APPLYING FIVE PRINCIPLES IN TEST MODIFICATION PRACTICE

Durdana Utepova*

UZBEKISTAN

ABSTRACT

Tests differ in types and structures according to the course types. It is of great importance to take into consideration the principles of tests when administering them in testing: practicality, validity, authenticity, reliability and wash back as taught. Seemingly, to identify learners' knowledge and schemata in a correct way, a well-designed test can also serve as a guideline for a teacher to achieve the certain goals in teaching and learning processes. The given work explores some modifying techniques keeping the applying five principles in testing.

KEYWORDS: *Testing, Authenticity, Practicality, Validity, Reliability, Wash Back.*

INTRODUCTION

Being a teacher, there is always something to change and create in terms of testing and assessing, as being still in the process of globalization, using the old techniques and tests are unlikely to yield good results. The main objectives of the work are to let learners get positive wash back after the administration of the modified test and to enable them to get flexible to any test types. The essence of the Test Modification Practice in teaching and testing system of English language teachers is to make the learning process more fruitful for the learners of 21st century in Uzbekistan. The context we make modifications into is the course on "Vocabulary in Context" at high educational institution. The purpose of the paper is to explore some new ways of testing vocabulary incorporating the other skills other than grammar into testing.

MATERIAL AND METHODS

In modern time if to analyze language learning process from the point of language policy in Uzbekistan, everything was changed ranging from course books to teaching methods almost in all institutions. Coming back to EFL and ESL learners, they are all aware of every single change

and it demands a lot of effort to test their comprehension with only one single test. After the introduction of PRESETT (Pre-service Teacher Training) curriculum, which is now used almost by 70 high educational institutions in Uzbekistan, the testing system ought to be different from the ones used in the past before the implementation of that program. The focus group in this given context is academic year students at Nukus State Pedagogical Institute. The language courses based on PRESETT curriculum are “Writing”, “Grammar in context”, “Listening and speaking”, “Integrated Skills”, “Independent Study Skills”, “Vocabulary in context” and “Reading”. One of the features from which the learners benefit in terms of language skills is that the schedule for each language course is designed in a way that all the topics are interconnected with each other. If learners have the topic “Business” in reading classes – materials for reading about business, then in listening they also have the same topic taught separately in each class. Therefore, it will not be difficult for them to acquire and learn new words off by heart and use them in their daily classes.

At Nukus State Pedagogical Institute the classes are taught in English language except for secondary social courses. Each course has its own peculiarities, and it is wrong to prioritize the one from the other. As mentioned above, according to PRESETT program the courses are interconnected with each other. We provide the test modification on the course “Vocabulary in context” and modify the test. Looking at the learning and teaching process, before it was named as “English Philology”, and the method of teaching was mostly based on Grammar Translation Method. The tests themselves were on translation from native to English or vice versa. Ergo, those tests used before do not coincide with today’s teaching methods and techniques in all respects. Nowadays, the placement tests for educational institutions with regard to developed English language learning system, they are getting more complicated based on the learners’ strong background knowledge in all four skills. As known for all, most applicants take NSFLA framework or IELTS to enter without examination.

DISCUSSION

Taking English language as a whole system, each aspect of it is of great importance to acquire and develop in our learning as well as teaching process. As mentioned above, to separate those aspects might be a wrong approach, and turning to testing per se, whether it is a test on listening or whether it is on writing, there is a small portion of each language aspect within the process; if not, those all four language skills should be included then. It is true that there are four major language aspects: listening, speaking, writing and reading. But going into the depth of testing English language proficiency level, there are aspects such as grammar and vocabulary that are worth paying heed to, so that these two additional aspects play a key role to teach separately and test as well.

As given in the syllabus and assessment specification, each theme should comprise the elements of the broad theme in the form of topics, and the topics of the above mentioned textbooks related to each topic. The test to be modified is on the given course “Vocabulary in context” for first academic year students of Foreign Languages Faculty. If to look closer and consider the principles of the given test, it does not meet all requirements of learners and their wash back seems negative after doing the test.

Describe your friend’s appearance

The test is taken from academic year students at the end of the year for their final summative assessment. From the given test it is evident that it is not practical that has different types of tests taken from the other course books rather than the topics the learners cover during the year round. Saville (2015) stated that “Practicality can be defined as the extent to which an examination is practicable in terms of the resources necessary to produce and administer it in its intended context and use” (p.30). The space for writing the answers is not enough, the directions are not clear enough to follow, the scoring is not given. The timing is not provided, the learners will definitely find it difficult because of the lack of practicality. According to the principle “reliability” in testing and assessment, Borsboom, Mellenbergh and van Heerden (2004) ratified that if measurement results in different scores and evaluation, then the test is considered to be invalid so that valid test should not cause any difficulty to a test taker to come to conclusion of final assessment. This test is not valid enough due to the absence of rubrics for the whole test variant. Besides that, if the given test contained only one particular type of a test as the whole test is on multiple choice questions or word formation, or any other types of test only in one format, then it would not be challenging not only for the teacher to assess, but also for the learners as well. Most learners claim that it is very difficult for them to move from one type of a test to the other which tests one and the same language skill.

The given test may have small portions of each principle, yet it is hard to consider to meet learners’ needs. As it is given in the original one, even for the teacher oneself, it may cause some difficulties to measure and assess test takers’ aptitude and comprehension on the covered topics. Some researchers Wells and Wollack (2003) mentioned that reliability of the test do not lie in the concept that “test is reliable if it does not cause any problems”, but reliable test means that if a student get 90% out of 100%, that student should be able to perform it in real life as well. If that student fails to perform in reality that he showed in the test, then it is wrong to state that the test is reliable enough. As a whole, the test does not compromise all four testing principles in balance. The problem for this can be the gathered ready exercises into one variant without any modification. There are texts within the variant, still the small texts do not contain any topics which make the test inauthentic. The given test needs modifying in order it have all the test principles and get positive wash back after administering.

Turning to the strengths and weaknesses of this test, the weaknesses overweigh its strengths. The strengths lie in the aspect that there are enough spaces to write the answers, so learners do not face with any difficulties concerned with practicality. The second strength is that it is appropriate for B2 level learners as described in the syllabus; the last strength is that the writing part is given in the last section which is a good opportunity for the learners to do it after they completed all the others, so that they will fully concentrate on one point after all. Admittedly, the weaknesses are that if we look closer and stop in each task of the test, the test contains various types of test items, and that may distract learners to come to one conclusion and think critically while taking this kind of tests. The second weakness can be in the last writing section there are no task specifications relating to task achievement. Overall, the last minus is that it is not properly designed that lacks practicality and reliability concerning the illegibility of that exact exercise,

Results

Learning is an endless process due to many aspects of education. In its turn, teaching process and learning to teach are linear and continuous process that occurs in almost every teacher’s professional life. Taking any type of test either being a learner and a teacher is of benefit and

food for self development. That is, tests are determiners for identifying and measuring how well one does in particular field of study. In teaching process, mostly teachers benefit much from testing their students' knowledge and comprehension in the given discipline or a course. Due to the results of test takers, teachers easily identify their weak points in teaching if one's learners get lower mark in the test, or vice versa, if the learners succeed in the test that means teacher does one's best in achieving course goals and objectives.

In designing and administering any test, the main five principles play a key role due to the interconnection of one another in one context as a whole. Some tests are considered good ones, still some may lack at least one of those principles. The test, chosen by the author of the given test, lacks many features and criterion in the principles that may cause some negative wash back and teaching results. Therefore, it is really important for teachers to take into their account the feature of asking themselves to what extent they are able to teach the given course. Nowadays it is really essential to know and be able to do and create one's own tests in many respects. That is because a teacher is the one, who is totally aware of what is happening in the teaching as well as in the learning process. Some tests administered by some organizations are unlikely to meet all the requirements of any course objectives and learning outcomes. Considering all the said above, the modification needs doing in the writing task from the whole test in the course "Vocabulary in Context" for summative assessment:

Original version of the test:

7. Describe your friend's appearance

Modified version of the test:

7. Describe your friend's appearance and character.

Word limit: 300 words, time: 55minutes. Try to use the passive vocabulary covered in the topic "Describing people". You may use the words and idioms given on the white board. For plagiarism you will be penalized and will not be given the second chance. The rubric for checking the task is provided at the back page of the paper. You may use a pencil or a pen. Words on the white board: "laid-back, generous, sincere, reserved, height, pale, plane, a peach, bigmouth, couch potato, cookie, a swot, achiever, cucumber, fishy, eager, in the pink, lanky, stout, garrulous, taciturn, effusive, impetuous, impulsive, gullible, obstinate, disdainful, approachable, conscientious, naïve."

Evidently, the modified version of the test counts for getting clear instructions compared to the original version, which is of practicality in its usage. Instructions define a lot in any exercises and tests, whether a student does the task successfully or not according to how well appropriate instruction is used both orally and in writing. One thing worth mentioning here in terms of giving instructions is that whether the test is taken orally or in writing, the instructions should be given in a written form. Considering the situation when students feel anxious or nervous before the test, oral instruction given by the teacher, first of all, makes them more confused; second of all, it may distract them while taking the test, and they may get negative washback in the end. Saville (2015) highlighted that within the test time the materials should be qualitative and be counted for equal quantity of papers distributed within the group equally. In this writing task which is closely connected to psychological sides of higher order thinking, any small minuses can affect the quality of the student's performance. Therefore, well-designed papers cannot be distracters in the

examination. Turning to the new design itself, it is practical enough taking into account a sufficient space and well-structured vertical lines for accurate writing. Most students and even senior teachers find it rather complicated to concentrate on the task when their handwritings get directed up or down. Therefore, in any kind of a writing task, the lines are important to take into consideration so as to avoid impractical consequences. In its turn, when it comes to assess the written work, it does not pose any problems for the teacher to deal with illegibly written lines or words of the students.

Apparently, taking placement test is of necessity for learners and as well as for teachers, Maree and Fraser (2004) emphasized that if the test results are the same for the whole group or even with slight differences in amount, then in that case the test seems to be reliable. In this sense, reliability refers to stability. If the test results are reliable, then teaching objectives are reached and meet learners' needs, inversely, there are some cases when learners' test results differ vastly from one another's that lead to some unreliable actions or conclusions made by the teacher negatively finding a mistake in one's teaching or in the design of the test and its purpose. In the modified version of the writing task the reliability can be identified according to the results of the learners; in this context that does not mean all of them got "A" mark or all of them get "B" equally, rather it stands for the convenience of checking and assessing their answers according to the given written instruction. The instruction states to use the words on the board in their writings, so it does not cause any challenges for the teacher to come to conclusion and put the final mark according to how many words the learners used in their work. If all of the learners use them successfully, that is a good result of designing a test from a teacher's perspective. In terms of reliability itself, that counts for homogeneity identifying internal consistency of the test and test takers' comprehension as well. In designing testing and assessment most come across hesitation between identifying in what ways validity of the test lie as opposed to reliability. The main difference is that if the test (take the modified writing task) coincides with the theoretical concepts, it is a valid test in its turn. In the given modified writing test teacher lists some topic-related words and suggests learners to use them when making sentences in their essays, so that the test relates to the theoretical part. Leedy and Ormrod (2004) asserted that "Face validity refers to the degree to which a test appears to measure what it claims to measure" (p.55). In the given context, face validity is seen through writing, each language aspect is measured as supposed to be measured. In this case, one of the aspects of reliability is evident by providing a rubric for assessment beforehand.

An appropriate rubric chosen by the author of the given work deals with all language areas to evaluate properly after checking the work. The type of the rubric above is holistic one that a teacher checks according to criterion-referenced assessment (See Appendix I). Weigle (2002) distinguished three types of rubrics: analytic, holistic and primary trait rubrics. The first one was ratified to be the most appropriate one for assessing mostly writing. Therefore, analytic rubric was chosen for the assessment. In most cases, it is a common situation in educational settings to do something not paying attention to the criteria and rules of doing any task. Therefore, in any tests, students should be provided with rubrics and be taught how to use them. One of the principles of testing again is the increase of reliability due to well-structured rubric. In the writing task, students first take time to be familiar with the criterion overall to get good results and positive wash back.

According to Graziano and Raulin (2006), test-retest reliability is identified after the test is taken and checked by a number of experts (teachers), and if the grading by them yields the same results and measurement, then it is supposed to assume the test-retest reliability exists. In the given context, the rubric is helpful enough to come to one conclusion what grade to put. If the written work is assessed the same, then not only the rubric was appropriate, but also the instructions are considered to be proper enough so that all learners do the task successfully due to the clearness of the test. The modified test is sufficiently reliable considering all clear objectives and clear directions as mentioned above, and rater reliability as well.

The modified writing task, which is aimed at testing writing skills and vocabulary building strategy also compromises the elements of authenticity. The principle authenticity does not only have one definition and identification within one task, rather there many characteristics seen in one item related to the circle of authenticity. In this sense, Brown and Abeywickrama (2010) stated and authenticity is mostly connected to the real world tasks taken from real life. For any kind of a learner regardless age or gender, or English language proficiency level, describing one's friend appearance or character is not complicated at all. For beginners, for instance, the vocabulary is simple enough for describing – good, nice, tall, short, brown, fair hair and the like, for advanced level learners the vocabulary word stock is complicated enough according to the course requirements and learning outcomes. The idea of displaying the necessary words on the whiteboard has more of advantage in the testing process. The first plus point is that it may help to ease learners' anxiety before the test starts. Evidently, in any kind of tests it is a natural process to get anxious, and if learners see some visual materials, they feel some confidence that there is nothing challenging to do their best. Secondly, key words or topic-related words are likely to be a prompt for the test takers to generate their ideas and retune critical thinking abilities, and get a productive work in the end. In this modified test learners use natural language as the topic itself suggests connected to their personal life. Still, the language they use should be formal as it is supposed to meet academic purposes.

The final product of any kind of test or exam type is inevitably learners' reaction towards the process – wash back. Yoneda (2012) asserted that “beneficial wash back influences what and how teachers teach, offers learners a chance to adequately prepare, giving feedback that enhances their language development, wash back is formative in nature than summative and provides conditions for peak performance by the learner” (p.45). Nowadays in educational settings, the term “wash back” is still new for them. In many cases, whether the test was good or bad, there is still stereotype that if the learners get lower mark then the test is complicated enough and it is a good test, the learners are not ready and graded in lower percentage of aptitude. It is a prompt for us – ESL teachers to wipe out this concept on test principles. In its turn, Linville (2011) mentioned that beneficial or be it a negative wash back should give some idea to teachers on their teaching and test designing principles, more or less those are the teachers who can rely on wash back results to identify and measure their own teaching results and learning outcomes from own teaching.

We assume that “wash back” is rather an umbrella term for all other four principles: practicality, reliability, validity and authenticity. After we administered the modified version of the test, it was visible to identify whether it was designed properly or not. Accordingly, focus group provided detailed insights on both original and modified versions of the test. They were given the original one and did not give any instructions on how to do the task as far as it was a test, not the

lesson: “Describe your friend’s appearance”. Before they started to write, several questions were given by them: “Can I write as many words as I want? After I wrote, did you assess it according to meaning or grammar, to which of them you pay most attention? How much time do you give for completing? I have many friends, can I describe all of them? Is handwriting also assessed?” they were told not to ask any questions related to the test and just what was asked of them was to write the answer. They wrote wholly two pages which were of A4 size. Also within the answer not only appearance was written about, but all features conceding to personal information in depth, character and appearance, which constitute one - thirds of the whole work. The time took them to write was one hour and 20 minutes, when they said to have finished writing. Word-choice and grammar were fine, yet there were not topic-related advanced level vocabulary word stock used by the test taker, which is mostly expected from course objectives and test specifications. When they were asked feelings about the test, they claimed it was difficult for them to concentrate because of the lack of the well-provided guidelines to follow. They admitted to have been anxious while writing not knowing between whether they were on the right path or wrong.

CONCLUSION

Evidently, we decided to administer the modified version of the test so that the test-takers felt well enough. Good writing demands higher order thinking abilities as well as flexibility in performance. When administering the modified version of the test, having a quick glance at it, the learners asked whether their knowledge was to be checked on another topic. That is, they admitted that the design of the test was completely different from the previous one. As the test was given, so there were no questions followed in terms of test specifications. The only drawback while doing the task they asked several times for the time in order to get the work done. Then we realized we should bring a clock in order to generate all the convenience for the learners. A real clock from the point of methodological science it is one feature of one of those principles – practicality. The learners could manage to show their high aptitude on the course. There were no questions followed by the test taker related to the test specifications. Coming back to each principle of testing, the test for the learners was quite practical considering well - prepared materials to write on a sufficient paper, time and scoring were provided in the instruction, so the modified test did not cause any difficulties in terms of reliability and validity. The learners did not face any challenges connected to performance and rater-reliability, which can usually appear during the test process. According to the results of the learner under the research and from their personal viewpoint, the wash back they got is positive and they stated to benefit much from the test.

Considering all features of testing principles, it is of importance to have theoretical as well as practical knowledge on modifying and administering any kind of test types in order to meet learners’ needs. We explored some new ways on how to modify the test according five major principles, and the importance of guidelines in assessment and testing. For example, for in the modified writing task I analytic rubric was used taking into account the strengths and weaknesses and aims of assessing writing. All five principles are interconnected with each other and whether the test is designed well or not, highlighting the important features “wash back” is supposed to determine the result. In our modification the learners’ wash back was beneficial to find out some strong points, and negative wash back in the original test gave us a prompt to identify what

exactly should be changed and what needs reconsidering. The outcomes of the modification seem to be effective on the whole.

Appendix I

Rubric for assessing writing. Retrieved from: www.studylib.net

	0 or 1	2	3	4	5	Score
Content: Relevancy, Adequacy, Clarity, Support	Conveys meaning with comprehensible sentences related to a picture prompt. Contains 4+ lines.	Meaning conveyed clearly through loosely organized paragraph with 5+ sentences related to one another & picture prompt. May have unrelated detail and/or need inference.	Writing consists of a 5-8 line paragraph that directly relates to a picture /written prompt. Little inference, if any, is needed to understand writing clearly.	Responds to prompt w/ clearly expressed ideas and relevant details. No inference needed. Writing consists of 8-10 clear, connected sentences and three well-developed, distinct paragraphs.	Writing consists of a 5-paragraph essay that responds to a written prompt with relevant, supporting details. No inference needed.	
Organization	Handles word order consistently & shows some apparent organization of a group of sentences. May write sentences in a list.	Begins with indentation. Writing includes a topic sentence and 4+ related sentences. May have a conclusion.	Begins with indentation & a clear, concise topic sentence followed by at least 3 distinct detail sentences & a conclusion that is different from the topic sentence.	Writing begins with a clear, concise topic sentence/ thesis statement that is expanded in three distinct, supporting paragraphs. Writer indents paragraphs & includes concluding statement.	Essay begins with a clear, concise thesis statement in the introduction. Three well-organized and well-developed supporting paragraphs expand the thesis statement. Includes concluding paragraph.	
Word Choice: Appropriate use, richness of expression	Word choice is related to prompt, but may be limited and/or incorrect at times. Uses subject pronouns correctly. May show repetition.	Word choice relates well to prompt, but may show errors w/ less common & content-specific words. May exclude/ incorrectly use prepositions & pronouns (S, Obj. & Poss.)	Writer uses appropriate words, less common vocabulary, and connecting expressions with few errors and little, if any, repetition. Pronouns & prepositions are mostly correct.	Writing contains a variety of content-specific, less common, and/or idiomatic expressions used with very few errors. A variety of adjectives and adverbs creates a richness of expression. Repetition is rare.	Word choice is creative, dynamic, and mostly accurate. Errors in word choice are few and do not interfere with meaning.	
Grammar & Sentence Structure	Simple SVO structure is evident. May contain multiple errors in subject-verb, singular-plural, & time-tense agreement.	Writing contains complete sentences that show correct use of simple present, pres. continuous, simple past, and/or simple future. May contain some agreement errors & run-ons. May be missing some articles.	Demonstrates correct, use of simple tenses; may include past continuous & present perfect. Errors in article use & agreement are minimal and do not interfere with meaning. May contain a run-on.	Demonstrates ability to use different verb tenses, articles, adjectives, pronouns, etc. with very few errors. May include a variety of complete sentences with independent & dependent clauses. Grammar errors are few & do not confuse reader.	Writing is easy to understand & combines a variety of verb tenses with simple, compound, & complex sentences. Very few, if any, agreement errors and run-ons.	
Mechanics: Spelling, Punctuation, & Capitalization	Uses capitals and periods with some errors. May contain multiple spelling errors that may confuse the reader.	Uses capitals & periods correctly & consistently. May make spelling errors with less common words. Common words have few spelling mistakes.	Uses capitals, periods, commas, & apostrophes with very few errors. May have spelling errors with less common words.	Demonstrates strong control in using capitals, commas, periods, etc. May use semicolons & quotation marks competently. Spelling errors are minimal and do not interfere with meaning.	Minimal to no errors in capitalization, spelling, or punctuation. Any errors do not interfere w/ meaning.

ABSTRACT

Social infrastructure ensures the development of the municipal unit, satisfaction of the basic needs and interests of the population, creation of the conditions for its subsistence and reproduction. In this connection, the paper aims at analysis of the main challenges and tendencies in the functioning of the social infrastructure and discusses the role of state and organizations in its development.

KEYWORDS: *Social Infrastructure, Civil Society, Non-Government Organization, Civil Rights, Labor Unions.*

INTRODUCTION

In the modern context social infrastructure is an important characteristic of the degree of economic and social development, the rate of the breadth and the depth of use of material opportunities for rational human activity, as well as an indicator of the social economy of the state. Social infrastructure in its economic nature on the one hand is the part of the social sphere of the state (society), which in turn is the part of the socio-economic structure of the state as a formal institution of society. On the other hand, in terms of involvement in the economic and financial relations between the participants of the market, it is a subset of a complete infrastructure of the economy, as the sphere of the production of socially important goods and

services. Speaking about the infrastructure as an economic category as a whole, it should be noted that it is part of the economic relations of material production sphere, which would produce a large number of final products. It is also an integral part of the productive forces of society, ensuring the normal operation of enterprises.

The emergence of infrastructure is closely related to material production, which development gives rise of new forms of production, servicing and integrating with them branches and forms of activity. The growth of labor productivity in the sphere of material production releases more and more of society's resources to serve the public. Thus, the emergence of infrastructure is a direct result of the development of the productive forces of society, and its content is determined by the internal economic unity of incoming industries and specific functional purpose of each one.

Characteristics of separation of the social infrastructure in individual subsystem of economic development are:

General conditions of the process of social reproduction,

Complex internal structure with distinguished parts, links,

The basis of the division of the social infrastructure with parts and links is the common functionality of the components in the process of social reproduction, that is, orientation of objects on the creation of conditions to meet the needs of a particular circle of society, population and production needs.

In the most common sense, social infrastructure is divided into social and household and socio-cultural parts. Social and household infrastructure aimed at creating conditions for the reproduction of human beings as a biological (through household environment) to meet him/her needs for adequate living conditions. Social and cultural infrastructure contributes to the reproduction of spiritual, intellectual (through cultural and educational environment), and to a large extent the physical characteristics of the individual, the formation economically active person that meets certain requirements of the society to the quality of the labor force (Table).

MATERIALS and METHODS

According to the table social and household infrastructure consist of some components: housing and communal services, consumer services, trade and food service, passenger transport and telecommunication services for the population, etc. Social and cultural infrastructure covers health care, recreational services, physical culture and sports, social security, education, culture and art, places of worship, etc.

Social infrastructure is one of the dominant factors, ensuring the satisfaction of basic human needs, as well as the development of the state and its territory. Transportation facilities, housing services, the systems of social protection, health and education are the key positions in the practice of state and municipal administration, which is determined by a number of factors. First Social infrastructure is one of the dominant factors, ensuring the satisfaction of basic human needs, as well as the development of the state and its territory. Transportation facilities, housing services, the systems of social protection, health and education are the key positions in the practice of state and municipal administration, which is determined by a number of factors. First of all, by the social significance of the social infrastructure, which appoints the availability of primary amenities for the population, the possibility of self-fulfillment of the individuals, the

development of their professional, entrepreneurial activity, and characteristic of conditions for transformational and transactional costs saving for businesses unit. Effective development of social infrastructure provides a pledging of social security and political stability. Complexity and multidimensionality of set problems raises special demands to the system of management, providing operation and development of social infrastructure, first of all at the local level. Concentration on a particular territory of all processes of sustenance of the population, territorial localization of the objects of social infrastructure confirms the effectiveness of autonomy of local government from the government institutions in the solution of the issues of local character.

Factors, determining the management practices of the social infrastructure development. Under the factors (from the Latin factor - making - producing) we understand the conditions that determine the nature, specificity, parameters of the activity of the management entity with the purpose of the social infrastructure modernization. Management practices are formed under the influence of many factors, which are interconnected and inter conditioned. The classification of the factors is based on their grouping by main scopes of activity: economic, social, political, cultural and spiritual. At the same time, natural and territorial factors are also considered as the key aspects of social infrastructure development.

Natural-territorial factors

Natural-territorial factors - is type and size of a settlement, climatic, ecological conditions, natural-resource potential of the territory. Natural-territorial conditions for the social infrastructure accommodation have prevailing significance. These factors identify the specificity of the functioning of the infrastructure sectors. Thus, harsh weather conditions, in particular, dictate a high level of requirements for functional performance of utilities system, significant material costs for the construction and maintaining of environmental support systems. But the only factor of the depth of ground freezing indicates the difference in the cost of construction and keeping of residence building, the objects of infrastructure in various regions. The high cost of community, transportation facilities, geographical isolation of the northern territories increase the transformation costs, connected with production, transportation and storage of food and industrial articles, restricting the development ability of the consumer market complex. Not less significant factor in the development of infrastructure is the type and size of the municipal unit. Belonging to the urban or rural settlement, in many respects determines the priority of any given area of activity of the instance of authority on the development of social infrastructure. The characteristic features of the rural settlement, indicating the specificity of its social infrastructure, are usually the following: dispersion of displacement of population, the prevalence of low-rise buildings, the lack of centralized utilities, low level of transaction costs when making different kinds of transactions, formation of a contract, which are determined by the specific of sufficiently close interpersonal communication (Kuhtin, 2008), the absence of a stable level of demand for commercial services of the consumer market, the socio-cultural infrastructure complex. The finely divided nature of the resettlement defines a high degree of dispersion of social infrastructure objects, high transportation costs of the population. Another significant factor is the size of the settlement. On the one hand, in the large urban areas special requirements are imposed to the work of the government in order to ensure the effective functioning of the objects of social infrastructure. Rather than anywhere else, in the large cities the organization of municipal improvement, transportation, and public services is associated with a high level of complexity. On the other hand, large cities, being the centers of the workforce, have a more stable financial base for the social infrastructure development (Makushkin et al., 2016). Statistics

affirm serious prerequisites to the mobility of personnel and capital to the large settlements. Higher population size serves as a factor of effective development of social infrastructure, as it creates the objective prerequisites for sustainable demand on related services, allows creating the taxation base of local budgets.

Political factors

Political factors are represented by the laws and regulations that define the parameters of government work in the development of social infrastructure, the direction of state, regional policy, the level of citizen activism, non-governmental organizations. The political sphere is inherent in the law, rules of which set the parameters and vector of the state policy, regulating the interaction of the main subjects of the modernization of social infrastructure.

Definition of civil society

Some people consider the civil society as a presence of people out of private sphere means their home and entering to the community and its functions. Some people believe that, a set of civil society is included active presence of people in different communities in society which impact the society any way. Some people consider civil society as public institutions and organizations trade union etc., that each of human includes a number of individuals in the general population and have a corporate, political, social and cultural aspects of the society.

Another definition of civil society consists of people who make groups and associations based on their will and chose and independent of the government and purpose of establishment of such groups is improving the favorites and interests of the members (civil society, GhasemKarbasiyan).

Eighteen century can be considered as an important period in the event of democratic governments and civil society. In this period universality of human rights was presented which moved into the realm of civility at the same time with French revolution and concept of citizenship (rights and responsibilities associated with it) was particularly important.

Development is one of the most important pillars of country's development. So it is important that development is examining. Economic, political, cultural and comprehensive development needs comprehensive planning. In comprehensive development, based on observed experience countries with the largest coordination to the community bodies, civil society have been successful. Because civil society is direct supervisory power of the people on the rulers and authority's performance and gain their power by people's integration and movement. That is why the civil society moved toward organizing and distribution. Guilds, parties, media, trade unions and any group of people who are engaged in giving service, turned in to intervening group in government's performance and decisions. So that if decision is harmful, they do something like: demonstration, strike and which are civil activities and express their demands avoid conflict and remain on their positions as far as being convinced. This process is more powerful than controlling the different sings such as: parliamentary oversight, inspection organizations and involve society to the participation in political and social affairs. In countries were the position of people and civil society have been respected in the constitution in the framework of maintaining the legal freedoms and people's fundamental rights, the rate of development and reducing corruption is more obvious than the countries were constitution hasn't been respected. This guarantees one of the most basic foundations of development.

Civil society organizations promote cooperation between two or more individuals through mutual cohesion, common approach and networking. Democracies inherently encourage such cooperative behavior. In the current model of economic growth, the voluntary/ civil society sector has been recognized as a key player in achieving equitable, sustainable and inclusive development goals.

Both the State as well as the market-led models of development has been found to be inadequate and there is an increasing realization that active involvement of the voluntary sector is needed in the process of nation building. They are now viewed as partners in progress.

Civil society organizations function outside the conventional space of both State and Market, but they have the potential to negotiate, persuade and pressurise both these institutions to make them more responsive to the needs and rights of the citizens. Voluntary Organizations can offer:

Alternative perspectives

Committed expertise

An understanding of the local opportunities and constraints capacity to conduct a meaningful dialogue with communities, particularly those that are disadvantaged. It is therefore essential that the Government and the Voluntary Sector work together. Based on the law under which they operate and the kind of activities they take up, civil society groups in our country can be classified into following broad categories:-

Registered Societies formed for specific purposes

Charitable Organizations and Trusts

Local Stakeholders Groups, Microcredit and Thrift Enterprises, SHGs

Professional Self-Regulatory Bodies

Cooperatives

Bodies without having any formal organizational structure

Government promoted Third Sector Organizations

The voluntary sector has contributed significantly to finding innovative solutions to poverty, deprivation, discrimination and exclusion, through means such as awareness raising, social mobilization, service delivery, training, research, and advocacy. The voluntary sector has been serving as an effective non-political link between the people and the Government.

Different types of civil society organizations

Civil rights advocacy organizations: to promote human rights of specific social groups e.g. women, migrants, disabled, HIV, sex workers, Dalit people, tribal people, and the likes. Civil liberties advocacy organizations: to promote individual civil liberties and human rights of all citizens, rather than focusing on particular social group. Community based organizations, citizens' groups, farmers' cooperatives: to increase citizen's participation on public policy issues so as to improve the quality of life in a particular community. Business and industry chambers of commerce: to promotion policies and practices on business.

Labor unions: to promote the rights of employees and workers.

International peace and human rights organizations: to promote peace and human rights.

Media, communication organization: to produce, disseminate, or provide production facilities in one or more media forms; it includes television, printing and radio.

National resources conservation and protection organizations: to promote conservation of natural resources, including land, water, energy, wildlife and plant resources, for public use.

Private and public foundations: to promote development through grant- making and partnership.

Also the Civil society includes – Political Parties; Religious Organizations; Housing cooperatives, slum dwellers and resident welfare associations.

Non-Government Organization

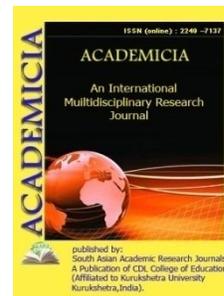

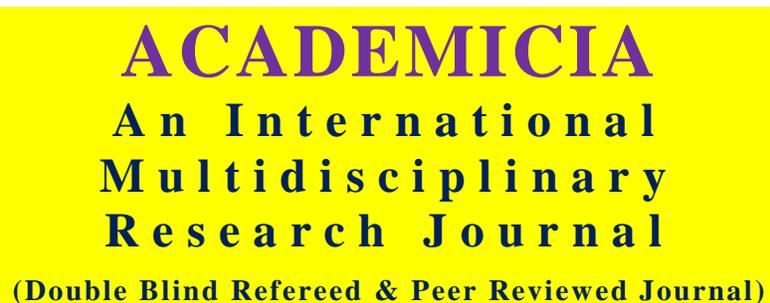

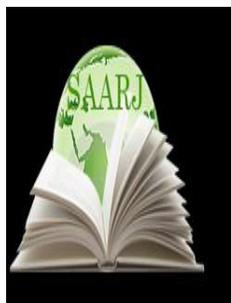

CONCLUSION

NGOs are legally constituted organizations, operate independently from the government and are generally considered to be “non-state, non-profit oriented groups who pursue purposes of public interest”. The primary objective of NGOs is to provide social justice, development and human rights. NGOs are generally funded totally or partly by governments and they maintain their non-governmental status by excluding government representatives from membership in the organization.

In a democratic society, it is the state that has the ultimate responsibility for ushering development to its citizens. In India, through the progressive interpretation of the Constitution and its laws and policies, the scope of development has been significantly broadened to include not just economic progress for citizens, but also promotion of social justice, gender equity, inclusion, citizen’s awareness, empowerment and improved quality of life. To achieve this holistic vision of development, the state requires the constructive and collaborative engagement of the civil society in its various developmental activities and programs. Non-governmental organizations (NGOs) as the operational arm of the civil society therefore have an important role in the development processes.

FORMATION OF PROFESSIONAL SKILLS OF FUTURE BIOLOGY TEACHERS AND DEVELOPMENT OF ITS CRITERIA

Salimova Sarvinoz Farhodovna*

*Student,
Bukhara State University,
UZBEKISTAN

ABSTRACT

Biology at a time when the teaching system needs to be absolutely reformed in the coming year's science teachers also need to be up-to-date and professional. Biological science to the subject that the teacher teaches, along with an in-depth knowledge of the subject he or she teaches knowledge of related sciences and the use of modern techniques, use them, as well as apply the theoretical knowledge learned in practice it is necessary to take.

KEYWORDS: *Curriculum, Pedagogical Technology, Interactive Method, Educational Effectiveness, Educational Process, Teacher Skills, Abilities and Qualifications.*

INTRODUCTION

Today, it is up to the teacher to properly organize the cognitive activity of students, to conduct the educational process as a whole system, to integrate the knowledge and skills of students with each other. requires high pedagogical skills. Based on the educational, pedagogical, developmental goals of each topic in the curriculum, the lessons were taught using problem-based learning, modular learning, collaborative learning, didactic game technologies. helps students to organize their knowledge and skills properly. A problem situation is created under the guidance of a teacher during a problem lesson. This problem helps students to acquire knowledge, skills, creativity and intellectual activity as a result of active independent work. Problem-based lessons are effective at all stages of the learning process: new topic statement, reinforcement, and knowledge control. In this case, the student must first try to identify learning problems, to create a system of problem situations, based on the content of the new topic.

Problem lessons are organized in the following stages:

1. An equal number of groups of students are formed, whose level of knowledge is psychologically close to each other.
2. The groups are given tasks consisting of problem questions and are introduced to their didactic purpose.
3. Focus students' knowledge on problem solving.
4. Have a group discussion

With the development of modern science, technology and industry, there is a need for a new project of educational content in the educational process, the use of advanced pedagogical technologies. In each lesson, the task is to continuously improve the effectiveness and quality of teaching using new pedagogical technologies to help students develop their interest in knowledge and independent work skills. Improving the learning process by focusing on students' cognitive activity as a factor in the formation of problem situations and tasks in the minds of students, the search for independent solutions, the acquisition of knowledge and intellectual development. Today, the reform of the system of continuing education in our country, which is on the path of independent development, and the introduction of information technology and improving the efficiency of education has risen to the level of public policy. At a time when the Republic of Uzbekistan is on the path to building a democratic, legal and civil society, the main goal and driving force of the ongoing reforms in the field of education is the education of a well-rounded person. An important condition for the development of our country is the creation of an improved system of training based on the development of modern economy, science, culture, engineering, technology. Until now, traditional education has taught students to acquire only ready-made knowledge. This method was tedious and deprived students of independent thinking, creative research, and initiative. Classes using modern innovative pedagogical technologies are more interesting, as they allow students to search for their own knowledge, to study and analyze it independently, and to draw their own conclusions. In this process, the teacher creates conditions for the development, formation, education and upbringing of the individual and the team, as well as acts as a manager, a guide.

Using modern innovative pedagogical technologies, students will be able to learn new information and evaluate their own knowledge. Therefore, the importance of modern teaching methods and innovative technologies in the teaching process in educational institutions is invaluable. In the educational process, it is important for every teacher to teach students to think creatively, to adapt to changing situations, to organize activities on the basis of free competition, and to be able to use pedagogical technologies, information technology, e-textbooks and multimedia in practice. This requires that students develop independence, free thinking, analysis of learning activities, and, in the future, professional skills and computer literacy.

Indeed, modern innovative pedagogical technologies increase the efficiency of the educational process, form students 'independent thinking, increase students' passion and interest in knowledge, and develop their skills and abilities to use them freely in practice. In the process of education based on pedagogical technology, the scope of teacher's and student's activities is clearly defined, the specific technology of organization of education is specified. Pedagogical technologies, firstly, allow students to learn their knowledge, skills and abilities easily and with interest, and secondly, help teachers to grow both professionally and spiritually. Today, a special goal is set for the educational process. It is about giving students the opportunity to express

themselves creatively and to help them develop positive personal qualities. Due to the complexity of the educational process, the effectiveness of education depends on the activity of teachers and students, the availability of teaching aids, the organizational, scientific and methodological excellence of the educational process. Today, there is a growing demand for teachers who take a responsible approach to the organization of lessons in innovative ways, have professional and methodological skills, master modern pedagogical technologies, and are able to organize education on the basis of innovations. Effective ways of teaching are being developed using the created conditions wisely. Even students of a certain class with different levels of mastery require a great deal of skill on the part of the teacher to achieve their pedagogical goal by applying differentiated-individual teaching methods. Individual teaching is a process in which each student actively participates in the learning process and makes a personal contribution to the learning process, taking into account the methodological approach and speed of the teacher. Interactive learning with interactive teaching methods encourages students to develop the following skills: the student is not taught, he is taught to read, study, work independently, to learn through independent analysis, to think creatively, to think freely on the basis of personal conclusions. to be able to think independently against opinions, to defend one's position. Thus, the quality and effectiveness of education depends on the student's effective reading, independent thinking and thinking activities aimed at mastering the content of learning. The use of creative games in biology lessons involves the creative application of knowledge, skills, and abilities acquired by students, and the solution of problematic situations that arise during reading through creative research. Such games are designed to develop students' independent creative research and logical thinking, to strengthen their knowledge, and to impart new knowledge. Creative games can be used to generalize knowledge of major topics and chapters in all biological sciences. In this case, the students in the class are divided into groups with equal opportunities according to the level and number of mastery. The groups can be conditionally divided into specialists such as ecological, parasitological, embryological, endocrinological. In this case, the experts of each group of participants independently and creatively perform the tasks given by the teacher and discover new things in science. Students base their answers on visual aids using visual aids. The organization of scientific conferences is in the form of research, lectures and discussions. In such classes, well-read and curious students prepare lectures and visual aids for conferences as biologists. The rest of the students ask questions about the issues they are interested in as conference participants. The main purpose of the scientific conference is to develop students' skills and abilities to work with additional literature, popular science materials, lectures, express their opinions, as well as to develop a culture of speech and communication. In this case, the teacher predetermines the topic of the scientific conference lesson. Divides it into separate sub-topics. Selects additional literature on small topics. Provides necessary instructions for preparation for the conference. Press conference sessions are held with the participation of all students in the class. Some of the students are industry experts, and most are newspaper, magazine, and television reporters. The theme of the conference and the responsibilities of the participants will be announced at least a week in advance. The teacher discusses with the students the questions to be asked to the conference and their answers. Questions and their answers should be short and to the point. In this lesson, the teacher introduces the topic, the purpose of the conference, and the participants. Instead of imparting knowledge to students in a ready-made way, students acquire the skills to acquire knowledge by searching, finding, and processing knowledge from textbooks, the Internet, and various other sources. Through the

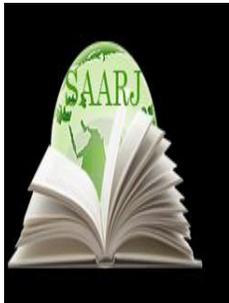

acquired knowledge, it is possible to think creatively. At the same time, the student's ability to apply the acquired knowledge in life and practical activities is determined by his / her skills and abilities. The effective organization of student activities plays an important role in the effective use of the structure of the learning process. Because the student's personality is at the center of the learning process. Today, multimedia is one of the main directions in informing the learning process. The use of modern information technologies in education is effective in improving the software and methodological base, materials and further raising the level of knowledge of students.

One of the main issues in education is the problem of personal development in the teaching process. Development is a complex process that expresses the essence of quantitative and qualitative changes in the physiological and intellectual growth of an individual. Personality development is the process of physical and mental changes in an individual over time, through which the individual rarely and more, from simple to complex, from the lowest to the highest, matures and matures. In the organization of this education, each student is approached on the basis of his psychological, physiological and social development, existing abilities and capabilities. Fundamentals of Developmental Education in Russia L.V. Zankov, D.B. Elkonin and V.V. Davydov. In the 1970s, V.V. Davidov put forward the idea of student self-development. In 1996, the Ministry of Education approved the introduction of these technologies in educational practice. There are currently a number of other developmental education technologies in the country, but they have the status of alternatives. Certain technologies are used in the organization of developmental education in the education system. Among them are: design technology, problem-based learning technology, modular learning, didactic games, collaborative learning. There are also trainings, creative assignments, cases, tests, puzzles, logic problems, special exercises, quick sayings, riddles, crossword puzzles, rebuses, scanwords, chainwords, projects, competitions, didactic games, brain teasers and more. Thus, developmental education helps to develop the individual's abilities, to fully realize his inner potential.

Modern pedagogical technologies are widely used in the process of developmental education. The teacher's ability to choose technology appropriately, appropriately and effectively ensures the successful organization of developmental education.

IMAGINARY LINE IN LANDSCAPE PAINTING OF UZBEKISTAN

Dilnoza Tulanova*

*Senior Lecturer,
 Tashkent State Pedagogical University,
 Named after Nizami, Tashkent,
 UZBEKISTAN

ABSTRACT

The 40-50 years of the twentieth century are one of the most interesting periods for landscape painting. It was during this period that a strong school of fine arts developed in Uzbekistan, which represented a variety of art trends. So, for example, from representatives of the avant-garde (A. Volkov, N. Karakhan, U. Tansykbayev) to realism (O. Tatevosyan, P. Benkov, Z. Kovalevskaya, R. Timurov).

KEYWORDS: *Avant-Garde, Painting, Image, Landscape, Nature, Stylistics, Artist.*

INTRODUCTION

Our study of the figurative-stylistic line in the landscape of Uzbekistan goes back to the post-war period (50s of the XX century). Therefore, it is considered relevant to study the development of the landscape of this period, the time is somewhat dramatic, since from the point of view of the ideology of the period under consideration, the country needed landscapes, where the main characters were a person transforming their native land, and the image of nature served only as a background. A. Volkov, U. Tansykbayev, N. Karakhan, P. Gan, P. Benkov, R. Timurov, Z. Kovalevskaya, O. Tatevosyan - these are the names of the artists who worked in the landscape genre at that time. After going through the trials of the war, the artists saw the nature of their native places in a special way after returning home. Hence the heightened feeling of love for nature, a deep awareness of its newly discovered beauty. In the best works of landscape painting of the post-war period, this ideological concept of artists is clearly revealed. The landscape of the period under study is closely connected with the traditions of Russian realistic landscape, Western European painting of the late 19th and early 20th centuries, frescoes, and oriental miniatures. It is important to note that it was the landscape in the works of many masters that served as the driving force, impulse, which in the future will lead to the creation of unique landscapes, and will become a recognizable feature of the national painting school, being one of

the leading genres of fine art in Uzbekistan. The decisive factor in the addition of his stylistic qualities was the communication of future masters - M. Saidov, R. Akhmedov, N. Kuzybaev and many others, with living bearers of these traditions (the evacuation of Russian universities during the war to Uzbekistan), the study of monuments of world art from antiquity to their contemporary period, as well as consanguinity with these traditions. Nevertheless, the dawn of landscape painting in Uzbekistan in the post-war period is due to a number of reasons. Important changes began to take place in the painting of the region in the second half of the 50s, which were the eve of the rise of national schools in the 60s [1, p.158]. In landscape painting, trends are observed in common with the development of other genres. Although the ideology of the period in question did not allow for landscape, nevertheless, this genre played a complementary role in large paintings. And the most interesting finds can be seen in sketches. It was the sketches performed in the open air that determined the specific features of the development of the landscape of this period. Such are, for example, the works of A. Volkov in the last years of his work, the so-called landscapes-memories: "Blue beds", "Sunset", "Autumn", "Low moon".

A special place in landscape painting of the second half of the 20th century was played by the creative achievements of such major landscape masters as U. Tansykbaev, N. Karakhan, P. Benkov, R. Timurov, M. Novikov. Confirming the idea of a national landscape, these masters mastered a wide range of artistic and light-plastic tasks with new pictorial means. In the landscape of this time, the problems of the light-air environment were solved and the tasks of the plein air were set. Observing the state of the atmosphere and changes in natural color depending on the lighting, the artists were looking for a more precise one: tonal-color relationships in the landscape. New techniques of landscape composition were also formed, which made it possible to build a landscape space not as a backstage decoration with division into plans, but as a fragment of living nature. For such representatives of the national school of painting as: R. Akhmedov, N. Kuzybaev, M. Saidov, T. Oganegov, work in the open air was the fundamental aspect of creativity. And naturally, this led to the development of the landscape genre.

During this period, the architectural landscape received sufficient development in the works of P. Benkov, O. Tatevosyan, Z. Kovalevskaya, R. Timurov and others. These artists try to convey in landscapes the national peculiarity, the sunny color of the East.

This period is considered a turning point in the work of A. Volkov. So in his research S. Khromchenko notes: "... Having experienced disappointment with the socialist utopia, A. Volkov found a new breath when he turned to real nature and began to write small "gratifying", almost plein air sketches. This is not a symbolic interpretation of the universe, but a specific piece of fertile land that gives shade, coolness, peace. Subtly noticing the change of lighting, weather, colors, comprehending quiet harmony, the artist finds a new meaning of life and creativity, allowing him to keep himself in the stream of the then officialdom" / 2; 158-159 /. These are the so-called genre landscapes with human figures, which, in essence, supplanted the multi-figure genre painting characteristic of his work: "... In numerous landscapes, the artist conveys dramatic transitions of the state of nature and man in it. These are such pictures as "Evening. Outskirts of the City", "Crossing the Stream", "Autumn" (Fig. 1), "Autumn Landscape" (1946-1956) [2, p.33].

Suburban gardens and corners of the old city served as objects for sketches by the Tashkent artist O. Tatevosyan. He, perhaps more than other artists who wrote before him, managed to do the most difficult thing in landscape painting - to express the specific, unique look of national

motives. In his own way, he deeply understood the typical features of the nature of Uzbekistan and knew how to convincingly portray them. He knew how to generalize what he saw without getting lost in the mass of unimportant details. He almost always succeeded in translating the phenomena of real life into the language of painting, while retaining the specific individual external features of these phenomena. These are landscape sketches "Tashkent. Soviet Street" (1946 State Museum of Fine Arts, Uz.), and "Outskirts of Tashkent" (1946 GMI Uz.) painted with wide dynamic strokes, in contrast to his "smoothed" still lifes. "Samarkand Suite (late 50s)". Tendencies towards a sensually convincing interpretation of the world lead to the fact that the landscape entourage begins to be conceptualized as a fundamentally important part of the spiritual atmosphere of the work. Conventional backgrounds are replaced by landscape backgrounds, which often grow to the size of a wide panorama of the world. This situation is explained as follows: A number of artists of the older generation, who made a significant contribution to the formation of the painting school of Uzbekistan in the 20-30s, in the 40s and especially in the first post-war decade, sharply departed from their previous searches, and not least - under pressure critics who were supporters of socialist realism. For O. Tatevosyan, N. Kashina, N. Karakhan and U. Tansykbaev, this period turned out to be contradictory, in some ways even crisis. However, in their work one can also notice the overcoming of the natural-stating direction due to the convergence with the principles of the "Benkov school" / 3; 18-19 /. It is known that even Dorival considered impressionism "a version of realism" / 4; 63 /. This fact was reflected even more precisely in the research of N. Akhmedova: ... for A. Volkov, U. Tansykbaev, N. Karakhan, V. Ufimtsev, M. Kurzin, Usto Mumin (A. Nikolaev) it was a complex, dramatic change in their aesthetic views. As M. Zemskaya correctly notes on the example of A. Volkov's evolution, the transition from flatness, decorative and symbolic understanding of color to the "softening" of these components led artists to a kind of impressionistic manner, associated with many of them in these years with work on nature» [5, P. 58].

One of the landscape trends of this period was the creation of paintings on industrial themes. Since 1935, the artist U. Tansykbaev has been working on the creation of landscapes of this type: "... In his paintings on industrial themes of these years, in the construction of volumetric plastic forms and partly in color with a predominance of locally conjugated colors similar in tone (brown, blue or the red scale), the influence of the pictorial concepts of A. Volkov and, more distantly, P. Gauguin is felt [1, p.86]. In the 40s of the twentieth century U. Tansykbaev, working in the vicinity of Tashkent and in the valley of the Chirchik river, relying on numerous full-scale sketches, creates a painting "In the Chirchik Valley" (1940), which exists in two versions. The main version was first exhibited at the Spring Exhibition of Landscape and Still Life in Tashkent (1940). The painting "In the Chirchik Valley" is a landmark, since from this period U. Tansykbaev began to work on panoramic compositions. The culminating point, which will be the creation of the painting "Morning of the Kairakkum Hydroelectric Power Station" (1957) - the result of the search for a new image of nature, one of the most famous works of the master, which received wide international recognition at the world exhibition in Brussels in 1958 [1]. The 50s of the twentieth century are for U. Tansykbaev the time that art critics (L. Zhadova, V. Lakovskaya, R. Taktash and others) characterize as the time of the final formation of his artistic style. It was during this period that the master's work gains stability [5, P. 58].

The work of the landscape painter N. Karakhan (1900-1970) is unique. The artist boldly operates with orange, golden yellow with violet-blue spots of bright greenery, creating a major chord. The pictorial solution is emotionally impressive and convincingly conveys the unique beauty of the mountain landscape with wheat fields cultivated by man ("Mountain studies" (1937), "Kishlak in the mountains" (1940), "Bukhara studies" (1943), "Native land" (1948) , "Watershed" (1947), "Blue Lake" (1947), "On Khirman" (1950 Termez Museum), "Our Fields Are Wide" (1951), "Takhiatash Harbor" (1952).

The founder of the so-called figurative-poetic trend in Uzbekistan, based on the traditions of Russian realistic art and impressionism in the Russian version, was P.P. Benkov (1879-1949). For P. Benkov, Central Asia is a country that has become a source of new pictorial motives, and its nature is the basis of the master's unique coloristic vision. The main role in it was played by the sunny atmosphere, the ability to directly express the showiness of nature, to free oneself from plot thinking in the direction of the picturesque element / 5; 56 /. When studying the work of P. Benkov, a sad fact was discovered: so during the life of the artist there was not a single of his personal exhibitions.

P. Benkov, being the founder of the chamber lyrical landscape, created a collection of landscapes that carry the energy of national color and European pictorial culture. Another artist K. Chebotarev, in his memoirs, emphasizes: "... Benkov ... preferred" sunlight "in painting / 3; 21 /.

The period under study is the last, mature stage of the artist's work. P. Benkov, subtly feeling nature, managed to convey its most beautiful moments (restrained spring flavor, hot summer, etc.). This period is marked by the following fact: "... In most of the artist's last paintings, painted in his characteristic light mobile manner, the image of a person is inextricably linked with the landscape environment / 3; 21 /. An example is the following paintings by the artist - "On the Registan" (1946), "Early Spring in Bibi Khanym" (1947), the picture is distinguished by a light mood, it successfully conveys the breath of early spring with its transparent haze, trees waking up from winter sleep, and In a number of other canvases, the figures of people are given in a generalized way, without specifying the psychology of the characters, in an organic connection with the landscape. This decision was determined by the task of creating a general emotional atmosphere and revealing the poetic essence of human existence in the environment by compositional-rhythmic and pictorial-coloristic means, but not by a narratively developed plot / 3; 21 /. This period is characterized by a more emotional saturation of landscapes. They become more lyrical, there is a slight sadness in them, there is a feeling of the author's loneliness. Further, this will lead to the creation of the so-called "mood landscapes". P. Benkov - a chamber artist who worked in the best traditions of impressionism, subtly felt the beauty of nature.

Landscape painting of the "Samarkand school". Analyzing the path of formation of landscape painting by the masters of the Samarkand school, one can come to the conclusion that recognition and interest in it are justified and natural. The school was founded by a talented artist and teacher P. Benkov, who had worked in Samarkand since 1930. He developed a painting style, largely inherited from the French impressionists. His work truly expressed the peculiarities of the color of the Uzbek landscape, its specific national features. The artist P. Benkov created his own unique school where Z. Kovalevskaya, R. Timurov, A. Razykov, A. Abdullaev, L. Abdullaev, R. Akhmedov studied painting. The world in the painting of the Samarkand school is presented realistically, impulsively, emotionally, brightly. The artists of this school were primarily interested not in events and actions, but in the state of the environment, which unites

objects and figures into a pictorial whole, which does not require a strict construction of space. "... The creativity of these artists is characterized by a poetic perception of reality, sensitivity to the dynamics of life, the dialectical interconnection of various elements of reality, to the peculiarities of nature and folk life of Uzbekistan, which led to the later manifested tendency towards decorativeness, as well as the predominance of landscape in their work (emphasized by the author D. T.) and genre painting, in which a significant role belongs to the landscape environment (emphasized by the author D.T.) This type of landscape painting tends to multicolor, rich color, broad brushstroke, graphic lines and silhouette. The style of the artists of this school can be said to be a synthesis of impressionism and modernity. An essential place in their work was occupied by the image of a person as a bearer of sustainable beauty. Folk motives in their works are presented in a colorful, festive form (Z. Kovalevskaya, R. Akhmedov). In this vein, plein-air, landscape-lyrical painting, in which the nature and state of nature were combined with the mood and feelings of a person, reached a special rise. A certain circle of images is formed, the motives of which are the architecture of the city - museums, small courtyards, bazaars, old streets - everything that is full of a peaceful, rich life, behind which a mighty layer of folk culture is hidden. The predominance of urban, architectural, landscape of pure nature (R. Akhmedov), industrial landscapes (R. Timurov) in the works of the painters of the Samarkand school is obvious).

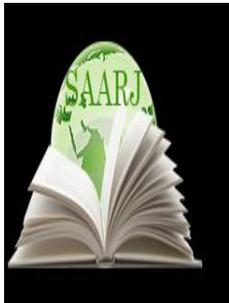

During the period under study, the landscapes of Y. Elizarov (1920-1974), who did not paint pure landscapes, but created plein air sketches of Samarkand out of love for the city - old streets, architectural monuments of the ancient city (Autumn (1950), " Yard "1956," Yard Shir-Dora "(1968)," Bibi-Khanym "(1969)). It is important to note that the Repin Art Institute (Leningrad) gave us tonal painting, the outstanding representatives of which are R. Akhmedov and M. Saidov. Y. Elizarov, a student of Grabar, later studied with S. Gerasimov, from there impressionistic plein air painting, an outstanding colorist of Uzbekistan, unfortunately, now, most of the inheritance is in the USA, with the artist's wife.

As our research shows, landscape painting is a whole pictorial line in the art of Uzbekistan. But for our study, it is important to analyze the work of precisely those artists for whom landscape painting will become the main impulse when an artist, inspired by nature, creates real works of art. Landscape painting became for the foundation on which a whole galaxy of contemporary artists will grow in the future (G. Abdurakhmanov, E. Melnikov, Zh. Umarbekov, B. Zhalalov). In conclusion, it should be noted that by now two great traditions have been deeply rooted in landscape painting - the tradition of A. Volkov, which will receive a stormy dawn in the 90s of the twentieth century, when the so-called iconic landscape, landscape symbol, and traditions laid down Benkov, which is further transformed into chamber-salon landscapes. In other words, precisely those methods of artistic recreation of the surrounding world were actualized, which were most consistent with the present moment. That is, the need to deepen the personal comprehension of the image of nature, its spiritual essence, avoidance of rigid schemes. This is related to the simultaneous presence in the landscape of Uzbekistan of the period under consideration of a number of bright trends, presented as the work of individual major masters of the period under study, united by the similarity of their ideological position, as well as preferences in the choice of support in the Russian and Western European artistic heritage (A. Volkov, P. Benkov , U. Tansykbaev, N. Karakhan) and groups of artists of the next generation (R. Timurov, Z. Kovalevskaya, R. Akhmedov and others). They became bearers and successors

of traditions, influenced the search for ways by artists of the next generation for those who dictate the modern development of art in Uzbekistan.

INTERACTION OF PARENTS IN THE ORGANIZATION OF SPEECH THERAPY FOR CHILDREN WITH SPEECH DISORDERS IN PRESCHOOL ORGANIZATIONS

Madina Jalilova*

*Doctoral Student,
 Tashkent State Pedagogical University
 Tashkent, UZBEKISTAN

ABSTRACT

The article deals with the issues of interaction with parents in the provision of speech therapy assistance to children with speech disorders in preschool organizations. The author expressed his own views and reviews about working with children with speech defects. A steady trend of combining efforts can be noted in the practice of family and social education. The speech therapist should meet with parents regularly to warn them about the successes and challenges of working with their children. In this group of children, the materials on pronunciation and speech formation are updated from time to time. It may be recommended that special stands be set up to reflect children's speech situations.

KEYWORDS: *Preschool Education, Speech Therapy, Children With Speech Defects, Fluent Speech, Speech Pathologist, Sign Language Teacher.*

INTRODUCTION

Identification, study, elimination of speech defects in children and the organization of speech therapy are relevant for all areas of defectology (speech therapy, oligophrenopedagogy, typhlopedagogy and deaf pedagogy). Speech defects have a negative impact on children's behavior and learning. Speech deficiency cannot be eliminated on its own. Speech disorders require long-term remedial action. In order to properly organize the exposure to children with speech defects, it is necessary to correctly understand the cause and nature of speech disorders, the emergence of speech defects, the development of speech disorders and the laws of its elimination. This contributes to the emergence of fluent correct speech, the elimination of shortcomings in the pursuit of a clear goal. Knowing the mechanism and causes of speech defects plays a key role in identifying speech defects in children with speech defects [1,2,3,5,8].

The main purpose of this topic is to involve parents in corrective activities in the elimination of speech defects, to jointly address, shape and develop speech defects.

This is especially important for teacher-speech therapists and parents working with the specifics of working with preschool and primary school children, which is a key stage in the mental, speech, social and personal development of the rising generation in a systematic: special, public and inclusive education process. Therefore, ensuring the social adaptation of children with severe speech disabilities, who need help, requires the development of scientific-theoretical and practical bases of continuous speech-language-correctional education and upbringing. On the one hand, speech disorders remain one of the most common problems in the psycho-physical development of preschool and school-age children, which in turn is of great importance in establishing family partnerships in the speech therapy process.

The organization of treatment and speech work with the participation of a speech therapist in the search for means of prevention and correction of speech disorders in children in the context of specialized, public preschool and educational institutions. The quality of upbringing is determined by the nature of the relationship between adult and child. A steady trend of combining efforts can be noted in the practice of family and social education. The speech therapist should meet with parents regularly to warn them about the successes and challenges of working with their children. For these purposes, the following activities are carried out: parent meetings, consultations, open speech therapy classes, seminars-practicums; special stands, exhibition folders are made.

The first parent meeting will be held in late August or early September. It acquaints parents with the structure of the institution, the tasks and content of work throughout the school year, the rules and agenda of preschool education. Usually, this meeting is chaired by the director of preschool education organizations together with speech therapists of all groups. The second session will be held in October by each speech therapist in their own group. By this time, the speech therapist will complete the examination and present the results to the parents, describing each child's general and speech development. It is important to clearly explain to parents the main disorders in children's speech development, the causes of their occurrence, the degree of backwardness and the need for joint action to address this defect. In the work plan, the speech therapist explains the initial period of training, its tasks and content. The third parent meeting will be held in January. It summarizes the results of the first half of the year, reveals the main directions of future correctional education. Each child's speech and general development is described, the children's successes and the difficulties that arise during the correctional sessions and those that need attention from loved ones are revealed.

The final parent meeting will be held in May, summarizing the educational work of the year, making recommendations on strengthening the material covered.

The speech therapist informs the parents of the decision of the commission that the children should continue their education in general or special school in the future or, if necessary, stay in a special group. The decisions of the Commission are given in detail.

Parents who experience difficulties in the work process are invited to the weekly open house. The speech therapist introduces parents to the basic methods of teaching the correct pronunciation of sounds, explains and demonstrates the exercises to be done at home written in the child's notebook.

Parents attend open speech therapy sessions throughout the school year (at least once every 3 months). In these classes, the speech therapist will introduce parents to the main methods of teaching, the selection of visual aids and speech materials, as well as the requirements for children's speech during the lessons.

Stands for parents are prepared throughout the year in collaboration with a speech therapist and educator. It contains information about the development of the child's normative speech, various speech defects, a list of recommended literature. In this group of children, the materials on pronunciation and speech formation are updated from time to time. It may be recommended that special stands be set up to reflect children's speech situations. This allows them to observe changes in their speech development. In the special section of the stand for parents will be posted information about the date of the parent meeting, the time of specialist consultations, an offer for an interview with a speech therapist.

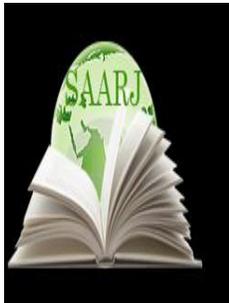

In conclusion, the upbringing and development of a child with a speech impediment is one of the most pressing issues that requires high attention, care, trust, knowledge and kindness from parents and family members. In addition, the child should have a thorough knowledge of the physiological laws of normal and abnormal development of physical and mental development at different ages.

One of the most important issues for a speech therapist is to determine the educational responsibilities of children with speech-impaired children in the family. The main laws inherent in the family in the upbringing of children with speech defects are the formation of personal qualities and speech of children, adherence to the common goals, objectives and principles of education.

Parents of children with speech defects should seek ways to nurture and adapt the child's speech in close collaboration with medical staff and a number of speech therapists.

ABSTRACT

The paper presents the results of a study to identify the physical mechanism of anomalous photovoltage in polycrystalline structures. A qualitative theory of the effect of anomalous photovoltage is proposed on the basis of experimental results. In this work, the results revealing the physical examination of the main photochemical polycrystalline structure's are brought. It is offered qualitative theory of the effect anomalous photochemical on base experimental result.

KEYWORDS: *Polycrystal, Grain Boundary, Surface States, Transparency Of Potential Barrier, Recombination, Concentration.*

INTRODUCTION

Let us consider, for definiteness, an n-type polycrystalline film with acceptor intergrain surface states that have one discrete energy level E_s located in the forbidden band. The doping level in the films is N_d , the impurities are fully ionized; concentration by surface states – N_s . $E_F^T > E_s$ (E_F^T - Fermi level in the dark). Conduction electrons are trapped on surface states, forming a potential barrier of height α symmetric with respect to the grain boundary, since the bulk properties of grains on both sides of the grain boundary are identical, and surface states are collectivized by contacting grains. The film model (a), the bottom of the conduction band E_s in the dark (b) and

under stationary illumination by the light incident perpendicularly on the film surface with a wavelength from the region of intrinsic absorption of the film material (c) are shown in Fig.1.

When the film is illuminated with its own light, electron-hole pairs are generated, which are spatially separated by the potential barrier of the grain boundary. Photo holes are captured by surface states, lowering the barrier height. Photoelectrons accumulate at the foot of the barriers, which prevent their capture by surface states and recombination. Stationary photoconductivity arises. Since, within the framework of the model, all grains are the same in geometric dimensions, doping level, concentration and energy by surface states, the changes in the film under illumination are the same at each grain boundary and are symmetric with respect to the grain boundary, which is shown in Fig. 1, c. In such a system, under normal lighting, the occurrence of an abnormal photo voltage effect is excluded

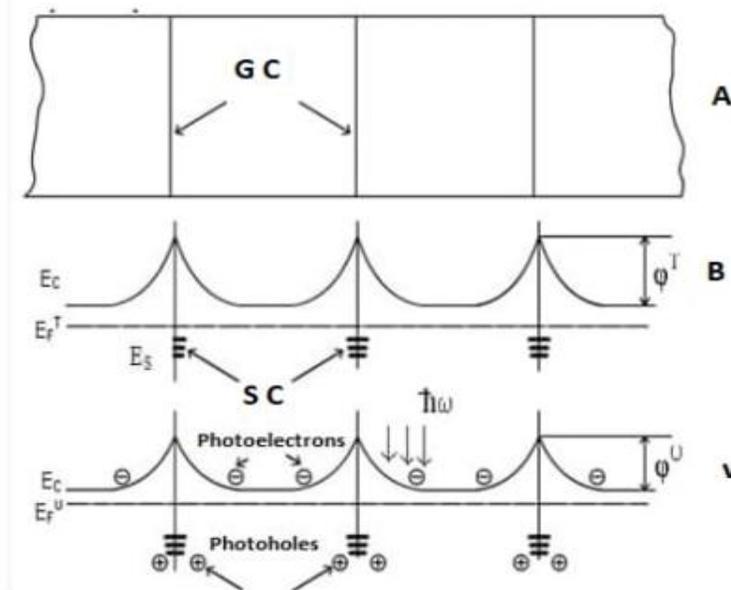

Fig. 1. Model of a polycrystalline film (a), curvature of the conduction band in the dark (b) and when illuminated by a normally incident light beam (c). ϕ^T and ϕ^U heights of the potential barrier for granite crystals in the dark and under illumination, respectively. E_f^o - nonequilibrium quasi Fermi level under illumination ($\phi^T > \phi^o$, $E_f^o > E_f^T$)

Before starting a discussion of the anomalous photo voltage effect, let us dwell on the issue of the model fit in Fig. 1 real polycrystalline objects. It is known that films with anomalous photo voltage are usually obtained by thermal vacuum condensation of a substance on dielectric substrates (for example, glass). These films grow continuously in the direction of the molecular beam and have a columnar structure. Changing the direction of the molecular beam, for example, by changing the position of the substrate - by sputtering onto substrates whose plane is not perpendicular to the molecular beam (oblique sputtering), leads to exactly the same change in the direction of continuous film growth [1]. In view of the extreme importance of precisely the

peculiarities of film growth for substantiation of further discussions, electron microscopic images illustrating the growth of films in the direction of the molecular beam and noted that similar illustrations exist for films of other semiconductors and metals [2, 3].

It has been experimentally confirmed that the surface of each grain at the grain boundaries is "rough" [4]. This is the so-called "natural roughness" relief, which is also due to the requirement for the minimum free energy. Roughness can also be the reason for the appearance of surface states on the grain boundaries [5].

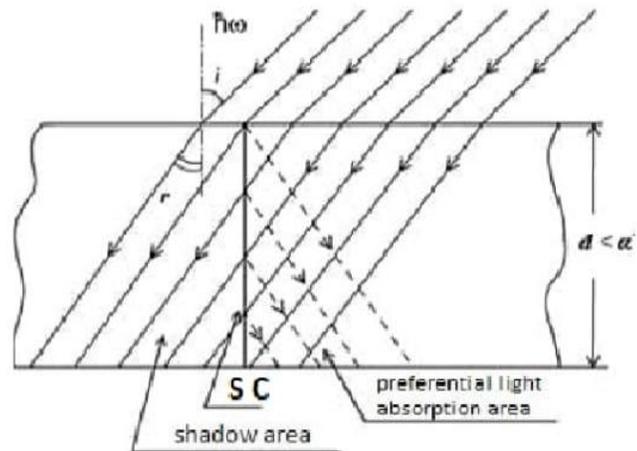

Fig. 2. Absorption of a plane-parallel light beam incident at an angle i to a film obtained under the conditions of a molecular beam incidence perpendicular to the substrate plane. r - is the angle of refraction; d - is the film thickness; α - light absorption coefficient. It is assumed that the refractive index of the granite crystals does not undergo changes.

As soon as the concept of the individuality of the crystallite surface on the grain boundaries is introduced into consideration, in optical phenomena it is necessary to take into account the features of the transmission of light through grain boundaries, in particular, its reflectivity. The roughness at the grain boundaries may be the root cause of this ability. The above is illustrated in Fig. 2.

The main result following from Fig. 2 is the inhomogeneity in the absorption of light by the volume of the film, which is introduced by the grain boundaries, due to the reflection of the incident light on it. Symmetry, which occurs at normal incidence of the light beam, is broken when illuminated at an angle to the surface and leads to the formation of regions of predominant absorption of light and shadow. This is one of the natural causes of anomalous photovoltage in such structures. The beam penetrating into the shadow region through the grain boundaries has an intensity lower than the intensity of the primary beam transmitted into the film.

In fairness, it should be noted here that such a view of the nature of the effect was first expressed by Ovsyuk [6] when explaining the effect in PbS films. There, it is assumed that an additional attenuation of the luminous flux occurs at the grain boundaries, associated with partial reflection

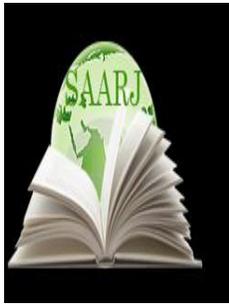

of light at the contact with the oxide film formed during the activating treatment of the films in an oxygen-containing medium having a lower refractive index. However, when processing PbS films obtained by thermal vacuum condensation in an oxidizing medium at not very high temperatures, the formation of oxide layers at grain boundaries is problematic. There, most likely, surface states of oxygen adsorbed on them arise [2, 1]. Moreover, the requirement for an additional layer with a lower refractive index to appear on the grain boundaries is not at all necessary.

Thus, it is the asymmetry in grain boundary illumination that causes the anomalous photo voltage. The optical anisotropy of semiconductor films obtained by oblique incidence of a molecular beam was reported in [7].

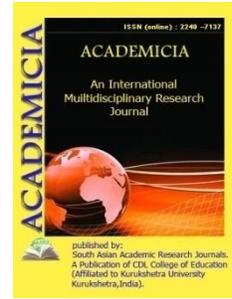

Having defined the model, which, in our opinion, corresponds most closely to the structure and electronic properties of real polycrystals, let us proceed to identifying the mechanism of the anomalous photo voltage effect.

KHALILA DAWLETNAZAROV'S POETRY IN KARAKALPAK LITERATURE

Fatima Otarbaeva*

*Student,
 Department of Karakalpak Language and Literature,
 Faculty of Turkic Languages, NMPI named after Ajiniyaz,
 UZBEKISTAN

ABSTRACT

This article deals with the poetry of the famous poet, Kh. Dawletnazarov, who has a vast contribution to Karakalpak literature. His works have come to the hearts of many readers today. We talked in the article about the peculiarities compared to other Karakalpak poets and his creative style in poetry.

KEYWORDS: Contribution, Distinguished,

INTRODUCTION

The term "Literature" itself is used in two senses, in a broad sense and in a narrow sense. This is because human thoughts and dreams, as well as human behavior, action, are widely described in literary masterpieces. Since the last century, our writers and poets have been widely known with this style. Recently, our national literature began to flourish from the left period.

Kh. Dawletazarov is one of the figures who has been enriching Karakalpak literature in various genres since that time.

He was born on February 10, 1952 in the village of Khalkabad, Kegeyli district. He came in the second half of the 70's, but over the years, the poet's pen made progress and his creative intentions became obvious. His lyrics, in particular, are distinguished by the emphasis on folk poetry and classical traditions.

After graduating from high school, he studied at the Nukus State Art College in 1970-1975s.

In his poem, "Ough, My Mother, My Amuw-Aral!.." (Anajanim,Amiw-Aralim!):

Seskengendeykeyinsheginip,

Ishtenkuyip, kewliegilib,

Armanlariqum bop togilip..

Aral, negeqashipbaratir? [1.23]

In other words, the flow of the Amu Darya, which is known to all of us, stopped and gives us a reflection of the current tragic fate on his dry in the affairs of the local people. Like other poets, he, for one of the most important exercises for us, the people of Karakalpakstan, could not stand paying special attention to the Amiw-Aral tragedy. He declares about this tragedy with a sense of elegy in his poems such as "The Last Unfinished Story of the River (Daryahaqqindasoñiadabolmastáshwishliqosiq)", "The State of the Karakalpak is awful (Qaraqalpaqlardıñawhalıshataq)" and others.

His poetic collections, including "Letter (Xat)", "I need you (Senmağankereksen)", "You are a good girl (Senjaqsıqızsañ)", "Is there anybody who was not in love?(Ashıqbolmağankim bar)", "Adieu, my youth (Xoshjashlıgım)", "Farewell, my love, farewell (Álwıdağ, muhabbat, álwıdağ)", "Everybody cannot be friend (Dos bolıwhámmeniñqolinankelmes)", "If if you live as a beloved (Ashıqbolıpjasasañ)" were published. The fact that the words in Kh. Dawletnazarov's poems are readily and separately clear makes the way him to reach the heart of readers.

The poet created not only works in poetry but also in prose "Flame of grief (Hásiretháwiri)", "A word about peace (Paraxatshılıqhaqqındasóz)", "A letter for my mum (Anamaxat)", "Nightingale's weeping (Búlbúlpıganı)", "Ownerless land (Iyesizjurt)", "The Karakalpak's song(Qaraqalpaqbayazı)", "Ziywar'sshejire* (Ziywariyshejire)", "Farewell, Love (Álwıdağ, muhabbat)", "Adieu, my youth (Xoshqaljaslıgım)" bar.

And he said that djigits* should be ready anything in the way of protection of homeland even, not fearing the death. They were described with such lines "My land!..you need to worry about your countryIf you worry!" andhis love for the people, his selfless service to the motherland, and the fate of the brave young men who can live If they are born or die.

Lebizpushlardankózashıbolmas,

Elim! depeñireskenerlerkerek.

Jırınjırlap, arınarlamasaq,

Ashıqturğan tap-tayıngórlerkerek! [2.9]

One of the hallmarks of the success of his works is the combination of publicist, educational style and emotional depiction in the poems written in recent years.

Kh. Dawletazarovhas been a member of the Writers' Union since 1991. The lyrical poems that were included in the collections"Is there anybody who was not in love? (Ashıqbolmağankim bar)" and "Everybody cannot be friend (Dos bolıwhámmeniñqol;nankelmes)" can precisely indicate life of our people in and negative effects of ecological changes of our earth and nature these days.

Of course, this demands a great deal of skill for a master of eloquence for the poet to have a deep understanding of the challenges of the transitional period and to be able to convey it to the general public in a beautiful way. For example, we can see that the state of what the poet told the ecological crisis tragically and depicted it with his whole pain is deeply understood in his poem,

“Our anxiety is endless (Tashwishimizqat-qabatdur)” with such lines “There is no land where has water (Suwsiz el bolmaydi)” in “You are My Painful Amudarya (Menindartli Amudaryamsan ...)”, “I missed your waves, “My mother, Amudarya, for my lake let you flow” and “If you are not here, we in terms of birds suffer”.

Kh. Dawletnazarov skillfully uses the vernacular language in his works. He is aware of exactly where the word should be put. They are appropriately used in its place in his poems, the words that inevitably provoke the emotions of the people act as an equal factor to comprehend the deep and beautiful expression of the poet's thought.

Doctor of Philological Sciences, Professor G. Orazimbetov, expressed the following views on Kh. Dawletnazarov's poetry:

“In Khalila Davletnazarov's collections there are feelings of great grief and excitement. In conveying such a state of the lyrical protagonist, he uses a variety of forms and stylistic ways. The artistic language of the poet is extremely appealing. This has had a positive impact on the content and form of the poems.” [3.131]

In fact, these comments were valuable words given to Kh. Dawletnazarov. There are such poems, “The baby sheep drinking water with crying here”, “Sparrows”, “Flame” comprised in the collection of “Is there anybody who was not in love? (Ashiqbolmagankimbar)”. Even though they are named with mentioned names, sheep, sparrows and flame are not drawn. Through allegorical depiction, the poet made progress to embellish his belief.

Kh. Dawletnazarov's poem, “Ownerless Land” has a special place in his works in recent years. The idea and theme of the verse is strongly expressed by the hero's heartbreak, who left his native village earlier. He is also impressed by the fact that his younger brother was moved to a city with his mother, little sister, the housekeepers and dog, but the birds, who built nests in the early spring, could not follow them.

Especially, in the native land the plants and trees that his father had planted and brought up influenced on the poet's heart. Finally, he blamed himself for the loss of his father's place in the lines “as if my village is looking at me as my father weeping”

The poet's love for his village is also expressed in the poem, “A dawn in the village”. The setting of the sun, the going of the sun, and even the chirping of birds are different for him. It is portrayed that the smell of the growing plants in the village pleasantly spreads.

In Kh. Dawletnazarov's poems one can see the depiction of great sorrow and excitement. In order to convey such a state of the lyrical hero, he utilizes a variety of forms. The poetic language is also so attractive in poetic poetry.

Ta'natıwdashıgıslalanlap,

Ta'nsapagınqushqankeregem.

Jas jıngıllar, qarabaraqlar,

Gúzarjoldıńboyınbezegen.

[4.15]

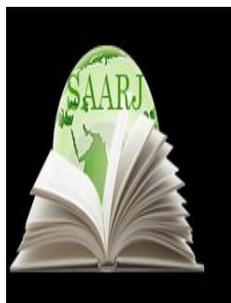

In conclusion, the poet Kh. Dawletnazarov is a great representative who wrote a bunch of poems in so many genres, had a large number of readers and became a beloved poet of our people.

**TO THE ISSUE OF THE COMPARATIVE ANALYSIS OF THE
 POLYSEMANTIC VERBS IN THE RUSSIAN AND UZBEK LANGUAGES**

Kasimova Feruza Sunnatova*

*Senior Teacher,
 Jizzakh State Pedagogical Institute named after A. Kadiri,
 UZBEKISTAN

ABSTRACT

The article deals with the comparative analysis of verbs in Russian and Uzbek, their semantics of polysemy, the assimilation of semantics, as well as the reaction of the interpreter to the use of polysemantic verbs. The verbal categories of voice, mood, tense, person, and number are also inherent in the Uzbek language. Uzbek verbs do not have categories of type and gender, but they are rich in time forms. The practice of the work proves that when mastering the native language, lexical and semantic variants of polysemical words are encoded and decoded instantly. Such goals are to prevent interference and take into account the transposition of the students' native language.

KEYWORDS: *Agglutinative, Inflectional, Interference, Polysemy, Semantics, Functionality, Unification, Differentiation, Encoding, Decoding, Transposition.*

INTRODUCTION

The Russian and Uzbek languages belong to different language types in their grammatical structure: Russian – to the type of inflectional languages, which is characterized by the integrity of words, the variety and diversity of inflections, and the Uzbek language is a type of agglutinative language, the main characteristic of which has an easy segmentation of a word into morphemes, consecutive addition of different suffixes to the base words and the uniqueness of each suffix.

The comparative method allows the teacher to predict the difficulties faced by the student, and on this basis to develop appropriate methods of work.

The polysemy of words in one language becomes especially noticeable when a language is studied as a non-native language, since words in different languages have laws of functioning

inherent in the nature of these languages, which are individual and diverse in each particular case. D.N. Shmelev noted that «It is the lexical polysemy of words, that makes the vocabulary of individual national languages unique, since the nature of combining meanings within the boundaries of one word, the types of connections between different meanings of the same word are largely different in different languages. Since the meanings of a polysemantic word form some complex semantic unities, they must be represented as units of meaning that are subject to a certain organization within the word» [3.90]. In this regard, polysemy is one of the objective difficulties of studying the vocabulary of the Russian language by Uzbek students. While learning the semantics of a polysemantic word, they face to difficulties, along with the complexities of the Russian language, due to the influence of one language system on another.

The verbal categories of voice, mood, tense, person, and number are also inherent in the Uzbek language. Uzbek verbs do not have categories of type and gender, but they are rich in time forms. In the work with verbal polysemy, the moment of determining the similarity-the discrepancy in the volume of meanings of certain polysemous Russian words and their equivalents in the native language of students is important[1, 157].

The practice of the work proves that when mastering the native language, lexical and semantic variants of polysemical words are encoded and decoded instantly. When you use only words students often bring a complex system of relations between the polysemy of the target language and its equivalent in the Uzbek language to its simplest scheme one-to-one.

It follows from this that in the educational process, along with the matching lexical and semantic variants of polysemical words in the Russian and Uzbek languages, it is necessary to fix those that may cause an inadequate reaction in the interpreter.

Types of semantic correspondences and differences of Russian and Uzbek **polysemical** verbs as follows:

Type I. Words with a partial discrepancy between the volume and the related words.

This type has two varieties:

I. Words with more meanings in the Russian language:

In Russian, «отобрать»

1. Extract, take the desired, preferred.
2. Choose by vote, extract from somewhere.
3. Without a remnant, find, release for some purpose /about time/.

In the Uzbek language –**тортиболмоқ**(to select, to extract, to take the required, preferred)[2, 712].

Type II. Words with different ways of expressing the same meanings in the compared languages.

The meanings of polysemical words in the Russian and Uzbek languages may coincide not only in semantic volumes, but also in the ways of expression. To transfer individual meanings of words from one language to another, complex words, phrases, and whole sentences can be used:

взаимодействовать-ўзаротаъсирқилмоқ;

возразить - қаршилиққилмоқ;

возмужать - воягаётмоқ; [2, 364]

изобрести - ихтироқилмоқ;

осуществить-амалгаоширмоқ;

отомстить - ўчолмоқ и т.п.[2, 766]

This type has two independent subspecies:

1 / the meanings of a polysemantic Uzbek word are expressed in Russian with one word / unified/, and in Uzbek-with several words /differentiated/:

ручка двери - эшикручкаси /дастаси/; ручка ножа - пичок, сопи /дастаси/; ручка портфеля - портфельнинг банди;ручка кресла - кресло ёндори

2 / differences in the ways of expression are characterized not only for the individual meanings of polysemantic words, but also for the words themselves.

This fact allows us to distinguish another special category of vocabulary, in which one word corresponds to different Russian words in the Uzbek language. This subspecies is the most **polysemical** verbs:

Брать, положить, получать, поставить

Type III. Words with a complete coincidence of the volumes of meanings and ways of their expression.

This type of polysemantic verbs is clearly represented in many academic Russian-national dictionaries. So, for example, the verb **работать (to work)** in all its meanings and various shades of meanings can be represented in the Uzbek translation by one equivalent-the verb **ишламоқ**, which indicates the coincidence of the meanings in them.

Due to the complete coincidence of values, which excludes the presence of semantic discrepancies, it would seem that these lexemes cannot be a source of interference. However, here the teacher faces to another danger of interference - at the combinable, grammatical level. Thus, the meaning of "to put something into action, to manage, to act with something" (tool,) of the Russian verb **работать (to work)** coincides with the lexical meaning of the Uzbek verb **ишламоқ** [3, 452]. However, in Russian it is characterized by a non-prepositional control of this verb in this sense, while Uzbek **ишламоқ** is characterized by a noun with the afterword bilan, which is equivalent to the Russian preposition с, for example: **работать лопатой (to work with a shovel)- белкуракбиланишламоқ**. And this feature of the native language is transferred by Uzbek students to their Russian speech. They say: **работать лопатой (work with a shovel)**. Similar errors are observed in verbs вооружить -куроллантирмоқ, писать - ёзмақ, обогатить- бойитмоқ.

So, an important basis of linguistic bases of teaching methods of Russian verbal polysemy/ along with the specific features and peculiarity of this layer of vocabulary in the system of the Russian language to Uzbeks students is based on the comparative analysis of the mentioned phenomena in the Russian and Uzbek languages. The development of the training perception correctly and accurately and use of only the verb in its semantic implementations is inextricably linked to pre-

identify similarities and differences in the amount of values activated polysemantic Russian words and their equivalents in the native language of the students of national groups.

At the same time, our task is to take into account both the phenomena of transposition and interference in the compared languages as much as possible and to help students overcome specific difficulties that arise, in particular, when mastering the lexical polysemy of verbs, using effective methodological tools.

In linguistic science, the term interference was introduced by representatives of the Prague Linguistic Circle. Scientists' points of view on interference, as a linguistic phenomenon that occurs when at least two languages interact and manifests itself in an individual's speech in a second (non-native, later studied) language, are not always the same. According to the most common point of view, interference is explained as a negative result of the interaction of languages, which manifests itself in the form of violations of the system and norms of the studied language in the process of using it by a bilingual. At each level of the language system, interference manifests itself in accordance with the peculiarities of phonetics, vocabulary, grammar, stylistics, and contacting languages. When one language comes into contact with different languages, the interference is different each time, both as a whole and separately on each level of the language. Thus, interference is a function of the main four factors: the language norm, bilingualism, the relationship between the native and the studied language, and social conditions.

In the educational process, it is necessary to keep in mind the general methodological goals of comparative analysis. Such goals are to prevent interference and take into account the transposition of the students' native language. In our case, we will understand interference as the transfer of the skills of the native language to the studied language, the result of which is an easier assimilation of the studied language due to the coincidence /or proximity/ content of lexical units, grammatical categories, etc. of the native and studied languages. As our experience of working in the study of the Russian language by Uzbek students has shown, interference hinders, transposition helps.

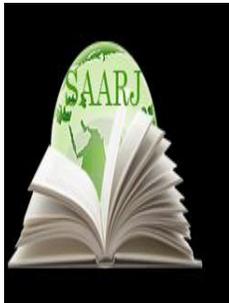

Our experience has allowed us to identify errors in the speech of students of philology of national groups concerning verbs. A large number of mistakes were made under the influence of interference of the native language - incorrect lexical construction of sentences. For example: "They killed all mathematicians and scientists, burned them to the fire, because they began to tell / began to tell / people the whole truth." - Ular barchaolimvamatematiclarni yldirib, ytd eladilar, chunki ular odamlargaxakikatni aytaboshlaganedilar.

Thus teaching nonnative language to students has difficulties and in this article we described some of them. Taking into account the peculiarities of the native language helps to prevent typical mistakes made by students when learning Russian and explained by the influence of grammatical norms of the native language.

 UZBEKISTAN

ABSTRACT

In our country, everything is paid to the development of professional sports. The success of athletes in high-level competitions is an important component of the country's international prestige. In this regard, the situation regarding the importance of the health of athletes for their achievement of high sports results has acquired special relevance [4; 17; 19]. Sports genetics is still at the beginning of the path, but at the same time it opens up many prospects for the development of medical and biological support for sports. The use of the genetic characteristics of the organism will lead humanity to new records, because now not only persistence, regular training, willpower and motivation of an athlete are important, but also his "Olympic" heredity. A detailed study of these genes is necessary for the correct organization of the training process, for predicting the capabilities of athletes. According to modern concepts of functional genomics, it is believed that individual differences in the degree of development of certain physical and mental qualities, as well as in the susceptibility to certain diseases of athletes, are largely due to DNA polymorphisms (variable regions in the DNA sequence). The FABP2 gene produces a protein that binds fatty acids in the digestive system, and thus directly regulates the absorption of fats in the epithelial cells of the small intestine (Baier, Sacchetti et al. 1995). Studies have shown that in the presence of the risk allele, the binding of fatty acids from food occurs to a greater extent and, the presence of the risk allele is directly associated with an increased body mass index, body fat, abdominal adipose tissue size and overweight (Baier, Sacchetti et al. 1995).

INTRODUCTION

One of the main theoretical and applied medico-biological problems of physical culture and sports medicine is the problem of sports selection, the development of the theory of which determines the level of sports achievements and sports science in general. The results of scientific research have proved that the optimal health indicators of athletes are based on the state of dynamic balance between the functional reserves of the body and the factors affecting it [1; 9; 22; 23]. At the same time, the magnitude of the influence of the factors that are inherent in the modern system of training athletes on the body of those involved increases in proportion to the stages of their professional development, which requires not just optimal health indicators, but the presence of an appropriate level of reserves of functions of its components [7; 12; 26]. The value of the latter is the basis of the athlete's reliability - an indicator that is characterized by high performance of actions and its stability in extreme conditions of activity [5]. In this regard, there is a consensus among specialists that athletes-children and adolescents have the lowest reliability coefficient, since it is this contingent of those involved in sports that has certain prerequisites for the development of maladaptive disorders in somatic systems, the structural elements of which are included in the newly formed system of adaptation of the body to muscular activity [thirteen; 16; 20; 26].

These prerequisites include specific features of the structure of the child's body, biochemical processes and functions in general, as well as individual organs, in which qualitative (development) and quantitative (growth) changes occur at various stages of ontogenesis [2; 12; 18]. In addition, the inconsistency of regulatory systems and the heterochronism of growth and maturation processes only exacerbate the problem of the development and progression of pathological deviations in the somatic systems of the body of young athletes with an irrational structure of the training process, which is confirmed by the data of scientific research on the morbidity of children-athletes [3; eleven; 21]. Regardless of the preventive and therapeutic measures taken, the number of somatic diseases among reserve athletes does not statistically decrease [13; 20; 26], which allows us to state the presence of a number of issues, the solution of which is associated with the development of the concept of physical rehabilitation of young athletes with dysfunctional disorders of the somatic systems, mediated by training and competitive activities.

Scientific substantiation and development of conceptual, organizational and methodological components of this concept is impossible without a detailed study of the health status of athletes of a particular specialization, without taking into account the characteristics of the biological, psychosocial and professional stages of ontogenesis. In the classical practice of sports medicine, it is generally accepted that all preventive, therapeutic and rehabilitation measures should be carried out on the basis of data from an in-depth medical examination of athletes, the resulting component of which is a conclusion on the admission of the examined to training activities [5; 15; 24]. The admission is carried out according to the following criteria: "healthy", "practically healthy", "requires limitation (full or partial) of training activity". But it follows from practical experience that the data obtained are sufficient for carrying out therapeutic and rehabilitation measures for a specific athlete, but not enough to substantiate the organizational and methodological foundations of the system of measures aimed at protecting the health of a vast contingent of athletes, especially during critical periods of ontogenesis.

At present, most of the sports games can be defined as disciplines "mixed energy system" [1], in which effort has intermittent characteristics with the participation of both aerobic and anaerobic metabolic pathways [2]. In this regard, physical fitness is one of the most important elements that affect the performance of athletes from mixed sports due to the high physical load due to intermittent activity [3]. Indeed, strength and endurance can be considered the key fitness elements for mixed sports such as football, wrestling and motorcycling [4,6]. All of these sports have been classified as mixed in terms of their metabolic predominance, thus showing the general multifaceted nature of physical demands, which include aerobic capacity, strength, endurance, strength and agility [4,6]. However, descriptive studies indicate that the physiological characteristics of an athlete can vary greatly across these disciplines, suggesting that there are different sport-related profiles in terms of the relationship between endurance and speed. Athletes from mixed sports disciplines do not have a clear focus on endurance or strength, thus demonstrating wide phenotypic heterogeneity [7]. It is common knowledge that genetic factors influence sprint / strength and endurance [21,23]. , but only a few studies have examined the relationship between genetic factors and athletic performance in mixed athletes. Among the potential polymorphisms potentially associated with muscle function and physical performance, the most studied are angiotensin-converting enzyme (ACE), variant R577X of the actinin-3 gene (ACTN3), and muscle creatine kinase isoform (CK-). MM), peroxisome proliferator-activated receptor α (PPAR α), and more recently SLC2A4 [9,14]. It has been demonstrated that alternative polymorphisms of these potential polymorphisms are associated with sprint / strength or endurance disciplines with reasonable replication in different groups of athletes [15,18]. Indeed, the I allele of the insertion (I) / deletion (D) polymorphism in the ACE gene is one of the most putative factors determining aerobic capacity in performance-oriented endurance [8]. Likewise, the PPAR-G, ACTN3 X, and CK-MM A alleles are involved in improving aerobic performance (16, 17, 19). On the other hand, it is assumed that ACE D, PPARN C, ACTN3 R and CK-MM G are more related to strength-oriented characteristics [8,16,20]. Given that the contribution of specific genes to athletic performance has been investigated primarily in athletes who are at the two endpoints of the human athletic performance continuum, less is known about the application of sports genomics in more complex disciplines that do not exhibit specific phenotypes. Thus, the aim of the present study was to compare the allele and genotype frequencies of four known polymorphisms in athletes from various disciplines of mixed sports in order to investigate the genetic markers suitable for distinguishing between the predominant components of these sports [25,26].

One of the rapidly developing areas of modern genetics is the development of molecular genetic approaches to determine a person's predisposition to various types of activity. So, in particular, in recent years, a search has been carried out for molecular genetic markers that determine a person's ability to perform high sports loads (Montgomery, 2000; Rogozkin, 2004), which is determined by the need to justify a system for selecting people for sports and correcting the training process. This approach is the most promising, since it allows you to determine the genetic predisposition to high physical activity and to carry out a targeted differentiated selection of children for sports at the earliest stages of their sports activity. It should be noted that in 2000 a human genetic map was created, in which genes were introduced, which in at least one study revealed associations with physical indicators and / or influenced human health (Rankinen, Bray et al, 2006). In an early 2000 version, the map included 29 genes. The 2005 version, 6th - amended, includes 165 autosomal genes, 5 -

located on the X chromosome, as well as 17 mitochondrial genes. To date, work of this kind is being carried out only in five countries: the USA, Great Britain, Australia, Russia (Scientific Research Institute of Physical Culture - under the leadership of Doctor of Biological Sciences, Professor V.A. Rogozkin; laboratory of molecular genetic research of the Department of Genetics at the Bashkir State Pedagogical University - under the leadership of Doctor of Biological Sciences, Professor Gorbunova V.Yu.) and Kazakhstan. On the site www.genoterra.ru - the register of leading scientific institutions, the laboratory of molecular genetic studies of the Department of Genetics of BSPU is included in the list of groups engaged in the search for genetic markers that determine the predisposition of people to sports activities [27,28].

Thus, it becomes clear that, from the point of view of health savings, it is of particular interest to study not just the health state of young athletes, but a comprehensive level-by-level screening of the functional state of the athletes. This type of layer-by-layer "screening" will allow to determine the corrected risk factors for the development of somatic pathology in athletes within the framework of uncorrected factors (determinants), in this case it is sports specialization and a stage in the process of many years of training.

According to the research of Svetlana Lyugailo (Results of studying the health status of young athletes: the first level of screening studies) _ using classical approaches to assessing the health status of young athletes, on the basis of the existing criteria for their admission to sports, the previously determined trends in the influence of ontogenetic risk factors for the emergence and development of somatic pathology in the age aspect and in the aspect of professional development. At the same time, a number of negative points were established:

- firstly, despite the presence of diseases and dysfunctional disorders in the somatic systems, athletes continue the training process, which indicates insufficient control over the functional state of the trainers and medical workers, who provide the process of training young athletes directly at the place of training;
- secondly, despite the comprehensive examination provided for by the algorithm for conducting an in-depth medical examination, the information obtained regarding the health status of athletes is not sufficient for making a rehabilitation diagnosis, since it is impossible to draw a true conclusion about the adaptive capabilities of the body of a young athlete to physical activity from the data obtained, to obtain quantitative characteristics of the parameters that form the adaptation reserve and, moreover, to forecast the occurrence of dysfunctional disorders in various systems of the athletes' body.

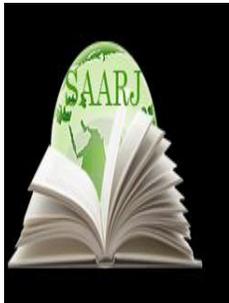

The above organizational miscalculations in the development of the structural components of the concept of physical rehabilitation for dysfunctional disorders of the somatic systems of the body of young athletes (somatic diseases) will be taken into account in the group of exogenous corrected risk factors for diseases in athletes.

ABSTRACT

This article discusses the effectiveness of teaching “cooperation” of the subject sports medicine in higher education. At the same time, in the process of training, students have the opportunity to jointly acquire knowledge in a team, small group and couple to ensure mutual development. Ultimately, collaborative learning fosters conscious discipline in the learner, sees its success as a group success, sets the stage for peer assignments, peer partnerships, peer support, and finally serious mental work.

KEYWORDS: *Practical Exercises, Sports Medicine, Interactive Teaching Method, Joint Training, The Effectiveness Of Collaborative Learning Technologies*

INTRODUCTION

In modern conditions, the education of cooperation, its organization is of particular importance. In addition to the above ideas, the essence of the collaborative learning method lies in the idea of step-by-step (inertia of ideas, separation of important ones, design revision) and implementation of problem-solving processes based on teamwork [2,7, 9,19]. Ultimately, collaborative learning fosters conscious discipline in the learner, sees its success as a group success, sets the stage for peer assignments, peer partnerships, peer support, and finally serious mental work. Collaborative learning is a process where students learn in groups, small groups, and pairs. Mutual development is education, which is the joint organization of teacher-student (s) relationships, the main idea of which is to perform learning tasks in a team, in small groups or in pairs, in cooperation. The ideas of this type of education were formed in the 80s of the last century on the basis of the views of J. J. Rousseau, K. Ushinsky, V. Sukhomlinsky, A. Makarenko and innovative teachers [1, 3,17,18].

Purpose of the topic: Joint training of students contributes to the formation of a worldview based on the development of spiritual, moral, intellectual physical abilities, interests, motives. This type of learning differs from Cooperative Learning in that it allows students to work in teams through pairs and small groups [4,5,6,11].

make sure they have the skills. This type of training is organized in different directions, including:

- organization of relations on the basis of educational cooperation;
- An individual approach to students based on humanistic ideas;
- Achieving professional and spiritual unity in the educational process

MATERIALS AND METHODS

In the transition to sports medicine, as in any education, coeducation is also based on certain priority principles. These principles serve to highlight the most important foundations for collaborative learning.

Important features and components of collaborative learning

Collaborative learning, which serves to determine the interaction of participants in the educational process, also has certain characteristics.

- pay attention to the personality of the student;
- mastering ready-made knowledge and refusing to process it;
- development of students' independent and critical thinking;
- Ensuring a positive attitude towards the teacher and peers;
- Development of students' cultural communication skills;

The creation of an environment based on cooperation and mutual equality will have its own set of components [8,10, 20].

Results and their analysis:

Collaborative learning technologies - in the learning process, students learn together in a team, small groups and pairs, develop each other, it also contributes to the effective and successful acquisition of knowledge that has educational value, which ensures the joint organization of the teacher-student relationship.

Scheme, table, basic designation, graphic drawing, basic material, material based on logical presentation, system-structural approach serve to systematize educational material. The use of basic materials in higher education opens up the following opportunities:

- frees students from boring mechanical recording of theoretical information presented by the teacher in lectures;
- allows the teacher to communicate more with students in the class;
- Provides effective perception of educational materials by students through words, visual and visual means;

- Increases the effectiveness of students' effective implementation of educational tasks in the educational process based on discussion;
- makes it possible to control the process and quality of the assimilation of new knowledge by students;
- helps students to organize their knowledge;
- By coding educational information, students can thoroughly master complex sections, concepts and concepts of the subject;
- reduces the time spent on studying the material, allowing students to do more practical and analytical work;
- teaches students the practical use of modern educational technologies in order to improve the efficiency of the educational process;
- decides on mutual cooperation between students;
- Students work independently with test items

The base material is formed based on the following requirements:

As mentioned above, the main material prepared by the teacher reveals the essence of the basic concepts, important theories, basic rules and effective methods, as well as visual samples, control questions, tasks.

In higher educational institutions, students first get acquainted with the basic material formed by the teacher, and gradually they are taught to independently form such basic materials [7,10,12,13]. If in the first lesson the students are provided with basic material, in the next lesson the teacher briefly repeats the content of the teaching material based on it. Then communication with students is organized. This communication is a mini-dictation, a blitz survey, an individual question-answer, a pair survey, a quick repetition.

Work with the basic material continues throughout the course and ends with control and correction [14,15,16,18].

CONCLUSION

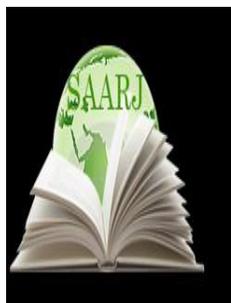

The application of these innovative methods in practical classes increases the level of student involvement in the educational process, creates conditions for students to learn from each other, and allows them to test their knowledge in science. Innovations in modern education are important, more precisely, the use of pedagogical and educational innovations. The effective, active use of pedagogical or educational methods by teachers of higher educational institutions, an innovative approach to professional activity, while ensuring the achievement of the intended goal, contributes to an increase in the quality and efficiency of teaching, and an increase in the cognitive activity of students.

INTERACTIVE METHODS "BLITZ METHOD" AND "CASE STUDY" FACTOR AFFECTING THE LEVEL OF KNOWLEDGE

Rakhmatova M.R* ; Jalolova V.Z ; Klichova F.K*** ; Rajabov N.G******

^{1,4}Bukhara State Medical Institute,
 UZBEKISTAN

ABSTRACT

Interactive teaching methods, in contrast to traditional ones, generally more effectively influence the process of mastering a complex of clinical knowledge. The use of educational clinical games in the process of teaching the subject of clinical pharmacology significantly develops the baggage of clinical knowledge with a simultaneous increase in the cognitive ability of students.

KEYWORDS: *Interactive Teaching Methods, Methods "Blitz Method", "Case Study", The Subject Of Clinical Pharmacology.*

INTRODUCTION

Interactive learning is a special form of organization of cognitive activity. It implies very specific and predictable goals. One of these goals is to create a comfortable learning environment in which a student or student feels their success, their intellectual viability, which makes the learning process productive. [1, 2]. Interactive teaching methods include those that require students to independently obtain, process and implement information presented in a specific didactic form.

Goal. Given the foregoing, the work was undertaken as a task, which was a comparative assessment of the level of clinical knowledge of students acquired by interactive forms of training "Blitz method" and "Case study". In order to implement the tasks in practical classes on the subject of clinical pharmacology, interactive methods of training were purposefully applied - educational clinical games "Blitz method" and "Case study".

MATERIALS AND METHODS

The study was conducted at the Bukhara State Medical Institute, at the Department of Pharmacology and Clinical Pharmacology. The control was the rating of students obtained using traditional methods of assessing knowledge in the subject of clinical pharmacology. The groups

of students involved in the study circle were representative in terms of the number of students, stages and types of knowledge assessment, as well as their individual rating [4,3]. The level of knowledge was systematically checked using oral and written (crosswords, tests, situational tasks and others) tasks during the current, intermediate and final tests. The interactive game “Blitz method” was used in a modified version, the essence of which was as follows: questions were divided according to the level of difficulty into lungs (L1), medium (L2) and complex (L3). Their ratio in the general bank of questions was 1: 2: 1. The magnitude of the allocated points and the time available for the correct answer options depended on the degree of difficulty of the question and increased as the latter grew [12,13].

Results. In the course of the research, the following results were obtained. It was found that interactive teaching methods, unlike traditional ones, generally more effectively influence the process of mastering a complex of clinical knowledge. In addition, they clearly differed in the individual nature of the impact on the formation of well-known levels of knowledge. So, if traditional teaching methods influenced the development of mainly primary I (knowledge - acquaintance) and II (knowledge - copy) levels, then interactive learning methods for more advanced III (knowledge - skill) and IV (knowledge - creativity) of their form.

Classes conducted with the use of the educational game “Blitz method” were distinguished by high activity of participants, which is partly explained by the condition of its conduct, which requires the indispensable participation of all members of the group. The ending of this educational game acquired a very tempting character, especially when the final pair of participants remained. The definition of a leader - a connoisseur of the group always ended with a surge of emotions and enthusiasm from the participants. However, the possibilities of this game in terms of improving individual levels of knowledge were far from equal. According to the results, the interactive method of teaching the “Blitz method” contributed to the improvement of I (acquaintance) and II (copy) levels of knowledge. On the formation of more advanced levels (III-skill and IV-creativity), it is not particularly affected. The latter significantly limits the possibilities of using the educational game “Blitz method”. To achieve the desired result, the choice of this educational game should be differentiated, taking into account the specifics of a particular lesson. For the level of acquired knowledge with the help of it, especially from the private section of the subject, clinical pharmacology, may ultimately turn out to be low [11,14].

Somewhat distinctive were the results obtained as a result of the use of an educational clinical game - “Case study”. When disassembling a case, students actually get their hands on a ready-made solution that can be applied in other similar circumstances. As the number of cases analyzed increases, the chance of using a ready-made decision scheme in one of the next situations with a similar nature increases. Consequently, the skills of meticulous solving more serious problems are formed [10,14]. There was another positive quality of the case study educational game. Among the participants - “players”, the frequency of individuals who own methods of physical research has steadily increased, and most importantly, the quality of their implementation has improved, which corresponds to the goal and objectives of the subject of clinical pharmacology. [6,7,16].

DISCUSSION

The department developed scenarios for various clinical situations, created special conditions with the necessary equipment for conducting clinical training games. The teacher vigilantly

monitors the course of the educational game, strictly controls each action of the participants. In cases of tolerance slip, carefully corrects them. At the request of the situation, he often makes additional information complicating the clinical situation.

Based on the research, we can conclude that interactive learning methods: the "Blitz method" and "Case study" affect the formation of individual levels of knowledge in different ways. So, if the first of them contributed to the predominant growth of I and II, then the second - III and IV levels of knowledge. Taking into account the latter, the choice of the method of the educational game should be carried out in accordance with the purpose and objectives of each lesson. We consider it appropriate to use the interactive game "Blitz method" in the course of training in general, and in the "Case study" of the special part of the subject, clinical pharmacology. [2,5,15].

CONCLUSION

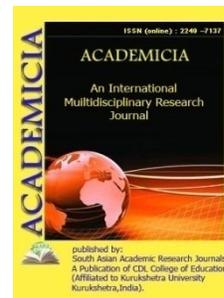

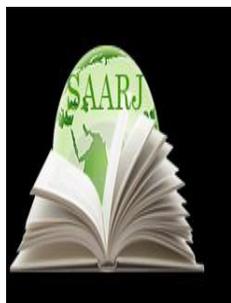

Summing up the above, it should be noted once again that these methods provide an excellent opportunity to creatively apply the material covered on the basis of their professional knowledge and allow students to quickly adapt to real and potential situations. No less important is the fact that the analysis of situations quite strongly affects the professionalization of students, contributes to their growing up, forms interest and positive motivation for learning [1,8,9].

The use of interactive forms in the learning process, as practice shows, removes the students' nervous load, makes it possible to change the forms of their activity, and switch their attention to key issues of the topic of classes.

INTERACTIVE LEARNING METHODS FACTOR DEVELOPMENT OF STUDENTS 'KNOWLEDGE LEVEL

Rajabov N.G*; Klichova F.K**; Mustafaeva. Sh.A***; Sharipova R.G****

^{1,4}Bukhara State Medical Institute,
Uzbekistan

ABSTRACT

In the present work results of application of interactive ways of training "a weak link" and "case study" on a subject clinical pharmacology are resulted. It is established that the used interactive methods of teaching have different influence on the formation of knowledge levels.

KEYWORDS: *Innovative Ways Of Training, Interactive Method «A Weak Link», Educational Game «Case Study», A Subject Clinical Pharmacology.*

INTRODUCTION

Interactive learning is a special form of organizing cognitive activity. It implies very specific and predictable goals. One of these goals is to create a comfortable learning environment in which a student or listener feels their success, their intellectual worth, which makes the learning process itself productive [2,3]. Interactive learning allows you to simultaneously solve several tasks, the main of which is the achievement of learning goals, the development of communication skills and abilities. It helps to establish emotional contacts between students, provides an educational task, as it teaches to work in a team, to listen to the opinions of their comrades. Considering the above, this work has been undertaken with the aim of making a comparative assessment of the level of clinical knowledge of students acquired by the interactive forms of training "weak link" and "case study".

In order to accomplish the set tasks in practical classes on the subject of clinical pharmacology, interactive teaching methods were purposefully used - educational clinical games "weak link" and "case study". The rating indicators of students, obtained using traditional methods of assessing knowledge, served as control. The groups of students involved in the research circle were representative in terms of the number of students, stages and types of knowledge assessment, as well as their individual rating. The level of knowledge was systematically checked with the help of oral and written (crosswords, tests, situational tasks and others)

assignments during the current, intermediate and final control works. The interactive game "weak link" was used in a modified version, the essence of which was as follows: questions were divided according to the level of difficulty into easy (L1), medium (L2) and difficult (L3). Their ratio in the general bank of questions was 1: 2: 1. The value of the allocated points and the time allowed for the correct answer options depended on the degree of complexity of the question and increased as the latter grew (2). In the course of the research, the following results were obtained. It was found that interactive teaching methods, in contrast to traditional ones, generally more effectively affect the process of mastering a complex of clinical knowledge. In addition, they were clearly distinguished by the individual nature of the impact on the formation of generally known levels of knowledge. So, if traditional teaching methods influenced the development of mainly initial I (knowledge - acquaintance) and II (knowledge - copy) levels, then interactive methods of teaching to more advanced III (knowledge - skill) and IV (knowledge - creativity) their forms[1,4,6].

Classes conducted with the use of the educational game "weak link" were distinguished by high activity of the participants, which is partly explained by the condition of its holding, which requires the indispensable participation of all members of the group. The ending of this educational game acquired a very tempting character, especially when the final pair of participants remained. The definition of a leader - a connoisseur of the group always ended in a surge of emotions and enthusiasm from the participants. At the same time, the possibilities of this game in terms of improving individual levels of knowledge turned out to be far from equal. According to the results obtained, the interactive learning method "weak link" contributed to the improvement of I (acquaintance) and II (copy) levels of knowledge. On the formation of more advanced levels (III-skill and IV-creativity), it did not particularly affect. The latter significantly limits the possibilities of using the educational game "weak link". To achieve the desired result, the choice of this educational game should be differentiated, taking into account the specifics of a particular lesson. For the level of knowledge acquired with the help of it, especially from the private section of the subject of clinical pharmacology, may end up being low [5,7,8]. The results obtained as a result of the application of the educational clinical game - "case study", turned out to be somewhat distinctive. By examining the case, students actually get a ready-made solution in their hands that can be applied in other similar circumstances. As the number of analyzed cases grows, the chance of using the ready-made decision scheme in one of the next situations with a similar nature increases. Consequently, the skills of scrupulous solution of more serious problems are formed [9,11,12]. This interactive way of teaching contributed to a significant increase in the baggage of both theoretical and practical knowledge of students. He contributed to the maximum understanding of the importance of the dialogue between the doctor and the patient and the improvement of the potential of clinical thinking, as well as the ability to use theoretical knowledge in a timely manner in his own practice. It should be emphasized that the successful implementation of the educational clinical game "case study" requires a fairly large amount of knowledge in fundamental medical disciplines, as well as mastery of a wide range of manipulations. This was due to the condition of collecting subjective and objective information, which is the closest to the real clinical setting [10].

It should be noted that the educational clinical game "case study" aroused increased interest of all participants. The knowledge obtained with the help of this type of educational game was much perfect and corresponded to level III (knowledge - skill), and even IV (knowledge -

transformation). More than half of the participants in the game clearly developed elements of III (knowledge-skill), and the rest of the IV level (knowledge-creativity) knowledge. At the same time, the bank of clinical knowledge was enriched much faster, which is an important and distinctive advantage of this teaching method [13].

There was also another positive quality of the educational game “case study”. Among the participants - "players", the frequency of persons who know the methods of physical research steadily increased and, most importantly, the quality of their implementation improved, which corresponds to the goal and objectives of the subject of clinical pharmacology [15,17].

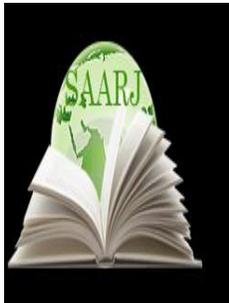

At the department, scenarios of various clinical situations have been developed, special conditions have been created with equipment necessary for conducting educational clinical games. The teacher vigilantly monitors the course of the educational game, strictly controls every action of the participants. In cases of miss tolerance, he scrupulously corrects them. At the request of the situation, he often introduces additional information that complicates the clinical situation. In the course of the educational game, the participants are allowed to discuss the role of each symptom in the diagnosis of this disease, discuss the plan for the upcoming examination of such patients. Summing up the lesson, the teacher gives an objective assessment of the actions of each participant in the game, comments on the answers, corrects the survey plan drawn up. Acting as an arbiter, he dwells in detail on the mistakes and mistakes made by the students of the “players” and advises on ways to eliminate them [14,16].

Based on the research carried out, it can be concluded that interactive teaching methods: “weak link” and “case study” have different effects on the formation of individual levels of knowledge. So, if, the first of them contributed to the predominant growth of I and II, then the second - III and IV levels of knowledge. Taking into account the latter, the choice of the method of educational game should be carried out in accordance with the goal and objectives of each lesson. We consider it expedient to use an interactive game "weak link" in the course of teaching general lessons, and "case study" of a special part of the subject of clinical pharmacology.

THE STUDY OF GENETICS IN MODERN SPORTS MEDICINE IS THE KEY TO HIGH ACHIEVEMENTS OF YOUNG ATHLETES

Mavlyanov Z.I*; **Jalolova V.Z****; **Rakhmatova M.R****

*Tashkent Institute of Postgraduate Medical Education,
UZBEKISTAN

UZBEKISTAN

ABSTRACT

Sports genetics is one of the young sciences. Genetic factors are generally known to affect strength and endurance, but only a few studies have examined the relationship between genetic factors and athletic performance in young athletes. One of the intensively developing areas of modern genetics is the development of molecular genetic approaches that make it possible to determine a person's predisposition to various types of activity, which is determined by the need to substantiate a system for selecting people for playing sports and correcting the training process. This approach is the most promising, since it allows you to determine the genetic predisposition to the performance of large physical activities and to carry out a targeted differentiated selection of children for sports at the earliest stages of their sports activity. Currently, predictive medicine is actively developing, the purpose of which is to identify possible diseases in a particular patient by the DNA structure, as well as to develop a set of preventive or health-improving measures based on these studies. Such preventive measures are also important in sports, so sports genetics can achieve high results using scientific methods.

KEYWORDS: *Sports Genetics, Predicting Athletes' Capabilities, Selection Of Young Athletes, DNA Polymorphism, Genetic Predisposition.*

INTRODUCTION

Genetic factors are generally known to affect strength and endurance [8], but only a few studies have examined the relationship between genetic factors and athletic performance in young athletes. Among the potential polymorphisms potentially associated with muscle function and physical performance, the most studied are angiotensin-converting enzyme (ACE), variant R577X of the actinin-3 gene (ACTN3), and muscle creatine kinase isoform (CK-). MM), peroxisome proliferator-activated receptor α (PPAR α) and more recently SLC2A4 [9-14]. It has been demonstrated that alternative polymorphic variants of these potential polymorphisms are associated with sprint / strength or endurance disciplines with reasonable replication in different groups of athletes [15-18]. Indeed, the I allele of the insertion (I) / deletion (D) polymorphism in the ACE gene is one of the most putative factors determining aerobic capacity in performance-oriented endurance [28]. Likewise, the PPAR-G, ACTN3 X, and CK-MM A alleles are involved in improving aerobic performance [16, 17, 19]. On the other hand, it is assumed that ACE D, PPAR α C, ACTN3 R and CK-MM G are more related to strength-oriented characteristics [8, 16, 20]. Given that the contribution of specific genes to athletic performance has been investigated primarily in athletes who are at the two endpoints of the human athletic performance continuum, less is known about the application of sports genomics in more complex disciplines that do not exhibit specific phenotypes. Thus, the aim of the present study was to compare the allele and genotype frequencies of four known polymorphisms in athletes from various mixed sports disciplines in order to investigate the genetic markers that are suitable for distinguishing the predominant components of these sports.

One of the rapidly developing areas of modern genetics is the development of molecular genetics approaches to determine a person's predisposition to various types of activity. So, in particular, in recent years, a search has been carried out for molecular genetic markers that determine a person's ability to perform high sports loads (Montgomery, 2000; Rogozkin, 2004), which is determined by the need to justify a system for selecting people for sports and correcting the training process. This approach is the most promising, since it allows you to determine the genetic predisposition to high physical activity and to carry out a targeted differentiated selection of children for sports at the earliest stages of their sports activity. It should be noted that in 2000 a human genetic map was created, in which genes were introduced, which in at least one study revealed associations with physical indicators and / or influenced human health (Rankinen, Bray et al, 2006). In an early 2000 version, the map included 29 genes. The 2005 version, 6th - amended, includes 165 autosomal genes, 5 - located on the X chromosome, as well as 17 mitochondrial genes. To date, work of this kind is being carried out only in five countries: the USA, Great Britain, Australia, Russia (Scientific Research Institute of Physical Culture - under the leadership of Doctor of Biological Sciences, Professor V.A. Rogozkin; laboratory of molecular genetic research of the Department of Genetics at the Bashkir State Pedagogical University - under the leadership of Doctor of Biological Sciences, Professor Gorbunova V. Yu.) and Kazakhstan. On the site www.genoterra.ru - the register of leading scientific institutions, the laboratory of molecular genetic research of the Department of Genetics of BSPU is included in the list of groups engaged in the search for genetic markers that determine people's predisposition to sports activities.

A lot of data, including the results of recent studies, confirm the influence of polymorphism of some genes on the physical characteristics of an athlete and, as a consequence, on the predisposition of the athlete's body to strength loads or to endurance training.

Its proclamation as a branch of knowledge took place at the Olympic Scientific Congress "Sport in Modern Society", which was held in Tbilisi in 1980. Also there was created the "International Scientific Society for Sports Genetics and Somatology."

In 1983, Claude Bouchard first coined the term "genetics of fitness and physical performance". Then he published two reviews in one issue of the journal "Exercise and Sport Science Reviews", where he presented generalizing facts, firstly, about individual differences in response to physical activity, and secondly, about the heritability of many qualities involved in the process of physical activity [3].

1995 was marked by the beginning of the international project HERITAGE (HEalth, Risk Factors, Exercise Training AndGENetics) led by Claude Bouchard. The project involved several research centers and more than 800 volunteers who were subjected to physical activity for several weeks. K. Bouchard and his colleagues searched for polymorphic loci associated with physical activity, and published hundreds of works on the topic of heritability of human physical factors. Progress in understanding this issue has been significant.

It is necessary to take into account that the development and manifestation of the physical qualities of a person depends on both genetic and environmental factors. The more genetic factors influence physical qualities (high degree of heritability), the less successfully these qualities are trained, and vice versa [1].

Sports genetics allows you to calculate the limit for each person to perform any type of exercise, depending not only on the nature of the task, but also on the genetic components. The human genotype largely determines such important characteristics for athletes as strength, endurance, composition of muscle fibers and muscle mass, flexibility, neuromuscular coordination, and reaction speed [2].

Over the past few decades, certain hereditary factors have been identified that are responsible for the development of the above qualities in humans. Therefore, sports genetics provides useful information on how to improve the performance of performances, which athletes to select for competitions and which of them will be able to cope with the task at hand. The selection of young, promising in their hereditary qualities athletes (at the same time the minimum risk of intense physical activity for their health) is an important issue in sports medicine, which can be solved by modern methods of genetics.

The introduction and active use of molecular genetic technologies makes it possible to create an optimal training program specifically for each athlete, in which the body's energy resources will be used as efficiently as possible, which will allow achieving high sports results.

I would also like to note that in connection with the active development of genetics as a science and methods of its study, genetic research is becoming more and more accessible. At the moment, sports genetics is present not only in elite sports, but also in amateur sports. Fitness is an important part of a healthy lifestyle, and you should approach the issue of its correct organization responsibly. In this case, on the basis of genetic research, a geneticist can recommend a specific diet, diet, exercise regimen, as well as the nature of the exercises, taking

into account the individual characteristics of the organism. In addition, sports genetics makes it possible to identify diseases to which a person is genetically predisposed (for example, cardiovascular diseases, bronchial asthma, obesity). Based on the data obtained, it is possible to recommend preventive measures to prevent these diseases for each individual person.

In 1998, the journal "Nature" published a scientific article "Human gene for physical performance" by a young British scientist Hugh Montgomery. He presented the results of his work with a team of authors (19 people) on the study of the role of the ACE gene (angiotensin converting enzyme) in sports activities. H. Montgomery and his colleagues investigated a group of alpine climbers [4]. The size of the article is just one page, which states that one of the polymorphic alleles of the ACE gene - allele I provides endurance, and allele D - the speed-strength qualities of an athlete. The conclusion was based on the fact that in athletes who are successful in sports requiring endurance, the frequency of allele I is higher than in the control group, and in athletes of high-speed types, allele D predominates [5].

This publication attracted the attention of the entire scientific community and society as a whole. The world media reported on the discovery of the "sport gene" (ACE gene), thanks to which it was now possible to identify a predisposition to a particular sport or physical activity in any person.

Among domestic scientists, Eduard Georgievich Martirosov should be noted, who created on the basis of VNIIFK (All-Russian Scientific Research Institute of Physical Culture and Sports) in 1972 the Laboratory of Sports Anthropology (later called the Laboratory of Sports Anthropology, Morphology and Genetics) [6].

Later, research in the field of sports genetics was started in the laboratory of prenatal diagnostics of the Research Institute of Obstetrics and Gynecology. BEFORE.Ott (St. Petersburg), as well as in the laboratories of the Institute of Biochemistry. A.N. Bach of the Russian Academy of Sciences (Moscow), at the All-Russian Research Institute of Physical Culture (Moscow), Research Institute of Transplantology and Artificial Organs (Moscow) and the Russian State University of Physical Culture (Moscow) [7]. Now such laboratories are located not only in Moscow and St. Petersburg, but also in other large scientific centers in Russia.

Sports genetics is developing quite rapidly, since the number of newly studied genes that characterize the physical qualities of a person is growing exponentially: in 1997 - 5 genes; in 2000 - 24 genes; B 2004 - 101 genes [8]. To date, about 200 genetic markers (DNA polymorphisms) associated with the development and manifestation of physical qualities are known [9].

In sports, to achieve the highest possible performance, talented athletes must be selected correctly and in a timely manner, and then included in long-term, planned training programs [10].

Today, due to the fact that investments in sports and individual athletes reach serious sums, the issue of effective selection of athletes is more relevant than ever [10].

Each of us is individual, we carry unique genetic information. And our uniqueness can be studied with the help of DNA diagnostics methods, which shows the characteristics of metabolism, the state of organ systems, the properties of the psyche.

In sports genetics, molecular genetic methods such as PCR, real-time PCR, RFLP analysis, QTL mapping, NGS, NNGS, biochip technology, as well as cytogenetic (karyotyping, fluorescent in situ hybridization or FISH), genealogical and biochemical research methods.

It is impractical and irrational to perform DNA typing for all possible genes responsible for the athletic characteristics of a person. The information obtained must be correctly interpreted and conclusions drawn in relation to each individual case. Moreover, the analysis of one gene is not sufficiently informative.

Genetic analysis provides information about the hereditary predisposition to a particular sport. For example, skeletal muscle is made up of two distinct types of muscle fibers: fast and slow. Slow fibers are characterized by little force of contraction, but low fatigue, they are involved in the performance of low-intensity strength work for a long time. Fast fibers, on the other hand, are distinguished by greater force of contraction and high fatigue; they are used when performing short high-intensity strength work [11]. For muscles, which are dominated by slow fibers, aerobic exercise will be most effective. These sports include swimming, rowing, tennis, long-distance running, cycling, and walking. And for muscles, which are dominated by fast muscle fibers, anaerobic loads (strength training) are most effective. Wrestling, sprint running, powerlifting, arm wrestling, rock climbing are examples of physical activity based on anaerobic muscle metabolism.

The type of muscle fibers prevailing in our body is genetically determined (this is associated with the ACE gene polymorphism). Thus, the results of a distance runner (long-distance runner) in a 2000-meter run negatively correlate with his own results in a 100-meter run.

When the type of physical activity matches the hereditary predisposition, the person can achieve the best results and get the most from the training in the shortest possible time.

Recent studies have demonstrated the high effectiveness of diet and physical activity in correcting metabolic disorders. When lifestyle changes in individuals with early disorders of carbohydrate metabolism, the risk of type 2 diabetes mellitus (type 2 diabetes) decreases by 58%. However, it is also known that in a number of patients, diet and increased physical activity are ineffective and do not prevent the development of the disease. Today, a new approach to building a diet based on the individual characteristics of a person is proposed. The influence of nutritional components on gene expression is being studied by a new science - nutrigenomics. Nutrients can induce metabolic changes by affecting the activity of certain genes. In addition, the genetic variability of the food itself can have an impact on human health. Nutrients can affect the genome of the gut microbial flora, which also causes metabolic changes. Thus, the subject of nutrigenomics is the study of interactions between food genomes, the human genome, and the genomes of the gut microbiota. Changes in gene activity that occur during the growth and development of an organism are called epigenetic. Epigenetics studies changes in gene expression that occur without disrupting the nucleotide sequence of deoxyribonucleic acid (DNA). There are three mechanisms of epigenetic changes: DNA methylation, histone modification, and RNA interference (suppression of gene expression using small molecules of ribonucleic acid). It is assumed that dietary components can influence DNA methylation processes [13]. First, nutrients are essential for the provision and regulation of the synthesis of S-adenosylmethionine, a universal methyl donor. Second, they can influence the utilization of methyl groups through changes in the activity of DNA methyltransferase. The third possible

mechanism is associated with the activation of DNA demethylation [12]. Currently, a large number of genes have been identified, the polymorphism of which is associated with the development of metabolic disorders. It turned out that food components can change the activity of these genes. Studies have been published that demonstrate interactions between a number of genes associated with obesity and type 2 diabetes and some foods. Variants of such interactions are presented below as examples. Fatty acid binding protein type 2 (FABP2) is an intracellular protein produced in enterocytes. It is involved in the transport and metabolism of long chains of fatty acids and can also maintain cellular homeostasis by acting as a lipid sensor.

The FABP2 gene is located on chromosome 4q28-q31. Polymorphism of this gene is associated with an increased risk of developing type 2 diabetes. This is because the protein it encodes is involved in the absorption of fatty acids and therefore can affect insulin sensitivity and glucose metabolism. Three genotypes are distinguished: normal, or the so-called wild type (Ala54 / Ala54), heterozygous (Ala54 / Thr54) and homozygous (Thr54 / Thr54). Heterozygous and especially homozygous Thr54 genotype is associated with the development of insulin resistance, type 2 diabetes, and, possibly, increased cardiovascular risks. A meta-analysis of 31 studies, which examined 13,451 people, demonstrated that a mutation in the FABP2 gene, namely the presence of the Thr54 allele, is associated with more pronounced insulin resistance, increased fasting plasma insulin levels and increased glycemic levels 2 hours after glucose loading [23]. It has been established that FABP2 expression may depend on adherence to a specific diet. D. de Luis et al. investigated the dynamics of body weight and a number of metabolic markers in response to a hypocaloric diet (1459 kcal / day) rich in polyunsaturated fats (22.7% of the total fat consumed per day) in obese individuals with FABP2 (Thr54) gene polymorphism ... The decrease in body mass index, body weight, and waist circumference was significantly more pronounced in the group with the Thr54 allele, compared with those with the wild type of the FABP2 gene allele. Moreover, only carriers of the Thr54 allele, while adhering to a diet enriched with polyunsaturated fats, showed a significant decrease in total cholesterol, low-density lipoprotein cholesterol, and insulin [25]. In another study, it was shown that people with obesity and FABP2 gene polymorphisms (Ala54 / Thr54 and Thr54 / Thr54) who followed a hypocaloric diet (1342 kcal) with a high content of monounsaturated fats (67.5%) did not have a significant change in biochemical markers, despite the improvement in anthropometric indicators. On the contrary, in the carriers of the wild allele for this gene, on the background of adherence to the proposed diet, in addition to the decrease in body weight, the levels of insulin, leptin, and insulin resistance significantly decreased [24]. Thus, on the basis of nutrigenomic studies, it should be concluded that individuals with FABP2 gene polymorphism (Ala54 / Thr54 and Thr54 / Thr54) are shown a diet high in polyunsaturated fatty acids (about 20% of the total fat consumed per day). To do this, it is enough to introduce fatty fish into the diet (about 750 g per week) or regularly take fish oil. Peroxisome proliferator-activated receptors (PPARs) belong to the group of nucleus receptors. PPAR proteins are involved in reading the genetic code in many genes. They play a significant role in glucose and lipid homeostasis: they determine the need of muscle tissue for glucose and its sensitivity to insulin, regulate adipocyte differentiation and glucose homeostasis, bind lipid-lowering drugs and fatty acids, regulate the production of a number of adipokines, and participate in the regulation of bone metabolism. Natural ligands of PPAR are polyunsaturated fatty acids and prostaglandins [26]. There are three subgroups of these receptors: PPAR α , PPAR δ and PPAR γ . The PPAR γ isoform is synthesized in fat cells and is involved in their differentiation. In addition, this protein is a mediator of insulin resistance. PPAR γ regulates

the synthesis of adipokines in adipocytes: interleukin-6 (IL-6), tumor necrosis factor- α , plasminogen activator type 1 inhibitor. In an experiment on animals, it was proved that after a diet high in fat in mice, there is an increase in PPAR γ -mRNA in adipose tissue [27]. Polymorphism of the PPAR γ gene is characterized by the substitution of cytosine nucleotide for guanine, which leads to the substitution of the amino acid proline for alanine in the protein. In obese Caucasians, the PPAR γ (Pro12Ala) gene polymorphism is associated with a lower risk of developing type 2 diabetes, and with the homozygous genotype (Ala12Ala), insulin sensitivity is even higher compared to the wild genotype [28]. It was found that the ratio of polyunsaturated to saturated fats in the diet can affect the concentration of blood lipids in carriers of the Ala12 allele of the PPAR γ gene. In the RISCK study (Reading, Imperial, Surrey, Cambridge, King's), this effect was studied in 367 ethnic Europeans with an increased cardiometabolic risk. According to the results obtained, the concentrations of total cholesterol and triglycerides in carriers of the Ala12 allele of the PPAR γ gene decreased with an increase in the ratio of polyunsaturated to saturated fats in the diet (from ≤ 0.33 to > 0.65) and did not depend on a decrease in saturated fat in the diet [9]. Therefore, carriers of the Ala12 allele of the PPAR γ gene should eat foods with a high ratio of polyunsaturated to saturated fats to reduce triglycerides and total cholesterol levels.

In the regulation of metabolic processes, leptin (LEP), an adipokine, plays an essential role in regulating the body's fat reserves, namely, it controls the amount of food consumed and the expenditure of energy reserves. Leptin is produced by adipocytes in white adipose tissue, enters the bloodstream and transported to the brain, where it regulates the production of a number of neurotransmitters. On the one hand, a deficiency in leptin secretion leads to severe obesity. On the other hand, in overweight and obese individuals, leptin levels rise and so-called leptin resistance develops. It is known that the effect of leptin is not limited to adipose tissue; it also participates in the functioning of the reproductive system, mammary glands, immune system, intestines, kidneys, lungs, and skeletal bones [10]. The LEP gene is located on chromosome 7. Polymorphism of the LEP gene on chromosome 7 is associated with the replacement of adenine with guanine at position 2548 in the promoter. This leads to changes in leptin activity and affects the perception of satiety, decreasing the central nervous system's control over appetite. LEP gene polymorphism can be associated with a decrease in leptin secretion and the development of obesity, and homozygous mutations of the LEP gene predispose to the development of obesity at an early age [11]. A relationship between the LEP A19G polymorphism and sugar cravings has been established [12]. The effects of leptin are due to interactions with its receptor. The leptin receptor gene polymorphism (LEPR) associated with the replacement of glutamine with arginine at position 223 alters the sensitivity of the receptor to leptin, can disrupt signal transduction, and contribute to the development of leptin resistance. The association of the LEPR gene polymorphism with the development of obesity has been confirmed in various ethnic groups [13, 14]. These disorders predispose to the development of obesity, accompanied by leptin resistance and hyperleptinemia. It turned out that a diet high and low in polyunsaturated fats affects the activity of polymorphic variants of the LEPR gene [15]. Polymorphism of the dopamine D2 receptor gene (DRD2) - TaqI A1 - is associated with various types of addictions (alcohol, cocaine, opioids). According to a number of researchers, mutations in this gene may be associated with eating disorders. C.L. Carpenter et al. showed that the combination of DRD2 and LEPR polymorphisms increases the risk of obesity [16].

The FTO gene is responsible for the amount of fat in the body and the propensity for obesity. It is expressed in the nuclei of the hypothalamus and islets of the pancreas. FTO gene polymorphism (AA rs-9939609) is associated with obesity, and according to the results of some studies, with type 2 diabetes. Patients with type 2 diabetes, who had this type of polymorphism, ate food rich in fat (more than 34% of daily calories; odds ratio (OR) 2.17, 95% confidence interval (CI) 1.02-4.63) and poor in fiber (less than 16 g / day; OR 2.42, 95% CI 1.05–5.57) [17]. In a study involving 7052 people with a high risk of cardiovascular complications, the presence of associative links between type 2 diabetes, gene polymorphism, and dietary habits was established [18]. In individuals not adhering to the Mediterranean diet, an association was found between the presence of the FTO gene polymorphism (rs-9939609) and type 2 diabetes: the relative risk of type 2 diabetes was 1.21 (95% CI 1.03–1.4). In contrast, there was no such relationship among those on the Mediterranean diet. A similar pattern persisted after standardization of the sample by body mass index. The same relationship took place in the presence of polymorphism in the melanocortin-4 receptor gene. Therefore, adherence to the Mediterranean diet eliminates the negative effect of polymorphic alleles of the FTO gene (rs-9939609). IL-6 is an adipokine synthesized by both adipocytes and fibroblasts, endothelial cells, pericytes and immunocompetent cells. IL-6 production and, accordingly, its plasma level increase in obese individuals and in patients with type 2 diabetes. IL6 gene polymorphism is associated with an increased risk of obesity. One study showed that the addition of 750 ml of apple juice with a high content of polyphenols (802.5 mg) to the daily diet for 4 weeks reduced the volume of adipose tissue in individuals with the IL6 gene polymorphism (C / C), and in others variants of the alleles of this gene, no changes were observed [19]. Personalized diet means that nutrition is tailored to the individual needs of a particular person, depending on the stage of life, lifestyle and life situation in which the person finds himself. It is obvious that such an approach to building a diet can significantly increase the effectiveness of treatment and prevention of metabolic disorders. At present, recommendations on nutrition have been developed based on the presence of certain gene polymorphisms, and the spectrum of gene polymorphisms has been determined, which should be studied in persons with metabolic disorders or with a high risk of their development. However, more research is needed to study different dietary regimens when certain gene polymorphisms are found.

CONCLUSION

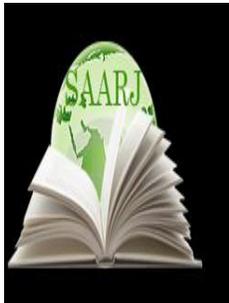

The genetic approach to the problem of selection of athletes will undoubtedly save you from performing ineffective work and ensure high rates of training for young athletes. With the help of genetic tests, it is possible to determine not only the predisposition to a particular sport, but also to identify possible health problems that can become a serious obstacle to sports victories.

ABOUT THE SYSTEM OF COMPLEX GRAMMATICAL FORMS MEANING "STYLE" IN UZBEK LANGUAGE

Sh.Z.Rahmatullaeva*

*Associate Professor,
 Karshi State University, UZBEKISTAN

ABSTRACT

In the given article, morphological forms are split into simple and complicated categories, and the structure of complex morphological forms is scientifically based. Movement type forms have been evaluated as morphological forms that are complex. Both semantically and formally, the ambiguity of the forms has been studied. Movement type forms are formally split into analytic and complicated morphological forms.

KEYWORDS: *Morphological Form, Prepositional Verb, Auxiliary Verb, Lexical Form, Lexical Meaning, Grammatical Meaning.*

INTRODUCTION

The model of the movement style is a system of complex morphological forms, and Turkic languages have a special place in the system of change of word.

One form of the action form is a morphological index created by the addition of an auxiliary verb with a relative form, which helps to provide additional grammatical meaning to the lexical meaning of the verb that it forms: to leave ('suddenly'), to give ('temporarily'), to wait ('continuous'). Movement.'). The second verbs in conjunctions are considered auxiliary verbs, and they have lost their lexical meaning in these uses, i.e., they express a grammatical meaning based on the lexical meaning. The verb being formed is the prepositional verb, and the combination of the prepositional and auxiliary verbs is referred to in traditional Uzbek linguistics as the auxiliary verb conjugation.

Auxiliary verbs have a practical significance, such as lexical shape-forming affixes, which are used to alter the lexical sense of words, modify, adapt to expression, and adapt. For this reason, the morphological markers of the mode of action, consisting of a mixture of leading and auxiliary verbs, are called an analytical verbform due to its "separation" feature, are also called

lexical form-makers. Hence, the term analytic form is chosen in relation to their formal structure, while the term form of action style is chosen in relation to its semantic essence. For example, in the sentence I read a book, the verb came out in its substantive sense, and in explanatory dictionaries it is recorded as semema. that is, it exaggerates the completeness of the action understood from it, and expresses the speaker's attitude to his own behavior. By its very nature, it combines both grammatical and pragmatic meanings. At the same time, it should be noted that the lexical meaning of its substantial basis is somehow preserved in this pragmatic adaptive grammatical sense. In general, the semantics of the corresponding lexeme sees the face of speech in a "reduced", generalized, abstract way at the level of grammatical meaning. in this pragmatically adapted grammatical sense the lexical meaning of its substantial basis is somehow preserved. In general, the semantics of the corresponding lexeme sees the face of speech in a "reduced", generalized, abstract way at the level of grammatical meaning. in this pragmatically adapted grammatical sense the lexical meaning of its substantial basis is somehow preserved. In general, the semantics of the corresponding lexeme sees the face of speech in a "reduced", generalized, abstract way at the level of grammatical meaning.

Depending on the context of the voice, the nature of the meaning conveyed, the content and the semantic nature of the verbs, and the communicative intent of the speaker, the guiding and auxiliary verbs combine in three different forms:

- 1) - through the form (i) b: told, came;
- 2) through the -a / y form: began to come, read;
- 3) directly: I told - I told, I left - I left.

It is known from observations that there is not a single pure auxiliary verb in modern Uzbek. According to the sources, more than 30 (25 in textbooks, sometimes 27) independent verbs can come as auxiliary verbs: give (give), know, bit (end), have, start, look, be, meat, summer, foreign, come, go, see, take, see, throw, get up, dream, get out, send, walk, die, grass, sit, look, stay, sheep. It should be noted here that independent verbs should come from the position of auxiliary verbs and seek homonymy from the state in which they express grammatical meaning, or ambiguity? When reviewing various dictionaries of the Uzbek language, the appearance of independent verbs as auxiliary verbs is noted as one of their meanings. But does not the fact that the auxiliary verb is not an independent verb, i.e., the auxiliary verb, take it beyond the scope of the independent verb? However, the meaning that the auxiliary verb expresses in dictionaries is not only its meaning, but also the meaning it expresses as a complex morphological form when combined with its relative form. So, the fact that the form of action in the verb read has the form [-b output] does not mean that its output is a completely different phenomenon from the independent verb?

As the researcher O.Shukurov noted, 25 auxiliary verbs (except for the word summer and start) can be combined with the leading verb using the form - (i) b:

11 auxiliary verbs -a / y (see auxiliary verbs only with the -a form: say) can be combined

Read	gave	was	Hesaw	(lit) fell	passed
	heknew	(consciously) did	Gotit	cameout	satdown

finished	laydown	(said)	sent	looked
went	came	Hethrew	walked	remained
looked	gone	Hestoodup	died	put

with morphological form:

1) give / give (write)	5) summer (wrote in the fall)	9) sol (coming)
2) bil (could find)	6) go away	10) type (write type)
3) has (changed)	7) blind	11) stay (say stay)
4) start (started writing)	8) take (forgot)	

This means that 16 auxiliary verbs cannot form a preposition with an auxiliary verb with the -a / y suffix, that is, they can only be combined with a prepositional verb with the -b / ib suffix (bit, bit, bol, et, yot, kel, throw, dream, get out, send, walk, die, grass, sit, look, put) determined by the researcher.

"Mother tongue. In the encyclopedia, 9 auxiliary verbs can be combined into a verb that takes both forms: give (tell, say), know (write), have (read, read), go (heat) gone, gone to speak), blind (tell, tell, see), take (write, write), see (spilled, come), get up (read, write), stay (finished, say).

According to the "Universal Manual of the Uzbek language", auxiliary verbs often have a different meaning with the form - (i) b, a different meaning with the form -a / y: wrote - wrote, came - came, tell - do not say, read - read, call - call. In some cases, the meaning fits: got heavier - got heavier.

Auxiliary verb conjugation can be shortened and sometimes added under the influence of style requirements, mental characteristics of the speaker and listener, as well as various other pragmatic factors: let go - let go, say - say, could not come - could not come.

As a result of the need to express different modal meanings in the auxiliary verb conjugation at the same time, the auxiliary verb can be more than one: keep reading, could not answer. In this case, the position of the leading and auxiliary verb is nysbium, in other words, for the next auxiliary verb, the prefix of the previous auxiliary verb is the leading verb, because the leading verb also expresses its essence in the same lexical position as the auxiliary verb: say (lead verb) give (auxiliary verb), telling (leading verb) type (auxiliary verb). It is fair to call it a chain of action style.

The form of the action style is similar to the form of a compound verb of the type [verb + verb] and a combination of words of the type [verb + verb]. After all, in the early days of Uzbek linguistics, the form of action was also considered as a compound verb on the basis of apparent similarity. But the differences between them are obvious in today's linguistics.

Since both verbs in the form of action style retain the full verb essence, their relation to the relation, which is the first and main category of the verb, is also known. In the verb in the form of an action style, the ratio of proportion and indivisibility is sometimes added to the leading verb, sometimes to the auxiliary verb, and sometimes to both: said; don't buy, don't go, don't write. Since the tense, inclination, person-number suffix is a means of expressing the syntactic form, and because it is specific only to the syntactic position of the cut, the auxiliary verb that comes as a cut is in the auxiliary verb conjugation. With the exception of the paired case of verbs only, the form of this cut category can be in both verbs: completed-put. The reason for this is that the speaker tends to exaggerate the meaning expressed by the auxiliary verb,

Limiting the mode of action only to the auxiliary verb conjugation narrows its functional essence. In Turkic languages, there are also affixal indicators that indicate the degree of strength or weakness of the movement, which is one of the manifestations of the style of action, and the study aims to examine their linguocultural and sociopragmatic features. Among them are:

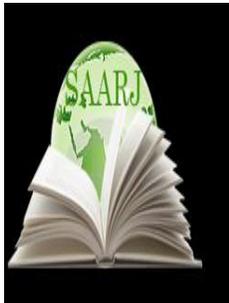

1) affixal style forms indicating a weak level of movement: -msira / imsira: crying, smiling; -qira / inqira: to believe, to whiten, to whine; -sh / work: filling, heating, whitening, stopping (heart); -q / iq / k / ik: tutaq, toliq, junjik, konik

2) affixal style patterns that indicate a strong level of movement: -la / ala: chase / chase, rub, rub, rub, rub, rub, rub; -qi / g'i: yulqi, sizgi, tuzgi, bijgi; -chi: tipirchila, tepchi, terchila; -a: bur - bura, joy - joy, urin - urn; -gila / kila / ola / gila: run, squeak, squeak, squeak, squeak, squeak, squeak, squeak; to: surga, surka, chayqa.

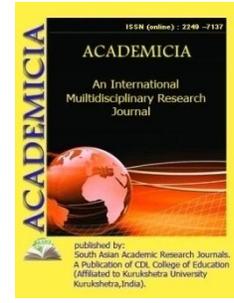

Hence, it is expedient to reveal the linguocultural, sociological and pragmatic possibilities of the verb by analyzing the action forms of the verb into two groups on a linguistic basis (analytical action forms and synthetic action forms).

AN ANALYSIS OF EXPORT OF INDIAN AGRICULTURE COMMODITIES

Dr. Anil Mishra*

*Assistant Professor,
 Humanities, College of Agriculture,
 Tikamgarh M.P,
 INDIA

ABSTRACT

The present work has attempted to examine the relationship between agricultural export and the effective factors influencing the same relationship in India. The review of literature has provided an overview of growth of agricultural exports across the countries and different methods used to calculate the export supply function of agricultural products. This study is based on the neoclassical trade theory which is evaluated in a neoclassical production function framework, incorporating an additional factor of production (exports) into the production function.

The study has attempted to analyze the long run and the short run relationship between agricultural exports as dependent variable and exchange rate, export price index, gross domestic product and domestic production of agricultural product as independent variables based on annual data during 1980- 2010. Also, World Trade Organization as a dummy variable has been taken as a determinant of India's agricultural exports. The autoregressive distributed lag model and error correction model are used to determine the long run and short run relationship between the variables. Further, paired t-test is used to investigate the impact of WTO on growth of agricultural export in India. Dynamic econometric model is estimated to test for time series properties, unit root test and cointegration (ARDL procedure). The results of cointegration test showed that the variables are cointegrated. The results of long-run estimated coefficients of export supply function showed that exchange rate had a statistically significant and negative impact on agricultural export. The long-run coefficient of domestic production of agricultural product and export price index have positive sign and are significant at 5% level respectively. The long-run coefficients of Gross Domestic Product (GDP) and WTO as dummy variable had positive and negative sign respectively but are insignificant. In brief, the coefficient of the ECM

is very high at (-) 0.54 implying a fairly high speed of adjustment to the long-run disequilibrium after a shock. The Coefficient of the ECM term suggested that adjustment process was fast and 54% of the previous year's disequilibrium in equity prices from its equilibrium path will be corrected in the current year. It is also observed that dummy variable is not significant in long run but it is statistically significant in short term.

KEYWORDS: *Agricultural Exports, Production Function, Gross Domestic Product, WTO.*

INTRODUCTION

Agricultural development is critical to developing countries, especially to the least developed of them. Although agriculture still remains the largest employer, the largest source of exports and foreign exchange earnings for the most developing countries its contribution to GDP is declining gradually. About 75 percent of population below poverty line in the worldwide resides in rural areas and most of them are dependent on agriculture. While agriculture declines relative to the rest of a growing economy as incomes improves, its growth is absolutely critical in the early stages of development and it can often drive export-led growth. But whatever the stage of development is the socioeconomic stability of a nation is determined by prosperity of agriculture sector.

A vibrant agricultural sector is therefore crucial to reducing poverty through economic growth, as well as improving global food security and conserving natural resources. Agricultural trade reform, to better integrate this sector into global markets is equally crucial to developing countries for a number of reasons. Agriculture has the highest levels of trade distortions and therefore has the greatest potential for gains from reform. And domestic reforms are necessary to implement trade reforms to benefit developing countries more than developed countries.

In recent years, agricultural protection and its impact on developing countries have attracted growing attention. While manufacturing protection has declined worldwide following substantial reforms of trade policies, especially in developing countries, most industrial and many developing countries still protect agriculture at high levels. Agricultural protection continues to be among the most contentious issues in global trade negotiations, with high protection in industrial countries.

India has a large and diverse agricultural forte and is one of the world's leading producers of agricultural product. It is also a major consumer, with a growing population to feed. For this reason and because of its agricultural and trade policies, its presence in the world market has been modest in relation to the size of its agriculture. While it has been a small net agricultural exporter overall since 1990, in recent years there have been many changes in its agriculture and trade policies and significant changes in its net trade position for many individual products.

Of late, development of exports of non - oil products have become one of the main objectives of economic development in India. Exports of agricultural products are the main part of exporting non - oil products in India, so agricultural products play a crucial role. It is necessary to consider sustainable development of all the sectors in India. Promotion of export of agricultural products is important in creating jobs and is a source of: income in the agricultural sector. It also can bring in foreign exchange to add to the economy.

This study proposes to use the regression model to analyze the growth of agricultural export in India by using time series data during the period 3 1980-2010. The most important factors of export supply of agricultural product are export prices index, exchange rate, quantity of domestic products, Gross Domestic Products (GDP) and dummy variables (WTO's Agreement on agriculture (AOA)). For this purpose, export supply functions were used to determine the relationship between export supply and independent variables, over the pre and post WTO period. Also, Trends in agricultural exports in India during 1980-2010 was considered. Finally, the empirical results of unit root tests and co-integration analysis for variables have been described, followed by a summary of the results and conclusions.

Objectives

Objectives of the Current Study are to:

1. Examine the agricultural export policy of the government during pre and post WTO.
2. Comparing the structure and growth of agricultural exports in India during pre and post WTO period.
3. Examine the determinants of agricultural export since WTO.
4. Estimate the export supply functions for agricultural products in India.

Hypotheses

To achieve the above objectives following hypotheses are formulated:

1. There is positive relationship between GDP and export supply of agricultural products in India.
2. Positive correlation exists between domestic production and export supply of agricultural products.
3. Exchange rate has no impact on export supply of agricultural products.
4. Export price index and export supply of agricultural products are positively related.
5. There is short run relationship between exchange rate, quantity of domestic production, export price index, GDP, dummy variable and agricultural export.
6. WTO has positive impact on export supply of agricultural products.

Research Methodology

The present research work is based on time series data from 1980 - 2010. The required data have been collected directly from Reserve Bank of India (<http://www.rbi.org.in>), Food and Agriculture Organization of the United Nation (<http://faostat.fao.org/>), World Bank (<http://worldbank.org>) and Central Farm Machinery Training and Testing Institute (<http://dacnet.nic.in/>) websites. The literature relating to the research work is taken from published articles, books and other Government reports. The literature relating to the research work has been taken from published articles, books and other Government reports.

In this study India's agricultural products Include Rice basmati and non-basmati, cashew, wheat, tea, sugar, spices, onions, coffee and tobacco.

This study has investigated the relationship between export prices index, exchange rates, and quantity of domestic products, Gross Domestic Products (GDP) and agricultural exports in India. Also World Trade Organization (WTO) as a dummy variable is taken as determinant of India's agricultural export. In this research work annual data are used in order to estimate the export supply function for India's agricultural products.

The aim of the research is to identify effective factors of export of agricultural products in India. Theoretical principles of export supply functions relying on the techniques of econometrics, especially least linear square method, with the calculation of partial elasticity of export supply of agricultural product in India.

Collected data are analyzed for functions estimation mentioned using software packages such as Eviews, Microfit4, SPSS and Excel Software of MS Office. The model has utilized the following techniques to explain the objectives and to test the hypotheses.

- 1) Unit Root test
- 2) Co integration test
- 3) Autoregressive Distributed Lag mode
- 4) Error Correction Model
- 5) Paired t-test.

Findings and Suggestions

This work has employed various econometrics techniques to examine and explain the growth of agricultural export in India during pre and post WTO. Another purpose of this study was to examine the long run and short run relationship between export price index, quantity of domestic production of agricultural product, exchange rate, gross domestic product, WTO (as dummy variable) as independent variables and quantity of agricultural exports as dependant variable. The time series data for 31 years are applied for analyzing the growth of agricultural export and its determinant variables in India.

Drawing on various arguments given by the different authors such as Narayanan (1992), Nagoor (2009), Kathuria (1996), Nidugala (1999), Veeramacheneni (2008), Benerjee (2006), Karnool (2007), Ejaz (2009), Bashir (2003), Sanday (2002), Yang (2005), Cota (2005), Umar (2010), Aydin (2004), Doyle (2001), Zibae (2004), Muchapondwa (2009), Yousef (2007) and Sutijo (2009) regarding the agricultural export and the effective determinant factors, this thesis analyzes India's case. An attempt has been made to trace the effect of WTO on growth of agricultural export.

Findings

The main objective of this study was to examine the determinants of agricultural export in India since WTO using annual data for the period 1980- 2010. Time series techniques were used to estimate the export supply function for agricultural export in India. Four time series techniques were used: unit root test, cointegration test, autoregressive distributed lag model and error correction model. The result of unit root test indicated that all variables except GDP and export price index were stationary at first difference. Export price index was stationary at level and GDP became stationary when second difference was used.

The results of co integration test showed that the F statistic was 5.1071 and was higher than the upper bound at 1% and 5% level of significance, thus the variables were co integrated. So there was a long run relationship among the variables, namely export price index, gross domestic product, exchange rate and domestic production which determined agricultural exports.

The value of determination coefficient was 0.99 which indicated that the 99 percent of agricultural exports explained changes of dependent variables such as export price index, gross domestic product, exchange rate and domestic production. F statistic was also significant at 1% which indicated overall goodness of fit.

The results of long-run estimated coefficients of export supply function showed that exchange rate (ER) had a statistically significant and negative impact on agricultural export i.e., one percent increase in exchange rate can lead to 0.79 percent decrease in agricultural export. The long-run coefficient of domestic production of agricultural product (QP) and export price index (PI) have positive sign and are significant at 5% level i.e., one percent increase (decrease) in domestic production of agricultural product and export price index can lead to 0.71 and 1.84 percent increase (decrease) in agricultural export respectively. The long-run coefficients of Gross Domestic Product (GDP) and WTO as dummy variable (D1) have positive and negative sign respectively but are insignificant. On the other hand, for the export supply of agricultural product, with the exception of Gross Domestic Product (GDP) and dummy variables, all other variables are significant and the coefficients are consistent with a priori expectations too.

The results of Granger causality test showed that there is no significant relationship between growth of agricultural exports and GDP growth rate in the pre WTO period. In Other words, both the variables do not cause each other in either direction. While there is significant relationship between growth of agricultural exports and GDP growth rate in the post WTO period. In the post period, Export growth does Granger cause GDP growth but GDP growth does not Granger cause growth of agricultural exports.

The results of long-run estimated coefficients of export supply function showed that the coefficient of the ECM is very high at (-) 0.54 implying a fairly high speed of adjustment to the long-run disequilibrium after a shock. The Coefficient of the ECM term suggests that adjustment process was fast and 54% of the previous year's disequilibrium in equity prices from its equilibrium path will be corrected in the current year. It is also observed that dummy variable is not significant in long term but it is statistically significant in short run.

The results of deceptive statistic of India's direction of trade showed that India's agricultural exports are broadly divided into following four groups.

The group of countries to which India agricultural exports are:-

1. Organization for Economic Co-operation & Development (OECD) comprising of USA, Canada, European Union (EU).
2. Organization of Petroleum Exporting Countries (OPEC) which includes Iran, Iraq, Saudi Arabia and others.
3. Eastern Europe which includes Russia and others.
4. Developing Nations which includes Singapore and others.

Direction of India's agricultural Exports:

Countries	(1990-1991) % of total	(2000-01) % of total	(2009-2010) % of total
OECD	17.24	42.71	34.47
OPEC	20.80	34.72	54.82
EASTERN EUROPE	60.44	15.37	7.24
Developing countries	1.52	7	3.47
Total	100	100	100

Sources: Directorate General of Commercial Intelligence & Statistics

Table reveals following changes in India's agricultural exports:-

1. The share of OECD was 17.24 % in 1990-91 and 34.47 % in 2009-10. About 46.53 % of these exports have been to European Union (EU) countries.
2. The share of OPEC which was 20.80 % in 1990-91.
3. In 2009-10 it has increased to 54.82 %
4. There was a rapid decrease in the share of Eastern Europe particularly U.S.S.R. Due to political problems and disintegration of the U.S.S.R, the share of Eastern Europe decreased from 60.44 % in 1990-91 to 7.24 % in 2009-10.
5. The share of developing nations increased from 1.52 % in 1990-91 to 3.47 % in 2009-10. Among the Asian countries the major export destinations have been Hong Kong, Singapore and Thailand.

The results of deceptive statistic also revealed that the average of Agricultural exports growth was 2.41 percent in pre WTO which increased to 13.78 percent in the post WTO regime. The global agriculture trade regime under the World Trade Organisation (WTO) has led to an increase in the import of farm products into India rather than boosting exports. This favourable trend in the initial years of the WTO did not last long and the next three years witnessed a whopping rise in imports and a slight decline in exports. The study attributes the slow-down on agro-exports and sharp rise in imports to the decline in global prices of almost all major agriculture commodities after 1997. This crash was due partly to the cyclical nature of international prices and partly due to increased global competition in agro-export because of liberalising trade. The situation was aggravated by an increase in the already high farm subsidies in the developed countries.

Result of hypotheses testing

The Autoregressive Distributed Lag Model (ARDL) developed by Pesaran (1996, 2001) was taken as the theoretical framework for undertaking empirical work on the estimation of export supply function in India. In the empirical investigation of the supply function of agricultural export in India, cointegration, error correction approaches have been applied. The results of regression model are summarized in table .

Hypothesis	Hypotheses	Methodology			Result	
		Statistical model	coefficient	t-ratio		
I	Export price index and export supply of agricultural products are positively related.	Autoregressive distributed lag model	0.71009	2.8110	Accepted	
II	Positive correlation exists between domestic production and export supply of agricultural products.	Autoregressive distributed lag model	1.8427	2.5769	Accepted	
III	Exchange rate has no impact on export supply of agricultural products.	Autoregressive distributed lag model	-0.78922	-5.2471	Rejected	
IV	There is positive relationship between GDP of India and export supply of agricultural products.	Autoregressive distributed lag model	0.37233	0.75505	Accepted	
V	There is short-run relationship between exchange rate, quantity of agricultural products and export supply of agricultural products.	Error correction model	-0.53554	-5.6031	Accepted	
VI	WTO has positive impact on export supply of agricultural products.	Autoregressive distributed lag model	Long	-1.505	-1.0630	Rejected
			Short	0.342	3.68	Accepted
		Paired t-	-5.294		Accepted	

Source: Research findings

The six hypotheses have been examined to present the relationship between India's agricultural export and macroeconomic variables. According to table (7.2), the result of ARDL model shows that the first hypothesis has accepted so the export price index and export supply of agricultural products are positively related. Also based on this model, the second hypothesis proves that Positive correlation exists between domestic production and export supply of agricultural products. The third hypothesis shows that there is negative

relationship between exchange rate and quantity of agricultural export in India. The fourth hypothesis shows that there is positive relationship between GDP of India and export supply of agricultural products. Based on error correction model, the fifth hypothesis has accepted, therefore there is short-time relationship between exchange rate, quantity of domestic production, export price index, GDP, dummy variable and agricultural export. Finally, the six hypothesis shows that WTO has positive impact on export supply of agricultural products in India.

Policy Suggestions

Developing countries have no alternative but to agree with this new arrangement of trade. Though WTO has given special status to the developing countries by giving concessions and extra time to full fills their commitments, yet the global economic scenario is not in favour of them. Most of the developing countries are not keen on fresh negotiations as they feel that the WTO agreement has not given them the benefits that were promised to them. The use of collective bargaining power by the developing countries is the only way out to protect their interest at WTO. The exports of India can benefit only in this way.

The growth of agricultural exports has shown that it has long run and short run relationship with its major determinants of the export price index, gross domestic product, exchange rate and domestic production of agricultural products in India. Therefore, the process of agricultural exports development in the country will be based on the nature and stability of all macroeconomic variables that are considered in this research and the policy suggestions for them are as follows:

D) Regression analysis shows that there is positive relationship between GDP and export supply of agricultural products in India. So, any increase in real GDP would have a positive impact on the growth of agricultural exports in the long run. Therefore, India provides the evidence of growth-driven exports over the sample period. The Government of India and other policy-planning bodies should devise prudential norms and policies to make the macroeconomic fundamentals of the country strong enough to absorb the external shocks thereby achieving a fast growth of real economic variables to ensure a noticeable surge in the country's exports. In this direction, increasing domestic and foreign investments in key areas and ensuring price, interest rate and political stabilities would go a long way.

Positive correlation exists between domestic production and export supply of agricultural products. Thus there is need for the Government to continue promoting manufacturing. Furthermore India has large potential in improving its agriculture sector as well as export sector. As the country has considered agriculture as the back bone of its economy, major policies are required for the agriculture sector to contribute more in the economic growth including agricultural exports. The government should support farmers through training agriculture. Extension services, hard and soft infrastructure, subsidies, agricultural inputs and etc. Proper execution and governance of agri- development policies and etc. go a long way in increasing of productivity as well as exports.

D) Regression analysis shows that the exchange rate has a negative impact on export supply

of agricultural products. In fact, in the era of devaluation, the authority in India used to place export as one of the foremost reasons of devaluing local currency against US\$. For India's agricultural export to be price elastic, policies that help increase the share of domestic goods in exportable commodities by the expansion of production base and that help diversification of the pattern of the export items should be prioritized. For improving the export earnings, India should adopt policies with the aim to maintain a stable competitive real exchange rate. In this direction, need is to establish a transparent exchange rate system under which the stability of the real exchange rate is achieved and maintained, and 'getting the exchange rate right' should be the essential part of the overall trade and economic growth strategy.

II) Regression analysis also shows that the Export price index and export supply of agricultural products are positively related. An examination of the coefficient of variation in the domestic and world prices shows that the domestic prices are more fluctuating than world prices. Hence there is no fear of volatility being transmitted to the domestic prices in opening up of trade. As it is seen that price policy has not been effectively implemented and that there has been an increase in trade volume of those commodities which showed a decline in the coefficient of variation in domestic prices. The external trade is more useful in reducing price instability in the domestic agricultural markets in India. Therefore a comprehensive domestic agricultural price policy and proper implementation can reinforce the positive externalities of agricultural exports in the post liberalisation era.

III) Regression analysis shows that WTO has no significant effect on export supply of agricultural products in the long run in India. But t-test proves there is significant difference with regard to effect of WTO on growth of agricultural export during pre and post WTO regime. Its reason being, the big standard deviation of agricultural exports growth before WTO than after WTO. So, the policy maker should find out the linkage of the export of different commodities in the domestic economy for stability situation on export strategy till it has positive effect on agricultural export and trade in the Indian economy.

The result of error correction model shows that WTO has positive impact on export supply of agricultural products in short run. So, this research has revealed that the government should continue the World Trade Organization policy focusing on trade, market access, export subsidies and domestic support to earn more benefits of trade with other countries.

The changing scenario of Global agriculture, especially agricultural trade in the post-WTO regime is much challenging for developing countries like India. The Indian agriculture sector as well as world agriculture are in the midst of tumultuous changes brought about by a number of internal and external factors.

Limitations

The first limitation of the study is when the unit root tests were conducted, some variables were tested as being non-stationary in levels, but they became stationary after they were transformed into First and second- differenced data. Moreover, because there was a mixture of I(1), I(0) and I(2) variables, using panel cointegration analysis may not be possible because it is required that all variables have the same level of integration. Data limitations do exist on agricultural exports in FAO website especially before 1994.

CONCLUSIONS

This research work has analyzed the growth of agricultural exports in India during pre and post-world trade organization. The review of literature has provided an overview of growth of agricultural exports across the countries and different methods used to calculate the export supply function of agricultural products. The regression model of this work has been estimated based on neo-classical trade theory. The econometrics techniques such as autoregressive distributed lag model and error correction model has been used to determine the relationship between India's agricultural exports and macroeconomic variables.

The regression model of this work has been estimated based on neo- classical trade theory. The econometrics techniques such as autoregressive distributed lag model and error correction model has been used to determine the relationship between India's agricultural exports and macroeconomic variables.

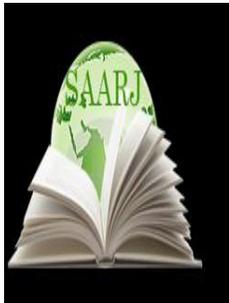

Considering quantity of agricultural export as dependent variable and macroeconomic variables such as exchange rate, gross domestic product, export price index, quantity of domestic production of agricultural products and world trade organization (dummy variable) as independent variables, an attempt has been made to analyze the growth of agricultural export in India. The results show that there exists a long-run and short-run relation between agricultural exports and its determinants and also WTO does not have a positive effect on agricultural exports in the long run but it has positive effect on it in the short run, also paired t-test has confirmed that WTO has positive effect on growth of agricultural exports in India.

Agricultural exports policy of the government should be accompanied by such policies by which it would reinforce the spread effects and neutralize the backwash effects. This calls for a synergetic approach, integrating and coordinating the policies pertaining to macroeconomic variables towards maximizing the benefit of world trade organization. Such empirical studies would provide the most needed base for policy direction.

**IDEOLOGICAL AND IDEOLOGICAL ISSUES OF PROTECTING THE
 INTERESTS OF THE PEOPLE OF UZBEKISTAN IN THE PERIOD OF
 NATIONAL GROWTH**

Khudayberdiev Khursand Khudayberdievich*

*TTSU,
 Termez, UZBEKISTAN

ABSTRACT

The scientific article contains theoretical and practical views on the issue of ensuring the ideological and ideological security of the Uzbek people in the transition from national revival to the national upsurge. Concepts are given a philosophical definition and their current development trends are shown. Thus, the ideas of ancient philosophers on a systematic understanding of the issue of interest helped to create a unique philosophical paradigm about the "Benefit" of the philosophers of the XVIII century.

KEYWORDS: *Security, Moral Security, National Ideological And Security, Public Interest, State Interest.*

INTRODUCTION

Over the past 30 years, the people of Uzbekistan have come a long way, consisting of endless struggles and hard work. This path, by its very nature and content, is: the attainment of independence, the struggle to preserve it, and the longing for dependence by some; maintaining peace and igniting the flames of civil war by enemies; justice and injustice; democracy and bureaucracy; finding a bite of honesty and amassing wealth with dishonesty; to think of the fate of the ordinary working man and to dishonestly pursue them in their own interests; adoption of laws and non-enforcement; disobedience to the people's grievances and increased aspiration for power; the rise of corruption in all spheres and the failure to combat it; the destruction of the people's trust in the government by their actions; lack of unity between word and deed; limited access to higher education for gifted ordinary children in higher education as a result of growing corruption in the education system; rising unemployment from year to year; the rise of ignorance of reality, arrogance, laziness, and bigotry, especially "god-making" of leaders; the deterioration of good neighborliness and, finally, the launch of comprehensive reforms to radically change the

economic, political and spiritual situation in the country in the interests of the people(Kuzmina, 2018; Song & Lin, 2010; Survey & 2008, n.d.).

Because if such conflicts are not prevented, the independence of our country will be lost. Because the effective use of such a country with rich natural resources (underground and aboveground), favorable weather conditions, skilled cheap labor, hardworking, educated children is in the interests of the most developed countries in the world.

Methodology

Therefore, countries such as Russia, China, the United States, Germany, Britain, France are trying to attract Uzbekistan to their interests by any means, means and methods.

So, what is the benefit? A number of philosophers who lived in Ancient Rome were among the first to answer this question and tried to understand and explain the role of interests in the life of society and the state. As a result, in ancient times, ideas were formed that understood the existence of interests and needs of people working in various spheres of life in relation to social institutions and norms, the decisive role of their satisfaction. For example, Aristotle "believes that the highest goal of human life is prosperity, and that it is achieved by satisfying one's own interests is the result of the need and emerging interests in society through causes" [1.371]. Thus, although ancient scholars did not define the concept of "interest" as a philosophical category, they also had an idea of its origin and formation, its role in social life(Bendini, 2013; Hench, 1998; Schools, 2010).

Thus, the ideas of ancient philosophers on a systematic understanding of the issue of interest helped to create a unique philosophical paradigm about the "Benefit" of the philosophers of the XVIII century. For example, the French philosopher Paul Henri Golbach, in his book On the System of Nature or the Laws of the Material and Spiritual Worlds, said: "Interest is the idea of one's own happiness according to one's character and ideas; are things that one of us thinks are necessary for our happiness. So the conclusion that follows from this is that no human being is completely deprived of his or her interests. For example, the interest of the trader is to accumulate wealth. Thus, the object that binds everyone to the idea of their happiness is called interest "[2.311], and another French philosopher, Claude Adrian Helvetius, in his book On Man, His Mental Ability and Upbringing:" Interest is the basis of all our thoughts and views. "[3.346.], - described and described. It is clear from this that they tried to solve the problem of the object and subject of interest in terms of the human factor living in the existing reality.

Main part

Thus P. Golbach, R. Diderot, K. Helvetius and others saw in the interest the real foundations of morality, politics, social order. In our view, it is not surprising that when they understood the nature of interests as a leading activity, they suddenly came to the correct conclusion that "interests change people's lives".

The famous Uzbek poet and thinker Alisher Navoi (1441-1501), thinking about the driving forces of history, believed that material interests and reason are the main factors determining the actions of people. In doing so, he argues, the first factor prevails, with some rare exceptions. Thus, he said, people's actions are determined by material gain, not spirituality concluded. In one of his works, Navoi says: "People do not act unless they feel the need. People act out of self-interest, striving for something that benefits. Know that a person does not do what is the result. "

Although he was not an economist, Navoi was well aware that material gain was a decisive factor in the actions of not only individual people but of society as a whole. He said: "Satisfaction of the people is a blessing that solves any other complex problems. According to him, it is possible to conquer the whole world "[4.26].

Many such examples can be cited from the history of social philosophy. However, today we are talking about ensuring the national interests of the people of independent Uzbekistan, the protection of their ideological and ideological security, prepared by a group of Uzbek scholars in the book "National interests and management responsibilities. Principles of Awareness and Vigilance ": "Interest is aimed at changing the objects of existence, bringing them closer to the needs of the social subject, that is, it acts as an active force that encourages people to consciously work to change beings. That is why interest acts as the motive of human activity interests arise in the process of practical activity of people and under its influence act as a necessary link in the transition of objective and subjective things. Both the reflection and change of social existence in the mind always takes place through interests "[5.12.], In the book " Legitimacy of Reforms "by H.F. Khaydarov: " By interest we mean the subject's satisfaction with the conditions, that is, his various needs we understand the set of attitudes and activities. "[6.49.], although they are correct in terms of the rational essence of these ideas, but they do not clearly define it as a philosophical category.

To clarify the matter, it is first necessary to know what the lexical meaning of the word means. In this regard, the "Explanatory Dictionary of the Uzbek language" states: "Manfaat [Arabic - profit, income] - means material, spiritual, physical and other (visible) benefit, naf" [7.540.]. Based on this word, the concepts of "Beneficiary - has an interest in something, who is interested", "Beneficial - has an interest, has a benefit; useful", "Beneficial - a pursuit of personal interests", "Uninterested - an interest, useless, useless, useless" They are deeply rooted in the language and way of thinking of the Uzbek people in their daily lives. Of course, this lexical concept does not claim a philosophical definition. However, based on the meaning of the word, it can be philosophically defined as follows. Benefit is a system of activities carried out by an individual, person, people, nation, people, state and society for the benefit of any material, spiritual, physical and other benefits, based on the requirements of the necessary objective and subjective factors in reality(Fangel, 1984).

Interests can be divided into several types depending on the object and subject, place in space and time, mode of operation, satisfaction of needs, moral content, place in politics, social structure of society and other aspects. Among them is the issue of national interest. Because as long as there is a social group, association, organization, national statehood, which represents their legal unity, the national interest also exists as a system of activities of individuals, communities, states, which have their own ontological and epistemological nature.

Finding an answer to the question of what the national interests of the Uzbek people are reflected in the transition from national revival to national uplift is one of the most pressing issues. In this regard, the President of the Republic of Uzbekistan Sh.M.Mirziyov said: "By national progress, we mean the development of our country, raising the living standards and quality of life of our people to a higher level in all respects. No matter what reforms, what changes, what new projects we are implementing today, they are all aimed at a single, great goal. And it is to please our hard-working, hard-working, noble people, to justify the trust of our compatriots, who are courageously overcoming all the trials of life, to alleviate their burdens. "[8.] Based on the

rational essence of these views, the concept of "national interests of the Uzbek people" can be philosophically defined as follows.

The national interest of the people of Uzbekistan is a system of activities carried out in order to gain some material and spiritual benefits, based on the requirements of the necessary objective and subjective factors arising in the existing reality in accordance with their national and universal characteristics. At the heart of this are a number of moral and spiritual qualities of the Uzbek people, such as diligence, honesty, gratitude, sharing and justice. When the national interest is not based on the high moral and spiritual qualities of the nation and universal moral norms, it loses its moral basis and leads to a weakening of the implementation of the principles of legitimacy in domestic and foreign policy. This, in turn, ends up disrupting the system of national interests.

In the context of globalization, efforts are being made to ensure the national interests of the people of Uzbekistan, firstly, in the broadest human interest, and secondly, in the relatively narrow sense, the interests of the state, by ensuring their ideological and ideological security (BOBUR et al., 2015).

As the head of our state Sh.M.Mirziyoev said: "Today, the main goal of our life, embodied in our Constitution, is to ensure the full protection of human interests. In order to ensure the interests of the people, first of all, it is necessary to communicate with the people, to know their concerns, aspirations, problems and needs. "[9.114] Based on this idea, in order to know the interests and needs of the people, the President Extensive dialogue with the people has been established at the initiative of the people. "People's receptions" have been established in all districts and regions. In the past three years, from March 2017 to 2020, the virtual reception of the President received 3644701 applications from citizens. mutual compassion 3592502 considered [10].

Governmental structure

The first direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to establish open dialogue with the people. The basis of ideological and ideological security in this area is that the communicating official does not lie, does not promise impossible things, acts at the level of authority given to him. It is clear from life experience that the official's "filling the sheep of the people with false promises" has always led to ideological confusion and paved the way for the formation of ideological consciousness, such as a confident view of state power.

The second direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to protect their interests in housing, food, clothing, etc., which are necessary for their vital needs. Thousands of houses are being built in this area, and significant work is being done to meet their needs for food and clothing. For example, in 2019 alone, 17,100 houses were built in rural areas, 17,600 in cities, and a total of 34,700 cheap and comfortable houses [11]. Ensuring ideological security in this area is primarily seen in the organization of work to provide housing to needy, low-income families, lonely disabled elderly people. Bordiu, who actually owns several houses and fraudulently bought a cheap house in order to profit from the sale of the house, is also one of the ideological perverts. Because they are first and foremost ordinary people, and then "self-interested people" who put their personal interests above the national interests of the state. Such people are "secular-materialist" who ideologically strike at the roots of the response of our internal national interests.

The third direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to ensure the interests of people in entrepreneurial activities in accordance with the requirements of a socially oriented market economy. As the head of our state Sh.M.Mirziyoev noted: "Entrepreneur feeds not only himself and his family, but also the people and the state. Obstruction of business development is considered to be an obstacle to the state policy, the policy of the President "[12.148.]. So, it is an objective necessity to fully protect the interests of entrepreneurs, who are the "driver" of the development of our country, to ideologically and ideologically protect the policy pursued by the state in this regard. After all, today a lot of work is being done to protect the legitimate interests of entrepreneurs. Among the arsenals of ideological protection of the entrepreneur from the attacks of the "hidden economy" are the values passed down from ancestors to generations as a spiritual heritage. For example, not to overestimate the value of the goods, not to weigh, not to engage in usury, to fulfill the contract on time, to help the widows from the proceeds, and so on.

The fourth direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to bring up children who are committed to the noble idea that "the interests of man are paramount." Because, "... our children will either bring us anxiety or benefit tomorrow" [13.91.].

It is well known that in today's world, the conflict of interests for the possession of material and spiritual resources is becoming more and more dangerous. At the same time, the main focus is on the ideological struggle to capture the minds and hearts of more than 2 billion young people in the world. Young people are becoming victims of conflicts of interest. That is why international organizations with great financial resources are trying to attract the youth of Uzbekistan, who make up about 60% of the population, to various conflicts of interest in the world under various pretexts (training abroad, employment, etc.).

The fifth direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to ensure the ideological and ideological security of anti-corruption work, which is a hidden force that prevents the full realization of human interests. In this regard, President Sh.M.Mirziyoev said: "Unless all segments of the population, the best specialists are involved in the fight against corruption, all members of our society will not be able to achieve our goals without being vaccinated with the "honesty vaccine". We must move to early prevention of corruption before dealing with its consequences. "[14] This is the worst ideological violation in the implementation of work in this area, which is the fact that in its past and present activities, officials directly or indirectly involved in corruption in large-scale meetings and gatherings on the fight against corruption.

CONCLUSIONS

In conclusion, it can be said that the main national interest of the people of Uzbekistan is to live a free and prosperous life in an independent, free and prosperous homeland. The common national interests of our country today and the commonality of national ideas and ideologies as a matter of law. "Most importantly, everyone living in our country, every family must feel the effects of our reforms in their lives today. To do this, leaders at all levels must work to ensure the vital interests of every citizen, without chasing interest, numbers, paper. Then our enlightened elders, honorable fathers and mothers, honorable women, dear children, great-grandchildren, and all our multinational people will be pleased with us. "[15]

THE DEVELOPMENT OF EFFECTIVE WAYS TO IMPROVE REPRODUCTIVE HEALTH OF MARRIED STUDENT GIRLS

Akmal Abduganievich Taniberdiev*

*Associate Professor, PhD,
 Department of “Methods of Physical Culture and Theory”, Gulistan State University,
 UZBEKISTAN

ABSTRACT

The article discusses the theoretical aspects of the study of reproductive health: the essence of the concept, the factors that negatively affect reproductive health, the current state of reproductive health of students, the means to improve it and the social consequences. Research on the sociological study of reproductive health of students of Gulistan State University was conducted. The theoretical conclusions of the study were aimed at shaping the reproductive culture of young people, which allowed developing a number of proposals and recommendations on various social services that can be provided by higher education institutions.

KEYWORDS: *Health, Reproductive Health, Contraception, Healthy Lifestyle, Students, Abortion, Gynecologist, Psycho-physiologist.*

INTRODUCTION

Relevance of the topic

Since the beginning of the 21st century, the reproductive health of student youth and its social consequences have become one of the most pressing issues. In society, students represent a special social group characterized by unique living conditions. The need for in-depth study of students’ health is related to the prevalence of dangerous diseases among them, difficulties in psychophysiological adaptation to the conditions of study in junior courses, the large number of subjects taught and the need to remain active in acquiring professional

Knowledge

The aim of our study is to identify, analyze and develop measures to improve the knowledge of students in higher education about reproductive health. Reproductive health of students depends on the influence of socio- economic, biological, environmental, medical and organizational

factors. All of this calls for a comprehensive approach to addressing maternal issues, educating young people on sexual issues, and shaping positive attitudes toward birth and family formation (including knowledge of contraception, abortions, infections, etc.). Studies show that most female students in higher education now start getting married in the early stages of their studies. This situation makes it necessary to provide them with specialized knowledge in the field of reproduction. Student health is a large part of the state's reproductive potential. Adverse conditions negatively affect the health of all newborns. At this point, the need to protect reproductive health, which is a new direction in the development of demographic policy, manifests itself. The reproductive health status of the population is the most important component of the socio-demographic development of a country, which determines the level of development of society as a whole. State support for research to improve the reproductive health of citizens of Uzbekistan, the introduction of modern methods and technologies, improving the medical knowledge and medical culture of citizens, including students, training in the field of reproductive health, the realization of their reproductive rights. The main directions for them are medical and social, as well as psychological assistance to the Republic of Uzbekistan Law of the Republic of Uzbekistan "On protection of reproductive health of citizens" (March 12, 2019, No. URD-528). The population of the Republic of Uzbekistan, which exceeds 34 million, has a 33.6% share of young people; so many demographic problems are determined by the attitude of young people to childbirth, methods of contraception and their reproductive health. The period of puberty is much higher than before; the question arises as to how trends in sexual, reproductive and family behavior of young people in sexual activity meet the criteria of a —healthy lifestyle and how these criteria are actually reflected. In January-June 2019, 104.2 thousand marriages were registered in Uzbekistan, of which 16.0 thousand ended in divorce. One of the main reasons for this is the lack of reproductive culture. Early onset of sexual activity, harmful habits and defects in sexual education are clearly observed to be inextricably linked with the health of the population. Often, a girl who does not have a confident idea about the work of a gynecologist, receives information

—on the street, is ashamed to turn to a specialist with complaints and questions. Early onset of sexual life, low level of health, lack of adequate culture of the population in the field of family planning lead to an increase in abortion and premature birth. The quality of services in this area in the health care system does not fully meet the standards. Quality advice on family planning, high medical care reduces the chances of unwanted pregnancies and abortions. This allows young women to maintain their reproductive health. According to statistics, prevention of pregnancy in women over 19 and 35 years of age, adherence to the age range of 2-2.5 years between births can reduce maternal mortality by 2 times and infant mortality by 4 times. Such data confirm the imbalance in the number of births (815.9 thousand) and deaths (155.0 thousand) in Uzbekistan in January-December 2019, the need to introduce appropriate services. In this regard, there is a need to create state programs for priority research in the field of reproductive health. The study of students' attitudes towards their own reproductive health is receiving serious attention.

II. THE MAIN FINDINGS AND RESULTS

The attitude of students of Gulistan State University in the areas of

—Development of women's sports,

—Primary education, sports and educational work and " Physical Culture & quot; to reproductive health was studied with the help of social research

In conducting it, the questionnaire method was used. The main objective of the study was to determine students 'attitudes toward reproductive health and their knowledge of reproductive health. Married students aged 18 to 26 years were selected as the object of applied research. In the study, students were divided into two groups according to their areas of study: students studying in the field of

—Development of women's sports and

—Physical culture to participate as respondents in the experimental group,

—Primary education, sports and educational work to participate as respondents in the control group. The results of the survey allowed us to conclude that students have a positive attitude to their health in general. So, —Do you know about reproductive health? 89% of respondents answered

—no and —average to the question. The majority of the control group respondents

(85%) said —average or —no, while the experimental group students had the same attitude, but their number was slightly higher (90%).

—How many times a year do you visit specialist doctors? The answers to the question are as follows: at least 48% of the representatives of the experimental group visit medical institutions. Of the control group, only 27%. In addition, the majority of respondents in the second group (69%) chose the —when needed option. Thus, respondents in the experimental group were more concerned about their health and were more closely monitored by physicians than those in the control group. The students in the pilot group asked, —Which doctors have you visited

recently? 48% answered —gynecologist, 14% - —gastroenterologist, 13% -

—endocrinologist, 6% - —cardiologist and another 50% - —other doctors. These results suggest that representatives from the experimental group surveyed visited physicians directly involved in sexual health protection. Representatives of the control group who answered the same question gave the following answers: 24% - —gynecologist, 20% - —cardiologist, 14% - —allergist,

11% - —gastroenterologist, 11% - —endocrinologist, 3% -

—urologists and 51% —other physicians preferred the answer. These figures suggest that members of the control group are less likely to have sexual health control than those in the experimental group.

Respondents were asked —What types of health do you know? when asked, the responses of the experimental group participants were as follows: 80% - —reproductive, 100% - —physical, 97% - —mental, 65% - —social. The following results were obtained in the experimental group: 50% - —reproductive, 100% - —mental, 97% - —physical, 30% - —social.

Thus, the results show that almost all of the respondents surveyed knew about physical and mental health. But among them, only 47% and 28% chose

—reproductive and —social health responses, indicating that many students are unaware of these types of health. Most of the students in both groups asked, —Do you think reproductive health...? answered the question incorrectly. —Reproductive ability was 75% and 86%, respectively, in the experimental and control groups that responded. 8% of the experimental group participants and 14% of the control group respondents chose the wrong answer. Responses from respondents (94%) show that the majority of participants believe that diseases that pose a risk to reproductive health are sexually transmitted infections. Most of the students in both groups asked, —Do you think reproductive health...? answered the question incorrectly. —Reproductive ability was 75% and 86%, respectively, in the experimental and control groups that responded. 8% of the experimental group participants and 14% of the control group respondents chose the wrong answer. Responses from respondents (94%) show that the majority of participants believe that diseases that pose a risk to reproductive health are sexually transmitted infections. The study found that a large proportion of students in both groups (56% in the experimental group and 43% in the control group) had insufficient awareness of youth about reproductive health. To sum up, the majority of students admitted that they wanted to know more about reproductive health problems.

—Is anemia a reproductive disease? The answers to the question indicate that there is incorrect information. Thus, while 14 percent of the experimental group representatives chose a —yes answer, 17 percent of the respondents in the control group chose the same option. The experimental group asked the students, —How do you feel about early marriage? analyzing the answers to the question, it is possible to distinguish serious differences: 58% of respondents are —absolutely against, 19% - " positive & quot;, 17% - —do not know and 6% - —good. The proportion of responses from female students who participated as respondents in the control group varied slightly: 37% - —positive, 34% - —absolutely against, 23% -don't know and only 6% —good. —What is the best age to get married? In response to the question, participants in both groups answered the question openly. The responses of the experimental

group respondents were placed in the following sequence: 47% chose —19-21 years old, 44% chose —16-18 years old, and 6% chose —other youth option and 3% chose 13-15 years old. In the second group, the following data were obtained: 57% - —16-18 years old, 26% - —19-21 years old, 14% chose the —other age option and only 3% answered —13 to 15 years old. The answers to the last two questions showed that the female students who participated as respondents in the experimental group were strongly opposed to early sex. —19-21 years has been confirmed as the optimal age for marriage. The second group of students demonstrated loyalty to their views, choosing —16-18 years old as the optimal age for marriage, with the answer —not opposed to early marriage at all. It is also worth noting the positive knowledge of students in the field of reproduction: all participants asked —Do you think a woman should prepare for childbirth? to the question, most students (94% in both groups) believe that it is necessary to prepare for the birth of a child for at least 1-2 years, and only 6% say that it is not necessary. Also, —What do you do in your free time? interesting results were obtained as a result of studying the answers to the question. Approximately the same numbers of representatives of both groups (54 percent) were involved in different types of sports.

III. CONCLUSION

The study of student reproductive health and its social consequences led to the following conclusions. Human reproductive health includes not only physical condition, but also financial

status of life, attitude to family and marriage, birth of a healthy child, sexual health, awareness of all aspects of family planning and the main means of preparing for marriage. Students are a special socio-demographic group of the population of the Republic of Uzbekistan in need of psychological and social assistance. The issues of formation, maintenance and strengthening of reproductive health of more than 449.2 thousand students in our country have a special social significance, because the health of the nation depends on the health of the population of this group. The study found that the majority of female students have little knowledge about reproductive health (10%). 94% of respondents are aware of only —popular infections of sexually transmitted diseases, while only 50% of students are aware of the remaining diseases. Although both groups positively assessed their health (TG 89%, NG 85%), the answers to other questions showed that students majoring in —Physical Culture and —Development of Women's Sports care about their health. Thus, 69% of female students in this field seek medical help only when necessary, 48% do so at least once a year, and 19% do it every six months. It should be noted that students in the field of —Physical Culture, and —Development of Women's Sports often turn to doctors for the maintenance and improvement of sexual health (experimental group 50%, control group only 25%).

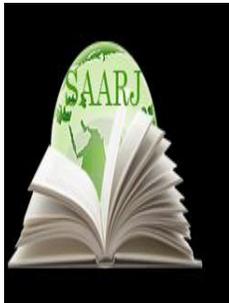

In addition, gender issues are more important among the first group (6% of the experimental group, 33% of the control group answered that this topic is not raised at all) and many parents talk to their children about reproductive health (56% in the experimental group, in the control group) 31%).

THE USAGE OF ETHNOGRAPHIC TERMS IN LITERARY SPEECH

Yusupova Dilnoza Uktamaliqizi*

*Teacher,
Interfaculty chair at Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

This article deals with the use of ethnographic terms in artistic discourse, with examples of works of art used by our national ethnographers. Ethnography is a science that studies the culture of these peoples. And the basis of it is ethnographies. Ethnography these are words that belong to the culture, tradition, mentality of a particular people. They also have their own history. Uzbek is a language rich in ethnographies and has a long history. When the Uzbek ethnography is used in artistic works, it clearly shows the culture of that period. Although additional innovations have been introduced to our customs with the passage of times, however, our traditions have never lost their nationality.

KEYWORDS: *Ethnography, Mentality, Sister-In-Law, Brother-In-Law, Culture, Custom.*

INTRODUCTION

As we know, customs are among the important signs that distinguish peoples from each other. The first president of our country I. A. In his work “High spirituality is an invincible force“, Karimov spoke about the factors that shape and influence our spirituality: “of course, the spirituality of any nation cannot be imagined without understanding its history, specific customs and traditions, vital values”. Therefore, it is permissible for a charismatic person to know the culture, history, customs, traditions of his people. And for this, we believe that first of all it is necessary to have knowledge of the science of ethnography.

Ethnography is a science that studies the culture of these peoples. And the basis of it is ethnographies. Ethnography these are words that belong to the culture, tradition, mentality of a particular people. They also have their own history. Uzbek is a language rich in ethnographies and has a long history. When the Uzbek ethnography is used in artistic works, it clearly shows

the culture of that period. Although additional innovations have been introduced to our customs with the passage of times, however, our traditions have never lost their nationality.

The culture of each people reflecting their nationality should be inherited by the future generation. The problem is, can we deliver national ethnographies to the next generation in a pure, clean way? It would not be a mistake to say that we are having some problems in this regard today. For example: "hello The Bride". Bride Hello this is one of the most ancient traditions of Uzbeks and the girl who stepped into the new Dynasty First of all thanks to Allah and then gives greetings to the owners of this house, relatives, sheep and troops by expressing respect. Bunda is sung by older women "Yor-yor". Songs of yor-yor, which are characteristic of Uzbeks, are given in many works in different variants. In particular, in the works of sharp Hoshimov "weddings are blessed", "Yor-yor", "Chimildiq" by ErkinKhoswaktov, "the uprising of Brides" by Said Ahmad, the Uzbek wedding ceremonies were revealed by the personages.

In addition, we can see that in the work "people walking in Aydin" by TağayMurad applied several ethnographies that reveal Uzbek national traditions. A wonderful example of "Gelinsalom", which is one of the traditions characteristic of Uzbek weddings, is three:

Soybean husks,
Dombirasin sang,
Married his sons,
Hello my mother-in-law...

In the work "people walking in Aydin" "there is also interesting information about the holiday" Navruz", which is our national holiday. In it, various signs are mentioned, depending on what day of the week the holiday "Navruz" will come, for example, the Navruz that comes on Monday will be good, the fault, the shortage of food, if it comes on Tuesday, there will be no hunger, there will be good flirting, there will be an increase in the number of Thieves on Wednesday, bloodshed for the staining, death, orphans are noted to be rare.

It is also worth noting that in the work "people walking in Aydin" by Tağay Murad we can also meet about the game "Basmalim", which is one of the Uzbek folk dances. In this game, national values, traditions, customs are skillfully described.

In addition, ethnographies associated with the names of individuals have also been used in many artistic literature.

A. In the work of Qadiri "The Last Days", many personal names were used.

For example, in the game the term kelinoyi was used with the term "owner".

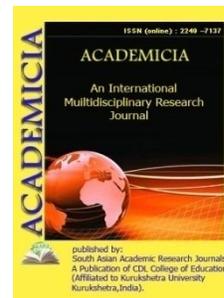

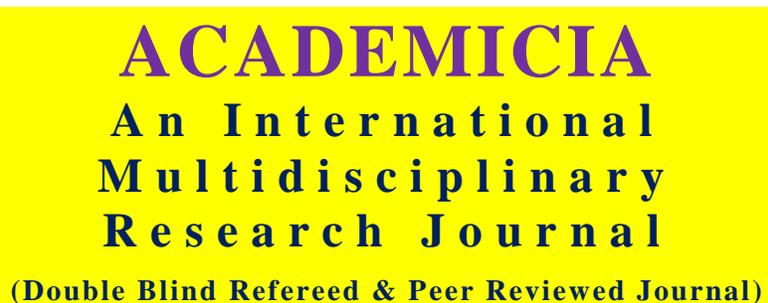

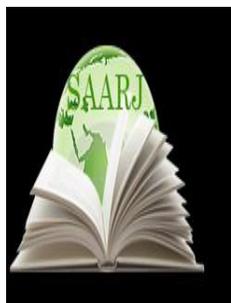

Z. M. In the work of Bobur, the term "pochcha" was used as "yazna".

The use of ethnographies in artistic works is a skill. Because bunda folk ethnography, along with glossing the work, also serves to shed light on the mentality of the nation.

In place of the conclusion, it is worth noting that the study of ethnographies united under the name of a similar ethnographic lexicon is significant in the study of national customs and values. In turn, traditions are a sign that can manifest the peculiarities of a particular people.

A MODEL FOR IMPROVING STUDENTS ' TECHNICAL CREATIVITY COMPETENCES ON THE BASIS OF ELEMENTS OF ROBOTICS

O. A. Tuychiev*

*Independent researcher,
Bukhara State University,
UZBEKISTAN

ABSTRACT

In this article, information will be given to secondary school students on the possibilities of using robotics in their teaching and extracurricular activities, the importance of physics in the development of technical creativity competences. Also, the model of improvement of students' technical creativity competences on the basis of elements of robotics, model components, model through the use of education in the educational process, the information on the opportunities for the development of students' technical creativity competences is covered.

KEYWORDS: *Robotics, Physics, Educational Tool, Integration, Electronics, Programming, Compensation*

INTRODUCTION

The use of elements of robotics in the organization of the educational process in secondary schools, in increasing the interest of students in science, will enable the students to have competitions on new areas of polytechnic education methodology and theory. The special design of robotics is integrated with compartments, educational and educational processes related to the training of assembling and modeling simple robots from training manuals. In our republic there are some tasks that need to be carried out in this direction, some problems that need to be solved. Initially, it is necessary to establish national educational literature intended for students in this direction. It is also required to carry out relevant tasks, systematic work to solve the need for personnel working in this area. In addition, the necessary tools, equipment for training are mainly produced abroad. For the development and popularization of robotics, it is necessary to carry out the design and modeling of robotic devices created by engineers with the participation of students, to demonstrate robotics devices in various competitions and competitions held with the participation of students at the regional, Republican level.

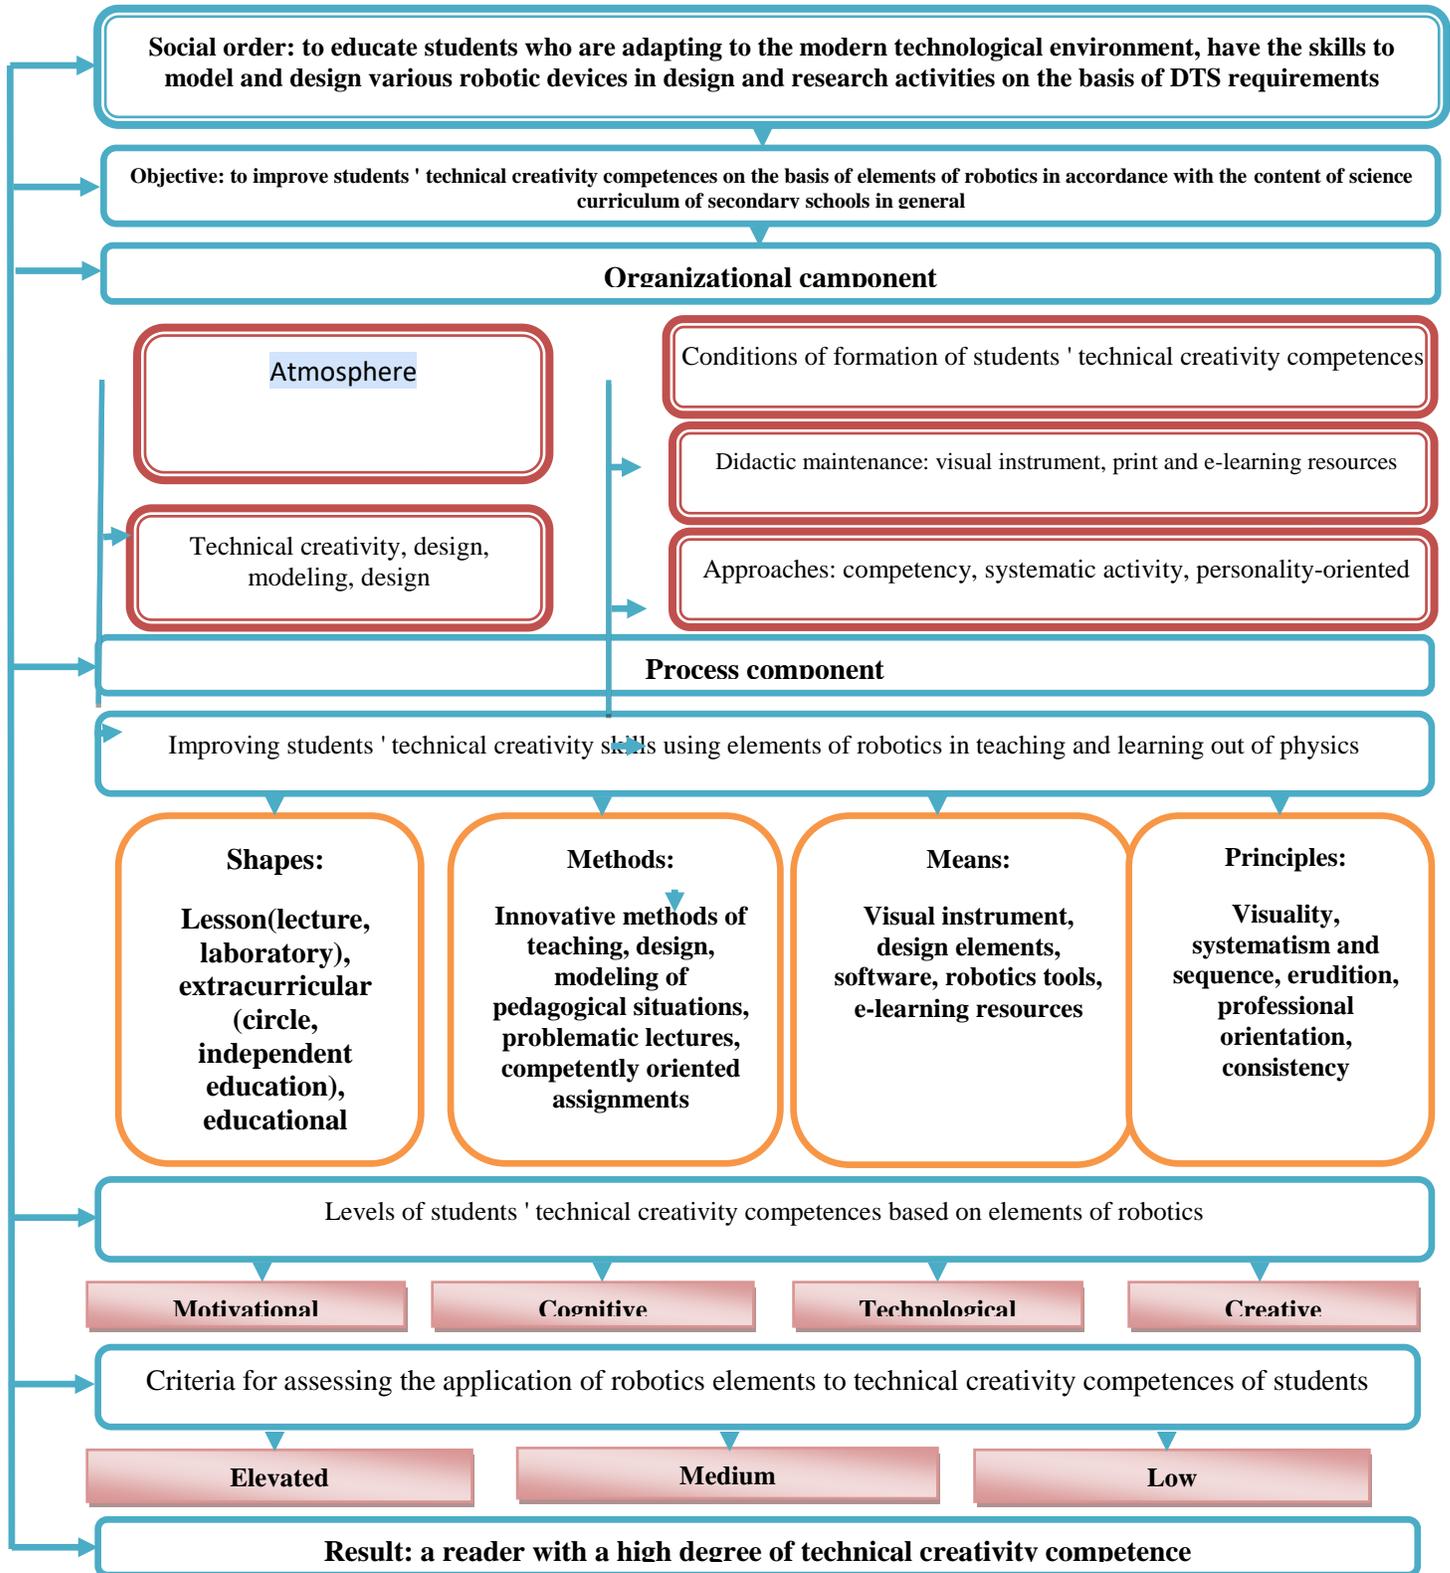

It was found out that there are the following problems and challenges facing secondary school students in the use of robotics in their classroom and extracurricular activities: 1) socio-pedagogical level: the extent to which modern robotechnical tools are oriented towards vocational orientation of students in secondary school due to the demands of the local industry for the sustainable growth of the potential of; 2) at the scientific and pedagogical level: the use of robotics in pedagogical science with the possibility of introducing the elements of robotics as teaching materials and tools of the directions of polytechnic education into the content of the programs of the subjects taught in secondary schools to implement the practice of its initial study in the educational system; 3) at the scientific and methodological level: primary knowledge and experience in robotics teaching materials and tools intended for students to form as a required component of the content of polytechnic education in the subjects of physics departments, as well as to develop a methodology for teaching robotics for the organization of the educational process, the formation of educational and methodological provision.

The content of polytechnic education for young people should be enriched, first of all, by the creation of new techniques and technologies used in various spheres of society, by studying the scientific foundations of their application in production [1, p. 9] . Robototechnics is one of the important areas of modern production. It is of particular importance to study it because of the breadth of the scope of implementation of this sphere, the development and improvement of the technical means of the sphere, as well as the breadth of the scope of their impact on the life of society in the future. Elements of robotics should become one of the necessary tools for students of general secondary schools to acquire Polytechnic knowledge [2, p. 35]. Because it becomes one of the integral parts of the future life of the growing younger generation.

At present, a model for the introduction of robotic elements into the educational process as a component of polytechnic education in Physics in the development of technical creativity competences of Secondary School students in general has been developed. The sequence of implementation of the technical creativity skills of students in the model using the elements of robotics, we will cover in detail its components.

Before we touch on the ideas and feedback on improving students ' technical creativity competences on the basis of elements of robotics, we will try to enlighten the content and essence of the concept of competence as well as the types of competences in physics.

Compensation-knowledge, skills, qualifications, views, values and personal qualities the ability to manifest or influence the qualification or the appearance of knowledge, skills, qualifications, values, other personal qualities, positive results in activities [4, p. 124].

1-graph. A model for improving students' compensation for technical creativity on the basis of elements of robotics

To the components of the compensation-efficiency, flexibility, achievement, success, understanding, result, accuracy, texture, property, quality, quantity, etc. are included.

The competence of a student in physics is the ability to use his / her knowledge, skills and skills in solving practical and theoretical issues, to understand scientific innovations, and to apply them in practice, which he / she encounters in his / her daily life [6, p. 5].

As a social order in the model, it is envisaged to educate students who are adapted to the modern technological environment, have the skills of modeling and designing various robotic devices in design and research activities on the basis of DTS requirements (Figure 1). The model aims at improving students' technical creativity competences on the basis of elements of robotics in accordance with the content of science curriculum of secondary schools in general.

As organizational components, students' technical creativity includes improving the content of the competences, technical creativity, modeling, designing, design, the conditions for the formation of students' technical creativity competences, didactic procurement tools: visual instrument, print and e-learning resources, approaches: kompetential, systematic activity, personality-oriented approaches.

Improvement of the content of technical creativity competences of students implies the introduction of innovative techniques and technologies in the transformation of this modern technological environment, the acquisition of modern scientific and scientific-technical knowledge in physical and extracurricular activities.

Technical creativity is a type of activity that serves to ensure the strength and perfection of the knowledge acquired by the educators, the formation in them the qualities of an active and independent thinking person, the development of intellectual abilities.

Design implies the development of the overall design of the workpiece. At the initial stage of the design, the goal to be achieved or satisfied is set. Tasks are defined in order to achieve the goal. When determining tasks, it follows from the available opportunities and conditions [5, p. 47].

The following can be included in the conditions of formation of students' technical creativity competences. It provides students with information on the history of the development of robotics and its prospects, the importance of the use of robotic systems in the modern technological environment, modern solutions and technologies in the field of robot design and programming.

Software-students use S++, Python, C# applications in the design and construction of various robotic devices. About these programs they will have enough knowledge and practical skills in the lessons of "Informatics".

Robotics tools include-Robokids, Lego WeDo, Arduino kits.

Electronic educational resources are textbooks and manuals, electronic copies of methodical manuals, electronic textbooks, teaching aids for virtual laboratories, tables, presentation materials, etc.

The process component includes the form, methods, tools and principles of teaching. Detailed information on the method of teaching about the organizers of this complex is given in the literature.

We will dwell on the motivational, cognitive, technological, creative levels of the formation of students' technical creativity competences on the basis of elements of robotics.

1) motivation – to ensure the meaningful communication of the educational process in the lessons and extracurricular activities of robotics; to establish a competitive environment, to create creative teams of educators, to direct their group activities to innovative solutions in the field of modeling and designing robots;

2) to know the specific characteristics of the cognitive – robotics elements, to be familiar with the diversity of their types, to study the cybernetic models of robots and to have the skills to evaluate the scientific basis, prospects of development and application in the Society of their elementary base activities;

3) formation of practical skills in the field of technological – technical modeling and design; development of technical culture in the field of robotics and the use of services of the robotic technological environment;

4) Creativity – mastering the elements of robotics as a condition for its adaptation to the modern technological environment and applying them in the later stages of education, as well as directing them to the profession for the selection of engineering and technical specialties in professional activity.

We give an idea of the high, medium, low evaluation criteria for the introduction of robotics elements into the technical creativity competences of students of the model.

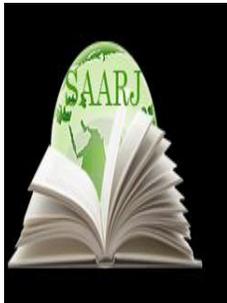

Criterion (Greek criterion – a tool for reasoning) - the basis for the classification of the system's development, the main indicator of the success of activity [4, p. 125]. The criterion is the main sign of the observed object, on the basis of which any assessment, determination or classification of something is carried out; the scope of the review, the evaluation of any phenomenon.

Achievements in various fields of Science and technology, which contribute to the development of modern robots to students: applied mechanics, electrical equipment, industrial electronics, practical optics; creation of new composite materials; development of technologies based on biomaterials, including 3D and 4D technologies; development of consciousness based on neurocomputer interface systems; improvement of sensors, biosensors of various types; development of robotics imaging technologies, development of navigation; to visually demonstrate the understanding and understanding of the world by the robot, improve programming and information technologies, develop virtual technologies; develop compartments on the creation of artificial intelligence systems and others. They will be provided with sufficient knowledge of the economic, ergonomic, socio-political and psychological aspects of the creation of robotics devices in the classroom and extracurricular activities from physics.

TECHNIQUES OF TEACHING MATHEMATICS

Akbarova Sevarakhon Khusanboy Kizi*

*Teacher,
Faculty of Physics and mathematics,
Department of Mathematics,
Fergana State University,
UZBEKISTAN

ABSTRACT

Mathematical methods and techniques of its study. The study of this science is carried out using the methods developed by scientists. The effectiveness of the lessons and methods of teaching, developed on the basis of these methods, are given. Processes are formed as laws, and their observance improves thinking and prevents gross errors in the process of complex cognition. The process of learning must go through the logic of thinking. The object of logic is to determine the correctness of the thought process in which the object of comprehension and reasoning are analyzed. Logic is a weapon and it helps to know things clearly.

KEYWORDS: *Mathematics, Methodology, Pedagogy, Algorithm, Programming, Theoretical Research.*

INTRODUCTION

Over the past 10 years, the teaching of mathematics in our country, especially in secondary school, especially in the primary education system, has undergone significant changes in terms of scale and importance. Especially after the independence of our republic, the adoption of the Law on Education and other decrees is a clear proof of this.

History is the true educator of the nation. The deeds and courage of our great ancestors will revive historical memories, form a new worldview, and become a source of historical and moral education and lessons. In the history of Central Asia, there have been many great figures who embodied political consciousness, moral courage, religious worldview and encyclopedic knowledge.

Didactics is a branch of pedagogy that develops the theory of teaching. Didactics is derived from the Greek word "didacticos", which means teaching, learning. In the Near and Middle East, such thinkers as Al-Khwarizmi, Al-Farabi, Abu RayhanBeruni, IbnSina, Umar Khayyam, Tusi are the founders of scientific didactics. An important feature of the views of their followers was that these scientists have always focused on the process of abstraction of the image of the object in the human mind, understanding, occurrence and formation of the essence and specificity of the object. They are interested in the subject and sources of knowledge, the stages of the cognitive process, and the relationship between cognitive activity and practical activity.

Al-Khwarizmi played an important role in the development of the theory of continuous development of the individual, defined the principle of unity of individuality and generality in inductive and deductive thinking.

Al-Farabi developed a classification of teaching methods. He divided them into practical and theoretical methods, thus asking for ideas about the practical direction of teaching and how it relates to people's lives and daily activities. The scientist pays special attention to experimental and demonstrative, inductive and deductive, practical methods of teaching. Combines all methods based on the student's life experience and logical thinking.

Prefer the deductive method in the development of requirements for the organization of the learning process, highlighting what to pay special attention to when explaining the material to students, the most important things with convincing and unquestioning evidence.

Al-Farabi develops the principles of scientific, visual, comprehensible and coherent teaching based on the examples of mathematics. Explains the essence of the cognitive process and forms of knowledge in science. According to him, these processes are formed as laws, and their observance improves thinking and prevents gross errors in the process of complex cognition. The process of learning must go through the logic of thinking. The object of logic is to determine the correctness of the thought process in which the object of comprehension and reasoning are analyzed. Logic is a weapon and it helps to know things clearly.

Al-Farabi also develops quite detailed recommendations on the organization of cognitive activities. He writes that in order to be a good theorist, regardless of the science to which the theory belongs, the following three conditions must be met:

1. Full knowledge of all science-based principles;
2. To be able to draw appropriate conclusions from these principles and information on the subject;
3. To be able to reject a false theory and to distinguish truth from falsehood, to analyze the opinions of other authors in order to correct a mistake;

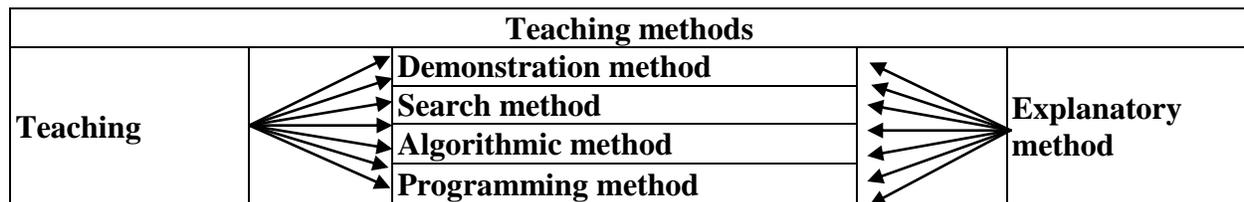

IbnSina's teaching about the results achieved through knowledge has a special place in the theory of teaching. According to him, true knowledge of things is achieved by analyzing their appearance and determining their causes. IbnSina develops the stages of development of the mind. The first stage of perception with observation is to explain the mental categories. The second stage is to perceive two different ideas. The third stage of mental development is achieved through the perception of learned ideas. Then it is called true intelligence.

Organizing the use of historical materials in the teaching of mathematics, according to its own system, serves two purposes in parallel. When mathematical laws, proofs, formulas, and mathematical interpretations are implemented, these laws, proofs, and formulas are demonstrated not only in mathematics but also in other disciplines, resulting in deeper students' knowledge in the field. Therefore, the interdependence of the methods used in the teaching process, as well as the pedagogical and psychological aspects of teaching mathematics in high school, especially in the primary grades, combined with historical materials, also differs in the didactic sequence. It is known that in pedagogy, along with teaching methods, there are teaching methods.

Especially since teaching methods are structured as a sum of an effective sequence of teaching or learning methods in terms of their structure, it is formed and applied to each teacher individually. Therefore, because each teacher's teaching method is unique, there are two ways to use the same methods, for example, teachers who teach in a problem-based way, and those who use teaching methods in between lessons. In particular, they differ slightly from each other. However, the diversity of the results obtained also confirms this idea.

It serves to achieve the set goal and bring it to the required level. There are methods of teaching mathematics that can be the basis of each of the above methods in terms of their epistemology, namely: observation and experiment, analysis and synthesis, induction and deduction, comparison, analogy, generalization, there are methods of abstraction and concretization. These techniques not only help to achieve the goal of the structure, but also to achieve it.

The data show that the correct use of a set of methods in the teaching of historical materials in the primary grades can be an important factor in the mastery of students. It is well known that the process of teaching historical materials in the primary grades is a link between the problem-based method and the explanatory method, which, by their very nature, are linked to teaching methods in the following order.

The use of this type of teaching method has its own characteristics, which depend on the structure of the content of the teaching material. For example, in a class that introduces students to units of measurement such as "time," "calendar," "mass," and "fraction," the process of teaching history is a little different than other classes. As you know, the types of lessons are divided into learning new learning material, improving students' knowledge and skills, generalizing systems, and combining, controlling, and correcting knowledge, skills, and competencies. Each of these general divisions, according to its function, has its own structure, and in the process of pedagogical development, the types and forms of lessons are interpreted differently by scholars.

We have described the didactic and methodological structure of teaching in the appendix. One student understands the cognitive task, the other comprehends and understands the material being studied, and the third develops skills and competencies. The teaching of historical materials in mathematics is based on practical experience in relation to life experiences:

1. Forming students' consciousness based on demonstration in the process of teaching mathematics;
2. Methods, rules, factors, interconnectedness, complementarity and organization used in teaching historical materials while helping to develop students' abstract thinking. developing students' thinking skills;
3. Each lesson has its own methodological structure and technology, as well as to help students develop their talents;
4. The application of historical materials used in the lesson in accordance with the laws and rules of didactics in terms of their purpose and content, not only contributes to the formation and development of mathematical logic, skills and abilities, but also contributes to the education of students. should also be affected.

The success of a student's learning depends on the following factors:

1. Theoretical studies have shown that the teacher plays a leading role in enhancing the active learning activity of students in the process of using historical materials in mathematics lessons.
2. The process of cognitive activity when using historical materials in mathematics lessons in order to increase the effectiveness of the lesson is based on the formation of knowledge, skills and competencies.
3. In the early stages of primary education, the general characteristics of all activities are modeled. Therefore, the formation of cognitive activity is considered in the unity of its components, as well as the didactic basis of this process. The developed theory of activity is an activity in which the learning process is organized by studying the methods of obtaining, processing and applying knowledge (problematic and reproductive).

Research methods used in teaching mathematics

1. Information on research and observation methods. It is impossible to develop pedagogy without studying and generalizing the experience of pedagogical education and without in-depth study of the pedagogical process. Modern education equips pedagogy with a general method of scientific knowledge, but like any other discipline, pedagogy has its own research methods.
2. Study of experiments and school documents. Experiments are also observations, which are conducted in a specially organized, supervised and systematically modified environment by the researcher. Pedagogical Experience is used to study the effectiveness of a particular method of teaching and education, instruction manuals.
3. Interview and questionnaire method. Interview method is also used in pedagogical research. The use of this method allows to obtain materials that complement and clarify the data obtained from the observation, to perform assignments. The key to the success of this method is the ability to communicate with children, to communicate freely with them.

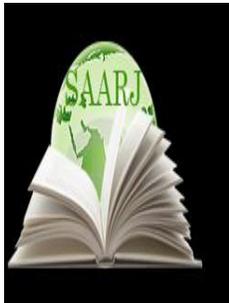

CONCLUSION

The conclusion of the article is that the study of mathematics and its methods and techniques is important for every future generation. Relying on the methods of our scientists and modern technology in the study of its methods, the study will ensure that the ways of comprehensive

study will be less tedious and boring. If every educator learns these methods perfectly, he will make a great contribution to the development of the next generation.

NATIONAL-MENTAL REASONS FOR THE ORIGIN OF SOME KINDS OF LATENT CRIMES

Ismoilov O.Y*

*Master Student,

First class lawyer of the Academy of General office of Public Prosecutor,
 UZBEKISTAN

Email id: olim.ismoilov.91@inbox.ru

ABSTRACT

The article discusses the content, types and causes of latent crime. The importance of national features in the emergence of certain types of latent crimes is discussed. Published under the editorship of U Tadzhihkanov[5], in the legal encyclopedia. the term "latency means crimes not identified and not reported to the state authorities carrying out the investigation of criminal cases." It means crimes which have not been identified and which have not been reported to the State authorities investigating criminal cases.

KEYWORDS: *Latency, Latent Crime, Types Of Latent Crime And Methods Of Struggle, National Mentality.*

INTRODUCTION

A lot of work is being undertaken in our country to ensure the rule of law and suppress crime. More than 80 statutory acts in this direction have been created and adopted. The composition of the internal affairs bodies was updated: 65% of the workers transferred to service houses to function closer to the public, situated at the locations where the service was launched. A great deal of public attention is paid to the problem of crime in the makalls, where most of the population lives, and this is yielding positive results.

Owing to the successful work of law enforcement officers and near public interest, the national crime rate has declined in recent years. At the same time, there are some shifts in latent (hidden) crime forms and classification features, which are the most dangerous for society.

According to the criminal statistics report of the Office of the Prosecutor General of the Republic of Uzbekistan, 3256 crimes were reported as latent crimes in 2018, and this number increased by

719 to 3975 in 2019. The emergence of new forms of latent crimes is another task that needs to be tackled, as can be seen in the statistical study. New forms of latent corruption in recent years crimes have appeared in the economic sector, public administration, computer technology, finance and banking, and in 2019 their number reached 98.

Based on the above, it can be inferred that the most urgent cause of occurrence is the study of latent offences and their forms.

Details about its true scale, information about the actual state of the crime, and not just its registered component, is a required prerequisite for an effective battle against a criminal phenomenon.

More and more residents are discussing problems of registration and consideration of criminal cases and the operations of law enforcement agencies at the People's Reception Offices of the President of the Republic. President of the Republic of Uzbekistan Sh.M. Mirziyoyev, paying attention to this, noted: "To briefly outline our goal in this area, we must create a truly popular one in the future." One of the reasons calling into question the state power in general, and the activities of law enforcement agencies in particular, is latent crime, in legal terms, latent crime.

Latent in different branches of knowledge, this concept is commonly used to describe phenomena and processes that do not appear to be observable.

The concept of "latency" is not given in the National Encyclopedia of Uzbekistan, but the meaning of "latency period" is given. Latent time "Latent period: 1) physiologically - the time period from the moment of exposure of any stimulus to the body (organ, tissue, cell, etc.) until a response is received is called the latency period. 2) in medicine - the latent period of the development of the disease [2] (eg: the latent period of the disease COVID (Covid-19) is 14 days).

In social sciences, a researcher deals with four kinds of latent systems, as I.P Ruschenko writes,[2] ". The first category is the demand phenomena, the actual processes and problems of society, which momentarily fall out of the realm of science due to artificial external obstacles, perceptions, constraints, but can be important in the process of political and cultural changes. The second type is virtual latency, which is associated with the specifics of the process of scientific thinking. This refers to the right to a hypothesis, a bold and paradoxical assumption, that is, to a "thing" entirely born of the consciousness of the researcher. The concept of "latent" entered legal science during the period of careful research of all forms of criminal manifestations in order to designate that part of the crime that took place in reality,

In the works of A.J Kettle, E. Ferry, F. Zakharevich [3], the first mentions of latency are identified. The renowned Belgian criminologist A.J Kettle, who was one of the first to measure the importance of latency, pointed out that we may also conclude that all we know about criminal statistics would not be of any value if it were not believed that the ratio between the crimes committed and the crimes recorded is almost unchanged and the whole unknown amount of crimes committed to us. This attitude is necessary, and, I repeat, if it did not exist in reality, then everything that has been established so far on the basis of criminal statistics data would be false and meaningless. The study of issues related to hidden crime in Russia began in the late 60s of the XX century. The works of A.A. Gertzenon, N.N. Kondrashkov, A.SShlyapochnikov, R.Z

Akutayeva, X.D Alikiperova, A.A. Koneva, V.V. Ponkratova were devoted to the analysis of latent crime.

Published under the editorship of U Tadzhi Khanov[5], in the legal encyclopedia. the term "latency means crimes not identified and not reported to the state authorities carrying out the investigation of criminal cases." It means crimes which have not been identified and which have not been reported to the State authorities investigating criminal cases.

Latent crime, according to V.V Pankratova, is a mixture of offenses not disclosed by the police, the prosecutor's office and the court. This means that these crimes were not reflected in the accounting of criminally punishable acts. She determined that latent criminality is common criminal acts committed in a particular region for a given period, which are not reflected in criminal statistics.[6].

The most acceptable explanation of latent crime, in our opinion, was given by A.A Kavalkin, in his opinion, latent crime is a set of crimes and persons who committed them, which in specific conditions of place and time were not identified or not registered by criminal statistics [6].

"In addition, the concept of latent crime was described in more detail and correctly in the "Instructions on the procedure for establishing a unified electronic criminal law statistics information system"[7] "Latent crimes - socially dangerous actions All indicators of corpus delicacy are inherent, but not recognized or known to have been selfishly shielded from registration by law enforcement agencies, previously unregistered or registered, but incorrectly qualified as a result of which are not recognized as a crime. "

The classifications of latent criminality have been studied quite well, this problem was dealt with by I.V.Shakhanov [8], A.M. Alekseev and A.N.Rosha [9], G.A. Avanesov [10]

Latent crime at the suggestion of I.V.Shikhanov can be divided into two types:

- normal delay - in the absence of information from the competent authority on the criminal offense committed, it is thus not included in the statistical reporting and, as a consequence, no legal (procedural) decision is made as to the facts of its commission;
- artificial latency - when there is no detail in the statistical reporting on the criminal crime committed, which is caused by the violation by law enforcement agencies of the established rules for registering and recording crimes.

Some researchers propose to highlight also the borderline latency. Is a set of crimes that is formed due to the erroneous or deliberately false qualification of a more serious crime as less serious, or due to the negligence or low competence of law enforcement officials, or when not one, but several crimes were committed against the victim, but were recorded just one thing.

The ratio of natural and artificial latency is governed in practice by naturally latent offenses. Since the human element, which is the explanation for the artificial delay of crimes, is gradually omitted when crime is registered in the modern world. Registration of a crime can be carried out through IT technologies (if an authorized employee refuses to register a crime, then the victim can contact a virtual receptionist or report the crime online). In this regard, in this article, more attention is paid to the problem of studying naturally latent crimes.

Four classes of natural-latent offences are differentiated in the legal literature. [11].

The first group includes crimes that no one may know about the commission, including the offender himself. These are crimes committed through negligence, or situations when, due to legal incompetence, the participants in legal relations allow the substitution of one norm of criminal law for another (moral or administrative).

Many violations of budgetary and staffing and budget discipline (Art. 1841 of the Criminal Code of the Republic of Uzbekistan) are committed by accountants for the first time carrying out budgetary operations, that part of the violation that is currently a criminal offense they often take as a violation of administrative, budget or tax legislation. This picture can be found in the commission of crimes under Art. 148 of the Criminal Code of the Republic of Uzbekistan "violation of the right to work" where often the employer does not realize his actions and thinks that he is violating the norms of the labor code and commits an administrative offense.

The second category covers offences where no specifically stated injured person is involved, so no one is expected to report the crime to the competent authorities. These offences are linked to violation of the rights of the state or the public. Especially if such crimes are committed by officials entrusted with or under the administration of state property. The one charged with guarding steals.

The third group consists of crimes where the fact of its commission is known to a narrow circle of persons or only to the guilty person. Such crimes include disguised theft, bribery, murder followed by hiding the corpse, possession of narcotic substances, attacks on persons with mental disorders, which makes it difficult to adequately assess what happened, some others.

And the fourth category - naturally latent - offenses, where victims do not disclose them due to lack of interest in identifying them, i.e. public disclosure, are the most common in our Republic. There may also be sexual freedom-related offences. As you know, victims of rape do not always report a crime based on a national mindset. If they do not want to be the object of compromising materials, or the injured party succumbs to persuasion to "settle the matter peacefully".

Likewise, and in family and domestic crimes, for example, causing bodily harm (Articles 109, 105 of the Criminal Code of the Republic of Uzbekistan) by the spouse. The national mentality also plays an important role here. The injured party, in most cases, women are persuaded not to report their husband's crimes. Exposing national sayings as an argument, "er-khotinurushidoka-rumolkurishi" (a quarrel between a husband and wife will be solved until the material gets wet), "er-hotinningo'rtasigaesiketgantushadi" (only an insane person interferes in marital disputes), "uydagi gap bozorgato'g'rikelmaydi" (household outfits do not coincide with bazaar affairs).

It should be noted that in recent years, this specificity of the national mentality of our people has been given special attention by the state authorities and the President of the Republic.

In order to radically improve the system of social rehabilitation and adaptation, prevention of family and domestic violence, as well as taking into account the tasks identified Action strategy on five priority areas of development of the Republic of Uzbekistan in 2017-2021, the Resolution of the President of the Republic of Uzbekistan dated 02.06.2018 "On measures to improve the system of social rehabilitation and adaptation, as well as the prevention of domestic violence" No. PP-3827[12]...

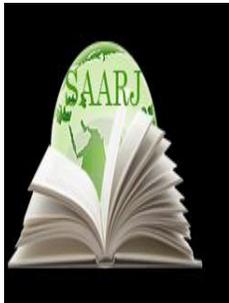

One of the objectives of this Decree is to establish an atmosphere of intolerance in society towards any manifestations of domestic violence, primarily from close relatives, including by ensuring the inevitability of punishment, and support for persons in a difficult social situation.

In addition, features of the national mentality can also be found in crimes related to bodily harm (Articles 105, 109, 277 of the Criminal Code of the Republic of Uzbekistan). Often victims, mostly middle-aged men, do not go to law enforcement agencies, they associate this with the so-called national aspect “g’urur”, “oriyat”, “uyat” (pride, honor, shame). On the one hand, this may be a positive moment, but on the other hand, people with such an opinion often feel offended and try to take revenge on the offender in the same way that pushes them onto the path of crime.

Based on the above, one can argue that the national mentality in many areas of public life has a positive impact. To preserve the family, to warn against making hasty decisions, etc. But, on the other hand, it should be noted that all kinds of latent crimes, regardless of their severity, entail a “spirit of impunity” and, naturally, repetition of the act.

HOW TO IMPROVE THE ABILITY OF LISTENING AND SPEAKING SKILLS IN THE COURSE OF COMMUNICATIONS BY INNOVATION TECHNOLOGIES

Norova Bahriniso Yuldoshevna*

*Teacher,

Department of "Languages" of Tashkent State Agrarian University
 Tashkent, UZBEKISTAN

ABSTRACT

The teacher in the modern environment is not only a source of the information and the academic facts - he helps students to understand process of training, helps to find the information necessary for them, whether it corresponds to the set requirements, and also to understand, how to use this information for the answer to the put questions and decisions of challenges. The teacher is compelled to raise regularly today the qualification in the field of innovational technologies of training.

KEYWORDS: *Audition, Audiovisual Means, Accelerates, Presentations, Pictures, Films, Gestures And A Mimicry, Listening, Speaking, Pronunciation, Communications Processes, Sounding Speech, TV And Radio Reports, Public Statements, Activities.*

INTRODUCTION

The great influence on audition renders duration of sounding of the speech message, quantity of its presentations, presence or absence of a visual support. Pictures enter into concept of a visual support and films, and also such paralinguistic means, as gestures and a mimicry. Use of audiovisual means accelerates process of formation of strong communications between a word, concept, image or the phenomenon. Speech is understood better if listening clearly sees the person speaking. The visual support at acoustical perception can have various forms.

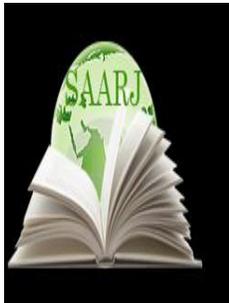

Presence of a visual support considerably facilitates perception of the information as visual canal possesses much throughput, than unvoiced. Misunderstanding and "information distortion arises more often if students only listen to it, and listening and seeing (audiovisual) they perceive more. For example factors characterizing conditions of a presentation of the information and degree of participation listening in communications processes. The perception of speech messages is

influenced essentially by distinctness and loudness of a pronunciation telling, its ability by intonation to allocate semantic parts of speech and logic chains of the statement, and also tempo of speech. The understanding of the messages shown in certain tempo of speech, is one of indicators generated skills and abilities of audition. Integrity of process of audition is provided with work of speech mechanisms (operative memory, likelihood forecasting, long-term memory, comprehension) which are necessary for developing at training to a foreign language. At audition of the long message to the dress. c. Process of storing which is accompanied by semantic grouping of the perceived information occurs understanding also. Students should be able will isolate from-text the main thing, to direct the attention to the basic thoughts of the statement. Thus, audition process depends on degree forming of skills. And abilities of students in the given kind of speech activity. Indicators forming skills and abilities of audition, are depth and accuracy of understanding of the maintenance, logic structure of the statements shown unitary and in rate, characteristic for native speakers. Proceeding from it, at training of students it is considered the main methodical requirement to audition ability to understand the maintenance and sense of speech messages. At perception and understanding of sounding speech students are compelled to overcome the various difficulties connected with action of some factors. For example factors characterizing conditions of a presentation of the information and degree of participation listening in communications processes. How to develop the ability of listening and speaking skills in the course of communications. Audition is a difficult thought process of perception and understanding of sounding speech in which result listening comes to certain conclusions. Proceeding from it, at training of students it is considered the main methodical requirement to audition ability to understand the maintenance and sense of speech messages. At perception and understanding of sounding speech students are compelled to overcome the various difficulties connected with action of some factors. Selective character is inherent, for example, in audition TV and radio reports, public statements. At hearing of lectures on a specialty there is a necessity of profound understanding. The received information with installation on its further use in practical activities. In this connection written fixing heard is required: drawing up of the developed plan, consecutive record of lectures, etc. In interactive technologies of training roles training and trainees, and also an information role essentially change. We will stop short on the characteristic of some technologies of interactive training and we will result examples of their use in the course of teaching of pedagogical disciplines. Discussion - all-round discussion of a question at issue in public meeting, in private conversation, dispute. In other words, discussion consists in collective discussion of any question, a problem or comparison of the information, ideas, opinions, offers. The perception of speech messages is influenced essentially by distinctness and loudness of a pronunciation telling, its ability by intonation to allocate semantic parts of speech and logic chains of the statement, and also tempo of speech. Defining requirements to educational audio texts it is necessary to characterize them from the point of view of the maintenance, the language form and presentation conditions. So, texts for listening are under construction taking into account style, genre, those structural features speech the message which students meet both in educational process, and during dialogue with native speakers, at audition of monologues, in time film viewing. At training it is necessary for audition to formulate at students a habit to ponder upon sense of the received information, to switch attention depending on a purpose, i.e. as much as possible to approach them to those natural conditions of dialogue which characterize communications in a native language. Realization of this problem will give the chance to pupils to participate actively in educational process,

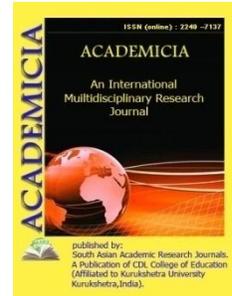

successfully to seize the future specialty, to communicate with the native speaker. Conditions of reception of the information depend on roles listening and speaking in the course of communications. If the student participating in dialogue has insufficiently well understood the interlocutor can ask again it and. To specify sense of the statement. In life we differently perceive the heard statements in a native language and differently we react to them. In one cases us the general maintenance of the text, the basic idea of the message, new data on the given theme interests, and in others it is important to us to understand message details, to establish logic connection between them and to draw certain conclusions.

DEVELOPING INTEREST AND ATTENTION TO THE APPLICATION OF INNOVATIVE TECHNOLOGIES IN THE EDUCATIONAL PROCESS

Kosimova Surayo Salohitdinovna*

*Teacher,

Department of "Languages" of Tashkent State Agrarian University,
 Tashkent, UZBEKISTAN

ABSTRACT

Numerous teaching methods have been created on the basis of the various forms and that are used and practiced in practice, and this process continues. The way that the way, the way a particular ACT of learning is shaped, is a form of self-study that serves to achieve that goal. Here are some of the paths that can be used for the activity that is required to be performed as a means of action, and the path chosen according to the intended purpose.

KEYWORDS: *Family Education, Schooling, Preschool Education, Teacher Training, Books, Computers, Exhibition Aids, Student, Teacher, Technology, Vocabulary.*

INTRODUCTION

Teaching methods involve a variety of working methods and forms that can be used to achieve the objectives of a specific pedagogical process. The introduction of modern communication technologies in the educational process is one of the most important issues, namely targeted and accurate use of them, increasing the interest of students in the foreign language through them. This creates opportunities for the use of innovative technologies in education and the demand increases.

For example, education can be taught through: family education, schooling, preschool education, teacher training, books, computers, exhibition aids, announce Similar tracks can also be used to teach a similar number, arithmetic meanings. By using these methods, different techniques are used to perform the action. For example, after selecting any of the foregoing methods to teach the doctrine, each of these methods is used for the purpose that is considered appropriate. These are the methods used by a teacher, a teacher in a family, a preschool education institution, and the school education; computer, books and other educational tools. Each path chosen by the same number to teach arithmetical acts implies using specific techniques. Each action is carried out in a specific way and in the appropriate method. Thus, the use of interactive methods in teaching

subjects is unique. Careful learning and practical application of each interactive method used in education can extend student thinking and have a positive impact on the problem's solving. Increase creativity and activity of students. When analyzing different theoretical and practical problems through interactive methods, the students' knowledge, skills, qualifications are expanded and extended. Below you will find general comments on this issue. Classification of the techniques can be divided into interactive learning strategies, interactive graphic organizers. "Last man standing" game. This game is a fast game. But it gives some time to think. This game encourages learning together, that is, when other students say, the rest of the students are thinking about themselves. You will need a little to play. And all students should be in a circle. You need to choose a theme. For example, things found in a kitchen, food, profession and so on. The game begins by throwing a ball to student. The reader speaks an English word on the subject and throws the ball to the next reader. Anyone who accepts the ball must make a statement on that subject. If they repeat the words or if they cannot find a word within a few seconds, they will quit the game and watch the game. Do not worry, they're still learning. You can change this game in a slightly different way. Instead of speeches on a subject, every student can say something different to the next reader.

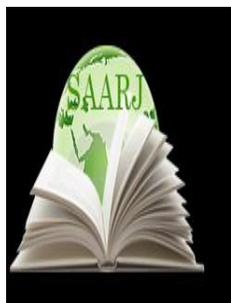

Numerous teaching methods have been created on the basis of the various forms and that are used and practiced in practice, and this process continues. The way that the way, the way a particular ACT of learning is shaped, is a form of self-study that serves to achieve that goal. Here are some of the paths that can be used for the activity that is required to be performed as a means of action, and the path chosen according to the intended purpose. For example, you can start the game by saying "say something red". The first reader who holds the Copter can then "strawberry" and the drop a topic and throw it to the other. This makes the game somewhat challenging, since the reader should know what the subject should look like before thinking about a word. "Pictionary" game. Many English speakers Pictionary are familiar with the drawing game. For illustration purposes, you can use simple whiteboard or white magnetic card. Divide the class into 2 groups and draw the table on the side of the board for each team. You write scores here. A team of the team will be released. And the chooses one of the many reversible words and draws that word on a board. And others will have to find. The score will be awarded to the team that won 10 points is the winner.

In the process of teaching foreign language courses, advanced pedagogical technologies are required to use interactive, innovative methods and communication methods. Foreign language teaching in the Republic of Uzbekistan is based on the recommendations of the European Commonwealth of Independent States (CEFR) to assess the knowledge and skills of foreign language teacher's new methods and requirements are being developed. Nowadays, interest and attention to the application of innovative technologies in the educational process is intensifying and one of the reasons for this that, in the current educational system, modern technology will help them to search for their knowledge, to independently analyze, and even make conclusions.

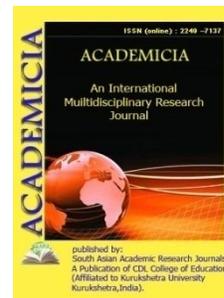

In this process, the teacher creates conditions for personal development, formation education and upbringing, and at the same time, fulfills the functions of management, guidance. In the course of the course the student becomes the main figure. Knowledge, experience, and interactive methods of pedagogical technology and pedagogical skills provide students with skillful, advanced skills.

ABSTRACT

This article presents the results of a study of the concentration and specific activity of various radionuclides, such as ^{222}Rn , ^{220}Tn and their variations in the form of the exposure dose rate-EDR, equivalent equilibrium volume activity of radon -EEVAR, long-lived alpha nuclides-LAN in the atmospheric air of the Samarkand and Navoi regions.

KEYWORDS: *Uranium, Equivalent, Volumetric Activity, Radiation Factors, Activity, Radionuclide, Exposure Dose, Equivalent Dose, Gamma Radiation, Error Rate, Migration.*

INTRODUCTION

In the Republic of Uzbekistan, in 2000, the law "On Radiation Safety" was adopted, and in 2006, the Radiation Safety Standards (RSS-2006) and the Basic Sanitary Rules for Ensuring Radiation Safety (BSRERS-2006) were adopted, the purpose of which is to control radioactivity and reduce the level of public exposure from natural and man-made sources of ionizing radiation (Vozjhenikov et al., 2006; BSRER, 2006; Rafalsky, 2013; Muzaffarov et al., 2013; Muzaffarov et al., 2016).

In atmospheric air, there are various radionuclides- ^{222}Rn , ^{220}Tn and their varieties in the form of the exposure dose rate-EDR, equivalent equilibrium volume activity of radon -EEVAR and long-lived alpha nuclides-LAN, and so on. Among radioactive radionuclides – ^{222}Rn is considered one of the most dangerous natural radionuclides. In the decay chain of uranium from radon, nonvolatile radioactive radionuclides - ^{218}Po , ^{214}Pb , ^{214}Bi - are formed, which, when they enter the body, are removed from it with great difficulty. In uranium-bearing regions, which in the republic are the territories of Samarkand and Navoi regions, the increased content of radionuclides requires determination of their concentration in the atmospheric air of settlements.

Based on the above, the development of a method for determining the values of radionuclides in atmospheric air of the Samarkand and Navoi regions is an urgent task of applied nuclear physics, analytical chemistry and radioecology (Jurakulov et al., 2020 a; Jurakulov et al., 2020 b; Muzaffarov et al., 2011; Muzaffarov et al., 2013).

Technique and methodology of physical experiment

The measurements of the volumetric activity of radon were carried out by the measuring complex "Alfarad plus", designed to determine the density of radon flux from the soil surface, express measurements and continuous monitoring of the volumetric activity - (VA) of radon-222 (^{222}Rn) and the amount of Po^{218} (^{230}Th) decays. The limit of permissible relative error when measuring VA of ^{222}Rn in soil is $\pm 30\%$.

The amount of radon is determined by the «Alfarad plus» installation complex based on the following reaction:

Measurements of the specific activity of radionuclides in the selected solid samples were carried out on a gamma radiometer "PROGRESS-GAMMA", the limit of the permissible relative error of which is $\pm 10\%$. The value of the specific effective activity – A_{eff} of natural radionuclides - (NRN) is calculated by the formula:

$$A_{\text{eff}} = A_{\text{Ra}} + 1,31A_{\text{Th}} + 0,09A_{\text{K}}; \quad (2)$$

where, A_{Ra} , A_{Tn} , A_{K} – are the specific activities of ^{226}Ra , ^{232}Tn and ^{40}K , respectively.

The value of the absolute error in measuring the specific activity – $A_{\text{eff}i}$ – of the radionuclide and the absolute error of determination (Δ_{eff}) are calculated by the formula:

$$\Delta_{eff} = \sqrt{\Delta_{Ra}^2 + (1,31 \times \Delta_{Th})^2 + (0,09 \times \Delta_K)^2} \quad (3)$$

The value of the specific effective activity - A_{eff} of NRN is calculated by the formula (1):

Basics of radiation monitoring and the study of the behavior of radon, based on experimental studies of the physicochemical properties of monitored radionuclides. Based on the results obtained, a conclusion can be drawn that makes it possible to predict their migration activity in the atmospheric air of Samarkand and Navoi regions.

Results and their discussion. More than 120 measurements of the values - DER, EROA and DAN were carried out at the observation sites of the Samarkand region and more than 100 measurements of the values - EDR, EEVAR and LAN at the observation points of the Navoi region. Of these, some of the results of the values of the volumetric activity of radon, the specific activity of radionuclides, the effective specific activity - A_{eff} and the physical parameters of the environment are given in table. 1.

TABLE 1 MEASUREMENT RESULTS FOR ON DETERMINATION OF VAR, SPECIFIC ACTIVITY OF RADIONUCLIDES, EFFECTIVE SPECIFIC ACTIVITY AND PHYSICAL PARAMETERS OF THE ENVIRONMENT

№	VAR mBq/cm ³	Air temper ature °C	Humi dity %	Pressure mm. Hg	Specific activity in the soil			
					K ⁴⁰ Bq/kg	Ra ²²⁶ Bq/kg	Th ²³² Bq/kg	A _{φφ} Bq/kg
Samarkand region								
1	11234 ± 323,2	30	36	727	496	260	126	388
2	9931 ± 312,2	30	37	728	485	285	116	391
3	7712 ± 313,3	24	31	729	397	209	149	368
4	9211 ± 332,4	28	33	729	477	240	185	393
5	8833 ± 223,3	33	38	729	458	211	158	302
6	4432 ± 148,4	31	32	730	399	198	107	304
Navoi region								
7	4421 ± 332,4	25	22	730	397	289	149	399
8	4441 ± 198,4	23	29	730	477	264	185	393
9	3882 ± 288,5	24	31	731	458	243	158	372
10	3332 ± 285,9	28	30	732	399	231	107	334

From the results obtained in table 1, it can be seen that the VAR values for the Samarkand region varies from 4432 mBq/cm³ to 11234 mBq/cm³, the specific activity of radionuclides - K⁴⁰ varies from 397 Bq/kg to 496 Bq/kg, - Th²³² varies from 107 Bq/kg to 185 Bq/kg and - Ra²²⁶ varies from 198 Bq/kg to 285 Bq/kg, and effective specific activity - A_{eff} varies from 302 Bq/kg to 393 Bq/kg, and in the Navoi region, the VAR values vary from 3332 mBq/cm³ to 4441 mBq/cm³, the specific activity of radionuclides - K⁴⁰ varies from 397 Bq/kg to 477 Bq/kg, - Th²³² varies from 107 Bq/kg to 185 Bq/kg and - Ra²²⁶ ranges from 231 Bq/kg to 289 Bq/kg. Effective specific activity - A_{eff} varies from 334 Bq/kg to 399 Bq/kg.

Although the volumetric activity of radon in the atmospheric air and soil in some areas of the Samarkand region reaches up to 11234 mBq/cm³, in some urban-type dwellings the VAR is 55000 mBq/cm³, and in the lower floors and basements it is three times higher (150,000

mBq/cm³); nevertheless, the average VAR value is not more than 3650 mBq/cm³. The results obtained show that the value of the volumetric activity for other radionuclides, ²²⁶Ra, ²³²Th and ⁴⁰K, as well as for the Samarkand and Navoi regions are similar. Also, for these areas, the values of effective specific activity are almost the same. As for radon-222, this radionuclide is the main source of radioactive isotopes in terrestrial space, and therefore high radon activity is observed in air and water, as well as in soil.

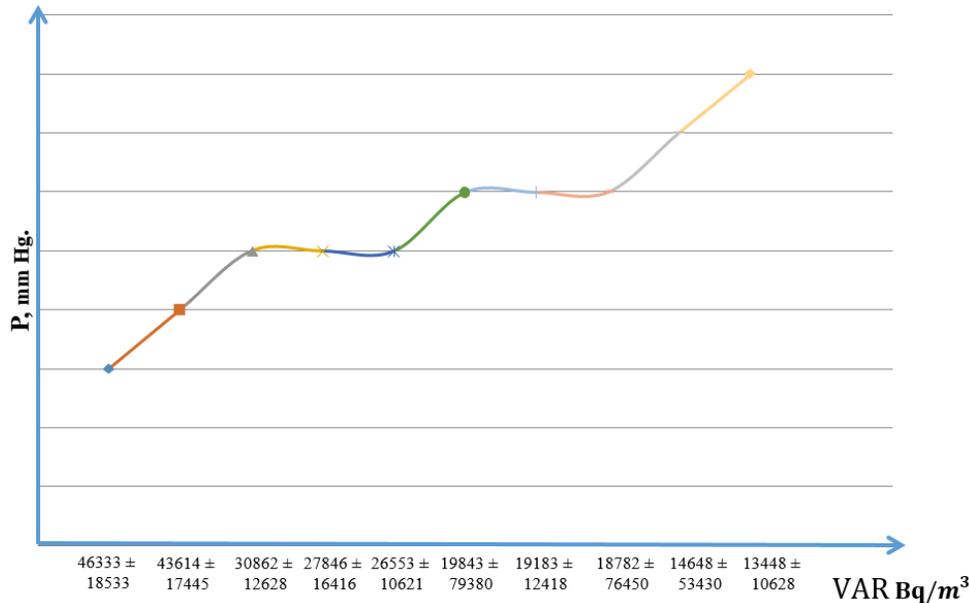

FIG. 1 GRAPH OF THE DEPENDENCE OF THE VAR ON THE ATMOSPHERIC AIR PRESSURE

Based on the results obtained, it was established that VAR depends on the specific activity of Ra²²⁶ and the effective specific activity - A_{eff}. In fig. 1.a graph of the dependence of the VAR on atmospheric pressure is shown. It follows from the figure that in the denser layers of the atmosphere (730 - 735 mm Hg), the value of VAR decreases significantly and varies from 46333 Bq/m³ to 13448 Bq/m³. In less dense layers of the atmosphere, the VAR is much higher. Such a numerical anomaly of radon in different layers of the atmosphere is due to the fact that radon gas is unevenly distributed at different heights of the atmosphere. On the surface layers of the atmosphere, the density of radon is much higher, especially 0-5 km from the Earth's surface, the relative concentration of radon is almost 3-5 times higher than in the upper atmosphere.

On the basis of the studies carried out, the change in the value of VAR was found, depending on the pressure of atmospheric air, the value of the specific activity of radionuclides - K⁴⁰, Th²³², Ra²²⁶ and the effective specific activity - (A_{eff}) were determined.

Based on the conducted studies of measurements, the values of EDR, EEVAR and LAN in the observation sites of the Samarkand and Navoi regions, the annual technogenic effective dose, which is up to 0.83 mSv/year for the population of the Samarkand region, and up to 0.89 mSv/year for the population of the Navoi region were calculated. Both values are less than the values of the established norm.

CONCLUSION

The experimental results obtained on the determination the specific activity of natural radionuclides K^{40} , Th^{232} , Ra^{226} , ^{222}Rn in atmospheric air and in the soil of the Samarkand and Navoi regions reveal that the specific activity of radionuclides in the studied regions corresponds to the established standards, and the effective annual dose of radon-222 for settlements does not exceed the values established in Sanitation Rules and Standards (SanRaS)-0193-06 (BSRER, 2006).

ABSTRACT

During the writing of this article, I looked at a lot of physical activity, as well as the organization of physical education classes, the attitude to this science, their study, to get acquainted with its peculiarities. In this article, I have tried to shed light on what we need to focus on in order to develop physical education teachers through professional competencies. They are short and limited in size, rich in content, and written in prose.

KEYWORDS: *Subject Matter, Physical, Standards, Accomplished, Educator, Experienced, Inclusive Teaching, Develop Skills.*

INTRODUCTION

This article describes what accomplished teachers should know and be able to do. It examines the deep and profound knowledge they have of their students and their subject matter. It discusses how this knowledge informs the meaningful curricular choices accomplished teachers make, the inclusive learning environments they create, and the effective instructional strategies they employ. More specifically, the standards within this article address how accomplished physical education teachers convey the concepts and principles their students need to maintain personal well-being through lifelong physical activity and healthy lifestyle practices.

Quality physical education programs empower young people to realize their fullest potential. The role that physical educators play is thus vital to the development of strong, capable, confident

adults. Scientific evidence continues to demonstrate a close connection between physical and intellectual maturation, indicating ever increasingly that physical movement directly impacts academic performance and professional achievement. Accomplished educators across all fields and disciplines thus understand the critical responsibility that physical education teachers have and the significance of the mission they undertake. Accomplished physical educators nurture their students' ability to learn. As professionals, they are uniquely trained to incorporate cognitive and psychomotor demands into activities that exercise thinking and motor skills concurrently. These teachers require their pupils to think flexibly and act within the moment. They create lessons that challenge students to analyze their objectives in dynamic situations and determine the best utilization of resources to achieve their goals. Whether working alone or in teams to perfect movement forms, devise sports strategies, or perform real-world tasks, the pupils of accomplished physical educators strengthen their agility holistically by using their minds as well as their bodies to solve problems. Accomplished physical educators teach their students that seemingly insurmountable conditions can be mastered. Acting as mentors, they encourage their students to acknowledge the capabilities they possess and persevere in the goals they pursue. These teachers foster a love of physical movement that compels students to become independent learners. When pupils experience success, they gain confidence in themselves and the people with whom they interact. They also acquire respect for their bodies and begin to assume responsibility for their well-being. These dispositions motivate students to challenge themselves in all aspects of their lives. The affective benefits of a quality physical education program are exponential. Physical education is an essential component of educational plans from early childhood through young adulthood. The classroom objectives of accomplished physical educators support local, state, and national learning standards as part of a comprehensive approach to the instruction of our students. Physical education teachers optimize their practice in various ways to meet and exceed their learning objectives. The committee responsible for the second edition of these standards does not claim this document to be definitive in its exploration of accomplished teaching, nor does the committee wish to be prescriptive in the endorsement of any specific method or technique. The committee would, however, like to direct the reader's attention to a set of common themes uniting the twelve interrelated standards appearing in this article. Physical fitness, health and body awareness, spiritual well-being, and meaningful social engagement represent the cornerstones of a sound physical education, each supporting and strengthening the others within a balanced approach to living. In the classroom and throughout the community, accomplished physical educators continuously strive to help their pupils embody wellness in the pursuit of an active, healthy life. Accomplished physical educators are dedicated to teaching every student in their classrooms. They understand their students represent diverse groups and backgrounds, each with a unique set of needs and abilities, and they know how to modify instructional strategies to engage every student. Accomplished physical education teachers respect their students' individual qualities, address biases that arise in the learning environment, and nurture feelings of mutual respect among their students. The examples of accomplished teaching that appear in Standard VI—Diversity and Inclusion, as well as those included throughout the standards, demonstrate this fundamental understanding of multiculturalism while stressing a steadfast commitment to inclusive teaching practices. The learning environment of accomplished physical education teachers extends well beyond the classroom. These educators continually seek opportunities to reinforce student learning through team teaching, interdisciplinary instruction, school activities, family outreach, and community

involvement. To address the whole child, they strive to ensure that physical activity and wellness concepts permeate all aspects of their students' lives. Accomplished teachers inspire people to join their mission for quality physical education and act as resources to create a culture of learning. Sharing ideas and exchanging best practices down the hall or across the world is thus a common theme in this document, as well as the subject of Standard X—Collaboration and Partnerships. Accomplished teachers stay in touch with current technology and its applications in the field of physical education. They utilize technology to augment various aspects of their instruction, from researching developments in the field to assessing student performance; tracking student progress; and communicating with students, families, and colleagues in virtual classrooms. Technology helps accomplished physical educators motivate their students by providing them with exciting learning experiences using media they find relevant. Effective uses of technology are illustrated throughout these standards. Accomplished physical education teachers use assessment to support the learning objectives of their students and promote the educational objectives of their programs. They administer assessments strategically to establish curricular goals, guide classroom instruction, monitor student progress, and adjust teaching strategies as needed. By making students active participants in this process, teachers encourage them to take ownership of their physical well-being. The aggregate data that teachers acquire help them advocate for student learning by demonstrating the measurable benefits of physical education to colleagues and administrators. Accomplished physical educators achieve these goals through the creativity of their teaching practice. Examples of accomplished teaching throughout the standards demonstrate this quality in different contexts and applications, such as lesson design or task modification. The addition of numerous dance examples in particular reinforces the understanding that this document is intended for a broad audience of practitioners with a wide variety of expertise. Accomplished physical education teachers come to the classroom with unique backgrounds and experiences, and they use their imaginations to immerse their students in learning experiences. Creativity and imagination help accomplished physical educators overcome obstacles as well. Every teacher has difficulties with which to contend, be they class size, budget constraints, or resource deficiencies. Accomplished physical educators recognize how serious these challenges can be, but they refuse to be disempowered by them. They instead face seemingly insurmountable situations with the same determination they encourage in their students. Through innovation, outreach, and persistent advocacy, accomplished physical education teachers transcend any limitations that threaten to impede student learning. What follows is a list of the structural revisions inherent within the second edition of Physical Education Standards. The committee responsible for the second edition of Physical Education Standards hopes this document will engage and inspire teachers throughout the profession. Whether educators are new to the classroom, in the process of applying for National Board Certification, or advancing their careers otherwise, the committee invites them to read these standards and reflect on their mission as teachers. Each of us has an impact on our students, our colleagues, and our communities. Accomplished physical educators channel their energy positively to improve their practice as teachers, assert their strength as leaders, and transform the well-being of those around them. Passionate about promoting quality physical education programs, accomplished teachers advocate persistently for their students and their profession. This committee shares their dedication and challenges other physical educators to join their movement. The standards are meant to reflect the current professional consensus about the essential aspects of accomplished practice. The deliberations of the Physical Education

Standards Committee were informed by various national and state initiatives on student and teacher standards that have been operating concurrently with the development of National Board Standards. As the understanding of teaching and learning continues to evolve over the next several years, these standards will be updated again. An essential tension of describing accomplished practice concerns the difference between the analysis and the practice of teaching. The former tends to fragment the profession into any number of discrete duties, such as designing learning activities, providing quality explanation, modeling, managing the classroom, and monitoring student progress. Teaching as it actually occurs, on the other hand, is a seamless activity. Everything an accomplished teacher knows through study, research, and experience is brought to bear daily in the classroom through innumerable decisions that shape learning. Teaching frequently requires balancing the demands of several important educational goals. It depends on accurate observations of particular students and settings, and it is subject to revision on the basis of continuing developments in the classroom. Accomplished teachers attain knowledge of their students' unique qualities and characteristics to build positive relationships and create meaningful learning experiences that cultivate beneficial attitudes toward lifelong physical activity and wellness. Accomplished physical education teachers are committed to the belief that all students can learn and benefit from a healthy, active lifestyle. Physical education teachers are dedicated to knowing their students as individuals, and they utilize this knowledge to improve teaching and learning. They nurture positive relationships that help students feel valued, build their self-confidence, and motivate them to learn. An appreciation of the unique qualities and characteristics of students informs the instructional choices and teaching practices of accomplished teachers. They combine their knowledge of students with their expertise in physical education to determine how they can best meet the needs of single students as well as groups of learners. Physical education teachers know that developing strong relationships with students can inspire a passion for physical activity and wellness by promoting trust and encouraging a disposition for lifelong learning.

Accomplished teachers embrace their students' unique traits. They understand that students possess a wide array of similarities and differences, and they respect each student's ethnic heritage, religious background, body image, sexual orientation, family configuration, socioeconomic status, ability level, and primary language. For example, a teacher who knows that a student will be fasting as part of a religious observation may plan modifications with the student and monitor the student's activity. Accomplished physical education teachers are attuned to their students' attitudes, abilities, personal interests, motivations, and prior learning experiences, as well as their learning styles. A teacher may thus have students journal about an upcoming activity to reflect on what they know, what they want to learn, how they hope to learn it, and what they believe they might gain from the experience. Physical education teachers obtain knowledge about their students intentionally and use this information carefully to build productive relationships and shape instructional decisions.

To learn how students express themselves and demonstrate their abilities, accomplished physical education teachers observe their students in different settings and listen to them in various contexts. Teachers create opportunities for purposeful dialogue so they can become better acquainted with their students and build trusting relationships. To this end, a teacher may watch a student at an afterschool event to learn about other aspects of that student's personal interests and social interactions and then use the information to work more effectively with the student.

Physical education teachers forge meaningful connections with students by remaining alert and attentive to significant developments in their daily lives.

Accomplished physical education teachers enhance their understanding of students by collaborating with colleagues and family members. Within the school environment, teachers exchange information in meetings and conferences to gain insight about their students. They have similar conversations with parents and families. For instance, when creating a behavioral plan, a physical education teacher may visit a student's home or speak with a parent to obtain an understanding of the student's life outside the educational setting. Physical education teachers implement a variety of methods to learn about their students and the individual needs they have.

Accomplished teachers contextualize the knowledge they gain through a careful study of their students over time. For example, a physical education teacher may use a district database system to acquire information about one student's health status, another student's academic progress, and yet another student's language growth. Researching pertinent information about students provides teachers with further insight to their students' social, emotional, and physical development. The broad and deep understanding that accomplished teachers have of their students helps them determine how best to support and extend their students' learning experiences. Accomplished physical education teachers consider multiple perspectives diligently when evaluating the needs of their students.

Accomplished physical education teachers reflect on their knowledge of individual students to create positive learning experiences. Teachers enhance student learning by utilizing different grouping strategies, teaching cues, management techniques, transitions, progressions, and modifications to equipment and space based on the awareness they gain about their students. When preparing for instruction, accomplished teachers consider variables such as class size, skill levels, and developmental levels relative to students' physical, emotional, cognitive, and social characteristics. Teachers adapt lessons for each class to meet their students' individual needs. They understand the importance of responding to their students in positive, personal ways, and they celebrate their students' efforts and accomplishments to build effective, supportive relationships with them. Accomplished physical education teachers strive to become trusted partners within their students' support systems. They create opportunities for students to develop their skills in emotionally, physically, and socially safe environments. Recognizing their important place in the lives of students, teachers cultivate learning experiences that allow students to interact with one another and express themselves in ways that are not readily available in other academic areas. Physical education teachers communicate enthusiasm for their subject matter in a positive, caring manner that demonstrates the respect and appreciation they have for the skills, abilities, qualities, and characteristics of each student. Accomplished teachers believe that knowing students is vital to shaping meaningful relationships with them and fostering beneficial attitudes toward lifelong physical activity.

ABSTRACT

During the writing of this article, I wrote about which language family Russian and English come from, and their different aspects. They are short and limited in size, rich in content, and written in prose. I wrote about the grammar of English and Russian and their similarities, similarities of the alphabet, phonetics, word structure, prepositions and similarities of pronunciation.

KEYWORDS: *Slavonic Branch, Cyrillic, Alphabet, Grammar, Phonology, Sentence Structure, Spelling, Specific Words.*

INTRODUCTION

English and Russian are parts of the huge Indo-European language family. However, the two languages have distinct differences because they belong to different branches. English is from the Germanic branch while Russian is from the Slavonic branch. Therefore, Russian is more related to Serbo-Croatian, Czech and Polish languages, which belong to the Slav languages. Languages naturally evolve and the theory goes that at some point in time, as groups of people went their separate ways, their languages evolved and changed over time in different ways. Eventually, the languages of the various communities of people evolved differently enough that they became different languages. Most languages share common factors and can be divided into language families. For example, modern languages like English, Dutch and German are part of the Germanic language family, and share a common ancestor called Proto-Germanic. Russian is part of the Slavonic branch of the Indo-European language family. It is closely related to other

Slav languages such as Polish, Czech and Serbo-Croatian. English and Russian are very different in many important aspects. The chief difference is that Russian is a synthetic language, whereas English is an analytical language. In particular the grammar systems show significant variations. English has a fairly fixed word order. Meaning is expressed through the addition of words (for example auxiliaries) and movement of words within limited boundaries. Russian, on the other hand, conveys meaning largely through changes in the composition of words (e.g., by inflections or the addition of prefixes and suffixes). Its word order is very fluid. Because of these differences Russians often find learning English a serious challenge. Alphabet. Russian language uses Cyrillic alphabet, some of whose letters are similar to letters in the Latin alphabet used by English. There are some unique letters that are not present in any other language. Decades back, when the region was still called the USSR, Russian was the first language spoken by more than 150 million people in Russia alone. Today, Russian is the eighth most spoken language in the world, still spoken as a first language in 19 countries by about [154 million](#), according to Ethnologue. Worldwide, Russian is spoken by 258.2 million people. The Russian language is one of the official languages of the United Nations. It is the official language in the Russian Federation as well as in Kyrgyzstan, Kazakhstan and Belarus and used in official and public capacity in Mongolia and Israel. Aside from the aforementioned countries, Russian is also spoken widely in the following locations: Azerbaijan, China, Estonia, Georgia, Latvia, Lithuania, Moldova, Poland, Romania, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. Russian is unique as it has so many features that are inherent to the language. Among the European languages, Russian is one of the most difficult to learn if you are an English speaker. But its distinct features are what make the language truly fascinating

-For one thing, did you know that astronauts today have to learn Russian before they can go into space?

-Did you also know that Russians could differentiate more shades of blue than people who speak English?

-The verb "to be" has many forms in Spanish. However, it is not present in Arabic. Surprisingly, the verb exists in Russian, but it is only used in the past tense and future tense, but never in the present tense constructions of sentences.

-While all Russian adjectives consist of two or more syllables, the term злой (angry) is the only exception.

-Russian is an inflected language. This means that the meaning of the word changes depending on the stress placed on a particular syllable.

-This one is definitely unique. Since the earliest times, native words in Russia do

-not start with the letter **A**. Two of the very few exceptions are the Russian

-equivalent of *perhaps* and If there are Russian words that start with **A**, it is very

-likely that these are borrowed words.

-Russian surnames have a gender. All Russian names have a **patronymic name**.

-Thus, all male children will have their father's last name followed by – **ovich**. If

-the child is female, she will have her father's surname followed by – **ovna**.

-Now, don't you find Russian intriguing?

Many aspects of the two languages are dissimilar. However, the main differences are found in their alphabets and grammar systems.

Grammar

The word order in English is fixed, whereby the meaning is established via the addition of auxiliaries and other words. The words move within a specified boundary. In Russian, the meaning is conveyed by the changes made on the constitution of the words such as by adding suffixes or prefixes or through inflection. For an English speaker, you have to forget verb conjugation if you're studying Russian. There are fewer tenses in Russian compared to English but Russian has many more cases.

A noun's case determines the role that it will play within the sentence.

This involves the changes made on the words' endings based on their functions in the context of the sentences. In Modern English, you'll find three

cases subjective (her/him), possessive (hers/his) and objective (her/him). The Russian grammar has six cases:

-Nominative case – also called the dictionary form or the initial form. It responds to the questions what or

-Genitive case – somebody or something refers or belongs to something or somebody.

-Dative case – shows that something is addressed or given to an object or a person.

-Accusative case – describes the action's object.

-Instrumental case – defines an instrument used to make something

-Prepositional case – used to indicate an object, person or place is an object of thought and speech. This particular case uses a preposition all the time.

The Russian grammar system is based on the concept that an action is either completed or not completed. It is shown by the addition of affixes to the verb stem since they do not have too many auxiliary verbs. Thus, English has no need to inflect or affix because of the existence of various auxiliary verbs as well as perfect tense and progressive forms. The Russian language has articles but often omits them. Instead, Russian nouns have gender. Three genders are used – masculine, feminine and neutral (neuter). It is easy if the words refer to physical gender, such as mother or father. Objects are trickier since the user has to know the object's gender to form the word correctly. It's a good thing that the noun's spelling denotes its gender. If the noun is the subject of the sentence, it will be in the nominative case (or dictionary form), which means it is easier to know its gender. If the noun is found in a different part of the sentence, the ending is changed to fit the case, using the following guidelines:

Check the word's last letter:

1. Masculine – ends with *й* or a consonant

2. Feminine – ends with *я* or *а*

3. Neuter – if the word ends in *е* or *о*

4. Either feminine or masculine – if the word ends in the soft sign, ъ

For Russian language learners, it is vital to memorize the words and the genders, since the assignation of the gender is often arbitrary. There will be times when the noun's gender is related directly to the gender of the object or thing it refers to.

Alphabet

English uses the Latin alphabet. On the other hand, Russian uses the Cyrillic script to form the Russian alphabet, which consists of 33 letters. Some of them have the same sounds as the letters in the English alphabet but the way they are written can be confusing because it is an entirely new alphabet.

Phonology

The Russian language has five vowel sounds. It does not differentiate between long and short vowel sounds. English has 12 vowel sounds, distinguishing the 7 short sounds, 5 long sounds and the 8 diphthongs. Russians find it difficult to pronounce the *cur* and *her* sounds, especially with words that start with the letter *W* such as *worth*, *work* and *were*. Russians are also not able to differentiate between the sounds created by words like *sit* and *seat* or *set* and *sat*. In terms of consonants, English and Russian have the same number but they are not similar in sounds. The Russian language does not have the /ð/ and /θ/ sounds, so they find it difficult to pronounce words like *clothes*, *then* and *thin*. And like the Germans, they have difficulty when pronouncing English words with /v/ and /w/. Russians also find it hard to produce the *ng* sound at the end of some words such as *thing*, *bang*, *belong*, *oblong* and so on. Russian is phonetic therefore the pronunciation is determined by the spelling. How the word is spelled defines how it is pronounced.

Sentence structure

Several rules apply when English sentences are structured. Moreover, English allows word order to be shifted. Russian sentences are more free flowing. Similar to English, words can be placed at different locations within a sentence to emphasize specific elements. However, this is different from English in that the point of the sentence is not lost even if the words are moved within the sentence. English speakers find it difficult to understand this rule when they first encounter it.

Specific words to stress a point

English and Russian are similar in that they both have words with several meanings and several words whose meanings are the same. However, the Russian language has specific words that are only used in a sentence to make a point. They do not have equivalents in English. These tricky words make translation difficult, since what they have to *translate are not the words* but the intent.

Fewer prepositions

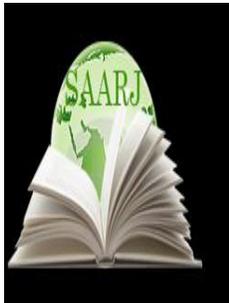

It is a good thing that there are only a few prepositions in Russian since they have various meanings. Otherwise it would be very difficult to translate them effectively. English speakers find this very difficult to understand because they are more used to specific orientation in space and time. It's customary for English speakers to be more precise when describing locations, thus prepositions are typically used.

Russian spelling is easier

Irregular spellings and homonyms are part of English grammar, which cause confusion among English language learners. Russian spelling on the other hand is simpler and easier as it's phonetic and intuitive. What you have to learn is the Russian alphabet and the distinct sound each letter makes. Once you have mastered this, it is very easy to spell words in Russian. These are the major differences between these two distant cousins – English and Russian. The differences are so great that learners of either language will find initial difficulty when they first encounter the language. As usual, everything will depend on the determination of the student to learn Russian or vice-versa. Russian is not an easy language to learn if you are an English speaker. If you need help with proper communication for whatever purpose, get in touch with us at Day Translations, Inc. We are a professional language services company that offers a full suite of services, including Russian interpreting and Russian translation services. Our native-speaking translators live in-country, assuring you that they understand the right nuances of the language.

INTRODUCTION

Existing national resources in languages - it is natural that units have a direct stylistic color, which indicates that language units are directly related to a particular functional style. Thus, any language resource carries some stylistic load, so it is appropriate to call it a "stilema" .

Styles serve to make communication in a language more colorful, expressive, colorful, and understandable, and are inextricably linked to functional styles in languages with the presence of such stylistic loads on them.

Associated with the various layers stilemas' talk to their structural role in the system - semantic and communicative-pragmatic aspects of the dialogue, the role and importance of the implementation of a separate branch of linguistics - teaching stylistics.

Stylistics is divided into phonetic, lexical, morphological, syntactic stylistics, etc., based on language layers. Stylistic departments have their own objects of examination. Our study is

devoted to the stylistic features of compound sentences, and this issue is one of the most complex problems of syntactic stylistics (see Mamajonov, 1990, 1993).

The problems of syntactic stylistics have long been studied with great interest by scholars in general linguistics.

In Turkic studies, a number of articles and monographs on the problems of syntactic stylistics were created, it was included in textbooks, and some dissertations were defended.

The study of the problems of stylistics of linguistic units in Uzbek linguistics has been in the focus of attention of our linguists since the 60s of the last century. As a result, articles, monographs, textbooks and manuals on the stylistics of the Uzbek language were published.

Given the paucity of work on compound sentence stylistics in comparative and general linguistics, and the lack of complex research work, we aimed to provide a systematic coverage of comparative stylistic issues of compound sentences, a problem of general syntactic stylistics relevant to our time.

In this paper, we present the results of our observations on the following issues related to the comparative and general stylistics of conjunctions:

1. Stylistic means, expressed at the syntactic level by means of joint sentences - definition of a separate layer, system of stilemmas; Identify structural-semantic types of stilemmas expressed through compound sentences;
2. Identify communicative-pragmatic types of stilemmas expressed through compound sentences;
3. Development of principles and methods of comparative analysis of stilemmas expressed by compound sentences;
4. To give a comparative analysis of stilemmas expressed in compound sentences in English, Uzbek and Russian;
 1. To reveal the similarities (isomorphic) and dissimilar (allomorphic) aspects of stilemmas expressed by compound sentences in comparable languages and to identify, highlight and draw appropriate conclusions on the factors that require such aspects;
 2. Development of recommendations for solving linguodidactical and translational problems of stilems expressed through compound sentences;
 3. To create the basis of the general stylistic theory of stilemmas expressed by compound sentences on the basis of comparative-typological analysis.

Given that there are 5 functional styles in any language, including English, Russian, and Uzbek, it makes sense to limit the research to syntactic-stylistic figures used in compound sentences and their function and use of compound sentences in speech styles. therefore, when studying the above-mentioned problems of compound sentence stylistics, it is not enough to look at only one or two speech appearances, but to try to refer to all speech styles equally for factual evidence and directly to the method of comparing language and speech units, which is the main method of stylistics. relies on.

It is known that any speech unit has at least two participants:

1) the author of the speech, i.e. the addressee.

2) the recipient, i.e. the addressee. The existence of these participants requires that there be a specific organic relationship between them, and that this relationship is reflected in an appropriate legal form. The existence of such a connection, which is made through the text of any speech, has been emphasized by many scholars.

Each published book or manual "addresses the reader on his behalf as a speaker and expects an appropriate response from him." It follows that any unit of speech, that is, a unit of communication, has at least two functions:

1) express an opinion about a particular event

2) to demand or cite an attitude to that idea. These two ministers of speech units are inextricably linked, and one cannot perform any function without the other - there is no communication without their interdependence. The first task is performed by the author of the speech. As a result of the realization of the attitude to the thought expressed through the unity of speech to one degree or another, the decisive third function of speech - the influence, "awakening" or "arousal" - is observed. This is a stylistic task and is the ultimate goal of speech - communication.

The stylistic task is characterized by the awakening and manifestation of feelings and moods such as contentment or impression, pleasure or excitement, sadness or joy, from the thought expressed by the writer in the reader.

The stylistic function, expressiveness and figurative possibilities of large linguistic units, including syntactic units and constructions, have not been studied in detail in linguistics.

The joint sentence is characterized by the breadth of the scope of content, the diversity of the means of binding, their richness in different stylistic colors. In such constructions, there is a unity of ideas that is one with each other and requires each other, through which different pieces of meaning and content, as the author intends, clearly and fully express the purpose of his communication.

The formation of compound sentences is directly related to the possibilities and achievements of thinking. As a result of the diversity of natural and social phenomena, the identification of complex relationships between them, the process of interpreting these phenomena expands, and advances in science and technology begin to have an impact on speech styles. In this way, different types of compound sentences begin to be used in different speech styles (Mamajonov, 1991, pp. 11-16).

Syntactic units, including compound sentences, are constructed based on specific constructive and communicative requirements. These requirements are primarily related to the logical and grammatical aspects of the language. As a result of their combination, a definite goal is achieved, the purpose of the communication is realized, a joint sentence is formed. Russian scientist MV Lomonosov explained the formation of compound sentences as follows:

Simple ideas (sentences) become compound sentences as a result of connecting the subject through one connector or their semantic connection. (Bogoroditsky, 1935, p. 354; Askarova, 1960, pp. 5-6).

The formation and emergence of types of compound sentences occurs according to their stylistic nature, based on the principle of selection of compound sentences related to any particular functional style. The following syntactic constructions

Let's compare compound sentences: For example:

- 1) In the evening, people started coming home from work (in English: The dusk fell, the people began to flow into their homes. In Russian: Вечер наступил, люди начали расходиться по домам).
- 2) It was evening and people started coming home from work. (In English: The dusk fell and the people began to flow into their homes; in Russian: Вечер наступил и люди начали расходиться по домам).
- 3) In the evening, people started coming home from work. (In English: As the dusk fell, the people began to flow into their homes; in Russian: Так как вечер наступил, люди начали расходиться по домам).
- 4) In the evening, people started coming home from work. (In English: The dusk having fallen, the people began to flow into their homes; in Russian: С наступлением (после наступления) вечера люди начали расходиться по домам).
- 5) As the evening fell, people started coming home from work. (In English: Because of the falling dusk, the people began to flow into their homes; in Russian: Связи с наступлением вечера люди начали расходиться по домам).

Conjunctions in modern Uzbek. Tashkent. 1960. Pages 5-6.

When we compare the above syntactic constructions, we see that they are very close to each other in terms of general content, i.e. there is a cause-and-effect relationship between the components of a compound sentence. However, each of the above syntactic constructions is characterized by the fact that the compound sentence type has specific semantic and grammatical features, including the absence of a connective in sentence 1, the presence of an equal connector in sentence 2, the presence of a follower in sentence 3, the specific intonation of components, 4 - The presence of followers in English and Russian in 5 sentences, and the presence of a common syntactic construction in Uzbek as a joint sentence, as well as a direct reflection of reality of different capacities.

The fact that the above types of conjunctions and other devices close to them express a common idea of the content and differ from each other shows that we are able to select and apply the desired type in a particular speech situation, as well as to achieve the desired stylistic load.

Adherence to the principle of choice is based on the semantic and stylistic side of syntactic constructions, a specific contextual requirement, or rather a communicative intention - emerges inextricably linked with the subject. This is primarily due to both the constructive and communicative appearance of the text and the nature of the speech style.

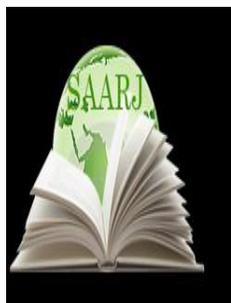

In languages, conjunctions are a very necessary and most convenient means of expression, not only for written but also for oral speech. Invariant types of compound sentences are syntactic constructions specific to all languages. Such constructions are large syntactic constructions resulting from the development, refinement, and complication of linguistic phenomena. A

compound sentence is the result of a set of important stylistic possibilities that can fully express the essence of language as a means of communication.

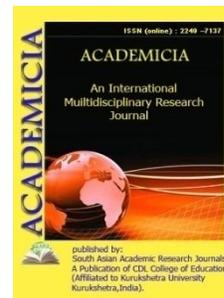

The possibilities of expressing ideas and communication in languages are not limited. These possibilities expand in direct connection with the level of development of human thinking, because the deeper and broader the thinking of the speaker (writer), the more different types of conjunctions are used in his speech, or vice versa, that is, conjunctions in the speech of people with disabilities diversity and diversity may also be somewhat limited.

ABSTRACT

On the basis of systems thinking, intelligent research methods have been developed for pressing briquette material by constructing a mathematical and computer model of the material compaction process. The apparatus of the installation for studying the process of pressing the material (fine coal fractions) has been developed. The first level of the pressing process deals with the production line for preparing and compacting the material. The second level of the hierarchy includes devices of the technological line, including the device for pressing the material. Starting from the second level of the hierarchy, a material compaction apparatus is considered, in the form of a material compaction plant, where one of the abstract indicators is the material compaction coefficient. The technique of the experiment in the apparatus of the material pressing plant is presented. On the basis of the main parameters of the process of pressing the briquette material revealed during the experiment, a mathematical model was developed in the form of a system of equations. On the basis of the developed mathematical model, the starting characteristic of the material compaction apparatus is studied, which characterizes changes in the relative density of the compressed material. The change in the density of the briquette during the compaction of the material for the installation is equal to 0.25, while the density of the material increases from 600 to 724 kg / m³.

INTRODUCTION

On the basis of systems thinking [1,3], the technological line and apparatus for obtaining briquettes from a mixture of coal waste have been studied. A multilevel hierarchical structure of system analysis [4,6] of the apparatus for compacting briquette material has been developed. At the same time, each level of the hierarchy encompasses elements - quasi-devices and the processes occurring in them. According to the proposed method [4], the indicators are initially determined - the input, output parameters of the object - the pressing apparatus, consisting of the system and the process occurring in the system. Then, the considered system (element) is divided into constituent elements, the parameters for each selected element - quasi-apparatus - are specified.

We have developed an apparatus for the installation for studying the process of pressing material (fine coal fractions).

In this machine, the first level of the pressing process deals with the process line for the preparation and compaction of the material.

The second level of the hierarchy includes the apparatuses of the technological line, including the apparatus for pressing the material, they have their own input and output technological parameters, in the next hierarchical level are the elements of the apparatus and the material; in the next hierarchical level, material elements are components.

Starting from the second level of the hierarchy, a material compaction apparatus is considered, in the form of a material compaction plant, where one of the abstract indicators is the material compaction coefficient.

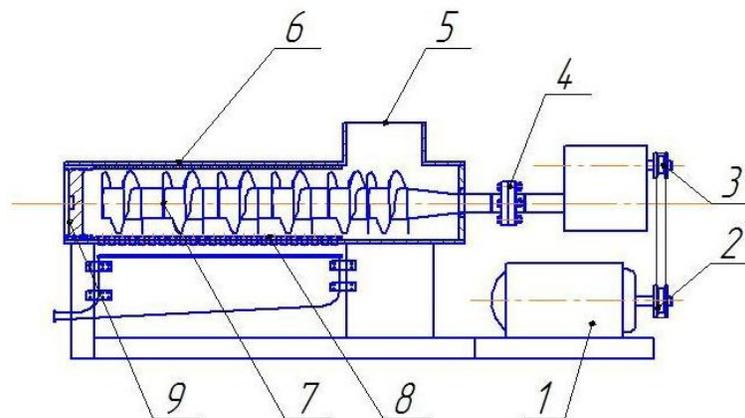

FIG. 1 APPARATUS FOR THE STUDY OF THE COMPACTION PROCESS BY PRESSING THE MATERIAL

1-electric motor, 2-driven pulley, 3-driving pulley, 4-clutch, 5-product inlet hopper, 6-cylindrical casing, 7-auger, 8-pulley devices, 9-intermediate dispenser.

Main section

On a semi-industrial installation for studying the process of compaction of a material mixture.

The apparatus of the installation for studying the process of pressing and compaction of a material mixture is shown in Fig. 1.

The experimental setup consists of an apparatus and a drive part.

The working chamber of the apparatus is made in the form of a cylinder with an annular surface. A shaft is installed inside, on which the auger is put on, with sealing dimensions of the pitch of the turns and diameters. At the end of the cylinder there is a bearing and seals for sealing the auger shaft. There is a washer on the other end of the shaft to keep the shaft centered. The initial part of the cylinder has a branch pipe for feeding raw materials coming from the tray, at the other end of the inner part of the cylinder there is a meter thread, where a ring with a handle is installed. The ring has an external one-meter thread to provide a gap between the last turn of the auger and the horizontal cylinder.

The experiment in the installation was carried out as follows: when loading the goods, the gap between the horizontal cylinder and the auger was maximized. By twisting the cutting ring towards the augers, the gap between the auger and the conical surface is reduced until a briquette is obtained with a thickness of 3-4 mm after pressing. At the exit from the press, the density of the briquette was $724 \text{ kg} / \text{m}^3$.

In this case, at the first level of the hierarchy, a semi-industrial apparatus for compacting briquette material is considered. Continuing the previous systemic thinking [2], in this work, the apparatus for pressing briquette material itself is brought to the fore, its input and output parameters are determined. The main parameters of the object of compaction of briquette material are the input parameters: consumption G_{in} of material for bracketing with a certain ratio of components, energy N ; outgoing parameters: consumption G of the outgoing briquette material and its compaction, when calculating the change in the volume of briquette material in quasi-compaction devices, the influence of the material compaction ratio is taken into account. The coefficient is expressed in a unit of measurement in $\text{kg} / \text{m}^3 \cdot \text{s}$.

In the second hierarchical stage, the working area of the apparatus is considered. In the third hierarchical stage, the main quasi-devices of the working area of the apparatus are specified in the form of a cylindrical conical body, a screw shaft and a briquette material.

In the fourth hierarchical level, the briquette material can be represented by quasi-apparatuses, these are the components of the material.

On experiments in the apparatus of a semi-industrial installation for pressing briquette material:

The experiments in the installation were carried out as follows: at the beginning of loading the goods, adjusting the gap between the inner surface of the cylinder and the auger, a cake petal with a thickness of 3-4 mm was obtained after pressing. After establishing stable operation of the installation, the consumption of briquette material was $160 \text{ kg} / \text{h}$. Basic measurements were taken. In a series of experiments at the exit from the press, the voidness of the briquette material decreased from 25% to an average value of 8%. The temperature of the cylinder was within the normal range ($40 - 70 \text{ }^\circ\text{C}$), the cylinder was cooled by air convection.

Let us consider the construction of mathematical and computer models of the process of pressing briquette material in the apparatus of a semi-industrial installation.

By analyzing quasidevices on the basis of systems thinking, considering the balance equations of the process and characteristics of the material and the apparatus, mathematical and computer models of the material compaction process are built

For the process at the hierarchical level of the briquette material, taking into account the research carried out in [2,3], a mathematical description of the influence of the supplied energy in the form of pressure exerted by the screw shaft of the apparatus on the briquette material located in the space between the tapered tube with the screw shaft is written. The supplied energy influences the compaction coefficient k , this is an independent work and will be studied separately. The equation for changing the void in the composition of the volume of the briquette material is written in the form:

$$\frac{dV_1}{d\tau} = k \cdot V \cdot X_1 \quad (1)$$

It is shown here that the mass of the material volume depends on the residual concentration of leakage X in the material and the coefficient k due to the compression of the material volume. Taking into account this dependence (1), the material balance equation for the compressible volume of the material in the pressing apparatus is written in the following form:

$$\frac{dV}{d\tau} = (G_0 \cdot X_0 - G \cdot X - k \cdot V \cdot X) \quad (2)$$

Here, G_0 is the flow rate of the incoming material, G is the flow rate of the outgoing material, X_0 is the initial concentration of leakage in the material, X is the concentration of leakage in the outgoing material.

The volume V of the material in the working area of the apparatus can be written by the equation, as multiplying the volume of the material V_0 to the density concentration $(1-X)$ in it, in the form:

$$V = V_0 \cdot (1 - X) \quad (3)$$

Then, equation (2) is transformed to characterize the concentration of leakage in the output material, in the form

$$\frac{dX}{d\tau} = \frac{1}{m_0} (G_0 \cdot X - G \cdot X - k \cdot V \cdot X) \quad (4)$$

Also written are equations for determining the volumetric flow rate of the outgoing pressed material G and the equation for determining the volumetric flow rate G_m of the outgoing briquette.

The equation for the volume of dry material is written as

$$V_c = V_0 \cdot (1 - X_0) \quad (5)$$

Considering that the mass flow rate of dry material at the beginning and end of the apparatus will be the same, you can write the equation

$$G_0 \cdot (1 - X_0) = G \cdot (1 - X) \quad (6)$$

then the equation of the volumetric flow rate of the material at the outlet of the apparatus has the form

$$G = G_0 \frac{1-X_0}{1-X} \quad (7)$$

or the equation of the volumetric flow rate of the material at the beginning of the process.

$$G_0 = G \frac{1-X}{1-X_0} \quad (8)$$

Taking into account equations (5-8), rewrite equation (4) in the form:

$$\frac{dX}{d\tau} = \frac{1}{m_0} (G_0 (X_0 - \frac{(1-X_0)}{1-X} X) - k \cdot V \cdot X) \quad (9)$$

As a result, a mathematical model of the briquette material pressing process was obtained in the form of a system of equations:

$$\begin{cases} \frac{dX}{d\tau} = \frac{1}{m_0} (G_0 (X_0 - X) - k \cdot V \cdot X) \\ G = G_0 \frac{1-X_0}{1-X} \\ G_m = G_0 \frac{X_0 - X}{1-X} \\ k = f(N, d, l, S, G_m, G_{cm} \dots) \end{cases} \quad (13)$$

Computer equations have been compiled using the MATLAB application program, in particular, for example, for the material balance equation for the material pressing process in the form,

$$(u(4) * (u(5) - ((1-u(5))/(1-u(1))) * u(1))) - u(3) * V * u(1)) / u(2) \quad (14)$$

A computer model of the entire material pressing process, obtained on the basis of a mathematical model (13), has the following form:

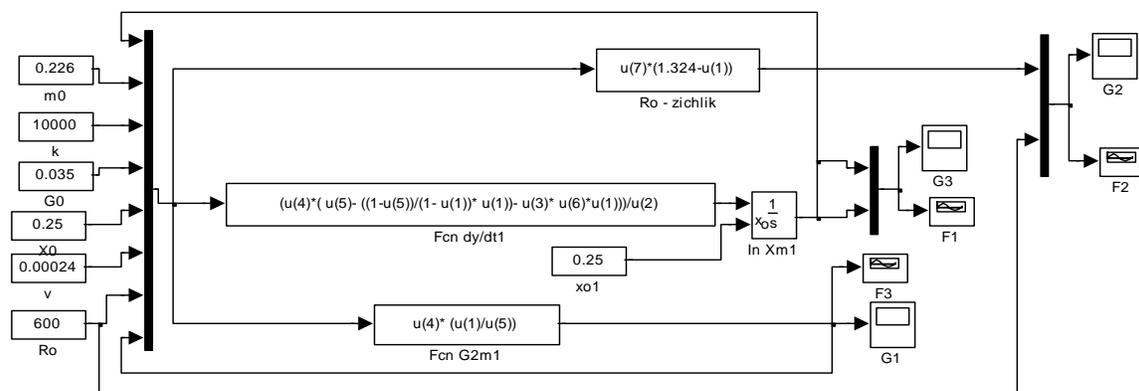

FIGURE: 2 COMPUTER MODEL OF THE COMPACTION PROCESS OF BRIQUETTE MATERIAL IN THE APPARATUS

In fig. 2. presents a computer model of the compaction process of briquette material in the pressing apparatus. The computer model consists of several blocks, on the left side are shown blocks for the introduction of the main input parameters. As you can see, this is the mass of briquette material. The mixture of the volume of the briquette material had a mass of 0.226 kg, the material consumption was in the range of 100 - 160 kg / h. Or translating it into a second

expression, 0.0035 kg / sec. A mixture of material with an average looseness of 0.25 or 25 percent of the mass of the material is found at the input summarization block. The values of the calculated indicators of the density of the outgoing material and the flow rate of the outgoing material returning from the integration side also come here, all these 6 parameters are included in the calculation unit under the integral expression presented by equation (13), the integration calculates the concentration of leakage in the outgoing material, above is the block for determining the density of the outgoing pressed material, below there is a block for determining the volumetric flow rate of the outgoing pressed material, and even below the block for calculating the volumetric flow rate of the outgoing squeezing air. The signals from these blocks go to the signal generalization block and they - the output parameters are fixed in the blocks of indicating and recording elements.

These are blocks A3 and block f1. The computer model works as follows. Input parameters are entered into the computer through input parameter blocks. Including, in the input parameters is the coefficient of pressing of the material characterizing the degree of reduction in the density of the material. This is, on a computer model, an equation expressed by multiplying the compression ratio by the concentration of leakage in the output material. Given the values of the compression ratio of the material mixture, it is possible to analyze the changes in the outlet concentration of its looseness using the method of directed random search. By varying the value of the compaction ratio, and comparing the values of the outgoing leakage concentration on a computer model to the result of an experiment obtained in a semi-industrial installation. The results of computational experiments on a computer model are shown in the following figures.

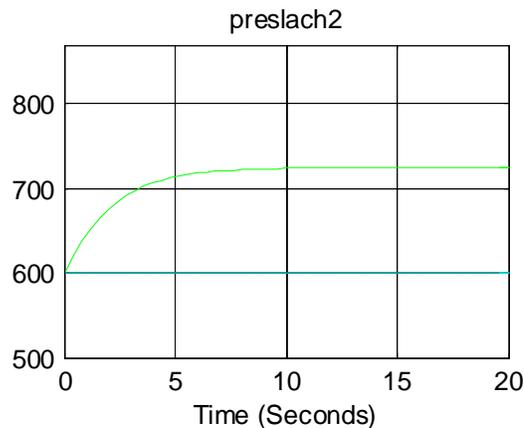

FIGURE: 3. CHANGE IN THE DENSITY OF THE BRIQUETTE ACCORDING TO THE START-UP TIME OF THE PRESSING APPARATUS, WITH A PRESSING RATIO EQUAL TO 10000 KG / M³ · S.

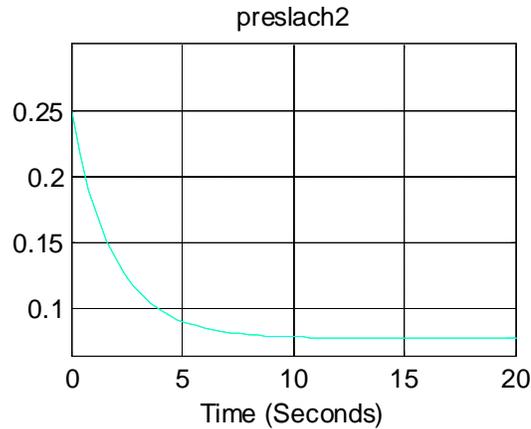

FIGURE: 4. CHANGE IN THE RELATIVE DECREASE IN THE LOOSENESS OF THE MATERIAL BY PRESSING TIME AT A PRESSING RATIO EQUAL TO 10,000 KG / $M^3 \cdot S$.

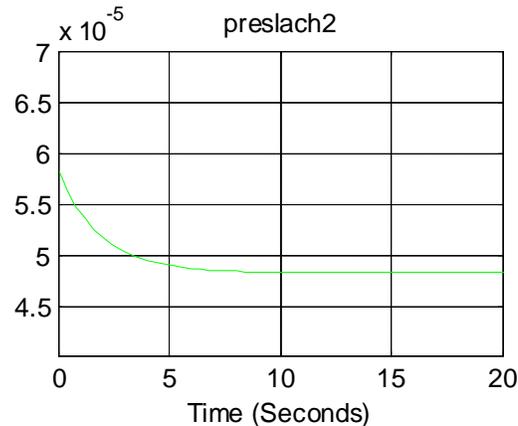

FIGURE: 5. CHANGE IN THE DECREASE IN VOLUMETRIC FLOW RATE, STARTING OUTPUT OF BRIQUETTE MATERIAL, IN TERMS OF PRESSING TIME AT A PRESSING RATIO OF 10,000 KG / $M^3 \cdot S$.

Figure 3 shows the change in the starting characteristic of the pressing device, which characterizes the changes in the density of the briquette according to the start-up time of the pressing device, with a pressing ratio of 7100 kg / $m^3 \cdot s$. In fig. 4 the relative decrease in the looseness of the outgoing material by pressing time. Figure 5 shows changes in the volumetric flow rate of the outgoing material. As can be seen from Figure 5, with the recovery factor k equal to 10,000 kg / $m^3 \cdot s$, the flow rate of the outgoing material from the initial value of $5.88 \cdot 10^{-5} m^3 / s$ decreases to $4.88 \cdot 10^{-5} m^3 / s$. The volumetric consumption of material gradually decreases and stops. As you can see, according to the results of experiments on a computer model of the pressed object, according to the change in all parameters of the material, the system mode is stable.

CONCLUSION

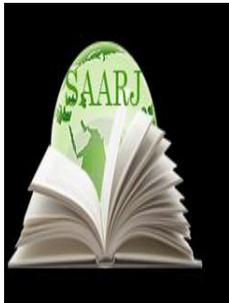

The apparatus of pressing the material of a semi-industrial installation is analyzed by systems thinking. A computer model of the process of pressing the volume of material made it possible to analyze the starting characteristics of the pressing apparatus, changes in the density of the outgoing material up to 0.08, volumetric flow rate of the material, etc. Experiments on a computer model and comparing them with the results of experiments on a semi-industrial plant determined the value of 0.06 of the density extraction coefficients for an industrial plant for pressing the volume of material. In this case, the material consumption decreases from 0.0035 kg / s to 0.00136 kg / s. The consumption of the obtained density is 0.00214 kg / s.

SYNONYMOUS PAIRS OF LEXICAL UNITS

Shirinova Nargiza Djabarovna*

*Senior Lecturer,
 Military-Technical Institute of the National Guard,
 Republic of UZBEKISTAN

ABSTRACT

In the article, the author considers pairs of such vocabulary units, which in lexicology are usually defined as doublet forms, absolute or complete synonyms. The main idea of the publication is that, by examining such lexical pairs, to show such functional properties of their members, which would make it possible to abandon the characterization of such units as absolutely identical, doublet. On the material of English nouns, marked in special publications and dictionaries as absolute synonyms, we show that in many cases there is a differentiation of members of lexical pairs, leading them beyond the limits of doublet units. It turns out that in the process of functioning, many absolute synonyms not only do not disintegrate, as linguists predict, due to the semantic and formal redundancy of such linguistic forms, but exist for a long time without experiencing a desire for transformation. Apparently, there are factors (reasons) in the language that contribute to the functioning of absolute synonyms. Analysis shows that the set of doublet forms of factors supporting the existence is specific for units of a terminological character, on the one hand, and for absolute synonyms of a commonly used character, on the other.

KEYWORDS: *Absolute Synonym, Lexical Doublet, Functional Characteristics, Lexical Unit.*

INTRODUCTION

As you know, characterizing the specifics of lexical synonymy, experts, noting some discrepancy in the properties of synonyms (the presence of semantic and expressive-stylistic "shades" in their use), also distinguish such lexemes in which there are no such shades, and call them absolute or complete synonyms, lexical doublets. Researchers usually accompany the analysis of such units with remarks that with the passage of time they either disappear (more precisely, one of the

members of a doublet, sometimes a triplet disappears) or differentiate both semantically and expressively stylistically.

However, literally hundreds of complete synonyms cited in special studies indicate that lexical doublets have existed for a long time and do not experience any desire for transformation. Apparently, there are factors (reasons) in the language that contribute to the functioning of absolute synonyms. Analysis shows that the set of factors supporting the existence of doublet forms is specific for units of a terminological character, on the one hand, and for absolute synonyms of a common character, on the other. Terms-doublets based on the material of linguistic terminology from the point of view of functional properties were considered by us earlier [1]. Here, attention will be paid to the common nouns, presented in scientific research and dictionaries as absolute synonyms.

So, the factors supporting the functioning of doublet forms among non-terminological nouns include: 1. The presence of an internal form perceived by native speakers as opposed to a joint of either a foreign language origin, or native English, but in which the internal form (motivation) is obscured. For example: advance - prepayment, applause - applause, bibliophile - book lover - book people, argument - proof - justification, strike - strike, cannibal - cannibal, column - column (numbers), Muslim - Mohammedan, octopus - octopus - lamprey, situation - setting, century - century and so on. 2. Articulation-acoustic advantage of one of the joints. This reason generally fits into the principle of saving labor energy in speech processes. For example, one of the doublet units has a noticeably smaller number of phonemes, and sometimes even whole syllables: applause - applause, advance - prepayment, strike - strike, octopus, argument - proof - justification, century - century, sweet tooth - sweet, marvel - a curiosity, mackerel - mackerel, layering - bedding, navigator - navigator, family - family, base - foundation (theories), hippopotamus - hippopotamus, darkness (flies) - abyss, silence - silence, boundary - border, a sorcerer is a magician, a Latvian is a Latvian, a puma is a cougar.

In the last pair there is a gaping of vowels, which is not pronounced for the English language, and in the pair hippopotamus - hippopotamus, the second word is generally cacophonous and clearly needs hapology. Wed very convenient in pronunciation, opposed to the forms of cougar and hippos, their doublet joints: puma, hippopotamus. 3. Limitations in valence (compatibility, environment). Family is a family. Explanatory dictionaries of the English language define the word family by reference: the same as family in the meaning of 'a group of close relatives'. But members of this lexical pair can appear in mutually exclusive environments. Thus, a family cannot function in official documents, where the family is normal: Large families will receive subsidies. The head of the family. Family members. Cannibal is a cannibal. In the contexts of English fairy tales, Koschey the Immortal is not a cannibal, but cannibal. Astronaut is an astronaut. American astronauts and English cosmonauts. But not vice versa .. The lesson is science (something from which conclusions can be drawn). Got a lesson for life; life lesson, learn from the event a lesson; lessons from the past are useful. It is impossible to replace a lesson with science in these environments. However, the reverse replacement is quite natural: his example is a lesson for others; this is a lesson for you; the lesson did not go for the future. Octopus is an octopus. The word octopus has an explicit context limitation: it is not used with culinary lexemes. Canned, pickled, boiled, fried, dried, etc. octopus. However, don't say canned etc. octopus. The moon is a month. Wed interpretation of these words in [2]: Moon ... 1. Heavenly body, satellite of the Earth ... Month ... 2. Heavenly body, moon. Let's note the main

limitations in compatibility: fell from the moon (but not from the month); tides are a consequence of the attraction of the moon (but not the month). Also, the designations in the following combinations are not subject to duplication: lunar calendar, astronauts landing on the moon, flight to the moon, etc.

4. Different word-formation activity and word-formation function of the years. So, according to the Word-Formation Dictionary of the English Language A.N. Tikhonov [3], cf. for example, the derivational activity of the members of the doctor-doctor pairs: the nest with the original doctor contains five derivatives (doctor, doctor, doctorate, doctoral, doctoral), and the nest with the word doctor contains twenty-nine; As can be seen, the member of the doublet doctor, together with his nest, serves a very insignificant part of the semantic field "health care specialist". The entire main body of the nomination in this field rests with its physician articulation; mackerel - mackerel: the first word in the given pair has four derivatives as derivatives - mackerel, mackerel, mackerel, mackerel. From mackerel - only two derived units: mackerel and mackerel; rebellion - rebellion: from rebellion twenty words are formed, from rebellion - ten. Moreover, not a single verb is formed from rebellion, and eight verbs with seven prefixes from rebellion. However, the rebellion makes it possible to form units with a negative and metaphorical meaning, which is not in the nest rebellion: serene, serenity, serenity, serenity. Nonsense is nonsense: if the second word here has no derivatives at all, then nonsense results from nonsense: fool, fool, absurd, foolish, foolishness, fool, fool, fool; border - border: border - six derivatives, border - eleven.

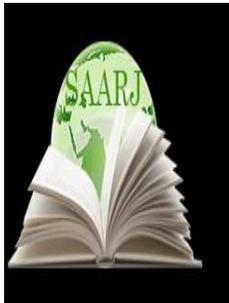

Here it is appropriate to say about one more type of derivational activity: the participation of doublets in the formation of phraseological units. The participation of doublet forms in such processes certainly contributes to the preservation of one or another element of the doublet pair in a static state. For example, lexemes: abyss - darkness (meaning 'a lot') are involved in the formation of phraseological units to the abyss, darkness is so (obsolete), darkness is dark. According to the data of the Phraseological Dictionary of the English Literary Language [4], in a couple of centuries - century the first term is found in twenty-three phraseological units, the second component of phraseological units is not. The doublet form border (border - border) forms eight phraseological units, road - path articulated for two participate in the derivation of ten idiomatic units. 5. Different implementation of the possibility of metaphorical and other semantic transfers. If a polysemantic word contains a doublet joint as one of its meanings, then other meanings "hold" it, according to the laws of association, not allowing the speaker to leave the consciousness of the native speaker, even if the doublet is ready for this departure for various reasons. So, in a couple of centuries - a century the first word has six meanings [5], the second only two [2]. In the following pairs, doublets also have a different number of meanings: original - original, situation - setting, steeplejack - high-altitude, abyss - darkness, twist - meandering, cannibal - cannibal, border - border, road - path, column - column (numbers), advance payment - prepayment, etc.

The analysis of the given doublet units, as we see, shows that none of the members of the pairs of complete synonyms possesses all the listed properties and functions. The exception here is the need to diversify the text in order to avoid tautology. Of course, all synonymous language means have this function. However, this reason, contributing to a more or less stable existence of absolute synonyms, we did not consider in this work because of its obviousness. But in fact, in

each case, we observe the intersection in more or less of several functional characteristics, which creates a certain margin of safety for the preservation of doublet pairs in the language.

**TO DEVELOP STUDENTS' KNOWLEDGE, SKILLS AND
 COMPETENCIES IN THE ORGANIZATIONAL AND TECHNICAL
 ASPECTS OF ESSAY**

Yusupova Tursunay Akhmedovna*

*Associate Professor,
 Candidate of Pedagogical Sciences,
 Tashkent State University of Uzbek Language and Literature named after Alisher Navoi,
 UZBEKISTAN

ABSTRACT

There is a constant need for knowledge, skills, competencies and competencies to teach the content and structure of a text. They can be grouped as follows. It is expedient to divide them into four large groups: a) external organizational and technical aspects of the essay; b) aspects of semantic-logical description of the written work (essay); d) knowledge, skills, competencies and competencies related to the functional and spiritual types of paragraphs in the text; e) writing skills, competencies and competencies.

KEYWORDS: *Epigraph, Typographical Errors, Elementary Grades.*

INTRODUCTION

Theoretical foundations that help to understand text errors and their causes, prevent and correct text errors – provide ample opportunities to allocate relevant knowledge, skills, competencies and competencies for each situation and to plan work on them.

When working on textual and non-textual errors, the principle of a different approach to describing the knowledge related to the structure of the text intended for students is derived: some errors are common, some are one or two of ensure that the student meets only in written work, to consider whether it is present in the curriculum and textbooks, to determine on this basis some theoretical information to be given to young people, some in class and out of class, in other work-related processes practical training measures should also be taken. This arrangement allows you to manage your time and avoid duplication. Numerous sources have been consulted in order to understand the errors in textual errors and their causes, and to study the theoretical foundations that help to prevent and eliminate textual errors. Analysis of sources showed that we have

witnessed A.Aliyev, S. Dolimov, S.Ismatov, Q.Ahmedov, B.Turdiyev, O.Madayev, K.Kasimova, R.Abdulahatova, N.Shukurullayeva, R.Inogomova, and N.Sattorova's dissertations and manuals cover some aspects of teaching students to write essays.

O.Madayev, A.Sobirov, Z.Kholmonova, Sh.Tashmirzayeva, G.Ziyodullayeva, M.Shamsiyeva's textbook "Types of written work: essay, statement, dictation" as a consistent guide to the essay can be cited. It covers the types of written work, theoretical information about the essay, the formation and selection of the topic of the essay, the design of the essay plan and thesis, the selection of the epigraph to the essay, the collection of material, recommendations for writing the essay, the organization of the essay writing process [4]. However, there is almost no information about the nature of typographical errors, their classification and causes.

At the N.Sattorova's dissertation "Improving essay writing skills in students" aims to analyze and make recommendations on teaching 5th class students to write essays [6].

It became clear that the topic, which we want to analyze and develop our recommendations, is studied in more depth in the methodological manual of R.Yuldashev and M. Rixsiyeva "Textual errors in essays, methods of their correction". This manual identifies, classifies, explains, defines the content of knowledge that must be known in the process of writing an essay (text creation), identifies textual errors in the creative writing of high school students, the methodology of work in this area illuminated [1]. This handbook is a great resource for teachers in organizing, conducting, and evaluating not only essays but also other creative work (creative texts, essays, essays).

There is a constant need for knowledge, skills, competencies and competencies to teach the content and structure of a text. They can be grouped as follows. It is expedient to divide them into four large groups: a) external organizational and technical aspects of the essay; b) aspects of semantic-logical description of the written work (essay); d) knowledge, skills, competencies and competencies related to the functional and spiritual types of paragraphs in the text; e) writing skills, competencies and competencies.

When it comes to the *organizational and technical aspects of an essay*, the first thing to consider is the *indention*. Do students have an idea of the indention? The question naturally arises. In response, we cite the following requirements set out in the new edition of the State Education Standard for Primary Education: "*Speech and text, text structure: topic, event details, main idea, conclusion, title, indention, dialogue, monologue, statement, short essay, oral and written work*" [2; 6-p.]. Apparently, the information about the paragraph was studied to some extent by the students up to the 5th class. So, in terms of standards and curriculum requirements, it can be said that students are taught textual knowledge from the elementary grades, and knowledge and skills are formed. The following can be seen about the paragraph of general secondary education in the section "Mother (first) tongue" of the "Integrated state educational standard and curriculum": in the section "Skills" of 7th class noted that [3; 11-p.]. According to the analysis of the programs, the necessary knowledge about the paragraphs did not play a key role in them. This means that in such a case, the teacher should take into account the textual errors that students will make in developing the knowledge, skills, competencies, and competencies they need for the indention. This requires practical work on knowledge, skills, competencies and competencies. First of all, it is important to explain to students the following as knowledge: a) any essay (written work) begins with a indention, b) separates the paragraphs,

they express a specific sub-topic, d) before the dialogue e) start the indentation with a hyphen, e) where the first line (line) of the poem begins on the page, the next lines should be written from the same place, f) if they are classified within the paragraph, each of them should be written from the indentation, g) paragraph if poetic verses are quoted in it and it ends with the author's sentence, it is necessary to make the reader understand as a necessary knowledge that this sentence is not written from the indentation. As a result of this necessary knowledge, the student ***develops the following skills***: a) to determine the inner boundaries of each sub-topic, depending on the points of the plan; b) on this basis, write the first sentence related to the next sub-topic from the indentation. These 2 skills are developed based on 6 concepts that are accepted as knowledge by the student. As a result of these skills, the student develops the ability to start the first sentence of the essay (written work), to write the relevant statements from each indentation, feeling the inner boundaries of each sub-topic and imagining the content based on the points indicated in the plan.

When students are introduced to the knowledge of the indentation, it is important to understand that a sentence cannot be a complete statement. G.Urumbayeva also said that "... monologue is an organized system of ideas wrapped in the form of words", that in a monologue sometimes the whole idea does not fit into one sentence, and therefore a group of interconnected sentences to express and emphasizes the need for it. [7]. In monologue, the theoretical knowledge that sometimes the whole idea does not fit into a sentence and that a group of interconnected sentences is required to express it is typical of 5-6th classes. We recommend that this theoretical and practical knowledge be distributed in a coherent and consistent manner throughout the school year and academic stages, and that it be presented to students in small increments. In the upper grades, the order in which classifications, dialogues and poetic materials are included in the text within the paragraph should be considered as special knowledge, skills, competencies and competencies. We recommend that you use appropriate texts to illustrate these materials.

In the elementary classes, students are given the necessary knowledge about the indentation, a small topic, which they have developed, both theoretically and practically. Therefore, in the upper classes, these theoretical and practical concepts must be restored in memory. To do this, it is advisable to choose one of the texts of 2-3 paragraphs in the textbook and analyze it on the basis of questions aimed at clarifying concepts such as *paragraph, sub-topic*.

In our opinion, in order to clarify this, we must first pay attention to two cases: a) classifications; b) dialogic sentences. We see that the same classification is given in the methodical manual of R.Yuldashev and M.Rixsiyeva "Textual errors in essays, methods of their correction" [1]. We also like this classification, because on the basis of these conditions students have the opportunity to develop skills, competencies and competencies in the organizational and technical aspects of the essay (written work). Of course, in the upper classes, on the basis of texts consisting of paragraphs 2-3, 3-5, 4-7, taking into account the age and level of mastery of students in each class, the concepts of small topics and indentation are restored in memory with the help of questions and answers and practical work. It is also important that the texts are in the genre of prose and poetry, and the theme is colorful. The number of indentation in the text is determined and numbered. Numbers, on the other hand, are named with topics that define what the same paragraph is about. For example, it is possible to work on texts about spring, summer, autumn, winter according to the period. In it, we know that the characters specific to this chapter are reflected in detail in separate paragraphs. It is classified by number and subject based on its

characteristic features. This means that the teacher-student collaboration will help the student to master the technical aspects of the written work and gain practical skills.

When thinking about the organizational and technical aspects of the essay (written work), attention should be paid to another issue - *the development of an essay (written work) plan*. Of course, it is important to focus on small topics when planning an essay. In this process, the following knowledge, skills, competencies and competencies must be developed. First of all, *it is necessary to know* the function of the essay plan, to understand that the topic of the essay is the main topic and that small topics should not go beyond the content of the big topic. Students develop thinking and reasoning skills based on the same topics, imagining what they want to talk about in the essay, and following the logical sequence of ideas in the plan points.

It is a good idea to give students at least 3-4 topics, rather than just make one topic' plan. This is because the student will be able to choose a topic that is more informative and imaginative in the planning process, and will be more free and active in creating the writing plan. They also try not to take advantage of each other. This is an important part of developing independent thinking and individual work skills. In this process, *knowledge* of the function of the essay plan, knowledge that the topic of the essay is the title, the points (parts) of the plan serve the scope and consistency of coverage of the main topic, what the essay (written work) wants to talk about (in each paragraph) to develop *skills* such as imagination and the ability to describe parts of the plan without deviating from the main topic, the ability to independently compose an essay plan and its parts, and the *ability* need to correctly describe-determined.

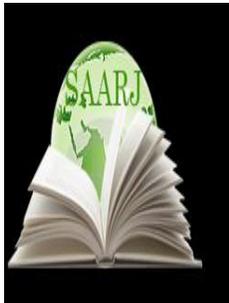

Another organizational and technical aspect of the essay (written work) is *the choice of epigraph for the essay*. Students should choose a wise word, proverb, or piece of fiction for the epigraph according to the topic and idea of the essay, and write it in the right corner before the main text, put the appropriate punctuation mark, and put the author of the piece in parentheses. They will develop *skills* such as the selection of a wise word, proverb and piece of art for the epigraph from the relevant sources as a practical work, from which the process of selecting the topic and the idea of the essay and placing it on the page, while *skills* are being formed. The process of quoting, narrating, or narrating a hadith is the same as choosing an epigraph. This teacher is required to provide students with additional information on how to place them in the text. To do this, the teacher must observe, study, analyze, interpret, and apply the theoretical material studied in literature classes, that is, information about the work, information about the life and creative activity of the writer or poet, take steps to create awareness.

So, when it comes to *organizational and technical aspects of the essay* (written work), first the *indentation*, then *the essay plan*, and finally *the choice of epigraph* for the essay are given to students theoretically and practically, skills are formed, the ability to perform these tasks independently. Students' understanding of and adherence to the organizational and technical aspects of the essay (written work) will help to ensure that the essay is well covered, both technically and in terms of content.

For the student who has mastered the external organizational and technical aspects of the essay, it is necessary to master the rest of its aspects, *the semantic-logical aspects of the essay (written work)*, *functional and spiritual types of indentation in the text and text creation* are facilitated the formation of skills, abilities, and competencies.

ABSTRACT

The association between HP infection and CAH development suggested by the Correa cascade is supported by several cohort studies. To diagnose and determine the severity of atrophy at the Center, patients underwent a serological analysis by ELISA method in the clinical and biochemical laboratory of the State Institution "RSNPMCT and MR". Analyzes were taken in 69 (58.5%) patients, including 35 (50.7%) with CAH, 34 (49.3%) with CNG. Analysis of the non-invasive indicator of the level of pepsinogens in patients with CAH determined that severe atrophy was detected in 20%, moderate atrophy - 42.9%, weak atrophy - 34.3%, and no atrophy was found in 2.9% of patients. The pepsinogen parameters in patients with CNG were also as follows: PG I was within $95.4 \pm 7.2 \mu\text{g} / \text{L}$, PG II 14.5 ± 1.3 and PGI / PGII 6.6 ± 0.2 . Pepsinogen values were more pronounced in patients with CAH: with a pronounced degree of atrophy, PGI was $8.7 \pm 0.1 \mu\text{g} / \text{l}$ and PGI / PGII was 1.1 ± 0.1 ; with moderate atrophy $16.6 \pm 0.9 \mu\text{g} / \text{l}$ and 1.6 ± 0.1 ; with mild atrophy 27.2 ± 1.5 and 2.3 ± 0.2 , respectively.

KEYWORDS: *Chronic Atrophic Gastritis, Chronic Non-Atrophic Gastritis, Pepsinogen, Helicobacter Pylori, Gastric Mucosa.*

INTRODUCTION

Helicobacter pylori (HP) is the main etiological factor for chronic gastritis worldwide, and long-term infection can lead to progressive destruction of gastric glandular patches throughout the stomach, described as multifocal atrophic gastritis, which is characterized mainly by macular lesions of the mucous membrane of the antrum and body stomach [2, 3, 7]. The relationship between HP infection and the development of chronic atrophic gastritis (CAG), suggested by the Correa cascade [10], is supported by several cohort studies [13] and the beneficial effect of HP

eradication in body atrophy, but without intestinal metaplasia, this latter presumably went beyond the "point of no return" [12, 13].

Epidemiological data on the prevalence of CAG in different parts of the world are scarce, and the results are difficult to compare due to methodological differences between studies in terms of the definition and diagnosis of CAG and the studied populations. In studies from Asian countries, the diagnosis of CAG included all atrophic lesions, regardless of the localization of atrophy in the gastric mucosa (GM); In most of the studies conducted in Western countries, the diagnosis of CAG included only patients with atrophic corpus lesions, such as atrophic gastritis with limited corpus or multifocal atrophic gastritis. In addition, various diagnostic methods for the diagnosis of CAG, that is, surrogate serologic markers of gastric function pepsinogen I (PGI) or pepsinogen I / II ratio (PGI / PGII) or histopathology of endoscopic biopsy specimens, make common data incomparable [1, 4, 5]. Serological studies carried out in different parts of the world have shown the prevalence of CAG up to 27% [6, 8]. According to a systematic review [11], estimates of the prevalence of CAG worldwide were 23.9% and 27.0% in the general population and in individual groups, respectively, using serology, and 33.4% in the general population, and 31.6 % in selected groups based on biopsies. An increase in the prevalence of CAG with age was shown in serological studies [9, 11], which was confirmed by an extensive histological study [2, 13].

MATERIALS AND METHODS

To diagnose and determine the severity of atrophy at the Center, patients underwent serological analysis by ELISA method in the clinical and biochemical laboratory of the State Institution "RSNPMCT and MR" using the ELISA apparatus Humareader HS (Human, Germany) using a set of reagents for PGI - IFA-BEST - D- 3762 and for PGII - IFA-BEST - D-3764 (Novosibirsk).

To determine the level of PGI and PGII, a fasting blood sample was taken. The blood was centrifuged at 1500 xg for ten minutes, after which the centrifugate was stored at a temperature of -20°C and further analyzed in the laboratory.

According to the manufacturer's instructions, a PGI $<30 \mu\text{g} / \text{L}$ was taken as a positive marker of gastric atrophy; for inflammation of the coolant, the amount of PGII was considered above $22 \mu\text{g} / \text{l}$; a PGI to PGII ratio (PGI / PGII) less than 2.5 was considered positive for atrophy.

RESULTS

Analyzes were taken in 69 (58.5%) patients, of which 35 (50.7%) patients with CAG, 34 (49.3%) with chronic non-atrophic gastritis (CNG). The prevalence of severe atrophic gastritis of the gastric corpus, determined by the content of PGI and the ratio of pepsinogens PGI / PGII in the blood serum, was 20% in the examined patients. For a weak atrophy of the mucous membrane of the body of the stomach, this figure was 34.3% (table 1.). No obvious fluctuations in the prevalence of atrophic gastritis in men and women were found.

The frequency of severe atrophic gastritis in the group of patients from 45 to 54 years old was 14.3%, 55-64 years old - 18.7% and over 65 years old - 25%. Moderate atrophy was diagnosed at the age of 45-54 years - 42.8%, 55-64 years old - 43.8% and over 65 years old in 41.7% of patients. Mild atrophy was detected at the age of 45-54 years - 42.9%, 55-64 years - 31.3% and over 65 years in 33.3% of patients. In total, severe atrophy was detected in 20%, moderate atrophy - 42.9%, mild atrophy - 34.3%, and in 2.8% of patients, atrophy was not observed. Age

55 to 64 and over 65 years was a risk factor for moderate to mild atrophy of the gastric corpus. The increase in the incidence of atrophy in older age groups did not have gender differences.

TABLE 1 FREQUENCY OF DIAGNOSIS OF COOLANT ATROPHY BY SEROLOGICAL METHOD IN PATIENTS WITH CAG

Age	Atrophy							
	Severe atrophy		Moderate atrophy		Weak atrophy		No atrophy	
	(PGI <9 µg / L), n=7		(PGI =19-10 µg / L), n=15		(PGI =29-20 µg / L), n=12		(PGI>30 µg / L), n=1	
	ābc	%	ābc	%	ābc	%	ābc	%
45-54 years old n=7	1	14,3**	3	42,9***	3	42,9***	0	0
55-64 years old n=16	3	18,8	7	43,8***	5	31,3***	1	6,3
Over 65 years old n=12	3	25.0***	5	41.7**	4	33.3***	0	0
Total (n=35)	7	20.0**	15	42.9***	12	34.3***	1	2,9

Note: * - differences relative to data without atrophy are significant (* - P <0.05, ** - P <0.01 *** - P <0.001)

We investigated the average level of PGI, PGII in the blood serum and their ratio in the examined patients with CNG (n = 34) (Table 2.). At the same time, we found almost no gender differences. Moreover, in all patients with CNG, PG I was within $95.4 \pm 7.2 \mu\text{g} / \text{L}$, PG II was 14.5 ± 1.3 , and PGI / PGII was 6.6 ± 0.2 .

TABLE 2 SERUM PEPSINOGEN LEVELS IN PATIENTS WITH CNG

Gender	PGI (µg / L) M±m	PGII (µg / L) M±m	PGI / PGII M±m
Men, n= 15 (44,1%)	98,5±7,3	15,9±1,1	6,9±0,4
Women, n=19 (55,9%)	92,7±6,1	13,2±0,9	6,2±0,3
Total, n=34 (100%)	95,8±7,2	14,5±0,1	6,7±0,1

Further analysis of the obtained data showed that the content of pepsinogens and their ratio significantly decreased in patients with atrophy of the coolant in comparison with those without atrophy (Table 3). Since the degree of atrophy was assessed by the indicators of pepsinogens, with a pronounced degree of atrophy, the PGI was $8.7 \pm 0.1 \mu\text{g} / \text{l}$ and the PGI / PGII was 1.1 ± 0.1 , respectively; with moderate atrophy $16.6 \pm 0.9 \mu\text{g} / \text{l}$ and 1.6 ± 0.1 ; with mild atrophy 27.2 ± 1.5 and 2.3 ± 0.2 , respectively.

TABLE 3 AVERAGE LEVEL OF PEPSINOGENS IN BLOOD SERUM IN PATIENTS WITH CAG.

Degree of atrophy	PGI ($\mu\text{g} / \text{L}$) M \pm m	PGII ($\mu\text{g} / \text{L}$) M \pm m	PGI / PGII M \pm m
1. Severe atrophy, n = 7	8,7 \pm 0,1	8,3 \pm 0,3	1,1 \pm 0,1
2. Moderate atrophy, n = 15	16,6 \pm 0,9	10,6 \pm 0,4	1,6 \pm 0,1
3. Weak atrophy, n = 12	27,2 \pm 1,5	12,1 \pm 1,1	2,3 \pm 0,2
4. No atrophy, n = 1	70,8	17,4	4

Thus, we can say that the risk factor for both severe atrophic gastritis of the gastric corpus and of a mild and moderate degree was age over 55 years.

DISCUSSION

To date, the world has already developed a certain idea of the serological diagnosis of ARS. Studies by various authors, conducted over two decades, have confirmed that atrophic fundic gastritis can be successfully diagnosed by measuring the serum content of PGI or PGI / PGII (U. Peitz, T. Wex, M. Vieth - 2011). Recent studies show that serological screening using a set of biomarkers can serve as a reliable indicator of precancerous pathology and early noncardiac gastric cancer (NGC) (M. Rugge, 2016; F. Ikeda, 2016; S. Saito, 2017; T. Kotachi, 2017 ; H. Yoon, 2015). Thanks to the national cancer control programs adopted in Japan and mass screening, including serological methods, there is the highest survival rate for NGC in the world, at 53%. In other countries, this figure does not exceed 20%. At the same time, the proportion of detected early cancer in the general structure of NGC patients increases (Zheng, H. 2007).

In studies conducted in the world to study the early diagnosis of atrophic processes of the gastric mucosa, a number of results were obtained, including: it was found that the low PGI level and the PGI / PGII ratio are prognostically significant for the risk of NGC (Belkovets A.V., 2018) ; it was found that the method of early detection of atrophic gastritis by the level of pepsinogens allows to reliably establish the presence of atrophy of the gastric body and assess the degree of its severity (KatchievaP.Kh., 2018); it has been proven that mass screening of serological markers of gastrin - 17 and PGI makes it possible to characterize the risk of formation of coolant atrophy (Khubieva M.M., 2014); it has been shown that chronic gastritis with or without HP infection is a variable process in which mild atrophy of the mucous membrane of the body may appear or disappear, and moderate to severe atrophy rarely regresses, it has also been proven that risk factors for the development of atrophy are age and the degree of chronic inflammation of the gastric mucosa (Stefan Redéen, 2010); It has been found that the use of serum biomarkers such as IgG to HP levels, pepsinogens can reduce the cost and public health burden of screening for HNGC (SomeeJeong, 2017).

In recent years, Uzbekistan has been the subject of many scientific works in the field of gastroenterology. Among them, the prevalence and molecular genetic characteristics of HP in Uzbekistan are shown (Karimov M.M., 2019). The results of the study showed that among patients with diseases of the gastrointestinal tract associated with HP, the degree of infection with Cag-positive strains up to 80% was found in patients with CAG and CNG.

CONCLUSIONS

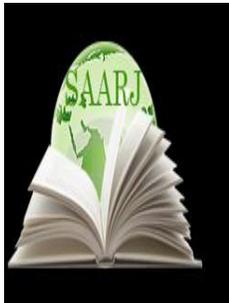

Analysis of the non-invasive indicator of the level of pepsinogens in patients with CAH determined that severe atrophy was detected in 20%, moderate atrophy - 42.9%, weak atrophy - 34.3%, and no atrophy was found in 2.9% of patients. The pepsinogen parameters in patients with CNG were also as follows: PG I was within $95.4 \pm 7.2 \mu\text{g} / \text{L}$, PG II 14.5 ± 1.3 and PGI / PGII 6.6 ± 0.2 . Pepsinogen values were more pronounced in patients with CAH: with a pronounced degree of atrophy, PGI was $8.7 \pm 0.1 \mu\text{g} / \text{l}$ and PGI / PGII was 1.1 ± 0.1 ; with moderate atrophy $16.6 \pm 0.9 \mu\text{g} / \text{l}$ and 1.6 ± 0.1 ; with mild atrophy 27.2 ± 1.5 and 2.3 ± 0.2 , respectively. It was also noted that the frequency of severe atrophy is more common in persons over 65 years of age. No gender differences were found.

Thus, it must be stated that we have revealed a rather high frequency of atrophic gastritis of the gastric corpus in the examined patients. The experience of using serological diagnostics of atrophic gastritis allows us to conclude about the adequacy of the methodological level used for the task. Undoubtedly, serological studies of atrophic gastritis deserve wide application in practical medicine and can undoubtedly replace the morphological diagnosis of the GM.

ABSTRACT

Onion is one of the most important vegetable cum condiment crops of liliaceae family grown in India. India is a traditional exporter of Onion. In 1951-52, the country has exported 5000 tons of onion. India exported 1783820MT of onion during 2008-09 with total value of 283428 ` lakh which is record quantity after the export was canalized through NAFED. The major export destination of onion are Bangladesh, Malaysia, UAE, Srilanka and Nepal.

KEYWORDS: *Liliaceae, Canalized, Competitiveness.*

INTRODUCTION

Onion is one of the most important vegetable cum condiment crops of liliaceae family grown in India. The onion is cultivated and is available to domestic consumer as well as for export, throughout the year. In agriculture year 2008-09, onion accounted for 10.5 percent of the total production of vegetable in country. Around 13565 thousand tones production has been notified during 2008-09 with productivity of 16.3MT/HA. India is a traditional exporter of Onion. Over the years there has been a progressive increase in the export of onion. India exported 1783820MT of onion during 2008-09 with total value of 283428 ` lakh which is record quantity after the export was canalized through NAFED.

TABLE NO 1: MAJOR ONION GROWING STATE, EXPORTING VARIETIES AND EXPORT DESTINATION COUNTRIES.

Major onion growing states	Major exporting varieties	Major export destination countries
Andhra Pradesh, Bihar, Gujarat, Karnataka, Madhya Pradesh, Maharashtra, Orisa Tamil nadu and Uttar Pradesh.	Big - Pusa Red, Agrifound Light Red, N-2-4-1 Agrifound Dark Red, N-53, Nasik Local, Bellary Red, etc. Small – Agrifound Rose, Bangalore Rose, Podisa, Multore, Nattu etc.	Bangladesh ,Malaysia, UAE, Srilanka and Nepal

MATERIALS AND METHODS

Export is key factor to accelerate the economic development as it earns not only foreign exchange but also important for employment generation. The main objectives of the present study was to analyze the export competitiveness of onion. The study was based on the secondary data, collected for the period of last 20 years. The data collected for the period of 1990-91 to 2009-10. divided into two sub periods (i. e. 1990-91 to 1999-2000 and 2000-01 to 2009-10). Data on different aspects required for the present study were collected from the APEDA, NHRDF, NHB, FAO, USDA publications and Directorate General of Commercial Intelligence and Statistics, Government of India.

The export competitiveness was studied using:

$$NPC = \frac{P_d}{P_b}$$

Where, NPC = Nominal protection coefficient

P_d = Domestic price of commodity

P_b = International price or Border price or reference price

The Wholesale price of Bombay market was taken for onion as a domestic price.

When there is no protection given to the commodity its domestic price is equal to its border price and NPC is equal to 1. NPC more than one indicates that protection is given to the commodity and there for trade liberalization would reduce the domestic price: conversely NPC is less than one indicates that commodity is taxed and liberalization would raise the domestic price.

RESULT AND DISCUSSION

In the study, NPC as a measure of assess in competitiveness was used as it measures the degree of protection to the domestically produced commodities NPC is generally estimated and presented in Table No 2.

TABLE NO 2: NOMINAL PROTECTION COEFFICIENT (NPC) OF INDIAN VEGETABLES (2001 TO 2010)

Sr. No.	Year	Onion
1.	2001	0.71

2.	2002	0.33
3.	2003	0.38
4.	2004	0.61
5.	2005	0.33
6.	2006	0.40
7.	2007	0.85
8.	2008	0.53
9.	2009	0.90
10.	2010	0.65
	Average	0.57

Table no 2. revealed that nominal protection coefficient for onion average was much below than unity (0.57%). The result showed that Indian onion prices were about 43 % per cent lower than world prices depicting moderate competitiveness of onion in international market. The nominal protection coefficient ranges from 0.33 % to 0.90%. The NPC highest in 2009(0.90%) and lowest in 2002 and 2005(0.33%).

SUMMARY AND CONCLUSION

The average NPC for onion was less than 1 (0.57) means the crop was export competitive. The export competitiveness of onion (0.57) indicated that there is wide scope for increasing the export.

ABSTRACT

At present, comprehensive research, from various points of view (social, economic, ethical, legal), devoted to the implementation of artificial intelligence technologies in various spheres of society, is of particular relevance. It is important to identify opportunities and threats, to determine the limits of the use of artificial intelligence in practice. The article is devoted to the implementation of artificial intelligence technologies in the field of higher education. The perspective directions of using artificial intelligence in the field of higher education are considered and analyzed. The authors come to the conclusion that artificial intelligence is not at all a competitor to the teaching staff, either in teaching or in evaluating students' knowledge. Artificial intelligence is an auxiliary, but valuable tool that can perform and improve a large number of different operations carried out at the university, help in organizing an effective educational process and building the necessary communications. The effective use of AI technologies in higher education will allow the selection of the most optimal learning strategy, adapted to the individual abilities and needs of students and the needs of the labor market.

KEYWORDS: *Information Technology, Artificial Intelligence, Education, Information.*

INTRODUCTION

In recent decades, the domestic higher education is in a state of constant transformation, caused by the need to integrate into the global educational space, improve the quality of educational services provided, increase the competitiveness of Russian universities in the international arena, as well as the general changes in the socio-economic nature that have occurred in the country. Modern education is being transformed into a mobile and open system. The introduction of information and communication technologies and electronic educational resources into the educational process contributed to the formation of a new paradigm of education.

Currently, there are many artificial intelligence (AI) programs that help in education, thanks to which students, schoolchildren and teachers receive huge benefits. A huge advantage is that the educational platform adapts according to the needs of students. The AI software development system helps scientists work on their weaknesses. During the process, the program detects where the student is having difficulties and sends the necessary materials to improve the skills. Adaptive learning uses a basic artificial intelligence algorithm. In addition, education at any convenient time is undoubtedly a huge plus for the student. Now such programs based on AI are already known.

The essence of digital transformation of education is reflected in the achievement of each learner the necessary educational results through personalization of the educational process based on the use of the growing potential of digital technologies, including the application of methods of artificial intelligence, virtual reality, development in schools digital learning environment; provide public broadband Internet access, big data. The term "artificial intelligence" (AI) was introduced by the American computer scientist John McCarthy in 1956. Artificial intelligence (AI) refers to the ability of intelligent systems and algorithms to perform creative functions traditionally performed by humans. The key task of AI is to intelligently model achievable cognitive processes.

METHODOLOGY

Artificial intelligence (AI) is a scientific field whose tasks are related to the development of methods for modeling individual functions of intelligence using software and hardware. Currently, there are several main areas of research in artificial intelligence.

1. Knowledge representation. In this direction, problems related to the representation and formalization of knowledge in the memory of the AI system are solved.
2. The manipulation of knowledge. Within the framework of this direction, methods of plausible and reliable inference are created on the basis of already known knowledge, methods of replenishing knowledge based on their incomplete descriptions are developed, methods of reasoning are proposed, which in turn rely on knowledge and recreate the features of human reasoning.
3. Communication. The range of tasks in this area includes: understanding and synthesis of speech, the problem of recognition and synthesis of coherent texts in natural language, as well as the theory of models of communication between a person and an AI system.
4. Perception. This direction includes the development of ways to represent visual scenes in their text description and methods of reverse transition, the development of techniques for presenting

information about visual images in the knowledge base, the creation of tools that create visual elements based on internal representations in AI systems.

5. Training. To develop the ability of AI systems to learn, we develop methods for moving from the known solution of particular problems (examples) to the solution of a general problem, methods for forming task conditions for describing a problem situation or observing it, and creating techniques for dividing the original problem into smaller ones that are already known for AI systems.

6. Behavior. Since AI systems must operate in a specific environment, it becomes necessary to develop behavioral procedures that would help them interact with the environment, as well as with other AI systems and people.

Artificial intelligence in education is used in several aspects: in the presentation of information, in solving problems, in the control of students' knowledge, as well as in the modeling of professional and educational situations. Further development and improvement of artificial intelligence technologies will inevitably lead to the substitution of the values of education in favor of e-learning.

Artificial intelligence technologies can be used in a wide variety of industries and areas: industry, construction, transport, communications, education, science, healthcare, finance, trade, culture, tourism, housing and utilities, etc. The use of AI can lead to significant changes in the field of education, creating new opportunities to restructure the work of the entire industry. The introduction of AI technologies in the field of education will increase the efficiency of the educational process and the resources spent on its organization.

The system of artificial intelligence of the educational process should include the following elements:

- A search information system that provides the formation of a database of the educational process from various sources;
- Automatically updated library of electronic textbooks, manuals and guidelines;
- A system for monitoring the level of knowledge of students, which includes a subsystem for continuous monitoring of their progress, activity and results;
- A library of control tasks, automatically adjusted to the level of training of each student, depending on their results;
- An automated system for scheduling and distributing the training load;
- A service system that provides communication between the student and the educational organization.

The use of technology in education can also play an important role in human learning and development throughout life. As the advanced technologies of Industry 4.0 in the content and means of modern education, we can distinguish:

- Internet of things (remote access training laboratories; remote laboratory stands);

- Additive manufacturing (3D printers in training workshops; 3D modeling (in the disciplines of computer science, mathematics); manufacturing of robot parts, technical devices in additional education of students);
- Machine learning and robotics (the use of avatars and chatbots in the educational process for consulting, testing and designing individual educational routes of students; the use of presence robots in distance learning);
- Big data, blockchain and cloud computing (creating a secure portfolio of students and teachers; fixing the formation of educational and professional competencies; using cloud technologies in the educational process);
- Virtual and augmented reality (the use of simulation laboratory stands and laboratory installations with elements of augmented reality in the educational process).

Universities are not only carriers of academic tradition and system-wide efficiency, but also have an incredible potential for innovation and innovative initiatives. Only by understanding this truth, it is possible to realize the potential of transformations, the system of higher education. The use of AI technologies by universities facilitates the process of providing educational services, contributes to improving their quality. AI allows you to create an individual educational trajectory for each student to successfully study at a university and further professional growth.

Let's present some promising areas of AI use:

Adaptive and personalized learning involves the selection of the necessary training content for the needs of each student with different levels of academic performance, with the ability to track progress in learning and change its trajectory depending on the results.

The automatic assessment system allows you to perform an automated, unbiased assessment of the level of knowledge of students, analyze information about the results of training, make recommendations, and develop effective individual training plans.

Intermediate training - a specialized computer program allows the student to consolidate the material passed, determines when he can forget it and gives recommendations for repetition.

The possibility of learning in a game form (gamification) is expressed in the use of game technologies and training simulators in the educational process.

It should be noted that the promising directions of using artificial intelligence in the field of higher education are not limited to the above-mentioned ones. In our opinion, it is not at all a competitor to the teaching staff either in teaching or in evaluating students' knowledge. AI is an auxiliary, but valuable tool that can perform and improve a large number of different operations carried out at the university, help in organizing an effective educational process and building the necessary communications.

CONCLUSION

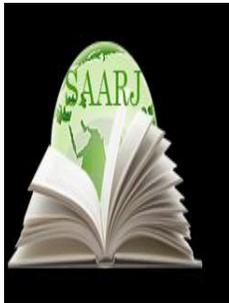

Artificial intelligence in education is used in several aspects: in the presentation of information, in solving problems, in the control of students' knowledge, as well as in the modeling of professional and educational situations. Further development and improvement of artificial intelligence technologies will inevitably lead to the substitution of the values of education in favor of e-learning.

Thus, as a result of the conducted research, promising areas of the use of artificial intelligence in higher education are identified and analyzed, the effective implementation of which will allow selecting the most optimal learning strategy adapted to the individual abilities and needs of students and the needs of the labor market, performing and improving a large number of different operations carried out in universities, helping to organize an effective educational process and building the necessary communications.

MORPHOMETRIC CHARACTERISTICS OF GIRLS 7-8 YEARS OLD

Mohinur Izatilloevna Ismatova*

*Bukhara State Medical Institute named after Abu Ali ibn Sino,
 Bukhara, UZBEKISTAN

ABSTRACT

On the basis of our studies, it was revealed that female gymnasts are less well-fed and shorter in stature than their peers who do not go in for sports. They are more plump and significantly taller than the girls doing rhythmic gymnastics. Girls who do gymnastics are longer-legged than those who do not play sports. Pelvic parameters tend to increase with age.

KEYWORDS: *Physical Development, Morphological Characteristics, Anthropometric Parameters, Rhythmic Gymnastics, Body Weight, Body Size.*

INTRODUCTION

The life cycle of human development undergoes stages of maturation, maturity and aging. [1]

Development and growth are complementary aspects of the same process. Physical development is a leading indicator of children's health. It is considered especially important to sit out the anthropometric parameters of a person, from the first days of life, when insignificant morphological and functional changes are found, to begin corrective treatment. Anthropometric examination associated examination helps to fill the clinical picture with the signs that characterize the disease. To date, there is a huge number of works that have reliable relationships between anthropometric indicators and the state of all body systems in children and adults. There is no opinion on the relationship between the development of physical health and the course of the disease, the processes of growth and formation of the human body, directly depends on the state of physical health, because the presence of a disease can significantly affect the process of physical development, this largely determines the course and outcome of this disease. [6]

Physical health is one of the criteria for indicators of the health of the child population. Assessment of the state of physical development is not possible without the data of anthropometric indicators of various children's age groups [2,4].

Anthropometry, which helps to assess the characteristics and condition of the human body, is actively used in medicine today. The variability in the size of the human body has led to a great need for anthropometric research. An important purpose of anthropometric methods lies in identifying the characteristics of human development, and is also the cause of certain diseases at the initial stage. Assessment of the state of physical health is possible with the help of individual calculations and comparison of their results with the generally accepted formed norms for the development of the human body [3].

The morphological typology of anthropometric measurements, body size and proportionality has been studied in the disciplines of rhythmic gymnastics such as artistic gymnastics and rhythmic gymnastics [7, 10,11].

Gymnastic exercise involves a combination of individual and group elements, synchronized with music, which is the essence of this discipline. In pairs and groups, two main functions are distinguished: groups, which play the role of support and support, and tops, which explain flexibility, balance and their combination or large acrobatic jumps in the air phase, movement, which then catch them again or on the ground [2] Gymnasts compete in different categories: groups (female trios or four).

Research in this area attracts the attention of representatives of various professions, including neuropathologists, traumatologists, pediatricians, gynecologists, physiotherapists, etc. In turn, the study of this problem can be helped by a detailed study of the processes of growth and development of children and youth, aimed at the formation of ways to improve physical health indicators [5,8].

As important factors determining the assessment of competitions in rhythmic gymnastics, such anthropometric indicators as weight, size of the upper and lower extremities and thigh circumference were proposed [9,13]. Physical fitness parameters such as flexibility and texture index were the determining factors contributing to the increase in performance [12,14,15].

The aim of the study was to study and compare the features of the anthropometric parameters of body parts of gymnasts engaged in rhythmic gymnastics and indicators of physical development of girls who do not go in for sports of the corresponding age.

MATERIALS AND METHODS

Almost healthy 80 girls of 7 and 8 years of age of Uzbek nationality took part in the survey. Of these, 40 girls were engaged in gymnastic centers in the city of Bukhara, and the remaining 40 were girls of school №7 in the city of Bukhara, who are not involved in gymnastics. The research was carried out on the basis of a bilateral agreement with secondary school No. 7 (protocol No. 5 of December 26, 2019), gymnastics centers (protocol No. 7 of February 17, 2020 and protocol No. 8 of March 6, 2020) of the city of Bukhara and Bukhara State Medical Institute.

Anthropometric indicators were assessed with the method of anthropometric studies of children according to the methodological recommendations of N.Kh.Shomirzaev, S.A. Ten and I. Tukhtanazarova, 1998 (Morphometric characteristics of assessing the physical development of children and adolescents.). Anthropometric studies included measurement of body length and weight, chest circumference, upper and lower limbs in accordance with generally accepted methods using standard measuring instruments (floor scales, floor height meter, centimeter tape, pelvimeter).

Anthropometric indicators of the observed contingent were assessed according to the following indicators: body length (cm), body weight (kg), chest circumference (cm), length of the upper and lower limbs (cm), pelvic dimensions (cm).

RESEARCH RESULTS

Our studies have shown that the body weight of 7-year-old female gymnasts varied from 19.3 to 38.4, on average $22.7 + 1.18$, and for girls of the same age, but not gymnasts, this indicator ranged from 22.5 to 25.6, on average $24.4 + 0.19$. For 8-year-old girls-gymnasts, weight indices ranged from 19.2 to 29.3, on average $23.6 + 0.62$, and among those who did not train, it varied from 18.5 to 41.8, on average $24.9 + 1.46$.

Indicators of growth of standing gymnasts of 7 years of age 113.2 to 129.4, on average $120.0 + 1.0$, for girls not doing gymnastics, the data varied within 114.3 to 127.1, on average $123.5 + 0.79$. The standing height of 8-year-old gymnasts varied from 110.0 to 133.0, on average $121.3 + 1.43$, and for girls not doing gymnastics this indicator ranged from 119.0 to 137.2, on average $127.5 + 1.12$. Changes in the parameters of the chest circumference in girls who do and do not do gymnastics are presented in Table 1.

TABLE 1. COMPARATIVE PARAMETERS CHEST CIRCUMFERENCE

Indicators	Girls not in rhythmic gymnastics		Girls in rhythmic gymnastics	
	7 years	8 years	7 years	8 years
chest circumference in a pause	60,0±0,74*	61,2±0,99*	58,5±0,62	57,5±0,49
chest circumference at inspiratory height	61,8±0,68*	64,5±0,93*	61,6±0,81	59,9±0,62
chest circumference with full expiration	59,9±0,62*	59,9±1,05*	57,4±0,62	56,9±0,49

Note: * - significant differences $p < 0.05$ were noted in relation to the previous group.

The size of the chest circumference in both girls not engaged in rhythmic gymnastics and girls-gymnasts increased unevenly with age, and the chest circumference of a girl who did not practice rhythmic gymnastics was 7–8 years old more than that of girls of the corresponding ages.

The length of the upper limb of 7-year-old female gymnasts varied from 52.0-63.0, on average $57.6 + 0.68$, among those who did not go in for gymnastics it ranged from 52.1-60.0, on average $56.8 + 0.49$. Measurements of these indicators in 8-year-old girls involved in gymnastics showed fluctuations in the range from 56.1 to 63.0, on average $59.7 + 0.43$. Girls, not going in for sports, had indicators of the length of the upper limb in the range from 53.0 to 67.1, on average $59.2 + 0.87$. The shoulder length of 7-year-old female gymnasts varied from 22.3 to 27.4, on average $23.9 + 0.31$, and for girls of the same age, but not gymnasts, this indicator ranged from 22.1 to 26.2, on average $23.8 + 0.25$. For 8-year-old girls-gymnasts, the shoulder length ranged from 22.2 to 27.3, on average $24.8 + 0.31$, and among those who did not train, it varied from 21.2 to 27.1, on average $24.5 + 0.37$. Indicators forearm length of 7-year-old gymnasts 16.2 to 22.4, on average $18.9 + 0.37$, in girls not doing gymnastics, the data varied within 17.3 to 20.1, on average $18.5 + 0.19$. The forearm length of 8-year-old gymnasts varied from 17.0 to 22.0, on average $19.6 + 0.31$, and for girls not doing gymnastics, this indicator ranged from 17.0 to 22.5, on average $19.3 + 0.34$.

The hand length of 7-year-old female gymnasts varied from 13.5-16.0, on average $14.7 + 0.16$, among those who did not go in for gymnastics it varied within 13.1-15.0, on average $14.5 + 0.12$. Measurements of these indicators in 8-year-old girls going in for gymnastics showed fluctuations in the range from 14.1 to 17.0, on average $15.4 + 0.19$. Girls, who were not involved in sports, had hand lengths ranging from 13.0 to 18.5, on average $15.4 + 0.34$.

Our results show that in 7-year-old girls-gymnasts, the length of the lower limb ranged from 64.2 to 77.4 cm, on average 69.2 ± 0.81 cm, girls who were not gymnasts ranged from 60.1 to 71.0, on average $66.2 + 0.68$. 8 year old girls doing gymnastics had a lower limb length in the range of 70.2 to 76.0, on average $72.6 + 0.37$, girls who were not gymnasts in the range of 64.1 to 79.0, on average $69.9 + 0.93$.

The hip length of 7-year-old female gymnasts varied from 33.0-39.0, on average $36.1 + 0.37$, among those who did not go in for gymnastics it varied within 32.1-39.0, on average $35.9 + 0.43$. Measurements of these indicators in 8-year-old girls doing gymnastics showed fluctuations in the range from 35.1 to 44.0, on average $39.0 + 0.56$, and in those who did not go in for gymnastics, it varied in the range from 34.0 to 46.1, on average $37.5 + 0.74$. The leg length of 7-year-old female gymnasts varied from 28.5 to 39.0, on average $33.2 + 0.65$, and in girls of the same age, but not gymnasts, this indicator ranged from 24.1 to 33.2, on average $30.5 + 0.56$. In 8-year-old girls-gymnasts, the shin length ranged from 30.2 to 39.3, on average $33.7 + 0.56$, and among those who did not train, it varied from 30.1 to 35.1, on average $32.5 + 0.31$.

When studying the size of the pelvis, it was found that in 7-year-old girls-gymnasts, the pelvic indicators varied from 18.2 to 25.3, on average $20.5 + 0.41$, and in girls of the same age, but not gymnasts, this indicator ranged from 18.1 to 21.2, on average $19.9 + 0.19$. For 8-year-old female gymnasts it ranged from 18.1 to 27.2, on average $22.4 + 0.56$, and among those who did not practice it varied from 18.0 to 28.1, on average $22.1 + 0.62$.

Discussion of research results

The aim of this study was to determine the anthropometric profile, body size and proportionality in rhythmic gymnastics, since there are only a few scientific studies that have analyzed these characteristics, and even fewer by event categories in accordance with the rules for selecting gymnasts. Our data are consistent with other studies that have shown that gymnasts have a lag in body length parameters compared to girls who do not go in for rhythmic gymnastics, which cannot be said about weight indicators. Gymnasts are lighter in weight compared to their non-athletic peers.

Low body weight is typical for rhythmic gymnastics athletes; Y. Taboada-Iglesias et al. (2017) indicated that the body weight of Spanish gymnasts was 38 kg, and the established body weight for high-class gymnasts was 35.60 kg.

The chest circumference at the height of inspiration among gymnasts involved in sports lags behind girls who do not do gymnastics due to their low weight. The size of the chest depends on the child's body weight and physical development.

The length of the upper limbs in girls doing gymnastics is almost the same as in girls who are not gymnasts of the same age. But the length of the lower limbs in girls doing gymnastics is greater than in girls who do not go in for sports.

Differences in the size of the pelvis in both groups are not significant, but with age, there is a tendency to their increase in female gymnasts.

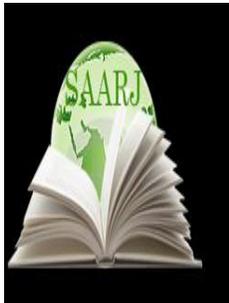

CONCLUSION

Thus, the study of anthropometric data allows us to conclude that girls doing gymnastics are less well-fed and shorter than their peers who do not go in for sports. Girls who do gymnastics are distinguished by their long legs than those who do not go in for sports. Pelvic parameters tend to increase with age. The texture of the gymnasts depends on the frequency of training loads, taking into account the requirements of gymnastic exercises, in this regard, the most appropriate seems to be the optimization of the training process, as well as the development of specific approaches to the correction of hormonal disorders in the body of athletes.

ABSTRACT

Clinical Features Of Atopic Dermatitis In Children With Bronchial Asthma Include: Atopic Dermatitis With Bronchial Asthma Occurs Mainly In Boys Up To 5 Years Of Age. 60,9% Of Young Children Had Severe Atopic Dermatitis With Bronchial Asthma. In The Comorbid Course Of Atopic Dermatitis With Bronchial Asthma, A High Diagnostic Concentration Of Specific Ige To Food Allergens Was Detected In 72, 5% Of Children.

KEYWORDS: *Dermatitis, Co morbid, Children, Age, Eosinophils, Immunology.*

INTRODUCTION

In recent years, the combined course of allergic diseases, especially atopic dermatitis with bronchial asthma, has increasingly come to be called the "global problem of mankind" because of their high prevalence in children and adults [4,6,13]. About 40% of the inhabitants of our planet suffer from allergic diseases. Among them, bronchial asthma (BA) occupies a special place - one of the most common diseases. BA still refers to life-threatening conditions. Thanks to the efforts of many specialists, it has now been possible to achieve certain success in the

treatment and decrease in the frequency of asthma exacerbations [1,2,10]. At the same time, the issues of preventing severe forms of the disease, as well as its prevention continue to expand the minds. In this regard, studies aimed at elucidating risk factors for the development and causes of allergic diseases, including asthma, are becoming relevant. Atopic dermatitis, which can be considered the first (in terms of onset) allergic disease, as well as the initial stage of the "atopic march": atopic dermatitis - allergic rhinitis - BA or atopic dermatitis - BA - allergic rhinitis / BA. It is atopic dermatitis that is one of the most common allergic (somatic) diseases in young children (the first year of life) [3,5,8]. According to our data, the peak incidence occurs in the first year of a child's life.

As a rule, in the vast majority (70–85%) of children, atopic dermatitis manifests itself in the first 6 months of life, and only in 10–15% of young patients it can begin at an older age. Numerous studies indicate that atopic dermatitis predisposes to the development of allergic rhinitis and AD [2,7,9]. Several prospective studies have obtained data on the development of the "allergic march" - from atopic dermatitis to allergic rhinitis and asthma. It is noted that wheezing occurs more often in children with atopic dermatitis; they are most common in the first years of a child's life, increasing from 5% - in the first year of life - to 40% of 60 patients who remained under observation by the end of monitoring (by age 22) [2,11,12]. In older children, there is a close relationship between atopic dermatitis and bronchial hyperreactivity. Considering atopic dermatitis as the initial manifestation of allergic pathology, have shown that 30–76% of children with asthma have symptoms of atopic dermatitis.

Purpose: Comparative analysis of clinical and immunological examination of 50 children with a comorbid course of atopic dermatitis during our observation in 2017-2019. With an indicator of children with atopic dermatitis (n = 30).

Material and methods: The scientific work presents the results of anamnestic, clinical, allergic and immunological studies. The determination of total IgE (HB / ml) in the blood by the immunochemiluminant method (COBAS E 411, Russia), serum-specific IgE (HB / ml) by the solid-phase ELISA method (CARLA, System, Russia) was carried out at TMA scientific laboratory. We used the SCORAD (Atopic Dermatitis Severity) Index to measure the severity of asthma in children. This index is calculated using the following formula:

$SCORAD = A / 5 + 7 * B / 2 + C$, here

A - area of skin lesions (%); B - the sum of points of objective signs (erythema, edema, hydration, excretion, lichenification, dehydration); S- is the sum of subjective signs in points (itching, sleep disturbances); Mild BP - up to 20 points (1-2 times a year, long-term remission, good response to therapy). BP of moderate severity - 20-40 points (relapses 3-4 times a year, remission no more than 4 months, there is no clear response to therapy); Severe blood pressure - more than 40 points (duration of symptoms, remission no more than 2 months, therapy is ineffective). Each subjective assessment is rated on a scale from 0 to 10 points; then the points are added up. The overall score for subjective characters can range from 0 to 20. Statistical processing of the results was carried out using the program for practical mathematical and statistical analysis Microsoft Exell Version 7.0.

Results and analysis: Analysis of data in children with suspected concomitant course of atopic dermatitis with bronchial asthma showed that 61.8% of respondents complained of an allergic rash during the last year, and these rashes were more common in children under three years of

age. Comorbid BA with atopic dermatitis in children under 5 years of age was detected 2.1 times more often than in other age groups. The common location of the rash, that is, on the skin of the elbows, ankles, neck, eyes and ears, is more common at the age of 5. With comorbid atopic dermatitis, 9.2% of children experienced a period of complete clinical remission, the rash completely disappeared, and no nighttime awakenings due to itching and shortness of breath were observed, which was higher in children aged 5–12 years (43.5%). Nocturnal sleep disturbances due to itching and shortness of breath were observed in 35.7% of children less than one day a week and 49.2% of children more than once a week and these data were higher in children under 5 years of age. The results show that the prevalence of asthma with bronchial asthma was 60.9% in boys under the age of 5 years and when distributed by sex ($r < 0.001$). Sensitivity to atopic dermatitis in the first 2 years is sensitivity to food proteins [5], and in our study, the symptoms of atopic dermatitis were observed in children under 5 years old, mainly due to food proteins. In our study, this was shown by studying these children with suspected comorbid course of atopic dermatitis with BA. 49.4% of mothers answered positively to the question "Was it noticed that when your child eats red food and eats a lot of sweets, skin rashes are accompanied by shortness of breath?" In our study, etiologically significant allergens in the development of atopic dermatitis in children under 5 years of age with BA: cow's milk - 67.2%, eggs - 31.9%, cereals - 30.5%, soy - 15.4%, fish - 29.4%, vegetables and fruits - 41.3%.

The study of the anamnesis showed that 89.5% of children had a complex heredity for allergic diseases, which generally corresponded to the results of studies by many authors [2]. Thus, one of the patients' parents had bronchial asthma in 39.6% of cases, allergic rhinitis in 29.5%, hay fever in 18.3%, food allergy in 19.5%, and 18.3% - atopic dermatitis and in 12.2% - drug allergy. All groups were dominated by mothers aged 20 to 30 (70.3%). Most of the children were born from a second pregnancy (51.8%). The study of gestational age showed that in the second half of pregnancy, mothers with gestosis (49.5%), anemia (63.5%) and allergies (69.8%) prevailed. It was noted that the presence of allergic and somatic diseases in most mothers during pregnancy led to the coexistence of AD and BA in their children.

Psych emotional disorders, especially in children before going to kindergarten and school, during school exams, were expressed in the form of sleep disorders, anxiety and emotional lability, and these indicators were manifested in comorbid BA.

In 42% of young children, the appearance of an erythematous rash, shortness of breath, recurrence of cough, skin syndrome was observed as a result of a violation of a hypoallergenic diet or the use of antibacterial drugs in the treatment of observed acute respiratory diseases. During the observation period, the recurrence of skin rashes and wheezing in 19.8% of children persisted as a result of a violation of hypoallergenic nutrition. In our study, the severity of asthma according to the SCORAD index: mild - 50%, medium - 30%, severe - 20% in children, 65% severe - occurred mainly in children under five years of age with comorbid BA.

The study of peripheral blood parameters in sick children during our observation showed the following changes. The data indicate that no significant changes in peripheral blood were found during the outbreak, with the exception of the number of eosinophil's in all children examined. In healthy children, the number of eosinophil's was 7.9 ± 0.23 and AD was 6.2 ± 0.1 higher in the comorbid course of atopic dermatitis compared to 1.31 ± 0.1 ($r < 0.001$). According to the literature, the number of eosinophil's in the peripheral blood in healthy children is 1-5%. In the comorbid course of atopic dermatitis BA, the range of indicators ranged from 2 to 15%. One of

the traditional markers used to diagnose and compare the inflammatory processes of BA and AD is the determination of the level of total IgE in the blood serum. In the comorbid course of BA atopic dermatitis, this indicator averaged 890.5 IU / ml in the range of 140.1-1890 IU / ml and 679.2 IU / ml in atopic dermatitis (Table 1).

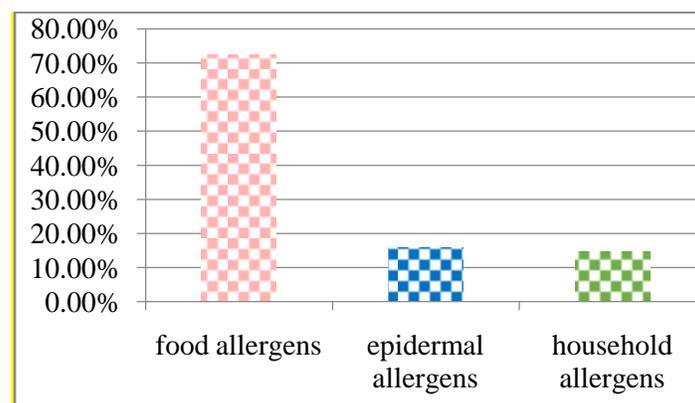

TABLE 1 DIFFERENCES IN PERFORMANCE IN GROUPS

Indicators	A Dcomorbidn=50	AD n =30	Healthy children n=20
Eosinophils%	7,9±0,23*	6,2±0,1*	1,31±0,1*
IgE,IU/ml	890,5±56,4**	679,2±34,2**	53,8±12,4**

Thenote: $p < 0,05-0,001$ compared with healthy children and children with AD.

In our opinion, a high level of eosinophil's and IgE in the comorbid course of AD indicates a relatively severe course of AD disease. Total IgE levels significantly differed ($p = 0.001$) compared to sick children in the group of healthy children (53.8 IU / ml).

One of the important factors contributing to the comorbid course of AD atopic dermatitis is genetically confirmed allergens, which are observed through an allergic reaction. It develops as a result of the body's sensitivity to allergens, which leads to an allergen-specific inflammatory reaction, that is, tissue damage and the appearance of clinical signs of allergic diseases. A special allergological examination was performed in 50 children with a confirmed comorbid course of atopic dermatitis BA. Collecting anamnesis of allergies and detecting allergen-specific IgE antibodies in the blood serum of the examined children revealed their sensitivity to household, epidermal, dust and food allergens. Diagnostically significant concentrations of allergen-specific IgE in blood serum were found in 92.5% of children. Diagnostically significant concentrations of allergen-specific IgE in blood serum for food allergens were found in 72.5% of children. Diagnostically significant concentrations of allergen-specific IgE in blood serum to household allergens were found in 14.8% of children with comorbid BA. Diagnostically significant concentrations of specific IgE in blood serum to epidermal allergens were detected in 19.7%. Diagnostically significant concentrations of IgE specific to dust allergens were found in the serum of 15.9% of children.

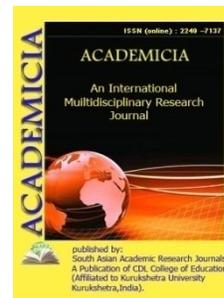

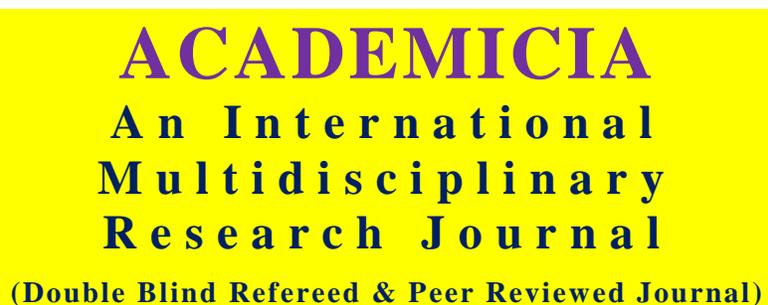

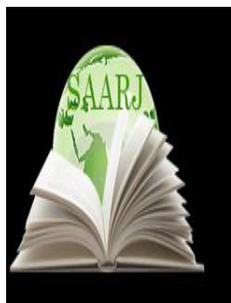

PICTURE 1 DISTRIBUTION OF ALLERGENS BY FORMS.

Findings: The clinical features of the comorbid course of atopic dermatitis with BA in children under 5 years of age are as follows: According to the SCORAD index, 65% of severe patients had

mainly comorbid BA in children under five years of age; High diagnostic concentrations of food-specific IgE were detected in 72.5% of patients with comorbid BA - at the onset of the disease.

ABSTRACT

This article reveals some features of the semantic structure of phraseological units of the English language. So, it is determined that the meaning of a phraseological unit is integral, and it does not follow from the meaning of the components that make up this unit. The author also notes that the human factor plays a huge role in phrase formation, because for the most part the overwhelming number of phraseological units is associated with a person, with various fields of his activity.

KEYWORDS: *Phraseological Units, Components Of A Phraseological Unit, Practical Skills, Semantics, Phraseology, Component From The Concept "Person".*

INTRODUCTION

A special way of transmitting evaluative knowledge, reflecting the value orientations of society, is a phraseological unit. Phraseological units as a product of an indirectly derived nomination is a verbalized result of a three-stage process of the subject's cognition of the surrounding reality: empirical perception of the world, conceptual understanding of reality and its interpretive and evaluative comprehension.

Empirical knowledge is based on sensory perception and accompanying practical activity. They allow the subject of cognition to conceptualize concrete-subject entities within the framework of their ontological features. At the level of conceptual comprehension, basic conceptual-

categorical meanings are created, which ensure the integrity and success of the cognition process. [1:58]

The means of the empirical and basic conceptual levels are used to verbalize the assessment with phraseological units characterizing professional activity at the level of interpretive and evaluative comprehension. Hierarchically completing the general process of cognition, interpretive-evaluative comprehension acts as a leading one in the general speech-thinking activity, since within the framework of communication, it provides focusing of attention on a certain fragment of reality, its participants and their individual features. [3: 390].

Phraseological units as a specific means of conceptualizing evaluation is the result of the qualifying activity of consciousness. Evaluative conceptualization refers to the evaluative comprehension of concepts in our minds. Evaluative categorization is a grouping of objects and phenomena by the nature of their evaluation into the corresponding classes and categories, i.e. a system of evaluative categories (static aspect), or mental correlation of an object or phenomenon with a certain evaluative category (dynamic aspect).

The process of categorizing a person's professional activity by means of indirectly derived nomination is carried out at the basic level using the everyday knowledge of the subject of assessment and at the subordinate level with the involvement of elements of the subject's professional experience.

The internal form of evaluative phraseological units, reflecting the characteristics of professional activity, serves as a source of activation of metalinguistic knowledge of all representatives of linguistic culture. In the acts of phraseological nomination, first of all, those fragments of human experience or knowledge that are important for both professionals and non-professionals are designated.

The semantics of phraseological units is a more complex phenomenon in comparison with the lexical meaning of a word. It can be distinguished in it:

- 1) denotative-significative element (subject-logical part of the meaning);
- 2) a connotative element, which indicates an idea of something and determines (motivates) the speaker's emotional-expressive assessment of a person, an object, their action, and quality. The connotative element of phraseological semantics consists of a set of components: first of all, motivational (internal form), emotive, expressive, evaluative. [4:79].

The following properties of phraseological units can be distinguished: stability, integral figurative meaning, separately-framed, permeability impermeability, productivity, imagery (characteristic of most phraseological units), and expressiveness. By the stability of a phraseological unit, we mean the presence of a strictly defined component composition, which preserves a fixed order of the components. Stability is associated: firstly, with the concept of constancy of the lexical composition of the components of the phraseological turnover; secondly, with the concept of the fixation of its structure in the language system. The meaning of a phraseological unit is integral, and it does not follow from the meaning of the components that make up this unit. Component - an integral part of a phraseological unit, devoid of the main features of the word. A component is a de-actualized word (words are de-actualized most often due to a metaphorical rethinking of free phrases). The components of a phraseological unit are de-actualized in a semantic sense, losing at the same time the subject (denotative) orientation, the

former ability to dismember into differential semantic features (which is why the eigenvalue of the components often cannot be established), etc.

For phraseological units, such a property as the permeability / impermeability of the component composition is also characteristic. Phraseological units, which have the permeability of the component composition, allow the insertion of words between their components. It should be noted that only a limited number of words can be inserted between the phraseological units and that the semantics of these words does not participate in the creation of phraseological meaning. Phraseological units, which have the impermeability of the component composition, do not allow insertions between their components. [2:26].

MATERIALS AND METHODS

An important property of phraseological units is that the meaning of a whole phraseological unit does not consist of the meanings of the words included in it, for example, the expression “ate a dog”, meaning “to be a master in some business,” is completely unrelated to the meaning of the words included in it.

Phraseology fills in the gaps in the lexical system of the language, which cannot fully provide the names of new aspects of objective reality cognized by a person, and in many cases is the only designation of objects, properties, processes, states, situations, etc.

Compare. A stable rethought turnover, which goes back to the rethought phrase: Hoist with one’s own petard (“caught in his own trap,” “suffered from his own intrigues”). Such phraseological units have predictive power, indicating the possible path of development of the prototype of another phraseological unit and its formation, which makes it possible to study the patterns of the phraseological process. It should be borne in mind that the phraseological name itself is a complex process of designating a denotation and human knowledge itself. Therefore, there are many figurative punsphraseological units.

Compare.(as) crooked as a dog’s hind leg (“dishonest”, “dishonest”, “there is nowhere to try”); there is a play on words based on two homonyms: crooked and crooked; or, for example, this phraseological unit (as) cross as two sticks (“in a bad mood”, “out of spirit”; “angry as the devil”), which reflects a pun based on two homonyms: cross (“out of spirit”, “Angry”) and cross (“crossing”), etc. [9: 368] An integrated approach to phrase formation in different languages makes it possible to establish a system of regular differences and common features. Moreover, the semantic structure of phraseological units is not limited only to their meanings. The most important elements of the semantic structure, in addition to meaning, are the construction of the entire education as a whole, its grammatical design and systemic linguistic connections.

So, a characteristic feature of the majority of substantive phraseological units with a component from the concept “person” (CCP) in modern English is the expression or concepts that cannot be conveyed in separate words, i.e. these phraseological units have no lexical synonyms. Compare: A rough diamond (“rude, but a good person”); A wolf in sheep's clothing (“a wolf in sheep's clothing”), etc. At the same time, in phraseological units (PhU), the image-building differs in breadth, conveying a very different palette of semantic content - up to the hyperbolized to the point of absurdity, as, for example, in the following case: (as) pleased as a dog with two tails (“happy as a dog with two tails”, “very happy”).

The defining in the semantic description of the phraseological fund of the language is the systematic approach. Here, an important description procedure will be the establishment of phraseosemantic groups in which certain phraseological units are used (In our case, these are phraseological units with CCP (Phraseological units with a component from the concept "person"). [3: 390].

Other synonymous (antonymic) groups are included in similar microfields "Man": a faithful Adam ("faithful old servant"); Man Friday ("Friday", "faithful, faithful servant"); b) big boy (bug, cheese, noise, shot, wheel) great gun ("biggie", "bump"); Anatomical connections between phraseological units with CCP (as an important indicator of semantic relations in phraseology) develop within individual semantic and thematic areas. For example, this is weight, strength: (as) strong as a horse ("healthy as a bull") and (as) weak as a cat (kitten or water) ("weak"); - wealth – poverty:

(as) rich as Croesus ("rich as Croesus") and (as) poor as a church mouse ("poor as a church mouse"); - beauty-ugliness: (as) pretty as a picture ("pretty as a picture") and (as) ugly as sin ("terrible as a mortal sin"); - experience - no experience: Old bird ("shot sparrow") and spring chicken ("yellow-bellied youth"); - emotional and intellectual properties: (as) gentle as a lamb ("meek as a lamb") and (as) hard as nails ("cruel", "heartless"); (as) straight as a die ("very straight, honest") and (as) crooked as a dog's hind leg ("careless", "dishonest"), etc. [6: 202] Most often for the semantic status of PhU with CCP a partial rethinking is characteristic - first of all for stable comparisons: (as) bold (or brave) as a lion ("brave as a lion"); (as) mute as a fish. All of these comparisons apply to humans. Moreover, the first component of comparison is used in its literal meaning.

Variable prototypes of robust comparisons are rare. So, if they say about a person he is as weak as a kitten ("frail", "weak"), then the comparison is phraseological unit, and if the comparison is used in relation to a puppy, then this is a variable phrase. As you can see, the role of the extra linguistic factor in such cases is obvious. [8: 270]

Phraseological units, the literal meanings of the components of which in their totality denote imaginary objects, are often based on violations of formal logic and structural semantic incompatibility of composite components.

an immediate contradiction, which consists in the fact that in this concept a sign is thought that is not characteristic of it: (as) drunk as a boiled owl ("drunk as a lord"); Walking corpse ("walking skeleton"; compare Russian "living corpse"); this phraseological unit is an oxymoron; - an absurd contradiction, which consists in combining features from different areas, which makes the concepts absurd: A hog in arm our ("a saddle goes like a cow"; compare Russian "soft-boiled boots"), etc. [7: 440]

Similar semantics - logical and structural-semantic disturbances contribute to the creation of bright, figurative phraseological units of a large evaluative characteristic.

As you can see, in all of the above cases, the semantic features of phraseological units with a component from the concept "person" (CCP) characterize such an obligatory feature as reproducibility. The second important feature is semantic integrity. In this case, the meaning of the phraseological expression has been partially or completely rethought, i.e. the meaning of phraseological units does not coincide with the meaning of its constituent individual words.

RESULT AND DISCUSSION

In phrase formation, where the dominant “Person” is played out semantically, the factor of abstraction is actualized. This is a form of cognition based on the mental separation of the essential properties and connections of the object of the name from others, its particular properties and connections.

Thus, “man in general” is an abstraction, that is, mental distractions from many people. In the objective world, there is no “man in general”, but only a specific person. Wed: a hard nut to crack (“a person who is difficult to cope with”; “tough nut”, “too tough”). Depending on the specific situation, phraseological units can receive an appropriate semantic refinement. Wed: dead to the world -1) “immune to what is happening”; 2) “unconscious”; 3) “fast asleep”. (as) sober as a judge - A large role in the expression of semantic-figurative motivation of phraseological units is assigned to the supporting components of the phrase-form, as its dominant structural element.

noun: small fry;- adjective: quick on the trigger (“quickly reacting”, “impulsive”). [6:202]

Most often these are phraseological units with CCP, in which some components are used in literal meanings, and the rest are rethought and motivated. The connection of the components with literal meanings with the rest of the phraseological units is also motivated here: (as) busy as a bee (“hardworking as a bee”); (as) silly as a goose (“stupid as a cork”); Eat like a horse (“have an excellent appetite”); nail sin mourning (“dirty nails”, “nails with a mourning border”). Among the metaphorical phraseological units, reflecting mental processes and personality traits, there is a complex metaphor based on an imaginary or unreal situation: have been in one's head; have a cobweb in one's throat (“you can't drive up on a goat”; “smart as hell”). [5: 334].

CONCLUSION

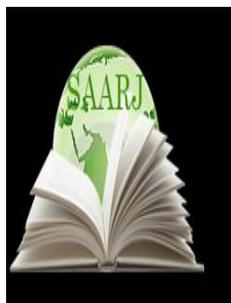

Phraseology is a treasure trove of language. Phraseological units reflects the history of the people, the originality of its culture and way of life. Therefore, PhU often have a clearly national character. They are the majority in the phraseological fund of any language. In phrase formation, the human factor plays a huge role, for in its mass the overwhelming number of phraseological units is associated with a person, with various spheres of his activity. [1:65]

Thus, rethinking means shifts in meaning, not narrowing or expanding. These are semantic processes that are associated with a change in the scope of a concept. In particular, this can be clearly seen in phraseology by analogy, based on the actualization of the visual capabilities of the original structural and semantic data of the syntactic form being played.

ABSTRACT

The article analyzes the scientific approach to the study of political phenomena as components of political culture in political processes, the issues of clear classification of their components, interaction and identification of manifestations. It has been studied that in our modern society the political culture of the population is changing rapidly, there is a growing need to determine its formation, peculiarities and scientific analysis of the manifestation of its various components and changes in modern conditions. Components of political culture, such as political psychology, political consciousness, political ideology, on the one hand, the emotional attitude of members of society to politics, values, attitudes that affect political behavior, and on the other hand, the behavior, participation, norms and the rules are analyzed to form stereotypes about the political outlook.

KEYWORDS: *Civil Society, Democracy, Political Process, Political System, Political Culture, Political Behavior, Political Perception, Political Participation, Political Activity, Political Consciousness, Political Ideology, Political Psychology, Political Values.*

INTRODUCTION

One of the problems of the current stage of formation of civil society in our country is related to the formation and manifestation of political culture in political processes. After all, political culture and the political process is one of the most important events in the political life of society. Although they are separate phenomena at a glance, they are mutually compatible as a constant object of study by political scientists. Indeed, the political culture of members of society is reflected in the political system and political processes. "So the focus today is on raising the political culture of the population," he said. Political culture ensures the natural development of democracy" [1:60].

A scientific approach to the study of political phenomena requires a clear classification of their components, identification of their interaction and manifestation features. As the political culture of the population changes dramatically in the context of our changing society, it is necessary to determine the specifics of these changes. In particular, there is a growing need for a scientific analysis of the manifestation of various components of political culture and their changes in modern conditions. In connection with the above, it is important to study the structure of political culture and its main components - political consciousness and political behavior, their role in the complex process of democratization of political culture in society.

Results. An analysis of traditional political behavior has shown that the relative passivity of participation in political processes is due, firstly, to the low level of public confidence in most state and public organizations; secondly, the ineffectiveness of participation in this type of activity is related to the dominance of the idea in the social consciousness.

Assessing the socio-political situation in the country in the process of formation of civil society, the head of state said that "our society has literally awakened, and now our people are learning to directly assess the actions of various officials and express their views freely" [2].

Scientific sources emphasize that political culture consists of such components as political psychology, political consciousness, political ideology. Political culture, on the one hand, constitutes the emotional attitudes of members of society to politics, values, attitudes that affect political behavior, and on the other hand, the behavior of different political cultures, participation, norms and rules, stereotypes about the political worldview.

The Political Encyclopedia, published in Russia, states that the components of political culture are "political knowledge, political ideology and psychology, political experience and traditions, political institutions, norms, forms and means of political activity" [3:174]. If we pay more attention to the analysis of the problem, the components of political culture as a separate system consist of a set of interrelated elements and have a specific structure. The structure of political culture includes needs and interests, knowledge of politics, beliefs, directions, assessment of political events, political consciousness, the essence of thinking, political norms, symbols, traditions, norms of behavior, skills, methods of political activity. The process of formation of these components is long and, at the same time, varies depending on individual characteristics, such as education, national mentality, level of socio-cultural and religious traditions, stereotypes, everyday life, practical understanding of political reality, participation in political processes.

Political culture is a set of general views and normative decisions made by the population in relation to its political system in political science. The concept of political culture does not mean an attitude towards certain state and government leaders, such as a president or prime minister, but rather how people view the political system in general and believe in its legitimacy. American political scientist Lucian Pay describes political culture as a combination of core values, feelings, and knowledge that underlie the political process. Thus, it can be concluded that the foundations of political culture are the beliefs, positions and approaches of citizens to the form of government of the state and society.

Both political culture and political science, as one of the basic concepts of political sociology, allow the study of the mechanisms of interaction of the social environment and the political system in terms of subjective foundations. Indeed, every society has its own norms, values, customs, stereotypes and forms of political participation, which in one way or another give

specificity to objective socio-political relations and relations and play an important role in defining the essence of the political process. It can also be observed that the political development of different countries has led to the instability of the political system as a result of disregard for institutional structures, the relevant cultural content.

For a political culture to be established in a society, civil society must be formed and democratic values must be established. To do this, it is necessary to achieve the realization of such concepts in the socio-political life of society as democracy, the rule of law, civil society, public control. "Democracy is valid only if there are people in society who can live in a democratic environment, have a civic position and a high political culture, otherwise democracy will not be manifested" [1:59]. He also noted that raising the political culture of the people is an evolutionary process that requires a certain amount of time, and stressed that there is no room for haste in its implementation. tried to justify. At the same time, he noted that the improvement of democratic processes should be in line with the growth of political culture [1:65].

Indeed, these social, political, legal events reflect the level of political culture of a society. U.S. political scientist Gabriel Almond describes that if each political system has a specific structural basis for the direction of political action, this factor is political culture [5:396-397].

Although the phenomenon of political culture has a universal nature, its formation and specificity are related to the dynamics of development in the context of nation-states. In the scientific literature, political culture according to the subject of politics: universal political culture; political culture of people, ethnos, civilization; national, regional political culture, subculture [6:326]. If we look at the national features of the formation of political cultures in the modern world, the historical path of development of French, Spanish, Russian, Ukrainian or other peoples in the West, Chinese, Japanese, Uzbeks in the East, the peculiarities of national character, the development of national statehood and their influence. differs in aspects.

It should be noted that not all knowledge is related to the culture of a particular society, nor does it form spontaneously. Indeed, the political consciousness of the people, in turn, determines the political strata, the political behavior of the peoples. In this sense, political culture is the commonality of historical and political experience, political consciousness and political behavior [6:322].

It is known that political culture is manifested not only in the "historically formed, relatively stable set of political ideas, beliefs and trends, but also in the actions and models of political behavior, the actions of the subjects of political relations" [7:169]. Based on these differences, it is possible to distinguish between general and specific types of political culture on the basis of comparing not only individual features, but also its structural features.

Political behavior is a qualitative level of political activity and political participation, that is, an activity related to how a person can behave in this or that situation, in this or that political event. For example, 150 members of a country's parliament can simultaneously demonstrate different levels of political behavior. Demonstrating political and legal activism, someone is actively involved in the discussion process, paying special attention to each legal parameter in the legislative process. There may be no clear political approach or legal position in the actions of other policy actors, they may sit quietly, in other words, simply observe the process, may not be able to penetrate deeply into the political and legal essence of the adopted normative legal act [8:9].

Political behavior is also reflected in the participation of citizens in political events, including demonstrations. Such participation is, on the one hand, in the peaceful conduct of relations along the declared route in accordance with the rules established in the socio-political processes in the country, as enshrined in the Constitution and laws, and, on the other hand, in organizing riots, damage to state and public property; disruption of public order is even manifested in cases leading to bloody clashes. Such an appearance of political behavior reflects the level of political consciousness and culture of the members of society. All of these differences in the actions of political actors and participants fall within the definition of "political behavior". In other words, all the subjects and participants described are engaged in political activities or participate in political events, but each behaves differently. Hence, political behavior is a way of political participation and manifestation in political processes.

Political behavior is manifested primarily in the subject-object relationship, which is an expression of the state of the subject itself in the process of action. However, in political activity, subject-object relations come first, that is, they are manifested in relations conditioned by the type of activity.

Russian scholar Ivan Alekseevich Ilin focuses on the role of political culture in society, describing it not as the ultimate goal of human life, but as a means to achieve the main goal - the cultural development of man [10:100]. Consequently, the creation of a common cultural foundation contributes to the formation of a political culture. Based on these rules, it can be assumed that modern political culture does not influence the development of political processes, but rather helps them to be reflected in the political consciousness of citizens. Accordingly, based on reflections on the activities of the state power and its governing bodies, each person immediately creates his own political culture postulates at the subconscious level. In general, the political behavior of an individual (group) can depend on many factors. This includes:

- the individual emotional and psychological qualities of the subject or participant in the political process. The difficulty of predicting one's feelings, the sudden onset of attitudes to political reality, often leading to surprising views, and vice versa, are manifested in situations such as caution, restraint, ability to maintain a certain political balance, external calm in political processes;
- personal (group) interest of a subject or participant in political actions. For example, a policy entity is involved in the discussion of a problem of interest or a draft normative legal act in the process of exerting influence on its acceptance or non-acceptance;
- Political movement and adaptive behavior in political participation - represents the behavior associated with the need to adapt to the objective conditions of political life;
- Situational behavior of a political subject in political processes - refers to the behavior associated with a particular political situation or participation in a political reality;
- Behaviors related to certain ethical principles and moral values in the participation of a political subject in political reality - how well the subject or participant in a particular political situation or political action controls the situation, understands the essence of what is happening and adheres to the norms of political processes. The level of motivation and involvement in political life has a significant impact on the political behavior of the subject of politics. For example, for some,

participation in political processes can be a random event, for some it can be a political career, for others it can be the meaning of life, for others it can be a way to make money;

- Forcing to engage in certain types of behavior. Such methods of influencing political behavior are typical of totalitarian and authoritarian regimes of power.

Knowledge of political behavior, which is a component of political culture, plays an important role in the organization of political processes in society. Here, the participation of the subjects of the political process in politics is reflected in the national mental characteristics brought up on the basis of the cultural traditions of their country. In this process, in political culture, universal rational knowledge and the peculiarities of the national mentality are intertwined.

DISCUSSION

Analyzing the content of the components of political culture and their practical manifestation in the socio-political life of Uzbekistan at the current stage of national development, we can draw the following conclusions:

First, political culture is a set of historically established stable forms and stereotypes of political activity, which are determined by knowledge, feelings, traditions, values, beliefs, attitudes, directions, i.e. elements of the political consciousness of the subject. There are different views on the components of political culture. In most scientific sources, political consciousness and political behavior, as well as cognitive, ideological, emotional, ethical, and behavioral, are considered to be key components of political culture. From their unity and interaction, a political culture is formed in the minds of both society as a whole and a particular individual.

Second, the analysis of theoretical and methodological approaches to the study of political consciousness and political behavior, which are a key component of political culture, showed that the theoretical concepts and specific political approaches developed on their basis are interconnected in a single spiritual complex.

Third, for the majority of the population, the formation of the cognitive component of political culture is primarily seen as the most convenient way to obtain information about current socio-political events in the media, in particular, television and the Internet. In this sense, the media form the information base of political culture.

Political education determines the qualitative level of political knowledge. In other words, the features of conceptuality, integrity, consistency, objectivity, scientific character in political education represent the formation of political culture. Interest in social and political life Integrated use of all sources of socio-political information, ie television, press and radio, the Internet as a subject of influence, the formation of political views, opinions, feelings that bring to the political consciousness certain political knowledge, ideas, norms, patterns of political behavior allows.

Based on the components of political culture, interest in politics is formed, which in turn becomes an important factor in increasing their cognitive activity. Observations have shown that this interest may vary depending on international relations, the socio-political situation in certain regions and countries, the socio-economic status of citizens, the degree of their practical involvement in public and political activities, and a number of other factors.

A factor in shaping political thinking is the subject's personal political experience, which helps to put into practice the knowledge he or she has acquired from various sources of socio-political information. Today, the importance of political thinking is growing significantly. Modern political life, with all its complexity and rapid change of political events, requires a person to navigate in it, to evaluate some events from a scientific point of view, to compare and analyze political events. Socio-political reality, empirical data show that citizens have a more positive side than the negative in the current changes in modern society [11]. Some assess the political reality based on changes in the social life of the country, others on their personal lives and observations. In most cases, there is a tendency for citizens to distance themselves from politics, to be afraid to comment on it. Such an approach has created a sense of "fear" in the political consciousness and culture of the society as a result of long-term political pressures, the serious impact of closed politics. Today, the socio-political reality is changing radically. In politics, first of all, the system of human-society-state interests, not the state, has been formed. The policy of the principle "Human interests take precedence over everything" is being implemented.

CONCLUSION

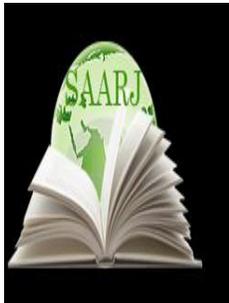

The emotional components of political culture (mood, emotions) reflect the standard and quality of life of citizens, contribute to the concentration of their attention on the issue of interest, carry important information about the state of public consciousness and appear as an important indicator of political culture. Observations show that our people are gradually adapting to changes in the economic and socio-political spheres. The number of citizens who have managed to overcome the difficulties due to the improvement of their financial situation is increasing. They began to have more hope for both their future and the positive trends in the country's development. Thus, citizens' perception of the economic and political situation in the country is becoming more optimistic.

An analysis of the components of political culture allows us to conclude that freedom and human rights, order and stability, social equality and justice are paramount to maintaining the vitality and sustainability of any socio-political system. Without them, the government will not be able to build and maintain public confidence in its legitimacy.

ABSTRACT

This article discusses pedagogical speech, which is one of the key factors in the educational process, and important aspects of the use of metaphors in it. The metaphor has been analyzed in depth as a tool to increase the effectiveness of speech in the process of training older employees from different fields, especially managers. In modern science, the reasons for the change in scientific views on the concept of metaphor and the laws of its use are revealed.

KEYWORDS: *Pedagogical Speech, Metaphor, Conceptual Metaphor, Creativity.*

INTRODUCTION

The use of metaphors in education, especially in the retraining, teaching, professional development and development of formal speaking skills of older personnel, is invaluable. Most scholars who analyze the effectiveness of speech in communication explain the increase in the number of media outlets to the extent to which every thought expressed affects the destiny of the world. However, the power of words has long been highly valued in the works of Eastern thinkers. It is noteworthy that in these sources, the use of the word in a figurative sense in relation to its original meaning plays a special role in increasing the power of thought. Although this theory has been emphasized by many philosophers, its practical proof is reflected in the fiction. The change of the essence of a word in the process of communication, the expansion of meaning through the transfer of nouns, i.e. metaphors are widely used in speech and its place in fiction determines its original value.

One of the primary features of the activity of the human mind is the creation of new ideas from existing things and events, that is, the formation of metaphors [1]. Indeed, metaphor has been of interest to a number of scholars since antiquity, and as its scope expands, so does interest in this phenomenon. The history of the study of metaphor is connected with the name of the great philosopher Aristotle, which shows that the above ideas are a valid emphasis. In his work *Poetics*, devoted to the science of poetry, the philosopher first dwells on the concepts of metaphors and describes them as portable words expressed in poetic speech [2]. The scholar also explains the metaphor as “a concept used in the comparative analogy of the name of one species to the description of another species”.

The research of the French philosopher N. Charbonel plays an important role in the identification of metaphors. His theory focuses more on the semantic descriptions of metaphor in modern philosophy. Analyzing the philosophical research on metaphor written from antiquity to recent years, the scientist divides these theories and their generalizing conclusions into four groups:

- The first theory: metaphor is not language, but speech, as well as a phenomenon of thinking;
- The second theory: the process of metaphorization occurs only when there is a comparison, approximation between words of different types (heterogeneous);
- The third theory: all metaphorical expressions should be evaluated according to their semantic properties, i.e. expressive and cognitive semantic aspects;
- The fourth theory: the presence of praxéologique or praxéoprescriptive semantic features of the metaphor [3].

Exactly the fourth theory, i.e. the praxiological features of metaphor, is a novelty of Nanin Sharbonel's study. He explains this concept as follows:

“Ces énoncés ne se contentent pas de porter un acte de langage’ expressivité. Ils font autre chose : par l’appel à un comparant (toujours hétérogène) et valorisé (comme dans le régime sémantique expressif) ils enjoignent aucteur, à l’interlocuteur, quelque chose à faire, dans la praxis extralinguistique. Dire : « L’enfant est une plante qui a besoin de beaucoup de soleil» (Michelet)c’est enjoindre au parent de donner à l’enfant de l’affection” [3].

In this commentary, this notion does not imply artistically expressive speech. This results in something else: (heterogeneous, heterogeneous) comparable and (expressive semantics) in accordance with the urge of the evaluator, he (i.e. the metaphorical word) instructs the speaker and the listener to perform a certain action on the basis of extra linguistic practice. For example, "A child is a plant, it needs more sunlight," and this urge suggests that parents should give more love to their children. N. Sharbonel proves that metaphor has the power to influence social events and, in its essence, can direct a certain action. However, it is noted that this feature has not been taken into account in most modern philosophical studies.

In modern linguistics, the focus is on the features of metaphor related to thinking. Issues of language and thinking are a key factor in determining the mechanism of formation of new ideas in the human mind. The study of these phenomena serves as a program for the discovery of important stages of human history and the criteria of development. From the point of view of modern linguistics, metaphor is one such mechanism. Metaphors, originally analyzed in philosophy as speech ornaments, later entered linguistics and were studied as an artistic means of

expression. Today, however, cognitive linguists view metaphor as a comparative-analytical activity of the mind. That is, every word that exists in the language is formed on the basis of exact analogy, in which metaphor serves as a basic cognitive mechanism [4].

Philosophical and linguocognitive theories of metaphor have made it possible to study the creative principles of thinking in modern science. In particular, the “empirical nature of the metaphor and its role as a basic cognitive mechanism” [5] and the systematic connection based on analogy, comparison and creation in various fields have given rise to this phenomenon. Existence of metaphorization process in various fields of science, including sports, architecture, art, cinematography, politics, mathematics, physics, as well as in areas related to production, such as advertising, marketing, services (names of hairdressers in barbershops, names of dishes in restaurants) and its practical effectiveness was determined in the course of the study. The metaphorical product in any field is primarily the result of the interplay of language and thought. After all, the idea that arises in thinking is first reflected in language and transformed into materiality through action. “Thinking is the companion of human activity. Imaginative thinking takes a different form from the direct reflection of reality, and it is based on imaginary imagination. Indirectly, the imagination leads to the formation of metaphors, metonymies and other mental symbols” [5]. The multifaceted and interdisciplinary study of metaphor serves to determine the practical value of metaphors given in works of art and to determine its productive and praxiological (results-oriented) features. At the same time, it shows that the creative activity of the human mind is related to the process of metaphorization. At a time when innovative ideas are relevant for the development of the country, one of the important tasks facing linguists is to study, analyze this process and determine its laws.

TG Popova and EV Kurochkina praised the features of metaphor as a cognitive mechanism and commented as follows:

“The metaphor is extremely practical. It can be used as a tool of description and explanation in any field: in psychotherapeutic conversations and in conversations between airline pilots, in ritual dances and in a programming language, in art education and in quantum mechanics” [6]. This approach explains the reasons for the interdisciplinary study of metaphor. Metaphorical thinking exists not only in the minds of representatives of the field of language and literature, but also in the minds of people working in different directions, helping to find appropriate solutions to certain problematic issues.

Catherine Fur, a researcher on improving the performance of enterprises and organizations, explains the role of sports metaphors in capacity building as follows:

“Les métaphores sportives employées dans ces formations permettent d’avoir accès aux représentations sociales par une connaissance spontanée, naïve, communément appelée connaissance de sens commun ou pensée naturelle. Nous pouvons les observer, par exemple, dans le langage: «l’entreprise, c’est un vaste bateau», «le marché commercial, c’est comme sur un voilier, il y a des moments où la mer est calme et d’autres moments où c’est houleux, on est tous dans la même galère», comme dans les situations sportives qui sont utilisées dans ces stages” [7]. The study explains that the doctrine called "OUT DOOR" conveys the laws of labor improvement to employees of the enterprise through simple and straightforward social images. It shows that the process of physical training of workers is not just a simple exercise, but the implementation of the recommendations of the leader who conducts this training. Illustrations

such as "Business is a big ship", "Being in a trading system, swimming in a sailboat means that sometimes the water is calm, and sometimes in floods are all at risk", and workers are advised how to act in such a situation. These images help to prepare the company's staff for the future, to establish collective activity and spiritual preparation for personal life, as well as professional activities. In this study, the main focus is on the leading speech, the figurative expressions reflected in the speech are metaphors that reflect different perceptions in the human mind.

Artificial intelligence is analyzed in a scientific article by French researcher Christian Notary comparing computer metaphor and cognitive linguistics. He negatively assesses the similarity between the computer and the human brain, arguing that the human brain is a complex system [8]. Scholars studying the laws of language analyze the degree to which metaphorical expressions such as "automatic change", "mechanical construction" and "grammatical formula" given in their theories correspond to computer language.

Linguist Bianca Tomoni has analyzed metaphors in the field of economics, relying on the cognitive properties of the metaphor. The following examples used in the research in the field of economics, in particular in the banking system, show that the conceptual metaphor "Bank is a battlefield": "Les banques sont conçues comme des armées, les agences bancaires en tant qu'unités militaires, les employés en tant que soldats, l'argent et les produits financiers apparaissent représentés en tant que ressources ou objectifs militaires, le marché financier apparaît comme un champ de bataille, la crise comme un ennemi" [9]. The examples given are analyzed on the basis of a socio-cognitive approach, based on the theories of several economists such as Boers, Demecheleer, Charteris-Black, Ennis, Musolff, and McCloskey. According to B., in economics, metaphors are used in order to engage and persuade the community, as well as to ensure the consistency of speech. Divide the nearly 6,000 metaphorical phrases collected on the basis of 74 documents related to the banking sector into three groups, «métaphores-clefs», métaphores conceptuelles and sous-métaphores. These sources also reveal the peculiarities of gender linguistics of metaphorical speech in economics: "Elles are porteuses d'idéologie et contribuent à masculiniser le discours et à limiter l'accès des femmes aux postes de haute direction" [9]. The analysis of metaphors is studied according to the text, its type and theme, the comprehension potential of the listener-receiver focused on metaphorical expressions is taken into account and psycholinguistically analyzed.

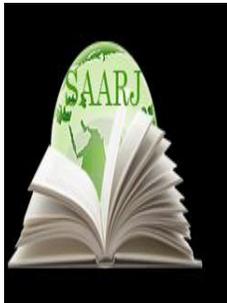

One of the most important features of metaphor is that it pushes this idea from immaterial to material. The theories of J. Lakoff and M. Johnson on the conceptual understanding of the universe and the empirical properties of knowledge later led to the discovery that there is a real mechanism of technical and scientific innovations in various fields. There is also a praxiological feature of metaphors, which means that it serves as a guide for the reader in understanding abstract concepts. The word formed by name transfer not only takes on a new meaning, but also conveys the necessary advice and guidance through existing experiences in thinking. This phenomenon has been studied in praxiology, and the most striking example of this is reflected in the metaphor. This feature is reflected not only in the metaphors used in fiction, but also in scientific and journalistic texts. It has also been found that in modern philosophy the praxiological feature of the metaphor is more manifested than its ornamental feature.

This means that metaphors can not only ensure the effectiveness of speech in different areas, but also stimulate the formation of new thoughts and ideas. Proper use of metaphors in speeches in

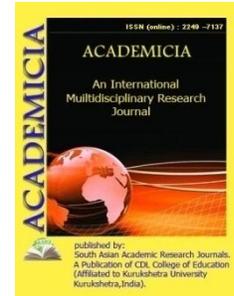

any field, while demonstrating the skill of the speaker, allows the listener to have a clear idea of the intended purpose.

ABSTRACT

The article discusses innovative teaching methods in primary school. The widespread introduction of new forms and methods of teaching, including modern information technologies, to ensure the possibility of individual development of each child. The development of the ability to motivate actions, independently navigate the information received, the formation of creative non-standard thinking, the development of children through the maximum disclosure of their natural abilities, using the latest achievements of science and practice, are the main goals of innovation. Innovative activity in education as a socially significant practice aimed at moral self-improvement of a person is important because it is able to ensure the transformation of all existing types of practices in society.

KEYWORDS: *Innovation, Primary Grade, School, Learning.*

INTRODUCTION

Innovation is the introduction of new methodologies and standards into a process. Obedience, repetition, imitation are replaced by new requirements: the ability to see problems, calmly accept them, and solve independently. This applies to all spheres of life: household, social and professional. Innovative education involves learning in the process of creating new knowledge -

through the integration of fundamental science, the educational process and production itself. It brings with it new foundations of developmental education, as the main modernizing factor in education. In relation to the pedagogical process, innovation means the introduction of something new into the goals, content, methods and forms of teaching and upbringing, the organization of joint activities of the teacher and the student. The purpose of innovation is a qualitative change in the personality of a student in comparison with the traditional system. This becomes possible due to the introduction of didactic and educational programs unknown to practice into professional activity, which involves the removal of the pedagogical crisis.

The development of the ability to motivate actions, independently navigate the information received, the formation of creative non-standard thinking, the development of children through the maximum disclosure of their natural abilities, using the latest achievements of science and practice, are the main goals of innovation. Innovative activity in education as a socially significant practice aimed at moral self-improvement of a person is important because it is able to ensure the transformation of all existing types of practices in society. [2]

When choosing a teaching style, the teacher's beliefs have a greater influence than his knowledge, since in the learning process they affect everything that he does in the classroom, the beliefs to accept new ideas, therefore, I completely revised my teaching methodology before and after. Modern requirements of society to the teacher are such that the teacher must constantly engage in self-education, expanding the boundaries of his capabilities. He should be able to change quickly and be able to apply new approaches and technologies in the classroom. The widespread introduction of new forms and methods of teaching, including modern information technologies, to ensure the possibility of individual development of each child. Development of a system of educational work on the principles of voluntariness, freedom of choice and creativity. The high-tech world is rapidly gaining momentum day by day.

In our children - children of the 21st century, we must cultivate the habit of changes, teach them to react quickly to changing conditions, obtain the necessary information, and analyze it in many ways. General development is understood as the development of the mind, will, emotional and moral ideas - everything that underlies the educational activity and the successful socialization of the student. The general development of the child is carried out in the process of his search activities when interacting with the teacher, the class, his environment. Therefore, it is necessary to pay special attention to the organization of educational activities and the socialization of children. In the pedagogical literature, a large number of classifications and groups of innovations are given. I am closer to innovations aimed at developing new forms, technologies and methods of the educational process; innovations aimed at working out the new content of education and new ways of structuring it.

The development of a student in primary school depends on many factors, including how visual and easy-to-understand the educational material is. Therefore, at the present stage of the organization of the educational process, the teacher cannot do without information and communication technologies in the lesson. Thanks to the Power Point program, any illustrative material can be turned into a good methodological aid for the teacher. Psychologists have proven that when conducting classes using new information technologies, the right hemisphere of the brain is activated, which is responsible for associative thinking, the birth of new ideas, intuition, the psycho-emotional state of the student improves, and his positive emotions are activated. [one] The effectiveness of teaching also increases due to the activation of independent work of

students, the development of their cognitive and creative abilities, and the figurative presentation of the material. An elementary school teacher is obliged to teach children to learn, to preserve and develop the cognitive need of students, to provide the cognitive means necessary for mastering the basics of science. Therefore, one of the main goals is to develop cognitive processes.

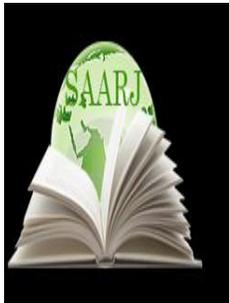

Cognitive activity develops cognitive processes, logical thinking, attention, memory, speech, imagination, maintains interest in learning. All these processes are interconnected. Ability to competently organize work in the lesson, create conditions of ease and the interest of all students allows the teacher to use additional opportunities (for example, the use of computer technology) to develop the abilities of each child. Such organization of classes helps in a shorter time to remember and consolidate those techniques that are known to children from preschool age, to more fully ensure the mastery of the newly shown teacher.

The developmental significance of computer technologies for the development of the abilities of a primary school student is very great. The use of computers in the classroom creates an emotional mood, which, in turn, has a positive effect on the development of children. This arouses great interest in children in the studied term or concept, increases attention and at the same time is a repetition of the previously known names of materials and tools, terms. In a modern elementary school, the personality of the child and his activities come first. Priority technologies include: Personal-oriented approach; Active approach; Health-saving technologies; Art-technologies; Gaming technologies; Test; Information and computer technologies; Implementation of design and research activities.

The technology of the activity method means that the formulation of an educational problem and the search for its solution are carried out by students in the course of a dialogue specially built by the teacher. Children under my guidance, but with a high degree of independence, while answering questions, discover new knowledge. I give children the opportunity to develop the ability to see every phenomenon from different points of view. Possession of this skill is one of the most important characteristics of a modern person. It is associated with such personality traits as tolerance to other people's opinions and habits, willingness to cooperate, mobility and flexibility of thinking. In the process of work, I came to the conclusion that a child who has not mastered the methods of educational activity in the elementary grades of school, in the middle level, inevitably goes into the category of unsuccessful ones. Learning through the activity method provides for such an implementation of the educational process in which at each stage of education, a number of intellectual qualities of the individual are simultaneously formed and improved. I believe that the correct use of the activity-based teaching method in the classroom in primary school will optimize the learning process, eliminate student overload, prevent school stress, and most importantly, make school a single educational process. Applying modern technologies in innovative teaching, the teacher makes the process more complete and interesting. Today, every teacher can use the activity method in his practical work, since all the components of this method are well known. Therefore, it is enough just to comprehend the significance of each element and use them systematically in work. The use of the technology of the activity-based teaching method creates conditions for the formation of a child's readiness for self-development, helps to form a stable system of knowledge and a system of values (self-education). This ensures the fulfillment of the social order reflected in the provisions of the RF Law "On Education".

INTERPRETATION OF THE IMAGE OF NATIONAL LIBERATION FIGHTERS (ON THE EXAMPLE OF THE HEROES OF BAHODIR MURODALI'S STORY "KO'KTO'NLIKAR")

Akramov Sherzod Xalmirzayevich*

*Independent Researcher,
Karshi State University, UZBEKISTAN

ABSTRACT

This article comments on the interpretation of the image of national liberation fighters through the story "Koktonliklar" by BahodirMurodali. The policy of perestroika that emerged in the mid-1980s and the disintegration of the USSR make it possible to study and shed light on historical documents that have been kept secret from the people for years. As a result, many things become clear. In particular, the emergence of the national liberation movement and their true identities were revealed. This is also reflected in the works. One of them is the story of the young writer BahodirMurad Ali "Ko'kto'nliklar".

KEYWORDS: *National Freedom, Spirituality, Narrative, Independence, Human Destiny, People, Oppression.*

INTRODUCTION

The effect of spiritual awakening is manifested in people's self-awareness, national pride, pride, pride in the past of our ancestors, the feeling that the future is in everyone's hands, labor and conscious activity. The task of today is to use literature to enhance the spiritual and intellectual potential of the nation, the mental and spiritual cultures of the people. Because, as we have said before, the world is protected not by beauty, but by spirituality. It is created by the perfect man. Fiction is an important factor in creating perfection. Well-informed writers are working in this direction.

In which story the process of human experience finds its suffering, its essence, its philosophical interpretation, the events do not retreat from history. When illuminated, the work survives any change in society. BahodirMurodali's story "Ko'kto'nliklar" captures the heart of the reader with such a quality and allows him to determine the right path in life by enriching his spiritual world.

This, in turn, will contribute to the humanization of society and the strengthening of democracy. Because only in a society where the people are perfect will the law prevail in the interests of justice and Islam. So the work serves the future of man.

It is well known that the images of national liberation fighters in scientific and artistic works written before independence are almost all evil, disturbing the peace of the people and causing great damage to the national economy, defaming women. described as people. The policy of perestroika that emerged in the mid-1980s and the disintegration of the USSR make it possible to study and shed light on historical documents that have been kept secret from the people for years. As a result, many things become clear. In particular, the emergence of the national liberation movement and their true identities were revealed. This is also reflected in the works. One of them is the story of the young writer BahodirMurad Ali "Ko'kto'nliklar". The story sheds light on the life process as much as it actually is, and erases the path of the national liberation movement. So what does this look like?

First, the story is dominated by the image of human destiny, destiny, its pain and suffering, not reality; secondly, the development of a person's sense of the spiritual world, his suffering, his worldview with sincerity and great human pain; third, to look at man as a man free from a class approach, and to describe him as having and possessing qualities; and fourth, the issue is essentially reflected in the correct coverage of it from a historical point of view.

The events of the story are based on the activities and destinies of three leading heroes. These are the leaders of the national liberation struggle - Askaralibek, Shamirzabek and mullaJaloliddin, who followed the path of the Reds. These three image activities and the behaviors of the people associated with them make up the three worlds. But even so, these worlds have integrity.

The story begins when Askaralibek is caught red-handed for treason. The plot of the work is based on the memory of Askaralibek. The memory is not described simply, but described completely. The events of the film are aimed at developing the spiritual world of Askaralibek, revealing the essence of his fate and tragedy. As a result, Askaralibek becomes more famous in the development of the plot. Because his actions and the events of life and the conclusions he draws from the process have a great philosophical generalization, which allows us to understand the fate of the homeland and the essence of national values. The subject of the story of the «Ko'kto'nliklar» is a sensitive one: for almost seventy years, works about the press have been created, exposing the negative brutality of the publishers. It would be wrong to say that the number of printers created in fiction and art has increased tenfold in terms of quantity. The word "printer" was just a symbol of blackness and negativity. No one asked, "Why hijacker?", "Where did he invade?" never thought The essence of printing has been re-examined for two or three years. Especially in 1990, the Central and local press published valuable articles about the background of the printing movement and the goals of the hijackers. The time is approaching for the press, or rather the national liberation movement, to be covered in a completely new artistic light. One of the first bold steps in this direction was the roundtable "hijacking: Truth and Fiction", published in the "Star of the East" (1991, No. 3). The «Ko'kto'nliklar» are one of the few novels, stories, short stories, and novels in our literature that shed light on the printing movement in a new direction. It is difficult to turn an obscure subject into a new one with an independent look. In the story of BahodirMurad Ali, the pressure of the old way of life is felt.

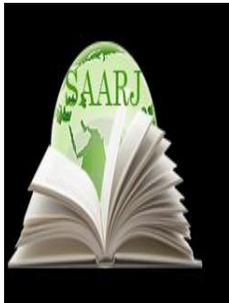

The story, of course, depicts the struggle between two opposing forces, the Reds and the Basmatis. Jaloliddin, Sorokin, Mansur, Kirgiy bola are the representatives of the Reds, Askarali, Umaralibek, Shamirzabek are the leaders of the "invaders". In the story, the people are portrayed as the main force. The author is not on the side of the publishers and does not fully use the reds. His point of observation is among the people. He looks at both opposing forces with the eyes of the people. In many works, the people served as a backdrop for the Red Army. BahadurMurad Ali evaluates both the Reds and the Basmachis in terms of the concept of a wise people. People are the decisive force in the story. There is no sense of revolution in his spirit. Rebuilding a new marriage is not the main goal either: Jalaliddin's father and mother reprimand a Tatar teacher for whitewashing the house. They are more concerned with reading the book bareheaded and urinating than with the novelty of Jalaliddin's views. So Jalaliddin's parents are so cousins, don't they understand? Both his grandfather and father performed Hajj. Imam of the Kadyrkulhoji mosque. But he does not use the money from the imam for his living. He feeds his family on produce from the garden. People of faith in Jalaliddin's family In the story of the «Ko'kto'nliklar», the image of the main characters proves that faith is the most sacred feeling of a person. Umaralibek bequeaths his faith even before his death. People like Askarali, Shamirza, Latofat, Nisora sometimes listen to the devil and make mistakes, but in the end they keep their faith strong.

The author has given a broad and detailed account of the essence of reality. The story contains in-depth analysis, comparisons and analogies. The author diligently and carefully studies the materials of Soviet-era books, articles, works of art, memoirs of military commanders, newspapers and magazines, radio broadcasts, television programs, analyzes the various views and interpretations, and at the same time personally was able to substantiate his views in every way.

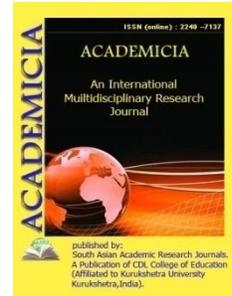

The conclusion is that every country, every nation can develop only in conditions of complete freedom, in an environment of political, economic, spiritual and spiritual independence, and have a place as a full-fledged member of the world community. to freely determine their present and future, to protect their rights and citizens, to uphold the rule of law in practice, to strive for spiritual maturity, to be proud of the spiritual and cultural riches created by their ancestors, to be the successors and educators of their ancestors The fighters of the national liberation movement will remain in the hearts for centuries.

**EXPANSION OF INTERCULTURAL RELATIONS OF STUDENTS AS
 IMPROVING THE QUALITY OF THE EDUCATIONAL PROCESS WHEN
 LEARNING A FOREIGN LANGUAGE**

ABSTRACT

The article discusses the issue of expanding the intercultural relations of students in the study of the English language, which is the most important at this time, when the relationship of peoples, languages, cultures has reached an unprecedented scale - and, as always, the problem of fostering tolerance for foreign cultures, awakening interest and respect for them, overcoming feelings of irritation in oneself from redundancy, insufficiency, or simply the dissimilarity of other cultures.

KEYWORDS: *Expansion, Intercultural Relations, Student, Study, English, Relationship, People, Culture, Education, Tolerance, Stranger, Interest, Respect, Dialogue.*

INTRODUCTION

At the present stage, the main task of teaching foreign languages cannot be precisely the mastery of linguistic knowledge, skills and abilities, and not even encyclopedic knowledge of regional studies.

The main goal in the pedagogical process should be the expansion of intercultural relations, which is the most important at this time, “when the mixing of peoples, languages, cultures has reached an unprecedented scale - and, as always, the problem of fostering tolerance for foreign cultures, awakening interest and respect for him, overcoming in oneself feelings of irritation from redundancy, insufficiency or simply the dissimilarity of other cultures. This is what caused the general attention to the issues of intercultural communication”. [7; 9]

The study of the problems of intercultural communication involves acquaintance with the following phenomena and concepts: the principles of communication, the main functions of

culture, the influence of culture on perception and communication in its various spheres and types, parameters for describing the influence of culture on human activity and the development of society. [5, 73]

An intercultural relationship is the mutual understanding of several individuals in communication. In addition, these individuals belong to different cultures that are not similar to them. It is the lack of similarity of cultures that can lead to a misunderstanding of individuals, although they communicate perfectly in the same language. Intercultural attitude is gaining demand in the field of the educational process in the study of a foreign language: knowledge of communication models, cultural stereotypes, values, images and symbols of culture.

The result of acquaintance with the culture of the country of the target language and mastering the methods of intercultural communication is the socio-cultural competence formed in students as an integral part of the communicative competence. [2]

Factors of the native sociocultural environment also play an important role in the formation of ideas about the culture of the country of the target language. [3]

Sociocultural competence includes regional and linguistic information. In foreign language classes, it is proposed to introduce students to the following information about the country of the target language: geographical location and natural conditions; state structure; the culture of the country and its contribution to world culture; organization of everyday life and leisure; information about educational institutions; holidays and significant dates; features of speech behavior and etiquette.

Linguistic and cultural knowledge includes information about non-equivalent and background vocabulary and methods of its transmission in the native language, the cultural component of authentic texts, speech etiquette of native speakers. [4]

Using well-chosen material for verbal communication, we can determine the socio-cultural knowledge and skills of students. The selected material for speech communication uses such topics as: Great Britain, London, Family, London, Museums, Traveling, School, Hobby, Ecology, Sport, My specialty, National holidays, Traditions. This means that a student studying English must know the information of the country under study: about the geographical location, about famous historical events, about the state system, about art and culture, about traditions, about the norms of behavior of the country under study. Possessing all the above socio-cultural knowledge and skills, the student will be able not only to take part in intercultural communication, but also to speak English at the level of his native speaker.

In the process of mastering a foreign language, students acquire material that demonstrates the functioning of the language in a natural environment, the speech and non-speech behavior of native speakers in different communication situations and reveals the features of behavior associated with folk customs, traditions, social structure of society, ethnicity. First of all, this happens with the help of authentic materials (original texts, audio recordings, videos), which are normative in terms of language design and contain linguistic and cultural information. [6,152]

In addition, in some cases, without understanding what it means to study and communicate in a foreign language, native speakers are simply not able to answer the questions popular among foreigners what and why. This happens not because they do not want to help, but because, having familiarized themselves with their native culture in a natural, implicit way, being in a

cultural environment, they have knowledge-concepts, are only able to intuitively determine what is what and very rarely can give the expected explanation. Thus, it is obvious that knowledge of culture gives confidence to everyone who speaks a foreign language enables students to make choices in action. In some cases, knowing the correct answer, you just need to ask what and why in order to start a conversation or continue the conversation. These tricks belong to the category of many strategies used in communication. Therefore, socio-cultural competence allows speakers of a foreign language to feel almost on an equal footing with native speakers (in terms of culture), which is a step towards adequate knowledge of a foreign language. [2; 19]

The actual task of teaching foreign languages as a means of communication between representatives of different peoples and cultures is, of course, solved when studying languages in an indissoluble unity with the world and culture of the peoples who speak them. This is a complex task, complicated by the fact that communication is not just a verbal process. The effectiveness of intercultural communication, in addition to knowledge of a foreign language, depends on many factors: conditions and culture of communication, rules of etiquette, knowledge of non-verbal forms of expression, background knowledge in general and much more. [1]

Thus, we are talking about the need for a deeper and more thorough study of the world of native speakers, their culture in the wide ethnographic sense of the word, their way of life, national character and mentality. [8.35]

Therefore, in the process of teaching English, you need to intensify pressure on the knowledge of the culture of the country and the people of the target language. Knowledge of the culture of the country and the people of the target language will help to easily establish intercultural relations among students in the country of the target language.

The acquired knowledge about the culture of the country of the target language leads to intercultural relations and mutual understanding of each other, which they all belong to different national cultures.

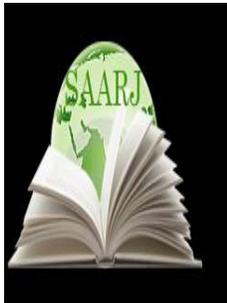

Language and culture in the process of communication are closely related. After all, language is the custodian of cultural values, embodied in language units, in oral and written texts. As a carrier of culture, language is at the same time a transmitter of cultural values from one generation to another. [9]

Consequently, the expansion of intercultural relations occurs depending on the ability of students to take part in the dialogue of cultures, showing mutual respect, tolerance for cultural differences and overcoming cultural barriers.

METHODS OF FORMATION OF SPIRITUAL AND MORAL COMPETENCIES IN THE EDUCATION OF FUTURE TEACHERS

Rakhmonova Gullola Shavkatovna*

*Teacher,
 Bukhara State University, Bukhara City,
 UZBEKISTAN

ABSTRACT

Measures aimed at forming a harmonious generation, educating young people spiritually and morally, turning them into an active participant in the ongoing reforms are being consistently implemented. Increasing the professionalism and competence was recognized as the main driving force of progress and activities leading to the goals of sustainable development. The modern education system involves the further improvement of the mechanisms for raising the competence of future specialists on the basis of a creative approach and an innovative system for putting them into practice. From this point of view, the research competence of future specialists on the basis of a creative approach is of particular importance for creating innovation, creating intellectual resources for socio-economic development through the development of cognitive and divergent thinking based on modern pedagogical processes that create new knowledge, and expanding the training opportunities for competitive personnel. The article looks into the requirements and policies for the competent teaching staff.

KEYWORDS: *Cultural, Moral, Political, Legal, Economic, Competence, Lifelong Learning, Technical Skill, Spiritual and Moral Competence.*

INTRODUCTION

The basic concepts of the spiritual and moral education of schoolchildren and the preparation of the future teacher for the corresponding activity were subjected to research. At the same time, an analysis of psychological and pedagogical literature suggests the need:

- Application in a complex of scientific approaches from the standpoint of which these phenomena were studied, as well as integrative and synergistic approaches;

- Definition of the essence of spiritual and moral education in comparison with spiritual and moral;

- identifying scientific provisions, approaches, patterns, principles, concepts that reveal the essence of preparing a future teacher for the spiritual and moral education of schoolchildren and ensure the achievement of its tasks within the framework of various areas of relevant professional and pedagogical training;

development of the concept of professional and pedagogical training of a future teacher for spiritual and moral education from the point of view of the requirements of modernization of education in conditions of a diverse worldview, a variety of value systems;

- solving the problem of the relationship between religious and secular traditions in the upbringing of the younger generation;

- determining the competencies of the future teacher in the field of spiritual and moral education of schoolchildren.

Thus, the relevance of the study is due to:

- at the socio-pedagogical level: the need to overcome the spiritual crisis caused by socio-economic development; a social order reflected in the latest state documents on education, in which the main task is the upbringing of a spiritually rich, highly moral, educated person who respects the traditions and culture of his people and other peoples; the need for the training of pedagogical personnel who are able to solve the problems of spiritual and moral education of schoolchildren in the conditions of the existence of various value systems, the inconsistency and aggressiveness of the information space, different types of worldview, etc .;

- at the scientific and pedagogical level: the appearance in recent years of scientific research in the field of education of the younger generation in modern conditions, containing alternative positions of scientists in solving the problem under study and the need to determine in this regard the conceptual foundations of the spiritual and moral education of schoolchildren; the lack of theoretical provisions that reveal the essence of preparing a future teacher for the spiritual and moral education of schoolchildren in the changed socio-economic conditions;

- at the scientific and methodological level: the need to analyze the existing one and develop a new scientific and methodological support for the process of preparing a future teacher for the spiritual and moral education of schoolchildren in the constantly changing conditions of the socio-economic and spiritual life of Russian society.

MATERIALS AND METHODS

It is shown that the goal of aesthetic education is the development of their intellectual, spiritual, moral, artistic and creative potential, as well as the development of aesthetic taste and aesthetic ideal while using the wide opportunities for students to master various types of artistic and aesthetic activities. The article considers artistic and creative activities that have a greater impact on the process of aesthetic education. The importance of artistic and creative activity in the formation of the aesthetic activity of a person is noted. The dynamics of the development of aesthetic education is revealed, showing that the acquired skills and practical aesthetic skills increase at each stage of professional training of future technology teachers in the context of studying and implementing various types of artistic and creative activities. The mechanism of

aesthetic education is effectively implemented as the achievement of the goal of professional training of future technology teachers through the creation of special conditions for a unified artistic and aesthetic educational environment in which teachers involve students in the process of creative activity and encourage them to choose and make independent decisions in creativity. It is shown that the artistic and aesthetic educational environment through discussions and thematic conferences on art, in particular, on decorative and applied art, folk crafts, artistic handicrafts, contributes to the aesthetic education of future technology teachers. The necessity of studying disciplines on arts and crafts, theory and history of design, morphology in technological design, as well as the development of artistic and creative self-expression in artistic and creative activities aimed at the aesthetic education of students of future technology teachers is noted.

Reforming higher professional and pedagogical education requires a deep rethinking and development of practical approaches to the spiritual and moral formation of the personality of a future teacher, who has spirituality and high morality, formed spiritual needs and moral motives of behavior, the ability for spiritual and moral self-determination, self-realization, self-improvement, allowing to solve practical tasks of future professional activity.

The study of the provisions of regulatory documents in the field of education and the analysis of the literature allow us to establish that domestic pedagogy has a certain need for scientifically based materials and methodological recommendations that regulate the spiritual and moral education of the future teacher. Particular attention in the professional training of teachers should be paid to the formation of the worldview of the individual, spiritual and moral position in relation to the phenomena of social life, readiness for public social action. We believe that the solution tool should be the system of spiritual and moral education of the future teacher in the field of professional training, taking into account the local history component, the basis of which is knowledge, skills and methods of local history activities, their worldview and moral orientation.

RESULTS AND CONCLUSION

The demand for local history material in the professional training of future teachers is due not only to the theoretical premises and new requirements of the federal state educational standard of higher professional education, but also to the practice of higher education - the humanization and regionalization of education, the pedagogical potential of local history in higher education, its upbringing function.

Teaching in our modern world is quite demanding and requires the educators to perform successfully in several positions.

Such a broad frame of reference can be a useful tool for analysis and dialogue, according to a systemic view of the teacher's professional development, in its tensions between person and institution, product and process, and what is desirable or possible.

It is possible to stimulate teachers to engage positively in developing their competences through a competence development plan that might:

- be based upon a clear model of teacher competence with sound theoretical underpinnings, on which there can be consensus;
- promote teachers' self-reflection;

- respect individual teachers' different starting points and levels of interest by offering a mix of options, incentives and requirements; and
- leave room for school autonomy in implementing continuous professional development plans.

A key question is: 'how to inspire teachers to be proactive, reflective professionals who take ownership of their own professional development?' Teachers vary in their learning styles, their level of engagement and their understanding of the benefits of acquiring and developing their competences. Therefore, their focus on internal or external stimuli for engagement in professional development will vary.

Teacher engagement in competence development can be stimulated by offering a mix of opportunities, incentives and requirements. The opportunities for competence development should meet the following conditions:

- Matching needs and demands at all levels – building a bridge between the needs of the teacher and those of the school (and education system);
- Accessibility, relevance and variety of opportunities on offer;
- Proper coordination between the content of ITE, induction and CPD, and the providers at each phase;
- being based on dialogue with stakeholders (teachers and unions, school managers and employers, school authorities and national ministries, teacher educators and universities, CPD providers) at all levels, to secure commitment and shared understanding;
- Adequate provision of time and resources (e.g. substitute teachers to cover for training absences).

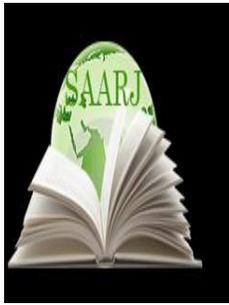

For teachers who are mainly stimulated by external factors, different material and non-material incentives can stimulate engagement in professional development; depending on the context, these may include:

- Opportunities to develop as professionals;
- Opportunities to fulfill other roles and take on wider school responsibilities;
- Recognition by colleagues and education authorities;
- seeing the success of their pupils; the appreciation of the school leader;
- The respect of the local community, including parents; and
- Salary increases.

ABSTRACT

This article provides an analytical account of the life, government, and military activities of Sultan Jalaliddin Akbar Shah, who ruled the Baburi Empire in India from 1556 to 1605. It was a mixture of Islam, Hinduism, Parsism, and Jainism. Akbar combined secular and religious authority. Those who believed in this religion were blessed by Akbar. Later, after Akbar's death, this new religion became a small sect. When Akbar could not find a ship by the river, he jumped into the water with the elephant he was riding and started to cross the river. He has a small army with him.

KEYWORDS: Akbarshah, Humayun, Baburis, India, Muslims, Reform, A Military March, Large Landowner.

INTRODUCTION

Akbar Jalaliddin Muhammad was born on October 14, 1542 in Amarkot. From 1556 to 1605 he was the ruler of the Baburi kingdom in India. Babur's grandson, Humayun's son, ascended the throne at the age of 13 (February 15, 1556). Shortly afterwards, Humayun and his family arrived in Kandahar, where his brother ruled. Then his brother knew that he was going to catch him and kill him and left for Iran. His son Akbar and his wife stay with his brother. Eventually, when Kabul and Kandahar fell to Humayun again, Akbar met his father Humayun again. After the conquest of India, his father appointed him governor of Punjab. After announcing the death of his father, he is enthroned in Punjab and announced to the people. At that time, in 1556, Akbar was only thirteen years and nine months old. For this reason, Bayramkhan was appointed as his advisor and assistant in the conduct of the affairs of the kingdom [1-5]. Bayramkhan was a very strong military leader who knew the events in the country in advance. He used to serve his father, but now he is helping to strengthen his son's property. It will amass great wealth and suppress all protests.

Initially, the Turkmen minister, Bayramkhan, ruled the throne with the help of his father, and then, when he reached puberty, he began to rule the country harshly. He constantly fought to expand his kingdom. During the reign of Akbar, the Baburi kingdom covered a vast area from Balkh in the north to the Godavari River in the south (with Kashmir and Afghanistan), from the Arabian Sea in the west to the Bay of Bengal in the east. In order to establish a centralized kingdom, internal reforms began in 1574: strengthening control over the army and reorganizing and rearming it, dividing the country into new administrative districts. Through marital ties, he strengthened ties with the principalities of Rajput. The Rajput cavalry formed the basis of Akbar's army [5-9]. Large landowners have taken several measures against the arbitrariness of the landowners. In 1574, instead of giving land to the commanders, the peasants entrusted their servants with the payment of wages from the treasury and the collection of taxes from the lands of the country. Akbar's policy was strongly opposed by the Jogirs. Akbar began appointing Hindus to high positions in order to achieve religious harmony among the population and introduced a new religion, the "divine religion." It was a mixture of Islam, Hinduism, Parsism, and Jainism. Akbar combined secular and religious authority. Those who believed in this religion were blessed by Akbar. Later, after Akbar's death, this new religion became a small sect. Akbar paid great attention to agriculture and trade, and European countries also traded. Akbar also sponsored science and art [7-12]. Akbar's minister and friend Abulfazl Allami wrote Akbarnama, a book on the history of Akbar's reign. Akbar was a great statesman, a strong, courageous and talented commander.

The political situation at that time was very complicated. Because of Humayun's sudden death, before he could finish his work, the Afghans continued to occupy large areas of the country. Alexander the Great still had the opportunity to gather an army and strike at the king of the Baburids, Odil Khan Suri sat with his minister Haymo in the East and took the opportunity to take back Agra and Delhi, and the junior rulers who wanted to take advantage of this destroyed the empire. it was a time when he dreamed of being independent.

Akbar had a difficult task to overcome. Taking advantage of the young king's accession to the throne with his minister Haymo, Odilkhan attacked Delhi and Agra, capturing the surrounding lands as well as the Baburis and depriving them of the land of Duob. He then prepares to expel Akbar from Punjab.

Upon learning of this, Bayramkhan gathered his army and went to Delhi, where he met Haymo in the Panipat Valley. Haymo's army consisted of 100,000 navkars and 500 elephants, while Bayramkhan's army consisted of 20,000 navkars. The battle took place in the month of Muharram in 1556 and was unexpected. Haymo falls on his horse. When the warriors saw this, they were terrified and fled. Meanwhile, Bayramkhan continued the battle and continued to invade Agra and Delhi until he recaptured them and captured Duob. He takes the animal captive and kills it.

MAIN PART

Akbar reached puberty in 1560. Although he did not enjoy the sciences as much as the royal children of his age, he was intelligent and knowledgeable. The life he lived, the conditions he grew up in, the process of growing up taught him a lot.

After Akbar ascended to his father's throne, Bayramkhan took on all the challenges of the throne, becoming his teacher, commander and deputy. He strengthened his position, drove out his enemies. But Bayramkhan was a fanatic, a Shiite. The people were Sunnis. Therefore, when Akbar reaches puberty, he decides to dismiss him gently. But kind words are of no use. Bahramkhan opposes Akbar. Akbar and his other generals chased him. Bayramkhan realizes that he has lost and apologizes. Akbar will forgive him on the condition that he spend the rest of his life in the land of Hijaz. On his way to Hijaz, near the city of Nani in Ghajarat province, the Afghans retaliated by killing him and burying him in a cemetery there. His remains will then be moved to Delhi.

Because Akbar is young, some generals and rulers try to oppose him. But even though he was small, he kept his word and cut himself off. Whenever he did something, he would do it all of a sudden, so he would destroy many of his enemies one by one.

One day, Alikulikhan, one of the generals, gathered the emirs around Khan Zaman (once one of Humayun's greatest generals) and took advantage of Akbar's departure to suppress a revolt organized by his brother Hakim Mirza in Punjab, capturing Kanuj and Avda. But Akbar quickly returned to Agra, gathered his troops and began to prepare for battle. Despite the rainy season, Akbar comes to the Ganga River. The khan was sitting quietly on the other side of the river. Because he thought that Akbar would not fight in this weather. When Akbar could not find a ship by the river, he jumped into the water with the elephant he was riding and started to cross the river. He has a small army with him. At dawn, battle drums sound at the gates of the Khan-era Gara Mank Pur. Khan Zaman and his troops were shocked by this sudden event and gave up their positions. Akbar captures much booty and destroys another enemy. This happened in 1567.

Akbar then captured Ranta-Pur Fortress and headed for Chitur Fort in Rajputana. It was rumoured at the time that the castle could not be captured. Akbar's army begins to destroy the castle walls with explosives. At night, when the commander of the fortress looks out of the wall, Akbar shoots him with an arrow. Frightened, the people of the castle and the soldiers began to kill themselves. After the defeat of the enemy, the capture of Chitur in 1568, and the annexation of Rajputana to the country of Akbar, the borders of the state reached as far as Ghajarat. Many of Akbar's fleeing enemies had settled in Ghajarat. They begin to attack Rajputana and Malva. Enraged, Akbar rushes to arrest him. Earlier, Humayun had conquered Ghajarat from the time of Bahadur Shah. But that didn't last long. When Humayun was defeated by Sher Shah and left India, Bahodir Shah retained his property. Gajarot remained independent. Now Ghajarat was

protected by Muzaffarshah, the grandson of Bahadur Shah. But he was a superficial ruler. The main power was in the hands of Gulam Etimodkhan. The situation in the country was not as peaceful as he converted to Islam. The government was very weak. The trustee, therefore, goes to Akbar and asks him to capture Ghajarat. Gajarat surrenders without resistance [6-11]. Enemies are destroyed and Gajarot is cleared of corruption.

When Akbar sent his troops to Surt, the Portuguese set up their own shopping malls there to help local forces. But after seeing Akbar's victory, they want to gain his trust. The Portuguese made a treaty with Akbar to take the pilgrims to Mecca freely and not to block their way at sea, because the city of Surt was a port city, and until the end, there was a street called "Bobi Mecca" - the gate of Mecca. was.

When Akbar returns from Ghajarat, his governor Muzaffarshah will also return with him. But the rulers of Gajarat advised him to return and take back his property. At their word, Muzaffarshah fled from Agra. Akbar appointed Abdurahimkhan, the son of his former minister Bayramkhan, as the leader of the army against Muzaffarkhan. When they arrived in Ghajarat, Muzaffar Khan fled to the coastal provinces and became a bandit for several years. But he finally surrendered in 1592. He commits suicide while being taken to Agra.

Hakim Mirza, Akbar's father's brother, was the governor of Kabul. From there he attacks Punjab. Akbar rebelled against him and pursued him, capturing Kabul. But after his sin, he returned to Kabul. Hakim Mirza attacks Punjab for the second time. For the second time, Akbar appointed him governor of Kabul. He ruled Kabul until his death in 1585. After his death, Kabul joined the Baburi state. Akbar appoints the Hindu Mon Sang as the governor of Kabul. This was a sign of Akbar's kindness to people of other nationalities.

Kashmir was also in the hands of Muslim rulers. But conspiracies and conflicts were undermining the government. Akbar wants to take over the region, which is famous for its air, wealth, flora and beautiful winds. Kashmir was conquered in 1586 as a result of such actions.

RESULTS

In Akbar's time, the country expanded exponentially. It includes northern and central India, including Gajarat and Malwa, as well as Bengal and western Afghanistan.

After these marches, Akbar jumps south. There, on the remnants of the Bahmani state in Dukkan, five small Muslim countries emerged - the Borishah state in Bidor, the Bihar states, Gulkanda, Pijopur and Ahmad Nagar. The ruler of Ahmad Nagar invaded Bihar in 1572 and annexed it. As a result, it was becoming a much more powerful and dangerous force. The wars between these countries have never stopped. There was another Muslim kingdom in the north of the country, called Hondis, with Burhanpur as its capital. There was the famous Asirgara Fortress. He was also added to Ghajarat. After the conquest of Ghajarat by Akbar, the fortress passed to him. Only the name of Khandis belonged to the Baburis. Its governor stops paying tribute to Akbar. Because of Snu, Akbar heads south. Ahmad marches on Nagar in 1595. Its ruler was a young boy at the time. But the boy's aunt, Chandbibi, was the real ruler. This woman meets Akbar face to face. It was one of the rarest meetings in history, with a woman at the head of the army. When Akbar attacked him, Chandbibi called on the rulers of the neighbouring country to stand in line in front of the enemy. The governor of Pijopur rushes to his aid. When Akbar's army begins to tear down the walls of the fort, its occupants begin to flee in fear.

Chandbibi then removes her mask from her face and orders the returning soldiers to flee with their swords in their hands. The soldiers return. The ruins of the fort were repaired at night. The siege of the fort was led by Akbar's son Murad. When both sides are tired, Murad offers to make peace. Chandbibi agrees to the terms of the truce. Bihar joins the Baburi state. In this way, this fearless woman resists Akbar's army.

This was followed by a fierce battle between Akbar's army and the country of Pijopur. The war between the two countries was sparked by Pijopur's support for Ahmad Nagar. Ahmad Nagar, a Muslim kingdom, fought in Gulkan and Pijopur. The war dragged on. Neither side won. Meanwhile, Murad, the son of Akbar, the leader of the army, dies. Akbar hastily sends his second son, Daniel, to war. He was followed in 1599 by an army of 80,000. But in the meantime, the position of the Khanate of Khandis changed considerably after the death of its ruler and the replacement of his son Shah Bahadur Dil. He disobeyed the Baburis and refused to pay tribute. The country was located north of Dukkan and was a gateway to the Muslim kingdoms. Akbar's goal is to completely surrender these countries. Eventually, Khandis and Ahmad Nagar joined the Baburi state. Gulkanda and Pijopur will remain independent. During the reign of Akbar, the territory of the Baburid state expanded enormously. At the beginning of the 17th century, the Baburi state consisted of Kabul, Kandahar, Sand, Multon, Lohur, Kashmir, Delhi, Agra, Achmir, Ilahabad, Avda, Bahor, Bengal, Arisa, Malwa, Ghajarat, Khandis, Baror, Ahmad Nagar provinces.

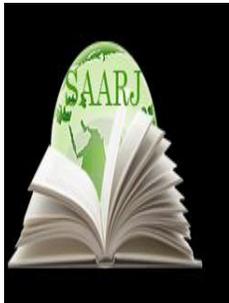

CONCLUSION

In conclusion, during the reign of King Akbar, the Baburi kingdom experienced its golden age. The people were grateful for the reforms in all areas and the just rule of the ruler. The state acted in accordance with the principles of justice. The reign of King Akbar was one of the most prosperous, and the people were prosperous. Architecture, art, music, literature and other fields flourished and flourished during the reign of Akbar Shah.

ABSTRACT

This article is focusing on investigation the emergence of Phraseology. In this article authors makes certain the question how to define the word phraseology and its isolation from lexicology. In order to comprehension of the word phraseologism they first introduced the scholars who made their initial attempt to study the field of linguistics we call phraseology. Coming from their notices it is clear that this branch of linguistic is very young and few scientists managed to see the world that brought by phraseology. In this article basic types of phraseological units are analyzed relating to the degree of idiomaticity in the process of learning a foreign language. The authors have tried to define the types of phraseological units with the help of using examples.

KEYWORDS: *Vocabulary, Language, Phraseology, Study, Stylistic, PU, Word-Group, Style, Origin, Idiom, Stability, Phraseological Fusions, Phraseological Unities, Phraseological Collocations.*

INTRODUCTION

Phraseology of each language makes a significant contribution to the formation of figurative pictures of the world. Knowing the phraseology allows - a deeper understanding of the history and character of the people. Phraseologisms exist in close connection with vocabulary. Their study helps to better understand the structure of vocabulary, education and the use of lexical units in speech. When we talk about this term our tongue instantly curves into another notion that signifies above concept. This is the term phraseological units (PU). They are special language means in which the originality and uniqueness of any language is concentrated. Considering PU in this aspect, we come to the disclosure of the concept of "phraseology" in the broad sense of the word. In a narrow sense, phraseology is a section of linguistics that studies stable speech speed [3].

For the first time, the concept of PU was formulated by the linguist S. Balli, a representative of the French school of linguistics. He called the PU "combinations that have firmly entered to the language" [4]. English and American researchers such as L.P. Smith, A. Mackay, J. Seidlou, and W. McMordi use the term "idiom" in their writings on the study of PU. By an idiom they mean an expression whose value is not inferred from the value of its individual elements.

The richness of vocabulary of every language depends on not only to the ways of forming new words, but also to the permanent idioms it may for the amount and quality becomes rich. The science which studies the "world" of those units is called phraseology. Phraseology is the science about idioms, and it was firstly used in 1928 by Y.D. Polovinov [1]

Phraseology resembles a picturesque gallery comprising the samples of eternal and marvelous customs and traditions of a nation, historical memorials, fairy tales and songs. Phraseology is not only the most colourful part of vocabulary, but also the most democratic layer.

At first phraseology was used in study of literature. While translating some fiction from one language into another it became impossible to translate inseparable word combinations. Then the phraseological unities in those languages were started to research. The term phraseology was first used in world philology in 1558 by English literary scholar Neander. While translating the literary works Neander had to use this term. Though the most part of phraseological materials are included in vocabulary and other sources, the research works on the theory of phraseology have been rarely met in the sources concerning linguistics (L. Smith, D. Curry, W. Ball, Ch.Bally). Up to now the matters of English phraseology have been studied within grammar, stylistics, lexicography and history of language. Later phraseology has been studied as a branch of lexicology. As the linguistics developed, nowadays phraseology has been admitted and is being researched as an independent branch of linguistics in most languages. It is worth pointing out that a number of Eastern European and Russian scholars researched this field in their works. A lot of results were achieved. Though French scholar Charlie Bally put the term phraseologie into the science, this term wasn't used in the works of Western European and American linguists. Bally uses phraseology within stylistics. The matter of studying phraseology as an independent branch of linguistics was advanced by Russian linguist E.D.Polivanov. As he maintains positively, lexis studies separate words' meanings, morphology studies words' structure, syntax studies the structure of word

combinations. In his opinion, there is a necessity for an independent field which studies peculiar unique word combinations. E.D.Polivanov was sure that phraseology would become firmly fixed in linguistics and it occurred. The matter of studying phraseology as a separate branch of linguistics was promoted by Russian scholar V.V.Vinogradov too. V.V.Vinogradov's great service is that he separated phraseological unities into semantic groups. However, phraseology remained a part of lexicology, because the principal criteria proving that phraseology could be an independent field of linguistics hadn't been worked out yet. So, phraseology was being learned as the part of lexicology. After E.D.Polivanov and V.V.Vinogradov the first who promoted the idea of studying phraseology independently was scholar B.A.Larin. He affirmed that enough scientific research hadn't been done in phraseology. In Russian linguist A.V.Kunin's opinion, phraseology came off the lexicology circle: its range and significance have been raised. Though a lot of, sometimes controversial ideas were expressed concerning phraseology a number of scientific research works had been done. Such outstanding linguists as N.N. Amosova, A.V. Kunin, V.A. Smirnitsky, S.S. Gorelik, V.L. Arkhangelsky, V.V. Vinogradov, B.A. Larin, I.A. Melchuk, I.I. Revzin, S.N.Savitskaya, Yu.D. Apresan have great services to this science.[1]

The meaning of phraseology is not deduced from the value of the sum of its elements, but is determined by rethinking. This is because the phraseological phrase is not a free phrase, but one of its main properties is reproducibility. So the free combinations are the expressions "white snow", "black pen", "yellow pencil", which are created from separate words in the process of communication, at the same time, the expressions "white lie", "black gold", "black market", "yellow papers" are PU that are retrieved from the memory in their entirety - just like individual words. Any violation in the syntactic or semantic structure of these PU irreparably leads to the loss of their meaning.

It has been repeatedly pointed out that word-groups analyzed as functionally and semantically inseparable units are considered to be the subject matter of phraseology. It should be noted that proper scientific investigation of English phraseology has not been attempted until quite recently. English and American linguists tried to collect various words, word-groups and sentences by presenting some features of view, style, origin, usage which are peculiar to them. These units are usually described as idioms but no attempt has been made to analyze these idioms as a separate class of linguistic units.

However, the existing terms,[4] such as set-phrases, idioms, word-equivalents reflect to a certain extent the main debatable issues of phraseology. The term set-phrase implies that the basic criterion of differentiation is stability of the lexical components and grammatical structure of word-groups. The term idioms generally imply that the essential feature of the linguistic units under consideration is idiomaticity or lack of motivation.

Phraseological units are habitually defined as non-motivated word-groups that cannot be freely made up in speech but are reproduced as ready-made system. This definition proceeds from the assumption that the essential features of phraseological units are considered to be the stability of the lexical components.[3] It is frequently assumed that unlike components of free word-groups which may vary due to the needs of communication, words of phraseological units are reproduced as single unchangeable collocations.

Taking into account mainly the degree of idiomaticity phraseological units may be classified into three big groups: phraseological fusions, phraseological unities and phraseological collocations.

Phraseological fusions are completely non-motivated word-groups, such as **red tape-***“bureaucratic methods”*; **heavy father-***“serious or solemn part in a theatrical play”*; **kick the bucket-***“die”* and the like. The meaning of the components has no connections whatsoever, at least synchronically, with the meaning of the whole group. Idiomaticity is, as a rule, combined with complete stability of the lexical components and the grammatical structure of the fusion.

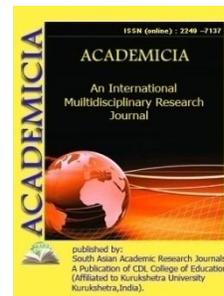

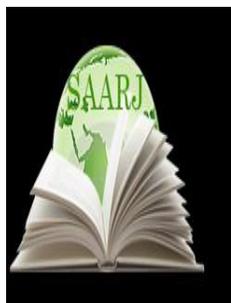

Phraseological unities are partially non-motivated as their meaning can usually be perceived through the metaphoric meaning of the whole phraseological unit. For example, **to show one’s teeth, to wash one’s dirty linen in public** if interpreted as semantically motivated through the combined lexical meaning of the component words would naturally lead one to understand these in their literal meaning. The metaphoric meaning of the whole unit, however, readily suggests ‘**take a threatening tone**’ or ‘**show an intention to injure**’ for *show one’s teeth* and ‘**discuss or make public one’s quarrels**’ for *wash one’s dirty linen in public*. Phraseological unities are as a rule marked by a comparatively high degree of stability of the lexical components.

Phraseological collocations are motivated but they are made up of words possessing specific lexical valency which accounts for a certain degree of stability in such word-groups. In phraseological collocations variability of member words is strictly limited. For instance, **bear a grudge** may be changed into **bear malice**, but **not into bear a fancy or liking**. We can say **take a liking (fancy)** but **not take hatred (disgust)**. These habitual collocations tend to become kind of clichés where the meaning of member-words is to some extent dominated by the meaning of the whole group. Due to these phraseological collocations are felt possessing a certain degree of semantic inseparability.

To conclude the article, it can be reviewed that by taking into consideration the degree of idiomaticity phraseological units are classified into three groups such as phraseological fusions, phraseological unities and phraseological collocations [2]. They are differentiated according to their idiomaticity and they are proven with the examples.

ABSTRACT

This article is dedicated to the study of influence of animated movies and mobile applications to the English language learning process among the young learners and results caused by implementing them into the education system.

KEYWORDS: *Types Of Learners, Mobile Learning, Animated Movies, Effects On Mind, Bad Eye Side, Changes In Behavior, Imitating The Actions, Collaboration.*

INTRODUCTION

Teaching the foreign language is one of the complicated issues standing opposite the teachers all over the world. English language is considered to be the most widespread international language in our planet. Day by day, the number of techniques and methods, forwarded to teaching this language, is improving. Up to now, there were worked out a great deal of activities for FL teachers by modern methodologists, to improve effectiveness of the learning process.

Nowadays, mobile technologies and mobile applications (apps) are becoming an indispensable part of learning, including foreign language learning [1]. This recent methodology of their use is called mobile learning (m-learning). M-learning further expands e-learning by promoting independent and active learning and by turning educational institutions into 24/7, no-barrier learning centers [2]. In a similar vein, Klimova [3] speaks of Mobile Assisted Language Learning (MALL) as a new sub division of Computer Assisted Language Learning (CALL). Leisetal. [4] even suggest a new acronym for Smart phone Assisted Language Learning, SPALL, as the smart phone offers capabilities far beyond the traditional mobile phone.

The key features of m-learning, such as personalized learning, independent on time and place, collaboration with peers and teachers in both formal and informal settings, ubiquity and interactivity of mobile devices, make m-learning efficient [1,3].

As we know there are 4 types of learners, they are: kinesthetic, tactile, auditory and visual. Visual learners learn information through sense of sight. They may read or write, the data we gave, and it will be most fruitful way to gain the message. Auditory learners receive majority of knowledge through hearing. The most effective way to study for them is visiting the lectures, listening to the recordings and debating. Tactile learners use sense of touch to gain the information. The most productive way for this kind of learners is to touch the objects of investigating, moving them around. Kinesthetic learners should imitate and act out the information they received and it will be the best drilling for them. While preparing the syllabus for our course, the first thing to pay attention is how to cover all these aspects and keep the concentration of students' minds on acquiring the information. The best solution for the problem is implementing movies and cartoons into learning program. The main reason for this resolution lays on that the afore mentioned ones can involve at list 3types of learners (visual, auditory and kinesthetic). Additional material for tactile learners should be also included into the syllabus, but the core of our course should be based on explaining material through the cartoons or movies. While choosing any of them, we should rely on the age of learners. Certainly, for teaching young learners, selecting animated movies is the best solution. It is the most motivating thing for children. That is why, visiting English lessons can be enjoyable and challenging for pupils.

The sense of perception of young learners is rather different from adults'. It is caused by peculiarities of infantile outlook. Children often have a great visual experience, but it does not mean that he can realize received information adequately. So A.N. Leontyev stated that presence of that or another content in the field of perception of child, yet does not mean that he poses it fully.

By the moment of entering the school the processes of reception of child are developed enough, but not completely. Grade by grade they come to right shape. Indifference with grown-ups, little ones cannot behave critically toward the information received. They cannot deny observing suspicious programs, films and cartoons.

Methods

It is note worthy that students usually report that they like m-learning. This view is supported by other authors who also maintain that using mobile devices like smart phones and tablet sin education is gladly accepted by learners. M-learning is sometimes used in order to help low-achieving students and motivate them (and others) to spend more time studying outside the classroom.

Teachers may use either some already established social networking platforms (WhatsApp, We Chat, Telegram, Line), or special applications for learning English (FunDubbing), or they may follow guidelines in creating tailor-made language learning apps.

As regards language skills practiced by means of m-learning, some research aimed at specific ones such as writing, speaking, and vocabulary, listening, and reading.

Perception of young learners is narrowly related to their emotional condition. Animated movies demonstrate not only emotional condition in which the main characters are involved, but also formulate stereotypes of behavior and solution to given problem. It's imagery and brightness strengthens implanting, as it covers demands of young learners.

According to Chiangtong (1975), cartoon comes from Latin language "charta" which means paper because in that era cartoon meant painting onto large textile curtains or drawing patterns or pictures on mirrors and making mosaics. But, through the centuries, it has completely changed the meaning of cartoon and now it is not just a drawing. It is a whole story, which can impress, lead, motivate and even teach our young generation. In the contemporary society a person is involved in the information space since one's very birth: television, films, e-games, Internet, video and etc. Animated films have a particular moral, aesthetic and emotional impact on the children. They also have a great pedagogical potential: they can explain to the pupils, such complicated notions as friendship, honesty, kindness and evil, empathy and others, in a bright, soft-core and unusual way without additional efforts. It has become a kind of device for teachers all over the world's result, studies concerning the contribution of cartoons to teaching process and academic achievement among multimedia researches have also intensified. It was observed in those researches that sound, graphics, texts and animations within such multimedia or cartoons generally attracted children's attention, effectively contributing to the learning process. And it was stressed out that they are an important tool to improve children's mental, physical and psychological developments and discover their yet unrevealed skills. Animated films which are used during the lessons can be useful for improving not only mental abilities and talents, but also they can increase physical state of learners. Because some of them require acting out the movements shown in the video.

DISCUSSION

On reading these selected articles, there is a feeling that not only language learning and teaching but education as such is on the threshold of a profound change. It may seem that the traditional model is on the wane. The use of mobile devices in education seems to be on an inevitable rise. The problem lies in the way they should be used. Therefore, it is vital to determine potential advantages as well as draw backs of m-learning utilization in education.

It seems to be true that the penetration of smartphones and the potential utilization of mobile devices make m-learning a great opportunity. Most young and adult learners use smartphones all the time. Teachers as well as their peers can approach them at almost any time. It may streamline communication. Mobile devices can be used for storing study materials, which significantly decreases heavy loads that children have to carry on their backs. Moreover, the Internet enables the learner to access target language content that they are interested in. For instance, if the student wants to study geography, there are a lot of texts available as well as video clips on the subject. At the same time, m-learning has become a major developing area in education. It is no coincidence that there are a lot of teachers who have started using m-learning in their classes and

researchers who conduct research into it. Last but not least, the way that people live in the 21st century supports using mobile technologies in education.

On the other hand, some apps used by learners are not designed by language experts. Moreover, it seems that students should be guided and controlled in using language learning mobile apps for various reasons, including the lack of self-confidence in using new technologies or an unsuitable language level of apps used for particular students. Other downsides of using smartphones in education could be small screens, external interference as well as distraction, the addictive nature of smart devices, and the sometimes unfavorable attitudes of some teachers and parents.

Despite of the great deal of advantages involved within utilization of animated cartoons, it has a number of drawbacks. New technologies, on producing cartoons as computer animation, allows to make animations brighter and more realistic. But perception of very bright and quickly moving scenes can be unacceptable for children's mind. It is the reason why this process requires parents' control. If older generation does not take it under control, results can be irreparable for nation in general. According to Dzikina O. S. in Japan after watching animated movie 'Pokemons' approximately 500 children were hospitalized with the symptoms of epilepsy. It was an example of bad influence on child's brain. Ningsih and Sari (2012) suggested that use of slang and foreign words may affect children's linguistic development negatively, that watching cartoons excessively may hinder children's relationship with the social circle and cause them to lose their critical thinking skills. Young generation is always tend to imitate native speakers and they try to sound as they are, and sometimes it can cause problems with linguistics. Words spelling is another problem brought by slangs' usage. Yorulmaz (2013) stated that some cartoons have problematic contents with respect to the education of religion and values. In this study, it was examined how all these perceived benefit and limitations as well as the attitudes and intentions concerning use of cartoons reflect on the behaviors of use. Children's attitude toward grown-ups in the western countries is more free, in comparison with our culture. If our pupils will try to simulate the cases, given within the animated movie. Subconsciously they will copy their behavior too, which is completely inappropriate in some cases for Uzbek culture.

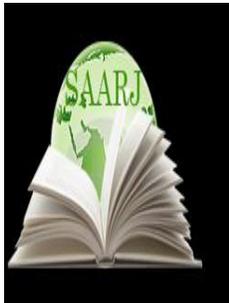

CONCLUSION

The results reveal that m-learning is becoming a salient feature of education as it is a great opportunity and an immense step forward, and it should be supported especially thanks to the benefits it brings for language learning. These include: the enhancement of the learner's cognitive capacity, the learner's motivation to study in both formal and informal settings, the learner's autonomy and confidence, as well as the fact that it promotes personalized learning and helps low-achieving students to reach their study goals. Although it seems to be effective overall, it is desirable to design, plan and implement m-learning with caution, according to students' needs, and to deliver multiple language skills in authentic learning environments.

The limitations of this review consist in the different methodologies conducted in the detected studies, as well as different subject samples (varying from only 10 [22] to 140 [4]) and the researching of different language skills. Future research should focus on the effectiveness of the use of such mobile apps for teaching all four language skills in the context of the learner's performance.

ABSTRACT

Massage is a set of mechanical methods by which the masseur acts on the upper tissues and functional systems and organs through reflex oil. Unlike exercise, in which exercise is important, massage does not increase the functional adaptation of the body, its exercise. But at the same time massage significantly affects the blood and lymph circulation, tissue metabolism, endocrine gland function, metabolic processes. The physiological effect of massage is primarily associated with the acceleration of lymph flow and metabolic processes. Acceleration of blood and lymph flow is not only helps to eliminate the absorption and stagnation of the inflammatory process, but also further improves tissue metabolism, increases blood phagocytic function.

KEYWORDS: *Phagocytic, Gland Function, Stagnation, Inflammatory Process.*

INTRODUCTION

No nation can record the creation and development of massage techniques at its own expense. It is difficult to determine when a person resorted to this simple, effective treatment. Probably, this disease occurred in ancient times, when our distant ancestors, who felt a sharp pain, rubbed the injured area vigorously. Massage was common in ancient China, India, Ancient Greece, Rome. But without a doubt, the highest place in the history of the development of massage belongs to Greece. It was here that they first began to apply it in various exercises. Here it is proven not only as one of the ways to strengthen and maintain health, but also as the best means of treating the disease.

For example, Hippocrates, the father of medicine, wrote about the treatment of shoulder pain in particular! "... The doctor should also be experienced in massage because massage can bind a very weak joint and loosen a very stiff joint!". As mentioned, massage was used all over the world in ancient times, but its methodology and features, physician, naturalist, musician and poet Abu Ali Ibn Sino (Avicenna) in his book "The Law of Medical Science" in the section "On massage for those who move between years" he wrote that it is necessary for all, only to be light for some and strong for others. And he advised that it should be done with a stiff cloth or hands. Nowadays, massage has not only lost its importance, but has gained the greatest popularity. Thus, massage helps to prepare patients for surgery, is a necessary means of recovery from it and after the recovery period, helps to combat muscle atrophy after a long stay in bed. The massage industry is used by ballet, dramatic and, of course, circus artists.

For athletes, massage is a first aid in improving sportsmanship, combating fatigue, it is a good tool to increase and restore physical and mental ability. Assists in the production of massage seamstresses, motorists, 23 telegraphers, milkmaids, typewriters. As an active means of enhancing vital functions, it is widely used by astronauts in the fight against hypertension. "Massage!" Who invented it! You get tired, you get relaxed, you get a massage - you feel like a newborn, you can do anything else, "said Yu.A. Gatarin. Two-time world boxing champion Boris Logutin said about this wonderful tool. "Without massage, I wouldn't be the first in two Olympics." Massage not only relieves postpartum excitement and fatigue, but also helps to be mentally and physically ready before going into the ring. "What is massage? It is a mechanical observation of the human body by hand or special devices. Such effects on the body are many with the central nervous system leading the way. refers to a complex physiological process in which systems and organs are involved.

First of all, there is an effect on the nerve "fibers" of the skin, muscles, tissues connected with other central and autonomic nervous systems. The mechanical power of the massage is converted into a nerve-stimulating force that represents the first part under the influence of complex reflex influences. Here it is added to the overall effect and leads to various functional shifts in the body. Impulses directed to the center change not only the functional state of the cerebral cortex, but also the functional state of the spinal cord, cerebellum. An example of the neuro-reflex action of massage is a change in the activity of the heart, lungs, intestines and other internal organs. Under the influence of massage manipulation on the skin, biologically active substances that enter tissue hormones and participate in vascular reactions, nerve impulses and other effects are formed and released into the bloodstream. For example, in cells - acetylcholine in a weak, bound state is converted to a soluble, active state under the influence of massage. It plays an important role in the transmission of nerve impulses from one nerve cell to another.

Massage accelerates the flow of all body fluids to the body: blood, interstitial fluid, lymph. It has a direct mechanical: reflex and humoral effect on the local and general blood circulation. Shows well on metabolic processes, which is especially important after mental or physical fatigue. Massage gives the muscles more than just relaxation. A 5-minute massage is more effective than a 20-minute rest, which increases the ability of the muscles to work 3-5 times. And, in short, the mechanical effect on the tissue is important - elongation, displacement, pressure, friction, twisting. It accelerates the circulation of fluid between the lymph, blood, tissues, helps to remove cells that are not receptive to the epidermis. The mechanical factor has a sufficient effect on the elimination of stagnation, metabolism in the massage areas and enhances skin respiration. The

effect of massage on the body is multifaceted. It is applied in almost all diseases, improves blood circulation, which leads to a decrease in venous stasis, especially in people leading a sedentary lifestyle, normalizes metabolism. Chest massage in slow-moving processes can help to eliminate and absorb residual inflammation of the respiratory organs, while preventing the development of the process of joining. It is also recommended for angina pectoris around the heart. Massage prevents fat deposition and fat is hardened, skin headaches are removed, intestinal peris-taltika is improved. Massage can also help to alleviate some physical imperfections.

Massage is a set of mechanical methods by which the masseur acts on the upper tissues and functional systems and organs through reflex oil. Unlike exercise, in which exercise is important, massage does not increase the functional adaptation of the body, its exercise. But at the same time massage significantly affects the blood and lymph circulation, tissue metabolism, endocrine gland function, metabolic processes. The physiological effect of massage is primarily associated with the acceleration of lymph flow and metabolic processes. Acceleration of blood and lymph flow is not only helps to eliminate the absorption and stagnation of the inflammatory process, but also further improves tissue metabolism, increases blood phagocytic function.

The effect of massage arises from the nerve impulses occurring in the tissues being massaged, under the influence of massage techniques and in the form of afferent impulses coming to the superior nervous system, correcting the systems and organs required for response. This can be expressed in the dilation of the vascular network, an increase in the amount of urine excreted, muscle relaxation, rapid breathing, increased sweating on the spot. The mechanical effect of the massage is also important, as the local temperature rises and the flow of blood and lymph from the massage area increases.

a) The effect of massage on the skin - a rise in local temperature, due to the influx of arterial blood, provides the best nourishment to the massaged tissue, increases the vital activity of skin cell parts. Massage involves the mechanical removal of aging epidermal cells, which helps to remove metabolic products from the body, improves skin respiration and expands the secretion of sebaceous, skin glands.

b) The effect of massage on the joints and muscles - improving the flexibility of the tissues being massaged, bleeding and hardening, which are of great importance in tumors near the joint tissue, is characterized by inflammation, helps to expand mobility, protects joints from contractures. The effect of massage on the muscles is conditioned by an increase in their ability to respond to muscle fatigue. For people with limited mobility, muscle tone is the tone of the muscles that work, which significantly increases their strength. After a five-minute massage, tired muscle capacity increases by 3-7 times. The effect of massage slows down the presence of muscle atrophy: the number of opened capillaries in the muscle reaches 1400 per 1mm² of muscle cross-section, its blood flow is significantly expanded, which increases oxygen flow and improves the axillary function of muscle tissue cells.

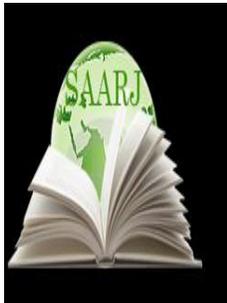

c) the effect of massage on the blood and lymphatic systems - oxygen, nutrients, endocrine products are excreted to all organs and tissues throughout the blood system, metabolism and the final product of carbon dioxide are removed from the body through the blood and lymphatic systems. The opening of additional capillaries using massage helps to improve the redistribution of blood in the body, which facilitates the work of the heart in circulatory failure. With the help of blood, humoral activity of various organs is carried out, various endocrine hormones are

distributed with the blood, the body is constantly moving. The lymphatic system consists of lymphatic capillaries and vessels, from which lymph moves in the direction of the heart. Massage has a great effect on the circulation of lymph, which is in a state of constant exchange with blood and tissues. At the same time, arterial blood enters the organs and strengthens almost everywhere, does not collide with tissue cells, lymph creates a nutrient environment for tissue and organ cells. The slowed temperature of the lymph (4-5 mm per second) is conditioned by the need to create good conditions for metabolism between lymph and tissue. Acceleration of blood and lymph flow under the influence of massage in the joints, abdomen, etc. Helps reduce stagnation, opens additional capillaries in the muscles. It has been proven that the effect of massage increases the number of erythrocytes and platelets in the blood.

g) The effect of massage on the nervous system - varies in the skin and on the nervous system associated with the cerebrospinal and autonomic nervous systems. Under the influence of massage, a number of general and local effects occur in the human body, involving all tissues, organs and systems. By changing the strength, properties and duration of the massage effect, it is possible to change the functional state of the cerebral cortex, reduce or increase excitability, strengthen deep reflexes and revive lost ones, improve tissue graphics and various internal organs. Different methods of massage have different effects on the nervous system: some are soothing (stroking, stroking), others are stimulating (shock methods). Properly selected massage methods significantly reduce pain sensations, which are widely used in medical and sports practice. Massage of tired muscles relieves fatigue, gives freshness, lightness, increases the ability to work. Massage instructions and inaccuracies. Massage is performed on all healthy people, but of course it must take into account the age and sensitivity of the nervous system. Initially, the sessions are done in short, less rapid ways, with the development of massage skills. It is recommended to massage before meals. Massage after a meal is done after 1.5-2 hours, rest for 8-10 minutes after the massage. Massage is recommended for high body temperature, acute inflammatory conditions, skin diseases, skin injuries.

TECHNICAL AND TACTICAL ASPECTS OF THE INDIVIDUAL ACTIONS OF DEFENDERS, MIDFIELDERS AND STRIKERS IN A FOOTBALL GAME

D.K Xidirov*

*Teacher

 Tashkent Institute of Architecture and Construction,
 UZBEKISTAN

ABSTRACT

The central striker is always aiming for the goal and looking for the closest way to get to the kicking position. He will always be under the strict control of a few of the opponents, so you will have to do a lot of maneuvers by combining distractions with key players in the opponent's defense with openings. The center-forward tends to be faster than the defenders in the fight for the ball, attacking the ball that the wing-forward has thrown or passed to the center of the penalty area or to a post near the goal itself during wing attacks. After the central striker takes the ball, he tries to create conditions for a goal-scoring shot, mainly using the means of bypassing the opponent.

KEYWORDS: *Dispatcher, Midfielders, Maneuvering.*

INTRODUCTION

All current spending is expected to include at least four players in the defensive line. However, the number of pure strikers (front row) and midfielders can vary. That is why when talking about the characteristics of the offensive behavior of players in a particular ampoule (specialty), it is necessary to consider how many players there are in each row of the team. If the team has two wing forwards, it is preferable that the defenders come forward to form the second echelon of the attack, along with the midfielders. The defender may be episodically on the front line of the attack. In doing so, he swaps places with the winger, otherwise the defender narrows the playing field of the attackers, as a result of which it is easier for the defenders to help each other. If there is only one winger on the team, then the defender on the side without the winger can break into the space to take an active part in the previous echelon movements at the end of the attack. In

doing so, his actions ensure that the offensive front is wide. However, it is important to keep in mind that such raids by the defender should not always be unexpected for the opponent and do not undermine the strength of their defense. one of his partners must enter the zone left by the defender who joined the attack.

Only central defenders can join the attack if they are not currently defending their opponent. He is insured by one of his teammates (preferably one of the midfielders), which ensures that the strength of the defense in the center is not compromised. Only when a central defender can play skillfully in attack and deliver a good shot from long range will his joining the attack be effective. An attacking central defender is usually unguarded and he has to keep attacking from the opponent's goal. That's why the central defender's addition to the attack always puts the alien goal in real danger.

An attacking player (he can be called a midfielder) moves to the front and gets a chance to get into the attacking position, as his maneuver starts at a high speed from inside the field, making it extremely difficult to defend. Mid-range players regularly join the front line of the attack. In doing so, they try to change the direction of their maneuvers in order to confuse the opponent. This means that his teammates need to be familiar with the midfielder's favorite movement zones and give him the ball as soon as he gets into a comfortable position. Even if such a player is not directly responsible for any of the opponents or the specific zone, he should be involved in the defense when the attack is suffocated. In such cases, he acts according to the situation. The player whose main task is to organize the team's offensive actions is called a dispatcher. As soon as the ball passes to the team, the dispatcher opens to one of the plots in the middle of the field. Once he gets the ball, he immediately decides how to organize the attack (quickly or gradually). Starting from the attack, he usually moves on the second echelon and only occasionally breaks through to the front of the attack. To successfully complete the attack, the tie must be strong and able to kick well, as he often has to kick the ball from a distance of 18-25 m.

The participation of a midfielder in an attack, whose main task is to participate in defensive movements (often a personal task such as not giving a game to a certain opponent, neutralizing it), is usually limited to moving to the second echelon. That doesn't mean it's impossible for him to move to the front lines of the attack, of course. In some episodes suggested by game conditions, such a player may suddenly appear at the front end of the attack and receive the ball for the final blow.

The general tasks of midfielders are to help keep the initiative for a long time when the ball is in the team, to control the center of the field, to join the front lines of attack, that is, to attack multiple players in a gradual attack or to pass the ball. . Organizing an attack as a team depends primarily on how well the midfielders of different specialties are selected and their skills. Wing movements can be performed either backwards to cooperate with the winger or midfielder controlling the ball, or actively advancing forward (moving closer to the 'out of the game' position limit to allow his partner to pass the ball remotely into the space behind the defenders).

Movements across the width of the field can be done by returning to cooperate with the midfielder who is controlling the ball, or by adding a quick advance to the front end of the attack.

After receiving the ball, the winger tries to pass the player who is guarding him alone or with his partner, almost to the opponent's goal line, and pass the ball to his teammates in the penalty area. If one of his teammates is standing open to get the ball, or if the attackers are successfully

fighting in the air against the defenders, it is effective to pass the ball high in such cases. Grinding signals, on the other hand, are appropriate in all cases. This is complicated not only by the fact that one of the strikers can get on the ball, but also by the fact that time is very tight, and the defenders, who sometimes cannot do their job, can "change direction" by "touching" their feet. In this case, the winger on the opposite side reaches the far post of the goal.

The winger plays close to the sideline to maximize the distance between the opponent's defenders. The center forward moves close to the sideline and when the center of the field is empty, the winger bursts into the empty zone at high speed. In some episodes of the game, the wing forwards are replaced. Such maneuvering across the width of the field makes it difficult to organize the defense and prevents the wing defenders from adapting to the characteristics of an attacking movement. Sometimes staying on that wing for long periods of time can help you succeed, but switching positions is especially effective during attack development. The winger must always be ready to maneuver quickly and at the same time have an excellent knowledge of the various methods of individual combat as well as strikes.

The central striker is always aiming for the goal and looking for the closest way to get to the kicking position. He will always be under the strict control of a few of the opponents, so you will have to do a lot of maneuvers by combining distractions with key players in the opponent's defense with openings. The center-forward tends to be faster than the defenders in the fight for the ball, attacking the ball that the wing-forward has thrown or passed to the center of the penalty area or to a post near the goal itself during wing attacks. After the central striker takes the ball, he tries to create conditions for a goal-scoring shot, mainly using the means of bypassing the opponent. But the partners are also not to be forgotten. Central strikers beat the opponent by cooperating with them to make it easier to get out and to pass the ball to a partner who is in a more comfortable position to hit the goal. In some episodes, the central striker may also retreat and open up. This is done to clear the zone to a partner or to take the ball away from the opponent's guards and then maneuver quickly. It is preferable to use the wings in an attack with four strikers. Wing strikers with high agility traits start to move forward in a single fight or with the help of their closest partner, leaving the player guarding him on the spot. In doing so, it can perform the following actions:

- a) Go close to the goal line and pass the ball as far as possible to the nearest column to complete the attack with the head;
- b) Go near the goal line and then roll the ball from the bottom to the length of the goal or slightly behind, so that the partner can strike or change direction by hitting the opponent's foot;
- c) The winger's attacking position in front of the goal, ie "corner cutting".

The main task of the central strikers is to organize the break through the center. Since they are in a comfortable position to score a goal, they need to make a bold, sharp move, making extensive use of the combination of detours and partner collaborations. Players in this specialty are always ready to kick back the balls that come back from the goalkeeper or the barbell, and to take advantage of even the slightest opportunity that arises to hit the goal. If the attack is coming from the center, then the center strikers will try to open up to a striking position by playing at variable speeds, using fake maneuvers and substitutions. Opening from behind one of the central defenders is the most useful opening. When combining a midfielder with an attacker, the central

striker must maneuver falsely and take the central defender out of the zone where his partner is entering.

Midfielders can advance to the finish line. In doing so, one of them takes an active part in the attack, while the other, together with the wing defenders, moves slightly backwards, supporting the attack. However, midfielders only need to join the first echelon of the attack episodically. The fact that midfielders are already advancing will squeeze the movements of the four strikers, depriving them of an operational playing field. Wing defenders also join the attack episodically. Mainly during the counterattack after the defenders get the ball. It is good that they have done so. Central defenders, on the other hand, are seldom attacked because they always keep in mind that there are collaborating players in the center of the field, which can put their own goals in jeopardy. If the opponents use only the zone defense system, then the attacker's movement will be characterized by:

- a) Midfielders and wingers join the attack and create a numerical advantage in some areas of the attack by maneuvering the team;
- b) Personally, defeating one of the opponents in a single fight in a certain zone in front of the goal, and then creating a numerical advantage in the neighboring zone or ending the attack with a blow.

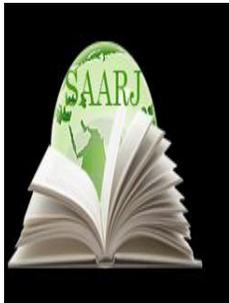

If the opponents use a mixed defense system and protect the main players very closely, then the attackers must perform the following actions:

- a) Transfer the liaison function to one of the partners and transfer the liaison to the wing together with the personal bodyguard in order to disperse the defenders and at the same time create a good opportunity for double combinations with the winger;
- b) Maneuvering across the width of the field and partially inside the field.

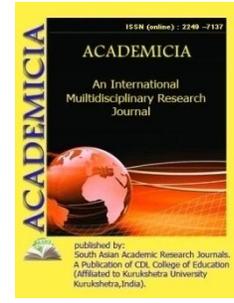

The essence of the exercise: speed close to the game and active obstructive activity of the opponent. It is very important that the opponent actively moves while learning the exercises. This exercise is of no use if the player tries to present himself as interfering with his opponent. The generalization of best practices has shown that training in the early stages of training should be based on certain principles.

STRUCTURAL EQUATION MODELING OF LATENT VARIABLES AFFECTING STOCK PRICES: A STUDY OF NEPAL

Dipendra Karki*

*Ph.D. Scholar,

Kathmadu University School of Management (KUSOM),
 Kathmandu, NEPAL

Email id: 1610002_dipendra@kusom.edu.np

ABSTRACT

This study uses the structural equation model in Nepali stock market, chooses investor sentiment, monetary and macroeconomic factors as latent variables, and selects a few observed variables which can explain the latent variables to study the influence on stock prices. Based on existing empirical research conclusion, influence path diagram is designed and gets its path coefficient and causal path diagram using maximum likelihood estimation. The statistical significance of the results indicated that the causal relationships of Nepal's stock market as follows can be accepted; firstly, investor sentiment, macroeconomic indicators, and monetary factors have certain influence on stock prices, the investor sentiment has a positive correlation. Secondly, the investor sentiment has the biggest impact on stock prices; when investor sentiment is more stable and optimistic, stock prices will relatively be better. This research also provides a certain reference for investors to make rational investment decisions.

KEYWORDS: *Structural Equation, Stock Prices, Investor Sentiment*

INTRODUCTION

The pricing implication of common stocks has drawn considerable attention since the publication of seminal work of Markowitz (1952) - the mean-variance portfolio theory. Since then there is an ongoing debate on whether the market risk factors explain better or there are some other anomalies influencing common stock prices. There are many studies about the affecting factors on the stock prices. Some studies showed that there is in fact a relationship between stock prices and certain macroeconomic indicators, those studies were mostly conducted in developed economies.

The price volatility of the stock is the foundation of the stock market. Officer (1973) correlated the changes in stock prices to the volatility of macroeconomic variables. Fama and Schwert (1977), Fama (1981), and many others, documented a strong positive correlation between common stock returns and real economic variables like capital expenditures, industrial production, real GNP, money supply, lagged inflation and interest rates and found a negative relationship between stock prices and inflation in the US Market. But, what about less developed economies? Some studies showed no relationship between the economies and the financial markets of less developed countries like Asian markets. Fung and Lie (1990) explained that macroeconomic factors can't be reliable indicators for price movements in the Asian markets because of the inability of stock markets to fully capture information about the change in macroeconomic fundamentals. Similarly, many others attempted to relate changes in stock prices and economic variables, including Fama (1981), Thorbecke (1997), Maghayreh (2003), Kandir (2008), and Alagidede and Panagiotidis (2010).

The studies on the effects of investor sentiment reveal that many general investors are puzzled about the stock prices in the market. The investor's main dilemma is whether or not to invest in the particular asset/assets, so that they can get better sustainable and fair return of their investment with bearing minimum/zero risk. Mackay (1841) assembled a book of readings about Tulip-mania and some equally famous market "bubbles" which had a self-explanatory title: Extraordinary Popular Delusions and the Madness of Crowds. In contrast to Mackey's astonishing stories, Bachelier (1900) set a forth formal model in which security prices were random outcomes that had probabilities attached to them. Baker(2006) analyzed the impact of investor's sentiment on stock price mechanism in theory. He used the measure indexes of investor sentiment by selecting six principal components including; turnover rate, closed-end fund discount rate, IPO quantity, the yield of the first day, bonuses premium rate, and equity distribution ratio and built composite investor sentiment indexes to measure the mood. The study found the statistical significance of the construct variable mood and its strong influence on individual stocks. Zhang and Wang (2013) applied EGARCH model for the empirical analysis on their study and found that investor sentiment index could explain better on stock returns.

The relevance of the studies conducted in developed and big capital markets is yet to be seen in the context of smaller, developing and under-developed capital markets. Nepal has guided towards a change in the financial architecture of the economy since the adoption of economic liberalization policy in the beginning of 1980s. In the contemporary scenario, the activities in the financial markets and their relationships with the real sector have assumed significant importance. Correspondingly, researches are also being conducted to understand the current working of the economic and the financial system in the new scenario of Nepal. A study of the effect of dividends on common stock prices in Nepalese context (Pradhan, 2003) showed the strong dividend effect, and a very weak retained earning effect, indicating attractiveness of dividend among Nepalese investors. Basnet (2007) reported that market price per share (MPS) is well explained by dividend and returns in Nepalese stock market. Baskota (2007) found that there is no persistence of volatility in Nepalese stock market and the stock price movements are not explained by the macroeconomic variables. Bhattarai and Joshi (2009) documented both short-run and long-run interdependence among stock index and some macroeconomic variables.

The review of early research papers reveal that there are several factors in determining stock prices. Based on the literature, this study constructs three latent variables namely; investor sentiment, monetary factors and macroeconomic indexes that affect stock prices. The important observed variables which can measure the latent variables, as suggested by the literature, are included in the model to make the structural equation model. The explained variable is the Nepse/Market index (MI) which is the proxy of stock prices. Then, it uses structural equation model to analyze the affecting factors on stock prices. This study on Nepali stock market from the perspective of macroeconomic and investors' sentiment has very important theoretical and practical significance. From theoretical perspective it has importance on deepening our understanding of the field and from practical perspective it can improve the performance of our investment with the rational allocation of resources.

Theoretical Analyses and the Variables Selection

THEORY ANALYSIS

The economists Wright first put forward the concept of "path analysis" in 1921. Karl Joreskog, the Swedish statistician and psychologist, put forward the Structural Equation Model (SEM for short) in 1973 (Hendry, 1986). Since then, path analysis was gradually shifted to LISREL, AMOS and SEM software, which is called the path analysis oriented in the SEM.

Structural equation modeling (SEM) is a statistical methodology that takes a confirmatory (i.e., hypothesis-testing) approach for simultaneous estimation of a structural theory bearing on some phenomenon. Typically, this theory represents causal processes that generate observations on multiple variables (Bentler, 1988). It's aim is mostly to confirm a research study design and is expressed by the casual model or path graph. In this model, the estimators are biased and inconsistent and estimated coefficients become meaningless if feedback is not considered. Formulation of SEM requires specification of equations in the model based on theory and it doesn't guarantee rightly estimated coefficients.

The analysis on the SEM begins with model identification first. The model is said to be identified if it meets the conditions for identification: Order and Rank conditions. For, order condition, if $g =$ no. of endogenous variables in system & $m =$ no. of variables (endogenous & exogenous) missing from equation under review then, $m = g - 1$ (exactly identified); $m > g - 1$ (over identified); $m < g - 1$ (not identified). For rank condition, If rank of the coefficient matrix of all variables excluded from a particular equation (excluding coefficients of concerned equation) is $g-1$, then identified. Order condition is necessary but not sufficient, whereas rank is sufficient. If model is identified or over identified then model is identified.

Simultaneous estimation method i.e. maximum likelihood estimation is used for the analysis of this recursive structural regression (SR) model. The impact levels of affecting factors, as well as correlations among latent factors and stock prices are presented and analyzed by using structural equation modeling.

DESIGN VARIABLES

The influence of selected factors on stock prices is analyzed using structural equation model where stock prices represented by market index (MI) is the endogenous variable, and investor sentiment, monetary factors and macroeconomic indexes are the exogenous variables. Market/NEPSE Index (MI) is a market value weighted index composed of the shares of listed

companies from different sectors in the Nepalese stock exchange. It gives the investor a general idea about the direction and performance of the market. While measuring the impact of macroeconomic and other affecting variables on stock prices, Market Index was used as the proxy of stock prices in several prior studies like; Mukherjee and Naka (1995), Osamwoyi and Osagie (2012), among others.

The selected observed variables that can explain the latent variables are; Market capitalization (MC), Volume (V), Narrow money supply (M1), Broad money supply (M2), Gross domestic product (GDP), Inflation (INF) and Interest rate (IR). Market capitalization (MC) reflects the changes of total price of the listed securities in a time, if MC rises stable then investor sentiment is optimistic. Volume (V) is the sum amount of transactions happens in a particular period. It represents the market liquidity, it reflects the investor's participation, if investor sentiment is optimistic, volume will be large.

GDP is used as a proxy of real aggregate economic activity in an economy. In this study nominal GDP has been considered for analysis. Higher GDP represents economic prosperity of the country and stock returns are expected to influence positively. Inflation (INF) has puzzle relationship with stock returns. As the worth of rupees gets reduced due to high inflation, it is expected that the stock prices would be high in the time of Inflation (Ibrahim & Aziz, 2003). But, higher inflation reflects higher discount rate leading to the lower value of equities. The interest rate (IR) is another important economic factor affecting the value of common stocks. The reduction in interest rates reduces the cost of borrowing and thus serves as an incentive for expansion. This will have a positive effect on future expected returns for the firm, so as stock prices. The IR used in this study is the weighted average 91 days T-bills rate, annualized % as of yearend. Narrow money supply (M1) consists of currency held by public (C) and demand deposits (DD) held at the banking sectors. Symbolically, $M1=C+DD$. Broad money supply (M2) consists of narrow money supply and time deposit (TD) held at commercial banks. Symbolically, $M2=M1+TD$. Both the monetary factors reflect the liquidity status in the market and hence expected to have positive relationship with stock prices as well as investor sentiment. To smoothen the data natural logarithms has been taken for the variables; MC, V, GDP, M1, and M2. The specific variable design is as given in the table 1.

TABLE 1 VARIABLE DESIGNING

Variables	Observed Variables
<i>Latent Variables</i>	
Investor Sentiment (Inv.Senti.)	Market Capitalization (MC), Volume (V)
Monetary Factors (MF)	Narrow Money Supply (M1), Broad Money Supply (M2)
Macroeconomic Indicators (MEI)	GDP, Inflation (INF), Interest Rate (IR)
<i>Endogenous variables</i>	
Stock Market Prices	Market Index (MI)

Upon completion of indicator design based on the theory and former research conclusion, this study uses AMOS17.0 software to construct the initial structural equation that shows a path model as given in fig. 1

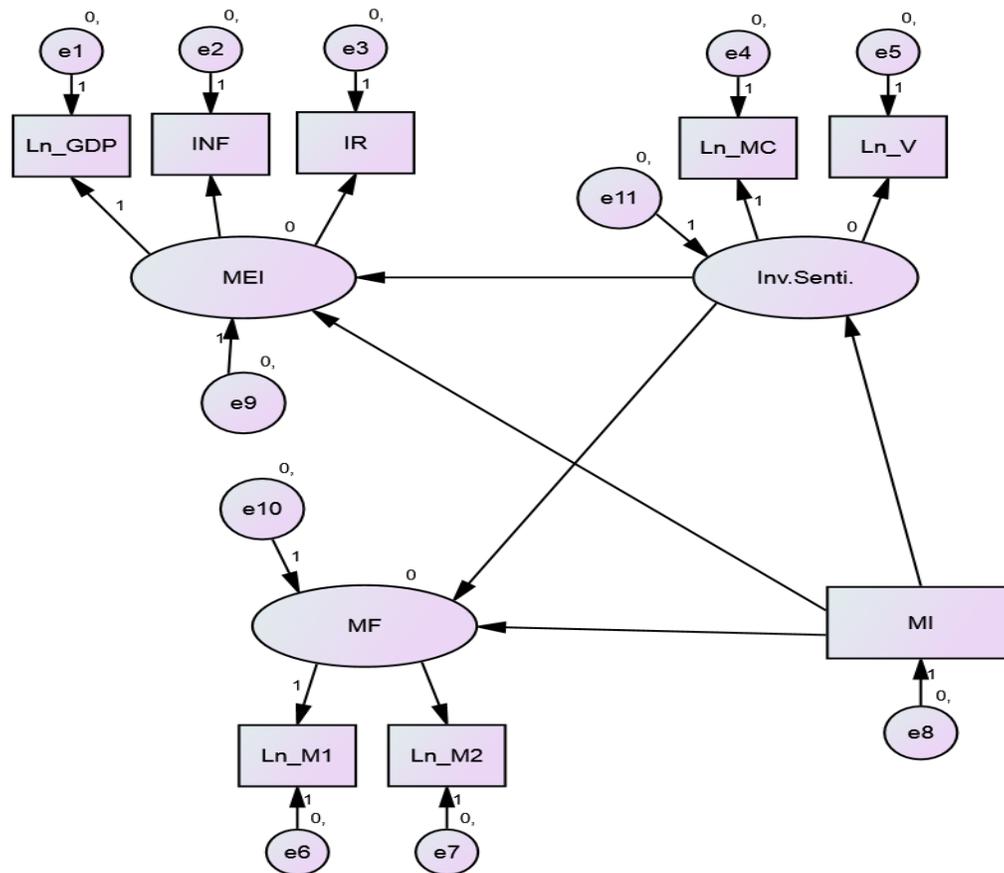

Fig. 1 Preliminary Design of SEM Path Diagram

Where, e_i are residuals of all observed and unobserved variables.

Parameter Estimation and Analyses

MODEL CONSTRUCT

This study uses macroeconomic, monetary and stock data for the period of 1994 to 2016 covering 23 years to study the influence factors of stock prices. The secondary data were retrieved from various sources like; Government of Nepal-Ministry of finance (MoF), Nepal Rastra Bank (NRB) and Nepal Stock Exchange Ltd. (NEPSE), then uses Amos17.0 software to carry on the fitting test.

Latent variables are scaled and errors, like latent variables, are also scaled for identification. For this, we assign loading for direct effect on any one of its indicators to 1 that is known as reference variable as GDP for factor MEI. Disturbances (e) in structural regression (SR) are assigned a scale equal to 1. Total no of parameters that can be estimated is limited by number of observations. With 'P' observed variables, no. of observations equal $P(P+1)/2$, for our model that has 7 observed variables, have 28 $[7(7+1)/2]$ no. of observations. $Dfm = p - q$ is termed as the model's degree of freedom. Our model contains 56 parameters, 28 free parameters, 44 sample

moments leading to 16 degrees of freedom (Dfm). When the model box is (OK: Default model), it means that it can display parameter estimates, and that there is no problem in theory model defining. With that standard, the model is fitted and the result is as follows:

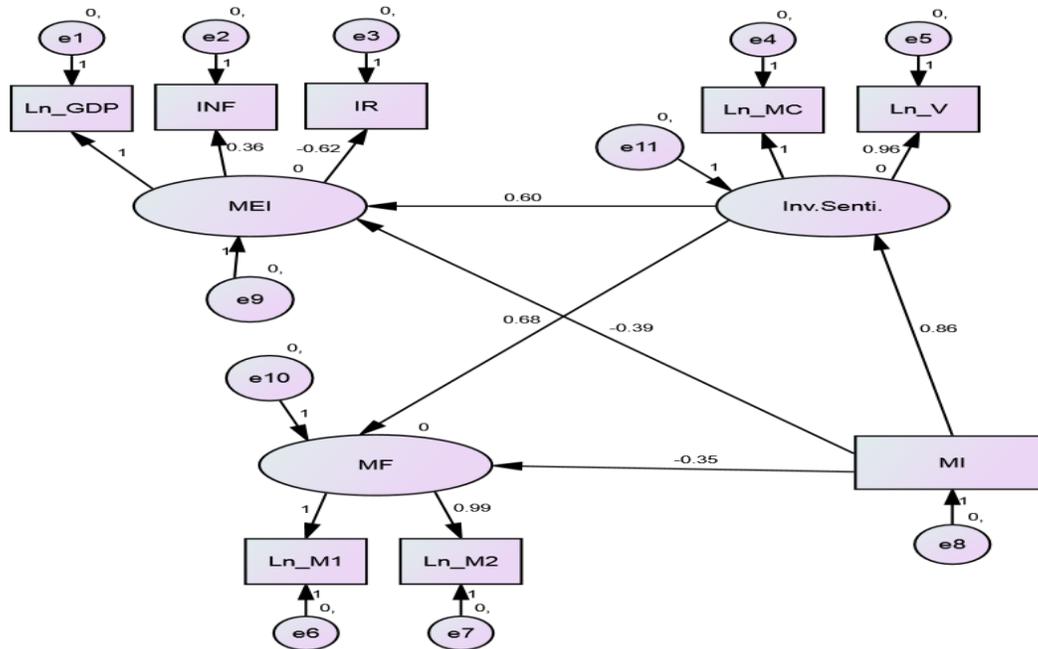

Fig. 2 Standardized Path Diagram and Path Coefficients (ML Estimation)

MODEL FIT

The aim here is to determine the degree to which sample variance data fit the SEM; commonly used criteria are: Chi-square (χ^2), the goodness-of-fit index (GFI), comparative fit index (CFI) and the root-mean-square residual (RMR). Asberg, Bowers, Renk and McKinney (2008, p. 491) suggest that the model is satisfactory with comparative fit index (CFI) greater than or equal to .90, the parsimonious fit index (PFI) greater than or equal to .60, and the squared error of approximation (RMSEA) less than or equal to .10. Schreiber et al. (2006, p.330) indicate a full set of criteria for an accepted SEM, which is mentioned in the following table:

TABLE 2. CRITERIA FOR AN ACCEPTED SEM

Indexes	Shorthand	General rule for acceptable fit
<i>Absolute/predictive fit</i>		
Chi-Square	χ^2	Ratio of χ^2 to df ≤ 2 or 3
Akaike information criterion	AIC	Smaller the better
Browne-Cudeck criterion	BCC	Smaller the better
Bayes information criterion	BIC	Smaller the better
Consistent AIC	CAIC	Smaller the better
Expected cross-validation index	ECVI	Smaller the better
<i>Comparative fit</i>		
Normed fit index	NFI	≥ 0.95 for acceptance
Incremental fit index	IFI	≥ 0.95 for acceptance

Tucker-Lewis index	TLI	≥ 0.95 for acceptance
Comparative fit index	CFI	≥ 0.95 for acceptance
Relative noncentrality fit index	RNI	≥ 0.95 similar to CFI
<i>Parsimonious fit</i>		
Parsimony-adjusted NFI	PNFI	Very sensitive to model size
Parsimony-adjusted CFI	PCFI	Sensitive to model size
Parsimony-adjusted GFI	PGFI	Closer to 1 the better
<i>Other</i>		
Goodness-of-fit index Adjusted GFI	GFI/AGFI	≥ 0.95
Root mean square residual	RMR	Smaller, the better
Standardized residual	SRMR	≤ 0.08
Weighted root mean residual	WRMR	< 0.90
Root mean square error of approximation	RMSEA	< 0.06 to 0.08 or below (0.1)

The criteria for an accepted SEM, presented in the Table 2, are used to assess the model fit for used data.

Table 3 illustrates the test statistics estimated for whole model to identify the fit measures.

TABLE 3. MODEL FIT SUMMARY

CMIN					
Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	28	27.157	16	.040	1.697
Saturated model	44	.000	0		
Independence model	8	427.609	36	.000	11.878
Baseline Comparisons					
Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
Default model	.936	.857	.973	.936	.972

Independence model	.000	.000	.000	.000	.000
NCP					
Model	NCP	LO 90	HI 90		
Default model	11.157	.527	29.628		
Saturated model	.000	.000	.000		
Independence model	391.609	328.710	461.957		
RMSEA					
Model	RMSEA	LO 90	HI 90	PCLOSE	
Default model	.174	.038	.284	.058	
Independence model	.688	.630	.747	.000	
AIC					
Model	AIC	BCC	BIC	CAIC	
Default model	83.157	119.157			
Saturated model	88.000	144.571			
Independence model	443.609	453.894			

ECVI

Model	ECVI	LO 90	HI 90	MECVI
Default model	3.616	3.153	4.419	5.181
Saturated model	3.826	3.826	3.826	6.286
Independence model	19.287	16.553	22.346	19.735

Among many fit measures, it is worth pointing out that the interpretation of many (but not all) fit measures depends on CMIN having a chi square (χ^2) distribution for correctly specified models. Many fit measures depend on the ratio CMIN/DF, which should be close to 1 (≤ 2) for a correct model. In maximum likelihood estimation, calculating the likelihood ratio χ^2 statistic requires fitting the saturated model. Whether or not Amos fits the saturated model is the evidence for the correct specification of the model.

The structural model fit is very good with chi square (χ^2) distribution; CMIN/df = 1.697, and p-value = 0.04; IFI (Incremental Index of Fit) = 0.973; CFI (Comparative Fit Index) = 0.972; Noncentrality parameter (NCP) estimate is framed within the bounds of confidence interval as suggested by Steiger (1990). Our hypothesized model yielded a noncentrality parameter of 11.157. This value represents the χ^2 value minus its Dfm (27.157-16). The confidence interval indicates that we can be 90% confident that the population value of noncentrality parameter (λ) lies between 0.527 to 29.628. However,

RMSEA (Root Mean Square Error of Approximation) = 0.174 PCLOSE(0.058) indicate the model doesn't fit very well as the value below 0.10 is preferred. This may be due to the reason of small sample size and large number of estimated parameters in the model. When sample size is small the RMSEA tends to overreject true population model (Bentler, 1999). Thus, the cutpoints for RMSEA should be interpreted with caution in this model. GFI is not reported as means are explicit model parameters. Because the published GFI/AGFI formulae ignore the residuals of the mean vector, using these GFI fit indices with means-level models is not logically appropriate.

Akaike's (1987) Information Criterion (AIC) and Bozdogan's (1987) consistent version of AIC (CAIC) both criterion address the issue of parsimony in the assessment of model fit. The Browne-Cudeck Criterion (BCC; Browne & Cudeck, 1989) and the Bayes Information Criterion (BIC) operate in the same manner as AIC and CAIC but they impose greater penalties than either AIC or CAIC for model complexity. Our results for all four of these fit indices pass the test and showed that the fit statistics for the hypothesized model are substantially smaller than they are for either the independence or the saturated models.

The Expected Cross-Validation Index (ECVI) is estimated as a means of assessing the likelihood that the model cross-validates across similar-sized samples from the same population (Browne & Cudeck, 1989). It assumes a comparison of models; the model having the smallest ECVI value exhibits the greatest potential for replication. In assessing our fit statistics, the lower ECVI value (3.616) for the hypothesized model, compared with both the independence and saturated models, represents the best fit to the data.

These indexes indicate a strong predictive validity of the model for the used data.

MODEL TEST

The study uses the recursive model. According to the model study, we estimated the path coefficients using the method of ML and got the path diagram Fig.2. In general, the parameter estimates should exhibit the correct sign and size, and be consistent with the underlying theory. Table 4 is the test result of parameter hypothesis.

TABLE 4. STANDARDIZED REGRESSION COEFFICIENTS AND THE STATISTICAL TEST (ML ESTIMATION)

			Standardized Estimate	Non-Standardized Estimate	S.E.	C.R.	P
Inv.Sentiment	<---	Market Index	.857	.004	.000	7.447	***
Macroeconomy.	<---	Market Index	-.390	-.001	.000	-4.878	***
Monetary Factor	<---	Market Index	-.345	.001	.000	-4.168	***
Macroeconomy	<---	Inv.Sentiment	1.319	.600	.038	15.842	***
Monetary Factor	<---	Inv.Sentiment	1.278	.677	.047	14.452	***
Ln_GDP	<---	Macroeconomy	.995	1.000			
INF	<---	Macroeconomy	.361	1.408	.767	1.836	.066
IR	<---	Macroeconomy	-.619	-2.454	.662	-3.710	***
Ln_MC	<---	Inv.Sentiment	.986	1.000			
Ln_V	<---	Inv.Sentiment	.956	1.124	.084	13.358	***
Ln_M1	<---	Monetary Factor	.996	1.000			
Ln_M2	<---	Monetary Factor	.999	1.233	.025	49.525	***

Note. ← means the influence path of variables.

Among them, Estimate represents the estimated value of the influence coefficient, S.E. the standard error and C.R. is the Critical Ratio test statistic which represents the parameter estimate divided by its standard error, as such, it operates as a z-statistic in testing that the estimate is statistically different from zero. Based on the probability level of 0.5, the test statistic needs to be $> \pm 1.96$ before the hypothesis can be rejected. Obviously, three latent variables; Investor sentiment, Macroeconomic indicator, Monetary factors, along with seven observed variables are all passed the test and reach the significance level. It also means that C.R. > 1.96 . However, the estimate of INF to Macroeconomic indicator has passed the test at 10% level of significance.

RESULTS AND DISCUSSION

After analysis, the causal relationships as followed can be accepted:

- 1) Investor sentiment, Macroeconomic indicator and Monetary factor have a certain influence on stock prices, and the biggest impact on stock prices is investor sentiment, it reaches 0.857, and then followed by macroeconomic indicator and monetary factors.

- 2) Investor sentiment has positive correlation with stock returns. It indicates that increase in investor confidence leads to the increase in stock prices. The result is consistent with the findings of Hua, Shiting, and Qiubai (2013). The relationships of macroeconomic indicators and the monetary factors to market index are negative. In the case of macroeconomic indicators, the literature review on observed variables Interest rate (IR) and Inflation (INF) documented the evidence of negative relationship with stock prices. The negative relation of interest rate implies that investors tend to invest less in stocks when interest rates go up causing stock price to fall (Kandir, 2008). The negative effects of inflation on stock prices is explained by three dominant hypotheses, namely, tax effect, proxy effect, and the reverse causality hypotheses, explaining the negative effects of inflation on stock returns (Fama, 1981). The justification for the negative relation of monetary factors on stock prices could be made as the increase in money supply M1 & M2 rises the level of inflation which brings higher discount rates and hence the lower value of equities. The above causes are justifiable to have the negative effects of latent variables; macroeconomic indicators and monetary factors and positive effect of investor sentiment with stock prices.
- 3) In the investor sentiment factors, the trading volume (V) has estimated coefficient 0.96 that shows a significant influence on stock prices, the higher is the volume, higher the stock prices.
- 4) The impact of macroeconomic indicators on stock prices is only after investor sentiment, it reaches -0.39. Assigning loadings 1 to GDP, the market interest has the better explaining capacity (-0.62) to stock prices. The higher the interest rate, lower is the stock prices. The monetary factor also has a certain influence on stock prices.
- 5) There also have a certain relationship between the investor sentiment, Macroeconomy and Monetary factors. While looking in un-standardized estimate, the monetary factor has positive effects on investor sentiment; the influence coefficient is 0.68. This shows that higher the money supply in the market, the higher will be the investor confident on rising stock prices. The macroeconomic indicators also have positive effects on investor sentiment; the influence coefficient is 0.60, the better the macroeconomic indices, the investor sentiment will be more optimistic.

CONCLUSIONS

Now stock investment activity has become a new hot spot of human financial activities, and an empirical analysis of the influence factors on stock prices can provide certain reference for investors and stakeholders. This paper uses the structural equation model, chooses stock prices as explained variable, and investor sentiment, macroeconomic indicators and monetary factors as latent variables, then selects observed variables which can explain latent variables to do empirical analysis, finally finds that investor sentiment has the biggest influence on stock prices followed by macroeconomic indicators and monetary factors. Knowing the positive relationship of investor sentiment and negative relations of macro-economy and monetary factors to the stock prices, investors can make scientific decisions and invest rationally. In addition, it provides some suggestions for improving the efficiency of investment from three angles that is the investors, listed companies and securities institutions to ensure the healthy and stable development of the Nepali capital market.

*Basic doctoral student of Tashkent State Agrarian University,
 UZBEKISTAN

Email id: davletmurodov@mail.ru

ABSTRACT

This article presents the results of a study on the agrochemical properties and salinity levels of irrigated grassland-alluvial soils distributed in the Aral Sea region. The results of the study show that the soils of the studied area are characterized by poor humus supply. The distribution of humus along the soil profile is based on clear laws. In the soils of the region, large amounts of humus and nutrients are distributed in the upper driving layers and a quantitative decrease is observed from the top to the bottom layers. Chlorine and sulfate anions predominate in soils. Also, weakly saline and non-saline soils are relatively high in humus and nutrients than moderately saline soils.

KEYWORDS: *Aral Sea Soils, Irrigated Grassland-Alluvial Soils, Humus, Nutrients, Dry Residue, Carbonates, Chlorides And Sulfates.*

INTRODUCTION

In the world today, food security is becoming a topical issue. This is a global problem in improving the agrochemical condition of soils in the agricultural sector, increasing productivity, ensuring accurate accounting and updating of agricultural lands, monitoring changes in the agrochemical properties of the topsoil and determining and assessing the impact of these changes on yield and quality, the study of the quantitative distribution of nutrients in plants and soils requires the implementation of responsibilities and priorities such as the management of the salt regime in soils.

The ecological crisis in the Aral Sea region, which has become a global problem of the XXI century, is leading to changes and degradation of natural resources, including soils, deterioration of land reclamation and agrochemical conditions, ie reduced productivity. This fact underscores the importance of a timely study of the amount of humus and nutrients in the soils of this region.

Therefore, improving the agrochemical condition of soils in the Aral Sea region, the impact of soil-climatic conditions and salinization processes on soil fertility, control over the level of agroameliorative and agrochemical measures have become the most important tasks of the day.

The research problem is to study the reclamation of soils in order to mitigate the negative effects of the aggravation of natural conditions in the Aral Sea region in recent years in the Republic.

In solving this research problem, the need for consistent reforms to prevent salinization of soils in the Aral Sea region is reflected in the following:

- ✚ soil-climatic conditions of the area have a negative impact on the main properties of the studied soils and lead to a decrease in soil fertility, so the seasonal study of soil-climatic conditions;
- ✚ comprehensive monitoring of the agrochemical condition of saline soils on the basis of timely assessment;
- ✚ study and analysis of possible negative consequences of salinization processes;

Inefficient use of agricultural lands in the Aral Sea region leads to a decrease in soil fertility, deterioration of land reclamation. This, in turn, leads to a decrease in the yield and quality of agricultural crops. In order to address such negative problems, major reforms have been carried out in the country in recent years.

LITERATURE REVIEW

Addressing the 75th session of the UN General Assembly in Uzbek, President of the Republic of Uzbekistan Shavkat Mirziyoyev said: "We propose to adopt a special resolution of the United Nations General Assembly declaring the Aral Sea region a zone of ecological innovation and technology. It would be appropriate to celebrate the date of approval of this important document as the International Day for the Protection and Restoration of Ecosystems, which indicates that an in-depth study of all areas of agriculture in the region, including the agrochemical situation is one of the most pressing issues today.

Resolution of the President of the Republic of Uzbekistan dated January 18, 2017, No PP-2731 "On the State Program for the Development of the Aral Sea Region for 2017-2021" and June 17, 2019 No PD-5742 "On efficient use of land and water resources in agriculture" In order to create digital agrochemical maps of arable lands in the region, the decrees address the issues of humus and nutrient content, dynamics of periodic change, assimilation by agricultural crops, yield and yield of various crops and agrochemical monitoring of soils [2,3].

Extensive research work in different years to study the properties, reclamation status and biological activity of soils in the Aral Sea region, to improve and increase their productivity L.T.Tursunov, I.T.Turapov, B.S.Mambetnazarov, S.A.Abdullayev, V.G.Popov, H.T.Riskieva, R.Q.Kuziev, L.A.Gafurova, M.M.Tashkuziev, V.E.Sektimenko, B.Jollybekov, A.Ramazonov, R.K.Kurvontoev, conducted by A.J.Boirov, M.E.Saidova, A.J.Ismanov, A.A.Tursunov and others. However, insufficient research has been done on the efficient use of the region's lands by diagnosing the agrochemical and reclamation status of saline soils in the Aral Sea region on the basis of modern geographic information systems.

Based on the above, the purpose of the study is to analyze the changes in the agrochemical status of irrigated meadow-alluvial soils of the Makpalkol massif of Takhtakor district of the Republic of Karakalpakstan in terms of soil salinity.

The object of the study was selected irrigated meadow-alluvial soils in the Makpalkol massif of the Takhtakor district of the Republic of Karakalpakstan.

Research results

During our research, a mixture of soil from 0-30 cm layer was taken from the irrigated meadow-alluvial soils of Makpalkol massif of Takhtakupir district and divided into massive elementary areas.

The reason we take mixed soil samples from the 0-30 cm layer is that this soil layer is constantly supplied with nutrients through mineral fertilizers used for agricultural crops. According to the results of the analysis, the amount of humus in the soils of the region varies from 0.369% to 1.301%, depending on the level of supply. It was found that mobile phosphorus in the soil was supplied in the amount of 4.8 mg/kg to 40.1 mg/kg and potassium in the amount of 63.1-289.9 mg/kg (Figure 1).

The low nutrient content of the region's soils can be attributed to the lack of plant residues, as well as the unfavourable climatic conditions of the region, which rapidly evaporate moisture from the soil surface due to high summer temperatures, relatively low humidity and frequent winds.

Which in turn leads to intensive salinization and increased plant demand for water. The reason for the low nutrient supply of these soils can be explained by the insufficient use of local in the area and the low accumulation of plant residues in the soil.

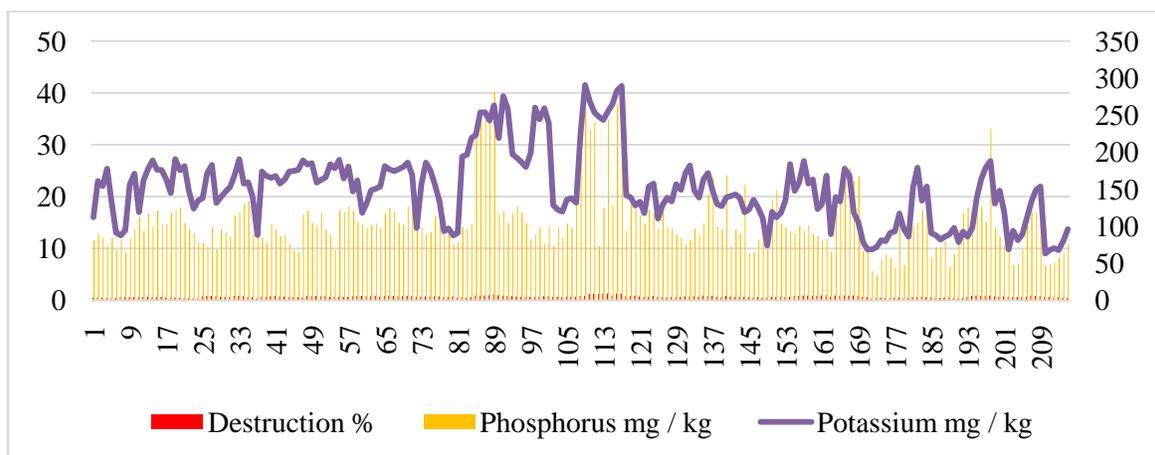

Figure 1. Levels of 0-30 cm layer of soil provided with humus, mobile phosphorus and exchangeable potassium.

We also studied the salinity levels of soils in the area during our research. This is because salinization not only affects soil fertility, but also complicates the absorption of water by the root system in plants as a result of the decrease in water potential in the soil solution, and as a result, has a negative impact on crop growth and yield.

During the study, the dry residue content in the drive layer of weakly saline irrigated meadow-alluvial soils in massive soils was 0.166%, carbonates 0.033%, chlorine ions 0.028%, sulfate ions 0.98, calcium 0.12%, magnesium 0.003, sodium 0.058%.

In the driving layer of non-saline meadow-alluvial soils, the dry residue content was 0.090%, carbonates 0.29%, chlorine 0.32%, sulfates 0.016, calcium 0.001%, magnesium 0.002% and sodium 0.023%.

In the drive layer of moderately saline irrigated-meadow alluvial soils the dry residue content was 0.360% carbonates 0.038%, chlorine 0.034%, sulfates 0.121%, calcium 0.001%, magnesium 0.002% sodium and 0.023%. -chlorinated salinity occurs

(Figure 1).

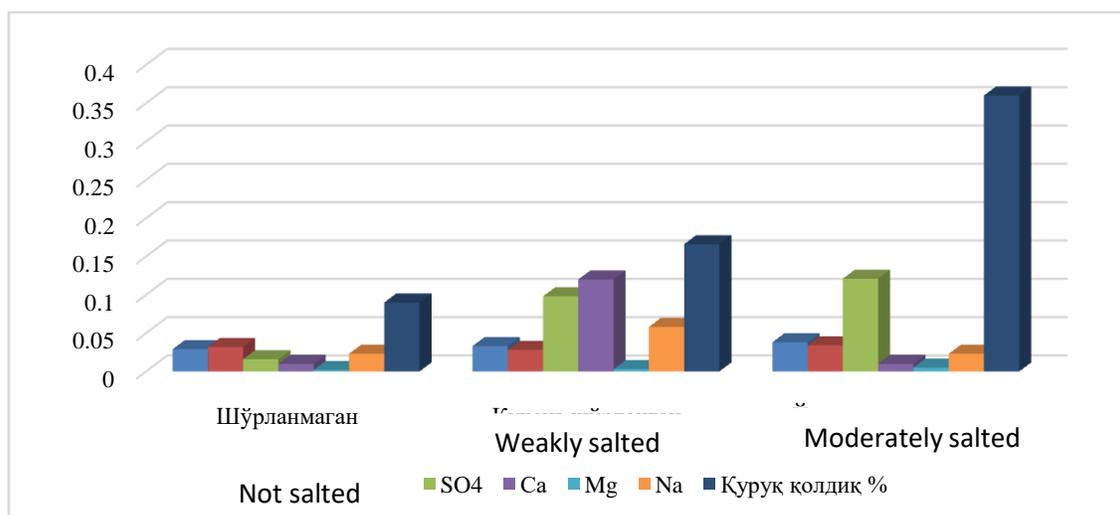

Figure 2. Variation of the 0–30 cm layer on salinity in irrigated of dry% ial soils

In general, the soils of the region differ in the degree of salinity, salinity, depth of location of saline layers and groundwater. Each studied soil separation is characterized by its own salt profile, salt composition and reserves, salinization processes of different intensities. Chloride-sulphate and sulphate type salinity soils, and in some places sulphate-chloride type soils are also observed. An increase in salinity is accompanied by an increase in the proportion of chlorides in the salts.

In the sown areas, mainly weakly saline or non-saline (washed) soils are prevalent. The remaining abandoned lands, which are not cultivated, are strongly saline.

CONCLUSION

In general, it was found that the soils of the region are not very rich in humus, the amount of humus in mixed samples in the 0-30 cm layer of soils in the massif fluctuates from 0.369% to 1.301%. The dependence of nutrient content on the mechanical composition of soils is clearly expressed: light sands contain more humus in heavy sandy soils than mechanical sandy soils. Also, as the salinity level increases, the amount of humus and nutrients decreases to a minimum. The mobile form of phosphorus is the main food source for plants. It was found that mobile

phosphorus in the soil was supplied in the amount of 4.8 mg/kg to 40.1 mg/kg and potassium in the amount of 63.1-289.9 mg/kg.

It is observed that the amount of nutrients depends on the mechanical components of the soil, i.e., the amount of humus is heavier in heavy soils than in soils with light sand and sandy mechanical content. Also, as the salinity level increases, the amount of humus and nutrients decreases to a minimum.

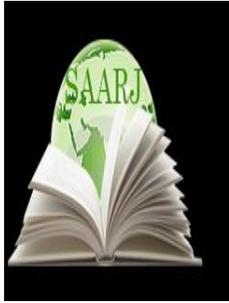

In massive soils, the amount of dry residue in the topsoil is around 0.162 to 0.178%, mainly chlorinated sulphate, chlorinated, sulphate chlorinated and sulphate salinity types are found.

It is advisable to carry out agrochemical monitoring using modern methods in the soils of the study area to obtain high quality and high yields of agricultural crops by increasing or maintaining the number of nutrients in the soils of the area.

A number of similar agrochemical studies, in turn, will increase the yield and improve the quality of agricultural crops grown in the Aral Sea region.

ENCRYPTION OF THE QURAN AND FORECASTING EVENTS

Aripov Masud Marufovich*

*Ph.D., Associate Professor,
 Kokand State Pedagogical Institute named after Mukimi,
 UZBEKISTAN

ABSTRACT

Considered and commented on the issues of encryption of the Koran by abjad and predicting events. An algorithm for encrypting the Quran and predicting events is proposed, and on their basis a computer program in PHP is created. Based on the developed program, a specific sura was determined, where the date of the appearance of COVID-19 was in a hidden form.

KEYWORDS: *Abjad, Surah, Ayah, Algorithm, Covid-19, PHP Programming Language*

INTRODUCTION

Every word in the Arabic alphabet has a specific numerical meaning. In other words, each Arabic letter has a specific numerical value, that is, the number can be expressed in letters and vice versa. Thus, each word, in addition to its literal meaning, also has a numerical meaning.

All events that took place in the history of the Arabs were recorded in especially composed letters, taking into account their numerical values, and, thus, both the description of the event itself and its date were recorded. This date was obtained by summing the specific numerical value of each letter used in the word.

Abjad is the following sequence of Arabic letters and their meanings.

1	2	3	4	5	6	7	8	9	10	20	30	40	50
ا	ب	ج	د	هـ	و	ز	ح	ط	ي	ك	ل	م	ن
60	70	80	90	100	200	300	400	500	600	700	800	900	1000
س	ع	ف	ص	ق	ر	ش	ت	ث	خ	ذ	ض	ظ	غ

It was also used in the pre-Islamic period to encrypt events. The Quran clearly indicates some events that will occur in the future, and some are encoded in encrypted form.

When examining some verses of the Quran using the coding method (abjad), we see that the events described in these verses correspond to certain dates in the history of mankind. For example, the Koran contains an indication that the landing of a man on the moon will take place in 1969 [1, p. 359].

اقْتَرَبَتِ السَّاعَةُ وَانْشَقَّ الْقَمَرُ

... We (the end of the world) approached and the moon split. (sura, 54: 1)

The word “split”, in the above verse, in Arabic sounds like “inshakka” and comes from the root of the verb “shakka”, which has several meanings. The verb “shaqqa” in Arabic is also used to express the definition of “splitting in two, plowing, digging out the earth, drilling the earth, tracing, swelling”.

From the above verse, select the last three words and at the bottom of each word write all the letters according to abjad:

السَّاعَةُ وَانْشَقَّ الْقَمَرُ

200 40 100 30 1 100 300 50 1 6 400 70 1 60 30 1

We sum up the corresponding numbers and get the following expressions:

$$200 + 40 + 100 + 30 + 1 = 371$$

$$100 + 300 + 50 + 1 + 6 = 457$$

$$400 + 70 + 1 + 60 + 30 + 1 = 562$$

$$371 + 457 + 562 = 1390$$

where 1390 is the year of the Hijri calendar, we translate it into the Gregorian calendar and get 1969. If we proceed from this meaning of the verb “shakka”, then we are faced with a phenomenal phenomenon: the expression of the ayah “the moon split” in terms of the numerical cipher abjad is equal to 1969.

Considering the above, let us return to the history of our century a few decades ago. 1969 is the year when we witnessed the accomplishment of the amazing phenomenon of the Koran. The sign sent down in Sura 54.1 ayah fourteen centuries ago took place on July 20, 1969, when for the first time in the history of mankind, work was carried out on the surface of the moon.

The fact that in this verse of the Qur'an we amazingly receive a number indicating the date of the landing of a person on the moon is the greatest sign, for this verse of the Qur'an was revealed 14 centuries before the event that took place in 1969.

The Prophet (peace and blessings of Allah be upon him) predicted the conquest of Istanbul by Muslim warriors 1400 years ago. Much has been written about this in history books and in the

works of Western and Eastern scholars. Many rulers tried to fulfill the prophecy of the Prophet and carry out this great conquest. But the goal was not achieved.

By the will of fate, this conquest was made by Sultan Muhammad in 1453 AD. (857 AH). This conquest is also mentioned in the Quran. This is due to the fact that in the 15th verse of Surah Saba the phrase "Ballat un Toiyiba" ("Good country") corresponds to 857 AH (1453 AD) [2, p. 177].

The Saba (tribe) in their settlement had a sign (indicating the might of Allah): two gardens - (one) on the right and (the other) on the left. (And exhortations came to them, who said): "Feed on the portion of your Lord and give thanks to Him! (After all, the place where you live is) - a good country (with a good climate and fertile soil), and (after all, Allah, only Whom should serve and worship) is the Forgiving Lord (forgives when people turn to Him with repentance!)" [3].

From the above verse, select the phrase "Ballat un Toiyiba" ("Noble country") and put the corresponding code for abjad above each letter:

Let's calculate the sum of the received numbers:

$$400 + 2 + 10 + 9 + 400 + 4 + 30 + 2 = 857.$$

This number can be considered as a sign of the conquest of Istanbul in 857 AH (1453 AD) [4, p. 6103].

From the above, we can conclude that in order to determine the presence of a certain date of some events in the Qur'an, you must first encode the text of the ayahs and then search among the codes of a certain date.

Considering that there are over 6,200 verses in the Qur'an, it is a laborious process to manually encode the text of the Qur'anic verses. Therefore, We have created an algorithm for coding the verses for abjad. The algorithm consists of the following steps:

1. Entering the text of the verse under study;
2. Entering the abjad table;
3. Calculation of the length of the text of the ayah;
4. Calculation of the number of spaces in the text of the verse;
5. Coding the word of the text of the ayah;

6. If all words are coded, then go to point 7, otherwise to point 5;
7. Displaying the received codes;
8. Analysis of the derived codes.

On the basis of this algorithm, a program for encoding the text of the Koran verses was created, and in the PHP programming language.

To date, the most discussed topic is Covid 19. Therefore, we posed the question whether there is a prediction about coronavirus in the Quran. Several hundred verses were coded with the use of the program compiled by Us and analyzed. As a result, we received a positive answer.

It turns out that there is a prediction about Covid 19 in the Holy Quran. This prediction is contained in verse 80 of Sura 26 ("Ash-Shuara" - Poets).

وَإِذَا مَرِضْتُ فَهُوَ يَشْفِينِ

And when I get sick, He heals me

Figure 1 shows a portion of the completed program where the input verse is 26.80.

//Sstring ="إِنَّ الصَّفَا وَالْمَرْوَةَ مِنْ شَعَائِرِ اللَّهِ فَمَنْ حَجَّ الْبَيْتَ أَوْ اعْتَمَرَ فَلَا جُنَاحَ عَلَيْهِ أَنْ يَطَّوَّفَ بِهِمَا وَمَنْ تَطَوَّعَ خَيْرًا فَإِنَّ اللَّهَ شَاكِرٌ عَلِيمٌ";
// 26-78
//Sstring ="وَالَّذِي هُوَ يُطْعِمُنِي وَيَسْقِينِ";
// 26-79
//Sstring ="وَإِذَا مَرِضْتُ فَهُوَ يَشْفِينِ";
// 26-80
Sstring ="وَإِذَا مَرِضْتُ فَهُوَ يَشْفِينِ";
```

Figure 1

In fig. 2 shows the result of the work of the compiled coding program, where the input is 80 ayahs of Sura 26.

Ayahs·26.80 ﴿ وَإِذَا مَرَضْتُ فَبُهِتَ الَّذِي كَفَرَ ﴾ - وَإِذَا مَرَضْتُ فَبُهِتَ الَّذِي كَفَرَ
 Sum of codes for each word ﴿ 40 200 800 400 = 1440
 707 ﴿
 1440 ﴿
 91 ﴿
 450 ﴿

Figure 2

The total code 1440 corresponds to the word مَرَضْتُ (I got sick) for it, according to the abjad table, we define the corresponding codes for each letter and as a result we get:

$$40 + 200 + 800 + 400 = 1440$$

this shows that the compiled program is working correctly. The number 1440 is the year in Hijri, we translate it into the Gregorian calendar and get August 2019, but Covid 19 according to the media (media) was discovered in November-December 2019.

Thanks to work [5], everything became clear, it turns out that an analysis of satellite images of parking lots near hospitals and queries in the Chinese search engine Baidu showed that the coronavirus epidemic began in Wuhan not in November-December, but in August 2019. This option was put forward by scientists from Harvard University.

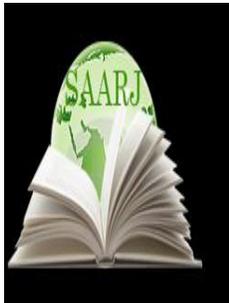

Based on the above facts, we can say that predicting events according to the encrypted Quran is relevant. Coding the verses of the Quran by hand is a tedious process. Therefore, We have developed an algorithm and a program in the PHP programming language for coding the verses of the Quran.

Using the program developed by Us, 80 ayahs of Sura 26 were found, where the date of the appearance of Covid 19 was found in a hidden form in it. The date found in an amazing form coincides with the dates proposed by scientists at Harvard University.

ABSTRACT

The article discusses the issues of focusing on the importance of folklore samples in the moral education of students, using educational ideas inherited from us in the Karakalpak folklore. He considered the Buzuglon to be his own child and gave him the golden throne. When the Buzuglon went hunting, he was again the owner of the golden throne. He accepts the deposit of forty young men. The reason was that Buzuglon knows that, Bobokhan king could not withstand the pressure of the king and left his country, but in his heart the feeling of love for the country and the land was not extinguished.

KEYWORDS: *Oral literature, Karakalpak folklore, creation, folklore art, tradition, story, patriotism, education, epos.*

INTRODUCTION

It takes a great deal of intelligence, faith and honesty on the part of the head of state to take care of orphans, to pay attention to their upbringing and development, to think about the future of the country. Restricting the care of the citizens of his country, including orphans, and extending a helping hand to them - makes the leader an oppressor in the eyes of the people. Oppression loses its appearance in a person with high positive qualities such as humanity, morality, faith, honesty, tolerance and so on. Here, the leader is ridiculed by a leader who does not have such positive qualities, and tries to disobey him.

In the epic "Buzuglon" (Buzuglon. Karakalpak folklore XIX-volume. Nukis, "Karakalpakstan" 1989) King Bobokhan confuses Konsuluv with Buzuglon, one of the orphans. He confiscated all the property left by their parents. As a minority, he declares to the people that "who cares for and sponsors these two orphans is mortal, and his or her property is the kingdom" (1,14).

It is known that there are many good people in the world. But there are many such good people in the land of Bobokhan. They consider this decree of King Bobokhan as a manifestation of indecency. If we become sinners by taking care of orphans and captives, the hungry people will move to the khan in anger, saying, "The law is yours, your country is yours, and your man is yours" (1,14). Here you can be sure that the proverb of the Karakalpak people, which calls for the etiquette of "digging the grass, digging the neighbor", is based on very accurate, life experiences.

Not only the living, but also the spirits of the dead do not like the negative actions of the Bobokhan king, the persecution of orphans and captives, even when they reach the level of self-abnegation. Thus, Bobokhan had a dream in which he spent the night on Mount Avliya while drawing an army to take revenge on King Buzuglon. "In a dream, there is a saga at the beginning, there is a white dress on it, there is a whip from the grain in his hand, a young boy of thirteen and fourteen years old took it from Bobokhan's neck, "where did you come up with a legend that you will show the orphans in your land, drive out them" (1,65) and told to Bobokhan.

After the victory over the Buzuglon Foam giant, the Bobokhan King comes to repentance. Of course, this repentance was the result not only of fear, but also of realizing one's mistake. Consequently, he said to the Buzuglon, ".....I am warm to the world left by your father. I have no power over my filthy lust, I have taken your property without looking at you.....I summoned the Foamy Giant in order to kill you" (1,116). That is why, he admits his misbehavior. He feels that the reason for his repentance is directly related to the reputation of the Buzuglon. The reason was that Buzuglon knows that, Bobokhan king could not withstand the pressure of the king and left his country, but in his heart the feeling of love for the country and the land was not extinguished. He did not resent his people, no matter how much he hated the khan, for the oppression of Bobokhan. On the contrary, they missed him. Therefore, Bobokhan, who had invited the Foamy Giant, Buzuglon said in reference to the king's man "I do not respect your Bobokhan, I sacrifice my life for my mother-in-law, for our elderly parents, for the young girls in tears". (1,72) He said that he loved his motherland and his people more than his own life. Thus, after the victory over the Foaming Giant, Bobokhan confessed to the people that he would give his land, property, and throne Bobokhan King to Buzuglon, and at the age of sixty-two he repented and became a valuable father to Buzuglon.

The peculiarity of the epic "Buzuglon" differs from other epics in that the epic pays special attention to the concept of "savings". "Saving is save your life" said our people. That is why he does not entrust the deposit to anyone.

Survival of the savings is both an obligation and a debt for the people entrusted with the deposit. This person is assessed based on the level of survival of the savings. Depending on his view of the deposit, the level of moral upbringing is determined. Through a savings, it is possible to distinguish between people who can and cannot be trusted.

In front of the people entrusted about savings, two different paths, two different perspectives, two different impressions awaken. The first is to encourage man to keep the savings alive in any way. The second encourages man to take advantage of this savings and take possession of it.

In the first group, the main question for the dreamers is "how can I deliver the deposit to the owner?" All efforts, he or she will and intellect are used to solve these problems. For example, in the epic "Alpomish", the hero of Karajon meets Barchinoy with Alpomish, asking his parents for a day's savings [p. 2,78]. The fact that Alpomish, no matter how hot-tempered he may be, is a clear indication of our opinion that betrayal of trust is in humane.

The second group uses various tricks to take over the deposit. He forgets responsibility, duty, debt. He sacrifices shame, prestige for his own selfish ends.

In the epic, Shaykhivaliy Eshan seemed to Buzuglon as a great scholar, an intelligent, trustworthy man, a dear father. The reason is that Buzuglon is moving around the city and paying attention to everything that "The scribes were gathered, the bowls were laid out, the fat cattle were slaughtered, the rest was rested, seven were beaten, and seven were encouraged". [1,76] Since there was a madrasah where this meeting was taking place, Buzuglon looked inside and said, "He has a turban on his head, a whistle on his forehead, a tasbi in his hand, seven tasbi on his shoulders, and a kalamullo on his lap..... looking south, he saw a Muslim reciting the Qur'an" [1,77].

He believed in Eshan so much that he ran and took him by the hand and told him that he was jumping on the rope at the request of Bobokhan. He warns that fifteen days have passed since the promised day, that he is obstructing his sister's feet, that he has not met a trustworthy man to leave her as a deposit, and that he will leave her as a trust if he chooses to do so.

Eshan, in turn, agrees. The six-month-old begs to be fed and clothed to the farthest of the forty cells. He promises to take the message through the hole in the roof, to do it if necessary, and to promise that the deposit will not be harmed by him unless it is harmed by God.

When Ranay brought the king's daughter Sholpanoy with him, Sholpanoy's mother, Bozkampir, believed that Buzuglon would be able to keep his promise and be brave, and left his only daughter to God first. [1,177] He entrusts the Buzuglon to himself.

After crossing the border of Shurshit, Buzuglon, twenty days before the arrival of the country, went ahead and went to the village to get information about his country, to know what was happening in the country, and if he survived, to go out in front of Shulpanoy. He does not lose faith in the forty young men and nine maids under Shulpanoy before he overtakes him. They think that Sholpanoy will survive as a deposit of the Buzuglon.

After forty days of not being able to chase Sholpanoy, who looked like a golden-headed, Buzuglon decided to let his men go and asked the forty young men to deliver their savings to King Bobokhan. According to this deposit, Buzuglon will return in twelve months, and if he does not arrive by this time, his share will be paid. He asks his friend Ersulton in a place called Saisuuyt, the mouth of the Black River, to tell Bobokhan to bless his sister. Forty young men under the Buzuglon did not betray the trust, but conveyed the message to Bobokhan.

King Bobokhan, too, seemed to be a very cruel man at the beginning of the saga, but he reconciled with Buzuglon because of the Foamy Giant. He considered the Buzuglon to be his

own child and gave him the golden throne. When the Buzuglon went hunting, he was again the owner of the golden throne. He accepts the deposit of forty young men. But he looks forward to two years and seven months, hoping that the Buzuglon himself will come from one side. Eventually, when he became ill and received the news of his death, he sent a letter to Ersultan, intending to hand over the deposit to the owner. Ersulton arrives with five hundred soldiers. However, Bobokhan had died before he could see that his intention had been fulfilled. Even then, Bobokhan's intention was correct. He also had no intention of betraying the savings. Therefore, in the face of death, Bobokhan's intention will be to accompany the king.

Shaykhivaliy Eshan, despite being seventy years old, was tempted by the devil and when he heard the news that Buzuglon had died, his sister, sixteen-year-old Kansuluv, decided to marry him. At this point, Shaykhivaliy Eshan looked at Buzuglon himself on the terms of the savings, "If you take my sister as a precious father..... If I come, I will take my savings from you, and if I die, you will find a partner who will not cry". [1,77] He did not mentioned about this.

As the saying goes, ".....Let the children miss you," after Kansulu's appearance, even if he is a devil, he will get a real marriage. However, it is well known that a person who commits treason is disliked by both God and man. Consequently, the people cursed Shaykhivaliy Eshan and announced that Buzuglon, who was dead, was coming safely.

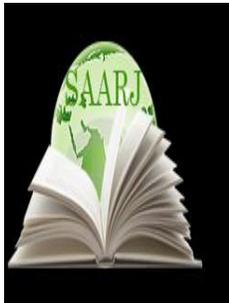

One of the direct respondents to the deposit, the occasional mother-in-law, also betrays Sholpanoy because of her love for Buzuglon and her resemblance to Sholpanoy. By tying his limbs and throwing him into the river, he will have "reached his goal" even if it is only for a few days. However, the content of the epic is a testament to the fact that the wisdom of the people "saves lives". Shaykhivaliy Ishan, who betrayed the trust, Kez-kez mother, concubines, and was killed by Buzuglon, and seven concubines were thrown into the Kisirov desert.

As an analysis of the above-mentioned issues in the epic "Buzuglon", we decided to conclude as follows.

1. The people of Karakalpakstan dreamed of the repentance of those who mourned orphans and captives.
2. The boundless respect for his country made the name of the couple great, raised their prestige, and through this prestige led to the repentance of those who oppressed the orphans.
3. The people of Karakalpakstan were in favor of his survival in the transfer, storage and return of the savings. The traitors of the deposit have been ruthlessly exposed by the people.

ABSTRACT

Based on the analysis of the methodological literature, questions can be resolved divided into three groups. The science of drawing plays an important role in the formation of technical knowledge in the next generation, in their technical and graphic literacy, in educating them so that they can "gold" with various technical means. Constructor serves as a means of expressing the idea of in the idea is to be able to create an image of a new object in the brain of the mind and represent it graphically. This is the successful side of design in the design process. In the creative activity of a person, graphic images perform two interrelated functions. Firstly, drawing is a unique tool for thinking, and secondly, it is a means of conveying ideas. Therefore, in design, we mainly study graphic aspects. Design problems relate to changes in the form and content of a particular part, device, machine, or structure. This change includes the addition of new structural elements to parts, mechanisms, devices and machines; reconstruction of parts, a more efficient, cheaper and more convenient type is required than its predecessor.

KEYWORDS: *Drawing, Spatial Imagination, Engineer, Abilities, Forms, Design Principles, Geometric Body, Image.*

INTRODUCTION

Develop students' ability to think independently by designing details. Based on the analysis of the methodological literature, the questions can be divided into three groups. These are problems associated with a change in the spatial position of an object, the spatial position of an object, and a change in the shape of an object. The content of such questions is as follows:

a) change in the spatial position of the object as a result of rotation;

b) change the shape of the object; c) change the shape of a product part as a result of its replacement;

g) a change in the shape of a part as a result of the removal of a part from it

Change the spatial position of the object if the answer is two or more, that is, very different, in the process of inventing new or improving existing ones, then the problem is considered positive.

When a designer is faced with so many different decisions in the design process, he takes into account the conditions of technical, technological and economic issues, using his highest level – creativity selects the most optimal option. Then they achieve their goal by drawing various graphics.

Change the shape of the item. When working out the content of creative questions and guidelines for their use in the educational process, it is important to take into account the characteristics that accompany their constructive and visual activity. First, to know to what extent students can apply the graphic knowledge formed in them; secondly, it is necessary to understand what characteristic difficulties arise in the process of creative work and how to prevent them. When studying the peculiarities of solving creative problems, which include building elements by students, the following draws attention.

1. Students' difficulties begin with the inability to analyze the initial data of the problem (inability to find the main contradiction in the design, not understanding what requirements the missing part corresponds to and how it should work). This negatively affects the research activities of students and ultimately leads to an irrational solution of the issue.

2. The complexity of the graphic representation of a constructive idea and the mistakes made by students are mainly associated with the inability to apply the previously formed graphic knowledge in a new situation. To some extent, this is reflected in:

a) The impossibility of choosing the optimal number of images that adequately and expressively reflect the characteristics of the structure;

b) The impossibility of choosing a scale (scale) that allows you to highlight the main thing in the design;

c) Difficulties with placing images on the drawing (d),

d) Errors associated with violation of the general drawing rules.

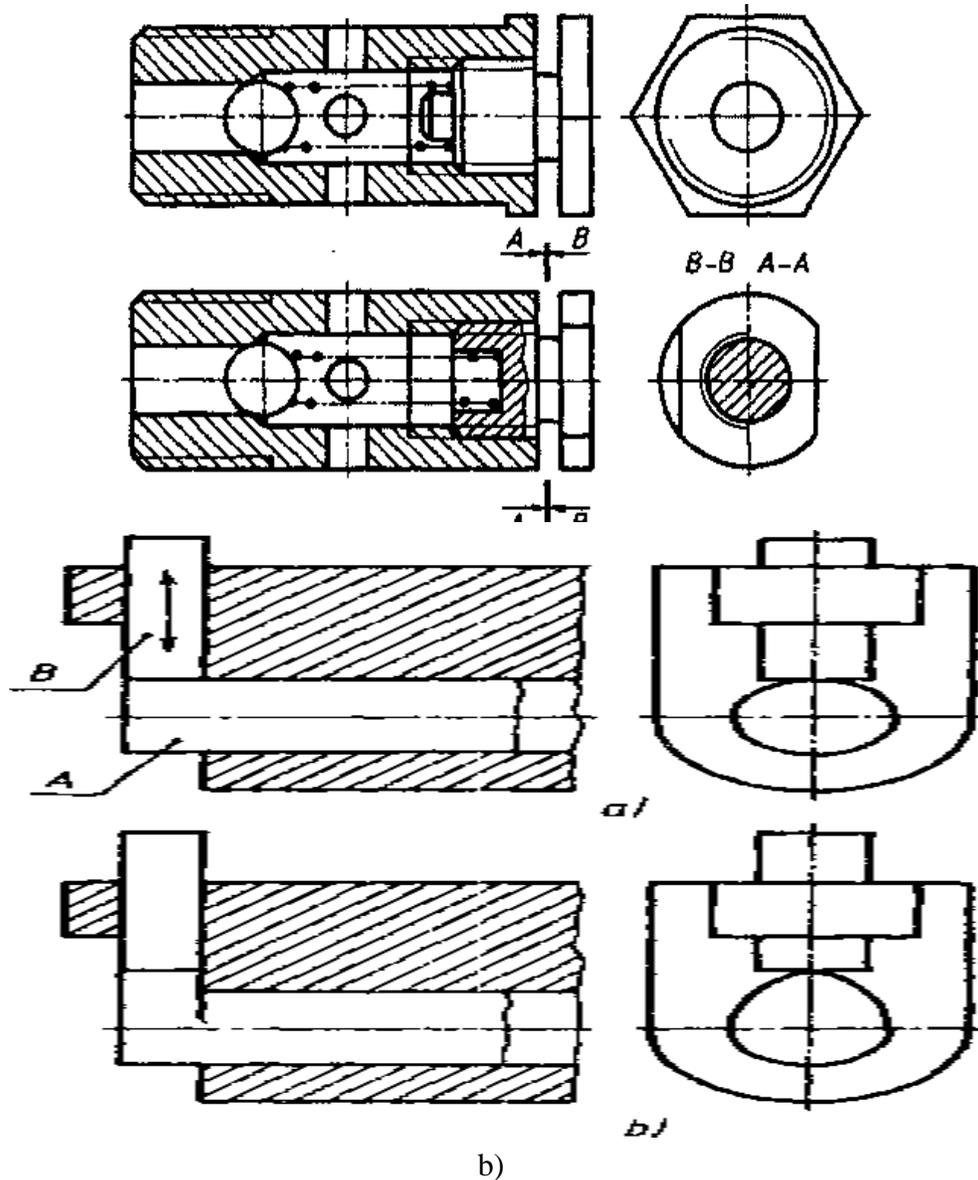

3. Students' performance of images, which we conventionally call "basic", is a characteristic stage of graphic research, which usually involves an attempt to fix the core of the future structure that has formed in our consciousness.

Development of technical specifications for construction according to this scheme.

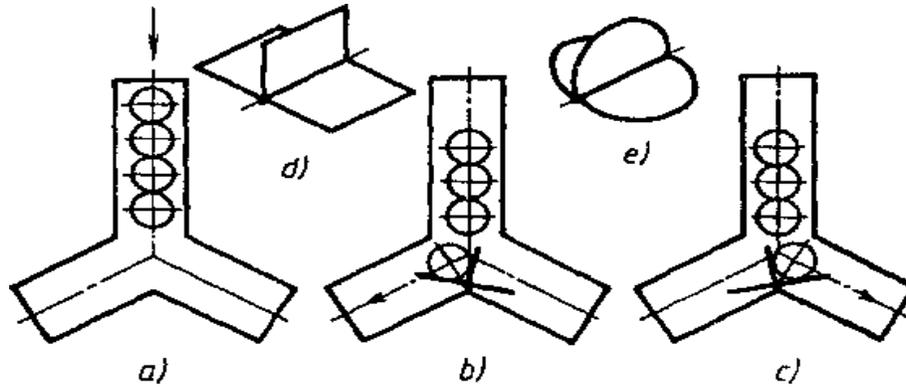

Depending on the location of the parts, the design must take into account the correct operation of the connector on the device or mechanism.

For example, in Fig. 9.1 shows an assembly diagram of a device in which part B moves up and down as shaft A. decision. For this, the end of the shaft A must have the shape of an elbow or an eccentric. Such a constructive solution is shown in Fig. 9.1, b of the wiring diagram. Let's look at other examples.

For instance. The option in Figure 8.2 is convenient. Now design, technological and operational issues will be studied, that is, tested to determine if this device-valve can be introduced into production.

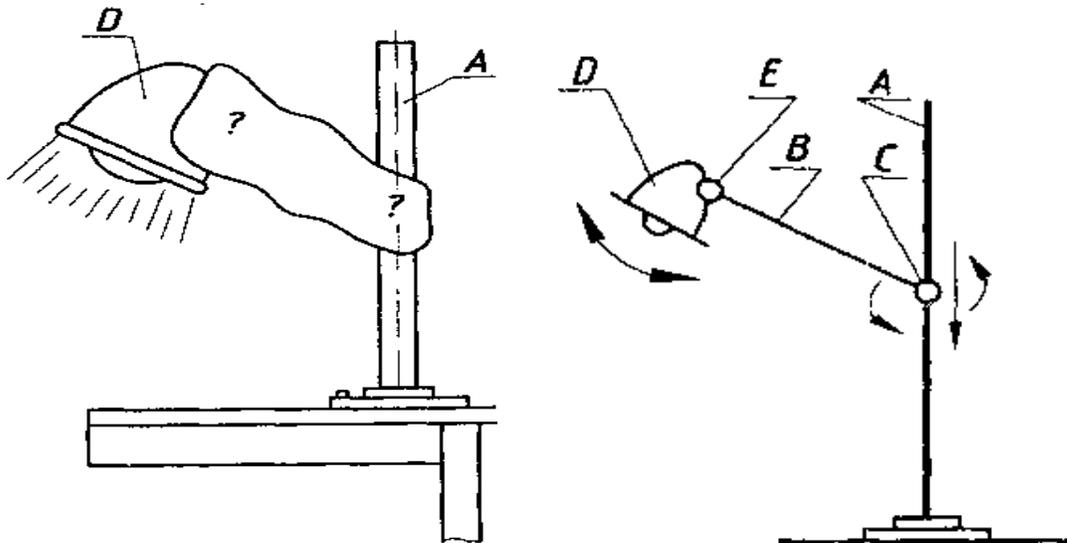

Decision. To save material and reduce the preparation time, it is necessary to make the main part of the roller from matte with a diameter of 020 mm. In fig. 9.4, and a diagram of the sorting (distribution) device is presented. Design the part so that the bubbles fall into the hole to the right or left and go out. Figure 9.4.

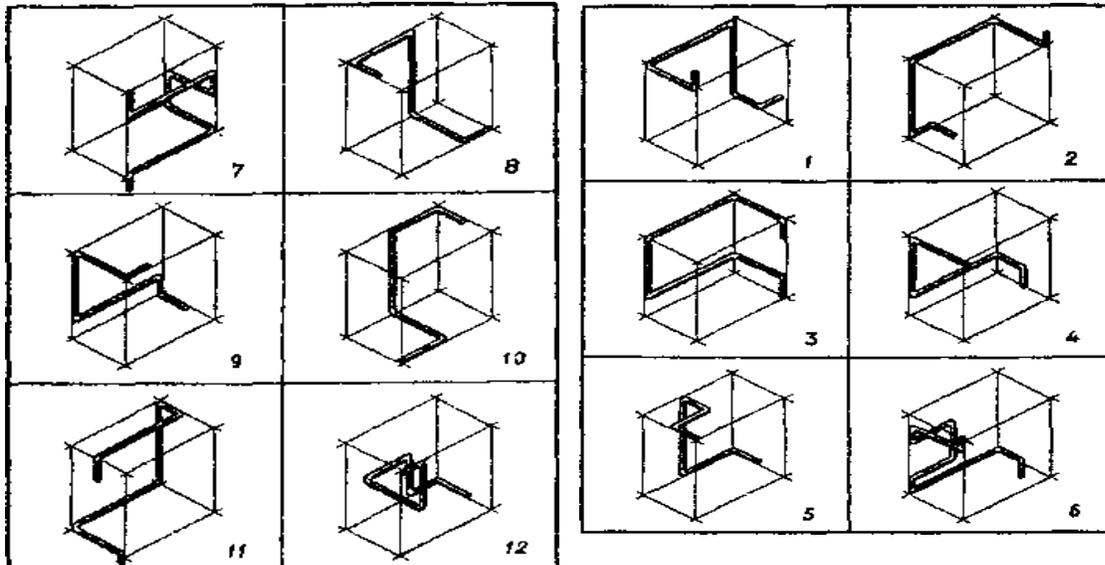

Solution A T-Barrier must be attached to the sorting chamber. Its geometric shape depends on the section of the finish. If the section is square, then the device is made as in Fig. 9.4, d, and if round, as in Fig. 9.4, d. Table lamp. The drawing schematically shows an electric lamp on a table: A - a vertical tripod with a base on the table; D - reflector; B-intermediate tube measuring reflector with tripod; S - a device that connects the intermediate pipe with a vertical stand; The device that connects the intermediate tube to the electronic reflector cap Requirements for the assignment: 1. Complete the design of the device C and its assembly drawing, which provides lifting and lowering of the intermediate pipe on the vertical tripod (A), as well as a rotational movement around it.

Sketch the details of the device. 1. Develop a connection concept (£) that allows the reflector cap to be rotated vertically when the reflector (D) is connected to the end of the intermediate tube (B). Fill in the wiring diagram of the concept and make sketches of its parts (Fig. 3.33).

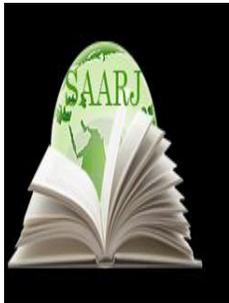

Make three appearances from this sharp image of the wire model.

When developing such tasks, it is recommended to use heuristic learning technologies. In accordance with the principles of this method, students are taught from time to time on the general purpose of the questionnaire and given training appropriate to the form of study. by the method of psychic attack. Through the form and method of teaching, one can observe the creative development of students. Creative thinking develops the student's spatial imagination and thinking. In addition, each of your students are given individual assignments that give them a sense of individuality. The individuality of this task allows the student to master self-development, the implementation of a personal idea, the implementation of various hypotheses, design work. As a result, the number of young people with intellectual potential will increase.

CHOOSING AUTHENTIC MATERIALS FOR THE ENGLISH CLASSROOM

Mirkasimova Madina Bakhadirovna*

*Tashkent State Pedagogical University,
 UZBEKISTAN

ABSTRACT

Authentic materials provide your students with, well, authentic language. By dealing with authentic texts, our learners are grappling with real language in a real-life context. The great thing about using authentic material is that it is everywhere, which makes it easy to find, and simple for learners to practice English in their own time. Remember that it isn't limited to articles from newspapers and magazines.

KEYWORDS: *Authentic Material, Real World, Methods, Technique.*

INTROUCTION

There are lots of resources available to English language teachers today: from textbooks to online teaching tools, they can all aid and enrich English lessons. Many teachers also introduce authentic English material into their lessons to expose learners to the language as it is spoken in the real world.

Using authentic materials is one of the mainstays of an imaginative and motivating higher level course, but rarely features at levels lower than intermediate.

There are several reasons for this, primarily a kind of fear that students will panic when faced with language that is largely unfamiliar, and a feeling that to prevent this the language should be edited to the students' level. This is an unnecessary fear, as using authentic materials can be rewarding and stimulating for both teacher and students.

When people first think of authentic materials they usually assume that we are talking about newspaper and magazine articles. However, the term can also encompass such things as songs, web pages, radio & TV broadcasts, films, leaflets, flyers, posters, indeed anything written in the target language and used unedited in the classroom.

The materials used, will of course, depend on the 'usual' factors:

- Topic
- target language area
- skills
- students' needs and interests

It's no good trying to get your students fascinated by a text on the latest art movie if they are all fans of action films. You might as well save your time and energy and just use the text book!

Authentic material is any material written in English that was not created for intentional use in the English language classroom. Using this content to teach the English language can make the learning process even more engaging, imaginative and motivating for students. It can also be useful to elicit genuine responses from learners.

The great thing about using authentic material is that it is everywhere, which makes it easy to find, and simple for learners to practice English in their own time. Remember that it isn't limited to articles from newspapers and magazines. Songs, TV programmes and films, radio and podcasts, leaflets, menus – anything written in English constitutes authentic material.

Selecting authentic material

The best content to select depends on the learners, their level of English and the course content the teacher wishes to focus on. It's also a good idea to find out the learners' interests – after all, there's no point trying to get students fascinated by a text on the latest sci-fi movie if they're all fans of action films.

The materials should reflect a situation that learners may face in an English-speaking environment – this will help them transition into a world where English is the norm. In this world, people use abbreviations, body language is important and they'll use “filler” sounds – such as “ummm” – when they are speaking English – and learners will encounter these in authentic material.

It's important not to overwhelm learners with the first piece of authentic material. So to begin with, choose articles, songs or sections of TV programmes or movies which aren't too difficult to understand or take too long to get through.

Some ways to use authentic material

Here are two ideas for using authentic material in class: do remember to develop the ideas into proper lesson plans and explain the aims thoroughly to your learners...

1. Restaurant menus: order your favourite dish

Food is important to everyone, so introduce language learners to some of the common dishes in English-speaking countries so that they will be able to order meals with confidence. Many restaurants have their menus online, so you can easily download them (no need to walk or drive around the neighborhood!). Try to use local restaurants, which will make it more meaningful for your students, and make sure you have plenty of copies of the menu.

You can then either go through the menu and ask students to guess what the meals are, or they can write down what they would order. You could use different menus for each course, which would widen the types of dishes you can cover during the learning activity. You or another team

member could pretend to be the waiter or waitress and your students can practice their spoken English by reading their order back to you.

At the end of the task, you could encourage learners to add up the cost of their courses to calculate their bill – and even ask them to add on a 10% tip to mirror the experience of being in a real restaurant.

Remember, that these suggestions focus on different skills, so you could use them to form lesson plans for a “speaking” lesson, a “reading” lesson, etc.

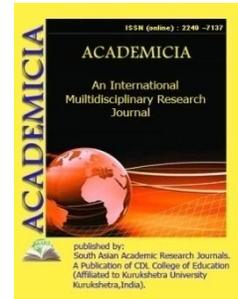

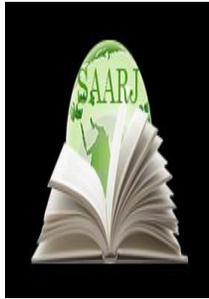

2. Songs: recognizing English lyric

Listening to songs with English lyrics is a great way of boosting skills in listening and pronunciation, and confidence in using the language. And students will always respond positively to a lesson that involves their favourite singer or bands.

Ask your learners to write down their favourite artist and a song by them that they like and have listened to a few times. They can then try to remember the lyrics, or look at the video on YouTube – they only need to write down a few lines of the song.

MORAL CONSCIOUSNESS, MORAL PRACTICE, MORAL RELATIONS AS ELEMENTS OF MORALITY

Sunatov Dilshod Hoshimovich*

*Independent Researcher of NUU,
UZBEKISTAN

ABSTRACT

In this article, it is thoroughly analyzed that the elements of morals consisted of morals consciousness, practice and relations which are considered as important components of morals. Everything we experience and feel will leave a trace in our hearts and will never be forgotten. It is not possible to have a certain mood, activity without emotion, creativity and heroic deeds. The moral behavior of people plays a big role in the formation of moral values and creating the moral climate of society. The characteristics of behavior, the element of its unity, it is an act. Morality, as a self-moving system, is the most important and broadest area of spiritual life and has a functional nature. Its complexity and role can be determined by the complex dialectic interaction in all its functions.

KEYWORDS: *Morals, Moral Consciousness, Intellect, Measure, Reality, Moral Sense, Moral Feelings, Moral Qualities, Moral Practice And Moral Relations.*

INTRODUCTION

Moral is changing complex social phenomenon. In order to understand the essence and nature of morals, it is necessary to know the structure, formation, and regularity of its formation. The moral expression of the objective interconnection between morality and society is that it demonstrates the need to harmonize common and individual interests. It is also one of the key forms of conflict resolution between the human and society. According to Abdulla Avloni, "...morality is a science that calls people for good and prohibits the from evil." [2,p-22] Morals cannot be incorporated into both social rules and subjective guidelines, such as law, because morality is one of the means by which individuality becomes social. Therefore, morality cannot be viewed as merely a moral consciousness. It has logically perfect unity, consisting of moral consciousness, moral practice and moral relations. These elements cannot be separated from each other. they are interrelated and can only be separated in theory, because there is no pure moral

events in social life. Also, all elements of morality are interrelated, but are relatively independent. In the field of ethics, the most important in its structure is moral consciousness.

Moral consciousness is theories, ideas that form the ethical requirements, norms, rules, perceptions of justice.[1,p-220] All human actions are carried out through consciousness, but only when society is sorted out and interested. This is the social significance of moral consciousness. In moral consciousness, the reality is noted not in the laws, but in the form of social order, requirements, norms of human behavior. Moral consciousness is divided into social and individual consciousness. For this reason, moral consciousness, on the one hand, represents the norms of the demands of society or group, and on the other, it is an individual, individual form of understanding and understanding of these requirements.

According to I.Kant, in the moral consciousness, besides the norms, habits and traditions are closely linked to important experience and intellect, without emotional experience, the mind is empty, and the emotional experience that the mind is not involved in is blind. As V.K.Belinskiy said: "Unconscious ideas are cold, they shine, but don't heat, and lack the charm and warmth."

The mind provides a certain social orientation to the emotions, and the emotions find its mental basis in the mind. Emotions, in a sense, reinforce the foundations of the person, because it takes a long time for the mind to influence the moral process associated with analysis and evolution, and the evaluation, and the emotional and emotional response to it very quickly. Ancient Roman philosopher Seneca once said, "Intelligence is a particle of the divine spirit that penetrates the human body." [4, p-157]

When a person is endangering his life, helping others, rescuing a drowning person, or removing a child from a burning home, he does not think about social problems or think about anything. In these conditions, the person reacts quickly to emotions and feelings. The experience gained in his psyche is actively activated, manifested as a force that motivates one to act. Feelings and emotions play an important role in human life. Everything we experience and feel will leave a trace in our hearts and will never be forgotten. It is not possible to have a certain mood, activity without emotion, creativity and heroic deeds. As Hegel says, no glory in the world has ever happened without passion. That is, without feelings there is no true moral glory.

But emotions, to some extent, imply the importance of behavior, are not always the cause of behavior. Although, it is possible for a person to act properly from the direct impact of a number of events in public life, to put social interest ahead of personal interests, but if he has not analyzed the whole situation, and has no firm aims, convictions or beliefs, his actions would not be an accidental enthusiasm. Therefore, the central element of moral consciousness is the belief that a person has a stable emotional response to the rigid knowledge and ethical behavior that is influenced by certain living conditions and upbringing. Belief is a subjective perception of the norm of behavior, and it is the conviction that the moral principles to which one is exemplary are correct and fair. However, the peculiarities of ethical belief are not limited to this, as it is only a mental understanding of the moral necessity.

It is not only an awareness of the validity of ethical requirements but also a complete readiness to abide by certain moral programs. Therefore, moral beliefs determine the direction of the individual's activities, his motives, the structure of the latent motives of the behavior, and his general point of view, his place in life, and the meaning of life. Moral beliefs represent the

rational and emotional side of it, give stability to the moral “rust” of the individual, meaning that the person will not abandon his principles under any difficult circumstances.

The most important and at the same time essential element of moral consciousness is the moral qualities of the individual. The moral qualities of the person are explained by social, political and economic reasons. The main moral traits in each period are determined by the general direction of dominant ideology. However, ethics differs from ideology with its universal, national characteristics. The moral qualities are positive and negative. Positive qualities include, such as diligence, humility, courtesy, kindness, sincerity, honesty, and good humor. These are our moral values. Negative traits, such as treachery, bribery, hypocrisy, covetousness, envy, ruthlessness, personalism, selfishness and so on.

As with other societal phenomena, the notions of moral virtues change, develop and polish throughout history. For example, religion in all areas of social life was considered to be the dominant qualities of the church-dominated medieval faith – hope, and love – that is, belief in God, hope and love for his compassion. Now that our country is on the path of independence and democracy and living in a market economy, it is necessary to combine the qualities of patriotism and national pride with the qualities of entrepreneurship, mutual interest, cooperation, patience, peace and contentment. Undoubtedly moral perfection, the spiritual elevation of our national traditions and our cultural and educational heritage will not be affected by the resolution of complex economic conditions.

Our ancient ancestors have developed a whole set of moral requirements about a perfect human being, in the modern language, the Oriental Code of Ethics. A person must have a hatred of uncleanness, a desperate rebellion against injustice.

Only such a person will keep his word, will not betray anyone, be faithful, and will not spare himself for the people. In contrast, a liar has no sense of patriotism. Every act of self-interest, no matter how ambitious it may be, no matter how fatigued it, it is a treacherous homeland.

Moral practice. Moral content does not consist of mental or emotional moments, i.e. moral consciousness. Moral consciousness is reflected in the actions and the practical life of people. Therefore, the second element of morality is moral practice. Moral practice is consciousness subordination of behavior, innumerable actions, communication relationships to moral goals, which are manifested in the phenomena of moral consciousness, that is, motives, intentions, worldviews, moral views and so on; social life of a person; attitude to work, community, family, relatives, friends, activities in the field of science, art, culture, as well as the attitude of the person to the events of daily life that he or she witnessed or participating in. In other words, moral practice is the morality in practice. It reflects not only the individual’s attitude to society, but also the relationship of society to the individual as well as the individual’s nature and self.

Morality is a narrower concept than behavior. Behavior is a set of systems of moral behavior, determined by the mind and will of the person. The moral behavior of people plays a big role in the formation of moral values and creating the moral climate of society. The characteristics of behavior, the element of its unity, it is an act. Behavior is an activity which exhibits positive and negative traits of person. In other words, behavior is a person’s consciously directed and completed action or activity.

Actions are more than just direct actions. They can also be expressed in inactivity- silence, passivity, indifference, or in gestures, actions, and tone. Person's behavior reflects his inner, spiritual world, his thoughts, feelings, aspirations, and manners. Both the positive and negative aspects of the moral requirements in society are reflected in the behavior. The last cell, in the form of morality, consciousness and activity, represents the good and the bad, justice and injustice, conscience or dishonesty. Therefore, we can express our opinion based on our behavior and activity. It is well known that a single action can be regarded as evil. Of course, in this case, both ratings are not correct. In order for moral evaluation to be not subjective, it is necessary to rely solely on objective criteria, the universal character of moral relations, in a particular society.

The moral reason, which represents the subjective attitude of a person to his actions, plays an important role in the moral evaluation of a particular activity. Reasons of behavior may be positive and negative. We condemn any behavior that has egoistic causes, even though it has produced positive results. When an action is done with high moral values and any selfish motives other than "what do I benefit from it?", the action will be not only moral but also beautiful. To illustrate, a man poured water on flowers growing on a balcony, this act is neither moral nor immoral. If the person watered the flowers of a sick, flower-stricken neighbor, it is quite another act. Actions are evaluated morally when it comes to the interests of another person, society, or group. The actions of people are evaluated and valued as good or bad because they are not part of themselves but part of social life. While it seems to be doing right from the surface, it is not moral to act for one's own fame, reputation, or favor. The level of morality of behavior is of moral value with consciousness, sincerity, impartially, voluntariness, free choice.

It is also important for a person to have a sense of self-awareness and of the moral requirements of the existing social environment. However, it is not possible for people to be morally justified by their knowledge and imagination about behavior. It is not enough to memorize the code of ethics, but to be convinced of the validity and necessity of the rules of conduct, so that they must find a practical reflection in the activities and behavior of people. Indeed, "Man, by doing good moral deeds," Hegel correctly stated, "can still be a virtue only when the means of active conduct become a permanent mark of his character". The true basis of ethical behavior is the combination of knowledge and spirituality of a person with knowledge. Thus, any behavior and activity is unethical.

The thorns and gourds will not grow flowers, And ravens will not be spoiled by education, said Ogahi.[5, p-151] Ethical practice refers to behavior and actions in which a person's attitudes toward others is expressed. In this case, a person may have a combination of social and personal interests, a conscious attitude to society, a moral choice in behavior, and finally, a certain degree of the basis of moral conduct. Shortly, ethical practice is the highest expression of consciousness, sociality and citizenship. Without these requirements, there would be no moral practice at all.

Moral relations. The third element of morality is moral relations. Moral relations are a component of social relations. As with type of social relations, moral relations are limited by ethics and exist in the form of contacts and connections between individuals and society. Accordingly, moral relations are divided into specific forms of assistance, such as a stable relations with people in the family, community, group and society. However, moral relations are not just about relations, connections, but also the interactions of people with other people's obligations to society.

Moral relations usually begin with a spontaneous, material relations. Then it progresses, separates itself from material relations and enters the realm of ideological, spiritual relations. Moral relations are born out of the will of the people, and, of course, through the process of establishing moral norms and public support, of course, through the minds of people.

Moral relations, in content, are either management or security functions. Managed moral relations arise in accordance with the norms of a particular society, which are related to the duty of obligation. Guarding moral relations arise as a result of actions that violate these norms and provide for social action. Therefore, the subject of moral relations is always individuals, whether they are individuals, groups, families, communities, countries and etc. Not only human and social phenomena, but also nature and its elements can be objects of moral relations.

Moral relations are different from other types of social relations and are always and everywhere exposed by moral norms and prices. They arise from the influence of ethics on behavior, moral activity, action and social well-being. The distinctive characteristics of moral relations, along with the evaluative nature, is their imperative and directive nature. In moral relations, the activities and actions of people play a key role as a moral and practical expression of their relations. At the same time, moral relations are as independent as any other social relations.

Thus, moral relations as an element of morality are, firstly, closely related to the other types of social relations, and secondly, to other elements of morality that make up a complex whole. As elements of morality, moral consciousness, moral practice, and moral relations are intertwined.

For example, moral activity and moral relations are the subject of moral consciousness as specific aspects of social life. Moral activity is caused by a person's moral understanding of the meaning and purpose of his or her practice. When it is difficult to separate moral relations from other ways of regulating human activities, moral awareness comes to the aid. Moral relations, in turn, are a social mechanism for maintaining and enforcing norms, and are always in the process of forming, developing, maintaining and relating norms for future generations. Impressiveness of moral norms is the expression of moral relations, the criterion of vitality. If moral norms were to exist beyond the results- moral relations would have lost its social significance. Thus, all aspects of morality are mutually exclusive and define one another.

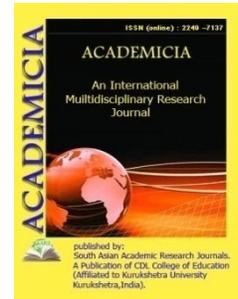

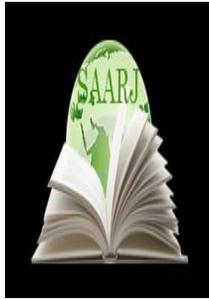

But the fact that all aspects of morality are solid does not exclude their differences and contradictions. For example, moral attitudes are a form of practice that reinforces the standards of behavior tested by moral consciousness and is manifested as an existing phenomenon. Moral consciousness, however, represents not only the existing moral phenomena but also the vents that are necessary. That is why they are compatible, they are contradictory. Conflicts can be acute, especially during the transition from one social system to another. After analyzing the components of morality, the following can be described. Morality is a historically emerging social phenomenon that combines, co-identifies, and defines human behavior, a complex unit of moral consciousness, moral practice and moral relations. Erkin Yusupov, a philosopher, said: "In general, the forms and norms of self-government of people who exist as individuals in the basis of moral social relations, and the spiritually inherent in their interactions and relationships, is the manifestations of the level of perfection." [3,p38]

Morality, as a self-moving system, is the most important and broadest area of spiritual life and has a functional nature. Its complexity and role can be determined by the complex dialectic interaction in all its functions. It is generally thought that the general functions of morality are:

regulation (management), encouragement, evaluation, knowledge, education. in practice, they are complementary and intertwined, and one through the other. In complementing each other, they represent the adaptation of personal and social interests of morality and, on this basis, of this discipline that is a prerequisite for the existence and development of society.

ABSTRACT

45 patient with leukoplakia of the bladder were examined. The patients were divided into three pears depending on the biopsy data and the next treatment method. Each group received the appropriate treatment: I pear received conservative treatment; Group I underwent transurethral resection of altered areas of the urinary bladder mucosa; the group underwent transurethral coagulation of altered areas of the bladder mucosa. It was found that patients with the first stage

of leukoplakia are shown conservative therapy, in the second and third stages of the process (transurethral resection, transurethral surgical treatment of electrocoagulation).

KEYWORDS: *Bladder, Leukoplakia, Metaplasia, Polymerase Chain Reaction, Hormone, Estrogen, Blood Plasma, Contraceptione, Viral Infection.*

INTRODUCTION

Treatment of leukoplakia of the bladder with various stages of the process presents significant difficulties. According to domestic and foreign literature, conservative and surgical methods are used in the treatment of bladder leukoplakia. When choosing a method of treatment, one should take into account the age of patients, the severity of clinical manifestations, and the stage of the disease.

According to domestic and foreign literature, the treatment of bladder leukoplakia should be etiopathogenetic [40]. In addition, it is necessary to carry out symptomatic therapy of this disease [40]. The etiopathogenetic methods of treatment include antiviral, immunomodulatory and hormone replacement therapy.

Surgical methods for treating bladder leukoplakia include transurethral resection (TUR) of altered areas of the bladder mucosa or laser excision of altered areas of the bladder mucosa with previous biopsy [24, 74, 135].

A certain place in the treatment of bladder leukoplakia is occupied by transurethral vaporization of the altered bladder mucosa [24, 135].

Purpose of the study: to identify the optimal treatment methods for bladder leukoplakia at various stages.

Research material and methods: Patients were selected from the number of patients hospitalized in the urology department of the clinic of the Andijan State Medical Institute named after Yu.Otabekov in the period from 2016 to 2019. A total of 45 women with bladder leukoplakia were examined. The patients were divided into three groups depending on the biopsy data and the subsequent treatment method. Each group received appropriate treatment: Group I received conservative treatment; Group III - transurethral coagulation of altered areas of the bladder mucosa was performed.

Research results: According to the morphological study of the biopsy material, the stages of leukoplakia were established. The first stage of bladder leukoplakia was characterized by metaplastic changes in the transitional epithelium; determined only by histological examination. In this case, against the background of a typical transitional epithelium, nests and fields of stratified squamous epithelium are visible. The number of cell layers increases 1.5-2 times; the upper layers acquire the polygonal shape of cells with a bubble-like nucleus with multiple nucleoli, characteristic of squamous epithelium. In the cytoplasm of these cells, a histochemical study determines a large amount of glycogen and prokeratin.

The second and third stages of leukoplakia of the urinary bladder were characterized by changes in the epithelium, determined visually by pricystoscopy in the form of whitish spots on the mucous membrane of the bladder. In the histological picture of fragments of the mucous membrane of the urinary bladder taken from these areas, the metaplastic stratified squamous

epithelium with its characteristic vertical differentiation prevails. The lower layers are composed of smaller hyperchromic polygonal cells: As they approach the surface of the layer, the cells increase in size, brighten due to the increase in glycogen and keratin in them. A certain amount of keratohyalin accumulates on the surface of the layer. Thus, in this case, we can talk about metaplastic squamous keratinizing epithelium, which, in its histological and immunological properties, is indistinguishable from the originally formed squamous epithelium.

The first group consisted of 20 women with the first stage of bladder leukoplakia, who received conservative therapy (antibiotic therapy, instillation of the bladder with antiseptic solutions, etc.).

The second group consisted of 10 patients with identified second and third stages of the process, which are true leukoplakia, who underwent transurethral resection of altered areas of the bladder mucosa.

The third group consisted of 15 patients with identified second and third stages, who underwent transurethral coagulation of altered areas of the bladder mucosa.

Among the observed contingent of patients with bladder leukoplakia, 3 (15%) patients of group I, 5 (50%) patients of group II and 5 (33%) women of group III showed signs of an active inflammatory process of the lower urinary tract (leukocyturia, bacteriuria). The most common causative agent of the infectious process of the lower urinary tract was gram-negative flora (*Escherichiacoli*), which was detected in 2 (10%) patients in group I, in 1 (10%) women in group II and in 3 (20%) patients in group III. *Staphylococussaprophyticus* was diagnosed in 6 (13%) women. Treatment of this category of patients began with antibacterial therapy, taking into account the inoculated microflora and the selection of an appropriate antibacterial drug. To eliminate gram-negative flora (*Escherichiacoli*), antibacterial therapy with fluoroquinolones (ciprofloxacin 500 mg 2 times a day for 10 days) was performed. In the presence of gram-positive flora, we used a combination of drugs: aminoglycosides and fluoroquinolones (amikacin 1.0 g intramuscularly once a day for 7 days and ofloxin 200 2 times a day for 10 days). In 14 days after taking the drug to confirm the elimination of the pathogen, a repeated bacteriological examination of urine was performed. According to the study, pathogenic flora was detected in 4 (9%) patients, which required additional antibacterial therapy with levofloxacin at a dosage of 500 mg once a day for 10 days. A control bacteriological study of urine after 12 days in patients with leukoplakia of the urinary bladder did not reveal any pathogenic flora.

All women with bladder leukoplakia who were diagnosed with a viral infection received antiviral therapy.

If a hormonal imbalance was detected, in the form of hypoestrogenism, local hormone replacement therapy was carried out in agreement with a gynecologist-endocrinologist according to the following scheme: the drug "Ovestin" in a dosage of 500 mg in the form of suppositories, once a day, 30 days, then the drug "Ovestin" at a dosage of 250 mg, a candle 1 time, a day for 20 days. Also, the patients underwent immunostimulating therapy with the drug "polyoxidonium" intravenously, drip in a dosage of 0.6 mg, once a day, for 7 days.

Surgical methods for the treatment of leukoplakia of the mucous membrane of the bladder include TUR and TUK of the altered areas of the mucous membrane of the bladder. Patients of group II underwent transurethral resection of altered areas of the bladder mucosa. Women of group III underwent transurethral coagulation of altered areas of the bladder mucosa.

After the treatment, 3 (15%) patients of the first group, 2 (20%) women of the second group, and 2 (13%) patients of the third group retained pain syndrome in the form of pulling pains above the bosom, periodically radiating to the perineum, which required additional conservative therapy. The choice, appointment and control over the action of pharmacological drugs and the corresponding procedures in the complex treatment of pain syndrome were made by neuropathologists and psychotherapists, taking into account the mental state of the patients.

The patients were followed up for 6 months. At the end of the observation period, almost all patients with bladder leukoplakia noted the disappearance of the pain syndrome.

After the treatment in patients of all three groups, complaints of pain, frequent and difficult urination disappeared, which is statistically significant. Thus, the statistical analysis showed that the best treatment results were achieved in patients of the third group, in comparison with the second group. When analyzing the pain syndrome before and after treatment in patients of groups II and III, it was revealed that also the best results, treatment were achieved in patients of the third group, who underwent TUR coagulation (according to the McNimar method at $p < 0.05$).

After 6 months, all patients underwent a comprehensive study of urodynamics.

All women noted an improvement in well-being, a decrease in the symptoms of the lower urinary tract, which is confirmed by the data of a urodynamic study, which revealed an increase in the functional capacity of the bladder, an increase in the maximum volumetric urinary flow rate.

There was also an increase in volume causing the first urge to urinate. These indicators were close to the norm by their values in the patients of the group, who received TCA.

Thus, the use of conservative therapy in patients of group I and surgical treatment in patients of groups II and III, we managed to achieve regression of the disease.

CONCLUSION:

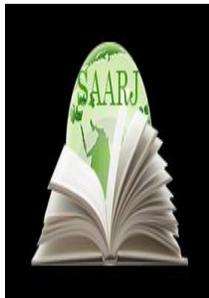

1. Patients with the first stage of the process are shown to carry out conservative therapy, in the second and third stages of the process, surgical treatment (transurethral resection, transurethral electrocoagulation).
2. The optimal method of surgical treatment of the leukoplaki urinary bladder is transurethral electrocoagulation, in view of the faster recovery of the transitional epithelium and the reduction in the recovery time of urination.

CONTENT OF TRAVEL STORIES

Nematova Hulkar Abdulbakievna*

*The Teacher of Uzbek Language and Literature,
City of Jizzakh, of "Umid" SPBS,
UZBEKISTAN

ABSTRACT

This article discusses the definition of the word "Safarnoma", its perfection as a genre, the peculiarities of the genre between the similarities and differences between works from the travel cycle, as well as the widespread use of the travel motif in a fairy tale. A comparative analysis of a number of works, revealing the impressions of travel of famous tourists or the content of travel, is carried out.

KEYWORDS: *Travel, Travel Story, Adventure, Travel, Road Sketches, Story, Uzbek Literature, World Literature, Educational Novel, Thinkers, Sea Route.*

INTRODUCTION

Today Uzbekistan is one of the most influential countries in the world community. Adhering to his national, spiritual values and traditions, he wins the attention and respect of the developed countries of the world. Out of respect for their great ancestors, they value the rich cultural and spiritual heritage that they left behind and pass it on to future generations. The rich spiritual heritage left by our great compatriots who deserve high respect and attention in the field of science and education has not lost its value for centuries. The sacred duty of each of us is to preserve the world heritage, precious to humanity. It is safe to say that today's youth are worthy heirs of our great ancestors, whose names are engraved in golden letters on the glorious pages of our past. One of the main tasks of our youth is to study the heritage of our ancestors.

ANALYSIS OF RELEVANT LITERATURE

Everyone has different answers to their questions. This is a sign of different people thinking. There are people among us who are trying to expand their horizons, traveling to learn more about the Universe and the mysteries of the world in general. A guide is a fiction, scientific and journalistic work of Uzbek classical literature, which can be written in various forms and genres.

The terms travel and journey are widely used in Turkish and Persian-Tajik literature. The dictionaries use the word "travel" means a journey to relax, unwind and see the world [2.420].

In Uzbek literature, the genre of noma is a letter that is written as works predominantly rhymed in the Masnavi style. The word "noma" in the word "Travel" that we are trying to explain is used in a broad sense..... to designate an event, fiction, historical, political book or brochure that describes in detail a person's life. In this case, the word "noma" in works often means "work about" from the meaning of the word used before it. [3.170] For example, "Travel" means a piece about travel.

The motive of travel is an important factor in the genre of folklore, which is used as "mature" in Mahmud Kashgari's "Devoni lug'ati turk" and is divided into several types and groups that have formed and improved to this day. The only fairy tale "Mukbil Toshotar" tells about the adventures of a young shepherd Mukbil Toshotar, who during a hunt fell in love with the beautiful daughter of the Bukhara Emir Mehrinigor. To win his love, he fulfills the king's conditions and embarks on a journey to achieve his goal. "With the blessing of the inhabitants of Mukbil Mountain, he went alone in search of the tiger. On the way, he reached a tugai forest, on the way climbed a mountain, where he met another tiger" [6.21]. A young shepherd fulfills all conditions, using both physical and mental abilities. In addition, the content of the tale shows that the role of life trials in the journey is invaluable in finding your own happiness and in reaching the level of an ordinary shepherd.

In my opinion, there are two different outcomes of traveling with one purpose or another, one negative and the other positive: ".....stimulated economic change. However, it should be noted that the gradual colonization of newly discovered lands also led to a number of negative elements such as slavery and the slave trade" [5.126].

Here it is appropriate to thank the famous Arab traveler Ibn Battuta, who overcame the unique dangers of travel and left an invaluable spiritual legacy for future generations. During his travels, Ibn Battuta gave information about more than two thousand people he knew personally, visited their graves and met with about sixty rulers and ministers. During twenty-eight years of his reign, Ibn Battuta covered a total of 120 km and "rightfully became the greatest traveler of his time in terms of the scale of his journey" [4.21].

"Prose travel stories abound in modern Uzbek literature. They are usually based on trips of writers to near and far abroad, sometimes to the most demanding regions of our country, to new construction sites, areas with environmental problems. Therefore, the style of such travel stories is distinguished by essays and journalism" [3.214]. The book by Sarvar Kadyrov "Targeted Trips" is a guide in which the author has visited foreign countries and got acquainted with their history, everyday life, in particular, with the higher education system. He carefully examines aspects that are new to the system and intends to apply their advantages in his work. Moreover, he intends to share his impressions of the trip with colleagues by publishing his impressions in the press [9.3].

We cannot always go on trips. And for some, as the child gets older, he or she outgrows it. But we are always interested in getting to know people from other countries, their way of life, nature, science and culture. It's fun to read memoirs written by scientists who share their impressions of the trip, but it also shines in our imaginary world: "The Mecca Writers' Club has two hundred members. They meet every Tuesday. The government rewards each new book with a minimum

of money. There are clubs similar to the Mecca Writers' Club in Jeddah, Riyadh, Al-Qasin, Gizan, Medina and other cities” [8.107].

RESEARCH METHODOLOGY

The contemporary poet Alisher Navoi and Zakhiriddin Muhammad Babur were not only a great talent, but also the ruler of the lands inherited from his father. Fate and life trials forced him to go to distant countries. His work "Boburnoma" not only serves as a program for a number of contemporary travels, but also as a spiritual support for our writers. We all know that many of these works are visible around the world under the influence of this work. This, of course, does not mean that the work was written in imitation. Perhaps we want to acknowledge that every piece of information in it is clear evidence, and that when the time comes, they will cite those facts instead of important information.

And the sacred duty of each of us is to preserve the world heritage, precious to humanity. To this end, through the efforts of the scientific expedition "In the footsteps of Bobur", unique works of such talented people as Mavlono Lutfi, Mir Alisher Navoi, Boborahim Mashrab, Abu Nasr Farobi, Jalaliddin Rumi, Shams Tabrizi, Ali Kushchi were brought to the exhibition. In our country, their graves have been identified and repaired.

As a member of the scientific expedition "In the footsteps of Bobur", Kamchibek Kenja made extensive use of relevant excerpts from the masterpiece of the great Babur Mirzo "Boburnoma", enriching the content of his travels. Each of these passages is evidence of the author's narrative and provides a basis for his words to be valid and persuasive. The writer, in particular, directly refers to "Boburnoma" when describing the names of places and events associated with them: "Seeing the signs of Karnal, Somon, Nematillo said: "Look, the names mentioned by Bobur. They are still there". In Boburnoma Somon is mentioned, but she is given as "Carnal", "Carol", and in the Kazan edition it is mentioned that it is written "Carmol". Babur Mirza called the province of Somon "Muhammad Kukaldosh". This means that these areas were sacred places touched by Babur Mirza, Humayun and other Babur". [10.115]

Unlike the stories about the travels of Kamchibek Kenji, although "Boburnoma" by Hayriddin Sultan contains impressions of the trip, it does not contain any content. The work contains a lot of historical and scientific information, as well as a number of instructive and spiritual events. Directly from "Boburnoma" by Zakhiriddin Muhammad Babur, the description of a number of events and images is presented in a comparative and consistent form in order to make the information understandable and memorable for the reader. The author explains this as follows: "The book was born as a valuable force in the educational analysis of the life of Babur Mirza and his glorious descendants. The book was named "Boburnoma" because of the deep content of the immortal "Boburnoma", it's pure, simple, courageous beauty. Of course, in meaning and content, this is a classic work of our great ancestor, which is impossible to achieve in this respect. We hope that our forgotten works will remind us of "Boburnoma", even if it is a form [1.7].

ANALYSIS AND RESULTS

Travel notes originated as a separate literary genre in antiquity. He has come a long way of development and improvement. Travel forms come in many different forms. They appear in both poetic and prosaic form. The further development of this genre is directly related to the independence of Uzbekistan. These travel stories can be seen as a worthy contribution to the

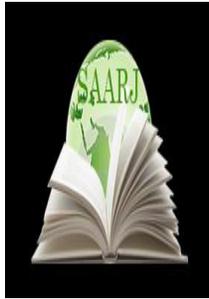

genre's renewal process. Special attention in this respect deserves "Boburiynoma" by Hayriddin Sultan. Kamchibek Kenja has created a number of works in this genre, which clearly demonstrates his significant contribution to the development of the genre.

CONCLUSION

"A long way tests a horse, a difficult way tests a man" or "Torment of the road, torment of the grave" [7.468], say our wise people. Since time immemorial, travel has not always been safe for all tourists. Just as travel is travel in itself, travel abroad is a challenge in itself. In such cases, patience, will and perseverance are tested. However, it should be borne in mind that at a certain stage of development, the role of tourists who have traveled and learned about the conditions of other countries and the best examples of life progress is invaluable. It not only serves the interests of one person or one country, but also serves as a bridge connecting human relationships. Travel notes are not just journals written while traveling. Anyone who goes on a journey cannot write travel stories that serve the excellence of humanity. At the first glance, this genre is based on high skill and immense work. Each of them, regardless of whether it is called a travel story, has something in common, such as kindness, consequence, and humanity.

THE USING OF AUTHENTIC MATERIALS IN TEACHING OF READING

Akramov Shukhrat Rakhmatovich*

*Tashkent State Pedagogical University,
UZBEKISTAN

ABSTRACT

Reading is an essential skill, and the course book certainly offers plenty of dialogues and texts to read – but the problem is they are written specifically for ESL learners. The conversations often sound stilted and contrived. The reading passages are simply not “real” enough. When you think of authentic reading materials, you probably automatically think of books, newspapers and magazines, which are fine and dandy for advanced learners, but too difficult for beginners to tackle. The good news is there are plenty of authentic texts ESL students can read – at any level.

KEYWORDS: *Reading Skill, Reading Strategy.*

INTRODUCTION

Reading means different things to different people, for some it is recognizing written words, while for others it is an opportunity to teach pronunciation and practice speaking. However, reading always has a purpose. It is something that we do every day, it is an integral part of our daily lives, taken very much for granted and generally assumed to be something that everyone can do. The reason for reading depends very much on the purpose for reading. The use of authentic materials in the classroom is discussed, with the student benefiting from the exposure to real language being used in a real context. Other aspects which prove positive when using authentic materials are that they are highly motivating, giving a sense of achievement when understood and encourage further reading. They also reflect the changes in the use of language, there is a wide variety of text types, they are also very versatile (they can be used in different ways to promote different skills) and can be used more than once as well as be updated. [1]

The combination of these qualities makes for a more real-world reading experience: beyond the classroom learners encounter such an enormous variety of reading and listening material. All very well for upper intermediate and advanced level learners, but what of lower levels, for whom such a range of language at native-speaker-like level can be challenging and demotivating? It's

too simplistic to suggest that all learners at lower levels have similar needs, but there are obvious candidates for useful types of text - most students will at some point need to understand a menu in English, or read a brochure of some description - and course books provide these. But no learner is the same: each will have different passions and interests, and their learning needs will differ wildly. So, there is a strong case for opening up the world of text beyond that of course books - and in doing so, focus on teaching the student, not the lesson. This is where authentic texts come in useful even at lower levels, but to avoid the risk of overwhelming the student, such texts need to be short: short articles or short films, short stories or poems, or a section of a podcast, for example, and this involves extra preparation for the teacher.

Anything can be used as authentic material but for developing reading one of the most useful resources is the Internet, with large amounts of varied material being easily accessible. One of the main reasons for using authentic materials in the classroom is once outside the “safe”, controlled language learning environment, the learner will not encounter the artificial language of the classroom but the real world and language how it is really used. The role of the teacher is not to delude the language learner but to prepare him, giving the awareness and necessary skills so as to understand how the language is actually used.

1. Classified Ads

Folks who place classified ads have to pay per line, which makes abbreviations absolutely necessary. But some are quite cryptic. With the use of classified ads you can give students a reading task that is challenging but not too difficult. [2]

Suggested Reading Activity: First, go over a list of abbreviations; don't tell them what each one means – have them guess. Include several like: *a/c, furn., bdrm., kit., bath., lg., sm., etc...* Then, give each student a real ad that they must decipher: *1 BR apt. in downtown Manhattan, near subway, lg. kit, central a/c, 2000/mo.* They must answer questions about the property in question: *How many bedrooms/bathrooms does it have? What are its main features?*

2. Takeout Menus

Restaurant takeout menus offer a wealth of authentic food-related vocabulary, and not just the food items themselves, but the ways in which they are prepared (sautéed, fried, baked, etc.)

Suggested Reading Activity: After making sure that any new food-related vocabulary has been properly introduced, divide the class into pairs or small groups. Tell them that they are going to order some takeout, but first they have to decide what they are going to eat. Hand out role cards to make it more challenging:

- You are a vegetarian, but you don't like onions.
- You're allergic to shellfish.

Before reading:

Show learners the title of the text, a subtitle where there is one, and any accompanying photographs or illustrations. Ask them what they think the text is about, and to make a mind map of what they already know about the topic. Next, ask the class to work in pairs or small groups to write three questions they would like answered in the text. After reading, students can then discuss whether they found the answers to their questions in the text, and if so, where.

As an alternative pre-reading activity, show learners the first and last one or two sentences of the text. Ask them what they think the text is about, and to brainstorm ideas about what they might find in-between. After reading, students can then discuss similarities and differences between their predictions and the actual text.

While reading

The way in which to approach the actual reading of a text depends very much on the individuals in the group. Options are to have students read individually or to have students read aloud in pairs or small groups. Having students read individually is more akin to real-world reading contexts and usually my preferred option.

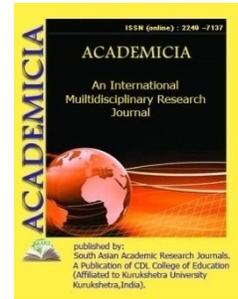

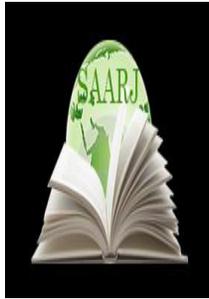

Post-reading

Questions and activities here divided into three sections: content, organisation & style, and language focus. Provided a comprehensive list of questions, but it's important not to explore a text 'to death' - be selective and choose the questions and activities that you think will generate most discussion and be most useful for your class, and that are appropriate for the text you have chosen. Discussion questions can be presented on the whiteboard, by reading them aloud and allowing time for students to discuss, or written on individual cards or post-it notes around the room or that you can rotate from group to group. Alternatively, you can give each group two or three different questions from the same section and regroup the class to share their original questions and responses.

As can be seen, using authentic materials is a relatively easy and convenient way of improving not only your students' general skills, but also their confidence in a real situation. This is only a brief introduction to the ideas involved, but some of these ideas could easily be expanded to form part of a motivating and effective course.

POETICAL INTERPRETATION OF THE IMAGE "COUNTRY" IN THE WORK OF ABDULLA ORIPOV

Mahliyo Mirsoatova*; Shahlo Hojjeva**

*Candidate of Philological Sciences,
National University of UZBEKISTAN

ABSTRACT

In this article is described about the analysis and interpretation of the poetry of the hero of Uzbekistan, People's Poet of Uzbekistan Abdulla Aripov. It was analyzed that the poet reached the peak of poetry in Uzbek literature, his poems on the theme of the homeland were sung on high curtains, with high pathos.

KEYWORDS: *Poetic Content, Poetic Image, Authoritarian System, Ode, Skill, Literary Tradition.*

INTRODUCTION

It is well known that at the beginning of the last century, representatives of Jadid literature followed the path of renewal of classical literary traditions. They sought innovation in both poetic content and form, and in poetic images as well. Cholpon, Fitrat, Behbudi and other representatives of modern literature fought for the fate of the homeland and the nation, its well-being. It is well known that their fate was difficult. At this point, it would be more correct to interpret the following lines of Cholpon in connection with the love for the freedom of the Motherland and the nation:

*The spark of love in the heart
I hid in a corner of my mind.
I'm tired of the power of this spark in my soul
I have a severe wound that cannot be healed*

The spark of love in the poet's heart is undoubtedly associated with the dream of independence. It is also clear that under the dictatorial regime, he had no choice but to hide it in a corner of his mind. This spark is so strong that it burns the heart of the patriotic poet incessantly. It seems no secret that the incurable, heavy wound in his heart is the result of his dream of independence, his transformation into a dream. The poet Abdulla Aripov is a sensitive artist who continues the dreams of his predecessors and is able to illuminate the image of the homeland in poetry.

Artistic image is the basis of literature. Where there is no figurative thinking, there is no literature. The works of true artists are distinguished by the bubble, the brightness of the image. Abdulla Aripov's poetry is a vivid example of this. The reason why the images created by the great poet always live in the minds of lovers of poetry is that the works of this poet are close to the heart of the reader, and it can be clearly seen in the eyes of the reader.

The secret of the poet's image is revealed in the fact that "the artistic image is a reflection of the being (object, event, etc.) seen through the eyes of the artist and expressed in a way that can be creatively processed and emotionally understood on an ideal basis."¹ It is impossible to find a poet or writer who did not write about his homeland. However, Abdulla Aripov is distinguished by his ability to write like no other, his ability to place a deep essence in the image, the ability to embody a mysterious spirit. The emergence of the poem "Why I love Uzbekistan" at a time when the feeling of abstraction, the land of the tyrants who invaded our country was interpreted as the homeland, and sometimes the concept of vast cotton fields is understood, struck a chord in the hearts of poetry fans. According to Professor Nurboy Jabborov: "... in 1964, when the poem was created, vulgar, ineffective words about the homeland and the people were presented as examples of poetry, and almost all of them had the same spirit of vitality.

In Uzbek poetry, lightning flashes and thunder blooms. Because of this lightning, the false feeling that the whole country is the union, the nation is the Soviet Union, was ignited. This thunder rang out from the hidden experiences of the Homeland. "Why do I love Uzbekistan?" - no one before him had been able to put such a question on the agenda in this way. Every honest person will admit how brave it was for that time."² The poem begins with a rhetorical question. Although it seemed to be the poet's own question, it was in fact an appeal to a nation alienated from itself, thrown into a whirlpool of abstract emotions:

Men nechun sevaman O'zbekistonni

Tuproq'in ko'zimga aylab to'tiyo.

Nechun Vatan deya yeru osmonni,

Muqaddas atayman, atayman tanho

Why I love Uzbekistan?

Why is it Dear to turn the soil into my eyes?

Why is the earth and heaven called dearest to me?

I call it holy, I call it lonely.

The soil is a symbol of the Motherland. That's why he was blindfolded. Abdulla Aripov is a poet who can add great meaning to every word. Given that clarity is the substance used to illuminate the eye, it is clear that it is not in vain that the poet uses the word in the beginning of the

poem. After all, in order to know the Motherland, to understand the Motherland, both the outward eye and the mind must be clear. It is known that at that time the beggars of the dictatorial regime did everything possible to hide the eyes of the nation. From the very first lines of the poem, this essence is fully interpreted artistically.

The poet used the word "soil" six times in this single poem, which was not large in size. But this repetition was applied so appropriately and in accordance with artistic logic that each time it revealed new facets of meaning. It served to ensure the balance of poetic content and form in the poem.

Men nechun sevaman O‘zbekistonni?
 Bog‘larin jannat deb ko‘z-ko‘z etaman,
 Nechun ardoqlarkan tuprog‘ini men
 O‘paman: “Tuprog‘ing bebaho, Vatan...”
 Aslida tuproqni odil tabiat
 Taqsim aylagan-ku yer yuziga teng.
 Nechun bu tuproq deb yig‘ladi Furqat,
 O, Qashqar tuprog‘i, qashshoqmiding sen?!
*Why do I love Uzbekistan?
 I see your gardens as paradise,
 Why do I cherish the soil of my land?
 I kiss: "Your soil is priceless, my Motherland ..."*
*In fact, the just nature of the earth
 Distributed the soil evenly over the earth..
 Why because of the soil Furqat cried,
 O soil of Kashgar, are you poor my dear?!*

Here, "soil" is a poetic detail that materializes the image of the Motherland. Being one of the four elements, the fact that human beings are actually created from dust also means that the meaning layer of this word is deep. The meaning of the word "umbilical cord blood" makes this word an embodiment of the national spirit. In this sense, the poetic detail of "soil" is open in discovering the essence of the image of the Homeland.

*Xo‘sh, nechun sevasan O‘zbekistonni,
 Sababini aytgin desalar menga,
 Shoirona go‘zal so‘zlardan oldin
 Men ta‘zim qilaman ona xalqimga:
 Xalqim, tarix hukmi seni agarda
 Mangu muzliklarga eltgan bo‘lsaydi,*

*Qorliklarni makon etgan bo'lsayding,
 Mehrim bermasmidim o'sha muzlarga?
 So why do you love Uzbekistan,
 Tell me the reason,
 Before the poetic beautiful words
 I bow to my native people
 My people, if the judgment of history is on you
 If it led to the permafrost,
 If you had a place of snow,
 Wouldn't I love those icebergs?*

When writing about the Motherland in the poetry of the pre-Soviet period, Abdulla Aripov was guided by the spirit of propaganda, the description of its subterranean and subterranean riches, the call to love it. However, poetry is not a tool of propaganda or a means of propaganda. In the poet's own words: "In a real lyrical work there are vibrations that neither the eye nor the ear can perceive, but only the strings of the soul."³ That is why a real poem depicts painful feelings, it is unique. The unexpected turn of the stream of artistic interpretation, the poetic conclusion that no one could have imagined, made the above poem a unique example of our national poetry. In his opinion, the feeling of love for the Motherland should be impartial, sincere and sincere. Such love has no value if it is due to material factors such as the inexhaustibility of its wealth, the uniqueness of its nature. He deserves to be loved only because he is the Motherland. "My people, if the judgment of history had taken you to the Eternal Glaciers, if you had settled the Snowmen, would I not have mercy on those icebergs?" - The lines are valuable in that they reflect this high criterion of love for the Motherland. The poet's poem "Uzbekistan" is also distinguished by the fact that the image of the Motherland is depicted with a unique, high art.

*Yurtim, senga she'r bitdim bu kun,
 Qiyosingni topmadim aslo.
 Shoirlar bor, o'z yurtin butun –
 Olam aro atagan tanho.
 Ular she'ri uchdi ko'p yiroq,
 Qanotida kumush diyori,
 Bir o'lka bor, dunyoda biroq
 Bitilmagan dostonidir bori.
 Faqat ojiz qalamim manim,
 O'zbekiston, Vatanim manim.
 My country, I finished a poem for you today,
 I never found your comparison.
 There are poets, the whole country -
 Olam aro atagan tanho.
 They flew the poem too far,*

*The land of silver on the wings,
There is a country in the world, however
It's an unfinished epic.
Only my weak pen is mine,
Uzbekistan, my homeland.*

Abdulla Aripov's poetry is dominated by a unique poetic interpretation of the national spirit. The first paragraph of the fifteen-verse poem is of a programmatic nature. This paragraph expresses the creative intention of the creator. "There are poets, the whole country is the only one in the world. Their poems have flown far away, the land of silver on their wings," he said, describing him as competing with Russian poets. "Silver Land" is a metaphor for Russia, which has been covered with silver snow for almost twelve months of the year. They have described their country sufficiently.

The poet's homeland is "an unfinished epic". Here is the national spirit, the feeling that the fruit he was born and raised is no less than any other country ...

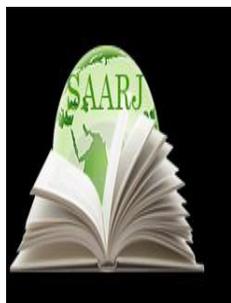

It is true that even before Abdulla Aripov, two great poets - Oybek and Hamid Olimjon - wrote poems on this subject. But the creator is not satisfied with this. He aims to create a new - magnificent monument of art, which depicts the Motherland with unique art. Professor Nurboyo Jabborov writes: "It is known that Oybek and Hamid Olimjon sang this theme at a high level in our poetry before Abdulla Aripov.

While Oybek's poem compares his time and the recent past, Hamid Olimjon's poem "Uzbekistan" depicts the unique nature of our country in the form of his unique spring. These two poems do not talk about the ancient and rich history of our people. It is also clear that Abdulla Aripov faced a difficult task, such as a unique poetic depiction of the great past and present of our country with all its complexity"⁵.

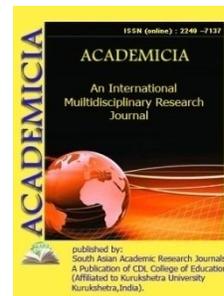

In addition to combining the composition of the poem "Uzbekistan, my homeland" repeated at the end of each verse of the poem into a single poetic system, it also served as a poetic conclusion of the interpretation in each verse.. Apart from the artistic image, neither literature nor poetry, which is its most active form, can exist. After all, the image is a condition for the existence of fiction, and figurative thinking is a key factor in the creative process. The world of images in Abdulla Aripov's poetry is of special importance in this regard. It is worth noting that the image of his homeland is sung on high curtains, with high pathos.

CYBER INSURANCE IN UZBEKISTAN: STATUS AND PROSPECTS FOR DEVELOPMENT

Khasanov Farrukh*

*Researcher,
Tashkent Financial Institute,
Tashkent, UZBEKISTAN
Email id: f.xasanov@bk.ru

ABSTRACT

The article deals with a topic that is relevant in modern society - cyber insurance, the essence and necessity of this type of insurance. The state of implementation of cyber insurance in Uzbekistan is described; the results of research in this direction are given. The factors and reasons preventing the development of cyber insurance are analyzed; proposals for the development of this type of insurance in the republic are formulated.

KEYWORDS: *Information And Communication Technology (ICT), Cyberrisk, Information Security, Insurance, Cyber Insurance.*

INTRODUCTION

The world is changing; the humanity lives in a society where information and communication technologies (ICT) are becoming the main means of all life processes. The active implementation and development of ICT in all areas of activity contributes to service improvement, the increase of goods and services quality, time and costs efficiency, economic activity growth, etc.

Recently massive computerization has become a global trend in world development in recent years, the world deals with a transition from an "industrial society" to an "information society".

On the one hand, the use of modern ICT, leads to a significant improvement in the activities of business entities, although, on the other hand, potentially creates the prerequisites for the risks of loss, theft, loss, modification, distortion, counterfeiting and destruction, including production management systems, electronic document management systems, unauthorized use of their own information and, as a result, economic, financial, social or other types of damage.

In the mid-90s of the last century the need to use a new approach for solving the problem of information security led to the emergence of a new concept of "information risk", which today is interpreted as "cyber risk". Cyber risk is a possible event of which leadsto unauthorized information deletion, distortion, or its confidentiality or availability violation. That is, the concept of cyber risk is used as a synonym of information security threat. Management of such risks comes down to information protection. Moreover, many experts understand information security as protection of themselves mainly from malicious actions.

Prevention and elimination of information security threats is based on the development and implementation of a set of means and protection mechanisms. These can be economic, technical, software, social, legal and other mechanisms that ensure the localization and prevention of threats. In the world practice of risk management, various methods are used to reduce risks and prevent their consequences. The experience of developed countries shows that one of the most effective methods is insurance, i.e. hedging of risk to a professional subject of such risk management - an insurance company. Today cyber insurance is gaining popularity as a method of protecting against cyber risks.

Uzbekistan, like most countries in the world, consistently takes measures to develop ICT. Along with this, preliminary results have been achieved on the introduction of cyber insurance in the country. In this article, the author examines the results achieved in Uzbekistan in this area, as well as the existing shortcomings and measures that need to be taken in the near future.

LITERATURE REVIEW

Cyber insurance is a frequently discussed topic in modern society. The role and importance of cyber insurance in the cyber security system are actively studied in foreign literatures and scientific articles. In particular, according to Ivanov IK, cyber insurance is an insurance product for the protection of information risks of any companies whose business is directly or indirectly related to the processing and storage of data [2].

Bolot J., Lelarge M. note that insurance is an important component of cyber risk management [3].

The article (Shetty, Schwartz, Felegyhazi, Walrand, 2010) examines the impact of cyber insurers on information security. The authors look at cybercrime protection at the individual and global levels. It is noted that cyber insurance has a positive effect on the safety of specific insured persons [4].

The authors Woods D. and Simpson A. investigated the practice of cyber insurance in public-private partnerships. Their research notes the mutually beneficial nature of cooperation between cyber insurers and government authorities. The authors analyzed the nature of the influence of state institutions on the functioning of the cyber insurance market [5].

Methodology

While preparing this article, the study used the statistical and economic method.

RESULTS AND DISCUSSION

Since the first days of independence of the Republic of Uzbekistan, large-scale transformations in the information and communication sphere have been carried out on a state scale, contributing to the further development and widespread introduction of ICT in all sectors of the economy.

The work carried out in previous years by the leadership of Uzbekistan on the widespread introduction and development of ICT is already bearing fruit. This is evidenced by the results achieved below:

- the level of coverage with digital television was 100%, the level of coverage with mobile communications - 97%, the level of coverage with broadband access to the mobile Internet network was brought to 70%;
- an online payment system has been established: in 2019, 299.3 million transactions worth 6.5 trillion sum were made through online payment systems;
- at the end of June 2020, according to the “Speedtest Global Index” rating, Uzbekistan demonstrated a sharp increase in Internet speed, taking 94th position, having risen by 36 positions over the year;
- the Unified Interactive Public Services Portal (EPIGU) - my.gov.uz – is formed for the further development of forms of contactless communication of the population and business entities with state bodies, through which more than 176 electronic public services are provided;
- ongoing work on implementation of Safe City project in all regions of the republic is conducted, the completion of which is scheduled for 2023 [6].

The technological growth in the field of ICT confirms the fact that cybersecurity has become an urgent issue in our country as well.

Nevertheless, cyber insurance in Uzbekistan, despite the rapid development of the ICT sector, until recently has not yet been recognized as an independent method of ensuring cyber security.

Taking into account this gap, in 2005 by the decision of the board of the Uzbek Agency of Communications and Informatization (now the Ministry of Development of Information Technologies and Communications of the Republic of Uzbekistan), a program of research work was approved to develop an appropriate regulatory framework. For this purpose, a working group was formed, which included the author of this article.

The implementation of the developments was started in 2007 and included the solution of the following main tasks:

- Consideration of the possibility of implementing a new type of insurance in modern conditions - cyber risk insurance;
- Study of the sources of cyber risks and possible mechanisms for protecting information resources, and from the standpoint of insurance to develop a classification of cyber risks;
- development of methodological approaches to the organization and conduct of cyber risk insurance, in particular, the development of a methodology for calculating the value of information resources and a procedure for assessing the amount of possible damage, i.e. the amount of insurance compensation;

- development of a procedure for the examination of information systems, during which deficiencies in the system of information protection measures are identified or for the investigation of an incident related to the loss of information.

In the course of the research, the following regulatory documents were developed [7]:

1. Rules for insurance of information risks. The rules establish the procedure and conditions for insurance.
2. Methodology for calculating the cost of information systems from information risks, which provides a calculation of the value of physical resources, determined by the cost of their restoration in the event of destruction.
3. Methodology for assessing damage and determining the amount of insurance compensation, which provides for the identification of risks, assessment of damage and threats, as well as possible damage when insuring information risks and ensuring the practical implementation of insurance compensation for damage in case of information risk.
4. Instructions for the examination (audit) of the security of information systems. This instruction regulates the procedure for the examination of information systems to identify deficiencies in the system of information security measures or to investigate an incident related to the loss of information.

The developed product covers losses associated with the loss, destruction or damage of information, loss of securities or funds in electronic form as a result of the following events:

1. Failures (failure) of information systems due to errors in their design, development, creation, installation, configuration, maintenance or operation;
2. Intentional unlawful actions of the policyholder's employees, committed by them independently or in collusion with third parties in order to damage the policyholder or obtain illegal financial gain;
3. Computer attacks against the policyholder by third parties;
4. Intentional illegal actions of third parties aimed at unauthorized modification, copying, and damage, destruction of electronic data, permanent or temporary disabling of the information systems of the policyholder;
5. Actions of computer viruses - fragments of malicious computer code or electronic instructions capable of self-replicating and spreading in information systems and networks independently or upon their activation by users (this also includes "Trojan horses", "worms", "logic bombs");
6. Theft of funds and securities in electronic form as a result of unauthorized access by third parties to the information system, including by:
 - a) Entering fraudulent electronic commands into the information systems of the policyholder;
 - b) Unauthorized modification of the computer code (programs) of the policyholder;
 - c) Transmission of a falsified (fraudulent) electronic order, allegedly originating on behalf of the policyholder, to the bank or the depository of the policyholder.

It should be noted that information is the property of its owner if it is documented information, created at his expense, acquired by him legally. Therefore, all the provisions of property insurance provided for by the legislation of the Republic of Uzbekistan are applicable to this type of insurance.

Therefore, the objects of insurance can be:

- Information resources - information in any electronic form (databases, libraries, archives in electronic form on technical media of any kind), software tools and complexes under development or operation;
- Financial assets - funds in electronic form in the form of entries on accounts (client-bank systems), securities in electronic (non-documentary) form.

As a supplement to the basic insurance coverage, indirect losses and unforeseen expenses related to the occurrence of the following insured events may be insured:

- losses from the temporary suspension of commercial activities in the event of an insured event - this is the lost profit for the period of forced downtime, current expenses for maintaining the business during the period of forced downtime, i.e. this is the remuneration of employees, mandatory contributions and payments that do not depend on the production facility;
- Additional expenses for emergency business recovery:
 - a) Temporary rental of equipment;
 - b) The use of third-party processing services;
 - c) Costs for urgent replacement of hardware and software;
 - d) Expenses related to investigation of the circumstances of the insured event;
 - e) Costs of protecting the reputation of the policyholder.

The sums insured (liability limits) for insurance objects are determined based on the cost of information systems in accordance with the "Methodology for calculating the cost of information systems from information risks".

Information is assessed using the cost method, i.e. based on the costs that may be required for its restoration, including both the additional time spent by the company's staff and the involvement of independent expert organizations.

The insurance rate is set separately for each risk. Its size depends on the state of the level of information security of information systems and the degree (number) of risks, determined on the basis of the analysis of the cyber security of the information systems of the insured.

In accordance with the decision of the Uzbek Agency for Communications and Informatization (now the Ministry of Development of Information Technologies and Communications of the Republic of Uzbekistan), in August 2009, a pilot implementation of a newly developed innovative insurance product was launched.

A number of organizations providing telecommunication, postal and Internet services, as well as other institutions operating in the field of communications and informatization, were identified as subjects in which the pilot implementation was carried out.

The Computer Incident Response Service "UZ-CERT" at the Center "UZINFOCOM" was determined as an expert in conducting an audit of the level of information security of information systems, as well as assessing the cost of information systems and damage caused as a result of an insured event, and the insurance company "ALSKOM" was identified as an insurer.

Based on the results of the pilot implementation, this product was approved and recommended for further use in the system of the Uzbek Agency for Communications and Informatization (now the Ministry of Development of Information Technologies and Communications of the Republic of Uzbekistan).

It should be noted that over the past period this product has not been so much demanded by potential customers. The limiting factors were the following:

1. Absence of serious incidents that threaten the cybersecurity of state and economic entities, there was only one insured event during the period of implementation of this insurance product in which the insurance company reimbursed the damage caused by the impact of cyber risks.
2. Limited statistical information for calculating insurance rates for this type of insurance, taking into account all risk factors. Unlike traditional types of insurance, where risk assessment and calculation of the insurance rate are based on statistical data using actuarial calculations, in cyber insurance, the use of classical approaches to calculating the insurance rate is not acceptable. This is because the limitation or absence of statistical data makes it impossible to apply the appropriate mathematical distribution laws to data series. The rapid development of ICT is accompanied by an increase in the number of risk factors, an increase in their cumulation with each other, which significantly increases the risk of errors in calculations.
3. Insufficient development of pre-insurance expertise in this area. At the stage of concluding an insurance contract, the available data on the activities of a potential insured is insufficient for an objective assessment of the state of their information security. This issue is especially problematic in commercial banks due to the specifics in the banking sector. In addition, potential policyholders may hide essential information regarding the state of information security.

However, over the past couple of years, along with the development of ICT, there has been an increase in the number of cyber security threats that can cause significant damage.

In 2019, 268 incidents, 816 vulnerabilities and about 132,000 cyber security threats were detected in information systems and websites of the national segment of the Internet [8].

In the first half of 2020, the number of fraudulent crimes in Uzbekistan doubled compared to the same period in 2019 and reached 3,881 cases. It should be noted that the growth of such crimes is associated with the development of technology. The most common of them are associated with bank plastic cards [9].

Thus, today, with the active development of ICT in Uzbekistan, ensuring cyber security is of paramount importance.

CONCLUSION

Currently, the Republic of Uzbekistan pays special attention to the tasks and problems of ensuring cyber security at the state level, as evidenced by the ongoing work to identify threats, vulnerabilities and incidents in cyberspace. The State Program for 2020, the Year of Science,

Education and the Digital Economy, approved in Uzbekistan, provides for a number of cyber security measures, the most important of these measures is the development of a bill on cyber security [1]. The bill provides for the protection of ICT from modern cyber threats, the introduction of modern cyber security mechanisms for various levels of systems, the definition of the rights and obligations of state bodies, enterprises and organizations in the field of cyber security, the coordination of their activities, and the unification of regulatory legal acts. Along with this, in order to develop and widely use cyber insurance in Uzbekistan, we propose to provide for the development of cyber insurance in the bill.

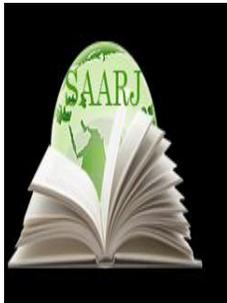

Today, government agencies are actively expressing their desire to purchase high-quality insurance coverage against cyber risks. The main problem hindering the widespread use of the existing insurance product for cyber insurance is the issue of assessing the cost of information, that is, determining the exact monetary value - the insured amount, within which the insurance organization will be responsible for fulfilling its obligations under the insurance contract. The fact is that according to the developed methodology, when calculating the cost of information resources, the costs associated with the creation and commissioning of information resources are taken into account. The amount of costs incurred is calculated on the basis of the balance sheet data. In the applied calculation of the cost of information systems, the level of value and criticality of information is not provided for, which does not allow realistically assessing the actual cost of the information resource and the information system as a whole. In this regard, we believe that it is necessary to improve the methodology for assessing the cost of information systems, taking into account the use of the level of value and criticality of information in it. This will allow assessing information resources and systems of not only legal entities, but also individuals.

In general, we can say that favorable conditions are emerging in Uzbekistan for the development of cyber insurance. At the same time, it is obvious that with the development of digitalization and widespread use of ICT, the demand for this type of insurance will grow. This, in turn, will serve to strengthen the cyber security system and minimize damage from the impact of cyber risks.

EXPRESSION OF IDEAS OF SELF-ORGANIZATION IN AVESTA

Ergasheva Maxbuba Xotambekovna*

*Associate Professor, PhD,
 Department of Philosophy and national idea,
 Samarkand State University, Samarkand, UZBEKISTAN
 Email id: mahbuba_ergasheva@mail.ru

ABSTRACT

In the article highlights the epistemological understanding of the features of self-formation in "Avesta", its process, the principles reflect the determinants of knowledge of the world and ourselves in relationship, provide the scientific and conceptual analysis reflecting mechanisms of the spiritual and psychological self-formation of people. Scientific conclusions, proposals and recommendations on the constructive (creative) influence of the philosophical ideas of "Avesta" on the development of modern philosophical thought, its place in the spiritual and moral self-organization of people, in educating young people as patriots and humanists were developed. Developed proposals and recommendations for improving the mechanisms for the wide use of the possibilities of synergetic methodology in an even deeper awareness of the ontological, epistemological aspects of the scientific, philosophical ideas of "Avesta". As a result of the objective study of "Avesta", we substantiated that the early elements of the idea of self-organization began to carve their way with the appearance of this outstanding work, subsequently gave a powerful impetus to the formation of humanistic, dialectical, synergistic ways of thinking as a theoretical basis of scientific knowledge. It is the epistemological analysis of the idea of self-organization that not only increases the historical value of this category, characteristic of synergetic methodology, but at the same time determines the place of this category in the development of today's philosophical thought, and also directs the whole society to a decent self-organization, self-ordering only with such qualities as "creativity", "Virtue", etc. In order to consider the Avesta the earliest source in which issues of ontological, epistemological, epistemological, ecological, synergetic knowledge are highlighted, researchers need to further study this work more deeply, logically substantiate these findings and prove to the world scientific community. At the same time, it is the synergetic methodology that is of

paramount importance. Of course, in development, in the progress of every state, of every society, in determining the prospects for their future, special attention is paid to the historical, spiritual heritage. Great history, high spiritual heritage serve as a reliable basis for a prosperous future. That is why the most effective results are provided by the analysis based on the synergistic methodology of such samples of rich spiritual heritage, like "Avesta".

KEYWORDS: "Avesta", world, self-organization, to know, knowthe world, self knowledge, synergetics.

INTRODUCTION

In the 21st century, ideas about humanism, human dignity, honor, life, honor, inviolability are rising to the highest level of value in the world. At the moment, these ideas were mentioned three thousand years ago in Avesta as ancient and unharmed values, which greatly influenced the development of philosophical thoughts of the whole of mankind. The content and versatility of the opinions expressed in it are also striking to today's researchers. Based on the synergistic approach that arose in the second half of the 20th century, the need to re-comprehend ideas in Avesta on the basis of non-verbal reasoning shows that the roots of synergistic laws are rather ancient, in particular, in the ancient lines of "Avesta" it is found that there are also non-verbal thought buds. In the years of independence, serious attention was paid to the restoration of our spiritual and religious-philosophical heritage in our country. "We follow the traditions of the wisdom of our ancestors and, with a deep understanding of their creative ideas, carry out decisive reforms, follow the path of forming a new image of our country" [1].

2. Materials and Methods:

Synergetic philosophical ideas in the sacred book Aves-to, which combines creative ideas and inspires people at a time when various global challenges - environmental disasters, terrorism, extremism, human trafficking and drug addiction threaten international security. From the point of view of studying, it is of great practical importance in the analysis of complex scientific and conceptual problems of today, formation of ideological immunity, national self-consciousness.

Creating a spiritual and intellectual environment that enables our compatriots to enjoy the philosophical teachings of the peoples of the East and the West, to give them a deeper understanding of the various, even contradictory, philosophies of the modern world. It is important to expand the scope of research in the field. After all, just such a serious philosophical ground serves as a solid scientific-theoretical and methodological basis for the creation of national and universal philosophy, which embodies the noble intentions and aspirations of our people. According to the scholar-scientist M.Isakov, the book "Avesta" is a historical written source that contains unique information about the social life and spiritual world of our ancestors [4; 3]. It is worth noting that ancient Central Asia has long been considered the cradle of world civilization. The great doctrines, priceless manuscripts and works that greatly influenced the spiritual and intellectual development of the East and the West were formed on this earth. The development of philosophical thought in Central Asia is more ancient than the one established by Avesta.

It should be noted here that the influence of the Orientalist philosophical thinking on the modern Western thought is determined, first of all, by the philosophical understanding of the inner world of man, the combination of the micro-universe and the macro-universe with moral and aesthetic

ideas. While the West has made significant progress and results in theoretical exploration of the outside world, the East has also made impressive advances in knowing the inner world (man). In this regard, academician Konrad writes: "For every generation, it is important to remember that the theoretical reflection of the Orient in all areas of human and social science is important, especially in these areas. Designed in the East "[6; 462].

K. Jaspers, one of the representatives of existentialism, who criticized European centralism, explained the need to appeal to Eastern philosophy and culture: "There is something we lack in Asia and it is important to us! From there, questions are being addressed to us, buried in our hearts. We paid a price for everything we did, what we could do, what we achieved. We are not yet on the path of perfection of human nature. Asia is a necessary supplement to us. "[12; 90]. That is why the need for external and internal harmony in human nature and the need for unity in world culture make the need for a healthy dialogue between the philosophy of the East and the West.

The high cultural heritage created by the peoples of Central Asia has served as an important source not only in this region but also in the formation of the Eastern and Western philosophies in general. The history of development of philosophical and scientific ideas and ideas in the territory of our country, which is recognized worldwide as one of the oldest centers of world civilization, goes back to the distant past. From today's research, it can be said that the beginning of the development of philosophical thought is more than three thousand years of history. In particular, the results of scientific researches after independence have shown that the roots of the history of spiritual and philosophical thought in our country can be compared with the ancient Greek civilization.

The scientific essence of the article. When we look at the history and development of philosophical ideas in ancient Central Asia, we can see that the book "Avesta", created centuries ago and its ideas are very important. The formation of the Zoroastrian philosophy and the creation of its sacred book Avesta have been the first, most complete, rare, and most powerful factor in the history of Zoroastrianism in the history of mankind. The strength of the ideas of Avesta lies in the fact that the highest esteem and respect for human beings with high morals and creative work are at the forefront.

One of the important ideas of synergetics is the idea of self-organization. Although it was founded in the late 20th century as a theoretical and philosophical doctrine, its philosophical ideas have a long history. The synergistic research combines distinct styles and rules that incorporate a new approach. This results in a change in the scientific picture of the world, a renewed way of thinking. . In general, the question arises as to how Zoroastrianism can be an idea of self-organization, based on the belief that God, the Creator of the universe, man, and the universe, is God. Because self-organization seems to be rejecting God, but it is not. In this sense, we should note the conversation of Russian scientist E.N. Knyazeva with the founder of synergetics G.Haken about the development of synergy. In this interview, Knyazeva told Haken, "One of the main ideas of synergetics is that everything is spontaneous and spontaneously everything comes from self-motion, self-organization. Does this idea mean that synergy denies the creator, God, primary motivation? Does this synergy conclude that it is atheistic teaching? " In response, the founder of Synergy G. Hacken made a very thoughtful comment. In other words, in the natural sciences it is impossible to prove the existence or absence of God. At the same time, it cannot be denied. Therefore, we cannot say that synergy is neither theistic or atheistic.

Synergetics is based on the idea of self-organization: At first glance, it seems that the role of God is ignored. But the puzzling question continues: Under what laws does self-organization take place?

Who made these laws? Or, as we know, self-organizing systems are always labeled with fluctuations that we cannot see in advance, but they are part of the system. Here we face the limitations of our thinking [10; 58]. So we need a broader approach to the idea of self-organization in the broader sense. The process of self-organization in synergetics is an important manifestation of spontaneous, spontaneous behavior. At the same time, it is the basis of self-government and, in general, reflects the possibility of the existence of a private, territorial unit. Many scholars have put forward their views on the question of self-organization and what its elements are. Especially noteworthy are the philosopher Fayzullaev's views on self-organization. According to the scientist, "Self-organization is an important manifestation of spontaneous movement without external influence; at the same time, it is the basis of self-government; Opportunities for the existence of a private, territorial part of the whole "[9; 32 b]. Amanulla Fayzullaev goes on to explain this, explaining the process of self-organization using examples. It is well-known that in human society and social life it is necessary to organize the processes of activity in order to achieve a particular goal. This function is usually performed by an organizer or an organization of several people. The task here is the object, the executing entity. This assumption also applies to nature. Artificial nature, as a rule, is man-made, that is, nature itself, the universe itself, ranging from elementary microscopes to solar systems, galaxies, quasars, and pulsars. The universe and its parts and systems are self-organizing. That is, the system is self-organized without external influence. According to religious teachings, God has made the world, man, and everything in it is the responsibility of man.

The task of synergetics is clear: both in the living world and in the animal world and the human community, there is an objective activity beyond the subject's organizational ability, and many things are organized without human subjectivity. Like all religions, Zoroastrianism and its sacred book Avesta teach that the universe, nature, and all things are created in the Supreme God Ahura Mazda. The emphasis is on the ability of the human being to organize itself in every way. It is said that every sane person in Ahura Mazda, by his words, organizes himself by virtue, or chooses the way of evil. We read in Avesta:

"Lies (duruj) from those two worlds Those who volunteered to do the worst, and those who turned to the Ashahar Truth, built for the righteous, covering the eternal heaven, pleased Ahura Mazda for their noble deeds and their love of freedom. " [3; 10].

So we can sometimes see that a person can be self-motivated, mentally or physically healthy, or willing to bark so that they can do something useful in this world. "...Then you gave him the freedom to choose his way so that he could obey the leader of truth or the leader of lies. " [3; 11].

While analyzing Avesta, spontaneous self-organization cannot be ruled out by the influence of matter on matter.

Although it is acknowledged that the Creator of all things, all things, nature, society, and man, is the creator of all things, it is argued that all things are preserved only through the good and the good deeds of mankind.

Especially Avesta, and all things, plant, land, water, man, all their own favors (fravashiy), there is a saying (there is some kind of inner power of self-preservation, or a spirit of ancestors). It is recognized that thanks to these freakashas, everything and events are self-sustaining.

We read in Avesta:

If not all the nobility of the nobles would have helped me, my most beautiful animals and men would have died; The keeper of the sky, the water-keeper; ground keeper; cow keeper; it is the Fravenies who have saved the lives of their babies in the womb so that they will not die, and that the bones, hair, flesh, and internal organs, feet, and the signs of masculinity and femininity are born before birth. [3; 252] From a synergistic point of view, the "Fravashi" referred to in Avesta can be understood as a systemic effect on the self-organization of all things, all beings, nature and the human world. "Arrangement" means the order and the process of locating a particular whole. Organization is a simple and complex feature that provides a unified structure and function of systems. If the source or the driving force of the organization itself is in the system itself, this property becomes self-organizing if it creates the nature of the environment by changing the parameters of the structure and function.

On the process of self-organization. G.I.Ruzavin writes: "In the field of synergistic research, we intuitively refer to the notion of self-organization, which means that the processes taking place in the system do not depend on human interference or external factors."

As we know, self-organization is the result of the collective action of components of an object only at the expense of their internal connections and in accordance with their past history. When we analyze the ideas of "Avesta", this doctrine appeared as an internal link in the process of self-organization. According to Professor S. Kushakov, the study of the phenomenon of self-organization began in the 18th century. This is in line with the theoretical studies of Adam Smith, founder of classical political economics (1723-1790). In his work *The Essence and Causes of the Wealth of Nations*, he argues that spontaneous ordering in the market is a result of interaction between participants with different, often opposing goals and interests described. [11; 157] With this in mind, the scholar points out that A. Smith implied that market prices should be regulated by themselves, not by anyone's will. On the basis of these considerations, the ideas of Avesta were gradually self-regulated by the circumstances of that time, which is under the influence of system changes.

It is worth noting that events and processes in space and time are also self-organized. According to B.Turaev: "The spatial points formed by the body and internal organs of each body are arranged in such a way that each point has its own fixed position. [8; 223] Ordering is also a form of self-organization. Everything in the universe has been in its present form since the beginning of its existence. Objects that were not self-organization were damaged without adaptation.

Professor S.Koshakov argues that the gnoseological root of the concept of self-organization lies in the idea of self-action. According to the scientist, the source of self-activity is the motive behind the moving object itself. The organism, the human community, the universe, and the like systems are the "things" that act on their own. From the earliest times, this problem has been discussed - is it the source of the movement of the universe in or outside it? [11; 153] According to Avesta, each system is a source of development and self-organization. At the same time, Professor S. Koshakov noted that self-organization is the source and basis for the existence of

evolutionary process. The self-organizing system is characterized by the fact that it continuously regenerates, stabilizes its components due to matter and energy it receives from the external environment, and updates its structure and function in response to internal and external influences. [11; 168]

The teaching of synergetics is based on a multifaceted, diverse approach to everything in the same way. In particular, for the development of the educational process, today we have a multilateral, diverse approach to it by representatives of the sphere, achieving a unity of Science and education, as well as the direction in which science and education serve for the development of our society. Synergetics leads to the fact that a person gets rid of the patterns of monotony, which limit his cognitive abilities. In the development of mankind, a person has a great influence on the activities of people, especially young people. Therefore, the moral perfection and maturity of each individual is necessarily influenced by society, the internal components of society and its components in determining the norms of social processes, changing them. Including changes in the educational process, reforms do not affect the spiritual and material formation of people. Therefore, it is very important to take a serious approach to this process, to work together, in cooperation. It is impossible to carry out reforms to the educational process with the instruction, opinion and reasoning of a single organization, or an individual. In this process, of course, the principles of plurality and tolerance must be strictly observed. After all, non-linear analysis and style of thinking create a wide opportunity for the formation of new knowledge. Ensures being in the right attitude to the issue, eliminates monotony [12; 37]. From these considerations, if we analyze the ideas of Avesta, we can see that the creator of the work, Zoroaster, and his posterity thought about the universe, nature, the source and the motive of society. According to Avesta, the supreme deity is Ahura Mazda, the source and driver of the movement. We read in Avesta:

"Oh Ahura!"

I beseech you, answer me with truth:

Who is the Creator of the whole universe?

Who founded the sun and the stars?

... Ashah - I have really heard that Ahura is her creator...

... He who created the worlds

That's what Ahura told me

I want to say It is a great practice for people to listen to these words. [3; 22].

From these texts, Ahura Mazda can be understood as the first cause of self-organization.

Philosopher V.P.Bransky, referring to self-organization in his article "Theoretical Foundations of Social Synergetics," states: "If a system generates its own function without any external, special effects, we call it a self-organizing system. The theory of self-organization combines all phenomenological features of development, complexity, diversity and flexibility on the basis of choice. This synergistic theory as a universal development mechanism is typical of all dissipative systems. Society is a similar system, so this theory is directly relevant to the development of society." [5; 117] It should be noted that the process of self-organization differs from that of an

ordinary organization in that it harmonizes with the nature of the system, penetrates the nature of the system, and is not influenced by external factors.

Sequencing is also a form of self-organization. Everything in the universe has been in its present form since the beginning of its existence. Objects that were not self-organizing were damaged without adaptation. One of our scholars who studied philosophy and ideas at Avesta A. Choriev answers the question of how spiritual maturity is defined in the book *The Philosophy of Man: Avesta* states that a person's spiritual maturity can be attributed to his friends, loyalty, forgiveness, and ignorance of the ignorant. is measured by the same criteria as Researcher B. Rakhmonov took a different approach. According to him, according to the ideas of Avesta, the most important force that manages human activity is moral standards. Therefore, the Supreme Leader of Zoroastrianism, Ahura Mazda, is tasked with defining the principles that lead people to moral perfection. According to him, a person can only be self-disciplined, self-directed, and self-directed. [7; 9) That is, spiritual growth according to the ideas of "Avesta", A. Choriev believes, is largely determined by the external world and human relations, but in B. Rahmanov's view it is determined by the inner world of man. At the same time, the problem becomes clearer when we study the features of the system in a comprehensive and comprehensive manner. Clearly, it is natural that there should be such different approaches and approaches to the principle of openness and closure. The main thing is that it retains originality and originality. "According to Avesta, Zoroaster was a self-organized and refined Ahura based on Mazda's divine words. And other people have self-organized under the influence of such ideas, pandas, and scriptures, and of course, the results of this organization have been informed by their actions. The following comments from Avesta are evidence of our opinion:

"- O Ahura Mazda!

You did good things; you have spoken and acted; We will bring before you the good, the word and the deeds. [3; 227]

Categories of synergetic became the theoretical and methodological basis of the postnonclassical style of thinking. Postnonclassical scientific thinking incorporates the Conceptual elements of modern sciences at the same time highlights the problems with the epistemological and heuristic value which are important for scientific knowledge and practice. The state of non-linearity, which is examined by postnonclassical science, manifests in objects that have not been studied by classical and non-classical science. It may be noted the formation of the concepts: "instability", "disbalancity", "organize" "self-organizing" that stand for characterizing features of objects. [14.21]

In the process of researching the Avesta book using synergistic methodology, new scientific conclusions were reached on the philosophical, religious, and scientific nature of the work. Avesta has proved to be a great spiritual force and power for human perfection today. According to the First President of the Republic of Uzbekistan Islam Karimov, in today's turbulent times, only a truly enlightened and enlightened person can fight for the value of human dignity, self-awareness, self-determination, living in a free and free society, and making our independent state a worthy place in the world community. . [2; 16]. Avesta plays an important role in nurturing and nurturing such highly motivated, well-educated, well-motivated, versatile, self-organized genuine creative people. Therefore, the purpose of the scientists of the country in which this

great work was created is to find the best, most consistent way to convey Avesta to the people and to discover new aspects of it based on modern methodological principles.

CONCLUSION

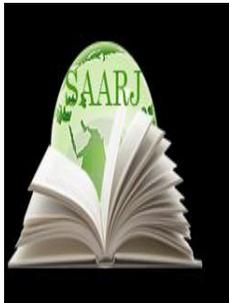

First, although the analysis of the process of self-organization has been the subject of research since recent times, its ideas go back to the very past, to the time when Avesta was created.

Secondly, understanding and identifying elements of the process of self-organization in Avesta enables us to re-examine the work using the methodological principles of the present. This in turn reflects on the processes of self-organization in Avesta, the importance of ideas for self-regulation, self-preservation, self-control, and self-organization for the development of humanity, nature, and society. and how important it is

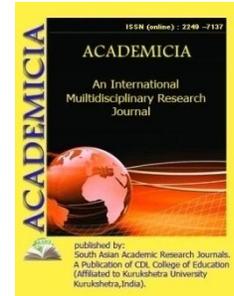

Thirdly, Avesta is very important in nurturing and developing genuine creative people with high spirituality, enlightenment, firm will, versatility and self-organization. Therefore, the purpose of the scientists of the country in which this great work was created is to find the best, most consistent way to convey Avesta to the people, and to discover new aspects of it on the basis of modern methodological principles.

ABSTRACT

This article highlights the state of the livestock sector in the country, development trends, its importance in various sectors of the economy, the factors of increasing efficiency, the opportunities created, the importance of the adopted reforms. Uzbekistan is one of the ancient centers of animal husbandry. The soil and natural-climatic conditions of the republic are fertile irrigated lands, vast hills, steppes and foothills, which are very favorable for the development of animal husbandry. Livestock is one of the most important sectors of agriculture. It serves as a source of protein from livestock, such as milk, meat, eggs, honey, fish, which are very important for human needs, as a raw material for industrial production, processing industry.

KEYWORDS: *Agriculture, Animal Husbandry, Fodder Base, Cattle Breeding, Sheep Breeding, Poultry Farming, Fisheries, Beekeeping, Pedigree And Pedigree Livestock, Soft Loans, Subsidies.*

INTRODUCTION

According to international experience, one of the essential tasks facing our government is to modernize and liberalize the economy in the country, to create organizational and economic conditions for the development of farms with private ownership in the agricultural sector, in particular.

As our President said: “The purpose of agricultural reforms is to ensure economic security, as well as food security and increase the welfare of the people. We must never forget that.”[1]

Uzbekistan is one of the ancient centers of animal husbandry. The soil and natural-climatic conditions of the republic are fertile irrigated lands, vast hills, steppes and foothills, which are very favorable for the development of animal husbandry. Livestock is one of the most important sectors of agriculture. It serves as a source of protein from livestock, such as milk, meat, eggs, honey, fish, which are very important for human needs, as a raw material for industrial production, processing industry. As a result of economic reforms and structural changes and diversification in the livestock sector, the number of livestock has increased in recent years. The production of products has been growing in recent years.

The literature review on the subject

The issue of increasing the efficiency of the livestock sector and its various products has been studied in detail by domestic and foreign agro-economists. In particular, scientists of our country N.S Bazarov, U.I Isanov, T.S Mallaboev, S. Mekhmanov, K.D Mirzaev, T. Omarov, J.H Rashidov, R. Khakimov, T. Kudratov have been developed proposals to increase livestock production and increase its efficiency, in order to meet the demand of the population for livestock products in Uzbekistan. Moreover, the proposals and recommendations developed as a result of research conducted by foreign scientists G.A Avanesova, I.A Altukhin, V.I Gayduk, F. Kotler, P.G Jennings provide services to the livestock sector. serves as an important theoretical and methodological guide in the development, increase of production and increase of network efficiency.

Analysis and results

In 2015, more than 4.5 thousand veterinary and artificial insemination centers in the country artificially inseminated 2 million 106 thousand cows and provided 11.5 billion soums to livestock farms. Soums worth of services were provided. [2]

Increasing foreign direct investment in the national economy, informing foreign investors about the opportunities and potential of the country in this area, improving the coordination of state and economic management and local executive authorities, as well as the five priority areas of development of the Republic of Uzbekistan in 2017-2021. Fulfillment of the tasks set out in the Action Strategy and the “Year of Active Investment and Social Development”, the implementation of the tasks set out in the State Program for the developing the Republic of Uzbekistan as also being launched until this days.

Over the past five years, 213 billion UZS have been allocated for these purposes to improve livestock breeding. To date, 18,191 head of cattle have been imported from abroad. The number of veterinary stations has been increased to 2,486 in order to provide qualified veterinary services to livestock of personal assistants, farmers and farms. More than 4.5 thousand veterinary and artificial insemination centers in the country artificially inseminated 2 million 106 thousand head of cows and provided 11.5 billion soums to livestock farms. soums were provided. For the development of fisheries, 761 fish farms have been established, bringing the total number to 3,281 and reaching 45 billion soums. soums were spent. In the development of beekeeping, 424,145 bee families are mainly cared for, and 2,320 queen bees have been imported by

beekeeping associations, and more than 80,000 bee packages have been prepared and sold abroad.

30 million 500 thousand breeding eggs were hatched in 320 poultry incubators operating in the country, and the chicks were delivered to the newly established poultry farms. In order to improve the breed and increase the productivity of poultry, 900,000 chickens and 11 million eggs were imported. Livestock is closely related to crop production, as the efficiency of network activities is determined by the state of the fodder base. In animal husbandry, field (grain waste, straw), vegetable growing (non-standard vegetables, leaves, stalks), processing industry (husk, bran, cotton-cake, meal) are used. In turn, animal husbandry helps to increase soil fertility by providing crops with organic fertilizers. The main feature of animal husbandry is that only part of the feed provided is used by livestock to produce the product, the rest of the feed is used to store them, determined by the additional feed. Therefore, a balanced and rational diet is necessary for the efficient use of livestock.

Compared to crop production, animal husbandry differs in that it is less dependent on natural-climatic conditions. Therefore, in animal husbandry, fixed and circulating production resources, labor resources are used evenly throughout the year, and there is a profit from the sale of products throughout the year. Livestock includes dairy and meat farming, poultry, pig, sheep, fishing, beekeeping, horse breeding, fur and other industries. Livestock is widespread in the country. The diversity of natural and economic conditions makes it possible to distinguish different species in the composition and proportions of different livestock.

The choice of livestock system is influenced by a number of factors, such as the location of the agricultural enterprise, the composition and proportion of fodder crops, labor supply, the degree of mechanization of work, the state of livestock markets. The development and location of livestock sectors should be designed to meet the demand of the population for livestock products, the rational use of production resources, especially feed and labor. Livestock production needs to be developed on the basis of intensification in all regions of the country, increasing livestock productivity.

As a livestock sector, it also plays an important role in the development of other sectors of agriculture. In agriculture it is a valuable organic fertilizer, ie manure. The availability of labor resources and mechanization of the farm are also taken into account in the placement of livestock. Dairy farming is one of the most labor-intensive industries in the industry and requires relatively high labor costs. Labor costs for milking cows are 40-50 people / hour per head of cow per year, which is up to 32% of the total labor cost of caring for cows. Labor costs in this area can be reduced only through the introduction of advanced technology.

Nowadays, the cultivation of dietary meat is of great importance for human health. Taking into account the lucrative nature of this sector in agriculture, positive work is being done to develop the rabbit industry in Kamashi district of Kashkadarya region. Mainly pedigree rabbits imported from Italy were raised and a large agro-firm was established. As a result, efforts are being made to provide the population with diet meat, create jobs and increase incomes. The possibility of achieving positive results by processing rabbit meat and exporting its skin and fur is expanding.

The main problems in the development of animal husbandry include:

- per head of livestock in the area under fodder crops for livestock

not proportionally separated;

- low productivity of fodder crops;
- Incomplete fodder harvest with modern techniques;
- Lack of breeding at the required level;
- failure to provide comprehensive veterinary services in a timely manner;
- production and sale of pedigree cattle and reduction of import of pedigree cattle;
- Insufficient provision of soft credits, etc.

To overcome the above shortcomings, we make the following suggestions:

- creation of opportunities for agricultural specialists with sufficient knowledge and technology, knowledge of modern methods of production and innovation;
- Ministry of Innovation to strengthen cooperation, develop training and retraining programs for farmers;
- Satisfaction of the demand for veterinary services for livestock farms, increase the productivity of livestock, provide appropriate scientific advice and assistance in improving the quality of livestock products;
- Achieving an adequate food supply;
- We must consistently fulfill the tasks set by the Cabinet of Ministers for the adoption of the "National Program for Food Security in the country for 2019-2024."

In addition to providing the consumer market with food products, agriculture also plays an important role in the economy. The products grown in the agricultural sector of this industry are primarily aimed at meeting the needs of the population, as well as providing the industry with raw materials and strengthening the fodder base of livestock.

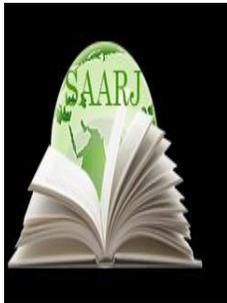

Given the current situation, it is expedient to study the international experience and pave the way for the private sector to monopolize areas where competition can be introduced, thereby creating a competitive environment. In this regard, it is necessary to update the laws on natural monopolies and competition in the country and to develop a strategy for creating a competitive environment in the economy.

ABSTRACT

In This Paper, The Role Of Family Relations In The Development And National Spiritual Values Has Been Highlighted. The Theoretical And Legal Basis For The Prevention Of Human Trafficking Has Been Analyzed. Young People Expressed The Need To Harvest Immunitet Against Trafficking And Not Be Unpunished From Any Crime. The Article Highlights The Methods And Means Of Training Of Young People In The Family On The Basis Of National And Spiritual Cadres.

KEYWORDS: *Family, Historical Heritage, History And Literature, National And Spiritual Value, Patience, Prosperity Of The Nation, Human Trafficking, Offenses, Crime.*

1. INTRODUCTION

Currently, human trafficking is becoming one of the most global issues in the world. It is a pity, especially in the coming days, that young children and teenage girls are abducted and sent out to other countries to buy, if they do not have parents. Of course, we can see that in the World of similar offenses there is a grave crime, as if depriving a person of the right to live freely.

The problem of trafficking in people exists in all countries, the only way to solve this problem is by creating a legal framework in the national legislative system of resistance to trafficking in people, if it is.

The first President of our country, “We are committed to deepening democratic and market reforms in our country with important structures such as the European Organization for security and cooperation, the European Union and NATO, and to strengthening cooperation in ensuring

security and stability in our country and in the region as a whole” [1. 43] his words are proof of our opinion.

In the process of globalisation, efforts are being made to bring about regional and state conflicts through various ideological means. Among the ideological conflicts that arise between the regional and the states, the most terrible is human trafficking. [2.488]

The following reasons can be cited, which characterize the occurrence and rapid development of the phenomenon of human trafficking. Firstly, there is a lack of international law in itself, which clearly expresses the measures of combating trafficking in people, the possibility of real implementation in practice; secondly, there is a lack of appropriate control over the activities of organizations engaged in the provision of citizens with unlicensed work abroad; thirdly, the low level of the legal culture of citizens is that they do not have information about the issues of human trafficking and ways of combating it.

In many types of international legal norms, measures have been developed aimed at combating human trafficking, the purpose of which is, of course, the protection of human rights. "Human trafficking has been a thing of the ancient times and now it exists. In fact, this crime can not be completely eliminated. Only it is no more reduced in a certain period. Over time, if this thing is a little out of control, it will develop again and may escalate in different parts of the world.”[3.32]

In addition, it is important to say that this criminal case, judging by the information above, exists from history. The primitive community system, after which, during the periods of slavery, led people into captivity, sold them as slaves, treated them as if they were dealing with a fur animal, completely deprived them of their rights and freedoms. And its modern appearance is widely spread in the countries of the world.[4.21]

This negative defect, which was previously Russian, is now widely persecuted not only within the framework of national legislation, but also internationally. The last, despite the fact that for more than 200 years there is a fierce struggle against slavery, he still exists pulpit. According to the United Nations, approximately 12 million people live in slavery conditions in Latin America, Africa, South Asia.[5.30-33]

For the first time, the activity of combating trafficking in Persons was embodied in the content of the convention “threat of trafficking in Persons and exploitation in prostitution”, adopted in 1949. But this agreement has received many criticisms and has not been accepted by most states because it has not given a satisfactory definition to the trafficking of trafficked people, the majburlovymi is free of shortcomings and prostitution is a cross-border human trafficking.

2.RESULTS AND DISCUSSION

In the process of research, the same thing is revealed that the legal and criminological problems associated with kidnapping in Uzbekistan are extremely complex, and most importantly,eksex problems.

The conducted research shows that the active, comprehensive use of the opportunities of law enforcement agencies makes it possible to take timely measures to prevent crimes such as kidnapping, to predict the actions of the perpetrators of the criminal acts committed, to prepare and to commit them.

It is necessary to know the following in the study of the definition of future directions aimed at improving the Prevention of criminological problems, crimes:

- the use of positive experiences in the prevention activities of law enforcement agencies and public organizations;
- what is justified from the theoretical-practical point of view, all-round consolidation in their practical activities;
- to reflect and take into account at a high level the essence and characteristics of crime prevention in the territorial aspect, its objectives, the content and main directions of its occurrence;
- to establish social guarantees of the participants of social relations that arise in connection with the commission of a crime, to give the most important of them the power of law.

For the successful solution of the task of crime prevention, it is very important that such a description covers as much as possible the criminological symptoms that allow to algorithm the work of obtaining the receipt of crimes, the most effective profilactic measures and the choice of means for their implementation.

It is important to note that when considering the elements of the description of crimes related to trafficking in Persons, law enforcement bodies should take priority.

The development of the main directions of increasing the effectiveness of human trafficking prevention activities implies the development of a number of directions, which, in addition to the general directions, necessitate the specificity of the activities of divisions in different regions of the Republic. In particular, it is possible to include in the sentence shular the provision of the legal and organizational framework for the cooperation of all state bodies and public associations interested in the Prevention of trafficking in persons. All of them must be inextricably built into a single system of law enforcement agencies in the territories. The study of the set of causes that provoke crime, the personality of the criminal and the environment around him is not only one goal at a time, but also the most necessary conditions for the purposeful Organization of work for the Prevention of crime in general, including human trafficking.

This constitutes the issue of compliance with the law of the most basic problem of activity, including the Prevention of crimes.

The Constitution of the Republic of Uzbekistan proclaimed the highest value of man, his rights and freedoms. It states that the recognition, observance and protection of the rights and freedoms of Man and citizen are the obligations of the state. This means that in the state respect for the individual, the protection of rights and freedoms is the obligation of all state bodies, public organizations and officials.

When considering the organizational basis for the Prevention of trafficking in persons, it is possible to draw a number of conclusions highlighting the characteristics of this institution in practice in different regions of the Republic:

- Prevention the moral content of the activity is often defined in this way that the actions of the offender do not contradict only the right. If a crime has been committed and has not been exposed, then it is necessary to consider that not only the right to crime, but also the morality is

violated, because in such cases the norms of social morality, like the norms of law, will not be implemented. Therefore, the timely and effective implementation of the actions that ensure the Prevention of crimes makes it possible for morality to prevail. Thus, the moral character of such activity is determined mainly by the fact that it is directed to the expressed humanism, which itself is the most effective means of confirming the norms of morality in society;

–when assessing the Prevention of crimes in general from the point of view of morality, it is necessary to proceed from the rules of scientific ethics that there is no pre-conditioned “good” or “bad” means, but there is a necessary tool. The choice of means for its intended purpose is based on compliance with certain parameters;

– it should be necessary to solve the task set before the tool: it is impossible to ensure the achievement of a positive goal in terms of morality in the situation that arose without it;

– the tool must be sufficient to achieve the set goal. The use of the selected tool should allow to effectively solve the task set before it, without involving other tools in this work;

– the chosen tool for the solution of the problem posed to him should not destroy the moral character of the goal, which will stand higher when compared with the task to be solved.

The proposed strategy in the field of solving the task of preventing crimes related to human trafficking, in our opinion, will help to raise the development of law enforcement systems and the improvement of its activities to a qualitatively new level.

Of course, it is necessary to struggle with solidarity of the countries of the world with the persistent Prohibition of such criminal acts. In the legal norms of each state, measures aimed at combating human trafficking are established, and in their implementation, special agencies require a period of serious approach.

The USA Department released a report on "human trafficking" in 2005 year. In this report, "trafficking in people" is becoming a rapidly growing criminal case around the world. This path of cholera, which has become a form of slavery of our time, has shared the lives of 600 thousand to 800 thousand people, and 14 states that do not fight against human trafficking, are individually monitored. In conclusion, taking into account the above information, we can say that more and more countries are trying to solve this problem, are in agreement with the measures taken. But in order to completely eliminate this plague, every country must strive harder.

Summing up from the above points of view, it is necessary not only for all countries, our government, ourselves, our own children, our sisters, our brothers and sisters to act in order to eliminate the plague of "human trafficking", but also to warn against deception. It is also desirable to create a climate of meaningful competition in the fight against human trafficking. In this regard, the definition given by Sh.Negmatova to spiritual competition clarifies the issue, "spiritual competition is the formation of an enlightenment-ideological, religious, political, legal, economic vision, which consists in understanding and understanding the events, processes taking place in the mutual Nature, Society, human thinking, in order to establish the goals of living, in order to find solutions to problems, to, they are told of their behavior towards achieving a certain advantage by promoting and promoting them." This means that due to spiritual poverty in people, the victimization of human trafficking has increased.[6.108]

In particular, the reason for the increase in human trafficking is moral poverty, low intellectual culture. In particular, the reason for the escalation of human trafficking is also the neglect, neglect and bitterness of malpractice.

The problem of human trafficking is caused by the lack of tolerance in people. If there was a principle of tolerance in people, then greed, humiliation of others, eating someone else's right, hitting the ground of human dignity could not be observed. After all, tolerance combines the properties of endurance, tolerance and endurance. According to the principle of tolerance, everyone has the freedom of thinking and remains in his own way of thinking, thinking. But at the same time it is distinguished by respect for the way others perceive the worldview and way of thinking. [7.171] It means that shaping tolerance thinking also serves as a moral criterion in the fight against human trafficking.

One of the issues that was found to be resolved internationally was the crimes related to trafficking in people, their prevention and the fight against these crimes. The most preliminary document aimed at ensuring and protecting human rights was the UN Universal Declaration of Human Rights, adopted in 1948 year. [8] exactly one year after the adoption of the Universal Declaration of Human Rights, on December 2, 1949, the United Nations adopted the Convention Against Trafficking in Persons and the use of prostitution by third parties, an international instrument aimed at preventing trafficking in persons. [9] to date, such a phenomenon as trafficking in people has become an integral part of transnational organized crime, and is now so widespread around the world that the number of people suffering from it, according to the analysis of experts from the UN and the International Organization for Migration, is millions.

Illegal use of people, their migration and resistance to trafficking in people requires the collaborative effort of several government agencies. Accordingly, there will be a need to identify the state bodies and their authorities that carry out activities to counter trafficking in people. In conclusion, from the last century to the Twenty-First Century, the three most dangerous types of transnational crime were "inheritance". The first of them - the spirit of international terrorism and violence under the guise of religion, the use of force, that is, extremist, fundamentalist, separatist attacks, the second-jinai associations engaged in narcobusiness or narco - traffics, the third-human trafficking, traffic-engaged in large-scale criminal organizations are increasing year by year.

Let's not analyze what kind of crimes listed transnationally crime, that is, do not choose a territory or border, it will be known that all of them are an obvious obstacle to the civilization of mankind, pose a serious threat to the development of society and the development of states.

That is why the problem of combating any form of trafficking in Persons, among the most serious crimes associated with organized crime, in particular international terrorism, drug trafficking, illegal sale of weapons, is of paramount importance even in our national legislation.

At the moment, it is no secret that in the whole world there is a growing number of crimes such as discrimination of people, non-recognition of their rights, trafficking in people. The real situation in the current age of extinction, which is becoming more and more dangerous to swallow any society from its own domain, dictates the need to further complicity in such a crime, to establish mutually independent cooperation within the framework of state and international organizations and to unite forces in this regard.

The self-governing bodies of citizens in the localities, non-governmental organizations, enterprises, institutions and organizations, officials, as well as the state bodies that carry out activities to combat trafficking in persons, as well as provide necessary assistance. Of course, the ongoing propaganda and propaganda work will give its effect, with the help of which it will be possible to take over these crimes, without doubt, to achieve a decrease in the number of victims. A thousand unfortunately, to dispose of human life, to turn a person into a bought-sold item is becoming a source of constant activity of some savage and notorious persons, as well as a possible source of income. But all measures are being taken in order to fight this disaster seriously in our country. In this regard, all legal grounds have been created. And from us it is always necessary to be vigilant and considerate. Therefore, we do not have time to be indifferent to this scourge, which is ravaging the life and future of the people next to us.

"In turn, non-governmental organizations in the fight against trafficking in human beings should carry out certain goals and objectives, in particular; 1) to raise the level of awareness of society about the dangers and scale of trafficking in human beings, as well as to have a proper attitude towards the global threat of this reality; 2) to promote the improvement of the National; 3) assistance in information, scientific and organizational support of all subjects participating in projects and programs to combat trafficking in human beings; 4) assistance in all-round development of cooperation of all layers of society in the fight against trafficking in human beings is necessary. [10.149]

3. CONCLUSION

1) In the Criminal Code of the Republic of Uzbekistan, the crime of trafficking in Persons is expressed in addition to the crime with the purpose of exploitation of people in terms of objectivity. Human trafficking or sale, acquisition and exploitation of people yollash, transportation, topshirish, concealment or acceptance is a phrase from a separate criminal context. Therefore, even in the Law (Criminal Code), these acts must be expressed in separate articles.

2) In order to increase the effectiveness of the fight against these crimes, it is necessary to improve the methods of identification of persons who go from our republic to foreign countries and are engaged in prostitution and annexation, to develop international cooperation in this regard.

3) Since human trafficking is mainly committed by the method of deception, it is necessary to pay attention to the content of offers, ads that promise a good job abroad in the media, in the internet system, it is necessary to set out to check their activities.

4) the crime of trafficking in Persons is committed in our republic by taking the nearest Army, which in many cases is easy to deviate citizens, to the states and then to the countries of the far abroad, therefore, it is necessary to determine the specific goals of our citizens who are leaving the army to the states, to cooperate with law enforcement.

5) instead of the question "use" in the first part of Article 135 of the Criminal Code of the Republic of Uzbekistan, the words "exploitation" and "use of people" in the eighth section of the code, called the legal meaning of terms, should be changed to "exploitation of people".

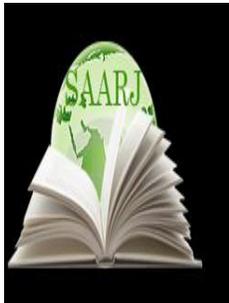

6) The question "cheating" should be entered after the word "stealing" in Paragraph a of the second part of Article 135 of the Criminal Code of the Republic of Uzbekistan.

7) The crime committed by the method of theft under Article 135 Part 2 “a” of the Criminal Code should be distinguished from the crime of kidnapping provided for in Article 137 of the Criminal Code. For this reason, it is proposed that the first part of the Criminal Code should be described in a new edition:

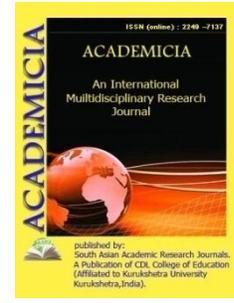

It is found that” kidnapping in the presence of symptoms provided for in articles 135 and 245 of this code”.

ABSTRACT

In the article, the issues of interdependence of the reforms carried out in Uzbekistan to the civil culture are analyzed by social philosophy. Attention was paid to the role and importance of pre-school educational institutions, general secondary, special secondary, higher education and scientific research institutions in the development of cultural culture of the younger generation in Uzbekistan, and views and comments on the content and level of development of cultural culture were expressed.

KEYWORDS: *Social Development, Cultural Culture, Modern Technologies, Innovative Ideas, Increasing The Intellectual Potential Of A Person, Raising The Madanical Culture Of Citizens, Innovative Culture In The Field Of Education And Science.*

INTRODUCTION

The achievements of Science and technology and innovative ideas have laid the foundation for the development of society in any era. The current period is considered to be the age of Science and innovative technologies, and it is impossible to imagine the current period without modern technologies, innovative ideas, a wide range of information and a high level of culture in Citizens. In the process of economic reforms carried out in the economic life of society in Uzbekistan, great attention is paid to the issue of increasing human potential, its material and spiritual stimulation, raising the level of citizens' social culture

In the global environment of the world economy, the innovation activity of Uzbekistan is directly related to the macroeconomic and active investment policy implemented by the state effectively and consistently, the development of foreign experience and the further attractiveness of the investment environment, and the formation of a social culture in the citizens of Uzbekistan is carried out in connection with the innovation. Today, innovation is an innovation introduced to

ensure the efficiency of processes and quality growth of products due to the demand of this market, which is the final result of human intellectual activity, its fantasy, creative process, discoveries, inventions and rationalization. If we look at the experiences of developed countries according to the democratic principles in the history of mankind, the results of the current development processes, we can see that the basis of socio-economic life is not only science, technology, technological development, but also the intellectual potential in their organization, the renewal of thought in complex historical periods is of great importance. In a word, today the world is being built with the help of the mind and intellect of humanity, at the same time, the negative or positive of the achievements is also the result of the actions. [1.34]

Intellect (in Latin intellectus-knowledge, understanding, perception) is the intellectual ability of a person, the ability to reflect and change life, the environment in consciousness, to think, to read – to learn, to know the world and to accept social experience; the ability to solve various issues, to come to a decision, to behave wisely, to foresee events. The structure of intelligence includes psychic processes of perception, memory, thinking, speaking, etc. [2. 139]. Today, the role and importance of intellectual activity and culture in the daily life of a person is increasing. In the process of Education, Labor, communication, a person lives, assimilates and socializes under the influence of factors such as social experience, knowledge, various relations, moral norms, political idea, national ideology, and in this process is formed as a person. Self-control, self-education, feeling of high responsibility, fighting for an idea, having a strong sense of self-esteem, freely expressing one's thoughts, socio-political activity and having a social culture are signs that are characteristic of a person. The issue of raising a virtuous and harmonious person in the conditions of transition to market relations in Uzbekistan has become an urgent task, and the reforms carried out in the field of education and training in our country have been entrusted with the task of forming such a person. A person occupies a special place in the system of democratic values of the Earth, freedom is a necessary condition for a person to achieve spiritual perfection. Man, thanks to freedom, manifests his creative abilities, fully feels personal responsibility and human duty. The person erkinligi first of all, morality, word, conscience, the press erkinligi will come true on the basis of. In a democratic society, the legal basis for the freedom of a person is created, and other spheres of science, art, religion, law and social consciousness are improved on the basis of spiritual culture. As the spiritual potential of society grows higher, people tend to treat freedom as an opportunity for spiritual development. In the formation of a perfect person, values such as spirituality, morality and enlightenment occupy an important place, and on the basis of these values, noble human qualities and spiritual culture are formed in people. In Article 29 of the Constitution of the Republic of Uzbekistan, Everyone has the right to freedom of thought, speech and religion. Everyone has the right to receive and disseminate the information he wants, [3.12], it says.

In the process of reforms in Uzbekistan, great attention is paid to the development of citizens' intellect and culture, Strategy of Action on the five priority directions of development of the Republic of Uzbekistan in 2017-2021, as well as the State program "Year of active investment and social development", The importance of increasing the intellectual culture of citizens is also important in such important programs and plans as "Every family is a businessman", "Our future for youth", "Five positive initiatives". is on the agenda. The strategy of action is to expand the network of pre-school institutions in the priority areas of education and science development, to radically improve the conditions for comprehensive intellectual, aesthetic and physical

development of children in these institutions, to significantly increase the availability and access of children to preschool education; Upgrading the level, etc. The Strategy also outlines the key objectives of improving youth policy, educating physically healthy, mentally and mentally developed young people with independent thinking, devotion to the Motherland, deepening democratic reforms and enhancing their social participation in the development of civil society; to support and realize the creative and intellectual potential of the younger generation, to promote healthy lifestyles among children and youth, and to involve them in physical culture and sports [4. 26].

Preschool, general secondary, secondary special, higher education and research institutions play an important role in the development of the intellectual culture of the younger generation in Uzbekistan. New kindergartens, schools, universities, branches of prestigious foreign universities, cultural and sports facilities, schools of Temurbeks, Presidential schools, schools of creativity are created in our country. It promotes the training of a new generation of capable professionals [5. 384].

Today, educational development is not only a means of training specialists, it is also raising the general intellectual, technological and cultural level of society, supporting the desire for innovation and development, and instilling in the public consciousness the modern way of life in society. In Uzbekistan, the role of the education system and, above all, the institutions of higher education is invaluable in developing the intellectual potential and intellectual culture of young people.

As it is known, today in Uzbekistan the youth under 18 are more than 11 million 720 thousand, that is 40% of the population and 60 million 60% of the population under the age of 30. It is obvious that the issues of increasing the intellectual potential of the younger generation remain one of the priority tasks of the state policy. On April 20, 2017, President Shavkat Mirziyoyev issued a decree "On measures for further development of the higher education system", which defined the following as the most important tasks of further development of higher education:

- Optimization of specialties and specialties in higher education institutions, taking into account the requirements and needs of programs implemented in the regions and industries, the prospects of integrated development of economic sectors and territories;
- Creation and wide introduction of new generation textbooks in higher education, provision of higher education institutions with modern educational-methodical and scientific literature, including the constant updating of information resource centers on the basis of acquisition and translation of the latest foreign literature;
- Continuous improvement of professional skills and qualification of pedagogical staff, organization of internship of teachers and researchers, training of graduates of higher educational institutions on the basis of PhD and foreign master's programs;
- Strengthening the scientific potential of higher education institutions, further development of scientific research in higher education, enhancing their integration with academic science, increasing the effectiveness of the teaching staff, attracting talented students to research activities;

- to strengthen the spiritual and moral content of higher education, to instill in the hearts and minds of students the idea of national independence, a sense of devotion to the high spirituality and patriotic traditions of our people;
- provision of higher education institutions with modern information and communication technologies, expanding access to electronic catalogs for students, teachers and young researchers worldwide for advanced educational resources, scientific literature and databases.

In order to ensure the effective solution of the tasks set in the Resolution, a comprehensive program for the development of the higher education system for 2017-2021 has been approved in order to qualitatively and radically improve the level of higher education, strengthen and modernize the material and technical base of higher education institutions. In accordance with the program, a comprehensive development program for 2017-2021 has been approved. In accordance with the program, construction, reconstruction and overhaul of 180 educational, research and laboratory buildings, sports facilities and social and engineering facilities in 48 higher education institutions in 2017-2021. Besides, 400 educational laboratories in 53 higher education institutions will be gradually equipped with modern teaching and laboratory equipment, and 7 higher education institutions will create scientific laboratories in collaboration with all higher education institutions. Most importantly, this program is based on the establishment of cooperation with each higher educational institution of the country with the leading scientific and educational institutions of the USA, UK, France, Italy, the Netherlands, Russia, Japan, South Korea, China and other countries. . This year, it is planned to involve more than 350 highly qualified foreign teachers and scholars in the educational institutions of the country and involve foreign scholars, teachers and specialists in the educational process of universities and network centers for retraining and advanced training of teachers of Uzbekistan. mechanism has been greatly simplified [6.336].

If all the states that have built a democratic, democratic state and a just civil society, building a well-developed world economy, a complete socio-political system, an improved ideological and spiritual life, have achieved these goals, first of all, science, culture and education. The education system, scientific achievements, cultural development, the priority of universal values and national nligiga its citizens on the basis of intellectual consciousness and culture, legal consciousness and culture, political consciousness and culture, economic and cultural development of the mind as a priority.

Emphasizing that the issue of upbringing the young generation is one of the most urgent issues facing all humanity, President of the Republic of Uzbekistan Shavkat Mirziyoev addressed the following issues in his speech at the 72nd session of the UN General Assembly. Today's young people are the largest generation in the history of humanity because they number 2 billion, "says Shavkat Mirziyoev. - The future of our planet depends on the well-being of our children. Our main task is to create the necessary conditions for young people to realize their potential and to prevent the spread of the idea of violence. We consider it necessary to develop multilateral cooperation for social support of young generation, protection of its rights and interests. In this regard, Uzbekistan proposes to develop a general international legal document - the UN Convention on the Rights of the Youth, aimed at the formation and implementation of youth policy in the rapidly developing environment of globalization and information and communication technologies. [7. 252]. The issue put forward by the President of Uzbekistan "to

create the necessary conditions for the youth to realize their potential" also reflects the issue of raising the intellectual culture of young people.

As the development and enhancement of the intellectual culture of the citizens of Uzbekistan, first and foremost, are shaped by the educational process and scientific achievements, not every innovation in the education system can be innovative. This is recognized as a failure if the activity is short-term and does not have a holistic system and entails only modifying some elements in a particular system. This process is considered innovative if the activity is conceptually based and results in development of the system or its fundamental change. The purpose of preparation for innovative activity is to improve the teacher's ability to innovate, to develop skills and self-study skills, to conduct lessons and extracurricular activities using new pedagogical technologies and interactive methods. When a teacher is ready for innovation, bringing the latest in the classroom to an exciting and engaging learning process, it guarantees the quality and effectiveness of the learning process. One of the most important issues in innovation is the personality of the teacher. The teacher must be an innovative creator, be creative, use pedagogical innovations and take an interest in pedagogical innovations. The innovative activity of a teacher is continuous innovation, which is formed and improved over time. Structure of innovative activity - creative approach, creative activity, technological and methodological preparation of innovations, new thinking and communication culture.[8. 48]

Intelligent culture, in turn, depends on innovative thinking, and its role and importance in science and practice depend in part on the development of heuristic approaches and approaches. Our research shows that innovative thinking is new, that is, in addition to traditional methods of inventiveness involving relocation, transmission, merging and separation, stimulating imagination: a system of tight deadlines, free discussion of problems, and creating an atmosphere of controversy, making fun of the assumptions. This includes liberalization of approaches to scientific thinking, probability, and intellectual game aspects. Innovative thinking has the feature of ijdoot science, which is the direction of research. The main task of creativity is to build a model of the new search process for a particular system, giving the same process details.[9.172]

In the study of creative thinking, which manifests itself in such activity, researchers began to distinguish between fertile and restorative, reproductive and innovative types of thinking. In our opinion, thinking, as a priority activity, is aimed at the production of new ideas, concepts and projects, and has the basis to define it as an innovative thought, and not simply productive one. The fact is that in every way of thinking there is an idea (image, idea and hoc.) the process of formation exists. A developed idea can be a new or restorative idea for the owner of thought. In a certain sense, the term productive thinking has a broader meaning than the term "innovative thinking". On the basis of the formation of non-directional, sectoral innovation thinking is aimed at the development, implementation and dissemination of new ideas, after the activity becomes a routine process, creative thinking rises to the level of productive, creative activity, that is, productive activity. In this way, cognitive, intellectual innovation is formed.[10.571]

Today many countries around the world are trying to make as much education as possible. Today's innovations require an organized, planned, mass approach, and innovations in education and science are long-term investments that accelerate the development of society. In order to stimulate innovation and nurture a person who wants to innovate, education and science itself must be innovative, with a spirit of creativity and atmosphere.

Since the first years of independence, care and attention of young people in our country has been considered as one of the main and priority directions of the state policy. Because young people are our future, - says President Shavkat Mirziyoev - The Law of the Republic of Uzbekistan "On State Youth Policy" was recently adopted to further deepen state policy in this area. All of this gives its results today. Our young people are making great strides in business, science, culture, arts, literature and sports. It gives us great confidence in the future of our country, and will continue the good works of our great ancestors for future generations [11.32-33]. It is also required by the President, Shavkat Mirziyoev, that perfect people, who are making great strides in the fields of business, science, culture, art, literature and sports, must be highly intelligent people.

It is clear from the international experience that the strengthening of intellectual culture depends on a system of free and open education. The education system under state control, the separation of the school from the church, universal free education - all this is the greatest achievement of social progress. But everything has its flip side: in this case, it is too much unification, which applies to teaching itself, and to programs, especially in such subjects as literature, history, social studies, geography, and the exam system. One cannot help but see the danger in an excessive appeal to authorities, in a certain narrowing of the scope of discussions and the intellectual courage of conclusions at the age when the formation of beliefs takes place. In old China, the system of examinations for a position led to mental stagnation, to the canonization of the reactionary sides of Confucianism. It is very undesirable to have something like this in modern society. [12. 12]

The notion of intellectual culture has a theoretical approach developed in the sociopolitical and philosophical sciences, in addition to the practical aspects related to the processes taking place in the life of society today. The theoretical framework of the concept of intellectual culture helps to integrate it into the life of society and to mobilize people for future goals. In the philosophical definition of intellectual culture, Intellectual culture is the level of personal development that involves the acquisition of spiritual wealth, the harmony of various knowledge, the independence of thinking, the understanding of the supremacy of universal values, antisocial approach and evaluation, the active pursuit of knowledge and creative approach to work. Intellectual culture includes a range of knowledge and approaches in the field of intellectual labor, which include the ability to determine the purpose of cognitive activity, its planning, the implementation of different cognitive processes, and the use of resources. The process of formation of intellectual culture is an integral part of children's mental development that involves the formation, transformation and development of mental activity under the influence of biological and social factors. To understand the essence of intellectual culture, it is necessary to consider it in combination with the process of intellectual development. In different historical periods, intellectual culture is defined in the context of the mental activities, knowledge, worldview, goals and objectives of the people of that time. The development of science and technology in the history of mankind has influenced the rise of intellectual culture. The emergence of new forms of intellectual culture does not mean complete renunciation of old forms in the course of development, and the positive aspects of the old intellectual culture in the form of cultural heritage remain in the dialectical denial of philosophy. At every next stage of development, the intellectual culture, tested by life and practice, is preserved and evolves, displaying all the

positive aspects. The essence of intellectual culture develops in the light of philosophical methodology.

Problems of formation of intellectual culture P.Ya.Galperin and N.F. Talizina , it has been studied in students' research on the processes of formation of intelligent activity, in studies of , V.V.Davidov and I.S.Yakimanskaya in the directions of improvement and personal orientation in education. V.V.Davidov believes that the intellectual culture of schoolchildren is formed by the development of theoretical thinking in them. I.S.Yakimanskaya believes that the development of individual cognitive capacities is determined by opportunities for self-development and self-development. N .A. Menchinsky, D.N. Epiphany, Z.I. Kalmikova try to study the ways of cognitive activity in the aspect of educational development, while V.V.Rubtsov and G.I.Tsukerman develop the theory of interaction in educational activity have been substantiated by [13].

Intellectual culture is the ability to solve extraordinary life, professional tasks, the mental abilities of a person, his emotional, spiritual state, it is a combination of a general culture and a culture of mental work. The structure of intellectual culture includes human intellectual activity, which includes four critical components: logical thinking, intelligence, creativity, critical thinking. The concept of intellectual culture encompasses a totality of ideas about educational potential, about the mechanisms of its reproduction and about its implementation in industrial, economic and social innovations. [14.99]

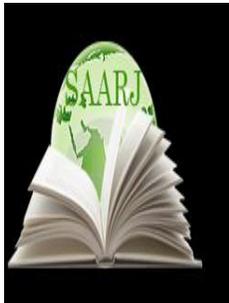

Today, in the process of building a democratic legal state and civil society in Uzbekistan, much attention is paid to the restoration of rich historical spiritual heritage and national values. The processes of national self-consciousness, revival of historical memory, increasing the national pride and dignity of citizens are accompanied by the reforms in the field of education, achievements in the field of science and culture. shows positive effects.

As a product of intellectual innovation is introduced to society in the innovation, it must first be used and benefitted in the socio-economic, spiritual and cultural life of the people. To do this, this product of intellect must be based on the principles of culture, humanism and ethics.

ABSTRACT

The present work deals with designing and analysis of crane wheel of E.O.T cranes that runs on a rail span of 34 meters. Weight of crane is 150 T and working load of 16 to 20 T. E.O.T crane consists of 8 wheels and all these wheels are subjected to total load of crane (170 T). hence wheels are subjected to more wear and tear. To overcome this problem, different parameters like wheel diameter, width of tread, depth of flange and thickness of guiding wheel flange at the base, are to be adopted carefully. Crane wheels have straight tread. To guide the crane properly and to prevent its derailment, they have flanges. In case of flangeless wheels there are guide rollers on both sides of track rails. The wheels are mounted in such a way that they enhance /facilitate removal and replacement will be easy. The wheel tread width is greater than rail head by such an amount which can facilitate for known variation in the gantry rail alignments and gantry track span dimensions.

KEYWORDS: Hoisting Assembly, Diameter, Forged.

INTRODUCTION

List of notation

p= pressure between wheel and rail, kgf / cm²

P= wheel load, Kgf

C_1 = Speed factor.

C_2 = Life factor

K_e = Useful width of rail head, cm

D = wheel diameter, cm

p_a = Allowable contact pressure, Kgf / cm²

$K_e = k - 2r_1$ (flat rail)

$= k - 4/3 r_1$ (Railway rail)

K = width of rail, cm

r_1 = corner radius of rail head, cm

3. ESSENTIAL PARTS OF E.O.T. CRANE

Sl.no.	Name of the part	Quantity
1	Bridge	2
2	End carriage	2
3	Wheel of the bridge	At least 4
4	Crab	1
5	Hoisting assembly	At least 1
6	Wheel of crab	At least 4
7	Bottom block assembly	At least 1
8	Wire ropes	At least 1
9	Rail for long travel	2
10	Rail for cross travel	2
11	Operators cabin	1

4. Important Design Parameters

4.1 Maximum Load: it is necessary to arrange for second hoisting machinery, called the auxiliary hoist, to lift a much lighter load. If the load at which the crane is operated in general is considerably less than the maximum load, an auxiliary hoist may be used.

4.2 Span of the crane: The distance between the centre to centre of the gantry rails over which the wheels on the bridge run.

4.3 Height from floor to gantry rail level If the crane is required to lift out of pits or from below the floor level, particulars should be specified.

4.4 Class of work of the crane: classification shall be determined in accordance with the provisions of clause 5 of IS: 807-2006

1. The working period is short if the crane is operated for less than 500 hours per year. Otherwise, it is long.
2. The effective load is high if the crane is used to lift loads greater than two third of its safe working load on more than one thousand occasions per year. Otherwise, it is low
3. The dynamic effect may be considered low if the speed of traveling of both crab and bridge or hoist is each less than 100m. per minute. If speed of operation is higher than this, the dynamic effect is high.

4.5 Operating speeds under loaded condition

Capacity In tons	Slow			Medium			High

Values of wheel diameters IS : 4137 – 1985

The diameter so calculated shall be selected from the following preferred diameters:

315, 400, 450, 500, 630, 710, 800, 900, 1000 and 1120 mm.

Allowable pressure, p_a , kgf / cm²

Material of wheel	p_a
CI	28
Cast or forged steel UTS 45	43
Steel UTS 50	50
Steel UTS 60	56
Steel UTS 70	65
Hardened Steel	65

7. DESIGN CALCULATIONS:

GIVEN DATA:

Weight of EOT crane = 150 T

Lifting capacity 16 to 20 T

Number of wheels = 8

Wheel diameter = 630 mm

Maximum speed of crane = 150 m/min

Relative operating period of travel drive, % = over 63%

TO FIND:

$p < p_a$

As per given data design is safe or not by taking 630mm wheel diameter

SOLUTION:

Weight of EOT crane = 150T

Maximum Lifting Capacity = 20T

Total weight of crane = 170 T

Maximum speed of crane = 150 m/min

$V = \pi DN$

60

$V = 150 \text{ m/min} = 2.5 \text{ m/sec}$

$\pi = 22/7$

$D = 630 \text{ mm} = .63 \text{ m}$

$N = ?$

$V = \pi DN$

60

$$2.5 = \frac{22}{7} * .63 * N$$

$$60$$

$$N = 2.5 * 60 * 7$$

$$22 * .63$$

$$= 76 \text{ rpm}$$

So C_1 Value from data book.

For 80 rpm of wheel

$$C_1 = 0.87$$

For 71 rpm of wheel

$$C_1 = 0.89$$

By interpolation C_1 value for 76 rpm of wheel.

$$C_1 = 0.881$$

From data book

C_2 for over 63%

$$C_2 = 0.8$$

Allowable contact pressure from data book for hardened steel.

$$p_a = 65 \text{ kgf / cm}^2$$

Crane consists of 8 wheels and all these wheels are subjected to load of crane.

So P_{\min} = weight of EOT crane

$$= \frac{8}{8} 150 \text{ T}$$

$$= 18.75 \text{ T}$$

P_{\max} = weight of EOT crane + lifting Load

$$= \frac{8}{8} 170 \text{ T}$$

$$= 21.25 \text{ T}$$

=> From data book $P = \frac{P_{\min} + 2 P_{\max}}{3}$

$$= \frac{18.75 + 21.25 * 2}{3}$$

3

$$= 20.416 T = 20416 \text{ Kg.}$$

From data book

$$K_e = k - 4/3 r_1$$

From IS : 3443 – 1980

K = width of rail = 100mm of ISCR 100

$$= 10 \text{ cm}$$

r_1 = corner radius of rail head

$$= 8 \text{ mm of ISCR100}$$

$$= 0.8 \text{ cm}$$

$$\Rightarrow K_e = k - 4/3 r_1 = 10 - 4/3 (0.8)$$

$$= 8.933 \text{ cm}$$

$$D = 630 \text{ mm} = 63 \text{ cm}$$

$$\Rightarrow p = \frac{P}{C_1 C_2 D k_e} < p_a$$

$$= \frac{20416}{0.881 \times 0.80 \times 63 \times 8.933}$$

$$= 51.471 \text{ Kg / cm}^2$$

$$p = 51.471 \text{ Kg / cm}^2$$

Hence the obtained pressure between wheel and rail is less than allowable contact pressure.

Hence preferred diameter of 630 mm crane wheel is accepted safe design parameters

As per Indian standard width of tread of 630 mm diameter is 130mm

Depth of flange and thickness of guiding wheel flange at base is given below as per Indian standards which are determined by the crane manufacturer

FLANGE DIMENSIONS		
Diameter of wheels , mm	Depth of Flange, mm	Thickness of guiding wheel flange at base, mm
From 300 up to 500	20	20
Above 500 up to 1000	25	25
Above 1000	30	30

Depth of flange of 630mm diameter = 25mm

Thickness of guiding wheel flange at base of 630mm diameter = 25mm

8. ANALYSIS

The crane speeds are varying from 50 m/min. to as high as 150m/min. in case of shipping cranes. The details speeds are as shown in the table.

Sl. No.	CRANE	SPEED m/min	
		LT	CT
1	DAEWOO 20/5T	80	50
2	DAEWOO 50/10T	80	50
3	JESSOP 16&20T	150	60
4	BRAITHWAITE 10/7.5T	60	50

- 1) These cranes are very vital.
- 2) These are directly linked with production.
- 3) These are having a huge number of wheels.
- 4) The travel speeds are very high.
- 5) They are engaged continuously.
- 6) The long travel distances are high, nearly, 1.2 km.

They are subjected to thermal stresses, being operated in hot zone

Crane wheel flange wear is inevitable and unavoidable and prolonging of crane wheel life is very much important for uninterrupted operation of cranes and this can be achieved by taking corrective and careful measures at various stages.

- 1) At design stage
 - a) Careful selection material.
 - b) Providing correct Heat treatment process.
 - c) Proper thickness and height of the flange.
 - d) Better clearance between flange and the rail.
- 2) At the time of erection
 - a) Proper fixing and alignment of wheel.
 - b) Maintaining of square ness of crane structure.
 - c) Proper laying and alignment of gantry and rail track.
- 3) In the course of maintenance.
 - a) Periodical lubrication of track and wheel flange.
 - b) Proper working long travel mechanism.

- c) Proper condition of electrical brake controls
- d) Proper fixing of wheel and wheel bearings.
- e) Periodical checking and realignment in time.
- 4) While operating the crane.
 - a) Smooth braking while stopping.
 - b) Avoid hitting of bay end stoppers and adjacent cranes
 - c) Avoid dragging of loads / wagons
 - d) Avoid hitting of the billets and pulling of cobbles.

As per ISO 9002 procedures we are maintaining inspection reports on monthly basis and yearly basis, which includes regular checking of wheel flange thickness. Basing on the above inspection as and when the flange thickness reduces 50 % of the original thickness, we plan to replace the wheel assembly, giving due importance to the wheel tread. In brief the common reasons for replacing a crane wheel are,

- a) Flange thickness wear out,
- b) Tread wear out,
- c) Failure of bearing, and
- d) Failure of axle.

wheels replaced due to flange thickness wear out and tread wear out comes under preventive maintenance. Failure of bearing and failure of axle comes under breakdown maintenance. The wheels changes occur in the period of January 2002 to December 2007 are as summarized below.

9. SOLUTIONS

1. MISALIGNMENT OF CRANE WHEEL

Crane wheels are generally mounted on live axles fixed with antifriction bearings. The housings are provided with guides which match with corresponding seating in crane structure, when fixed. In case wheel trucks are used, wheels fixed in the seating of the truck in turn is fixed to the crane by a pin over which it can freely oscillates depending up on the track condition.

The perfectly aligned wheel will have its horizontal axis and its vertical axis perpendicular to the rail axis and its vertical axis will be in the same vertical plane passing through rail vertical axis.

Minor deviation in the vertical axis does not have much effect on the wheel performance. The misalignment of horizontal axis will cause the flanges of the wheel to grind with the rail resulting in faster wear out.

Excessive deviations may even lead to raiding of the wheel on the rails if the wheel flanges are worn out badly. When new wheel assemblies are fixed, it should be checked that the wheels are properly seated in both the vertical and horizontal planes.

Reasons for misalignment of wheels

- a) Improper seating of wheel bearing housing.
- b) Loose fixing bolts of bearing covers.
- c) Deformation of end girders.
- d) Lack of proper jacking pads.
- e) Wearing wheel truck and pin.
- f) The variation in the wheel span.
- g) Improper parallelism and perpendicularity of the wheels.

Detailed Explanation

- a) Improper seating of the wheel bearing housing results the gaps at guides. The housing should be made to sit properly and gaps to be eliminated and fixing bolts to be tightened.
- b) Loose fixing bolts of bearing covers may ultimately lead to misalignment of the wheel. So fixing bolts should be tightened properly and damaged bolts should be replaced.
- c) Deformation of end girders where the wheel is fixed will also cause the misalignment of the wheel. This type of problem in heavy duty cranes occur due to
 - d) Dragging of jamming loads. E.g. Cobble removing, wagons pulling.
 - e) Hitting of suspended loads. E.g. hitting of billets with magnets.
- 3) Frequent collision of the cranes with adjacent cranes or end stoppers.
 - f) Using of lifting jacks in odd positions due to Lack of Proper jacking pads while changing the wheels will cause deformation of end girder. In this case the deformed structure should be repaired and realigned if possible.
 - g) In case of multi wheeled cranes fixed with wheel trucks it is found the housing, where the truck axle is fixed, wear out under the constant loading.
 - h) The variation in the wheel span beyond the norms causes wedging of the wheels with the track and thus resulting in faster wear out of wheel flanges. Normally the tolerance of wheel span is + 5mm. and the difference in the wheel diagonal lengths should be within the tolerance of +5mm.
 - i) To attain proper parallelism and perpendicularity of the crane wheel the diagonality must be maintained within the safe allowable and permissible limits.

j) Method of alignment checking

There are various methods available for checking the alignment of the wheels of EOT cranes. But with practice and experience it is possible to judge misalignment by a simple visual observation of the wheel. The vertical misalignment can easily judge by a plumb line. The horizontal misalignment is worked out by measuring of distances to the wheels from a reference wire stretched perpendicular to the crane longitudinal axis. In a sophisticated method of alignment checking has been adopted i.e. geodetic survey with the help of theodolite. Wheel spans, wheel diagonals, wheel misalignment and skew in crane can be very accurately ascertained by the above method.

9. ALIGNMENT OF CRANE WHEELS

As per I.P.S.S (Interplant standard steel industry)

Description	Maximum permissible tolerance in mm
1. Tilt of wheels (verticality) for LT and CT	1 in 1000mm
2. Parallelity of wheels with track and horizontality for LT and CT	1 in 1000mm
3. Difference in Diagonal	+ 5 + 3
4. Bridge span LK	+ 5 + 3

Span (side A) = 33.997

Span (side B) = 33.987

Skew = Span (side A) ~ Span (side B)

= 33.997 ~ 33.987

= 0.01m or 10mm.

10. MISALIMENT OF CRANE TRACK

Proper alignment of the track is also equally important. Even best aligned wheels of any crane working on a bad track will give poor life. The alignment of the track rails is directly linked with that of the alignment of gantry girders. So proper care should be exercised from the construction stage itself.

Following are the norms of track rail alignment to give the better performance.

- 1) Variation in span.= + 10 mm.
- 2) Max. permissible deviation of crane track rail from centre line = 15mm.
- 3) Variation of track rail levels =1mm/m length.
- 4) Difference in level between rails on both runway girders =max 1mm/m. length of span.
- 5) Wear of rail tread width =10% of original width.
- 6) Rail joints are to be joined closely and evenly.
- 7) Buffers or stoppers should be at equal distance.

11. ALIGNMENT OF CRANE TRACK

The problem of crane alignment can be solved by machining the bottom flange of the rails and realigning the track rail with modified clamping plates to adjust for the best possible alignment. This has resulted in an appreciable improvement in the wheel performance.

Periodical track maintenance involving through tightening of clamp bolts, fish plate bolts, maintaining of joint gaps and replacement of worn out fish plates are very much desired for getting good wheel life. Besides the alignment and levels are to be checked at least once in a year and suitable adjustments has to be done.

Bad track joints result in pitting and dents on the wheel tread and reduces the wheel life. The variation in the temperature results in thermal expansion and contraction. In other words the joints are under thermal stresses and they are getting cracked. Thermit welding of track joints can solve the above problem. Though, thermit welding is costly it can pay back, by improved wheel life and reducing thermal shock loads on girders.

Excessive level difference in track rails across the bay causes shifting of the crane towards one side and the flanges get wear out. Sinking of columns might also causes this, but it is very rare occurrence, releveling of gantry girders in such cases is very much required although this is very major job. The rail track is relevelled .Hence the problem can be reduced to a greater extent.

11. SKEWING OF THE CRANE

The leading ahead of one side wheels to the other side is called skewing of the crane. It can further be explaining of the crane longitudinal axis will become inclined with reference to the track axis instead of being perpendicular to it. This causes wearing out of opposite collars of the diagonally opposite wheels. The wear out will increase with the magnitude of the skewing.

The reasons for skewing as follows—

a) Unequal wheel diameter :

b) Unequal wheel loading :

a) Unequal wheel diameter: Unequal diameter is either due to metal flow at the corner of tread of driving pair of wheels. The side with bigger wheel diameter will lead the crane and cause skewing. The running pair of wheels with equal diameter should be fixed to avoid this. Normally variation in diameter up to 0.02D can be allowed.

b) Unequal wheel loading: Normally all the wheels of the crane should take designed load, when the crane is erected on the gantry. But in course of time it is some times noticed that one or two of the wheels are not taking the load as designed. This is due to the deformation of the crane structure at corner of the wheel support. This deformation causes all the four corners of the crane being not in one /same level. If the off loading is on one of the drive wheel the other drive wheels will lead causing skewing of the crane.

This could be checked by taking the crane to even position of gantry and checking the wheel loads by strain gauges. Use of copper strips can be restored to, which can give fairly good idea of wheel loading by measuring the strain in the strips when placed below the wheels.

Proper loading can be restored, after identifying off loaded wheel, by giving required horizontal packing between the crane end girder and the wheel seating.

Some of the cranes have developed a tendency to skew to one side due to frequent hitting side bye cranes or end buffers. In such cases creating skew in opposite direction is very much helpful. Skewing may occur frequent dragging of jammed loads, pulling of cobbles, hitting of billets. It may also occur, if one side wheels slip, or if the one side of level is appreciably lower than the other side. Hence necessary corrective action to be taken to improve the situation.

FRICITION

Crane wheel flange wear can also be controlled by reducing the friction at the contact surfaces, i.e. between wheel flange and the side of the rail head by using suitable lubricants. Inadequate

lubrication of overhead crane wheel flanges leads to excessive wear and premature failure of the wheels. The flanges are difficult to lubricate since they are not readily accessible. Dry lubricants are more preferred as it will avoid the unnecessary spreading of the lubricant onto the tread and subsequent slippage of the wheel. Some brands of quick drying lubricants are developed which, after application will solidify and will be effective for certain period of time. But these need manual application.

Carbon disulphide sticks are also used for this purpose which were kept pressed against the moving wheel flanges by a suitable fixer with spring arrangement.

We are using graphite grease-5083, as crane wheel lubricant. It requires manual application. It gives very good result for minimizing the wheel flange wear out.

Last but not least as far as possible the worn out wheels which are removed from the cranes can be reused by building up the material on the flange inner surfaces. Metal is diffused on worn out flange surface by arc welding process. Tufalloy-320, welding electrodes are the best suitable material for this purpose. After completing material built up grinding is required to get the smooth surface.

After having seen all the possible reasons causing wear of wheels from the maintenance and operation point view it shall be worth, if the following points also taken due care.

- 1) The wheel housing structure of the crane end girder should be designed adequately strong sections to with stand all forces during the course of operation.
- 2) The end connections of the main bridge with the end girder should be strong enough to with stand all possible forces that might occur either in the normal use or in the accidental abuses.
- 3) The clearance between end girder joint and the rail head should be adequate enough to avoid fouling with rails.
- 4) Suitable jacking pads with adequate jacking clearances should provide.

12. Materials

Materials for crane wheels : (C55Mn35 IS :1570 or equivalent)

Wheels shall be of cast or forged /rolled steel or shall have cast steel Center with steel type shrunk on and registered. The material used shall Comply with relevant – Indian standard as appropriate.

The average surface hardness of wheel tread shall be 350 BHN(Brinells hardness number) and tread and flange should have min hardness of 300 BHN to a length of not less than 6mm.

But in industries after testing the wheels they got the hardness of wheel Around 220-260 BHN. It is also one of the regions to get more wear out of wheel.

If under any unavoidable circumstance wheels of higher hardness or with toughened steel are used, the rate on which they are running shall be heat treated to avoid frequent replacement of the same.

If we use wheels of higher hardness i.e. more than 350 BHN

Then the material becomes more brittle and it leads to crack and set failure of material.

So as per IS they must be in between 300-350BHN.

Material of crane rail:

Chemical composition

Designation According to IS: 1762 – 1974*		C	Mn	Si	S Max	P Max
New	Old					
55C 11	C 55 Mn1	0.50-0.60	0.95-1.25	0.05-0.30	0.060	0.060
55C 12	C50 Mn1	0.40-0.60	0.90-1.45	0.03-0.30	0.060	0.060

The material used shall comply with relevant Indian standards as appropriate.

The average hardness of crane rail shall be 275-280 BHN and

It should not be less than 200BHN. Hence rail track hardness is less than wheel hardness i.e. wheel carries the load and rail guides the wheels.

12. COST OF SAVING

Number of wheel replacements before modifications = 69 per year.

Cost of each wheel = Rs 1,75,000/-

Cost of replacement = Rs 10,000/-

Total cost per year = (1,75,000 + 10,000) *69
= Rs 1,27,65,000

In 2007

Number of wheel replacement after modifications = 37 per year.

Total cost per year = (1,75,000 + 10,000) *37
= Rs 68,45,000/-

Cost of saving = 1,27,65,000 – 68,45,000 = Rs 59,20,000/-

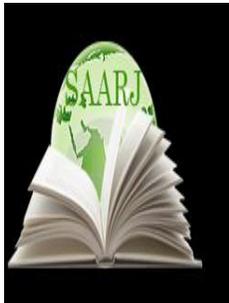

Saving percentage in 2007 as compared to 2006 = cost of saving / total cost of year 2006
= $\frac{59,20,000}{1,27,65,000} = 46.37\%$

13. CONCLUSION

The phenomena crane wheel wear is inevitable and unavoidable and hence could only be minimized by continuous alertness and awareness of the whole system. Each wheel problem has its own specialty and one type of rule or set of remedies can't be used as a thumb rule for all problems. Each has to be studied in the light of above discussion and solutions to be worked out careful analysis.

Hence the design parameters of the crane wheel that have been studied in this project is found to be safe and in accordance with I.S norms . This ensures complete safety and sustainability of the crane wheels.

In huge steel complex like VISAKHAPATNAM STEEL PLANT with ever increasing material handling activity in turn with raising production, the problem of wear can't be ignored. Efforts are being made constantly, by a regular system of watch on the wheel life, supplemented by up to date documentation of all wheel changes with reasons for each and every wheel, which helps in analyzing the causes and to apply the correctives.

ABSTRACT

This article is about the theory previously studied in the course called Linguistics. In a way ties will be established between general principles of linguistics and concrete linguistic facts, in other words, theoretical knowledge will find its application in practice. The field of linguistics may be divided in terms of three dichotomies: synchronic versus diachronic, theoretical versus applied and micro linguistics. According to the micro linguistics view, languages should be analyzed for their own sake and without reference to their social function, to the manner in which they are acquired by children, to the psychological mechanism that underlie the production and reception of speech, to the literary and the aesthetic or communicative function of language.

KEYWORDS: *Linguistics, Discipline, Social Function, Psychological, Mechanism, To Realize, Fulfillment, Satisfaction and Achievement.*

INTRODUCTION

Literature that inspires and educates aims to make society a better place to live in. The audience of a good work of literature should feel uplifted in thought after completing the book. All epics in different languages do this. They convey a message to society through their art.

Though literature is all this, the result of having read a piece of literary work is a sense of fulfillment, satisfaction and achievement. We recognize we are not alone in what we feel and think, for literature is the depiction of universal thoughts. We realize that men and women have the same emotions and react almost similarly cutting through time, space and matter. Literature

intrigues our minds with its allusions, similes and metaphors. When we decipher them, we partake of the creative process. This gives us a sense of accomplishment. [1, 3]

In rare cases, books have had the power to shake the very foundations of society. They lead to paradigm shift of thought and way of living. They inspire whole nations to rebel and change. This is the power of literature. It shapes, it moods and in the process entertains.

The poem is great relaxation. If literature is spiritual rest, honorable literature then is like a treatment of soul that often gets tired and exhausted of everyday worries, problems, and even sorrow. Food for the heart and other better senses of the human species can be given only by literature and other fine arts. They nourish souls and enrich lives. A society or a people who give up on literature do themselves a terrible harm.

It is important to note that subject of the proposed course work was not yet a subject of the broad discussion in study of literature since analysis in this aspect was not subjected to the aggregate. There were only some eyewitness publications about it.

MATERIALS AND METHODS

Every language has a history; and as in the rest of human culture, changes are constantly taking place in the course of the transmission of a language from one generation to another. Languages change in all their aspects, in their pronunciation, word forms, syntax, and word meanings. These changes, mostly gradual in their operation, become noticeable only cumulatively over the course of several generations. [1,3] In studying a foreign language, English in our case, the student inevitably compares it to his native tongue and is often astonished to find great differences not only in the structure of the target language but also in the way ideas are expressed in it.

There is no denying that English spelling is somewhat difficult for a Belarusian learner of English. This is because the written form of the English word is conventional rather than phonetic. Therefore, some phonetic phenomena cannot be explained from the modern point of view without going into the history of the language. When the Latin alphabet was first used in Britain, writing was phonetic. After the introduction of printing in the 15th century, the written form of the word became fixed, whereas the sounds continued to change. This resulted in a growing discrepancy between letter and sound. Hence, such 'difficult' words as *light*, *daughter*, *speak*, *great*, *book* and many others where their pronunciation and spelling differ. Moreover, if you ask a little English boy or girl to write the word *light* (in the meaning of *daylight*) he or she would rather spell it as *lite* because they have not learned its spelling yet .On the other hand, modern spellings show how such words were pronounced in the past. For example, the word *light* sounded as [lix't], which is easy to prove if you compare it with the Belarusian word *лiхmap* (something that produces light). [5]

As far as English vocabulary is concerned, it contains words, which are similar to words found in other languages. For example, English – German (*mother – Mutter*, *father – Vater*, *winter – Winter*, *hand – Hand*, etc.); English - French (*revolution – revolution*, *autumn – automne*, *river – rivière*, etc.); English –Russian (*float – ллот*; флот); English –Belarusian (*glebe – глеба*, *must – мусiць*, etc.). Without going into the history of English, it is difficult to say whether these words are native or borrowings from the above mentioned languages. [5]

English grammar also presents some phenomena, which a Belarusian learner of English will find misleading. For example, the irregular plural of nouns (*man- men*, *foot –feet*, *mouse – mice*, etc),

or the same form for both singular and plural of such words as *sheep, deer, fish*, or the fact that English modal verbs, unlike the other verbs, take no ending –s in the 3d person singular, and many other similar facts. All these things are traced back to a distant past and can be accounted for only by studying the history of the language.

Another important aim of this course is of a more theoretical nature. Study of the history of any language is based on applying general principles of linguistics to the language in question. While tracing its evolution through time, students will be confronted with a number of theoretical questions connected with the language development in general and its aspects in particular. To find answers to these questions, students will have to rely on the theory previously studied in the course called *Introduction to Linguistics*. In this way ties will be established between general principles of linguistics and concrete linguistic facts, in other words, theoretical knowledge will find its application in practice.

While studying the history of the English language we will inevitably have to deal with the history of the English nation considering the ‘traces’ it left in the language development. It goes without saying that a systematic study of the language’s development from the earliest times to the present day will enable the student to acquire a more profound understanding of modern English, its role in our world and perspectives of its future development.

The field of linguistics may be divided in terms of three dichotomies: synchronic versus diachronic, theoretical versus applied, and micro linguistics versus macro linguistics. A synchronic description of a language describes the language as it is at a given time; a diachronic description is concerned with the historical development of the language and the structural changes that have taken place in it. The goal of *theoretical linguistics* is the construction of a general theory of the structure of language or of a general theoretical framework for the description of languages; the aim of applied linguistics is the application of the findings and techniques of the scientific study of language to practical tasks, especially to the elaboration of improved methods of language teaching. The terms *micro linguistics* and *macro linguistics* are not yet well established, and are used purely for convenience. [2, 4] The former refers to a narrower and the latter to a much broader view of the scope of linguistics. According to the micro linguistics view, languages should be analyzed for their own sake and without reference to their social function, to the manner in which they are acquired by children, to the psychological mechanism that underlie the production and reception of speech, to the literary and the aesthetic or communicative function of language, and so on. In contrast, macro linguistics embraces all of these aspects of language.

Every living language changes through time, but no records of linguistic changes have ever been kept, as most changes pass unnoticed by the contemporaries.

Therefore, the main source for the history of any language is written documents that have come down to us. And on the basis of these documents a language history is reconstructed. As for documents themselves, they give a clear picture of the vocabulary and grammar of a certain period. As for phonetic structure, such documents do not always give clear enough information, for, as we have already discussed, sound may change but spelling remains or, as often as not, one letter may denote different sounds, etc. So in this sense written documents may be misleading.

Nevertheless, study of pronunciation of a particular period may be helped by illiterate spellings which are found in private letters and diaries as they are mostly phonetic. (Remember the example with *lite* = light). So they can give a clue to the pronunciation of this or that word.

Some hints are proved by rhymes. For example, careful study of words, which in spite of similar spelling, do not rhyme together, may help to establish phonetic differences hidden by the spelling. For example, a rhyme *light* – *write* gives good reason to suppose that digraph **gh** was no longer pronounced at the time the text was written.

DISCUSSION

In many instances the availability of extant texts is not sufficient to explain some phenomena of the language in question. That is why scholars may resort to studying related languages, (the comparative method) which have older written records as is the case, for example, with Gothic, namely the translation of the Bible made in the 4th century AD, while the earliest documents written in Old English date about 7th century AD. Besides related languages, English can be compared to other languages of the Indo-European family, namely those which came into contact with. For example, Latin and French.

Beowulf is an epic poem written in the Anglo-Saxon language, which was composed in the eighth century and written down circa 1,000 by an anonymous bard. The poem is the oldest surviving epic in English literature.

Part history and part mythology, the long narrative poem, which was written in England, relates the story of a great Scandinavian fifth century warrior, Beowulf, a Geat (Swede) whose fame 'far flew the boast of him'. [2, 4]

The only surviving manuscript dates to around 1010. This manuscript fortunately survived the Dissolution of the Monasteries under King Henry VIII and a disastrous fire which destroyed the library of Sir Robert Bruce Cotton (1571-1631), a keen collector of old manuscripts. On 23 October, 1731, Cotton's home was engulfed in flames which destroyed or damaged a quarter of his library. Beowulf was rescued along with other manuscripts, but its edges were badly scorched. The manuscript is now contained in the British Library at London.

The story related in the poem occurred in the late fifth century, during the century after the Anglo-Saxons had begun to arrive in England, and tells of how for many years a monster by the name of Grendel had terrorized the hall, Heorot, of the Danish king, Hrothgar and his wife Wealhþeow. The monster descends at nightfall, while Hrothgar's court are sleeping, to feed on his retainers.

The poem is written in an alliterative verse, a style typical of Anglo-Saxon poetry. Alliteration is the repetition of initial sounds of words; Anglo-Saxon poetry does not possess stanzic form or rhyme. The mother tongue, from which Modern English descends, Anglo-Saxon, or English, as its speakers knew it, is closely related to Old Frisian and appears like an entirely different language to Modern English speakers.

Beowulf is as Language and Poetics

English is divided into three periods: Old English (ca. 449-1100), Middle English (ca. 1100-1500), and Modern English (ca. 1500-). While many people think of Shakespeare's English as old, Shakespeare wrote and spoke Modern English, albeit, an early form of it. Chaucer's poetry,

including his most famous work, *The Canterbury Tales*, are a good examples of Middle English poetry. *Beowulf*, which probably dates to some time between 700 – 1000 CE, is an Old English poem. Old English is sometimes known as Anglo Saxon.

It would be wrong to believe that the English language just changed from Old English to Middle English in 1100 and from Middle English to Modern English in 1500. These shifts took place over hundreds of years. It is important to realize that the wide-spread notion of a standard language or even of standardized spelling are modern notions only made possible by the printing press. Not only did the printing press made wide-scale distribution possible, it provided the ability to fix language in time on a grand scale, thereby slowing down the process of language change.

However, while English was always changing, the dates 1100 CE and 1500 CE, while approximate, are significant for the English language. Although major grammatical and phonetic changes took place throughout the Old English period, the Norman invasion of 1066 and its resulting influx of French words into the language meant that the English of 1100 was much more different from the English of 1000 than the differences between the English of 900 and the English of 1000. Likewise, while English underwent a number of grammatical and phonetic changes throughout the Middle English period, the fifteenth century saw such a radical change in the pronunciation of English that 1500 serves as a useful date for the shift from Middle to Modern English. [4]

Old English makes use of unfamiliar letters, most of which derive from the runic alphabet, an alphabet used by the Germanic peoples. These letters are "þ" (thorn) and "ē" (eth) (often used interchangeably to represent the "th" sound of "that" and "thin"), "ā" (ash) (the vowel sound in cat), and wynn, which represents "w" and is rarely used in modern editions of Old English texts. If you look at a picture of the first page of *Beowulf*, you can see two capital wynn in the first line. They are the second and fifth letters:

"H[wynn] ÆT [wynn]E GARDE." When looking at the manuscript page, you'll also notice one additional unfamiliar looking letter, "g" which is the letter "g."

While Old English can look foreign at first glance, it can also look and sound surprisingly modern when one knows a few basics. Consider, for instance, the sentence, which is repeated multiple times in *Beowulf*. "g" represents a "th" sound is the "a" in cat, and the "o" in god is pronounced just as if you were saying "go" but holding the "o" a little bit longer than you normally would. Knowing this, it is not hard to recognize the first three words, as "That was good." While that last word may be a little more difficult, it is still recognizable. The "c" in cyning is pronounced as a "k" and the word itself is pronounced just as if you were adding a "ing" to the word "kin" (kin + ing). Once you know how to pronounce cyning, it is not a stretch to see how the pronunciation of the Old English word could have simplified to our modern day "king."

Putting all this together, we can now recognize the Old English sentence to be our Modern English sentence "That was [a] good king."

Poetics

Note: No one translation of *Beowulf* will foreground or even have all the poetic elements that exist in the original Old English. A translation that tries to be true to the alliterative verse may

have done so by ignoring such features as compounding, formulas, and even variation. Likewise, translations that try to represent the phrasing of Beowulf, and thereby preserving a sense of the formulas and variation, will often have little or no alliteration.

Alliteration: Alliteration is the repetition of stressed sounds, particularly consonants from the beginning of words or syllables. Poetically, alliteration can have a similar function as rhyme. An example of alliteration is the tongue-twister "She sells seashells by the sea shore."

Compounding: Old English poetry makes extensive use of compounding, the combining of two words to make a new word. An example is *feorhseoc*, literally "life-sick" (*feorh* = life, *seoc* = sick), which can be translated as mortally wounded. A more common example can be found in the first line of Beowulf: *Gar-Dena*, literally "Spear-Danes" (*gar* = spear, *Dena* = Danes). Compounding may be done to meet the needs of the alliterative meter, as part of a formula, or to make a new word. [2]

kennings: Kennings are a special form of compounding that are metaphoric in meaning. For example, the kenning *banhus* (*ban* + *hus*), literally "bone-house," refers to the human body; *hronrad* (*hron* + *rad*), literally "whale's road," refers to the sea; and *rodores candel*, literally "sky's candle," refers to the sun.

For a more detailed discussion of Old English poetics, including the rhythm of Old English alliterative verse, see chapters 13 and 14 of *The Electronic Introduction to Old English*, in this poem.

The epic Beowulf had been told by the Anglo-Saxons for over five hundred years before it was finally written down. As you read, see if you can understand why it has remained popular.

Here you can read even original version of the poem and its modern translation as its more understandable than before.

Anglo-Saxon Original (first lines of Prologue)

Hwæt! We Gardena in geardagum,
 þeodcyninga, grim gefrunon,
 hu ða æþelingas ellen fremedon.
 Oft Scyld Scefing sceaþena þreatum,
 monegum mægþum, meodosetla ofteah,
 egsode eorlas. Syððan ærest wearð
 feascraft funden, he þæs frofre gebad,
 weox under wolcnum, weorðmyndum þah,
 oðþæt him æghwylc þara ymbsittendra

Modern translation

Praise of the prowess of people-kings
 Of spear-armed Danes, in days long sped,
 We have heard, and what honor the athelings won!

Oft Scyld the Scefing from squadron foes,
 From many a tribe, the mead-bench tore,
 Awing the earls. Since erst he lay
 Friendless, a foundling, fate repaid him:
 For he waxed under welkin, in wealth he throve,
 Till before him the folk, both far and near,
 Who house by the whale-path, heard his mandate,
 Gave him gifts: a good king he!

Soon after Canute's death (1042) and the collapse of his empire, the old Anglo-Saxon line was restored but their reign was short-lived. The new English king, Edward the Confessor (1042-1066), who had been reared in France, brought over many Norman advisors and favourites; he distributed among them English lands and wealth to the considerable resentment of the Anglo-Saxon nobility and appointed them to important positions in the government and church hierarchy. [2, 3] He not only spoke French himself, but insisted on it being spoken by the nobles at his court. William, Duke of Normandy, visited his court and it was rumoured that Edward appointed him his successor. In many respects Edward paved the way for Norman infiltration long before the Norman conquest. However, the government was still in the hands of Anglo-Saxon lords, headed by the powerful Earl Godwin of Wessex.

In 1066, upon Edward's death, the Elders of England (OE Witan) proclaimed Harold Godwin king of England. As soon as the news reached William of Normandy, he mustered a big army by promise of land and plunder (one third of his soldiers were Norman, others mercenaries from all over Europe), and with the support of the Pope, landed in Britain.

In the battle of Hasting, fought on October 14, 1066, Harold was killed and the English were defeated. A victory in battle by Alfred saved the English language, less than two hundred years later a defeat in battle by Harold threatened to destroy it. This date is commonly known as the date of the Norman

However, the main bulk of the population – the peasantry and the townspeople, and people in the countryside, those who lived in the Midlands and up north – spoke Anglo-Saxon (English) and looked upon French as foreign and hostile. Since most of the people were illiterate, the English language was almost exclusively used for spoken communication.

CONCLUSION

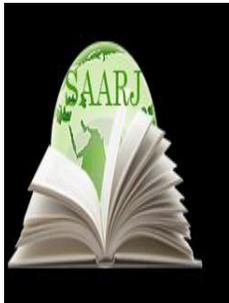

Though literature is all this, the result of having read a piece of literary work is a sense of fulfillment, satisfaction and achievement. We recognize we are not alone in what we feel and think, for literature is the depiction of universal thoughts. We realize that men and women have the same emotions and react almost similarly cutting through time, space and matter. Literature intrigues our minds with its allusions, similes and metaphors. When we decipher them, we partake of the creative process.

Another important aim of this course is of a more theoretical nature. Study of the history of any language is based on applying general principles of linguistics to the language in question.

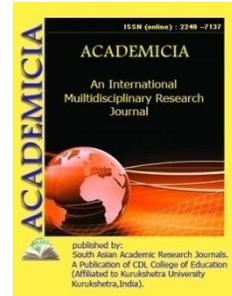

In my article I tried to explain the importance of literature in humans' life and I tried to open the main meaning of this Anglo- Saxon poem Beowulf. It is an epic poem written in the Anglo-Saxon language, which was composed in the eighth century and written down circa 1,000 by an anonymous bard. The poem is the oldest surviving epic in English literature.

POETIC USE OF EUPHEMISTIC MEANING AND THEIR SOCIOLINGUISTICS ANALYSIS

ABSTRACT

Euphemism is an issue of sociolinguistics used in both past and contemporary society because it is the language behaviour of a group of people. Euphemism is a word or series of words which replaces sad, unpleasant or shocking ideas with softer and nicer expressions. But in fulbemaare euphemism is unique, it has been categorized into domains e.g. religious, excretion, death etc. another uniqueness of it is that, it's not just replacing of unpleasant and what have you; even the accepted and pleasant words/phrases will be euphemized because of its (fulbe) doctrine called Pulaaku. Pulaaku is a fulbe code of conduct related to shame or shyness which they are known with and this sometimes makes them to use pleasant and accepted words/phrases in indirect words or phrases for a leisure and style in the use of their language.

KEYWORDS: *Euphemism, Sociolinguistics, Domain, Word(S), Phrase(S) and Fulbemaare, Linguoculturology, Euphemistic Meaning, Orphoepic Factor, Mental Factor.*

INTRODUCTION

The word "euphemism" comes from the Greek word "euphemos", meaning "auspicious/good/fortunate speech" which in turn is derived from the Greek root- words "eu", "good/well"+"pheme" "speech / speaking".The"eupheme" was originally a word or phrase used in place of a religious word or phrase that should not be spoken aloud especially the taboo words (Wikipedia, 2006: 1).

Within any society, people are organized into groups. These groups can be characterized in terms of shared attitudes and beliefs, which are expressed by the accepted behaviour of the members of

the group, including, of course, their language behaviour. Thus, common attitudes, beliefs and values are reflected in the way members of the group use language. For example, what they choose to say and how they say it. However, certain words in all societies are unacceptable for social or cultural reasons; they are considered taboo-words. What acts or words are forbidden reflect the particular customs, beliefs, attitudes and views of the society. In addition, some words may be used in certain circumstances and not in others. In certain societies, words which have religious connotations are considered profane if use outside the formal or religious ceremonies. Another type of words which are related to death, and natural bodily functions, make up a large part of the set of taboo-words of many cultures. The existence of taboo-words or taboo ideas stimulates the creation of euphemism. (Fromkin, 1983: 266-70).

These issues gave birth to new euphemisms prove to be nonce terms, while those that are ratified through reuse as true euphemisms may last for generations or centuries, while others fade away or develop into unconscious euphemisms which are still in use but reflexively without thought of their checkered origins. However, euphemisms are embedded so deeply in our languages. Few people including those who are proud of speaking plain language i.e. without jargon, slang, code mixing, code switching etc. can ever get through a day without using euphemism. In other words, euphemisms have become a part of our everyday language. Euphemism is a word or series of words which replaces sad, unpleasant or shocking ideas with softer and nicer expressions. For instance: "departure from life" is a euphemism for "death".

Examples are as follow:

1. Rose's father is a gentleman on the high way. (He is an armed robber)
2. The young school girl has been put in family way. (she has been impregnated)
3. The thug has gone to the white college. (he has gone to prison)
4. The beautiful lady is every man's wife. (she is loose/immoral)

In the examples above, it can be observed that a word/ phrase have being substituted to mild or subtle instead of the offensive or direct word. So also, many languages of the world use Euphemisms where unpleasant or direct words or phrases are substituted with a mild and indirect words or phrases. But in some languages the substitution may be beyond "Sociolinguistics Analysis Of Euphemism In Maare Fulfulde" harshness or directness of the words or phrases. Fulfulde for example, the use of euphemism is beyond harshness or unpleasant. It becomes a style or a mastery of the language will make the speakers use euphemisms in the language. More so, Fulbe have a doctrine called Pulaaku (shame or shyness). This is a code that controls them in their activities.

MATERIALS AND METHODS

The national nature of each language is visible in the examples of the folklore, artistic literature, the press, cinema, television and radio, using the variety of figurative expression, proverb, saying, and phrases which are used in people's daily speech. That's why these language expressions are evaluated as units which are untranslated events, but their casual counterparts and alternatives are found in other languages, too. Their originality is associated with the view of the people and scope, traditions which are its product, the geographical environment and economic situation which are determined by the way of their life, it is being closely as the skin

and nail, they generally show the unity of life and culture. They show speciality with their polyphonic nature in the example of proverbs as the symbol of the wisdom of the nation.

Understanding the universe has the ethnic character. Researchers will gesture to the national speciality of understanding the universe. Of course, it is not true to absolutely reject or complete it. There are number of objective factors. First of all, the nation - in many cases, is the discrete event of linguistic aspects. After all, any national language has the dialectic points. The speciality of dialectical points is marked by phonological, grammatical and lexical differences. Orphoepic and mental factors exist under these differences, and have determining status. The look and intuition which are the roots of mentality and at the same time, the branches, are related with ethnic factors as the characters of national unit like the articulation base for the orphoepics. The ethnic-level among the person and nation is also discrete, the mental and geographical foundation is more stronger than the linguistic base of this discretisizm.

Clearly, the differences are visible at the linguistic "view" of the parish who forms the nation. The linguistic differences on the basis of the national discretisizm decreases from the differences on the basis of ethnic discretisizm to particular personality element as the arithmetic progression. Indeed, the motivational base which came out in its expression, of course, is objective, universal, and indifferent rather than representational.

It seems, understanding the universe has specific feature in the different dialects in one language as its speciality in each language, but the differences among the ethnic languages (dialects) are the subtlety case.

Research specification of understanding the universe may be done at the diachronic or synchronic aspect. Research specification of understanding the universe will be the analysis of the combination of the form and the particular development of the language at the diachronic aspect.

Understanding the universe on the basis of linguistics, nation and cultur is considered to be the mutual counterpart influenced by these events. The national look and intuitive form serve not only on the basis of national culture, but also as the development factor or tool of the national culture.

For example, the first euphemistic use of the unit of particular language is the result of the influence of the environment, the national-cultural situation, also, it serves to enrich and develop culture which is related to it in its level. Studying the proverb and adage which is the product of the nation's wisdom, in particular, their euphemistic use are undoubtedly on the focus of originality of research of national culture.

The poetic making event and literary norm relation of euphemistic meaning

Any artistic work is the utterance of national artistic mentality, the national mentality is the product of the national look and intuition. National culture, the antiquit and richness of inscription culture which are part of it, provide the suitability of elasticity and euphemistical level of expressions which is the product of artistic mentality. The elasticity of language expressions is implied first of all by their multiple meanings and the opportunities of speech identity of multiple meanings.

In the speech identity euphemistic paint has the special role. Euphemistic depiction of language expressions in poetic text is seen as one of the artistic appearances. The common aspect on the basis of artistic speech and literary speech is seen in the inseparable completeness of the literary from artistic and artistic from literary. Although literary and artistic word is the product of one base, the genetic continuity among them in the terminological aspect exchange with the differentiability. For example, when artistic expression comes as the adjective for speech lexeme, it will serve to express the speech type which will be written in the artistic work as the alternative of expressions in the Uzbek language: “художественная” (речь) in Russian language, „artistic“ (speech) in English language. Literary speech has characteristics “over-simplified, normalized, recycled form of common national language”, three characteristics in this definition are combined with the artistic norm category. That’s why, in the literary speech, seeing the elements and symptoms of artistic speech is natural. In this regard, artistic speech corresponds with all measurements of literary speech.

These measurements can be divided as follows: 1) the accuracy and objectivity; 2) processing and sorting; 3) selecting and estimating; 4) stability and openness; 5) development and modernity; 6) traditionality and typicality; 7) widespreading and versionality; 8) strictly limitation and methodological identification; 9) record in measure and modelity; 10) samplity and nationwideity; 11) specific to some people and admitted by majority; 12) functional necessity, cultural and aesthetic property [1, pp. 26-27].

Linguist A. E. Mamatov added the sign of expediency and separated it with, such as stability, development, legalization, alternatively as the main dimensions among them [4, pp. 71-72].

According to the emphasis of the linguist G'. N. Zikrillaev that the norm of the Uzbek literary language is evaluated as a whole from the following criteria: 1) stability; 2) differentiability; 3) regulating; 4) variability [2, p. 24]. When this linguist comments each of these main characters, understands the unchangeability of the language structure as the stability. Clearly, the first stage of the literary language (literary language of the nation) and in the first period of the second stage (the national literary language) relative stability will lead to the next period of the second stage, namely, the strong developed stage of the literary language in which the strict stability will occur.

DISCUSSION

Euphemisms in Fulfulde like other languages“ euphemism is a substitution of direct, unpleasant, offensive words or phrases to indirect, pleasant, less offensive and mild words or phrases. Although sometimes words are not even offensive but Fulbe do substitute these words simply because of Pulaaku(fulbe code of conduct related to shame or shyness) which they are known with, and this sometimes makes them to use pleasant, indirect words or phrases for a leisure and style in the use of language.

The following are examples of Fulfulde Euphemisms according to the three sociolinguistics domain of their usage:

1. Religious domain

a) Taaskaago (preparation): this word is used when a person wants to be ready in doing religious activities such as performing ablution; he may simply say „haa mi taasko“ literally it take a meaning of (let me get prepared), but euphemistically it can take a meaning of „purification“.

b) Odonloota; she is washing; this word is used to refer to a female who is in menstruation period; although many languages do hide this kind of words for example they can say things like; O donnder al-aada, „she is menstruating“ but due to the code of conduct Fulbe known with, the sentence O donnder al-aada is also considered aggressive or unpleasant, they rather prefer the first sentence Odonloota, means literally „she is washing“ but it actually means „she is in menstruation period“. More so, the sentence „Odonloota‘ have a meaning of „he/she is washing cloth or something“. Therefore, the context determines the intended meaning.

Thus, in English we may also use an expression such as she has been put in the family way, (That is she is pregnant). But this expression mostly refer to the unwanted pregnancy (that is pregnancy out of wedlock). This is considered negative euphemism as Rawson, 1981: 3; Henry, 2006: 1 stated that, the negative euphemisms deflates and diminishes. It is defensive in nature, offsetting the power of tabooed terms and otherwise eradicating from the language everything that people prefer not to deal with directly. Thus negative euphemisms replace language that people prefer to avoid using. Examples include 'harvesting' in place of 'killing', 'collateral damage' instead of "civilian casualties" or 'deaths', 'relationship' for 'sexual relationship', and 'intestinal fortitude' in place of "guts".

In first column, second column indicates its direct usage in Fulfulde and the third column states the literal meaning of the Euphemism in English, while the last column states contextual meaning of the Fulfulde Euphemism in English.

G'. ZikrillaeV refers to versionality as the differentiability. "Differentiability means regional, functional and methodological of regulatory instruments, in other words, it is understood versionality. It is based on having more than one formal view of them in the case that the word and its form, main meaning of the syntactic units do not change" [2, p. 24]. Versionality is associated with euphemistic of language expressions. It may approach to this from both sides. The first is the characterization of objects at two types on the basis of euphemistic or uneuphemistic use of particular language unit, the second is giving two variants of one object - euphemistic or uneuphemistic expression.

For example, the proverb “Qarg“a qarg“aning ko“zini cho“qimaydi”, plead (yon bosmoq) phrase, compassionate (ayamoq) lexemes are the different linguistic forms which is representing one event, linguistic form represents one of the various objects in the euphemistic base, the other in the uneuphemistic base. Or eventuate (tamom bo“lmoq) phrasal verb means "end" (tu gamoq), “overwork” (holdan toymoq) and "die" (o“lmoq), in the first case the expression is neutral to the euphemistic, in the second is dispheemic and in the third has euphemistic value. Versionality of expressions is referred in the first case, versionality of the meaning is visible in the second case, too.

As linguists noticed, the norm of literary language, namely, is not its normalization but it is its pure social-legal and social-historical phenomenon, which historicity and traditionality lead in its formation. Together with this, the language policy in the society, the stability degree of the relationship among languages, as well as the dominant social religious belief have a great influence to the social value of the language. In particular, it has a specific role at the euphemistic level of language expressions. Euphemistic unit of one language is related to the

social-historical and socio-psychological factors, which is shown in the artistic speech at the brightness of images.

The euphemistic units which are used in the context of poetic texts, passed traditions, national outlook, experience of the nation which were formed historically from the artistic point of view of the author are harmonized with the system of created images. In particular, the proverbs are specified units which are used to represent thought with "encircling", this "cover" in them becomes stronger, and euphemistical level may increase.

The following tasks of euphemistic units are seen clearly in the artistic text, such as:

- Participation in the formation of the text;
- Aesthetic effect;
- giving beauty to the speech [9; 3; 5; 10].

In the poetic text, entirety of thought, expression and goal and mutual harmony of these elements supply the entirety and "strength" of the text. It is referred to the two techniques that effect to the formation of the text:

- expressing the thought in the text;
- connecting structural parts of the text.

In the expression of thought, the character of language is determined with the contribution to show logical weight of representing thought and supplying the aesthetic strength. The expression of thought creates openly the opportunity by directly giving to it the logical weight. Together with this, it surfaces clearly the artistic intention of the author or the speaker.

However, because of the artistic text which is one of the main component or characteristic of thought is not seen directly. Selecting the unit, which the sign of „softness“ is the leader variant in the expression system of thought which impacts the importance of the logic depending on the scope and situation of the listener. In this approach, using replacement language unit is determined by one of the two cases below:

- The speaker cannot afford using "rude" expression, therein, in the position of addressing person will be the second degree than the position of adresant in terms of the importance;
- the character of adresant cannot allow using "rude" expression of the speaker, therein, the balance will be seen at the position of speaker and the listener.

At communication balance the equal scope of both communicants gives opportunity to show the intension of adresant by the aspects of choosing and receiving euphemistical means.

Taking into account the nature of the listener in the first case, (his language knowledge, his scope, his cultural level) the euphemistic means may impede expressing properly and fully the communication intension of adresant. The ability and intellect of communicants choosing and using expression, is usually given with the "linguistic taste" term [9].

It should be noted that the linguistic taste is specified ethnosocially. The unit which is high in its cultural level, euphemistic capacity for one ethnic region may have different character for another [7, p. 42]. Therein, the author is out of the ethnic reality and acts in accordance with the requirements of the national literary norms. For example, tungullamoq (tungullamoq- means

“return”, “refuse”), unguillamoq words in the proverb “Tusi borga tungullama, tusi yo“qqa ungullama” at Kipchak dialects are specified ethnically, therefore, using this proverb is not expedient by the linguistic taste point of view at the individualization of ethnic outlook and language of character. It can not assume “softness” responsibility because it has no literary norm type and it is inhabited, and it impacts negatively to the linguistic taste level.

The proverbs are specialized by the aspect of using and directing socially, their euphemistical level will bow differently by this aspect. Specific to the herdsman’s speech or the euphemistical proverb used for the herdsman may be below the representatives of other field in terms of euphemisms. For example, the proverb “Semiz qo“yning umri kalta” is the euphemism for the sentence that “fat sheep is not stored, is slayed (die)”, it is not advanced to move wholly to the social life [7, p. 42] and, therefore, in other areas it is not euphemistic, contrariwise, it may be dispheemic. That's why, the dispheemic nature of this proverb shows that it will be poetic painful and "soft" expression. But using proverbs related to the herd is not limited by the social aspect, and, therefore, in the poetic speech they can do euphemistic task.

For example, Ot yigitning yo'ldoshi, Sinamagan oting sirtidan o'tma, Ot tepmas, it qopmas dema proverbs. Or in the proverb “Aslini bilmay so‘z demaslar, Naslini bilmay qiz bermaslar” using the word “generation” shows that this proverb is actually connected with the animal world, the world of herd. However, the correlation is very low and the proverb has social and euphemistic value. In the work of Tog‘ay Murod „The people walking in the moonlight“ (“Oydinda yurgan odamlar”), Eson qassob (butcher) replied with the euphemic proverb “Aslini bilmay so‘z demaslar, Naslini bilmay qiz bermaslar” to “Singlingning boshiga baxt qushi qo‘ndi, uchirib yuborma(euphemistic expression “the good husband is found, give sister to him”)” sentence of matchmakers (familiar with Eson butcher) who came to the house of her brother for Oymomo (orphan girl).

Competence in using euphemisms is an on-going linguistic socialization process throughout in individual’s life. Since euphemisms are culture-specific, they constitute the living and live experiences of individuals. They can only be acquired and used appropriately through the linguistic socialization process. This perspective is line with Duranti (1985) and Hymes (1972) who described speech events as “socially recognised activities that occur in specified situational settings, involving participant performing one or more socially relevant acts using communicative resources in conventionally expected way to achieve certain outcomes.” The point being made is that linguistic socialization.

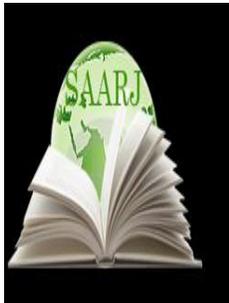

CONCLUSION

In this paper we have observed that Fulfulde euphemisms are words/phrases being used by Fulbe to hide unpleasant issues and substitute them with the pleasant words/phrases which is applicable to many human languages in the world. Euphemisms in Maare Fulfulde may change from time to time for instance if the substituted words/phrases to hide a particular expression become popular among the speakers of the dialect, another will be coined or euphemize to serve instead of the popular one. More so in Fulfulde some words are not even aggressive in nature but influence of Pulaaku (Fulbe code of conduct) they endowed with, might cause the substitution of the words to portray the image of Pulaaku. It is only three domains had been uncovered in this paper, there are possibility of other domains that are left for

other researchers to explore the area(s). We believed that there are gaps that need to be bridged because this is the nature of every realistic research.

ABSTRACT

The article describes some of the parameters of the new national Aurora fabric, its specificity, the parameters of threading weaving on a loom, the main weaving processes, as well as the processes of forming the main pile, consumer properties of the finished fabric. In the current market economy, one of the important tasks of the textile industry is to increase the economic potential of the country through the deep use of environmentally friendly, natural raw materials grown in our country, deep processing and production of finished competitive products.

KEYWORDS: *Specificity, Textile Industry, Ornaments, A Ball-By-Ball Manner, Cross-Section Of The Ring, The Yarn, Mass.*

INTRODUCTION

In the current market economy, one of the important tasks of the textile industry is to increase the economic potential of the country through the deep use of environmentally friendly, natural raw materials grown in our country, deep processing and production of finished competitive products.

The decision of the President of the Republic of Uzbekistan dated March 29, 2017 on measures to organize the activities of the Association "Uzbek Silk Industry Association" not only implemented the program for the development of the industry, but also opened wide opportunities for the production of our national fabrics.

In our country, artisans are creating new types of "Uzbek Silk Industry Association", patterns with attractive designs. The demand for Uzbek Silk Industry Association in the domestic market of the republic, as well as in neighboring countries and tourists visiting our country is growing day by day. It should be noted that due to the prudent policy pursued in our country, great attention is paid to domestic and foreign tourism. This requires further improvement of the appearance and design of national fabrics quality indicators. The uniqueness of the unique pattern ornaments is the attractiveness of the texture, which differs from other fabrics in the design of the appearance of "heavy fabrics", which creates a pattern. The main goal of the article is to analyze and cover the process of creating a new range of national fur fabrics.

MATERIALS AND METHODS

It is worth to say about ancient traditions of hand-made silk fabrics, which are called the Ikat on the West. This name came from Indonesia and originated from the verb "mengikat", which means "to bundle". It is a very ancient way of creating designs in fabric by resist-dyeing the threads before the fabric is woven. In Uzbekistan such technique is called the abrband, which in Persian means "tying a cloud", and the fabrics produced by such a method are called "abra" fabrics.

There are some legends about origin of such technique. One legend states that once an artist sat by a fast running stream. The stream reflected the clouds, and changed their form. Suddenly sunrays were fractured and became a rainbow which was reflected in the stream. The artist saw a picture of clouds playing with colors. He painted that picture and showed it to weavers who then transferred his picture to fabrics. Later the word abr (which means cloud) was used as the name of the process of dyeing base threads in traditional fabrics, so fabrics were named abr-fabrics and weavers were called abrband.

Pure silk is used as the body yarn of the new woolen woolen fabric, and as a back yarn, a mixture of silk and cotton yarn is added [1], [2]. At present, test variants of the fabric are being produced. In the basic laying parameters of the national fur fabric: the linear density of the threads in the ground is $3.23 \times 3 \text{ tex}$. The linear density of the wool yarns is $3.23 \times 3 \text{ tex}$. The linear density of the back yarns is $3.23 \times 3 + 18.5 = 28 \text{ tex}$. The number of threads per cm of ground yarn, ie the density of 16 threads per sm.

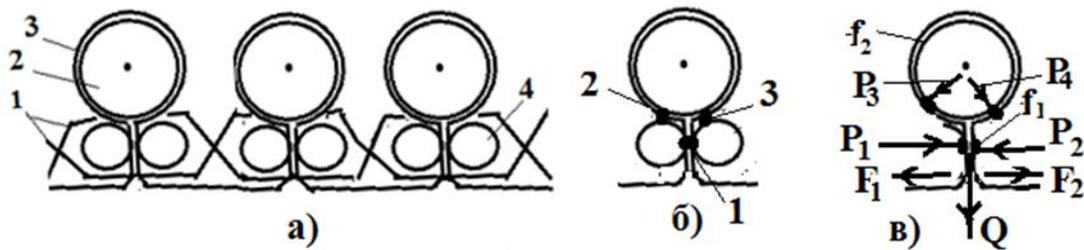

FIGURE 2: A) SECTION OF THE HAIRY HAIR TISSUE IN THE DIRECTION OF THE BODY), B) THE POSITION OF THE GROUND BODY THREADS WITH THE THREADS OF THE HAIR BODY, C) THE STATE OF BALANCE OF THE HAIRY BODY THREAD DUE TO THE FORCES ACTING ON IT WHEN THE THREAD IS THROWN.

In the figure, the points of influence of the main forces on the strand of the strand are shown in the case of the strand of the stalk (Fig. 2 b) and c) the direction of the forces acting on the stalk of the stalk when it is in a state of equilibrium. In the following articles, the effect and direction of these forces will help to develop the equations of the ring in equilibrium. In the picture above a) ground tangent thread 1, rod 2, loop hair 3. Also b) in the picture the point of forces acting on the fluff threads passing between the back threads 1, at the top of the hair ring thread, the points of impact of the back thread with the thread on the hair ring thread 2.3 are given. The next figure c) shows the direction of the forces acting on the yarn, in which the tensile force F_1 , F_2 is directed to pull the ring in the horizontal direction. The mass Q of the thread in the fleece is directed downwards. The compressive forces on the hair strands passing between the back strands are P_1 , P_2 . The forces acting on the thread in the loop of the hair thread are denoted by P_3 , P_4 . The friction forces between the back thread and the hair thread f_1 , the friction forces between the thread and the hair thread 2.

Once the thread is pulled out of the ring, the tension force of the thread in the loop is lost, as well as the force that pulls it is lost, in which case the loop thread can be pulled out between the back threads due to the forces F_1 , F_2 at the bottom of the loop.

In order to prevent such a defect from occurring in the tissue, the forces of interaction between the back and hair strands must be in balance and the following condition must be met. That is: F_1 , F_2 , $Q \leq P_1$, P_2 , f_1 must be greater than the tensile strength of the yarn and its mass, the compressive strength and coefficient of friction of the back yarn to the yarn. When this condition is met, the height of the feathers on the surface of the tissue and the coefficient of filling of the tissue with feathers is the same, and its quality is further improved.

Of course, the size of the rods, that is, the diameter of their shape, the perimeter has a great influence on the formation of hairy tissue using rods, as we know. In the production of heavy woolen fabrics, the type of raw material, the linear density of the threads, the diameter is 1.2, depending on the purpose for which the fabric is used; 1.4; 1.6; 1.8; It is advisable to use in the manufacture of cylindrical rods of 2.0 mm. When throwing rods into the hammock, the surface of the rods should be smooth, there should be no bulging areas; otherwise the breakage of the threads will increase.

In the first variant, after weaving both loops of yarn in the woven fabric on the loom [3], the yarn is again spun into the fleece, which increases the density of the fleece and increases the consumption of natural silk.

Now let's look at the second option, which is to produce a slightly reduced yarn in the fleece (Fig. 3). In the weave in this structure, 2/1 half-body reps was taken as the base weave for the ground weft strip. The two strands of feathers are made into one (Fig. 3b) and form a weave in the same direction as the first ground thread, but are separated only when the feathers are formed. Figure 3 below (Option II) shows a reduced version of the hair density of the annular tissue of the ring hair.

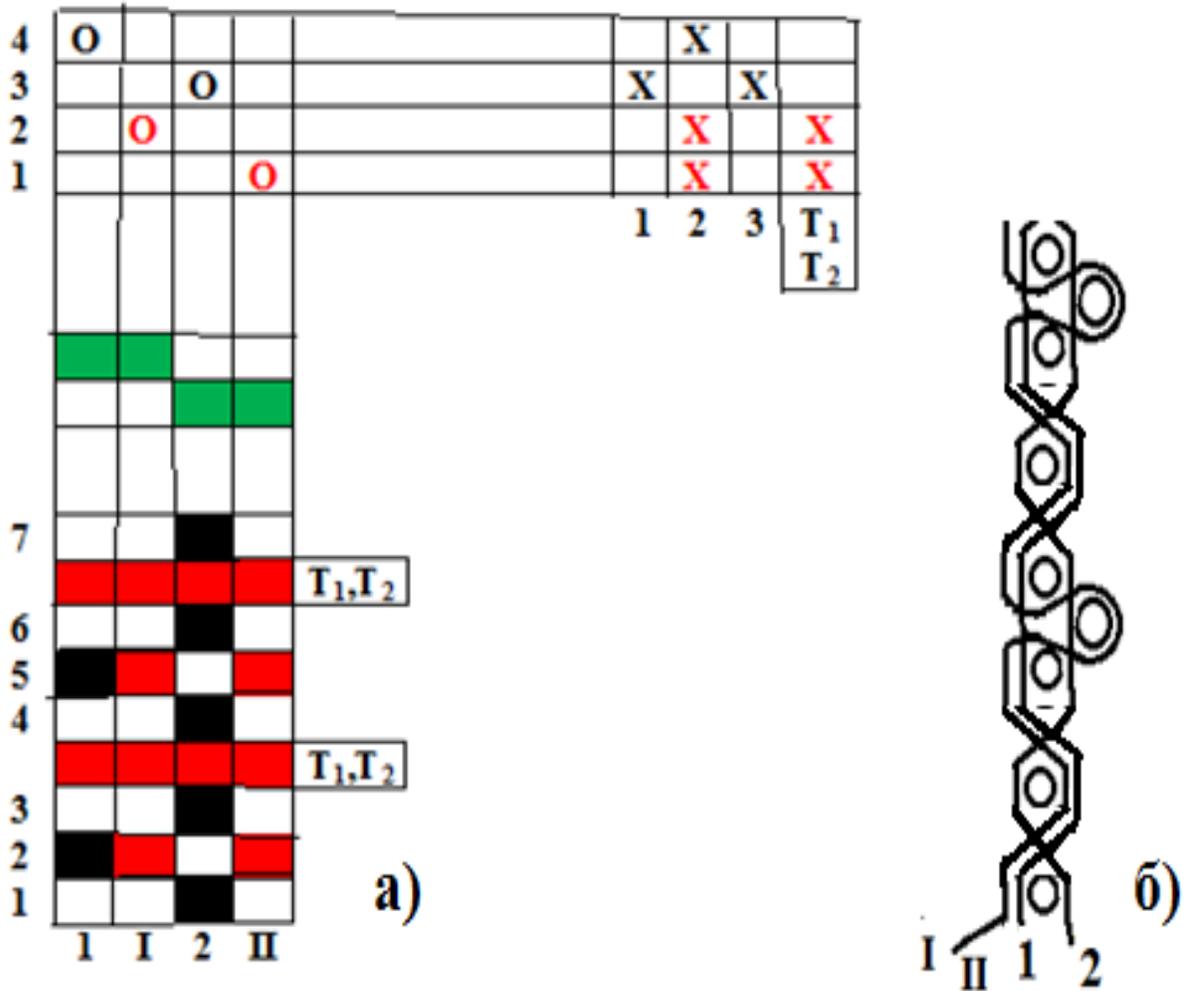

FIGURE 3: A REDUCED VERSION OF THE HAIR DENSITY OF A RING-SHAPED AVOCADO TISSUE. A) CROSS-SECTIONAL DRAWING, B) CROSS-SECTION IN THE DIRECTION OF THE BODY.

When a braid is formed in this structure, a single hair is formed after three back strands are thrown. The average back density in the fabric was 21 and the number of loops was 7.

FIGURE 4: APPEARANCE OF A NEW NATIONAL HAIRY FABRIC.

A replica of the second version of the national fur fabric is shown in Figure 4. The quality of suits, shirts and other items is used in the consumption of national fur fabric in this form. In existing abrband, the gap between the feed rolls is constant and the feed rolls performance is controlled by changing the number of their revolutions. In the gap between the rollers, the abrband should have a density that does not damage the seeds. Abrband rollers pick up raw cotton from the storage shaft and feed it to the section of the cleaner. During the passage of raw silk between the rollers, the fluffs and fibers should not be damaged. To quickly change the performance of the cleaner, the feed rollers must have a mechanism for regulating their rotation speed and work without fraction.

Let us carry out a theoretical analysis of the movement of with a uniform supply of the material. We consider raw cotton to be a compressible medium; the process is stationary; therefore, we assume that the cells (space) between the blades are filled with material. Select an element from the mass of raw cotton and compose the equation of motion of this element. The main goal is the effective use of environmentally national materials in the construction of housing in rural areas and their implementation with the help of innovative technologies.

Modern abr materials and technologies, from other materials to design proposals for adras, not only save beauty but also make the aesthetic appearance of the material attractive. Now you can provide such indicators, each of which (taking into account the thermal resistance and insulating properties of the outer look of abr). However, these materials were used successfully in the north. If we pay attention to proven energy-saving wall structures, then when designing energy-saving walls, we must first of all pay attention to their material, because there are a lot of types of insulation materials, such materials can be used depending on climatic conditions.

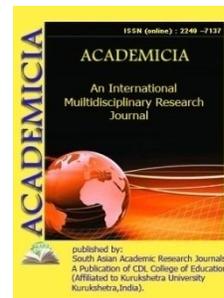

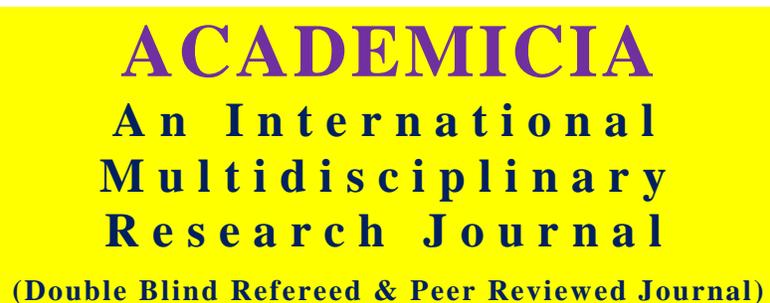

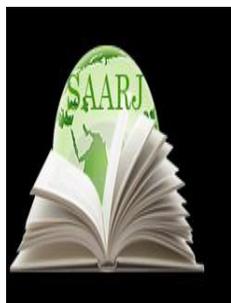

CONCLUSION

As mentioned above, the practical and theoretical studies of the process selected for the tissue being produced, studied as an experimental option in scientific research work, are reflected in recent articles. Modern abrband also were made in shape of traditional Uzbek abrband including

drop-earrings and triangular-shaped pendants (tumor). When a young Uzbek woman got married, she was expected to wear abrband, which represented the wealth of her family. It was said that if a woman could not walk due to the heaviness of her new abrband she came from a wealthy family. However, abrband was expensive, and a wedding ceremony without jewelry was considered shameful, so to solve this problem, people began to buy abrband with patterns representing jewelry.

THE PROBLEM OF INTERFERENCE IN THE SECOND LANGUAGE ACQUISITION

M.I Rasulova*

Uzbekistan State World Languages University,
UZBEKISTAN

ABSTRACT

The paper presents the results of corpus-based research related to a linguistic interference mainly used in speech activity based on psychological-speech interference. The analysis focuses on the norms of one language under the influence of another which are observed in the speech of people speaking these languages. The examples analyzed cover interference in phonology, morphology, syntax, lexis and word-formation.

KEYWORDS: *Interference, Transference, Target Language, Specificity Of Speech Activity, Communicative And Non-Communicative Behavior, Types Of Interference: Positive And Negative, Progressive And Regressive, Explicit And Implicit, Inter-Lingual And Intra-Lingual, Productive And Receptive.*

MATERIAL *The material of investigation is based on the examples of speech activity (errors, mother tongue interference, mistakes) taken in the process of teaching students a foreign language.*

METHOD *A comparative analysis is used to reveal similarities and differences of languages belonging to different language family groups. The types of interference were analyzed and determined in the use of target languages.*

INTRODUCTION

The issue of linguistic interference is an urgent, at the same time one of the disputable problems and moreover hasn't been studied enough in Modern Linguistics yet. In this article we focused on the formulating the problem and showing the importance of this phenomenon in the second language acquisition. It is necessary to fight with negative interference as it leads to the breach the linguistic norms of the target language.

Main part

The method of comparative language learning is widely used in teaching foreign languages. In this process, practical knowledge of the structure and grammar of the native language, its abilities and relative automation can have both positive and negative consequences. When learning a foreign language, the first indication of the native language skills' influence is called *transference*, and the second indication is *interference*.

A *transfer* is a process of positively transferring the elements and skills of the native language to the target language, while *interference* is the negative impact of the same factor that leads to a violation of the norms of the target language, and to errors. The phenomenon of transference has been little studied referring to the problems of interference [Weinreich, 1999, p.7-42]. It is associated with the phenomenon of interference because both transference and interference occur under the influence of the same psychological mechanisms. Differences are usually observed only in bilingual and multilingual speeches. If the transfer creates a favorable environment for the absorption of new material, barriers are created by the interference. In the methodological literature little attention is paid to transfer issues. Interference, which is the primary source of errors, is of greater interest to researchers. However, transference also deserves the attention of lingua didactic.

Since interference is a complex phenomenon, it is studied by many related disciplines [Leontjev, 1997]. Therefore, the classification of interference patterns is based on their various characteristics (source, area of application, the degree of consideration of the distinctive features of the native language during polishing, the form of interference, its communicative sensitivity, etc.).

The source of transferring can be defined when we observe the communicative and non-communicative behavior of learners. We should take into account that not all errors in the learners' speech can be considered as a result of interference. That is why a teacher should analyze errors and find out those that have appeared due to interference.

There are several classifications of interference that have been undertaken in line with specific criteria.

I. Interference is related to positive and negative effects:

a) Interference can be communicative -relevant and communicative -irrelevant, i.e. not impeded to understanding and breaking mutual understanding.

b) Interference is distinguished as synchronic (invariable) and dynamic, which is preceded to the static and reflects progressive development in language mastering and can be overcome.

II. Interference is related to the specificity of speech activities, that is productive and receptive interference, i.e. during the speech production and its perception and understanding. The production interference usually has an explicit form and is stronger expressed than interference in perception and understanding that has implicit character.

III. Depending on its appearance between contacted languages and inside of the target language. There are inter-lingual and intra-lingual interferences. Inter-lingual interference is between two languages when we transfer knowledge and skills from the native language, but intra-lingual proposes is any transfer of some rules and sub skills within the target language. For example,

incorrect using: a) of an article – *the* Uzbekistan, b) inflexion in the past tense – He *taked* the book. Different kinds of errors within intra-lingual interference occur during the learning process of the target language at a stage when the learners have not really acquired the knowledge. In addition, errors are also caused by the difficulty or the problem of the language itself.

IV. Depending on the deviation of the norm:

a) Combinatory and modifier interference. In the speech, combinatory interference is the elements of the other language or organization of the discourse incongruently to the target language norms and conventions. This type is associated with the inter-lingual phenomenon. In turn, modifier interference proposes the appearance of the correlated elements of the other language systems. For example, the English [t] pronunciation is as in Uzbek or Russian, not leading to misunderstanding.

IV. Depending on the character of breach language norm:

a) Over-differentiation when there is no specific indicator in the target language but a learner transfers it from the native language. E.g. *There is not nothing*. In English, two negations are not used.

b) Under-differentiation, when a learner does not use a certain element that is not in his native language, such as articles *I want book*.

c) Reinterpretation of differences when a learner confuses with the word *magazine* instead of *shop*.

V. The last types of interference become apparent in the bilinguals' speech in different form as explicit and implicit interferences. Explicit interference when breaking the linguistic norm is visible as *errors*, and the second one – *not using idiomatic language*.

Interference is an effect of the native tongue on speech production in the target language communication. It is most discussed in the academic literature [Karlinsky, 1972; Weinreich, 2000; Fomichenko, 2005] that interference is the primary source of errors in learners' speech (negative transfer). However, when the same elements or features can exist in both languages it leads to correct language production (positive transfer). The more differences between the contacted languages bring to more negative effects. It has been proved that individuals can refer to the native language and based on the first language acquisition to acquire the second language [Yusupov, 2007].

The transfer may prove to be justified because the structure of two contacted languages in the FLT framework is different – this case is called transposition or facilitation, or it may be proved unjustified because the structure of the two languages is different – that case is called interference [Haugen, 1972, p. 199].

The positive and negative transfer can appear at all levels of the language system, discourse organization, including pragmalinguistic aspect of communicative competence (sociocultural, pragmalinguistic).

The transfer can be dealt within two dimensions: 1) transfer of knowledge, sub skills and skills, 2) transfer in the cognitive process. The last one presupposes understanding the cognitive process

in the language acquisition and how learners can use the previous experience and what they have acquired before they can successfully use learning strategies to learn a second language.

Thus in the context of L2 acquisition or use, transfer broadly refers to the influence of a learner's native language. Any two languages diverge in some respects but converge in others. When the influence of the native language leads to errors in the acquisition or use of a target language, we say that negative transfer or interference occurs. When the influence of the native language leads to the immediate or rapid acquisition or use of the target language, we speak of positive transfer or facilitation. For example, in vocabulary acquisition, the positive transfer may account for the immediate recognition and acquisition of words with similar or identical pronunciation in both the native language and the target language; however, there are words that look or sound alike (or both) in the native and the target languages but have different meanings (*journal* – *журнал*). So interference is the transfer that has (at least temporarily) a negative or inhibitory effect on mastery of a new language, while facilitation is the transfer that makes the acquisition task straightforward or trivial. The extent to which transfer occurs is an essential issue in any general model of a second language acquisition; whether a given instance of transfer is negative or positive it is purely a function of whether proficiency in the target language is inhibited or facilitated.

Applied linguists (FLT methodology) tend to focus much more on negative transfer than on positive transfer because it is generally believed that only negative transfer presents teaching and learning challenges. Negative transfer manifests itself in different linguistic domains, including phonetics and phonology (or pronunciation), morphology and syntax, vocabulary, and pragmatics. From the methodological point of view, interference is defined as unintentional inaccurate using of linguistic items in the speech compared to the norms of the target language as a result of the negative influence of the previous language experiences. For applied linguistics, it is important to realize the mechanisms of spontaneous transfer in the process of code-switching.

That is why psychological and linguistic studies of transfer phenomenon introduced into the methodology of FLT because of the following reasons:

- 1) it is necessary to stimulate positive transfer leaning on the mother tongue and previous knowledge and skills;
- 2) it is necessary to fight negative interference because it leads to the breach of the linguistic norms of the target language.

Interference occurs at all levels of the language hierarchy. Accordingly, its phonetic, morphological, syntactic, lexico-semantic types are distinguished.

1. Phonological interference is related to phonetic errors. For example, the hick of distinction between the phoneme [p] and the phoneme [b] among Russian and Uzbek ESL learners; so we hear them is saying *pird* and *brison*, instead of *bird* and *prison* that leads to the replacement of the meaning of the word in the given context.

The transfer serves as a factor accelerating the process of learning a second language when the phonetic-phonological, lexical, grammatical phenomena of the native language and the languages being studied are mutually compatible.

Another example, since there are some nasal sounds in Uzbek (*сўнгги, денгиз, кўнгил, сингил, тонг*) such as [ŋ] which is easier for an Uzbek student to learn English words like *morning, evening, everything* with this sound than for a Russian learner.

The differences in the phonemes [c] and [rc] in Russian and the presence of only Uzbek phoneme [c] in Uzbek causes in Uzbek students' speech several errors in pronunciation and it can be an example of inter-lingual interference. Here are some examples to prove this fact: *свет – ёрузлик* and *цвет – ранг; рассвет – тонг* and *расцвет – гуллаш*. The English phonemes [w] and [v] differs, while the Uzbek language has only one [v] phoneme. It can lead to the indistinguishability of the following English words: *wine - вино, vine – узумтоқи; wail – додламоқ; veil - вуаль*.

2. **Morphological interference** is a deviation from the norm observed in the speech related to the infringement of categorical indicators of parts of speech, which appeared under interference. Norms of deviations can be formal and functional (inadequate using grammar structure). It is called modification interference. Here we come across with overgeneralization. Examples of overgeneralization include the use of *comed* and *goed* as the past tense forms of *come* and *go* and the omission of the third person singular s under the heavy pressure of all other endless forms as in *he go, or He write a letter*. One more example: *He can swims*. Instead of saying: *He can swim* or *He swims*.

A person accustomed to the general features and characteristics of his/her native language thinks so about all these features of languages. When learning another language the process of complete transmission of communicative behavior is implied. As a result, such a free system of correspondences is formed in the multilingual consciousness that all the contiguous distinctive features of languages are mixed. Not all scholars consider the integrity of the language. This phenomenon is often highlighted in methodological researches [Fromkin, 1988, p.117-138]. Because of the use of linguistic units is not well mastered, it can be transferred incorrectly from one case to another in the same language. The Russian language learners focus on incorrect usage of various verbs based on the similarities of their forms: They use the phrase "Я рукоплескаю" instead of "Я рукоплещу" (on the model of *таскать – таскаю*); the forms *хочем, хотите, хочут* are used instead of forms *хотим, хотите, хотят* – proceeding from the forms *хочу, хочешь, хочет* of the 1st, 2nd, 3rd persons.

The inability to distinguish between perfectness and imperfectness by Uzbek speakers in Russian (*я экзаменнесдала, я экзаменнесдавала*); in the use of Russian prepositions "в" and "на" (*в факультете, в стадионе*); in the verb governing (*испугалсяотнего*) leads to errors in the language use. All of them are interpreted, taking into account the influence of the native language. For example: *группада, факультетда, стадионда; унданкўрқди*.

In all these cases, the mother tongue interference to interlingual feature, that is, **progressive interference** occurs when the native language affects the foreign language being studied. However, *regressive interference* can also occur both in the mother tongue and target language. For example, a child learning Russian can use overgeneralization like "гулларниўтиргизайлик" in its language instead of "гулларниўтқизайлик", and "соатникиямиз" instead of "соатни тақамиз".

In Uzbek, the plural form of the subject does not influence the meaning of the predicate in the sentence. Sometimes the subject can come in plural and predicate in the singular form. For example, *итларакиллади, буйилёмгиркўнёгди*. This leads to mistakes in the Uzbek students' speech learning Russian: *сабакилает, в этом году участваиёлдожди*.

Moreover, under the influence of the Russian language, the agreement of the plural form of the subject and predicate can be observed. It also affects Uzbek speech, For example, *итларакилладилар, буйилёмгирларкўнёгдилар*.

3. **Syntactic interference** is related to:

–the agreement of tenses and the transmission of indirect speech as phenomena that are not present in the Russian language;

–non-distinction in English conditional sentences (*If-sentence*) of possible and unreal forms of utterance;

–incorrect word order in the sentence of the English (*analytical*) language under the influence of structural norms of the native (*synthetic*) language;

– the absence in the native language of the grammatical category of the complex complement-parts of the sentence (Complex Object) and complex subject (*Complex Subject*) significantly simplifies the syntax of the utterance.

For example, it implies errors in expressing syntagmatic relations between words (agreement), revealed in the wrong choice of prepositions in Russian and Uzbek students' speech that learn English. So the verb "*enter*" in English is used without any preposition; in students' speech, we often observe the usage of this verb with the preposition "*to*", which indicates a dative case in the Russian and Uzbek languages. Contrary to the verbs "*wait for, listen to,*" which are used in English only with fixed prepositions. Also, the wrong usage of the Complex Object expressed in gerundial, infinitive constructions in the English language can be referred to as syntactical interference (e.g., "*I expect he comes on time*" used by Uzbek students instead of the right sentence "*I expect him to come on time*").

4. **Lexical Interference** mostly is related with the lexicon of investigating languages:

- in vocabulary acquisition, positive transfer may account for the immediate recognition and acquisition of words with similar or identical pronunciation in both the native language and the target language; however, words that look or sound alike (or both) in the native and in the target languages but have different meanings (journal – журнал);

- Reinterpretation of differences, when learner confuse with the word *magazine* instead of *shop*;

- Communication base. When learner instead of “balloon” uses “air ball”.

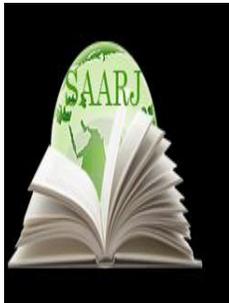

CONCLUSION

Thus, the analysis of errors caused by interference shows that in teaching a second language, it is necessary to take into account the differences between languages and the difficulties associated with the characteristics of the studied language system.

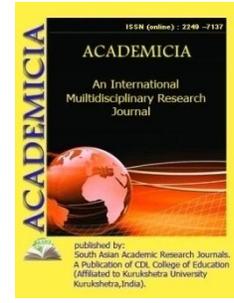

In the process of using another language in a speech situation, the use of linguistic means specific to the native language or the first foreign language, which to a certain extent is closest to it, is a key factor in the formation of interference. The phenomenon of interference can occur at any language level (graphic, phonetic, morphological, syntactic, lexical, and derivational). One of the essential factors in the presence of interference is the degree of a person's linguistic competence. During the study, it has been noticed that the phenomena of substantial interference are clearly manifested in the speech of persons with a low level of proficiency in a foreign language. The phenomenon of interference takes the form of interaction between the native language, the first foreign language, the second foreign language, and more. In speaking in any other language, the activity of the human brain is tuned to the opposite system of relations, in contrast to the usual system of manifestations of relations, in which the native language plays a leading role.

ABSTRACT

The article discusses the importance of Uzbek and English songs in education and language learning, and the importance of music in education. Uzbek music culture has an ancient and rich heritage. It embodies the national spirit, high human qualities, artistic spirituality, struggle for independence and aspirations and aspirations of our people. The role of education in Uzbek music is also invaluable. Music is also widely studied in the UK. Young people between the ages of 11 and 14 are given a lot of attention in music. In the UK, students learn musical instruments and consider songs to be very important in education. They are also given a number of details about how they play important parts of memory and notes, knowing their contributions. They use different notes and use appropriate musical instruments such as music, melody, rhythm, chords and structures in different situations. They analyze and compare musical features.

KEYWORDS: Education, Upbringing, Music Pedagogy, Rhythmic, Aesthetic, Note, Concept, Composer.

INTRODUCTION

After gaining independence, special attention has been paid to the issues of spirituality and culture in our republic. Familiarity with the art of singing in music culture classes brings great

opportunities in educating students in the national spirit, shaping their worldview and spiritual needs. Only if a teacher can put into practice the wide educational potential of music can he teach children to develop their musical and creative abilities, to understand and appreciate their works of art. The song genre is unique in its mass character and social significance, as the song occupies an important part of the airtime. The song undoubtedly impresses the listener with the integrity of the oral and musical design.

The music culture of Uzbek folk songs has an ancient and rich heritage. It embodies the national spirit, high human qualities, artistic spirituality, struggle for independence and aspirations and aspirations of our people. There are also excellent schools of Uzbek music education. The following methods of music education are available in the national traditional music pedagogy:

1. Pedagogy of popular folk music. This is reflected in the daily life of the people, in family ceremonies, in the process of labor, and so on, and is done naturally and spontaneously. Popular genres of music are performed individually and collectively at weddings and funerals. In the process, new melodies and songs are created. This is an invaluable factor in the artistic and musical development of the people, in the enrichment of our musical heritage, especially in the moral and artistic education of the younger generation.

2. The methodology of professional music education has a perfect school. In his practice, the science, duration, and consistency of education are logically linked. The content of education is rich due to the quality and sophistication of the profession and the Eastern moral upbringing. In this, the teacher's experience in the teacher-student practice, especially the skillful performance and spiritual wealth, play an important role. Young artists have been blessed with a white blessing to serve the people only after years of perfect theoretical and practical study of music.

Under the guidance of a professional musician, skilled performers - musicians - khalfas, poets and maqom players are trained. At the same time, many of them are learning the art of composition and enriching our musical heritage.

3. In national Muslim schools and madrassas, music is taught in a way that combines philosophy with theology and literature. This is done in the process of becoming more literate and reciting surahs of the Qur'an using specific techniques on individual, group and collective pronunciation expressiveness and musical melody (clarity, logic, sound formation and sound rhythms, breathing patterns, etc.). carried out.

The teaching of literature has long been associated with music as an art. In this case, the weights of poetry and music are studied jointly on the basis of the dimensions of desire. That is why many writers and scientists have made significant contributions to the development of musicology. The unique art education in madrassas has had a positive impact on the development of our musical heritage. Influenced by the teachings of more Sufis, it played an important role in the development of philosophical ideas in the musical and artistic content of maqams and dervishes, dhikrs and kalandars.

Of course, it was a positive thing that music was taught as a subject in Uzbek schools during the Soviet era. At the same time, certain experience and special training have been achieved. But these events were not enough to shape the musical culture of the younger generation. This is due to the following problems: the reconstruction of music education on the basis of national and cultural traditions, the improvement of the material and methodological support of schools and

the provision of qualified personnel. So that music education "can make a worthy contribution to the development of our spiritual culture, the ultimate goal of which calls the nation to the highest goal, inspires confidence in its representatives in the future, promotes creative and creative activity."

According to the new concept of music education, the goal of music education is to bring up the younger generation at the level of a cultured person who can inherit our national musical heritage and understand and appreciate the richness of universal music. To do this, to develop the musical talent of each student, to increase their love and passion for the art of music, to create the necessary knowledge and practical skills in music, to create the necessary conditions for the musical development of gifted students - school music education is the main function.

English-language poets say that music is a powerful, unique form of communication that can change the way students feel, think, and act. It combines mind and emotion and provides personal expression, reflection and emotional development. As an integral part of culture's past and present, it helps students understand themselves and interact with others, establishing important connections between home, school, and the wider world. Teaching music develops students' ability to listen and appreciate a variety of music and to draw conclusions about the quality of music. It encourages active participation in various forms of both private and public amateur music, developing the group's sense of identity and solidarity. It also enhances self-discipline and creativity, aesthetic sensitivity and satisfaction." (Taken from NC for England).

Chapter 3 of the Concept of Music Education is entitled "Content, Structure and Stratification in Music Education". Music lessons are important as an education that shapes an individual's artistic thinking. Through it, along with cultivating a sense of sophistication, it is intended to instill in the younger generation the highest human qualities. It is necessary to rely on national and universal music education and teaching methods. In the context of music education and upbringing, our national musical heritage plays a key role. An important didactic direction of music teaching is to get acquainted with the fraternal peoples and universal music culture in comparison with the laws of our national music, that is, to adhere to the "priority of universal and national-cultural values in education."

The educational process takes two forms - in the form of lessons and extracurricular (as well as out-of-school) music lessons. Music lessons are a basic and essential form of teaching for all students. Therefore, it is important to use different forms of lesson structures and teaching methods, and to discover new lesson structures and methods in the process of experimentation. An important factor in this is the study and effective use of national and Oriental music education.

The theory and practice of music education is based on best practices, the content of which is based on the general laws of the art of music and is developed on the basis of programs developed on the basis of music-thematic system. It is a combination of education and provides that school graduates develop positive skills in the field of music, as well as in all disciplines, and acquire general knowledge and skills necessary for cultural life.

Listening to music, singing, artistic perception through playing simple instruments, sharing experiences and impressions of music, artistic evaluation of works, and the development of musical creativity skills stimulate students' interest and artistic need for music. Music lessons are

an equal subject at school and are taught for two hours a week, and written work, grading, and mandatory and voluntary exams are introduced into school curricula and programs.

Talented and enthusiastic students are artistically developed in optional classes, music clubs and other activities depending on their artistic needs. Necessary opportunities will be created for differentiated education of students in the way of musical development, meeting their artistic needs, positive development of gifted students. The concept provides information on the following forms of differentiated learning.

A school (classes) for in-depth study of music will be opened; various music clubs and studios in gifted children's homes and a network of children's music schools will be expanded; Group and individual lessons on playing instruments, dance, singing, etc. are organized in schools with qualified specialists and the necessary conditions, with the consent of parents and the decision of the pedagogical council of the school are organized semi-paid or full-paid individual and group music lessons .

Research is conducted to meet the artistic needs of gifted students, studying the experience of developed countries. Colleges and lyceums will be opened to study music in detail, and opportunities will be created to develop a network of private art schools. Programs for all forms of music teaching will be developed on a scientific basis, and new textbooks and teaching aids will be created. A competition will be announced for the best programs and textbooks. The professional qualities of a music teacher will be described. should strive to explore forms and methods. It is also emphasized that the teacher should enrich the content of music education and upbringing by connecting it with the content of other disciplines and daily life. The advanced experience and new methods discovered by the inquisitive and creative teacher are constantly improving the music education in the school, the mainstay of the development, the source of inspiration, the knowledgeable and experienced music teacher as an art intellectual in the school music. it is mentioned that he should be the commander of the reef affairs.

Students are expected to learn independently and in groups with increasing levels of independence through music creation. Therefore, the role of teacher is perceived as a flexible role: principal, teacher, assistant, fellow musician, critic, resource manager, coach, and so on.

The goal of English music curricula is to provide students with composition, performance, and evaluation experiences that enable them to recognize, manage, and control music elements in an increasingly fluent, imaginative, and expressive way. The curriculum promotes a wide and diverse repertoire (including traditional music from the British Isles, western classical, popular, jazz and other eras and music from other places). There are also level descriptors (equivalent to two chronological years) that provide the expected learning outcomes for students at each stage. The curricula of Wales and the Netherlands share basic structure and concepts together with the UK but the content aspects are different. In the UK, a great deal of attention is paid to the 11-14 age group.

Students learn musical instruments and consider songs to be very important in education. They perform important parts of memory and notes, knowing their contributions, such as leading others, participating in a solo, and or providing rhythmic support. They improvise melodic and rhythmic materials within given structures, use different notes, and use appropriate musical instruments such as music, melody, rhythm, structures in different situations. They analyze and

compare musical features. They assess how place, event, and music affect the creation, performance, and hearing, and refine their work.

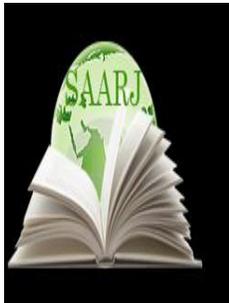

The content and methodology of music education and upbringing are developed based on the richness of our national musical traditions and cultural traditions. It is noted that the best practices of the fraternal and peoples of the world in this area will be taken into account. It is on this basis that the diversity of the new curricula will be achieved. In addition, a wide range of opportunities for teachers' creativity and inquisitiveness, the creation of new textbooks and manuals based on their experience, the involvement of knowledgeable scientists, experienced music teachers. First of all, it is necessary to take measures to strengthen research, to eliminate artificiality, scientific shallowness, duplication in today's scientific work.

To this end, it is necessary to involve more experienced practitioners in scientific and pedagogical research, to develop and implement methodological recommendations only on the basis of a thorough theory formed from extensive experimental practice.

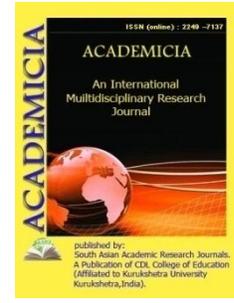

Thus, the adoption of the Concept of music education in secondary schools of the Republic of Uzbekistan is one of the most important cultural and educational issues. This document outlines the prospects for the development of music education in the public education system of the republic, raising the quality of teaching music culture, the organization of educational and musical work on the basis of the objectives of music education, professional training of music teachers. Prospects for further improvement of their work are outlined. Today, teachers of music culture, future specialists in this field, of course, diligently study the new concept of music education in the country, deeply understand the essence of the chapters described in it, and understand their pedagogical skills. should be applied in their activities.

ABSTRACT

When translating original texts, it is a clear textual copy of the works that have become a universal cultural monument - sometimes it is even difficult to determine their "homeland", let alone restore the original. The immortal works created by the great representatives of world classical literature have reached many people's around the world with various translations and "reworkings". But such masterpieces certainly did not arise spontaneously. The creation of a work of art in any language is created primarily for those who speak the language in which that work was created. Especially if this work of art has reached the level of a masterpiece of a particular nation. The masterpieces of many nations are translated into several languages of the world. Among such fiction books there are many that reflect the history, culture, dress, customs of the people, the country to which the work belongs, and all this requires pragmatic corrections in the translation to achieve adequacy between the original and the translation. At this point, translation has its own challenges. In this case, the words match each other in terms of meaning and style; it is necessary to "overlap" each other, to find alternative expressions, to create unique syntactic devices, to solve problems of tone, rhythm.

KEYWORDS: *Fictional Heritage, Area, Level, Sophistication, Adequate Translation, Lyrics, Rhythm, Melody, Pragmatics, Contamination.*

INTRODUCTION

Just as nations can never live in complete isolation from each other, so their material and cultural monuments, literature and art can never be kept "pure" within a single national boundary.

The best examples of art and literature created by mankind knew no boundaries, sometimes changing, sometimes shrinking, sometimes merging, moving from hand to hand, from language to language. For this reason, it is sometimes difficult to identify their "homeland", let alone restore the original, a clear textological copy of such works, which have become a universal cultural monument.

Translation occupies a worthy place in all national literatures with a centuries-old literary tradition. Therefore, it is safe to say that without creating a history of translation, it is impossible to fully and perfectly cover the history of national literature without understanding the laws of translation in each period, the schools of translation in the development of national literature and the role of these translations in world culture. For example, Arabic fairy tales "A Thousand and One Nights", Indian proverbs "Kalila and Dimna", Abulqasim Firdavsi's "Shahnameh", Umar Khayyam's rubai, Nizami, Abdurahman Jami, Alisher Navoi, epics, whether in fact or in various translations, seven served to nurture the descendants of the many eastern peoples living in the climate in the spirit of high humanity.

The immortal works created by the great representatives of world classical literature have reached many people's around the world with various translations and "reworkings". But such royal masterpieces certainly did not arise spontaneously. There is a lot of hardship behind this. One such difficulty is the problem of conveying the pragmatic features of the original.

The pragmatic problems of translation are directly related to the genre characteristics of the original and the type of reader who reads it. Translators face significant difficulties in the field of literary translation in conveying the pragmatic features of originality in translation, but the greatest difficulty is related to the translation of works in the lyrical genre.

Just as the types and varieties, styles and methods of word art, which are the fruit of artistic thinking, are diverse, so are its translations in a variety of activities, ways, methods and techniques.

The creation of a work of art in any language is created primarily for those who speak the language in which that work was created. But these works are not the only artistic heritage of the people who speak that language. Especially if this work of art has reached the level of a royal work of a particular nation. The royal works of many nations are translated into several languages of the world. Among such fiction books there are many that reflect the history, culture, dress, customs of the people, the country to which the work belongs, and all this requires pragmatic corrections in the translation to achieve adequacy between the original and the translation.

Professor Gragof, an expert in ancient Greek language and literature who interpreted Homer's works, manually copied the original of Homer's epic The Odyssey, wrote the German meaning under each Greek word, and in turn underlined the grammatical meaning of the Greek word under each German word. As a result, a literal translation of the epic "Odyssey" is created.

In ideas of the translator, all the materials of the "building" were available, and now they had to be integrated. In other words, it was necessary to search for poetic taste and subtlety under the verbal examples, to discover a musical melody from a set of rough-sounding sounds.

Speaking of this translation, N.V. Gogol had assessed that it was not just a translation, but a re-creation, restoration, and resurrection of Homer.

Any work of art is made of the same linguistic material. But even so, the lexical methodological tools of fiction are not the same. In other words, the dictionary of a work created in each literary genre or literary type has its own peculiarities. First of all, "field" and "level" also play a role in this.

It is clear that no one can make the same demands on a dictionary of a novel as large as that of a silkworm, and on a dictionary of rubai, the level of which is limited to only four lines. Even an epic with lyrical poetry, a ballad with a continent, a short story with a contribution language and style have their own requirements.

What stylistic features in the language of the translator are relatively stable. What stylistic features change depending on the nature of the original? To identify these issues, it is necessary to compare several translations of works by different poets whose styles differ from one another, translated by the same poet, and, if possible, the same translator's own original works.

Poetry is a peculiar form of national language bisoti. The spirit of the people, its historical and cultural maturity is reflected in the work of the poet. Therefore, to feel, feel, understand the poetry of other peoples means to understand the spiritual, spiritual world of another people.

Prose translation has its own difficulties. In this case, the words match each other in terms of meaning and style; it is necessary to "overlap" each other, to find alternative expressions, to create unique syntactic devices, to solve problems of tone, rhythm. The depiction of words, elegance and beauty in prose play is an essential element, the main means of creating a work of art.

In poetry, the word is an element of the general context, which completely changes the requirements and conditions for the choice and expression of the word.

How the word sounds, whether it is long or short, the proportion of vowels and consonants in it, etc., are of great, sometimes decisive importance in poetry. Rhythm and sound, meaning and order of words, lines and sentences, the long brevity of a word, and weight are all interdependent. If any of these elements are changed, the whole thing in the poem has to be changed. But in translating all this into another language, it is necessary to destroy and rebuild this whole, this poetic organism. Now the same words are the same it doesn't make the same sense, it doesn't sound the same.

In short, from the time when the concept of pragmatics emerged, many scholars began to study and analyze it in depth. The pragmatic problems encountered in translation in this regard were not left out either.

One of the pragmatic problems of translation is the problem of pragmatic adequacy. Adequate translation is the perfect translation. AV Fedorov and Ya.I. Resker, the authors of the concept of adequate translation, urge not to understand translation as a clear narrative. Adequate translation

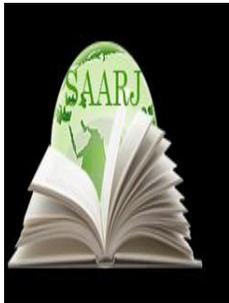

is both the narrative and the re-creation of the grammatical, stylistic, functional features of the original in the translation.

Achieving pragmatic adequacy may depend on a variety of factors. In particular, the norms of the original and translated language, dictionary structure, culture, translator skills, etc. But the most important of these is the skill of a translator. Only a skilled translator can overcome the pragmatic problems encountered in the translation process as much as possible. The skill of the translator allows you to reduce the differences between the original and the translation.

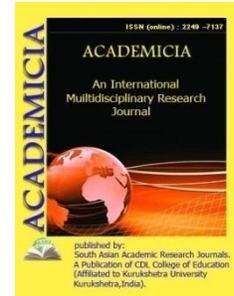

Another pragmatic problem of translation is that of contaminated speech translation. Many languages have forms that go into the standard form of distortion, and the methods of distortion vary in different languages. For example, contaminations with incorrect choice of verb forms are typical of most foreigners who try to speak Russian, while Russians, as well as all foreigners, are more likely to misuse or mispronounce verbs when speaking Uzbek.

ABSTRACT

The article deals with historical development of mining terminology, considers questions of drawing up a lexicographic source – the dictionary of mining industry, including terms, professional units and social speech units, which are used in English, Uzbek and Russian languages. From pre-historic time people have used mining techniques to access minerals in the surface of the Earth. So it is essential to learn the history of mining to the modern life we enjoy today, as mining continue to supply all the basic resources used by modern civilization

KEYWORDS: *Mining Terminology, Mining Industry, Geological Science, Etymology Of Mining Terms.*

INTRODUCTION

Mining has been supposed as one of the most primitive human activities which evolved from the first attempts to search for the stones appropriate for making tools. Since that time it has been considered as basic and significant industry of early civilization and later became a breakthrough for technological advancement.

From pre-historic time people have used mining techniques to access minerals in the surface of the Earth. So it is essential to learn the history of mining to the modern life we enjoy today, as mining continue to supply all the basic resources used by modern civilization.[3, p1] Here the term mining is used in its broadest context as encompassing the extraction of any naturally

occurring mineral substances — solid, liquid, and gas — from the earth or other heavenly bodies for utilitarian purposes. For example:

HUMANS' USES OF MINERALS

Need or Use	Purpose	Age
Tools and utensils	Food, shelter	Prehistoric
Weapons	Hunting, defense, warfare	Prehistoric
Ornaments and decoration	Jewelry, cosmetics, dye	Ancient
Currency	Monetary exchange	Early
Structures and devices	Shelter, transport	Early
Energy	Heat, power	Medieval
Machinery	Industry	Modern
Electronics	Computers, communications	Modern
Nuclear fission	Power, warfare	Modern

Mining in its simplest form began with Paleolithic humans some 450,000 years ago, evidenced by the flint implements that have been found with the bones of early humans from the Old Stone Age. Our ancestors extracted pieces from loose masses of flint or from easily accessed outcrops and, using crude methods of chipping the flint, shaped them into tools and weapons. By the New Stone Age, humans had progressed to underground mining in systematic openings 2 to 3 ft (*abbreviation of foot, a unit of length*) (0.6 to 0.9 m) in height and more than 30 ft (9 m) in depth. However, the oldest known underground mine, a hematite mine at Bomvu Ridge, Swaziland, is from the Old Stone Age and believed to be about 40,000 years old. Early miners employed crude methods of ground control, ventilation, haulage, hoisting, lighting, and rock breakage. Nonetheless, mines attained depths of 800 ft (250 m) by early Egyptian times. [3, p5]

In its place Uzbek mining also has rich historical background, which goes back to the ancient times. The presence of gold deposits in Central Asia, and especially in modern Uzbekistan and the first information about their usage was given by Greek scholars such as Herodotus and Strabo. Ancient Greek philosophers and scientists Herodotus and Strabo mentioned about the existence and exploitation of gold deposits in Central Asia, and especially in the territory of modern Uzbekistan.

Herodotus, "The Father of History" in the fifth book of his nine-volume "History of the Greece-Iranian Wars" wrote they (the peoples living between the two rivers) do not use gold and silver at all because of the abundance of gold." The ancient historian Herodotus reports on nomadic Massaget tribes living in the Kyzylkum deserts stretching from the Aral Sea to Nurata, mentioning that their ornaments were made of gold. "They do not use iron or silver at all, but they are rich in gold and copper" he wrote. Strabo, a geographer who lived five centuries later, wrote "There is no silver in their land, nor iron, but plenty of copper and gold." The information written by the mentioned scientists and related to Western Uzbekistan was further confirmed 2500 years later in our time on the basis of new scientific evidence. [7, p17]

In modern society almost every aspect of life relies on minerals or mineral products, such as base metals, precious metals, coking coal, iron sands, aggregates, limestone and industrial minerals. These are all vital elements used for building and construction, vehicle manufacture and fuel, computers and other electronics, communications, healthcare and dentistry, food production, and

energy production and transmission. As well as supplying the world with the minerals modern society needs, mining creates jobs and is a direct contributor to our economic prosperity.

Today Uzbekistan's mining industry is one of the country's most important and strategic industries. Uzbekistan is one of the world's largest producers of gold and uranium (ranked ninth and seventh respectively). Uzbekistan also produces copper, silver, coal, phosphate, molybdenum, potassium, tungsten, lead, zinc and other minerals. The Republic of Uzbekistan is among the top five countries of the world by the confirmed gold reserves and among the top ten countries of the world by gold mining. Moreover, Uzbekistan is one the leading countries in the World by uranium reserves and mining. Major gold mining bases are the deposits of Kyzylkum, Samarkand and Near Tashkent mining areas.

Since the second half of the twentieth century, large-scale mining and metallurgical production has changed the industrial image of Uzbekistan. For example, the industrial development of the Kyzylkum desert districts necessitated the emergence of gold and uranium mining, where the construction of the Navoi Mining and Metallurgical Combine stimulated the development of the copper and lead-zinc industries. Uzbekistan became a leader in gold mining industry. Its first ingot was obtained in June 1969 at the Zarafshan gold mining plant. By the end of the 1980s, up to 50 tons of "yellow metal" were smelted annually in the Republic. The republic was the largest supplier of gold to the former USSR, supplying about 50% of the Union's gold.[7]

The rapid development of the mining industry and technology, the achievements of scientific and technological progress - all this has an impact on the emergence of mining terminology, which is an integral part of the progressing mining industry. Therefore, the study of special mining terminology is one of the most significant and urgent tasks, which is aimed at achieving adequate translations, contributing to the acceleration of the exchange of information in the field of the latest achievements in mining science among specialists and scientists in most developed countries.

Having considered certain moments of the origin and formation of the Uzbek mining industry, one can come to the conclusion that it has deep historical roots. Yet the terminological system in this area is not sufficiently developed and studied by Uzbek linguists. Consequently, the main tasks of the work could be defined as following:

- To study mining terminology of foreign-language countries (English, Russian);
- To look through their historical origin and formation of mining terms;
- To analyze and compare etymological resources;
- To conduct lexicographic analysis of mining term;
- To compile English-Uzbek terminological dictionaries of mining terms.

An active start to the development of Russian mining industry was laid by Peter the Great in 1698 after returning from Saxony. Exactly then he met a mining expert - a mining foreman Enderlin and the ore maker Bluer, who were able to carry out successful mining and processing of minerals. Rapid development of the geological industry was also associated with the of Peter The first Decrees about the free activity of foreign miners. Such kind of approach to the development of the mining industry in Russia contributed to the active introduction of foreign

concepts and definitions into Russian language. Among these borrowings, mainly there were definitions from German, Dutch and English.

The 19th century there was a huge leap forward in the study of geology; accordingly, terminology develops along with science. Progress and achievements appeared in geological science required new terms for designation. In 1841- 1843 the first "Mining Dictionary" was published in Russia, which included 3850 mining, geology, metallurgy, construction, physics, chemistry terms.

The last period of the development of the geological system of terms began at the end of the 19th century and continuous up to the present day. This period defined as the time of rapid technological progress that also implies the rapid development of mining terminology in Russian language.

The most important term of mining terminological system "горная наука" was introduced into Russian language by M.V. Lomonosov. In the middle of the 17th century at the St. Petersburg Academy of Sciences M.V. Lomonosov laid the foundations of the national mining science, formulating the tasks of mining for that time. He noted that "mining science teaches minerals to know, seek out and bring to such a state that they would be pleasing in human society." Thus, the term "mining science" belongs to M.V. Lomonosov.[6]

The history of English geological science goes back to 1815 year when the English geologist William Smith created a large-scale map, which displayed the geological composition of a large region - Geological map of England and Wales. The map showed the rock layers identified from the fossils that were contained in them. In 1822 by studying the Carboniferous and Cretaceous systems, appeared a new scientific area - stratigraphic systematics. Main divisions of modern stratigraphic scales were officially adopted in 1881 year in Bologna at the 2nd International Geological Congress. [6]

Large percentage of different system languages mining terminology consists of borrowings. Such trait is inherent in almost all systems of terms. Borrowing from other languages is a natural procedure that forms terminology and professional language. This phenomenon contributes to the further internationalization of the language, which undoubtedly makes a huge contribution to the expansion of the area of terms by other language groups.

In the development and formation of mining terminology, most of the terms are borrowed from other languages. Borrowing terms in the studied terminology represent a significant group of words that have penetrated into the mining terminology of a particular language from other languages along with new scientific and technical inventions in this industry. For example the term *anchor- анкерное крепление- қозіқли мустақамлағич* was introduced into English mining terminology from German language. It is taken from practical use of fixing process, where the fixing bolt was named as *anker*, and latter adapted in other languages. The term *aerage-вентиляция-шамоллатиш* was borrowed from French word *aérage*, where it is used in the same meaning.[4]

Many English mining terms have come into the use through the common language, for example the term *drift* (in modern English language *to drive*) appeared in 1300 in the meaning of driving and transformation. Since 1711 it is used in mining terminology in the meaning of mining

production, in Russian language “горная выработка”, but in the Uzbek terminological dictionary of Russian –English mining terms it is given in a bit different way.

Russian	English	Uzbek
горная выработка	mine working [maɪn 'wɜ:kɪŋ]; opening ['ɔ:pənɪŋ]; entry ['entri]	кон лаҳими: ер остида қазиш ишлари олиб борилиши натижасида ҳосил бўлган сунъий гор- йўлак

Today in modern Russian mining terminology instead of the term “горная выработка” which is used in the meaning of mining production, the specialists use the term “штрек” it coincides with the term *drift* in English mining terminology.

Russian	English	Uzbek
штрек	drift [drift], roadway [rəʊdweɪ]	штрек: шахтани шамоллатиш, юклар ва одамларни ташиш учун хизмат қилувчи ер юзасига бевосита чиқмайдиган горизонтал лаҳим.

Analyzing the two examples from the Uzbek terminological dictionary of Russian-English mining terms, we have found two forms of using the term “*drift*”. Consequently, this phenomenon leads to the occurrence of doublet terms, which in some places can cause misunderstanding for specialists. So we can conclude that Uzbek mining terminology is not developed enough and needs deeper investigations, even though it has ancient roots.

Based on the above mentioned historical facts, we can assert that the Uzbek terminology of the mining industry deserves a more extensive research. As in the local language of the Uzbek people, mining terms have been used since pre-historic times.

Trade and transit routes played an important role in the origin and growth of mining in the primitive period. By the third century BC, most territory of Central Asia was inhabited by local people. By the Bronze Age, the nomadic tribes living in deserts and steppes had established closer relations with the sedentary population of the oases. According to historical sources, long before the appearance of the Great Silk Road, in the territory of the Ancient East and Central Asia there had already existed a number of trade routes.

One of such roads in the Bronze Age (III-II millennium BC) was called the Lozhvard (lapis lazuli) road, a branch of which connected Badakhshan, Bactria and Margiyana with Khorezm, Sughd region, Central Kazakhstan and the Urals.[7]

Semi-precious stones mined in the mountains of Central Asia were highly valued in the East, consequently the discovery and expansion of valuable deposits of lapis lazuli, jade, onyx and turquoise served to the broader development of trade and exchange affairs. This means that the

names of mining minerals such as lapis lazuli, jade, onyx and turquoise, which are the means of the mining terminology, had already existed in the common vocabulary of the Uzbek people in the era of the primitive communal system.

Russian	English	Uzbek
<p>Лазурит- $\text{Na}_6\text{Ca}_2(\text{AlSiO}_4)_6(\text{SO}_4,\text{S},\text{Cl})_2$ также: <i>лазуревый камень</i>, <i>ля пис-лазурь</i> или <i>лазурик</i>¹, реже <i>бухарский камень</i> — <u>сульфатсодержащий</u> непрозрачный <u>минерал</u> от синего до голубовато-серого или зеленовато-серого цвета, подкласса каркасных силикатов.</p>	<p>Lapis lazuli (/ˈlæpɪs ˈlæzjʊli, -laɪ/), or lapis for short, is a deep-blue metamorphic rock used as a semi-precious stone that has been prized since antiquity for its intense color. As early as the 7th millennium BCE, lapis lazuli was mined in the Sari Sang mines, in Shortugai, and in other mines in Badakhshan province in northeast Afghanistan</p>	<p>Ложувард—(<i>fors.</i> — moviy), lazurit, iyapis-lazur — <u>mineral</u>. Kimyoviy tarkibi (Na,Ca)g[Al SiOJ6(SO4, Cl,S) ,Kubsingoniyadakristallanadi . Asosan, to‘qko‘k, binafshavako‘kimtir-yashilyaxlit, zichtusdagimaydonadorma ssalarko‘rinishida, ba‘zidakristallarholidauchray di.</p>

Summarizing the definitions of the given term we are able to formulate the following general definition: *Lapis* is the Latin word for "stone" and lazuli is the genitive form of the Medieval Latin lazulum, which is taken from the Arabic *drawazāl* □□□□□□, itself from the Persian *dravejāl* □□□□□□, which is the name of the stone in Persian, and also of a place where lapis lazuli was mined. Lazulum is etymologically related to the color blue and used as a root for the word for blue in several languages, including Spanish and Portuguese *azul*.

Comparing the definitions, it is obvious that in the modern Uzbek mining terminology there has been preserved the original form of this term “*ложурвард*”, borrowed from the Arabic and Persian languages. The same cases might be observed with a number of other terms, such as gold, diamond, jade, etc.

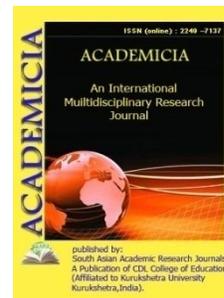

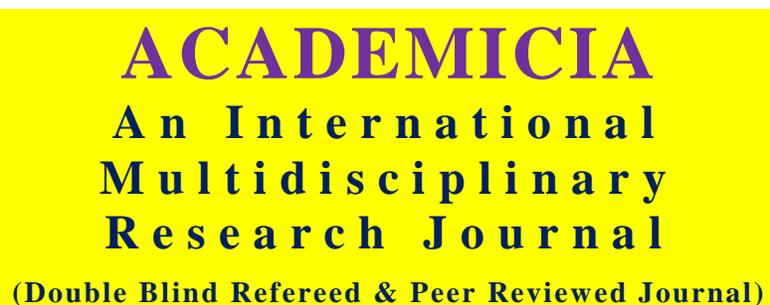

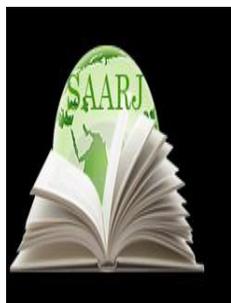

CONCLUSION

The process of forming special terminology, as a rule goes through two historically established stages - spontaneous and purposefully organized. If the first is associated with the implementation and realization of the professional and scientific industry, then the second is associated with a high level of its development and construction. However, for both stages, it is characteristic that in the act of terminological nomination, only those objects to which human activity is directed, are named.

Consequently, the Uzbek mining industry, which has rich historical background, needs perfectly worked out professional mining terminological system. The Dictionaries of English-Russian Mining Terms should contain units of the professional language used by mining industry specialists, as well as more detailed aspects and terms used by specialists of mining enterprises (coal mines, quarries, open-pit mines), underground construction (tunnels, metro construction).

STEAM TECHNOLOGIES FOR THE DEVELOPMENT OF PROFESSIONAL SPEECH IN ENGLISH FOR STUDENTS OF THE MINING AND METALLURGICAL FACULTY

Iroda Sharipova*

*Navoi State Mining Institute,
UZBEKISTAN

ABSTRACT

The article discusses the features of using STEAM technology for the development of professional speech in English by students of the Mining and Metallurgical Faculty. It reveals the essence of STEAM as a pedagogical technology and describes in detail the content of its components. The author substantiates in detail the relevance, expediency and effectiveness of the use of subject-language integrated learning in English lessons. Analysis of the main advantages of STEAM - teaching and teaching English to students of the mining and metallurgical faculty combines an interdisciplinary and project approach, which is based on the integration of natural sciences into technology, engineering creativity.

KEYWORDS: *STEAM Technology, Subject-Language Integrated Learning, Specialized English Language Training, Students Of The Mining And Metallurgical Faculty.*

INTRODUCTION

Today, in the education of the Republic of Uzbekistan, there are many initiatives that can help, first of all, teachers, and through them - students of universities in their desire to master modern innovative technologies. Of particular importance for the development and implementation of these technologies in pedagogical practice are advanced training courses in institutions of additional vocational education.

Analysis of the main advantages of STEAM - teaching and teaching English to students of the mining and metallurgical faculty combines an interdisciplinary and project approach, which is based on the integration of natural sciences into technology, engineering creativity. STEAM Pedagogy is the most comprehensive course of research initiatives that transforms from STEAM through the development of thinking skills embodied in reading and writing. Excellent

transformation of the curriculum into extracurricular activities, the purpose of which is to abolish the teaching of the above disciplines as independent and abstract. It is very important to teach science, technology, engineering, because in practice these areas are closely interrelated. English is the world language; all people need to use it at an ever-higher level. A good knowledge of the English language is needed more than a choice. Globalization, science, technology, education make English proficiency in all fields of science. Teachers who deal with these areas must be prepared for all these changes, challenges and difficulties in higher education institutions. Therefore, it is important to have a clear idea of how prepared our universities are for global demand and why our graduates do not achieve the required level of English proficiency and are not ready to face such problems.

The modern education system involves preparing students for the choice of a profession while still in school, mainly through specialized training in high school. The composition of high school students is differentiated according to their interests, the field of subjects that they plan to study in depth, as well as the development of their professional orientation. While some have already chosen their future profession and a number of specialized subjects, others are still at the stage of selection, without a clear plan and definite interest in a particular subject and field of activity.

Profile training allows you to organize the educational process of students in accordance with their individual capabilities, to create a special educational trajectory that will allow each student to study a certain number of subjects in an in-depth form.

STEAM Integrated Education as "an attempt to combine some or all four disciplines of science, technology, engineering and mathematics into one class, unit or lesson based on links between subjects and real-world problems. "

There are many benefits of STEAM that come with the use of integrated education: "Research shows that using an interdisciplinary or integrated curriculum provides students with opportunities to have more relevant, less fragmented and more stimulating experiences."

Other benefits that have been found are that it is student-centered, improves higher-level thinking skills and problem solving, and improves retention.

An integrated STEAM education often requires students to have a variety of materials and resources to find solutions to real-world problems through the development, expression, testing and revision of their ideas. For genuine learning, students need to be given the opportunity to develop processes or products that address different types of mining engine technologies.

Integrated STEAM education is an attempt to combine science, technology, engineering and mathematics into one class based on links between subjects and real-world problems. However, in general, an integrated STEM education can include multiple grades, and teachers do not have to always include all four STEAM disciplines. Engineering is becoming more prevalent and can provide students with excellent problem-solving opportunities to learn about mathematics, science and technology while working in the design process of mining engineers.

STEAMs must evolve not only to a deep knowledge of the content they teach, but also to specialized knowledge of how to teach STEAM to students, that is, to pedagogical knowledge. Teacher training and support is essential to achieve the goal of quality STEAM STEM education.

Paradoxically, many teachers have limited basic knowledge, beliefs, confidence, and effectiveness in teaching STEAM, which can hinder STEAM teaching to students.

One of the pressing problems in specialized non-linguistic groups is the attitude of students to a foreign language and its place in the system of specialized training. Obviously, knowledge of a foreign language in the modern market of competencies is a priority and in demand. However, it is not difficult to imagine that an in-depth study of specialized subjects can push the English language into the background, significantly reduce the motivation of students to study it. One of the ways to improve it is to integrate interdisciplinary communication with specialized subjects into the educational process, where language does not become a direct means of studying other subjects and mastering communicative competencies. In this regard, more and more English teachers are using new educational technologies in the process of teaching English. The specificity of the STEAM methodology lies in the fact that knowledge of the language becomes a tool for studying the content of the subject. At the same time, the language is integrated into the curriculum, and the need to immerse yourself in the language environment in order to be able to discuss thematic material significantly increases the motivation to use the language in the context of the topics studied.

Speaking about the content aspect of STEAM technology, we mean educational material, first, a text selected taking into account the subject content of specialized subjects. At the same time, attention is focused on both the content of the texts and the necessary thematic terminology. For example, in English lessons at the Mining and Metallurgical Faculty, a text on the design of mining engines ("Engine types"), differences in units of measurement in different countries ("Units of measurement in different countries"), etc. can become a meaningful basis. The communicative component of the technology is fully justified, since in the educational standard the main goal of teaching foreign languages is the formation of communicative competence - the ability to communicate in a foreign language in real life situations and in the learning atmosphere.

It is the communication component that determines the stages of the lesson using STEAM technology. Having formulated the topic of the lesson goal, the students proceed to the stage of texts, where they are asked to determine the topic and idea of the proposed text, to eliminate language difficulties by reading special vocabulary: terms, formulas, and also the related universal mining and metallurgical dictionary. Only after this is reading and linguistic understanding of the text carried out so that students understand the main idea and the phenomenon described and can briefly tell the text and convey the essence of this idea in their own words, using the already known mining and metallurgical vocabulary.

After this translates into speech, the stage at which the teacher can offer students a wide range of language exercises. Most often, this can be a problem statement that students must solve using their knowledge of the main subject, language skills and speech skills, as well as imagination, thinking outside the box. In addition, the logical conclusion of this stage can be project activity, when students receive a new product by scientific methods in the process of research. At the same time, the work can be carried out both in groups and in pairs and individually. For example, in English lessons in mining and metallurgical universities, interesting topics for the project can be a comparison of mining and metallurgical systems in technical universities in Uzbekistan, Russia and English-speaking countries, a list of mining machines and metallurgical plants used all over the world; history, order and attitude towards exploitation in different countries, etc.

Specialized classes using subject-language integration cannot take place without cognitive activity. During the lesson, the student is actively involved in the cognitive process, the student's knowledge of the core subject and his language knowledge and skills are integrated.

Firstly, the existing knowledge of the subject is updated, and secondly, within the framework of the subject areas, deep knowledge, skills of analytical and critical thinking, as well as cognitive universal learning actions, such as the ability to find the necessary information from various sources in order to separate the basic information from secondary, formulate a problem, put forward theses and arguments, find evidence, present your point of view on the problem posed. The last, so-called "cultural" component

This makes it possible to find similarities and differences, to consider the problem from different positions, cultural, religious and ideological views. For example, at a socio-economic university, a subject-language integrated English lesson can be viewed as a political device in Uzbekistan, Great Britain or America and reveal similarities and differences in their legislative, executive and judicial branches of government. Such classes will undoubtedly broaden the horizons of students, immerse them in a natural language environment, and will contribute to the formation of the socio-cultural competence of miners.

Thus, we consider the use of STEAM technology in English lessons in non-linguistic universities necessary and effective. Firstly, this approach meets the requirements of the State Standard of the Republic of Uzbekistan, forms integrated interdisciplinary communications, is actively aimed at developing the skills and abilities of students, contributes to the formation of the necessary competencies. Secondly, subject-language integrated education fits perfectly into the educational process of mining students, where the main forces of students are concentrated on the study of specialized subjects. Integrated classes become an additional source of knowledge and skills of students in a specialized subject. Thirdly, the development of all four-language skills, the replenishment of the vocabulary with different layers of vocabulary, certain terminology, new language constructions, an abundance of language exercises and conversational speech contributes to a qualitative increase in the language level of miners.

In addition, this technology is versatile and suitable for use at any level, regardless of profile, configuration and language level. It should also be noted that integrated classes are professionally oriented, especially for students who cannot decide on their main subjects and their future profession. Finally, interesting integrated classes will certainly increase the motivation of students to learn English, even despite the need for in-depth study of complex subjects of the profile cycle.

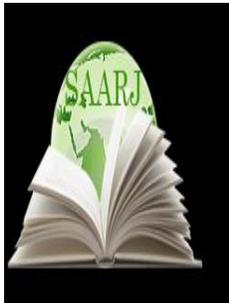

However, despite its many advantages, STEAM has several disadvantages. Namely, an English teacher does not always fully possess the necessary skills and abilities for a complex lesson, especially when it comes to complex chemical or physical phenomena, processes, quantities. So, we can conclude that the use of STEAM technology in English lessons in specialized high school classes meets the requirements of the modern educational standard, and allows you to successfully optimize the process of learning a foreign language by students through the integration of a foreign language and specialized subjects.

In Outcome, recent discussions have confirmed that STEAM offers opportunities to improve language learning and language teaching. "STEAM theorists and teachers argue that the learning environment created by STEAM increases the student's overall learning ability, his / her

motivation and interest." There is a lot of discussion about the global spread of English as a teaching medium. Over the past twenty years, great strides have been made in teaching English as a second / foreign language. Some approaches to subject learning have been radically developed, others to a lesser extent. The same is with the way teachers teach.

 Namangan, Republic of UZBEKISTAN
 Email id: devdas@mail.ru

ABSTRACT

The article deals with new non-traditional types of mass culture that prevent the formation of spiritual and moral life of young people. In the era of market economy and transformation of national values and ideals, there is a need to improve the tolerant attitude of mass culture. Tolerance as a special quality of the ethno-confessional life of the peoples of the region is the result of a long historical process of developing the idea of collectivism of the people for the sake of achieving the common good.

KEYWORD: *National Value, Transformation, Mass Culture, Tolerance, Starism, Kitsch, Flashmob, Vandalism.*

INTRODUCTION

Scientific and technological progress, in particular information technologies, are radically changing the face of modernity: the rapid dynamics have complicated world politics, the probability of war is high, the priority of threat and danger is focused on the spiritual life of peoples, that moral education and the education of citizenship of young people are becoming the primary task of the education system. [2, p.27] In the context of the implementation of a promising course of Action Strategy, the education of tolerant behavior of young people, awareness of what is happening in the country remains relevant.

Methods

In this regard, the formation of tolerance of young people involves not only compromise or loyalty, but their activity in the spheres of creative life. At the same time, the phenomenon of tolerance has not yet been sufficiently studied in the social sciences. In many cultures, the

concept of "tolerance" is characterized by a kind of synonym for tolerance: Latin-*tolerantia*; Portuguese-*tolerância*; Italian-*tolleranza*; Dutch-*tolerantie*; Uzbek-*bag'rikenglik and sabr-toqatlilik*. In addition, all dictionaries of the twentieth century clearly indicate a direct interpretation of tolerance as tolerance. In a globalized world, tolerance is seen as loyalty or neutrality to someone else's lifestyle, behavior, customs, feelings, beliefs, and opinions. It is assumed that tolerance can be a useful and profitable value within the framework of one state or society, forming related religious-national relations. However, it can play a negative role at the international level, as the values of European society differ from those of the East, which can affect religious feelings with destructive force.

Tolerance as a special quality of the ethno-confessional life of the peoples of the region is the result of a long historical process of developing the idea of collectivism of the people for the sake of achieving the common good. Thus, "tolerant relations to representatives of other nationalities among Uzbeks are so developed, as the first President of Uzbekistan I. A. Karimov noted, that national and spiritual tolerance has become an integral feature of their common culture and mentality." [1, p. 77]

It should also be noted that this value has become popular in the last decades of the new century. We often hear from TV screens, from leading politicians, the word "tolerance" or "tolerance in different guises and meanings of socialization of young people, which we were not familiar with until recently. Apparently, this phenomenon arose with the process of globalization in all spheres of life, which is a response to the challenges and realities of our time, which open up huge opportunities for humanity. As we noted above, tolerance as a norm of relations plays a negative role in social life. Moreover, some forces in the world use values to achieve selfish goals. An example is the recent increase in cases of violence, intolerance, vandalism, which have exacerbated conflicts among young people on the basis of ethnic confessionalism.

RESULTS AND DISCUSSION

In our opinion, it is tolerance that has become the basis for the spread of new types of mass culture among young people. In order not to be unfounded, we will cite starism, kitsch, flash mob, vandalism, which are gaining popularity as new types of youth mass culture. Starism – translated to English means the stars that youth have a new artificial idols role model for the youth [5]. These idols, i.e., stars, popularize the norms of behavior and the image of European society in our republic with their mass culture. New-found idols from among the performers of pop music, actors, athletes, TV announcers become the subject of youth discussion and bearers of a new model of advanced youth culture. An example is the performance of young artists and showmen in unconventional clothing on the stages of the capital's palaces of art.

Another type of mass culture of young people can be distinguished by Kitsch -(German: kitsch -hack, tasteless, "cheap") [6]. One of the earliest standardized manifestations of mass culture, characterized as modern hack work, tasteless production and status value. This form is dangerous by focusing on the needs of the everyday consciousness of young people. It is harmful because it lowers the aesthetic taste, turns the consumer of European unconventional fashion, which is not possible to be tolerant and loyal.

Another type of modern youth action, the so-called Flashmob - (from the English flash - moment, instant, mob - crowd) - a pre-planned mass gathering in which a large group of people appears in a public place, performs pre-agreed actions (scenario) and then disperses [7].

Recently, it has become a new value to car gatherings on significant dates and images of cars on a large area—a flash mob of cars "2019", the number "27", etc.

The danger of such a gathering is that today it is positive, that tomorrow it becomes the most powerful weapon of immorality of young people. Today, in European cities, it has become a flash mob to walk naked in public places and events of young people, which is not tolerable for the peoples of the East.

Vandalism [8] is becoming one of the negative phenomena of the youth of the post-Soviet space, which is included in the life of the youth of the republic. As we assume, vandalism in the past has manifested itself in the destruction of historical monuments of the people, which passes into the area of the spiritual life of the population, especially young people. It is difficult to be a tolerant vandal girl who mocks not only the monument in honor of the Shomakhmudov family, but also the historical memory of the multinational Uzbek people.

Sociological analyses of some types of modern non-traditional forms and patterns of culture have a negative impact on the spiritual and moral life of the younger generation. The determinant of the spread of this kind of negativity, as we believe, is the result of the vacuum of educational and educational work of the system of science and education. In addition, there is a lack of participation and activation of political parties and public organizations, apart from their occasional events held to report on the activities of organizations. We stand in solidarity with those specialists in the expediency and consistency of the work carried out among young people. However, the most important innovative method that ensures the effectiveness of educational work, as we think, is the revival of the traditional social status and function of the family. All the good things a person gets from his native home, ancient thinkers said, that no public organization can replace family education. The family as a traditional institution has been modernized to the detriment of national color and ideals. Based on the principles of innovative educational approaches, we assume that the education of tolerance covers not only the education system, but also the family life of young people.

At the same time, the results of globalization are manifested in equipping the life and everyday life of the population with modern information technologies and mobile connections, which is a source of penetration of non-traditional "mass values" - this is a process that gives a high assessment of objects that do not have artistic aesthetic value. Values that are popular and prevalent among a wide range of young people in a given society, which affect the spiritual life. Thus, it is necessary to pay attention to the "transplantation" of values - the "transplantation" or replacement of the traditional way of life and values with new Europeanized values, which negatively affects the social moods and orientations of young people. As a result, there is a "transplant" of new values in place of traditional values, replacing them with new norms of behavior of national ethics.

People are increasingly coming to understand that uncompromising and intransigence should give way to higher values - the ability to find mutually acceptable solutions in the family, to prevent emerging and overcome existing conflicts. However, we are inclined to the idea of the supremacy of the national interests of society, education, which acquires the most important conditions and is the guarantor of the social progress of the republic.

In the interval of ideological work, the family has a special responsibility in the formation of high moral character of the young people that we believe the improvement of the legal acts in the field of marriage and family.

Practice has shown that the implementation of the most effective measures of the principle of tolerance involves some not difficult conditions:

- The creation of a family atmosphere based on blood-related principles at the level of democracy and the rule of parents' rights, the innovation of family education, as we think, is that the equality and freedom of each family member places the responsibility on everyone to form their own civic position.
- Fostering a sense of love for the national culture, improving literacy, ensuring academic performance in all educational systems. Familiarity with the culture, traditions, and way of life of representatives of other nationalities will allow you to translate the evaluative activity inherent in many people into cognitive activity.
- To form a culture of patience, i.e., to accept the other as he is. This condition means that the subjects of interaction should strive not to remake each other, but to perceive the other as something whole with all the individual characteristics.
- to focus on the unifying factors of socialization and professionalization of young people, high moral, spiritual and intellectual ideals of the people.

CONCLUSION

The work on the formation of tolerance in modern society should be associated not only with the training of young people in specific skills of tolerant behavior, but also with the formation of certain personal qualities in them. We are talking about a sense of self-esteem and the ability to respect the dignity of others; the awareness that each person is diverse in their manifestations and is not like others; a positive attitude towards himself and representatives of other peoples and other cultures [4, p.26].

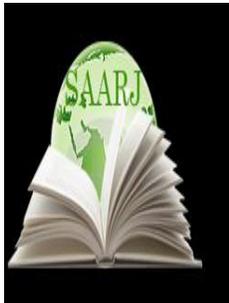

Uzbekistan has always been a multi-ethnic country with various national and religious confessions, which is enshrined in the constitutional norms that "The people of Uzbekistan are citizens of the Republic of Uzbekistan, regardless of their nationality." [3, p. 5]

The unity and unity of the people on the highest universal and national ideas, as we see it, can play a creative role of society, which ensures a bright future of the republic.

IN THE HIGHER EDUCATION SYSTEM THE IMPORTANCE OF INTERNATIONAL COOPERATION

Karimov Mansur*

*Researcher,
 Karshi State University,
 UZBEKISTAN

ABSTRACT

The adoption of the Law on Education and the National Training Program, the rapid implementation of reforms in the field of education, are clear examples of the fact that the basis of economic development is science and education. Addressing the socio-economic and cultural-political challenges facing society since the early years of our country's independence, first of all, radically reform the education system, the rich spirituality and values of our people, innovative science and technology, high market spirit. Requires the creation of a newly formed and spiritually new system based on economics. Due to the key role of science and education in the development of innovative development, historical work is being carried out in our country.

KEYWORDS: *Uzbekistan, Cabinet of Ministers, Ministry Of Higher And Secondary Special Education, Science, Education, Action Strategy, Technology, International Cooperation, Professor, Conference, Research.*

INTRODUCTION

The experience of developed countries shows that the use of modern technologies in teaching guarantees to increase the speed and efficiency of learning materials by students. Named the "Miracle of Japan", "The Miracle of South Korea", "The Miracle of Singapore" and now the "Miracle of China" in the late twentieth and early twenty-first centuries, it is rapidly entering the world market due to its high level of development. it would be appropriate for us to pay attention to the fact that countries organize education and training.

The Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 identifies important issues related to the radical renewal of the content of training, the

creation of the necessary conditions for the training of highly qualified specialists at the level of international standards.

The decrees of the President of Uzbekistan and the Cabinet of Ministers on further improvement and development of higher education for 2017-2019 set tasks for the establishment of priority areas of international cooperation in higher education and its implementation.

It is planned that higher education institutions will develop cooperation with the world's leading scientific and educational institutions, widely introduce advanced pedagogical technologies, curricula and teaching materials into the educational process. Particular attention is paid to the active involvement of highly qualified teachers and scientists from foreign educational institutions in educational activities, professional development courses, the organization of internships for masters, young teachers and researchers in foreign educational and scientific institutions, professional development of teachers.

Over the past 3 years, 1,611 professors and teachers of higher education institutions have been provided with internships and advanced training in foreign higher education institutions. Within the framework of international cooperation, 112 young people were admitted to master's and 51 doctoral programs at foreign universities and research institutions.

Through the El-Yurt Umidi Foundation, 46 professors and teachers have been trained in Canada, the United Kingdom and Italy.

In 2017-2019, 1,154 highly qualified foreign teachers and scientists were involved in the educational process (94 people from the United States, 445 people from European countries, 299 people from Asian countries, 316 people from the CIS countries).

The higher education institutions of the Republic and the Ministry of Higher and Secondary Special Education, developing international relations in the field of higher education, studying the experience of developed countries, include the following tasks:

- Professional development of professors and teachers of higher education institutions;
- Creation of new curricula, modern educational and methodical literature for various areas of education;
- Wide participation of professors and teachers of higher education institutions in foreign scientific-practical seminars, conferences and symposiums;
- Participation of professors, teachers and students in foreign exchange programs and trainings;
- Inviting foreign teachers and professors to work in higher education institutions of the country to improve the educational process and exchange experiences;

International cooperation in the field of higher education is based on intergovernmental agreements with China, the Republic of Korea, Malaysia, Egypt, the Russian Federation, Azerbaijan, Turkmenistan, Ukraine and a number of other countries.

Within the framework of the Agreement on Cooperation in Education signed between the Ministry of Higher and Secondary Special Education and the Ministry of Education of the People's Republic of China on November 8, 1999, 40 students, candidates of science and young professionals from a number of higher education institutions of Uzbekistan are undergoing internships.

Internships in Chinese higher education institutions are conducted in order to improve knowledge of Chinese language and literature, as well as various technical and natural sciences. Higher education institutions of Uzbekistan cooperate with the United States, Germany, Great Britain, France, Italy, Japan, the Republic of Korea, China, Malaysia, India, Russia and others on the basis of direct inter-institutional agreements.

These agreements provide for the exchange of professors, teachers and students, their participation in various conferences and symposiums, joint research, publication of scientific articles, and so on.

Higher education institutions of Uzbekistan have close ties with the British Council, the Goethe Institute, the German Society for International Cooperation, the International Cooperation Agency of Korea and Japan, the India-Malaysia Technical Cooperation Program, the UN Development Program, the WB, ADB, IDB and others. All these programs and projects are aimed at developing higher education in the country, improving the educational process using advanced foreign experience, improving the skills of professors and teachers, expanding student exchanges.

It should be noted that the higher education institutions of Uzbekistan are actively involved in the European Union's Tempus and Erasmus Mundus educational programs.

Currently, 20 projects of the EU Tempus curriculum are being implemented in the country, which involve about 40 higher education institutions of Uzbekistan.

The Tempus project is mainly dedicated to the development of curricula for master's and bachelor's degrees in technical sciences and theoretical technologies. The higher educational institutions of the republic work in cooperation with European universities to develop new curricula in various disciplines and improve existing ones. In addition, the Tempus project will provide participating higher education institutions with modern computer equipment and techniques. The Tempus project also aims to improve the skills of professors and teachers in higher education institutions. It should be noted that the projects include short-term seminars, scientific-practical conferences, training courses in European higher education institutions. Higher education institutions of Uzbekistan also participate in the Erasmus Mundus program of the European Union, aimed at strengthening the academic agility of students and teachers, cooperation between universities. Under the programs, students and teachers will have the opportunity to do research internships in European universities.

Currently, great attention is paid to cooperation with foreign partners in attracting foreign teachers and specialists to the educational process. The most active work in this direction is being carried out by the Korean and Japanese international cooperation agencies JICA and KOICA.

According to the Decree of the President of the Republic of Uzbekistan "On approval of the Concept of development of the higher education system of the Republic of Uzbekistan until 2030", the development of international cooperation in science, active cooperation of leading local higher education institutions with relevant institutes of the Academy of Sciences in which the priorities for the wider use of the mentoring model are identified.

The Concept of Development of the Higher Education System of the Republic of Uzbekistan until 2030 includes the development of joint degree programs with foreign higher education

institutions, expansion of cooperation with foreign countries in the field of education and improvement of their regulatory framework, joint cooperation with foreign higher education institutions. expansion of training programs, increase the number of joint scientific conferences and seminars, implementation of international scientific and educational projects, joint international scientific journals in cooperation with higher education institutions and research centers of developed countries, as well as educational forums, rectors' conferences and to organize other conferences, to strengthen relations with international financial institutions, leading international organizations in order to develop international cooperation in the field of higher education. contacts are being held in support of innovative initiatives in the interests of the country's education system.

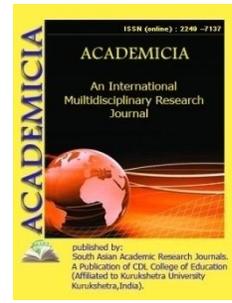

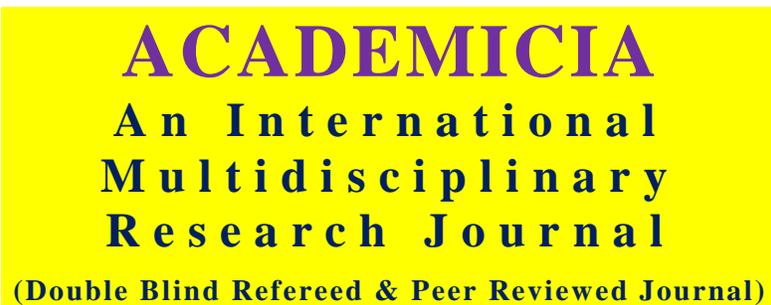

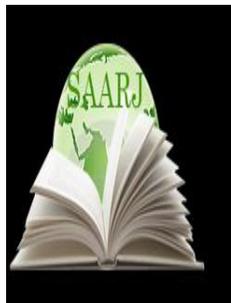

By improving the quality of education in universities through the development of international relations, it is possible to organize a modern educational process, help universities to take the lead and ensure a link between education and production. Today, higher education institutions in the country have a number of goals for international cooperation and human resources:

- Establishing cooperation with foreign higher education institutions, research centers and advanced training institutes;
- Study of the latest educational and scientific experience and their application in education;
- Return of students and teachers to gain experience in prestigious educational institutions around the world;
- Introduction of new pedagogical technologies in the educational process;
- Attracting foreign investment by participating in international grants and programs;
- Invitation of specialists from foreign universities to give lectures;
- Organization of scientific-practical conferences, seminars and forums together with foreign partner universities;
- Establishing friendly relations in the field of education with embassies and missions operating in Uzbekistan;
- Development of specific mechanisms and programs of international education in order to improve the quality of education and enhance the reputation of the university in the field of international education;
- Organization of the study of best international practices in the field of professional training of university students and professors, etc.

In short, participation in today's globalization processes, integration into the world community in ensuring the quality of education is very important for the future of our country. Education is a process of mastering the achievements of secular scientific-intellectual, artistic-aesthetic and spiritual-moral culture, and the fact that real education is based on world experience without recognizing national-state borders is a strong factor for the future of any state.

ABSTRACT

This article is devoted to current issues of low-carbon energy development. Renewable energy sources are considered as important sources of low-carbon technology implementation, where special attention was paid to wind generators. The advantages and disadvantages of wind generators are described, some technical characteristics on the use of their power are given. In the article the indicators of the leading countries for the use, investment development of wind energy and production of wind generators installations are given. The issues of development of renewable energy sources in Uzbekistan are considered.

KEYWORDS: *Low-Carbon Energy, Low-Carbon Technology, Carbon Dioxide, Renewable Resources, Renewable Energy Sources, Solar Energy, Wind Energy, Wind Power Plants, Wind Turbines, Wind Farms.*

INTRODUCTION

From the point of view of the state of the environment, at present, in many developing countries, natural ecosystems for the most part have not lost the ability to self-regulate the process of renewing biological resources and ensuring ecological balance. However, signs of degradation are present. The progressive urbanization of territories is accompanied by a significant increase in air pollution, a decrease in access to high-quality drinking water, degradation of land resources, loss of biological diversity, the problem of the accumulation of solid household waste,

an increase in the number and scale of natural and man-made emergencies. The expected climate change will have a significant impact on the living conditions and health of the population. Also, climate change will lead to an increase in natural emergencies associated with emissions of carbon dioxide, in other words, carbon dioxide (CO₂).

Carbon dioxide is the key greenhouse gas causing global climate change. It is released through many different activities such as; deforestation, burning fossil fuels, and volcanic eruptions.

Humanity has always faced the problem of providing sufficient energy for its growing needs. The recurrent and, in some countries, existing energy problems show the importance of solving this issue.

It is widely recognized that the energy sector is fundamental to economic growth and environmental sustainability. Access to affordable, reliable and sustainable energy is vital for eradicating extreme poverty and promoting shared prosperity. Modern energy services can help improve the quality of life for millions of people around the world and underpin progress in all areas of development.

About 1.1 billion people worldwide still lack access to electricity - most of them in Africa and Asia - which has an impact on children's education, public safety, service delivery, and job creation. Another 2.8 billion use wood or other biomass for cooking and heating, which leads to indoor and outdoor air pollution, and which causes about 4.3 million deaths annually [1].

This problem is also acute in Uzbekistan, many settlements in regions suffer from insufficient supply of electricity and gas. And this figure unfortunately grows from year to year.

In order to effectively reduce CO₂ emissions while maintaining economic growth, different countries began to look for new ways of development, among which low-carbon development has been widely promoted.

What is low-carbon development?

Low-carbon development is based on the use of low-carbon energy technology, low-carbon energy development. Different sources give different interpretations, and a number of concepts related to low-carbon development have appeared in the literature, such as low-carbon energy, low-carbon living, low-carbon society, low-carbon city, low-carbon community, low-carbon tourism, low-carbon world. These concepts are related to each other, but also have some fundamental differences.

Implementation of low-carbon technologies is based on energy-saving technologies, the category of which includes renewable energy sources (RES), the economic justification of which is given insufficient attention. This affects the pace of development of this direction in the energy sector.

As a result of human influence on the environment, negative effects begin to appear at an increasing rate: thermal, chemical, radioactive pollution of the environment, combined with a rapid decrease in readily available fuel reserves, especially oil, gas, high quality coal. New ways to process uranium will not remove the problems of thermal pollution, waste storage, and possible accidents of energy giants.

The dwindling reserves of fossil fuels and their apparent scarcity in some countries necessitate the creation of energy plants that use the energy of the sun, wind, ocean in its various forms and

the thermal energy released in the Earth's crust, in underlying processes. This energy is continuously renewable and virtually inexhaustible.

From the technical side the problems of using renewable resources (RR) have been solved successfully for a long time, but we cannot say about the solution of methodological issues of financial and economic efficiency of installations and systems, working on these resources (UWER).

When considering renewable energy sources, there are many examples that have come into our lives, some of which are actively used. Such sources include solar and wind energy sources.

Wind energy is a branch of energy industry that specializes in converting the kinetic energy of air masses in the atmosphere into electrical, mechanical, thermal or any other form of energy convenient for use in the national economy. Such conversion can be carried out by such units as wind turbine (for obtaining electric power), windmill (for conversion into mechanical energy), sail (for use in transportation) and others.

Consider the three main phases of low-carbon development.

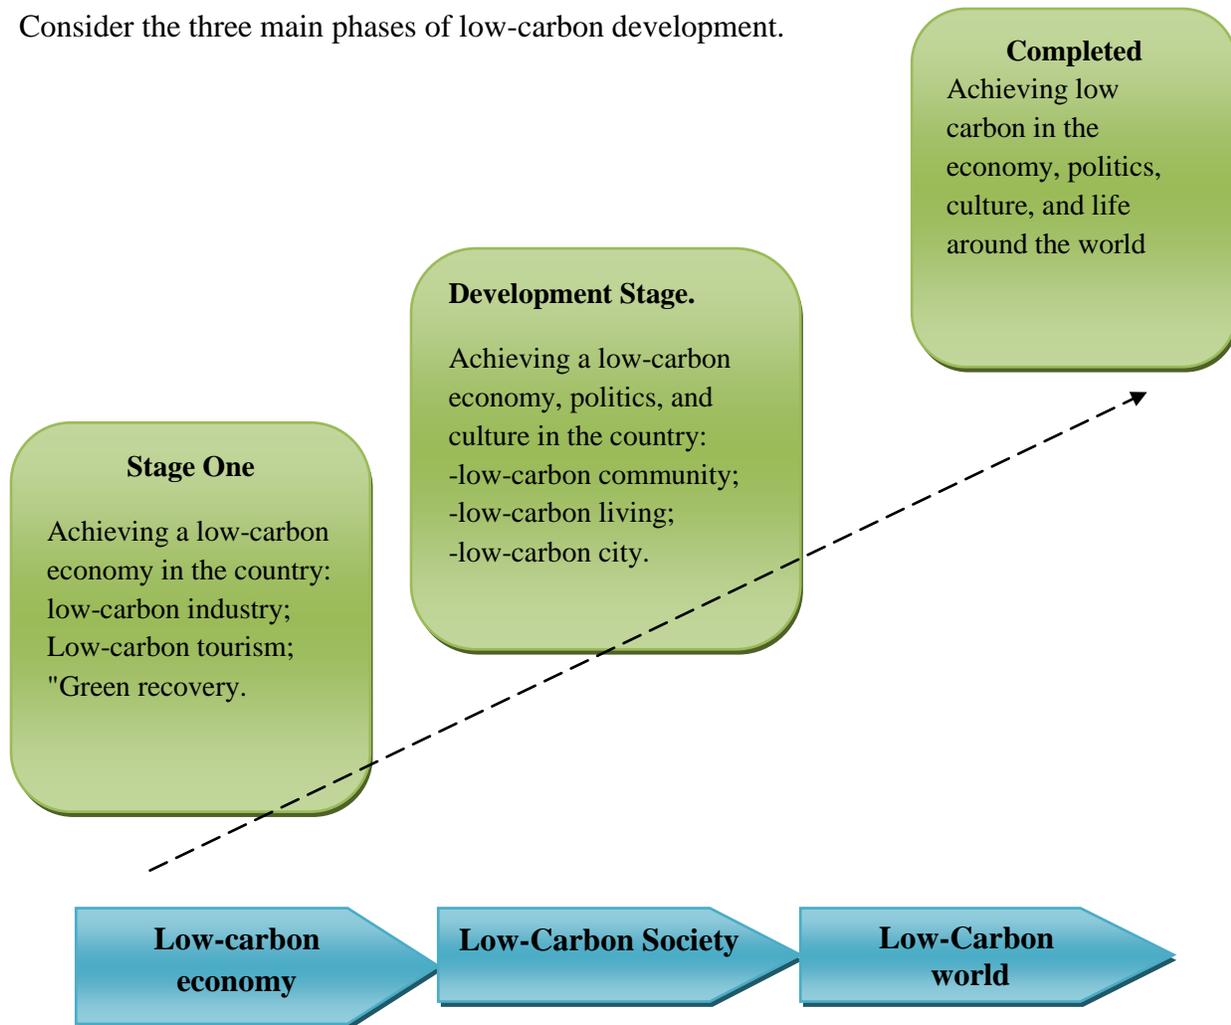

FIGURE 1 THREE PHASES OF LOW-CARBON DEVELOPMENT

Currently, there are three main types of wind farms: propeller, where the rotating shaft is horizontal to the wind direction and with the highest efficiency, drum and carousel, where the shaft rotating the blades is vertical and which are installed in places where the wind direction does not matter (e.g. in the mountains).

Large wind farms are included in the general grid, smaller ones are used to supply electricity to remote areas. Unlike fossil fuels, wind energy is almost inexhaustible, universally available and more environmentally friendly.

However, the construction of wind farms is associated with some difficulties of economic and technical nature, slowing down the development of wind energy. In particular, the variability of wind flows does not create problems with small portions, the problems of reliability of electricity production also increase [2].

In general terms, the structure of a wind power plant is as follows. The flow of air rotates the blades, and the blades spin a shaft, which is connected to a set of gears that drive the electric generator. Large power supply turbines can produce from 750 kilowatts (kilowatt = 1,000 watts) to 2.5 megawatts (megawatt = 1 million watts) of electricity. For power supply of residential complexes, telecommunication stations and water pumps, compact single wind turbines of less than 100 kilowatts are used as a power source. This is primarily characteristic of remote and hard-to-reach areas, where there is no connection to the public power system [3].

In wind turbines, groups of turbines are connected together to generate electricity for the public power grid. Electricity is supplied to consumers by means of transmission lines (transmission lines) and distribution lines. If the wind blew constantly with a certain force and direction, without gusts and stops - there would be an ideal wind farm. Let's consider the advantages and disadvantages of the characteristics of these structures.

Advantages:

- ✓ These power plants are simple and straightforward by design;
- ✓ We get almost free electricity;
- ✓ Wind power plant is environmentally friendly;
- ✓ It does not require a lot of wires to deliver electricity to the place of consumption;
- ✓ Indispensable in areas where power cannot be delivered by conventional means.
- ✓ Disadvantages:
- ✓ The wind is erratic and the generator runs unevenly;
- ✓ At any time, usually the most inopportune, the power supply can be cut off;
- ✓ The power of a wind farm is not fully utilized;
- ✓ Large areas open to all winds are required to locate a wind farm.

With all the seeming balance of pros and cons, the advantage is still apparent in the side of wind turbines.

Modern energy companies prefer to use large wind turbines as the main source of current generation in order to ensure stable operation of power supply systems. For this reason, the

developers of such devices, put a lot of effort, thanks to which wind turbines began to meet not only the technical, but aesthetic and economic requirements of customers [4].

Let us note the safety of megawatt wind turbine. Wind turbine generator 1.5 MW at 690 volt with three blades and wind wheel diameter of 70-87 meters belongs to the devices of megawatt-class. It was designed taking into account:

- the application of all current European regulations and design standards;
- using strict quality control in the production process;
- norms limiting the possible noise level, which during the operation of such a wind turbine is within 70db.

The total weight of the turbine is 61,500 kilograms. If you purchase this wind farm, it will be able to generate electric current with complete safety for life and health of animals and people. Automatic lightning and storm protection is possible with the use of a safety system. Such a wind generator will not interfere with the operation of household devices and electrical appliances. In this regard, there is no need to obtain a permit for its installation and operation.

The operation of the wind generator is as follows. It operates at an average wind speed of 13.5 m/sec. If the speed increases over 25 meters per second, then the braking blades are triggered. At wind speeds less than 3.5 meters per second, this wind turbine generates no electricity because its blades cannot rotate. Energy supply of buildings with electricity in this case will be carried out with the help of accumulated during the operation of powerful accumulators of energy. [5]

In addition, such mega wind turbines are equipped with:

- Necessary sensors, by means of which wind speed and direction are regulated;
- a system that allows to change the angles of the installed blades;
- a control system capable of operating with the help of microprocessors via a network of computers;
- a system by means of which the blades are forced to turn in the direction of the wind.

The use of high quality materials in the manufacturing process of such wind turbines allows such wind power plants to operate under warranty for at least five years and a minimum of twenty-five years in all conditions. After installing a mega wind turbine generator for 1.5 MW at 690 volts will be able to produce annually in the range of eight million kWh of electricity at an average wind speed of more than nine meters per second.

For the past five years, wind power has been growing at a rate of about 50 gigawatts per year. Today, all of the planet's wind farms generate 591 gigawatts. GWEC expects that in another five years the world will have 300 more gigawatts of new capacity.

Wind power is the second largest energy industry in Europe. The European Union's wind farms produce about 180 gigawatts of energy. This is almost half of all European power generation. The Wind Europe Association predicts that wind power could outgrow the gas industry this year. In 2018, almost 12 gigawatts of wind turbines were commissioned in Europe. Of all the energy facilities built in 2019, renewable energy accounts for 95 percent. But gas, oil and coal are losing ground: new installations of gas and coal in the EU have reached a record low.

Every year, billions of euros are invested in green energy in Europe. 2018 was a record year for wind energy project financing, with investments totaling nearly 27 billion euros. The largest investors are the UK and Sweden. Ukraine, with 1.2 billion euros, is in the top ten in terms of investments in green energy.

Among manufacturers, Germany is the leader in the construction of wind power plants. Europe in general is experiencing a boom in the construction of wind turbines; their number is growing in Scandinavian countries and Greece.

In Asia, China is experiencing the greatest practical interest. The construction program provides for the mandatory installation of such installations when constructing new buildings.

FIGURE 2: TOP WIND ENERGY LEADER COUNTRIES, 2018, GWEC, GIGAWATTS

A wind farm consists of several wind turbines combined into one grid. The largest wind farms are located in China, India and Great Britain. For example, China's Gansu province has an entire complex of wind power plants with a capacity of nearly 8 gigawatts, which can compete with the largest nuclear and hydroelectric power plants.

A wind turbine is a plant that converts wind energy into electricity. According to Wind Europe, the average capacity of one wind turbine varies from 2 to 3.6 megawatts.

The most powerful wind turbine in the world is installed off the coast of Scotland. Diameter of the wind turbine blades is 164 meters, which is more than the wingspan of any airplane, its height is 191 meters. Power of the installation is 8,8 megawatt. Wind energy from one revolution of the wind generator blades is enough to illuminate one apartment for a day.

The construction of a wind generator weighs hundreds of tons, its mast is made of thick sheet metal, and the foundation is made of large-diameter fittings - 20-32 mm. One foundation can take from 60 to 130 tons of rebar. Steel alloy makes the installation strong and resistant to stresses.

When introducing wind turbines, financing the process plays a huge role. The leader in this area is the UK (Fig.3.) [6]

Speaking about introduction and development of renewable energy sources in Uzbekistan, it is necessary to note that modern Uzbekistan has a developed energy sector.

In recent years, the government of Uzbekistan has paid great attention to the prospective development of renewable energy sources.

Uzbekistan will adopt a National strategy for low-carbon development, which is currently being developed by the Ministry of Energy with the involvement of international experts.

The document will reflect the ways of transition to the production of electricity with low greenhouse gas emissions that negatively affect the environment.

In early May 2020, the Concept of Electricity Supply in Uzbekistan for 2020-2030 was adopted, which was developed with the participation of the Asian Development Bank and the World Bank. The concept provides for the modernization of existing power plants and the creation of new types of power generation through renewable energy sources (RES) and the planned construction of a nuclear power plant. These measures are expected to reduce greenhouse gas emissions by 2030 by 10% compared to the indicator of 2010 [7].

Based on the concept, the National Low-Carbon Energy Strategy of Uzbekistan is currently being developed, with the participation of experts from the European Bank for Reconstruction and Development. The strategy is necessary to solve the problem of energy supply of the country on the one hand, and to reduce the negative impact on the environment. The document will reflect three scenarios of transition to low-carbon energy, with special attention to the development of generation based on RES, in particular solar energy. The plans will be implemented with the funds of investors. According to the plan, by 2030, Uzbekistan is expected to have wind power plants with a combined capacity of 3 GW, solar power plants with a combined capacity of 5 GW, as well as nuclear power plants with a capacity of 2.4 GW.

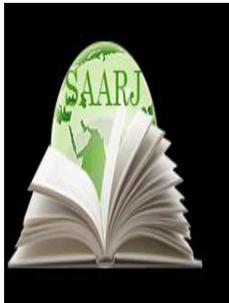

Based on the above, we can conclude that today wind energy is experiencing a new birth, as science does not stand still. No matter how rich the country is in natural resources, they are finite, which eventually leads to the limitation of their use. The limited supply of traditional fuels and the increasing need for energy set the stage for the search for renewable energy sources.

Various renewable energy sources are widely used around the world, among which solar energy is the most leading. But, everything in nature is co-dependent and the issue of providing solar energy has a regional, or rather geographical, nature. To help substitute comes wind energy, which is the main aspect of this article.

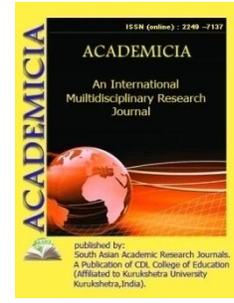

And here I would like to highlight the fact that the geographical location and climatic conditions in Uzbekistan are favorable for the further promising development of both solar, wind and hybrid power plants

CRIMINAL AND CRIMINOLOGICAL ANALYSIS OF LIVESTOCK THEFT

Bobomurodov Farkhod Boymorotovich*

*Teacher,

Department of Operational-Search Activities Major
 Academy of the Ministry of Internal affairs,
 Republic of UZBEKISTAN

ABSTRACT

The article provides a criminological analysis of the causes and conditions of cattle thefts, criminal law and criminological aspects, stages of the commission of a crime, as well as the issue of responsibility for cattle thefts, which have recently become more relevant, causing significant material damage to the population. Characteristics of the perpetrators of this type of crime (gender, age, social status), state, place, time, season of the crime. As a result of the study, appropriate conclusions, suggestions and recommendations were made to prevent these crimes.

KEYWORDS: *Theft Of Livestock, Stages Of The Crime, The Reasons And Circumstances Of The Crime, The Identity Of The Offender.*

INTRODUCTION

In our country, the prevention and exposing of theft of livestock has always been an important task and will remain so, since livestock is one of the sources of daily income of the rural population of our republic.

In terms of Health in the post-kidnapping of the household in the area of theft committed on the territory of the Republic more cattle theft occurred, according to the statistical data analysis of the last 11 years, on average from 37,2 percent to 43,1 percent of cattle theft has not been exposed.

When analyzing the theft of livestock that has not been exposed in the past years, it became known that in 2016-2020, a total of 1012 cattle of victims were stolen and material damage was caused in the amount of 5.7 billion sums.

In the development of effective measures to combat this crime, it is necessary to analyze the criminological aspects of animal theft in the field of the criminal legal aspect, the causes and conditions that allow it to happen.

Abdrzakov S. from foreign scientists, ICE S.I., Zheludkov M.A., Ismagilov R.G., Lipatov A.E., Pantyushin I.S., Savelov O.P., Semenov V.M., Fedotov A.V., Shiryaev A.S. in the scientific work of scientists such as: 1) criminal-legal aspects of animal theft; 2) the causes of theft and the conditions that allow it to happen; 3) methods of prevention of theft; 4) description of the criminal person, the main factors that influence the occurrence of theft; 5) the criminological status, dynamics, latent level of theft committed by minors; 6) opinions were expressed about the features inherent in the socio-psychological, criminological description of the burglaries committed by the household.

Criminal and legal aspects of the theft of pet goods mean the stages of committing these theft, the peculiarity of its occurrence in the structure of an individual or group, the issues of responsibility (qualification) in accordance with the norms of criminal law in relation to the guilty person.

Persons engaged in the theft of livestock receive attention to the level of preparation of participants for committing crimes, physical and mental abilities, as well as other aspects of the formation of their criminal groups. The unusual nature of the object of crime determines a number of characteristics inherent in the process of preparing for a crime.

On the basis of the study of the practice documents, such a conclusion can be made. Theft of livestock occurs in three stages, namely: 1) preparation for the commission of this crime; 2) implementation of a criminal act; 3) temporary storage, use, or disposal of stolen livestock. Of course, these three stages are carried out in sequence.

Particular attention should be paid to the fact that almost 89% of the theft of pet products was committed by a group of persons, and more than 11% by a single person. In most cases, this group consists of 2-3 or more persons, and the perpetrators consist of persons who live in the immediate vicinity of the place where the incident occurred, in the city-district of the army, or in the city-district of the province of the army.

Taking into account the signs of object and subject of theft of livestock, officials of the state body are qualified and criminal responsibility for the guilty persons is established.

The study of criminal cases related to the theft of livestock in 2017-2020 showed that 20,6 % of the committed pet theft – the first part of Article 169 of the Criminal Code (individually), 11,7 % - the second part of Article 169 of the Criminal Code (in a significant amount), Paragraph "b", 66 % – the second part of Article 169 of the Criminal Code (pre-linguistic % – The second part of Article 169 of the criminal code (intentional entry into the House, premises or other premises) "g", the third part of Article 169 of the Criminal Code (repeated or dangerous by a recidivist) "a", the third part of Article 169 of the Criminal Code (in large quantities) "v", the fourth part of Article 169 of the criminal code (in large quantities) "the fourth part of Article 6,7-169 of the Criminal Code of the Republic of Uzbekistan (organized by the group or in the interests of it) was initiated criminal cases under paragraph V

It is known that in criminology, such categories as "reason", "circumstances", "criminal", "the personality of the criminal" are studied, the concept of "criminal personality" characterizes the

social signs of the criminal in its own way, that is, serves to reveal the "social image" of the individual.

The criminological aspect of pet theft is understood as a set of criminological data on this crime that can be used to prevent and expose them.

It is necessary to study the causes of these crimes and the conditions that have allowed them to happen in order to prevent and expose the theft of livestock.

There are several favorable conditions that make it possible for the theft of livestock to occur, including the following:-the carelessness of livestock grazing in reeds, the lack of good closing of the doors in the property of citizens, the non – durability of the yard walls, the lack of the required level of conditions for the protection of livestock. In addition, in hot weather, the livestock of citizens is kept in the yard at night or in open areas above, in the surrounding area of sheep (sheep, otar)made of cobwebs. Access to such places does not cause great difficulties to thieves.

The fact that shepherds, herbivores, herdsmen are in a neglected, irresponsible attitude towards the pet entrusted to them makes it possible for the theft of livestock to occur. This is evidenced by the fact that 22,3 percent of the total theft occurred – from sidewalks and courtyards, and 77,7 percent–from molehouses where livestock is fed and stored.

It is important to know that the theft of livestock committed in yaylov or in the countryside usually occurs after 2-3 days. Because the Shepherds are looking for their cattle in the territory of Sagittarius for a couple of days in the guise that they have joined someone else's herd or are grazing somewhere else. And the criminals can also succumb to the slaughter and purchase of stolen livestock during this time.

In most cases, criminals sell stolen livestock in other districts or regions, imagining that employees of local internal affairs bodies do not know about this. Some find those who buy the meat of their pet among employees who work in restaurants, teahouses or cafes.

All this has a negative impact on the fact that these crimes are exposed at a fast opportunity, that is, from the "hot trail".

The analysis of materials on the theft of livestock in the Republic revealed some information on the persons who committed these crimes. Including: information on the sex of the perpetrators is as follows: the main part of these crimes (96,4%) was committed by men, the rest by women; by age: 25 percent of criminals – underage, 75 percent were persons aged 18-50 years; by social status: 37 percent-previously convicted, 33 percent – temporarily unemployed (25 percent of which are citizens with low legal awareness and culture); 21 percent – persons guarding livestock, that is, shepherds, minors, living in the same neighborhood with victims, working citizens or close acquaintances (son – in-law, nephew, classmate and chief);9 percent-persons who temporarily live without registration.

When analyzing the situation and time of the occurrence of pet theft, the following were determined: according to the composition of the jinoi group: 88,7 percent-participation (2-3 persons or more together), 11,3 percent-individually; according to the time of occurrence: 90,6 percent – committed at night (from 20:00 to 06:00), 9,4 percent-committed during the day (from 07:00 to 20:00). The main reason for this is that adequate attention is not given to the work of

guarding livestock at all times; by the days of the week: 14,4 percent – Monday; 16,1 percent – Tuesday; 11,3 percent – Wednesday; 10,8 percent – Thursday; 11,9 percent – Friday; 16,8 percent – Saturday; 18,7 percent – coincided with Sunday. From this we can observe that pet theft occurs more often on weekends; by seasons: 29.4 percent-in autumn (9,8% - in September, 9,9 % – in October, 9,7% – in November); 33.9 percent – in winter (14,3% – in December, 11,3% – in January, 8,3% – in February); 25,0 percent – in spring (13,3% – in March, 4,3% – in April, 7,4% – in May); 17,9 percent – in summer (4,3% – in June, 5,3% - in July, 8,3% - in August) [1; 2; 22]. So most of the crimes are committed in the cool and cold seasons of the year.

As practice shows, the perpetrators will attempt to escape the punishment of jinoi or abandon the methods of committing a crime known to everyone and try to think about their new methods. For example, when a criminal case related to the research work was investigated, it was found out that two persons committed the theft of livestock using a Malibu duty-free light vehicle during the day.

Above, the analysis of the criminal-legal and criminological aspects of animal theft allowed us to draw some conclusions.

The following are the main causes of pet theft: first, the fact that some citizens (mostly previously convicted persons) do not want to engage in socially useful work, in any case, intend to make a fortune in an easy way;

secondly, the low level of legal consciousness and legal culture of persons prone to committing crimes, provoking rapid interest;

third, the ease of criminal penalties imposed by the court on persons who committed this crime (in this case, this is the reason for the repeated Commission of this crime by the same persons).

The main conditions that allow the commission of these crimes include:

- 1) the victim leaves the pet unattended in the field for a long time;
- 2) inadequate or timely payment of wages to the shepherd who controls or takes care of the pet of the owner;
- 3) lack of adequate supervision by internal affairs personnel of persons who have been previously convicted, have resorted to drinking drugs or alcohol, have been temporarily brought up in an unemployed or unhealthy family;
- 4) uncontrolled leaving of young people or not engaged in socially useful labor;
- 5) the fact that the forces and means of the internal affairs bodies are not fully attached to the regions where the crime occurred, the operational-search profile work is not sufficiently organized;
- 6) structural inadequacy of cooperation in the Prevention of crimes with the internal affairs bodies, as well as with other state bodies, authorities, enterprises, institutions and organizations, public structures (for example, in the case of night lighting of the territory, installation of surveillance cameras, etc.)the G.);
- 7) as a result of the late notification of the victims to the employees of the internal affairs bodies about the committed theft, the fact that the investigative group does not reach the place of the accident on time.

Theft of livestock is carried out in three stages. At the first stage, the choice of the object of jinoi aggression; study of the direction of its arrival; study of its preservation, illumination, existing obstacles and ways of entry and exit to the object; study and determine the obesity of the method of catching stolen livestock (cattle, cows, horses, moths, sheep, goats, etc.); determine the number of selected participants in committing a crime and; in the case of committing a crime, it is necessary to carry out the selection and preparation of objects (montirovka, hammer, rope, knife, fodder), special tools, equipped vehicles, cargo transportation vehicles; in search of permanent and temporary storage places for stolen pet; in the preparation of tools for slaughter of livestock, in the determination of places of transfer of meat and other actions are carried out.

In the second stage, in most cases, the jinoi rape object is visited in the evening according to the plan, the object is entered and the pet is usually cut with a back, when the object has guardian dogs, they are given a suction with the addition of a special chemical agent and put to sleep. After the members of the jinoi group move their pet away from the object, they are transferred from the situation to the ready-made cargo or light vehicles. Cattle are deceived by giving them a little fodder when they resist this, in other cases cattle, mostly cows and husks, are placed in the transport vehicle, although the jarring is delivered to them, that is, they break their hoofs. The stolen pet is taken to a permanent or temporary place (apartment, building) according to the plan.

At the third stage, the livestock is slaughtered at the time of theft or the next day and sent to the designated place of transfer (sale, topshirish, issuance, etc.). In some cases, it is sold alive or taken place among the participants of the jinoi group. Most often, cattle are slaughtered and sent to the markets of other regions for the sale of meat, as well as to the CEX, where meat products are produced.

Most of the theft of livestock occurs in the autumn and winter seasons. This condition is caused by many reasons. First of all, in the autumn-winter season, the population's need for meat products will sharply increase; secondly, cold weather will allow the slaughtered cattle meat to be stored for a long time; thirdly, at the same time the level of obesity of livestock will be high, and therefore it will be easy to sell them; from the four, after harvesting the harvest in the field in the autumn, in most cases, the preservation of livestock does not meet the demand, since Citizens Drive to the field, to the field, to feed the livestock, without adequate control.

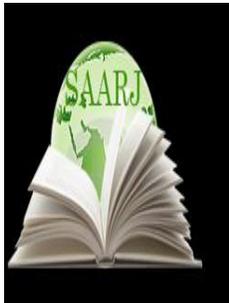

Pet theft is often committed by a group of individuals. This is due to the fact that it is difficult to carry out this crime alone. Members of the criminal group-organizer, acting, executor – perform relevant tasks related to the implementation of the crime. The jinoi group usually includes individuals with different capacities. Because of the need for a means of transport in the event of theft, as well as the need to quickly transport the stolen animal (meat) from one address to another, the jinoi group is attracted by a person who has a personal means of transport as an assistant. And the type of vehicle is selected depending on the conditions and structure of the road.

Livestock is usually stolen in the evening or at night. To this end, the criminals secretly monitor the location of the theft facility, the state of the guard at the beginning of the evening, thoroughly study the ways of entering the property and leaving it. After that, at night they take out the cattle from the mulch and drive to the side of the car, put it on the vehicle. In the dark of the night, this does not cause them much trouble.

In the place of the conclusion, it is worth noting that the knowledge of the criminal-legal and criminological aspects of the theft of livestock, first of all, serves as an important direction in the implementation of systematic analysis for the Prevention of these crimes, as well as in the effective and qualitative Organization of the service activities.

USE OF DISTANCE LEARNING OPPORTUNITIES IN THE SYSTEM OF PROFESSIONAL DEVELOPMENT

Bukholida Abduvaliyevna Supiyeva*

*Senior Teacher,

Science of the state (Uzbek) Language of the Regional Center,
 Retraining and Professional Development of the Staff of Public Education of Tashkent City,
 UZBEKISTAN

ABSTRACT

An interactive database is a structured set of knowledge that can be learned through telecommunication technologies, on the basis of which the course organizers provide the necessary database of materials for listeners and teachers with the help of created resources. E-journals are periodicals that are distributed to students through a computer network. They are an important source of information for learners. The basic didactic principles of the development of education in the system of teacher training and retraining also serve as a basis for distance learning. According to the principle of teacher-centered educational and developmental tasks (goals), in addition to the formation of certain knowledge, skills and abilities in the audience, the pedagogical and developmental factors of training on a particular topic 'should be taken into account.

KEYWORDS: *Professional Development, Retraining, Digital Tools, Distance Learning*

INTRODUCTION

Professional development, advanced training and retraining (in Uzbekistan) is a type of continuing education system, the process of updating and deepening the professional knowledge and skills of specialists and managers working in all sectors of the economy. Ensures that the competitive qualities of the staff and their knowledge and skills are up to date. Professional development and retraining is a process of scientific theoretical and practical training of each employee, which includes acquaintance with the latest scientific achievements, innovations in their field, mastering them, new methods of practical work, learning best practices. The frequency of training and retraining varies for different specialists and managers, once every 2-5 years, and if necessary, for shorter periods. Advanced training and retraining is carried out in

universities, training institutes and training centers with the right to professional retraining. This process can be disconnected from production, partially separated or not separated. Its form is determined by the in-service training institution taking into account the complexity of the training program and the needs of the client on the basis of a contract with him. The duration of training and retraining varies, and in each case is determined by the goals and objectives. The institution of advanced training and retraining creates the necessary conditions for students to master the educational programs through the targeted organization of the educational process, the use of forms, methods and technologies of education. These programs are developed, approved and implemented by in-service training institutions taking into account the needs of the customer, as well as the state requirements for the content of additional vocational training programs. The process of professional development and retraining of specialists will be completed with the final state certification. The procedure for attestation is determined by the relevant state education authorities. Students who meet all the requirements of the curriculum and successfully pass the final state certification will receive a standard diploma or certificate of advanced training and retraining. The Cabinet of Ministers of the Republic of Uzbekistan shall determine the procedure for professional development and retraining of personnel.

The purpose of retraining and retraining of public educators is to form and increase the creative potential of teachers, improve their academic level, broaden their worldview and develop their personality. If we pay attention to the process of organizing training courses for public educators in Uzbekistan, we can see the different forms and their specific history. That is, in our country there are full-time, short-term and distance learning courses.

MATERIALS AND METHODS

In addition to traditional training, distance (Moodle, E-learning, Web-based training) and blended-learning forms of vocational training, as well as the periodicity of training of public educators, as an experiment, it is proposed to gradually introduce a credit-module mechanism, which provides for the annual training of employees. According to the ministry, for the first time this year, 5,800 teachers took part in distance learning courses, and experts from the United States, the United Kingdom, Germany and other countries were involved as coaches.

The top 500 university graduates in the international rankings can teach in schools without retraining. Graduate students in all areas of national higher education have the same right - for this, master's programs include courses in pedagogy.

The Ministry also proposes the gradual introduction of a mandatory professional licensing procedure for heads of public education institutions with a periodicity of 3 years and for teachers with a periodicity of 5 years from January 1, 2021.

Distance learning is a new form of teaching that differs from the separate and non-production forms of teaching. It refers to new forms, methods, means, organization of education, forms of communication between the teacher and the listener, as well as between the listeners. Also, different forms of such education will have their own purpose, based on social order, the content defined in the curriculum of the selected educational institution, as well as the organizational form and special tools of teaching methods.

Modern computer telecommunication technologies, which form the basis of distance education, are distinguished from traditional teaching aids in the transfer of knowledge and the provision of

a variety of educational information to the audience. CD-ROM is characterized by the fact that interactive disks, electronic bulletin boards, multimedia hypertext, Internet interfaces provide information and knowledge from the global network, actively engage listeners in the process of interaction and manage pedagogical processes. The use of modern information and communication technologies in education by teachers of various disciplines is an important principle in increasing the effectiveness of education, its intensification and facilitates the organizational and methodological support of the system of professional development and retraining of teachers. . In addition, distance learning for teachers, based on interactive, pedagogical experience-sharing methods of diagnosis and control using computer-based tests, provides course participants with the necessary practical assistance in the workplace, at their convenience.

Distance learning technologies can be divided into three categories: publishing materials; computer aids for education (electronic textbooks, computer tests and knowledge control, new multimedia tools); video conferencing - audio and video channels, computer network telecommunications technology tools.

The organization of video communication through telecommunications and computer networks, their formation as a means of distance learning, allows the system of advanced training to implement new methodological and technical support. Quality video communication is one of the most reliable means of organizing video seminars and video conferences using a computer. Such tools are used in distance learning of teachers, in particular, in solving problems related to education with a group of dozens of people, individual training of the listener, providing him with methodological assistance, effective implementation of innovative technologies in practice. is important in providing. In addition to audio and video communication, the listener and the teacher have the opportunity to control the images on the computer monitor.

Distance education is based on the following methods: a method of teaching students based on distance learning resources and tools; individualized teaching method;

A method based on the mastery of learning materials provided by the listener to the teacher or expert (the listener actively participates in the communication process);

a method based on the interaction of all participants in the learning process.

The first method is characterized by a multimedia approach, the use of various teaching aids to create educational resources based on publications, audio and video materials, and the following training materials are delivered to the audience through a computer network: interactive database; electronic journals; educational computer software products (electronic textbooks).

An interactive database is a structured set of knowledge that can be learned through telecommunication technologies, on the basis of which the course organizers provide the necessary database of materials for listeners and teachers with the help of created resources. E-journals are periodicals that are distributed to students through a computer network. They are an important source of information for learners. The basic didactic principles of the development of education in the system of teacher training and retraining also serve as a basis for distance learning. According to the principle of teacher-centered educational and developmental tasks (goals), in addition to the formation of certain knowledge, skills and abilities in the audience, the

pedagogical and developmental factors of training on a particular topic 'should be taken into account.

In distance learning, this principle is interpreted in the form of the principle of creative description of the listener's cognitive activity. Creative information technology is interactive and requires the listener to apply the description of the general information received to specific situations. The implementation of the scientific principle of teaching in the process of distance learning involves the acquisition of scientific evidence, concepts and laws, as well as theories in a particular subject. The principle of science requires students to develop research skills. This requires the widespread use of problem-based learning methods in the laboratory and in practice. The successful implementation of this principle in distance learning serves to ensure the fundamentality of the acquired knowledge.

The implementation of the principle of fundamentality of education on the basis of the following psychological criteria ensures that the student fully masters the materials of the curriculum: high motivation of the student; the listener's focus on achieving educational goals; formation of communication skills; continuous self-improvement based on critical analysis of activities; psychophysiological characteristics of the listener in the development of distance learning plans, taking into account the time budget.

According to the principle of fundamental education, the listener is required to perform creative tasks in mastering the topics of the curriculum. This principle distinguishes creative distance learning from traditional education, which involves the direct acquisition of a certain amount of content. In distance learning, the principle of free choice to receive information through specific activities can be considered as a continuation of the above principle. The principle of systematization and coherence is that in traditional teaching, knowledge, skills and abilities are transferred in a certain system, in a clear sequence, each new element of the learning material in an interconnected and logical sequence. Requires In distance learning, a linear approach to individual learning is formed. In order to activate the learning process of the listener, a system of gradual complication of the content of education has been formed, which allows the listener to clearly define his personal goals, choose the priorities, form and speed of teaching.

RESULTS AND DISCUSSIONS

In distance education, the principle of adapting the learning materials to the level of the listener according to the level of content and complexity serves to ensure that the learners acquire the planned knowledge, skills and abilities without mental and physical overload. The principle of taking into account the individual characteristics of the listeners plays an important role in the organization of distance learning, the structure of the distance learning module provides for the consideration of psychophysiological, psychological;psych sociological individual characteristics of the listener. The principle of demonstration is to increase the effectiveness of education by influencing all the senses of the individual. In distance education, this principle is mainly provided by virtualization technology. In particular, it provides for the widespread use of videos, computer training programs, interactive technologies. Demonstration materials and methods of using multimedia tests are widely used as important tools of the principle of demonstration in distance learning.

In conclusion, the following should be noted:

1. The system of distance education has a positive effect on the training and development of personnel and the provision of educational institutions with qualified personnel.
2. The use of computers and network telecommunication technologies in education is a convenient tool for improving the skills of teachers.
3. Distance learning forms are used in the system of teacher training and retraining in accordance with didactic principles.

Today, there are 3 institutes of advanced training, 55 regional centers of advanced training (faculties), 5 regional centers of advanced training, 16 network centers of advanced training (including BIMM), as well as centers and trainings established at enterprises and organizations. courses are available. This department coordinates the activities of all training institutes, centers and training courses and provides practical assistance.

In total, about 450 staff members have been licensed to conduct training and retraining activities. Currently, the department is working on concrete measures to radically reform the system of training and retraining. At the same time, it is developing and testing new criteria for evaluating the system of professional development.

Distance learning courses were organized

The State Program of the President of the Republic of Uzbekistan for March 2, 2020 on the implementation of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 in the "Year of Science, Enlightenment and Digital Economy" In order to ensure the implementation of the Decree No. PF-5953 and Order No. 74 of the Ministry of Transport dated April 17, 2020, the Institute of Advanced Training and Retraining of Motor Transport under the Ministry of Transport from June this year will have the following areas: Distance learning courses were organized in:

"Organization and management of road transport - training of managers and executives of legal entities."

"Traffic rules and the basics of traffic safety - training of legal entities in charge of traffic safety."

"Improving the skills of drivers involved in international road transport."

We would also like to inform you that there are opportunities to organize new training courses based on the needs and requirements of customers.

In order to effectively organize distance learning courses, qualified teachers with information technology skills were formed, and distance learning plans and programs were developed. The ZOOM social network is being used wisely as a distance learning platform for the convenience of the audience.

These distance learning courses offer the following benefits to students: register online without much hassle; improve skills without leaving the place of work and residence; overhead costs are saved; saves extra time.

From the standpoint of systems engineering, an electronic educational and methodological complex (EEMC) is an automated information system (AIS) for educational destination, which at a new quality level provides continuity and completeness of the didactic cycle of the learning

process and contains organizational and systematized theoretical, practical, control materials based on the principles of interactivity, information openness, distance and formalization knowledge assessment procedures. Depending on the scale of the covered subject area distinguish electronic educational and methodological complexes for individual academic disciplines (EEMCD) and electronic educational methodological complexes in the specialty (direction) (EEMCS). The supporting part of the EEMC consists of information, technical, mathematical and software, linguistic, methodological, organizational and legal support. EEMC information support is a set of design decisions on volumes, placement, and forms of organization of educational and methodological information. Information support of EEMC is a complex of logically related structured didactic units presented in electronic form, containing all components of the educational process:

- state educational standard for this specialty,
- work programs,
- Funda lectures,
- teaching aids for practicing practical and laboratory tasks,
- lists of educational questions to be submitted for credit and examination,
- tests of intermediate control of progress and control of the residual knowledge,
- teaching, teaching aids,
- a list of recommended basic and additional literature, addresses of Web sites on the Internet with information necessary for learning and annotating each resource, reference books and databases for educational purposes,
- educational and methodological literature on conducting tactical and special and operational
- tactical exercises, business games, etc.
- themes of seminars, essays, term papers and theses,
- educational films, presentations, videos, etc.

EEMC technical support is a complex of technical means, designed to ensure its work, as well as the corresponding documentation for these tools and technological processes. Modern technical means for the educational process in its own way composition and functionality are diverse. To them can be attributed:

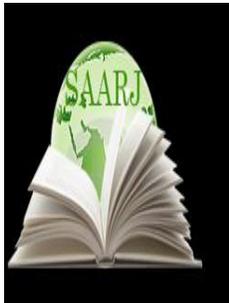

- multimedia projectors, slide projectors, overhead projectors,
 - interactive whiteboards,
 - video conferencing systems,
 - computer simulators,
 - computer equipment - computers of any model
 - (personal and high performance),
-

- computer networks and devices for connecting computers to him,
- tape recorders, voice recorders, turntables, linguaphone devices,
- TVs, VCRs,
- means for online printing (copying) of the handout material, etc.

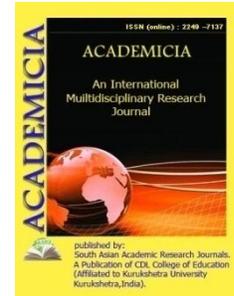

EEMC mathematical and software are the combination of mathematical methods, models, algorithms used for educational purposes for solving problems, as well as system and special software products, applied software and technical documentation to them. The means of mathematical support include software tools for mathematical and simulation modeling, which allow you to expand the boundaries of experimental and theoretical research, supplement or replace a physical experiment computational experiment. In some cases, objects are modeled research, in others - measuring installations. Such funds allow you to reduce the cost of purchasing expensive laboratory equipment, the level of safety of work in educational laboratories. The simulation software can also include domain-specific software environments, enabling operating with model objects of a certain class.

FEATURES AND TRENDS OF DIGITAL ECONOMY DEVELOPMENT IN UZBEKISTAN AND ABROAD

S.N Khamraeva*

*Head,

Doctor of economic sciences,
 Chair “Innovative economics”,
 Karshi Engineering-Economics institute,
 UZBEKISTAN

ABSTRACT

Today, the role of the digital economy in the world and its development trends is growing. Digitization of economic processes is becoming a comprehensive trend that covers not only the direct information and communication network, but also all areas of economic activity in the country. This article describes the distinctive specifics of the digital economy in contrast to the traditional economy, its advantages and disadvantages. Based on the results of the comparative analysis, the article examines the impact of the digital economy on the country's economy on the example of developed countries and Uzbekistan and the need for active government involvement in promoting and supporting promising digital innovations in various sectors of the economy.

KEYWORDS: *Digital Economy, Information And Communication Technologies, Investment, Digital Technologies, Economic Growth.*

INTRODUCTION

“Digital (electronic) economy” is a type of economy, which is characterized by the maximum satisfaction of the needs of all participants through the use of information, including personal information. This may be due to the development of information and communication and financial technologies, as well as the openness of the infrastructure that allows full interaction of all economic entities in the hybrid world - the objects and subjects of the process of creation, distribution, exchange and consumption of goods and services.

The term of “digital economy” owes its appearance in the scientific and business community to the author of the book “The Digital Economy” Don Tapscott, which was published in 1994, and

to the American scientist Nicholas Negroponte from the University of Massachusetts, which introduced it to widespread use in 1995.

More than 25 years have passed, but there is still no single generally accepted definition of this term. In addition, there are many synonyms for this definition: Internet economy, post-industrial economy, creative economy, et cetera.(in the USA - API-economics (application programming interface)).

But the essence of many definitions is that the digital economy is an economy based on digital technologies and is closely related to e-business and e-commerce, and the digital goods and services they produce and sell.

Many economists have expressed their views on the role and importance of the digital economy in the development of the country's economy. In particular, the peculiarities of the formation of a national digital strategy based on the factors of the digital economy in developing countries and the importance of state support in it are substantiated[Dahlman C., Mealy S., Wermelinger M., 2016.].

V.Kundius, O.Ruschitskaya, E.Kot devote their scientific works to the priority areas of scientific research of techniques and technologies in agriculture, organization and management of agribusiness based on digitalization[V. Kundius, O.A.Ruschitskaya, &E.Kot, 2019].

According to the research results of some authors [T. V.Ershova, Y. E.Hohlov, S. B. Shaposhnik, 2018], the main features of assessing the development of the digital economy are presented as a tool for managing digital transformation processes at the national, regional and sectoral levels.

Uzbek scientists also highlighted the advantages of the digital economy and its role in the development of the country's economy. In particular, by N.Ismoilova [N. Ismailova, 2019] the concept of development of digital economy, its scale, by I.Khotamov [I. S. Khotamov, 2020] the role of the digital economy in ensuring the economic security of the country, G.Abdurakhmonova and D.Rustamov focused on the problems of training potential personnel in the development of the digital economy [G. Abdurahmonova, D.Rustamov, 2020].

This study highlights the social and economic benefits of the digital economy as well as the government's initiatives to develop the digital economy. This study presents the opportunities and challenges of developing the digital economy in Uzbekistan, as well as its impact on society and business. These results can help decision makers and managers analyze the value of this technology and develop the right strategy to solve problems. Thus, this article aims to fill this gap and understand the factors influencing the development of the digital economy in Uzbekistan, as well as to explore ways to overcome organizational problems.

Methods The data in this article are based on various statistical reports prepared by local and international organizations. In particular, it is based on the UN Report on the Digital Economy, the Ministry of Innovation Development of the Republic of Uzbekistan and the Decree of the President of the Republic of Uzbekistan "On the approval of the strategy "Digital economy-2030" and measures for its effective implementation"and other normative legal acts. The research work was analyzed using comparative analysis, methods of scientific abstraction.

RESULTS AND DISCUSSION

Naturally, the digital economy has a number of advantages over the traditional economy: first, it lowers the cost of payments and opens up new sources of income. Online, the cost of services is lower than in the traditional economy (primarily due to lower promotion costs), and the services themselves, both public and commercial, are more affordable. Secondly, thanks to digital technologies, it is possible to realize such ambitions as to sell their goods faster, not only in the domestic market, but also in the world, goods and services can become available to people anywhere in the world. Thirdly, the proposed product can be almost instantly modified to meet new expectations or needs of the consumer. For example, various applications are being tailored based on customer requirements. And most importantly, the digital economy provides much more diverse information, educational, scientific, and entertainment content - faster, better, and more convenient.

In general, the digital economy has the following social and economic advantages over the traditional economy:

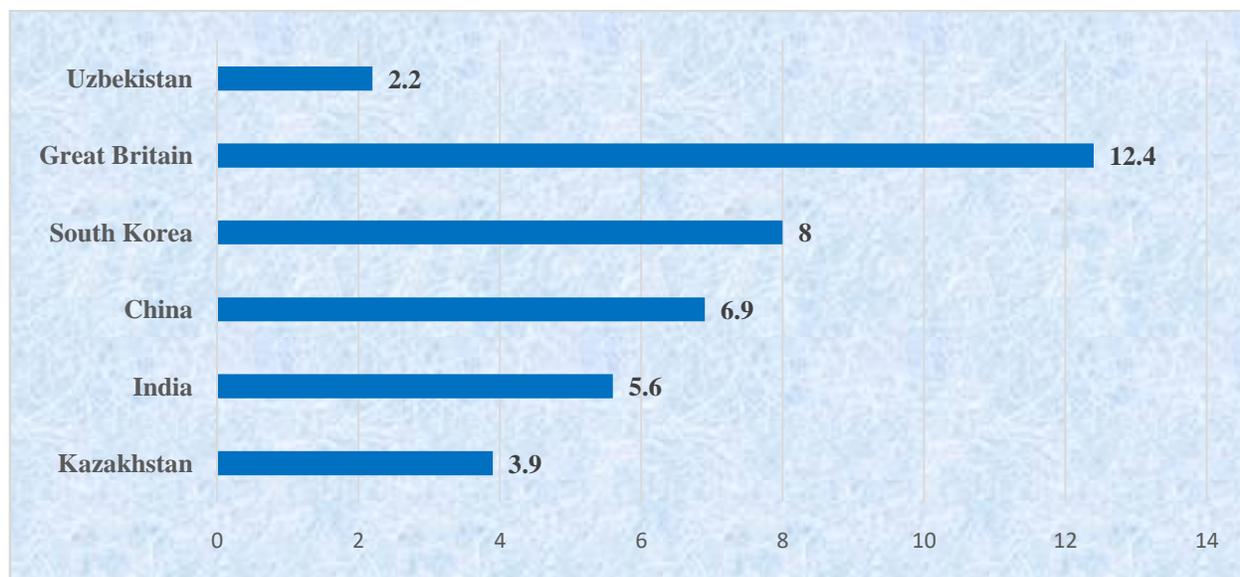

1. **Social benefits:** favorable impact on the environment, accessibility and reduction of the cost of education, inclusiveness of education, accessibility of medical services, accessibility and efficiency of financial transactions and public services, reduction of poverty.
2. **Economic benefits:** accelerating the rate of economic growth, creating additional jobs in related industries, reducing production costs, accelerating the growth rate of small and medium-sized businesses, increasing labor productivity, promoting products to the world market.

The volume of global traffic based on the Internet Protocol (IP), which provides a rough idea of the scale of data flows, has grown from about 100 gigabytes (GB) per day in 1992 to more than 45,000 GB per second in 2017 (see chart). And this despite the fact that now the data-driven economy is only in its infancy; global IP traffic is projected to reach 150,700 GB per second by 2022, driven by an increasing number of new Internet users and the expansion of the Internet of Things.

The pandemic had a negative impact on the GDP growth of many countries, including the world. Therefore, states are trying to overcome this trend by encouraging the development of ICT.

Based on the report, since there is no generally accepted definition of the digital economy, in addition, there is a lack of reliable statistics on its key components and aspects, especially in developing countries. Depending on the definition used, the size of the digital economy ranges from 4.5 to 15.5% of the world GDP.

The share of the digital economy in the GDP in Uzbekistan is 2.2%. At the same time, the average optimal indicator is considered to be 7-8%, for example, in Great Britain it is 12.4%, South Korea - 8%, China - 6.9%, India - 5.6%, at the same time in Russia - 2, 8%, Kazakhstan - 3.9%. In accordance with the draft Concept for the Development of the Electronic Government System of the Republic of Uzbekistan, by 2025 it is planned to increase the share of ICT services in GDP to 5.0%, and by 2030 - to 10% (Picture 1).

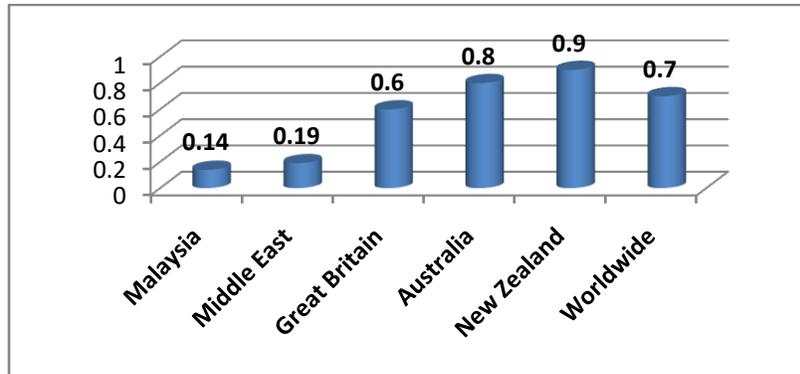

PICTURE 1 SHARE OF DIGITAL ECONOMY IN GDP IN UZBEKISTAN, %

Although, according to the 2019 Digital Economy Report, the US and China together account for 40% of the global digital sector.

At this time, in many countries, including Uzbekistan, as one of the priority areas of economic development, much attention is paid to the development of the digital economy. So the state is taking large-scale measures to develop the digital sector of the economy. electronic document management systems are being introduced, electronic payments are being developed, and the legal framework in the field of electronic commerce is being improved. Recently, a number of regulatory documents have been adopted for the development of the digital economy.

However, the indicators of the development of the digital economy in Uzbekistan lag far behind the world average. For example, in terms of Internet speed in 2020, Uzbekistan ranked 98th out of 176 countries and amounted to 29.68 megabits per second..

At the same time, one of the factors influencing the development of the digital economy is the investment in ICT. In 2017, investments in ICT in Uzbekistan amounted to 3.1% of total investments in all sectors of the economy, while in 2019 this figure decreased by 1.8 times to 1.7%.

PICTURE 2 GDP GROWTH SITUATION WHEN ICT INVESTMENT IS INCREASED BY 10%

However, research shows that the ICT sector is also highly competitive in developed countries, which in the future will increase efficiency in the economy. Practice shows that investments in ICT also have a positive impact on the country's macroeconomic indicators. As shown in Figure 2, when ICT investment increased by 10%, GDP increased by 0.6% in the UK, 0.8% in Australia, 0.9% in New Zealand and 0.14% in Malaysia. This figure averaged 0.7% worldwide.

CONCLUSION

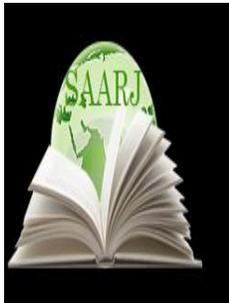

The state can stimulate the digitalization of economic processes by the following actions:

- Acting as an organizer of common technological platforms that unite various organizations, or as a regulator that directly establishes requirements for the use of certain technological solutions, since without synchronizing the processes of introducing standard technological solutions in entire segments of the economy, their wide distribution is impossible;
- constantly improving the existing regulatory framework governing the development of the digital economy, and doing this in a dialogue mode and taking into account the opinions of users, developers and service providers who, in practice, will encounter new types of objects and subjects of information legal relations that require legal registration;
- becoming a participant in the general process of digitalization of relations, including by developing the "Electronic Government" system and the list of public services provided in electronic format;
- Stimulating and encouraging the introduction of information systems, electronic services in organizations and introduce tax incentives for the development of digital technologies, as well as cross-border online commerce;
- training in the required quantities the staff of both the IT specialists and programmers themselves, and qualified users who are able to use constantly updated digital technologies;
- ensuring security against cyber threats, as well as confidence in all entities involved in one way or another in the digital economy that the data they collect, store and use are protected from possible criminal actions;
- expanding international cooperation and creating attractive conditions for the influx and implementation of advanced information technologies in all areas of economic activity.

ABSTRACT

The article examines the socio-philosophical nature of threats to the development of society, such as corruption and crime, nepotism, localism and nationalism, as well as their negative consequences to society and ways to overcome them. Such threats include corruption and crime, localism and tribalism, people's indifference, boastfulness, flattery, jealousy, arrogance, disregard for the truth, acquaintanceship, careerism, and bribery, which are contrary to universal morality.

KEYWORDS: *Society, Individual, Tribalism, Localism, Nationalism, Acquaintances, Bribery, Jealousy, Flattery, Indifference, Threat, Danger, Authority, Legitimacy, Discipline, Politeness.*

INTRODUCTION

There is no denying that there are ideological threats to the independence of the Uzbek people, its socio-economic, political, legal, spiritual and cultural foundations, not only from the outside, but also from within the country.

There are basic principles (Principles) that ensure the social development and stability of the country, as well as the negative factors that hinder the growth of the country: crime, tribalism, localism, nationalism and the fight against various forms of corruption. These include: legitimacy, openness and transparency, systematization, cooperation between the state and civil society, ensuring the priority of measures to prevent corruption in society, the formation of a sense of responsibility in the performance of tasks of strategic importance for the development of society goals can be achieved. Therefore, the fight against various forms of corruption in the

social development of society has always been the most pressing issue, as the state paves the way for its promising development by eliminating corruption in its practical activities. Indeed, the state carries out its activities on the basis of state programs in the fight against corruption, as it carries out its activities on the basis of taking comprehensive and systematic measures to combat corruption, depending on the state of corruption. At the solemn meeting dedicated to the 26th anniversary of the adoption of the Constitution of the Republic of Uzbekistan, President of Uzbekistan Sh.M.Mirziyoev said: "A serious threat to the development of the state and society, the people's confidence in justice - the prevention and fight against corruption in each government agency has its own internal guidelines for the fight against publicly controlled corruption." [1] Based on his ideas on combating corruption, the head of state is developing specific tasks to strengthen public control. In order to strengthen the fight against corruption, Order No. 6013 and Resolution of the President of the Republic of Uzbekistan dated June 29, 2020 no. PK-4761 on the improvement of the system of anti-corruption measures in the Republic of Uzbekistan and organization of the Anti-Corruption Agency were announced. The purpose of the adoption of such decisions and laws in our country, based on social justice, is to eliminate all forms of corruption that threaten the development of our country.

Such threats include corruption and crime, localism and tribalism, people's indifference, boastfulness, flattery, jealousy, arrogance, disregard for the truth, acquaintanceship, careerism, and bribery, which are contrary to universal morality.

Corruption and crime are the most dangerous threats to the social development of our society. Because corruption is one of the threats to the country's governance and social development, leading it to the brink of crisis. Even today, corruption exists to some extent in every public sector, and as a result, the development of sectors under the influence of corruption is not going well enough. Bulungur district of Samarkand region in the early 1990s, "Ming living in Sycamore," Abdul Rahman, a citizen fifty thousand rubles from the state for the purpose of bank loans and 50 breeds of cattle a year, the bank bought back the loan and, in addition, the state 2 tons of businessman handed over the meat. Seeing that the entrepreneur's activity was developing, the director of the company's farm was jealous and plowed the ditch leading to the farm with a bulldozer, as a result of which the 14-hectare field was dried up due to lack of water. As a result, the farm was also in crisis. A similar incident was reported in October 2020 by the radio - a young Uzbek businessman from Canada in Andijan district of Andijan region, who bought a 14-hectare plot of land and tried to develop cattle breeding by importing 60 head of cattle from abroad, but the district governor refused. As a result, he returned to Canada again, squandering his investment in livestock development. Similar phenomena can be observed in every sphere of our society. Well, the question arises as to what corruption is and how to fight it. Corruption (from lat. corruptor "to defile", lat. corruption "bribery, venality; spoilage, decomposition; corruption") - is a crime of an official, abusing the rights associated with his position for the purpose of enrichment. The Law of the Republic of Uzbekistan "On Combating Corruption" adopted on January 3, 2017: "Corruption is the unlawful use of one's position or position for personal gain or the gain of tangible or intangible benefits for the benefit of others, as well as the unlawful provision of such benefits." [2]

As outlined in the United Nations International Fight against Corruption; "Corruption is the abuse of power by the state in its own interests," he said. [3]

Indeed, the prospects for the country's social development cannot be secured without a concerted fight against corruption by developed countries at the international level. That is why the Kazakh scientist SM Zlotnikova edited "Corruption in Kazakhstan; In the book "Measures to prevent it and international experience": - "Deliberate involvement of certain officials in criminal cases, and as a result, on the one hand, have a very convenient system. This form of corruption is closely linked to organized crime. In addition, they are persecuted, provoked and threatened. A corrupt official does not receive a one-time charity, he serves in the criminal system and receives his share there." [4.13]

This process leads to a gradual disruption of the social development of society, violation of the law, disobedience to the law. This situation has become one of the factors that have a serious negative impact on the social development of the country and threatens the social development of society.

From the point of view of historical development, corruption is one of the most ancient crimes: wherever there is a state, in various branches of the state apparatus, there has been a crime that has spread from the bottom up. Territorially, corruption is one of the most widespread crimes in the world. Thus, corruption is one of the forms of crime that is equally prevalent in time and space. Different countries, past and present, have fought and will continue to fight corruption, successfully or unsuccessfully, on all continents of the world. Each country has been actively fighting corruption to ensure the smooth development of its society. However, this process has been carried out differently in different countries. However, this process is carried out differently in different countries. So far, they have not and cannot find a way to completely eradicate corruption in human development.

Even the authoritative international organization, the United Nations, has dealt with this issue separately, made special decisions and described corruption as follows:

- 1) Theft, robbery and misappropriation of state property by officials;
- 2) Abuse of official position for illegal gain;
- 3) The conflict between social duty and personal greed, interests. Given the prevalence of corruption and the difficulty of eradicating it, it can be described as an "international catastrophe" and a threat to social development.

The first President of the Republic of Uzbekistan IA Karimov also expressed the following views on the causes of corruption and its negative consequences. The existence of a criminal "shadow economy" in society leads to organized crime. Representatives of different levels and levels of government are also exposed to its deceptive influence. When corruption arises, it primarily uses the opportunities of the civil service to support or directly assist organized criminal structures. This is a direct threat to the security and stability of society due to the negative consequences that crime and corruption have on society.

Currently, the threats posed by corruption to the security of our country are:

First, politically, corruption is an expression of resistance to ongoing reforms. In it, the interests of the "secret" economy are objectively merged with the administrative-command system, which has lived its life, trying to slow down the development of new economic relations as a threat to itself. According to Deputy Chief of the Prosecutor General's Office Bahrom Kobilov, corruption

crimes committed by officials in Uzbekistan in 2017 decreased by 33% compared to 2016. [5] It was noted that the Virtual Reception of the President of the Republic of Uzbekistan and the People's Reception received 1464 complaints on corruption. It is noteworthy that the number of appeals has decreased.

According to Azamat Mukhtorov, "Fighting corruption is not a one-time event. It is a consistent process. In order to prevent corruption in our country, the introduction of modern information and communication technologies in the education system is yielding good results. In the 2017-2018, 2019-2020 academic years, for the first time, entrance exams to some educational institutions were held online. This process will be further improved in the future. According to the decision of the President of the Republic of Uzbekistan dated November 16, 2017, starting from the 2018-2019 academic year, the test will be held from August 1 to August 15. The results will be announced on the official website of the state testing center the day after the test. This system also serves to prevent illegal actions and corruption." [6.53]

Indeed, the use of such measures in the field of education will prevent such shortcomings as the training of low-quality personnel that hinder the social development of our society.

In their monograph "Fight against Corruption", B.Aliyev and R.Khakimov noted that "the beginning of corruption is used for personal gain, especially for government employees, when wages do not correspond to the realities of life. "The fight against corruption cannot be carried out without transparency, openness, knowledge, public activism, the media and non-governmental organizations". [7.121-122]they said.

Indeed, when people's material well-being improves, the vices that cause corruption in society will decrease, and as a result, social progress in society will increase. Therefore, by the decision of our government, the monthly salary of employees is being increased. This is an important factor in preventing corruption. Corruption-ridden officials put personal gain and the interests of the tribes ahead of the interests of the state. This will cause irreparable damage to the political and economic path of the country and to the majority of the population. Moreover, during the transition period, when new economic relations are just being established and a qualitatively different political system is being formed, corruption has the potential to block this process with its behavior.

Second, the rise of crime and corruption undermines the constitutional foundations of the state, leading to serious violations of the rights and freedoms of citizens. The utterly naughty rule that "the purpose of passing laws and decrees is to circumvent them" leads to the deprivation of society of its ability to maintain the simplest legal order and public order. If criminal gangs and "racketeering" gangs "party" in the economy and people run away from random passers-by on the streets for fear, can there be stability and stability in society? No, of course not.

Third, crime and corruption undermine the moral foundations of society. Eliminates the civic status of members of society. It creates the conditions for a negative attitude to the changes that are taking place. The idea of reform itself is discredited and evokes a sense of longing for the old days, including the "strong arm of the powerful center".

Unfortunately, at a time when we live in the new millennium, which requires perfection, perfection as a person, it is not only a mistake to indulge in fanaticism and animal desires, but also an avenue for the future. From this point of view, the verses of the Koran, which serve the

perfection of human perfection, are blindfolded or have a narrow mind to analyze or make fat was at the same time in the interests of others. It is a sign of destructive ideals. History shows that Islam is the main factor in kindness and goodness.”[8,140].

In the context of certain difficulties of the transition period, an absolutely immoral view may be formed and decided in the minds of citizens, especially in the younger generation, that the main way to achieve a high standard of living is through illegal activities. The pursuit of wealth in a devious way, if left unchecked by society and legal control, can lead people astray, especially young people who are just starting out in life. After all, what could be more tragic and destructive for society and the state than the moral depravity and apathy of the younger generation?

Fourth, there is a saying that “money seeks power”. But even if this money is found in a criminal way, it is not difficult to imagine how they will manage if its owners get out into the power structures of society.

It is well known and tested in many countries how influential people in the criminal world can come to power. First of all, this work begins with liaising with and strengthening government agencies in order to preserve untapped sources of income and ensure their safe use. After that, the power itself will be seized. This situation is a great threat to social development.

The involvement of the authorities in crime is one of the most serious threats to a developing society. The confusion of criminal structures with government officials, their infiltration into various branches of government, increases the public's sense of insecurity. It discredits the state itself. As a result, the threat is growing, both inside and outside the country, and mistrust is growing.

Fifth, it is important to know that those who have amassed wealth in an unclean way are prepared to take any action to avoid punishment and to protect their criminal capital. Such people are ready to do everything, even destabilize the situation, to cause mass riots, for fear of fair punishment. An example of this is the recent events in the Kyrgyz Republic. At a time like this, there is nothing more comfortable than stirring up passions, stirring up the crowd, and hiding behind it. The advice of such people, "Only if we are good, if our work is done," is a clear manifestation of selfishness, arrogant indifference to their compatriots.

Sixth, we have many examples, including those of those who have amassed wealth and wax through criminal means, trying to get into politics as new human rights activists and even struggling for democracy.

Needless to say, by such actions, they are seriously damaging the noble ideals of humanity, such as justice and democracy, and tarnishing the honor of their peoples and countries? In short, they are completely indifferent to the fate of their peoples and countries, to the ideals of freedom and independence.

The behavior of such individuals consists of a chain of consecutive criminal acts. First, capital is accumulated by deceiving its own people, and secondly, political prestige is gained by deceiving public opinion in the name of democracy and justice. It is no secret that such individuals are always ready to serve an external force that is trying to influence the situation in the republic in their own interests.

Every conscientious citizen who values the future and prestige of our country must remember this threat. Every citizen who wants to work honestly, to have a stable environment to spend his knowledge, energy and creativity, and whose children and loved ones in the future will be able to take full advantage of civilized market relations in a democratic, civil society, to the path of crime and corruption they need to be aware of the tragic consequences of these shortcomings if they are not addressed in a timely manner.”[9.90-93]

In accordance with the Law of the Republic of Uzbekistan "On Combating Corruption" No. ARU-419, adopted on January 3, 2017, the main directions of state policy in the field of combating corruption are:

- raising the legal awareness and legal culture of the population, the formation of an intolerant attitude to corruption in society;
- implementation of measures to prevent corruption in all spheres of state and public life;
- timely detection of corruption offenses, their suppression, elimination of their consequences, their causes and conditions, ensuring the principle of inevitability of liability for corruption offenses (Article 5). [10]

According to the definitions given in most dictionaries about tribalism, tribalism is a phenomenon specific to feudal societies. It is a union of people connected by blood ties. The seed team was named after its leader. He was the most influential man for his members, expressing the interests of the seed outside the relatively limited world of the community. It was the tribe that protected, sponsored, and helped its members.

Times have passed, socio-economic formations have changed, relationships between people have changed. It has changed, but it has not disappeared without a trace. Just as traces of an ancient plant can hardly be seen in the rocks, so in modern society, in its socio-cultural phenomena, there are clear traces of the distant past. Seed communities are one such event.

In today's world, it must be difficult to find a society that is truly divided into tribes. But sometimes it exists in a changed form, "updated". In many countries, blood ties are not as strong now. However, they were replaced by other commonalities, ties of other unity, including citizenship, territorial proximity. The question may also arise as to what is wrong if people from this or that place, who have settled outside the territory of that place, in other parts of the country, help their fellow-citizens. Not bad, of course. However, their infiltration into state structures and their use of positions in the system of power for their own personal gain is a dangerous threat.

At the same time, the goal of tribalism is to raise its members as high as possible above the ranks of state power. The distinguishing feature of tribalism is that its members are born in the same place. It should be borne in mind that the general character of the place of birth is not the generality of the types of training, the commonality of spiritual interests, the commonality of worldviews. Acting on this basis gives rise to localism. This process is also a very dangerous threat that hinders social development and hinders development.

At the same time, one nation should not pursue its needs and interests at the expense of discriminating against the similar aspirations of another nation or representatives of other

nations. It is necessary to eliminate any conditions in which some nations may be arrogant and disrespectful to others. [11.]

Localism is the negative manifestation of a sense of territorial closeness that is formed in people in connection with the place where they were born and raised.

The most unfavorable aspect of localism is that the interests of the neighborhood, region, region take precedence over the interests of society. The existence of such a system of attitudes and relations in society has a negative impact on the territorial integrity, stability, and development of the state. Increased localism, in turn, can lead to self-delimitation of places, weakening of the existing system of economic and social relations, economic, socio-political and spiritual decline. It is also possible for a particular region within a state to create extremist and subversive groups that fight for power under the slogan of subversive ideas in order to secure their dominance.

It is an important task to prevent the emergence of any form of localism, realizing that it is a threat to the social development of society, and, consequently, to prevent this defect. The role of the ideology of national independence in fulfilling this task is invaluable. This ideology, by its very nature, serves to realize the main goals and aspirations of all peoples, nations and peoples living in our society, and can fight against the ideas of localism, tribalism. It is based on the spiritual maturity and enlightenment of the people, along with a sense of national pride in the minds of the people, and calls for respect for the culture and dignity of our compatriots living in all regions of the country.

Nationalism is a system of ideological and theoretical views and practices that express indifference to the interests and needs of people of other nationalities, selfish attitudes. Nationalism is the satisfaction of the interests and needs of one's own nation by discriminating against the interests and needs of other nations.

Nationalism does not form true national pride. Equating national pride with nationalism undermines the culture of interethnic relations. While national pride is an aspiration to develop the characteristics of a nation, to enhance their future life, nationalism is an action aimed at disregarding the interests and needs of other nations, peoples, and restricting their rights and freedoms.

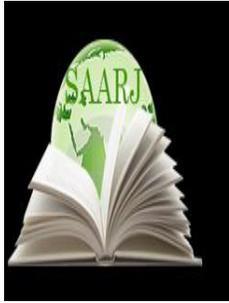

It should be noted that nationalism can take a strong negative direction if it becomes political. This can become a much stronger threat to the security of the state and the nation, to regional and large-scale security.

Nationalism manifests itself in various forms. It can also occur in the form of the supremacy of one nation over another or, under certain imperial conditions, between nations living in the same region or between nations living in the same country.

Any nation, no matter how small, is the wealth of humanity, and the disappearance of any national unity, its language, culture and other features will lead to the impoverishment of the cultural and genetic fund of the Earth, the capabilities of the individual. Therefore, the preservation of every ethnic unity should be the most important goal of the people who belong to it. And this goal is, first and foremost, the task of each individual state, which includes these ethnic groups.

ABSTRACT

Owing to the inadequacy of in-depth research, actual practice of Joint Consultative Councils/Employees' Councils in Sri Lanka remains a mystery. This paper explores the process of diffusion of Joint Consultative Council/Employees' Council in Sri Lankan organizations using Actor-Network Theory. Based in the interpretive paradigm, we employed qualitative methodology and multiple case study strategy, where four BOI approved organizations (cases) were purposefully selected from Textile & Garment industry and Tyre industry in Sri Lanka. In-depth interviews, focus group discussions as well as observations were used as data collection methods. The study revealed that the diffusion process starts with the management strategically creating a need for Joint Consultative Council/Employees' Council among employees, where in most instances management even go to the extent of imposing the concept on the employees. Afterwards, management employs different actions and mechanisms to promote and continue the practice of the concept within the organizations. Finally, management ensures that the Council remains within its tight control. Thus, it is apparent that, while the concept itself suggest a council of employees, from the initiation to the continuation of Joint Consultative Council/Employees' Council, management takes the control of the process and uses the practice mainly to fulfill their own agendas.

KEYWORDS: *Joint Consultative Council, Employees' Council, Actor-Network Theory*

INTRODUCTION

Employee voice representation is the term used to characterize a wide range of processes and structures that enable employees to contribute to decision-making in organizations (Boxall and Purcell, as Cited in Armstrong, 2006). Employee voice representation generally and traditionally operates through trade unions. However, non-union voice representation also plays a vital role in Industrial Relations (IR) and had secured an important place in IR discussions (Benson, 2000; Gollan, 2002). Non-union voice representation takes different forms. Among those, joint consultation is considered a widely used mechanism around the world, as well as in Sri Lanka. Joint consultation is “a voluntary system which is an outcome of arrangements between the parties, based on the mutual acceptance of the need to avoid conflict through strikes or other actions” (De Silva, 2004: 127). It is regarded as a mechanism for managers and employee representatives to meet on a regular basis, in order to exchange views, to utilize members’ knowledge and expertise, and to deal with matters of common interest which are not the subject of collective bargaining (Marchington, 1992). However, depending on the context, the mechanism which is used to practice joint consultation varies and generally refers to as Joint Consultative Council (JCC) or Works Council (WC) or Employees’ Council (EC).

By the year 2009, it was reported that more than 60% of enterprises in Export Processing Zones (EPZ) and Industrial Parks in Sri Lanka practice JCC/EC (BOI, 2009). Even though JCC/EC has over thirty year’s presence in Sri Lanka, the actual practice of JCC/EC in Sri Lanka remains a mystery due to the inadequacy of extensive and in-depth studies and research in many areas relating to JCC/EC. While the knowledge on rationale for introducing JCC/EC by employers in Sri Lankan BOI enterprises is available, how JCC/EC gets diffused in organizations remains unknown. In this backdrop, the current article attempts to explore in-depth how JCC/EC get diffused in organizations by exploring, how organizations actually introduced JCC/EC? How the practice of JCC/EC was made popular among employees? and How employers sustained the momentum of JCC/EC in their organizations? While contributing to the existing literature of IR discipline by fulfilling the knowledge gap on JCC/EC in Sri Lanka, the findings of the study would also assist organizations to gain a comprehensible depiction about the initiation, promotion, and maintenance of the EC/JCC concept in organizations.

JCC/EC IN SRI LANKA

The beginning of the JCC practice in Sri Lanka took place with the establishment of Greater Colombo Economic Commission (GCEC), now known as Board of Investment (BOI) in 1978. At the inception, in 1978, GCEC introduced the concept of JCC, which was a bipartite committee, consisting of both management and employee representatives. In this council, equal representation of management and employees was assured. However, the Chairman of the JCC happened to be the CEO or a top manager of the respective enterprise. This structure of Sri Lankan JCC resembles the ‘French Model’ that is practiced in European countries (Priyankara & Adhikaram, 2010). Later, in the year 1994, BOI replaced the concept of JCC with a slightly different concept of Employees’ Councils (EC). Thus, the first version of EC was introduced in 1994 by BOI with the guideline on EC which provides procedure of EC concept. This initial phase of EC continued till the year 2004. The second version of EC guideline was introduced and recommended by BOI in the year 2004 and it continues to-date (Director IR of BOI,

personal communication, August 13, 2009). The core difference of EC when compared to JCC is that EC consists of only the worker representatives and the EC is chaired by one of the workers. Thus, Sri Lankan EC resembles the 'German Model' of worker council (Priyankara & Adikaram, 2010). While there are marked differences in these two concepts, the terms JCC and EC would be used interchangeably in the current study, due to the similarities in practice and the understanding of the concept in the Sri Lankan organizations.

RESEARCH METHODOLOGY

Based in the interpretive paradigm, we employed qualitative methodology in pursuing the research objectives of the study. Multiple case study strategy was used as the strategy of inquiry (Yin, 1994). Four BOI approved organizations (cases), which practice JCC/EC, were purposefully selected from Textile & Garment industry and Tyre industry in Sri Lanka. Specific data collection methods included in-depth interviews, focus group discussions and observations. Twenty one in-depth interviews with managers, council members, and non-council employees in the selected organizations were conducted. In order to execute interviews, we used two interview guides respectively for managers and employees. Apart from the in-depth interviews, two focus group discussions, consisting of six participants each, were held. By being observer participants (Saunders, Lewis & Thornhill, 2008) at the JCC meetings of the selected companies, we also gathered information on how JCC/EC meetings were actually held and how management and employees interact with each other on JCC/EC related matters.

Qualitative data analysis was carried out parallel to data collection, in five steps as, organizing and preparing the data for analysis, coding of data collected, developing categories, refining categories and arriving at the findings. Except two interviews, all other interviews and focus group discussions were audio recorded with the consent of the interviewees. Recording of the entire interview session prevented the loss of information that would have otherwise been lost in an attempt to record manually. Thereafter, all the recordings were transcribed verbatim. Use of Actor-Network Theory (ANT) in the analysis ensured the theoretical rigor of the study. Callon as well as Latour (as cited in Gao, 2005) identified that a key feature of ANT is that the actors include both human beings and nonhuman actors, together composing a network to be studied. Human actors represent social interest and these actors' interests are influenced by different situations. Change takes place due to dynamics of the contextual/situational elements and struggle of the actors to inscribe their interest into the phenomenon (Gao, 2005). Thus, the potential application of the actor-network theory in this study is to investigate the process whereby the respective interests of different actors are aligned into a social arrangement (Gao, 2005) that can have an effect on the diffusion of JCC/EC in organizations.

FINDINGS AND DISCUSSION

Findings of the study clearly indicated how the managers, being the main actors, diffused the practice of JCC/ECs in their organizations through an identifiable process. It was thus identified that the diffusion process of JCC/EC in the four organizations selected for the study consisted of three phases. The first phase is the creation of the need for JCC/EC and imposing the JCC/EC concept on employees, the second phase is the advancement of JCC/EC through various activities and practices, and the final phase is the maintenance of the JCC/EC practice to meet the management expectations. These specific phases identified through the study, would be discussed in more detail below.

Diffusion Phase One: Creation of a need for JCC/EC and imposing the JCC/EC concept on employees

Though forming and engaging in trade union activities is a right of employees granted by the country's legislations, yet trade unions are seen in a negative perspective by employers and there always exist an adversarial relationship between trade unions and employers in Sri Lanka (Employers' Federation of Ceylon, 2006). It was found that management had wanted to discourage trade unions from entering their organizations too. In this background, management has realized that one of the ways of obstructing trade unions is the formation of JCC/EC. Hence, in order to sell the JCC/EC concept to the employees, management had constructed the problem of 'how to solve common grievances of employees?', while constructing this problem, management has also convinced the employees that the best solution to this problem is the creation of JCC/EC. Here, management has started their promotion of JCC/EC by highlighting the repercussions of having trade unions and emphasized the need to have direct relationships without letting third parties to act as intermediaries between the management and employees. In this effort of convincing employees, management had highlighted examples of negative Sri Lankan trade union actions through formal and informal meetings with employees. Meanwhile, the management has also engaged in forceful actions to keep unionists away from their organizations. Industrial Relations executive of Organization Two (O2) commented that

As a private sector organization, outsiders won't do any good for us and they (trade unions) too are an organization and might have different objectives that may be political or otherwise getting membership fees from members and strengthen their organizations. Outsiders' objectives, organizations's objectives, and employees' objectives are three types of objectives. Therefore, the top management team convinced the employees that without going to an outside organization, our organization and employees should get together.

This discouragement of trade unions in the organizations closed the main avenue employees had to express and redress their common grievances or concerns. Thus, it created a vacuum of employee voice representation. More specifically, management intentionally created a vacuum of employee voice representation. Further, management successfully convinced the employees of the need to have an in-house and direct mechanism to address employee problems. Consequently, management constructed a need among employees for an alternative voice representation to trade unions. Thereafter, management proposed the solution of JCC/EC as a remedy to their problem and made it the only mechanism to represent employee voice. One of the Former Council members of Organization One (O1) attested to this fact as follows.

HR manager said that there is this concept; actually we didn't have a place or a stage to discuss our issues that we had. There, he said that this (JCC) is a stage to discuss the common problems that we have. That's how he explained the concept.

Even though the term JCC/EC indicate councils of employees or a joint endeavor of employers and employees, the discussions and interviews with the management and employees of the four organizations, indicated that the introduction of JCC/EC in these organizations have taken place merely according to the initiative and discretion of the management, where the employees have only played a very passive role. As clearly apparent from the employees' comments, management has, more or less, imposed JCC on the employees. One of the council members of O1 commented that *in my organization there was no employee council, but HRM of the group*

has come and taken two employees from each section and discussed about this..... Then employees have told a lot of issues, and then she, Head of HR of the company, had told them to establish an Employees' Council and forward issues through that. It is not the employees who have formed this. It is the management who established this.

With the introduction of JCC/EC in their organizations, by and large, management imposed and positioned JCC/EC on employees in a continuum of goals which ranges from employee wellbeing to organizational wellbeing. Employee voice representation is the extreme concern that would be in the employee wellbeing side of the continuum. Discussion of welfare related common grievances is the basic goal in the employee wellbeing region. The other side of the continuum depicts organizational wellbeing. In ensuring organizational wellbeing management expects at least to maintain sound industrial relations. At the utmost extreme, management expects the JCC/EC bringing productivity improvement suggestions through capturing and utilizing employee potentiality physically as well as psychologically.

The objectives (of JCC) was to maintain industrial peace in the organization, to improve the relationship and trust between employees and the employer, to create a happy working environment by fulfilling common objectives of employees, and to increase organizational productivity through increasing organizational efficiency. Also to discuss, inform, and collectively implement the decision that will be taken to enhance the wellbeing of both employees and the organization. (Industrial Relations Executive, O2)

Management, as the main actor of the JCC/EC network at organizational level, imposed and positioned JCC/EC on employees as the mechanism to reach the above objectives. According to ANT, an actor reinterprets or appropriates the interests of other human actors and the interests embedded in non-human actors according to one's own (Gao, 2005) which is known as Translation. As per Callon (as cited in Harrison & Laberge, 2002) translation of interest is a process that involves the construction of the problem, Interestment, enrolment and mobilization of allies. Accordingly, the main actor of the network constructed a problem in order to translate its interest on other actors and propose the network as the solution (Gao, 2005). ANT further shows how one actor constructs the identity of the other actor by trying to make the latter act in accordance with his wishes (Harrison & Laberge, 2002). The above explanation of phase one of JCC/EC diffusion resembles the construction of the problem which is the first step of the translation process of ANT. Thus, similar to the arguments presented in ANT, management of companies have acted as the main actors, whereby constructing the problem of how to solve common grievances, and then proposed the solution of JCC/EC as the solution. Further, they have inscribed the meaning into employees and attempted to ensure enrolment of members to the network of JCC/EC.

Diffusion Phase Two: Advancement of the concept of JCC/EC

Having successfully introduced the concept of JCC/EC, it appears that the management uses different actions and mechanisms in translating the management's expectations and to advance of the concept within the organizations. Through these mechanisms, management stabilizes their role in the process and attempts to retain members in the network of JCC/EC. The mechanisms and actions that were employed to advance the concept were identified as, a) formalizing JCC/EC practice in the organization, b) building ownership through member selection, c) providing continuous learning opportunities on JCC/EC to both council members and non

council members, d) usage of multiple communication tools, e) attending to employee concerns and giving systematic feedback, f) recognizing JCC/EC, and g) paying high attention to JCC/EC by top management. Some of the above findings were further evident from the observations carried out during the study. The various mechanisms and actions listed above are elucidated below.

a) Formalizing JCC: At the outset, management paid due attention to make JCC/EC a formalized mechanism within the company. In that endeavor, management brought in a guideline/policy on JCC/EC by getting the essence of BOI guideline on JCC/EC. Organizational guideline/Policy on JCC/EC included formally stated objectives of the council, functions of the council, membership, power of appointing the council, council officials, tenure of the council and other procedures. In addition to the guideline/policy on JCC/EC, management introduced formal agenda for meetings, preparation of meeting minutes, and publicity of meeting minutes.

b) Building ownership through member selection: As guided by the BOI with its guidelines on JCC/EC, management has enabled employees to select their members to the council and developed 'employees' ownership' on the concept. It was evident that the employees have selected the council members, and that the management does not appoint employees whom management likes. Officials for the council are also selected from the elected council members. In other words, council members elect President and Secretary, and it is generally without an election. However, in Organization Three (O3), even the council president is selected through an election. Consequently the opportunity and the ability to select the members and officials that they prefer, have given the employees the ownership of the concept. It is obvious from the responses of both management and employees.

Actually we are not participating in their meetings or the selection process. We can't influence to select these guys. (Assistant Human Resource Manager, O1)

Once a year we appoint the members to the EC and it is not management who appoint the members but the members in relevant sections. Every year, in the general meeting it is announced that the tenure of the council is over and the need to appoint a new EC, so employees then suggest and nominate members from all the sections. (Former Council Member, O1)

Those days, when I joined the company this (JCC) was not that much popular and there was no competition. But, as time passed JCC became a familiar word. Now, there is an election to select JCC members and there is an election to select the president too. (Former Council Member, O3)

c) Providing continuous learning opportunities on JCC/EC to both council members and non council members: Two companies have enabled the non council members to participate in JCC meetings so that non council members too gain awareness about how JCC/EC operates. At the same time, during the orientation programme, management educates employees on JCC/EC concept. In addition to that, they conduct leadership skill development programmes as soon as a new council is appointed for the members of previous council and new council with the management team. These have helped management to inculcate the expected message of JCC/EC in employees and council members. Head of Human Resources of O3 highlighted the fact as follows

What we normally do is, immediately after the JCC election, we conduct a work shop on developing leadership skills for the present and previous committee of JCC along with the

management team. We hire a consultant, and get them sharpened up their leadership skills because they are the natural leaders but we also need to refine them and guide them in theoretical terms. And also we get them to do a kind of a SWOT analysis, and come out with an action plan for their own term. Again it is also to not only to recognize the body, but also to give them kind of a training opportunity to further develop.

d) Usage of multiple communication tools: Apart from formalizing the practice of JCC/EC, management further the concept among employees through various communication tools such as general meetings, exclusive notice board, education through council members, orientation program, and council member election. Except the most common communication tools identified above, getting the council members to wear a badge and enabling non council members to participate in JCC/EC discussions, were found to be other symbolic and tactical tools that management had used to promote the concept among employees.

JCC members wear a badge. Then, others know to forward issues to JCC member. She collects all the issues before the meeting (Former Council Member, Organization Four (O4)).

We sometimes invite certain cross section or percentage of non JCC members to those meetings for them to come and experience what is going on (Head of HR, O3).

From ANT's percept, intersement, the second phase of the translation process, is defined as "a set of actions through which the *primens movens* impose and stabilize the identity of other actors, promoting the pursuit of the objectives and goals that have been attributed to them" (Callon, as cited in Harrison & Laberge : 502). In imposing and stabilizing the identity of employees, council members, and JCC/EC meetings, management used the translation strategies, viz, formalizing JCC/EC practice, building ownership through member selection, using multiple communication methods and providing continuous learning opportunities on JCC/EC to both council members and non council members. Accordingly, intersement is an essential stage in which the main actors impose and stabilize the identity of the other actors as they have been defined in the construction of the problem (Harrison & Laberge, 2002). In the case of diffusing JCC/EC management used different intersement strategies not only to ensure the identity defined in the first phase but also to reinforce and further the identity created in the phase one. Specially, through providing training programs to mold leadership qualities of JCC/EC members, main actor make sure the momentum of the practice and further the employees' buy in on the concept.

e) Attending to employee concerns and giving prompt feedback: After introducing JCC/EC, Management has paid a great deal of attention on ensuring that management addresses employee issues. In fact, this is what management had promised in establishing JCC/EC in the phase one. As a consequence, employees' confidence on the new system increased and employees started to buy in the concept. Giving considerable amount of solutions for the JCC/EC concerns had attracted the employees towards the network of JCC/EC. This can be identified as the most decisive aspect or the glue without which the practice of JCC/EC will not continue. As a result of the amount of solutions and their speed JCC/EC became a discussion topic and reached employees with less amount of effort.

Definitely 50% or 75% of problems are resolved. Most of the time, it is over 75%. Then the remaining 25% automatically get reduced. Pressure of the unsolved issues won't increase

because of the solutions that were already received. So pressure of employees reduces due to the solutions. (Council Member, O2)

JCC went to employees automatically since employees got benefits like salary increments, food and transport. Employees got to know that they receive those through JCC and then it created an opinion amongst employees that in order to get benefits it is required to go through JCC. (Council Member, O3)

In the event of keeping the momentum of the JCC/EC concept, management ensures giving prompt feedback to the requests made by JCC/EC. In giving feedback to the entire work force, management had introduced a noticed board distinctively to communicate the JCC/EC discussions and results. This is the mechanism to involve all the employees and managers to the network of JCC/EC. Since the decisions are displayed publically, employees could check whether their concerns are noticed to the management by council members. Further, employees get to know management responses to their respective concerns. This practice showed transparency of the network too.

HR managers respond to the requests and the decisions are displayed in a notice board which is allocated to EC decisions. There is a separate notice board to display EC decision with columns to indicate the suggestions/issues and the solutions given for those suggestions/issues. (Council Member, O1)

f) Recognizing JCC/EC: Certain approving powers which have been assigned to JCC/EC members have given them due recognition within the organization, which in turn had created a sense of value among the council members. This recognition which is given to JCC/EC has reinforced the concept within the organizations. In addition, top management intentionally keeps JCC/EC meeting at a very high level in the meeting hierarchy through participation in the council. Specially, in O3, Managing Director has highly appreciated and recognized the JCC/EC in his annual review in the Magazine of the company. On top of that JCC/EC has been recognized as the strength of the organization even in the company's official web site. This fact was again highlighted by respondents in the in-depth interviews. Further, it appears that the previous council members have received certificates or letters of appreciation for their contributions in the council. These certificates are included in the personal files of the employees. Apart from that, in the service letter which an employee receives when he/she leaves the organization, the service of the member in the council is mentioned.

We can't spend even a cent from our welfare account without the proper approval of the president and the secretary of the JCC. When they give their approval, they feel that they are having this kind of recognition in our organization. It's a good thing to motivate; they also feel that they are recognized people in the organization. And they feel that JCC has a good place in the organization. (Assistant Human Resource Manager, O1)

This is one of the main meetings out of our meetings. That recognition has been given to that. GM, Line managers, HR, Welfare represent the council, highest personnel from our side, who can give answers or solutions to employee problems participate in the council. Most of the time, it is chaired by CEO or DGM from Central. Then top personnel in our structure definitely come for the meeting on the schedule date and they spent the three or four hours in the council. Then this becomes one of the top meetings in our organization. (Human Resource Manager, O2)

We consider them (JCC members) as the strength. Even in our annual magazine we put them under “our Shakthiya”(our strength). That is the message given, because otherwise if we don’t recognize and if we don’t listen to their voice, there could be a kind of another element to basically express their grievances. So we always make sure to recognize the JCC and get all their common grievances or issues or even suggestions channelled through JCC. (Head of HR, O3)

When I finished my period, HR send a letter to my personal file indicating that I have worked as a JCC member. (Former Council Member, O4)

Supplementary to the above, management releases council members from ordinary work for council discussions and council related activities. The respective sectional heads have been informed to release council members from ordinary work when the council discussions are held and council activities are carried out. This authorized release of council members from ordinary work to attend council meetings and other related activities too has given them a sense of value and official status. Employees also expressed that management facilitate council meetings not only by releasing members for council meetings but also by providing board room and refreshments. Further, management assisted council members to conduct their meetings and preparing meeting minutes too. From ANT percept, this can be seen as an enrolment strategy, which enhanced the commitment of council members towards JCC/EC.

g) Paying high attention to JCC/EC by Top management: In creating and maintaining faith of employees on the new system, top management plays a significant role. For example, as per observations CEO of O2 sits on the floor with employees in the JCC/EC sessions. This practice was very attractive to employees, as it symbolizes the willingness of management to create an attentive atmosphere which is mutually beneficial. It also exhibits management’s closeness and readiness to come down. Further, CEO or MD, the highest official in management, regularly attends the JCC meetings. This has given more credibility to JCC, because employees could get direct solutions from CEO or MD without dragging the issues.

The second phase of the diffusion of JCC/EC, from the perspective of ANT, elucidates the interestment and enrolment of members to the network of JCC/EC. If the interestment is successful it will lead to enrolment. Enrolment is the moment of agreement and consent, which may take the form of either conformity with rules or authentic commitment (Kerfoot & Knights, as cited in Harrisson & Laberge, 2002). Evidences of the concerned organizations indicate that there is a successful enrolment of actors to JCC/EC network. From one hand main actor has gained consent and agreement of employees, the critical actor, through formally laid down policy and procedural activities. On the other hand, it had taken authentic commitment via giving solutions and prompt feedbacks, recognizing JCC/EC, letting them to select their own representatives and committing top management time and attention on JCC/EC.

Diffusion Phase Three: Maintenance of the JCC/EC practice within the management’s controls

As per ANT certain actors make an innovative proposal, mobilize resources and try to translate the interests of others in an effort to enroll them. There can be two mutually exclusive results of this process; those are enrolment or resistance (Harrisson & Laberge, 2002). In the phase two of

the diffusion, it was evident that enrolment was a success, where JCC/EC had been recognized by both parties and they willingly participate in JCC/EC. However, respondents were of the view that, if JCC/EC functions in its full potentiality, it may negatively affect the organization by making it in to a status of a traditional trade union, and thereby deviating from expectations of the main actor.

If Employee Council rises in its full potential, there is a possibility of destroying the organization. (Council Member, O1)

I think the role which is expected by the management changed. I would say, it (management) was more or less playing to the tune, whenever they saw that JCC is losing power, they were willing to give power but as soon as they saw that JCC is gaining momentum, and then they were, I would say, ready to take it out of JCC. So it was a more or less controlled mechanism than a very free organization. (Human Resource Manager, O4)

ANT shows that one actor constructs the identity of the other actors by trying to make the latter act in accordance with his wishes (Harrison & Laberge, 2002). Management also adopted a range of strategies to ensure that JCC/EC will not reach its maximum potentiality and it will be within management's purview. Thus, phase three of diffusion can be identified as the maintenance of JCC/EC practice within the management's expectations. In order to maintain the JCC/EC practice without deviating from the management's expectations, management redresses only common grievances and discourages individual grievances in the EC/JCC, uses indirect manipulations, policy level control, and coercion to eliminate non aligned members.

Management does not like to entertain individual issues at JCC and discourages individual grievances coming through EC/JCC. Management is keen on channeling common grievances through EC/JCC. One of the reasons for discouraging individual grievances channeling through EC/JCC is the lack of time to pay attention to large number of grievances in a council session. The other reason is the fact that, once all the grievances are entertained at JCC/ EC, it gets elevated value and recognition among employees and reduces the one-to-one relationship between managers and individual employees. Also, this reduces the power in management to a certain degree as employees would not come to management with their problems but rather would go to JCC/EC, where the employee commitment is taken away from the management and placed with JCC/EC. This clearly is not something the management wants, as it goes against the management's initial intentions of forming JCC/EC (which is the maintenance of sound industrial relations and improvement of productivity within the enterprise without the presence of politicized trade unions). Thus, management hesitates to give due recognition that EC/JCC should receive owing to the fear that EC/JCC will go out of management's purview if majority of employee problems are solved through the EC/JCC. Management also dislikes giving excessive recognition to EC, since excessive recognition may increase the power of JCC/EC and too much power of JCC/EC is considered to be destructive for the organization.

Management always says that 'we give privileges before you request it through employee council'. However, management doesn't like to show that the solutions were given for the requests made by the council because of the fear that employee council will gain power. There is a fear that more requests will go beyond current level. Therefore, they don't like to give credit to EC all the time. (Council Member, O1)

Tenure of the council members is one year and the same employee cannot be a member of the council in the next year. These policy level provisions restrict building a strong leadership in EC, as every year a new member takes the presidency of the council and a totally new set of member representatives are appointed. It provides management with the ability to ensure the functioning of the concept without letting it reaches the pinnacle point. This also prevents developing a strong coalition that might go to the state of a trade union. Human Resource Manager of O4 highlighted this fact as follows.

There is a restriction where the office bearers of this year can't hold office next year. That is again a sort of a tactic to ensure that there is no continuous rhythm in terms of control.

In addition, management also uses other subtle tactics to control the mechanism when they see JCC/EC is derailing from the track that management needs. It is obvious from the following comment by Human Resource Manager of O4.

This company has about 30% male employees and 70 % females. We saw a trend developing in the presidency, where it was generally held by employees of one particular department which is the Stores department, a male dominant department. So then, we saw a sort of aggressive behavior among these leaders over a period of time and then we realized that we need to do something. So what we did was, there was a CSR program to empower women. We used this tool to say, ok now it's high time that you all bring a female leader to the council. Not merely because we wanted a females empowered as the president, but we wanted to break that trend of these stores guys occupying this hot seat on a continuous basis. We saw a small coalition building which we thought would be detrimental to the organization on the long run. So we used that tactic to break that rhythm and ever since it was broken, now the leadership has been on here and there not concentrating on one point.

Further, there were instances of one of the strongest trade union federations in Sri Lanka having tried to penetrate into one organization. This was viewed as a major threat to the system and to the organization. This attempt of trade unionists approaching organization and receiving support from some of the employees was an indication about destroying JCC/EC. Here, Management used coercive influence and made the leaders of union movement to resign from the organization.

One of the strongest federations of trade union which is led by a political party, tried to enter into our organization. That influence was there. We identified two fellows and we indirectly ask them to resign. We said if you are here, this country will lose this organization, directly 5000 will lose jobs and indirectly one lakh will suffer and this country will not have this organization, therefore please. We didn't tell them to resign but we told so that they will resign. (Industrial Relations Executive, O2)

From ANT percept, mobilization of allies is the stage in which order is transferred. The network becomes irreversible or, on the contrary, the network begins to fall apart due to resistance. "Successful networks of aligned interests are created through the enrolment of sufficient body of allies and the translation of their interests so that they are willing to participate in particular ways of thinking and acting that maintain the network" (Walsham & Sahay, 1999: 42). As a whole that interestment effort of management is a success and it had led to enrolment. However, intermittent attempts of external trade unionist to establish trade unions shows that JCC/EC network underwent opposition from competing associations. Main actors then will try to build

alliances and destroy competing associations. (Kerfoot & Knights, as cited in Harrisson & Laberge, 2002). In this case, management considered trade unions as competing association that threatens the network of JCC/EC. In order to confront the challenges to JCC/EC network, management has taken steps to destroy formation of trade unions within the organizations. It is one of the salient features of the mobilization of allies as per ANT.

CONCLUSION

The main objective of this paper was to explore the process of diffusion of JCC/EC in organizations. The diffusion process of JCC/EC was identified to consist of three phases; (a) the creation of the need for JCC/EC and imposing the JCC/EC concept on employees (b) the promotion of the EC/JCC concept and (c) maintenance of the JCC/EC practice within the management's expectations.

At the first phase it was identified that management created the need of EC/JCC among employees through various avenues. Management being the prime actor in the process of diffusion constructed a problem for employees. After creating the problem, management proposed a solution, JCC/EC, to solve the constructed problem. Thereafter, management imposed and positioned JCC/EC as a mechanism to achieve both employee wellbeing and organizational wellbeing in the employees' minds through the help of HR Division. It was clear that discretion of the management has been the key factor in initiating and diffusion of the practice of JCC/EC. Employees have not been active or joint participants in the first phase of diffusion of the concept at all. They have just been mere recipients of the management's strategic plans concerning JCC/EC. This in turn, negates the whole concept of JCC/EC, where the concept emphasizes joint consultation and joint roles. Hence, the start of JCC/EC in organizations itself indicates contradicting and opposing practices.

In promoting the EC/JCC concept among employees, management used different strategies/mechanisms including formalizing JCC/EC practice, building ownership through member selection, providing continuous learning opportunities on JCC/EC to both council members and non council members, usage of multiple communication tools, attending employee concerns and giving systematic feedback, recognizing JCC/EC, and paying high attention on JCC/EC by Top management. All these strategies and mechanism that management used to promote JCC/EC network can be identified as interestment and enrolment mechanisms according to ANT.

In the third phase, management controlled the JCC/EC so that it will not reach its maximum potentiality. With a view to maintain JCC/EC within their control, management restricted the individual grievances coming into the JCC and encouraged only common grievances in the JCC, applied policy level controls, used subtle manipulations and used coercion to undermine the threats to the existing net work of JCC/EC. The final phase of interest translation in ANT theory, mobilization of allies, was apparent in this third phase of the diffusion process of JCC/EC.

In conclusion, the findings indicate that management engages in a comprehensive diffusion process in taking the concept to the employees and behave tactically to inculcate the expectations of management on employees and keep the momentum of the JCC/EC. All the above findings reveal that, from the initiation of JCC/EC to the continuation of JCC/EC, management takes the control of the process and employees' participation, especially at the initiation of JCC/EC, is not up to the level as expected in the literature of JCC and BOI guideline on EC. Thus, though there

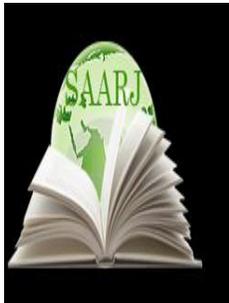

are certain features in alignment with the conceptual meaning, it signifies that the way establishments have diffused JCC/EC at organizations is a deviation from the expected practice of JCC by the scholars in industrial relations and EC by BOI Sri Lanka.

ABSTRACT

The article deals with the establishment of equestrian clubs in the Surkhandarya oasis in the last century, the activities of masters of sports who grew up in them, the popularity of equestrian sports in the oasis, the worthy participation of oasis athletes in regional, national and union equestrian competitions.

KEYWORDS: *Master Of Sports, Spartakiada, Riders, "Girl Chase" Competition, "Cotton Holiday" Sports Competitions, "Pakhtakor" Sports Society, "Spartak" Sports Society, Chavgon, "Boks", "Bazzafil", "Bedakur".*

INTRODUCTION

Equestrian sport is one of the ancient sports of the Uzbek people, which demonstrates the courage, bravery, agility and pride of the young man. Today, the development of equestrian sports is clearly visible.

In Tashkent, Fergana, Jizzakh, Kashkadarya and Surkhandarya regions, equestrian competitions and kupkari (horse riding) are often held. Sufficient attention is paid to improve the breed of horses, replenish the ranks of athletes and increase the number of horse riders. These events, in turn, are yielding positive results, and world-famous horse-riders are emerging. If we take the Surkhan oasis as an example, we can see that a lot of positive changes are taking place there.

The end of the third quarter and the fourth quarter of the last century had a unique positive point in the development in the history of equestrian sports in Surkhandarya oasis. In 1966, the first equestrian club was established in our region. The site for the club was selected and allocated from the collective farm named after U. Aliyev (former) in Sariosiya district. That year, the process began with the participation of only two riders. It can be said that the opening of this

club was the prelude to the great work of the following years and the foundation of future great victories.

METHODS AND METHODOLOGY

Since then, it has been observed that the level of interest in equestrian sports is extremely high. In a short time, the number of members of the club exceeded more than thirty members. As early as 1967, one of the members of the club, Robak Sigov, was nominated for the master of sports. Badilla Buriev and Shamil Murtazaev took the title of masters in sports. [1] The members of the club went to the Republican Spartakiad in 1967 by taking an intensive training courses. They were rewarded with silver medal in the Spartakiad competition. It was a huge success for the club members who had just started work. After that event, in a short time, the participants of the club received the top reward in the competition among rural athletes. Of course, after that, the club members worked hard to have further consolidation the achievements. Particular attention was paid to increase the number of club members, involving energetic and talented young people. A conscientious efforts were made to keep an incessant training of the athletes. It should be noted that, Stepan Vasilevich Ilyasov, the coach of the club, master of sports, played a significant role in this process. Of course, great things could not be accomplished by the dream alone. In the first place, favorable conditions were created for training in the club. The capable youth to equestrian sports are constantly involved in the club. Secondly, special attention was paid to the selection and care of purebred racehorses. Good riders need good horses. This later served as the basis for great success.

Later, a branch of the equestrian club was opened on the territory of the former collective farm "Communism", taking into account the growing interest in equestrian sports in the district. This, in turn, was a factor in the further expansion of the number of horseriders.

In 1971, a cotton festival was held in the Republic. It can be said that this holiday has aroused great interest among many people due to its richness in sports. In particular, equestrian competitions attracted a lot of attention. The riders from Surkhandarya, who took an active part in these competitions again. The national team of our region, consisting of talented riders, took the first place in these festive competitions and raised the flag of victory. Members of the regional equestrian club took an active part in 13 rounds of the competition program in classical equestrian sports. For example, Badilla Buriev, a student of school No. 56 in Sariosiya district, strengthened her team's position by winning the first prize in the steeplechase competition. Mirza Tursunov, Mamat Khudoynazarov, Shamil Murtazoev, and other skillful members of the team achieved great success in the steeplechase competitions. [2].

RESULTS

The second day of the competition began with the national equestrian sports. It is well known that overturning an opponent on horseback requires strength, agility and skill from the horserider. Two participants of the regional team took part in the competitions of this round. Turob Mamashukurov and Ergash Suvonov from Surkhandarya impressed the audience, beating all rivals. They won the competition with great honor and superiority.

Flyura Otakhonova and Ergash Suvonov from Surkhandarya took the second place in the " Kiz kuvmak"(chase after the running girl) competition.

Then began the championship in kupkari, one of the most popular and favorite types of equestrian sport. In this case, the riders of our region showed real skill. For example, such skilled riders as Turob Mamashukurov, Rakhmon Khushbokov, Layli Berdiev, Nurmon Boymurodov, Mamarayim Juraev, Rakhmat Omonov, Odima Zoirov, Bekmazar Kurbanov, Ergash Suvonov gradually defeated the riders of Bukhara, Namangan and Kashkadarya regions. Thus, for the first time, Surkhandarya athletes won the mobile cup - the grand prize of the Republican sports festival "Cotton Holiday". Speaking about the path of development and progress of equestrian sports in the Surkhandarya oasis, it is worth mentioning about the organizers, who have devoted themselves to this cause in every possible way. The services of such leading officials as B. Omonov, U. Mamajonov, B. Kholmatov from Sariosia were invaluable in the formation of a strong team of skilled horseriders in the region. Zokir Valitov, former chairman of the Pakhtakor Voluntary Sports Association of Sarnosiyo district, has not only helped to increase the number of riders, but also to improve their skills, increase the number of purebred horses and ultimately ensure the success of the national team. In addition, it is worth mentioning the services of horse breeders A. Dilmatov, T. Kholikov, B. Tashkulov.

Later, the interest in equestrian sports began to be observed not only in Sariosiya district, but also in other districts. This march was also demonstrated in December 1970 at the regional cotton festival competitions held in the territory of Namuna collective farm in Termez district. The festival was attended by many spectators from different districts of the region. Similarly, famous riders from almost all districts came to demonstrate their skills. Then the riders had a great time. The riders raced a thousand meters.

DISCUSSION

They rode along a special path. Thousands of spectators watched the riders without taking their eyes off them, shouting. F.Boymurodov, a rider from Namuna collective farm in Termez district, was the first to cross the finish line and won the race. The second place was taken by K.Murodov from Sherabad and Muhammadi Boykulov from Baysun. The riders also took an active part in the kupkari competitions held on the same day. In this case, the great interest in kupkari was once again proved within public. It was a very interesting show. Kuldosh Yodgorov from Zharkurgan demonstrated in practice that he is a great rider and took the first place. Odina Zoirov, the Republican champion in equestrian sports, took the second place. [3]

It should be noted that in those years, in the competitions in the classic equestrian sports, the riders of our oasis have always steadfastly defended the honor of our region. The coach of one of the sports clubs in Sariosiya district, master of sports Sharof Badalov, masters of sports from Sariosiya Isok Sodikov, Fayzulla Mirzaev raised the flag of victory in many competitions in classical equestrian sports. In other words, the same riders contributed to the further strengthening of the prestige of the regional team.

The number of equestrian clubs increased to ten by 1970 due to the efforts of direct equestrian devotees. There were 100 good horses and 135 of them. Thirteen of the trainees were first-class athletes. By 1990, equestrian sport had risen to a higher level in terms of quality and quantity.

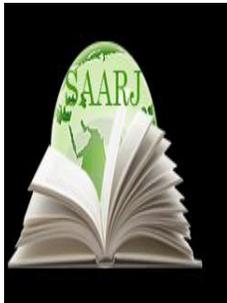

SUMMARY

At that time, the number of equestrian clubs reached to 14, the number of horses - 600, and the number of active riders - 856.80 breeds of horses were brought from abroad. At that time, the

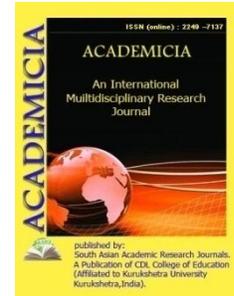

number of masters of sports was 32, and the number of first-class athletes was 113. The heyday of equestrian sports was observed in these years. [4] In conclusion, the last quarter of the last century went down in history as a memorable period in the development of equestrian sports in the Surkhandarya oasis. During these years, the classic types of equestrian sports became widespread in our region and developed rapidly. Our riders, who are well-known all over the world, showed great skill. At the same time, thousands of our young people began to look at equestrian sports with great interest and love. Secondly, they also have extensive experience in the restoration, cultivation, reproduction and maintenance of horse parking. The acquired skills helped a lot in later events.

ENERGY SAVING AND APPLICATION OF FREQUENCY CONVERTERS AND SOFT START DEVICES

Olimov Orif Nosirovich*

*Senior lecturer,
 Department of Power Engineering, Jizakh polytechnic institute,
 UZBEKISTAN

ABSTRACT

The questions of the use of frequency converters and soft starters on pumping equipment are considered. The advantages of using frequency converters and soft starters are indicated. Particular attention is paid to the theoretical issues of the use of frequency converters and soft starters. The corresponding graphs of dependence are given. The approximate cost of implementations is indicated.

KEYWORDS: *Throttling, Soft Starters, Frequency Converters, Control Cabinets, Protection, Energy Saving.*

INTRODUCTION

As already mentioned, the use of frequency converters allows you to save energy. The classical method of controlling the supply of pumping units involves throttling (lowering the water pressure when flowing through the narrowing of the pipeline passage) of pressure lines. In this case, pumping units are selected based on certain design characteristics (as a rule, with a margin of productivity) and constantly operate at a constant speed, without taking into account the changing flow caused by variable water consumption. At minimum flow, the pumps continue to run at a constant speed, creating overpressure in the network (the cause of accidents), while a significant amount of electricity is wasted. This, for example, happens at night, when water consumption drops sharply. The main tasks solved with the help of frequency converters:

- stabilization and optimization of technological parameters depending on the operation of the electric drive;
- replacement of a regulated DC drive with an adjustable asynchronous drive;

-smooth acceleration and deceleration of the drive load, stopping at a given position (with the possibility of a cyclic process), constant movement speed for a varying load;

Energy-efficient electric drive and alternative renewable sources.

-saving electricity by reducing power consumption, in some cases up to 50%;

-universal control of an electric drive without significant costs for automation and retraining of personnel;

-automation of technological processes using an electric drive.

MATERIALS AND METHODS

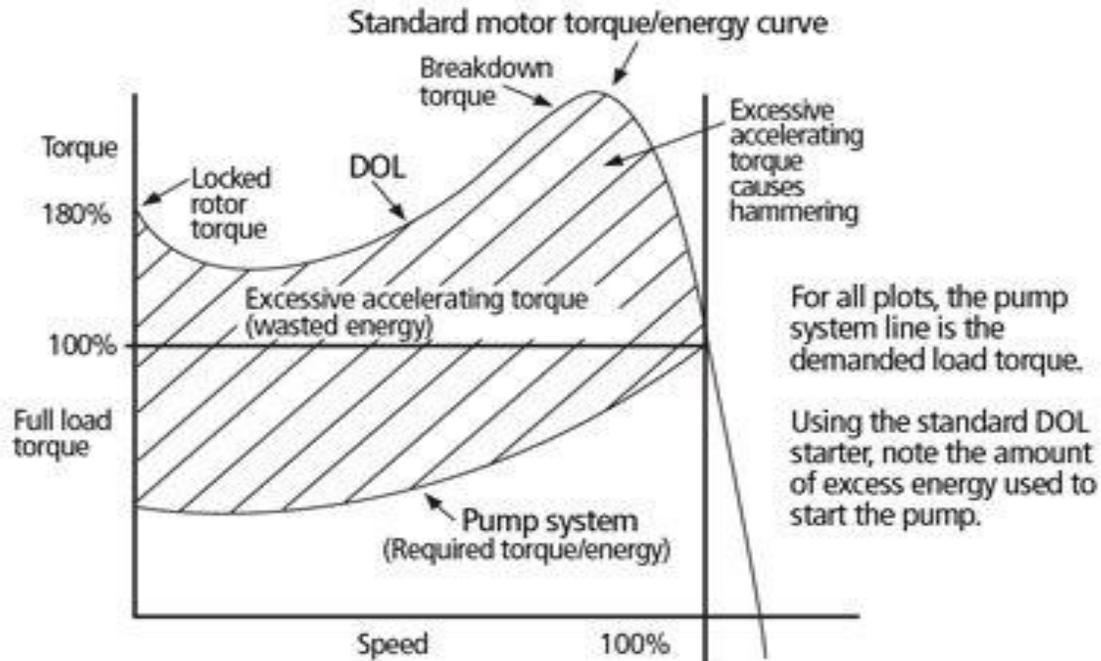

Consider the use of a private converter and soft starters on pumping equipment.

The use of the above devices allows you to achieve the following results from the equipment:

- 1) Energy savings in the case of variable load (i.e. operation of the electric motor at partial load);
- 2) Smooth start of the engine, which significantly reduces its wear;
- 3) Reduce water consumption by reducing leaks when the pressure in the pipeline is exceeded, when the water consumption is actually small (on average 5%);
- 4) To achieve a certain saving in heat in hot water supply systems by reducing the loss of water that carries heat;
- 5) increase the head above normal, if necessary;
- 6) Promptly diagnose the drive;
- 7) Recognize phase failure for input and output circuits;
- 8) Take into account engine hours;
- 9) Control the braking and automatically restart the drive in case of loss and appearance of the mains voltage;
- 10) Pick up a rotating electric motor;
- 11) Replace the circuit breaker;
- 12) To comprehensively automate the water supply system, thereby reducing the payroll of the service and duty personnel and eliminate the influence of the "human factor" on the operation of the system, which is also important.

RESULT AND DISCUSSION

The main effect when introducing frequency converters are achieved not only by saving energy, but also by significantly reducing the cost of repairing water supply networks.

Pic.1. Power consumption with different control methods pump speed

The graphs are shown in the P and Q / Qmax axes:

The first curve corresponds to the power consumed during throttling [3]. It is known from the physics course [1] that the power consumption is proportional to the product of the torque and the speed:

$$P_{\text{potr}} = M \cdot n, \quad (1)$$

Where P_{consum} - consumed power of the electric motor, kW; M - moment, Nm; n - rotation frequency, rpm.

At the same time, it is known that for a load of this type (i.e., a fan load) [2], the torque is proportional to the second power of the rotational speed:

$$M = n^2. \quad (2)$$

Thus, the power consumption is proportional to the third power of the rotational speed:

$$R_p = n^3. \quad (3)$$

The second curve corresponds to the power consumed during frequency regulation [3].

The third curve, which is the result of subtracting the second curve from the first, corresponds to energy savings when using frequency converters on pumping equipment.

CONCLUSION

Soft starters practically do not allow saving electrical energy, but at the same time, their use can provide the following advantages:

- 1) Increase the resource of equipment;

- 2) Reduce the hydraulic resistance of the pipeline due to the absence of a control valve;
- 3) To reduce costs (the main economic effect) for preventive and overhaul of structures and equipment (it has been proven that the service life of equipment increases by at least 1.5 times) [3].

LLC "Rosavtomatizatsiya" is engaged in the production of control cabinets based on frequency converters and soft starts. It is possible to install control cabinets both indoors (heated, unheated) and outdoors.

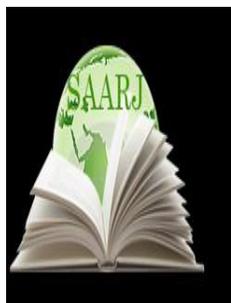

The main functions of the control cabinet are protection of the electric motor against short circuits, protection of the electric motor against phase loss, protection of the electric motor against phase imbalance, protection of the electric motor against incorrect phase sequence, performance of the functions of either a frequency controller or a soft start. The functions of the cabinet also include the alternation of pumping equipment on a day / night schedule.

The estimated cost of control cabinets based on frequency converters is calculated based on the capacity of the equipment: 10 ... 11 thousand rubles. for 1 kW of pumping equipment power and 5-7 thousand rubles. For 1 kW of pumping equipment power when using soft starters.

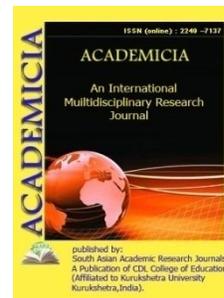

According to the available data, the payback period of the project for the implementation of frequency converters and soft starters is from 3 months to 2 years.

TO STUDY THE FIBER CONTENT OF NATURAL COCOON SILK

N.I. Matrasulova*; **M.M. Baltayeva***

*Department of Chemistry,
 Faculty of Natural Sciences,
 Urgench State University, Urgench,
 UZBEKISTAN

ABSTRACT

Natural silk is a very expensive material for the textile industry. Silk mills produce large amounts of fibrous waste from natural silk. It is very important to prepare the necessary materials for industry from the fibrous waste of silk. We obtained a multifunctional sorbent from silk fiber waste by various methods to purify vegetable oils. The resulting sorbent was used to purify cottonseed oil instead of bentonite-based sorbents. We are currently conducting research to modify natural silk fibro derived from silkworms. In this case, mainly the silk fibers derived from spinning are studied as objects. Silk waste fibers from yarn are also chemically composed of fibroin. However, their hydrolysis and sorption properties have not yet been studied. In our research, we are studying the hydrolysis and sorption properties of silk waste fibers. As a result of the hydrolysis of polymers, they change from a fibrous state to a powdery state. Thus, silkworm fibers have three structures, the second of which is used in spinning silk weaving. The structures on the first and third floors are removed as waste. Their chemical properties, hydrolysis and sorption properties are still poorly understood

KEYWORDS: *Biopolymers, Natural, Silk, Fibroin, Protein, Solution, Hydrolysis.*

INTRODUCTION

Major defining difference between **biopolymers** and **synthetic** polymers can be found in their structures. All polymers are made of repetitive units called *monomers*. Biopolymers often have a well-defined structure, though this is not a defining characteristic (example: lignocellulose): The exact chemical composition and the sequence in which these units are arranged is called the primary structure, in the case of proteins. Many biopolymers spontaneously fold into characteristic compact shapes (see also "protein folding" as well as secondary structure and

tertiary structure), which determine their biological functions and depend in a complicated way on their primary structures. Determination of structural content is the study of the structural properties of the biopolymers. In contrast, most *synthetic polymers* have much simpler and more random (or stochastic) structures. This fact leads to a molecular mass distribution that is missing in biopolymers. In fact, as their synthesis is controlled by a template-directed process in most *in vivo* systems, all biopolymers of a type (say one specific protein) are all alike: they all contain the similar sequences and numbers of monomers and thus all have the same mass. This phenomenon is called monodispersity in contrast to the polydispersity encountered in synthetic polymers. As a result, biopolymers have a polydispersity index of 1[1].

MATERIALS AND METHODS

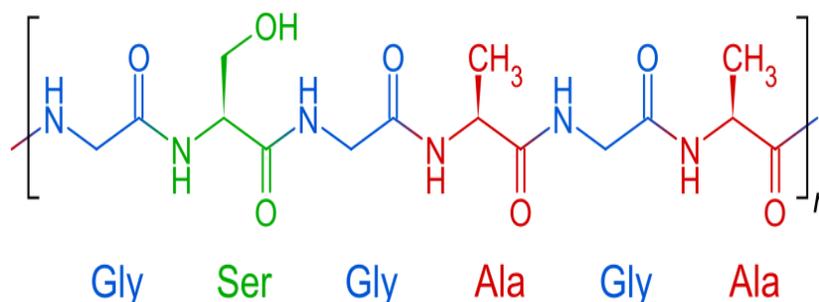

Required materials and equipment

Fibrous waste of silk (Cleaned of additives. Khorezmipagi LLC, Urgench, Uzbekistan), Sodium carbonate (purity 99,9%), HCl(chemically pure), KOH(purity 99,9%) was purchased from Chimreaktivinvest (Uzbekistan), unrefined oil obtained from cotton seeds. Optical microscope ("Optika_B-150 DBR"), Lovibond® Tintometer Model F. Bidistilled water is obtained from the "GFL 2104 Double distillation water still" device (Germany).

Obtaining fibroin fiber from fibrous wastes of natural silk

Studies have focused on the use of silkworm waste as a sorbent in the purification of vegetable oils. The fibrous waste of silk was found to contain up to 75% fibroin, up to 25% sericin and other substances. Conditions were selected for the obtaining of fibroin from the fibrous waste of silk: sericin was dissolved in a Na₂CO₃ solution at 95°C for 50 min. Fibroin fibers were obtained from the solution and washed with distilled water.

Silk fibroin primary structure, (Gly-Ser-Gly-Ala-Gly-Ala)_n

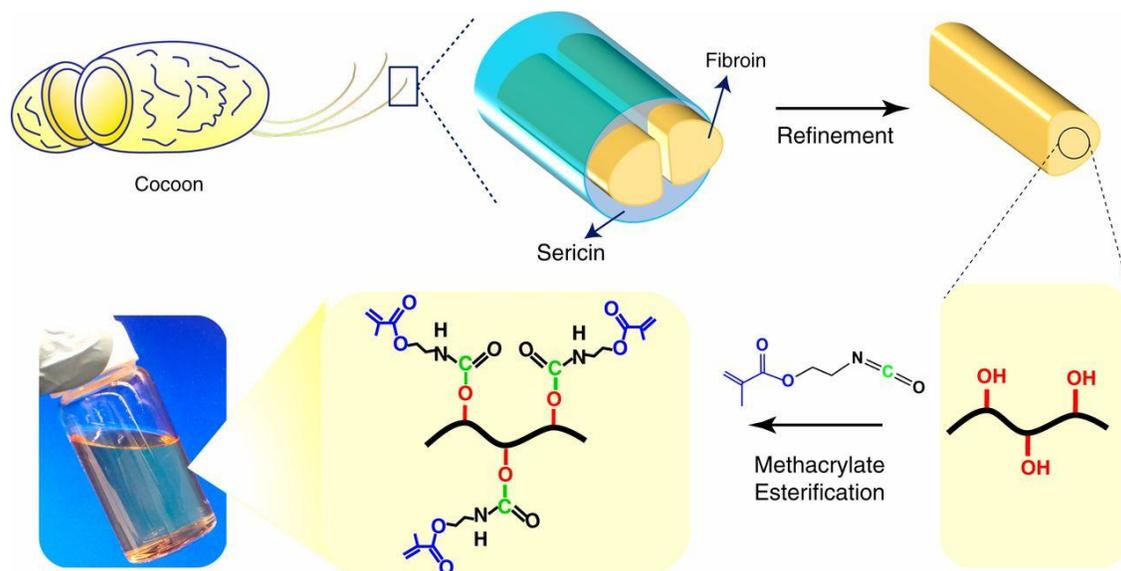

Fibroin is an insoluble protein present in silk produced by numerous insects, such as the larvae of *Bombyx mori*, and other moth genera such as *Antheraea*, *Cricula*, *Samia* and *Gonometa*. Silk in its raw state consists of two main proteins, sericin and fibroin, with a glue-like layer of sericin coating two singular filaments of fibroin called brins [2,3,4].

The silk worm produces fibroin with three chains, the light, heavy, and the glycoprotein P25. The heavy and light chains are linked by a disulphide bond, and P25 associates with disulphide-linked heavy and light chains by noncovalent interactions. P25 plays an important role in maintaining integrity of the complex [4].

The heavy fibroin protein consists of layers of antiparallel beta sheets. Its primary structure mainly consists of the recurrent amino acid sequence (Gly-Ser-Gly-Ala-Gly-Ala)_n. The high glycine (and, to a lesser extent, alanine) content allows for tight packing of the sheets, which contributes to silk's rigid structure and tensile strength. A combination of stiffness and toughness make it a material with applications in several areas, including biomedicine and textile manufacture.

Fibroin is known to arrange itself in three structures, called silk I, II, and III. Silk I is the natural form of fibroin, as emitted from the *Bombyxmori* silk glands. Silk II refers to the arrangement of fibroin molecules in spun silk, which has greater strength and is often used in various commercial applications. Silk III is a newly discovered structure of fibroin [5]. Silk III is formed principally in solutions of fibroin at an interface (i.e. air-water interface, water-oil interface, etc.).

Silk Fibroin reveals some known applications like the preparation of scaffolds for bone and meniscus regeneration ^[6], small-diameter graft for vascular substitution [6] and transparent thin films for biophotonics.

From the silkworm plumage, not all silk fibers are obtained; 10-15% of the silkworm plumage fiber remains together with the plumage. This is a fiber waste of silk. In addition, if the silkworm butterfly comes out of the cocoon, such a cocoon becomes unsuitable for pulling thread and becomes a waste. There are options for the preparation of promising materials through the extraction of silk fibroin from such fiber waste.

Today, preparations from silk fiber are used in pharmacology, medicine, cosmetics and other fields. From silk fibroin, skin resurfacing materials are obtained [7,8].

Obtaining “HF” from silk fibroin

“HF” obtained as a result of the hydrolysis of silk fibroin fibers, has a high sorption capacity and is used in cosmetics and pharmacology. Applied in cosmetics, “HF” positively affects and restores the skin, nails and hair. Thanks to this, the aging process in the skin slows down. The chemical composition of HF is similar to the composition of proteins of the skin and nails, hair [9].

In addition, SF as protein has amino acids that act as cell receptors and mediate important interactions between mammalian cells and extra cellular matrix (ECM) facilitating cell adhesion and growth and it presents antimicrobial activity. However, the regenerated SF has some disadvantages, such as brittleness, easy fragmentation, and difficulty in creating a uniform thickness [10].

Thus, the aim of this study was to prepare porous scaffolds based Silk Fibroin by lyophilization process, in order to maintain their properties and complement each other as a composite, taking advantage of BC's surface modification with amino acids extracted from Silk Fibroin. Toward meeting these objectives, the resultant nanocomposites were characterized by physicochemical techniques and the cytocompatibility was assessed by the investigation of the cytotoxicity and genotoxicity of the developed material.

Purification of cottonseed oil with “HF”

Silk fibroin solution. Silk fibroin (SF) solution was obtained from silk cocoons produced by *Bombyxmori* silk worms supplied by Bratac, Fiação de Seda S.A. (Bastos/SP, Brazil). The method was based on previous reports from literatures. Raw silk was degummed with 0.02 M Na₂CO₃ solution at 100 °C for 30 min and washed thoroughly with distilled water. Degummed silk was dissolved in a solution composed of CaCl₂, H₂O, and ethanol (1:8:2 molar ratio) in a proportion of 1 g of silk to 4 mL of the solvent. The resulting viscous solution was dialyzed against mili-Q water for 48 h in order to remove salts. A 3.7% (w/V) aqueous fibroin solution free of impurities was obtained after the centrifugation (twice) of the dialyzed solution at 20,000 rpm at 4 °C for 30 min. The final concentration of aqueous SF solution (3.7 wt.%) was determined by weighing the dried solids. The final solution was stored at 4 °C before use. The stock fibroin solution (3.7%) was used to prepare BC/fibroin composites.

RESULTS AND DISCUSSION

We are currently conducting research to modify natural silk fibro derived from silkworms. In this case, mainly the silk fibers derived from spinning are studied as objects. Silk waste fibers from yarn are also chemically composed of fibroin. However, their hydrolysis and sorption properties have not yet been studied. In our research, we are studying the hydrolysis and sorption properties of silk waste fibers [11]. As a result of the hydrolysis of polymers, they change from a fibrous state to a powdery state [12].

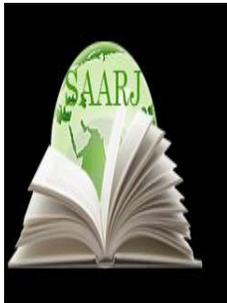

Thus, silkworm fibers have three structures, the second of which is used in spinning silk weaving. The structures on the first and third floors are removed as waste. Their chemical properties, hydrolysis and sorption properties are still poorly understood.

ANALYSIS OF FOREIGN EXPERIENCE IN THE USE OF FRANCHISE OPERATIONS

Sharipova Umida*

*Head,

Department of International Finance and Investments,
 University of World Economy and Diplomacy,
 UZBEKISTAN

Email id: umida-s@mail.ru

ABSTRACT

Franchising is one of the few tools for business development, which has great and effectively "work" in the world, including in our country, where the franchise is developing actively. In a severe shortage of funding as the main and P working capital enterprises in in Uzbekistan a franchise allows you to create quickly growing business on quite favorable terms for the franchise companies, and for purchasers of a franchise. However, not all entrepreneurs in Uzbekistan well aware of the benefits franchising as a promising type of business.

KEYWORDS: *Franchising, Franchise, Franchisor, Trademark Royalties, Employment*

INTRODUCTION

After as low start to 2017 , the pickup in the second half helped if the overall 2017 outlook for franchise businesses . With more complete data for 2017 , our estimates of franchise output growth have been revised upward slightly from our August 2017 report on the franchise business outlook . We estimate that 2017 franchise output grew 5.6% compared to 5.3% in our August outlook . Consistent with the overall economy ' s improvement in productivity , our estimate of 3.1% employment growth in franchise businesses in 2017 is the same as our August outlook , however there have been some revisions both upward and downward in individual business lines . In 2018 growth across franchises picks up to arobust 3.7% in employment and 6.2% in output.

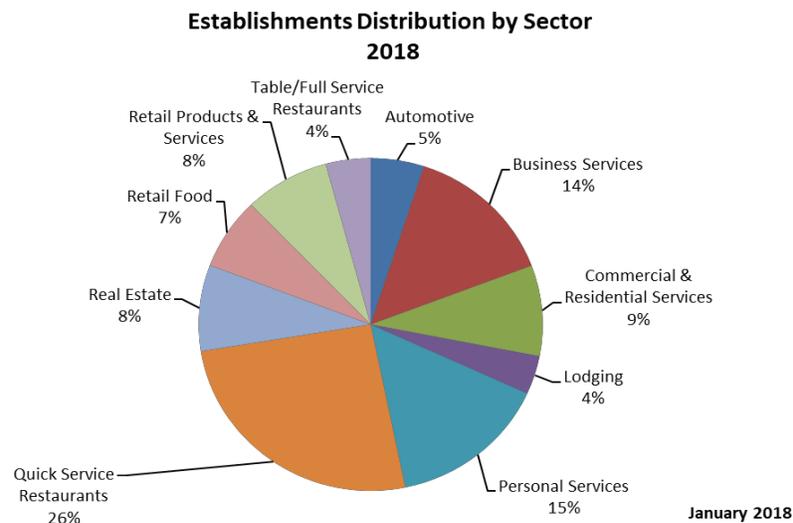

FIGURE 1 ESTABLISHMENTS DISTRIBUTION BY SECTOR

Just as the franchise sector was not impacted as much by the economic head winds the full economy experienced in 2016 , it was less impacted than the overall economy as those winds dissipated in 2017 . Thus , franchise sector growth slowed slightly in 2017 compared to 2016 , even as real GDP growth improved to 2.2% . None the less , the franchise sector will continue to grow faster than the economy as a whole in most of its business lines:

- We expect the number of franchise establishments to increase 1.9% in 2018 to 759 thousand.
- Franchise employment is forecast to grow 3.7% in 2019. Franchise employment continues to out pace growth in businesses economy-wide . Total private nonfarm employment is forecast to increase 1.8% this year.
- The output of franchise businesses in nominal dollars is projected to increase 6.2% in 2019 to \$757billion.

**TABLE 1 FRANCHISE BUSINESS ECONOMIC OUTLOOK : JANUARY 2020
FORECAST**

	Establish	PercentC hangeOv erPrevio	Employment(thous	PercentC hangeOv erPrevio	Output (\$Billio	PercentC hangeOv erPrevio
	Amount		Amount		Amount

--------------	---------------	-------------	--------------	------------	-------------	-------------

The estimates of output, employment and the number of establishments in the franchise industry reported here provide valuable measures of the size and growth of the industry. But, because most of the key data inputs required to make these estimates are published only on an annual basis, the estimates are made only at an annual frequency. A time series reading of the business environment for franchise operations in the US is provided by the Franchise Business Index (FBI) – a monthly index of franchise activity that was developed or IFA by HIS Market. The FBI combines indicators of the growth or decline of industries where franchise activity has historically been concentrated with measures of the demand for franchise business services and the general business environment. The components of the index are:

- Employment in Franchise Businesses(ADP)
- Number of Self Employed(BLS)
- Unemployment Rate(BLS)
- Retail Sales of Franchise –Intensive Industries (CensusBureau)
- Small Business Optimism Index(NFIB)
- Small Business Credit Conditions Index(NFIB)

The Franchise Business Index continues to signal steady growth in the franchise sector. The strength in the November reading reflects the momentum going into 2018 as the uncertainty in the first half of 2017 gave way to increased optimism among businesses and consumers. The FBI increased by an average 0.3% per month over the months August-November for which data are available, and the index was up 2.8% in November compared to November 2016, which is 0.2 percentage points higher than the year-over-year pace a year ago.

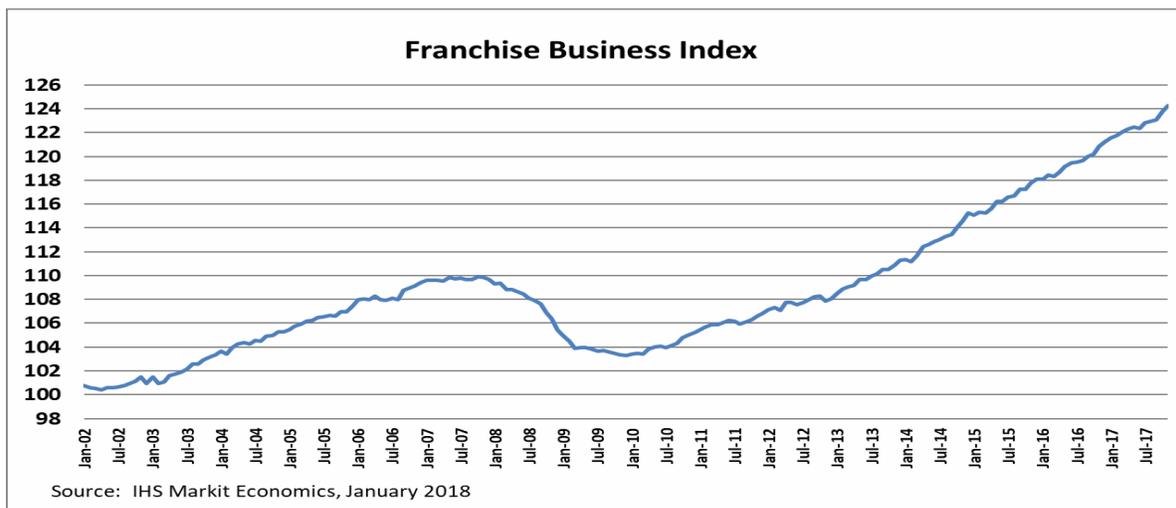

FIGURE 2 FRANCHISE BUSINESS INDEX SOURCE OF INFORMATION: [HTTPS://FRANCHISEECONOMY.COM/](https://franchiseeconomy.com/)

The gross domestic product (GDP) of the franchise sector will increase by 6.1% to \$ 451 billion in 2018. This will exceed the growth of USGD Pinnominal dollars, which is projected at 4.7%. The franchise sector will contribute approximately 3% of US GDP in nominal dollars.

The following chart shows how the franchise economy has fared over the last three years, along

with our 2018 forecast ,by various measures . Growth rates of output and GDP are in nominal dollars.

To provide background for our view of how different segments of the franchise sector will fare in 2017 and 2018 , we view HIS forecasts of employment and output in the industries where there is a large concentration of franchise businesses . Key drivers of the franchise economy drawn from the IHSUS Industry and US Macroeconomic forecasts are summarized below.

The progenitor of franchising in the US can be considered Isaac Singer (Isaac Singer) - the world famous founder of the production of sewing machines. After inventing his version of a sewing machine, he had two problems with the sale of his product on the market. First, before buying a sewing machine, buyers had to learn how to use the machine. In today's world, this can be compared with the purchase of an original software package, the use of which must first be studied, or with the control of working machines with a fully electronic filling. Secondly, Singer had insufficient capital to produce the necessary number of sewing machines, the demand for which was constantly growing.

Many outstanding ideas were born in such a seemingly hopeless situation. Singer had the idea to sell the right to trade in sewing machines to local entrepreneurs and at the same time to put the training of sewing machine buyers on their shoulders. A sewing machine was available for about \$ 100. Thanks to this option, his company began to grow rapidly.

After three more patents were registered, it became possible to finance the rapidly growing production with money earned from the sale of property rights to patents. The Singer Manufactory Company soon registered 22 patents, and the firm's capital increased to \$ 550,000. Many manufacturers followed this successful franchise model. For example, Coca-Cola was able to expand its activities throughout America, shifting the concerns of production, warehousing and sales to local entrepreneurs who received the appropriate permit.

In the United States, the franchising system for creating hotels and restaurants began to develop particularly rapidly. This was facilitated by the emergence of a trademark law in the United States. However, companies operating under the franchise system had problems. Most of them were related to the fact that some franchisors sought to sell more licenses to franchisees than they allowed to increase the sales of goods and services to the public, as well as the opportunities for training and helping the franchisee. Mistakes made by franchisors in relation to franchisees periodically led to legal proceedings, thus attracting the attention of the administration and local authorities. As a result, taken in the 60s and 70s. Legal norms related to the problems of franchising in specific industries, for example, in the automotive and auto service industries.

One of the most vivid and convincing examples of the development and formation of the franchise system is the activities of the world-famous firm MacDonalds, which can currently be considered as the undisputed leader in the fast service industry.

Currently, most franchises are sold by US enterprises. Studies conducted in the USA showed that if only 15% of start-up enterprises survive after two years of activity, the share of successful enterprises among franchisees is 85%. The franchise system sales in the USA amount to about \$ 1 trillion a year, with 40% of retail sales being franchising.

American franchising, having gained extensive domestic experience, moved abroad. Many companies have sold their franchises in other countries, and some of them are rapidly spreading their international network.

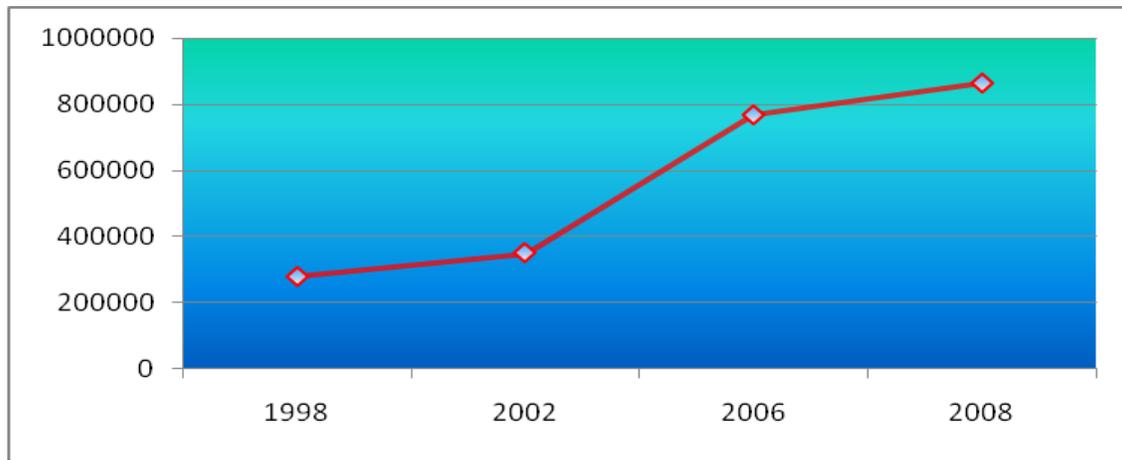

FIGURE 3 NUMBER OF FRANCHISEES IN THE USA SOURCE OF INFORMATION: [HTTPS://FRANCHISEECONOMY.COM/](https://franchiseeconomy.com/)

The United States is a world leader in the development of the franchise system. In 1998, there were about 1,200 franchisors in America; in 2002, approximately 1,500 franchisors and 350,000 franchisees were already operating; in 2006 there were about 2,400 franchisors and 767,000 franchisees. In 2008, there were approximately 3,000 franchisors and 865,000 franchise points in the United States, which involved 10,000,000 people

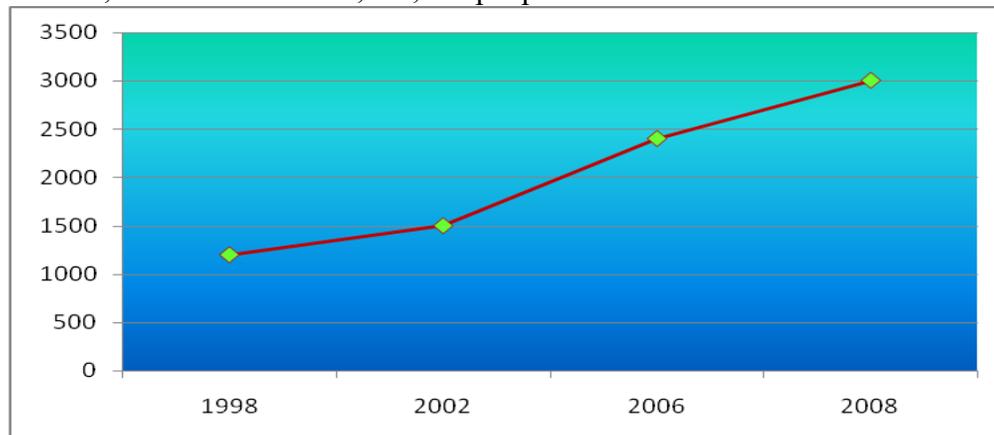

FIGURE 4 NUMBER OF FRANCHISORS IN THE USA

Source of information: <https://franchiseeconomy.com/>

Slowing down the economy in 2009 will lead to the loss of hundreds of thousands of jobs in franchising in the United States, predicts the International Franchising Association. The US National Franchise Association estimates that the number of franchise establishments will decrease by only 1-2%, which is 10,000 points. Closing points will cost the market 207,000 jobs, as the US franchise association has estimated.

First of all, according to the estimates of the US franchise association, the reduction of franchise points will affect the automotive industry, real estate. At the same time, fast-food outlets and full-service restaurants will not be subject to such a fall and will grow moderately.

Franchising in America can count on the support of International Franchise of Washington (IFA), an association established in 1960 by a group of entrepreneurs to promote franchising, to provide services to interested companies, and also to organize events.

There are approximately 3,000 franchise systems in the United States in more than 75 activities. On average one franchisor has 230 franchise points. However, most franchisors have less than 100 points.

According to IFA is dominated mainly by business format franchises (see Figure 2.3). Manufacturing franchising is apparently used for US manufacturers, but outside the country.

Currently, according to some estimates, up to 56% of franchise systems in the USA are concentrated in the top ten industries in which franchising is most effective.

Half of the top ten industries are in the service sector, and in fourth place is the industry entirely from this area (repair and cleaning), and in third place is the industry in which there is both a product component and the provision of car maintenance services. If we isolate five service industries from this list, it turns out that they account for about 20% of franchisors and 17% of franchise enterprises. It is important to note that franchise systems in this area are represented not only by these industries. The most active franchise systems in America include America Center (services), Athlete's Foot (sports equipment), Avis (car rental), Baskin Robbins (ice cream), Burger King (fast food), Century (real estate), Chem Dry (services), City Looks (hair salons), Comfort Inn (hotels) and many others.

Franchising is very widespread in real estate in the United States. There, the parent company supplies its franchisees with a full package of various programs in all areas of real estate activities, by purchasing which you can create a ready-made business. In fact, the purchase of a franchise is a net interest capital investment, in which the investor himself does not necessarily have to independently manage, and may well hire for this qualified manager. However, earning direct income from a firm's work is not the only possible goal.

About 80% of franchise systems require investments from 50 to 250 thousand US dollars. However, this does not mean that systems with low investment do not receive development. About 20% of systems have an investment rate of less than \$ 50,000.

Periodic payments, the so-called royalties, which form the basis of the income of franchisors, on average vary from 3% to 6% of sales. Annual sales in the franchise system exceeds 1.5 trillion. About 40% of retailers are franchised (forecast for 2010 - 50%). Retail franchising accounts for approximately 15% of US GDP. Approximately 60% of the country's GNP is produced by small and medium-sized businesses, more than 50% of which work under the franchise system. According to the US Small Business Administration, over the past five years, more than 85% of small businesses in the country have ceased to exist for one reason or another. During the same period, only 14% of franchisee enterprises were closed. In this way, on average, of the eight established franchise enterprises in the first five years, only one ceases to exist.

The franchisee service department provides intermediary services in the field of establishing contacts between the franchisor and potential franchisees. Often, the franchise departments of US banks implement franchisee selection programs for a franchiser, or determine the franchisor that is most suitable for franchisee specialization.

The function of the franchise department of the credit organization, which plays the main role, is to provide financial resources to the franchisee and franchisors. The fundamental components of the division's activity are: the development of programs, the definition of instruments and sources of debt and equity financing, participation in the design and optimization of interbank programs for monitoring and hedging operational risks.

The policy of various lending institutions in the provision of financial resources to franchises is similar. Its main aspects are:

- the establishment of lower interest rates compared with this parameter used in lending to independent enterprises;
- the ability to link interest rates on loans to the basic industry indicators. For example, when lending to franchisees of oil companies, the interest rate on loans is related to the index of price changes for crude oil or final oil products. When this index fluctuates, the interest rate is adjusted;
- granting free service to the franchise entities in the bank during the first year. This mechanism allows franchisees and franchisors to use the entire range of banking services without having to pay commissions and fees. Some banks, subject to a significant constant annual turnover of funds on the current account, increase this period.

The main schemes for the participation of commercial banks in financing franchise companies are as follows:

1. Lending to franchisees by commercial banks using government guarantees. In accordance with this mechanism, the state acts as a guarantor for loans granted to franchisees, and in case of non-return of the financial resources received by the latter at the expense of budget funds or extra budgetary funds, the bank reimburses its losses.

It should be noted that a fee in the amount of 2.5-5% of the loan amount is charged for the provision of guarantees by the state body. The activities of a number of countries, including the United States, showed that the total amount of commissions significantly exceeds the cost of reimbursing losses of commercial banks and constitutes a very substantial state revenue.

2. Lending to franchisees on the security of the brands owned by them. When using this scheme, the brand value should be assessed by companies specializing in this field.

In this case, the brand must be sufficiently known and have a value commensurate with the size of the requested loan. If the loan is not repaid, the brand can be realized by holding an auction or become the property of the bank. In the latter case, the credit institution acquires the right to collect royalties from the existing franchisees of this network. The advantage of this mechanism is that when a brand is sold or a regular royalty is levied from franchise operators, a commercial bank is able to receive a much larger amount than the loan amount and interest on it.

3. Lending to franchisors using factoring. In this case, the interest payments for the use of the loan by the franchisor does not pay the bank directly, but gives the latter the right to demand royalties from one or several franchisees. At the same time, the amount of royalties must be commensurate with the size of interest payments for the use of credit resources.

4. Lending to the franchisee by a commercial bank under the guarantee of the franchisor or franchisee associations, i.e. structures uniting franchisees of one or several franchises and seeking to protect the interests of franchisees, to provide information and consulting services, mutual lending at the expense of the funds of the jointly established fund, guarantee under loan agreements and loan agreements.

5. Crediting franchisees on the security of their private property using guarantees of third parties. Providing loans to franchises using credit risk insurance schemes by large insurance companies.

The next function of the franchise department, which has the nature of a PR campaign, is to hold exhibitions, presentations and conferences on franchising issues, to popularize the fundamental principles of the commercial concession among entrepreneurs. In addition, the franchise department is engaged in conducting training and educational programs in the field of commercial concession, advising on personnel management.

High credit risks are the main problem of credit services for small businesses. This problem is primarily due to a significant proportion of ruined and liquidated enterprises in the field of entrepreneurship.

Considering the above problem, it should be noted that one of the most significant benefits of servicing franchisees for credit institutions is precisely the low level of risk of lending operations associated with a low level of bankruptcies among the category of companies under consideration (the lowest among all categories of small businesses).

The minimization of banks' credit risks when lending to franchisees is also helped by the possibility of using low-risk original lending schemes, as well as the ability of the bank to predict the results of operations conducted, based on the experience of the franchisee's previous service to this or that franchise network.

The advantage of servicing franchisees for commercial banks is the ability of a credit institution to receive significant income from providing franchisees and franchisors with additional services, including consulting, implementing programs to select franchisees for foreign franchisors or offering potential franchisees to an operating business.

Servicing franchisees also increases the degree of stability of a commercial bank to systemic macroeconomic crises, since franchise companies operate in differentiated market segments and do not cease their activities even in the face of economic cataclysms, thus providing the bank with a regular stable income.

The use of Franchising in the Economies of the European Union After the Second World War, franchising spread in Europe in different ways, depending on the country, customs, culture, and especially on everything related to the socio-economic history of trade, level of development and economic systems. Thus, some countries preferred franchising in the service sector (Great Britain, Germany), others in the distribution sphere (especially France). At the same time,

franchising does not actually exist in certain areas of activity: for example, in Germany there is no such business in the hotel industry.

At the institutional level, the franchise system is represented and promoted by the European Franchise Federation (EFF), which is a non-profit international association founded in 1972.

Her mission and main goals:

promotion of franchising in Europe;

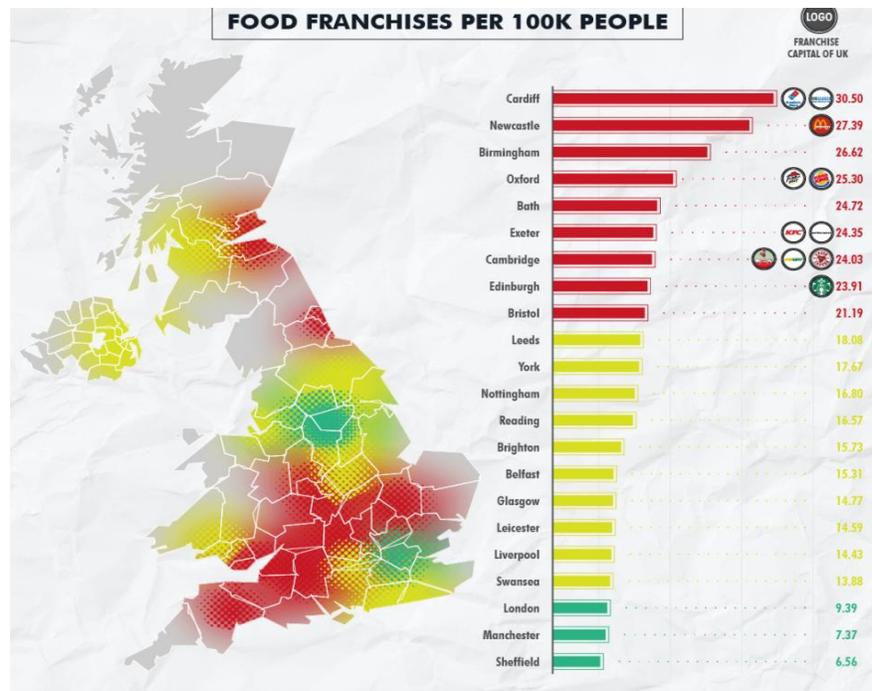

- representation of franchising interests in international organizations (European Commission, European Parliament, etc.);
- promotion and representation of European franchising and its members in the international arena;
- exchange of information and documentation between the national franchise associations of Europe and other continents.

In 1977, the British Franchise Association (British Franchise Association) was established, which for the first time in history gave clear definitions of the franchise concept as a control license issued by one person (Franchisor) to another person (Franchisee).

At present, there are 4,500 franchise systems operating in Europe, each of them has an average of 37 partners, their total turnover is \$ 150 billion. Nevertheless, the degree of development of franchised businesses in Europe is much lower than in the United States, where the volume of such transactions exceeded \$ 800 billion.

The leading positions in the development of franchising among European countries in terms of the number of franchisors and franchisees are held by the United Kingdom. The formation of franchising as an integral part of the national economic environment began in the 50s and 60s. The following factors contributed to its development: a shift in emphasis in the economy from production to provision of services, general urbanization processes, and income growth. These factors allowed the creation of a service sector, where the degree of convenience and speed of service provision began to play no less a role than traditional price and quality.

The fast-food sub-sector is far ahead of others in the degree of use of franchising schemes and in many aspects reflects the situation in the entire franchise sphere in the UK. Here, the highest level of distribution of this business format was manifested among the thematic restaurants and restaurants of national cuisine. The annual income in the field of franchising is more than 10 billion f.

PICTURE 2.6 FOOD FRANCHISES IN UK

Source: Growth business Co.UK

<https://www.growthbusiness.co.uk/fish-and-chip-restaurant-in-huge-uk-franchise-expansion-2554498/>

In 2004, there were 568 franchisors and 29,100 franchisees in Britain, and in 2008 - 670 franchisors.

The following figures illustrate the situation in the UK franchise business:

- the share of franchising in the retail sector is at 29.4%;
- 90% of all franchises mark the profitability of their business;
- in 2005, 642 franchisors of business format were registered, which corresponds to a growth of 55% compared with the previous 5 years, and 35,200 franchisees (compared with the previous year, the increase was 17%);
- in 2005, 86% of franchisors and 79% of franchisees expected improvements in their business performance next year.

By the number of franchisors and franchisees, Germany occupies one of the leading positions in the development of franchising among European countries.

The total number of franchise systems has reached 598 and is represented by 28,000 franchisee firms. The annual growth is about 7% for franchisors and 17% for franchisee objects, which indicates a high dynamics of the development of the franchise sector. This conclusion is confirmed by the following data: in five years the number of franchisors and franchisee firms increased by almost 60% (from 370 and 16430, respectively). At the same time, the German franchise association predicts a steady increase in franchisee facilities by 8-10% annually. In 2010-2011 the growth of the franchise business is projected at 10-15%. The economic viability

of franchise systems is confirmed by the following data - over the past 5 years, only 8% of enterprises turned out to be insolvent. Turnover in the field of franchising - 22.4 billion euro.

The highest growth of franchise networks has been noted in the field of fast food, as well as in the areas of service, atelier, car services and car dealerships, entertainment, education, clothing cleaning, tourism and hotel business. Although stable growth is expected in all franchise sectors, the best prospects are in the areas of training products, fast delivery services, office services, cleaning and machine washing, retail (especially specialized), consumer services.

France ranks third in the number of franchise networks among European countries (517 franchisors and 28851 franchisees). At the same time, France is leading, covering 40% of the entire European franchise market. The franchise market in France is currently developing steadily and dynamically. The capacity of the franchise market in 2007 was estimated at \$ 32.5 billion.

Most of the franchise networks accounted for the trade. Next in the number of franchisors followed the service industry, hotel and restaurant business. The service sector is the largest number of attracted workers (services for car owners, dry cleaning, and hairdressing). There are several other areas with very good potential, such as, for example, discount / consignment stores.

The franchise market, in contrast to most other retail markets, has been developing steadily and dynamically.

Franchising plays an important role in the economy of Italy. Even in a situation of economic stagnation, it has become one of the few sectors that have shown positive growth trends. The growth of the franchise sector is 3% per year. In 2007, there were 502 franchisors in Italy and 26,274 franchisee firms. In terms of franchising, Italy is close to such recognized European leaders as Germany, the United Kingdom and France.

The liberalization of the economies of the Central and South-Eastern countries, their desire to become part of an organized commercial system based on personal investment, encourage them to choose in favor of franchising and independent business. The absolute leaders in the implementation of franchise systems are the Czech Republic and Hungary.

Hungary is the absolute leader in franchising in Central and South-Eastern Europe. In 2006, there were about 220 franchisors and 5,000 franchisees in Hungary.

In Hungary, despite the fact that this type of activity is considered relatively new, now there are already about 250 franchisors and 20,000 franchisees. 45,000 people work in this sector, and sales amount to 2.6 billion euros, which is 5% of the total retail sales. Most franchisees operate in the fast-food industry, a significant number in such as the clothing industry, photo services, copying, gas stations, hotels, postal services, auto services, real estate, tourism, rental and distribution services, and so on.

Successful franchisors have changed their approach to the Hungarian market, using sub-franchisors within the master franchise system, providing financing, lower franchise taxes and business success.

In the Czech Republic 79 franchise systems and 260 franchisees. The Czech Republic is at the beginning of a promising franchise development. Food and clothing industries are the most

attractive for franchising. Due to high incomes and relatively quick return on investment costs, the most preferable for franchising are areas where the population has high purchasing power.

In a short time, well-known companies of highly developed countries managed to penetrate the Czech market. On the other hand, domestic franchisors appeared like ETA (electrical appliances), Boty Roman Petr (shoes), Dobra Ajovna (tea production), Body Basics (cosmetics), Rapid Service (cleaning services).

Franchising in Poland is still a little-known area of business, although it first appeared here before World War II. To date, there are about 170 franchise systems operating in Poland: 105 domestic and 65 foreign. The annual turnover in the field of franchising is 3.5% of GNP. In Poland, the franchise market is continuously developing. Until 2002, there was an annual increase, on average, 10-15 new networks; since 2002, the growth has doubled, reaching 26 new networks, in 2003 - 27, and in 2004 - 39. The absolute record was broken in 2005 from 64 points in the franchise sphere to 258 trademarks; In 2016, more than 300 franchisors operated in Poland. Franchising is expanding more and more in the field of commercial activity, although it is slowing down this process - lack of information and lack of suitable forms of enterprise lending.

Franchising in Poland can count on the support of the Polish Franchise Association, an association that acts to create ideal conditions for the development of franchising, and deals with legal and financial issues.

The degree of development of franchise business in Europe is much lower than in the United States. The United Kingdom by the number of franchisors and franchisees is at the forefront of franchising among European countries Germany ranks second, and 3rd place belongs to France.

The franchise market is still limited in Central and Southeast European countries. As an important component of foreign direct investment, franchising is not yet sufficiently clear to local and central authorities, as well as to the local business world. This situation is explained by the existence of a number of barriers in the process of introducing franchising.

Franchising in Russia began to develop much later than in the United States and later than in Europe. Modern franchising is a relatively new phenomenon in the Russian economy, although its roots go back to the Middle Ages. Over the past few years, more and more enterprises operating in the Russian market have declared their desire to use franchising to grow their business. In the coming years, franchising may become one of the most effective methods for entering an enterprise on the regional market of Russia.

The franchisor and franchisees are linked to each other by a system of contracts based on the franchise. This is a control license issued by one person (the franchisor) to another person (the franchisee), which establishes a specific relationship system between the franchisor and the franchisee.

Franchising as an economic tool and as a type of business has advantages and disadvantages. The most important of the advantages is that franchising allows you to significantly expand the market for standard, well-known to the consumer product, while maintaining the independence of the franchisee as an entrepreneur. It is very important that franchising allows you to dramatically expand the capabilities of small businesses, giving it many opportunities of large enterprises. Thus, this economic tool dramatically increases the survival rate of small

businesses. The most significant drawbacks are associated with the standard product and restrictions in the conduct of business. Franchising reduces competition, which leads to a decrease in the quality of goods. In the end, the franchise system is less flexible compared to large corporations and especially with small businesses.

Franchising is an extremely promising type of business: if no more than 10 out of 100 emerging businesses survive in ordinary business, then out of 100 franchises 90 will work successfully, which is also important from the point of view of creating new jobs.

The experience of foreign countries shows that the successful development of the economy is largely determined by the integration of large and small companies, which are the main elements of the foreign economy system. Large firms introduce stability and controllability into this system, and small business that forms a competitive environment provides flexibility and individualization of production, abroad this form of activity is considered not only useful, but also prestigious. It is obvious that the strengthening of the interaction of large and small businesses is also necessary for the successful development of Uzbekistan.

Franchising thrives because it combines a stimulus of personal ownership with the managerial and technical skills of big business. For entrepreneurs, franchising offers a shortcut to growth, as they get a ready-made business. For franchisees, franchising allows for rapid expansion. Franchisee is growing, allowing entrepreneurs to finance its growth through the sale of franchises.

Not the prevalence of franchising in Uzbekistan is not related to any specificity of the country, but is explained by the extremely limited knowledge in this area not only among broad sections of the population, but also among specialists, entrepreneurs, i.e. weak training of entrepreneurs who could act as organizers of franchise systems (franchisors) and work in these systems as franchisees.

The development of franchising in Uzbekistan does not find adequate support at the state level. The first thing that hinders the development of franchising is Uzbekistan legislation. If in foreign countries this type of activity does not require any official registration and registration, then according to the Civil Code of the Uzbekistan, an agreement on commercial concession must be registered with Rospatent, which leads to bureaucratic delays. In addition, there is no necessary legal framework. The United States alone created about a hundred federal laws, one way or another relating to franchising, while in Uzbekistan there is not even a law on franchising.

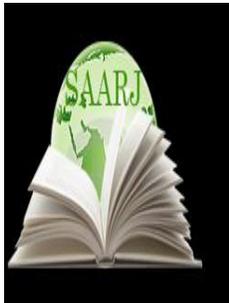

Nevertheless, despite the presence of certain inhibiting factors, franchising in Uzbekistan is already successfully developing. More and more business circles are turning to using this effective form of doing business. However, its importance for the Uzbekistan economy is difficult to overestimate: for the franchisor it is one of the fastest and most effective ways to create new independent enterprises combined into a single system, for the franchisee to develop their own business based on a proven business model, and for the state it is effective a tool to support small and individual entrepreneurship, and consequently, the development of the entire

Uzbekistan economy. The development of franchising in Uzbekistan will take place at an ever-increasing pace, so you should not miss the chance to outrun your competitors now.

The prospects for the development of franchising in Uzbekistan are the most favorable. Recently, there has been a trend towards the accelerated development and spread of the franchise business method.

However, unfortunately, it can be started that the pace of development of franchising in Uzbekistan is relatively small compared with developed countries.

Summarizing all the above, we can safely say that franchising, as a type of business, is quite interesting and promising in Uzbekistan. It can develop both in the domestic system and with the participation of foreign firms and entrepreneurs.

DIFFERENT VIEWPOINTS ON LEXICOGRAPHY AND DICTIONARY TYPES

Dilafroz Khodjaeva*

*PhD,

The Head of Foreign Languages for Natural Sciences Department,
 Bukhara State University, UZBEKISTAN

ABSTRACT

The article deals with different approaches to defining dictionary types and lexicography. It also analyses the practice of using signs in dictionaries. As the first President has repeatedly said, learning foreign languages should not be at the expense of forgetting one's mother tongue. "As heirs of the priceless wealth passed down from our ancestors, we must constantly work to preserve, enrich and enhance the prestige of our native language. In the process of conducting research on dictionaries we observed two types of using signs. In the first type there is a sign indicating the general name of science, the names of its branches are not indicated.

KEYWORDS: *Dictionary, Explanatory Dictionary, Glossary, Thesaurus, Definition, Lexicography, Terms, Terminology, Linguistic Dictionary, Normative Function, Informative Function.*

INTRODUCTION

It is known that a society develops only when it is independent not only politically and economically, but also spiritually. Among them, spiritual independence occupies a leading position, as it lays a solid foundation for the emergence of political and economic independence. On the one hand the clear proof of this is the adoption of the Law on the State Language was one of the first among the former Soviet Union republics, on the other hand, it shows the high role of language in ensuring spiritual independence. "Spirituality," writes the first President of the country, "is an incomparable force that calls a person to spiritual purification, to the growth of the soul, to the inner world of man, to the strength of his will, to the integrity of his faith, to the awakening of his conscience" [1, 19].

Thanks to the great independence, languages in Uzbekistan have reached a new stage of development, gained a dynamic character, and expanded the scope of application. We can see

this in the fact that our native language is facing the world, the world is facing our mother tongue, and the scope of linguistic research is expanding. As the first President has repeatedly said, learning foreign languages should not be at the expense of forgetting one's mother tongue. "As heirs of the priceless wealth passed down from our ancestors, we must constantly work to preserve, enrich and enhance the prestige of our native language. The expansion of the use of our native language, the creation of etymological and comparative dictionaries, the development of necessary terms and phrases, concepts and categories in such important areas as fundamental sciences, modern communication and information technologies, banking and financial system undoubtedly will serve the noble goals of understanding the national identity and the sense of homeland" [1, 87]. The study and interpretation of languages, especially, terms belonging to different languages is of particular importance.

The role of dictionaries in language learning, especially their level and scientific-practical value plays an important role. Therefore, if we look at the history of linguistics, we can be sure that in most cases it consists of the history of dictionaries. Therefore, the creation of dictionaries is one of the priorities of the state and specialists. It is known that a dictionary plays an important role in the spiritual and cultural life of people, because it reflects the knowledge and experience accumulated by mankind. Dictionaries also serve an informative, communicative and normative function. While its informative function informs people about the accumulated knowledge and experience, its communicative function informs students about a native language and foreign languages. Its normative (normative) function records the meaning and use of language units of language as a means of communication and helps to improve them.

There are different types of dictionaries. Its main type is a monolingual dictionary in which the meaning, usage, phonetic, grammatical, stylistic meanings of words are expressed. It is necessary to distinguish types of dictionaries. According to prof. O.S. Ahmanova, dictionaries are formed on the basis of the following features: 1) encyclopedic dictionaries according to the content; 2) a thesaurus according to the method of lexical selection (it reflects the whole lexicon of the language) and a dictionary reflecting specific, some thematic and stylistic elements. The latter includes dictionaries such as terminological, dialectal dictionary, slang, writer's language, neologism, archaism, acronym, nickname, and dictionary of foreign words; 3) a special dictionary that explains some aspects of words and the relationship between them according to the method of description. These include a dictionary of etymological, grammatical, orthographic, orthoepic, synonymous, antonymic, homonymous, paronymic phrases, a dictionary reflecting frequency, rhyme, and other units; 4) dictionary of units smaller than words (dictionary of stems and morphemes) and dictionaries of units larger than words according to the unit of lexicographic description (vocabulary, phraseology, quotation); 5) according to the placement of the vocabulary dictionaries are divided into idiographic, analogical (in which words are arranged not in alphabetical order, but according to the semantic relationship), inverse dictionaries. In the last type of dictionary (inverse) words are placed according to the last letters of the words; 6) a historical dictionary is compiled according to the period of use of words; 7) the dictionary, depending on the intended recipient, is divided into a dictionary of errors, a dictionary of difficulties, a dictionary of learning, etc.; 8) according to the number of languages (such dictionaries are also called educational dictionaries) are divided into multilingual and bilingual dictionaries. It should also be borne in mind that the later types of dictionary are divided into active vocabulary and passive vocabulary. In the active dictionary, the words of the

native language are given on the left, and in the passive dictionary on the right. The Uzbek-English dictionary is active, and the English-Uzbek dictionary is passive.

The practice of using signs in dictionaries is of great importance. In the process of conducting research on dictionaries we observed two types of using signs. In the first type there is a sign indicating the general name of science, the names of its branches are not indicated. For example, in Macmillan (Macmillan English Dictionary for advanced learners, 2006) only the sign **ling.** is given and no areas of linguistics are indicated. This situation definitely makes it difficult to use, so it is not easy to find the right term from it. In Oxford (Oxford Advanced Learners Dictionary, New 7 th edition, 2006) the signs indicating both general science and its spheres are given separately. This is also impractical, because it gives rise to the notion that linguistics and its branches are synonymous. Therefore, in our opinion, the sign **ling.** Is not necessary. We observed the same case in Uzbek and Russian explanatory dictionaries.

The role of examples in explaining the essence of a dictionary is very important, since they substantiate the existence of a word or its meaning in a language, explain the meaning of a word in a text, show cases of the transition of a word from language to speech, from speech to language, determine methodological stylistics or neutrality. Examples can be in the form of a sentence, a phrase or a whole paragraph. Examples in dictionaries can be taken from a specific text, compiled by a lexicographer and in the form of a quotation [5, 463].

Prof. V.G.Gak also provided basic and additional valuable information about vocabulary in dictionaries, its etymology, grammatical description and compliance with the norms of speech. In his opinion, the solution of the following three tasks is important in the compilation of explanatory and partial translation dictionaries: a) the compatibility of synchrony and diachrony; b) compliance with language and speech requirements; c) adherence to the ratio of linguistic and extra linguistic information [5, 463]. This allows a dictionary to be perfect, to meet the requirements of the time, to be ideologically stable.

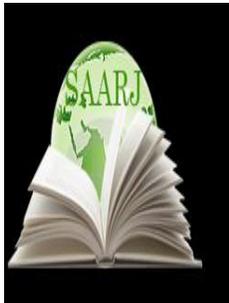

We will now try to address the issues of linguistic terminological dictionary and its structure. This type of dictionaries are divided into explanatory dictionaries which are a specific type of terminological dictionaries (Linguistic Terminological Dictionary) - dictionaries arranged in alphabetical or thematic order of terms, and thesaurus which records the semantic relationship between terms. Such a dictionary, according to N.V.Vasileva, is divided into general and private dictionaries. The General Terminology Dictionary covers as fully as possible all the terms of linguistics. This is an extensive type of dictionary. Special Linguistic Terminological Dictionaries are formed on the basis of a particular linguistics school or part of the science of language, and they occupy a leading position in linguistic lexicography. According to the level of information Linguistic Terminological Dictionaries are divided into interpretive, nomenclature dictionaries and glossary. The terms are not defined in nomenclature dictionaries.

Glossary dictionaries are also divided into two types: encyclopedic dictionaries and explanatory dictionaries [4, 461-462].

CLINICAL MANIFESTATIONS OF BRONCHIAL ASTHMA AND CHRONIC OBSTRUCTIVE PULMONARY DISEASE IN ADULTS

ABSTRACT

Background: Bronchial asthma (BA) and chronic obstructive bronchitis (COPD) are one of the most common respiratory diseases in children and adults all over the world, leading to socio-economic and medical losses to society. The problem of BA and COPD has been insufficiently studied; information on the dependence of manifestations on the age at which BA and COPD debuted is absent in the literature. The aim of the study was to study the features of the clinical manifestations of BA and COPD, as well as to determine the prognosis of the disease in adult patients and, on the basis of the data obtained, to develop measures to improve the clinical assessment of the condition and treatment tactics. Objects and methods of research: In 25 patients with bronchial asthma (group 1), the circumstances of the onset of the disease, its manifestations and the results of treatment were compared with those of 25 patients with COPD (group 2). The prescription and circumstances of the onset of BA, the nature of concomitant pathology, and the relationship with heredity were revealed. In the groups, the following were assessed: general blood analysis, general urine analysis, biochemical blood test, general sputum analysis, FVD, shadow picture in the lungs, ECG, EEG, ultrasound and the functional state of the thyroid gland (TTG, T3, T4), immune status. Results and conclusions: it was proved that the circumstances of the onset, manifestations of the disease and the effectiveness of treatment are different depending on the age at which BA and COPD first appeared.

KEYWORDS: *Clinical Manifestations; Bronchial Asthma; Chronic Obstructive Pulmonary Disease; Adult Age.*

INTRODUCTION

Bronchial asthma (BA) remains one of the global problems all over the world. Recently, there has been a global trend towards an increase in the incidence of bronchial asthma. It is one of the non-communicable chronic diseases that cause death in middle and old age, reducing the average life expectancy for men by 6.6 years, and for women by 13.5 years [3, 6].

Chronic obstructive pulmonary disease (COPD), despite modern advances in diagnosis and treatment, remains one of the most important health problems, which causes significant economic and social damage every year. According to the 2019 Global Strategy for the Diagnosis, Treatment and Prevention of COPD (GOLD, 2019), COPD continues to be the fourth leading cause of death worldwide[7].

Despite the large amount of information in the available literature, there is little information on whether the age and gender composition of patients can affect the manifestations and course of asthma and COPD.

Currently, there is not a significant amount of specific data that allow assessing the prognosis of the course of asthma and COPD, as well as the treatment strategy depending on the age and sex composition. Meanwhile, the determination of the features of the course and manifestations of BA and COPD, depending on the age and gender in which the disease manifests itself, can improve the diagnosis, prevention and treatment of these diseases. These circumstances were the basis for this study.

The aim of the study was to study the features of the clinical manifestations of BA and COPD, as well as to determine the prognosis of the disease in adult patients.

Object and research methods: 25 patients with BA (group 1), and 25 patients with COPD (group 2) were examined.

Patients were selected from among patients who received inpatient treatment in the department of pulmonology and allergology of the Bukhara regional multidisciplinary clinic in the period 2019 - 2020.

The inclusion criteria were:

- 1) The presence of a confirmed diagnosis of bronchial asthma and chronic obstructive pulmonary disease
- 2) Age over 18 years of age at the time of the survey;

The exclusion criteria did not include patients with bronchiectasis, pulmonary tuberculosis, cystic fibrosis, oncopathology, respiratory failure and the need for oxygen therapy, renal failure, severe liver pathology (with an increase in AST, ALT by more than 2 times), with severe arterial hypertension, with uncontrolled therapy, with unstable exertional angina, with heart failure (III and IV NYHA), as well as patients taking corticosteroids (inhaled and oral) for 2 months before the study. The patient's unwillingness to comply with the doctor's prescriptions was also taken into account.

BA and COPD were assessed according to generally accepted criteria according to existing classifications (GINA 2002, 2006, 2011; GOLD 2017, 2019). The main etiological mechanisms of the disease formation were taken into account, the severity of the clinical course, the degree of

controllability, the presence and nature of complications were assessed. Complications included the presence of respiratory failure (DN) in the interictal period, as determined by pulse oximetry. Emphysema was taken into account according to the signs determined by radiography and CT of the chest organs, the presence of hormone dependence was taken into account according to the anamnesis.

In all patients, except for age, the nature of respiratory disorders, family history (cases of asthma and other allergic pathology in blood relatives), and the presence of concomitant diseases were determined.

All were studied general blood tests, urine, sputum, biochemical blood test (bilirubin, ALT, ASAT, C-reactive protein, etc.). All patients had their FVD determined by spirometry using a computer spirometer "MAC2-C".

The X-ray picture in the lungs was assessed by plain radiography and computed tomography of the chest organs.

Results: Information on the distribution of patients by sex, age and place of residence at the time of the onset of BA and COPD are presented in Table. one.

TABLE 1 DISTRIBUTION OF PATIENTS BY SEX, AGE AND PLACE OF RESIDENCE AT THE TIME OF ONSET OF BA AND COPD

Patient contingent	Floor		Age at the moment survey			Disease duration (years)				Place of residence	
	Male	Female	Up to 30 years	30 - 59 years	60 and more years	Less 5 years	5 to 10 years	From 10 upto 20 years	More 20 years	Town	Countryside
Bronchial asthma (25 people)	10 (40%)	15 (60%)	0 (0%)	15 (60%)	10 (40%)	2 (8%)	7 (28%)	8 (32%)	8 (32%)	18 (72%)	7 (28%)
Total:	25	25	25	25	25	25	25	25	25	25	25
Chronic obstructive pulmonary disease (25 people)	12 (48%)	13 (52%)	0 (0%)	8 (32%)	17 (68%)	4 (16%)	8 (32%)	13 (52%)	0 (0%)	21 (84%)	4 (16%)

Total:	25	25	25	25	25	25	25	25	25	25	25
--------	----	----	----	----	----	----	----	----	----	----	----

Differences are reliable (processing by methods of variation statistics)

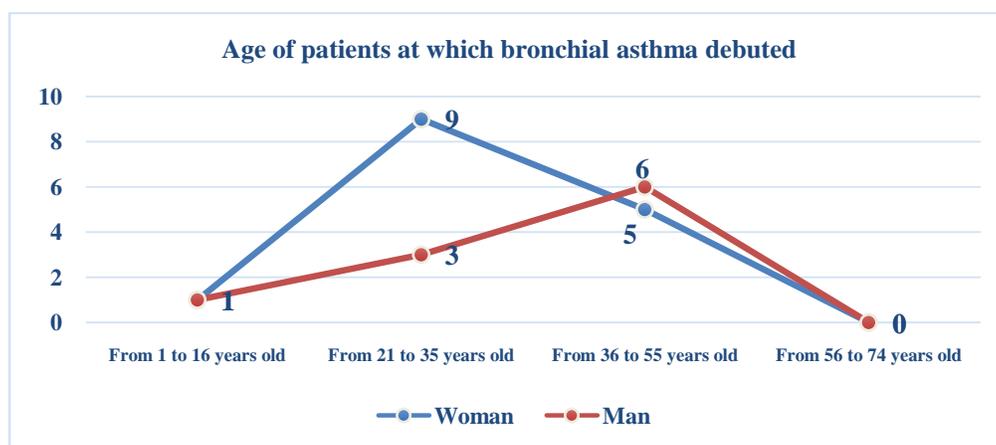

As follows from the table, among patients with BA 60% are women, 40% are men. Among those with COPD, 52% are women and 48% are men. No significant differences were found in the sex of BA and COPD patients.

Among those with BA, 72% were urban residents and only 28% were rural residents. Among patients with COPD, urban residents also predominated, who accounted for 84%, while rural residents were only 16%.

Thus, among the contingent of BA and COPD patients, regardless of the age at which the disease was formed, urban residents predominate (72% and 84, respectively). This does not mean that the incidence of asthma and COPD is higher in the city (although this cannot be ruled out). The second reason may be that in rural health care facilities, the diagnosis is not always established, even in cases where the patient has already developed BA or COPD.

Data on the age of patients at which bronchial asthma first appeared are presented in diagram 1.

Diagram № 1.

As follows from Diagram 1, at the age from 21 to 35 years, BA manifested itself more often in women, who make up 75% of patients. In other age periods (from 1 to 16 years old, from 36 to 55 years old and from 56 to 74 years old), there were no significant differences in the sex of respondents during the period of BA manifestation. These data correspond to the literature data that AD more often manifests itself in women aged 21 to 40 years [1].

Data on the age of patients at which the symptoms of COPD first appeared are presented in table. 2.

TABLE 2 AGE OF PATIENTS AT WHICH COPD DEBUTED

		Age of patients at which COPD developed.			
Age		From 1 to 16 years old	21 to 35 years old	36 to 55 years old	56 to 74 years old
Floor					
	Female	0 (0%)	1 (50%)	5 (41.6%)	5 (45.4%)
	Male	0 (0%)	1 (50%)	7 (58.4%)	6 (54.6%)

Total:	0	2	12	eleven
--------	---	---	----	--------

In all age periods (in this sample), there were no significant differences in the sex of the respondents during the period of COPD manifestation.

Data on the presence of concomitant or underlying diseases preceding the development of BA and COPD in the history of patients are presented in Table. 3.

TABLE 3 THE NATURE OF CONCOMITANT DISEASES IN PATIENTS WITH BA AND COPD

Accompanying illnesses.						
Patient contingent	Chronic cardiovascular disease	Chronic diseases of ENT organs	Allergic diseases	Digestive system pathology	Endocrine system diseases	Diseases of the musculoskeletal system
Bronchial asthma (25 people)	10 (40%) *	6 (24%)	21 (84%)	14 (56%)	3 (12%)	15 (60%)
Total:	25	25	25	25	25	25
Chronic obstructive pulmonary disease (25 people)	23 (92%) *	3 (12%)	6 (24%)	6 (24%)	14 (%)	18 (72%)
Total:	25	25	25	25	25	25

* - the differences are reliable (processing by nonparametric methods)

As follows from the table, in the group of patients with BA, persons with a history of allergic pathology predominate (21 out of 25, $p < 0.05$), while in the group with COPD, chronic cardiovascular diseases were more common (23 out of 25 patients).

Also, it should be noted that in the group with BA, diseases of the digestive tract are more common (56%) than in the group with COPD (24%).

Among patients with COPD, diseases of the musculoskeletal system are more common than among patients with BA (72% and 60%, respectively). Perhaps this is due to the age category of the sample of patients with COPD where people over 60 years old predominated (68% - 17 people).

BA patients are more susceptible to allergic diseases than patients with COPD (84% and 24%, respectively)

There were no significant differences in the incidence of ENT organ pathology, endocrine diseases in patients of group 1 and group 2.

Data on the dynamics of the clinical course and severity of bronchial asthma in patients of group 1 and group 2 are presented in table. five.

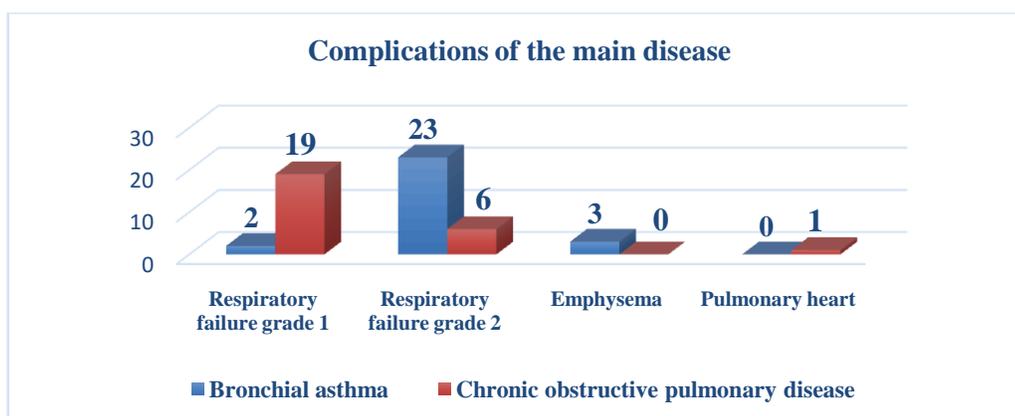

TABLE 4 THE NATURE OF THE CLINICAL COURSE OF BRONCHIAL ASTHMA AND COPD

Patient contingent	The severity of bronchial asthma and COPD		
	Light flow	Moderate course	Heavy current
Bronchial asthma (25 human)	0 (0%) 1	16 (64%)	9 (36%) 2
Total:	25	25	25
Chronic obstructive pulmonary disease (25 person)	2 (8%) 1	8 (32%)	15 (60%) 2
Total:	25	25	25

1, 2 - differences are reliable (processing by methods of variation statistics)

As follows from the table, the disease is significantly more severe in patients with COPD than in patients with BA. Severe forms are observed in 60% of patients in the COPD group and only in 36% of patients in the BA group ($p < 0.05$). A mild form of the disease was not registered in any patient of the BA group, while in the COPD group, a mild course was observed in 2 patients.

The nature of BA and COPD complications is shown in Diagram 2.

In BA patients, more often (than in patients with COPD), signs of grade 2 respiratory failure (92%) were noted, and in patients with COPD, signs of grade 1 respiratory failure were more often noted, emphysema and hormone dependence were noted in the BA group (12 % respectively) and the signs of corpulmonale in the COPD group was 4%.

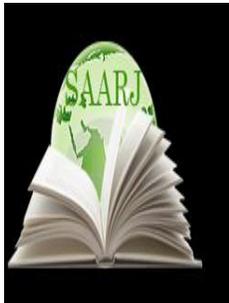

FINDINGS:

- 1) At the age from 30 to 59 years, BA is found in women more often than in men (60% and 40%, respectively), and in COPD no significant differences in gender were found.
- 2) BA and COPD are diagnosed more often in urban residents (72% and 84%, respectively) than in rural residents (28 and 16%, respectively), regardless of the age of patients in which the disease manifested itself.
- 3) The manifestation of BA disease is more often observed in the age group from 21 to 35 years, and in COPD from 36 to 55 years.

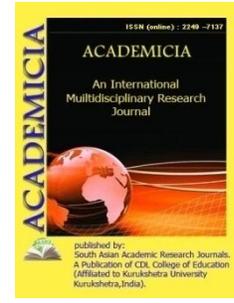

- 4) Cardiovascular diseases are more common in both groups of patients with BA and COPD among concomitant diseases.
- 5) By the nature of the course, moderate-severe BA in group 1 and severe COPD in group 2 prevail (16 people - 64%, 15 people - 60%, respectively)

COMPETENCE OF MODERN TEACHER

Begmatova Sevara Nematovna*

*Karshi State University,
 UZBEKISTAN

Email id: nematovna_8190@mail.ru

ABSTRACT

In this article it is spoken about the importance and necessity of the competence of modern pedagogue in the development of education system. Modern educational institutions need pedagogically competent specialists. One of the main requirements of the educational system today is the training of highly qualified personnel, this task is now directly entrusted to the teacher. The changes that are taking place in the modern education system are necessary to improve the qualifications and professionalism of the teacher, that is, his professional and pedagogical competence.

KEYWORDS: *Competence, Informational Competence, Professional Competence*

INTRODUCTION

The country is implementing consistent measures to raise the education and upbringing system to a new stage, improve the quality of training of teaching staff on the basis of advanced international standards, as well as increase the level of coverage of higher pedagogical education.

In order for further improve the field of pedagogical education, provide professional pedagogical personnel for the training of highly qualified specialists with modern knowledge and skills in the use of pedagogical technologies that make a worthy contribution to the socio-economic development of the country, the introduction of advanced educational technologies in this area, as well as the implementation of the tasks defined in the Address of the President of the Republic of Uzbekistan to the OliyMajlis of January 24, 2020:

- to determine the priority areas for the development of the sphere of pedagogical education;
- training professional pedagogical personnel who have firmly mastered the methods of education and training, information and communication technologies and foreign languages, who have the skills to use modern pedagogical technologies in the educational process;

- identification of young people showing an increased interest in the teaching profession, as well as the introduction of a continuous system of its targeted training and education;
- improvement of curricula and programs in the areas of education and specialties in the field of teacher education based on advanced foreign experience, the creation and implementation of innovative teaching, regulatory and educational resources;
- improving the quality of education, training competitive personnel, effective organization of scientific and innovative activities by ensuring close interconnection of education, science and production;
- regular study of the requests and requirements of customers of pedagogical personnel, the development of mutual cooperation with them, as well as the definition and implementation of scientifically grounded long-term plans for the training of pedagogical personnel;
- creation of additional conditions for the continuous development of professional skills of teaching staff as a result of the introduction of digital technologies in higher pedagogical education and ensuring the solid integration of modern information, communication and educational technologies;
- systemic development and improvement of management activities in higher educational institutions for the training of teaching staff;
- improving infrastructure and further expanding international cooperation in teacher education;
- increasing the efficiency of the processes of forming modern teaching staff with a high culture, practical professional skills, firmly mastered the methods of education and training, assessment criteria.

One of the most pressing problems facing higher educational institutions is the training of professional teachers with high skills in the use of modern knowledge and pedagogical technologies, which make a worthy contribution to the socio-economic development of the country.

Issues such as the development of modern teachers in the field of pedagogy, the development of their competencies in accordance with modern requirements, the development of knowledge, skills and abilities in this area are reflected in the research works of foreign and Uzbek scientists-teachers. In today's rapidly changing world, the effectiveness of educational activities depends on the level of knowledge, skills and abilities of students in the field of information technology. Therefore, in pedagogy, a number of scientific studies have been carried out on the problem of developing the teacher's professional competence.

Raising the professional level of teaching staff that would meet the needs of modern life is a necessary condition for the modernization of the education system. Modern educational institutions need pedagogically competent specialists. One of the main requirements of the educational system today is the training of highly qualified personnel, this task is now directly entrusted to the teacher. It is necessary to clearly understand that the teacher must have the knowledge and skills that meet the requirements of the 21st century.

In the modern world, education is seen as one of the main values. The main task of education is the upbringing and development of the student's personal qualities, the creation of conditions for his creative self-realization. And a free, humane, spiritual, creative person can be brought up only by a teacher with a high level of professional, including research, competence.

Speaking about the pedagogical competence of the teacher, it is necessary, first of all, to define the key concepts. Competent - knowledgeable, knowledgeable, authoritative person in any field. Hence the often mentioned phrase "competent specialist". And competence is a range of issues in which this specialist is well aware.

The content of the teacher's professional competence is determined by the qualification characteristic, which is a normative model of the teacher's competence, reflecting the scientifically grounded composition of professional knowledge, skills and abilities. A qualification characteristic is essentially a set of generalized requirements for a teacher at the level of his theoretical and practical experience.

Conditionally separating professional competence from other personal entities, we mean that the assimilation of knowledge (accumulation of the information fund) is not an end in itself, but a necessary condition for the development of "knowledge in action", that is, skills and abilities - the main criterion of professional readiness.

When considering the formation of the competence of a future teacher on the scale of the system of higher education, one can talk about his knowledge, skills, abilities, that is, about the readiness of a specialist. The new millennium dictates its own conditions, now a vocational school needs to move from training specialists to training professionals who have not only professional competence and qualifications, but also key qualifications and components.

The most important stage in the professional formation and development of a teacher is the stage of his training in a higher educational institution. At this time, the future specialist enters the world of professional competence: the general outlines of future professional activity are determined, the corresponding knowledge, skills and abilities are mastered, the foundations of the professional worldview are mastered, etc.

The professional competence of a teacher can be understood as a set of professional and personal qualities necessary for successful pedagogical activity. The work of a teacher is a complex psychic reality, which is a multidimensional space, consisting of three interconnected spaces:

- the personality of the teacher,
- teaching activities,
- pedagogical communication.

These three spaces are united by the global task of developing the student's personality. At the same time, they do not overlap, do not repeat, do not duplicate, but enter into complex dialectical relations, and each of them in the process of the teacher's work is now a prerequisite, now a means, now a result of development.

A professionally competent teacher can be called a teacher who carries out pedagogical activities at a high level and achieves consistently high results in the education and training of students.

The development of professional competence is the formation of a creative individuality, the formation of receptivity to pedagogical innovations and the ability to adapt in a changing pedagogical environment. The social, economic and spiritual development of society directly depends on the professional level of the teacher.

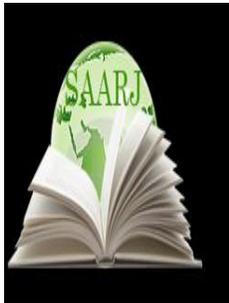

The changes that are taking place in the modern education system are necessary to improve the qualifications and professionalism of the teacher, that is, his professional and pedagogical competence. The main goal of modern education is compliance with the current and future needs of the individual, state, society, the preparation of a diversified personality, capable of social adaptation in society, the beginning of work, self-education and self-improvement.

A free-thinking, predicting the results of his activities and modeling the educational process, the teacher is the guarantor of achieving the set goals. Therefore, now the demand for a qualified, creatively thinking, competitive personality of a teacher who is able to educate a personality in a modern, dynamically changing world has sharply increased.

Having considered and analyzed many terms and definitions, it was decided that competence is a field of human activity in which the acquired knowledge, skills and experience of a person are used, and competence is a quality or characteristic of a person's personality, which allows him to take responsibility in solving certain questions and easily solve all arising problems. And the professional competence of a teacher is understood as the readiness to make important and relevant decisions in the area corresponding to him and his ability to perform his professional activities at a high level.

PROSPECTS FOR THE DEVELOPMENT OF THE FRUIT AND VEGETABLE PRODUCTS MARKET

Berdiyev Abdumalik Hakimovich*

*Associate Professor,
Candidate of Economic Sciences,
Karshi engineering-economics institute,

ABSTRACT

The fruit and vegetable sector is an important sector of agriculture in Uzbekistan. This sector will meet the demand of the population for food products, and the processing industry for raw materials. Fruit and vegetable growing is one of the sectors for Uzbekistan that provides integration into world agricultural and food markets and foreign exchange earnings. In order to ensure uninterrupted supply of food products to the population of Uzbekistan today, special attention is paid to increasing the volume and variety of production, raising incomes and living standards of the rural population. A number of positive results have been achieved as a result of the implementation of the established regional action programs for the cultivation of fruit and vegetable products, the timely and quality implementation of agro-technical measures. Analysis of the experience of developed countries in the cultivation, storage, processing and export of fruit and vegetable products shows the need to develop cooperation and clusters of producers of these products. It is known that the current natural and climatic conditions in our country allow for the sustainable development of agricultural products, especially fruit and vegetables. The President and the Government of the Republic of Uzbekistan pay great attention to the development of fruit and vegetable growing as a priority in the transition to market relations. The fact that a significant part of the country's foreign exchange earnings is formed through the sale of fruit and vegetable products in foreign markets also indicates the priority of radical reform and rapid development of the industry.

KEYWORDS: *Agro-industrial complex, processing industry, cooperation, production, export, import.*

INTRODUCTION

In the economy of Uzbekistan, in particular, in the implementation of the food program for the development of the fruit and vegetable and viticulture sectors of agriculture, specific reforms are indeed playing an important role. In this regard, during the years of independence, special attention is paid to the gradual improvement of reforms in this complex and the development of a wide range of regulatory measures at the governmental level.

Today, the rapid development of science and technology in the countries of the world, the deterioration of the environmental situation, the production of food products, the processing of manufactured products, the application of various technologies in the field of their transportation have led to an increase in consumer demand for quality, harmless and chemical-free products. Therefore, at present time, the agro-industrial sector enterprises are faced with the task of improving the quality of their products, organizing the production of environmentally friendly natural products that do not have a negative impact on human health[8].

Organizing a healthy diet requires improving the technology of obtaining traditional products and creating a new generation of food products that meet today's opportunities and realities. They are the products with low levels of sugar and fat, containing high health components, and are expanded for functional and therapeutic purposes. They are storable for a longer periods, fast cooking and completely safe for humans. It is also a low-calorie product with a balanced composition.

In recent years, the problem of maintaining people's health as a result of environmental degradation has come under threat. And the need arose to organize the production which has new functional properties with prophylactic and therapeutic properties, using various biologically active substances. It is necessary to change the qualitative and quantitative composition of food consumed by the population[7].

World practice shows that in developed countries, the market for vitamin-rich fruits, grapes and vegetables in the restoration and strengthening of human health is developing, its position is constantly growing. Sustainable economic growth is being ensured in our country due to the measures taken to increase the effectiveness of reforms in the supply of food and raw materials to industry.

The fruit and vegetable market is not significantly different in content from other markets, and it has all the common aspects of market relations. However, there are some specific aspects of the fruit and vegetable market that are related to the forms of management, the characteristics of the products grown and sold.

Like other markets, the fruit and vegetable market is made up of many producers and consumers. The entire population of the country is consumers of fruit and vegetable products, and, of course, many of them are actively involved in commodity-money relations as buyers of fruits and vegetables.

MAIN BODY

In recent years, a number of decrees and resolutions have been accepted in order to develop the

country's food industry and create opportunities for the future export of these products not only to the domestic market, but also to foreign markets.

Decree of the President of the Republic of Uzbekistan PD-5388 dated March 29, 2018 “On additional measures for the accelerated development of fruit and vegetable growing in the Republic of Uzbekistan”, Decree of the President of the Republic of Uzbekistan PD-5853 dated October 23, 2019 “On approval of the Strategy of agricultural development of the Republic of Uzbekistan for 2020-2030”, Resolution of the President of the Republic of Uzbekistan PR-3978 dated October 17, 2018 “On additional measures to increase the efficiency of export of fruits and vegetables”, Resolution of the President of the Republic of Uzbekistan PR-4239 dated March 14, 2019 “On measures to develop agricultural cooperation in the field of fruit and vegetables” can be cited as an example.

Presidential decree №4821 “On measures for the accelerated development of the food industry of the Republic and the full provision of the population with quality food products” was adopted to provide the population with quality food products in the future.

As a result of measures taken in recent years in our country, exports of agricultural products in 2019 increased by 2 times compared to 2017, more than 10 million tons of vegetables, more than 17 million tons of other agricultural products and 2.5 million tons of meat.

At the same time, the fact that agricultural products do not fully meet international standards and safety requirements, the lack of proper relations between food producers and exporters hinder the growth of the country's export potential and the opening of new markets.

To overcome such problems and obstacles, the following tasks are assigned:

- ❖ Increasing the volume of processing of fruits, vegetables, meat, dairy and other agricultural products on the basis of international quality standards, the introduction of a system of state support for the production of local food products that are competitive in domestic and foreign markets, as well as further improving the provision of quality and safe food to the population;
- ❖ creation of conditions for mutually beneficial relations between enterprises growing (producing) agricultural food products such as fruits, vegetables, meat, milk and enterprises processing, preparing and selling these products;
- ❖ Development of strategies and models for the development of the food industry on the basis of increasing the competitiveness and diversification of local food products, the efficient use of existing natural and economic resources of the regions;
- ❖ creation of new means and information systems, which are financial and non-financial measures to support businesses processing agricultural food products such as fruits, vegetables, meat, milk, implementation of projects in high-efficiency areas;
- ❖ analyze, forecast the impact of private and direct foreign investment on the development of the food industry and develop appropriate proposals in this regard
- ❖ establishment of modern trade and logistics centers, promotion of local food products in world markets, increase of their competitiveness, expansion of export potential and reduction of import volumes.

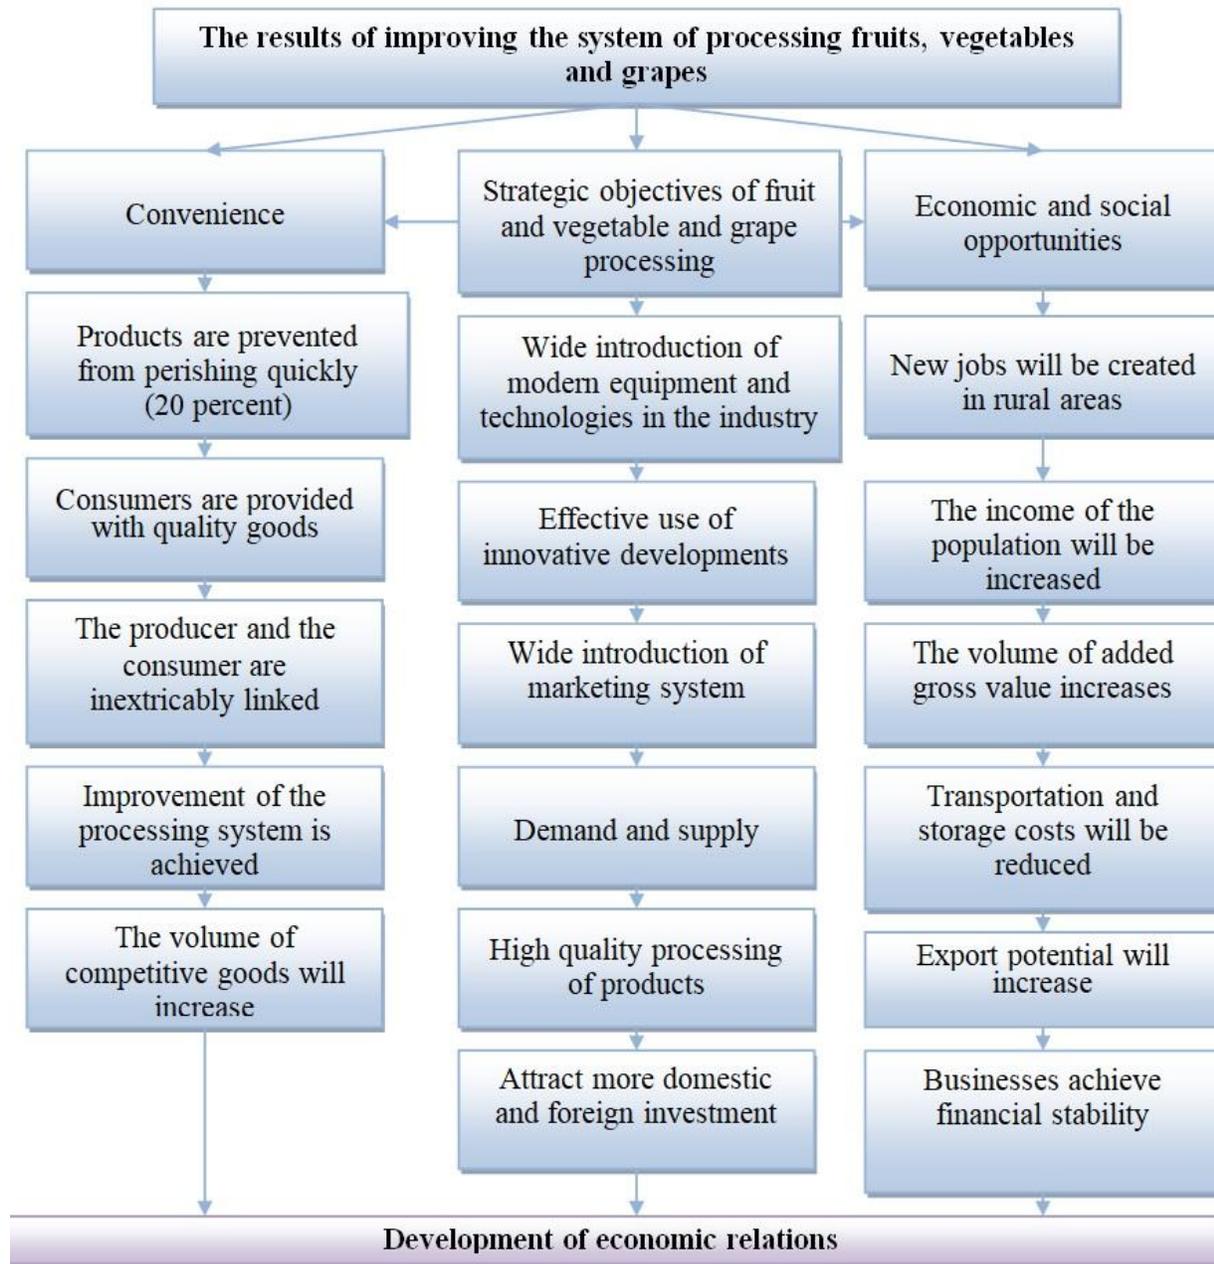

The market of fruits and vegetables and grapes consists of a set of target, integrated industries and activities of different forms of ownership, technologically, organizationally and economically interconnected, aimed at meeting the needs of society in primary and processed products. In this case, each participant aims to achieve their own economic interests, and they do not always coincide. Therefore, the task of the fruit and vegetable and grape market is to take full account of the conflicting economic interests of the participants and to effectively organize the satisfaction of the needs of the population in accordance with their solvency, to introduce economic instruments for harmonization[6].

The peculiarities of the market of fruit and vegetable and grape products, in particular, the large number of producers and consumers, the seasonal nature of production, especially horticulture and viticulture are inextricably linked to natural and climatic conditions, the rapid deterioration of the product, makes it difficult to store and transport. These features affect the organization of the economy of the fruit and vegetable and viticulture complex.

According to the analysis, the volume of losses in the cultivation of fruits, vegetables and grapes in our country exceeds 20% in the process of harvesting, processing, storage and transportation. This is because fruits, vegetables and grapes fall into the category of perishable products and are not suitable for transportation. In addition, the storage of these products as fresh is required at great expense for special refrigerators and other related equipment and devices.

Organizing the storage of industrially processed products in the form of canned food, juice, wine, etc., and providing them to consumers for a long time, is not only easy, but also economically beneficial. They also provide convenience in transporting and storing fresh fruits and vegetables and grapes. This is also important in exporting them to foreign countries.

It is recommended to expand the methods of growing fruits and vegetables and grapes, including through the optimization of arable lands, the development of vacant lands in mountainous and foothill areas, and the construction of small reservoirs that can collect water in winter and spring.

Figure 1. The results of improving the system of processing fruits, vegetables and grapes

DISCUSSION AND CONCLUSION

The following should be noted as the main factors determining the competitiveness of economic entities growing fruits, vegetables and grapes in the country:

- The level of use of advanced technologies in the context of modernization of the economy;
- financial stability of the enterprise and reduction of cultivation costs;
- market share and sales efficiency of the enterprise;

- high quality and wide range of products and branded products;
- level of product advertising;
- organizational management and entrepreneurial potential of the enterprise;
- social protection of employees, remuneration of labor, etc.

In the future, in the preparation of fruits, vegetables and grapes for export, special attention should be paid to the label and its advertising. Fruits, vegetables and grapes grown in Uzbekistan do not lag behind foreign products in terms of quality, but rather, it dominates on most indicators. However, it must be acknowledged that the label lags behind foreign goods in terms of bright decoration and presentation of the product to the consumer. Advertising of fruits and vegetables and grapes grown in the country is not yet in demand, which has a negative impact on the export situation.

It is necessary to consider the development of exports of fruits, vegetables and grapes as one of the priorities of economic policy.

Taking into account the increasing demand for fruit and vegetable and grape products in the Republic, in order to increase the production efficiency in this area, it is necessary to carry out the following:

1. In the context of modernization of the economy, it is necessary to develop the following priorities in the market of fruits, vegetables and grapes in Uzbekistan:

- further development of fruit and vegetable and grape farms and their full support;
- Improving the reclamation of fruit and vegetable and grape lands;
- Development of fruit and vegetable and viticulture selection;
- implementation of development programs of fruit and vegetable and viticulture sub-complex;
- modernization of fruit and vegetable and grape processing enterprises.

2. In the future development of fruit and vegetable and grape growing and processing industry in the country:

- providing the product storage system with modern technologies;
- increase investment from various sources;
- Introduction of organizational and economic mechanisms for the development of cooperation in the system of supply to consumers;
- organization and development of specialized service infrastructure for the implementation of agro-technical measures;
- In order to provide economic incentives for the establishment of enterprises for sorting, storage and packaging of products, it is necessary to provide soft loans.

3. In further increasing the opportunities for the development and stabilization of the market of fruits, vegetables and grapes in the country:

-
- Stimulation of increase in investments at the expense of resources directed to the development of fruit and vegetable and grape production, while attracting investments in the fruit and vegetable and grape growing complex;
 - Development of storage and processing of fruits, vegetables and grapes, the provision of modern technical equipment and facilities, new technologies;
 - Introduction of organizational and economic mechanisms for the development of cooperation in the system of supply of fruits, vegetables and grapes to consumers with primary processing and processing;
 - state support of the fruit and vegetable sector, with the transfer of foreign exchange earnings for these types of products to this sector;
 - issues such as improving the economic and legal framework for the adaptation of the transport system and sales networks to market conditions in the supply of agricultural products to consumers should be addressed.
4. Collection and analysis of market information at the regional level, forecasting of supply and demand, assessment of the system of commodity movement, information and advertising and other aspects play an important role in managing the development of agro-industrial complex of fruit and vegetables and viticulture. It is advisable to organize the marketing service as an independent center for the implementation of orders for the provision of marketing services to stakeholders, fruit and vegetable growers and consumers in the region.
5. It is expedient to take the following measures to ensure the economically sustainable development of the entire sub-complex on the basis of ensuring the interdependence of the system of cultivation, storage, processing and sale of fruits, vegetables and grapes in the Republic:
- storage and processing of fruit and grape products
 - new laws and regulations aimed at development
 - receipt of documents;
 - establishment of specialized shops specializing in the sale of material and technical resources;
 - diversification of economic relations between producers and processing enterprises and improvement of the final settlement system;
 - allocation of soft loans for economic incentives for the establishment of enterprises for sorting, storage and packaging of products;
 - encouraging the establishment of "cooperative" entities providing storage, sorting, packaging, processing and various services in order to strengthen the voluntary and mutually agreed economic cooperation of farms;
 - in order to effectively organize the activities of newly established agricultural firms, to provide them with seasonal benefits in the export of their products, the systematic allocation

of soft loans for economic incentives for the import of advanced technologies and the creation of new jobs in rural areas, etc.

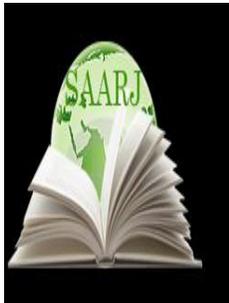

As a result of the above-mentioned measures, the development of the entire horticultural and viticultural sector will be achieved through the processing of 35-50% of fruit and vegetable and grape products, the creation of new jobs through the establishment of small processing plants in rural areas.

ABSTRACT

This scientific article is about business activities of agricultural area, peasant about reform and results of reform of products in farms to the activities carried out in the country in recent years, farmers mainly to improve the living standards of the people's welfare reforms. In this sense, directed attention given to the agricultural sector is of particular importance.

KEYWORDS: *Agricultural Sector, Agricultural Entrepreneur, Agribusiness, Dehkan Farming, Farming, Landowner*

INTRODUCTION

Business, as a useful activity, or rather an activity aimed at creating new or increasing existing values, revitalizes the economy, improves its quantitative and qualitative parameters, and also allows every person who wants to work to mobilize their intellectual, physical, professional potential, to find their place and be socially in demand. The economy acts as a kind of "customer" of business in all its useful and effective forms of manifestation and organization. It regulates supply and demand, production and consumption, makes the business focus on priorities in making a profit, without violating the moral and legal rules and norms.

Intensification of the development of small and medium-sized businesses (and in the field of agricultural business), as one of the conditions for the early completion of the market transformation of the domestic economy. The agrarian sector plays an important role in the system of economic and social relations, since the main entrepreneur and economic entity is the farmer and the peasant [1].

The state provides a lot of assistance to the development of the agricultural sector, new incentives are being created for the advanced development of farms and dekhkan farms, many measures are being taken to strengthen the dekhkan's sense of master on the land. However, despite measures to reform agriculture, as President Sh. Mirziyoyev noted in his Address to the Oliy Majlis in 2019, "this industry still remains and will remain at our highest level of attention and will be the most conservative sphere of the country's economy." [2]

REVIEW OF LITERATURE

Important are the results of works and research work on the development of small business and family entrepreneurship in agriculture, the development of dekhkan farms in its structure by such foreign scientists as A.V. Chayanov, G.I. Shmelev, A.I. Shapochnikov, S. A. Belozero, E. Budko, A. Bobok, V. Zherebin, A. Romanov, I. G. Kopanev, G. V. Chubukov, A. Raskazov, Z. I. Kalugina, T. P. Antonova, Z. Temirova, P.N. Sizova, Yu.S. Balandin, O.S. Belokrylova, A. Oleinik, G.A. Kaliev, L. Abalkin, N. Utukin, S. Pirogov and others.

In the field of development and increasing the efficiency of the agrarian economy in Uzbekistan, research was carried out by such scientists as A. Ulmasov, B. B. Berkinov, A. M. Zhuraev, B. Salimov, R. Kh. Khusanov, O. Zokirov, S. Gafurov, U.P. Umurzokov, N.S. Khushmatov, K.A. Choriev, S. Khashimov, O. Makhmudov, N.M. Narzullaev, Kh.R. Yakubova, S.N. Usmonov, Yu.T. Dodobaev, R. Khakimov, M. Ch. Kosimov, R. Kh. Ergashev, Z. Sh. Shokhodzhaeva, B.F. Sultanov, A.A. Abdusamatov, U.K. Akhmedov and others.

In the context of modernization and diversification of the economy of the agrarian sector of the Republic of Uzbekistan due to the fact that the sustainable development of agriculture, the growing demand of the population for food in the future is all sided with the activities of dekhkan farms, landowners need to develop recommendations to increase the income of dekhkan farms further development of their activities.

RESULTS AND DISCUSSION

Since the first days of independence, one of the priority tasks has been deepening economic reforms in agriculture. The main tasks of the agricultural policy in the republic were: transferring land to its owner, creating a class of owners, improving their lease and other relations, developing infrastructure facilities that provide services to agricultural producers on the basis of rational and efficient use of land and water resources.

Thanks to these reforms, there have been significant structural changes in agriculture. As a result of structural transformations, a steady growth in agricultural production has been achieved. Uzbekistan was the first among the CIS countries to halt the recession and ensure high rates of growth in agricultural production. These high rates are also ensured by the agricultural family business, including the expense of dekhkan farms.

According to the law "On Dekhkan Farms", a dekhkan farm is a small-scale family farm that produces and sells products based on the personal labor of family members on a personal plot of land given to the head of the family for inherited tenure for life [3]. This law defines all the rules from education to liquidation of dekhkan farms.

Dekhkan farms at the beginning of their formation operated together with farms and shirkat workers, there is an additional source of income from land plots in the amount of 0.25-0.35

hectares by the estate allocated to each rural family. The homestead is usually located on the land of shirkat and is focused mainly on agricultural production, according to the law, the construction of houses on these lands is strictly prohibited.

Since 2000, the state has urged the owners of the farmstead to register as dekhkan farms, on the basis of a long-term lease (50 years), becoming legal entities. Registration allows farmers and dehkans to obtain loans, but at the same time strengthens state control over income through taxes, so farmers are reluctant to participate in this program. This type of production can be viewed as a purely private type, because agricultural producers make their own decisions on production and marketing. The size of the farm and irrigation are the limiting factors.

Also, according to the law "On dekhkan farm" it is envisaged to apply taxation, in accordance with this law, dekhkan farms with the status of a legal entity and without the status of a legal entity pay land tax, tax on the use of water resources and property tax. Dehkan farms are of particular importance in the sustainable development of agricultural production.

If we compare them with farms, then dekhkan farms are the main producers of agricultural products. In the structure of agricultural products, the share of dekhkan farms in 2020 was 71%. More than 825.7 thousand lands are assigned to dekhkan farms and more than 1748.9 thousand people are employed in them.

Dekhkan farms in Andijan, Fergana, Kashkadarya, Samarkand, Surkhandarya, Namangan and Bukhara regions of the Republic of Uzbekistan turned out to be more efficient. The most striking examples of their effectiveness can be seen in the economic indicators of livestock and fruit and vegetable production. For example, the share of vegetables produced in our republic is 92.1%, fruits - 92.3%, potatoes - 90.2%, milk - 92.1%, meat - 91%, eggs - 97.8% - show and lead dekhkan farms

CONCLUSION AND RECOMMENDATION

For several years of independence, thanks to the successful implementation of agricultural policy aimed at introducing advanced farming systems, agricultural technology and breeding new varieties of plants and new breeds, improving old methods, stable production of the main types of agricultural products was ensured. Dekhkan farms, as one of the agricultural businessmen, provide the residents of the republic with more and more agricultural products, they also increased the production of potatoes by 1.2 times, vegetables - 1.3 times, fruits and berries - 1.1 times, meat - 1.4 times, milk - 1.4 times, eggs - 1.5 times, astrakhan fur - 1.1 times, etc.

The high efficiency of certain prospects of family peasant (dehkan) farms is determined by the fact that for further development they must include conditions for ensuring competitiveness: rational size, level and conditions of material and technical support, the creation of new high-quality agricultural products.

But, despite the important place of dekhkan farms in the sustainable development of agriculture and the growth of incomes of the population, insufficient attention is paid to its functioning, in fact, there is no purposeful support and incentives for them. In the future, for the development of dekhkan farms, it is necessary to organize the processing of local raw materials and bring them to finished products, which will allow them to expand the export of these products to international markets and take their rightful place among world manufacturers - entrepreneurs [4].

In modern conditions of intensive economic development, an increase in production efficiency indicators is becoming increasingly important for theory and practice, since the economic policy of each country has a goal - to provide the people with a quality life, providing them with agricultural products is especially important. To achieve this goal in the near future, the deepening of reforms (monetary, fiscal, financial, administrative, industrial policy), including the following agrarian reforms, follows:

- restructuring of agricultural enterprises;
- organization of efficient farms and dekhkans on their basis;
- carrying out land reform by transferring land to farmers and dekhkan farms in a long-term lease;
- improving the systems of accounting and registration of land, pricing and the mechanism of public procurement for the main types of agricultural products;
- increasing the independence of rural producers in the choice of crops and in the sale of products;
- rejection of administrative methods of distribution of material and technical resources for agriculture and the creation of a competitive market for these resources;
- reforming the water use system with the gradual introduction of payment for it in agriculture, stimulating water conservation;
- improvement of the irrigation and reclamation system by expanding the volume of public, private and foreign investments, etc. [5]

In 2017, on October 9, the Decree of the President of the Republic of Uzbekistan No.UP-5199 "On measures to radically improve the system of protecting the rights and legitimate interests of farmers, dekhkan farms and owners of household land, the effective use of agricultural sown areas" was adopted, and in the execution of the Decree on October 10, Resolution No. PP-3318 "On organizational measures for the further development of the activities of farms, dekhkan farms and owners of household plots" of the President of the Republic of Uzbekistan.

The decree adopted the main tasks and directions of activities of the Council of Farming, Dehkan Farms and Owners of Household Lands in Uzbekistan. The main tasks and directions are determined:

- protection of the rights and legitimate interests of farms, dekhkan farms and owners of household plots, including in relations with state and economic management bodies;
- Comprehensive support of farms, dekhkan farms and owners of household plots in the production, processing, storage and sale of agricultural products, including in the implementation of agrotechnical measures, as well as drafting contracts, exporting products to foreign markets;
- organization and expansion of various forms of cooperation of farms, dekhkan farms and owners of household plots with other organizations for the provision of consulting services on legal, economic, financial, agrotechnical and other issues in agriculture, as well as on the production, purchase, processing, sale of products, supply and service, the introduction in this area of advanced foreign experience, etc. [6].

As you can see, this decree will serve to deepen the agrarian reforms. Since agriculture is one of the main sectors of the economy of Uzbekistan. It accounts for about 20% of the gross domestic product, 70% of domestic trade, more than 30% of employment and more than half of the country's foreign exchange earnings. Agricultural production is carried out on 26.5 million hectares of land, of which 16% is used for arable land.

The structure of cultivated areas and the variety of crops in many cases depends on the degree of freedom of management. Therefore, shirkats (agricultural cooperatives) and farms have the least variety of crops due to the existing public procurement system. In contrast, dekhkan farms and owners of household plots have greater diversity in crop production.

The results of sociological studies have shown that dekhkan farms and owners of household plots are of great importance, as they are quickly motivated to agrarian reforms. Farmers such as dekhkan farms or family contractors usually have a limited amount of land, so the intensity of land use, such as two or three harvests, is an important factor in efficiency. However, only 22.4% of dekhkan farms in Uzbekistan used re-crops such as wheat, corn and vegetables.

To increase income, re-planting is essential for dekhkan farms. The largest share in re-planting is occupied by wheat - 22.8%, greens - 21.4%, fodder - 10%, vegetables - 6.2% [7]. Crop rotations are another important factor that has a direct impact on soil fertility and yield. In some farms of Uzbekistan, there is a negative practice of re-cultivating one crop for 20-30 years in the same areas, which leads to the spread of various plant diseases and an increase in the population of harmful insects.

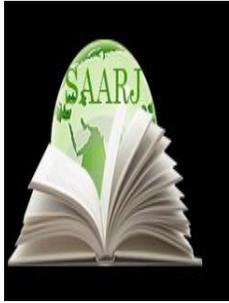

Only 18.5% of respondents working in family contracts confirmed the presence of crop rotation in cultivated fields.

The conclusion is that dekhkan farms and owners of household plots should intensively solve problems of land use, and also achieve an increase in income through diversification.

THE ROLE OF NATIONAL MUSIC IN EDUCATION OF YOUTH

Shodiyeva Gavkhar Eminjanovna*

*Teacher,
 Department of Music Education, Faculty of Arts,
 Kokand State Pedagogical Institute,
 UZBEKISTAN

ABSTRACT

This article identifies effective ways to nurture young people through national music. A good song is a good song with its aesthetic impact, social function, educational function, and vitality. The art of singing is inherently wide-ranging and wide-ranging. Music education and moral education through music also begins at school. Moral values are stable only when they are tested many times, and they motivate a person to act in life as a real support. The invitations, exhortations, and instructions in the thoughts and melodies of folk songs are the product of vital conclusions that have been re-examined and refined as a result of his centuries of experience.

KEYWORDS: Art, Spirituality, Psyche, Culture, Morality, Education, Aesthetics, Beauty, Anemism, Totemism, Magic, Values, Tradition, And So On.

INTRODUCTION

Art by nature is a tool of education that leads people to beauty, by nature to spirituality, to high spirituality. "When the word is over, the song begins," says our people. Because music is stronger and more powerful than any other word with its charming melodies. Music is not, as some people say, a means of relaxation.

Art awakens in a person, directs his emotions to a common goal, mobilizes people for a noble cause, glorifies the motherland in words and melodies, instills in young people a sense of homeland. It's a wonderful miracle that awakens and nurtures it!

It is no coincidence that the great Beethoven called music an expression of language higher than wisdom and philosophy.

One of the great contributions of Al-Kindi, one of the scholars of the East, in the field of medicine, - said the famous physician - scientist Z. Egamberdiyev, - was the discovery of the relationship between music and medicine. Ibn Sina, who devoted much of his time to the

spiritual effects of music on man, achieved world-class results of music therapy by Al-Kindi in the treatment of mental illness based on their work. Al-Kindi writes that between melodies and flowers there are some similarities. The fragrance of flowers evokes the spirit of man raises, adds strength. The thinker is against music and medicine that is, these considerations have not lost their value to this day. The song is accompanied by a strong sense of life. It overflows and pours into the tongue, and it is a flood of the heart that makes the tongue sing to its tune.

This flood comes from the heart and the tongue and flows into other hearts and tongues. He is calm temperature. This temperature touches the heart and gives pleasure and excitement. A good song is a good song with its aesthetic impact, social function, educational function, and vitality. The art of singing is inherently wide-ranging and wide-ranging. Music education and moral education through music also begins at school. School music lessons and extracurricular activities music and singing clubs play a special role. The role and importance of song and music in the formation of personality have been demonstrated in the research work of educators and psychologists with the help of a lot of evidence. According to the sources, music education plays a special role in the development of a person's worldview, spirituality, morality, level of culture, and emotional development.

The role and importance of song and music in the formation of personality have been demonstrated in the research work of educators and psychologists with the help of a lot of evidence. According to the sources, music education plays a special role in the development of a person in the development of his worldview, spirituality, morality, level of culture, emotions. The great role of art and literature in moral education is the whole of human life process continues. Art is a school subject or a text book cannot be exchanged for While writing about the reasons that gave rise to the science of music, Farobi draws attention to the moral and educational aspects of music. This knowledge is useful in this sense, writes Ihsa al-Ulum, and it regulates the behavior of people who have lost their balance, perfects and maintains immature behavior. This knowledge is also good for the health of the body, because when the body is sick, the soul is also hindered. Therefore, the body is healed by the healing of the soul under the influence of sounds, and the soul is healed by the regulation and adaptation of its forces to its substance.

The human body, psyche, and spirituality in general is closely related to the fact that music changes a person's mood in addition to the psychological and aesthetic effects that affect its overall spiritual appearance substantiated. About how music perfects human behavior ideas are a great innovation in the history of musical-aesthetic thinking, in which special attention is paid to the educational and spiritual significance of music.

In order to feel the essence of spiritual and moral concepts, one must follow them in one way or another, and carefully observe how the result is, think and draw one's own conclusions. It is advisable to master the moral and ethical norms in the educational process. Music education, in particular, has great potential. Moral values are stable only when they are tested many times, and they motivate a person to act in life as a real support. The invitations, exhortations, and instructions in the thoughts and melodies of folk songs are the product of vital conclusions that have been re-examined and refined as a result of his centuries of experience. Every positive thing that people say is true, and it is natural for someone who has not read it to be fooled in life.

The study of spiritual and moral concepts leads to the formation of perfectly formed habits, skills and competencies as a result of comparing different events and psychological situations that occur in everyday life. Music education plays a special role in helping students find their place in the classroom, school community, family, and community during their time in general secondary education. Content-based music lessons, in-class and out-of-class activities, and a general musical environment are also important resources for shaping students' spirituality.

The teacher's knowledge, talent, enthusiasm, advocacy, kindness, and counseling play a key role in making music lessons a real educational tool. The great power of music is that it penetrates the student's inner world. can stir up emotions. According to psychologists, music the largest, thinnest of the neural networks in the hemispheres of the human brain, it can also penetrate a layer that no other medium can affect.

These layers store a huge amount of human energy reserves and good music it is this mental power that can mobilize the emotional reserves. One of the main goals of education today is youth inculcating in the generation the spiritual riches of our ancestors accumulated over the centuries, instilling in them human qualities and constantly developing them to go, to teach them to feel their duty and responsibility to the Motherland and the nation consists of.

The multifaceted sources of spiritual and moral qualities, such as the love of students for the Motherland, labor, people, play an important role in arousing in them a spiritual need and interest, in cultivating spiritual activity and values. Spiritual and moral resources are also a means of forming the components of spiritual quality in the student. Spiritual and moral formation of students through the samples of national music, teaching them to take into account their age, individuality, perception, analysis and synthesis of music is directly related to the existence of pedagogical and psychological conditions.

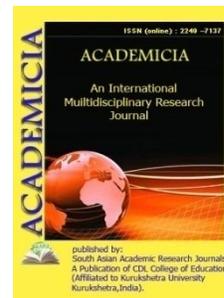

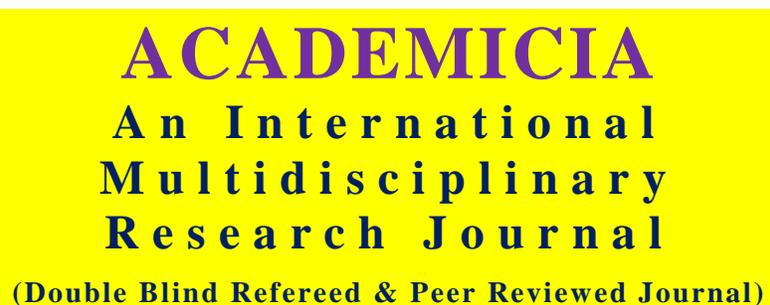

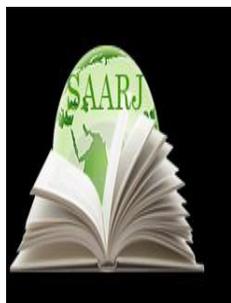

Thus, the spiritual and moral formation of students through folk songs is more convenient than other genres of music. Because folk songs reflect the traditions and customs of this people. Awakening of the sense of nobility in man, their development and Among the various tools that contribute to the formation of works of art, in particular, folk songs have a special place. The Uzbek people are delicate by nature, art-loving and demanding of the people of art His songs are a reflection of a wide range of spirituality. Even in ancient times people did not know what writing was who knew how to have fun, sing, draw.

It is known from history that in primitive society (in the Paleolithic period) hunting, animal husbandry, and then agriculture, in the "Seed Society anemia of early religious beliefs and ritualstotemism (worship of ancestral spirits), magic (magic) are among them. Folk art is a product of his wisdom and collective art. From all of this in raising a child spiritually, morally and physically healthy has been used effectively in hardening. Since ancient times, various types and genres of art, including Folk singing also inspires members of society, especially the younger generation has served as a shaping tool.

In the spiritual and moral formation of students through national music music lessons have great potential. After all, the samples of national music are directly connected with the noble intentions, aspirations and inner feelings of the people, their customs and traditions.

ABSTRACT

Particular attention is paid to the organization of cotton and textile clusters in agriculture and the development of their modern forms. Improving production efficiency through the development of cotton and textile clusters is becoming a topical issue. This article develops proposals and recommendations for the organization and development of clusters in the cotton sector of the regions.

KEYWORDS: *Cluster, Agrocluster, Cotton-Textile Cluster, Cooperatives, Innovative Technologies, Water-Saving Technologies*

INTRODUCTION

In the process of economic reforms in the agricultural sector of the country, new market relations have emerged between management, ownership, wages, producers and service providers. The legal, economic, organizational and institutional measures taken to develop economic relations in the country's agriculture have laid the foundation for the deepening of direct market relations.

Therefore, the President of Uzbekistan Sh. Mirziyoyev "On the strategy of actions for further development of the Republic of Uzbekistan" the decree prioritizes "implementation of investment projects for the deep processing of agricultural products, construction of new processing plants equipped with the latest high-tech equipment for the production of semi-

finished and finished food and packaging products, reconstruction and modernization of existing ones." tasks are defined. Finding effective solutions to these problems requires exploring ways to improve and increase the efficiency of production cooperation relations between agricultural producers and processors based on best international practices. In this regard, the substantiation of scientific, methodological and practical aspects of the expansion of horizontal and vertical cooperation between agriculture and processing industries through the introduction of cluster forms is very relevant and necessary at the current stage of implementation of the country's economic development strategy.

President Sh. Mirziyoyev said: In this regard, in his speech on the Day of Agricultural Workers. At the same time, we will continue to work to establish clusters of grain, fruit and vegetables, poultry, livestock, fisheries and silkworms.

Today, many government decisions have been made in the country on the organization of clusters in various fields and are noted as the main support of the regions. However, the mechanism of economic relations between cluster participants is often not covered. It is expedient to study foreign experience in this regard.

According to the research of Menshenina I.G., Kapustina L.M., there is almost no clear national policy aimed at cluster development in the United States. The state only uses traditional supports such as competition, research and education support. The main initiators of cluster development policy are the regions (states and other small administrative regions). In the United States, the federal government does not have the authority to directly interfere in the policy pursued by regional territorial clusters. In turn, the U.S. Federal government agencies, such as the Economic Development Administration (EDA), which operates under the Department of Commerce (DoC) (USA), work with regional economic development and direct regions, and support the use of a cluster approach in developing regional socio-economic development strategies.

The French government has been pursuing a national cluster policy since 2005. Interaction with the local government plays an important role in this process. Foreign experience shows that in the developed countries of North America and Western Europe, the policy of clustering is carried out on a "bottom-up" system, ie from the regional to the state (federal) level. In Russia, by contrast, central governments take the initiative to develop clusters, while local governments adapt their programs and strategies to programs and strategies adopted at the federal level.

We can observe a similar situation in our country. Therefore, it is expedient to develop a law regulating relations in the field of formation and development of cluster structures so that local governments and economic entities operating in the region understand the mechanism of cluster operation and the relationship, rights and interests, responsibilities, opportunities and benefits of all participants.

MATERIALS AND METHODS

Comparative and comparative analysis, complex assessment methods were used in the study of the problem.

RESULT AND DISCUSSION

Currently, there are 18 cotton and textile clusters in the country, and research shows that the efficiency of production in cotton and textile clusters is high, which proves that they are a promising form of management.

Based on the above, we will consider how the system of organization of clusters in agriculture of Kashkadarya region is established and the example of the cotton cluster on its effectiveness.

In 2019, Kashkadarya region accounts for 12.7% of raw cotton grown in the country, and the volume of cotton production reached 381,300 tons.

According to the Resolution of the President of the Republic of Uzbekistan dated March 6, 2020 No PP-4633 "On the widespread introduction of market principles in the cotton industry", in 2020 cluster enterprises in the region developed a plan for the cultivation of raw cotton.

TABLE 1 VOLUMES OF PRODUCTION OF RAW COTTON FOR THE HARVEST OF 2020 IN KASHKADARYA REGION

№	Name of cluster enterprises	Square, hectare	Fruitful, ts / ga	Gross yield, tons	Share
1	"Indorama Agro" MChJ	35650	31,3	111440	26
2	"Sulton Tex Group" MChJ	15000	30,5	45820	11
3	"Litai textel Overseas" XK	23750	28,4	68033	17
4	"Bunyodkor" MChJ	7000	29,4	20580	5
5	"Oq Saroy klaster" MChJ	20800	30,0	62320	15
6	"Mirishkor nur Cotton klaster" MChJ	10000	28,8	28767	7
7	"MT Amir tex" QK MChJ	9000	27,5	24720	7
8	"Kitobipyigiruv" MChJ	6500	24,2	15700	5
9	"Lamp cluster" MChJ	8200	27,8	22820	6
	Jami:	135900	29,4	400200	100

Indorama Agro LLC has the largest cotton area in the region, covering 35,650 hectares, or 26% of the total usable area. The planned yield from raw cotton was 31.3 t / ha and the total yield was 111440 tons. The next is Litai Textel Overseas with an area of 23,750 hectares, which is 17% of the total, and the service area of Oq Saray Cluster LLC is 20,800 hectares. Thus, the average yield of raw cotton grown by cotton clusters established in the region was 29.4 t / ha, and the yield of raw cotton grown by farms was 28.1 t / ha.

The future task of cotton growing is not to drastically reduce the total volume of raw cotton, but to improve its quality. Intensive development of cotton growing and related industries will increase the efficiency of use of available labor, land, water and other material resources and create real conditions for sustainable economic growth.

In 2020, water-saving technologies were introduced on 44,000 hectares of land, or almost 4 times more than last year. For this purpose, 300 billion soums of subsidies were allocated from the state budget.

Today, in the development of the cotton industry of the region, resource-saving best practices and innovative technologies are widely used, and as a result, high efficiency is achieved. We can explain this by the measures shown in Figure 1 below.

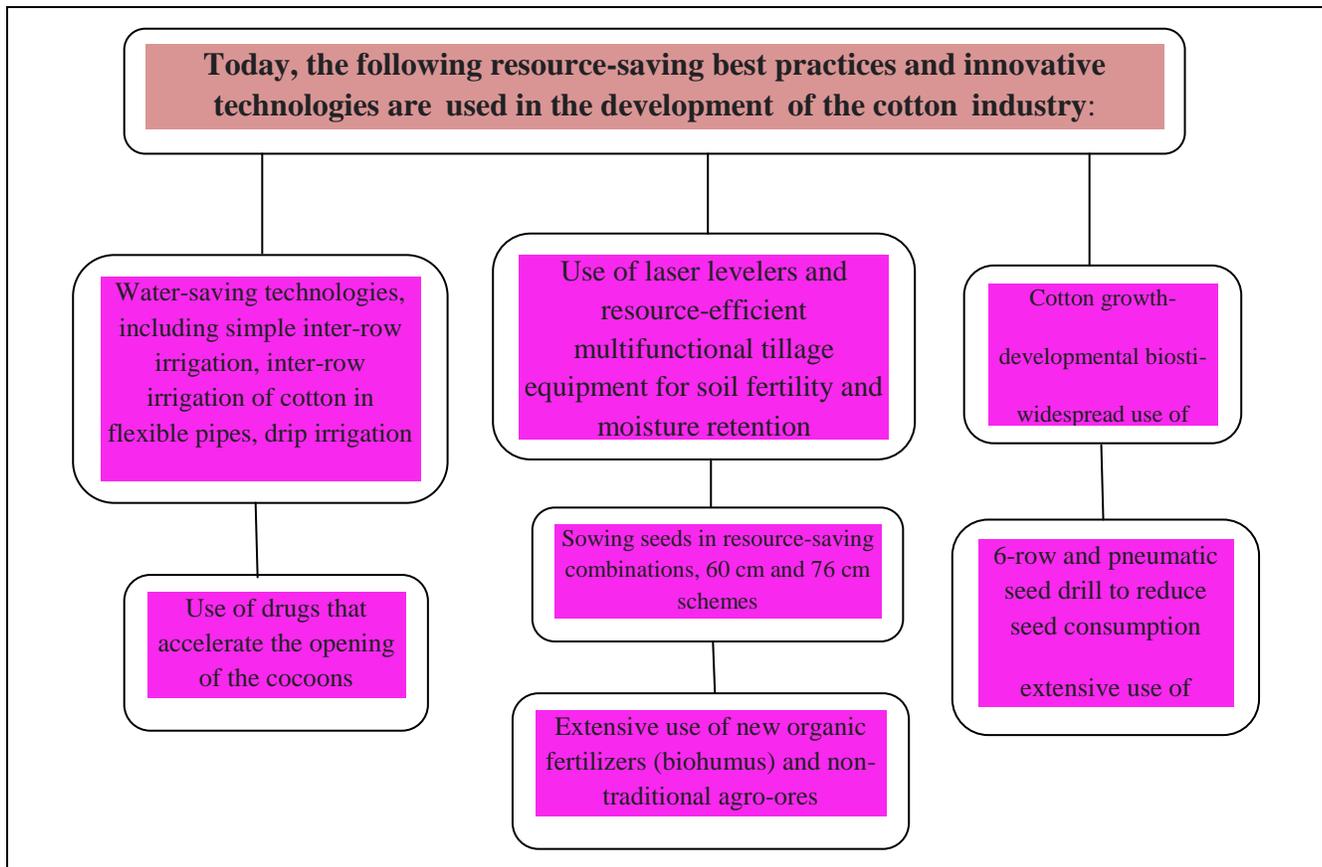

Figure 1. Application of innovative technologies in agriculture of Kashkadarya region in 2020

Supporting cotton and grain growers in Kashkadarya region through the introduction of innovative technologies in agriculture and the intensification of the development of selection and seed production, which will make the existing clusters one of the most important agro-clusters in Uzbekistan.

The economic and technological impact of innovative processes is only partially reflected in new products and technologies. This is reflected in the increase in economic and scientific-technical capabilities (purchase of new equipment and technologies), ie the technological level of the innovation system increases, which leads to an increase in demand for innovation.

World experience shows that a complete cluster should have a clearly defined specialization. Therefore, first of all, it is necessary to identify areas with a high volume of production and processing of certain types of agricultural products that can supply a number of neighboring areas. One of the main criteria for determining specialization is the competitiveness of agricultural production, which in turn is determined by the coefficient of specialization and the coefficient of production per capita, it is expedient to consider its dynamics over the past 3-5 years.

Based on the data obtained and the above criteria for selection, it is possible to make a comparative assessment of the organization and specialization of agro-industrial clusters in the regions and their potential. This allows all stakeholders to form real clusters using resources.

At the same time, the following initiatives can be implemented: projects to stimulate demand for domestic industrial products through budget subsidies; establishment of competence and engineering centers; development of infrastructure for storage and marketing of products; development of new educational programs and targeted training of specialists; establishment of counseling centers, etc. This allows to eliminate disparities in the development of cooperative relations between cluster participants.

In accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated November 18, 2019 No 914, 9 cotton and textile cluster enterprises were established in Kashkadarya region. In particular, as shown in Figure 2 below, there are cluster enterprises in the districts of the region. In this:

- 3,600 hectares of low-yielding, poorly reclaimed cotton fields have been reduced and replaced by export-oriented food crops
- 39.5 thousand hectares (29%), 60 cm in areas with heavy water supply and relatively low productivity. 76.3 thousand hectares (56%) and 90 cm in the scheme. 20.2 thousand hectares (15%) of seeds were planted in the scheme;
- Sowing of seeds by “double” method on average yield per hectare 0.5-1.0 quintals, and the efficiency of material resources and mechanization services was increased by 10-15%;
- With pneumatic seed drills newly purchased and imported by cluster enterprises Consumption of seeds as a result of sowing seeds on 70-75 thousand hectares Reduced by 25-30 percent;
- 9 cotton-textile clusters were established, which were allocated 135.9 thousand hectares of land;
- water-saving technologies were introduced on 5342 hectares by newly established clusters, including drip irrigation on 4213 hectares (in 2019 there were only 320 hectares); At the same time, irrigation water was saved by 40-50% compared to conventional methods, labor and resource costs were reduced (cultivation was reduced), productivity and quality were improved (45-50 quintals of cotton per hectare), soil erosion, groundwater level rise and salinity decreased, mineral fertilizer efficiency increased to 30%;
- increased use of plant growth regulators in cotton fields, which have the property of harvesting and improving fiber quality;
- In order to improve the purity and quality of cotton seeds grown, a system of scientifically based "cotton-alfalfa" rotation was introduced on the lands allocated to all elite seed farms;
- Starting from the harvest of 2020, a system of "crop rotation" of 10% or 13.5 thousand hectares of irrigated arable land of cotton and grain farms has been introduced.

Figure 2. Cotton and textile cluster enterprises established in Kashkadarya region

CONCLUSION

In conclusion, we would like to make the following recommendations for the implementation of cluster enterprises in overcoming the problems in the development of the cotton sector in the region:

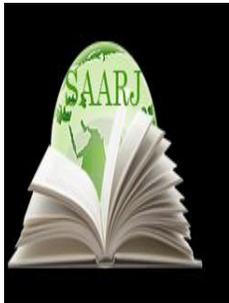

- Organize the distribution of at least 300 kg / ha of phosphorus, 100 kg / ha of potassium and nitrogen fertilizers by chemical plants at the expense of increasing the production of phosphorus fertilizers and at the expense of the cluster enterprises at their own expense. Improving the system of timely delivery of mineral fertilizers to farms.
- Reduce their cost by up to 3 times by cluster enterprises by purchasing and importing chemicals and their active ingredients directly from foreign manufacturers before the start of the season.
- Re-registration of existing equipment on the balance of machine-tractor parks and farms in the region, the organization of work on the write-off of physically obsolete. A total of more than 520 different types of agricultural machinery will be purchased by the Cluster Enterprises through leasing and at their own expense. is achieved.

ABSTRACT

It is not possible to achieve a controversial goal, such as gender equality, without a clear strategic plan setting out policy, objectives, action, time frame and resources. Any organizational entity of the public or private sector nature should contribute to enhancing greater gender equality in order to minimize the widely expanding gender equality gap between men and women. It should be able to contribute substantively to greater gender equality by having the appropriate gender mainstreaming structures, policies and procedures in place. The objective of this article was to show the existing situation of organizational (input) level factors towards the promotion of gender equality in the Gambella Peoples' National Regional State of Ethiopia. The study has shown that the basic policy documents did not exist in several public sector organizations. Certain basic gender and gender-related strategies to implementing the gender and gender-related policy documents were not practiced in the public sector offices. The existing gender and gender-related strategies to implementing such gender policy documents were not clear to the civil servants. Gender focal point networking were absent in the public sector organizations. It has also shown that equal hiring or employment opportunities or practices were existing, gender unit department (division) activities were incorporated in the basic organizational core policy goals, objectives, and projects, and job responsibilities and mandates for the gender unit departments or divisions were existing in the public sector offices. The human resources development aspect and the work organization aspect of the organizational

human resource practices were not building the capacity of the public sector staff in terms of a number of elements. But, documenting, updating, respecting, and utilizing the existing job descriptions for the GU staff were practiced as the organizational human resource practices to building the capacity of the public sector staff at the regional and local administrative level in the Gambella regional state.

KEYWORDS: *Organizational (Input) Level Factors and Promoting Gender Equality*

1. INTRODUCTION

As Hunt (2000) and UN (2002) stated, gender mainstreaming involves all the steps between analysis and incorporating that analysis into the policy and program decisions that can contribute to equality of outcome for men and women in all development work. In other words, gender mainstreaming is a concern for advocacy, networking and knowledge management as much as it is about analysis. It is about policy influence as much as it is about project and program design. Ensuring that such diverse elements produce coherent results requires a clearly defined gender mainstreaming strategic plan (Mourison 2004, pp1-2).

The Swedish International Development Agency (SIDA) has identified gender mainstreaming strategies as being relevant in three linked arenas or “spheres” of the organization: a) In the organization’s structures, policies and procedures, and its culture (the inputs); b) in the substantive activity that the organization pursues (it’s program, the throughput)); and in the impact of the organization’s performance to increasing gender equality in the broader community-the outcome/impact-namely gender equality (Shalkwyk et al. 1996. p 3).

Shalkwyk also noted that activities in each arena are critical to ensuring effective gender mainstreaming process/strategy in every entity. He claimed that if strategies and assessments have tended to distort these three arenas, and have often forgotten the fact that change in the third level is the final goal, increased/reduced gender equality, it is important not to conflate these three arenas since different strategies and indicators of change apply to each of them (Mourison 2004, p2).

2. Data Presentation, Analysis and Discussion on the Context of Organizational (Input) Level Factors in Gambella Regional State Public Service Offices

2.1 Existence of Gender and Gender-related Policy Documents in the Public Sector Organizations

Table 1 Response Rates for the Existence of Gender and Gender-related Policy Documents in the Public Sector Organizations at the Regional administrative Level in the Gambella Region.

Indicator		Strongly Agree / Agree	Neutral	Disagree / Strongly Disagree	Total
ADLI Document	Policy	13 (26%)	2 (4%)	35 (70%)	50 (100%)
PASDEP Document	Policy	5 (10%)	5 (10%)	40 (80%)	50 (100%)

Employment and Labor Works Policy Document	47 (94%)	0	3 (6%)	50 (100%)
Family Law Policy Document	43 (86%)	0	7 (14%)	50 (100%)
The 1993 Women's Policy of Ethiopia Policy Document	42 (84%)	2 (4%)	6 (12%)	50 (100%)
NAP-GE Policy Document	10 (20%)	3 (6%)	37 (74%)	50 (100%)
RAP-GE Policy Document	5 (10%)	4 (8%)	41 (82%)	50 (100%)
National Health Policy Document	4 (8%)	0	46 (92%)	50 (100%)
National Hygiene and Sanitation Policy Document	2 (4%)	0	48 (96%)	50 (100%)

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

Table 1 shows the response rates of the 50 (1 Core-process owners, 1 HRM sub-process owner, 1 Plan and Information sub-process owner, the Focal Person, and 1 Officer) research respondents from the 10 selected public sector offices/bureaus purposively selected for the existence of such policy documents at the regional administrative level. The Table showed that 70% and 80% of the survey informants respectively rejected the existence of ADLI and PASDEP policy documents in their organizations at the regional administrative level. However, 94%, 86%, and 84% of the respondents respectively accepted the existence of work and labor law, family law, and the 1993 Ethiopian Women's policy documents in their public sector organizations at similar administrative level.

The Table also shows that 74% and 82% of the respondents respectively denied the existence of National Action Plan for Gender Equality (NAP-GE) and Regional Action Plan for Gender Equality (RAP-GE) in the public sector offices at the regional administrative level in the regional state. Similarly, 92 and 96% of the respondents also respectively denied that National Health, and National Hygiene and Sanitation policy documents do not exist in their public sector offices at the same administrative level.

Even though the respondents have accepted the existence of the 1993 Ethiopian Women's Policy, the research informants have confirmed that both the NAP-GE and RAP-GE policy documents do not exist in their public sector organizations at the regional administrative level in the region. This may also show that these policy documents are not available in the district and local administrative levels in the region, since the regional administrative level is the place where new policy documents are disseminated to the lower levels. Similarly, though the research informants have accepted that Employment and Labor Works Law, and Family Law do exist in their public sector organizations, they denied the existence of ADLI, PASDEP, National Health, and National Hygiene and Sanitation policy documents in their public sector offices at the regional administrative level. This implies that most of the gender and gender-related policy documents are not in place at the local and regional administrative levels in the regional state,

regardless of the 1993 Ethiopian Women's Policy, the Family Law, and the Employment and Labor Works Policy Document. The fact that the NAP-GE and Regional Action Plan for Gender Equality (RAP-GE) are not established in the region poses a critical gap and constraint to the implementation of gender mainstreaming strategy/process, threatening the attainment of effective gender equality, in the region as a whole.

Table 2 below showed that 57.9% (223) of both male and female informants responded that the organizational gender policy documents were clear to them at both local and regional administrative levels in the Gambella regional State. However, 38.2% (147) of them responded that the organizational gender policy documents were not clear to them at the same administrative levels in the region.

TABLE 2 CLARITY OF THE GENDER POLICY DOCUMENTS RESPONSE RATES BY GENDER IN THE PUBLIC SECTOR ORGANIZATIONS CROSS TABULATION

Level Of Clarity Of The Stated Gender Policy Documents In The Organization	Response Rates				Total
	Very Clear/ Clear	Uncertain	Not Clear	Not Very Clear	
Male	134 (63.2%)	11	48	19	212
Female	89 (51.4%)	4	71	9	173
Total	223 (57.9%)	15 (3.9%)	147 (38.2%)		385

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

2.2 Existence of Gender and Gender-related Strategies in the Public Sector Organizations

The survey result below presents and describes respondents' survey opinions on the existence of such strategies to effectively mainstream gender in the public sector offices at the regional administrative level in the Gambella regional state. The proposed gender and gender-related strategies include: Existence of Political Will to Managing Gender Issues; Planning Issues; Gender Analysis (Sex-disaggregated data) Issues; Gender Networking Issues; Gender Advocacy and Sound Information Issues; Gender Knowledge Management Issues; Meeting Management Issues in Relation to Gender Activities; Leadership Issues; team and Membership Issues; and Communication Issues for the attainment of greater and effective gender equality in the Gambella regional state of Ethiopia.

TABLE 3 RESPONSE RATES FOR THE EXISTENCE OF GENDER STRATEGIES FOR THE STATED GENDER AND GENDER-RELATED POLICY DOCUMENTS IN THE PUBLIC ORGANIZATIONS

Indicator	Strongly Agree / Agree	Neutral	Disagree / Strongly Disagree	Total
Political Will to Managing Gender Issues	18 (36%)	0	32 (64%)	50 (100%)
Planning Issues	37 (74%)	0	13 (26)	50 (100%)

Gender Analysis (Sex-disaggregated data) Issues	9 (18%)	3(6%)	38 (76%)	50 (100%)
Gender Networking Issues	14 (28%)	4 (8%)	32 (64%)	50 (100%)
Gender Advocacy and Sound Information Issues	42 (84%)	2 (4%)	6 (12%)	50 (100%)
Gender Knowledge Management Issues	13 (26%)	1 (2%)	36 (72%)	50 (100%)
Meeting Management Issues in Relation to Gender Activities	17 (34%)	0	33 (66%)	50 (100%)
Leadership Issues	11 (22%)	0	39 (78%)	50 (100%)
Team and Membership Issues	28 (56%)	5 (10%)	17 (34%)	50 (100%)
Communication Issues	31 (62%)	0	19 (38%)	50 (100%)

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

The above Table 3 shows the response rates for the availability of gender and related strategies for 50 (1 Core-process owners, 1 HRM sub-process owner, 1 Plan and Information sub-process owner, the Focal Person, and 1 Officer) research informants from the 10 selected public sector offices at the regional administrative level. The Table showed that respective 74, 84, 56, and 62% of the survey respondents accepted that gender strategies such as planning, gender advocacy and sound information, team and membership, and communication did exist in their public sector offices at the regional administrative level. However, respective 64, 76, 64, 72, 66, and 78% of them accepted that gender strategies such as political will, gender analysis, gender networking, gender knowledge management, meeting management, and leadership were not existing in the their public sector offices at the similar administrative level in the region. This implies that the most important gender and gender-related strategies to implement the gender and gender-related policy documents were not available in the public sector offices at the regional administrative level in the Gambella region. This also indicates that the most important strategic factors such as political will and leadership issues were also not taken into account, with the rest four strategic factors, by the public sector offices at the same administrative level in the region. This also indicates that existence of such strategic factors in the public sector offices at the district /zonal/ and local /woreda/ administrative levels in the region is doubted, since existence of such a situation can jeopardize the attainment of effective gender equality in the region as a whole.

Table 4 below discloses that 52.5% (202) of the survey informants responded that the organizational gender policy strategies were not clear to them at both local and regional administrative levels in the Gambella regional State. Nonetheless, 41% (158) of them responded that the organizational gender policy strategies were clear to them at the similar administrative levels in the region. This, generally, implies that the gender and related strategies to

implementing such gender policy documents are not clear to them at the local and regional administrative levels in the Gambella regional state.

TABLE 4 SEX OF THE RESPONDENT * LEVEL OF CLARITY OF THE STATED GENDER POLICY STRATEGIES IN THE PUBLIC SECTOR ORGANIZATIONS CROSS TABULATION

	Very Clear	Clear	Uncertain	Not Clear	Not Clear	Very	Total
Male	31	60	18	103 (48.6%)			212
Female	17	50	7	99 (57.2%)			173
Total	158 (41%)		25 (6.5%)	202 (52.5%)			385

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

2.3 Existence of a Gender Unit Department/Division in the Organization

Table 5 below shows that 86.2% (332) of the survey informants agreed that there was a gender unit department in their public sector offices at the regional and local /woreda/ administrative levels in the Gambella region. However, only 2.1% (8) of them responded that there was not any gender unit department (division) in their public sector offices at the same administrative levels. This implies that gender unit structures were existing in most public sector organizations at both administrative levels in the Gambella region.

TABLE 5 SEX OF THE RESPONDENT * EXISTENCE OF A GENDER UNIT DEPARTMENT IN THE PUBLIC SECTOR OFFICES OR BUREAUS CROSS TABULATION

Sex of the Respondent	Male	Female	Total
Male	182 (85.8%)	26 (11.7%)	212 (100%)
Female	150 (86.7%)	19 (11.7%)	173 (100%)
Total	332 (86.2%)	45 (11.7%)	385 (100%)

Source: Field data collected from Public Civil Servants by the author, October 2012/13

2.4 Existence of a Gender Focal Point Net Working in the Public Sector Organizations

Table 6 below exhibits that 51.45 (194) of the survey informants responded that gender focal point networking did not exist in the public sector organizations at the regional and local administrative levels in the Gambella regional state. Nevertheless, 40.5% (156) of them said that gender focal point networking did exist in the public sector organizations at the same administrative levels in the region. This implies that significant number of the contributors have confirmed the absence of gender focal point networking in the public sector organizations at the regional and local administrative levels in the Gambella regional state.

TABLE 6 SEX OF THE RESPONDENT * EXISTENCE OF A GENDER FOCAL POINT NET WORKING IN THE PUBLIC SECTOR OFFICES OR BUREAUS CROSS TABULATION

2.5 Organizational Human Resources Practices for Gender Departments in the Public Organizations

5a. Existence of Equal Hiring or Employment Practices

Table 7 below shows that 75.3% (290) of the survey informants from 385 accepted that there exists an equal hiring or employment practices in the public sector offices at the local and regional administrative levels in the Gambella regional State. However, only 6.5% (25) of them denied the existence of similar practices in the public sector offices at the same administrative levels in the region.

5b. Incorporation of gender unit departments' activities in the basic organizational core policy goals, objectives, and projects in the public sector offices or bureaus

Table 7 also entails that 55.8% (215) of the informants accepted that GU department (division) activities are incorporated in the basic organizational core policy goals, objectives, and projects in the public sector organizations at the regional and local administrative levels in the region. The table, however, also shows that 38.2% (147) of the respondents denied the incorporation of GU department (division) activities in the basic organizational core policy goals, objectives, and projects in the public sector organizations at the same administrative levels in the region.

TABLE 7 EXISTENCE OF EQUAL HIRING PRACTICES AND INCORPORATION OF GU SECTIONS' IN THE PUBLIC SECTOR OFFICES OR BUREAUS CROSS TABULATION

Opinions on the Existence of Equal Hiring or Employment Practices in the Office		Yes	Neutral	No	Total
Sex of The Respondent	Male	174 (82.1%)	28	10	212
	Female	116 (67.1%)	42	15	173
	Total	290 (75.3%)	70 (18.2%)	25 (6.5%)	385
Opinions on the incorporation of gender unit departments' activities in the basic organizational core policy goals, objectives, and projects					
		Yes	Neutral	No	Total

	Total	215 (55.8%)	23 (6%)	147(38.2%)	385

Source: Field data collected from Public Civil Servants by the author, October 2012/13

By using Pearson Chi-square test output for 385 observations for the sated indicators (respondent sex and the variables), the p-value is 0.000 and 0.022 or less than 0.05. Therefore, we reject the null hypothesis (Ho) and conclude that there is a positively significant correlation between the two variables and respondents' sex at the 5 percent level of significance. The Chi-square test result below, therefore, ensures that there exists a positively significant relationship between sex of the respondents and their opinions in regard of such indicators at a 5% level of significance.

TABLE 8 CHI-SQUARE TEST

	Sex of the Respondent	Existence of Equal Hiring Practices	Incorporation of Gender Unit Departments' Activities
Chi-Square	3.951^a	98.766^a	5.260^a

5c. Existence of Job Responsibilities and Mandates for Gender Unit Departments in the Public Organizations

The following survey result shows the civil service employees' opinion survey level on the existence of job responsibilities and mandates for gender unit departments in the public sector offices at the regional and local administrative levels in the Gambella regional state.

TABLE 9 SEX OF THE RESPONDENT * EXISTENCE OF GU JOB RESPONSIBILITIES AND MANDATES RESPONSE RATES CROSS TABULATION

		Fully Existing	Existing, But Not Exhaustive/ Complete	Uncertain	Not Existing at All	Total
Sex Of The Respondent	Male	80 (37.7%)	107(50.5%)	6	19	212
	Female	49 (28.3%)	93 (53.8%)	3	28	173
Total		129 (33.5%)	200 (51.9%)	9 (2.3%)	47(12.2%)	385(100%)

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

Table 9 above shows that 51.9% (200) of the survey informants from 385 accepted that there existed, but not exhaustive, job responsibilities and mandates for gender unit departments or divisions in the public sector offices at the regional and local administrative levels in the region. The result also shows that 33.5% (129) of the respondents said that job responsibilities and mandates did fully exist in the public service offices at the same administrative levels in the region. However, 12.2% (47) of the respondents replied that job responsibilities and mandates for gender unit departments or divisions did not exist at all in the public service offices at the same administrative levels in the region.

This, generally, shows that 85.4% (329) of the respondents agreed that job responsibilities and mandates for the gender unit departments or divisions were existing in the public sector offices at both administrative levels in the region. Therefore, based on the survey opinions of the respondents, it can be said that job responsibilities and mandates for the gender unit departments or divisions were existing in the public sector offices at both administrative levels in the region.

TABLE 10

Chi-square Test Output

	Sex of the respondent	Level of the existence of job responsibilities and mandates for gender unit department posts
Chi-Square	3.951^a	227.270^b

0 cells (.0%) have expected frequencies less than 5. The minimum expected cell frequency is 192.5.

b. 0 cells (.0%) have expected frequencies less than 5. The minimum expected cell frequency is 96.3.

The above Chi-square test result confirms that there exists a positively significant relationship between sex of the respondents and their opinions regarding the indicators at a 5% level of significance.

TABLE 11 RESPONDENTS' SEX* EXISTENCE OF HR PRACTICES, AND DELIVERY OF GENDER-SPECIFIC TRAININGS (THE HUMAN RESOURCE DEVELOPMENT (HRD) ASPECT) IN THE PUBLIC SECTOR ORGANIZATIONS CROSS TABULATION

The Existing Human Resources Development Planning Incorporates Gender-Specific Issues.							Total
		Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree	
Respondents' Sex	Male	31	34	13	59 (27.8%)	75 (35.4%)	212
	Female	28	24	16	45 (26.0%)	60 (34.7%)	173

Total		117(30.4%)	29 (7.5%)	239 (62.1%)	385		
A number of gender-specific trainings have been given to the organizational employees.							
		Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree	Total
Respondents' Sex	Male	54	26	11	62(29.2%)	59(27.8%)	212
	Female	34	22	10	54(31.2%)	53(30.6%)	173
Total		136 (35.3%)		21(5.5%)		228 (59.2%)	385
A Number Of Gender Specific-Awareness Forums, Workshops, And Review Meetings Have Been Delivered To The Employees.							
		Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree	Total
Respondents' Sex	Male	44	29	0	72(34.0%)	67(31.6%)	212
	Female	22	32	0	59(34.1%)	60(34.7%)	173
Total		127 (33%)		0%		258 (67%)	385

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

The survey result (table 11 above) shows that 62.1% (239) of the survey informants responded that the existing organizational human resources development planning does not incorporate gender-specific issues at the regional and local administrative levels in the region. However, 30.4% (117) of the respondents appreciated that organizational human resources development planning does incorporate gender-specific issues. The table also shows that 59.2% (228) of the survey informants responded as there were no gender-specific trainings given to the public service organizational employees, while the reverse is true for 35.3% (136) of the survey responses. The table also shows that 67% (258) of the respondents said that a number of gender specific-awareness forums, workshops, and review meetings were not delivered to the public sector employees. But, (33%) 127 of them accepted that several gender specific-awareness forums, workshops, and review meetings have been delivered to the public service employees. This implies that the human resources development aspect is not building the capacity of the public sector staff in terms of incorporating gender-specific issues into the organizational human resources development planning; offering gender-specific trainings; and delivering a number of gender specific-awareness forums, workshops, and review meetings to the employees at the same administrative levels in the region.

TABLE 12 CHI-SQUARE TEST RESULT

The above Chi-square test also ensures that there exists a significant association between the perceptions of both sexes in this regard at a 5% significance level.

TABLE 13 RESPONDENTS' SEX* EXISTENCE OF DOCUMENTED, UPDATED, AND APPLIED JOB DESCRIPTIONS FOR GU STAFFS (THE HUMAN RESOURCES MANAGEMENT (HRM) ASPECT) IN THE PUBLIC SECTOR ORGANIZATIONS CROSS TABULATION

Job descriptions for GU staff are documented and updated:		Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree	Total
Respondent Sex	Male	63(29.7%)	51(24.1%)	62	20	16	212
	Female	58(33.5%)	51(29.5%)	57	4	3	173
Job Descriptions for GU staff are respected and applied:		Strongly Agree	Agree	Uncertain	Disagree	Strongly Disagree	Total
Respondent Sex	Male	68 (32.1%)	74 (34.9%)	18	21	31	212
	Female	66 (38.2%)	81 (46.8%)	7	6	13	173
Total		289 (75.1%)		25 (6.5%)	71 (18.4%)		385

Source: Field data collected from Public Civil Servants by the author, October 2012/13

Table 13 shows that 57.9% (223) of the informants agreed that the existing job descriptions for GU staff were documented and updated by the public sector organizations. However, 36.1% (139) of the respondents said that public sector organizations (employees) did not document and update the existing job descriptions for GU staff. The survey result also shows that 75.1% (289)

of the informants responded that the existing job descriptions for GU staff were respected and practiced by the public sector organizations. However, 18.4% (71) of the respondents said that the existing job descriptions for GU staff were not respected and practiced by the public sector organizations. This implies that documenting, updating, respecting, and utilizing the existing job descriptions for the GU staff is in practice as the organizational human resource practices to building the capacity of the public sector staff at the regional and local administrative levels in the region.

TABLE 14
CHI-SQUARE TEST RESULT

	Sex of the Respondent	Job Descriptions for GU Staff Documented and Updated.	Job Descriptions for GU Staff are Respected and Applied.

b. 0 cells (.0%) have expected frequencies less than 5. The minimum expected cell frequency is 96.3.

c. 0 cells (.0%) have expected frequencies less than 5. The minimum expected cell frequency is 86.5.

Source: Field Survey, 2013/14

The above Chi-square test also confirms that there is a significant relationship between the perceptions of both male and female respondents. For instance, respectively 29.7 and 33.5% of both male and female respondents strongly agreed that the existing job descriptions for GU staff were documented and updated by the public sector organizations. Similarly, respective 32.1 and 38.2% of male and female respondents strongly agreed that the existing job descriptions for GU staff were respected and practiced by the public sector organizations. On the other hand, respective 24.1 and 29.5% of male and female participants agreed that the existing job descriptions for GU staff were documented and updated by the public sector organizations. The same 34.9 and 46.8% of both male and female respondents agreed that the existing job descriptions for GU staff were respected and practiced by the public sector organizations.

Source: Field data collected from Public Civil Servants by the author, October 2012/13.

Table 15 above portrays that 81% (312) of the informants said that staff meetings did not provide opportunities to the gender unit section or department to share experiences, ideas, and suggestions with the other staffs in the public sector organization at the regional and local administrative levels in the region. However, 15.6% (60) of them admitted the reverse condition. The table also shows that 55.1% (212) of them said gender unit staffs were not given the opportunity to provide inputs and suggestions into the organizational decision-making process. But, 36.8% (142) of the informants supported the opposite side. The survey result also shows that 76.1% (293) of the research participants responded that there existed no team work among the staff members and the GU staff members of the public service organizations. However, 21.6% (83) of them responded that there existed a team work among the organizational staff members and the GU staff members of the public service organizations. The survey result also informs that 75.1% (289) of the participants said information was not shared freely among all the organizational staff members and gender units' staff. Even so, 22.3% (86) of them said that information was freely shared among all the organizational staff members and gender units' staff. Finally, the survey result shows that 89.1% (343) of the survey informants said GU staffs were not encouraged to take initiative and be self-motivated in the organizational operational activities. However, 9.1% (35) of the informants said that GU staffs were encouraged to take initiative and be self-motivated in the organizational operational activities.

The Chi-square test in Table 16 ascertains that a significant relationship (at the 5% significance level) does exist pertaining the perceptions of both male and female respondents in this aspect, as significant percentages of both sexes are the contributors to the survey result.

TABLE 16 CHI-SQUARE TEST OUTPUT

3. SUMMARY AND CONCLUSION

Any organizational entity of the public or private sector nature should contribute to enhancing greater gender equality in order to minimize the widely expanding gender equality gap between men and women. It should be able to contribute substantively to greater gender equality by having the appropriate gender mainstreaming structures, policies and procedures in place.

The study showed that the National Action Plan for Gender Equality (NAP-GE), Regional Action Plan for Gender Equality (RAP-GE), Agricultural Development Led Industrialization (ADLI), Plan for Accelerated and Sustainable Development to End Poverty (PASDEP), National Health, and National Hygiene and Sanitation policy documents did not exist in several public sector organizations. Though the existing gender policy documents were clear to the civil servants, the most important gender and gender-related strategies (such as political will and leadership issues) to implementing the gender and gender-related policy documents were not available in the public sector offices. The existing some gender and gender-related strategies to implementing such gender policy documents were also not clear to the civil servants. Even though the gender unit structures were existing in most public sector organizations, gender focal point networking were absent in the public sector organizations.

The study has also shown that equal employment opportunities or practices were existing in the public service organizations. Gender unit department (division) activities were incorporated in the basic organizational core policy goals, objectives, and projects. Job responsibilities and mandates for the gender unit departments or divisions were existing in the public sector offices;

However, the research showed that the human resources development aspect was not building the capacity of the public sector staff in terms of incorporating gender-specific issues into the organizational human resources development planning; offering gender-specific trainings; and delivering a number of gender specific-awareness forums, workshops, and review meetings to the employees at both administrative levels in the region. The practices of documenting, updating, respecting, and utilizing the existing job descriptions for the GU staff were practiced as the organizational human resource practices to building the capacity of the public sector staff at the regional and local administrative level in the Gambella regional state. Finally, the study has confirmed that the work organization aspect of the organizational human resource practices was not contributing to building the capacity of the public sector staff in terms of:

- i. Providing opportunities to the GU staff to share experiences, ideas, and suggestions among their sections and with other departments through staff meetings;
- ii. Creation of opportunities to the GU staff to provide inputs and suggestions into organizational the decision-making processes;

- iii. Establishing a team work among the organizations' staff members and the GU staff members;
- iv. Freely sharing information among all staff members and gender units' staff; and
- v. Encouraging GU staff to take initiative and be self-motivated at the regional and local administrative levels in the region.

ABSTRACT

The high level of the role of dekhkan farms in improving the socio-economic well-being of the country makes it necessary to conduct research on scientific and practical problems in these areas. This is primarily to ensure the employment of their population as well is associated with an increasing contribution to social issues such as improving welfare. For this reason, the peasant economy has a key role as a business entity that is rapidly adapting to market relations. At a time when agriculture is becoming increasingly important for the economy of our country, there is a need to study their socio-economic significance, the laws of development. The next task is to create ways to achieve high efficiency in increasing the efficiency of crop production on farms. Today, the rapidly growing demand of the population for agricultural products shows that attention in agriculture is extremely necessary. As a result of intensification in production, the increase in agricultural production in line with market demand, processing, cooperation relations and increase the income of direct agricultural producers. Economic efficiency can be achieved through the use of scientific knowledge, especially on a farm that grows basic food products.

KEYWORDS: Agriculture, Farmers, Dekhkan Farms, Landowners, Agricultural Products, Development, Quality Products, Demand, Increase.

INTRODUCTION

The activities of farms and landowners play a key role in the agricultural economy of the world. They are representatives of an important sector in agriculture in the production of quality and marketable food products. In particular, in Asian countries, Russia and Eastern Europe, the activities of private owners - farmers - are widely used in the creation of 38-42% of agricultural production.

The drastic changes in the global climate, the steady growth of the population and the demand for agricultural products indicate the need for consistent continuation of reforms in the agricultural sector. Currently, 10% of the world's population suffers from hunger, and more than 30% of the world's population suffers from malnutrition¹. With the rapid growth of the world's population, limited opportunities for growth in food production, the issue of food security is becoming more and more pressing in countries and regions. This makes it necessary to increase the production of intensive food products through the targeted use of farmland. In our country, large-scale reforms are being carried out to expand the volume of food production, introduce innovative market mechanisms in the system and implement them, while protecting the legal interests of farmers and landowners. Therefore, the Action Strategy for the further development of our society prioritizes issues such as "further support of agricultural producers, ensuring the efficiency of use of farmers, peasants and arable land, and ultimately radically change the attitude of landowners to increase incomes."² The implementation of these tasks shows the need to develop the cultivation of quality agricultural products on farms.

In the context of the pandemic, strengthening the health of the population and ensuring food security has become a topical issue. According to the recommendations of the World Health Organization, it is important to increase the consumption of local fruits and vegetables in order to promote a healthy lifestyle among the population. In order to increase the efficiency of cultivation of quality and useful products on farms and plots of land in the country, to significantly improve their economic performance, to improve the systematic approach to production, intensive development of farms and landowners, increase the volume and quality of agricultural products extensive scientific research is underway. Proof of our opinion is the fact that in the implementation of relations with the population and businesses, electronic documents, online loans to farmers, reducing the tax burden. "In addition to the establishment of large-scale virtual communication between the population and government agencies, the further development of democratic civil society in the country, it is important to qualitatively increase the effectiveness of public activities as a key target institution"³. At present, in the world practice, one of the priorities is to improve the activities of farmers and landowners, the development and promotion of innovative ideas in this process.

In recent years, Uzbekistan has taken structural measures in the field of agriculture, in particular, targeted measures to develop the activities of farms and landowners on a multi-sectoral basis, financial support of the sector, the development of the sales system. However, the current stage of economic reforms in agriculture requires an increase in the quality of products, along with an increase in the volume of production on the lands of the population. The Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 states that "... first of all, it is necessary to stimulate and develop diversified farmers engaged in processing, preparation, storage and sale of agricultural products priorities such as "creating conditions"⁴. Effective implementation of these tasks requires the study and efficiency of agricultural

economic activity of the regions, further improvement of the system of economic indicators of farms and the population, study of scientific and methodological bases of the industry, research and forecasting of economic development in the region.

MATERIALS AND METHODS

“On Additional Measures to Ensure Rapid Entrepreneurship Development, Comprehensive Protection of Private Property and Qualitative Improvement of the Business Environment” of the President of the Republic of Uzbekistan dated October 5, 2016 No. 4848, February 7, 2017 “Action Strategy for further development of the Republic of Uzbekistan PD-4947 of the President of the Republic of Uzbekistan dated October 9, 2017 "On measures to radically improve the system of protection of the rights and legitimate interests of farmers, dekhkan farms and landowners, the efficient use of agricultural land" PD-5199 Resolutions of the Cabinet of Ministers of the Republic of Uzbekistan dated March 4, 2017 No 119 "On additional measures for the efficient use of land and dekhkan farms, the development of water-resistant, export-oriented tree plantations" and the President of the Republic of Uzbekistan PD-3318 of October 10, 2017 "On organizational measures for further development of the activities of farmers, dekhkan farms and landowners", May 18, 2020 "On additional measures to improve the activities of farmers, dekhkan farms and landowners" Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated January 30, 2020 No. 53 "On measures for more efficient use of land plots of farms and residential areas" and other legal acts related to this activity performance of duties will shed light on the legal basis of this topic.

The issues of studying the agricultural sector, including the socio-economic development and prospects of dekhkan farms, have been studied by many foreign scholars. In particular: A.V.Chayanov, G.I.Shmelev, A.I.Shapochnikov, S.A.Belozyorov, E.Budko, A.Bobok, V.Jerebin, A.Romanov and others and the results of scientific research are important.

B.B.Berkinov, B.T.Salimov, R.Kh.Husanov, O.Zokirov, S.Gafurov, on further development and increase of efficiency of activity of dekhkan farms in the agrarian economy of Uzbekistan. U.P.Umurzakov, N.S.Khushmatov, S.Hoshimov, O.Mahmudov, N.M.Narzullaev, H.R.Yakubova, S.N.Usmonov, Yu.T.Dodobaev, R.Khakimov, M.Ch.Kasimov, R.Kh.Ergashev, S.N. Khamraeva, Z.S.Shokhodjaeva, G.T.Samieva and others conducted scientific researches.

In order to further study the cultivation of crops on farms and farmland, the development of the agricultural sector in the regions, the factors affecting them, the potential and prospects of the regions, these aspects serve as a basis for choosing the topic of this dissertation. .

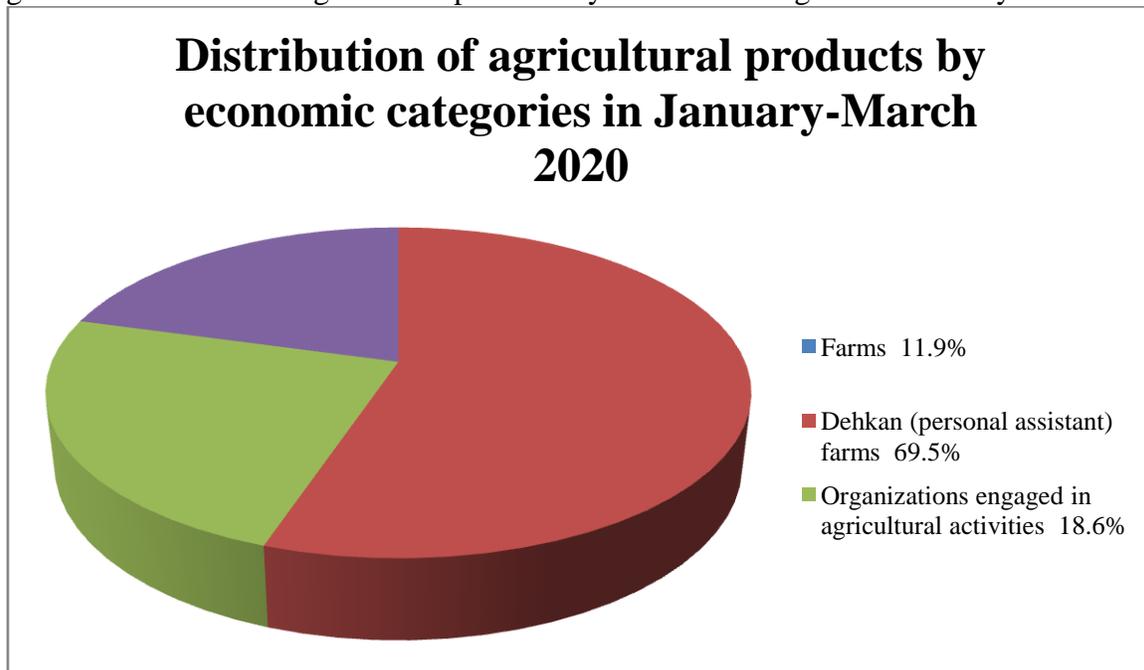

The analysis of M. Kasimov, who conducted research on the development of farms, is recognized, noting that along with the positive effects of these reforms, these reforms did not ultimately allow the full formation of a sense of ownership. “This, in turn, has failed to increase interest in the end result of production, as well as to create good conditions for increasing the efficiency of the use of fixed assets. Only when the ownership of property is based on the law will it be possible to form a class of owners in the village.”⁵

RESULTS

In agriculture, the products are mainly grown on farms and dekhkan farms, as well as on the lands of the population. In this case, the main component of the product consists of vegetables

and melons, the cultivation process is carried out seasonally. The distribution of agricultural products by economic categories in January-March 2020 is shown below (Figure 1):

Figure 1. Distribution of agricultural products by economic categories in January-March 2020

In January-March 2020, all categories of farms produced 62,617 tons of vegetable products. This is 11.3% more than in January-March 2019. The analysis of vegetable production by categories of farms shows that 69.5% of the total volume of vegetable production falls on the share of dekhkan (personal assistant) farms.

“Agriculture intensification may expand farmland reducing habitat area fostering population declines at the “natural” patches (via habitat reduction and decreasing species intra patch flux through the matrix), as well as at the farm site by direct effect of intensification (heterogeneity reduction and pesticide use), leading to a species extinction and ecosystems services loss. This multiple negative effect of agriculture intensification is worsening in regions where habitat proportion is below 30%, such as in many tropical biodiversity hotspots, making LSH a much safer strategy for conservation and food security”⁶.

It can be seen that the bulk of agricultural production falls on the share of dekhkan farms. It is important to supply quality and useful products to food markets in a cheap and convenient way⁷. Therefore, in such a situation, farmers and landowners are required to have the necessary scientific skills and hard work.

Given the growing demand of our people for quality food in the context of the pandemic, food security has become a key issue. At the same time, agricultural producers have a great responsibility.

DISCUSSION

As a result of measures taken in Uzbekistan within the framework of a number of state programs to prevent and mitigate the effects of the global financial and economic crisis, the number of

farmers and landowners is growing, and the volume of agricultural production in demand across the country is growing. In particular, as of January 1, 2020, the number of dekhkan farms and landowners in the country reached 4,548,927, and the total area under crops was 431,998.4 hectares. In Kashkadarya region, there are 462,606 dekhkan farms and landowners with 55,964 hectares of land at their disposal. The growth of these indicators from year to year is the result of high attention and incentives to farmers and landowners.

In order to further increase the role of farms and farmland in the national agricultural sector, the following should be widely introduced:

- preparation of scientific and practical proposals for the development of a system of economic indicators of farms;
- Development of proposals for the transition of the economic system of farms and landowners to new innovative agricultural technologies;
- Study of the state of socio-economic development of the agricultural sector in Kashkadarya region, trends, factors affecting them;
- economic analysis of the relationship between the main trends in the production of agricultural products on farms and farms;
- Development of scientific proposals for the expansion and forecasting of quality and volume of agricultural products;
- Development of innovative methods of agricultural production, taking into account the seasonal components.

CONCLUSION

It can be concluded from the above considerations. Many scientists have conducted scientific research and applied research on the cultivation of quality products in agriculture.

- Improving the "field-to-store" system of agricultural production on the basis of indicators of increasing the efficiency of agricultural production;
- Inter-regional competitions between farmers and landowners based on the principle of "Every family is an entrepreneur." In this case, the main focus is on product quality and volume;
- Development of multivariate economic forecasts for the growth of agricultural production until 2025;

By implementing these measures, it will be possible to further increase the share of farms in GDP. As a result:

- economic analysis of factors influencing the processes of socio-economic development of the agricultural sector;
- Scientific proposals for the organization of farms specializing in agriculture will be developed;
- Analysis of the volume, dynamics of agricultural production and the creation of economic models;
- Scientific proposals for the analysis of economic indicators in order to economically develop the activities of farmers and landowners and to determine their effectiveness;

- Innovative systems are proposed for the development of the agricultural sector, on the basis of which the future directions of development of the industry in the regions are substantiated.

ACKNOWLEDGEMENT

The scientific significance of the topic is that multi-factor complex economic analysis methods can be used in economic research of socio-economic development of farms in the regions, in the development of economic forecasting options and in studying the factors influencing the economic development of landowners.

The practical significance of these recommendations can be widely used in the development of targeted programs, measures and roadmaps to increase the efficiency of agricultural development in the regions of the country, especially in Kashkadarya region, to identify promising areas.

On the basis of the positive solution of the issues of increasing the efficiency of cultivation, as well as the scientific results obtained on the economic study of the activities of farmers and landowners:

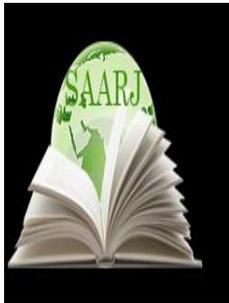

- Proposals to improve the system of economic indicators of agricultural activities on the basis of "drip irrigation" and "rain irrigation", "cluster" technology, service infrastructure and efficiency of agricultural products, which affect the changing trends in agricultural production Kashkadarya Regional Economic Committee implementation of the Department of Agriculture and Environmental Economics. The implementation of these proposals will increase the level of reliability of economic information in the agricultural sector by 10-12%;
- On the basis of the organization of farms specializing in the production of horticultural products, the proposals for improvement will lead to the gradual development of agriculture in the region. The implementation of these proposals will ensure the effective use of scientific and practical knowledge in the formation of the industry, the reliability and transparency of the disseminated information;
- Proposals to improve the dynamics of cultivation of the main types of agricultural products on the basis of quality indicators to increase the efficiency of production through the introduction of "field-to-store" system will make a significant contribution to the development of agriculture in Kashkadarya region. The implementation of these proposals will allow the use of information technology and the system of economic indicators in the production of products on farms and farmland;
- It is planned to determine the forecast indicators of agricultural production in Kashkadarya region until 2025. In this case, the natural climatic conditions, fixed assets, working capital, internal and external investment climate are fully taken into account.

“If there is some decrement in per-hectare agricultural yield from wildlife-friendly compared with intensive agriculture and if the relationship between land-use intensity and measures of diversity is concave (upward) for a substantial number of species (both reasonable assumptions), then more bird diversity (in their analyses) could be sustained by partitioning land between intensive agriculture and reserves than by practicing wildlife-friendly farming”⁸.

Every researcher has their own ideas, worldviews. However, the goal is one. If the quality products are delivered to our people in a timely manner at low prices, a healthy and stable environment will develop in society.

ECONOMETRIC MODELING OF THE DEVELOPMENT OF EDUCATIONAL SERVICES TO THE POPULATION OF KASHKADARYA REGION

Anvar Norimovich Rakhimov*

*Associate Professor,
Karshi Engineering-Economical Institute,
UZBEKISTAN

ABSTRACT

The factors influencing the development of the public education service sector have been studied, the interrelationships between them have been analyzed, and multi-factor empirical models have been built based on them. An economic analysis of the constructed model was made and forecasted based on it.

KEYWORDS: *Socio-Demographic, Socio-Professional, Socio-Domestic, Socio-Psychological, Socio-Economic, Empirical Model, Correlation Coefficient, Regression Equation, Covariance, Student Criterion, Darbin-Watson Criterion, Fisher Criterion, R-Probability, Elasticity Coefficient, Determination Coefficient, Standard Error Of Regression, Akayke's Information Criterion, Schwartz's Information Criterion.*

INTRODUCTION

If we look at the welfare trends in the regions of the country, which do not depend on the level of income, the service sectors are education, health, utilities, clean drinking water and heating.

If we study the current state of education services and the development of this sector, we can see the following pressing issues in the development of educational services: to determine the classification of types of educational services provided to the population, to assess the nature of the field of educational services, to develop a system of indicators of educational services in the current situation, to improve the process of econometric modeling and forecasting.

President of our country Sh.M. Mirziyoyev in his address to the OliyMajlis on December 29, 2020, emphasized the following in the field of education:¹

- The coverage of preschool education will increase to 65% and by 2023 to 75%;

- 600 billion subsidies will be allocated for the construction of kindergartens, it is planned to build 2,000 private kindergartens;
- 30 new schools will be built, 320 schools will be repaired, for which 2 trillion soums will be allocated;
- Higher education grants for girls in need of social protection will be doubled (up to 2000);
- The number of young people sent abroad to study through the El-Yurt Umidi Foundation will be increased fivefold. For the first time, 200 boys and girls will be sent for a bachelor's degree;
- 10 Presidential schools, 197 schools specializing in chemistry, biology, mathematics, information technologies to open in Uzbekistan in 2021;
- Next year, the number of doctoral students in universities and research organizations will reach 4.5 thousand, and an additional 240 billion soums will be allocated from the budget;
- The authority to award the academic titles of associate professor and professor, the degree of Doctor of Philosophy and PhD is transferred to the scientific councils of prestigious universities.

Based on the above reforms in the field of education, the factors influencing the growth of the effectiveness of educational services to the population can be grouped as follows:

Socio-demographic: covers the system formed by the location, sex, age, marital status of the population;

socio-professional: industrialization of production, training and vocational guidance system, ie education, specialization, internship, skills development;

socio-domestic: including the improvement of living standards and housing, cultural and domestic services, the solution of transport problems, the organization of public catering and medical services, the availability of preschool institutions, the effective organization of leisure and leisure;

socio-psychological: reflects the socio-psychological state of the work team in the enterprise, group, job satisfaction, the development of mutual assistance and friendship, the formation of a healthy spiritual state;

socio-industrial: covers the organization of labor, participation in competition, the system of remuneration of labor, remuneration based on the work performed, labor discipline;

socio-economic: this includes the level of wages, per capita income.

Such grouping of social factors influencing the development of education services allows full use of management in the development of development.

Education plays an important role in the development of all sectors of production and services through intensive factors, the growth of labor productivity depends to some extent on the training and effective use of personnel.

The following sectors of the economy are included in the social sphere: housing and communal services, non-industrial types of public services, passenger transport, communications (in the field of social organizations and public services), water management (in the social sphere),

health, physical culture and social security, education, culture and the arts, credit and public insurance, government and public administration².

Therefore, the role of educational institutions in the education system is an important link and plays an important role in the comprehensive development, development and upbringing of children, as well as preparing children for society, as well as creating new jobs by expanding the network of preschool institutions. creates conditions for.

We have selected the following factors in order to build a multifactorial empirical model, taking into account the factors influencing the development of public education services, and have made the following definition:

$T_{o'x}$ – provision educational services to the population of the region (in billion of soums) - Y;

O'_s – the number of teachers per thousand students in the province – X_1 ;

TFO_{bx} – total costs associated with improving the welfare of the population of the region (in billion of soums)– X_2 ;

MK_x – provision of household goods and computer repair services to the population of the region (in billion of soums) – X_3 ;

X_{tx} – expenditures on public education in the region (in billion of soums)– X_4 ;

Based on the field of education services to the population and the factors influencing them, we have created the following general functional view:

$$T_{o'x} = \varphi_7(O'_s, TFO_{bx}, MK_x, X_{tx}) + \varepsilon_1 \quad (1)$$

TABLE1 STATISTICAL DATA ON THE VOLUME OF EDUCATIONAL SERVICES PROVIDED TO THE POPULATION OF KASHKADARYA REGION AND THE FACTORS INFLUENCING IT FOR 2004-2018

$T_{o'x}$ - providing educational services to the population of the region Y	O'_s -the number of teachers per thousand students in the province X₁	TFO_{bx} -total costs associated with improving the welfare of the population of the region X₂	MK_x -provision of household goods and computer repair services to the population of the region X₃	X_{tx} - expenditures on public education in the region X₄
3.9	53.3	20.3	4.7	56.576

11.9	52.7	34.5	7.6	90.9
15.2	53.8	43.9	11.2	121.1
18.9	55.4	79.2	20.7	170.0
32.3	56.1	108.3	30.8	223.2
39.3	53.9	128.1	48.4	294.8
38.9	52.7	127.3	60.6	369.0
46.2	51.6	149.4	61.8	469.1

69.6	49.8	136.5	92.3	557.6
89.8	48.0	147.1	135.4	674.1
106.5	47.0	165.6	185.3	746.1
131.1	45.4	150.7	216.4	848.8
163.9	47.3	165.6	226.5	984.9
227.8	50.7	239.9	256.5	1331.9

One of the basic rules of constructing a multivariate empirical model is to determine the bond densities between the factors selected for the model, i.e. to investigate the problem of multicollinearity of the relationship between the selected factors. To do this, the correlation coefficients between the factors are calculated, x_i and y_i variables $i=1, \dots, n$ when accepting values, the most common indicator showing a linear relationship between x and y is the correlation coefficient. It is calculated as follows:

$$r_{xy} = \frac{Cov(x, y)}{\sqrt{Var(x)}\sqrt{Var(y)}}. \quad (2)$$

the value in the form of equation (2) is determined by the following ratio:

$$Cov(x, y) = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y}) \quad (3)$$

x and y is called the covariance of the variables and is found as follows:

$$Cov(x, x) = Var(x), Cov(y, y) = Var(y). \quad (4)$$

The correlation matrix between the factors influencing the development of each sector of the service sector in Kashkadarya region was calculated in the program Eviews 9. For example, the number of teachers per thousand students in the region, the total cost of improving the living standards of the population, the cost of public education in the region and the repair of household goods and computers were selected as factors influencing the modeling of quality education services in the region. We conduct an autocorrelation analysis to determine if there is no multicollenity between these factors (Table 2).

TABLE 2 CORRELATION MATRIX BETWEEN FACTORS AFFECTING THE NETWORK OF EDUCATIONAL SERVICES TO THE POPULATION OF THE REGION³

Sumsquaredresid	155.3005	Schwarzcriterion		6.077872
Loglikelihood	-38.81391	Hannan-Quinncrier,		5.839341
F-statistic	965.8553	Durbin-Watsonstat		2.369623
Prob(F-statistic)	0.000000			

If there is no autocorrelation in the residuals of the resulting factor, then the value of the calculated DW criterion will be around 2.

It was found that the value of the DW criterion calculated from the empirical models built for each network of the service sector is higher than the table value. This indicates that there is no autocorrelation in the resulting factor residues. The Fisher and Student criteria were calculated and the calculated value was compared with the table values to determine their magnitude from the table values.

The appearance of the empirical model based on the factors affecting the provision of educational services to the population of Kashkadarya region is as follows:

$$Y = -263,794 + 4,954 * X_1 - 0,283 * X_2 + 0,320 * X_3 + 0,169 * X_4$$

$$t \quad \quad \quad (-7,528)(7,502)(-5,965)(4,094)(8,711)$$

(7)

TABLE 4 COEFFICIENT OF ELASTICITY OF THE EMPIRICAL MODEL BUILT TO PROVIDE EDUCATIONAL SERVICES TO THE POPULATION OF KASHKADARYA REGION

<i>T_{oX}</i> -model coefficients of providing educational services to the population of the region			
Variable	Model coefficients	Standardized coefficient	Elasticity coefficient
X ₁	4.954385	0.247513	3.810989
X ₂	-0.282665	-0.269612	-0.485385
X ₃	0.320081	0.437684	0.435337
X ₄	0.169310	0.991042	1.183737
C	-263.7938	NA	-3.944678

The multifactorial empirical model developed for the development of educational services (Y) in the region has yielded the following results: the volume of educational services provided to the population of the region (Y) will increase by 3.81% if the number of teachers per thousand students in the region (X1) is increased by 1%, the total cost of improving the living standards of the population of the region (X2) increased by 1%, decreased by 0.49%, the volume of household goods and computer repair services to the population of the region (X3) will increase by 1% to 0.44% and expenditures on public education in the province (X4) will increase by 1.18 per cent if they increase by 1 per cent (Table 4).

TABLE 5. FORECAST OF SERVICES FOR THE POPULATION OF KASHKADARYA REGION (BILLION SOUMS / THOUSAND SOUMS)

Indicators	2019 (real)	Forecast years					
		2020	2021	2022	2023	2024	2025
$T_{o'x}$ —providing educational services to the population of the region Y_7 / per capita	287,90	380,64	501,95	657,77	854,66	1098,7	1397,6
	88,65	115,04	148,96	191,73	244,77	309,3	386,7

We achieved the following efficiency when forecasting using empirical models: As can be seen in Table 5, the consistent implementation of the priorities set out in the Presidential Decree "On the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021", empirical models for future development of education in Kashkadarya region. The analysis of the results of the forecasts obtained taking into account the ongoing reforms shows the following:

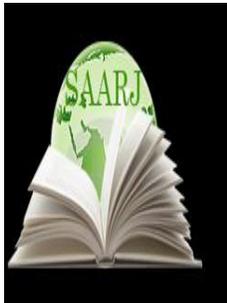

Provision of educational services to the population of Kashkadarya region ($T_{o'x}$) is projected to increase 1.32 times in 2020 compared to 2019, and 4.85 times by 2025.

In short, socio-economic factors have a significant impact on the development of education. At the present stage, the full use of all the system of economic and social factors for the development of the education sector is an objective necessity for the development of the sector.

THE ROLE OF SERVICES IN HOUSING AND UTILITIES AND THEIR OPPORTUNITIES TO INCREASE EFFICIENCY

Yuldasheva Shahribonu Anvar qizi*

*Assistant,
 Karshi Institute of Engineering and Economics,
 UZBEKISTAN

ABSTRACT

This article describes the activities of housing and communal services, the types of services, the ongoing reforms to improve the efficiency of utilities and the solution of the problem of employment. The sharp increase in the service sector in the housing and communal services sector has created additional jobs for state-owned enterprises and organizations, those laid off from institutions, and so on.

KEYWORDS: *Housing, Utilities, Services, Efficiency, Employment, Reforms, Social Services, Services*

INTRODUCTION

In the context of deepening globalization, intensification of competition, increasing the level of production and services, the quality of services, including housing and communal services, the social and economic spheres. The objective need for the development of this sector is explained by the positive impact on improving the quality of life of the population, as well as increasing employment.

Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No 4947 "On the Strategy for further development of the Republic of Uzbekistan" to create new jobs and ensure employment of the population, especially graduates of secondary special and higher education institutions and reduce unemployment; creation of conditions for full implementation of labor and entrepreneurial activity of the able-bodied population, improvement of the quality of labor force, expansion of the system of vocational training, retraining and advanced training of persons in need of employment, etc. [1]

“The share of the service sector in the GDP of developed countries is 75% and the share of employment is more than 70%. Employment in the service sector of the economy exceeds 75%

in developed European countries, 80% in the United States and 82% in Japan ”[16]. From this point of view, special attention is paid to the development of modern services in the world, increasing the volume and quality of services.

Review of the literature on the subject

The issues of service in housing and communal services have been studied in detail by domestic and foreign economists. In particular, among the scientists of our country H.M. Mamatkulov, Q.J. Mirzaev, M.Q.Pardaev, J.I.Isroilov, A.Q. Gapparov, Yu.P.Urinbaeva, J.M.Kurbanov¹ have developed proposals to improve the service and increase its efficiency in housing and communal services in Uzbekistan. Also, foreign scientists L. Demideva, K.R. McConnell, S.L. Brew, A. Marshall, Yu.P. Sviridenko, V.N². Suggestions and recommendations developed as a result of research conducted by Soloveva service in housing and communal services serves as an important theoretical and methodological guide in improving service and increasing the efficiency of the industry.

In the developed countries of the world, due to the process of globalization and its impact on the formation and development of the services market, targeted research is being conducted to provide scientific solutions to a number of problems. In particular, the flexibility, institutionalization and socialization of the services market, competition in the services market, the development of new activities that require higher education and professionalism, the use of new working hours, increased incomes, the development of the national labor market and the interaction of multinational companies and the International Labor Organization. special attention is paid to focused scientific research.

The strategic plans of the Republic of Uzbekistan aimed at improving the structure of employment in the future include “Decent work for the population, especially youth and people with disabilities through the implementation of active measures in the labor market, protection of private property, support of small and large businesses and private entrepreneurship The creation of favorable conditions for the provision of employment and the expansion of effective employment”[2] and in accordance with it, the development of new approaches to the formation of rational and effective employment of the able-bodied population is one of the urgent issues.

The interest of the population in the service sector and the activities of individual entrepreneurs is gradually growing. Because the number and quality of services provided by them is much higher than state-owned enterprises.

The sharp increase in the service sector in the housing and communal services sector has created additional jobs for state-owned enterprises and organizations, those laid off from institutions, and so on. One of the unique advantages of service enterprises is that they have the opportunity to change the type of activity they need, the range of services they provide, the purchase of materials needed for cash, increase or decrease the cost of services. State-owned enterprises did not have such an opportunity.

However, state-owned enterprises also had advantages over enterprises in the service sector. The main ones were that if the service sector buys buildings and equipment at its own expense, the state-owned enterprises are financed according to the plan, and the service sector has old equipment at its disposal, which makes it difficult to fulfill orders on time. experienced. However, wages in the service sector were higher than in state-owned enterprises.

There were shortcomings in some areas of service. That is, part of the salary is directed to the development fund of the service sector. Some of the service sectors, knowing the shortage of services, have gained additional income by unreasonably raising their prices.

Despite the above-mentioned shortcomings, the service sector has played an important social role in the life of the country. That is, they have been able to increase consumers' leisure time by reducing less productive labor at home.

The development of the service sector could not solve the existing problems in the service sector as they were part of the service sector.

Nevertheless, consumer services of any form are considered to be one of the most convenient forms of organization of the service system and are based on the principles of self-sufficiency, self-management.

Analysis and results

Statistical reporting of services by types of economic activity in the Republic of Uzbekistan is carried out in accordance with the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated February 26, 2016 No 55 "On the program of development of services in 2016-2020".

The production of services by type of economic activity is differentiated according to the level of income, taste and desire of consumers. In particular, compared to 2018, the share of transport services increased from 28.2% to 30.5%, communication and information services from 6.7% to 6.9%. At the same time, the share of financial services increased from 10.7% to 12.6%, and services in education from 3.5% to 3.7%.

TABLE 1 SERVICES IN THE REPUBLIC OF UZBEKISTAN IN 2011-2018

Indicators	2011 year	2012 year	2013 year	2014 year	2015 year	2016 year	2017 year	2018 year
I. Volume of services (at current prices), trillion sum	33,7	42,6	53,7	65,9	118,8	75,4	92,5	95,7
<i>increase compared to the previous year, %</i>	117,2	114,7	114,4	115,1	110,7	114,0	114,5	115,4
<i>Growth compared to 2010, %</i>	117,2	134,4	153,8	177,0	2,6 п.	2,0 п.	2,3 п.	2,5 п.

II. Volume of services provided per capita, thousand soums	1148,7	1429,1	1774,0	2141,9	3668,3	2407,6	2905,6	2975,9
--	--------	--------	--------	--------	--------	--------	--------	--------

The steady growth of demand for various types of services by the population and the practical measures taken by the state to develop infrastructure (social, transport, telecommunications, trade, etc.) have allowed the rapid development of all sectors of the service sector.

Today, 49.8% of those employed in the economy are in the service sector. If we analyze the structural structure of employment in the services sector, a large share falls on activities such as wholesale and retail trade, education, transportation and storage, health care and social services.

Comprehensive development of the housing and communal services sector, improving the living standards of the population and ensuring sustainable economic development through productive employment are urgent issues.

As the President of the Republic of Uzbekistan Sh. Mirziyoyev noted: “In the new year, the ultimate goal of economic reforms will be to reduce poverty and increase the welfare of the population. These strategic goals will be achieved through high economic growth that creates equal opportunities for all. The scope of our work to provide housing for needy families will be further expanded. At the same time, 27,000 families, or 2.5 times more than this year, will receive 2.4 trillion soums to pay the down payment on mortgage loans and subsidize interest rates. [3]

It is necessary to accelerate the process of urbanization in our country, to comprehensively develop the regions, to create decent living conditions for the population. Within the framework of this work, 12 satellite towns adjacent to 7 major cities - Andijan, Bukhara, Samarkand, Karshi, Fergana, Namangan, Nukus were selected and comprehensive measures for their development were developed.

Another issue related to this task is that there is a gap between our regions where the main workforce lives and where jobs are created. The solution is to liberalize internal migration.

Therefore, the international experience in reforming the propiska system by April 1, 2020 has been studied by the parliament and the government, and specific proposals on this issue have been developed.

Without the active involvement of the private sector in housing construction, it is impossible to fully meet the demand for housing. That is why a new mortgage system is being introduced. In this regard, about 18,000 houses will be built by the private sector in the cities of the regions and in Tashkent, and 4,000 in rural areas. The state will allocate about 4 trillion soums through auctions to ensure healthy competition between banks.

In order to support the poor, 1 trillion soums will be allocated from the budget to cover the initial cost and interest on loans for housing for 16,000 families in cities.

As President Sh. Mirziyoyev said: “My greatest intention is that if everyone in our Motherland has its own “small homeland” - a home, both our people and the Creator will be pleased with us. Today, we have 150,000 children under the age of 18 in need of special attention in our country. It is our duty, first and foremost, our human duty, to educate them, to help them acquire a definite profession, to treat the seriously ill, to help orphans find their place in life, to provide them with housing. In 2021, for the first time, the budget will allocate 50 billion soums to provide housing for 900 Chinese orphans. [3]

In the future, we will prioritize the training of our sons and daughters in modern professions that are in high demand in the labor market, the formation of entrepreneurial skills and diligence, as well as the implementation of their initiatives, employment and housing.

CONCLUSIONS AND SUGGESTIONS

The implementation of targeted programs for the construction of affordable housing, the improvement of road transport, service, development and modernization of engineering and communication and social infrastructure, which will improve the living conditions of the population, requires:

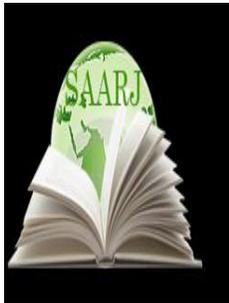

- further improvement of the living conditions of the population, first of all, young families, citizens living in dilapidated houses and other citizens in need of housing improvement through the allocation of mortgage loans on favorable terms and the construction of affordable housing in urban and rural areas;
- radically improve the provision of clean drinking water in rural areas by increasing the level of public utilities, first of all, through the construction of new drinking water networks, the gradual introduction of cost-effective and efficient modern technologies;
- Ensuring that people live in an environmentally safe environment, building and modernizing complexes for processing household waste, strengthening their material and technical base, providing the population with modern facilities for waste disposal;
- radical improvement of transport services to the population, increase of safety of passenger transport and reduction of emissions of harmful substances into the environment, purchase of new comfortable buses, construction and reconstruction of bus stations and bus stations;
- Continuation of construction and reconstruction of road infrastructure, first of all, development of regional highways, capital and current repair of inter-farm rural roads, streets of settlements;
- Implementation of measures to improve the supply of electricity and other fuel and energy resources to the population through the construction and modernization of new power generation facilities, modernization of low-voltage power grids and transformer substations, as well as expanding the use of renewable energy sources;
- It is necessary to develop and improve the activities of theaters and theaters, cultural and educational organizations and museums, to strengthen their material and technical base.

ABSTRACT

In the article, the provision of food to the population of the country in the context of a pandemic is a very topical and important issue. This article examines the negative impact of the crisis on the income of the population and the problems of providing the population with food, and develops proposals and recommendations for their solution.

KEYWORDS: *Food Products, Horticulture, Peasant (Personal Assistant) Farms, Family Business, Innovative Irrigation Technologies*

INTRODUCTION

The coronavirus pandemic around the world is also having a negative impact on the economy of our country. Significant declines were observed in all real sectors of the economy in industry, agriculture, trade, construction, transport, tourism and other services.

In order to ensure the stability of economic sectors in the country during the coronavirus pandemic, the Decree of the President of the Republic of Uzbekistan "On additional measures to support the population, sectors of the economy and businesses during the coronavirus pandemic" Resolutions and decrees of the Cabinet of Ministers of the Republic of Uzbekistan "On measures for the efficient use of farms and lands, systematic organization of sowing and increasing

production" in order to increase employment and income and ensure food security is one of the most important documents in the organization.

On April 8, 2020, President Mirziyoyev held a video conference on food security, development of horticulture, and on April 14 to further deepen this issue and further increase food production. Representatives of agriculture and food industry While this crisis has been a great test for us, it is safe to say that they have noted that it is a period of great opportunity

Therefore, the agricultural products of our country, which account for 80% of the population's food needs, require the development of proposals and recommendations, studying the problems in this area.

Fatima Nazarova believes that the most effective way to protect the population in a pandemic is to develop entrepreneurial skills and encourage social innovation, which will reduce poverty among the population and further develop family business. It will also be possible to meet the demand of the population for food products by establishing family-based agricultural production on farmland.

At the same time, it is expedient to further improve the mechanism of effective use of entrepreneurs' own funds in the regions, and in places where there is a shortage of funds of commercial banks.

M. Pardaev's scientific articles pay special attention to the following: "The global coronavirus pandemic is also affecting Uzbekistan. In the first quarter of 2020, the economic growth rate in the country decreased by 1.6% compared to the same period last year. In the second quarter of this year, the economic growth rate was 4.1%, a decrease of 1.6% compared to the same period last year (5.7%). M.Pardaev also noted that one of the ways to solve the problems of unemployment and food security is to use the land efficiently.

To date, the government has allocated 350 billion soums from the state budget for the implementation of new projects in the field. The allocation of UZS will create an opportunity to meet the demand of the population for food products through the efficient and rational use of farmland.

MATERIALS AND METHODS

Comparative analysis and comparative analysis methods were used in the study of the problem.

RESULT AND DISCUSSION

In our country, everything is aimed at ensuring man and his well-being. One of the main conditions for a healthy lifestyle is to provide it with quality food. Therefore, improving the quality and ensuring food safety in our country is one of the important tasks. Particular attention is paid to the stable supply of food products to our people in the context of the pandemic, the full satisfaction of the needs of the population through ecologically clean and high-quality fruits and vegetables, melons, grapes, potatoes.

The total volume of products (services) in agriculture, forestry and fisheries in January-June 2020 amounted to 97.2 trillion soums. soums or 102.8% compared to the corresponding period of 2019, including 93.9 trillion soums in agriculture and livestock, hunting and services in these areas. soums (102.7%), forestry - 2.8 trillion soums. soums (102.0%), fisheries - 0.5 trillion.

soums (116.7%). The share of agriculture, forestry and fisheries in GDP (GRP) was 24.1%. The impact of this sector on the absolute growth rate of GDP was 0.6 f.p.

The volume of agricultural production in January-June 2020 amounted to 93.6 trillion soums. soums or 102.7% compared to the corresponding period of 2019, including agricultural products - 39.4 trillion. soums (104.0%), livestock products - 54.2 trillion soums. soums (101.6%).

The analysis shows that 76.7% of the total volume of agricultural production falls on dehkan (personal assistant) farms, 20.0% - on farms, and 3.3% - on organizations engaged in agricultural activities.

The highest share of farms in the structure of agricultural production is in Andijan region (29.4%), the highest share of dehkan (personal assistant) farms is in Khorezm region (83.0%), the highest share of agricultural organizations. It was registered in Tashkent region (10.3%)

The lowest share of farms in the structure of agricultural production is in Khorezm region (15.2%), the lowest share of dehkan (personal assistant) farms is in Andijan region (69.1%), the lowest share of agricultural organizations is in Andijan and Bukhara. regions (1.5%)

The volume of agricultural products in the analyzed period amounted to 39.4 trillion soums or 104.0% compared to the same period in 2019. The share of agricultural products in the total volume of agricultural production was 42.1%.

For example, the largest volume of potato production is 1374.6 thousand tons, or 92.2% of the total volume of cultivation falls on the share of dehkan (personal assistant) farms (Figure 2). Compared to the corresponding period of 2019, an increase of 14.2% was observed in farms, 0.4% in dehkan (personal assistant) farms, as well as 27.2% in organizations engaged in agricultural activities.

The largest volume of melon production, ie 62.9% (128.9 thousand tons) fell to the share of dehkan (personal assistant) farms, and 3.0% was observed in agricultural organizations.

Compared to the corresponding period of 2019, there was an increase of 30.1% in melons on farms, 0.5% in dehkan (personal assistant) farms, as well as 3.2 times in organizations engaged in agricultural activities.

The largest volume of fruit and berry production fell on dehkan (personal assistant) farms, which amounted to 644.1 thousand tons or 63.1% of the total production. The lowest volume was observed in agricultural organizations - 14.0 thousand tons or 1.4% of the total production. The analysis shows that compared to the corresponding period of 2019, the production of fruits and berries decreased by 1.5% in dehkan (personal assistant) farms, 20.1% in agricultural organizations, as well as 29.9% in farms.

The analysis of the statistics shows that in January-June of this year, 65-92% of food products fell on the share of dehkan (personal assistant) farms.

It is no coincidence that special attention is paid to horticulture, which is the main source of employment and income. First, the "Stay at Home" project aims to "keep" people in their homes during the quarantine period in the fight against the pandemic, and secondly, to increase the efficiency of use of farms, land plots and real incomes of our compatriots.

The greatest wealth of our country is its fertile lands. The efficient use of fertile land is the product of the diligence and hard work of every farmer. Because if a farmer plows the land, we live in a land where it grows. This means that we have the opportunity to meet the needs of our people in terms of food supply and security. Our opinion is confirmed by the fact that our citizens are using their land effectively and getting a rich harvest and a large income.

The issue of wide introduction of the experience of high-yielding farmers is also identified as one of the important directions. It is known that the landowners harvested the first crop from their land and also had a good income.

For example, many families living in Kat mahalla of Karshi, Kashkadarya region, bought seedlings and berries grown on their land. Another group of landowners grew crops such as tomatoes, cucumbers, and bell peppers in their backyards, satiating both their families and farmers' markets with the product. In general, there are many such landowners in all regions of the country. Our main task is to popularize their advanced experience and work methods. It is to achieve a high level of income from all land plots in the country.

CONCLUSION

Today, agriculture in our country has great potential, such as increasing incomes, employment, complete elimination of food insecurity, as well as the export of fruits and vegetables to foreign countries.

In order to meet the demand for food products and increase the efficiency of farms during the pandemic, the Presidential Decree "On additional measures to increase the efficiency of use of lands" is one of the timely decisions. subsidies are provided for drilling vertical irrigation wells to irrigate unused land, and for the purchase and installation of drainage facilities from rivers, canals and other water bodies.

Having studied the above-mentioned problems, we consider it expedient for our state and people to take the following measures to provide the population with food during the current pandemic:

1. Ensuring food security and production on the principle of "from the field to the table";
2. Increasing the production of fruits, vegetables, livestock and other food products while ensuring the stability of food prices in the consumer market;
3. Planting crops suitable for each region, growing new high-yielding varieties, increasing the number of greenhouses based on modern innovative technologies where possible, paying special attention to the efficient use of land;
4. To promote the development of animal husbandry, poultry, fisheries, silkworm breeding, beekeeping and home-based work in order to alleviate the crisis;
5. Achieve at least two or three times the yield from the ground using each inch of land efficiently;
6. Further improvement of the mechanism of effective use of funds of commercial banks in the effective organization of the activities of farmers (personal assistants) and farms.
7. Centers for knowledge and innovations in agriculture will be established, where more than 100 agro-services will be provided on the basis of the "single window" principle. Through

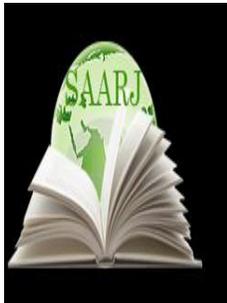

these centers to improve the quality of the soil, fight diseases, provide important services related to the selection of seeds.

8. More than \$ 600 million in loans and grants will be attracted for the modernization of agriculture, digitization, increasing land productivity, the introduction of modern agricultural technologies.
9. The area of lands where water-saving technologies will be introduced will be increased 5 times to 430,000 hectares, and 90,000 hectares of new lands will be developed.

 University of Geological Sciences,
 Tashkent, UZBEKISTAN
 Email id: akmal73@gmail.com

ABSTRACT

Lineament analysis is one of the main methods for automated decoding of satellite images. In this work, the lineament analysis was performed using the LESSA program. As a result, statistical data on lineaments were obtained, such as roses, elongation lines, lineaments density, and a map of lineaments of the Auminzatau mountains was compiled. This map allows a detailed study of faults in this region associated with the mineralization zone.

KEYWORDS: *Satellite Images, Digital Elevation Models, Binary Image, LESSA, Lineaments, Elongation Lines, Rose Lineaments, Lineaments Density, Lineaments Map.*

INTRODUCTION

On all space images (SI), regardless of the geological region, linear objects are highlighted. Linear objects on the SI are called lineaments. The term "lineament" (from the Latin lineamentum - line, line, contour) was introduced into the literature by the American geologist U. Hobbs in 1911 to designate linear relief elements and geological structure elongated in one direction.

Currently, geologists understand lineaments as linear inhomogeneities of the earth's crust and lithosphere of different rank, length, depth and age of occurrence, which are manifested on the earth's surface by geological and landscape anomalies [1-2].

Lineaments as objects of geological mapping have geological and geomorphological and other features. Geological features of lineaments are outcrops of faults on the earth's surface and their direct mapping features: faults and cracks proper, fractured, sheeted, cleaved rocks, dikes and veins, etc., traced by lineaments. Additional geological and hydrogeological features confirming the

existence of disjunctives include manifestations of magmatites (hypabyssal, volcanic rocks), deposits of hydrothermal-metasomatic rocks and ores, mud volcanoes, sources of thermal and mineral waters, outcrops of fractured groundwater, which form spatially isolated linear distribution zones.

Geomorphological features of lineaments are traces of disjunctive dislocations of the earth's crust on its surface, represented by spatially ordered linearly oriented landforms. Mostly these are negative relief forms - rift continental and oceanic depressions, erosional-structural depressions or their elements, river valleys or their sections, canyons, hollows and ravines. Positive landforms, directly or indirectly reflecting the linear orientation of tectonic structures, include mid-ocean ridges, arched-block and stepped uplifts, elongated in one or two directions, chains of volcanic islands, uplands of volcanic origin and laccolithic mountains, mountain ranges and watersheds, linearly oriented rocky outliers, ledges, etc. [3].

Lineaments are well fixed on ERS materials and are widely used to decode linear geological structures. The subject of lineament analysis is usually a lineament diagram, which is a set of lineaments deciphered on ERS materials. Traditionally, lineament schemes are built manually, based on visual decoding of satellite images.

Currently, there are widespread software complexes ERDAS IMAGINE, ENVI, Geomatica and programs developed by leading experts based on the author's technological schemes, such as LESSA, LINEAMENT, ALINA for automated decoding of lineaments with subsequent ordering, combining and statistical analysis. Statistical analysis includes building a set of maps of lineament distribution statistics such as density, main directions of lineaments, etc.

MATERIALS AND METHODS

The algorithm for automatic construction of lineaments is one of the pattern recognition algorithms, it is complex and therefore requires significant computing resources. The simplified scheme of the algorithm is as follows - the image is binarized (i.e., it turns into a two-gradation black and white image), then for each pair of image points a segment connecting them is built, statistics are collected on all image points belonging to this segment, and, according to certain rules, is taken the decision is whether the segment under consideration is a lineament.

In this study, the methodology for the automated selection of lineaments of the Auminzatus Mountains was tested using the LESSA program. As the initial data, we used Landsat-8 multispectral satellite images with a spatial resolution of 30 m / pixel, a digital elevation model (DEM) SRTM with a resolution of 90 m / pixel (Fig. 1).

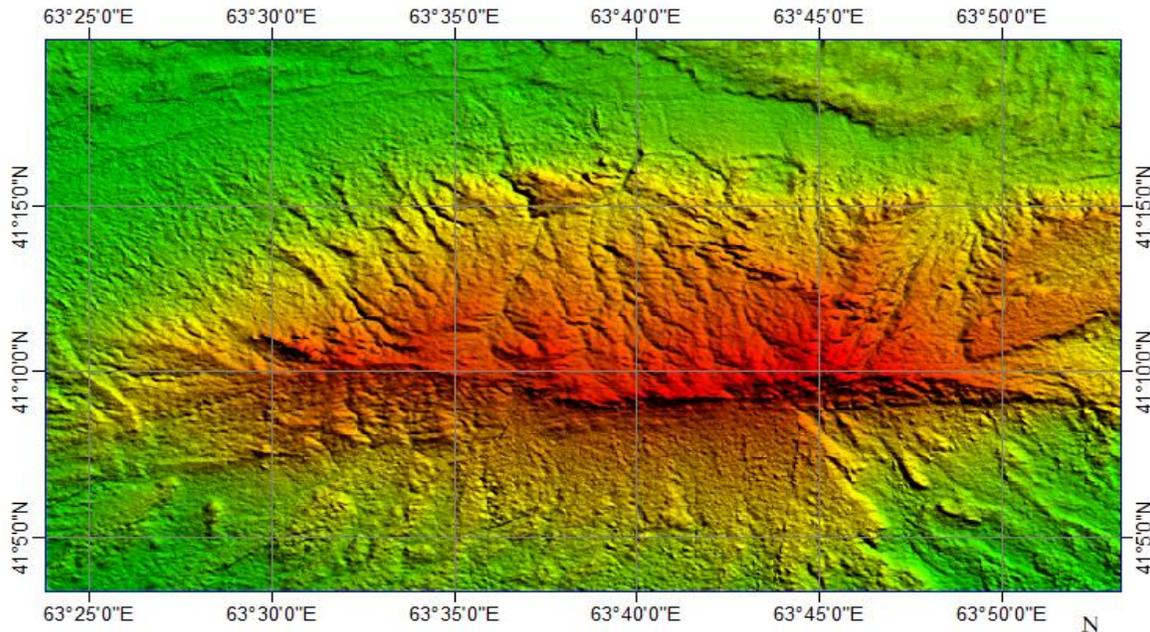

Fig. 1. Digital elevation model of the Auminzataus mountains according to SRTM

The lineament analysis algorithm using LESSA is shown in Fig. 2. Input data can be grayscale images, binary images and digital elevation models. Analysis is based on identifying linear relief elements - strokes. For grayscale images strokes will be the boundaries of homogeneous areas, for digital elevation models - axes of valleys and ridges. The program highlights the strokes of eight different stretches. There are two ways to analyze them further. The first is statistical analysis of strokes. It allows to build pseudo-color images (fields) of the density of strokes of various stripes, the elongation of rose-diagram of strokes, the proximity of the rose-diagrams to the cross, the difference from each other, etc. The second is the construction of extended lineaments. The resulting strokes are combined into straightened lines depending on their extent. However, the lines obtained in this way require further expert judgment, and are nothing more than a prompt about the location of the lineaments.

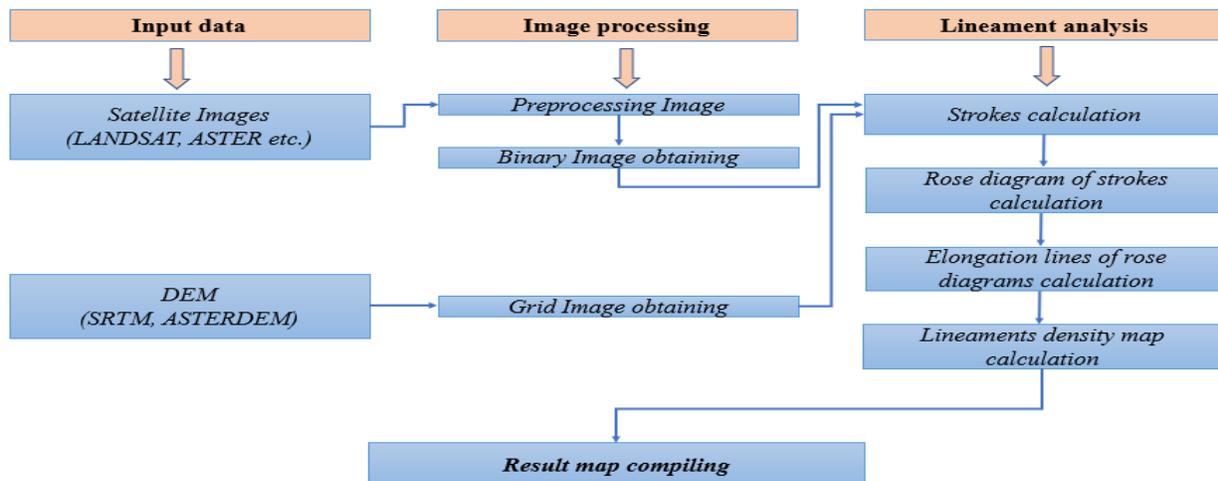

Fig. 2. Lineament analysis algorithm using LESSA

Lineament analysis is based on linear image elements (strokes). The LESSA software automatically detects them and determines the direction (8 directions). In a binary image, strokes are boundaries of homogeneous areas and / or lines, which must be sufficiently long and straight. In digital elevation models, the axes of valleys and ridges are identified and analyzed. An essential feature of working with DEM is that only relief elements are involved in the analysis and brightness anomalies caused by other sources (vegetation, technogenic objects) are excluded (Fig. 3).

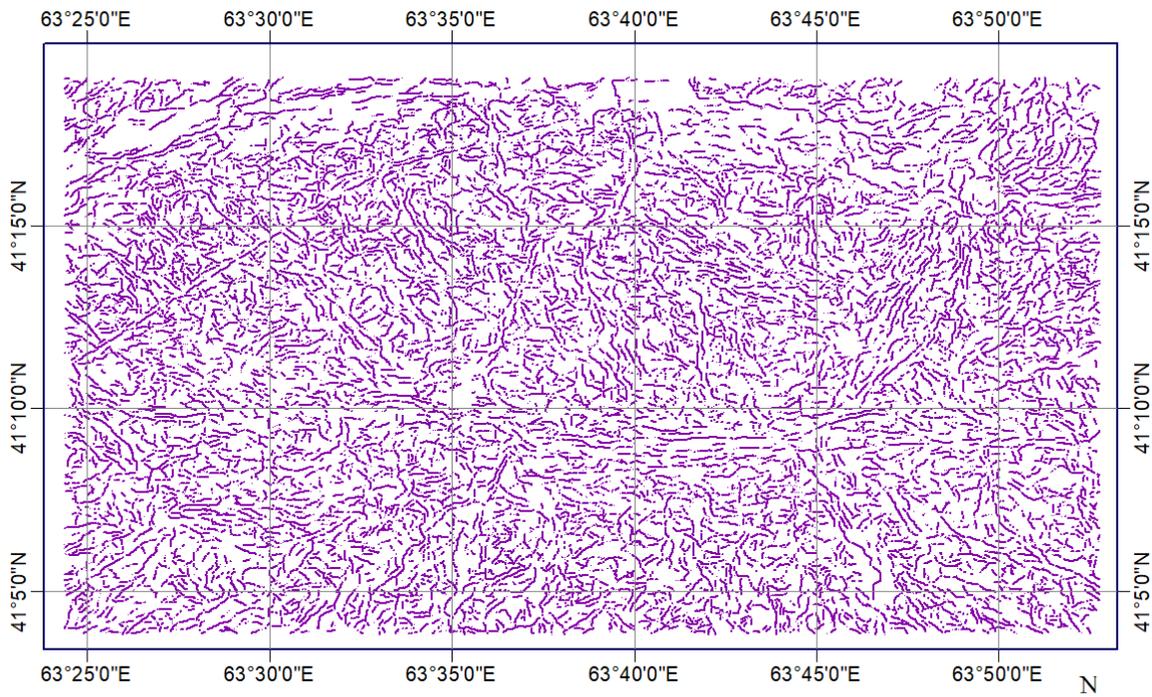

Fig. 3. Short lineaments (strokes)

Through lineaments and lines of elongation of rose diagrams correspond to morphostructural lineaments of the 1st and 2nd ranks, respectively. To identify faults and blocks of higher ranks, it is advisable to use the fields of rose diagrams of striations and the density of striations of various strikes (Fig. 4 and 5).

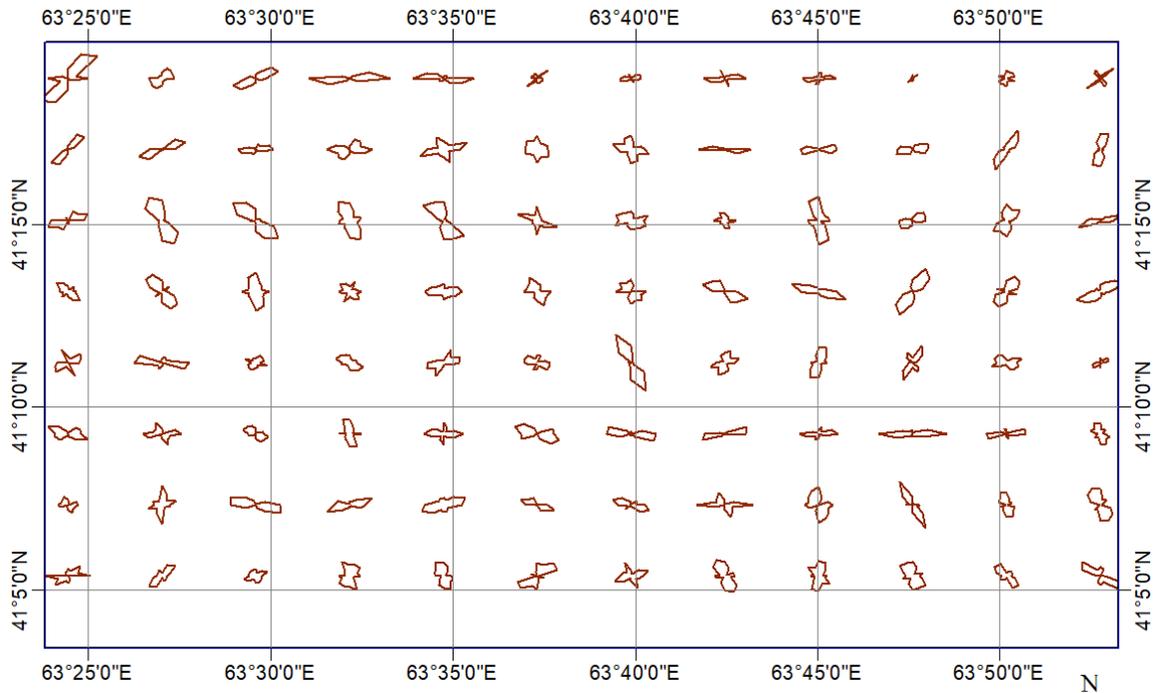

Fig. 4. Rose diagrams of long lineaments

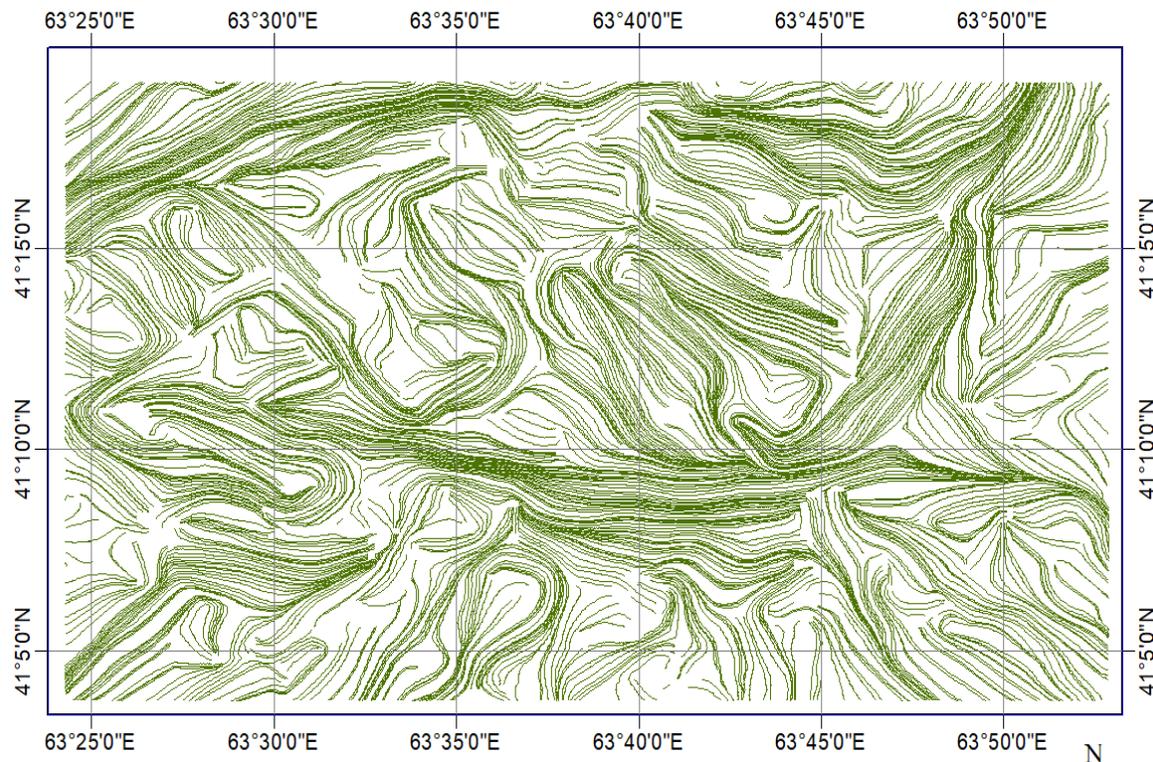

Fig. 5. Elongation lines of rose diagram

RESULTS AND DISCUSSION

An automated lineament analysis of the DEM and the synthesized satellite image of Landsat-8, obtained by synthesizing the spectral channels of the green, red and mid-IR (1.55–1.75 μm) ranges, has been performed. This made it possible not only to identify the indicator statistical indicators of lineaments, but also to carry out a comparative analysis of the results obtained by lineament analysis of images and DEM. As a result of the processing of the image and the DEM, the streak density diagrams were obtained both for the general (along all strikes) and for each strike separately.

Figure 6 shows the line density of the study area. The intensity color scale corresponds to the transitions from the maximum intensity present in the given image to the minimum. The map is built according to the principle of a topographic surface - that is, only adjacent intensities border each other, similar to maps in isolines. Therefore, straight sections with large gradients can be interpreted as faults. Sections with maximum intensities correspond to either uplifting areas with intensely incised small streams, or heavily indented mountain ranges preserved from erosion. Sagging fragments of the area covered by accumulative sediments are characterized by the minimum values of the streaks.

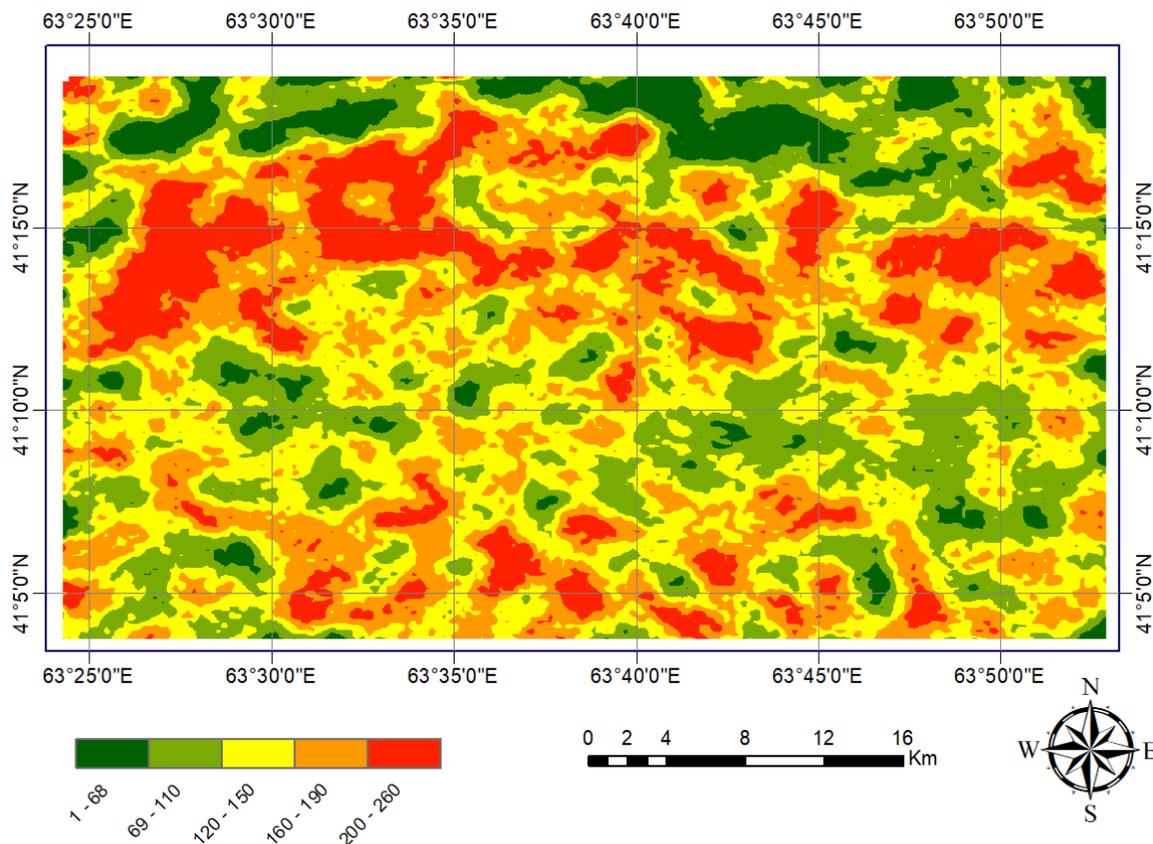

Fig. 6. Lineaments density

When analyzing the obtained data, the linear elements of the studied region were identified, representing faults of different orders, zones of regional and local fracturing. Figure 7 shows a

map of the lineaments of the Auminzatau Mountains. Most lineaments have a latitudinal direction, which corresponds to the orientation of the faults presented on geological and other maps of the region. Lineaments oriented to the north-south and north-west direction indicate the block structure of the study area and require further detailed study.

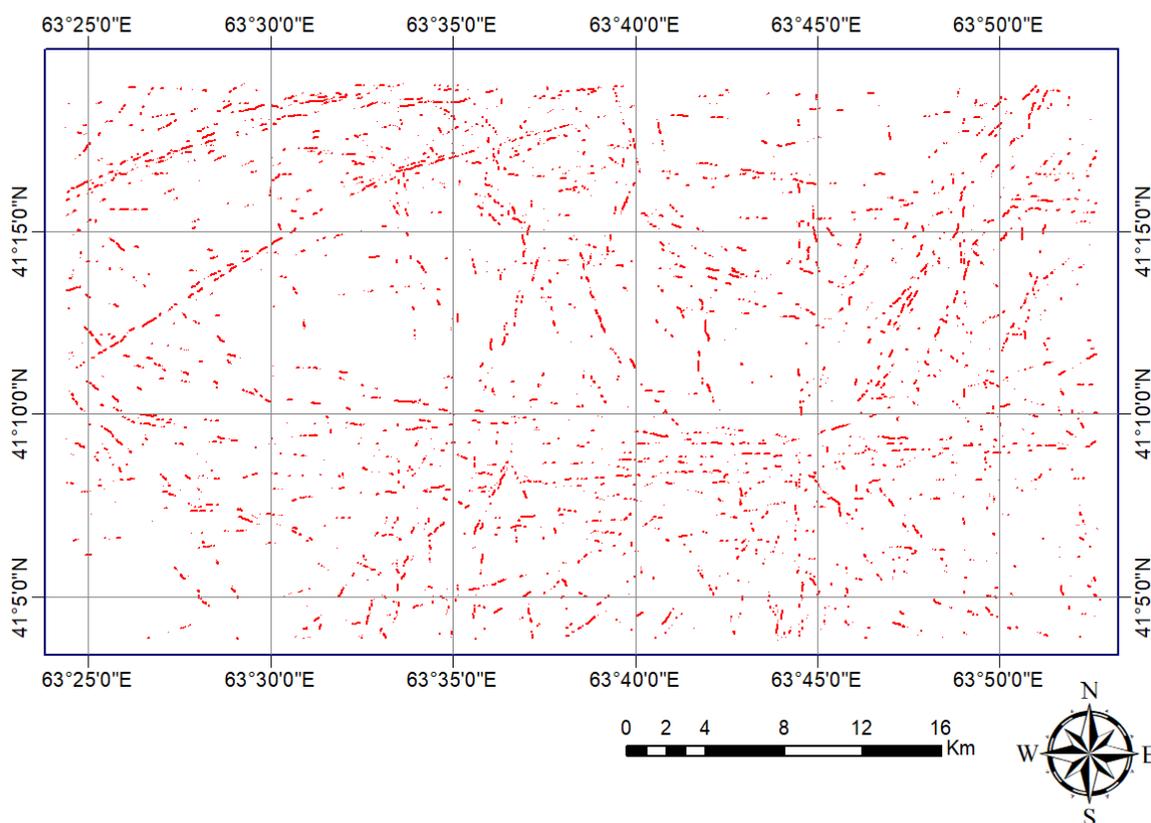

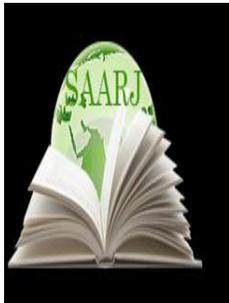

Fig. 7. Lineament map of Aumizataumontan

Thus, as a result of automated analysis of DEM and satellite images, lineaments of different types are revealed. When using DEM, mainly longitudinal lineaments are revealed. When using space images, landscape indicators reveal mainly intersecting lineaments that complicate the main geological structures.

 UZBEKISTAN

ABSTRACT

The article pays attention to the general physical training of young figure skaters 6-8 years old in the initial stage of training. Several specific exercises for mastering standing and walking on skates have been proposed. Jumping up and down in place, followed by a deep squat. You can do exercises with assistive devices, find some kind of rack or ladder rail and do squats on one leg side by side, holding on to the support. It is necessary to use simple exercises, perform them in different directions - movements of the right and left arms and legs, and change the amplitude of movements, speed of movement on ice.

KEYWORDS: *Technique, Process, Physical Condition, Teaching, Stand On Skates, Sliding, Movement, Furrow, Semi-Furrow.*

INTRODUCTION

Sport is health, good looks, high activity of the brain and physical movement. Physical education and sports training is not a spontaneous, but a controlled process. At every moment, a person is in a certain physical condition, which is determined mainly by health (compliance of vital activity indicators with the norm, the degree of resistance of the organism to adverse sudden influences), physique and state of physical functions.

Figure skating is a difficult coordination sport. It combination elements of speed skating, rhythmic gymnastics, acrobatics, and choreography. The variety of forms of skating in this sport is very great. Modern figure skating is characterized by long-term exposure to acyclic work

rhythms. Performing exercises, difficult in coordination, takes place to the music of a certain rhythm and requires from the skater a high sliding speed, expressiveness, artistry, and ease. And all this is carried out under conditions of unusual body support (skate blade).

It is advisable to control the physical state of a person by changing it in the right direction. This control is carried out by means of physical education and sports, which, in particular, include physical exercise.

There are a number of decrees and decrees adopted by the country's leadership and the Cabinet of Ministers, which are the basis for a regulated procedure for implementing work in this area. For example, the decree of the President of the Republic of Uzbekistan No. PD-4877, 3rd November 2020 on "Measures to improve the training system and increase the scientific potential in the field of physical culture and sports" also, Resolution of the Cabinet of Ministers №122 of 4th March, 2020 on "Measures to further improve the system of selection of athletes in the national teams by sports." One of the many important of them is considered the resolution of the President of the Republic of Uzbekistan 4th February 2020 №PD-4583 on "Measures for the development of winter sports" in our country.

In order to ensure the fulfillment of the tasks specified in State programs, Decrees and Resolutions, as well as to improve the quality of training of qualified personnel, possessing comprehensive knowledge in the field of physical culture and sports in accordance with international standards, accelerating the development of science, further improving the processes of training highly qualified competitive coaches-teachers, specialists and scientists in the field of sports, a quota was opened at the Uzbek State University of Physical Culture and Sports in the relevant sports and for the first time in the history of the university, a department of "Winter Sports" was created.

Relevance: In this regard, the question of training and retraining of personnel, the creation of schools and the selection of athletes in winter sports was raised. And learning to exercise ice skating is the basis of all winter sports, and walking or running is the basics of learning.

In this regard, the goal was set: to develop and propose the optimal variant of the leading exercises for learning to walk on skates.

To master the mobile and running elements, first of all, you need to become on skates, when learning to stand on skates, it is very important to learn the correct repulsion: alternately one, then with the other leg, transferring the weight of the body to the supporting (sliding) leg, while slightly pushing the body forward. Sledging helps a lot in this training. After a few visits to the skating rink, a beginner will already be able to independently improve in skating, turning, braking, etc. The stay at the rink should not exceed one and a half hours. The best and comfortable air temperature for skiing is from 5 to 15°. On the ice, children must be in motion all the time.

Well, for those who are just starting to skate, it is recommended to practice around the ice, or rather, hold on to the side of the rink with your hands, forming skills for exercises. If from the first days they start practicing on ice without studying safety techniques, they may face serious injuries. And therefore, after 2-3 workouts around the ice, they can adapt and feel the ice, then they can skate and do simple movements on the ice.

Before mastering ice skating, you should take care of the necessary equipment. Skates and boots must match the shoe size. The boot should fit snugly around the leg. The correct position of the skate runner on the boot: the runner passes through the middle of the heel and between the big and second toes. Skates need a periodic point.

When teaching those who cannot skate, one should at first support them by helping them master sliding, learn to maintain balance and then move on to teaching the basic movement - pushing off and stopping by the "furrow", "half-furrow".

The results of pedagogical observations should be presented in the form of concrete material, which can be assessed not only qualitatively, but also quantitatively. The analysis of observations creates a general understanding of the research subject that is available at the moment. In this regard, it became necessary to conduct testing, which determines the general physical fitness of the trainees.

In order to substantiate the feasibility of the developed research methodology. The documents on planning and conducting training sessions were studied with special attention. The main tasks of the formative part of the experiment are:

- identifying the features of the organization and implementation of techniques for teaching the basics of figure skating.
- selection of means and methods of figure skating that develop motor abilities.
- determination of the dynamics of changes in the level of motor abilities during figure skating.

In connection with this, several test exercises of general physical fitness were proposed, which were carried out in the gym with less safe performance and operational visual assessment by specialists (table-1):

Swallow - develops balance, makes posture more even and helps develop coordination. Thanks to the mechanics of body position, many muscle groups are involved and the vestibular apparatus is trained. In addition, the Swallow exercise develops endurance and a sense of balance. It is important to stand in the swallow position correctly, without swinging or swinging your arms. It will be easier if you breathe evenly and focus your gaze on one object directly in front of you. You need to return to the starting position, at the same time unbending the torso and placing the extended leg on the floor.

Pistol - perform from sliding in a squat, pulling forward one leg. Preliminary exercises for performing these figures: squats on one leg in front of a mirror, the other is extended forward, the toe is pulled. Jumping up and down in place, followed by a deep squat. You can do exercises with assistive devices, find some kind of rack or ladder rail and do squats on one leg side by side, holding on to the support. Squat smoothly and under control, do not fall down. It is important to ensure that the heel of the supporting leg remains on the floor, and, on the contrary, does not touch the ground.

Rope walking -(shortly surface) - go to the middle of the stretched line, turn your face along the rope, put one foot on the line (the line is exactly under the center of gravity), straighten it and try to maintain balance, balancing with the other leg and arms. It is necessary to train, using alternately one and the other leg as a support. When it starts to work out, you try to step from one

foot to the other, without going to the ground. Keep your back straight. The foot is placed on the line strictly along the line. Looking forward, keep your head upright.

Walking on a gymnastic balance beam-reinforces the types of walking on a narrow surface, develops the ability to highlight and formulate the assimilation of the field of knowledge. In this case, we use a low gymnastic beam (or you can use an inverted gymnastic bench). Performing any exercises (stands, movements, turns), keep your body straight and shoulders within the plane of the log. Do not make sudden movements from side to side trying to maintain balance. At the initial stages, try to "freeze" in the position in which balance is lost when you lose balance.

Shuttle run-develops high speed in order to run a short distance to the end point, but almost immediately you need to turn around in order to run to the opposite point a certain number of times. Here the sense of balance turns on to the maximum, a large number of muscles are involved, coordination and speed qualities develop.

TABLE-1

№	Exercise GPT	number of errors experiment	
		X -before	X-after
1	Swallow (60 seconds)	6	5
2	Pistol (sit down 5 times)	10	8
3	Rope walking (15m, 3 times)	10	6
4	Walking on a gymnastic balance beam (5 times)	10	7
5	Shuttle run (3x10, 2 times)	4	2

A distinctive feature of the exercises in the experimental group was the use of exercises for the development of such abilities as coordination of movements, including orientation in space and vestibular stability. In the control group, practically no attention was paid to these abilities. In order to lead the trainees to success in proper walking and sliding on the ice surface, a set of special training exercises with dosage and intensity of performance was proposed. Namely:

Stork -the first exercise skaters usually start with. When sliding on one skate, the heel of the raised leg from the side touches the calf of the supporting leg, the end of the foot is directed downward, the thigh is parallel to the ice surface. Hands are spread apart at shoulder level. Sliding on each leg is entered after acceleration in a straight line.

Pistol-performed from sliding in a squat, pulling forward one leg. Preliminary exercises for performing these figures: squats on one leg in front of a mirror, the other is extended forward, the toe is pulled. Jumping up and down in place, followed by a deep squat.

Squat -after a run, they slide on parallel skates, turning into a deep squat by flexing the ankle and mainly knee joints. The body is slightly tilted forward. The head and back are kept straight, the arms are extended forward at the level of the chin, the hands are closed. Preliminary exercises: standing on one leg, squats, performed first without skates, then on the ice from a place and in motion.

Swallow -from sliding on one skate, the free leg is pulled back parallel to the ice surface with an extended toe facing down. Knees are straight. The back muscles are tense. Hands are spread

apart. An exercise for learning this figure is a long slide on one leg, strongly bent at the knee, the free leg is extended back.

Track -when moving forward, the skates are parallel. The right hand is pulled forward, the left is pulled back. They begin to push off only with the right foot. With each push, the supporting leg is bent at the knee. When pulling up the pushing leg, the supporting leg is straightened. The torso is held vertically, with the shoulders turned in the direction of the slide. Backward "lane" is performed while sliding backward. The right leg is placed not in front of the left, but parallel to it. Take off with the right leg is done with reinforcement. Hands are kept at shoulder level, deployed along the slide. Do the same with the left foot clean and jerk. Also you can make it difficult to slide with different objects and stepping over objects.

To master the take off, you need to place one foot on the inner edge of the skate at a right angle to the other skate, push off with the edge of the entire runner back, put the jogging foot and slide on both skates.

When this is mastered, they begin to do two or more alternate take-offs, and then slide on two legs.

Plow braking: bringing your knees together, push them forward a little, spread your heels, leaning against the ice with the inner ribs of the skates. When braking, you can use a half-plow, which is performed in the same way as a plow, with only one leg, or a half-plow from behind (turning your free leg from the back at an angle of 90° to the supporting leg, straighten it a little and put it on the inner edge).

The simplest turns on two skates are performed by shifting the weight of the body in the direction of the turn (arc). A more complex turn is done like this: pushing off the left skate to the side, put it to the right, which is placed on the outer edge tangentially to the turn. The same to the left.

Children of the experimental group improved their performance after the experiment (which was presented in table-2). The children in the control group studied according to the usual program, and the children in the experimental group studied according to the changed method, that is, GPT complexes and a special set of ice skating exercises were added to the educational process, which contributed to the development of ice skating on the ice surface (table-2), as well as increasing motor abilities in children 6-8 years of age.

TABLE-2

№	Full name	stork		pistol		squat		swallow		track	
		exp-t		exp-t		exp-t		exp-t		exp-t	
		before	after	before	after	before	after	before	after	before	after
1	Rakhmanov Dilshodbek	5	3	5	4	4	2	4	3	4	2
2	Asadova Asila	4	2	3	3	4	2	3	2	4	2
3	Kurbanova Malika	4	3	3	2	4	2	3	3	4	2
4	Karimov Temurbek	6	4	4	3	5	3	4	4	5	3

5	Nazarova Gulirano	4	2	3	2	4	2	3	2	4	2
6	Malikova Madina	5	3	4	3	5	3	4	3	5	3

Note: performance of special exercises on ice was evaluated and technical errors were visually calculated.

Stork - bugs for entering a pose, maintaining posture, keeping one leg hanging, position of the arms and head;

Pistol -mistakes for falls, deviations from balance, holding the leg with a pulled toe;

Squat-mistakes for holding the head, back and hands;

Swallow -mistakes for holding the head, back, legs, lower leg condition;

Track -errors for repulsion, extension of the lower leg and smoothness of movements.

When skating, the muscles of the legs and back carry a lot of stress. With the help of physical exercise, they need to be prepared to carry this load. The proposed version of exercises for strengthening the leg muscles is recommended in the preparatory part of the lesson. The exercises can be varied and dosed at the request of the trainer and the physical condition of the trainees. The following exercises were recommended for walking in front, back and to the side: on toes, heels, outer arches of the feet, bend step, side step, lunges, jumps (Table-3).

TABLE -3

Distance (meter)	Exercises are performed while walking in front, back and to the side						
	on toes	on heels	on the outer arches of the feet	bending step	side step	lunges	podsko- kami
10	back	back	side	back			back
20	in front of	in front of	back	in front of	back	back	in front of
25	side	side	in front of	side	in front of	in front of	side

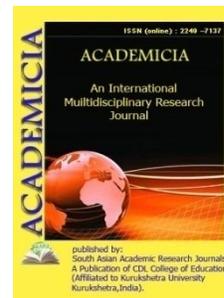

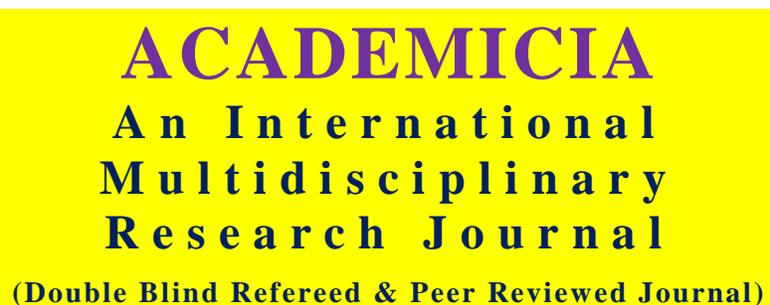

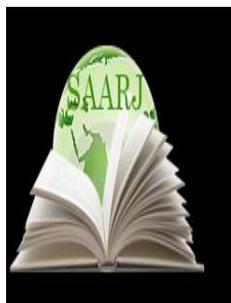

Findings: The results of the comparative analysis of the test results prove the positive influence of the selected methodology on the development and formation of motor indicators in children of 6-8 years of age. The use of a wide range of figure skating means for the development of motor abilities leads to harmonious physical development. After analyzing the methods, means of figure skating for the formation of children's motor abilities, that it is preferable to use the method of dissected exercise, holistic exercise and its varieties as a method of leading exercises.

In figure skating, when learning the basic elements, it is always necessary to pay attention to general physical fitness. It is necessary to use simple exercises, perform them in different directions - movements of the right and left arms and legs, and change the amplitude of movements, speed of movement on ice. At the same time, the coordination of children will be improved, muscle feeling is developed as they learn a variety of exercises.

You can build your workout like this: warm-up, including walking, running, gymnastic exercises, light skating; then improvement in running on the corner, several accelerations on small sections of the ice track -20-35m; at the end - a calm ride.

THE ROLE OF METHODOLOGICAL FIGURES IN MEDICAL ADVERTISEMENTS

Dilnoza Rasulovna Sobirova*

*PhD Student,
Department of "Uzbek Linguistics",
Bukhara State University,
UZBEKISTAN

ABSTRACT

In recent years, there has been a growing interest in the study of the media. In particular, the study of the language and style of advertising, which has become a major tool in the media, is gaining more and more attention among scientists. In modern society, advertising texts play the most important communicative function. This is not surprising. Because in a free market of goods and ideas, "advertising is the engine of development." One way to create a bright emotional image in advertisements is to make effective use of stylistic figures in them. This article discusses the use of stylistic figures in advertising, such as repetition, antithesis, anaphora, assonance, inversion, gradation, etc., as a means of increasing their effectiveness. These ideas are explained in the example of medical advertising texts. Stylistic figures not only make the advertising text attractive and effective, but also help the advertised product to be quickly imprinted in the minds of the recipient.

KEYWORDS: Advertising, Medical Advertising, Advertising Text, Addressee, Stylistic Figure, Poetic Syntax, Repetition, Anaphora, Assonance, Gradation, Melody, Inversion, Ellipsis.

INTRODUCTION

It is known that advertising means informing the population about a product or service, explaining its advantages and opportunities [17, 266]. Advertising (Latin "advertising" - shouting, shouting) - information about the quality of goods, the benefits of their purchase; special information about legal entities and individuals or products for direct or indirect profit (income) [11, 300]. The Uzbek Explanatory Dictionary also explains that the word advertising has three meanings:

1. Information about these goods and services in order to inform consumers about certain types of goods or services in the economy, to create or increase demand for them.
2. Dissemination of information about a person, organization, thing in order to promote it.
3. An advertisement, poster issued for this purpose [13, 374].

Claude Hopkins, one of the world's most famous advertisers, wrote in his 1923 book, *Scientific Advertising*, "summer is short, it saves people time!" [14, 45]

Advertising texts in world linguistics have been studied by a number of scholars such as T.Vestergaard, A.Akoun, N.Kokhtev, Y.Golovleva, A.Dulyaninov.

In Uzbek linguistics, A.Abdusaidov's monograph "The social essence of the Uzbek language", articles "Advertising language", "Advertising and literacy", F.Muminov, T.Eshbekov's "Advertising art" in the text of lectures, as well as in D.Mamirova's master's dissertation on "Sociolinguistic study of advertising in the Uzbek language" studied advertising from a linguistic point of view.

THE MAIN FINDINGS AND RESULTS

One way to create a bright emotional image in advertisements is to make effective use of stylistic figures in them. In philology, methodological figures are called "syntactic figures", "rhetorical figures", "speech figures" and even "poetic syntax". It is worth recalling Cicero's words: "The use of words in figurative senses is slow, first of all, because of the semantic poverty of the words in the dictionaries. -the need for slow beauty and charm continued to expand their meanings. It's as if clothes were originally designed to protect against the cold, and later became a form of clothing that adorns the body."

In fact, artists are constantly searching for the appeal of speech. They try to find new ways to express them. As a result, the number of stylistic figures in the language of fiction is quite large and plays a significant role in the emergence of artistic influence.

A review of the evidence in the scientific literature suggests that these figures are antithesis, apacopa, asindeton (incoherence), assonance, gradation, diathesis, sound imitation, oxymoron, paronomasia, parallelism, counting, rhetorical appeal, reduction, silence, ellipse, inversion and many of them live in modern poetry, including Uzbek poetry.

The existence of about thirty types of repetition alone, such as alliteration, anaphora, refrain, pleonasm, tautology, commentary, epiphora, epistrophe, repetition, testifies to the breadth of expressive possibilities in artistic style. Of course, such tools also play an important role in advertising. The use of stylistic figures in medical advertising, in particular, attracts the attention of the addressee.

RESULTS AND CONCLUSIONS

Repeat in medical advertisements. Repetition serves to reinforce meaning, intensity, and emotion. The speaker realizes that the phrase does not fit his senses and tries to fill the quality with quantity. This causes repetition. Repetition characterizes emotional speech [5, 103]. The use of repetition in medical advertising is significant. We observe:

Not right now

Not right now

Not right now

No, no, no,

Not right now! (From the text of the drug Stopdiar)

Pain can be different: sharp, squeezing, sharp... Pain, ache, pain! Stop! There is a tempalgin. Tempalgin contains two components: the first relieves pain, and the second relieves nervous tension. Tempalgin is an effective remedy for various types of pain. Tempalgin without nervous tension.

(Tempalgin drug from the ad text)

You can't anymore

You can't anymore

You can't anymore !!!

If you have enough magnesium in your body, it is easier to stay calm during pregnancy. (From the text of the Magne B6 drug kit)

Loranex works against allergy symptoms for 24 hours. Loranex is recommended for children from one year of age. Life is good without Loranex allergies! (From the text of the drug Loranex)

Super fruits, super hair! Super you! (From the ad text of Fructis)

In the above-mentioned advertising texts, the method of repetition, in addition to expressing thoughts and feelings, served to enhance the effect, to exaggerate the intonation. At the same time, it serves to ensure that the text of repeated advertisements, especially the name of the drug, is quickly preserved in the minds of the addressees.

Antithesis in medical advertising. Antithesis is a form of stylistic figure that compares conflicting concepts, ideas, images, and individuals to describe expressive situations in order to enhance expressiveness in speech. Advertising texts also contain antithesis:

Less effort for more profit! Go to Persil! (Persil tool from the ad text)

Fewer and more antonyms in the ad text are antithetical. It turns out that the use of antonyms creates a great image of the art of antithesis, which provides some effectiveness in advertising.

Anaphora in medical advertisements. It is well known that an anaphora is a line in a poem or verse, a word or phrase at the beginning of a sentence that is repeated exactly at the beginning of the verse. [11]

If you have a fever,

If you have a headache,

If the toothache doesn't calm down,

Helps kupen.

Kupen, it hurts,

Tablets and gel cups. (Kupen drug tool from the ad text)

Assonance in medical advertisements. Assonance is derived from the Latin word "assonare", which means "melody". Used to add tone to a text, to express expressiveness. Assonance is a poetic verse, especially in the form of rhyming words, which gives the speech integrity and originality:

Mothers are happy with our bipanten,

Our little baby in safe hands. (From the text of the drug Bipanten)

Rest on your stomach,

Healing espumizan. (From the text of the drug Espumizan)

Every moment with Femini

A reliable and bold step. (From the ad text of the Femini tool)

The rapid memorization of the ad text is also due to the melody that results from the assonance.

Inversion in medical advertisements. In linguistics, the term "inversion" is used to refer to a change in the usual order of parts of speech. Inversion is mainly used to give an emotional-expressive spirit to a speech by emphasizing a part of speech. Naturally, this methodological figure is widely used in advertising texts. We observe:

Don't let the headache scare you anymore (from the text of the drug Trimol). In fact, it should be in the form of "Don't scare the headache anymore".

When a child has a stomach ache, only when he laughs out loud (from the text of the drug Enterogermina). In fact, it should look like, "A baby's stomach hurts only when it laughs hard."

Rest in the womb, healing espumizan! (From the text of the drug Espumizan). In fact, it should be like, "Espumizan is a cure for stomach aches." It is important to pay attention to one aspect of the advertising text. If the text of the advertisement was presented in accordance with direct syntactic norms, the process of preservation of the advertisement in the minds of the addressee would be very slow.

Gradation in medical advertisements. The word "gradation" means "degree." Gradation is also the result of the desire to emphasize certain features and actions in things and events in human beings. There is a harmony of words. Characteristically, in gradation, the meaning of one word after another is stronger in meaning than the word that precedes it:

Knee pain is always a surprise. But I'm not used to it. Tera-flex cream contains a painkiller and a base for joint construction. Therefore, tera-flex cream can not only reduce pain, but also strengthen the knee itself.

"I want to, I can do it, I do it." (From the text of Tera-flex cream advertisement).

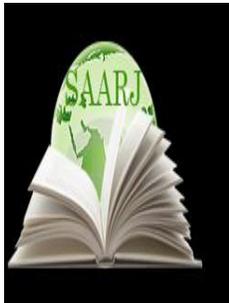

CONCLUSION

In the words of Richard Harris, an American scientist who specializes in the psychology of mass communication, advertising is a "type of persuasive communication" and is used as an important

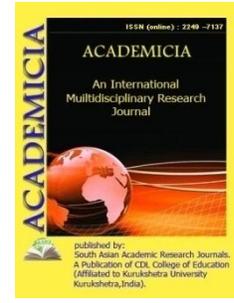

tool for influencing stylistic figures and making product information easier to remember. A number of methodological figures, such as repetition, assonance, antithesis, inversion, gradation, are widely used in Uzbek medical advertising texts. As a result, the synthesis of information and skills in the minds of consumers the creation process is easy.

ABSTRACT

In this article some views based on the specific character of Babur's work in Eastern and Western literature are expressed. In particular, the role of Babur's work, its translation and expression in different languages has been taken into account, as well as bringing the culture and literature of our country closer to each other.

KEYWORDS: *Baburnama, Babur's Work, Translation, Translation Into Other Languages, Art Of Translation, Alternative Variant, Reality, Rank And Position.*

INTRODUCTION

The interest in the works of our ancestor Zahiriddin Muhammad Babur, one of the brightest representatives of Uzbek classical literature, the study of his masterpieces and their translation into other languages has always attracted not only Eastern literature, but also Western researchers.

In particular, when talking about the relations between East and West, he contributed to the further improvement of work not only in the socio-economic, but also in the spiritual and educational spheres. This has been done to some extent by translating masterpieces of literature into other languages.

According to G. Salomov, the founder of the School of Translation Studies in Uzbekistan, the types of translation should be as follows:

- Translating from one language to another into a sibling or non-sibling language;
- Translating from a literary language to any of its dialects and from any dialect to a literary language or from a dialect of one language to another literary language;
- Translating from the language of antiquity to the modern state of that language (for example, from ancient German to modern German) [6, pp. 110-113].

THE MAIN FINDINGS AND RESULTS

Interest in Babur's work has attracted the attention of many researchers, literary scholars and translators in Uzbekistan.

In particular, the literary scholar, Doctor of Philology M. Yuldashev, thinking about the "Boburnoma", notes that this work is invaluable as a unique historical and scientific monument in world and Uzbek literature. This priceless work was written in the old Uzbek (Chigatay) language and was known as "Boburia", "VoqeotiBobur", "Voqeanoma", "TuzukiBoburii", "TabaqotiBoburii", "TavorihiBoburii", and Bobur himself used the names "Vaqoye" and "Tarix" in its place. It is worth noting that the play contains extremely valuable information for many disciplines, such as history, literature, linguistics, folklore and ethnography, geography, biology, zoology [1, pp. 9-18].

Literary scholar VahobRakhmonov describes Boburshah as a linguist and argues that Boburnoma should be considered a work of linguistics. The author of "Vaqoe" describes his most interesting and in-depth scientific observations in the most interesting areas of linguistics - etymology, phonetics [4, pp. 20-22].

Another monograph, written by a literary scholar, candidate of philological sciences, associate professor T.Saydaliev, is dedicated to the interpretation of the art of Babur's lyrics in Russian translations.

The study of translations of "Boburnoma" into foreign languages in our country in the field of special research dates back to the seventies of our century. This monograph provides feedback on the masterful translation of the work into a number of languages [5, p. 132]. It is no coincidence that Babur's poetry has been translated into a number of languages of the peoples of the world and is also becoming a literary heritage. Much of this poetic heritage is well known, especially to readers.

Babur's work is also widely covered in a number of research works carried out across the country. Among them are the works of N. Otajonov, B. Mamedov, L. Khodjaeva, G. Khodjaev, S. Shukrullaeva, F. Salimova and others.

The nineteenth century marked the beginning of a new era in the study of Babur's legacy in Europe, especially in French oriental studies, and in the translation of his works. During these

years, French scholars have made significant research in the translation of the "Boburnoma" into French, the study of its textual features, the assessment of its political and historical significance [7, pp. 59-88].

Babur introduced the most advanced ideas of his time into the history of world culture, which is why his legacy has been translated into many languages of the world, studied by scholars of the West and the East. In this regard, the services of Russian orientalists N. Ilminsky and L. Samoylovich, English scientists Elfinston, Erskin, Mrs. Beverij and D. Ross should be noted.

In 1983, the 500th anniversary of Babur's birth was widely celebrated by UNESCO. French scientists are also preparing a wonderful gift for this anniversary. The Publication of Orientalist de France (ROF) in Paris publishes a new French translation of the Boburnoma under the title The Book of Bobur (La livre de Babour). The translation is 478 pages long and was written by the great Turkologist Dr. Jean-Louis Bake-Grammon. The translation was prefaced by a well-known French orientalist, Professor Louis Bazen. The introduction begins with a detailed account of Babur's struggle for the establishment of the Great Mongol Empire, the history of the writing of "Boburnoma", the role of this work in world literature. In 1981, Dr. Bake-Grammon's translation of the Boburnoma won the IFT (International Federation of Translators) Grand Prize.

1985 The French translation of the Boburnoma is reprinted. The second edition differs from the first not only in its size, paper and quality, but also in the new scientific sources, some corrections, numerous miniature ornaments. It seems that the translators of the Boburnoma, such as A. Pave de Courteil, F. Grenard, and Bake-Grammon, made a worthy contribution to the development of the study of Babur's legacy in Europe" [5, p. 132].

The work "Boburnoma" was translated into several foreign languages several times, and in 1828 it was translated into German by A. Kaiser. It is noteworthy that the version of "Boburnoma" translated by A. Kaiser was not translated from Turkish, but from English. The study of Babur's work in French oriental studies dates back to the second half of the 18th century. In 1773, the orientalist A. de Longperie published an article on Babur's Behavior in his Oeuvres collection. The English translation of the work is in two variants, the first by J. Leiden from Old Uzbek and the second by U. Erskin from Persian. Summarizing these two translations, A. Kaiser, having studied the semantics of the old Uzbek, Persian, English and German languages, was able to make a remarkable translation into German.

The work is not only memoir and historical, but also has scientific and encyclopedic significance. Therefore, in the process of working on the translation of the work, the translator requires high skill and taste. The original of the work is written in the old Uzbek language, and it is possible to find alternative versions of some words in it and to observe that there are some shortcomings in the translation process. It can be seen that the presence of nature, portrait, character image, use of linguistic and stylistic means, proverbs, aphorisms, idioms in the play caused some difficulties in the German version.

Here are some examples:

1. Tengriahmatigabormoq (2216.)

von der Welt aufgerufen werden (S.329)

2. Olamdannaqlqilmoq (196 6.)

die Erde verlassen (S.285)

3. Jon chiqmoq (183 6.)

den Geist aufgeben (S.264)

4. Vafotqilmoq (162 6.)

die Schuld des Lebens entrichten (S.210)

5. Olamifiniyivido' qilmoq (162 6.)

das wechselreiche Leben verlassen (S.210)

6. Olam in kechmoq (81 6.)

ausatmen (S.105)

In the translation of the title and career words in the Boburnoma one can find some peculiar words, and they are expressed in the process of translation as follows:

Yunusxonqoshidaoftobachilikqildi, so'ngra beg bo'lubedi.

In Yunus Khan's Diensten war er vom Träger des Waschbeckens bis zu Beg gestiegen.

Sulton Abusaid Mirzo Samarqandxukumatniva Sulton Ahmad
Mirzoo'zeshiginingixtiyorinimungaberibedi, munieshikoqoqilibedi.

Sultan Abusaid Mirzo hatte ihn zum Befehlshabervon Samarkand und Oberausseher an Sultan Ahmed Mirza's Hofe ernannt.

There are many such examples. It should be noted that our ancestor Zahiriddin Muhammad Babur, one of the brightest representatives of Uzbek classical literature, occupies a worthy place in the history of world literature, culture and science with his lyrical work in various genres and encyclopedic scientific heritage.

CONCLUSION

In general, by studying Babur's work, he not only brought the two peoples closer together, but also brought the literature and culture of the East and the West closer together. Babur's work combines not only Eastern and Western literature, but also primary Turkish literature. The secondary also brings long languages closer together. Ultimately, it binds nations and peoples together.

ABSTRACT

The article deals with the issues of organization of innovative methods on efficient teaching of languages with the scientific and point of view. Methodologist scientists said that: national system of education makes students be more intelligent and open-minded. Nowadays we have to give an attention to increase the role of teachers in our life. Mostly, learners have desire but they haven't got any possibility. If we plan the aim absolutely, the result will be higher. Today the specialists who we are teaching are the leaders of this specialty.

KEYWORDS: *Language, Method, Teacher, Student, Learning, Technology, Speech, Process, Word, Intonation, Discussion.*

INTRODUCTION

Nowadays one of the most important functions of educational system's members is preparing youth for every part of life, can develop every part of society, can make intellectual ideas, can self-thinkable, high intellectual capability, and bring up elevated spiritual human.

Nowadays every lesson must be organized through capability of teacher, not the same as traditional come ups, so innovative methods of education must take high role. This type of come ups can create much chance to make lesson through conversation and discussion. To refuse the role of teacher "who gives questions" and the role of student "who tells ready and memorized opinions" is thought one of innovative methods. In this position teacher and student learn reading materials creatively and starts lively conversation by drawing to personal skill.

Materials

When teacher and student works with coexistence, renewed pedagogical skill will may get to expected result. Nowadays main ideas of viewpoints, which are called pedagogics of coexistence creates trust in student. On one of efficient and modern methods of traditional system of teaching is pedagogic of coexistence's important occupation of teacher is an activity of directing. It wants reliable and respected relation to student and recognize themselves to them and find interests and develop capability of getting creation. Difference them teaching methods which have been used since now that only have wanted to give knowledge to student, pedagogics of coexistence thinks knowledge and upbringing are inseparable part, it wants to create personable dignities of student. This type of pedagogic doesn't want that students repeat knowledge like parrot, which is given by teacher, so it wants that every student can reflect through their skill. By this way student wastes his all chance to create personable dignities.

It will be simple position that we draw to different methods to teach Uzbek language. That's why, new educational system needs to make a discussion, seminar lessons, conference lessons and etc. These lessons' advantages and results are thought useful and profitable by methodologist scientists and advanced teachers.

Methodologist scientists said that: national system of education makes students be more intelligent and open-minded. Nowadays we have to give an attention to increase the role of teachers in our life. Because, lesson's result depends on teacher. Student's thought plays the main role in quality of education. It is known that , over the teaching we can shape youth's spiritual appearance. If teacher is so clever and skillful but hasn't got any respect among the students, he can't affect students. Therefore, prominent teachers can make unimpeachable people.

Results

Firstly, we must plan the aim of learning language. It is impossible that teaching language by force. It depends on desire and possibility. If we have desire but haven't got any possibility, result will be less. Mostly, learners have desire but they haven't got any possibility. If we plan the aim absolutely, the result will be higher. Today the specialists who we are teaching are the leaders of this specialty. That's why, they must know language, especially their mother tongue.

Making aims of education, its main methods of teaching, supervising control and verification of knowledge jointly and with dependence is a main part of pedagogical technology.

Pedagogical technology is a systematical method of education. Especially, with this value this method opens new chances for teacher in process of teaching language. To open these chances organizing practical lessons play high role.

Firstly we have to create groups by category. Group A consists of beginners, group B consists of intermediates, group C consists of advanced students. We must create program of every group and mechanism of moving from one group to another. We need make sending materials to know more lexicographical and grammatical themes, have to give lexicographical theme's text in sending material, make up questions about text, find answers to questions, telling the text, analyze the speech, project the review, find new words from another words to enlarge mind of students, organize games through poems.

Pedagogical technology`s important peculiarities will be seen during assigning educational events and reorganizing. For this, to make a design of learning language is very useful way. Because, pedagogical technology consists of pedagogical aims.

It is known that, learning English begins learning sound, syllable and intonation. Learning experiences of super segments and things of intonation are being left out our attention. Scientists emphasized that the most difficult thing during learning language is intonation.

CONCLUSIONS

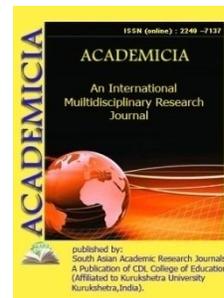

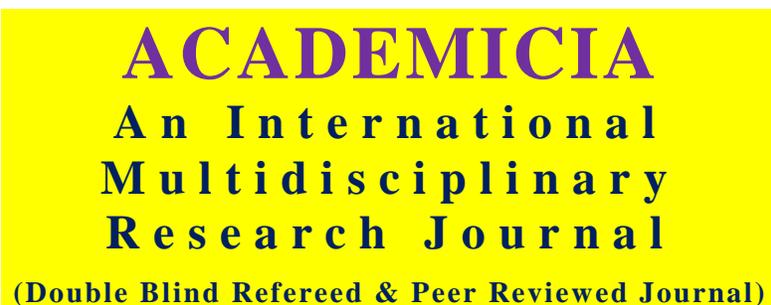

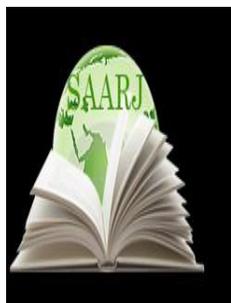

Mostly, student put his mother tongue`s intonation on the learning language`s words. Inconsequence , happens accent. This way, student must know to differ them. At the next stage of learning language, we must give students new words and we have to make a discussion clubs with them .

In consequence:

1. After providing educational progress with advanced methods, procedures and modern pedagogical technologies, teacher will lose his “king” role, and new type of effective teaching methods comes that make student be active and think logically.
2. In educational progressteacher`s whereabouts needs much attention . Result of learning language depends on personal peculiarities too. Only knowledge-able, pedagogical skillful, spiritual prominent teachers can create smart people.
3. Spiritual appearance and scale of though provides significant role in increasing quality of education. As we know, drawing to demands of educational program, teaching knowledge with arrangement learning language we may create spiritual appearance of youth.
4. It may bring up free thoughtful people that have own viewpoint through providing relations between teacher and student with principles of coexistence.
5. It increases chance of organizing lessons with advanced technologies, new theoretical ideas, scientific conclusions.
6. Through increasing of result teaching language, it can bring up perfect people.

ABSTRACT

As you know, homonymous lexemes differ from polysemous words. Polysemantic words have semantic or formal connections, and homonymous tokens are monosyllabic words with different meanings. Both phenomena are considered an urgent problem in the linguistic processing of texts. In particular, the definition of homonymy is important for translation and analysis in Natural Language Processing (NLP). This article discusses several ways to identify and analyze homonymous forms in Uzbek texts using word combination models.

KEYWORDS: *Homonym Form, Method, Hidden Markov Model, N-Gramma, Model Of Word Combinations.*

INTRODUCTION

Automatic reprocessing of texts is divided into several stages, and one of them is the stage of morphological analysis. At this stage, each word undergoes a morphological description: lemma [1] (base), agreement, government, number, level, ratio, in person, case, gender, and etc. The task of morphological subdivision of words in morphological analysis is complicated by homonyms.

As it is known, homonyms are lexical units in which the forms of words are the same, but their meanings, semantics are different. The phenomenon of survival in automatic reprocessing is found in the following units:

1. Homonymous words are based on the same forms of words, that is, a certain word possesses meanings belonging to one category of words or several categories. For example:

<i>ot(noun)</i>	<i>modal(modal)</i>
<i>Avval birliklarni, keyin o'nliklarni qo'shamiz. – (first we add singular numbers, then tenth numbers, units)</i>	<i>Suv bor joyda hayot bor. Ruchkang bormi? (there is, have/has) where there is water their is life/ Do you have a pen?</i>
<i>ot(noun)</i>	<i>hisob so'z(word used to count)</i>
<i>Kuch – birlikda. (Power is in unity)</i>	<i>Bir necha bor taklif yubordim.(times) – I've sent invitations several times</i>
<i>ot (noun)</i>	<i>ot(noun)</i>
<i>Og'irlik birliklari.Til birliklari Weight unit; language units</i>	<i>Bor – kimyoviy element. – Bor is a chemical element</i>
	<i>fe'l (verb)</i>
	<i>Ishga bormoq. Maktabga bormoq. to go to work, to go to school</i>

In the first column, the word “birlik” (unit) is a homonym within the framework of a series of words: 1) a whole number up to ten; grammar plurals (noun); 2) communion, harmony (noun); 3) a measure taken for the mutual evaluation of quantities of one kind; a terminology specific to the construction of the language (noun).

In the second column, the word “bor” has formed a form belonging to two different categories: 1) mavjud– exist (modal); 2) marta, daf'a, bora– times, folds (accounting word)

2. Suffix homonym-belongs to a different group of additives according to a certain additional function. For example:

-ki	<i>ko'chki, tepki, turtki ustki, ichki, kechki</i>	(ot yasaydi) - forms a noun (sifat yasaydi) – forms an adjective
-(i)ng	<i>uying, kitobing, ishing ko'ring, boring, tayyyorlang</i>	(shakl yasaydi: sintaktik mun.shakli – egalik qo'shimchasi) – makes a form: a form of case (genative case, possessive case) (shakl yasaydi: sintaktik mun.shakli –

shaxs-son qo‘shimchasi)

3. Phrase homonym-phraseological units in which the form, that is, the structure is the same, but the semantics are different.

qattiq shovqin soldi
cried loudly, made a loud noise

– yuksak darajada izzat-hurmat qildi – respect highly

uyni *boshiga ko‘tarmoq*

onasini *boshiga ko‘tarmoq* – carry his mother
on his head (respect highly)

4. Sentence homonymy is a specific sentence which differs according to the purpose or content of the expression.

darak gap – declarative sentence

so‘roq gap – interrogative sentence

*Ishni bajarmadim – I haven’t done the work**Ishni bajarmadim? – Haven’t I done the work?*

Analysis of Source

In the types of homonyms in the Russian language, homonyms, morphological homonyms and lexical homonyms are distinguished by the category of words [2]. It is noteworthy that the grouping of words by morphological and lexical homonyms plays an important role in transformation of natural language.

In morphological homonymy, the words Lemma (base), which belong to one category, are different, but only in certain forms they become the words which make up the homonymy, and are taken into account. For example:

lemmasi *ter*lemmasi *terim*

terim – mening terim(skin – my skin
possessive inflexion)

terim – hosil(havesting)

(-im egalik qo‘shimchasi: I shaxs, birlik)

In lexical homonymy, the word belonging to one Lemma gives different meanings:

ot

bog‘ – to‘dalab bog‘langan holat – pile –
pile of things

*Bog‘lamoq, bog‘lam. Bir bog‘ piyoz – to tie,
to pile. A bunch of onion.*

ot

bog‘ – o‘simlik va daraxtlar ko‘p ekilgan
joy – garden where trees and
pant grow

*bog‘-rog‘, bog‘-bo‘ston;**Uzumini ye, bog‘ini surishtirma.*

- *Garden- prospering garden, flowering
garden*

Morphological and lexical grouping of homonyms is important for lemmatization and stemming processes in text reprocessing for software and systems [3]. Both technologies are focused on finding the basis of a word or phrase,

It is worth noting that the phenomenon of survival is the most urgent issue in the process of automatic reprocessing. Therefore, in NLP, the identification of homonyms and their analysis are specially studied, even several methods have been developed.

Methods

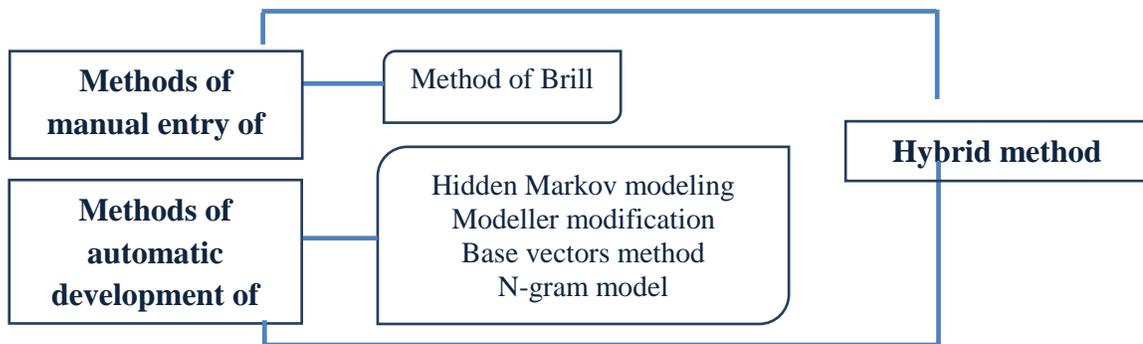

All of the methods for determining homonymy are divided into two groups:

1. Rules-based methods. In turn, they are divided into:

- a) manual input methods of rules.
- b) methods of automatic production of rules.

2. Methods based on statistics.

Each of these groups has its own advantages and disadvantages. As often happens in such situations, combining the characteristics (and advantages) of both groups in one way can show a better result than the results achieved before. Such kind of method is called a hybrid method.

1-chart. Determination of homonymy methods.

Systems that rely on these methods, in turn, make the following groups:

1. Systems based on rules created manually.
2. Systems based on probabilistic models and based on the described corpses.
3. Hybrid systems based on probability models and rules.

To determine the homonymy, each pronoun needs to be "classified", that is, it is connected by its Lemma, a series of words and a set of morphological features that combine into one tag.

Hidden Markov model Baum L.E. and this model, developed by his colleagues [6], helps to take into account the probability of all variants occurring in the statistical process, the statistical method of determining homonymy. For example, if in a certain text words related to the category of the noun meet more often and more often than the connecting, then the homonym present in the same context will be a word related to the category of the noun, not the connecting one with a greater probability, in the next case it will be considered as a connecting. N-Gramm is used to describe the context. N -mama is a mathematical calculation tool that is widely used in automatic

reprocessing of texts. Uzbek computer linguistics S.Rizayev represented letter combinations with the terms bigramm, trigram [5].

N – gramma-represents a sequence of N-identifying elements, such as words or labels. The sequence of two elements-bigramma, while the sequence of three elements is called the trigramma. For example, the **prefix+noun** status is an example of a bigram.

To bring a description of the simple statistical method for determining homonymy and other similar techniques, the following methods are used:

- w_i – a word in the sentence in the i -place, t_i – a pronoun identifier (tag) of this word.
- $(D_{(w)} = \{t_1^w, t_2^w, \dots, t_k^w\})$ all possible set of characters in the word w . This information can be obtained with the help of a morphological dictionary. If the word is not in the dictionary, it can be considered as a noun phrase, as done in the Brill method, but it is necessary to put all possible tags so that the linguistic supply is reliable.
- The number of specific cases in the corpora (n-grams). In there $C(t)$ – the number of T tags; and $C(t_1, t_2)$ – the number of bigrams (t_1, t_2) .
- $C_i(w, t)$ – w the number of words a t tag.
- $F(w, t)$ – The probability that the word w has a tag t . Descriptions are calculated using the following formula:

$$F(w, t) = \frac{C_t(w, t)}{C(t)}$$

- $P(t_i|t_{i-1})$ – this is the state of the probability of the arrival of the t_i tag after the t_{i-1} tag. In this case, when $i = 1$, the t_i tag is the first tag in the sentence. The calculation formula is as follows

$$P(t_i|t_{i-1}) = \frac{C(t_{i-1}, t_i)}{C(t_{i-1})}$$

Based on the Hidden Markov model, as a result of working with the help of the statistical method of determining homonymy, in the sentence with the length n , when $T_i \in D(w_i)$ is $T = \{T_1, T_2, \dots, T_n\}$ the probable sequence of labels is found [7].

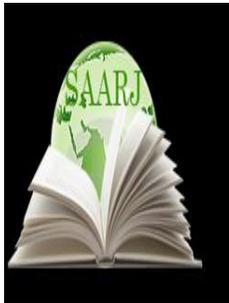

Results

In conclusion, when the methods of elimination of homonymy in the world computer linguistics were studied, the appropriate verification formula of vocabulary in Uzbek texts was created using the experience in this regard. To eliminate homonymy, it is necessary to “classify” each word, that is, it can be compared with a lemma – sentence fragment and a set of morphological features, they are added to one tag for convenience. To study all possible tags, it is enough to find related links to words in the morphological dictionary or use a morphological analyzer such as My Stem, which will help in finding the word tags. After that, it will be necessary to choose only the appropriate tag among several tags.

The optimal linguistic method used in analyzing homonyms will be an important factor in the processes of editing and analyzing texts, machine translation, text processing.

CRAFT AND TRADE RELATIONS IN EASTERN BEKS OF THE BUKHARA EMIRATE

Allamuratov Shukhrat Ashurovich*

*PhD student of Termez State University,
 UZBEKISTAN

Email id: allamuratovs@tersu.uz

ABSTRACT

The article describes the economic situation of the Bukhara Emirate, the economic activity and trade relations of the population of the beks of Eastern Bukhara. This article analyzes the production of handicrafts and the growth of trade relations that led to the development of crafts.

KEYWORDS: *Eastern Beks, Commodity-Money Relations, Trade Routes, Waterways, Agriculture, Handicrafts, Handicraft Associations.*

INTRODUCTION

It is known that the Bukhara Emirate was founded on a monarchical system of government, and the emir was considered the head of state. Bekliks or beks (regions) were ruled by beks and they were subordinate to the emir. The beks were divided into amlaks (districts), and several villages were part of the amlaks. The inhabitants of the Amlaks were ruled by the amlakdars appointed by the bek. And in the villages it was led by aksakals (elders) [1, p.31]. As a result of various political and economic processes taking place in the Bukhara Emirate, sometimes there were changes in the administrative structure.

RESULTS AND ITS DISCUSSION

The population of the Bukhara Emirate paid attention to the development of trade and traded with neighboring countries, such as the Kokand and Khiva khanates, Afghanistan, Iran, India and the Russian Empire [2, pp. 171-176]. There were 9 beks in Eastern Bukhara, 470,000 people lived in them [3, p.9]. One of the problems that tormented these beks was poor transport links. Of course, there were land and waterways leading from the beks of Eastern Bukhara to the center. But these roads were a problem for both the emirate and the tsarist government. The cities of Baysun, Darband, Sherabad and Termez played an important role in trade relations between the Surkhan oasis and the beks of Western Bukhara. The most convenient route in trade relations

between the neighboring beks of the Surkhan oasis, the beks of Western Bukhara, with Afghanistan and India were the roads passing through the ridges of the Hissar mountains. An important role was played by four roads passing through the Gissar ridges [4].

The waterways played an important role in connecting the territories of the eastern beks of Bukhara with the western territories. Boats transported along the river mainly agricultural products, such as grain and cotton [5, p.247]. Under favorable weather conditions, a boat loaded from Saray to Termez (210 versts) sailed with the stream in three days, upstream, usually in 12 days, without cargo in 8 days [6, p. 90]. The Russian Empire strove to use the waterways whenever possible. First, there were fewer robberies on waterways than on land. Secondly, transporting goods by water was relatively inexpensive. The above reasons the Russian Empire paid serious attention to waterways in the first years after the conquest of Central Asia [7, p.331]. The opening of the Amu Darya flotilla was of great importance both for the Bukhara Emirate and for the Russian state. The mutual rapprochement of the Beks played an important role in the development of economic relations between them. The flotilla created an opportunity for tsarist Russia to quickly export raw materials from the emirate, sell more domestic products, and also completely seize the markets of Bukhara [8, p.70].

During this period, the sale of handicrafts in the beksies of Eastern Bukhara was carried out by artisans, brokers and traders in local markets. In the city markets, special rastas were allocated for master craftsmen, handicraftsmen, jewelers, blacksmiths. Also, artisans sold handicrafts in their workshops. Traders who had written permission from the representative of the Russian government in the Bukhara Emirate and the Khiva Khanate could open shops in local markets [9]. They were given permission, in which there was information about the opening of the store and the planning of the sale of which goods in it. The exchange of products was carried out in cash or by bartering a certain amount of goods.

Cities such as Bukhara, Samarkand, Karshi, Shakhrisabz, Denau were the main centers of crafts. Various products created by local craftsmen to meet the needs of everyday life, raw materials, handicrafts made by skilled craftsmen and goods produced by residents of nearby villages were exchanged in neighboring states.

Representatives of this industry produced not only textiles, copper, ceramics, jewelry, silk and silk fabrics and many other handicrafts, bringing their products to the level of works of art, they satisfied the demand of the population for handicrafts and exported them to foreign markets [10, p. 174].

A. Vamberi, a Hungarian traveler who visited the Bukhara Emirate in the 19th century, spoke about the city markets: "... in the eyes of foreigners, markets with a variety of peoples, clothes and customs create a fascinating, dazzling picture" [11, p.36]. According to the researcher A.G. Azamova, the markets of late medieval cities specialized in the sale of certain types of goods [12, p.40].

According to B.Kh. Karmysheva, in the twentieth century in the villages of Sina and Vakhshivor of the BekstvaDenau, Gazarak and Khufor of the GissarBeksies, Passurkhi of the BaysunBeksies, more than 20 varieties of grapes were grown. The local population living in these villages, with semi-sedentary Uzbek livestock breeders and in the nearest markets, exchanged grapes and wheat for products such as wool, meat and dried cheese [13, p.119]. In eastern Bukhara, there were villages with individual varieties of fruits, which were even exported

to large markets in distant cities. For example, the Dashnabad pomegranate was planted in large areas [13, p.121].

A community of artisans was organized in the cities, such a community existed in dozens of guzars of Samarkand, Bukhara, Shakhrisabz, Kitab and Karshi [14, p.116]. In such guzars, mainly individual artisans lived, who were engaged in this or that kind of crafts, and their workshops were located in the courtyards where they lived [15, p.172].

In addition, there was a community of artisans with a separate shop and workshop in the market or next to the stalls. This means that in the development of trade there is a specialization of the community of artisans and the finding of cities closer to retail outlets. Sometimes the production of handicraft products also depended on natural geographic and political processes. Handicrafts are widespread mainly in large cities, as well as in large villages. All branches of crafts had their own professional communities, which were headed by aksakals and controlled the entire production process. The recruitment of apprentices, apprentices, assistants was a rare occurrence, and the secrets of the craft were mainly passed on from father to son.

Due to the large number of mountainous areas in the eastern beks of Bukhara and as a result of the demand for the protection of the beks, the need for the production of weapons increased. As a result, swords, spears, shields, knives, various types of large and small weapons and small objects were produced in the arms workshops. The available iron and coal ores were used in Yurchinsky, Baysunsky, Sherabadskybeks. In Boysunbeksies there were 25 ore-smelting furnaces, in which 50 people worked [16, p.56]. Simple blacksmith tools were made with hard work, and the import of high-quality weapons and blacksmith products, nails, needles, began to displace the products of local craftsmen [17, p.62].

Especially from the 80s of the XIX century - the beginning of the XX century, as a result of the construction of railways in Turkestan, that is, in the territories of the Central Asian khanates, wide access to local markets for Russian goods was opened. Many local craft workshops found themselves in a difficult economic situation.

While the sedentary population, that is, the Chigatais, the takchi were engaged in various branches of the craft, such as: blacksmithing, carpentry, textiles, sewing, pottery, milling, butter-making, weaving, embroidery, embroidery of skullcaps, making footwear, leather dressing, and the semi-sedentary population of the Kungirats, Juzes, Mangits, Sarays were mainly engaged in carpet weaving and preparation of the necessary equipment for the yurt [17, p.61-62].

The sedentary population of the city, with semi-sedentary people living in the suburbs, exchanged goods, along with a large number of handicrafts, animals such as sheep, goats, cattle, as well as the necessary raw materials for the textile and leather industry - wool, leather and various carpet weaving products. In addition, the rural population, who were engaged in agriculture, exchanged the cultivated various melons and gourds, and vegetables, in the form of a commodity, for handicrafts [18].

The cities of the Bukhara Emirate were distinguished by the production of individual handicraft products. For example, pottery was developed in Sherabad because Sherabad clay was better suited for pottery. Tandoors, khums and jugs of Sherabad potters were famous for their strength and grace [19, p.315]. A special place in the processing of iron and leather products was occupied by the city of Boysun, and in the production of jewelry - the city of Denau. Ships and boats of

various sizes were built by local shipbuilders in Chardzhou, Burdalik, Narazim, Kerki, Kelif, Sherabad, Kabadian, Karshibekstvah of the Emirate [20, p.424].

Although the products made by local artisans in the khanates of Central Asia met the needs of the domestic and foreign markets, the living conditions of the craftsmen were in a difficult situation. The reason for this was the lack of financial and practical support for the development of crafts in the emirate.

CONCLUSION

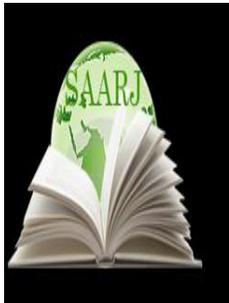

In a word, at the end of the 19th and beginning of the 20th centuries, the growth of the population in cities, the strengthening of commodity-money relations, led to the development of trade. The strengthening of trade relations of the Bukhara Emirate, in particular, the Eastern beks with the Russian Empire and other foreign countries, influenced the production of local handicrafts and stimulated the integration of the beks into the world market.

The growing demand of the population for handicrafts has led in the regions to specialize in various industries. In Eastern Bukhara at the end of the 19th and the beginning of the 20th centuries, the products of local artisan associations, although they were produced in a simple way, could withstand competition at least in part, ready-made industrial products imported from Russia. Handicraft associations existing in the region had their own customs and rituals, which took shape over the centuries.

ABSTRACT

Modern sport on a global scale is characterized by bright competitiveness and sets as its most important task the formation of a scientific and theoretical basis for the fastest and most successful achievement of the peak of athletes' physical fitness. The fulfillment of such a task creates the need for research on athletes with highly conditioned genetic, biomedical and medico-psychological data. This proves the need for continuous and deep scientific and applied research related to the growth of sports success and performance in all sports. The selection of gifted and promising athletes is of particular importance for achieving high results in sports. A number of anthropometric indicators, in particular, the total size and proportions of the body, the soma to type, significantly affecting physical performance, sports activity and the choice of sports specialization, have a high hereditary condition, which, along with psychological, physiological and biochemical factors, creates an opportunity determining the prospects of athletes.

KEYWORDS: *Peculiarities Of Morphophenotype, Physical Performance, Young Football Players, Playing Role, Sports Success.*

INTRODUCTION

Physical performance is the most important component of an athlete's preparedness for competitions and is largely determined by the level of the athlete's functional state (Platonov V.N., 1984; 1997; Polikarpochkin A.N., 2008, 2010, etc.). Physical development is largely due to hereditary factors (genotype), but at the same time, its state after birth (phenotype) to a greater extent depends on the conditions of life and upbringing. In the process of regular physical exercises, various motor skills and physical qualities are formed and improved, fitness gradually develops, characterized by a complex of morphological and functional shifts in the body's activity, improved mechanisms of regulation and adaptation to physical stress, and accelerated recovery processes. Physical development is one of the indicators of the health status of a football player (V.A.Epifanov, 1990). Currently, most sports games can be defined as disciplines of the "mixed energy system" in which effort has discontinuous characteristics involving both aerobic and anaerobic metabolic pathways. In this regard, physical fitness is one of the most important elements that affect the performance of athletes from mixed sports due to the high physical activity due to intermittent activity. Indeed, strength and endurance can be considered the key fitness elements for mixed sports such as soccer, wrestling, and motorcycling. All of these sports have been classified as mixed in terms of their metabolic predominance, thus showing the general multifaceted nature of physical demands, which include aerobic capacity, strength, endurance, strength and agility. However, descriptive studies indicate that the physiological characteristics of an athlete can vary greatly across these disciplines, suggesting that there are different sport-related profiles in terms of the relationship between endurance and speed. Athletes from mixed sports do not have a clear focus on endurance or strength, thus showing wide phenotypic heterogeneity. Genetic factors are generally known to affect sprint / strength and endurance, but only a few studies have examined the relationship between genetic factors and athletic performance in mixed athletes [13,19,37,38,39,47].

The study of morphophenotype indices in football players, in particular the Erisman, Livi, skeleton indices in general, and depending on their playing role. The human constitution and its morphological expression - the somatotype serves as a determining factor in many physical and mental manifestations of human life. Constitution is the integrity of morphological and functional characteristics of an organism, formed on the basis of hereditary and acquired properties of the organism (BA Nikityuk, 1991, 2000). This proves the need for continuous and deep scientific and applied research related to the growth of sports success and performance in all sports. One of the main theoretical and applied biomedical problems of physical culture and sports medicine is a problem sports selection, the development of the theory of which determines the level of sports achievements and sports science in general. In our country, large-scale measures are being taken to radically improve the sports movement among the population and, in particular, to support the development of physical culture and sports among the children and youth contingent, where sports selection is mainly carried out.

The selection of gifted and promising athletes is of particular importance for achieving high results in sports. According to R.N. Dorokhova [30, 31], sports morphologists and anthropologists currently face the challenge of finding new criteria for selection, orientation and improvement of the training process. Achieving high results in any kind of activity depends on many factors, the main of which is the maximum correspondence of individual characteristics of a person the requirements of the chosen specialization. In this regard, taking into account the

requirements of a particular sport for the human body is the most important condition for the education of highly qualified athletes [28, 29, 46]. A number of anthropometric indicators, in particular, the total size and proportions of the body, somatotype, significantly affecting physical performance, sports activity and the choice of sports specialization, have a high hereditary condition, which, along with psychological, physiological and biochemical factors, creates an opportunity to determine the prospects of athletes.

Each sport has specific requirements for the athlete's physique. In addition to determining the so-called total body dimensions, it is necessary to investigate the ratio of individual links (kinematic pairs and chains), since they determine biomechanical adaptability to the implementation of the main "working movements" [32]. It is known that in case of insufficient biomechanical compliance with a sport, one has to use the compensatory capabilities of the organism, which requires additional energy capabilities [33]. Among the many indicators of the individual characteristics of the body of athletes, anthropomorphological signs are of great interest, since they can determine the manifestation of strength, speed, endurance, etc. [40, 42]. The emergence of a new scientific discipline - sports anthropology was due to the need to study the patterns of changes in the morphological and functional characteristics of athletes in connection with sports achievements. Anthropometric measurements allow obtaining objective data on important morphological parameters of the body - length, mass, chest circumference, etc. They are the basis of somatometric methods for studying human physical development [41, 45]. The data of many studies in different countries of the world show that height, body weight and other morphological indicators play an important role in human physiology, his health directly depends on these indicators [2, 15.34].

Football is one of the most popular sports in the world. The game requires a high level of skill and resilience, and the participants strive to show specific physical and physiological characteristics. [26, 28, 50]. During the game, exercises that are different in nature, power and duration are alternated in different sequences and proportions at different intervals. The intensity of physical activity during the game ranges from moderate to maximum [36, 43]. The main part of a football player's workload is work of a high-speed-strength nature of sufficiently high power, which requires a high level of general, speed and special endurance [37]. The need to develop and improve this entire set of qualities is precisely the main difficulty of organizing and conducting the training process in football [35]. A retrospective analysis of anthropometric indicators shows an increase in the total body size (length and body weight) of football players at the present stage of football development [21,43].

In team sports, including football, there are three main components that affect the final result of the match: physical condition, technical readiness and the ability of football players to implement the tactical model of the fight [12]. The running speed of a football player depends on the level of his physical fitness [14]. In football, periods of moderate and high activity alternate, therefore the players are required to be quick, strong and endurance [11]. The high level of development of speed-power qualities among the players allows them to perform higher jumps, strong strikes, effectively take the ball away from the opponent and make sprint dashes [7]. The high demands of sports impose a constant need to monitor all parameters that are important for every achievement in sports [16,27, 30, 31]. Along with physiological, biomechanical and psychological variables, all morphological variables are of significant importance. The anthropometric method, which uses measurable body surface values applied in the equations

needed to calculate body composition [49], is very often used in assessing all morphological aspects of football players [6, 18, 21, 22].

One of the classification signs is morphological and functional status as a flexible criterion for sports orientation and an informative indicator of the individual development of the organism of children and adolescents, the types of their adaptive reactions and their state of health in general.

The morpho-phenotype of the constitution (somatotype, somatic type, body type) is the most accessible to research, relatively stable in ontogenesis and genetically determined characteristic of the integrity of the organism. Recently, in our country, the method for determining the somatotype of R.N. Dorokhova (1985, 1991). In the studies of R.N. Dorokhov's constitutional diagnosis is based on the priority of morphological features, and the constitution itself is considered as a set of general and particular constitutions. The somatotype is understood as the equivalent of the term "constitution". Therefore, studies of the characteristics of the human somatotype, which are significantly reflected in the future on football players, do not lose their relevance. The influence of sport on human body length cannot be considered proven, while the influence of body length on athletic performance (both in a positive and negative sense) is beyond doubt. The proportions of the body parts of football players differed from those of non-athletes, even depending on the age periods. So, if among people involved in football, 73% of young men and 79% of men in the first period of adulthood have a normosthenic body type, then among people who do not go in for sports, this body type was 63% in boys and 51.2% in men of the corresponding age [6]. Moreover, with a normosthenic physique, young men and men who go in for sports have a "shift" of the Pignet index towards asthenic physique compared to people who do not go in for sports [8]. Research by E.V. Morozova [44] showed that in these same persons the angle of active flexion in the knee joint of football players is less than that of their peers from the comparison group. The revealed decrease in the angle of flexion in the knee joint [48] may be due to increased muscle tone of the lower limb and, first of all, the quadriceps femoris muscle, which, according to A.S. Lobova [36], often found among football players.

The capabilities of football players are related to the effectiveness of various energy-relative systems [7,10,20]. Throughout the season, players perform intensive programs with multiple goals of increasing strength, power, speed, speed endurance, speed, aerobic fitness, and playmanship [4,5,10]. In fact, despite the prevailing patterns of activity in the game that are aerobic in origin, the most deterministic indicators of the match result depend on anaerobic mechanisms [23]. This is quite natural, since the most intense periods of unfavorable match scenarios are associated with periods of high mechanical and metabolic stress. In fact, recently developed match analysis methods provide evidence to support the belief that the neuromuscular demands of training and competition are higher than originally intended (eg, acceleration / deceleration) [7,24] and further support the view that strength is critical to performance high-level athletes. In addition, there is evidence supporting an association between team success and jumping ability (eg CMJ and SJ) [1, 16]. Thus, starter football players demonstrate higher strength and power performance capabilities than non-starters [14], and their greater neuromuscular capabilities are associated with physical parameters related to the game and low development of fatigue during the match [12,20]. In addition, after a period of match overload, players with longer playing time on the field achieve better scores in certain neuromuscular parameters (CMJ, height and contact of a falling jump) than players with a shorter game duration, although this result was still of low statistical significance [5.9]. Despite the obvious

limitations and universal agreement on the importance of aerobic fitness in football, these observations suggest that anaerobic power is the so-called "space grab" from aerobic power in relation to football performance [7,23]. The presented facts well illuminate the role of neuromuscular exercises in the process of football training and assume the competitive performance of football programs, since they are competitive by nature. In fact, physiological systems associated with endurance development are usually targeted at any kind of match competition, friendly play, tactical drills, ongoing technical training that often involves frequent movement and / or small lateral play drills performed during a 90-minute soccer competition / training session. sessions [10, 12, 17, 23, 25].

Thus, in order to train professional football players, it is necessary to control their physical fitness. The given data allow us to say that body sizes and their ratios, if not determine, then in many respects contribute to the achievement of sports results.

PROGRESS IN THE STUDY OF THE PATHOGENESIS AND DIAGNOSIS OF HYPERTENSION

Jumaeva Gulrukh Aliyorovna*

*Tashkent Medical Academy,
UZBEKISTAN

ABSTRACT

In recent years, there has been a tendency to "tighten" the criteria for the diagnosis of hypertension. So, experts from the unifying national committee (ONC) for the identification, assessment and treatment of high blood pressure (USA, 1993) recommended diagnosing hypertension with a high blood pressure of more than 140/90 mm Hg. and highlight 4 stages. In 1999, recommendations of the World Health Organization (WHO) and the International Society of Hypertension (SAG) for the treatment of hypertension were published, which provide a new classification of hypertension. According to this classification, it is necessary to determine the degree of arterial hypertension, as well as stratify the risk of developing cardiovascular complications to assess the prognosis.

KEYWORDS: *Arterial Hypertension, Diagnosis, Risk Factors, Classification Of Arterial Hypertension.*

INTRODUCTION

Arterial hypertension (AH), in terms of its medico-social and economic significance, is one of the leading human pathologies, characterizing the global spread, a high level of cardiovascular complications and mortality (R.G. Oganov, 1999; M.S. Tozhiev et al., 2000; V.A. Drobyshev et al., 2002; N.U. Makhkamova, R.Sh. Mamutov, 2006; WBKannel, 2000). According to MK Tundybaev (2007), hypertension is the most common chronic pathology among the adult population, the prognosis of which is largely determined by the degree of hypertensive damage to vital organs [1,5,10,15,16].

In economically developed countries of the world, the proportion of the incidence of hypertension is on average 20-30%, and in the age group over 50 years old - 60-65% [M.Sh. Nasyrova et al., 2008]. If in 2000 the prevalence of hypertension worldwide among people over

20 years old was 26.4% or occurred in 972 million people, then according to the forecast of WHO experts, by 2025 it will reach 29%, which is 1 billion 56 million people [M.R. Eliseeva, 2006].

According to the Specialized Center of Cardiology of the Republic of Uzbekistan, the prevalence of hypertension among the urban population of Uzbekistan is 26.6%, among the rural population - 14.4%, including 12.6% of men and 15.7% of women [A.G. Gadaev, Sh S. Gulyamova, 2007].

Arterial hypertension is diagnosed in one in four of the adult population, is one of the leading causes of disability and mortality in many countries of the world, and patients with high blood pressure (BP) are at a significantly higher risk of stroke, coronary heart disease (CHD), other CVD and renal failure [F.A.Zakirov et al., 2007].

According to B.A. Sidorenko et al. (1999), in persons with hypertension, IHD develops 3-4 times more often and acute cerebrovascular accident 7 times more often. Within 7 years, 25% of patients with hypertension develop acute myocardial infarction [VN Ardashev et al., 2004]. At the same time, the share of these diseases among the causes of death in the group of patients with hypertension is 83.5% [L.A. Alekseeva et al., 2002]

It was found that the average age of the onset of high blood pressure is 30-40 years of patients [VB Simonenko et al., 2007]. At the same time, it is known that the clinical signs of hypertension, as a rule, "lag behind" the increase in blood pressure, and 30-40% of patients with hypertension do not know about their disease [Yu.Ya. Varakin et al., 1996]. Therefore, the average age of newly diagnosed hypertension shifts to 40-50 years. This requires attributing patients with even a slight increase in blood pressure to groups at high risk of cardiovascular complications.

95% of patients suffering from increased blood pressure refer to patients with primary (essential) hypertension and only 5% suffer from secondary (symptomatic) hypertension [M.Sh. Nosyrova et al., 2008].

According to T.A. Syavineseka et al. (2008), almost all currently existing concepts consider hypertension as a disease of violation of regulatory mechanisms (E.E. Gogin, 1997 and M.S. Kushanovsky, 2002). All of them, to one degree or another, accurately describe the development of hypertension, but none of them provides an answer to the most important question why does hypertension arise? In this regard, since the beginning of the 90s, great hopes have been pinned on the achievements of the rapidly developing molecular genetic technology. A gene whose expression product can directly or indirectly participate in the development of pathology is called a candidate gene. These genes include genes for angiotensin II receptors type 1 angiotensin II, angiotensin-converting enzyme (ACE), β -adrenergic receptor subunits, nitric oxide synthase, proteins involved in the transport of sodium ions across the membranes of the renal tubules, etc. The nature of gene defects and their combinations is obviously not the same in different patients. The most studied ACE is a zinc containing protease that catalyzes the conversion of angiotensin I to angiotensin II. The ACE gene is mapped to chromosome 17q 23. The presence or absence (division / insertion; D / I) of the 287 bp fragment in the 16th side of the gene is used as a marker of ACE gene polymorphism. Structural polymorphism at this locus is called insertion-deletion (I / D), which is characterized by the Mendeleev type of study. The presence of the D allele is associated with a higher amount of circulating ACE (from 14% to 50%) and a higher activity of the tissue enzyme. Carriers of the I / I genotype have the lowest level of the enzyme, the I / D

genotype is characterized by intermediate levels of ACE (G.A. Savinskaya et al. 2008). No specific genetic dominants responsible for the development and formation of hypertension have been established (Sirozhiddinova N.Z. et al., 2007). Genes involved in the regulation of water-salt metabolism in the kidneys are of particular interest, since impaired renal function and sodium reabsorption are associated with an increase in blood pressure. In particular, the genes encoding the b, -c, -d subunits of adducin can serve as an example (N.Z. Sirozhidinova et al., 2007; J.M. Saavedra, 2005). Adducin is expressed in all tissues and is involved in multiple functions, including cell movement and synaptic transmission (Y. Matsuoka et al., 2000). The role of adducin includes the stimulation of the activity of Na⁺ -K⁺ -ATP-ase, a key enzyme of Na transport through the renal tubules (Ferrandi et al., 2000).

According to Brigov A.N. et al. (2006), one of the main roles in the pathogenesis of hypertension is the hyperactivity of the sympathetic nervous system (A.N. Britov et al., 2006). This is proved by numerous studies of catecholamines in blood plasma, as well as by recording the activity of peripheral nerve fibers (G. Grassi et al., 1998). Moreover, several possible mechanisms of the formation of hypertension are considered: the central nervous mechanism of changes in ion exchange, impaired endothelial function, oxidative stress, along with the study of the importance of electrolyte metabolism in the pathogenesis of hypertension, there is growing interest in the role of trace elements (ME) in the development of cardiovascular diseases. There is little information that copper (Cu), zinc (Zn), iron (Fe), are integral parts of various enzymes, can have a significant effect on the development of hypertension, while the point of application of the action of ME is considered to be their effect on the functioning of pro- and antioxidant systems (A.R. Antonov et al., 2006; M.G. Yakobson, 2000).

In recent years, there has been a tendency to "tighten" the criteria for the diagnosis of hypertension. Thus, experts of the Joint National Committee (NOC) for the detection, assessment and treatment of high blood pressure (USA, 1993) recommended diagnosing hypertension with an increase in blood pressure of more than 140/90 mm Hg. and distinguish 4 stages. In 1999, the recommendations of the World Health Organization (WHO) and the International Society of Hypertension (ISHP) for the treatment of arterial hypertension were published, which provided a new classification of arterial hypertension. According to this classification, it is necessary to determine the degree of arterial hypertension, as well as to stratify the risk of developing cardiovascular complications to assess the prognosis[4,8,9].

Establishment of the "true" degree of blood pressure increase is possible only with newly diagnosed or untreated arterial hypertension. The blood pressure level is assessed based on the average values of at least two blood pressure measurements during at least two visits at intervals of 2 months. after the first detection of high blood pressure. The new classification of blood pressure levels has fundamental differences from the previous classifications [3,7,12,13]. The first important feature of the new classification is the identification of several categories of normal pressure, i.e. those values that cannot yet be called arterial hypertension (blood pressure <140 and 90 mm Hg). Distinguish between optimal, normal and high blood pressure. It is well known that there is a direct link between blood pressure levels and the risk of cardiovascular disease. Even in the range of normal blood pressure values (systolic <130 mm Hg, diastolic <85 mm Hg), those with the lowest blood pressure have a definite, however, the lowest risk of developing cardiovascular diseases. The second important feature of the new WHO classification of hypertension - ISHP (1999) is the rejection of the previously used (WHO, 1993) terms based

on the value of diastolic blood pressure: mild (90-104 mm Hg), moderate (105-114 mm Hg) and severe (more than 114 mm Hg) forms. The refusal to use these terms is due to the fact that they often do not correspond to a long-term forecast. To characterize the degree of blood pressure increase in patients with arterial hypertension in the new classification, it is recommended to use the terms degree 1, degree 2, degree 3 of the disease instead of "stage", as it was in the WHO classification in 1993 (A.N. Okrokov, 2003).

The goal of modern antihypertensive therapy is cardiovascular protection, leading to a decrease in cardiovascular morbidity and mortality. Early diagnosis of hypertension is of great importance, allowing for an effective effect before changes occur in target organs, which can lead to the death of the patient (VT Ivashkin et al., 2001).

Until recently, the diagnosis of hypertension was made in those cases when, upon repeated measurements, systolic blood pressure (SBP) was at least 160 mm Hg. or diastolic blood pressure (DBP) of at least 95 mm Hg. These recommendations were based on the results of a single-stage survey of large groups of the population, while hypertension was defined as a condition in which the blood pressure level exceeds the average value of this indicator in a given age group by a value greater than twice the standard deviation [2,6,11,14,16].

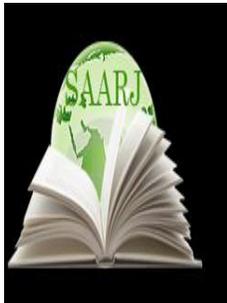

In the early 90s, the AH criteria were revised towards their tightening. According to modern concepts, hypertension is a persistent increase in blood pressure (SBP above 140 mm Hg or DBP above 90 mm Hg). In people with increased emotionality, as a result of a stressful reaction to the measurement, overestimated data may be recorded that do not reflect the true state. As a result, misdiagnosis of hypertension is possible. To avoid such a condition, which has received the name "white coat syndrome" in the medical literature, rules for measuring blood pressure have been developed. Blood pressure should be measured with the patient sitting after 5 minutes. rest 3 times with an interval of 2-3 minutes. True blood pressure is calculated as the arithmetic mean between the two closest values. HELL below 140/90 mm Hg It is conventionally considered normal, but this level of blood pressure cannot be considered optimal if we take into account the risk of subsequent development of coronary artery disease and other cardiovascular diseases. The optimal blood pressure level from the point of view of the risk of developing cardiovascular diseases was established only after the completion of several long-term studies that included large groups of the population. The largest such prospective study was the 6-year MRFIT study (Multiple Risk Factor Intervention Trail, 1986). It involved 356,222 men aged 35 to 57 years without myocardial infarction in the prognosis. Analysis of the data obtained showed that the 6-year risk of developing fetal ischemic heart disease is the lowest among men with baseline DBP below 75 mm Hg. and SBP below 115 mm Hg, mortality from coronary artery disease is increased with DBP levels from 80 to 89 mm Hg. and SBP from 115 to 139 mm Hg. which are conventionally considered normal. According to Khodzhimetov A.K et al. X-ray ultrasound methods also play a significant role in the diagnosis and assessment of the effectiveness of treatment of patients with hypertension. The use of methods of X-ray ultrasound studies, along with clinical and biochemical studies, made it possible to identify the initial signs of hypertension and to carry out the treatment complex in dynamics (A.K. Khojimetova et al., 2008). The greatest difficulties arise in the diagnosis of the initial stage of hypertension. This is due to the lack of motivation in patients who feel healthy and ignore the need for in-depth examination. With the wider use of the methods of daily monitoring of blood pressure (ABPM) and self-monitoring of blood pressure (SAD), new criteria for the diagnosis of hypertension have

emerged. ABPM allows you to identify the individual characteristics of the daily blood pressure profile, to assess the pressure load, which reaches its maximum values in people with LVH. The ABPM and ECHOEG methods make it possible to objectify the diagnosis of hypertension, significantly reducing the examination time (E.D. Dokina et al., 2008).

**HEALTHCARE SYSTEM IN THE SURKHANDARYA REGION:
REFORMS AND RESULTS (ON THE EXAMPLE OF THE KUMKURGAN
DISTRICT)**

Khuzhanazarov Absalom Ziyadullayevich*

*Termez State University,
UZBEKISTAN

Email id: xujanazarova@tersu.uz

Abstract

This article describes the progress of reforms in the healthcare sector over the years of independence in our country and in the Surkhandarya region, in particular in the Kumkurgan region, and changes in the field of regional (district) medicine. They also analyzed issues such as the fact that problems in the field of medicine are solved through the reforms carried out over the years of independence.

KEYWORDS: *Health Care System, Medical Sphere, Reforms, Doctors, District Medical Association, Rural Medical Centers.*

INTRODUCTION

In the first years of independence, significant work was done to improve medical services to the population, the necessary logistics for the medical sector were created, and modern medical complexes appeared. One of the important strategic tasks in the current pandemic is to radically improve the quality of medical services provided to the population in our country, to provide the health care system with potential personnel, to implement comprehensive measures to improve the material resource capacity of medical institutions. Speaking at the 75th session of the UN General Assembly, President Sh.Mirziyoyev said: "From the first days of COVID-19, we have focused all our efforts and resources on curbing this dangerous disease and, most importantly, saving lives. Social protection and health care systems are being sharply strengthened to mitigate the negative effects of the pandemic"[1].

Methods. The article is based on generally accepted methods - objectivity, historical analysis, comparative and logical analysis, chronological sequence, the principles of objectivity, and

describes the changes in health care in Kumkurgan district of Surkhandarya region during the years of independence.

Results. Indeed, in our country, as in all spheres of society, radical reforms have been carried out in the health care system, and more than 170 legal documents on health care reform have been adopted [2]. In this process, important projects are being implemented to further improve medical and preventive care, patronage care, improve the quality of emergency and specialized medical care, provide the population with cheap and quality medicines, and develop private medicine. In particular, it is no exaggeration to say that the decree of Sh. Mirziyoyev dated December 7, 2018 "On comprehensive measures to radically improve the health care system of the Republic of Uzbekistan" [3] opened a new era in the development of medicine in our country. As a result of these reforms, a number of important changes are taking place in the medical field in Surkhandarya region.

Specialized clinics equipped with modern medical technologies and techniques play an important role in the health care system of the region. The fact that they have highly qualified specialists, performing complex and unique operations around the world, saving people's lives and adding life to their lives is a practical manifestation of our reforms in this area. The role and importance of a wide range of "Family Centers" in the health care system, which regularly monitors the health of expectant mothers and serves the birth of healthy children, is growing.

If in 1991 the maternal mortality rate was 65 per 100,000 women, by 2006 this number had dropped to 24. Infant mortality dropped from 35 per 1,000 babies to 14 by the end of 2006. Life expectancy also increased from 67 years to 72.5 years. All this was the result of measures aimed at protecting human health and improving living conditions [4, p. 44-45]. Also, as a result of large-scale work on the prevention of infectious diseases in the mid-1990s, only in Surkhandarya region there were no cases of polio, typhoid, tetanus, anthrax and highly contagious diseases (plague, etc.). Salmonellosis decreased by 42%, diarrhea by 1.8 times, and viral hepatitis by 1.6 times [5, B.8].

In addition, in many cities in the region (mid-1990s), 60 percent of medical facilities were located in adapted buildings, so the ability to fully organize treatment was limited [6, p.261].

Given that 58-59% of the patients treated in hospitals each year are from rural areas, they have started to establish rural medical centers. Health care in Surkhandarya region was further improved in 1999-2000, and Presidential decrees and resolutions of the Cabinet of Ministers were consistently implemented. As a result of the provision of medical facilities with equipment, in particular, the establishment of contacts with the German company Simiens, 2 X-ray diagnostic devices of the model "Syroscope TsX" were installed. Artificial kidney hemodialysis, a filtration apparatus that filters blood and delivers moc fluid to the human body, several dozen autoclaves, a cardiomonitor, a dental complex have been commissioned [7, p. 374-375].

If in 2017, 7.1 trillion soums were allocated to the medicine industry, then in 2019, 12.1 trillion soums were allocated. Also, the amount of funds allocated for medicines and medical equipment and the construction of medical facilities has tripled. Recently, much attention has been paid in our country to medical prevention. Currently, in this direction in the service of the people 1793 outpatient clinics, of which 817 rural medical stations, 798 rural family polyclinics, 178 city family polyclinics [8, pp. 168-172].

By the 2000s, the number of rural outpatient clinics was 111, the number of paramedic and obstetric centers was 548, and the number of rural medical centers was 100 [9, p. 582-583].

In 2005, 4,020 doctors and 18,073 nurses worked in the treatment and prevention facilities of the regional health department, of which 587 were highly qualified specialists. In 2005, in order to develop the material and technical base of health care facilities, medical equipment and devices worth 1 billion 92 million soums were imported [10, p. 74].

DISCUSSION

In 1991-2019, the health care system was improved, the quality of medical services provided to the population was improved, and great attention was paid to children's sports, incentives for medical workers and social workers.

One of the main issues identified in the program for the organization of guaranteed free medical services to the population is the provision of emergency medical care (EMERCOM). For this purpose, in 2000 in Kumkurgan district was opened the Department of Emergency Medicine (EMA) for 30 beds. In order to prevent tuberculosis in the district, 10 mln. 2 DOTS laboratories equipped with medical equipment worth UZS 1 billion were formed. In order to create favorable conditions for the treatment of the rural population, 115-bed day hospitals were established at the outpatient clinic [11, p. 216].

During the years of independence, modern medical facilities were built and renovated to provide medical services to the population of the oasis. The following examples show the share of the number of hospitals operating in the provision of services to the population and the level of service. In 2009-2016, along with improving the quality and efficiency of treatment and prevention work under the district medical association, the construction of new treatment centers and the complex repair of existing ones was accelerated. In particular, for the construction of a new building of the District Infectious Diseases Hospital - 1714284.0 soums, for equipment and facilities - 274200.0 soums; 985818.0 soums for construction of Obakli and Karsokli rural medical stations, 46819.255 soums for equipment; For construction and repair works of the multidisciplinary central polyclinic - 729637,0 soums, for equipment 157300,0 soums; 4314221.0 soums were spent for the repair and construction of additional buildings of the district medical association, 491053.0 soums for equipment, 7740960 soums for the construction of the district medical association, 969372.250 soums for equipment and facilities [11, B. 216], created favorable conditions for public health, treatment and positive work has been done.

The number of hospitals in Kumkurgan district was 7 in 1992, 7 in 1995, 8 in 2000, the number of hospital beds was 1075 in 1991, 580 in 1995, 360 in 2000, the number of doctors in medical institutions was 213 in 1991 and 210 in 1995. , 254 in 2000, the number of secondary medical staff in medical institutions was 687 in 1991, 739 in 1995, and 870 in 2000 [11, p. 217], they took an active part in public health work and formed a modern service.

The medical association of Kumkurgan district works on the basis of state programs for the health of the population of the district, equips modern medical facilities in accordance with international standards, increases the number of medical staff, effectively uses the medical experience of developed countries and provides diagnostics. The district hospital is fully equipped with modern medical equipment developed by countries such as Japan, Korea, Germany, USA, France, India and Russia in 2010-2015 [12], constantly improving the skills of medical staff and introducing new types of treatment.

As part of the investment program, the department of infectious diseases for 40 places in the district was reconstructed and fully equipped for 1 billion 741 million soums. In 2012, the building of the 40-bed therapy and 20-bed children's department was completed for 2 billion 18 million soums, fully equipped and the existing buildings were overhauled for 2 billion 100 million soums. In Azlarsoy, Kindiktepa, Mehrabad, Elobod, Khalkabad, Arpapoya mahallas in 2013, within the framework of the Investment Program, a multidisciplinary central polyclinic was built for 7 billion soums. 481 million soums, Oboqli rural medical center - 399 mln. soums and Korsakli rural medical center was rebuilt for 660 million soums [11, p. 218].

The Council and working groups for the prevention of iodine deficiency diseases were established under the auspices of enterprises, institutions and public organizations, self-governing bodies of Kumkurgan district. On the basis of the decision of the district hokim No. 190 of October 29, 2005 No. 425 "On the establishment of the Coordination Council for the prevention of iodine deficiency diseases in the district" [11, p. 219].

With the decision to improve the development of the private sector of the health care system in 2017-2019, the number of medical specialties that can be engaged in private medical institutions in the country has increased from 50 to 126. In particular, a private joint medical clinic with the Indian government was established in Kumkurgan district [13, p. 171]. These huge reforms in the region are aimed at further strengthening the health of our people, and these reforms will certainly continue in the future.

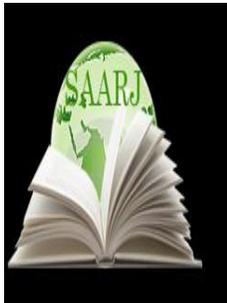

CONCLUSION

In short, the ongoing reforms and changes in the health care system are aimed at improving the health of the population, the quality of medical services in all regions of the country, and targeted government programs in this area serve to develop the sector. Reforms in the field of social life are bearing fruit. It should be noted that in recent years, a number of pressing issues in the field have been considered. In particular, the quality of coverage of systemic patronage services in rural areas has been improved, the material and technical base of primary health care facilities has been strengthened, and their cooperation with inpatient facilities has been ensured.

ROLE FORMATION OF ECOLOGICAL THINKING AND EDUCATION IN HIGHER EDUCATION INSTITUTIONS

Sharafutdinova Rumiya Infarovna*; Muratova Gulsara Saitovna**

^{1,2}Faculty of Ecology and Geography,
 Bukhara State University, UZBEKISTAN

ABSTRACT

This article discusses the relevance of environmental education and upbringing in the minds of university students, as well as the steps that need to be taken to solve these problems. On the territory of the university there should be an experimental garden, a plot with flowering ornamental trees and shrubs. On this experimental site or in the garden, work is underway to preserve, preserve and care for the pupils. Fostering love for nature, the ability to use it correctly and consciously is the basis of environmental education and environmental culture, fostering in people a sense of responsibility towards nature.

KEYWORDS: *Students, Environmental Education and Upbringing, Environmental Protection, Environmental Education.*

INTRODUCTION

“Environmental education is the formation of a person's conscious perception of the natural environment, the conviction of the need to respect nature,” the ecological dictionary explains. In other words, not burdened with scientific terminology: an ecologically educated person understands that nature is as much a living being as he is. Its powers are great, but not unlimited. One of the essential directions in the formation and education of civic consciousness among young people should be environmental education, the formation of responsibility for the purity of their native land, intolerance to manifestations of ignorance and lack of culture in relation to nature. It is difficult to overestimate the importance of ecological education in the issue of upbringing a real person: we encounter nature in the earliest childhood; it is she who is the first teacher, the main component of our character and personality. The first basic understanding of environmental education and training begins in high school. But for some reason, work in this direction in higher education lags behind. To overcome this problem, it is necessary to develop

the following strategies for the formation of environmental education and upbringing of students, namely:

1. Teach students in the spirit of love and aesthetic enjoyment of the beauty of nature.
2. To give knowledge about the laws of development of living and inanimate nature, complex relationships between nature and society, as well as the consequences of human activities for nature.
3. Education of ecological culture among students.

The upbringing of the ability to love nature, to use it correctly and consciously is the basis of ecological education and ecological culture, it creates in people a sense of responsibility towards nature. It all starts with love for the Motherland and patriotic nature. Therefore, it is impossible to educate students in the spirit of patriotism without creating in them a true sense of love for nature. Staying in the arms of nature refreshes a person spiritually, increases his efficiency and creative activity [2].

The problem of nature protection, as mentioned above, is a complex, multifaceted problem, and its pedagogical aspect is one of the most important.

It is necessary to instill in children the ideas of love for nature, love for natural beauty and rational use of nature, and continue this education in the process of education in middle and high school. This is the only way to instill in the minds of people a respectful attitude towards nature. [3,9,10].

The feeling of love and care for the nature of students is brought up in the family and at school. Well-known progressive teachers in their works emphasized the need to start raising children in the spirit of love for nature, for example, the famous teacher Ya.A. Comenius, who lived in the 17th century, wrote the book *Expressing Significant Things in Pictures*. [1,13,14]. This book is an encyclopedia, understandable for children and written in such a way as to help children to love nature and get acquainted with its life and structure.

In the protection of nature, an important role is played by the goals of mankind - humanism, that is, to do good and take care of people. [5,7,11,12]. All renowned teachers emphasized the importance of educating students in the spirit of humanity and nature from an early age.

To overcome such situations, it is important to conduct nature excursions with students after school hours. On such excursions, it is necessary to collect various materials on nature protection, carry out explanatory work, acquaint students with animals and plants useful for humans [4, 8]. It is necessary to show by examples that negligence harms nature. Students should be told that planting useful seedlings and creating artificial bird nests is a means of augmenting natural resources.

It is also important to show short environmental films in universities. Art, paintings, poems and stories about nature and its beauty also instill in students a sense of a good relationship with nature.

On the territory of the university there should be an experimental garden, a plot with flowering ornamental trees and shrubs. On this experimental site or in the garden, work is underway to preserve, preserve and care for the pupils. The primary organization of the conservation society

should be created in universities, and students and teachers should become its members [6]. Special evenings dedicated to nature protection should be held, during which reports and talks should be held on the topics "Nature protection", "Society and its affairs", "Reserves of Uzbekistan and their activities".

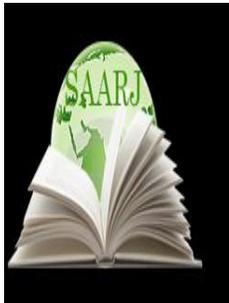

CONCLUSION

Fostering love for nature, the ability to use it correctly and consciously is the basis of environmental education and environmental culture, fostering in people a sense of responsibility towards nature. We can say that the highest level of human thinking is ecological thinking. Since a person understands himself and improves his attitude to the environment, that is, to foresee the consequences of any action that may adversely affect nature in our daily life, and to act accordingly, have the appropriate knowledge and skills, each of us is an integral part of nature. we must not forget that we are part of it and its saviors. Therefore, the development of ecological thinking of listeners and students at all stages of education should remain a sacred duty of each of us to nature.

COMPONENTS OF POLITICAL CULTURE IN POLITICAL PROCESSES

Rasulov Khakim Mamanovich*

*PhD of Political Sciences,
 Docent of the Termez State University,
 UZBEKISTAN

Email id: rhm1973@mail.ru

ABSTRACT

The article analyzes the scientific approach to the study of political phenomena as components of political culture in political processes, the issues of clear classification of their components, interaction and identification of manifestations. It has been studied that in our modern society the political culture of the population is changing rapidly, there is a growing need to determine its formation, peculiarities and scientific analysis of the manifestation of its various components and changes in modern conditions. Components of political culture, such as political psychology, political consciousness, political ideology, on the one hand, the emotional attitude of members of society to politics, values, attitudes that affect political behavior, and on the other hand, the behavior, participation, norms and the rules are analyzed to form stereotypes about the political outlook.

KEYWORDS: *Civil Society, Democracy, Political Process, Political System, Political Culture, Political Behavior, Political Perception, Political Participation, Political Activity, Political Consciousness, Political Ideology, Political Psychology, Political Values.*

INTRODUCTION

One of the problems of the current stage of formation of civil society in our country is related to the formation and manifestation of political culture in political processes. After all, political culture and the political process is one of the most important events in the political life of society. Although they are separate phenomena at a glance, they are mutually compatible as a constant object of study by political scientists. Indeed, the political culture of members of society is reflected in the political system and political processes. "So the focus today is on raising the political culture of the population," he said. Political culture ensures the natural development of democracy" [1:60].

A scientific approach to the study of political phenomena requires a clear classification of their components, identification of their interaction and manifestation features. As the political culture of the population changes dramatically in the context of our changing society, it is necessary to determine the specifics of these changes. In particular, there is a growing need for a scientific analysis of the manifestation of various components of political culture and their changes in modern conditions. In connection with the above, it is important to study the structure of political culture and its main components - political consciousness and political behavior, their role in the complex process of democratization of political culture in society.

Results. An analysis of traditional political behavior has shown that the relative passivity of participation in political processes is due, firstly, to the low level of public confidence in most state and public organizations; secondly, the ineffectiveness of participation in this type of activity is related to the dominance of the idea in the social consciousness.

Assessing the socio-political situation in the country in the process of formation of civil society, the head of state said that "our society has literally awakened, and now our people are learning to directly assess the actions of various officials and express their views freely" [2].

Scientific sources emphasize that political culture consists of such components as political psychology, political consciousness, political ideology. Political culture, on the one hand, constitutes the emotional attitudes of members of society to politics, values, attitudes that affect political behavior, and on the other hand, the behavior of different political cultures, participation, norms and rules, stereotypes about the political worldview.

The Political Encyclopedia, published in Russia, states that the components of political culture are "political knowledge, political ideology and psychology, political experience and traditions, political institutions, norms, forms and means of political activity" [3:174]. If we pay more attention to the analysis of the problem, the components of political culture as a separate system consist of a set of interrelated elements and have a specific structure. The structure of political culture includes needs and interests, knowledge of politics, beliefs, directions, assessment of political events, political consciousness, the essence of thinking, political norms, symbols, traditions, norms of behavior, skills, methods of political activity. The process of formation of these components is long and, at the same time, varies depending on individual characteristics, such as education, national mentality, level of socio-cultural and religious traditions, stereotypes, everyday life, practical understanding of political reality, participation in political processes.

Political culture is a set of general views and normative decisions made by the population in relation to its political system in political science. The concept of political culture does not mean an attitude towards certain state and government leaders, such as a president or prime minister, but rather how people view the political system in general and believe in its legitimacy. American political scientist Lucian Pay describes political culture as a combination of core values, feelings, and knowledge that underlie the political process. Thus, it can be concluded that the foundations of political culture are the beliefs, positions and approaches of citizens to the form of government of the state and society.

Both political culture and political science, as one of the basic concepts of political sociology, allow the study of the mechanisms of interaction of the social environment and the political system in terms of subjective foundations. Indeed, every society has its own norms, values, customs, stereotypes and forms of political participation, which in one way or another give

specificity to objective socio-political relations and relations and play an important role in defining the essence of the political process. It can also be observed that the political development of different countries has led to the instability of the political system as a result of disregard for institutional structures, the relevant cultural content.

For a political culture to be established in a society, civil society must be formed and democratic values must be established. To do this, it is necessary to achieve the realization of such concepts in the socio-political life of society as democracy, the rule of law, civil society, public control. "Democracy is valid only if there are people in society who can live in a democratic environment, have a civic position and a high political culture, otherwise democracy will not be manifested" [1:59]. He also noted that raising the political culture of the people is an evolutionary process that requires a certain amount of time, and stressed that there is no room for haste in its implementation. tried to justify. At the same time, he noted that the improvement of democratic processes should be in line with the growth of political culture [1:65].

Indeed, these social, political, legal events reflect the level of political culture of a society. U.S. political scientist Gabriel Almond describes that if each political system has a specific structural basis for the direction of political action, this factor is political culture [5:396-397].

Although the phenomenon of political culture has a universal nature, its formation and specificity are related to the dynamics of development in the context of nation-states. In the scientific literature, political culture according to the subject of politics: universal political culture; political culture of people, ethnos, civilization; national, regional political culture, subculture [6:326]. If we look at the national features of the formation of political cultures in the modern world, the historical path of development of French, Spanish, Russian, Ukrainian or other peoples in the West, Chinese, Japanese, Uzbeks in the East, the peculiarities of national character, the development of national statehood and their influence. differs in aspects.

It should be noted that not all knowledge is related to the culture of a particular society, nor does it form spontaneously. Indeed, the political consciousness of the people, in turn, determines the political strata, the political behavior of the peoples. In this sense, political culture is the commonality of historical and political experience, political consciousness and political behavior [6:322].

It is known that political culture is manifested not only in the "historically formed, relatively stable set of political ideas, beliefs and trends, but also in the actions and models of political behavior, the actions of the subjects of political relations" [7:169]. Based on these differences, it is possible to distinguish between general and specific types of political culture on the basis of comparing not only individual features, but also its structural features.

Political behavior is a qualitative level of political activity and political participation, that is, an activity related to how a person can behave in this or that situation, in this or that political event. For example, 150 members of a country's parliament can simultaneously demonstrate different levels of political behavior. Demonstrating political and legal activism, someone is actively involved in the discussion process, paying special attention to each legal parameter in the legislative process. There may be no clear political approach or legal position in the actions of other policy actors, they may sit quietly, in other words, simply observe the process, may not be able to penetrate deeply into the political and legal essence of the adopted normative legal act [8:9].

Political behavior is also reflected in the participation of citizens in political events, including demonstrations. Such participation is, on the one hand, in the peaceful conduct of relations along the declared route in accordance with the rules established in the socio-political processes in the country, as enshrined in the Constitution and laws, and, on the other hand, in organizing riots, damage to state and public property; disruption of public order is even manifested in cases leading to bloody clashes. Such an appearance of political behavior reflects the level of political consciousness and culture of the members of society. All of these differences in the actions of political actors and participants fall within the definition of “political behavior”. In other words, all the subjects and participants described are engaged in political activities or participate in political events, but each behaves differently. Hence, political behavior is a way of political participation and manifestation in political processes.

Political behavior is manifested primarily in the subject-object relationship, which is an expression of the state of the subject itself in the process of action. However, in political activity, subject-object relations come first, that is, they are manifested in relations conditioned by the type of activity.

Russian scholar Ivan Alekseevich Ilin focuses on the role of political culture in society, describing it not as the ultimate goal of human life, but as a means to achieve the main goal - the cultural development of man [10:100]. Consequently, the creation of a common cultural foundation contributes to the formation of a political culture. Based on these rules, it can be assumed that modern political culture does not influence the development of political processes, but rather helps them to be reflected in the political consciousness of citizens. Accordingly, based on reflections on the activities of the state power and its governing bodies, each person immediately creates his own political culture postulates at the subconscious level. In general, the political behavior of an individual (group) can depend on many factors. This includes:

- the individual emotional and psychological qualities of the subject or participant in the political process. The difficulty of predicting one's feelings, the sudden onset of attitudes to political reality, often leading to surprising views, and vice versa, are manifested in situations such as caution, restraint, ability to maintain a certain political balance, external calm in political processes;
- personal (group) interest of a subject or participant in political actions. For example, a policy entity is involved in the discussion of a problem of interest or a draft normative legal act in the process of exerting influence on its acceptance or non-acceptance;
- Political movement and adaptive behavior in political participation - represents the behavior associated with the need to adapt to the objective conditions of political life;
- Situational behavior of a political subject in political processes - refers to the behavior associated with a particular political situation or participation in a political reality;
- Behaviors related to certain ethical principles and moral values in the participation of a political subject in political reality - how well the subject or participant in a particular political situation or political action controls the situation, understands the essence of what is happening and adheres to the norms of political processes. The level of motivation and involvement in political life has a significant impact on the political behavior of the subject of politics. For example, for some,

participation in political processes can be a random event, for some it can be a political career, for others it can be the meaning of life, for others it can be a way to make money;

- Forcing to engage in certain types of behavior. Such methods of influencing political behavior are typical of totalitarian and authoritarian regimes of power.

Knowledge of political behavior, which is a component of political culture, plays an important role in the organization of political processes in society. Here, the participation of the subjects of the political process in politics is reflected in the national mental characteristics brought up on the basis of the cultural traditions of their country. In this process, in political culture, universal rational knowledge and the peculiarities of the national mentality are intertwined.

DISCUSSION

Analyzing the content of the components of political culture and their practical manifestation in the socio-political life of Uzbekistan at the current stage of national development, we can draw the following conclusions:

First, political culture is a set of historically established stable forms and stereotypes of political activity, which are determined by knowledge, feelings, traditions, values, beliefs, attitudes, directions, i.e. elements of the political consciousness of the subject. There are different views on the components of political culture. In most scientific sources, political consciousness and political behavior, as well as cognitive, ideological, emotional, ethical, and behavioral, are considered to be key components of political culture. From their unity and interaction, a political culture is formed in the minds of both society as a whole and a particular individual.

Second, the analysis of theoretical and methodological approaches to the study of political consciousness and political behavior, which are a key component of political culture, showed that the theoretical concepts and specific political approaches developed on their basis are interconnected in a single spiritual complex.

Third, for the majority of the population, the formation of the cognitive component of political culture is primarily seen as the most convenient way to obtain information about current socio-political events in the media, in particular, television and the Internet. In this sense, the media form the information base of political culture.

Political education determines the qualitative level of political knowledge. In other words, the features of conceptuality, integrity, consistency, objectivity, scientific character in political education represent the formation of political culture. Interest in social and political life Integrated use of all sources of socio-political information, ie television, press and radio, the Internet as a subject of influence, the formation of political views, opinions, feelings that bring to the political consciousness certain political knowledge, ideas, norms, patterns of political behavior allows.

Based on the components of political culture, interest in politics is formed, which in turn becomes an important factor in increasing their cognitive activity. Observations have shown that this interest may vary depending on international relations, the socio-political situation in certain regions and countries, the socio-economic status of citizens, the degree of their practical involvement in public and political activities, and a number of other factors.

A factor in shaping political thinking is the subject's personal political experience, which helps to put into practice the knowledge he or she has acquired from various sources of socio-political information. Today, the importance of political thinking is growing significantly. Modern political life, with all its complexity and rapid change of political events, requires a person to navigate in it, to evaluate some events from a scientific point of view, to compare and analyze political events. Socio-political reality, empirical data show that citizens have a more positive side than the negative in the current changes in modern society [11]. Some assess the political reality based on changes in the social life of the country, others on their personal lives and observations. In most cases, there is a tendency for citizens to distance themselves from politics, to be afraid to comment on it. Such an approach has created a sense of "fear" in the political consciousness and culture of the society as a result of long-term political pressures, the serious impact of closed politics. Today, the socio-political reality is changing radically. In politics, first of all, the system of human-society-state interests, not the state, has been formed. The policy of the principle "Human interests take precedence over everything" is being implemented.

CONCLUSION

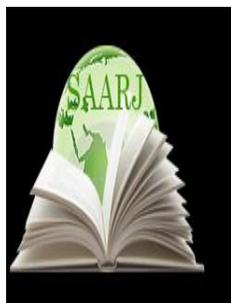

The emotional components of political culture (mood, emotions) reflect the standard and quality of life of citizens, contribute to the concentration of their attention on the issue of interest, carry important information about the state of public consciousness and appear as an important indicator of political culture. Observations show that our people are gradually adapting to changes in the economic and socio-political spheres. The number of citizens who have managed to overcome the difficulties due to the improvement of their financial situation is increasing. They began to have more hope for both their future and the positive trends in the country's development. Thus, citizens' perception of the economic and political situation in the country is becoming more optimistic.

An analysis of the components of political culture allows us to conclude that freedom and human rights, order and stability, social equality and justice are paramount to maintaining the vitality and sustainability of any socio-political system. Without them, the government will not be able to build and maintain public confidence in its legitimacy.

THE ACQUISITION OF A SUBJECTIVE COLOR AS A RESULT OF THE CONVERSION OF THE MEANING OF THE WORD

Mirzakarimova Z.D*

*Associate Professor,
 Candidate of Philological Sciences,
 Almalyk branch of TSTU,
 UZBEKISTAN

ABSTRACT

We are not talking about all types of syntactic conversion. Here we think only of syntactic substantivization and adjectivalization. This is because subjective paint can have the meaning only of words that have been subjectivized by a qualitative substantivization. From the point of view of order, we first consider the substantivization of quality.

KEYWORDS: *Conversion, Lexical Conversion, Syntactic Conversion, Substantivization, Adequacy, Subjective Dye, Semema.*

INTRODUCTION

Conversion is the transfer of a word from one category to **another**. Many words in the Uzbek language have this feature, that is, a word in one category with a certain lexical meaning serves as a word in another. As a result, this meaning acquires a subjective color. The phenomenon of conversion has been sufficiently elaborated by turkologist **linguists**.

They divide conversion into two types:

1. Lexical conversion;
2. Syntactic **conversion**;

Word conversion, that is, the transfer of words to another category, does not always create a subjective color. In particular, lexical conversion does not result in subjective color.

According to the above linguists, syntactic conversion is divided into several groups: they are called nouns such as substantivization, adjectivalization, propolinization, conjunctionalization.

Subjective color formation as a result of substantivization

Only when words belonging to the category of adjectives have a certain semantic subjective syntactic substantivization and the meaning that is the basis for the substantivization can be subjective. To do this, the words belonging to the category of adjectives must have the following semantics.

1. Words within the category of adjectives are subjectively syntactically substantivized and have a subjective color. The color-expressing meaning of a word in the category of syntactically substantivized adjectives can have a positive subjective color. For example:

Uxlao`g`lim, kenjatoyim, oppog`im,

Umrinningmardpospon, shovvozi bor.

(Sleep my son, my youngest, my white,

My life has a brave pospon, shovvozi.) (G`.G`ulom).

The word *oppoq* (white) in this sentence means color. The word, which belongs to the category of adjectives, has undergone a syntactic substantivization on the basis of this meaning, that is, it has acquired a subjective color by moving to the noun. The word "oppoq" is an intensive form of the word "oq" and means a sign of honor. Here are a few more examples of how a word in the category of adjectives is syntactically substantivized by the meaning of color and acquires this positive subjective color:

Hali yoshsan, bilmaysanoqu- qorani,

Joyshoyaber ,qabulo`lsin, nazrqilginporani. (H.N).Qozongayaqinyursangqorasiyuqar. (You're still young, you don't know black and white, Give him a place, let him die, offer a bribe. If you walk close to the pot, the black is high.)

(Proverbs).

In the above sentences, the words black and white, which belong to the category of adjectives, have acquired a positive subjective color as a result of syntactic substantivization. The positive subjective color of their meaning is formed in a similar way to the color of the meaning of the word white.

This means that words within the category of adjectives acquire only a positive subjective color when they are syntactically substantivized by the meaning of color.

2. Words belonging to the category of adjectives can be substantivized and have a subjective color.

Gar ko`chauzraqo`ysa, hechahmoqolmasoni

Birdardisarbalodur, yuzyilturarmashinam.

(If she puts it on the street, she will never be a fool

It's a mess, my car has been around for a hundred years.) (H.N).

In this sentence, the word idiot belonging to the category of adjectives is monosemantic, syntactically substantivized by the existing lexical meaning, and that meaning acquires a negative subjective color.

Here are a few more examples of how the meaning of words within the category of adjectives acquires a negative subjective color as a result of syntactic substantivization.

Bu dunyodaborbo`lsa-yabag`ributun

Qog`ozdanqozonqilayguldano`tin.

(In this world, there is a whole heart

Make a pot out of paper and make firewood out of flowers.)(G`.G`ulom).

Tezroqyo`qoling, shum, mal`un

Shaytonsifatxonsolar.

(Get lost soon, damn it

Satanic khans.)(H.N).

In these sentences, all the words of the category of adjectives have a negative subjective color due to the syntactic substantivization.

3. Words within the category of adjectives can also be syntactically substantivized by their characteristic meanings, and the same meanings can have a subjective color. For example:

U, bubedavolarniqishloqguzaridanqandayqilibolibotaman, deganxayolbilan band edi. (He wondered how he could get these poor people out of the village.) (S.Ahmad).

The word *bedavo*(incurable), which belongs to the category of adjectives in this sentence, has a syntactic substantivization in its unique meaning and has acquired a negative subjective color.

Here are a few more examples of the fact that as a result of syntactic substantivization, the characteristic meaning of words belonging to the category of adjectives has a negative subjective color:

Oradanchiq, kosako`z

Xumchaqorin, tekinox`r. (Get out of here, eyeballs

Smooth belly, free) (H.N.).

Afsus, o`g`ilegilmadi... qotgantayoq

Ulfatlaribo`ldiuninguch-to`rtsayoq.(Unfortunately, the boy did not bend... a solid stick

He had three or four trips.) (T.Yo`ldosh).

The meanings of the adjectives in these words, which are syntactically substantivized, are negatively subjective. The negative subjective color of the meaning of these words is formed in a similar way to the color of the meaning of the word *bedavo*.

5. As a result of syntactic substantivization, the meaning of words that express an important feature of the category of adjectives also acquires a subjective color. For example:

Grajdanlarniko`rgandaBarno

ham

nazaridako`nglidamiltirtaburganbirchiroqeribso`ngandaybo`ldi. (When he saw the citizens, it was as if a lamp flickering in his heart had melted away.)(O.Yoqubov)

In this sentence we give another example of the fact that the meaning of the word *grajdanlar*(citizens) in the category of quality has a syntactic substantivization of its meaning, which acquires a negative subjective color:

Boylar boy o`lurilmsizyashab,

Oriqlarinisemizioshab.(The rich die without knowledge,

Lean fat.) (H.N)

This sentence, like the one above, has a negative subjective color.

Subjective color formation as a result of adjectivation

MashinaoynalaridanDo`ndiqxonningoltinsirg`alariyaltirabko`rinibketdi...(Dondikhon's gold earrings shone through the car windows...)(Mirmuhsin). E, buo`shamuttahambaqaloq-ku!(Oh, that's the accuser!)(O.Yoqubov).

As a result of substantivization, the meaning of the words thin, fat, fat, which belong to the category of adjectives in these sentences, has acquired a subjective color. Thus, the meanings of the words belonging to the category of adjectives, which express important features, also acquire a negative subjective color as a result of syntactic substantivization.

The meaning of words also acquires a subjective color as a result of syntactic adjectivalization. However, the meanings of words belonging to any category have such a feature as a result of syntactic adjectival. As a result of syntactic adjectival, the meaning of the word belonging to the category of nouns has a subjective color in two cases:

1. A certain meaning of the word belonging to the category of nouns will be expressed only by the object. It does not acquire a subjective color. However, when the word is syntactically adapted to this meaning, the features that express the meaning appear. This is the reason for its subjective color. For example,

Avvaloyigitkishisabrli, toqatlibo`ladi. (First of all, a young man is patient.)(R.Rahmon).

The word *yigit* (*young man*) in this sentence has undergone syntactic adjectivation, its meaning has been expressed in the character of a person, and has acquired a positive subjective color. It is not uncommon for such meanings of words belonging to the category of nouns to acquire a subjective color as a result of syntactic adjectivalization.

Here is another example of the facts we have collected:

U, ham bo`lsa, aeroportda,Azimjonbucho`tir bola bilanzo`rg`aajrashdi.

At the airport, however, Azimjon barely divorced the boy. (A.Muxtor)

In this sentence the meaning of the word *cho`tir* is the acquisition of a negative subjective color as a result of syntactic adjectivalization.

2. As a result of syntactic adjectivalization of the word belonging to the category of noun not by its nominative meaning, but by the expression of the sign of the object, which has a nominative meaning, the expression of the sign acquires a subjective color.

The lexical meaning of a word is also called *sememe* in semantics, and it consists of semantics. The word undergoes syntactic adjectivalization based on a certain semantics of its semantics.

The syntactically adjective semantics of a word semantics belonging to the category of nouns have a subjective color as an independent sememe as an adjective category. For example:

Oltinuzukuzrako`zbo`lib, yal-yal,

Qizaribbalqiganyuzlaribahmal.(Looking at the gold ring,

Their reddened faces are velvet.)(Sh.Shomuhamedov)

The word *oltin* (gold) in this sentence is syntactically adjective based on its lexical meaning, ie semantics. Therefore, this semantics of the word gold has not acquired a subjective color as a category of quality. The following example is different:

O, suvuzraqalqqanoltinyaproqlar

Hayotbilanmanguxayrlashdingiz. (Oh, the golden leaves floating on the water

You said goodbye to life forever.)(X.Solih)

The word gold in this sentence is syntactically adjective based on the color semantics of its semantics. That is, the seme of the word gold consists of several semes, which are:

- 1) a semaphore indicating that it is a metal;
- 2) a seme indicating that it is expensive;
- 3) a seme denoting uniqueness;
- 4) a seme indicating yellow color;

5) consists of semantics denoting matter. The word gold in the example has been syntactically adjectivated on the basis of the semaphore representing the yellow color of its semaphore. The seme, which means yellow, was formed as an independent semaphore of the word gold as a set of qualities and gained a positive subjective color. It is very common in the Uzbek language that a word belonging to the category of a nouns acquires a subjective color as a result of syntactic adjectival with the expression of an object sign, which has its nominative meaning. Words belonging to the category of nouns acquire a subjective color as a result of syntactic adjectival based on the expression of signs as follows.

1. Animal names acquire a subjective color as a result of syntactic adjectival with the expression of a color symbol. For example:

Uningyulduziniissiqliqilibturganchatishganingichkaqoshlarimivaquloqkipriklarimi,

bo`tako`zlarimi – Murzikajrataolmadi.(Murzik couldn't tell the difference between the twinkling thin eyebrows and eyelashes that kept his star warm, and the bushy eyes.)(Shuhrat).

In this sentence, the word bush expresses the color of the bush's eyes.

Here is another example of the fact that the meaning of a word belonging to a group of nouns, which represents the name of an animal that has undergone syntactic adjectivalization, acquires a positive subjective color:

Q`oyko`z ... ShundaYorqinoyningyuragiorziqibketgan, o`ziniyo`qotibqo`ygan, a`zoibadanigatitroqturganedi. (At that moment, Yorqinoy's heart was longing, she was lost, her body was trembling.)(R.Rahmon)

The word *sheep* in this sentence has a positive subjective color as a result of its syntactic adjectivalization with the expression of color.

As a result of syntactic adjectival, the words denoting a plant belonging to the nouns also acquire a subjective color with the expression of a color symbol. For example:

Lablarig`unchadekcharos, ko`zlariyulduzdeknurli. (*His lips are like buds, his eyes are as bright as a star.*)(M.Jaloliddinova).

The word *charos*, which refers to the name of a plant belonging to the category of nouns, is syntactically adjectivized with a black expression and acquires a positive subjective color.

As a result of syntactic adjectival, the words denoting the name of an object belonging to the category of nouns also acquire a positive subjective color with the expression of a color symbol. For example:

Ammo bilamankinsonbolasi

Yaproqdekyo`qbo`libketmasbutkul, yo`q!

Misoliqirlarningyoqutlolasi. (*But I know a human child*

It does not disappear like a leaf, no!

An example is the ruby tulip of the hills.)(H.Solih)

The word *yoqut* (*ruby*), which belongs to the nouns in this sentence, has acquired a positive subjective color as a result of syntactic adjectival with color expression.

Here are a few more examples of positive subjective color as a result of syntactic adjectival with the color expression of the noun group denoting the name of the object:

Kelinningqovoqlariqizargan, shirmonyuzlarisalsiniqqanliginiaytmaganda, o`zinitiktutardi. (*Not to mention that the bride's eyelids were red and her cheeks were slightly broken.*)(R.Fayziy).

Ilk bahorpaytidayo`llarzumradyoqatutadi, birnafasdasharrosquyganyomg`irdanko`lmaklarhosilbo`ladi. (*During the first spring, the roads are covered with emeralds, and in one breath the puddles of rain are formed.*)(S.Abduqahhor)

Bog`lardagibarqutyaproqlar,

Tongniqutlab, chalmoqdachapak. (*Velvet leaves in gardens,*

Good morning, applause.)(X.Xudoyberdiyeva)

The words *shirmoy*, *zumrad*, *barqut* belonging to the nouns, which represent the name of the body in these sentences, also acquire a positive subjective color as a result of syntactic adjectival with the expression of color.

We have seen that words belonging to the category of nouns denoting animals, plants, and bodies are syntactically adjectivized with the expression of the same animal, plant, or body, and this expression is subjective as the meaning of the word. acquires paint.

2. As a result of syntactic adjectivation, words belonging to a category of nouns denoting an animal acquire a subjective color with the expression of a characteristic feature of that animal. The following is an example of a positive subjective color:

Bo`liq, yag`rindor, bulutko`z, qaddibaland (It's cloudy, rainy, cloudy, tall)(Shuhrat).

In this sentence, the word *burgutas* a noun is used to describe the shape of the eagle's eye, which has acquired a positive subjective color as a result of syntactic adjectival.

Here is another example of how the meaning of words in the category of nouns acquires a positive subjective color in this way:

Ohuko`zlaribirdanochildi, ohuchaqqonligibilanbirsakrabarg`imchoqtaxtasigachiqiboldi. (The deer's eyes suddenly opened, and Ohu jumped on the swing board with agility.)(Shuhrat).

In the above sentence, the word *ohu*, which belongs to the category of nouns, has undergone syntactic adjectival expression, expressing the shape of the eye, and in this sense has acquired a positive subjective color.

Words denoting the name of an animal belonging to the nouns may also acquire a negative subjective color as a result of syntactic adjectival expression with the expression of this formal sign. For example:

Nechundirto`satdan u boyagikirpiqiyofadanodatdagioyimsupurgiqiyofagakirgan, o`ta ham muloyimlashibqolganedi. (For some reason, he suddenly changed from a hedgehog to a normal motherfucker, and became very gentle.)(O.Yoqubov).

The word *kirpi* in this sentence has acquired a negative subjective color as a result of syntactic adjectival expression with the expression of the shape of the hedgehog. This is because the image of an animal, which is perceived as negative for humans, has become a sign.

The words denoting the nouns are syntactically adjectivized with the expression of the figurative sign of the object that expresses their meaning, and the meaning acquires a positive subjective color. For example:

Bodomqovoqlariostidagijavlonko`zlarmamnun, mamnunkuladi. (The pale eyes under the almond lids smile happily, happily)(Shuhrat)

In this sentence, the shape of the body is expressed by the word *bodom*, which belongs to the category of nouns, and has acquired a subjective color as a result of syntactic adjectivalization.

Here are a few more examples of the fact that the words denoting the body as a noun have a positive subjective color as a result of syntactic adjectival with the expression of the shape of the body:

In the above sentence, the words "*kulcha*", "*qalam*" and "*sadaf*" belonging to the category of nouns have been syntactically adjectivized with the expression of the form and in this sense have acquired a positive subjective color.

Words belonging to the noun group denoting the name of an object undergo syntactic adjectivalization as they express the shape of the object, and the phrase acquires a negative subjective color. For example:

Lekin qizbirko`rinishdachiroyliemas, buningustigachillakoyoq, sallapanglabroq ham yuradi. (But the girl is not beautiful in appearance, and on top of that she walks barefoot and a little limp.) (Shuhrat).

The word *chillak*, which belongs to the category of nouns in this sentence, was syntactically adjusted by the form of *chillak*, which means a sign of a human foot. Accordingly, the word *chillak* has acquired a negative subjective color.

We have seen that words belonging to the group of nouns denoting animals, plants, and bodies undergo syntactic adjectives with the expression of the sign characteristic of that animal, plant, or body, and this expression as the meaning of the word. subjective color.

3. As a result of syntactic adjectival, the words denoting the name of an animal belonging to the category of nouns acquire a subjective color with the expression of that animal, creature, characteristic feature. In this case, the subjective color can be both positive and negative, depending on the meaning of the word. The following is an example of a positive subjective color acquisition. For example:

I couldn't, but I couldn't. : *Olmayedim-u, bo`lmadiqo`limgashaytonqizbeixtiyorushlatibqo`ysabo`ladimi?* (I couldn't, but I couldn't. Is it possible to catch a devil girl in my hand?) ("Sharq Yulduzi" magazine). The word *shayton* in this sentence is syntactically adjusted to express the ability of the legendary creature. Therefore, this expression of the word *shayton* has a positive subjective color. As a result of syntactic adjectival, words belonging to the nouns denoting the name of an animal creature can also acquire a negative subjective color with the expression of a feature, a character trait. For example:

A`lamharzamonda Polvonga ayiq qarashqilaredi. (Alam was always looking at Polvon as a bear.) (A. Qahhor).

The word *ayiq* in this sentence is syntactically adjusted to express the ugly look of an animal. Therefore, this expression of the word *bear* has a negative subjective color. As a result of syntactic adjectival, a word belonging to a group of nouns denoting an animal may have a negative subjective color as a result of syntactic adjectival with the expression of a characteristic feature of that animal. For example:

Eshonzodabujblajibonxotinning gapini eshitmas, harakatini payqamasedi. (Eshonzoda did not listen to this jibblajibon woman and did not notice her movements) (Sh.uhrat).

The word *jibblajibon* in this sentence has a negative subjective color due to its syntactic adjectival meaning.

Here are a few more examples of words belonging to the category of nouns denoting an animal acquiring a negative subjective color as a result of syntactic adjectival expression of animal behavior:

- *Shu quyonyuragingborki ... - Avliyoqushbo`g`ildi. (- You have this rabbit heart... - Saint choked.) (I.Rahim.) Seningeshakmiyangiz ham oraniochiqqiliboliamiz. (Your donkey will also open the gap.) (B.Daminov). Bu albatta "o`zbolangnitizzangdantushur, o`rnida men o`tiraman" deydigan mushuk tabiat A`zamgayoqmadi. (Of course, Azam didn't like the cat saying, "Get your child off your knees and I'll sit in his place.") (Shuhrat)*

The words *qayon*, *eshak*, *mushuk* (rabbit, donkey, cat) there is a negative subjective color as a result of syntactic adjectival expression in these sentences, which is a characteristic feature of the animal.

As a result of syntactic adjectival words of the category of nouns denoting the event acquire a positive subjective color as they express the process of the event. It is rare in the Uzbek language that words belonging to the category of nouns that have the name of an event acquire a positive subjective color as a result of syntactic adjectival with the sign of the process. Therefore, we will confine ourselves to one example below:

Joni olovso`zlari, Shudirmeniovlagan. (The words of the fire of life, This hunted me.)(Sh.Shomaxmudov).

The word *olov* (*fire*) in this sentence has a positive subjective meaning as a result of syntactic adjectival, meaning that the process is effective. Syntactical adjectival It is very rare in the Uzbek language. Therefore, we will suffice to give just one example below:

Muzjismidanharoratolib, Senga yoqibqilartomosh. (Ice takes the temperature out of your body and burns you.) (Zulfiya).

The word *muz* (*ice*), which belongs to the category of nouns in this sentence, has undergone syntactic adjectives with a cold meaning and acquired a negative subjective color.

We have seen that the words belonging to the category of nouns denoting an animal, a body, are subject to syntactic adjectival expression by the expression of that animal, body-specific feature, character trait, and with this expression the subjective color is acquired as the meaning of the word.

4. The word denoting the noun acquires a subjective color as a result of syntactic adjectival, even if it expresses the value of the body. For example:

Oltinxotiralaryuragimdajo. (Golden memories are in my heart.)(O.Muxtor)

We have seen that the words belonging to the group of nouns denoting a body, a metal, are syntactically adjectivized by the expression of a valuable sign peculiar to that body, metals, and by this expression the subjective color is lost as the meaning of this word. For example:

Buvimqizilguldانبittaqirqib, Ra`nogaberdila-rda, uni "asalqizim" deb yelkasigaqoqibqo`ydilar. (My grandmother cut a red flower and gave it to Rana, who called her "honey girl" and patted her on the shoulder.)(Z.Sa`dullayeva)

The word asal (*honey*) in this sentence is syntactically adjective in the sense of pleasantness, and this expression has a positive subjective color. As a result of syntactic adjectivation, it is rare for words belonging to the category of nouns to acquire a positive subjective color with an expression of pleasantness. Therefore, we will give only one example below:

Shakarqizekan-u, qayoqlardayuruvding, hammanisarsonqilib. (She was a sweet girl, where did you go, and everyone was confused.)(R.Fayziy)

The word *shakar* (*sugar*) in this sentence is also syntactically adjective in the sense of pleasantness, and this expression has a positive subjective color.

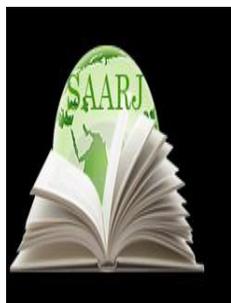

CONCLUSION

As a result of syntactic adjectival, words belonging to the category of nouns can also acquire a negative subjective color. For example, the word *zahar* (*poison*) in the word combination *Zaharodam* (*Poison man*) has been syntactically adjectiveized as an expression of dislike, and this expression has acquired a negative subjective color.

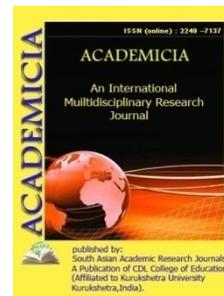

In short, as words perform the function of another category as a result of conversion, the meaning of that category also acquires a subjective color.

ABSTRACT

Samples of a trisubstituted tin-organic compound with D - (+) - galacturonic acid have been synthesized. A study of the compound was carried out by a semiempirical quantum-chemical method, its structural feature was proved, and also graphs of changes in energy and electronic characteristics are constructed depending on the charge on atoms, the order of bonds, the energy of the boundary molecular orbitals. Computer models of the complex compound of polygalacturonic acid with tin ions were obtained, the centers of nucleophilic and electrophonic attacks, donor-acceptor groups, and the electronic structure were determined. The new synthesized compounds were characterized by ^1H , ^{13}C and ^{119}Sn NMR - a method was shown that galacturonic acid acts as a monoanionic fragment and indicates the dynamic behavior of compounds with the participation of the anomeric carbon atom of the ligand.

KEYWORDS: Polygalacturonic Acid, Tin, Coordination, Computer Model

INTRODUCTION

At present, one of the important problems is the creation of new physiologically active substances that expand the arsenal of means of influencing a living organism. Among such substances, substances of natural origin, in particular, polygalacturonic acid, attract special attention. The unique properties of polygalacturonic acid are associated with the presence of active functional groups that determine its complexing ability [1].

Of great interest are tin compounds that have shown high anticancer activity, which makes it possible to consider these compounds as promising pharmacological drugs. However, due to the high toxicity of inorganic compounds, their slow elimination from the body and severe side effects, an active search for new metal-containing compounds is being carried out [2]. The polymeric form of galacturonic acid is a linear polymer consisting of α -D - (+) - galacturonic acid residues linked by 1,4-glycosidic bonds.

One of the approaches to reduce side effects anti-cancer agents on healthy cells, is the introduction of fragments into the structure of molecules of inorganic compounds that exhibit a protective antioxidant effect in healthy cells. Natural compounds of the class of polysaccharides (pectin substances) are part of the antioxidant defense system of the body.

Given the relevance and prospects in this direction, synthesis was carried out to obtain complexes of PGC with Sn IV ions. Samples identified with using physicochemical research methods and NMR spectroscopy, and the calculation energies of molecular models of the complex using quantum chemical method PM3 and molecular dynamics.

METHODS AND MATERIALS

For many chemical reactions, there is a good correlation between the so-called reactivity indices (IRI) and the yields of the final products. The reactivity indices are the electronic and energy characteristics of the system obtained using quantum chemical calculations, the data of which correlate with the experimental data on the reactivity of the compound under study.

Charges on atoms, bond orders, energies of boundary molecular orbitals, squares of the expansion coefficients of boundary molecular orbitals in the basis of atomic orbitals (partial electron densities), etc. are usually used as IRS to study reactivity. In this case, the term "boundary molecular orbitals" denotes the higher occupied (HOMO) and lower unoccupied (LUMO) orbitals of the compound. The search and establishment of a structure corresponding to the required properties is one of the main tasks in the study of chemical compounds.

A study was carried out of a compound - a complex compound of polygalacturonic acid with tin, shown in Fig. 1, the structural characteristics were calculated by the semiempirical quantum-chemical method [3] using the software package Hyperchem 8.0. [<http://hyper.com>].

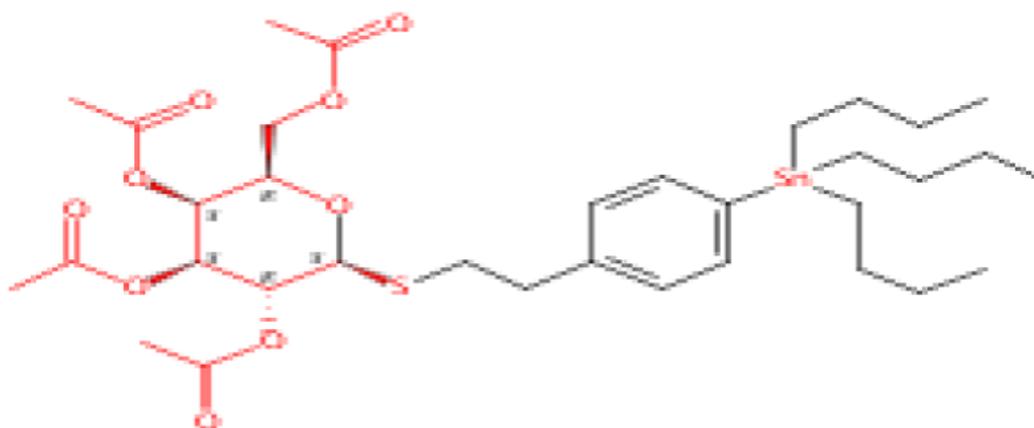

Figure 1. Complex compound of polygalacturonic acid with tinC₃₄ H₅₄ O₉ S Sn(b-D-Galactopyranoside, 2-[4-(tributylstannyl)phenyl]ethyl 1-thio-tetraacetate)

RESULTS AND DISCUSSION

The boundary molecular orbitals, HOMO and LUMO, play a role in chemical reactions, electronic and optical characteristics. HOMO characterizes the electron-donor ability, while LUMO is characterized as an electron acceptor, i.e. the ability to capture an electron. In this case, the sulfur atom in the structure of the complex exhibits acceptor properties, which can be seen from Fig. 2, the HOMO orbitals are located on the sulfur atom.

At the same time, LUMO orbital's are located on the tin atom of the structure (Fig. 3), the electron density is obviously shifted to the benzene ring, so the tin atom has a charge of 1.043134, while the sulfur atom has an excess of electrons (Fig. 2), its charge is -0.085889. Figure 4 shows the energy diagram of the electronic spectrum of the complex compound. The degree of manifestation of reactivity is determined by the concentration of free electrons and can also be characterized by the value of the HOMO-LUMO energy gap (ΔE_i).

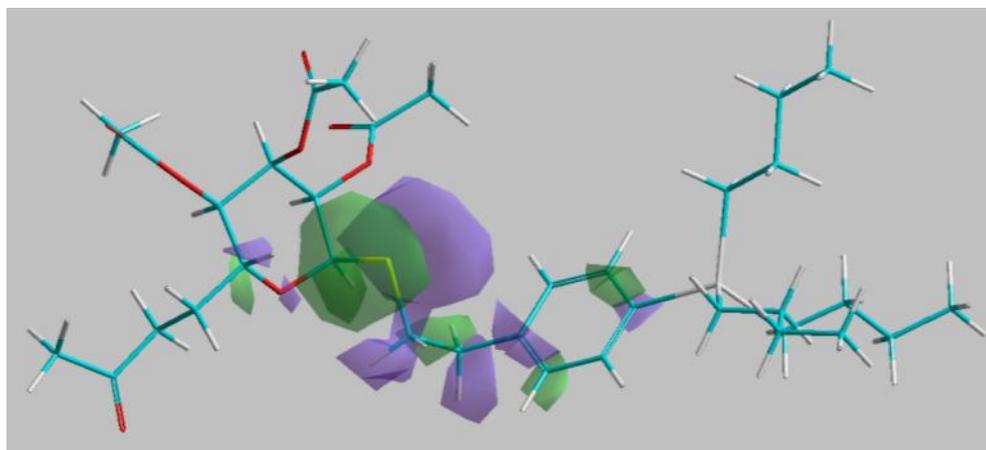

Fig. 2. Graphical representation of the HOMO orbitals of a complex compound (yellow color - sulfur atom), the numerical energy value of the HOMO orbital is 8.8018 eV.

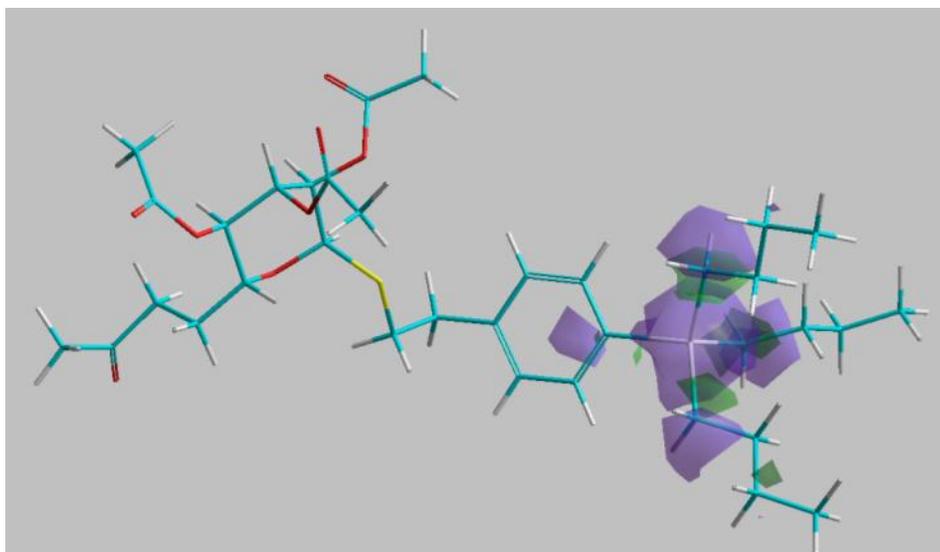

Fig. 3. Graphical representation of the LUMO of the orbitals of a complex compound (yellow color - sulfur atom), the numerical energy value of the HOMO of the orbital is 0.0969 eV.

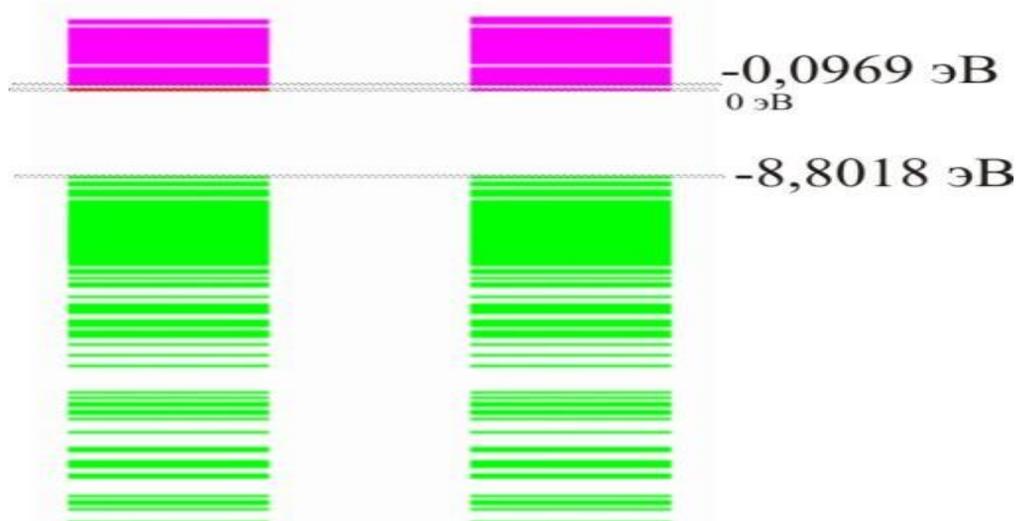

Fig. 4. Energy diagram of the electronic spectrum of a complex compound.

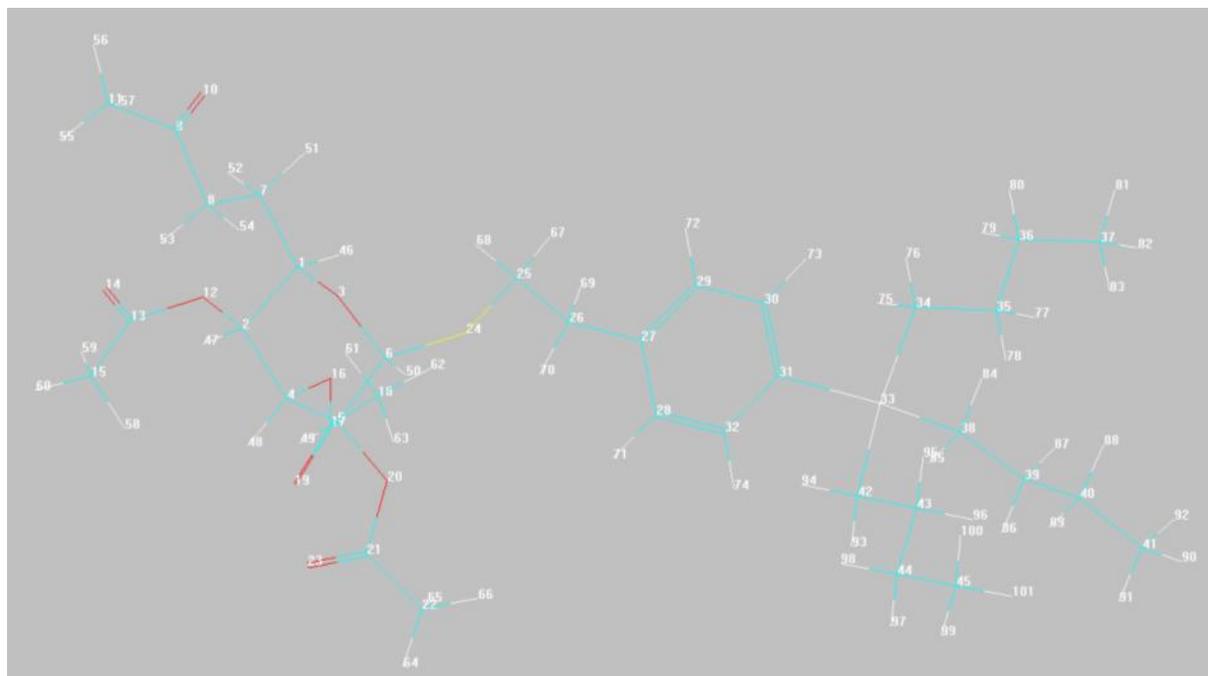

Figure: 5. Model structure of a complex compound with atomic numbering.

The calculation of atomic charges according to Mulliken plays an important role in the application of quantum chemical calculations to study the electronic structure, dipole moment, the effect of atomic charges, molecular polarizability, and many other properties of molecular systems. The atomic charges of the complex compound were obtained using the AM1 semi empirical quantum-chemical method. Table 1 shows the number, charge and coordinates of the arrangement of the model atoms; from the calculation data, one can see the numerical value of the charges of electronegative atoms, as well as of the tin atom, which is positively charged.

common and informative static index of the reactivity of a molecule is the molecular electrostatic potential (MEP). Its physical meaning is as follows. Let the charge q_1 create a MEP $V(r)$ at a point in space with a radius vector r . If a point charge q is placed at this point, then the energy of electrostatic interaction between the charge q and the charge q_1 will be equal to qV . The electrostatic potential of the complex compound was calculated (Fig. 6). In the area of lone electron pairs on the sulfur, oxygen atom, the electrostatic potential is negative, which is displayed in green, and positively infected atoms are displayed in red. In the area of lone electron pairs on sulfur, oxygen and others, the electrostatic potential is negative, which is displayed in red. In this case, the sulfur atom 24 (S) $-0.085889e$ has a negative charge (Table 1), however, due to the shift of the electron density towards the tin atom, its value is reduced, respectively, this compound will enter into nucleophilic substitution reactions at the sulfur atom, which, as the

results of quantum-chemical modeling show, is the most reactive. In the case of an electrophilic attack, the tin atom will react with electronegative atoms.

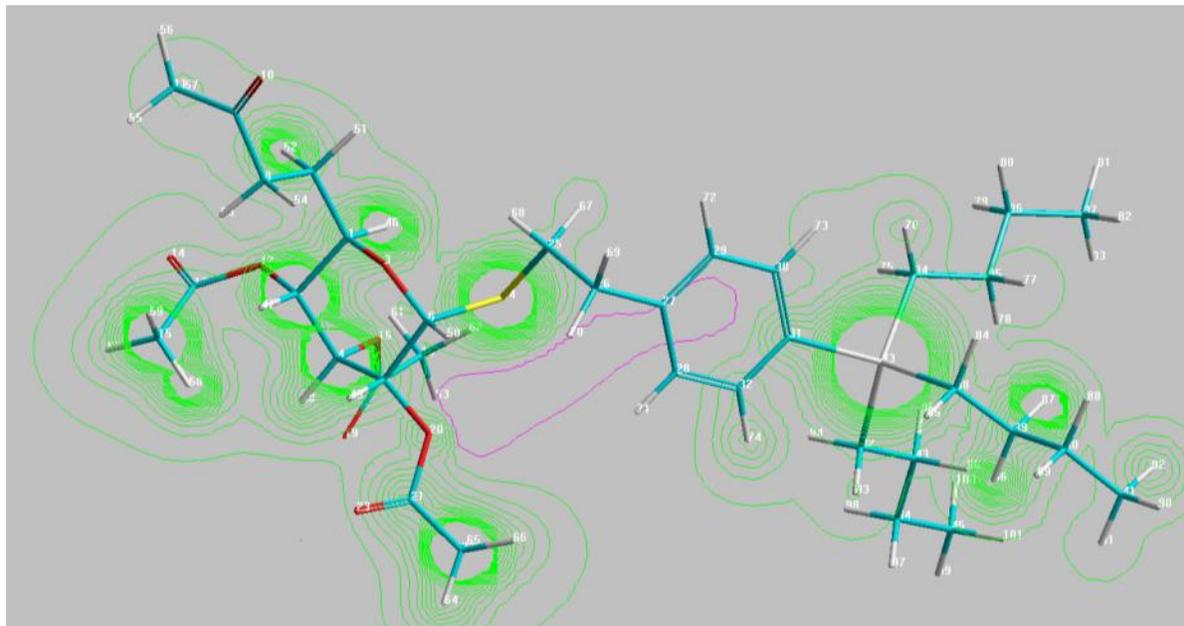

Fig. 6. Electrostatic potential of the complex.

It can be seen from Fig. 6 that the presence of a sulfur atom and a benzene ring in the structure draws a partially positive charge from the tin atom, which can be seen in red on the 2D projection of the complex compound model.

The characteristic duality of the electronic structure of this complex compound characterizes its participation in reactions of both nucleophilic and electrophilic substitution, which determines its reactivity, and, as a consequence, a wide biological spectrum of action.

Modeling and predicting the electronic characteristics made it possible to reveal the presence of various heteroatoms in the structure of the complex. The calculated HOMO and LUMO energies show the existence of interactions and, according to Mulliken's theory, the formation of complex charge transfers is associated with the transfer of an electron from the HOMO orbital of the donor to the LUMO orbital of the acceptor.

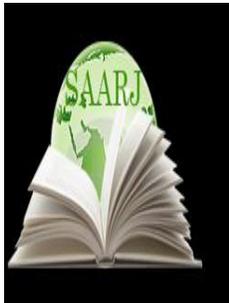

The highest occupied molecular orbital was located primarily on the sulfur atom, the lowest unoccupied molecular orbital was located on the tin atom. The electronic structure of chemical compounds plays an important role in chemical reactions, the manifestation of specific properties, and biological activity. The question of the quantum chemical theory for describing the reactivity of a chemical compound containing various atoms is considered. The reactivity of a given complex compound containing various functional groups is a quantum concept, it is determined by the synergism of reagents in a chemical reaction, but in some approximation it can also serve as an individual characteristic.

CONCLUSION Thus, the synthesis of the complex compound Sn (IV) and galacturonic acid with 2,6-di-tert-butylphenol fragments in the ligand was carried out, the structure of this compound was studied, and computer modeling was carried out to reveal the duality of the

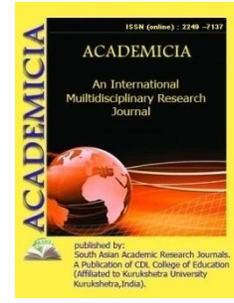

electronic structure of this complex compound, which characterizes its participation in the reactions both nucleophilic and electrophilic substitution.

ABSTRACT

Many of MahmudhojaBehbudi's journalistic articles have not yet been republished, or rather, collected and studied. Nevertheless, the articles that have already caught the attention of readers show that he is an active politician and a sharp political commentator. For example, the famous Jadid's article "KhairulUmuruAvsatuho" (1906) informs the public about the four parties in Turkestan in the early twentieth century. He urges 6 million Turkestan Muslims to unite around one of these parties and fight for their rights. At the same time, he says, the party of the Union of Muslims of Russia, which was close to him, met in Nizhny Novgorod in 1905, St. Petersburg in early 1906, and again in Nizhny Novgorod in August this year to determine its political program. But the party says it will join cadets who are close to them with their political program and work to achieve their goal. This article by Behbudi gives the impression that it was written in order to educate the political masses of the people. Perhaps one of the tasks of a leading political figure like Behbudi was to make the people politically literate and gradually bring them to the arena of political struggle.

KEYWORDS: *Turkestan, Jadids, Artisans, Religious, Secular, State Building, Dictatorial Party.*

INTRODUCTION

Behbudi's activity as a political publicist intensified, especially in 1913-1915, when he published the magazine "Oyna" and the newspaper "Samarkand". At that time, he knew not only the life of the peoples of Turkestan, but also the situation in foreign countries of the East, and by comparing the two lives, he determined the ideological direction of the newspaper and magazine and acted with a clear purpose. The ideological direction of these publications, of which Behbudi is the editor, is first and foremost some of the traditions that have caused the masses of the people to live in difficult economic and cultural conditions. In his articles, the ardent publicist raises the issue of marriage, which is one of such flawed and harmful habits. Interestingly, this issue is also relevant for our reality today. Some time ago, Uzbek television broadcast a series of programs under the heading "Our weddings are our thoughts" for several years, urging people to look at the wedding issue wisely and intelligently. Behbudi and other Jadids raised this issue in 1913, which has always been relevant.

Until 1917, handicrafts were the most widespread and labor-intensive profession among the Uzbek people. That is why Behbudi, in his article "Our deeds or our desires", refers to these professionals:

"The work of a poor carpenter is a wedding. He does not have a happy face. We have artisans who work 18 to 20 hours a day. That's it. "

Behbudi points out that a three-day wedding can leave some families with worries for a decade or even a lifetime, even ruining a home and leaving them homeless. A wedding costs a thousand soums for a carpenter, 2,000 or 3,000 soums for an average person, and 5,000 soums for a "nimboy". In addition, these sums are eaten at a three-day wedding. Kosib, the intermediary, and even the "nimboy" get this money from a bank, a firm, or a "beneficiary." That is why they are forced to sell "garden room and indoor appliances" while paying off the debt, and even give the "poor bride and groom's" bedding and clothing to the "borrower". "The Nimbays will try," writes Behbudi, "if they are not alive, they will try when they die. All their wives will be lost. Oh, what is this? Isn't it a kind of madness? -bet).

People can experience similar consequences not only on a wedding, but on also when they are overwhelmed by the anxiety of tragedy. That is why Behbudi, as a true humanist and enlightener, reveals the difficulties of the traditions that gnaw at the people from within. The issue raised by Behbudi is not of particular importance, but of General Uzbek significance. After all, there is no day without the wedding and death of a great nation. "Every day," writes the publicist, "a Muslim's things are sold on the market for his religion. How many bills are" protests "every day, how many shops, businesses are hajj (seal). What is the punishment for this? Weddings, celebrations, condolences, kupkari, feast "(same page). However, one in 20 people in a neighborhood is either literate or illiterate. Even such a literate person may not be found tomorrow instead of the one who is judging today. Behbudi describes the life of the people as follows:

"Hey, hey, people! Are we crazy, okay? Of course... We enjoyed the idea of weddings and celebrations. We were proud of our wedding celebrations. We tried to collect or capture the money spent on the wedding celebrations. If the wedding and celebrations are not as old as the wedding and celebrations. What should be done with that money? The answer is that weddings and celebrations should be held. But not as extravagantly as it is now. And as small as possible.

And with extra money to teach children Muslims and Russians well. The money spent on weddings is spent on old madrassas and cemeteries. Let the children be sent to Mecca, Madinah, Egypt, Istanbul, and the Russian medicine and medicine industry, and let them be educated to be religious, secular, and modern people. It is necessary to send a child to the Caucasus, Crimea, Orenburg and Kazan to learn the method of education with the money spent ur... "(p. 159).

We see that in the aforementioned article, Behbudi raised two important issues. Both of these issues can have an impact on the fate of the people. When Behbudi raises one of these issues and warns the people that they may become even poorer because of weddings and celebrations, urges them not to overspend, warns of homelessness, he emerges as a fiery humanist and demonstrates the humanistic nature of his views. But it is not enough. He urges that the money to be spent on weddings and ceremonies be spent on the education of his children, the repair of madrassas and schools, and the sending of students to foreign cities and countries. On the one hand, he wants to save the poor people from the danger of homelessness, but, on the other hand, he is again advising him on where to open the door to spending. Doesn't this indicate a contradiction in his views?!

Although Behbudi did not show a material difference between the two costs, the subsequent cost is much less than the previous one. Nevertheless, most importantly, it is not a cost to eat and drink, but a cost that comes back, directs the destiny of their children to other luminous destinations, and, of course, the parents themselves enjoy the fruit. Therefore, Behbudi remains a humanist even when he raises this second issue and shows the "mask" of enlightenment on his face, and at the same time does not deviate from the enlightenment front. Conversely, if the first proposal is mainly aimed at saving every household from being destroyed, the second proposal is to enlighten this house on the one hand, and the whole nation on the other. What is important is that Behbudi presents his enlightenment program to us as a coherent system while expressing his suggestions and desires in this spirit.

Behbudi's enlightenment program includes the following issues:

1. Teaching children in Muslim, modern, Russian-style schools and gymnasiums.
2. Repair of old madrassas, mausoleums, mosques and "damaged rest" schools.
3. Sending children to study in the pharmaceutical and pharmaceutical industries of the East and Inner Russia.
4. Teaching children in Russian government schools; for this purpose to teach and educate every child in Russian for two years; to receive the sum of 600 soums to be paid for these two years from the accumulated funds for the wedding.
5. Opening boarding houses for children; to ensure that these educational institutions are in a modern, national and religious spirit.
6. To open these kindergartens and to open societies such as "Nashrimaorif" or "Jamiyatichariya" or "Jamiyatiatfol" to prepare children for government schools.
7. With the help of these societies and through training in relevant higher education institutions, together with specialists such as lawyers, engineers, engineers, "modern schoolboy", patron and employee of the nation, deputy of the State Duma, able to reform our national industry, work in

technical, commercial and banking to train specialists who will work in the city dumas and in the offices to be opened in Turkestan in general.

"Even our current seniors, middle-aged people, will soon die, and the times will be renewed every day. New science and new thinking and fun will be required by the people of the time. 4-5 modern people will appear in the city, enter government positions, modern circles, commerce and industry, and benefit us. The future time is different"(p. 160).

This enlightenment program of Behbudi envisages raising the nation to a higher level, leading it to the path of national development, to a stage where self-sufficiency and self-governance are possible. Clearly, this program envisages not only the rise of enlightenment, but also the attainment of free and liberated times through enlightenment perfection, and its direction is also far-reaching - the destination of freedom.

According to Behbudi, at that time, if two Uzbeks were fighting or arguing, he would go to a Jewish or foreign lawyer, and if he had a headache, he would see a foreign doctor. That is why it is a requirement of history to act in the way of this "deed-ideal-desire-wish-purpose" instead of weddings, celebrations and kupkari.

So, how did Behbudi, who was passionate about the future of his people and homeland, react to the political situation in Turkestan, to the issue of raising the legal culture of the people? Did the issues of state and society building also occupy a place in his literary and scientific heritage?

Undoubtedly, Behbudi did not connect the future of his people only with the issues of enlightenment. A well-educated scholar, he was also interested in the future of his people, studied the political systems of other countries, and wondered which state system to follow.

From this point of view, Behbudi's 1906 book "The Book of Selected Geography in General" ("A Selected Book from General Geography") is particularly important. Behbudi writes that one of the introductory chapters of this work is about the importance of the science of "geography" and that it consists of "historical geography", "political geography" and "Umrnian (general) geography": "In short, the modern science of geography and there is a world of people, animals, life, and everything, and it is a necessary scientific worldview to express it." Behbudi then dwells on the history of human society and its important points. Coming to the chapter of the work entitled "Government and Rulers", he directly expresses his views on the issues of state building.

In the East, France was called "France" and the French were called "France". But at the same time the word "farang" was generalized and applied to Europeans in general. In this sense, in Behbudi's words, the discussion is not about the French, but about the Europeans of the early twentieth century and their state systems:

"There is now a respectable three-part government or dominion among the Farangs. The first is an independent office (absolute office) in which the king is in charge of the mother and every rule and order is law and order. The order, the rule, the rule is insignificant. , the union, the will, and the judgment of the councils are subject to the signature of the emperor to strengthen him.

Hence, one of the three political systems in operation in the European states of the early twentieth century was the monarchy, in which the private views of the person who ruled the kingdom took precedence.

"The second part," writes Behbudi, "is the rule of the constitution, in which the majority of the people under knowledge are knowledgeable and knowledgeable. And elects a governing representative. Thus, the king gathers the elected representatives and decides to intervene in the inevitable courts, the affairs of the country, and to see to it that they are corrected and protected by consultation. dum", "majlisisinodiy", "el majlisi ". Some other councils appoint their own advisers and rulers. he interferes in the affairs of kings. The king is subject to the order of this assembly "(pp. 243-244).

The second state system in Behbudi's description is, in today's terms, a parliamentary republic. Despite the presence of a king or the head of the kingdom in this type of state-building, the parliament or the "assembly of the nation" does not look to his opinion, but rather to the opinion of the members of that organization and is subject to its laws.

Now let us get acquainted with the third state system in Behbudi's interpretation.

"The third part," the publicist writes, "is the office of the Republic, in which the majority of the people are scientists, and the representatives of these wise people elect a wise man from among themselves to lead some governments for seven years." ", "the chairman is called the "nation," "the president." Every judgment, order, and order is subject to the program of the country and the masses, that is, to the whole nation, in accordance with the laws and regulations. the assembly of the nation is "subject to the judgment, fulfilling the requirements of the judgment. The king of these two classes swears to some country, "I will submit to the ruler, "and then ascends to office" (p. 244).

Behbudi thus divides the state system in European countries into three groups and describes their distinctive features in such words. He also connects the difference between these state systems with the ignorance, enlightenment-enlightenment of the people living under the rule of these states. He draws attention to the fact that the political system that governs the nation can reflect the level of the people, as well as the level of culture and enlightenment.

Thus, in Behbudi's view, three different state systems have been established in European countries: the monarchy, the parliamentary republic, and the republican system of government.

Behbudi, in an article entitled "Khairulumuriavsatuho" published in the sixth issue of the Khurshid newspaper in the same year, showed that he had carefully studied the political parties in Russia and their programs. According to his observations, the four parties in power in Russia at that time were:

1. Mustabid faction (government party).
2. Mashrutaiavomiya (cadet party).
3. Participation of the masses (Social Democratic Party).
4. Union of Russian Muslims.

The last of these four parties was formed on January 13-23, 1906 at the II Congress of Russian Muslims in St. Petersburg.

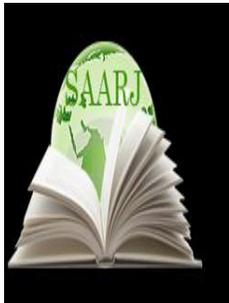

CONCLUSION

If we consider that the first two of the four parties are spiritually close to the monarchy and the parliamentary republic from the European state systems, especially since the leading party is

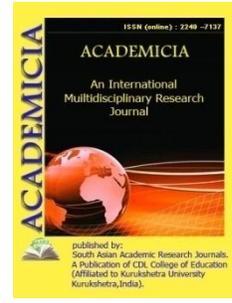

called the dictatorial party, Behbudi's attitude towards the tsarist government and its leading party becomes especially clear. It is also clear that he is optimistic for the future of the Union of Russian Muslims.

ABSTRACT

The article is dedicated to the sorts of proceedings and the execution of rulings related to intervention decisions, which are one of the types of civil proceedings, in which the introduction of the practice of intervention legislation within the national legal system, the specifics of the proceedings and the specifics of authorization and scientific conclusions prepared on this basis, which have been covered in practice.

KEYWORDS: *Arbitration Court, Proceedings Related To The Decisions Of The Arbitral Tribunal, Arbitration Proceedings, Application, Decision, Court Ruling, Writ Of Execution, Enforcement, Alternative Resolution Of Disputes.*

INTRODUCTION

In world practice, elective ways of settling disputes (disagreements) (an agreement, mediation assertion, arbitration, etc.) are expanding. The main purpose of this is often too broadly promote conciliation procedures (conciliation, intercession), as well as the broad use of elective strategies of strife determination, recognizing that it could be a justified institution in the hone of foreign countries; as well as mutual coordination (simplification) of the workload of the judiciary and other bodies.

In general, as the reform of the judicial system comes to a new level, the procedures for resolving disputes (problems) take on a new meaning. In this sense, the selection of the Law of the Republic of Uzbekistan “On Arbitration Courts”[1] has played a vital part in regulating relations in the field of organization and activity of intervention courts within the country. According to this law, permanent and temporary arbitration courts will be established in the Republic of Uzbekistan.

THE MAIN FINDINGS AND RESULTS

Arbitration courts resolve disputes arising from civil law relations, including economic disputes emerging between business entities.

Arbitration courts do not resolve disputes arising from administrative, family, and labor relations, as well as other disputes provided by law [2].

What is the need to establish arbitration courts in Uzbekistan? Are there many reasons for this?

First, the experience of self-justifying foreign states;

Second, there is a need in national practice to resolve disputes in an alternative (pre-trial and out-of-court) manner;

Third, the over-burden in the practice of the competent courts (economic court or civil court) and the fact that this situation has driven to a number of problems;

Fourth, a few of the rising disputes (particularly in civil law relations, as well as economic disputes) can be resolved quickly, at low cost, without the inclusion of state courts [3, p. 5];

Fifth, the shortness of the time for resolving disputes, the simplicity of procedural processes, the priority of the principle of conciliation (conciliation andreconciliation) between the parties;

Sixth, the parties have the right (without limitation) to appeal to the competent state courts, depending on the outcome of the case.

Based on the above needs and strategic goals, for the primary time in the practice of Uzbekistan, the Law of the Republic of Uzbekistan “On Arbitration Courts” was embraced [4].

Then the Law of the Republic of Uzbekistan “On Amendments and Addenda to Certain Legislative Acts of the Republic of Uzbekistan in association with the adoption of the Law “On Arbitration Courts” [5] of August 1, 2007, No. LRuZ-106 [6], the Code of Economic Procedure was amended [7].

Is it precisely their decisions that need to be considered in civil and economic courts? What are the guidelines in the substantive and procedural codes?

Arbitration court (permanent arbitration court or temporary arbitration court) is a non-governmental body that resolves disputes arising from civil legal relations, including economic disputes between business entities.

An arbitrator is defined as a citizen of the Republic of Uzbekistan elected or duly appointed by the parties to an arbitration agreement to resolve a dispute in an **arbitration court**.

According to the data [8], the list of judges of 15 Arbitration Courts established under the Chamber of Commerce and Industry of Uzbekistan and its territorial divisions includes 146 highly qualified specialists, including 6 doctors of law, professors, 6 candidates of law, associate professors, 2 Candidate of Economic Sciences, Associate Professor.

For example [9], in the first 11 months of 2019, the Arbitration Courts considered 9,014 cases, the amount of claims amounted to 236.6 billion soums, 2.9 million US dollars. This is 3,233 more than the number of works done in 11 months of 2018. In particular, the CCI of the

Republic of Uzbekistan Kashkadarya (2,629 cases - 2,267 cases), Syrdarya (1,272 cases - 880 cases), Jizzakh (494 cases - 407 cases), Bukhara (551 cases - 211 cases) It was noted that the Arbitration Courts under the territorial administrations of the regions have achieved high results.

It should be noted that in the first half of 2019, the Executive Committee of the Chamber and regional structures in the interests of members of the Chamber in a total of 33,436 cases for a total of 2 trillion 883 billion UZS. Of these, 25,458 cases were fully satisfied, 136 cases were denied, and 623 cases were dismissed.

When these indicators are distributed according to the jurisdiction of the courts, including:

- Economic courts in 23,258 cases;
- Civil courts in 10,103 cases;
- In 75 cases the share of Administrative Courts.

At the same time, in 793 cases, disputes between business entities were resolved in the pre-trial dispute resolution process.

During the first half of 2019 [8], the Executive Committee of the Chamber and regional structures filed claims in the interests of members of the Chamber in a total of 33,436 cases totaling 2 trillion 883 billion soums. Of these, 25,458 cases were fully satisfied, 136 cases were denied, and 623 cases were dismissed.

When these indicators are distributed according to the jurisdiction of the courts, including:

- Economic courts in 23,258 cases;
- Civil courts in 10,103 cases;
- In 75 cases the share of Administrative Courts.

At the same time, in **793 cases**, disputes between business entities were resolved in the pre-trial dispute resolution process.

Research also confirms that a number of scientific developments in this area have been carried out in the country, ensuring the activities of arbitration courts and the review and enforcement of their decisions, increasing the role of arbitration courts in resolving disputes [10], [11], [12], [13].

It is entitled “Subsection 4 of the Code of Civil Procedure. Proceedings in connection with the decision of the arbitral tribunal”, which deals with two types of civil cases, including

- 1) On annulment of decisions of arbitration courts;
- 2) Applications for the issuance of writs of execution for the enforcement of decisions of arbitration courts.

Specific aspects of the proceedings on the application for annulment of decisions of arbitration courts:

One of the types of civil proceedings (Article 1 of the CPC);

- The party to the arbitration proceedings may challenge the decision of the arbitral tribunal on a civil dispute within **thirty days from the date of receipt of the decision** by filing an application with the civil court for annulment of the decision of the arbitral tribunal.
- The application for annulment of the **decision of the arbitral tribunal shall be submitted to the civil court of the place where the decision** of the arbitral tribunal was made;
- Considered in accordance with the **general rules** of civil proceedings;
- The application for annulment of the decision of the arbitral tribunal is considered individually by the judge;
- An application for annulment of an arbitral award shall be considered within the grounds for annulment of the arbitral award specified in Article 352 of the Code of Civil Procedure;
- A private appeal (protest) may be filed against the ruling of the civil court on the decision of the arbitral tribunal;
- The rights and obligations of the arbitral tribunal in respect of the decision of the arbitral tribunal **on civil disputes may also be disputed by persons who have not been involved in the decision** of the arbitral tribunal;
- Application for annulment of the decision of the arbitral tribunal suspends the proceedings on the execution of the decision of the arbitral tribunal until the completion of the proceedings on the dispute by the civil court;
- The court shall not have the right to examine the circumstances established by the arbitral tribunal during the hearing of the case or to reconsider the content of the arbitral award.
- Procedural rules of proceedings on applications for the issuance of writs of execution for the enforcement of the decision of the arbitral tribunal:
 - The issue of issuing a writ of execution for the enforcement of the decision of the arbitral tribunal arises in the event of non-voluntary execution by the defendant (debtor);
 - Such application may be filed no later than six months from the date of expiration of the period of voluntary execution of the arbitral award;
 - The issue of issuing a writ of execution for the enforcement of the decision of the arbitral tribunal shall be considered by the civil court at the request of the party in whose favor the decision of the arbitral tribunal was rendered;
 - The application is submitted to the civil court at the place or place of residence of the debtor or, if the place of residence or location of the debtor is unknown, the property of the debtor;
 - The application is considered by the judge individually;
 - The court shall not have the right to examine the circumstances established by the arbitral tribunal during the consideration of the case in the court session or to reconsider the content of the decision of the arbitral tribunal;
 - The court shall issue a ruling on the issuance of a writ of execution or a refusal to issue a writ of execution for the enforcement of the decision of the arbitral tribunal;
 - The ruling on the issuance of a writ of execution must be executed immediately.

Analysis of case law materials [14]. In the inter-district court of civil cases on the application of the microcredit organization “S-CREDIT” LLC against the defendants O.A., Y.M and D.A. on the application for the issuance of a writ of execution on the enforcement of the decision of the arbitral tribunal X- Civil case No. 3/19 is pending. According to the case, the permanent employee of “CH-F” LLC Ch. by the decision of the city arbitration court of July 20, 2018, the plaintiff's claim was fully satisfied and the defendant O.A., Y.M and D.A. 1,182,079.38 soums, 2,874,016.55 soums on fines and 307,000 soums on arbitration fees and 7,000 soums on postage, a total of 10,120,000 soums.

At the hearing, the defendants were asked not to voluntarily execute the decision, to satisfy the application and to issue a writ of execution for the enforcement of the decision of the arbitral tribunal. At the end of the case, the court issued a ruling stating that the application could be upheld, a writ of execution issued, a state fee charged for filing an application with a civil court, immediate execution of the ruling, and a private complaint or protest.

The judge shall issue two writs of execution: 1) writ of execution on the debts (principal debt, interest debt, penalty debt, arbitration fee, postage) specified in the decision of the arbitral tribunal and to be recovered from the defendant; 2) a writ of execution on the recovery of the state duty paid from the defendant, which must be collected in favor of the plaintiff, when applying to the civil court. The writ of execution, signed by the judge and the clerk of the court, issued on the basis of the ruling on the case, shall indicate the amount to be recovered, the issue of immediate enforcement and detailed information about the debtor and the claimant. The writ of execution shall be immediately sent to the Bureau of Enforcement at the place of residence (address) of the debtor in the general order or in electronic form by a letter of referral.

Another example is that plaintiff B.A. filed a writ of execution against the defendant A.A. with a writ of execution to enforce the arbitral award, in which the Ya permanent district arbitration offices under the Tashkent city branch of the HSA of Uzbekistan The court's decision of May 17, 2014 fully satisfied his claim, a copy of the decision was provided to him on May 23, 2014, the defendant's offer to voluntarily execute the decision on May 24, 2014 and the full text of the decision although sent, stating that the judgment had not been enforced voluntarily by the defendant, requested that his application be granted and that a writ of execution be issued for the enforcement of the judgment of the arbitral tribunal [15].

It was found that according to the decision of the Arbitration Court of the Ya District Permanent Arbitration Court under the Tashkent City Branch of the HSA of Uzbekistan dated 17 May 2014, a total of 18,420,000 soums was recovered in favor of Defendant A.A. in favor of Defendant B.A.

The court, having considered the plaintiff's application and the materials submitted, as well as considering the grounds for refusing to issue a writ of execution for the enforcement of the arbitral award, considers it necessary to satisfy the application and issue a writ of execution for enforcement.

Defendant A.A. was charged a state fee of 179,180 soums in favor of plaintiff B.A in the application for a writ of execution to enforce the award of the arbitral tribunal and was sent to the Bureau of Enforcement for immediate execution of the judgment.

Because Article 274 of the Code of Civil Procedure is called the execution of a ruling, a court ruling is enforced immediately, unless otherwise provided by law or by a court.

CONCLUSIONS

Based on the above analysis, the following are some of the points, some of which are controversial:

1). Until now, the legislation and practice of arbitration courts have been characterized by an independent, confidentiality of information, an alternative form of dispute resolution and a number of privileges and priorities, the type of proceedings in our procedural codes (EPC, CPC) [16] a separate chapter provides an analysis of the lack of a higher instance to review arbitral awards, but whether the competence of the competent state courts is an alternative or a function of a higher instance court, or a form of appeal against their decisions and activities. However, the Procedural Codes (EPC, CPC) do not specify that the power of review belongs to this system, or it is expedient to establish a mechanism for administrative proceedings, establishing the procedure for proceedings in the form of complaints against these actions (decisions).

2) Article 14 of the Law of the Republic of Uzbekistan “On Arbitration Courts” states “Requirements to the arbitrator”.

According to it, a citizen of the Republic of Uzbekistan not younger than twenty-five years, able to ensure an impartial settlement of the dispute, not directly or indirectly interested in the outcome of the dispute, independent of the parties to the arbitration agreement and agreeing to perform the duties of an arbitrator. In addition, in this article, an arbitrator who resolves a dispute individually must have a higher legal education. It is stated that the chairman of the arbitral tribunal must have a higher legal education when resolving a dispute in a panel. However, it is advisable to include higher legal information in the above “Requirements for Arbitration Judge”. In practice, this has led to a number of problems, including lack of confidence in the arbitral tribunal, its reputation, the quality of the case, the procedural documents, the appeals to civil and economic courts, and the annulment or enforcement of certain decisions in these courts. leading to the rejection, most cases being reconsidered from the beginning (new) in the general claim procedure.

3) On the basis of Article 194 of the Code of Civil Procedure, the court shall issue a ruling on the refusal to accept the application for processing, in accordance with Article 195 on the return of the application. At first glance, this list is a complete list, and it is understood that other articles of the Code do not contain such grounds and no such procedural actions are taken. However, the provisions of Subsection 4 of the Code of Civil Procedure, which deals with the decision of the arbitral tribunal, state that “refusal to accept an application shall be permitted on the grounds set forth in Articles 175-176; 350-355 of the CPC”. The Code provides for separate grounds for dealing with decisions of other arbitral tribunals, as well as “Article 175. Grounds for refusal to accept an application for a court order” and “Article 176. Return of an application for a court order”, but the general norm (Refusal to accept the application under Article 194 of the Code of Civil Procedure, return of the application under Article 195) does not specify this.

Articles 350-355 of the Code of Civil Procedure are limited to the following norms:

Article 350: If the application for annulment of the decision of the arbitral tribunal is subject to the requirements provided for in the first and third parts of Article 349 of this Code, as well as if

filed in violation of the provisions of this article, the civil court shall refuse to accept such an application in accordance with the rules provided for in Article 194 of this Code.

Article 350: If the application for the issuance of a writ of execution for the enforcement of the decision of the arbitral tribunal is filed in violation of the requirements of Article 354 of this Code, as well as if the provisions of this article, the civil court shall refuse to accept such an application in accordance with the rules provided for in Article 194 of this Code.

Article 266 of the Code of Civil Procedure. Decisions to be executed immediately, Article 267. It sets out the grounds on which the court has the right to allow the immediate execution of the decision. However, this list does not address the issue of immediate execution of the ruling issued on the basis of the results of consideration of the issue of immediate execution of the decision and is not specified in the ruling section.

Therefore, “Article 266 of the Code of Civil Procedure. It is proposed to add to this article the item 7) immediately enforceable court decisions”, called immediate decisions (rulings) to be executed.

ABSTRACT

Human being tangibly has obtained this fact that thoughtfulness, intelligence and wit play a major role in bliss and improving the material and spiritual life. Swift development in social and behavioral sciences re-identified this role in different life aspect. This research under the title of “analyzing the effect of organizational factors or creativity in Jahad Daneshgahi Urmia branch” with statistical population of 132 people is written based on these goals: recognizing the effect of organizational factors on creativity, the study of leadership approach and its effect on creativity, the study of organizational structure and its effect on creativity, investigating training and education and its effect on creativity. Research hypotheses include: 1. Organizational factors have a positive effect on creativity 2. Leadership approach has a positive effect on creativity 3. Organizational structure has a positive effect on creativity 4. Rewarding system has a positive effect on creativity 5. Required resource supply has a positive effect on creativity 5. Training and

education have a positive effect on creativity. Field method and questionnaire were used to collect data and SPSS software was used to analyze data. All hypotheses were approved.

KEYWORDS: *Creativity, Leadership Approach, Organizational Structure, Reward, Resource Supply, Education.*

INTRODUCTION

Economical efforts of human being have already focused on obtaining the most result from the least amenities and efforts. This tendency can be named as an enthusiasm to reach an increased efficiency. All inventions and originalities of human being from the most initial ancient tools to the most complicated contemporary electronic and mechanic equipments are influenced by this enthusiasm.

In spite of the long presidency of creativity in human being life, organizations have discovered recently that because of the swift technological revolutions, global competition and economical unreliability, creativity is the key and constant resource of competitive and viability privilege. This constant competitive privilege is appeared based on opinions, goods and services. Those organizations that paid less attention to the effective factors on organizational success will face some difficulties in their viability.

SIGNIFICANCE OF STUDY

Always this question is raised that why a country has developed while another country with better utilities and resources is left behind. Which important factor in the same situations can lead to development and success (organizational - group- individual) or lead to malfunction and dropping behind of some others. The answer of this question should be sought in direct relationship and positive correlation between creativity and innovation of human force and the level of organizational efficiency.

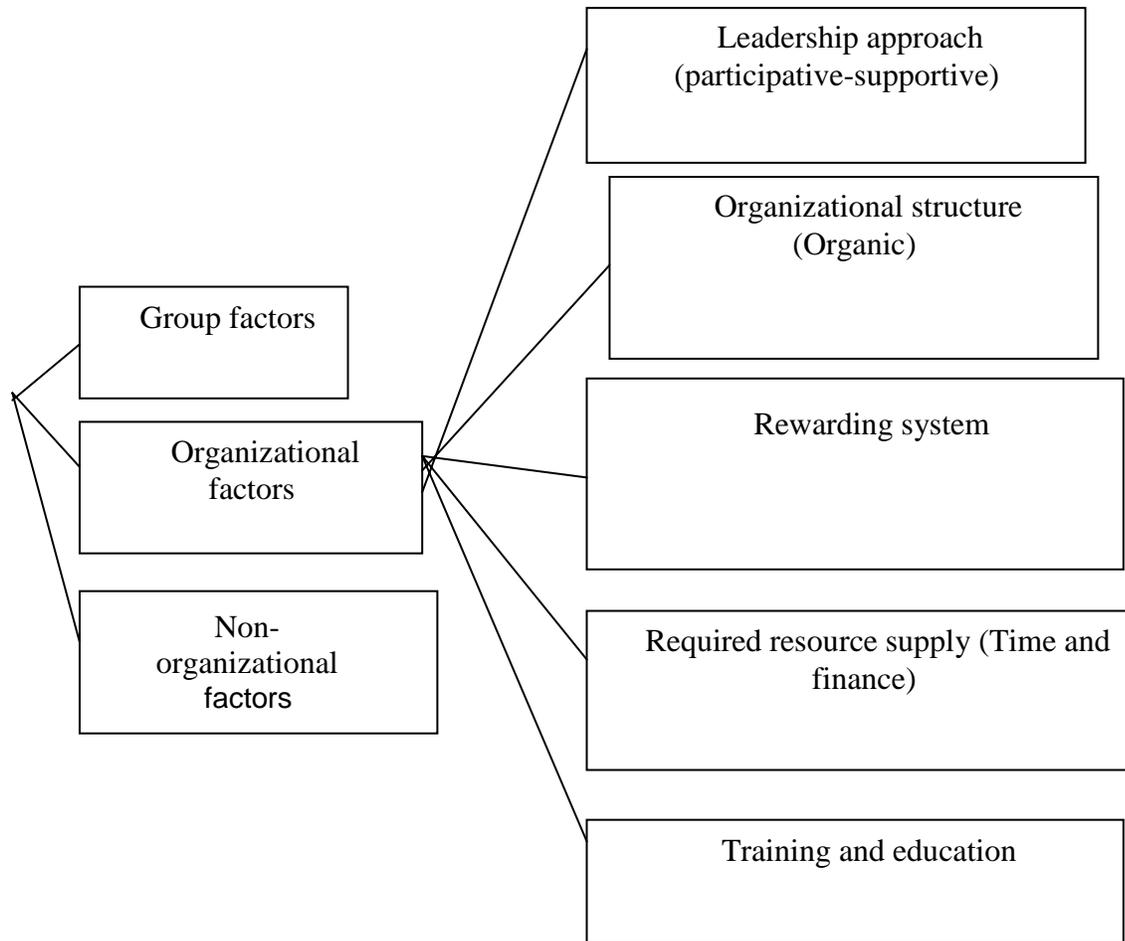

STATEMENT OF THE PROBLEM

Human being tangibly has obtained this fact that thoughtfulness, intelligence and wit play a major role in bliss and improving the material and spiritual life. Swift development in social and behavioral sciences re-identified this role in different life aspect. Nowadays fundamental indexes of intellection in creation and innovation play the basic role in the magnificence of material civilization of the world. Today those companies and organizations that are pioneer in creativity and innovation can achieve success. Viability and development are the most important principles for organizations. In recent decades these viability and development were naturally feasible through the simple responsiveness to environmental changes, but nowadays conditions are different. Innovation and creativity are the most valuable assets of organization and also they are equipments that enable organizations to precede their rivals which are involved in revolutions. Companies and organizations that go toward the innovation and encourage their human resources in this way are successful. (Robins 1376: 26). Therefore according to the important role of creativity in viability and ascendancy of organizations especially Jahad Daneshgahi which is an educational and investigational entity, creativity plays a fundamental role in achieving organizational goals in Iranian Academic Center for Education, Culture & Research. In this study first of all we will discuss about organizational factors and then the effect of some

organizational factors variables including structure, leadership approach, rewarding, education and resource supply on creativity as empowerment output is going to be investigated.

THEORETICAL BASIS OF RESEARCH

Creativity is an essence for the viability of any organization (Griffin W.Ricky. 1993, PP.295-297). Amabil in 1983 investigated about 7000 articles about creativity and found out that only 138 articles have discussed about creativity variables. Of these 138 cases just a few numbers spoke about the role of organization's environmental variables in creativity. Amabil et al (2003) after more than two decades research about the relationship between working environment and creativity and investigating numerous organizations and hundreds of individuals and groups concluded that creativity is intensely influenced by working environment. These findings state that environment has a more significant role in comparisons with other factors like individual features and talents in creativity. According to Amabil organizational factors are absolutely more manipulative and changeable than individual features and talents. Peter Draker (1999) confirms Amabil's idea about the difficulty of changes in innate talents and suggest never try to change yourself, this is not practical. Fiddler also declares that it's difficult to change people and it's better to change their position (organizational environment) rather than changing people. Amabil (1998), Andriopoulos (2001) Cardinalo and Hotfild (2001) demonstrate in their research that creativity is affected by organizational variables. The most important organizational variables effecting creativity include "leadership approach", "organizational structure", "rewarding system", "and organizational atmosphere", "resources". This research aims to study the effect of organizational factors and variables on creativity; thus it investigate the relationship of organizational factors like leadership approach, organizational structure, rewarding system, required resources supply and education with creativity.

LEADERSHIP APPROACH

Conducted researches in organizations environment demonstrate that leadership approach is one of the organizational aspects that significantly affects creativity (Amabil and Graigzoikz, 1987, King and Anderson, 1990). Herad believes that the basic challenge of organizations interested in creative trading solutions is to provide a “leader” who provokes creativity in an organizational field (Ford and Gioia, 1995). “Effective leadership” is the proper leadership for encouraging creativity in organizations which is a fairly extensive idea. Leadership behaviors that lead creativity include setting clear expectations about what should be done and supporting the choices and options of staff in achieving these goals. Researches show that management effort to dictate working procedures are completely inappropriate. Understanding the fact that liberty of act and supportive behaviors can lead to creativity is related to participative- supportive leadership, while dictatorship does not produce creativity. Bernard M. Boss is the first person who declares between successful and effective leadership (Blanchard, 1380: 71). If the leadership approach was not adjusted with staff expectations and people do their job because the leader is in authority, we can say that the leader was successful, but not effective. This is because of the fact that people obey the leader just because he controls rewards and punishments. In contrast if the leader’s affairs lead to a successful response from staff and they do their job because they wanted it themselves, in this case the leadership is effective. In such a condition the leader not only is in authority, but also has a personal power that staff respects him and want to

cooperate with him (Blanchard, 1380:92). Dignity is given to the leader by organization while personal power is something that is given to the leader by staff acceptance. Hardy and Schwartz (1996) believe that a leader is effective only in a condition that his behavior was adjusted with his orders. Therefore, regardless the fact that leader's orders are coordinated with his behavior or not, his behavior creates group or organizational culture. (Sadeghi 1376:172). Management efforts in order to dictate working procedures are completely inappropriate. Understanding the fact that liberty of act and supportive behaviors can lead to creativity is related to cooperative-supportive leadership, while dictatorship does not produce creativity. In other words, creativity is a result of liberty of act in supportive environments not following dictatorial orders. Oldham and Kamingz (1997, 1996) investigated the effect of leadership approaches on creativity in their studies and found out that supportive and non-control approach is the most effective factor on creativity and innovation. Vizberg (1992), Scot and Broos (2004) demonstrated that leaders are able to affect staff creativity through creating self-confidence in them. King and Anderson (1995) explain that specialists considerably agree upon the fact that the leadership approach required for creation and innovation is participative or democratic approach, i.e. staff should be active participants in decision-making process and it should be possible for them to convey their ideas to organization leaders. Alton Mayo believes that participative approach is a democratic approach which reduces working tension and increases creativity. In such a situation, we can expect people to utilize whole their capabilities (Parkinson et al, 1987). Faris (1982) showed in his studies that participative leadership approach leads to the most thriving creations and encourages innovations rather than appointive system. (King and Anderson, 1995, PP.96-100)

ORGANIZATIONAL STRUCTURE

Considering the structure goes back to Hasoren's studies in electronic company of western electric (Joe Mary, 1387:387). Organizational structure is one of the organization's dimensions which aim to divide jobs among organization members and coordinate them. (Moghimi, 1385:196). Organizational structure's function is to remove ambiguities in a way that is a solution for environmental unbeknownst and emerges from correlated behaviors in connected processes. Structure is produced considering strategy and most of the organizations design their strategy according to innovation and creation, expense reduction and imitation (Robinz , 1376:313). Experts believe that structure has different types and they studied them in two general groups of mechanic and organic. According to Bronz and Scatter (1962) there were two environments and each of them results in special structure formation of itself. "Mechanistic structure" was appropriate for the organizations that act in consistent and safe environments and "organic structure" is suitable for organizations operating in dynamic and inconsistent ones. They determined that mechanistic and organic structures are the most ideal organizational structures that are coherent and no organization exists with mere organic or mere mechanistic structure (Sadeghi, 1386:180). These two researchers found out that using organic structure is more practical whenever the organization needs more creativity. These kinds of organizations expect more of their staff so that they can maintain their competition privilege with new plans. Mintzberg (1989) with a systematic point of view concluded that each organization includes five divisions and each of these divisions has a strategic and dominant in the organization. Structure is formed based on that division. These structures involve "simple", "mechanic bureaucracy", "professional bureaucracy", "partial bureaucracy" and "bureaucracy". Bronz and Stoker (1962) and Mintzberg (1989) believe that organizational structures are effective on creativity and

declare that organic structures (bureaucracy, simple, connected and matrix structures) simplify creativity and mechanistic structures prevent the appearance and emerge of creativity. Martin and Troblanch (2003) believe that “flexibility”, “liberty” and “co-operated team work” are the most important characteristics or values of organic structures that result in the development of creativity and innovation. In contrast, features like “inflexibility”, “controlling”, “predictability” and “discipline related to hierarchy” hinder creativity. Taro (2000) states that whenever affairs are organized precisely, there would be no gap and no weed may grow out of it, and on the other hand it means that excessive sticking to structures won’t allow the emerge of any gap so that new flowers can flourish. Organizations with low adjustment have a high level of control through concentrated decision making. Mere obedience of rules has a negative effect on creativity. Ford and Gioya (1995) based on an ultra-analyze of researches, kind of emphasize on bureaucracy structure features and declare that structure in creative organizations tend to flexibility, low level of rules, little explanation of career, and high level of independency since these mechanistic, traditional and hierarchical structures hinder creativity. Some of the other features of organic structure which resemble mostly to the structure of freelance organizations (Robinz, 1376:312) and lead to creativity include: lack of concentration in decision making and low formality, flexibility due to low level of rules and lack of their effectiveness, general explanation of job, granting high level of liberty and appointing authority to individuals in any levels to represent their new opinions and thoughts. Most of the restricting factors of creativity regarding bureaucratic organizations include: hierarchical structure, concentration in decision making, insufficient and inappropriate resources, reduction of budget, tendency to do things in traditional ways and a high level of rules and disciplines. Most of the researchers believe that high formality, hierarchical structure and management supervision of creative behavior are not suitable and mechanistic and inflexible structures prohibit the creativity (Ford and Gioya, 1995).

REWARDING SYSTEM

The reason people do something is that they want to meet their own requirements. They always think about the result and rewards they would get before starting to do it. Organizations control most of the rewards and in most cases these rewards are the way of motivation (Robinz, 1377: 363) and the answer of this question that how it is possible to make staff do some significant creative jobs and special operations. Staff rewarding system is consist of organization’s cohesive policies, processes and approaches according to staff’s role, proficiency and competence which are an effective assist in organizational efficiency (Abbas Pour 1384:230). Creative decision makers and others expect the organization to recognize their hard work and creativity and appreciate and reward them (through tipping or increasing their wages). Amabil (1997) studied the effect of internal and external motivation on creativity and believes that internal motivation has a more significant and determinant effect on creativity rather than external motivation. He declares that one of the features of creative organizations is rewarding the creativity, but it should avoid external rewarding like money to make their staff creative. Monetary rewarding makes the person to feel that he is under observation. In contrast lack of rewarding to creativity produces negative feeling in organizations. People may think that they are being manipulated or they are not appreciated because of creative functions. Consequently providing a rewarding system and encouraging creative people in this field can be efficient and effective (Alvani, 1372:217). Amabil suggests some rewarding of internal motivation in order to increase creativity including: allowing people to join those projects that they are interested in, generous and

enthusiastic appreciation of individuals and groups creative works, allowing people to work on their desirable ideas, although they are not sure about its success. Rewarding system permits taking risks that has a significant effect on creativity. Researchers like Izenburger and Armeli (1977) believe that external rewarding is utilized with two different controlling and informing purposes. If we use them with controlling purpose, Amabil precisely confirms that external rewarding causes the control of individual's behavior and finally leads to the reduction in internal motivation and creation of staff. If we use rewarding with informing purpose i.e. rewarding convey information that reflects competence and creative function of individuals, it leads to internal motivation and creation. Therefore external rewarding should be observed as those things that demonstrate individuals' competence and endeavors to undertake creative functions. If rewarding distribute through these informing approaches, they can have a positive effect on staff creativity (Sadeghi, 1386:205). Martin and Trablanch (2003) suggest that staff should be rewarded to encourage them to creativity, taking risks, producing, experiencing and executing in their work. As Craft (2001) believes any creative working or behavior should be rewarded to reinforce creativity. According to Strat's idea rewarding should involve flexibility, uniqueness and be special and adjusted with individual or individuals who receive it tyo reinforce creativity through rewarding system. Amabile (Amabile, 1979, PP.221-223) found out that inaccurate evaluation and granting external rewarding results in individuals' creativity repression. Amabile (Amabile 1998, PP.77-80) suggest that the organizations who attempt to encourage creativity, at the same time have to appreciate creativity constantly and avoid monetary rewarding since internal motivations of individuals increases whenever they feel what they do is important for others. In other words, allocating rewards in organizations should provide the most output. At the first step, organization should be planned in a way that rewards were allocated to effective functions (by effective function we mean a function that is along the lines of organizations goals). Just in this case, utilizing rewarding is an effective solution to encourage and motivate staff (Saadat 1375:254-265)

EDUCATION

Education is considered as a tool by which organization determine a range in which their human asset is being considered as a sustainable asset (Abbas Pour 1384: 166) In order to have creativity we require two kinds of knowledge (not any kinds of knowledge) which are both acquisitive. One is factual knowledge and the other is experimental knowledge. Factual knowledge is the basis of everything, to learn a language w should learn its vocabulary and their meanings, otherwise speaking in that language is not practical (saadeghi,1386: 128). Creative people have the required knowledge in the related field of function. The related knowledge includes "education", "training" and" experience" that a person in contact with the related function (Gardener, 1993). Education exposes the person with a variety of experiences, viewpoints and knowledge basis to reinforce using experiments and divergent problem solving proficiencies and preparing people to utilize different and numerous viewpoint and create more intricate plans (Perkins, 1986). Creativity as other human talents is fairly acquisitive and is not peculiar to special people. Creativity development requires special conditions and educating and guiding organization staff are others facilitators of encouraging and emerging creativity and innovation in an organization. Creativity can be found in all people with various strength and weakness and can be flourished and extended through education (Aghaieefisahani, 1377:157).

Study shows that the feasibility of achieving an invention among those who have academic education is lower than other people and this means that explorations and inventions don't necessarily require academic education (Ojen K. wan fanjeh, 1364:240). People who didn't have academic education, in most cases showed some creations while people with higher education didn't have any creations. Creative characteristic doesn't form intrinsically, however it flourishes in social environment and through education. A teacher who emphasizes on a question leads his students to a creative thinking (Aghayi Fishani, 1377:219). Assiduity and perseverance make creative people use their intellectual and knowledge processes (Esternburg, 1998). Most people fail because they only spend 9 minutes on solving a problem, while solving it requires 10 minutes. Creativity needs hard work and enthusiastic energy and time consumption since nothing valuable including creativity can be obtained simply and swiftly. It only achieves by studying, researching and knowledge educating. Simonten, the magnificent researcher of creativity, on the strength of the results of numerous studies demonstrates that creativity emerges from lots of efforts. Creative people like Edison, Picasso and Einstein and etc. had lots of inventions which means that they faced lots of failures and successes (Sadeghi, 1386:137) since merits are flourished based on experience and education.

RECOURSE SUPPLY

Amabile (1998) believes that money and time are two major resources influencing the creativity. Managers should be aware of allocating these resources. Making decisions about the amount of allocating time and money to a group or project as well as appointing people to a suitable job is an intricate judgment which concludes to encouraging or repressing creativity. Unfortunately, organizations usually suppress creativity through determining unreal urgencies which lead to uncertainty or unreasonable time pressure that causes disenchantment. It's obvious that creativity is most often time consuming. Managers who don't allocate enough time to exploration and doesn't have any special plan for waiting period, hinder creativity inadvertently.

Shali and Gilson (2004) emphasize on time resource and believe that time is an important resource to monitor and manage creativity and managers must ensure that their staffs have access to it. The research conducted by Amabile, Moler, Simson, Hadlei, Kramer and Fleming (2003) demonstrate that people under time pressure are significantly less committed to creativity. Creativity requires time consumption and Basedore (1987) in his research found this fact that time restriction in doing creative jobs is one of the most prominent limitations of creative behavior. Katz and Alen (1988), in agreement with Amabile, express financial resources as one of the important resources of creativity in an organization. However some other scientists like Sikezentemi Hali (1997) believe that managers encounter a big challenge about various resources such as financial resources in association with creativity. In another way, while the material resources are important for creativity, in some cases the restriction or availability of material resources may have a negative effect on creativity. In other words, lack of material resources could really cause encouraging creativity. Managers should assure that required resources for working are reasonably available for staff.

Managers, who empower staff and make them more creative, act as the backup defenders of a football team rather than forward players. They are mostly resource providers and problem solvers and don't act as a guide or leader that much. Therefore, empowerment and assisting staff in their way to reach their goals are one of the fundamental missions of managers. Managers, who try to provide required resources to enhance staff abilities, attempt to assure that their staff

receives the sufficient and consistent education and experience of professional development (Nave Ebrahim, 1386:75)

REPRESENTING CONCEPTUAL MODEL

A valuable thought is neither developed in a vacuum condition nor will it. Thus, existence of a desirable organizational environment is of the essence to develop new ideas and thoughts. Nowadays, creativity and innovation is not considered as a feature that is better to have it rather than lack it and also it cannot just be found in some peculiar people. But, creativity and originality are vital and prominent discussions in the leader organizations of business that try to survive in competition with others and remain pioneer. This is because of the fact that creativity is of paramount importance as structure flexibility base and originality and innovation ability. Organizations that fail in noting the effective factors of organizational success will encounter some difficulties in their viability (cook, 1998, p 24) Staff creativity would lead to organizational survival (Amabile,1996) just in the case that they were innovative in their works and represent and also utilize new and beneficial ideas about productions, function, service or organizational procedures (Oldham,2002; Shali and Gilson, 2004). The results of this study show that there is a relationship between organizational factors and the amount of creativity. In the form of conceptual model of study which is obtained by investigating creativity literatures and some factors of organization field, the model consists of five variables of creativity, organizational structure, rewarding system, required resources, leadership approach and education.

RESEARCH QUESTIONS MAJOR QUESTION

Which variables of organizational factors have positive effect on creativity?

MINOR QUESTIONS

1. What is the effect of leadership approach on creativity?
2. What is the effect of organizational structure on creativity?
3. What is the effect of rewarding system on creativity?
4. What is the effect of required resources supply on creativity?
5. What is the effect of education on creativity?

RESEARCH PURPOSES

1. Recognizing the effect of organizational factors on creativity
2. Studying the approach of leadership and its effect on creativity
3. Studying organizational structure and its effect on creativity
4. Recognizing rewarding system and its effect on creativity
5. Investigating the required resource supply and its effect on creativity
6. Investigating education and its effect on creativity

RESEARCH HYPOTHESES

Research hypotheses are represented in two major and minor groups.

MAJOR HYPOTHESIS

Organizational factors have positive effect on creativity.

MINOR HYPOTHESES

1. Leadership approach has positive effect on creativity.
2. Organizational structure has positive effect on creativity.
3. Rewarding system has positive effect on creativity.
4. Required resource supply has positive effect on creativity.
5. Education has positive effect on creativity.

METHODOLOGY

TYPE AND METHOD OF RESEARCH

According to the subject and purpose of this study, it is an applied research with a descriptive method.

DATA COLLECTION METHOD

In order to gather data in this study a questionnaire and for theoretical basis and review of literature the library method of study were applied.

DATA ANALYSIS METHOD

After gathering data by using a questionnaire, it was analyzed by SPSS 18. Statistical methods like descriptive and inferential were applied as follows:

DESCRIPTIVE STATISTIC: it's like the calculating the abundance averages, standard deviation, percentages, tables and diagrams.

Inferential statistics: Freedman ranking test, Pearson correlation test (based on normal data condition).

STATISTICAL POPULATION

Statistical population of this study is consist of 132 people of Urmia Jahad Daneshgahi staff of back up, educational, cultural, and research department.

STATISTICAL SAMPLE

Since statistical sample is limited and confined, questionnaires were distributed among all members.

SUBJECTIVE SCOPE OF STUDY

An important thing in this study is to investigate the effect of organizational factors on creativity of Jahad Daneshgahi and expressing the solutions and suggestions. Therefore, issues related to organizational factors effective on creativity have formed the subjective scope of the study.

LOCATION SCOPE OF STUDY

Urmia Jahad Daneshgahi is the location scope of this study.

TIME ZONE OF THE STUDY

The collected data is related to the first half of 1391.

- 1) Responders' sensitivity and the possibility of insincere responding to the questions.
- 2) Low amount of motivation and tendency of some people to answer the questions.
- 3) Determining the extent of research scope.

DEFINING KEY WORDS CONCEPTS AND EXPRESSIONS CONCEPTUAL WORDS DEFINITION

- 1) **CREATIVITY:** creativity includes utilizing subjective capabilities to develop an idea or concept (Kizer, 1968)
- 2) **LEADERSHIP:** leadership includes any measurements to tempt people for enthusiastic working in order to reach determined goals (Kate Davis 1981).
- 3) **ORGANIZATIONAL STRUCTURE:** organizational structure is one of the organization's dimensions which aim at sharing jobs among organizations' members and coordinating them. (Moghimi, 1385:196)
- 4) **REWARDING:** people do some jobs because they want to meet their needs. People think about the result and reward that they will achieve. Most of the rewards are considered as the most effective motivational tools (Robins, 1377:363) and these rewards are the answer to this question that how is it possible to make staff do creative and special jobs.
- 5) **RESOURCE SUPPLY:** Amabile (1998) believes that time and money are two major effective resources on creativity. Managers must act precisely in allocating resources. Decision making about the amount of time and money allocated to a group or project as well as appointing people to suitable jobs is a complicated judgment that can conclude to encouraging or suppressing creativity.
- 6) **EDUCATION:** Education is equipment through which organizations determine a range and in that their human asset considers as their sustainable asset (Abbaspour, 1384:166). To have creativity, we need two types of acquisitive knowledge entitled experimental and factual knowledge and are obtained through education. Creativity development requires some conditions and special educations. Educating and guiding organization personnel are assisting factors of creativity and innovation in organization.

DATA ANALYSIS OF STUDY

DEMOGRAPHIC CHARACTERISTICS OF STUDY POPULATION AGE GROUP OF STUDY POPULATION

As it is demonstrated in the table, statistical population of study are classified in three age groups of 20-35, 36-50, and 51-higher. 99 people of 132 statistical populations are in 20-35, 29 people are among 36-50 and 2 people are in the last age group. Most of staff and statistical population of study are in 20-35 age range and we can say that they are rather young.

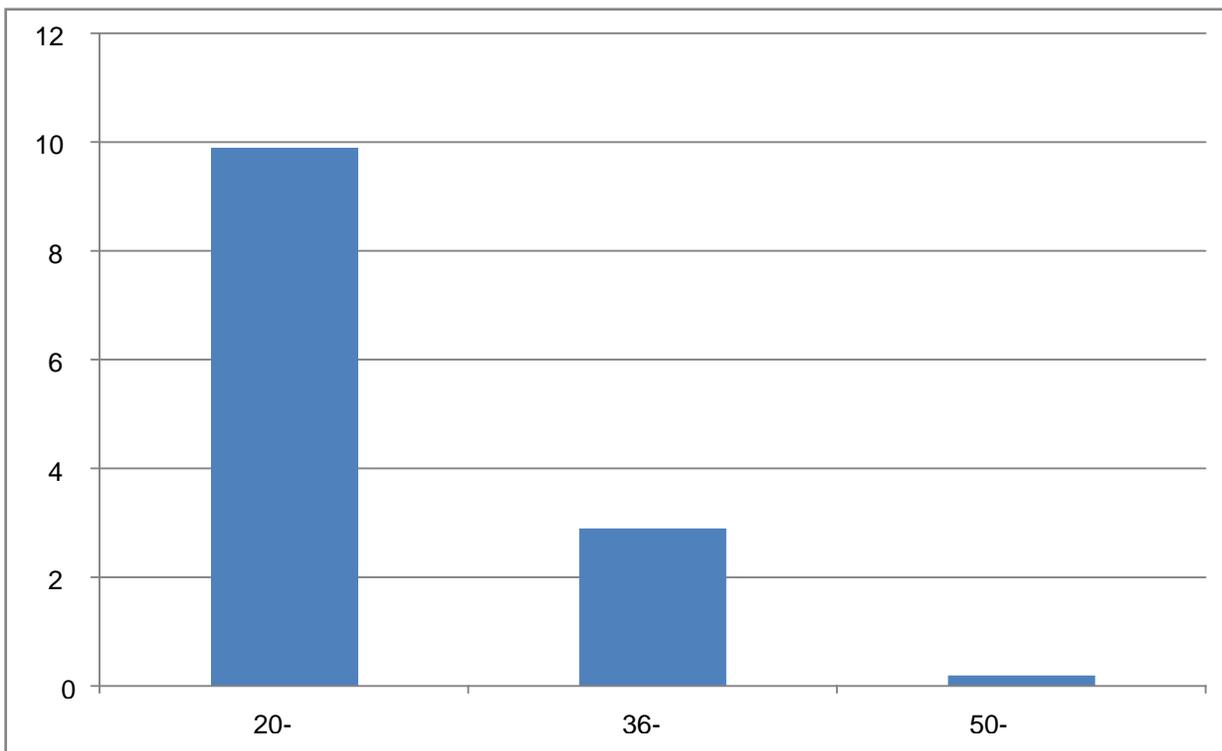

TABLE 6: AGE GROUP OF STUDY POPULATION

Number	Age range	Frequency	Frequency percentage
1	20-35	99	76

2	36-50	29	22
3	51-higher	2	1
Total		130	100

THE NUMBER OF STATISTICAL POPULATION OF STUDY

The total number of statistical population was 132 consisting of 72 men and 58 women that shows the number of men was more than women and 2 people didn't give back the questionnaire.

TABLE 7: THE NUMBER OF STATISTICAL POPULATION OF STUDY

Number	Population	Frequency	Frequency percentage
1	Men	72	55
2	Women	58	45
Total		130	100

Resource: research data

DIAGRAM 2: GENDER COMPOSITION OF STATISTICAL POPULATION

The composition of education of statistical population

Table 3 demonstrates the composition of education of statistical population. As it is observed, the population consists of 132 people who hold five levels of education including diploma, collegiate, B.A, M.A, and PHD. According to table's data most of the population i.e. 59 people hold B.A and 55 of them have M.A. 2 people didn't give back the questionnaire.

TABLE 8: LEVEL OF EDUCATION OF STATISTICAL POPULATION

Number	Level of education	Frequency	Frequency percentage
1	Diploma	3	2.5
2	collegiate	7	5
3	B.A	59	45
4	M.A	55	42
5	PHD	6	5

Resource: research data

DIAGRAM 3: LEVEL OF EDUCATION OF STATISTICAL POPULATION

PRECEDENT INDEX OF RESEARCH POPULATION

Table 4 demonstrates the composition of staff precedent in statistical population. They are classified in groups of 1-10, 11-20, and 21 or more according to their precedent. 97 people have 1-10 years, 17 people 11-20 and 16 people 21 or more years of experience. By investigating data in the mentioned table it is understood that most of the statistical population in the first group has the working experience of less than 10 years.

HYPOTHESES TESTING

Hypothesis 1(H1): leadership approach has positive effect on creativity

The opposite hypothesis (H0): leadership approach doesn't have positive effect on creativity.

Table 9: the effect of leadership approach on creativity (correlation)

Creativity	Leadership approach		
0.725	1	Pearson correlation	Leadership approach
0.000	0	Sig (1-tailed)	
130	130	N	

SPSS result is an output since Sig is less than 5%. Thus, H0 is disapproved and H1 is approved. Accordingly, it can be 95% said that leadership approach affects positively on creativity and has a significant relation with it.

HYPOTHESIS 2 TESTING

Research hypothesis: organizational structure has a positive effect on creativity. H1: p#0

Opposite hypothesis: organizational structure doesn't have a positive effect on creativity. H0: $p=0$

CORRELATION

TABLE 10: THE EFFECT OF ORGANIZATIONAL STRUCTURE ON CREATIVITY (CORRELATION)

Creativity	Organizational structure		
0.936	1	Pearson correlation	Organizational structure
0.000	0	Sig (1-tailed)	
130	130	N	

Resource: research data

According to Sig that is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that Organizational structure has a positive effect on creativity and has a significant relationship with it.

HYPOTHESIS 3 TESTING

RESEARCH HYPOTHESIS: rewarding system has a positive effect on creativity. H1: $p \neq 0$

OPPOSITE HYPOTHESIS: rewarding system doesn't have a positive effect on creativity. H0: $p=0$

CORRELATION

TABLE 11: THE EFFECT OF REWARDING SYSTEM ON CREATIVITY (CORRELATION)

Creativity	rewarding system		
0.721	1	Pearson correlation	rewarding system
0.000	0	Sig (1-tailed)	
130	130	N	

According to Sig that is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that rewarding system has a positive effect on creativity and has a significant relationship with it.

HYPOTHESIS 4 TESTING

RESEARCH HYPOTHESIS: required resource supply has a positive effect on creativity. H1: $p \neq 0$

OPPOSITE HYPOTHESIS: required resource supply doesn't have a positive effect on creativity. H0: $p=0$

CORRELATION

TABLE 12: THE EFFECT OF REQUIRED RESOURCE SUPPLY ON CREATIVITY (CORRELATION)

Creativity	required resource supply		
0.645	1	Pearson correlation	required resource supply
0.000	0	Sig (1-tailed)	
130	130	N	

Resource: research data

According to table 12 the amount of Sig is less than 5%, H₀ is disapproved and H₁ is approved. Therefore with 95% confidence we can say that required resource supply has a positive effect on creativity and has a significant relationship with it.

HYPOTHESIS 5 TESTING

RESEARCH HYPOTHESIS: education has a positive effect on creativity. H₁: p#0

OPPOSITE HYPOTHESIS: education doesn't have a positive effect on creativity. H₀: p=0

CORRELATION

TABLE 13: THE EFFECT OF EDUCATION ON CREATIVITY (CORRELATION)

Creativity	Education		
0.599	1	Pearson correlation	education
0.000	0	Sig (1-tailed)	
130	130	Sig (1-tailed)	

According to table 12 the amount of Sig is less than 5%, H₀ is disapproved and H₁ is approved. Therefore with 95% confidence we can say that education has a positive effect on creativity and has a significant relationship with it.

MAJOR HYPOTHESIS OF STUDY

Organizational factors have positive effects on creativity.

RESEARCH HYPOTHESIS: organizational factors have positive effects on creativity.

H₁: p#0

OPPOSITE HYPOTHESIS: organizational factors don't have positive effects on creativity.

H₀: p=0

TABLE 14: THE EFFECT OF ORGANIZATIONAL FACTORS ON CREATIVITY (CORRELATION)

Creativity	Organizational Factors		
0.639	1	Pearson correlation Sig (1-tailed)	organizational factors
		N	

TABLE 15: THE EFFECT OF ORGANIZATIONAL FACTORS ON CREATIVITY (CORRELATION)

Creativity	Organizational Factors		
------------	------------------------	--	--

0.639	1	Pearson correlation	organizational factors
0.001	0	Sig (1-tailed)	
130	130	Sig (1-tailed)	
1	0.639	Pearson correlation	Creativity
0	0.001	Sig (1-tailed)	
130	130	N	

According to the amount of Sig which is less than 5%, H0 is disapproved and H1 is approved. Therefore with 95% confidence we can say that organizational factors have positive effects on creativity and have a significant relationship with it.

FRIEDMAN TEST

This testing is used to investigate the significance of variables' ranking. The average rank of independent variables in study is the same: H0 The average rank of independent variables in study is not the same: H1 Test statistic (a)

TABLE 16: FRIEDMAN TEST

N	130
Chi-square	320.114
DF(degree of freedom) Asymp.sig	4
	0.000

A. FRIEDMAN TEST

By 95% certainty and because of the fact that the level of significance (0.000) is less than error degree (0.05), it is said that H1, which expresses the average rank of independent variables is not the same, is approved.

Next table demonstrates ranking according to the level of importance and the effect of independent variables in research population.

RANKS

TABLE 13: RANKING ORGANIZATIONAL FACTORS

	Man rank
Leadership approach	3.75
Organizational structure	4.10
Rewarding system	1.60
Resource supply	2.25
Education	3.40

Resource: research data

DISCUSSION AND CONCLUSION

In analyzing data at the first step, research population was demographically investigated briefly and in the second step a pre-test was applied to examine research hypotheses. Then all of the hypotheses or the correlation test was evaluated and according to the results all research hypotheses (both major and minor) were approved. Finally a Friedman test was used to rank all organizational components.

- Based on the first hypothesis test leadership approach has a positive effect on creativity which correlation coefficient in SPSS software between the approach of leadership and creativity in West Azerbaijan Jahad Daneshgahi is 0.725. Since this number is positive and near 1, therefore, the range of correlation is high and direct which means that as the leadership approach improves (cooperative method), the range of creativity in organization improves too.
- A Conclusion based on the second hypothesis test which shows that organizational structure has a positive and meaningful effect on creativity, expresses 0.936 ranges between organizational correlation and creativity. This means that as the organizational structure is organic and appropriate, the level of creativity in organization increases.
- Based on the analysis of the third hypothesis test, which tells that “rewarding system has a positive effect on creativity”, it is revealed that the range of correlation between rewarding system and creativity is 0.721 that is a positive number and near to 1; and shows a positive correlation between two parameters. As the amount of reward corresponding with a function elevates, creativity on that organization increases too.
- Based on the analysis of the fourth hypothesis test, which tells:” required resources have positive effects on creativity” correlation coefficient is 0.645. Since this coefficient is positive and near 1, it means that there is a positive and meaningful relation between required supplies and creativity. It is concluded that, if supplies are prepared sufficiently and on time (finance, time, etc) it will provide and boost creativity in organization.
- The analysis of fifth hypothesis shows that, education has a positive effect on creativity. Aas correlation coefficient shows (0.559), by rendering training and providing education it could be possible to create and elevate creativity in Jahad Daneshgahi.
- Based on the main hypothesis which was about analyzing the organizational factors on creativity, the relation and its effect was positive, and it is concluded that if organizational factors in Urmia Jahad Daneshgahi is provided sufficiently and on time. It will bring creativity in organization. Based on ranking test, the effect of organizational factors on creativity was ranked as follows:

Rewarding system <supply < education and training < leadership approach < organizational structure

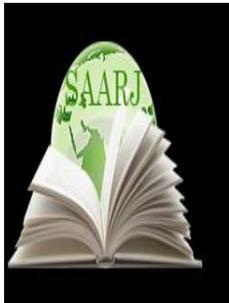

Modeling based on these results is possible. Utilizing these factors according to their rank and importance in organization elevates creativity in organization and causes problem solving and increased development. Therefore the structure of organization is in priority.

PRACTICAL SUGGESTIONS

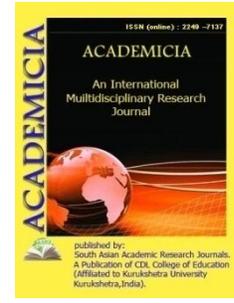

According to one by one data analysis of research hypotheses as well as the major hypothesis, if the honorable Jahad Daneshgahi managers tend to develop creativity and increasing it, they should reinforce all of the organizational factors specially based on their rank and priority to increase the amount of organizational creativity in Urmia Jahad Daneshgahi.

FURTHER SUGGESTIONS

1. It is recommended to researchers to study other effective factors of creativity like interpersonal factors, and environmental factors that include other group and out of organization factors.
2. It is recommended to executive managers and non- governmental company managers to study the factors other than organizational factors in their managing scope in order to develop creativity and increasing it in organization.

COMPARATIVE ANALYSIS OF PHRASE LOGICAL FUSIONS IN THE FRENCH AND UZBEK LANGUAGES

Kurbonova Gulsara Sodikovna*

*PhD, Associative Professor,
 National University of UZBEKISTAN
 Email id: gulsara.qurbonovna@gmail.com

ABSTRACT

In this article, the national and cultural features of fictional toponymic component phraseological units are studied based on the stylistics calembour's. Death informs the gardener that he will come to the garden the day after his death, hearing this news, the gardener escaped to Samarkand that night in agreement with his master, but destiny is inevitable, as the meeting with death will take place in Samarkand at the same time. Thus word play is one of the most characteristic features of French phraseology. The peculiarity of this word game depends on the peculiarities of the French language and the national spirit peculiar to the French.

KEYWORDS: *Toponym, Phraseological Etymology, National-Cultural, Borrowing, Associative Connection, Fictional Toponymic Components, Calembour.*

INTRODUCTION

Additional to the geographical toponyms available within the two languages involved in the analysis, phraseological units associated with the artificial geographical name may also be encountered. Most of the phraseology that falls into this group is formed using a pun (calembour) or word game that is considered a cultural stylistic means.

It is necessary to reconstruct cultural information as it really is in order to understand calembours. The description of the object is considered as the difference between such fictional toponyms and elemental toponyms. The figurative meaning occurs because of the metaphorical phenomenon. In terms of the structure of fixed expression, calembour is the most productive stylistic tool.

The aim of the research work is to identify national-cultural features of phraseological units with fictional toponymic components in the French and Uzbek languages and to study their similarities and differences.

MATERIALS AND METHODS

The object of the researchwork is national and cultural phraseological units with toponymical component in the French [3] and Uzbek [4] languages.

Methods used in the article linguistic, comparative, etymological and component analysis.

1.1. Linguoculturological features of phraseological units with toponymical components in French and Uzbek

Calembur is widely utilized in simple communication, as well as in the works of writers as an important figurative and expressive emotionally influential means. The tradition of making toponyms based on calembours such as word games has already existed in France for a long time. The widespread use of calembour reflects not only the national character, but also depicts the "spirit" of the French language, its characteristic "originality".

A.G. Nazaryan divides phraseological calembours into three groups. These are:

1. Phraseologisms are constructed on the basis of the ambiguous meaning of one of their components (passer l'arme à gauche).
2. One of the homonymous components of phraseology will be replaced (raisonner comme un tambour, literally may be translated as 'think as a drum'; meaning: to say something unkind, to say nonsense; raisonner (to think), résonner (to sound))
3. Onomastic phraseological calembours are based on the ambiguous or figurative meaning of proper nouns and names.

Two distinctions can be differentiated:

- a. A phraseological unit is constructed on the basis of the melody of a word and a proper noun (often, antonyms), which are, in particular, fictional units: sainte Nitouche – literally. Nitush; meaning: a person who does not joke, short-tempered (Nitouche = n'y touche) café de sainte Claire – literally. Saint Clara's coffee; meaning: not too bitter coffee (the name of St. Claire melodious with the adjective 'bright' – 'clair(e)')
- b. Phraseological unit is formed on the basis of the mutual harmony of word and toponym of fictional toponyms: aller à Crevant – (literally. To go to Krevan) meaning: to die / pass away. Crever/ from the verb to pass away Crevant formed a fictitious toponym; aller à Niort – (literally. To go to Niort) meaning: firmly reject. The capital of the French department is called Niort; the phrase is derived from the verb nier/reject [2,238-239].

Fictional toponymic phraseological units were studied in 4 groups.

1. Toponyms in toponymic phraseological units not only perform their main function as (naming a geographical object), but also perform the function of conveying cultural-historical or socio-economic information. For example, Le rendez-vous de Samarkand (literally: meeting in Samarkand, meaning: meeting with destiny) toponymic phraseology is a phrase related to the fairy tale "A Thousand and One Nights". Death informs the gardener that he will come to the

garden the day after his death, hearing this news, the gardener escaped to Samarkand that night in agreement with his master, but destiny is inevitable, as the meeting with death will take place in Samarkand at the same time. Une conduite de Grenoble (literally.: behaviour of Grenoble) meaning rudely put behind the door. The phrase belongs to Marshal de Ledigera (1543-1626), governor of the province of Dauphiné of Louis XIII, he was expelled from Grenoble along with his inhabitants and entered the city without warning.

2. The toponymic phraseological unit includes occasional toponyms that reflect the utopian philosophical worldview. For example, pays de Cocagne– the land of fairy tales, a prosperous life and idleness, a paradise on earth. (Literally.: Kokan, the country of sweets). The phrase was first mentioned in the old French epic poem “Aymeri de Narbonne”, which refers to a paradise on earth where everyone lives happily. The walls of the house are made of various delicacies ... red wine flows from one side of the river, white wine from the other; three times a week it rains a hot cake [3, 329].

3. Toponymic phraseological units are built on the basis of word games: Aller à Argenton – (Literally.: Going to Argentina) meaning: to earn money. Argenton argent/formed from the word money; aller à Cachan – to hide, formed from the verb Cachan se cacher/to hide); aller à Montretout(argo) – (Literally. Going to Montreux) meaning: get a medical examination. Montretout montre tout/formed from the word to show everything.

4. The toponymic phraseological unit contains a topocomponent in which the word game is actually involved with proper place names. For example, in the professional language of theater actors aller à Rouen – (Literally. Going to Rouen) meaning: to face the whistle of the audience, to fail. Melodious with the name of the wheel movement of the Rouen astionim based on (Rouen/ supplice de/roue). In describing such phraseological units, the term calembur phraseology of A.G. Nazaryan was used [2,55-56]. The phrase emerged as a result of a combination of historical memory and verbal memory. French is a very productive language for making geographical calembours with toponymic constructions Aller à +. Aller à Versailles – (Literally.: to Versailles). to fall, to fall into a ditch, Verser (to turn over, to overthrow) and a calembour was used in the words of the French city of Versailles.

1.2. National and cultural features of phraseological units with fictional toponymic components in French and Uzbek

In French, there are also fictional phraseological units with the components orographical name, horonym, oykonym and urbanonym:marquis d'Argencourt poor, poor baron (literally: Marquis Arjankur). At the basis of the idiom the fusion of geographical name Argencourt– is taken as a word game based on the similarity of the pronunciation of the phrase à court d'argent. Marquis de la Bourse Plate (bourse plate – wallet) the phrase is also based on a similar word game; pivois de Blanchimont – (Literally.: Wine of Blanchimont) white wine.Blanchimont – can be made up from the word montagne blanche. Pivois – the name of the wine, the reason it is so named is that the grape resembles a bud, in the dialect such a fruit is called a pine bud. In the past, many cafes had a label called a pine bud. Other researchers believe that pivois is derived from the paeonia, the red color of the peony;aller à Dormillon – (Literally. To go to Dormion) meaning: to go to sleep. Dormillon is based on a word game - a geographical name is created from the word dormir (sleep).

Thus word play is one of the most characteristic features of French phraseology. The peculiarity of this word game depends on the peculiarities of the French language and the national spirit peculiar to the French. As Sh.Bally points out, "... the incorrect division of words and syllables forms a calembour; they appear easily, especially in French. This is not accidental; the main reason for the formation of puns is abbreviated expressions" [1, 141].

Considering, calembours of geographical names and word games in French phraseology vividly reflect the sense of French humor. This national feature of the French people is more clearly reflected in the phraseology of modern French, which is based on the pun (word game).

RESULTS AND DISCUSSION

Calembourtoponyms in the Uzbek language are formed in two ways:

1) In the name of oronyms: Қўҳи Қоф – a legendary mountain, the origin of which is difficult to reach, associated with a religious concept. The phraseological units formed with the participation of this word differ from other toponymic component phraseologies belonging to this group by their active use in the spoken language of the people. Ёмон лоф деса, ола Қоф дейди; Қоф– the legendary mountain that surrounds the whole earth; Турум тоғи means eternity, permanence, stability. It may also have been made in the name of the Тури Сино Mountain in Arabia. Ётиб еганга Турум тоғи ҳам чидамайди [4, 111]. Вариант: Ётиб еганга тоғ ҳам чидамайди.

2) Anaphor - phraseological units related to real names, formed in the phonetic style, i.e. as a result of repetition of the same sound at the beginning of the word and based on rhyme and stylistic repetition: Ёмон сомонхона куйди деса, Самарқанд куйди, дейди; Отбоши, Арпа еринда ҳориди от, От отанг бўлса, қозикни қоқ-да ёт (There are places called Otboshi, Norin, Arpa in the territory of present-day Kazakhstan); Оқ қоптол от Отбоши ўтин ўтламас (Отбоши – the name of the place. The saddle of the horse, with the addition of the saddle - the shoulder is called "koptol") made using an alliteration stylistic phenomenon. Яхши от келар Жиззақдан, Қўшса келар узақдан. In this case, words Jizzakh and far away are called as Жиззақ, узақ in accordance with the rhyme and dialect. Jizzakh has long been famous for its thoroughbred horses; Including phrases such as Хонқалининг бойини, Хивалининг камбағалини билиб бўлмайдди; Шовотдан шариллаб ўт; Кайвони керак бўлса Гурланга бор; Хонқага манзират қил.

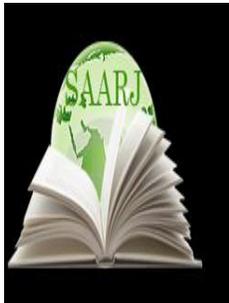

The peculiarity of phonetic changes in the formation of topocomponents in the phraseological unit with a toponymic component in the Uzbek language reflects the national and cultural features of the language.

CONCLUSION

The conclusion is that the phraseological fund of the language, in particular, toponymic component phraseology is the most valuable source of culture and folk mentality, which reflects the legends, customs, traditions, religious rites, customs, ethics, behavior, etc. belonging to the people. Phraseologisms always indirectly reflect the worldview of the people, the ideas of current period and the social structure.

THE ROLE OF PARENTS IN INVOLVING CHILDREN WITH DISABILITIES IN GENERAL SECONDARY EDUCATIONAL INSTITUTIONS

Gulnoza Salixova*

*Tashkent State Pedagogical University
Named after Nizami, Tashkent,
UZBEKISTAN

ABSTRACT

The article discusses the issues of focusing on the harmonization of their social, emotional, cognitive and physical needs in the upbringing and education of young children. The author comments on the fact that teachers of preschool educational organizations play a key role in the implementation of preschool educational goals, therefore it is important to create and maintain a wide range of opportunities to develop their skills and provide their services.

KEYWORDS: *Inclusive Education, Social, Cognitive, Parental Interaction, Innovation, Variable Technologies, Approach.*

INTRODUCTION

Scientific and theoretical research on the widespread introduction of inclusive education for all in the world based on the principle of education for all, the general pedagogical views that ensure the sustainability of lifelong learning, advanced trends, identification, selection and effective implementation of innovative and alternative technologies It is conducted in the United States, France, Germany, Switzerland, Russia, Belarus, Kazakhstan and other countries. Priority is given to research on technologies for early detection of disability, correctional and compensatory approaches in educational institutions, teaching subjects through the effective application of the principles of the communicative system, improving the content and mechanisms of preparing students for family and work.

In our country, the legal and regulatory framework for strengthening targeted social protection of persons with disabilities as full members of society has been developed, the material and technical base of educational institutions has been strengthened. The content of individual, specialized and inclusive education in the family for deaf and hard of hearing children, organized

on the basis of state educational standards of general secondary education, has been improved in accordance with modern requirements and international approaches. The Action Strategy for the further development of the Republic of Uzbekistan identifies as a priority the radical improvement of the system of specialized general secondary education, along with all links and types of education, the introduction of innovative technologies in this process. As a result, a wide range of opportunities has been created in our country for the comprehensive modernization of the younger generation, optimization of educational services for upbringing, upbringing, further modernization of mechanisms for organizing pedagogical processes.

In the upbringing and education of young children, attention is paid to the harmonization of their social, emotional, cognitive and physical needs. Teachers of preschool education organizations play a key role in achieving the goals of preschool education, so it is important to create opportunities for them to develop their skills and provide their services, to support them.

Inclusive education is an opportunity for educational institutions to educate all children. This education is based on understanding it as a fundamental human right. Inclusion is used in both a broad and a narrow sense.

The ideas of inclusive education are based on socio-cultural theories. Psychologist L. Vygotsky (1896-1934) was the founder of the idea of inclusive education, through which his theory of social constructivism allows children to acquire the most effective knowledge in the social environment. L. Vygotsky noted that the development of higher mental functions begins with social cooperation and then becomes personal.

Thus, this social partnership has always been a key method of development and learning. He also believed that education preceded development. Adults can encourage learning by focusing on the skills or knowledge that the child is in the “immediate developmental zone”. Vygotsky defined “such a development zone” as an area or space where a child knows or can do and can do or understand what he or she is doing with the help of a capable person.

Vygotsky's theory of socio-cultural development clearly defines the role of the educator. We need to get to know our children well and actively communicate with them to identify learning activities within their “immediate development center”. If children learn primarily through social interaction, we educators need to maximize the amount of time a child interacts with other children and adults. A noisy (but not loud), busy (but not chaotic) group of preschoolers is a normal learning environment.

The practice of inclusive education in many countries has demonstrated the validity of this theory. Studies show that children with special needs tend to show better results in learning and social interaction when they read with their peers.

All children benefit well from inclusive education practices. Usually, the fact that a child with special needs is in a group with developing peers tries to imitate them, to communicate with them, to develop their social skills. Developing children understand the problems that people with special needs face. They are sensitive to the needs of others and understand the differences better. They learn that all people can solve important problems and succeed.

It is also beneficial for educators to have children with special needs in their group so that they can become proficient in observing differences in teaching methods. They also gain more self-confidence in assessing children's individual strengths and at the same time identify areas that

need support. This allows educators in teaching all children to identify the individual strengths and special needs of the child and to improve the teaching method based on this. The existence of inclusive education means recognizing that children differ from one another in many ways, and that these differences are a valuable resource, not a barrier. Different educational needs and opportunities of children and their different rates of development can be met through individualization and differentiation of learning activities and learning strategies.

Features of inclusive preschools: the general education of children with special needs is carried out by a team of specialists together with teachers in regular groups; it is necessary to determine how many children with special needs can be successfully included in a group. Typically, this amount depends on the type of characteristics of each child and the support the educator receives from his or her preschool organization. For example, with the help of other professionals, an educator may include in his group only one child with a serious illness or several children with a mild diagnosis. There is a practice of including children with special needs across the state at no more than 5-10% of the total number of children in the group. If there are 20 children in the group, accept 1-2 children with special needs; active participation of parents and other family members in decision-making on the education and development of their children; all educators (group educator, preschool psychologist and defectologist, music director, physical education instructor) work as a team and coordinate their efforts. Decisions are made by team members who work effectively with each other; strategies and education ensure the development of all children and take into account the specific developmental needs of each individual child; work with children with special needs is designed with an individual child's development map, taking into account the strengths and needs of children; the effectiveness of the programs is regularly assessed; all stakeholders are involved (family members, educators, other professionals); all educators should have an understanding of the features of teaching and development of children with special needs, through special training through training, professional development, study of special literature.

The early introduction of inclusive education allows the child to become familiar with the behaviors of their peers. In inclusive preschools, children have daily opportunities to interact with their peers with or without special educational needs.

Children in inclusive preschool:

- make friends;
- not to be afraid of differences between people;
- development of good social skills;
- mastering adequate self-assessment;
- to learn positive patterns of speech and non-speech communication and behavior.

There are many ways to organize such an environment: role-playing games, group work, projects, holidays, birthdays and many other activities help to organize children's joint activities. One of these methods is the "friend" method.

The "friend" method - in which all children are taught to communicate in pairs, which significantly increases the appropriate social interaction, allows them to learn and play together. The "friend" method helps the child to overcome the difficulty of concentration, improve the

ability to remember rules and schedules, increase the attention of peers. The “friend” method allows for compromise in a variety of situations through play and learning together.

Inclusive education for a child with special needs can only be effective in partnership with the educator, the preschool and the family. Involving a child’s family in the process of education and development requires educators to understand the characteristics, priorities, prospects, and values of each family. Mutual understanding helps families find ways to engage, which leads to positive outcomes for children, their family members, and the preschool organization.

The active participation of the family in creating an individual learning map (ITX) for the child's education and development helps parents to understand the goals and methods of education, to support the child in learning new knowledge and skills at home.

Inclusive education - the active involvement of children, parents and education professionals in joint activities: the creation of an inclusive society as a model of a real society through joint planning, joint activities, seminars and celebrations.

The principle of a complex approach. The diversity of individual characteristics of children requires a comprehensive approach to the definition and development of methods and means of education. Specialists working in a group (with the participation of an educator, speech therapist, psychologist, defectologist, methodologist) regularly diagnose children and organize a learning path that focuses on both a particular child and the group as a whole during the discussion.

The principle of variability in the organization of educational and upbringing processes. Inclusion in an inclusive group of children with different developmental characteristics implies a changing developmental environment, i.e. the necessary developmental and didactic tools, teaching aids, a barrier-free environment, a changing methodological framework for education and upbringing, and the educator’s ability to use different working methods and tools.

The principle of family partnership. The efforts of educators are only effective when they are supported by parents, understood by them, and tailored to the needs of the family. The task of the specialist is to establish a reliable partnership with the child's parents or relatives, to pay attention to the demands of the parents, to coordinate their joint efforts to support the child, which is at the same time important and necessary for the child.

Involvement of parents and the local community is important both within and outside the group of preschools. This is especially important for inclusive education, which is much broader than traditional education and should not be limited to group rooms.

Parental cooperation can be beneficial not only for children, but also for all partners: improving the interaction of parents with their children, making them more sensitive and attentive to their needs, more confident in their parental responsibilities; educators gain a deeper understanding of family culture and diversity, feel more comfortable at work, and improve their mood; through the involvement of parents and community organizations, preschool education organizations are able to strengthen their reputation.

The first step for families to cooperate with MTT is the unity of the social and educational environment, and at the same time parents and children need to feel respected, trusted and needed.

To increase the pedagogical competence of parents and help families to adapt and integrate children with special needs into society, a number of tasks need to be addressed:

Involvement of parents of all foster children in cooperation with specialists of preschool education organizations; involving parents in creating an individual educational map; to form the motivation of parents to be in close contact with teachers, educators, psychologists and thereby obtain the most complete information about the child; increase the psychological and pedagogical literacy of parents, provide them with information on how to work with the child at home and develop it outside the preschool organization; involving parents in developmental and recreational activities that develop together with children.

Principles of working with parents of children with special needs:

- providing comfortable, safe conditions, taking into account the individual characteristics of the child and family;
- The principle of personal humanity - to treat the child and each member of the family with all-round respect and love, to express confidence in them;
- The principle of generality - psychological assistance can be considered only in general with the educator, psychologist, teacher-defectologist, music teacher, parents;
- The principle of freedom - the content and methods should be clear to parents.

Organizational forms of work used by preschool organizations to maintain continuous communication with foster families include: team work forms, individual work forms, and visual poster information.

Individual sessions with the child with the participation of parents are held to demonstrate specific methods of working with a particular child. Such sessions provide not only an introduction, but also an opportunity to teach the child's parents basic techniques and techniques. At the same time, this process helps to develop parents' interest in the child and his or her abilities. It also helps to increase the psychological and pedagogical literacy of parents.

Expert interviews and advice. It provides practical assistance to parents of children with special needs, the essence of which is to find solutions to problematic situations in psychological, educational, pedagogical, medical, social and so on.

The specialist will help to deal with emotional disorders in the family as a result of having a child with special needs. Methods such as psychodrama and gestalt therapy are used during the lessons. These methods contribute to the formation of psychological and physical health, social adjustment, self-acceptance, and productive living.

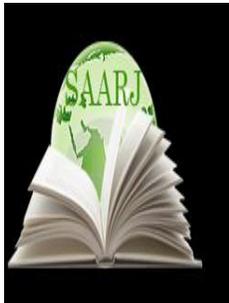

Informing parents about the progress of educational work with a child with special needs.

Cooperation should be constructive and effective, in which all parties should feel comfortable, agree and understand different roles, and information should be provided regularly, openly and democratically..

PATRIOTIC IDEAS IN THE WORKS BY FITRAT: THEORETICAL AND PRACTICAL HARMONY

Mavluda Rahmonova*

*Senior Teacher, Independent Researcher,
 Bukhara Engineering-Technological Institute,
 UZBEKISTAN

ABSTRACT

The desire to see the people free from any fetters of oppression, to see the Motherland as independent country that in development and progress has reached the most advanced countries in the world, prevails in all the works of Fitrat. The theme of patriotism has a central place in the works of Fitrat. Patriotism has been one of the important factors in the spiritual, social-political development of society in all periods of historical progress. He wrote about from Afrosiab to Yassavi, from Yusuf KhosHajib to Navoi, from Mashrab to Umarchan, to his contemporaries Elbek and Cholpon. He laid the foundation stone of the new Uzbek literary science.

KEYWORDS: *Fetters, Patriotism*

INTRODUCTION

Abdurauf Abdurahimogli Fitrat (1886-1938) was one of the most classical and enlightened scientist among the scientists of Central Asia in the XX century. The phenomenon of Fitrat is unique not only in the history of the Uzbek people, but also in the history of the peoples of world. His scientific legacy, which complied from more than 260 printed works, point to encyclopedic thinking of Fitrat. Moreover, Fitrat was the first Uzbek scientist to be awarded the title of professor in 1924.

The whole life of Fitrat, his creative and social activities have been devoted to the struggle for national progress and independence. From his earliest works, he promoted the ideas of national awakening. As the main theme of Fitrat's art, the sorrow of the country, the love of the motherland is passed in each of his works. The fiery lines of Fitrat like:

My mother! Is my soul to save you?

Is my trust with honor and conscience needed? ...

- in the words of academician NaimKarimov, serve as a “business card” for his work. Fitrat loved his homeland with a great love, and this love illuminated his whole activity with a bright

light. Patriotism as the main theme of Fitrat's work is runs all through each of his work. The desire to see the people free from any fetters of oppression, to see the Motherland as independent country that in development and progress has reached the most advanced countries in the world, prevails in all the works of Fitrat. To achieve this, the country needed knowledge and enlightenment to help it escape economic and spiritual poverty. Therefore, Fitrat called on the people to free themselves from the shackles of ignorance, heresy and superstition, to live freely, to know themselves as an enlightened, civilized nation, as masters of their own destiny.

President Sh. Mirziyoyev in his speech at the ceremonial meeting dedicated to the 24th anniversary of issuance of Constitution of Republic of Uzbekistan, said: **“Speaking about the education of the younger generation, I would like each of us, especially our sons and daughters, to follow the ideas of our grandfather Abdurauffitrat. Here is what our great ancestor wrote”**: “People strive for a clear goal, to be rich, to be brave, happy and honored, or to be weak, to be humiliated, to bear the burden of unhappiness, to be neglected, enslaved –all of that depends on the upbringing they received from their parents in their childhood. Because Fitrat said: “If a family bring up children in the spirit of love and devotion to the Motherland, this feeling will accompany him throughout his life”; “Educating in the spirit of independence will help our people, who were oppressed by colonial despotism, to stand on their own feet, and will be the reason to awake their national spirit”.

The theme of patriotism has a central place in the works of Fitrat. Patriotism has been one of the important factors in the spiritual, social-political development of society in all periods of historical progress. Patriotism is not a simple feeling, but a high spirituality, it is the norm and criterion of mental, moral, ideological-political, cultural-spiritual maturity of a person, and is reflected in his patriotism.

Fitrat for the first time used popular phrase “The homeland is my shrine” and “The homeland is as sacred as the shrine” in his poem “The Sorrow of the Country”. Indeed, for Fitrat, the concept of homeland was as sacred as a shrine, as great as a shrine:

My sanctuary, my shrine, my hope!

Did your enemies put you to this day?

My dream, my wish, my happiness!

Did your children put it that way?

Not only the Bukhara government, but also the Russian government began to persecute those who read “Sayha”¹, which Fitrat published while studying in Turkey. The Persian translation of the word “Sayha” is “roar, ringing”, which is used in the sense of calling for freedom, independence. The collection was published under the pseudonym “FitratBuxoroi” and includes nine **gazals**, two **tarkibbands** and several **kit’as**.

As Fayzulla Khodjaev says, “The idea of independence was first expressed in these poems in a very vivid way”². That is why the publication of this collection was opposed by the Emir of Bukhara SayidAlimkhan ... Despite the ban, the collection was widely spread among Russian Turks (Crimean and Kazan Turks), Iran and Germany. When these poems were published in SadoiTurkiston in July 1914 with Turkish content under each byte, they sounded like a song to be read with interest among all sections of society. In one of his poems, Fitrat writes:

Homeland is my soul, my place of altar,

It is my mother, my peace, my honor,

It is my Kaaba, my Qibla and my Gulistan³

The articles of the poet on the freedom of homeland and nation, on the independence, published in the newspaper "Hurriyat" in 1917-18, in particular, the series "Sorrow of the Country" are of special importance. Because Fitrat, an ardent fighter for the national independence, called not one, but five of his works "The Sorrow of the Country"⁴. This is a proof of how much he loved and lived for his homeland, nation, people and country: 1) "Sorrow of the country" (poem), 2) "Sorrow of the country" (prose); 3) "Sorrow of the country" (from the Uzbek language); 4) "Sorrow of the country" (before the mausoleum of Temur); and 5) "Sorrow of the country" (Talk of mother and son in absentia). These works were published in the newspaper "Hurriyat" in 1917, issues 26, 31, 47, 62, and later H. Boltaboev collected them and included them in the first volume of the author's 5-volume selected works. One of these five works is a poem with rhyme and weight in place, and the rest are "mansura".

In particular, the following call in the work "Sorrow of the country" for the reunification of the great Turon, which shook the world during the reign of Amir Temur but broke up then, and to open the eyes of the sleeping nations, is in full harmony with our time:

"O Great Turon, land of lions! What is the matter with you? How are you? What days are you living? O glorious cradles of Genghis, Temur, Oguz, Attila! Where are the high places you have climbed? Why did you fall into the pit of slavery?"

Where are your tiger-hearted children, trembling the world with their roar? Where are your boys with mountain-like body, who are throwing the earth into the sky? Why do not they make their voices? Why did they retreat? Why did they leave? Why did they leave the battlefields to others? Why ... Why... Why? .. Tell me, O Great Turon, land of lions! What happened to you?!

Have you not built the great kingdoms of the earth? Did you not send the great kings of India, Iran, and Europe? O hearth of the Hakans! O uncle of heroes! Where are the lightning bolts? Where are your former bullet-ridden, cavalry beks? Why your roar cannot be heard ...

O Great Turon, land of lions! Don't worry! Your old state, your old kingdom, your former young men, your former lions are all there, none of them are lost. Alone ... Oh, alone ... scattered. There are your eighty million children on earth today. The blood in their veins is the blood of Genghis and Temur"⁵ With these words, Fitrat calls on the people to unite to cleanse the sacred soil of Turkestan from the feet of the oppressors.

With the formation of the Bukhara People Soviet Republic, Fitrat served in 1921 as Minister of education, in 1922 as Minister of foreign affairs, Chairman of the national economic council, Deputy chairman of the MIK and the Council of People's inspectors. During this period, he initiated the sending of 70 promising young people (including 55 from Bukhara and 15 from Turkestan) to study in Germany at the expense of the Bukhara People Soviet Republic, including his own fund, so that young people could become enlightened and study abroad and return to the prosperity of our homeland, Uzbekistan, and the head of government F. Khodjaev supported him in this activity. Fitrat took a group of young people (including ValiQayumkhan, one of his

former students in Tashkent) to Samarkand to stand loyal to the Motherland under the rule of Temur, to study in Germany, to return home as a good specialist, to join the ranks of developed countries and to serve its future. He made this young people swear to “restore the old honor and glory of Turon”⁶. At the end of the oath, the young people repeat him what Temur has said:

Oh lion of the lions! Forgive my sins, take my hand, gird my loins, and give me your holy blessing! I swear to your unbounded in the world energy that I will not sit at your feet until you restore the old honor and glory of Turon!

Later, ValiQayumkhan remembered: “He wanted to take me to Bukhara. However, before going there, I promised to kneel before the mausoleum of the great **Hakan** Amir Temur in Samarkand and fight for the fate of the nation. Tears welled up in my eyes”⁷.

Fitrat recalls with regret that the power of the Turkish nation is spreading to all parts of the world. Temur speaks about the history of the Turkish people:

“My heart is burning, my face is black, my heart is broken, and my neck is crooked.

I have come to visit you, my sultan!

For my crushed head, my crushed conscience, my burnt blood, my burnt soul, I have come to seek healing from this mausoleum, my lord!

I have come to shed the bloody tears of a Turk who has suffered and mourned for hundreds of years.

For the eyes of the Uzbeks, who left without light in the darkness, I came to ride on your soil.

Seeing his honor at the feet of the wicked, the blood of the Turks will boil, the importance of Islam will be stoned, and the flames of hell will be scattered.

Nevertheless, I came to tell the story of a Turk who, realizing his own weakness turned back and cried blood, my lord!

My great master! Turkish honor was plundered.

The state you left for the Turks is over,

The **Hakan** you built for the Turks went to the past.

The honor, attention, faith and conscience of the Turks were under the feet of the oppressors.

The land of the Turks, the hearth, the horse, the Turon fell into foreign oppressor hands.

The knowledge, consciousness, thinking and intelligence of the Turks fell prey to ignorance.

The Turk, who is the owner of the world with your sword, could not find a peaceful bed ...
Crush, strike and kill those who betrayed your trust!

The above moans of Fitrat shows the patriotism of the scientist, his level of perfection, his knowledge of his place in society, and the fact that he is an integral part of society.

Fitrat was a PERSON who deeply understood that his dignity was connected with the dignity of the people, the nation, and was involved in the events taking place in the society and the country. It is no coincidence that Fitrat, who was burnt by the grief of our country

in the early twentieth century, who was enslaved by colonialism, first felt guilty in the calamities that befell the country. Addressing the spirit of Amir Temur, he wrote:

My Sultan! I know that at that moment your high and great priesthood is laughing angrily at the plight of a low-spirited and ruthless child like me.

I know that at this time your heart, like the waves of the sea, hates this sight of a heartless son like me.

Because I was the cause of all the things I said above, I did everything myself.

I myself plundered your Turon, I myself crushed your Turkishness, and I myself betrayed your trusts.

If I did not want to spend the rest of my three-day life in peace, none of this would have happened.

If I had not taken the sword and the instrument that you had given me, my Turon would not have been plundered!

I have come to your mausoleum not to shed my bloody tears alone, but to confess my sins, my lord.

Do not leave me! I have not come to confess my sins alone, but to pay the damages I have inflicted on Turon, my lord.

Do not hate me! O lion of the lions!

Go through my notes. Hold my hand.

Tie my loins; give me your holy blessing!

I swear to your unbounded in the world energy that I will not sit at your feet until you restore the old honor and glory of Turon.⁶

Abdurauf Fitrat with all his being dreamed to see his homeland, his people free and independent. Although he was proud of his homeland, he was suffering from the devastation of his condition. His words of the son to the holy Turon are thrilling: “If not snakes, but army of devils comes upon me, if not chains, but the serpents of hell are sucked on my feet, I will go to you again. If all the calamities of the world fall on my head, the iron thorns of the wilderness of oppression enter my eyes, I will save you again”⁷

He grieved over the fate of his beloved homeland in the conditions of the dictatorship, in the colonial situation, and in “Sorrow of the country” wrote: “Death to those who want your death, hatred to those who came to bury you”, “I was born for you, I live for you, I die for you, o holy hearth of Turkism!” – Isn’t it patriotism? Only a person who loves his homeland and understands his national identity, like Fitrat, can say out loud: “My Turon, to lose you is death for me, to die for you is my life” prefers not to save his life like Najmiddin Kubro, but to defend his homeland from surrender and to give his life. It is also a dedication to the country, the Motherland

The enlightened and patriotic writer, like a number of his fellow-fighters: Behbudi, Fayzulla Khodjaev, Musa Saidjanov, Munzim, Munavvarqoriet al., knew that independence does not fall from the sky, and was well aware of need in devoted forces to achieve independence

under the slogan “Right is taken, not given”. That is why the July 28, 1917 issue of Hurriyat newspaper he wrote: “O great Turan, land of lions! What happened to you? Where are your tiger-hearted children who have shaken the world with their roar? Why don't they make noises? ... Why did they retreat? Why did they leave? Why did they leave the battlefields to others?”

Fitrat welcomed the Turkestan Autonomy, calling its November 27 announcement “our national holiday”. Autonomy was also a response to the fact that the Russian Bolsheviks were the second in the territory of the Russian state after Petrograd to seize power in Tashkent and to establish Soviet power in Turkestan. His work “Autonomy” begins as follows: “Autonomy of Turkestan ... I do not believe that there is a word that is more stolen, more sacred, more pleasant word for the true children of TemurHakan. If there is a force that boils the blood of the people of Turkestan and raises their faith, it is only in this word, the autonomy of Turkestan”. According to ZakiValidiTogon, Fitrat not only wrote high-level articles about Autonomy in Hurriyat, but also “went to Kokand with the appeal of Turkestan Autonomy”.

Enlightened-Jadids sought political and cultural ways of struggle. They had learned a lesson from the bitter experience of previous popular uprisings. As Fitrat said: “It is impossible to destroy a nation by force of arms. No society can be driven to culture by force of arms”. The firm belief of the Jadids was: “Bovurlar... takes, but do not pays”.

In fact, autonomy is also taking, but not giving. If the peoples of Turkestan do not unite and strive for autonomy, they will, of course, destroy our present-day autonomy on paper” (December 22, 1917).

The works of Fitrat such as "Munozara" (1909), "Sayohi Hindi" (1912), works full with the ideas of independence "Oila" (1916), "Begijon", and even his scientific research was devoted to the love of the motherland, love of his mother tongue, to the noble goal of preserving the masterpieces of culture, literature, art and philosophy of his people. Scientific researches of professor Fitrat ranks with the works of E. Bertels, I. Krachkovsky, L. Klimovich and other scholars of Eastern history, literature and philosophy of the first half of the last century. Fitrat provided them with some manuscript texts, showing and explaining the level of study of those works. In those years, Fitrat, in collaboration with world-renowned scientists, academicians A. Samoylovich, S. Malov, E. E. Bertels, also contributed to the training of Central Asian orientalists, literary critics, philosophers, Turkologists and teachers. Until the repression of Fitrat in 1937, he directly or indirectly taught such well-known scientists as Yahyo Gulyamov, Ibrahim Muminov, Cholpon, Botu, Komil Yashin, Oybek, Khodi Zarifov, Izzat Sultan, Homil Yakubov, and Rahim Hashim. A. Fitrat told them: “The homeland is our guardian and mentor, and every guardian and mentor must be served; so to serve the Motherland is a duty”⁸.

Fitrat's patriotism is also can be seen in the fact that he began a comprehensive, consistent, in-depth scientific study of the rich and ancient cultural heritage of the peoples of Turkestan. He wrote about from Afrosiab to Yassavi, from Yusuf Khos Hajib to Navoi, from Mashrab to Umarchan, to his contemporaries Elbek and Cholpon. He laid the foundation stone of the new Uzbek literary science. He is best known for his books “Rules of Literature” (1926) and “On Aruz” (1936). A number of dramatic works, such as “Abulfayzkhan” (1924), “Rebellion of devil against God” (1924), “Lion” (1926), the popular scientific essay in the philosophical spirit “Bedil” (1923), an experiment on “Rules of the Uzbek language”: Sarf (Book 1), Nahv (Book 2) (1925), tutorial books “Sarfizabonitojik” (1925), “Rules of the Literature” (1926) were published.

The 20s of the XX century were important and fruitful years in the scientific activity of Fitrat, who worked at the higher pedagogical institute in Samarkand (now SamSU). He wrote a lot of research works like “The oldest examples of Turkish literature” (1927), “Examples of Uzbek literature” (1919), “Eastern chess” (1928), “Uzbek classical music and its history” (1927), “Persian poet Umar Khayyam”(1929). He has published many articles in the press. With these works, he laid the foundation for a number of new areas of Uzbek science and culture.

Fitrat proved that he was a great patriot not only through his works but also through his lifestyle. Academician Izzat Sultan testified that the Iranian and Egyptian governments had officially invited Fitrat to work as a permanent professor at Tehran and Cairo universities. Nevertheless, he refused the offer, not wanting to leave his homeland⁹. This incident took place in the early 30s of XX century, when Izzat Sultan was studying for a postgraduate degree and Fitrat was his scientific adviser.

His patriotism, his search for opportunities to improve the destiny of the people, his fearless hatred of the colonialists made him one of the brightest figures of our national culture, spreading his fame to a number of Eastern and Western countries. However, because of these characteristics, Fitrat did not fit into the “happy” era of the Soviets. The Red Empire did not need independent thinkers, but flatterers who would applaud everything. Of course, those who questioned the doctrines of the ruling ideology were severely punished. He, like many bright children of our nation, was first insulted as a “nationalist”, called an “enemy of the people”, and then have been murdered without judge...

The great patriot Abdurauf Fitrat is one of the figures who was martyred for the freedom of our Motherland and our nation... The Soviet government accused him of being a nationalist, an “enemy of the people” and shot him on October 4, 1938, on the same day as Kodiri and Cholpon. The verdict was handed down on October 5, a day after the execution. In 1957, the military board of the Supreme Court of the former Soviet Union overturned the verdict and acquitted all three scholars named¹⁰.

Although at that time the Soviet government banned the reading of Fitrat's works, even mentioning his name, and tried to remove him completely from the pages of history, this heinous intention did not materialize. Although it was late, the truth came out, justice was decided. During the years of independence, Fitrat returned to its place in the history of our culture. In 1991, Fitrat, Kodiri and Cholpon were awarded the Alisher Navoi State Prize of the independent Republic.

Our people will always cherish in their hearts Abdurauf Fitrat, wise son, great enlightener, philosopher and scientist of the nation, as a selfless person who laid the foundation stone of independence, lived for the people and for the country. Thanks to independence, his name, which was deliberately erased from the memory of our people during the dictatorship, has been restored, and his scientific and philosophical heritage has become the legacy of our people. Therefore, the noble deeds of enlightened, selfless person like A. Fitrat, who sacrificed his personal interests and well-being for the benefit of the people and the development of our country, will never be forgotten.

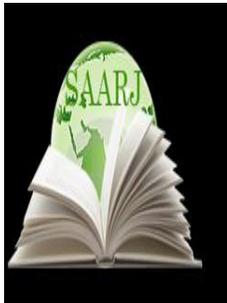

“I was born for you, I live for you, and I die for you, Motherland!” Fitrat wrote about his burning love for country, was a ruthless and selfless fighter for its enemies, and a tireless fighter for the development of the country. His ideas on patriotism, nationalism, the development of science are valuable for today¹¹. “My country, Turon! Losing you is my death. I was born for you, I live for you, and I die for you. O holy hearth of Turkism! Death to those who want your death, hatred to those who come to bury you!”¹² Fitrat's spiritual and moral concept of patriotism, freedom,

nationalism is still one of the important factors in educating young people as a harmoniously developed generation. At a time when a strong democratic state and a just civil society are being built in our country, we believe that it is important to bring to our people the unique scientific heritage, teachings and ideas of our great thinkers.

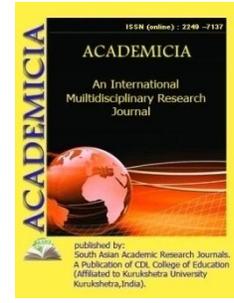

As conclusion we can say that the ideological leader of the Jadids, patriot, tireless fighter for the freedom of the homeland, Abdurauf Fitrat in each of his works: whether it was journalism, philosophical work like “Way of Salvation”, tragedy like “Abulfayzkhon”, scientific study of Navoi or Mashrab – the feeling of homeland shines in all of them. In addition, the life and legacy of the Fitrat, his spiritual and moral doctrine “My homeland is my shrine!” embodies the idea that, in terms of its example and essence, is of practical importance due to its dependence on the values of our modern independence. Indeed, the sense of Homeland, the concept of Homeland, must be as pure and glorious as shrine for us. Today, we also must learn from our ancestors, such as Fitrat, how to defend the independence and honor of our Motherland, and always be ready to protect it.

IMPROVING THE POSSIBILITIES AND CHALLENGES OF INCLUSIVE ECONOMIC GROWTH AND E-COMMERCE SYSTEM IN COUNTRIES

Isokhudjaeva Munira Yashnarovna*

*Associate Professor,

Tashkent Branch of the Russian Economic University named after G.V. Plekhanov,
 UZBEKISTAN

ABSTRACT

This article provides detailed information on inclusive growth and inclusive economic growth. The analytical results of the developed countries of the world, as well as the economies of Central Asia, in particular, Uzbekistan, were addressed. The impact of inclusive economic growth on the living standards and well-being of the world's population is also discussed in detail. Information is provided on the impact of the global economic and financial crisis, which began in 2019, on the economy of Uzbekistan and its impact on inclusive economic growth.

KEYWORDS: *Inclusive, Inclusive Economic Growth, Government, International Organizations, Asian Development Bank, International Poverty Center, International Policy Center, Living Standards, Annual Interest Rates, Households, Annual Income, Global Finance Crisis (GFC), One - Time Income, Self - Employment, Economic Opportunity.*

INTRODUCTION

The global crisis and its tragic human legacy followed a long period of global prosperity, the so-called Great Moderation. During that time, sustained economic growth led to a substantial increase in average living standards worldwide and a reduction in poverty in the developing world. **Society continues to feel the effects of the crisis.** More than 200 million people worldwide are out of work, there are 15 million more people in OECD countries that are unemployed today than when the crisis began in 2007, and millions more people in developing countries have fallen in poverty. Weak global growth prospect is expected to push unemployment beyond today's already high levels, leaving an additional 5.1 million unemployed in 2013 and 3 million in 2014. The risk of entrenched unemployment is high – a condition that further aggravates poverty and inequalities. Slowdown in emerging economies and developing

countries is taking its toll on social spending, and in certain countries it threatens the sustainability of nascent safety net schemes in the context of already higher poverty levels.

Social tensions are visible across the globe. Citizens throughout the world are taking to the streets to voice their concerns and demands: from the initial “flash-point” social movements in the Arab countries, Los Indignados in Spain, Occupy Wall Street-London-Davos, labour protests in South-East Asia, student protests in Santiago de Chile and Montreal, to political demonstrations across Europe. It is **imperative to find solutions that foster economic growth in a more inclusive manner**, where the gaps between the rich and the poor – not only in terms of income, but also in other dimensions that matter for people – are less pronounced, and opportunities, as well as the “growth dividend”, are shared more equally.

LITERATURE REVIEW

Various aspects of Inclusive economic growth have been studied and researched by many scientists, as well as many projects have been implemented in this field. Including G.Bolotaulo, E.Hyop and L.Donghyun (Fiscal Policy for Inclusive Growth, 2014); C.Adamba, K.Alatinga (Social and Health Policies for Inclusive Growth, 2015); Dev, S.M. (Inclusive Growth in India. Agriculture, Poverty, and Human Development, 2008); Dollar, D. and Kraay, A. (Growth is good for the poor, 2002); Heintz, J. (Informality, inclusiveness and economic growth, 2012) discuss the advantages and disadvantages of inclusive growth. K.P.Kannan (How inclusive is inclusive growth in India?, 2012); T. and Tabellini, G. (Is inequality harmful to growth?, 1994); Thomas, V. (Inclusive growth: From desirable to essential, 2011) discusses the possibilities of development and inclusive growth. In this article highlights the opportunities and challenges of inclusive economic growth in countries.

The issues concerning theoretical foundations of formation of e-commerce system and entrepreneurship in the sphere of information and communication technologies have been studied in the works of such foreign scientists and economists as N. Vulkan, G. Duncan, D. Kozie, M. McCartney, L. Mitchell, A. Sammer, T. Wilson and others.

These problems, organizational and economic issues in e-commerce have been studied in the works of the following scientists as I.T. Balabanov, L.E. Varakin, N.I. Gerashchenko, A. A. Kantarovich, O. A. Kobelev, G. Ya. Rezgo, L. D. Reiman, V. I. Skiba, I.V. Uspensky, V.V. Tsaryov in near-abroad countries.

In the Republic of Uzbekistan the issues of structural transformations and development of the sphere of information and communication technologies have been investigated by A.N. Aripov, R.I. Isaev, A.A. Dzhurabaev, Kh.A. Mukhitdinov and L.I. Shibarshova. The issues of theory and practice in e-commerce have been researched in the works of R.I. Isaev, T.K. Iminov, Kh.A. Mukhitdinov. M.M. Yuldashev considered conceptual instrument of the essence of e-commerce system as well. The questions of electronic documents circulation and digital subscription are investigated in the works of R.I. Isaev, P.F. Khasanov, Kh.P. Khasanov and others. Practical examples of econometric analysis in the sphere of ICT have been studied and suggested in the works of S.V. Chepel and L.I. Shibarshova. The works of R.I. Isaev, M.M. Karimov, R.Kh. Khamdamov, Kh.P. Khasanov and others can be marked out among special studies devoted to the information security.

RESEARCH METHODOLOGY

Definition of inclusive growth in the activities of other international organizations. The World Bank has been working for many years on the concept of inclusive growth. [1] In the previous approach, inclusive growth implied the pace and form of economic growth, and economic growth led to rapid growth, which is necessary to reduce absolute poverty and reduce the wide range of needs across sectors. In the long run, part of the country's workforce has focused on inclusive growth in this perspective as follows: effective employment has been achieved instead of employment or income distribution. Increasing employment, creating new jobs and incomes, increasing productivity, raising the wages of workers and the incomes of the self-employed, and so on. Recently, the World Bank developed the Framework for Common Welfare. The concept of overall well-being encompasses the two elements of economic growth and equality through a new indicator that tracks income growth, and the Asian Development Bank (ADB) has developed a corporate strategy (Strategy 2020) to promote it among the lower 40 percent of the population. chose inclusive economic growth as one of its main goals. In this context, the concept of continued inclusive growth, in addition to broad growth, is that "growth not only creates new economic opportunities, but also provides them with equal access to opportunities created for all segments of society, especially the poor. includes ".

An episode of revenue growth is considered "inclusive" if it:

- focusing on the ability of all members of society to participate, the poor and the poor to participate in growth (the 'non-discriminatory' side of growth). This means that the "process" of growth will be the focus;

-this is particularly important for the development of economic opportunities, including education, health, nutrition and social integration, associated with a reduction in inequality in uncertain measures of well-being. The "gap reduction" side of inclusive growth. This means focusing on the "results" of growth.

The UN recently changed the name of the International Poverty Center in Brazil to the Center for International Politics. On Inclusive Growth (IPC-IG), its work is based on better performance by equal societies. Development In the perspective of UNDP, inclusive growth is seen as both a result and a process. On the one hand, this ensures that everyone is involved in the growth process, both in terms of decision-making. Inclusive growth, on the other hand, is growth whose benefits are evenly distributed. Inclusive growth implies participation and profit sharing. The Europe 2020 Strategy includes the concept of "Inclusive Growth". Inclusive growth in this strategy is the modernization, transformation and integration of labor markets, training and social protection systems to provide people with high levels of employment, invest in their skills, fight poverty and help people expect and manage. concepts such as community building. It is also important that the benefits of economic growth spread to all sectors. The Alliance, including its external regions, will thus strengthen regional solidarity. Ensuring that growth and life cycle opens up opportunities for everyone.

Over the past thirty years, the development of the world economy has been marked by broad regulation of markets - especially financial and foreign exchange markets - in both rich and poor countries, the outdated public sector and the expansion of creative opportunities are among the growing sectors. social, cultural and political life. This is the period described as "Hyperglobalization".[2]

Hyperglobalization has resulted in a major change of government, with more capital being used than labor. This has led to more and more asymmetries, through which more concentrated and strong transnational units working through international trade and financial relations and, in many cases, weakened governments, have occurred in countries. Other features of globalization include financial financing. The economy, growing inequality, high market concentration, rent-seeking and ever-increasing debt, and more. The global financial crisis of 2008-2009 (GFC) to some extent slowed down this process of hyperglobalization, which did not negate any of them. Governments have embraced saving private investors with taxpayers' money and net economic savings, and have violated the social policy envisaged by this: they continued with "business as usual" to help the most vulnerable. Hyperglobalization has intensified the political and technocratic grievances of the people, as well as provoked a backlash. Since Brexit, the choice in various forms and at different levels, through the "yellow vests" and "trade wars" in France, to mention a few of the school strikes, as well as the movement for appropriate climate action is the most comprehensive project and universal in history.

"Companies to company" (B2B), "Companies to consumer" (B2C), "Government to companies" (G2B), "Government to Consumers" (G2C) and "Government to Foreign Citizens" (G2F) [4]. Inclusion of important categories "Government to Government", "Government to Business", and "Business to Business" in the theory stipulates that they are today priority for the republic, because they facilitate foreign currency inflow and development of exports of resources, goods and services. There produce the greatest interest categories "State to business", "Business to business", "Business to consumers" in connection with the declaration of 2019 year as the "Year of Active Investment and Social Development" in Uzbekistan.

Obstacles to the development of electronic transactions, including regulatory, economic, organizational, technological, social, personnel and security issues are identified in the study along with the known classification of main types of electronic transactions as models of relationships between participants in e-commerce market. For each factor there assessed reasons that facilitate and refrain the development of e-commerce.

ANALYSIS AND RESULTS

The issue of inclusive growth is relevant for the Eurasian economy. Member States of the Union (EAEU) (Republic of Armenia, Belarus, Republic of Kazakhstan, Kyrgyz Republic and Russian Federation). According to Article 4 of the Treaty on Eurasia, the economic union, one of the main objectives of the union is to improve the living standards of the population, the conditions for sustainable economic development of these member states. The responsibility to the supervisory authorities of the EU Member States for these additional areas applies to all citizens of each country. This is because the EU's commitment to implement long-term scenarios of economic development could lead to a deterioration in the current quality of life. In addition, the external economic environment has generally been unfavorable for EU member states in recent years. In the past, there was a need to create more fully, the vision of the problems facing the population in the global context, the turmoil of the economy and the intensification of internal problems focused on the development and implementation of integration measures and actions.

Problems of achieving more financial inclusion and future research directions. The evidence suggests, [3] financial inclusion is the ability to manage operations through the use of a formal financial system to enable people to create day-to-day financial opportunities to conduct

operations more efficiently and securely and to expand their investment and financial risk. This is especially true for people: the poorest 40 percent of the population needs help in the household. However, not all financial products are equally effective in achieving development goals such as poverty reduction and inequality. Current evidence suggests that the biggest impact comes from the savings account - if they exist, they are cheap and serve a clear purpose. The impact of microcredit research shows mixed and rare effects, some research shows that insured people have invested in risky and high-yield technologies, but little is known about its impact on well-being. there is.

Over the past two years, the number of publications on measuring the impact of financial inclusion has been growing rapidly. However, the study of the impact of different dimensions of financial inclusion on economic development still has a long way to go. In particular, there are currently several studies on payments, savings, and insurance, and it is suggested that they should be even better.

The results of randomized controlled trials are somewhat ambiguous. Positive conclusions may apply to other countries and groups of people. For example, it is not known whether a savings product that benefits women in the Kenyan market will benefit a male farmer. Repetition of successful interventions in a variety of activities answers such questions and leads to clarification of situations that improve financial inclusive living conditions. Similarly, research is needed to understand why more financial inclusion may have a beneficial effect on some. For example, available evidence of financial inclusion can have a significant impact on product design, including prices, demand and development outcomes.

Our analysis shows that,[4] According to Professor TursinShodiyev, the development of the economies of small countries, including Uzbekistan, will cover economic losses in 5 or 6 months, this year's GDP growth rate will be 1.2-1.5%, and next year - 7%. , Increases by 0-7.2 percent. The global crisis resulted from the global spread of the coronavirus pandemic that erupted in late 2019 in the city of Uwan in the People's Republic of China. It differs from the world crises in various respects and its negative impact on the economy is becoming very strong. In economic terms, this pandemic is an external "shock" to aggregate demand (AD) and Forecasts and aggregate supply (AS), macroeconomic stability (external shock), which outperform previous economic indicators in terms of scale and damage. much different. crises. This crisis occurred suddenly in 185 countries around the world. This affected both aggregate supply and aggregate demand at the same time. The emerging open global economy and national economy have been in a closed form for several months. In the world economic literature, little experience has been gained in identifying and mitigating the negative impact of the coronavirus pandemic on the world and regional economies, and the topic has not been studied systematically. The purpose of this article was to partially study the effects of the spread of the coronavirus pandemic on global and regional skills and to predict the effectiveness of measures to mitigate its effects in our country. and positive silences in the national economy, signs of sustainable development. Its high rates are observed in China, Tajikistan, Armenia and Uzbekistan, low rates are observed in the United States, Great Britain and the Russian Federation, and in recent years the economic growth rate in the world economy has averaged around 3 percent. The gross income of the world economy in 2019 was \$ 84.5 trillion, including \$ 20.6 (share 24.4%), the People's Republic of China 13.1 (share 15.6%), Germany 3.9 (4). , 6%), 2.8 (3.3%)) of the United Kingdom, 1.5 (1.9%) of Russia and South Korea (Table 1)

TABLE 1 THE STATE OF THE WORLD ECONOMY AND ECONOMIC COOPERATION WITH UZBEKISTAN IN 2020

Countries	Area, thousand sq.km	Population the number (mln. man)	GNP (bln.fertilized)	Population per capita income (fertilized)

Armenia	29,7	3,0	12,5	4230
Turkey	785,4	82,3	858,1	10420
Worldon	132025,2	7594,3	84478,9	11124

Looking at the table, per capita income declines are projected in the United States (\$ 1892), followed by Germany (1413), the United Kingdom (1216), South Korea (\$ 918), Russia (311) and China. (284dol). The total damage in the Republic of Uzbekistan amounted to 2.1 billion soums. That's in U.S. dollars and \$ 60 per capita. Some countries are distributing money to cover the loss of income of the population. However, the government of the Republic of Uzbekistan makes an alternative decision, and through the general movement of "support and assistance", enterprises and public organizations hold charity events for low-income families.[5] The participation of enterprises in the general movement "Support and Assistance" is not an attempt by the state to reduce the damage caused to entrepreneurs by the crisis, but an attempt to correct the situation in which this general demand is falling. Because at a time when aggregate supply is declining, increasing aggregate supply by distributing money to the population increases inflation and the population may not benefit from it at all. The participation of enterprises in general activities benefits them. Modern global social and economic problems.[6]

For the last few decades decrease in rates of world economy growth was matched by increasing inequality in income and accumulated wealth among world's population. [7] There are bases to believe that the system of income distribution affects not only stability of society, but growth rates of world economy as well. Aggravation of economic inequality leads to access restriction to education for lower-income population strata that has negative impact on development of the human capital as a main resource of a modern economic system.[9] The problem of the growing inequality in income and accumulated wealth among world's population is closely related to demographic processes which happen in the developing and developed countries.[8]

Today the steady trend of decrease in rates of natural population growth in the developed countries is observed. It confirms the oncoming demographic crisis in a number of countries. Thus, according to forecasts of United Nations Department of Economic and Social Affairs natural increase of the cumulative population of the most developed regions (Europe, North America, Australia/New Zealand and Japan) will continue to decrease up to the period of 2025-2030 when the indicator of natural increase takes negative value and will mark the beginning of depopulation. Long-term decrease in rates of natural population growth combined with high standard of living and the growing indicator of life expectancy at birth triggers changes in population age structure, as a result it leads to increased demographic pension expenditure burden on the population of working-age (Tables 2).

TABLE 2. THE RATES OF NATURAL POPULATION GROWTH IN REGIONS OF THE WORLD CALCULATED ON THE BASIS OF INFORMATION FROM THE UNDESA (1985-2030)

Regions or area	Rate of natural population growth (per 1,000 population)								
	1985-1990	1990-1995	1995-2000	2000-2005	2005-2010	2010-2015	2015-2020	2020-2025	2025-2030
More developed regions	4,2	2,3	1,0	0,7	1,3	1,1	0,6	0,1	-0,5
Less developed regions	21,8	18,6	16,3	15,3	14,8	14,1	12,9	11,6	10,4
Least developed countries	28,1	26,8	26,6	26,3	26,0	25,2	24,2	23,0	21,8

In less developed and the least developed regions of the world (Africa, Asia except Japan, Latin America and the Caribbean plus Melanesia, Micronesia and Polynesia as defined by the United Nations General Assembly) it is possible to observe quite different processes. In less developed countries with the low and average levels of income usually high rates of natural growth of population is accompanied with low standard of living and a weak health care system [8]. The indicator of life expectancy at birth in such states is much lower than in the developed countries. It implies specific changes of age structure of the population and increase in child demographic burden on a working-age population (Table 1,2,4). The majority population of such regions are young people of working-age. When a national economy is not able to provide high employment and a decent standard of living for citizens they tend to migrate for search of better conditions for life and self-realization.

The contrasting differences of demographic processes in developed and developing countries added to increasing economic inequality within the last three decades has led to growth of international migration in absolute and relative numbers to the total population of the planet [9]. International migration is a complex phenomenon which directly influences process of human capital formation and can render both positive and negative impact on national economic systems. International migration may partially contribute to the solution of the problem of economic inequality, as it positively influences the income of immigrants.

TABLE 3. LIFE EXPECTANCY AT BIRTH IN REGIONS OF THE WORLD CALCULATED ON THE BASIS OF INFORMATION FROM THE UNDESA (1985-2030)

Regions or area	Life expectancy at birth for both sexes combined (years)								
	1985-1990	1990-1995	1995-2000	2000-2005	2005-2010	2010-2015	2015-2020	2020-2025	2025-2030
More developed regions:	73,94	74,16	74,80	75,59	76,93	78,43	79,28	80,12	80,93

	1985	1990	1995	2000	2005	2010	2015	2020	2025
Less developed regions									
Least developed countries									

Today the world community has to apply new approaches to the problem of economic growth in order to achieve acceleration of economic development and find solutions to global social and economic problems. One of those can be the inclusive approach, which is the cornerstone of the concept of inclusive growth. It is impossible to create and implement a new concept of economic

growth targeted for increase of GDP rates through the solution of social problems without methodological and statistical base. The new system of social and economic development level assessment of the state which received the name Inclusive Development Index can take this place. Prospects of the index of inclusive development application

The main objective of the index of inclusive development is broad disclosure of economic information about the state to all interested persons and the public for the benefit of economic development of the country. This index is calculated on the basis of 12 indicators divided in three groups (Growth and Development; Inclusion; Intergenerational Equity and Sustainability), each of which reflects various aspects of social life.[10] The index of inclusive development initially was developed within the concept of inclusive growth, however, it can find application outside the separate concept.

There given the system of interrelated equations below:

$$1. \text{LTGDP} = 4.68 + 0.94 * \text{LNEC}$$

$$2. \text{LNEC} = -4.8 + 0.1 * \text{LNIU} + 0.07 * \text{LAS} + 0.033 * \text{LNDOM} + 0.055 * \text{LINV} - 1.3112 * \text{LNAT}$$

$$3. \text{LNIU} = 4.34 + 0.91 * \text{LAS} + 0.46 * \text{LOPER}$$

$$4. \text{LAS} = -4.044 + 1.45 * \text{LOPER} + 0.157 * \text{LNDOM}$$

$$5. \text{LNDOM} = 4.89 + 0.19 * \text{LINV} + 0.072 * \text{LNAT} + 1.072 * \text{LKOL}$$

$$6. \text{LINV} = -18.71 + 2.37 * \text{LDOH} + 1.29 * \text{LNAT}$$

$$7. \text{LKOL} = -11.11 - 2.74 * \text{LNAT} + 0.21 * \text{LNDOM}$$

$$8. \text{LDOH} = 4.81 + 0.505 * \text{LNEC} - 1.44 * \text{LNAT}$$

$$9. \text{LOPER} = -5.945 + 0.154 * \text{LINV} + 2.29 * \text{LNAT}$$

When forming with the subsequent implementation the new concept of economic growth directed specifically to GDP growth rates increase through the solution of social and economic problems, application of this index can be in high demand. As the system of assessment of social and economic level of development of the country, the index of inclusive development gives the most comprehensive information on a state of national economic system as well as society in general. Some common and widely accepted indicators of economic development of the country such as GDP cannot provide full information for working out effective policy of the state. No doubt, GDP is the most widely used indicator of economic development of the state, the convenient instrument for accounting the size of economy today. However, it is incorrect to use GDP as the main reference point while planning social and economic development policy of the country at present, because GDP indicator for the purpose has a number of restrictions.

As GDP indicator measures economy size is does not always adequately reflect quantitative characteristics of a modern economic system.[11] Scientific and technical progress contributed to creation of essentially new types of goods and services and to substantial enhancement of ways of information and resources exchange. Using the existing methods of collecting statistics it is getting increasingly harder to account for some specific transactions or to carry out financial assessment of new types of economic activity. As an example, consider the market of crypto currencies which is difficult to account and regulate. Another example is investment accounting

for intangible assets becoming more and more relevant today. In modern economy long-term investments in such valuable resources as information, knowledge, scientific R&D and human capital can hardly be fully reflected in GDP. As an indicator of social and economic level of development of the country GDP also has certain restrictions. It does not measure the system of product distribution, therefore GDP can not be used as a measure of country's prosperity. Besides, GDP does not fully measure ecological and social factors of economic growth.

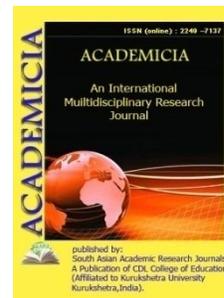

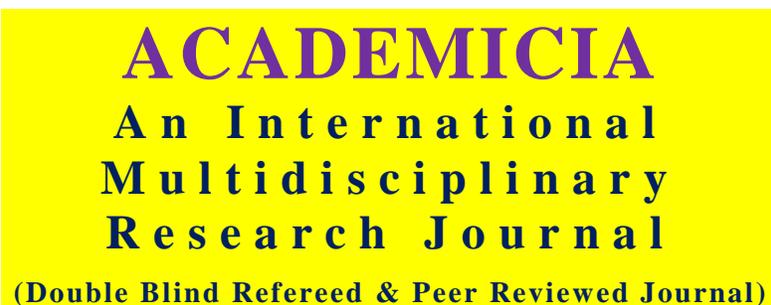

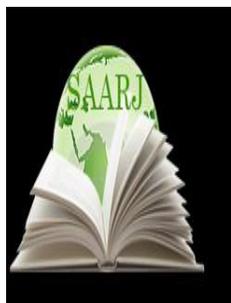

CONCLUSION

The essence of the earlier stated boils down to the idea that GDP cannot be effectively used to adequately estimate the level of social and economic development of the modern state, as it does not reflect the influence of non-economic factors on an economic system and society in general. On the opposite, the index of inclusive development provides complex information on various aspects of society. In the long term perspective this index can be used in forecasting of social and economic development of the state. Active application of a new system of assessment of economic development by the international community will promote changes in the social and economic policy of states, stimulate international economic integration and development of methodological base of national and international statistical institutions. Taken together, the index of inclusive development opens new opportunities for working out, development and implementation of new concepts of economic growth, such as inclusive growth, sustained economic growth, social and economic problem solution in developed and developing countries. Where state (financial) capacity to redistribute is limited, broader institutions, at national and international level, such as tax regimes, competition authorities, consumer organisations, and trade negotiations and institutions, impact growth at least as much as growth, whether it is inclusive and whether it can be sustained.

ABSTRACT

The author of the article describes the peculiarities of speech and voice of Rhino children, defects in the pronunciation of sounds and their manifestations. Some exercise complexes for the development of soft palate and articulatory apparatus are also presented in the article.

KEYWORDS: *Rhinolaryngology, Preschool, Speech Impairment, Voice, Education, Correction, Rehabilitation, Breathing, Speech Breathing, Special Education, Organic, Functional, Rhinophony, Speech.*

INTRODUCTION

One of the main causes of pronunciation disorders in children with congenital cracks of the upper lip and palate is the presence of palate-throat closure and tooth-jaw deformities. Corrective-pedagogical work on the correction of rhinolalia speech defect should be built taking into account the state of the articulatory apparatus before and after uranoplasty surgery, the effect of limited function of the laryngeal apparatus on pronunciation and sound formation, the specifics of the individual's reaction to his condition.

In this regard, methodological work methods are differentiated according to the principle of individual approach.

The process of speech formation is ensured by the consistent functioning of many nerve centers and structures, such as the appendix governing bodies, which form a hierarchically organized system. Any dysfunction of this system or articulatory organs, which causes congenital malformations, leads to a complete disruption of function as a result of illness or injury.

At the same time, the ability of the nervous system to be effective in all rehabilitation measures, which sets a modern trend for previous rehabilitation, leads to early rehabilitation of patients with tangential fractures. This applies to all areas of the rehabilitation process - surgery, speech therapy, psycho-correction, surdology and others. One of the corrective techniques used in rehabilitation practice is massage.

Massage is a set of mechanical dosing methods of action that is performed by friction, pressure, vibrations, directly on the surfaces of the human body. Massage can be general and local. Speech therapy massage is local.

Massage of articulatory organs helps to regulate peripheral blood and lymph circulation, nourish muscles, improve their elasticity and contractility, increase metabolism.

Massage is especially important for patients with open rhinosinusitis; has a positive effect on the absorption of scars after surgery, because the mobility and elasticity of the articulators - lips, tongue, palate - depends on the restoration of complete speech. Children with congenital cleft upper lip and palate need speech therapy massage.

Massage of the upper lip before surgery. To restore the anatomical integrity of the upper lip, cheiloplasty surgery is often performed during the breastfeeding period, i.e., 3-6 months of age. Because in this case, in addition to its main features, massage has the purpose of preoperative preparation and requires the advice of orthodontists and maxillofacial surgeons who perform therapeutic procedures in articulatory and physiological movements of the lips, planning different methods of massaging the upper lip.

The size of the lips and the type of cracks should be taken into account when coordinating the work on the relative correction of the size of the upper jaw alveolar branches, the implementation of activities aimed at shrinking. Thus, in the bilateral upper lip cleft, great attention is paid to the visible part, in the unilateral full cleft, the injured part of the lip and the nasal wings.

It is given 3-4 times a day for 1-4 minutes for each massage course.

The methods of massaging the upper lip in the pre-surgical period are performed by stroking:

- ◆ stroking in a circle (the index fingers of both hands move downwards from the base of the nose to the lips). It is done for 20-40 seconds.
- ◆ longitudinal caress (the index fingers of both hands move perpendicular to the mouth line from the base of the nose downwards). It is done for 30-40 seconds.
- ◆ clasping (superficial rubbing with the thumbs and index fingers of both hands from the cheeks to the crack boundaries). It is done for 10-30 seconds.
- ◆ transverse stroke (with the index fingers of both hands moving parallel to the mouth line in the direction of the crack boundaries from the cheeks). Execution - 10 - 40 seconds.

The middle part of the bilateral cleft on the upper lip is massaged for 30 to 50 seconds by alternating the pressure vibration on the index finger.

When massaging the upper lip, the child lies halfway down or halfway down, facing the face of either the masseur (or the mother's knee). During the massage, the little patient should not cry or worry. All massage methods are conducted in an atmosphere of conversation, cheerful, friendly contact with the child.

Upper lip and palate cracks massage methods do not cause great difficulties. Parents can then massage the upper lip and palate during a series of treatments that go hand in hand with their learning. In such cases, the task of the specialist is to supervise the parents during the massage.

Contraindications to upper lip massage: general and local acute inflammatory diseases, decompensation of concomitant chronic pathology, certain diseases of the blood and central nervous system, maceration of the skin of the upper lip, upper lip lesions (hemangiomas, nevi, etc.).

Massage the hard and soft palate before surgery. The goal of preoperative tangled massage is to improve future lymphatic and blood circulation by activating the soft palate, which is necessary for the activation of the muscles involved in future tangential-pharyngeal valve activity in the tangential tissues. Massage is performed 3 times a day for 3-5 minutes. Each massage method varies with stroking:

- ◆ stroking along the longitudinal surface (using the index or middle fingers from the teeth of the upper jaw piles in the direction of the larynx along the boundaries of the cracks. Duration - 10-30 seconds.
- ◆ stroking along the transverse surface (with the index or middle finger, movements are made in both directions from the tooth necks in the direction of the fracture boundaries). Duration - 10 - 20 seconds.
- ◆ straight-line friction (with the index or middle finger, movements are made from the upper jaw pile teeth in the direction of the larynx on both sides of the crack). Duration - 10-20 seconds.
- ◆ Rubbing in a circle (rubbing movements in a circle with the index or middle finger are performed for 10 seconds).
- ◆ linear friction (linear (bar) movements in the direction from both sides of the fracture to the larynx from the upper jaw pile teeth with the index or middle finger are performed for 10 seconds).
- ◆ pushing kneading (pushing movements with the index or middle finger for 10 seconds, pushing hard and soft palate tissue from the upper jaw pile teeth and tooth necks to the boundaries of both sides of the crack.
- ◆ Press crushing (with the index or middle finger, perform movements under light pressure on both sides of the crack boundaries from the hard and soft palate tissue of the upper jaw pile teeth and the side for 10 seconds.
- ◆ continuous vibration (circular and zigzag movements along the crack boundaries and the transverse boundaries of the crack by the hard and soft palate tissue with the index or middle finger for 20 seconds).

Sometimes there is a desire to record after a few massage sessions. This condition can be reduced by rinsing the mouth with a slightly saline solution or giving a mint pill.

In the preoperative period, massage techniques were combined with organic special breathing and articulation gymnastics, phonologorhythmic, and included in the course of speech therapy corrections.

Postoperative upper lip massage. In the postoperative period, massage is of great importance after the removal of the threads. It is one of the main ways to prevent the appearance of hypertrophic and keloid scars of the upper lip, in which case a cosmetic effect has not yet been achieved.

In addition, massage helps to develop the articulatory function of the lip, reduces the complications of postoperative deformities of the upper lip and nose. The massage consists of the following manipulations:

- ◆ longitudinal caress (with the index fingers of both hands moving from the base of the nose to the side - towards the corners of the lips). Duration - 10 seconds.
- ◆ transverse stroking (with the index fingers of both hands from the base of the nose down and up along the red border of the upper lip - perpendicular to the line of the mouth for 10 seconds).
- ◆ proper rubbing (with the index fingers of both hands moving downward from the base of the nose to the edge of the upper lip and in the direction of the nasolabial folds on the sides and back). Execution - 20 - 30 seconds.
- ◆ circular and spiral rubbing (with the index fingers of both hands in a circular and spiral motion in the nasal area and upper lip areas for 10 seconds).
- ◆ sawing friction ("sawing" movements with the index fingers of both hands are performed in a straight and transverse direction from the base of the nose downwards - in the direction of the edges of the upper lip and nasolabial folds for 10 - 20 seconds).
- ◆ transverse kneading (with the index fingers of both hands away from the base of the nose - in the direction of the upper lip and in opposite directions for 10-20 seconds).
- ◆ longitudinal kneading (index fingers of both hands from the base of the nose to the side - along the folds of the nose and in the opposite direction). It is done for 20-30 seconds.
- ◆ push-kneading (with the index fingers of both hands, the tissue is pushed from top to bottom and in both directions). Execution - for 20 - 30 seconds.
- ◆ pressing kneading (light pressing kneading movements are performed with the index fingers of both hands from the base of the nose to the edges of the upper lip edges and nasolabial folds for 10 - 20 seconds).
- ◆ clamping (movements with the index and thumbs of one or both hands to the edge of the upper lip and from the base of the nose to the upper nasolabial folds are performed for 20 seconds).
- ◆ constant vibration-vibration (continuous vibration movements with the index fingers of both hands from the base of the nose to the upper lip edges, down - movements towards the nasal-lip folds are performed for 10-20 seconds).
- ◆ continuous vibration-vibration ("finger shower" - straight and transverse movements in the upper lip areas with the index fingers of both hands are performed for 10-20 seconds).
- ◆ Vibration-vibration of the beat (with the index fingers of both hands in the areas of the upper lip and nostrils, movements in straight and transverse directions are performed for 10-20 seconds).

◆ postoperative scar compression (the index finger is in the mucous layer of the upper lip under the scar, and the thumb is on the scar; crushing movements are performed with pads between the fingers). It is done for 10-20 seconds.

◆ Massage of the scarring sides of the wing and dome of the nasal passage is performed using a dense elastic object that is slightly smaller than the diameter of the nasal passage (e.g., the tip of a small rubber spritz). The tip of the syringe, pre-lubricated with Vaseline, is inserted 3-5 millimeters into the depth of the nose, and pulling movements from the tips of the nasal wing upwards and towards the healthy side are performed for 10-20 seconds).

◆ Massage the tip of the nose and wings (the tip and wings of the nose are large and slightly pulled and lightly compressed with the pads of the index fingers). It is done for 10-20 seconds.

In order for the child to massage the tongue on its own, it is necessary to teach it to move backwards from each tooth towards the soft palate using the tip of the tongue. This type of exercise not only affects the tip of the tongue, but also strengthens the muscles. It is also possible to teach older children and their parents some self-massage techniques in the tanning area.

The criteria for the effectiveness of tangled massage include: tactile sensations that soften the scar, increased mobility of the soft palate in both active and passive closure.

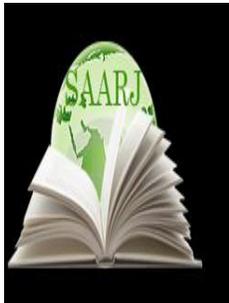

In general massage practice, various special ointments, creams and oils are successfully applied to ensure the effectiveness of the massage and the protection of the hands of the masseur.

Properly organized massage, individually selected methods, massage norms and timing have a positive impact on the effectiveness of the complex rehabilitation process in patients with congenital oropharyngeal fractures.

It should be noted that massage treatments are not recommended in children under 4 years of age, unless the pathological position of the tongue and muscle deformation is formed.

**SOME ISSUES OF FORMING A CULTURE OF HUMANITY IN
 PRESCHOOL CHILDREN IN THE CONDITIONS OF INCLUSIVE
 EDUCATION**

Madina Arslanova*

*Lecturer,
 Preschool Education organizations Retraining,
 Directors and specialists and the Institute of Advanced Studies,
 UZBEKISTAN

ABSTRACT

This article discusses the importance of the formation of a culture of humanity in children in preschool education in the context of inclusive education and its specific features. Since inclusive education is a vital necessity, a child's perception of this system, as well as the formation of an assessment of its quality and effectiveness, will have an impact on the child's simple yet realistic relationships. The difference between these activities and traditional activities is that in developing the methodology of their organization, the main focus should be on the integration of children with special educational needs into the group.

INTRODUCTION

In our country, educating the younger generation in accordance with modern requirements has been one of the constant priorities of state policy. In his Address to the Oliy Majlis of December 29, 2020, President Mirziyoyev called for the implementation of large-scale reforms based on the idea that "New Uzbekistan begins on the threshold of schools, the education system." In this process, quality education in kindergartens, schools and universities It was strongly emphasized that all efforts and opportunities should be mobilized for them to grow up to be physically and mentally healthy, patriotic people.

In improving the conditions and opportunities created for the education of the younger generation, special attention is paid to the problems of children with special educational needs. In particular, the Law of the Republic of Uzbekistan "On the Rights of Persons with Disabilities"

states that "persons with disabilities have the right to education throughout life and to participate in public and state life for the full development of their abilities in educational institutions of all levels." to ensure the development of inclusive education, the creation of the necessary conditions for their education and vocational training, retraining and advanced training.

In the pre-school education system, where special attention is paid today as the first and most important link, the main task of educational institutions in this area is "the use of individual educational programs for children, including children with special needs, as well as timely inclusive pre-school education. This will allow for the widespread introduction of the principles, forms and methods of inclusive education in this area.

In this article, as a result of our observations and research in recent years, we found it necessary to share some ideas and comments on the formation of a culture of humanity in children in the context of inclusive education in preschool education.

"Inclusive education is needed by both healthy and disabled children. We want to instill in every child the idea that human values do not depend on their ability, while teaching them to be tolerant. At a young age, a child's mental state is open, flexible, and ready to learn. Children who have learned that there are people with different verbs and appearances among them will not oppress children who are different from them in the future. Participation in the organization of preschool education for children with various disabilities will facilitate their subsequent social adaptation, creating opportunities for them to acquire communication skills," said the Minister of Preschool Education of the Republic of Uzbekistan A. Shin.

The basic idea of inclusive education is first and foremost the humanization of society and the right of people with special educational needs to co-education. The idea that "inclusion in education is an inclusion in society and one of the most humane ideas in its development" is now leading the way in the theory of inclusive education and defines the leading trends in research in this area.

An explanatory dictionary of the Uzbek language defines the concept of "humanist" as "caring for people, loving people, pursuing human goals." Hence, human culture is made up of qualities that are manifested in a person who has such qualities.

Formation of a culture of humanity in children in the conditions of inclusive education in preschool educational institutions is carried out for the following purposes:

First, humanity is one of the leading values among universal and national values, and humanistic culture is one of the key components of individual culture. The formation of any culture from childhood is important for the future development of the individual.

Second, in the context of inclusive education, one of the first necessary socio-spiritual conditions is humanity. If the human environment is not good enough, inclusion is not good enough.

Third, in the organization of preschool education, the relationship between children of different levels of development is directly "moved" through children to larger social environments - the family and society, and finds its own expression in them.

Fourth, the opportunities of the humane environment formed among children in the preschool education environment are more psychologically important for the quality and effectiveness of joint education of children of different levels. skills are also important for their future lives.

Fifth, this process does not take place within a single preschool organization, but in turn requires the direct participation and intervention of the family, the community, and other individuals in the community. As a result, the scope of not only the subjects of education, but also the objects expands.

We will try to explain our ideas with some examples. It is known that the experience of developed countries in the introduction of inclusive education, first of all, raises the issue of the correct formation of public opinion in this regard. It is no exaggeration to say that today all the countries that have made significant achievements in inclusive education have reached this level through the support and goodwill of the general public.

The main consumer of preschool education services is the child, the child's participation in the educational process, the satisfaction of educational needs directly affects the attitude of parents, their choice. Since inclusive education is a vital necessity, a child's perception of this system, as well as the formation of an assessment of its quality and effectiveness, will have an impact on the child's simple yet realistic relationships. This includes the formation of a correct understanding and perception of inclusive education in the parents of children with special needs and children with special educational needs.

Finding an answer to the question of how the presence of two or three children with special educational needs in a group affects children who are developing normally is one of the important and constant issues for preschool leaders, educators and psychologists. At this point, it is undeniable that it is important, first of all, to create a healthy humane socio-psychological environment among children in accordance with their age, psychological and mental development characteristics.

The correct acceptance of a child with special educational needs by his peers alone demonstrates the importance and relevance of humanity as one of the mechanisms of quality education, not just a value.

Below we found it necessary to cite some methods related to the formation of a culture of humanity in a large group of pupils of the organization of preschool education.

Ways to work with parents: explain to parents that each child is a unique world, that it has its own characteristics, that developmental disabilities should not lead to the isolation of this child from other children in society, our national, religious values, special care for such children and to hold roundtables, trainings with the participation of experts, advocacy activities, spiritual-educational and sports events, to create and disseminate methodological manuals and recommendations in order to correctly explain the need for assistance, to involve them in activities related to the formation of humane culture in children. The correct concepts, knowledge and skills formed in parents in this regard are naturally reflected in children.

Methods of working with children: "Be my friend", "Friendship is the highest virtue", "I help my friend", "I help my friend", "To be my friend", "Friendship is the highest quality", "I help my friend", It is advisable to hold conversations, mornings, story discussions, intellectual and creative competitions as a team, in particular, active games and sports competitions, taking into account the capabilities of children. The difference between these activities and traditional activities is that in developing the methodology of their organization, the main focus should be on the integration of children with special educational needs into the group. At the same time, the

difference between children with special educational needs and those who are developing normally should not be noticeable, but it should be convenient and educational for both parties.

Based on the above, the following recommendations for the formation of a culture of humanity in children in inclusive groups of preschool education can be made:

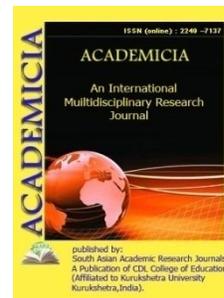

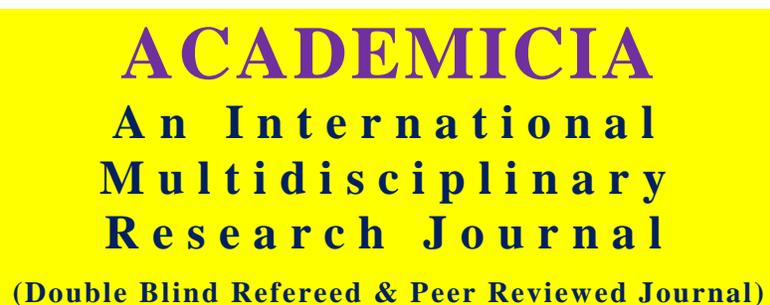

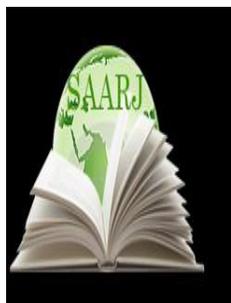

- effective use of methods and tools to promote the integration of children with special educational needs with children with normal development in the educational process, in particular, during the various classes, to the extent possible and more actively;
- formation of team mood and atmosphere among children in the group;
- to take special psychological and pedagogical skills to prevent the isolation of children with special educational needs in different situations by their normally developing peers, and to work in optimal solutions for both parties;
- Development and implementation of short-term and long-term pedagogical, psychological programs for the formation of human culture;
- Strengthen public confidence in the humanity of inclusive education through the achievement of the widest possible coverage of parents in these programs, the organization of special trainings, roundtables and consultations for parents.

Since inclusive education is a humane education, it is natural that the formation of a humane culture in children using the opportunities of this education will increase the role and importance of inclusive education not only in preschool education, but in society as a whole.

In conclusion, the formation of a humane culture in children in the context of inclusive education plays an important role in improving the quality of education in preschool education and can be studied as one of the specific research problems in pedagogy and psychology.

ON THE BASIS OF GAMES FOR CHILDREN WITH SPEECH DEFICIENCY LITERACY TEACHING

Mukarram Ayupova*

*PhD Professor,
Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

In this article, reveal didactic games and methods, as well as the occupation of their conduct by specialists Speech therapist, they aim to develop thinking in children with a pronunciation defect. The speech therapist gives the child a picture and offers to make a sentence based on the pictures. For example, if a child has a rabbit in his hand, the rabbit jumps, like a rabbit is eating grass. To help children pronounce speech sounds correctly, use words appropriately and correctly, construct speech and independent speech correctly, and teach spelling skills based on them, a speech therapist should use a variety of fun games during the lesson.

KEYWORDS:

INTRODUCTION

During literacy training, children not only get acquainted with the sounds of speech, but also learn to form words from syllables, to read words.

Teaching literacy to children with speech impediments in preschool has a unique character. This feature is due to the fact that education is reorganized according to their physiological and mental characteristics, it is based on the game. It is characterized by the fact that the game with education is carried out in harmony, in mutual regularity.

Didactic games are organized on the basis of different materials. These include dolls, toys, special colorful pictures and cards, various cubes and objects, geometric shapes, counting and calculating tools, natural materials. It is advisable to prepare such materials for training in advance.

When choosing a game, first of all, attention is paid to its ideological content, spiritual and moral value. The mission and purpose of the game should be consistent with the purpose of education

and upbringing. When choosing didactic games, it is necessary to take into account the level of children, the scope of knowledge.

During the game, which is organized with children with speech disabilities, their personal abilities, perceptions, comprehension features are demonstrated.

Didactic games are also widely used in the process of teaching literacy in order to activate the creative abilities of six-year-old children.

During the game with children, their personal abilities, perceptions, comprehension features are demonstrated.

Didactic games are also widely used in the process of literacy in order to activate six-year-old children [1, 2].

In didactic games, in addition to children's perception, there are ways of perception through auditory activities. "Great bag," "What sounds like?" such games require children to be able to concentrate, compare, differentiate, and generalize [4]. Didactic games with the help of various word games, along with the development of children's oral speech, develop the ability to think independently, to think, to teach them to be responsive.

To help children pronounce speech sounds correctly, use words appropriately and correctly, construct speech and independent speech correctly, and teach spelling skills based on them, a speech therapist should use a variety of fun games during the lesson. Proper use of fun games can help to prevent speech defects in children, to achieve literacy and positive results in independent work [3].

Below is an example of a fun literacy game.

1. Sound and letter. The main method in literacy teaching is the analytical-synthetic sound method. Fun games should be based on this method.

Game 1. The speech therapist raises one of the specially made letter forms (printed and written forms of each letter are made of 4 pieces) on white cardboard with a width of 10 sm and a height of 15 sm..

children who know raise their hands. The mother orders a child to answer whatever she wants. This game develops children's ability to recognize letters, pronounce sounds correctly, and quickly distinguish between uppercase and lowercase, uppercase and lowercase letters.

Game 2. The speech therapist will show you what you want from the above letters in different ways. It asks the children the name of the letter.

This game develops children's visual perception, thinking, reasoning ability.

Game 3. The speech therapist displays the desired letter from a specially prepared alphabet. The children take turns saying the name of the letter and the vowel or consonant.

Game 4. "Identify the letter in the air" game. Several children will take part in the game. The speech therapist gives an idea of the game and distributes picture cards with the letters o, a, l, n learned in the previous lessons. He takes the cards with the letters o, a, l, n.

The speech therapist puts a card with the letter o on the table. The participants of the game put pictures corresponding to this letter (moon, apple, plum, horse, cherry) next to the letter and say the names of these objects.

He then places another card with the letter a on the table. Game participants post pictures accordingly. The game will continue in the same way.

Game 5. For the game, pictures of different objects reminiscent of the letters passed by the speech therapist, and for children, the samples of the letters passed should be in a special envelope.

The speech therapist shows all the children in the group pictures of the sounds a, i or n, g (pomegranate, spruce, snake, in). The children quickly draw a letter from the envelope that starts with the name of the object.

Game 6. This game is about building from joints and joints. This will show the desired joint from the "Joint Table" created by a speech therapist. Children make this syllable from cut letters. They find the second link themselves. Masaan: lo-la, sho-li ...

This game helps children learn the rules of composing words and dividing words into correct syllables.

Game 7. Consonant letters stand mixed on the table. Four children participate in the game and each participant is given four letters. So there will be a total of 16 letters. The children take the consonant letters in order, then add a vowel to it to form a syllable. For example: m + a = ma, n + a = na. Then the word ma + na = mana is formed by adding both syllables. Each child monitors his or her partner's work.

Game 8. "Sort things" game. In this game, children learn how to pronounce the "R" sound correctly and how it comes at the beginning, middle and end of a word by sorting the picture cards into types.

The speech therapist shuffles the picture cards prepared on the table. The speech therapist explains the rules of the game to the children. Kids now you take pictures involving the "R" sound and divide them into nomlb types (rum, wolf, rubob, spruce, trumpet, cucumber, dutar, rooster, doctor, radish, tomato). At the same time, when you say the name of something, you indicate where the sound "R" comes from in the word.

Game 9. "Find the right word in the picture" game. Through this game, children learn that the "Z" sound comes at the beginning, middle, and end of a word, and reinforce the correct pronunciation of the "z" sound in their speech.

The speech therapist puts a picture of things or a mix of toys on the table.

The speech therapist explains to the children today that with you we will know that the "z" sound comes at the beginning, middle and end of the word, and you take the pictures from the pictures

on the table in the order I said. He then invites one of the children to the table and suggests that the “Z” sound show a picture of the word that comes at the beginning of the word. The game continues this way.

This game can also be played to learn and reinforce other sounds.

2. The word. Exciting games on word information help children learn the names of familiar objects, toys, school supplies, household appliances, clothes, fruits, pets, and wild animals, and learn them in groups, as well as who? what? how what does he do helps children to distinguish them from each other through questions such as.

Game 1. The speech therapist shows the child one of the letters passed. The child finds the words that come at the beginning of that sound and says them orally.

For example: head, bexi, wolf, cucumber ...

The game continues in this way.

Game 2. The speech therapist hangs one of the letters on the board. The child finds and says this sound from the words that come at the end of the word.

For example: to the sound "A": apple, father, mother, brother, saw, spruce, pen, Halima, Nargiza, bowl ...

Game 3. The speech therapist says a word to the children. The child must find a word with the same answer to the sound that the word ends with, that is, to the sound that he hears at the end of the word.

For example: child - pomegranate - rocket - spruce - stream - spoon - yogurt - pencil - car.

This game will keep the kids from starting speech therapists. To do this, children need to listen carefully to their peers.

This is called a "Chain" game.

Game 4. The speech therapist says some words to the children. Children add syllables that match that word.

This is called a “multi-syllable word game”.

Game 5. "Word after word" game.

The speech therapist tells the children to take one of the objects and pictures on the table and say their name. For example: sphere. The children have to find the words with the sound “Sh”. For example: candle, scarf, king, Shahida ... Thus the game continues. The child who finds the most words in the game and actively participates is the winner of the game.

Game 6. Find words with the "O" vowel. Write them using cut letters.

For example: horse, soup, bread, eyebrow, grandfather ...

Game 7. Find words with the “A” vowel and write them using cross letters.

For example: pomegranate, apple, spruce, saw, pencil, scissors, rocket...

Game 8. Find words with the vowel "U" and write them using cross letters.

For example: flour, bread, night, three, house, bird, salt, Hope ...

Game 9. Find words with the vowel "I" and write them using cross letters.

For example: in, work, winter, tooth, thread, dog, two, edge ...

Game 10. Find words with the vowel "E" and write them using cross letters.

For example: early, foreign fairy tale, a sieve, boots,...

Game 11. Find words beginning with a vowel and ending with a vowel and writing using cross letters.

For example: brothers, sisters, mother, father, saws, tree, Aziza, Ali ...

Game 12. Find words that start with a consonant and end with a consonant and write using cross letters ...

For example: winter, head, eyebrows, teeth, pencil, book, snow, paper, eight ...

Game 13. Find single syllable words and write them using cross letters.

For example: soup, horse, flour, in, mulberry, yarn, eyebrow, bread...

Game 14. Find two-syllable words and write them using cross letters.

For example: car, plum, peach, swallow.

3. After preparing for speech and spelling, children are able to distinguish sentences from speech, answer questions in full, tell who or what the sentence is about and what is said in the sentence, compose a sentence, put a full stop at the end of a sentence and start a sentence with a capital letter. skills are given. Thanks to interesting games, the knowledge given about the above is repeated and strengthened.

Game 1. "Speak words" game. Through this game, children's speaking skills are strengthened.

The speech therapist puts cards with a few words on the board. Two of the game participants are called. They read the words on the cards and make sentences using those words. Whichever child completes the task correctly is the winner of the game.

Game 2. The speech therapist gives a speech of 2-3 sentences. The children clap once after each sentence where a full stop should be made.

For example: Dawn. The sun came out. We went to kindergarten.

Game 3. A child speaks and asks the child he wants what he is talking about.

For example: Alijon said: "Sabir wrote a letter". Hope said, "You talked about Sabir writing a letter."

Game 4. The speech therapist said the word he wanted. Children make sentences in the presence of this word. Each child takes a turn to say what they have composed.

For example: Book. I got a book. Azamat read a book.

Game 5. The speech therapist says the words placed randomly by the child. The child finds a place for the words and makes a sentence out of them.

For example: Playing, Zarina, ball. Zarina is playing ball.

Game 6. "Give a complete answer" game. The speech therapist begins to ask the children a series of pre-formed questions. The child's answers to the questions are based on answering in a complete sentence, not a single word.

The questions to ask the child can be as follows.

The speech therapist says the pen, and the child says the pen is black, red, and blue. Wardrobe - wardrobe large, wardrobe black; board - board large, board black; tree - a large tree; the leaves of the trees are multi-blue and hlkazo.

Game 7. Picture Talking Game. Through this game, children expand their understanding by constructing sentences based on pictures.

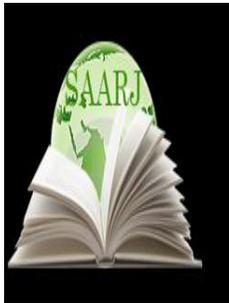

The speech therapist gives the child a picture and offers to make a sentence based on the pictures. For example, if a child has a rabbit in his hand, the rabbit jumps, like a rabbit is eating grass. The child asks the child to determine how he or she performed the task. It helps if you can't do the task.

Preschoolers get tired quickly because their attention span is unstable. Therefore, increasing the effectiveness of training, attracting children's attention to training depends primarily on the speech therapist.

In conclusion, it can be said that interesting games are typical for children aged 5-7, and only when they are used in their place, it is possible to awaken in children a love for knowledge. In addition, the above-mentioned fun games develop children's creative thinking and independent work skills in teaching communication and speech development.

PSYCHOLOGICAL MECHANISMS OF THE FORMATION OF A STUDENT'S SOCIO-CULTURAL ACTIVITY

Zulfizarxon Nadjibullaevna Yulchieva*

*Head of the Department of Pedagogy and Psychology,
Tashkent State Technical University named after I.A. Karimov,
UZBEKISTAN

ABSTRACT

The article presents the socio-psychological mechanisms of the dynamics of social intelligence in the process of professional formation of the student, designed a mechanism that provides psychological and educational assistance, fixes problems in the professional formation, has a systematic nature of the activities. The intellect of students in psychology will be reached in process researching social- psychological quality of dynamic's developing, and also were elaborated theoretical approaches, directed at solving problem, elaborated scientific-methodical recommendations. These approaches can be used on planning work sections and youthful organizations, at determining contents of textbooks, educational- methodical work of higher educational institutions.

KEYWORDS: *Intelligence, Mental Ability, Social And Emotional Intelligence, Empathy, Psychological Diagnostics, Intelligence Dynamics.*

INTRODUCTION

By the decree of the President of the Republic of Uzbekistan Sh.M. Mirziyoyev dated February 7, 2017 No. PF-4947 "in the fourth direction of the" strategy of actions in five priority areas of further development of the Republic of Uzbekistan for 2017-2021 "(footnote 1), the task was set -" to raise technical education and provide the industry with highly qualified personnel. " The idea of individual freedom and the presence of intellectual potential in a person is one of the main in the implementation of this task, since a free person, a free people is able to actively act in the process of creativity, prosperity, humanitarian, creative labor, science, culture and modern production and achieve the intended goals.

1. Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No. PF-4947 "On the Strategy of Actions for the Further Development of the Republic of Uzbekistan". Collection of legislative acts of the Republic of Uzbekistan 2017, No. 6 70-article.

The cardinal changes taking place in the development of society at the present time pose qualitatively new and relatively complex tasks, and at the same time, the level of development of the intellect of a person is a regulator of his mental capabilities, moral aspects are of particular importance. So how do the above aspects manifest and form during the student period?

Scientific analysis of research methods and results:the study of the nature of the social intelligence of youth, its in-depth analysis from a scientific point of view is in demand today, therefore it is important to deeply study and analyze the features of the dynamics of social intelligence in the upbringing of a harmoniously developed generation, its potential in the formation and professional development.

The study of the nature of social intelligence of young people, its in-depth analysis from a scientific point of view is in demand today, therefore it is important to deeply study and analyze the features of the dynamics of social intelligence in the upbringing of a harmoniously developed generation, its potential in the formation and professional development.

As the object of the research, we selected from the number of students of vocational education (total of 480 respondents) at the stages of higher education. 240 of them were students of the pedagogical and physics and mathematics faculties of Gulistan State University and 240 students of the social and humanitarian faculty of the National University of Uzbekistan. In determining the mental abilities of students, J. Rowen's test "Progressive Matrices" was used; provides for the ability of students to work with words associated with the V factor, tests "Interpretation of proverbs", including with numbers N, tests "Series of numbers" and "Logical series of numbers", "mathematical intelligence", tests "practical intelligence" associated with practical and motor activity, as well as the use of "visual intelligence" tests related to spatial perception.

As the object of the research, we selected from the number of students of vocational education (total of 480 respondents) at the stages of higher education. 240 of them were students of the pedagogical and physics and mathematics faculties of Gulistan State University and 240 students of the social and humanitarian faculty of the National University of Uzbekistan. In determining the mental abilities of students, J. Rowen's test "Progressive Matrices" was used; provides for the ability of students to work with words associated with the V factor, tests "Interpretation of proverbs", including with numbers N, tests "Series of numbers" and "Logical series of numbers", "mathematical intelligence", tests "practical intelligence" associated with practical and motor activity, as well as the use of "visual intelligence" tests related to spatial perception.

We used the method of K. Guilford and M. Sullivan "diagnostics of general intelligence". We used the method of V.V. Boyko "Diagnostics of the degree of empathic abilities". (2-footnote)

J. Guildford proved that creative thinking is based on divergent and convergent types of thinking. When analyzing the overall assessment of students, typical cases of the principles of constructing assignments are taken into account. The general IQ of students according to Raven's method was $IQ = 92.75 \pm 11.73$. This is characterized by a reflection of values between results above average and average. Even when comparing the results of students of natural ($IQ = 95.75 \pm 11.38$) and humanitarian ($IQ = 90.16 \pm 11.61$) orientation, their values did not differ sharply from each

other, but there was a difference in their academic performance ($t = 2, 13, p < 0.05$).

The results show that the relationship between indicators of social intelligence and other indicators of intelligence is growing.

And in the results of male and female students, different aspects were noticed. They have sufficient knowledge and intelligence to prepare themselves for a common environment and relationships, but students must be able to improve them in the process of life experience and professional development. Because among the rest of the criteria for general intelligence, no significant result was observed.

2. Guildford J. Three sides of intelligence // Psychology of thinking Edited by A.M. Matyushkin, Moscow, 1995, P433-456

Diagram of the dynamics of students' intelligence

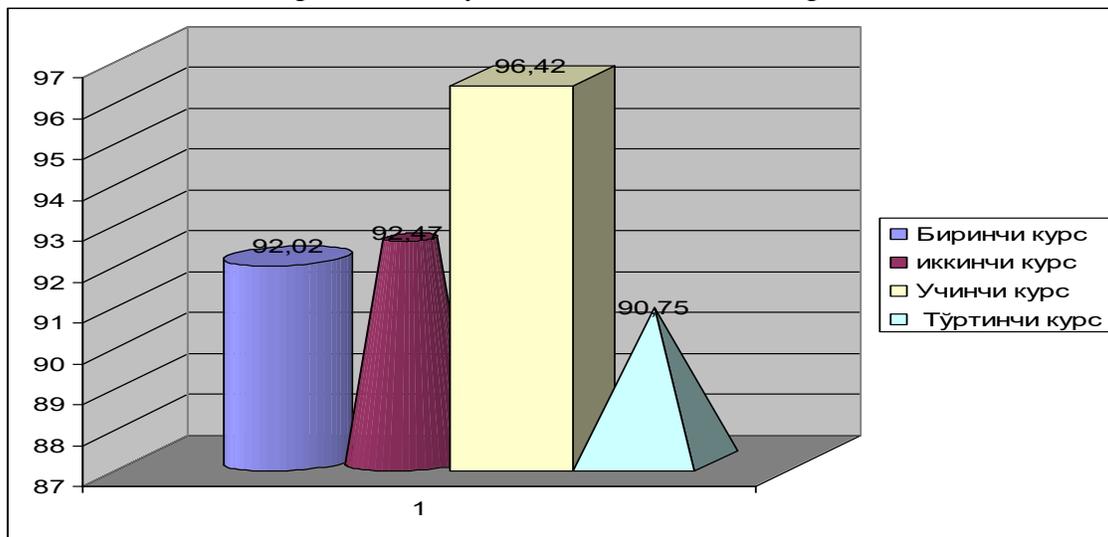

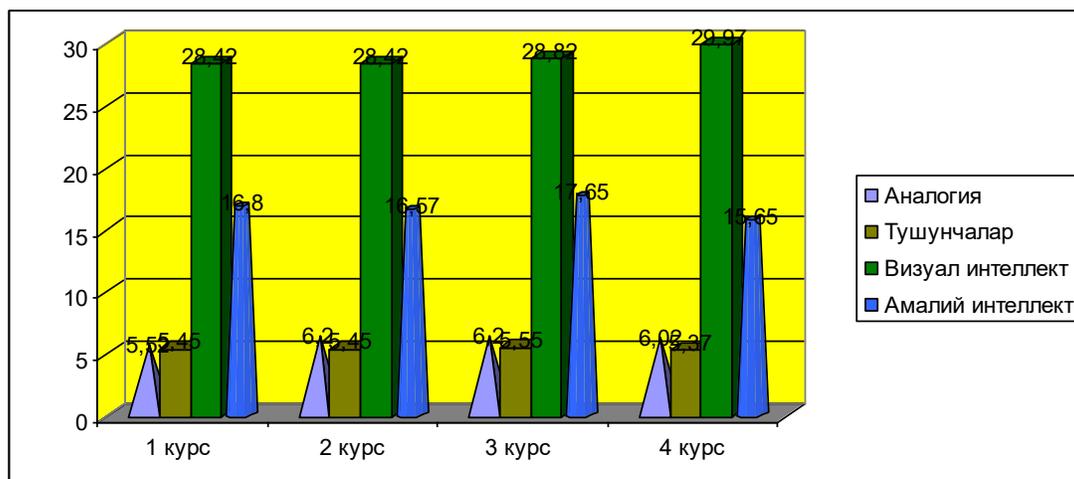

Figure 2.

It turns out that signs of growth in social intelligence are more pronounced in relation to the general intelligence of students. Among his criteria there are also relative, although interrelated.

Is social intelligence an independent phenomenon? What are the functions of social intelligence? When answering these questions, it is necessary to pay attention to the following characteristics: ensuring adequacy and flexibility in changing conditions; formation of mutually successful programs and plans of proportionality in tactical and strategic directions, solving current problems; planning activities in relationship with a person and forecasting their development; motivational function; expansion of social competitiveness (IR.); self-formation, self-awareness, self-learning.

Forming long-term relationships is one of the main goals of social intelligence. Understanding the level and nature of the relationship is an expression of positive interaction with each other in the future and strengthening the relationship.

The mobilization function of social intelligence, which helps in cases of extreme crises, prolonged stress, understanding self-esteem is very important.

In contrast to the structure of general intelligence, the features and characteristics of the personality's self-awareness in the structure of social intelligence play a huge role. At the same time, self-awareness should not become overgrown with "hard", complex and psychological defense barriers. Since then a person does not develop self-consciousness, he has complexes. Personal interests will be small or not at all, he involuntarily becomes aggressive.

Social intelligence plays an important role in professions of the "person-to-person" type, makes it possible to predict the activities of teachers, psychologists, journalists, managers, lawyers, doctors, politicians, entrepreneurs.

Due to the lack of local teaching aids, social intelligence has been the subject of few specialized studies.

According to the results of the study, it is possible to trace the growth of social intelligence by age, in particular, in the indicators of the method of studying social intelligence in those who at the first stage revealed a correlation between the understanding of verbal expression according to the criterion of understanding the feelings, thoughts and intentions of the participant in the dialogue, as well as factors influencing on the development of social intelligence.

Then, a correlation was also observed between verbal expression and the factors of organizing interpersonal interaction. This situation shows that at the 1st stage students have a well-formed concept of "I" and the symbol "I". They understand difficult situations between people, the logic of the formation of situations, feel what the essence of the change in this state is when other people are attracted to this state.

The lack of the first stages encountered in the development of social intelligence is that their ability to understand behavior is poorly formed. When analyzing the relationship of indicators of social intelligence at the second stage, a well-developed understanding of the feelings, thoughts and intentions of the participant in the dialogue in its place led to an understanding of verbal behavior, an understanding of verbal influences.

At the third stage, the emotions, thoughts and intentions of the participant in the dialogue are factors of understanding and analyzing the interaction of the individual, are interrelated and correlative communication takes place. The ability to understand non-verbal and verbal expression was observed.

And the students of the fourth stage showed their good results. There were many correlations in the overall results.

In turn, when these results were observed at the faculties, they did not lose their positive significance: physical and mathematical-4.30, pedagogical-4.55, psychological-4.42, philosophical-4.44 and sociological-4.38 - respectively. It turns out that the use of educational methods can be beneficial for the educational process.

CONCLUSIONS AND OFFERS: The obtained results showed that when using elements of innovative educational technology in the classroom, the introduction of interactive teaching methods in them had a positive impact on professional development in the process of mastering knowledge in the educational process. When using interactive techniques, the content of the educational material should be rethought by the teacher, the meaning of difficult terms for him explained to the student, awakened in his consciousness and his mental activity should be stimulated. For this, the content of the topic is transformed from concepts in the form of information into problematic questions, tasks and situations.

In the process of an innovative approach, knowledge arises on the basis of students' own social order, and this affects the change in the form of behavior. A particularly problematic organization of education has a positive impact on the learning activities of students. In order for this process to be more successful, it is necessary to focus on the psychological basis.

Based on the foregoing, we can draw the following conclusion: the study of the nature of social intelligence of youth, in-depth analysis from a scientific point of view is in demand today, it is important to deeply study and analyze the features of the dynamics of social intelligence in the upbringing of a harmonious generation, its intellectual potential and professional development. The possibilities of assessing the social environment, the behavior of the interlocutors, their personal qualities, their life activity in the unity of personal abilities in the individual relations of young people are the connecting link from the point of view of regularity.

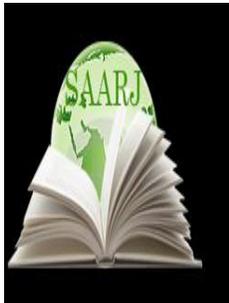

Having the ability to understand the feelings, thoughts and intentions of the participant in the dialogue has a positive effect on both the growth of social intelligence and the understanding of complex logical connections, and the ability to distinguish between important and insignificant aspects of concepts leads to an increase in the ability to process information through viewing and self-expression in professional and personal activities. Among students of the fourth stage, the indicator of social intelligence was significantly higher and more positive. In them, we observed the same indicators within the first and third, second and fourth factors. But on the third and fourth indicators, they managed to score the maximum score. This means that in the fourth stage, students will be able to predict what their circumstances are and what they are going to say from the changes in the face and actions of other strangers, their facial expressions, hand gestures and other emotional behavior.

When organizing the educational process on the basis of innovative technologies, there are several interrelated stages of cognitive assimilation, which represent the levels of assimilation of knowledge, understanding of situations such as transmission, recall, memorization, written expression of ready-made knowledge in the mind of the student. At these levels, student creativity is not required. At later stages of mastery, students must practically apply the knowledge they have acquired, receive, supplement, enrich, change certain results, and have their own independent point of view.

The problematic approach to these levels of mastery is indicative. Universities have great opportunities to use innovative technologies. Realizing these opportunities, a more or less creative technological approach to pedagogical activity creates the basis for students to thoroughly assimilate knowledge in each subject, while ensuring interest in lessons. In fact, the constant monotonous repetition of classes creates in students a mood of indifference, irresponsibility in relation to the acquisition of knowledge. Currently, for the most effective prevention of such a situation, it is necessary to consistently and purposefully apply innovative technologies in the activities of educational institutions.

ABSTRACT

The effectiveness of combined spinal-epidural anesthesia in gynecological simultaneous operations was studied in 65 patients. The average age of the patients was 51,56 years. The parameters of external respiration, hemodynamics, norepinephrine excretion, and changes in cortisol concentration were studied. The use of CSEA has a pronounced protective effect against surgical trauma and associated adverse neurohumoral, hemodynamic, and biochemical changes.

KEYWORDS: *Gynecological Simultaneous Operations, CSEA, Norepinephrine, Cortisol, Hemodynamic, Central Neuroaxial Blockade, Subarachnoidal Cavity, Longocaine, General Anesthesia, Ejection Volume*

INTRODUCTION

Over the next 30 years, interest in the use of methods of regional anesthesia has been increasing. The use of this method is incomparable in the practice of surgery, Traumatology, urology and

gynecology. Modern views of the pathophysiology of acute pain in this case are very important to subconsciously understand, that is, to protect the spine from nociceptive influences, while ensuring adequate anesthesia. In solving this problem, it is necessary to choose such a method of anesthesiology arm, it is worth noting that with the blockade of the afferent zvenos of the reflex arc, it prevents the additional activation of the efferent impulse mechanism, the application of regional anesthesia as a component of anesthesiological maintenance.

Features of simultaneous operations in gynecology usually make patients older, and the presence of various concomitant diseases reduces the possibility of compensatory-adaptation of the organism. In operational intervention, it is necessary to take into account the fact that the operational damage occupies a large area (requires the spread of the motor-sensor block level in the TVI-SII range) and lasts longer. But it is not excluded from the lack of a traditional central neuroaxial blockade (CNB), which limits its wide application: the time of spinal anesthesia, the needless wide spread of the spinal block is in the sentence. The main disadvantages of epidural anesthesia are the need for relatively large doses of local anesthetics, the long duration of the latent period of block development, the inadequacy of anesthesia due to insufficient maturation of the sensor block level. In addition, the unresolved problems of CNB are hemodynamic disorders, the occurrence of postpunctive headaches, this method can also not be called absolute (completely) safe.

Use of combined spinal-epidural anesthesia (CSEA) with spinal and epidural anesthesia increase the advantages of its possibility of cooperation. It reduces the shortcomings and complications associated with them.

Purpose of research. To study the possibility of application of combined spinal-epidural anesthesia in gynecological simultaneous operations and to evaluate its effectiveness.

Materials and methods. The effect of CSEA in simultaneous operations in 65 women was studied in the gynecological department of the 1st clinic of SamMI. The age of the patients was from 40 to 65 years (an average of 51,56). The risk of anesthesia was assessed by IV classes in 45 patients with ASA, III classes in 25 patients and IV classes in 5 patients.

Distribution of performed gynecological simultan operations: Total hysterectomy and intermediate plastic-25, subtotal hysterectomy and cystomectomy -22, ventricular and intermediate plastic-15, others -3 people.

Patients were divided into 2 groups (Main and control) to assess the supply effect of applied anesthesia. In the main I group, 40 patients were administered CSEA as the main component of anesthesiological maintenance.

The control group was performed under general anesthesia (GA) in 25 patients. during operation ketamine, thiopental sodium, propofol anesthetics, NLA preparations, ardoan from muscle relaxants were used in normoventilation mode using the respirator phase -21 with oxygen-air mixture for artificial ventilation of the lungs against the background of mioplegiya. The average duration of operations in both groups was 1,5 - 2,5 hours. The volume of lost blood was significantly lower in I group.

For premedication, sedative medications were used in the evening, atropine 1mg 30-40 minutes before anesthesia, morphine or promedol 10 mg, dimedrol 10 mg, and in some cases sibazone 10 mg. Infusion therapy for 1 hour before the application of CSEA was conducted in an average

volume of 3-1ml/kg of crystalloid and colloid (from preparations of gidroxiethyl starch) solutions in a ratio of 2:1 or 10:15. When choosing a puncture level (from LI-LIV intervals), the intended operating volume was taken into account. The patient is in a lying position with a special two - hole Tuochi (G18) under local anesthesia (0.5% - 10 ml novocaine) (Espocan, " B. Brown", Germany) was punctured by an epidural cavity with a needle. Then, through the same needle hole, a subarachnoidal cavity was punctured with a longer spinal needle (G26). After drip of transparent cerebrospinal fluid, 0.5%-2-3 ml (10-15mg) solution of Longocaine Heavy (Ukraine) was sent and the spinal needle removed and the epidural cavity through the Tuochi needle was fixed by inserting the microcatheter 5-6 cm cranial direction. The initial dose of lidocaine was administered by a catheter into the epidural cavity on average 60-100 mg after 1.5-2 hours of operation. But when the spinal anesthesia clinic was slowed down, then it was repeated every 30-45 minutes. It mainly took into account the depth of the sensor block, the ABP and pulse indicators. We evaluated the sensor block spread with tactile sensitivity loss (pin prick test). During anesthesia, oxygen inhalation (5-6 l/min) was performed through the face mask. As a sedation during operation we used intravenous infusion of small doses of sibazone or sodium oxybutyrate. Intraoperative monitoring: ECG, SpO₂, pulse, ABP (cardiomonitor "Triton", Russia) were monitored. When assessing the reaction of the sympatoadrenal system, the rate of excretion of noradrenaline through urine was taken into account. The reaction of the hypothalamic –pituitary-adrenocortical system was evaluated based on the amount of cortisol in the blood serum (immunoferment method). The results were analyzed according to the Student criteria of the method of data collection statistics.

Results of the examination and their discussion.

Subarachnoidal anesthesia was started after 8,0±0,3 minutes. Symptoms of impaired external respiratory activity and reliable SpO₂ changes were not observed during anesthesia.

TABLE -1 CHANGES IN HEMODYNAMIC INDICATORS IN GYNECOLOGICAL SIMULTAN OPERATIONS (M±M).

Stages of research	Groups	Indicators				
		volume of blood ejection. ml	minute volume of blood circulation	total peripheral vascular resistance*s *sm	HR per minute	BP _{med} , mm of mercury
Preoperative period	Main (n=40)	70,5±2,1	5,8±0,1	1546±150	82,0±4,1	111,2±2,1
	Control (n=25)	75,1±5,0	5,9±0,2	1431±144	78,2±2,0	105,6±3,5
Beginning of operation	Main(n=40)	81,1±3,5	6,0±0,2	1229±125*	74,0±3,1	92,2±2,7*
	Control (n=25)	71,8±2,8	6,1±0,3	1417±120	84,5±3,0	108,1±4,0
Before injury	Main(n=40)	83,1±3,7	6,0±0,2	1146±105*	72,0±3,5	86,0±2,7*
	Control (n=25)	77,3±4,1	5,9±0,2	1209±117*	76,9±2,1	87,2±3,0

During traumatic stages of operation	Main(n=40) Control (n=25)	80,1±4,1 * 70,0±3,8	5,8±0,1 6,1±0,3	1205±110* 1312±142	73,2±3,7 * 86,6±2,6 *	87,4±3,3* 100,1±9,9 *
Операция тугаганда	Main(n=40) Control (n=25)	84,5±4,0 * 68,1±2,1	5,9±0,2 5,5±0,1	1140±101* 1401±157	70,1±2,9 * 80,34±4,	84,1±2,6* 96,4±3,5

Comments. 1-2 tables *- a reliable difference in comparison with the initial indicators within the internal group ($p < 0,05$).

In the study of changes in the indicators of hemodynamics, it was found that in patients of the main group at the beginning of the operation reliably increased the ejection volume (EV) by 15%, against the background of a decrease in the total peripheral vascular resistance by 21%, but the minute volume of blood circulation (MVBC) did not change significantly. This condition can be explained as a compensatory adaptation reaction of the cardiovascular system. This is also confirmed by the fact that myocardial hypoxia on the ECG is not observed. Similar hemodynamic changes in the main group were observed at all stages of the examination. The norm of ABP was administered with infusion therapy without vasopressors. In rare cases, the minimum dose of mezaton solution(1%-0,1-0,2 ml) gave an effect. During the examination, hemodynamic changes in the control group were reliably detected with an increase in the number of heartbeats and ABP, especially at the traumatic stage of the operation.

TABLE -2 NORADRENALINE EXERTION AND CHANGES IN CORTISOL CONCENTRATION IN CONTROLLED GROUPS (M±M)

Stages of research	Groups	Noradrenaline (urine),n/mol/l	Cortisol (plasma),mmol/l
Initial indicators	Main(n=15)	6,2±0,9	390±35
	Control (n=15)	5,7±0,5	435±40
Traumatic stages of operation	Main(n=15)	-	450±41
	Control ((n=15)	-	677±51*
End of operation	Main(n=15)	8,1±1,2*	608±47*
	Control (n=15)	15,4±2,1	721±61*

When assessing the reaction of the indicators of the sympathoadrenaline system (Table 2), it was found that in patients of the main group, there was no change in the rate of noroadrenaline exertion, while in patients of the control group, noradrenaline exertion increased reliably, it is permissible to deduce this from the adaptive reflex activity of the sympathetic nervous system. A reliable increase in the amount of cortisol was also detected in the patients of the control group and was 54% in the traumatic stage, while in the patients of the main group this was not observed.

Patients who underwent surgery under CSEA were normalized glucose content in the blood during the operation. At present, patients with operations under general anesthesia were prone to an increase in the amount of glucose in the blood and consisted of 4.5 ± 0.6 mmol/l ($p \leq 0.05$) from 4.8 ± 0.4 . A change in the amount of noradrenaline, cortisol and glucose confirms the

antinociceptive protective effect of CSEA, since it is known that the segmental block disrupts the conductivity at the beginning of the processes of spasm in the neurons of the spinal cord.

Analysis of the course of anesthesia and the initial period after the operation revealed that from the positive clinical effects of the recommended method, nausea and vomiting after the operation were detected, including in 21% of patients with operations under CSEA, and in 46% of patients with operations under UA. The absence of headaches after puncture can be explained by the fact that the local anesthetic introduced during epidural anesthesia is associated with an increase in pressure in the same area. It should also be noted that EA also has a great role in providing post-operative epidural analgesia. Paresis of the intestines, respiratory depression is not observed, diuresis stimulation improves, patients are activated sooner, provides an early exit from the hospital, the economic effect is also etoric.

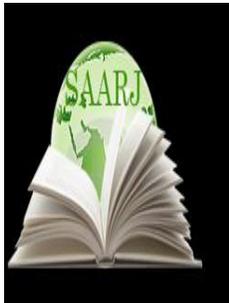

CONCLUSION

1. The use of combined spinal-epidural anesthesia adequately and reliably protects from operational damage, as well as prevents the associated negative neurohumoral, hemodynamic and biochemical changes.
2. In the prevention of possible hemodynamic disorders that occur when CSEA is transferred, it is necessary to choose the patients with proper examination, adequate infusion therapy - the use of hydroxyethyl starch preparations in a uniform manner.
3. Applying CSEA dramatically reduces the postoperative headaches.
4. Makes it possible to conduct post-operative epidural analgesia.
5. It is recommended to widely use CSEA in gynecological simultaneous operations.

CIVIL SOCIETY AS A SOCIALITY AND A FORM OF CULTURE

Djurayev Avaz Akhmedjanovich*

*PhD, Associate Professor,
 Almalyk branch of the Tashkent State Technical University named after I.A. Karimov-
 Tashkent, UZBEKISTAN

ABSTRACT

One of the topical issues of modern socio-political life, respectively, of social science, are the problems of civil society. The profound changes that have taken place in the social reality of the post-Soviet republics have significantly raised interest in this topic. Uzbekistan also pays special attention to this problem, based on the ultimate goal of democratic development - building a civil society.

KEYWORDS: *Political Communication, Civil Society, Civilization, Culture, Globalization, Virtuous City.*

INTRODUCTION

The study of the state of developed countries with a high level of economy, democracy and social security of citizens confirms the need for a developed civil society with high activity of citizens and their voluntary associations and organizations in all spheres of social life of the republic. However, the practical implementation of the above stated goal presupposes a theoretical understanding of the essence and structure, as well as the history of the emergence and existence of this issue, its development prospects in the expected future.

MATERIAL AND METHODS

In connection with the research, the article used methods such as dialectical, historical and morphological methods, methods of comparative analysis.

Results

It is logical to begin the solution of such a capacious problem by considering the genesis of the concept of «civil society», which has a long two thousand-year history. It arose along with the emergence of the science of society. Studying social processes, thinkers of different eras could not ignore the non-political sphere of human activity - civil society. Various approaches and

assessments to this problem have expanded and enriched the semantic baggage of this concept, including various common human values. It is important to emphasize an important idea in the development and strengthening of civil society: “Values determine not only spiritual culture, but also material, therefore, cover all aspects of society. Values permeate the entire life of society, shape people's attitude to the world, faith, and turn into conscious or unconscious psychological attitudes. It can be said that values have a greater impact on the creation of a national-ethnic community, where value orientations are formed in the process of cultural development. Values provide an opportunity for a qualitative change in society, both in the spiritual and social spheres. Here, it should be concluded that there is a curious phenomenon in the value sphere: with the emergence of new urgent problems and new values corresponding to these problems, the old attitudes are partially revised and gradually rebuilt in the spirit of the times”[1, 32].

Even before our era, from the point of view of systematicity, consistency, substantiation (of course, from the point of view of ancient times), Plato's social utopia (428-348 BC) and his projects of “ideal” legislation, which the previous before him the world thought of antiquity. In Plato's famous dialogue “The State”, sketching out the draft of the ideal state, the author declared it free from slavery, essentially removing the question of slavery from discussion. In subsequent works, in particular, the dialogue "Laws", Plato advises, on the one hand, humanely, humanely towards slaves, as much as possible to cause them less offense than those who are equal to us. On the other hand, it is necessary to punish the slaves justly. The disappointed author of The Laws saw the growing importance of slavery in ancient society.

Dialectical reflections on social problems are shared by Plato in The State. The author reflects on such an important and today contradictory unity as the state and individuals, their opposition and interconnections; values of justice and injustice. The philosopher seeks to reveal the genesis, the reason for the unification of many individuals in society. It was extremely important and promising in Plato's position that he nevertheless brought to the fore the real needs of people, their satisfaction, the need of individuals in each other as the primary source of social unification, interaction within the state. The philosopher from different sides fixes and comprehends the system of division of occupations, meaning a civilized society (state).

Speaking about the primary “bodily needs of ours” and the fact that someone in a civilized city of the state must perform the appropriate work in the name of their satisfaction, the author quite realistically examines a whole tangle of needs, mutual obligations and expectations of people. Plato carefully lists the most varied professions up to the warriors, since a need for a wide variety of needs arises in society.

Plato pays special attention to social law. “The law sets as its goal not the welfare of any segment of the population, but the welfare of the entire state. Either by conviction, now by force, he ensures the cohesion of all citizens, making sure that they are mutually useful to each other to the extent that they can be useful to society”. The legislator, according to Plato, should be guided by such goals-values as beauty and truth.

The student and follower of Plato, the ancient Greek philosopher Aristotle, also paid a lot of attention to issues of state, politics, place and role of man in this sphere of activity. In particular, the socio-philosophical views of Aristotle are set forth in the “Politics” adjoining his "Ethics". Both works form a single whole. Aristotle speaks of politics and political arrangements already in Ethics. In Politics, he again returns to the question of virtues and considers the moral tasks of

politics and the state. In the third book of his "Politics", discussing various types of communication, communication, the main goal of which is the pursuit of good and justice, Aristotle called the state, or "political communication" (politikekoinonia).[2, 376]

Aristotle reveals the essence of politics through its goal, and she, according to the philosopher, is the highest - educational and consists in giving citizens good qualities and making those people doing great. In other words, the goal of politics is good, moreover just, that is, the common good. And therefore, referring to the rulers of this world, Aristotle, in particular, in a letter to Philip writes: "Those who take on leadership, do good deeds for the sake of their subjects, not by chance, but by their nature, draw courage, relying not on possessions that tend to perish, but they are proud only of virtues, the ability to citizenship well and prudently».[2, 376]

According to Aristotle, man is a social, political being and the state is a natural product of the development of a society of political citizens. The philosopher analyzes the life of citizens in various spheres of society's life, namely, in the spiritual, marriage and family, economic, scientific, religious, moral, where state intervention to a certain extent was not necessary.

The state consists of different people, experts in their field. Further, the state consists of families, which also differ from each other. Aristotle also distinguishes in the state noble and ignoble, rich and poor, educated and ill-mannered, free and slaves (but slaves are not part of the state). The state consists of citizens, it is nothing more than a mass of citizens: "Before determining what the state is, it is necessary to clarify the concept of a citizen, for the state is nothing more than a collection of citizens, a civil society». [3, 101]

Aristotle defines a citizen as one who participates in court and government ("the state is the communication of free people») [2, 456]. This is the absolute concept of a citizen. In addition, citizens do military service and serve the gods. Therefore, citizens are those who have access to four functions: military, administrative, judicial and priestly.

Of course, in his works, Aristotle did not specifically consider the essence of civil society. Nevertheless, in his works the idea of a certain division of society into the state and civil society was evident. His reasoning about the role of property in society is acquiring special significance today: he who owns property has virtue.

Unlike Plato, who saw private property as the source of public evil, Aristotle was a supporter of private property; he criticizes Plato for thinking of achieving a perfect state by abolishing the latter. He believes that the desire to own property is inherent in the very nature of man, because "how much pleasure is there in the consciousness that something belongs to you" [2, 410]. Aristotle emphasizes that the mere thought of property gives indescribable pleasure, but abolishing it will not give anything, since everyone is blaming the common cause on each other and everyone cares very little about the common thing for everyone. According to Aristotle, the source of social evil is not so much property as the infinity of human desires and his greed, and the latter is aimed at honors, so you need to care more about leveling the desires of citizens than their property.

The ideas of civicism, of the "ideal state" did not exist simply in theory; they were a reflection of social practice. It is impossible not to recognize the consciousness of civil solidarity of the inhabitants of the Ancient World, which was expressed in certain unions and associations. In particular, a characteristic feature of the Roman craft was the association of artisans in a college

of professions. These colleges were formed in Rome long ago, existed for the entire republican period and were especially widespread during the period of the Early Empire. Although the colleges united people of the same profession, they did little to deal with production issues; members of the colleges made contributions for general needs, organized festivals and dinners, and buried their poor members at the expense of the college. Each college, as a rule, had its own patron god. Colleges made it possible for "little people" to get together, to feel a living connection with each other, at least sometimes to eat their fill. Artisans valued their collegiality more than their belonging to the Roman state. In Pompeii, an inscription has been preserved that paraphrases the first words of Virgil's famous poem "Aeneid", where the poet glorifies Roman valor. The place of the "Husband and the battle I sing" (the owl is a sacred bird of the goddess Minerva, who was considered the patroness of artisans). Unable to influence the political life of the state, the collegiums could influence the election of a person to city government bodies. Pompeian walls are full of a kind of election posters: bakers, for example, offered one of their colleagues to the aediles (a city official whose functions were to supervise order, including in trade).

The emperors were suspicious of the activities of the colleges; some of them banned the collegia (Julius Caesar, Augustus, Claudius). However, colleges continued to exist: the need for collective forms of everyday life was too strong and the tradition of the existence of colleges was too ancient.

Another "Aristotle of the East", the famous medieval philosopher Abu Nasr Farabi, paid much attention to the socially just structure of the state in his scientific activity. In his works, such as "A Treatise on the Achievement of Happiness", "A Book on the Study of Society", "Aphorisms about State Leaders" Farabi comprehensively sets out views on society, state, law, politics, justice and education. Particular attention is drawn to his 37-volume work "Views of the inhabitants of a virtuous city", which is devoted to the socio-political structure of society. In it, the author gives a vision of the origin of society, the emergence of the state, the forms of its existence.

Like Plato, the reason for the emergence of the state of al-Farabi is that "by nature, each person is arranged in such a way that for his own existence and achievement of the highest perfection he needs many things that he cannot provide for himself alone and for the achievement of which he needs a certain community of people, each individually delivering to him some thing from the totality of what he needs. Moreover, each person in relation to the other is in exactly the same position. That is why only the unification of many people who help each other, where each delivers to the other a certain share of what is necessary for his existence, a person can acquire the perfection to which he is intended by nature. The activities of all members of such a community, in their totality, delivers to each of them everything that he needs to exist and achieve perfection» [4, 109].

The highest good and perfection, according to al-Farabi, can be achieved by a city, but not by a society that is at a lower stage of development. It should be noted that the scientist guessed about the difference between society and the state. In the socio-philosophical views of the thinker, the main pathos was associated with the "virtuous city." But such a city, according to Farabi, can be governed by a ruler with high moral qualities. According to the author, peace, happiness, well-being of society are directly related to fair and wise government. Thus, we are talking, in essence, about the features of a civil society.

While making high demands on the rulers and their art of government in the "virtuous city", the author, however, highlights the responsibilities of the inhabitants of this city. Every resident should know the first principles of existing things that lead to the achievement of happiness, "what should be done to achieve happiness" [5, 122], i.e. it is about the need for every citizen to possess such virtues as the theoretical, mental, ethical and practical arts. Here, the author's distinction between political and civil spheres is already obvious.

Many interesting thoughts were expressed by Farabi about such non-political spheres of human life as labor, education, science, art, religion, etc. And here, in essence, we are talking about the civil sphere of the life of society.

Thus, Abu Nasr Farabi, following Aristotle, kind of groped in the complex interweaving of political, economic, spiritual spheres of a state-organized society, the existence of a civil society with a certain independence.

Subsequently, in the history of social philosophy, the problem of civil society is more and more actualized, concretized and expanded. This topic is considered in the works of philosophers of the 15-16th centuries, such as Nicolo Machiavelli, Thomas Hobbes, John Locke and others.

So, Thomas Hobbes, in contrast to previous philosophers, already uses the concept of "civil society". However, in works on the issue of dividing social reality into the state and civil society, there is inconsistency. In particular, in his work "On the Citizen," Hobbes argues that the state is not bound by civil laws, customs, law and is separated from civil society. And at the same time, the author likens the state to the biblical monster Leviathan, which consumes everything, and through the concept of "civil society" shows that it submits to the state [6, 97].

The ideologist of the emerging bourgeoisie of the 17th century, John Locke, recognizes the superiority of civil society over the state. Actively using the concept of "civil society", Locke proclaims property as the basis of society.

Speaking about the emergence of the state, political power, the thinker points out that they arise at a certain stage of civil society. The purpose of uniting citizens into a state is to preserve property. Consequently, the task of political power, according to Locke, is the creation of laws that would preserve and regulate property relations. No less relevant ideas of John Locke today are his statements on obedience to the law, set out in the work "Two Treatises on Government". According to Locke, no one should stand above the law, in civil society no exception is made for anyone "one law for the rich and the poor, for the favorite at court and for the peasant at the plow" [7, 346].

The notions of civil society were not ignored by progressive thinkers of the 18th century, such as Charles Louis de Montesquieu, Jean Jacques Rousseau, who view civil society as a result of historical development, make differences in the laws of civil and state, define the principles of civil society.

The herald of republican-democratic ideas, preacher of civil freedom, equality, democracy, Jean-Jacques Rousseau in his treatise "On the Social Contract" formulates the basic principles that form the basis of civil society. He sets out the doctrine of sovereignty, civil status, property and a number of positive changes resulting from the implementation of the social contract. In the sixth chapter of the first book, the author formulated the main, fundamental principles of civil society, arising, in his deep conviction, from the feeling of freedom and natural equality. According to

Rousseau, after people lost their natural freedom, the entire further development of primitive society went to the detriment of their innate rights, and in order to maintain their previous state, they had to find a form of association that protects and protects with all common power, personality and property of each of the members of the association and thanks to which everyone, uniting with everyone, obeys, however, to himself and remains as free as before, each person will acquire here "civil freedom and the right to property" [8, 12-13].

According to Rousseau, primitive people, in order to preserve themselves from inevitable death in certain periods, often spontaneously, had to take the path of association, the path of social contract as a necessary condition for their life. On this path, people made a significant step forward: at the cost of their life experience, instead of innate rights and obligations, they acquired civil freedom and moral equality [8, 44].

Immanuel Kant was the first German thinker who defined law not just through the concept of legal freedom, but also through the concept of freedom precisely in the socio-philosophical sense, thereby deepening the understanding of civil society. In the preface to Critique of Practical Reason, the problem of freedom is immediately brought into focus. Freedom is not in the form of a curtailed, limited, threatening to develop into a compulsion of a person in relation to himself ("free" conformism) or to other people (when, say, freedom is taken away from people "in the name" of their liberation), but in the form of pure, transcendental freedom in its "absolute meaning". The main thing is the inextricable inner dialectical interconnection of freedom and moral law. In addition, the human race is forced by nature to resolve the "greatest problem of the human race" - the achievement of a universal legal civil society in which "there is the greatest freedom." Civil freedom of the individual, legally secured by law, is a necessary condition for self-improvement, a guarantee of preserving and enhancing human dignity[9, 95]. According to Kant, freedom in society is due to nature itself. Accordingly, civil society is based on such a priori principles as the freedom of a member of society as a person, his equality with others as a citizen, the independence of a member of society as a citizen.

The problem of civil society is noticeably expanding with new views in the works of the representative of German classical philosophy of the 19th century, Georg Wilhelm Friedrich Hegel. According to him, civil society exists as an independent institution along with the state. However, it definitely depends on the state and is absorbed by it. Speaking about the specifics of each of them, Hegel pointed out that civil society is the sphere of realizing the special, private interests of individual individuals, while in the state the universal will of citizens is represented. Hegel viewed civil society as a system of needs mediated by labor, based on the domination of private property and universal, legalized, equality of citizens.

The problem of civil society is reflected in the theoretical works of representatives of various political trends of the late 19th and early 20th centuries. This issue is discussed from different angles both in the works of representatives of the communist movement - K. Marx, F. Engels, and in the works of the theorists of anarchism M. Bakunin, P. Kropotkin.

In the literature of the Soviet era, this issue was unpopular and, for well-known political and ideological reasons, was not theorized.

Particular attention to this problem began to be paid from the end of the 80s. The experience in the field of building a civil society in developed countries and thinking about the future of the country of the USSR, which found itself in a socio-political deadlock, and then its collapse,

stirred up intellectual thought. Publications of a controversial nature began to appear by such authors as A. Migranyan “On the way to civil society”, D. Kol “Civil society”, O. Shkaratan, E. Gurenko “From statocracy to the formation of civil society” and others. Philosophers, historians, political scientists considered issues of both history and theory of civil society.

DISCUSSION

“Uzbek society is a special world, a civilization, so it needs to be analyzed by examining the corresponding inherent phenomena and categories” [1,33]. The acquisition of independence by the Republic of Uzbekistan and the tasks of social reorganization of society have caused a serious attitude towards this topic in Uzbekistan. Now it is in the field of vision not only of theorists, researchers, but also of practitioners. This is due to the fundamental interest of society - building a civil society. And in this regard, interesting provisions and thoughts are contained in the works of the first President I. Karimov. So, in particular, the article “Formation of democratic institutions and dreams of civil society” in the book “Uzbekistan on the threshold of the XXI century: threats to security, conditions and guarantees of progress” is specially devoted to this topic. It should be noted that building a strong democratic rule of law and civil society is the fundamental, key theme of the President in his works.

CONCLUSION

Of course, this problem, due to a number of existing historical, socio-political, as well as taking into account the new economic and ideological conditions, taking into account the national mentality of the region, is in the initial stage of both analytical research and practical activity. However, in the republic, interest and striving for an economically prosperous, socio-politically stable society, with the priority of law, justice, based on high socio-cultural activity and self-government of citizens, in other words, towards civil society is high. As a result, in recent years, a large number of scientific publications, articles, monographs, as well as scientific defenses on various aspects of civil society have appeared in the Republic. In the diversity of theoretical information, one cannot fail to notice the diversity of approaches and opinions on this phenomenon, which gives rise to controversy and problemat�icity. And this is natural, since there are at least two reasons, namely: 1) the novelty of the very social model of civil society for the post-Soviet republics; 2) the local feature of the simulated project, in particular for Uzbekistan, taking into account its mentality: traditions of customs, socio-economic development, and so on, generate controversial views. In addition, foreign theoretical thought, the basis of which is calculated by a solid historical and practical background, cannot but affect the theory of young states with the strategic goal of building a civil society.

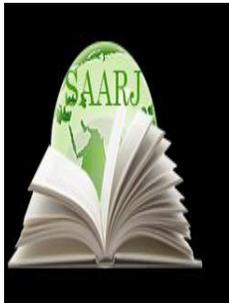

Acknowledgement

I would especially like to express my gratitude to my scientific advisor, Candidate of Philosophical Sciences, Associate Professor Djurayev Anvar Mukhammadievich for valuable advice in planning the research and recommendations for the design of the article. I would also like to express my gratitude to the daughter of a sensitive and attentive translator Djurayeva Nigora Avazovna, who assisted in preparing the manuscript before sending it to the editorial office.

Also, the author is very grateful to his family and colleagues for friendly support and to all those who made our work easier and helped us to achieve success!

 UZBEKISTAN

ABSTRACT

This article provides data on the natural death of winter moths on beans in Andijan region of Republic of Uzbekistan. It has been established that the death of the winter moth from mycoses ranges from 5.3-14.6%. The greatest mortality from mycosis was observed in older caterpillars. Studies have shown that among the winter moth caterpillars, collected on the beans crops, patients with mycosis in the spring were 10.1-13.2%; summer 5.3-10.5%; autumn 11.5-14.6%. The research results showed that mycosis is widespread in all populations of the winter moth, inhabiting in the areas of Andijan region we surveyed.

KEYWORDS: *Mycosis, Winter Moth, Pathogenicity, Strain, Beans, Processing, Titer.*

INTRODUCTION

Modern biological pest control of agricultural crops in integrated protection is a powerful factor in increasing the products yield and quality, reducing the use of plant protection chemicals, preventing environmental pollution with pesticides, preserving beneficial organisms in nature, reducing labor and money costs, as well as increasing cost-effectiveness of protective measures.

At the present scientific and technological progress stage, the preserving crops problem from harmful organisms and protecting the environment from pollution with chemicals does not lose its relevance. In this regard, the task of modern agricultural science is to find safe ways to protect the crop.

The need in agriculture for preparations of microbial synthesis puts forward the need to expand the entomopathogenic micromycetes range to create new, even more effective preparations. In this regard, the search for spontaneous epizootics foci among insects and the entomopathogens isolation is of particular importance.

The winter moth (*Agrotis segetum* Schiff) is one of the most dangerous cotton pests, legumes and vegetables and melons. In this regard, the fungal flora study of the winter moth on beans, in order to find pathogenic forms for it, has a certain theoretical and practical significance.

The aim of this work was to study the winter moth legume crops epizootics caused by entomopathogenic fungi. The epizootics study is extremely necessary for the identification and isolation of new pathogenic microorganisms that can be used in the future to develop a biological method for legumes controlling pests.

Insect diseases have been known for a long time. Even Aristotle (1st century BC) described the bees diseases by I.M. Krasilshchik in 1886 discovered a fungal disease of the silkworm, the causative agent which was the mushroom *Beauveria bassiana*.

I.I. Mechnikov (1879) established a disease in the bread beetle larvae caused by the green muscardina (*Metarrhizium anisopliae*) and fungi (*Entomophthora anisopliae*). Studies by other authors have also shown that insects get sick, and are caused by bacteria, fungi and viruses. In the first half of this century, bacteria pathogenic cultures for insects began to be used in practice and in a number of cases gave effective results.

The literature mentions numerous cases of spontaneous extinction of the winter moth. Solovieva A.I. (1940-1947) made some external signs description of caterpillar diseases in the Votsk region (without establishing the causative agents of the disease by the nature). The author came to the conclusion that the disease can regulate the number of pest, but only under certain meteorological conditions unfavorable for the winter moth. According to this researcher, the winter moth vitality is indirectly affected by the increased temperature.

F.I. Markov /1958/, summarizing the literature data and his research results, came to the conclusion that in the summer period the factors causing the winter moth death are high temperature and low relative humidity of air and soil. In late autumn and winter periods, the mass death of the winter moth occurs under the low temperatures influence.

The reasons causing the winter moth death are also considered by other researchers (Kozhanchikov, 1948; Nilova 1971). The natural death of the winter moth was observed to identify the fungal diseases role in reducing the number of pests, to determine the species composition of fungi, as well as to select highly virulent strains from natural conditions.

In harmful insects' populations, microorganisms' infection foci often arise, in which a gradual withering away of the pest occurs. Under favorable conditions for the microorganisms' activity, foci can develop into local epizootics, and sometimes into wide scale epizootics.

Due to the entomopathogenic fungi harmless for humans and the effectiveness in the fight against the winter moth on beans, which are a valuable food product for the human body, its use is very promising in Central Asia for environmental protection in densely populated areas.

RESEARCH METHODS AND MATERIALS

To find out the importance of the winter moth fungal diseases in the decrease in its number, we examined the leguminous crops infected with this pest. From the hatching moment of the first pest generation and until it left for wintering, observations were carried out in the districts of Andijan region. In 2019-2020, sick, dead and healthy caterpillars were collected on beans. During the growing season for 2 years, 10-20 days later, surveys and counts of the winter moths number were carried out on early and repeated beans crops.

The winter moth death was taken into account in 20 samples of 0.25 m² taken in a checkerboard pattern, with the subsequent recalculation of the results per 1 m². In the samples, the number of winter moths, the development phase and caterpillars age on plants and in the soil at 5-10 cm depth were revealed. Excavations were carried out before the spring plowing of the fields and after the emergence of beans. In these fields, from March to May inclusively, the winter moth is widespread, harming the leguminous crops seedlings. Total for the period 2019-2020. 708 specimens of healthy, dead and diseased caterpillars and pupae of the winter moth were collected and analyzed.

To study the normal mycoflora of winter moths, we took healthy caterpillars, and to study pathogenic - sick and dead ones. To clarify the species composition of the fungi and isolate them into a pure culture, inoculations were made on a nutrient medium. If the insect was abundantly covered with mycelium and fungal spores, the latter immediately pre-sterilized the outer covers of the insects with 96% alcohol, followed by burning or washing in sterile saline. The resulting suspensions were plated on a nutrient medium. After appearing on the corpses surface, the fungal mycelium were transferred in a loop onto agar slants.

Fungal flora isolated from dead mummified winter moth caterpillars after preliminary surface sterilization were placed in sterile Petri dishes with moist filter paper. After the spores appearance on the corpses surface, the fungus was isolated into a pure culture, and then identified to species. Wort agar, Sabouraud's medium, Czapek agar, Mendelso, and potato agar were used as a nutrient medium for the isolation of fungal flora.

The species belonging of the isolated strains of fungi were used by T.K. Kalvish (1969) E.Z. Koval (1974), A.A. Evlakhova (1974), M.A. Litvinov (1967).

The laboratory assessment of the biological effectiveness of the isolated fungi was carried out in jars with napkin closures. Repetition is 4 times. The feed was processed at 4 ml rate of suspension per 1 alfalfa branch. The suspension titer was determined by counting cells in a Goryaev chamber according to the method described by G.L. Seliber etc. (1953) was determined by the counting method in the counting chamber of Goryaev (Labinskaya A.S. 1963).

Research results

To elucidate the fungal diseases role in reducing the number of winter moths, determining the species composition of fungi, as well as selecting highly virulent strains from natural conditions, we observed the natural death of this pest.

The species composition of mushrooms isolated from the winter moth is presented in the table.

The results of our research have shown that isolated strains of fungi from healthy caterpillars in most cases are soil saprophytes characteristic of the mycoflora of the pest habitat. Of the 100

examined healthy caterpillars, 4% were affected by the fungus, and the remaining 96.0% were not affected.

Observations in vivo showed that healthy caterpillars of summer generations were weakly affected by fungi. Apparently, this is due to the biological characteristics of the pest in the studied areas.

Our studies have shown that among the caterpillars of the winter moth, collected on the crops of beans, patients with mycosis turned out to be 10.1-13.2% in the spring; summer period 5.3-10.5%; autumn period 11.5-14.6%.

Analysis of sick and dead caterpillars revealed the maximum mortality from mycosis at an older age. Among the identified fungi, there are saprophytic forms that got on caterpillars from the soil or from plant debris and facultative parasites, which, under conditions unfavorable for the host, can cause the death of caterpillars of the winter moth (table).

TABLE SPECIES COMPOSITION OF MUSHROOMS ISOLATED FROM WINTER MOTH (2019-2020)

№	Type	Owner's condition		
		healthy	Sick	dead
1	<i>Aspergillus flayus</i> Link ex Fr	+	+	+
2	<i>A.fumigatus</i> Fris.	+	+	-
3	<i>A. nigerv.</i> Tiegh.	+	-	+
4	<i>A.tamaritii</i> Kita	+	-	-
5.	<i>A.terreus</i> Thom	+	+	-
6.	<i>Beauveria bassiana</i> (Bals.) Vuill	-	+	+
7.	<i>B. bassiana</i> sp.	-	+	+
8.	<i>Cladosporium herbarum</i> Fers, ex Fr.	-	+	+
9.	<i>Cephalosporium roseum</i> Oud.	-	+	+
10.	<i>C.lecanii</i> Zium.	+	+	+
11.	<i>Fusarium javanicum</i> Koord. Var.	-	+	+
12.	<i>Metarrhiziumanisopliae</i> (Metsch.) Ber.	-	+	+
13.	<i>Penicillium caseli</i> Staub.	+	+	+
14.	<i>Spicaria farinosa</i> (Fr.) Vuill.	-	+	+
15.	<i>Oospora destructor</i> Del.	-	+	+

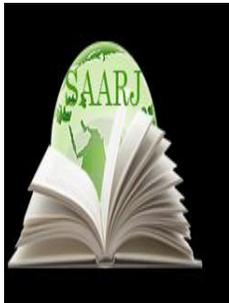

The isolated pathogenic fungi were tested for virulence against the older caterpillars of the winter moth. The tests were carried out in laboratory conditions in 4-fold repetition of 40 specimens of caterpillars. For this, healthy caterpillars from natural populations were placed in 10 specimens in a jar. Caterpillars treated with tap water served as control. They were infected by a contact method at a titer of 5×10^7 and 1 billion spores with a suspension. Experimental and control caterpillars were kept under identical conditions in a thermostat at 28-30 °C, relative humidity - 62-76%. The counts and phenological observations were carried out daily for 12-15 days. The results established that the experimental individuals were more or less affected by mycoses. The best results were shown by the strains represented by the mushrooms *Beauveria bassiana* asp.,

Beauveria bassiana Bals Vuill., *Aspergillus nigerv. Tiegh.*, *Cephalosporium lecanii* Zimm., *Metarhizium sp.* Infection of winter moth caterpillars with these strains of fungi causes death of 75.0-88.9% of individuals within 10 days.

Thus, it has been established that fungal diseases of the winter moth are widespread in nature in Andijan region, which plays a significant role in reducing the number of the pest.

ABSTRACT

This article deals with different types of intelligence indicated by Howard Gardner and his outstanding theories which could be playing a major role in grasping the information with the full-scale usage of media competency, that might be beefed up by using wide range of media communication tools to deliver the lectures or conduct classes.

KEYWORDS: *Intelligence, Media Education, Media Competency, Linguistic Intelligence,*

INTRODUCTION

Learning in general and **EFL** learning in particular is a complex process. Learning at times requires great effort and at other times, proceeds with relative ease. It compasses a multitude of competencies. The results of learning are often observable, but the process is less obvious. Numerous theories of learning exist in an attempt to explain learning. The use of technology has assisted for many years now with the goal of reaching students. One important item missing from this element is a cross sectional method of teaching to each learning style with the use of technology. [Rebecca J. Reynolds EdD]. According to Oroles Florescu,

The formal education (according to an explicit curriculum and final certification) is done by learning, an activity conducted in an organized institution (kindergarten, school, university), directed by specialists and oriented towards at least two directions

1. Informative through the accumulation of knowledge;

2. Formative through the transformation and the development of the personality. The one method that is about to be implemented in the classroom for a certain number of students might be vividly not suitable for the other group of students as there are an accelerating number of diverse teaching methods postulated by linguists to be a far more effective than the last one. Apart from the influence of computer technology which has penetrated into all spheres of life, It has resulted in a group of people in a society that have problems and difficulties in everyday life from not being able to learn and use computer technology. This especially pertains to hardware or software which a group of users are not familiar with .They are also lacking the skill for use of computers and other devices that could result in a loss of a lot of information and government service. Recently, the affected individuals will have a greater shift away, more and more from being part of society. They cannot use the communication channels of the system to communicate with other people. [Kittikhun Meethongjana vs Nisanart Tachpetpaiboonb].

Literature review: Intelligence and competency are interrelated to each other as we cannot define them as an individual term. In addition to this, Gardner emphasizes that there could be at least eight intelligences in human that individuals could exhibit more or less and they are follows:

Verbal-Linguistic: The ability to use words and language and sensitivity to the meaning of words. People who have this intelligence share sensitivity to sounds, rhythms, inflections, and meters of words.

Logical-Mathematical: The ability to use numbers effectively, to recognize abstract patterns, to discern relationships and to reason well.

Visual-Spatial: The ability to visualize objects and spatial dimensions, and create internal images and pictures.

Bodily-Kinesthetic: The ability to use one's body to express oneself and to solve problems.

Musical: The ability to recognize tonal patterns and sounds, as well as sensitivity to rhythms and beats.

Interpersonal: The ability to understand people's moods, feelings, motivations, and intentions. It also includes the ability to work cooperatively with others in a group and communicate verbally and non-verbally with other people. **Intrapersonal:** The ability to understand the internal aspects of the self and to practice self-discipline.

Naturalistic: The ability to recognize order in nature and to organize and categorize the natural world.

With the use of verbal intelligence, we could turn to utilizing effectively from the media communication tools, such as radio, TV, CDs, internet messengers and others. In this process, we are typically on the action of transforming and receiving outer signals with our subconscious mind that teachers normally fall back on a mere projector to describe any subject in details to grab the attention of students or children in schools and even in higher education. And suppose that teachers were not capable of express his or her feelings as well as a lack of shared emotions with the audience, then the lecture or class would loom large. The pictures, images and detailed presentation flashed through the projector connected to the laptop require teachers to be able to absorb the convey of the messages beaming through the screen of the projector so as to shed

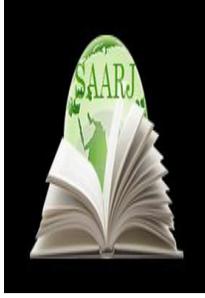

light on the subject in the class and provide students with explanations. So, many of us wonder about that the mathematical intelligence relation with the media competency and in what ways they are crucially interconnected to each other. As a matter of fact, reasonable thinking is called for when individuals get to use media communication tools, including a mere rebooting a laptop. This could be achieved even though the mathematical calculation and intelligence are cloud on the horizon for some of the teachers or students. Imagine that you are to deliver the lecture for students who have an insatiable curiosity with a wish to be engulfed in your lecture in the fully-booked audience, and then you would turn on your computer with a conscious mind that naturally or unnaturally being cognizant of the algorithm needed to switch on the computer system.

Moreover, as it has been stated above, interpersonal intelligence is regarded as a person's ability to communicate verbally and nonverbally being in close touch with others understanding their mood, shared feelings, motivations as well as intentions. Hence, the question is that how it is related to or could act as a scaffolding to improve media competency or what kind of connection emerge might pop up in your mind. As you know computers share a slew of information needed for us to both keep up with and no to lag behind with the latest advancements of scientific or pedagogic paradox theories, so the case is that we understand and feel what is the computer pondering about us logically as well as setting up a casual warm relation with it, which seems to be weird and esoteric but in theoretically it is completely known. Its impact on our either mood or feelings is so intense and huge that we may not be able to notice it.

Conclusion: the application of ICT in a learning language is an indomitable matter that have been wreathing us in any shape and form. As we see above that intelligence plays a key factor in comprehending a word conveyed though the text with the core intelligence types banking on media competency

ABSTRACT

This article deals with the relationship between the languages of the peoples of Central Asia and Sanskrit. These relations are based on the study of common sources of Turkic (Uzbek) Buddhist (Sanskrit) literature, the study of Sanskrit with Sogdian, Old Turkic and Uyghur languages, bilingual "texts written in two languages (translation)" and the analysis of articles on bilingualism "Sogd-Sanskrit", "Turkish-Sanskrit", "Uyghur-Sanskrit" and the conclusions of scientific speeches. The researches of European scientists on this study is analyzed.

KEYWORDS: Sanskrit, Sogdian, Turkic, Uyghur, Central Asian Languages, Bilingual, Bilingual Texts, Sanskrit Words, Writings

INTRODUCTION

The historical and literary relations of the Indian and Asian peoples also play an important role in the occurrence of Sanskrit words in the languages of Central Asia. Because, if we look at our long history, there are many sources of common Turkish (Uzbek) - Buddhist (Sanskrit) literature. Among them are various literary genres, proverbs, divination books, songs, mourning songs, stories and narratives, sutras, poems, prayers of repentance, magical texts [1]. Many of these texts were written under the influence of Buddhism, and included works translated from Sanskrit, Chinese, Tokhar, Sogdian, and other languages, as well as original literature.

The main part. It is known that most European scholars [2,3,4,5,6,7,8,9,10,11] spoke the languages of the peoples of Central Asia (Sogdian, Mongolian, ancient Turkic), Uyghur, Turkish, Khorezm, Persian, Avesto) and Sanskrit. Among these scholars was first a member of the Saxon Academy, Dr. Dieter Mauern can be named. It is translated into Sanskrit, Sogdian, Old Turkic and Uyghur by bilingue "bilingual texts" (in linguistics, the term "biscrpt" is

synonymous with the term "bilingue" and is used to mean "bilingual texts"). Sogdian-Sanskrit,

Sanskrit	Turkish (uzbek)	German
<i>an-anulo(ma)</i>	<i>tärsqärü (teskari)</i>	<i>verkehrtherum</i>
<i>prajñapti</i>	<i>ukitilmak (o'qitilmoq) (majhulnisbat)</i>	<i>erklären, erläutern, belehren</i>
<i>sthāna</i>	<i>orun (o'rin, joy, -iston)</i>	<i>Punkt</i>
<i>me</i>	<i>māni (meni)</i>	<i>mich</i>

Turkish-Sanskrit, Uyghur-Sanskrit bilingualism, makes scientific speeches. Compares the spelling and pronunciation of more than 20 Sogdian words with Sanskrit, including hune, hone, purni, pirne (many, full), ine (bu) [8] (Uzbek) in our language and dialects. In 1954, the 8th part of the series of Turkish-Turfan texts of the Berlin Academy's pamphlets was published. Nine of the 15 texts were written by Dieter Maue and co-authored with Jens Uwe Hartmann on the state of Sanskrit-Uighur bilingualism in Europe (Zum Stand der Erforschung der indisch-türkischenBilinguen) [6], form and content (ZuInhalt und Form der Bilinguen) [2]. First, where are the texts found (place names - Sängim, Xočo, Murtuq), then the Sanskrit types of the text (Vasantatilakā-weighted poem, Varṇārhavarṇa - the poet Māṛceta's Buddhist hymns, Sūtrapīṭaka - some Buddhist sermons) the Turkish translation of the words and their German equivalent are given. We will try to give schematic examples [6]:

As mentioned above, Maue's main goal was bilingue - to study bilingual texts, identify types of texts and find out what they are about. The juxtaposition of translations in the texts, the fact that they are translated from one language to another, is understood as evidence of the close relationship between these languages and their owners - peoples. The discovery of these materials and their study by European scholars and the great interest of linguists in the subject led to the organization of a major scientific conference on May 7-10, 2001 in Göttingen, Germany. Its organizers were the Commission for the Study of Buddhism of the Göttingen Academy of Sciences, the Seminar on Turkology and Central Asian Studies, the Hungarian Academy of Sciences and the Societas Uralo-Altai / SUA Ural-Altai (Scientific) Society. The conference was attended by 29 scientists from around the world (the most important of these for our article: [4,12,13,14]). Klaus Rohrborn, a professor at the University of Göttingen, spoke on "The Cultural Brotherhood of the Indo-Central Asian Languages" and said that the basis of cultural communication is interlingual communication, the effect of which is inextricably linked to wars of aggression or trade or the Great Silk Road. rather, it often emphasizes that religious relations played a major role in this. His work is supported by the discovery of written monuments by Buddhist missionaries in Central Asia - religious texts (songs, hymns, legends, prayers for protection from magic, sorcery, evil. [12] A German scholar dates these events to the 4th and 5th centuries. It is known that at that time in Central Asia, especially in the Turfan region, in the Tarim region, Monism (Monism is a religion that originated in Iran in the 3rd century. Its founder was Monism. Monism is the difference between light and darkness in the universe, spiritual and material basis, good and evil). It is based on the recognition of the constant struggle. Light, the spiritual basis, the gods in the world of goodness, and the devil in the other world) were widespread. When the scholar showed the participants the text of the monastic anthem, which he had at his disposal, he argued that it was full of Buddhist terms. He added that if Buddhist texts of the time were found, there would be a lot of monastic terms in them. [12] In our opinion, the German scholar ignores one point in his assertion that the Turkic peoples living in the region lived (even mixed) between the Indians and the Iranians, and that the

Buddha (Sanskrit) taught them from the east and the Old Iranian language. and does not take into account that it is the closest neighbor on the south side, and that Sanskrit and Old Iranian are mutually closely related. In other words, the Sanskrit words considered by K. Röhrborn may be a product of the old Iranian dictionary. The Sanskrit word "rañj (rañga)", cited by K. Röhrborn as an example of this possibility, and "naman" by Jens Peter Laut, are active in the Iranian language as units of ranj, color, and noun. K. Röhrborn says that the Hindi word "kuśala" (good) came into the Turkic language early and is an alternative to the modern Turkish lexeme. These scholars note that the influx of religious terms from Hindi to Turkish continued from the 3rd-4th centuries to the 14th century, after which Buddhism was completely ousted from the region by Islam. All European linguists study Sanskrit-Uyghur, Sanskrit-Turkic, Sanskrit-Sogdian, Sanskrit-Tokhar, Sanskrit-Mongolian bilingual texts directly based on the lexical system of these languages. The alternative is created (Lehnschöpfung: the name is exalted "glorified" (-skr. lokajyeṣṭha, bhagavat) [UW IV, 259-260]), depending on the meaning of assimilation (Lehnbedeutung: adirt "difference" (- skr.vikalpa) [UW I, 54b]), to make a new word on the basis of a borrowed word (Lehnbildung: akig, "reader" (-skr.āsra) [UW II, 79-80b]), o They analyzed one part of the word zlashma as if it were in a foreign language and made the other part translated into their own language (Lehnübertragung: arig aşay (-skr.śuddha-āśaya) [UW III, 186b]) [4].

The Drevnetyurkskiy Slovar (1969, Leningrad, edited by Nauka), published at the Institute of Linguistics of the USSR Academy of Sciences and edited by well-known Russian scientists V.M.Nadelyaev, D.M.Nasilov, E.R.Tenishev, and AMShcherbak, confirms these views. can also be seen. It is known that this dictionary is based on five written monuments of our ancestors in the VII-XIII centuries - Orkhon-Enasay, Arabic, Uyghur, Monism and Brahma. The dictionary includes: Yusuf Khos Khojib's "Qutadgu bilig" (XI century), Mahmud Qashqari's "Devonu lugotit turk" (XI century), Namangan manuscripts (XIII century), Cairo (XIV century) and Herat (15th century) written sources, Ahmad Yugnaki's poem "Atābāt-ul-haqqajiq", Uyghur sutras "Suvarṇaprabhāsa" (Golden Light), "Khasṭvānift" (Repentance), "Türkische Turfan-Texte" (Turk- Turfan-texts), "Türkische Manichaica aus Chotscho" (Hotan turk moniyiligi), "Uigurica" series of monuments and "Sekiz jükmäk", "Tišastvustik", "Kuanshi-im pular", "History of Princes Kalyanamkara and Papamkara". translations of the sutras (bilinguasi) [15] have been widely used. While this dictionary deals with the quantitative and qualitative analysis of Sanskrit words, it confirms the diversity of Sanskrit words in ancient Turkic writings. As we get acquainted with this dictionary, its pages contain more than 20,000 comments on famous, geographical and ethnic names, as well as a number of linguistic units of the Turkic-Sanskrit bilingualism. But most of these words are not used today. They have not been able to take a permanent place in our language. In support of these considerations, we cite examples from the dictionary that were active for the time and space described in the scriptures, but have now become archaic and completely unfamiliar to today's linguists. They were related to various spheres of human life at that time, including place names (kapilavastu, madhyadeśa, purvadesa, sindhu, kailāsa, kāśmīra), folk names (licchavi, mathurā, piśāca, sākyā, vṛji), time names (kṣāṇalahza, lava-zum, muhurta-one-thirtieth day, mahakalpa-great period of time, kalpa-legendary time), etc. BBAbdushukurov's survival of some Sanskrit words in the Turkic language is almost close to the level of his own word The second interpretation of [16] includes only the rice (śāla), sart (sārtha), lily / nilutpal (nilotpala), and pepper (marica) mentioned in this dictionary.

Conclusion. In conclusion, we can say that European scholars have compared the Sanskrit language with Turkish and neighboring Sogdian, Tokhar, Uyghur, Mongolian, and Persian bilingual texts. can be reported. The influence of Sanskrit on the languages of Central Asia and their interrelationships can be traced in the above-mentioned popular scientific works, large and small. These words prove that the Indian people have had close ties with the peoples of Central Asia in the distant past. Because any communication (social, political, cultural and spiritual) that has taken place and will take place between countries, first of all, leaves its mark on the language.

ABSTRACT

It is to show that the image of the Ottoman state was formed through the Turkestan press during the reign of the Russian Empire. Turkestan periodicals regularly publish articles and reports published abroad. The political developments in Turkey have been closely followed. In particular, the processes related to the coming to power of young Turks in 1908, changes in the Turkish army, various wars are given special attention. It is also noted that the spread of ideas of pan-Islamism and pan-Turkism and that this is extremely dangerous for Turkestan. Socio-political processes in Turkey in the early twentieth century, the activities of young Turks in Turkey, party struggles in the country, as well as the attitude of the European community to the leadership of the "Unity and Development" party in the political process were widely covered in Turkestan periodicals. It was also noted in the Western media that the interpretation of these processes was covered without a full understanding of the political activities of young Turks.

KEYWORDS: *Turkestanskije Vedomosti, Unity and Development Party, Young Turks, Irade, Neutral Parliament, Pan-Islamism, Surati Mustaqiyim*

INTRODUCTION

Relations between the Ottoman state and Turkestan have ancient roots. After the Russian Empire invaded Turkestan, colonized Turkestan was deprived of an independent foreign policy with foreign countries. The government of the Russian Empire determined what policy to pursue with

which states. He also used periodicals to inculcate the attitude of the Turkestan population towards foreign countries. Beginning in 1870, the first newspaper was published in Turkestan. It was the Turkestanskije Vedomosti newspaper [2], the official organ of the Turkestan Governor-General's Office. After that, the official Uzbek-language newspaper of the Governor-General of Turkestan, the Turkestan Regional Newspaper [6], was published. After 1905, national newspapers began to be published as a result of world events, especially Turkey's influence. Under the heading "Foreign News", these newspapers cover events in foreign countries, as well as articles analyzing developments in Turkey. Turkestanskije Vedomosti and Turkistan Provincial Newspaper, which are the official bodies of the Governor-General of Turkestan, cover the political situation in Turkey. Most of these articles are devoted to the political processes in Turkey in 1908-1914 and their interpretation.

MAIN FINDINGS AND RESULTS

It is known that in 1907-1908 a revolutionary situation arose in Turkey. On July 3, 1908, a revolt broke out under the leadership of army officers from the Young Turks. It was led by Niyazbi. He was a member of the Unity and Development Party and a military garrison commander. On July 20, 1908, in the city of Monastir, the Unity and Development Party solemnly announced the restoration of the Constitution and demanded that the sultan issue a decree on the matter. Abdulhamid was alarmed that the army was on the side of the Young Turks. He issued a decree on July 24, 1908, restoring the Constitution. He promised to hold parliamentary elections. The Turkish Revolution of 1908 was won.

Issues related to the political events of 1908 were in the focus of Turkestan's official newspapers. In particular, newspapers have now been freed from censorship without censorship, and women have taken to the streets with open faces. According to high-ranking sources, the Sultan has begun to restore the constitution. The position of Minister Said Pasha is increasing day by day, he has released his spies in many places, he has succeeded in expelling the personal secretary of the sultan from the Council of Ministers, and he has openly opposed the palace officials. This is actively explained in Turkish society. In Thessaloniki, we can read that the city was reportedly taken over by a military force of young Turks who were in favor of a change of government [7]. In addition, in this issue of the newspaper, the publishers of the newspaper came to the Prime Minister on July 14 and conveyed the people's demands for amnesty of political prisoners, and the Minister prepared a will *irade* (order) to release political prisoners in prison and exile. It was published in an emergency issue of the newspapers, [7] and 963 people were released from Constantinople prisons as a result. It is also noted that along with political prisoners, those charged with criminal offenses were also released, so that young Turks were able to re-arrest criminal prisoners [14].

According to Turkestanskije Vedomosti, military officers will gather and send a six-member delegation to the minister to demand the dismissal of some negligent officers. However, the minister stated that he could not dismiss them under the current constitution [7].

It is said that the European community is closely following the party struggles in Turkey. It is written in the newspaper that the young Turks sincerely supported their victories over their enemies. According to the Turkestanskije Vedomosti newspaper, this attitude of the European media was not due to their preference for young Turks. Perhaps this was due to the fact that he believed that Turkey would join the world community if the dominance of this party was fully

established [3]. The daily says that after the Young Turks Party came to power, most of their goals remained on paper and they did not pay much attention to changing the administrative structure of the Ottoman Empire. Also, according to the authors of newspaper articles, the committee of the party "Unity and Development" is content with the organization of the external form of constitutional power. The existence of a "neutral parliament" was enough to ensure that European countries would not interfere in Turkey's internal affairs. As a result, young Turks lost their supporters in Western European political circles, and Turkey's situation worsened compared to the reign of Abdulhamid II [3].

The local press pays a lot of attention to the fact that European newspapers write a lot about young Turks. "But young Turks are writing that they are splitting the Turkish government in two, without understanding what they are doing, without giving any idea of what they are using," he said. "These actions of the young Turks are politically motivated and disregard for government laws," he said. It is their ignorance that the young Turks who came to power issued their first statutes by order of the government and brought the Albanians, Macedonians, Armenians, Jews and Arabs to the original caliphate. Although they are far-sighted, intelligent, educated, they are only striving for the throne and power instead of spending their intellect for the development of the country. On the one hand, it is argued that such actions by the Arab communities and the instability in Albania and the internal conflicts of the young Turks will lead to the disintegration of not only the Khilafah but the entire Islamic world in the future. Since Mr. Abdulhamid Khan's ouster, young Turks in Paris have been adhering to the French rule, "We need freedom first, then France," according to local media.

Turkestan media regularly reported on the uprisings against Turkey in Macedonia, Albania and Arabia. In particular, given Turkey's difficult financial situation in 1912 and the uprisings against it in Macedonia, Albania, and Arabia, Turkey mobilized troops in the Urmia region, which borders Iran, and near Russia's borders in the Caucasus, without consulting leading countries such as Russia and Britain. It is emphasized that the jazm is abstract [5].

In Albania, a war has reportedly broken out between Assad Pasha and Ismail Kemal, with more than 8,000 troops on both sides. Former Turkish Defense Minister Izzat Pasha is reported to have entered Albania. The report says that an army of 6 officers led by Izzat Pasha and several Turkish soldiers entered Albania. However, European countries, especially Austria, were concerned [10].

There were reports of clashes between Arabs in Baghdad and Turkish troops trying to resolve the situation, killing many Arabs [9].

The newspaper "Turkistan Province" published information about the military technical strengthening of the Turkish army in 1914. [9] Turkey has increased the number of weapons in order to technically strengthen its army. In particular, it is said that the navy has allocated more funds for the development of the shipping industry. In recent days, the Turkish army has purchased an extremely powerful warship called the Rio de Janeiro. It has reportedly signed an agreement with Armstrong to purchase weapons needed for other navies in order to strengthen coastal cities and navies. The Turkish government also summoned a general from Germany to develop not only the navy but also the land forces. It is said that the Turkish government, which is developing its naval and land forces, should not leave its army without aircraft. The daily goes on to say that the Turkish government's aim in arming and strengthening its entire army is

unknown. Perhaps there is no risk of war, and if there is a war, with a population of 20 million who are helpless, the Turkish government will be ruined no matter how many weapons it buys. To date, the conflicts caused by the first and second Turkish-Balkan wars have not been resolved. Because the solution to these problems is very important for the Turkish government. The Turkish press has expressed its satisfaction with the Istanbul government's purchase of the Rio de Janeiro warship [10].

In addition, Turkestan newspapers paid great attention to the issues of management personnel in the army. In particular, the Sultan's decree [9] on the appointment of Colonel Anvarbek of Istanbul to the post of Minister of Defense was issued. It is reported that Defense Minister Anwar Pasha was given the rank of general and that some were dissatisfied with his appointment [11]. The daily also covers the dismissal of 280 officers of the Istanbul Command. The report says that Chief of General Staff Hadi Pasha and Edirne Commander Shukri Pasha are among them. Defense Minister Anwar Pasha explained that the Turkish government's move was aimed at developing the economy by reducing military spending [10].

It is reported that German General Otto Liman von Sanders was expelled from the Istanbul Ottoman Command. The report explained that the general's withdrawal was the result of the efforts of the Russian Empire [12].

Newspapers also reported on the ambassadors to Russia. In particular, the Turkestan regional newspaper reports that Tarkhan Pasha, who has been the Turkish government's ambassador to St. Petersburg for many years, has been fired. [9]. Hilmi Pasha, appointed by Turkey as Ambassador to St. Petersburg, is one of the most famous people in Turkey. The report details Ambassador Hilmi Pasha's activities and political views [12].

It is also said that Tawfiq Pasha, the Ottoman ambassador to London, was relieved of his post and replaced by Rifat Pasha, the ambassador of Paris. Instead, Sadri Azam Said Halim Pasha has been appointed ambassador and Interior Minister Talat Bek has been appointed Sadri Azam. The news says that the remaining ministers have remained in their posts and their names have been listed.

Turkestan media also covered the Turkish press. In particular, periodicals published in Turkey report on the spread of "pan-Islamist" ideas. In particular, the articles of the magazine "Surati Mustaqiyim", which changed its name to "Sabili Rashshad", are devoted to the promotion of "pan-Islamic" ideas. It is worth noting that the war between Turkey and Italy also had a great impact on the promotion of these ideas. It is said that the war against Italy was intended to unite the people under the banner of religion in order to turn it into a "war". The article in Turkestanskije Vedomosti says that the Turkish government even sent a representative to meet with the leader of the secret sect, Sheikh Sennusi, in order to unite all forces against Italy. The newspaper draws the attention of its readers to the fact that the senators are against European culture, against all non-Muslims. Calling on the people to unite, the Turkish press emphasizes that each article is supported by excerpts from the Qur'an and Hadith. They also provide information on history, including the disappearance of Muslim states in Spain, India, Turkestan, and Crimea, and the reasons for this [1]. The Russian imperial government is concerned that such ideas will enter the country and affect the local population. They believe it could further fuel hatred for Russia in the hearts of locals.

A correspondent for the Berliner Tageblatt in Constantinople wrote in a letter on June 7 (20) that Turkish journalists were on strike. This was reported in the newspaper Turkestanskije Vedomosti. Journalists did not report on the cabinet meeting that day. In fact, the meeting took place in Porta, but journalists were not allowed to enter. Nonetheless, journalists wait for the meeting to end, ask the ministers to report on the meeting, and receive a very sharp response. So the journalists decided not to write about it [16]. A reporter for the Berliner Tageblatt said the journalists' case had not yielded any results, but instead had been very helpful to the government.

In 1914, the Arabic-language newspaper Nahru-l-Oss, published in Syria, was shut down by the Turkish government and its editor arrested for a month. It states that in the Palestinian city of Jaffa, the Jews published a newspaper called Al-Ahbar without the permission of the government, and the government closed the newspaper and sued its editors. [11]

In 1914, the Turkistan Provincial Newspaper reported that Turkish Defense Minister Anvar Pasha had summoned military commanders to command 60 newly formed warships. [13]. European countries are said to be urging the Turkish government to return the islands taken from Greece, and Sadri Azam is strongly opposed to this. It was even reported that Turkish soldiers were ordered to prepare for war with the Greeks. The daily also writes that a bilateral intergovernmental ceasefire was reached to cover the damage caused by the Turkish-Italian War.

The article says that reports in some newspapers about a war between Russia and Turkey are completely baseless. Turkey's ambassador to St. Petersburg also said the report was unfounded. The article also says that he had talks with the Russian ambassador to Istanbul, Sultan, about the rumors, and that the meeting was held in a very cordial and open atmosphere. [7].

Turkestanskije Vedomosti reports that Britain's plan to separate the Arab countries from Turkey and turn them into its protectorate is based on articles in the Turkish press. [4].

In addition, the war between Turkey and Italy has been regularly reported. [15].

In addition to short stories, the pages of the Turkistan Region newspaper contain analytical articles. In particular, one such article analyzes the situation in the Ottoman state in 1912. In particular, the article reads: "I know from recent reports of unrest from the Ottomans that not only young Turks and Italy's victory in Africa, but also a gradual revolutionary conflict in Albania, all Albanians are slowly and militarily opposed to the Turkish government. making a fuss. The Turkish government was surrounded by two sides, domestic and foreign enemies. The second of these two enemies is likely to do great damage to the Turkish government. The first internal enemy is only leading the Turkish government to ruin, while the second is causing the Ottoman-starved provinces to secede from the Turkish government. [8].

CONCLUSION

In conclusion, it should be noted that the official attitude of the government of the Russian Empire was reflected in the official press of Turkestan. They published messages from the center of Russia on their pages.

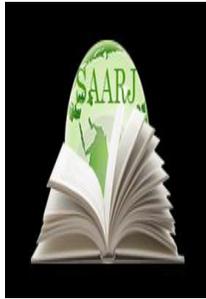

At the same time, analytical articles were published in local newspapers. In addition, articles and reports published in foreign media were also published. The political developments in Turkey have been closely followed. In particular, special attention will be paid to the processes related to the coming to power of young Turks in 1908 and the changes in the Turkish army and various

wars. It is also noted that the spread of ideas of pan-Islamism and pan-Turkism is extremely dangerous for Turkestan.

2. In Tashkent, one of the cultural centers of Turkestan, the country's first newspaper, Turkestanskiye Vedomosti, was published on April 28, 1870 (May 10). According to the 23 rules governing the Turkestan region, the newspaper is equated with the Russian provincial statements. Officials had to subscribe to it. Turkestanskiye Vedomosti is divided into official and unofficial sections, and the official section contains orders and decrees of the governors-general of Turkestan. The unofficial part of the newspaper contains articles and reports on the history, geography, cultural life of the country, as well as statistics. The newspaper also has sections on "domestic news", "local news", "international news" and "feuilleton". Although Turkestanskiye Vedomosti is the official body of the Governor-General of Turkestan, its pages are rich in information from N.A.Seversev, A.P.Fedchenko, I.V.Mushketov, V.F.Oshanin, V.V.Bartold, N.A.Mayev, A.D.Grebenkin, A.P.Xoroshkin, N.S.Likoshin, G.A.Aranderenko, interesting articles are published regularly. ENGLISH AS A MEDIUM OF INSTRUCTION IN HIGHER EDUCATION

Atabayeva Zarnigor Bakhrankizi*

*ESP Teacher,
Samarkand Branch of Tashkent State University of Economics,
Samarkand, UZBEKISTAN
Email id: Sweety.zarinka@mail.ru

ABSTRACT

This article attempts to analyze the importance of English in global world, the role of using English as a medium of instruction in tertiary education. Special attention is given to the «content and language integrated learning» (CLIL) as the most progressive approach to defining the scope of professional education.

KEYWORDS: *English As Medium Of Instruction; Content And Language Integrated Learning; Context-Based Learning; Content Of Professional Training; Subject-Based Learning; Vocational Training; Language Learning; Englishisation; Culture*

INTRODUCTION

There are many countries in the world, and the languages spoken by their inhabitants are even more numerous. And in this case, we are not talking about a hundred or two, but about several thousand. How can the population of the Earth comprehend each other? But this goal is served by international languages, which allow all of us to communicate with each other, regardless of nationality and place of residence. One of them is English. Moreover, English is the language of international communication for all mankind

The significance of the English language in the modern world can hardly be overestimated. After all, one cannot but reckon with the choice of more than 1 billion people who use it. And if for half of them he is native, then about 600 million chose him as a foreign one. Of course, the range of spread of the English language in the modern world is so great that this language cannot be identical in different areas. Despite its varied variants and the presence of specific features for each nationality, English remains the most popular language in our globe. What role does English play in our lives now?

In general, the political, economic, scientific, sports life of the whole world "flows" in English. English is considered to be the official and working language of the United Nations. All kinds of summits and meetings of heads of state, signing of laws and decrees, negotiations and debates - all this is conducted in English. International trade, the work of the banking system, the activities of the transport system on land, at sea and in the air are carried out in English. This language is a living instrument of communication for academicians, doctors of sciences, scientists from all over the world. After all, international conferences, the study of world experience and the exchange of information of scientific minds occur only with the use of English. But what can I say - the Olympic Games and all kinds of competitions between the countries chose English as the official language.

The importance of the English language in the modern world is so great that its knowledge is not a privilege or luxury. Once upon a time, computers, as well as mobile phones, could only be afforded by people of a certain social stratum. Now such things are essential items. The same can be said for English. It is taught by everyone everywhere: in schools, universities, in courses. And in this digital age, anyone can learn English via Skype without leaving home. It is realized that any educated person is simply obliged to speak English, since it is he who is his key to further self-education and self-improvement. That is why there are so many organizations now offering to teach you English. However, do not think that this is so easy to do. Learning any language is a long process that requires certain costs, both mental and financial.

There is great importance of English in how universities respond to the increasingly global context in which they operate.

The growth in provision of English Medium Education (EME), the use of English to teach and learn academic subjects in countries where it is not the primary language of communication, has been rapid and substantial.

As universities around the world seek to internationalise by introducing or expanding their EME offer, the need for change at the macro (policy) level, meso (institutional) level, and micro (classroom) level, is urgent to enable successful and sustainable language policy and implementation

Today, more and more supporters are gaining the idea that mastering a subject through the English language will greatly stimulate students for whom English is not their first language. The emphasis is on scientific areas, arguing that most important and meaningful research is carried out through the English language. Thus, if students read a large volume of scientific materials on the subject of the course in English, then oral interaction in the classroom or a lecture array should be presented in English and, as a result, the assessment system should be developed in English. This suggests that the turn towards adoption of English as the language of instruction is not accidental, as the course of English for Academic Purposes is insufficient to motivate students to read and write in English. If we assume that the presentation of information (i.e. the lecture array) and interaction in the classroom are carried out in English as the language of instruction, will the learning process be sufficiently high-quality and serious in relation to those subjects that have a clear professional trajectory?

Another argument in favor of introducing English as the language of instruction is that students will have a real opportunity to compete in the global market in the long term, or more effectively build their educational trajectory if they study in another country where the language of

instruction is English. However, the question arises about the level of formation of language competence (graduation qualification) when teaching in English. Currently, there are two widely used linguistic measurement tools for postgraduate education in many English-speaking countries: international exams such as IELTS or TOEFL. They are generally accepted in English-speaking countries and Europe, but the question arises whether IELTS and TOEFL are academically oriented enough to provide a clear linguistic picture at the postgraduate level (Hennebry, Lo and Macaro, 2012). As an alternative to international exams, it makes sense to consider an undergraduate course in English, the successful completion of which might be a better predictor of sufficient qualifications at the postgraduate level than IELTS.

The choice of English as the main language of instruction can be fraught with a number of difficulties, but in practice it unfolds according to three possible scenarios. First, if the study group is dominated by students who speak only their native (not English) language, then the teacher is tempted (which is quite justified) to use the students' native language, which is to the detriment of foreign students who do not speak it. Secondly, if foreign students are the majority, then the use of the native language is excluded, since the teacher must be pedagogically and linguistically competent to meet the needs of all students using English for interaction. Thirdly, if there are foreign students in the group, although most of the students still speak their native language, the teacher is faced with a dilemma - whose interests should be satisfied? Thus, the introduction of English as the main language of instruction is an important aspect for analysis and detailed study.

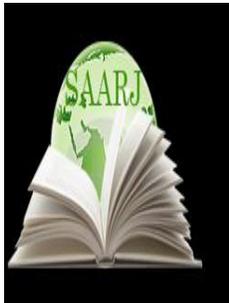

Another argument put forward in favor of English as a language of instruction is that it is an authentic way to learn the language and focus on topics and situations (e.g. travel abroad, communication) that may or may not arise in reality. For decades, foreign language teachers have been arguing about what is authentic in terms of language teaching, what materials for work are considered authentic and what are not. Is studying a subject in English as the primary language of instruction an authentic way to learn a language? In a sense, it is, because the educational material is not processed in order to make it easier for the student to understand, the authenticity of the tasks is also preserved in order to help the student acquire exactly the knowledge, understanding and skills that are necessary for the given subject, and not aimed at training the grammar rule. The student will certainly be motivated to learn English through the subject while improving their English at the same time. This is one of the main provisions of the CLIL methodology (subject and language integrated learning). It is important to make a clear distinction between CLIL and EMI, which are not identical. Unlike CLIL, EMI technology is a vehicle for delivering academic content to the student, and improved language competencies are more a derivative than the goal itself.

The last argument for introducing English as a language of instruction that needs to be considered is the pedagogical component, which reinforces the distinction between subject-language integrated learning (CLIL) and teaching subjects in English as an intermediate language (EMI). Any educational situation that includes the assimilation of some educational content through an intermediary language must, of course, include consideration of those pedagogical techniques that the teacher uses in his daily practice. This postulate is obvious when it comes to teaching in the native language. However, the level of the teacher's qualifications and especially the level of his lexical training when using the EMI is a completely different matter. Thus, the crux of the problem is that with the introduction of EMI, pedagogical techniques

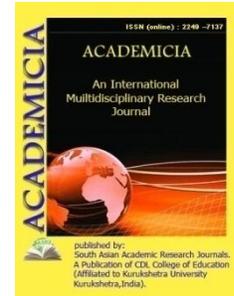

should become more student-centered in the sense that the teacher should take into account the linguistically limited vocabulary of students. It is advisable to use more interactive techniques for presenting material in your work, which is typical for teaching language disciplines.

STUDY OF OPEN EDUCATIONAL RESOURCES: A SURVEY BASED APPROACH

Ansari Shahin Abdul Hakim*

*Assistant Teacher,
 Al-Ittehad Junior College, Jogeshwari (West),
 Mumbai, INDIA
 Email id: shaenansari@gmail.com

ABSTRACT

The main purpose of writing this article is to prevent those who are unfamiliar with educational resources from learning due to this epidemic. Especially students and teachers should be aware that any kind of educational material that permanently, can be used anytime and anywhere, such as books, educational videos, homework, assignments, quizzes and charts etc. Such content falls under the category of registered license or copyright. Their use can enhance learning. Similarly, the traditional method of teaching through teachers and books has been completed in just four walls. Educational content can be published in any digital format. Higher education student's books are expensive, not all students can afford them, and these OER books can be taken anywhere and used forever. Therefore, more or less problems have been solved for getting higher education. Many articles and websites have been mentioned in this article so that the people can get acquainted with them. And use them to enhance their knowledge and shape their future. Teachers can enhance their skills through OER also the Organisation go through OER, any organization can involve students in e-learning. There are very few developed countries. They have all the resources for open education, but it depends on the interest of the people. Therefore, highly educated and qualified individuals are moving towards developed countries for their own betterment. And make developed countries more developed in terms of their capabilities. Backward countries are backward in every way but the OER lighten them. However, OER has been launched in different ways. For example, distance education system, distance education, online education, and tuition etc. OER is very much needed in modern times. Everybody knows that what disease has locked the whole world in one room. Due to which most people are suffering from mental illness, the government and private sectors have launched the

large number of courses through which people can use their time in the right place and avoid anxiety.

KEYWORDS: Education, Resources, Method, Books, Teachers, Student, Digital, Pandemic, Developed countries.

INTRODUCTION

Man is the best CREATION of the Universe, and the whole universe is made for him. Man has an excellent ability to absorb and expel through formal and informal procedures. Due to his immense abilities and talents, he rules over every particle of the universe, using it for his past, present and future. Education is paramount in all spheres of human life. New aspects of education are emerging in modern times. In the near and distant future, Educational needs will continue to create new educational directions, their use will become inevitable, because change is an infallible principle of the universe.

Stability is a change in time

(Translate from Urdu Couplet's line i.e.

"SIBA'ATEkTAGHAIYURKoHaiZAMAANE MEn")

In the traditional teaching method, teachers and students have been facing many problems. In the present age, open education broad the man in the vast field. The modern student is achieving the desired goal with the help of modern means like computer, laptop, tab and mobile etc.

However, it is also important to present lectures, slides and notebooks on a computer when needed. This method never deviates from the centre of learning, as we move forward in the modern method of education, the signs of the destination begin to appear.

Open Education Resources (OER) are readily available but their use is proving to be useful and useful for teaching, research and editing in text, media and other digital forms etc.

➤ **What is open education:**

Educationist Dr. Mohammad Kaleem Zia has defined open education as follows:

"This method of teaching is like water its findout its own way and whatever colour you add in to it, it will be in the same, so this method of teaching chooses its own way.

For example: The combination of formal and informal education can be called open education. While there is scope for formal education in this method, there is also scope for informal education cannot be solved through accessories, then the problem can be solved in the form of a regular class or individually with the help of accessories and a teacher. Otherwise the learner can achieve his desired goal by his own."

➤ **What is OER?** Any kind of educational material that can be used freely, consistently anytime and anywhere, such as books, educational videos, homework (assignment), assignment, quiz and Charts etc. Such content falls under the category of registered licensee and copyright.

➤ **Five R's of Open Education [5 R's of (OER)]:**

There are 5 key points to consider when using open educational resources within licensed boundaries.

I Retain: Content can be reused in its unaltered and original form - the right of use, such as in the classroom, in the study group, on a website and video, etc.

II	Reuse:	Copies of content may be retained for personal archives or for reference.
III	Revise:	Content may be modified according to specific requirements - the right to adapt, adorn, edit or modify, such as transferring material to another language, etc.
IV	Remix:	The right to mix the content with other relevant content and the right to create new content. For example, mix the content and so on.
V	Redistribute:	Exchange the obtained material with others in original or modified form. Copies of original material or revised materials and the right to share your combined material with others: such as providing material to a loved one, etc.

OERs include many types of content: assessments, dissertations, books, articles, curricula, journals, basic media, reference materials, transcripts, tutorials, testimonials and textbooks etc.

➤ **Definition of OER:**

• **The William and Flora Hewlett Foundation**

"OER are teaching, learning, and research resources that reside in the public domain or have been released under an intellectual property license that permits their free use and re-purposing by others. Open educational resources include full courses, course materials, modules, textbooks, streaming videos, tests, software, and any other tools, materials, or techniques used to support access to knowledge."

• **UNESCO defines OER as follows:**

Open Educational Resources (OER) are teaching, learning and research materials in any medium - digital or otherwise - that reside in the public domain or have been released under an open license that permits no-cost access, use, adaptation and redistribution by others with no or limited restrictions.

➤ **Brief history:**

- "Educational Objectives" This theory was first developed by Wade Hudgins in 1994.
- David Valley first coined the term open content in.
- Open educational resources, open distance learning, open distance education system and open source education, etc. have emerged in the twentieth century.
- In 2002, UNESCO first used the term "open educational resources" for open curriculum in higher education in developing countries.
- The term "Open Education Resources" was first coined by UNESCO at the Forum on the Impact of Open Courseware for Higher Curriculum Influence in Developed Countries, as

well as a meeting held in Cape Town in September. There was the "Open Education Declaration" which was issued on January 5.

➤ **Types of OER:**

Types of OER are textbooks, open curricula and online curricula.

Open Educational Resources Books, Complete Curriculum, Textbooks, Videos, Tests, Assignment and Images etc. which are readily licensed (with licenses) are included in all types of Open Educational Resources.

➤ **Differences between traditional and open education:**

Traditional education is like a train. In the same way, the traditional method of teaching has been completed only in four walls, through teachers and books. In it, the student had to pay a certain fee, the same type of books, fixed time constraints and then the rigors of examinations etc. while the method of open education is It is like a ride that can not only run on railway tracks but also walk on the surface of the water, run like a submarine in the sea and river and also in the winds and space. Can reach destination with speed. That is, it can go anywhere and anytime, which means that for this method of education, a person does not have to be in the form of a teacher. And there is no passage of the toughest exams and the attainment of the destination is very easy and in harmony with nature and temperament and it is not that the method will prove to be equally useful and effective in the distant future.

➤ **Sources of OER:**

There are many resources for open education. Some of the resources for seemingly OER are as follows:

* Open Stax, * OER Metafinder, * Library, OER Commons, * YouTube, * Merlot, * Creative Common Search, * Open Text Book Library, * Khan Academy, * Wikipedia, * Saylor.org, Peer 2 peer University, * Rekhta etc.

Apart from all these, all the books of 1st to 12th Grade are openly available by M.S. Board through "balbhartiebook". In addition to these, there are numerous other websites through which higher educational materials are easily available.

The following are the Indian OER Portals and distance learning universities by states.

➤ **Use of OER materials:**

Library is an important source of OER that can greatly enhance educational resources.

Educational materials can be published through any digital form. For this, first selection, then the choice, arrangement, dissemination and dissemination through which educational materials can be made available openly.

- **For students:** Higher educational books are expensive, all students cannot buy, this OER books can take and keep them forever use any time anywhere. Therefore, problems of getting Higher Education have been solved.
- **For Teachers:** Teachers can enhance their abilities through OER. They can have a wide range of materials through which they can easily understand students under any topic. Teachers can save their time. OER are beneficial for teachers. It's important for the teachers.

- **Management:** Through OER any organisation can equip students with E-Learning. In addition, it can provide numerous educational resources to students and teachers through a computer. This will save money as well space.
- **Behaviour of different countries regarding open education:**

(A): Developed countries:

Developed countries are scanty. They have all the resources for open education, but it depends on the interest of the people. It is an offence not getting Education.

(B): Developing countries:

Developing countries are more than developed countries. They have less resources than the developed countries. Therefore, the highly educated and qualified people move towards developed countries for individual betterment. And make developed countries more developed to the best of their ability. Due to lack of opportunities in their own countries they are not getting the desire education.

(C): Backward countries:

Backward countries are backward by all means. Lives of people here worse than the animal, the pursuit of education becomes meaningless. In this almost fear even getting the traditional education is such a difficult task then how one could think of OER.

➤ **Reasons for open education:**

This method of teaching is new and it is coming into being according to the requirements of the situation. However, the OER has been started in various ways. For example, distance education system, distance education, online education, and tuition, etc. The epidemic that has been unfolding for the last six months has imprisoned human beings in their own homes, which has strengthened of this method of teaching. That is why the process of getting education has not been interrupted.

➤ **Advantages of OER :**

There are so many advantages of OER like helping before and after learning, reducing student costs of books, there is a lot of access, attracting students, teachers, schools, colleges and

universities to better education, providing peace of mind to students and teachers, providing education for all, maximizing the use of open education resources and increasing the availability of educational materials, raising the quality of educational resources, etc. These are just some of the goal setting shareware that you can use.

➤ **Disadvantages of open education and their remediation:**

There are no visible disadvantages to open education. But every coin has two sides. Of course, there are advantages as well as disadvantages to the above-mentioned education under this regulation, which are listed below:

• **Difficulties faced by students:**

Students face particular difficulties in open educational resources. For example, many students are poor that they do not have a digital device through which they can access open educational resources. For example, Android mobile phones, laptops, computers, etc.

- Because man is a social animal and he likes to live in society and live among other people like himself and his relatives so that others can share in his joys and sorrows and also share in the good and bad of others. Separated from human beings and each and every person is shrinking in his own shell, which has started to disintegrate the fabric of relationships in the society, man is running away from man.
- In the traditional style of teaching, there was a strong link between the teacher and the student, which extended the chain of respect and compassion of the teacher to form a better society. The method of open education has deprived the society of this blessing. Due to which many forms of corruption are emerging in the society.
- Relationship between teacher and guardians: In the traditional style of education, there was a kind of relationship between teachers and guardians through their children. This relationship had a profound effect on morality, which is now lacking.
- There may be these and other issues of open education due to which a person can develop individually but by removing the corpse of the society, then consider such an education which increases the chances of disintegration of the society to such an extent that man is not human. What is the use of such an education if human turns in to machine?

➤ **Procurement:**

The above few negative points can create a kind of vibration in sensitive minds. Therefore, the inclusion of ethics in open education should not only be mandatory, but now the world needs love more than ever, so it is necessary to include twenty to twenty-five percent ethics in all curricula.

➤ **The need for OER in modern times:**

There is a great need for OER in modern times. Everyone knows what disease has locked the whole world in one room. Due to which the education system has been completely cut off. OER has proved to be the most useful in this global epidemic or disease. Students, teachers, parents and organizations, etc. have tried to facilitate education through OER. That is why students all over the world are using books openly today. By reading books according to their syllabus. Countless people who have to stay at home are using all the books openly. Teachers are helping

children complete the curriculum through OER. Many online courses have come out, through which many people are spending their time under OER.

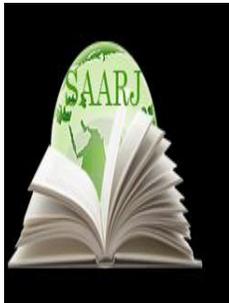

The following are five such government portals that will help you take free online courses.

- ✚ NASSCOM. NASSCOM is offering **free** AI and Data Science **courses**. ...
- ✚ SWAYAM. ...
- ✚ ICT. ...
- ✚ iGOT. ...
- ✚ AICTE ELIS **Portal** Launched. Etc.

OER has become a medium through which education has not only flourished but has opened a new path all over the world.

THE PROPORTION OF ARABIC ISOPHICAL COMPOUNDS IN THE "BABURNOMA" WITH THE ORIGINAL

Amonov Mukhtorjon Umarovich*

*Fergana State University,
 UZBEKISTAN

ABSTRACT

The article analyzes the issue of the proportion of Arabic isophical compounds in the work of Zahridin Muhammad Babur "Baburnoma" with the original. Assimilation in the composition of isofic compounds is a lexical-semantic analysis of words. In Uzbek linguistics, Tajik isophal compounds have been studied more deeply. And Arabic isophal compounds are relatively poorly studied. Researcher M.Yusupov's candidacy on the topic "Types of isafet constructions in prose works of Alisher Navai" devoted Chapter 3 to the study of Arabic isopha.

KEYWORDS: "Baburnoma", Arabic isofi compound, originality, degree of application is limited, out of consumption.

INTRODUCTION

In Uzbek linguistics, Tajik isophal compounds have been studied more deeply[1,2]. And Arabic isophal compounds are relatively poorly studied. Researcher M.Yusupov's candidacy on the topic "Types of isafet constructions in prose works of Alisher Navai" devoted Chapter 3 to the study of Arabic isopha[3].

Until Yusupov, professor F. Abdullaev, professor E. Begmatovs touched on this issue in part[4]. Philolog D.Hakimov in his article titled "The system of isopha compounds in the Uzbek language lexicon" draws attention to the Arabic isophas and their spelling in the current Uzbek literature[7, 63-67].

MAIN PART

First of all, Alisher Navoi's works in "Baburnoma" and the majority of Arabic isophical combinations denoting the name of the works of other poets have the same meaning as in the original until today and are now widely used in both languages without changing their meaning:

Arabic and Uzbek: “*Badoiyus-sanoyi*”, “*Badoiyul -vasat*”, “*Mantikut-tayr*”, “*Mahzanul-asror*”, “*Mizonul-avzon*”, “*Navodirush-shabob*”, “*Lisonut-tair*”, “*Favoidul-kibar*” kabi.

Secondly, one of the words in the composition of the Arabic isophical compound in the work is used in the current Uzbek literary language, the other is not used or has a limited degree of conjugation, or the derivative or singular form of this word is used: *doimul-avqot* [8, 357] – *each time, also*. In this combination, the word *avqot* is a plural form of the word of time, which has mastered the Arabic language and is in active consumption in the current Uzbek literary language, and in the current Uzbek literary language *avqot* is completely out of consumption and is only three in historical works. In the current Arabic language of literature, this word is in active consumption.

Also, *dorulkhilofa* in the meaning of the house of khalifas, capital in the work [8, 352] the combination of isophical in Arabic *isopha* is consumed not only in the current Uzbek language, but also in the Arabic language, although many *isopha* compounds are used in the composition *дор* of the present Arabic literature: *دار الآثار Dorul Hazor Museum*, *دارالبريد took medicine – post office*, *دار التمثيل dorul fable – meamp* as. In the classical Arabic language and in the old Uzbek language meant the capital *dorulhilof* (دار الخلافة) *isopha* combination instead of the current Arabic language *عاصمة* (عاصمة) word used. The oral survey experiment with current Arabic literature speakers shows that, *dorulhilof* (دار الخلافة) *isopha* do not understand the meaning of the combination without a dictionary. The *хилофа* of the caliphate in the composition of the compound does not apply at all in the current Uzbek literary language, the Explanatory Dictionary of the Uzbek language also does not contain this word. But in the speech of various extremist groups, which are currently operating, this word is widely used by variants of *хилофа*, *хилофат*, *халифалик*. Compound content *дар дор* word today in uzbek language as *dorulfako*, *dorulfano*, *dorulfunun* met Arabic *isopha* compounds in the composition.

He traveled through the mountains and came to Dar al-Khilafah (BN: p. 352).

In the current Arabic literary language, many isophical compounds are used, in which the structure of which the word *дор* is involved: as *دار الآثار дорул асор-museum*, *даралбарид дорул барид-post*, *дарالتمثيل дорут тамсил-ertaet*. The *хилофа* of the caliphate in the composition of the compound does not apply at all in the current Uzbek literary language, the Explanatory Dictionary of the Uzbek language also does not contain this word. But in the speech of various extremist groups, which are currently operating, this word is widely used by variants of *хилофа*, *хилофат*, *халифалик*. Compound content *дар дор* word today in uzbek language as *дорулбақо*, *дорулфано*, *дорулфунун* met Arabic *isopha* compounds in the composition.

Third, both words in the composition of some Arabic isophic compounds used in the game are used in the current Uzbek literary language, but the meaning of the compound does not meet the current Uzbek language. For example, in the composition in the game means a house, a palace *дар дор* there are a number of isofi compounds with the suffix, both words in the composition of the compound are used in the current Uzbek language of literature: *дорулхараб*[8, 250]- *the abode of the unbelievers, and their country*; *дорул-ислом*[8, 250]- *country of islam*; *азимуш-шаън* [8, 287] –*great*; *каримут-тарафайн*[8, 146]- *two side great, two-sided magnified*; *муддатул-умр* [8, 174] – *throughout life* words in the composition of such combinations are used independently in the current Uzbek literary language, but do not meet in the case of a combination.

From the fourth, one of the words in the composition of the Arabic isophical compound is not used in the current Uzbek literary language, the second is used in the case of a semantic shift, the meaning of which is narrowed: the Babur is eaten in the work, and the flesh of which is understood the meaning *maqulul-lam* [8, 256] used composition Arabian isopha. Eating, meaning of what happens while *маъкул* word is not used in the current Uzbek language, the word in active consumption in the current Arabic language, the word meaning meat, in the current Arabic language, also means meat, but in the current Uzbek literary language, the meaning is narrowed and boneless: as *лаҳм зўит*. Author *лўча* the name says giving the definition to the bird: *Boshidin Kuyruzuzacha besh-olti mukhtalif ranks bor, kabutarning byynidek barroқdur. Uluқluzi kabki dariycha bълai, olibo Хinduston kabki dariysidur ... Ul ajab nima ildilar: қish bълoch, toz domanalariga tushar, agar uchursalarkim, uzum bozidin uchtsa, yana aslarlo Makkulul-lamdur, beads laziz these bordur.* [8, 256]

Umdatulmulk [8, 329], which also means the base, head of the country in the work, the Arabic isophical combination is used both as a free isophical compound and as a phraseological unit in the current Arabic language, while in the Uzbek language it is excluded from consumption. *Umda* word in the composition of the compound is completely out of consumption in the current Uzbek literary language, it is not indicated in the explanatory dictionaries, the meaning of the word *mulk* property in the composition of the compound is narrowed and is used in the current Uzbek language in the meaning of property. In the old Uzbek language this word was widely used in the meaning of the country.

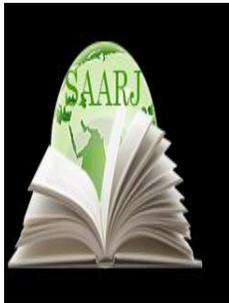

We pulled 16 pieces of analysis from a total of 40 Arabic isophal compounds used in the "Baburnoma". From the results of the analysis, it is known that none of the above Arabic isophalic compounds is not used in the current Uzbek language. Of the 16 compounds, only 7 of them (44%) are used in oral speech in the current Arabic language. And in the current Arabic language, some of these combinations are used in the artistic literature. It was used in the meaning of the capital in "Baburnoma" and in the classical Arabic language it also meant *دار الخلافة* [дорул-хилофа] the combination of isopha has become archaism in the current Arabic language. In the current Arabic language, this word replaces *عاصمة* *asimatun* gave empty to the word. Also in the work, the name of one of the works of the historian Khondamir means *السيار حبيب* [Xabibus-siyar] Arabic is also not used in the Uzbek language. In fact, the full name of this work: "Kabibus-siyar fi akhbori aphrodul-bashar"[9, 573], it means "A friend who reports from the shape of the people of man". *خلاصة الاخبار* [Хулосатул-ахбор] the full name of his work means "Khulosatul akhbor fi avolil akher" – "Summary of the news about the brother situation". And the above abbreviations do not mean anything in Arabic either.

CONCLUSION

Many Arabic isophical compounds in the "Baburnoma" or one of their components is not fully compatible with the original. This situation can be observed in other historical works. In summary, the reason why so many Arabic isophical combinations are used in Babur's own speech is that, first of all, if the tradition of the Turkic literary language of that period, then, nevertheless, Babur, like other creators, sought to make the image solemn, the impact of his speech.

THE HISTORY OF VISUAL ART AND IT'S IMPORTANCE IN PEOPLE LIFE

Barchinoy Qurbonova*

*Senior Lecturer,
 Fergana State University,
 UZBEKISTAN

ABSTRACT

There are hundreds of definitions of the art in the history of aesthetics; therefore, it seems hardly possible to propose the only one and ultimate research-based definition. A deep impact on the emotional and intellectual levels of human consciousness that works of art produce is their distinctive feature. In this article highlights of the history of visual art and its importance in people life;

KEYWORDS: *Art, visual art, people life, aesthetics, artistic art, image, symbol.*

INTRODUCTION

In the history of aesthetics, there are hundreds of definitions of art. Therefore, it is simply impossible to give a single and ultimately scientifically sound definition of this concept. Based on my experience as a teacher of aesthetics and author of books on aesthetics and art theory, I can offer my own definition of art, without in any way claiming to be the ultimate truth. In my opinion, art is the professional activity of an artist, which aims to create artistic images that are generalized, often symbolic in nature. The desire for decoration and even for the creation of some of the simplest images exists in the animal world, but no animal is capable of creating symbols. This allowed the German philosopher Ernst Cassirer to call man "an animal that creates symbols". Artistic creativity and art as its highest manifestation are symbol-creating activities.

Visual art has always been and still is of a mimetic nature. In any form, even in the form of abstract art, it is an imitation (mimesis) and a reproduction of reality. This statement is the conclusion of the entire history of aesthetics and art theory, and few people have questioned it. A distinctive feature of works of art is the deep impact on the emotional and intellectual levels of human consciousness. Aristotle, explaining the effect of tragic art on a person, called this process catharsis, that is, the purification of the psyche with the help of fear and compassion. The idea of

catharsis, developed by Aristotle in relation to tragic and comic art, lasted for several millennia. It was actively discussed by the theorists of the Renaissance and Modern Times, and in the twentieth century it was supported by Sigmund Freud and many other art psychologists. We can say that the concept of catharsis is not completely outdated today. There are many topical and controversial issues in the understanding and interpretation of art.

One of them is the problem of authenticity of works of art. It presupposes the existence of a necessary internal connection between a work of art and its author. Without this connection, art loses its aura, originality and uniqueness, connection with the ethnic and national environment. Art becomes so devoid of an individual beginning in the era of mass reproduction, in which the connection of the work of art with the author becomes conditional and often completely lost. This is the basis for some of the ideas of postmodernism, which proclaim the "death of the author", the dissolution of his personality in an anonymous text that needs only a correct reading-a discourse.

Today, the need to understand the authenticity of a work of art is becoming extremely important due to the problems of art forgeries. This is one of the fundamental problems associated with the expansion of the art market and the endless increase in prices for both classical and contemporary art. True, art forgeries have existed throughout the existence of European art. It is known that some major masters of the Renaissance forged the works of contemporaries, which was rather not a borrowing, but a demonstration of the universality of the style and Renaissance versatility. In the subsequent time, the forgery of the art of the masters became a real industry, undermining the real artistic values.

Some art historians believe that the classic works of the XV-XVI centuries. - this is a third of the forgery. It is known that in the world there are eight paintings depicting the "Mona Lisa". Which of them belongs to Leonardo da Vinci, and which are her fakes? Since the 18th century, artists have been fighting the growing plagiarism industry, defending the originality of their work. The rapid growth of the means of replication, especially in such an art form as graphics, made it possible to borrow other people's subjects and to appropriate commercially successful compositions.

The first to oppose this was the English artist William Hogarth, in whose work graphics occupied a greater place. He appealed to the English Parliament with a proposal to pass a law according to which all graphic works had to contain the name of the publisher and the date of manufacture of the graphic work. This proposal was accepted and is still legally valid today as the "Hogarth Act". Hogarth promptly defended the art of graphics, but in the field of painting, the plagiarism industry continued to grow, bringing huge profits to the authors of fakes. Today, many names are known by artists who supplied the art market with quite professional fakes. For example, the Italian Giovanni Bastiniani was engaged in forgery of Renaissance sculptures, the Dane Han van Meegeren skillfully forged paintings by Vermeer, the Frenchman Yves Shadron created fakes of Leonardo's Mona Lisa. The art of the twentieth century has also been the subject of extensive falsification. The German Otto Wacker forged paintings by Van Gogh, the Frenchman Jean-Pierre Shekroun and the Hungarian Elmir de Hory were engaged in forgeries of Picasso's paintings. The subject of falsification was and still is the graphics of Chagall, Miro, and Dali. All this is a small list of underworld figures who falsify art.

To stop the flow of falsified art products, modern science uses various methods, including X-rays, spectrography, atomic analysis, etc. Museums around the world create catalogs with descriptions of paintings by masters and their owners. In the United States, a special act has been passed against the counterfeit industry, and the Federal Trade Commission (FTC) monitors the trade in works of art.

The fine art of Uzbekistan, as an integral part of the world art, makes a worthy contribution to its development. In the art of Uzbekistan, completely new, previously non-existent types and genres of art have developed and achieved significant success. One of them was painting, and within it important compositional problems were solved, and in which particularly noticeable creative successes were achieved. Reflecting the life of the people, the unique nature, the spirit of the time and the images of contemporaries has become the main ideological and artistic task of the painters of Uzbekistan. Artistic achievements have become the object of constant study and analysis. In accordance with the development of fine art, art studies and art criticism were formed and developed. Therefore, the study of the problems of the historical development of the fine arts of Uzbekistan is currently relevant both in theoretical and practical terms

Nevertheless, the number of falsifications of works of art is not decreasing, they fill the modern art market. Due to the huge popularity of the works of Uzbekistan art of the twentieth century, the counterfeit industry has shifted its interest from Western art to Uzbekistan art in recent decades. This industry generates huge revenues and is related to illegal, criminal activities. Uzbekistan does not have a special organization that would control the sale of Uzbekistan art abroad, which gives freedom of action to falsifiers specializing in Uzbekistan art. The creation of such an organization requires the joint efforts of art historians, restorers, art dealers, and representatives of art galleries. Obviously, the Uzbekistan could take appropriate legislative measures to regulate the modern art market and eliminate the trade in art forgeries.

Then, in the continuation of the lesson, pride in the native land, for the ancient culture of its people, quotes statements from the hadiths of the Prophet Muhammad: First bow to your mother, again and again, and then to your father. Anyone who wants to go to heaven must receive the blessing of the mother.

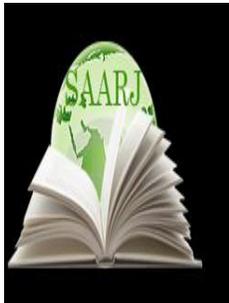

And here they recall the work of Odil Yakubov "Everything will return to normal", which tells that the son who made a pilgrimage to Mecca and returned to his homeland, should first of all come to his mother and worship her.

To open the world of beauty to the child, to make him sensitive to the beautiful and to teach him to appreciate the beautiful and to create the beautiful with his own hands is not easy and not easy, but it is necessary. It should be answered to raise and educate children: familiarization with folk art, the development of pictorial paintings by artists with its imagery are the guides of a living tradition of art.

KHOJA NASRIDDIN AFANDI AS PEOPLE'S HERO

Haitov Hamza Akhmadovich*

*Researcher,
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

In this article, the personality and activities of the image of Khoja Nasriddin Afandi, who became the hero of the Uzbek people's laughter culture, are revealed on the basis of the analysis of sources and literature. In the history of the spirituality of the peoples of the East, the unprecedented high development of literature, art, science, philosophy and thinking, there is a special role of the image of Nasriddin Afandi. In the colloquial speech of the people of this space, where memory capacity, soul memory are high, we can listen to the colors of Nasriddin Afandi and the anecdotes associated with him. Who is the master of Khoja Nasriddin Afandi has historical documents on his personality and his? We are thinking about publications about Nasriddin Afandi.

KEYWORDS: Afandi, laughter, Nasriddin, "Mushtum", "Saltuknoma", sayohatlar kitobida", "Manzilnoma", anecdote, "Letdif", story, hero.

INTRODUCTION

In the history of the spirituality of the peoples of the East, the unprecedented high development of literature, art, science, philosophy and thinking, there is a special role of the image of Nasriddin Afandi. In the colloquial speech of the people of this space, where memory capacity, soul memory are high, we can listen to the colors of Nasriddin Afandi and the anecdotes associated with him. Who is the master of Khoja Nasriddin Afandi has historical documents on his personality and his? We are thinking about publications about Nasriddin Afandi.

Afandi word is derived from the Greek word "afendus", which means "Sir"[1]. There are two distinct views on whether or not Nasriddin Khoja was truly a historical person. The inadequacy of the evidence is based on the fact that many researchers are skeptical that he is a real person in history. In addition to stories about Nasriddin Khoja and his life, there are various historical facts

about him. The first of them is an inscription on one of the pillars of his grave; A few lines written by Yoman Mehmed in the Bayazid service in 1393-1394 years: "Nasriddin Khoja's tomb and the date is 683-th year". Footage from the grave of the girls of Nasriddin Khoja, which is still preserved today in the Oqshahar museum, is also taken as an important evidence. These are the articles written by the elder daughter of Nasriddin Khoja Fatima Khatun from the cemetery in Sivrihisar in 1931 and "Duru malak binti Nasriddin Khoja", which was found at the foot of the Nasriddin Khoja grave, between the ages of hijra 727 and 1326-1327. The most important evidence is the information on the income received by the fund "Nasriddin Khoja God-fearing", the care of the Nasriddin Khoja shrine, which is listed in the regional records in 1476. Nasriddin Khoja's name was written in 1480-th year, the finished work is mentioned in two places in the book "Saltuknoma" of Abul Khayr Rumi. In his work, known as "Mad brother", "His book Dafiylul – Gumum Rafiul – Numum", written by Mehmet Gazali of Bursa, samples of the anecdotes of Nasriddin Khoja are presented. There is also valuable information about Nasriddin Khoja in the Guhis pendants, which was written approximately in 1527 year[2]. Another source of 16 century began with anecdotes of Khoja Nasriddin. In his work "Letdif", an unknown poet of the Boyazid period tells about the anecdotes of Nasriddin Khoja, in the same way he brings four anecdotes and one story. Duman Mustafa also published in his work anecdotes of Nasriddin Afandi "No brains", "My fur", "Ready-made money"[3]. Approximately in 1535, the work written by Lamil Chalabi of Bursa, in 1581, the works of bayburt Usman "Cindov-Muriti-Sihan", written by Khoja Nasriddin, also provide important information. When the Polish tourist Simyon arrived to the Oqshahar in 1618 year, visited of tomb Khoja Nasriddin. He wrote about this in the third volume of his book "Northern trips". Saint Chalabi, who came to the evening in 1638, gives information about Nasriddin Khoja in the book of trips. There are also opinions about Nasriddin Khoja in the works "Tuhfatul Haramain" and "Ziyazoz Mehmet Afandi" written by Yusuf Nabiyy (death 1712-th year) written in the 17th century. Written by an unknown author in the XVIII century in the work called "Manzilnoma" there is information about the Oqshahar. Nasriddin Khoja recommends visiting, saying that the mausoleum is in the city. From Ayvonsaroy was written by Huseyn Afandi and was completed in 1675 and stored in the treasury library of Tupqopi Palace there is information about the life of Nasriddin Khoja. Information about Nasriddin Khoja from the second half of the XV century repeats the previously mentioned facts. Since the XVI century, in particular, anecdotes of Nasriddin Khoja began to be transferred from oral culture to written literature and met in many documents. In the same way it is possible to see that the stories of Nasriddin Khoja of the beginning of the XVI century were written by heart in separate records. The "Hikoyati kitobi Nasriddin Xo'ja", written by a person named Hussein in 1571, contains 43 stories. According to Perteve Naili Varatov in the National Library in Paris there are 12 books about Nasriddin Khoja, the oldest of which dates back to the 16th century and the most recent of which dates back to the 19th century. Among the works of Ismail Sahib in the library of the faculty of languages, history and geography of Ankara University (hijra year 1171, mil.1777) there is a book written and number of 1/1838 cataloged with the number 142 page. This name is "Hikoyati kitobi Nasriddin Xo'ja". Turkish literary critic Mustafa Duman composed and completed 68 pieces about Nasriddin Khoja [4]. According to the information, Nasriddin Khoja was engaged in several different jobs, but most of his life passed on as an imam, preacher, theologian, judge or peasant. He died in 1285 at the age of 77 or 78 in the Oqshahar. His grave is open on five sides, one side is raised above six marble columns with a giant locked door and a dome. It is located in the center of the city of Oqshahar from the Great Cemetery – the cemetery

of the Seljuks. The first tomb, written by Nasriddin Khoja, does not exist today. According to some data during the last restoration (hijra 683. mil 1285-y) found in stone.

Russian writers L.Salavev, Victor Vitkovichs wrote about Nasriddin Afandi about 10 works of art, collected and published anecdotes. In 1910-ies, our magazine "Mushtum", "Mullah Nasriddin" from Azerbaijan, was published regularly. We have in our hands the number of 2 and 42 of these magazines taken from the Azerbaijani archive. Samples and quick drawings of the Afandi anecdotes are given in the journal.

Later, Nasriddin Khoja from Kastamonu, Nasriddin Khoja from Oqshahar, Nasriddin Khoja from Zivrihisor, Mullah Nasriddin Tusi from Azerbaijan, Nasriddin Afandi from Bukhara were the same savior and aesthetic people. There is no scientific evidence of this, but this case shows the strength and broad influence of Nasriddin Khoja's conventional intelligence [5].

In almost all works created in Russian literature, the image of Nasriddin Afandi is directly related to Bukhara. A special collection of anecdotes, which are an incredibly public and witty, subtle kidnapping, gently cynical, a small funny story, the study began on steam. In 1223, Muhammad Avfiy Bukhari (1172-1176-1233/1242) collected anecdotes and edited and published them as a separate book under the name "Javomeul hikoyat va lavomeur – rivoyot" (collection of stories and narration). Perhaps the same phenomenon also paved the way for Nasriddin Afandi (anecdote genre) to be regarded as Bukhara [6].

Nasriddin Afandi lived 70 years later, lived with the great Timur and even appeared directly during the reign of several rulers of the Tsar. Nasriddin Afandi lives as a funny image reflecting the feelings of people. As a proof of our thoughts, we note with pride that Zahir Alam's work "Afandining qirq bir pashshasi" is an independent artistic work about Nasriddin Afandi in Uzbek literature. In this place we quote the words of writer's heart: "there are books in different languages about the Nasriddin Afandi. Why should not such a book be written about him now in his native language? The desire to write this work was also born to me in the midst of anxiety" [7]

In contrast to the interpretations of the image of Nasriddin Afandi in world literature, Zahir Alam describes another new facet of Nasriddin Afandi. "The look is simple, the sheep eye, the beard is dark brown, the trick from the middle is high, the coat gets to the pen that this guy's legal literacy" is even higher than a goose or goose. This image, which is aimed at maintaining official legislation and making more effective use of it, evokes aesthetic pleasure in the reader.

-While everyone is afraid of you! When you come from your hands to beat everyone? - heard a strong irony.

It was he who was made of paint. Nasriddin understood that this strange man was pushing the word "all" into the back and horn. Slowly he began to go to the side.

-Do you mean that by saying it makes everyone go crazy, haram? - asked him a suitable sarcastic smile and a threatening tone. - Where do you stand without shaking, it's like sitting on a single poppy on your collar.

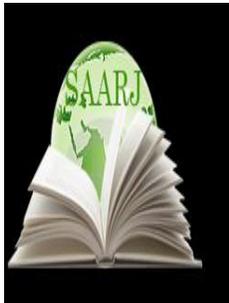

Laughter rose. The eyes of the one who was made began to be dazzled [8]. Yes, our hero was represented as an intelligent and wise, poor businessman. The person who is talking uses the

mouth of the speaker. Then people produce their own voice in the language of Nasriddin Khoja [9].

The image of Nasriddin Afandi and his anecdotes continue to educate the minds of people in different ways. Its traditional pulp is becoming the basis and source of creative activity. The unique anecdotes of Nasriddin Afandi are rich sets of themes that cover different spheres of life. Thoughtful thoughts and ideas in anecdotes, the philosophy of life has the power to surprise our modern people. The image of Nasriddin Afandi is inextricably linked with our spiritual ideals.

ABSTRACT

This article describes the history of the Uzbek Model School in Gulja (PRC), its achievements in the field of education on a scientific basis through numbers and evidence. Turkistan region is a historical fact. For two centuries, the cities and regions of East Turkestan (the present-day Xinjiang Uygur Autonomous Region along the countries of the world), such as Qashgar, Gulja Urumchi, Yorkent, Khotan, Oksu, Uchturfan, Kuchar, Garla, were densely populated areas of the Uzbek communities. The Uzbeks, who got away from their homeland, stood abroad and thought about the future of their children and lived with the desire to return to their original homeland for a long time.

KEYWORDS: *School, Education, educated, East Turkestan, Uzbek language, national - pride, scientific conference, reader, book, example, scientific degree, love Homeland.*

INTRODUCTION

During the years of the colonialism of the Russian Empire (1867-1917) and the historical stage in which Soviet power existed (1917-1991), due to national discrimination, the conduct of the policy of great statehood and radical economic changes, thousands of our nationalities were forced to leave their original homeland and leave for emigration. The historical fact that the emigrant Uzbeks spread through Afghanistan, Iran, East Turkistan (PRC), which borders on the

Turkistan region, is a historical fact. For two centuries, the cities and regions of East Turkestan (the present-day Xinjiang Uygur Autonomous Region along the countries of the world), such as Qashgar, Gulja Urumchi, Yorkent, Khotan, Oksu, Uchturfan, Kuchar, Garla, were densely populated areas of the Uzbek communities.[3.] The Uzbeks, who got away from their homeland, stood abroad and thought about the future of their children and lived with the desire to return to their original homeland for a long time. In the relatively densely populated city of Gulja, the Uzbek nationalities laid the foundation for the school, which was "the greatest of the world's buildings" at the expense of its funds and ions. Our compatriots tried to follow the aphorism of "if the book is oftob, the school is a dun, then a real man is a perfect man". The Uzbeks, who had such desires as their children to grow up as honest and conscientious, educated and educated people, restored the school in Gulzha at their own expense and free of their labor, and later (in 1936) called it the Uzbek school named after Alisher Navoi "Model". The first four rooms of this school were built in 1906 under the leadership of the Uzbek immigrant investor Gayniddinkhoja Fakhriddinkhoja.[4.]

In 1914, the Uzbek school "Model" began to provide students with secular knowledge. Later, the school was built in two floors, with the new four classes, the number of Ja'mi classes reached eight. Having studied at this school, the writer achieved his career either. Yakvalkhozhaev said about the construction of the school: "both women and boys of Ahat Shokir, who wrote poems dedicated to them, such as Tursunoy, who suffered until the second floor in the scorching heat, took part in this work. I do not have a dream that Aqlima, Ovdad, Rovziya sisters, Iminjan afandi, Sunnatilla, Shahabiddin, Nabi, Ubaydulla, Qadir, Hikmet afandi taught him in the construction of the school," he wrote.[5.31.]

About the responsibility of teachers Y.Yakvalkhujaev: "our native language and literature teacher Iminjan afandi (deputy head-Sh.H.) sometimes when we cannot pronounce more difficult words or names well, we slowly come to our side and say: "if not today, then if you go to your house (to Uzbekistan), my child will sit there and say the same, who taught the native language, if they ask, they will remember in the style of "I was a man called what".[5.30.]

The school "Model" has repeatedly won the nomination of the winner in the competitions between secondary schools in the city of Ghulja. At school, children from Uzbek, Kazakh, khoyzu (dungan) studied, and the pupils wore a symbol called the school "pattern".[7.27.]

One of the comrades of the "three regional revolutions" Ahmadjon Kasimiy got acquainted with educational work at the school on October 6, 1946, and concluded that "Uzbek" Model School is a Model School corresponding to the name of the body". In 1946-1947, the Uzbek school "Model" became a seven-year incomplete secondary school. From 1953 year the school was included in the list of schools of educational supervision of the country.[6.101.]

Among the classes of schools in the city of Gulja, the 5 Class A of this school took the first place in the nomination competition "the highest-mastered class" with 100 percent mastery. From the 1952-1953 academic year to the 1957-1958 academic year, Ma'sud Ismail was the head of the school. During his tenure, the school operated botanical, painting, calligraphy, music, language and literature circles. A "living corner" is established, which serves the teaching of zoology and biology. We found it necessary to note the list of persons who used and sponsored it in different years, as well as about them, in the transformation of the school from a 4-room small school to a 24-room modern educational institution. Gayniddinboy Fakhriddinoy (1906); Setivoldiboy

Kyrgyz and Uzbek Mirzahakimboy (1932). Mirzahakimboy, the head of the "help" company, when he died because of the help he provided to the school, the school teachers expressed respect to this person by writing to the plaque hanging on the funeral head of the deceased: "the people will not forget you".[6.97.]

In 1930-1940, Nasriddin boyvachcha, Mullo Ruzi domulla, Tashmuhammed afandi, Asadulla afandi, Abdurauf Maxsum, Abdurakhmanboy Komiljonbot Tukhta Kari etc. provided great material assistance to the school. When they built the club under the umbrella of the school due to their economic support, the modern training building with 2-storey 20 rooms with material collapse of educators such as Gulomboy, Shonigmatboy, Tukhta Kari, Mirhofiz raised to in the 1950s.

In the past historical period in the school, hundreds of teachers taught students different subjects.

Since 1930-ies in the school "Model" taught educated intellectuals. Among these, Hamid Saidi, Hamid Vakiliy, Nasrullo Kari as raised education to a high level. Nasrullo Kari (Farhodi) founded a music lesson and a special theater Circle in the school. Under his leadership, more than 20 pupils became a well-known singer and musician. He himself became a poet, playwright, composer of all works. Under the direction of Nasrullo Kari, drama and comedies such as "Падаркуш", "Лайли ва Мажнун", "Насаб қурбони", "Арзигул", "Тўрт тантик", "Шарлатон" were staged. This event served to raise spiritual consciousness and raise the material condition of the school. Teachers of the Uzbek school "Model" Teyipjon afandi, Iminjan Yusup, Ubaydullo afandi, Tursun afandi and Zaynab Shokirs passed language-literature, Shovudin afandi, Abdukadir Samari, Muhammad Nor, Sabir afandi math lesson, Muhammad Sultan chemistry lesson, Ablakim afandi physics lesson, Ma'sud afandi geography lesson, painting lesson, Jopgrukhan khanzu(Uighur language) lesson; For more than 100 years, the list of teachers working at the Gulja Uzbek "Model" school has been long, and representatives of kazakh, kyrgyz, tatar, dungan, Uighur nationalities can also witness the large number of them. The school is headed by a head, a scientific director, a management consisting of a list of Economic Affairs.[1.115.]

In 1934-1936 Zaynab Jilkibaeva, in 1936-1939 Parikha Aliakbarieva(tatar women) worked as the head. In 1945-1951, Mir Asim of Sunnatillo, in 1952-1958, Ma'sud Ismail was the head of the school. This list can be continued. We would like to give information about some people who studied at the Uzbek School of "Model", later achieved a scientific career, worked in responsible tasks.

Bahodirkhonov Mukhamed Kabir Saidkhonovich-was born on August 17, 1941 in the city of Gulja, the PRC. His father, Muhammad Saydikhon, was an imam for 30 years in Andijan mosque in the Tajiboy neighborhood of Gulja city.

K.Bahodirkhonov was the most diligent and resourceful of the Uzbek school "Model" in Gulja. He graduated from the school with an excellent result in 1957 year. Kabir Saidi is the youngest brother of Hamid Saidi, who was a student of the Uzbek School of samples in the 1930s. In 1958-1959, Kabirjon studied at the Gulja lands full secondary school. On June 14, 1959, from Gulja moved to Tashkent, the capital of Uzbekistan. In 1965 he graduated from the Faculty of physics of Tashkent State University (now NUUz) with excellent grades. He conducted scientific research in the field of electronics and microelectronics and achieved the degree of doctor of physical and mathematical sciences, professor. In 1996-2003 he served as chairman of the

Higher Attestation Commission under the Cabinet of Ministers of the Republic of Uzbekistan. He is a laureate of the state prize named after Abu Rayhon Beruni (1992), winner of the badge "Independence" (2001), member of several foreign academies of Sciences, honorary professor of Xinjiang University, 35 candidates of sciences and doctors of sciences.[2.]

K.Bahodirkhanov is the author of dozens of books and monographs and more than 300 scientific articles. He also believes that this person, who is a participant of international scientific conferences in the USA, Germany, the PRC, the Russian Federation, Spain, is strong in teaching, giving knowledge in the school "Model" of his achievements, awards, achievements in life. It is recognized by the scientist that the service of teachers of the Uzbek school "Model" is incomparable.

Kabirkhon Saidi is currently a professor of the Department of electronics and microelectronics of Tashkent State Technical University and serves in the field of science. The scientist reiterates the fact that "the knowledge obtained in youth is a stone-carved pattern", the motto "the core of the science accumulated in your youth is the moment of spending in old age is vital.

Yusupov Javdat Boqijonovich- was born on November 8, 1954 in the city of Gulja, Uzbek nation. J.Yusupov received a 7-year and then a secondary full-time education at the Uzbek "Model" school in Gulja. After returning to Uzbekistan, Graduated from the Faculty of physics of M.V. Lomonosov Moscow State University (1972-1977 yy.). He is a junior and senior researcher at the Department of thermal physics of the Academy of Sciences of Uzbekistan (1977-1978; 1982-1988 century.), Tashkent State Aviation Institute (1997-2008), Tashkent State Technical University, Department of "general physics" has been working in the positions of associate professor. Doctor of physical and Mathematical Sciences, professor J.Yusupov is the author of more than 100 scientific articles, 2 monographs, 13 educational-methodical works.

J.Yusupov has been the head of the General Physics Department of Tashkent State Technical University since 2011. This optimistic person passionately tells about the fact that on the ground of his achievements in life and science, the lessons of his teachers and teachers at the Uzbek "Model" school in Gulja are laid.[2.]

Iliev Kholmurot Majidovich- was born on November 1, 1958 in the city of Gulja of the PRC. He received primary education at the Uzbek school "Model" in gulzha. After moving with his family to Uzbekistan, he studied at the Physics Faculty of TashSU (NUUZ) (1977-1982). Kholmurot Majidovich, who started his labor activity at the stake of the Mikond plant, later passed the stage in connection with his work in the positions of a laboratory assistant, an aspirant, a scientific worker, an assistant, a senior teacher, an associate professor, a professor. Doctor of physical and mathematical Sciences, professor X.M.Iliev from 2012 to the present time has been working as the chair of "electronics and microelectronics" of Tashkent State Technical University.

Shorahmetov Shoturgon Shopulatovich- doctor of physical and mathematical sciences, professor. He worked at Tashkent State University of economics for many years. He was born in 1947 year in the city of Gulja. Shoturgun brother studied at the Uzbek school "Model" in 1955-1962 in Gulja city. 1962 year with his parents moved to Tashkent. In 1971 he graduated from the Faculty of mathematics of Tashkent State University (Uzmu). In 1971-1973 he worked at the Institute of mathematics of the Academy of Sciences of Uzbekistan in Tashkent, in 1973-1982, in Tashkent State Economic University since 1982. Sh.Shorahmedov is a well-known scientist in

the field of probability theory and mathematical statistics in mathematics. His more than 60 scientific articles have been published in prestigious journals of countries other than Uzbekistan, such as the USA, Sweden, Germany, France, Russia.

He is a member of the Bernoulli Society of World probability theory and Mathematical Statistics (JSJ).[2.]

Azizov Uzbektura Odiltura ugli - was born in 1941 year in the city of Gulja in the family of a breeder. He graduated from the Uzbek school "Model" in Gulja at excellent prices. After moving to Tashkent, he successfully graduated from the Tashkent automobile Institute and began his labor activity from 1968. He was promoted from simple service to Deputy Director General of the Tashkent regional cargo transportation concert of the Ministry of transport and Chief Specialist of the Republican Association "Uztransanoat".

Uzbektura Azizov was awarded with honorary certificates of the Ministry of Automobile of Uzbekistan, the jubilee medal of the Tashkent regional authority, in addition to the above, the specialist of the trade sphere Ulugkhoja Burakhujayev (was born in 1942 in Gulja). The constructor, technologist Abduvali Abdurashid ugli Abdurakhmanov (born 1942 year 19 January in Gulja). Murodbek Azizov (was born in 1938 in Gulja), a member of China's motospace national team, was a former student of the Uzbek school "Model" in the city of Gulja, Xinjiang Uighur Autonomous District.[3.105.]

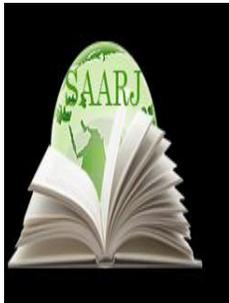

Most of the Uzbeks, who were convicted of emigration in 1900-1930 and spread throughout the cities of East Turkestan, did not give anything for their children to study at the Uzbek "Model" school, if they did not study. The next generations studied at this school moved to the republics of Uzbekistan, Kazakhstan, Kyrgyzstan of the former Union, diligently entered the higher educational institutions. They achieved the status of a scientist, a doctor, an engineer, a skillful entrepreneur. Teachers, who worked at different times in the school "sample", brought up their children wisely and taught them to be kind and willing to give their lives for the homeland of ancestors, if necessary.

A delegation from Uzbekistan also visited the 100th anniversary of the school in Gulja. Members of the delegation were welcomed by the head of Gulja city Turgon Pido, the Permanent Secretary of the people's Congress of Gulja City Tosh Ibrahim, the head former Hasan Ibrahim of the same Permanent Committee, head of school Ahmatjon Ilohun and the chairman of the school party, Shovkat Dovuts. The 100th anniversary of the Uzbek school "Model" was celebrated on September 8, 2006.[6.110-111.]

SAND THERAPY - ONE OF THE METHODS OF ART THERAPY

Khodjaeva Gulnora Abdubannonovna*

*Assistant,
 Fergana Public Health Medical Institute,
 UZBEKISTAN

ABSTRACT

Art therapy is a method of treatment through artistic creativity. This method is used in working with both children and adults. Art therapy is one of the most gentle and at the same time profound methods of work of psychologists and psychotherapists. This is the expression of yourself, your feelings through creativity.

KEYWORDS: *Art Therapy, Sand Therapy, Reveals, Conflicts, Depicted.*

INTRODUCTION

Perhaps, each of us has his own positive memories from childhood, associated with games in the sand - sea, river, or that fall asleep in the sandbox at home. However, the sand is not so simple. Elementary, seemingly, games can be very useful for the mental health and development of children. Especially if these games are sand therapy;

Have you noticed that sand for babies has a certain magical power?

At a certain age, they begin to be attracted to it: children want to touch the sand, dig in it with a stick, play with toys, and dig a hole.

First of all, sand therapy for children is a great opportunity for self-expression, the development of creative inclinations in the child, as well as a simple and effective way to learn how to express your feelings, emotions, experiences. Sand therapy classes under the guidance of a psychologist provides answers to many questions of parents concerning the inner emotional world of their child, allows you to reveal and see the true causes of conflicts, fears, and in the future, to make a correction!

The sandbox is an excellent intermediary for establishing contact with the child. And if he does not speak well and cannot tell an adult about his experiences, then in such games with sand, everything becomes possible. Playing an exciting situation with the help of small figures,

creating a picture of sand, the child opens up, and adults get the opportunity to see the inner world of the child at the moment, and in the course of sand therapy, it will definitely "pour out" on the sandy surface.

But this is not the only plus of sand therapy: it perfectly develops fine motor skills (sand due to its structure has a beneficial effect on tactile sensations and stimulates the nerve endings that are located in the fingertips), imagination, creativity, imaginative thinking and much more.

Working with sand is calming (especially for generative children) - it seems to contain life-giving solar energy, which charges us with positive emotions.

Good sand therapy for preschoolers and the fact that when creating certain compositions here do not need artistic skills. This means that there is no place for frustration, mistakes and self-doubt. At the "sand" lesson, children are relaxed, cheerful and inspired: they create their own world, and it is infinitely pleasant to do this.

Sand therapy is akin to a game, and in the game the child learns about the world around him, overcomes difficulties, and learns to solve adult problems. Here it is important to involve a psychologist, who will help the child find a solution and a way out of this situation in time.

Children in the older group can learn to make up stories based on what they have "drawn" in the sand. This teaches them coherent speech, retelling skills, and it is really interesting to them: who does not want to describe what kind of situation is depicted in the sand?

Classes are conducted with the help of a large number of small figures and special sandboxes with dry or wet clean sand.

In the classroom, children love to travel to fairyland with the Sandman-the guardian of the magical sandbox. Each time, sitting around the sandbox, the children listen to the story of the Sandman about a new interesting game.

The classic sand therapy session begins with the psychologist giving the task to create a picture of his mood, and the child chooses the most attractive toys for him.

It is important that they are diverse and allow the child to engage in different aspects of life in their games. These should be figures of people (preferably of different ages, different nationalities, professions, categories), both real and imaginary. Figurines of animals - domestic, wild, mythical, some symbolic objects like mirrors, eggs, butterflies. Toy buildings and furniture: houses, churches, towers, castles. Connecting toys: ladders, ropes, stones, seeds, beans, Cars, planes, trains, boats, Vegetation: trees, twigs, flowers, bushes. Different things: buttons, feathers, coins.

After that, these same figures are placed in random order on one of the trays with sand. You can place them as you like: in one row, in a circle, at different ends of the tray, and so on. The figures can connect the "paths" drawn (connections between objects),"footprints" made with your fingers, or they can connect nothing at all - everything is as the child wants to do.

The therapeutic effect is achieved already at the stage of placing toys. When the picture is complete, the psychologist will be able to interpret what is bothering the child in this period of time, and also help him find a way out of a difficult situation during the game.

In the classroom, quiet music can play, or there can be complete silence—depending on the mood of the group and the age of the children.

It is thanks to independent drawings in the sand that the child learns letters and numbers faster, learns the concepts of "right" and "left", temporary concepts of day and night, seasons. With the help of constructions on the sand, you can develop visual-imaginative thinking, perception and memory. In the sandbox, tactile sensitivity and fine motor skills of the hand develop powerfully.

When playing games on the sand, the child becomes interested, he tries to do it correctly, beautifully, accurately and, importantly, quickly.

Children often cannot clearly articulate or name what is happening to them. Building different stories, the child can play various difficulties in his life. For example, difficulties in communicating with children, indecision or your own fears;

Playing with sand is a kind of self-therapy of the child with the help of a psychologist. The child is the master in the sand box and, experiencing this feeling, he becomes internally stronger, because he can change his pictures, stories, attitudes and moods.

In games on the sand there are wars, the struggle of good and evil, but the child always knows that good will win! And this experience is very important for his future life.

In sand therapy, children gain inner freedom and confidence that no one will judge them and accept them as they are. First on the sand, and then in real life!

The goal of such therapy is not to change and remake the child, not to teach him some special behavioral skills, but to give him the opportunity to be himself.

What are the benefits of playing with sand?

- * Develop perception, thinking, memory, attention, speech, self-control and self-regulation skills, creative thinking, imagination and fantasy;
- * Form the child's ideas about the world around them;
- * Develop fine motor skills, eye sight;
- * Soothe and relax, relieving tension;
- * Foster a sense of success and self-confidence (here's how I can!);
- * Help you learn about the outside and your inner world.

Forms and options of sand therapy

1. Game methods

Didactic game practice with the use of a sandbox is used for the youngest. Scientists have proven that sand absorbs negative energy, calms, fills with harmony. That is why it is so useful for kids to play in the sandbox.

2. For the purpose of diagnosis (individual and group form)

In an individual form, you can diagnose:

- * The presence of internal conflicts (struggle, sand country in a state of destruction);

- * The level and direction of aggression (hetero and autoaggression);
- * conflicts with significant others: In this case, there is a confrontation between the heroes of the sand fairy tale, who play the role of real members of the author's entourage;
- * Potential, resource opportunities (when there are some wonderful objects that bring deliverance and a happy resolution of the situation);
- * Ways to overcome difficulties (mutual assistance, patronage, avoidance);
- * The level of development of the emotional sphere (analysis of feelings, reflection);
- * Analysis of the location of the figures in the sandbox and their meaning.

In the group form of working with the sandbox, you can diagnose:

- * The nature of interaction in the group;
- * Distribution of roles in the group;
- * The style of behavior of each member of the group.

3. The method of psycho corrective influence (for example, if the child has emotional and behavioral disorders of a neurotic nature. In other cases — it is used as an auxiliary tool that allows you to stimulate the child, develop his sensor motor skills, reduce emotional stress, etc.)

4. As a psycho prophylactic, developmental means

Psycho prophylaxis is carried out in order to prevent problematic situations. Having a remarkable property of "grounding" negative psychic energy - sand is an excellent psycho prophylactic agent. Psycho prophylactic and developmental aspects are manifested in the setting of fairy tales and myths in the sandbox. Playing together with your child, you can pass on your own life experience.

5. in psychological counseling of children, adolescents and adults as primary psychological care.

Drawing with sand: This technique called "Sand Art Therapy" is amazing because it offers the use of sand and sand painting techniques as a basis for creativity and self-discovery.

Sand painting, sand animation - all these are the names of the same activity, which has recently become extremely popular. And no wonder.

Sand painting is an unusual art of creating pictures with sand, it is an opportunity to express your feelings and emotions without words.

Sand painting develops and stimulates:

- * Fine motor skills;
- * improves memory;
- * Movement plasticity;
- * Brain function;
- * stress management

It is in this state that stress, internal tension, and problems are best removed... Drawing with sand is especially characteristic of the fact that by manipulating loose materials, a person gets rid of negative emotions. Drawing takes place directly with the fingers on the sand, which contributes to the development of sensory sensations, liberates and harmonizes, and also contributes to the development of two hemispheres (since drawing takes place with two hands).

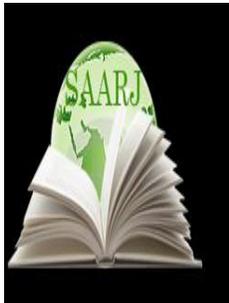

Even very young children can draw on the sand. To develop motor skills, this activity will be no worse than drawing with finger paints, and the mess from it is much less.

Experience with children has shown that the use of sand therapy gives positive results:

- * Children feel more successful;
- * The classes are fun, there is no boredom and monotony;
- * In kindergarten, the child is easier to adapt to the team;
- * Fear and tension disappear.

ABSTRACT

The article describes the formation of management culture, management, competencies, organizational forms aimed at improving the education system and its effectiveness, the interaction of leaders and teachers in educational institutions, the study of management culture, management organization and the formation of a management culture. Talent means dealing with life and performing professional duties in a particular field. The ability is based on the knowledge of the ways of activity, existence, when thinking about the ability to act in pedagogical experience conditions, the ambiguity of goals, as well as the existence of a professional strategy are among the activities that depend on the teacher's activity or behavior strategy, that is, on the competence.

KEYWORDS: *Professional competence, management, behavior, management culture, personnel potential, culture formation.*

INTRODUCTION

In accordance with the state educational standards in higher educational institutions, qualified personnel are trained on the basis of modern educational and professional programs. Based on the development in the future that meets the requirements of society, the economic and social development of the country, the achievements of modern science, technology and culture, the training of managers is organized and regularly improves it. Also, education of young people in the spirit of national ideology of independence, loyalty to the ideals of independence on the basis of knowledge of universal values, love of the motherland, family, surrounding nature; maintenance and enrichment of moral, cultural and scientific values; satisfaction of the

individual's social, cultural and moral development requirements; introduction of new pedagogical and information technologies, integration of science and; the tasks of science, technology, technology development, scientific pedagogical personnel and the development of creative activity and effectiveness of scientific research of Education recipients, the use of the obtained results in the educational process are carried out.

In this regard, from the point of view of pedagogical science, the formation of professional culture remains one of the urgent tasks in the educational process. This is especially noticeable in the preparation of future manager-teachers for management activities. Information about the meaning of culture allows to determine the established humanistic methodology of education, setting the main goal in the context. Due to this, the formed future manager-educators are valued as leaders in the future, their approaches and the degree of manifestation in life are determined, the choice of personal and professional methods, directions is carried out, self-awareness processes are organized.

Talent means dealing with life and performing professional duties in a particular field. The ability is based on the knowledge of the ways of activity, existence, when thinking about the ability to act in pedagogical experience conditions, the ambiguity of goals, as well as the existence of a professional strategy are among the activities that depend on the teacher's activity or behavior strategy, that is, on the competence. External and internal requirements are imposed on the activity. External requirements-at the influence of the relative external environment, the idea of pedagogical activity and on its basis the competence of pedagogical activity is formed. In modern conditions, society promotes new requirements, such as education, that is, the principles of education, built on an anthropological basis. Therefore, today, the main criterion is the professional competence and culture of the future manager-teacher of existence[1].

A competency-based approach to the organization of educational processes education lies in the culture of self-determination (ability and readiness). Self-determination of fate, self-development, self-education). In order to determine the content of education, it is necessary to plan the preparation of future manager-educators, to determine the professional competence, the skills of which a specialist capable of solving professional problems should know the following:

- Ability to analyze, interpret and apply, pedagogical concepts and theories;
- Ability to reflect oneself in a system of values;
- The ability to combine theory and practice (that is, activity) is an approach that can manifest competence;
- The ability of the manager-educator to evaluate the results intermediate stages of the interaction of the subject-subject;
- Ability to work in a team and in a group;
- Availability of appropriate extracurricular competences modern social outcomes in education.

It is known that the effect of self-determination of a person is determined by his choice. Values are the same determinants individual and collective choice, the determination of prospects ensures the development of both the individual and the whole society. In conditions of choice of values, the analysis of the managerial role of professional competence in a rapidly changing socio-economic environment gives new results in the life of society and pedagogical science.

The future manager-educator is that when a student is able to identify the humanistic values of life as a future leader and solve problems, not only personal and corporate-based professional tasks, professional interests and tendencies, experience and priorities, but also success is guaranteed, because he or she is able to overcome the existing dependence, professional and pedagogical competence, the culture in management, Such an approach provided an opportunity to determine the functions of comparative analysis of modern pedagogical activity.

In order to ensure a culture of management, which should be formed in the branch manager-educators, serious attention should be paid to the formation of the following skills and skills in educational processes, in particular:

1. Monitor the diagnostics of the development of teachers in the process of their activities in the educational institution; formulate their needs for changes.
2. To examine whether the activities of the educational institution towards the achievement of the objectives are properly organized which will ensure further innovation development.
3. The fact that an educational institution has established effective interaction with all suicides, ensuring relations on a contractual basis.
4. The fact that a comfortable educational environment is created, changes are taken into account.
5. The systematic design of personal professional development, as well as the organization of self-training of employees.

These components are of particular importance in the practice of the content of teacher-teacher training, since the available scientific sources indicate this. For example, researchers emphasize that modern organizations are becoming more and more highly skilled and the sense of lack of initiative leaders is felt at all levels of management. Lack of growth in social and professional requirements, lack of personnel, inadequate analysis of competences in the field of management of managers with talent and good knowledge, qualifications and skills at all levels causes the need for effective forms izlash modern management. These changes are necessary to find solutions to a variety of problems, the formation of a culture of management of future manager-educators in educational processes means the urgency of finding solutions to the problems.

Analysis of the research in the field of management showed that the requirements, the formation of the educational process, the perception of the need for the development of the personality's ideas and qualities of a personal management culture about the future management activity, indicates the necessity of organizational activities. For this purpose, the solution to the problems of shaping the future manager-educators management culture in the educational process is determined by the fact that their training is directed to the future, the manager for effective activities in the future:

- Reduce time costs and "eliminate paperwork when working with documents";
- Focus on the specific needs and objectives of the organization;
- Focus on the skills and abilities of employees;
- Employees' experience in minimizing impact, honesty in employee appraisal, and transparency in career growth;

- The desire to attract a variety of employees from outside, depending on their current situation in the organization;
- Develop strategic skills and skills focus on staff planning;
- Greater involvement in staff planning work, personal and organizational development;
- To take into account the maximum number of employees' opportunities;
- Striving to maintain the talented leaders of the organization, middle and senior management, expanding and improving their professional competence.

The content of the disciplines that ensure the formation of the culture of management of managers-teachers includes materials for the implementation of management competences, rules as the basis for effective management. Any strategy can be implemented only when it is available. In order to develop the skills necessary for the organization of effective and experienced leadership, decisions on the exchange of personnel among the employees of the organization, effective systems for ensuring continuity of management, the mechanism for the growth of the talents of the personnel choir and the method of maintaining the most qualified and creative personnel, the leadership ability and talent of all

The student should know that in his / her activities it is necessary to pay special attention to a high level of cooperation with teachers with leading positions and highly qualified self-potential. That is why managers at any level always strive to operate effectively. If the relationship with such individuals is an impetus to the formation and development of a culture of management, as a result of the necessary resources and support, the student will be able to achieve the intended goal, change the behavior patterns of the student and achieve the formation of a competitive specialist. At the same time, teachers(employees) with high potential should take care of the future manager-educators about the formation and development of a culture of management. The development of future manager-educators management cultures is not a single action, but a continuous process, which requires significant efforts, new practical tasks and more impact on the target experience, such as the implementation or direct participation of work tasks, an effective result is obtained during training.

From this point of view, B.Shleder's concept is very close to the issue we are researching, and in terms of simple operation and survival of the society, the individual's competence is not taken into account, but a relatively well-functioning society and a successful life for all will be considered. The importance of the component presented plays a crucial role in the formation and development of management competents of undergraduate students and in the preparation of them for practice. Also, a number of other studies have been carried out within the framework of the topic:

- Ideas about the general subject of activity (K.A.Abulkhanova Slavskaya, B.G. Ananiev, A.V.Brushlinsky, A.L.Zhuravlev, I.A.Zimnyaya, V.S.Merlin, A.Robinshteyn, V.A.Slasten and others);
- To reveal the creative potential of a person and the essence of his existence as a corrective property of ideas about the subject (K. A. Abulkhanova-Slavskaya, O. A. Konopkov, A. N. Leontiev, S.L.Rubinshteyn);

- Qualification, cultural, dialogic, personality-activity approaches (Y.K.Babansky, L.S.Vygosky, B.G.Gershonsky, V.V.Kraevsky, V.Krichevsky, A.N.Leontiev, L.M.Mitina, A.A.Orlov, N.F.Radionova, S.Selevka, A.P.Tryapisyna, T.I.Shamova, B.G.Shadrikov and others);
- pedagogical design ideas (V.N.Vinogradov, E.S.Zairbek, I.A.Kolesnikova, V.A.Kozyrev, A.G.Prikot, V.E.Radionov);
- The idea of preparing students for management within the framework of specific characteristics is a skill-based approach (A.A.Andreeva, A.V.Barannikova, L.N.Y.Bogolyubova, E.B.Volodarskaya, B.S.Gershonsky, S.Z.Goncharova, E.Zeer, I.A.Zimney, V.Zygina, I.Kalinikava, Z.M.Makasheva, A.K. Markova, E.Symanyoke, Y.G.Tatura, Y.Frolova).

Russian scientists L.N.Zakharova, V.V.Sokolova, V.M.Sokolovs believe that understanding the ability to effectively solve practical issues under professional competence it is recommended to socialize a developing person, to ensure internal conditions, to actively integrate into society due to his development value trends, Nature, Society, spiritual orientation experience of people, formation of practical skills self-awareness of activities that are socially necessary or at least acceptable[3:64]. I.A. Kolesnikova believes that the initial indicator of professional competence is "attitude to man, the work of the teacher - this is the activity in the system" person - to-person". It is for this reason that such a component as the personal-humanistic direction is the professional and personal characteristics that are presented today as an integrated indicator in the composition of professional competence. The sphere of real professional education is also characterized by the ability to regularly perceive the pedagogical process and as a result of regular action in IT, professional competence is formed and developed[2:46].

When we consider the training of future managers-educators from the point of view of their preparation for the management of pedagogical processes, the educational activity remains relevant in the first place, the ability of the future teacher to have a dialogue with the world determines the level of formality and development of the world(socio-cultural context), other people(interaction) and the culture The object of considering pedagogical activity as socio-cultural is dialogue, during which the exchange of information and enrichment of the teacher's subjects with elements of management culture becomes the goal of the educational process. The ability of the teacher to carry out educational functions is determined by the fact that in this case he is inclined to change himself qualitatively. In the structure of professional compensation N.N.Lobanova distinguishes between management tasks and professional and personal component at the level of social responsibility, in which the qualities that provide the solution as a component of the formation of the system are emphasized. Psychological and pedagogical and socio-cultural knowledge of the teacher is a priority in the main component.

Thus, we consider the formation and development of the management culture of the manager-educator as the main element of management activity. Self-education in pedagogical activity is an integral part of this professional development. S.G.Vershlovsky, A.P.Vladislavlev, S.I.Zmiev, Y.N.Kuliutkin, E.I.Stepanova, S.G.Vershlovsky, Y.N.Kuliutkin, L.N.Lesoxina, G.S.Sukhobskaya the works of show the importance of an active approach to adults. The importance of an active approach subjects and decision-making independently in accordance with them internal motivations, values and attitudes are developed in the process of professional activity. On the problems of promotion of professional activity (T.L.Badoev, V.D.Bregin,

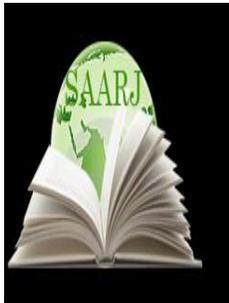

R.S.Veisman, M.V.Vovchik-Blakitnaya, V.I.Kovalev, S.V.Kovalev) has studied the improvement of management competences through the formation of management motivations.

A certain level of motivation formation has been shown that the professional activity and vocational training of the subject determine the effectiveness of their professional development in the context of competence, growth motivation management competence and their dynamics in the learning process have been studied. According to the analysis of V.I.Drujin, S.V.Kovalev, V.I.Klemeshova, M.M.Lapkina, A.V.Filippova, N.V.Yakovleva and others, the factors determining the formation of professional motivations, shaxsiyat structures, the impact of their characteristics were revealed. To encourage vocational training, Y.N.Kuliutkin and G.S.Sukhobskaya characterizes the nature of the subject and the current situation[4:32].

In conclusion, the analysis of the above interpretations makes it possible to confirm that the future manager-educators are the highlighted components of the teaching tasks. In the study of management sciences from a pedagogical point of view, it is one of the relevant directions in the formation and development of management culture of future manager-teachers.

CAUSES OF DEVIATION FROM THE SOCIAL NORM

Matibaev Toshpulat Baltabaevich*, Kayumov Qahramon Nozimjonovich**

*Professor,
 National University of UZBEKISTAN

**Senior Lecturer,
 National University, UZBEKISTAN

ABSTRACT

In this article, the non-compliance of some individuals with the social norms established in the society, which is one of the painful issues inherent in every society, the so-called deviation in sociology has been studied. The concepts of social norms, values and social institutions that cause the individual to be a deviant-minded or educated person have been studied and their attachment to them and the resulting form of behavior have been analyzed.

KEYWORDS: *Social norm, value, social institution, deviant behavior, crime, suicide, drug addiction, alcoholism.*

INTRODUCTION

Thanks to social norms, the society creates stability and order in the relations between people and their associations. At the same time, the content of social norms is constantly changing, depending on a variety of subjective and objective factors. Therefore, it is impossible to fully understand this category, to fully determine its role in social development. That is why social norms have always been and will always be the focus of attention of both scientists and practitioners.

In the scientific literature, a fair opinion is expressed that the very wording of the definition of a social norm is important only for methodological reasons. From the point of view of its research, it is more important to develop the concept of social norms. Apparently, this is why many textbooks on the theory of law do not formulate a definition of the concept of a social norm.

The German scientist Conrad Laurens, who lived in the twentieth century, came to such a conclusion by studying the comparative behavior of humans and animals. The behavior of animals depends on innate instincts, and in each problematic case there will be a pre-

programmed solution in animals. Therefore, if any emergency does not occur, they will not have difficulty living in this world, they will continue to move with the help of instincts. This regulation mechanism Lorenz called "natural morality". And man, in the course of his development, sought to subjugate nature to himself, developed his intelligence, and along this path he also moved away from his instincts. As a result, a modern man has become a creature that, if he does not work with the mind, will have difficulty living in life. That's how we are different from other creatures. We cannot live with the help of instinct, neither relations between people, nor instincts do not regulate, in a word we are no longer animals. For millennia, humanity, along with the development of its own mind, developed "artificial morality", which was the product of this mind, serving to regulate human relations. Relations today in sociology are regulated with the help of generalized rules under the term "social norm".

The concept of "social norm" was first studied by thinkers of antiquity. In particular, Plato states that in the work of "laws" people cannot live like animals, but are guided by laws developed with the mind. The great thinker, referring to all the manifestations of the social norm under the term "law", proved at that time that in the life of society they occupy an important place. Later, he developed his views on the work of Aristotle "morally". The great thinker considered maintaining moderation and normality in all actions as a virtue. He noted that "virtue is a situation between an anti-dependent character and inclinations." Even in the views of medieval Eastern thinkers, we can observe close views on the approach of Plato and Aristotle. They were one of the manifestations of social norms in the regulation of human relations – recognizing the place of morality, focusing on the issues of educating more perfect morality.

Later, European scientists also followed in the footsteps of Eastern thinkers and continued to look at morality and its place in human relations with high importance. In particular, the great German philosopher I.Kant talks about universal morality, which is reflected in every person, the scientist explains that morality is a high human understanding. He says that the laws that regulate behavior and behavior must be formed as a result of human morality, that is, morality is the basis for all manifestations of social norm.

In the work of Kant and pre-thinkers, it was emphasized that morality is for all, although it does not have to be fulfilled, is a general rule, and those who studied it as a universal, abstract concept. And representatives of "utilitarianism", which appeared in the XVIII-XIX century, considered "more happiness of a person "moral. That is, if the kantists talked about the fact that a person should limit himself to the total morality, then I.Bentham and his followers consider the morality itself also a changing phenomenon.

The division in the methodology of Science and philosophical approaches also divided the approaches to social norms from the nineteenth century into two great directions. The first direction – supporters of the metaphysical approach, like other social phenomena, characterize the social norm as a concept that has hardened itself separately from society. In their eyes, the social norm is the starting point, the specific base program. Each individual moves out of it. The second direction – supporters of dialectical methodology, however, consider the social norm as an element of a complex structure of society that changes.

In sociology, "social norms" are widely studied as a factor that greatly affects the relationship between people. Initially this is about E. Durkheim widely touched on the work of "suicide". Later T. Parsons and R. Merthonsin his works, the analyzed the issues of social norm, its role in

the life of society, its structure, its validity; Representatives of the school of classical sociology interpret the social norm as a behavior that must be recognized and fulfilled by society.

Today in sociology, the social norm is the patterns of behavior that arise on the basis of the experiences of these people who have lived together for a long time, and as a result of joint activity, forms and windfalls of proper behavior are created that are acceptable to all. Social norms indicate what a person should do, how he should do it, and, finally, how he should be.

Social norms govern the behavior of a person, although sometimes it goes against the will of a person. That is, some of our lives are led by something we “do not like”-events, too, we are forced to subordinate them to our own will. If it is not done so, it is difficult for mankind to survive. All social norms are created according to the norms of international law, primarily based on this need.

As noted above, "social norms" regulate human relations. By performing this task, it affects human behavior. However, this is not the only factor that controls behavior. Man moves in two or more rounds within the framework of one norm, Without Borders. In particular, building a family without marriage is a social norm. If you follow it, you do not violate the order established in society. However, when choosing a marriage couple, everyone has their own opinion, and this is a huge variety. Someone is looking for a rich bride, someone appreciates beauty. For whom else training is important. So one more factor that drives our behavior is social values; That is, what is dear to us, we strive accordingly.

A person lives by striving for events-something that is dear to him, and when two situations that are dear to him contradict each other, he strives, depending on what is of paramount importance to him. The values that drive a person are what we call the purposes of his values. In addition to the variety of values in these purposes, it will also have a sequence according to its priority. That is, each person will have placed all the cases that he considers valuable in a row in the style of hierarchy, both according to their importance. This complex system is largely absorbed through the knowledge obtained in youth, and some can also be acquired through later life experiences. Therefore, along with education in youth, special attention is required to be paid to upbringing, in particular to teaching what is valuable in society, and to determine the priority value in the diversity of existing values and to be taught to follow it in activities. But what if the educational institutions and social institutions in general have different problems in themselves? It is of course necessary to come up with various problems and to study in-depth the undesirable situations in social institutions.

The concept of “social institute” in sociology was originally conceived by the English scientist by G.Spencer it was used as a concept that represented a stable structure of social behavior. The founder of the organist School of sociology says that society at certain stages of its development creates devices that ensure its survival, and such devices as biological organism-like nutrition system (such as the nutrition system), system (such as the circulatory system), regulation system (such as the nervous system) as an example. That is, the structural element that society has created as a device to facilitate the satisfaction of its needs is the social institution. In modern sociology, the social institution is understood as relatively stable types and norms of social practice that make up the life of society, ensure stable relations and relationships within its social structure. Sociology is primarily aimed at meeting the basic needs of members of society (family and education), aimed at ensuring material living (economic), uniting social groups and

communities (political, legal) and preserving spiritual values (culture) institutions are more interesting.

It is possible to distinguish the following types of social institutions:

- 1) House institutions (family, marriage, upbringing), which characterize various forms of relations between the Indians;
- 2) ritual institutions, which provide for the regulation of the daily life of people by means of customs, labels, fashion, etc., which are mandatory established or supported by the majority;
- 3) Political institutions (central authority, army, police, Court, law), which regulate;
- 4) Religious institutions, uniting society on the basis of single beliefs and traditions;
- 5) Professional institutions (professional associations, trade associations), formed on the basis of division of labor, uniting people on the basis of professional signs;
- 6) Industrial institutions, they also appeared on the basis of division of labor and constitute the production structure of society.

The scan of human life takes place in various social institutions. We are born and raised in the family institute, we build a family ourselves. In addition to obtaining knowledge in educational institutions, training is also conducted. Failure of the family and marriage institutions to perform their duties properly will lead to an increase in the number of children born without marriage in the society or to absurd situations such as childless families, same-sex families, as in today's Europe. Or, seeing the collection of money for repairs, gifts and other things in the kindergarten and school, the grown-up child will grow up, accepting corruption as a "normative condition".

In this way, violations in social norms, values, as well as in social institutions eventually undermine social relations. The correct formation and accurate functioning of relations in this triangle will help to ensure that the deviant circumstances associated with young people in our country – crime, alcoholics, drug addiction, suicide, family conflicts, all-help us to overcome and prevent what concerns us today regarding the upbringing of young people. Therefore, in order to prevent the deviance of youth today, special attention should be paid to the following:

- In the era of reforms, deviantities of different views on the scale of society abound, and in sociology it is considered a natural state;
- The fight against extrovert deviants (actions directed at the external environment, for example, crime directed against another person or his property) does not bring up a deviant-minded person, but rather develops introvert behavior (deviancy directed at the person himself, for example, suicide, and alcoholism or drug addiction). In our country, the decline in youth crime can naturally lead to an increase in suicidality, drunkenness or drug addiction. Therefore, the fight against deviant situations should be taken into account, in order to prevent it, a wider attention should be paid to the family education, the educational environment in the kindergarten and the school;
- Scientists of the social sphere, educators should develop the values that are important in the education of young people and their sequence according to their priority;

- Globalization and the liberalization of information exchange, the process of liberalization in society can lead to the emergence of some manifestations of immorality as the norm in the population, especially in young people.

In order to prevent these cases, the normative requirements corresponding to the values that have traditionally prevailed in our country should be developed strictly and the barge should be interpreted equally by representatives of social institutions – family, educational institutions, media, state and public organizations. In this regard, especially youth organizations are required to take the initiative into their own hands.

It should be borne in mind that social norms are only one of the means of regulating social relations. In addition, there are non-normative regulators of social activity. Unlike normative institutions, they do not have the qualities of generality and general obligation.

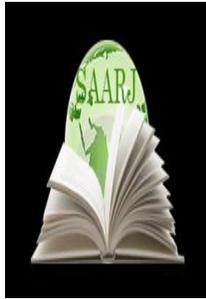

So, taking into account all of the above, we believe that a social norm is a generally binding social establishment (rule of behavior) of a general nature, aimed at regulating the socially significant behavior of an individual in his relationships with other people.

On the basis of all the above-mentioned healthy and unhealthy social norms, human upbringing lies, and its yield is manifested in the behavior of a person. So it turns out that our health would also depend on our own behavior in all respects. As a rule, people become good and bad-natured, and the worldview should be exactly the same, when their specific behavior is formed, of course, good and bad-natured, at the same time, there should be middle-aged children who have not yet grown up with an acute form, and in those children there is a strong probability of being bad-natured. So, as we mentioned earlier, bad plants grow quickly and a lot. The prevalence of a bad factor has a strong impact on children with exactly the same moderate upbringing as on the factors of good upbringing, and the risk of deviation on their side becomes stronger. I would have called those good ones a completely non-formed merit even on the side of being bad-natured, on the side of being good-natured, on the characteristics of children with middle behavior, which cannot be included in the bad either. When you say why, dignity is considered a talent that has not yet fully awakened and formed. If any excitation factor is not affected by it, it can stay in this state for a long time, which is dormant. However, this condition does not stay in one lifetime anyway, when it is treated either by good-natured people, or otherwise, by affecting bad-natured people, it turns out to be a necessary skill. If it turns out to be a good talent, it will serve the formation of healthy social norms in a person. If the public allows him to commit, know that to this person, of course, by analyzing in our entire booklet above, unhealthy social norms are formed, which look for the reasons for his formation. This is when, first of all, it creates an unhealthy environment for itself, second and most importantly, it becomes a source of unhealthy environment for society and for many.

ABSTRACT

Today, a significant number of studies are devoted to the problems of physical education of students and the formation of a healthy lifestyle for modern youth. Most authors agree on the need to make structural changes in the process of physical education of students in order to improve their health and development of physical qualities. The article discusses various structural forms of organizing the process of physical education of students in modern conditions.

KEYWORDS: *Students, Physical Education, Modular Training, Specialization, Physical Activity.*

INTRODUCTION

Currently, a significant number of scientific studies are devoted to solving urgent problems of physical education of student youth. One of the most important problems is the state of physical health of modern young people. According to special monitoring data, only about 10% of young people have a level of physical development and health close to normal. A sharp increase in cardiovascular and musculoskeletal diseases was recorded, which is largely due to the insufficient level of physical activity of young people. In general, about 50% of young people with 2 - 3 different diagnoses of diseases come to higher educational institutions, and only about 15% of graduates can be conditionally considered healthy people [4, p. 15]. Another problem is the decrease in the effectiveness of educational technologies in the system of physical education

of students of higher education. Scientific research carried out in educational institutions shows an unsightly picture of a sharp deterioration in the level of health and physical fitness of students to the loads that they may encounter in their subsequent work [1, p. 91]. It is noted that today teachers of the departments of physical education orient students only towards passing the test in the subject, and not towards the need for the formation of special knowledge, skills, competencies, norms of a healthy lifestyle, strengthening the level of their health, etc., therefore, qualitative changes are needed in structure and methods of conducting physical education lessons in universities in order to correct the current situation [7, p. 116]. All of the above forms the relevance of this work.

MATERIALS AND METHODS

One of the ways of introducing qualitative and structural transformations into the educational process of physical education of students is to change the form and methodology of the classes in order to increase the level of development of physical qualities, strengthen health, and prepare for the upcoming labor and social activities. Such (modified) modern forms of conducting training sessions in the discipline "Physical culture" include: specialized classes in selected sports (sports specializations), modular training of students, individual programs. A comparative analysis of the effectiveness of conducting training sessions on these forms in the context of increasing the level of development of physical qualities and functional readiness among students forms the scientific novelty of the research.

The methodology of conducting classes with students in the form of specializations is based on a sports-specific approach - the pedagogical direction of physical education of students at a university based on classes in one or several sports using modern technologies for training athletes, adapted to the educational process and contributing to the realization of individual motor needs, the formation of sports culture, improving the physical and special training of young people in their student years [2, p. 135]. It assumes the conversion of sports technologies into the process of physical education of students.

Modular training programs are based on the sequential development of students' basic motor skills: walking, running, skiing, swimming, etc. Classes with students are held in different, sequentially following one after another, modules. As a rule, 1 semester includes: athletics, gymnastics, sports games (football), 2 semesters: athletics, swimming, sports games (volleyball, basketball). The modular training system includes blocks of training sessions (the number of classes is 18 for each block), theoretical, methodology, practical training and mandatory acceptance of control and technical standards. Today, this form of study prevails in most of the higher educational institutions of our country.

The practice of physical education shows that the effectiveness of physical training will be high only if physical activity is individually dosed, taking into account the level of health and physical fitness of a person. [5, p. 186]. Individual programs of physical education of students are designed for young people who, for health reasons, belong to the main and preparatory group, but for any reason (recovery of post-illness, insufficient level of physical development, etc.) cannot perform physical activity in full... These programs are based on the methods of intensive physical and functional training of young people with mandatory control over the level of students' health. Thus, the total volume and intensity of physical exercises is limited by the

functional state of the trainees, and does not depend on the subjective opinion of the teacher [6, p. 133].

In the light of the above, the authors of the article decided to conduct studies that determine the quality of the level of physical and functional training of young people attending various forms of physical education classes in universities. The aim of the research was to identify the most effective, in terms of increasing physical qualities, forms of training. The research was carried out at the Samarkand State University named after A.Navai (sports specialization) and Samarkand Medical Institute (modular training and individual programs). The research involved 300 young men - students of the 1st year of study (100 people selectively from each form of education). The choice of the studied students was carried out arbitrarily using computer programs.

When conducting research on the effectiveness of modern forms of the educational process in the discipline "Physical education and sports", the authors used a set of control tests and tests that are widely used to assess the level of physical and functional state of students. The following were investigated: the level of strength development (the number of pull-ups on the bar), the level of speed development (time to overcome 100 m distance), the level of flexibility development (forward bends in a sitting position), functional readiness (time to overcome 3000 m distance, squat test). It is believed that the results of these tests will most fully and accurately indicate the physical form of a person.

The squat test should be discussed separately. This test is widespread in the practice of pedagogical observations and sports medicine to assess the level of functional readiness of subjects. The essence of the test is to perform 30 squats

Results. In the course of the research, data were obtained on the increase in the level of development of physical qualities and functional readiness of students. Students engaged in sports specialization programs and students of the modular form of education slightly (according to the Student's t-criterion) improved their level of training. The level of functional training among students studying according to individual programs increased (according to the Student's t criterion) statistically reliably. The full results of the research are presented in the table.

The level of development of physical qualities of functional readiness among students of various forms of education

Forms of learning Physical qualities Beginning of experiment End of experiment Significance of differences

Sports specializations strength 10 + 3 14 + 3 unreliable

speed 14 + 4 12 + 2 unreliable

flexibility 7 + 2 10 + 4 unreliable

endurance 15 + 4 13 + 2 unreliable

functional readiness 5.3 ± 0.6 5.1 ± 0.4 unreliable

Modular learning strength 8 + 4 12 + 3 unreliable

speed 16 + 3 13 + 2 unreliable

flexibility $8 + 3$ $11 + 2$ unreliable

endurance $15 + 2$ $14 + 2$ unreliable

functional readiness 5.5 ± 0.3 5.2 ± 0.5 unreliable

Individual training programs strength $7 + 2$ $10 + 2$ unreliable

speed $17 + 4$ $14 + 3$ unreliable

flexibility $6 + 3$ $10 + 3$ unreliable

endurance $18 + 2$ $14 + 3$ unreliable

functional readiness 5.6 ± 0.4 4.8 ± 0.2 $P < 0.01$

DISCUSSION OF THE RESULTS

The data obtained by the authors indicate that the teachers of the departments of physical education can choose the most suitable form for them (from the climatic, material-technical and other aspects) of conducting training sessions with students. An increase in the level of development of physical qualities and motor abilities is demonstrated by students of all studied forms of education. However, according to research data, there is no significant increase. According to the authors, this fact can be explained by the fact that students attending modular training classes spend a significant part of their time learning technical actions and techniques to the detriment of the development of physical qualities. Students attending classes in the form of sports specializations, on the contrary, concentrate their time on the development of any one quality (swimmer - endurance, athletes - speed, etc.). When selectively determining the indicators of other physical qualities, the development of which has not been given due attention, it can be found that the increase may be small. An increase in the level of functional readiness for physical activity was also recorded in students of all forms of education, but a statistically significant increase in the Student's t-test ($P < 0.01$) was recorded in students studying according to individual programs.

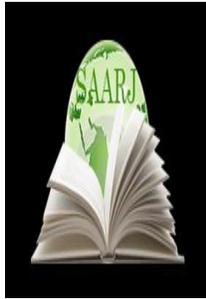

Findings. The research carried out by the authors of the effectiveness of various structural forms of physical culture lessons among university students show:

1. No reliable significant advantage of any one structural form of conducting classes over others in the development of students' physical qualities has been revealed. An increase in the level of development of physical qualities is demonstrated both by students pursuing programs of various sports specializations and pursuing modular training programs, as well as students pursuing individual programs. Consequently, for the effective development of students' physical qualities, teachers of the departments of physical education can use various forms of conducting training sessions or combine them.
2. An increase in the level of functional readiness is also demonstrated by all the studied students, but reliably significant changes occurred among students of the individual form of education. If the differences were unreliable for students studying in specialization programs and modules, then for students of the individual form the reliability was $P < 0.01$. Consequently, from the point of view of efficiency, the individual form of training is most suitable for increasing the level of functional training of students.

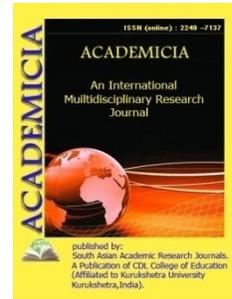

In conclusion, the authors want to note that the most promising form of organizing the process of physical education, they consider the individualization of the educational process, taking into account the level of the physical and functional state of young people. This form allows (in contrast to specializations and modular training) to involve students with different levels of physical and technical training, as well as students of special medical groups, in practical classes.

IMAGE OF MAGICAL ITEMS IN ENGLISH AND UZBEK FAIRY TALES

Djumayeva Nozima Djurabayevna*

*Researcher of Bukhara State University,
 A senior Teacher of the Department of English Linguistics,
 UZBEKISTAN

Email id: nozima.djumayeva@mail.ru

ABSTRACT

The existence of magic items in fairy tales plays an important role in defining the nature of fairy tales. This article discusses magic items that are used in similar functions in both English and Uzbek fairy tales.

KEYWORDS: *Folklore, Fairy Tales, Magic Items, Magic Sword, Magic Ring, Magic Cap, Magic Fruits, Magic Plants, Magic Animals, Magic Coat.*

INTRODUCTION

Fairy tales form a special kind of folk tales. In particular, the involvement of magical objects plays an important role in determining the nature of such tales. Examples of magical objects include a magic ring, an open tablecloth, a hot pot, a hammer, a flying carpet, a hat or cloak that makes you invisible, and an apple, that can rejuvenate or heal, or even kill, a magic sword, etc..

Main part. It is interesting that, such magic objects can be observed in English and Uzbek fairy tales, written in different systematic languages and produced by the people living in different parts of the world. These include swords, rings, hammers, and hats. While some of these objects form similar function in English and Uzbek fairy tales, some of the above-mentioned magical objects are found and used in English and Uzbek folk tales based on their national mentality.

For example, in the Uzbek fairy tales, when magic tablecloth (ochil dasturkhon) is spread out, it creates a variety of delicious dishes in the blink of an eye, while in the English fairy tales, this feature is reflected in the magic table. Apparently, although the ochil dasturkhon and the magic table are interpreted in the same function in fairy tales, their shape and name are different.

There is no word for *dasturkhon* in English. In this language, the word table cloth is used instead of the word dasturkhon. Because tablecloth and dasturkhon are different objects that are spread and food and drinks are put on them. Therefore, they often use one of these words instead of the

other in the process of translating from English into Uzbek or from Uzbek into English. In fact, they differ from each other in terms of shape and preparation. For example, in the "Explanatory Dictionary of the Uzbek language" the following explanation is given for the word "dastarkhan":

Овқат қўйиладиган мато; унга қўйиладиган таомлар.

1. Ўртага ёзиб устига овқат қўйиладиган махсус мато, рўзгор буюми.¹

1. A special cloth, a household item, on which food is written.

The word "table cloth" is defined in the Oxford English Dictionary as follows:

A cloth for covering a table, especially at meals.

It is clear from the comments that the words "tablecloth" and "dasturkhon" are close only in terms of function.

With this in mind, the researcher R. Kasimova considers the word "tablecloth" as one of the ethnographisms in the Uzbek language, noting that it does not fully correspond to the English word table cloth.

However, in English and Uzbek folklore, the presence of magical objects with similar names and functions can be observed. In particular, the image of the magic sword is one of them. In Uzbek fairy tales, it is often said that a magic sword extends to 40 gases in one swipe, emphasizing that it is magical, or that the soul of the hero is in his magic sword. Also in English fairy tales and legends, too, the magic sword is interpreted as a close helper of the hero in destroying his enemies.

In English folklore, the image of weapons with magical properties attracts special attention. The most famous of these is the magic sword. True, it is found in the folklore of every nation that has used the sword. But in the folklore of the peoples being compared, it is noticeable that the image of the magic sword is interpreted not in one, but in several functions on the basis of ancient animistic, magical and fetishistic views, so that they acquire originality.

For example, in English folklore, the plot of the legends and fairy tales about King Arthur has a wide range of battle scenes, so the image of the sword, which was one of the main weapons of the time, plays a central role in them.

In the beginning, Arthur's sword is stuck in the stone. Only Arthur can pull him out of the stone and become the owner of the magic sword. This seems to point to the ancient animistic views that the weapon of war is spiritually connected to the spirit of its owner. Traces of such views are embodied in the fairy tales of the Uzbek people, such as "Kilichbotir", "Kilichqora", as well as in the plot of the epic "Alpomish".

In the epic "Alpomish", the most ancient and perfect example of the Uzbek heroic epic poem, the protagonist Hakimbek is named Alpomish with the help of fourteen bowed bows left by his grandfather Alpinbiy. Only Alpomish could lift this bow.

Arthur himself pulls out a sword that no one can pull out of a rock, Alpomish lifts a fourteen-foot-long bow from his grandfather that no one else can lift, and Homer's epic poem Odyssey raises a bow that no one can hold in his hand.

Some versions of Arthurian legends say that the sword was broken and that Arthur received a new Excalibur sword from the Lady of the Lake. Sometimes again Excalibur is also mentioned as a sword in the same stone. The sword is described as always protecting its owner from physical harm.

Some variants of Arthurian legends say that there were five magic weapons belonging to Arthur. These are:

- 1) Excalibur - King Arthur's magic sword;
- 2) Clarent - King Arthur's sword of peace (also known as the "Coward's Blade". This sword is later stolen by Mordred and thereby kills Arthur);
- 3) Carnwennan - King Arthur's dagger;
- 4) Rhongomiant - the spear of King Arthur;
- 5) Caliburn - A sword drawn by Arthur from a stone.

Another rare gem of English folklore, the epic Beowulf, also features a magical sword. This sword is called Hrunting. With his help, Beowulf defeats Grendel's mother in a fight.

Another English folk tale, Molly Whoopi, also features a magic sword. This sword belongs to a giant. The power of the giant was concentrated in three things - a sword, a wallet and a ring. So if the giant seemed to lose any of them, it would also damage his power. This motif is directly related to the fact that in the Uzbek folk tales "Kilichqora" and "Kilichbotir" the soul of the hero is similar to the motif of his connection with the sword.

In the tale of Molly Whoopi, there is a passage about a magic sword belonging to a giant: "The king said: 'Well, Molly you are a clever girl, and you have managed well, but if you would manage better and go back and steal the giant's sword that hangs on the back of his bed, I would give your eldest sister my eldest son to marry. '"

After that, Molly Whoopi manages to grab the sword from the giant.

In general, in Uzbek folklore, the image of sharp objects such as knives, daggers, swords, arrows, scissors, axes has a special place. For example, in both fairy tales "Kilichbotir" and "Kilichkora" it is said that the souls of the protagonists are in the sword that belongs to them, the enemy tries to defeat them by capturing this sword. This motif can be seen in the English folk tale "Molly Whoopi".

The image of the magic sword is also found in the English folk tale "Jack the giant killer". Jack destroys the two-headed giants in battle with his magic sword. In the fairy tale, this sword is described as "sword of sharpness". Because it was never defeated and conquered any enemy.

The sword, which is embodied as a magical object in the fairy tale "Child Rowland", is Child Rowland's father's sword. As his mother holds it in the hero's arms, she first says a magic word. This also further enhances the magic power of the sword. An important mysterious feature of the sword was that it always led its owner to victory, and the one who fought with it in his hand was never defeated. Using this magic sword, Child Rowland fights the King of Elfland and defeats him, rescuing his sister.

In the fairy tale "St. George of Merry England", the protagonist uses a magic sword called Ascalon, which is able to cut what it touches, defeats the giant dragon that holds the Egyptian queen Sabia in captivity and saves the girl. He takes this sword from the evil sorcerer.

The Uzbek folk tales "Olov Polvon" and "Zaharli Kilich" also depict the sword. In the tale of the "Olov Polvon", the sword, which was pulled from its scabbard at the request of the hero, stretches forty gazes, moves spontaneously, and beheads the rival forces. In the tale of the "Zaharli Kilich", in the blink of an eye, the sword stretches forty gazes, knocking down the enemy and trapping him. The features of the magic sword in these tales differ in that their power is more exaggerated compared to English folk tales.

In fairy tales involving the image of a magic knife, special emphasis is placed on the fact that it was inherited from the father to the youngest son. When the protagonist addresses him with magical words, he appears in human form and instantly does any difficult task in the blink of an eye. For example, in the tale of Ernazar and Kimonazar, the knife says, "I am the slave of whoever takes me," and he instantly fulfills the wishes of the protagonist. This motif is also found in the tale of Mulla Panqush. In the English fairy tale Child Rowland, we saw that the sword was inherited from the father. So, although there are different types of strangely sharp objects in English and Uzbek fairy tales, the motives are very close to each other.

The image of the magic ring can also be seen in the plot of English and Uzbek fairy tales. Uzbek folklorist Z. Rasulova groups the functions of the magic ring as follows: 1) a means of giving happiness to the epic hero; 2) evolution, that is, a means of transforming a fairy-tale protagonist from one form to another; 3) a means of transport from one place to another, that is, a long-distance approach; 4) a magical object that informs, warns or has the ability to reflect reality from distant realities; 5) a generous material supplier; 6) a companion and miraculous helper to those who set out on a journey in search of happiness; 7) creator, builder and creator; 8) enchanting or enchanting means.²

The image of a magic ring is also common in English folk tales and legends. For example, in the aforementioned Molly Whoopi fairy tale, the "magic ring" belongs to the giant. It is described as the source of all the power of the giant. If the giant seems to lose this ring, it will also lose its power. Knowing this, the protagonist Molly Whoopi tries to snatch this magic ring from the giant, and succeeds. She thus manages to deprive the giant of his power and destroy it.

There are two English folk tales called "Magis ring", which depict the image of a magic ring. A good deed done by a hero will have a magic ring as a reward for good deeds. More precisely, in one fairy tale the protagonist receives a magic ring as a gift for rescuing a snake, and in another for rescuing the king's daughter. Then, with the help of this magic ring, they reach a luxurious palace, full of life.

Another magical object is a magic hat, which in Uzbek folk tales is often said to make the wearer invisible. In English folk tales, however, this task is performed by a magic coat. For example, in the fairy tale "Jack the giant killer", the protagonist Jack achieves his goals with the help of a magic coat that makes him invisible. The same fairy tale also features the image of a magic cap, which serves as a source of knowledge and information, i.e. it can tell the protagonist the information he is asking for.

According to the role of the magic pot in the Uzbek folk tale "Ur tukmoq", it is close to the role of the magic donkey in the English folk tale "The Ass, the table and the stick". Because when you pull this donkey's ear, gold and silver coins spill out. The donkey is a source of endless wealth, just like a magic pot.

In the same fairy tale, the stick comes in the same function as the stick in the Uzbek fairy tale, that is, in the function of punishing bad people.

The English fairy tale Nix Nought Nothing depicts a mysterious object used to block an opponent's path. In it, a "magic flask" creates water, a "magic comb" forms a thick bush, and a "hair dagger" forms sharp-edged barriers. There are similar motives in Uzbek folk tales. In Uzbek fairy tales, for example, the path of a rival character chasing back and forth with a magic comb is blocked by creating a thick forest. But in Uzbeks, the water barrier is created through a magic mirror.

Magical objects used in English and Uzbek fairy tales can be divided into the following types:

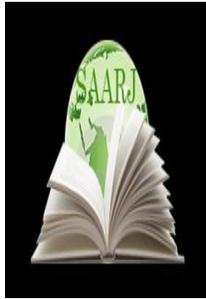

1. Magic household items: a tablecloth, a magic table, a chair, a door, a window, an oven, a pipe, a hammer, a pot or a hot pot, a magic knife, a magic spoon, a magic pot, a magic glass pot, a magic carpet, a broom.
2. Magic clothes: magic hat, boots, shoes, magic coat.
3. Magic foods and drinks: bread, cake, water, etc.
4. Magic fruits and vegetables: apples, peaches, plums, etc.
5. Magic plants: trees (apple tree, orange tree, walnut tree, briar bush, flowers, beans....
6. Magic place names: gardens, palaces, forests, hills, kingdoms, cities.
7. Magic animals and creatures: shell, deer, lion, bear, wolf, fox, bull, cow, horse, donkey, frog, worm, dragon.
8. Magic birds and birds: golden goose, golden-crowned rooster, hen laying golden eggs, pigeon, nightingale.
9. Magic jewelry and ornaments: rings, hairdaggers, amulets, mirrors, combs, magic snuffbox, magic wallet.
10. Magical weapons: sword, knife, helmet.
11. Magic musical instruments: nay, rubob, doira, dudka, harp, trumpet, pipe.
12. Magic tools: mill, saw, wheel, scissors, saw, ax.

CONCLUSION

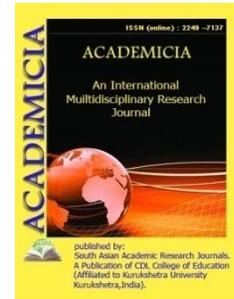

In fairy tales, there is often a description of the future, that is, the dreams and aspirations of the people for the future. Therefore, the magical objects in it artistically express people's dreams and desires. For example, flying shoes, flying carpets, magical slippers are formed on the basis of people's desire to get to their destination easier, while the magic pot, magic ring, etc. show their dreams of prosperous life. Magical items in English and Uzbek folklore have many similarities in terms of their function, even though they are called by different words in their language.

ABSTRACT

This article devoted to the analysis of scientific research and shows the role of euphemisms in the speech of two non-related languages, which are English and Uzbek. The task of the euphemisms is to soften the awkward and rude words in the language, a cultural enrichment of the language, as well as the development of the branches of linguistics, such as sociolinguistics, linguoculturology, and cognitive linguistics.

KEYWORDS: *Euphemism, Linguistics, Sociolinguistics, Linguoculturology, Cognitive Linguistics, Research.*

INTRODUCTION

It is better to start covering the history of the study of euphemisms in domestic and foreign linguistics from the time, when linguistics had not yet taken shape as a science and the term "euphemism" had not yet emerged, however, the concept of euphemism (as an expression, that softens and replaces an inappropriate, rude word) has already appeared and underwent the first comprehension. These are the days of antiquity - the heyday of the schools of the art of rhetoric.

From the 5th century BC, appear the texts and treatises, that speak of the euphemisms as the words, with the help of which, the speaker can avoid an evil word and remain silent.

During the Middle Ages, the euphemisms appear in three main forms, which can be designated as three types: 1) the words, that replace other words due to superstition; 2) the words, which are used instead of other words out of modesty; 3) the words, that replace other words for the reasons of decency.

The former were used to replace words and expressions, which denoted a bad omen, i.e. such words, which were believed to have a certain power and which could have brought a trouble.

Such euphemisms included figurative replacements of the word "to die" with "to take the last breath", "the soul has passed to God", as well as the figurative name of Satan - the Evil One. The euphemisms of the second type expressed the ideas, that were forbidden by morality, and, as a rule, were associated with sexuality and illness. Such euphemisms could be considered as a form of showing respect and delicacy in the interpersonal communication of people. The euphemisms of the third type started emerging from the 11th century - their emergence is associated with a "poetic glut", with the time of the troubadours, when it was necessary to "circumvent" a number of social and religious prohibitions with the skill of words.

A new milestone in the history of the study of euphemisms became the end of the 19th century, because it was then that the works of the German researcher Hermann Paul were published, in which he singled out the euphemisms in the "scheme of semantic changes along with the metaphor and the metonymy".

One of the essential features of studies of euphemisms in the West - is the applied nature of these studies. First of all, this applies to British and American linguistics. This explains why many foreign linguists, who have studied the problems of euphemis or euphemisms, are fairly well-known lexicographers.

Charles Caney, one of the prominent American linguists, was among the first, who has compiled a bilingual dictionary of euphemisms (English versus Spanish), has substantiated the relation of euphemis to language phenomena, while interpreting this concept through the term "indirect name". This fact also underlines the fidelity of the tradition of broad interpretation of euphemisms in American linguistics.

Such a broad interpretation is also manifested in the fact, that in the British and American dictionaries of euphemisms, a certain percentage is occupied by technical and professional terms, slangisms, jargonisms and vulgarisms.

The reason for this is that the words of this kind are understandable only to a limited group of people, who are united by a specific social or professional characteristic. The absence of clear criteria for the selection of euphemisms, of course, is also indicated by Western researchers K. Silver, J. Niemann, J. Ayto, B. Warren, R. Holder, who recognize a high degree of subjectivity in classifying this or that word or expression as a euphemism.

At the present stage in foreign linguistics, the euphemisms are actively studied not only and not so much from the point of view of lexicography as *from the point of view of linguopragmatics* (A. Horak, M. Cordoba Rodriguez).

A lot of works are devoted to the targeted study of individual *thematic groups of euphemisms*, for example, political euphemisms, economical euphemisms, etc.

It is noteworthy, that in the 21st century, the scientific interest in studying of *connections of euphemism and taboo hasn't disappeared* - thus the continuity of research traditions, a continuous development of scientific thought is ensured (B. Brown Gfrorer).

From such a short historical passage, it is clear that the euphemisms have been interpreted and studied abroad for many centuries; while the range of views approaches to the consideration of theoretical problems are expanding. And the more multifaceted the linguists study euphemisms, the more significant and unresolved issues are revealed.

How the things with the study of euphemisms in Russia stood and still stand, is presented in an overview below.

It is generally accepted, that the first mention of the euphemisms in Russian linguistics refers to the middle of the 20th century and is associated with the publication in 1961 of a B.A. Larin's work "About euphemisms", which was published in the collection "The problems of linguistics", dedicated to the 75th anniversary of the Academician I.I. Meshchaninov.

However, to be more precise, it is important to remember, that twenty years earlier - in 1935-1940 - an article on euphemism was published in the "Explanatory Dictionary of the Russian Language" under the editorship of D.N. Ushakov. In this article, the euphemism was defined as follows: "Euphemism (from" Greek. " *euphemeo*- I say politely) (ling.) - a word (or expression), used for an indirect, veiled designation of some object or phenomenon, when calling it by its direct name in a given setting is inconvenient, indecent or is not accepted (for example, "in a delicate situation", instead of "pregnant"; "if nothing happens to the patient"

instead of "if the patient does not die)". And here is an interesting fact: the definition of this term has not undergone changes in subsequent reprints of the dictionary by D.N.Ushakov.

Returning to the work of B.A.Larin, it is worth noting its main message, related to the need to study the euphemisms, and the main provisions, which in many ways became programmatic for further research of the problem of the euphemisms:

- the connection between euphemism and taboos with the proviso of the need to differentiate the vestigially preserved substitute words according to the prohibitions of ancient religions (taboos) from the modern euphemisms, whilst "direct historical connections with the euphemisms of the new time have only those renamings according to the prohibition, the purpose of which is to embellish their subject, in order to avert its bad influence";
- the highlighting of the spheres of use of euphemisms (on the one hand, diplomacy, journalism, oratory, where euphemisms are conditionally obligatory, and, on the other hand, colloquial speech, in which the euphemisms are optional and are often used for fun);
- the fragility of the euphemisms: "as soon as the implied unpronounceable expression goes out of use, the euphemism loses its "ennobling" properties, as it goes into the category of direct names, and then requires a new substitution";
- the perspectiveness of the classification of the euphemisms according to their social nature, in contrast to the classifications of euphemisms according to purely formal indicators (in terms of the parts of speech, the composition, and the origin);
- an identification of euphemism and figures of speech (a metaphor, a metonymy, a synecdoche) according to the semantic structure and their delimitation according to the scope and functional orientation (the figures of speech are used to represent reality, (while) the euphemisms - to "obscure, cover up the unsightly phenomena of life or immodest thoughts, intentions".

The ideas, presented by B.A.Larin have played a significant role in Russian linguistics, have outlined another circle of linguistic issues, have outlined the trajectory for the study of the euphemisms, and have provoked new scientific discussions.

In Russian linguistics of the 20th century, as in foreign linguistics, a wide interpretation of euphemisms prevailed, in connection with which the euphemisms and substitutes for taboo names were mixed. However, a narrow approach to understanding the euphemisms was also indicated in the scientific literature. "The supporters of a narrow approach have attributed to euphemisms only words and expressions, that are used by the speaker instead of the forbidden (taboo) ones (L.A. Bulakhovsky, J.J. Warbot, A.A. Reformatsky); or the substitutes for obscene words (V. Bui)".

The problem of identifying the criteria, by which a linguistic unit can be attributed to euphemisms, is also very very relevant for domestic linguistics, as well as for a foreign one. One of the attempts to resolve this problem is presented in the work "The euphemisms of the Russian language" by E.P. Senichkina. Despite this, the relevance of the problem of finding clear criteria remains up until these days.

In Russian linguistics, the euphemisms are studied mainly on the material of the Russian language, however, quite a lot of research has already been carried out on the material of other languages: of English (A.M. Katsev, E.K. Temirbaeva, T.S. Bushueva, Yu.S. Baskova, T.A. Kovaleva, Yu.S. Arsentieva, etc.), of French (L.S. Turganbaeva, E.Yu. Golovanova), of German (N.M. Berdova, A.N. Prudyvus), of Spanish (A.V. Rodchenko], K.V. Yakushkina), simultaneously on the material of all the above languages (L.V. Porokhnitskaya).

At the present stage of development of the theory of linguistics, the euphemisms are actively analyzed from the positions of:

- *sociolinguistics* (G.A. Vildanova, E.O. Miloenko);
- *cultural linguistics* (N.V. Tishina, L.V. Porokhnitskaya);
- *cognitive linguistics* (N.V. Tereshchenko, O.S. Tsydendambaeva);
- *linguopragmatists* (E.V. Kiprskaya, L.V. Savvateeva).

In Uzbek linguistics, this issue was first covered by Nemat[smatullaev's scientific research [6]. Anvar Omnturdiyev's doctoral dissertation examines the problems of professional speech euphemisms [14]. B. Urinbaev also expressed his valuable views on the phenomenon of euphemism in speech in a number of his works [25]. Linguist H. Shamsiddinov comments on the euphemistic functional-semantic synonyms of words [23]. Particularly, Z. Kholmanova, who studied the lexicon of "Boburnoma" in a special monograph, expressed her valuable views on the euphemisms used in it [22]. Scholar - euphemistic expressions in "Boburnoma" emphasize the semantic structure of the lexicon of the old Uzbek literary language, emotional-expressive features, the author's linguistic skills, the method of artistic description. The research analyzes the euphemistic units of the concept of "death" and describes its forms used for specific semantic and methodological purposes.

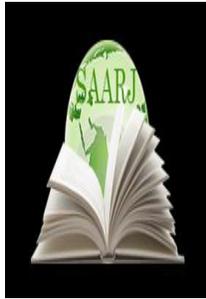

By the XXI century, the field of study of the concept of euphemism has expanded significantly, and in recent years, scientific research has studied its gender characteristics, its application in a particular field, in medicine - medical euphemisms [24]. When studying the evolution of euphemisms, it becomes clear that many terms become obsolete over time and can no longer be a casual, pleasant expression of those concepts. As a result, a new, more audible euphemism emerges in place of the first euphemistic engine. In this case, the original euphemistic means are

re-tabulated, new euphemisms are formed. It is because of this need that many euphemisms arise from a single concept. For example, the “**gajdum**” and “**kajdum**” euphemisms used instead of “**scorpion**” were tabooed when they did not meet the requirements of speech, “**donkey**”, “**nameless**”, “**benom**” (**without name**) (because people were afraid of saying its name, that’s why they used euphemism to soften the meaning) euphemisms were used instead. The word “**birth**” was used only as a metaphor for mankind and later for animals. As a result of the development of language, the concept of birth is “**to turn a blind eye**” to man, to be saved; in the case of animals, it has been used interchangeably with euphemistic means such as “**calving**”.

ABSTRACT

This scientific article describes the results of research on the theoretical foundations of the design of lessons aimed at the formation of cartographic competence in students majoring in "Geography", the control and evaluation phase, selection and justification of teaching methods, forms, tools.

KEYWORDS: *Lesson Design, Control And Evaluation Phase, Teaching Methods, Teaching Forms, Teaching Aids, Design.*

INTRODUCTION

The teaching technology developed for the formation of cartographic competence of students through the study of cartographic disciplines in higher education is a specially developed educational process.

As a type of design-pedagogical activity, it means the development of an appropriate project of teaching technology-a didactic description of the pedagogical system, the implementation of which is carried out within the educational process.

By design, we mean a set and sequence of procedures, as a result of which the teacher develops a model of the future process of teaching cartographic subjects in higher education. It follows from the above that the teacher needs to develop a learning process that involves the selection, comparison, and development of teaching material, i.e., it is necessary to create this project and fill it with real content.

The technology of teaching cartographic sciences aimed at the formation of cartographic competence of students of higher education institutions includes the following stages:

1. The stage of defining educational goals - provides the definition of goals and objectives of education.

2. The stage of selection and structure of the content of the study material. The components of this phase in the technology under consideration are a set of knowledge, skills and competencies in cartography, topography and the main sections of the GIS needed to carry out certain types of learning activities.

1. The stage of selection and justification of teaching methods, forms and tools.

2. Monitoring and evaluation phase - is associated with the need to establish feedback between teachers and students, which allows to monitor the progress of the pedagogical process at all stages of the implementation of teaching technology, evaluate and correct its results.

Based on the fact that the process of teaching cartography, topography and GIS is a system with stages, we conclude that one of them cannot be changed, corrected or missing to ensure that the teacher achieves the set learning objectives. Otherwise, the achievement of the goals and objectives set in the learning process will occur partially or not at all. Therefore, the creation and application of the above steps is the most important condition for the successful implementation of the technology of teaching cartographic sciences.

A similar learning process can be presented in the form of a diagram. We will consider the main stages of designing a person-centered technology of teaching cartographic subjects aimed at the formation of cartographic competence of students of higher education institutions.

The subject "Fundamentals of Topography, Cartography and GIS" belongs to the general professional sciences .

The stage of defining learning objectives is the first stage in the design of person-centered learning technology aimed at forming the cartographic competence of university students.

According to the proposed approach [1], didactic goals can be divided into the following levels: the systemic level ensures the formation of common goals in accordance with the state education standard. the level of science involves the formation of didactic goals in accordance with the teaching profile of a particular specialist. at the module level, as well as at the level of a particular course of study, the objectives of the study of the topic according to the section or topic of a particular course of study are described in detail.

It would be legitimate to use this approach to define learning objectives in the context of this study.

Given that this teaching technology is developed in accordance with the requirements of the state educational standard, we will focus on the formation of goals for the study of these subjects at the science level.

Analysis of the curriculum of the subject "Fundamentals of topography, cartography and GIS " showed that the current objectives of teaching cartography are: to teach students about maps, atlases, plans, photographs, topographic maps and other cartographic works; to get acquainted with the main types and types, to master the skills of working with them, to compare, to analyze maps, aerial photographs; to master the main types of topographic and geodetic surveys of the region; to solve problems of topographic maps and plans; to create cartographic works.

The objectives of the study of cartography and topography at the science level are formulated as follows:

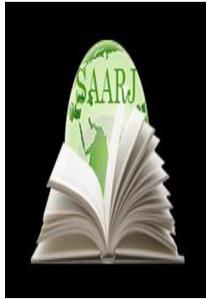

1. To form in students the correct understanding of cartography and topography as a profession of professional significance, which provides the formation of cartographic competence.
2. To treat the chosen profession with respect, to develop the need for cartographic knowledge, skills and competencies for geographical education.
3. To form the knowledge and skills of students in the field of cartography and topography, as well as the ability and readiness to use their generality to carry out educational and professional activities.

The main and ultimate goal of education is to provide the necessary cartographic competence of graduates in the field of education "Geography". The description of these goals has a very wide range, so it is very difficult to check the level of achievement of three goals in a limited time (during one lesson). In our opinion, it is necessary to analyze in detail the objectives of the study of "Fundamentals of topography", "Cartography" and GIS at the modular level, as well as the level of a particular course.

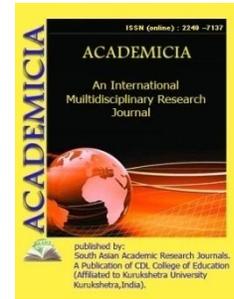

The content of teaching in these subjects is presented as a set of what students need to learn in the learning process in order for the quality and level of knowledge of cartographic knowledge to meet the requirements of their future professional activities and the goals and objectives of teaching.

HISTORICAL INVERSION ON THE EXAMPLE OF THE GREAT UZBEK WRITER ISAJON SULTON'S WORK "BOQIY DARBADAR"

Naimova Aziza Muxammadovna*

*Teacher,
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

In this article we have focused on understanding the essence of the content of historical inversion, its specific types of directions. We have also witnessed very different images of the chronotope from the past and the future. The time and space phases of the chronotope were analyzed using each sample.

KEYWORDS: *Historical Inversion, Chronotope, Future, Past, Gene, Euthanasia.*

INTRODUCTION

We know that literature is a huge ocean, its diversity, its charm, its visual qualities attract people. Literature is a means of helping him to understand and feel in a special world, concepts and imaginations that have never been seen or heard, different kinds of things that have not yet been completely identified by new scientists for humanity. It is so powerful that it allows the reader to discover worlds and planets other than Earth, new research and techniques that the human brain cannot yet comprehend, advances in science, a completely different vision than the human child, and a few brains. It creates an understanding by feeling creatures that work equally hard and have their own natural diversity. When a writer creates a certain literary work, he adds to it the colors of emotion and richness, so that the reader can read it and feel like a pedestrian in this country. The brilliance of these colors brings it back to the past a few years ago, and in some cases, the reader is able to imagine himself in the future several hundred years ago and become acquainted with the research of scientists. Such travels about the past and the future are one of the features of historical inversion, and this is its peculiarity. According to several researchers, the basis of inversion is the chronotope. That is, the word chronotope is Greek, meaning chronos-time, and topos means place, a term very close to psychology in science. The term was first used in science by Professor Ukhtomsky, a skilled psychologist in his field, through physiological laboratory research. The term began to be used by many literary creators, scientists and

researchers in the twentieth century, and its original use is due to the close interdependence and commonality of the units of space and time. In the literature, the term was first coined by the Russian scholar M.M. Bakhtin introduces the units of time and space in a chronotope in a single literary work and says that literary criticism is included in works of art of different genres, in different historical periods, in different authors to define specific ways of describing time and space relations. . In his view, the chronotope has a very important genre in the literature, so the genre and genre varieties are determined by the chronotope, and the leading principle in the chronotope is time.¹

MAIN PART

In fact, this tradition dates back to antiquity, when Aristotle and Leibniz, geniuses with a deep knowledge of the genre, argued that the understanding of time and space are contradictory concepts, and Gegel linked such categories with each other. that is, the interdependent coordinates of a four-dimensional constant context. Another idea was put forward by Vernatsky, and based on his research, the same shape of the nosphere is explained by a single time and space, which is associated with the spiritual dimension of life. These two terms, which are radically different from psychology, consist of two concepts in perception, that is, in the phase of perception, such as coloring and coloring, and they have their own semantic features. In the same way, if we recall the example of M. Bakhtin, within the framework of these concepts it is possible to understand both material and spiritual reality, but at its center is man. That is, time and space help us to grasp the essence of a particular work. In this case, space and time are considered abstract, through which it is possible to create an image of a single space, a single and ordered universe. It depends only on the place and time of the writer's desire, and determines the development of the movement and the behavior of the characters. This imaginary time and space is not like any other writer's abstract chronotope in a work of art, nor is time and space in real reality. In general, the chronotope in the pearl of literature is the similarity of these spatial and temporal relations. Thus, the writer introduces the reader to the world of his imagination, forming an associative connection between the reader's consciousness and the new world.

Centuries later, there was a lot of debate among researchers about the specifics of historical inversion. Behind this debate, scholars have repeatedly debated whether the categories of space and time are mutually exclusive or contradictory, and these debates have shown their development as an integral unit of the two-component historical genre. . We can see the features of the genre in Isajon Sultan's work "Eternal Wanderer", which was chosen as the main object of our article. In this work, the author was able to show the unique brilliance of society as a whole, with the invention of an unusual-looking human child, forcing the reader into a special situation.

First of all, we can take the desert worm as an example to prove our point: *u o'zidan juda kuchli elektr quvvati chiqarib, yon-veridagi har qanday jonzotni ko'mirga aylantiradigan ulkan to'mtoq sahro qurti – olg'oy-xorxoy haqidagi xabarlar keldi Professorning xayoliga. Olg'oy-xorxoy faqat Gobida yashaydi. Tana tuzilishini shaffof holga keltiraoladi, goh ko'rinib-goh ko'rinmasligining sababi shunda...*²

It would not be a mistake to say that the first study above was a specific type of creature, a worm, which has its own characteristics, more precisely, the fact that it emits electricity from the body, which gives it transparency. The research in this example is a type of worm that appears a few years after our era, but in this case, the invisibility of the body of this man-made creature is

its novelty, and it emits some kind of fire. At first glance, some of the features are similar to those of dinosaurs that lived a few years ago. The general technique of fire is the same, but this worm burns everything around it and turns it into charcoal, and its body becomes transparent. its arrival is its peculiar novelty. This means that the existence of this timeless animal in the Gobi Desert is a testament to the writer's chronotopic creativity.

Monitorda shisha xona ichida ko'zlari katta-katta bir odam ko'rindi. U tevarakka olazarak alanglar, nimadandir juda bezovta edi.

– Bu – olti yuz oltmishinchi raqamli odam, – qorong'ilik ichidan ovozi keldi olimning. – To'rtinchi halqa DNA o'ramlariga o'tkazilgan ta'sirlar natijasida u nurlanishlarga chidamli bo'lib dunyoga keldi. Bu genomning nuqsoni – u ko'r. Chunki oddiy sharoitda yashay olmaydi, quyosh nurlari vujudiga halokatli ta'sir ko'rsatadi.³

In this example, the author surprised us with another invention on the trip. More precisely, it is astonishing that this invention is a human being: scientists have created this human-like creature due to the influence of the fourth ring of DNA bundles. Scientists who have shown great interest in this invention have shown that it is resistant to radiation, but his eyes can not see, and his resistance to strong rays of the sun is his minus. In general, the fact that such beings do not correspond to our time, both in terms of time and space, is a masterful depiction of historical inversion, which is the invention of the human child, designed to live in a different world. The uniqueness of this invention is that its body can withstand radiation, and the effects of summer radiation on humans are very dangerous. For example, a few years ago, when the United States dropped its atomic bombs on the Japanese cities of Hiroshima and Nagasaki, history has shown that several innocent people and their future generations will suffer from a number of incurable and serious diseases. It is no exaggeration to say that the cause of such diseases is the radiation caused by atomic bombs, which has affected seven generations of the Japanese people.

Every researcher who took part in this conference would have lost his inventions due to various future goals of someone, and if he did not give the expected result, he would have lost them in the same way. It seems that even a tiny creature, which is considered to be an object in a glass room, was created to perform very important functions in operations performed by various rays, but like the back of a coin, this invention can withstand the effects of radiation, but God He was also intolerant of the rays of the sun, which is one of the great blessings of God. This also proved to be a failure as a miracle of nature, or as an event that shows the oneness of God.

– Mazkur jonzot favqulodda qobiliyatlarga ega holda dunyoga kelishi ko'zlangan edi. Darhaqiqat, uning suyaklari g'oyat egiluvchan, lekin vujudi bunday egiluvchanlik uchun lozim bo'lgan katta miqdordagi ma'danlarni yetkazib berolmagani uchun halokatga mahkum.⁴

This means that the next invention is a creature belonging to another world in the form of a human being, which has different properties, ie the flexibility of its bones. The names of such inventions are called by a combination of numbers consisting of a combination of several numbers, and their inherent qualities are not compatible with the globe. This indicates that the chronotope in our article is a sharp pen of the writer through very strong images. That is, no human body on our planet is very flexible.

If we look at this extraordinary talent in the example of the chronotope's unit of time, this creature is not typical of the XXI century, that is, maybe a few centuries later it will have many

relatives and clans. In addition, such extraordinary abilities are not typical of our time, that is, a period long before the age in which such creatures live and reproduce. This also shows that humanity has a very strong imagination and can serve as an example of the future image of historical inversion.

If we now turn our attention to the spatial part of the chronotope, the bony organs of this creature must be distinguished by the highly flexible body of minerals. But it does not have the feature of producing such mines. This means that scientists have not been able to determine the reasons for the inability to deliver these minerals, and this again indicates that the location in the chronotope is not suitable. Probably, the reason for the survival and development of this creature is an alien planet, which contains biovitamins, air, water and other similar substances, which are suitable for the body to produce minerals at the desired pace. In general, the environment on our planet is not specific to this creature, and this indicates that the object of space is completely different from the current state.

– *Mana bunisi esa barhayot jonzot, – deb davom etdi olim. – Avstraliya toshbaqasining genlari bilan chatishtirish orqali dunyoga kelgan bu odam juda uzoq yashaydi. Afsuski, teskari qonuniyatlar yana pand berdi – harchand uzoq yashasa-da, unda aql nishonasi yo ‘q.*⁵

The next new and different discoveries are the most unique of all, and one of the greatest dreams of every scientist is to create a life-long human being. However, this described the longevity of the human-like creature. The reason why it survives at this level is that it is crossed with the genes of the Australian tortoise, which is said to live a very long time, and this peculiarity is inherited from this creature. However, it was once again emphasized that the discoveries of these scientists could not be compared to the miracles of Allah, no matter how hard they tried, that is, no matter how long this unique creature lived, it did not have the ability to think. Although the appearance was human, it was an example of an animal or a tortoise with mixed genes.

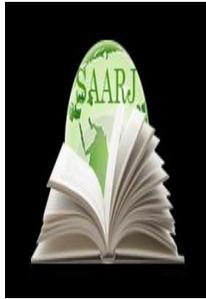

So, we have considered the characteristics of this discovery, and now we will focus on whether such creatures are relevant to our time and space in terms of time and space. First of all, in terms of time, there are many difficulties in creating such creatures. For such a very difficult laboratory training, it is necessary to have a variety of very complex tools and equipment, to successfully complete a number of procedural operations. Here the writer was able to see similar future discoveries with a very beautiful and sharp look, and was able to show it to the reader in such a realistic way. In this case, we see the brightest and most influential point of the science fiction genre. When we measure Xtonotop on a time scale, we see that such unseen and unheard discoveries must have taken place centuries later. The spatial category of inversion also leads to chronotopic inconsistencies in the fact that the same situation occurs in this region.

CONCLUSION

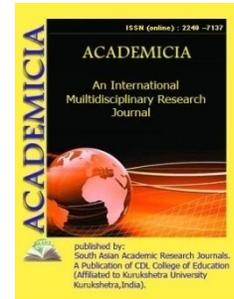

In this article, we have focused on understanding the essence of the historical inversion, its specific types of directions. We have also witnessed very different images of the chronotope from the past and the future. We have tried to study this scientific work in the framework of a well-known work of Isajon Sultan, and among his works we have found and analyzed many examples of the subject of our subject. Most of the examples are about the future depictions of the chronotope, which the author tried to show under a very strong lie - the truth.

SOME CONSIDERATIONS ABOUT PERIPHRASES

Kobilova Aziza Bakhridinova*

*Researcher,

A teacher at the Department of English Linguistics,
 Bukhara State University, UZBEKISTAN
 Email id: aziza.kobilova2101@gmail.com

ABSTRACT

The article deals with the scientific importance of periphrasis. The article analyzes the universally accepted periphrasis (phraseologies, wise sayings) and the situational periphrasis (some of which, as a result of consistent use, are related to a particular text), figurative and logical periphrases. The article also discusses metonymic periphrases, euphemistic periphrases, traditional periphrases, and author's periphrases through examples.

KEYWORD: *Periphrasis, Language, Linguistics, Stylistics, Figurative Periphrases, Logical Periphrases, Original Periphrases, Traditional Periphrases, Metonymic Periphrases, Euphemistic Periphrases, Traditional Periphrases.*

INTRODUCTION

Journalism is a type of literary work devoted to the coverage of the most important and topical socio-political issues of our time, news, articles, essays, feuilletons, pamphlets, reports, announcements that appear in the media around us, and cover journalistic elements such as news. In doing so, the publicist not only uses his or her skills to think about an event or problem but also influences the thinking, emotions of the reader or viewer. The main task of journalism is to arouse public opinion, shape it, direct it to a specific goal, and create a picture of reality based on concrete facts.

Main part

It is known that the most striking feature of the journalistic genre is the brevity and conciseness of the image in the text, which is characterized by its sharpness, richness of images, and expressiveness. In some forms, this trait plays a leading role. They make extensive use of figurative and adjective-based imagery. The active use of metaphorical units is especially characteristic of this genre. In a speech situation, there is a need to describe the events of the

society in a way that suits the situation and to choose the right methods of expression. In such cases, the speech refers to ready-made, common expressions, such as phrases, periphrases, idioms, euphemisms, and dysphemisms. We often encounter such examples in everyday communication as well as in artistic discourse. Among them are periphrases, or figurative expressions, which are one of the devices that make speech beautiful, figurative, and uplifting.

Periphrases are a compound that describes an object, an event, not by its name, but by describing an important feature: *white gold* - cotton, *silver fiber* - cocoon, "*Northern capital, a city in Neva*" - Saint Petersburg, etc. Periphrases enrich the vocabulary as society evolves. It avoids repetition in the speech, encourages the speaker to speak and the listener to observe. Besides, periphrases are used not only to appeal to the imagery, to enrich the speech, to enhance its content, but also to expose, ridicule, and challenge the flaws that hinder society's progress [5, 2]. In particular, periphrases are an important speech tool in describing, exaggerating, interpreting, and supplementing an important feature of an event that does not occur in its name [2, 104].

"Periphrasis" in Greek means "*a detailed, broad explanation of a compressed speech, expressing a word with another word, changing words to interpret one word*" [1, 14]. This includes replacing a word with a broader expression or expressing a concept more broadly using other concepts [4, 8162]. In other words, it's like naming a word with a different combination of artistic colors. The use of *desert ships* for camels and *white gold* compounds for cotton is a periphrasis phenomenon.

Periphrasis is found mainly in the language of fiction, in journalistic and oral discourse, and in scientific discourse, it is devoid of imagery and is used as a term. Functionally, there are two types of periphrasis: the universally accepted periphrasis (phraseologies, wise sayings) and the situational periphrasis (some of which, as a result of consistent use, are related to a particular text). At the same time, there are artistic, figurative periphrases (such as *white gold* - cotton, *blue fire* - gas, *steel bird* - airplane) and mantle-like periphrases (example, euphemisms, taboos). Most periphrases are equestrian compounds based on metaphors, metonymy, and synecdoche.

L.N. Sinelnikova points out that, periphrases are formed in four different ways: [6, 304]

1. In a logical way: "*the queen of the field*" - corn "*Instruments of obstruction*" - pistols. "*The most pardonable of human weakness*" - love.
2. In the synecdoche method: *the horned commander* - Alexander the Great "*Furry paddle tailed mammal*" - the beaver.
3. In the method of authorship: "*American inventor*" - Christopher Columbus "*A disturber of the piano key*" - pianist (O. Henry) "*Creator of Macbeth*" - Shakespeare.
4. Naming with a way to increase expressiveness: blonde-haired child - full moon "Thief"! Pilon shouted. "*Dirty pig of an untrue friend!*" (Steinbeck)

Also in linguistics, there are the **metonymic periphrases**: *white-collar* nurses, "Send me a steel knife tied to a bottle-turned head, that is, a chariot, using Delilian's language" (a letter to Pushkin's brother); **euphemistic periphrases**: (die) - to go to the eternal world, a toilet - a washroom, public convenience); **traditional periphrases**: ("*better half*" - husband or wife), and etc.

According to Moskvina, periphrases should consist of at least two components. Accordingly, it is also divided into two or three (or more) component periphrases [3, 376]. Periphrases can be divided into genuine and contextual periphrases, depending on how they occur in speech as a unit of speech. Well-known scientist Galperin calls genuine periphrases traditional and contextual periphrases original periphrases [1, 161]. In this case, genuine periphrases express a certain meaning, a concept without any context, and, most importantly, can be understood by the public without text. For example: “*guardians of our health*” - doctors, “*owner*” - Amir Temur, “*white gold*” - cotton, “*silver fiber*” - cocoons. Contextual paraphrases, on the other hand, are descriptive expressions that are created only in a particular text and live for that text. They cannot be taken separately from the text. More precisely, they are a figurative expression of a particular language unit only in the text, surrounded by other words. For example, the periphrasis “*medicine of kings*”.

Periphrasis is a stylistic term to describe an object. Such a description occurs based on any bright and significant character or quality distinction. An example of periphrasis in English can also be found in ordinary speech. Often the periphrasis is so vividly expressed that it is stable and many people use it in everyday communication. Often we use different phrases, but we don't know if they are periphrasis. As a child, while watching cartoons and reading books about different animals, every child hears the phrase “*king of beasts*” and we know that he is a lion because he looks so important and wonderful, so powerful and scary. Or we watch movies about most space exploration and hear how the Earth is called the “*blue planet*”. Much of it is occupied by the surface of blue water.

There are many such examples of periphrases in English. They are used by many people in different fields. For example, “*bovine milk factory*” - a cow, “*vitamin - laden liquid*” - milk, “*passed away*” - died, or when it comes to Margaret Thatcher, “*Iron Woman*”. Such periphrases are present in every language. Some of them are logically universal, while others have a specific nation and its speech. For example, Lady Margaret Thatcher. The motivation for this periphrasis can be explained by the following: The little girl, the daughter of a grocery store owner, had many nicknames, but she became known around the world by the nickname *Iron Lady*. The nickname given to her after she became prime minister in 1979 justified itself again.

Where did these figurative expressions come from and why are they so popular? Periphrases often come to us as a result of their authors being read, loved, and discussed by many well-known writers, publicists, poets, and their works. They can be taken from live newspaper headlines, commercials, media, movies, TV shows. Anyone can be the author of a periphrasis. These can be some phrases that convey an image that is understandable in the family or among friends. Such periphrases are unlikely to be popular, but they can be used among humans. The periphrasis retains the meaning of the concept or event, in other words, for example, “*Blue planet*” - The Earth; “*Black gold*” - oil; “*Second bread*” - potato; “*King of mushrooms*” - porcini; “*Ship of a desert*” - Camel; “*Eternal city*” - Rome; “*Twilight of life*” - old age; “*The leader of the country*” - president; “*Precious adornment of the night*” - the moon and stars; “*Our little friends*” - animal.

In works of fiction, journalism, and public speaking, it is used as a stylistic device to increase the clarity of the statement, to have a stronger impact on the reader or listener. In many cases, people unfamiliar with artistic ways are often confused by paraphrasing - a word that sounds very similar but has a completely different meaning, and the term refers to different types of text

interpretation: detailed, abbreviated, adapted, from poem to prose and vice versa. Various commentaries, including scientific texts, are examples.

Periphrasis has a completely different purpose. Examples of this in speech are in many ways similar to the role of rhymes in grammar. Both linguistic phenomena do not call objects, signs, but refer to them: "an armed bandit" instead of "he", instead of "man" and "slot machine". Periphrasis is the replacement of a group of words with a descriptive or metaphorical equivalent equal to its source. In other words, a periphrasis is an indirect, longer way of expressing a concept.

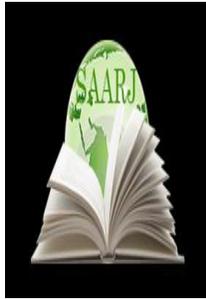

Periphrases include euphemisms or dramatic vulgar phrases, as mentioned above. For example, "I will kick you where your back loses its noble name" or Winston Churchill's phrase "he is economical in telling the truth" is a periphrasis of a liar. In the early days, periphrases were used to eliminate dictionaries from poetry that were used over and over again in everyday life. Over time, periphrasis has spread to other areas of language, especially medicine, and many have become commonplace.

CONCLUSION

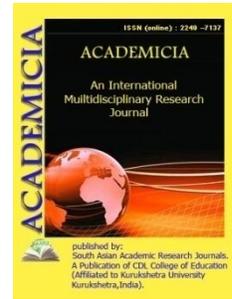

To sum up, periphrasis is one of the devices that serve to enrich speech, make it attractive, figurative, effective, and enhance the content of speech. In stylistics, the term is understood as a lexically indivisible expression of descriptive meaning. He explains another phrase or word allegorically. Periphrases are often used in fiction. Authors can use examples of periphrasis, knowingly or unknowingly, and professional writers tend to be short. Periphrases are one of the most important stylistic devices associated with the speech process, giving speech a glorious, uplifting, expressive.

ENGLISH PHRASEOLOGY AND ITS INTEGRATION WITH TERMINOLOGY

Saidova Zulfizar Khudoyberdievna*

*Bukhara State University,
UZBEKISTAN

Email id: zulfizar1984list.ru

ABSTRACT

The article is devoted to the study of English semi-idioms (a term suggested by A. Kunin), units with both terminological and metaphorical meanings. These units were studied from different angles but here their dual nature is viewed through the possibility of providing an experiment. The paper shows how a linguistic experiment can reveal not only the meaning of some unit, but the peoples' attitude towards the use of these phrases, their individual level of understanding, interpreting and realising. As cognition is very important in the understanding of semantics, as well as a new perspective in the study of phraseology, a synergetic approach as well as a cognitive one is becoming one of the ways to scrutinising the nature of terminological phraseological units. The paper focuses on the possible ways of showing that terms can develop metaphorical meanings though sometimes people have no ideas of the etymology of some units. An experiment to show the dual nature of such units as terminological phraseologisms was provided on the bases of a specially created questionnaire. The result of the experiment proved that some terms can acquire new metaphorical meanings and function in the language and speech as phraseological units. The results of the experiment as well as various references to the matter of the study – semi-idioms – may turn to be useful in language studies, learning English as a second language, investigating English Terminology and Phraseology.

KEYWORDS: *Semi-Idioms, Terminological Phraseological Units, Metaphor, Meaning, Experiment.*

INTRODUCTION

It is well known that the term phraseology itself was proposed by Charles Bally, who studied French stylistics and considered phraseology to be a part of this science. Since his book *Precis de*

stylistique (1905) was published and translated into various languages, there have been many studies of phraseological units. In the Russian school of thought of academician V. Vinogradov described phraseology in his book "Russian language" [19,4]. After that, phraseological units were studied in terms of their semantics, structure and complexity. Kunin wrote: "a phraseological unit is a stable connection. It is well known that the term phraseology itself was proposed by Charles Bally, who studied French stylistics and considered phraseology to be a part of this science. Since his book *Precis de stylistique* was published and translated into various languages, there have been many studies of phraseological units. In the Russian school of thought of an academician.

V. Vinogradov described phraseology in his book "Russian language" [19,4]. After that, phraseological units were studied in terms of their semantics, structure and complexity. Kunin wrote: "a phraseological unit is a stable combination of words with a fully or partially figurative meaning" [3,210]. In the late 90s, cognitive research emerged. This new study is in fact an interdisciplinary study of how people perceive learning and how words are learned through learning. Thus, phraseology became a new direction for those linguists who were fond of cognitive approaches. As Nacicsione writes in his book, "The use of metaphors has been recognized as an integral part of cognition, an uncovering cognitive mechanism" [3,1].

The purpose of this article is to show a modern approach to both English terminology and English phraseology, since some units with a special meaning may undergo certain changes: they acquire a new metaphorical meaning and begin to function in the language as phraseological units. The first linguist to point out some of the features of these dual units was Professor A. Kunin, who compiled the first English-Russian phraseological dictionary, which, along with phraseological units and phraseological units, included the so-called semi-idioms. and described. As Kunin said in the preface to the dictionary, "semi-idioms have both literal and transmitted meanings, the first meaning being usually terminological or professional, and the second being figurative" [5,14]. Examples of these semi-idioms are: chain reaction is a chemical term and an idiom meaning a chain of quarrels, or say too close to the wind is a nautical term and an idiom meaning "to take risks." There are many more examples of semi-idioms, and I intend to reveal their nature by showing the results of research and experiments conducted on the basis of such units. In other words, the synergistic nature of the units under study is the subject of research.

It should be mentioned here that the terminological system does not simply reflect the field of knowledge or activity, but represent the theory underlying it, so that two or more theories appear and are present simultaneously in the same field (for example, in physics and linguistics). Moreover, the terminology is integrative: sometimes the terms of some sciences can function in different terminological systems or even penetrate the language for general purposes (LGP) [6, 14].

In the case of semi-idioms, a rather complex process can be observed: the sphere of LSP (language for specific purposes) penetrates into LGP (language for general purposes), but "mutates" into units with metaphorical meaning.

Material and research methods. The research findings presented in this article are drawn from an experiment conducted in the United States using interviews with people of different ages, social status and gender. The experiment was based on the hypothesis that native speakers cannot confidently assert that the same phrase can be both a term (a word with a special meaning that is

used in a special context) and an idiom. Along with the experiment, a number of other methods were used, such as synthesis and analysis, the method of phraseological identification, the method of contextual analysis, and also some contexts from literary works were used. It was very important to apply the statistical method. The results of the study show that the nature of the so-called semi-idioms, or terminological phraseological units [8,3], is really complex and deserves to be studied from different points of view. The analysis was carried out in several stages: first, a questionnaire was drawn up, including about 33 semi-idioms, taken at random from about 20 dictionaries, and a place to mark whether this unit is a term, an idiom, or both; secondly, each participant had to put a word or phrase related to the unit; thirdly, the method of statistical analysis was used.

RESULTS AND DISCUSSION

According to Seliverstova, the sciences in which we use the experiment include, first of all, physics, chemistry, biology and linguistics [9,432]. The experiment in linguistics originates from the published works of Professor L.S. Shcherba, 1933 Seliverstova and her students developed a theory of linguistic experiment, which is based on the method of testing specific hypotheses with the involvement of native speakers. Seliverstova pointed out that for language learning “a detailed system of qualitative representations is needed, which would be a conceptual apparatus of description ...; linguistic semantics is intended to reveal the picture of the world reflected in the language” [9, 431].

To solve the problem of the so-called "definition of a semi-idioma", a questionnaire was developed, including 33 phrases, the sources of which were the terminology of the military sphere, sports, physics, chemistry, botany and marine science. terms, terms of art and mathematics. The experiment involved teachers and students from the universities of South Arkansas, North Dakota, Wisconsin and Maryland (USA). It is noteworthy that all semi-idioms and their definitions were verified in various terminological and phraseological dictionaries, so that the author had no doubts that the units under study have both terminological and metaphorical meaning.

Participants' work: The person who received the questionnaire had to fill out the table in about 45 minutes. It was quite important to indicate nationality, age, gender and occupation; the following recommendations were given in the questionnaire: Read the phrases below. First, put any word that arises as an association with the word combination, then mark (x) in the appropriate column if you consider this unit a term of any field of knowledge (chemistry, sports, culture, art, military). term, nautical term, etc.) or just an idiom, or both.

So, initially the table looked like this: To prove that all units selected for analysis have both direct, literary and indirect, metaphorical meaning, here are some definitions from special dictionaries: acid test: a method of proving value, truth, etc. anything. The original acid test was the nitric acid test for gold. If it was genuine and pure, it was not touched; if they are false or mixed with other metals, they will corrode [2,1], or else: sail close to the wind: violate the rules of acceptable behavior, etc. [10,4220].

Thus, as shown, all semi-idioms used for analysis have a synergistic, dual nature: being originally a term, they can undergo some specific process. Thus, metaphorization takes on a metaphorical meaning.

However, the whole experiment just shows how people immediately understand some idioms: units can not only come from terms, but also function as terms in the terminological realm. As Koveches writes in his book, “metaphor plays a role in human thinking, understanding and reasoning, and, in addition, in the creation of our social, cultural and psychological reality” [6.13].

CONCLUSION: The research results presented in this article clearly show that one of the promising ways of studying linguistic phenomena is their combined study: the semantics of some units can expand and give way to some new meanings, which, in turn, will develop further and further combinations ... On the other hand, it is important to emphasize that all registers overlap, they can diverge in different areas, giving way to such complex units as semi-idioms. Studying them is not only an expansion of vocabulary or a deepening of knowledge, it is an opportunity to reveal the laws of the formation of new words and phrases, to find universal features and to be able to trace the patterns of the formation of new meanings. A good way to learn more about language and cognition is to do an experiment, compare the results, and find out some of the features. It is also important for our brain to work to understand how new associations and metaphors emerge and overlap. When conducting a linguistic experiment, it becomes possible to investigate the issue of inference - to obtain a certain result in the process of information processing, that is, to study terminological phraseological units from a cognitive point of view. Phraseology is an area for deeper study, and there are many approaches that reveal the complex nature of phraseological units. One of them was presented in the article, and the experiment contributes to a better understanding of our metaphorical competence. The prospect of studying the semantic features of semi-idioms is quite difficult and may give way to new discoveries in the field of terminology and phraseology, their core and periphery.

Email id: smunavvar2015@gmail.com

ABSTRACT

The article discusses speech etiquette as an integral part of the national language and English speech etiquette is a set of special words and expressions. It also deals with the purpose of the speech act, focus act, pronounced psychological state of the speaker, the power of striving to achieve the goal, differences in the status of the speaker and the addressee, expression of interests of the speaker and listener.

KEYWORDS: *Speech Etiquette, Intercultural Communication, Society, Extra-Linguistic Goal*

INTRODUCTION:

It is obvious that speech etiquette is an integral part of the national language and culture of every country. It is impossible to talk about a high level of proficiency in a foreign language if this proficiency does not include knowledge of the rules of verbal and non-verbal communication and the ability to apply these rules in practice. It is especially significant to be aware of the discrepancies in national speech etiquette. The norms of speech etiquette are very diverse; each country has its own traditions and characteristics of the culture of communication. English speech etiquette is a set of special words and expressions that give a polite form to English speech, as well as the rules according to which these words and expressions are used in practice in various communication situations. English speech etiquette is important not only for the English themselves, but for all learners of English as a foreign language.

A speech act is a purposeful speech action performed with the principles and rules of speech behavior adopted in a given society. The speech act has such features as intention, purposefulness and conventionality.

The speaker and the addressee participate in the speech act, acting as carriers of certain, mutually agreed social roles, or functions. Participants in a speech act have a fund of general speech skills,

knowledge and ideas about the world. The product and at the same time the instrument for achieving a certain goal of the speech act is the statement. A speech act can achieve a set goal and thus be successful, or not achieve it, it depends on the circumstances in which it is performed. To be successful, the speech act must be appropriate. Otherwise, the speaker will have a communicative failure, or a communicative failure.

RESULTS AND DISCUSSION: As we have already understood, a speech act is speaking of something. And therefore, in this aspect, it acts as a locative act (from the Latin locutio "speaking"). In the process of speaking, a person simultaneously performs some action that has some kind of non-linguistic purpose: he asks or answers, informs, assures or warns, appoints someone as someone, criticizes someone for something, etc. A speech act, considered from the point of view of its extra-linguistic goal, acts as an illocutionary act [10,51].

According to John Austin, these very functions of the speech act are usually called illocutionary forces, and the corresponding verbs - illocutionary ("promise", "notice", "apologize", etc.). The concept of illocutionary force, along with the illocutionary goal: intensity, method of achieving the goal, features of the dependent proposition and other individual conditions for the use of specific speech acts: (acts motives, demands, advice, etc.) [1, 85]. Some illocutionary goals can be achieved with facial expressions or gestures. The classification of speech acts is based on various criteria associated with one or another aspect of the speech act itself. One of the fundamental classifications of speech acts belongs to John Searle. The researcher builds a typological system based on the following parameters: 1.) the purpose of the speech act; 2.) focus act; 3.) pronounced psychological state of the speaker; 4.) the power of striving to achieve the goal; 5.) differences in the status of the speaker and the addressee; 6.) expression of interests of the speaker and listener; 7.) attitude to the speech context; 8.) difference in propositional content; 9.) the difference between acts that have only verbal realization and acts that can be carried out both verbally and non-verbally; 10.) the difference between speech acts, the success of which is due to certain extralinguistic factors and those acts, the success of which does not depend on social institutions; 11.) distinction between acts in which he does not belong to the category of performatives; 12.) the style of the speech act. The most important of those listed by J. Searl is the first three.

Based on the named parameters, J. Searl singles out [3, 48]:

- 1.) Representatives - speech acts that represent a certain state of affairs (statement, prediction, explanations, classifications, descriptions, etc.). Example: I predict it will rain;
- 2.) Directives - speech acts used by the speaker to induce the listener to perform some action (request, advice, etc.). Example: I predict you will leave;
- 3.) Commissions - speech acts imposing on the speaker an obligation to perform a certain act (a promise, vows, offers, etc.). Example: I promise to pay you;
- 4.) Expressive - speech acts that convey the psychological state caused by some event (expression of gratitude, congratulations, condolences, etc.). Example: Congratulations on your victory;
- 5.) Declarations are speech acts, the success of which guarantees the establishment of a correspondence between their propositional content and a certain state of affairs. I would like to draw your attention to one of the listed groups of speech acts, namely, directives. All directive

speech acts fall into three large classes: prescriptive (prescriptive); advice (suggestions); requests (requester speech acts). Within these classes, various functional variants of directives are distinguished.

1. Prescribing speech acts include: order, order, prohibition, demand, etc.

2. Tips include: proposal, appeal, warning.

3. Requests. The pragmatic characteristics of this speech act are the optionality of performing an action for the addressee, his right to make a decision to perform or not perform an action, and the profitability of an action for the speaker. These include: a *request for permission, supplication, and an invitation. Here are some examples:*

1. - *May I ask you? - May I go out? (Can I get out?).*

2. - *I beg you, do not shout, please!;*

- *I appeal to you, to let me alone. (Please leave me alone)*

3. - *I ask everyone to the table!;*

- *Shall we go for a walk? (Shouldn't we go for a walk?).*

The success of a speech act depends not only on the psychological state of the speaker, but also on his sincerity and correct presentation.

When considering the issue of politeness in an intercultural aspect, it should be assumed that the understanding of politeness in different cultures is different. For example, some peoples may associate politeness with reverence, with modesty, and still others with demonstrative attention to others. The most standard definition of politeness as a manifestation of respect, attention to others, also does not seem to be acceptable for intercultural communication, since even such universal concepts as respect, attention have different content (*compare, for example, attention in an unfamiliar woman in Arab countries and Latin America, respect for elders in the East and in Europe*). Every culture has its own concept of politeness. The different content of this concept is reflected in language and speech and is manifested in lexical-grammatical, functional, pragmatic, discourse features. Since politeness is understood differently in different cultures, it is incorrect to say that one nation is impolite or more polite than another, since there is no "culturally free" basis for determining the degree of politeness.

It is possible to understand and explain what politeness is only with an integrated sociocultural approach at an interdisciplinary level - through consideration of culture and the characteristics of social relations characteristic of its representatives, that is, first of all, through cultural anthropology. Supporting Fraser's assertion that politeness is a dynamic concept that changes in time [2,220]. We consider it necessary to add that it is also a variable concept that changes depending on territorial and cultural affiliation. In addition to the time vector, the spatial vector also affects the content of politeness. It seems that politeness should be viewed as a communicative category. Communicative categories mean the most general communicative concepts that order a person's knowledge of communication and the norms for its implementation.

Communicative categories reflect the communicative consciousness of a person, they contain certain conceptual knowledge about communication, as well as norms and rules of

communication. Among the communicative categories that regulate communicative activity, researchers distinguish communication, tolerance, communicative immunity, communicative evaluativeness, communicative pressure, etc. [7, 60].

In our opinion, the category of politeness is one of the most important communicative categories, since it has a cross-cutting nature for the communicative consciousness and integrates a number of more private categories. She plays an important role in ensuring and organizing harmonious communication.

Like the communicative consciousness in general, the category of politeness has a national and cultural specificity, and it can be considered, moving from the type of culture and structure of social relations to the basic cultural values and accepted norms, and then to the rules of communication [9, 95]. This path has great explanatory power and allows you to understand the reason for the differences in communicative behavior, to see, to trace a certain logic in the actions of representatives of another culture. As E.S. Markaryan wrote, "ethnic cultures are historically developed ways of activity, thanks to which the adaptation of various peoples to the conditions of the natural and social environment surrounding them was ensured" [6, 88].

Politeness, in our opinion, is, first of all, adherence to the norms of communication through the use of culturally specific communication strategies that reflect socio-cultural values and correspond to the communicative expectations of a partner. Politeness is about etiquette. However, these two phenomena, important for communication, do not completely coincide. Politeness is broader than etiquette. Etiquette is a set of communication norms and rules. Politeness is a system of communication strategies and tactics used in real communication and aimed at achieving harmony and mutual understanding. Politeness includes everything that contributes to harmonious, conflict-free communication, despite the fact that some of its elements may not be (at a certain stage or in a specific communicative situation) the norm enshrined in etiquette. We offer the following definition of politeness: Politeness is a nationally-specific communicative category, the content of which is a system of ritualized strategies of communicative behavior (linguistic and non-linguistic) aimed at harmonious, conflict-free communication and adherence to socially accepted norms in interactional communication (establishing, maintaining and ending interpersonal contact). Communication strategy is the correlation of communicative actions with the purpose of communication [8, 97]. At the speech level, a communicative strategy is the correlation of speech actions with the purpose of communication and the conventional linguistic means with which it is realized. Thus, verbal (speech) politeness is a system of communicative strategies and conventional linguistic means serving them. The communicative strategy is determined by "the macrointention of the participant in the dialogue, conditioned by social and psychological situations" [5, 73]. Speaking about intercultural communication, obviously, it should be added that the strategy is also determined by the communicative consciousness of the participant in the dialogue, which largely determines the choice of means of achieving a particular communicative goal in a particular communicative culture. The main purpose of being polite is to show your partner a friendly attitude. This goal is achieved using a variety of communication strategies and tactics, the choice of which depends on many communicative factors - situational, psychological, social-cultural.

So, for example, when making an invitation, Uzbek communicants, in order to have a greater pragmatic effect, allow an increase in the impact on the interlocutor (*Come to my birthday party. I will definitely, I will wait very much*), the British, on the contrary, prefer to minimize the

pressure, make the invitation in the most indirect form (*I'm just wondering whether you would like to come to my birthday party*); in response to the invitation, Uzbek communicants like as a rule, they thank and promise to come (*Thank you, I will definitely come*), the British give an emotional assessment (*Great, That would be lovely*).

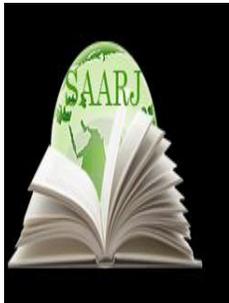

CONCLUSION:

Politeness as a whole is a flexible system of strategies, since in the process of communication in connection with the changing communicative context, communicants are forced to adjust their communicative behavior, trying to make the most optimal choice of strategies and language means in order to make the most favorable impression on their partner. Since the strategies of politeness, the corresponding goals and conditions of communication are assigned to certain roles, as well as conventional speech means, we can say that they are ritualized.

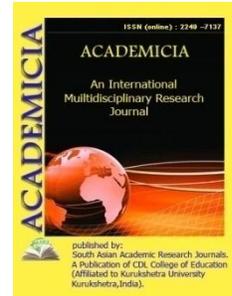

Thus, we proceed from the premise that politeness, despite its universality, has a relational character, its specific content is nationally specific. This specificity is manifested not only through the peculiarities of the use of different etiquette formulas, but primarily through different communication strategies, communicative actions, the focus of which is determined by socio-cultural parameters: the type of social relations and dominant cultural values.

ABSTRACT

The aim of this study was to evaluate the acceptability of online education to students in higher learning institutions in Zambia. The emergence of coronavirus disease 2019 (COVID-19) forced the education system world-wide to adopt online education immediately. An online survey was conducted amongst the students at ZCAS and ZCAS University in Lusaka, Zambia. A randomly selected sample of 542 students participated in the online survey. Firstly, a descriptive statistical analysis of the responses was conducted in which frequencies were tabulated; thereafter, cross tabulations which produced chi-square value testing for significance and analysis of variances were run. The main findings of the study are that female students were more receptive of online education than their male counterparts, while postgraduate students embraced online education better than undergraduate students. However, the mode of study i.e. whether full time, part time or distance education, and the type of programme i.e. whether academic or professional had no significant influence on acceptability of online education. With respect to the challenges associated with online education, the study found that cost of data bundles and internet speed were the most significant hindrances to learners' accessibility to online education. These and several other factors resulted in learners' overall dissatisfaction with online education. The findings of this study can be used in designing strategies for online education in Zambia and across the world. The main recommendations are that universities should implement initiatives to motivate male learners to adopt online education, and reduce students' cost of access to their online learning platforms.

KEYWORDS: *COVID-19, Higher Education, Lockdown, Online Education, ZCAS University.*

1. INTRODUCTION

The aim of this study was to evaluate the acceptability of online education to students in higher learning institutions in Zambia. Accordingly, we conducted an online survey of students studying professional courses at the Zambia Centre for Accountancy Studies (ZCAS) and their ZCAS University academic counterparts. Although Mukwena and Sinkala (2020) investigated the impact of COVID-19 on universities in Zambia, their study focused on public universities. By carrying out a comparative study of ZCAS University (a private university) and ZCAS (a public institution that offers tuition for professional programmes), our study is significant because we address two main issues. Firstly, we evaluate whether there are differences in students' perception of online education between private and public higher education institutions and, secondly how students studying academic degrees perceive online education compared to those undertaking professional courses.

In order to enhance teaching and learning in online education, universities need to tailor their offerings to address specific attitudes of students. This requires a detailed understanding of students' preferences. Therefore, the overarching question we set ourselves to guide this study was: *To what extent do gender, mode of study, type of learning programme and level of study affect acceptability of online education in higher education in Zambia?* For example, do female students respond the same way to online learning as their male counterparts? How about students studying on different modes of study such as full time, part time and distance education? Is online education equally acceptable to students taking degree programmes as those studying professional courses? Similarly, is online education more attractive to undergraduate students compared to postgraduate students?

ZCAS was established by an Act of Parliament, ZCAS Act No. 1 of 1989, to train professional accountants, improve the standing of the accountancy profession in Zambia, and provide advisory and consulting services in finance, accountancy as well as related matters (*ZCAS Act, 1989*). ZCAS offers tuition to students undertaking courses in professional programmes such as the Association of Business Executives (ABE), Association of Chartered Certified Accountants (ACCA), Chartered Institute of Management Accountants (CIMA), Chartered Institute of Marketing (CIM), Chartered Institute of Procurement and Supply (CIPS), NCC Education and the Zambia Institute of Chartered Accountants (ZICA) (Zambia Centre for Accountancy Studies, 2020).

In 2016, ZCAS registered a wholly owned private university, ZCAS University, with the Higher Education Authority in order to award degree qualifications (Higher Education Authority, 2021). The University offers undergraduate and postgraduate degree programmes in accountancy, finance, ICT, marketing, business administration, supply chain management and other business-related fields (ZCAS University, 2020).

On 18th March 2020 the Government of the Republic of Zambia closed all schools, colleges and universities in the country to prevent the further spread of the coronavirus disease 2019 (COVID-19). The closure was indefinite and with effect from 20th March 2020. In response to the closure of learning institutions, ZCAS and ZCAS University decided to switch all full time, part time and distance education students to online teaching and learning. The main platforms used for online learning included Zoom and WizIq. A training session for lecturers, most of whom were

already familiar with these platforms, was immediately carried out and the institutions commenced online classes within one week of the official closure of learning institutions.

In order to determine students' experiences with online education at ZCAS and ZCAS University during the COVID-19 pandemic, we conducted an online survey at the end of the first semester of 2020 i.e. in June and July 2020. Our findings indicate that female learners had a higher uptake of online education than male students, while postgraduate students embraced online education better than undergraduate students. However, the mode of study i.e. whether full time, part time or distance education, and the type of programme i.e. whether academic or professional had no significant influence on acceptability of online education.

With respect to engagement in online education, the cost of data bundles and internet speed adversely affected learners' ability to participate. These factors, together with several others, could have contributed to the overall student dissatisfaction with online education.

We organise the remainder of the paper as follows. Section 2 provides a brief review of the prior literature, while a description of the methodology and dataset is provided in Section 3. We discuss our empirical results in Section 4 and offer concluding remarks in Section 5.

2. LITERATURE SURVEY

Abdullah and Ward (2016) developed a General Extended Technology Acceptance Model for E-Learning (GETAMEL) which suggests external factors that affect students' adoption of e-learning. The five factors they identified as having a significant effect on students' perceived ease of use (PEOU) and perceived usefulness (PU) of e-learning are Self-Efficacy, Subjective Norm, Perceived Enjoyment, Computer Anxiety and Experience. PEOU and PU of e-learning affect students' attitude towards online education, and subsequently their intention to use and actual use of e-learning. We have used the GETAMEL model in our review of the literature to identify challenges of adopting online education in higher education.

2.1 CHALLENGES OF ONLINE EDUCATION

In a study of 424 universities from around the world, Marinoni *et al.* (2020) found that only 29% of the African universities that responded to the survey had replaced classroom teaching by online education at the time. The other regions in the world had performed far much better in this area with 85% of European respondents having switched to online education, the Americans were at 72% and, Asia and Pacific at 60%. The most common hindrances to switching to online teaching and learning were inadequate technical infrastructure, lack of skills in delivering online education, and the overbearing demands in specific fields of study, particularly those that require students to undertake practical activities in laboratories or workshops as part of their training.

Elsewhere in Africa, internet connectivity and inadequate infrastructure have been identified as the prominent hindrances to online education, particularly in rural settings (Kajiita, Nomngcoyiya and Kang'ethe, 2020; Mukwena and Sinkala, 2020; Okereke *et al.*, 2020; Rahali *et al.*, 2020). Other deterrents to online education in Africa include lack of electricity (Kajiita, Nomngcoyiya and Kang'ethe, 2020), absence of student-student interaction and student-teacher engagement (Okereke *et al.*, 2020), lack of self-discipline (Mukwena and Sinkala, 2020; Rahali *et al.*, 2020), high cost of data bundles (Agormedah *et al.*, 2020; Kajiita, Nomngcoyiya and Kang'ethe, 2020; Motala and Menon, 2020), living conditions unsuitable for studying (Kajiita,

Nomngcoyiya and Kang'ethe, 2020; Motala and Menon, 2020), lack of online pedagogical skills (Agormedah *et al.*, 2020; Kajiita, Nomngcoyiya and Kang'ethe, 2020; Marinoni, Land and Jensen, 2020) and inadequate orientation of students in the use of online learning platforms (Agormedah *et al.*, 2020).

Most of the challenges that adversely affect online education as outlined above are also evident in other parts of the world, particularly in the less developed countries. For example, internet connectivity for online education is problematic in India (Bisht, Jasola and Bisht, 2020; Mishra, Gupta and Shree, 2020), Austria (Ebner *et al.*, 2020), China (Chang and Fang, 2020; Xiong, Mok and Jiang, 2020), Malaysia (Chung, Mohamed Noor and Mathew, 2020a; Chung, Subramaniam and Dass, 2020b), Indonesia (Ginting *et al.*, 2020) and Nepal (Gautam & Gautam, 2021; Gupta *et al.*, 2020). Other deterrents to online education around the globe include inadequate interaction with fellow students and faculty members (Chung, Subramaniam and Dass, 2020b; Bisht, Jasola and Bisht, 2020; Ebner *et al.*, 2020; Gupta *et al.*, 2020; Mishra, Gupta and Shree, 2020), passive student participation in learning (Chang & Fang, 2020; Chung *et al.*, 2020b), and the home environment not being conducive for online learning (Gupta *et al.*, 2020; Mishra, Gupta and Shree, 2020; Wu *et al.*, 2020; Xiong, Mok and Jiang, 2020).

2.2 ENABLERS OF ONLINE EDUCATION

Alshaher (2013) adapted the McKinsey 7S model framework for e-learning system readiness assessment in higher education. The model has since been used in empirical research (Ebner *et al.*, 2020). We use this model (which presents the seven "S"s as strategy, structure, systems, style/culture, staff, skills, and shared value) to identify factors that facilitate online education in higher education.

Bhowmik and Bhattacharya (2021) categorized factors that influence online education in higher education into three groups namely, student related, lecturer related and institutional related factors. Boredom and frustration were the most influential students' related factors, whereas lack of immediate feedback was the most profound lecturer related factor. With respect to institutional related factors, infrastructure and suitable online examination design were the prominent factors that affect online learning.

The student related factors seem to hinge on attitude and motivation of students (Lukong *et al.*, 2020; Zia, 2020) and degree of interaction with peers and lecturers (Lukong *et al.*, 2020; Xiong *et al.*, 2020). Lecturer related factors hinge on teaching strategy/style (Chang & Fang, 2020; Kajiita *et al.*, 2020; Zia, 2020), training for online delivery (Chang & Fang, 2020; Chung *et al.*, 2020a; Xiong *et al.*, 2020), curriculum tailored for online delivery (Zia, 2020), and attitude towards online education (Kajiita *et al.*, 2020; Zia, 2020). Institutional factors are characterized by virtual platform functionality (Chang & Fang, 2020; Gupta *et al.*, 2020; Marinoni *et al.*, 2020), institutional policy for online delivery (Chang and Fang, 2020), and software and hardware support (Chang & Fang, 2020; Gautam & Gautam, 2021; Kajiita *et al.*, 2020; Marinoni *et al.*, 2020; Xiong *et al.*, 2020; Zia, 2020)

2.3 SATISFACTION WITH ONLINE EDUCATION

Our survey of the literature has revealed that gender plays a significant role in satisfaction with online education. Most of the studies reviewed suggest that female students accepted online education more easily than male students. Studies carried out by Bisht *et al.* (2020), Chung *et al.*

(2020b) and Shahzad *et al.* (2020) that involved a total of 1,110 students in India and Malaysia, for example, found that female students embraced online education more readily than their male counterparts. On the other hand, Rakhmanov and Dane (2020) found that female students recorded higher depression and alexithymia scores than male students. In terms of readiness for online learning, Chung *et al.* (2020b) concluded that female students were readier for online education than males. Bhowmik and Bhattacharya (2021) and Chung *et al.* (2020a) did not find gender as a significant factor in students' perception of online learning and readiness for online education respectively.

With respect to the level of study, degree students reported greater satisfaction with online learning and had better learning experiences compared to diploma students (Chung, Subramaniam and Dass, 2020b). Similarly, Gautam and Gautam (2021) found that postgraduate students had more effective online learning experiences than undergraduate students.

Bhowmik and Bhattacharya (2021) investigated the role of locality (i.e. whether dwelling in rural or urban settings) on students' perception of online learning. Their study found no significant difference in perception of online learning among rural, semi-urban and urban students.

Despite the differences in acceptability of online education described above, most of the studies carried out in the COVID-19 era indicate low levels of satisfaction with online education. For example, Xiong *et al.* (2020) concluded that only 27% of the surveyed students were satisfied with online learning, while Gupta *et al.* (2020) found that 76.9% of the surveyed students felt that the online class was distracting. Similarly, Slamet *et al.* (2021) concluded that students and lecturers found online learning materials less effective, student participation average, participants bored with online learning, and online lecture implementation less effective. This study also found that online dissertation supervision was not effective, while online assessment was less effective. On the same hand, a survey of 399 students in Malaysia revealed that more than half of the respondents did not want to continue with online learning in the next semester (Chung *et al.*, 2020b), suggesting high levels of dissatisfaction.

However, in Bangladesh, Biswas *et al.* (2020) found that students had positive perception of mobile learning. Gautam and Gautam (2021) also reached similar conclusions in their study of Nepal students' perception of online education in the COVID-19 era.

3. DATA AND METHODOLOGY

We collected data for this study from a Google Docs online questionnaire that was availed to all students at ZCAS and ZCAS University through the virtual learning environment (VLE). A message was sent to all students through the VLE urging them to provide feedback about their experiences with online education since the COVID-19 induced lockdown that prevented in-person learning and teaching. 688 students out of a population of about 2,700 completed the online questionnaire. We consider this response to be adequate because using Yamane's (1967, 886) highly recognised formula for determining sample size, an appropriate sample, n , would be

$$n = \frac{2,700}{1+2,700(0.05)^2} = 348.$$

The main research question we set out to answer in this study was: *To what extent do gender, mode of study, type of learning programme and level of study affect acceptability of online education in higher education in Zambia?* To answer this question, we used SPSS's cross tabulations, chi-square tests and analysis of variance (ANOVA) to analyse the data.

4. EMPIRICAL RESULTS

We imported the questionnaire responses from Google Docs into an Excel spreadsheet for data cleaning. After data cleaning, we remained with 542 usable questionnaire responses, that is, 472 for ZCAS University students (student population: 2,174) and 70 for ZCAS professional students (student population: 547).

4.1 DESCRIPTIVE STATISTICS

In order to determine internal consistency of the survey questionnaire, we generated the Cronbach's alpha coefficient after importing the data into SPSS. The Cronbach's alpha coefficient obtained for the data was 0.733 as can be seen from Table 1 below. The coefficient is higher than the recommended minimum of 0.7, suggesting that our data collection instrument was reliable.

TABLE 1 CRONBACH RESULTS FROM SPSS
Scale: ALL VARIABLES

		N	%
Cases	Valid	542	100.0
	Excluded ^a	0	.0
	Total	542	100.0

a. Listwise deletion based on all variables in the procedure.

Cronbach's Alpha	N of Items
.733	7

We present descriptive statistics in Tables 1 – 4 below. Table 2 below shows that majority of students (87.1%) who responded to the questionnaire are enrolled on academic programmes. This reflects the overall student population in the two institutions as the ratio of academic to professional students from the Student Information System is 85:15 (Edurole, 2021).

TABLE 2 STUDENTS BY TYPE OF LEARNING PROGRAMME

		Type of Programme			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Academic programme	472	87.1	87.1	87.1
	Profesional Programme	70	12.9	12.9	100.0
	Total	542	100.0	100.0	

In terms of gender, there was an equal number of respondents. As can be seen from Table 3 below, 50% (271) of the respondents were female and exactly the same number were male. This statistic mirrors the population statistics as information from the Student Information Systems shows that the split between male and female students is roughly 50:50 (Edurole, 2021).

With regard to mode of study, learning programmes are offered on three modes of study. Some students study on a full-time basis, which means they engage with their lecturers during normal working hours from 08:00 hrs to 17:00 hrs. Part time or evening students have classes from 17:30 hrs to 20:00 hrs. The third mode of study is referred to as distance learning, where in-person classes were available for two weeks within the semester.

TABLE 3 SEX OF RESPONDENTS**Sex**

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	271	50.0	50.0	50.0
	Male	271	50.0	50.0	100.0
	Total	542	100.0	100.0	

From our survey, it can be noted from Table 4 below that most of the respondents were full time students (55.4%), followed by distance learning students (31%). Part time students accounted for the remainder.

TABLE 4 MODE OF STUDY

Mode of study					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Full time	300	55.4	55.8	55.8
	Part time	70	12.9	13.0	68.8
	Distance	168	31.0	31.2	100.0
	Total	538	99.3	100.0	
Missing	4	4	.7		
Total		542	100.0		

The above scenario basically depicted the structure of the institutions as regards mode of study. Statistics from the Student Information System show that most of the students were full-time, quite a good number were on Distance and fewer were on part time (Edurole, 2021).

4.2 GENDER AND ONLINE EDUCATION

A cross tabulation was undertaken to ascertain whether there was any significant relationship between gender and acceptability of online education as per research question. Results from the cross-tabulation analysis are shown in the Table 5 below.

With respect to the question on how often the respondents attended live online lectures, 63.8% of female student always attended the live online lectures while 55.6% did so most of the time. On the other hand, only 36.3% of the male students always attended live online lectures, while 44.4% did so most of the time. There was a higher proportion of males (66.7%) who never attended the live online classes compared to only 33.3% of females. From these results, we can safely conclude that there was a significant relationship between gender and live online class attendance.

TABLE 5 SEX VERSUS LIVE ONLINE LECTURE ATTENDANCE CROSS TABULATION

Sex * Live Online Lecture Attendance Crosstabulation

			Live Online Lecture Attendance					Total
			Always	Most of the time	Often	Rarely	Never	
Sex	Female	Count	51	85	66	60	9	271
		Expected Count	40.0	76.5	67.0	74.0	13.5	271.0
		% within Live Online Lecture Attendance	63.8%	55.6%	49.3%	40.5%	33.3%	50.0%
Male	Count	29	68	68	88	18	271	
	Expected Count	40.0	76.5	67.0	74.0	13.5	271.0	
	% within Live Online Lecture Attendance	36.3%	44.4%	50.7%	59.5%	66.7%	50.0%	
Total	Count	80	153	134	148	27	542	
	Expected Count	80.0	153.0	134.0	148.0	27.0	542.0	
	% within Live Online Lecture Attendance	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%	

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	16.266 ^a	4	.003
Likelihood Ratio	16.439	4	.002
Linear-by-Linear Association	16.181	1	.000
N of Valid Cases	542		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 13.50.

Furthermore, the chi-square p-value of 0.03 associated with the cross tabulation, is less than 0.05, which means that gender is significant. This finding is in line with many other studies which have revealed that female students accepted online education more readily than their male counterparts (Chung, Subramaniam and Dass, 2020b; Bisht, Jasola and Bisht, 2020; Shahzad *et al.*, 2020). A possible explanation for this finding is that in general, women spend more time on social media than males (Comscore Inc., 2021). They are therefore, more tech-savvy and readier to use their time online for studies than male students.

4.3 MODE OF STUDY AND ONLINE EDUCATION

The other research question was to assess whether the mode of study the students were enrolled on (i.e. full time, part time or distance learning) had any significant relationship with adoption of online learning. We ran a cross tabulation between mode of study and online lecturer engagement. It can be noted from Table 6 below that there was no significant difference between the expected values and the observed values within a cross tabulation of mode of study and online lecturer engagement. This suggests a normal tendency with regards to online lecturer engagement and mode of study. It really did not matter what mode of study a student was enrolled on; the way learners studying on full time, part time and distance education engaged with their lecturers online was the similar.

TABLE 6 MODE OF STUDY VERSUS ONLINE LECTURER ENGAGEMENT CROSS TABULATION

Mode of study * Online lecturer engagement Crosstabulation

			Online lecturer engagement					Total
			Always	Most of the time	Often	Rarely	Never	
Mode of study	Full time	Count	15	60	83	104	38	300
		Expected Count	15.1	54.6	89.2	107.6	33.5	300.0
		% within Online lecturer engagement	55.6%	61.2%	51.9%	53.9%	63.3%	55.8%
	Part time	Count	3	12	20	28	7	70
		Expected Count	3.5	12.8	20.8	25.1	7.8	70.0
		% within Online lecturer engagement	11.1%	12.2%	12.5%	14.5%	11.7%	13.0%
	Distance	Count	9	26	57	61	15	168
		Expected Count	8.4	30.6	50.0	60.3	18.7	168.0
		% within Online lecturer engagement	33.3%	26.5%	35.6%	31.6%	25.0%	31.2%
Total	Count	27	98	160	193	60	538	
	Expected Count	27.0	98.0	160.0	193.0	60.0	538.0	
	% within Online lecturer engagement	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%	

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	4.739 ^a	8	.785
Likelihood Ratio	4.753	8	.784
Linear-by-Linear Association	.026	1	.873
N of Valid Cases	538		

a. 1 cells (6.7%) have expected count less than 5. The minimum expected count is 3.51.

The chi-square p-value of 0.785 associated with the cross tabulation confirms that there was no significant relationship between mode of study and online lecturer engagement as it was greater than 0.05. This could be attributed to the fact that all students at ZCAS and ZCAS University have equal access to online resources and facilities regardless of their mode of study.

4.4 TYPE OF PROGRAMME AND ONLINE EDUCATION

The third research question was to establish whether the type of programme pursued (i.e. academic or professional) had a significant relationship with acceptability of online education. Academic programmes lead to the award of a degree from a university, while professional qualifications are awarded by professional bodies such as ACCA, CIMA, CIPS etc. We ran a cross tabulation between type of programme and online lecture attendance. The results in Table 7 below show no major differences between the expected values and the observed values. This implies that the responses obtained were as expected, signifying no significant relationship. It really did not matter what type of programme the respondents were doing – their online lecture attendance was basically the same. The chi-square p-value of 0.289 which is above 0.05 confirms no significant relationship between type of programme and live online lecture attendance.

Furthermore, we ran an analysis of variance (ANOVA) test on whether there was any significant difference in the means of professional and academic students who were attending online classes. The results are shown in Table 8 below.

TABLE 7 TYPE OF PROGRAMME VERSUS LIVE ONLINE LECTURE ATTENDANCE

Type of Programme * Live Online Lecture Attendance Crosstabulation

			Live Online Lecture Attendance					Total
			Always	Most of the time	Often	Rarely	Never	
Type of Programme	Academic programme	Count	66	135	121	129	21	472
		Expected Count	69.7	133.2	116.7	128.9	23.5	472.0
		% within Live Online Lecture Attendance	82.5%	88.2%	90.3%	87.2%	77.8%	87.1%
	Profesional Programme	Count	14	18	13	19	6	70
		Expected Count	10.3	19.8	17.3	19.1	3.5	70.0
		% within Live Online Lecture Attendance	17.5%	11.8%	9.7%	12.8%	22.2%	12.9%
Total		Count	80	153	134	148	27	542
		Expected Count	80.0	153.0	134.0	148.0	27.0	542.0
		% within Live Online Lecture Attendance	100.0%	100.0%	100.0%	100.0%	100.0%	100.0%

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	4.986 ^a	4	.289
Likelihood Ratio	4.648	4	.325
Linear-by-Linear Association	.006	1	.941
N of Valid Cases	542		

a. 1 cells (10.0%) have expected count less than 5. The minimum expected count is 3.49.

As can be seen above, the means of online class attendance for academic programme was 2.80 and that of professional program was 2.79, implying that there no significant difference between the two groups of students, and the ANOVA significance value of 0.941 confirms this. This result is as expected because ZCAS and ZCAS University do not segregate access to online resources and facilities between the two groups of students.

TABLE 8 ANOVA

Report				ANOVA					
Onlineattendance				Onlineattendance					
Type of Programme	Mean	N	Std. Deviation		Sum of Squares	df	Mean Square	F	Sig.
Academic programme	2.80	472	1.122	Between Groups	.007	1	.007	.006	.941
Profesional Programme	2.79	70	1.284	Within Groups	706.260	540	1.308		
Total	2.80	542	1.143	Total	706.268	541			

4.5 PROGRAMME LEVEL AND ONLINE EDUCATION

We further investigated whether there was a significant difference in acceptability of online education between undergraduate and postgraduate students. Accordingly, we compared the two group means based on their attendance of live online classes. A total of 472 students from

academic programmes responded to the questionnaire, out of which 419 were undergraduate students and 53 were postgraduate students as can be seen from Table 9 below.

Table 9 shows the mean against each programme level of online class attendance as 2.84 and 2.49 for undergraduate and postgraduate students respectively. As can be seen, the means were different; we therefore set out to analyse the levels of association which can be noted in the cross tabulation in Table 10 below.

TABLE 9 MEAN OF PROGRAMME LEVEL AGAINST ONLINE CLASS ATTENDANCE Report

Onlineattendance			
Programme level	Mean	N	Std. Deviation
Undergraduate	2.84	419	1.130
Postgraduate	2.49	53	1.012
Total	2.80	472	1.122

We note from Table 10 below that, proportionately, more postgraduate students (58.5%) attended live online classes either all the time or most of the time, compared to 40.5% of undergraduate students who did so.

TABLE 10 CROSS TABULATION OF PROGRAMME LEVEL AND LIVE ONLINE CLASS ATTENDANCE

Programme level * Live Online Lecture Attendance Crosstabulation

			Live Online Lecture Attendance					Total
			Always	Most of the time	Often	Rarely	Never	
Programme level	Undergraduate	Count	58	112	111	117	21	419
		Expected Count	58.6	119.8	107.4	114.5	18.6	419.0
		% within Programme level	13.8%	26.7%	26.5%	27.9%	5.0%	100.0%
Postgraduate	Count	8	23	10	12	0	53	
	Expected Count	7.4	15.2	13.6	14.5	2.4	53.0	
	% within Programme level	15.1%	43.4%	18.9%	22.6%	0.0%	100.0%	
Total	Count	66	135	121	129	21	472	
	Expected Count	66.0	135.0	121.0	129.0	21.0	472.0	
	% within Programme level	14.0%	28.6%	25.6%	27.3%	4.4%	100.0%	

We further carried out an ANOVA test, results of which are shown in Table 11 below. The significance value of 0.035, which is less than 0.05, denotes that there is a significant relationship between programme level and online education. Postgraduate students engaged more in online education than undergraduate students. This finding buttress other studies such as Chung, Subramaniam and Dass (2020b) and Gautam and Gautam (2021) in which researchers concluded that students pursuing higher level learning programmes accepted online education readier that their counterparts on lower level programmes. We attribute our study's finding to the

fact that postgraduate students, most of whom are in employment, have more resources and greater access to the internet than undergraduate students, and can therefore easily adopt online education.

TABLE 11 ANOVA TABLE FOR ONLINE CLASS ATTENDANCE AND PROGRAMME LEVEL

ANOVA Table

		Sum of Squares	df	Mean Square	F	Sig.
Onlineattendance * Programme level	Between Groups (Combined)	5.592	1	5.592	4.478	.035
	Within Groups	586.883	470	1.249		
	Total	592.475	471			

4.6 FACTORS THAT INFLUENCED PROVISION OF ONLINE EDUCATION

The study also went further to ascertain to what extent certain suggested variables impacted on online education. Respondents were required to rate how factors such as internet speed, cost of bundles, platform unavailability, how user friendly the platforms were, delayed feedback, outdated materials, lack of training to use platform and lack of interaction with lecturers impacted acceptability of online education. A 5-point Likert scale statement analysis was conducted based on the standard interval table shown in Table 12 below.

TABLE 12 INTERVAL SCALE TABLE FOR 5 RESPONSE LIKERT STATEMENTS

	Scale	Interval Length	Lower Limit	Upper Limit
Always	1	0.8	1	1.8
Most of the time	2	0.8	1.8	2.6
Often	3	0.8	2.6	3.4
Rarely	4	0.8	3.4	4.2
Never	5	0.8	4.2	5

TABLE 13 DESCRIPTIVE STATISTICS ON LIKERT STATEMENTS

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Internet speed	542	1	5	2.47	1.128
Cost of bundles	542	1	5	2.29	1.336
Platform unavailability	542	1	5	3.36	1.149
Platform not user friendly	542	1	5	3.55	1.222
Delayed feedback	542	1	5	3.15	1.162
Outdated materials	542	1	5	3.85	1.155
Not trained to use the platform	542	1	5	3.61	1.330
Lack of interaction with lecturers	542	1	5	3.14	1.312
Valid N (listwise)	542				

From Table 13, our interest was to determine how the mean against each statement compared with the standard interval table given in Table 12. From this comparison, we note that internet speed and cost of data bundles adversely affected students' online education most of the time. Platform not being available, delayed feedback and lack of engagement with lecturers online often adversely affected students also. Out-dated materials on the platforms, lack of training to use the platform and platform not being user friendly rarely affected students' online education.

Table 14 below indicates percentage responses on the given statements. We can conclude from the responses that 60.7% of the respondents indicated that cost of data bundles adversely affected their online education either always or most of the time, while 56.1% of the respondents said the same regarding internet speed. Therefore, cost of data bundles and internet speed were the major factors that adversely affected students' engagement in online education. This finding is in line with what the literature suggested. Lack of financial resources (Agormedah *et al.*, 2020; Kajiita, Nomngcoyiya and Kang'ethe, 2020; Motala and Menon, 2020) and unstable internet (Kajiita, Nomngcoyiya and Kang'ethe, 2020; Mukwena and Sinkala, 2020; Okereke *et al.*, 2020; Rahali *et al.*, 2020) have been identified as hindrances to online education elsewhere, particularly in less developed countries.

TABLE 14 RESPONSES ON FACTORS THAT AFFECTED LEARNER ONLINE EDUCATION

	Always (%)	Most of the time (%)	Often (%)	Rarely (%)	Never (%)	Total (%)
Cost of Bundles	40.6	20.1	16.6	14.9	7.7	100
Internet Speed	22.5	33.6	22.0	18.6	3.3	100
Platform Unavailable	7.2	17.9	21.8	38.2	14.9	100
Platform not user friendly	7.9	13.1	19.9	33.8	25.3	100
Delayed Feedback	10.1	18.5	29.2	30.3	12	100
Out-dated Materials	5.4	10.0	13.5	37.1	34.1	100
Not trained to use the platform	10.9	10.7	17.5	27.9	33.0	100

4.7 OVERALL SATISFACTION WITH ONLINE EDUCATION

Lastly, respondents were asked to rate how satisfied they were with online education overall. The majority of the respondents (59.4%) indicated that they were not satisfied with online education as shown in Table 15 and Figure 1 below.

TABLE 12 OVERALL SATISFACTION WITH ONLINE PLATFORMS

		Overall satisfaction			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Highly adequate	17	3.1	3.1	3.1
	Adequate	203	37.5	37.5	40.6
	Inadequate	236	43.5	43.5	84.1
	Highly inadequate	86	15.9	15.9	100.0
	Total	542	100.0	100.0	

Figure 1 Overall Satisfaction of online platforms

This finding echoes many other studies on student satisfaction with online education. As our literature review has revealed, many researchers have found that overall, majority of the students are dissatisfied with online education (Chung, Subramaniam and Dass, 2020b; Gupta *et al.*, 2020; Xiong, Mok and Jiang, 2020; Slamet *et al.*, 2021). The overall lack of satisfaction with online education can be attributed to inability to participate in online classes due to financial constraints and poor internet speed.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1 CONCLUSIONS

The conclusions from this study were that gender was significant in influencing acceptability of online education. Results indicated that majority of the female learners (63.8%) always attended online classes compared to only 36.3% of the males. Mode of study had no significant relationship with online lecturer engagement as indicated by a Pearson chi-square p-value of 0.785 which is way above 0.05.

This study further set to ascertain whether the type of program i.e. academic or professional had any significant relationship with online education. Going by the ANOVA test that was conducted, there was no significant difference in the mean of academic respondents who attended online classes (2.80) and that of professional students which was 2.79. Both academic and professional students engaged in online classes in the same way.

With respect to the level of study, we found, like many other researchers, that postgraduate students adopted online education better than undergraduate students. We think that postgraduate students adopt online education easier than their undergraduate counterparts because they have greater access to resources.

In terms of factors which influenced students' acceptability of online education, the Likert scale showed that cost of data bundles and internet speed were the greatest hindrances to student's online education. Overall, majority of the students were dissatisfied with online education.

5.2 RECOMMENDATIONS

The first recommendation from this study is that universities should implement strategies to motivate male students to embrace online education. For example, faculties could offer tutorials to male students on how to use online platforms.

Secondly, higher education institutions (HEIs) should facilitate student access to online teaching and learning in ways that are affordable to their students. For example, HEIs could negotiate with internet service providers to zero-rate student access to their learning platforms to reduce the prohibitive cost of data bundles for students.

FEATURES OF FORMATION OF NATIONAL ETIQUETTE SKILLS IN PRIMARY SCHOOL CHILDREN: A STUDY

Khaydarova Marguba Inomovna*

*Teacher,
 Department of pedagogy and psychology,
 KSPI, UZBEKISTAN

ABSTRACT

This article gives an idea of the features and stages of formation of National etiquette skills in primary school children. It will be helpful during the whole educating system. If the interests are fair and just, if they meet the needs of the majority, if the means of education in this field are effective, and if the educators are active and selfless, the goal of ideological education will be achieved. The moral education of primary school students consists in the formation of a positive, humane orientation in the interaction of the student with adults and peers, the formation of national habits, the formation of positive behavioral characteristics.

KEYWORDS: Education, Majority, Ettiquette, School, Elementary, Primary, Teacher, Pupil, Instructor, Learner, Idea, Feature

INTRODUCTION

The development of any nation depends on the attitude of the youth in society towards national concepts and values, how it affects the minds of young people and how they rely on their practical activities, as well as the development, spirituality and education of highly educated youth. Young people make up more than half of the population of the republic. It also depends on young people's understanding of national concepts, their beliefs and convictions, and what new values are formed. Because nationalism, firstly, sees young people as its object, and secondly, young people are considered to be the advanced developers of the concept of nationality and pass it on to future generations.

Third, the more young people are armed with and aware of the notion of nationalism, the more society will prosper. This situation determines the interdependence of nationality and youth. In other words, the concepts of nationality, such as "national etiquette", "national upbringing", "national customs", "national idea", "national traditions", are meaningful, the long-term goals

and interests of each person, and ultimately, the nation. if it serves to determine the future, it will be accepted by young people so quickly and a positive attitude towards it will be formed. This means that the society will have ideologically hardened, patriotic, modern knowledge in accordance with what ideas and thoughts it offers to the youth through the notions of nationalism.

The younger generation belongs to such a social group of society that they have a sharp emotional cognitive ability and are more sensitive to cases of disproportion of words and practice. Some of the "injustices" that are common to adults can have a devastating effect on the minds and worldviews of young students, which are not yet fully formed. Therefore, the spiritual and spiritual conditions associated with national etiquette, national upbringing, national idea, national pride and honor are important among young people today.

Young people should not be afraid to tell the truth, to avoid fraud, to openly state the existing difficulties and problems. At the same time, the positive work done by the head of our state Sh. Mirziyoyev and the efforts made to eliminate the existing problems are commendable.

The importance of the concept of national morality to mobilize, inspire, call students to a great future, its place and role in education and upbringing is determined by its relevance to the realities of life, real life, people's lives. However, along with the formation of national etiquette skills in students, "ideological education" is also important.

Ideological education is a process aimed at shaping the worldview of a person, social group, nation, society, equipping them with ideological knowledge that expresses specific goals. If the interests are fair and just, if they meet the needs of the majority, if the means of education in this field are effective, and if the educators are active and selfless, the goal of ideological education will be achieved. Society is more likely to be influenced by foreign and harmful ideas when the people have not yet realized their interests, formed their own ideology and mobilized for their goals. This makes it an urgent task to establish ideological education, to constantly inculcate the principles of healthy ideology in the hearts and minds of students.

Ideological education in society requires, first of all, the joint work of the family, schools, lyceums, colleges, universities, the media, public organizations. The main link in the system of continuing education is primary education - the main link in the ideological education, because the task of inculcating ideological goals in the minds of students is carried out mainly through education.

Primary school students have a high propensity for the truth, deception, verbal practices are disgusting to others, and the spirit of hatred is strong. The cultural heritage of the people, national values, the exemplary life of our great thinkers and today's achievements play an important role in the formation of national etiquette, pride and honor.

Yusuf Khos Hajib's "Kutadgu bilig", Nizamulmulk's "Siyosatnoma", Amir Temur's "Tuzuklari", Alisher Navoi's "Mahbub ul-qulub" serve as historical and scientific sources in the formation of national etiquette skills and inculcation of ideas about social justice in primary school students. .

Tasks related to the correct orientation to national values through the formation of national etiquette skills in primary school students. The attitude of primary school students to national values shows the need to strengthen, stabilize, accelerate the spiritual, educational and ideological work of the rapidly changing, renewed, socio-economic, political, legal, cultural and

spiritual foundations of Uzbekistan. Also, the strength of national etiquette depends, on the one hand, on educational work and its effectiveness, on the other hand, on the correct understanding of the problems faced by students in everyday life, the ability to respond on the basis of ideas. The development of the nation requires young people to be self-sacrificing and nationally proud. It is also necessary to establish a school of education based on the universal values, Eastern philosophy, high moral and aesthetic ideals, national traditions inherited by our thinkers from the elementary school.

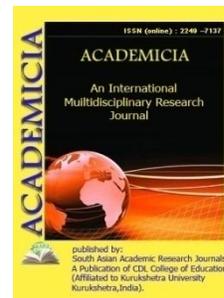

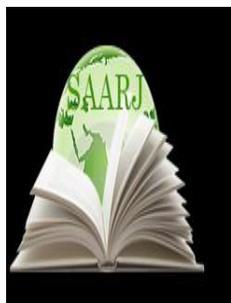

Because “to be a great state, first of all, it is necessary to take care of the culture, education and spirituality of its future citizens. As we leave a free and prosperous Motherland to the younger generation, we must pay attention to the spiritual and educational awakening of the youth, as they intend to continue the great work of our thinkers and heads of state.

The moral education of primary school students consists in the formation of a positive, humane orientation in the interaction of the student with adults and peers, the formation of national habits, the formation of positive behavioral characteristics. Great attention should be paid to the task of developing and nurturing positive emotions in students: love for parents and loved ones, kindness, friendship with peers.

In conclusion, nurturing love and affection for loved ones is a key factor in a young student’s moral development. It is on the basis of these feelings that a valuable quality is formed in the student to develop the desire to fulfill the demands of adults, to earn their praise, to show kindness to others.

ABSTRACT

The article provides information about the current problems of teaching students in higher education institutions and modern interactive methods used to improve the quality of education, improve the quality of knowledge of students. Also in this article, the types of education that are relevant to the present time demand, the interesting injurious techniques used in increasing the knowledge and skills of students are also touched upon and briefly highlighted their types.

Keywords: *Practical Games, Graphic Organizers, Problematic Teaching, Interactive Learning, Module-Credit System, Distance Learning, Blended Learning, Strategies.*

INTRODUCTION

Nowadays in modern conditions it is expedient to use innovative forms of education in order to strengthen the learning activity of students, improve the quality and effectiveness of teaching. [1] **Practical games, problematic teaching, interactive learning, modular-credit system, distance learning, blended learning and master classes** are recognized as innovative forms of modular education and other education (Scheme).

Scheme. Innovative forms of modern education

Main part

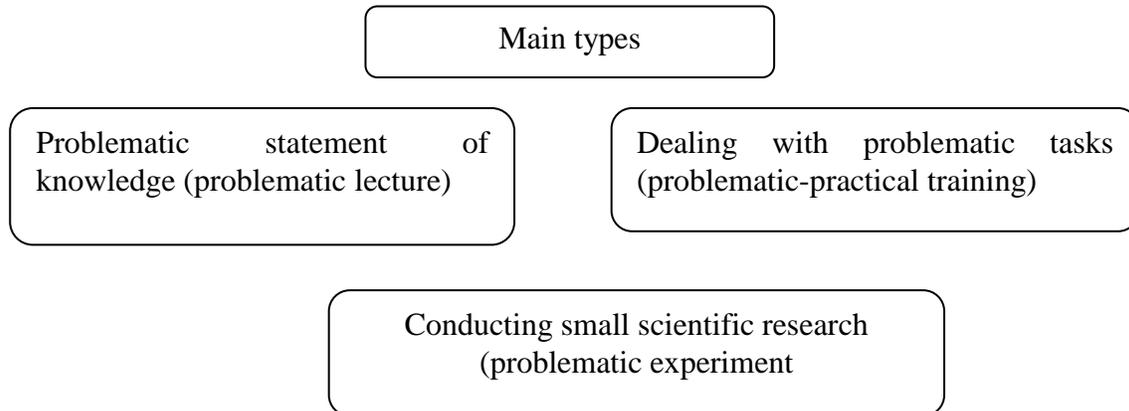

The scheme shows the innovative forms of modern education. Games of practical-innovative nature are effectively used in educational practice on modern conditions.

I. Practical games – games that allow you to imitate the organization of certain practical actions. Game technologies (game learning) – all forms of social experience: one of the types of person-centered education, which represents a conditional learning situation aimed at the formation of knowledge, skills, abilities and the process of emotional-evaluative activity.

II. Problem-based learning - improved teaching technology. Effective teaching technology in today's high school is a problem-based learning. Its task is to encourage an active cognitive process and to shape the research method in thinking. Problem-based learning is consistent with the goals of educating a creatively active individual.

Problem-based education – education aimed at developing students' skills and competencies such as creative research, small research, making certain assumptions, substantiating results, drawing certain conclusions.

In the 1960s, problem-based learning was further developed based on the views of researchers such as L.Rubinshteyn, M.I.Maxmutov, V.Okon, I.Y.Lerner. **S.L.Rubinshteyn's** idea that "Thinking begins with problematic situation" was accepted as the psychological basis of problem-based learning.

Problem-based learning (greek, "obstacle", "difficulty") forms the basis of problematic learning, and problem-based learning serves to find solutions to them. In most cases, problem and problematic situation are accepted as synonyms. Actually, they differ from each other.

III. Interactive learning - the type of education and form of teaching that is recognized as the most optimal way to increase the effectiveness of education.

Interactive learning – the education based on the organization of students' interaction in the acquisition of knowledge, skills, competencies and certain ethical qualities.

In essence, interactivity means that students have the ability to organize a movement based on cooperation, in the process of acquiring knowledge, skills, competencies and certain ethical qualities. From a logical point of view, interactivity refers, first of all, to the fact that social actors carry out activities based on dialogue interaction.

Interactive learning has the following opportunities:

- Arouses in students an interest in the acquisition of knowledge, encourages every participant in the learning process;
- Has a positive effect on the psyche of each student; creates favorable conditions for thorough mastering of educational material;
- Has a multifaceted impact on students;
- Stimulates students' thinking and attitudes on topics;
- Forms vital skills in students;
- Ensures that students' behaviour changes for the better.

Nowadays the following most popular technologies are used in the organization of interactive education in educational institutions of the Republic:

1. **Interactive methods:** “Case study”, “Blitz-poll”, “Modeling”, “Creative work”, “Attitude”, “Plan”, “Conversation” and etc.
2. **Strategies:** “Brainstorming”, “Boomerang”, “Galery”, “Zig-zag”, “Step by step”, “Icebreaker”, “Rotation”, “T-table”, “Rounded snow” and etc.
3. **Graphic organizers:** “Fishbone diagramme”, “BBB”, “Conceptual table”, “Venn diagramme”, “Insert”, “Cluster”, “Why?”, “How?” and etc.

Nowadays actively used interactive methods, strategies and graphic organizers are discussed in the appendix of the manual.

- I. **The modular credit** system is the most advanced form of modern education. Nowadays progressive humanity is continuing to seek new ways to achieve mutual understanding, cooperation in the social, economic, military and cultural spheres.

The Term: credit” means “passed the test” and provides information on the student’s successful completion of a particular course at the institution.

Modular-credit system is a system that ensures that each subject is mastered by students on the basis of a certain number of credit units.

- II. **Distance learning** – the most important and increasingly popular form of modern education. The rapid development of information and communication technologies in modern conditions created favorable conditions for the use of their potential in the educational process. At the same time, it has accumulated rich experience in distance learning in leading foreign countries. Distance learning technologies are a set of forms, methods and tools aimed at ensuring that education is carried out on the basis of a defined content.

- III. **Blended learning** is a relatively new but increasingly popular form of modern education.

Blended learning – a form of teaching based on online teaching materials and group learning under the guidance of a teacher.

In this form of teaching, the student receives independent learning, but at the same time is supported by the group and the teacher. Due to the use of “**Blended learning**” in group lessons, each student develops communication skills, reflecting the positive changes that are taking place in the acquisition of educational materials, revises the materials and prepares to explore a new topic.

Blended learning, in most cases, relies on assignments and is mainly organized on the basis of important information, additional materials are provided to the student through an online platform.

Blended learning The success of Blended learning is determined by the right choice of teaching aids. The advantage of this education form is that the student himself/herself determines the speed of mastering the learning material and the intensity of the learning process.

In higher education institutions Blended learning is based on the followings:

1. Online lecture sessions.
2. Online practical sessions.
3. Project and group work discussed on the Internet.
4. Online laboratory classes.
5. Online independent test.
6. Online advice.

IV. Master classes are once again a popular form of modern education. Master classes are an openly organized and effective form of teaching aimed at promoting best pedagogical practices.

This type of teaching is disposable. The professional skills of innovative teachers with many years of experience in organizing master classes, as well as, effective methods or technologies will be demonstrated to colleagues and students in an open, interactive manner. [3-4].

Today's day 21st century is the century of high technologies, the concept of computer graphic is closely linked to our lives.

In our society there are a lot of software products such as Maya, ZBrush, Blender, 3DMax, Nazzar.uz, 3D Virtual, 3D life three-dimensional modeling in the hearts of people of all ages. The term "D" is derived from the English word "dimensions". 3D technology is the most advanced method of visual and audio transmissions of an image in the world. All the smart people in the world have complete concepts like 3D image, 3D graphics, 3D modeling [5]. If we look at the modern film industry, architectural design and even the field of education, it is possible to observe real processes through various 3D special effects. The use of 3D technology in the teaching of chemistry in the organization of virtual laboratory classes leads high efficiency in teaching science. It is explained to students that virtual laboratory lab rooms are created in a web environment and that experiments can be performed as desired [6-7] .

Explosive experiments, experiments with toxic properties can also be performed in a virtual chemistry laboratory, and the results of ongoing reactions can be clearly seen in 3D virtual images (image).

V Academia virtual environment provides an opportunity to ensure high quality of education through trainings, various games, simulators, master classes.

On the implementation of virtual learning technologies as follows:

- Firstly, assessing the positive and negative consequences of the use of virtual learning technologies in our educational environment based on world experience;
- Secondly, paying special attention to the preparation of manuals on the effective use of virtual learning technologies in Uzbek;

- Thirdly, conducting research to promote national virtual learning environments and devices and promote research-based software and devices;
- Fourthly, providing conclusions and recommendations such as the introduction or government incentives for producers of virtual learning resources.

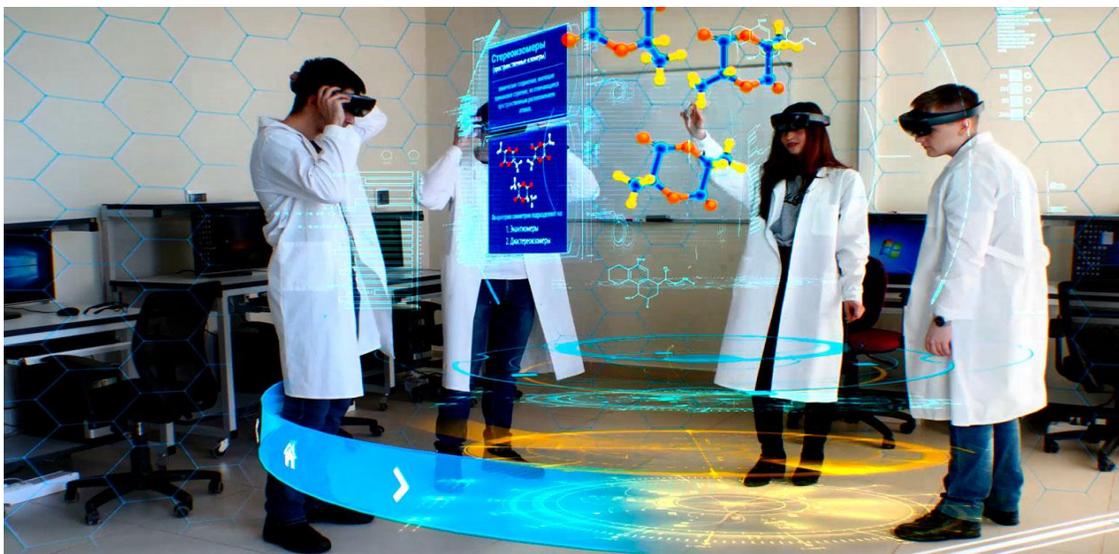

Image. Virtual presentations of students based on 3D programme in circle sessions

The following suggestions can be made for the development of distance learning technology in education:

1. It is achieved to improve the quality of education through the widespread use of interactive methods in teaching.
2. There will be an opportunity to use specially developed teaching aids (e-textbooks, training courses, videos, audio-video lectures and etc.)
3. Integration between listener and teacher is ensured in assessing listener mastery through a developed test bank.
4. Access to the world's leading Information Resources Center through development.
5. Distance learning is introduced to improve the qualification of professor-teachers.
6. During the implementation of the development in practice, students receive training on a paid contract, in addition, the university does not require additional buildings, inventory, electricity, teaching staff, etc.
7. The implementation of this project will increase the ability of students to re-learn e-textbooks, training courses, video films, audio-video lectures.
8. There will be an opportunity to further enhance the role of deen's office among the audience.
9. The interaction between the educator and the learner is lost.
10. Additional opportunities will be created through the implementation of the practice (loss of "workbook", "seminar notebook", "journal grades", etc.)

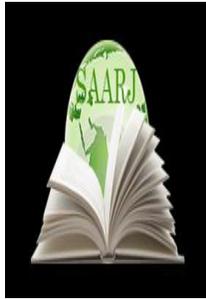

11. Commercialization increases the economic potential of the higher education institution.

CONCLUSION

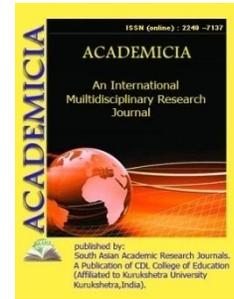

To sum up, nowadays we can clearly see that every field, including education, is developing rapidly. All of the above-mentioned modern forms of education are aimed at the same goal, and all of them serve to increase the quality and effectiveness of the lessons taught to students. Educational technology and distance learning technology in education solve tasks such as the development of individualized teaching methods, the formation and improvement of student knowledge and determining the level of knowledge acquired. The use of distance learning technologies in the educational process has a strong impact on the positive change in the content, forms and methods of education.

PROBIOTICS INFLUENCE ON THE GLANDULAR STOMACH OF BROILER CHICKENS IN POSTNATAL MORPHOGENESIS

N.B.Dilmurodov*; **S.Kh.Yakhshieva****; **G.Sh. Rakhmanova*****

^{1,3}Samarkand Veterinary Medicine Institute,
 UZBEKISTAN

ABSTRACT

In the postnatal ontogeny of broiler chickens belonging to the ROSS 308 cross, linear dimensions of the stomach and absolute values of weight were studied. Stomach morphometric parameters were observed to be higher in broiler chickens in the experimental group receiving probiotics than in the control group, especially after 14 days of postnatal ontogeny.

KEYWORDS: *Poultry, Chickens, Broilers, ROSS 308, Cross, Glandulargastric, Postnatal Ontogeny, Length, Weight, Growth Rate, Linear Dimension, Absolute Index.*

INTRODUCTION

Popular in our country, the direction for meat (broiler) is widespread breeds Ross - 308 (UK), Cobb - 500 (USA).

Since chickens are very delicate creatures, improper feeding, unfavorable weather conditions or poor veterinary hygiene can also lead to their disappearance and infection.

Climate, nutrition and environmental hygiene pose many dangers to chickens. To avoid these risks, their meals should be fortified with vitamins, probiotic and prebiotic supplements. Raw poultry processed with probiotics is safe because the probiotic microorganisms' metabolites do not accumulate in body tissues. Poultry is distinguished by the metabolic intensity processes compared to other farm animals.

Poultry meat is characterized by the metabolic processes intensity in relation to other farm animals. Therefore, poultry meat is one of the main products characterized by high nutritional and taste characteristics.

Therefore, poultry meat is one of the main products with high nutritional and taste qualities. Their meat production is assessed by their rapid muscle growth at a young age, body composition, rapid maturation, nutrient-based weight gain, fertility and chick survival.

As a result, modern cross-broiler chickens are characterized by rapid growth (35-42 days) and high productivity (increase in live weight 50-55 times per day), low resource costs and low cost of chicken meat compared to other meat and meat production types [1, 6].

The modern stage in the development of industrial poultry farming is inextricably linked with those lines breeding and chickens breeds that are capable of producing high-quality feed[2, 4].

According to the authors, "Ross-308" from local crossword puzzles fully meets these requirements.

Subtilis is an active source of a number of *Basillus* licheniformis probiotics VKM-2250 and *Basillus* licheniformis VKM-2252 strains isolated from soil, and *Basillus* licheniformis VKM-2287 strains from the rumen of large horned animals.

One of the main features of the digestive organ in a bird is a goiter presence, the teeth absence and the simple structure of the nasopharynx (nasopharynx).

They do not chew food, its softening and digestion occurs in the following parts of the digestive tract - the glandular and muscular stomach. Food in the mouth is moistened with saliva, which contains α -amylase-ptyalin, which converts starch into glucose.

Since the enzymes action on food is short-lived, this process does not play an important role in the body[5].

According to the authors, the new probiotics generation of the *Subtilis* series includes at least 90-95% spores, when in the microbial mass of the first generation spores the spores proportion was 5-7%, while in the case of probiotics Vetom-1, Sporovit, Subalin did not exceed 45 % [3].

MATERIALS AND METHODS

The studies were carried out on the digestive organs of broiler chickens of the one-day cross-country POSS 308, brought from LLC "Dargom Parranda Faiz", Samarkand region. They were divided into 4 groups, each of which had 40 chickens. All chickens in the group were fed a diet of the same composition. They were divided into 4 groups, each of which had 40 chickens. All chickens in the group were fed a diet of the same composition.

The first group of chickens was given only food and water; the second group of chickens was given food, water, were vaccinated under farm conditions, and preventive drugs were administered; the third experimental group of chickens was given food, water and water with the probiotics addition containing 100 million microbial bodies; the fourth experimental group of chickens was added to water with probiotics, which stored 200 million microbial bodies.

Morphometric measurements were carried out on days 1, 7, 14, 21, 28 and 35 of the experiment.

Used by N.P. Chirvinsky in determining the linear dimensions and organs weights and scientists of the Samarkand veterinary medicine institute (D.H. Narziev, M.H. Allamurodov, A.S. Daminov, R.M. Tashtemirov, N.B. Dilmurodov) general morphological methods improved and introduced by were used.

In determining the linear dimensions and organs weights, used by N.P. Chirvinsky and improved and introduced by scientists of Samarkand veterinary medicine institute (D.Kh. Narziev, M.Kh. Allamurodov, A.S. Daminov, R.M. Tashtemirov , N.B.Dilmurodov) general morphological methods.

All numerical data obtained as a result of scientific research were mathematically processed according to E.K. Merkurjeva method.

Mathematical and statistical analysis was carried out on a Microsoft Excel computer spreadsheet using Student's and Fisher's tests.

Results and their analysis. The absolute value of the glandular stomach length in the first group chickens was 1.48 ± 0.04 cm on the first day of postnatal ontogenesis with a rapid increase up to 7 days (1.88 ± 0.06 cm, $p < 0.04$; $K = 1.27$) and continuing this process step by step until the next 35 days of the study, i.e. at 14 days - up to 2.54 ± 0.09 cm ($K = 1.35$), at 21 days - up to 3.98 ± 0.12 cm ($p < 0.04$; $K = 1.57$), at 28 days - 3.74 ± 0.09 cm ($p < 0.03$), at 35 days - 4.02 ± 0.15 cm ($p < 0.04$; $K = 1.07$). It was found that the growth rate of this indicator of the glandular stomach was 2.72 times for the period from 1 to 35 days of chickens.

The absolute value of the glandular stomach thickness of the first group chickens was 0.47 ± 0.01 cm on the first day of postnatal ontogenesis with a rapid increase up to 7 days (0.63 ± 0.02 cm, $p < 0.04$; $K = 1.34$) and continue this process in stages until the next 35 days of the study, i.e. after 14 days - up to 0.87 ± 0.02 cm ($K = 1.37$), after 21 days - up to 1.22 ± 0.01 cm ($K = 1.4$), at 28 days - 1.31 ± 0.02 cm ($p < 0.03$; $K = 1.06$), at 35 days - 1.41 ± 0.02 cm. It was found that the growth rate of this indicator of the pancreas was 3.0 times for the period from 1 to 35 days of chickens.

The absolute value of the glandular stomach mass was 1.20 ± 0.03 g on the first day of postnatal development of the first group chickens, but increased to 1.29 ± 0.05 g by 7 days ($p < 0.04$; $K = 1.08$), this process accelerates to 14 days, 2.81 ± 0.06 g ($K = 2.18$), and continues periodically until the next 35 days, i.e. at 21 days - 5.49 ± 0.07 g ($p < 0.02$; $K = 1.95$), at 28 days - 5.62 ± 0.19 g ($p < 0.04$; $K = 1.02$), at 35 days - 7.48 ± 0.27 g ($p < 0.04$; $K = 1.33$).

It was found that the growth rate of the absolute index of the glandular stomach than in chickens at the studied stages of postnatal ontogenesis was 6.25 times higher.

The absolute glandular stomach length slightly increased from 1.46 ± 0.04 cm to 2.1 ± 0.06 cm ($p < 0.03$; $K = 1.44$) in the 2nd group chickens in the period from 1 to 7 days postnatal development. And at subsequent age periodically, up to 2.97 ± 0.07 cm ($K = 1.39$) after 14 days, up to 3.39 ± 0.14 cm ($K = 1.35$) after 21 days, up to 6.6 ± 0.07 cm ($p < 0.04$; $K = 0.92$) and 6.76 ± 0.19 cm ($K = 1.85$) after 35 days.

The absolute value of the glandular stomach thickness in the 2nd group increased chickens slightly from 1 to 7 days of postnatal development, from 0.48 ± 0.01 cm to 0.86 ± 0.03 cm ($p < 0.04$; $K = 1.81$). And periodically at a later age up to 1.08 ± 0.04 cm ($p < 0.04$; $K = 1.25$) after 14 days and 1.38 ± 0.04 cm ($K = 1.28$) after 21 day, up to 28 days at 1.44 ± 0.04 cm ($p < 0.04$; $K = 1.04$) and at 35 days up to 1.6 ± 0.06 cm.

The absolute index of the glandular stomach weight in the second group chickens rapidly increased from the first day to 14 days of postnatal ontogenesis, increasing from 1.17 ± 0.04 g after 7 days to 1.37 ± 0.05 g ($p < 0.04$; $K = 1.16$), at 14 days - up to 2.48 ± 0.03 g ($K = 1.81$) and at the next stages continue this process periodically, that is, on day 21 - up to 4.42 ± 0.14 g ($K = 1.78$), at 28 days - 5.46 ± 0.21 g ($p < 0.04$; $K = 1.23$), after 35 days - 6.92 ± 0.18 g ($p < 0.03$; $K = 1.27$). It was observed that the growth rate of the absolute value of this bone mass reached 5.89 times in the period from 1 to 35 days of postnatal development of chickens.

The absolute value of the glandular stomach length in the 3rd group chickens rapidly increased from 1.54 ± 0.06 cm to 2.5 ± 0.08 cm ($p < 0.04$; $K =$) from the first day to the 7th day of postnatal ontogenesis, as in the first and second groups. 1.62) and at 14 days - up to 2.56 ± 0.08 cm ($K = 1.02$), at 21 days - up to 3.96 ± 0.15 cm ($K = 1.55$), at 28 days - 3.66 ± 0.12 cm, at 35 days - 6.56 ± 0.19 cm ($p < 0.03$; $K = 1.79$).

The absolute indicator of the stomach gland thickness of the 3rd group chickens from the first day of postnatal ontogenesis to the 7th day of the first and second groups chickens with an increase in intensity from 0.42 ± 0.01 cm to 1.0 ± 0.03 CM ($p < 0, 03$; $K = 2.37$), as well as for the 14th day - 1.12 ± 0.04 it was found that it reaches 1.07), on the 35th day - 1.42 ± 0.04 cm ($p < 0.03$).

The absolute weight of the glandular stomach increased from 1.21 ± 0.03 g to 1.84 ± 0.06 g ($p < 0.04$; $K = 1.53$) from the 1st to the 7th day of postnatal ontogenesis in chickens of the third groups. With slight acceleration up to 3.01 ± 0.06 g ($p < 0.02$; $K = 3.02$) and without significant deviations at subsequent stages, by day 21 - up to 4.11 ± 0.11 g ($K = 1.36$), by day 28 - up to 5.52 ± 0.14 g ($K = 1.34$), at 35 days - up to 6.73 ± 0.25 g ($p < 0.04$; $K = 1.22$). The growth rate of this indicator of the glandular stomach was 5.57 times from the first day of postnatal development of chickens to 35 days.

The glandular stomach length increased from 1.6 ± 0.06 cm to 2.06 ± 0.04 cm ($p < 0.03$; $K = 1.29$) in the 4th group chickens from the 1st to the 7th day, and postnatal ontogenesis was further studied in 35 people, the condition will continue in stages until the day. That is, this value was increased to 2.56 ± 0.06 cm ($p < 0.03$; $K = 1.24$) in 14-day-old chickens and to 3.4 ± 0.06 cm ($K = 1.33$) in 21-day-old chickens, days - up to 5.34 ± 0.14 cm ($p < 0.03$; $K = 1.57$), at 35 days - up to 6.02 ± 0.23 cm, its growth rate from the first day postnatal development up to 35 days increased by 3.76 times over the period.

It was noted that the glandular stomach thickness increased from the 1st day in the 4th group chickens to the 7th day from 0.47 ± 0.02 cm to 0.84 ± 0.03 cm ($p < 0.04$; $K = 1.76$), and postnatal ontogenesis progressed gradually by the next 35th day of the study.

That is, in 14-day-old chickens up to 1.08 ± 0.04 cm ($p < 0.04$; $K = 1.28$), in 21-day-old chickens up to 1.5 ± 0.03 cm ($K = 1.39$), in 28-day-old chickens - up to 1.5 ± 0.03 cm ($K = 1.39$), in old chickens - up to 1.44 ± 0.04 cm ($p < 0.04$; $K = 0.96$), at 35 days - up to 1.6 ± 0.05 cm ($p < 0.04$; $K = 1.11$), the rate of its growth increased 3.36 times over the period from the first day of postnatal development to 35 days.

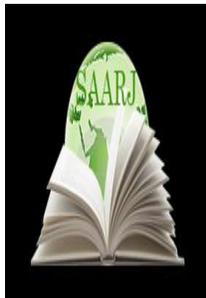

The absolute value of the glandular stomach mass of the fourth group chickens increased slightly from the first day of postnatal development to 14 days, from 0.86 ± 0.03 g, after 7 days - 1.21 ± 0.04 g ($p < 0.04$; $K = 0, 41$), on day 14 - 3.24 ± 0.04 g ($K = 3.77$), at subsequent stages of the study - periodically, on day 21 - 5.28 ± 0.18 g ($p < 0.04$); $K = 1.63$), on day 28 - up to 5.57 ± 0.17 g ($K = 1.05$), after 35 days - up to 7.49 ± 0.24 g ($K = 1.35$). It was noted that the increase in the absolute mass of the stomach reached 8.70 times in the period from the first day of postnatal ontogenesis of chickens to 35 days.

CONCLUSION:

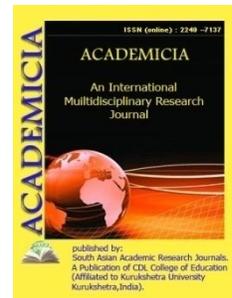

- the absolute indicators of the length, thickness and weight of the broiler chickens pancreas slightly increased in the period from the first day of postnatal ontogenesis to 14 days, and at subsequent stages of the study this process continued without significant deviations;
- at the studied stages of postnatal ontogenesis of broiler chickens (from 1 to 35 days), it was found that the growth rate of the morphometric dimensions of the glandular stomach was higher in absolute weight than in absolute length;
- It was found that the absolute indices of the linear dimensions and glandular stomach mass, especially at the late postnatal ontogenesis stages after 14 days, were higher in the 3 and 4 broiler chickens group, which were additionally given probiotics.

**ISSUES OF SUSTAINABLE DEVELOPMENT OF DIGITAL
 AGRICULTURE AND ITS PROVISION OF QUALIFIED PERSONNEL**

A. D. Ravshanov*

*Associate Professors

Karshi Institute of Engineering Economics Department of "Innovative Economics",
 UZBEKISTAN

ABSTRACT

The article presents the concept of digital agriculture, important aspects and main directions of digitalization of agriculture, as well as the requirements for qualified personnel in this process and comments on improving the staffing system.

KEYWORDS: *Digital Economy, Digital Agriculture, Qualified Personnel, Staffing, Geoinformation System, Strategy, Geoinformation System Digitization, Smart Garden, Smart Greenhouse, Smart Farm, Smart Field, Digitization Of Selection Data, Genobank.*

INTRODUCTION

Agriculture is one of the largest sectors of the economy of the Republic of Uzbekistan, the mainstay of food security and welfare of the rural population. In recent years, significant work has been carried out in the Republic of Uzbekistan to accelerate the development of agriculture and deepen economic reforms in the sector. In particular, the Decree of the President of the Republic of Uzbekistan No. PF-5853 of October 23, 2019 adopted the "Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030", which includes strengthening the country's food security, development of modern public administration systems, the agricultural sector. A number of tasks have been identified, such as the gradual diversification of support-oriented public spending [1].

Analysis of the relevant literature

The issue of sustainable development of digital agriculture and its provision with qualified personnel is one of the most pressing issues today. Many scientists of our country are engaged in this research. In particular, R.H.Ergashev, A.D.Ravshanov developed ways of strategic development of agricultural enterprises through strategic development and increasing the competitiveness of agricultural enterprises [2]. Economist G. Adilova has developed indicators

for the development of the digital economy in agriculture and ways to ensure economic growth of the economy as a whole and its single sectors, including agriculture [3]. U.Khusanov's researches have developed strategic ways of development impact of development of digital economy in agriculture on employment [4]. Professor MK Paradaev's research has developed prospects for sustainable development of agriculture through savings and the introduction of digital technologies in agriculture [5]. AD Ravshanov substantiated the economic indicators of the priorities for increasing the competitiveness of products through the development of the digital economy in agriculture [6].

Research methodology.

As a result of the research, economic analysis and synthesis analysis methods were used to analyze popular scientific sources, digital development of agricultural enterprises and increase the competitiveness of agricultural products to determine the importance and place of the economy in the development of digital economy, including agricultural sectors.

Analysis and results

It helps to increase the efficiency of agricultural activities through the processing of large numbers and digital data, the storage of technological solutions and equipment, and the improvement of the delivery system to consumers. However, we cannot say that the digital economy is widely introduced in all sectors of the economy. In particular, the peculiarities of the agricultural sector lead to a slow pace of development of innovations in "digital agriculture".

In our opinion, digital agriculture is a set of activities aimed at implementing the relationship between the collection, generalization, coordination, analysis and use of data from various sources during the activities of agricultural enterprises using modern digital technologies. Digital agriculture means the integration of digital technologies in all aspects of the agricultural sector and requires open and free access.

Agriculture is such a network that it requires not only an adequate database, but also many years of practical farming experience. The reason is that if digital information comes to a conclusion by processing data from different sources, an experienced farmer will be able to make a comprehensive assessment of external factors. While digital agriculture will enable the country to achieve new efficiency indicators, it will further expand its potential when combined with the experiences of farmers.

Digitization of agricultural activity means not only the use of digital information to determine and improve the efficiency of a particular type of activity, but also the introduction of an optimal time and method of obtaining information on all issues faced by farmers in their daily activities.

In our country, the issue of digitalization of the economy, the organization of activities aimed at the modernization of all sectors on the basis of digital technologies is becoming one of the urgent tasks of today. In particular, as stated in the Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Oliy Majlis on December 29, 2020, "optimization of the number of employees and work processes through the widespread introduction of digital technologies, training of all employees to work on modern information technologies" [7]. As a result, the following can be achieved through the digitization of agriculture:

- the rule of law is ensured;

- A strong economy will be created;
- saves money;
- Prosperous life of the people is ensured;
- Citizens' rights and freedoms are fully guaranteed;
- Public safety and legal advocacy will ensure the country's defense capability, security;
- corruption cases decrease;
- Eliminate dissatisfaction in agriculture.

On this basis, we need to implement the Digital Uzbekistan-2030 program. The digital economy will increase GDP by at least 30 percent, dramatically reducing corruption. The analysis conducted by leading international organizations also confirms this. Therefore, it is necessary to carry out digital transformation in the economy, the development of national information technologies and attract investment in this area "[8].Decree of the President of the Republic of Uzbekistan dated January 8, 2019 PF-5614 "On additional measures to further develop the economy and increase the effectiveness of economic policy" defines and develops the Strategy for the development of the national digital economy (Digital Uzbekistan-2030) [9].

At the same time, the Decree of the President of the Republic of Uzbekistan dated April 17, 2019 No PF-5708 "On measures to improve public administration in agriculture" was adopted and the issue of digitalization of agriculture was identified as one of the main tasks and activities of the Ministry of Agriculture. [10].

Based on the experience of developed countries, there are opportunities to organize effective activities by digitizing agriculture in the following areas (Figure 1).

Fundamentals of agricultural digitization	
digitization of geoinformation systems (especially gis, esri, mapinfo, smallword)	digitization of information such as price changes, resource allocation, market conditions
digitization of information on external influences on crops	digitization of radio frequency identification systems
digitization of smart garden, smart greenhouse, smart farm, smart field systems	Digitization of registers, registers and normative information
digitization of information on selection, genobank, breeds and plants	digitization of agricultural management systems and services

Figure 1 Directions of agricultural digitization

In general, by digitizing agriculture, we can have the following opportunities: first, data becomes a primary resource and it does not dwindle; secondly, the volume of trading space on the Internet is not limited and it allows to provide real-time data on the sale of agricultural products; thirdly, there is an opportunity to provide one type of agroservice; fourth, it will be possible to minimize external natural factors that are a key feature of agriculture. It all depends on the size and speed of the internet database.

Based on the above, we can say that digital agriculture is a system that is equally effective for all link entities that grow and serve products, and its implementation can save a lot of time and resources.

But in turn, there is an issue related to the organization and use of digital agriculture, which creates a demand for qualified professionals with in-depth knowledge of the industry and modern technical and technological knowledge. The introduction of digital agriculture requires qualified personnel with a number of different specialties. In particular, it covers such areas as agronomist, economist, programmer, engineer, IT specialist, breeder.

In order to introduce a management system based on the digitization of agriculture in developed countries, the following requirements are set for qualified personnel. Including:

- Have a quality higher education in accordance with the STEM (Science - specialty, Technology - technology, Engineering - engineering, design and engineering, Mathematics - mathematics) approach;
- Manager - the ability to think systematically, creatively and quickly make independent decisions;
- have a culture of digital data distribution and service, information security, etc.

Here, the STEM (Science - specialty sciences, Technology - technology, Engineering - engineering, design and engineering, Mathematics - mathematics) approach itself requires not only specialized knowledge, but also knowledge of engineering, technology and mathematics. One of the main problems facing the education system is the integration of all these areas. This can be explained by the complexity of solving problematic tasks such as educational directions, teaching methods, textbooks, teachers and material and technical base.

CONCLUSIONS AND SUGGESTIONS

Our country is taking the first steps towards digitalization of the digital economy, especially agriculture, and in the future it is expected to focus on this. In such circumstances, in our opinion, the following tasks are required to train qualified specialists in the field of agricultural digitization and to prevent staff shortages or the involvement of personnel in several different areas for one function. Including:

- Development of a system of training of digital agricultural specialists, ensuring the opening of new directions and disciplines in the university, which trains personnel for the agricultural sector;
- Strengthening the material and technical base of higher education institutions for the digital agricultural system, systematic provision with modern devices, technologies, programs and engineering developments;
- Pay special attention to the financing of scientific and innovative projects in the institutes and universities, including research institutions, which train personnel for the agricultural sector;
- Improving skills, education mechanisms in foreign countries with developed digital economy. Development of a system of financing and financial incentives from the "El Yurt Umidi" Fund and other financial sources;
- Introduction of new educational standards in the curricula of agricultural universities;
- development of new qualification requirements for digital agricultural personnel, optimization of all processes in the agricultural sector through digitization of professional services of agricultural consulting centers;

□ It is expedient to develop organizational and economic mechanisms for opening joint routes not only with foreign universities and departments, but also with national universities and their departments, in conditions where digital agricultural personnel are required to have a thorough knowledge of several areas.

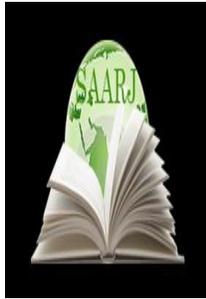

In short, the introduction of digital technologies in agriculture has the potential not only as a necessary infrastructure of the production process, but also as an area of direct application of artificial intelligence in the production process, the creation and development of agricultural systems. It is also closely related to the further expansion of the application of the digital economy in agriculture, the level of knowledge accumulated, the development of science, technical and technological equipment of production processes and the ability to control processes at all stages of the product life cycle.

ABSTRACT

In this article the principles of effective speech communication, general provisions of the theory of politeness have been widely discussed and the definition of the concepts of "politeness", "interrupting a conversation" has been formulated as well. The article contains certain theoretical and practical ways upon expressing politeness in different languages on the material of phrases implying polite interruption in business discourse in terms of the linguocultural traditions of the category of politeness occurring in the given languages. The article also discusses some critiques of the most commonly used theories of politeness, and highlights some of the trends in which these critiques might help to advance researches on politeness in the future.

KEYWORDS: *Communicative Postulates, Business Communication, Culture, Category Of Politeness, Markers Of politeness, Interruption Of Speech Action.*

INTRODUCTION

Since 2005, a specialized journal "Journal of Politeness" has been serving as a "scientific testing ground" for interdisciplinary and international studies in the field of politeness: over the years, it has published about 130 articles devoted to various aspects of the study of communicative-pragmatic categories of politeness and impoliteness (rudeness). In the rather long history of the study of linguistic politeness, three stages can be distinguished:

a) *the first stage*, called Graisian, covers works based on the basic principles of linguophilosophy by P. Grais and J. Austin. This stage includes the classical theories of politeness by R. Lakoff, P. Brown and S. Levinson, J. Leech;

b) *the second stage* is associated with the discursive ("postmodern") direction in the study of linguistic politeness. This approach originated in the early 90's of the XX century as a reaction of many linguists to various shortcomings and disadvantages of the Universal Theory of Politeness by P. Brown and S. Levinson, identified in the 80's of the XX century;

c) *the third stage* is associated with the observed literally in the last few years, a turn in the study of linguistic (im) politeness towards the sociological (interactional) approach.

Among the classical theories of politeness, P. Brown and S. Levinson's Universal Theory of Politeness has had the greatest influence on further research in this area of sociolinguistics. Scientists began to consider politeness as a fundamental aspect of the socio-communicative interaction of people. With its generally recognized value, "the Universal Theory of Politeness rises above most other theories, being a guiding star for scientists looking for the phenomenon of politeness in the examples of interactions between communicants. It is distinguished by the breadth of penetration into the essence of human behavior, which is not characteristic of any other theory of politeness"[14, p. 9-10].

If we briefly dwell on the main shortcomings of the classical theories of politeness, they are as follows:

- 1) The ontological status of politeness is not sufficiently defined in all models
- 2) The definitions of politeness presented in them are characterized by a number of restrictions
- 3) These theories are essentialist in nature and are governed by rationalistic principles
- 4) practically all classical theories of politeness leave out of the field of interest the phenomenon of impoliteness, i.e. the phenomenon that politeness is designed to avoid.

According to Universal Theory of Politeness by P. Brown and S. Levinson, its shortcomings include:

- 1) The claim to its universality
- 2) The analysis by the authors of individual speech acts considered out of context
- 3) dialectical, but not dynamic understanding by the authors of the central concept of the social face "face", coupled with the European understanding of the cornerstone categories "politeness" and "threat to the social face", which implies the wrong, from the point of view of representatives of collectivist Asian cultures (China, Japan, Korea), understanding by the authors of this theory of some speech acts, for example, compliments
- 4) Ignoring the social nature of the phenomenon of politeness
- 5) The explicit addressing-centeredness of the theory, since the authors pay excessive attention to the social faces of the addressees, but not the addressees of the statements
- 6) Almost complete ignorance of situations of aggressive, offensive or rude communicative behavior.

A certain weakness of the Universal Theory of Politeness, according to S. Mills, is manifested in the fact that "although it is possible to find data that confirm the adequacy of the theory of Brown and Levinson in the analysis of politeness in the communication process, nevertheless,

this model can only consider cases of manifestation of explicit communication by participants, open politeness".

Main Body

The definition of politeness is not a simple one but we nevertheless hold that it is possible to isolate those utterances which are considered to be polite or impolite by participants. Whilst we value the development of terms such as relational work and rapport management, we still hold that politeness is a term which we will continue to use, despite its problems. We all define politeness differently, because of our different perspectives. In the essays that we have written for this collection, we all define politeness and impoliteness, but here are some of those definitions. Sara Mills defines politeness in the following way: For me, politeness has to be defined in two separate ways. Drawing on Watts' (2003) notion of politeness¹ and politeness², we need to see that the way we as theorists of politeness define politeness does not necessarily map onto the way that interactants use the term. As a person, relating to other people, I use politeness to refer to behavior which I see as showing concern for others and which fits in with, and shows respect for, wider social norms. I often use it to refer to behavior which is a little exceptional, for example, if I referred to someone as "a polite young man", I would be referencing the general social view of young men as being problematic. So we need to be aware of the role politeness plays in indexing social status and the way that communities of practice can include or exclude people through the use of particular styles of politeness.

There is no simple definition of politeness from this theoretical perspective, but for me, politeness consists of language choices which negotiate the indexing of social status and which attempt to include or exclude members of social groups.

Jodie Clark's definition also draws upon a politeness/politeness² distinction. From her perspective, politeness² can be defined as "the moral compulsion to respect the boundaries around different levels of social structure" and politeness as the discursive dispute over either how this respect should be manifested or where these boundaries should be drawn.

Jonathan Culpeper defines politeness as:

- (a) an attitude consisting of particular positive evaluative beliefs about particular behaviours in particular social contexts
- (b) the activation of that attitude by those particular in-context-behaviours
- (c) the actual or potential description of those in-context-behaviours and/or the person who produced them as *polite*, *courteous*, *considerate*, etc.

Politeness "cultures" are social groups who share similar politeness attitudes, that is, they share a politeness ideology. Linguistic politeness refers to linguistic or behavioural material that is used to trigger politeness attitudes. Politeness strategies (plans of action for achieving politeness effects) and formulae (linguistic/behavioural forms for achieving politeness effects) are conventionally associated to some degree with contexts in which politeness attitudes are activated. Impoliteness, although its performance involves significant differences from politeness, can be defined along similar but contrary lines: it involves negative attitudes activated by in-context-behaviours which are associated, along with the person who gave rise to them, with impoliteness meta language (e.g. *impolite*, *rude*, *discourteous*, etc.)

Louise Mullany views im/politeness as an ongoing, evaluative process with which interactants actively engage rather than something which statically pre-exists any interaction. She maintains the importance of “face” as a valuable analytical concept and incorporates notions of “personal” face and “social identity” face into her analytical framework. She sees im/politeness evaluations and judgments emerging across discourse(s). This can include judgments shifting between different speech events as our perceptions of interactants are part of an on-going process that both develops and maintains itself over time and in different contexts.

Not surprisingly, given their many collaborative projects, Bethan Davies and Andrew Merrison have very similar views about politeness issues.

They find the general distinction between politeness¹ and politeness² a useful one: as Sara Mills states above, linguistic theorists need to be aware that their conception of politeness may not be coterminous with that expressed by general users of the language. Equally, we also need to recognize that our judgments about politeness (as researchers) are just as ideological as those made by non-linguists: we cannot hide behind the justification of “theory”.

Sandra Harris would stress the importance of both speaker intention (even if less accessible) and, more crucially, hearer evaluation when defining im/politeness as the active and ongoing process of negotiating interactive relationships, emphasizing the significance of the immediate and wider contexts in which they are situated. Such encounters are less influenced by the pre-existence of politeness norms than the discursive engagement. Impoliteness or (im)politeness is used by many theorists to mean politeness and impoliteness.

From these definitions, it is clear that we are not offering one simple definition of politeness and impoliteness; this very difficulty with offering a definition indicates the complexity of politeness.

In linguistics category "politeness" was chosen to be part of an overall strategy speech

behavior or when analyzing the features of speech acts in a particular language (apologies, gratitude, compliments, expressions of sympathy, etc.). Ways of expressing politeness in different languages depend on the structure of the society in which these languages are in operation, and it accepted models of social behavior. In Korean, for example, the category of politeness has the following stages: polite, respectful, characteristic of the female speech, polite, intimate, familiar, and patronizing, physical. Each form of politeness has its own set of grammatical and lexical indicators that signal a different degree of politeness. A good example of a language with a developed system of forms of politeness is Japanese. So, in Japanese, there are four grammatical categories of respect, showing the attitude of the speaker to the interlocutor and the object of the statement. In Hungarian, together with the three equivalence of the form "you", there is a fourth form. The general provisions of the theory of politeness are presented in the works of P. Brown and S. Levinson. Let us consider this theory in more detail as the most complete and consistent. The main concept of this theory is the concept of "face" (public self-image face), which refers to the positive social value that each member of society has. Any action is performed in order to save "face" or to avoid "losing face". Using the concepts of "saving / losing faces" P. Brown and S. Levinson develop a general theory that justifies predictability in the implementation of the category of politeness, based on the assessment of the "weight" of the speech act. This weight is determined by the following factors: the difference in

the social distance and distance of power between the speaker and the listener and the complexity of performing an action associated with the threat of "losing face".

The main idea of this theory is the position that the greater the state of the speaker creates a threat of losing face for the listener (The person threatening actions), the more polite he will be.

There are usually "negative" and "positive" forms of politeness (positive and negative politeness). Negative politeness is associated with giving a person freedom, positive politeness is associated with giving a person freedom with a demonstration of unity and solidarity.

Positive politeness strategies consist in expressing the speaker's solidarity with the listener and are expressed in the following lines of speech behavior:

- showing attention and interest to the listener, that is, direct quoting, involving the listener entering into a dialogue, seeking agreement, taking into account the desires and inclinations of the listener;
- creating an intra-group atmosphere identity, that is, the use of dialect, jargon, the use of "you", elliptical formations.

Negative politeness strategies consist in giving the listener a free hand, which is accepted in the traditions of Western culture and is usually understood as the norm of politeness. These strategies boil down to the following behavior:

- avoiding direct requests and using indirect speech acts;
- the formulation of statements in a softening modal package;
- showing respect by lowering your own position and increasing the position of the addressee, as well as the willingness to apologize;
- depersonalization of participants in communication, that is, the use of passive and impersonal constructions, vaguely personal pronouns.

The norms of politeness are also associated with the channels of modern business communication (telephone conversation, telegram, communication by fax or via the Internet), where they have their own characteristics and rules.

Thus, taking into account the different approaches to the definition of the category "politeness", we will try to formulate our own understanding of this phenomenon from the point of view of the studied subject of research. In the present study, politeness is considered as a speech-behavioral category that is implemented in speech by a certain set of lexical-grammatical and prosodic means, the main purpose of which is to achieve a positive communicative effect.

As follows from the definition, each of the language levels is characterized by the presence of politeness markers. At the lexical level, preference is given to normative vocabulary. Universal polite means are not only clichéd, standard phrases, but also such positively emotionally colored words as fine, nice, good, please, kind, happy, very well, etc. At the level of grammar, complete, complete sentences are used, with the correct grammatical form. The semes of politeness are realized due to the grammatical form of the subjunctive mood, the question positive and negative constructions, as well as modal verbs. At the level of phonetics, clarity and thoroughness of the full version of the pronunciation, moderate volume of the sound and the use of prosodic markers of politeness are required.

Interrupting a conversation is seen as a demonstration of power, strength, as an attempt to dominate the dialogue. Researchers distinguish between the concepts of "interruption" (interruption) and "simultaneous speaking" (overlapping). When the rights of one of the speakers are violated (violating another speaker's right and obligations). To talk about interrupting a conversation, you need to have the following knowledge about the interlocutors and the situation: the topic and duration of the conversation, how long each of the participants speaks, their relationship, how they relate to the fact of the interruption, and most importantly-for what purpose one interlocutor interrupts the other. To define the concept of "simultaneous speaking" (overlapping), it is enough to use mechanical criteria, because anyone who hears a dialogue or a tape recording can tell when two people are talking at the same time.

The sociality of the act of polite communication is manifested in its special qualities.

It is among these qualities that we stand out:

- 1) the historical connection of the given symbolism of communication with the people
- 2) the ability to be an expression of a common ethnic group
- 3) the ability to form and use culture, which are manifested only in speech.

Striking differences in the norms of etiquette speech behavior are manifested at the interlanguage level. If in Russian speech etiquette, in an official setting, it is not permissible to address the student to the teacher with the "you-ты" (yes in the case when the teacher is about the same age as the student), as well as to an adult, then in English (you), the address in this situation usually has a touch of intimacy. Or: in Russian speech etiquette, in a situation of greeting, it is customary for a younger person (by age, position) to inquire about the life, health, and affairs of an older person, while in English, this form of politeness is permissible form of a allowed and bear the character of frequent use. However, in Uzbek it is not permissible to address the student to the teacher with the "you-sen" in any situation even if the student is in the same age with the teacher.

When addressing speech etiquette is quite a complex phenomenon. Its character is influenced by both vertical and horizontal connections in the process of interaction. Situations of speech etiquette are subject to standard regulation. It embodies the concepts of accepted, due, required, expected, approved in society. They tend to reflect the cultural and historical processes taking place in the environment. In various national variants of it, there are also specific norms of speech etiquette, which are sometimes not identical with each other, and sometimes the academic standard. They can be interpreted as accepted in speech in the practice of this national collective in this period of time, etiquette (polite) forms of speech behavior.

In English, there are three types of communication situations: neutral, informal, and formal. The category of politeness is indirectly represented in the second situation, which is reflected by short, elementary structures in which only the decisive component is present, while as in the third one, it leads to the construction of structures oversaturated with politeness indicators, where the number of pragmatic signals can exceed three.

At the first stage of the situation, the number of pragmatic signals is balanced.

It is important to take into account the very nature of these signals, which also forms a clear opposition neutral communication (light structures of direct speech) official communication

(heavy structures of direct speech). So, in the field of formulas of speech etiquette of the English language, the oppositions are distinguished: informal, official and neutral communication.

The situation of neutral communication is characterized by the same pragmatic signals, such as: the structure of the general question, the structure of the subjunctive, formulas of apology (Gosh sorry, I'm afraid), modal verbs, verbs of mental activity (can/could).

The situation of formal communication is characterized by detailed formulas, including a large number of complex sentences with main sentence, such as: I hope you don't mind my asking but ... I wanted to know if you could tell me..., I should be interested to know... (I hope you don't mind me asking, but... . Could you tell me... I would like to know ...). Functional expressions of this type contribute to creating greater distance between speakers, thereby achieving the effect of super-politeness.

Situations of informality are expressed by short and elliptical sentences with the omitted subject and part of the predicate, such as: (Happen to) know...? Heard about...? (Don't happen to know...? Did you happen to hear...?) These structures contribute to the achievement of close contact between speakers, i.e. they are markers of the situation of informal relations between speakers.

This suggests that social communication formulas are important pragmatic signals for speakers. They regulate their social relationships and implement specific communication tasks [Russell 1997]. Their study from this point of view is the most important condition for learning and mastering a second foreign language on a communicative basis.

If you follow Haferman's concept of politeness/Paul [1996:26], then it will become clear why so many misunderstandings between foreigners and Russians are so common. In the developed and three-step concept of politeness, it influences society, it is based on morals and customs, and it sanctions misdemeanors and violations. Therefore, violations of elementary rules of behavior always have a shocking effect.

It should be noted that one of the most characteristic features of the polite speech behavior of native English speakers is their inability to maintain an easy, relaxed conversation. Paying tribute to the traditions of upbringing and observing decency, the British follows the ingrained habits of men circle and those prescribed by an ethic that allow him to keep in a convenient distance and intimate, personal, social interaction with the interlocutor dependencies on the configuration. The essence of effective communication is the ability to respond to cues adequately to the situation, but at the same time avoiding hidden confrontation "in conversation the English... **hardly ever lie, but they would not dream of telling you the truth** " in the conversation, the English **hardly ever** will lie, but they will not dream of telling you the truth.

Politeness in communication, from the point of view of representatives of British culture, involves two main lines of behavior "commandments", which can be conditionally called "not British politeness": 1) don't be direct and negative, and 2) don't be silent. I think we can assume that the habit of always to keep a distance. Based on the above, we can imagine that the ethical foundations categories of politeness can be put in the form of several levels. The first category includes cognitive processes, primarily thinking. The second set of linguistic and extra-linguistic knowledge. The following components can be included in the knowledge base: 1) language knowledge: a) knowledge of language; b) knowledge of the principle of speech

communication; 2) non-linguistic knowledge : a) knowledge of the context and situation, about the addressee (including knowledge of the setgoals and plans, ideas about the speaker and the surrounding environment and so on); general phonetic knowledge (i.e. knowledge about the world). This can also include knowledge of the psychological mechanisms of influence of their addressee.

The third level is the culture of speech, which is the sum of skills and abilities that provide the same characteristics of the utterance , logic, expressiveness, stylistic adequacy, etc. At the same level are also the skills of both correct / normalized and expressive use of non-verbal means in communication . And finally, the fourth level, which includes the ability to plan the discourse and manage it for the purpose of performing a speech action on the addressee.

CONCLUSION

The category of politeness has received a fairly wide coverage in linguistic science, however, among researchers there is no common view on the definition of the very concept of "politeness" in the aspect of linguistic investigations.

At present time in the development of linguistics, none of the three stages in the study of the phenomenon of linguistic (in) politeness has not fully clarified the social complexity of this multifaceted phenomenon and has not proposed any unified clear theory for conducting research in this area of human relationships. Nevertheless, it is obvious that scientists are striving to develop more sophisticated theoretical models with increasingly strict consideration of a wide communicative context, including the "social history" of both communicants.

In our opinion, it will not be superfluous to study this phenomenon taking into account the theoretical provisions of linguoecology, since sociolinguistics, pragmalinguistics and linguoecology can easily find common ground in the analysis of both environmentally friendly speech devoid of "rude" (V.I. Jelvis's term) speech, and speech in which, due to various factors, including the factors of the addressee and the addressee, there is non-ecological under normal conditions, the vocabulary clogging up speech, which, nevertheless, cannot always be unambiguously attributed to speech manifestations of rudeness.

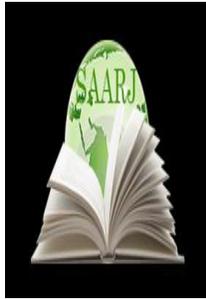

The English language has a rich system of similar lexical and grammatical formulas: modal verbs and their equivalents, subjunctive mood, passive voice, interrogative constructions, etc. After analyzing some sources relating to the category of politeness, we came to the conclusion that the principle of politeness is widespread in the English language.

Moreover, we have proved that politeness can be expressed not only by absolute markers, such as "please" and "thank you" (lexical way), but also by syntactic ways (at the level of sentence structure). It should also be noted that the use of certain constructions, words in various situations affects the degree of politeness. The noted features of communicative behavior affect the dominant features of English communication. The English style of communication is characterized by ambiguity and inadmissibility of direct influence on the interlocutor.

DEVELOPMENT OF TOURISM IN CENTRAL ASIA AND TERMINOLOGY FORMATION

Vakhidova Fotima Saidovna*

*Lecturer of the Linguistics Department
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

This work will provide the reader with valid examples of touring types and tourism terminology system, which, appropriately and effectively can be used in travel industry for tour agents as well as tourists for better consolidation of the knowledge while offering packages to tourists for traveling.

KEYWORDS: *Terminology System, Travel Industry, Tour, Tourism, Tourist Communication.*

INTRODUCTION

Tourism arose during the period of development of society, when a person got the opportunity to think not only about meeting priority, vital needs, but also about recreation. Although people have always travelled, only at a certain stage of the economic development of society, with the growing need for travel, manufacturers of these services have appeared which led to the formation of a special type of goods - tourist services. Then tourism became a separate branch of the national economy, which required the formation of an appropriate industry, the availability of qualified personnel, etc. All this made it necessary to separate the entire formation of lexical units into an independent terminology system.

International tourism is one of the largest and most dynamic industries in the world. It inevitably affects all aspects of society, including language. Over time, the tourism business continues to develop; contacts of Uzbek and foreign partners who are forced to use tourist terminology are intensified; Uzbek travelers are also constantly faced with the need to understand the terms used in the field of tourism services. At the same time, the science of tourism is developing rapidly; new terminology enlarging our vocabulary which specialties of the tourist profile are allocated in the education system.

Main part

Development of the "tourism" terminology system in both English and in Uzbek due to the level of development of the relevant sphere professional activities of a person. The regions of Southern Turkmenistan were part of the Sassanid state. The established political balance contributed to the growth of the economy. In the VI century, crafts and trade flourish, caravans go from West to East. Sogd played a prominent role in the cultural life of that time. The prototype of tourism activities – covers period from antiquity to the beginning of the 19th century, when the main motives for the travel of the Uzbek were trade, pilgrimage, treatment, education. Tourism terminology was in its infancy: they appear terms that are borrowed from the general literature language (Arab/Turkic) : single traveler, overnight stay, hour of arrival, hour of departure, travel book, karvonsardor (meaning "accompanying"), route (xarita), karvansaray (meaning "hostel") tourist (musofir) pilgrimage (ziyoratchi) khonakoh (single room) and etc.

XX centuries (when central Asia was occupied by Russia) voluntary and public form of organization of tourist activity - falls at the end of the twentieth century - 1936. This was the period when tourism development in Russia (Uzbekistan was under governor of USSR) was mainly due to activities of voluntary public organizations. It was on the second stage includes the terms tourist and tourism as borrowing from French. At this stage, the excursion was especially developed activity, terminology of tourism was replenished mainly with terms excursion business (educational, student, cheaper, walking tour), participants (the tourist ex-plying), equipment(tent, tourist clothing, stormy), organizers of excursions(sightseeing station, sightseeing bureau, sightseeing section).There is also a whole layer of terms devoted to the technology of the organizationhikes and excursions: tourist-excursion work, tourist route, planned tourism; accommodation: tent camp, tourist house, tourist base.

During the years of independence, Uzbekistan made a significant breakthrough in this area, coupled with the preservation and enhancement of the historical and cultural heritage of the people, the revival of national traditions and customs, and the restoration and arrangement of the sights of the Republic.

In order to create a modern high-performance and competitive tourist complex, a solid regulatory framework has been established in the Republic, the basis of which is the Law "On Tourism," adopted on August 20, 1999. There are programs of targeted events to improve tourism infrastructure, including attracting investments, diversifying tourism products, intensifying educational events, training and training of specialists in the field.

An important step in the formation of the national model of tourism was the creation in 1992 of the National Company "Uzbecturism" by Decree of President Islam Karimov. Since then, the structure coordinates the activities of sectoral organizations, trains relevant personnel, contributes to the influx of internal and external investments in the creation of a new and expansion of the existing material and technical base, stimulates the development of all types of tourism, actively participates in foreign events, and organizes major international forums. Commercial forms by tourist activities - begins in 1993(after Independency of Uzbekistan) and continues today. On this, the tourism system has undergone fundamental changes and the current system of terms has undergone a significant restructuring: on the one hand, whole term subsystems disappeared (first concerning planned and trade union tourism), on the other hand, steel English-language terms to be actively introduced. The formation almost all terms, including

derivatives and complex, occur based on the source root words; resulting in nested structures (route: route marking, categorization route, routing route sheet, routing book, linear route, radial route), that indicates the substantive and linguistic connectivity of the terms. In this regard, we can talk about the current terminological system of tourism.

Homeland of tourism as a species economic activity is considered England. In the history of English there are four stages are identified for tourism, which correspond to stages the formation of English terminology.

The first stage - In English, the terminology of tourism began to take shape: means of transportation, living conditions were indicated as insignificant set of lexical units of the general literary language: carriage, board, excursion, hotel, resort, itinerary and e.t.c. Reviewed literatures show that on this stage, about 5% of the studied corpus of English terms developed. The second stage - the beginning of the development of mass tourism - covers the XIX the century when the foundations of the material and technical base were laid, methods and tourism management bodies. It is in this century that they appear English terms tourism and tourist. In 1841, the founder modern tourism Englishman Thomas Cook organized the first sightseeing rail tour. Success in sightseeing accompanied Cook, and in 1851 the first travel agency was opened "Thomas Cook and Son." Due to the rapid development of the tourism industry in the second tourism terminology is actively formed at the stage: about 50% the terms studied were developed in the 19th century. At the same time, they formation was carried out in accordance with various tourist services: intermediary services *turbojuro* (conductor, booking), services transportation (commute, Pullman car, and liner), accommodation (*maitred'tel*, *bivouac*, room), catering services (a la carte, table d'hote, buffet), entertainment (safari, attraction). At the second stage, English terminology is actively introduced foreign terms: from French (*coupon*, *bivouac*, *maitred'hotel*); German (*Baedeker*), Swedish (*smorgasbord*).

The third stage of the development of English tourism and its terminology - mass conveyor tourism - occurred at the beginning of the 20th century and continued before World War II. Tourism development at this stage is characterized by unpretentiousness of services provided, standard of their recruitment. In this period also saw the growth of the hotel business, which led to creating new terms - designations of new placeholders and rooms (*motel*, *penthouse*, *duplex*), persons (*hotelier*, *receptionist*), types of services (*reservation*, *room-service*).

The fourth stage - mass differentiated tourism - takes its toll the beginning after World War II and continues to this day. Differentiated tourism is characterized by a variety of needs and motivations of tourists, multiplicity of highly specialized segments in tourism demand, variety of services offered and pronounced specialization of tourist offer. In this regard, it was noted that English terminology of tourism began to be actively replenished with terms specialized tourism (*agroturism*, *disaster tour*, *nostalgic tourism*, *familiarization trip* и др.). 50-60s - a period of intensive creation tourism infrastructure, which led to the emergence of new terms in the sphere hospitality (*check-in*, *check-out*, *boutique hotel*), spheres catering (*brunch*, *catering*, *stand-up buffet*), mediation services tour operators and travel agencies (*catchment area*, *last minute tour*, *reservation system*). A feature of the replenishment of the terminology system at this stage is active creation of composite and derivative nominations that reflect already established conceptual structure (*tour leader*/*tour operator*/*tour participant*).

The logical and conceptual analysis of the studied terminology system made it possible to conclude that the typological proximity of the studied terminology systems speaks with sufficient clarity at the conceptual level. They are terminology tourism in both languages reflects the system of concepts that operate its numerous industries and are presented in the form of conceptual thermos logical fields (tourism industry, tourism statistics), micro-fields (transportation, hospitality industry, tourism organization, catering industry, leisure activities) and thematic groups.

The development of international tourism has led to an increase in professional communication in this area. The participants of communication in the field of tourism are professionals in this field, tourists and representatives of the local population. Any form of their communication gives rise to a text of tourist topics aimed at exchanging information. However, the text created to transmit information from one professional to another contains a larger number of terms and less vocabulary of general topics than the text aimed at persuading or informing a tourist. When creating the text of tourist topics, somehow we face with terms that can be divided into various areas. The types of tours and tourism are as follows:

Agro tourism/agro tour, Incentive tour, Rural tourism, Space tourism, Extreme tours, Ecotourism, Independent travel, Self-guided tour, Package tour, Culinary tourism, Tolkien tour, Weekend tour, Daytrip, exclusive tour, leisure tour, MICE and etc.

Professional fields: Guide, Event organizer, Travel agent, Airport baggage handler, Car valet, Tourist information center assistant, Sports therapist, Hotel/Resort representative, Outdoor pursuits leader, air traffic controller, Airport representative.

Hotel accommodation: Standard room, Daily average rate (DAR), Netrate, Rack rate, Reservation, Cancellation, to book, Room facilities, Limited service hotel, mezzanine, occupancy vacant, check-in, check-out, prepaid room

Restaurant service: Full board/ American plan (AP), Alacarte, Back of the house, all-inclusive, expediter, front of the house manager, tip,

Transfer: Charge, refund, non-refundable (NRF), gate, access drive, Seat-in-coach, excess baggage, return ticket, scheduled flight, charter flight, frequent flyer, shuttle, cancellation fee/charge/penalty, pick up, drop off .

Excursions: Itinerary, overnight, sightseeing, city guide, departure point, meeting point, driver-guide, shore excursion, day visitor, heritage site, meet and greet, hoponhop off tour.

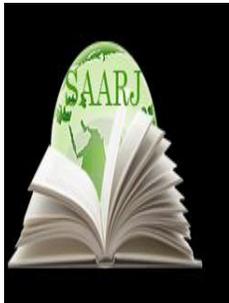

CONCLUSION

Thus, tourism terminology in English and Uzbek, it was concluded that the terminology system of tourism English can be called developed, while the Uzbek language -developing. To conclude, terminology as a collection of terms used in a certain field of knowledge is a key aspect of study in thermal science. Terminology is an integral part of the field of science and technology. The main area of the work of thermal studies is the collection and inventory of terms, which can then be combined into terminology systems. The terminology system is an ordered set of terms with fixed relationships between them, reflecting the relationship between the concepts called these terms. The terminology system is a constantly developing, dynamic part of the lingua. The concept of "term" does not have a single definition. The most capacious and concise term can be

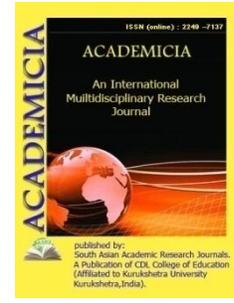

defined as a unit of language that denotes the concept of a special field of knowledge or activity. The term can be both a separate word and phrases that most closely reflect the concept described. Use and consumption of tourist terms from other industry terms varies significantly according to the degree. Tourist terms in international languages, mainly, it is actively used in the speech of tourists and their attendants.

ABSTRACT

Aim: Study of social factors of the formation of a low level of quality of life parameters in patients with chronic obstructive pulmonary disease (COPD) and bronchial asthma (BA).
Material and methods: Researching of screening survey was carried out in the pulmonary department. 140 patients with chronic obstructive pulmonary disease and 314 patients with bronchial asthma were questioned. The average age of patients with chronic obstructive pulmonary disease was 53.6 ± 0.74 years, in patients with bronchial asthma it was 46.3 ± 0.61 years. Quality of life was determined using the Seattle questionnaire, which included 29 questions assessing physical condition, emotional state, professional fitness and satisfaction with treatment. **Result:** The results of the study identified the criteria of social factors that determine the increased risk of a low level of QOL parameters, which is determined for both COPD and BA patients. A high degree of low level of physical condition for patients with COPD and asthma

are determined by factors: gender, with a deficit in body weight ($IC \leq 19$), or its excess ($IC > 30$), with the length of the disease, villagers employed in agricultural production (collective farmers), living in poor living conditions, in families of more than 5 people, or single, with a smoking experience of more than 20-30 years, with the presence of concomitant diseases and observed by therapists at the place of residence.

KEYWORDS: *Chronic Obstructive Pulmonary Disease, Bronchial Asthma, Social Factors, Quality Of Life.*

INTRODUCTION

Chronic obstructive pulmonary disease (COPD) and bronchial asthma (BA), being one of the leading causes of morbidity and mortality worldwide, is an important medical and social problem, and the prevention and treatment of COPD is an important public health problem (2, 9,13).

Among the numerous problems that have befallen modern humanity, one of the leading places is occupied by the problem of psycho-emotional stress (11). It is important to note that COPD, characterized by progressive irreversible bronchial obstruction and an increase in chronic respiratory failure, causes a decrease in exercise tolerance, limitation of vital activity, an increase in the symptoms of the disease and a decrease in the patient's quality of life (QOL) (1, 5,10).

The lowest QoL score in COPD patients is an important predictor of hospitalization and mortality from various causes. The development of questionnaires such as the Seattle questionnaire can help identify patients who will benefit greatly from preventive measures (3). QOL also correlates with medical and social factors. So, the older the patient or the longer the length of the illness, the lower his viability and social activity; the size of the family increases the vitality, but at the same time worsens mental health, but material wealth has a favorable effect on the state of the patient's psychoemotional sphere (4, 8).

S.S. Mirzakhmidova (2003) conducted studies to determine QoL in elderly patients with COPD and revealed a significant decrease in QoL parameters. The study of the effect of tobacco smoking on QoL showed that there were significant differences in the groups of smokers and non-smokers. Smokers more often had a lower quality of life, especially role emotional functioning and vitality (12).

It was also found that concomitant diseases affect the QOL of BA patients only if they need constant correction. It was found that in BA patients, the QOL of women is slightly lower than that of men (6).

Objectives. Study of social factors of the formation of a low level of quality of life parameters in patients with chronic obstructive pulmonary disease and bronchial asthma.

MATERIAL AND METHODS

Screening-questioning was carried out in 514 patients with COPD and BA during an exacerbation of the disease on the basis of the pulmonology department of the Scientific Research Institute of Phthysiology and Pulmonology of the Ministry of Health of the Republic of Uzbekistan. 200 patients with COPD aged 19 to 79 years were surveyed, of which there were 122 men ($61 \pm 4.4\%$) and 78 women ($39 \pm 5.5\%$). The average age of patients with COPD was

54.2 ± 0.77 years, the average age of men - 55.4 ± 1.08 years, women - 52.5 ± 1.31 years. Also, 314 patients with bronchial asthma at the age from 17 to 79 years old were questioned, of whom there were 141 men (45 ± 4.2%), 173 women (54.9 ± 3.8%). The average age of BA patients was 46.3 ± 0.61 years (the average age of men - 45.6 ± 0.99 years, women - 46.9 ± 0.87 years). Among patients with COPD, villagers accounted for 45.7%, city residents - 54.3%. Among BA patients, residents of rural areas accounted for 45.1% (142 out of 314 patients) and city residents - 54.9% (172 out of 314 patients). Among the COPD patients included in the study, workers accounted for 39.2%, office workers - 45.5%, collective farmers - 14.2%, housewives - 2.1%. Among BA patients, workers accounted for 46.2%, white-collar workers - 39.4%, collective farmers - 6.8%, housewives - 3.4%. The distribution of patients with COPD by the nature of work showed that in patients with COPD, the mental nature of work prevailed - in 45.7%, heavy physical labor - in 34.2%. In BA patients, manual labor prevailed - 32% and mental nature of labor - 42.8%. Heavy physical labor took place in 24% and mechanized labor - 8.5%. 52.8% of patients with COPD and 26.8% of patients with BA were actively smokers. The average smoking experience in patients with COPD was 28.2 ± 0.98 years, in patients with BA - 17.6 ± 0.67 years. 22.1% of COPD patients and 4.5% of BA patients had a smoking experience of more than 30 years, 9.2% and 14.8%, respectively, smoked before 20 years. 13.5% of COPD patients and 4.5% of BA patients have smoked in the past. The presence of concomitant diseases was noted in 56.4% of patients with COPD and in 52.5% of patients with BA. The analysis of medical services for patients with COPD and BA showed that only 10.7% of patients with COPD and 20.5% of patients with BA are covered by dispensary registration with a pulmonologist. 77.8% of patients with COPD and 76.5% of patients with BA are registered with a general practitioner.

Quality of life was determined by the Seattle questionnaire comprising 29 questions that assess physical condition, emotional state, the state of professional competence and satisfaction with treatment.

RESULTS AND DISCUSSION

A comparative analysis of the factors that form a low level of QOL parameters in patients with COPD and BA showed their pronounced differences (Table 1).

Thus, a low level of QOL formation in terms of physical condition in patients with COPD has a high prognostic risk in the contingent: women over 55 years of age, with CI over 30 or underweight, with more than 20 years of illness, with over 30 years of smoking experience living in the countryside and engaged in agricultural work, with poor living conditions and a family of up to 3 members, with concomitant diseases and observed by a therapist. In contrast to COPD, in BA patients, a low level of the QOL parameter in terms of physical condition is formed with a high degree of risk in the contingent: people in the age group from 35 years old, residents in cities, occupations in the industrial field of activity, with a length of illness of 5 years, nonsmokers, non-smokers. observed in medical institutions.

The low level of the QOL parameter, according to the emotional state of patients with COPD, is determined by a high risk in the contingent of patients: women, aged 35 to 44 years, having more than 30 of them or underweight, living in a city, having an agricultural orientation of work duration, with poor housing conditions,

Model of social factors high prognostic risk of the formation of a low level of quality of life parameters in patients with COPD and BA

with the number of family members, nonsmokers, no concomitant diseases and not observed in medical institutions. In BA patients, a low level of emotional states with a high degree of risk is formed in the contingent: women, aged 35-44 years, who have a body weight deficit, with a length of illness of 5 years, villagers and have an agricultural orientation of work duration, conditions and a large number of family members (more than 5 people), with a smoking experience of up to 20 years, with concomitant diseases and observed by a therapist.

Analysis of the low level of professional adaptation in patients with COPD and BA showed that some factors, namely: female sex, high anthropometric indicators - IC > 30, poor living

conditions, a large number of family members (more than 5 people), the presence of concomitant diseases and the absence observations in medical institutions — determine a high prognostic risk of the formation of a low level of professional adaptation.

Differences in some factors were also noted. Thus, the predictive risk of a low level of professional adaptation in patients with COPD differs at the age of over 55 years, and in BA - at the age of 35-44 years. In COPD, the risk of low occupational adaptation is higher with a disease experience of more than 20 years, and in BA - from 10 years. The risk of low professional adaptation for patients with COPD is higher among rural residents engaged in agricultural work, and for BA - urban residents with an industrial sphere of work.

CONCLUSIONS

1. The results of the study identified the criteria of social factors that determine the increased risk of a low level of QoL parameters determined for both COPD and BA patients.
2. Thus, a low level of QOL formation in terms of physical, emotional state and professional adaptation in patients with COPD and BA has a high prognostic risk in the contingent: women over the age of 55 years (COPD), people in the age group from 35 years old (BA), with IC more than 30 or underweight, with more than 20 years of illness, with more than 20-30 years of smoking experience, living in rural areas and engaged in agricultural work, with poor living conditions and family up to 3 members, with concomitant diseases and observed by a therapist.

Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
