policy did not work, they began to close schools of the new method under various pretexts, such as "lack of light" and "the building is helpless." These measures did not apply to older method schools. From 1911 onwards, the Tsarist government began to exert its influence on the internal affairs of all Muslim organizations. In Muslim schools, from academic work to student attendance, the necessary facts began to be collected.

Beginning in 1914, the issue of reconsidering the management of Turkestan due to World War II was raised. Commissions sent from St. Petersburg concluded that Muslim schools should be completely reformed in the interests of tsarism. However, the Turkestan administration of education opposed the reform of Muslim schools. Because the reform would strengthen the aspiration of the Muslim people to national unity on the basis of Islam. This was the main threat to Russia. Therefore, in 1916, the newly appointed Governor-General Kuropatkin took into account the above-mentioned social, religious and psychological situation in the suppression of the national liberation movement with a spear. The Russian Bolsheviks, on the other hand, accelerated this process not only from a political and ideological point of view, but also in the interests of colonialism. The legal policies of the Tsarist government on "non-interference" and the Russian Soviet government on "separation" were essentially the same. However, before the decree "On the separation of the church from the state and the school from the church," a number of state legal measures were taken, which served as a basis for the implementation of this decree. In particular, as early as October 26, 1917, the Decree "On Land" adopted at the 2nd All-Russian Congress of Soviets, all lands, including vakf lands, were confiscated as public property.

On November 2, 1917, the Council of People's Commissars adopted the "Declaration of the Rights of the Peoples of Russia." It proclaimed the equality of all religions, all citizens, regardless of their religious beliefs. On November 20, 1917, an appeal was made to the "Muslim workers of Russia and the East." In particular, it says: "Your religion and customs, your national and cultural institutions will henceforth be declared free and inviolable. Enjoy your national life with freedom. You have the right to do so. Know that your rights, like the rights of all the peoples of Russia, will be protected by the full power of the Soviets of Workers and Farmer Deputies, which are the organs of the revolution."

The attitude of the Soviet government to religion was further clarified by the decrees of the All-Union Central Executive Committee and the Council of People's Commissars of the RSFSR of December 18, 1917, "On the Introduction of the Act of Marriage, Children and Status" and November 19, 1917, "On Divorce." Was becoming clear. Religious organizations began to be deprived of civil registration. They were replaced by a special state agency in the local Soviets - the Wedding Offices. Polygamy was abolished, and the strict ages of married boys and girls were determined. According to the decree of the Soviet government of November 24, 1917 "On the abolition of privileges of citizens and classes", the previous privileges of the lords and saids were abolished.

The legal policy of the Soviet government "On the separation of the church from the state and the school from the church", by its very nature, deepened and masked the colonialism of our country and our people. The decree repealed any law, decision, or measure that forcibly deprived any citizen of the right to believe in any religion or to believe in any religion, or to deprive him of the right to believe in any religion; any information on whether or not a person belonging to a religion was removed from all official documents. The equality of all religions and believers before the state and the law was strengthened as a political and legal status. Freedom of religion was allowed, which did not violate public order and could not be continued by violating the rights of citizens. The main purpose of the decree was to separate the church from the state and the school from the church, which created the socio-political conditions for the implementation of freedom of conscience. As a result, religious organizations were deprived of the right to compulsory religious education for children. The provisions of the decree were guaranteed only after the official authority of religious organizations over the people was abolished.

The decree clarified the principle of freedom of conscience, the rights and duties of believers, the legal and property status of religious organizations, the relationship between state and religious organizations on the basis of proletarian class. Due to this act, religious oaths in state, public, religious, legal organizations were abolished. However, in the implementation of these rules, many articles of the decree were not fully implemented and were not followed. On the contrary, the rights of believers and the activities of religious communities were gradually restricted and measures were taken against them. In particular, people were deprived of religious education and training. The property of religious organizations was gradually declared the wealth of the people and taken over by the state. At the same time, some buildings and related worship items were left free for use to demonstrate the "populism" and "fairness" of the decree.

If we consider that the historical life of the peoples of Uzbekistan from the second half of the 19th century to the present day consists of colonial and independence civilizations, e.g. civil societies, colonial civilization consists of two stages - Tsarist Russian colonialism and Russian

Soviet socialist colonial civilization. The common denominator between them was that Russian colonialism was secured. Historical facts, therefore, show that the political and legal relations of the Tsarist autocracy and the Russian Soviet government to Islamic culture have one thing in common - to break Islamic culture by separating Islamic organizations from a legitimate state. This policy of "non-interference" or "separation" revolved around Russian colonialism, nationalism and chauvinism. The essence of the differences between the two stages of colonial civilization lies in the fact that the cultural beings that form their basis, including the political and legal systems, differ from each other. These differences also determined their political and legal tendencies. For example, the policy of "non-interference" of the Tsarist autocracy was carried out within the framework of pure Russian nationalism, not against Christianity, but against Islam. Christianization and Russification were the original goals of the Tsarist government. The Bolsheviks' policy of separating religion from the state was pursued in the interests of the Russian poor, in the colonial regions of Russia, including Central Asia, by subordinating the Russian proletarian class to Russian nationalism in general. It is obvious that the legal treatment of religious life was different in different systems and civilizations. This is due to the fact that legal processing of religious life is also carried out in terms of value. According to Our colleague, Doctor of Philosophy Kiyomiddin Nazarov, certain values change with the change of certain social systems. In particular, it is true to say that socialist values have fallen from the stage of history with the advent of the socialist system. Also, the legal processing of religious life depends on the types and levels of understanding of social life. The epistemological basis of the tsarist government's legal policy on Islamic culture was the idealistic understanding of society, the socio-philosophical basis of the Bolsheviks' legal treatment of religious life was the materialist understanding of history. As a result, the differences between these concepts served as the epistemological basis of the differences between the "non-interference" and "separation" policies and legal measures of the Tsarist and Russian Soviet governments.

Also, an analysis of the Tsarist government's attitude towards Islam and the Soviet state's religion shows that legal laws were enacted by the ruling state. Their "branches" in the colonial countries (for example, the legislative and executive branches of the USSR) were only engaged in their implementation on the ground.

This legal process and turmoil lasted until August 31, 1991, when our independence was declared. In the next paragraph, the analysis of the negative consequences of ensuring the rights of citizens to freedom of conscience in the socialist era alone shows that this process was dominant.

PSYCHOLINGUISTIC APPROACH TO SPEECH ACTIVITY IN MODERN LINGUISTICS

Alpanova Shirinxon Hakimovna*

*(PhD) Lecturer,
Doctor of Philosophy in Philology,
Department Of Uzbek Linguistics,
Andijan State University,
UZBEKISTAN

ABSTRACT

The article discusses the psycholinguistic aspects of speech activity. Views on aspects of communicative behavior related to the national character, as well as its relation to human psychology and physiology, were evaluated as an anthropocentric approach to the language system.

KEYWORDS: *Psycholinguistics, Internal Speech, Logic, Consciousness, Thinking, Cognitive Linguistics, Text, Pragmatics, Discourse, Interpretation*

INTRODUCTION

The interrelationship of linguistics and logic is that both are related to thinking.Language, which is the object of study of linguistics, interacts with thinking. Language is a means of conveying and shaping people's knowledge and thoughts about the universe. Since language and thought are in a dialectical relationship, there is a similar relationship between the linguistics that studies them and logic.

Learns the laws and methods of forms of logic-thinking. It ensures that the human mind is clear, distinct, consistent, and grounded. Therefore, logic is directly related to the grammar section of linguistics will be in touch. Because if a concept is expressed through words and phrases, an idea is expressed through speech. While the forms of logic are concepts, conclusions are common to all peoples, their forms of expression in different languages are diverse. This shows that logic and language are interrelated, they complement each other.

Analysis and results

Language is the most important means of human communication, the means of preserving knowledge and transmitting it to future generations. Given these functions, language is a social phenomenon. Because it serves the community. Second, language of a social nature is materialized on the basis of certain physical and physiological processes. Third, language and thinking are inseparable. Language is a material means of forming and expressing thought. In this respect, language and thinking take on a certain form. In this sense, linguistics can be included in the system of logic, psychology. Hence, language and thought are inextricably linked, and just as language cannot express thought without thought, language without thought cannot form its own expression. Just as language is unique to human beings, thinking is also unique to humans and is related to the materiality and physiological function of the brain. But it is a mistake to think that thinking and language are exactly the same thing. Contemplation is the highest form of reflection of the external material world in the human brain. Language, on the other hand, expresses thought through words and phrases and sentences. The laws of language and the laws of thinking are not equal. The relationship between language and thinking is a complex process. Both language and thought are formed in the process of labor, in the society of the individual.

Language plays an important role in human life. All human life is connected with language, and with the help of language people have the opportunity to communicate with each other. At the same time, human language is extremely complex and contains contradictory qualities. Language is the most important means of communication in human society and serves as the main means of preserving and transmitting from generation to generation all the cultural and scientific riches created in the course of long historical development of mankind. does.

In the history of linguistics, there have been various theories and currents in the study of the most important issues such as the nature of language, its social significance. A. Schleicher conducted scientific work on the nature of language, the biological nature of language, G. Paul on the fact that language is an individual phenomenon only, B. Wundt on the relationship between folk psychology and language. [1.17] allows characterization as an event. In general, language as the most important means of interpersonal communication is inextricably linked with society and all its members, who use language extensively and comprehensively in its culture, life and work. This function of language in society cannot be deeply understood without understanding its relationship to society, human consciousness, and the ability to think, the language system, its units, and its categories. People interact, interact, understand each other, expressing their thoughts, desires, intuitions and spiritual experiences. The function of language as a tool of communication in society is its communicative function. In addition, language performs an expressive and accumulative function. Language arose out of the need to interact with other people. The fact that this need is related to changes in people's social spheres and human activities is reflected in language, primarily in the lexical part of the language. This means that language is not a natural and biological phenomenon, and the emergence and development of language is not subject to the laws of nature. The social nature of language requires its existence in society, not in the individual. Language is created by society, and its destiny is closely linked to the destiny of society. Cognitive activity is the process of thinking that makes a person perceive something or reality. One of the important theoretical aspects is that it is possible to analyze the relationship between language and thinking in conjunction with the concepts of

national mentality and national culture. [2.6.] The introduction of the category of "language owner" in the scientific paradigm requires the further activation of such concepts in linguistics as personality, linguistic consciousness, thinking, activity, mentality, culture. [3.5]

According to I.N. Gorelov, K.F. Sedov, psycholinguistics is the core of the anthropocentric direction in linguistics. [4.4]

The phenomenon of speech creation has always been an issue for linguists. There is a lot of research on this topic today. It can be said without exception that the factors of formation of the theory of speech creation as a separate direction depend on the separation of language and speech phenomena. The distinction between language and speech by F. de Saussure has influenced the concept of "speech activity" in psycholinguistic research. According to Leontev, F. de Saussure explained speech activity as a unit of language and linguistic ability. L.V. Shcherba, on the other hand, considered speech activity to be a generalization of the processes of speaking and comprehension. [5.21] According to ES Kubryakova, it was LV Shcherba who distinguished speech related to linguistic phenomena, its real basis and the product of the speech process. [6.9] AA Leontev described speech activity as "non-verbal subjective codes of speech sentences. Programmed through". [7.25] ES Kubryakova emphasizes that under the term of speech activity it is necessary to understand all the phenomena related to the creation of speech and its reception. It is clear from the definitions given to speech activity that it is sometimes interpreted as a static event (e.g., text) and sometimes as an event in action (e.g., speaking and hearing). Although these scientific definitions of speech activity differ in many respects, they all reflect two factors, namely, the activity of the speaker and the listener.

This means that speech activity is primarily an anthropocentric activity. The relationship between language and thinking is one of the most pressing issues in the theory of speech creation.

The connection of the process of speech formation with thinking is reflected in the schemes called "speech creation model" in psycholinguistics. In almost all of these models, the concept of "From thought to meaning, from meaning to word" put forward by LS Vygotsky was reflected. [8.10] According to LS Vygotsky, the idea must go through several stages before it can become speech. The scientist's idea of the "inner word" had a great influence on the development of ideas about inner speech. The inner word is an image in the human mind that appears in inner speech, a symbolic symbol of associations. It is he who can be a tool in the transformation of inner speech into external, natural speech. He interprets the process of transformation of thought in inner speech into words. developed by linguists and has a strong place in psycholinguistic research. Among the views on speech thinking, Yu.N. Karaulov's views on the intermediate language are unique. He asserted that "intermediate language is the mediator between the language of the brain (i.e., the language of neurons) and the language of man, which has a biological, physicochemical nature." [2.72]

The realization of inner speech as external speech is illustrated in the following example:

Asadbek looked at his wife, who was standing on the threshold, hoping that he would "rub the good news." "Speak quickly!" Said an inner shout, "No, keep quiet!" Said another voice. The couple stared at each other silently for three or four breaths. But in Asadbek's eyes, seconds passed like clocks. Involuntarily: "Speak!" He said. However, he did not hear his own voice.

Even his tongue rumbled as if frozen. It was as if Manzura had heard that voice disappear. He could not speak. "

Asadbek could not find any expression in the current of conflicting thoughts in his mind, because it was about his lonely, beloved brown-kidnapped daughter. Finally, he gathered all his strength and summed up all his questions in one word:

"Asadbek tried to catch himself:

- Was it found?

Manzura nodded and cried as if to say yes.

"Is he alive?"

Asadbek himself did not know why he asked that.

"Thank God he's alive ..." Manzura bit her lip.

That word gave Asadbek his life back. Shart got up, approached his wife, grabbed her by the shoulders and shook her:

"Then why are you crying, why are you panicking?"

Manzura bowed her head and cried. Asadbek, a man who had never beaten his wife, did not even notice that he had slapped her.

"Speak, I say!"

That applause was enough for Manzura to catch herself.

"I'm going to die ... your daughter ... I can't tell you, father ..."

"Speak, as if I'm suffocating," Asadbek's voice was threatening, it didn't sound like a threat.

"Your daughter was abandoned in one condition ..."

Asadbek is unable to continue the conversation. He was bent like a father, his heart was broken, he was helpless.

"Asadbek understood what he was saying. "It would have been better to kill him," he said to himself. "It's not just a coincidence. Someone stabbed me with an impenetrable knife. It was done by someone who wanted me to taste the pain of a dog until I died. Knowing revenge. He couldn't enjoy it when he was going to kill me. Now he wants to see me in pain and enjoy ... No ...he counted the dumplings raw. Can't enjoy it. I can pull out my heart and chew it myself, but he doesn't see the spark of pain in my eyes. If this calls me to fight, then I will fight !! " [10.29]

One of the psycholinguistic features of the text is interpretive is calculated. According to V.P. Belyanin, each recipient can have his own interpretation of a particular text. The nature of the interpretation that results from text comprehension depends not only on the psychological nature of the text, but also on the recipient. The closer the author and the recipient are psychologically, the more appropriate their interpretation of the text will be. [9.8]

CONCLUSION

Texts that reflect a person's state of mind show that their syntactic and formal structure and the nominative units needed to create a text are determined by the nature of the emotion expressed in the text - the compiler tries to use words, sentences and tone that correspond to that emotion. This is one of the important psycholinguistic features of the text, as V.P. Belyanin pointed out.

ABSTRACT

This article reveals the achievements of science, culture and architecture in Herat, including the construction of architectural monuments, specifically mosques during the reigns of Amir Temur and Temurid rulers ShahrukhMirza and Sultan Hussein Boyqaro.

KEYWORDS: *Khorasan, Herat, Hafiz Abru, Palace, Hissar, Mosque, Shahrukh, Hussein Boyqaro, Feruzshah, Alishernavoi, Ustodshamsiddin, Khandamir, Urban Planning, Jarib, Ganj, Painting, Sangtarosh.*

INTRODUCTION

The brightest works of the architectural genius of the Timurid period are grouped in the capitals of the state, in the large centers of the country, in the places that are sacred shrines. Hafiz Abru wrote about one of such cities, Herat: "Khorasan, especially its capital Herat, despite the efforts of several great kings to build it, flourished and prospered during his (Shahrukh's)happy reign"[1]. While the architecture of Timurid cities is a symbol of its social existence, their castles are an expression of state power. Palaces were the brilliance of the authorities, Islamic religious buildings symbolized the Muslim ideology, market buildings were the result of handicrafts and trade, the development of densely populated neighborhoods was the life and blood of a complex urban organism. Although according to the study of the architectural solution of the city of Herat in the XIV-XV centuries the experience of previous centuries were taken into account, it also gave rise to new urban planning ideas arising from the general development of architectural theory and practice in the east and it served as a prominent school to identify historical cities of Timurid Period [2]. The city citadel of Herat was inherited from the previous period, and fortress was consolidated by Shahrukh in AH 807 - 1405 A.D, he tried to give a look of constructed rectangle to the citadel (area is 1300x1350) [2]. In Herat, the fortress was located in the center and faced to the city gates, being intersected at the fortress, main streets served as arteries of the

movement, which passed along the main direction of the caravanserais and the main market was also located in the fortified citadel. The architectural buildings around the city were placed more freely than in Hissar, allowing the architects to implement the most precise design while creating architectural ensembles subject to a strict planning system. In the fifteenth century, attempts were made to reconstruct the main roads of Herat with architecturally symmetrical directions by making parallel and sometimes intersecting streets, but the general plan of the city streets or neighborhoods still included an integral and important part of system – parks. In the context of soil density and population growth in the inner cities, the issues of urban beautification required a number of ambitious tasks. The walls of cities such as Herat, Marv, Shakhrisabzwere covered with construction materials, such as clay, sometimes baked bricks, for example, as in the fortress of Ikhtiyoriddin in Herat. With that in mind, Herat was one of the most beautiful cities in the east during the reign of the Timurids. The study of the physiognomy of cities during the reign of Amir Temur and the Temurids was mainly studied by several researchers in the twentieth century, the plan of 15th century Samarkand citadel studied by – M. E Masson, the 15th century Merv's plan by – O. V.Obslchseko, the fifteenth-century Herat's plan was studied by G.S.Pugachenkova [2]. The accomplishment of city planning and improvement of Herat, continued to be fulfilled successfully by Sultan Hussein Boykaro, who ruled for almost forty years after Shah Rukh. Architecture during the Timurid period, as well as a number of socially useful structures, are associated with the names of noblemen deputies such as Amir JaloliddinFeruzshah, a high-ranking official during Shahrukh's reign. Later improvement of Herat and its environs is associated with AlisherNavoi, who served as prime minister for several years at Husayn Boyqaro's court. AlisherNavoi's high position in the state created ample opportunities for intensive construction work. His name is associated not only with the construction of mosques, palaces, madrasas, and mausoleums–but with other beautiful monuments that laid in harmony with them. At the same time, many recreation facilities, baths, caravanserais, bridges were built during this period, and many privileges were given to the common people [3]. Among the many buildings in this city, mosques are of special importance. Khandamir's works contain a wealth of information about the development of Herat and its districts and other cities of Khorasan during the reign of the Timurid sultan Hussein Boykaro (873/1469 - 911/1506) in the last quarter of the 15th century - early 16th century. He provides a complete list of religious buildings, unlike his predecessors. In addition, information about the construction of a particular building in the works of Khandamir, first of all, the construction of domes and roofs, is supplemented by information about other creative works, taking into account the mistakes of previous historians. Sultan Hussein Boykaro and his Prime Minister AlisherNavoi played an important role in the construction and reconstruction of mosques and religious buildings, which are among the most important architectural structures in the city of Herat.

It is preferable to study the mosques built in Herat dividing in two groups:

-To the first group-mosques built before the reign of Sultan Hussein.

-To the second group- mosques built during the reign of Sultan Hussein.

Mosques belonging to the first group include the following. Herat Jome (Friday) Mosque. It is the most luxurious mosques among all in Herat and has been preserved to this day. Construction of the mosque was begun around 1174-1175- / 1206 by Sultan Shahobiddin, and later the

construction of the mosque was continued by Sultan Shahobiddin's brother [4]. However, due to the endless wars of the Khorezmshahs, the construction work was not completed. The construction of the mosque was completed during the reign of Sultan Ghiyasiddin Mahmud, and during the invasion of Genghis Khan (1206-1227) the mosque was destroyed. It was rebuilt by Malik Ghiyosiddin Kurt after the period of Mongol rule. The decoration of the mosque continued after his death. His son Malik Mu'iz al-Husayn continued the restoration work, the mosque was again destroyed due to the strong earthquake and the rash acts of Giyosiddin Ahmad's son KhojaMajiddin Muhammad, after which it was rebuilt thanks to the efforts of Alisher Navoi [5]. At the same time, Navoi, in consultation with experienced and noble engineer builders, erected verandahs on both sides of the main building of the mosque. The mosque was renovated for two years (from April 23, 1496 to May 23, 1498). Informing about the repair work, Khandamir said that AlisherNavoi visited the construction site every day, and along with these details, there were also information about the raw materials used for the reconstruction. The mosque is said to have been covered with plaster and there was information about a marble pulpit brought from Hawaf. In addition, the total number of unknown artisans involved in the restoration of this mosque is stated to be one hundred. Among them were skilled engineers, glassblowers, painters and stone carvers, and the name of only one of them, the stone carver - Master Shamsiddinwas scribed. At the present time, the arches of the mosque have been demolished and the verandas have been preserved. The mosque is decorated with skillfully drawn paintings. After the roofing work was completed during the repair, special attention was paid to its reliability, and after long discussions, it was decided to cover the roof of fourteen jarib[1] with two layers of material prepared by masters and mix the top with mashed clay with straw. The mosque has verses from the Qur'an written by MirakNaqqash, a unique calligrapher of his time.

In addition to this mosque, the list of magnificent buildings also contains information about the restoration of other mosques built in previous periods, and Khandamir noted that the restoration work was completed due to the efforts of Alisher Navoi.

In addition to these mosques, several other mosques have been renovated. These were: Amir Feruz Shah Mosque(The Friday Mosque is one of the most beautiful structures built during the reign of the great noblemanAsafJaha, restored by HojaAfzaliddin Muhammad); Ziyaratgah Mosque, the site of which belonged to the ancestors of SahibkiranJamshid, was built three centuries ago by Amir Abdul Wahid ibnMusamma; The mosque in Sheikh Jaushbi Bazaar was built during the reign of Temur and was renovated during the reign of Sultan Hussein Boykaro.

The mosques of the second group were built during the reign of Hussein Bayqara, and were not only Jome mosques (Friday Mosques) but also localquarter ones. The mosques in the second group are as follows: The SaripulInjil Mosque was truly a magnificent building, a unique structure, on its north side a beautiful building of Darul-Haffuz (Hause of Quran reciters) was built, the walls and ceilings adorned with gold; TilKatiyan Mosque; Sari KuchayiUlugota Mosque; Sari Kuchai Amir Islam Barlos Mosque; Chaharsuk Mirza Ala Daula Mosque – a mosque built not far from the Palace of Jahonnoma; Kalandaryon local mosque [3], BoghiZaghan mosque; Torkhonyon local mosque; Mir Odil local mosque; Friday Mosque in Pul Card; Pul Kard Ziyaratgah (Eid) mosque; Old Bahr Mosque; Isfizor Friday Mosque; mosque built in Gure; Iyidgoh Jom'e(Friday) Mosque; Mosque in the village of Fushanj [9]; A mosque in the village of Seraxs; Karat Turshiz Friday Mosque; Astirabad Jome (Friday) Mosque; Mir Alisher Jome Masjidi; Herat Friday Mosque (it is connected to the Grand Friday Mosque); The

Murgani Garden Mosque was located in front of the Murgani Garden. AlisherNavoi, as soon as the building construction of that beautiful mosquewas finished, confirmed Hodja Hafiz Muhammad Sultan Shah as its imam, who was one of the sheikhs of his time who recited the Qur'an very well, and the people gathered in the mosque to pray five times a day; The mosque behind Darby and Iraq was built by HodjaAfzaliddin Muhammad Kermani, the minister of Sultan Hussein of Herat; Darby Hush FridayMosque; Built by Ghiyasiddin Muhammad Baghban outside the city of Herat; the Balkh mosque builtoutside Herat, by JalaliddinQasimFaranhud, who served as Sadr and Wazir for some time; a mosque built by Amir Muhammad, the eldest son of Amir MubariziddinValibek, near the Rizavia Garden in Mashhad; The mosque in Kandahar which was rebuilt by Amir Shujayiddin Zulnun Argun and his descendants and others [6].

CONCLUSION

In conclusion, the city of Herat developed in all directions during the reign of Amir Temur and the other Temurids. HafazAbru wrote about Herat: "If you are asked what kind of city is good, answer as Herat. The world is the sea, Khorasan is the pearl shell here and Herat is the pearl of this shell." Architectural structures, especially mosques, are considered sacred shrines of special significance throughout the Muslim world. With this in mind, it can be said that during the reign of Amir Temur and the Temurids, special attention was paid to the construction of mosques.

ABSTRACT

World is moving from socialist to capitalist's mode of economy with an objective of fostering development with unabated pace for which nations are searching alternative approach of development. New institutional economics (NIE) is one such approach that has emerged recently which addresses issues of economic growth from a wide range of perspectives such as political, cultural, legal, behavioral and social. The present-day NDA Government in India, led by Shri Narendra Modi is an epitome of this. This paper is exploratory and attempts an in-depth analysis of how the Modi Government has positioned the Indian economy on the trajectory of institutional development. His government has created both formal and informal institutional framework for creating, regulating, transforming markets and auguring the economy. In fact, Modi government plank for institutional development is aimed at fostering the mission of sowing the seeds of capitalism and India's growth take-off.

KEYWORDS: *New Institutional Economics; Institutionalist Political Economy; Neo-liberalism; Douglas North; Modi Government; Institutional Reforms.*

1.1 INTRODUCTION

It has been a matter of great debate for long about the philosophical dogma required for the development of an economy at a fast pace. Development without philosophy ruins the country in the long run[1] and hence, pillars of development should be laid on strong philosophical dogma. Development philosophies, however, varies very significantly in their content and impact and India is also still exploring the best possible development philosophy and ideas. There is a dominant view prevailing world over that emergence of neo-classical economics just opposed to state interventions, provides to some the panacea for development. Neo-liberal economics views that if economy is opened for demand and supply forces, it will augment the pace of national growth. However, a contrary school of thought has also emerged which opined that nations differ with respect to the pace of growth and development despite having adopted the same neo-liberal economic approach. They felt that the laggard economies ignored building of institutions and organizations that are very vital for development[2]and hence, institutional economics approach emerged to explain this dichotomy of development.

Institutional economists felt that dearth or abundance of institutions creates difference between the growth trajectories of any two countries. Even in a country itself, growth trajectory may differ in different times and space due to the same reasons. In fact, the death nail to the state driven economic philosophy has led to the emergence of new institutional economics. However, Ha-Joon Chang highlighted some important limitations of the institutionalisms' views and substituted that philosophy with his "institutionalist political economy" (IPE)[3] The present paper tries **to examine the New Institutional Economic views and explores its linkages with the philosophy adopted by the present central government of India he**aded by Shri Narendra Modi.

1.2 The Objectives of the Paper are:

- To analyze the New Institutional Economic perspective
- To explore & assess the Modi government reform for institutional development

1.3 Plan of Study

The paper is divided into three sections. Section one introduces the theme of the paper. Section second explores the concepts and perspectives pertaining to New Institutional Economics (NIE). Section third is an extensive review of Modi Government reforms in the light of New Institutional Economics.

Section- 2

2.1 Concept of Institutional Economics

Today, we are living in a world which is fraught with numerous challenges and the biggest of all is: a world free of poverty. This can be achieved by building and deepening of competitive markets and making them thrive for growth.[4] This argument got incredible importance in neo-liberal economic literature. Neoliberal economists felt that State imbibes imperfect nature and hence, causes 'government failure'. In the State patronage of development, interested group creates immense pressure on the development authorities; crony capitalism and rent seeking

becomes an undefined rule and a collusion of politicians, bureaucrats, industrialists and business men emerges that distorts policies and programs. Here, State patronage and intervention in the development process was felt uncalled-for and an alternative theory of neoliberalism emerged in which the role of State was made restricted and role of market, however, invigorated.

Neo-liberal economic philosophy, however, has some limitations. Chang argues that market driven economy requires 'free market' defining of which would be a pointless exercise because no market is in the end free and entails market failure as well. For him "Market Failure" refers to a situation when the market does not work like what is expected of the ideal market. He equated 'perfectly competitive market' as ideal market of neoliberal framework.[5] So, an alternative approach of development emerged in the form of new institutional economics (NIE). David Harvey, Douglas North, Acemoglu, Johnson & Robinson pioneered this philosophy. David Harvey said that the '*human well-being can best be achieved by liberating individual entrepreneurial freedoms and skills within an institutional framework characterised by strong private property rights, free markets, and free trade. The role of the state is to create and preserve an institutional framework appropriate to such practices*.' (Harvey, 2005:2)[6]Douglas North defined institutions as the 'rules of the game of a society or more formally is the humanly-devised constraints that structure human interaction**.** They are composed of formal rules (statute law, common law, regulations), informal constraints (conventions, norms of behavior, and self-imposed codes of conduct), and the enforcement characteristics of both'[7].In the same way 'organizations' are also important factors for development. 'Organizations are the players: groups of individuals bound by a common purpose to achieve objectives. They include political bodies (political parties, the senate, a city council, a regulatory agency); economic bodies (firms, trade unions, family farms, cooperatives); social bodies (churches, clubs, athletic associations); and educational bodies(schools, colleges, vocational training centers,)'.[8]

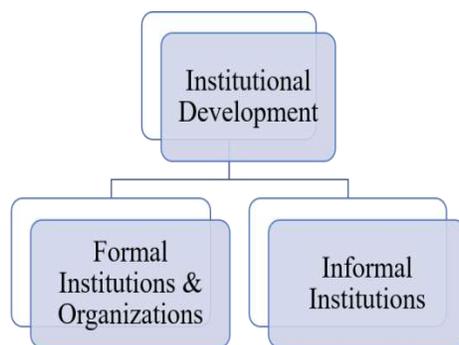
'Rules include norms of behavior and social conventions as well as legal rules'[9] whereas 'moral and ethical behavioral norms' are often embodied in informal institutions and informal institutions plays very vital role in determining formal institutions and in the operation of markets.[10] Growth-igniting and growth-sustaining institutions further are required for development and operations of market. Institutions should keep on evolving and the right kind of institutions are those that are able to pick up signals about needs and problems (information, feedback, anticipation of future problems) and balance different interests by forging agreements (transparency, voice forums for negotiations) by avoiding stalemates and conflicts and hence, protecting and nurturing them is most important. Because institutions govern behavior, when they are strong they are social assets, when weak they become liabilities.[11]

Institutions are essential components of a state because they are directly responsible for creating, developing and stabilizing, legitimizing, transforming and finally regulating market performance. In doing so, they develop a conducive environment for business. Even in the wake of relinquishing market activities of the state, the state still has an important function of regulation that is less provision of market functions and more of regulation. Similar views have been outlined by Mr Arvind Subramanium on the role of public institutions for promoting and sustaining long-run development.

Chang, however, argued that it is not institutions alone that transform the economy or development structure but it is 'institutionalist political economy' (IPE) which includes politics

and institution in its analytical core, plays significant role. For him, IPE is a "political economy" approach because; it puts emphasis on the role of political factors in determining state policy. He emphasized that market too has political nature and hence, just like analysis of state, political economic arguments should be implied on it also. [12]

The above description and conception of NIE and IPE philosophies bolsters the capitalist's economic system that restricts state role in economic development to its minimal. The theories do not rely on market development alone but development of institutions was thought more logical and proper. (Figure-1) The chronology of development in the philosophical dogma hence brings out a more scientific, more convincing and more authentic philosophical plateau that is accepted world-wide now as a panacea for just and fast development.

Figure 1: Components of Institutional Development according to NIE


Section-3

Movement for freedom of India was fought primarily on political pitch; however, it created a platform for conception of economic, social and cultural philosophies as well that India could pursue after getting Independence. A number of leaders were working on the second platform and Shri D.D.Upadhyay and Dr. B.R. Ambedkar were prominent figures amongst them. Development of the economy was paramount for both of them. Both of them came to the conformity with their deep knowledge of the society and researches they made in the area of economics that key and basic industries should be developed by the State itself. The NDA government is enamored by the thinking of these great philosophers, since its formation. Modi and his team accepted them as philosopher and guide[13] and tried to craft India into their footsteps. However, it is interesting to see that there are deviations from these old philosophies towards a more pragmatic and institutional regime. A closer look at Modi government policies and programs will provide further strength to the statement. It seems that a new approach of economics is in the offing.

3.1 New Institutional Economics & Modi Government:

On the platform of NITI AYOG on 26 August, 2016 Prime Minister Narendra Modi observed that 'there was a time when development was believed to depend on the quantity of capital and labour. Today, we know that it depends as much on the quality of institutions and ideas.'[14] It seems, Modi's stance in favor of this statement has crystalized from the Daron Acemoglu and James A. Robinson philosophy *Why Nations Fail* (2012). In fact, his vision is to augur the economy by institutional development and deployment as he knows well that institution creates, regulates and transforms markets.[15] It seems that Modi government is having conformity with the

growing recognition world over that markets—building them and helping them thrive—are essential to a world free of poverty[16] and state should not 'direct' the economy but *should* facilitate private initiative. It is apparent that **Modi's vision of development is much influenced by the new institutional economics**. Apart from competitive market and FDI flows, he holds that good institutions are key to economic success. In the last six years, his development philosophy has emerged as an amalgamation of the philosophies of Shri D. D. Upadhyay & Dr. B.R. Ambedkar on one hand and on the other; it very much reflects the philosophy of neo-liberalism and the theory of new institutional economics. Modi's philosophical dogma reflects a dynamic and shifting ideological faith & functions**.[17]** Slowly and silently Modi has molded the economy towards new institutional economics by accepting, adopting and translating the institutional changes in all areas of the economy to convert the economy in true sense a liberal, competitive and institutionally strong one**.** The entire gamut of vision, mission and formulation of formal, informal institutional and organizational creation by the Modi government are as follows that **establishes that Modi government is bending towards NIE policy.**

3.2 Institutional Development by Modi Government:

 Modi Government is treading on the path of institutional development supported with its philosophy, vision and aims of development (Table-1). This serves the twin objectives of *inclusive growth* as well as *transformation of markets and societies* at large. In doing so, the government has introduced a large number of reforms of economic interest. These reforms & institutional development can be categorized as under.

TABLE1: PHILOSOPHY, VISION & AIMS OF MODI GOVERNMENT

Philosophy & Goals of Modi Government	To make India '**Ekk Bharat & Shrestha Bharat**'[18]	Less role of State to play in economic activities and hence, Modi government talks about less government and more governance.[19]
Vision of Modi Government	Build a modern, prosperous and vibrant India - based on our (Indian) ethos and values.[20]	
Aims of Modi Government	Including everyone in the development process (Sabaka saath, Sabaka Vikash).	Converting Indian economy into a vibrant, modernand faster growing economy with inclusive growth that should be sustainable in the long run.
Insights Drawn	• Lowers Transaction Costs through: Creating less complex structures& by less governance. Government will become regulator & facilitator • Frees pressure of Elite Groups: It fosters inclusive growth & sustainable development • Social & behavioral approach is impacted through cultural & religious institutions in which values & ethos becomes important. It is suitable to India's culturally diverse & vibrant society	

(A) Formal Institutional & Organizational Reforms:

Modi government has enacted, modified and strengthened the policies and programs for development of formal institutions and organizations. This is being done by taking into consideration all the sections and sectors of the economy. Following well-knit and structured institutional arrangement has been created to augment economic activity, improve administration and governance and finally to achieve social as well as sustainable goals.

(I) Institutional reforms in policies & programs

Several reforms have been made to existing policies and many new programs have been initiated across all the sectors of the economy and they are mapped as under:

1. Cultural & Tourism Development:

Institutional arrangement has been initiated to foster the cultural integration, revitalization and tourism development (Table-2). In a good cultural environment, creative class and ideas develops. Such environment is characterized by tolerance, openness, educational and social opportunities. **Culture brings to the fabrics of society, a physical and social scenario in which development takes place countinuously[21]**

TABLE-2: INSTITUTIONAL REFORMS FOR CULTURAL & TOURISM DEVELOPMENT

Policies & Programs	Aims & Objectives	Insights from NIE
Swadesh Darshan	Promote international & domestic tourism across the thirteen thematic circuits of the country.	Modi government realizes that culture and religion are important institutions for creating a conducive society for growth and innovation
Heritge City Development and Augmentation Yojana (Hriday)	Augment &preserve the rich cultural heritage and soul of heritage cities, the government has initiated holistic development of them with this program.	

2. Social Sector

2.1 Ethos of the Programs: Inclusive growth

Modi government recognizes that faster development takes place in the environment of social harmony and hence, it has adopted a well thought of social program that encompasses inclusive growth as its social ethos. This policy includes the excluded ones in its ambit for instance; prominence has been given to deprived sections of the society& to women (Table-3)

TABLE-3: INSTITUTIONAL REFORMS FOR SOCIAL SECTOR (SOCIAL PROGRAMS)

Areas	Policies & Programs	Aims & Objectives	Insights from NIE
Social Program	Sabkasath, sabkavikash	A commitment that everyone would be involved in the growth process and fruits of development would be distributed between one	No collusion of elite class (bureaucrats, diplomats,

	and all.		industrialists, etc.)
	Pradhan Mantri Ujjwala Yojana	LPG connections to women from Below Poverty Line (BPL) households that safeguard their health by providing clean cooking fuel to them.	Development of healthy social sector
	Pradhan Mantri Jan Dhan Yojana	Financial services to marginalized people to ensure financial inclusion of them. The institutionalized scheme can transform the economy to a great extent.	Fostering inclusive growth, more depth to financial sector
	SukanayaSamridhi Yojana	The scheme ensures gender equality by making certain resources and savings of a family to a girl child	Fostering inclusive growth through gender equality
	Atal Pension Yojana, Pradhan Mantri Suraksha Bima Yojana, Pradhan Mantri Jeevan Jyoti Bima Yojana	These programs offer a gamut of benefits to senior citizens as well as insurance for the poor and the unprivileged sections of the society	Fostering inclusive growth

2.2 Communication and Education

Modi Government has laid special emphasis on the building a culture of open communication characterized by free flow of ideas and information. It lays great thrust on education and believes that it is one of the most important institutions to transform nations and societies at large. Hence, Modi government is determined to overhaul the education system ranging from school to the higher education including University Grants Commission. NITI AYOG was entrusted to suggest the steps that can be undertaken by the government. The aim of the Modi government is to strengthen the education system under the ambit of National Education Policy-2020.Table-4 summarizes the key initiatives of the government under these two heads:

TABLE-4: INSTITUTIONAL REFORMS FOR SOCIAL SECTOR (COMMUNICATION & EDUCATION)

Areas	Policies & Programs	Aims &objectives	Insights from NIE
Communication	**Mann kiBaat**	To communicate effectively to the nation using All India Radio on different issues that has generated lots of enthusiasm and interest among the masses. Scores of ideas have emerged and received on the website.	Neo- liberal economic philosophy advocates for creating a channel of social communication which should always be open, wide and deep. Both government and the masses should have the opportunity to be fully informed on all issues and programs

	My Govt. online Portal	To know the views of masses on several issues.This platforms ensures free flow of public opinion.	Information efficiency. Free Flow of information & ideas.
Education	Expansion of IITs &IIMs	To foster technological development.	Education remains a very significant institution for economic growth. Development of technology, managerial skills and empowerment of educational institutes can significantly lower the transaction costs.
	Padhe Bharat Bade Bharat	To attain the goals of SarvaSikshaAbhiyaan. To improve the reading and writing skill of children.	Education leads to empowerment, knowledge creation, innovation & entrepreneurship
	Pandit Madan Mohan Malviya National Mission on Teachers &Teachres' Training	To build requisite capacities in faculties through existing and new institutional structure namely PMMMNMTT.[22]	Creating change agents by developing new institutions. (Example: Teachers.)

2.3 Health, Sanitation & Urban Development:

Improving health and sanitation has a special focus under the Modi regime. Various initiatives have been undertaken for keeping masses healthy. Universal immunization of children, emphasizing importance of nutritional food and re-enforcement of programs of mid-day meal etc. are some initiatives undertaken. Apart from that universal health care has been launched in 2018 budget. Sanitation has been given top priority (Table-5).Amongst many reforms 'Swakchha Bharat' and 'AMRUT' are of notable significance. They are being propagated heavily to the masses.

TABLE-5: INSTITUTIONAL REFORMS FOR SOCIAL SECTOR (HEALTH & HOUSING)

Areas	Policies & Programs	Aims & Objectives	Insights from NIE
Sanitation	Swakchcha Bharat Abhiyan	To promote cleanliness and sanitation throughout the country	Sustainability & Ecological Balance is a precondition where market can flourish freely. Absence of these leads to violence, wastage of resources and land
Ecology	NamamiGange	To protect natural resources and lifeline of civilizations through a national mission of cleaning 'The Ganges'	
Housin	Pradhan	To accomplish 'Housing for all' by the year 2022.	

g	Mantri Awas Yojana	The credit linked subsidy scheme is a great help to the economically weaker section of the society	disputes. This further increases unrest and transaction costs. Institutions are a major link between market economy and long term growth sustainability.
Urban Development	AMRUT	(i)To ensure that every household has access to a tap with a assured supply of 'water and sewerage' connection; (ii) increase the amenity value of cities by developing greenery and well maintained open spaces (e.g. parks); and (iii) reduce pollution by switching to public transport or constructing facilities for non-motorized transport (e.g. walking & cycling)[23]	

The urban and semi urban landscape will see many changes in times to come. For example, under the 'AMRUT' plan, government has planned to construct 100 smart cities in the country having all amenities. The government has created an institutional arrangement by which States involvement is ensured in planning and implementation of project, thus actualizing the spirit of cooperative federalism.

3. Political Programs

Political institutions are organizations which create, enforce, and apply laws; that mediate conflict; make (governmental) policy on the economy and social systems.[24] The influence of political environment on business is enormous. The political system prevailing in a country decides, promotes, fosters, encourages, directs and controls the business activities of that country.[25] Modi government knows that a political system which is stable, honest, efficient and dynamic and which ensures political participation of the people and assures personal security to the citizens is a primary factor for economic development.[26] Following political institutions are successfully working in the country.

3.1 Presidency

3.2 The Election Commission

The institutional arrangement of Election Commission is efficiently doing its duties, impartially and effectively. Certain reservations, however, has been raised against electronic voting machine, yet the institutional arrangement of election commission in India is mostly regarded fair and efficient.

3.3 Political Funding

In line with the promise made by the government, political funding has been rationalized. Now parties are bound to disclose the name of the donor if the amount of donation is above Rs.2000 (it was Rs. 20000 previously) and political parties can receive donations in electronic mode, cheque.[27] 'Electoral Bond Scheme' is one such mode through which any donor can purchase the bond from specified bank branches. These measures will made election funding more transparent.

3.4 Active Consensus Building:

Active consensus on critical policies like the Bankruptcy Code, FDI, GST, etc. has been formed. These efforts ensure political unisonamid political antagonism.

4. Legal System:

Modi government has been working on amending the rules both for consumers and the enforcing body, i.e., Supreme Court.

4.1SupremeCourt:

Supreme Court has introduced collegium system in which Chief Justice of India along with four seniors most judges of the court will decide the appointment and transfer of the judges. This decision of the court, however, is not in conformity with the government thinking.[28]

4.2 Consumer Protection:

Modi government enacted Consumer Protection Act, 2019 who's primary responsibility is to promote, protect and enforce the right of consumers.

5. **Governance/Administration**

5.1 Philosophy& Style of governance:

Philosophy of Governance	Style of Modi's Governance[30]	Insights from NIE
'Minimum government and maximum governance' and 'perform with transparency'[29]	PMO drives policy as well as monitors implementation.	Creation of institutional arrangements for monitoring, rewarding, performance audit and maximum governance with minimum government is essential for fast development.
	PMO rewards talented bureaucrats. Reward is based on performance.	
	Members of Cabinet are prone to performance audit and accountable.	

5.2 Administration

The government has undertaken concrete actions to address administrative and governance issue. Most of these are directed towards creating a more efficient market economy. Table-6 summarizes various improvements underway**.**

<p align="center">**TABLE-6: SOME ADMINISTRATIVE & GOVERNANCE PROGRAMS**</p>

Areas	Action Points	Insights from NIE
Police	Transform police force into 'Smart Police Force' that should be strict and sensitive, modern and mobile, alert and accountable, reliable and responsive and techno-savvy and trained.[31]	Maintaining law & order is a prime responsibility of the State. It is a pre-condition for functioning of market & capitalist economy.
Manning Right persons at right places	Appointments of efficient personnel with impeccable service record like Nripendra Mishra, AjitDoval etc. in administrative team. Mr. Arvind Panigaria, Arvind Subramanian, K.V Subramaniyam regarded as staunch	Manning of right persons at right places is key to success. It promotes collectivism; better & fast decision making and acts as change agent.

	followers of neo-liberalism and NIE, were given key posts.	
Digital India	Introduction of technology and digitalization on every stage of administration is aimed at to convert India into a digitally empowered nation. This program ensures availability of government services electronically and masses should be benefited from the latest information and communication technology.[32]	It improves efficiency by better flow of ideas & information. Rationalization ofcomplicated structures can reduce transaction costs drastically
Repealing of unnecessary rules	Modi government weeded out 1200 redundant rules as early as by June 2017. These rules had seized their relevance in course of time and many of them were regarded as obstacles to smooth running of administration and ease to do business.	Reduction in transaction costs is possible with elimination of redundant rules, complicated structures. Itimproves market efficiency & privatization.
Direct Benefits Transfer (DBT)	DBT reform ensures better and timely delivery of benefits and eliminates ghost beneficiaries, thereby plugging the loopholes. This scheme targets better beneficiaries as well as curbs pilferage by de-duplication.	Drastic reductions in transaction costs. Elimination of complicated structures. Building trust, confidence, transparency & openness. Plugging economic leakages.
Strengthening of autonomous institutions	Strengthening of existing autonomous institutions (TRAI, SEBI, IRDAIetc.) and creating new regulatory agencies. Monitoring agencies enlarges competition and augments quality of services.	Strengthens market economy with regulatory role. State role should be minimal. Develops free market economy.

5.3 Autonomous Institutions

5.3.1Telecom Regulatory Authority of India (TRAI)

TRAI has been constituted by Government of India to regulate the telecommunications sector in India. One of its main objectives is to provide a fair and transparent environment that promotes and facilitates fair competition in the market. TRAI regularly issues orders and directions to various subjects such as tariffs, interconnections, quality of services, DTH services and mobile number portability.[33]

5.3.2 Security Exchange Board of India (SEBI)

SEBI is the apex regulatory body for finance and investment markets in India. Stable and efficient financial and investment market invigorates capital market activities and SEBI plays a vital and credible role in it.

5.3.3 Insurance Regulatory and Development Authority of India (IRDAI)

IRDAI is an autonomous, statutory agency tasked with regulating, promoting and developing the insurance and re-insurance industries in India. The efforts of IRDAI encourages consumer choice and satisfaction by promoting competition.[34]

5.3.4 Goods & Services Tax (GST) Council

GST is regarded as the most revolutionary action taken in Indian taxation history with an aim of accomplishing 'One Nation, One Tax, One Market' ethos.[35] The work of GST is looked after by the GST Council that has been constituted to recommend to the Union and the States on important issues related to GST, such as the goods and services that may be subjected or exempted from GST; model GST Laws, etc**.**[36]

5.3.5 Right to Information (RTI) Act

Right to information Act is regarded most potent weapon provided to the public. Timely reply of all the applications under RTI provides information hitherto regarded confidential and without the reach of the general public**.**[37] Availability of information to the public is pre-requisite of neo-liberal economy and society.

6. Economic Programs

Neo-liberal society talks of strengthening economic institutions and creation of an environment for business and private investment. The present government in India has ensured that various economic programs should percolate to the states through competitive federalism.[38]The **Government is trying to develop the market as an economic institution**. Protecting property rights (both physical as well as intellectual), guaranteeing sanctity of contract and providing necessary Law & Order has assumed tremendous importance to secure market economy. **In conformity withDavid Harvey's philosophyModi government has emphasized design, innovation and creativity-led entrepreneurship and created and strengthened the new institutions and programs for development** (Table-7)

TABLE-7: INSTITUTIONAL REFORMS FOR MARKET ECONOMY

Policies & Programs	Action Points	Insights from NIE
Start-up India	A new program that nurtures innovation across India. Its aim is to provide financial support and technology, sect oral experts, business planning support, seed capital; training to encourage innovation, etc. to MSMEs.[39] It is hoped that it will cause a paradigm shift among youth from job seekers to job creators.	Enthuse entrepreneurship. Create new& expand existing markets. Promote innovation & productive allocation of resources. All these insights are met through this program.
Stand-up India	To help the deprived sections to fight vagaries of the market forces, Under this scheme at least one SC & ST borrower each along with one woman entrepreneurs will be provided loans between Rs. 10 lakh to Rs. 1 crore per bank branch for setting up a green field enterprise.	Promotes inclusive growth, innovation & entrepreneurship.Fosters new & existing markets.Promotes empowerment & gender equality.
Skill India	Skill India initiative through PMKVP is one of the most important initiative directed towards youth by imparting industry-relevant skill training that will help them secure better livelihood.	Lowers transaction costs by enhancing employability. Development of creative, innovative and thoughtful minds. Conversion of social

		acts into market transactions.
Ease of doing business	To create business friendly environment by several institutional reforms like regulation of property, pay taxes and enforce contracts and insolvency. By these measures it is now easy to start and operate a local firm and enhance business activities.[40].	India's ranking has improved tremendously in recent years which is creating & strengthening free market economy.
Dismantling Planning Commission & Creating NITI AYOG	NITI AYOG has been created as premier policy 'Think Tank' of the Government of India. It is providing both directional as well as policy inputs to the government[41] and it is expected that through it, government will design strategic and long term policies and fulfill its policy of cooperative federalism[42]	Promotes Co-operative Federalism between societal stakeholders & eliminates redundant State structure/layers. It develops creative, innovative and thoughtful minds.
Inclusive growth & sustainable development	'**Sabakasath, sabkavikas'** is in fact a commitment of development to all sections of the society. Institutions have been developed for weaker sections of the society, for women, backward and minority communities, etc.	NIE regards promotion of inclusive growth, empowerment, equality& mutual trust essential for market economy

The Government has laid emphasis on reforms that nurtures youth to become **job creators rather than job seekers**. These changes in the ethos of the government are in conformity with the policy of neo-liberalism/NIE that has pervaded throughout the world including India. Institutional arrangements& reforms have been initiated for SC/ST, women & small entrepreneurs in the form of Stand-up India, Start-up India & Mudra Yojana. On the other hand, program like Make in India has been initiated for big entrepreneurs. Similarly, institutional initiatives like D D Upadhyay Grameen Kaushal Vikas Yojana and Pradhan Mantri Kaushal Vikas Yojanahavehave been initiated to impart skills among the youth of rural and urban India alike.

7. Preventing Corruption

Curbing corruption, which is eating the wealth of the nation, through systematized planning is hall-mark of Modi government. The following **institutional initiatives** have been undertaken for arresting corruption

7.1 Introducing Amnesty Scheme	7.3 Introducing Goods & Services Tax (GST)
7.2Creating corruption less society by introducing Demonetization	7.4 Fostering Digitalization in the Economy

8. Banking & Financial Sector

Modi government recognizes the autonomy of the RBI, however, for making its functioning more democratic, government constituted Monetary Policy Committee (within RBI).[43] Apart from that in order to curb the problem of NPA an insolvency act has been introduced. Similarly,

Central Board for Direct Taxes (CBDT)has been announced for providing inputs and planning of direct taxes in India.

9. Agriculture Sector:

Farm sector is in a distress situation. From production to distribution and prevention of loses and for rejuvenating this sector, Modi government has launched several schemes. Schemes like soil health card has been introduced which will recommend crop-wise nutrients and fertilizer required for the individual farms to help farmers to improve productivity. Similarly, 'Pradhan Mantri Krishi Sinchai Yojana' has been launched to provide water to all fields in the country. 'Crop insurance scheme' has also been initiated. To augment income of the rural population and to provide alternative source of income and employment, Rastriya Gokul Mission has been initiated. On 1st June, 2020 Modi government has approved free trade in the farm sector as well. These initiatives will enhance market efficiencies of the farm and rural sector in India.

10. Industrial Sector

Modi government institutional reform for industrial development encompasses several components. One, creation of conducive environment for industrial development with initiation of **ease of doing program**. Second, categorization of industrial sector into two sub-sectors, one for big industrial sector and that should be developed by private sector through Make in India program and second, development of MSMEs by small entrepreneurs under the different programs of Start-up India, Stand-up India, etc. Development of skills through Skill India program has been adopted. Government should best be a facilitators is the policy of the government. Third, role of public sector has been diluted to a great extent and policy of disinvestment of public sector units is followed. FDI in several sectors and also use of external technology to a great extent has been encouraged.

11. Services & Infrastructure Sector:

Modi government has undertaken notable reforms to develop services and infrastructure sectors as well. Some of them are as follows

11.1 Fuel price deregulation

Modi government has deregulated fuel price. Now petrol and diesel rates are changing daily**.**

11.2 Fiscal Responsibility and Budget Management (FRBM)

The Fiscal Responsibility and Budget Management (FRBM) Act institutionalizes financial discipline, reduces India's fiscal deficit, improves macroeconomic management, [44] etc. Modi government is religiously following this Act to cope with the targets assigned to it.

11.3 UDAY scheme

Economic development critically depends on the supply of reliable, continuous and reasonably priced power supply. However, this precondition of economic development was not ensured due to paucity of power as well as due to debt reddens power sector companies.[45] Uday scheme has been initiated to rescue the country's ailing power distribution utilities (DISCOMS).[46] The Statesnow undertake the burden of debts upon themselves and thus banks are assured of timely repayment.

11.4 Smart Cities Mission

The unplanned development of cities has created negative impact on development compared to positive ones. Hence, Modi government initiated Smart City Mission in which Planning for unplanned areas and area-based development planning has been introduced. The objective of this scheme is to provide world class facilities to the inhabitants of these cities.

11.5 REITs

Modi government has introduced Real Estate Investment Trust (REITs) by which not only large investors but also small ones can also invest their money safely.Unscrupulous activities can also be restricted by REITs.

11.6 Digital India: With digitalization, Indian economy is going to experience a metamorphic change.

(II) Organizational Reform

Organizations are players, group of individuals bind by common cause. Modi government has initiated and strengthened several organizational reforms related to political, economic, social and educational bodies to make organizational structure stronger. These reforms are as under:

1. Political Bodies

Modi government is strengthening the political bodies created in the form of political parties; political activism; regulating institutions and conflict management endeavors, etc. **Better organizational structure has been created for augmenting the policy of democratic federalism; electoral rules and electoral funding** has been reorganized; organizational structure to safeguard the political, social, economic and religious rights of weaker sections of the societies and minorities have been protected and augmented. Organization of trade unions has been used and several regulatory organizations have been instituted to control the respective fields of the economy. Autonomous functioning of these regulatory authorities in fact prevents government interventions and maintains institutional balance amid political pressures.[47] Safeguarding the interest of minority women against teen talaq is an example of protecting the interests of the women group. On the other hand, opposing the land acquisition act by the opposition parties and consequently its withdrawal by the government is yet another example that shows strength of functioning of our democratic organizations.

2. Economic Bodies

Economic bodies in the form of Economic Advisory Council and regulating agencies such as SEBI; Telecom Regulator; NITI AYOG; RBI; UGC; Insurance Regulator; NABARD; Finance Commission; CBDT; NSE; Central Pollution Control Board, etc. have been functioning efficiently in the era of present government. Economic Advisory Council to the PM is constituted to give economic advice to the Government of India, especially to the PM.[48]Similarly, in the field of economic professionals Indian Economic Association is smoothly functioning. Several Indian Economic Trade organizations (IETO) are constituted as non-government organizations that empower Indian enterprises by inculcating global business knowledge and awareness. These efforts are encouraging to the firms to enlarge their business. Competitive cooperative federalism is the brain child of Modi government which is regarded as a brilliant idea to transform the economy[49] and an organization structure in the form of NITI

AYOG has been formed and nurtured. Trade unions, however, are not finding solace in the Modi government and they fear that wage code bill, if passed will sideline them forever.[50]

3. Social & Cultural Bodies

Social institutions are structures in society, manifested as groups of social positions and associated social relations … that serve to maintain and carry out essential social functions and perpetuate the social order.[51]Creative inputs that play an important role in development, hence, can be cultivated in a lively and stimulating cultural environment. **Development of creative class invigorated in an environment of tolerance, openness, educational and social opportunities.[52]In short, culture can be seen as driver of a new stage of development**.[53]

Against this backdrop, if we assess the social and cultural bodies' development by Modi government, we find two distinct facets of its ideological plank. One, it is trying to foster the ideology of RSS, its ideologue organization that talks of **Hindutva,** a word that binds every Indian without difference in religion, cast, etc. The cultural renaissance that Modi government is trying to bring in India is now paying dividend and a vertical social structure (cast ladder) has been brought down to a horizontal level.[54] Modi government religious policy provides equal respect and freedom to all the religions.[55]

4. Educational Bodies

After Independence, India has created a well-structured educational regulatory bodies in the form of Central Board of Secondary Education; U.G.C.; AICTE; Distance Education Council; Indian Council of Agricultural Research, Pharmacy Council of India; Medical Council of India; Dental Council of India; National Council of Teacher Education; Central Council of Indian Medical; National Assessment and Accreditation Council; Bar Council of India; Navodaya Vidyalaya Samiti; Indian Nursing Council, etc. However, **in the quest of consolidating and reforming the regulatory bodies, Modi government intended to introduce a Bill to create single higher education regulator.**Apart from reorganizing the regulating bodies, Modi government has introduced Skill India Mission on a humongous scale. Recently; Modi government has introduced National Education Policy, 2020 with a view to transform the education system in the country and to create a vibrant knowledge society.

(B) Informal Institutions

Laws require support from **social norms** if they are to be effective. **Social norms play an important role in generating and sustaining commitment to a society's institutionalstructures.**[56]**Custom, tradition and behavior are some of the traits that affect development significantly.** Promotion of the value-based life and development further is not only required but business with ethical value and norms along with transparency is accepted and preferred world over. Custom means a traditional and widely accepted way of behaving or doing something that is specific to a particular society, place or time.[57].Similarly, tradition is the transmission of customs or beliefs from generation to generation, or the fact of being passed on in thisway.[58]Behavior, on the other hand, reflects how one acts or conducts oneself, especially towards others.[59] In different environment one acts differently and behaves differently. **There is a chain of behavioral change that starts from origination of an idea or thought and culminates into attitudinal transformation and ends in change in habit**. **The great leadership not only changes its behavior according to the environment or societal needs but**

also transforms the behavior of the masses. This transformation in behavior may be purposive, spontaneous or induced and with institutionalized effort and direction it can transform societies. Faith is another important factor of development. **Faith of leadership towards masses and faith of masses towards leadership is a vital element of development.** Extent of faith on philosophy is yet another important factor that shapes or mars the life of millions. Value of the society and leadership; customs, tradition and behavior all are important factors for shaping the social norms of the society that fosters or injures the development of any economy.

Modi government is not only developing formal institutions but also strengthening the informal ones. 'Team India' is the political vision of the Modi government and for bringing this vision into reality it is harping on political unison with opposition parties on several issues and is accommodating and actively building consensus on critical policies like the Bankruptcy Code, FDI, GST, etc. **It is harboringon institution of cooperative and competitive federalism.** This policy brings out the nation, state and even local governments to interact cooperatively and collectively to solve common problems. Further, in competitive federalism the stake holders compete with each other on several issues of social and developmental indicators. All these policy and institutional changes along with integration of Jan-Dhan Yojana with Adhar and Mobile is creating financial inclusion of deprived sections of the society to a large extent. Prime Minister Mr. Modi has reached the masses directly with his effective program of communication 'Mann Ki Baat'. Similarly, he infused good political intent across the party line to people having different faith, philosophy, ideology, religion and social association with his **"Swachh Bharat Abhiyan"**.[60] The attitude of the Modi (the leader of the government) is to do away with the irrelevant thinking or ideas that have seized their importance in the course of time and instilling and creating faith in the young generation that they can reap demographic dividend. **Motivating and instilling confidence in the beleaguered masses that 'acchhe din aayenge'** is another behavioral change one can notice in recent times. For him innovation is key to success. Similarly, Modi government is challenging the negative habits in the society & economy and introducing and imparting new habits in the society through **'nudge policies'.**[61] Modi is also challenging the belief that India cannot oppose to corruption; old and discarded technology and thinking, etc. **Providing importance to new generation, technology and thinking and linking them to the old Indian ethos are some of the basic and fundamental transformation that the Modi government has brought in the society and the economy.** Instilling faith in NRI that India is changing and it will welcome them in the pursuit of development, is yet another important perceptional change it has infused in them. **Creation of social values** that contains concerns for 'others' welfare such as triple talak and creation of **social institutions that provides equality of opportunity to marginalized masses a**re examples of such efforts. In fact, Modi government is practicing a new kind of economics mixed with formal institutions with the values, behavioral aptitude, attitudes and governs not only with rationality but also with the morality, traditions, etc. which was something missing from polity practiced in India.[62]

CONCLUSION:

The above discussion of public policy of Modi government reveals that it has selected strategies and made choices between various philosophies and set agenda and formulated, adopted and implemented them. In fact, a new economy is emerging on the debris of old ones with the help of policies, programs and institutions that fosters the development of all sectors, all sections and all spheres of the society with human values.[63] One can argue that if Modi government was

enamored by the two greats namely Pt. D.D. Upadhyay and Dr. B.R. Ambedkar then what makes him a student of NIE. The answer lies in the fact that perhaps for Modi, world is changing fast and one cannot stick to one or two philosophies only. Second, people want to telescope their imaginations, aspirations and visions very fast and no leader can survive with slackening effort. Hence, the **economic philosophy of NIE that Douglas C North &Daron Acemoglu are preaching vehemently and which has been considered many as philosophy for development of economies in 21ˢᵗ century, has not only been accepted but also carved with precision as development policy by the Modi government.** It is, therefore, **Modi government is making no stone unturned to promote innovation & entrepreneurship on the one hand and on the other, is creating a well-structured institutional development in which a range of institutions, including the markets has been created & strengthened.** The entire gamut of vision, mission and formulation of formal & informal institutional and organizational creation by the Modi government, not only establishes that **Modi government is bending towards NIE philosophy** but also development & deployment of **institutional framework** is accepted for creating, regulating, transforming markets and auguring the economy which **would convert the economy in true sense a liberal, competitive and institutionally strong one.** Much water has flown between State Socialism to pure Capitalism and **his efforts of institutionalizing the economy** are aimed at fostering the mission of sowing the seeds of capitalism and India's growth take-off.

SALTYKOV-SHCHEDRIN'S CREATIVITY IN SECONDARY SCHOOLS OF UZBEKISTAN

Chjen Yelena Vitalevna*

*Associate Professor,
Candidate of Pedagogical Sciences,
Department of Russian Language and Literature,
Namangan State University,
UZBEKISTAN

ABSTRACT

In the work of Saltykov-Shchedrin until the 70s, the methods of artistic exaggeration did not go so far. The heroes of his satyrs generally fit into the framework of everyday life. But already in the previous artistic practice of the satirist there were such extraordinary comparisons and comparisons that predicted and prepared the development and use of the techniques of satirical fiction.

KEYWORDS: *Secondary Schools, Teaching Methods, Great Writers.*

INTRODUCTION

Currently, positive changes are taking place in the field of public education of the Republic of Uzbekistan. They are the foundation on which the new building of the education and training system is being built. Concepts, curricula, textbooks and teaching aids are being developed on the basis of state standards of general education schools, new pedagogical technologies are being developed. It became obvious that new teaching methods are guided by the use of new pedagogical technologies, scientific approaches and analysis and organization of the educational process, taking into account the achievements of high results in personality development. In his book "High spirituality is an invincible force" I. A. Karimov states that "Spirituality is considered an inexhaustible source of enormous wealth not only for an individual person, but also for the people, society and the state as a whole." In a state devoid of high morality, humanism, mutual respect, happiness and progress will never reign.

The life and literary path of M. E. Saltykov-Shchedrin naturally led him to the History of one city. This bold, honest book, full of lively laughter and deep sorrow, hatred and hope, the great

writer literally suffered. Born into a wealthy landowner family, he spent his childhood and adolescence in his parents' estate, being an unwitting witness to serfdom. "I grew up in the bosom of serfdom," the satirist later recalled, "I saw all the horrors of age-old bondage in their nakedness. A graduate of the Tsarskoye Selo Lyceum in 1844, a member of the revolutionary Petrashevsky circle, an ardent admirer of Belinsky, Mikhail Evgrafovich Shchedrin immediately joined the democratic camp of the Russian intelligentsia. The very first anti-government stories decided the matter: in 1848 Saltykov, on the personal order of Nicholas I, was sent to Vyatka. After the exile, an active literary activity began, including in the magazines "Contemporary" and "Otechestvennyezapiski". At the time of writing the "History of one city" for the ruling regime of Russia there was no more formidable and hated name than "Shchedrin" (the pseudonym of the writer is N. Shchedrin). One of the masterpieces of Mikhail Saltykov-Shchedrin as a master of social and political satire was The History of a City. This work is unique not only in its sharpness, not only in the scale of the phenomena of social and political life covered, but also in the skill and originality of the composition. The writer made extensive use of fantastic, fabulous, satirical elements, closely intertwining them with a description of the real life of the people. Thus, the tragic and satirical principles are here in a complex and constant interaction. The author himself emphasized this circumstance: "In portraying life under the yoke of insanity, I counted on the excitement in the reader of a bitter feeling, and not at all of cheerfulness."

Reading the work, with each page we plunge deeper into the atmosphere of the plight of the people. At the beginning of the story, satirical motives prevail. All the rulers are depicted sharply satirically, starting with Brudasty and ending with the most unpleasant figure of Gloom-Grumblev. Invective laughter is also heard in popular episodes. But here you can already hear the notes of indignation. And the further to the end, the more tragic motives permeate the narrative. Laughter is not so funny now, it gives way to bitterness and indignation. This is especially clearly manifested in the chapters "The Hungry City" and "The Straw City", where not the stupidity of the townsfolk comes to the fore, but their poverty and hungry existence. The tragedy of the position of the Foolovites lies in the fact that, instead of help, they will face a harsh suppression with the help of military force. The author directed his satire on parasitism, ignorance, emptiness and limitations of the ruling strata; to the false, flattering words of "sentimental lovers of the people"; on obedience, unquestioning obedience, inertia of the people in the face of merciless oppression and cruelty, and even on their inept, unconscious attempts to rebel. Yes, the Foolovites express dissatisfaction, they murmur and rebel. But their dense downturn, lack of understanding of their own interests and their strengths make their protest fruitless.

However, episodes in which laughter almost disappears play an important role in the characterization of the Foolovites. Pictures of lean years, terrible drought, terrible scenes of total loss of life are filled with severe drama. At the same time, the harsh, stingy and gloomy to despair landscapes and everyday descriptions are interspersed with the caustic laughter of the narrative about the "superior care". The scenes of the village fire are also filled with incredible drama: a fire blazing menacingly over the dilapidated buildings, suffocating puffs of smoke, the powerless despair of the victims of the fire, covering their sense of hopelessness. People no longer moan, no longer complain, but only silently wait, realizing with inescapable persistence that "the end of everything" has come. The screams and groans of the crowd, distraught with grief and pain, the ominous drumbeat of the punitive team entering the city is also heard in the

scenes of the "riot on their knees." The great satirist in his depiction of folk life reflected everything that he himself knew about the situation in the Russian countryside and that was written in the progressive press about the incredible poverty, the ruin of the peasantry, about the police reprisals. And if the laughter at the "inhabitants" is filled with warmth and sympathy, then the satire on the mayors is merciless in its revealing power.

In the concluding chapters, the writer's thoughts that the stupidity and passivity, which the author seemingly ridiculed in the Foolovites, in fact form only "artificial impurities" become more and more vividly manifested. Residents, in the author's firm conviction, can be capable of both protest and persistence. There are brave, courageous people, heroic personalities, lovers of truth, endowed with outstanding moral strength in the masses. In this respect, the comparison with the river is symbolic, which, despite all the tricks of Gloom-Grumblev, stubbornly flowed in the same direction.

The work of Saltykov-Shchedrin more than once became the subject of heated disputes during the writer's lifetime. Writers and journalists hostile to satirist often perverted not only the ideological orientation of his works, but also his creative principles. Under their pen, Shchedrin appeared as a man striving at all costs to "caricature" reality and allegedly deviating from the truth of life.

The critic, friendly to the writer, sought not only to protect him from these attacks, but also to comprehend the most important artistic features of his works. In the speeches of N.G.Chernyshevsky, N.A. Dobrolyubova, N.K. Mikhailovsky, A.M. Skabichevsky a lot of sensible considerations were expressed regarding certain aspects of the satirical poetics of Saltykov-Shchedrin. It was justly said that the creative principles of the satirist are aimed at revealing the truth of life, that the "caricatures" of the writer do not distort reality, but reveal its deep laws.

After the death of Saltykov-Shchedrin, the task of literary scholars who studied his legacy was to identify and make public works that had not been published for censorship or other reasons, or were published without a signature, as well as to collect the writer's works together and comment on them. This work began with the book by A.N. Pypin about Saltykov-Shchedrin, the main part of which is devoted to the journalist's activities in 1863 - 1864. Pypin pointed to the articles and reviews published in Sovremenniki by Saltykov-Shchedrin, analyzed them in detail, expressing a number of considerations about the features of the satirist's creative manner. The study of Saltykov's legacy was continued by K.K. Arsenyev and V.P. Kranichfeld, who introduced into scientific circulation some previously unknown materials that allowed a glimpse into the satirist's creative laboratory, attempted to comprehend the ideological and artistic originality of his work.

Collective and active work to identify and publish unpublished works of Saltykov-Shchedrin has been developing since 1917. In the 1920s and early 1930s the following books appeared: "Unpublished Shchedrin", "M.E. Saltykov-Shchedrin. Unknown Pages ", Letters" and "Unpublished Letters" by Saltykov-Shchedrin and such important articles as "Results and problems of the study of Saltykov" by V.V. Gippius and "The fate of the literary heritage of M.Ye.Saltykov-Shchedrin "S.A. Makashin, in which a meaningful overview of the state of the writer's creative heritage was given and tasks were outlined for its further study and scientific publication.

ABSTRACT

The article describes the stages of formation of nominative units, the naming of things and events, the people's unique perception of the world, their vision, the uniqueness of the people in the creation of the image.

KEYWORDS: *Nominative Unit, Acoustic Signal, Nomination Process, Denotation, Designat, Conceptualization, Sign, Speaker, Ethnolinguistics, Anthropolinguistics, Discursive Analysis.*

INTRODUCTION

Language represents life. Therefore, life is inextricably linked with language. The relationship between language and life is one of the central problems in philosophy, which is why a number of works devoted to this subject have emerged.

Any nominative unit names things, events, and situations in existence. These are generalized images of things and events, actions and situations that are reflected in our minds. The image reflected in this consciousness is represented by the acoustic signals of one or another language. These three stages are necessary components of the overall nomination process. The first two components of the nomination process, namely denotation and signification (concept), are common to all languages in the nomination process, and in the third stage, there is a distinction between languages.

The second stage is manifested in the conceptualization of the world in the human mind. Although the service in conceptualization of common signs is common to all languages, with the exception of specific features of things in existence, there may be differences between languages depending on which features of the thing being conceptualized are the basis for generalization. In the naming of most things and events, the people's unique way of imagining and seeing the world is reflected, as well as the people's uniqueness in creating an image. That is why the relationship

between an object and its name, the reason why it is so named, its motivation have long been of interest to scientists.

It is known that the meaning of a separate word is determined by the relationship of the expressed (denotate - a real object or event) to the expressive (designat - the reflection of the object in the mind or the concept of the object).

A separate word indicates the expressed (denotate) and represents the expressive (designat) [1,68]. Expressed in words (denotate) also belongs to a particular subject area and enters into a number of relationships. The class of expressions is called the extended expression (metadenotate), where the extended expression corresponds to the subject, the subject classes. In turn, the expressive (designat) also enters into a number of relations, connections that are unique to it, that is, corresponds to a certain class of expressives. The class of expressives can be called an extended expressive (metadesignat). The extended expressive includes the pragmatic aspect of the word [6,56].

In the last years of the last century, the idea of viewing the language as a system of signs began to be felt in linguistics. It is known that at the heart of such an interpretation lies the relation of the sign to the objective being, the relation of the sign to the sign, the relation of the sign to its users, but the connection between the sign and the speaker was not sufficiently studied during this period. Today, the attention of a number of linguists is focused on the study of anthropolinguistics, which is closely related to pragmatic linguistics, focusing on the relationship between the signs and the speaker [2;3;4;5;6;7;8;9;10]. Anthropolinguistics covers a number of areas, including cognitive semantics, psycholinguistics, and linguoculturology.

The focus on the speaker in the speech process has been a major event in the history of linguistics. As a result of structural linguistics's focus on the study of the relation of sign to sign, the question of the relation of sign to object and sign to subject was far removed from the view of structuralists who interpret language as a pure "form." Due to the attempt to fill the same limited aspect in linguistics, new directions of linguistics, called pragmalinguistics, neolinguistics, anropolinguistics have emerged.

The emergence of such areas of world linguistics as linguopragmatics, lingvoculturology, psycholinguistics, cognitive linguistics, ethnolinguistics, discursive analysis is associated with a deeper study of human in science and the broader coverage of linguistic activity [9,3].

Any thought, content, or form that arises in the human mind is nothing more than a reflection of the material world. The object of our study can be not only the subject-phenomena of the material world, but also spiritual phenomena.

Any mental event is considered an indirect reflection of life. Because every concept, thought and conclusion is a reflection of the material world. Thus, man has the ability to reflect in the mind, distinguishing between general and specific signs of things and events in the material world.

We know that no language can be learned correctly and completely without distinguishing it from the "native speaker of the language." After all, in every act of speech there is a trace of the speaker. In the speech process, the communicators' knowledge of the language helps them to understand each other correctly and clearly. The great German scientist W. Humboldt's antinomy of "understanding and misunderstanding" was used to describe the same process.

Linguistic knowledge of speakers means not only their ability to use language codes correctly, but also their ability to relate language codes to beings. The second skill is inextricably linked to a concept that has been called the "linguistic landscape of the world" (LLW) in recent times.

The linguistic view of the world is an integral part of epistemology and shows the reflection of the members of the world in the human brain. In other words, the members of the world are reflected in the human mind conditionally and interdependently, and these reflected members are represented by the codes of a particular language.

While the members of the world are interconnected and reflected in the human mind as groups, so are its codes. Such an associative relationship between codes is the basis for uniting linguistic units into specific semantic fields. For example, a person's semantic field includes linguistic units that name a number of characteristics, such as his or her behavior, intellectual ability, lifestyle, culture, and behavior.

In particular, verbs such as crawl, sing, laugh, talk; adjectives such as intelligent, wise, prudent, cultured, rich, poor form a semantic field based on the "human" archetype.

The semantics of "human" are repeated in all members of a semantic field. This repeating sema acts as a unifying sema-archisema for all these members. There will be a hierarchical connection between the small fields and the large field that are broken down from the content of a semantic field. It is this connection that unites them under one semantic field.

In short, for the formation of the anthropocentric paradigm today, the practical aspect of language, that is, the in-depth study of pragmatics focused on the relationship between the sign and the speaker, is of great importance.

PHILOSOPHICAL PROBLEMS OF MODERN EDUCATION

Ravshan Mardonov*

*Associate Professor,
Candidate of Philosophical Sciences,
Department of Social Humanities of Samarkand Branch,
Tashkent University information Technologies,
UZBEKISTAN

ABSTRACT

The purpose of this article is finding ways to influence education on the genesis of social problems. The worldview and humanistic function is paid particular attention. Education is viewed as a social institution and a human institution. The author comes to the conclusion that the lack of balance in the contradictory functions of education inherent in his ontology is one of the reasons for the emergence of social problems as a result of the research.

KEYWORDS: *Education, Philosophical Aspects, Integral Approach, Functions of Education, Paradigm Of Education, Social Problem.*

INTRODUCTION

The topic of education has been studied by modern science for a long time since education is one of the fundamental spheres of social life. D. Dewey in his work "Democracy and Education" encourages the reader to use all human knowledge to resolve problem situations. Therefore, we consider it useful to investigate the ontological prerequisites of education and identify the contradictory essence and role of educational systems in the context of the genesis of social problems. Note that focusing on the laws, categories, concepts, principles, methods, hypotheses, and so on, characteristic of philosophy, moves away from the analysis of real contradictions in education. However, it is precisely philosophy that can comprehend the contradictory ontology of education. This point was well revealed by G.E. Zborovsky: "Analysis of multilateral and multidimensional contradictions in the sphere of education leads, from the standpoint of a philosophical approach to the realization and disclosure of the essence of the world (and even more so national) educational crisis, which consists in the recognition of the inability of modern education to satisfactorily solve the social and individual-personal tasks facing it and perform

basic functions " [Zborovsky, 2000 23]. This indicates the relevance of this study for modern education.

INITIAL PREMISES

In the philosophy of education, there are several main approaches that express their position in relation to the essence of education. Their ideas are reflected in the works of G. Hegel and I. Kant (humanitarian pedagogy), M. Scheler (pedagogical anthropology), L. Wittgenstein (analytical philosophy of education), K. Popper (critical-regionalist philosophy of education), K. Rogers (humanistic pedagogy), and others. Different paradigms of education are based on different ideas about the world, about the nature of knowledge, man, values, relationships, etc. And all these approaches put their definite meaning into the ontology of education. But we can also notice that among this diversity some general universal nature of education crystallizes.

FORMULATION OF THE PROBLEM

There are modern studies that reveal the contradictory nature of education. These are articles by G.E. Zborovsky, F.T. Mikhailova, A.G. Bermus, A.P. Ogurtsova, E.V. Paley, N.A. Antipina, A.O. Karpova, I.A. Kolesnikova, as well as D.M. Fedyaeva, N. D. Fedyaeva, and others. These articles analyze in detail the nature of education, and the conclusion is drawn about the need for a single basis for this multidimensional phenomenon. In the study below, an attempt is made to substantiate the use of the phenomenological approach as an integrative theory of education.

CONDUCTING RESEARCH

The above works arouse interest in defining education in its independent interpretation, outside the cultural and historical context, highlighting its inner essence, uniform laws, mechanisms, goals, and values. However, cultural and historical features are naturally woven into the essence of education. Therefore, it is reasonable to approach it from several positions.

To analyze the impact of education on society, we have identified two approaches. The first approach reveals education from the position of its meaning-forming, ideological function, and the dependence of its results on the truth of the worldview transmitted within its framework. The second approach considers education as a social institution that actively interacts with society and affects its social problems.

The first approach looks at education in terms of its goals, values, meaning, and worldview. The goals of education are invariably the main criterion that has a significant impact on the selection of the content of education at various stages of development, which determines its essence. The goal expresses the actual interests of society and the individual. Therefore, each society has its own, corresponding to the culture, the image of an educated person, since the goals subordinate everything to themselves: content and organization, forms, and methods. They are also determined by the system of values underlying the culture and setting the educational ideal. With regard to the values of E.V. Paley talks about their role in human life: "Values as meaning-forming elements of existence are an element of the potential transition into the sphere of actual being, into the sphere of reality when values-goals are realized and turn into values-means for achieving new goals. In the anthropological dimension, the problem of value as a goal and significance acquires the content of the problem of the meaning of life "[Paley, 2007, 93]. This clearly shows how the values inherent in education can influence a person's life. And not only for the life of a specific person, but also for society as a whole, since a qualitative leap in society

becomes possible only when the consciousness of society rises to a new level of values, and not because of the emergence of new ideas. Thus, one of the main tasks of modern society is to educate young people in the skills, capabilities, and abilities of adaptation to the rapidly changing social image of the world. In this regard, the following task of education arises: the construction of new value guidelines and the reconstruction of old ones through the formation of universal values. R.A. Kurenkova offers a phenomenological approach to the formation of values: by activating the centers of self-individualization, education orients the development of the individual in the global space. Thus, "The task of education is to help a person develop his own position in life, to become the subject of interaction in this life, the subject of the implementation of the individual Logos of life" [Kurenkova, 2012, 48]. However, such a subject-centrist approach contributes to the development of the irresponsible nature of relativism. This is noted by M. Van-Manen, a specialist in phenomenological pedagogy, who proposes a normative orientation of the values of social knowledge and the predominant orientation of education towards everyday life experience [Van-Manen, 2008, 209-210]. This difference in the position of teachers also highlights the ontologically contradictory nature of education.

From the standpoint of pedagogical anthropology, it is appropriate to ask the question: "What image of a person forms modern education as a human institution?" This is one of the fundamental contexts since it is in the immediate sphere of the analysis of social images. S.A. says about its relevance. Smirnov: "In the existing daily educational practice, neither in secondary, nor in higher education, in principle, even the question of the anthropology of education, or of education as a human institution. That is, it is not even discussed - what image of a person is built when a certain educational practice is carried out ... what social order should be presented to education as an institution? As a result, it is not clear: what to do for an unformed animal, so as not to destroy and destroy completely this world in which it appeared, and how to make it so that it can gather itself into a single image "[Smirnov, 2013, 173]. The anthropology of education emphasizes the importance of education in the formation of a person as a full-fledged personality. But the main question remains: what does a full-fledged personality mean?

In modern Russia, in the context of a change in the educational paradigm, there is an active search for the deep foundations of identity, which will not be influenced by active external changes that are so characteristic of our time, but at the same time will correspond to the current needs of society. In this regard, it is necessary to analyze the images of identity that the educational system can provide and their impact on society.

In this regard, V.V. Kostetsky points out the role of philosophy in education: "... in simpler terms, philosophy can be likened to a system of axioms, from which a certain pedagogical doctrine can be derived. If we proceed from different philosophical systems, then different systems of pedagogy will be formulated, respectively" [Kostetskiy, 1995, www]. The relevance of careful consideration of the philosophy that education carries in itself is confirmed by the fact that in the information age a modern person has situations of a conscious choice of alternatives to ideas about this world and, accordingly, behavior that a person who prefers to lead a traditional lifestyle did not have. Due to its ideological character, philosophy breaks down into many directions, trends, and concepts. Since at present there are many philosophies, then education can be based on different, sometimes even contradictory philosophies. In many ways, this concerns questions that go beyond sensory experience. In support of this, N.A. Antipin cites the International Encyclopedia of Education, which outlines the content of philosophical approaches

to education based on "positivism, anti-positivism, empiricism, relativism, realism, postmodernism, existentialism, pragmatism, neo-Thomism, neorealism and other currents of Western philosophical thought" [Antipin, 2003, 25-26]. Here we run into the danger of artificially confusing them in the search for an integrative approach. However, F.T. Mikhailov confirms the need for a fundamental theory of education, which could be the basis for the whole variety of educational theories. In this issue, we can talk about two sides of the approach: the worldview transmitted by the educational system and the worldview on which it is based, that is, its pedagogy. We see the integrative phenomenological approach since with the help of the method of phenomenological reduction it can single out the hierarchy of levels of philosophical discourse. However, this is not the hierarchy of educational images that A.E. Krikunov in the article "Education as the formation of the ideal" as a new attempt to control the personality [Krikunov, 2014, 42]. The key is that the result of the phenomenological reduction is "pure consciousness" - the essence of the autonomous creative part of the human personality.

The second approach views education as a social institution. The culturological approach to the philosophy of education, presented by E. Spranger and K. Kershenshteiner, shows that the ontological function of the institution of education is to familiarize the subject of society with a set of cultural values that dominate in a given society through the transfer of knowledge and related skills. It follows from this that it is a culture that puts into education those images, attitudes, worldview, roles, and other transmitted knowledge. A humanistic approach based on the ideas of D. Dewey, C. Rogers, J. Piaget, and L.S. Vygotsky, highlights the main function of personality disclosure. However, it is fair to say that the humanistic model is not a modern innovation. Throughout history, we can find many examples of great personalities whose potential was revealed by their teachers.

As we can see, there are two components in the process of acquiring education by a person: on the one hand, a person is active and has his own search in the world outlook and choice of patterns of behavior, on the other hand, while learning in a certain cultural environment, a person becomes part of it, adopts tools and rules for interacting with other members of society. However, a person cannot contact culture at all. He contacts her through her separate parts: specific books, representatives, music, films. And at the same time, not every contact becomes educational for a person, but only the one that is reflected inside him. For example, a student learns from a teacher, but he may not have a deep contact with him and therefore learn only formally, and a chance meeting with a stranger can be imprinted deeply in the memory and have a strong impact in the future. Therefore, we can say that in addition to the public, there is also an individual culture that corresponds to the level of consciousness of a particular person. Naturally, an individual culture consists of parts of a common culture, which in turn consists of its representatives and reflects different levels of consciousness. E.N. Gusinsky and Yu. I. Turchaninov, explaining the nature of education, well expressed this point: "Education, like an umbilical cord, connects the individual with the culture of the community; it sets the context for any personal achievement" [Gusinsky, Turchaninova, www]. That is, education organizes contact with individuals who are representatives of culture through cultural objects. And in this contact, communication between individuals, the transformation of the personality takes place, its change ontological identity. Education is an institution of communication. It depends on him what level of communication the student will have access to. D. Dewey also wrote about this, criticizing purely formal education: "Education consists primarily in the transfer of experience

through communication" [Dewey, 2009, 34]. This approach to education is sometimes manifested in its role as an institution of social isolation, which Dewey also speaks of: "The second function of the school environment is to protect, as far as possible, the growing personality from the influence of unacceptable features of the existing social environment" [ibid, 36].

Phenomenology, developing the concept of "intersubjectivity", explains this feature of education, contained in the nature of consciousness. So, the mind of the subject has an intersubjective nature and in its formation and manifestation depends on interpersonal contact, in which the fundamental quality of mind is formed - a collective vision, a vision that there is a place for everyone in this world, I have my place in the world, in society everything has a general meaning. Thus, interpersonal relationships are an attribute of the subject's consciousness. In the natural attitude, these relations are manifested as the interconnection of personal and social culture, forming the everyday life of A. Shchuts. Intersubjective contact in the phenomenological attitude creates the life world of E. Husserl [Sokol, 2013, 275].

The other side of the socio-cultural function, emphasized in the analytical philosophy of education, is that culture is assimilated more often at the unconscious, linguistic level. Especially in childhood, mastering the structure of the native language occurs unconsciously. For example, according to the hypothesis of linguistic relativity or Sapir-Whorf, together with the native language, its structure, a person accepts ideas about the world of his native culture. Education, after learning a language, shows it from the conscious side, compares it with other languages, enables a person to go beyond the framework of culture. It is also an important personal function of the educational institution. Thus, we note that the humanistic and anthropological philosophies of education focus on the consciousness of education, while phenomenology deepens the concept of consciousness. This is possible using the procedure of phenomenological reduction and exit from the subject-centrist concept of consciousness.

K.S. Pigrov speaks about the importance of the institution of education in the process of constructing a civilization, a social universe, or an intersubjective social image: "Civilization is, first of all, a social institution of education. In the country, thousands and thousands of teachers, lecturers, professors enter classrooms and auditoriums and speak out the present civilization "[Pigrov, 2009, www]. This homogenizing function of education is aimed at uniting members of society through the fact that education provides a single system of images, concepts, attitudes, patterns of behavior, social roles through which interactions between individuals are carried out.

Here we again come across the contradictory nature of education, emphasized by the creator of the philosophy of education, D. Dewey. He believed that the main goal of this discipline should be to maintain a balance between the various components of education [Dewey, 2009, 34]. The phenomenological approach handles this function well due to its conceptual foundations. This position was well expressed by E.A. Plekhanov: "The deployment of pedagogical knowledge in the context of the factual intersubjectivity of social experience makes it possible to remove the complex of oppositions constantly produced by philosophical and pedagogical thinking - social and individual, development and formation, education and training, school and life, theory and practice" [Plekhanov, 2013, 37] .

CONCLUSION

This article examined the concept of "education" in the light of its contradictory nature and made an attempt to highlight the universal component of education using an integrative approach. The phenomenological approach was chosen as an integrative approach. The works on the phenomenology of education by A. Shchuts, M. Van-Manen, and domestic articles by R.A. Kurenkova, E.A. Plekhanov, L.G. Abramova, A.E. Krikunova, O.V. Sannikova, V.P. Sleeve. However, we note that there are various directions and interpretations of E. Husserl's phenomenology. Our position differs from the aforementioned authors in the emphasis on the "misunderstood" Husserl and in the purely phenomenological approach of delimiting consciousness and thinking, described by V.B. Falcon.

Within the framework of the phenomenological integrative approach, the following definition of education can be formulated. Education is a process of direct and indirect (through cultural objects) intersubjective interaction, as a result of which there is a transformation of one, some or all of the consciousnesses of the participants in the interaction, aimed at 1) expansion of consciousness through the development of rationality, as a change in the level of phenomenological reduction towards objectivity (disclosure of levels of self-awareness - human institution); and 2) saturation with its content with the help of culture, as a tool for realizing the need for intersubjective interaction, social relations for the formation of reason (social institution).

The novelty of our work is to highlight the natural orientation of education to increase the consciousness of the individual in the phenomenological understanding of E. Husserl and the intersubjective nature of education, which is associated with culture as an instrument of communication. Balance in seemingly contradictory functions, if it is consistent with time, place, and circumstances, gives harmony in society. Therefore, the institution of education is always flexible and dynamic. The dynamics are visible not only in the educational approach (methods, goals, and values) but also in the content of education (broadcast culture, worldview, worldview). Therefore, the lack of consistency in different approaches leads to a deepening of the crisis in education and the crisis in the world in general. An integrative phenomenological approach can combine the contradictions inherent in education and highlight the levels of different approaches to it. This emphasizes the relevance of developing an integrative approach, enclosed in the universal nature of consciousness.

NATIONAL AND CULTURAL FEATURES OF ANTHROPONOMIC COMPONENT PHRASEOLOGICAL UNITS IN ENGLISH AND UZBEK LANGUAGES

Abdusamatov Zafarbek Hurmat ogli*

UZBEKISTAN

ABSTRACT

A phraseological unit is a unit related to language and speech as a linguistic phenomenon. A linguistic unit consisting of a combination of more than one independent lexeme form and having a figurative spiritual nature is called a phraseological unit: the top hair is straight, the vinegar does not carry water; to show the white feather, to play the first fiddle. Phraseological unity is also referred to by the terms phrase, phraseologism, stable compound, stable compound, phraseological compound. In this article, we will focus on phraseological units with anthroponomic components in Uzbek and English.

KEYWORDS: *Anthroponomic Phraseology, Linguoculture, Stable Compound, Lexeme, Homonymy.*

INTRODUCTION

Phraseology is a small branch of linguistics in which a phrase means a phrase and a logos means a doctrine. The term phraseology is used in two main senses:

1) The field of linguistics, which studies the phraseological structure of the language;

2) A set of phraseology of the same language.

The subject of phraseology is the nature and substantive features of phraseology and the laws of their application in speech. A set of words or phrases consisting of two or more words, representing a coherent portable meaning, having an effect, and having the same meaning as a word is called a phrase.

Phrases are studied in the phraseology department of linguistics, so we also call phrases phraseologies. In addition, the Department of Phraseology of Linguistics has studied the development of this field, linguists who have made significant contributions to the field of

phraseology, phraseological meaning, phraseological polysemy, opposite meanings, phrase synonymy, phraseological paronymy and paraforma, phrase homonymy, phrase variation, specific grammatical features of phraseologies, etc. are studied. As you know, phraseology in linguistics has been studied in lexicology for many years. Because phraseological units are the equivalents of words in a language, lexicology is the discipline that studies the words that make up the vocabulary of a language and their equivalents. In recent years, as phraseology has become a separate discipline of language or an independent language stage, phraseology has emerged as an independent branch of linguistics, an independent branch of lexicology since the 1950s, as a new field.

VV Vinogradov played an important role in the formation of phraseology as a separate linguistic direction, including the birth of Uzbek phraseology. It is because in the former Soviet Union, the phraseology of the languages of the colonial peoples was based on the teachings of this scientist.

In foreign linguistics, phraseology is sometimes included in the lexicon or stylistics. The fact that phraseology is an independent language discipline is often not recognized by Western European and American linguists. Nevertheless, the English school of phraseology has been studied with great interest by many scholars. In particular, such scientists as academicians A.Shakhmatov, A.Yefimov, N.Shansky, A.Kunin, N.Amosova, V.Zhukov have made their contribution to the development of this field, especially to the development and progress of the English school of phraseology.

Shavkat Rakhmatullayev's name is associated with the study of Uzbek phraseology on a consistent scientific basis. The scientist laid the foundation for the creation of our national phraseology with a number of researches devoted to this field. In particular, the following research works of the scientist - "Explanatory phraseological dictionary of the Uzbek language",

With the scientific literature such as "Short phraseological dictionary of the Uzbek language", "Some issues of Uzbek phraseology", "Basic types of phraseological combinations", "Basic grammatical features of figurative verb phrasal units of modern Uzbek language" He contributed to the development of the Uzbek school of phraseology. Y. Pinkhasov also achieved great success in the study of phraseological units. His works such as "Phraseological expressions in the language of production Hamida Alimjana", "Modern Uzbek literary language" (lexicology and phraseology), "On the phraseology of the Uzbek language" are in the treasury of linguistics. The services of Yuldashev, Abdumurod and Abdugafur Mamatov are invaluable. B. Yuldashev elaborated on the connotative meanings of phraseologies, their potential as a means of artistic expression. Abdumurod Mamatov raised the problem of phraseological norm and showed the relationship between phraseological norm and phraseological variant. Abdugafir Mamatov, in a number of his works, raised the problems of phraseological formation and highlighted the factors of its emergence. He pointed out that an important distinguishing feature of phraseological units is semantic transformation. A widely used distributive method in linguistics can be used in the scientific study of phraseological units. By studying the features of the use of phraseological units in speech using the distributive method, their structural and semantic features are more deeply defined. In addition, in the study of phraseological units, it is necessary to consider their semantic and structural features in relation to the content plan of the language and its plan of expression. When examining the composition of phraseological units, it is necessary to consider

the types of connections between its components, the nature of the connecting words on the basis of the valence method.

The main features of phraseological units are:

1. A phraseological unit consists of two or more lexemes.

2. Phraseological unit expresses a single lexical meaning.

3. Words in a phraseological unit have lost their lexical meaning.

4. A phraseological unit as a stable compound is only homonymous with a free compound.

5. The phraseological unit can only be replaced as a whole

6. Phraseological unit comes in a syntactic function as a whole in the structure of the sentence.

7. Phraseological unit cannot be translated literally into another language, it is translated as a whole. Since the phraseological unit is a lexical unit, it acts as an independent word in the speech process - it comes as a part of speech or as an augmentative: 1. Madamin fell from the accusation against her. 2. His head spun until he came to the table; Several candidates are already jockeying for position. 3. Such incidents, which are supposed to be eyebrow-raising, still occur in small numbers; Talks between staff and management will resume after a two week cooling off period. 4. The bucket needs to be adjusted; The sky is the limit. In sentences 1 and 2, the phraseological units are in the center of the sentence - in the participle position, in sentence 3 - the expander - the determiner, and in sentence 4 - as a whole ownerless sentence.

A phraseological unit is, in appearance, a phrase or a sentence. Phraseological unit in the form of a phrase: empty, touching the jaw; heavy father, to take care and so on. The phraseological unit of the sentence type is a product of the pattern "speech expander + cut": hot, butterfly flew; to let the cat out of the bag;

As for the phraseological units with an anthroponomic component there is no doubt that today language is not being evidently taught and learnt only by linguistic aspects but also by cultural studies as well. Culture is assumed to be implemented on the content plane of linguistic expressions, reproduced in an act of denomination and transmitted from generation to generation through linguistic, extra linguistic and cultural norms of usage. As one basic trend of cross cultural studies can be regarded linguoculturology. Linguoculturological science is a science which has emerged as the junction between linguistics and culturology engaged in research of manifestations of cultures which had displayed and established themselves in their languages. The term "linguoculturology" is being often used in association with the term "culture-through-language studies". As a special branch of science, linguoculturology emerged in the 1990s. As is evident from the analysis of English and Uzbek phraseological units, reference in English as well as in Uzbek phraseological units is often made to people or places with which the members of the respective culture are familiar. On the other hand, many phraseological units with the same origin are more universally used in several languages with the same cultural and historical background, which also holds true of English and Uzbek. The final finding is that proper names that are components of phraseological units and which are characteristic of a given culture should be observed from different points of view, such as historical, geographical, cultural, linguistic, cross-linguistic and social, and that more thorough studies of phraseological units with an onomastic component would contribute to a higher level of cross-cultural awareness.

In our paragraph, we investigate a number of English and Uzbek Phraseological units with anthropological elements. An overview of the personal names involved phraseological expressions in the English languages indicates the following types of source:

Phraseological units (further PhUs) containing anthroponymic constituents compose one of the most picturesque and colourful subsystems in every language and culture. It is to be interpreted as the reflection of the anthropocentric character of phraseology and language in general. Most of the anthroponymic PhUs have a rich cultural background, conceptualized in national memory as rigid associations-personalities. This fact convinces that modeling of such component of language system as anthroponymic phraseology is a promising area of learning language picture of the world of different nations in the framework of anthropocentric (nominative-pragmatic) paradigm at the junction of various sciences (in particular, onomastics, dialectology, cognitive linguistics, psycholinguistics, sociolinguistics, ethnolinguistics, etc.). From this point of view, anthroponymic PhUs as a universal phenomenon is one of the most interesting objects for the contrastive investigations at both synchronic and diachronic levels in two or more separate languages. Contrastive exploration of PhUs with anthroponymic component explicates one of the deepest layers of the picture of the world introducing universal (constant) and specific features of a native speaker and his culture, the reproducibility of which contributes to the translation of ethnospecific information between generations and the preservation of the collective cultural identity. It is worth considering that anthroponymic set expressions become the object of different linguistic studies of native and foreign scholars. Azhnyuk B., Kravchuk A., Lalayan N., Mokienko V., Moroz O., Pasik N., Safronov O., Stepanova L. and others, first of all, give a general description of the material or cover some aspects based on a particular language. At the same time, many problems are not finally solved yet. Interlingual comparison of the anthroponymic PhUs, which forms the foundation for a clarification of a lot of theoretical and applied trends of actual linguistic explorations, e. g. the problems ofphraseography and PhUs translation, the question of the parameters of a contrastive study of the anthroponymic PhUs are still at issue. A comprehensive contrastive study of linguistic features of idioms with an anthroponymic component in English versus Uzbek has so far not been dealt; a functional aspect of these universal language units and their national-cultural specificity has not been fully studied out. Therefore, the topicality of our article is determined by this fact. The objectives of the presented research are to trace the peculiarities of anthroponymic PhUs formation in English versus Uzbek, to identify the main semantic modifications that occur to the anthroponymic component before the process of its complete phraseologization, to describe the structural-grammatical types and models of English and Uzbek anthroponymic phraseology, to emphasize the differences conveying important cultural implications.

Originating in the religious anthroponomy:

1. Adam's Ale- reference to the only drink available to Adam, the first man in the biblical tradition, while in Eden

2. The Old Adam

3. Old as Adam

4. One's outward Adam

5. Since Adam was a boy

6. When Adam delved and Eve span who was then a gentleman?

7. The daughter of Eve (Eve's daughter) – Very beautiful, charming and gorgeous woman.

The following Phraseological Units are covered with the ideas and conditions that are connected with Adam and Eve. Here Adam and Eve are taken from Holy Bible and considered as a religious anthroponomy. Furthermore, Saints` names are used in the Phraseological Units as well.

8. Vitus's Dance – (behalf of Saint Vitus)

9. David and Jonathan– close friends (Bible II, Samuel I)

10. Judas Kiss - an act betrayal; Judas Iscariot, the disciple who betrayed Jesus, after the Bible (Mathew) 'and he that betrayed him gave them sign, saying, whomsoever I shall kiss, that same is he: hold him fast'

11. Doubting Thomas - a person who refuse to believe something without incontrovertible proof; a skeptic from the story of the apostle Thomas, who said that he would not believe that Christ had risen again until he had seen and touched his wounds; from the Bible(John)

12. The mark of Cain- the stigma of murder, a sign of infamy; the sign placed on Cain after the murder of Abel, originally as a sign of divine protection in exile.

13. Abraham`s bosom- heaven, the place of rest for the souls of the blessed; Abraham the Hebrew patriarch from whom all Jews trace their descent; from the Bible (Luke) 'And it came to pass, that the beggar died, and was carried by the angels into Abraham`s bosom' The above anthroponomy are taken from Bible

Originating in the Mythological anthroponomy:

1. Castor and Pollux – candles that are fired at the end of the competition. (Castor and Polluxare considered as twin sons of Jupiter and Leda in the Roman mythology).

2. Achilles' heel- a person`s only vulnerable spot, a weak point; from the legend of the only point at which Achilles could be wounded after he was dipped into the River Styx, his having so that heel was protected from the river water by her grasp.

3. Pandora`s box- a thing which once activated will give rise to many unmanageable problems; in Greek mythology, the gift of Jupiter to Pandora, 'all-gifted', the first mortal woman, on whom, when made by Vulcan, all the gods and goddesses bestowed gifts; the box enclosed all human ills, which flew out when it was foolishly opened.

4. Cupid`s dart - the conquering power of love; Cupid the roman god of love, son of Mercury and Venus, represented as a beautiful naked winged boy with a bow and arrows.

5. Invita Minerva- lacking inspiration; Latin- Minerva (the goddess of wisdom unwilling).

6. Bow down in the house of Rimmon pay lip-service to a principle; sacrifice one`s principles for the sake of conformity; Rimmon- a deity worshiped in ancient Damascus.

Originating in the Historical person anthroponomy:

1. A banquet of Lucullus (a Lucculan, Lucculeanor Lucculian; party night, taken from the name of ancient Roman aristocrat.

2. Vandyke (or Van Dyke) beard- taken from the portrait of Van Dyke.

3. Big Bertha –German army`s big gun during the World War I; here phraseological unit is based on the historical event.

4. A beau Brummel – beautiful Brammel (G. B. Brammel 1778-1840, famous person of her period.

5. According to Cocker - right, correct (E. Cocker (1631-1675) – the author of the arithmetic textbook in English language.

6. The admirable Crichton– educated, broad horizon person, lettered husband; taken from the book of Scottish scientist G. Crichton lived in the XVI century.

7. Like the devil looking over Lincoln– distressed, grieved, upset.

8. Even blind Freddy could (would) see it! (Australian oral conversation) –this is evident event to blind; taken from the merchant lived in the Sydney in the 20s of the XX century.

9. Let her go, Gallagher! (Australian oral conversation) – Let`s go, go ahead! ; Tom Gallagher – famous coachman of his time.

Originating in the Political figures` anthroponomy:

1. Gladstone bag - suitcase made from skin: taken from the name of the Prime minister of England U. Gladstone.

2. Teddy Bear – a soft toy bear: taken from the name of American president T. Roosevelt (1858-1919)

3. Big Ben – the big watches of the Parliament of England; taken from the name of sir Benjamin Hall.

4. Teddy boy – a British man who has his own dressing style; Teddy is the short form of the name Edward; taken from the name of the England King Edward VII.

5. Appeal to Caesar – addressing to high authority.

Originating in the literary texts` anthroponomy:

1. Peck's bad boy – a person who makes others in uncomfortable condition with his bad-mannered behavior; taken from the name of the book "Peck's bad boy and his pa" by J. U. Peck.

2. Fortunatus' cup– a cup that does all wishes of its owner; Fortunatus is the hero of the fairy tale.

3. Dr. Jekyll and Mr. Hyde – a person who is sometimes good and sometimes bad; taken from the work by R. L. Stevenson "Strange case of Dr. Jekyll and Mr. Hide".

4. Father Knickerbocker – taken from the name of the satirical book by V. Irving.

5. Cornelia's gift – tiny and pleasant voice of women; Cornelia is the name of hero of Shakespeare's tragedy "King Lear".

6. Sherlock Holmes – police detective; Arthur Conan Doyle`s popular fiction personage

7. John Bull –stupid, drunk; "Jon Bull" is firstly used in the satiric pamphlet by J. Arbuthnot (J. Arbuthnot, 1667 - 1735)

8. Tom Sawyer – advocate; the main hero of the work by Mark Tween.

9. Beauty and the Beast - characters in a fairy story by the French writer for children 'Madame de Beaumont' (1711-80), translated into English in 1757.

10. Elementary, my dear Watson - remark attributed to Sherlock Holmes, but not found in this form in any book by Arthur Conan Doyle There are also numbers of real people anthroponomy in the structure of English phraseological units and especially they have negative meanings.

Originating in the real people anthroponomy:

1. Brown, Jones and Robinson – common Englishmen

2. Jack – the way of addressing to common English man.

3. Good-time Charlie – person who live with full of excitement in life.

4. a proper Charley (Charlie) – stupid. silly

5. turn Charlie – to fear, to be scared

6. cheap Jack (or John) – the clerk of cheap goods.

7. Cousin Betty – silly

8. Clever Dick – clever, intelligent

9. Dumb Dora (American jargon) – stupid girl

10. Jack and Jill; Jack-and-Jill – banknote, a box that us money saved, cash; taken from the name of the hero of children poem.

11. The Corsican ogre - Napoleon I (1769-1821), Emperor of France, in the reference his Corsican birthplace.

12. Homeric laughter - irrepressible laughter, proverbially like that of homer`s gods in the Iliad as they watched Lame Hephaestus hobbling.

Survives show that anthroponomy of real common people has not deep meaning and mostly are used in the negative marked phraseological units.

Some of Uzbek names are also created through the stylistic devices of antonomasia. Here proper names are made from common names. For example, To'lqin, Erkin, Oydin. In this case we will observe the lexical meanings of following words. The first main lexical meaning of the word To`lqin is: waved water. Figurative meaning of the word is: emotion, inner feelings, raging movement. The first main lexical meaning of the word Erkin is: free from any barrier. The second meaning is: political, financial and legal independent. The first main lexical meaning of the word Oydin is: bright, moon light. Figurative meaning of the word is: clear, evident, obvious. It should be taken into consideration that in the antonomasia two types of lexical meaning is expressed at the same time: main nominative and figurative text meanings: Aka-uka baliqchilar Tolmas va Qo'rqmas Qaytmasovlar (radiodan). Antonomasia has the connection between

another stylistic devices for example, epithet and most cases is used with it. Epithet is stated person`s main qualities.

The closeness of antonomasia to epithet is seemed in the function of it, not in the form because the function of antonomasia is to give definition, to assign and to describe main peculiarities of person behave. Most nicknames of historical and social person were based on such describing. Samples: The Iron Duke (The first duke of Wellington), Old Hickory (Andrew Jackson, the seventh President of USA), the Iron Lady (M. Thatcher, former Prime minister of Great Britain) and etc.

CONCLUSION

Representatives of different nations use and understand the words and meanings of their language regarding their national traditions and mentality. This is the reason why one speech can be perceived differently by the representatives of different nations. Each culture has an experience gathered by the humanity by centuries. Perception and reasoning of the news are also related to the cultural habits of the nation. As the one basic ways of representation of linguoculturology can be regarded phraseological units (PU). Phraseology as a complex area of the linguistic system is a developing field of research and has attracted interest from many sides. The term Phraseology originated in Uzbek studies which developed from the late 1940s to the 1960s. Today, it is too crucial learning and teaching language through culture. Names as the element of culture participate in the linguistic fields such as phraseological units that include phrases, proverbs, sayings and etc. In this case, we analyzed number of English and Uzbek phraseological anthroponomy comparatively.

INTERACTIVE METHODS IN THE FORM OF DISTANCE LEARNING IN TEACHING ENGLISH DURING THE COVID-19 PANDEMIC

Badalova Zulfiya Kutbiddinovna*

*Teacher,
English Language,
Tashkent branch of the Institute of Samarkand Veterinary Medicine,
UZBEKISTAN

ABSTRACT

U.S. researchers recommend distance learning in the preparation of qualified cadres and in the thorough mastery of foreign languages, without deviating from traditional forms of education. This article discusses international experience and interactive methods in organizing English language classes for students in the COVID-19 pandemic. Suggestions for the problem are given.

KEYWORDS: *Distance Learning, Interactive Methods, English, Multimedia, Based, Informal, Integrated Learning Model, External Type Of Teaching.*

INTRODUCTION

The 21st century has been a turning point in the development of information technology and communications. At a time when the monopoly in the interstate economic, political and cultural spheres is growing, the issue of training qualified personnel has risen to the level of politics. Today, the effective use of a wide range of information technologies in the educational process serves to train professionals with high educational potential. U.S. researchers recommend distance learning in the preparation of qualified cadres and in the thorough mastery of foreign languages, without deviating from traditional forms of education. Distance education is derived from the Latin word "distance", which means "distance use", ie without direct, personal contact between teacher and student. The use of modern information and telecommunication technologies, which allow for "distance learning", according to which the educational process is organized using new information technologies, multimedia systems. [1] It has the potential to make learning more effective and to develop cognitive skills. Computer training is a special type of distance learning. [2]

What are the advantages of distance learning?

Distance education saves time and money for young people who want to learn English. During distance learning, the student may spend more time practicing in their field. Another advantage of this course is that the applicant determines the class time. The organization of classes with high quality information technology will also benefit the country's economy. For example, an English teacher does not need to spend a lot of paper to print textbooks and manuals on the specialty, the use of electronic books allows you to quickly transfer and receive assignments in a timely manner. It is more effective than traditional forms of education. For example, the University of Oxford and Cambridge in the United Kingdom, the University of Sheffield in the Netherlands, the University of Wales in South Australia, the University of Massey in New Zealand, and the University of Pennsylvania are making effective use of distance learning. [5] Like all educational models, it is a distance-based approach for all students. Without distance from other forms of education, distance learning is also divided into three types: a statement of the subject, direct and indirect communication with teachers on the topic, practical training on the subject of the subject and monitoring of students' knowledge and evaluation. The responsibility of teachers and students plays an important role in making this process possible through technology. The use of some models is reminiscent of the traditional education system, for example: the teacher retains the management function in the teaching process, just as he teaches students in the classroom. In other models of distance learning, the management function is performed by students.

During the COVID-19 pandemic, radical changes took place in the higher education system of our country. The transition from traditional education to distance learning has taken place. In a short period of time, English language classes for students, as well as other subjects, began to operate online. However, with the introduction of the fastest technologies of ICT in our country, there are a number of problems with the organization of distance learning hours. In the study of this system, the team led by E. S. Polat cites the following 6 models in the organization of English lessons in its monograph: 1. External type of teaching 2. University distance learning model. 3. Distance learning forms based on the cooperation of several higher education institutions. 4. Distance education models organized in cooperation with specialized educational institutions. 5. Autonomous learning model. 6. Informal, integrated learning model based on multimedia programs. [3]

1. External training. In this way, students can spend time on additional foreign language classes that interest them, for example; English language courses, computer literacy courses. During the extracurricular internship, students can improve their knowledge and skills by learning English terms in a short period of time. The University of London has extensive experience in the field of external education.

2. University distance learning model. One university offers English language classes using high-quality information technology. Departments organized by specialties are enriched with e-books and textbooks on the relevant subject. Students' mastery is determined by a variety of practical tasks. The advantage of this form is that e-books based on advanced technologies are widely used for this and other forms of the university. The use of e-books based on a single program in various forms of education will deepen students' knowledge and provide great economic benefits.

3. Distance learning forms based on the cooperation of several higher education institutions. In this case, it is possible to form distance learning in universities on the basis of popular foreign languages of neighboring countries. With this project, the United Kingdom was one of the first countries in Europe to develop the Partnership in Education. In the distance learning system with English-speaking countries, students have the opportunity to study at a distance in any country.

4. Distance education models organized in cooperation with specialized educational institutions.

It is mainly intended for part-time and distance learning, which uses non-telecommunication multimedia courses, which expands the opportunities for students to pass certification in addition to assessment. E-textbooks developed in the specialty can be applied to the methods of teaching English in partner educational institutions. Examples of such educational models include the National University of Technology in Colorado, the Open University in London, the National Distance Learning University in Spain, and the Indira Gandhi University in India.

5. Autonomous learning model.

The system is based on a completely free system, with English language classes based on television and radio broadcasts. Classes are organized for students via satellite broadcast. In the process, professionals can gain additional expertise by continuing to improve their skills without interrupting production. An example of an American television project is this type of training. The basic requirements of the lesson are clear the student is required to be monitored at the appointed time.

6. Multimedia-based, informal, integrated learning model. This education system allows for independent training for additional specialization and language learners without the need to apply to any educational institution. Classes use programs that do not involve teachers or educational institutions.

Is distance education possible in Uzbekistan?

The Ministry of Innovation Development held a meeting on the launch of a distance learning institution in Uzbekistan - "University of the Future". The University of the Future is planned to open in cooperation with foreign investors such as Hong Kong, the United States, New Zealand and the Netherlands. [6]

What opportunities does the introduction of distance learning in our country provide for young people?

There are twelve regions in Uzbekistan. The main part of the country consists of agricultural areas (middle rural areas). We have higher education institutions in urban areas. The population of our country is average. As a result, not everyone has access to higher education. For example, in the era of COVID-19, the technical and economic factors of the Internet.

Today, when teaching English to students, it is necessary to effectively use social networks, modules, zoom, platforms in the organization of lessons. To improve the cognitive potential of students, it is necessary to use thematic tests, interviews, organize online open communication debates. By consolidating the above proposals, the popularization of distance education in our country will once again increase our economic development.

PSYCHOLOGICAL BASIS OF DEVELOPMENT OF SPEECH IN A FOREIGN LANGUAGE

Merganova Nigora Mamadodilovna*

*Teacher
Fergana State University,
Fergana Region, UZBEKISTAN

ABSTRACT

This article discusses the direct relationship of oral speech in a foreign language to psychology, the stages of speech formation, and the process by which students perform oral speech in class. In doing so, one first thinks, prepares the speech, and then brings it out. The meaningfulness and logic of speech depends on the occurrence of first internal speech and then external speech. In our opinion, speech comparison can be a bit difficult in oral practice and not everyone can compare speech, but speech control is a common condition that can be observed mainly when students studying German as a specialty speak monologue.

INTRODUCTION

Since language learning is a mental activity, it has a psychological basis. Mental activity is scientifically investigated in psychology. In this regard, there is a need to study the psychological principles of foreign language teaching. The methodology of foreign language teaching is based on the evidence of speech psychology. Speech psychology studies the speech process from different angles, revealing the differences between oral and written speech and their specific features. Speech psychology divides speech into receptive and productive types. While receptive activity in speech is related to the reception of information and takes place through listening comprehension and reading types of speech activity, the reproductive process is related to verbal and written expression of thought and this is done through speaking and writing types of speech activity. Below we talk about the occurrence and formation of oral speech:

In external speech, a person expresses speech orally, and this process is accomplished through speaking. In doing so, one first thinks, prepares the speech, and then brings it out. The meaningfulness and logic of speech depends on the occurrence of first internal speech and then external speech. Therefore, the methodology suggests that in teaching speech to students, first create an internal speech, and then an external speech based on it. Internal speech takes place on the basis of the student's thinking, reasoning.

Speaking without thinking often leads to illogical speech, which is especially evident when learning a foreign language. Because students perform two different activities in the process of speaking a foreign language, the first is to think, to think, and the second is to translate that thought and idea and only then to express that idea orally.

Psychologists have different views on the issue of speech formation.

F. Keynes believes that the formation of speech consists of 4 stages.

1. Speech target. Something is an motivating, motivating reason to give information about an event, and an inner experience that arises because of that reason.

As an example of the purpose of speech in working with students studying German as a specialty, let's take the first German lesson:

Lehrer: Stellen Sie sich kurz vor, bitte!

Realizing that there will be an introduction in the first German class, the student intends to talk about himself and his interests.

2. Deciding on the expression of an inner experience. At this stage, the speaker is mentally preparing to express the inner experience.

This process involves the student making an internal speech, thinking about what he or she can say about himself or herself and imagining the sentences in German.

3. Selection of language tools and methods of expression to express the inner experience.

Now the student thinks about how to express his opinion. That is, it should be known to him what words and phrases are used in self-introduction in German, that the speech be short, succinct, and clear, that this speech be formally expressed.

4. Pronunciation. At this stage, the sentences are expressed orally, following the phonetic, lexical, grammatical and pronunciation norms based on the rules of this language.

This last stage is the most important stage and the prepared internal speech takes place in the external speech. In this process, students mainly speak sentences with attention to grammatical structure, what words are used, and correct pronunciation. From our experiments it is known that at this stage students often try to correct their mistakes (Selbstkorrektur).

A.A. Leontev states that speech formation consists of 3 stages:

1. Thought planning of speech movement.

2. Perform speech movement.

3. Comparison and control of speech.

In our opinion, speech comparison can be a bit difficult in oral practice and not everyone can compare speech, but speech control is a common condition that can be observed mainly when students studying German as a specialty speak monologue. In many cases, students try to control the words or phrases they say in a foreign language and correct their mistakes during the interview. Others speak aloud to determine the correctness or incorrectness of a double word or sentence structure and correct the word or sentence according to its tone:

*Ich sitze **in das …in das, hmm… im** Zimmer.*

In the example above, we can see that the student corrected the error by repeating the word.

In practice, we always hear the phrase "For some reason it does not look like" from students. It is clear that the brain expresses its reaction to mispronounced words or phrases and corrects human error, sometimes consciously and sometimes unintentionally:

*Ich studiere **in**… nein, **an** der Universität.*

This example is taken from a German lesson where a student makes a mistake in using prepositions and at the same time corrects the mistake. In doing so, he translates his speech into internal speech, that is, compares it, and then realizes and corrects his mistake.

A study of the views of psychologists on speech formation allows us to draw the following conclusions. The reason that motivates speech to speak is influenced by the motive. The reasons that motivate the speaker to behave are divided into 3 groups I.A.Zimnyaya:

1. Motives to acquire spiritual knowledge, to expand the worldview.

2. Moral motives

3. Emotional and beauty motives.

The success of foreign language teaching depends on the strength, regularity, and stability of these motives.

Well-known psychologist N.I. Jinkin states that "the goal can be achieved only when a person moves from the control of the teacher to self-control in the study of language."

In our opinion, a language learner, especially a student, is able to express his / her thoughts orally in a foreign language only if he / she is independent and feels free in the classroom. This requires the teacher to encourage the student to be courageous, spiritually uplifting and, of course, encouraging.

ABSTRACT

This article provides information on the ethnic composition of the population of the Kokand Khanate, nomadic and semi-nomadic peoples, their location and occupation. In the constant battles with Amir Said, the Karakalpaks waged a war on the side of the Kipchaks and the Qtays, and they settled down and began to cultivate grain. Even before these wars, there was a sedentary life among the Karakalpaks, but not to that extent. The villages themselves are reminiscent of huts along one or both banks of the river. Yards with fences around it are rare, and if such a barrier is encountered, it also serves not to hide the inside of the yard, but only to protect the yard from being destroyed" [11].

KEYWORDS: *Nomadic, Semi-Nomadic, Qurama, Kyrgyz, Kazakh, Kipchak, Chinese, Karakalpak, Cattle Breeding, Horse Breeding, Tashkent, Turkestan, Dashtikipchak, Bilqillama.*

INTRODUCTION

Livestock is a major sector in the life of the country, and the inhabitants of the desert, mountains and foothills are engaged in this field. This field is widespread in the mountainous areas inhabited by nomadic Kyrgyz tribes, in the Tashkent oasis and in Turkestan. Sheep-breeding and horse-breeding are well developed in the khanate [1].

The semi-settled peoples lived in the foothills and oases, in the deserts, in the meadows and caves. In the early spring, they drove their cattle and horses to the steppes. After harvesting

grain crops and melons, they drove their herds and flocks to the wintering grounds (villages) and spent the late autumn and winter. In the early spring they again went out into the steppes.

Very few of the tribes lived in semi-nomadic conditions, living in the deserts and engaged mainly in cattle-breeding. Their water sources were wells and shallows. Irrigated with well water, they also received more or less farm vegetable crops [2].

T. K. Beysembiev says there is a lack of information about the nomadic population in Tarikh-i Shahrukhi. The Fergana settlers were mainly engaged in horse-breeding, as the cavalry had to be constantly replenished. The Kipchaks, who lived between the Karadarya and Naryn rivers, may have lived a semi-sedentary lifestyle, as they were said to have settled in Mangurqul and Bilqillama.

In the early 19th century, nomadic farms in the Tashkent region had horses, sheep, camels, and large horned animals. Some compound seeds lived a semi-sedentary and almost sedentary lifestyle in the 1840s. Evidence of this can be found in the fact that the tama seed had a strong position in Boka [3].

According to Nalivkin, the semi-nomadic lifestyle in Fergana was predominantly Kipchak and partly Karakalpak. They were engaged in animal husbandry as well as farming. They also built large, winter-hardy mounds, which had plenty of irrigated arable land.

The author also writes that the territory of Fergana was inhabited by non-nomadic, semi-nomadic and sedentary peoples [4]. At the same time, the sedentary and nomadic population traded and exchanged goods in different places. It is reported that trade and handicrafts, agriculture played a key role in the social life of the khanate.

Trade played an important role in the life of Kokand. It consists of a domestic and foreign market, and domestic trade in the Central Asian khanates has since ancient times been based on the products of mutual nomadic pastoralists, settled peasants, and urban-rural artisans.

Historian U. Abdullayev Based on statistics,found that 52.7% (828,080 people) of the total population of the Fergana region of the Russian Empire's Turkestan region were Uzbeks, 26.3% (423,639 people) were Kyrgyz, and 9.8% were Kyrgyz. % (153,780 people) are semi-nomadic, (semi-settled) Uzbeks, 6.6% (103,931 people) are Tajiks, 1.7% (25,971 people) are Karakalpaks, and 2.9% (34,561 people) are of other ethnicities. Formed by community representatives [6].

The poor nomads mainly used their own livestock products, making their own coats (tones), shoes, and building their own houses. Farmers could also satisfy themselves with produce if needed. Urban and rural artisans produced high-quality products and sold them mainly abroad and to their own exploiting class, the wealthy feudal lords.[7]

The settled Uzbeks, Tajiks and Uyghurs, who have a long history of farming, have exerted their influence in the field of agriculture to the semi-nomadic and semi-nomadic peoples of Fergana, such as Kyrgyz, Kipchak, Kurama, Turk, Yuz, Karakalpak.

As the herdsmen switched to farming, they learned to use the tools of labor used by the settlers. The agricultural tools used by Uzbeks, Tajiks, Uighurs, Kyrgyz, Turkmen and other peoples are almost identical. With only a few local features, they differed in different areas.

The 41st issue of the "TurkestanskieVedomosti" newspaper of 1871 contains information about some semi-settled Uzbek tribes - Karakalpaks, Qtays and Kipchaks

In the constant battles with Amir Said, the Karakalpaks waged a war on the side of the Kipchaks and the Qtays, and they settled down and began to cultivate grain. Even before these wars, there was a sedentary life among the Karakalpaks, but not to that extent. As the Karakalpaks became peasants, their tents became houses, lakes, ditches, and canals appeared around them, swamps were drained, thorns and reeds were destroyed. The Karakalpaks worked hard to adapt their territories to agriculture.

Instead of nomadic tents, there are now farmers 'yards. The villages of the Karakalpaks each consist of a separate rabat, with arable lands between the rabat. The rabots are surrounded by high rectangular walls in a rectangular shape.

The Karakalpaks planted rice, oats, maize, wheat, and other crops. Melons and watermelons were also grown.

In addition to farming, the Karakalpaks made plows for hammers, rakes, ketmon, and oybolta. Patlak, chelem (mokhnatyykovrik) were sewn, ropes were made to tie the tents, and camel hair coats were made. The women made a thin thread of cotton for the adras, and plik (wick) for the firearm. The richest people had up to 2,000 small cattle, and about 50 people had 150-200 goats. There were also racehorses and camels.

These two seeds were cultivated and cultivated all that has been sown in Central Asia to this day. The richest of the Kipchaks had up to a thousand sheep and goats. The camels were only in the Kipchaks, the rest of the Ktoys and Kipchaks grazed small cattle around the fields.

Representatives of both breeds produced different products from wool, while the women prepared yarn for the market in four different ways.

Both of these breeds were the best hunters. It was very difficult to find literate among them. The emirs were always harassing the Chinese, especially the Kipchaks, and recruited them as soldiers. It was said that it was better to be a militant soldier than a warrior citizen. However, this policy did not protect the khans from the Qtays and Kipchaks.

Another semi-nomadic tribe is the Kyrgyz, who have long been engaged in animal husbandry. In the XVIII-XIX centuries, the system of animal husbandry, based on many years of experience, developed almost the same in terms of maintaining the system of animal husbandry in other nations. The Kyrgyz had permanent wintering grounds at the end of the nomadic season.[9]

Settlements have been formed for a long time. The semi-nomadic population (Kyrgyz, Kipchak, Kurama, Turk, Karakalpak), which combined animal husbandry with agriculture, lived in the foothills and on the banks of rivers and streams. These settlements have different views, among which there is a fortress-type. Settlements in mountain valleys are temporary (summer) and are considered to be aul-type settlements, consisting mainly of mobile "black houses" of representatives of one or another breed that graze their livestock. [10]

The semi-nomadic population (such as Kyrgyz, Kipchak, Kurama, Turk, Karakalpak) is now more stable in the former winter areas. Their settlements became more and more like those of settled Uzbek and Tajik villages. However, there is a difference between such villages of the newly formed semi-settled population and those inhabited by settled Uzbeks and Tajiks.

This difference is primarily reflected in the fact that the houses ("roof houses") in the Uzbek and Tajik agricultural villages of the valley are surrounded by cotton walls as much as possible. It was also possible to see fruit trees planted in and around the courtyard. This appearance of the village was a sign that its population was stable.

The appearance of the Kyrgyz, Kipchak, Kurama, Turkic, and Karakalpak peoples in the countryside was unique. N. S. Lykoshin described his impressions of Kyrgyz villages at the time: "The courtyards in Kyrgyz villages were not arranged in a certain order. The villages themselves are reminiscent of huts along one or both banks of the river. Yards with fences around it are rare, and if such a barrier is encountered, it also serves not to hide the inside of the yard, but only to protect the yard from being destroyed" [11].

Historian U. S. Abdullayev as a result of his research on the interethnic processes in the Fergana Valley, determined the total number of semi-nomadic (semi-settled) Uzbeks in the valley with different tribal structures. According to statistics for that period, the total number of Uzbeks in the valley was more than 215,000. These semi-nomadic (semi-nomadic) Uzbeks united a number of sub-ethnic groups, including ethnographic groups such as Turks, Kipchaks, Yuz, Kurama, and Ming.[12]

While there were economic ties between the settled population and the semi-nomadic population, in the process, peasant and pastoral ethnic groups played the role of "influential ethnos" due to the specialization of their farms.

CONCLUSION

In conclusion, it can be said that from the earliest stages of historical development, the relationship between the nomadic pastoral population and the settled population was determined on the basis of economic relations. The herdsman has always been in need of agricultural and handicraft products developed by the settled population. At the same time, they themselves provided livestock products such as meat, leather and wool to the oases inhabited by the settled population. The exchange of products between settled peasants, artisans, and nomadic pastoral tribes has long been established, and trade relations have developed.

ABSTRACT

This article discusses the importance and relevance of legal psychology, which is a type of psychology. In addition, the article emphasizes the importance of acquiring psychological knowledge for employees involved in legal activities, as psychological knowledge is an integral part of legal information, which not only helps to solve specific legal problems for the lawyer, but also "accusation", "criminal" the pros and cons of considering the solution of basic "criminal law" concepts such as "person" and "criminal behavior" from the perspective of legal psychology.

KEYWORDS: *Legal Psychology, Youth, Crime, Legislation, Education, Personality, Psychiatry*

INTRODUCTION

In recent years, a number of effective works are being carried out to reform the legal sphere and bring it to a new level in our country. Including, President of the Republic of Uzbekistan January 19, 2017 "On measures to radically improvement the activities of the legal service" Resolution PQ-2733[1], April 29, 2020 "On additional measures to radically improve legal education and science in the Republic of Uzbekistan" Decree PF-5987[2] accepted, public administration the bodies legal field including legal to ensure the continuity of education a number of important tasks have been identified.

In the legal field operating professionals effective with citizens while communicating the role and scope of psychology, especially legal psychology, is strong. The essence of this process consists of several interrelated aspects:

- studying people and evaluating them;

- establishing and developing a psychological connection with them;

- to give them the desired effect;

- teaching, learning, upbringing, etc..

Legal psychology – studies psychological issues related to the legal system. It has the following branches.

a) forensic psychology – analyzes the behavior, mental characteristics of the participants in the criminal process;

b) criminal psychology – deals with the behavior of the offender, psychological issues related to the formation of personality, the motives of the crime.[3]

The essence of legal psychology depends primarily on the work with the human psyche and the study of changes in his subconscious, and the role of legal psychology and its related forensic and criminal psychology in the detection of crimes is great.

The modern concept of legal psychology is a science that studies various psychological aspects of the individual and activity in the context of legal regulation, which focuses on solving and developing the tasks facing it through a systematic approach. The combination of psychology and jurisprudence contributes to the mutual enrichment of science and the solution of current problems in the judiciary.[4]

Indeed, the relevance and importance of legal psychology is paramount. The relationship of legal psychologists with individuals in the process of trial and investigation plays an important role in solving crimes.

The responsibilities and duties of a legal psychologist include:

- assessment and diagnosis of the psychological state of legal entities;

- advising the judiciary on matters of their discipline;

- development and implementation of programs of prevention, treatment, rehabilitation and integration of legal entities in society or in the penitentiary environment;

- training of legal system specialists on psychological methods and components that are useful in their work;

- social prevention measures against crime and helping victims to improve their quality of life.

It should be noted that legal psychology has different fields and is applied in criminal cases, for example, judges and is responsible for reporting to the courts of defendants and victims. Prison psychology, the study of the personality of prisoners according to psychological methods and the assessment of their temperament characteristics. The mediation tasks within it, on the other hand, are dedicated to preparing a sufficient context for the parties to interact and have more opportunities to reach an agreement.

In the case of Spain, in 2006 a structure called the Spanish Society of Legal and Forensic Psychology was established to promote and develop scientific research in the field of legal psychology.

The field of study of the influence of acmeological factors is also important in legal psychology. One of the conditions for the professional formation of specialists is the level of development of personal-professional qualities (N.A.Tigunseva)[5], a set of internal and external socio-psychological conditions of successful professional formation (O.V.Tomilova)[6], to diagnose a set of professionally important qualities that are part of the main characteristics of the person (A.V.Kokurin)[7], to study a group of psychological difficulties that negatively affect the process of formation of young employees (Yu.V.Dracheva)[8] is calculated.

The organic connection of the whole field of law with psychology and the strengthening of the rule of law, regardless of psychological factors, about the impossibility of combating crime, because any law lives and works only when people understand, want and can do it.[9] Because legal psychology is considered by psychologists to be a "frontier field of science", in the "legal" part, it is how the subject understands the subject of jurisprudence, in the "psychological" part, too, how psychological science understands its subject, emphasizes that he must understand so. The comments on the two-pronged approach to the topic of legal psychology are very interesting and in line with our opinion. According to psychologists, the subject of legal psychology is not the sum of the subjects of psychology and jurisprudence, that is, mental phenomena, processes, cases and state-legal phenomena, not separate parts of the truth in psychological color, but the psychology of state-legal phenomena as a whole, in which psychology can not be legally mechanically separated, but only the existing psychological and legal subsystems can be separated action, development, continuous communication. This unique collection includes the psychology of law in the future, the psychology of legal behavior, the psychology of the activities of legal entities and authorized persons with rights and obligations, the personality of the lawyer, etc. However, psychological components can be distinguished using a systematic approach to the topic. Processes, status, events, activities, personality behavior, communication, and so on.

There is also a significant increase in crime, which is on the rise in today's processes, as well as the development of its most dangerous forms (organized crime, sexual murder, premeditated murder, and so on) requires increasing the efficiency of the law enforcement system. On the other hand, in the process of prosecuting them, there is a growing tendency to protect the rights and interests of individual citizens and to humanize the process of investigating and prosecuting criminal cases, which determines the need for high-level professional competence of law enforcement officials. The main integral factor in ensuring the protection of individuals and organizations from criminal encroachment, observance of all legal rights and interests of citizens and groups, as well as compliance with ethical standards.

The psychological culture of a legal includes this set of psychological knowledge, including the psychology of personality and activity, the psychology of legal activity and the psychological characteristics of certain legal professions, the skills and methods of using this knowledge in professional situations in communication.

Professionals must have professional psychological qualities in order to rationally distribute their strengths and abilities in order to maintain work efficiency throughout the working day. The

recommendations of the science of psychology are of great importance in the consistent development of professional qualities such as flexibility of mind and character, sharp observation and firm memory, self-control and endurance, adherence to principles and justice, coherence and independence, which show the ways and means of their formation. At the same time, further improving the efficiency of judicial investigators requires a comprehensive, in-depth development of the psychological basis of judicial tactics, as well as other participants in the criminal process (accused, victim, witness, etc.) to study or know psychology. Psychological competence of forensic investigators "to avoid mistakes that can sometimes occur in the assessment of human behavior due to underestimation of psychological moments, sometimes leading to serious consequences" helps.

CONCLUSION

In conclusion, it is clear that the role and scope of psychology in the process of training and retraining of young lawyers is wide. Legal psychology, which is mainly recognized as a type of psychology, and its branches in related fields, it is important to rely on psychology to ensure an integral relationship between the specialist and the person, to identify and investigate the guilt of the "guilty" person, to train law enforcement officers. The main reason is that in the provision of criminal law, first of all, in the study of the causes of crime, the understanding of its nature, legal psychologists should engage in a broader scientific approach, which will serve to further develop the field. Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated June 7, 2019 on further improving the efficiency of legal psychologists in Uzbekistan "On measures to further improve the system of training in the field of psychology and the prevention of delinquency in society" Resolution №472[10] accepted, from the 2019-2020 academic year on the basis of a program of special measures with the decision On the basis of the bachelor's degree in "Psychology" introduced mechanisms for the introduction of educational areas "Management of psychological services", "Social Psychology", "Clinical Psychology", "Legal Psychology".

ABSTRACT

This article emphasizes that issues such as ensuring the well-being of the family, strengthening it, protecting the health of the population, restoring our national values, the strength of the family is a decisive factor determining the economic, social, political and national development of society.

KEYWORDS: *Education, Philosophical, Moral-Psychological, Personal Relations Ideological, Family, Avesto, Upbringing, Tolerance, Knowledge.*

INTRODUCTION

It is known that the problems in the field of family-marriage relations are characterized by their versatility. We can see from the attention paid today that the family and family relations have risen to the level of state policy in our country. Resolution of the President of the Republic of Uzbekistan dated June 27, 2018 No PP-3808 "Concept of strengthening the family in the Republic of Uzbekistan" provides for strengthening the educational potential of families, preservation of traditional family values in society, improving the spiritual and moral environment in families. caught. Indeed, issues such as ensuring the well-being of the family, strengthening it, protecting the health of the population, restoring our national values have become a priority policy of our state. The strength of the family is a decisive factor in determining the economic, social, political and national security of a society, its development. The fact that divorces and conflicts are mainly perpetrated by young families, in turn, shows that the notions of the family and its sanctity are diminishing in the minds of young people. That is why preparing young people for family and marriage relations is an important task. In this regard, it is necessary to teach young people the concepts of the family at all levels of the education system. Family relationships ensure the mental and spiritual maturity of children and also create a kind of activity for parents. In particular, due to the direct influence of children, the

range of their interests and activities expands. Family relations are not pure "personal relations". Family and family relations are directly related to the development of the state and society, their spiritual wealth. After all, the family is a key factor in raising children to be perfect human beings. Cases of violence against children in the family, sadly, worries us all. Such cases occur in families that are more vulnerable. The emergence of a problematic situation not only has a negative impact on parental relationships in the family, but also on the upbringing of children. One of the most common family conflicts is between husband and wife. So why do young people who are married to each other with the best of intentions have conflicts in their relationships after marriage? Why do they fight?

Is it possible to live a couple's life without conflicts and quarrels? Questions like these can go on and on. There is a saying among our people: there can be a home without soup, but there can be no home without conflict. Only, conflict is different from conflict. It is known that the sacred sources of Islam - the Holy Qur'an and the Hadith - reflect the views of the family and family relations. It is said in the Qur'an: "Your wives are your abode." This means that the main purpose of marriage is to have children, to ensure that they grow up to be perfect people. It is also repeatedly stated in Islamic spirituality that keeping the family honest and clean, the devotion of men and women to each other, and that immorality is a great sin. For example, it is said, "If a local woman enters a street once and commits adultery, she will be blessed for forty years." Alisher Navoi: "There is no shame in fidelity, there is no fidelity in shame. Not everyone has the faith to have these two, and not everyone believes in being human. That is, he is not a disbeliever. He wrote.

Therefore, economic prosperity cannot be achieved without spiritual maturity. Marriage is a vital necessity for every adult man and woman and is manifested as a social unit based on their mutual agreement. The strength of a family depends on the well-being of the family members and the level of the couple's family management skills. A woman has a special role in the strength of the family. After all, he is responsible for most of the family's worries. The great thinker Alisher Navoi says: "... If a husband and wife are compatible, there will be wealth and order between them. The decoration of the house is from him and the peace of the bride is from him. Husni, on the other hand, is pleasant, and his goodness is nourishing. If you are smart, your life will be disciplined and your life will be orderly and orderly. It is known that the family, which has a socio-psychological basis for influencing the formation of the individual in the family, as an integral part of society, not only performs social functions, but also reflects its own characteristics. can create the temperate climate needed to restore working capacity.

The main purpose of family life is to restore the state of interpersonal relations through childbearing, as well as to ensure the continuity of the succession of generations and ancestors, as well as the historical development of mankind on earth. Because interpersonal relationships in the family are one of the most controversial issues as an important factor in personality formation, we would like to share some of our thoughts on how parents 'relationships with their children relate to their age. The study of problems in this area, scientific research, is a very topical issue, especially today. Because the important task of the family is to continue the best traditions and customs of our ancestors, to strengthen the society by educating the younger generation. In the world, the Uzbek family has a rich history, national traditions, customs and values aimed at upbringing, and plays an important role in the formation of a person as a person and a perfect person for society. In this regard, Burhaniddin Marghinoni said: "The family is the

basis of society and the cradle of the spiritual world of man." Indeed, the family is an important social institution, a sacred place where a person's thinking, spirituality is formed, determines his place in society, preserves the national values of the people.

The Avesto, the sacred book of Zoroastrianism, is considered to be an ancient historical source as a social unit based on the natural-biological, economic, legal and spiritual relations of families. Reflected In this rare source, the Avesto pays special attention to family and marriage relations, conflicts between parents and children in family relations, and human rights in the process of family relations.[1] Initially, interpersonal relationships begin to find content in the family's interactions with parents, siblings, grandparents. Communication with brothers and sisters in the family encourages each person, ensures that the problems that he could not express to his parents are solved through relatives, prevents conflict situations.[2] This means that while a healthy family environment allows for communication, an unhealthy environment can also impede communication. If there is reliable communication and support in the family, in our opinion, it is almost impossible to face family conflicts.

In ancient times, Plato continued the idea of Socrates that all the evils of the earth are due to the selfishness of people, their uneven stratification, primarily due to the unequal conditions in the family for the upbringing of children. Parents argue that their excessive love for their children creates individualism, selfishness, and similar conflict-causing traits that deprive people of each other.[3] Undoubtedly, the role and influence of the family in shaping and, of course, elevating the unique spirituality of each nation is incomparable. The child first tries to repeat by paying attention to how the parent behaves in any situation, the culture of behavior, the actions he or she takes, and even what he or she says. A polite, knowledgeable, intelligent and hardworking, faithful child is the greatest wealth not only of a parent but of the whole society. It should be noted that in family relations, the values of self-confidence, compassion, impartiality, self-sacrifice, trustworthiness, obedience, compromise, independence, personality traits are formed in the family. In this case, the purest and purest feelings of a person are formed in the heart of the family, first of all, the first life knowledge, experience, life concepts and imaginations. If an interpersonal conflict means a disagreement between two people, a disagreement in the family, a breakdown in the relationship as a result of misunderstanding between the children and the parents, creates a conflict situation. "Conflict" is a state of disagreement or conflict, enmity, hatred, attitude, disagreement. There are basically four types of conflicts. These are:

-internal personal conflict;

- Interpersonal conflict;

- Intergroup conflict;

- Conflict between an individual and a group;

Family conflicts arise from relationships with parents in situations of internal personal conflict and interpersonal conflict. It is natural for conflicts in the family to manifest in the form of moral, economic, and domestic pressures, and to occur in interpersonal relationships with any member of the family. What causes family conflicts? What types of family conflicts differ? Depending on the origin of family disputes, they can be divided into the following main types:

1. Disputes between spouses;

2. Disputes between mother-in-law and daughter-in-law;

3. Disputes between in-laws;

4. Disputes between the Ovsins;

5. Conflicts between children;

6. Conflicts between parents and children.

Of course, this list could go on and on. We will give some of our comments on the conflicts between parents and children and the reasons for their origin.

What can cause conflicts between parents and children?

The grounds for such disagreements are:

1. Not taking into account the existing differences between worldviews;

2. Unwillingness of young people to fight with their parents for independence in the organization of leisure time, independence in the choice of friends, independence in the field of emotions, independence in the choice of profession, independence in the choice of spouse;

3. Parents abusing alcohol or committing immorality;

4. Sometimes children are not taught to work and, as a result, become accustomed to a light life;

5. Some young people forget their childhood duty;

6. Disagreements that occur as a result of insufficient level of psychological and pedagogical knowledge of parents.

7. Neglect of children, unjust punishments for insulting them

8. Family upbringing is given priority over material interests

9. Parental illiteracy

10. Financial insecurity in the family - the inability of the head of the family to provide for the family.

11. Lack of mutual respect between spouses, lack of knowledge of the culture of treatment.

12. Lack of a healthy environment in the family.

The family consists of three components according to its social content.

They consist of children as the basis of the family, marriage as a result of marriage, husband and wife as a result of marriage, and children as a result of marital relations. This means that the system of preparing young people for family marriage is also a set of these three components, the content of which is related to the explanation of the family to young people. As a result of the above shortcomings in the relationship between parents and children, there is a loss of happiness in the family; there is a coldness in the middle.

Psychologist Charles Lixon expressed his views and opinions on conflicts and the factors that cause them, and family conflict is in a sense the first point that initiates the development of the individual. Therefore, the fact that such conflicts can be assessed in a positive light emphasizes that in the process of this conflict, the attitude of the couple and the children towards it will

always be negative. After all, the family has a great influence on the moral and spiritual formation of the individual.

In this context, the existence of conflict in the family, i.e., the physical or mental treatment of children by parents, can have serious consequences. Researchers have found that the onset of conflict in children also depends on the crisis period in their youth. Psychologist in family relations V. Schuman discusses age-related conflicts, i. Conn, on the other hand, expresses his views in his research on the impact of family conflicts on children's development. [4]In most cases, parents are unaware of the crises that will inevitably occur in their children between the ages of 3-6, 13-14. The crisis of childhood to school age, the crisis of transition to primary school age, the crisis that accompanies adolescence and adolescence lead to conflict situations. B. M. Umarov's research shows that 34.8% of suicidal tendencies in adolescents are caused by "family conflicts." The results show that suicidal behavior and predisposition in adolescents are mainly due to poor psychological environment, socially contradictory behavior in parental relationships (such as quarrelsome, drunkards, drug addicts), low cultural level, authoritarian style in interactions, in families where there is physical and spiritual pressure, there are cases of misunderstanding. At this stage of the adolescence, new psychological features and changes in behavior are observed in the child's psyche. We can see this in their relationship with their parents. In order for the younger generation to rise to a level where they feel responsible for themselves and their parents, they need a very strong spiritual and psychological training. Children who are brought up by parents who keep their children away from the complexities and contradictions of life, who provide everything for their child in every field, often lack the same spiritual training, resulting in various conflict situations in the family. The role of interpersonal communication in the development of the individual is in fact embodied in the social experience of each person as his or her human image. After all, in the event of a conflict in the family, the first implies upbringing, the second implies its spiritual upbringing, the fact that both of them are carried out simultaneously with a specific goal prevents the occurrence of family conflicts.

Thus, self-confidence, compassion, impartiality, self-sacrifice, trustworthiness, obedience, tolerance, values of independence, personality traits for family relationships eliminate family conflicts and their causes.

MODEL CONCEPT MODELLING IN LINGUISTICS TYPES OF LINGUISTIC MODELS

Mamajanova Mahbuba*

*Associate Professor,
Humanities Faculty of foreign languages,
Fergana Region, UZBEKISTAN

ABSTRACT

The article discusses the interaction of the language system, its modeling through the linguistic personality, which has a three-level structure, which determines the modeling language and forms the linguistic picture of the world.

KEYWORDS: *Cognitive Science, Modeling, Worldview, Pragmatics, Structure, Level, Linguistic Personality, Linguistic Semantics.*

INTRODUCTION

Modeling - elucidation of the properties of an object by building its model. Model properties: convention image m. not only material, but also mental, and move through the means of the sign system model not only the image, but also the prototype of the original the model is most often holomorphic, i.e. many elements of the original correspond to fewer elements in the model

A linguistic model is a real or mental device artificially created by a linguist that reproduces or imitates its behavior and the behavior of the original for linguistic purposes. Linguistic modeling involves the use of abstraction and idealization. Any model is built on the basis of a hypothesis about the possible structure of the original and is a functional analogue of the originals. Ideally, the model should be formal. Model construction is an objective practical criterion for verifying the truth of knowledge in a language.

speech activity; speech works (where models are built); language mechanism; structural models - for studying and describing the internal structure of an object.; functional models - study the behavior of an object during a certain process.; dynamic models - in temporary development, are created as needed.

Types of linguistic models:

1. On the scope of the structure of the language: General (global) tend to cover the entire language: <VG> (vocabulary, grammar)

Private: phonetic model of the Russian language, model of the vowel system 2.by typological status:

- Universal seek to cover all languages of the world: <VG>

- Specific are characteristic for a certain language or a group of languages: softness - hardness of consonants rus. language (does not work in English, French)

3. by gnoseological status:

Language models: models of linguistic knowledge, various phonetic schools; linguist activity models

4. on the reflected aspect of language and speech activity:

Models differ not only in their focus on a specific object, but also in the modeling tools used (algorithm or calculus) Algorithm-strict sequence of prescriptive rules. Calculus - a set of permissive rules (the order of execution is not important) Analyzing models model the process of understanding, use a logical tool, an algorithm

- synthesizing models model the process of verbalization, the meaning of a speech segment

- generating models author Chomsky object of modeling - a set of correct speech segments are drawn up rules for distinguishing between acceptable and unacceptable; logical means - calculus

- Do not serve as an expression of meaning; at the output - chains of elements (gram. correct sentences)

- Structural models proper, the basis of all the other objects of modeling is the structure of the language as such; logical apparatus - the logic of relations and classes.

Basic theoretical requirements for the model: 1.completeness of the model - the ability to reflect all the facts for which it is designed, for the coverage of which it claims

2. Simplicity - convenience, using as few means (symbols, rules) as possible to achieve the set scientific goal

3. Explanatory power - the ability of the model to reveal the reasons for the observed facts and predict new facts (for example, models of the historical change of a word; machine translation systems are to a very small extent explanatory)

4. Adequacy - the property of maximum similarity to the modeled object can be reduced to explanatory power or set-theoretic correspondence

5. Economic - economical use of energy and time resources when applying the model

6. Accuracy - the ability to perform operations by the formal apparatus represented by the model

7. Aesthetic properties - beauty of the model

Applied criteria: the main thing is the convenience of the model. For language modeling, logical means of implementing the model (computer implementation of the model) are very important. Language modeling is central to many important natural language processing tasks. Recently, language models based on neural networks have shown better performance than classical methods, both stand-alone and as part of more complex natural language processing problems. In this post, you will learn about language modeling for natural language processing. After reading this post, you will know: Why language modeling is critical to solving problems in natural language processing. What is the language model and some examples of their use; How neural networks can be used for language modeling.

The image is a model of reality. The structure of an image is the ratio of its elements., images of objects are not considered. We build for ourselves images (models) of facts. There may be more images (models) than facts, since some images (models) are images (models) of only possible, but not actually existing facts. At the same time, the very image (model) is a fact. Models are facts too. The model and the fact being modeled have the same structure, the same logical form. That is why one can act as the image of the other; and if we want we can swap them and treat the fact as an image of the model. The image (model) can reflect any fact; but he cannot depict the very relation connecting him (model) with the fact, (see naive attitude to modeling). This relationship exists because the image (model) and the displayed have the same logical form, i.e. thanks to the logic that determines the structure of both facts and images. Each image (model) is logical.

The image (model) may or may not correspond to reality (be true or false).The logical image (model) of a fact is a thought. A sentence is a sensually perceived expression of thought (a sign, visible or audible, plus a projective attitude that connects it with the fact it represents). The boundaries of my language also mean the boundaries of my world. The language is limited by its expressive possibilities, which consist in the fact that the language is the image (model) of the world. The limit beyond which there can be no images (models) is at the same time the limit beyond which there can be no facts. For where there are facts, there are also images (models). At first glance, a sentence - for example, printed on paper - does not at all resemble the image (model) of reality about which it speaks. - But the musical notation at first glance does not seem to be the image of the recorded music ... The gramophone record, musical theme, musical notation, sound waves are images (models) of each other and, despite all the external differences, have a common logical structure.

There are similarities in the linguistic and scientific pictures of the world: they model the world in the mind of a person. However, they also have significant differences: the scientific picture of the world reflects scientific knowledge, it is the result of the activities of scientists; a naive picture of the world reflects everyday consciousness. The main characteristics of the linguistic picture of the world it is a system of all possible contents: spiritual and linguistic (determining the existence and functioning of the language itself); is a consequence of historical development; is the reason for the original path and further development of the ethnos and language; clearly structured and in linguistic expression is multilevel (includes sound structure, prosody, vocabulary, word-formation capabilities of the language, syntax, paremiological baggage); the linguistic picture of the world is changeable in time; creates the homogeneity of the linguistic essence, contributing to the consolidation of linguistic and cultural originality in the vision of the world and its designation by means of language; exists in a homogeneous, peculiar self-

consciousness of a linguistic community and is transmitted to subsequent generations through a worldview, rules of behavior, a way of life, captured by the means of language; is a transformative force that forms the idea of the world around us through language as an "intermediate world" among the speakers of this language; common cultural heritage of a particular linguistic community.

NEPAL - CHINA BILATERAL ECONOMIC COOPERATION AND ITS IMPACT TO NEPAL

Dhan Raj Chalise*

*Lecturer,
Shanker Dev Campus, Faculty of Management,
Tribhuvan University, NEPAL
Email id: sgreport2dr@gmail.com

ABSTRACT

Nepal and China have been enjoying good neighborly respects and benefit since the establishment of diplomatic relations on August 1, 1955. Both countries respect the spirit of real friendship and mutual support. Nepal has formally committed to One-China policy and committed not to allow its soil to use against China. Two countries have enjoyed and fruitful bilateral relations characterized by amity and goodwill, equally and harmony and mutual support and cooperation. They pursuit of social and economic development by exchanging cooperation in trade, tourism, investment and connectivity, building human capital and infrastructure and deepening people to people relations is at the center of Nepal-China bilateral relations. There are enormous possibilities for further promoting socio-economic transformation and raising the living standard of the people through cooperation and joint collaboration in various areas of mutual interest. Cooperation under the Belt and Road Initiative (BRI) is of great significance for Nepal and China. This paper has been conducted to examine the economic impact of bilateral economic cooperation of Nepal and China. The economic impact of bilateral economic cooperation of Nepal with China has been analyzed in terms of Chinese economic assistance, FDI inflows of Nepal from China, trade of Nepal with China and tourist arrivals from China. Descriptive and analytical research design has been applied to analysis the data by using simple statistical tools. The results show that there have been positive influences on Nepalese economy with bilateral economic cooperation of China.

KEYWORDS: *Economic Impact, Bilateral relations, Economic cooperation, Nepal and China, Evidence*

INTRODUCTION

China is one of the closest neighborhood countries and recognized as one of the biggest economic development supporter country of Nepal. The economic and political relationship between Nepal and China started with Tibet serving as the link. The 16th and 17th centuries were critical periods for the relation between Nepal and Tibet. During that period Tibet underwent an internal crisis in the competing Buddhist sects. Nepal took advantage of that situation to seize control of the vital border-pass areas through which most of the trans-Himalayan trade passed. In early 18th century, China established a presence in Tibet and became for the first time, an important factor in Himalayan area politics.

After 1950s, China began to provide economic aid and technical assistance to other countries and gradually expanded the scope of aid. Since 1970s, China has adopted the reform and opening-up policies its economy and developed rapidly, with the overall national strength growing notably. China has been doing its best to provide foreign aid, to help recipient countries to strengthen their self-development capacity, enrich and improve their people's livelihood, promote their economic growth and social progress. China has consolidated friendly relations and economic and trade cooperation with other developing countries, promoted South-South cooperation and contributed to the common development of mankind (MoFA,2014).

RESEARCH REVIEW

China has been extending sympathy, support and assistance. Nepal has been also supporting one China policy and allowing and anti-Chinese activities in Nepalese soil. Nepal respects China's sovereignty and territorial integrity with respect to Tibet and Taiwan. The scope of mutual relationship between Nepal and China has been becoming broader but it should be enhanced further in coming days (Prasad,2015).

Fukumoto (2000) has focused on analyzing the economic effects of regional cooperation for all Northeast Asian countries. As remarked by him economic benefits are analyzed based on Economical and Technical Cooperation (ECOTECH) activities which results in economic benefits in all countries, it can stimulate economic cooperation and bring about a consequent increase in regional trade. The more regional trade expands, the better the economic relations become and which enhances greater political stability within countries. Though, increasing interchange based on purely economic benefits plays an important role in constructing better political relations.

Rahman & Amin (2009) attempts to assess the potential economic gains of the regional cooperation initiative in real terms by quantifying the economic effects such as trade creation and trade diversion together with revenue and welfare effects with the help of a partial equilibrium analysis. They concluded that there have large potential for enhancing economic growth by increasing intraregional trade among the member countries and would have a positive impact both on economic and human development.

Economic cooperation between Argentina and Chile has not created the type of interdependent relationship between two countries which security analysis has usually looked for consolidating peace. The bilateral economic relationship constitutes a small portion of each country's overall economic activity. Economic cooperation was further stimulated by the adoption of neo-liberal economic development strategies by the two countries. The economic relationship between Chile

and Argentina particularly in the financial sphere which was reflected of that new relationship. Significant progress on economic cooperation could only be made after both countries adopted the view that national security dependent upon maintaining the status quo (Mares, 2000).

The European Commission has negotiated the Comprehensive Economic and Trade Agreement (CETA) with a view of establishing a state of the art and privileged economic relationship with Canada. CETA was expected to significantly improve business opportunities for European companies in Canada. CETA contains a wide range of provisions that would have direct positive impact on the ability of EU and Canadian companies to engage in closer economic relations-notably commitments on the liberalization of tariffs, investment or services, increased access to each other's public procurement markets, disciplines on intellectual property rights, geographical indications, conformity assessment, subsidies and so on (European Union,2017).

There were substantial benefits that could be reaped through greater cooperation between India and Sri Lanka in the services sector. This has been recognized by both governments and effects were made to formalize and institutionalize cooperation in the form of CEPA, the negotiations for which began in 2005. The study suggests scope for expanded cooperation for goods, investments and services by computing indices suggesting pruning the negatives lists, identifying potential investment on the basis of bilateral intra-industry trade in commodities at the disaggregate level and suggesting policies for expanding cooperation in services (Edited by Mukherji & Iyengar, 2013).

The bilateral issues of China and US prevailed that the US government interacts with China bilaterally in two basic ways The first is proactively through US policies to encourage economic reform in China and China's responsible integration into the international economy. The administration regards technical assistance as the primary channel through which it could influence economic reform in China. Similarly, bilateral intergovernmental relations were dominated by a second track of reactive trade conflict, largely a function of China's rapid growth, partially reformed economic systems and the complainant driven US trade policy making system (Noland, 1996).

Rahman et al.(2020) has remarked that the Indo-Pacific could become a powerful regional block if the South and Southeast Asia could be linked through the connectivity, maritime link, improved trade facilitation and other networks that would reduce trade costs. The findings also indicate that South and East Asian improved trade facilitation could bring huge gain as a large part of Indo-Pacific trade has remained unrealized. The trade transaction cost is one of the major trading barriers improvement in infrastructure and connectivity that leads to less trade transportation costs should be a necessary step to realize Indo-Pacific trade potential.

Chinese investments and financing have a big role to play in Nepal's infrastructure goals, but it is up to Nepal to create a conductive environment for success. The political leadership must put aside its differences with opposition parties and work together to user a new era of infrastructure propelled development

By reviewing the different research papers, it has been found that there is significant contribution and economic impact of bilateral economic cooperation in Nepalese economy. There has been economic impact of bilateral economic cooperation on assistance, trade, FDI and tourism in Nepal. The research papers have been conducted different studies unilateral and multilateral economic cooperation and relations of different country context. In the context of economic

impact of bilateral economic cooperation between Nepal and China, there have not been conducted comprehensive studies. Thus the focus of this study is to analyze the economic impact of bilateral economic relations on Nepalese economy.

Research Objectives

There have been conducted many studies toward the economic impact of bilateral economic relations as well regional relations on economy in different countries, in case of Nepal and China such bilateral comprehensive study has not been done. The general objective of the study is to analyze the existing Chinese projects of Nepal. The specific objectives of the study are as follows:

i. To extract the trade relations of Nepal and China.

ii. To ascertain the flow of Chinese FDI to Nepal.

iii. To analyze the flow of Chinese tourist in Nepal.

RESEARCH METHODOLOGY

This study is based on secondary data and descriptive and analytical research design is applied to analysis data. All analysis and discussion have been based in published source of secondary data such as Economic Surveys (2000/01-2019/20), Ministry of Finance, Ministry of Tourism, Department of Industry, Trade Promotion Center, Nepal Rastra Bank, Central Bureau of Statistics (CBS) and other different associations which are related with Relations of Nepal and China. The economic impact of bilateral economic cooperation has been analyzed in terms of tourist arrivals from China, FDI from China and trade between Nepal and China by using descriptive statistics such as table and line graph are also used to explain the data.

RESULTS AND DISCUSSION

Economic impact of bilateral economic cooperation of Nepal and China can be examined from two aspects as (i) Nepal-China Economic Cooperation and (ii) Economic Activities: Trade, Tourism and Investment.

Nepal-China Economic Cooperation

Nepal and China have formalized their relations 1st August 1955 by establishing diplomatic relations. The relations of two countries have marked by friendliness, understanding, mutual support, cooperation and respect for each other's sensitivities. The economic cooperation of Nepal-China dates back to the formalization of bilateral relations in 1950s. The first agreement between Nepal and China on economic aid was signed in October 1956.From the mid 1980s, Chinese Government has been committing grant assistance to the Government of Nepal under Economic and Technical Cooperation Program in order to implement mutually acceptable development projects. Chinese assistance to Nepal falls into three categories as: Grants(Aid Grantis), Interest free loans and concessional loans. The Chinese financial and technical assistance to Nepal has significantly contributed to Nepal's development efforts in the areas of infrastructure building, industrialization process, human resources development, health, education, water resources, sports, military empowerment etc. Existing Projects under Chinese Assistance are:

S.N.	Existing Projects
1.	Upper Trishuli Hydropower Project-power station and Transmission Line Projects
2.	Food/Material Assistance in Northern 15 bordering Districts
3.	Kathmandu Ring Road Improvement Project
4.	Larcha (tatopani) and Timure (Rasuwagadi) Frontier Inspection Station Project
5.	Pokhara International Regional Airport
6.	Upgradation of Syaprubensi-Rasuwagadhi Road
7.	Upgradation of Civil Service Hospital
8.	Upgradation of Kodari Highway and Restoration of Bordering Bridges at Kodari and Rasuwagadi

New adventures for bilateral cooperation in the mutually agreed areas has been opened after the signing of the Memorandum of Understanding(MoU) on Cooperation under the Belt and Road Initiative (BRI) on 12 May 2017. The major thrust of the MoU is to promote mutually beneficial cooperation between Nepal and China in various fields such as economy, environment, technology and culture. Similarly, the MoU aims at promoting cooperation on policy exchanges, infrastructure connectivity, trade connectivity, financial integration and connectivity of people.

The Government of China had provided substantial and spontaneous support in search, relief and rescue efforts of Nepal following the devastating earthquakes of 2015.China provided 3 billion Yuan on Nepal's reconstruction to be used in the mutually selected 25 major projects for the period of 2016-2018. The two countries signed three separate bilateral Agreements on Economic and Technical Cooperation on 23 December 2016, 15 August 2017 and 21 June 2018 for providing Chinese grant of one billion Yuan each to Nepal for implementing post-disaster reconstruction projects, livelihood projects and other mutually agreed projects.

Sino-Nepalese Relations during the 2000s

Chinese projects were equally important such as the Trolley bus service, Civil Service hospital, Ring road, and the International Convention Hall which later became the Constituent Assembly building. Chinese aid in the focused on promoting industries along with infrastructure building in Nepal to have a direct multiple effects to its aid program and indirectly decrease its economic dependence on India. Since 2014, there were tremendous increase of Chinese investments in the infrastructure, energy and other sectors of the Himalayan country. The new Chinese Belt and Road (BRI) initiative was proposed to give further momentum for China-Nepal development cooperation.

An agreement has been signed to interlink both countries linking Kerong of Tibet through Rasuwa in Nepal by railway. There is an urgent need to develop transport system between two countries and construct a dry port in Nepal in order to enhance the bilateral trade between Nepal and China. Nepal has already signed the Bilateral Investment Promotion and Protection Agreement (BIPPA) with India. BIPPA is also necessary between Nepal and China to increase the Chinese investment in Nepal.

Nepal and China Trade Relations

Nepal and China have bilateral relations since time immemorial which was officially justified by the landmark Sino-Nepal Treaty of Peace and Friendship signed on April 28, 1960. Trade and

Payments Agreement was signed between Nepal and China on May 31, 1974. The agreement had initiated and promoted the trade between the countries and open the ports for transaction of goods through Chinese ports. That Trade and Payments Agreements was followed and signed on November 22, 1981 between Nepal and China which was the replacement of trade agreement of 1974 to be enforced for three years with the purpose of further developing the friendship between two countries and strengthening the economic and trade relations. The payments of trade overseas between the two countries should be made in freely convertible currency (Department of Customs, Tripureshwor, Kathmandu, Nepal 2014).

The bilateral relation is further exemplified through a series of engagements post-2015. In 2016, Nepal and China signed the Trade and Transit Agreement (TTA). Subsequently, Nepal became one of the first countries to join China's Belt and Road Initiative (BRI), the latter's trillion dollar plus to expand its global influence. Moreover, since 2018, the two neighbors have been negotiating a number of railroads and transmission line projects.

Trade and other related matters treaty was signed on July 10, 2002 for further development of friendly and good neighborly relations. The agreement remained in force for ten years and can be renewed automatically further for same period unless it is terminated by either party. Nepal and China have signed a Transit Trade Treaty and Nine other pacts March 22, 2016 for using northern port facility, building a regional international airport in Pokhara and exploring the possibilities of signing a bilateral free trade agreement and finding oil and gas reserves in Nepal.

Trade Status of Nepal with China

China is the second largest trade partner country of foreign of Nepal. Nepal's foreign trade with China has been increasing after 2006s. The ratio of foreign trade of Nepal with China ranges from 7.41 percent to 13.70 percent during the study periods. The foreign trade of Nepal with China has been shown in the Table-1:

TABLE-1: TRADE RELATIONS OF NEPAL & CHINA FROM2006/07-2018/19.(RS. IN TEN MILLION)

Year	Total Trade Rs.	Trade with China	Ratio to Total Trade (%)	Import from China	Export to China	Trade Balance

Table-1 represents the total volume of foreign trade, total trade with China, import trade from China, export trade to China and trade balance of trade between Nepal and China from 2006/07 to 2018/19.

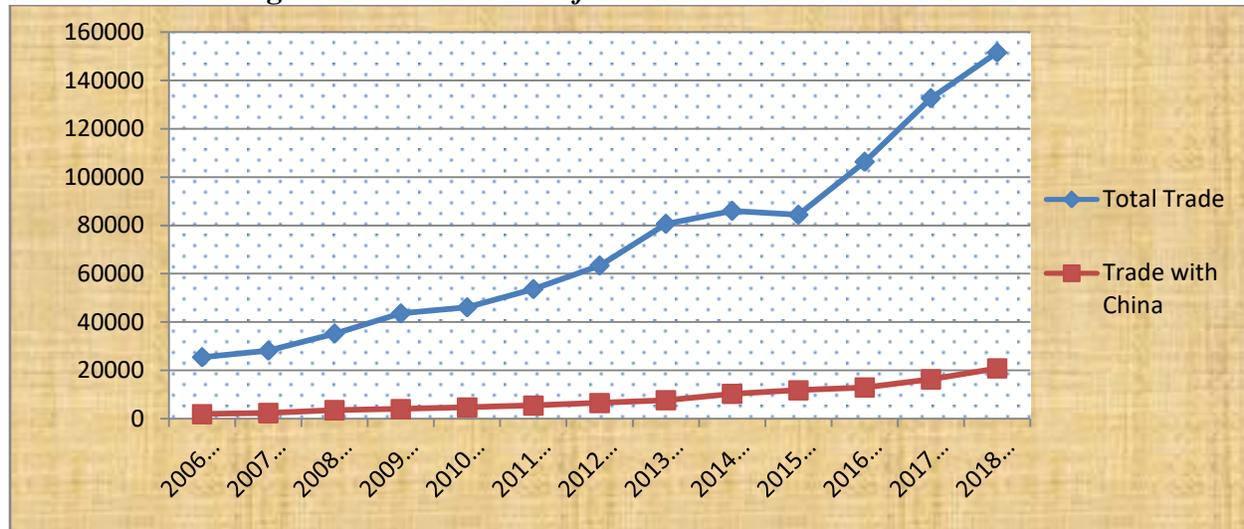
Figure-1: *Total Volume of Trade & Total Trade with China*


Figure-1 depicts the total volume of foreign trade and total trade with China. The trends of total volume of foreign trade and total trade with have been increasing during the study periods.

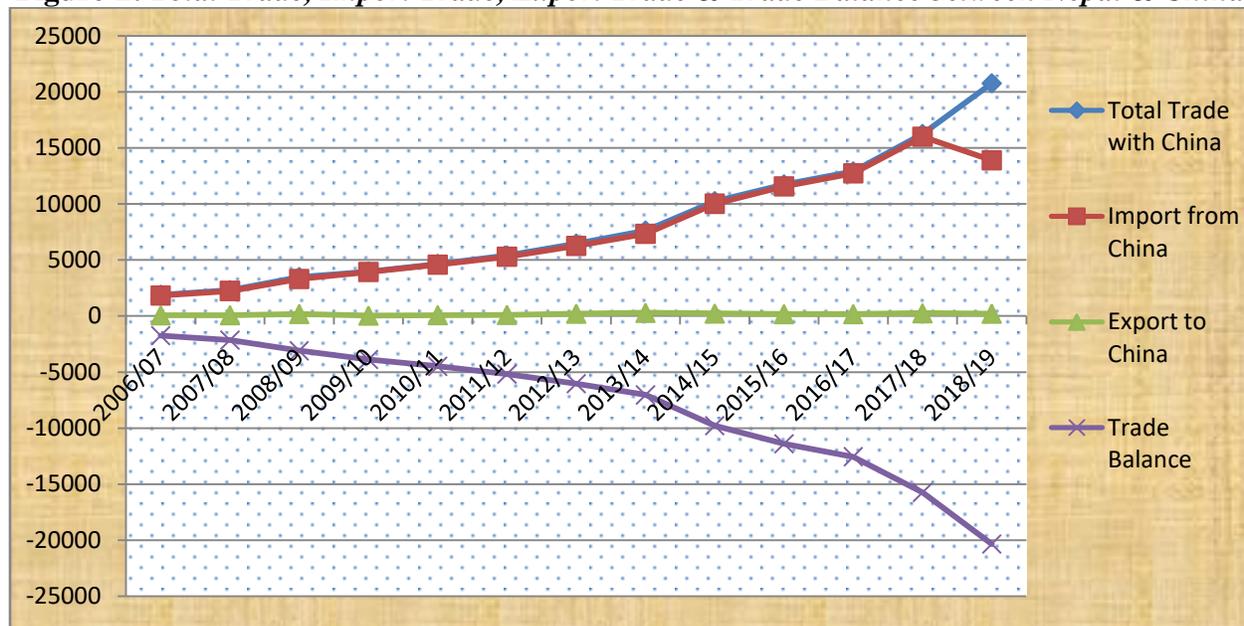
Figure-2: *Total Trade, Import Trade, Export Trade & Trade Balance between Nepal & China*


Figure-2 depicts the total trade, import trade, export trade and trade balance of Nepal and China from 2006/07 to 2018/19. The export trade of Nepal to China is insignificant in comparison to import trade from China. The trade deficit of Nepal has been expanding during the study period.

Foreign Direct Investment Relations of Nepal and China

Foreign direct investment of Nepal has one of the major components of economic development and prosperity of Nepal. The flow of FDI of Nepal has increased after 1990s while Nepal introduced the Foreign Investment and Technology Transfer Act (FITTA) in 1992. The liberal and open economic policy invites the foreign capital of Nepal. After 2000s, the trends of Chinese FDI have significantly increased. Since last decades, Chinese FDI stands the biggest position of Nepal. China's investment in Nepal in the form of foreign direct investment (FDI), humanitarian assistance and development aid in the recent past has reconfigured the geopolitical relationship between Kathmandu and Beijing (Table-2).

Table-3 represents the FDI projects and investment of top ten counties in Nepal upto 2019/20.China stands the first rank in projects and investment and India stands second rank in both parameters. Similarly USA stands third position in projects but South Korea stands the third position from the side of investment. Till the date, there are all together 4 thousand 5 hundred 65 FDI projects under which total investment depicts Rs.33693.52 ten million generating 1,93,934 employment opportunities from the existing FDI in Nepal.

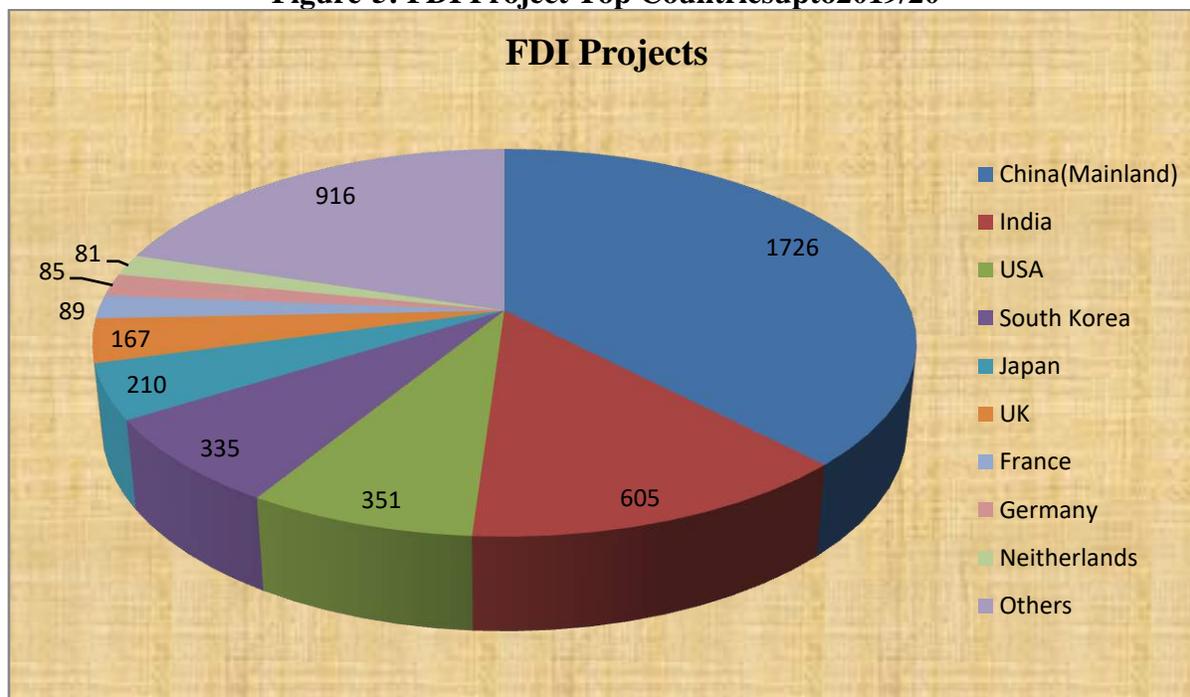
Figure-5: FDI Project Top Countriesupto2019/20


Figure-5 depicts the status of FDI projects of top countries up to 2019/20. China ranks the highest position of FDI in Nepal and India stands the second position.

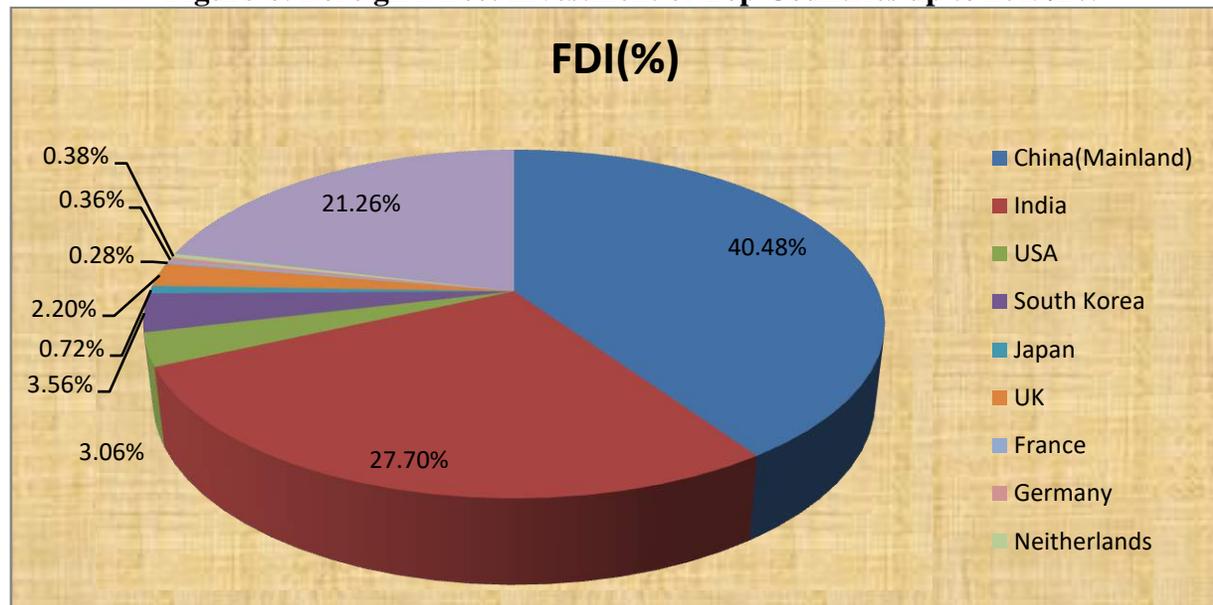
Figure-6: Foreign Direct Investment of Top Countries up to 2019/20.


Figure-6 depicts FDI of top countries in Nepal. Chinese FDI is the biggest investment which covers 40.48 percent and Indian FDI stands second biggest which is 27.70 percent as well.

Tourism Relations of Nepal and China

Tourism industry is one of the most potential areas for economic development of Nepal. By developing tourism industry, Nepal can boost its economy with small investment. China is the second tourism arrivals country of Nepal. After 2000s, the flow of Chinese tourist arrivals has been increasing (Table-4)

TABLE-4: TOTAL TOURIST ARRIVALS & TOURIST ARRIVALS FROM CHINA FROM 2006/07-2019/20.

Year	Total Tourists	Chinese Tourists	Ratio to Total (%)
2006/07	383926	17538	4.57
2007/08	526705	28618	5.43
2008/09	500277	35166	7.03
2009/10	509956	32272	6.33
2010/11	602867	46360	7.69

2012/13	803092	71861	8.95
2013/14	797616	113173	14.19
2014/15	790118	123805	15.67
2015/16	538970	66984	12.43
2016/17	753002	104005	13.81
2017/18	958532	104664	10.92
2018/19	1173072	153633	13.10
2019/20	1197191	169543	14.16

Source: *Economic Survey 2019/20.*

Table-4 states that the flow of Chinese tourist arrivals of Nepal from 2006/07 to 2019/20.The trends of Chinese tourist arrivals has been increasing in the study periods. China stands 4.57 to 14.16 percent of total tourist arrivals of Nepal during the study periods.

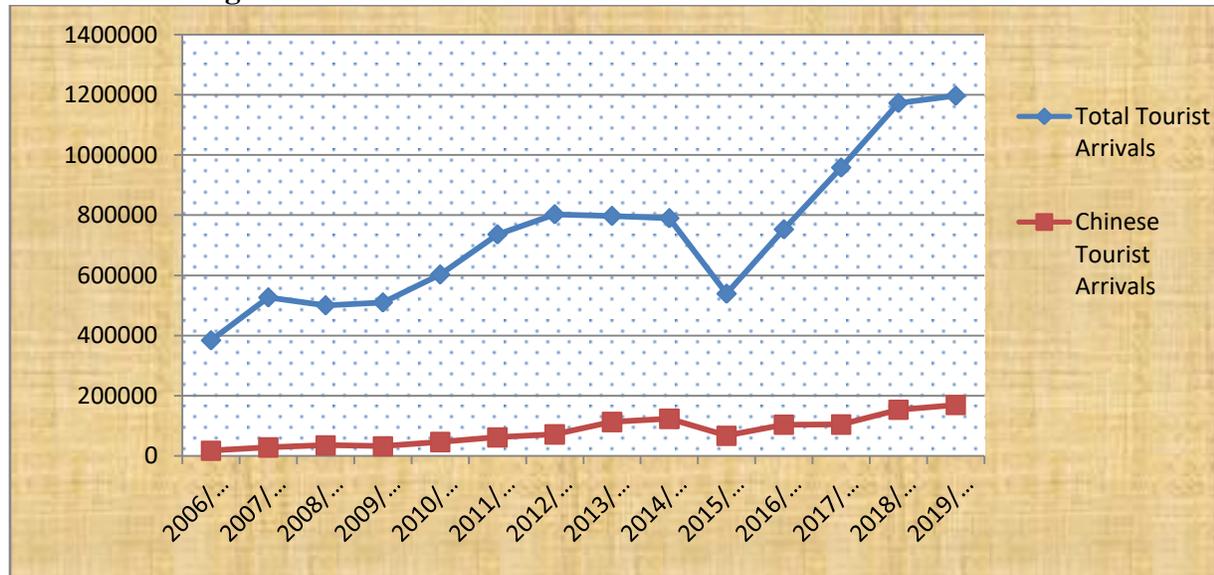
Figure-7: Total Tourist Arrivals & Tourist Arrivals from China


Figure-7 depicts the total tourist arrivals of Nepal and tourist arrivals from China from 2006/07 to 2019/20. The arrivals of Chinese tourists have has been increasing trends. The trends show that China is one of the largest potential countries of tourist arrivals of Nepal. Nepal needs improvement in tourism facility to attract large number of Chinese tourists.

CONCLUSIONS

China is one of the closest neighborhood countries of Nepal. China is also recognized as one of the biggest economic development supporter country of Nepal. Nepal took advantage of that situation to seize control of the vital border-pass areas through which most of the trans-Himalayan trade passed. China has been extending sympathy, support and assistance. Nepal has been also supporting one China policy and allowing and anti- Chinese activities in Nepalese soil. Chinese Government has been committing grant assistance to the Government of Nepal under Economic and Technical Cooperation Program in order to implement mutually acceptable development projects.

Nepal and China have made significant achievement in promoting bilateral cooperation in the fields such as building infrastructure, advancing connectivity and deepening people to people exchanges. There are enormous possibilities for further promoting socio-economic transformation and raising the living standards of the peoples of our countries through enhanced cooperation joint collaboration various areas of mutual interest. China is the second largest trade partner country of foreign of Nepal. Nepal's foreign trade with China has been increasing after 2006s. The ratio of foreign trade of Nepal with China ranges from 7.41 percent to 13.70 percent during the study periods. The export trade of Nepal to China is insignificant in comparison to import trade from China. The trade deficit of Nepal has been expanding during the study period.

Foreign direct investment of Nepal has one of the major components of economic development and prosperity of Nepal. The liberal and open economic policy invites the foreign capital of Nepal. The trends of Chinese FDI have significantly increased. Chinese FDI stands the biggest position of Nepal. Tourism industry is one of the most potential areas for economic development of Nepal. By developing tourism industry, Nepal can boost its economy with small investment. China is the second tourism arrivals country of Nepal. The arrivals of Chinese tourists have has been increasing trends. The trends show that China is one of the largest potential countries of tourist arrivals of Nepal. Nepal needs improvement in tourism facility to attract large number of Chinese tourists.

ABSTRACT

The article analyzes the essence and relevance of food security and analyzes the measures taken to ensure food security in Uzbekistan in the context of a global pandemic. The current state of agriculture and food industry in the Republic of Uzbekistan requires new approaches to the formation of state policy.In recent years, several measures have been taken in the Republic of Uzbekistan to strengthen food security. At the same time, in the face of growing global risks, it is important not to stop there, but to continue work on the development of the agro-industrial complex and strengthening the country's food security. Thus, food security is one of the key components of the national development plan, as it is associated with a wide range of socio-economic, demographic and environmental factors.

KEYWORDS: *Food Security, Food Consumption, Food Crisis, Food Shortages, Domestic Market, Consumption Norms.*

INTRODUCTION

Food security is one of the most serious challenges facing countries around the world today.According to the UN, 815 million people are currently starving, and by 2050 this number will reach 2 billion. reaches. 12.9% of them live in developing countries.Forty-five percent of deaths among children under five are due to malnutrition.Today, 3.1 children die each year as a result [3]. The concept of food security was first proposed at the World Food Summit in 1974, which means that "the world always has sufficient stocks of basic foodstuffs to ensure sustainable growth in food consumption and compensate for changes in production and prices" [2].Today, food security is considered a comprehensive concept, including the availability of safe and quality food for the population and their purchasing power [1]. Thus, food security is one of the key components of the national development plan, as it is associated with a wide range of socio-economic, demographic and environmental factors. Population growth, growing demand

for land and water resources, growing demand for energy resources, and climate change are major food security challenges.

MATERIALS AND METHODS

Achieving sustainable long-term food security is an important task that is interconnected with the macroeconomic, political and social achievements of the Republic of Uzbekistan.This is difficult to achieve without addressing major macroeconomic and agricultural problems.To achieve food security, it is necessary to develop and implement comprehensive institutional policies to ensure continuous and sustainable economic growth in agriculture and poverty reduction.As the population grows and resources, primarily land resources, are limited, their per capita area is shrinking from year to year.In particular, in recent years there has been a shortage of land suitable for agricultural production in the republic.As of January 1, 2019, the average agricultural land per capita in the country was 0.61 ha.20.2 million for agriculture, only 20.7% of the land is irrigated.The use of land in agriculture is largely dependent on the availability of irrigation.Over the past 15 years, the amount of irrigated land per capita has decreased by 24% (from 0.23 to 0.16).This situation has arisen as a result of population growth, reduced water supply and the transition of agricultural eras to other categories of land.Irrigated land is projected to decline another 20-25 percent over the next 30 years [4].

Also, with today's global coronavirus pandemic, food security problems could be exacerbated and exacerbated, leading to even more negative consequences.Three international organizations - the Food and Agriculture Organization (FAO), the World Health Organization and the World Trade Organization - have released a joint statement warning of the dangers of responding to a pandemic that threatens global trade and food security.It is argued that a lack of confidence in an adequate food supply can lead to a wave of export restrictions, creating a deficit in the global market.At the same time, experts from FAO, WHO and WHO warn that a change in the balance between supply and demand for food will lead to a sharp rise in prices and an increase in their volatility [5].

Therefore, today food security is an important element of the national security of countries. The success of any state depends on its ability to provide all segments of the population, regardless of any international situation, with safe and high-quality food in the amount necessary for an active and healthy lifestyle. Filling the domestic market with food, achieving self-sufficiency in their production and ensuring food security is one of the priorities in the development of agriculture, which is an important sector of the economy of Uzbekistan. The current state of agriculture and food industry in the Republic of Uzbekistan requires new approaches to the formation of state policy.In recent years, several measures have been taken in the Republic of Uzbekistan to strengthen food security. The ongoing reforms have made a positive contribution to ensuring the country's food security and strengthening its place in the world, thanks to which the country is gradually improving its position in the world.In particular, the implementation of these requirements will be facilitated by the "Strategy for the Development of Agriculture of the Republic of Uzbekistan for 2020-2030", approved by the Decree of the President of the Republic of Uzbekistan dated October 23, 2019, No. UP-5853.

Of the Republic of Uzbekistan, aimed at the implementation of major reforms aimed at increasing the competitiveness and development of the agricultural and food sectors of the Republic of Uzbekistan. At the same time, in the face of growing global risks, it is important not

to stop there, but to continue work on the development of the agro-industrial complex and strengthening the country's food security. In this regard, at the video conferences chaired by the President of the Republic of Uzbekistan Shavkat Mirziyoyev on April 8 and 14 this year, specific tasks were set to analyze the effectiveness of work on the ground in combating the coronavirus pandemic and ensuring food security, the development of home gardens, which is an important source of growth. employment and income of the population, as well as an increase in the production and export of food products.In particular, it was noted that to ensure the volume and diversity of agricultural products, increase in 2020 the volume of production in horticulture and livestock breeding by 2 times, efficient use of every centimetre of row spacings, repetitive areas in gardens and vineyards, yield 2-3 times, as well as to increase the volume of production, it is necessary this year to fully develop 124 thousand hectares of land freed from circulation.Also, the head of our state has given instructions to increase the volume of fish production by 350 thousand tons this year, by 5 times the production of honey, and to fatten 382 thousand boxes of silkworms. The importance of introducing modern agricultural technologies in the field of rational use and increasing the fertility of land resources, the effective use of irrigation and water-saving technologies are emphasized. Also, attention was drawn to the need for a pre-planned development of selection and seed production to provide agriculture with the necessary reserves, to achieve high yields.Solving these tasks will create a "safety cushion" for uninterrupted food supply to the population, preventing shortages and rising prices for it, protecting the population from external factors such as the coronavirus pandemic, the global recession, and the food crisis. To ensure the achievement of the above results, the system of state order for cotton was cancelled, the tax rate for the use of water resources was reduced by 50% in terms of volumes used for irrigating agricultural land, the deadline for individuals to pay property tax and land tax was extended until October 15, 2020, established that all costs associated with irrigation and reclamation activities are fully covered by the state budget.The funds for gardening and viticulture have been allocated 300 billion soums for the development of empty and wetlands. A mechanism has been introduced for the allocation of subsidies for pedigree livestock up to 2 million soums, for pedigree sheep and goats - up to 400 thousand soums. For the implementation of projects on livestock, poultry, fish farming and rabbit breeding, a mechanism has been established to guarantee up to 50 percent of the loan amount up to 20 billion soums issued by commercial banks.In addition, to ensure efficient use of land and prevent large crop losses, the program "Every family is an entrepreneur" provides for the establishment of greenhouses for 1-1.5 hundred square meters for at least 100 apartments in each sector. separated. An effective system has been created for the supply of fruit tree seedlings, vegetable seeds and other material resources to low-income and homeless families, as well as the supply of home-grown products to domestic and foreign markets. It should be noted that the cultivation of crops in the field will not only contribute to strengthening food security in our country but will also be an additional source of income for the population. In short, today the sources of funding for all activities are fully resolved, and an incentive mechanism that did not exist in previous years is working.

CONCLUSION

In conclusion, it should be noted that at a time when the risk of food shortages is growing around the world, Uzbekistan is taking important and necessary measures not only to meet domestic demand but also to increase the supply of food to foreign markets.

THE STATUS OF TURKESTAN ISLAMIC SOCIETY ON THE EVE OF THE RUSSIAN INVASION

Shuxrat Ergashev*

*Senior Researcher,
Candidate of Historical Sciences,
The Institute of History of the Academy of Sciences,
The Republic of UZBEKISTAN

ABSTRACT

The article is devoted to the analysis of some aspects of the Islamic society of Turkestan on the eve of the invasion of the Russian Empire. The Russian invasion took place at a time when the Islamic community in Turkestan was experiencing a crisis. The author seeks to reveal the historical reasons for this process, to justify the need for reform in Turkestan society. According to the author, Islamic fanaticism, its closeness to debates and doubts, had an impact on the social and political life of Turkestan, the mentality of the peoples here, became one of the causes of backwardness and ignorance, and eventually the Russian invasion.

KEYWORDS: *Russia, Turkestan, Empire, Islam, Muslim*

INTRODUCTION

In the second half of the 19th century, on the eve of the Russian invasion, there were three independent states in Central Asia - the Bukhara Emirate, Khiva and Kokand Khanates, which were far behind the development. This was partly due to the Islamic culture of the time and the mentality formed on its basis.

In the process of its emergence and in the early period of its development, Islam had a very positive impact on historical development. The Christian and Islamic worlds, which are side by side, in most cases in competition, are not just at war with each other. They learned a lot from each other, enriched each other in science, culture, technology, including military equipment, handicrafts, agricultural production, art and architecture. In this interaction, the predominance was on the side of the Muslims in the twelfth and fifteenth centuries, so that Europe adopted many aspects of Arab-Islamic civilization. But with the advent of the Renaissance and then the

Enlightenment in Europe, the situation changed dramatically. Cultural and historical leadership has now shifted to the West [1. P 30].

MATERIALS AND METHODS

One of the main reasons for this was the attitude towards rationalism. It is well known that there is rationalism in all civilizations, but its level varies. An important indicator of the development of rationalism is the achievements of science and philosophy. In the thirteenth century, the rise of fanaticism in the Islamic world and the prohibition of the interpretation of the Qur'an and Sunnah were a powerful blow not only to criticism but also to rationalism. Science gradually declined, and mysticism took a central place in philosophy [2.P. 96].

Turkestan, which converted to Islam, became one of the major centers of Arab-Muslim culture and science. Along with world-famous scholars such as Imam Bukhari, Imam Termezi, Imam Moturidi, NajmiddinKubro, Khoja Ahmad Yassavi, Muhammad Khorezmi, Ahmad Fergani, Abu Nasir Farobi, Abu RayhanBeruni, Abu Ali ibn Sino, Mahmud Zamakhshari, AlisherNavoi, Mirzo Great figures of science and literature such as Ulugbek and Mirzo Babur emerged. The advent of Islam has led to a global shift in paradigms in the worldview of the Turanian peoples. There were drastic changes in the worldview, moral, cultural and spiritual orientation of the peoples of Turan, who converted to Islam, and a new culture with a completely different spiritual and philosophical basis began to take shape.This religion put an end to the spiritual and cultural fragmentation of many peoples and nations and accelerated the process of their formation as a single nation. Islam's tolerant approach to the customs, traditions, rituals and principles of the peoples of Turkestan ensured the success of this complex process.

But the intellectual depression in the history of Muslim nations, which began in the thirteenth and fourteenth centuries, also led to an economic and political crisis in the sixteenth century. Especially the magnificent civilization of Central Asia, completely isolated from the rest of the Islamic world, faced a deep intellectual crisis in the seventeenth century, and the region, once an important cultural center of Islam, became a hotbed of narrow-minded fanatics and uncompromising ignoramuses.

Also, the ongoing civil wars have in a sense led to the destruction of the economy, the crisis of urban life, and even the desolation of a city like Samarkand, leading to a serious structural transformation of Islam as a confessional organization.Despite the occasional crisis in the khanates, Islam retained its position in the field of practical law, politics and social spheres. The annexation of a large part of Central Asia in the 18th century to the pursuit of the short-lived empire of King NadirshahAfshar of Iran was a turning point for the subsequent historical development of the region. The assassination of the founder of the last great state in the Islamic world in 1747 and the ensuing civil war in Iran marked the chronological boundary of the process of centralized state formation in West Turkestan [3. S. 18, 42, 63].

In Bukhara Mangits, in Khiva Kungrad took power and formed their own state. The Kokand khanate gained full independence; thousands strengthened their power and expanded its territory. Although there have been some positive developments in the development of these states during the eighteenth century, they have not been able to fully emerge from the general crisis that has engulfed the Islamic world and is intensifying. Because it was not just a political crisis in Turkestan. In fact, it was a crisis of the idea of Islamic unity, an idea that once called many people's living in the region from the Arabian deserts to the Chinese border to cultural unity.

Such a crisis, which began after the Reformation that shook the Catholic world in Europe, was overcome by the process of formation of nations and nation-states after the Age of Enlightenment. In the Islamic world, however, this process was accompanied by an intellectual crisis and created the conditions for the conquest of Muslim countries by Europeans. The process of nation-building in the Muslim world has largely been associated with the formation of nation-states. By the 19th century, science was completely suppressed by fanatical priests in Turkestan, who were afraid of losing their status, and secular education was destroyed. During this period, for example, in Bukhara, science, philosophy, ethics, social views, in general, the whole spiritual life of Bukhara was subordinated to religion and was associated with it. Abu Nasr Kursavi, a Tatar reformer educated in Bukhara at the time, developed his own program for reforming the Bukhara education system, arguing that Aqeedah [4] and Kalam [5] should be removed from the madrassa curriculum and that Islam should be studied only through the Qur'an. His opinion provoked strong protests from a large number of Bukhara scholars. They considered it necessary to read all 7 or 8 religious books. At a meeting between Kursavi and Bukhara scholars, a fatwa was issued stating that Muslims would be considered "apostates" and sentenced to death if they did not read 7 or 8 religious books. Abu Nasr Kursavi was arrested [6. P 21-22]. This suggests that Muslim schools, once a source of progress and high culture, became a hotbed of scholasticism and obscurantism during this period, and that the majority of the population lacked a broad sense of secular knowledge and literacy. The situation was especially deplorable compared to European countries. For example, at the beginning of the 16th century there were large printing houses in 12 European countries, which published 40,000 books a year. Until the 18th century, most scholars considered printing to be unclean. Every text related to religion was considered sacred, so it had to be copied and bound by the calligrapher gradually, lovingly [7. P 10].

That is why the printing and printing of books in Tashkent called stone printing appeared only in the late XIX century. At that time, for example, in Leipzig, Germany, there were 200 printing houses, as well as paper mills, binders, and typefaces. In Europe, the method of book publishing invented by Johann Gutenberg in 1445 was mastered by us almost 450 years later. It was not until the end of the nineteenth century and the beginning of the twentieth century that sane Muslim scholars realized that some of the prohibitions of the Shari'a hindered social progress. In Egypt, the country's chief mufti, Muhammad Abdo, only tried to adapt Islam to the demands of a new, bourgeois way of life in the late 19th century. In his fatwa in 1899, he justified the possibility of interest-bearing loans for Muslims as well, and allowed banks to invest and profit from capital. Many historians say that this was the beginning of reforms in Islam, which, unfortunately, ended mainly with some minor changes, mainly in the field of Sharia. A complete reform, such as the Reformation in Christianity in the sixteenth century, was not carried out in Islam. Islamic teachings, which were acceptable for agrarian relations and the civilization formed on its basis, were not adapted to the needs of industrial civilization, which was also entering Muslim countries. The conquest of Central Asia by Tsarist Russia made the issue of reforming Islamic values in the region even more urgent. But compared to the situation in the West, which had advanced sharply by this time, Russia itself needed reform. For example, to determine the level of literacy in the Russian Empire in the early twentieth century, many rely on the results of the 1897 census, which was also recognized by foreign scholars. According to it, 21.1% of the population was literate, including 29.3% men and 13.1% women [8. S 244].In the second half of the 19th century, efforts were made to reform traditional Muslim schools in Islamic countries as

well. Like other Muslim nations within the Russian Empire, this process gradually spread among the peoples of Turkestan. The need for such a reform was such that the content of teaching in Muslim schools did not meet the requirements of the new era, the emerging industrial civilization. Mahmudkhoja Behbudi, one of the founders of school reform who understood how far Turkestan had lagged behind in development, spoke enthusiastically about Beirut universities, which teach German, French and English, are taught by French and English teachers, have chemistry laboratories and operating rooms. "Young people from all over the world, except Turkestan, study here," [9] wrote M. Behbudi.

During this period, the Islamic concept of foreign economic relations also hindered the development of bourgeois entrepreneurship among Muslims. In the Islamic states, including the Central Asian khanates, the policy was pursued in complete opposition to the economic policy of the Western European countries. During the development of the first capitalist relations in the countries of Western Europe (1500 -1750) the state pursued a policy of mercantilism, and it played a major role in the decision-making of new methods of production. The basis of this policy is the desire to have an active balance of trade in foreign relations, in which to sell more and buy less goods abroad, to protect their industry through protectionism, and the introduction of high customs duties on imported goods, and to encourage local producers. And, finally, to encourage the expansion of their traders, that is, their conquest of new markets.

Based on the Islamic concept of the "sanctity of trade," Muslim scholars believed that the prosperity of a country was determined by the abundance of consumer goods in the domestic market. In this way, imports were encouraged and exports were restricted. The government did not oppose the import of any foreign goods. Even more surprisingly, foreign traders, especially those engaged in imports, were given various privileges. As a result of this policy, local production and handicrafts naturally fell into disrepair, and the state was deprived of protectionist protection in competition with foreign producers. The competition was even stronger with Russian goods, which were lagging behind the Europeans, and the products of their factories and plants were of better and cheaper quality than our handicrafts.

This approach to trade has led to the formation of a system of huge incentives for foreign traders. These privileges to foreign traders gave them an advantage in competing with local businessmen and traders, and gave the local peoples an idea of the superiority of the West in all spheres, as well as a sense of impossibility and submission. The state of Islamic teaching at that time was imbued with the spirit of fatalism, which for another reason hindered social progress. Muslims believed in concepts such as destiny, destiny, and risk more than members of other religions.

RESULTS

According to Islamic teachings, the destiny of every person is predetermined by Allah, "written on the forehead" from birth, and it is inevitable. This put an end to people's desire to know the world, to innovate, to improve their position in society and living conditions. Blessings and the constant inculcation of common gratitude in the minds of the people weakened their desire to change their lives, and created a psychology of helplessness and apathy. Islamic fanaticism, its closeness to controversy and suspicion, has had an impact on the social and political life of Islamic countries, on the mentality of the peoples here. During this period, the new worldview formed in European countries, democratic ideas, the vast opportunities opened up for human freedom, entrepreneurship and initiative were not settled in Islamic countries. The intellectual

integration of the advanced part of the world, as well as new economic, social and political processes, and the revolutionary aspirations of the people to build a decent life, bypassed the Islamic world. The society, accustomed to living under the unconditional domination of a single creed, accepted the colonial invasion and even its chauvinistic policy of discriminating against the local population without much resistance.

CONCLUSION

Therefore, before the Russian invasion, Turkestan did not have a local elite based on the principle of mutual solidarity. At least the advanced part of the society did not fully realize the current status of slavery of itself and the people, the danger that traditional society retains, and failed to inculcate in society the need for reform.

ABSTRACT

This paper examines the problems associated with the reflection of liabilities in accounting records in insurance organizations as well as the inadequacy of mutual proportionality in the reflection of liabilities in financial statement forms and recommendations for their elimination have been made. At the same time, it is necessary to stratify the insurance portfolio, excluding the possibility of using incomparable indicators.Insurance liabilities as an accounting object have their own value, which must be estimated.

KEYWORDS*: Insurance, Obligation, Account, Assessment, Insurer, Insurer, Insurance Premium, Insurance Accident, Insurance Coverage, Loss In Insurance, Insurance Franchise.*

INTRODUCTION

In the development and development of the country's economy, it is important to reduce the amount of obligations of economic entities, including insurance organizations. Obligations directly affect the financial position of economic entities and their solvency. Therefore, determining their level and compliance with the deadlines of Return are considered important issues of weight loss. The existence of problems associated with the reflection of liabilities in the accounting records in insurance organizations, the problem of the methodological basis for the proper assessment of the amount of liabilities, the lack of mutual proportionality on the reflection of liabilities in the forms of financial statements does not provide an opportunity to make management decisions based on such circumstances. This in turn means that the study of the issues of improving the accounting performance and its audit organization of obligations in

insurance organizations and the development of appropriate proposals and recommendations is urgent.

The theoretical and methodological problems of accounting and audit of liabilities were mainly dealt with by foreign economists and research was carried out.These include H. Anderson, T.G. Lantseva, D. Caldwell, N.P. Kondrakov, B. Needles, Yu.V. Sokolov, T.P. Karpova, V.F. Paliy, M.L. Pyatov, A. Yu. D. Sheremet, T. G. Lantseva, T. Shishkova and others.The theoretical problems of calculating and analyzing liabilities have been partially studied in textbooks, monographs and textbooks created by the republic's economists, as well as in published scientific articles and dissertations.For example, O. Bobozhonov, A.V. Vokhobov, A.K. Ibragimov, A.T. Ibroksimov, A.A. Karimov, S. Maksmudov, B.A. Khasanov, M.K. Pardaev, A.Kh. Kozlov. In the works of Pardaev, K.B. Urazov, A. Tuychiev, the problems of improving the theoretical and methodological aspects of accounting and analysis of obligations are investigated [3-5].

It should be noted that the theoretical and methodological problems of liability accounting and auditing in insurance companies are not considered in the scientific works of the above economists, and the existing regulations are not studied in detail, taking into account the changing conditions of economic modernization.In general, the methodological problems of liability accounting and auditing in insurance companies are not sufficiently studied, which indicates the need for in-depth research in this area.

MATERIALS AND METHODS

Obligation-the norms of civil law – is the most common form of social relations, regulated by civil legal relations. Obligation is a legal relationship, in which one party (borrower) is obliged to perform a certain action in favor of the other party (creditor), for example, to transfer property, perform work, provide services, pay money, or to withdraw from a certain action, while the creditor has the right to demand from the debtor the fulfillment of his obligations. The requirements for the performance of obligations are related to their essence and are expressed in the law as follows: the obligations must be fulfilled accordingly and within the established period in accordance with the law and the contract instructions, and in the absence of such instructions – in accordance with the requirements that are usually imposed. The term and method of performance of obligations are established by law or by contract. According to the current legislation, the methods for ensuring the fulfillment of obligations include: fine, pledge, guarantee, guarantee, deduction.

Thus, by means of obligations, the entrepreneur, having wisely organized his business, provides him with all the necessary things, sells his own commodity(work and services), and as a result, fulfills the obligations that arise before other persons.From the point of view of accounting, the obligation is reflected in the event of economic activity, this information should be provided to the users of the financial report. In turn, the circumstances of the occurrence, change and reversal of liabilities are determined by the general approaches in the financial statement.

In our country, the concept of liability is approached from the point of view of the Civil Code, which does not fully correspond to the classification, assessment and reflection of obligations in accounting.In adapting the national accounting system to international standards, there are problems with the assessment, classification and recognition of liabilities, which are one of the important objects of accounting.The National Accounting Standard of the Republic of Uzbekistan, entitled "Conceptual (Principled) Framework for the Preparation and Presentation of

Financial Statements," states that an obligation usually arises when an asset is received or from the moment the entity enters into an asset purchase agreement.The above procedure does not limit the concept of liabilities.The convenience of this procedure can be applied both in developed and underdeveloped countries, and in large or small insurance companies.

These views can be characterized as the interpretation of obligations in the accounting rules introduced in the Republic of Uzbekistan, which does not allow insurance companies to cover the entire range of obligations in accounting.

The accounting subject is defined as "property, liabilities and business transactions of organizations."

However, in the Accounting Law, the category of "liability" is defined in a much narrower sense as accounts payable.As a result, it will be impossible to disclose the full content of the obligation. Developing this issue, the Russian economist A.S. Bakaev notes that the obligation under the current accounting rules is the existing debt of the organization at the reporting date, the result of projects implemented in its economic activities, and calculations on them should lead to an outflow of assets [2].

Liabilities are considered from the point of view of economic analysis, according to economists Abdullaev YA, Ibragimov AT, Rakhimov MR, "enterprises understand obligations to the other party, all types and forms of debt" [3].According to O.B. Bobodjonov and K. Jumaniyazov, "liabilities are debts (creditors) that arose in the reporting period or in previous periods, and their repayment (that is, repayment) leads to a decrease in economic benefits, that is, a decrease in available assets.The obligation arises as a result of the performance of the subject of various agreements and is the legal basis for future payments for goods, services and work performed "[4].

In this regard, economists A.A. Karimov, F.R. Islamov. and Avlokulov A.Z. expressed the following opinion: payment and other obligations or obligation to refrain from certain behavior "[4].

This topic was also analyzed in detail by the economist A. Tuychiev and developed his own definition.According to him, an obligation is a legal relationship in which an economic entity transfers property to another person, performs work, provides services, pays money and acts as a result of another transaction.Many economists divide obligations into long-term and current ones.According to a group of economists, long-term liabilities are liabilities that do not require their use to pay for current assets during the next business cycle or the next reporting year (whichever is longer) [5].

Short-term liabilities are liabilities that are due during the entity's operating cycle or within 12 months after the reporting date.In some sources, current liabilities are also defined as current liabilities.In particular, according to A. Ibragimov, I. Ochilov, I. Kuziev, N. Rizaev, short-term liabilities include liabilities that need to be refinanced at the expense of working capital [6].

As a general rule, the obligations arising from the contract concluded by the insurance company are reflected in the accounting records from the date of execution of the contract by one of the parties.For example, insurance companies and the insured enter into an agreement on the provision of insurance services, subject to the payment of losses after an insured event.From the moment of the conclusion of the contract, legal entities and individuals who are parties to the

contract bear certain contractual obligations determined by the terms.After the conclusion of the insurance contract, the insured must pay the insurance premium on the date specified in the contract.Unless otherwise provided by the contract, the insurance contract comes into force from the moment of payment of the insurance premium or the first premium.Insurance companies undertake to pay insurance coverage in the event of an insured event in exchange for the insurance premium paid by the policyholder.These obligations are imposed on the parties by an agreement that must be fulfilled, and their failure to fulfill them entails certain legal liability for the party in breach of the obligation.Moreover, from the point of view of the likelihood of fulfillment, the buyer's payment for insurance services does not differ from the obligation actually assumed by the insurer in providing insurance services.

Determining the principles of accounting for liabilities for the purpose of complete, accurate and timely reflection of liabilities in accounting and financial reporting allows you to fully comply with the regulatory legal documents on accounting, as well as provide reliable information for users [8].

Business continuity is associated with the importance of accurate accounting of insurance obligations under insurance contracts, the socio-economic significance of insurance coverage, the need to correctly determine the financial results of the insurer's activities and the resulting tax liabilities for income tax, as well as compliance with the principle of insurance obligations.Insurance obligation (insurance indemnity) is the obligation of the insurer to pay the amount determined in accordance with the terms of the insurance contract to the insured or the person in whose favor the insurance contract has been concluded upon the occurrence of a predetermined event arising from the terms of the insurance contract.Liability insurance as a fact of economic life should be considered in three cases:

– firstly, the legal status, reflecting the legal forms of compulsory insurance relations;
– secondly, the economic situation, which determines the meaning of the insurance obligation as a loan from the insurer (before the actual payment) with the definition of the effectiveness of this operation and the role of the insurer in business processes;
– thirdly, accounting, combining the legal and economic content of insurance payments for reflection in financial statements.

The legal peculiarities of insurance payments as compulsory legal relations between the insurer and the insured make it possible to classify them by sources (agreement, in the case of compulsory state insurance - by law and other legal acts), which is aimed at making managerial decisions of insurance organizations. identifies opportunities.Growth of financial results of activity, "non-proliferation" of the insurance fund by small insurance premiums; The study of the content of the principle of nominalism, used for the legal assessment of insurance obligations, reveals the limitations on accounting data, if this principle is adopted as the basis for accounting methods of insurance obligations.Thus, in order to improve the quality of accounting data on insurance liabilities, it is possible to combine the methods of accounting for insurance liabilities used in economics with their legal interpretation.In this case, the legal content described by the source of the insurance liability can be identified as important in the management of the insurance liability.

From an economic point of view, insurance liabilities reflect the amount of the loan received or to be received by the insurance organization (loan to the insured) and the cash flows that

constitute it.Management of insurance liabilities in order to increase the amount of profit includes a change in the legal value of insurance liabilities by including insurance risks in the terms of the insurance contract, changing the insured amount, setting the amount of deductions, applying compromise payments in individual cases, etc.

However, the legal assessment of insurance liabilities is, in other words, an economic assessment that affects the financial result; the nature of changes in the economic assessment of insurance liabilities over time is determined by the coefficient of lost profits.An insurance premium, which is a realized insurance obligation, is recognized as an expense of an insurance organization to make insurance payments if it (insurance payment) was made in accordance with an effective insurance contract or in accordance with legal requirements.In this case, there is a decrease in the economic benefits of the insurance company.It's time to recognize insurance payments as expenses - this is to sign an insurance act for the insured event in which it occurred.Determination of the impact of insurance liabilities on the financial stability of the insurer as an element of the insurance portfolio is carried out by determining the legality of the auditor's use of the assumption of going concern when preparing financial statements.It is advisable to analyze insurance liabilities on the basis of quantitative and cost indicators through the elements of insurance statistics. At the same time, it is necessary to stratify the insurance portfolio, excluding the possibility of using incomparable indicators.Insurance liabilities as an accounting object have their own value, which must be estimated.

The accountant participates in assessing the fulfillment of insurance obligations at the final stage of the formation of the cost of insurance premiums based on the amount of damage and losses incurred by the insurer to reduce losses associated with an insured event, based on the documents submitted to him. defines.The costs incurred by the insurer to mitigate the damage caused by the insured event are not insurance premiums as they do not cover damage, but rather prevent cumulative impacts that could lead to catastrophic insurance risks.Therefore, it is impractical to consider these costs as an element of insurance payments.Analyzing the accounting of the insurer's costs to mitigate damage caused by an insured event, it should be noted that in accordance with the "Chart of accounts of financial and economic activities of insurers and instructions for its use" insurance company 2210 "Insurance for direct insurance in the reporting period In the account" Insurance payments for accidents ", the insurance organization reflects insurance payments to insurers (beneficiaries) in the reporting period in connection with the occurrence of an insured event, as well as expenses incurred by the insured to reduce losses.

Thus, the inclusion of the costs of the insured in insurance premiums in order to reduce the losses covered by the insurer distorts the true cost of losses in the financial statements of the insurer, therefore we recommend that the insurer reduce the loss from the insured event. either in accordance with the instructions of the insurer of the insured, or, if necessary, we consider it appropriate to reflect the invoice. One of the types of expenses of the insurer is a compromise payment, which is a loss of the insurance organization not related to the fulfillment of obligations under the insurance contract. In accounting, trade-offs are recognized as other operating expenses.Evaluation of compromise payments for accounting is carried out at an agreed cost determined by the parties to the transaction, taking into account natural restrictions.One of the important conditions of insurance is the organization of this franchise.Deduction (deductible) means a condition for the insurer to be exempted from full or partial payment of insurance compensation (coverage), that is, a discount (deductible) is a deduction from the insurer's

insurance obligations to the insurer.Accounting for franchises in the insurance business is important for management.The methods of maintaining such records are determined by the needs and capabilities of a particular insurance organization.Currently, the regulatory documents governing the accounting of insurance companies in the country do not provide for the accounting of franchising.

To account for the franchise, add to accounts 2210 - "Insurance payments for direct insured events in the reporting period", 2220 - "Insurance payments for early terminated contracts", 2230 - "Insurance payments for risks accepted in reinsurance". 2212 - We consider it expedient to open an analytical account "Franchising under insurance and reinsurance contracts".The deductible is not reflected in the tax account, because it is part of the insurer's profit, calculated by reducing the income received to the amount actually incurred and approved.

CONCLUSION

The solution of certain problems in the timely and accurate accounting of obligations in insurance companies is based on the need to comply with the following requirements when reflecting changes in obligations in accounting:

- accurate reflection of business transactions in primary accounting documents;
- fix the date of occurrence and termination of obligations in accounting documents for a specific date;
- clear indication of information about liabilities in the balance sheet;
- Ensuring the compliance of the balance sheet and indicators in the statement of receivables and payables;
- in the explanatory letter to the financial statements, indicate full information about the occurrence and termination of obligations, the main creditors.

We believe that attention to the above cases, ensuring their implementation will contribute to the efficient operation of insurance companies, correct and timely calculation of obligations and stabilization of their economic and financial indicators.

ABSTRACT

In this research paper: To increase the energy efficiency of a solar-air heater for solar dryers by the method of airflow turbulization. Research has been conducted on the more efficient use of alternative energy sources. An increase in heater efficiency has been studied by making the airflow turbulent and breaking the boundary layer. A model of a solar air heater was prepared in accordance with the theoretical calculations of the research work. Experimental results have been obtained using the heater model in practice. Optimal operating modes have been investigated to achieve maximum efficiency of the heater. The efficiency of the device for laminar and turbulent flow was calculated. Recommendations for the use of research results have been developed.

INTRODUCTION

It is safe to say that the country's development and sustainable growth are determined by the strength of its economy. It is hard to imagine today's industrialized world economy without production. Manufacturing ranges from small firms to mega-factories. Every production facility,

whether it is a small enterprise or a large factory, needs a source of energy. The most widely used type of energy today is electricity. Therefore, the conversion of any energy source into electricity is relevant.

Until the end of the twentieth century, the conversion of the potential energy of water, the internal energy of coal, gas, fuel oil and other fuel products, the heat energy released by nuclear reactions into electricity was widely used. Unfortunately, fuel stocks are also depleted. Given the inexhaustibility of petroleum products and the enormous damage that nuclear reactions can do to the environment, 21st-century energy experts have a huge task ahead of them. That was to find a source of energy that would not harm the environment and that would last as long as possible. This inexhaustible source of energy can be the Sun. The use of solar energy is nothing new to anyone today.

The conversion of solar energy into direct electricity, the transfer of heat energy to consumers through the use of solar collectors are becoming increasingly popular. It's about making the most of the solar energy that nature has given us. The efficiency of solar panels and collectors currently in operation is very low. So we can use this energy source more and more efficiently.

MAIN PART

A device that converts solar energy into heat energy is called a solar heater. Naturally, the traditional power supply to low-energy consumers far from the central grid is an economically complex process. The new device, created as a result of scientific research, is very useful in solving this problem.

There are also several types of use of solar thermal energy. Examples are solar-water heaters, solar-air heaters. The following research work explores the method of turbulization of airflow to increase the efficiency of solar air heaters. Solar-air heaters are not very popular today. This is due to the fact that heating air, which is considered a heat carrier, is more difficult, but the structure of solar air heaters is simple and easy to install.

The relevance of the research: The efficiency of solar-air heaters, which have been developed and used to date, is not high. The fact that a lot of energy from the sun is not used. This is due to the presence of a boundary layer between the surface of the heater screen and the airflow, and it is important to develop heaters that have a boundary layer distortion and more energy exchange. To study the effect of airflow turbulence on the acceleration of the energy exchange process between the heat-receiving screen surface and the air. The result is the development of a high-efficiency heater model and recommendations for practical application.

Scientific novelty: By preparing the heat-absorbing surface in a wavy form and controlling the airflow rate, small micro-breaks are achieved. As a result, heat exchange is accelerated. The control range is achieved by controlling the opening angle and the airflow rate. The sun understudy is to determine the optimal modes of wave flow and airflow with a certain opening angle in the air heater. And with that, more heat is transferred to the air.

The basic principle of operation of solar air heaters is the use of radiant and convective heat exchange methods of heat exchange. The screen surface inside the heater receives heat and delivers heat energy to the consumer through the air. The screen, which receives heat rays from the sun, receives heat through radiation and uses a convective method to heat the air again. To determine the energy efficiency of the heater under study, we first calculate the amount of heat

energy obtained by radiation. The convective method then calculates the heat transferred to the air inside the heater. By comparing the thermal parameters of the previous case with conventional heaters and the airflow turbulent heater, we determine the level of efficiency.

Radiant heat transfer is the conversion of a body's internal energy into radiant energy (energy of photons or electromagnetic waves), the transfer of energy into space through radiation, or the absorption of matter by objects. The difference from other types of heat exchange processes is that this phenomenon can occur even without the material environment that separates the heat exchange surfaces, as light is scattered by electromagnetic radiation. Some of the light energy that falls on the surface of an opaque body is absorbed by the body and some are returned from it. Any object whose temperature is not equal to absolute zero emits energy, that is, light when heated. The amount of energy dissipated by a radiating body in all directions per unit time is called the radiation flux (Q). The ratio of the ability of an object at the same temperature to emit light to a black body is called the absolute blackness of the object.

$$A = \frac{Q_j}{Q_{q \cdot j}} \; ; (1)$$

The absolute blackness level is less than 1 for all bodies $0 < A < 1$. Based on radiant heat exchange, any object in the system returns a stream of rays and emits a stream of specific rays. The total amount of energy leaving the surface of an object is called the effective radiation flux. Some of the energy absorbed by the body is returned to the system as specific radiation. Therefore, the basis of radiant heat exchange can be considered as the difference between the flux of absorbed and specific rays. Radiant heat exchange is mainly used in metallurgy, nuclear power, rocketry, chemical technology, drying technology, solar engineering and other fields.

The following attitude is called the light-reflecting ability of an object.

$$\frac{Q_j}{Q_{q \cdot j}} = 1 - A \; ; (2)$$

From this, we can derive the following expression.

$$Q_j = Q_{q \cdot j} \cdot (1 - A) \; ; (3)$$

The amount of energy radiated in all directions from one square meter of surface per unit time is called the radiation flux density.

$$E = \frac{Q}{F} \left[\frac{Vt}{m^2} \right] ; (4)$$

Stephen is Bolsman's law. This law characterizes the total radiation intensity of a black body with rays of all wavelengths at room temperature.

$$E_0 = \int_0^\pi E_\lambda d\lambda = c_0 \left(\frac{T}{100} \right)^4 \left[\frac{Vt}{m^2} \right] ; (5)$$

Here C_o the radiative coefficient of a black body,

$$c_0 = 5.67 \frac{Vt}{m^2 \cdot K^{-4}} \; ; (6)$$

It can be seen from this equation that E_o the magnitude corresponds to the area shown in Fig. 1.

The Stefan-Bolsman law for real bodies is as follows:

$$E = c * (\frac{T}{100})^4 \; ; (7)$$

Here C is the radiation coefficient of a real body, which is always smaller than the radiation coefficient of an black body: $c < c_0$

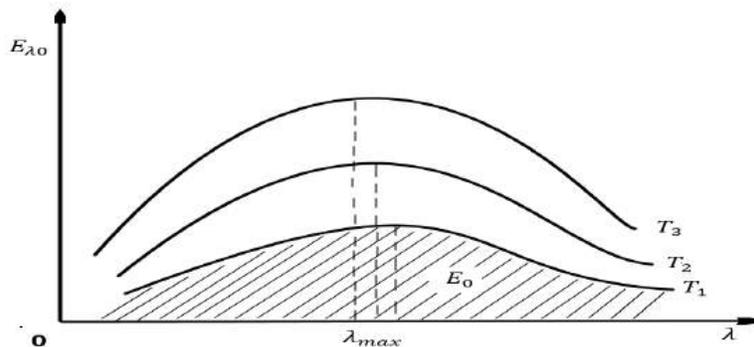
The following is a graph of the wavelength of radiation energy


Figure 1. The energy of radiation depends on the wavelength of the incident light.

Of course, the radiation from the sun also depends on the angle at which it hits the receiving surface. Maximum radiation is observed when light falls perpendicular to the surface. When the rays are perpendicular, the surface absorption is high and the reflection is small. When light falls at a certain angle, the intensity of surface heat absorption decreases as most of the light rotates. The smaller the angle of incidence, the lower the intensity of the radiation. This can be seen in the following attitude:

$$l = l_0 * \sin \cdot h \; ; (8)$$

Here l_1-h is the intensity of sunlight falling at an angle. The angle of incidence of sunlight is only 90° at $23^o\ 27\ '$ north latitude and $23^o\ 27\ '$ south latitude. In all other latitudes, it is less than 90°. Therefore, to achieve maximum intensity at other latitudes, it is necessary to try to bring the angle of descent closer to 90°. This angle varies depending on the season and the time of day.

Electromagnetic radiation enters the Earth's atmosphere from the sun. The average wavelength of radiation from the sun is in the range of 0.17-4 μm, and radiation to the earth is received by rays with a maximum wavelength of 0.475 μm. About 48% of the energy of radiation from the sun is transmitted by visible light (in the range of 0.4 to 0.76 microns). 45% is transmitted by infrared rays (rays with a wavelength higher than 0.76 μm). And 7% of the energy comes from ultraviolet light (less than 0.4). Solar radiation is the main source of energy on Earth.

The processes that take place in the atmosphere, hydrosphere and biosphere depend directly on energy from the sun.

In this study, methods for more efficient use of solar energy were explored. Methods of receiving energy from the sun and delivering it to the consumer of thermal energy by means of solar air heaters were analyzed. To do this, you first need to determine how much energy is received on the receiving surface of the heater and its temperature rises.

$$E = l_1 * F * t \text{; (9)}$$

Where F is the heat-receiving surface of the heater [m^2], t is the time [min].

The following expression is used to determine the temperature at which the energy obtained heats a thin plate:

$$Q = C * m * \Delta t \left[joul \right] \text{; (10)}$$

Here C the specific heat capacity of the plate material, m is the mass of the plate, Δt the difference between the initial and subsequent temperatures ^{o}C.

Given that 1 calorie equals 4.2 joules, we equate the above two expressions:

$$4.2 * l_1 * F * t = C * m * \Delta t \text{; (11)}$$

From this,

$$\Delta t = \frac{4.2 * l_1 * F * t}{C * m}; \left[{}^0 C \right] \text{; (12)}$$

We will have an expression.

This expression can be used to calculate the average temperature of an object with a given surface over a period of time using a stream of radiation from the sun. Conversely, the flux of solar radiation can be calculated as the temperature of a given object changes under sunlight.

To increase the energy efficiency of solar air heaters, turbulization of the airflow through the heater is effective. This requires moving the airflow from the laminar to the turbulence and maintaining that state. To do this work theoretically and practically, the following calculations are performed.

RESULTS AND DISCUSSIONS

To see the theoretical value of the research work in practice, we developed a model of a solar-air heater and conducted experiments. We tried to assemble the device more simply. Its construction is simple and assembled in the form of a parallelepiped. The heating walls are made of raw wood. We used 4 layers of glass to transmit the light. This helps to retain most of the radiation energy. The heat-receiving surface of the heater is made of black painted metal tin with an opening angle of α = 24°. So it looked wavy.

Figure 2. The appearance of the heat-receiving surface

An air guide is installed at the inlet and outlet to direct the airflow. and fans are attached to the air duct to create artificial airflow.

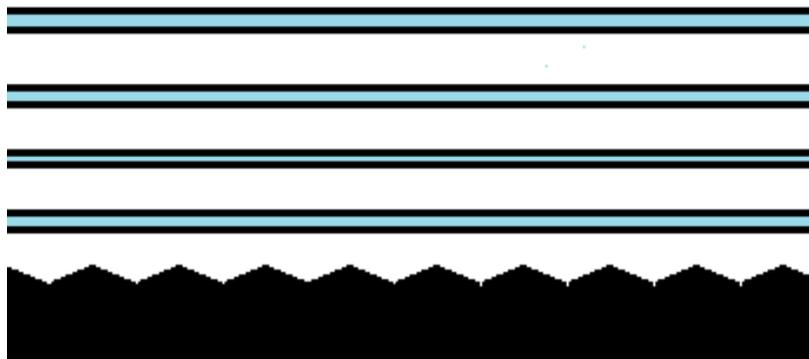
Here is a ready-made view of the device.


Figure 3. Solar - the structure of the air heater.

The schematic view of angle α is shown in the figure below

α

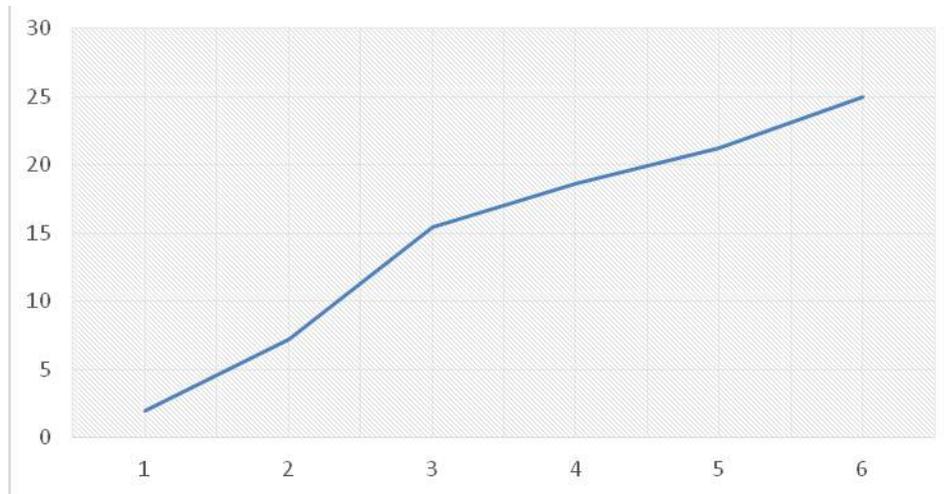

Figure 5. A diagram showing the increase in the efficiency of the device

Recommendations for using a new heater and turbulization method:

CONCLUSION

It is recommended to use in heaters used for drying fruits, vegetables, grains and cotton products. Because the new type of heater has high efficiency, it saves a lot of energy and dries the product faster.

The use of high-efficiency solar-air heaters as a backup energy source in the heating systems of homes and businesses helps to regulate the operating temperature in the rooms on open winter days. The main thing is that it can provide a sufficient temperature for solar dryers

ABSTRACT

In this article, the author aims to reveal the essence of the important socio-cultural processes in the history of our country by comparing them with similar processes on a global scale, analyzing similarities and differences. One of the reasons for this was the "cultural revolution" in Uzbekistan led by the Bolsheviks, which the communist ideology called "socialist changes", Turkey described such processes as "bourgeois reforms." The main of these principles was nationalism, which became one of the most important unifying factors in the history of Europe in difficult times associated with the emergence or restoration of national statehood.

KEYWORDS: *Cultural Processes, Cultural Revolution, Reforms, Modernization, Separatism, Customs, Sharia, Ideas, Bolsheviks.*

INTRODUCTION

One of the important ways to study history is to compare important socio-cultural processes in the history of our country with such processes on a global scale, to distinguish similarities and differences. Comparing the modernization processes that took place in the countries that are close to us in terms of religion, lifestyle and status in the early twentieth century with such processes in Uzbekistan, it is important to understand their essence. Especially today, when world politics has entered a new phase when the traditions of national statehood are cracking under the influence of opposing trends such as separatism and globalism, and some people understand "globalization" as "westernization" revealing the essence of the ongoing modernization process by comparing it with such historical processes is of new importance for a deeper understanding of the identity of our people.

One of the most important events of the twentieth century was the overthrow of the colonial system. Colonial empires, built by Europeans from the 15th century onwards as the main symbol of a great statehood, began to flourish. The revolutionary and national liberation movements that flourished in the world in the early twentieth century, especially in Asia, such as the Iranian Revolution of1905-1911, the Young Turks Revolution of 1907-1908, the Indian Revolution of 1905-1909, and the Xinjiang Revolution in China, became independent after the First World War. led to the emergence of states [1]. They have become a new important factor in world politics. At the same time, European states sought to maintain their political influence, and sometimes to further strengthen it through new methods and tools. Although the national liberation movement was politically directed against the metropolitan states in Europe, the movement itself was the result of the influence of the ideas of European civilization on Eastern society. The slogans of the national liberation movement, "Young Afghans", "Young Bukhara" and "Young Khiva", which led these processes, testify to this. Moreover, the leaders of these movements did not set themselves the goal of restoring traditional pre-colonial social order. They sought to create a modern, advanced nation-state with a developed industrial system, where the population had the right to universal suffrage, education, and access to modern medical care.

Therefore, the leaders of the movement realized that the main task was to overcome the backwardness and modernize their countries. In fact, the victory of the modernization movement was an important step towards the formation of a single world civilization based on common values. There are many similarities between the modernization processes in Turkey in the 20s and 30s and the "cultural revolutions" carried out by the Bolsheviks in Uzbekistan at the same time. However, these modernization processes were linked to the ideas of bourgeois reform in Turkey and Bolshevism in Uzbekistan, which set the ultimate goals of the modernization process and became an important factor that led to various results. Of course, the revolutionary processes that took place in the countries at the beginning of the twentieth century have been seriously studied in foreign and Uzbek historiography. However, a comparative analysis of these processes, similarities and differences related to existing ideologies, is not sufficiently reflected in the historical literature. One of the reasons for this was the "cultural revolution" in Uzbekistan led by the Bolsheviks, which the communist ideology called "socialist changes", Turkey described such processes as "bourgeois reforms." For Turkey, which still retained the medieval Ottoman Empire, the sultanate and the class system in the early twentieth century, Europe seemed to be the ideal of European society, without a doubt, a modern society. Although the Turkish revolution was directed primarily against the domination of foreign European capital and the sultan's feudal system and to build a new, independent Turkish state, the system of values it established was in harmony with the values of Western civilization. [2]

That is why, we see that Turkey's reforms, especially in the fields of culture, life and religion, are in the direction of Europeanization. At the same time, modernization is the modernization of society in accordance with modern requirements, and the process of Europeanization in the Republic of Turkey can be called modernization in this sense.

Now, as for the called "cultural revolution" carried out by the Bolsheviks in Uzbekistan, first of all, unlike Turkey, the national liberation movement in Turkestan in the early twentieth century did not succeed, did not lead to the formation of an independent state. Secondly, in contrast to Turkey, which idealized Europe, the communist future, which was the ideal of the Bolsheviks, was not real, but abstract. This ambiguity, combined with the more abstract but very attractive

Bolsheviks' slogans aimed at the people's senses rather than their minds, appealed to a large part of the population. was quite. The first principle of the reforms - secularism, that is, secularism - was reflected in the separation of religion from the state. One of the most complex aspects of the reforms carried out in Islamic countries in the early twentieth century was the attitude of the reformers towards Islam. In their view, Islamic fanaticism, its closeness to controversy and suspicion, had an impact on the social and political life of Islamic countries, on the mentality of the peoples here. The intellectual integration of the advanced part of the world, as well as the new economic, social and political processes, the revolutionary aspirations of the people to build a new, dignified life, bypassed the Islamic world. During this period, it was a long and difficult process to establish in Islamic countries the new worldview, democratic ideas, the wide range of opportunities for human entrepreneurship and initiative, which were formed in the countries of Western Europe [3].

MATERIALS AND METHODS

One of the common aspects of the reforms implemented in Turkey and Uzbekistan in the 20s and 30s was an attempt to reduce the influence of Islam on governance and the social and economic spheres, especially in the cultural sphere. In the first Constitution of the Republic of Turkey, adopted on April 20, 1924, Islam was called as the state religion. On April 9, 1928, this clause was removed from the Constitution. It was the Muslim mentality that made Kemal well aware that fanaticism was a major obstacle to reform. That is why he started the reforms from religion. In 1924, the Grand National Assembly decided to end the caliphate. With this, the system that united the Muslims of the world was destroyed, and the orders of the dervishes and the dervishes were disbanded. The Ministry of Religion and Waqf Affairs was abolished, and waqf property was nationalized. Madrassas were closed and all schools were transferred to the Ministry of Education.

On February 2, 1918, the Bolsheviks, who had come to power in the Russian Empire, issued a decree separating the Church from the state and the school from the Church. The secular nature of state power was established and freedom of conscience and religion was proclaimed. Religious organizations were deprived of all their property and legal entity rights. On the basis of this decree, secular education and judicial system have been formed in Uzbekistan. The process was violent, violating the principle of freedom of conscience, closing mosques completely and trampling on people's religious freedom. The decree laid the foundation for a policy of atheistic propaganda and atheism throughout the 70-year history of the Soviet state. The eradication of illiteracy in Uzbekistan, the creation of a new type of Soviet school system, the training of "people's intellectuals" was carried out under the control of the Bolsheviks and on the basis of Marxist-Leninist ideology. In fact, the main goal of the "cultural revolution" was to subjugate the whole spiritual life to Marxist ideology. One of the first steps taken along this path was to eradicate illiteracy. In addition to the lack of school buildings and qualified staff for the introduction of general compulsory education in Uzbekistan, there were barriers to religious and national traditions, which was very similar to the situation in Turkey. For centuries, the lives of Uzbek and Turkish women have been determined by the rules of Sharia and the traditions that follow from them, and in the minds of men, stereotypes about women have prevailed. From the very beginning of the reforms, the task of liberating women was set. However, unlike in Turkey, the hasty resolution of this issue in Uzbekistan has caused many problems. After October 1917, several laws and decrees were passed on the question of women: the equality of women with

men, the prohibition of the marriage of underage girls, and so on, which were unquestionably revolutionary decisions. The women's sections, established in the 1920s, carried out active explanatory work. Special women's clubs, artels, shops were organized, women were trained in literacy and various trades. This work was done mainly through explanation, persuasion, without violence, and without much resistance in society. However, the pace of these events, which took into account the traditions and customs, did not satisfy the Bolshevik authorities. In order to artificially accelerate this process, in 1927 the movement called "Attack" was started. The Bolsheviks did not take into account the psychological and religious factors as well as the lack of a social environment for the full liberation of women. During the "Attack" campaign, 100,000 women were forcibly thrown off their veils. However, the policy of accelerating the release of Uzbek women has had tragic consequences. In 1927-1928, 2,500 women activists, leaders of women's clubs, librarians and women teachers were killed in Uzbekistan. [4]

During these years, the development of culture in Uzbekistan was controversial. On the one hand, raising the level of literacy of the population, development of the most important areas of fundamental science, training of scientific and technical personnel is an objective necessity; on the other hand, the Soviet government has set the strengthening of its ideological influence in society. Contradictions are especially evident in the relationship between tradition and modernization. For example, the Soviet policy of modernizing the population of Uzbekistan is similar to that of Turkey. But the difference is that the Soviet state pursued its policy in order to build an abstract communist society, and therefore the Bolsheviks aggressively entered the spiritual world, the national traditions of which they sought to protect and preserve the Uzbek people. The Soviet modernization policy was in line with similar processes in Turkey. However, the complete alienation of the Soviet way of life for Uzbeks in the 1920s and 1930s led to strong-armed action against it in Uzbekistan. In Turkey, however, such a move was slower. Another reason is that if the modernization process in Turkey was carried out under the national slogans by intellectuals who followed Mustafa Kemal Ataturk, the goals and objectives of these processes in Uzbekistan were set by the Bolshevik Party and led by Moscow. did not fully reflect his will.

The main principles of modernization in Turkey are reflected in Article 2 of the Constitution of the Republic of Turkey. Later, in 1931, at the III Congress of the ruling Republican People's Party in Turkey, six independent principles were developed. These are the principles of republicanism, nationalism, populism, statism (secularism), secularism and revolution, which were declared the basis of the activities of the ruling People's Republican Party. The main of these principles was nationalism, which became one of the most important unifying factors in the history of Europe in difficult times associated with the emergence or restoration of national statehood. In Europe, it was only after the First World War that nationalism lost its progressive potential and democratic basis and became a reactionary phenomenon. In Turkey, too, nationalism has played a progressive role in raising the spirit of the nation and instilling confidence in its capabilities in the process of state-building. M.K. Atatürk's "How happy I am to say I am Turkmen!" (What a Happy Category!) Became the unifying slogan of the Turkish nation.[5]

In Uzbekistan, the Bolsheviks see internationalism as one of the main principles of the modernization process. This principle, which became a political weapon of the Bolsheviks during the Cultural Revolution, became the basis for the repression of nationalist intellectuals

and leaders in Uzbekistan, accusing them of nationalism. The process of modernization turned into mass Russification. Therefore, the Cultural Revolution, which was positive, caused great damage to national traditions in Uzbekistan, especially to the emerging national pride.

CONCLUSION

In conclusion, the modernization processes that took place in Uzbekistan and Turkey in 1920-1930 were close to each other in terms of their goals. They relied on similar principles, solved similar problems, but differed from each other according to the basic idea of the processes. Modernization in Turkey was carried out on the basis of nationalist ideas, in Uzbekistan on the basis of communist ideas, and the results were consistent with these ideas.

ABSTRACT

Object detection and face recognition in image are essential major in this century. Because, every part of industries need security system, service system has to do comfortable their services. To detect object applies some methods of computer vision. Computer vision is one most important part of artificial intelligence. Segmentation considers basic method of computer vision. Segmantation and filtring images change interface of image, also separate objects in image. Below all method of segmantation image showed in this article.

KEYWORDS: *Image Segmantation, Open Source Computer Vision, Frames, Color Space Model, AI.*

INTRODUCTION

Now, perhaps the era of deep learning and big data has arrived, where complex algorithms analyze images based on showing them millions of examples, but color spaces are still great for analysis. Simple techniques remain extremely powerful. In this article, you will learn how to easily segment an object from an image based on color using Python and OpenCV. A popular computer vision library written in C / C ++ and related to Python, OpenCV, offers easy ways to manipulate color spaces.

The main part

In the most common color space, RGB (Red Green Blue) colors are represented in terms of their constituent red, green, and blue. More technically, RGB describes a color as a tuple of three components. Each of them can be a value from 0 to 255, where (0, 0, 0) represents black and (255, 255, 255) represents white. RGB is considered an & quot; additive & quot; color space, where colors are the product of red, blue, and green light against a black background.

Here are some more examples of RGB colors:

TABLE-1 RGB COLORS

Colour	RGB value
Red	255,0,0
Orange	255,128,0
Pink	255,153,255

RGB is one of five major color space models, each of which has its own ramifications. There are so many of them, because each space is used for different purposes. In publishing, CMYK is used because it describes the combinations that are required to produce color on a white background. If in RGB tuple 0 is black, then in CMYK it is white. Therefore, printers contain cyan, magenta, yellow, and black cartridges. In certain areas of medicine, glass slides containing stained tissue samples are scanned. They are saved as images. These are analyzed in the HED space - representation of the saturation of the types of paint - Hematoxylin, Eosin and Diaminobenzidine. HSV and HSL are descriptions of hue, saturation, and brightness. They are suitable for detecting contrast in images. These spaces are often used for color selection in web design software.

In fact, color is a continuous phenomenon, which means that there are an infinite number of them. Color spaces, however, depict colors as discrete structures (a fixed integer), which is quite acceptable, because the perception of the human eye is also limited. Color spaces are capable of rendering all colors that we distinguish. Now that everything is clear with color spaces, you can move on to describing how to use them in Open CV.

Simple segmentation with color spaces

To demonstrate the segmentation technique based on color spaces, we will use a set of clown fish images. They are easily recognizable due to their bright orange color, so we will look for Nemo in the picture. The key libraries required are the advanced scientific computing package NumPy , the Matplotlib plotting tool, and of course OpenCV. This example uses OpenCV 3.2.0, NumPy 1.12.1 and Matplotlib 2.0.2 versions. But small differences in versions should not greatly affect the understanding of the very concept of work.

Color spaces and reading images in Open CV

First of all, you need to set up the space. Python 3.x should already be installed on your system. Please note that despite using OpenCV 3.x, you still need to

Import cv2:

Import cv2

If the library is not already installed on your computer, the import will not work.

Here you can view the installation guide for different operating systems. After import, you can see all the color space transformations that are available in Open CV, and save them all to a variable:

Flags = [i for i in dir(cv2) if i. starts with('COLOR_')]

The list and number of flags may differ slightly depending on the version of

Open CV, but there will be many in any case. Just look at the total:

Len (flags)

258

flags [40]

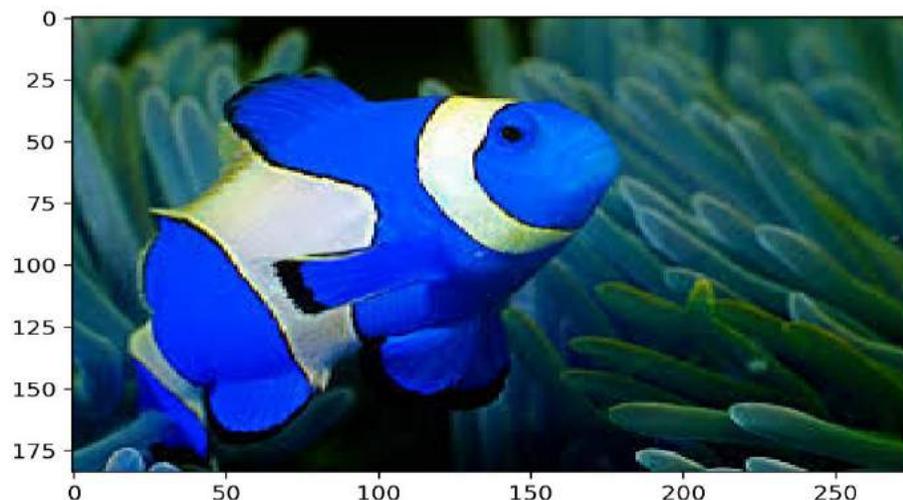
'COLOR_BGR2RGB'

The first characters after the COLOR original color space, and the characters after the 2target. This flag represents the conversion from BGR (Blue, Green, Red) to RGB. These spaces are very similar. They only have different values of the first and last channels. To view images you will need Matplotlib .pyplotNumPy as well. If they are not installed, use the command pip3 install matplotliband pip3 install numpyprior to import:

Archive with images:

Import matplotlib.pyplot as plt

Import numpy as np

Now you can download and explore the image. Please note that if you are working from the command line or terminal, the images will appear in a pop-up window. If it is Jupyter Notebook or something else, then they will be displayed below. Regardless of the setting, you will see the image generated by the command show(): nemo=cv2.imread('./images/image_1.jpg') plt.imshow(nemo) plt.show()


Figure–1

HSV is a great choice for color segmentation, but to find out why this is, you need to compare RGB and HSV to see the color distribution of their pixels. The 3D graph demonstrates this perfectly. Each axis here represents one of the color space channels. Here is a plot of the color scattering of a Nemo image in RGB

(Fig. 1.).

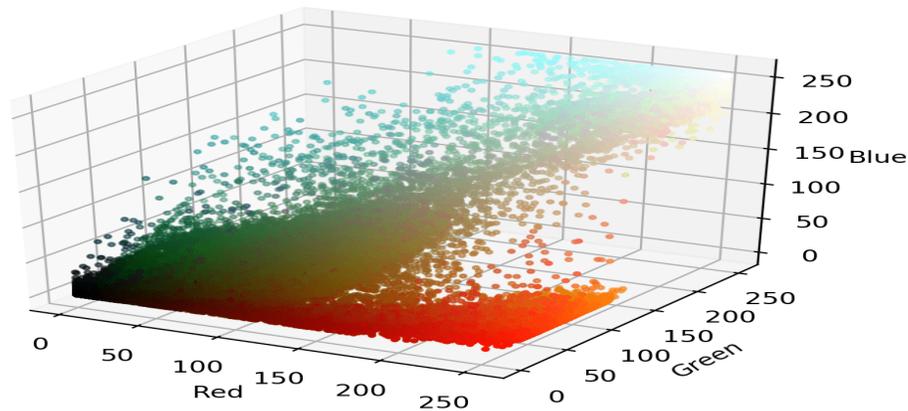
Here you can see that the orange pixels are spread across all the red, green and blue values. So segmenting Nemo in RGB space based on RGB values is not an easy task at all.


Figure-2.

Rendering Nemo in HSV color space

Now let's see how Nemo will look in HSV space and compare the results. As mentioned, HSV is Hue, Saturation, and Value (hue, saturation, and brightness). This is a cylindrical color space. Colors, or shades, change as you move around the cylinder. The vertical axis is responsible for brightness: from dark (0 at the bottom) to light at the top. The third axis, saturation, determines the shade shadows as we move from center to edge along the radius of the cylinder (from less to more saturated)

To convert from RGB to HSV you can use cvtColor():

hsv_nemo = cv2.cvtColor(nemo, cv2.COLOR_RGB2HSV)

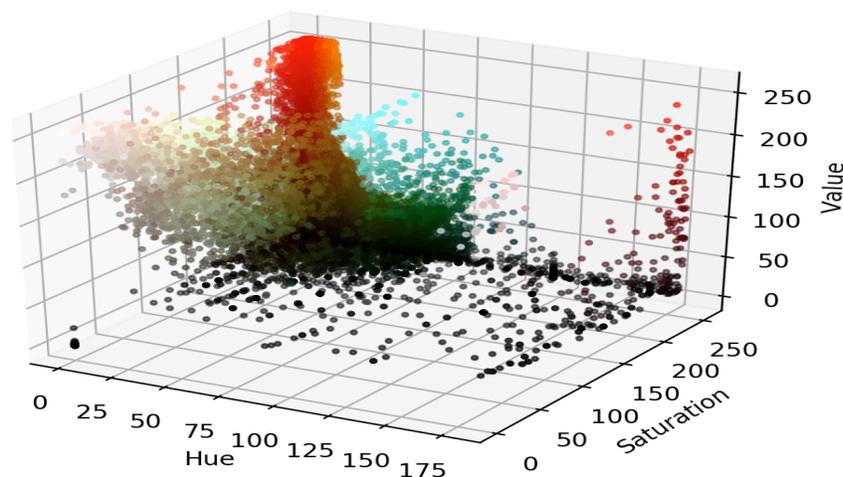
Now hsv_nemostores Nemo's representation in HSV. Using the already familiar technique, you can look at the graph of the image in HSV (Fig. 3.):


Figure-3

In HSV space, Nemo's orange color is more localized and visually distinguishable. The saturation and values of orange vary, but they have a small range along the hue axis. This is a key point that can be used for segmentation.

FORMATION OF A CORPORATE GOVERNANCE MODEL SIMILAR TO THE JAPANESE ONE WOULD BECOME EFFECTIVE AMONG UZBEK ORGANIZATIONS

Talipov Mukhamadjan Sharifdjanovich*

*Associate Professor,
Candidate of Economic Sciences, Tashkent State Technical University,
UZBEKISTAN

ABSTRACT

This article reveals the importance of developing corporate governance in Uzbekistan. Using the experience of foreign countries, in particular Japan, can become the root of creating an effective model of corporate governance in our country.

KEYWORDS: *Corporate Governance, Foreign Investment, Efficient Model, Japanese Management Model, Joint Stock Companies.*

INTRODUCTION

Corporate governance is a key factor in the development of joint-stock companies and will open up opportunities for increasing the flow of foreign investment in the economy of Uzbekistan. This idea was widely discussed during the conferences on "Topical issues of the development of corporate governance in the economy and increasing the attractiveness of the investment climate" on October 21, 2016.During the conference, the decree of President Mirziyoyev Sh. M. "On additional measures to ensure the accelerated development of entrepreneurial activity, the comprehensive protection of private property and the qualitative improvement of the business climate" was widely discussed. The head of state emphasized the importance of creating a unique model of corporate governance and early implementation in the enterprises of our country. To develop an effective corporate governance model, it is necessary to study the experience of developed countries. This will make it possible to avoid unforeseen obstacles and develop your own model as soon as possible. After conducting research and taking into account a number of factors, we can conclude that one of the most suitable for our enterprises is the development experience of Japanese companies.

The main part

The Japanese model of governance, being quite successful in world practice, may also be quite suitable for governance in Uzbekistan. This is due to a number of factors and advantages of this model. First of all, the Japanese model was formulated under the great influence of culture, as well as in Uzbekistan: cultural values and mentality of the people has a huge impact on all spheres, as well as in the management system. Accordingly, the formation of a model similar to the Japanese one, applying the successful experience of foreign management, but at the same time, taking into account the spiritual values of the people, would become effective among Uzbek organizations. The next factor is the requirements for disclosure of information, which are quite strict in contrast to the Western European model. Given the system of doing business in the country, this is currently one of the key requirements from the government.

Corporations must disclose the following information: a semi-annual report with information on capital structure, board members, salaries, information on proposed mergers, changes in the articles of association, a list of the top 10 shareholders of the corporation. Also, the fact that the approval of shareholders requires such issues: payment of dividends, election of the board of directors, appointment of auditors, amendments to the charter, mergers, acquisitions is important in our country. The main reason is that Uzbekistan is a country with a transitional economy and at this stage of development, this kind of power is an essential condition for investment.

Another factor is that Uzbek companies, like Japanese corporations, are interested in long-term, mostly affiliated shareholders and participants. This will create openness and trust between the participants, as well as become a guarantee of prospects, both for the company and for the human resource.

The annual meeting of shareholders in Japan is mostly formal, and the board of the corporation coordinates all issues in advance. Speaking of Uzbekistan, many investors want to have power and influence, this is one of the key factors for our people. Also, pre-agreed and balanced actions are the best option for gradual development and for people who are not used to radical actions.

Undoubtedly, the Japanese personnel rotation system deserves attention. Many consider the constant change of activity to be a weak point of the Japanese government. However, when it is necessary to coordinate the activities of many functional services in order to achieve a common goal, then broad-based specialists are simply needed here, since, figuratively speaking, they understand each other perfectly, knowing the problems of their neighbours. In Japan, there is no concept of the function of one person, but there is the concept of the function of a group, and each member of the group must know and, if necessary, perform the functions of its other members. In contrast to Japanese specialists, in the United States and Europe, a highly qualified specialist is an employee who knows only his very narrow field of activity to the finest detail. The reason why Japanese and other systems differ in terms of worker specialization is that Japanese workers do a variety of jobs within the same firm. Lifetime and contractual hiring also determine different approaches to improving the qualifications of personnel. The Japanese invest in this without hesitation, because they know that this is the guarantee of the future of the company, because a highly qualified employee cannot leave for another firm if the conditions of employment are better there.

CONCLUSION

In the conditions of Uzbekistan, the most acceptable and justifiable option is such a form of ownership when, along with domestic, foreign investors become owners of shares. In our country, there are already more than 4 thousand of such enterprises established with the participation of foreign capital from more than 90 countries. There are examples of successful functioning of enterprises based entirely on foreign capital and foreign methods of corporate governance.

ABSTRACT

This article attempts have been made to determine the object of investigation of culturology and discover types of culture, its layers, its ties with other fields of sciences, including humanitarian sciences among which there are psychology, sociology and others. Special attention in the study of culturology is paid to cultural, social state and national features of people speaking this or that language and possessing the culture with all its self-belonging peculiarities. The work aims to investigate the interrelated issues between language and culture and its effect on understanding and implementing semantic structures of English phraseological units and explain their grammatical, lexical and semantic-syntactical features and reason of using them paying attention to the national and cultural matters. So, this work aims at exploration the linguistic-cultural aspects and appropriate usage of phraseological units.

KEYWORDS: *Phraseology, Stylistics, Comparative Linguistics, Idiom, Foreigner And A Native-Speaker.*

INTRODUCTION

Language not only reflects reality but also deals with its interpretation creating particular reality, in which human being exists. Language fulfils different functions. And it is regarded as the main means by which people express themselves and use it for social interaction and communication. Language serves as the means of gathering and keeping culturally important information. Language is also named by different linguists as "the house of objective reality" and the way, on which we penetrate not only into the modern mentality of the nation but also into the outlook of ancient people to the world, society. The events of long-passed years, outliving through the ages,

find their reflection today in proverbs, sayings, phraseological units, metaphors, symbols of culture. They are considered to be valuable sources of information about the culture and mentality of the nation, tinned with myth, legend, and custom. Many approaches have been implemented by different linguists for studying and teaching the interrelation of language and culture as an integrated unit.

Foreign language education concerns social and personal-oriented values. Dynamic processes in all spheres in Uzbekistan need acquiring one or two foreign languages. The richness of the country under the conditions of market economy and information technologies development can be achieved with the help of human resources – the significant factor of economic and social progress. Foreign language education contributes to solving this vital objective. Under the knowledge of foreign languages, we should comprehend not only the practical but theoretical basis too. These days various fundamental and applied researches have been carried out by our linguists and scientists in many areas of modern science.

The main views and suppositions of given research are defined within the framework of linguoculturology, which, in correspondence with the universal tendency of modern linguistics, looks through and observes the language phenomenon closely linked with a person, his spiritual and practical activity. The main postulate of this science is believed to be learning language, mentality and culture of ethnos in organic unity. If we will make a short analysis of literature it is obvious to see that the material of the research work was based on theories and concepts of linguists in the sphere of phraseology and linguoculturology as in the works of V.A. Maslova[1], V.F. Humboldt[2], N.N. Amosova[3], A.V. Kunin[4], E.V. Slepushkina[5], several phraseological dictionaries, original texts, and research works of various linguists.

MATERIALS AND METHODS

The methodological ground of the work consists of theoretical issues of scientists and linguists in the sphere of phraseology, stylistics, comparative linguistics, culture study, history, psycholinguistic features of nations and the results of investigations that have been made in these spheres too, etc. I have used their books, articles and thesis dealing with the theme of our investigation. I have introduced some which deal with phraseological units. In research work, I tried to implement the elements of etymological analysis, lexicographical analysis and also different types of descriptive method.

The following methods were used in my research work: -descriptive method (to describe main points of the research work), -comparative analysis (to compare English phraseological units with their equivalents in Russian and identify their similar and dissimilar peculiarities), -componential analysis (to take component: phraseological units that are represented of cultural life out of the whole phraseological unit and analyze it), -cognitive–conceptual analysis (to investigate associations, background cultural knowledge in phraseological units), -lingual-cultural analysis (to link the study of phraseological units with the study of cultural issues and national peculiarities of a nation that use them), -critical analysis of the literature on the problem of investigation (to analyze scientific issues dedicated to the theme of investigation).

Any language can be learnt, but even with the ideal knowledge of the words, it is not always possible to comprehend the speech that we are addressed to. In the English language, as in others, many phraseological units require more time and consideration to understand. Teaching phraseology to foreign learners requires from the teacher a large amount of time, patience and

skills to clarify the meaning of each phraseological unit. The formation of these phraseological units is intertwined with culture, customs, traditions, natural conditions in which the nation lives and develops. Without possessing enough amount of knowledge about phraseological units one cannot properly understand oral and written speech, free communication of people. The structure and their usage are closely connected with phonetics, lexicology and grammar, so we should first attach our attention upon learning those phraseological units that are considered as widely-used and give the language special delight and expressiveness. Comprehension problems with phraseological units arise as a result of lacking knowledge of their meaning and structure, their expressive-stylistic features. The first problem that the learner faces is to differentiate the phraseological unit between free syntactic word-combination. The second obstacle is said to be dissimilarity in the interpretation of the meaning of the phraseological units in one or two languages which can cause in misunderstanding. To fully comprehend the meaning of any phraseological unit, it is necessary to know the etymology of that expression, its original development [6].

Idioms are the expressions fixed by the language that is initially used in a figurative sense. For example, in the sentence *Exams are part of a carrot and stick method*, there are undoubtedly no real carrots and sticks involved. The image is that of a donkey being supported to move forward by dangling a carrot in front of it or by hitting it with a stick. We can use this idiom to depict any event that includes more abstract rewards (the carrot) and threats (the stick). All languages are full of idioms, and native speakers use them spontaneously without even thinking about their figurative nature. Language learners generally find idioms difficult to understand, and this is not surprising. For example, learners are often not certain what image the idiom is based on. If a native speaker offers to *show you the ropes* and you are not familiar with this expression, you might not immediately comprehend that she is proposing to teach you how to do a certain job. It would help if you were familiar with that the expression was initially used in the context of sailing, where an experienced sailor had to show a novice how to handle the ropes on a boat.

Linguists used to think that idioms were totally arbitrary: that is, you could not guess their meaning from the words they contain. As a result, teachers used to tell their students that the only way to master idioms was undoubtedly to learn them by heart. Fortunately, we now realize that many idioms can be interpreted and explained after all, and so they can be learned in systematic ways too. Research shows us that when idioms are presented as non-arbitrary features of the language, students find them much easier to comprehend and remember. In the following sections, we will demonstrate the non-arbitrary nature of idioms.

Many idioms are derived from our general physical experiences (we will be looking at this area in more detail in an article about Metaphor later in the Language Awareness series). For example, the expressions *hot under the collar*, *breathe fire* and *let-offs tea m*all refers to being angry, and they do this through the image of anger as something hot inside us. This makes sense to us because when people get angry they often get red in the face as a result of rising body temperature. Similarly, the figurative expressions *lend someone a hand*, *try your hand at something*, and *have your hands tied* all use the image of the hand to refer to acting. This also makes sense, because we know from everyday experience that most activities involve the use of our hands.

Other idioms are derived from more specific areas of experience (or domains), such as sport, war, or cooking. Some of these domains may no longer be common in present-day life, but if we learn the original context in which the idiom

was used and if we understand the image it is based on, we will find it is easier to understand. A helpful way of remembering idioms is to group them according to the domain that they are derived from.

If you recognize the origin of an idiom, you will often be able to work out its meaning on your own. For instance, the idiom *put something on the back burner* originates from the domain of cooking, and *take a back seat* comes from the domain of driving. Language pedagogy like any other academic field has its challenges, one of the most demanding of which is teaching idioms. Language teachers, material developers and theoreticians have all attempted to seek the most efficacious ways to teach idioms. Learners, however; are still faced with the difficulty of remembering and internalizing idioms. The word "idiom" originates from the Greek "idios", meaning "one's own, strange". There is no specific definition for idioms on which all experts in the field unanimously agree. Nonetheless, they are considered to be a subtype of 'multiword units' (MWU), which are defined as "a fixed and recurrent pattern of lexical material sanctioned by usage"[6].

According to the Oxford Dictionary of Current Idiomatic English: "Familiarity with a wide range of idiomatic expressions and the ability to use them appropriately in context are among the distinguishing marks of a native-like command of English".While many second language learners may be satisfied with something less than 'native-like' command, idiomatic usage is so common in English that it can be difficult to speak or write without using idioms. Tajalli states that using idioms in speech can have a great effect on the listener or reader. So idioms constitute an integral part of vocabulary learning. The importance of teaching and learning idioms has fostered an interest in developing more effective ways of teaching idioms.

Most linguists consider that students are likely to be passive learners when they receive lectures only in classrooms. On the contrary, small group discussion could encourage students to be involved in the active process of buildingknowledge. Furthermore, without any doubt, during group discussions, students whether consciously or unconsciously will learn from each other. Accordingly, many teachers bring into use group discussion in students' active learning of English idioms before making clear the meaning of idioms to them. Students in a group discussion can comprehend English idioms better than when they were presented to English idioms within a story only. This shows the significant effect of group talk on students' comprehension of English idioms.

Retelling has been a good strategy to know how much students have acquired and to expand their comprehension. Retelling activities can make easier for students' reading retrieval because the activities can encourage students to try to remember. Their recalling assists teachers to realize how much information their students have acquired. Brandi-Muller states that older students can advantage from retelling stories because it lets students study to organize and give detailed information about events, which improves reading comprehension. In BrandiMuller's classroom, she found that her English language learner students not only became more enthusiastic and willing to take a chance and read aloud but also remembered the vocabulary better with this method. As a result, retelling activities can reinforce the integration of recently learned reading.

Consequently, while researching for the phraseological issues of comprehension, retelling activities are good techniques to make students' reading retrieval, it causes to have a great enthusiasm for every teacher to apply the activities in teaching English idioms. After one introduced the meanings of English idioms to his students, he asked his students in pairs to retell the content in their own words instead of the English idioms and to rewrite sentences provided in class by using English idioms. The retelling and rewriting activities supply students with more chances to be familiar with the meanings of English idioms and get to know about the English idioms they have just studied.

Another method in understanding and effectively learning English idioms can be dialogues which provide circumstances for students to practice ordinary conversation and propose students ample practice with basic speaking skills incontext. Firstly, dialogues can be understood as short plays and applied for students to act out rather than simply read aloud. Furthermore, the dialogues are said to have for the students writing function as basic communication at all levels. Also, putting pupils into pairs for the role-play in the daily dialogues is an effective way of oral practice for various ages and levels. Nunan confirmed that role-plays are also wonderful activities for learners' speaking in the relatively safe environment of the classroom before they must do so in a real environment. Therefore, dialogues suggest students having opportunities to perform and practise oral skills before facing the real world [7].

Dialogues and role-play are useful written and oral activities so that I assigned my students in pairs to write one dialogue by using the English idioms introduced in class and then act out the dialogue out in the following class. Dialogue writing could motivate students to write without burden because of pair collaboration and role-play activity could help them remember the dialogue they wrote through repetitive practices. It was easier and more fun for them to remember English idioms because they shared and enjoyed learning English idioms with friends. Thus, dialogue writing and role-play are useful and interesting activities for students' meaningful and efficient drills.

Since language learners need to learn English idioms to master English, foreign language teachers need to design various activities for students to use with English idioms and subsequently acquire them efficiently. Moreover, students learn better when they are provided with collaborative activities because they can interact with peers and share the fun in learning. Finally, when teachers integrate listening, speaking, reading and writing activities together in teaching English idioms, students can be involved in the application of English idioms in four skills. Thus, it is effective to teach EFL learners English idiom when they are provided with various activities to practice and utilize English idioms in different contexts.

CONCLUSION

Based on the research material we can say that the difference between cultures causes some misunderstandings in the interactive communications between a foreigner and a native speaker. Millions of people travel around the world and they all need to communicate in some way. They need to acquire not only linguistic competence but cultural awareness as well. Cross-cultural investigations can provide materials that help language learners to deal with the problems of unknown environments. The native speaker puts in a language his world vision, mentality, and the relation to other people in cross-cultural dialogue, and the non-native speaker receives that vision [1,8].

The Lingua-cultural approach of teaching idioms widens cultural awareness of students, as they will get to know not only about language but the traditions and customs of the English people, they become more tolerant of other cultures, they begin to evaluate other people's beliefs through the prism of their native linguacultural heritage.

A thorough analysis of different approaches to teach phraseology to foreign learners confirmed the role and significance of meaningful contexts in interpretation of meanings of idioms rather than simply memorization, drilling or learning by heart them in isolated words.

Another important thing that catches our attention is the implementation of didactic illustrations in the learning process of idioms. The images imprinted within them, initiate actuality, mastering of non-imagery information, come to be their representation s. Allotted with the visual analogy, visual aids can help a person to observe, evaluate and cognize what is happening. Besides, visual images have not only meaningful, cognitive, but and valuable potential. Thanks to them, the world appears before every person as spiritual, ethical and aesthetic value. This increases the cognitive value of studying material, promotes communication, the cognitive interest of learners. Didactic illustrations can be considered as an important tool system in mastering the phraseology of both languages, Russian and English.

CLINICAL AND IMMUNOLOGICAL SHIFTS IN CHILDREN WITH CHRONIC KIDNEY DISEASE ON THE BACKGROUND OF LYMPHATIC DIATHESIS

I.R. Iskandarova*

*Department of "Propaedeutic of children's Diseases,
Pediatrics and higher nursing work",
Urganch Branch of Tashkent Medical Academy,
UZBEKISTAN

ABSTRACT

In order to study clinical and immunological changes in children with chronic kidney disease against the background of lymphatic diathesis, 120 children aged 7 to 11 years were examined. Of these: 35 - NS without LD - 1-group; 35 - HC with LD - 2-group; 25- LD- 3-group. It was determined that LD is considered as a risk factor influencing the progression of CKD, which is confirmed by more pronounced (1.5-2 times more often) manifestations of clinical, laboratory and immunological changes in children with CKD with LD compared to the group of children with CKD without LD. Clinical and immunological shifts are criteria for early prognosis and make it possible that LD can be considered as a predictor of the development of chronic renal failure in such patients.

KEYWORDS: *Lymphatic Diathesis, Immunity, Kidney*

INTRODUCTION

Currently, as the main criterion for the progression of chronic kidney disease (CKD), the transition and development of chronic kidney disease is considered, noted in more than 50% of patients within 5-10 years, which determines the quality and duration of life of patients, the fight against which has not only medical, but also and socio-economic importance [1,2,3,4,5,6,7,8,9]. In this regard, he pays attention to CKD in children, proceeding against the background of lymphatic diathesis (LD). LD is characterized by: a peculiar habitus, diffuse hyperplasia of lymphoid tissue, endocrine dysfunction, thymomegaly, signs of dysembryogenesis,

dysadaptation to environmental influences, impaired immunity, lymphocytosis, anemia, "status lymphatics", "sudden death syndrome" and the development of secondary immune 10, 11, 12].

The aim of our study was to study clinical and immunological changes in children with chronic kidney disease against the background of lymphatic diathesis.

Materials and research methods

The research was carried out on the basis of the Urganch branch of the TMA, in the department of pediatric nephrology of the Khorezm Regional Children's Multidisciplinary Medical Center (KhRChMMC) and the 3-family polyclinic in Urganch. Under our supervision there were 120 children aged 7 to 11 years. Of these: 35 - CKD without LD-1-group; 35-CKD with LD-2 group; 25- LD-3-group. The control group consisted of 25 apparently healthy children of the same age. The clinical diagnosis was made on the basis of anamnesis, clinical laboratory and functional research methods according to the ICD-10 classification, as well as clinical and laboratory markers of LD. The state of the immune status (cellular, humoral immunity, cytokine production), antigen-binding lymphocytes (ABL) of the kidneys and lungs was studied by the method of F.Yu. Garib and coauthors [13, 14]. Phagocytic activity of neutrophils (PhAN) was studied using the nitro blue tetrazolium test using latex particles [15]. The concentrations of circulating immune complexes (CICs) were determined by the method of precipitation [16], the production of interleukin-2 (IL-2) was studied by ELISA [17]. GFR was determined by endogenous creatinine clearance. The material for the study was venous blood taken in the morning on an empty stomach. Statistical processing of the results obtained was carried out on a personal computer using the method of variation statistics with the calculation of the reliability of numerical differences according to the Student.

Results and its discussion

We studied the distribution of the surveyed children by sex and age (table-1).

TABLE 1 DISTRIBUTION OF EXAMINED CHILDREN BY SEX AND AGE

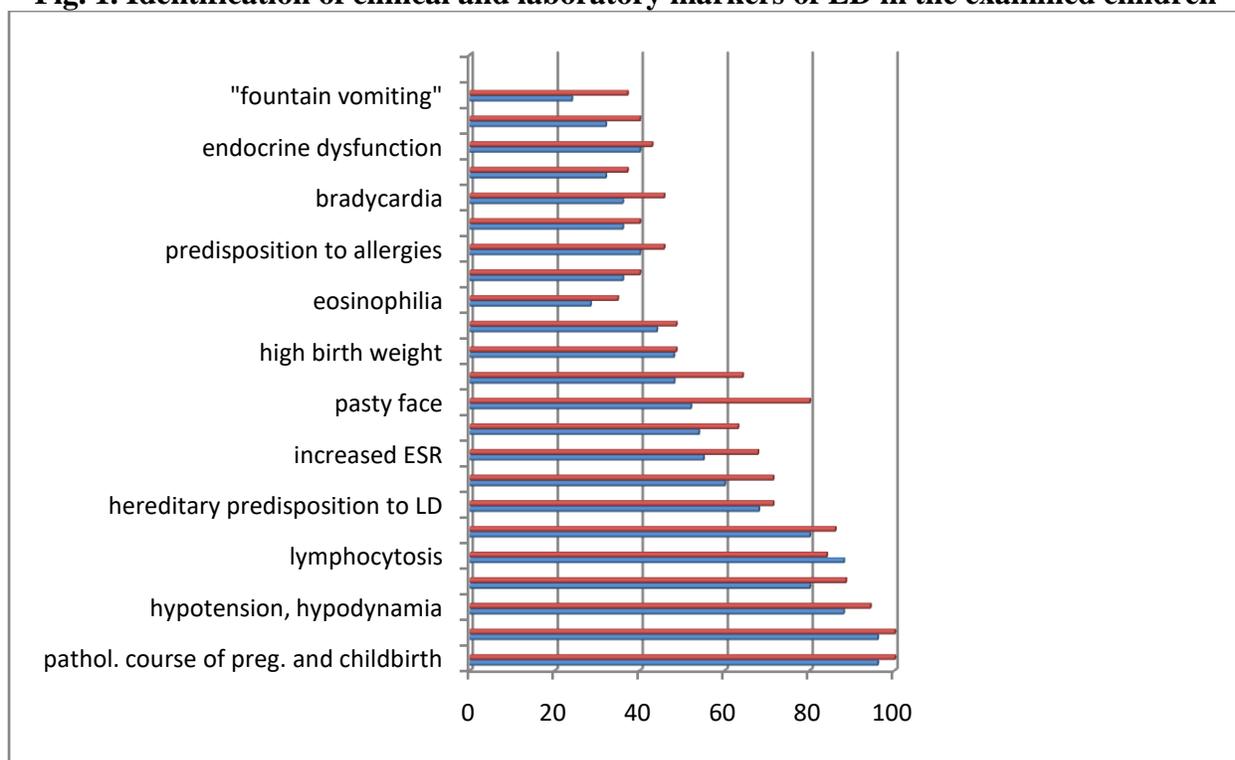
Gender	Overall, n=120					
	CKD, n=35 Group 1		CKD with LD, n=35 Group 2		LD, n=25 Group 3	
	Quantity	%	Quantity	%	Quantity	%
Male	21	60,0	26	74,3	17	68,0
Female	14	40,0	9	25,7	8	32,0
Age: 7-11 years old	35	100	35	100	25	100

In terms of age, all examined children were up to puberty, which is important in the manifestation of LD.

The duration of the disease in the examined children varied within wide limits: in the 1st group (CKD), the maximum manifestation of the NS clinic was 7 years, averaging 3.7 ± 1.6 years; in group 2 (CKD with LD), the duration of the disease reached up to 9 years, averaging 5.8 ± 1.7 years; in group 3 (LD), the maximum duration of LD was up to 11 years, averaging 6.5 ± 2.6 years, that is, the clinical manifestations of LD in children were noted from an early age.

When studying GFR, the difference in the frequency of different stages of CKD in the groups was statistically insignificant, however, the following tendency in the progression of CKD was revealed: for children of group 2, with CKD with LD, a lower frequency of I and II stages of CKD is characteristic with a relative increase in the number of children with III and IY stage (1.5-2 times more often). The average GFR in CKD with LD (group 2) was 52.3 ± 4.34 ml / min, which is significantly lower than in CKD without LD (group 1) 57.8 ± 3.45 ml / min.

Based on anamnestic materials, we studied the formation and development of LD in the examined children in the aggregate of all clinical and laboratory signs. The indices of clinical and laboratory markers of LD in the examined children were assessed (Fig. 1), a statistically significant high frequency was found: high infectious index, imbalance in physique, pasty face, hypotension and hypodynamia, nervous lability, thymomegaly, bradycardia, "fountain vomiting", lymphocytosis, an increase in ESR, a decrease in serum IgA and monocytosis, which are more pronounced in children with CKD with LD compared to children with LD.

Fig. 1. Identification of clinical and laboratory markers of LD in the examined children


When assessing the clinical manifestations of CKD in the group of examined children, the tendencies were statistically significant towards a higher frequency of the following symptoms in the 2nd group compared to the 1st group: "chalky" pallor of the skin (70.8% -62.0%), decreased appetite (44.0% -32.7%), oliguria (93.7% -87.0%), fatigue (74.9% -63.9%), a positive beating symptom (34.5% -29, 8%), common edema (85.7% -68.0%), ascites (64.8% -43.7%), hepatomegaly (29.4% -17.5%), respectively.

When studying the functional state of the kidneys and biochemical parameters of blood in the examined groups, there was a significant decrease in daily urine output, an increase in daily proteinuria, total cholesterol, triglyceride, fibrinogen, hypoalbuminemia, hyper

gammaglobulinemia, an increase in the content of urea, creatinine and fibrinogen, which were also significant in the 2nd group. higher than in the 1st group.

In the examined children, the frequencies of comorbidities were analyzed and it was found that a statistically significant percentage in the 2nd group was: anemia (78.2%; 83.4%), chronic tonsillitis (80.6%; 87.1%), adenoids (28.0, %; 36.0%), helminthiasis (25.9%; 34.4%), recurrent bronchitis (32.9%; 48.0%), thyroid gland (35.6%; 54.6 %), gastroduodenitis (12.7%; 28.3%) compared with group 1, respectively.

Comparative assessment of the results of immunological studies (table-2) with the control group showed a significant decrease in T-lymphocytes (CD3), T-suppressors (CD8), T - helpers (CD4), FAN and IL-2 production; an increase in the number of B-lymphocytes (CD19), ASL of the kidneys, lungs and the concentration of CEC, which were also high in the 2nd group (1.5-2 times) than in the 1st and 3rd groups of children.

TABLE 2 IMMUNITY INDICES IN THE EXAMINED CHILDREN (M ± M)

Figures	Healthy children, (n=25)	CKD (n=35), Group 1 P	CKD with LD, Group 2 (n=35), P^1	LD, Group 3, P^2	P	P^1	P^2

Note: the significance of differences compared to the group of healthy children. ASLs are compared between groups 1, 2 and 3. *** - p <0.001; ** - p <0.01; * -p <0.05

CONCLUSIONS

1. In children with CKD on the background of LD, clinical and immunological changes are characterized by a decrease in T-lymphocytes, T-suppressors, T-helpers, FAN and IL-2 production; an increase in the number of B-lymphocytes, ASL of the kidneys, lungs and CEC

concentration, which are 1.5-2 times higher than in the group of children with CKD without LD and LD.

2. LD is considered as a risk factor influencing the progression of CKD, which is confirmed by more pronounced (1.5-2 times more often) manifestations of clinical, laboratory and immunological changes in children with CKD with LD compared with the group of children with CKD without LD.

3. Clinical and immunological shifts are criteria for early prognosis and make it possible that LD can be considered as a predictor of chronic renal failure in such patients.

ABSTRACT

In India, the Scheduled Tribes population is around 8.6% of the total population of the country. There is considerable progress of these communities in terms of many human development indicators. Acquisition of land for development projects have often become a major threat to the tribal people. Displacement of tribal people from their original habitats causing further marginalized. They are the worst sufferers since independence of development projects such as dams, industries, roads, quarrying and mining operations etc. It is largely this group that is paying for the development of India. A majority of the displaced people have not been properly resettled or given adequate compensation. Cash payment does not really compensate the tribals for the difficulties they experience in their lifestyle and ethos. The tribal people of Andhra Pradesh have been the disproportionate victims of dam displacement. With this backdrop, the present paper examines the issues of compensation and resettlement of Indira Sagar Project. An ethnographic study conducted in the village Devargondi. Anthropological tools and techniques were used in collection of primary data.

KEYWORDS: *Dam, Displacement, Tribals , Resettlement, Compensation, Andhra Pradesh*

INTRODUCTION

Development-induced displacement is increasing in depth and intensity all over the world and particularly in developing countries. Infrastructural development in the period 1990-2000 caused the displacement of 90-100 million (Cernea and McDowell, 2000). The greatest burden of displacement is caused by dam construction which is credited with the displacement of 40-80 million people (Cernea, 2000; WCD, 2000). Growing developmental projects have been causing massive acquisition of land and displacing millions of people in different parts of the world, including India. The development projects in today's globalised world such as dams, industries, roads, mines, infrastructure, power plants, special economic zones, and new cities are intended to promote national, regional, and local development. It is said that for any development project the cost has to necessarily be borne by the displaced and affected population.

In most developing countries such as China, India, Zambia, Ghana large scale development projects have rendered increasingly sizeable population homeless, landless, jobless and food insecure, considering that their socio-economic asset base is often destroyed (Oliver-Smith 2009; Bond and Kirsch 2015). Globally, it is estimated that approximately 15 million people are forced to leave their homes to give way for huge development projects every year (Carnea and Mathur, 2008).

A majority of the displaced people have not been properly resettled or given adequate compensation. For instance, in India 75 percent of displaced people have not been "rehabilitated" (Fernandes, W, 1991; Fernandes, Walter & Thukral. 1989). Their livelihoods have not been restored; in fact, the vast majority of development resettlers in India have become impoverished (Mahapatra, L. K. 1999). Resettlement & Rehabilitation (R&R hereafter) policies have been unable to avoid the impoverishment of the displaced population and restore the previous level of well-being (Cernea and Mathur, 2008).

In India, the Scheduled Tribes population is around 8.6% of the total population of the country. There is considerable progress of these communities in terms of many human development indicators. Acquisition of land for development projects have often become a major threat to the tribal people. Displacement of tribal people from their original habitats causing further marginalized. They are the worst sufferers since independence of development projects such as dams, industries, roads, quarrying and mining operations etc. A recent estimate suggests that at least 55% of those displaced across India are tribal people (GoI 2004). It is largely this group that is paying for the development of India. A majority of the displaced people have not been properly resettled or given adequate compensation. Cash payment does not really compensate the tribals for the difficulties they experience in their lifestyle and ethos. The tribal people of Andhra Pradesh have been the disproportionate victims of dam displacement. With this backdrop, the present paper examines the issues of compensation and resettlement of Indira Sagar Project.

Methodology and Study Area

The present study has made an attempt to find out the impact of involuntary displacement and rehabilitation of Indira Sagar Project (Polavaram) on the tribal community in Andhra Pradesh. An ethnographic method has been adopted to carry out this study. Before the main fieldwork, a pilot study conducted in project-affected areas. The pilot study was conducted for 15 days from 2nd to 16 in month of December, 2014. At the time of pilot study visited the villages that were in the first phase of relocation. The pilot study was helped to identify the study village and also

helped in rapport building with the villagers. To know the magnitude of displaced people and the implications of rehabilitation and resettlement policy, an empirical study conducted in west Godavari district. The fieldwork of research was conducted in February 2015 and continued till May 2015. The second phase of the fieldwork was conducted in November and December 2015. For the collection of primary data and to reach the objectives of the study, six months of fieldwork conducted in the project-affected area.

The study of involuntary displacement is methodologically complex in nature. Therefore, multiple tools and techniques were used to study the various aspects of displacement, and rehabilitation. The following anthropological tools and techniques were used:

- observation,
- informal and formal discussion,
- household interview,
- case study, and
- focus group discussion.

Secondary data has been collected from books, articles, reports and available literature. The secondary data about project-affected area and people was derived from the records of revenue department, land acquisition, and resettlement and rehabilitation office.

Indira Sagar Project and Displacement of Population

The Indira Sagar (known as Polavaram) project is a major multipurpose irrigation project which is constructed on Godavari River, close to Ramayyapeta village of Polavaram mandal in West Godavari district, Andhra Pradesh. The Indira Sagar Project is the most awaited major irrigation project for many decades. Most Central and state-based political parties have given priority to construction of this project across the Godavari River. The construction of Indira Sagar dam is a political and controversial issue involving political parties, civil society organizations, independent researchers and NGOs. Though, many people are agitating against it and there is much opposition but finally work on the project has gained momentum in the year 2004. The Andhra Pradesh State Re-organization Act, 2014 declared the project as a national project in March 2014 (Government of India, 2014).

According to the assessment report of Reddy, N.S (1996), total 276 villages are affected by the project housing 1, 77,275 people consisting 44,574 households. The project involves submerging 28,336 cattle sheds, 69,255 productive trees. Of these project-affected people, 47% are scheduled tribes and 14.4% are scheduled castes. And the IEA, 2005 mentioned based on the information extrapolated from the 2001 Census of India, total affected population is 1,70,000. Of the total, scheduled tribes (47%) and scheduled castes (14.4%) and the total affected villages are 157. It is reported that over 276 villages in the state of Andhra Pradesh are likely to be submerged. In Odisha 10 villages and in Chhattisgarh 7 villages are going to be submerged. The total submerging villages in this project are 293 (Reddy, N.S, 1996). According to a study by Agricultural Finance Corporation Limited based on the 2001 Census, a total of 2,36,834 people are affected by the project, of which the male constitute 1,17,321 and the female 1,19,513. Among them, 53.17 per are tribals. Tribals and dalits together account for 65.75 per cent of the displaced population.

Issues of Resettlement and Compensation

The study village Devaragondi is a newly established resettlement and rehabilitation (R&R) colony, constructed close to the Polavaram mandal headquarters which is 2 km from the village. The village is submerged by the Polavaram dam and it is the first village as a model village shifted from the old village which was located in the dam site. The Devaragondi village is a tribal village, inhabited Koya community. The villagers shifted from the old village to new R&R colony in 2012. Devaragondi is a revenue village which comes under Mamidiondi panchayat village, Mamidigondi panchayat consists two villages: Mamidigondi and Devaragondi. These two villagers have an informal internal agreement that the panchayat sarpanch is elected rotation wise; If the sarpanch is from Mamidigondi, the next sarpanch will be from Devaragondi.

The total population in the village is 316 of which males constitutes 133 and females are 183. The Devaragondi village comprises 104 households (Actually, there were 115 households including newly married households but after shifting to the new R&R colony, 11 households, who were single, died due to ill health and displacement trauma). The 104 houses are pucca houses (buildings) constructed under R&R scheme.

The primary occupation of most Koya tribe households (95) in the newly settled village is casual wage labour both agriculture and non-agriculture works, engaged in dam construction works, agriculture and other allied works. Five households have started petty business/ self-employed and two households are settled in government jobs.

The secondary occupation is agriculture. Although, the villagers have received land-to-land compensation under R&R package for their loss of agriculture land in old village, the compensation land which they received is located nearly 20 km from the newly settled village. The villagers are facing difficulties for cultivation so most of the households have given their agriculture lands on lease to local farmers. For lease, the farmers will pay Rs. 15,000 to 20,000 per acre per a year. In the village, of 58 households who received agriculture land under R&R in new location:

- 38 households have leased out their fields to the outside farmers.
- 18 households cultivate fields on their own,
- One household is not cultivating his fields because it is submerged by the right canal.

The major crops are maize, paddy, pulses and vegetables. The compensation lands which the villagers received under R&R is totally rain-fed cultivation and very recently, the farmers have received bore-wells under land development schemes but the bore-wells are not functioning due to rocky soil.

The village Devaragondi situated in the project core zone area is affected by the project. The Dam preparatory activities started in this village in 2006. The right canal of the dam passes through this village. The twin tunnel passes through two neighboring villages Mamidigondi and Thotagondi. In mid-2005, the villagers came to know that the village was going to be submerged by the Dam and they had to leave their village and shift to the new location. When the news came in to the village through the notification displayed at the community centre, the villagers got scared and decided that they would not leave the village. They were scared about the

challenges which they would face in the new location. They were clueless about the new location.

Implementation of resettlement and rehabilitation process was started in 2007-2008 covering all the submerged villages in the first phase of R&R implementation, vide G.O. Ms. No. 68. Land-to-land compensation up to 6.25 acres was offered to the tribals for their loss of agriculture fields. For housing structures and loss of trees and other immovable assets, the compensation in lieu offered based on the cost analysis which was done by the experts of concern departments. For cost analysis, the Panchayat Raj, R&B engineers and housing boards were involved. The details of land-to-land compensation are furnished below:

Details of R&R Land for Land Compensation

Loss of Agriculture lands in acres	Land to Land received in acres	Land to be given in acres
192.81	163.11	29.7

Source: Field Data

The data show that out of total acquired agriculture land 192.81 acre, 85 per cent of land 163.11 acre have been received under land-to-land compensation and 15 per cent of the land 29.7 acre is yet to be received. The farmers are still waiting for their loss of remaining land. The reasons for the delay in giving land-to-land compensation for remaining loss of land is due to

- scarcity of land,

- dual names existing on the list and

- lack of evidences and

- Entitlements problems.

The consequences of displacement have driven the tribals into vulnerable conditions altering their traditional livelihoods. In the old village, the tribals had many resources and they could manage them skillfully. They were happy with their environment and they had never thought that they would be dislocated from their habitation and settle in new location. The Devaragondi village was the main submerged village. The displacement wave hit the village first among all submerged villages in the project area.

The rehabilitation and resettlement (R&R) process was initiated in 2005 in the project area. Out of nine submerged mandals, rehabilitation and resettlement was initiated in two mandals (Polavaram in West Godavari and Devipatnam in East Godavari) in the first phase. In the first phase, 14 villages have been covered under the provision of G.O.Ms No: 68, Andhra Pradesh Rehabilitation and Resettlement Policy, 2005 (GoAP, 2005).

- The villages in West Godavari district are Mamidigondi, Devaragondi, Ramayyapeta, Chegondapalli, Singanapalli, Pydipaka and Thotagondi.

- The villages in East Godavari District are: Anguluru, Paragasanipadu, Veeravarapulanka, Bodigudem, D. Ravilanka, Nelakota and Gandikota.

The implementation of Rehabilitation and Resettlement to the Project Affected Population in seven mandals come in Khammam district, Telangana State, after bifurcation of the United

Andhra Pradesh State, the ordinance was issued on 28 May 2015 under AP Reorganization Act 2014 that seven mandals from Telangana have been merged into Andhra Pradesh state for smooth R&R functioning (Government of India, 2014).

- The mandals merged in West Godavari are Kukunooru, and Velerupadu.
- The mandals merged in East Godavari districts are Chintoor, V.R.Puram, Kunavaram, and Burgampadu.

In 2015-16, the second phase of R&R implementation started covering 134 villages in seven mandals.

- The mandals from West Godavari districts are Polavaram, Kukunooru, and Velerupadu
- The mandals from East Godavari district are Devipatnam, Chintoor, V.R.Puram, and Kunavaram.

The remaining two mandals (Badrachalam and Burgampadu from East Godavari) will be covered in third and fourth of R&R implementation. Of the nine submerged mandals, three are in West Godavari and six in West Godavari.

- The mandals from West Godavari district are Polavaram, Kukunooru, and Velerupadu
- The mandals from West Godavari district are Devipatnam, Chintoor, V.R.Puram, Kunavaram, Badrachalam and Burgampadu.

In the second phase of R&R implementation, the Govt. of AP has issued G.O. Ms No. 389 adopting the provisions of LARR Act 2013. A new G.O. No.92 was issued by the government during 2017, directing another 90 tribal villages to evacuate immediately due to the danger of submergence. The NCST report, 2018 has mentioned that under second phase nearly 110 tribal villages (38 in West Godavari and 72 in East Godavari) were displaced to enable construction of Upper Coffer Dam. The displaced tribal families were to be rehabilitated as per new land acquisition Act of 2013 (The Gazette of India, 2014).

The Rehabilitation and Resettlement (R&R) Policy of Government of Andhra Pradesh, 2005 (also called as the "Policy on the Rehabilitation and Resettlement for Project Affected Families – 2005") came into effect through a G.O. Ms. No. 68 on 8th April 2005 issued by Irrigation and CAD (projects wing) department. This was in conformity with the national policy on R&R 2003. This policy also recommends land-to-land compensation in case of project-affected families (PAFs) belonging to ST community. This policy stands different from the earlier G.O.s only in providing wage compensation to landless people. Various projects during 1990 to 2005 revealed that the provisions of G.O. No. 64 of 1990 were never implemented in any irrigation project constructed during this period. Therefore, this policy is no different from earlier ones unless it is implemented in its true spirit (GoAP. 2005; 2006a; 2006b).

In the course of time, however, the Andhra Pradesh R&R policy 2005 was modified several times for making it better – first in 2006 in response to the protests by the oustees of Gundlakamma reservoir project and another important one in 2009 to incorporate the provision of Social Impact Assessment in compliance with the National R&R policy 2007.

However, for a policy to be a better one and successful, its proper implementation is also important. This implementation largely depends on the better and operational provisions, as well as the knowledge (and proper understanding) of the policy and the interest and concern among

the project/government authorities and the officials connected with this implementation. Due to the negligence in its implementation in letter and spirit, presence of vested interests, and pressure tactics on the oustees mounted by the authorities, several problems arose in the process of resettlement and rehabilitation, leading to corruption, improper distribution of benefits, and deprivation of R&R to project affected families. These problems are in addition to the unexpected problems faced by the oustees due to their being uprooted from their roots and attempting to relocate and resettle them in totally alien areas (with a different culture, language, and social milieu), where the locals could treat them as "intruders."

In view of the above, the rehabilitation and rehabilitation policy of erstwhile Government of Andhra Pradesh could not safeguard the project-affected people in rural and tribal areas of the state. Thus, the earlier R&R policies (central and state) were obscure, problematic in operation, lack in certain crucial provisions, and their implementation depended on the interest and mercy of authorities as they were just "policies". These problems are clearly visible in the major irrigation projects of the earlier Gundlakamma reservoir project in Prakasam district and the ongoing Polavaram project in West Godavari district, and to some extent in the medium irrigation projects of Bhupathipalem and Musurumilli projects in the Rampachodavaram Agency area of East Godavari district.

The Indira Sagar project (Polavaram) was recognized as a national project in the year 2014. In this project the villagers were displaced phase wise and in the first phase 14 villages were displaced from West and East Godavari districts to the new location. The villagers were displaced according to the Andhra Pradesh R&R policy 2005. Till the 31st December 2013 they adopted the same policy for rehabilitation of the people. After the 31st of December 2013 from 1st January 2014 they adopted RFCTLARR 2013 Act 2013 for the rehabilitation of the remaining villagers. The first phase of displaced people from the 14 villages reported that they are not satisfied with the compensation of R&R policy 2005 because of the following reasons:

1. They were displaced from their ancestral homes and they were deprived of lands assets

2. They were not happy with the compensation and R&R package of Andhra Pradesh R&R policy 2005

3. There were many problems of implementation of resettlement and rehabilitation policy

4. People faced numerous problems at the rehabilitation centres

5. They were displaced very far from the original villages

6. Agricultural lands were provided to them very far from their homes.

7. The new location lacked proper infrastructural facilities at such as drinking water, electricity, roads, schools, and healthcare facilities.

8. They were not able to coping with other local people at the new location due to the differences in culture and socio-economic lifestyle

9. They had lost access to forest resources and products,

10. They felt that other villagers are relatively better because they were rehabilitated according to the RFCTLARR Act 2013

The Rehabilitation & Resettlement Package of Polavaram Project (G.O.MS No: 68):

Components	Compensation Details
Land Compensation	**For Scheduled Tribes** (a) for land holdings up to 6.25 acres, land for land compensation is given; (b) for land holdings exceeding the 6.25 acres, cash compensation is given for the excess land (c) Cash compensation for land at the following rates: Rs 115,000 per acre for non-irrigated land; Rs. 130,000 per acre for cultivable land with canals and irrigation tanks; Rs. 145,000 rupees for land having deep borewells or small irrigation projects.
	For Non-Scheduled Tribes (a) Cash compensation for land at the following rates: Rs 115,000 per acre for non-irrigated land; Rs. 130,000 per acre for cultivable land with canals and irrigation tanks; Rs. 145,000 rupees for land having deep bore wells or small irrigation projects.
House Construction & Relocation Site	(a) Free House Site - 0.05 Cents (b) Rs 45,000 grant for house construction (c) Rs. 5,000 grant for Individual Toilet (d) The resettlement colony must be provided with basic amenities and infrastructure: drinking water, internal roads, drainage, electricity, primary school, playground, community hall, approach road, community center.
Wage & Allowances	(a) 750 days @ 85 Rs per day of minimum agricultural wage for loss of livelihood if after the acquisition of land the owner becomes landless; (b) 500 days @ 85 Rs per day of minimum agricultural wage as one-

	time financial assistance if after the acquisition of land the owner becomes marginal farmer; (c) 375 days @ 85 Rs per day of minimum agricultural wage as one-time financial assistance if after the acquisition of land the owner becomes small farmer; (d) 625 days @ 85 Rs per day of minimum agricultural wage as one-time financial assistance for laborers; (e) 240 days @ 85 Rs per day of minimum agricultural wage as one-time financial assistance for each displaced family; (f) 500 days @ 85 Rs per day of minimum agricultural wage as compensation for the loss of customary rights and usage of forest produce;
Compensation for Immovable Assets	(a) For loss of houses, based on the type of house the affected household will receive an amount up to Rs. 100,000 and above. For the house valuation, a separate team has been appointed by the R&R implementation authorities. The households who have lost their agriculture land would receive crop loss Rs. 5,000 to 15,000 per acres for three years. The compensation valued for the trees Rs. 150 to 1,000 based on the type of trees.
Other	(a) Rs 25,000 for income generating scheme grant. (b) Rs 5,000 grant for construction of a new cattle shed; (c) Rs 5,000 for transportation from the old to the new place,

The Right Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act 2013

Currently, the second phase of R&R is being implemented in 134 villages in seven mandals (Polavaram, Kukunooru, Velerupadu from West Godavari and Devipatnam, Chintoor, V.R.Puram, Kunavaram from East Godavari District) in West Godavari & East Godavari Districts. The plan of action for implementing R&R is scheduled to be completed in 2021. In the second phase of R&R implementation, the Govt. AP has issued G.O. Ms No. 389 adopting the provisions of LARR Act 2013.

The remaining two mandals (Badrachalam and Burgampadu from East Godavari) and the implementation of R&R shall be completed in four phases. The list of submerged mandals is nine; three Mandals (Polavaram, Kukunooru and Velerupadu) under West Godavari and six Mandals (Devipatnam, Chintoor, V.R.Puram, Kunavaram, Badrachalam and Burgampadu) under East Godavari District.

The Policy enforced into implementation in the Project in 2014 and the provisions are:

Components	Amount Rs.
Livelihood Assistance for each family (one-time payment):	500000
Subsistence grant/allowance for a period of 12 months:	36000
For all families Additional for SC & ST	50000
Transportation cost for each family (one-time payment)	50000
Artisan/Small traders and other grant (if any) One-time grant	25000
Additional Support to cattle sheds petty shops	25000
One-time resettlement allowance for each family	50000
Total	736000

Source: Field data, The Gazette of India. (2013), http://randrwestgodavari.com/r&r.html access on November 2, 2018

For construction of the houses of Adivasis the Government should allot Rs. 4.55 lakhs as per Government Order (G.O. Rt. No.641, Revenue Department) in which it enhanced the housing budget of Adivasis from Rs 2.80 lakh to 4.55 lakh rupees for a 275 sq feet house which the lower revenue officials choose to ignore. The R&R process has been initiated in the project area in 2005. To address the issues of displacement and justification of DPs, the Government of Andhra Pradesh has come up with the policy 'G.O. Ms No 68'. The policy essentially addresses the need to provide succour to the asset-less rural poor, support the rehabilitation efforts of the resource-poor sections, namely, small and marginal farmers, SCs/STs and women who have been displaced, besides, it seeks to provide a broad canvas for an effective dialogue between the project-affected families and project-displaced families and the Administration for Resettlement & Rehabilitation.

Initially, in the first phase of land acquisition and R&R activities, the Government of Andhra Pradesh has implemented vide G.O Ms No 68 and as per the G.O. the compensation has been paid to the DPs on loss of their fixed assets, land to land and R&R household monitoring benefits. In 2014, the second phase of land acquisition and R&R activities has been initiated, the Government of Andhra Pradesh has adopted a Central act called 'The Right Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act, 2013 and subsequently the G.O.AP issued vide G.O.M.s No 389 following the central act – RFCTLRR

Act, 2013. The RFCTLRR Act has been enforced dated the 16th September 2013. The following checklist has been presented on the component of compensation package in respect of land acquired under the Act, the elements of Rehabilitation and Resettlement entitlements, provisions of infrastructural amendments etc.

The Comparison of the Rehabilitation and Resettlement Policy of Government of Andhra Pradesh, 2005 and the RFCTLARR Act, 2013

Sl. No.	Component & Provisions	Entitlements	
		G.O. Ms. No. 68 2013	The RFCTLARR Act, 2013
Individual Entitlements			
1	Provision of housing units in case of displacement	0.05 cents	0.05 cents
2	Household Compensation (Include all allowances) in Rs.	170,200/120,200	636,000/736,000
3	For House Construction in Rs.	40,000/50,000	Rs 2.80 lakhs to 4.55
4	Land for land (ST PDFs)	Up to 6.25 acres	Up to 6.25 acres
5	Compensation on loss of land per acre Rs in lakhs	1.15 to 1.85 lakh	7.5 to 10.5 lakh
6	Land development		Through MGNREGA
7	Stamp duty and registration fee	Free of cost	Free of cost
8	Fishing rights	Yes	Yes
9	Loss of Assets (House, trees, cattle shed etc.)	As per the assessment of current market value	As per the assessment of current market value
Community Entitlements: Basic Infrastructure Amenities & CPR			
1	Basic Infrastructure Amenities (Drinking water, Health, Education, Roads etc)	As per G.O	As per Act
2	CPR (Common lands and Grazing lands	As per G.O	As per Act

Source: Field data, GoAP. (2005; The Gazette of India. (2013)

The above details gives the clear picture on the comparison of Rehabilitation and Resettlement Components and Entitlements & provisions of both Individual and Community under Rehabilitation and Resettlement Policy of Government of Andhra Pradesh, 2005 and the Rights Fair Compensation and Transparency in Land Acquisition, Rehabilitation and Resettlement Act, 2013.

CONCLUSION

The displaced families in the first phase were paid compensation on their loss of assets & household grant through G.O.Ms No 68 while currently the displaced families under second phase are being paid through the RFCTLARR Act 2013. The displaced people who received household compensation in the first phase are unhappy that they have received inadequate

compensation compared to the displaced people of second phase. The displaced people from the 14 villages of West Godavari and East Godavari Districts are expecting benefits & provisions of the RFCTLARR Act 2013.

Although the above policies came into existence in revised form there were problems in its implementation by the Central and State governments. For example, in Indira Sagar project the Government of Andhra Pradesh implemented 2005, 2007 and 2013 policy for rehabilitation and resettlement of displaced people. Villagers were not informed about the project displacement; they were not sensitized through meetings. Projects officials did not make any serious efforts to explain about the details of R&R package, not even bother to translate them in to local language. In many of the panchayat Gram Sabha was not convened. Officials not served any kind of notice to the households to vacate their places.

There was delay in payment of compensation. At time of acquisition of land they committed to complete the compensation package as early as possible but till today, some of the villagers have not received the package. Most of the displaced people reported that they faced many problems at the rehabilitation centres. The agricultural lands were not provided nearer their location. Overall officials did not properly implement the rehabilitation and resettlement policy in the study village.

Several issues and concerns of the project displaced families in the study village and other affected villages in the project were noticed. The Government should rely and take necessary actions to address those problems of displaced population immediately and further, the Government should enhance the monitoring mechanism to fulfill lacuna in implementation of R&R policy in the project-affected area. Due to improper implementation of the policy, the affected population especially tribes are not fully compensated. Six households in the village were not paid any compensation because they were not included in the award list. Similar issues are also noticed in the other affected villages. Therefore, the Government should ensure that the every affected person should get R&R benefits without fail.

THE NEED TO STUDY INTERCULTURAL COMMUNICATION

Poziljonova Zulfiya Sobirjonovna*

* Kokand State Pedagogical University,
UZBEKISTAN

ABSTRACT

This article discusses the need for the study of intercultural dialogue, the factors that led to the introduction of this science in the United States, Europe and Uzbekistan, as well as the main aspects of intercultural approach.

KEYWORDS: *Globalization, Culture, Communication, Intercultural Communication, Norms Of Behavior, Linguocultural Studies, Ethnopsychology, Knowledge, Skills, Abilities.*

INTRODUCTION

The process of globalization today has embraced all aspects of human society, including culture. Until recently, the history of mankind was the history of individual countries, peoples and cultures, but today it is becoming a common history: the events that take place in the lives of some countries are reflected in one way or another in the lives of other parts of the world. At the same time, modern cultures lose their originality, and the boundaries between them gradually disappear.

The process of globalization required communication with different cultures, which has become a daily reality for many countries and peoples. This created an initial interest in intercultural communication and a need to study it later. Currently, the study of intercultural communication is engaged in a number of humanities, including cultural studies, communication studies, sociology of culture, linguocultural studies, ethnopsychology and other disciplines. Thanks to the work of experts in this field, the first publications devoted to the study of the problems of the interaction of cultures appeared. However, most of these publications have been written by linguists [1,2], in which the process of intercultural communication is mainly focused on linguistic communication, which in itself significantly reduces the real scope of intercultural communication. This, in turn, ignores its cultural-anthropological aspect.

MATERIALS AND METHODS

Today, many people participate in international forums and conferences, work in international political, economic and professional organizations, multinational companies, Uzbek students study abroad, and Uzbek tourists travel around the world. Experience has shown that the establishment of various relations and forms of communication requires not only knowledge of the appropriate language, but also knowledge of the norms and rules of the culture of another nation. Representatives of every nation quickly realize that mastering a foreign language alone is not enough to engage in intercultural communication. To do this, they need knowledge of the norms of behavior, psychology, culture, history of the country. Finally, knowledge of the communication process itself is also required to anticipate the possibility of misunderstanding partners and to get its name.

In turn, the rapid development of society requires more effort from a person to understand what is happening, including how a person builds his or her relationships with other people. Mutual understanding of people is becoming one of the important aspects of the development of modern society. For modern man, the need to achieve perfection in communication is characterized by the desire to "be an example and value to others."

The main means of mutual understanding between people is their communication, in the process of which people manifest all their characteristics. In communication, a person is formed as a person, as a carrier of culture, assimilating universal experiences, historically formed norms of society, values, knowledge and methods of activity.

Living in such a society, the ethnic, racial, social and cultural diversity of the world opens up endless possibilities for the mutual spiritual advancement of human beings. In the process of communicating with people who are not like him, a person acquires new skills and abilities, shapes and improves what he already has. However, there are other aspects of human differences: the greater the differences in the nature, upbringing, education, and culture of the partners involved, the greater the likelihood of conflicts and clashes between them. For this reason, relationships between different peoples, social groups, or cultures place high demands on each of them. People need to master different forms of intercultural communication, have a psychological knowledge of the behavior of their partners in communication. Each individual must be able to form their own communication skills and use them wisely in specific life situations, as well as be able to resolve any confusion, misunderstandings and conflicts in a timely manner.

It is known that a person understands the world by describing his personal impressions to others, teaching them his own experiences, that is, evaluating the behavior of others based on his own personal life situation. He creates his own 2nd person by sharing his personal experiences of understanding the world with others. He begins to see in his eyes a copy of himself, a spiritual world similar to his own, and not another person embodied in his uniqueness. To get out of this egocentric circle, one must see a unique person in each person, replacing the usual direction towards oneself by directing oneself towards the inner world of others.

In order to avoid mistakes and contradictions in the process of communication with other people, it is necessary to remember that "another person" means, first of all, "a person different from me." Everyone retains the power of uniqueness and uniqueness that is inherent in the circumstances of their way of life. The deeper he begins to understand that he can distinguish

one person from another, the shorter the path to mutual understanding becomes. Everyone has greater opportunities to be equal in the process of communication based on mutual respect and the right to remain as they are.

The solution of the above-mentioned issues is the subject of a new field of science called "intercultural dialogue". Problems of intercultural communication first became the subject of scientific research in the United States in the middle of the last century under the influence of a number of social and political factors. In Europe, the issues of intercultural communication began to take shape in connection with the influx of labor from other parts of the planet, as well as socio-cultural development aimed at tolerance and intercultural understanding. In multinational and cultural Uzbekistan, too, these issues have become relevant over the past 10 years. Since linguists were the initiators of intercultural research in the science of our country, the issues of intercultural communication have been studied by them for several years as communication between different languages   in a narrow sense. Nevertheless, it is not difficult to understand that the above-mentioned issues go beyond the realm of linguistics and clash with a number of scientific disciplines. We are talking about psychology, ethnology, cultural studies, semiotics and others.

DISCUSSIONS AND RESULTS

The main aspects of the intercultural approach are:

Historically, it examines any cultural event as a result of the dynamics of human culture;

Morphologically, it illuminates the components of a particular cultural phenomenon;

Anthropological refers to a culture formed from the knowledge, beliefs, customs, abilities, behavioral habits and stereotypes that a person acquires as a social being;

Value-oriented, culture reflects a system of values, and each of its events has value for the people of that culture;

Activity-based, according to which culture is manifested by the individual as a process of carrying out certain goal-oriented activities to achieve certain goals and necessary results [3].

CONCLUSION

Each of these aspects defines the boundaries of culture and interacts with all other aspects. They cannot be contrasted equally. However, depending on the specific goals and objectives of the research, each of them may come to the forefront and gain its own level of relevance.

ABSTRACT

The article analyzes the semantic features of artistic comparison: the most frequent thematic groupings of comparisons that contribute to the creation of a female image in Russian and Uzbek literature are identified.

KEYWORDS: *Female Image, Artistic Comparison, Object Of Comparison, Thematic Group.*

INTRODUCTION

The study of the artistic heritage of outstanding authors has always attracted the attention of a wide range of researchers, linguists and literary critics. Of great interest is the study of the means and techniques used by authors of fiction to create the imagery of their works and aesthetic impact on the reader. All this is achieved due to the fact that various expressive and emotional shades are added to the purely logical content of the works.

Main part

One of the most common tropes is figurative comparison. It gives speech a special expressiveness. Of particular interest is the analysis of figurative comparisons in works of fiction, the ways in which they reveal the author's view of various objects, phenomena and characters, that is, the identification of the special role of figurative comparison in reflecting the writer's artistic intent. In our study, we adhere to the definition of M. D. Kuznets and Yu. M. Skrebnev, who define figurative comparison as "the comparison of two objects that have some

common feature for them, in order to more clearly and clearly characterize one of them" [1, p.145].

The Russian national character found its vivid embodiment in the work of N. S. Leskov. The writer managed to reveal the depth and essence of the nature of the Russian person. And in Uzbek literature, Abdullah Kadiri's novel "Past Days" reveals a wide range of universal themes and problems. Therefore, it is very difficult to define it unambiguously. But still, it can be argued that, having based the work on a beautiful love story, the author managed to touch on the most complex problem of the confrontation between God and the devil, light and darkness in the destinies of humanity.

Special attention should be paid to the depiction of Russian female characters in the prose of N. S. Leskov. Their nature in the work the author comprehends most often through the eyes of his characters. So, in the chronicle "Soboryane" ProtopopSavelyTuberozov "is deeply shocked by the cordiality of his wife, who is ready to raise a "fledgling pigeon" (an orphan child). She presented herself to him as a Russian woman, inseparably connected with the people's soil: " ... he fell on his knees before her and, bowing to her to the ground, sobbed with that sob that there is no description in the world and indeed, "he says," tell me the times and peoples where, in addition to our holy Russia, such women as this virtue will be born. Who taught her all this? Who brought her up, except you, all-good God..."" [8, p.19].

The plot scheme "old husband – wife – young lover", traditional for Russian literature since the time of pushkin's "EvgeniyOnegin", Leskov uses to show the destruction of the patriarchal way of life in the merchant environment of post-reform Russia of the xix century. The sin of adultery and the love of money drive lovers to bloody crimes in the story.

The topic of the relationship of the sexes in Russian literature of the XIX century was rarely covered in hedonistic tones, it was more often considered in the context of socio-philosophical and religious problems of a tragic plan. The Orthodox faith of the Russian people contributed to the formation of a fairly strict morality. The national consciousness recognized the legitimacy of love between a man and a woman only in marriage, and marriage was considered the greatest sacrament. Extra-marital love affairs were classified as fornication and debauchery. In order to fully expose the processes that have begun to lose the sacred halo of marriage ties in the minds of people of post-reform Russia and the freedom of love relationships, both artists use the phenomenon of plot polyphonism in the structure of their works. So, Leskov four times reproduces the paradigm of a love triangle: Kopchenov – wife Kopcanova Sergey; Zinovy Borisovich, Katerina, Sergey. In the story, all the conflicts arise around the young hero-lover, for whom the wife brings poisoned tea to her husband. Katerina puts rat poison in the cup. In symbolic terms, this poison removes the heroine from herself not only her husband, but also her lover. Sergei would later say that he "liked Sonetkin's worn-out shoe better... than Katerina Lvovna's faces," a kind of skinned cat " [9, p. 290].

"Lady Macbeth of the Mtsensk district", V. Guminsky believes, "in essence, is an artistic development of the "predatory", according to the well-known Grigoriev classification, Russian type. This" brilliant indeed, and passionate indeed, and predatory indeed type, which in nature and in history has its justification, that is, the justification of its possibility and reality", coexists in Russian life, according to Apollo Grigoriev, with the type of "meek", "humble", "Belkin". but "we would be a people not very generously endowed by nature, if we saw our ideals in some

humble types… Not to mention the fact that we have had predatory types in our history" [10, p. 238].

The transcendent name "Lady Macbeth" stated in the title serves as a psychological preparation for the reader before the terrible pictures of murders. The clash of Christian morality, so important for Russia, and cruelty in the heroine vividly demonstrates the boundless possibilities of a person who ignores ethical norms in a fit of emotional outburst, whether it is love or grief.

Russian Russian female characters In the works of N. S. Leskov there are several types of Russian female characters: humble, virtuous, predatory, which in turn represent different facets of the rich Russian nature.

And in the novel "Past Days" we are faced with the multiplicity of the narrative, the presence of side plots, the consistent and increasing intensity and tragic denouement of events.

The ideological and compositional center of the novel is the image of Otabek, who adheres to advanced views. He openly opposes outdated methods of conducting trade and economic relations, adheres to new views on family and household problems. There is a conflict between Otabek and conservative forces that hinder development in the region. In many ways, Abdullah Qadiri puts his own thoughts and judgments into the mouth of his hero. In parallel, the writer traces the fate of an Uzbek woman. Inhumane and cruel customs, in particular polygamy, lead to a deadly feud between two women - Kumush and Zainab. With special love and sincerity, the writer draws the image of the beautiful Kumush, who, thanks to the pure and all-consuming love for Otabek, overcomes the trials of life and the treachery of enemies. However, tragedy is inevitable. She dies, poisoned by them, and Otabek dies in battle with the enemies of his Homeland.

CONCLUSION

The artistic literature often resorted to the use of imaginative comparisons to achieve the expression of speech and the transmission of the characteristic features of the characters. When creating female images, the use of comparisons allows you to create an original description of the appearance of the heroines, their behavior, feelings, thoughts and the world around them. Comparisons in the speech of characters can give a figurative characteristic of various actions and actions of people, determine the psychological and physical state of a person, his worldview, circumstances, situations and situations in which the heroine of the work finds herself.

THE PROBLEM OF COLOUR SYMBOLS IN LINGUISTICS

Akmal Uktamovich Abdullaev*

*Teacher
The Faculty of Philology Uzbek Language and Literature,
Fergana State University,
UZBEKISTAN

ABSTRACT

This article discusses the linguistic study of symbols associated with colors, their features of symbolic expression. The symbols associated with color are so ingrained in the minds of people that it is difficult to imagine the process of communication without them. If we observe a process associated with the color of one garment, the colors change depending on age, gender, position and a number of factors. One of the scholars, B.A. Basima, puts forward the idea of limiting the number of symbolic colours. It offers a separation of colours that are relatively often used in fictional text and increase the artistic value of the text - red, yellow, white, black, etc.

KEYWORDS: *Symbol, Metaphor, Color Concept, Color Psyche, Semantic Relevance, Hidden Meaning, Conditional Sign, Root Words, Compound Words, Culture Indicator.*

INTRODUCTION

The symbolic use of colors is given special attention in linguistics, as well as in a number of fields of science, including psychology, philosophy, logic, linguoculturology, methodology, and literature.

Main part

The study of color-representing units, their symbolism and reflection in language is carried out in linguistics, mainly in the following areas:

- assessment of different stages of modern language development;
- studying colours in the field of culture;
- psychological characteristics of colours;
- lexical and semantic properties of colours;

- highlighting the ethnolinguistic basis of colour;
- the study of colours that express a symbol;
- the relationship of colour and sound as well as their associative relationship;
- Interpretation of the colour concept [1, 192].

A number of scientific publications emphasize that colours and their symbolic meanings play a special role, mainly in literary texts. We see that the symbolic use of such colours has become an integral part of social life. Colour and associated symbols serve not only in a literary text, but also so that a person understands and comprehends the world, and the processes of interaction are simple and understandable. The symbols associated with color are so ingrained in the minds of people that it is difficult to imagine the process of communication without them. If we observe a process associated with the color of one garment, the colors change depending on age, gender, position and a number of factors. For example, men's clothing is made in a serious, calm colour, women's clothing is attractive, beautiful, attractive, bright, and the clothing of older people is in simple, calm, unobtrusive colours. Even the colours of clothing can reflect the character of people. It should be noted that such properties of colours are inextricably linked with their symbolic meanings.

Psychologist M. Luscher studies the psyche of colours, determines the nature and character of a person in relation to colour and divides colours into four types [2]:

1. Colour *(red)* denoting awakening, activity, striving for a clear goal, success.

2. Colour *(blue)* denoting peace, harmony, intimacy and a tendency to loneliness.

3. Colour *(green)* denoting self-expression, stability, resilience, confidence in the future.

4. Colour *(yellow)*, which characterizes the readiness for new impressions and changes, freedom and creativity.

These four colours are considered *"symbols of the ideal person"* ("komil inson ramzi"). M. Luscher emphasizes that a perfect and harmonious person embodies these four color features. It should be noted that the above four colors symbolize concepts that express the same meaning for all peoples.

Words denoting colour constitute a colorative lexicon in linguistics [1, 192]. Their study serves to determine the lexical and semantic features, the place and role of units of this type in the language.

The expression of colours using linguistic means is considered on the basis of two types - primary colors and related manifestations. For example, in Russian, including Uzbek, there are seven basic chromatic colours (red, orange, yellow, green, blue, blue, ink) and achromatic (black, white, gray). In English, there are 6 primary colours - black, blue, green, yellow, orange and red, while the rest of the colours in nature are considered basic products in linguistics.

It is known from history that colours are one of the indicators of culture. In the course of research carried out by specialists, the *"assimilation"* ("o'zlashtirilish") of colours by humans, that is, their entry into cultural life, occurred gradually or sequentially. For example, it is now noted that culturally 11 primary colours are coded in sequence. It turns out that initially **white** and **black** came into human life, and they have almost the same symbolic meaning among all peoples and are called two terms. The third term for colour is **red**. The fourth term is considered

yellow or *green*, the fifth term is *yellow* or *green*, the sixth term is *blue*, the seventh term is *brown*, the eighth and subsequent terms are called such colours as *black, pink* and *orange, gray.* These ideas found confirmation throughout the study of cultural history. For example, the ancient Greeks divided colors mainly into *white, black* and *red*. The rest of the colours are divided into *bright* (warm) and *dark* (cold) colours. The metaphorical and symbolic nature of colours are closely related to human activities [3, 189].

Words denoting colour can be divided into several groups, taking into account their formation, structure, structural features:

1. Basic words, that is, lexical devices consisting of one root: *blue, red, white* and others

2. Colour expressions formed by the addition of two bases: *brown, cabbag, (bargi karam), gray.*

In turn, simple words, taken on a metaphorical basis, compared with the color of the object – *dice* (zar), *gold* (tilla), *juice* (shinni); Compound words - *apple flour* (olma talqon), *frog robe* (baqa to'ni) etc. also form a separate group. Our language also has words that express the colours obtained by adding: *sky* (osmoni), *heavenly* (samoviy), *peacock* (tovusiy), *honey* (asaliy), and so on. You can also specify active and inactive color names according to their use in our language. The aforementioned archaic words, such as *juice (shinni), sky* (osmoni) and, are less commonly used in our language today.

There are about 100 linguistic means in the Uzbek language, and examples, as mentioned above, are mainly the names of derived colors. The scope of using these words in our language is already. Therefore, there are practically no cases of symbolic expression through such colours. Since our research was devoted to the representation of symbols using colours, we did not stop with the study of words for derived colours, since symbols are expressed using linguistic means.

In linguistics, the interpretation of colors is carried out in close connection with the mental and psychological components and reflects the psyche, the state of reality. One of the scholars, B.A. Basima, puts forward the idea of limiting the number of symbolic colours. It offers a separation of colours that are relatively often used in fictional text and increase the artistic value of the text - red, yellow, white, black, etc. As the main color [4. 208].

The scientist also explains the symbolism associated with colour into three main types:

1. Colours that consist of only one colour, representing a certain symbol in isolation from other colours. For example, *white, red, black.*

2. Generalizations formed by adding two or more colours. In this case, the colours in the compound represent only the whole, the whole symbol, and not one symbolic meaning.

3. Generalization of colours and different shapes. The image of a symbol as a result of colour harmony with geometric shapes (circle, square, etc.). For example, curly gems, various jewelry, and more.

N.A.Martyanova argues that "colours can be seen as symbols that indicate hidden meaning". In language and speech, color-related symbols are represented by color lexemes, which have and do not have the property of symbolic representation. The original meaning of the word colour representation occurs as a conditional representation of content, which is relatively abstract [5. 56-66].

As a result of research carried out by scientists to determine the lexico-semantic nature of color expression, it was found that a person has about ten colour pigments that are unique for each person [6. 252]. By generalizing a specific pigment gene, people can understand color and its derivatives in different ways. It should be noted that the perception of colours is closely related to culture, national identity and traditions of the society in which a person lives. For example, *“white”* is the *colour of mourning (“motam rangi”)* for the Chinese or Indians, but for many other peoples, including the Uzbek people, it is a symbol of *goodness, peace, happiness, goodness, a happy future,* and *new hope.* Also, *“red”* is a symbol of *“danger”* (“xavf”) in America, *“superior class” (“oliy tabaqa”)* in France, *“life” (“hayot”)* in India, *“anger” (“g'azab”)* in Japan, *“happiness” (“baxt”)* in China [7. 371].

The study of the lexical and semantic features of color expression and associated symbols plays an important role in determining the national and cultural identity of language and speech. The semantic versatility of symbolic colours is closely related to spiritual perception and leads to the emergence of specific manifestations of each national culture in relation to events in human life.

The expression of a symbol through colour is closely related to the national mentality, and each nation understands, comprehends, digests the external world in different ways, based on its own worldview, and this is reflected in its language.   In the visual arts, colours have a deep symbolic meaning. In this art form, *blue* represents the main color - the sky, and *green* - the mother colour means nature, and the rest of the colours are described as the result of the addition of these colours.

It should be noted that each colour has its own unique, individual symbolic meaning. For example, *white* is good, *black* is evil, *green* is youth, *yellow* is separation, and so on. However, in the course of our observations, it was found that words expressing colour are used in different meanings, depending on the context, symbolizing different concepts. For example, the lexeme *“white”,* usually expressing a number of positive concepts such as goodness, purity, virginity, played a role incompatible with its main meaning in such constructions as *“white”, “make white”.* The token *“blue”* is used to mean *“mourning” (“wearing blue” – “ko'k kiymoq”), “cold” (“sovuqqotish”), “violent fear” (qattiq qo'rquv”), “shame” (“uyat”), (blue lips, blue face)* along with meanings such as blue sky, serenity, glory, and so on. serves for the appearance of related symbols.

To prove our point, let's look at the properties of *green colour.* This colour is ambiguous and is considered a symbol of nature in the culture of a number of peoples. According to A.Veybitskaya, in many languages of the world the equivalent of the word “green” are the names of morphologically and etymologically related representatives of *herbs, plants* and other *flora* [8. 254]. For example, in Russian the word *“green” (“зелень”)* means *“grass, plant”,* in German *“trees” (“daraxt”),* in French *“nature”* (“tabiat”) [9, 124]. In Uzbek speech, the colour *“green”* is usually represented by the lexeme *“blue”.* With this lexical tool, meanings such as grass, plants, green nature *(“pick blue”, “blue pie”)* are expressed. In German, this colour reflects concepts such as *“healthy”, “sound”, “strong”, “young”, “strength”* [9, 124].

Among peoples with hot climates, *green* and the language units that represent it symbolize concepts such as *“pleasure”, “peace and quiet”* and *“productivity”,* while in ancient Egypt *green* was a symbol of the *god Osiris,* who taught people about agriculture and gardening. [10, 337]. However, in medieval Indian poetry, hideous concepts are represented in *green.* [11]. In

Russian, it is also used to express various negative emotions in the presence of a ***green*** lexeme *("green melancholy" – "зеленая тоска", "turn green with envy" – "позеленеть от зависти")* [12, 1022].

Over time, linguistic units representing ***green*** began to be used in new meanings and their meanings expanded, and among the English-speaking peoples the word ***"green"*** symbolized meanings such as ***"money"*** and ***"wealth"*** in relation to the color of currency. The meanings of terms such as ***"green corridor"*** and ***"green zone",*** which are currently used in the Uzbek language, represent a new meaning of the lexeme ***"green"*** in connection with the development of science and technology.

What kind of symbolism is used in colors becomes clear from the context. N.A. Shekhtman uses the term "allonim" in relation to words that determine the meanings of symbols in the context. Allonyms are descriptive-conditional descriptive words that help clarify the meaning of words associated with it, and have a common meaning with these words [13. 37].

In a word, the symbolism of lexical and other linguistic units representing color is associated with the psychophysical understanding of the surrounding world, the commonality of semantic processes and factors such as religion, cultural traditions, the development of civilization [14, 11-14.]. All this, of course, finds expression in language and speech.

ABSTRACT

This article aims to review the investigations on synonymy in the English language ,therefore, the process deals with different linguistic descriptions relating scale of synonymy .The scale involves absolute synonymy(can be rarely found) ,cognitive synonymy (denotes with sememe) , near –synonymy(almost the same meaning).A number of examples are analyzed to detect near-synonymy from the Merriam- Webster's dictionary. Finally, it is concerned that synonyms in Thesaurus dictionary are approximately near synonyms. Comparing and contrasting methods are used to fulfill the research.

KEYWORDS: *Synonym, Synonymous, Cognitive Synonym, Near Synonym, Thesaurus Dictionary.*

INTRODUCTION

Having variety meanings of a word is really vital in linguistics. Everyone can agree that the English language richness is more than comparing with other European languages. Learning to use synonyms effectively can provide the reader with colorfulness both written and oral speech. Hence, choosing a right word for each situation might be utterly confusing when you avoid making expression more arid and repetitious. As we know, the word synonym in the linguistics can have exactly meaning or nearly the same as another word or phrase in one language .Synonyms may be any part of the speech, on condition that both words must belong to the same part of speech .For instance:

- noun : choice and option
- verb: look and gaze
- adjective : small and tiny
- adverb : quickly and fast
- transitions: consequently and therefore
- preposition: to and towards
- phrasal verb : go on and carry on

 Words that have the same meaning are said to be *synonymous* which they can be in one particular function for example : *consume* and *use* ,in the context *consume petrol* and *use petrol* are synonymous ,but *use* cannot be practiced in the phrase *consume meat* .Here we can see synonyms are different according to their meaning and collocation .Synonyms with exactly the same meaning belong a seme or denotational sememe while these with incisively similar meanings share a broader denotational or connotational   sememe and thus overlap within semantic field. *Denotation* is the relationship between sense and reference. A lexeme outside the context has sense and denotation but when it is used in the context reference arises. It is the relation between the lexeme used in the context and the exact entity which is being talked about, called the referent. It is singled out from the classes of entities in the external world determined by denotation[1].

There are a number of views for dividing synonymous into sub groups. Cruseclaims that a scale of synonymycan be established. The scale which he has set up consists of absolute synonymy, cognitive synonymy and near-synonymy. On the other hand, most lexemes are polysemous (have different senses in different contexts)[2].Murphy (2004:146) introduces logicalsynonyms(which include full synonyms and sense synonyms) and near-synonyms. Denotationally equivalent words whose all senses are identical (toilet/john) are called fullsynonyms, whereas sense synonyms share one or more senses, but differ in others, i.e. they have at least one identical sense (sofa/couch). Another view on this issue: Lyons (1981:148) claims that there are absolute synonymy, complete synonymy, descriptive synonymy and near-synonymy. According to him, complete synonyms have identical descriptive, expressive and social meaning in the range of the given contexts.

The theories on Cognitive synonyms

The synonyms with the exactly same meaning called *cognitive synonyms* which sharing with the same denote or lexeme. Several linguistics described cognitive synonymy in a different way :according to Lyons (1996:63) as there are no two lexemes with absolutely the same meaning and no real synonyms, cognitive synonymy is what most semanticists would regard as synonymy. A lot of theories of semantics would restrict the notion of synonymy to what he calls descriptive or cognitive synonymy, which is the identity of descriptive meaning. Cognitive synonymyis the identity of cognitive (descriptive) meaning and it is also known as descriptive synonymy, propositional synonymy or referential synonymy. Cognitive synonymy is sometimes described as incomplete synonymy (Lyons, 1981), or non absolute or partial synonymy (Lyons, 1996). The examples of cognitive synonyms: *chair / seat* and *freedom /liberty*. One of the definition about cognitive synonym is the words with the same cognitive meaning Lyons (1995:63), and as words with the same sense (Cann et al., 2009, 9). Therefore, cognitive synonymy is regarded as a sense relation. Moreover, this type of synonymy is concerned with

sameness or identity, not similarity of meaning. This is a pragmatic or context-dependent understanding of synonymy and it is the view presented by Murphy (2003).Cognitive synonyms may differ in their collocation range. When lexemes that belong to different parts of speech are combined into phrases, collocations are restrictions imposed upon linguistic units and their relations in a sentence or discourse, which allow a limited number of lexical combinations to take place. Interchangeability is restricted, as well.

The most common examples are *pretty*and *handsome* as two different forms which have the same sense. However, *pretty* collocates with girl and *handsome* collocates with man[3.]

The notion of near –synonymy

As I mentioned above a word can have almost the same meaning as synonym of another word. Particularly, such kind of synonymy may be called differently in linguistics: near- synonym, incomplete synonym, poecilonym, plecynonym . We come across more often the term near synonymy in the linguistic field. *Near-synonyms* are lexemes whose meaning is relatively close or more or less similar (mist/fog, stream/brook, dive/plunge)[4]. However, the given definition of near-synonymy is vague, because there isn't a precise correlation between synonymy and semantic similarity. Near-synonymyis associated with overlapping of meaning and senses. The senses of near-synonyms overlap to a great degree, but not completely. (Murphy, 2003, 155) Moreover, unlike cognitive synonyms, near-synonyms can contrast in certain contexts:

He was killed, but I can assure you he was NOT murdered, madam.[5]

Near-synonymy is regularly found in dictionaries of synonyms or *thesauri* where most of the terms listed under a single dictionary entry are not considered to be cognitive synonyms (*e.g. govern - direct, control, determine, require).*[6]

 The term*poecilonymy* (poecilo + onymy, uncountable noun , 'the use of several names for the same thing in the same documents'). The word poecilonym is a rare synonym of the word *synonym*. It is not entered in most major dictionaries and is a curiosity or piece of trivia for being an auto logical word because of its meta quality as a synonym of *synonym.*The term poecilonym is mentioned at the conference   in 1997 by Grambs David , in his book Endangered English Dictionary: Bodacious Words Your Dictionary Forgot.

In English, many synonyms emerged in the Middle Age , after the Norman conquest of England. While England's new ruling class spoke Norman French , the lower classes continued to speak Old English (Anglo-Saxon). As Old English became more developed, more words would be borrowed from a variety oflanguages, resulting in more synonyms. Thus, today we have synonyms like the Norman-derived   *people*, *liberty*   and *archer*, and the Saxon-derived *folk*, *freedom* and *bowman*.[7]

According to some lexicographers view point that any word does not have the same exactly meaning in all context because of etymology , orthography, phonic qualities, connotations , ambiguous meanings, usage , and so on make them unique. Different words that are similar in meaning usually differ for a reason: *woman* can be used for person rather than female*; and *extended* are only synonyms in one usage and not in others (for example, a *long arm* is not the same as an *extended arm*).

When we try to use the synonyms the surface meaning seem to be similar exactly but we should draw attention there is a slight difference on account of *tone* .The tone of communication shows you what you are going to say and provide with variety meanings of the word. In discourse communication using synonyms is vital like *"blood for human body".* They can color the speech in different way to provide with essential meaning to emphasize the word meaning in certain tone.

Synonyms are defined with respect to certain senses of words such as: *hilarious comical* and *priceless* can be synonymous in the meaning of funny , however, they mean funny in a slightly different way:[8]

- *Hilarious* [adjective] – very funny (laugh out); *Hilarious cartoon that the whole family can enjoy.*

Comical [adjective]–means funny in a silly way (cause laughter especially by unusual or unexpected): *Little girl looked comical in her mother's dress*;

Priceless [adjective] –can mean extremely funny: *I could not help laughing whenever I saw that priceless film.*

Additional examples are analyzed for investigating **near- synonyms** with the help of *Merriam Webster Dictionary.*

- *sleep*[noun] and *nap*[noun]are synonymous but *nap* is a type of   short sleeping especially during the day: *She is taking a nap now;*
- *strange* [adjective] and *bizarre* [adjective] both mean odd but *bizarre* means strikingly out of the ordinary, very unusual: *The new film is full of bizarre situations ; strange* may also apply for unfamiliarity and nonnative or unnatural*: She does not know anybody , she is strange here;*
- *shop*[noun] and *store* [noun] ; store cannot be placed instead of shop in some cases , store is a large building or room things are sold and kept ; *I'm going to store to buy groceries , Jane's aunt keeps flower shop;*
- *close* [adjective] and *near* [adverb] are synonymous, however, near cannot be synonym of *close friend* because *near* is close to someone or in distance : *My close friend is Sally ; Sally lives near collage ;*
- *expensive* [adjective], *dear* [adjective]and *pricey*[adjective] they all mean that something cost a lot of money but *pricey(pricy)*is more informal so it is difficult to see that in written form, *dear* is more modern , for instance :
  I have bought a new expensive mobile phone it is a bit pricey but not as dear as previous one.[9]
- *kill [verb]*, *slay* [verb]and *murder*[verb] here *kill* states the fact of death caused by an agency in any manner: *the frost killed the plants*; *murder* specifically implies stealth and motive and premeditation and therefore full moral responsibility :*he was arrested and accused of murdering his wife*; *slay* is a chiefly literary term implying deliberateness and violence but not necessarily motive: *the knight slew the dragon;*
- *Alike and same* ; both words mean similarity but there is a great difference in grammar structure   alike [adjective]- similar in appearance, exhibiting close resemblance without being identical ; alike is predicative adjective so that it comes after noun or auxiliary verb:

These covers of the books are alike .Your new suit seems alike;

Same shows similarity of size ,color and age .After *same* follows a noun "the same + noun +noun" , moreover, same is used with definite article "the ".

For instance: *Both girls have the same color dresses.*

Thesaurus or synonym dictionary

A thesaurus lists similar or related words; these are often, but not always, synonyms. Dictionary for synonyms are first appeared in 1852 by Peter Mark Roget. Roget's Thesaurus is two volumes set which are available both published and electronic version .It was initial work of synonyms which listed and put in alphabetical order. Thesauruses   are often used by writers or students to find out a proper word to express an idea. Many of the dictionaries don't have definition but include a list of synonyms of the word.

Thesaurus is used to avoid word repetition and also to enrich vocabulary in a language. However, while searching a synonym in thesaurus draw attention to semantic and denotative meaning of the word. I think there are a lot of near synonyms (almost the same meaning) in thesaurus, choosing a synonym is profound effort anyway.

CONCLUSION

As it is mentioned synonym is a good tool for writers in order to avoid plagiarism, dullness of the text and enrich their work even in a scientific field. Synonymous are differentiate according to aspects of connotative and denotative semantic meaning .It is essential to take into account synonyms differ in various aspects of associative meaning, such as expressive meaning, stylistic meaning, collocational   meaning. I totally agree with the theory on near synonymy by Palmer (1977) no two words can substitute each other according to their etymological appearance and dialectical usage. As Murphy (2003) claimed using near synonyms not only share the meaning, somehow, it can even contrast each-other.

ABSTRACT

The article examines some of the economic and biological features of the local fat-tailed Jaydara sheep and hybrids of different degrees of the blood of the Gissar breed of Karakalpakstan. And also the economic characteristics of the local fat-tailed Jaydarabreed are given. Common to all breeds and offspring is the presence of a characteristic fatty build-up on a shortened reduced tail - a fat tail. Its size and shape vary greatly depending on the degree of fatness, breed, sex, and age of the sheep.

KEYWORDS: *Local Fat-Tailed Sheep, Plasticity, Year-Round Grazing, Productivity, The Color Of Sheep, Methods Of Feeding, Keeping, And Breeding.*

INTRODUCTION

Livestock is an important component of the agriculture of Karakalpakstan, contributing to the provision of the population with jobs, food, and industry with raw materials. The concept for the development of agriculture in the Republic sets the task: along with the further growth of the livestock of animals, to expand the range, to improve the quality of products. To solve this problem, first of all, it is necessary to improve the existing methods of feeding, keeping, and breeding, to develop innovative, scientifically grounded, environmentally friendly methods, a system of breeding work, to develop effective options for selection and selection for specific breeding conditions of a certain type of animal.

In Karakalpakstvan, 846 farms are engaged in breeding sheep, goats, cattle, horses, and camels.In the bulk, year-round grazing is used, based on extensive breeding methods.

As of January 1, 2020, 1,131,088 heads of small ruminants were breeding in the republic, 83,229 pieces of astrakhan, 106,925 tons of meat, 1,320 tons of wool were produced in all categories of farms.

Sheep are bred everywhere, in almost all regions, in 182 farms, while in the southern regions - Turtkul, Beruniy, Ellikkala, Takhtakupyr, the local population prefers to breed sheep of the Karakul breed of the Karakalpak breed type, which is distinguished by high tricky qualities. In the rest of the districts, dehkans prefer to breed local coarse-wooled fat-tailed sheep known as "Jaydara", mainly for mutton production. This is due to the high demand for meat, the presence of a stable market, and the traditions of the local population.

With the general similarity, fat-tailed sheep of different breeding zones differ in size, productive characteristics, the presence and shape of horns [3.p.48].

Main part

Fat-tailed sheep for the most part are red, brown, and black, black-eared and black-headed, pure white, are rarely found. Rune wool is composed of different types of fibers, the ratio, and nature of which vary depending on the breed. Some offspring are characterized by the presence of a mane, consisting of coarse fibers. Common to all breeds and offspring is the presence of a characteristic fatty build-up on a shortened reduced tail - a fat tail. Its size and shape vary greatly depending on the degree of fatness, breed, sex, and age of the sheep. A large fat tail is inherent in sheep of high fatness. Emaciated sheep of the fat-tailed breed does not have a fat tail, in their place, wrinkled skin remains right on the shortened tail vertebrae.

There are several assumptions about the appearance of a fat tail. Some scientists [1.p.12-15]. and others suggested a mutational theory of the emergence of a fat tail. In the opinion of others, this explanation has no theoretical justification, since it has been practically proven that the fat tail is not a dominant trait, it disappears from the first generation of hybrids and is very difficult to recover even with reverse absorption crossing on the fat tail. He also does not behave like a recessive: when mating hybrids of the 2nd generation "in themselves" fat tail does not appear [2.p.71].

Apparently, due to the uneven food supply throughout the year, local sheep developed the ability to accumulate fat in the season of abundant nutrition on the rump and at the root of the tail. Therefore, the fat tail was formed under the influence of artificial selection and its biological significance lies in the fact that the sheep, who fell into the conditions of severe winter starvation, can maintain their existence due to the fat of the fat tail.

Common and characteristic for all fat-tailed sheep of Karakalpakstan is the widespread, year-round, grazing and uneven nutrition for the seasons, as a rule, in spring and summer, sheep receive adequate nutrition, increase their fatness and deposit a large amount of fat in fat tails. In winter, on the contrary, the food is scarce, and the fatness of the sheep decreases, by the spring they come out without fat tail. Seasonal fattening with subsequent depletion is repeated every year from generation to generation and, probably, this was the cause of the fat tail.

In Karakalpakstan, fat-tailed sheep "Jaydara" are mainly raised. In the 60s of the last century B. Abdirov and A. Islamov researched fat-tailed sheep in the conditions of Ustyurt, the goal was to increase wool productivity. For this B. Abdirov crossed them with the Saraja rams, and A. Islamov studied crossbreeds with the Tajik rams. Unfortunately, later, due to various organizational and economic reasons, these works were stopped. In recent years, due to the increased demand for mutton, local livestock breeders have spontaneously started crossing local fat-tailed sheep with Gissar rams.

Research conducted in 2020 at the farm "Sultanov Tukhtabai" of the Khodjeyli region showed that 42 heads of 120 heads of fat-tailed sheep were attributed to "Jaydara", and the rest were crosses with Hissar sheep of varying degrees of blood. This is, one might say, typical for the sheep breeding of Karakalpakstan. According to the farmers of the Jaydara x Gissar hybrids, it is difficult to endure the heat in summer and suffer from cold winds in winter. In contrast to them, local fat-tailed sheep are able, if available, to eat and process double and triple the amount of feed, quickly increase body condition and fat, and vice versa, if undernourished, they are limited to rations, their better and more complete digestibility, slowing down of vital functions and losing weight a lot without particularly great harm life and health.

CONCLUSION

Thus, year-round grazing with nomadic wandering from one seasonal pasture to another, with appropriate artificial and natural selection with intensive farming, contributed to the formation of a plastic, constitutionally strong, relatively early maturing breed with moderate meat and fat productivity of the breed of local fat-tailed sheep, which can be used both in "purebred breeding" and serve as a basis for creating a new, more combined breed.

MODERN TRENDS IN TRADE IN GOODS AND SERVICES BETWEEN USA AND CHINA

Feruza Askarova Abdullayevna*

*English Teacher of "English Language Department"
Tashkent State University of Economics
Tashkent, UZBEKISTAN
Email id: Feruza_askarova@inbox.ru

ABSTRACT

In 2012, bilateral trade in goods between the United States and China amounted to 536.1 billion dollars. China was in second place in terms of trade with the United States after Canada, the third export market and the largest supplier of goods for the United States. More and more often these companies now receive permission to conduct operations in China to implement their services to consumers in this territory. This opens up great opportunities for US service provider companies. In addition, increasing trade with China has a positive effect on labor productivity in the United States. This effect was especially noticeable until 2005. US consumers win twice: firstly, their average annual income increases by the same percentage as GDP; secondly, the level of consumer prices is falling.

KEYWORDS: *Bilateral, Increasing*

INTRODUCTION

For the United States, China is one of the fastest growing markets, the importance of which will only increase. Despite the growing US trade deficit, including trade in high-tech goods, in the long term, the development of trade and economic cooperation with China has a positive impact on the economy of the United States, even taking into account short-term negative effects for individual industries.

At present, trade and economic relations between the United States and China amid growing volumes of trade are characterized by increased interdependence of economies. Despite the development of mutually beneficial trade cooperation in many areas, the US trade deficit is growing, in particular in the trade in high-tech goods.

In 2012, bilateral trade in goods between the United States and China amounted to 536.1 billion dollars. China was in second place in terms of trade with the United States after Canada, the third export market and the largest supplier of goods for the United States. The volume of US merchandise exports to China amounted to 110.5 billion dollars (which is 6.2% more compared to 2011) . In 2007, China surpassed Japan in terms of imports from the United States, and in 2012, with a share of 7.1%, it became the third largest export market for the United States

The leading US exports to China in 2012 were soybeans, civilian aircraft and aircraft engines, cars, copper and semiconductors

Over the past few years, China has been one of the fastest growing US export markets, the significance of which will only increase. Over the past decade, US exports to China have grown five-fold with an average global growth of 123%.

Economic reforms in China are an incentive for the growth of consumer demand for imported goods, and taking into account the size of the population (1.3 billion people) and the volume of savings in the economy, the level of potential demand seems significant. According to (Boston Consulting Group, 2009), there were about 148 million middle-class and wealthy consumers in China whose average annual income was above 60,000 yuan ($ 9,160) .It is forecasted, that   in 2020 this indicator will amount to 415 million people. Moreover, in 2010, there were about 1.1 million people in China. With an income of more than $ 1 million per year. Although private consumption in relation to GDP in China is inferior to the leading economies of the world, the level of growth in domestic consumption is significant. For example, in 2010, private consumption in relation to GDP was 35% (in the USA - 71%), and the average annual growth of private consumption in China from 2001 to 2010 was 8.2%, while in the USA - 2.1% 3.

Major American banks and financial institutions are suppliers of services to the Chinese market. Law firms, insurance and travel companies, consulting companies, express delivery companies, companies providing medical services, etc. More and more often these companies now receive permission to conduct operations in China to implement their services to consumers in this territory. This opens up great opportunities for US service provider companies. In addition, the United States has a rapidly growing positive balance with China in trade in services, which, in turn, has a positive effect on the balance of payments of the United States.

Theoretical background

Nearly 40 years ago, China used to keep the economy, which was very poor, stagnant, centrally controlled, inefficient and isolated from the global economy (Morrison,2019).By opening up to foreign trade in 1979 and implementing free-market reforms,it has become one of the fast-growing economies(Congressional research service, 2019)

 The Chinese government has announced plans to stimulate domestic demand to reduce dependence on export earnings, which are today the main driver of economic growth. In 2008, $ 586 billion was allocated as a program of economic incentives mainly for infrastructure projects in the western regions of the country. China's ability to invest in such projects is explained by much lower debt ratios compared to other leading economies (Aksenov, 2017) For example, the forecast of China's budget deficit in relation to GDP for 2013 is 1.5%, while in the USA it is 8.5%. The forecast for China's public debt in relation to GDP for 2013 was 17.4%, in the United States this indicator is at the level of 103.8% 4.

During the 1980–1990s almost all US imports from China consisted of low-value-added mass-produced goods such as children's toys, clothes and shoes, household appliances, and electronics. In recent years, the share of high-tech products has been growing rapidly in US imports from China(E.Duffin,2019). According to official US statistics, the US deficit in trade in high-tech goods with China in 2012 amounted to $ 119.0 billion, (in 2003 - $ 21.0 billion). The expert (M.Stanley,2019) believes that a growing deficit of this magnitude is cause for concern, as it reflects the growing role of China as an active player in the international high-tech market. On the other hand, a significant share of this import is made up of goods that are only collected in China from imported high-tech components. When trade in industrial goods is often considered to be something that works only in the interests of a country (in terms of employment and impact on the balance of payments), the effect of trade in services and investment in this area is overwhelmingly positive for both countries(Aksenov,2017). In 2011, exports of services from the United States to China totaled more than $ 26 billion, with imports of about $ 11 billion and a surplus of $ 15 billion. Broadly speaking, the growth of the Chinese services market, especially financial services, is important for China's integration into the global economy.

A 2006 Oxford Economics study predicted that if the most serious obstacles to growth in the service sector in China were removed, then by 2015 the surplus in trade in services with China would increase to $ 60 billion. Moreover, additional income from US investments China will amount to $ 7 billion, and US GDP growth in the short term is about 0.3%, which will create up to 240,000 jobs in the service sector in the United States

 Over the past decade, the US trade deficit with China has grown significantly. Although at the same time, imports from China for 2000-2012. Grew by almost 325%, and exports - by 582%. The deficit has increased almost four times over this period - from 83.8 billion to 315.1 billion dollars. In 2009, during the crisis, there was a significant reduction in imports from China as a result of falling consumer demand in the United States, which was cause deficit reduction. In 2010–2012 deficit growth continued.

Today, it seems obvious that the cause of the huge US trade deficit is China. But trade policy must be factual. And although there is no doubt that the United States buys more goods from China than they sell, the facts nevertheless provide a more accurate and comprehensive picture.(K.Dmitrieva,2019).

There are currently three key trends in US-Chinese trade: First, many goods that the United States received from Japan, Taiwan, and other Asian countries are now imported from China, as Asian companies have moved their export-oriented production there. As a result, China's share of the US trade deficit has increased, although the share of the US deficit with other Asian countries has declined.In 1990, 47.1% of US industrial imports accounted for Asia-Pacific countries (including China). In 2010, imports of industrial goods from the countries of the region amounted to 42.7%. During this period, China's share increased from 3.6% to 21.4%. In other words, while China was becoming one of the leading suppliers of industrial products in the United States, the relative share of other Asia-Pacific countries was declining. A change in the structure of world production is also evidenced by the volume of computer imports in the United States (this category of goods is the leading one in imports from China).

In 2000, Japan was the largest foreign supplier of computer equipment to the US market with a share of 19.6% of imports. China was in fourth place with a share of 12.1%. By 2012, Japan

moved to third place, US shipments fell by 61% compared with 2000, the share of US imports fell to 4.2%. In 2012, China became the largest supplier of computer equipment in the United States with a share of 62.2% of the total imports of this equipment. From 2000 to 2012, computer exports from China to the United States increased by more than nine times, while total US imports of computer equipment grew by less than two times.

Secondly, although much of what China exports is produced domestically, a significant part of the goods is only collected from materials and components supplied to China from other regions, including the United States. Trade statistics indicate that goods are imported from China at full cost, but cash flows do not confirm this.

Thirdly, against the background of excessive attention to growing imports from China, the fact is sometimes not taken into account that, despite the negative impact of the global economic downturn on trade flows, US exports to China are also booming. In each state, there has been a sharp increase in exports to China (Aksenov, 2017).

The United States is interested in the further development of the Chinese economy, because as a result of this, as well as due to an increase in the purchasing power of the emerging middle class in China, US industrial production, agriculture, and export of services will only grow. As Bob McDonald, CEO of Procter & Gamble, explained, "... the business that ... the company operates in China and other countries provides a large number of highly qualified jobs in the USA - for engineers, researchers, marketers, financiers and logisticians. One of five P&G employees in the United States, with 40,000 employees, is involved in the company's international operations. Therefore, it is success in fast-growing markets, such as the Chinese market, that provides the creation of new high-paying jobs in the United States.

The growth of China's domestic market opens up new opportunities for American companies to strengthen their positions and sell goods and services in China. Many of these products can be produced in China itself. It is inefficient to meet the needs of customers in China through exports from the United States due to remoteness and increased delivery times. But even these products and services require service support or supplies of components from companies located in the United States, which contributes to the growth of employment in the United States.

Some US companies are closing production because they are no longer able to compete with imports from China. They face the greatest challenges of maintaining international competitiveness, even with their clear performance advantage. The increase in productivity, in turn, means a reduction in labor costs for the production of the same product, a reduction in the costs of the enterprise and a decrease in the number of employees. Indeed, US manufacturing employment has been steadily declining over the past decades.

Meanwhile, in 2010, China became the world leader in industrial production, overtaking the United States. The volume of industrial production in China amounted to 1.923 trillion dollars, while in the US - 1.856 trillion. dollars. The share of China in world industrial production from 1995 to 2010 increased from 5.2% to 18.9%. This growth occurred against the backdrop of a decrease in Japan and, primarily, was associated with the transfer of export-oriented production to China.(Aksenov, 2017)

Prices for US-imported goods dropped significantly as a result of increased trade with China. These price changes have arisen both due to the direct impact of lower prices for goods from

China, and as a result of lower prices by other exporters of goods to the United States. This reflects direct benefits for US consumers and companies, increasing their real incomes and profits by 0.8% . The aggregate demand in the USA also increases, which leads to an increase in GDP in the short term. In addition, increasing trade with China has a positive effect on labor productivity in the United States. This effect was especially noticeable until 2005. US consumers win twice: firstly, their average annual income increases by the same percentage as GDP; secondly, the level of consumer prices is falling. Together, the purchasing power of an average American household has increased by $ 500 in 2005 and $ 1,000 in 2010. However, the impact on output and employment, especially in the short term, will not be distributed evenly across all sectors of the US economy. The degree of influence of increased commodity circulation and investment cooperation with China on the industrial sectors of the US economy depends on two factors: 1) on the share of a particular sector in the economy, 2) on what part of the imports this sector receives from China. The growth of trade with China, of course, was a factor in reducing employment in the US industry. The textile industry, the production of office and telecommunication equipment, and the electrical industry suffered most. In the services sector, by contrast, employment has grown. The entry of Chinese manufacturers into global markets has created a tough competitive environment for US companies. Some were forced to lay off employees, other firms closed production. The remaining companies were required to increase productivity for successful competition. The decline in employment in US industrial production has been observed for a long time. The current economic crisis has caused a decline in employment in all sectors of the economy, although the decline in the industrial production sector was the most significant compared to previous recessions. The Chinese government's purchase of US government bonds on a significant scale also affects the stock market, trade flows, industrial structure, labor productivity and R&D investment. Despite the significant progress that China has shown in integrating into the global economy, the stage of industrial production of goods, where China occupies a leading position, is usually associated with a slight added value of manufactured products and, as a result, profitability. The following stages, such as research and development and innovation, along with the lower stages (marketing and after-sales service), are more profitable. That is why Chinese manufacturers are striving to gain competitive advantages by expanding the scope of their activities to these more profitable stages. Some multinational corporations already transfer limited functions in R&D, marketing and sales to their Chinese partners. The long-term benefit to the US economy from developing trade cooperation with China is also substantial. Although the intensification of this cooperation is characterized by a significant increase in the negative trade balance of the United States, the overall effect on the US economy, including growth in GDP, employment, real income and labor productivity, as well as lower prices, is positive. While these long-term benefits have an impact at the macroeconomic level, there are a number of problems in import-sensitive industrial sectors. Therefore, the central part of political debate in the United States is the search for a compromise between reducing time losses for specific industries and satisfying the long-term interests of the economy as a whole. On the other hand, pursuing sound policies in the fields of energy, healthcare, education, as well as modernizing infrastructure and innovations can do much more to maintain US competitiveness than unsuccessful attempts to isolate itself from China and the global economy. China is a leading global exporter and manufacturer with a rapidly growing economy. Over the past decade, China accounted for about 20% of foreign direct investment in developing countries. More than 50% of Chinese exports and imports are

carried out by companies with foreign capital. From 2000 to 2008, sales of US companies based in China grew by 431%. Moreover, more than 90% of sales were in the domestic market of China or other countries, and about 8% was exported to the United States. Thus, trade and economic relations with China today have become a critical element in the growth and development of the US economy and American companies. The policy of the President D. Trump is intended to move production out of China(R.Reed,2019). Existing duties on $250 billion in Chinese products will be raised, and tariffs on another $112 billion of Chinese goods, are now 15% instead of 10%.(Gipson,2019)

However, few companies are planning to move completely out of China. Apple is prime example. Most of the technology giant' products are located in China(Nelis,2019).For hundreds of American companies, names such as Starbucks, leaving China isn't something they can afford to do(CNBS, Brewing up gains, 2019)

At the same time, under the intensive pressure of Donald Trump "Made in China" loses its value.

According to annual survey(U.S-China Business Council, 2019) 30% of the 220 respondents said that they have already slowed, delayed or cancelled investments in China, due to trade uncertainty.

METHODOLOGY

The Dispute, which has already taken 18 months, is still having impact on tariffs of hundreds of billions of dollars worth of one another's goods. China has long been accused of unfair trading and intellectual property theft. Donald Trump's tariffs policy aims to encourage consumers to buy American by making imported goods more expensive. As a result the two largest economies are suffering from uncertainty. The expectations from top trade negotiators are very low. The lack of trust between China and US is influencing the real world.

CONCLUSION

Taking into account all the given data, the quantitative method of research have been applied(Aksenov,2017) A period of time between 2000 and 2017 demonstrates a rapid growth of both economies. In order to reduce the negative impact , in other words catastrophic output , it's better for China not accept conditions which are not advantageous to itself. It is predicted that mutual understanding and coming to agreement is a best way in solution in this problem. The authorities should look back and identify the root problem, as before the ideas and predictions of economist were ignored and were not taken into consideration.

THE IMAGE OF AL-HAKIM AT-TERMIZI IS ON THE UZBEK STAGE

Faxriddin Abduvohidov*

*Doctoral Student of the Institute of Culture,
Uzbek state art, UZBEKISTAN

ABSTRACT

The article discusses the scenic interpretation of the image of Hakim at-Termezi, who is considered one of the leading medieval scholars of Maverannahr, who made an invaluable contribution to the development of world science, in particular, to Islamic teachings and created works containing "sahih" hadiths in their structure.

KEYWORDS: *Theater, Dramaturgy, Theme, Genre, Character, Plot, Monologue, Action, Actor, Director, Composition, Artistic Idea.*

INTRODUCTION

Many medieval scholars made invaluable contributions to the development of religious sciences as well as secular sciences. Religious sciences have already played an important role in the development of society, the development of people, the formation of their worldview, so the example of these great personalities, the way of life, the invaluable heritage and spiritual values left by them to our people through research, research, art. Ensuring that it makes an important contribution to the spirituality and upbringing of the younger generation is one of the most pressing issues today. In order to raise the work in this area to a new level, a number of decrees and resolutions of the President have been issued, and intensive research is being conducted to further improve the religious and educational sphere. The International Center for Islamic Civilization, Islamic Academy, mosques and madrasas have been established to study the invaluable heritage of our great ancestors, to convey the purity of Islam to the world community, and to develop our people, especially our youth, as highly spiritual and cultured people.

As the first President of the Republic of Uzbekistan Islam Karimov noted, "Secular and religious sciences, especially those related to Islam, which have become an integral part of universal civilization and culture, have grown to the highest level in the history of this great

land, where great people, scholars, politicians and commanders grew up. We are very proud of the incomparable services of the great scholars who were born and raised in our country "[1.1].

Abu Abdullah Muhammad ibn Ali Hakim Termezi, who made a great contribution to the development of world science in the Middle Ages, in particular, several branches of Islamic science, is one of the leaders of the Transoxiana scholars. Hakim al-Tirmidhi, who was almost contemporary with hadith scholars such as Imam Darimi, Imam Bukhari, and Imam al-Tirmidhi, who worked in the "golden age" of the science of hadith, was engaged in regulating the Sunnah of the Prophet (pbuh) and defining the science of hadith. In contrast to these famous hadith scholars, who created valuable works that contain hadiths, they have a special place with their fruitful work, rich in instructions on in-depth analysis of hadiths, their originality, understanding of wisdom and its application to human life.

Muhammad ibn Ali Abu Abdullah al-Hakim al-Termizi (824-892) was a Sufi thinker who was well versed in hadith and jurisprudence. His contemporaries called al-Hakim al-Termizi "the sage from Termez" because of his breadth of worldview and deep thinking.

Al Hakim at-Termizi lived and worked in 820-932 and made an invaluable contribution to Islamic teaching. His deep knowledge and incomparable potential have been highly praised by many scholars. The great thinkers Abdurahman Jami in his work "Nafaot ul-uns" and Alisher Navoi in his book "Nasaim ul-muhabbat" mentioned him as one of the greatest sheikhs and included him in the second line of imagination. Alisher Navoi gives the following information about al-Hakim at Termizi: "He is the second layer. His name is Abu Abdullah. Mashayikh is arrogant and has had conversations with Abu Turab Nahshabi and Ahmad Khizrawaih and Ahmad Khizrawaih and Ibn Jalla, and there are many hadiths and apparent karamat and tasanifi (written works). In particular, he has the books Hatm ul-vilaya and Nahaj, Nawadir ul-Usul and other books, and he is the originator of a commentary (Qur'anic commentary). But they do not fulfill it (the end) ... "Hodja Bahauddin Naqshband and his commentary on al-Hakim at-Tirmidhi:" Every time I look at the clergy of al-Hakim at-Tirmidhi, the leader of the saints, I see mysticism without description and description "[2.1] describes his high career and status with special grace. Fariddin Attar describes it as "Shaykh al-Islam, the saint is perfect in the Sunnah, the great scholar of the nation, the leader of the scholars, the only one of the pure" [2.7]. The way of life and multifaceted activities of such great compatriots began to be regularly studied by our scientists, mainly after the independence of our country.

During his visit to Surkhandarya region, President of the Republic of Uzbekistan Shavkat Mirziyoyev visited the Hakim Termizi complex and gave recommendations on studying, promoting the heritage of great scholars, beautification of monuments. emphasizes that all favorable conditions have been created [1.3].

Today, effective research is being conducted to study on a scientific basis the invaluable treasure created by our ancestors over the centuries, to make it an integral part of our worldview. Great allomal

In staging the play "Allomai zamon", the theater's director Mansur Ravshanov approaches the play with an in-depth study of the period of Hakim at Termizi, his life and work, and tries to bring the team into the historical environment. In order to ensure the historical authenticity and artistic integrity of the play, the director invites the Deputy Chairman of the Muslim Board of Uzbekistan Sheikh Abdulaziz Mansur as a religious adviser, well-known literary scholar

Shukhrat Rizaev as a literary adviser, Bakhtiyor Turaev as an artist. Thanks to the creative collaboration, a large-scale performance depicting Termez's life was created. In understanding the environment in which the great scientist lived, and in providing an artistic solution to the play, the views of the director and the artist were in harmony. The majestic stage decorations created by the artist B.Turaev stand out with their design in accordance with the idea of the work. Each stage design designed by the artist serves to reveal the character of Termez. It is also noteworthy that more than seventy performers were allowed to move freely in accordance with the scenery of the stage. Keeping the stage interpretation of a great work in step, developing it step by step, required serious responsibility and high skill from the director and the artist. As a result of M.Ravshanov's skillful management of this process, an artistic integrity, a whole ensemble is formed on the stage.

The exemplary life of Hakim Termizi, who lost his father early in his life, devoted his whole life to learning in accordance with his mother's teachings, suffered various injustices, did not give up his goals and aspirations even in difficult conditions, and created several works for the spiritual development of future generations. The various curses and slanders inflicted on Termez during the conflicting events did not bend him, on the contrary, his relentless, arduous pursuit of knowledge led the scholar to happy days. She shines a light as a singer of goodness.

The monumental stage decoration developed by B. Turaev plays an important role in enhancing the impact of the play and the full revival of the image of Hakim Termizi. The scenery, which alternates between the content of the events, is sometimes reminiscent of the mausoleums of Termez, sometimes the holy book that shared knowledge and enlightenment with Termez, and sometimes the image of a huge tree that always calls humanity to its bosom. The majestic stage decoration is also one of the main means of ensuring the glory of the image of al-Hakim at-Termizi.

During the events of the play, al-Hakim at-Termizi learns tafsir, hadith and jurisprudence from mature scholars in his hometown after the death of his father. His mother fell ill when she decided to go to Baghdad, one of the largest centers of science and enlightenment in the East. Although he could not go to Baghdad, he never backed down from his education. He took lessons from great scholars and studied the science of hadith and Islamic literature. But like Eshqabil, who has not seen his knowledge and high status, he wants to stand in his way. Despite various pressures, Hakim Termezi achieves his goal.

The skill of the lead and lead actors serves to ensure the success of the play. The director entrusts the role of Hakim at Termizi to F. Boltaev, an experienced actor. Termizi, created by F. Boltaev, stands firm in the way of Allah in any situation and does not pay much attention to the sufferings of such lowly people as Eshanqul (A. Panjiev). On the contrary, they travel the world, increase their knowledge, make disciples, write books (sources say that the scientist wrote about 400 books, and only 60 of them have reached us) and reach great heights. These processes are convincingly, sincerely interpreted by the actor, ensuring that the inner spiritual world of the image is fully revealed.

The image of the mother performed by D.Yunusalieva is manifested as a person who sacrificed his whole life for the perfection of his child, who helped Hakim Termizi in difficult conditions, who was a shield, a shy, kind, benevolent, prayerful person. The performances of honored artists of Uzbekistan H. Aripov in the roles of Ismail Somoni, H. Nasriddinov in the roles of

Imam Bukhari are interpreted in different ways, which attracts the attention of the audience. This indicates that the creative team has done serious research on the staging of the work.

Stage works such as "Allomai zamon" play an important role in constantly studying and applying the exemplary way of life, scientific and creative heritage of our great compatriots in our history, that is, in educating young people as spiritually mature individuals through artistic and theatrical works [2.4]. It is true that the study of religious teachings, which are the basis of spiritual and spiritual education today, issues related to spirituality, such as knowledge, faith, morality, sanctity of the homeland, the works of our great ancestors, the application of their teachings to the hearts of young people. . Therefore, in a number of decrees and resolutions aimed at further development of culture and art, at a historic meeting with intellectuals, in the concept of development of national culture, in the first paragraph of the five initiatives, the President paid special attention to theatrical art as a means of educating the younger generation. The glorious history, the way of life of our ancestors, the scientific and creative activity of our ancestors through the staging of historical periods, historical figures, commanders, religious figures, scientific and creative activities in the positive impact on the spirituality of young people. in which case it is advisable to bring it to the stage. After all, the presentation of our historical values on stage serves to further deepen the national spirit in the minds of the audience.

THEORETICAL VIEWS ON CHILD-SPECIFIC SPEECH NOMENCLATURE: ANALYSIS AND ATTITUDE

Fotimaxon Bakhtiyarova*

*Tashkent State University of Uzbek Language and Literature,
Named after Alisher Navai, UZBEKISTAN

ABSTRACT

This article examines the nominative features of the speech of Uzbek children, their study in world and Uzbek linguistics, as well as the formation of nominative units and the linguistic and extra linguistic factors influencing them. "As long as the child does not understand," they are required not to be indifferent to it, to pronounce the names of the objects around them correctly, and to pay attention to the correct development of their speech. In today's linguistics, the main aspects of the study of nominal units in children's speech are their construction, in our opinion, modern linguistics in the study of children's nominal units, along with derivational aspects of research, should focus on the nominal functional aspects of children's speech.

KEYWORDS: *Nominative Unit, Linguistic, Extra Linguistic, Speech Situation, Phrase Logical Unit, Pragmatics, Contextual-Semantic, Lexeme.*

INTRODUCTION

Language is considered as a mirror that shows how developed a society is. Undoubtedly, the role of language in the rise of a nation to the level of a nation, in the unification of the people who make up this nation in the path of dreams and goals, is incomparable. It is well known that the language issue is at the forefront of the efforts being made in our country to achieve national independence.

Encouraging research and improving innovation activities, identified as a priority in the state program of the Strategy of Actions for the Further Development of the Republic of Uzbekistan[1], requires in-depth and innovative research in the field of linguistics. The responsibility for the development of our language lies with the science of linguistics, which today requires in-depth scientific research on various levels of language.

The study of stylistic and pragmatic features of children's speech in world linguistics, the study of the hard work of word artists in achieving originality in the creation of national characters on the basis of creative and linguistic commonality, the coverage of their pragmalinguistic, linguoculturological, ethnolinguistic and psycholinguistic features. It is known that the national-cultural image of the world formed in the minds of children on the basis of socio-cultural, psychophysiological, linguistic factors and conceptual knowledge is realized in the process of speech activity through specific nominative expressions and shows a pragmatic nature. The study of the pragmalinguistic features of speech patterns that occur as a result of this cognitive process on the example of Uzbek children's speech provides valuable theoretical knowledge for pragmalinguistics.

The development of children's speech in world and Russian linguistics has been consistently studied. In particular, in the researches of E. Beloglazova[2], OL Strogonova[3] the discursive-pragmatic and linguistic representative features of children's speech were studied on the example of the literary text, in the works of E.Yu. Moiseenko the representative image of children's speech scientifically based.[4] Also, the possibilities of development of children's speech and their nominative features were extensively studied by Russian scholars such as S.N.Tseytlin[5], T.A.Gridina[6], G.R.Dobrova[7], A.K. Vaganova[8], AN Gvozdev[9].

In Uzbek linguistics, starting from the 90s of the XX century, a number of researches on children's language and style began to appear. Although Uzbek linguists such as Sayidirahimova N.[10], Qurbonova M.[11], Ismailov M.S.[12], Umarxo'jaeva O.[13], G.Iskandarova[14] and N. Mahmudov have begun to study the linguistic features of Uzbek children's speech, sociopsycholinguistic aspects, the expression of modern relations in the speech of Uzbek children in bilingual conditions and their specific linguistic features, the effects of linguistic and extra linguistic factors have not been studied separately. In this regard, in our study, we aimed to identify issues such as the nominative features of speech of Uzbek children, their occurrence by phonetic, lexical, grammatical means and the influence of linguistic-extra linguistic factors in this process. The goal we have set above requires the following tasks:

- To determine the phonetic devices and their specific features that ensure the completeness of the nominative expression in the speech of Uzbek children;

- To determine the activation of naming at different levels in the speech of Uzbek children;

- Structural-functional and contextual-semantic analysis of the factors providing the potential of nominativeness expressed in children's speech through lexical-grammatical units;

- to study the linguistic and extralinguistic factors influencing the occurrence of naming in children's speech and the degree of their impact on the speech situation.

The object of research is the nominative units and compounds in the speech of Uzbek children, as well as the results of long-term, daily systematic observation, children's speech as a dynamic process and naturally recorded samples of children's speech.

The subject of the study was the functional structural-semantic and contextual features of phonetic, lexical and grammatical devices that create nominative in Uzbek children's speech.

The upbringing of a harmoniously developed generation in our country has become a priority of state policy. The Ministry of Preschool Education has been established in the Republic of

Uzbekistan, the material and technical base of preschool education institutions has been strengthened, normative and legal documents, the Bolajon base program have been improved, the Ilk Kadam state curriculum has been developed, and modern educational programs have been introduced.

The Action Strategy for the Further Development of the Republic of Uzbekistan states that "... expanding the network of preschool educational institutions and radically improving the conditions for comprehensive intellectual, aesthetic and physical development of children in these institutions, controlling access to preschool education, training of teachers and specialists tasks such as "upgrade". The aim is to develop the speech of young and old preschool children, as well as to ensure their successful transition to the next stage of education.

Children of today, no matter where they live, are constantly confronted with changes in the social, political, environmental, scientific, technical and industrial spheres.[15] Since the development and growth of the child is a continuous process, it is natural for him to form as a person, to perceive the world for the first time through the objects and things around him, to try to find meaning in it, to develop interests and feelings. Each period of life has its own stages according to developmental characteristics and needs. The pre-school period in a child's growth and development can be included in this, as this period is the initial stage of a child's development, psyche and education.

The world of children is a mysterious and miraculous world, they live in a period of very rapid growth, development and change. In this regard, this period is very important in the upbringing of children.

The period of human development begins in the womb. The baby goes through a very rapid development process and a complex developmental period in the mother's womb for nine months. Even during this period, the child is to some extent exposed to the external environment. Therefore, it is necessary to ensure that this effect is positive. After the birth of a child, parents, adults in the family develop children's movements, visual, auditory and sensory organs, that is, to look carefully at the faces of those who communicate with the baby, to observe moving objects, to hear sounds, speech, singing and should be taught to listen to different voices. The development of a child under the age of one is mainly influenced by the family environment, where he is breastfed. Such nutrition is very important in the proper development of the child's brain activity. Even if the child does not have speech during this period, he will be able to understand speech, comprehend, perceive actions, recognize family members. Therefore, from infancy to the age of three, a child's speech and thinking develop rapidly. The child begins to say the first words by the age of one. During this period, adults, especially family members, need to establish proper care for the baby. "As long as the child does not understand," they are required not to be indifferent to it, to pronounce the names of the objects around them correctly, and to pay attention to the correct development of their speech.

The process of formation of characteristic language units is considered in modern linguistics as a nominative function, that is, to serve as a name (semantics of reality, the formation of a relevant concept) as a "nomination". Although the interpretation of the term nomination differs in Russian and Uzbek dictionaries, they are close in meaning.[16] Nomination (Latin "nominatio-" noun) is the "birth" of linguistic units characterized by a nominative function, naming and

separating parts of reality on the basis of analogy and connection, as well as reshaping words in the form of phrases, phraseological units and sentences.[17]

In modern linguistics, the increase in attention to the language owner-person is a positive development, as in the process the focus is on the creative side of speech. In this, man serves man not for language, but language.

The activation of language in practice constitutes a speech situation. This in turn is caused by the human factor. B.Yu. Norman argues that human speech activity is a complex process in which the relationship from the smallest units of language to the weightiest units is interacted[18], resulting in a relationship of communicative, nominative, and predicative meanings. We can again see the complexity of the speech situation in that not only communicative and nominative aspects but also extralinguistic factors play an important role in this. Children's speech is widely recognized in the scientific literature as the initial period of language. Russian linguist A.K. Vaganova explains the nominative creativity in children's speech by saying that "if the speech process is viewed as a river, the speaker and the perceiver is the ship's captain."[19] Yu.N. Karaulov describes the birth of nominative units as a "process of linguistic activity of the inventor of the name,"[20] that is, he evaluates a certain functional flow of human speech and its specific features as a nominative activity. V.P. According to Grigoriev, in the ordinary language of children, "armor doors open"[21], that is, many unexplored linguistic materials manifest themselves.The creative aspect of childish speech is that nominative units are free and unique. Some are often not "born" easily, but arise as a result of the likeness of the "creators" and their own "decisions" rich in controversy. In our study, we described such "decisions" as "new facts".

Suhrobbek showed his brother a leaf that was falling from his bandage and said: "Brother, that is a tapalat (butterfly), touch it for me." His brother laughed and said, "It's not a butterfly, it's a leaf." Then his little brother cried, "No, he is a tapalat (butterfly) it is flying away." His brother was "defeated" and agreed to surrender.[22] Here the "birth" of the "new truth" is based on a metaphor, that is, the falling of a leaf on the ground is comparing to the flight of a butterfly. It turns out that in order for a child to create a "new truth", he must first have a basic knowledge. Because nominative units are formed on the basis of an existing object or reality.

As a child's speech develops on the basis of adult speech, the correct formation of speech in them is closely related to the speech of those around them, the perfection of the adult speech experience, and the establishment of the correct speech environment. Because speech is not an innate ability, but a dynamic process that is formed and developed along with the physical and mental development of the child throughout life. Speech and its development are inextricably linked with the growth of thinking. The normal development of speech in a child allows him to constantly learn new concepts, to expand his knowledge and imagination about the world through his own thinking.

From the age of 2 or 3, a child replenishes his or her vocabulary as a linguist through two factors.

1. By mastering an existing language.

2. By creating new nominative units in the game activity or observation process. For the child, the second process is faster and easier than the first. In this process, the child "thinks" and "observes" as an independent person. In the process of nominative creation, even new sounds are observed in children. These sounds are called metaphorization in linguistics. N.M. As Yuriev

points out, the processes of metaphorization in the children's speech category have not yet been studied[23], because in modern linguistics metaphor and metanymy are considered only as a means of artistic expression. In today's linguistics, the main aspects of the study of nominal units in children's speech are their construction, in our opinion, modern linguistics in the study of children's nominal units, along with derivational aspects of research, should focus on the nominal functional aspects of children's speech. This is because the multifaceted function and imagery of nominative units in children's speech reveals the possibilities of their level of speech development.

In our study, we focused on these aspects of nominative units in children's speech.

When two-and-a-half-year-old Bakhtiyarov Suhrobbek was shown pictures of domestic animals and wild animals, such as sheep, goats, deer, and deer, and asked what kind of animal they were, he said without hesitation, "baji (a sheep)"; when pictures of cattle, donkeys, horses, and zebras were shown, he replied, "mo (a cow)". And so on: when a picture of a dog, a wolf, a fox, a cat, a lion and a tiger is shown, "vuuuy, babovlay ... iyiii miyavvvv!" he replied. From this small test, it became clear that the accuracy of nominative cognition in children also depends on its living conditions, because when the same pictures were shown to children who keep pets in the household, they answered the questions more accurately, i.e. pictures of sheep, goats, cattle (baaa, moo'oo, maaaa), but when a picture of a dog, a wolf, a fox, a cat, a lion, and a tiger is shown, they have the same definite nominative attitude to the dog and cat as above, but the wild animals are common. the name was "explained" as "wow-wow."

In children's speech, nominative substitution is also actively observed in actions (verbs): paper "shindi" -sindi (torn), I "flew" (jumped), Yomolingni (a kerchief) "tok" -taq (put on).[24] Such transfers are, of course, characteristic of the early stages of development.

In children's speech, the types of nomination represented by comparisons are also very actively used. In this process, the child's mental activity, imagination and cognitive skills are formed. Comparing of the setting sun like an egg yolk ("Aya, ana kuku (egg)"), the pouring of rain on the pouring water ("Peaeta fua bam dyed" - water pouring down from the top), multi-storey buildings like the ship ("Ay biz temada tetamiz bu tema, bu uymash "- mother we will go on a ship, it is not a house.) is a clear example of this.

In conclusion, the development of small vocabulary along with the ability to choose words is important in the expression of nominations ("new truths") in children's speech, i.e. the direct and indirect use of metaphorical types and the ability to correctly and figuratively compare the subject with nominative units.

ABSTRACT

This article examines the role of information and communication technologies in increasing the competitiveness and economic growth of countries, as well as its importance in public services. The article provides an analysis of the world's best practices in the development of ICT and the development of the domestic market for modern information, communication and digital technologies in Uzbekistan, notes the important role of government documents on the development of digital technologies in the country.

KEYWORDS: *Digital Economy, Information And Communication Technologies, Digital Technologies, Competitiveness Of The Economy, Information Society, High-Tech Services, ICT Development.*

INTRODUCTION

The prosperity and development prospects of Uzbekistan, the success of large-scale reforms carried out in our country directly depend on the introduction of new innovations into the national economy. Today, the study on a scientific basis of the laws, trends and opportunities for the development of the digital economy, in particular the degree of penetration of modern information technologies into various sectors of the economy, is of particular relevance. Therefore, the improvement of the digital economy and the scientific study of its social, economic, political and legal foundations play an important role.

Currently, the issue of developing the digital sector of the national economy in the country is being raised to the state level, and large-scale measures are being implemented in this direction.

In particular, electronic document management systems are being introduced, electronic payments are being developed, and the legal framework created in the field of electronic commerce is being improved. At the same time, the digital economy powered by information technology platforms is developing rapidly. This requires the creation of new models of such platforms.

As world experience demonstrates, in addition to unlimited benefits, the development of the digital economy, being an objective process, portends many problems. The digital economy usually refers to any economic activity associated with the production, sale and consumption of goods and services using digital technologies, as well as with the use of e-commerce, web and Internet economy. After the amazing success of some reforms in the digital economy, overcoming the crisis of organizations whose business is entirely based on the work of the Internet and exceeded the capitalization of the largest enterprises in the traditional sectors of the economy, the importance of the digital economy began to increase. The formation and development of the digital economy is causing a number of problems. First of all, the accessibility of information and the creation of more efficient technologies for its processing and application should mainly reduce transaction costs (costs associated with information retrieval and processing of information found) and increase the flexibility and efficiency of the economy. But this may not happen if at the same time the old technologies for working with information do not die away and the share of transaction costs increases due to the increase in the cost of protecting information, assessing its reliability, etc. Also, the transfer of business activities to online dramatically reduces, sometimes even eliminates the need for intermediaries and agents. It should be added that the economy of mass production is giving way to piece-goods, which are ordered by customers online .

Another problem is that, like any mass technological innovation, digital technologies require specialists in new professions and new competencies, and, moreover, render useless numerous groups of people employed in traditional activities, which causes resistance and protests. The lack of such specialists as programmers, marketers, analysts, etc., does not compensate for the elimination of many other jobs and causes an increase in income differentiation and new poverty. The security of data coming from external sources is of particular concern. Since data is traditionally considered reliable and reliable if it is confirmed from three independent sources, today the creation of many independent sources of information is rather a technical problem. In general, the problems of transformation of information from a product into a product and the socio-economic results of this process require separate analysis and discussion.

The development of the digital economy implies total globalization, an ultra-high competitive environment, the availability of qualified personnel and high-quality education, a new quality of life, business and public services, the deployment of modern Internet infrastructure in modern cities, an increase in the level of digital literacy of the population and systematic training of IT specialists in all areas of the economy. An important criterion for the digital economy is improving the quality of state and municipal services, and reducing the costs of the state when providing them. At the same time, the state must guarantee the stability and security of infrastructure, ensure a high level of education of the population, including digital literacy, link the digital economy with all industrial spheres, and most importantly, integrate the international digital industry into the national infrastructure.

To this end, work should be carried out in the republic on the creation of technology parks, research and production clusters and other innovative projects, widespread and accessible education of citizens of digital literacy, the introduction of digital technologies, ensuring the coverage of the country's territory with the Internet from 5G and higher, the introduction of electronic document management into activities enterprises.

All these measures will require huge financial investments from the state, trained specialists to train employees of enterprises and the population in the basics of the digital economy, but this is the imperative of the time and the requirements of progressive information technologies that will be put at the service of the people. Thus, the Digital Uzbekistan 2030 program is not just another major state project of the country, it is an important aspect of the innovative activity of the Republic of Uzbekistan, the main goal of which is not only to achieve a high level of development, but also to integrate and interact with the developed states of the world.

Having mastered digital knowledge and information technology, you can get the opportunity to follow the shortest path to achieving all-round progress.

In this regard, the task was set in 2020 to make a radical turn in the development of the digital economy, completely digitalize the spheres of construction, energy, agriculture and water management, transport, geology, cadastre, health care, education, archives, critically review the "Electronic government" system and programs and projects implemented within its framework, to complete the development of the program "Digital Uzbekistan-2030" .

The process of creating high-tech parks in the country will be further developed. The first IT park with modern infrastructure is already functioning in Tashkent. Similar ones will also be created in Nukus, Bukhara, Namangan, Samarkand, Gulistan and Urgench. By bringing science closer to production, IT parks will contribute to the socio-economic and innovative development of regions and the country as a whole, as well as become centers for generating innovations and creating promising start-up projects.

In order to train highly qualified specialists in the field of information technology, the project "One million programmers" was launched .Lists of priority projects were also approved for the further development of e-government, the widespread introduction of modern information and communication technologies in the real sector of the economy, the development of information technologies and telecommunications in 2020-2022. Interdepartmental electronic interaction of all information systems and resources used by state bodies and organizations in the process of providing public services will be carried out exclusively through the interdepartmental integration platform of the "Electronic Government" system.

Thus, the country creates the necessary legal framework and conditions for the development of the digital economy. And Uzbekistan needs to keep up with the global technological development processes, including those related to the development of e-commerce and the introduction of digital technologies in all spheres of the economy and government. The speedy implementation of the latest developments and achievements in the digital economy into business processes will provide an opportunity for increasing labor productivity, reducing costs, as well as creating competitive products in many areas of the economy.

CONTAMINATION OF THE GENRE OF THE CLASSIC STORY IN "WOMEN'S PROSE"

Feruza Murtazaeva*

*Assistant Teacher,
Russian Language and Literature Department,
UZBEKISTAN
Email id: feruza79.79@list.ru

ABSTRACT

The article examines the genre and specificity of the author's style of works by Victoria Tokareva and Zulfiya Kuralboy kizi. The works of the authors are prone to contamination of genres, since they combine the features of several genres. The interaction of genre and individual style turned out to be extremely fruitful for the work of Tokareva and Zulfiya Kuralboy kizi, they led to long-term success and recognition of the general public.

KEYWORDS: *Genre, Author's Style, Features Of Genres, Classic Story, Women's Prose, Fantastic Story, Wisdom, Philosophy, Aphorism, Parable, Style.*

INTRODUCTION

The specificity of the genre traditions of each nation reflects the world in accordance with its ethno semiotic systems. Differences in the worldview are directly related to mentality. It is the mentality that forms the conceptual picture of the world. The literary image, being refracted in the context of linguistic consciousness, acquires new interpretations, associations and serves as the basis for the creation of national cultural phenomena that serve as means of representing the artistic picture of the world. The text of a work of art makes it possible to decode literary phenomena, to understand their deep artistic implications, since each work is born as a product of the creative artistic and aesthetic world of perception.

II. LITERATURE REVIEW

The work of Victoria Tokareva and Zulfiya Kuralboy kizi stands out against the background of no less talented and close worldview authors with a special realism, which creates the effect of the reliability and truthfulness of the events described, and special attention to moral issues, the

solution of which among writers is raised to the level of philosophical generalization. At the same time, the authors remain within the bounds of that reality, which limited time, space and human characters that they and readers see every day and who they themselves are.

In their works, the authors turn to eternal themes: the search for the meaning of life, the spiritual evolution of man, his inner world, the way of thinking, the problem of the hero's moral choice. Synthesizing in their texts the features of the classical story and "women's prose", they create a number of works that allow drawing conclusions about the genre originality, the nature of the reflection of reality in the literary text. It is difficult to identify contamination in their works, since they skillfully use their artistic synthesis, while the story and novella are dominant in the work of these authors.

III. Analysis

This study defines a set of methods of comparative-historical, structural-semantic, comparative-typological analysis, as well as the principles of hermeneutics (interpretation of texts) and methods of literary analysis of the text. The work also uses general scientific and literary methods, namely analytical, contrastive, comparative, inductive and deductive.

The prose of Tokareva and Zulfiya Kuralboy kizi tends to be synthetic, as it can combine signs of genre contamination, which are universal for these authors. The interaction of the contamination of the genres of the classic story in "women's prose" turned out to be extremely fruitful for the stories: from the anecdote and the fantastic story in them, the unusualness, brightness of the plot, originality, "momentary" situations, scenes and at the same time, vital reliability and convincingness, expressive giving stories absolute authenticity in the eyes of the reader; from the parable - wisdom, philosophy, depth, universality, universality of the story being told, the instructive meaning of which is long-lasting.

The story, due to its genre specificity, stands out from the entire existing system of epic genres. In literary criticism, there is an idea of the story as a particularly mobile genre, which can become a form where the artistic trends of its time are reflected with maximum concentration.

This form of literary creation was chosen for them by Victoria Tokareva and Zulfiya Kuralboy kizi on a par with the story. And the choice was not accidental. With the help of stories, authors can change themes, plots. Such works are easy to read, they do not take much time, but they leave a reflection in the mind of the reader like a flashing comet. Where else, as in the story, you can leave the reader the right to reflect on the ending and allow yourself not to go into details. Meanwhile, a short description requires a lot of effort by the author, since every word and phrase must be clear, concise and significant.

The stories of Tokareva and Zulfiya Kuralboy kizi are of a psychological nature. It is fate, the inner world of "little people" in an ordinary or difficult, dramatic life situation for them that creates the storyline of their stories and stories and their moral low pathos. In stories and novellas, the character of a character is revealed in relationships with other characters, as well as its introduction into everyday life circumstances, in little things, depending on the time. In addition, the authors are interested not so much in the social status of the characters as in their behavior, psychology and their human nature.

The central conflict is predetermined by the difference in ethical views and moral principles of the characters. The prose of Tokareva and Zulfiya Kuralboy kizi is humanistic and full of

feelings. Their heroes, not free from everyday worries, problems, poverty or life trials, do not lose faith in life, hope for the realization of the romantic dream of happiness. The plot center of a work is usually a "situation of choice", a test that reveals the true content of a person, the strength and depth of his moral convictions.

Authors give the reader the opportunity to be present in a "life" experiment "when specially selected circumstances guarantee the accuracy of the test and to some extent determine the actions of the characters. The logic of the stories of Victoria Tokareva and Zulfiya Kuralboy kizi follows the logic of everyday life, which helps to bring the work closer to reality and simplify its understanding by the reader. Seemingly ordinary people and ordinary life situations. But this is just the beginning. For each phrase in the works of the authors, an irony of fate is expected, tests that the hero will have to go through. This reveals the fundamental difference that exists between the habitual, forced acceptance of certain moral norms of life and the true moral content of a person. A test always helps to see the difference that always attracts a real artist. The authors focus on depicting the complex process of a person's spiritual and moral development, the formation of a harmonious, self-sufficient, happy personality.

Each work of Victoria Tokareva and Zulfiya Kuralboy Kizi is a small journey inside yourself ... Country and era, cities, streets and houses, city life, rural life, heroes - all this is subordinated to the main idea of the work. Such "travels" leave a mark in our consciousness and cause certain images from our subconscious, since the described events and places are a direct reference to the life of people in the recent past and present. This explains the phenomenon that the reader presents the world, characters and life to the smallest detail, despite the fact that the works of the authors are not filled with detailed descriptions. They write very succinctly.

Each of their lines in a literary text has an intrinsic appeal: there are no unnecessary phrases, no meaningless phrases - each is valuable in itself and creates vivid imaginations and memorable images. For example, V. Tokareva's prose is aphoristic. For example, in the story "Japanese Umbrella" whole paragraphs are created from aphorisms: "When a person can afford anything, he can afford the luxury of walking in an old coat. And I am not yet rich enough not to value money. Not wise enough to stop looking for the meaning of being. Not old enough to enjoy life as such. And he is not young enough to rejoice without reason, submitting to biological optimism "[1, p. 136].

In a language accessible to the general mass of readers, she simply and clearly conveys her thoughts and, after reading her works, you do not notice how her words and phrases appear in everyday life. It is very important "when this or that writer's" statement enters "the social, cultural and verbal use, far beyond the boundaries of literature" [2, pp. 267-274], - this is popular recognition, triumph, an indicator of literary talent. As for the prose of Zulfiya Kurolboy kizi, the artistic embodiment of the author's idea of reality in her stories is the individual author's use of visual means, especially primitive rural vocabulary, the stylistic use of which makes it a means of typing, the basis for creating a system of characters and the author's tone in the story. Zulfiya Kuralboy kizi uses a language that is close to the common man, at the same time, giving it imagery and correctness in the author's manner, the artistic imagery of which arises at the intersection of the sentimental and the natural. The composition of commonly used vocabulary in works is diverse and covers various aspects of human life. The author often switches the attention of readers, using transitions of lexical components or chronological "swing" (a

progressive description of the past and the present, often in the wrong chronological order, for example, in the story "The Daughter-in-law"). Thoughts and ideas of the author are not lost in cumbersome phrases, ornateness does not change the meaning due to its complete absence.

Many works of Victoria Tokareva and Zulfiya Kuralboy kizi contain elements of philosophical prose. Writers are trying to find answers to such philosophical questions as the transience of life, happiness and the right to it of an ordinary person, the need for loyalty and love of men and women. Elements of a philosophical narrative are visible in the constant discussion of "good and evil", "the phenomenon of happiness", "love". The authors show a keen interest in universal human problems, maximalism in solving moral and ethical issues, strive to "expand" the internal conflict of characters, "reliable convention" of situations and urban and rural life itself, acting rather as a specific artistic method for posing and solving deep philosophical questions. The authors make readers think, realize how difficult and ambiguous everything human is, how unexpectedly difficult it is to get into "simple" circumstances, how accidentally invisible "sacrifices" of ordinary people bring family, love, happiness into life.

It is obvious that, for example, Tokareva's early stories differ from her later ones. In the early stories ("About that which did not exist", "-Rubl sixty is not money", "Japanese umbrella", etc.) a somewhat fantastic element prevails, the author is inexhaustible on unexpected plots to describe ordinary everyday situations. The stories "A Day without Lies", "One Cube of Hope", "This Best of the Worlds" are different in tone: they are dominated by regret about unfulfilled dreams, sadness, the writer's skepticism, expectation of a miracle, they are more philosophical. In some works we find the author's opinion on the necessary correct distribution of happiness and goodness on Earth. For example, in the story "One Cube of Hope" we read: "The bus braked sharply - apparently, a cat or a dog was running across the road, and the driver did not want to take a sin on his soul. All passengers fell forward in unison, and those who stood first must have experienced unpleasant moments, because they could have been flattened against the driver's cabin. And those who stood behind were in the most advantageous position. Then the bus jerked sharply before going further, everyone swung back, and the latter swapped places with the former. The last was bad, and the first was good. The law of higher equilibrium has worked. A person cannot be bad all the time or good all the time. And those who, like Laura, stood in the middle, experienced about the same in the first and second cases. It was not very good for them and not very bad "[3, p.410].

We often meet such a metaphorical description of life in Tokareva. Life is compared with a bus, seasons or repairs: "... her life is a continuous endless repair, where one is broken, the other is being built, and then after everything it turns out that what is broken should not have been broken. And what was built did not have to be built" [4, pp. 281-282].

IV. DISCUSSION

Zulfiya Kurolboy Kizi is an excellent philosopher. Her story "Kelin" (Daughter-in-law) is a vivid proof of this. She brings two generations together to show how people change, values and life itself and eternal questions and their perceptions are subject to change according to circumstances.

Considering the work of Victoria Tokareva and Zulfiya Kuralboy kizi, it is easy to notice that the theme of the city and the village runs through their works. Authors often try to convey the style of the time and the character of the characters through the description of the city and village.

Attention is drawn to the specificity of the reflection of the city and village in the text: here is a description of the equipment, and urban and rural life, and the features of buildings with people living in them.

The dominant meaning in the stories of the writers is the city and the village, as a collective image: the description of streets, villages, parks, squares, courtyards, public transport, just mentioning the words of the city and the village. Describing the city and the village, urban life and rural life, the authors acquaint the reader with the subconscious awareness of their involvement in the events of the story being read.

Tokareva and Zulfiya Kuralboy kizi's descriptions of urban life lack elements of mysticism and fantasy. All their descriptions are real, and in them every ordinary reader can recognize his village, his city, especially since often in the works the specific name of the city simply does not sound. This gives their prose a special realism.

People interact closely with the city. They live in it, walk the streets, ride public transport, look for houses, work in various organizations. Heroes are inextricably linked with him. From Tokareva's story "Happy End": "We stood at different ends of the city and listened to each other's breathing ..." [6, p. 427], - thus, ordinary telephone communication shows the psychological connection between people despite the distance.

Descriptions of life in the city and difficult rural life, we see in the stories of Zulfiya Kuralboy kizi "Muhabbat va nafrat"(Love and hate)" Ten years ago, he came to town saying 'I'm reading'. Laughing at fate, the girl, who had been admitted to the institute and had spent five years working hard, refused to return to the village, and since she had known her mind, she had dreamed of living in the city. So he didn't want to leave. "It's easy to live here," he thought at the time. (Ten years ago she came to the city to study. Fate smiled at her, she went to college. With all her efforts, she graduated from it and refused to return to her native village, because she had always dreamed of living in the city from her childhood. "It's easier to live here - she thought then."

Tokareva's stories, some, contain elements of folklore - references to long-known ancient Russian works, images from folk art (for example, Prince Guidon in One Cube of Hope, Tsar Solomon in The Unromantic Man).

Very often she uses words that can be called "Tokarevs". They are not so many times used in everyday vocabulary (and some were invented by her herself), but they are so ideal for this or that episode in her narratives: "they are interesting, comprehension", etc. With the help of such specific words, the author most clearly and aptly expresses his idea. And it seems that if she had chosen a different word, the moment he conveyed would have been perceived by the reader less expressively or in a completely different direction. Not only "her" words, but also only her inherent manner of combining them, the unique intonation that expresses the writer's worldview, helps her describe her thoughts and her own attitude to a person. The genre specificity of the stories of Tokareva and Zulfiya Kuralboy kizi are generated by an unusual union, the contamination of several genre types. Before us are psychological, philosophical, everyday stories and stories. In the stories of the authors, much attention is paid to women's problems and women's psychology.

Admittedly, the contamination of the genre by Zulfiya Kuralboy kizi is colorful, each story amazes the reader with the novelty of the topic, completely different characters. Artistic and psychological interpretation, a mystical plot that attracts the reader with a series of extraordinary events and romantic descriptions. Zulfiya Kuralboy kizi does not look for the reasons for such situations, but simply describes them.

The story "Ayol" ("Woman") is vitally reliable and with all its agitated lyricism is subordinated to the study of the emotions experienced by the heroine, the psychological content of these experiences. The author seeks to extract an extract of feelings, an extract of moods, thereby creating a psychological flow, a complex movement of the female psyche. The peculiarity of the composition of the story is in its circular character.

The work begins and ends with a description of a beautiful morning, when the "radiant and shining" sun wakes up and begins to warm everything around, which allows the reader, despite the tragedy of death, to poeticize the image of the Woman. Zulfiya Kuralboy Kizi turned everyday drama into a story about mysterious attractiveness, charm, vitality of femininity, embodied in the image of Nazokat (graceful). The style in the story "Ayol" ("Woman") by Zulfiya Kuralboy kizi has specific properties: accuracy and laconicism contain deep subtext behind reticence and silence.

If in the story "Ayol" ("Woman") the writer demonstrated subtlety, scrupulousness in the selection of vital material, then in the work "Kulanka" ("Ghost") she deliberately does not care about lifelikeness. At first glance, it may seem that this is the author's miscalculation, but Zulfiya Kuralboy Kizi, in our opinion, deliberately omits some moments in the development of the action, since it was more important for her to show the characters not as an object of artistic observation, but as a subject of ethical choice. This allows us to speak about the author's attempt to create a modern story-parable about Love.

The proximity of implausible fiction with reliable reality in this work helps the author combine the techniques of fiction (entertaining intrigue, ease of assimilation, accessibility to different ages and segments of the population, regardless of their education, melodrama, etc.) with the parable of the story [9].

Also, we find the contamination of the genre of the classic story in Tokareva's prose, these are elements of anecdote and parable: these genres, for their entire opposite, have much in common: they are characterized by brevity, accuracy, expressiveness, situationality and, at the same time, generalization of the plot, simplicity of composition.

The text of the story with elements of a parable was originally designed for different interpretations. The interesting thing about this work is the peculiar impossibility of the final meaning ... Tokareva uses the elements of the parable as an allegory, an attempt to sacralize certain knowledge. The author does not always manage to admit something, even to himself. And she uses this technique, consciously or, more often, unconsciously - she creates a parable in order to explain to herself and make available to the reader some thoughts that she cannot express directly. Not because of his linguistic inadequacy, but because of deep psychoanalytic reasons.

The use of parable elements in Tokareva's work is a consequence of the changing goals and functions of new literature. Elements of parables in stories help connect the plot with eternal

truths and truly reveal the meaning and essence of the work. In many cases, we can only talk about the presence of formal signs of a parable. In the world portrayed by Tokareva, two opposite qualities are paradoxically combined: specificity (an abundance of everyday and even naturalistic details, historical and social characteristics) and the non-plasticity of this world - in fact, disinterest in things as such. Elements of the anecdotal genre are manifested in V. Tokareva's works in several guises: these are just comic situations, sarcastic remarks of the characters and the author himself, effective verbal solutions, and sometimes an unexpected witty ending of the story. All this is intended to attract more attention and interest of the reader, and to make the work of lightness, without losing the semantic load on the text.

"The semantic constant of the anecdotal genre is an emphasized focus on the operational identification of the absurd (in a person, society, the world) at a given moment. Deploying an anecdotal situation is a very expressive technique, when the anecdotal core is overgrown with additional plot lines, motivations, details "[7]. This can be seen in the story "One Hundred Grams for Courage": "Tell me, please, what is your best perfume? - Nikitin asked the saleswoman. - "Triple" take, "Triple", - suggested Fedya "[8, p. 351].

CONCLUSION

From all of the above, it follows that "women's prose tends to be synthetic, since it can combine the signs of genre contamination, which are universal for these authors. The interaction of the contamination of the genres of the classic story in "women's prose" turned out to be extremely fruitful for Tokarev's stories: from an anecdote and a fantastic story in them, the unusualness, brightness of the plot, originality, "momentary" situations, scenes, and at the same time, vital reliability and persuasiveness, expressiveness of dialogues giving stories an absolute authenticity in the eyes of the reader; from the parable - wisdom, philosophicality, depth, universality, universality of the story being told, the instructive meaning of which is durable.

The works of Zulfiya Kuralboy kizi combine the contamination of principles and methods such as realism, romanticism, modernism, postmodernism, mysticism. Each work of the author is a whole world, each image is individual. The genre of her prose is unique, the language of the work is unique. The works reflect the fate of a woman, her experiences, her desires and dreams. Zulfiya Kuralboy kizi does not exalt her heroines to heaven for chapped hands from black work or for cracked heels of feet, does not exalt them for their loyalty to their spouse and family. She only appeals to readers so that they hear the cry of her soul addressed to women: "Hey, woman, realize yourself, appreciate yourself, find your true path." Knowing this feature of the author's stories, the reader will see stories in the stories that will make you think about your own and someone else's life, sympathize with the heroes and personally feel the situation - after all, this is so close to ordinary everyday life. The women's prose of Victoria Tokareva and Zulfiya Kuralboy kizi is marked by the search for universal models of national life. It traces the author's desire to establish a moral and spiritual national experience in contrast to the fragmented and disharmonious nature of modern life.

Thus, on the example of the stories of Tokareva and Zulfiya Kuralboy kizi, the authors investigated the contamination of the genre of the classical story in "women's prose", the search for universal models of national life. In their works, universal models of national life are traced, in which the author seeks to assert the moral and spiritual experience of the people as opposed to the incoherent and disharmonious modern life.

ABSTRACT

While labelling Africa as 'exotic and mysterious', we often forget that its residents had to go through centuries of slavery, colonialism, discrimination, and oppression. Slavery and colonial rule have been ended, but the poison of racism is still very much alive. The horrifying yet true account of race-related brutality and suffering can be seen in various African as well as non-African texts. Numerous artists and authors have attempted to address the issues of race, identity crisis, and demand equality. With Ngugi we "decolonize our mind" and Achebe brings "the second coming" which leads to Things Fall Apart, Soyinka bringing the culture via A Dance of the Forest which was a tribute to the dead people also who lost their lives in the fight for the independence. The present paper will attempt to throw some light on African literature, racism, trauma, and identity issues faced by the non-white community.

KEYWORDS: *African Literature, Racism, Black Identity*

INTRODUCTION TO AFRICAN LITERATURE

African Renaissance marked the beginning of art and culture after a long, painful journey from slavery and inequality to independence. The British did not consider Africans as humans lest they allow any cultural activity, so it began as a postcolonial uprising to assert the African identity. The struggles of the colonized, the culture and traditions are beautifully manifested in African literature. It is true that 'black is beautiful', but the non-whites have been oppressed, enslaved and tortured just because of their dark skin. This constant physical and emotional torture has created an identity crisis among the non-whites, especially those who have migrated to an alien land. As evident from the title, the term African Literature is often used to refer to the literary works of Africa including oral literature. Scheub & Gunner define African Literature as; "the body of traditional oral and written literatures in Afro-Asiatic and African languages

together with works written by Africans in European languages" (2020). African literature is marked by discussions of indigenous cultures, colonialism, slaver, racism and the plight of the oppressed. African literary works have been written in numerous languages. In the colonial era, authors started writing in European languages like French and English. But a lot of literary works have been written in indigenous African languages such as Amharic, Zulu, Hausa, and Swahili. The first name that comes to mind concerning African literature in general and Nigerian literature in particular, is Ngugi wa Thiang'o, who suffered a lot in 'Mau Mau' rebellion, and he also abandoned the English language to show his indigenous longing as he wrote *Decolonizing the Mind*. He pointed out that the African writers are still using the language of their colonizers and oppressors: "Even at their most radical and pro-African, position in their sentiments and articulation of problems they still took it as axiomatic that the renaissance of African cultures lay in the languages of Europe" (1994:5). African literary texts also carry the legacy of oral literature in the form of proverbs, songs, and narratives. For instance, the title of Achebe's novel *Arrow of God* has been derived from an indigenous proverb. Africa is known for its diverse culture. Traditions and rituals are a part and parcel of the African culture as aptly depicted in Achebe's portrayal of the Igbo tribe of Nigeria in his book *Arrow of God*. Every village has different Gods and shrines. At birth, every individual is assigned a personal god known as Chi. The significance of rituals in African culture can be understood from their frequent portrayal in African Literature. For instance, in his play A *Dance of The Forest*, Soyinka depicts ritualistic ceremonies including the ceremony of the self-discovery of the mortals, which revolves around the dead man and woman. In other ceremonies, the spirits of the forest perform and deliver monologues (known as Dance of Welcome) and the fate of the unborn child is decided (known as Dance of the Half-Child). Indigenous rituals like the consumption of yams by the priest according to the moon, New Yam feast are also beautifully portrayed in Achebe's Arrow of God.

Representation of the issues of colonial and imperial rule

Africa was colonized and enslaved for a long time and it is clearly manifested in African texts. The advent of colonizers proved to be the death knell for the freedom and culture of the natives. The natives were robbed of their lands, dignity, and liberty. They were forced to feel inferior and were lured to accept the colonizer's faith. This whole process is accurately depicted in Chinua Achebe's *Arrow of God*. Men like Okonkwo who resisted were crushed or met their demise too soon. Given below are some issues related to colonialism and imperialism that are often discussed in African Literature.

Abandonment of indigenous traditions

The colonized tried to impose their ways and cultures on the natives; by making them think that their (the colonized's) rituals and customs were worthless and outdated. This is aptly presented in *Things Fall Apart*, as this novel paints a true picture of the demise of native ways at the hands of European colonizers whose culture and appearance are seemingly modern. Elites like Ezeulu, the protagonist in The *Arrow of God*, are unwilling to accept such changes, as in his case, he might lose his status which primarily stems from his position as a priest. The downtrodden sections of the Igbo society are more open to foreign religions and cultures like Christianity which offer equal status to all.

Spread of Christianity

The colonizers considered their religion to be the only righteous faith; hence, they made untiring attempts to spread it. They constructed churches and offered tempting incentives to anyone who embraced Christianity. The marginalized were the first to take up this offer as it meant being equal, unlike the way they were treated in the native society. Corruption among the priests and religious heads, unequal treatment of the lower section were some reasons why the indigenous religions became unappealing to the masses. Achebe's novel Arrow of God deals with this issue. The priest Ezeulu sends his son Oduche to the missionary school, hoping that he will become their inside man among the white people, but his plan fails when Oduche starts adopting the ways and religion of the white man. To please the colonizers, he traps a python, which is considered sacred in the African culture.

Administrative issues and corruption

The indigenous leaders were gradually devoid of all power and were constantly humiliated. The colonizers installed local indigenous rulers as puppets while in reality; the colonizers were the de facto rulers. In Achebe's novel *Arrow of God*, Ezeulu, a priest, is offered the position of chief and when he denies it, he is imprisoned. Due to the ever-increasing poverty in African nations, corruption is and has been a grave issue. Achebe represents the severity of corruption in the government in his novel *No Longer at Ease*. Initially, the protagonist Obi Okonkwo is an idealist, and he refuses to accept bribes in any form, whether it be monetary or in the form of sexual favours. But forced by his worsening economic situation, he starts accepting bribes and is caught while accepting what was supposed to be his last bribe. Soyinka also depicts corruption in his play *A Dance of the Forest* through the character of Mata Kharibu and Madame Tortoise. King Mata Kharibu forces the soldiers to fight and condemns free thinking. The queen Madam Tortoise also uses her beauty for the wrong purposes.

Depiction of the plight of the oppressed

As Maya Angelou confesses in her autobiography *I Know Why the Caged Birds Sing*; "It was awful to be Negro and have no control over my life. It was brutal to be young and already trained to sit quietly and listen to charges brought against my color with no chance of defense" (2002). The European colonizers used the non-whites as a means to an end. A glimpse of the ugly face of imperialism can be seen in Joseph Conrad's novella *The Heart of Darkness*. During his voyage to Africa, Marlow, the protagonist, witnesses the heartless exploitation of the natives, who are forced to work for the Europeans. They are ill-treated and forced to work for long hours. This can be discussed by the plight of non-white South Africans who faced racial segregation for decades. The worst thing was that they were discriminated against in their own country, despite being the majority, by the minority of white folks. Nelson Mandela, an anti-apartheid politician who went on to become the President of South Africa, describes these experiences with racism when he joined a new law firm:

". . . a young white secretary, Miss Lieberman, took me aside and said, "Nelson, we have no color bar here at the law firm." She explained that at midmorning, the tea-man arrived in the front parlor with tea on a tray and a number of cups. "In honor of your arrival, we have purchased two new cups for you and Gaur," she said. "The secretaries take cups of tea to the principals, but you and Gaur will take your own tea, just as we do. I will call you when the tea comes, and then you can take your tea in the new cups." She added that I should convey this

message to Gaur. I was grateful for her ministrations, but I knew that the "two new cups" she was so careful to mention were evidence of the color bar that she said did not exist. The secretaries might share tea with two Africans, but not the cups with which to drink it. (1994:191)

In his autobiography *Long Walk to Freedom*, Mandela revealed that even while serving time in prison, he faced severe discrimination; "We would fight inside as we had fought outside. The racism and repression were the same; I would simply have to fight on a different term" (1994:988). Achebe also depicts the helplessness of the non-whites in his novel The Arrow of God through the sufferings of the villagers of Umuaro who are humiliated and forced by the colonizers to perform manual labor without pay. The worst part is that non-white women, especially those who are a part of the working class, have to face three times as much oppression; by the whites for being black, by the patriarchal society for being a woman, and by the capitalist for being a working class. As Angelou puts it; "The Black female is assaulted in her tender years by all those common forces of nature at the same time that she is caught in the tripartite crossfire of masculine prejudice, white illogical hate and Black lack of power" (2002). The discriminatory attitude of the colonizers created a physical and psychological distance between non-whites and whites. Angelou mentions this in her autobiography; "The town was halved by railroad tracks, the swift Red River and racial prejudice. Whites lived on the town's small rise. . . while blacks lived in what had been known since slavery as "the Quarters" (Angelou 1974:125).

Superiority complex and white man's burden

The colonizers wrongly believed that they were superior to the natives in all aspects. Rudyard Kipling, a British imperialist poet, and author, coined the term 'white man's burden' to justify colonization and imperialism on the pretext of 'mission of civilization'. Like most white men, he believed that the non-whites are savage, uncivilized, uncultured brutes, who need to be civilized (and Christianized) under the imperial rule of white nations. Kipling goes on to call the colonized; "sullen peoples, / Half devil and half child" (1899). Achebe also presents this attitude of the colonizers through the character of John Wright, a civil servant, in the Arrow of God. Wright considers the natives as lesser humans, mindless and lazy beings. He severely punishes the native labourers and has sexual relationships with, probably unwilling indigenous women. Racist beliefs like this are shocking and a bit hard to swallow, especially when coming from a champion of democracy, third President of the United States, American Founding Father and one of the authors of the Declaration of Independence (1776), i.e. Thomas Jefferson. He stated; ". . . the blacks. . . are inferior to the whites on the endowments of both body and mind. . ." (2011:330). Mandela also describes how white people were ashamed of the fact that they had to work with the non-whites:

I was dictating some information to a white secretary when a white client whom she knew came into the office. She was embarrassed, and to demonstrate that she was not taking dictation from an African, she took a sixpence from her purse and said stiffly, "Nelson, please go out and get me some hair shampoo from the chemist." (1994:193)

This insensitivity towards the issue of racism comes from white privilege, as for some people, a problem is not a problem until they have to face it firsthand themselves. As stated in Adichie's novel *Americanah*; "Race doesn't really exist for you because it has never been a barrier. Black folks don't have that choice" (2013:30). Another reason for this insensitivity is the avoidance of

the issue of race altogether. In diverse countries like America, white people are uncomfortable talking about race even in this day and age. Adichie aptly puts it in her novel *Americanah*; "Of all their tribalisms, Americans are most uncomfortable with race" (2013:791).

Racism and its Depiction in Literary Texts

Racism refers to discriminating and alienating a person based on their ethnic origins. "Racism is the most vicious part of that general ideology that gives rational expression and legitimacy to exploitation, oppression and domination" (Ngugi 1993:126). It also refers to; "the belief that. . . some races are innately superior to others. The term is also applied to political, economic, or legal institutions and systems that engage in or perpetuate discrimination on the basis of race or otherwise reinforce racial inequalities" (Smedley 2020).

"One of the worst effects of racism is the way it numbs human sensibility. Horrendous things can be done to a section of the population without other sections registering the horror because their feelings have been numbed. . ." (Ngugi 1993:121). A recent, unbelievably horrifying and appalling event comes to mind. An African American man, George Floyd was suffocated to death by a white policeman who knelt on his neck until Floyd met his sad demise. "More than 1000 people were killed by police in the US in 2015, nearly a third of them black. This is despite the fact that black people represent just 13 per cent of the population" (Knox & Herbert, 2020). Racism has been a part and parcel of slavery, and it is the basis of exploitation and oppression. "Racism is a psychological, cultural, political, and economic reality and not some disembodied abstraction" (Ngugi 1993:122). It has created a rift between the whites and the non-whites. As Ngugi pointed out; "racism is meant to scatter, confuse, and weaken resistance, prevent it, if you like, from reaching the stage of demanding and effecting revolutionary changes in the status quo" (Ngugi 1993:122). Du Bois popularized the term 'colour line to refer to the segregation and discrimination on the basis of race; "the problem of the twentieth century is the problem of the color line" (DuBois, 2007;15). Racism is not something that we are born with; we learn it from our biased society. As Adichie stated; "But race is not biology; race is sociology. Race is not genotype; race is phenotype" (2013:26). Despite decades of anti-slavery and equality movements, prejudices and stereotypes related to non-whites such as; black people are criminals, they dress shabby, they are poor and shady, black neighbourhoods are dangerous, and so on, still exist. In some cases, racist people have trouble accepting the fact that non-whites can be educated and work as well as the whites; "Lots of folk today don't mind a black nanny or black limo driver. But they sure as hell mind a black boss" (Adichie 2013:792). Racism is deeply rooted not only in society but also in languages. Through his satirical poem *White Comdey*, Benjamin Zephaniah humorously presents how the word and concept of 'black' have been demonized for centuries:

> I waz whitemailed
>
> By a white witch,
>
> Wid white magic
>
> An white lies,
>
> Branded by a white sheep
>
> I slaved as a whitesmith

Near a white spot

Where I suffered whitewater fever.

Whitelisted as a whiteleg

I waz in de white book

As a master of white art,

It waz like white death.

People called me white jack

Some hailed me as a white wog,

So I joined de white watch

Trained as a white guard

Lived off the white economy.

Caught and beaten by de whiteshirts

I waz condemned to a white mass,

Don't worry,

I shall be writing to de Black House. (2003)

The prejudiced white society has been demeaning the non-whites for centuries. The non-whites have been wronged even by the government and the law. Laws and government are supposed to be about the welfare and safety of every citizen. But for centuries, laws have been formed against the non-whites. It's no wonder an evil like racism has been festering when even the government, judges, and juries were prejudiced. This is aptly portrayed in the case of Tom Robinson in Harper Lee's novel *To Kill a Mockingbird*. It is clear that Tom Robinson did not rape Mayella Ewell, he did not even have the hand which the victim and her father claimed, was used to hit her. His only crime was taking pity on and trying to help a lonely girl, abused by her father. Still, he was imprisoned and was attempted to be murdered just because of the colour of his skin. Had he been white, the case probably wouldn't have been even taken to the court. The racist residents of Maycomb attempt to murder Tom, and they taunt Atticus for fighting on behalf of a black man, he is addressed as a 'nigger-lover". The fact that even the children boycott Atticus's children, Jem, and the narrator calls attention to the appalling reality that the racist environment has polluted the minds of innocent children. Instead of attempting to curb racism, the biased government started passing laws like The Population Registration Act of 1950, which made the distinction based on race official and all social, political and educational benefits a person got was on the basis of a person's race. Du Bois aptly states:

Daily the Negro is coming more and more to look upon law and justice, not as protecting safeguards, but as sources of humiliation and oppression. The laws are made by men who have little interest in him; they are executed by men who have absolutely no motive for treating the black people with courtesy or consideration; and, finally, the accused law-breaker is tried, not by his peers, but too often by men who would rather punish ten innocent Negroes than let one guilty one escape. (2007:119)

Racial identity

Even in this day and age, racism is almost everywhere, and it is taking a devastating toll on 'the sense of self' of the non-whites. "Much of African-Caribbean performance and literature deal with the question of identity, usually through a continuous re/negotiation of the past, in relation to cultural origin, geographic origin and the debilitating experience of transatlantic slavery…" (Igweonu 2011:61). Some issues related to identity are discussed below:

Detachment from tribal roots

Tribes are one of the unique features of African societies. Most of the tribes had their own history, rituals, myths, and even deities. The members of each tribe lived in harmony like a big family. Adichie aptly states in her novel *Half of a Yellow Sun*; the only authentic identity for the African is the tribe:

. . . I am Nigerian because a white man created Nigeria and gave me that identity. I am black because the white man constructed black to be as different as possible from his white. But I was Igbo before the white man came. (2006)

During the colonial era, the non-whites were enslaved and shipped off as indentured labours and slaves. Generations were dispersed and displaced from their homeland and culture, and thousands of people lost touch with their tribal roots in an alien land. Even the people who still live in African countries are witnessing the death of their culture under the influence of the west. Consequently, thousands of people are forced to go through the trauma of identity crisis.

Derogation of native languages

The colonized and enslaved were led to believe that their native language is inferior to the European languages; "his own native languages were associated in his impressionable mind with low- status, humiliation, corporal punishment, slow-footed intelligence, and ability or downright stupidity, non-intelligibility and barbarism" (Ngugi, 1994:18). Speaking in the native languages was strongly discouraged. "This approach resulted in the creation of a Babel society because of the inability of the various tribal nationalities from Africa to speak the same language, therefore making it necessary for them to learn colonial languages... to communicate" (Igwenou 2011:74). This led to the development of Pidgins and eventually, Creoles. Due to the status and privilege that comes with speaking European Languages, many non-whites started preferring them. This further exacerbated their existing identity crisis.

Double consciousness

W.E.B Du Bois put forth the concept of double consciousness in order to refer to the conflict that the marginalized sections of society go through.   He used this term regarding the duality of existence, the twoness the African-Americans such as him go through. Du Bois states "One ever feels his twoness, -- an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body. . ." (2007:8). Simply put, it refers to the dilemma of remaining authentic to one's cultural roots while adopting the various aspects of a foreign land, in order to avoid being an outsider:

In this merging he wishes neither of the older selves to be lost. He does not wish to Africanize America, for America has too much to teach the world and Africa. He wouldn't bleach his Negro blood in a flood of white Americanism, for he knows that Negro blood has a message for the

world. He simply wishes to make it possible for a man to be both a Negro and an American without being cursed and spit upon by his fellows, without having the doors of opportunity closed roughly in his face. (2007:9)

Inferiority Complex

For centuries, the non-whites have been led to believe that they are ugly, worthless, and inferior. The colonizers also adopted this tactic to enslave the minds of the colonized. "The African had to be dehumanized in the mind to explain away the necessity of treating him like a brute in the flesh" (Ngugi 1993:141). In the midst of oppression and slavery, the non-whites started believing these lies as; "the oppressed will always believe the worst about themselves" (*Frantz Fanon Quotes*). Consequently, the non-whites start questioning their self-worth. As Fanon puts it; "The Negro enslaved by his inferiority, the white man enslaved by his superiority alike behave in accordance with a neurotic orientation" (2008:42-43)

Identity crisis faced by the non-white younger generation

Despite all the efforts to create a society where an individual's self-worth is not determined by their race, it is an undeniable fact that racism is still interwoven in our society's social fabric. As the American Academy of Pediatrics stated; "Racism is a socially transmitted disease passed down through generations" (Barker, 2020). It can be considered socially transmitted as we all are not genetically different but society sows the seeds of racism in our minds since the minute we are born. Children who experience racism in their early years go through mental trauma, resulting in low self-esteem, behavioural issues, anxiety, and much more. It also negatively affects their career. "Experiences of racial discrimination can make children feel . . . less worthwhile, a child may react by withdrawing from activities they like or speaking up less in class. Over time, learning suffers, and often, future opportunities as well" (Barker, 2020).

In her autobiography, *I Know Why the Caged Birds Sing*, Maya Angelou describes the agony of living in a world where white is considered beautiful, pure, and good and blackness is associated with ugliness, evil, and impurity, which forces innocent kids to think that there is something wrong with them. Surrounded by white people all around them, non-white children are isolated and start considering themselves as odd. "The most harmful thing is when children internalize racism. They see so much negativity about people like them they develop negativity about themselves" (Klass 2019). Angelou reveals that as a child she kept imagining that one day she will wake up, and she will be white, and 'beautiful':

I was going to look like one of the sweet little white girls who were everybody's dream of what was right with the world. . . one day I woke out of my black ugly dream, and my real hair, which was long and blond, would take the place of the kinky mass that Momma wouldn't let me straighten? My light-blue eyes were going to hypnotize them, after all the things they said about "my daddy must of been a Chinaman. . . I was really white and because a cruel fairy stepmother, who was understandably jealous of my beauty, had turned me into a too-big Negro girl, with nappy black hair, broad feet and a space between her teeth that would hold a number-two pencil. (Angelou 2002)

The above confessions paint a horrifying picture of the extent the impact of racism on child psychology. In the process of adopting and adapting to the elements of the white culture, the non-white children and youths get farther and farther away from their own culture, and then they

realize how far away they have come from their roots and end up going through an identity crisis, failing to recognize what they have become. Even the toys, games, and movies are not as inclusive and multicultural as they should be. In a world featuring white toys and animations, non-white kids feel alienated and different. Children who face racism, have lifelong physical and mental health issues, it even affects their relationships with their children as well as their children; "parents and caregivers who reported they had been treated unfairly were more likely to have children with behavioral issues such as attention deficit hyperactivity disorder" (Klass 2019).

The trauma of dislocation and identity issues among non-white migrants

Due to slavery, thousands of non-whites were forced to move to a foreign land where they continued "searching for root...in the desire to, perhaps, escape the debilitating experience of slavery and the persistent feeling of alienation as a result of their position as unwilling exiles in the land that has now become home. . ." (Igweonu 2011:61). Even when the displaced Africans physically return to their homeland, they are conflicted and alienated: "since they, in turn, become outsiders in the context of the local communities that they encounter. . ." (Igweonu 2011:62). The migrants are worst hit by an identity crisis. They look around and see unfamiliar faces and customs and in the process of blending and adopting the culture of an alien land, they lose a sense of who they are. In a foreign land, all the migrants belonging to a same homeland, start connecting on an emotional level, just because they are going through the same trauma, as the African migrants in *Americanah* connect, despite being strangers; "Halima smiled at Ifemelu, a smile that, in its warm knowingness, said welcome to a fellow African; she would not smile at an American in the same way" (Adichie 2013:30). To express solidarity, many non-whites use the well known 'black nod' which is essentially a tip of the head by a black person, to acknowledge another black person in a place where there are not that many of them. "It is a way for black people to say "You are not alone, I am here too" (Adichie 2013:505).

Nostalgia. Migrants often long for their home; a sense of nostalgia can be triggered by the things that seemed insignificant before, such as the smell of the food item of our homeland. Achebe depicts this longing for home via the character of Obi Okonkwo, a Nigerian student who goes to England for higher education. "It was in England that Nigeria first became more than just a name to him. . . But the Nigeria he returned to was in many ways different from the picture he had carried in his mind" (1960:12). It was only after leaving his homeland that he realized its true worth. He longs to return to his village, and sometimes he is filled with shame regarding his decision to study in a foreign land. Now he takes pride in his mother tongue, Ibo, and tries to speak it with any Ibo-speaking person he finds in London. Although while speaking "English with a Nigerian student from another tribe he lowered his voice. It was humiliating to have to speak to one's countryman in a foreign language, especially in the presence of the proud owners of that language" (Achebe, 1960:39). Obi also writes poems about Nigeria. Being an idealist, he thinks that he will go back to his country and improve it with all the knowledge he has acquired, which is ironic as it is what the colonizers thought, that they were civilizing and doing the natives a favour by imparting them English education. Another moving depiction of nostalgia can be seen in Ifemelu, the protagonist of Adichie's novel *Americanah*. After moving to America from Nigeria for higher education, she longs to return to her homeland; "Nigeria became where she was supposed to be, the only place she could sink her roots in without the constant urge to tug them out and shake off the soil" (2013:20).

Condemnation of non-white cultural markers

Suppression and loss of cultural markers worsen the trauma of identity crisis. The non-white slaves were also discouraged to carry out any ritualistic practices, from which they might have derived a sense of identity; "African rituals were considered subversive, because they not only reinforced a sense of dignity and identity in the slaves, but were means of articulating the unveiled cruelty of slavery to the ancestors, soliciting their comfort and intervention" (Igwenou 2011:63). In this case, dance became a medium of reconnecting with their roots without having to face the wrath of their masters for them. "Dance gained ascendancy among the slaves as a medium of self-expression because of the perceived inability of these African slaves to communicate orally with each other in any language other than that of the colonial slave masters" (Igwenou 2011:65).

The developed European countries and the USA have certain biased 'standards', which forces the migrants to abandon their culture to 'fit in'. For instance the natural Afro hair, a unique physical feature is considered 'unprofessional'. Braids are condemned. Consequently, women had to straighten, relax and iron their hair causing considerable damage not only to their hair but also to their sense of identity; "relaxing your hair is like being in prison. You're caged in. Your hair rules you. . .You're always battling to make your hair do what it wasn't meant to do" (Adichie 2013:273-274). The female characters Ifemelu and Aunt Uju in Adichie's novel *Americanah* constantly struggle to make their hair look like a white person's hair for the sake of their career. Ifemelu's hair gets badly damaged in the process, but Aunt Uju, like all other migrants trying to blend in, justifies it; "You are in a country that is not your own. You do what you have to do if you want to succeed" (Adichie 2013:273). The way migrants change their appearance, dressing, language might seem insignificant at first but it causes irreparable damage in the long run. Migrants often start feeling lost and oscillate between the foreign land and their homeland that has changed beyond recognition. For instance, Aunt Uju, in the process of adapting to America ". . . deliberately left behind something of herself, something essential, in a distant and forgotten place" (Adichie 2013:273).

Colorism

The sad truth is that even the non-whites participate in skin colour based discrimination. Colorism refers to discrimination based on skin tone and preferring lighter skin color among the non-white community. Alice Walker coined the term 'colorism' in her book In Search of Our Mothers' Gardens, and defined it as "prejudicial or preferential treatment of same-race people based solely on their color. . . colorism, like colonialism, sexism, and racism, impedes us" (2011:529). Being a few shades lighter comes with a lot of privileges, opens the same doors of opportunity which are closed for people with darker skin tone. In Adichie's novel *Americanah*, Obinze's Nigerian wife, Kosi is considered attractive and people are drawn to her beauty as she has a lighter shade of skin; ". .   . she laughed, with an open, accepting enjoyment of her own looks, when people asked her "Is your mother white? Are you a half-caste?" because she was so fair-skinned" (2013:56). For her, being mistaken for a mixed-race woman because of her light skin was a delight. Both light skinned and dark skinned non-whites often feel alienated and experience an identity crisis.

Overview of African Literary Works and Cultural Aspects

African Literature is also an apt example of Postcolonial existence in African and Asian countries with its roots taking everyone back to the indigenous literature and culture pre-colonial period. Some significant names in Nigerian literature are Chinua Achebe and Wole Soyinka. Yet these two names are not the only names in relation to the upbringing of culture and theatre. Acehebe's first novel *Things Fall Apart* (1958) is a wonderful account of the clash between native Igbo African culture and British colonisation. He weaves together the oral traditions with Igbo traditional folktales. Wole Soyinka, a playwright, poet and novelist won the Nobel Prize for literature in 1986. He is the epitome of Nigerian theatre as he said in his famous speech, "the greatest threat to freedom is the absence of criticism" (*Wole Soyinka Quotes*), and he also coined the concept of 'tigritude'. Soyinka's writings focus on the weak masses oppressed by the strong class. He has played a pivotal role in Nigerian politics which caused him great personal threats. Soyinka's famous play *A Dance of the Forest* was written to celebrate the Nigerian independence and give tribute to the martyrs of independence.

Nelson Rolihlahla Mandela, was a South African anti-apartheid revolutionary, political leader and philanthropist, he has also served as the first black President of South Africa from 1994 to 1999. He was famous for his first anti-hate speech as an elected president and urged people to win with love and compassion. He became a godfather to the African cultural heritage and traditions. His famous autobiography *Long Walk to Freedom* is a painful journey towards black identity. There is a unity in diversity among African playwrights and poets as we see Soyinka severely opposed the term "negritude" favoured by Maritinique Aime Cesaire and Senegalese Leopold Sedar Senghor and in reaction, coined the term "tigritude" to show resentment against British forces. African renaissance explored this thought of resentment, displayed the true picture of African people. It was not confined to the're-birth' of independence; it was a're-birth' of culture, nation, values, black identity, and African theatre. Mau Mau uprising gave them true independence from child abuse, slavery, and prostitution. African slave history is filled with torture, oppression, and horrible abuse inflicted on women and children. All this led to revolutionary writings by various playwrights, poets and novelists. African theatre explores these experiences as a living example and also plays as a tribute to the dead in search of lost traditions, customs and cultural values.

Theatricality in Africa is understood in the form of a human behaviour as self and social surroundings. It is the soul of the Nigerian people to find meaning in their lives by relating themselves with their indigenous culture. *The Black Hermit* was the first play by the Kenyan author and playwright Ngugi wa Thiong o' and the first published 'East African' play in the English language. The travelling theatre of Makerere College was the first to produce the play, giving it the honour of 'Ugandan Independence' at the 'Ugandan National Theatre' in Kampala in November 1962. The play was published in a small edition by Makerere University Press in 1963, and republished in Heinemann's African Writers Series in 1968. The play attacks the capitalism, religious hypocrisy, and corruption among the new economic elite of Kenya. Ngugi presented his ideas on literature, culture, and politics in numerous essays and lectures, which were respectively collected in *Homecoming* (1972), *Writers in Politics* (1981*), Barrel of a Pen* (1983), Moving *the Centre* (1993), and *Penpoints, Gunpoints, and Dreams* (1998). In *Decolonizing the Mind: The Politics of Language in African Literature* (1986), Ngugi actively argued for African languages and literatures as the only

authentic voice for Africans and declared his own intention of writing only in Kikuyu or Kiswahili from that point on. These works earned him a reputation as one of Africa's most articulated social critics.The transition from colonial to post-colonial has been the central theme of Ngugi's works. *Decolonising the Mind* by Ngugi was his last work in the English language as he abolished writing in English to assert his native identity; and embraced Kikuyu and Kiswahili as his further language for plays and novels. As Ngugi writes in the introduction of this book:

The oppressed and the exploited of the earth maintain their defiance: liberty from theft. But the biggest weapon wielded and actually daily unleashed by imperialism against that collective defiance is the cultural bomb. The effect of a cultural bomb is to annihilate a people's belief in their names, in their languages, in their environment, in their heritage of struggle, in their unity, in their capacities and ultimately in themselves. It makes them see their past as one wasteland of non-achievement and it makes them want to distance themselves from that wasteland. It makes them want to identify with that which is furthest removed from themselves; for instance, with other peoples' languages rather than their own. It makes them identify with that which is decadent and reactionary, all 'those forces which would stop their own springs of life. It even plants serious doubts about the moral rightness of struggle. (Thiong'o, 1994:3)

The theme of this book is simple and lucid. It is actually picked from a poem by the Guyanese poet Martin Carter in which he looks at ordinary men and women hungering and living in rooms without lights; especially those men and women in South Africa, Namibia, Kenya, Zaire, Ivory Coast, El Salvador, Chile, Philippines, South Korea, Indonesia, Grenada, are Fanon's 'Wretched of the Earth', who have announced very loudly and clearly that they do not sleep to dream, but dream to change the entire world. Ngugi dreamt to change the world around him by decolonizing these people's mind. Chinua Achebe created stories which speak for themselves as he famously said "I would be quite satisfied if my novels . . . did no more than teach my readers that their past" (1976:59). These lines set the tone of his works whether it is *Things Fall Apart* or other works. Representing an African world view through narratives that tell a tale for themselves meant that Achebe would throw a light upon 'Igbo oral' traditions to tell the stories of his communities, while keeping in mind Richard Bauman's exhortations that in utilizing 'oral traditions' to engage the 'canons of elite' Western literary 'traditions and texts,' oral narrative must not be taken just to be 'the reflection of culture' or 'the cognitive arena for finding out the logic of cultural codes' in historical writing: instead, 'oral narratives' must be utilized 'contextually and ethnographically', in order to discover the individual, social and cultural factors that give it 'purpose and meaning'. Wole Soyinka is famous for his political controversial speeches and rebellions in the form of various theatres and movements as he also coined the term "tigritude":

Soyinka has been a proponent and practitioner of two seemingly incompatible tendencies in modern theatre: mythopoetic drama and revolutionary agit-prop. A social activist as well as a multi-talented artist, he combines the roles of playwright, actor, director, producer, and manager with those of poet and novelist. An advocate of joining the old and new, Soyinka has brought the techniques of traditional folk theatre to late twentieth-century mass media—radio, television, and cinema—issuing an album of satirical songs and producing a film, Blues for a Prodigal (1985), banned in Nigeria for its attacks on corruption in high places. (Gerould 2000)

His sole aim is to assert the national identity in post-colonial Africa. He unmasks the mechanism of power that operates through its own laws. Soyinka was arrested in Nigerian civil war, tried, acquitted, then re-arrested and held without trial for more than two years-twenty one month in a solitary confinement for being an active participant in civil war. He was in forced exile for many years, and then in 1976 he returned to Nigeria and opened 'Guerrilla Theatre' which satirized the corrupt state power and abusive civil rights. Soyinka founded a semi-professional acting company to stage play his masterpiece *A Dance of the Forest* at the university theatre in Ibadan. It was a classic success among independent Nigerian citizens. Soyinka gave a new life to African practice of theatres and plays on the world stage. He founded the Yoruba ritual theatre in order to show tragic plays specially based on the sacrifices of the African martyrs who vehemently fought for Nigerian Independence. He was again forced into exile in 1994 for many more years after the successful representations on the stage. Soyinka was a playwright, political leader, and an iconoclastic hero who played a pivotal role in the unveiling of the culture and traditions through African theatre:

Although he rejects the notion that all art is only an organ of class rule, the playwright recognizes that for the most part the artist in modern society "is an innately regulated being" with a deep-seated craving for conformity, enslaved to seductive ideologies and dictated fashions. But art, Soyinka argues, by its very nature "will try to contain and control power," making it something always feared by despots. (Gerould 2000)

Nelson Mandela is the living legend for African identity as his autobiography is one single milestone to measure entire African identity. Soyinka talks about Mandela in his famous book *You Must Set Forth at Dawn*:

IN 1990—IN MY NOTATION, the Year of Mandela's Release—when he made Jamaica one of his earliest stopping points for his reunion with the living world, I made a startling discovery on that same island. If Nelson Mandela was discovering the space of freedom on a global scale, I was also discovering a micro-world that was founded in freedom. Thus did I embark on a pilgrimage that would begin as a sentimental, and evolve into a morbid, attachment. (Soyinka, 2007:57)

Mandela was a true political leader, he has given the true identity to his people by asking them in a loving 'Ahimsa (non-violence)' way to 'Vote', he made it very clear to his people that independence will come only at the election. People were barging into violence, killing white people, torching places, but it was not the idea of Mandela. He was looking at the future of Africa in safe hands. He was a true 'Gandhi' in his independence movement and wanted to create an identity for a peaceful Africa. He knew independence won't come by violence but by peace. His 'Swaraj(self-rule)' actually made Africa an independent country on the world map making it forever 'black is beautiful'. Ngugi, Achebe, Soyinka and Mandela stand tall not as African theatre artists or political leaders but as the immortal narratives of African culture, traditions and iconoclastic parables on the world map.

CONCLUSION

Africa has its own beauty and as a former colony, its own set of issues. This beauty along with the diversity of Africa is mirrored in African literature. The above discussion also makes it clear that the presence of racism is an undeniable fact and it has long term impact on its victims as well as the society. Racism has already ruined the life of too many people and just when we

think that issues like racism and colorism are ancient history, we are struck with the harsh reality that it is still present in our society and psychology. Victims of bias and racism have life-long psychological issues. We have to understand that every color of skin is beautiful and equal. The need of the hour is to acknowledge this biased point of view towards the non-whites and to make all possible attempts to eradicate it. We should keep in mind Mandela's message; ". . . no one is born hating another person because of the color of his skin. People learn to hate. They can be taught to love, and love comes more naturally to the human heart" (1994:1579).

ETYMOLOGICAL-SEMANTIC FEATURES OF MEDICAL TERMS

Shokir Mamadaminovich Choriyev*

*Independent Researcher,
Termez State University, UZBEKISTAN
Email id: shokir-86@bk.ru

ABSTRACT

Explaining the etymological and semantic meaning of medical words in the Uzbek language on the basis of their forms in the national language dialects is one of the most pressing and sensitive issues. The subject of this article is the etymological and semantic features of medical terms in the Uzbek language. The purpose of the article is to determine the importance of medical terms in a clear and easy to understand through the issue of etymological and semantic analysis of medical terms in the Uzbek language. The nature of the Uzbek word chipkan was also explained through an analysis of the phonetic relationship in the nature of the national language. It also addresses the issue of systematizing ancient medical terminology and nationalizing modern medical education.

KEYWORDS: *Etymology, Semantics, Phonetics,Chipkan(Tip Pustule), Chyk, Chuvan, Chubon, Chigon, Chipkan, Chykan, Chykgan, Oguz, Kipchak, Phonetic, Etymological-Semantic, National Language, Dialect, Dialect.*

INTRODUCTION

It is no exaggeration to say that the promotion of medical terminology research in the Uzbek language as a fundamental field of research is an important state order in the field of linguistics "full use of the state language in medicine and other fields" [1]. Undoubtedly, the role of language in the rise of a nation to the level of a nation, in the unification of the people who make up this nation in the path of dreams and goals, is incomparable.

It should be noted that the study of the etymological and semantic features of medical terms in the Uzbek language is, by its nature, the most complex field of linguistics. At the same time, it is natural that the phonetic, etymological and semantic issues of medical terms in the Uzbek language have not been studied in detail, which creates some difficulties in research.

THE MAIN FINDINGS AND RESULTS

Medical terms are a special, complex, unique terminology, the study of which is one of the most important areas of human knowledge and has been evolving for more than two thousand years. In the literature, there are views on medical terminology from ancient Greek sources.

"Some terms may be related to other terms or terms in terms of content or some feature. Demonstrating this connection helps to understand the meaning of the linguistic concepts used in these terms" [2, p. 7].

One of the most pressing and sensitive issues in the terminological system of the Uzbek language is the disclosure of the etymological and semantic essence of medical concepts based on the forms of national language dialects.

The study of the etymology of medical terms is of great scientific importance, as it identifies the sources of word formation formed over thousands of years by the Turkic peoples, reveals the etymological and semantic features of the terms in the Uzbek language by making a general comparison of the peculiarities of the sources of formation of these names created by the Turkic peoples. In studying the historical and etymological status of medical terms in the Uzbek language, Mahmud Kashgari's work "DevonuLugat-it Turk" is the first universal dictionary covering all elements of historical and etymological dictionaries in the history of Turkic peoples. A number of researches and explanations of terms, analysis of concepts in the Uzbek language on modern medical terminology have been carried out. In particular, the work on medical terminology in the Uzbek language in 2003-2008 was developed by AzimjonKasimov in 4 volumes "Explanatory Dictionary of Medical Terms"; the first volume [3, p. 472] contains about 5,000 explanations of Uzbek terms. Volume 2 [4, p. 568] contains about 7,000 intermittent terms that have entered our language in Latin-Russian form, which is an external source of speech. Also, as a continuation of this dictionary, Volume 3 [4, p. 576] was published in 2008, which includes about 10,000 international Uzbek lexemes, and Volume 4 [4, p. 480] contains about 6,000 terms. In 2010, the "Great Medical Etymological Dictionary" [5, p. 328] (Russian-Latin-Uzbek) was created, which contains about 4,000 terms and concepts.

MATERIALS AND METHODS

The etymological-semantic study of medical words provides a basis for a clear and easy understanding of the terms. For example, in Uzbek words such as measles, rubella, measles are used.

The word chypkan (tip pustule) is defined in dictionaries as "*acute purulent necrotic inflammation of the follicle and surrounding sebaceous glands and tissues*" [6, p. 113]. Let us consider the etymological-semantic analysis of the linguistic unit that represents this concept of medicine.

In this case, the word chipkan has a conceptual connection with the word chykkan in terms of meaning and content. We can see that the word chipkan is etymologically related to the term.

The etymological dictionary of the Uzbek language contains information on ***chiqiq*** [7, p. 431] "*diseases such as ulcers, gonorrhea, and scabies*" [7, p. 431]. The etymological feature of the word "chykkan" mentioned by the linguist Sh. Rakhmatullayev is the first name and expression

of the word. It is said that the word chipik etymologically means "*to rise to the surface*" [7, p. 431] in Uzbek.

It is incorrect to interpret the etymological form (chyg-iq) of the Uzbek dialects as chygyk, chuvan, chubon, chyqkan, chyikon, chyggan as the past tense. Because the word itself refers to the quality of the object. The word *chipkan* is semantically defined in the Glossary of Medical Terms as "*Chiqiq II - in folk medicine - the general name of any wound on the skin*" [3, p. 266]. The word "chip" is used in the structural sense to mean chip-enclosed, and the word "blood" in the dictionary "Adamato" is a red substance in the veins of living things interpreted as a word meaning [8, p. 307].

The etymology of the word differs from the elements of the nationallanguage. That is, literary language is the only variant of all the word forms used in the national language (dialect), which means the product of unification in the sense of one concept. Dialects are the creators of language that reinforce the etymology of words with information and source. In this regard, the linguist H. Jamolkhanov describes the literary language and the national language as follows. "Modern Uzbek literary language is the highest form of the Uzbek national language - a developed, standardized, stable form common to all members of the nation. This means that there is no contradiction between the national language and no other system, but only the general appearance of the higher level of the national language" [9, p. 4]. From this it is understood that the etymological-semantic feature of the word chipkan is more fully strengthened by the phonetic side of the language.

Mahmud Kashgari points out that as early as the 11th century, the phonetic nature of words in Oghuz and Kipchak "For ease of pronunciation" required an approach as a plane of formation and preparation of material for the literary language within the national language, with some sounds omitted [10, p. 69]. In fact, many words in Uzbek dialects tend to be abbreviated rather than added.

In the national language dialect of the word chipkon, there are such forms of the word chipkan as chygyk, chuvan, chubon, chykkan, chygan, chiykan, which are used in the speech of the representatives of the national language. Although Turkic languages are phonetically close to each other, each group or a particular Turkic language has its own phonetic development process. Accordingly, while there were common consonants in the Babylonian period, some consonant sounds later became the distinctive sounds of some languages.

In the history of the Uzbek language, consonants have not changed dramatically. Consonantal changes are usually limited to the acquisition of new consonants and the exchange of sounds.

Some words in the dialectal system of the Uzbek language have a common feature and are often associated with different historical conditions. However, many words in the language dictionary have similarities.

The formation of the word Chipkan in the dialectal system of the national language is characterized by a certain feature.

Literary language form	Khorezm dialect		Surkhandarya dialect		Historical form
Inflammation of the surface	Kipchok	Oguz	Qipchoq		Bobo til
	Chu**b**an	chu**v**an	chi**y**kon	chikkan	chikik

of the human skin results in the formation of a small, purulent rash (chipkon) with a mixture of blood.	It can be observed that the phonetic-morphological features of the speech of the representatives of this dialect are preserved.	Some of the sounds in these dialects have some phonetic features.	Used to describe the concept of ascension.

In the Khorezm dialects of the Uzbek language, the p-consonant sound in the word chipkan occurs in various phonetic changes in the dialects. For example, in the Oghuz dialects, "the drop of the sounds *q, g ', k, g,* in the cores and affixes of some words is characteristic of the dialects of the Oghuz group: *chuvan- (chipqon)*" [11, p. 137] phonetic changes occur. Also, in Oghuz dialects, this word is different from Kipchak dialect. When words ending in p are added with a vowel, in Oghuz dialects this sound remains silent, and in Kipchak dialects p the sound shifts to b: undergoes a phonetic change like *chuvan-chuban* [11, p. 276].

In the Kipchak group dialect, the consonant (p) is in the intervocular position between the words p> b. The P-consonant sounds in the following dialects and shifts to v in the intervocal and Sandhi states: *chivar (chipor)*; *jovib* (closing); The p> v event does not occur at the beginning of a word, but occurs mainly between words and at the end of the first component of a verb formed by the combination of two word forms: *ta; valdim* (found).

The fact that the consonant p loses its explosive properties, that is, the transition to p> b and p> v is characteristic of J-hunting dialects. However, the phenomenon of p> v, shown by Sh.Shoabdurahmanov, also occurs in the intervocal state in snow-type dialects. For example, the consonantal consonant kovayma (multiplication), (p) is found in the y- hunting and j- hunting dialects of the Uzbek language and in some Turkic languages.

CONCLUSION

1. The above observation shows that the word chipkan is used in different forms according to its phonetic features in the national structure and semantically represents a common concept.

2. The word chippon refers to the fact that the bulge is closed due to inflammation of the chip-skin and is named on the basis of qualitative characteristics in relation to the accumulation of blood and pus as a result of inflammation. In Uzbek dialects, the following phonetic features of the word chipkan are observed.

3. The term chipkon in the Uzbek literary language In the dictionary of Khorezm dialects of the Uzbek language there is a transition to phonetic changes in the form *"chuvon, chuban"* [11, p. 100].

4. It should be noted that the lexical units of the national language serve as a source and strengthen the etymological basis in the formation of words in the modern Uzbek literary language. In this case, the words of the dialect were collected on the basis of information from informants

5. Therefore, it is correct to consider this case as a morphologically adjective form of the verb *chikkan*.

6. In conclusion, it is appropriate to emphasize the following. The forms of medical terminology used in the national language, in turn, serve as an important research material in the formation and emergence of elements of literary language. The phonetic features of medical terms, in turn, help to clearly and easily understand the meaning and essence of the term. The expressiveness of a term largely depends on how it is understood. The above analysis serves to replace the terms in the literary language, and in medical education to enrich the national material.

ABSTRACT

This article describes the history of the formation of the judicial system of the Republic of Uzbekistan and the reforms carried out to ensure the independence of the judiciary based on historical sources and an analysis of regulatory legal acts. The article reveals the state policy aimed at ensuring in practice the rights, freedoms and legitimate interests of citizens enshrined in the Constitution through the specialization and ordering of courts.

KEYWORDS: *Judge, Constitution, Code, Law, Reform, Instance*

INTRODUCTION

One of the priorities for further development of public administration is the gradual democratization of the judiciary, ensuring strict adherence to constitutional norms on the independence of the judiciary. Over the years, significant work has been done to establish the judiciary as an independent and separate branch of government, to transform it from a penitentiary body into a truly independent institution of the state that protects and reliably protects human rights and freedoms. The adoption of a number of decrees by the President of the Republic of Uzbekistan Sh. Mirziyoyev on radical improvement of the structure of the judicial system is an important step in the implementation of these tasks, raising the state policy in this area to a qualitatively new level. The study and research of the history of the judiciary, which is an integral part of the history of statehood in the process of changes in the current judicial system, is one of the urgent tasks facing the science of history.

METHODS

The article is based on generally accepted historical methods: historical, comparative and logical analysis, consistency, objectivity, in which the history of the formation of the judicial system of the Republic of Uzbekistan is studied on the basis of historical sources and relevant regulations. Some aspects of the formation of the judicial system have been covered in research conducted by lawyers such as U.Mingbaev, F.Muhitdinova, M.Rustamboev, U.Tukhtasheva, J.Abdurahmonkhodjaev and have not been studied by historians as a special study. However, the formation of the judiciary requires a study of its integral relationship with socio-political and economic reforms, a comprehensive coverage of the gradual development of the judiciary, noting the causes and consequences.

RESULTS AND DISCUSSIONS

During the seventy years of the dictatorial Soviet rule in Uzbekistan, the courts acted as a punitive tool of the ruling party and the totalitarian regime. Only after gaining independence did the constitution and laws stipulate that the judiciary functioned independently of the legislature and the executive, political parties, and other public associations.

The history of the formation of the judiciary during the years of independence is divided into three periods:

- The first period 1991-2000;

- The second period 2001-2016;

- The third period is the years after 2017.

The first period in the history of the judiciary began with the declaration of state independence. Article 5 of the Law "On the Foundations of Independence of the Republic of Uzbekistan" adopted on August 31, 1991 stated that the state power is divided into legislative, executive and judicial branches [1, P.35]. Later, this principle was further strengthened in Article 11 of the Constitution of the Republic of Uzbekistan, adopted on December 8, 1992. Chapter XXII of the Constitution is devoted to the judiciary and covers Articles 106-116. Article 107 of the Constitution stipulates that the judicial system of the Republic of Uzbekistan is elected by the Constitutional Court of the Republic of Uzbekistan, the Supreme Court of the Republic of Uzbekistan, the Supreme Economic Court of the Republic of Karakalpakstan, the Supreme Economic Court of the Republic of Karakalpakstan, regional courts, Tashkent city court, district, it was stated that it consisted of city and commercial courts [2, p. 37-38].

According to the Constitution, the judicial system of the Republic of Uzbekistan initially operated in three major sectors. That is, the Constitutional Court, the Supreme Court and the Supreme Economic Court. Of these courts, the Constitutional Court and the Supreme Economic Court were established for the first time in the history of our country.

The judicial system of the Republic of Uzbekistan corresponds to the national-state, administrative-territorial division and is structurally composed of district, regional and republican branches.

There was no Constitutional Court in Uzbekistan during the Soviet era. Articles 108-109 of the Constitution of independent Uzbekistan, adopted in 1992, define the organization and scope of

powers of the Constitutional Court. On this basis, the laws "On the Constitutional Court of the Republic of Uzbekistan" were adopted on May 6, 1993[3, P.16-28] and then in a new edition on August 30, 1995 [4, P.88-97]. One of the courts of the Constitutional Court is the representative of the Republic of Karakalpakstan.

The Supreme Court of the Republic of Uzbekistan acted as the highest body of judicial power in the field of criminal and civil proceedings. The Law "On Courts of the Republic of Uzbekistan" adopted on September 2, 1993 defines the organization and powers of the Supreme Court of the Republic of Uzbekistan, as well as its middle and lower courts, the Supreme Court of the Republic of Karakalpakstan, regional, district and city courts [5, P.115-150].

Military courts were also established. By the Decree of the President of the Republic of Uzbekistan dated February 28, 1992 "On military tribunals and military prosecutor's offices", the former Turkestan military district military tribunal was abolished and replaced by the Military Court of the Armed Forces of the Republic of Uzbekistan [6, P. 89-92]. On July 3, 1992, a Military Board was established within the Supreme Court of the Republic of Uzbekistan. The highest court of military courts is the Supreme Court of the Republic of Uzbekistan, which includes the Military Commission. In accordance with the Decree of the President of the Republic of Uzbekistan dated September 23, 1999 "On the establishment of the Military Court of the Republic of Uzbekistan", the Military Court of the Republic of Uzbekistan was established on the basis of the Military Court of the Armed Forces. The Supreme Court of the Republic of Uzbekistan is composed of a Military Board, a military court, district and regional military courts.

The emergence of economic courts is directly related to the period of independence. In the Soviet era, economic disputes were considered not by the courts, but by a special body of executive power, the State Arbitration, which was part of a single system called the USSR State Arbitration. The formation of the system of economic courts in independent Uzbekistan as an integral part of the real judiciary began on November 20, 1991. On this date, the Law of the Republic of Uzbekistan "On Arbitration Court and the Procedure for Consideration of Economic Disputes" was adopted [7, P.65-66]. This law served as the primary legal basis for an independent judiciary capable of ensuring the protection of the rights and legitimate interests of economic entities, regardless of their form of ownership. Later, these courts were renamed economic courts, and their legal status was enshrined in the Constitution of the Republic of Uzbekistan, the Law "On Courts" and the Code of Economic Procedure.

 Commercial courts were established in the Republic of Karakalpakstan, regions and the city of Tashkent as the middle branch of the Supreme Economic Court of the Republic of Uzbekistan. Commercial courts were not established in the districts and cities of the provinces.

The second period in the history of the judiciary begins on January 1, 2001. This was based on the Decree of the President of the Republic of Uzbekistan dated August 14, 2000 "On improving the judicial system of the Republic of Uzbekistan" and the new version of the law "On Courts" adopted on December 14, 2000.

In accordance with the Decree of the President of the Republic of Uzbekistan dated August 14, 2000 "On improving the judicial system of the Republic of Uzbekistan", the following specialized courts were established on the basis of existing courts of general jurisdiction: Supreme Court of the Republic of Karakalpakstan, regional, Tashkent and interdistrict courts on;

The Supreme Criminal Court of the Republic of Karakalpakstan, regional, Tashkent city and district (city) criminal courts.

The decree was aimed at further specialization of the courts in order to ensure fair and timely consideration of court cases, to strengthen the guarantees of protection of the rights and freedoms of citizens. On January 1, 2001, the courts of civil and criminal cases began to operate separately in the Republic of Uzbekistan.

The specialization of the courts in the republic was carried out in order to eliminate the objective causes of errors previously made by the courts. Judges had the opportunity to study laws and judicial practice in greater depth, depending on their specialization. In addition, the Ministry of Justice has developed separate programs for the retraining of judges in criminal and civil cases. Thus, the decree on the specialization of judges was a major step in the implementation of judicial reform.

Judicial reform has highlighted the need to revise the Law on Courts. Second convocation The fourth session of the Oliy Majlis of the Republic of Uzbekistan on December 14, 2000 adopted a new edition of this law [8, P. 267-298]. One of the main innovations in this law was the introduction of specialization of courts of general jurisdiction - the establishment of independent courts for civil and criminal cases.

 Amendments to the Criminal Procedure Code and the Civil Procedure Code were a logical continuation of the introduction of judicial specialization. Thus, in the second stage of the formation of the judicial system, a slightly improved procedural order of consideration of cases in the courts was established.

The third period in the history of the formation of the judiciary began in 2017. An important role in this was played by the adoption of the Decree of the President of the Republic of Uzbekistan Sh. Mirziyoyev dated February 7, 2017 "On the action strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021". The second priority in the Action Strategy was to ensure the rule of law and further reform the judiciary[9, P. 12-14]. On this basis, on February 21, 2017, the Decree of the President of the Republic of Uzbekistan "On measures to radically improve the structure and efficiency of the judicial system of the Republic of Uzbekistan" was adopted and changes were made in the judicial system [10]. In particular, on June 1, 2017, the Supreme Court of the Republic of Uzbekistan and the Supreme Economic Court were merged. The Supreme Court of the Republic of Uzbekistan, the only supreme body of judicial power in the field of civil, criminal, administrative and economic proceedings, has been established.

The parallel functioning of the two former supreme bodies of the judiciary - the Supreme Court and the Supreme Economic Court - failed to ensure uniform application of the requirements of the legislation, leading to different decisions on similar issues. Significantly, this reform has led to the elimination of duplicative functions in the management of the judiciary and the formation of a unified judicial practice.

Of particular importance is the formation of a new judicial system with jurisdiction over cases of administrative offenses. For the first time, the Judicial Board on Administrative Cases of the Supreme Court of the Republic of Uzbekistan, administrative courts of the Republic of

Karakalpakstan, regions and the city of Tashkent, district (city) administrative courts were established.

Significant changes have also taken place in the system of military courts. The inclusion of military judges in the staff of the Ministry of Defense did not comply with the basic principles of the independence of the judiciary, the organization of its activities, due to the fact that this ministry is an executive body. Therefore, the state units of the Military Court of the Republic of Uzbekistan, district and territorial military courts were transferred from the Armed Forces of the Republic of Uzbekistan to the Supreme Court of the Republic of Uzbekistan. The Military Board of the Supreme Court of the Republic of Uzbekistan was abolished and the Judicial Board for Administrative Cases was established.

Based on modern requirements, as well as in order to further improve the system of protection of the rights of business entities, the economic courts of the Republic of Karakalpakstan, regions and the city of Tashkent were renamed into economic courts. At the same time, taking into account the economic potential of the country and the growing number of business entities, 71 inter-district, district (city) economic courts were established, which are authorized to consider cases in the first instance.

Prior to the decree, commercial courts operated only in regional centers, and some districts were far from the regional center, so entrepreneurs had to attend the regional center several times from the time they filed a lawsuit until the dispute was heard in court. This caused them to incur material costs and extra time. Therefore, inter-district, district (city) economic courts were established.

In general, the establishment of administrative and economic courts has increased the level of access to judicial protection for citizens, including entrepreneurs, living in areas far from the regional center.

Despite the comprehensive measures taken to reform the judiciary, the persistent problems in the judiciary have made it necessary to continue reforms in this area. The adoption of the Decree of the President of the Republic of Uzbekistan on July 24, 2020 "On additional measures to further improve the functioning of courts and increase the efficiency of justice" played an important role in improving and liberalizing the judicial system [11].

This decree identified the main priorities of state policy in improving the organizational and legal form of the judicial system in our country in accordance with modern requirements and international standards, ensuring the true independence of the judiciary. In particular, the structurally separate functioning of civil, economic and criminal courts in the regions today has caused certain problems in practice. The fragmentation of the courts was a source of confusion for citizens and businesses, and a lack of uniform case law. For example, in France, Italy, Canada, South Korea, Kazakhstan, Belarus, and other countries, courts of middle jurisdiction operate as a single court for civil, criminal, and economic cases. Therefore, today's requirement is to ensure that courts are open to citizens by optimizing the judiciary.

According to the above decree, from January 1, 2021, a number of organizational and structural changes in the judicial system were discussed. In particular, the establishment of courts of general jurisdiction of the Republic of Karakalpakstan, regions and the city of Tashkent on the basis of regional and equivalent civil cases, criminal courts and economic courts, maintaining the

strict specialization of judges and the establishment of separate judicial boards for different types of proceedings. .

In addition, from January 1, 2021, the principle of "one court - one instance" is being introduced into the judicial system through the abolition of red tape. That is, the decisions of inter-district, district (city) courts are reviewed by the courts of the regional level on appeal, and the decisions of the Supreme Court are reviewed by the Supreme Court, and the decisions of the Supreme Court are reviewed by the Chairman of the Supreme Court, the Prosecutor General and their deputies a retrial in cassation in accordance with the protest.

These rules are designed to facilitate individuals and prevent their harassment, which in itself means how popular the decree is, where the protection of the rights and legitimate interests of the individual is a priority.

Already, leading scholars, experienced lawyers and international experts say that the introduction of this principle in our country is only a positive development, which will further strengthen the independence of the judiciary, the existence of only one stage in one court will allow for impartial consideration of cases, emphasizes that there is an opportunity to quickly correct the mistakes made.

CONCLUSION

A study of the history of the judiciary during the years of independence suggests that the courts have gone through several historical stages in the formation process. In the first decade of independence, a theoretical and legal framework for the formation of the judiciary was developed. For the first time, in contrast to the constitutions of the Soviet period, the constitution and laws of the independence period recognized the judiciary as a separate and independent branch of government. In the second period of development of the judicial system, specialization was carried out. The establishment of criminal, civil, economic, and later administrative courts, first, helped judges to become more professional in their field, leading to a reduction in erroneous judgments and decisions by the courts. In the third period in the history of the judiciary, there was a process of streamlining the courts. Initially, the narrowing of the upper echelons in 2017 and the middle and lower echelons in 2020 was aimed at reducing the confusion and inconvenience of citizens and ensuring justice. In short, the implementation of systemic reforms in the judiciary contributes to the protection of human rights and public confidence in justice in our country.

ABSTRACT

This article discusses the expansion of the concept of speed, distance, and time in elementary classes. We know that in elementary classes we see tables in which simple problems are reduced to the formula S=VT. In this article, we have explained how the elementary classes explain questions about accelerated movement, slow motion, what methods exist, what methods exist.

KEYWORDS: *Distance, Speed, Time, Drawing, Modelling, Material Point, Acceleration, Deceleration.*

INTRODUCTION

In the viable teaching of mathematics, the focus on education, the complete informatization of education, the modification of the substance of traditional teaching, as well as the integration of scholarly disciplines, inventive academic technologies in teaching requires the organization on the premise of effective utilize. A number of measures have been taken to progress in the quality of mathematics instruction and the development of inquiring about [1].

This, in turn, requires the creation of a centralized learning environment within the educational institution, the creation and successful use of databases, the change of educational and administrative documents on the premise of the integration of disciplines.

In today's quickly evolving life, the awareness of our children is exceptionally tall and quickly advancing. With this in intellect, it would be appropriate to advance issues of smooth increasing speed and smooth deceleration in essential school. The capacity of today's essential school students to master these aptitudes may be a test case in hone. First of all, students are given a straightforward view of the issues of smooth acceleration and smooth deceleration.

THE MAIN FINDINGS AND RESULTS

Velocity (in mechanics) is one of the most kinematic markers of point motion; the vector may be an amount characterized by the parameters *S, V, t*, where we consider *S*-distance, V-material point velocity, t-time as a concept. We know that material science is instructed within the 6th review. The move of his concept of development in essential school; we are talking almost presenting him, to begin with, concepts of "distance and time" to essential school understudies. We know that the way equation is found by the equation *S = VT*. We are talking about solving movement issues without using this formula.

Method

1) The helicopter flew the same distance each hour and secured 460 km in 2 hours. How quick did he fly? 2) The cyclist strolled at the same speed and secured 39 km in 3 hours. How fast did the cyclist move? 3) Survey the chart with the speed and travel time of the helicopter, the cyclist, and the distance travelled by each of them:

Velocity	Time	Distance
230 km / h	2 hour	460 km
13 km / h	3 hour	39 km

Here the issue is worked out on the table. [2.64] In this case, the issue is understandable.

Let us be given the taking after question.

Problem: In case a Nexia car voyages 60 km per hour, how numerous times will the car travel in one hour, two hours, and so on?

Solution: We bring the arrangement by drawing.

1-soat   2-soat   3-soat   ….

/-----------------/-----------------/-----------------/

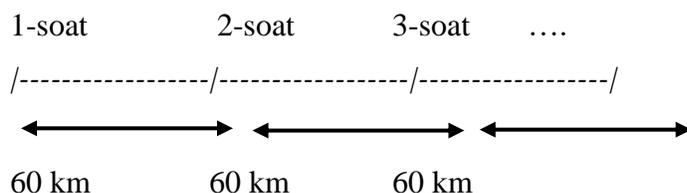
60 km   60 km   60 km


Figure 1

The drawing shows that the car travel the same distance each hour. In physics, typically called the constant movement of a fabric point. Within the drawing, the child works with great creative energy. Different questions can be asked through this issue. 11 Now let's complicate the matter. That's, we see the problems of smooth speeding up and smooth deceleration. 12 Address: On the off chance that a Nexia car travels 10 km more in 60 hours in 1 hour than within the past hour, how much distance will it travel in 1 hour, 2 hours, and 3 hours… hours? How distant does it take in 1 hour, 2 hours in 3 hours, and so on? What is the distance between 1 hour and 3 hours?, and so on, in case we are inquired to reply to comparative questions, we'll search for a solution as takes after.

Solution:

1-hour   2-hour   3-hour   ….

|-----------------|-----------------|-----------------|-----   ----

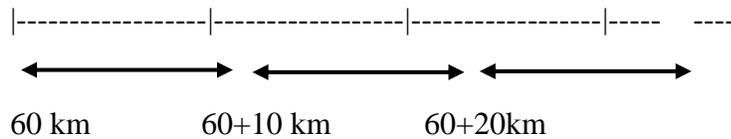
60 km   60+10 km   60+20km


Figure 2

It is clear that the distance is rising by 10 km per hour.

Problem 1: The train went from city A to city B at a speed of 60 km / h.

It reached the destination after traveling for 4 hours, raising his speed to 5 km / h. What is the distance between cities A and B?

We will explain this problem through modeling

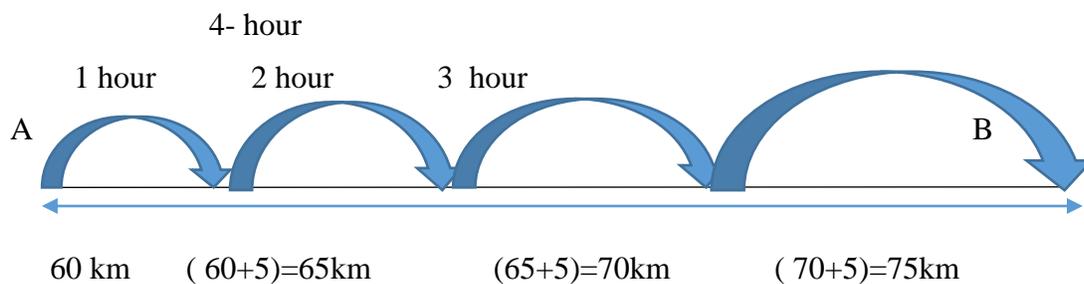
60 km   (60+5)=65km   (65+5)=70km   (70+5)=75km


Figure 3

The problems postured within the modeling strategy draw in children's consideration, increase their intrigue, and "force" them to fathom the issue.

The reason for the subject is to grant the student a thought of physics before examining material science, that's, in basic school.

We increment the level of trouble of the issue.

2-masala; Moving from city A to city B on a cruiser with 20km / h. From city B, the Matiz began moving simultaneously towards city A at a speed of 60km / h. The motorcyclist expanded his speed to 2km / h and the Matiz to 10km / h. Three hours after the start of the development, the remove between them remained at 75 km. Discover the separation between cities A and B.

20km   / 22km   /24km   80km   /   70km   /   60km

20+22+24=66km   60+70+80=210km

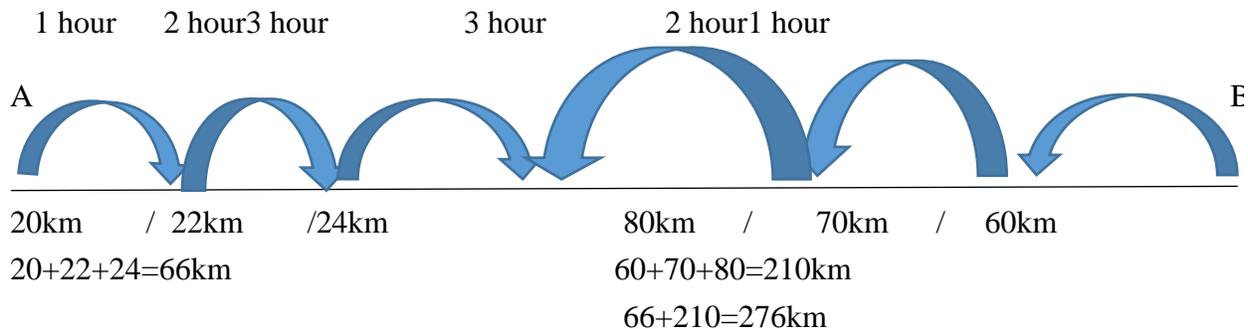
                                              66+210=276km


Figure 4

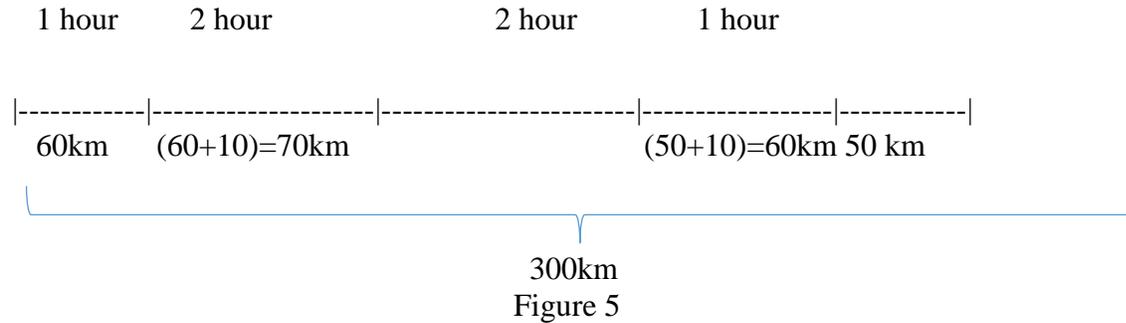
Issue: A Spark car from city A started moving towards each other at a speed of 60km / h, and a Damas car from city B begun moving towards each other at a speed of 50km / h. The remove between the two cities is 300km. On the off chance that they increment their speed by 10 km / h each hour, what is the remove between them in 2 hours?

We display this issue in a modeled form;

1 hour   2 hour   2 hour   1 hour

|------------|---------------------|-----------------------|------------------|------------|
   60km   (60+10)=70km   (50+10)=60km 50 km

300km

Figure 5


Solution;   Spark --   60+(60+10)=130;

Damas--   50+(50+10)=110;

Spark+Damas --   130+110=240;

Total distance (Spark+Damas)-- 300-240=60km

Answer; 60km is left.

On the off chance that we donate indeed slow-motion issues in this way, not as it were will it be clear and curiously for students, but they will moreover create logical considering and free-thinking skills.

Problem: The distance between the two cities is 500km. Two cars drove towards each other from the two cities. The speed of the first car is 80km / h and the speed of the second car is 70km / h. In the event that they moderated down to 5km per hour, what would be the distance between them after 3 hours?

1 hour 2 hour   3 hour3 hour   2 hour1 hour

|----------|--------|-------|--------------------------|--------|--------|----------|
     80km   (80-10)=70km   70km   (70-10)=60km

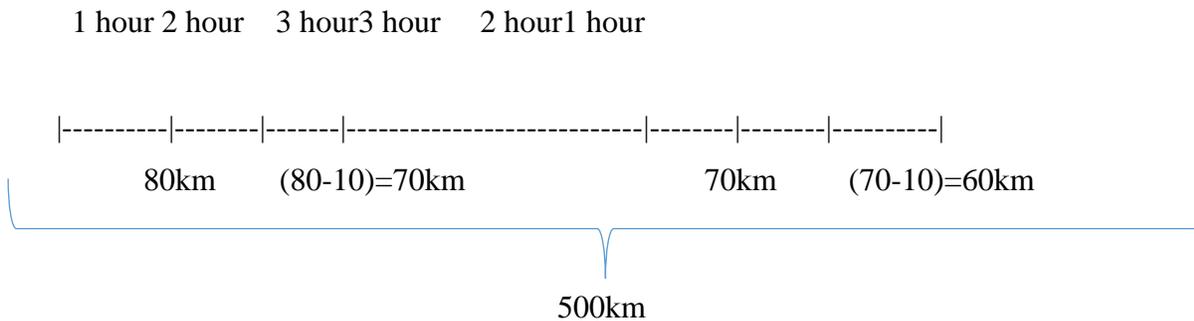
500km


Figure 6

It is also exceptionally simple to alter the question of these issues. This saves the teacher time. For example, if you alter the position of a character in the issue module over, the content of the problem will also change.

80km   80-5km 80-10km   ? 70-10km   70-5km   70km

A |----------|---------|-----------|--------------------|-------------|------------|--------|B

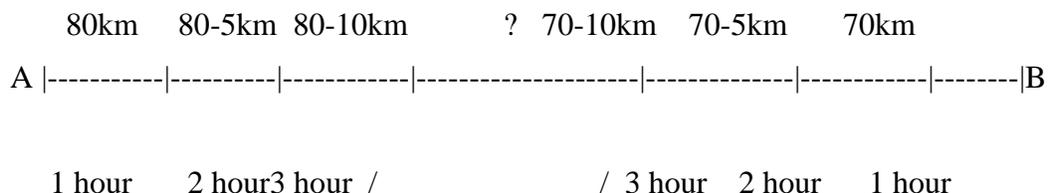
1 hour   2 hour3 hour /   / 3 hour   2 hour   1 hour


Figure 7

The graph shows that the condition of the issue has changed. This chart shows the distance between the two cities. 12 It is clear from the chart that the motion is the opposite.

?   80+5km   80km   **A** 70km   70+5km   ?|

|------------------|--------------|----------|----------|------------|-------------------|

3 hour   2 hour   1 hour 1 hour   ?hur   3 hour

?

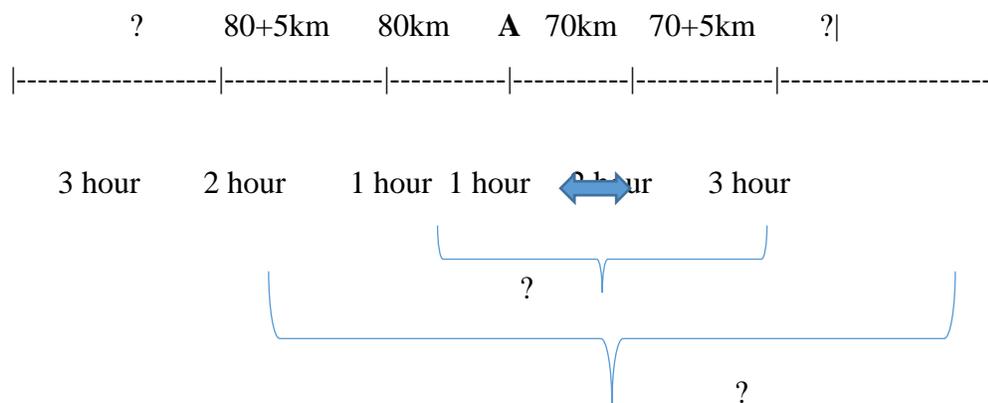
?


Figure 8

You can make an issue for this module as follows;

From City A, two cars drove in inverse directions at the same time. The speed of the primary car is 80km / h and the speed of the moment car is 70km / h. If the speed of the years increases by 5 km per hour, what is the remove between them in an hour? Two hours later…

The reason for this article is to help students to create physical creative ability in basic school.

CONCLUSION

Physical objects are all objects that happen in nature. For case: sun, stars, planets, rocks, water in a holder, discuss in a room, etc. A framework of objects could be a collection of objects in which certain physical phenomena show up as in case they were in a single body. For example, the development of a car; in this case, all parts of the car travel a certain remove over time [3.5]. In this way, modern material science instructs the various physical forms of movement of matter, their interrelationships, as well as the properties of matter and space.

Material science is derived from the Greek word phusis, which suggests common science. The antiquated Greek logician Aristotle (384-322 BC) was the primary to depict the science of physics in his eight-volume book. Physical marvels are those that happen when the particles that makeup matter don't alter. For example, amid the drop of a shake, the turn of a wheel, the

bubbling and solidifying of water, the discharge of warm from the burning of coal, the emanation of light.

As a result of the disclosure of new phenomena in innovation and nature and their practical application, material science is isolated from the physical sciences, such as physical chemistry, astronomy, geophysics, biophysics, and so on.

One of the incredible accomplishments of the physics of our century is the science of cosmic-physics, which emerged as a result of the ponder of space.

Improvement of logical and methodological suggestions for the down to earth application of the concept of material science within the essential instruction framework before the study of physics, in the essential school.

Instruction, which is the main task of educating mathematics to grades I-IV, depends on the level of their readiness for the mathematics course in solving educational problems [4.8].

ABSTRACT

The Sary-Chekku copper deposit is considered to have a complex tectonic structure. The deposit is composed mainly of sedimentary and effusive rocks. As the quarry deepens, there is a systematic decrease in the level of groundwater. The article provides information and conclusions on the distribution of areas depending on the hydrogeological conditions of the field, the lithological composition of interfering rocks, circulation and accumulation, types of groundwater in terms of distribution depth and form of occurrence, direction of movement of groundwater trash, total and seasonal discharge.

KEYWORDS: *Fault, Hydrogeological Conditions, Water Inflow, Groundwater Levels, Hydrogeological Conditions, Aquifer, Groundwater, Fracturing, Groundwater, Fractured Groundwater, Fractured Vein Water, Water Cut.*

INTRODUCTION

The Sary-Cheku field is located 25 km away. To the east of the city of Almalyk within the Saukbulak ore field. The area of the deposit from the east and west is limited by the Urgaz and Saukbulak rivers, which are the left tributaries of the Akhangaran River, which are located on the northwestern slope of the Kuraminsky ridge, flow from the south-east to the north-west, obeying the general direction of lowering the surface of the relief of the northern slope of the ridge. [1]

The deposit is located in a tectonic wedge between the Miscan, Central and Sargalam faults and their supporting cracks in the zone of influence of the deep tectonic structure of the Almalyk

fault and is confined to the eastern wing of a gently sloping brachyanticlinal storage, composed mainly of Lower Devonian effusive rocks: andesite porphyry; quartz porphyry; andesite-dacite porphyry and carbonate deposits of the Upper Devonian, into the core of which a stock of "pink" granodiorite-porphyry was introduced. Body morphology of "pink" granodiorite - porphyry is defined as a stock with a jagged upper boundary and unlimited depth prospects.[1;2]

Main part

The ore body of the deposit is an elliptical in plan and lenticular in size stockwork with slight subsidence in the northeast,

As a result of many years (50 years) opencast mining of the deposit, a mind-out space (quarry) was formed with an average depth of more than 400 meters, a length of 2000 m, and a width of 1800 m.

During the development of the field, a systematic decrease in the natural level of groundwater occurs in the form of a depression funnel. Such a change in the natural regime of groundwater will continue throughout the entire period of field development. [3].

RESULTS AND DISCUSSIONS

Analysis of the hydrogeological and hydrological studies of the past years and our own observations of water inflows into the quarry during the period of development of the field allowed us to assess the hydrogeological situation of the field area.

The hydrogeological conditions of the deposit are closely related to the geological and tectonic structure, fracturing of rocks, the nature of the relief, climatic and orographic conditions [4]. In this regard, in the area of the Sary-Cheku deposit, the following are distinguished:

1) Aquifer of modern alluvial deposits;

2) Underground waters of the zone of open fracturing of carbonate rocks of the Upper Devonian - Lower Carboniferous;

3) Underground waters of the zone of open fracturing of the Lower Devonian rocks and mainly metamorphic rocks of the Ordovician - Silurian;

4) Underground waters of the zone of open fracturing, mainly acidic, to a lesser extent, medium intrusive rocks of the Middle - Upper Paleozoic;

5) fissure-vein waters of tectonic disturbance zones.

According to the litho logical composition of water-bearing rocks, according to the conditions of accumulation and circulation, according to the depth of distribution and forms of occurrence in the field, the following types of groundwater are distinguished:

1) fractured ground and fractured vein waters;

2) groundwater of modern sediments.

Fissure-ground waters are spread over the entire area of the field, forming in the described area, it is composed mainly of effusive and intrusive rocks, broken by local and regional cracks. The relief of the watersheds has a gentle shape, which favors the infiltration (penetration) of

atmospheric precipitation into the strata of rocks, which are the only source of nutrition for the fractured groundwater of the field.

The water abundance of rocks composing the area of the characterized deposit largely depends on the state of their fracturing.

In terms of their physicochemical properties, igneous rocks are hardly water-soluble. Therefore, atmospheric precipitation penetrating into them circulates mainly within the upper zone of extended fracturing. Regional fracturing according to geological survey data in the area of the field is developed to a shallow depth, about 100 m [5].

Moreover, with depth, fracturing decreases and, consequently, the water permeability of igneous rocks decreases [6].

Therefore, the relatively small amount of atmospheric precipitation in the area and the shallow development of fracturing in igneous rocks exclude the possibility of accumulation in them of significant reserves of fractured groundwater.

The flow rates of springs are measured in hundredths and tenths of l / s and increase only in spring, during the period of heavy rains and snowmelt. The water temperature of the springs is low and amounts to 9-14 ° C, which indicates an insignificant depth of circulation of fractured groundwater.

The regime of fractured groundwater is formed under the influence of atmospheric precipitation and evaporation. Groundwater supply occurs in the high-mountainous part of the region, the level fluctuation follows directly the change in the amount of atmospheric precipitation.

The movement of fractured groundwater in the area of the field follows three directions:

1) According to the general slope of the relief, from southeast to northwest;

2) Away from the watershed;

3) To local cracks-faults.

As the flow of fractured groundwater moves down the watershed from the recharge area to the runoff area, the level gradually sinks and the level fluctuation lags behind changes in meteorological factors. The rise in the level of fractured groundwater begins from late February to early March.

The maximum position of the level of fractured groundwater was noted in late May and early June. The decline in the level begins from mid-June and continues until October-November. The minimum position of the level is observed in November.

Mineralization of these waters varies from 220 to 800-900 ml / l. Moreover, mineralization increases as the flow of fractured groundwater moves from the recharge area to the Unloading area. Fissure-vein waters in the area of the deposit are confined to the aforementioned faults and their feathering fissures.

The Miskansky fault in the area of the field is very weakly watered. Consumption of fissure-vein water throughout the year is subject to slight fluctuations. If its maximum value in April-June months is 12,5 l / s, then for the period of minimum flow rates (winter period) this value will decrease only to 9,3 l / s. In places of deep erosion, when the channel of river valleys is crossed

by fault zones, they come to the surface in the form of springs with a discharge from 0,5-1 to 10-17 l / s. The discharge of these springs is relatively constant. The source of water for fissure-vein waters is mainly fissure-ground water and partly atmospheric precipitation. Waters of this type have little areal development, since they accumulate only in the zones of local fracturing development.

Mineralization of fissure-vein waters is somewhat higher than fissure-ground waters. In terms of chemical composition, the fissure-vein waters of the deposit belong mainly to the sulphate class of calcium, less often of the sodium group of the second type.

Water hardness varies from 5.7 to 13,2 mg-eq / l. The dense residual of fractured groundwater throughout the year varies on average from 300 to 1040 mg / l. However, springs with a dense residue of 2000 and more mg / l are not rare.

According to the classification of O.A. Alekina waters belong to two classes:

1) Sulfate;

2) The bicarbonate calcium group, the second type.

Groundwater circulates through the pores of Quaternary sediments, and has little development within the field. It is confined mainly to the alluvial pebble deposits Saukbulak and Urgaz.

The maximum flow rate of groundwater along Saukbulaksay is 42 l / s, the minimum is 10 l / s, along Urgazsay is 4,0 and 7,0 l / s, respectively.

The filtration coefficient of pebbles for Urgazsai is 9 times less than for Saukbulaksai, this is due to the fact that the filler of the Urgazsai alluvial deposits contains a very large amount of clay material. By chemical composition, the water is hydrocarbon ate, calcium, with a dense residue of 0,16-0,28 g / l. The total hardness of water is 1,3-4 mg-eq / l. The amplitude of fluctuations in the groundwater level at the field reaches 5-6 m. The maximum level falls on April-May. From mid-May, it begins to receive due to the infiltration of surface waters, the flow of which depends entirely on a sharp decline in the level, which lasts until October. Groundwater is fed from precipitation.

The general waterways into the quarry can be characterized by the drainage data. Analysis of water drainage data from 2017 and especially over the past three years (2017, 2018 and 2019) shows that there is a certain pattern. The intra-annual regime of drainage, and, consequently, of water flows, is characterized by an increase in water discharge during the spring flood and in the autumn - winter period. The lowest flow rates are observed in the summer, when waterways are formed only due to the fissure waters of the Paleozoic. In the long-term section, waterways are determined by the water content of the year.

The nature of the water cut of the overburden by the quarry of Paleozoic rocks is different, but the degree of humidification of the sides is dispersed outflows of groundwater along thin (1-2-3 mm) cracks at the base of the ledges, and weak jet outflow along more powerful (up to 5-7 cm) cracks. Sometimes on the horizons there is an accumulation of groundwater due to latent pinch-out. The discharge of groundwater from the alluvial sediments of the Saukbulak rivers along the northwestern side is more pronounced, which is characterized by an increased degree of water cut, i.e. this part of the quarry is the guide of river waters to the quarry.

In the future, with the expansion of mining operations at the deposit, an increase in water flows from the Saukbulaksaya river and from the Urgazsay alluvial deposits is expected. as well as from Paleozoic sediments. Possible maximum total groundwater inflow into the open pit is 300 cubic meters per hour.

CONCLUSION

1. With the further expansion of mining operations at the Sary-Cheku deposit, there will not be a sharp change in the lithological and petrographic composition of Paleozoic rocks both in plan and in depth. In the future, basically the same intrusive formations will be exposed, only as mining deepens, filtration properties will decrease. This leads to the conservation of heads, which will lead to a decrease in the stability of benches, sides and to the moistening of the mineral, a decrease in its quality characteristics.

2. In the area of the deposit, the main contours of the unloading of the aquifer is a drainage contour. Along with the emergence of new technogenic drainage contours, the conditions for feeding the aquifer are changing noticeably. At the same time, enhanced drainage of groundwater occurs due to the processes of overflow and concentrated inflow of groundwater into the quarry in the form of local sources in areas of tectonic faults.

3. Despite the complexity of the geological structure of the deposit, intense tectonic disturbance of rocks. The proximity of surface watercourses, watercourses, until now, have not been a limiting factor or an obstacle in the development of the field. Currently, in the northern part of the quarry (at the lowest level with an elevation of 1075 m), there is a sump with a capacity of up to 500 cubic meters and a depth of 7 meters. Above the water level, pumps with a capacity of 180-300 m are installed, and round-the-clock drainage is successfully carried out. The pumped-out water is purified in treatment facilities and enters the Saukbulaksay bed.

AN INTERPRETATION OF THE NEW THEMES THAT THE NEW ERA HAS BROUGHT TO THE TELEVISION INDUSTRY

Ilmira Nazrullaevna Rahmatullaeva*

*Senior Lecturer,
Candidate of Arts, Faculty of PR (Public Relations) and International Communications,
Journalism and Mass Communications,
University of UZBEKISTAN

ABSTRACT

The article provides a scientific analysis of the activities of the media, especially state television, based on the Strategy of Actions to eliminate the current situation in the socio-political, cultural and educational spheres at the new stage of development of Uzbekistan.

KEYWORDS: *Television, Globalization, Democratic Reforms, Free And Impartial Media, Freedom Of Speech, Human Rights, Pandemic.*

INTRODUCTION

A new stage in the development of our country has put on the agenda that it is impossible to cope with the world community without solving the problems that have arisen in recent years in our socio-political, cultural and educational spheres and hinder our progress.

As the President of the Republic of Uzbekistan Shavkat Mirziyoyev said in his speech at a meeting with the creative intelligentsia of Uzbekistan on August 3, 2018, in today's era of globalization, a deep financial and economic crisis, growing competition, in order to develop our country at a stable and fast pace, to further increase the efficiency of of reforms, a Strategy of Action was developed for five priority areas of development of the Republic of Uzbekistan for 2017-2021. In accordance with this Strategy, it is determined that raising the development of culture and art, literature and the media, as well as all spheres and industries to a new level, is one of the most urgent tasks facing society [1].

Main part

"We believe that citizens' self-governing bodies - makhallas, as well as non-governmental organizations, free and impartial media - will continue to play an active role in realizing the

concept of further deepening democratic reforms and developing civil society in our country," the President said[5].These words, in turn, set new tasks for journalists - noble and responsible professionals who put the interests of the Motherland and the people in the first place.Journalists began to speak openly about problems in society, and topics reflecting problems that hinder our progress began to appear on the pages of the media.

Freedom of speech is the main guarantee of the realization of human rights of our citizens, our people, and an inalienable human right. Knows human rights in words, expresses them in words, defends them in words. Until a person's freedom of speech is stifled, his other rights and freedoms will not be realized. The attitude towards the press and its representatives is the attitude towards people, their human right to speak, which is the main indicator of whether the state is democratic or not.

RESULTS AND DISCUSSION

 "The realization of the noble aspirations of our people, the courage to overcome various obstacles, bureaucracy, indifference, greed, corruption and to form an uncompromising public opinion against them is the essence of his profession and his life. I consider journalists who know me as real journalists, "he said, adding a new spirit, courage, perseverance and new criteria to the activities of the media in our country. Based on these tasks, elements of freedom of speech and transparency began to appear in the programs of a number of TV channels of the National Television and Radio Company of Uzbekistan.

In order to provide round-the-clock regular, reliable, accurate information, informing the population about the processes in the country, the President established the Uzbekistan 24 TV channel.The International Press Club was launched, the purpose of which is to promptly and objectively inform the international community about the development of the national information space, updates and changes in the economic, social and political life of the country.In the new media space, government officials will report to the public and exchange views with experts and journalists.

Live broadcasting was resumed in the NTRK system of Uzbekistan. Socio-political talk shows have reached a new level and acquired interactivity. This process, typical for TV channels all over the world, has already been forgotten on our national TV channels.There are a number of advantages of live broadcasting, the impossibility of editing the received and sent information, as well as the fact that live broadcasting is extremely convenient and useful for electronic voting or discussion of topical and controversial issues.This fact was confirmed by live broadcasts of such programs as "Relations" (host - K. Azam), "International Press Club" (host - Sh. Kudratkhodzhaev). The Uzbek public also had the opportunity to transform from a living observer into a live participant in lively discussion topics.

The blessed names of forbidden poets, writers and scientists have returned to the television screens.They began to prepare shows with their participation. In accordance with the Decree of the President of the Republic of Uzbekistan dated December 29, 2016 No PD-4907 "On measures to further improve and encourage the activities of academicians of the Academy of Sciences of the Republic of Uzbekistan", the role of academic science in further enhancing the scientific prestige, scientific and technological potential A number of scientists have been elected academicians of the Academy of Sciences of Uzbekistan in order to strengthen the membership of the Academy of Sciences, expand the membership of well-known scientists recognized by the

national and international scientific community, to continue the traditions of existing scientific schools and create new schools. In this regard, television programs began to prepare programs dedicated to the activities of leading figures of Uzbek science, academics ("Enlightenment devotees") ("Uzbekistan"), "Ziyo dargalari" ("Culture and Enlightenment").

The realities of the Second World War, the courage of our people, who showed heroism behind the front, have become a reality. The programs were replaced by shows with the participation of veterans of the Great Patriotic War.

In connection with the month of Ramadan, the Madaniyat va Marifat TV channel, in cooperation with the Spiritual Council, launched the programs "Enlightenment of the Holy Quran", "You Asked", "We Study the Quran", "Golden Series" and "Reading the Scriptures".

Also, new processes began in the coverage of issues of spirituality on television. We see these changes in the projects of the TV channel "Culture and Education", "Letter" and "Truths that I understand" towards the channel.The art-publicist program "Letter", dedicated to the analysis of letters of Uzbek, Russian and world celebrities in the field of literature, art and science, has interpreted the unforgettable images of our people through their correspondence -the spirit of freedom, the spirit of freedom, the images of great people who lived by such deeds, who dedicated their lives to the happiness of mankind, their letters dedicated to the struggle for freedom, the happiness of mankind were taken as a basis for the show[3].The letter of the great writer Leo Tolstoy to the Russian ruler Nicholas II in 1902, which has never been discussed even on Russian TV channels, has been analyzed[4].In this letter, Leo Tolstoy warned the ruler about global problems in Russia. In this letter, the genius wrote that, firstly, the tsarist government was spiritually and politically backward and outdated form of government, and secondly, that the Russian people were dissatisfied with the support of the tsarist government for Orthodoxy in the form of a religion not characteristic of humanity as a whole. warned of the bloody October Revolution.

The fact that images of people who, despite pressure from the authorities, struggled with their obsessions began to appear in television programs, also allowed them to approach long-awaited and interesting topics of the audience.Images of people like Mahatma Gandhi, Andrei Sakharov, Vladimir Vysotsky, who rebelled against the society in which he lived, and who did not obey the established rules, began to pass through the eyes of television.Andrei Sakharov, a prominent Russian scientist and Nobel laureate, wrote a letter demanding the withdrawal of Soviet troops from Afghanistan, citing the fact that the former Soviet Union was spending too much money on weapons. It should be noted.

In turn, such steps can be observed on the show "Truths I understand." In the show with the participation of famous people of our country, writers, poets, scientists, artists, the author reflects on social life and its problems.Each protagonist thinks about the area in which he works, about his past, compares it with the period of independence, the previous period, in many cases independently searches for existing problems, notes the mistakes of some leaders. However, over the years, television has become accustomed to covering life only in a positive way, no problems could be mentioned.

CONCLUSION

The conditions of today's pandemic have also made some adjustments to the television environment. According to the professor of journalism at Moscow State University I. Zasursky, "because of the pandemic, the media initially returned millions to television: in recent months, despite the fact that more and more young people have switched to the Internet, the older generation and children remain a large audience"[2].While everyone has smartphones and computers, customers for bulky TVs are growing. More TV series and entertainment shows appeared, news coverage increased, quality Internet publications, media channels, online lessons were watched more and more all over the world. The pandemic also affected the filming process: the production of serials and documentaries has ceased.A series of programs dedicated to excursions to museums have appeared on Russian TV channels. Theatrical performances began to be increasingly addressed. This process was also observed on Uzbek TV channels, which began to show films that had been archived for many years, including many films that had not been shown for a long time.Entertainment content has influenced the quality of the leisure entertainment industry and has been instrumental in ensuring natural competition in the television market.

However, television faces big challenges: "What will happen tomorrow, whether it can handle high-speed internet or whether it can be outdoors with other private TV channels that are cable, satellite and entertainment. Will state-owned TV channels keep their positions in the competition? Time will show how these issues will be resolved.

COOPERATION BETWEEN UZBEKISTAN AND THE COUNTRIES OF THE WORLD IN THE FIELD OF HUMANISM AND GENEROSITY

Abdulazizbek Utkirov*

*2nd Year Student of the Faculty of History,
Tashkent State Pedagogical University named after Nizami,
UZBEKISTAN

ABSTRACT

In this article, the cooperation of the Republic of Uzbekistan and the countries of the world in the field of humanism and sahovatpeshalik was demonstrated. the importance of charity and sponsorship issues in the social protection of the population, the state of development of charity and patronage is highlighted as part of the historiography.

KEYWORDS: *Charity And Sponsorship, UNICEF, Red Crescent Society, Year Of Charity And Doctors, Light Of Hope.*

INTRODUCTION

In the current period of development and changes in the whole world, respect and respect for humanitarian qualities such as charity and sponsorship activities, traditions, traditions, which are considered universal values of humanity, are of particular importance to us. It cannot be overestimated to say that one of the important tasks of historiography is the attitude to the values of charity and sponsorship, the study of its history, the importance of charity and sponsorship in the social protection of the population, the coverage of the state of development of charity and sponsorship. Undoubtedly, "…the effectiveness of economic reforms that we are implementing and social changes is measured, first and foremost, by the extent to which it contributes to the wellbeing and welfare of the population and the quality and standard of living. "[1, 148]." General human values in the social protection system, that is, charity and sponsorship, have been developing for thousands of years in Uzbekistan, and in countries around the world with their essence, significance, role and place. A legal and normative framework for charity and sponsorship is also being created around the world. Currently, international charity organizations can be divided into two groups those that collect and distribute donor funds, as well as those that directly implement charity activities. As an example of the organization belonging to the first

group, CAF (Charity Aid Foundation, charitable assistance fund) can be cited in this regard. The organization has been operating independently since 1974 year. The main goal of the CAF is to increase the number of non-profit organizations and develop charity activities in the world. The primary mission of CAF is to attract capitals to charity foundations, support and develop them, as well as help to manage charity projects. In recent years, the CAF includes more than 250 thousand sponsors and more than four thousand charity organizations. Since 1992, branches of the Foundation have been opened in Russia, Belgium, USA, South Africa, India, Australia, Bulgaria, and Ghana [3].

The second group, which directly implement charity, includes such organizations Médecins sans frontières, the United Nations Children's Fund (UNICEF), the International Red Cross and the Red Crescent Society. Médecins sans frontières, MSF is an international, independent, non-profit organization providing emergency medical care to people affected by military conflict, shortage, epidemics, force migration and natural disasters in more than 70 countries. The organization was established in Paris in 1971 to help the victims of the armed conflict in Nigeria in 1967-1970. The Society of "Médecins sans frontières" provides help to victims of natural and man-made disasters, as well as victims of armed conflicts and considers the principle of humanism as a priority. Another organization that carries out charity activities is the United Nations Children's Fund (UNICEF). The Fund was established on December 11, 1946, by the decision of the UN General Assembly. In 1953, the organization expanded its operations and extended its authority indefinitely. At present, UNICEF implements its programs in 157 countries. The organization is currently working in such areas supporting families for the upbringing of children, reducing the number of orphans, supporting graduates of public schools and disabled children who do not live in their families, promoting a healthy lifestyle among them, fighting against discrimination in society, as well as protecting the rights of children regardless of their abilities, health or nationality.

As well as, along with the organizations above, the activities of the International Red Cross or Red Crescent Society have now been launched in many countries around the world. The organization came to existence in Switzerland, and the symbol of the Red Cross was derived from the mutual exchange of colors on the flag of Switzerland. In fact, the flag of Switzerland is red, and the cross on it is white. The international movement consists of three components: the International Committee of the Red Cross (ICRC), the National Red Cross and Red Crescent Societies (National Societies), the International Federation of Red Cross and Red Crescent Societies [5, 9]. The Red Crescent Society of Uzbekistan was established in 1925 and became one of the oldest humanitarian organizations having the status of an independent, humanitarian and public association in 1992, and in accordance with the decree of the first president of the Republic of Uzbekistan "on the Red Crescent Society of Uzbekistan" established a new stage of development of charitable and humanitarian activities[16].

The International Committee of the Red Cross (ICRC) was founded in 1863. The activities of the ICRC are not controlled by any state, regional or international organization belonging to the state. The committee has offices in more than 50 countries, each of which is engaged in charity, such as providing medical and financial support and protection the people who suffer from armed conflicts. It is worth to note that the consular office of the ICRC in Uzbekistan has been operating since 1993. In general, these national societies care for low-income, sick, needy families throughout their activities. They are also engaged in such charity activities, providing

emergency aid to families faced to misfortune as a result of a natural disaster, improving the living conditions of the aged people [6, 15-16].

The analysis of a number of legal-normative documents on charity and sponsorship in Uzbekistan [7], called 2006 as the " Year of Charities and doctors" [8], for the development of charity and sponsorship reforms in Uzbekistan, is also one of the important factors determining the existence of a care in the sphere. For instance, the Law of the Republic of Uzbekistan "On Sponsorship" was adopted on May 2, 2007, and its purpose regulating relations in the field of sponsorship. According to the laws of the Republic of Uzbekistan, the functions included in the state program such as charity and sponsorship improve the financial situation of socially unprotected and under-provided groups of the population, social rehabilitation of the unemployed, disabled and other persons, assistance to strengthening the prestige and role of the families in society, activities in the field of Education, Science, Culture, Art, enlightenment, support the population to victims as a result of natural disasters, ecological, terroristic acts, protection of the environment. In cooperation with the countries of the world, Uzbekistan carries out a number of charity and sponsorship activities in order to build "children's home" communities in accordance with international requirements, to organize meaningful leisure activities of educators. In particular, children's neighborhoods under the auspices of SOS-Kinderdorf (Austria) began its activity in Tashkent from April 1998. Five hectares of land were allocated for the construction of the "children's neighborhoods of Uzbekistan", and 12 million were invested in the dollar account[9] From July 23 to September 26, 2004, in the building of the Republican Association "Uzbekistan state circus" was demonstrated charity circus performances "Indian elephants "and" African show circus "of Russia dedicated to the "year of kindness and generosity". 250 children from the Mirobod District Children's Home, 450 from the Shayhontohur district children's home "Sog'lomAvlodUchun" , 1,200 from the Republican Rehabilitation Center, 450 from the Chilanzar District children's home, 500 from the Republican Charity Foundation "Sen yolg'izemassan", and from the "SilaDushi Eco Club" 55 children participated In these charity events [10]. Since the first years of independence, the International "Navruz" charity foundation has also been providing financial aid to low-income families, multi-child mothers, widows and elderly people, war and labor invalids and carrying out charity activities. In 1997, the Foundation issued twenty thousand items from the Navruz-97 lottery and announced sixteen 3-4-room apartments, 36 cars from "Uzavtosanoat" as a charity share [11].

Such charity and sponsorship are studied not only in Uzbekistan, but also abroad, as well as the organizational activities organized by the people of Uzbekistan. For example,' light of hope " is a charitable organization, which opened in New York, Uzbekistan. Founded in Brooklyn, the charity Light of Hope (light of Hope) has sent several grandfathers to Uzbekistan since 2001. MuniraMahmudova Foundation slogan for the organization. His charitable initiative is also supported by compatriots of sakhovatpesha, diplomats of Uzbekistan and the company 'Uzbekistan Airways". "Basically, we send carriages to invalids. We sent mechanical beds to hospitals, pamperses to the nursing home 'Sahovat', rolator, walker, special canvases for the elderly, which will help to walk, - says the founder of the organization M. Makhmudova [17].

It should also be noted that non-profit organizations in Uzbekistan have established international cooperation with the UN Development Program, Japan's International Cooperation Agency (JIKA), South Korea's international charity agency (KOIKA) in the sphere of social protection [12, 37]. During the 2017 year, more than $ 1 trillion 864 billion 358 million sums were

transferred to the accounts of non-profit organizations [13]. These sums are being spent on socially significant issues in places throughout the year. A large part of this charity and sponsored activities corresponds to the contribution of the charity fund of Uzbekistan "Mahalla", the Federation of Trade Unions of Uzbekistan, the Liberal-Democratic Party of Uzbekistan, the branch of the international charity organization "Medecins sans frontiers", the public fund for restoration and modernization of the activities of sanatoriums of the Republic of Uzbekistan". The international organization " organization "Medecins sans frontiers" has been working with the Ministry of the health of the Republic of Uzbekistan since 2003. Over the past years, assurance projects have been developed to treat infectious diseases that are resistant to many types of drugs. In December 2018, a new national program on the struggle against such infectious diseases was signed in Uzbekistan. In order to further strengthen the activities of Uzbekistan and the International Organization, on February 28, 2019, the branch of the international charity organization "Medecins sans frontiers" organized an international symposium on "New Horizons: innovations and opportunities in the field of drug-resistant tuberculosis treatment". Pulmonologists of Uzbekistan and foreign countries participated in this symposium. Special attention was paid to the issue of radically improving the quality of medical services, strengthening the material and technical base of medical institutions, providing them with the necessary equipment and tools, supporting doctors in all respects, stimulating their activities in the process of reforms carried out in the field of medicine in our country.

Also at the symposium, The World Health Organization (WHO) announced that Uzbekistan ranked second place among 53 leading countries in the European region for the successful implementation of the national program on the struggle against tuberculosis. We know that the Ministry of the health of the Republic of Uzbekistan and the organization "Medecins sans frontiers" have been cooperating in the field of struggle against tuberculosis for more than 20 years[14]. In order to support the positive international experience, Uzbekistan has been cooperating with the international non – profit organization Worldwide Initiatives for Grantmaker Support (WINGS) - "support Global grant initiatives", which unites more than 100 charity and infrastructural organizations in the direction of charities in 40 countries of the world[15].

CONCLUSION

In conclusion, it is important to note that in the countries of the world charity and sponsorship are being extensively talked and written, philosophers and culturologists are having debates about its main essence, various aspects of charity activities are studied by representatives of scientific disciplines such as sociology, economics, jurisprudence, psychology. On one hand, media coverage of charity activities can be described as systematic and controversial. On the other hand, they write about the low culture of charity activities, the lack of formalization based on the relevant legislation, the sluggishness and lack of interest of the population, as well as the negative (indicating the presence of envy towards wealthy and successful people) attitude towards those who are engaged in charitable activities. However, as a result of the reforms carried out in Uzbekistan, radical changes are taking place in the social, cultural and economic life of the Republic, and the idea of supporting each other is strengthening among people, the number of volunteers wishing to engage in charity and sponsorship activities is increasing. In particular, the recognition of sponsorship activities carried out in Uzbekistan and the world by international organizations is a vivid example of our opinion. According to the World Giving

Index, which was established by the Charities Aid Foundation (CAF) and covers 135 countries of the world, Uzbekistan occupies different positions in the period from 2010 to 2018.The result of the mentioned positions means that in the future it is necessary to take measures to further improve the financial charity system of the Republic of Uzbekistan.

PECULIARITIES OF INSURANCE ACTIVITY IN UZBEKISTAN

Khojayor Musurmanovich Shennaev*

*Associate Professor,
Candidate of Economic Sciences,
Department of Insurance and Pension Affairs.
Faculty of Taxation and Insurance,
Tashkent Financial Institute,
UZBEKISTAN

ABSTRACT

This article discusses that insurance is one of the most significant sectors of the economy and a significant means of protecting the population and business from losses caused by unforeseen events.In this regard, the state pays great attention to supporting this activity all over the world, developing insurance products that meet the needs of the population and business. In this article, the author analyzes in detail the work done on the development of insurance in Uzbekistan and tries to reveal its features.The study provides for an in-depth study of the problems of insurance development in Uzbekistan and the development of proposals and recommendations for their solution.

KEYWORDS: *Insurance, Insurance Activity, Insurance Company, Insurance Premium, Insurance Contract.*

INTRODUCTION

Insurance activity as an significant branch of the market infrastructure is a key element of risk management. As pointed out by Kenneth J. Arrow (1992), insurance is of great significance in the economies of developed countries, about which, unfortunately, theoretical economists are not very well aware.In addition to the author's opinion, it should be noted that insurance is a financial institution that makes a valuable contribution to the development of the economy of not only developed countries, but also developing countries such as Uzbekistan.Continuing the point of view of Kenneth J. Arrow, I.L. Kirilyuk, A. Sviridov (2019) argued that in the contemporary world, insurance has a positive effect on the development of society and the economy, while

fulfilling its direct function of protecting the interests of the insured and benefiting insurance companies.

Ulrich Schmidt (2012) in his study studied the demand for insurance from legal entities within the framework of forecasting theory and analyzed who would benefit more in the event of an insured event involving individuals with or without an insurance policy. The results of the analysis showed that at the time of the insured event, those who had an insurance policy had an advantage over those who did not have an insurance policy.Indeed, insurance activities have a positive effect on ensuring the financial stability of citizens and businesses. B. Usmonaliev (2020), studying the current state of insurance activities in Uzbekistan, in 2019, Uzbek insurance companies paid a total of 813.5 billion soums (91.9 million US dollars) to cover losses from insured events.

In Uzbekistan, much attention is paid to state support for insurance activities. Decree of the President of the Republic of Uzbekistan dated August 2, 2019 No. PD-4412 "On measures to reform the insurance market and ensure its rapid development" (2019) provides for the introduction of new innovative insurance products and the development of popular traditional products. Expansion and improvement of the volume, types and quality of services, the widespread use of modern information technologies in the organization and regulation of insurance activities, the active introduction and development of electronic types of insurance services are identified as key areas for the development of insurance activities in the country.

The implementation of insurance activities in Uzbekistan corresponds to the current state of economic and social development. At the same time, S&P Global Ratings (2020) rated the insurance sector in Uzbekistan as a whole as a sector with high and country-level risk. According to the company, in the next two years the economic situation for insurance companies in Uzbekistan will remain unfavorable.Also, given the well-being of the population, ie the GDP per capita is very low (\$ 1585), the economic risk remains high.

The presence of such problems indicates that this study is devoted to one of the urgent problems. The purpose of the study is to reveal the specifics of insurance in Uzbekistan.

Main Part

A lot of research has been done on the organization and implementation of insurance activities. This study examines in detail the existing issues of increasing the effectiveness of insurance. For example, Alma Cohen and Peter Siegelman (2009) argue that the main prediction of adverse selection theory is related to the correlation between coverage and risk, and that high-risk insurers tend to opt for larger coverage with a lower, relatively low deductible.According to Harris Schlesinger (2012), insurance demand theory is considered by some to be a prime example of economic behavior in the face of uncertainty. Interestingly, if twenty years ago the topic of uncertainty was not studied at all in most high-level sources on microeconomics, then today this topic is reflected in almost all literature.

According to Christian Gollier (2003), risk sharing and risk transfer are an important aspect of our modern economy. He went on to say that private insurance markets and social insurance programs have played a key role in improving the welfare of the population over the years.David Bland (1998) argues that insurance is designed to offset the financial consequences of certain risks and is an incentive to increase business activity. H. Shennaev (2013) put forward the idea

that insurance products are a unique product sold in the market, and their prices are formed on the basis of supply and demand.According to I. Abdurakhmanov (2018), who conducted a study of the theoretical foundations of insurance, insurance as an independent economic category plays an important role in the system of economic relations. This is closely related to such economic categories as finance, credit.

RESULTS AND DISCUSSION

According to the Ministry of Finance of the Republic of Uzbekistan (2020), as of November 1, 2020, 37 insurance companies of various forms of ownership operate in Uzbekistan. Of these, 29 provide insurance services for legal entities and individuals in the general insurance network, 8 - in the life insurance network.17 years ago, there were 20 insurance companies in the country, and there were no insurance companies specializing in life insurance. The following figure provides information on the dynamics of changes in the number of companies entitled to carry out insurance activities in Uzbekistan in 2003-2020 (Figure 1).

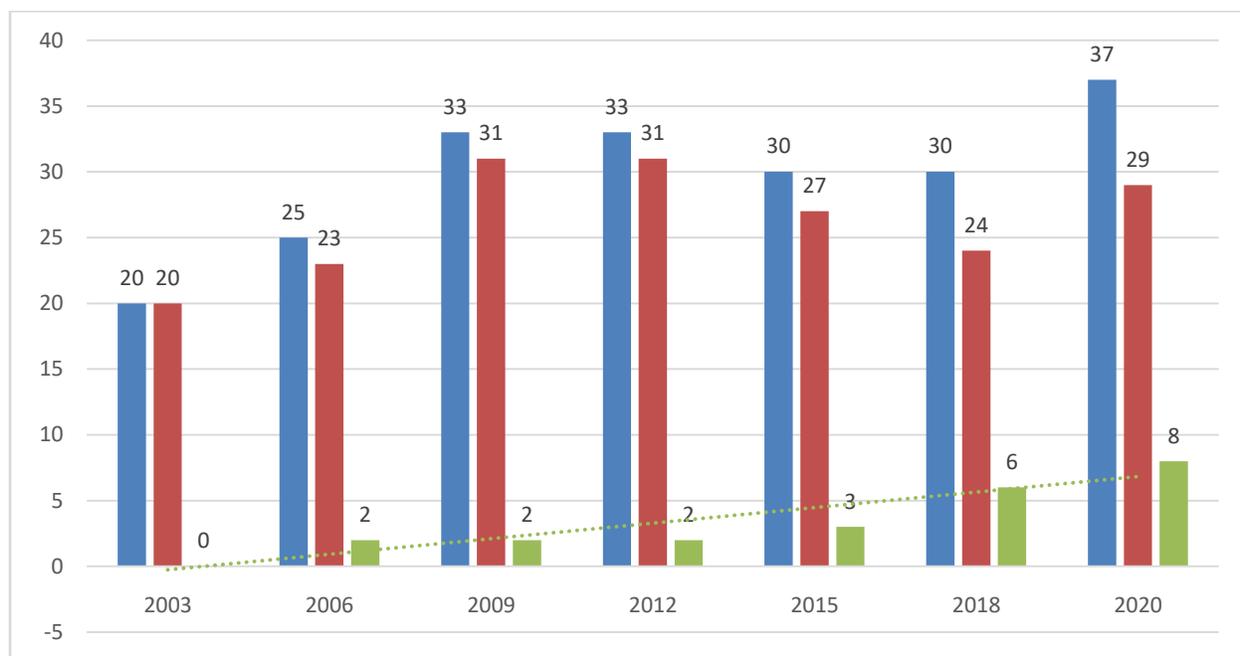
The data in Figure 1 show that in 2003-2017, there were uneven changes in the dynamics of insurance companies operating in the insurance market of Uzbekistan. For example, in 2009 the total number of insurance companies was 33, but by 2015 it had dropped to 30.On the contrary, the number of life insurance companies has been growing steadily during the period under review.


Figure 1. Dynamics of the number of insurance companies in Uzbekistan in 2003-2020
[Prepared by the author on the basis of the Ministry of Finance of the Republic of Uzbekistan]

The number of these companies increased from 2 in 2006 to 4 by 2020. According to the State Statistics Committee of the Republic of Uzbekistan (2020), as of January 1, 2020, the population of Uzbekistan was 33,255,538 people.So, as of this date, 923,765 citizens had one insurance company. More than half of the existing insurance companies operate in the form of limited liability companies.

The volume of insurance premiums collected by insurance companies licensed to carry out insurance activities in Uzbekistan is growing steadily from year to year. This can be seen from the data in Figure 2 below.

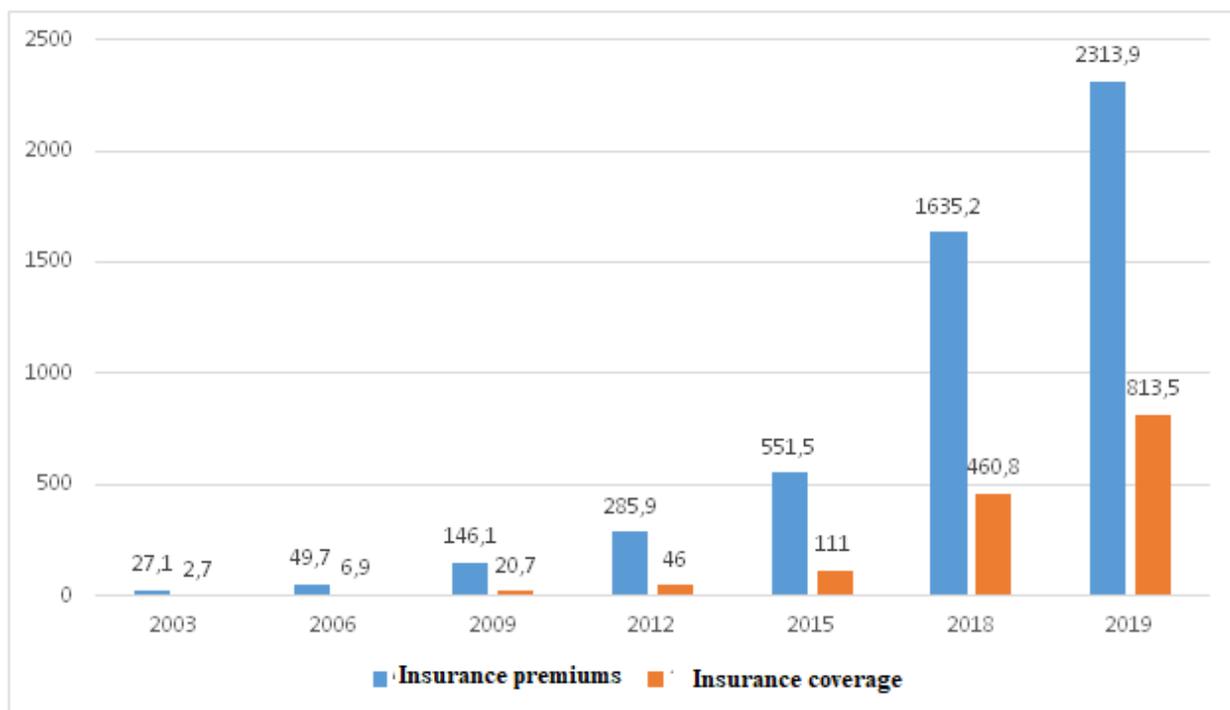
The volume of insurance premiums collected in 2019 increased by almost 85.4 times compared to the amount of insurance premiums collected in 2003.The main reason for this is not an increase in the number of insurance companies, but an increase in demand for insurance services, as well as the introduction of compulsory civil liability insurance for vehicle owners in 2008, compulsory civil liability insurance for employers in 2009 and compulsory civil liability insurance for carriers in 2015. associated with the adoption of laws on Russia.


Figure 2. Dynamics of accumulated insurance premiums and paid insurance coverage in the insurance market of Uzbekistan in 2003-2009.[Prepared by the author on the basis of the Ministry of Finance of the Republic of Uzbekistan]

Regulation and supervision of insurance activities in Uzbekistan was carried out by the State Inspectorate for Insurance Supervision under the Ministry of Finance, established on July 8, 1998 by the Resolution of the Cabinet of Ministers No. 286 "On measures of state regulation of insurance activities." By the Decree of the President of the Republic of Uzbekistan dated August 2, 2019 No. PP-4412 "On measures to reform the insurance market and ensure its rapid development", the system of regulation of insurance activities in the country was reformed. Instead of the State Inspectorate for Insurance Supervision, the Agency for the Development of the Insurance Market was created under the Ministry of Finance with expanded powers and functions.

CONCLUSION

The implementation of insurance activities in Uzbekistan has its own characteristics, which include:

Firstly, the volume of insurance premiums and insurance coverage in Uzbekistan has been growing steadily over the past fifteen years. This growth has been observed in recent years due to the introduction of several types of compulsory insurance by law.

Secondly, insurance companies engaged in insurance activities are mainly located in the capital of Uzbekistan, Tashkent, and the provision of insurance services in the regions is carried out by their branches and divisions.

Thirdly, GDP per capita is very small, reaching $ 1,585 in 2019. This situation leads to a decrease in the population's demand for insurance services. The reason is that insurance services are paid.

Fourth, it is necessary to radically increase the importance and role of the private sector in the implementation of insurance activities. It is advisable to take measures to sell the state part of insurance companies with a state share in the authorized capital to investors, including foreign investors.

Fifth, it is recommended to gradually bring the insurance business of Uzbekistan to international requirements and standards, as well as to actively attract foreign investors to the country's insurance market.

We are confident that the above conclusions and recommendations will become an significant factor in the development of insurance in Uzbekistan in the future.

APPLICATION OF MODERN INFORMATION TECHNOLOGY IN THE DESIGN OF UNDERGROUND MINING

Bakirov G.X*

*Lecturer,
Almalyk Branch of the Tashkent State Technical,
University Named After Islam Karimov,
Almalyk, UZBEKISTAN

ABSTRACT

We have analyzed the criteria for the selection and use of modern information systems and technologies for optimizing the processing of mining and geological information, modeling, design and planning of underground mines and quarries.

KEYWORDS: *Underground Mining, Technological Information, Modern Geo-Information, Mining-Geological, Geometric, Calculations Mathematical Calculations, Engineering, Maintenance, Engineering Support, Mining Operations, Single Information, Constraints, Structure.*

INTRODUCTION

The efficient production planning system is the basis of effective work of the mining enterprise. Traditional planning methods are one of the most time- consuming processes of engineering support and maintenance of mining operations, often accomplished over time and cannot ensure the efficiency and effectiveness of the enterprise. The production planning of mines and mines is based on the work with spatial mining-geological and technological information, the implementation of various geometric constructions and mathematical calculations. The most effective means for performing tasks of this kind are geo-information and mining-geological systems.

MAIN PART

The use of such systems in the mining enterprise allows to fully automate the processes of engineering support of mining operations. The use of a single information space and multi-user mode makes it possible to simplify and speed up the processing of information, improve the accuracy of calculations, analyze several different scenarios for the development of mining

operations, perform scenario analysis and select the optimal one based on various criteria and constraints, improve the safety of mining operations and others.

The use of software solutions for planning and design provides the miners with tools for transforming geological models of coal seams or ore bodies into spatial location projects of mine workings, optimal schedules for their execution, and also allows finding a rational way to develop the deposit or its site. Modern geo-information systems can be used for known schemes for the development of stratified and steeply dipping bodies by traditional or mechanized methods (chamber, column, chamber-column, floor, sub-floor, block, layers, with or without tabs).

The Figure 1 shows an example of the structural scheme of an integrated mining management system (hereinafter ISM GR) on the basis of a single software (in this case, K-MINE example), which is a closed cycle of automatic processing of mining and geological data and optimization tasks for engineering support for mining operations. The structure of the system includes a central database and a set of specialized software modules.

The basis for the work of program modules of planning and design are digital models of the deposit and objects of mining technology. This ISU GR contains tools that allow performing modeling of any genetic type deposits for different types of minerals (coal seams: horizontal, inclined or steeply dipping, ore bodies and veins: monoclinic, folded structures, disjunctive structures, vein and

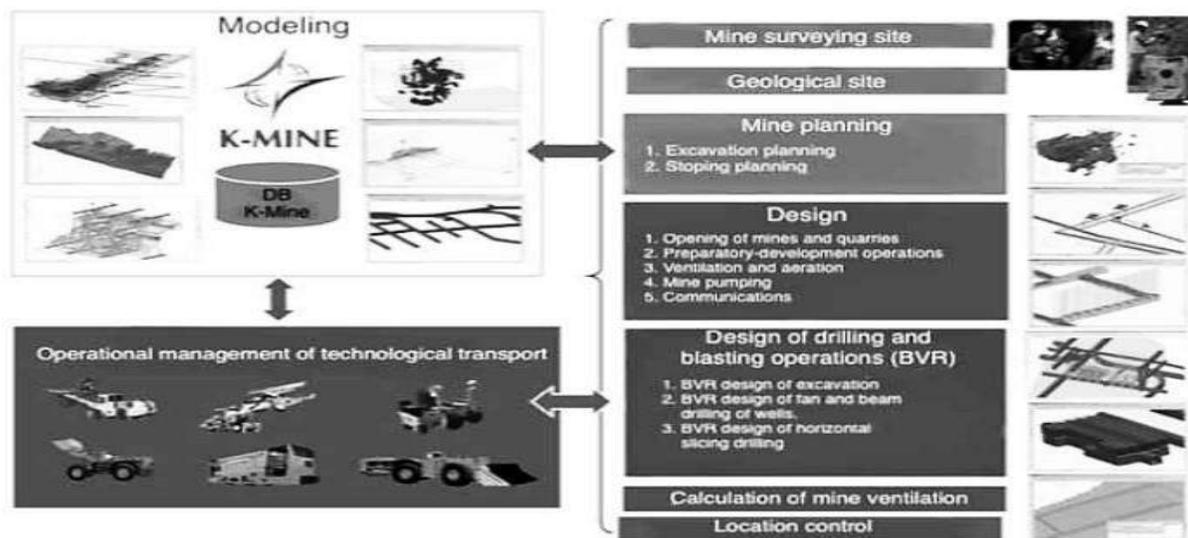
lenticular structures, etc.).


Figure 1 - ISU GR structure for underground mines and shafts

Modern technologies of three-dimensional modeling provide a full range of works on the creation and maintenance of models of deposits and objects of mining technology. All information (text, table, graphic in various formats) should be structured and systematized in a single information array. On its basis, it is possible to form three-dimensional models of underground excavations of any technical purpose (horizontal, inclined, vertical). There should also be a toolkit that allows you to exchange data with other GIS, GIS and CAD.

The result of the simulation is a three-dimensional geological model of the deposit, combined with a three-dimensional model of the mine field, structures and surface. The resulting integrated model is the basis for the operation of all technological modules: planning, designing, calculating the stressed state of the rock massif and geodynamic phenomena, calculating mine ventilation, accounting tasks of the mine and many others.

The mine or quarry, from the point of view of management, is a complex mathematical object, with a dynamic structure, the state of which is constantly changing: work is carried out to drive the workings and redeem the reserves, and the geometric and qualitative indices of the mineral are refined as they are worked out. Monitoring of rock pressure, air pollution and other safety indicators for mining operations are conducted regularly. Therefore, for the models created and used at the enterprise to be up-to-date and could be used for the tasks of production planning and design, they must be promptly refined and updated. To this end, technological complexes of mine surveying and geological support of mining operations should be implemented within the ISU GR.

RESULTS AND DISCUSSIONS

Current mining and geological models are also the basis for the design and planning of mining operations. In the software complex for the design of underground mining operations, tasks that automate most of the processes associated with the implementation and optimization of projects for the development of the field as a whole or its sites should be implemented. In general, the complex should be focused on the execution of design works of mining and capital workings, analysis of preparatory- cutting and cleaning works, design of drilling and blasting operations, calculation of mine ventilation and aeration. When developing projects, you can use typical scenarios for various development systems: solid, column, chamber or combined.

The decisive factors that influence the development of the production program for a given period are the condition of the front of the cleaning faces and the provision of the enterprise with prepared and ready-to-extract reserves of minerals.

In order to create programs and plans for mining operations, we use previously prepared design solutions for the development of the field site such as the panel, the block, the lava and the actual geological model of the deposit or site.

Based on the standard performance of the equipment (excavating, tunneling, transport), the program is divided into intervals, indicating the amount and timing of performance of certain types of work (basic and auxiliary). At the same time, the ISU GR should address optimization tasks related to determining the order of carrying out preparatory and cleaning workings, minimizing the amount of drilling operations during the extraction cut, reducing the load on the units, maintaining stable work fronts for the fastest development of production capacity.

An important advantage of using ISU GR for mines and mines is the ability to control all information processes and flows, as well as analysis of project and planned solutions. The functionality of the design and planning complexes should include an analysis block that enables mining engineers to monitor the development of mining operations for compliance with projects and development plans.

The ISU GR analysis module should allow comparing mining projects on the basis of normative indicators of technological processes, to estimate the terms, order and parameters of actually performed work, compare them with plans and projects, and also control the timing and order of execution of work.

In order to ensure the safety of mining operations, the ISU GR is integrated with the dispatching systems to monitor the location of equipment and personnel in real time from different manufacturers.

CONCLUSION

Thus, ISU GR should be a universal integrated system with a single software interface, a single information base and a single mathematical tool for optimizing calculations. The application of such an ISMS GR in mines and mines allows to cover all stages of work with mining and geological information; solves the problems of mining in an integrated manner; optimizes planning and design processes from the point of providing the enterprise with resources for the whole period of its operation; rational development of mineral resources, through increased extraction of minerals; improves the accuracy of stock assessment, calculation of losses and clogging of minerals; increases the safety of mining, reduces the cost of production, which ultimately allows the company to work more efficiently.

AREAS OF PROTECTION OF YOUTH SPIRITUALITY FROM HARMFUL RESOURCES OF THE GLOBAL INTERNET

Sh. N. Taylakova*

*Head of the chair "Digital Media and Internet Journalism",
Uzbekistan Journalism and Mass Communications University,
UZBEKISTAN

ABSTRACT

The article focuses on the protection of youth spirituality from the harmful resources of the global Internet, the development of Internet technologies, innovative methods of personal development and social activism, protection of students from various ideological influences in the global information space and information security mechanisms.

KEYWORDS: *Internet, Internet Network, Social Networks, Globalization, Information Resources, Media, Media, Computer Games, Cyber bullying*

INTRODUCTION

The Internet is a product of human thinking, intellect and intelligence. The Internet plays an important role in the socio-economic, cultural and technical development of society. His immense power is undeniable. The Internet has become a major, important link in today's information space. Currently, the Internet can be used not only in the computer network, but also via satellite, radio, cable television, telephone, mobile. It is no secret that in a globalizing world, information and communication technologies, and especially the Internet, have become an integral part of the daily lives of young people. The global network is rapidly evolving and its capabilities are expanding. The emergence of more than a few million information resources in the virtual space every day indicates that its volume is growing by the minute.

The Internet is a mass, fast source of information: unlimited informal communication in real time; watching entertainment games, movies, music, video games; use for advertising and commerce; development of intellectual, creative skills.

MAIN PART

Researchers from the analytical company IDC surveyed 302 citizens aged 15 to 24 in the United States, Brazil and Russia and concluded that all those who answered the researchers 'questions in the three countries recognized the global network as convenient, useful and secure. IDC analysts point out that young Americans, unlike Russians and Brazilians, see online communication as normal. Uzbek students, like their peers around the world, use the Internet mainly to read the news, search for coursework and essays, communicate with friends, make new friends and get information. For schoolchildren, the Internet has become the main source of information about books or television, often replacing teachers, peers, and even parents.

The student's personality also has its own psychological characteristics as a human being. His individuality, however, is not always recognized by parents or teachers. This is especially true in areas where there are many Internet users, especially in Tashkent. During the experiments, we tried to find out exactly what interests them on the Internet by interacting with 172 children and young people who visited places that provide access to the Internet (Internet cafes, internet clubs, game clubs, etc.):

communication - interested in making new friends on social networks and chats, participating in discussions, participating in virtual forums; read and strive for perfection - see tests and abstracts, read the news, increase their knowledge, acquire new knowledge and skills in computer literacy; they play games, listen to music, watch videos and movies.

Students are interested in the Internet social networks "Essay Catalog", "YouTube", "Google", "Wikipedia", "Facebook", "Odnoklassniki", "V kontakte" and various sites. Many young people access games, all kinds of videos, and "Adult Only" sites without spending their precious time reading and learning materials. In most cases, girls are more interested in using learning materials than boys. In addition to reading, they are very interested in modern fashion, music, and spend a lot of time exploring resources and sites that reflect the lives of celebrities. Boys and girls look at social networks with equal interest. The results of social surveys among young people show that in a virtual environment, children and young people try to relax from the mental problems of real life and try to get rid of the accumulated stress. Some young people see the internet as a free space where anyone can do whatever they want. While these are very exciting moments for them, not all young people think the same in this area. The child goes through different stages of his mental development that are very different from each other. This situation is also reflected in the interest of children and young people in the Internet. We need to pay more attention to what exactly we need to pay attention to when talking to children about the rules of Internet safety, including aspects related to the age characteristics of children, young people. It is also important to take into account that children and adolescents learn to work on the Internet at different ages: some at the age of 12-16, some at the age of 7-11, and some at the preschool age. Young people actively use the services of search servers to search for information on the Internet, most young people access chats, many of them participate in adult or private chats, and access open sites for adults.

In this way, children, as a relatively active and curious audience, are often the first to learn new technologies from the internet before their parents. While such activities have advantages related to increased levels of intelligence, development of communication skills with different people, they also have disadvantages such as high probability of becoming a victim of online harassment

due to lack of life experiences. Therefore, we cannot ignore the benefits and harms of the Internet, which opens the door to a number of opportunities for young people. There are many sources on the Internet that have a very negative impact on the spiritual development of society, the worldview, the ideological upbringing of such young people, especially those who have not yet formed consciousness. A certain portion of the material in the online system is largely biased, questionable in appearance, and the moral depravity promotes aggression and violence. The life-threatening aspects of the Internet can be summarized as follows:

«Internet: the transformation of real communication into a virtual form; Internet connectivity to games; damage to health; inaccurate information; pornographic sites; sites that affect the human mind (sects, terrorists, etc.), drugs, suicides, sites of terrorist clubs pose a great threat to young people». This is evidenced by the fact that there are more than 9,000 sites on the Internet that promote easy ways to commit suicide, and more than 4,000 sites with erotic content. Special studies conducted by experts show that about 12 percent of existing sites are pornographic in nature. Existing special programs filter only 90 percent of pornography on the Internet, which means that it can block the path of the computer from appearing on the screen beyond the user's control. This means that no matter how hard you try, sites with pornographic content and militant nature can attract the attention of Internet users, regardless of their desires. In particular, studies show that 42% of children and young people are exposed to online pornography.

Analyzes have shown that 49% of computer games distributed over the internet look significantly violent and vicious, while 41% of militant (based on various shootings and explosions) games use such violence and evil to achieve the protagonist's goal. In 17 percent of games, that violence and evil itself is the main goal. There are many cases of depression in the person of a teenager who is exposed to such situations on the internet. Changes in a teenager's behavior and mood lead to the appearance of negative character traits in him:

Depending on the nature of the individual, sources of threat may include:

1) Threat of computer games;

2) Propaganda of assassination;

3) Addiction;

4) Crime and delinquency;

5) Alcoholism;

6) Popular culture;

7) Uncertainty;

8) Ignorance;

12) Shamelessness and others.

The development of the Internet and the opportunities it provides are also addictive. It is estimated that about 10 percent of Internet users worldwide are regularly connected to it. This condition in humans is a sign of "cyberludomania". "The term cyber ludomania is the name of a disease that has been officially introduced into world medical practice. Cyber-addiction is a computer game. Complications of cyber-addiction are observed in the lifestyle, physical and

spiritual development of those who suffer from computer gambling among young people. "In the classification of young people with gambling, scientists IP Korolenko and TA Donskikh came to the following conclusions:

an increase in the amount of time a teenager spends playing; previous habits, narrowing of interests and thinking more about the game; he can't get out of the game whether he wins or loses; looks forward to the start of the game, gets annoyed and nervous when left without a game; wants to play more and more, more and more things are stuck in the game; unable to stop himself from the game; he hides his excessive playfulness from family members, doctors and others and lies "

The fact that students are distracted from school and spend their free time in Internet clubs also causes them to fall ill with gambling. Interested socio-political forces, which skillfully use it, are pursuing ulterior motives on the Internet. We must always be vigilant, vigilant and vigilant against such growing dangers. Such threats can be responded to with comprehensive, well-thought-out, well-organized, well-organized, regular, and continuous spiritual education.

A number of events, meetings, competitions and roundtables aimed at the spiritual development of young people are organized in educational institutions, scientific and creative institutions, mahallas, in which the active participation of young people is ensured. However, the movements in the modern field of information today are so intense, so rapid, that in such a situation the process of spiritual education cannot be stopped for a moment. The Internet, which ensures the speed of information, is becoming a means of promoting harmful ideas that are alien to our national values. The fact that the Internet has become a major arena for ideological struggle and propaganda can also be seen in the example of its role in promoting extremist, including religious extremist views. The websites of religious extremists and terrorists provide a wide range of information about the organization's goals, history, socio-economic and political content. Dedication"songs and music videos serve to increase the ideological and emotional impact of such sites. Such sites aim to form conflicting opinions in society and to cause internal hesitation by spreading fear, panic, and psychological exposure under the spirit of violence. It is unfortunate that these goals apply to young people as well as to their peers. These symptoms are indicative of cyber bullying.

RESULTS AND DISCUSSIONS

"Cyber bullying is the pursuit of messages that include social boycotts, harassment, intimidation, aggression, and insults through various Internet services. This kind of work is mostly done among young people. In the modern information society, the internet and mobile phone are used for bulling. The main area of cyber bulling is the social network. It is possible to insult a person not only with messages, but also by posting content on a fake e-mail address in his name. Even in most families, parents do not feel the effects of cyber bullying on their child. Worst of all, some young people are unable to escape the danger of cyber bullying and commit suicide.

The term "cyber bulling" is also referred to as "cyber mobbing". The study found that about 16 percent of young people unknowingly engage in cyber bullying online. And 40 percent of them said they did it as a casual joke. In recent years, cyber bullying has mainly affected children and young people. Children aged 11-16 make up the majority of those affected by cyber bullying. Their classmates or some violent peers insult and discriminate in front of others because of the character, social status, and appearance of weak, defenseless children. For example, if a teenager

posts a photo of himself on social media, cyber bullying can make different comments on these photos, making fun of him, making fun of him, insulting him or insulting him. As a result, young people who become victims of cyber bullying (because it is a transition period) may experience mental states such as depression, depression, a sharp decline in interest in learning, inhumanity, loneliness, sleep disturbances, organ dysfunction, and suicide. To get rid of cyber bulling, it is important not to post personal information, photos on the Internet, not to have very personal conversations with even close friends on social networks, to lock the address on the social network and not to join the conversation of various unfamiliar groups on social networks.

In the course of our observations, parents were asked "Do you know what your child does on the internet?". 70.8% of parents were unable to give a clear answer to the question. Most parents concluded, "It's hard to control the Internet, it's anonymous." Interview surveys show that more than 76% of parents do not know what sites their children visit. As a result, some young people are becoming victims of 'cyberludomania', as mentioned above. This, in turn, worries the world community and puts the issue of information and spiritual security of nations and peoples on the agenda.

Internet issues are also discussed at the European Security Council, with particular emphasis on preventing users from accessing obscene web resources. For example, in Germany, since 1951, there has been a law against the distribution of harmful material to young people in public places, since 1954 there has been a law banning the dissemination of harmful information to young people in general, and since 1997 there has been a law on information and communication services. by enforcing the laws, their original purpose is to protect minors from information that may pose a threat. In Germany, the Federal Bureau of Investigation has been operating for 50 years, investigating materials that could harm students. Its mandate includes the compilation of a list of such inappropriate and prohibited products (media, books, videos and computer games), and on the basis of this list will be developed measures to prevent violations. Legislation in many countries around the world (UK, Norway, Switzerland, USA, Brazil, Japan, China, Uzbekistan, Russia, etc.) provides for the dissemination of information that may adversely affect the mental and spiritual development of students.

The issue of dissemination and promotion of biased information has not been neglected in the legislation of our country. In particular, the Law of the Republic of Uzbekistan dated September 8, 2017 "On protection of children from information harmful to their health" also serves to ensure information security in this area. Article 11 of the law defines the important tasks of the bodies coordinating the education system and the education system in this regard.

CONCLUSION

An analysis of the impact of information resources on the global network on the formation of the lifestyle of the younger generation suggests that the Internet has become a unique environment of social relations. Therefore, in our opinion, taking into account the psychological characteristics of students in the national network, it is extremely important to create spiritually meaningful, as well as modern topics that directly cover the interests and problems of the younger generation, based on their worldview and interests.

since information affects different social strata, professional and national groups, and its consumption differs from one another, in order to select information among students, that is, to form a culture of information consumption at a high level, first of all, , it is important to evoke

feelings of patriotic devotion. Only in this way, in the process of globalization, students will be able to blindly follow the information, misinterpret the information. Students with a culture of information consumption are not exposed to negative and biased information, as they develop a strong ideological immunity to such information. Here are some suggestions for parents on how to prevent threats to the student's personality and protect students from such negative effects of the Internet:

explain to the child what can and cannot be done while using the Internet;

to limit the child's time in the network, to search for the necessary information with him by being as friendly as possible; blacklisting inappropriate sites in the browser; installation of parental control software on home computers and TVs; (However, children and young people should not feel this, it may seem like a state of mistrust towards them) explain the etiquette of use when the child is allowed to use social networks; be able to convey highly personal information in a friendly manner, such as home address, phone number, not posting photos; be as aware as possible of the child's friends in the virtual world and what topics they are talking about; Awareness and readiness are key to the safety of every family. So, it is the duty of every member of society to participate in the virtual life of young people and teach them to use the Internet wisely.

ABSTRACT

The article focuses on the role of training in higher education, which is the basis for the rapid development of the economy, which is currently oriented in Uzbekistan to reforms in the system of higher education. At the same time, the emphasis is on international cooperation in higher education and the priorities of these reforms in order to improve the quality of education by adapting the higher education system to modern requirements for the training of highly qualified personnel who simultaneously meet the requirements of the time in the world with the processes of globalization and integration. Today, Uzbekistan has established good partnerships with many developed countries in the field of higher education. Uzbekistan has branches of leading higher education institutions in a number of developed countries. The role of the Russian Federation in these partnerships is of particular importance. On this basis, cooperation between the leading higher educational institutions of Uzbekistan and the Russian Federation was analyzed, and recommendations for the further development of this cooperation were presented.

INTRODUCTION

As you know, the main factors determining the development of any society are education and upbringing. Therefore, it can be said that the progress of the developed countries is connected, first of all, with the globalization of the education system, high competition, and investments in education play one of the leading roles. This can be traced by the example of developed countries. For example, according to materials of the General Archive of Korea (1944), the

literacy rate of the population reached only 13.8 % [1]. Later, due to fundamental changes in the public education system, Korea was able to become one of the world leaders in various sectors of the economy. At the same time, it should be noted that cooperation of the countries of the world in the field of education not only strengthens the economy and enriches with highly qualified personnel, but also serves to establish friendly relations, thereby avoiding socio-economic, ethnic, environmental and other problems between nations.

In turn, in Uzbekistan, after acquiring independence, large-scale educational reforms were also carried out. The main tasks were the education of qualified personnel with the skills to work with innovative developments and research approaches. In solving this problem, an important role is played by the higher education system. As you know, it is not possible to imagine the development of higher education without international cooperation. That is why, in Uzbekistan from the first years of independence, they gave special attention to international cooperation. In particular, relations were established with the leading countries of the world. As a result of this collaboration, therehas appeared an opportunity not only to educate young people in foreign universities, but also to open branches of famous educational institutions in Uzbekistan. In particular, today, in the republic successful activities are conducted by branches of universities of such countries as Russia, Great Britain, Singapore, South Korea, Italy, Latvia, etc.

The Main Part

It should be noted that the Russian Federation is the closest partner of Uzbekistan in the field of education. Moreover, the cooperation between the countries manifests itself not only in education, but also in socio-economic areas, and this cooperation is evolving today. It is also important that in all educational institutions of Uzbekistan, along with the state language, teaching is also conducted in Russian. In particular, in the 2014/2015 school year, out of 9,733 schools, 793 were purely Russian schools [6, p. 91]. And it was 8.1% of all schools in the republic. Also, it is no secret that Russian is the most frequently used language after the state language, which serves to bring the two peoples closer together and creates new opportunities for young people in education. Thus, in almost all universities of the country there are groups in which they teach in Russian. In addition, there are a lot of people among the Uzbek youth who want to get higher education in Russia [2, p. 228]. For example, in the 2015/2016 academic year, more than 14 thousand citizens of Uzbekistan studied at universities of Russia [3].

As we see, Uzbekistan and Russia have established very strong ties in the field of education and science. The range of joint work includes academic exchange, training of highly qualified personnel and researchers, the development and implementation of projects, the organization of seminars and conferences. Moreover, scientific cooperation covers not only educational institutions of the capital, but also universities from all over the country.

In particular, back in 1996, together with the All-Russian Research Institute of Agricultural Engineering and St. Petersburg State University, the Namangan Institute of Engineering and Technology prepared two candidates of science, published a joint monograph and a number of articles[1]. Also, the Fergana State University has been cooperating with scientific institutions of the Russian Academy of Sciencessince 1996[2].

As previously noted, in addition to scientific cooperation, the Uzbek side is interested in opening branches of Russian universities. So, in Uzbekistan today, branches of such universities as G.V. Plekhanov University (2002) [7], M.V. Lomonosov Moscow State University (2006) [9],

I.M. Gubkin Russian State University of Oil and Gas (2007). In these universities prepare specialists for the socio-economic sphere of the country.

As a result of close collaboration, universities and scientific centers of the two countries hold conferences, symposia, and collective works are published. In particular, Moscow State University and the Institute of History of the Academy of Sciences of the Republic of Uzbekistan have published the work "Russia and Uzbekistan: Past and Present" [5, p. 36].

In general, it is difficult to underestimate Russia's place in the field of education for Uzbekistan. In turn, the government of Uzbekistan attaches particular importance to this cooperation. Thus, appreciating the role in establishing close ties between the two countries, labor in training personnel for the economy of Uzbekistan, as well as in connection with the 110th anniversary of the Russian Economic University named after G.V. Plekhanov, by the decree of the President of Uzbekistan, the Rector of the University V.I. Grishin was awarded the Order of Friendship [4].

The level of cooperation between the two countries has reached a completely new level after the official visit of President of Uzbekistan Shavkat Mirziyoyev to Russia at the invitation of the President of the Russian Federation Vladimir Putin on April 4-5, 2017. Since an agreement was signed on the training and retraining of personnel, the creation of branches and representative offices of leading medical centers of Russia in Uzbekistan. Further, effective steps were taken to open a network of branches of Russian universities in the country. This has led to an increase in the scale of academic exchanges between Uzbekistan and Russia [8].

These agreements have also resulted in the introduction of advanced curricula and teaching materials in the educational process of the Russian Federation, cooperation in the integration of science, education and production. An equally important step in deepening ties was the opening of the National Research Technological University "MISiS" in the town of Almalyk in the Tashkent region [14]. The branch was established at the initiative of President Shavkat Mirziyoyev, by the Decree of the President of the Republic of Uzbekistan "On the organization of activities of the branch of the Federal State Autonomous Educational Institution of Higher Education" the National Research Technological University "MISiS" in Almalyk No. PP – 3714 dated 11 May 2018. This scientific institution enrolled its first students on September 1, 2018.

By the Decree of the President of the Republic of Uzbekistan No. PP-3875 dated July 20, 2018, a branch of the Federal State Autonomous Educational Institution of Higher Education "The National Research Nuclear University MEPI" was created in the city of Tashkent [10].

Further, at the invitation of President Shavkat Mirziyoyev, October 18-19, 2018, the President of the Russian Federation arrived in Uzbekistan on an official visit. Along with other issues, the issues of deepening cooperation in the field of higher education were also discussed. In particular, some agreements were reached on the signing of a cooperation agreement between the Academy of Public Administration under the President of the Republic of Uzbekistan and M.V. Lomonosov Moscow State University., the Agreement on the opening in Uzbekistan of a branch of MGIMO, the Agreement between the Council of Rectors of Uzbekistan and the Russian Union of Rectors [11].

Within the framework of the visit, for the first time in history, the Uzbek-Russian educational forum "New Personnel – for the New Economy" was held. This forum, being the first major event of this kind, has contributed to the strengthening of relations between the countries. The

forum was attended by representatives of the presidential administration, ministries, and university rectors, and more than 80 rectors from Russia attended the forum. One can state, that the development of the Russian-Uzbek partnership in the educational sphere is gradually becoming the foundation of a bilateral dialogue. The capacity of the Uzbek educational market is so great that the prospects for increasing the volume of interaction between universities currently appear to be limitless. The only question is to keep the level of high quality education behind the growth of quantitative indicators [10].

Speaking about the results of the forum, we note that in the end, 114 agreements and agreements were signed. Thus, it provides for the opening of 6 branches of universities and 2 faculties of Russia. It is noteworthy that according to all the agreements, the appropriate road maps for their implementation have been developed. Evidence was given to all ministries and departments for the strict implementation of all points of the road maps. The parties noted the need to ensure control over the development and implementation of regulatory documents for each initiative [12].

To date, in the branches of universities of Russia, leading their activities in Uzbekistan, 2,140 specialists have been trained. Starting this year, a double degree rule has been jointly introduced for local specialists who receive education in Russia. On August 1, 2018, the Ministry of Higher and Secondary Specialized Education of the Republic of Uzbekistan signed agreements with institutes specializing in nuclear and engineering physics research. According to the agreements, from 2018/2019 academic year in Uzbekistan there begins the training of specialties in "Nuclear energy and physics" and "Nuclear physics and technology" [10].

Special attention is paid to the fact that reforms in this direction are carried out not only in the capital, but also in the regions. Thus, in the Namangan Institute of Engineering and Technology, together with the Saratov State Technical University, an integration program is being implemented in such areas as Chemical Technology, Technological Machines and Equipment, and Control and Automation of Technological Processes and Production. This program is implemented in the form of 2 + 2, which implies the recognition of a diploma in the territory of both countries [13].

CONCLUSION

As we see, Russia is the closest partner in the field of education development and the role of its universities is high in training personnel for the country. Based on this, here are some recommendations.

- Universities of each region of the Republic need to establish cooperation with Russian universities.

- It seems expedient to open branches in the Fergana Valley where there is a difficult demographic situation.

- It is necessary to improve friendly relations between the two states in the field of training candidates of science and a doctors of science.

WORKING ON TEXT

M. M. Kaxarova*

*Associate Professor,
Ferghana State University,
UZBEKISTAN

ABSTRACT

The article discusses the specific features of using literary texts in foreign language lessons and the use of modern methods in their application, as well as their content and essence. The word "Epic" is derived from Greek , it means narrative literature. In epic works, the author acquaints the reader with the inner experiences of different images, encounters life events in different times and places, and travels in the midst of fantasies.

KEYWORDS: *Communicative Method, Authentic Text, Modern Method, Novel, Fairy Tale, Story, Novella, Anecdote, Parable, Ballad, Creativity.*

INTRODUCTION

Existing texts in textbooks based on the communicative method differ from older textbooks in their authenticity. The texts in the old textbooks would have been written only by the textbook authors. Authentic text refers to an original and an exact written or oral copy.

Experiments show that introducing students to texts, explaining the meaning of the text through various linguistic observations, is effective in teaching foreign languages.We decided to make some recommendations for working on authentic texts below

1. Divide the text into paragraphs.

Arrange the divided paragraphs in groups according to their meaning. In this case, students can do it independently in groups or listen to it on a tape recorder at set times.

2. Divide the text into paragraphs and arrange the pictures in order according to the paragraphs.

If the textbook does not have pictures related to the text, teachers can be creative and prepare pictures themes eves.

3. Continue the text, read it partly and ask the students to continue the rest.

Students compose different stories according to the content of the text. The best-structured stories or relevance of the text will be discussed in the plenum and encouraged by the teacher.

4. Memory exercise on memorizing the content of the text.

The teacher reads the text once. He then gives the text to the students in different pieces and the students try to place it as correctly as possible. The teacher, in turn, motivates them to place them correctly.

5. Create a similar story.

After working on the given text, the teacher asks the students to create similar stories according to the content of the text. Structured similar stories will be discussed in the plenum.

6. Divide the text into paragraphs and refer students to give the title to each paragraph.

The exercise will be conducted in groups and discussed in the plenum.

7. Translate the text into paragraphs in groups.

One paragraph is given to each group and translated in this group, then after the allotted time only one person stay in the group and the rest are distributed to the other groups one by one. Representatives of all groups are gathered in one group and the text is translated according to paragraphs. Each representative will translate their own paragraph.

This way of working on text helps save time.

This method seeks to understand the content of the text globally.

Finding effective ways to work on a text certainly depends on the creativity of the teacher.

The use of literary texts in foreign language lessons plays an important role not only in the development of pupils/students' speaking skill, but also increase their interest in the country where the language is spoken, broadening their worldview.

Types of literary texts include epic, dramatic, and lyrical works. As we use more epic works in foreign language lessons, we will focus on epic works. The word "Epic" is derived from Greek , it means narrative literature. In epic works, the author acquaints the reader with the inner experiences of different images, encounters life events in different times and places, and travels in the midst of fantasies. Epic works include novels, short stories, fairy tales, legends, anecdotes, stories, parables, and ballads.

The novel reflects the author's worldview and the spirit of the period. Unlike novellas and short stories, novels include the life of the hero and events related to them. According to their meaning novels are divided into some types: about adventure, science, history, love, war, homeland.

Fairy tales appear mainly in the Middle Ages, in which miraculous events are described and performed in conditions that are possible or impossible. In fairy tales, the laws of nature are exaggerated. Talking animals, fictional princesses and princes, pure, impeccable morals, the defeat of evil and the triumph of good are among the most essential features of fairy tales in the true sense of the word.

Tales are divided into folk tales and fiction. The creator of folk tales is unknown, they were passed on orally among the people and later collected in book form. Fiction tales are created by a particular writer or poet and reflect the author's worldview or the spirit of the period.

In parables, moral norms or common truths between people are reflected through figurative images. The parables are of a lively socially critical character.

The anecdote is derived from a Greek, meaning "unpublished". Anecdotes are "gossip stories" in terms of their origin, and they are spread secretly. Celebrities are characterized by funny phrases or actions. The anecdote serves as a small means of criticizing certain shortcomings encountered in society.

The novella is derived from Latin and means "novelty". Describing controversial events, such as "What's new?" served to describe the conversation of the upper strata of society under question. In the XIX century, the novella took on its true form and meaning

Commenting on the novella, I.V. Goethe says: "The novella reveals human nature and its inner experiences in an instant."

The process of events is described artistically as in classical drama. The main feature of the novel is that the depiction of events takes place without the intervention of the author or narrator.

The short story is derived from the American translation of the word "short story". Short stories describe the events that take place in everyday life and do not reflect the introduction, developmental processes of the event, and the conclusion. It often represents a moment that is resolved, that doesn't explain everything, and that the end often remains open.

The word ballad is derived from the Latin word "ballare", which means to dance, and was used to mean a dance song in a ballad until the end of the 18th century. The main features of the ballad are epic-textual character, the centrality of the person, the contrast of the person with the existing world, the lack of a certain series or poetic form, interesting and final structure, the stories are given in the form of dialogue.

Literature has a special role in foreign language lessons, and the following are the basics of their usage in the classroom:

● Literature creates very interesting learning situations.

● working with literary texts creates authentic communicative situations.

● Through literature, learners have the opportunity to get acquainted with the culture of the country where the language is spoken.

ANALYSIS DEVELOPMENT OF PAYMENT TERMINALS AND ATMS IN THE REPUBLIC OF UZBEKISTAN

Shermukhamedov Bobur Abbasovich*

*PhD Applicant,
Tashkent Financial Institute,
UZBEKISTAN

ABSTRACT

One of the fastest growing areas of the use of self-payment services in the world is the introduction of payment terminals and ATMs that pay for the services of mobile operators. Self-service payment tools includes payment terminals, touch screen ATMs, video ATMs, and bank terminals. The article discusses the development of payment terminals in the republic. The article discusses the development of self-service payment tools in the Republic of Uzbekistan.

KEYWORDS: *Payment Terminals, Operator Services, Atms And Bank Terminals.*

INTRODUCTION

Over the past few years, the active penetration of mobile services and the boom in the consumer lending market have led to the fact that millions of consumers need to pay monthly for services. Payment terminals are designed to sell goods and services automatically. As you know, terminals for accepting payments are hardware and software systems that allow you to receive payments from customers in automatic mode.

MATERIALS

The sale of goods and services through payment terminals has long been popular in the West. There are more than **7** million payment terminals in the USA, and about **8** million in the EU. In Russia, payment terminals began to appear in the mid-90s. The income of each payment terminal is then higher, when more services can be paid by this specific device, therefore, many payment kiosks and ATMs allow citizens to pay not only for cellular services, but also for the services of Internet providers, as well as to make utility payments and to pay for government services, bank loans and etc.

Research methods

During writing the article, we used the methods of analysis and synthesis of the materials under study on payment terminals in the Republic of Uzbekistan.

DISCUSSION

The self-service banking market of Uzbekistan is actively developing, ATMs were very poorly distributed in Uzbekistan. Self-service devices began to actively fill the market only two years ago, but even today there is an acute shortage of ATMs in the country. Thus, for **34** million of the population of Uzbekistan there are only about **12,455** ATMs, and they are distributed unevenly throughout the country: the main number of ATMs is concentrated in the largest cities. On average, in most countries of the world, it is believed that 1 ATM for **1000-3000** people is sufficient. This means that in order to completely cover the need of the population of Uzbekistan for self-service devices, the country should have about **20-36** thousand ATMs.[1]

The leading position among the existing payment systems is occupied by systems based on plastic cards and, above all, credit cards. Most online transactions are made using this particular type of payment. As you know, a plastic card is a personalized payment instrument that provides the ability to pay for goods and services without cash, as well as receive cash in bank branches and ATMs. One of the main functions of a plastic card is to ensure the identification of the person using it as a subject of the payment system. The issuing bank that issued them is the guarantor of the fulfillment of payment obligations arising in the process of servicing plastic cards. Therefore, payment cards remain the property of the bank throughout the entire validity period, and clients, as cardholders, receive them only for use. The nature of the guarantees issued by the issuing bank depends on the payment authority granted to the client and fixed by the card class. The most common automatic authorization, when the card is placed in a POS-terminal (POS- Point of Sale) that is compatible with all contact and contactless interfaces payment cards operating in Uzbekistan and functions in payment terminals of the main international manufacturers Ingenico Group, Verifone, PAX Technology, including on their latest platforms Telium Tetra (Ingenico), Engage (Verifone), Prolin (PAX).Penetration of bank cards in Uzbekistan.

Results

The number of bankcards in Uzbekistan turnover exceeds **24** million. **19** million of them are registered in the "Uzcard" payment system, and **5** million - in the "HUMO" payment system. And the system consists 99% debit cards. (93%) of the one hand, it indicates the success of the efforts of Uzbek banks on the way to a fully digital bank, on the other hand, it demonstrates a huge potential for growth. If in 2017 the penetration of cards was 31.03%, in 2018 it was 40.52%, in 2019 it was 60.84%, then in 2020 it was 92.85%.[2] The low level of penetration of banking services in general hinders the development of the banking sector due to the lack of sources of cheap liabilities - household deposits. Now, statistic shows that 1 sum of cash accounts for only 0.55 sums of deposits of individuals. If in 2017 the penetration of cards was 31.03%, then in 2020 it increased and became 92.85%.

TABLE 1 NUMBER OF PAYMENT TERMINALS IN THE REPUBLIC OF UZBEKISTAN[3]

Years	Number of payment terminals in the Republic of Uzbekistan (pcs.)
2016	183 060
2017	208 536
2018	235 712
2019	244 913
2020	438 386

The number of payment terminals has grown by 62% over 2 years, however, entry to the payments market is due to high costs for the purchase of non-alternative devices from one player and payment high payments for the maintenance of the system.

TABLE 2 NUMBER OF USERS OF REMOTE BANKING SYSTEMS IN THE REPUBLIC OF UZBEKISTAN[4]

Years	Legal entities	Individuals
2016	81,5	979,5
2017	135,6	1906,5
2018	227,9	4225,4
2019	359,8	7599,3
2020	794,9	11878,0

In 2018 showed a strong jump in remote servicing bank accounts: almost 3 times among legal entities and individual entrepreneurs and 5 times among individuals. The penetration of banking services is gradually increasing due to the development of infrastructure, but a significant part of the population is still not provided with basic banking products. According to the report of the Central Bank of Uzbekistan, for 2020, the number of payment terminals in the country increased by 60%. At the same time, in 2018 this figure was only 20%, in 2019 in Uzbekistan the number of ATMs increased by a third, their growth rate was 34%, and since 2019, contactless payment technologies have been actively introduced.

Commercial banks were given plastic cards "HUMO", as well as terminals that were installed and are installed in hotels, supermarkets, catering, pharmacies and other places. The number of payment terminals installed throughout the country amounted to 438,386, an increase over the same period last year by 244,913 or 45%. The number of installed ATMs and self-service kiosks is 12,455 units, which is 4,128 units or 49% more compared to 1 October 2018. The number of bank cards in circulation exceeded **24** million, which is **4.2** million more than in the same period last year.

CONCLUSION

Every year, mobile technologies penetrate deeper into everyday's life, and in many areas of activity, under the influence of mobile services, fundamental changes have occurred. Among the leaders, of course, is the financial sector. The desire to pay faster, pay more conveniently, pay more securely is the hallmark of the modern consumer, and mobile payments are likely to be the next evolutionary stage in the development of payment systems. There are many definitions of

mobile payments. In general, mobile payments include payment for goods and services, as well as transferring funds using mobile devices.

ABSTRACT

This research paper gives an insight on the recent researches undergoing in the various research areas of golf. The major research areas includes determination of the Club-Head Inertia Properties, Modal Analysis and Finite Element Analysis, Dynamic Response and Simulation, effect of skill level of golfer on variability of EGG measures under different pressure settings, Golfers brain activities during the preparation phase of a full swing, effect of confirming grooves as shown by measured spin rates in skilled golfers, Effect of polymetric exercise on golf swing kinematics, perceptual and biomechanical conflicts in putting, Accuracy of reading putts as a function of skill level and direction of break and viewing position. At the end of the research paper scope of further research based on current research is suggested in the paper.

KEYWORDS: *Golf performance, EGG measures, polymetric exercise and swing kinematics*

INTRODUCTION

The game of golf is an enigma. Shots, which are solidly hit straight and true on one day, may slice, fade or hook on the next, and for years, golfers of all ages have attempted to conquer, or at least understand, the mysterious nature of this game. To provide the average player with more consistent results, manufacturers have continued to improve the available equipment. This has led to larger club-heads, with larger corresponding "sweet spots", different shaft thickness for different swing styles, and the use of advanced materials, such as graphite and titanium, for the construction. The development of improved equipment, which utilizes advanced materials, has

spurred the need for advanced scientific analysis using a variety of techniques. Among the most prevalent of these methods are finite element analysis and experimental modal analysis, and use of these techniques in examining a golf club is the focus of this research.

The finite element method is a numerical method for analyzing structures and system that are typically too complex to be analyzed through standard analytical techniques. In this technique, a structure is divided piecewise into elements, and the performance of each element is then simply characterized. The elements are then connected, and the resulting algebraic equations are simultaneously solved utilizing computational capabilities. Experimental modal analysis has emerged as an extremely useful procedure. Performed under controlled conditions, it encompasses excitation of a structure, or component; acquisition of data; and the subsequent analysis of the response. The uses of modal analysis are varied and range from determination of natural frequencies and damping factor to full development of a mass-spring-damper model of a particular system. For this work, a finite element model, which uses beam elements, is developed from analytically and experimentally determined data and is used to examine the dynamic response of the golf club. The number of elements is increased until convergence, and resulting eigen values and eigenvectors are subsequently correlated with results from experimental modal analysis. Two boundary conditions, free-free and clamped-free, are employed for both techniques since these conditions are among easiest and most widely used for both methods. Also, an additional case, hands-free, is investigated solely using modal analysis to ascertain the boundary conditions of a typical grip. The experimental modal analysis is performed on a golf club, and the mode frequencies and mode shapes are then extracted for three different boundary conditions. The first two boundary conditions, free-free and clamped-free, are used to compare with the finite element model, while the final case, hands-free, is employed to simulate the conditions due the golfer gripping the club. The finite element analysis (FEA) and experimental modal analysis (EMA) results are correlated to determine the suitability of the finite element model, and with this established, the nonlinear dynamic response of the club during the down-swing is investigated using FEA in the software package Algor®. To accomplish this task, swing shaft strain data is first calibrated and converted to produce an input moment curve, which is then approximated in the software. This information is input into the software, which automatically converges the model at the desired time steps, and the results are then examined to determine shaft and club-head response, with special interest in the club-head position at impact with the ball.

Golf fitness has been discussed informally in golf magazines, on television, and at the range. Effects of fitness, strengthening, and stretching exercises have been formally researched by kinesiologists and bio mechanists; and their research has been published. But up to the point of the execution of this study, there had been no research studies directly linking golf fitness to changes in the body directly linked to the accuracy, carry, and distance of

the drive. There had been extrapolations of increased power which would increase distance, but the drive had not been tested directly. Because of existing and emerging opinions and the practice of golf fitness intervention with respect to a golfer's game, and because of the gap in the literature showing direct links of changes in the body from specific golf fitness to the actual outcome of a drive, this study is important. There were no studies looking at the specific physical needs of the individual golfer. Other studies showed responses to general exercises. Previous authors requested more studies looking at the individual golfer and his or her specific needs. This

study filled that gap in the research with a research design sensitive to the individual's needs but with a methodology which could be generalized to all golfers.

2. REVIEW ON RECENT RESEACH AND DISCUSSION

The earliest scientific analysis of the golf-swing and club performance is contained in Cochran and Stobbs' [1] groundbreaking work, *The Search for the Perfect Swing*. Since its publication in 1968, numerous scientific articles concerning golf have been published, and three scientific congresses on the game have been held.

Determination of the Club-Head Inertia Properties

The center of gravity of a structure is traditionally determined by suspending an object at several different points, noting the position and using the principles of statics. To determine the club-head center of gravity, Thomas, Deiter and Best [2] utilize a similar technique. The club-head is suspended from a string and photographed with the appropriate scale, and the center of gravity is then determined from the scales and Previous research [Ref 1] has shown that the brain electrical activity of golf experts shows distinct differences relative to non-experts and facilitates an understanding of the neuro physiological mechanisms that underscore the performance differences between elite and amateur. Compared to novice golfers, experts demonstrate higher frontal theta power values during task performance and an increased stability (decreased variability) in electroencephalograph (EEG) rhythms. The frontal theta is related to working memory, is an indicator of increased attention and is associated with higher skill level during a complex task such as a golf putt. To evaluate the amounts of theta produced during task along with the variability of EEG rhythms, three different levels of golfers were recruited to go through varying pressure settings under golf putt task. The experiment was conducted at Medalist Golf Course in Hobe Sound, Florida. Participants included a professional baseball player but novice golfer, a professional golfer not on PGA listings and an expert golfer. Low-pressure consisted of 18 putts at predetermined locations. Moderate-pressure involved the same putt scenario except this trial would be filmed and an announcer would be describing their actions and putt results so that this footage could be used for a show on the Golf Channel. The high-pressure setting had predetermined putt positions, announcer and cameras, but in addition, each golfer worked as a team with the other golfers and for every putt made, money could be won or lost that would ultimately be donated to a charity. Multiple physiological measures were recorded including electroencephalograph (EEG), heart rate (HR), respiration rate (RR), heart rate variability (HRV), electromyography (EMG), skin conductance, and hand temperature.This method can be quite cumbersome, so Twigg and Butler [3] utilize an "analytical balance" with a sliding beam balance and the sum of moments principle about a pivot to determine the center of gravity. The club-head moments of inertia are generally determined using two different approaches. The first method, utilized by Thomas et al [2] and Johnson [4], uses a pendulum to determine the moment of inertia about three axes. The values are obtained for a second coordinate system, and the principle moments of inertia are then determined using the direction cosines between the two coordinate systems or by solving the inertia matrix. For the other method, used by Twigg and Butler, the moment of inertia is obtained by spinning the object on a spring attached to a drill motor, and "as the system reaches steady-state", the object will align itself with a principle moment axis.

Modal Analysis and Finite Element Analysis

The use of modal analysis and finite element analysis has increased in the determination of shaft response. The correlation of FEA and EMA is examined in a number of articles, with most focusing on the correlation of results for particular boundary conditions and some attempting to characterize the hands-free case as either free-free or clamped-free. In their work, Swider and Ferraris [5] model the shaft and club-head using plate elements but consider only a clamped-free boundary condition for the club. Examination of the results reveals "good" correlation between the experimental and finite element mode shapes and frequencies, and this suggests that an appropriate FEA model can be developed for the club. Okubo and Simada [6] consider the three boundary conditions – free-free, clamped-free and hands. In this case, tests are performed solely on 1 wood, and the EMA results are compared with "the vibration and strain mode shapes generated using computer aided engineering." Based upon their results, the authors suggest that the boundary conditions due to gripping vary through the swing, with the conditions similar to clamped-free at lower frequencies and closer to the free-free case at higher frequencies. Thomas, Deiter and Best [2] model the shaft using tapered beam elements, and the club-head is modeled as a lumped mass at the center of gravity. Three boundary conditions are again employed, but for the finite element analysis, the hands-free case is assumed to be a clamped-free case using springs to represent the hands. Additionally, only the FEA and EMA frequency results are compared, with no comparison of mode shapes included. Friswell, Smart and Mottershead [7] also utilize beam elements, but only the clamped-free boundary condition is analyzed to avoid any uncertainty that may be associated with the hands-free boundary condition. The club-head mass moments of inertia are initially determined from a computer-aided design (CAD) package and then updated in their model. Experimental frequencies are determined directly from the frequency response functions (FRFs) and then compared with the initial and updated FEA results. Friswell, Smart and Mottershead suggest that mode shapes are difficult to obtain "due the mass loading of the accelerometer", and thus the typical "modal analysis techniques, using a roving accelerometer or roving hammer excitation, are impractical on the golf club."

Dynamic Response and Simulation

Cochran and Stobbs provide the earliest analysis of the golf swing and the shaft response. In the work, Cochran and Stobbs model the golfer and the golf club as a two pendulum system, with the upper pendulum constituting the golfer's shoulders and arms. With the wrists as a pivot, the lower pendulum consists of the club, hands and wrist. Using this double pendulum model, Budney and Bellows [8] develop a dynamic model of the club to relate the forces and torques that are present during the swing. Expanding on this, a kinetic analysis of the golf swing is performed, which establishes the force curve for the swing. [9] While the double pendulum model is the most commonly held, the swing can also be modeled as a cantilever beam that is attached to a rotating hub. Using this method, the natural frequencies have been determined by Schilansl [10], Rao and Carnegie [11] and Pnuelli [12]. The dynamic deflections are determined by both Christensen and Lee [13] and Yoo, Ryan and Scott [14]. hristensen and Lee utilize a Newton-Raphson method to solve a nonlinear finite element model, which considers both axial and transverse deflections. Meanwhile, Yoo, Ryan and Scott use the Raleigh-Ritz method to solve a set of linearized equations, which account for the both axial and transverse deflections. The effects of tip mass are introduced in the works of Bhat [15], Hoa [16], Lee [17], Putter and Mannor [18] and Winfield and Soriano [19]. In Bhat's approach, the mode frequencies and mode

shapes are determined by the Raleigh-Ritz method, while the remaining approaches use the finite element method to determine the natural frequencies. In their work, Winfield and Soriano determine "the dynamic response of the beam due to a specified hub rotation", and the results of this analysis suggest that the club-head "kicks" or "springs back" just before impact with the ball. In other words, the club-head position is behind the shaft through the majority of the swing, but just prior to impact, the club-head quickly moves to a position just in front of the shaft. This sudden change of club-head position, or "kick", is then thought to impart greater momentum on the ball.This "kick" phenomenon has also been the focus of other works, and there appears to be a slight controversy on the actual club-head position just prior to impact. On one side, Horwood [20]. Thomas et al [2], Masuda and Korjima [21] all believe that the club-head "springs back" just beforehand. On the other side, Milne [22] and Milne and Davis [23] believe the club-head lags just before impact.

Golf fitness

This study[29] specifically looked at the EEG data and focused on theta but also included the frequency bands: delta, alpha and beta. EEG data was collected during each pressure scenario at Fz and P_Z for the different skill level athletes under the three different pressure settings. Artifact was removed from the EEG recordings and the variance of EEG amplitude within each task was calculated. The variance and standard deviation were calculated and plotted for each subject across each condition for comparison. Results indicated trends between the skill levels of golfer as having an interaction with the variability in EEG. The findings indicate the novice and elite golfer demonstrated low variability across multiple pressure settings while the professional, non-elite golfer demonstrated highest variability between settings. Additionally, as had been previously reported (Babiloni, 2008), The expert participant demonstrated increased levels of frontal theta during the putting task.

Neurophysiological studies have been conducted using and electrophysiological approach (EEG) before and during the golf putt to examine changes related to EEG spectral power during the preparation phase directly before the execution of the full swing in conjunction with the activation of the fronto-parietal network. Ten male, right-handed expert golfers volunteered in this study were screened with a health questionnaire and had no history of neurological, cardiovascular or other major disorders, no current use of medications or drugs. The participants were asked to execute 15 golf shots with a full swing to reach a 100m target with high precision at their own pace. After this execution block (M1) they rest for two minutes in sitting position with eyes open (R1). This procedure was repeated six times (M1/R1-M7/R7). The precision of the shots was measured by the percentage of shots reaching the target within a 10m circle. EEG activity was recorded continuously using only 6 Ag/AgCl electrodes (F3, FZ, F4, P3, PZ, P4) out of 32 embedded in an elastic cap (QuickCapTM, Neuroscan, USA) in accordance with the international 10:20 system. The signals were sampled at 1000 Hz / 32 bit amplified and filtered. An impedance test (< 5 k) ensured a sufficient signal to noise ratio before each measurement. The EEG recordings were bandbass filtered (0.5 – 40 Hz) and visually inspected for artifacts. Only artifact free 2 s epochs (2048 sample Cosine windows) before the start of the movement were used for analysis. Power spectra were calculated for each epoch and divided into Theta (4.75 – 6.75 Hz) and Alpha-2 (9.75-12.5 Hz) frequencies. For statistical analysis (ANOVA TIME x CONDITION) the average power values were log-transformed. Spectral power in each frequency was computed in each block (M1/R1-M7/R7) in each subject. The participants

reached the 100m target very precisely with 85.4 % of all balls lying within a 10m distance circle. The statistical analysis demonstrated a CONDITION effect with higher Theta values in frontal brain areas during the preparation phase compared to rest in all three frontal electrode positions (F3: p=0.017; part. eta2=0.579; Fz: p=0.031; part. eta2=0.509; F4: p=0.026; part. eta2=0.529). Parietal Alpha-2 spectral power show significant lower values in the preparation phase 2 s before execution in P3 (p=0.043; part. eta2=0.523) compared to the resting condition.

A study is conducted recently [30] to quantify the spin rates of skilled golfers with 2 different wedges (56° and 60°) with conforming versus non-conforming grooves. Eight university-level golfers (mean handicap 1.1) were asked to hit a series of golf shots with each wedge in an indoor laboratory setting from a launch monitor that measured impact characteristics. The results of the study showed that the skilled players in our study were actually putting greater spin on shots using wedges with conforming grooves. These somewhat puzzling results were explained, at least partially, by supporting evidence that showed that the players were swinging the newer wedges at greater velocities. It was concluded that, for yet unknown reasons, skilled players were delivering the conforming wedge to the ball with greater club head speeds, thereby imparting significantly greater backspin to the golf ball. The implications of these data are discussed from both skill acquisition and applied (i.e., club fitting) perspectives.

A study [31] to examine how plyometric training can influence golf swing kinematics is conducted recently. Sixteen male golfers who were plyometric naive participated in the study. Participants were randomly assigned to either the control group (n=8; hcp 3.3 • } 1.6; 24.4 • } 8.8 yrs) or experimental group (n=8; hcp 3.8 • } 1.6 [2 professionals excluded]; 21.5 • } 5.5 yrs). The control group continued with any existing exercise programme that they were performing, whilst the experimental group followed an 8-week plyometric exercise program. Training consisted of two plyometric sessions a week for eight weeks. Sessions contained the following exercises: Multi-directional Hops, Bounding, Lateral hops, Squat Jumps, Overhead Throws, Squat Ball rotational throws, Kneeling lunge Rotations, Frontal rotation throws. All swing kinematic analysis took place on a driving range and after completion of their normal warm up routine each participant hit five 6 iron shots from a driving range mat at full speed toward a designated target at a distance on the range using a full compression ball. Three-dimensional kinematic data was collected using a Polhemus Liberty electromagnetic tracking system (Polhemus Inc., Colchester, VT, USA), sampling at 240 Hz. The target was located so that a line drawn between it and the position of the ball on the driving range mat was parallel to the x-axis of the global frame. Kinematic variables were calculated for each shot and included: maximum rate of X-factor stretch (MROS), maximum rate of X-factor recoil (MROR), maximum X-factor (mXF), X-factor stretch (XFs), peak pelvis speed (pelvispeak), peak upper torso speed (torsopeak), peak lead arm speed (armpeak), peak hand speed (handpeak). A between groups repeated measures design approved by the University Ethics Committee was used **to assess the impact of an 8-week plyometric exercise programme on golf swing kinematics**. The effects of the intervention on swing kinematics were analysed using mixed factorial MANOVAs with a repeated factor of test (pre-test, post-test) and a between-groups factor of group (control, experimental). Where significant effects were found follow-up mixed factorial ANOVAs were performed to identify significant effects within individual variables along with pairwise comparisons. All data and reported as mean (95% CI) unless otherwise stated.

Table 1. Kinematic variables pre and post intervention. *significant change between pre and post testing, p<0.05)

	Power training		Control	
	Pre	Post	Pre	Post
mXF (°)	61 (56-67)*	68 (60-76)*	57 (51-63)	56 (48-64)
XFs (°)	14.9 (9.8-20.0)	17.0 (12.4-21.6)	15.5 (10.4-20.5)	13.4 (8.7-18.0)
MROS (°s^{-1})	91 (63-119)	99 (81-117)	72 (44-100)	67 (49-84)
MROR (°s^{-1})	771 (652-889)*	929 (769-1090)*	651 (533-770)	651 (490-812)
Pelvis$_{peak}$ (°s^{-1})	490 (430-550)	513 (465-561)	443 (383-503)	457 (408-505)
Torso$_{peak}$ (°s^{-1})	745 (688-802)	770 (725-815)	718 (661-774)	734 (689-779)
Arm$_{peak}$ (°s^{-1})	868 (766-970)*	930 (840-1020)*	905 (803-1007)	908 (819-998)
Hand$_{peak}$ (°s^{-1})	1483 (1401-1565)*	1562 (1473-1651)*	1438 (1356-1520)	1404 (1315-1493)

There was a significant interaction effect between test and group for MROR, MROS, mXF, XFs (Wilk's λ=0.32 F4=5.9, p=0.009). Follow-up ANOVAs showed the interaction to be present for MROR (F1=5.0, p=0.04), XFs (F1=7.2, p=0.02) and mXF (F1=7.0, p=0.02) with pairwise comparisons showing significant increases in MROR and mXF for the experimental group post training (Table 1). There was a significant interaction effect between test and group for peak segmental speeds (Wilk's λ=0.45 F4=3.4, p=0.049). Follow-up ANOVAs showed the interaction to be present for armpeak (F1=5.5, p=0.03) and handpeak (F1=13.5, p=0.003) with pairwise comparisons showing significant increases in armpeak and handpeak for the experimental group post training (Table 1).

A study [32] is conducted on to quantitatively analyze how golfers couple versus uncouple their feet from their putting actions on right-to-left (RTL) and left-to-right (LTR) breaking putts, to relate these actions to their estimation of break, and to propose a partial explanation for why LTR putts are considered more difficult than RTL putts, for right–handed golfers. Twenty-one proficient male golfers (ages: 20-25, USGA HCPs: 0-7) participated in the study. Each golfer performed three straight putts 6.1 m (20 ft) in length in a swing laboratory. An overhead camera captured foot placement relative to the ball-to-hole direction. Average baseline toe-line angles (TLAs) were determined for each golfer. Each golfer then putted three times each to two different holes on a putting green. These putts were also 6.1 m (20 ft) in length, incorporating moderate RTL and LTR breaks. Prior to each attempt, golfers provided an estimate of total break (EST), defined as the distance from the hole to the putt's starting velocity vector, measured at the hole perpendicular to the original ball-to-hole line. To control for putting pace, putts were considered valid if the ball reached the hole, or stopped within 0.46 m (18 in) beyond the hole. An overhead, boom-mounted video camera captured ball motion and foot placement relative to the original ball-to-hole line. EST and attempt outcomes (make, miss high, miss low) were recorded, and TLAs and initial ball projection angles (BPAs) were calculated by analyzing the overhead videos. TLAs for each golfer during breaking putts were corrected based on their

straight putt TLAs. The putt's actual breaks were determined trigonometrically based on the average BPAs of the made putts. ANOVA was used to analyze differences between TLA, BPA, and EST for each putt, and ANOVA with repeated measures evaluated learning effects across the three attempts. The actual breaks of the 6.1 m (20 ft) RTL and LTR putts were 1.14 m (44.8 in) and 0.98 m (38.7 in), respectively. Perfectly struck putts were thus struck with the ball initially travelling 9.3 and 10.8 degrees above the original ball-to-hole line for RTL and LTR breaking putts, respectively. EST averaged 76.4% of the actual break for the RTL putts, and only 64% of the actual break for the LTR putts. These estimates did not statistically improve across attempts. Only 9% of RTL putts were made; 24% were missed on the high side, and 67% were missed low. For LTR putts, 19.7% of the putts were made,were missed high and 59% were missed low. With LTR putts, TLA and BPA were nearly equal (averaging 9.8 and 9.7 degrees, respectively); one degree lower than the actual break. Thus, on average, golfers struck LTR putts parallel to how their toes were aligned and below the required break. TLA and BPA were statistically greater than EST, differing by 2.8 deg. For RTL putts, TLA and BPA were remarkably disparate (averaging 2.8 and 8.8 degrees, respectively). On average, these RTL putts were struck half a degree lower than needed to make the putt, while the feet were aimed 6 degrees more open than the ball's starting direction. TLAs were statistically different (less) than both estimated break (EST) and BPA. Cluster analysis exposed differences in technique. It appears many proficient golfers uncouple their feet from their putting stroke on RTL breaking putts, prioritizing ball starting direction with less regard to foot placement. The putter is swung dramatically away from the toe line, well above the estimated break and TLA. By contrast, the feet are placed parallel to the starting direction of the ball on LTR putts, but aligned below the required break. To make a LTR putt, the putter must be swung toward the toe-line (out to in); a potentially more difficult/uncomfortable action than the outward (in to out) swing path of the RTL putt. These findings alter the understanding of putting mechanics and should be considered in instructional settings.

3. CONCLUSION

We have variety of research undergoing in the above field but a research design sensitive to the individual's needs but with a methodology which could be generalized to all golfers is still in need. A lot of fields including golf injuries, Epidemiology of female golfers, coach's perspective on fitness, relation between injuries and golf playing surfaces, drag on the golf ball drops, Reduction on body load during swing and impact and optimal kinetic sequencing need more attention.

ABSTRACT

The articles reflect the dreams, human qualities, in short, all the positive qualities of the wise people and teach young people to express their thoughts deeply, concretely and figuratively. Proverbs are of great ideological and educational importance in our daily life because of the fact that they test and reflect the views of people's life, dreams and the world in centuries - old experiences. Thoughts about the spirituality of the people of ancient times, particularly, morals, ancient customs, traditions, enlightenment, thoughts about education are expressed in the folklore, for example, about Gurugli, Alpomish. At present, Samarkand pigs, Namangan suits and trousers, Fergana jackets are valued in the world markets as goods in demand. Unless we teach our young people who are the future of our homeland our national values, traditions, the next generation will not forgive us.

KEYWORDS: *Qualities, Figuratively, Traditions*

INTRODUCTION

The article considers the problems of educational and moral influence of folklore. A great importance is attached to the values of our culture, our national art, the wide use of wonderful art samples created by our ancestors in the education and training of students today and which are famous all over the world. It is not surprising that the oral creativity of the people is compared to a large ocean.

Our wise grandfathers thought up folk Proverbs, songs, wise sayings that inspire respect for the adult, compassion for the little one, love for the motherland, preservation of natural riches.

Through such samples of oral creativity, they encouraged to appreciate respect the fatherland, to appreciate the parents, to honor the elderly.

Thoughts about the spirituality of the people of ancient times, particularly, morals, ancient customs, traditions, enlightenment, thoughts about education are expressed in the folklore, for example, about Gurugli, Alpomish. These traditions are also represented in samples of ancient Sogd, Manichae, Khorezm, Turkish inscriptions.

Counted as one of the valuable masterpieces of our people, the epic "Alpomish" is a huge epos singing heroism, bravery, patriotism, unity of different nationalities and peoples, love and loyalty, family stability and kinship, relations during the emergence of statehood, socio - political life of that time, customs, morality, feelings of brotherhood, people's thoughts and dreams are brightly expressed in the life of the herdsmen. This epic is an immortal work about heroism, friendship and togetherness, loyalty and trust.

In the epic, the symbols of Alpomish, Princes Tavka, the simple shepherd Kayqubot were motivated by the students to moral purity, physical perfection, spiritual heights, Kalmakshokh, Surhayil maston, the kalmak Alps, who were the head of The Elder, Bodomchu'ri and his son Ultontoz, through the like of the evil in men, greediness, hypocrisy, humiliation of others, vanity, ambition, chastity, discrimination, dishonor, dishonor, dishonor vices are expressed. In this rare example of people's oral creativity, people's lifestyle, customs, rituals, traditions, religious beliefs, dreams, spiritual experiences, spiritual and moral ideals are described in a specific way. The human dignity stains the dogmatic vices.

Opinions on education and morality are expressed in folk Proverbs, which are considered rare examples of oral creativity of the people. Proverbs are of great ideological and educational importance in our daily life because of the fact that they test and reflect the views of people's life, dreams and the world in centuries - old experiences. As an example,
Translation:
> Be respectful to the adult,
> Be in the glory of the little one.
> The water of the river flows in the spring.
> Labor increases the value of man.

These proverbs say exemplary thoughts. The IBA thought expressed in the proverb is conspicuous not only in individuals, but in the profession of a universal character.
Translation:
> If you walk with good, you will get your achievement,
> If you walk with evil, stay ashamed.
> > If the sun warms the air,
> > Friendship warms the heart.
> > Gold Silver is obsolete.
> > No price will be equal to parents.

The articles reflect the dreams, human qualities, in short, all the positive qualities of the wise people and teach young people to express their thoughts deeply, concretely and figuratively. Motivating them to be truthful, hardworking, courageous, brave, patient and resilient, they will capture the best human qualities. For this reason, their socio - political and educational significance is enormous. Folk songs are also examples of unique creativity, created by our wise

ancestors, reflecting their lifestyle, worries - admonitions. People's songs, especially moral relations in terms, three of the views of educational importance. Most of the terms have a didactic character. The creative hard workers, who saw the bitterness of the world, the low and high, the good and the bad, created a series of works about the positive and negative sides of these different situations. So,

Translation:

> Sweet in this world, friends, living,
> Conversation with your own equal, yorons.
> Say a person with a good approach,
> Do not be every single, friendly, yorons.

The lines about compassion for friends, understanding of good and evil, hatred for the enemy, being in the circle of good people living right, honest in life, more to enjoy their conversation are imbued with an idea. Examples of songs and terms related to the peoples of ancient Central Asia are also numerous triples in Mahmud Kashgari's work "Devoni Lugoti Turk(Dictionary of Turkish words)". Excerpts from folk songs presented in Devon are of both scientific and educational importance. Some examples of songs which carry didactic meaning are similar to the traditional motive - father sermons available in Uzbek folk friends.

Translation:

Nobody doesn't pay attention to bad words,

To Bad, mercenary, without conscience.

Be pleasant, be joyful,

Let your name last for many years.

In the above lines, such vices as cheekiness, greediness, hypocrisy are condemned; such qualities as kindness, gentleness are glorified.

Our wise people did not say in vain the proverb "Fairy tales-lead to good". Fairy tales are considered one of the most ancient and common examples of folk oral creativity.

High samples of morality and decency are glorified in them, and oppression and injustice are condemned. Uzbek folk tales express the long-term life, social relations, traditions, political and moral concepts, world views of our people. Fairy tales can be called an artistic history of the Uzbek people, a living art.

The educational significance of fairy tales is great. About this, one of our great scientists said:"there is nothing in the world that cannot be a lesson; there is not a single fairy tale in itself that does not include didactics, tools of lesson." There are different types of fairy tales: magical fairy tales, life-household fairy tales, figurative fairy tales, satirical fairy tales, etc. Each fairy tale has its own ideological direction, composition, in which a common feature is noticeable. The end of all fairy tales ends with goodness, which is always glorified by the victory of good over evil, the injustice of truth, over oppression. The pedagogical significance of fairy tales is enormous. They develop children's spiritual and aesthetic tastes, the world of thinking. Tasks help to believe in the idea that good will eventually abstract evil by showing them ways to get out of any ill situations . We know that in fairy tales a certain positive and negative images are expressed.

For example, dev(monster), witch, stepmother, dragons are considered as negative heroes vs Semurgans are considered positive images which assisted for youngest sons, orphan girls. For example, Semurgosbek in mythology and fairy tales is a kind friend of Heroes, a defender, a good-natured, an enemy of evil, in short, a fantastic hero bird. It promotes the achievement of

obesity on its own goal. He lives on top of a secluded tree in the desert, where the legendary addresses- "The wing of the bird flies, the leg burns if the man walks". Semurg is widely described in fairy tales, such as "Hero", "Semurg', "Oynai Jahonnoma (Mirror which you can see the world)", "Rustam", "Kenja Botir(Junior Brave man)". One of the samples of oral creativity of the people is told in the fairy tale "The Just King" that the King was chosen as a king in his childhood because of his moral, good manners and wisdom. As a just king, he walked around the world, became a medicine for the sufferings of the poor, wiped the head of the orphans, and opened the door to charity.

Examples of the oral creativity of the people: Proverbs, fairy tales, riddles, freedom through the image of positive heroes in anecdotes, orders, labor, patriotism, provoked by negative symbols, were called to dry the seeds of evil, sow the seeds of good.

In the period of the primitive community and slavery in Central Asia, methods such as instruction, explanation, encouragement, praise, sample rendering, rebuke, banning, coercion, poking, intimidation were used in the upbringing of the child. And the use of these methods is carried out by relying on the rules of morality, that is, the work done by the child is sure of the correctness or inaccuracy of his actions, and also by explaining the meaning of morality and dirt, good and evil. This order was considered the main rule in the upbringing.

In the past (even now) it was considered that the most optimal way for parents in upbringing, adults to be an example for children. To encourage children to learn the craft from the head, to explain to them that an ingenious person will never be offended, is the duty of every teacher and parent. In ancient times, the craft was considered sacred, those who deeply respected it. With crafting, people began to engage in primitive times, making various items, things. Over the centuries, the tradition of craftsmanship has evolved and improved and reached us. Craftsmanship has also historically been self-centered and tradition. These things did not come of their own. They appeared on the basis of certain reasons and passed on from generation to generation.

For example, each craftsman is accustomed to his own master. This Pir (Master) was considered the founder of this craft. It is believed that the hands of our ancestors were given, and the elderly Masters said that the spirit of the master craftsmen who passed through the world wandered around the masters of this craft. Therefore, the Masters of craftsmanship always prayed before starting work, rejoiced the spirits and asked them for spiritual help. Each craft had its own feathers. For example:

- The father of wood carving and boatman is Prophet Noah;
- The father of blacksmiths is Hazrat Dovud;
- The father of weavers is Prophet Idris(Andrew);
- The father of gold embroidery is Hazrati Yusuf(Josef);
- The father of pattern of embroidery is Bahouddin Nakshband;
- The father of shepherds is Zangi Ota;
- The father of pottery is Mir Emir Kulal (Mir Kulal)

In ancient times, it was customary to praise and appreciate every Master and master of craft. Students and their parents relationship contained to pir(master) and eastern to the teachers. There were oriental criteria of decency to teachers and masters (pirs) by students and their parents. Sufi demonstrator Sufi Olloyor wrote:

Translation:

If there is no way
Shower is pir,
Satan around neck
Domi tazvir.
When every pir knows
Happy roads,
If you know the fine, give him your hand,
He is pir, who is the man of the Earth,
Become a lion of the sect profession.
The criteria for the interaction of the teacher with The students under the arm are as follows::
- Lack of laziness;
- Not betraying the deposit of a friend;
- To be in an intimate relationship with mutual sympathy;
- To be disciplined;
- Not revealing each other;
- Not to be hypocritical and dishonest; envy, not to gossip, not to seduce, not to lie;
- help each other;
- To enjoy the success of a friend.

Student had the name Master on the basis of the ceremony "master agree" after a certain period of time, reaching the level of independent work. With the consent of the masters, they gave good luck to continue the same craft to the students. The Masters who did not receive a luck from the craft they said that "The master(pir) of the devil".

Embroidery, gilding, tailoring were carried out by both women and men. If gilding was famous in Bukhara Sharif, embroidery was famous in Karshi on the sides of Surkhandarya, tailoring and sewing works was famous in Fergana, Namangan cities. Items of jewelry: chopons (Roe), jacket, forehead, sandals (cowl), teapot, cooler, tarpaulin, duppi (hat) are used for good days – wedding, anniversary ceremonies. Embroidery products: umbrella, joypush, joynamaz (praying carpet), pillow skin, paranji, duppi (hat), nimcha, jacket, takyapush...it is also used in the present days. A good tailor-made item is worn long. At present, Samarkand pigs, Namangan suits and trousers, Fergana jackets are valued in the world markets as goods in demand. Unless we teach our young people who are the future of our homeland our national values, traditions, traditions, the next generation will not forgive us.

In accordance with the "National program of training of cadres", we carry out education and training, we need to fully use the National originality, the criteria of etiquette for eastern teacher-student, the spiritual heritage left by our ancestors.

ABSTRACT

In modern comparative linguistics, special attention is paid to the study of concepts, which makes it possible, using the accumulated data, to structure concepts and compare them, examining in their content universal (global) and nationally specific characteristics using the techniques and methods of comparative linguistics. Even L.V. Shcherba attached great importance to the comparative study of languages for a better understanding of his own [13, p. 101].

KEYWORDS: *Comparative Linguistics, Concept, Conceptosphere, Cognitive Features, Bilingualism, Bilingual Elements, Psychoimages, Hybridization, Lngvospatial Space.*

INTRODUCTION

The application of the methods of comparative linguistics, that is, the constituent seasons of the concept sphere (the concepts of winter, summer, spring and autumn) on the material of different structural languages - Russian and Uzbek, makes it possible to identify and detect the similarities and differences in the content of concepts. Since, in general, within the framework of comparative linguistics, the common and different in the set and number of units that make up a particular subsystem are clarified, the core and periphery of the subsystems of the languages being compared are revealed. This approach uses a comparison of two or more languages at the same time, while the similarities and differences are equally important [11, pp.13-15; 12, p.128].

II. LITERATURE REVIEW

In this article, Russian will be the source language, and Uzbek is the language of comparison. Because, despite the structural differences between the Russian and Uzbek languages, our countries have a historical experience of social, cultural, and, of course, linguistic interaction.

So, the most ancient (archaic) cognitive layers in the meaning of concepts, which are based on the system of observations of ancient people and their behavioural reactions to natural and climatic conditions, are among the universal (global) characteristics of the concepts of winter and summer of the concept sphere "seasons". So, for example, the definition "coldest time of the year" or "period of the year following autumn and preceding spring" can be applied to the dictionary definition of winter in both Russian and Uzbek: see, for example, "самое холодное время года, следующее за осенью" [9, p. 206] and "Yilning kuzdan keyin keladigan eng sovuq fasli" (coldest time of the year, following in the fall) [16, p. 253].

And such characteristic weather phenomena associated with winter on the territory of the Eurasian space as cold, snow, snowfall, frost, shortened daylight hours, and their attendant meanings, allowing the creation of metaphors with the word winter (such as: hunger, freezing, death, darkness, evil, old age), are equally present, and / or can be metaphorically (or contextually) present in both Russian and Uzbek concepts of "Winter".

III. Analysis

The vocabulary definitions of summer in the Russian and Uzbek explanatory dictionaries are also almost identical: "Самое теплое время года, следующее за весной" [9, p. 285] and "Yilning bahor bilan kuz orasidagi eng issiq fasli" (The warmest season following spring) [16, p. 253]. Both definitions emphasize the characteristic weather feature - "the warmest season", and in the meanings of the concept, both in Russian and in Uzbek, we meet such common meanings as heat, rest and vacation.

Note that the real, pragmatic meanings of the concepts winter and summer, associated with the state of nature, weather and temperature, refer to the deep cognitive layers of concepts, since they reflect the experience of "Homo sapiens", going back to archetypal, ancient ideas based on the experience of cognition of the environment space and reality and survival in them.

Ancient people, in order to survive, had to be very observant, so they noticed cyclical changes in nature very early. They recorded their observations, knowledge in astral drawings, which reflected rather complex patterns of behaviour of the Moon and the Sun [8, p. 47]. Such observations were of a practical nature and were associated with the collective economic activity of man. Observations and representations of this kind are correlated with the basic codes of culture; they record ideas about the universe. The basic codes of culture can be traced in the basic oppositions, which include the oppositions "up - down", "far - close", "good - bad", "friend - foe", and some others [4, p. 375]. These include a winter-summer pair, the opposition of which is reflected in folklore: proverbs, sayings and riddles in which the attitude of winter is bad, comparable to the threat to life - cold, hunger, death, danger, etc .; the attitude of summer is good, solarity, gifts of nature, and a favourable period for hard exhausting work to prepare for survival in winter. Thus, these two seasons turn into a conceptual opposition "winter-summer". For example, in Russian: *Summer works for winter, and winter for summer, What is born in summer will come in handy in winter; In the summer you will not collect - in the winter you will*

not find; There will be winter - there will be summer; Prepare the sleigh in the summer and the cart in the winter; You will lie in summer, in winter you will run with a bag; In the summer you walk up, in the winter you get hungry; You won't sweat in summer, and you won't get warm in winter. In the Uzbek language: qish g'amini yoz o'yla - Take care of winter in summer; Yoz g'amini qishda, qish g'amini -yozda - Take care of summer in winter, winter in summer; Yozda yozilasan, qishda yig'ilasan - In the summer you will put everything out, in the winter you will pick up everything. Thus, both in Russian and in Uzbek, despite the linguistic design, that is, the structural differences between the Slavic and Turkic languages, the similarity of the display in the language of the opposition of the concepts "winter-summer" is traced, reflecting, thereby, the similarity of cognitive processes ancient people, that is, the similarity of the worldview of our ancestors of fragments of the surrounding reality (collective unconscious, according to the term proposed by K. Jung). In the linguistic system, such conceptual oppositions are presented as isolated antonymic pairs that are not connected by polysemy or synonymy relations with other words expressed by unambiguous words opposed to each other. Thus, we observe the antonymic pair winter (the coldest season) and summer (the warmest season) in both Russian and Uzbek languages [1, p. 360; 10, p. 305], and a similar pair in the Russian and Uzbek languages shows the maximum similarity, both in semantics and in structure [7, p. 17]. Also, in Russian and Uzbek languages, in terms of temporal settings, the concept "Winter" and the concept "Summer" reflect the linear concept of time, that is, winter and summer oppose each other, but do not follow each other; their recurrence is cyclical according to the course of the four seasons.

Considering that the linguistic projections of the collective unconscious, in this case the conceptual opposition "winter-summer", do not have blood and racial heredity, but belong to humanity as a whole, we can conclude that in the deep, or basic cognitive layers of the concepts of winter and summer, as in Russian as well as in the Uzbek languages, there is a single for all mankind, a common integral and identical basis. The further development of mankind, a change in historical, social and cultural realities worked to introduce additional layers - meanings and meanings in the concepts of winter and summer in general and in particular: As, for example, the celebration of the New Year on December 31st on January 1 realities and holiday traditions. Since this tradition, in comparison with the territory of Russia, appeared on the territory of Central Asia relatively recently, at the beginning of the 20th century, the connection of this phenomenon with the concept of winter in Russian is historically "older", more than 200 years, than in the Uzbek language, since in Russia, this holiday has been celebrated since 1700, according to the decree of Peter I on the reform of the calendar. Before Peter I, the New Year came at the beginning of September, and before the decree of 1492 of Tsar Ivan III - in March, that is, according to the calendar rhythms of the solar calendar, preserved from the pre-Christian, pagan era. Note that the Old Russian tradition of counting the New Year in March according to the solar calendar coincides: it coincides with the tradition of the celebration of Navruz in March among the Iranian and Turkic peoples, also according to the astronomical solar calendar. However, if, after historical state reforms in the linguocultural space of the Russian language, the celebration of the New Year "stuck" on the dates of December 31 to January 1, then in the Central Asian region, in the linguocultural space of the Turkic languages in general, and the Uzbek language, in particular, by the beginning XX century traditions of counting the new year according to the lunar calendar (Muslim calendar, "floating" date) and the solar calendar - Navruz - coexisted. In the 20th century, they were supplemented by the celebration of the New Year in the Western style. Today, in the 21st century, due to the revival of Muslim traditions

within the secular state, a unique phenomenon is observed in the linguocultural space of the Uzbek language - the new year is associated with three phenomena: the "winter" New Year, the new year according to the lunar Muslim calendar, and "Spring" national new year according to the solar calendar - Navruz. Thus, emphasizing that the concept of "Winter" in the Russian linguistic picture of the world and in the Uzbek linguistic picture of the world are phenomena, although they have a number of similar characteristics, but, nevertheless, are not the same, but unique in their national specificity.

In contrast to the rational assessment of the deep layer of the concept (an objective assessment of the surrounding reality, the phenomenon), in the peripheral layers of the meanings of the concepts of winter and summer, the emotional-associative beginning (subjective assessment of the surrounding reality, phenomenon), closely related to evaluativeness, dominates. "Evaluation, represented as the correlation of a word with an assessment, and emotionality associated with emotions, feelings of a person, do not constitute two different components of meaning, they are one. Evaluation, as it were, absorbs the corresponding emotion <…>" [6, p. 40]. A positive assessment is associated with approval, admiration, etc., a negative assessment - with disapproval, indignation, etc.). This is the origin of certain psycho-images of winter and summer in the minds of native speakers of the Russian language and the Uzbek language. N.V. Krasovskaya and V.I. Drachuk in his studies define this as a tradition of national use of this concept [5, p.22; 3].

IV. DISCUSSION

The essence of the matter is that Russia is a country located in the northern latitudes, where more than 60% of its territory is covered by permafrost, and about 77% of the country's territory (13.1 million square kilometres) is occupied by the Siberian region, with its extremely cold climate. The exceptional duration of winter time, low air temperature, typical for a significant part of the country, determined not only the type of management, economy, culture and worldview, reflected in the meaning of the concept of "winter", but also its perception as a typical "Russian" season. Whereas, for example, Tashkent and Tashkent region are located in a subtropical continental climate zone, and due to the proximity of mountains, the city receives an average of 400 mm of precipitation per year, which is much more than in the lowland semi-deserts and deserts in western Uzbekistan. Precipitation, as a rule, falls in the form of rain (98 days a year), less often in the form of snow (27 days) and rain and snow (14 days). The snow cover in Tashkent is unstable and during the winter it lays down for a total of 32 days [Source https://ru.wikipedia.org/wiki/Climate_Tashkent]. Moreover, due to global warming, the snow cover in Uzbekistan is becoming less and less stable, winters are becoming milder, with even less precipitation, and dry heat begins almost from mid or late May. And although the Russian winters have also been affected by global warming, the difference between the winters in the Russian Federation and in Uzbekistan is still significant. Consequently, the concept of winter on the peripheral layer, in its additional cognitive features, is significantly different for a Russian speaker from Russia, and an Uzbek - a native of the Uzbek language, as well as Russian - a native of the Russian language, but born and living in Uzbekistan. After all, Russian-speakers by ethnicity, born and living in Uzbekistan, are in close contact with the local climate, local population and, accordingly, their language and their understanding of reality. It is not by chance that in Russian poetry, in contrast to Uzbek poetry, there are so many poems in winter; only

among the poets of the XIX century wrote about winter P.A.Vyazemsky, V.K.Kyukhelbeker, A.S. Pushkin, F.I. Tyutchev, M. Y. Lermontov, I.S.Turgenev, A.A. Fet, A.N. Maikov and others. In them, the varieties of atmospheric precipitation associated with the winter season are represented by lexemes snow and lexemes denoting types of snow and its intensity: **powder, ice, blizzard, hoarfrost, rime, swan down**; or figurative associations: snow swan down. Such a variety of designations for types of snow has not been noted in Uzbek poetry. Snow in the works of Uzbek poets is often associated with something light, reminiscent of cotton or flour: - Hey, who is shaking from the clouds // Are there bags of flour on us? (Winter morning, Quddus Muhammadi). Have you heard about cotton? Our cotton is whiter than snow. (Uzbekistan, K. Khikmat).

Let us also note an important aspect of hybridization of psycho-images arising through social, cultural, and linguistic interactions. It is well known that the Russian Federation is attractive for earning not only among residents of the capital and the capital region of Uzbekistan, but also among people from other regions of the Republic, where the percentage of the bilingual population is traditionally lower: "There is an informal concentration of regional origin, for example: Tashkent Uzbeks live in the Kalinin bases and Sennaya Square (St. Petersburg, our italics), Samarkand ones - near the Torzhkovsky market, people from the Fergana Valley settle on Uralskaya Street on Vasilyevsky Island, and on the 24th line of Vasilyevsky Island - Uzbeks come from Khorezm. <…> An important aspect of the Diasporas' activities is teaching the Russian language. <…> For more than 5 years in the city on the Neva there has been a volunteer organization "Children of Petersburg", which specializes in classes for the younger generation. The centre is in great demand, as often little Uzbeks go to schools and kindergartens <...> It is very difficult for foreign children without basic knowledge of Russian. [Source: Sputnik Uzbekistan   https://uz.sputniknews.ru/analytics/20180124/7335844/migranty-uzbekistan-saint-Petersburg-spb.html, accessed 05/20/2020].

Thus, we can assume that leaving for Russia, and having experienced its climatic conditions, Uzbeks acquire other, different from the usual, psycho-images of winter and summer (spring and autumn). While maintaining universal human significance, individuals develop a hybrid (Uzbek-Russian, Russian-Uzbek) understanding of the concepts that make up the conceptual sphere of the seasons, which are more vividly manifested in the cognitive signs of the peculiarities of weather conditions and anomalies and seasonal clothing.

In the Russian language, among the additional cognitive features of the concept winter are presented in a comparative table compiled on the basis of the "Cloud of associations" drawings presented on the material of the Russian and Uzbek languages:

Figure 6: Comparative table of additional cognitive features of the concept "Winter" in Russian and Uzbek languages

Comparison of additional cognitive features of the concept "Winter"		
Cognitive signs	**Russian language**	**Uzbek language**
features of weather conditions and anomalies about water conditions	icicle, cold, ice, frost, snowdrift, crust, lump, snowball, ice skates	snow, frost, muses, icicle
means of winter physical activity	skis, sledges, snowboard, snowballs powder, ice	games

types of snow and its intensity or its figurative associations	blizzard, snowstorm, hoarfrost, rime, swan's down	cotton, down
locations related to winter and / or winter pastime festive events	Russia, North	Chimgan, mountains, Beldersay
associated with positive emotions	New year, tree fur coat	Christmas tree, New Year
seasonal clothing	mittens, felt boots, down jacket, jacket, sheepskin coat	warm socks, hat, coat
social and / or cultural phenomena	fireplace, pattern (i.e. frosty patterns on glass), firewood, sheepskin coat, wolves, smoke, fairy tale, troika, hunger, earflaps, session, battery, bath, vacation, hardening, Umka, mulled wine	Santa Claus, olive, mandarin

Comparison of data emphasizes the national specificity of the concept of "Winter" in the Russian and Uzbek languages, since additional cognitive features differ, and their difference is due to climatic, social and cultural characteristics. The mild winter of Tashkent and the Tashkent region does not require the same variety of warm outerwear as in Russia; in the Russian concept of winter, the features of weather conditions and anomalies about water conditions, types of snow and its intensity, social and / or cultural phenomena are also more diverse. They also differ in the imagery of the presentation of snow, but they have a common point of contact: the celebration of the "winter" new year as a vivid illustration of the contact, interaction and mutual influence of two cultures.

Summer climatic features also formed the difference in additional cognitive features of the concept "Summer". We have already noted the fact that the concept of summer in the linguo-historical and linguocultural space of the Russian and Uzbek languages has changed from a phenomenon associated with heavy agricultural work in preparation for the winter period to a phenomenon associated with positive, psycho-emotional reactions, associations with rest, vacation, vacation, abundance, travel or trip, goodies.

Figure 7: Comparative table of additional cognitive features of the concept "Winter" in Russian and Uzbek languages

Comparison of additional cognitive features of the concept "Summer"		
Cognitive signs	**Russian language**	**Uzbek language**
features of weather conditions and atmospheric phenomena	heat, thunderstorm, lightning, rain, heat	chill, heat, heat, sunshine, long day
means of summer physical activity	travel, bike, camp, trip, walking	football, camping, camping, swimming pool, water park

locations related to summer and / or summer pastime	Mexico, Rome, Colosseum, Europe. Odessa, Anapa, Vienna, dacha, river, village, sea	mountains, river, dacha, water park, Charbagh, Samarkand, Turkey, Thailand
phenomena associated with positive emotions	holidays, relaxation, weekend, cocktail, carelessness, carelessness, weekend, freedom, idleness, children, grandchildren, grandmother, vacation, rest	vacation, vacation, rest, ice cream
social or cultural phenomena	mosquitoes, holiday, Boniface, Prostokvashino	conditioner, flowers, fruits, repairs, construction, dust, insects, mosquitoes

The national and cultural specificity of the concepts "Summer" in Russian and Uzbek is due to climatic characteristics: in Russian there is no analogue of the Uzbek concept of "chilla", and summer rains with thunderstorms are a more familiar phenomenon for the Russian linguocultural space. Undoubtedly, the similarity of the concepts dictates the possibilities of physical activity, and trips inside and outside the country, despite the somewhat wider geography of travel in the Russian concept, as well as minor negative phenomena: see mosquitoes in the Russian concept and insects, pasha in the Uzbek concept.

Thus, when comparing the concepts of winter and summer in Russian and Uzbek languages, one cannot ignore such factors as the fact of partial bilingualism in additional cognitive features of concepts in the Uzbek language; hybrid perception of concepts, which arose in connection with contact with the climatic and socio-cultural conditions of other countries and languages, and integral perception (where monolingual individuals did not come into contact with the climatic and socio-cultural conditions of other countries and languages).

Note that in general, bilingualism in Central Asia is a unique phenomenon. As professors of the University of Syracuse in the United States, Tej K. Bhatia and William S. Ritchie, noted in their research: Bilingualism in Central Asia is first and foremost to be associated with societal language practice, where proficiency in more than one language is typically presupposed for participants in linguistic interaction. <...> Consequently, Central Asian language identities and cultural identities, as far as common classificatory features are concerned, may seem extraordinarily flexible and fluid, if not indeterminate at times [Bhatia, Ritchie 2006, p. 808] - Bilingualism in Central Asia, first of all, it is associated with linguistic practice in a society where the participants in linguistic interaction usually require knowledge of several languages. <…> Consequently, the linguistic and cultural identities of Central Asia, from the point of view of general classification features, may seem unusually flexible and smooth, if not at times uncertain [Bhatia, Ritchie, 2006: 808].

In the conditions of coexistence on the same territory of different-structured languages, in this case, Uzbek and Russian languages, in the context of globalization of economies, when departure to the countries of near and far abroad, influences and changes the psycho-images of the seasons

that have developed since childhood, obviously, subject to change both linguistic and cultural - worldview systems, when concepts, traditions, habits, conditions and norms are borrowed.

So, in the case of the Uzbek concepts "Winter" and "Summer" we observe doublet Russian elements in additional cognitive features: juniper and Christmas tree, "Yangi yil" and "New Year", "ta'til" and "vacations", ladies and vacations, "Qorbobo" and Father Frost(Santa Claus). Doublet, bilingual elements as part of additional cognitive features of concepts, as well as the processes of hybridization of psycho-images, can be the topic of a separate study within the framework of comparative and cognitive linguistics.

Thus, in each concept that makes up the concept of the "Seasons" in general, and in the concepts "Winter" and "Summer" in particular, it is possible to single out the basic and nationally specific content. The nationally specific content of the concepts "Winter" and "Summer" in the Russian and Uzbek linguistic pictures of the world is associated, first of all, with climatic features and cultural and value dominants of Russian and Uzbek cultures; their ethnocultural differences are manifested in additional cognitive features of concepts at the semantic, figurative, conceptual, associative and symbolic levels. The intensification of intercultural and intersocial contacts in the modern era, most effectively affects the change and expansion of additional cognitive features of the concepts of winter and summer, while maintaining the similarity of their basic, ancient layer, in each of the languages described.

Cognitive signs of the concepts of winter and summer are due to the impact of the surrounding reality in which the individual and the community to which he belongs, such as the state of nature and weather, temperature, features of weather anomalies, and the linguistic and cultural traditions of the Russian and Uzbek peoples, national and state holidays, events, social and everyday features of everyday life, financial capabilities of individuals (travel, trip), images and characters of the cultural space: fiction, film and music products. All these conditions cause corresponding associations in the native speaker of the Russian language and the Uzbek language, and, therefore, participate in the increment of additional cognitive features of the concepts of winter and summer. The originality of the concepts of winter and summer in the artistic (poetic) picture of the world of the Russian linguistic space and the Uzbek linguistic space lies in the development of a number of individual author's verbal images of the seasons, which, with the availability of universal secondary education, both in Russia and in Uzbekistan, plays an important role in expanding the composition of additional cognitive features of concepts.

The linguoculturological analysis of associations and the construction of an associative field of the concepts of winter and summer in Russian and in the Uzbek language made it possible to reveal the characteristic features of their perception in the Russian and Uzbek language pictures of the world - as certain images of winter and summer, which have a vivid specificity precisely as Russian winter and as Russian summer, like the Uzbek winter and the Uzbek summer by referring to the historical layers necessary for a deeper understanding of the content and development of the concepts of winter and summer in terms of preserving and transmitting recorded cultural information.

Analysis of additional cognitive features of winter and summer concepts in Russian and Uzbek, presented in the form of a cloud of associations, as well as in works of oral folk art (proverbs and sayings, tongue twisters) and modern poetry, made it possible to identify general linguistic

characteristics of winter and summer concepts in Russian and the Uzbek language as two antonymic, but interconnected in negative characteristics of the phenomenon; to reveal the private and subjective in relation to the semantic potential of the cognitive content of the winter and summer concepts in both linguistic pictures of the world.

There is also such a unique factor in filling the content of the concepts "Winter" and "Summer" as the hybridization of psycho-images, when Uzbeks leaving for work or living in Russia are forced to adapt to other weather conditions (cold snowy winter, requiring the cost of appropriate warm clothes and shoes that become unnecessary when returning to their homeland); or when Russians, accustomed to wearing light capes or jackets, having an umbrella in their bag, and a wet, rainy summer, can hardly stand the dry heat of the Uzbek summer.

CONCLUSION

In the process of analyzing the concepts of winter and summer, among the additional cognitive features of concepts in the Uzbek language, the functioning of Russian doublet words was revealed, which exists as a result of language interference (ta'til - vacations, Yangi Yil - New Year, Qorbobo – Santa Claus, qor - snow). Note that this phenomenon is not equally widespread in the speech of all speakers of the Uzbek language in the republic.

This phenomenon, although widespread, nevertheless has localization within the republic, and allows us to assert that the use of Russian words in the Uzbek speech of bilinguals plays the role of a factor contributing to the acceleration of the development of historically ripe potentials, implicitly formed in the Uzbek language as a result of the intense mutual influence of two cultures during the XX and the first half of the XXI centuries. Also, this illustrates one of the facts of linguistic influence (in this case, unilateral influence, when one side (Russian) is a donor, and the other side (Turkic) is a recipient), observed both in Uzbekistan and in all Turkic-speaking republics of the CIS [2, p.11].

ABSTRACT

It is written about the historical significance and place of the Mingtepa archeological monument, which dates back to the IV-V centuries BC in the development of tourism. Opinions of the U.S. and Chinese ambassadors on the Mingtepa archeological memory are set forth. There are about 70 shrines in Marhamat district of Andijan region, healing springs for scab manges, chickenpox, gastrointestinal tract, ear diseases, psoriasis, eye pain, healing soils for various rashes and healing properties of sand for hand, back and leg pain, as well as the development of national tourism. The possibilities of these shrines are described.

KEYWORDS: *Mingtepa Archaeological Monument, Shrines, Healing Springs, Healthful Soils, Healing Sand.*

INTRODUCTION

The Republic of Uzbekistan is one of the countries with a rich heritage of shrines and historical sites.Today, the state pays great attention to the tourism development.Historical sites and shrines play an important role in the national tourism development.The importance, uniqueness and opportunities of the tourist destination attract the tourists attention and interest.One of the historical sites that can attract the tourists interest and attention is Mingtepa archeological monument.

Mingtepa archeological monument is located in Andijan region, 38 km from the center of Andijan, in the center of the present-day Marhamat district. According to historical sources, Mingtepa was the capital of the ancient state Davan (Parkana, Day-yuan)[1] which existed in the IV-V centuries BC. According to famous archaeologists A. N. Bernshtam[2], Yu. A.

Zadneprovskiy and B. Kh. Matbabaev[3] Mingtepa city monument was discovered Ershi city as the capital of the ancient Dovan state. Excavations have been carried out at this historical monument by archaeologists, professors M.E. Masson in 1939, A.N. Bernshtam in 1946-1948 and in 1950-1952, Yu.A. Zadneprovsky in 1974 and 1987, and Bakijon Matboboev in 1986-1987 and 2002. In particular, since 2012, archaeologists from the Archaeological research institute of the Sciences academy of the Republic of Uzbekistan and the Archeology Institute of the Social sciences academy of the People's Republic of China have been conducting joint archaeological field research under the leadership of Doctor of historical sciences, Professor Bakijon Matboboev.

As a result, very valuable finds and material objects were found in the ancient city[4]. These findings are unique sources that can capture the interest and attention of tourists.

Also, scientific and popular works on Mingtepa historical significance, its role in the tourism development were created by local authors, Doctor of historical sciences MakhmudKhasani[5], O. Makhmudov[6]. The author of the article published a popular scientific collection "Mingtepa"[7]. There is information about the shrines located in Marhamat district of Andijan region in the book "Shrines and pilgrimages of Uzbekistan (Andijan and Namangan regions)[8], the author of the article "Pilgrimages and shrines of Mingtepa"[9].

THE MAIN PART

Historical sites are also important for today's rapidly developing tourism industry.Mingtepa city monument, which is recognized as the capital of the ancient Davan state, is also a place that can serve for tourism.The first information about the ancient Davan state history can be obtained from Chinese language sources.Located on the Great Silk Road, mentioned in Chinese written sources, this majestic city was world-famous for its craftsmanship, farming, and "Celestial Vultures".This city ruin consists of inner and outer city parts, the inner part is about 41.2 hectares, the outer city part is one of the ancient period monuments occupying the area about 300 hectares.It should be noted that Mingtepa archeological monument, with its antiquity, uniqueness and historical significance, can attract tourists and become a hotbed of tourism.

It is also possible to organize agro, eco, literature, history, pilgrimage, rural areas of tourism in Marhamat district, using its unique nature, natural landscape, healing air flow, especially its rich historical heritage.Among the cultural heritage objects in our country, the President decree of the Republic of Uzbekistan on December 19, 2018 №4068 "On measures to radically improve the activities in the material and cultural heritage protection "and the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan №1059 on December 29, 2018 "On the protection, research and rational use of the archeological heritage object "Mingtepa" in Marhamat district of Andijan region" indicates the monument existence that can be shown to the world. In this regard, it should be noted that in order to increase tourism, first of all, we need to attract the attention not only of our state, but also our citizens to preserve, beautify and restore the rich cultural heritage of historical sites, shrines and monuments in Mingtepa.Explaining the importance of Mingtepa monument and historical shrines in the district to the general public, strengthening the sense of pride and population involvement, especially our youth, through the conduct of propaganda work, these places beautification, the tourism organization and development.

President of the Republic of Uzbekistan Shavkat Miromonovich Mirziyoyev visited Andijan region on May 16, 2019.The head of state supported the project on beautification of the Mingtepa archeological monument and the tourism organization and development on its basis.

Mingtepa historical monument is a place of great interest not only to local tourists but also to foreign tourists.We are proud to have foreign tourists from China, Japan, USA, Italy, South Korea and CIS countries among the visitors.In particular, in an interview with "Uzbekistan-24" after her visit to Mingtepa, the Ambassador of the United States of America Mrs. Pamellacommented on Mingtepa: «One factor that should be considered for tourism development anywhere: for the tourist, the country itself should be interesting.Uzbekistan is one of such interesting countries.Many people have an idea about such historical cities as Samarkand and Bukhara.The conditions created for tourists visiting the ancient cities are also growing.However, I would like to talk more about cities that are not popular abroad.For example, I took a closer look at Mingtepa location in the Fergana Valley. Undoubtedly, this is also of great interest to tourists»[10].

On January 22, 2019 in Tashkent at the State history museum of Uzbekistan was organized an exhibition entitled "From Changan to Vandu."The exhibition purpose was to showcase ancient artifacts found in historical sites from Changdan, the ancient city of China on the Silk Road, to the capital of the ancient Dovan state. The opening ceremony of the exhibition, which is scheduled to last until June 2019, was attended by the Ambassador Extraordinary and Plenipotentiary of the People's Republic of China to Uzbekistan Jiang Yan, Uzbek and Chinese historians and intellectuals. Chinese Ambassador highly appreciated as: "This exhibition, organized at the base of the Mingtepa monument, will serve to further strengthen cultural and spiritual ties between the two countries".

It should be noted that there are several dozen shrines in Marhamat district of Andijan region, which serve for tourism in synchronizationwith Mingtepa archeological monument. There are about 70 places in Marhamat district that can serve tourism.They include more than 10 shrines, more than 30 healing springs, dozens of historical and modern sites. Shrines such as "Alitepa", "Korovultepa", "Oktonliota", "Toshtepa", "Jungortepa", "Yigloktepa", "Davkarota", "Lombitepa", "Okboshtepa", "Temiratkicemetery", "Boboxurosonota", "Khotinkum", "Koychikhalfa", "Khoja Bosmonota", "Guzalota", "Mirishkorota", "Koktonliota", "Bandiota", "Chashmaimuborak", "Tora bobo shrine", "Mulla Toychi shrine", "Tabib shrine"[11] of Markhamat district serve tourists and pilgrims.These historical places have been revered and visited as sacred places of our people for centuries.

Our people have been visiting these places since ancient times and have been using the healing spring waters and soils for healing purposes.Although the healing properties of these springs are not scientifically based, there are many examples of how they can cure various ailments in practice.

An example of this, is the presence of the springs cure ear pain and the scabies on Khodja Bosmonota shrine, healing springs for rashes, gray hair, gastrointestinal diseases on Akbashota shrine, springs that heal chickenpox, rashes, rash wounds on Bobo Khurosonota shrine, soil to cure lichen disease at the top of Temiratki cemetery, soil that cures eye diseases on Guzalota shrine; sand, which cures hand, foot and back pain in the Khotin sand shrine. Research has

shown that patients from different regions of the country, as well as from neighboring Kyrgyzstan, Tajikistan and Russia, seek treatment for these healing benefits[12].

CONCLUSION

In conclusion, it can be said that Mingtepa archeological monument, with its antiquity and majesty, can be a hotbed of tourism.As a result of the state's attention to the material and cultural heritage objects, and our people are carrying out beautification work in many of them.Although many shrines have been preserved, some of them need attention.Today, the state pays more and more attention to historical sites, sanctity, shrines and healing springs.But this is not enough. By widely promoting the history, spiritual and cultural significance of these shrines, especially among our people, it is possible to preserve, beautify and use them wisely, that is, to develop the pilgrimage and medical aspects of tourism.

ABSTRACT

This article also provides for the establishment of independent educational process in higher education in tertiary institutions. Independent education of students is considered as their aspiration to expand and deepen their knowledge, improve existing skills and abilities, as well as to master new ones. The main purpose of Independent Education is to cultivate the personal and professional qualities of students.

KEYWORDS*: Communicativeness, Intellectual, Constructiveness, Organization, Cognition, Pedagogical, Sensure Produktive, Flexible, Local-Modeling, Private-Didactic, Illustration.*

INTRODUCTION

Main part

According to the law of the Republic of Uzbekistan "on education", the purpose of higher education is to provide highly qualified, competitive personnel who meet the requirements of the present period, are able to provide scientific, technical, economic, social and cultural development and have high moral and moral qualities.

The main tasks of preparation of students of the direction of technological education of higher educational institutions for pedagogical activity:

*Provision of high-performance higher education and training of qualified personnel in accordance with state educational standards on the basis of modern educational and professional programs;

* Preservation and enrichment of moral, cultural and scientific values;

* Development of cultural and cultural activities of the individual;

* introducing new pedagogical and information technologies into the educational process, the introduction of integration of technological education with science and production;

* The development of science, technology, scientific pedagogical personnel and creative activity of Education recipients, the use of the obtained results in the educational process.

Technological education teacher training is a practical training for students.

The most important requirement for the person of the teacher is that he is highly qualified.

The following requirements are imposed on the teacher:

* Ability to properly assess the political, social and economic dimensions of Community Development;

* to have mastered the standards for the formation of a future specialist necessary for society during a certain period of development;

* loves pedagogical activity;

* To have special knowledge in their field;

• be smart;

• Pedagogical feeling;

• High accuracy;

* General management and high-level management of the country;

* Mastery of pedagogical technology

Teacher training teachers.

Educational pedagogical activity. This activity is directed to the organization of the educational process in accordance with the requirements of society. In pedagogical activity is carried out with the addition of theoretical and practical activity.

In the description of the pedagogical activity of the teacher distinguish the following components:

* Constructiveness;

* Organization;

• Knowledge;

* Communication.

To characterize and evaluate the activities of the teacher, the following levels are used:

• Reproductive. In this, the teacher only designs his own information, but does not take into account the level of students;

* Flexible. At this level, the teacher models the educational information in accordance with the level of the students;

* Local-modeling. At this level, the teacher should not only explain the information, but also be able to model the knowledge, skills and competences of certain subjects;

* Systematic-modeled knowledge. At this level, it simulates the system of its activities and activities of students necessary for mastering concrete science;

• Systematic-modeled activity. At this level, the teacher, along with the students, will be able to model the entire system of educational work.

Organizational activities. Such activities appear in the qualification of exact planning and organization of the process of scientific research and training.

Organizational activity manifests itself, its time; the work of individual, group, collektiv of students; the selection of students for the implementation of their joint research and the determination of their duties in the organization qualification.

The main task of organizational activity is the integration of the behavior of participants in this activity.

Scientific-cognitive activity. This activity is seen in the qualification of deep and comprehensive knowledge of the surrounding world and self.The teacher analyzes the process and results of his research, the academic activities of the students.

Communication activities. This activity provides for the qualification of establishing optimal interaction with colleagues and students.

On the basis of communicative activity lies the self-management ability of the teacher. Forms of educational process in higher education.

Forms of the educational process in higher education include lectures, seminars, practical classes, laboratory classes, educational conferences, tips, excursions, expeditions, pedagogical practice of educational production, course and graduation qualification work, Independent Education of students.

Lecture-the correct, logical consistency and clear interpretation of this or that scientific issue. The lecture is the most effective, vivid form of communicating with the inner world of students through all the wealth of the teaching person: consciousness, emotion, will, feeling, motivation. It helps to realize the functions of orientation, information delivery, methodological and upbringing of teaching.

. The main tasks that will be solved in the lecture are as follows::

- A certain amount of scientific knowledge is explained;

- Students will be introduced to the methodology of Science and research;

- Methodical relations between all types of educational activities and training activities are shown.

The didactic purpose of the lecture, its role in the teaching process, according to the techniques of Information Statement will have its own characteristics. According to the didactic purpose, introductory, thematic and general - final lectures are distinguished.

The system of higher education, along with lectures, includes practical (training, seminar and laboratory) type of training, which: performs the functions of connecting education, upbringing and theory with practice.

The term" practical training" is interpreted in pedagogical literature both in a broad and narrow sense. The term" practical training "in a broad sense summarizes exercises, seminars (all kinds of them) and laboratory classes. If the lecture outlines the basis of scientific knowledge, then in practical training the knowledge is deepened, expanded and detailed. Most importantly, practical training also serves to test the knowledge of students.

One of the forms of practical training is a workshop. The workshop will be aimed at solving the following tasks:

Improvement of theoretical rules explained in the lecture;

- Expansion and deepening of knowledge in science;

- To develop students ' research, cognition skills;

- Recognition of the acquired knowledge in the course of theoretical teaching in practice.

In the theory and practice of pedagogy, three types of seminar sessions are distinguished: workshop, seminar, and specific seminar.

Pre-seminary classes are held mainly for the purpose of familiarizing students with the peculiarities of independent work. It teaches literature, reference books and other methods of working with sources, prepares students for the transition to research work in the initial form. Pre-seminary training is a form of preparation for the training of seminars and is usually conducted in the first courses.

In pre-seminary classes, the teacher is the leader, because the students pay little attention to the teaching work of a particular specialty, therefore, they are not able to take the initiative sufficiently.

In the workshop, extremely important tasks are solved in relation to pre-seminary training. For example, some seminars aim at an in-depth study of a particular regular course that is thematic-bound. Others will be dedicated to the methodological development of a subject or subjects in which the course is separate and incredibly important and common.

Special seminars will not be related to lecture topics and will not be included in the program content of a subject. It usually pursues the goal of in-depth study of the private issues of science.

Comments on students ' reports should be as follows:

- stand in the direction of independent thinking;

- to determine the essence and form of the proposed issue;

- Immediately distinguish between the points of view in the student debate;

- to encourage a non-standard solution of the issue.

It is worth noting that during the seminar sessions, students are involved in the activity, in order to write abstracts by them, discuss them and conduct a review.

Laboratory classes. The main characteristic of laboratory classes is that students independently perform tasks or conduct experiments on it.

Laboratory Training provides the student with the formation of research skills, a creative approach to science and technology, allows him to master the general methodology of the experiment.

When conducting laboratory classes, the following didactic principles are observed:

- Ability to plan and conduct laboratory sessions;

- To accurately determine the purpose of laboratory training;

- To arouse interest in students in opportunities to deepen their knowledge in science and production;

- To provide the student with the opportunity to independently obtain the result;

- Theoretical training of the student;

- Laboratory classes are not only the completion of knowledge on a specific topic, but also the source of training of students.

Independent work of students plays an important role in the radical restructuring of the system of training of specialists, increasing the importance of the educational process. Independent work means such educational activity that, along with the acquisition of knowledge in it, the formation of skills is also ensured independent organization. And this is done in 4 independent types of work, depending on the private-didactic goals in practice.

The first type of private-didactic goal of independent work is to determine the skills that are formed and required of them in students on the basis of factors of the formation of the initial knowledge (the first stage of knowledge), that is, the algorithm of activity consists of data and conditions of tasks, than in the surface. It is envisaged that in order to achieve this goal it is necessary to solve the tasks perceived by the students.

Independent work is the second type of private-didactic purpose. In this, knowledge is formed, in which the assimilated information is aimed at processing in memory and performing typical tasks, that is, the second stage of knowledge.

The general characteristic of all types of the second type of independent work is that in such work the idea (principle) of the solution of tasks is declared, students are required to develop this idea (principle), methods and methods of applying it to concrete conditions.

The third type of the private-didactic goal of independent work is an expression from the knowledge that is formed during the performance of the third stage – non-typical tasks in students.

This goal can be achieved in the process of solving the problems of cognition (perception), which require students to establish the algorithm fundamentals of the causes of changes in the object under study.

The fourth type of the private-didactic goal of independent work is to create factors for creative activity.

The cognitive activity of the students in the performance of such work is such that the expression it becomes increasingly deeply embedded in the essence of the object to which the students are being discussed, establishing new relationships necessary to find new, previously unknown ideas and to solve the principles of generating new information.It is the essence of the actions that the student must create for himself at each stage of the performance of tasks, which is new to him, he or she will be forced to strain his head on this or that information character.

In the pedagogical literature, the following types of independent work are noted:

- Independent work on samples;

- Reconstructive-variable;

- Heuristic (partial, creative);

- Creative research.

Independent work on samples is the solution of typical tasks, different exercises on a sample basis. They will be a factor in the assimilation of the material, but will not grow the creative activity of students.

Reconstructive-communicative independent work involves not only the practical description of knowledge, but also the redevelopment of the structure of knowledge, the attraction of existing knowledge in solving a matter, a problem.

Euristic independent work is connected with lectures, laboratories, practical classes, some issues put up in seminars, solving problems.

The research work is designed to determine the qualification to be able to see the problem of the study, to express it independently, to determine the hypothesis, to develop a plan for the solution of the problem, to solve it.

Creative research work. In such work, the task will be to create conditions that will prevent the occurrence of a problematic situation. The student in his / her activity is looking for ways to solve the problem without being free from ready samples, studies. Such works include tasks related to the design of experiments, equipment, layouts and workbenches.

Thus, independent work is the most important method of teaching, in which the individual activity of the students in the process of training, strengthening the acquired knowledge, skills and abilities increases.

The main conditions for the effective organization of independent work are as follows::

- The science of independent work, its research character;

- Formation of the need to independently further increase their knowledge;

- Individualization of functions of independent work;

- Methodical guidance to the organization of independent work.

The educational process in higher education also envisages the organization of Independent Education. Independent education of students is considered as their aspiration to expand and deepen their knowledge, improve existing skills and abilities, as well as to master new ones.

The main purpose of Independent Education is to cultivate the personal and professional qualities of students.

Functions of independent education: updating the individual's abilities, increasing their ideological-theoretical level, improving their professional skills and culture.

In order to ensure the consistency and purposefulness of independent training sessions, its plan is drawn up. The main method of Independent Education is individual work on literature.It also includes the performance of tasks that are of practical importance to Independent Education.

Great importance is attached to the methods of teaching in the pedagogical literature. When we say method, in education, the goal is achieved, ways of solving issues, methods are understood. In the composition of the teaching method, the methods are distinguished separately. The method is an element of the method, the component of which is applied only once in the implementation of the method and is considered a separate step.

Traditional methods. The first philosophical and pedagogical systems form the beginning of these techniques. Currently, five of them are taken into account: practical, visual, expressive, working with books, video techniques.

Teaching methods (M.I.Mahmutov).

Teaching method the method of learning	Giving information-statement
Explanation	Reproductive
Instruction - practical	Productive-practical
Explanation-persuasion	Partial creation
Playing persuasion	Creating novelty

Teaching methods and their functions (Yu.K.Babanskiy):

Teaching methods	Education	Keep	Improving	Persuasion	Monitoring and correction
Statement	+++++	+++++	+++++	+++++	++

ABSTRACT

The article analyzes the importance of the widespread introduction of new ideas and innovations in the production of sustainable development of the national economy, increasing the competitiveness of enterprises, the importance of expanding the share of export-oriented products and thus increase overall resource productivity. The article sets out the views of economists and the author's approach to the role of the socio-economic potential of the regions in the development of the country's economy and the investment climate in the regions. In addition to the traditional method of assessing the investment climate, the author presents a methodology for assessing the investment climate of the regions based on a generalized assessment, which is evaluated taking into account the specifics and characteristics of the regions of the Republic of Uzbekistan.

KEYWORDS: *Innovation, Competition, Market Mechanism, Investments, Innovations, Investment Activity, Attractiveness Of The Environment, Budgetary And Financial Potential, General Integrated Indicator*

INTRODUCTION

The "Strategy of Actions" for 2017-2021 on the five priority areas of further development of the country, approved by the Decree of the President of the Republic of Uzbekistan dated February 7, 2017 [1], 1 states that one of the urgent tasks is liberalization and development of the economy. Today, the Republic of Uzbekistan is an integral part of the international community and the global financial and economic market. This is evidenced by the ever-expanding relations with the outside world, the implementation of programs for the development, modernization, technical and technological re-equipment of economic sectors with the support of developed

countries, the successful implementation of the five priorities for further development of the country for 2017- 2021. possible. In the context of globalization, increasing the country's competitiveness, increasing its economic potential, the widespread introduction of innovations and the rational use of resources on this basis is a guarantee of sustainable development and improving the living standards of the population. The purpose of the article is to study the state of development of the economy of the republic, factors, resource efficiency and opportunities for sustainable economic growth.

Analysis of the relevant literature

The essence, purpose, factors and the process of formation of the innovative economy are the work of local and other foreign scientists D.Romer, Chen Derek, D.A.Medvedov, A.A. Researched by Dinkin, NI Ivanova, VV Glukhov, LN Orlova, T.Sh.Shodiev and others. In particular, D. Romer [2] thinks about the role and importance of innovation in the formation of an intellectual, ie knowledge economy, in order to improve the living standards of the population and ensure sustainable economic growth in the post-industrial stage of development. He proposed an endogenous model of economic growth and emphasizes that intellectual potential, a set of knowledge, new ideas and innovations have become a key factor in development. Foreign scientist Chen Derek [3] proposed a multi-factor econometric model of economic growth, talking about the four pillars of the knowledge economy: the external environment of the economy, the knowledge complex, the innovation system and information and communication technologies. Prof. D.A. Speaking about the prospects of the Russian economy, Medvedev [4] said that the main goal of the Russian Federation in the future development of the country is the production and export of goods with a high capacity for knowledge. A.A. In the monograph published by Dinkin and NI Ivanova [5], the content, essence, purpose, factors and sources of development of the innovative economy are described on the examples of the Russian economy VV Glukhov [6]. Features of the innovative economy, the advantages of exporting intellectual products from the export of raw materials, the ways to increase the competitiveness of enterprises are described in detail. L.N. Orlova studied the indicators of the [7] innovative economy and the challenges of ensuring competitiveness. Uzbek scientists T.Sh.Shodiev [8] and scientists of the United Nations Economic Research Center in the country [9] studied the state of formation, formation and development of the knowledge economy in Uzbekistan, important scientific and methodological aspects and tried to create an econometric model. As a result of the research, the UN Office in Uzbekistan has developed a draft program of innovative development of the national economy for 2012-2020 [10].

Methodological approaches of scientists to the study of the process of formation of a new qualitative stage of innovative development, innovative developments, research to ensure sustainable economic growth through the introduction of new technologies and products in enterprises are of both theoretical and practical significance. The level of formation of the knowledge economy, or in other words, the innovative economy, the analysis by combining statistical indicators and factors, qualitative and quantitative methods of analysis, has not been comprehensively studied on the basis of econometric models. This problem has also escaped the attention of research scientists.

The article calls for increasing the role of intangible resources in production for the intellectualization of economic activity in the framework of "2018 - the Year of Active

Entrepreneurship, Support of Innovative Ideas and Technologies", ensuring the priority of intellectual labor in the capacity of goods, liberalization and regulation of the economy. In the future, the development of innovative development strategies of the national economy is of great practical importance today. In this regard, in September 2018, the Strategy of Innovative Development of the Republic of Uzbekistan for 2019- 2021 was adopted and measures for its implementation were identified.

RESEARCH METHODOLOGY

In studying the process of innovative development of the economy of the Republic of Uzbekistan and the implementation of the Action Strategy for 2017-2021, statistical data on the country's development in 2001-2017, dynamic series, averages, variance, variation, correlation and regression equations were used in their comparison, analysis and synthesis. Finally, a two-factor model was developed to identify the factors and sources of economic growth, and the marginal efficiency of each factor (resource), the limits of exchange of resources and optimal combinations were determined, the absolute and relative "pure" effect of each factor on GDP, excluding capital and labor. the coefficient of overall efficiency of factors was determined, the directions of sustainable economic innovative development were identified. Methods such as didactic approach, systematic and logical analysis, statistical observation, statistical aggregation, time dynamic series, correlation and regression analysis, economic-mathematical modeling were used in the research process. The database uses the indicators of socio-economic development of the country in recent years of the Statistics Committee of the Republic of Uzbekistan. As a research hypothesis, the formation of an innovative economy is assumed to be a tool for sustainable development and competitiveness.

Analysis and results

In the process of globalization of the economy, the competitive environment is changing rapidly, which requires companies and enterprises to create innovations, to introduce innovations so that they do not deteriorate in market conditions. At present, innovations are taking place through the continuous introduction of new products, scientific developments, marketing and management methods in the areas of fundamental research, practical development and experimentation. The logic of technological development and potential markets are equally valuable sources of innovative ideas. In other words, innovations can be created by bypassing the stage of scientific research in which an idea emerges and a concept is developed and directly developed.

Innovation is not always the use of a completely new product or process. Innovation is often an effective combination of previously known elements in a new combination. This does not diminish the importance of fundamental and applied research. However, they are approached when difficulties arise, i.e. the results of the practical work are first analyzed. In studying the process of intellectualization of the economy, first of all, the implementation of the Action Strategy of development adopted in our country requires further development and liberalization of the economy, reducing market interference in the economy, using more market mechanisms to regulate the economy. We use production functions in an in-depth study of this process. 2001-2017 of the Republic of Uzbekistan production created as a result of processing statistical data the contribution of each factor to economic growth based on its function we found out. Average economic growth for the period covered by the study the rate is 6.1%, the share of labor is 1.8%,

the share of capital is 2.9 percent. The contribution of factors to the overall efficiency is 1.4 percent formed.

The main results of scientific research

Intangible manufacturing sector resource constraints on the expansion and replacement of labor by knowledge significantly reduces. The innovative potential of the national economy today Reconstruction in the field of small business, including the development of scientific high - tech organizations and manufacturing enterprises the introduction of developments and the development of science that took place during the reforms to consolidate in order to eliminate the consequences of disconnection facilitate, direct and innovative research and applied research indirect support is essential. Small businesses state in the field of innovation to support innovation activities should be one of the priorities of the policy. Small innovative business is an integral part of the regional innovation system, effective innovation the developer, their consumer, the mediator between science and production is calculated.

Intellectual activity is an indication of the formation and development of innovative social production. "Innovative production is a production based on technology, know-how, a new combination of factors of production, the organization of production and management, and the use of new knowledge that allows to gain an advantage over intellectual income and competition. At the macroeconomic level, the effectiveness of innovations is reflected in the decrease in resource capacity per unit of output and the increase in the overall productivity of factors. In recent years, the dynamics of the overall efficiency of the factors in the country was around 3% on average.

TABLE 1 DYNAMICS OF OVERALL RESOURCE EFFICIENCY IN ECONOMIC GROWTH IN THE REPUBLIC OF UZBEKISTAN IN 2010-2019

Years	Manpower change,%	Investment dynamics,%	GDP dynamics,%	Total Factor Efficiency,%
2010	102.8	128.3	109	101.4
2011	102.7	124.8	108.1	101.2
2012	102.1	103	108.5	106.1
2013	102.3	109.7	108.3	103.7
2014	102.4	110.5	108.2	102.8
2015	102.6	111.7	108.4	102.6
2016	103	112	108.9	102.5
2017	103.1	113.7	108.1	101.7
2018	102.8	114.2	107.8	101.5
2019	104.1	104.8	105.5	101.2

The table shows that in our country at the beginning of the century the dynamics of investment and economic growth fluctuate, the dynamics of the labor force which was more stable. Due to this, the overall effectiveness of the factors is years It should also be noted that entrepreneurs and investors innovate in a market economy socio-economic innovation relations with leading entities on the basis of interest. Most of the innovations in 2019 financed by the organizations' own funds (69.7%). In 2019, the funding of organizations from their own funds will be 6.4

compared to 2015 times Innovative developed in our country in 2015-2019 there was an increase in the share of goods, works and services in the economy.

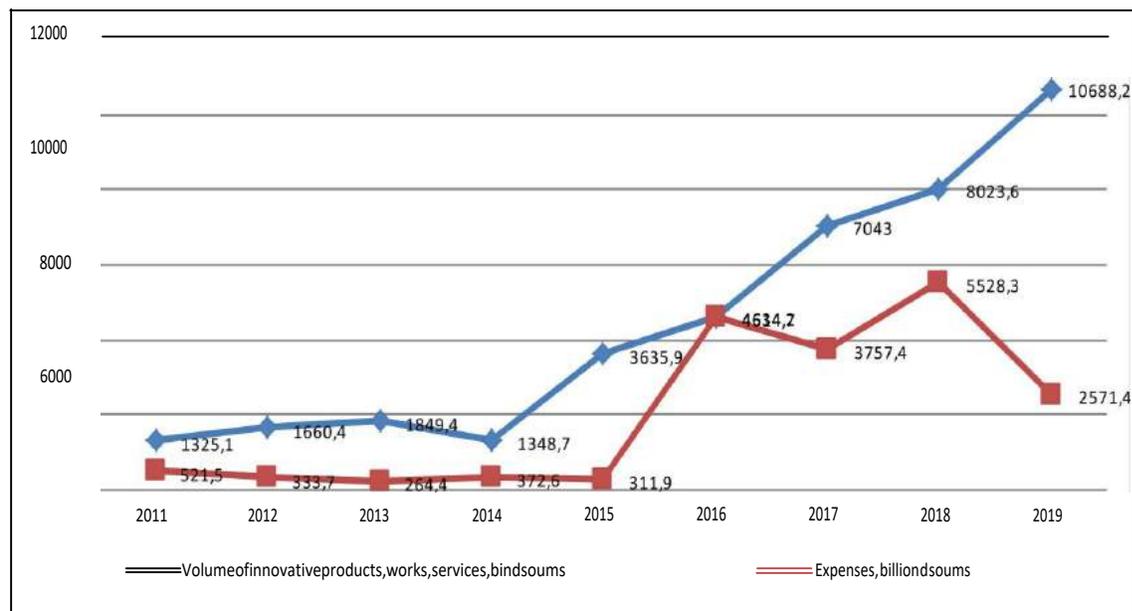
An enterprise that produces innovative products, works, services and the number of organizations increased 8-fold between 2010 and 2019, to 289 from 2374 to. Including first time, first time innovative mastered the production of products, works, services the number of enterprises increased to 696.


Figure 2. Volume and cost of innovative products, works, services dynamics (2011-2019)

The volume of innovative products, works and services in 2019 amounted to 10688.2 billion soums. This figure is 1.3 times higher than in 2018. Expenditures on innovations increased by 5 times compared to 2011 and decreased by 53% compared to 2018.

Products, works, services produced in 2019 on their own The bulk of the volume goes to the city of Tashkent (48%), the Republic of Karakalpakstan (18.3%), Tashkent region (9.3%) and Andijan region (8.3%), the rest (56.1%) were in other provinces.

Social sphere and economic development in the Republic of Uzbekistan for organizations of all forms of ownership in 2019 amounted to 49770.6 billion soums (In the equivalent of $ 16,782.3 million) or 107.7 percent compared to 2018 fixed capital investments were used. Fixed capital the volume of investments is 4.2 times higher than in 1991, 5.4 times higher than in 2000, Increased by 4.3 times compared to 2005 and by 170.1% compared to 2010. The share of capital investment in GDP in 2019 was 25% increased by 0.6 percentage points compared to the previous year. (18.8% in 1996, 2000) 22.9%, 2005 19.9%, 2010 24.6%, 2015 24.4%)

CONCLUSIONS

The transition from a traditional economy to a knowledge-based economy innovation, long - term information and communication technologies (ICT) investment efficiency, as well as efficient allocation of resources and appropriate economic and institutional to ensure placement conditions. World experience shows that modern the development of the economy in the

innovative direction is mainly high technology-driven small firms and companies. In short, laboratories such as small businesses, startups, incubators are a natural and convenient area for the development of innovative processes. Therefore, the continuation of economic reforms in the country in terms of supporting innovative ideas and developments in small business and private entrepreneurship, macroeconomic resources. great attention should be paid to savings, especially the efficient use of intangible resources.

It is expedient to consider the innovative economy as a promising economy, requiring the continuation of the policy of structural changes aimed at increasing the competitiveness and strengthening of Uzbekistan's position in the world market and the rapid development of modernhigh-tech industries and industries. To achieve an innovative economy: first of all, to establish partnerships between education, science and industry; secondly, financing the production of innovative products by the enterprise based on partnerships; third, to create opportunities for the application of scientific and technical achievements in the production process of the enterprise; fourth, it is necessary to develop measures to create incentives for enterprises producing innovative products.

THEORETICAL FUNDAMENTALS OF MOTHER TONGUE LEVEL ASSESSMENT

Abdiraimov Shokhrukh Samadugli*

*Teacher,
Tashkent state university of Uzbek Language and Literature named after Alisher Navoi,
UZBEKISTAN
Email id: shohrux.abduraimov@mail.ru

ABSTRACT

The article discusses the theoretical basis for assessing the proficiency level in the mother toungue. This article describes the author's scientific views on the mother toungue skills' assessment, i.e. to define the basic constructions of reading comprehension, listening comprehension skills, and speaking and writing skills indicator.

KEYWORDS: *Assessment Theory, Speaking Skills, Domain, Construction, Test System, Indicator, Psycholinguistics, Testology.*

INTRODUCTION

Research on pedagogical dimensions shows that "assessment is a bridge between learning goals and teaching" [1]. In fact, the better the assessment, the better the education quality. This is an important factor in educating a well-educated, open-minded, creative-minded, modern generation. Therefore, in developed countries, special attention is paid to the education assessment, to determine the students' knowledge level. Many developed countries have developed a special examination system for determining the students' knowledge level in general education and introduced certification.

These include the SAT (Scholastic Aptitude Test) in the United States, the GCSE (General Certificate of Secondary) in the United Kingdom, and the USE (Unified State Examination) in the Russian Federation. The special test systems introduction in Uzbekistan, such as SAT, A-levels, YeGE, is one of the education priorities. In the UK, the GCSE [2] examines graduates' native language speaking skills: *reading, writing and speaking*. In the United States, the SAT [3] tests students' *reading, writing, and linguistic skills* in their native language. In the Russian Federation, the USE [4] special examination system assesses students' *reading, writing and*

linguistic skills in their native language. In general, these exam systems focus on testing students' speaking skills.

Research Methodology and analysis and results

It is known from testological research that before any evaluation measurements development, the measurements domains and constructions are determined, and test tasks are formed to evaluate and measure them. "A domain is a set of knowledge, skills, qualification and competencies"[5]. In our opinion, the domain should be defined based on the mother tongue teaching purpose. "The main purpose of the mother tongue teaching is perfection of the person who expresses one's thoughts orally and in writing correctly and fluently, forms reading culture, thinks independently and creatively, understands the others' opinions, develops communication and speech culture"[6]. Indeed, the main goal of mother tongue education is to bring up a generation with well-developed speaking skills, creative thinking, and the ability to understand the essence of events. At the same time, the language acquisition models mentioned in psycholinguistic research should be taken into account in the mother tongue assessment format development, because there is a specific language nature acquisition and use. Language acquisition is based on certain psychological laws. In particular, as noted by the American scientist Noum Chomsky, "language is learned through the coding and decoding process " [7].

Psycholinguistic research has shown that the coding and decoding processes underlie four speech skills. They are *listening comprehension, reading comprehension, writing and speaking* skills. The assessment should be based on the competencies characteristics in determining the construction. "Design is a property that needs to be measured"[5]. That is, the skills and abilities that reveal students' speaking skills level in their native language.

First of all, if we talk about reading comprehension skills, we see that the research provides complementary explanations. Psycholinguist I. Azimova explains *reading comprehension* skills as follows. "Reading comprehension is a complex psycholinguistic process that involves recognizing graphemes, reading a word, understanding the lexical meaning, contextual meaning of a word, correctly solving a syntactic structure (that is, the relationship between words, understanding which word represents the main concept in the sentence, which subordinate concepts), and understanding the interconnection of textual blocks"[8].

In a handbook written by A. Ismailov "The students' reading literacy assessment in international research" summarizes the concepts of "Reading", "Reading comprehension" and "Reading literacy" and calls it "Reading literacy" and defines it as follows: "Reading literacy is the ability of an individual to understand, use, reflect on, and respond to texts in order to develop his or her knowledge and potential and achieve his or her place in society".

... Reading literacy covers a range of mental activities and language competencies. These include understanding a particular word meaning, the grammatical and linguistic text structure, and relating the meaning of the text to his/her own world perceptions"[9].

Based on these definitions, we believe that the reading comprehension assessment should be based on the following constructs:

– understand the purpose of the text;

– understand the general meaning of the text;

– understand the occasional meanings of words in the text;

– understand the meaning of phrases, proverbs, sayings in the text;

– understand the information given in the drawings and diagrams in the text;

– understand contextual connections in text;

– understand the hidden meanings in the text;

– understand that the units in the text are used correctly.

Psycholinguistic research shows that a person learns language primarily through hearing. Over the years, the ability to hear and understand in communication and speaking situations develops. Therefore, we consider it appropriate to base the listening comprehension skills assessment on the following constructs:

– understand the purpose and idea of the audio text;

– be able to respond to audio text in writing or orally;

– understand the general meaning of audio text;

– understand the occasional meanings of words in an audio text;

– understand the meaning of phrases, proverbs, sayings in the audio text;

– understand semantic connections in audio text;

– understand the hidden meanings in the audio text;

– understand the correct use of units in the audio text;

– pay attention to the words pronunciation and spelling in the audio text.

Speaking skills begin to be formed in the early stages of a person's life due to the need for communication, and develop over the years through experience gained in speech situations, gaining a mastery level. Most importantly, a person actively uses oral speech throughout his life, as a relentless society representative, has become a participant in speech situations, expresses and explains his thoughts to others. Therefore, special emphasis should be emphasised on the students' oral speech development, which should include the special assignments development and their inclusion in general secondary textbooks. These tasks help students to "express their ideas correctly through linguistic means, use the available vocabulary wisely, speak without deviating from a topic, structure the speech correctly, i.e. enter the topic, state the main idea and summarize; skills such as the ability to anticipate how the speech will affect the listener and the ability to capture the listener's attention must be developed "[8].

Therefore, we consider it appropriate to use the following indicators in the oral speech assessment:

– understand the questions asked in the communication process;

– answer questions in communication based on the speech situation;

– ability to use arguments in oral speech;

– speech ordering: introduction, main idea, and conclusion;

–word skills and vocabulary in oral speech;

–speech fluency;

– use meaningless units in oral speech;

– the presence of dialectal elements in oral speech;

– be able to control the excitement in oral speech;

– the ability to use nonverbal means in oral communication.

Writing is also a complex psychological process, and we believe that the following indicators' use to assess this skill in general will help to improve the education quality:

– be able to express a personal attitude in writing to a particular topic;

–written speech structure: introduction, main idea and conclusion

– creative approach and reasoning in the written text;

– make effective use of the vocabulary available in the written text;

– the ability to use words in a written text;

– the degree of grammatical tools use in the written text;

– spelling literacy in written speech;

– correct use of punctuation in written speech;

– calligraphy.

On the basis of these constructions it is possible to develop a test system format and test methodology for assessing the proficiency level in the mother tongue. It should also be noted that "an open-type test or use closed-loop test samples of various formats on the mother tongue for a comprehensive qualification assessment requirements for general secondary, secondary special and vocational education institutions graduates, defined in the State education standard assignments"[10].

CONCLUSION

In conclusion, the test system for assessing mother tongue acquisition level in language education should be developed based on the mother tongue acquisition and testological laws psycholinguistic foundations. The test system should focus on the speaking skills assessment acquired in the mother tongue and the students' skills assessment aimed at developing their worldview. In short, the use of the test system format and tests, developed based on the above constructions, in the final state of general secondary education graduates certification will serve to improve the mother tongue education quality.

ABSTRACT

International banking operations are carried out in currencies raising, attracting foreign exchange and by banks financing, including loans in international currency, leasing, factoring, forfeiting, project financing, consists of mergers and acquisitions of banks. Processes of globalization in the banking system of developed countries laws, its positive and negative effects in analytical data justified.

KEYWORDS: *Legal, Non-Bank, Foreign, Leasing, Agreement, Law.*

INTRODUCTION

The conclusion of an international financial leasing agreement in several countries is determined in accordance with the provisions of the UNIDRUA Convention on International Financial Leasing, based on the law of that country "On Leasing" or the agreement of the parties to the agreement. Leasing in the Russian Federation is regulated by the Civil Code and the Law on Financial Leasing. According to the Civil Code of the Russian Federation, a lease agreement is recognized as a type of lease agreement. Therefore, in order to eliminate the problems that arise when concluding an international financial leasing agreement, the conflicting norms imposed on the parties to the lease agreement are applied. In addition, the Law of the Russian Federation "On Financial Leasing (Leasing)" clarifies issues related to the subject of the lease agreement. According to him, if the object of the lease agreement is real estate, it must be registered with the state, unless otherwise provided by law.

MATERIALS AND METHODS

The requirement for companies engaged in leasing activities in the Russian Federation to obtain a license (permit) was initially defined by law. However, in order to ensure the free development of leasing relations in the territory of the country, the legislature removed the requirement for a lessor to obtain a license under the Federal Law No. 10 of January 29, 2002. In several European countries, in particular in the leasing laws of the Republics of Macedonia, Albania and Serbia, as well as in the leasing legislation of the Republic of Azerbaijan, the lessor operates after obtaining a permit (license). In addition, certain types of property (vehicles, hazardous equipment) that are the subject of leasing must be registered with the state.

In the United States, it is important to draw the boundaries between the lease agreement and the conditional purchase agreement. In American law, a contingent sale contract is included in the category of supply contracts and these contracts are governed by the Unified Trade Code (Section 9). U.S. courts and tax authorities reveal different differences in whether a lease agreement is a mixed relationship. In particular, it gives the parties to a lease agreement the opportunity to enjoy significant tax benefits. It is determined by the tax authorities whether the parties to the contract have provided a "masked" purchase agreement in the form of a lease agreement in order to receive benefits. Courts, on the other hand, classify this practice differently, meaning that it is important for them whether or not the lease agreement falls into the category of collateral agreements, and that other types of legal consequences may arise. Under U.S. law, commercial banks are not allowed to perform certain types of financial transactions, so leasing services are not provided directly by banks. Leasing companies operate separately from banks. U.S. tax law provides that individuals have the right to purchase and lease equipment from their earnings. In particular, today the main volume of leasing operations in the United States is almost 40% of world leasing.

In countries with a continental legal system, as in the Anglo-Saxon legal system, the subject of the contract is used through a lease, and the practice of conditional sale of goods is applied. As an example, a leasing relationship is called a credit-lease in France and is regulated by the Law on Enterprises engaged in leasing on July 3, 1966. But the French Court of Cassation overturned the classification of such a lease agreement, which contradicted the conditional sale of the property. At the present time, the French legal practice, having made a legal analysis of the leasing relationship, has come to the following conclusion: leasing is a medium- or long-term credit transaction. In this case, the lessor provides for the purchase of property from the seller at the request of the lessee, the transfer of the property for long-term use on lease terms, and the purchase by the lessee at the end of the lease. The French doctrine, which adds to the concept of the close interdependence of several contracts in leasing, emphasizes that it is inseparable from one another, and there are conclusions of jurisprudence in this regard. If there are differences between the lessee and the subject of the contract, then the issue of liability is governed by this law (Article 1721 of the Napoleonic Code).

In the Belgian state, leasing is referred to as "location financement" and this relationship is regulated in the same way as the French. That is, the Royal Law of November 10, 1967 "On enterprises engaged in the practice of financial leasing" reflects the terms such as financial leasing, rent and related categories. In Italy, the financial lease agreement (operazion di locazionefinanziaria) is of special importance, in which the industrial equipment and facilities

that are the subject of leasing are regulated by the rules established in relation to real estate. In this case, the lessor may transfer the leased asset through a lease agreement, separating it from real estate.

The anglo-axon system of law plays an important role in the legal regulation of leasing relations. Its main feature is that a special institution of the Anglo-Saxon legal system is included in the composition of any contract as a presumptive condition. This serves to satisfy the will of the parties who have reached an agreement on the contract in the courts, and the lease agreement is no exception. The 1982 Law of the United Kingdom on the Supply of Goods and Services lists the approximate terms of a lease.

In the U.S., leasing companies are set up by major equipment manufacturers, and other leasing companies are owned by large controlling banks. The area of activity of these companies falls under the influence of regional banks. An important aspect of U.S. law is that it prohibits commercial banks from performing certain types of financial services and separates leasing companies from banks. In addition, even large insurance companies pay special attention to the field of leasing, that is, they are engaged in insuring their activities. Under U.S. tax law, legal entities benefit more from purchasing equipment through leasing at their own expense, and they are provided with tax benefits.

However, Professor M. Moyb points out that even though the German Civil Code was established a hundred years ago, there are no special legal norms regulating leasing relations in this country. In this state, leasing is manifested in two types: lease purchase and lease lease. In the regulation of leasing relations, it uses either the right regulating trade relations or the right regulating lease relations.

In Austria, the average service life of the leased object is 2 to 15 years. Upon expiration of the contract, the lessee may enter into a new contract or purchase the subject of the contract for the remainder of the lease term. The law "On Lease" serves as a basis for the legal regulation of leasing in Austria.

In 1979, the People's Republic of China passed a law allowing the establishment and operation of joint ventures engaged in international leasing activities. The bulk of financial leasing agreements are from 1 to 5 years, the average lease term is 2-3 years, and leasing users prefer short-term acquisition of low-cost equipment to pay interest. Upon expiration of the contract, the user can purchase the equipment at its residual value and the contracts are backed by bank guarantees.

In the Republic of South Korea, the volume of agreements between the parties has doubled since the adoption of the 1989 Law on Supporting the Development of the Leasing Market. There are a total of 14 leasing companies operating in South Korea, eight of which are private leasing companies and six are commercial banks.

If the service life of the equipment is more than five years, the lease term should be less than 60% of the service life of the equipment. It should be noted that the purchase of leased equipment is not mandatory, but may be offered by the lessor at the discretion of the user. The South Korean government has made it its main goal to encourage small and medium-sized enterprises to do business in the country. Therefore, the government has developed a special directive, according to which leasing companies are instructed to allocate at least 35% of the

volume of leasing operations to small and medium enterprises, and this will be implemented in practice.

In the event of a dispute between organizations engaged in international financial leasing in the CIS countries, it shall be resolved in accordance with the general provisions of the Agreement on the Procedure for Settlement of Disputes, adopted on March 20, 1992. Pursuant to Article 11 (e) of this Agreement, their rights and obligations shall be determined by the law of the State in which the Agreement is concluded, unless otherwise provided by the contract concluded between the parties. Legal regulation of financial leasing is defined in the Civil Codes and special laws of all CIS countries. Legislation in these states treats leasing as a type of lease, and all of them are based on the Ottawa Convention.

Articles 594-595 of the Civil Code of the Republic of Uzbekistan are harmonized with Article 12 of the Ottawa Convention. Also, Article 597 of the Civil Code of the Republic of Uzbekistan unifies the provisions of Article 9.13 of the Convention and provides a detailed legal basis for the lessee's obligations, the order of delivery of leased property to the lessee in a quality and on demand.

Under the influence of international legal mechanisms and through the formed norms of national law, the practice of leasing has found a sufficient legal solution in the CIS countries. The CIS countries have special laws regulating leasing relations, including the 16-article Law of the Republic of Azerbaijan "On Leasing" adopted on November 29, 1994, the Law of the Republic of Moldova "On Leasing" adopted on February 15, 1996, and the Law of the Republic of Ukraine 16 February 1997 Examples are the Law of the Republic of Uzbekistan "On Leasing" of December 14, 1999, the Law of the Republic of Uzbekistan "On Leasing" of April 14, 1999, and the Law of the Republic of Kazakhstan "On Financial Leasing" of July 5, 2000. .

Chapter 34, paragraph 6 of the Civil Code of the Republic of Belarus, approved by the Decree of the President of the Republic of Belarus No. 587 of November 13, 1997 and the Resolution of the Council of Ministers of the Republic of Belarus No. 1769 of December 31, 1997 is regulated by the Regulations on According to the Law of the Republic of Moldova "On Leasing", the lessor retains ownership of the property during the term of the contract in respect of the property transferred to the lessee.

The Law of the Republic of Ukraine "On Leasing" also retains the right to own property for the entire term of the contract. In the event of bankruptcy of the lessee, in case of confiscation or confiscation of all its property, the leased object is separated from the lessee's property and returned to the lessor. These norms are reflected in paragraph 4 of Article 15 of the Law of the Republic of Uzbekistan "On Leasing".

In the Republic of Kazakhstan, leasing relations are also regulated by a special law. Article 2 of the country's Financial Leasing Law sets out the basic concepts of a lease agreement. According to him, financial leasing is recognized as one of the types of investment activities. In addition, a separate description is given to the lessor, lessee, seller, leasing agreements, subleasing, leasing activities, items that can not be used in the leasing relationship.

The results of the analysis of international conventions and leasing legislation of several countries led to the conclusion that the national leasing legislation should be further improved. Article 4 of the Law of the Republic of Uzbekistan "On Leasing" provides clarifications on the

subjects of leasing. In particular, this article does not fully disclose the status of the subjects of the lease agreement, and so far the issue remains unclear. In our opinion, Article 4 of the Law on Leasing should clarify the categories of "resident" and "non-resident" of the subjects of the lease agreement. The Tax Code stipulates that tax policy should be pursued separately for resident and non-resident businesses. However, this is not reflected in the legislation governing leasing relations.

CONCLUSION

In particular, it would be expedient to determine in the law on leasing on the basis of what norms the national lessor and lessee, on the basis of which the lessor and lessee, which are foreign leasing entities, the legal norms. This is because the inclusion of the above norms in the leasing legislation is important, first of all, in determining the scope of benefits provided by the state to entities and guaranteeing their activities. If the legal status of foreign entities is clearly defined in the leasing legislation, the procedure for concluding contracts and the conditions of their activity are defined, then the rights of the subjects of the contract will be protected by law and international norms will be harmonized. In addition, the inclusion of these provisions in the law will facilitate the implementation of international leasing operations on the territory of Uzbekistan and will limit the problems that arise between the parties.

FEATURES OF NATIONAL AND CULTURAL SPECIFICS OF PHRASEOLOGICAL UNITS IN THE LESSONS OF THE NATIVE LANGUAGE

Bohodirova Gulrukh Bohodirovna*

*Teacher,
Shakhrisabz branch state Pedagogical University named after Nizami Shakhrisabz,
UZBEKISTAN

ABSTRACT

The article is devoted to the peculiarities of national and cultural specifics of phrase logical units in the native language lessons as the activity of effective pedagogical technologies. The article discusses the concept of phrase logical units in the lessons of the native language skills and abilities, and their application.

KEYWORDS: *Specific Phrase logical Units, Folklore, National Specifics, Culture.*

INTRODUCTION

In order for a person to remain a person, a person, he needs to remember his roots. It is impossible to enter the universal culture, bypassing the national one. Each nation remains itself as long as it retains its own way of life, language, special climate and human relations. In order to implement the principle of interrelated study of the Uzbek and Russian languages, as well as the wider use of the national cultural component in the Uzbek language classes. Phrase logical units are one of the most interesting manifestations of the national — determined specificity of the mentality of a particular people. The internal form of most phrase logical units contains such meanings that give them a cultural and national flavor [1].

Main part

The phraseology of different languages has a lot in common, as phrase logical units reflect universal concepts and views on the world. But most of the phrase logical units of each language differ in their national specifics. This difference is manifested in the shades of meaning of phrase logical units, their national imagery, in the lexical composition. Any language reflects the culture of the people who speak it. Learning a foreign language always means getting to know the new

culture that underlies the language. due to the divergence of the two cultures in the studied language, a foreign student meets with a large number of words and expressions that do not have semantic correspondences in their native language. v. n. telia writes that the phrase logical composition of a language is a mirror in which a linguistic and cultural community identifies its national identity. It is phrase logical units that native speakers call a special vision of the world, a situation [2]. Here it will be appropriate to cite one of the most famous facts related to the words denoting color in different languages. For example, native Japanese speakers represent "apple color" only as red, and native French speakers represent it only as green. And so in the Japanese language there is such a common expression — "the child has a face like an apple" i.e. a red, healthy face. In this case, such an expression is difficult to translate verbatim from Japanese to French, or a comment is required when translating. Therefore, linguistic units that do not have equivalents in their native language are subject to linguistic and cultural commentary. In the field of non-equivalent vocabulary, phrase logical units occupy a special place. In this regard, it should be noted that native speakers of the   Russian language represent the color of the apple in both red and green [3]. There is also an Uzbek phraseology, "ikki yuzi kip-kizil olmadai", close in meaning to the Japanese "yuzi olmadek kip-kizil" — "cheeks rosy as apples" i.e. cheeks, face pink-red color. Also in the Uzbek language for the expression of an angry person state with a value of "blush", used the word "lavage" — beets, for Example: jandan using uzlari lallaguda sarib ketdi. . Phrase logical units that reflect the experience of the people, the originality of their material and spiritual culture, give the language a unique national flavor. For example, Uzbeks call cotton "white gold" and oil "black gold", while in a number of Western countries "white gold" means porcelain, and "black gold" means coal. Mourning ceremonies also have their own national specifics, for example, during mourning, Uzbeks wear blue clothes, Europeans and Russians wear black, and Asian peoples (Japanese, Koreans, Hindus, Chinese, etc.) wear white. Thus, the national-cultural aspects of the language, of course, are reflected in phrase logical units. consequently, language tends to encode information that includes a national-cultural aspect. Each language encodes information differently. Let us give an example: in the Uzbek language the word "Aynamo" has several meanings: bolalar boғda Aynayaptilar - "children play in the garden". Incomplete equivalents that differ from the original are more common.

phrase logical turnover for any of the indicators, for example, there are other, often synonymous components, small changes in the form, a change in syntactic construction, other compatibility, other morphological attribution the correspondence of the translated phraseology, the "relativity" of which is hidden by the context. Here are some examples. Cat scratching on the soul (heart) – icini Musuc of tutelati. The word "soul" has two meanings: 1) the inner, mental world of a person, his consciousness; 2) this or that property of character, as well as a person with these or other properties [2, p. 168]. the word "heart" has two meanings: 1) the central organ of blood circulation in the form of a muscular sac; 2)peren .: this organ as a symbol of human experiences, feelings, moods [2, p. 656]. This second, figurative, beginning is used in Russian phraseology, and in the Uzbek language it sounds like "ichini", i.e. something internal, something that is inside a person, his soul. Note that in the Uzbek language there are still one phraseology with the meaning "someone is sad, sad, restless, anxious" is ichini it tirnayapti, in which the word "cat" is replaced by the word "dog". The phraseology head (pot) cooks in the sense of "someone is expressive, quick-witted, understanding" [5, p. 111] has an Uzbek correspondence to Callasi ishlaydi , in which the word "ishlaydi" is translated as "works".

In the blink of an eye, instantly, instantly, very quickly [5, p. 240].

This phraseology in the Uzbek language corresponds to kyz ochib yumguncha, which literally means: for the time during which you can have time to open and close your eyes, i.e. blink. As the Apple of the eye (to protect) – cs arachidic salamo (asrama).In both examples, the component composition differs from the original phrase logical turn, in Uzbek phraseology the image is more extensive, but, nevertheless, the images of the two analogues in Russian and Uzbek are very close, touching: oko (obsolete word means the same as eye) - kyz (eyes); zenitsa (obsolete word-eye, pupil) - korachagidek (pupil). Phrase logical equivalents should have approximately the same component composition, have a number of identical lexical and grammatical indicators, for example, compatibility, belonging to the same grammatical category, usability, connection with contextual satellite words, lack of national color.

Incomplete equivalents may differ from the original phrase logical unit in synonymous components, slight changes in form, change in syntactic construction, other compatibility, other morphological attribution: to turn up (turn up) your nose in the meaning of "arrogance, self-importance, swagger" [4, p. 163] - burnini (osmonga) kўtarmoқ [1, p. 30], lit .: to raise the nose (to the sky). However, the general meaning remains. When translating phrase logical units, the presence or absence of national coloring should be taken into account. For the most part, phrase logical units, except for some borrowed ones, have a national flavor, which may be due, firstly, to the specific coloring of a separate component (reality, proper name) and, secondly, to the nature of the unit itself, associated with the national characteristics of the people.

CONCLUSION

When translating from one language to another, as a rule, the specificity of the figurative components is distorted, on which, in essence, all the semantics and generalized thought of phrase logical units are held. In principle, the above phrase logical units are connotative, each of them is associated with a specific historical and cultural background, known only to native speakers.

The linguo culture logical approach to the consideration of phraseology is of great cognitive importance in the study of.

DEVELOPMENT OF METHODS FOR DETERMINATION AND SEPARATION OF IRON OXIDES FROM KAOLINS

Isakulov Fakhriddin Bakhronovich*

*Applicant Chemistry Department,
Tashkent, UZBEKISTAN
Email id: faxriddinisakulov 8881@gmail.com

ABSTRACT

Kaolin, Iron Oxides, and Standard Metal Samples. The Subject Of Research Is Heavy Toxic Metals, In Particular Oxides And Hydroxides Of Iron, Titanium And Other Ions Accompanying Kaolins.

KEYWORDS: *Kaolin, Iron Oxides, Immobilization, Heavy Toxic Metals, Organic Reagents, Sorption Spectroscopy, Photometry, Polymer Carriers, Sensitivity.*

THE AIM OF THIS WORK: Is To Develop Methods For The Determination And Separation Of Iron Oxides From Kaolins.

INTRODUCTION

Optical (sorption-spectroscopic, X-ray fluorescence, reflection spectroscopy (MOS), atomic absorption) were chosen as research methods; electrochemical and statistical methods for calculating the data obtained. Used as elemental analysis, IR, UV -, electronic spectroscopy and quantum chemical calculations.

Infrared spectrometer - Avatar System 360 FT - IK Pratege 460 Magna - IR techology from Nicolet Instrument Corporation (USA), PMR spectrometer Bruker DR- 500 (USA), spectrophotometer SF-46, concentration photo colorimeter KFK-2 and KFK 3. Apparatus for preparing bid stilled water (glass) ASD, analytical scales VLR-200 and ADV-200, pH meter "pH / mV / - TEMP METER P 25" (South Korea);

Drying cabinet, electric stove, water bath, magnetic stirrer, muffle furnace, melting apparatus (PTP), thermometers;

Cuvettes, volumetric flasks, graduation pipettes, plastic glassware, chemical beakers, ash-free filters "blue tape", sorbents CMA-1, CMA-2, CMA-3, PPA, PPD, PPM, etc. Acids: nitric, hydrochloric, phosphoric, acetic, boric, sulfuric, sodium, potassium and ammonium hydroxides, EDTA and metal salts of special purity grade. and ch.d.C spruce producing iron oxide from kaolin optimum conditions were found separation of iron ion and obtaining IMOR on basis of polyacrylonitrile fibers modified by various reagents for anion exchange groups for determination of iron ions. On the basis of experimental data and analysis of the scientific literature on this subject we have proposed combo the IU Todd purification of kaolin iron ions to form complexes with its IMOR. Combined methods of enrichment of kaolin using known GOST methods and those proposed by us have been proposed and compared.

The structure and composition of kaolins were studied by various modern physicochemical methods and the results obtained were processed by the methods of mathematical statistics.

The optimal conditions for the immobilization of azo reagents on a polymer carrier were found and their chemical-analytical properties were compared.

The properties of the initial and enriched kaolins after the removal of iron oxides with organic reagents and the available GOST methods are compared.

The influence of the pH value of the medium and the volume of aqueous solutions of acids on the separation of iron ions from kaolins was investigated.

The research results showed that the dependence of the stability of iron complexes decreases with an increase in the pH-value of the solution.

The proposed enriched and purified from iron oxides kaolin can be recommended for use in the paper and ceramic industries.

Relevance of the topic

Kaolin is one of the most versatile types of mineral raw materials used in industrial production [1]. High refractoriness, low plasticity and binding capacity, chemical inertness, high dispersion, purity, white color, high alumina content, the ability to maintain a given shape, acquire high strength after firing, a highly developed active surface - this is not a complete list of kaolin properties that predetermine it use [2]. Usually, kaolin is enriched by removing harmful impurities (hydroxides and sulfides of Fe and Ti), which reduce whiteness and refractoriness.

METHODS: The world production of kaolin is more than 40 million tons per year [3], moreover, a steady tendency of growth in consumption of kaolin concentrates remains, the scope of their application is expanding. In the last decade alone, the world production of kaolin has increased 1.6 times [4-5].

The existing kaolin production facilities meet the needs of Russian enterprises only by 10%, offering not the highest grades of kaolin. Especially in a difficult situation due to import dependence were enterprises producing fine ceramic products, electro porcelain, building ceramics [6].

In this situation, an urgent task is to create a full-fledged domestic raw material base of kaolin, first of all, by involving kaolin deposits located in various regions of the Republic into economic circulation [7]. The choice of the optimal method for their enrichment to obtain high-quality

products for fine ceramics, since at the moment the kaolins of the Angren, Navoi and Samarkand deposits were considered exclusively for the production of refractory products.

The purpose of th research was and zuche of the physico-chemical properties of kaolin from various deposits areas of the Republic of Uzbekistan and the development of ways to reduce the content of iron oxide compounds.

The objects of research were kaolins and waste slags of kaolins of the Angren, Navoi, Samarkan, Khorezm, Surkhandarya regions. This work presents the results of the physical and chemical analysis of the Angren, Navoi, Samarkand, Khorezm, Zarafshan regions. The chemical compositions have been studied and the individuality of kaolin samples has been established, the composition and individuality of kaolin have been investigated in order to obtain further ceramic materials on its basis.

To achieve the goal, the following tasks were set:

1. Study of the state of the raw material base of kaolin in Uzbekistan, CIS countries and abroad;

2. Study of the physical and chemical composition of kaolin;

3. study of the physical and mechanical properties of kaolin of the Angren, Navoi, Samarkan, Khorezm, Surkhandarya deposits, subjected to the stages of drying , chemical treatment and roasting;

4. development of methods for the purification of kaolin of the Angren, Navoi, Samarkan, Khorezm, Surkhandarya deposits, leading to an improvement in their physical and chemical properties;

5. study of the possibility of using enriched kaolin of the Angren, Navoi, Samarkan, Khorezm, Surkhandarya deposits in the production of high-quality ceramic products.

RESULS: The practical value of work sosotoit in p azrabot ke and tested uu under laboratory conditions, the method and the chemical beneficiation of kaolins using immobilized reactants , providing a high degree of extraction of iron oxide from kaolin product.

Designed n s e proposed and alternative methods of purification of iron compounds from kaolin serve for use in the production of enriched kaolin ceramic masses, where the first field is used Angren kaolin.

Contents of purified kaolin Angren field set various modern physicochemical methods allow to obtain a product , having changed its 0.4 wt . % iron , provides the production of kaolin with the extraction of up to 70 % of the finished product;

CONCLUSION

The kaolin of the Poletaevskoye deposit was taken as a sample or a comparative standard, which in its parameters corresponds to GOST for kaolin. **The scientific novelty of the work lies** in the fact that for the first time it was established that the hydrothermal chemical method for purifying kaolins makes it possible to reduce the content of iron oxide compounds in them by ~ 2 times;1 . for the first time it was shown that the method of interaction of kaolins in a 10 wt.% aqueous solution of HC1 and an immobilized organic reagent makes it possible to reduce the content of iron oxide compounds in them by ~ 1.5 times;2 . shows that the composition Angren kaolin deposits, in contrast to other fields, the iron oxide compound (III) are present as individual phase γFeOON which are readily converted into the salt form3 . For the first time, compositions of ceramic masses based on kaolins of the Angren deposit for the manufacture of ceramic products and fine ceramics were proposed.

ABSTRACT

The article presents methods of obtaining compounds of magnesium-containing fatty acids with amides, their crystallographic characteristics, such as interplanar distances, relative intensities of lines of free molecules and mixed-ligand complexes, the thermal stability of the obtained compounds is studied by derivatographic method. Based on the results obtained, it was concluded that the mixed ligand complexes were identified.

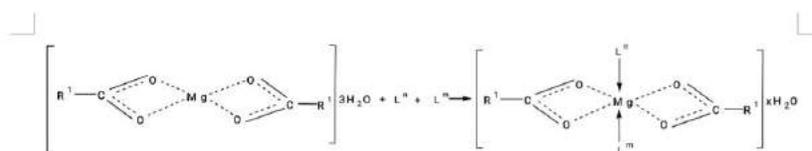
INTRODUCTION

The urgency of the problem: in the agriculture of the Republic of Uzbekistan, great attention is paid to saving water resources when growing cotton, increasing its yield, as well as reducing the time for opening the bolls and thereby meeting the needs of various sectors of the economy. In the third direction, the Action Strategy for the further development of the Republic of Uzbekistan is defined as the most important task "further improvement of the reclamation state of irrigated lands, development of a network of reclamation and irrigation facilities, widespread introduction of intensive methods in agricultural production, primarily modern water and resource-saving agricultural technologies, productive agricultural machinery ". Consequently, the synthesis of environmentally friendly, water-saving stimulants of polyfunctional action and their application in practice when growing cotton, grain and melons, as well as to increase yields, is important.

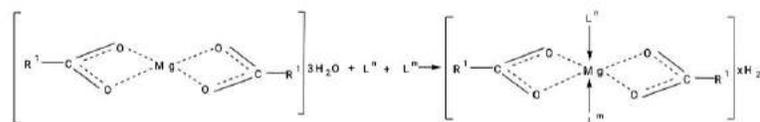
Materials and methods

In this regard, the works of such leading scientists as Parpiev N.A., Khodzhaev O.F., SharipovKh.T., SharipovKh.Kh., Shabilalov O.I., Yunuskhodzhaev A.N., deserve special attention. Nabiev M.N., TuraevKh.T., Azizov T.A., Azizov M.A., NasimovKh.M., Dusmatov A.F., Ibragimov B.T., Umarov B.B., KadirovaSh K., Kadyrova Z.Ch and others, investigating methods for the synthesis of complex compounds of metal carboxylates with organic ligands and the effectiveness of their use in various sectors of the national economy.

The coordination compound of the composition Mg $(R1COO)_2 \cdot Ln \cdot Lm \cdot 3H_2O$ was obtained by vigorous stirring of 0.5892 g (0.001 mol) of magnesium palmitate trihydrate with 0.0601 g (0.001 mol) of carbamide and 0.123 g (0.001 mol) of nicotinamide in ball mill with a volume of 100 ml, at room temperature for 36 minutes.

$$R^1 - C_{15}H_{31}; \qquad L^n - urea \qquad L^m \quad nicotinamide \qquad x = 3;$$


The coordination compound of the composition Mg $(R1COO)_2 \cdot Ln \cdot Lm$ was synthesized by intensive stirring of 0.5892 g (0.001 mol) of magnesium palmitate trihydrate with 0.0761 g (0.001 mol) of thiocarbamide and 0.1223 g (0.001 mol) of nicotinamide in a ball mill volume of 100 ml, at room temperature for 0.5 hours.

$$R^1 - C_{15}H_{31}; \; L^n - \text{thiocarbamide } L^m - \quad nicotinamide$$


The amount of metals in the synthesized compounds was determined on a novAA 300 atomic absorption spectrophotometer (Analitik Jena AG, Germany). Nitrogen was determined by the micro-Dumas method, carbon and hydrogen by combustion in a stream of oxygen.

To establish the individuality of the synthesized complex compounds, X-ray diffraction patterns were taken on an X-ray diffractometer "Drone-2.0" .

Comparison of the main interplanar distances (d, Å) and relative intensities (I,%) of the lines of free molecules of urea – 3.98 (100), thiocarbamide – 4.30 (100) and nicotinamide – 5.92 (100) and new mixed ligand complexes of magnesium palmitates of the following compositions: Mg (C15H31COO) 2 CO (NH2) 2 NC5H4CONH2 3H2O ,8 3.82 (100); Mg (C15H31COO) 2 CS (NH2) 2 NC5H4CONH2–3.77 (100) shows that they differ significantly from each other and from similar ones for the initial components. Therefore, mixed ligand complex compounds are individual chemicals (Table 2).

CONCLUSION

The thermal stability of all synthesized compounds was studied. The values of thermal effects, temperature ranges of all stages of thermolysis, weight loss, total weight loss, nature of effects and compositions of the resulting products were determined.

Endothermic effects observed during heating can be caused by such physical phenomena as melting, evaporation, changes in the crystal structure, or by chemical reactions of dehydration, dissociation. Transformations that are accompanied by exothermic effects on heating are much less common: these are oxidation processes and some structural transformations.

Analysis of derivatograms of synthesized compounds, determined endo- and exo-effects during the decomposition of complexes and identification of thermolysis products are shown in Table 3.

ABSTRACT

This article presents the results of an evaluation of the effectiveness of an experimental model of a "neutral" seat for train dispatchers. An experimental model of the developed chair allows the dispatcher to move about 30-35% of its total weight to the front support points in the same body position in both seats. This experimental model of the chair indirectly confirms that the dispatcher's body is close to the neutral position when the muscles are sitting with minimal movement, ie the weight of the body parts is transferred to the chair in the least tense position of the muscles and joints (through the kinematic chain). is achieved by the action of the supporting forces of the knee brace on the body parts. The design of the experimental model of the chair ensures that the design parameters and elements of the human body in the sitting position are in the "neutral position", as well as the upper part of the body at the waist (payer) at an angle greater than 900 feet. This eliminates the force moment caused by the weight of the upper back of the body when people sit in a normal chair, the knee pads of the chair and the spring-loaded stretches relieve the muscle tension needed to maintain the position of the legs.

INTRODUCTION

Relevance of the issue. It is known that train dispatchers use modern information technologies, mainly through personal computers, video terminals, various office equipment. The process of labor activity is 80-90% of the shift timein the sitting position, with the body leaning forward, and in 10-20% of the standing positions [1].

The posture of train dispatchers in the work activity to some extent causes them to prolonged static loading of the members of the musculoskeletal system (arms, legs, spine, fingers).

Prolonged stay of train dispatchers in such an awkward working position (working position) for several years (over time) due to occupational activities, osteochondrosis, radiculitis, spinal hernia, joint disease, displacement of the spine and increases the likelihood of developing various diseases [1].

Theoretical basis for the creation of an experimental model of the seat of train dispatchers "neutral position". Based on the results of the study of labor activity, train dispatchers [1] transmit the weight of the body parts through the base points touching the seat, which allows people working in a sitting position for a long time to ensure a minimum load on the limbs (muscles). (via a kinematic chain) an experimental model of the chair was developed.

The experimental model of the chair provides a "neutral" position of the body when the musculoskeletal system is sitting with minimal movement of the muscles, which allows the weight of the body parts to be transmitted and balanced in the least combed position (through the kinematic chain). is achieved by the action of additional supporting forces on the body parts [2,3,4,5].

In the experimental model of the proposed chair, special metal frames are welded together, the frame is mounted at an angle of 150-200 degrees to the horizontal plane of the seat, which corresponds to the size of the geometry of the human figure, as well as knee and leg supports. made in a curve corresponding to the geometric shape and fastened to the frame with the ability to move in horizontal and vertical directions, the legs are placed on the stirrup at the open end of the Archimedes spiral-shaped plate spring [6].

Experimental research program, methods and equipment. The program for evaluating the effectiveness of the experimental model of the seat of train dispatchers "neutral position" consists of the following:

- Preparation of a model of an experimental chair;

- Preparation of a sample of a chair used in practice;

- Preparation and weighing of measuring instruments;

- Measure the weight of the experimental participant and determine the sitting position;

- measuring the force of gravity on each base of the chair used in practice;

- measurement of the force of gravity falling on each base point of the experimental chair model;

- Processing of experimental results.

In practice, an experimental sample of a chair and an designed chair used by train dispatchers was determined by weighing the weights falling on the reference points. Prior to the installation of the scales, the position of the floor surface relative to the horizon, where the experimental specimen of the chair and armchair is located, was monitored using a level deflection device ("uroven") and the scales were set at an angle of 00 to the horizon. The model of the existing chair and experimental chair was repeated 5 times by the gravitational force at each (4) reference point. The arithmetic mean of the measurement results was determined and their value was taken as the measurement result. The histogram, based on the results of the experiment, was performed in the standard Excel program.

The experimental model of the chair and armchair used was measured on mechanical scales equipped with an arrow indicator of the model VT-1955 GY.

During the experiments, the position of the dispatcher in the sample of the experimental model of the current chair and armchair and the position of the scales in measuring the force of gravity falling on the reference points are shown in Figure 1.

a   b

a-an example of an experimental model of a chair b-chair used in practice

Figure 1. The position of the dispatcher in the sample of the experimental model of the current chair and armchair and the location of the scales for measuring the forces acting on the reference points

Analysis of experimental results. According to the program of experimental research, the results obtained using the methods and equipment described above were processed and then tabulated for analysis (Table)..

TABLE RESULTS OF EXPERIMENTAL RESEARCH

№	Base points	The force of gravity falling on the base points (N)	
		chair used in practice	an example of an experimental model of a chair

1	Front left	140	250
2	Front right	140	250
3	Rear left	235	120
4	Rear right	235	120
Total weight		750	750

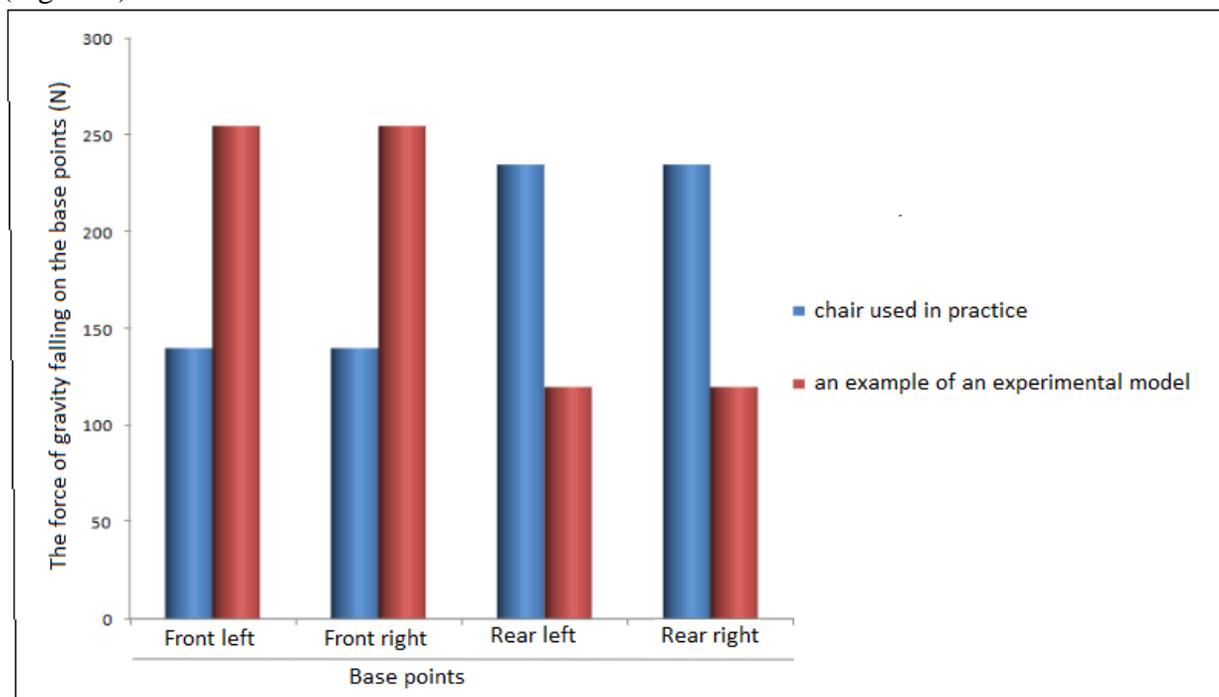
Based on the results of the experimental studies presented in the table, a histogram of the gravitational forces acting on the reference points was constructed to compare their values (Figure 2).


Figure 2 Histogram of gravitational forces acting on anchor points

The analysis of the obtained results shows that the experimental model of the developed chair allows the dispatcher to move about 30-35% of its total weight to the front support points in the same sitting position in both seats. This experimental model of the chair indirectly confirms that the dispatcher's body is close to the "neutral position" when the muscles are sitting with minimal movement, ie the weight of the body parts is transferred to the chair in the least tense position of muscles and joints (via kinematic chain). balanced body parts are achieved by the action of the base forces of the knee brace. The design of the experimental model of the chair ensures that the design parameters and elements of the human body in the sitting position are in the "neutral position", as well as the upper part of the body at the waist (payer) at an angle greater than 900 feet. This eliminates the force moment caused by the weight of the upper back of the body when people sit in a normal chair, the knee pads of the chair and the spring-loaded stretches relieve the muscle tension needed to maintain the position of the legs.

CONCLUSION

The results of experimental studies show that the design parameters and elements of the experimental model of the chair can be such that the human body is in a "neutral position" by transferring about 30-35% of its total weight to the front support points. The upper bouts featured two cutaways, for easier access to the higher frets. The lower bouts featured two cutaways, for easier access to the higher frets. This eliminates the force moment caused by the weight of the upper body from the waist when people sit in a normal chair, as well as the muscle tension needed to keep the chair's knee braces and spring-loaded stretches in the leg position. The fact that the body of the train dispatcher sits in a "neutral position" in exchange for relieving the statistical tension of the members of the base movement,joint disease, displacement of the spine drastically reduces the likelihood of occurrence and ensures high efficiency of labor activity.

ABSTRACT

In Gaza strip during 2011, 1041 completed a follow up interview to study the effect of water pollution on the health of sea visitors .A total of 91 participants (8.7%) reported symptoms ,male / female ratio was 1.75. Incidence of Skin infection was 21%, Ear infection 16.5%, Eye infection 25.0%, Gastroenteritis 17.7% and UTI 20.0%. Water analysis showed that total coliform Geometric mean range (226-1901), Fecal coli form (92-390) and Fecal streptococci (60-195), Staph aureus (171-440), Pseudomonas (2.1-5.6). The percentage of samples exceeding European Union standard were 51.1% for total coli form, 66.6 % fecal coliform and 36.2%fecal Streptococci .The risk factors associated with infections were Sea bathing period > 60 minutes, Age group (1-10 years) and duration of visiting beaches more than two per week Odds ratio 1.9 ,P-value 0.011   Conclusions .The results of this study suggest that the swimming in polluted marine water could a risk of acquiring different type of diseases.

KEYWORDS: *Fecal Indicator Bacteria, Polluted Water, Risk Factors*

INTRODUCTION

Marine water recreational activities form an integral part of the tourist industry in Gaza strip making the protection of the marine environment of particular economic concern, The Gaza strip coastline has a length of approximately of 45 km with an area of 365 km^2 of which an estimated 40 km is used for recreational uses, these are exposed to different types of pollution especially biological contamination by dumping the fecal effluents of the area. Most beaches and bathing

areas are near cities, the dumping of urban and industrial waste waters into the sea, with their high level of pathogenic and other polluting agents, raises concern about its consequences for both health and ecology. Health Organization (WHO) and academic research sources has made an estimate that globally, each year, there are in excess of 120 million cases of gastrointestinal disease and in excess of 50 million cases of more severe respiratory diseases caused by swimming and bathing in wastewater-polluted coastal waters (Shuval H.2003).Using other data, it was employed a cost-of-illness model to estimate economic impacts that health consequences due to marine-borne pathogens in the USA had annual costs on the order of US$900 million. (Ralston et al 2011).Sewage-polluted water may contain different types of disease-causing microorganisms or pathogens. Numerous reports demonstrated that many classes of pathogens excreted in feces are able to initiate waterborne infections. There are bacterial pathogens, including enteric and aquatic bacteria, enteric viruses, and enteric protozoa, which are strongly resistant in the water environment and to most disinfectants (Saliba ,Helmer 1990,Papastergiou et al 2012,Ashbolt et al2010).The wide range of pathogenic micro-organisms in water and their low concentration make their determination difficult. Therefore, some indicator organisms used for water quality are to reflect the presence of pollution. There is no agreement on which indicators are the best predictors for conditions related to bathing. Faecal coliform,(Graczyk et al2010), Enterococci(Korajkic et al2013) and faecal streptococci(Suzuki et al 2012),other indicators recently used as antibiotic resistance bacteria resident in water of fecal origin(Wiggins et al 1999) and Staphylococci are often accepted bacteriological indicators in addition to E.coli (Efstratiou et al1998).The European Union Directive 76/160/ EEC(EUD 2006) and U.S. Environmental Protection Agency (US EPA) (US EPA2007) sets out the limits of certain physical chemical and microbiological parameters in order to ensure that the environment and public health in bathing areas are protected throughout the European Community. Nevertheless, there are doubts as to whether this Community Directive should be applied in areas with very different environmental features and uses. Bathers are considered a potential non-point source of contamination impacting recreational waters (Wade et al 2010) ,studies have found that bathers shed appreciable amounts of microbes via their skin into the water column, and swimming related illnesses appear to be associated with the microbial water quality even in the absence of point sources of contamination . On a general level, pathogenic micro-organisms can be broadly divided into two categories: those that affect the gastrointestinal tract, and those that affect other parts of the body. As regards the former category, all the diseases which are spread by the faecal–oral route, and whose etiological agents are shed in the faeces of diseased individuals or carriers, could potentially be contracted through the ingestion of seawater while swimming or bathing in sewage polluted waters. Such diseases have been reported to include bacterial diseases, viral diseases and diseases caused by a variety of protozoan and metazoan parasites (McQuaig et al2012,Graczyk et al 2007) Several epidemiological studies have found that bathing in temperate recreational waters with known point sources of faecal contamination (such as domestic sewage or storm-drain runoff) has been associated with an increased risk for transmission of infectious diseases(Marion et al2010) . US Environmental Protection Agency (EPA) recommended indicator microbes for evaluating beach water quality in subtropical regions (Boehm et al2009)

Previous epidemiological studies have investigated the exposure-response relationship between health outcomes and bathing-water quality based on measures of faecal pollution indicator bacteria. The existence of threshold values of indicator-bacteria counts for health outcomes was

studied, as well as possible variations in the severities of outcomes associated with microbiological water quality. Bacteriological water quality criteria (fecal pollution bacteria thresholds) have been recommended to ensure bathers' health. These criteria are based on estimates of bacterial indicator counts and gastrointestinal illness rates that are currently believed to provide a high level of protection for bathers' health The US EPA is in the process of developing new Ambient Water Quality Critieria by 2012 for recreational waters (US EPA, 2007,Boehm et al., 2009). Evaluation of these new criteria includes both the use of alternative fecal indicators and rapid molecular methods that will give some day results (within 4 h or less). These alternatives include enterococci by qPCR and the Bacteroidales group by qPCR. Although not-specifically included in the EPA studies, other researchers have also evaluated the relationship between S. aureus, a common skin pathogen, and human health outcomes (Fujioka and Byappanahalli (Fujioka and Byappanahalli 2001) and, recently markers have been developed to delineate impacts from seabirds relative to mammals which frequent beach sites (Lu et al., 2008).

The specific goal of the study was to determine the relationship between swimming and the incidence of swimming-related illness. Microbiological data and the choice of an optimal bacteriological water quality indicator for swimming-related illness will be evaluated

MATERIALS AND METHODS

Sites description

The water samples were collected from the beaches along Gaza strip coastline . The climate of Gaza strip is classified as 'moderate ' because of its geographic location . The study was carried out in the summer of 2011 (from 1 July to 16 September) at five beaches of Gaza strip (South of Palestine of). The beaches are 30 km long, relatively shallow, and characterized by weak water circulation ,the collection of water samples met the requirements established in the norms concerning the quality of bathing waters, maintaining the sampling points throughout the whole bathing season in an area with maximum density of swimmers and collecting the water 30 cm below the surface in a shallow about one meter deep. The five beaches were sampled from 1 July to 15 September, every Monday, Wednesday and Friday, around 10 am.

Sample collection and measurement of indicators

The water samples were taken in sterile bottles, and kept in the dark inside isothermal bags during their immediate delivery to the laboratory. Friday samples were kept refrigerated until they were processed within 24 hours of collection. Bather-collected composites were analyzed for many different microbes, including the EPA-recommended marine bacterial indicator, membrane filtration The following bacterial indicators were analyzed and quantified in colony forming units (CFU/100 ml): total coli forms, faecal coli forms, faecal *streptococci, Staphylococcus aureus*, and *Pseudomonas aeruginosa*. Using membrane filter technique To achieve this we used the methodology and culture medium proposed in the methods specified in the Standard Methods (1995) (APHA 1995)

Epidemiologic study

The epidemiological study was performed in two parts: survey on the beach and follow up. Both surveys were carried out by people trained by research staff. completed in situ on each beach. The survey was of family type: once a person was selected, everybody on the beach and living in

the same home was interviewed. The surveys were done on the same days the water quality was analysed (Monday, Wednesday and Friday) between 11.30 am and 3 pm so as to obtain a daily average of 25 people interviewed. Subjects were selected using a random route procedure in the beach areas closest to the water sample points. To ensure that any group of people situated anywhere on the beach would have the same likelihood of being surveyed within the pre-established daily route, interviewers stopped at preset regular times (initially 1 minute) and the person nearest the interviewer was asked to participate. The follow up survey was carried out, mainly by telephone, within seven days after the interview on the beach. Exceptionally, whenever the surveyed person had no telephone, the follow up took place on the beach itself. The aim was to find out possible affections attributable to the use of the beach. They were asked about fever ($>38C^0$), skin irritation, itching, otitis, conjunctivitis, cold, and sore throat. The follow up was done by two people only, who were previously trained. All the questions regarding the outcome were always asked for in the same way. In case of doubt, they consulted with another researcher to maintain the same criteria. The interviewers did not know the results of the water analysis. Data were obtained on sex, age, job, place of residence, marital status, personal history of allergy, eating habits, sun and sea bathing habits on the beach, and symptoms suffered during the week before the interview.

Statistical analysis

Parameters that met the normality requirements were analyzed using the following parametric tests: A bivariate analysis was carried out to examine the relation between exposure (to bathing, water quality and other variables) and health conditions. Odds ratios (ORs) with a level o> 1.0 significant and Pearson chi square analysis was conducted using their 95% confidence intervals have been estimated. P-value with statically significance of <0.05

Ethics

The clinical and socioeconomic data were collected according the general rules of Helsinki committee in which the participants whom developed diseases were informed the methodology and the objectives of the research.

Results

Health outcomes

The method for assessing illness, as well as other epidemiologic considerations using the individual exposure data .Participants were mainly males (64%) with a mean (SD) age of 33.8 (18.7) years (range 0–65years). They were residents (49.1%) and holiday makers (33.7%), whereas day trippers were in a lower proportion (17.2%). Most participants were students (31.6%) and housewives (15.3%). The frequency of symptoms were varied in both men and women and tended to decrease with age (p = 0.023) (table 2). The most common symptoms recorded were skin 21% , Ear 16.5%, Eye 25% ,Gastroenteritis 17.7% , UTI 20%

Environmental parameters

Throughout the study period a total of 500 water samples were collected, equally distributed among the five beaches. The microbiological quality of the water notably varied from day to day. The average temperature of water during the study was $22.1^0C+\_1.1^0C$.The European Community Directive establishes that 20% and 5% of samples of water must not exceed the

guide and mandatory standards, respectively. The guide standard for total coliform is 500/100 ml, 100/100 ml for\ both fecal coliform and fecal streptococci. The mandatory standards for total coliform and fecal coliform are 10,000/100 mL and 2000/100 ml, respectively. There is not any mandatory standard for *fecal streptococci* .The water quality exceeds the guide standard value for total coliform in 51.2% of the total samples, for fecal coliform in 66.6% of the samples, and for fecal streptococci in 36% of the samples .(and does consequently not comply with the guide standards of the EU directive). The results obtained for each beach are shown in table 1.the distribution of total coliform samples which exceeds the EU standard were as following site I 29% of the samples were exceeds the EU standard ,site II 12%, site III 37% , site IV 88% and site V 57% . for Fecal coliform the samples which exceeds the EU standard were site I 31% , site II 26% , site III 93% , site IV 95% and site V 88% . for Fecal Streptococci site I 10% of the samples were exceeds the EU standard ,site II 1% , site III 48% , site IV 88% and 34% for site V . *Staphylococcus aureus* presence in the water was varied and there is no EU standard guidelines to show up the no of samples which exceeding the normal standard ; therefore we used the range(minimum and maximum) to show up the density of these pathogens in the water .*Pseudomonas aeruginosa* presence in the water was used the same density range as *Staphylococcus aureus* (minimum and maximum), for all sites the minimum values were 1, while the maximum values were 9, 8, 17 , 40 and 20

All beaches showed higher Total coliform , Fecal coliform and fecal streptococci values than the guide standard. Therefore, two of the studied beaches (No .I and II) can be classified as relatively polluted, as 14-15% of their samples were above the guide limits, other two can classified as moderately polluted(No III and V) as 36-39% of their samples were above the guide limits Only one beach V showed 54% of samples higher than the EU guide limits

Risk factors

The risk factors recorded in association with developing infection are indicated by Odds ratio(>1.0) and statistical significance P-value(<0.05) . For age group only age group 1-10 years showed risk factor with statistical significant(P-value 0.01 ,odds ratio 1.82) ,also it showed with Sea bathing >60.0 minutes (P-value 0.001, odds ratio 1.82) ,Duration of beach visit weekly ,twice per week (P-value 0.011 ,odds ratio 1.91) , other factors like residency , awareness of bathing in sea water illnesses , and eating on beach

DISCUSSION

This study was the first randomized exposure study of bathers with individual exposure assessment in moderate recreational marine waters with known source of domestic sewage. This study made association between concentrations of microbial water contamination and subsequent illnesses in which the bathers collected their own water samples at the same time they were being 'exposed'. The number of interviews which could completed the survey process was 1041(87%) while those could not be completed due to such problems as wrong address or telephone number was 59 or 13 per cent. However, the selection of a follow-up method with the best chance of yielding usable data became apparent as an important factor in this study, and therefore only data reflecting questionnaire response by telephone were used.

Our results demonstrated bathers to be at increased risk of reported Gastrointestinal(17.7% , Ear (16.5%),Eye(25.0%) ,UTI(20.0%) and Skin21% illnesses. Several reports from other countries demonstrated that similar to our results In spain Prieto reported that (7.5%) of the participients

reported symptoms and incidence rates of gastrointestinal, cutaneous and high respiratory tract symptoms were higher in bathers. Total symptoms were related with the amount of total coliforms, faecal coliforms, and *faecal streptococci* in the water(Prieto et al2001.Wade reported from USA that they completed 21,015 interviews and tested 1359 water samples. Enterococcus cell equivalents (CEs) were positively associated with swimming-associated gastrointestinal (GI) The association between GI illness and CE was stronger among children aged 10 years (Wade et al 2008).Marion also from USA reported that. Human health data was collected over 26 swimming days during the 2009 swimming season in conjunction with water quality measurements. Adverse health outcomes were reported 8-9 days post-exposure via a phone survey. Wading, playing or swimming in the water was observed to be a significant risk factor for GI illness among water users, Escherichia coli density was significantly associated with elevated GI illness (Marion etal2010) while Colford reported that Diarrhea and skin rash incidence were the only symptoms that were increased in swimmers compared with non swimmers. The incidence of illness was not associated with any of the indicators that traditionally are used to monitor beaches (Colford et al2007)

The discrepancies from those studies conducted in other countries and our results can be attributed to three facts. Firstly, differences in water quality, as we have explained before. However, these differences cannot explain the contradictions we have found. Secondly, they can, on the other hand, be attributed to differences in bathing characteristics (duration, head immersion, etc). Regarding head immersion, our results differ from those obtained in other studies: we have not found differences for any of the analyzed symptoms between those who submerge their head and those who do not. In this way, we have considered swimmers all those people who get into water, both either with or without head immersion. finally, it can also be attributed to people's different susceptibility (Turbow et al 2008) .

All sites showed variations in different indicators used in this study table IV summarized the no. of samples exceeds the European guide standard for marine water for total coliform, fecal coliform and *fecal Streptococci*(table IV) at site1 results showed that (29%,31%, 10%) of total coliform ,fecal coliform and *fecal Streptococci* respectively exceeding the European guide standard for marine water the same also for site II(12%,26%,1%) ,site III (37%,93%,48%) site IV(88%,95%,88%) and site V(57%,88%,34%) for *Staph aureus* range of minimum\maximum site I (30-400),site II(45-350),site III(70-850),site IV(85-1000) and site V(72-815) for *Pseudomonas aeruginosa* range site I(1-9), site II(1-8),site III (1-17), site IV(1-40)and site V(1-20) .

These results clearly showed that some of the sites (beaches) has relatively low pollution in respect of no. of samples exceed the European standard guidelines for marine recreational water like site I I has low pollution for the three main indicators ,while sites I , III ,V has moderate level of pollution and site IV has high level of pollution which could be attributed to that site IV was near the sewage treatment plant and the pollution occur naturally in this area ,therefore it was noted that the pollution decrease as the urban runoff far out .

Similar studies showed similar figures like in our study ,these conducted in different sites of Gaza Strip by Elmanama the highest level of fecal indicator of pollution was detected during winter, especially after a rainfall or after a discharge from Wadi Gaza location which is associated with sewage discharge. Statistical analysis of the data demonstrated significant linear

correlations between several physical and chemical parameters (e.g DO and biochemical oxygen demand, biochemical oxygen demand and fecal coliforms(Elmanama et al 2005, Elmanama et al 2006)

Statistically significant correlations between health outcomes and water quality were not identified in our study; however, the data suggest relationships which could not be verified statistically given the limited number of times that samples were positive for many of the water quality parameters. Statistically significant correlations were found with younger age group 1-10 years P-value 0.001 odds ratio 1.82 ,Sea bathing period >60 minutes P-value <0.001odds ratio 3.24 and duration of beach visit > 3 visits P-value 0.011 odds ratio 1.91.Furthermore, only those bathers exposed to the highest concentrations of exposure showed a statistically significant increase in the risk of acquiring symptoms in relation to non-bathers. An increase in the risk of gastrointestinal symptoms was also noted. Just one figure of coliform is be over the guide standard proposed.

A threshold was not noticed for the rest of the bacterial indicators, but there was an increase in morbidity with the number of faecal coliform and faecal streptococci. There are differences among the different studies about which micro-organism should used as an indicator of health risk in swimmers. Our results suggest that the count of total coliform is the best predictor of the analyzed symptoms. These results differ from those found in other studies in which faecal coliforms (Graczyk et al 2010) or fecal streptococci (Marion et al 20100) were the best predictors. Moreover, we should say that in these studies no comparison with total coliform was made, so that we cannot say they are worse indicators. Besides, a relation between gastrointestinal and skin symptoms and the degree of pollution by total coliform was observed. This is another reason why total coliforms should be used as indicators of morbidity risk (Wyer et al2012031,Mansilha et al2009). Papastergiou according to these results suggest that risk assessments of recreational seawaters should not only focus on bacteriological water quality criteria (Papastergiou et al 2012).

The current study did not demonstrate a consistent relationship between indicator microbes and pathogens .*Pseudomonas* and *S. aureus* but showed a concentration of these pathogens in relation to other indicator bacteria . Roberts in their study observed *S. aureus* including methicillin resistant *S. aureus* in the beach water and sand at this particular study site and attribute the source to shedding from human bathers(Roberts et al 2013) . Khan demonstrated that the marine P. aeruginosa isolate exhibits a unique pattern of culturability and survival which demonstrates a physiological adaptation to the ocean environment.(Khan et al 2010;).

CONCLUSION

In conclusion our results provide evidence that the risk of swimming-related illness increases with increasing pollution levels.

FACTORS IN THE FORMATION OF PROFESSIONAL AND PEDAGOGICAL COMPETENCE IN FUTURE ENGLISH TEACHERS

U.U. Jumanazarov*

*Doctor Of Philosophy In Pedagogical Sciences (Phd),
Jizzakh State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article examines the factors that form the active, personal or professional communicative competence of future English teachers, the features of each of the models. Here I want to emphasize that the humanism and anthropocentrism of the modern educational process implies a special emphasis on language and speech, because it is in them and only through them that a student can be formed as a specialist. Currently, it is important to select content that requires a fundamental approach, i.e. to include educational content for the development of the student, to meet his needs, to obtain and know everything necessary for self-determination.

KEYWORDS: *Education, Competence Pedagogical Environment, Teacher Role, Teaching Content, Development, Modern Education, System, Linguistic, Pedagogical-Psychological Factor.*

INTRODUCTION

In today's rapidly changing and quickly changing social environment, graduates of pedagogical universities have a high level of competence, initiative, discipline in teaching and the ability to work independently on an ongoing basis, dynamically and constructively, they are fluent in one of the leading foreign languages, particularly English requires the development of personal qualities related to pedagogical competence, such as computer literacy, education based on world standards, interest and commitment to advanced contemporary pedagogical innovations.

Promising teachers of pedagogical universities, including teachers of the English language, strive for independent learning throughout their lives, are aware of new pedagogical technologies in the digital transformation environment and use them to make independent decisions that fully comply with world educational standards, must be able to adapt to social life and future

professional environment, always ready for emotional situations, but be able to quickly and skillfully get out of them. All this is a requirement of modernity and profession.

Professional competence of teachers, along with the focus and flexibility of a specific profession, is also an integral characteristic of a person. It is no secret to the scientific community that the term *"competence"*, in particular, "*professional competence*" and, in some cases, "*teacher competence*" is used in many scientific studies. However, there is still no clear definition of them, in particular, brief information about the factors and conditions of the formation of *"pedagogical competence"* or specific observations.

The Main Findings and Results

L.M. Mitina defined the term "*pedagogical competence*" as "a body of knowledge about the subject, teaching methods and didactics, pedagogical communication skills and competencies, as well as methods and means of self-development, self-improvement, self-realization" - explains and emphasizes that there are three leading factors in its structure (active, communicative and personal)[1. 320]. we also agree with the opinion of this scientist and take it as a theoretical basis. We believe that there are three factors that determine the level of development of the pedagogical competence of a future English teacher, identified in the course of the research and verified in experimental work:

a) Active or special competence (a set of different individual methods of knowledge, skills, qualifications and pedagogical practice);

b) Personal or professional competence (a set of knowledge, skills, and competencies related to professional self-improvement, independent relentless research, and ultimately self-realization);

c) Communicative competence (a set of knowledge, skills and competencies related to the implementation of pedagogical activities).

We emphasize that the active and personal structure of pedagogical competence is a priority in the development of the linguistic competence of the future English teacher. Below we will briefly dwell on the autho's approach to each of the identified factors in the development of the pedagogical competence of future English teachers.

1. *Active competence of an English teacher.*It is focused on acquiring knowledge, skills, competencies and individual approaches to learning English independently and with feeling. Active competence includes, first of all, all linguistic knowledge related to a given field.Learning English independently and with a sense of responsibility is not a reliable way to master the content and subject of education in language teaching.

The content of teaching English in pedagogical universities must be constantly updated so that, firstly, it does not lag behind the achievements of English-speaking science, and secondly, it meets the needs of society. Currently, it is important to select content that requires a fundamental approach, i.e. to include educational content for the development of the student, to meet his needs, to obtain and know everything necessary for self-determination. In addition, you need to know the criteria and criteria for choosing the content of teaching English, in particular, the laws of learning and teaching the language. Organizing English teaching with a sense of responsibility requires differentiation, individualization and optimization of content. It should include the basics of awakening and personal development.The content of English language teaching is a

solid, but constantly evolving educational foundation, which is confirmed by the fact that the majority of the world's population has adopted this language as the state language, which is actively used in the education system.

In our opinion, *active competence* is broader than subject competence. Understanding is an important condition for the formation and development of competence. Simple knowledge is still not considered the basis of human activity, because it does not yet know how this knowledge fits into a real situation.Knowledge must be combined with understanding, in order to gain knowledge, it is necessary to understand them in essence. The task of the teacher is to provide an understanding of the knowledge gained, and for this he must first of all own the methodology of teaching English. The content of training should be understood not in isolation from the means of illustration, that is, teaching methods, but in its essence.

We have certain reasons to emphasize these comments: to complete our research for the degree of Doctor of Philosophy (PhD) in pedagogical sciences, we conducted a series of experiments at Tashkent State Pedagogical University, Jizzakh and Kokand State Pedagogical Institutes.At the same time, in order to assess students' knowledge of the English language, to draw appropriate conclusions, we organized a special course in specialties designed to prepare future teachers of the English language. To achieve the goal set in this special course, special attention was paid, first of all, to the approach of methodological and linguistic analysis.We have been actively involved in the organization of the learning process in English teaching, mastering the methodology and linguistic competencies, mastering the relevant knowledge, never denying the system of knowledge, skills and qualifications.Finally, we strongly believe that one of the first factors in the development of the pedagogical competence of future English teachers is *active or specialized competence*.

2. *Personal or professional competence of an English teacher.*This competence refers to the ability of the field teacher to develop professional self-improvement and self-realization. The need for self-improvement and self-realization of a person is the highest need for a person in accordance with the idea put forward by A. Maslov, that is, the concept of self-activation of a person.Self-activation of a person is understood as a person's desire to realize himself, to try to realize his potential. A. Maslov proposed the following interpretation of human nature: a person by nature is kind and capable of self-improvement, a person-conscious and intelligent creator, the essence of a person himself constantly directs him to personal growth and creativity.In his view, the tendency to independent activism is the essence and core of the individual[2].

Based on the experience of pedagogical activity, we would like to emphasize that the following factors play a decisive role in building a model for the development of pedagogical competence of a future English teacher:

a) professional and pedagogical competence is understood as a harmonious combination of linguistic knowledge, methods and didactics of teaching English, pedagogical communication (skills and qualifications), culture, self-development, self-improvement, methods and means of self-determination;

b) The professional and pedagogical competence of a future English teacher, as noted above, consists of the following three structures: *active* (knowledge, skills, qualifications and individual methods of pedagogical activity with initiative and responsibility in teaching

English to students of general secondary schools, academic lyceums and professional colleges); *personal* (need for self-development, knowledge, skills and competencies for self-improvement)*; communicative* (knowledge, skills, abilities and methods of creative implementation of pedagogical communication);

c) The formation of professional competence in pedagogical universities is carried out in several stages: from the internal "I-real" and "I-ideal" in the profession of an English teacher to the elimination of imbalances;

d) the formation of professional and pedagogical competence in the future English teacher is carried out through two interrelated, i.e., gnostic and practical stages, which must be taken into account when organizing training;

e) the professional self-development of a future English teacher has a creative nature, so as a subject of pedagogical work it is necessary to organize a learning process that allows the student to freely choose their own possibilities in existence.

We emphasize that in the context of the formation of the personal and professional competence of the future English teacher, a special role belongs to speech competence, which serves to implement pedagogical communication.

The final results of the work carried out on the experimental fields show that many areas of professional activity in which graduates of pedagogical universities have to work in certain positions are associated with interpersonal pedagogical communication, which actively affects the personality. There is no doubt about the connection between a student's speech culture, general culture and opportunities for a full education, as well as prospects for spiritual, social and professional growth. As the linguist A.A. Potebnya rightly points out, "the word finds a new world that is not external and alien to the human heart, but it has already been processed and assimilated by the spirit of another one sleeps morally in various external stimuli without exchanging words"[3. 17].

Here I want to emphasize that the humanism and anthropocentrism of the modern educational process implies a special emphasis on language and speech, because it is in them and only through them that a student can be formed as a specialist. Speech is not only a mirror of the student, but also an integral part of his activity, which determines his personal, mental essence.

According to scientific methodologists in the scientific and methodological literature, modern graduates of pedagogical universities should not only be educated, be able to analyze and solve complex problem situations, but also pay attention to their speech culture, which is an important part of their professional and personal development. We believe that this principle applies to graduates of the English language course.

Methodist M.P. Manaenkova emphasizes that the need for the formation of speech competence in all aspects of the global education system is growing.In many ways, such relevance is based on the fact that the development of the educational process and the resulting speech-thinking activity ensures successful socialization of the individual, when it seeks to manifest itself with its own characteristics and differences, shows the need for acceptance by society [4]. It should be noted that the relationship between a student's speech culture, his or her general culture, opportunities for full-time education, and prospects for spiritual, social, and professional growth undoubtedly leads the way.

It is impossible to form an educated person, especially a future teacher of the English language, as a specialist without familiarity with the speech culture of society, therefore the main task of all disciplines and classes that make up the environment of humanitarian education today is the formation of speech competence in students. In the course of the study, we took into account that this problem has not been scientifically studied in pedagogical science, therefore, in the third chapter of our study, we devoted a separate chapter to the problems of the speech competence of future English teachers and considered it necessary to make appropriate observations.

Thus, speech competence is one of the main personal and professional competencies of a future English teacher, therefore, the issues of its formation and development require special attention in the modern education system, especially in the pedagogical areas of higher education.

3. *The communicative competence of an English teacher.* According to E.G. Azimov and A.N. Shchukin, communicative competence is the ability to solve problems of communication in a foreign language in everyday, educational, industrial and cultural life; is to achieve the goals of communication using language and speech means [5. 210]. In addition to this, on the basis of the author's approach, we would like to emphasize the following: communicative competence to communicate with people in society, to speak the native language, the official language of the country and foreign languages, to express themselves clearly and intelligibly orally and in writing, to ask questions logically and be able to answer questions correctly, adapt to the communication situation, adhere to the culture of communication in the process of communication, defend one's point of view with respect to the opinion of the interlocutor, persuade the interlocutor, self-control in conflict situations, resolve problems and disagreements covers many aspects such as decision making.

In the scientific-theoretical and methodological literature, we note that the opinions of foreign scientists on this matter differ. To show the fundamental importance of communicative competence, Yu. Zhukov calls it meta-competence or "core competence"[6. 160]. According to other scholars, this type of competence is subdivided into social, professional and interpersonal competences and connects them with each other. However, professional, social and interpersonal competence is interpreted as components of communicative competence [7].We support the point of view that communicative competence is one of the key factors demonstrating a person's efficiency in communicating with the outside world in all its aspects.

CONCLUSION

In the course of the study, we took into account, first of all, that communicative competence is the leading factor in the formation of the language competence of a future English teacher. Based on the requirements of his competence, we tried to identify linguistic and pedagogical and psychological factors.In our opinion, these factors include: knowledge of field vocabulary; development of oral speech (clear and correct speech); development of written language; compliance with ethics and ethics of communication; possession of communicative tactics and strategy; knowledge of the specifics and problems of communication participants; be able to analyze external signals (body and face movements, tone of speech); conflict prevention; self-confidence; the ability to listen to others; possession of public speaking skills; acquire the skills of organizing and conducting discussions; empathy (sympathy); understanding the interests of others, and so on.

These components of communicative competence, which we identified during the research and repeatedly tested in experiments, can be characterized mainly by pedagogical and psychological aspects, but it confirms that these components are not the same in all areas of this competence. We clearly observe and recognize this in the process of forming the language competence of an English teacher.

ABSTRACT

This article examines the evolution of fiction, a comparative analysis of the compatibility of fiction with theater, the role of radio and television in the development of radio and television as a result of technological progress, the emergence of artistic genres on the air using the example of Uzbek television and radio journalism.

KEYWORDS: *Television, Theater, Art, Globalization, Radio Journalism, Loudspeaker, Writer, Listener, Television, Internet, Social Network.*

INTRODUCTION

One of the film's protagonists argued that when television developed, no one would go to theaters. Now every home has a TV.But the significant of the theater as an art school did not diminish. This example shows that the development of modern media does not negate previous trends in art, but proves that they continue their own evolutionary path.

Speaking about theater, which is one of the most ancient forms of art, it should be noted that interest in literature, including reading, attitude to the art of speech today requires deep scientific analysis.Teachers point out that the younger generation is now more interested in technical means than reading books, as one of the issues awaiting resolution in an informed society.Therefore, the development of new technical means - the analysis of the impact on the areas based on the art of speech - is a topical issue.

Main part

Following the development of the media, it should be noted that literature undoubtedly occupies a special place in the popularity of radio and television. That is, in history we see that these two directions do not deny each other, but complement each other and develop harmoniously.For example, experts link the emergence and popularity of radio journalism with the political processes in the world in the early twentieth century. In this regard, it is worth noting that literature and the art of speech have a special place in the popularity of radio and its place in the hearts of listeners.The technical capabilities of radio have given a special touch to the WORD, which has been a means of human communication for centuries, and contributed to its "life". Fans accustomed to listening to their favorite work on the loudspeaker have once again grown to love literature. The radio introduced an audio version of the fiction to the public, turning word art enthusiasts into its fans.Thus the radio also increased its spiritual significance. The works of art staged on the radio took on a new form in their audio interpretation as a work of radio journalism.

The spiritual value of thousands of radio works stored today in the archives of the NTRK cannot be measured in numbers. The "Radio Fund" section has been recording radio production since the 1930s.Today, the number of radio products in the archives is more than 80,000, with a total volume of 20,000 hours. The words, poems and stories (...) of famous poets and writers such as Abdulla Qahhor, Gafur Gulam, Hamid Olimjon, Maqsud Shaykhzoda, Mirtemir, Saida Zunnunova, Said Ahmad are included in the fund "[10,116].Radio has played an important role in the recognition of writers who lived and worked in the last century, and their works have won the hearts of millions of fans. Unlike reading a book, radio has become a sacred place where writers and poets meet their aspirants.The voices of writers or heroes of fiction have become more natural with the help of music, various noises, that is, through the audio speech of the radio. The audience had the opportunity not only to follow the development of Uzbek literature, but also to enjoy examples of world classical literature.Radio productions revived these works and expressed their impact.Today, they have become real masterpieces of the NTRC Foundation. "Painful Teeth" (1950), "Othello" (1954), "Navoi" (1959), "Hamlet" (1959), "Toshbolta lover" (1962), "The poors" (1979), recorded in different years of the republican and regional theaters Radio performances such as are invaluable works of the foundation".[10,116]Significantly, radio productions are different from theatrical performances. The actors tried to express their feelings, to show their skills through voice and sound.

Radio has a higher social significance than the press or television. The cost of radios is low. The listener has the opportunity to listen to the radio without moving away from the work they are doing. At the same time, radio is the only media for blind fans. For this social stratum of the audience, radio is an important means of conveying the full tone of literature and words.Given the lack of specially written works of art for the visually impaired audience today, it can be argued that the broadcasting of radio performances may be an alternative solution to this problem.

Of course, the art of speech, which has developed over the centuries in our country, has a special place in the attention of the people. The importance of radio as a media outlet was strengthened by the broadcasting of works by popular artists, poets and writers. Fans' attitude to art has made it possible for literary and artistic broadcasts to be a major part of radio programs.In the 1960s,

the majority of Uzbek radio broadcasts were artistic and ethical, and many radio magazines ("Literature and Art of Uzbekistan", "Musical Culture of Uzbekistan", "Musical Hour for Youth") were devoted to literature and art. interviews with composers and artists[10,16].Interviews with poets and writers, organized in radio studios, helped the audience to get acquainted with the authors of the work.Fans listened to their favorite poems in the author's voice. Radio is a kind of "bridge" that brings the fan and the author closer.

The development of television journalism in our country has formed a figurative expression of "WORD" This process began with the emergence of the art of cinema at the beginning of the last century. Samples of literature, first in the form of a silent film, and then in the form of a TV show, won the hearts of the audience. "After the radio, the writer on television had the opportunity to communicate face to face with his reader."[9]The television form of the works of art, intended for a large part of the audience, formed the spiritual world of several generations. The phrases that sounded on TV moved into the vernacular and into the spoken word. "Television, which developed and improved under the influence of fiction, in turn contributed to the popularity of literature as a result of technological advances"[9].The effectiveness of the roundtable discussions on television was high from the artistic meetings organized on the radio. Fans now have the opportunity to see their favorite writers on the screen, who previously only heard their voices. The writer's appearance on television made them popular among the audience. The art of film and theater has found a new look for itself on television.

With the speech, facial expressions, and actions of the protagonists, the television captivated the audience with the help of the impact of the audiovisual speech.The number of imitators of positive heroes has increased.Television has since become an art promoter, a hotbed of enlightenment. "It was photographed in the 1930s and 1940s "Before dawn", "Paranji", "Ramadan", "Second wife" silent films called, "Tahir and Zuhra", "Alisher Navoi", "The star of Ulugbek", "Nasriddin in Bukhara", "You are not an orphan", "There is a lot of talk in the neighborhood" dozens of works are unique masterpieces of the archive fund.It was staged by Uzbek theater and film directors."Navoi", "Bobur", "Layli and Majnun", "Imam Bukhari", "Mirzo Ulugbek", "Jaloliddin Manguberdi", "Spring does not return", "World Affairs" are the masterpieces of the foundation"[10,114].New television genres have also emerged in the process of staging works of art on television. Works of art have appeared on the air in the form of TV series, TV shows, videos. The performances filmed in the studio took on a different look than the theatrical scenes. Of course, the joint creative work of professionals such as stage decorators, designers, make-up artists, sound directors, lighting masters, stage directors has paid off.

Of course, the formation of a work of art on television is a much more complex process than on radio. In it you can see the harmony of several art directions: theater, cinema, music, fine arts. It took a lot more time and technical capabilities at that time than a radio to see a single work on the air."Screening of works of art plays an important role in the interaction of television and literature. Screening a work of art is one of the most common forms of creativity today. When converting from one art form to another, its equivalent is not created.Every time there are aesthetic and artistic losses in the television adaptation of a work of art. Today, according to the experience of world television, the screening of works of art continues to develop to this day[9].

The work done in the field during the years of independence has caused great changes. During the "years of independence", the "Uzbektelefilm" studio has been creatively and technically

renewed."Charkhpalak", "Attention: engine!", "Akbar's adventures", "Uvaysiy", "Iman", "Lafz", "Garden", "Scorpion from the altar" and others are video films and TV series.Until 2005, such works as "In the eyes of Sahibkiran creator", "Amir Temur", "Stars burned by Ulugbek", "Sahibkiron Amir Temur", "Jaloliddin Manguberdi", "Khoja Ahror Vali", "Imam At-Termizi", "Burhān al-Dīn al-Marghīnānī"a number of documentaries have been made" [10,100].The images of our great figures have moved from the beads of history to the present day through the air. This has a special meaning in Uzbek art. Significantly, works of art in the form of TV series, TV productions, videos have also created an opportunity to record the works of many great theater actors for the archive.It has further popularized the works of art performed by our talented actors and increased the audience's interest in literature.

"Television has the potential to engage a large audience in reading. Literary critical commentary promotes and promotes reading through television programs, memoirs about writers, art portraits, and screenings of works of art" [9].Even today, television and book reading have a role to play in the popularity of literature. For example, on the TV channel "Culture and Enlightenment" today "Book and reader", "The book that changed me", "Have you read this book?", "Elegant meetings", "Nasoyimul love", "Creative meeting", "Compassion" such as will be broadcast. "Screening a work of art on television is the process of translating a creative work from visual language to verbal language — transforming one form of art into another. At the same time, in the process of screening, changes can be made to the work, new plot lines can be invented. This process can be compared to translating a poem into another language"[2].

RESULTS AND DISCUSSIONS

In the XXI century, which is described as the century of technical progress, the global network - the Internet - has begun to take its place in the information space.The Internet, which disseminates information rapidly, without borders, quickly and without obstacles, has a special place in the development of literature.Now people are starting to strive to be aware of all the news in a changing world. But it should not be forgotten that new technical possibilities do not deny each other, but complement each other.As all print media appearances create their own online forms, mobile versions of many works of art are finding their readers.

CONCLUSION

Writers no longer have to wait for publishers to publish their work, and they don't have to pay for postage. When writers finish writing their work today, they can publish it online and immediately find out the fans' attitude.Now there are personal websites of writers, special Internet editions, convenient forums for expressing the opinion of fans. You can immediately find out how many scribes a writer has read this or that work.

It should be noted at this point that no technical means can replace literature. No one repeats it, giving a special meaning to traditional reading culture.The interpretation of fiction on radio and television made it possible to listen to, watch, and pass on the WORD to others at once. Methods of using technical capabilities have determined in which direction these tools will be affected.

So, watching TV, adhering to the norms and criteria for the use of social networks will prevent their negative consequences.Currently, the moral basis for preventing the negative aspects of technical means has become one of the problems that need to be addressed at the state level, in the economic, political, and social spheres.To shape attitudes towards the art of speech in an

informed society, experts analyze the pros and cons of technology and warn of the various risks that may arise in their research.At the same time, scientific work in the field of journalism requires research in the fields of philology and art history, as well as in sociology, psychology and pedagogy.

ABSTRACT

This article is dedicated to the results of the first excavation conducted by the author in 2019 at the archeological monument Qaliyatepa, the ancient site of the city of Jizzakh. The material evidence obtained during the excavation was scientifically analyzed. Material sources serve as an important source in determining the age of a monument.

KEYWORDS: *Kaliyatepa, Material Objects, Pottery, Baked Bricks, Primary Source, Defensive Structure, Aqua Layer, Cultural Layer, Fortress, Tower.*

1. INTRODUCTION

The study of the history of the defensive walls of Ustrushna, which played an important role in the history of Central Asia, in the fight against invaders in the ancient and medieval times is of great importance. For example, the study and analysis of the remains of the defensive walls found during archeological excavations at the Djizak-Qaliyatepa city monument, the center of the Feknonrustok in Ustrushna, allows us to draw broader conclusions about the defense capabilities of the city population.

The history of the defensive walls of the Qalyatepa city monument has not yet been fully studied by historians. This research has been left out of the view of archaeologists and historians. It is important to study the history of the defensive walls of the Kaliyatepa monument, the ancient site of the city of Jizzakh, to study its peculiarities, to analyze on a scientific basis the unexplored aspects of the existing research published so far.

2. Methods and level of study:

This small article is based on the principles of historical methods - historical, scientific, comparative and logical analysis, objectivity, which are accepted as a reference.

The role of the urban defense system in the political, economic, social and spiritual life of the ancient and medieval period of Central Asian history was undoubtedly great. In particular, there is no doubt that the cities of the state of Ustrushna, which include the present-day Syrdarya and Jizzakh regions, as well as the north-western regions of the Republic of Tajikistan, have a great position in the region due to their important location.

Ustrushna was a geographical "gate" that opened on the north-east to the Fergana Valley, on the south - the right bank of the upper reaches of the Zarafshan River, on the north - the Syrdarya, on the west - Mirzachul. Here, from ancient times, people settled in large and small white basins and began to engage in agriculture. The inhabitants of the oasis fortified the surroundings of their prosperous towns and villages, surrounded them with high walls, and defended the oasis from nomads living in the deserts and steppes.

The ancient site of the city of Jizzakh, which has such a defensive fortification, is the monument to the city of Kaliyatepa. In this regard, Ya.G'ulomov, N. Archaeologists such as Nemtsevahave speculated that the ancient site of Jizzakh was in the Horde, in the Old City. Because they did not carry out excavations at these monuments.

T.Shirinov, E.Qodirov, M.Pardaev, E.Berdimurodov, C. Specialists such as Suyunov and Z. Kholboev, who conducted archeological excavations directly in Jizzakh, believe that the first buds of urban culture in the oasis were formed and developed in Kaliyatepa [2].

Experts have noted that the politically central center of Ustrushna is the Feknonrustok, whose capital is Dizak, which replaces the present-day Qalyatepa archeological site. Qaliyatepa is the largest archeological monument of the Jizzakh oasis. Lying in a north-south direction, the total area of the present-day surviving part of these complexes is 30 ha. Qaliyatepa is a traditional three-part city like the ancient eastern cities:

1. Ark - the palace of the mayor;

2. Shahristan - a city district connected by a defensive wall, an arch surrounded by military towers;

3. Rabod consists of 5 separate hills in addition to the defensive wall and trenches (Figure 1).

Figure 1. Spatial map and topographic plan of Qaliyatepa monument.

The Rabods consist of 5 separate hills surrounding the Qaliyatepa arch and shahristan on the north, south, and west sides. Since it is unlikely that these hills are a single building structure, given that the periodic date of the first construction and the stages of development have not yet been studied, the conditional researcher A. Berdymurodov considered it expedient to describe them numbered as separate rabbis and put them into scientific circulation [4].

According to the preliminary results of the excavations, 3 fortresses were built in the northern, north-western and western parts of Qaliatepa, surrounded by defensive walls. According to the analysis of stratigraphic excavation materials conducted in fortress-fortress 2-3. These fortresses avv. It was built in the III-II centuries and its life stopped at the end of the VIII century AD due to Arab consumption [5].

To date, the defense system of the ancient site of Jizzakh, the monument to the city of Kaliyatepa, has not been fully explored. Although effective research has been conducted in Qaliatepa in the past, excavation research has not been studied in relation to the defense system itself.

In his Address to the OliyMajlis on December 22, 2018, the President of the Republic of Uzbekistan Sh.M.Mirziyoev named 2019 the "Year of Active Investments and Social Development". It is worth noting that the President has set specific tasks for historians and archaeologists to study the ancient and rich history of our country, to strengthen archeological research in this area, and research is underway today.

3. Research results:

We conducted our excavation work at the Qaliyatepa Archaeological Monument, the ancient site of Jizzakh, in the last ten days of October 2019 and the first ten days of November 2019 (Figure

2). The rainy weather forced us to suspend our excavations. However, this article is devoted to an initial summary of the archaeological findings obtained.

Figure 2. In excavation processes

Excavations were carried out on the south-eastern side of the Kaliyatepa monument. This place is the gateway to the entrance to the city. We aimed to explore the left-hand tower defense system at the very entrance to the gate.

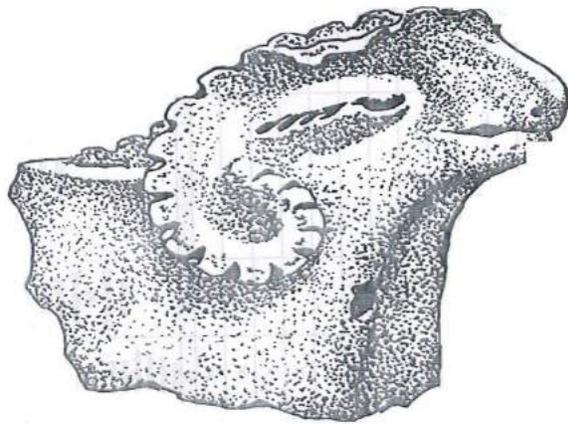
Excavation began at the top of the left tower, about 8 feet above the mainland. About 6 meters of the object to the mainland, that is, part of the drainage layer, was opened. After 35-40 cm from the top of the tower, 27x27 baked bricks of the Middle Ages were left intact. During the excavation, pottery fragments of different periods, large mountain rocks and animal bones were found among the waste layer and pieces of cotton.

The baked brick clay is mixed with reddish soil of good quality and presented in the form of a square in the mold. Then the good baking of the brick in the humdon led to its quality preparation. The brick measures 27x27x5.5 cm. As the top of the brick was hand-smoothed by the master, the traces of the four claws have been preserved. Baked bricks of this size were recorded only after excavation of about 30–35 cm in the upper part of the excavated object (pic. 3).The baked bricks used in such construction are also recorded in the Blue Ravot monument. This monument is located 7-8 km north of Qaliyatepa and 15-16 km east of Orda. Researchers have collected fragments of pottery of the IX-X, XI-XII centuries, baked bricks of the Samanid period in the form of 21x21x4 cm from its top and sides [6].

Figure 3. Baked brick and fingerprints on it

Among the aqua layer, a farm-used blanket was found. It is made of river sandstone and has the appearance of an elongated boat. The upper part of the pelvis is polished, the central part is formed by a small groove of about 1 cm. The view from the top is in the form of an irregular ellipse, the tag part is in the form of an incomplete semicircle. The upper part of the pelvis measures 26.5x17.5 cm longitudinally and laterally, 4 cm high (pic. 4).

Figure 4. Blacksmith

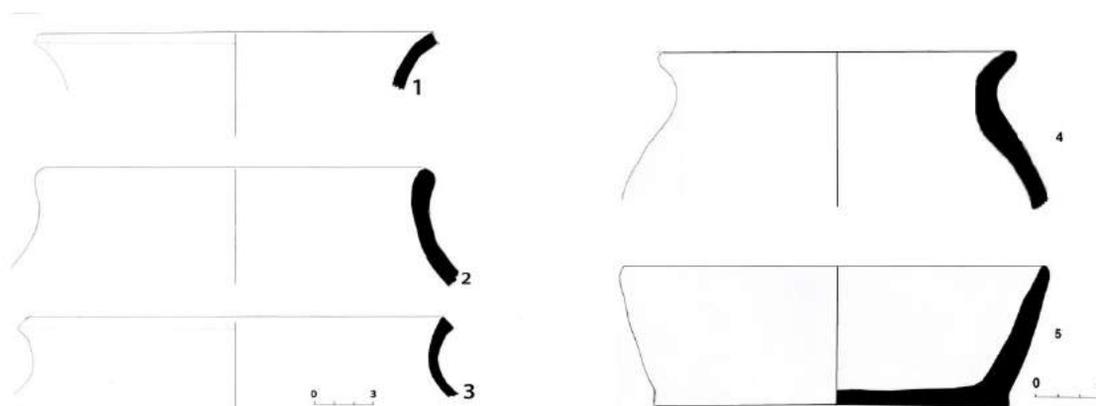
Another important find is the divine, revered object of our ancestors who lived in the early Middle Ages. This material evidence informs about the ideology of the Osh period, the religious worldview and some customs and rituals in life. This find is made from reddish clay, mixed with crushed clay and a small amount of limestone powder. It doesn't have a full view as it has damaged this find in our hands. The worship item has the following dimensions. The stored body is 20 cm from the top, 18 cm from the bottom, 12.5 cm wide and 12.5 cm high. The upper part of the body has an elliptical shape. On the right side, a finger-shaped horizontal groove is formed. The statue is unglazed, yet has acquired a natural reddish hue due to its clay composition and baking in a jar (Fig. 5, Fig. 1). Finds related to this type of religious belief are also recorded in the Pardakul archeological site (Fig. 5, Fig. 2).


1-fig.   2-fig.

Figure 5. Items of religious worship

We know that the pottery found gives a certain impression of the archeological monument. Therefore, it is possible to clarify the periodicity date by dividing pottery vessels into types and categories. Based on this, M.X. Isomiddinov, M.X. Pardaev, E.M. Pesherova, Yu. Yakubov, G. Scientific works of Mirzalievs were used [7].

Boilers. These dishes are designed for cooking hot meals. This is because the quality and shape of the boilers guarantee fire resistance, ease of installation in the oven, the fact that the fire hits the bottom and side surfaces of the pot, and the boiler can be easily removed from the oven. Two properties of boilers, namely fire resistance and ineffectiveness even when the fire level changes sharply, determine their quality level. The pots are made of pure less earth clay and are made by mixing lime, clay, fine-grained limestone and shells to increase their fire resistance. Boilers can be divided into certain categories depending on their shape, size, method of construction.

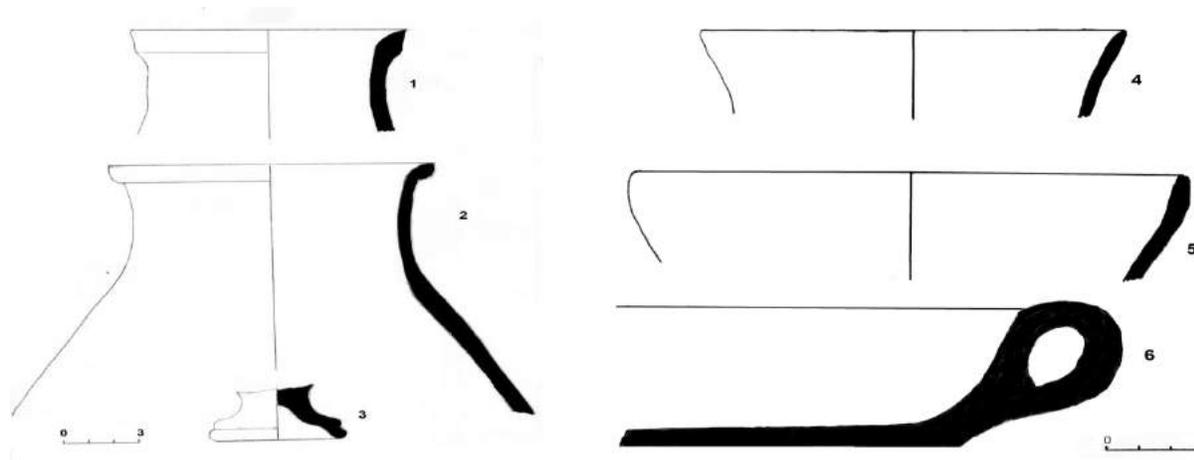
Type 1 boilers have the flange part turned sharply outwards. The neck is about the size of a finger, and the abdomen is as big as a balloon. The diameter of the boiler flange is 10.5 cm. The thickness of the flange is 1 cm, the neck is 0.8 cm and the abdomen is 0.6 cm (Fig. 6, Figures 1 and 3). The flange of the boiler was blackened by a severe burn. The dish is made on a pottery wheel.


6-fig.

The flange part of the Category 2 boilers is made in the width of one finger, with the neck part turned outwards. The diameter of the flange is 16 cm, the thickness is 0.8-0.9 cm, the area of the neck is up to 1.4 cm, and the abdomen is 0.8-1.0 cm (pic. 6, pic. 4).

The pots are visually distinguished from the pots by their small size and relatively thin walls. The pots are made of reddish pure less soil, mixed with fine-grained pottery fragments and partly limestone. From these containers, liquid foods such as water, fat, milk and dairy products were stored on the farm in ancient times. Bottles can be divided into certain categories depending on how they are made and size.

The neck of the Type 1 vessels is small and the flange is slightly turned outwards. The lower abdomen from the neck is of average size. The diameter of the flange is 9.6 cm, the thickness of the walls is 1.0-0.8 cm. The vessel is made on a ceramic wheel (pic. 6, pic. 2).

The flange portion of the Type 2 snout is slightly turned outwards, resembling the appearance of a snake's head. The flange part turns sharply outwards and has the appearance of an index finger. The vessel is machined by a potter and has a smooth surface and a white angob. The interior is uneven, rough. The diameter of the flange is 6.5 cm, the thickness of the wall of the neck is 0.6 cm, and the side of the abdomen is enlarged, ie 1.0 cm. (pic. 7. pic. 2-5.).


7-fig.

The demand for drinking water in the Central Asian climate, the scarcity of water, the high consumption have created the task of maintaining a moderate, uninterrupted supply of water. A variety of special jugs are made by potters in order to save water and use it efficiently. The only ceramic jug we have is made of pure less clay, mixed with a very small piece of pottery.

The flange is slightly outwards, resembling the appearance of a snake's head. The flange part is delicately attached to the neck of the vessel. It has a diameter of 5.5 cm and a wall thickness of 1.0 cm to 0.6 cm. It is obvious that the vessel was made delicately by the potter on a wheel (pic. 7.1-pic.4).

Frying pans are vessels with a low flange and a bottom diameter almost the same size. The only pan found during the excavation was made of yellow clay, and the raw material was mixed with crushed pieces of pottery and limestone. The outside of the vessel wall was darkened by a strong fire taffeta. The inside is yellow. The flange of the vessel is 19.0 cm in diameter and 6.3 cm high. From the flange to the base of the tag, the wall thickened (0.5 cm to 1.3 cm). The base part of the tag is thinned from the wall side to the center, i.e. from 1.2 cm to 0.7 cm. The diameter of the base part of the tag is about 15.6 cm (pic. 6, pic. 5).

Bowls. These types of dishes are associated with the family's eating activities. Only one such vessel was found during the excavation. The vessel is fused with the body of the flange part, which is finely made of yellow earth, and is slightly bent outwards, the head of the flange being partially pointed. By the potter, the inside of the vessel flange is about 1.0 cm, and the outside is painted completely black. However, until it reaches us, the black color fades. The diameter of the vessel flange is 13 cm, the thickness of the walls is 0.3-0.4 cm. The inside and outside of the bowl are polished (pic. 7, pic. 4, pic. 8).

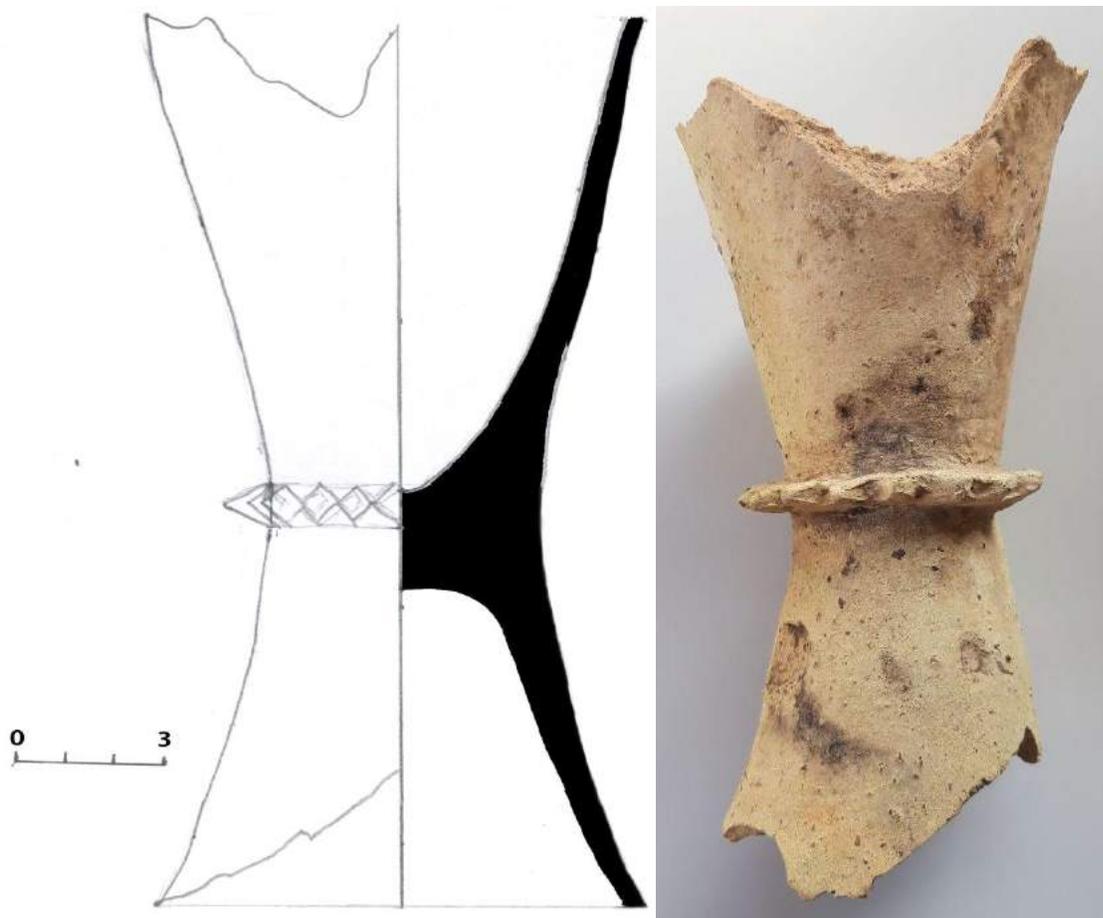
Fat. The pot is made of pure less clay, mixed with small pieces of pottery, a small amount of limestone, and made on a pottery wheel. Although the dish looks like a pan, it has a handle the width of a finger cigar to hold it. The handle is mounted on the flange, next to the body. The head of the flange is blunt and slightly turned outwards. The floor is flat. The flange of the vessel is 24 cm in diameter, 17 cm in height, and 5.9–5.8 cm in height (pic. 7.6. pic.10).

Among the pottery items, fragments of glazed pottery from the Middle Ages were also noted. These vessels are made of pure lees soil. It is of high quality and made on a ceramic wheel. The exact appearance of the objects has not yet fully reached our day. However, the diameter of the tag base of the glazed vessel has been preserved, i.e., 5.4 cm. In our opinion, this dish must have served as a saucer on the farm (pic. 8, pic. 1). Another glazed pottery is 8 cm in diameter, although the base of the tag is not completely preserved. We can assume that this vessel was a shock used by our ancestors in household life (pic. 8, pic. 2).

8-fig.

Among the finds was the bottom of the cup, which was made of pure red soil and was given a red angob on the surface. The piece of ceramic pottery is distinguished by its quality workmanship. The tag base of the cabin has been preserved. The base is 2.7 cm in diameter and is made on a pottery wheel (pic. 7, pic. 3).

A ceramic vessel that does not have a complete appearance reminiscent of a vase or a lamp in appearance attracts attention. The pottery is made of yellow clay. It contains very fine-grained limestone and a small amount of ceramic powder. The preserved height of the vessel is 19.3 cm, the thickness of the walls is from 0.4 cm to 1.5 cm. The diameter of the waist is 5.6 cm. The waist of the vessel is wrapped with a serrated toothed tape. The underside was blackened as a result of severe burns from the fire taffeta.

Even the fine limestone in it has darkened. The upper part is supposed to be yellowish in color and the effect of fire is almost imperceptible. Although the pottery is machined on a wheel, the roughness on the wall is noticeable (pic. 9).


9-fig.

4. CONCLUSIONS:

Based on the data obtained during the initial excavation, the following can be concluded:

- First, the thickness of the drainage layer (not reaching the defensive wall) indicates the height and strength of the fortification;

- Secondly, the archeological materials found, that is, the pottery fragments, belong to the III-X-XI centuries AD;

- Thirdly, glazed pottery fragments and square bricks in the X-XI centuries;

- Fourth, the development of socio-economic and cultural life in Central Asia in the X-XII centuries can be observed in the culture of Kaliyatepa.

At present, the defensive fortifications of Qaliyateparabots have been studied. In the future, we will continue excavations and clarify the defense system of Qaliyatepa.

METHODOLOGICAL SUPPORT OF THE EDUCATIONAL PROCESS IN THE CREDIT-MODULAR SYSTEM

Khurshida Aliyevna Ustadjalilova*

*PhD,
Kokand state pedagogical Institute,
Republic of UZBEKISTAN

ABSTRACT

In the article, such issues as the essence of the credit-module system of education, how it works and the emergence of the credit - module system on the basis of conditions and needs are discussed. What this system gives us and its advantages from the current educational management system has been revealed. In the credit-module system, it is established that curriculum should be created and what other work should be done to study the credit-module system.

INTRODUCTION

The current state of development of higher education in Uzbekistan is focused on the European educational and scientific space, characterized by modernization and reforms. This process requires a step-by-step credit-module system to change educational programs, forms and methods of training, monitor and improve the quality of education in accordance with the ECTS (European credit transfer and accumulation system). In this system, education has its own characteristics of elegance, is based on national culture and values, and does not harm the national characteristics of the education system. Its goal is to improve the quality of education, accelerate the educational process, update and improve the structure of the teaching staff, bring the staff and students, as well as teaching methods to a higher level.[1]

According to the "Concept for the development of the higher education system of the Republic of Uzbekistan until 2030" approved by the Decree of the President of the Republic of Uzbekistan on October 8, 2019, 85 percent of the country's universities are planned to be gradually

transferred to the credit-modular system. As an experiment, from the 2018-2019 academic year, the Musa al-Khwarizmi Tashkent University of information technologies and the Tashkent law University switched to the education system in accordance with ECTS. from the 2020-2021 academic year, among other universities, the credit training system was launched at KSPI name isMukimi. Based on this, the issue of analyzing the educational process based on the use of credit units-credits, analysis of curricula, disciplines, elective subjects, criteria for evaluating knowledge, the transition from a rating system of assessment to a point-credit system, etc. is relevant.

ECTS credit-module system requires students to convey all the information relevant to their learning processes in a predictable, understandable, complete and transparent manner. The higher education institutions will have to provide students with complete and transparent information in advance, about what subjects they need to master during their entire studies, the expected reading results from them, what methods and norms the students will be tested on. The increase in the number of institutions of Higher Education, the introduction of elective courses into educational programs also contributed to the transparency in education. Because in order for a student to literally exercise their right to choose, they must have all the prior knowledge about the program and the subjects in it.After all, the student cannot exercise his right of choice only if he knows the name of the faculty or the name of the subject.

Main part.

The credit-modular system is the process of organizing education. It is an assessment model based on a combination of modular learning technologies and credit measurement. Conducting it as a whole is a multi-faceted and complex system process. In principle, the credit module attaches great importance to two main issues: ensuring independent work of students; assessment of students ' knowledge based on rating assessment.

The main functions of the credit module system are recognized as follows —

- Organization of the educational process based on modules;

- Unified scientific, course (credit)estimation;

- assessment of students ' knowledge based on the rating score;

- create an opportunity for students to create their own curriculum on an individual basis;

- increasing the share of independent learning in the educational process;

- convenience of educational programs

Tasks and functions of the credit module system:

- improve the quality of education, speed up the learning process, update and improve the structure of teaching activities; bring training, training of future teachers and students, as well as teaching methods to a higher level.

- full provision of the educational process with all necessary methodological tools, preparation of materials in printed and electronic forms;

-credit-modular construction of the educational process, use of credit points to assess the quality of education, personal participation in the formation of the personality of each student, a

curriculum based on a large freedom of choice of subjects, involvement of academic consultants (Tutors) to participate in the learning process;

- adaptation of all educational areas of the bachelor's degree using the ESTS (European credit transfer system) types of work and activities in the educational process, developed on the basis of state educational standards. The evaluation scale adopted in the educational system EST ("excellent", "good", "satisfactory", "unsatisfactory" or "credit", "no credit") and, based on international experience, is the estimate of the average scaled score, the credits the student with a positive assessment of his academic work.

The main advantages of the credit-modular approach are: compactness (forming a block of several disciplines for a specific purpose), term - calendar module, the composition of each academic science, components-modules of Sciences, acceleration of independent work of students due to rational organization and constant monitoring, regularity and objectivity of evaluation of teachers 'and students' activities. [2]

Let's focus on the concepts of the credit-modular system.

A module is a part of a curriculum that studies several subjects and courses. This is a combination of several disciplines (courses) aimed at developing students ' specific knowledge and skills that have the potential to conduct analytical and logical observation. The teacher organizes the educational process, conducts live, video and audio lectures, coordinates and controls the student's activities. A student independently studies the subject and performs these tasks.

According to foreign experience, the educational process in the credit-module system will consist of 6-7 modules in each semester. The subjects concentrated in the module are easily formed based on complexity, theoretical and methodological subjects depending on practical subjects, and logically based on complementary printing. To form a student as a specialist, it is necessary not only to have knowledge, but also to be able to process it and put it into practice.

Modular training programs are developed according to a special scheme and include:

- Full disclosure of educational goals and objectives;

- Requirements for the student's qualifications, which must begin and increase after the course ends;;

- a summary of each subject included in the module (syllabus), that is, the topics of lectures, the plan of seminars and practical classes, tasks designed to assess the independence of learning;;

- Brief description of the learning process: method and means of learning; consists of methods and forms of knowledge assessment.

The module is based on a rating system for evaluating students ' knowledge, qualifications and skills in the training system. In it, all the student's educational activities, that is, the knowledge acquired outside of the classroom and the audience, are evaluated using a point rating.[3]

Credit (credit) is a unit of measurement of the academic load (time) spent by a student on studying and mastering subjects in a particular direction or program of study (course). Credit is a minimum measure of time that is set by a student's regulatory act, usually allocated for a week in

the classroom and for independent study. Credit is given to a student after successfully passing the final exam, completing tasks set for a specific subject.

Each student must accumulate credits in order to have a diploma in the chosen field and specialty in the future. The accumulated credit will continue to serve the student throughout their life to improve their skills or obtain additional higher education. In economic terms, the accumulated credit becomes an academic "asset" of the student.

Credit technology gives education recipients the right to choose elective subjects included in the working curriculum, so they are directly involved in the formation of an individual curriculum. They are given the freedom to choose not only subjects, but also professors and teachers. It is considered positive that students are given the opportunity to choose subjects. This is also considered as an indicator of the specific value of evaluating training processes. [2]

We will consider foreign credit systems. A distinctive feature of American higher education there is such a phenomenon as a modular course with its "credit units". Requirements for the degree expressed in the credits, but not grades on exams. These results, collectively referred to as "credit units", are a kind of measure of circulation, an educational" currency " in the US higher education system. Accumulated and stored "credits" can be transferred from one educational institution to another, from one faculty to another. This practice makes it possible to temporarily stop training to resume later. The credit system makes it much easier for students to move from one institution to another and makes it possible to link interrupted and restored studies.

But this form of accounting for results, by introducing flexibility in the higher education system and allowing students to move from one institution to another or from one faculty to another, reduces the socializing effect of a concentrated period of study at one of the universities several times. Another distinctive feature is the significant degree of independence and autonomy of American universities, which, together with the modular principle of training and the absence of state exams, makes it relatively easy to create new training courses, levels of education and specialties, courses related to other disciplines. Note that the organizational structure of mass higher education in the United States was already created about 200 years ago, and has its own problems caused by the wide availability and ease of access to higher education standards. Currently, there are discussions about the quality of knowledge of applicants entering universities. A student who successfully completes the course receives the number of credit hours allocated for this subject. They use the credit hours they receive to later complete their degree.

The difference in student success is determined by the grade, the credit hour indicates the structure of the learning process, but does not indicate the level of knowledge of the student. In other words, the credit hour indicates only the time spent on the given day subject, it is not related to the concept of difficulty of this subject. Some items require a lot of time, but give little credit-hours and Vice versa. Credit-hour-a measure based on training time. As a rule, one credit hour is the number of weekly 50-minute lessons during one semester, i.e. it means a combination of 1 hour of lectures per week, 2 hours of practical training, 3 hours of laboratory work plus preparation for them, exam acceptance / passing tests, homework, coursework.

In the United States, the number of subjects studied during a semester is usually 4-5, and the normal course load is about 15 credit hours. This means that students will be in the classroom for approximately 15 hours a week. A student who has completed the specified number of credit

hours can earn a certain degree. Credit-hour and degree are interrelated. In an average of 120 credit hours are required for a bachelor's degree, 30 to 35 credit hours for a master's degree, and 6 to 12 credit hours for graduate students each semester.

In the higher education system, the credit hour is used in various forms, and it serves as the basis for estimating the funding provided by the state. The workload of departments, teachers, and students is determined by the credit hour, which is used to decide on the student's transition to the next course. Payment for training is made also based on credit hours. There is a contradiction in the provision of credit hours. But in any case, the credit hour plays an important role in planning estimates and expenses. Despite its weaknesses, the "credit system" has found wide application. It regulates the many-sided activities of the University: the curriculum, curriculum, schedule of classes, assessment of students ' knowledge, awarding degrees, determining tuition fees, etc.

This system makes it possible to really evaluate the activities of the teacher and student, helps to determine the loads of teachers and regulate the student load, providing opportunity to work. It provides freedom of learning that corresponds to market economic relations. [5]

RESULTS AND DISCUSSIONS

The introduction of the credit system is due to the need to modernize higher professional education, the development of telecommunications technologies, as well as increasing participation in international integration processes.

You can put forward the following tasks for the introduction of ects-compatible credit units in the educational process of higher education institutions:

- establish a common approach to the issues of academic mobility and recognition of results of prior learning that is compatible with the ECTS system, and to ensure the unity of educational space in higher education an experiment on the organization of educational process in Universities on the basis of credit units focused on individual educational route;

- Development and testing of necessary regulatory and methodological documents during experiments;

- ensuring the introduction of credit units in the state educational standards of higher professional education;

- Justification of new approaches to the formation of the teaching load of teachers in the organization of the educational process on the basis of credit units;

- Identification of the features of the formation of a cumulative system of credit units in the design of educational programs of higher professional education based on secondary vocational education [6].

The problem for higher education in Uzbekistan in the context of the transition to a credit system of education is:

- First, determining the cost of student's academic time of a certain current level of development for adequate study of educational material in the volume of the module;

- secondly, the development of methods for calculating the pedagogical load of higher school teachers in the conditions of a credit-modular system for organizing the educational process and the student's academic load, as well as the relationship between them.

The credit module system should be developed in Uzbekistan as part of the implementation of distance education, in particular

CONCLUSION

Thus, the study of foreign experience in higher education, as well as domestic experience in implementing the credit system, allows us to improve the credit-modular system of teaching subjects, the choice of appropriate teaching methods, the choice of disciplines of choice, and the subject of independent work. A special role in this is given to joint work with employers, secondary schools, colleges and lyceums. The credit system in education in Uzbekistan is not fully implemented, not all its elements are created and functioning, and not in all universities. At the same time, the participation of the higher education system of Uzbekistan in the Bologna reforms can only be aimed at its development and acquisition of new quality features, and not at the loss of the best traditions, reduction of national standards of its quality. Orientation to the Bologna process cannot lead to excessive restructuring of the national education system. On the contrary, its state should be thoroughly understood, compared with European criteria and standards, and determine the possibilities for its improvement at a new stage.

ABSTRACT

This article provides methodological recommendations for the performance of pieces and performances in the acting class on the subject «Acting skills». This type of art will help the artist to identify the events in the process of free thinking on stage.

KEYWORDS: Drama, Initial Event High Goal, Leading Action.

INTRODUCTION

The initial event is a life process that begins outside the play and ends in front of our eyes. The leading condition given in the initial event will underlie the initial condition that led to the writing of the poem. For example, the main idea of Mahmudhoja Behbudi's work «Padarkush or the situation of an uneducated child» is to promote enlightenment, and the author called the genre of his work «tragedy».It states that the initial incident was when an uneducated child went astray and caused the death of his father. The play emphasizes that there is still an element of ignorance and ignorance, behavior, moods among the local people. The drama, as the author himself noted above, was a «national tragedy,» with three parts and four scenes. Not only is the play about the negative impact of an uneducated child on the progress of society, the author describes the attitude of the Jadids to the social system and colonial oppression in Turkestan on the example of the rich and his uneducated son.But an illiterate, ignorant, unarmed people could not fight the colonialists. In order to achieve their goals, the Jadids first had to open the eyes of

the common people and make them fight. The course of events confirms the correctness of the views of Domla and Ziyoli. The author's problem is that a young man who does not enter the streets of knowledge and enlightenment, but is addicted to alcohol and life, becomes his father's killer: at the end of the play, the son comes to spend the night with his companions and causes his death.The work is not so big, the plot is simple, but the author was able to absorb a deep meaning: far from enlightenment, far from the light of knowledge, the end of society in general - alas.Behbudi's highest goal is to prevent the children of the nation from growing up as uneducateds, and to support their aspirations for science. Seeing secular sciences alongside religious sciences is both an obligation and a duty. While the initial conditions given in Gogol's play«The inspector general»from the plays of Russian writers are defined as the «kingdom of the accused,» the initial event can be called the «military council of the accused»convened urgently to save their lives.If the initial condition given in A. Griboedov's poem «Woe from mind»is«fake Moscow», in the initial event we see a «secret meeting at night» that confirms the lie and hypocrisy. The main event. From here, the given leading conditions in the passage take effect, giving rise to the main event, and the struggle in the line of continuous leading behavior begins. The leading condition of the play, as well as the leading condition of the main event, determines the continuous behavior of the participants. Romeo and Juletta «is the main event -» Romeo and Juletta's first meeting at the ball, falling in love «, the leading condition of the poem and the main event - «Love», the continuous leading behavior of the poem -»Struggle for Love».Counter-action is the «struggle against the love of Romeo and Juliet», the central event - the constant leading behavior - the culmination of the struggle for action.This is where the unexpected turn of the struggle takes place.For example, in A.N.Gogol's poem «The Inspector»«Khlestakov's boast»;«Slander» in Griboyedov's «Woe from mind» and «murdery» in Shakespeare's «Romeo Juletta»whereRomeo kills Tibald.The final event is that in a continuous play, the fate of the leading action is decided, and the given leading condition finds its end.For example: the death of Romeo and Juletta, the revelation of Khlestakov.The main event. In the main event, the fate of the initial conditions (the author's pain, the problems that bothered him) is decided.We know what it ended up with, that is, we know whether a change occurred or remained unchanged.The degree to which the solution and interpretation of the main event is thought out determines the purpose for which the play was written.Typically, the level of a performance is determined by whether its artistic, ideological, good or bad main event is resolved.The main event is the last event in the poem, which is based on the highest goal of the work, and it determines the theme and idea of the work.The scheme (drawing) proposed above shows the theme, the idea, the ultimate goal. This is unquestionably the main event. Behavior-action analysis is based on five events-column. But it is difficult to quickly determine the initial event and the main event. The rules of the game are set in the initial event. The actor's lifestyle, environment, level and nature of emotions, and so on. The interpretation of the play depends on the resolution of the main event. The analysis can be started from anywhere that can be taken. It does not matter whether it is the definition of the initial event, the main, central, final, main events, or even the continuous behavior of the participants. Even the name of the poem and dozens, hundreds of trivial reasons are important as a source of analysis. Behavior - a method of action analysis - is the transfer of one type of art to another type of art that is completely different.That is, the ability to translate the symbols created in literature, drama into «stage language», to transfer the stage to the creative process. This is the difference between the method of behavior analysis and the method of literary analysis. The analysis of spiritual and moral

problems is interrelated with the historically accurate analysis of the work. That is why the fundamental concept of the method is the highest goal. That is, what is the idea of the work, how does it relate to today, for what purpose is the work staged? Defining a higher goal clarifies the author's inner world, spiritual and moral views, his highest goal. The path to a higher goal is continuous leadership behavior. Continuous leadership behavior is a clear struggle in which the action takes place in front of the viewer.It is this action, through struggle, that the author's supreme goal is proved, finds its confirmation.As the two halves say as a whole, the ability of theatrical creators to diagnose the being through the events of the work is tested by means of style, «mental research» and «self-examination, physical testing».In the process of «mental research», the director begins to show how the play is formed. From the initial event, the main, central, final events are finally brought to the main event. The development of the events of the work is an important aspect of the director's potential. The only integral part that forms the basis of any stage work, the behavior - the atomic particle that drives the process of action - is the event. The chain of events identified in the «mental research» phase is the most appropriate way for the play to be staged. Most importantly, the process of conflicting actions in the events of the work, the conflicts not outside the play, «must take place right here, in front of my eyes». Only a given range of conditions can be beyond the play. The concepts shown in the diagram above and listed in the style are closely related to each other and can only provide the essence of the essence in a holistic analysis. There is no concept of style that is not connected through a single work and many connections with other concepts. It is this style that serves as a beacon in the birth process of the play, a beacon that keeps the creator from going astray.Behavior - a method of action analysis that aims to identify an action that may be instantly generated by an actor during an event.That is, it is two-sided: it is a test of the actor's and director's consensus analysis, which can also be called a «physical test.»This part of the method is called the method of physical action (method of physical action). The director's logical analysis of the play before meeting with the actors serves to arouse the actors' inner curiosity, to find a common language between the actor and the director. Behavior is an involuntary creative process that can be triggered through the method of action analysis. It should also be noted that «mental research» is a conditional name. Because only a dry logical mental analysis is incapable of expressing the perception, intuition and feelings of the work, first and foremost by the director. When we say «physical test» analysis, we should mean not only physical movement, but also the movement of holistic mental, mental and physical activity. That is, the action of the creator, both mentally and emotionally. As noted above, continuous leadership behavior is a clearly defined path of struggle for the realization of a higher goal, a path that leads to the proof of a higher goal. It always begins at the same time as the leading conditions in the «main event» and defines the essence of the struggle in the process of continuous behavior - action. This struggle reaches its peak in the central event and reaches its climax in the final event. Here the leading condition given in the play also finds its solution. The initial conditions (the author's thoughts, pain) that do not change throughout the whole play are reflected in the initial conditions of the initial event. In the main event, the fate of the initial conditions is decided. We observe what happened to the event, whether these conditions changed or remained the same, overcame, or were defeated. The main purpose of the play is also clarified in the main event. We will try to explain this idea by analyzing Shakespeare's Romeo and Juliet.

1. Topic: (about what?) The fate of tragic love in the conditions of enmity and hatred.

2. Idea: (main idea) Only love, peace, wisdom can save the world.

3. Higher goal: (for what purpose, why?)Peace and kindness - to ensure the stability of love. Hostility inevitably leads to tragedy. Theme, idea, lofty goal (leading condition) - Romeo and Juletta's love (central event) Tibalt's death conflict: Love - Hostility (leading behavior - action) - struggle for love. Ball meeting (main event), (final event) death of heroes, (initial given conditions) enmity of two families, enmity, quarrel (initial event), (main event) reconciliation. In the play, the author conducts an experiment as follows: the author's pain, which irritates his heart - the senseless enmity of two families, the emergence of love in the conditions of mutual hatred (conditions given in the beginning).Romeo is a son of Montecchi, Juletta is a daughter of Capuletti. Children of two families who are enemies to each other - «fall in love with each other» (conditions given in the lead).As a result, in the main event there is a «struggle for love» (continuous leading behavior in the poem). The «death of Tibalt» (the central event) creates the most dangerous crisis. This event is both the peak and the turning point of the play. Finally, in the final episode, the plot ends with Romeo and Juletta committing suicide. That is, the «struggle for love» (the continuous leading behavior in the poem) is defeated. The leading condition of this event is «Romeo is lifeless.» The initial given condition, which is reflected in Pesa's initial story (the preparation of two family servants who are enemies to each other to prepare for battle), creates tension and conflict as a result of the collision with the leading condition (love), and this confrontation escalates. Through the test, the author shows that the problem that bothered him in life - «stupid hostility» - leads to disaster, ending in tragedy. What is the main event of the play, and what is its spiritual outcome? Let us turn to the end of the work. Upon hearing the news of Romeo and Juletta's death, the Duke no longer tolerates the quarrel between the two families and urges them to reconcile. This situation determines the main event of the play. That is - «reconciliation». This event in the poem is an objective reality. However, each director has a different approach to this event, depending on their higher purpose. Proof of this are the performances of Franco Dzifferelli and Anatoly Efros The Italian director believed it was important to show that the death of children was a tragedy for both families, to open the eyes of the hostile Montecchi and Capuletti families. It is as if they were born again. Through sincere repentance, the two families reconcile with each other. For the director, it was important how much he sacrificed in the way of achieving goodness and enlightenment that scratched his heart. At the same time, Dzifferelli is convinced that it is inevitable that humanity will be wise and prudent as it goes through brutal beatings, ignorance, bloody struggles, sacrifices in the historical process. According to the Italian director, it is possible to save life on earth from catastrophe by reaching out to each other in a friendly way, drawing appropriate conclusions from the bloody paths that humanity has traversed. Anatoly Efros takes a completely different view of the main event. In his play, reconciliation is interpreted in a false and artificial form. Montecchi and Capuletti shake hands in front of the Duke of Verona, just to distract him. Just so as not to appear to have refused to carry out his command, the man appears to be pleasing to the eye. In fact, we see that the mutual struggle has become stronger, and that this struggle will continue in a more brutal way. Only now this struggle continues in secret. This is the most horrible. So we see that nothing can shake people, not even the death of those closest to them.This hatred is so widespread that nothing can stop it anymore. Only kindness and love can give life to a person. If hatred destroys love, if the heart does not tremble, if it hides its true face with a false smile, then a catastrophe that endangers human life is inevitable, the bell in the ephros spectacle rings an example. As can be seen from the above examples, the definition of the main event leads to

different understandings, different interpretations by the directors. From the interpretation of the destiny of the conditions given in the beginning, it seems that the supreme purpose of the work may change. While Franco Gisferelli's play is staged in a spirit of hope and confidence in a single idea, a happy future, Anatoly Efros's play is interpreted in a completely different way: the future of humanity is interpreted in a form of brutal struggle, panic and anxiety. A. Efros directly attacks the spectator in order not to be indifferent to the events of the work, to encourage him to be passionate, and calls for vigilance from drowsiness. The personal attitude to the being, the unique worldview of each artist, the unique creative potential lead to different interpretations of a poem. It is most important and interesting for us that as each director captures a classic work, he reveals aspects of the play that were hitherto unknown to us by finding a unique interpretation, a vivid form. In this respect, the life of the classics is eternal. Key words: the leading behavior of the poem; event system; the main opposite is resistance; continuous leadership behavior; initially given conditions; leading precondition - conditions; leading conditions in a small range; given leading conditions in the middle range; a wide range of conditions; higher purpose; continuous leadership behavior; Initial event; The main event; Central event; The final event; The main event; event resolution; interpretation of the play; higher purpose; the highest goal; «Physical test»; method of physical activity; the end of the work. The idea, the ultimate goal, has to do with art. The idea is the main idea of the work, watered with desire, aspiration. That's why the creative front happens. The idea of the poem is based on emotional feelings, and at the heart of the work lies this concept in an objective - inner way. It is the author's pain and vigilance. Often it has an objective truth but also reflects the author's apparent desires. There is a complex connection between them. In some cases, the author has meant one thing, while in reality something else appears. In some cases, the author's words should not be listened to. For example, Aleko in A.S. But his actions are the opposite of what he said. Pushkin's «Gypsies» - loves freedom. But his actions are the opposite of what he said. Or take Hamza Hakimzoda Niyazi's «The Servant with the Rich». As the name of the work suggests, it is a product of its time and seeks to advance the idea of class struggle. The end of play is the protest of the workers at the rich man's cotton factory, at the end of which he is exiled to Siberia, where the righteous Bolsheviks politically harden the protagonist Gafur. The main theme is the oppression of the rich, the idea is to call the poor to revolt, to revolution. Today, such views cannot be justified in any way. The historical process has shown that the revolutionary path of development of a society is dangerous for that society itself. But the value of the poem is that it always reflects a common human theme: the struggle for honor and love, as well as doing what the owners want, competition, greed, jealousy, and most importantly, the development of characters. A.I.Katsman said of the idea: «In the age of walking, I can express a higher goal only after the play has passed its life, but in the course of the work it is necessary to set the direction, albeit rough.» The idea is always hidden. So is its surprise. Ethical issues will be on the surface. But the idea is much harder to define. Those who say it is easy to find are mistaken. They often use lofty words to define an idea. But it's not something that's frozen, nor are the slogans. The idea is imbued with the emotions, the high spirits, the pure spirit, the passions of the person who breathes. In order to realize the director's idea of the play, it is impossible to solve the problem of «Nature of Emotions» and «Lifestyle» in the play without finding a solution. In the process of staging a work, each genre has its own «emotional nature» and «lifestyle». G.A.Tovstonogov pays special attention to these very terms. The reason is that the solution to this problem is to help solve the genre of the play in a deeper, more precise way. According to G.A.Tovstonogov, «the nature of

emotions» is a genre in which the author is a unique way of reflecting life and breaking the laws of the scene. It will be reflected through the director's ultimate goal and the actor's «lifestyle» on stage.»Commonly accepted notions of genre definition: such as «tragedy», «comedy», «drama», the boundaries of which are wide and vague, do not define a clear «lifestyle» for the actor in a particular place and time. Indeed, the comedies of Shakespeare, Moler, A.N.Ostrovsky, N.Erdman, Hamza, Said Ahmad, Sh.Boshbekov cannot be approached in the same way. The same can be said about the tragedies of Sophocles, Euripides, Shakespeare, Schiller, M. Prince. Moreover, in the works of each author we can see dozens of genres and genre colors.«Every play has its own genre. «It's difficult to define «emotional nature» theoretically, and there are no ways to teach it,» Tovstonogov said. Almost every director has to find the originality of the work in practice. Sometimes it can fall clearly on target through involuntary sensations, sometimes it doesn't. When he begins to feel the show with his whole body, it means to feel the same «emotional nature». If the «emotional nature» of the work is found, a wave will appear on the stage and the actors will act according to the laws of that nature The search for the «emotional nature» depends on the way in which the conditions specific to that work are selected, evaluated, defined, and interacted with. This also applies to the «lifestyle» of the actor. It also depends on the actor's lifestyle, more precisely, the dialectical connection and relationship between the actor-role-character-image, the precise definition of the genre and the chosen theatrical method Suffice it to say that in the works of B.Brecht, A.Chekhov, Moler, Shakespeare, the lifestyle of the actors, the style of performance are radically different. Brecht urged actors to «alienate» themselves from the image they were creating. There had to be a certain distance between the actor as a person and the image he was creating. The main goal of the Stanislavsky School of Acting was to achieve the assimilation of the image with the actor-person «Lifestyle» and «emotional nature» are complex and controversial issues in the psychotechnics of actor's work and require separate research.

THE ROLE OF MILITARY EDUCATION IN FORMATION THE SENSE OF NATIONAL PRIDE AT THE OFFICERS OF INTERNAL AFFAIRS BODIES

Hasan Mamadjanovich Akrambaev*

*Lecturer,
Academy of the MIA of the Republic of UZBEKISTAN

ABSTRACT

The article highlights the concepts of "Motherland", the feeling of the Motherland, military patriotism, the positive viewpoints of military education and upbringing, the increment in military patriotism among the representatives of the internal affairs bodies, as well as the historical roots of cultivating dedication to the Motherland and the people when educating military disciplines. It is vital that teachers have such qualities as a sense of national pride.

KEYWORDS: *Motherland, Patriotism, Military Patriotism, Sense Of National Ideology, Training, Education.*

INTRODUCTION

Nowadays, with the processes of globalization, ideological and instructive battle, the world financial emergency, mass challenges, regional conflicts, heightening of internal conflicts taking place within the world, it is vital to pay more consideration to the issue of guaranteeing the security of states. This, in turn, increases the have to reinforce the part and place of the inner affairs bodies as one of the key links within the state machinery that ensures public organization and the safety of citizens.

The same is getting to be critical within the consistent improvement of the abilities and proficient information, skills, and capacities of students-cadets of educational institutions within the Ministry of Internal Affairs, reinforcing combat preparation, as well as the cautious organization of military exercises.

Indeed, national pride is one of the establishments of patriotism; in arrange to gotten to be a nationalist, everybody must have thought of the Motherland and know what patriotism is.

In fact, national pride is one of the establishments of patriotism; in arrange to end up a nationalist, everybody must have thought of the Homeland and know what patriotism is.

THE MAIN FINDINGS AND RESULTS

The word "Motherland" implies a certain region. The scale of the space-related to the country can be diverse: from the particular put where a person was born and raised (locale, settlement, territory), to the country, state of which he could be a citizen [1, pp. 213-216]. Within the lexicon of V. I. Dahl, the native land is caught on as the native land; within the broad sense of the word, it is the arrive, the state where somebody was born; within the contract sense, it could be a particular settlement, city, or village [2, p. 3].

Patriotism may be a concept that communicates the love and devotion of people to their homeland. Patriotism may be a common human feeling, national esteem, common to people of all countries and nationalities. From the authentic point of see, patriotism is additionally a set of feelings that emerged in individuals within the preparation of social advancement in association with the fate of their Motherland, the struggle of people groups for the sacredness and autonomy of the region in which they live. This can be reflected in pride within the country's past and show, in securing its interface. For centuries, our Uzbek people keep the memory of their heroes, notwithstanding of their nationality, religion, and convictions.

The priceless part of history in shaping a person's sense of national pride. An illustration of this is the courage of our precursors, who within the past protected their country, gave their lives for the peace of the country, and fought with the adversary to the final drop of blood. From the pages of history, we know almost the respectable qualities of our ancestors, such as Shirak, Spitamen, JaloliddinManguberdi, Temur Malik. And also approximately the military aptitude of national heroes on the battlefield, ownership of the privileged insights of weapons of that time, tall intelligence, solid will, and devotion to the people.

The feeling of national pride is respect for the golden heritage, traditions, language and culture of our individuals, consistently study the history of our nation. This feeling moreover implies living with extraordinary confidence in our expensive and excellent Country, continuously being reliable to it. Devotion to the Motherland is our obligation. To be faithful to the Motherland, one must be able to feel the Country, stir sentiments for it. The feeling of the country starts with the knowledge of the people, acknowledgment of it, and its greatness.

Sense of national pride also consists of:

- Knowledge of the history of their people and pride in it;

- preserving the material and spiritual heritage created by the great ancestors and passing it on to future generations;

- Study of traditions and customs, heritage of ancestors and their continuation;

- A sense of stability of the independence of our country, the greatness of its future, sincere support for its creation.

Nowadays, one of the urgent errands is to teach future representatives of the internal affairs bodies of the republic to be faithful to the individuals and the state, to extend adore for their

country. For this, we accept that understudies and cadets of instructive teach of the Ministry of Internal Affairs of the Republic of Uzbekistan ought to be able to feel the Motherland, love it.

World War II veterans play an extraordinary part in educating law authorization officers within the soul of military patriotism. Their mission to commit the more youthful era to learn from their encounters and lessons in open security and pass them on to the following era remains more urgent as their numbers shrink each year.

It is satisfying to note that war veterans are people who merit profound respect and honor. Since they made a noteworthy contribution not only to the freedom of mankind from fascism but too to keeping up open arrange, anticipating wrongdoings and offenses that posture a danger to people after the war. It is imperative to utilize their life encounter to make strides in the effectiveness of the exercises of the inner undertakings bodies, to fortify peace and secure our nation, to teach our understudies and cadets examining at the colleges of the Ministry of Internal Affairs within the soul of national pride.

To do this, you must follow the taking after standards:

- the rule of the progression of eras in military-patriotic instruction is based on making strides in the forms and strategies of military-patriotic instruction of youthful people by organizing coordinate interaction of the more seasoned era with life and proficient encounter with the unused era. In this case, it is necessary to rely not only on accumulated experience but also on theoretical knowledge;

- the guideline of historicity in teaching students and cadets within the spirit of military patriotism is based on the study of the combat exercises of military pioneers at all stages of verifiable advancement, behavior, information, and abilities of military faculty, from privates to military commanders;

- The rule of interaction with government organizations, open organizations, associations, and other social educate within the formation of a sense of military patriotism. This can be done through the collective. The framework of collective instruction is based on the methodology and strategies of preparing workers of internal affairs bodies to guard the Motherland. Only in a group can a capable, patriotic personality developed in all regards (but for a person approach) be raised?

Military-patriotic education will be strong in case it is based on the over standards. In any case, these standards are not obligatory but are a portion of a comprehensive approach. In fact, a comprehensive approach to military-patriotic instruction shows up as implies of optimizing instruction, and progressing the ethical, political, psychological, military-technical, and physical training of young people. It requires, on the one hand, the recorded viewpoints of education, and on the other, its interaction with ideological, political, labor, and ethical instruction.

An imperative condition for utilizing a coordinated approach is the advancement of criteria for surveying the instruction of national pride. The level of awareness of students and cadets is expressed through ideological feelings, a sense of patriotism, as well as the system of political, military-technical, and physical preparation.

The indicators of military-patriotic education are reflected within the tall ethical and political preparing of youthful people, their dynamic interest within the study of military works out, and

in mass sports. One of our fundamental objectives in this respect is to appear each person the qualities of cherishing for the Motherland, commitment to it, and pride in one's honor, title, and position.

To execute a coordinated approach to military-patriotic instruction, it is necessary to generalize the encounter of military-patriotic work. It'll offer assistance to acclimatize the designs, structure, and instruments of the instructive handle, the hypothesis, and strategy of military patriotism, as well as the standards and organizational shapes. Educational science prepares analysts and professionals with methods of forming a sense of patriotism in young people and the craving to ace military service.

Dependence on knowledge almost the quirks of the mental state of people require to assist the improvement of practical proposals for the defense of the Motherland and the mental status of workers of the inner undertakings bodies to fulfill their obligation.

Military sciences find the reply to the address: "What fighting, moral, political and psychological qualities, what knowledge, abilities and capacities should a defender of the Fatherland have?"

Military instruction and military preparation are critical means of shaping patriotism and play a vital part in upgrading information and abilities within the arrangement of the ideological and otherworldly picture of audience members and cadets examining in instructive teach of the Ministry of Inner Affairs.

It is known from history that the Turkic peoples once had the most capable armies within the world; great commanders such as Amir Temur, military procedure, and tactics were carefully and ideally developed [3, p. 5].

It should be noted that in Soviet times, representatives of our people did not have the opportunity and got to get military instruction and preparation. Subsequently, insufficient consideration was paid to military-patriotic education. Since the Soviet government was against the training of national military staff. A little portion of our national officers and warriors were constrained to serve the Soviet individuals and take the military oath. Like other spheres, military-patriotic instruction was ideological, that's, it was adapted as it were to communist education.

Thanks to independence, the current officers of the Service of Defense and the Ministry of Internal Affairs of the Republic of Uzbekistan today serve their Homeland, nation, and individuals. They clearly know their objectives and destinations.

At display, physical instruction is a necessary portion of such instruction whereas upgrading the glory of military patriotism in our nation. Military-patriotic instruction cannot be envisioned without physical instruction. Through physical preparation, such qualities are created as perseverance in cold and hot weather, overcoming difficulties, willpower, perseverance, the ability to move rapidly and ably, commitment to the Homeland and the individuals.

Physical education fosters the human body and wellbeing, military instruction gives individual military information and abilities, and energetic instruction cultivates the human soul.

The rational utilization of the capabilities of the authority and the educating staff of instructive teach of the Ministry of Internal Affairs of the Republic of Uzbekistan also plays a vital part in impacting the awareness of understudies and cadets by cultivating national pride.

When organizing the instruction of national pride, it is fundamental to rely on the rules and conclusions of military disciplines that teach knowledge about military exercises.

In this way, the most goals of all events are to teach students and cadets of educational institutions within the framework of the Ministry of Internal Affairs of the Republic of Uzbekistan as military patriots.

Formation of energetic confidence is the premise of educational work. The more grounded the feeling of patriotism and national pride among students and cadets, the stronger and more stable they require for otherworldly development, the protection of the Motherland, and conservation of the peace of the people.

The formation of a sense of patriotism and national pride requires the presence of such qualities in teachers. For this:

• In the handle of studying social and humanitarian disciplines, students and cadets ace the foundations of the national thought, a modern worldview is shaped, the feeling of cherishing for the Motherland is strengthened, qualities that decide the readiness to guard the Motherland are brought up;

• Energetic feelings of understudies and cadets, preparation to guard the Motherland and guarantee the peace of the people are too shaped in the handle of educating simply military disciplines. In this process, students and cadets obtain information around the priority areas of military information and technology, discoveries, and the power of the army;

• It is vital to know the rich historical heritage and conventions of our people in the formation of energetic beliefs among students and cadets. In this regard, it is advisable to uncover, using the example of the activities of people heroes who gave their lives for the interface of the Motherland and the nation in the far off and recent past, the accomplishments of Uzbekistan on the way of free development;

• It is vital to guarantee the formation of patriotic qualities in understudies and cadets within the handle of instructing military disciplines related to the awareness and respect of national interests.

CONCLUSION

In conclusion, it ought to be noted that education within the soul of patriotism and national pride in the process of military disciplines is one of the priority errands of educational work in the soul of devotion to the Motherland and its people.

ABSTRACT

Teaching translation is one of the foremost vital issues in the education system. It ought to be noted that the phenomenon of interference is experienced in the teaching of interpretation in any language. To avoid it, it is necessary to perform uncommon works out, ie translation exercises. It is known that teaching translation requires the utilize of distinctive techniques. This requires taking into account a few features of the education system. This article gives a brief diagram of a few features of teaching translation in the education framework.

KEYWORDS: *Translation; Translation Exercises; Exercise System; Foreign Language Teaching; Education System; Translation Method; Translation Method; Foreign Language Specialization; Types Of Speech Activities; Interference; Reveal The Meaning Of The Word.*

INTRODUCTION

The interaction of our country with numerous foreign countries in the economic, socio-political, and spiritual-educational circles has essentially increased the part of translation today. In our country, serious attention is paid to the methodology of teaching interpretation through a seriously educating of outside dialects. The interpretation is translated nowadays as a strategy, strategy implies teaching in foreign language educating methods.

THE MAIN FINDINGS AND RESULTS

It is known that interpretation has also risen to the level of a strategy within the history of foreign dialect teaching. Text translation and grammar-translation strategies have been broadly used in

foreign language teaching for many years. Over time, other strategies of educating a foreign language have been developed as translation strategies have ended up obsolete. Handle methods such as associate, practice, the application started to apply, the educational status of translation has totally changed.

From the above, it is evident that the educational errands of translation can incorporate: (1) discovering the meaning of a new word; (2) clarify the grammatical phenomenon; (3) find the meaning of new words independently using a dictionary. In the remaining cases, the study of foreign language units without translation has been demonstrated in the methodology. Deviation from these rules leads to confusion of errands of other disciplines (interpretation theory and hone, comparative etymology, text interpretation, stylistics, lexicology, etc.) within the course of foreign language practice course (FLPC). It is well known that FLPC requires a communicative approach to language learning.

The existing literature gives common concepts and information almost translation, and the term "translation" has been used in the sense of translation, translation, translation from one dialect to another.

It ought to be noted that translation has educational esteem as an auxiliary type of speech activity in an outside dialect. Translation is referred to by the terms translation (in English), *Übersetzung* (in German), *перевод* (in Russian). The word "translator" is translated from German into Turkish as *"тилмоч" (dolmet)*. The Germans call him *"Dolmetscher"* (interpreter), and a person who translates from one language to another is called *"Übersetzer"*. In English, it means translator (written), interpreter (oral).

The study of scientific literature and pedagogical practice appeared that in the handle of teaching a future foreign language teacher, firstly, translation from the studied remote language into the local dialect and bad habit versa, besides, from German, which is the language of specialization, into English and bad habit versa.

Researchers decipher the translation differently.

Researchers A.V.Fedorov [4, p. 120] and L.S.Barkhudarovs [1, p.310] take a linguistic approach to translation and emphasize that it is utilized in two faculties: 1. Interpreting a specific text (or piece of content) into another language.2. The translation itself is a derivative of the verb "to translate".

The following difficulties arise when translating from language to language: a) the translation of the translated text in both languages; b) the content of the translated text differs from the native language, has a specific character for foreign language teaching; translation text, piece of text, lexical-stylistic structure of word combinations.

The issues of interference and positive migration that occur in foreign language teaching in high school have been solved experimentally in the methodology. B.A., who conducted the experimental research. Lapidus discovered the following laws of interference:

- each of the first two languages is available during the reception (comprehension) of the text of the second foreign language;

- The difference in the effect of a language that has only just begun to be mastered on previously learned languages is that interference is more likely to occur at this time. It considers not only the inter-linguistic negative impact, but also which language the source of the interference will be;

- The first foreign language has a strong negative impact on the native language, if students know enough about a certain correlation (relation) of the phenomenon of the second language in the first language;

 - In the period of acquisition of the second language, it is possible to recognize that the stronger negative influence of the first foreign language than the native language contradicts the methodological reality [3: 8].

We found it suitable to cite some comments from translators around translation in general.

Reflecting on translation, P. Hegboldt [6, p. 160] contends that when reading less difficult writings, one should not feel they require for translation, but or maybe resort to interpretation in troublesome writings.

Focusing on issues directly related to translation, I.V.Rakhmanov pointed out two laws of foreign language teaching: 1) the teaching of a foreign language should be based on the mother tongue (this law remains pertinent nowadays, since learning a foreign language through the mother tongue reflects reality); 2) teaching a foreign language, for whatever purpose, should be at the cost of tuning in comprehension and speaking exercises [4, p. 120].

According to L.V. Shcherba, "a speaker in one language can find the signs in that language, but on the contrary, a person who knows a foreign language is able to get out of this situation and think in another language" [7, p. 112].

Most people associate it with the concept of "translation" when they say "foreign language" or, conversely, when they say "translation" they mean "foreign language". There are a number of reasons why this is the case.

We can observe two cases in the history of foreign language learning: first, the fact that a foreign language has long been taught / studied worldwide by translating it into a mother tongue (we will mention the "translation method"); - translation".

In the history of foreign language teaching, translation has been given a put in one way or another. This means that outside dialect learners were to a few degrees engaged in interpretation, the participation of translation in the system of works out in the foreign language being studied was continuously noticeable.

When the term "translation", which is the Arabic word for "Aslan," is perceived (read and listened to) or imagined, various concepts associated with it come to mind.

The range of meaning of the word translation is so wide [2, p. 432] that it can be easily grasped in the following combinations; (1) translation method, translation exercise, translation method; (2) literary translation, scientific translation, translation skills: (3) text / phrase / word translation, oral / written translation, simultaneous translation: (4) translation of ancient texts / sources into modern literary language, etc. . Translation can be the object of research in a number of disciplines. The first is studied in areas such as foreign language teaching methodology, the

second in literature, the third in linguistics, the fourth in literary relations, and finally the fifth in textual studies.

CONCLUSION

The method of translation is the correct method used in the history of foreign language teaching, the mixed method, the comparative method and the modern method, which, in time, "lived" the longest period and is still using certain elements. Among the most common types of translation methods, such as "grammatical-translation method" and "text-translation method" were popular and popular in their time. It is worth mentioning that there are still some teachers who go astray, such as the full translation of the text. However, according to modern methods, the goal is to master a foreign language - speaking, listening, reading and writing. Teaching / learning types of translation does not rise to the level of a goal in the process of acquiring a foreign language as a subject of general education.

The study of translation can be considered as the acquisition of professional skills in a foreign language, that is, this field is a special goal for students studying in translation departments (faculties).

ABSTRACT

In this article, on the basis of periodical materials, the changes in the socio-economic and cultural life of our country during the years of restructuring (1985-1991) In August 1989, the First President of Uzbekistan Islam Karimov revealed the essence of the "imperial" and "colonial" policies of the Soviet state. The remains of calcium arsenate and DDT have been stored in the warehouses of the republic for many years. As of 1989, 5,000 tons of harmful and toxic substances and an additional 200 tons of toxic seeds, more than 60,000 containers with various poisonous preparations were stored here.

KEYWORDS: *USSR, Rebuilding, Press, Central Asia, Chirchik, Angren, Jizzakh, Aral Sea Problem.*

INTRODUCTION

By the 80s of the last century, the crisis in the USSR increased sharply, covering all spheres of the country's life. Under the Soviet regime, the monopoly on state property and the dominance of the administrative-distributive system in its management became more and more powerful.As a result, the rates of growth of production, gross output, labor productivity fell sharply, the alienation of producers from the means of production, labor productivityincreasedetc.

Such socio-political and ideological processes that took place during the perestroika period, as well as the predominance of the agricultural sector, the cotton monopoly, the economic interests of the center - all this led to many unfavorable situations in the industry. A lot of illegal, especially in the use of student labor.Years of reconstruction In Uzbekistan, schoolchildren

spend three months in the field during the academic year, which means they skip 600-700 hours of classes. The curriculum, the curriculum will be shortened, the practice will remain, as a result, the general level of the child's knowledge will decrease. For example, in 1986, when examining the knowledge of 300 students who graduated from secondary schools of the Samarkand region with a medal, only 75 of them justified their knowledge. In 1985, in the Zadarya district of the Namangan region, 4 million soums were allocated for the services of hashars. soums were spent. In fact, it was equal to the district's annual budget [1]. Even the fact that the students themselves shouted when they could be prohibited from engaging in illegal agricultural activities was a sign of their sharp dissatisfaction with the existing order. For example, Nafisa Makhmudova, a 10th grade student in the Izbaskan district of the Andijan region, said that there are 39 students in her class, that their level of knowledge is too low, that even two students cannot write at all, because they have been in the field for three - four months [2].

The Main Findings and Results

It is known that the role of the education system in the sociocultural policy of the republic is extremely important, and certain successes have been achieved in improving it. According to 1988 data, there were 7,840 schools, 563 vocational schools, 250 technical schools and 42 higher educational institutions in the country. More than 320 thousand teachers worked in this area more than a million students were educated.

But mistakes and shortcomings in the field of education remained. In particular, only about 40% of schools in the country are located in standard buildings, 75% of classes are held in two shifts, about 150 thousand children study even in the third shift, 700 schools are in emergency mode. Almost 50% of schools lacked kitchens, gyms, central heating and sewage.

This situation affected the level of education. Of the 6,000 children who passed the entrance exams in mathematics at the Tashkent Institute of National Economy, 4,000, or two-thirds, received an "unsatisfactory" grade and only 1.6% received an "excellent" grade. 50% of applicants to the Fergana Polytechnic Institute have failed the physics exam. At the Tashkent Institute of Highways, 63% of students did not receive higher education in mathematics, and 58% - even in arithmetic [3. 17].

During the reconstruction period, there were also problems with the deterioration of the ecological situation in the country, the excessive use of chemicals harmful to human health, and water problems. In some regions of Karakalpakstan, water supply fell by 4-5%, while in the USSR 30 kg of toxic defoliants were used per hectare, while in Uzbekistan this figure was 500 kg / ha.

It is also necessary to study in advance the impact of new enterprises, plants and factories on the environment, only after the public reaction has been determined, but in Soviet times there was a one-sided approach to this problem. For example, the wastes of the Chirchik caprolactam and chemical plant are used not only in Bostanlyk or Chirchik, but also among the population of 2 million also polluted Tashkent.Waste from the Akhangaron cement plant occupies more than 200 hectares of land annually, and the Almalyk Mining, Metallurgical and Chemical Plant pollutes the population of the city 5-6 times more than normal.For each liter of untreated water from the Chirchik River, which supplies water to the population of Tashkent, through the fault of caprolactamists, 4.2 grams of mineral salts, 2 grams of nitrogen and chlorides, and 8.6 grams of

sulfate waste were discharged. In 1988, out of 280 cities in the country, 140 were classified as dangerous due to the fact that the water level at the surface dropped below 140 [4].

The policy of strengthening the cotton monopoly, turning Uzbekistan into a raw material base for the center during the study period will be even more active. This, in turn, led to the deterioration of the environment, the spread of various diseases, and the further development of the chemical industry. By 1983, the republic's chemical industry had grown by 345% compared to 1970.As a result, the land became marijuana. A total of 1.5 tons of mineral fertilizer per hectare of land was left uncultivated. As a result of inspections conducted by the Ministry of Health of Uzbekistan in Jizzakh, diseases related to toxic chemicals were detected in machine operators, watermen, livestock breeders and children under 14 years of age.When using more than 15-20 kg of toxic chemicals per hectare of land, blood pressure in adults, diseases of the gastrointestinal tract, pulmonary tuberculosis, anemia (anemia), diseases of the eyes, ears, throat, hypertrophy of any part of the body in children under 14 years of age. outside), the incidence was twice as high as in other places [5].

It is known that in 1988 the use of butifos was prohibited by a decree of the Chief Sanitary Doctor of the USSR. However, in 1989 there were cases of its use. The remains of calcium arsenate and DDT have been stored in the warehouses of the republic for many years. As of 1989, 5,000 tons of harmful and toxic substances and an additional 200 tons of toxic seeds, more than 60,000 containers with various poisonous preparations were stored here. At the "Lenin Yuli" collective farm in Orta Chirchik district, a warehouse for toxic chemicals belonging to the Tashkent regional branch of the "Uzselkhozhimiya" production association is located just 300 meters from the kindergarten.

Such a situation could be seen in all regions, cities and villages of the republic. The situation was particularly bad in the industrial city of Navoi and nearby villages. There are 3,234 farms in the Kommunizm and Lenin Yuli collective farms of Navoi district, and residents of Ayrinchi, Temurshaykh, Yangiariq, Chorravot, Argun, Kyzyltom, Beshkent and Luvaton villages affected by Navoiazot.53 children died in 1986, 49 in 1987, and 42 in 11 months of 1988. In 1988, the Navoiazot production association registered 8,039 cases of illness, lost 76,854 working days, and the number of acute infectious diseases, bone meningitis, kidney and jaundice, lung diseases, and gynecological diseases among workers increased.Navoi is the 6th most environmentally hazardous city in the USSR. 40% of the population of some regions of Uzbekistan suffer from severe changes in the nervous system and liver [6].

In 1987, 286,000 people in Uzbekistan were diagnosed with jaundice, while in 1988 the number reached 323,000, 42,000 people became incapacitated each year, and the mental weakness of their children was a cause for concern.For example, in 1986, 4.5 thousand people were diagnosed with mental retardation, and in 1987 this number reached 8.7 thousand [7].In the republics of Central Asia, 1.8 million cubic meters of coal are annually emitted into the atmosphere from the existing "pipes" of the enterprise. 1.5 million tons of toxic "dust" tons ended up in Uzbekistan. The amount of toxic toxins "spilled" in the air has increased.For example, every person in Tashkent had 22 kg of chemical "toxic elements" such as sulfuric acid, hydrocarbons and carbon monoxide during the year. The Chirchik River has 291 times more ammonia, 43.5 times more nitrates and 11 times more "chemical turbidity" than the government norm [8].

During such a dangerous time, many dedicated people worked to draw the attention of the entire community to the dire environmental situation. For example, in 1983, the documentary "Island State" was shot. However, V. Antonov, director of the "Sredazgiprovodkhlopok" Institute, did not allow it to be shown. He noted that the problem of the Aral Sea was "dramatized". However, due to the efforts of the creators, the film was shown at the TV festival in Jurmala under the motto "Man and the Sea" and was awarded a special diploma [9].

The situation in Uzbekistan has been improving since June 1989. In August 1989, the First President of Uzbekistan Islam Karimov revealed the essence of the "imperial" and "colonial" policies of the Soviet state. He noted that the productive forces and, above all, production facilities are located mainly spontaneously, more precisely, on the basis of various arbitrary, command decisions, often without taking into account the recommendations of authoritative experts in science and design organizations.50% of the country's industrial potential is concentrated in the cities of Tashkent and Tashkent region. Only 5 percent of the rural population is not provided with sewerage and water supply, almost 50 percent are not provided with normal drinking water, and 17 percent are not provided with natural gas. In 1989, 240,000 families living in rural areas were left without husbands, of whom 1.8 million. In Tashkent alone, more than 92,000 families are in line to receive land plots that need to be expanded for housing and agricultural production [10].

Social issues, especially public health, were often raised by intellectuals. According to Salimova, only in Uzbekistan in 1987, 286 thousand people were infected with jaundice, which is 47 thousand more than in 1986, and in 1989 - 214 783 people, of which 169 095 are children under 14 years old.In 1987, more than 18,000 people were infected with diarrhea, 142,000 with other acute intestinal diseases, 1-2 per 1,000 children born in the United States and Japan, 24 in the USSR, 46 in Uzbekistan, 42 in Karakalpakstan, and 118 in the Bozatov district near the Aral Sea [11].

Such a difficult socio-economic situation caused serious protests among the population, which in turn had a dramatic negative impact on the socio-cultural life of society. In particular, the position of women was dire. In the second half of the 1980s, a situation of self-immolation of women was observed in the republic. In 1986, 132 women committed suicide, in 1987 - 143, in 1988 - 245, and in 1989 - 233 women.Of the 478 reported cases of self-immolation recorded between 1988 and 1989, 280 women had secondary education and 9 had higher education [12. 68].Critical analysis shows that Uzbekistan lags far behind the USSR in all economic and social indicators, ranking 12th in the Union in terms of GDP per capita. In terms of national income per capita, it was 2 times lower than the national average.While the share of the population earning less than 75 soums (rubles) a month on average was slightly more than 12% in the USSR, in Uzbekistan the figure was 45% [13. 8].This in turn, had a negative impact on the cultural life of the republic.

CONCLUSION

In short, despite such a tragic situation, some local leaders tried to eliminate the negative attitudes and sentiments of people towards the Soviet regime with the help of various opinion polls in order to save the USSR. For example, P. Shikharov notes that the attitude of different nationalities towards the Russian nation has worsened in Uzbekistan, the national culture and

language of other peoples is being discriminated against, and to some extent it is true that Uzbekistan is in a state of subsidization [14. 49].

It should be noted that in the second half of 1989 - early 1991, people's attitudes and attitudes towards the existing system changed. As a result, among various categories of citizens, surveys were conducted on transparency, "reconstruction" and the economic situation.The responses said that "reconstruction" stretched like a rubber band, that "reconstruction" had left a negative imprint on the life of Uzbekistan, that human values such as love had disappeared, that they were deceived in Soviet times, and that they believed that Uzbek the flag will fly one day in front of the UN [15. 18-19].

Thus, during the study period, one could see the aggravation of the ecological situation in the socio-economic and cultural life of Uzbekistan, the satisfaction of the daily needs of the population, the specificity of women's problems.In turn, it is necessary to recognize that the only way to solve the existing problems in the republic is to realize that advanced scientists, intellectuals, specialists, ordinary citizens are in national independence.

DEVELOPMENT OF PHYSICAL QUALITIES OF PRESCHOOL CHILDREN

Sohiba Khamidovna Achilova*

*Teacher,
Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article shows the role of physical exercises in the development and strengthening of the musculoskeletal system of children. Physical exercises have an educational value. Children develop attention and observation, develop strong-willed qualities, and develop character. Examples of exercises for preschool children are given.

KEYWORDS: *Preschool Educational Institution, Physical Education, Physical Exercises, Attention and Observation, Child Development, Movement, Games.*

INTRODUCTION

Ensuring the implementation of the Decree of the President of the Republic of Uzbekistan dated September 30, 2017 No PF-5198 "On measures to radically improve the management of preschool education" and the establishment of state and non-state networks of preschool education further expansion, creation of conditions for the formation of a healthy competitive environment between public and private preschools, the introduction of new forms of preschool education in the context of public-private partnership, as well as In order to ensure the effective organization of the Ministry of Preschool Education of the Republic of Uzbekistan, the Ministry of Preschool Education was established. The document says the number of public preschools in the country has shrunk by more than 45 percent over the past 20 years, while enrollment in preschools has risen by about 30 percent. [1]

In this regard, it is planned to retrain preschool teachers and teachers on the basis of modern technologies and methods and to create "appropriate conditions for the upbringing of children"In the next 4-5 years, all children of kindergarten age in Uzbekistan will be fully covered by preschool education, President ShavkatMirziyoyev said in his speech at the ceremony dedicated to International Women's Day."We have set a goal to fully cover all preschool children in our

country in the next 4-5 years. This is our duty to our women, our children, if necessary, our sacred duty to the future, and we will definitely fulfill it, " the President said.

The law on pre-school education and the Republic of Uzbekistan sets out the basic principles of pre-school education and upbringing. The main principles of preschool education and upbringing are: accessibility of preschool education and upbringing for every child; equality of conditions for the development of the inclinations, inclinations and abilities of each child; unity of education, upbringing and health improvement of preschool children, the educational impact of the family and the preschool educational organization; harmonization of education and upbringing of preschool children; a person-centered approach to the development of a child's personality; continuity and continuity of preschool and General secondary education; democratic and secular nature of education and upbringing; transparency and openness of the educational process; correspondence of the content, level and volume of preschool education and upbringing to the development and health status of preschool children. [2]

Main part

Preschool children have a huge need for movement - they need outdoor games, outdoor entertainment. Gradually, you can introduce sports activities. Children 3-6 years old learn quickly, but it is necessary to monitor the level of their workload. Sports activities will help in adapting the child to society, reveals his "I". This is a great workout not only for his body, but also for his mind. [5]

An essential feature of early childhood is the relationship and interdependence of health, physical and neuropsychic development of children. A strong, physically fit child is not only less susceptible to diseases, but also develops better mentally. Starting from the age of three, the child can do a lot, is very mobile. Physical exercises develop and strengthen the musculoskeletal system, prevent posture disorders and skeletal deformities. Physical exercises are not only health-improving, but also educational value. Children develop attention and observation, develop strong-willed qualities, and develop character.

It is very important to remember that the child's development is complex - focusing solely on his emotional and mental development will be a mistake. The formation and development of physical qualities plays an important role. It's not just about playing sports. Before this physical activity, the child needs to develop speed, flexibility, and coordination of movements.

Relevance of this problem: in the General system of comprehensive and harmonious human development, physical education of a preschool child occupies a special place. It is in preschool childhood that the foundations of good health, proper physical development, and high performance are laid. During these years, there is a formation of motor activity, as well as the initial education of physical qualities.

An important task is the development of children's movements, the formation of motor skills and physical qualities-dexterity, speed, strength, endurance.

Physical qualities of a child include such concepts as strength, speed, endurance, agility, flexibility. Currently, among specialists in the field of physical education, the formation of physical qualities of a child is widely discussed. Their development is an important task of physical education. Analysis of special literature shows that the problem of physical

development of a child is largely determined by the development of its motor qualities in different periods of childhood, which are still insufficiently studied.

Currently, the issues of genetic and social conditionality of the level of performance of the child's body, its motor qualities: endurance, strength, speed, flexibility, etc. are widely discussed. This is the subject of many studies, so the point of view about the interdependence of social and biological factors in the development of children is quite common. According to this statement, psychophysical qualities are a manifestation of a person's motor capabilities, which largely depend on their innate anatomophysiological and psychological characteristics. However, it is necessary to take into account the fact that under the influence of a systematic, purposeful process of education and training, you can significantly influence the development of these qualities.

The development of basic physical qualities is closely related to the formation of motor skills. Exercises aimed at developing psychological qualities are used in a strict sequence, are included in various forms of motor activity, including independent motor activity of the child on a walk.

Motor activity of children is associated with the development of basic physical qualities it is Almost impossible to imagine the isolated development of any one quality. Education of various physical qualities represents different aspects of a single process of comprehensive physical development of the child, since as a result there is a General increase in the functional capabilities of the body. [3]

Human motor activity, including sports, is characterized by certain qualitative parameters. Among the main physical qualities are muscle strength, speed, endurance, agility and flexibility. A number of authors distinguish the speed and power capabilities of a person as the main quality.

The development of physical qualities depends to varying degrees on innate characteristics. At the same time, the leading mechanism in individual development is conditioned-reflex. This mechanism provides qualitative features of the motor activity of a particular person, the specifics of their manifestation and relationships. When training skeletal muscles (and the corresponding parts of the Central nervous system) on one side of the body, identical reactions of the nervous system and muscles of the other half of the body are achieved by conditioned reflex, ensuring the development of this quality on non-exercised symmetrical muscles.

The goals of activity in physical education and sports are United by a common focus: the formation of the need for physical exercise, health promotion, increasing working capacity, intellectual, moral, ethical and aesthetic development. Each area has its own focus: in physical education-providing both physical and spiritual development, as well as professional and applied training for work, mastering the rules, norms and laws of motor activity in various conditions of reality; and in sports - the achievement of the highest possible sports result, the development of special abilities necessary for a particular sport. [4, page 30]

Here are the possibilities of using mobile games for the development of physical abilities of preschool children. Mobile games for the age period of 5-7 years include the same tasks as in the previous period, but require additions.

Main task:

- Promote the development of speed abilities, strength, endurance, agility, flexibility;

- Formation of correct posture, smooth, graceful movements, orientation in space, rhythmicity of movements;

- Enriching the child's motor experience with various types of physical exercises and outdoor games;

- The development of interest in training activities;

- Develop children's activity in the process of joint play activities;

- Train you to follow the rules and control the game.[6] (Shokhista, 2020)

1 week: speed Games:

- To develop the speed of reaction for a given signal;

- Develop attention to changing conditions during the game.

Week 2: skill and coordination Games:

- Develop children's ability to coordinate movements with the visual signal;

- Develop coordination of movements, motor activity;

- Exercise children in orientation in space.

Week 3: play on the development of strength and endurance:

- Perform tasks using muscle effort;

- Develop the ability of children to use their willpower in performing games with increased fatigue.

Week 4: fun Games

- Emotional stress relief;

- Boost your mood;

- Develop your imagination;

- Training in matching movements with each other and the rhythm of the text;

- Creating an atmosphere of joy that brings children together;

- Development of active speech and attention of the child;

- Auditory perception, attention, reaction speed, interaction skills with adults and children;

- Development of trust and partnership relations.

RESULTS AND DISCUSSIONS

During outdoor games, the preschool educational institution employee must take into account the age and individual characteristics of children, carry out competent management of outdoor games; use various versions of games with complexity, for the development of physical qualities.

The preschool educational institution uses a systematic approach to the sports development of children. In addition to outdoor games, exercises and free motor activity are used (for example, during walks). Children experience a huge physical load, but most often do not notice it, because

they are passionate about the process. And even rolling down the slides several times will be an excellent compromise for outdoor games.

For serious training of physical qualities that take place during the school period, it is necessary to pass the stage of outdoor games. And the main task of the teacher is to interest the child in physical activity. If during an event a child is forced to engage in an action that is not interesting to him, this will never happen. Emotional commitment is very important. If a preschooler is passionate, then over time it will be possible to introduce more complex tasks into their mobile activities.

There are hundreds of outdoor games that involve different groups of children. Children play by the rules while developing their qualities related to motor activity. In these games, you need to squat, run, manage your coordination, be attentive and agile. During the game, children do not notice how they train. As shown, this type of activity is suitable for children of different levels of preschool age. The game does not make you think about the goal of "Training", but gives you the freedom to choose your level of physical exertion.

One of the important qualities of outdoor games is to help you adapt to new conditions. The teacher offers a joint game in which all the children of the group are involved. Mobile play has become an indispensable tool for mental education of preschoolers, as it manifests and develops creative imagination, the ability to design, develops the rhythm and beauty of movements, and the ability to assess situations. It also reflects and develops the skills and knowledge gained in the classroom, establishes the rules of behavior that children are taught in life.

We must not forget that it is important to know the physical condition of the child before conducting outdoor games. To do this, before coming to kindergarten, the child passes a medical Commission, where his health condition is fully assessed. At the end of the examination, the child is assigned a certain health group. Therefore, children of preschool age develop their physical qualities individually. Outdoor games are aimed at developing basic physical qualities. Educators know that games should be played at an average pace. The group has different children with different abilities - you need to select activities that would be able to all group members, and not allocate special ones. It is impossible and even dangerous to immediately give them a large load (possible injuries). Heavy loads can damage the musculoskeletal system, slow down the development of the cardiovascular system. But a kindergarten is a place where children are involved in the movement. Therefore, kindergarten programs are prepared so that children can develop comprehensively and safely.

CONCLUSION

Having considered physical qualities and studied the patterns of their development in preschool children, we can conclude that physical qualities are important for the comprehensive physical development of children. For training physical qualities as a means of forming physical development in preschool children, the universality of outdoor games is important. During the game, only one of the child's qualities does not develop. There is a General training of the body with a great emphasis on one of the types of qualities studied. The development of physical qualities is measured by certain indicators, such as speed, flexibility of the body, endurance, coordination of movements. This is necessary for the proper development and full life of a person.

In the course of the work done, the goal was achieved and the tasks were solved. We must remember that it is a huge mistake to encourage children at preschool age not to move and be silent. During this period, children learn the world. And the development of physical qualities provides a solid Foundation for a comprehensive study. It can be concluded that as a result of the use of outdoor games in preschool children, the level of physical fitness increases. In addition, a physically developed child does not lag behind in his mental development. It is easier for him to establish friendly relations with other children during the game. From here we get a healthy person on all levels: physical, mental and social.

This work can be used by teachers and physical education instructors in kindergartens.

ABSTRACT

Single-celled microalgae was isolated from different reservoirs of Uzbekistan. They were classified according to their morphological and cultural characteristics. Dynamics of growth of microalgae were up to 72 hours and $2,3 \times 10^7$ -$3,4 \times 10^8$ cells/ml. It was found that microalgae produced 0.135-0.302 g/l of biomass when cultivated for 14 days on a nutrient medium "Chu - 13". Lipid content in the cell was 17.5–45.7%.

KEYWORDS: *Microalgae, Chlorococcum, Scenedesmus, Biomassa, Lipid.*

INTRODUCTION

The science that studies algae is called algology. The role of algae in the biosphere is crucial, their production for the year is 550 billion tons. Algae are the oldest photosynthetic organisms on Earth, which created its oxygen atmosphere and are a very significant part of nature. Algae are predominantly inhabitants of the aquatic environment, but many have adapted to life in non-water habitats — in the soil and on its surface, on rocks, tree trunks, and in other terrestrial biotopes [1].

Natural groupings of microalgae in soils are an integral part of the corresponding soil biocenoses, which unite all the inhabitants of the soil layer. By the systematic and species composition of soil microalgae are quite diverse such as *Cyanophyta*, *Chlorophyta, Xantophyta*, *Bacillariophyta*, *Euglenophyta*, *Chrisophyta*, Pyrophyta, *Rhodophyta*. The most numerous ones

are blue-green, green, and diatom microalgae [2]. They are represented by types of genera *Nostoc, Microcoleus, Prasiola, Phormidium,Trentepohlia, Chlococcum, Chlorella, Botrydium, Vaucheria, Gloeocapsa, Stigonema* and others. Prokaryotic and eukaryotic microalgae often live alone, but very often form a variety of compounds, including colonies. The degree of integrity and isolation of these compounds may vary during the life cycle of microalgae and depends on environmental conditions [3, 4, 5].

Identification is a necessary process for obtaining pure cultures and represents the first step towards the selection of potential microalgae strains for the production of biodiesel. Traditional Identification methods include the use of micropipettes to isolate their cells under a microscope and then sow into a liquid or agar medium. As a result of complex isolation processes, a pure microalgae culture can be obtained and easily identified [6]. In nature, among the chlorococcal algae, representatives of the genus Chlorella, Ankistrodesmus, Closteriopsis, Scenedesmus and other kind *Chlorella vulgaris* belongs to the genus Chlorella, which combines a group of autotrophic protococcal algae, mainly represented in the form of single cells. Of the maniy species of algae that are used for mass cultivation [7], Erepresentativesof the genus Chlorella occupy the main place, and of these, the Ch. vulgaris. In nature, members of the genus Chlorella are widespread. They can be found on the surface of the soil, in water bodies and even on the bark of tress. However, not every species, variety or strain isolated from nature can meet the requirements of industrial cultivation.

The purpose of this paper is to search and screening of local strains of microalgae, which are high productive on the accumulation of lipids.

MATERIAL AND METHODS

Obtaining of accumulative cultures of microalgae

To obtain acumulative cultures of local strains of unicellular green algae, water samples were taken from different regions of Uzbekistan. To receive the accumulative culture of microalgae, following medium was used: «Чу - 13» (g/l): KNO_3 – 0,2, K_2HPO_4 – 0,04, $MgSO_4$ x $7H_2O$ – 0,1, $CaCl_2$x$6H_2O$ – 0,08, iron citrate – 0,01, lemon acid– 0.1, бор – 0,5 ppm, $MnSO_4$ x$7H_2O$ – 0,5 ppm, $CuSO_4$ x $5H_2O$ – 0,02 ppm, $CoCl_2$ x $2H_2O$ – 0,02 ppm, Na_2MoO_4 x $2H_2O$ – 0,02 ppm, pH 7,5 [8].

After receiving the cumulative culture - microalgae from the liquid medium (1 cm^3 or more, depending on the purity of the cumulative culture), THEY were transferred through several passages (3-5 transfers) using conventional microbiological technology to a Petri dish with frozen nutrient agar (Chu -13 "), and distributed over the surface of the agar with a sterile spatula. Cups were placed on the light to form microalgae colonies [9, 10]. From the grown microalgae colony, the loops transferred part of the culture back to the liquid medium.

TAXONOMY OF ALGAE

Taxonomy of isolated algae was identified based on their morphological characteristics, particularly: form of cell, diameter and length of cells, the presence or absence of flagella, spare products and pyrenoids [11,12,13].

Determination of lipids from microalgae

Extraction and determination of intracellular lipids of microalga ewere conducted according to the standard protocols in the previous literatures [14,15]. Dry biomass of algae was placed in a glassmortar and sand were added in the ratio 1: 4, i.e. 1 portion of plant biomass and 4 portion glass sand and comminuted until smooth.To the biomasswas addedmethanol containing 10% DMSO (volume fraction) and stirred 1 hour at roomtemperature. Then themixturewas centrifuged awere re-extracted 4 timeswith amixture of hexane and diethyl ether (1:1, volume ratio) for 30 min. Each time themixturewas shakenand then centrifuged for 10min and 3000 g and of the upper organic layer was collected [16].

Isolation and selection of local microalgae

Microalgae - the oldest prokaryotic and eukaryotic photosynthetic organisms, leading a free and symbiotic lifestyle. Spread across the globe, in a wide variety of habitats, they play a huge role in the life of nature and people. Their main habitats are freshwater, brackish and marine ecosystems. Microalgae are found not only in common aquatic ecosystems, such as lakes, rivers, and oceans, but also in extreme environments, such as volcanic and saline waters [17]. Local microalgae have a great advantage in certain conditions, i.e. they are competitive to local geographic, climatic and environmental conditions. Researchers have shown that most local microalgae are well adapted to local adverse conditions (due to the induction of lipid synthesis in microalgae cells.

RESULTS AND DISCUSSION

To assess the activity of algae at the first stage, it is necessary to have algologically pure forms. It should be borne in mind that in the case of obtaining algologically pure culture of algae from more than one cell, the culture is a population in which certain cells may prevail, which may cause a change in the properties of this culture. Therefore, preference should be given to algae strains isolated from a single cell. Based on the above, for obtaining accumulative cultures of microalgae from various water and soil samples, we used the Chu-13 medium.

To obtain cumulative microalgae cultures, the following standard conditions were created:

1. Continuously illuminated by fluorescent white light (200 µmol photons $m^{-2} \cdot s^{-1}$).;
2. With the supply of carbon dioxide by blowing air containing 1% CO^2;
3. Cultures of microalgae were grown under sterile conditions in medium "Chu-13". for 14 days at 25°C;

When water samples were incubated on Chu-13 media for 20-25 days, visually prominent associations of unicellular green algae appeared. From water samples of the different regions of Uzbekistan 12 accumulative cultures of microalgae were obtained, which differed in suspension density, light and crop uniformity.

To optimize the cultivation conditions, single colonies or the threads of different algae strains using sterile micro capillaries, grown colonies in solid medium were transferred into flasks containing 30 ml of liquid nutrient media: "Chu-13" because it does not form a precipitate and has a given pH value, equal to 7.5, close to optimal for the growth of microalgae. Thus, in the case of mass cultivation of microalgae, the intensification of the growth and development process can be achieved by creating high tension of the main factors causing high productivity of photosynthesis and biomass accumulation under autotrophic conditions. These factors primarily include light, carbon dioxide and mineral nutrition.

The next step in the selection of microalgae was the study of the growth dynamics of crops under conditions of intensive culture in the nutrient medium Chu-13. Cultivation was carried out in flasks with a volume of 300 ml with round-the-clock illumination of cultures with luminescent lamps (3500-4500 Lx) with continuous air bubbling. Accounting for the growth rate of the cultures was performed by direct counting the number of cells in a Goryaev camera.   As shown in table 1,   cell numbers of the source culture T№ 3 $(2,1x10^7$ cells/ml) and C№4 $(2,4x10^7$ cells/ml) on the nutritional environment «Чу-13» within 72 hours it reaches a density of about 290 and 340 million cells / ml, respectively, that is, the cells of cultures increases by one power. The titer of cell cultures of microalgae С №8, АС №4, БТ №1, БТ №4, БН №7, БК №18, БК № 25, ВК №2, ВС №15 и ВТ №20 when growing on medium «Чу-13» every day it increases approximately 2 times in relation to the number of initial cultures and on the third day the number of cells reaches from 2.3 x 107 to 5.6 x 107 cells /ml.   On the basis of the obtained data, we can conclude that the local cultures of microalgae ТN№3; С №4, С №8 and AS №4 were the most active cultures for colony formation, biomass accumulation and growth rate among selected local microalgae (Figure.1).

Figure.1 The cultivation of effective local microalgae in the tube in the growing on medium «Чу-13» feeding environment.

Identification of local microalgae

Microalgae are important components of various ecosystems, play a large role in nature as the primary producers of organic matter and molecular oxygen, used as a valuable feed for invertebrate animals and fish, take an active part in the processes of self-purification and water quality formation. Some of them serve as bioindicators of trophic and saprobic properties of crops, are cultivated and used as stimulating additives in feed for farm animals and in human food. Information on the species composition of Chlorococcales algae and their distribution in the world is currently quite limited and incomplete.

In accordance with Figure 2. microscopic examination to identify 12 local single-celled green algae Т № 3, С №4, С №8, АС №4, БТ № 1, БТ № 4, БН № 7, БК № 18, БК № 25, ВК № 2, ВС №15 и ВТ № 20   by their morphological parameters, they were assigned to the following orders a) Phylum: Chlorophyta Class: Trebouxiophyceae Order: Chlorellales Family: Chlorellaceae Genus: *Chlorella*   b) Phylum: Chlorophyta Class: Chlorophyceae Order: Chlorococcales Family: Chlorococcaceae Genus: *Chlorococcum* c) Phylum: Chlorophyta Class: Chlorophyceae Order: Chlorococcales Family: Chlorococcaceae Genus: *Chlorococcum* d) Phylum: Chlorophyta Class: Chlorophyceae Order: Chlamydomonadales Family: Chlamydomonadaceae Genus: *Chlamydomonas*   (e)   Phylum: Chlorophyta Class: Chlorophyceae Order: Sphaeropleales Family: Scenedesmaceae Genus: *Scenedesmus* (f) Phylum: Chlorophyta Class: Chlorophyceae Order: Sphaeropleales Family: Scenedesmaceae Genus: *Scenedesmus* g) Phylum: Chlorophyta Class: Chlorophyceae Order: Sphaeropleales Family: Selenastraceae Genus: *Ankistrodesmus* h) Phylum: Chlorophyta Class: Chlorophyceae Order: Sphaeropleales Family: Selenastraceae Genus: *Ankistrodesmus* q) Phylum: Chlorophyta Class: Chlorophyceae Order: Sphaeropleales Family: Scenedesmaceae Genus: *Coelastrum*   p) Phylum: Chlorophyta Class: Trebouxiophyceae Order: Chlorellales Family: Botryococcaceae

Accumulation of biomass and Oil of Microalgae of Uzbekistan

Microalgae strains were grown under sterile conditions on minimal Chu-13 medium for 14 days at a temperature of 25 °C. Cultured biomass cultures were collected by centrifugation at 3000g for 30 minutes, and the biomass residue was washed 2 times with distilled water. As shown in table 2, the wet biomass of the studied microalgae cultures ranged from 0,679 g to 1,296 dry biomass 0,157 g to 0,302 g/l of medium. The greatest accumulation of biomass and lipids of microalgae belonging to the genus Chlorococcum was established in strains: Chloroprocum macrostigmatum UT4, Chlorococcum macrostigmatum UT8, The dry biomass of effective strains of the genus Chlorococcum ranged from 0.269 to 0.302 g/l. The content of lipids in these microalgae was in the range of 17.5–45.7% of the total dry biomass of cultures. It should be noted that the highest productivity in the synthesis of oils was observed in cultures of Chlorococcum macrostigmatum UT4 and this is confirmed by studies of light microscopy of culture cells, i.e. In the destruction of cells Ch. macrostigmatum UT4 droplets of oils are visible in the form of emulation of heterogeneous systems.

TABLE:2- ACCUMULATION OF BIOMASS AND OIL OF MICROALGAE OF UZBEKISTAN GROWN ON MEDIUM "CH-13" FOR 14 DAYS

№	Microalgae	Wet biomass, g/l	Dry biomass, g/l	Quantity lipid,%
1	*Chlorella* sp. 4	1,104±6	0,235±3	32,0±1,2
2	*Chlorococcum macrostigmatum*UT4	1,268±8	0,302±5	45,5±1,5
3	*Chlorococcum macrostigmatum* UT8	1,129±5	0,269±2	45,7±1

4	*Chlamydomonas reinhardtii* UT5	0,743±4	0,173±3	33,2±1,3
5	*Scenedesmus armatus* UT39	1,032±6	0,240±2	24,5±1,5
6	*Scenedesmus quadricauda* UT4	1,220±7	0,283±6	31,0±1
7	*Ankistrodesmus falcatus* UT20	1,280±5	0,297±4	33,5±1,2
8	*Ankistrodesmus angustus* UT15	1,070±6	0,270±5	29,0±1,5
9	*Coelastrum microporum* UT4	0,975±3	0,226±1	24,0±1,6
10	*Botyococcus* sp.14	0,679±5	0,157±2	25,5±1,3
11	*Pediastrum tetrias* UT1	0,707±2	0,164±6	17,5±1
12	*Stichococcus bacillaris* UT1	0,580±4	0,135±4	44,3±1

Throughout the study, Chlorococcum macrostigmatum were found in Ch. macrostigmatum UT4, Ch. macrostigmatum UT8 strains have been found to have high efficacyy compared to other strains studied. When these strains were examined microscopically, small drops were observed in their cells, and a large number of fat droplets emerge when cell shell cracks were discovered.

CONCLUSION

Thus, from the aggregate of the data obtained, it can be concluded that local microalgae Chlorococcum macrostigmatum UT4, Chlorococcum macrostigmatum UT8, Scenedesmus acutus UT1, Scenedesmus quadricauda UT4 and localized by the accumulation of biomass and lipid synthesis. Chlorella sp. 4, Chlamydomonas reinhardtii UT1, Coelastrum microporum UT1, Ankistrodesmus angustus UT15, Ankistrodesmus falcatus UT20, Botroucoccus sp.14, are highly efficient cultures and serve as an object for biodiesel production.

DANIEL DEFOE'S "ROBINSON CRUSOE" AS THE PROTOTYPE OF THE ENGLISH NOVEL

Hikmatova Nargiza Ravshanovna*

ABSTRACT

Robinson Crusoe's experience is not only the adventure tale it seems at first, but a moral illustration of the virtues of solitude and reliance on one's own powers and resources. In the beginning, Crusoe can only comprehend his isolation as a punishment. Though, by the end of his adventure, when he turns an uninhabited island into a piece of civilized land, he reaches the inner peace of soul and mind. In the broad sense, "Adventures of Robinson Crusoe" marks the beginning of the history of European realistic novels and it was Defoe who pioneered this genre.

KEYWORDS: *Enlightenment, Adventure, Virtues, Realistic Novel.*

INTRODUCTION

At the time of the creation of the novel, Daniel Defoe had already had a great experience: he came from a lower-class family, was a member of the rebellion led by Duke of Monmouth, escaped execution, traveled through Europe and knew six languages, and experienced malevolence and beneficence of Fortune. However, the author of "Robinson Crusoe" is one of the most mysterious literary figures of the period. There are still many dark areas in his biography, to begin with, the date of his birth which is not yet certain. In his early years, Daniel Defoe was a witness of the two greatest calamities of the seventeenth century: a recurrence of the plague and the Great Fire of London in 1666. Such events could have shaped his high interest in catastrophes and survival in his works. Defoe acted as a publicist, political journalist, and pamphleteer for Harley and other politicians. Moreover, he worked as a spy reflecting his own changeable identity as a merchant, poet, journalist, and prisoner. This characteristic of variable personality would later be depicted in the life of Robinson Crusoe, who turns to be a merchant, slave, plantation owner, and even unofficial king.

Main body

The narrator of Robinson Crusoe, by Daniel Defoe, has a conspicuous style of relying on reason. Defoe, being a journalist, makes the work seem realistic not fiction by referring to many details. There are a number of objects and particular actions that impose this feeling on the reader making one think that whatever happens to Crusoe is true. The author creates this impression of absolute reality by three main methods, which are the use of details, the form of biography or the first-person narration, and the nautical language.

Robinson Crusoe, by Daniel Defoe, altered storytelling at the same period when philosophers revolutionized an "individual". The resemblance in both had led to a view of changing the value of society from protecting the common good to a high estimation of personal freedom. The main purpose of Enlightenment was to resolve conflicts by means of reason, thus Robinson Crusoe attempts to settle personal conflicts through experience.

Furthermore, the Enlightenment ideal presented by Crusoe is the right to seek happiness, the idea propagated by many Enlightenment philosophers: "…The highest perfection of intellectual nature lies in a careful and constant pursuit of true and solid happiness; so, the care of ourselves…is the necessary foundation of our liberty"[1]. Crusoe pursues his ideal by leaving his father by becoming a sailor. Later he almost dies during his first voyage and attributes it to God's punishment for disobeying his father, but still returns to the sea. "That evil influence which carried me first away from my father's house which hurried me into the wild and chaotic notion of raising my fortune, and that impressed those conceits so forcibly upon me as to make me deaf to all good advice"[2]. By leaving not only his father but God as well, Crusoe moves in the direction of the individual freedom proposed by several philosophers of the Enlightenment period. The plot of the novel is based on a real story told by Captain Woods Rogers in the report of his journey, which Defoe could read in the press. Thus, part of his narrative follows the story of the Scottish castaway. Alexander Selkirk, who spent four years and five months stranded in the Juan Fernandez Islands[3]. Captain Rogers described how his crew saved a man from that uninhabited island in the Atlantic. Alexander Selkirk, the mate on the English ship, was known for his wild temper, quarrelling with his captain, and was landed on the island with a gun, gunpowder, tobacco stock, and the Bible. When Rogers later found the sailor, the man was wearing a goatskin and "looked on the more savage the original owner of this garment." [4]He had forgotten how to speak and on the way to England hid the biscuits in secret places, so it took some time for him to return to a civilized state. Unlike his prototype, Defoe's Crusoe did not lose his humanity even after twenty-eight years on a desert island and the narrative of Robinson Crusoe is permeated with enthusiasm and optimism.

Through the book, the protagonist of the novel, Robinson, an exemplary English entrepreneur who embodies the ideology of the bourgeois class, grows to a monumental image of the creative and constructive abilities of a man. Robinson, the son of a merchant of York, from his early years, dreams of the sea. On the one hand, there is nothing unusual for a common Englishman of that period as long as England was the leading maritime power in the world; English sailors crossed all the oceans and a sailor was the most common and honorable profession. On the other hand, Robinson is neither attracted by the sea for its romantic nature, nor he is trying to master the skills of seamanship, and in all voyages, he is merely a passenger paying the fare. Robinson pursues a more prosaic reason: a reckless idea to make fortune roaming around the world. In fact,

outside Europe, it was easy to get rich quickly with a bit of luck, and Robinson runs out of his home ignoring the admonitions of his father. According to Franco Moretti who states that "the adventures of Robinson Crusoe, and the modern novel, begin when a son no longer heeds his father's wise counsel" [5]and Moretti unfolds the appearance of the novel in this tension between authority and a "new attitude towards life and history". Although the topics of the journey and paternal disagreement reflect actual issues of all times reappearing in much of the novelistic traditions, many have chosen to ignore these parts of the book. Jean Jacques Rousseau, for instance, in his "Emile, ouL' Education" (1762), in which Robinson Crusoe is stated as the only book worth reading as part of a child's education, "had no patience with Defoe's frame-story (the way Crusoe sought his route to the island and twenty-eight years later, his journey back to England); he was interested only in the episodes on the island". [6]

So this was the central point of the novel, namely an unprecedented experiment that the author puts on his hero. Robinson is a small representative of the bourgeois world, the one not seeing himself out of this system and treating everything around as a means to achieve his goals, the one who traveled through three continents purposefully following his way to great wealth. He is artificially taken out of society and placed in isolation face to face with nature. An experiment on a man was conducted in the "laboratory" conditions of a tropical desert island: the survival of an individual torn from civilization, individually confronted with the eternal problems of existence and interaction with nature was investigated. And Crusoe repeats the evolution of humanity as a whole: he starts to work so that the work becomes the main theme of the novel.

It is fair to say that it was the first time in Enlightenment history when labour was praised to such an extent. Since in the history of mankind labour was perceived as punishment or even evil: according to the Bible the need to work was entrusted to the descendants of Adam and Eve as a punishment for their original sin. However, Daniel Defoe depicts labour as the essence of human life as well as the main means of earning a living. Before Defoe puritan moralists had already claimed the work to be worthy and eminent. When Robinson lands on an island, he is rather unskilled and applies much force on any task, and only after a certain period and through much misfortune he learns to grow seeds, wave baskets, produce his own instruments, clay pots, clothes, umbrella, boat and breed cattle. Furthermore, it should be noted that the most difficult tasks Robinson comes across are those Daniel Defoe himself was well familiar with; as long as Defoe once owned a file producing company, the description of the pottery made by Robinson is described in great detail. However, there is a concession the author makes towards Crusoe: he soon finds means of survival and can feed as well as shelter himself. It should be noted that thorough analysis reveals that Robinson wasn't completely cut off the civilization; first of all, civilization is present in his skills, memory, and attitude towards life. Second, the plot of the novel presupposes favorable conditions for the survivor, every assistance being just on time. On the other hand, these conditions are merely circumscribed to consumer needs, thus, leaving his social demands unsatisfied. It is the loneliness that tortures him most, until the only relief, Friday, appears on the island. However, as it was mentioned above, Robinson embodies bourgeois psychology: it seems perfectly natural for him to appropriate everything and everyone on which no European has legal ownership and he immediately makes Friday his servant. Robinson Crusoe is a new image in the gallery of great individualists, and the absence of extremes makes him different from his Renaissance predecessors. No one would call Crusoe a dreamer like Don Quixote, either an intellectual or a philosopher like Hamlet; his scope of

actions is more practical involving management and commerce, in other words, he is living the life majority of mankind does. His selfishness is natural; it is aimed at a typical bourgeois ideal wealth.

Furthermore, a marked indifference to beauty is actually a significant feature of the novel. Intriguingly,

Crusoe concentrates little on the visual attractiveness of the Caribbean landscape, nor he doeson more abstract forms of beauty, namely beauty of character or experience. Refusing preliminary views that the objective of art is to beautify and make charming what is ordinary, Daniel Defoe shows that novels can be absolute by focusing on the tedious, unattractive facts of everyday life that nevertheless are deeply meaningful to an individual.

CONCLUSION

The 18th century witnessed the development of the contemporary novel as a literary genre, indeed many candidates for the first novel in English come from this period, among which Daniel Defoe's Robinson Crusoe is presumably the best known. Daniel Defoe is considered the founder of the early realistic bourgeois novel. His work, "The Life and Strange Adventures of Robinson Crusoe", arouses strong feelings in people of all ages and times. It is not just a work of fiction, a novel of adventures or biography; it isanexploration of human will and power concerning labour, harsh natural conditions and private property.

ABSTRACT

The article examines one of the most important aspects of modern linguistic teaching - media text as a unit of media discourse. Media discourse and media text are considered as the main objects of media linguistics and science that became the most popular in the twentieth century and studying the language of mass communication. At the same time, the media text is considered as a unit of media discourse, any text as a product of discourse, and special emphasis is placed on the main differences and similarities of these four concepts. Constantly increasing influence media on society increased interest scientists to the language of the media, which led to the appearance of numerous works, dedicated to this phenomenon.

KEYWORDS: *Text Linguistics, Linguistic Factor, Context, Media Text, Discourse, Communication, Information, Mass Communication Language.*

INTRODUCTION

In a dynamically developing world, in a dynamically developing world, information flows inevitably affect a person and undoubtedly, most of the facts and knowledge that we receive about the world are transmitted to us through the media, because it is the media that participate in the construction of an individual's special picture of the world and even are "an instrument of power and an instrument of information impact."

The purpose of research is to identify the features of the functioning of the media text at this stage in the development of the concept of mediadiscourse.

One of the key provisions of media linguistics is the relationship between the concepts of media text and mediadiscourse, which are relevant to this day. Before defining such key concepts of media linguistics, it is necessary to analyze the linguistic concepts of text and discourse, which are basic in this issue.

Discourse is a multidimensional phenomenon that does not have a common definition to the present day and which could cover all the features and spheres of its application, since this term is used in many areas of scientific knowledge (in linguistics, sociology, etc.), which implies the analysis of discourse completely from different sides. It is believed that the concept of discourse was introduced by Y. Habermas in 1952 "to designate a type of speech communication that involves a rational critical examination of values, norms, rules of social life"[8, c. 111]. Simultaneously with Habermas, the scientist Emile Benveniste put forward his theory in relation to the concept of discourse, who defined discourse as "speech attributed to the speaker." [1, c. 63].

Speaking about the concept of a text, it should be borne in mind that the text did not immediately begin to be considered as the main linguistic unit. At first the sentence was the subject of multifaceted grammatical analysis. Only in 1972, T. van Dijk in his work "Some aspects of the grammar of the text" proposed to consider the text as the main unit of linguistic analysis.

Among the numerous definitions, the definition of the text by I.R. Halperin, who believes that "a text is a work of a speech-making process that has completeness, a work objectified in the form of a written document, consisting of a name (title) and a number of special units (supraphrasal units), united by different types of lexical, grammatical, logical, stylistic connections, which has a certain purposefulness and grammatical attitude [2, c. 18].

The main findings and results

In relation to mediadiscourse, mass mediatexts act as convenient discrete units that make it possible to divide information flows into separate fragments that can be scientifically analyzed. Being a discrete unit of mediadiscourse, mediatexts allow to streamline and structure the rapid movement of information in a globalized society. As for the concept of mediadiscourse, it is a derivative of the general concept of discourse that has been popular in recent years. When defining discourse in modern domestic and foreign science, both the traditions of various national scientific schools (discourse analysis in Western Europe and text linguistics in Russia) and the actively developing processes of integrating humanitarian knowledge are of great importance. Representatives of the Western European and American linguistic traditions (Theun van Dyck, Z. Harris) consider discourse as a connected speech in oral and written form, in which the factor of interaction between the sender and the recipient of the message is clearly manifested.

Thus, defining discourse as a complex communicative phenomenon, which includes the entire set of extra linguistic factors accompanying the communication process, such as: a social context that gives an idea of the participants in communication and their characteristics; peculiarities of production, distribution and perception of information and cultural and ideological background [6, c. 11].

The renowned Dutch researcher Theun van Dijk places great emphasis on a broader understanding of the contextual perspective of discourse, especially when studying media texts [3]. In the German-Austrian school of discourse analysis (W. Maas, Z. Jaeger, J. Link, J. Habermas, R. Wodak), which developed on the basis of the discourse concept of the French historian and sociologist M. Foucault, discourse is considered as a linguistic expression of a certain social practice, the orderly and systematized in a special way the use of the language, behind which there is an ideologically and historically conditioned mentality.

In this regard, the range of issues that make up the subject of discursive research is traditionally associated with the problems of speech activity and the study of the interdependence of linguistic and extra linguistic factors on various functional-style and textual material. Discourse-forming characteristics, in other words, criteria for the selection of texts taken as an empirical basis for studying a discourse of one type or another, are various spheres of human communication and speech practice. For example, the functioning of the language in such spheres of activity as science, education, politics, medicine, mass media, etc. serve as the basis for highlighting the relevant discourses, including the mediadiscourse considered in this article.

In its most general form, mediadiscourse is a set of processes and products of speech activity in the field of mass communication in all the richness and complexity of their interaction. When studying functionally conditioned discourses in general and mediadiscourse in particular, it is necessary to take into account that the concept of discourse is traditionally delimited from the concept of "text". This is due to the fact that discourse is primarily associated with oral speech, it is defined as "speech immersed in life," while the concept of a text presupposes a connection with written speech. That is why a complete understanding of the concept of mediadiscourse is impossible without comparison with such important categories as text and media text. Most clearly, the similarities and differences between the concepts of text, media text and mediadiscourse can be demonstrated using the communication model, which is key for the study of communication processes, the meaning of which is that it allows you to present the complex and multifaceted process of human communication in a structured form.

The gradual comprehension of the accumulated experience led to the fact that by the end of the twentieth century, a kind of "universal version" of the communication model was formed, taking into account all the basic components of communication, such as the sender of a message, its receiver, channel, feedback, the message itself, the processes of its encoding and decoding, and finally, the communication situation or context. By defining text, media text and mediadiscourse based on this model, we can say that text is a message, media text is a message plus a channel, and mediadiscourse is a message in conjunction with all other communication components [4, c. 54].It is impossible not to agree with this statement. As we found out, media discourse is a flow of information that is literally introduced into society, and media texts are separate units of media discourse that form a kind of structured education from media discourse, freeing it from chaos. Media discourse is something more voluminous than media text.

In our research we adhere to the definition of T.G. Dobrosklonskaya, who came to the conclusion that mediadiscourse is a set of processes and products of speech activity in the field of mass communication in all the richness and complexity of their interaction. The main characteristics of mediadiscourse include distance, the presence of an individually-collective subject, the presence of an unknown, collectively undetermined dispersed addressee.

Let us dwell on this position in more detail. If, within the framework of traditional linguistics, a text is defined as "a sequence of sign units united by a semantic connection, the main properties of which are coherence and integrity" (and it is understood that these units are of a verbal nature, in other words, the text is, first of all, a sequence of words), then when transferred to the sphere of mass media, the concept of text significantly expands its boundaries. Here, the concept of a media text goes beyond the verbal level of the sign system, representing a sequence of signs of various semiotic systems - linguistic, graphic, sound, visual, the specificity of the combination of which is due to a specific media channel. In the media, the technological characteristics of each particular distribution channel, be it print, radio, television or the Internet, have a huge impact on the form and content of the message [5, c. 6; 7, c. 160].

CONCLUSION

From all of the above, we can conclude that the media text is a dynamic complex unit of a higher order, the structure of which includes units not only of the verbal level (media text can include a graphic image, video sequence, audio material, etc.) and which subsequently affects the formation of a person's picture of the world, being presented in various media "manifestations" (print press, the Internet, etc.) and various media genres: interviews, advertising text, etc. Thus, the concept of mediadiscourse makes it possible to compile an even more voluminous idea of speech activity in the field of mass media, since it covers not only the message plus the channel, but also all the numerous extralinguistic factors associated with the peculiarities of creating a media message, its recipient, feedback, culture-based methods of encoding and decoding, as well as the socio-historical and political-ideological context. We can say that text is a photographic representation of reality, media text is a video image or "moving image", and mediadiscourse is a holographic image that gives a complete and comprehensive view of an object.

Media text, however, can be analyzed outside of these factors, keeping in mind only those features that can be extracted directly from the text. In addition, the concept of media text goes beyond the language level. The media text can combine the signs of different semiotic systems, that is, its language can be partially determined by the transmission channel of this message. Therefore, not only the language itself is directly important for the media text, but also the transmission channel. It is the media text that can be considered a special form of life of media discourse, since only the totality of media texts helps to present media discourse as a coherent system within the mass media space.

Therefore, we can conclude that text, discourse, media text, media discourse are closely interconnected, have a number of similar features, as a result of which they cannot be opposed, but they can be compared in many parameters as related concepts.

SAY NO TO CHILD MARRIAGE: A SITUATIONAL ANALYSIS IN KANDHAMAL DISTRICT

Mr. Junas Sabar*

*PhD in Women's Studies,
District Child Protection Unit DCPU,
Kandhamal District, Odisha, INDIA
Email id. junas143@gmail.com

ABSTRACT

This paper has discussed about child marriage related issues in Kandhamal District. The paper has discussed a theoretically, practically and by field study in this areas. We discussed about the Child Marriage not only Kandhamal district but also other district of Odisha. Marriage is un universal for us. Marriage is legally but child marriage is injustice, illegal or not legally. Child Marriage is one of social stigma from the rural areas, basically we found like tribal areas. They have more practiced to get married under the age of 18 years means below 18 years. Not only girls but also boys are engaged on this practice with concern of their family support to them. Basically we found in tribal areas like Kandhamal, Koraput, Malkangiri, Mayurbhan, Keonjhar, Dhenkanal and Gajapai District etc. The study used both secondary sources and primary data in order to establish attitudes and beliefs regarding child marriage with in communities, as well as attitudes and practices of key institutional actors such as police, government departments, community workers and Panchayat members.

KEYWORD: *Child Marriage, Child Abuse, Child Trafficking, Drop Out and Poverty.*

INTRODUCTION

Kandhamal district experiences sub tropical hot and dry climate in summer. Dry and cold climate in winter. The maximum temperature recorded in the District is 45.5 degree C and minimum temperature is 2.0 degree C. The average annual rainfall recorded is 1522.95 mm. The Kandhamal district covering a geographical area of 7654 sq kms is bounded by Boudh district in the North, by Rayagada district in the South, by Ganjam and Nayagarh districts in the East and Kalahandi District in the west. The district covering a natural beauty with natural jungle,

mountain and waterfall picnic spot. We found bestowed with the beauty of nature. It has wild life, scenic beauty, healthy climate, and serpentine ghat roads for the tourists. It has attractions, like panoramic coffee gardens, pine jungles, Ghat roads, hills and waterfalls, virgin forest and typical tribal village life. We found highly indigenous people in Kandhamal district. People are practices their on traditional wisdom, traditional custom and traditional culture, practiced own indigenous technology for their agriculture.[1]

Child Marriage: Child Marriage is a marriage or similar union, formal or informal, entered into by a child or youth under a certain age, typically age eighteen. Child marriage violates the rights of children and has widespread and long term consequences for child brides and grooms. It affects both boys and girls, but it is more common among girls. The legally prescribed marriageable age in some jurisdictions is below 18 years, especially in the case of girls. Even where the age is set at 18 years, cultural traditions may take priority over legislative law and many jurisdictions permit earlier marriage with parental consent or in special circumstances, such as teenage pregnancy.[2] Child marriage is related to child betrothal and it includes civil cohabitation and court approved early marriages after teenage pregnancy. In many cases, only one marriage-partner is a child, usually the female.

Child Marriage in India: Child marriage in India has been practiced for centuries, with children married off before their physical and mental maturity. The problem of child marriage in India remains rooted in a complex matrix of religious traditions, social practices, economic factors and deeply rooted prejudices. Regardless of its roots, child marriage constitutes a gross violation of human rights, leaving physical, psychological and emotional scars for life. Sexual activity starts soon after marriage, and pregnancy and childbirth at an early age can lead to maternal as well as infant mortality.

Cause of Child Marriage: As per field study the main cause of under the following list Dowry and Bride price, persecution, forced migration and slavery, social pressure of protection, poverty or lack of sustain, Religion, Culture etc. Causes of child marriages include poverty, bride price, dowry, cultural traditions, laws that allow child marriages, religious and social pressures, regional customs, fear of remaining unmarried, illiteracy and perceived inability of women to work for money. Child Marriage is defined as a marriage of a girl or boy before the age of 18 and refers to both formal marriages and informal unions in which children under the age of 18 live with a partner as if married. Child marriage is rooted in gender inequality and the belief that girls and women are somehow inferior to boys or men. Child marriage is a complex issue like poverty, lack of education, insecurity, lack of awareness, social practice and culture practices. Child marriage is a social stigma.

Gender Inequality: On the way of social stigma and social mindset, in many communities where child marriage is practiced girls are not valued as much as boys; they are seen as a burden on their family. Marrying your daughter at your age can be viewed as a way to ease economic hardship by transferring this burden to her husband's family. Child marriage is also driven by patriarchal values and desire to control female sexuality, for instance, how a girls behave, how she should dress, who she should be allowed to see and to marry. It is basically social mind set or social stigma.

Tradition Practice: Child marriage is a traditional practices that in many place simply because it has happened for generations. In some communities, when girls start to menstruate, they

become women in the eyes of the community. Marriage is therefore the next step towards giving a girl her status as a wife and mother. Harmful traditional practice can be linked to each other. In southern Ethiopia for instance, child marriage usually follows the practice of female genetic mutilation or cutting, which is considered a rite of passage to womanhood. Traditional practices often go unquestioned because they have been part of a community's life and identity for a very long time. According to Nelson Mandela tradition are made by people and people can unmake them.[3]

Poverty: More than half of girls from the poorest families in the developing world are married as children[4]. Where poverty is acute, families and sometimes girls themselves believe that marriage will be a solution to secure their future. Giving a daughter in marriage allows parents to reduce family expenses by ensuring they have one less person to feed, clothe and educate. Families may also see investing in their son's education as more worthwhile investment. Income cases marriage of a daughter is a way to repay debts manage disputes or settle social, economic and political alliance.

Insecurity: Many parents marry their daughter young because they feel it is in her best interest, often to ensure her safety in areas where girls are at high risk of harassment and physical or sexual assault. Child marriage can increase in humanitarian crises, such as in conflict or after a natural disaster. When families face even greater hardship, they may see child marriage as a coping mechanism in the face of poverty and violence. Nine out of the ten countries with highest child marriage rates are considered fragile states.[5]

The study used both secondary sources and primary data in order to establish attitudes and beliefs regarding child marriage with in communities, as well as attitudes and practices of key institutional actors such as police, government departments, community workers and Panchayat members. Field visits and discussions revealed a multitude of factors that help sustain and even endorse the custom of child marriage, despite legal barriers. First, social groups follow traditions from previous eras without questioning contemporary relevance. Early marriage allows parents to waiver 'responsibility' of settling their children. Secondly, economically weak and large families encourage the practice as it helps send off girl children early, while marriage of a boy brings an additional hand to assist in household and economic activities. Third, members of communities practicing child marriage tend to have little to no formal education. Belief in religious scriptures and the idea that these contain prescription for early marriage drive families to fulfill this "obligation." Fourth, early marriage ensures full "utilization" of fertility and childbearing capacity. Last but not least, strong caste ties limit the availability of suitable marital partners.

Inclusion: my suggestion and conclusion, we should be increasing some awareness programme to the community. Now a day the govt. of Odisha under the DCPU, ICDS and some NGOs those are working under the child related issues like Child Marriage, Child Trafficking, Child Labour. The stakeholder have given some awareness programme, campaign against Child Marriage, Child Trafficking in the community level and also some School awareness programme in the district**.** We need increase awareness generation as well as all stakeholders should be sensitized and convinced about the negative impacts of child marriage. Comprehensive sex educations can help to prevent child marriage. Gender sensitization programs: Gender training programs should be spread throughout the district for police and NGOs. Primary and secondary education for girls

should be promoted. Checking loopholes in the law: Shortcomings must be corrected to strengthen the law. Training: Child Marriage Prevention Officers need to be trained for vigilance. Special police cells: Task forces must be set up to focus on cases of child marriage. Increased authority for NGOs: NGOs should be given the authority to report and intervene in cases of child marriage.

ABSTRACT

In the article, the authors conducted a thorough analysis of the emergence and formation of the Uzbek language as a historical phenomenon, starting from cave paintings, clay tiles, manuscripts and old-printed books. The data on the worthy contribution of the great scholars, thinkers and rulers of Central Asia to the development of the Turkish-language writing are presented. The scientific works of modern linguistic researchers on the place of the Uzbek language in the world are reviewed and analyzed.

KEYWORDS: *Emergence, Phenomenon*

INTRODUCTION

Uzbekistan is one of the ancient centers of culture. The state, famous for such monumental cities as Tashkent, Samarkand, Bukhara, Khorezm, Khiva, unique architectural structures (mausoleums, palaces, minarets, mosques , libraries) and, of course, a multinational country with a bright and rich history . The original and unique culture, which has been formed over many centuries, is saturated with a special color, peculiar only to such a state, which is located at the intersection of the Great Silk Road, and which has absorbed all the best from other cultures - Persian, Greek, Chinese, Indian, Arab, Russian ...

"The ancient peoples of Uzbekistan have created a distinctive civilization. Their achievements in agriculture and irrigation, construction, handicraft industry, military science, literature, hard science and art can compete with the most cultural achievements of ancient peoples. Perceiving and creatively absorbing the best that could be taken from the civilizations of neighboring countries - India, China, Mesopotamia, Iraq, Scythia, the peoples of ancient Uzbekistan, in turn,

had a powerful influence on the cultural development of the surrounding nations. China from Central Asia received the culture of grapes, alfalfa and a number of other plants,the breed of military horses bred by ancient people of Fergana, the art of manufacturing glass and, finally, the Buddhist religion.S. P. Tolstov. [1]

Reader culture and writing, along with Uzbek literature, began with ancient folklore - oral folklore. Tales of the heroes Alpamysh, Rustam, Chirac, who once defended their homeland from treacherous and cruel invaders; myths and legends about a wonderful life, about magical patron birds and protectors of the weak and oppressed - Humo and Semurg, epics, gazelles, legends, song-muhnazhata, funny and instructive jokes-askiya, wise sayings-macola and proverbs, before the first paper, passed by the people from mouth to mouth, from heart to heart.

The writing of the peoples of Central Asia, and in particular the ancient Turan-Uzbekistan, which included: Sogd, Bactria, Khorezm, Chach, Fergana in the first centuries BC, lagged far behind the applied cultures that had already developed at that time: agriculture, handicraft production, construction, painting and music. But the level of the spiritual culture of the state, its civilization was nevertheless determined by the presence of literacy, a developed reading culture, and writing.

"Written culture is a determining factor in the level of development of civilizations and states. The significance of the culture of one or another people was largely determined by the presence of writing as one of the most outstanding achievements of civilizations. At the same time, the most important function of writing is the ability to store in the memory of new generations of people the achievements and deeds of their ancestors "- confirms our idea, the doctor of historical sciences, professor, historian, archaeologist, orientalist E. Rtveladze [2 , 136] .

The transition from substantive writing (ostracons, clay tiles with cuneiform text, ceramic shards, wooden planks, leather scrolls, code books) to picturesque (pictographic, ideographic), further, from verbal-syllable to the syllabic and separately alphabetic was so slow that its development took centuries. "Central Asia did not enter the zone of initial foci of the emergence of writing, on its territory, until it is possible to trace the early stages of the development of writing ...", continues Professor E. Rtveladze in his monograph "Civilizations, States, and Culture of Central Asia" . [2 , 163].

Another important feature of Central Asia, including ancient Uzbekistan from the time of " anno domini " confirming the speedy appearance of its writing, according to scientists E. Rtveladze and V. Livshits , was "... Ethnic heterogeneity of the urban population, trade and cultural ties that coexisted "at the same time and in the same areas of several religions, penetrating from different countries and bringing with them various scripts." [3]

Yes, indeed, as mentioned above, ancient Turan (Mawarannahr-Turkestan-Uzbekistan) included such large historical areas as Bactria , Sogd, Chach, Fergana, Khorezm, which in turn, after a while, turned into large cities and independent states with their own writing system. Due to the lack of strict state and political control over the multinational population living in the territory of ancient Uzbekistan and strict claims to external and internal migration, people with different religions and religions - Christians, Jews, Buddhists, Hindus, followers of Zoroastrianism, etc. could peacefully coexist here.

But in the seventh - eighth centuries, the invading Arab conquerors for many centuries put an end to the diversity of writing throughout Central Asia. And for a whole millennium, up to the twentieth century, the main, but still not the only, system of writing was the Arabic script, spread throughout Central Asia along with the Islamic religion, with its new alphabet.

"The historical destinies of the Uzbek people in the field of writing evolved in a very peculiar way: not a single nation has been subjected to so much violence so often than the Uzbek people. The Arabs-conquerors, starting from the seventh century, forcibly imposed their written language on the people instead of the pre-Islamic writing. Then, in 1929, Latin was administratively introduced. In 1940, the totalitarian system introduced Russian writing based on the Cyrillic alphabet", - K. Khanazarov writes in his monograph. [4]

In this way, the place of "Aramaic , Khorezmian, Parthian, Baktrian, Soghdian, Middle Persian, Manichean, Greek, Greco-Baktrian, ancient Turkish, Turkish Uygur, Syro –turkic, Kharoshthi, Brahmi, Issyk , Ephtalite" [5] writing systems came the new script is arabographic.

And as M. Iskhakov writes: "For the peoples of Central Asia with thousands of years of written culture, the transition to Arabic writing was not particularly difficult. This, in particular, was facilitated by the commonality of the principles of spelling of Arabic and ancient scripts based on Aramaic with a change in only the graphic appearance of the letter. " [6]

The new Arabic script imposed by the conquerors did not greatly affect the development of Central Asian book culture. The emergence of a new written language could not influence and even more so suppress the feeling of love and devotion of the Uzbek people to their homeland: freedom-loving poets, bakhshi, albeit still in a foreign language, but still continued to glorify their homeland and freedom, artists in their paintings describe beauty and originality boundless native lands, musicians chant her ... Life went on. This is how writing and reading culture developed, inevitably going through its historical stages of writing . Written and book culture was an inseparable and indispensable part of the history of Uzbekistan itself.

E. Akhundjanov divided the development of book business (handwritten and printed) in the history of Uzbekistan into five main historical periods:

1.   The period of the ancient and early Middle Ages. (V century BC - VII century AD);
2.   The period of the Middle Ages (mid- VIII century – mid- XIX century);
3.   The period of colonial Turkestan (1867 - 1917);
4.   The period of Soviet power in Uzbekistan (1917 - 1991);
5.   The period of sovereign Uzbekistan (after 1991); [5 . 48].

In each of these stages, which lasted quite a long time, commensurate with the natural and social conditions   -   the   absence   of   long   wars, raids   of nomads, epidemics, famine, devastation, internal unrest and strife ,   in   short,   under favorable economic conditions - writing also developed. Especially great damage to the culture of Uzbekistan and Central Asia as a whole was caused by ruthless, conscious and total destruction of the invaders-conquerors of educational architectural structures, rare handwritten copies of literature, libraries and other valuable intellectual culture archetypes created by people for many years. There was very little left for the next generation. But the hardworking and relentless people rose from the ruins: books (manuscripts), libraries, bookstores, maktaba, theological educational institutions reappeared.

It should be especially noted that science, art, Turkic-language literature, books, and the entire educational culture reached a high peak during the reign of Amir Temur and Timurids. Since there was no printed book, a manuscript book played a large role in the development of the spiritual life of Turkestan. As E. Akhundzhanov writes: "... a book is a way of social communication, a **manuscript is an elitist form of this communication, a** printed book is a form of national communication . " [5, 74] .

A manuscript book among all the peoples of Central Asia has so far been the only source of spiritual connection and intellectual continuity of generations. Manuscript books were prepared from Samarkand paper and parchment. For the first time in Central Asia, good quality paper, suitable for creating manuscripts ,   started to do in Samarkand in the VII century. The appearance of such a convenient and high - quality material has become one of the most important prerequisites for the development of book culture, art and science of Khorasan and Mawarannahr. The book business included: calligraphy, binding, decoration , carving , selection of the right paper, ink, and paints. Sometimes, in order for the manuscript book to be fragrant, flavored ambergris and fragrant pink water were added to the ink liquid . Each such book required a lot of work and time. It was truly subtle, almost jewelry work. The masters of book business should have had great endurance, delicate taste, wide horizons and calligrapher talent. A well-made book was very expensive and was only a few copies, so it was ordered by rulers and fairly wealthy people. Due to these families, the rulers who reliably guarded their expensive and rare books, a certain number of these books have survived and have survived to our times and are now kept in large state museums and central bibliographies of modern Uzbekistan.

The reign of the Temurids, as mentioned above, was about the heyday not only of all science and art, but also fiction, the founder of which was Alisher Navoi (1441-1501). Turkic literature began to develop rapidly - poetry, prose, scientific founder of the works were already written in Turkic language and Turkic dialects. Many well-known works written in Arabic and Farsi were translated into Turkic languages, and literary studies began to develop criticism.

Glorified among the Turkic people and famous for their immortal religious, artistic and scientific works - the legendary Sufi and mystic Ahmad Yasawi, Mavlono Abdujabbar Khorezmi, Khoja Afzal, poet Ahmad Yugnaki, Sufi sheikh Suleiman Bakirgani, many other poet and writer Rabzavis, Hugiiz, Lugavi, poets and thinkers - they wrote their works in the Turkic language. So gradually the rudiments of the Turkic language and writing began to appear in the literary arena of world art, which in the course of natural development will fully turn into a modern, melodic and beautiful Uzbek language.

127 years ago, on November 25, 1893, the Danish linguist, polyglot **Wilhelm Thomsen** discovered the key to ancient Turkic writing, thereby making a unique discovery in the world of science. Since then, a new chapter has begun in the history of Turkology. This, in turn, allowed foreign Turkologists to translate Turkic written monuments. Over time, in the twentieth century, scientists from the Turkic countries joined them - Uzbek, Kazakh, Azerbaijani, Turkish and other researchers.

Since then, November 25, 1893 is the International Day for the Revival of Ancient Turkic Writing .

SCIENTIFIC-METHODOLOGICAL ASPECTS OF UNINTERRUPTED IN-SERVICE TRAINING BASED ON THE PRINCIPLE "LIFELONG LEARNING"

Pulotov Abdurayim Murotovich*

*Candidate of Pedagogical Sciences,
Deputy Director In Educational and Science,
Navai Regional Center of In-Service Training Of The Cadres Of Public Education,
UZBEKISTAN

ABSTRACT

In the following article the basics of the scientific-methodological principles of in-service training of the cadres of public education relying on the "lifelong learning" are revealed. The modern cycles of Computer-Based Management Process is substantiated. New approaches are presented taking into consideration of the modern available data.

KEYWORDS: *In-Service Training, Sequence Of Knowledge, Computer-Based Management Process, "Lifelong Learning"*

INTRODUCTION

In the 21st century, the organization of a system of continuous professional development on the principle of *"Lifelong learning"* became inextricably linked with information technology. In other words, in a continuous system of professional development, every action of a cognitive recipient consists in the acquisition and transfer of information or its more effective use, its independent study, mastering, storage and enrichment in memory.

The introduction of information technologies into the organization of continuous professional development system on the basis of the principle of "lifelong learning" is increasing attention to the effective organization of the training process in educational institutions and the factual assessment of the level of knowledge of listeners and retraining of teachers and their professional development.

The implementation of modern pedagogical and information technologies into the process of continuous professional development, improvement of forms and methods of teaching subjects,

improvement of their quality and effectiveness in accordance with its content and control of their assimilation by the audience also necessitates the organization of evaluation processes with the help of computer technology.

Due to these needs, the organization and management of the educational process on the basis of a continuous system of professional development, the use of pedagogical prognostic methods in determining the knowledge of the audience, factors affecting the process of mastering the knowledge of the audience and the use of computer technology in their control are studied on the basis of state requirements.

Continuous training on the principle of "lifelong learning" is a new form of education that differs from traditional or distance learning forms. It not only reflects on itself the form of distance learning, but also demonstrates the interaction of listeners.

The organization of the management of the system of continuous professional development on the principle of "Lifelong learning" consists of the following three stages (Figure 1):

The first phase. Organization of the management process in solving the problem, setting the requirements for it, determining the conditions of the problem, choosing the methods for solving the problem.

The second phase. To attract highly qualified pedagogical and structural-programmer specialists in the organization of management of continuous in-training system and collecting, processing the necessary information and determining the parameters of the problem and modelling it by computer on the basis of determining the functional link between them.

The third phase. Apply the created model to the process of qualification and establish a computerized management process. The methods of managing the process of improving the skills of the model. Here, the plans are drawn up, the use of existing methods of improving the skills of the process and the development of Computer-Based Management Process of education are developed.

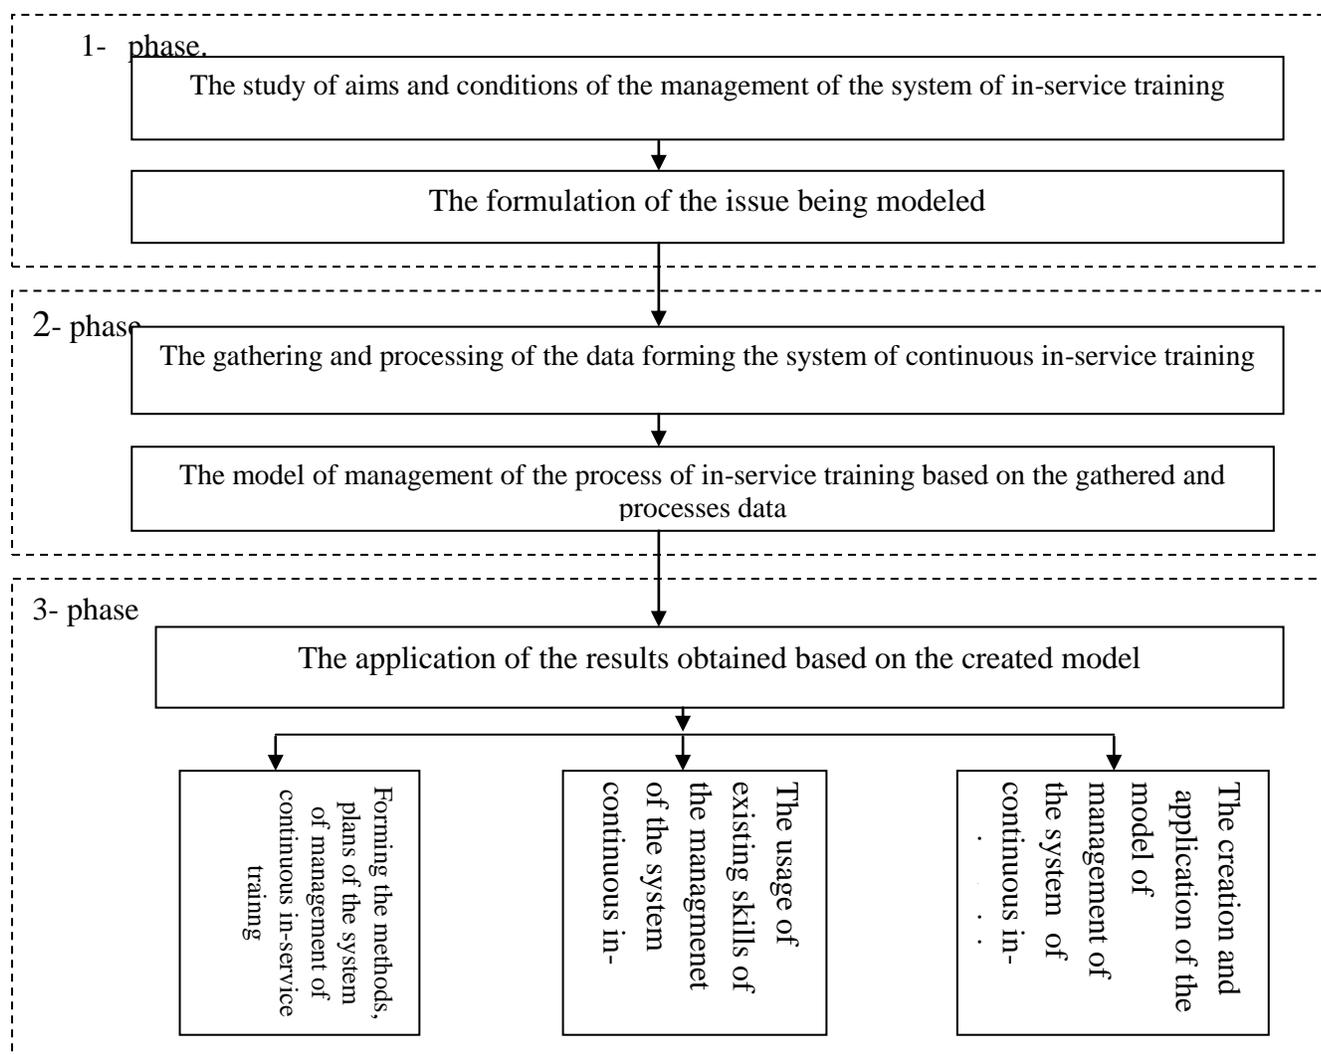
The main purpose of continuous professional development on the principle of "lifelong learning" is to provide the participants with the necessary educational materials in optimal planning of his activity, to clearly establish the purpose and function of the educational process, to establish an active connection between the system of continuous professional development and the listener, to establish communication between the listener and informer.

In accordance with the analyzed scientific and methodological literature and the scientific research work carried out, we set the following main objectives in the organization of Computer Management System of continuous professional development on the basis of the principle of "Lifelong Learning" [1]:

- improve the knowledge, skills and talents of listeners in the specialty;
- teaching and assessing the knowledge of listeners on separate fields of specialty science;
- preparation of listeners for attestation in separate subjects;
- in-depth training of knowledge on the subject of specialization;
- The maintenance of the continuity of the knowledge on the skills, knowledge and qualification of listeners.

- The tasks of the system of continuous professional development on the principle of "lifelong learning" are as follows:
- create the opportunity for the listener to independently master new knowledge;
- provide convenient methods and means of searching for the necessary information from the internet;
- establishment of effective use of addresses of information sources of educational and scientific literature, normative documents;
- Formulate a systematic and creative approach to working with e-learning literature and data bank, carrying out assignments.

Figure 1.

The structure of organization of the system of in-service training based on the principle of "lifelong learning"


fan(mutaxassislik)ning hususiyatlarini, shuningdek, tinglovchining

In the organization of a continuous system of professional development, the following forms are used, taking into account the peculiarities of a particular science(specialty), as well as the degree and ability of the listener to master:

- independent development of theoretical topics using educational literature, electronic textbooks and internet system;
- preparation of information (synopsis, course work, recommendation and other methodical materials) on a given topic;
- preparation for seminars, training and practical classes;
- preparation of qualification and final essays;
- apply theoretical knowledge in practice;
- find solutions to existing problems in practice; make-up, model and sample making;
- preparation of scientific articles;
- Preparation of lecture texts and abstracts for scientific conferences.

Due to the peculiarities of the subject under study, other forms can also be used in the organization of a continuous system of professional development and in-service training.

The proposed management in the organization of a continuous qualification system is based on the process of imitational modeling, which includes the following stages:

1. Determination of the areas of change of parameters - what parameters are used in the system, their units of measurement and areas of change are determined.

2. Drawing up a model of problem is a real reality at this stage, that is, a logical scheme of the course of the educational process is drawn up, it is characterized by physical and mathematical regularities. From building a model, it is necessary to determine the purpose and its mathematical expression. It is impossible to fully model any reality in nature. Therefore, the model is made up with some deviations and limitations.

3. Preparation of data is carried out due to the accumulation of the necessary information in the process of Model construction and adaptation to the process of their application.

4. Drawing up a plan for the organization of continuous professional development - at this stage, the methods of data collection, which are necessary for the organization of professional development and which will help it, will be developed.

5. Determination of the method of organizing continuous in- service training on the basis of experience, the methods and methods of studying each module are determined.

6. Imitation process-at this stage, the data that provide a solution to the problem are determined.

7. Results of analysis - data determined on the basis of continuous improvement of qualifications are compared theoretically with practice.

8. Application in practice-at this stage, if the data identified in the imitation process is close to the real reality, this model is used to solve the issues of continuous improvement of qualifications.

9. Insufficient results - it is made sure that the results obtained on the basis of the created model are close to the actual result.

Based on the results of the applied research work, the following conclusions can be drawn:

- continuous in-service training provides the opportunity to solve several problems at the same time;
- develop the skills of independent thinking;
- creates the opportunity for listeners to interact;
- the listener is created an opportunity to freely operate the nervous system.
- In view of the abovementioned opinions, the following tasks should be solved on the basis of directing pedagogical studies to the system of in-service professional development on the basis of the principle of "lifelong learning.
- to develop the essence and problems of education and training in secondary schools on the basis of a multi-disciplinary approach;
- to update and enrich the technologies of the system of continuous improvement of qualifications on the basis of the principle of "lifelong study" based on the analysis of developed system technologies;
- adaptation of continuous professional development of the listener to the laws of the national educational system on the basis of modern pedagogical technology.

CONCLUSION

In conclusion, the purpose of creating a system of continuous improvement of qualifications on the basis of the principle of "lifelong learning" is to establish a system of continuous improvement of qualifications for interrelated educational institutions (pre - school education and training, general secondary and secondary Special Education, professional Education, Higher Education, Post-higher education, retraining and professional development, institutions of extracurricular education).

ABSTRACT

The purpose of this article is to study the various possibilities of modern combat surgical trauma. Combat surgical pathology includes gunshot and non-gunshot injuries, various types of weapons of mass destruction, which determine the definition of combat surgical trauma. The article deals with the treatment of surgical diseases in a military environment, taking into account their tactical characteristics. In this work, the structure of sanitary losses of a surgical profile is studied, the components of which are wounded, also injured and patients with combat surgical pathology.

KEYWORDS: *Modern Combat Trauma, Injury, Armed Conflicts, Sanitary Losses.*

INTRODUCTION

After the end of World War II, firearms and various explosive ordnance evolved significantly. As a result, the volume and severity of tissue destruction increased sharply, and the frequency of multiple and concomitant injuries increased significantly. The consequence of modern combat surgical trauma is the emergence of a traumatic disease, which is characterized by a complex, severe course in combination with a high percentage of deaths and the subsequent frequent development of disability. However, modern achievements in the field of medicine, physics and biology now make it possible to consider various biochemical processes not only at the cellular,

tissue, organ levels, but in the aggregate in the entire body of a patient who has received a modern combat trauma.

During the Great Patriotic War, bullet and fragmentation wounds were predominant. At present, in addition to these types of weapons, many leading countries are armed with modern dangerous nuclear, chemical, and biological weapons. The use of these types of weapons will inevitably entail a change in the structure of combat damage. An example is the use of atomic bombs by the United States in the war with Japan. The percentage of burns with the use of modern weapons has increased from 65 to 75%, and the percentage of combined radiation damage has increased by approximately 15-25%.

Improvement of firearms led to the emergence of small-caliber bullets with a fairly high initial flight speed. Also of great importance was the creation of new types of anti-personnel and anti-tank mines, including remote mining and ammunition systems, which are based on the thermo baric type of action; at present, various types of laser weapons are actively being developed, affecting mainly the visual apparatus. Microwave weapons are also a priority in development. Along with means of attack, various personal protective equipment is being actively studied and developed: multilayer metal-plastic helmets; body armor, etc.

These discoveries and developments have led to the fact that in modern local wars and armed conflicts - in Korea, Vietnam, the Middle East, Afghanistan, Chechnya, there has been a significant change in the structure of combat pathology determined by the weapons used. In terms of the number of gunshot wounds, they still retain the palm, but the proportion of bullet wounds has increased significantly. In the American troops in Vietnam, among the Russian military in Afghanistan, a significant part of the sanitary losses (up to 30%) were mine and explosive wounds. On the other hand, in the troops of North Korea and Vietnam - due to the widespread use of napalm in the US army - the proportion of those burned reached 35-40%.

In terms of localization in the structure of sanitary losses, as a rule, injuries and wounds in the limb area prevailed earlier. In modern local wars, there has been an increase in wounds to the head and stomach. Thus, the main changes concerned a decrease in the total number of sanitary losses of the surgical profile of the number with an increase in the proportion of non-combat losses, as well as a change in the localization of injuries and wounds with an increase in their severity and the likelihood of disability.

Achievements of domestic military field surgery during the anti-terrorist operation in the North Caucasus can be attributed to a significant improvement in the results of treatment of the wounded due to the introduction of a two-stage system of surgical care. During this period, there is also an intensified effective implementation of new technologies in the provision of early specialized surgical care, namely the use of external fixation devices for fractures of the long bones and pelvis from the KST-1 set, endovideosurgery for chest and abdominal injuries, a programmable multi-stage surgical technique for treating especially severe injuries, the use of complex reconstructive interventions for injuries of all parts of the body, etc.

The list of specialized interventions includes surgical treatment of gunshot fractures of long bones, decompression craniotomy. At present, much attention is paid to the development of new techniques and the improvement of previously created algorithms for angio-traumatological care for the wounded. Surgical reinforcement detachments from the Military Medical Academy and central hospitals, permanently working in hospitals in Mozdok, Vladikavkaz, Buinaksk, provided

a high level of specialized care for the wounded based on advanced trauma surgery technologies. With a through wound in a gunshot wound, the inlet and outlet openings and the wound channel will form.

The mechanisms that substantiate the fact that the wound channel of a gunshot wound has irregular contours and shape are that, firstly, the trajectory of movement of the wounding projectile changes due to the fact that there is contact with dense structures of the human body, for example, bones and tendons. Another mechanism is based on the fact that human tissues have different contractility. M. Borston in 1925 for the first time described three zones of a gunshot wound within the wound channel, which play a role in therapeutic tactics.

The first zone is the zone of the wound defect resulting from the direct impact of the wounding projectile. The zone of the wound defect is an irregularly shaped tortuous gap. Inside, it is filled with blood clots, bone fragments, wound detritus and foreign bodies. The contents of the surgical treatment will be carefully removed, and the zone itself will determine the further direction of surgical tactics.

The second zone is the zone of primary necrosis. Its occurrence is facilitated by the action of all factors of the formation of a gunshot wound in aggregate. The tissues will adhere tightly to the area of the wound defect and will not be viable. During surgical debridement, the necrotic tissue is completely excised.

The third zone is the zone of secondary necrosis. According to the author N.I. Pirogov - "molecular shock". The lateral impact energy will contribute to the formation of this zone. The zone of secondary necrosis has a mosaic structure of morphological manifestations. Visually, you can see focal hemorrhages, and microscopically it will manifest itself as a violation of the formed elements and vessels of the microvasculature. The tactics of treatment will be aimed at the early healing of wounds in order to prevent the development of secondary necrosis.

The gunshot wound has a number of its own characteristics. This is the presence of a necrosis zone around the wound channel, and the formation of secondary necrosis a few hours or days after injury, and not the same length of damaged tissues, as well as the presence of foreign bodies in the tissues. Primary surgical treatment of wounds is the main method that prevents the development of infectious complications in gunshot wounds. For wounds of minor caliber, in which there are no zones of necrosis, hematomas and edema, primary surgical treatment is not performed. These wounds are usually self-cleaning from necrotic tissue. Such wounds are inflicted by projectiles with low kinetic energy.

When such wounds are localized only within the soft tissues, the wound toilet is carried out. The wound is drained, treated with an antiseptic, solutions of antibacterial drugs are injected into it, and then an aseptic bandage is applied. In case of massive damage or injury to the nerve trunks, transport immobilization will be shown. Next, it is necessary to carry out dressings, remove the drains for 3-4 days. The treatment will be carried out for 8-10 days during the provision of qualified surgical care. If internal organs, blood vessels or bones are damaged, surgical intervention will be performed on a specific area of damage, and the inlet and outlet openings will not be surgically treated, but the wound will be cleaned.

When there are extended and extensive zones of secondary and primary necrosis, surgical debridement of the wound should be performed, because cleansing is possible only through

wound suppuration. Suppuration of the wound contributes to the accumulation of nova, which leads to the violation of physiological barriers and the development of favorable conditions for the development of wound infection. Surgical treatment of a wound is an operation aimed at removing necrotic tissue, preventing purulent-septic complications and creating favorable conditions for wound healing.

To prevent purulent-septic complications, the wound is widely dissected at the inlet and outlet openings. All non-viable tissues and the contents of the wound canal are removed from the wound. A sufficient level of hemostasis is restored and maintained in the wound, and it is fully drained. It is necessary to influence all the links of the wound process in the area of secondary necrosis. Surgical wound, depending on the tasks, is divided into primary and secondary.

A primary surgical wound is always performed if indicated. In military field conditions, primary surgical treatment can be postponed if there are no urgent or urgent indications for its implementation. If it is postponed, intravenous antibiotics must be administered to prevent purulent-septic complications. According to the timing, the primary surgical treatment is divided into early (on the first day after injury), delayed (during the second day), and late (within the third day or more).

Primary surgical treatment of a gunshot wound includes several stages:

Dissection of the wound. The incision of the wound will be performed with a scalpel through the inlet or outlet of the wound canal. It should be linear and of the required length for further work in the damaged area. The direction of this incision should be in accordance with the principles of topographic anatomy. The tissues are dissected in layers. A wide fasciotomy will be performed, and in cases where muscle damage extends beyond the skin incision, the skin incision is expanded to the boundaries of the damaged muscles.

Removal of foreign bodies. To remove foreign bodies, such as fragments of wounding shells, scraps of clothing, bone fragments and blood clots, the wound is washed with antiseptic solutions with a pulsating stream. For deep-lying foreign bodies, specialized help is needed.

Excision of non-viable tissue. If there is good bleeding in the wound, the tissues are bright in color, and the muscles contract in response to irritation with tweezers, then the tissues are viable.

The excision should be carried out in layers, it is necessary to take into account the tissue reaction to damage. The skin is excised economically with a scalpel. Avoid cutting large round holes around the inlet and outlet. The subcutaneous tissue is excised with scissors until signs of vitality appear. In the places of the fascia, only those places that have lost contact with the underlying tissues are excised. Necrotic muscles are excised with scissors, and hemostasis will be performed in parallel with the excision. Due to the fact that the zone of viable muscles has a mosaic character, areas of reduced vitality or areas with minor hemorrhages will not be removed, but will constitute a zone of "molecular shock" and the formation of secondary necrosis.

Operations on damaged organs and tissues.

Passive or active wound drainage.

Closing the wound. Considering all the features of gunshot wounds, the primary suture is not applied. Exceptions are injuries to the scalp, penis, and scrotum. With minor lesions of the chest, when there is pneumothorax and there are all conditions for wound healing without tension after

primary surgical treatment, then the wound is sutured. If there are no such conditions, then they resort to using ointment dressings. After laparotomy, the peritoneum is tightly sutured in the area of the outlet and inlet holes, and the wounds of the holes themselves are not sutured. The first suture is also applied at the sites of surgical approaches to the wound channel.

In addition to the installed drainage tubes, it is necessary to introduce materials that have a drainage function into the gaping wounds formed after the initial surgical treatment. Such materials include gauze wipes moistened with antiseptic solutions or water-soluble ointments. Filling the wound with carbon sorbents is a more effective method. Due to the quick drying of the dressings, PVC or silicone tubes with a diameter of 10-12 mm, cut lengthwise, are installed in the wound.

After initial surgical treatment, inflammatory reactions (edema, exudation and plethora) will develop in the wound. But since we discussed above, tissues with reduced viability can be left in the wound, and inflammatory reactions will disrupt the blood supply to the altered tissues, which in turn can contribute to the development of secondary necrosis. In such cases, it is necessary to carry out anti-inflammatory therapy and anti-inflammatory blockades.

Multiple lesions, acute blood loss, contusion of the heart and lungs, early traumatic endotoxicosis - these are the main factors of mine-explosive injury. With a combination of these factors, the prognosis of the life of the affected will be aggravated and vicious pathological circles will form, which constitute the essence of the pathogenesis of an explosive wound. Based on this, the main goal of the treatment of mine-explosive wounds is reduced to the timely elimination of pathological factors and their causes, as well as a preventive effect on those links of pathogenesis that are involved in the formation of vicious circles.

GENERAL FEATURES BETWEEN ENGLISH AND UZBEK FOLKLORE GENRES

Akhmedova Sarvinoz Hikmatovna*

*PhD, Student of English Linguistics Department,
Foreign Languages Faculty, Bukhara State University,
UZBEKISTAN

ABSTRACT

The article notes that the English and Uzbek languages are close in all respects, which is why there are many similarities between the folklore genres of the two languages. Their similarities and differences are analyzed in detail. There is a saga in the Scandinavians, an epic genre that differs from that in the Altai. Exaggeration and witticism are the main genres of Uzbek folklore. Similar genres in several nations also differ in character traits. In 1911 he published the Khorezm version of the epic "Yusuf and Ahmad" in full. In the XIX century, at the initiative of some folklore and book lovers, as well as bakhshis, some manuscripts of folk epics appeared.

KEYWORDS: *Folklore Genres, Fairy Tales, Riddles, Myths, Customs, Traditions, Tribal Customs, Legend, Narration, Epic, Historical Song.*

INTRODUCTION

From time immemorial, man has not only fought for his own survival, but also for the longevity of his tribe. Consequently, the content of alla, rubbish, fairy tales and riddles is primarily aimed at shaping a conscious, strong, agile and agile human upbringing. People's perceptions of the world around them and the accumulated knowledge about it, wise sayings and conclusions based on life experience are conveyed to children in the form of specific advices, in a way that they can understand. That is why there is a lot in common in the folklore of different peoples, even in countries very far from each other. The oldest literary of many nations in monuments, as well as in myths and legends, in fairy tales - similarities are obvious: This aspect is reflected in the hymns of heroism, intelligence, nobility, goodness, and beauty, which are the highest notions of man and his great and honorable mission on Earth.

Scientists rightly say that in the development of scientific ideas, philosophy, in the emergence of literature, fine arts, sculpture, architecture, music, theater, myths have served as a unique source. The oldest fairy tales describe various folk customs, traditions, tribal customs. Or they can be traced back to the plot (reality) of primitive myths.

II. LITERATURE REVIEW

Over time, with the development of human society, fairy tales and myths were "mastered" by children (or as adults once presented to children the best things they created for themselves), and later, along with the brightest examples of world literature, "Robinson Cruzo", "Gulliver", "Gargantua". Folklore studies folklore genres in three literary rounds. The concept of tour has a wide meaning. It covers a variety of genres. Species differ in the nature of their depiction of reality. While the epic objectively reflects reality in a plot-narrative form, the lyric subjectively describes a person's impressions of reality, his inner experiences; and drama reflects the scenes of life through the speech and action of the characters. According to Professor B. Sarimsakov, three types of literature can be applied to folklore works, but these three literary types do not fit, only folk proverbs, riddles, various sayings, applause and curses should be studied separately. It is necessary.

In this regard, the scientist divides the genres of Uzbek folklore into the following types:

1. Epic: legend, narration, fairy tale, epic, folk, historical song, anecdote, loaf;

2. Lyrics: love songs, ceremonial songs, labor songs, lapars;

3. Drama: oral drama, comedy, puppetry, witticism;

4. Special type: simple sitting applause, curses, insults, proverbs, sayings, riddles and other phrases.

III. Analysis

Tradition is a product of folk art. It has its own socio-historical sources. It is known that the first examples of folklore were created in primitive society, which reflected the relatively established traditions and worldviews of the people of that time. This ensured a certain stability of the form, plot, images and motives of folklore works. The artistic pleasure of the people formed over the centuries - There is an aesthetic taste, folklore always lives by these international aesthetic principles. This is an objective law for folklore.

Oral creation and oral performance of folklore works unchanging stable forms - created traditions. For example, there is a certain difference in genre between heroic tales and epics however; the artistic style has a traditional form. In both genres of folklore, the composition consists of a traditional beginning, plot statement and conclusion, and the images are expressed in a contrasting way. The heroes of traditional epics are often distinguished by their supernatural birth and infinite power. Divine patrons (Hazrat Hizr, forty chilton, Hazrat Ali, Bobo Qambar, etc.) provide spiritual support to such ideal heroes, who represent the hopes and aspirations of the people, in determining justice and truth.

The composition of genres of Uzbek folklore is rich and diverse; it differs from the composition of genres of folklore of other nations. It also contains the genres of common folklore found in the folklore of all peoples - fairy tales, proverbs and riddles. There is a saga in the Scandinavians, an

epic genre that differs from that in the Altai. Exaggeration and witticism are the main genres of Uzbek folklore. Similar genres in several nations also differ in character traits. This feature is explained by the uniqueness of folklore, which is an expression of the history, customs, way of life, dreams, religious beliefs, worldview of each nation. The set of all genres in Uzbek folklore is the only historically formed artistic system, which is based on the complex and unique connections and interactions of different types of works. The formation and existence of a system of genres is one of the most important laws of folklore development.

IV. DISCUSSION

When we study the system of genres of English and Uzbek folklore, this system is based, first of all, on the generality of their ideological and artistic principles; secondly, their historically developed relations; thirdly, we have analyzed the emergence of genres in relation to their common historical destiny. In our analysis, we identified the following commonalities:

1. Ideological and artistic principles in the genres of English and Uzbek folklore generality each genre, despite its distinctive features, also has commonalities, which make them subject to a single system. These include:

a) All genres of English and Uzbek folklore are ideological, in essence, they are common to all, and in all of them the life of the people, psyche, dreams, joys and sorrows are expressed; folklore of both nations aims to depict the psyche of the people.

b) The interaction between folklore genres is also reflected in their similarity in the reflection of reality. Each genre, by its very nature, represents a particular aspect of life. For example, genres in a particular group reflect the history of a nation: epics, historical songs, legends, and myths. While lyrical songs reflect personal human experiences, proverbs and sayings express the lessons learned from the people's moral views and life experiences. These features can also be seen in the oral traditions of both nations;

c) Ideological commonality of folklore genres, as well as reality the commonality of their function in expression has created in them the similarity, the generality of the theme, the plot and the protagonists;

d) Folk aesthetic principles are also common for folklore genres: simplicity, provided conciseness, conciseness, plot, poeticization of nature, accuracy (positive and negative) of the moral assessment of the protagonists;

e) The generality of the system of artistic means of folk genres, symbols, figurativeness, and qualitative peculiarities also form a certain system.

2. Commonalities between genres. Genres relationship is a very complex process, which takes the form of interaction, coordination and mutual enrichment.

a) Genetic relationship of genres. In the emergence of every genre in folklore The main feature of genetic communication is that the second one acts as a source. For example, in Uzbek folklore, folk tales were the source of some examples of the epic genre, and in turn, the genre of historical songs emerged on the basis of epics. According to folklore considerations, the proverb emerged as the final conclusion of the narrative; the same can be said about English epics, but historical song is often replaced by a historical process in English folklore.

b) The occurrence of a work of one genre in the composition of a work of another genre. This feature of folklore can be seen in the fact that the genre of proverbs can be found in epics, fairy tales or songs. And in some fairy tales, it's the protagonist riddles can be encountered as a condition for testing one's intellect;

c) The occurrence of one work in several genres. The long-term existence of genres allows them to merge or to move from one work to another.

3. Historical similarity of genres of English and Uzbek folklore principles. Genres of Uzbek folklore did not appear suddenly and simultaneously.

The most ancient genres of folklore - based on myth, legend, legend, word magic songs, as well as seasonal ceremonial songs, followed by genres such as fairy tales, epics, proverbs and riddles, followed by anecdotes, folk dramas, witticism, historical songs. Historically, the system of genres of Uzbek folklore, formed in this way, has developed, improved and even underwent extinction. Genres of English folklore also developed, first of all, from myths to epics, from epics to fairy tales, from fairy tales and epics to historical and romantic songs.

In short, folklore works as a creative product of the people have made a unique contribution to the development of world literature. In the history of nations and peoples, the issues of oral art occupy a leading place. The commonalities between the genres of folklore, the interdependence of principles, the complimentarily of genres testify to the self-enrichment of folklore. In this chapter, we have studied the commonalities, the principles of similarity between the oral traditions of the English and Uzbek peoples, without the closeness of the two continents, the two cultures, the two countries, and on this basis we expressed our views.

The similarities and commonalities between English and Uzbek folklore show that in the history of mankind the culture of all nations began to develop equally, as well as a clear example of the complementarily and expansion of folklore of world peoples in world civilization. The similarity between the themes of the genres and the ideas is a clear confirmation of this idea. The first writers, researchers and publishers of some samples of Uzbek folklore were European tourists, ambassadors and scientists who lived in the second half of the XIX century and the beginning of the XX century. In the diaries and works of such scientists as A.A. Kushakevich, N. Lyapunova, A. Vasilev, A.N. Samoylovich there are important notes on the life, customs and oral traditions of the Uzbek people. For example, his impressions of folk songs, jokes, hobbies, folk festivals are described; some oral drama, some fairy tale details. N.P. Ostroumov's activity in the collection and publication of Uzbek folk tales, riddles, proverbs and sayings, as well as examples of oral theater is significant. Although he originally pursued missionary goals, his work in this field was an important contribution to the objective study of Uzbek folklore.

From the same period, some examples of Uzbek folklore became known around the world. The Hungarian scientist and traveler H. Vamberi played an important role in this. He published more than a hundred folk proverbs and excerpts from the epic "Joseph and Ahmad" in a German translation with an Uzbek text in the anthology "Chigatay language textbook" published in Leipzig in 1867. In 1911 he published the Khorezm version of the epic "Yusuf and Ahmad" in full. In the XIX century, at the initiative of some folklore and book lovers, as well as bakhshis, some manuscripts of folk epics appeared. Such publications were created as a result of translation or reworking of folk epics and fairy tales. Such works include "Hikoyati Gorogli sultan", "Yusufbek and Ahmadbek", "Tulumbiy", "Chor dervish", "Rustami doston", "Tahir and

Zuhra", "Oshiq Gharib va Shohsanam", "Sanobar", "Bozoglon", "Bahrom and Gulandom", "Hurliqo and Hamro", "Aldarkosa". Collection and research of samples of folklore, mainly XX revived from the 1920s.

CONCLUSION

On behalf of the Uzbek Board of Education, Ghazi Olim Yunusov, who conducted observations on folk art in Tashkent, Syrdarya and Samarkand regions, collected many fairy tales, songs, riddles and proverbs spread in 1922. For the first time in the history of epic studies, Fozil Yuldosh oglu and Hamroqul Bakhshi wrote a part of the epic "Alpomish". The scientist summarized the results of his observations and wrote an article in which he first thought about the great examples of the Uzbek epic: "Alpomish", "Gorogly", "Yusuf and Ahmad". It is noteworthy that the researcher compares the epic "Alpomish" with such famous epics as "Odyssey", "Iliad", which played an important role in world literature. The oral tradition of the English people is the literature of the tribes subjugated to the nation developed at the expense of. That is why in the examples of oral creativity of the English nation there are many similarities with the examples of folklore of different peoples of the world.

MYTHOLOGICAL BASIS OF UNUSUAL IMAGES IN TURKISH PEOPLES

Allambergenov Hamza Kamalovich*

*Senior Lecturer,
Department of Uzbek Literature,
Doctor of Philosophy in Philology,
Nukus State Pedagogical Institute named after Ajiniyaz,
UZBEKISTAN

ABSTRACT

In general, the image of a one-eyed man has ancient roots in the folklore of Turkic peoples. Furthermore, the fact that this supernatural symbol often belongs to negative heroes is reflected in fairy tales. The supernatural, on the other hand, is largely a product of myth. For primitive human tribes, the sun and moon, trees and rivers, clouds and wind are living "beings". Dirty meat is also not put on the horse. Women cannot ride such a horse, and if they ride, a bad thing will happen in their lives. The yellow horse now belonged to the Khan god. If we, men, ride a horse, we wash first. Indeed, it can be interpreted that the ancient imagination and concepts, the criteria for understanding the primitive world, are mostly preserved in these categories and are views that apply to all the peoples of the world. In any form, these views emerge as a product of artistic thinking and are referred to in the scientific literature by the terms "remnants" and "relics."

KEYWORDS: *Interpreted, Primitive, Supernatural*

INTRODUCTION

The origin of the supernatural in human life lies, first of all, in the connection of daily life with nature, in the belief that all nature is alive. It is at this stage that the myth emerges. The supernatural, on the other hand, is largely a product of myth. For primitive human tribes, the sun and moon, trees and rivers, clouds and wind are living "beings". These were also thought to be beings like humans or creatures. These objects in the human imagination, with the help of their

artificial weapons, like creatures, with the help of certain organs, perform the tasks assigned to them in this universe. [5, 129]

Even under any object or material, some half can be a terrifying creature that belongs to man. This creature can move everything - future events, society with words, even breath and other actions. This shows humanity's connection to the outside world. We see the attitude of mankind to the outside world in the examples of fine and applied arts, legends, fairy tales and epics created in Central Asia.

Supernatural emblems have been moving from nation to nation, from time to time. The image of one-eyed, four-eyed, and human-like creatures is proof of our point. In particular, the image of ape-like people and four-eyed giants is also present in Nishati's romantic epic Husnu Dil [1, 195] and retains the character of an unnatural symbol, just as in works of art or legends. In some peoples, however, people do not have a nose [5, 189], in some peoples the eye is one, in others the mouth and eyes are located in the chest [5, 190] and so on. Such perceptions came as a product of primitive thinking.

In the tales of the Turkic peoples, there are many supernatural symbols that are the product of such primitive thinking. In particular, the image of a one-eyed man continued in the tales of the Turkic peoples. There are vivid examples of this symbol in Kazakh folk tales. For example, in the fairy tale "Ағайынды екі жігіт", the protagonist is walking on a mountain and meets a man with one eye on his forehead. He greets him, "Assalamu alaykum, father." Interestingly, in this tale, we do not see the image of a one-eyed man as an evil hero as described in many other sources. The one-eyed man who sees the child also refers to him as "my child." No one asks what he was doing on this mountain and where he came from. The child tells him that he is an orphan without parents, a child without a child, a herdsman without a shepherd. Upon hearing this, the lone beggar asks him to have a child of his own and invites him to his house to eat. When he had finished eating, the lonely-eyed old man said to him at bedtime, "Al, my child, do not be afraid of me when you are asleep. My eyes burn like a horse in the dark, illuminating the work of the house" [7, 232].

Then the boy says he is not afraid and comes out. When he goes outside, he puts the cooking iron under the fire. When the old man fell asleep, his eyes began to burn like grass. When the boy, who was lying in wait, said that the old man had fallen asleep in the water, he brought the iron he had put under the fire outside, put it in the old man's eye, and fled. The protagonist of this plot did not respond well to the kindness of the lonely-eyed old man. He does evil to the hero who showed him kindness, who gave him a place in his house, probably out of fear that he would kill me anyway.

In the Kazakh folk tale called "Жалғыз көзді дәу", a one-eyed man is interpreted as a giant. The protagonist of the fairy tale unknowingly arrives at the palace of a one-eyed giant and takes up space in this deserted place. One day, when he came back from a hunt, while he was fast asleep, he suddenly woke up to a loud noise as if the earth were shaking, and he met a lone-eyed giant. The one-eyed man is described in the tale as follows: ("… мандайында жарқыраған жалғыз көзі бар дәу айғайлаған даусы жер жаратындай, астындағы мінген қара тұлпарының тұяғы тиген жер жерошақтың орнындай опырылып, буы бұрқырап, осқырынған күйінде сарайға шауып кіреді") "The voice of a giant with a lone eye shining in his forehead is like the earth, and the hoof of a thousand-capped horse under it is like the earth. [7, 238]. The protagonist

shoots the lone-eyed giant in the eye with a bow arrow, injuring him. He fights for three days and nights, defeats the giant, and throws him into a dungeon inside the palace. In the fairy tale, the one-eyed giant is not just defeated. The reason for his defeat was that he came to the palace very tired, having slept and not eaten for forty days, and oppressed many people. Each time he came to the palace, he slept for forty days, rested well, gathered strength, and went hunting again.

In the Kazakh folk tale "Alaman men Jolaman", a one-eyed man appears as a lizard. According to the tale, a lone-eyed lizard would snatch its prey from a place for a day. The protagonist of the fairy tale, Alaman, gets rid of the lone eye with the help of a magic ring. Alaman's son wounds the lone eye of the lizard with a bullet. On his mother's advice, he doesn't shoot a second time. Because, according to the fairy tale, if the lizard is shot in the eye a second time, the old woman may regain her composure. The boy waits, despite the fact that the lizard says, "If you are brave, shoot again," and eventually they get rid of him [7, 262].

In general, the image of a one-eyed man has ancient roots in the folklore of Turkic peoples. Furthermore, the fact that this supernatural symbol often belongs to negative heroes is reflected in fairy tales. Just as Herodotus described the Arimasp people as a warlike people, word of mouth about them, the perceptions of neighboring peoples, gradually spread. The harmony between the Avesto of Central Asia, the Rigveda of the ancient Indians, and the one-eyed creature in Aristotle's Epic of Arimaspus, quoted by Herodotus, connects at some point in southern Siberia and Central Asia, where Turkic peoples have long lived. The existence of historical and cultural connections between geographical regions has also ensured the integrity of artistic thinking in these countries.

As a result of research in the science of ethnography, legends have been written that the heads of some peoples resemble the heads of dogs. People tended to fabricate mythical plots about peoples they did not know. Such creatures in the form of half-creatures are also found in sources on the history of Uzbek literature.

It is clear that the tribes going through the process of primitive culture, the supernatural symbols in the peoples continued in different beliefs, myths. The way of thinking and worldview of those tribes and peoples has been going on since the time of primitive thinking. We do not view myth as an ideal concept, relying on people's perceptions of these symbols. However, myth is neither an idea nor a concept [2]. Myth is the first artistic process to create a supernatural symbol. The way in which the first human beings perceived the world, their perception of life within their own imagination, led to the emergence of such supernatural symbols, or to the preservation of the mythical content of the symbols.

When it comes to the relationship between ancient works of art and written and oral literature, it should be noted that there is an integrity between the word and the work of fine art. After all, the purpose and content of mythological content is the same in customs, folklore and written literature.

In our view, all types of myths have supernatural emblems, and supernatural emblems have given rise to all kinds of myths.

The semantic abnormality that is semantically synonymous with the fine arts also exists in ancient Turkic written monuments. We find this harmony in the various descriptions and interpretations of the image of the horse in The Book of Race. In the following chapters, we will

focus on the mythological basis of the image of the horse in The Race. In ancient Turkic monuments, especially in the "Race Bitigi" there are such inscriptions that the image of a horse can be seen expressing an unnatural meaning in connection with customs and beliefs. Otherwise the image of the horse would not have appeared without the supernatural. As a proof of our opinion, let us pay attention to the following passage from the "Race Letter":

Tugh at qudruqin tugup tigrat yazigh qodi jadrat tooquz qat uchurgung, topu ulugh ancha taritzun tir. Know a lot: take a sling (50) - Run with a straw tied to the horse's tail, run the desert very fast, tie nine layers of slippers on the horse, let him sweat a lot, say: know that it is bad.

The straw in this passage is a pale yellow horse, which, according to the beliefs of the ancient Turks, must have been named after the Khan god. The Han god means heaven, and at the same time the king of China. A sign of parallelism can be placed between Heaven (God) and the King of China. This belief also reflected the ideas of the ancient Turks about the Chinese kings. Anyone who sees Chinese kings in the afternoon will live long and become rich [3, 92]. For this reason, the yellow horse must be dedicated to heaven (God). Beliefs about the yellow horse, which remained in the imagination of the people until later times, were preserved in the Yellow Uyghurs, who lived in East Turkestan, the country where the "Race Bit" was created - in the late XIX - early XX centuries. S.E.Malov gives the following information about the horse dedicated to the Khan god: "The yellow horse is dedicated to the Khan god. It is not possible to cover dirty slippers on a horse. Dirty meat is also not put on the horse. Women cannot ride such a horse, and if they ride, a bad thing will happen in their lives. The yellow horse now belonged to the Khan god. If we, men, ride a horse, we wash first. If an unclean person rides a horse, he becomes ill ... "[4, 139]

Consistent study of the relationship of folklore with ancient wall paintings of Central Asia, the mythological content of Central Asian works of fine and applied art brings a lot of clarity to Central Asian mythology, helps to identify the roots of mythology.

Until the nineteenth century, the school of anthropology had collected legends about human tribes, sometimes unnaturally tall, sometimes extremely small, one-eyed, one-legged, with no head or mouth. These myths were read as real beings among people in life until the nineteenth century, when notions of myth had not yet formed in them. It was only in the early nineteenth century, when this universe began to be studied scientifically, that the difference between myth and reality began to emerge. That is why the notions of the supernatural have now emerged in the fields of ethnography and anthropology. For example, a twelfth-century rabbi named Benjamin Tudelsky (Jews called the Torah commentator rabbi - H.A.) described the Turkic tribes as follows: "They have no noses, they breathe through two small holes." [5, 189] This rabbi imagined that he was ignorant of the anthropology of the Turkic peoples - some tribes of the Turkic peoples, including the Kipchak tribes, could not understand the peculiarities of the anthropology. The notion of a "noseless" people is derived from those whose noses are large and clearly visible, including those of the Jewish and Greek peoples. The first impression of something or an object certainly seems unnatural to the observer. In particular, the English ethnographer E.B. Taylor, studying the ethnographic life of the peoples of North America in the XIX century, their religious-mythological system, describes their life, emphasizes important details, including supernatural imaginations and myths and legends that exist in their lives. Other details in fairy tales pay more attention to supernatural emblems than to emblems or plots. It was

considered expedient to use supernatural symbols to attract the attention of the listener, humanity in general, to amaze him.

Mankind has long been susceptible to external influences. Especially in the primitive and ancient times, there is a peculiarity in the way of thinking, the worldview of humanity, the criterion of understanding the world. This specificity is based on a certain law. The law is that man has taken all his imagination from external phenomena. But he did not do it consciously. In order to understand and comprehend this phenomenon, it was necessary to express their attitude to nature and natural phenomena and to regard it as a natural law. The "nature" that we perceive today was felt very closely by man in primitive times, and he understood the laws of nature in his own way. Simply put, knowing that there is a connection between natural phenomena and himself, he moved nature precisely to his own actions. Only man has expressed his attitude to what he belongs to, what he wants. "That is why for hunters the external nature is united with the animal world" [6, 19]. Because hunters are so close to nature, the worldview of hunters, as well as farmers, ranchers, and other categories of people close to this category, also plays an important role in assessing primitive thinking. Indeed, it can be interpreted that the ancient imagination and concepts, the criteria for understanding the primitive world, are mostly preserved in these categories and are views that apply to all the peoples of the world. In any form, these views emerge as a product of artistic thinking and are referred to in the scientific literature by the terms "remnants" and "relics." But it is wrong to think of it as a "mental backwardness," as some scholars say, and should be seen as an attempt to express primitive man's way of thinking, his attitude to natural phenomena, on a "scientific" basis.

THE CONCEPTUAL RELATIONSHIP BETWEEN THE TERMS "AGRICULTURE" AND "FARMING", THE PROBLEM OF LEXICOGRAPHICAL INTERPRETATION OF AGROTERMINOLOGYIN THE UZBEK LANGUAGE

Allayarova Zebiniso*

*Teacher,
TSPU Branch Shakhrisabz,
UZBEKISTAN

ABSTRACT

Today, Uzbekistan has undergone a major agricultural reform, and the agrarian sector is rapidly developing. Creation of the legal basis for property relations in the agrarian sphere has become a guarantee of this process. The resulting extensive social change has made huge changes in the national linguistic mind. Social life, social thinking, and language integrity have shaped important changes in the linguistic classification of the existence. Especially in the field of agrarian reforms, new forms of agrarian relations require studying agrarian terminology as a special system, and the development of international agrarian relations and relationships require special attention to the linguistic expressions, which are the main factors in this.

KEYWORDS: *Cognitive Meaning And Structure, Farming, Livestock, Farming Laws, Frame, Agro Industry, Complex Of Agro Industry, Agroclimatology, Monoculture, Virus, Content Of Meaning, Agrofirm.*

INTRODUCTION

During the years of independence, the structure of the terminology of the agrarian sector of the Uzbek language has undergone serious changes. Here are two important. points:

Firstly, the content - meaning of the word has changed. This is the result of new achievements in the study of natural phenomena, the changing of social consciousness and outlook, the deepening of the conceptual essence of things , entering a new stage of human and nature relations, as well as the rise of agrarian economy in the country, which is marked by significant changes.

Secondly, there are absolutely new words, terminology, and word-terms in the language.

The linguistic expression of the concepts of the agrarian sector in the Uzbek language has different structural, semantic, genetic and derivative properties and constitutes a separate field. It is characterized by the presence of a very robust and super-simple cognitive essence and structure, if the subject matter is experimental in a very complex, theoretical way.

It is well known that the system of agrarian terms is a component of the agricultural heritage. This field, first of all, consists of two significant areas:

- Farming;

- Animal husbandry.

The significant area of farming is, in its turn, subdivided into the internal groups (lexical-semantic):

-field work;

-vegetable growing;

-horticulture

-gardening;

-forestry.

Other topic areas are, in turn, composed of inner groups or divided into inner groups. For example, animal husbandry:

- Cattle breeding;

- Sheep breeding;

- Tyranny;

- hogging;

- Poultry farming;

- Beekeeping;

- Silkworm;

- Rabbit as linguistic-spiritual groups.

The internal divisions of these linguistic-spiritual groups can be divided into specific species of plants and animals. Specifically, cattle breeding, weft and tyranny, sheep breeding and goat breeding. Indeed, the term "cows" was used in order to comply with the classification criteria. The term "cattle" in Uzbek is used to describe large pets, in contravention of the term "wet merchandise", in the above classification, in general, the cattle (cows, calves, oxen, bulls, etc.) too. We have seen that the linguistic-moral field of cultivation, according to the type of plant, forms many internal linguistic-spiritual groups. These groups are subdivided into specific sectors depending on the type of plant. For example, the linguistic-moral group of horticulture:

- Melon;

- Pumpkin;

- Greens.

The factor that unites the linguistic content field of agriculture is its immediate-linkage of land. Thus, in the semantic structure of all the lexical units entering the field, the concept of "land" is a "constellation" of the meaning of the word semantic. That is true that the field of production of livestock and fisheries is also land.

This ensured the activation of the "land" element in the field of livestock and fishery in the field of farming. It does not serve as a ground for livestock breeding, but is a food product that grows out of the ground. The attitude of the land to the animal is in the second place after the feeding. The same applies to poultry farming. The connection of the fishing industry to the land is through water. Therefore, the primary means of production for fishing is water. Accordingly, the element of "water" is a component of the "fishing industry". So, for the "livestock" and "poultry farming", the "nutrition of the crops" is a combination of the "living things" for the content of the "land growth", the "fishery" for the field of cultivation. In general:

 a) Land area: livestock, husbandry, and poultry farming;

b) Water related area: fishing.

As above indicated, land-related areas vary widely by the degree of dependency and and direct/indirect. Farming is an indirectly related branch of the land - in modern terminology it is based on the term "agrarian". Of course, although agrarian and farming expressions are at first glance imagining terms, the difference between them is differentiated by the linguistic mind.

It is well known that in the Uzbek language there are many terms formed on the basis of agr(a/o): agrarian, agrarian reform, agrarian case, agrarian crisis,agrobiznes, agrobiological, agrobiology, agrobiocenosis, agrogidrology, agro-climate map, agroclimatic zoning, agroclimatic, agro-irrigation layer, agrochemistry, agrochemical laboratory, agrochemical service, agrochemical analysis, agrochemical mapping, agromelioration, agrometeorological bulletin, agrometeorological chronicle, agrometeorological monitoring, agrometeorological factors, agrometeorological service, agrometeorology, agrometeorology post, agrometeorology station, agronomist, agronomic, agronomic ore, agronomy, agroindustry, agroindustry integration, agro-industrial complex, agrotechnical, agrotechnical protection method, agrotechnical brakerage, agro-technics, agro-technology, agro-soil, agro-soil zoning, agro forest reclamation, agro-physics, agro firm, and agroelectronics.   Agrobiology, Agrochemistry, Agromeliorology, Agrometeorology, Agronomy, Agro-Engineering, Agrotechnical, Agro-Physics (1.120) are part of the 5-volume annoted Dictionary of the Uzbek language

It follows from the comments that **agr(a/o)** component units represent a scientific approach to this field, which is directly related to the land. In the mirror of this component we see the difference between vocational lexical system and scientific terminology. Generally speaking, agr(a/o) component units are characterized by the general meaning of "terminology" if the expressions of farming have a common denominator. The phenomenon and process of harvesting the land is a multidimensional phenomenon in terms of its relation to it. On the one hand, it is a normal labor process, on the other hand, a subject of scientific approach. In the first case, the centuries-old experience of people in this process, based on the practical knowledge gained from ancestors of nature, reflects the systematic activity related to the study of the second case by special methods and means. The difference between these two states is that of linguistic consciousness, which forms two different attitudes to one process. The concept of *farming* is

also inherent in the *agrarian sphere*. In the "Explanatory Dictionary of the Uzbek Language" it has its own bright expression:

"**FARMING:** The field of agriculture, which is engaged in cultivation of agricultural crops, and cultivation. *In ancient times, farming was widely spread across the primitive nature of beautiful Fergana, Tashkent, Bukhara and Khorezm, such as Amu Darya, Zarafshan, Syrdarya.*   K. Makhmudov, Interesting culinary.

2. Cultivation, occupation. *Farming. Cultivation is a culling, but dryness. Proverb. In summer he is a farmer, he goes by and is late.* M.Ismoiliy, Fergana t.o.

3. Crop, field of crops. *We have farming down here. All right, everything comes from us.* Oydin, daughter in-law has had a baby boy"(2.603).

The first meaning of the footnote is two-sided, characterized by the fact that it has a common use and terminology. The first of its two parts ("agriculture-specific", "crop cultivation and agricultural production") has the most of its terminology. It is more used in scientific literature and the limited scope of use in public use is a proof of our idea. These words in the Uzbek language *деҳқон, деҳқонбоп, деҳқонпарвар, деҳқонсифат, деҳқончасига*   in their attitude to the meaning of деҳқончилик (farming in English) refers to the general use of the essence.

Now let's take a categorical notion of agricultural laws. The only thing we can say about this concept is that it is a unique, secular, scientific worldview. Laws such as "recycling of soil," "minimum", "optimum", "maximum", "jointly affecting life factors", "lack of uniformity and vitality of life factors", as a scientific area, as well as the term "farming" that they contain as a term. In this case, it is in full agreement with the scientific term of the agrarian sector.

The relationship between the terms of the *agrarian* and *farming* above was lexical-semantic. Here we try to see similar and different between them in cognitive aspect.

Analyzing cognitive concepts on the basis of their frames is a good idea, it provides good results. As you know, frame-based analysis is a complex method of analysis that illustrates the extensive concept of the concept, covering all aspects of it (3.**152).** Each frame has a certain edge of the cognitive object. The concept of farming consists of a set of frames (4.57).

> *Farming is an integral part of rural life.*
>
> *Farming is a long history.*
>
> *Farming is a field based on past experiences.*
>
> *Farming is a field of animal husbandry, fishery and poultry farming.*
>
> *Cultivation is a productive field.*
>
> *Cultivation is mainly irrigated area.*

These frames are a combination of the concept of farming in the national consciousness   of the Uzbek nation: "Farming is based on past experiences of rural life and is an irreplaceable agricultural sector, mostly derived from irrigation."

The agrarian sector is similar to the concept of farming, and its differences distinguish it from the following:

Agrarian sector - agriculture.

Agrarian sector is a productive field.

Agrarian sector - public and private sector.

Agrarian sector is an area that contradicts the industry.

Agrarian sector is mainly irrigated area.

Agrarian sphere is a field in the form of historic farming.

Agrarian sector is a technique area.

Agrarian sector is a common infrastructure.

Agrarian sphere is a sphere of continuous science advancement.

We are trying to describe the conceptual nature of the agrarian sector: "The agrarian sector is a sphere of agriculture (in its narrow sense, its productive), which is mainly used for irrigation as a private and private infrastructure, a science - based manufacturing industry. "

At the same time, the conceptual difference is not only because of the nation-wide one and the other as having a scientific essence, but also the connection of the first to the nation's and the other to the more scientific application. The combination of the agr (a / o) component described above also indicates that. The agrarian sector requires not only land treatment and harvesting, but also a scientific approach. Therefore, agr (a / o) - the events representing all terms are the constituent parts of the agrarian sector. For example, let's look at the term "Agro climatology" (4.140).

Sources say, Agro *climatology is* an important component of the agrarian sector, which explores the climatic conditions of agricultural production. Agro climatology studies morphology of the land connecting with climatic conditions. The cultivation of the necessary crops, of course, depends on soil fertility, water resources in a particular environment, and on the properties of flora and fauna. These situations are related to the climate.

Agro climatology:

- Attitude to the climate as an agrarian production factor;

- Study climate in terms of agrarian goals;

- Agro climatic description and mapping of the territory;

- Development of agro-climate recommendations for plant selection;

- Development of the groundbreaking guidelines for appropriate agro-technical measures, based on soil, water, air and plant relations.

Each of these tasks serves to the essence of agro climatology concept, and each of these *agrarian* components links it to the agrarian sector. In the concept of *farming,* we do not see a set of conceptual concepts.

On the other hand, the concept of agro climatology is a conceptual component of the concept of *agrarian sphere*, but its essence also has its internal structure:

- The primary climatic factors needed to obtain sufficient yield from the ground: light, heat, humidity;

- Secondary climatic factors needed to obtain sufficient yield from the soil: wind, cloud, soil and air drought, dust.

Based on these factors, agroclimatic indicators are developed and presented as recommendations for the agrarian sector **(5.140).**

So, the concept of agroclimatology consists of three components:

1) Research of agroclimatic factors;

2) Determination of the influence of agroclimatic factors on plants;

3) Development of agroclimatic indicators.

If the concept of *farming* is in a dialectical relationship with the consciousness of *farmer*, the expression of the agrarian sector is associated with the units representing many fields of expertise, such as *farmers, agro-engineering, agronomists, agrochemicals, agrobiologists, agro-biophysics, agro-generators*. It is the *agrarian sector* is a modern manufacturing industry, we can see the distinctive features of professionalization and specialization. In *farming*, we do not see such distribution of labour. The farmer is seen as a universal producer.

At the same time, farming is a traditional semantic essence that is preserved in the traditional sense of the word, even when it comes to modern understanding, with the elements of farming, land, water, work weapon (hoe, plow, etc.) in traditional social thinking.

Industrialization is one of the peculiarities of the agrarian sector. The conceptual essence of the *agro-industry* and its current state is also evidenced by this. The current state of agrarian and industrial integration is agro-industrial associations, agro-industrial enterprises combining agrarian and industrial activity in the form of a single economic unit, agro-industrial associations, which are a complex of territorial, institutional and technological joint ventures, including all stages of production, processing and finished goods production and the emergence of agro-industrial complex at the national level demonstrate a radical difference in modern agrarian industry from feudal farming (6.116).

Development of the terminology system of the Uzbek agrarian sector and problem of lexicographical interpretation.

Due to the intensification of international integration in the field of Uzbek agriculture and the radical reform of the agro-economics and continual exploration of the world experience, we see new agro-terms input into our language.

First of all, in the semantic structure of the word occurs when new meanings are made. This, in many cases, allows for words to be used in new sem-boards or semicircles, as well as expanding the range of linguistic-spiritual groups, to see the emergence of new micro-groups. For example, in the agroterminology of the Uzbek language there was no term for ***drip irrigation***, which means the process until recently. Drip irrigation is a complicated process, which involves a series of events, tools, and results, or words that express them, either new or existing, have a new meaning in this linguistic-moral system. Any new expression that appears in the language has the inherent systemic nature of the system as a spontaneous and evolving system.

The term *hydroponic (7 205.)* in Uzbek is one such unit. This terminology was introduced in the traditional agricultural terminology system of Uzbekistan in the fourth quarter of the last century. It was mentioned in the 2-volume dictionary of the Uzbek language. Nowadays, the phenomenon representing this term has a dominant position in the Uzbek agricultural sector and becomes a popular type of farming. Hydroponics is a term used to describe grape / sand, nutrient, nitrogen, phosphorus, potassium, calcium, magnesium, sulfur, iron, magnese, boron, copper, zinc, molybdenum, cobalt, and artificial environments. But in the last century, the *term* had only one sememe: "Raising plants without soil, feeding through a nutritious solution"(8. 235). At the present times, due to the wide-ranging hydroponic agriculture, the term hydroponic has two sememes:

1. Raising the plants using soil-free, nutritious solutions.

2. An environment that uses this method for plant growth (9.203).

The Russian dictionaries are reflecting this (10.1231). It is noteworthy in the Uzbek-language dictionaries. Speaking about the spiritual and thematic development of the terminology of agrarian sphere in Russian, linguist T.D. Dankova speaks about the features of the term *monoculture*. As the linguist mentions, the term in Russian in the dictionary of the last century, " It is said that cultivation of only one crop in one square for many years. This dictionary was published in 1965. The liguist said that the terminology was included in LMG (lexical meaning group) "Agro-technical" LMG "Agricultural processing" LMG. The only crop / plant specialization ".(11.267). Thus, the term "*monoculture*" is now part of the LMG "Cultural Plants". This comment is found in the 2001 Glossary (12. 203) . From the point of view of term monoculture can be seen in the Uzbek dictionaries. The term is not contained in the 2-word dictionary of the Uzbek language published in 1981. However, in the 5-volume dictionary of the Uzbek language we have the following description:

 MONOCULTURA [mono ... + cultura; cultivation of only the same crop in the field, without taking into account the transplant. Cotton monoculture" (13. 215). The National Encyclopedia of Uzbekistan "also observed the following:

MONOCULTURA (mono ... and lot. Culture - planting, cultivation) is the cultivation of only one crop in the field itself without compromising the cultivation of crops"(14. 320). It is apparent that today's monoculture has a new meaning in the world, without waiting for his updated version of the Uzbek dictionary and vocabulary.   The use of terminology in the development of the terminology in other spheres is often used to express other meanings in the industry itself (15.47). The meaning of these terms is seen as an enlargement of meaning. The fact that the word "virus" in Uzbek language is expanding this meaning is the evidence. However, traditional sources of the last century have been preserved in Uzbek sources: **VIRUSES** [Lot. virus - herbal juice; poison] It grows in living cells, only human, animal, microorganisms that cause infectious diseases in the plant. Today, however,   the meaning of the term has expanded and new types of computer virus, media virus have emerged and are widely used in speech. For example, the definition of this   "vid **vredonosogo programmnogo obespecheniya, sposobnogo sozdavat kopi I samogo sebya I vnedryatsya v kod drugix programa, sistemyye oblastinsky pamyati, zagruzochnye sektory, a takje rasprostranyatsvo i kopi i porazno obraznym kanala svyazi (16).**   Indicates that the traditional content of the terminology has expanded. The term was launched in 1981 with the creation of the first software

virus (Virus 1, 2, 3, and Elk Clonen).   However, anyone working with a computer can face to face a problem with software viruses. Therefore, the meaning of the term *viruses* has become the basic meaning of today. And also, it is time to record it as a meaningful extension of the term of the virus and to describe it in the appropriate dictionaries.

The 2-word explanatory dictionary of the Uzbek language, published in 1981, has 10 terminology agro-component (*агротомия, агрокультура, агроном, агрономик, агрономия, агрономлик, агротехник, агротехника, агрохемия*) , 5 volumes contain 14 terminologies **агробиологик, агробиология, агрокимё, агромелиорация, агрометеорология, агроном, агрономик, агрономия, агрономлик, агросаноат, агротехник, агротехника, агрофизика).** However, many new terms such as agro-industry, agribusiness, agrobiocenosis, agrogidrology, and agro-economics are used in our speech to provide them with commentary notes in relevant dictionaries.

Changes in property and economic relations, both in the agrarian sphere and in other areas, have removed "ideological dye" from the linguistic value of many words. The word "business" in the former regime was described as "in capitalist countries: a work of personal gain (e.g., speculative, commercial, profitable enterprise)." Thus, the agro-business term of the agrarian sector was not explained. Today, any ideological stance that is derived from the word *business* is "any form of income, profit-making, or any other organizational, economic activity that is not law-abiding, commerce; business ". Accordingly, the term   *agrobusiness* is also one of the elements in the modern dictionary.

The main producer of modern agrarian industry is a farmer, whose linguistic expression has its own status and place as an individual in our explanatory dictionaries: "**FERMER** [ingl. farmer] Owner of a small or average agricultural enterprise, engaged in the production of agricultural, livestock and poultry in the area of long-term occupation or lease. " This word-term also reveals that it has been liberated from its following ideological pattern: "in capitalist countries: a farmer is a tenant of a farm or owner of a farm." In this definition, the essence of the lexema is broken and does not require proof of misinterpretation.

The term "agrofirm" is also considered to be one of the new lexical units in the Uzbek language. Agro-firm is one of the key components of agrarian infrastructure and this is the consequence of its conceptual nature. The cognitive learning of language phenomena is the sharp contrast of categories *meaning, understanding* and *concept*. This distinction has led to the differentiation of categories *meaning* and *concept,* which ultimately becomes a necessary category for traditional and modern linguistic interpretations.

The content of meaning of the language units is the semantic area of the language. *The meaning* that is formed after the *concept* is, to a certain extent, it is a result of concept. It is a conceptual language which is characterized by its broad, comprehensive, evolutionary, intricional and intense affinity with objective reality, and reflects the common and private relationship with the meaning of the conceptual semantic area of the concept. The concept and meaning of members are other extent, direct or indirect cognitive nature. The concept is a dynamic phenomenon, where the meaning is an instrument of perception without recycling. The essence of meaning is based on the concept. The meaning differs from concept, which is regarded as a unit of thought, is closely related to the phonetic shell of the word, and has a specific relative independence from the concept of the indirect specification for the communicative task. A word "communicates"

with everything in a communicative task, while the concept "communicates the unverse in forming knowledge. Therefore, frames can be systematically orchestrated by all aspects of the concept, which is characterized by relative independence of the frames. We try to define our ideas on the basis of the frame structure of the concept *agrofirm*:

"*Agrofirm* - is a tool that provides a solid relationship between consumer and manufacturer in the agrarian sector".   Agrofirm is not a raw material, but in most cases the finished product is marketed and is directly "face to face" with the buyer. It relies on the combination of responsibilities and interest **"Agrofirm - agro-industrial enterprise".** The agrocompany is a complex enterprise of this conceptual system, combining agricultural production, processing and sales of agricultural products, and unification of service points on a single management basis.

"Agrofirm - complex structure". Agrofirm is a complex of aggregate processes, from production to consumer. Timely coordination of all work in the production, processing and delivery of products through a single system.

"Agrofirm - a means of labor productivity and productivity". Increase of labor productivity, reduction of   waste, as well as large investments from the received profit, and rational distribution of profits among internal enterprises of the agrofirm.

"Agrofirm - open system". Agro-firms provide access to local resources, but may include subsidiary networks and small businesses.

It is clear from the   mentioned that the essence of the category of *agrofirm* consists of syllables such as "agricultural production", "complexity", "industrialization", "direct interest", "producer and consumer".

ABSTRACT

The article provides information on the impact of the planting scheme on the yield elements and productivity of peanut varieties. According to the sowing schemes, one bush "Qibray-4" variety produced 18.9 pieces/bush to 30.1 pieces/bush. This resulted in an increase in the number of legumes to 11.2 pieces/bush in the 70x30–1 planting scheme with a high feeding area of 2100 cm². In the "Mumtoz" variety, the sowing scheme of 70x15–1 yielded 20.0 pieces/bush, while in the sowing scheme with a high feeding area of 70 x 30-1, the yield was 30.9 pieces/bush. In the "Salomat" variety, the sowing scheme of 70x15–1 yielded 19.5 pieces/bush, while in the sowing scheme with a high feeding area of 70x30–1, 33.3 pieces/bush were produced. This resulted in an increase in the number of legumes to 13.8 pieces/bush in the 70x30–1 planting scheme with a high feeding area of 2100 cm². Peanut planting schemes have been found to affect yields, yields of 30.1 ts/ha obtained in the sowing scheme 70x25-1 of the "Mumtoz" variety, which was more to 0.8 ts/ha and 0.5 ts/ha in compared to "Qibray-4" and "Salomat" varieties respectively.

When sowing peanuts "Qibray-4" and "Mumtoz" in the sowing scheme 70x25-1, it was found that the grain yield was high (21.1-22.5 ts/ha).

KEYWORDS: *Peanuts, Planting Scheme, Feeding Area, Yield Elements, Grain Yield.*

INTRODUCTION

Peanuts are grown in many countries around the world, and the variety of agro-technical measures applied to them has a significant impact on yields. It is important to use planting systems that provide an optimal feeding area that is cost-effective in growing high and quality crops from nuts. Because walnuts are a plant that provides the necessary raw materials for industrial production and human food. It is important in getting a product rich in essential human fats, proteins, glucosides, and many vitamins. In the cultivation of nuts, the number of seedlings and agronomic techniques causes changes in the nutrients in it.

The relevance of the problem

Irrigation norms and methods have a significant impact on productivity when peanuts are widely planted at a rate of 55-65 thousand pieces/ha. In India and China, the yield is 12-14 ts/ha when planted in narrow rows. However, in Georgia state, peanuts planted in a wide range of 60,000 / ha yielded 22-24 ts/ha when irrigated at a rate of 400-550 m^3 / ha [1, 2, 6].

Planting methods in nut cultivation depend on soil climatic conditions and applied agronomic techniques. In addition to planting peanuts in wide and narrow rows, high yields were obtained when planted in square nests. Experiments have shown that high yields are obtained when planting in a square nest with a row spacing of 50 cm and a nest spacing of 25x25 cm [3].

Peanuts are planted in wide rows with 50-60 cm between rows, 20-25 cm between plants, 40-50 cm between nests when planted in a checkerboard pattern, 70 cm between rows when planted in the form of ribbons, 20-25 cm between plants and 50 cm between rows, high yields were obtained when the branches were planted at a depth of 12-15 cm [5].

At the Central Asia and Turkestan research station, 26.3 ts/ha of peanuts were grown on a 1,200 cm^2 feeding area. Also, scientific studies have shown that high yields are obtained when planting peanuts in the 20x20 and 22x32 schemes by squaring the squares in the SSh-6A seeder [4].

Research conditions and methods. Our research was conducted in 2009-2011 in the fields of research and experimental farms of Tashkent State Agrarian University, the effect of the planting scheme on the yield elements and yields of peanut varieties was studied. In field experiments, 3 varieties of peanuts "Qibray-4", "Mumtoz" and "Salomat" were studied by planting in 4 planting schemes 70x15-1, 70x20-1, 70x25-1 and 70x30-1.

The experiments were performed in laboratory and field conditions. In the field experiment, the number of variants was 12 and was performed in 4 repetitions. The number of stakes is 48. The total area of each option is 84 m^2, of which the calculated area is 56 m^2, ie 20 meters long and 2.8 meters wide. The surface area of one variant was 336 m^2 in 4 repetitions, with a total experimental area of 4032 m^2.

Research results

Yield from plants is one of its most important indicators. In our study, it was observed that the effect of the feeding area on the formation of yield elements of peanut varieties was significantly greater (Table 1).

According to the results of the study, the number of legumes in "Qibray - 4" variety in planting schemes yield from 18.9 pieces/bush to 30.1 pieces/bush. This resulted in an increase in the number of legumes to 11.2 in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2.

In the "Mumtoz" variety, the planting scheme of 70x15–1 yielded 20.0 pieces/tree, while in the planting scheme with a high feeding area of 70 x 30–1, the number of legumes was up to 30.9 pieces/bush. It was observed that the number of legumes increased to 10.9 pieces/bush in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2.

In the "Salomat" variety of peanut, the planting scheme of 70x15–1 yielded 19.5 pieces/bush, while in the planting scheme with a high feeding area of 70x30–1, the number of legumes was 33.3 pieces/bush. This resulted in an increase in the number of legumes to 13.8 pieces/bush in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2.

According to the experimental data on the weight of legumes in one tree of peanut varieties, according to the planting scheme of "Qibray-4" variety increased from 23.9 g / bush to 51.9 g / bush. In the variant with a planting scheme of 70 x 30 - 1, it was found that the weight of the legumes increased to 28.0 g / bush compared to the variant with a feeding area of 1050 cm^2.

According to the planting scheme of peanut "Mumtoz" variety increased from 24.7 g / bush to 53.8 g / bush. In the variant with a planting scheme of 70 x 30 - 1, it was observed that the weight of the legumes increased to 29.1 g / bush compared to the variant with a feeding area of 1050 cm^2.

In the "Salomat" variety of peanuts, this figure increased from 24.5 g / bush to 49.1 g / bush according to planting schemes. In the variant with a planting scheme of 70 x 30 - 1, it was found that the weight of the legumes increased to 24.6 g / bush compared to the variant with a feeding area of 1050 cm^2.

The results of the study showed that in all varieties, as the feeding area increases, the number of legumes per tree (up to 11,2 – 10,9 – 13,8 piece/bush) and the weight of legumes (up to 28,0 – 29,1 – 24,6 g/bush) increase.

According to the data on the number of grains in one tree of peanut varieties, according to the planting scheme of "Qibray-4" variety produced from 26.7 grains/bush to 47.3 grains/bush. It was observed that the number of grains increased to 20.6 grains/bush in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2.

In the "Mumtoz" variety, the number of grains increased from 28.6 grains/bush to 48.7 grains/bush, while in the planting scheme with high feeding area 70x30–1, the number of grains increased to 20.1 grains/bush.

According to research from "Salomat" variety of peanuts, the number of grains per tree ranged from 38.9 pieces/bush to 53.9 pieces/bush according to planting schemes. It was found that the

number of grains increased to 15.0 pieces/bush compared to the variant with the lowest feeding area of 1050 cm^2 in the planting scheme with a high feeding area of 2100 cm^2.

According to the experimental data on the grain weight of walnut varieties per bush, the grain weight increased from 14.5 g / bush to 37.3 g / bush according to the planting scheme of Qibray-4 variety. In the planting scheme with a high feeding area of 70 x 30 - 1, it was observed that the grain weight increased to 22.8 g / bush compared to the variant with a feeding area of 1050 cm^2.

It was found that the grain weight of "Mumtoz" variety of peanut increased from 15.7 g / bush in the planting scheme with the feeding area of 1050 cm^2 to 39.4 g / bush in the planting scheme with the feeding area of 2100 cm^2.

TABLE 1 ANALYSIS OF YIELD ELEMENTS OF PEANUT VARIETIES (2009 – 2011 YY.,)

№	Varieties	Planting scheme	Number of legumes per bush, pcs	The weight of a legume in a bush, g	The number of grains in a bush, pieces	Grain weight in a bush, g
1	"Qibray – 4"	70x15-1	18,9	23,9	26,7	14,5
2	"Qibray – 4"	70x20-1	24,4	34,5	35,6	22,3
3	"Qibray – 4"	70x25-1	28,6	51,4	45,2	37,1
4	"Qibray – 4"	70x30-1	30,1	51,9	47,3	37,3
5	"Mumtoz"	70x15-1	20,0	24,7	28,6	15,7
6	"Mumtoz"	70x20-1	24,7	35,4	36,3	24,7
7	"Mumtoz"	70x25-1	29,0	53,2	46,5	39,0
8	"Mumtoz"	70x30-1	30,9	53,8	48,7	39,4
9	"Salomat"	70x15-1	19,5	24,5	38,9	15,2
10	"Salomat"	70x20-1	30,4	41,9	45,0	30,6
11	"Salomat"	70x25-1	32,1	44,7	51,1	31,0
12	"Salomat"	70x30-1	33,3	49,1	53,9	32,5

$HCP_{05}=t_{05}*s_d$	0,07	$HCP_{05}=t_{05}*s_d$	0,18	$HCP_{05}=t_{05}*s_d$	0,09
$Sx =H*100/x$	3,2	$Sx =H*100/x$	3,8	$Sx =H*100/x$	3,5

In "Salomat" variety of peanut, this indicator was observed in planting schemes with feeding area from 1050 cm^2 to 2100 cm^2, from 15.2 g / bush to 32.5 g / bush, and 17.3 g / bush grain weight was found.

According to the results of the study, the number of grains (up to 20,6 – 20,1 – 15,0 piece/bush) and grain weight (up to 22,8 – 13,7 – 17,3 g/bush) per bush of plant increased in all varieties as the feeding area increased.

Data on the productivity of peanut varieties given in table 2. According to the table, the total yield varies from 44.8 t / ha to 37.3 t / ha according to the planting scheme of "Qibray-4" variety, which is 70x30–1 in the planting scheme with a high feeding area of 2100 cm^2 decreased to 7.5 ts/ha compared to 70x15–1 variant.

In the "Mumtoz" variety, the total yield was 51.3 ts/ha in the planting scheme with a feeding area of 1050 cm^2, while in the planting scheme 70 x 30 - 1 with a high feeding area, the total yield

decreased to 43.3 ts / ha, that is to say by 8.0 ts/ha. According to a study of "Salomat" variety, the total yield decreased from 56.7 t / ha to 45.3 t / ha under planting schemes. It was found that the total yield decreased by 12.4 ts/ha in the planting scheme with a high feeding area of 2100 cm^2. Based on the results of the study on the total yield, it was found that in all varieties of peanuts in the planting scheme of 70x15–1 the total yield was high, and in the variant, with a high feeding area of 2100 cm^2 the total yield was reduced.

Among the varieties used in the experiment, the highest total yield was observed in the variety "Salomat", compared to the variety "Qibray - 4" it was 11.9 ts/ha higher; Compared to the "Mumtoz" variety, it was 5.4 ts/ha higher. According to the planting scheme of Qibray-4 variety, the stem yield varied from 22.1 t / ha to 13.3 t / ha, which decreased by 8.8 t / ha in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2 observed.

In the "Mumtoz" variety with a feeding area of 1,050 cm^2, the stem yield was 27.9 t / ha, while in the 70x30–1 planting scheme with a high feeding area of 2,100 cm^2, it was 18.5 t / ha and decreased to 9.4 t / ha. In "Salomat" variety of peanuts, the yield of stems decreased from 33.5 t / ha to 22.1 t / ha according to the planting scheme. It was found that the stalk yield decreased to 11.4 ts/ha in the planting scheme with a high feeding area of 2100 cm^2. According to the results of the study on stem yields, in all peanut varieties, the planting scheme of 70x15–1 had a high stem yield and decreased in the planting scheme with a high feeding area of 2100 cm^2. Among the varieties used in the experiment, the highest stem yield was observed in "Salomat" variety, 11.4 ts/ha compared to "Qibray-4" variety; Compared to the "Mumtoz" variety, it was 5.6 ts/ha higher.

According to the table, the yield of legumes in the "Qibray-4" variety increased from 22.7 ts/ha to 29.3 ts/ha, and in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2 - 24.0 ts/ha. The highest rate in this variety was observed in the variant with a feeding area of 1750 cm^2, and it was found that it produced up to 6.6 ts/ha higher than other planting schemes. According to the sowing scheme of "Mumtoz" variety, it increased from 23.4 ts/ha to 30.1 ts/ha, and in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2, it was observed to be 24.8 ts/ha. The highest rate in this variety was observed in the variant with a feeding area of 1750 cm^2, and it was found that it produced up to 6.7 ts/ha higher than other planting schemes.

According to the planting scheme of "Salomat" variety, it increased from 23.3 t / ha to 29.6 t / ha, and in the planting scheme 70x30–1 with a high feeding area of 2100 cm^2 it was observed to be 23.2 t / ha. The highest rate in this variety was observed in the 70x30–1 planting scheme with a feeding area of 1400 cm^2, which yielded up to 6.4 ts/ha higher than in other planting schemes. According to the data on legume yield, in the planting scheme of 70x25–1 varieties "Qibray-4" and "Mumtoz" the yield of legumes is high (29.3–30.1 ts/ha), and in the planting scheme with a high feeding area of 2100 cm^2, the yield of legumes (24.0–24.8 ts/ha) is to be low due to it was found that the number of plant bushes decreased due. The highest legume yield in "Salomat" variety used in the experiment was observed in the 70x20–1 planting scheme with a feeding area of 1400 cm^2 (29.6 ts/ha). Among peanut varieties, the highest legume yield was observed in "Mumtoz" variety, 0.8 ts/ha compared to "Qibray-4" variety; Compared to variety "Salomat" was 0.5 t / ha.

According to the table, according to the data on the bark of legumes, according to the planting scheme of the variety "Qibray-4" changed from 8.9 ts/ha to 6.3 ts/ha, this was reduced to 2.6

ts/ha in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2. In the "Mumtoz" variety with a feeding area of 1050 cm^2, the legume shell was 8.5 ts/ha, while in the 70x30–1 planting scheme with a high feeding area of 2,100 cm^2, the legume shell was reduced to 2.4 ts/ha. In "Salomat" variety, legume bark decreased from 8.9 t / ha to 7.5 t / ha according to planting schemes. This was reduced to 1.4 ts/ha in the planting scheme with a top nutrient area of 2100 cm^2. According to the results of the study on legumes, in all peanut varieties in the planting scheme of 70x15–1, the legume shell is higher, in the planting scheme with a high feeding area of 2100 cm^2, it was found that the shell of the legume was reduced.

Among the varieties used in the experiment, the lowest value was obtained in the variety "Salomat", which was 1.2-1.3 ts/ha higher than in the varieties "Qibray-4" and "Mumtoz". It should be noted that the seeds of the variety "Salomat" are fine and the shell of legumes are thin, due to the thick shell and grain size of Qibray-4 and Mumtoz varieties, the yield of legumes shell was high. Also, as the feeding area increases, the legumes and seeds are fully formed as peanut kernels absorb the nutrients and moisture in the legumes, the output of the legumes is reduced. According to the results of the study, the grain yield increased from 13.8 t / ha to 21.1 t / ha according to the planting scheme of "Qibray-4" variety and decreased to 17.7 t / ha under the planting scheme 70x30–1 with a high feeding area of 2100 cm^2 observed. The highest grain yield in Qibray-4 was observed in the 70x25-1 planting scheme (21.1 ts/ha) with a feeding area of 1750 cm^2. Grain yield was 7.4–5.3–3.5 ts/ha higher than other planting schemes.

According to the planting scheme of "Mumtoz" variety, the grain yield increased from 14.9 t/ha to 22.5 t/ha and decreased to 18.6 t/ha in 70x30–1 planting scheme with a high feeding area of 2100 cm^2. The highest grain yield was observed in the 70x25-1 planting scheme with a feeding area of 1750 cm^2 (22.5 ts/ha). Grain yield was 7.6–5.0–3.9 ts/ha higher than other planting schemes. According to the planting scheme of "Salomat" variety, the grain yield increased from 14.4 t/ha to 21.6 t / ha and decreased to 15.7 t/ha in the 70x30–1 planting scheme with a high feeding area of 2100 cm^2. The highest grain yield in the "Salomat" variety was observed in the 70x20-1 planting scheme (21.6 ts/ha) with a feeding area of 1400 cm^2. Compared to other planting schemes, the grain yield was 7.2–4.0–5.9 ts/ha higher. According to the data on grain yield, in the planting scheme of 70x25–1 varieties "Qibray-4" and "Mumtoz" the grain yield was high (21.1–22.5 ts/ha).

In the planting scheme with a high feeding area of 2100 cm^2, it was found that the grain yield decreased due to the small number of plant bushes (17.6–18.6 ts/ha). The highest grain yield in "Salomat" variety used in the experiment was observed in the 70x20–1 sowing scheme with a feeding area of 1400 cm^2 (29.6 ts/ha). Among peanut varieties, the highest grain yield was observed in "Mumtoz" variety, which is 1.4 ts/ha compared to "Qibray-4" variety; Compared to the "Salomat" variety, it was 0.9 ts/ha higher. The effect of the planting scheme on the 1000 grain weight of peanut varieties was significant. According to the planting scheme of "Qibray-4" variety, the weight of 1000 grains increased from 694.9 g to 737.0 g. In the planting scheme with a high feeding area of 70x30–1, the weight of 1000 grains is up to 42.1 g compared to the variant with a feeding area of 1050 cm^2; The weight of 1000 grains of "Mumtoz" variety was 650.8 g in the variant with a feeding area of 1050 cm^2, and 710.8 g in the planting scheme with a feeding area of 2100 cm^2. This is up to 60.0 g compared to the variant with a feeding area of 1050 cm^2; In "Salomat" variety, this indicator was observed to vary from 492.1 g to 527.9 g in the feeding area from 1050 cm^2 to 2100 cm^2, and the difference in weight of 1000 grains increased to 35.9 g.

According to the results of the study, it was found that in all varieties, as the feeding area increased, the weight of 1000 grains increased, the highest grains were observed in "Qibray-4" variety (737.0 g), 26.2 g more than in "Mumtoz" variety; Compared to "Salomat" variety was 209.1 g higher.

TABLE 2 YIELD INDICATORS OF PEANUT VARIETIES (2009 – 2011 yy., ts/ha)

№	Varieties	Planting scheme	Total yield	Stem yield	Legumes yield	Legumes shell	Grain yield	1000 grain weight, g
1	"Qibray – 4"	70x15-1	44,8	22,1	22,7	8,9	13,8	694,9
2	"Qibray – 4"	70x20-1	43,7	19,3	24,4	8,6	15,8	704,5
3	"Qibray – 4"	70x25-1	43,4	14,1	29,3	8,2	21,1	727,8
4	"Qibray – 4"	70x30-1	37,3	13,3	24,0	6,3	17,7	737,0
5	"Mumtoz"	70x15-1	51,3	27,9	23,4	8,5	14,9	650,8
6	"Mumtoz"	70x20-1	50,2	25,2	25,1	7,6	17,5	662,2
7	"Mumtoz"	70x25-1	49,3	19,2	30,1	7,6	22,5	687,9
8	"Mumtoz"	70x30-1	43,3	18,5	24,8	6,2	18,6	710,8
9	"Salomat"	70x15-1	56,7	33,5	23,3	8,9	14,4	492,1
10	"Salomat"	70x20-1	55,2	25,6	29,6	8,0	21,6	509,3
11	"Salomat"	70x25-1	50,5	25,1	25,4	7,8	17,6	519,8
12	"Salomat"	70x30-1	45,3	22,1	23,2	7,5	15,7	527,9

$HCP_{05}=t_{05}*s_d 0,18$ $HCP_{05}=t_{05}*s_d 0,07$ $HCP_{05}=t_{05}*s_d 0,09$

$Sx = H*100/x$ 3,5 $Sx = H*100/x$ 3,2 $Sx = H*100/x$ 3,8

CONCLUSION

Peanut planting schemes have been found to affect yields, the yield of 30.1 ts/ha in the plant scheme 70x25-1 of the "Mumtoz" variety, was 0.8 ts/ha higher than "Qibray-4" variety and 0.5 ts/ha higher than "Salomat" variety. When planting peanuts "Qibray-4" and "Mumtoz" in the planting scheme 70x25-1, it was found that the grain yield was high (21.1-22.5 ts/ha).

THE ROLE OF CHILD PSYCHOLOGY IN PUZZLES

Ibragimova Lizaxon Avezovna*

*Lecturer,
Nukus DPI Preschool Education,
UZBEKISTAN

ABSTRACT

The importance of puzzles in preschool child psychology, their methodological features and place in society. One of the main tasks of preschool children is to visualize information about objects and events in the child's brain. For example, by drawing, playing various games, making cubes, the child develops this information in his thinking. In the 12th grade textbook, there are more riddles under each text. The aim is to make the content of the text more understandable based on the riddles.

KEYWORDS*: Leonid Yakovlevich Bereslavsky, A.V. Zaporozhets, Topishmoq, M. Abdurahmonov.*

INTRODUCTION

At all stages of the development of society, the criterion of human perfection has been the enrichment of the human heart from infancy with such qualities as goodness, nobility, humanity, humanity, intelligence, morality, diligence, patriotism, honesty, purity, generosity, kindness, knowledge. Because the spirituality of a perfect person is high. A person with a high spirituality knows and follows the history, customs, values, traditions and culture of his people.

Preschool is a period when a child has a strong desire to grow, develop, strive to be small, organic, and curious. It is during this period that the foundation is laid for the development of the child's human qualities and mental potential. The earlier education with a preschool child begins, the earlier the effect will be manifested and the positive impact it will have on the child's entire life. Therefore, the development of children's thinking becomes one of the main tasks.

Imagination is the development of thinking. One of the main tasks of preschool children is to visualize information about objects and events in the child's brain. For example, by drawing, playing various games, making cubes, the child develops this information in his thinking. This

type of thinking is the basis for other types of thinking and contributes to the richness of vocabulary, the formation of logical thinking, the development of future school lessons.

In preschool, the logic of "kids" is a unique world with its own tricks, ways, and skills. The child constantly compares, compares and classifies different things and events in his daily activities.

Leonid Yakovlevich Bereslavsky believes that the child's intellect should be developed in a timely and systematic manner, he achieves the goal, learns well, learns logical thinking and self-confidence. The development of a child's brain goes through the addition of new levels relative to the old level

Children are overly curious by nature. They need to know everything: to taste, to taste, to invent little to explain things that are incomprehensible and new, to experiment, and to test their little hypotheses. Every parent needs to help their little one get to know the world around them.

The use of problem-based learning in teaching is also effective in shaping creative activity. Along with heuristic or research methods from the teaching methods associated with children's independent search and discovery of any truth, the process of bringing children into the laboratory of creative thinking is also of paramount importance. Problem-based learning has several advantages in this regard:

It teaches children to think logically, scientifically, didactically, creatively.

It makes the teaching material believable, thereby facilitating the transformation of knowledge into belief.

It is usually quite impressionable and creates deep intellectual feelings, including a kotarinki spirit, a sense of confidence in the lesser possibilities and power of the senses, so it engages children, forming a serious interest in scientific knowledge in children.

It has been established that the independent discovery of the law of truth does not forget the acquired knowledge, and even if the independently generated knowledge is forgotten, it can be quickly restored.

A condition for the emergence and development of a child's thinking is A.V. Zaporozhets is a change in the types and content of children's activities. The accumulation of simple knowledge does not automatically lead to the development of thinking. The child's thinking is formed in the pedagogical process, and it should be emphasized once again that a distinctive feature of a child's development is not adaptation, individual adaptation to the conditions of existence, but the child's active mastery of socially derived practical and cognitive activities. According to A. V. Zaporozhets, the mastery of such methods plays an important role not only in the formation of complex types of abstract, verbal-logical thinking for preschool children, but also the features of visual-figurative thinking.

Riddles play a special role in teaching children speech. It is well known that riddles are a brief description of an object or event. "A riddle," writes the literary critic M. Abdurahmanov, "is a small poetic work based on the conscious concealment, secrecy, of the concept of an object or reality." Riddles are, first and foremost, an educational tool that hardens the mind, especially encouraging children to think logically from an early age, but it is also a fun month.

Under the influence of folklore, cognitive ability improves, the emotional realm develops, moral ideas are enriched, observation and voluntary attention are enhanced.

Folklore contributes greatly to the formation of personality, enriches and develops children's speech.

Kids love dramatic games. They live a life with dramatization and dramatization protagonists, expressing their consent, protesting with shouts, and often interfering with the process of events. They often repeat themselves, change the dramatization, incorporate them into role-playing games, which makes them more expressive and interesting.

Riddles describe things and events, objects, flora and fauna, etc. that are related to human life. Often found - signs and objects are given signs such as size, shape, color, sound, taste, movement.

The puzzle makes it easy to teach children to adjust figuratively and clearly. Ingenuity allows you to develop such conditions as mental activity.

The puzzles chosen for school-age children should be simple, concise, and understandable. Therefore, the choice of puzzles should take into account the age characteristics of students, especially the ability to learn another language.

For primary school students, it is important to make effective use of the representation of the most important features of things and events in selected puzzles.

Riddles are questions or assignments in a poetic or prose structure that are based on finding a deliberately hidden sign, shape, behavior, position, and function of an object or event by comparing it to another object or event. Riddles are created in close connection with the life of the people. Underlying them are people's ancient beliefs and imaginations, their desire to know and comprehend the world.

What is hidden in the puzzle is his answer. To find the answer to a riddle, it is necessary to read the text of the riddle carefully, to understand what is being pointed out, and to try to find it by guessing exactly what the main feature and features of the riddle are.

The puzzle teaches students ingenuity and resourcefulness. For this reason, this genre of folklore has been widely used in textbooks. In the 12th grade textbook, there are more riddles under each text. The aim is to make the content of the text more understandable based on the riddles. For example, in the 1st grade textbook, the text "Love for the book" Underneath the puzzle "Layer by Layer, Throw If You Have the Mind" is selected and chosen very appropriate to the topic. When puzzles are given in this form, their answer is easy to find. Various riddles are also given in the textbooks of grades 1-4 under the theme "Riddles", which further increase the ingenuity of students, increase their thinking. given.

The teacher expresses the riddles in an expressive way, repeating the text so that the children can remember all the signs of what is being said. Using questions should draw children's attention to the characters and the connections between them.

Puzzles are a useful exercise for the child's mind. The game consists of discovering, guessing, revealing hidden and hidden things. When teaching children to find puzzles, toys can be used to get started. This form of working with the puzzle does not cause great difficulties for the child,

because there are things hidden in front of his eyes. In the future, children will learn to guess puzzles based on their own ideas. The experience of the children should be taken into account.

Telling different riddles about something allows children to enrich their vocabulary.

IMPORTANCE OF EARLY DIAGNOSIS OF ANGINA-FREE FORM OF CHRONIC TONSILLITIS IN CHILDREN

M.M.Murodova*

UZBEKISTAN

ABSTRACT

This article examines that topical issues of epidemiological and laboratory studies of angina-free forms of chronic tonsillar pathology of childhood, as well as the possibility of timely detection of persons at risk, diagnosis and treatment.

KEYWORDS: *Children, Chronic Tonsillit, Antisreptolin-O, Streptokokk.*

INTRODUCTION

Importance. Chronic tonsillitis is an infectious-allergic disease that manifest itself locally in the form of an inflammatory reaction of the tonsils, morphologically expressed alteration, exudation and proliferation. Today, interest in the problem of chronic tonsillitis is increasing.

The prevalence of the disease is high level in childhood, adolescence and youth, as well as, according to the World Health Organization, more than 100 somatic diseases of immune pathological profile with a leading infectious toxic-allergic mechanism related to chronic tonsillitis.

In the etiology of chronic tonsillitis, infectious factors are of primary importance. Lymph is an vital problem in the pathology of the ringeal ring.

Their contamination by conditional pathogenic microflora.

These flora species are very diverse in terms of composition, including gram-positive and gram-negative microorganisms, combinations with anaerobic microorganisms, and fungi. The main link in the pathogenesis of chronic tonsillitis is the state of immunodeficiency of the organism, and as well, chronic tonsillitis itself is a sign of immunodeficiency. Disruption of palatine tonsil drainage provided by anatomical and topographical method of subsequent pathogenetic linking.

Structural features of the tonsils.

This, in turn, leads to the activation of the microflora that is constantly present in the lacunae and the frequent purulence in them, resulting in the addition of infectious-toxic and allergic components (streptococci and tissue) to the pathogenesis of chronic tonsillitis. If there are forms without angina on the background of pharyngoscopic signs of chronic process of chronic angina, the patient does not allow it. In such cases, it can be assumed that the chronic process in the tonsils continues against the background of altered reactivity of the body. In other words, the absence of a history of sore throat does not mean the absence of chronic tonsillitis. The "angina-free form" of chronic tonsillitis is believed to occur in 4% of patients.

The purpose of the study is timely diagnosis of angina-free form of chronic tonsillitis in children on the basis of mathematical analysis of data on the referral of specialists in patients, laboratory parameters and identification of risk groups.

MATERIALS AND METHODS

In 2019, 56 children aged 2 to 18 years were examined at the Children's Multidisciplinary Treatment Center in Bukhara, of which 33 (59%) were boys and 23 (41%) were girls and they went to a notary otolaryngologist for medical advice.

Examination of patients:

otorhinolaryngologists and narrow specialists conducted examinations by specialties (cardiologist-rheumatologist,neurologist,allergologist, nephrologist, and pediatrician).

Appeals to doctors of relevant specialties include: The main complaints of a specialist doctor are:

- symptoms, syndromes, diagnosis and number of people,
- consulting a doctor cardiologist (ENT),
- rheumatologist pain in various joints, pain in the heart, weakness, discomfort;
- cardinal syndrome; articular syndrome; joint hyperlability;
- undifferentiated connective tissue dysplasia;
- ECG: PQ contraction, sinus node disruption;
- Ultrasound examination of the heart and blood vessels: mitral valve prolapse33 (58%), etc.
- Infectious sore throat, low-grade fever, etc.
- chronic bacterial-viral infections;
- Symptoms of prolonged subfebrile condition;
- lymphadenopathy 8 (15%)
- Allergist sore throat, skin rash, etc.
- Ineffective treatment of atopicdermatitis, allergy, bronchial asthma 6 (12%)
- Neurologist headache, weakness, sore throat, sweating, pain in the uterine spine, etc.
- VSD syndrome; - instability of cephalalgia 3 (5%)
- Nephrologist weakness, fever, low back pain,acute and chronic pathologies of the urinary tract 2 (3%)

Local doctor and others. Children in the BCH group, with more than 4-6 episodes per year (4) (7%).

RESULTS AND DISCUSSION

All patients do not have a history of acute primary tonsillitis,but have local symptoms of chronic tonsillitis - two or more, as well as changes in different organs and systems do not suit them. A set of symptoms of the affected organs (CVS, central nervous system, urinary tract, etc.).

Results of bacteriological studies.

In the studied group, the bacteriological method showed that in 30 people (54%) were representatives of the pathogenic microflora dominated by tic-hemolytics, group A streptococci (Str. Pyogenes) (GABHS), found in 18 children (32%).

The highest rate of BHSA fertilization is observed in the group of children aged 4-7 years - 16%. Pathogens of different age groups. 104-106 CFU age, number, up to 3 years, 4-7 years, 8-12 years, 13-18 years.

St. Pyogenes - 9 (16) 5 (9) 4 (7)

St. aureus - 2 (3) 2 (3) 1 (1.5)

Moraxella Cataract - 2 (3) 1 (1.5) 1 (1.5)

Gemof.Infi - 2 (3) 1 (1.5)

Normal microflora -2 (3) 13 (22.5) 10 (17.5) 5)

Bacteriological studies revealed that representatives of the pathogenic microflora were isolated in 30 individuals (54%), where GABHS (Str. Pyogenes) accounted for 18 children (32%) and other pathogens in 21%. The largest number is Str. Pyogenes is observed in a group of children aged 4-7 years - 16%. 26 people (46%) had normal pharyngeal microflora at the time of examination.

Anti-streptolysin-O is a sign of streptococcal infection in the body that is an antibody to the antigen.

GABHS streptolysin in group A.

An increase in this indicator indicates a previous streptococcal infection and the body's sensitivity to streptococcal antigens. ASL-O levels rise one week after infection, peak after 3-5 weeks, and decrease after 6-12 months. Climbing to a permanent level.

ASL-O test results:

ASL-O in human blood indicates the persistence of streptococcal infection in the body, which is a risk factor for chronic tonsilllogen infection. Method for determination of ASL-O - immuneturbidimetry, reference values: under 7 years - less than 100 U / ml, more than 7 years - less than 200 U / ml. Negative less than 100, more than 100, less than 200, more than 200 .

under 7- 5 (9%) 8 (14%) 8 (14%) 6 (10%)

7 years old- 4 (7%) 6 (10%) 7 (13%) 12 (22%)

Total - 9 (16%) 14 (24%) 15 (27%) 18 (32%).

According to the results of the study, in a group of children under 7 years of age, 26 people (46%), 14 people (24%) had an anticortisol of more than 100 U / ml, in a group of children over

7 years of age - 12 people (22%). It has an anticortium of more than 200 U / mL, clearly children in this group suffer from chronic infection indicated by GABHS and have tonsillogenic pathology.

Twenty-one (37%) of the ASL-O tested group did not have chronic inflammation of the streptococcal tonsils, but they were a bacterial carrier of streptococcal infection or a spread of acute infection. These local symptoms of chronic tonsillitis, bacteriological, laboratory studies, revealed an increase in GABHS secretion in 9 children (16%) and an increase in ASL-O above 100 U / ml in 14 children (25%). 14 people in this group suffer from chronic tonsillitis.

In children aged 8 to 18 years, a combination of GABHS secretion from 9 people (16%) and an ASL-O level above 200 U/ml in 12 people (22%) is an indicator of the development of chronic tonsillitis.

CONCLUSION

1. Timely and early diagnosis of chronic tonsillitis, especially in children, leads to the prevention of complications in various forms and organs.

2. These researches show that the angina-free form of tonsillitis is most often associated with diseases of various organs, especially the cardiovascular system, in almost half of the children who see an otorhinolaryngologist.

3. The most common form of chronic tonsillitis without angina is observed in the rapid growth and development of the child from 4 to 7 years.

4. Early identification of patients at risk for angina-free forms of chronic tonsillitis is necessary.

5. Specialists, district physicians should be aware of tonsillitis infection in children with symptoms of unknown origin, such as subfebrile condition, lymphatic denopathy, arthralgia, cardialgia for a long time, and consult an otorhinolaryngologist for advice immediately.

6. All children in the risk group of chronic tonsillitis are recommended bacteriological examination and study of antistreptolysin-O to detect GABHS.

THE ISSUE OF STATE REGULATION OF INVESTMENT ACTIVITIES OF INSURANCE COMPANIES IN UZBEKISTAN

Babaeva N. M*

*Associate Professor,
Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article defines the essence, role and importance of investment activities of insurance companies in the formation of investment resources in the economy. Based on the analysis of the structure and dynamics of the total investment portfolio of insurance organizations of Uzbekistan in 2010-2018. The contribution of the insurance sector of the economy to the formation of investment resources is determined. The directions of improving state regulation of investment activities of insurance companies in Uzbekistan have been determined.

KEYWORDS*: Government Regulation, Investments Of Insurers, Investment Portfolio, Investment Potential Of Insurance Companies, Insurance.*

INTRODUCTION

In the modern world, the insurance market acts as a catalyst for the socio-economic development of the state, since the economic significance of insurance is dualistic and performs not only a protective function, but also is a significant source of investment, including long-term ones. As the world practice shows, insurers, as financial intermediaries, play the role of a financial and credit institution and are powerful providers of capital to the economy. Insurance companies in many developed countries are the most important institutional investors that effectively place funds and manage assets, have significant investment capital, which plays the role of a global cushion for financial stability and security of the economies of these countries. In such conditions, the problem of improving state regulation of investment activities of insurance companies in Uzbekistan becomes especially urgent, since ineffective investment activities can provoke the failure of domestic insurers to fulfill their obligations and lead to severe economic and social consequences.

The problem of investment activity of insurance companies and its state regulation is studied by many domestic and foreign scientists and practitioners. At the same time, in the published sources there is no single point of view in defining the economic essence of the concepts of "investment potential" and "investment activity", and the influence of factors that are formed by modern reforms in the economies of countries, including Uzbekistan, and are of particular importance when determining measures to improve state regulation of investment activities of insurance companies in the republic.

International experience in the implementation of investment activities of insurance companies around the world shows that in recent years, investments of insurers from the EU member states have significantly increased. For example, in 2018, the investment portfolio of EU insurance companies amounted to more than 10 billion euros, which indicates a decrease of 1.5% compared to 2017. The most significant declines were in the Netherlands (-5.2%), the UK (-4%) and Germany (-2.1%), but small declines were also seen in France (-0.7%) and Sweden (- 0.6%). In contrast, Italy recorded an increase of 2.6% and Spain 2.4%. The slow annual growth of the total investment portfolio of insurers can be explained by the fall in stock prices in all European markets and bond prices in a number of European countries.

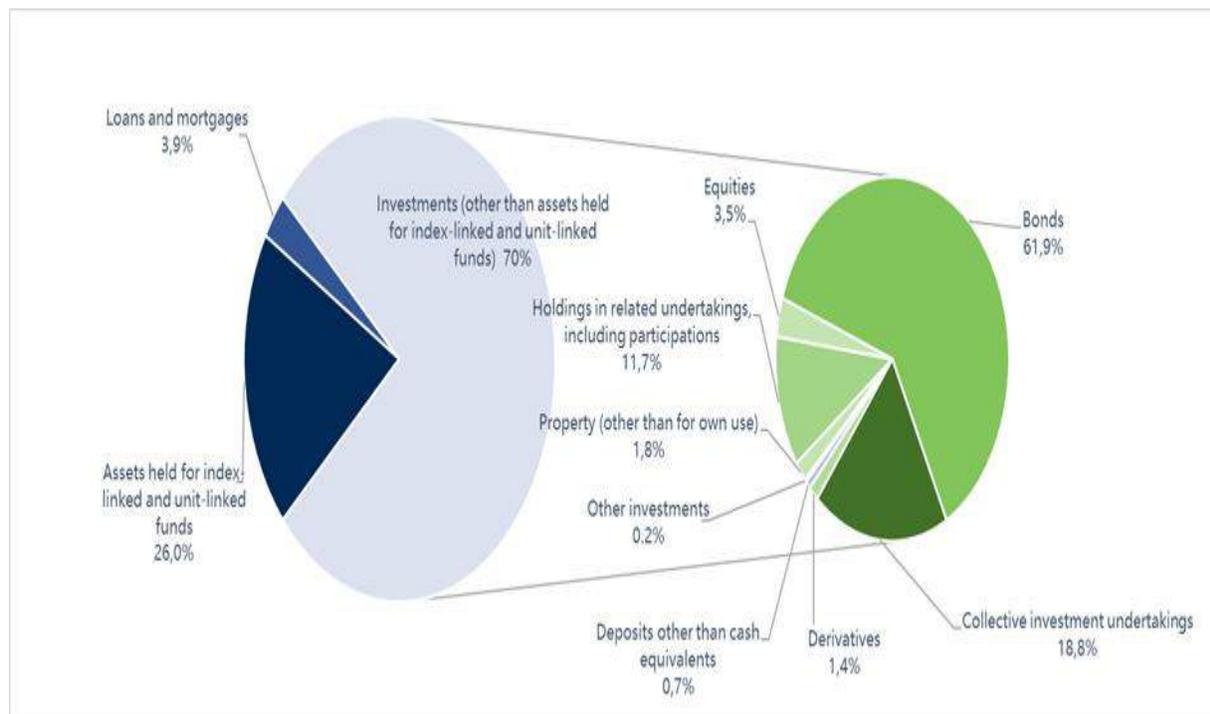
Changes in the investment portfolio of European insurers are mainly related to the development of the life insurance market, which accounts for more than 80% of investments. Investment assets of insurers from the UK, France and Germany together account for more than 60% of all European investments of insurers.


Figure 1. The structure of the investment portfolio of European insurers. (2018)

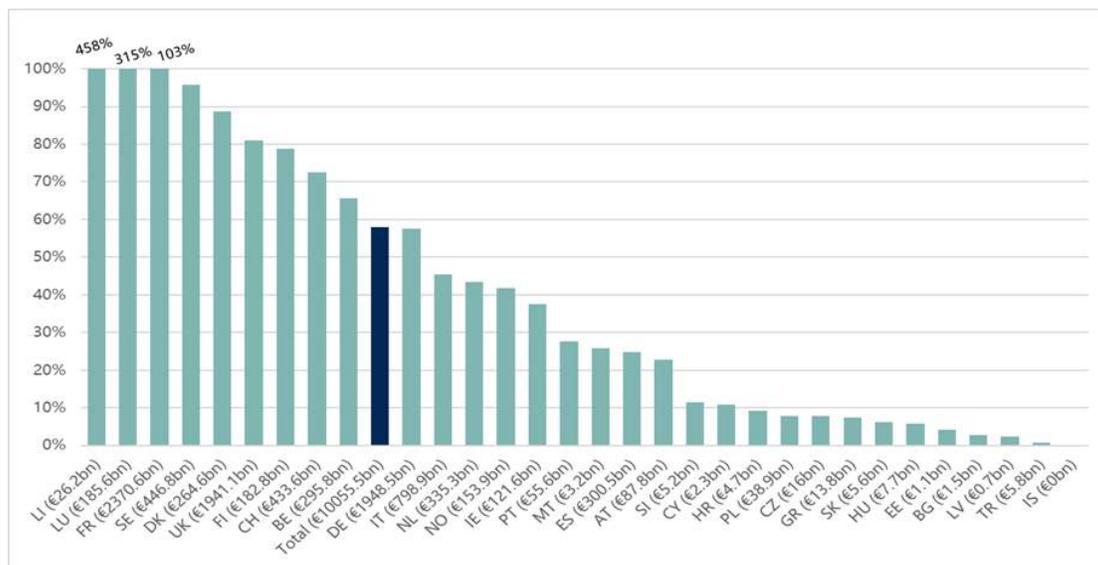
Analysis of the EU insurance market shows that investments in debt securities and other fixed income securities (61.9%) prevail in the structure of investments, the second largest of the total portfolio are assets of indexed and mutual funds and collective investment enterprises (18.8%), the third - investments in the activities of holding organizations, including participation interests (11.7%). The investment portfolio of European insurers in the structure of GDP is about 75%

Figure 2. Insurers' investment portfolio as % of GDP - 2017-2018

At the same time, the largest indicator was recorded in Liechtenstein (458%), Luxembourg (315%) and France (103%). A special direction of the investment policy of insurance companies in the EU and the United States is investment in the securities of the largest transnational


companies. Although in most cases the aggregate shareholding of insurance companies does not exceed 10% of the share capital of such corporations, there are cases where insurers control up to 30% of their portfolio of voting shares, which allows them to exercise effective control over the corporations. Direct ownership of securities is complemented by the participation of insurance organizations in the financing or management of corporations through investment companies. For example, UK insurance companies own more than 20% of the share capital of all London Stock Exchange listed public companies. Investments in various government securities also occupy a significant place in the investments of Western insurance organizations. Leasing operations of insurers are also widely used, in which they successfully compete with specialized firms. International experience shows the great importance of mortgages for the development of investments of insurance companies. The share of insurers' investments in mortgages in the "old markets" - with all the richness of the choice of investment instruments and with the existing huge fund of already built residential and non-residential premises - reaches significant values. At the beginning of the 21st century, mortgages accounted for 8% of the total assets of American insurance companies.

In the investment portfolio of American insurers, the main place (74% of its "mortgage section") is occupied by commercial, industrial and institutional mortgages, which provides for the issuance of loans for the construction of shopping malls, offices, industrial premises, and medical centers. It is generally accepted that without investment resources, including investments by

insurance companies, it is impossible to achieve macroeconomic stabilization and solve social problems. The investment activity of the insurer acts as one of the means of stabilizing the process of social production and increasing the efficiency of the economy and depends on two main factors - the specialization and the size of the investment potential of the insurer.

In our opinion, the investment activity of an insurance company is the purposeful placement of insurance reserves, reserves of preventive measures, equity capital of insurance organizations for a certain period in forms, in objects and instruments that can generate income in order to make a profit and (or) achieve another useful effect for fulfillment of insurance obligations to customers, as well as other obligations to creditors and owners of the insurer.

The following factors influence the investment activity of insurance companies: the volume and structure of the insurance market, its capitalization and concentration; the effectiveness of government regulation; the development of the stock market and the availability of reliable stock instruments, as well as the degree of their influence on the investment potential of the insurance sector of the economy. Carrying out investment activities, making a profit from it, insurers at the same time find themselves in significant dependence on the state of affairs in the financial market and in the country's economy as a whole.

This makes it necessary to carry out rather strict state regulation of the investment activities of insurance companies. The investment activity of an insurance company directly depends on state regulation, the state's awareness of the importance of investment activity for insurance companies. The two goals of the state in regulating the investment activity of an insurance company are absolutely opposite. This is due to the fact that, while protecting the interests of the policyholders, ensuring an effective social policy, the state restricts the activities of insurers in the field of investments and obtaining appropriate investment income.

In general, two main approaches of state regulation of insurance activity in relation to the investment activity of insurers can be distinguished: "European" and "American". The first provides for the mandatory profitability of purely insurance operations, excluding the investment activities of the insurer. The second (American) provides that the actual insurance activity may be unprofitable, but the losses will be covered by income from the investment activities of the insurer. These approaches determine not only the role of investment activities of insurance companies from the point of view of the state, but also affect the overall tariff policy of insurers.

In the EU countries, the regulation of investment activities of insurance companies is carried out at two levels: by EC directives and government regulation within countries to protect insurance companies. State regulation implies compliance with the principle of congruence, establishing requirements for the structure and composition of the investment portfolio, introducing control over the state of the investment portfolio, regulating the process of informing the regulator about its changes. It is believed that the economic basis of the financial stability of an insurance company is a competent investment policy based on a balanced investment portfolio based on the principles of repayment, liquidity, profitability and diversification. Therefore, the strategy and investment tactics of an insurance company should be focused on liquidity and profitability, depending on the structure of the insurance portfolio and market conditions. In turn, the investment potential of insurance companies is the ability of insurers to realize the opportunities contained in investment resources, while observing the principles of diversification, liquidity, profitability, and repayment. Developed countries have established asset allocation rates,

minimum and maximum quotas, and a list of assets that cover insurance reserves. The norms are regulated depending on the state of the economy, national traditions.

Investment directions are established separately for life insurance and other types of insurance or separately for each type. The key principles that characterize the investment process are currency matching, diversification, localization. The first principle means that the currency of the investment must match the currency of the insurance liability. The second principle: there should be no overdependence on any one category of assets, any one investment market, or an individual investment. The localization principle requires that assets intended for insurance payments be invested mainly in the EU or in a country that is a party to the contract. In recent years, the norms for placing temporarily free funds have been unified in the EU. At the macroeconomic level, investment by insurance companies can play an important role in the economic and social development of regions, as is the case, for example, in the United States. The US insurance market has an important feature: the regulation of insurers' activities occurs not at the federal level, but at the state level, which creates significant prerequisites for the socio-economic development of regions.

Despite the increased investment activity of the domestic insurance market of the economy, as a result of the adopted legislative measures, the insurance sector is currently not quite capable of exerting a significant influence on the investment of the national economy, in contrast to the Western experience, where insurance companies are the largest institutional investors. So, at the moment, the basis of state regulation of investment activities of insurers in Uzbekistan is the Law of the Republic of Uzbekistan "On insurance activities", Resolutions of the President of the Republic of Uzbekistan "On measures to reform and develop the insurance market", "On measures to ensure accelerated reform and development of the insurance market Republic of Uzbekistan ".

But despite the measures being taken, the investment resources of the insurance market of Uzbekistan are used relatively ineffectively, since the structure of placing insurance reserves and own funds is not capable of providing high returns due to the lack of instruments in the stock market. The investment activity of the overwhelming majority of insurance organizations does not correspond to the investment objectives of the insurance sector in market conditions.

According to the experience of the world's leading companies, the following criteria are defined in the investment portfolios of these companies: 15% are investments in the authorized capital of enterprises and real estate, 25-30% investments in securities, 15-30% funds on deposits of commercial banks and 1-12% investments in other areas of investment activity. (Table 1) If insurers carry out life pension insurance in the non-state pension system, the funds of reserves formed under such agreements are allocated in accordance with the Law of Uzbekistan "On State Pension Provision of Citizens."

In order to improve the insurance market, on the basis of the Decree of the President of the Republic of Uzbekistan "On measures to reform and ensure the accelerated development of the insurance market of Uzbekistan", adopted in August 2019, a "roadmap" for the development of the sphere for 2019-2020 was developed and approved, in which seven main directions are identified:

The first is to improve the regulatory framework. The law "On insurance activities" is considered outdated and does not meet modern requirements. It is planned to adopt a law on compulsory types of insurance, improve mechanisms for voluntary pension insurance, as well as create a Fund for guaranteed payments for life insurance, which will give market participants the opportunity to use new investment instruments.

The second is the institutional development of the regulation of insurance activities. It is planned to revise the solvency standards of insurers, increase the size of authorized funds, and impose requirements on the quality of assets of insurance companies. In addition, it is planned to revise the methodology for calculating the formation and placement of insurance reserves and the transition to International Financial Reporting Standards, which will allow companies to enter the international market.

Third, the development and expansion of the insurance market infrastructure. It is supposed to develop a new edition of the regulation on insurance agents. The regulation on the procedure for the provision of adjuster, sujourveyor and assistance services will be approved.

Fourth - increasing the level of capitalization, solvency and financial stability of professional participants in the insurance market.

Fifth, strengthening the protection of the rights of consumers of insurance services and other entities and promoting insurance and insurance culture.

Sixth - expanding the range and improving the quality of insurance services. It is planned to introduce new innovative types of insurance and provide services in electronic form.

Seventh - the system of training specialists in the insurance market. This direction is the most important and at the same time very problematic. It is envisaged to introduce the "insurance business" direction in specialized universities, to introduce mechanisms for increasing the insurance and financial literacy of the population.

CONCLUSIONS

From the position of the state, the directions of improving state regulation of investment activities of insurance companies should be aimed at ensuring the competitiveness of domestic insurers, redistributing investment flows, as well as stimulating investment in the development of the national economy and integration into the world economy. From the standpoint of insurance companies, this is the maximization of profitability and liquidity of investments while minimizing risk in order to continuously ensure and maintain solvency, prevent the depreciation of invested capital by inflation, increase competitiveness in the insurance market and improve performance. From the perspective of clients of insurance companies, this is an increase in the level of trust, loyalty and an increase in demand for insurance services.

Summarizing the above, it is advisable to emphasize that the most important factors influencing the investment potential of the insurance market of a particular country are external and internal factors of influence, such as: the volume and structure of the insurance market, capitalization and concentration of the insurance market; the effectiveness of government regulation; stock market development and availability of reliable stock instruments; stability of economic development; the level of the insurer's own funds; introduction of new types of insurance; the effectiveness of financial planning and the availability of professional staff.

And the functioning of insurance companies in the financial market is directly dependent on the level of development of the economic system, on the investment climate prevailing in the country, on the macroeconomic situation in general, which is directly ensured and regulated by the state. In the absence of attractive investment instruments on the insurance market, the investment activities of insurance companies will not bring the expected effect.

ABSTRACT

The main raw material for obtaining technical carboxymethyl cellulose (CMC) is wood pulp, both in our country and abroad. Given the wide range of CMC applications, the possibility of its synthesis from non-traditional raw materials: beech wood, bark, sugar beet pulp, hydrolytic cellulose, waste of viscose yarns has been studied in world practice. As a cellulosic raw material, waste from the production of alkaline cellulose that does not require additional activation can also be used. Waste cereals, i.e. straws of rice and wheat in terms of cellulose content occupy after wood.

KEYWORDS: *Carboxymethyl Cellulose, Cellulose, Cellulose Ethers, Degree Of Polymerization, Degree Of Substitution, Ash Content, Temperature, Humidity, Mercerization, Natural Polymer Material, Non-Woody Plant Species Such As Flax, Cotton Stalks (Cottonwood).*

INTRODUCTION

The main raw material for obtaining technical carboxymethyl cellulose (CMC) is wood pulp, both in our country and abroad.

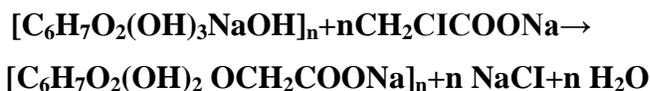
Given the wide range of CMC applications, the possibility of its synthesis from non-traditional raw materials: beechwood, bark, sugar beet pulp, hydrolytic cellulose, waste of viscose yarns has been studied in world practice. As a cellulosic raw material, waste from the production of alkaline cellulose that does not require additional activation can also be used. Waste cereals, i.e. straws of rice and wheat in terms of cellulose content occupy after wood. If the cotton contains up to 98%, and in the wood up to 50% cellulose, and in the straw contain 40 to 42% cellulose.

At the Namangan Karbonam LLC, the CMC is currently produced on the basis of sulphite cotton cellulose from the Fergana Furan Plant (FZFS), which is not satisfied with cellulose. In our country there is a large amount of cellulose-containing raw materials (cotton linters, rice and wheat straw, kenaf fire, cotton lint and hardwood wood - poplar, etc.) from which various brands of CMC can be obtained. However, the issue of isolating cellulose from these cellulose-containing fibrous materials for obtaining CMC has not been fully resolved and its production is not established, which is the main obstacle in the organization of the CMC industrial output based on them. In this connection, this chapter of the thesis deals with the development of technology for the production of CMC from cellulose from local annual plants and poplar wood, which can provide the demand for cellulose to LLC "Carbonam". The above cellulosic semi-finished products contain 85-90% cellulose.

In the circle of problems of oilfield chemistry, one of the first places belongs to drilling fluids. This is due to their importance as an environment in which rock destruction takes place and by the fact that they carry a number of responsible technological functions that largely determine the success of drilling. The success of drilling wells depends to a large extent on the composition and properties of drilling fluids, which should ensure safety and trouble-free operation at high speed and drilling and a qualitative opening of the productive formation. The use of drilling fluids with controlled properties justifiably requires considerable resources in order to economize the time spent on work related to accidents, complications, processing and washes, duration and results of development. For the drilling of oil and gas wells, the stabilization of drilling muds based on the use of protective colloids, in which high-molecular compounds, in particular widely used in drilling, carboxymethylcellulose (CMC), are used as one of the decisive factors.

The water-soluble carboxymethylcellulose (Na-CMC) is obtained by the action on alkaline cellulose monochloroacetic acid according to the following reaction:

$$[C_6H_7O_2(OH)_3NaOH]_n + nCH_2CICOONa \rightarrow$$

$$[C_6H_7O_2(OH)_2 OCH_2COONa]_n + n\ NaCI + n\ H_2O$$


The main parameters of Na-carboxymethylcellulose, which determine the properties of drilling muds based on it, are the degree of polymerization, the degree of substitution, and also the content of the basic substance.

As is known, with standard methods of producing Na-CMC, it is possible to obtain a technical product with a main substance content of 45-55%. This is due to a number of technological parameters leading to a decrease in the selectivity of the carboxymethylation reaction of alkaline

cellulose with sodium monochloroacetate (a decrease in the efficiency of sodium chloroacetate). One of these factors is the water content of alkaline cellulose, leading to a shift in the carboxymethylation reaction towards the hydrolysis of sodium monochloroacetate to form glycolate and sodium chloride, with a general decrease in the content of the basic substance and the degree of substitution in the technical Na-CMC.

In view of this, the effect of the content of the organic solvent in the dissolution solution on the content of the basic substance, the degree of substitution, the viscosity, the solubility, and also the filtration index of the clay solution was studied.

To synthesize Na-CMC, an aqueous and water-methanol solution of sodium hydroxide with a concentration of 260 g / l was used, water was replaced by methanol by 10-40%, cotton cellulose, and sodium monochloroacetate.

Table 1 shows the technical characteristics of the obtained Na-CMC samples.

TABLE №1. EFFECT OF THE CONTENT OF ORGANIC SOLVENT IN THE DISSOLVING SOLUTION ON THE QUALITATIVE CHARACTERISTICS OF SYNTHESIZED NA-CARBOXYMETHYLCELLULOSE

Content CH$_3$OH (in a dissolving solution), %	0	10	15	20	25	30	35	40
Consumption NaMXUK mole /1 mole cellulose	1,8	1,8	1,8	1,8	1,8	1,8	1,8	1,8
Content of the main substance, %	52	56	59,5	62,4	67,8	72,6	75,2	76,3
Degree of substitution	72	74	76	76	79	82	85	86
Viscosity 2%-го solution Na-CMC, мPa*c	210	235	248	267	289	304	315	330
Solubility, %	96,5	96,8	97,0	97,2	97,3	97,3	97,4	97,5
Liquefaction of mud, B^{30*}	6	5,8	5,5	4,8	4,0	3,8	3,5	3,0

* the water yield of the clay solution was determined by a standard method, with a sodium chloride content of 10%, bentonite-10%, Na-CMC-0.75%.

From the data given, it can be seen that replacing the traditional solvent in a dissolving solution, water, with an organic solvent, leads to an increase in the content of the basic substance and the degree of substitution in the technical Na-CMC, while improving its other characteristics.

ABSTRACT

This article discusses the didactic system of developing the professional and pedagogical competence of future computer science teachers on the basis of an integrative approach, its application and effectiveness.

KEYWORDS: *Didactic System, Integrative Approach, Person-Oriented, Competent Approach, Mixed Learning, Zoom Program, You Tube Channel, Telegram Social Network, Keys Style, Steam Education, Horizontal Integration, Vertical Integration.*

INTRODUCTION

Today, the education system is more than ever in need of serious attention to the processes taking place in society. The education system faces the task of developing competitive individuals with special skills and abilities in the electronic information environment.

There is a need to formalize this process and develop its didactic system in order to develop scientific recommendations for the implementation of such a complex process as the development of professional and pedagogical competence of future computer science teachers on the basis of integrative approaches. Now we will try to describe the didactic system of development of professional and pedagogical competence of future computer science teachers on the basis of integrative approaches.

Didactic system (Greek "systema" - a combination of integral parts) - is the definition, highlighting of the whole state of the educational process on the basis of certain criteria. The didactic system can be divided into groups such as traditional, advanced (modern) [4].

The main idea of   the didactic system is to develop the professional and pedagogical competence of future teachers of computer science on the basis of an integrative approach through the goals, stages, content, form, methods and tools of education. The basis of the process of development of professional and pedagogical competence is the didactic system. The structure of any didactic system can be represented by its interrelated elements. Such structures make it possible to conduct research and develop this process as a single pedagogical phenomenon.

The didactic system proposed by us consists of the following parts:

 -Development of professional and pedagogical competence of future computer science teachers based on targeted social needs;

-Organizational - the content, stages, forms, methods and means of development of professional and pedagogical competence of future teachers of computer science;

-Reflexive - to express the criteria and effectiveness of the process of development of professional and pedagogical competence of future teachers of computer science.

We offer integrative, person-centered and competent approaches to the development of professional and pedagogical competence of future computer science teachers.

 Integrative approach - means the implementation of the principle of integration in any component of the pedagogical process, ensuring the integrity and consistency of the pedagogical process. Integrative processes are the processes of qualitative change of individual elements of the system or the whole system [10].

 In a person-centered learning process, the learner is a key participant in the whole learning process, an independent learner equal to the educator, and the educator is not only a "source of information" and a "supervisor" but also a facilitator, supportive, motivator and is also diagnostic. The organization of such a learning process requires guidance based on the principle of "Help me do it independently" derived from the teachings of M. Montessori (a theory called Montessori pedagogy or Montessori system developed in the twentieth century by the Italian pedagogue Maria Montessori. based on supporting the rhythm and direction of personal development) [7].

 Unlike traditional education, person-centered education is a type of educational organization that aims to create the necessary conditions for the development of students' personal abilities, taking into account the full range of opportunities and abilities of learners in the learning process. [3]

 The main essence of person-centered education is to reveal the personal experience of the student as a central subject of the educational process on the studied topic, to adapt it to the given knowledge and to transfer it to the appropriate scientific content [8].

 Competent approach, according to O. E. Lebedev, it is a set of general principles for defining educational goals, choosing the content of education, organizing the learning process and evaluating learning outcomes. This principle includes:

• The content of education is to develop students 'ability to solve problems independently in different areas and types of activities based on the use of social experience, an element of which is the students' own experience.

• The content of education is a didactically adapted social experience of solving cognitive, ideological, ethical, political and other problems.

• The purpose of the organization of the educational process is to create conditions for the formation of students' experience of independent solution of cognitive, communicative, organizational, ethical and other problems that make up the content of education.

• Assessment of learning outcomes is based on an analysis of the level of education achieved by students at a particular stage of the learning process [5].

The development of professional and pedagogical competence of future teachers of computer science is carried out in different forms, on the basis of the use of different methods and tools. It should be noted that today the development of professional and pedagogical competence of future computer science teachers is not possible in the context of traditional forms and methods. Indeed, the leading form of development of professional and pedagogical competence in educational institutions is the system of teaching subjects.

Modern forms of organization of the educational process can include mixed education, which requires increasing the responsibility of students for learning outcomes and expanding the scope of independent work. Students focus on interacting and collaborating with the teacher. There will be an opportunity to study the material and control it.

Blended learning. Information technology offers a variety of new forms of education, especially in recent years, the principle of an integrated approach in the modular education system is growing. The adaptation of different forms and methods has led to the introduction of mixed education as an innovation. Declan Berne says of blended learning, "this learning is about making the most of the rich pedagogical experience." Such an approach can be based on the use of different methods in the presentation of information, the organization of traditional activities in the organization of education and information technology, individually and in groups in the educational process. Such a diverse approach does not tire the reader and reinforces their motivation to read. The main task is to ensure the compatibility of the selected methodologies and achieve high efficiency at low cost. Today, blended learning is a combination of elements of full-time traditional education and distance learning, which allows for the combination of traditional methodologies and new technologies. In this system, the teacher stays at the center of learning and makes extensive and effective use of the Internet. Blended learning consists of distance learning, classroom learning (Fake-to-Fake learning) and online learning [6].

<div align="center">1st table</div>

Traditional forms of education	Mixed forms of education
-lecture	-Lecture in network classes -tele (video) conference lectures -report-presentation
-practical trainings -seminars -laboratory works	-classes in computer classes - Distance learning is carried out through the distance learning platform distant.tsul.uz and the program

	Zoom, as well as lectures on Zoom are recorded and uploaded to the youtube channel of universities and groups of students on the social network Telegram; - Distance competitions and Olympiads
-independent (individual) work of students -design activity -course and diploma projects -work with library resources - conducting educational conferences using e-mail and telecommunications -student communication (telegram) during the study of the topic - Work with the electronic library -work with the database	-conducting educational conferences using e-mail and telecommunications -student communication (telegram) during the study of the topic - Work with the electronic library -work with the database

Nowadays, the use of new methods of teaching has become one of the requirements of the time.

We consider it expedient to use Keys technology to develop the professional and pedagogical competence of future computer science teachers in the teaching process.

Case (visual Case - means "event", "event", "situation", "situation") - is a written description of the real situation that occurs in an organization, and during its use from students:

-analysis of the situation;

- to study the essence of the problem;

- suggest possible options for the solution;

- you will be asked to choose the most optimal solution.

The main purpose of the case method (visual case-study, case-by-case method, situational analysis method) is to use situation models in students to solve different situational problems, analyze problems in groups and suggest, evaluate and solve the most effective solutions. Presentation is about strengthening their knowledge of the sciences through the production of skills and competencies [1].

We propose to use appropriate STEAM training to develop the professional and pedagogical competence of future computer science teachers on the basis of integrated approaches.

STEAM education is an alternative approach to traditional teaching. In doing so, students study Science, Technology, Engineering, Art, and Mathematics based on interdisciplinary connections and a practical approach. STEAM allows students to carry out project and research activities in and out of the university.

Strange as it may seem to some, but already understandable to some, the trend is gaining momentum across the country. Any educational conference, any serious event from the world of pedagogy is combined into an attractive "STEAM" that doesn't end without these five letters. And for a smart teacher, what hides the widest opportunity and potential for himself.

What is STEAM training?

It all started with the term STEM, which originated in the United States. The only difference between STEAM and STEM is the single letter A- (Art), but the difference in approach is huge! It is this STEAM education that has become a real trend in the U.S. and Europe, and many experts call it future education.

You don't work in school without art. It's children's creativity.

STEAM is a new educational technology that combines several disciplines as a means of developing critical thinking, research skills, and teamwork skills.

STEAM is the development of the well-known abbreviation STEM, with the exception of a work of art. S-science or fan. T-technology, i.e. technology. E-electronics means engineering in English. M-mathematician, queen of sciences-mathematician. Art, a new component of the A-abbreviation — art, can be understood as completely different directions — painting, architecture, sculpture, music, and poetry.

The addition of art expands the student body involved in the project so that students with strong design and mathematical skills can provide aesthetic support to the group.

The STEAM curriculum is based on the idea of teaching students using an interdisciplinary and practical approach. Instead of studying each of the five disciplines separately, STEAM combines them into a single educational path.

STEM training allows the use of scientific methods, technical manuals, mathematical modeling, and engineering design. This leads to the formation of innovative thinking, skills, abilities of the student of the XXI century.

According to teachers, integration allows for success in most professions. Almost all researchers claim that advanced technology increases the motivation to learn and expand basic knowledge in the field of design and programming.

STEM training is an innovative methodology that allows our future computer science teachers to reach a new stage of skill development and competence development. With its help, we can form an advanced human resources base that will allow us to become an economically independent and competitive country.

Advantages of STEAM Education:

 - Integral learning by topic, not by topic.

 - application of scientific and technical knowledge in life.

 -Develop critical thinking and problem solving skills.

 - building self-confidence.

 - active communication and teamwork.

 - Development of interest in technical sciences.

- creative and innovative approach to projects.

- Development of motivation for technical creativity through student activities, taking into account the age and individual characteristics of each student.

 - Initial vocational guidance.

 - To prepare students for the technological innovations of life.

 - STEM, in addition to the mandatory part of the basic training program (ATD) [9].

For example, BS Akhmetov noted that teaching methods should be reflected in the development of all components of the information and educational environment. It is a method of modeling teaching methods that meet the requirements of the education system based on the application of high-level computer technology. The use of computer modeling in the educational process (the study of the phenomenon on the basis of ready-made models and the construction of models by students) has a significant impact on the acceleration of the learning process. In addition, the efficiency of the educational process is significantly increased during the computer solution of specific problems [2].

In today's information society, the future specialist can not achieve the desired results without the use of the necessary electronic communication tools. These include operational search tools, storage and transmission of training and other information, which directly affect the professional and pedagogical competence of the specialist. Hence, these tools are necessary for the future teacher to use the skills and competencies to obtain the necessary information. Such tools include, in the first place, computers, peripherals, local and global computer networks. It follows that the technological conditions also have a direct impact on the development of professional and pedagogical competence of the teacher.

These technological conditions require free communication between the student and the computer, and these conditions require universities to introduce a number of tasks - to change the curriculum in science, to introduce a special independent course on information technology, to modernize the material and technical base of universities with modern electronic communication tools. requires provision.

The presence of incompletely structured information requires students to acquire certain skills in the real search for information. The information is in print (primary sources, textbooks, manuals, methodical recommendations on independent study of educational materials, scientific, popular science, fiction, documents, legal collections, etc.). It can be presented in the form of a computer program or a computer network resource. Adding this information to the information learning environment makes it person-centered, that is, humanized.

Among the various systems used in the educational process, it is possible to distinguish declarative knowledge that supports the educational process. These include databases of e-books and other computer tools that collect, store and transmit information. They will not only be in the form of text, but also in the form of graphics, audio and video images. The results of a number of studies confirm the existence of computer-based learning systems that are effective. They affect mental phenomena: long-term storage of acquired knowledge in memory, increase the contribution of acquired knowledge, increase the analytical and logical abilities of learners. Information appears as the main driving factor. Therefore, the development of today's society depends more on the effective functioning of the information learning environment in this society.

One of the hallmarks of today's information-educational environment in higher education is the ability of teachers and students to access structured teaching materials, multimedia complexes that teach at any time and in any space. At the same time, the opportunity to have access to the training material at any time allows you to communicate with the teacher, get advice online or offline.

Information technology creates the opportunity and the need to make changes to the model of the learning process: from reproductive learning, that is, the transfer of knowledge from the teacher to the students and from it to the creative model. At the same time, the modeling of life situations in the classroom with the help of new technologies and equipment is provided. In this regard, according to experts, the development of traditional and new technologies should be based on complementarity and mutual correction.

Independent work in the form of organizational, educational and methodological support for independent work, forms of training and supervision offered by the teacher develops informational and general educational competencies in students.

Now, summarizing the materials described in this paragraph, we present the didactic system formed by us for the development of professional and pedagogical competence of future teachers of computer science.

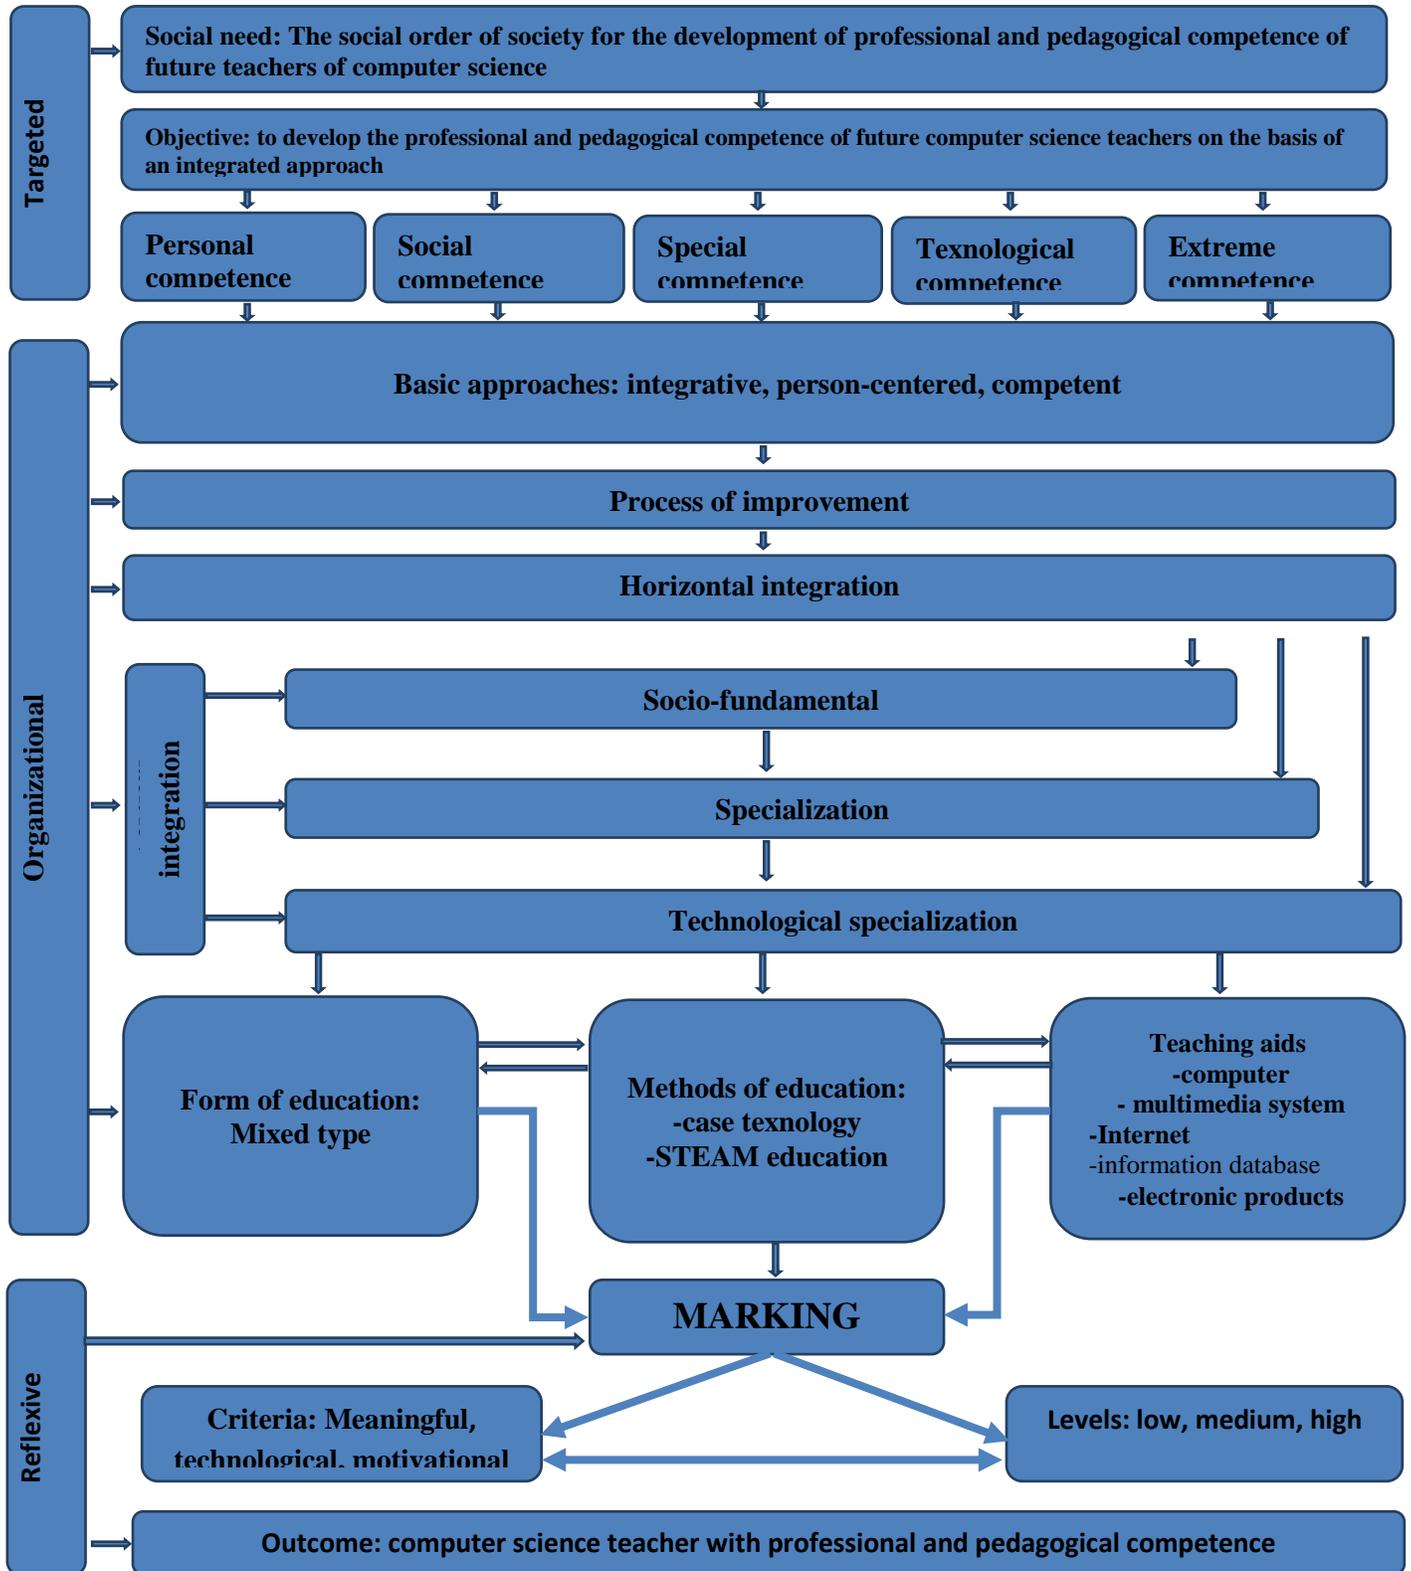
Now let's talk about the horizontal and vertical integrations in our system: horizontal integration is the integration of computer science teaching methods in the curriculum in the semester in blocks; vertical integration is the integration of computer science teaching methods in the curriculum of the disciplines in the curriculum in blocks.


Figure 1 Didactic system of the process of development of professional and pedagogical competence of future computer science teachers

Thus, we propose a didactic system of the process of developing the professional and pedagogical competence of future computer science teachers, created during our research. It is expressed in the form of a pedagogical system, based on certain methods, forms and tools, and consists of purposeful, meaningful organizational and reflexive components.

 Below is the learning outcomes based on the didactic system.

 Calculations show that the performance of the experimental group increased by 15.7% compared to that of the control group.

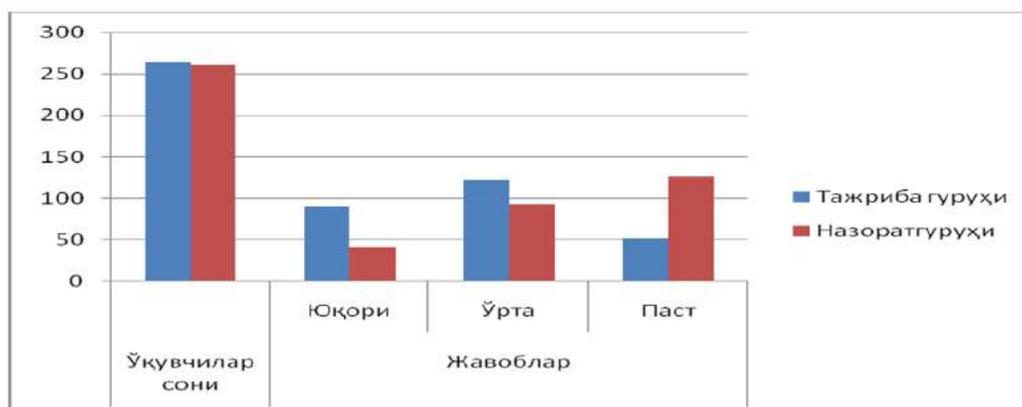
 A diagram of the general statistical analysis of the results obtained from the conducted pedagogical experiment is shown in Figure 2.


Figure 2 Diagram of general statistical analysis of pedagogical experience

CONCLUSION

Summarizing the above statistical analysis, it can be said that the pilot methodology to increase the effectiveness of the process of developing professional and pedagogical competence of future computer science teachers in experimental groups on the basis of integrative approaches is effective.

ABSTRACT

Strengthening the independence of the Republic of Uzbekistan in the economic sphere provides the creation of its own productions for the production of pulp and paper products based on local cellulose-containing plants.

KEYWORDS*: Carboxymethyl Cellulose, Cellulose, Cellulose Ethers, Degree Of Polymerization, Degree Of Substitution, Ash Content, Temperature, Humidity, Mercerization, Natural Polymer Material, Non-Woody Plant Species Such As Flax, Cotton Stalks (Cottonwood).*

INTRODUCTION

Strengthening the independence of the Republic of Uzbekistan in the economic sphere provides the creation of its own productions for the production of pulp and paper products based on local cellulose-containing plants.

Analyzing the chemical composition results obtained after the extract of the vegetative part of safflower (Table 1), it can also named as a ligno-carbohydrate complex, with about 65% of carbohydrates accounting for more than 35-40% of the total cellulose content of polysaccharides. The non-hydrolysable part of plant raw materials-lignin is 1/3 of the sum of polysaccharides.

TABLE 1.CHEMICAL COMPOSITION AFTER EXTRACTION RESIDUE VEGETATIVE PART OF SAFFLOWER

Index	Content, % (а.с.в.)
Minerals	1,65
Substances extracted with hot water	2,02
(ЛГПвт.ч.) pentosanoids hexosans	22,21 6,58 15,63
(ТГП вт.ч.) cellulose	40,60 43,11
Total: polysaccharides	60,20
Substances of lignin nature	22,14

As can be seen from Table 1, in the solid part of safflower up to 40% of cellulose is contained, which indicates that safflower is one of the promising sources for the production of cellulose, suitable for further chemical processing.

In this connection, the chemical analysis of the solid content of safflower was carried out according to the methods adopted in the chemistry of wood for the production of cellulose.

Further studies were conducted to establish the optimum cooking temperature. For this purpose, a series of experiments were conducted on cooking safflower at different temperatures and at an alkali concentration of 50 g / l for 5 hours. Qualitative parameters of the obtained samples were studied. The obtained data are given in Table 2.

From Table 2 it can be seen that before reaching 1000C, non-cellulose substances are not produced and the raw material retains its external fibrous appearance (does not crumble).

As a result of cooking at 1000 ° C, the yield of pulp is much higher, about 40.0%, humidity 3.6%, ash content 1.15%, content of α-cellulose 93.2% and SP-850.

With increasing temperature, the qualitative characteristics of cellulose change markedly. It is known that an increase in temperature leads to an increase in the rate of destruction (hydrolysis) of the ether bond between the glucopyronose cycles of the macromolecule of cellulose. Therefore, an increase in temperature by 10 ° C leads to a decrease in the yield of cellulose to 36.7%, a cellulose content of 90.6%, a DP feeds up to 740. Reduction of the content of sol in cellulose is due to an improvement in its solubility at elevated temperatures.

TABLE 2. EFFECT OF TEMPERATURE ON THE YIELD OF CELLULOSE AND OTHER INDICATORS OF CELLULOSE

№	NaOH, г/л	temperature, ^{0}C	τ, hour	Exit, %	Humidity, %	slush, %	α-cellulose, %	PP
1.	20	98-100	5	-	-	-	-	-
2.	30	98-100	5	-	-	-	-	-
3.	40	98-100	5	44,1	-	1,25	90,1	960
4.	50	98-100	5	41,2	3,0	1,15	93,2	850
5.	60	98-100	5	35,4	3,1	0,89	94,3	740

The pulp obtained in the optimal cooking mode after cooking is a pale brown mass. Color bleaching has been carried out to bleach the pulp. As a bleaching agent, the hydrogen peroxide (H_2O_2) was used, which is an environmentally friendly and non-toxic liquid substance.

From the literature data it is known that the bleaching process with hydrogen peroxide is carried out at a temperature of 70 ° C in an alkaline medium. To determine the optimum concentration of H_2O_2 in the bleaching of cellulose obtained from the vegetative part of Jerusalem artichoke, studies were conducted of the dependence of cellulose whiteness on the content of H_2O_2 in the bleaching mixture under the above conditions. Theobtained data are shown in Table 3.

TABLE 3. INFLUENCE OF BLEACHING CONDITIONS ON THE BASIC INDICATORS OF CELLULOSE

Content , H_2O_2, %	White , %	Content α-cellulose, %	PP	slush, %
1,5	62	87,6	-	0,86
2,0	68	88,4	-	0,84
2,5	74	89,8	840	0,82
3,0	82	93,8	820	0,97
3,5	84	94,1	710	0,78
4,0	87	94,3	640	0,71

From Table 3 it follows that as the concentration of H_2O_2 in the bleaching mixture increases, the brightness of cellulose increases from 62 to 82%.

An increase in the concentration of hydrogen peroxide reduces the ash content of cellulose. Apparently, atomic oxygen oxidizes inorganic substances to a maximum degree of oxidation, which are more soluble in water.

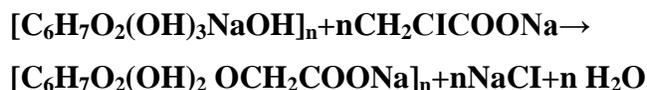
As can be seen from the table, the brightness of cellulose increases with increasing concentration of H_2O_2 to 82% and then increases insignificantly.

Therefore, to obtain cellulose with sufficient whiteness and a high content of a-cellulose, a greater degree of polymerization behind the optimal concentration of H_2O_2, it is possible to take 3% in the bleaching mixture.

To confirm this assumption, as well as to expand the assortment of raw materials for the production of various cellulose ethers, we subsequently obtained simple and esters based on cellulose obtained from Jerusalem artichoke. Ethers were prepared from carboxymethylcellulose, from complex acetylcellulose. The choice of these ethers is explained by the fact that two large enterprises operate in Uzbekistan (in Namangan for the production of carboxymethyl cellulose, in Fergana for the production of cellulose acetate).

The water-soluble carboxymethylcellulose (Na-CMC) is obtained by the action on alkaline cellulose monochloroacetic acid according to the following reaction:

[C$_6$H$_7$O$_2$(OH)$_3$NaOH]$_n$+nCH$_2$CICOONa→

[C$_6$H$_7$O$_2$(OH)$_2$ OCH$_2$COONa]$_n$+nNaCI+n H$_2$O


For the synthesis of CMC, a sample of cellulose obtained from Jerusalem artichoke with the following qualitative indices were used (Table 4):

TABLE 4. INFLUENCE ON THE MAIN INDICES OF NA-CARBOXYMETHYL CELLULOSE OBTAINED FROM CELLULOSE SAFFLOWER, CONCENTRATION OF SODIUM HYDROXIDE AND MOLAR FLOW OF NA-MHUK,

Consumption of components		Indicators of carboxymethylcellulose			
Concentration, NaOH g / l	Cellulose: Na-MHUK, mole	Content of the basic substance, %	SZ on carboxyl groups, γ %	Power polymerization(PP)	Solubility in water, %
220	1,0	42,0	0,64	970	97,1
	1,5	42,0	0,67	950	97,0
	1,6	44,3	0,72	890	97,2
	1,8	47,5	0,75	870	97,5
240	1,0	48,4	0,75	810	97,2

It is known that the CMC production process consists of several stages, including alkaline mercurying, alkylation, pre-ripening, and drying. The obtained CMC on the basis of the above-mentioned stages undergoes various destructive effects for the entire technological path, which leads to mechanical, thermal, and chemical degradation. In this case, the rupture of elementary links in the chain of fiber macromolecules adversely affects the qualitative characteristics of the CMC obtained (Table 5).

TABLE 5 THE CONDITION FOR OBTAINING CMC FROM JERUSALEM ARTICHOKE PULP AND THE INDUSTRIAL CONDITION FOR OBTAINING CMC OF THEIR COTTON LINTERS

№ п/п	Name of conditions	Prototype	The industrial grade of carboxymethylcellulose 85/600 produced from CC and DC at Namangan chemical plant according to OST 605-386-80
1	The temperature of the mercerization process, ^{0}C	20-25	26
2	The duration of the mercerization process, min	15-30	60

3	Extraction degree of cellulose from excess alkali	3	2,6
4	The content of sodium hydroxide in alkaline cellulose, %	17	13
5	The duration of crushing of alkaline cellulose, h	0,5	2
6	Theesterification temperature,^{0}C	35-40	25-33
7	The duration of mixing alkaline cellulose with NaMKhUK, min	60	120

As can be seen from Table 5, the condition for obtaining CMC prototypes from the Jerusalem artichoke pulp practically does not differ from production ones.

Qualitative parameters of CMC, obtained from cellulose of Jerusalem artichoke, were compared with samples of CMCs obtained from other sources of raw materials of CC, DC and existing in production (Table 6).

TABLE 6 PHYSICOCHEMICAL PARAMETERS OF THE PROTOTYPES OF CARBOXYMETHYLCELLULOSE AND THE PRODUCTION MARK PRODUCED ACCORDING TO TU - 88.2 - 12-2005.

№ п/п	Indicators	Samplesofcarboxymethylcellulose			
		Cellulosefromsafflower	Cellulosefrompoplarwood	Ofcottoncellulose	TU-88.2-12 2005
1	Power polymerization(PP)	640	760	930	500
2	The content of the main substance,%	52	51	53	50
3	The viscosity of a 2% aqueous solution, cPs	128,0	135,0	140,0	100
4	Solubility in water,%	98,2	98,4	98,8	97

As can be seen from the data in Table 3, the CMC, obtained from the pulp of Jerusalem artichoke, is practically inferior in quality to CMCs obtained from other raw materials, meets the requirements of the specifications, and it is quite possible to use it in the same industries that they are used for.

DEVELOPING STUDENTS' WRITING SKILLS THROUGH TEACHER AND PEER CORRECTION AT UNIVERSITY LEVEL: AN ANALYTICAL STUDY

Jassim Al Herz*

*Lecturer in English,
English Language Center
King Faisal University, Al-Ahasa, SAUDI ARABIA

ABSTRACT

Writing is, undeniably, an essential skill for students' academic success at the university level. This is doubtless because the courses at graduate study are always assessed by writing tasks and for this purpose, the number of prerequisite writing courses are imposed in university curriculums. Despite the pivotal role of writing skills in the academics, university students are prone to make a multitude of errors in their writing which subsequently impact their academic performance. Linguists and teachers, therefore, have given great attention to this problem in their studies trying to find solutions to improve students' writing ability and reduce their errors. Of late, they have shown a special interest in the role of corrective feedback and how it is given on students' writing. Results from their studies showed how students' writing improvement responds differently to three sources of corrective feedback: teacher correction, peer correction and self-correction. There has been an ongoing debate about how to give feedback to students on their writing and which source of corrective feedback has more influence on their writing development. Some studies showed that the improvement of students' writing can be achieved with peer and self-correction more effectively than with teacher correction. With this controversy, a lot of questions regarding the role and the type of source of correction remained open and the present paper addresses these problems regarding teacher correction and peer correction and also finds solutions. The present research paper aims at analyzing the impact of the corrective feedback given by teachers and peers on students' writing development. Moreover, this paper throws light on the self-correction of students and their self-evaluation for their improvement in writing. Some data is also incorporated in this study and recommendations are also given in the end.

INTRODUCTION

All languages consist of symbols that guide or help people to communicate and interact. These symbols can be displayed in the form of vocals and written scripts, or through using body language. Every language has four basic skills: reading and listening known as receptive skills, and writing and speaking called productive skills. And it should be acknowledged that it is only through writing, among other skills, a language can perpetuate and be transmitted over generations. There are many ancient languages which have become extinct because of no extant records of their alphabet and scripts now. On the contrary, during the current scientific revolution, writing has become an essential medium to keep records and transfer knowledge. Particularly at universities and research centers, writing is used for authoring, translating and publishing books as well as research papers. Writing is also a dependable and stable method used at universities for student's assessment. Students are required to submit a successful graduation writing project before they are granted a degree. Hence, the strong correlation between students' academic success and their writing competence can be evident.

Due to the importance of writing in the students' academic life, linguists, curriculum designers and teachers have paid more attention to develop students' writing skills. Despite their strenuous efforts, they have still witnessed inefficiency in students' writing. This can be traced back to the abundance of errors made by students in their writing. Students' deficiency in writing is not unexpected especially for writing is not just a combination of letters and words and students cannot master it during a short period. It is a complex process that deals with several aspects of language and learners' differences. In fact, it is the ultimate result of language learning that comes after a long term exposure to language and practice reading and listening.

However, a lot of researches and surveys have been recently conducted, to overcome these problems, on students' errors in writing. One interesting result from these studies has shown that the method of corrective feedback (CF) given to students and the source of feedback can play a vital role in improving students' writing skills. Except for few researchers such as Truscott (1996), most of the researches and surveys have shown a strong relationship between writing corrective feedback and the improvement of second language acquisition. The discussion on the efficacy of corrective feedback on students' language performance has been ignited in the literature since the opposing view of Truscott (1996) that objects to the importance of grammar corrections to student's improvement. Because of the scope of this research paper, I will not delve into the controversy for the benefit of corrective feedback, but I would rather discuss the methods and sources of giving corrective feedback; that is how students' errors are treated and who should determine and correct their errors and this analysis would contribute to the improvement of students' writing performance.

There are three types of corrective feedback (correction) in terms of their sources: teacher, peer and oneself. Traditionally, students' writing errors are typically corrected by teachers, and corrections are written in red above students' errors but different effective strategies could also be used. Teachers' correction might not satisfy students for several reasons (Truscott, 1996; Truscott, 2004). For one reason, students are not usually willing to review and benefit from their teacher corrections as teachers suppose. They have more concern about their total mark than

reviewing their errors. There is no guarantee that students engage with their teachers' corrective feedback (Ferris, Liu, Sinha, and Senna, 2013; Lee, 2008b);and this necessitates the need for finding strategies to enhance students' engagement with written corrective feedback (Han and Hyland, 2015).

The other sources of given corrective feedback are peer and self-corrective feedback which is supported by a greater number of researchers compared to the traditional correction.

This paper will review the three methods of corrective feedback and present an overall evaluation of each type as well as its impact on students' language performance.

LITERATURE REVIEW

Researchers have various definitions for writing ability, but generally they are not at loggerheads with the general view that deems writing skill as the knowledge of the language used by language users for communicative purposes as well as for expressing thoughts, feelings, information and experiences through a written form (Harmer, 2001). Writing is a significant language skill for students that can enhance and enrich their lingual ken. Yet, it is the most difficult skill for second language learners and represents a challenge for teachers who teach writing. This is because writing is a complex process that includes stages of prewriting, writing, and rewriting, and not simply a product (Murray, 2003; Way, Joiner and Seaman, 2000). Before the final written product, students go through a complex thinking process. Teachers should be aware of the complexity and the process of thinking during the writing and hence they are expected to implement the best methods to provide guidance, clarification and corrective feedback to their students. Since teachers always deal with writing assignments, they should consider their choice of the best method of giving correction because this choice can influence their students' language development.

Researchers have found that correction can play a significant role in reinforcing students' accuracy if it is used effectively by teachers (Hyland and Hyland, 2006; Ellis, 2008). They have talked about three types of corrective feedback based on their sources: teacher correction, pear correction and self-corrections.

There are several studies on the role of corrections on students' general language development but keeping in view the purpose of this research paper, only studies that are conducted to evaluate the effect of each method of corrective feedback for students' writing development will be included in this section and the other studies will be referred to only when it is necessary.

Before discussing the previous studies, it is important to acknowledge that students' engagement with the corrective feedback represents the key factor that determines the extent of benefits students can get from feedback despite its types.

Students' Engagement with Corrective Feedback:

Results from a case study, conducted by Han and Hyland (2015) on four non-English major Chinese EFL learners at a university in southeastern China to investigate the errors made by students and how they cognitively respond to written corrective feedback, showed that students have difficulties in terms of the engagement with written corrective feedback that can be attributed to students' beliefs, experiences and individual differences. This study adopted Ellis's (2010) proposed framework of engagement with corrective feedback. Findings revealed that

word choice errors followed by sentence structure errors were most frequent made by the participants. Teachers' corrective feedback was mostly selective and directed to the most common error type. Students differently responded to the given corrective feedback. All these observations explain the effect of teachers' and students' beliefs on corrective feedback. The study also suggested that teachers should be aware of their students' backgrounds to adopt or create effective strategies that enhance students' engagement with corrective feedback. Let us have a glance at the previous studies conducted on the effect of corrective feedback.

Studies on the Effect of Corrective Feedback:

In a comparative study of the effect of teacher correction and self-correction, which was conducted on German college students divided into two groups based on the source of the giving feedback, Lalande (1982) found that students in the self-correction group significantly improved higher level of accuracy than the group of students receiving a traditional method of teacher correction. The study concluded that the self-correction method of giving feedback was more successful in enhancing students' writing ability in Germany.

In another study to investigate strategies to respond to EFL students' writing, Joyce (1997) found that peer correction was a dynamic method that helped students improve writing efficiency when comparing their initial writing attempt with the third attempt after peer reviewing and editing.

Ryoo's experimental study (2004) aimed at investigating the effect of teacher corrective feedback on 41 EFL students in a Korean university class and showed a significant improvement in the participants' writing performance after receiving multiple teacher feedbacks during one term. They took into consideration mainly the content, organization and grammar issues during this investigation.

In another study conducted on Chinese college EFL students, Li and Lin (2007) studied the effect of teachers' indirect feedback on students' accuracy. Results emphasized the importance of students' revision of teacher correction to achieve language improvement. In other words, students could not improve their writing performance without the uptake of teacher corrections.

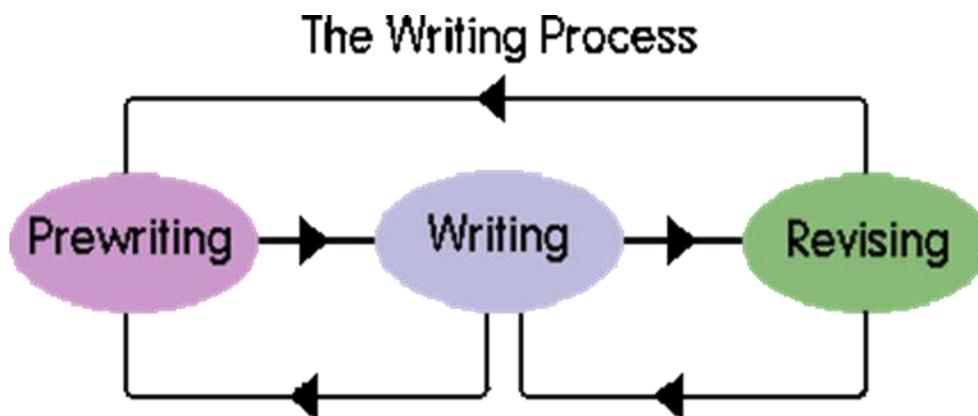
In the same year, Kurt and Atay (2007) conducted an experimental study to examine the effect of peer correction on 86 Turkish prospective teachers who were split into two groups with one receiving peer feedback while the other receiving direct teacher correction. Results from this study showed that the peer feedback group encountered significantly less writing anxiety compared tothe other group who received traditional teacher feedback. The study suggested that peer feedback should be an integral part of teacher feedback.

Ganji's (2009) study, which was conducted to investigate the impact of three types of giving corrective feedback on 54 Iranian students' performance on IELTS writing tasks, found that there was a significant difference between the three types: teacher, peer and oneself corrections. The study declared that peer correction and self-correction were more effective than the traditional teacher correction with peer correction as the best method among them.

WRITING

Writing has always been a major interest to language pedagogues, learners and researchers, because it remains a significant skill for successful language learning. It is the medium by which knowledge, thoughts, experiences, emotions can be exchanged. It helps students become

independent and creative. Yet, it is a difficult skill not only for students to master but also for language teachers to teach. When it comes to learning and teaching 'writing' in a foreign language like English, it becomes a more challenging task. In fact, writing ability is the last achieved skill that comes after the other three language skills: listening, reading and speaking. The complexity of learning and teaching writing comes due to its componential process which includes different facets of learners' behaviors. On the superficial level, it encompasses the process of thinking and pre-writing, the mechanism of writing and the post writing: reviewing and editing (revising) (Watkins, 2005). It is evident in the picture given below:

The Writing Process


Palmer (2003) elucidates that during writing, students deal with a range of writing skills that include grammar, spelling, sentence structure, word choice, and text organization. However, when we observe keenly, writing can also be influenced by other social and psychological variables surrounding the writer. Hence teaching writing requires skillful and highly trained and qualified teachers who should be aware of the complexity of writing as a process not only as a submitted product.

The difficulty of teaching and learning writing increases at the university level because writing for academic purposes is different from other non-academic forms of writing and it requires students to consider and comprehend sophisticated notions such as style, register, genre, tone and other features of academic writing. This explains why university students, on one hand, are more prone to commit errors in writing, and teachers, on the other hand, are supposed to respond to their students' errors by giving them corrective feedback to help them to minimize their errors and improve their writing skills. Russell and Spada (2006: p. 134) define written corrective feedback, by any means, addressing students' errors and giving feedback to correct them. In their words: "…any feedback provided to a learner, from any source, that contains evidence of learner error of language form". Feedback can be given from three sources: teacher, peer and oneself. Since feedback is a part of the learning process and students are observed to engage differently with each type of corrective feedback, it is considered essential for students' writing development. In this regard, researchers have a disagreement on the usefulness of giving corrective feedback to students.

Based on the results elicited from the previous studies, attitudes towards the influence of giving corrective feedback to students can be conceived through two main perspectives manifested through this section. The extreme view against corrective feedback is adopted by a minority of researchers. The tendency about giving correction was triggered off since the publication of

Truscott's article 'The case against grammar correction in L2 writing classes' in 1996. In his article, he criticizes and suspects the usefulness of the corrective feedback to students' writing and suggests that corrections should be avoided. According to Truscott and other researchers who adopt the same view, giving corrective feedback to students has no significant value to students if it does not harm their writing development. He claims that correcting students' errors can waste teachers' energy and time which are supposed to be spent on teaching and research. His view, however, was not reliable according to his opponents' perspectives such as Ferris (1999) and Chandler (2003) because he relied for his claim on the findings from only three studies conducted by Kepner (1991), Semke (1984) and Sheppard (1992). Harmer (2004) also claims that students receiving a written product that is replete with red and corrective marks from teachers can be harmfully discouraging.

On the contrary, the second view adopted by the majority of researchers favors the corrective feedback and simultaneously believes in its positive impact on students' writing ability. They believe that corrective feedback has a motivational impact on students writing (Richards and Renandya, 2002; Eliss, 2009). However, they differ on which type of feedback has a more positive influence on students. Based on results from previous studies, some researchers believe in the significant value of teacher direct feedback, while other studies' results manifested the superiority of peer corrections over other types of feedback. Self-correction has also proven some positive effect on students' writing development.

Based on the findings of previous studies, a descriptive analysis will be provided in the next section to estimate the potentiality of each type to develop university students' writing skills. The features of every type of feedback will be discussed separately to help teachers to recognize each type's effect on developing writing skills, make their decision and modify their writing teaching practices accordingly.

Developing Writing Skills

Teachers employ various strategies, methodologies and techniques to teach and develop students' writing skills in the classrooms. As writing is an important skill, the teachers need to focus on their corrective feedback as well as encourage peer correction to reduce students' errors and develop their writing skills. The following section discusses how students' writing skills are developed through teacher correction and peer correction comprehensively and also how their feedback helps the students or learners overcome their writing errors. Moreover, self-correction is another important aspect in this regard and it helps the students find their own mistakes and improve their writing ability and it will be discussed briefly in the following section.

Teacher Correction in Writing

Generally, students are more dependent on teachers inside the classroom. They consider their teacher as a trusted source of knowledge and information. The majority of students respond to corrective feedback given by their teachers more than those given by other sources like their peers but a few students do not. This assumption is also proven by the findings of Ryoo's experimental study (2004).

Teacher corrective feedback can be delivered in two forms: Explicit and Implicit forms. In the explicit form, direct corrective feedback is given where the teacher marks the errors and provides the student with the correct form. Here, the teacher also provides feedback on the correct

linguistic form or structure to the students above the linguistic error. This form of corrective feedback is favored by learners with low language proficiency as they find it difficult to correct their language errors. In the implicit form, indirect corrective feedback is given where the teacher specifies that the student has made an error, without providing the correct form or without providing correction and leaving it up to the student (Ellis, 2009).

A further distinction is drawn for the use of coded and uncoded: coded feedback identifies the error and type involved whereas uncoded feedback underlines the error but leaves it to the student to determine the error (Jamalinesari et al., 2015). Coded feedback is useful as it enables students to treat error correction as an active process which helps them in learning better (Westmacott, 2017). So, learners are required to engage in guided learning and problem-solving that allow them to reflect upon linguistic forms and promote long-term acquisition (Lalande, 1982).Therefore, teacher correction enables the students to find their errors and correct them for error-free writing.

Peer Correction in Writing

Peer correction is a useful technique as learners feel less intimidated being helped by peers in the classroom. It is a procedure that allows learners to cooperate as one of them acts as a peer teacher as he shares with others (peer learners) his knowledge, experience and basic skills of the language that he has acquired previously under the supervision of the teacher. Also known as peer feedback or peer review, peer correction has proven itself to be an effective tool for enhancing students' writing ability since it actively engages learners in the learning and teaching process. The analogy between two students' writing broadens learners' thinking and understanding of their writing process as well as their reading as a critical thinker. The benefits of implementing peer correction in the classroom are many. Through peer correction, peers can share their feedback with the students and both can discuss it thoroughly for accurate writing. Learners' active participation in the correction activity creates a healthy atmosphere as the feedback received from peers (classmates) is less threatening because it saves time and effort for many EFL instructors and allows them to assess learners' writing regularly thereby reducing the negative effects of time constraints and large class sizes. Peer correction also helps students develop their soft skills and build an argument with each other. Besides, it is common that peers give feedback according to given criteria established by the teacher which are checklists, feedback sheets, error codes, and error logs. These tools are helpful for the process of error correction and provide learners with a guide to classify errors which reduces their levels of anxiety.

Self-Correction in Writing

Self-correction is indirect feedback where the teacher allows students with choices that would help them find out the correct form on their own. Another feature of self-correction is that it draws the students' conscious attention to their errors which helps them not only to identify their errors but also to correct them. This technique makes them aware of their errors and resolves their mistakes in that area.

Studies on self-correction mostly identify its positive effects on the reduction of the number of errors made by the students. Other findings also suggest that self-correction is more effective than teachers' correction (Lalande, 1982) and it favors the learners' positive attitude towards

error analysis and activates meta-cognition in the classroom which provides learning opportunities. Self-correction prepares students to plan and revise their texts and evaluate the progress of their writing. The involvement of students in self-correction practices helps them achieve their objective of not only improving their writing but also their met cognitive skills.

QUESTIONNAIRE AND OBSERVATIONS

The Aimsof the Study

Recently, we conducted a study on 54 students in an academic writing course at the college of engineering to identify the impact of corrective feedback on students' writing development based on students' perspectives. Particularly this study tries to explore how students respond to the corrective feedback given by teachers and peers, and also identify their attitudes towards each type of feedback during the eight-week session (Quarter). Findings from this study will help to evaluate and subsequently recommend effective strategies for giving feedback. Students' assessment of the usefulness of each type of corrective feedback is important in this study because the student is central in the process of learning (learner-centered education). If we raise students' understanding of all types of feedback and modify our feedback strategies based on their conscious preference, they will interact and respond to corrective feedback and subsequently improve their writing proficiency.

Data Collection

Some data is collected from two questionnaires, one is distributed to students at the beginning of week 1 and the other is given in week 8 after implementing different strategies of giving feedback. Other data is drawn from observational sessions. Through these questionnaires and observations, data related to the students' writing improvement and their engagement and attitudes towards the corrective feedback is analyzed.

The first and the second questionnaires are used to explore the change that occurs in the student's writing improvement and also attitudes towards each type of corrective feedback before and after students experiencing them during the eight-week session. The data, drawn from the questionnaires, is based on students' perspectives. The teachers' analysis of their students' responses to the questionnaire is also given based on the data collected from the observational classroom sessions.

FINDINGS AND DISCUSSION

Based on students' responses to the questionnaire in week 1:

Data (Table1) shows that 72% of students favor teacher correction more than peer and self-correction in the first week of their study. Moreover, the data shows that 67% of students are willing to receive and discuss corrections that come from their teacher. Only 26% of them think they can share their writings with peers for corrections. In terms of engagement with the self-correction, most students evince no significant interest in thinking over their errors and thereby correcting them. As for the students' expectation of their writing development, approximately 79%of the students believe that receiving teacher correction can enhance their writing proficiency more than peer and self-correction.

TABLE1: FINDINGS FROM THE QUESTIONNAIRE IN WEEK 1.

Students	Teacher Correction	Peer Correction	Self-Correction
Attitudes toward feedback (Ss' preference)	72%	16%	12%
Engagement with feedback	67%	26%	7%
The potentiality of writing improvement	79%	12%	9%

Based on the teacher's observation in week 1:

From teachers' observations, it is found that most of the students are interested in teacher correction because they think that they can improve their writing proficiency through teachers' feedback.

Based on students' responses to the questionnaire in week 8:

Table2 shows an increase of only 8% of the students who show interest in peer correction. Students have developed their interest in peer correction when compared with week 1. Students are not interested in self-correction as in week 1. Although they show some interest in peer correction, they still believe that teacher correction can improve their writing more than peer correction and self-correction (see Table 2). This finding does not conform to that of Lalande (1982) and Ganji (2009).

TABLE2: FINDINGS FROM THE QUESTIONNAIRE IN WEEK 8.

Students	Teacher Correction	Peer Correction	Self-Correction
Attitudes toward feedback (Ss' preference)	67%	24%	9%
Engagement with feedback	60%	38%	2%
Observed writing improvement	71%	24%	5%

Based on the teacher's observation in week 8:

In week 8, teachers observe a significant improvement in students' writing and observe more engagement with their peers. Self-correction does not get any importance in week 8 also. Students have been observed to be reluctant to respond to the self-correction strategy. This explains how students' attitude towards certain corrective feedback affect their level of engagement in the given feedback (Han and Hyland, 2015)

Therefore, it is clearly understood that students at the university level improve their writing proficiency mostly through teacher correction (Ryoo, 2004; Li and Lin 2007) and,to some extent through peer correction (Lalande, 1982; Joyce, 1997; Kurt and Atay, 2007; Ganji, 2009). Thus, corrective feedback is a useful tool for students to improve their writing skills.

CONCLUSION AND RECOMMENDATIONS

Many students feel weak in speaking in English but in reality, they are weaker in writing than speaking. Teachers allot writing tasks in the form of homework, assignments and exercises and improve students' writing skills at the university level.Though they practice much in the classroom or at home, yet they fail, to some extent, in examinations, particularly in writing. As we discussed above, students' writing skills can be developed through teacher correction, peer correction and self-correction. Through corrective feedback, students can identify their own mistakes and correct them for good writing. Teacher correction is more important than peer correction and self-correction in the beginning at the university level. Simultaneously, teachers have to encourage peer correction also in the classroom to make students understand and realize where they have made errors in their writing and how to correct them. Self-correction is also another technique that students can sometimes apply to correct their errors. Above all, peer correction and teacher correction help the students mostly improve their writing but it depends on learners' perception towards error analysis that may differ due to their cultural and educational backgrounds and the nature of feedback. As a common problem, it is necessary for teachers to focus on writing in the class along with other skills as a form of action research.

ABSTRACT

In the Uzbek language, the concept of family stands out by its national-cultural character, actively usage, and being expressed through lexical, paremiological, syntactic units. The concept of family is the basis of all the religious, enlightening, spiritual, socio-political notions.

KEYWORDS: *Anthropocentric Linguistics, Cognitive Linguistics, Concept, Association, Lexical Units.*

INTRODUCTION

The object of cognitive analysis is the language system, which is the source of knowledge acquisition and storage, its application and transmission, and finally the means of its formation. Accordingly, while the nature and essence of knowledge and cognition form the basis of this science, the subject of study is the properties of language as a general mechanism for the formation, use, storage, transmission, and processing of knowledge. The object of study of linguistic research in all areas is the language system, that is, linguistic activity and its products.
