ACADEMICIA

An International Multidisciplinary Research Journal

ISSN (online) : 2249 –7137

Editor-in-Chief : Dr. B.S. Rai

Impact Factor : SJIF 2021 = 7.492

Frequency : Monthly

Country : India

Language : English

Start Year : 2011

Indexed/ Abstracted : Scientific Journal Impact Factor (SJIF2020 - 7.13), Google Scholar, CNKI Scholar, EBSCO Discovery, Summon (ProQuest), Primo and Primo Central, I2OR, ESJI, IJIF, DRJI, Indian Science and ISRA-JIF and Global Impact Factor 2019 - 0.682

E-mail id: saarjournal@gmail.com

VISION

The vision of the journals is to provide an academic platform to scholars all over the world to publish their novel, original, empirical and high quality research work. It propose to encourage research relating to latest trends and practices in international business, finance, banking, service marketing, human resource management, corporate governance, social responsibility and emerging paradigms in allied areas of management including social sciences , education and information & technology. It intends to reach the researcher's with plethora of knowledge to generate a pool of research content and propose problem solving models to address the current and emerging issues at the national and international level. Further, it aims to share and disseminate the empirical research findings with academia, industry, policy makers, and consultants with an approach to incorporate the research recommendations for the benefit of one and all.

ACADEMICIA

An International Multidisciplinary Research Journal

(Double Blind Refereed & Peer Reviewed International Journal)

**RELATIONSHIP WITH EARLY AND LATE ADOLESCENT'S
 EDUCATIONAL ASPIRATION IN SECONDARY SCHOOL IN
 KALKUDAH ZONE, BATTICALOA IN SRI LANKA**

ABSTRACT

Understanding the relationship with early (junior grades) and late adolescents' (senior grades) educational aspiration (EA) is important in determining effective and valid performance in these grades of secondary schools in Sri Lanka. The students' educational aspiration is the determination factor of their future performance in life. The Objective of this study is to find out any relationship with early (junior grades) and late (senior grades) adolescents' educational aspiration in secondary school in urban and Semi-urban area in Kalkudah zone, Sri Lanka. Determining the correlation between these two variables is important for all academics to understand, so that all students can achieve to their academic potential. In this study was a design survey method was used and directed at the population of senior secondary students in Kalkudah zone, Batticaloa district of Eastern Province in Sri Lanka. Ten school of IAB, 1C, grades were selected from this research area. These schools were stratified random into urban (3) and semi-urban (7) schools among IAB and 1C. 160 students who studied in grade 9, and 160 students who studied in grade 13 science and arts stream were selected at systematic random. 32 samples were selected from each school among grade 9 and 13. The average age of the students is 13.4 (early adolescent - grade 9) and 17.5 (late adolescent - grade 13). The research instruments, questionnaire format titled Student's Questionnaire; it's to measure the students' aspiration with teacher responses about the students' attitude to the subject. Reliability was checked by test – retest after three weeks for the EA. The very high correlations obtained reveal the reliability of the instruments of measurement. Its split-half reliability coefficient of correlation yields are 0.81, 0.84, and 0.89 for Academic Motivation (AM), Self Concept (SC) and

Students Attitude towards Education (SAE) respectively. Null hypotheses was postulated from objectives and tested at 0.05 level of significant to determine how the relationship of junior grade's (early adolescent) educational aspiration correlates on senior grade's (late adolescent). The data was collected through questionnaire related to the variable. Qualitative and quantitative method (mixed method) was used to analysis. Statistical Package of Social Science (SPSS) which includes t – test and Pearson Product Moment correlation coefficient was used in analyses. The result revealed that, there are strong evidences to prove that there are no relationships between the EA of early adolescence (grade 9) and late adolescence (grade 13). Hence the null hypothesis is completely accepted. That is, there is no significant relationship between the EA of Grade 9 and EA of grade 13. This research findings have been explored the educational aspiration of junior and senior grades in secondary school and current nature of the research areas also gives different levels of variables of EA in the secondary school students.

KEYWORDS: *Educational Aspiration (EA), Academic Motivation (AM), Self Concept (SC), Students Attitude towards Education (SAE), Urban, and semi-urban, IAB and IC school, early and late adolescent (Junior and senior grades).*

INTRODUCTION

The concept of aspiration was first introduced by Demo and Hoppe (1982). Aspiration is concerned with what goal a person sets for himself. Many have investigated the factors that influence goal setting behavior (Crockett, 1982); Frank (1985), provided a definition of the level of aspiration which is now generally accepted. He defines the level of aspiration as the “level of future academic performance in a familiar task which an individual knowing his level of past performance in that task undertakes to reach”.

Some research workers like Demo and Hoppe (1982) have identified the concept of “ideal goal” and “action goal” in relation to aspiration phenomena. The subject's verbal statement on aspirations corresponds to the goal he intends to reach and this is referred to as “ideal goal”. His achievement on the sphere he sets his goal is referred to as “action goal”. “Goal discrepancy” is determined by the discrepancy between the two. Left to the own devices, most children would live in the present and let the future take care of itself. But they are not left to their own devices. Even before they enter school, parents, relatives and family friends ask children what they are planning to do when they are grown up. Most of the adults regard a child who says, “ I want to be the Prime Minister of Sri Lanka” or “ I am going to be a doctor or an engineer”, as ambitious, and as courageous.

In a culture which provides vast opportunities for its members to be and to achieve what they want, it is understandable that children at an early age would be subjected to pressures to create aspirations for the future. Aspiration, it is believed, motivate children to take advantages of the opportunities parents and society provide. Social pressures to plan for the future are reinforced by competition with members of the peer group in play and school or college work. As the students compare what they can do with, what their peers can do, it adds new meanings to their aspiration and puts new emphasis on the creation of aspirations that are both ego satisfying and admired by members of the social group. Thus, forming aspirations become an important area of creativity in students.

REVIEW OF LITERATURE

Aspiration is a natural phenomenon of human life, and educational aspiration is no exception. Level of aspiration was also considered to play a significant role in scholastic achievement. Miller, (2004) found that job aspiration; educational aspiration and general ambition were strongly associated with high achievement, particularly in girls. Ramkumar (1992) found that job aspiration, educational aspiration and general ambition were strongly associated with high achievement, particularly in girls. He had observed a strong association between achievement and goal discrepancy. Agreeing with these results Kuppaswamy (1996) informed that the achievement in school is closely related to the level of aspiration.

The following sub variables are taken based on the EA of the students. These are the factors determine the value of the student's EA (Mc. Clelland and Atkinson, 1984). Such as; achievement motivation (AM), self-concept (SC), and students' attitude towards school and homework (SAE). Achievement motivation is often correlated with actual achievement behavior. The motivation to achieve, however may evidence itself only in behavior that children value. Academic achievement motivation is used to mean the pupil's need or drive towards the achievement of success in academic work (Amalaha, 1975). A great deal of research has found that students high in academic motivation are more likely to have increased levels of academic achievement and have lower dropout rates Bansal et.al., (2006). Other studies have reported positive relationship between motivation and academic performance and success (Broussard and Garrison, 2004; Bansal et.al. (2006); Skaalvik and Skaalvik, 2004; Skaalvik and Skaalvik, 2006).

Studies on the relationship between self-concept and students' academic achievement in educational setting have been a major focus for research for many years Hudson and Rottmann, (1991). Most of these researchers have supported the belief that there is a persistent and significant relationship between self-concept and achievement and that a change in one seems to be associated with a change in the other. In a major longitudinal study Brover and Thomas (1992) and Joiner as cited in Hudson and Rottmann (1991), investigated the relationship between self-concept of ability and academic performance of more than 1000 male and female students from the time they started seventh grade to the time they completed 10th grade. They found out that self-concept was a significant factor in achievement at each grade level studied.

In a study by Harris et al. (1995) in Australia, aspirations of country adults were lower than those of their urban counterparts. As inhabitants in isolated communities experienced better education, improved communication and greater mobility, their aspirations were raised not only for themselves and their children, but also for the whole community in which they lived. In a study of rural-urban differences in educational aspirations of 6,000 Minnesota youth, Nelson (1997) found that rural students register academic aptitude scores similar to those of urban students and they are as strongly encourage to attend college as urban students. Rural students are as likely to enjoy school as urban students and they do not reject college attendance because of the scarcity of family financial support. What emerges from his study is the importance of social class in understanding community effects. Class differences in rural and urban areas are pronounced in Minnesota. When social class as a variable is controlled, rural-urban differences are reduced. However, the rural community structure appears to depress college aspirations below the level of comparable students from more urbanized areas. Data from a sample of 52,639 Minnesota high school juniors indicated to Nelson (1997) that although attendance at small rural school appears to lower values on one variable (rural-urban residence) related to aspirations, it simultaneously

increased values on a second related variable (participation in co-curricular activities). He suggested that reporting simple community size differences in determining aspirations obscures complex and confounding variable effecting the formation of aspirations.

Though most research works tended to overlook the differences in aspirations of rural growth when compared to urban youth growth, the few studies available reveal that it is logical to treat them as different cultural sub-group. Schwarzweller (1994) studied children in a rural and urban area in Kentucky. He found that the children in a more urban area of Kentucky had very different occupational values from those in a rural part of the state.

Objective of the Study

The main objective of the research is to study, how far correlates between junior grade's (early adolescents) educational aspiration and senior grade's (late adolescents) educational aspiration of secondary school students in urban and Semi-urban area. Under this objective, one null hypothesis was constructed.

Hypothesis

There is no significant relationship between early adolescents' educational aspiration and late adolescents' educational aspiration among urban and semi urban area in secondary school.

METHODOLOGY

In this study was a design survey method was used and directed at the population of senior secondary students in Kalkudah zone, Batticaloa district of Eastern Province in Sri Lanka. Ten school of 1AB, 1C, grades were selected from this research area. These schools were stratified random into urban (3) and semi-urban (7) schools among 1AB and 1C. 160 students who studied in grade 9, and 160 students who studied in grade 13 science and arts stream were selected at systematic random. 32 samples were selected from each school among grade 9 and 13. The average age of the students is 13.4 (early adolescent - grade 9) and 17.5 (late adolescent - grade 13). The research instruments, questionnaire format titled Student's Questionnaire; it's to measure the students' aspiration with sub-variable of EA, such as; academic motivation (AM) self-concept (SC), and teacher responses about the students' attitude to the subject (SAE). Totally 60 question was included based on sub variables of EA. Reliability was checked by test – retest after three weeks for the EA. The very high correlations obtained reveal the reliability of the instruments of measurement. Its split-half reliability coefficient of correlation yields are 0.81, 0.84, and 0.89 for AM, SC and SAE respectively.

Null hypotheses was postulated from objectives and tested at 0.05 level of significant to determine how the relationship of junior grade's (early adolescent) educational aspiration correlates on senior grade's (late adolescent). The data was collected through questionnaire related to the variable. Qualitative and quantitative method (mixed method) was used to analysis. Statistical Package of Social Science (SPSS) which includes t – test and Pearson Product Moment correlation coefficient was used in analyses.

Data Analysis, Results and Discussion

This hypothesis checks that there is any relationship between EA of grade 9 and EA of 13 students. Here inter-correlation test had been done to check the relation between the sub-variables AM, SC, and SAE that decide the value of EA and the individual values of grade 9 and

13. Table 1 shows the above test. The correlation between AM, SC, SAE, and composite EA of grade 9 students and AM of grade 13 students are 0.029, 0.061, 0.071, and 0.018 respectively. The above result shows that the relationship is very weak. Likewise, the correlations of SC of grade 13 students are 0.210, 0.014, 0.064, and 0.147. This correlation is also a weak one. Further, the correlations of SAE of grade 13 students are 0.017, 0.059, 0.070, and 0.026 and the correlations of composite EA of grade 13 students are 0.127, 0.022, 0.026, and 0.067. Hence, the correlation value between these two variables does not get beyond 0.2. Therefore, there is no significant relationship between the above two variables since the correlation between these two is very low and the value of p is very high ($p < 0.05$).

Table 2 clearly indicates that the value of non-determination factors (residual) for the correlation between AM, SC, SAE, and composite EA of grade 9 students and AM of grade 13 students is very high. Here, the values of non-determination factors (residual) are 99.9% ($R^2=0.001$), 99.6% ($R^2=0.004$), 99.5% ($R^2=0.005$), and 100% ($R^2=0.000$). The value of non-determination factors (residual) for the correlation between AM, SC, SAE, and composite EA of grade 9 students and SC of grade 13 are 95.6% ($R^2=0.044$), 100% ($R^2=0.000$), 99.6% ($R^2=0.004$), and 97.8% ($R^2=0.022$). The value of non-determination factors (residual) for the correlation between AM, SC, SAE, and composite EA of grade 9 students and SAE of grade 13 are 100% ($R^2=0.000$), 99.7% ($R^2=0.003$), 99.5% ($R^2=0.005$), and 99.1% ($R^2=0.001$). Finally the value of non-determination factors (residual) for the correlation between AM, SC, SAE, and composite EA of grade 9 students and composite EA of grade 13 are 98.4% ($R^2=0.016$), 100% ($R^2=0.000$), 99.9% ($R^2=0.001$), and 99.6% ($R^2=0.004$). The above relationships show that there are no significant relationships between the above grade 9 EA and grade 13 EA.

As shown above, since the correlation (r) values between the two variables are very low, the values of the non-deciding external factors are very high. That is, the values are always lying between 95 – 100%. That is, the EA of the early adolescence (grade 9) is completely different from the EA of the late adolescence (grade 13), and it is obvious that there is no correlation between these two. Comparing the EA of grade 9 and 13 students, the EA of early adolescence (grade 9) students could be as follows:

- a. They do not forecast future. Based on the current needs, their EA would be based.
- b. They do not have sufficient knowledge about the future job market, so EA is also formed based on that.
- c. Since they are encircled with the aspiration of their peer group, the group aspiration might influence the individual's educational aspiration.
- d. Parents' likeliness is usually the students' one, so parents' likeliness influence mostly on the students' EA.
- e. They think based on themselves; therefore the EA is also formed on that.
- f. Since they are in the early adolescence, sexual thoughts also influence on their EA.
- g. They might have some unachievable likings, they too might influence on their EA.

Unlike the early adolescence, the EA of the late adolescence is completely different. The following might be the reason for this:

- a. They think of their future, jobs, planning their life, etc. So their EA is based on these factors.
- b. Since they are able to forecast, their EA is usually achievable.
- c. Parents' expectations are usually not taken into consideration by them. Therefore, they have their own EA.
- d. They plan for their future jobs. They usually know what to study to achieve that job. So they set their EA based on that.
- e. The general characteristics of this group are social needs, racial thoughts, and ideas to achieve something. These too participate in deciding their EA.

Therefore, there are strong evidences to prove that there are no relationships between the EA of early adolescence (grade 9) and late adolescence (grade 13). Hence the null hypothesis is completely accepted. That is, there is no significant relationship between the EA of Grade 9 and EA of grade 13.

The some importance research findings about how to not correlate early adolescence's aspiration (grade 9) and late adolescence's aspiration (grade 13). This is support and help to this research finding. Research in the area generally differentiates between and compares aspirations and expectations (early and late adolescence). Aspirations are defined as an individual's desire to obtain a status object or goal such as a particular occupation or level of education (both levels of education are entirely difference). Expectations are the individual's estimation of the likelihood of attaining those goals, plans, ambitions or dreams. The conceptualization of these terms is credited to Kuvlesky and Bealer (1996) in their attempt to define occupational choice which they consider to be a reflection of an individual's aspirations or preference concerning work statuses. The late adolescences plan for their future jobs first. They usually know what to study to achieve that job. So they set their EA based on that and but not in early adolescence stage. A few studies compare aspirations and expectations to attainment which are defined as the behavioral realization of the goal.

Kuvlesky William's (1991) work also produced evidence that aspirations do not because significantly more realistic as youth mature, at least within the limited time frame of the high school years, countering Ginzberg's theory. Coleman, whose subjects also encompassed Ginzberg's three stages (from preadolescence to late adolescence), reported substantial declines in educational aspirations and less substantial declines in occupational aspirations, supporting Ginzberg. Again, expectations declined more than aspirations. In a study of 614 young adults, Sollie and Lightsey (1995) found that aspiration increased during the time period from 1966 (as tenth graders) to 1972 when they had achieved full time employment status. Expectations during this time period decreased. Both aspirations and expectations were substantially higher than actual occupational attainment. In their study, race, sex, and residence (small city, small town, rural farm or rural non-farm), when examined, failed to alter the nature of the relationship observed for the sample as a whole. So, above research finding are more related and supported to finding of this study.

Adolescents' academic performance has also been researched in relation to occupational aspirations and expectations. Adolescents who experienced minimal academic risk expected occupations of greater prestige (Rejewski, 2005), while adolescents who experienced substantial risk of academic failure were more likely to report lower occupational aspirations and higher

aspiration-expectation discrepancies (Rojewski and Hill, 1998). Similarly, adolescents who were confident of their academic ability evidenced a higher correlation between their occupational aspirations and expectations (Furlong and Biggart, 2001). Cosby (2004) found that the rural youth in his study, when examined as adults, showed stability in occupational aspirations, a decline in occupational expectations, and an increase in educational aspirations. Educational attainment in early adulthood was reportedly by career preference developed during their school years.

Underlying much of the research is the implicit assumption that aspirations and expectations are in some way predictive of actual attainment in adult life and that there is a process which begins in childhood and might be subject to social intervention if we understood it better. Aspiration has been considered an essential component in the motivation to achieve, operating somewhat like a self-fulfilling prophecy. Much of the early research on aspiration or status projection and attainment was concentrated in the Midwestern states and involved primarily white, middle-class, high school students. Due to the nature of those populations, few blacks or lower socioeconomic status youth were included. By using high school students, the most deprived youth were often excluded by virtue of the fact of their non-attendance at school. Furthermore, most of the studies focused largely or entirely on boys because of an assumption that careers and status attainment are more important for males or that the status of females is determined by that of their husbands (Coleman, 1996).

CONCLUSION AND RECOMMENDATION

The results indicated that, there are strong evidences to prove that there are no relationships between the EA of early adolescence (grade 9) and late adolescence (grade 13). Hence the null hypothesis is completely accepted. That is, there is no significant relationship between the EA of early adolescents (grade 9) and EA of late adolescents (grade 13).

The test done to check the relationship between the sub-variables of EA of the early adolescence and the sub-variables of EA of the late adolescence shows that the non-deciding external factors for the correlation is more than the deciding factors for the correlation. Therefore, there is no significant relationship between these two variables. Table 2 shows the percentage of the above non-deciding external factors. That is,

- a. Since the correlative percentage between grades 9 AM and grade 13 AM of the non-determination factors (residual) is 99.9%, the required AM for both the students must be given by the parents and the teachers.
- b. Since the correlative percentage between grade 9 SC and grade 13 SC of the non-determination factors (residual) is 100%, there are different trends in the SC of the early and late adolescence students. That is, the self-concept of themselves reflects their future desire. Hence, there are no relationship between grade 9 SC and grade 13 SC.
- c. Since the correlative percentage between grade 9 SAE and grade 13 SAE of the non-determination factors (residual) is 99.5%, the learning attitude among them is entirely different. That is, the learning attitudes of these two groups (early adolescence and late adolescence) are totally different from each. Curiosity towards education for these groups may be based on the following needs:
 1. The differences in motivations by the parents and the teachers,

2. The interests in teaching shown by the teachers,
 3. The response by the students towards learning,
 4. The trends and corporation of the peers,
 5. The interest towards science subjects, and
 6. Family status and their needs.
- d. Since the correlative percentage between the composite EA of the grade 9 and grade 13 of the non-determination factors (residual) is 96.6%, the EA of the above two groups are different from each other. The parents and the family must act according to satisfy their required needs of the students. Also teachers and the schools must prepare their projects and regularities accordingly.

Some recommendations are follows;

1. Results of the present study show that students' aspiration level is very important for the academic achievement; hence it is recommended that government should take solid steps to increase the job opportunities and encourage the suitable jobs for world trend for in charge of the family. Career and counseling is very important programme for this society, because this factor has more relationship to academic achievement of the children.
2. Precaution should be taken when it comes to parental encouragement since unreasonably high demand and too much pressure for good performance in subject made by some parents on their children may cause anxiety and fear of failure which may affect the child's academic achievement negatively.
3. Many parents may not be aware of the influence of various home environmental factors on the academic achievement motivation (AM) of their children. It is recommended that, teachers, educationist and leaders should try to create awareness in parents on the importance of the home environment on academic achievement motivation which can improve the children's performance. Parents need to be informed that, they can contribute to the education of their children through encouragement, provision of learning facilities, and active assistance among other strategies.
4. Helps students make their aspiration become a reality. Students need to be told about the professional or academic requirement needed for a particular occupation. They need to be advised on the academic qualifications needed to obtain a place in their desired field of studies.
5. Semi-urban and urban cultures appear to be somewhat different. Semi-urban students tend to be more homogeneous than urban students. It is recommended that schools develop ways to provide cultural interchange between semi-urban and urban schools and students. Students from rural areas should learn what it is like to live and work in an urban area.

ABSTRACT

We performed experimental studies on 50 rabbits, where morphologically using the electron microscopy, we studied the changes in the tissues and lymphatic bed with a gunshot injury. The experimental results showed that the lymphatic system undergoes a significant restructuring after a gunshot wound, and the regional lymph stimulation contributes to a significant acceleration of the wound healing process by the 3rd day after the commencement of treatment.

KEYWORDS: *Gunshot Wound, Lymphotropic Therapy, Electron Microscopy.*

INTRODUCTION

In recent years, a gunshot wound is relevant not only in the field of military medicine but also in the field of civilian health systems. There was a sharp increase in the number of gunshot injuries to the civil population in the world. Inevitable bacterial contamination of gunshot wounds, the destruction of tissue along the wound canal leads to a large number of septic complications,

which requires constant improvement of treatment methods. Despite the great experience of effective use of lymphotropic therapy in the treatment of purulent surgical infections, we found only sporadic works dedicated to this method in the prevention and treatment of wound infections in gunshot wounds. In this regard, our study aimed to determine experimentally the opportunity to influence the lymphotropic antibiotic therapy and regional lymph stimulation method on the healing of gunshot wounds.

Research objective: Peculiarities of pathogenetic approaches in the prophylaxis of surgical infections and treatment of burn injuries

MATERIALS AND METHODS

Experimental studies were carried out on 50 rabbits of both sexes with a weight of 5-6 kg and were led by professor Baybekova I.M. and held in the Central Scientific Research. medical Institute as well as in the Laboratory of Pathomorphology at the Republican Specialized Center of Surgery named after academician Vakhidov V.V. In the experiments we used a trial model of gunshot wounds. All the animals in experimental and control groups were injected kalipsol anaesthesia fifteen minutes before the injury, after which they were fixed on special plates. Standard gunshot wounds of the soft tissues were applied to the region of the middle third of the right femur of the rabbit.

According to the tasks, the experimental animals were divided into two groups (Table 1).

TABLE 1 THE DISTRIBUTION OF ANIMALS IN RESEARCH GROUPS

Animals	Method of treatment	Number of animals
Control	Traditional treatment of intramuscular antibiotic therapy	25
Study/Main	Lymphatic antibiotic therapy (LA) and Regional lymph stimulation (RLS)	25

Regional lymphatic therapy (RLT) was carried out by the following method. Under the skin of the calf on the border of the lower and middle thirds of the rear surface, the lydas (Hyaluronidasum) solution was injected in the amount of 16 units. After 4-5 minutes, without removing the needle, an antibiotic (gentamicin at a dose of 1 mg/kg) was injected. In the same section heparin at a dose of 70 units/kg was injected. Lymphotropic infusion of antibiotics with RLS was performed 1 time per day.

Experimental tissue samples were taken of the wound channel from the animals under anaesthesia on the 1st, 3rd, 5th, 7th and 9th day after application of a gunshot wound.

The samples were subjected to light (LM), transmission electron (TEM) and scanning electron (SEM) microscopy. Samples were fixed in specific solutions, photography was performed on colour film Kodak Professional Pro Foto 100 or Fugicolor Superia 100. Micro photos were obtained on a microscope «Axioscope» (Zeiss) with a digital camera «Sony», followed by computer processing on Intel Pentium IV with BC-Statistika, as well as Microsoft Office applications.

RESEARCH RESULTS

The results showed that in the early stages there are no significant differences in the healing process between control and study groups.

Significant differences during wound healing, ascertained in SEM, TEM, and in light microscopy, begin to appear on the 3rd day from the beginning of the process. In the group of wounds, where lymph therapy was used, in the concussion zone, the necrotic muscles were undergoing significant resorption, multinucleated giant cells, microvessels, such as blood and lymphatic. In the area of primary necrosis among fibrin, the round cellular individual elements and cells similar to fibrinoblast appeared (Fig. 1).

On the 5th day in the lumen of the wound channel among the strands of fibrin the round cellular elements with individual fibroblasts appeared, while in the area of primary necrosis infiltrate, consisting of polymorphic cells, including macrophages, emerged. In the concussion zone between the preserved muscle fibers, the significant intervals are determined, which indicates the presence of oedema. When comparing the results in the LA with the RLS group, an increase in the number of blood and lymph vessels is indicated.

Figure 1. Roundcellular individual elements and cells are similar to fibrinoblast among fibrin. 3rd day. LT. SEM x 400.

Since the 7th day from the beginning of the process in the group with RLT, a significant initiation of granulation tissue remodelling and revascularization was noted.

According to the TEM of this period not only an extension of lymphatic capillaries was noted, but also the thinning of the cytoplasm of endothelial cells with the presence of small vesicles, indicating the strengthening of transport processes through the wall of the lymphatic capillaries, which is a structural reflection of the stimulation of lymphatic drainage under the influence of lymph therapy (Figure 2).

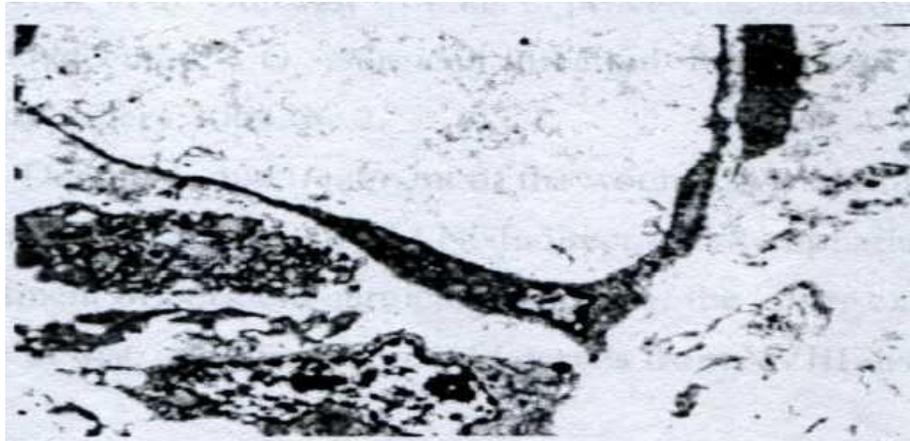

Fig. 2. Lymphatic capillary with extended clearance. 7th day after injure. LT TEM. x 7500.

On day 9. there are signs of replacement of scar tissue by muscle tissue, which was evidenced by the areas of fibrous connective tissue proliferation in the concussion area along with the already recovered fibers.

Thus, the morphological picture suggests severe mosaic wound healing process in these terms, the comparative characteristics of two groups confirms that lymphatic therapy contributes to a significant anti-inflammatory effect during the wound healing process. Lymph therapy causes a well-expressed stimulation of neovasculogenesis of not only blood but also of the lymphatic vessels. This position requires the application of modern methods of lymphatic therapy, aimed at combating posttraumatic oedema and infection.

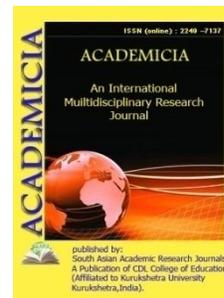

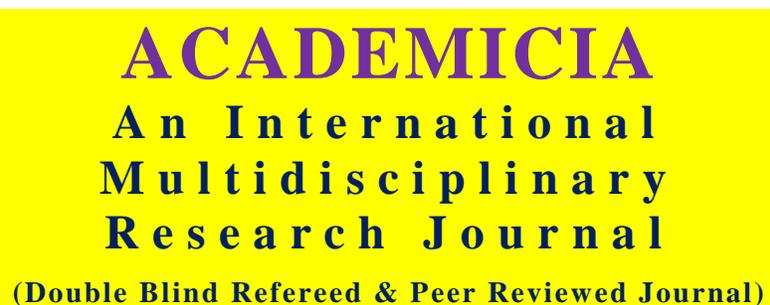

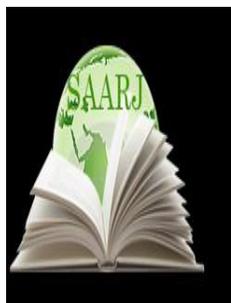

CONCLUSIONS

1. Experimental studies have shown that lymphatic therapy accelerates wound healing, beginning with the 3rd day. it helps in the reduction of swelling, resorption of necrotic masses, removal of foreign particles and microbes, scarring of the wound channel and the full restoration of muscle fibres in the concussion zone and in tissues, which are more distant from the wound channel.
2. The use of lymphotropic therapy will allow successful usage of early primary surgical treatment of gunshot wounds and reduce the development of surgical infection.

Email id: kimnd69@gmail.com

ABSTRACT

This article presents the issues of speech activity and communication. In studies of speech activity, it was found that almost every speech utterance contains speech phenomena that are provided neither with the language system, nor with the norm of the language or with the usage. In this article sentences of motivation in the Korean language are considered, as well as forms of imperative and inviting inclination which are added to motivational sentences. This fact makes the syntax science solve the actual problems of communication and cognition. The question of the sentence and its structure, peculiarities of the syntax connection have various solutions in the researches of the contemporary Korean language. The reason is that in syntax analyzing theoretical question is connected mostly with the research of simple and complicated sentence, defining the methods of interaction of different parts of sentence. The sentence is a unit of communication and its semantics and structural composition had specific signs and certain grammatical constructions.

INTRODUCTION

In the circle of the humanities, linguistics plays a particularly important place. The nature of interdisciplinary relations, the mutual influence of these sciences and linguistics largely determined the strategic directions of language learning, established the type of correlation of tradition and innovation in the history of linguistic teachings. The first reflections on the language were recorded already in the ancient Indian treatises of the 5th-4th centuries BC. Antique thinkers (Heraclitus, Agustite, Democritus, Aristotle, etc.) posed and partially addressed the philosophical issues of language.

They were interested in the problems of naming, the connection between thought and speech, the relationship between lexical and grammatical semantics, the theory of anomalies and analogies, and the questions of the origin of the language. Along with the philosophy of language, ancient scholars actively studied the grammatical structure of the language (Alexandrian and Pergamon grammar schools). Roman grammars were created on the model of the Greek, rhetoric issues were solved (Mark Terence Varron, Ely Donat, Priscian, etc.).

Modern linguistics is facing not only the future. Many of its ideological ties are associated with traditional linguistics, since it concentrates the scientific energy of linguistic ideas of previous eras, the energy that stimulates the search for new approaches to language.

2. Korean linguistics within existing directions

Korean foreign (Russian-speaking) linguistics has been actively developing since the beginning of the 20th century and is represented by the works of E.D. Polivanov, A.A., Kholodovich, Yu.N. Mazur, L.R. Kontsevich and others. For the first time in 1925-1930, E.D. Polivanov in his article talks about the relationship of the Korean language with the languages of the Altai family. Scientific studies have shown that issues in Korean linguistics are dealt with in different ways. Of great importance are the scientific studies of Korean scientists Seo Jung Soo, Nam Ki Sim, Guo Young Geun, Kwon Jia Il, Park Young Song, Yom Song Mo [서정수 1996: 50-69]. System descriptions of the grammatical structure of the modern Korean language are reflected in the works of A.A. Kholodovich, G. Ramstedt, Yu.N. Mazur, L.B. Nikolsky, L.R. Kontsevich, S.E. Martin and others, whose feature is the priority of synchronous descriptions, a subjective understanding of the structure of the language, taking into account the knowledge accumulated in the process of pedagogical activity [Rudnitskaya E.L. 2013:5-20].

During the formation of the Korean grammar tradition, the role of universal grammars was quite deep: undoubtedly, the problem of terminological adequacy as a completely required analysis. The transitional stage from universalism to the description of the idiomatic nature of Korean grammar is reflected in the writings of Yu Gil Zhong and Kim GyuSik, who managed to illuminate the interaction of the principles of universalism and idiomaticity in grammatical theories.

The actual use of language in communicative situations (M. M. Bakhtin, S.I. Vinogradov, T.G. Vinokur, O. B. Sirotinina, etc.) and the study of the communicative nature and structure of the language from the standpoint of the patterns of organization of speech communication, rationing and the functioning of language in society (V.M. Alpatov, T.V. Arutyunova, etc.) determined the formal-semantic structure of linguistic nature.

In the 20th century, as in world linguistics, Korean linguistics affirms the tendency to use "objective" methods of language research, which require to exclude as much as possible the imposition of categories alien to it borrowed from other sciences (schools of linguistic structuralism). In addition, the principles of mathematical thinking (mathematical linguistics, linguistic statistics, computer / computational linguistics, machine translation, etc.) are being introduced. Recently, more and more prominent place in modern Korean linguistics is occupied by such linguistic objects as linguistic activity and products of linguistic activity, especially communicative linguistics. However, communication and speech activity, becoming objects of study in linguistics, put forward a number of tasks that need to be addressed. These are issues of speech activity not in a narrow understanding (psycholinguistic), but in a broad sense: linguistic means in the processes of generating speech and its understanding in discourse and text. This position can be expressed by the formula presented by us:

Speech activity = language (norm) + speech.

Language is presented as a system and as a norm. The language system defines the language material of the system - the grammar of the language (rules for the compatibility of elements). The grammar of the language, in turn, includes the means and rules of communication.

The speech includes the usage and the actual speech, where language material and speech acts (communication processes) are considered - speech material (texts). The end result is real conversion.

Language in this correlation of the components of speech activity is a knowledge of the system of means and rules of speech thinking (think speak and understand) fixed in the linguistic consciousness. Paraphrasing E. Coseriu, we can say that language is an ideal system of means of language elements (units) and the corresponding classes of language elements (units) that provide the potential for speech-interpretation acts: the norm is what and how to or should be said; and speech is the realization, actualization of the potential capabilities of the language system in the process of communication (real communication, speech acts and texts as products of speech thinking).

Since real communication may differ from customary ways of speak, as they usually say, between the norm and the speech act (text) an intermediate link is distinguished - the usage (a kind of generalization of specific speech acts and texts, an unconscious and unmodified norm). When speech is perceived, the selected links (language - norm - usage - speech) correspond to the scheme "an ideal system of means, realizing the ability to understand the message - how to understand - how nice to understand - the real perception of the message."

All components of speech thinking are in certain relationships: the system and the norm belong to the language, the usage and the actual speech acts - speech; norm and usage are brought together by their "normalization". The norm consists of speech models adopted and traditionally used in the corresponding ethno linguistic collective (such a definition of the norm is close to the definition of a language by A. Gardiner N). Indeed, a norm as a set of rules for the implementation of a language system and a system of such rules turns out to be connected with both the language and the external conditions for the generation of speech. In this sense, the norm "serves as a filter that distributes the capabilities of the system (while providing some choice within limited limits) for specific speech acts depending on specific (typical) situations." In other words, the norm governs the use of elements, structures, models of both the language

system and the speech system. In that regard, it acts as part of the system. The further development of the norm theory is associated with the concept of variance, independent of whether we follow the triad of E Coseriu “systems - norm - speech”, where the norm as correlates of the system limits the variation inherent in the latter, or we follow the concept of the Prague Linguistic School, where the norm represents how system of mandatory manifestations of the language (ideal invariant) in speech (in the form of a real version). Thus, the norm, on the one hand, and on the other, in a certain sense, is subject to variability as a necessary condition for its own development.

The buffer link between the norm and the speech act is the usage (uncodified norm). By being elements of speech activity, language, norm, usage, speeches constitute the object of linguistics. Between the components of speech activity there is a functional relationship, which can be represented as follows:

TABLE 1 SPEAKING PRACTICE

<i>Speech situation(speech)</i>	<i>Speech act</i>	<i>Usage</i>
	<i>Speech act</i>	<i>Norm</i>
	<i>Speech act</i>	<i>Language system</i>
	<i>Speech act</i>	<i>Norm</i>
		<i>Usage</i>

The diagram shows that the generation of the statement (speech) is determined, on the one hand, by the language system and the norm and usage superimposed on it, and on the other hand, completely independent of the language and not controlled by the speech situation. In studies of speech activity, it was found that almost every speech statement contains such speech phenomena that are not provided for either by the language system, or by the norm of the language, or by the usage. These are various kinds of over-phrasal elements of constructing sentences, word combinations, neologisms, etc. if such non-systemic units appear regularly in speech, they can penetrate the usage, and from there move to the norm, which creates real prerequisites for individual shifts in the language system or even to its restructuring.

These arguments are certainly enough to determine as an object of linguistic research not speech or language, but speech activity in its broad sense.

3. Speech activity and incentive targeting in Korean speech

In the modern Korean language sentences of imperative objective (청의문, 명령문) are a special type of communication in contrast to the types observed earlier – narrative (평서문) and interrogative sentences (의의문), as the presence of a status-oriented relationships in conversation performs a leading role. Status-oriented relations are accompanied by grammatical structures in the sentence of imperative objective to specify respectful treatment between the participants of communication – the addresser and the addressee [Pak 2005:287-288].

In the grammar of the contemporary Korean imperative sentences are classified into imperative and invitation sentences [Kim 2018:5-10]. We adhere to this point of view, combining form imperative and invitation mood to sentences of imperative objective type. This decision is connected with the tasks of research – to consider the proposals, which are implemented by the participants of the communication as a call to action and motivation for joint action.

Formal-semantic structure of sentences of imperative objective is that these proposals are used for appellative [Yartseva 1990:80] communication and by nature often do not require reciprocal voice reactions, their purpose is to seek, offer and call to any specific action of the addressee or interlocutor, for example:

A: 어디가아파서오셨어요?

B: 배가아파서왔는데요.

A: 그럼여기이름과생년월일을쓰시고잠깐기다리세요.

A: *Where is your pain?*

B: *I have a stomachache.*

A: *Write down your name here, date of birth and wait for awhile!*

In the form 기다리세요 – wait formed by attaching to the verb 기다리다 of an affix-marker of the final predicativity of imperative form –세요 the author-sender is requested to wait. Whether it is perceived by the addressee as the imperative form or as request, can be judged by the speech situation at the moment of action. Given the status-oriented relationship "employee – patient", "staff – user", rather this form is an expression of request from (A). The speech situation at the moment between staff and the patient indicates the respect of the addresser staff to the recipient-the patient. This conclusion follows from the peculiarities of the status of relations in Korean culture and society. Or consider the following dialogue between a grandfather and grandson:

A. 할아버님,아침마다운동을해보십시오.

B. 그렇게해야겠어.

A. *Grandfather, try to do physical exercise in the morning.*

B. *Yes, it would be necessary to do so...*

In the above dialog, you can specify that the speech addressed to elders – дедушке 할아버님, 해보십시오 - try, and the source (sender) younger age, as in answer (B) 그렇게해야겠어 is no indication of high respectful social status (age, position). However, you can allow the recipient (B) statement 그렇게해야겠어 – *it would be necessary* is directed toward himself, thinking about his future intentions design –야겠어 (form of obligation 아야/어야/여야하다 and the future tense 겠), gives the interlocutor (the addressee) their attitude to the statement of the addressee (A).

Thus, the grammatical means of transforming incentive sentences are: a) a predicate in the form of an imperative mood; b) an affix that gives the sentence an incentive; c) incentive intonation. It is noteworthy that in Korean the motivational intonation does not play such an important role as the final motive affix in the predicate. Nevertheless, in order to correctly express a thought,

emotional state, feelings, it is necessary to properly prepare your speech using grammatical means (grammatical categories and forms, service words, interjections, etc.) for expressing various semantic and modal relationships between words as members of a sentence [Kim 2018: 200-215]. Korean sentence of incentive target setting often structurally does not have two components, they lack the subject. The function of the predicate lies in the fact that it appears in all the sentences we have analyzed not only as the main component, but as the main connecting “exponent” in sentences that differ in purpose.

4. CONCLUSION

As already noted, a person’s communicative activity is an essential component of his social behavior, therefore, communicative (speech) behavior itself can be considered as part of the national culture. From the point of view of the activity approach, communication is understood as a joint activity of the participants of communication (communicants), during which a common view of the world is developed. It is characterized by processuality, continuity, conceptuality. In general, the activity approach better explains the world and is more humanistic.

One of the most common forms of information transfer is verbal communication. This form of transferring information is carried out in the form of texts. Text is a universal tool that can be used both in mass communication systems (text in a newspaper or on television, etc.), and in interpersonal (texts exchanged between communicants). Of great importance for the communicative approach is the introduction to linguistic research of the communicative situation, i.e. set of factors determining the possibility and nature of a communicative act. On the one hand, the communicative situation is always concrete, unique, on the other hand, it is reducible to a certain number of invariants. The structure of the communicative situation includes, according to L. Sakharny, 1) the speaker, 2) what is being said (the subject of communication), 3) the listener, 4) the code (language), 5) the text (implementation of the code), 6) general conditions communication. Communication is influenced by: 1) the setting of the participants in communication, 2) the nature and purpose of communication, 3) the social roles of communicants, 4) the community of knowledge about the world and language, which awakes in the listener about the same range of ideas that are related to the subject of communication, etc.

Whatever the speech utterance is in terms of volume, no matter how much a person participates in a given communication, in whatever conditions it takes place, it is based on a certain model that is applicable to any type of speech communication. Its scheme includes the following components: addressee, message, context / situation, contact, code, addressee.

In connection with the enthusiasm for this approach, an important and dangerous trend has emerged - the absorption of linguistics by the theory of communication. An indirect proof of this can be found in the emergence of the second half of the twentieth century, several new original theories that were born in line with the theory of communication interest in which linguistics is still great. This is the theory of speech acts, the theory of speech genres, the theory of language games, the theory of intercultural communication. A common thing for them is an active approach to communication and the language as a whole with its idea of the unity of communicative and non-communicative human activity. Each of these theories in its own way solves the problem of personal communication in the social environment, and each of them has its own fate.

Thus, the theory of communication, indeed, absorbs linguistics, which can be observed now. This is not only dangerous, but also wrong, and therefore this process cannot be successful, although it can be quite lengthy.

THE IMPORTANCE OF DISCOURSE AND MEDIA TEXT IN MODERN MEDIA

Avaz Khamitovich Mirzajonov*

*Scientific Researcher,
National University of Uzbekistan named after Mirzo Ulugbek,
UZBEKISTAN

ABSTRACT

The article is devoted to the analysis of changes in the communication processes of the late XX - early XXI centuries, reflecting the powerful impact on the real life of modern mass media, the problems associated with understanding media text in the condition of Mass Media convergence, clarifying the role of the Mass Media in forming society and individual recognition and how far their influence extends on modern man.

KEYWORDS: *Text, Media Text, Discourse, Discursive Activity, Cohesion, Coherence, Intertextuality, Media, De-Personification.*

INTRODUCTION

The emergence of the media and their widespread dissemination is the most important aspect of our social life. We live and act in the flow of information that falls on us through all media channels, and if it is true that a person's behavior is determined by his knowledge and assessments, then we must not forget about what a huge share of this knowledge and assessments comes to us thanks to the media. The media exerts not only the strongest influence on us, but also the strongest pressure.

Faced with all these and many other factors, the linguist must connect them with what interests him the most - the verbal side of the discursive activity of the media.

When considering the special role of the media in the life of modern society, it is no longer enough to talk only about how the media work in different countries and the interests of which groups or strata of the population they express. The most important today are the questions of how exactly the media participate in the formation of society and the consciousness of the individual and how far their influence on modern man extends.

THE MAIN FINDINGS AND RESULTS

The dissemination of information through the media takes place in the course of a special activity called discursive. This activity of the media is not purely linguistic, therefore, when studying it, it is necessary to take into account all its versatility and various aspects, dependence on a mass of pragmatic factors and, therefore, to analyze it in its real course, realizing that the linguistic aspect of media activity is the result of the intentions of its subjects, their specific social orientation, value attitudes, etc. In order to establish all these components of the media activity, the efforts of scientists of different specialties - sociologists, political scientists, philosophers, linguists are needed. Cognitive science, an interdisciplinary science, centered on the problems of human assimilation of information (ways of expressing and processing it, as well as the peculiarities of its presentation / "packaging" when transmitted from one people to another) can best combine different specialists for a multivariate analysis of media problems.

First of all, the question arises about the relationship of the concepts of discourse with the text, as well as those limiting units for the chosen level of consideration, from which the text is "composed" as opposed to discourse, or those into which they respectively decompose. It is usually considered that the text is composed of sequential distributions, while the discourse is divided rather into statements. But if the initial concepts of a sentence and utterance are not divorced, and the definitions of the text and discourse do not include the features that differentiate them, both concepts are often used as identical, and their designations are used as synonyms. This state of affairs often characterized works dating back to the late 1970s and 1980s, when the terms "text linguistics" and "discourse analysis" were largely interchangeable. In the overwhelming majority of modern publications in the 1990s, however, the ideas of the need for a more strict differentiation of the concepts under consideration are carried out, for which, in fact, they resort to the oppositions of the process and its result, dynamics and statics, etc.

Changes in the communicative processes of the late XX - early XXI centuries, reflecting a powerful impact on the real life of modern mass media, actualized the problems associated with understanding the media text. The term "media text", which is most demanded to denote mass communication texts, has incorporated parallel, interchangeable or intersecting phenomena - mass communicative text, mass media text, journalistic text, newspaper text, teletext, advertising text, PR-text, Internet text, etc. It should be noted that the semantic content of the term media (from Lat. "Media", "medium" - means, method, mediator) allows you to call a media text any information carrier, from rock paintings, traditional books, works of art and ending with ultra-modern phenomena of technological progress ... However, as a generalizing term, media text was assigned precisely to the texts of mass communication. Another issue is related to the volume of the media text, since everything that is involved in the media sphere quite coexists within the framework of this concept. Apparently, the term acquires its explanatory power when interpreting a media text as an aggregate product of three global subsystems of mass communication: journalism, PR and advertising.

According to N. I. Klushina, "the media text consists of the main text categories, which are:

- 1) Cohesion - means of communication between components in a text segment;
- 2) Coherence - semantic unity of the text, its integrity;

- 3) Pragmatic attitude, as well as intention (in other terminology - communicative intention);
- 4) The perception of the text by the recipient, that is, understanding the text, its decoding;
- 5) Informativeness - the degree of surprise or novelty of information in the text;
- 6) Situationality;
- 7) intertextuality (intertextuality) - a connection due to background knowledge and familiarity with other similar texts”.

Thus, the text is considered not only in the purely linguistic, but also in the cognitive, psycholinguistic, pragmatic, functional-stylistic and communicative aspects.

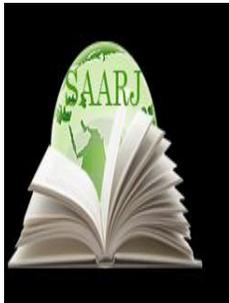

Currently, media text has acquired the status of a basic category in media linguistics, media culture, media education - new areas of linguistic, philosophical, pedagogical science (works by T.G. Dobrosklonskaya, N.B. Kirillova, G.Ya. Solganik, A.V. Fedorova, N.V. Chicherina, etc.). We can also say that the theory of media text claims to be an independent niche within the theory of text or seeks to branch out from it.

CONCLUSION

Communication models are the starting point for typologizing mass communication texts. In fact, any of the components of the model can be the basic basis for organizing texts. This approach to the analysis of media texts testifies to the multidimensionality and diversity of media products and can serve as a universal method for analyzing media texts. In this direction, the study of media texts in the context of the convergence of mass media is just beginning.

MATERIALS ON THE BIOLOGY OF STREPTOPELIA DECAOCTO FRIV 1838 IN BUKHARA REGION

Boymurod Normurotovich Doniyorov*

*Lecturer,
Bukhara State University,
UZBEKISTAN

ABSTRACT

The article describes the features of collared dove in Bukhara region in contrast to other pigeons, meeting places, behavioral reactions, nest location, nest building, nest components and morph metric dimensions, breeding care during egg laying and heating, hatching, biological properties and importance of the species, such as size, nutrition and nutrient diversity.

KEYWORDS: *Egg, Nest, Chick, Bird, Biology, Ecology, Areal, Agrobiogeocenosis, Morphometric, Unsanitary.*

INTRODUCTION

It is important to study the distribution, biology and ecology of bird species in the habitat, which are an important component of biological diversity, their involvement in agrobiogeocenoses, rural and urban areas, to identify conservation measures.

Collared dove is a rapidly expanding species in Central Asia, including Uzbekistan (Nazarov, 1990; Bakaev, Salimov, 1990; Lanavenko, 1993; Ametov, 1994; Ametov, 2008, etc.). The collared dove was first recorded in Bukhara Province on March 1, 1988, while looking for food with blue pigeons in a city park. For more than 30 years, this bird has been widespread throughout the districts, cities, villages and agrobiogeocenoses of the region. However, the biology of this bird is still poorly understood (Bakaev, Kholboev, 1994). With this in mind, in this article we present our views, based on the observations made in the biology of collared dove in 2007-2020, the collected data.

RESEARCH METHODOLOGY

In doing so, G.A. Novikov (1953), A.V. Mixeev (1984), A.S. Malchevsky (1959, 1981) methods were used. 348 nests of Collared dove were found, 59 eggs, 31 chelpers were studied. Several other observations were also made.

Main part

To study the biology and economic significance of collared dove in Bukhara region to make recommendations on the relationship between humans and collared dove, their importance, ways of attraction, protection, identification.

RESULTS AND DISCUSSIONS

Collared dove is a sedentary bird common in Uzbekistan, including Bukhara region. This bird is close to a rock dove in appearance, much larger than a laughing dove. The character is much more complex and is expanding its range. Not only the slightly larger size of the body but also the semi-circular black band around the neck play a big role in distinguishing the collared dove from other pigeons, especially the turtle dove. Because of this, it can be recognized quickly from a great distance. During the year we met this bird in the villages and towns of Bukhara region, in the trees along the roads, in agrocenoses. The fertility rate (number) of collared dove varies considerably in urban, rural, agrobiogeocenoses. For example, the number of collared doves at the main stations in Bukhara varies throughout the year, the average number per 10 hectare ranges from 1.3 to 25.0. The average number of collared doves in the old city is 3.0, in small areas - 3.6, in green areas - 25.0, in ruderal plots - 6.5, in industrial centers - 9.4 and in cemeteries - 1.3. Even in rural areas, the number of collared doves per unit area varies at different stations: 17.0 in wheat fields, 4.7 in cotton fields, 10.7 in corn fields, 19.3 in millet fields, 3.8 in lucerne fields, 7.5 in vineyards, 4.4 in apple fields. 1.6 in apricot orchards and 1.1 in plowed lands.

The song of this bird has three syllables - "gu-guu-guuv" can be heard in almost all months of the year. The abundance of collared doves that just sing will be more from March to August, and from September to February their sound can be heard less. In 2008, when the winter was severe, the singing mode of collared doves changed significantly. During the winter months, they stopped singing. The first round was held on the first of March (01.03.2006; 09.03.2007; 06.03.2009; 02.03.2010; 03.03.2011; 10.03.2012; 05.03.2013; 04.03.2014; 08.03.2015; 06.03.2016; 08.03.2017; 06.03.2018; 05.03.2019; 29.02.2020). Collared doves form a pair just like other species before nesting. During this time, they chase each other, sometimes touching each other's beaks, making a distinctive sound of "gurgling, gurgling," flapping their wings, clapping, and soaring up into the air. skillfully demonstrates character. In different conditions, we found and studied its 348 nests. Information on their location is given in Table 1. Most nests are in *Fraxinus excelsior* (69), *Morus alba* (52), *Malus domestica* (47), *Platanus orientalis* (40), very few (1) *Purus communis*, *Pinus sievestris*, *Elaeagnus angustifolia*, *Spiraea trilobata* was found to be placed. Different buildings choose less to build nests.

25	In buildings (porch, barn, chimney)	8,12 (1,85-30,0)	5	8
Total			218	348

In the Bukhara region, collared doves build their nests mainly on 22 species of trees (332), partly in various man-made buildings (11) and in the old nests of magpieni (5). When Magpie uses older nests, species such as magpie (if the nest is well preserved) and common myna, partly pale scops owl, and rock dove compete with the collared dove. Due to natural conditions, in this interspecific competition, collared doves sometimes win, sometimes lose. Sometimes collared doves reuse their nests that have been used for years or more.

Both sexes are involved in the construction of the nest collared doves. The construction period sometimes takes an average of 6 days, from 3 days to 10 days, depending on the time of spring arrival, depending on the weather. In a tree, a pair of usually collared doves build nests. Sometimes two pairs, up to four pairs of collared doves build and use a nest in a bush if the tree is well branched from time to time, another convenient place to place the nest is lacking, the amount of food is large and the human impact is low. For example, on 06.05.2009, four nests of collared dove were recorded in the mulberry grove of school No. 10 in Bukhara. In this case, the

birds exhibit a number of inter-species relationship elements, such as stealing nest material from each other, obstructing nest construction, attempting to squeeze each other out, and drowning. Collared doves nests also use various parts of the surrounding vegetation, mostly thin, colored wires (in 3 nests) in a radius of 50 meters. The nest is characterized by flatness, porosity, lack of nest material. Plate-shaped. Sometimes you can see the eggs in the nest from below. The nests are placed on the branches of tree trunks, or on the side horns. Collared dove uses vegetative parts of various plants and a very small amount of anthropogenic material in the construction of the nest (Table 2).

TABLE 2 INFORMATION ON THE COMPONENTS OF THE COLLARED DOVE NEST

Components	Slots					On average, weight, g
	1	2	3	4	5	
Streptopelia decaoctane feces	34,50	13,40	13,10	16,70	-	15,54

The raw material of the Collared dove nest and their size, weight varies depending on the conditions and the season, the nesting period. The morphometric dimensions of the collared dove nest are given in Table 3.

TABLE 3 MORPH METRIC DIMENSIONS OF THE COLLARED DOVE NEST

T / r	Measured area	n	Awake				Information source
			height, mm	width, mm	weight, g	height from the ground, m	
1	Bukhara city	6	86,0 (70,0-115,0)	210,0 (85,0-230,0)	39,0 (34,0-48,0)	5,1	Kholboev, Baqoev, 1994
2	Olot	3	79,0	200,0	32,0	5,7	Kholboev,

	district		(67,0-91,0)	(190,0-210,0)	(29,0-35,0)		Baqoev, 1994
3	Nukus and his surroundin gs	25	82,1 (56,0-150,0)	156,2 (80,0-270,0)	-	4,3 (2,1-7,5)	Ametov, 2008
4	Bukhara region	39	97,4 (66,0-137)	154,3 (92,9-216,0)	47,9 (29,2-76,5)	4,2 (2,2-10,0)	Our data

As the data in Table 3 show, there are also local, individual variables in nest sizes. When the nest is finished, it lays white eggs on it. Eggs are laid once a day, sometimes for a day. The number of eggs in the nests is 2. Data on the morphometry of collared dove eggs are as follows: egg (n = 59) length 31.20 (28.6-34.9) mm., Width 23.59 (21.4-25.0) mm., Weight (n = 88) 9.01 (7.1-11.0) g. Eggs are pressed, heated by the female collared dove. When the eggs are weighed, the mother swells the collared dove, writes down the rudder feathers, shows off her large body, flaps her wings, spreads her wings like butterfly wings on the back of the trunk, and makes a "proud" noise. Egg-laying female collared dove body dimensions are as follows: beak length 18.6 mm, nostril length 11.4 mm, beak height 5.9 mm, wing length 180.0 mm, two wings spread 530.0 mm, body length 325.0 mm, diameter 30.6 mm, tail length 144.0 mm, weight 173.4 gr. The male, on the other hand, protects the female at a distance of 8.43 (0.4-40.0) m from the nest (n = 24) and connects it to the surrounding situation. When the sun goes down, it comes close to its nest. During the egg-laying process, the female collared dove allows the man to come closer to her, even to touch her, to photograph her. This case may indicate that the care of the offspring of *Streptopelia decaocto* is strong. The process of laying eggs takes 15-17 days. Egg-pressing density of female collared dove was observed (n = 3). On the second day of the procedure, the egg-laying density was much higher - 96.0%, on the eleventh day - 94.0%, and on the fourteenth day - slightly lower - 88.6%. During daylight hours (from 7:00 to 20:00 in the morning) the average duration of one egg laying is 115.4 min. (78.0-205.0), and in subsequent observations - 187.8 min. (55.0-329.0), and 212.6 min. (47.0-412.0). As the duration of the nest emptying of the eggs increases each time from the beginning to the end of the process (i.e., 4.5 min; 12.2 min; and 27.3 min.). On days 12-15 of this period, cracks appear in the egg shells. This phenomenon may indicate that the chicks are moving to hatch from the eggs. During egg laying, the weight of eggs decreases by 0.2-0.3 g per day (n = 88). On the day of hatching, the weight of the chick (n = 6) is 8.82 (7.40-9.60) g. The weight on the eve of leaving the hive was 108.7 g. This means that the chicks grow and develop rapidly. Their initial weight increased by 11.7 times. The average daily body weight is 6.7 g. increases from. The appearance, appearance, color of the chicks will change. Initially, the tip of their beak and fingertips are white. On the surface of the body there are yellow and bright yellow embryonic tufts, and in some places: around the eyes, ears, beak, paws, lower neck, along the abdomen. The eyes of the chicks are weak, the ear holes are closed. In 3-4 days after they hatch, feather growths appear on the whiskers, wings and tail of dark-colored patches around the eyes and ears. Later, at 5-6 days, the auditory canal and eyes are opened. The chicks begin to respond to external influences, i.e., squealing, littering, trembling, throwing themselves backwards, squealing with their beaks, trying to fly and dive, squeezing their paws, trying to walk fast, breathing frequently, can grab the nests in the hive, move the head, paws, beak. Now the tips of the feathers on the wing, the tail feathers, crack and swell, forming tufts reminiscent of a brush. The color of the beak, legs, nails becomes brown, thickens.

The chicks spread their wings slowly, keep their head upright, and breathe often. By 7–8 days of life, white feathers emerge from both ends of the tail feathers of the chicks. The wings have been shown solely to give a sense of proportion. Because the contour feathers are well developed along the surface of the body, the body is well covered with feathers, at 10-12 days they still cannot fly, but are much more mobile. Later, when the chicks are 14-15 days old, they become like their parents, trying to fly out of the hive. But for another 3–4 days they will be in the shelter of their parents in the hive. Then they leave the hive. Below are images of the reproductive cycle of collared dove.

- E. Breeding care of egg-laying collared dove;
- F. The collared dove hatched from the egg and its egg;
- G. 3-4 day old chicks;
- H. 7-8 day old chicks;
- I. 11–12-day-old chicks;
- J. Adult but not reproduced collared dove;

But for a few more days the bird will depend on the nest of the children, rest, spend the night, and so on. Thus, in the Bukhara region, the nesting nests of collared dove can be found from the second decade of March to November. Depending on the weather, they sometimes show mowing movements either in the fall or early spring.

From late June to early July, new generations of collared doves are grouped into groups of 13 to 50 individuals. By the end of August, the number of individuals in the association will increase to 500. In trees such as *Juniperus virginiana* and *Biota orientalis*, *Salix alba*, *Armeniaca vulgaris*, *Morus alba*, *Populus alba*, *Fraxinus excelsior*, *Ulmus pumila*, *Malus domestica*, *Platanus orientalis*, the soil ($n = 8$) to 5.5 (3.0-7.5) meters high ($n = 15$) with 72.7 (2.0-500.0) collared doves. The number and branching of trees, bird's body size, character, natural features of the place, the presence of food are important at night, *Corvus frugilegus*, *Corvus cornix*, *Acridotheres tristis*, *Pica pica*, *Turdus merula*, *Streptopelia senegalensis*, *Passer montanis*, *Parus bokharensis*, *Sturnus vulgaris* Birds such as *Corvus monedula* are adjacent to *Streptopelia*

decaocto from late evening to early morning. In this case, *Corvus frugilegus*, *Acridotheres tristis* are numerous and also cause strong noise. Collared dove is mainly a bird of prey. However, in the seasons of the year, their nutrient spectrum, location may change. For example, in the spring, summer Bezostaya 1, Zeya Mays, seeds of weeds, partly insects, in autumn and winter they are food debris, seeds of *Juniperus virginiana* and eastern sauri, cotton, wheat, corn, beans, moss, peas, millet, rice, fields planted with sunflowers, rye, grapes, apples, apricots, quinces, walnuts, markets, cemeteries, barns, crows tickle the birds in the shelter, find grain in the settlements, garbage dumps, nurseries. It sometimes swallows pieces of stone, glass, iron to improve the process of consuming solid foods. In the diet were recorded *Columba livia*, *Streptopelia senegalensis*, *Passer montanis*, *Acridotheres tristis*, *Sturnus vulgaris*, *Parus bokharensis*, *Corvus monedula*, *Corvus cornix*, *Pica pica*, domestic birds, livestock and in rare cases *Larus ridibundo* around Buraus decibrepti, *Burhinus oct.*

CONCLUSION

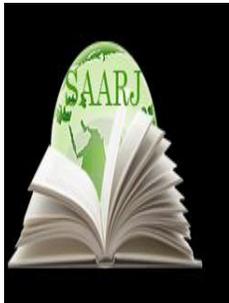

Collared dove feeds on grains and grasses of cultivated plants, encounters around food stalls in markets, on benches in parks, in homes, and sometimes causes unsanitary problems. The use of our cultural monuments for the night, for reproduction, will cause their erosion. The transport of ectoparasites in the body causes them to spread. It is a partner in the feeding of domestic poultry and livestock. The waste feeds on food debris and performs a sanitary function. Important in the food chain. During the breeding season, the chicks feed on pests and benefit agriculture. Garbage is rich in phosphorus, which mixes with the soil and affects fertility. It uses the body parts of weeds to build a nest and limits their spread.

In recent times, shaping trees, cutting them down, has been influenced by the number of collared doves by children, kittens and magpies. The Collared dove is a cute, beautiful bird with a distinctive voice-singing. It has its place in different corners, constantly keeping an eye on nature. Therefore, it is advisable to protect it, to feed them in unfavorable weather conditions during the winter. During the study of Collared dove biology, it was found that this bird feeds on various grains, seeds of foreign plants, sometimes in densely populated areas (markets, alleys, parks), as well as in the creation of unsanitary conditions in cultural and historical monuments, transportation and spread of various ectoparasites. can participate. It consumes various wastes, food scraps, and feeds its chicks with pests during the breeding season. Manure is rich in phosphorus, enriches the soil with minerals. It plays a positive role in human ecology at various stations with these characteristics.

ABSTRACT

The article is about the condition of Samarkand's architectural monuments during the period of Turkestan's dependence on Russia. The article considers firstly, the consequences of the Russian administration's failure to maintain the system of protection of architectural monuments in the region, which had existed for centuries in the area until early days of the Russian occupation, specifically, the consequences of the change in the system of management and use of waqf property; secondly, removal of architectural parts of Samarkand monuments and placing them in the central museums of the empire by the Imperial Archaeological Commission under the pretext of carrying out scientific research of existing cultural heritage sites in the territory of the empire, as in other regions, as stipulated in its regulations; thirdly, efforts of the Commission to protect and repair the monuments of Samarkand.

KEYWORDS: *Dependency, Waqf, Inheritance, Conservation, Restoration*

INTRODUCTION

Copies of the archives of the Imperial Archaeological Committee (now the Institute of the History of Material Culture of the Russian Academy of Sciences) in the scientific archives of the Samarkand State Museum-Reserve play an important role in the study of the condition of the material culture and architectural monuments of Central Asia in the late XIX-early XX centuries.

These archival documents contain information related to the activities of the Committee in Central Asia in 1867-1925, and copies were taken from the originals in 1937 in Leningrad by the staff of the Samarkand Museum. The archival documents were compiled in one tome in 1963 by museum researchers. Documents on the activities of the Imperial Archaeological Commission in Samarkand can be divided into groups based on their characteristics, such as research work, descriptions of newly discovered and antiquities sent to the Commission, and the Commission's activities related to Samarkand monuments. In this article, the condition of architectural monuments in the Samarkand region during the period under review is analyzed using the documents of the scientific archive of the Imperial Archaeological Committee.

It is known that when Turkestan became dependent on the Russian Empire, the land property system of Waqf¹ collapsed, the largest and most influential of them were abolished, and the rights of the middle and small ones were severely restricted. At the same time, the control over the profits of waqf was also transferred to the control of military governors [Alimova, 2000, pp 90]. This, in turn, led to a certain degree of neglect of architectural monuments that had been protected and maintained at the expense of income from the waqf property.

In particular, in 1878, during the reign of Major-General of Zarafshan district Ivanov, the heads of the department were instructed to deduct interest from the income of the foundation for the city funds with instruction latter under №45 [fund 1, 1895, file 69, pp 7-10]. It is planned that the department administrators would repair the waqf buildings themselves if necessary, at the expense of these funds. That is, the main part of the income from the waqf was used for city expenses, from which a certain amount was allocated for the maintenance of monuments. The allocation is as follows: 8% of income from less than 100 rubles, 10% of income of 100-500 rubles, 15% of income from 500 rubles.

While waqf buildings were repaired at the expense of these allocations in 1878-1885, the allocations mentioned in 1885-1891 were also used for municipal expenditures. In 1891-1894, allocations according to the percentage were again used in their own direction, and the maintenance of the waqf buildings was carried out on the basis of estimates and under the supervision of a special commission [Ibid].

This issue was discussed on January 9, 1896 in the general court of Samarkand region, and it was decided that the maintenance of architectural monuments would be carried out at the expense of the waqf under the authority of the chief of the waqf – “mutawalli”, but under the supervision of the head of the district. Thus, the necessary funds for the repair of monuments collected in the hands of the administration [Ibid].

However, we know from the artist and architect S. M. Dudin's reports that although the incomes from waqf had been directed to the maintenance of relevant monuments since 1896, with the exception of some monuments (the Shokhizinda ensemble and several mosques controlled by local clerics), architectural monuments in Samarkand have were not repaired at all and became

trash dump [Dudin, 1903, pp. 61]. Especially, the mosque in the mausoleum of Amir Temur, the mosque of Amir Temur (Bibi Khanum), the mausoleum of Bibihanim, Ishratkhana, Childukhtaron became in ruins [Ibid].

The issue of preservation and repair of Samarkand monuments was of great importance on the agenda. The Chairman of the Imperial Archaeological Commission A.A. Bobrinsky in a letter № 688 to Governor-General of Turkistan A.V. Samsonov in April 2, 1912, commenting on the waqf of Samarkand Monuments declared that many madrassas and mosques in Samarkand had lost their waqf after the Russian invasion, as their waqf were under the control of the Bukhara Emirate and informed that occasionally waqf funds were being used aimlessly and asked to stop that [fund 1, 1901, file 53, pp 52-55].

The neglected architectural monuments have become a hotbed of looting for various categories of people - the military, local Russian administration officials, tourists, scientists in various fields, and others. As a result, the monuments of Samarkand were looted beyond recognition.

Among the literature on the subject under consideration, the first work created directly on the basis of documents from the scientific archives of the Imperial Archaeological Commission was published under the general editorship of E. N. Nosov, it is devoted to the activities of the Imperial Archaeological Commission in 1859-1917 [Imperial Archeological Committee (1859–1917): To the 150th anniversary of its foundation. At the origins of domestic archeology and the protection of cultural heritage / Scientific. ed.-comp. A. E. Musin. Ed. E.N. Nosova. - SPb .: DMITRY BULANIN, 2009.]. This work deals with the following issues related to the topic:

1. Information on N.I. Veselovsky's historical-architectural expedition to Samarkand in 1895-1899, the publication of the first part of the album "Samarkand mosques"[ibid; pp 222-224; 793-795; 1088].
2. About the activities of the A.L. Kun in Turkestan in 1867-1882, the publication of the "Album of Turkestan", which included the monuments of Samarkand [ibid; pp. 785].
3. About the Photographers (S. M. Dudin, S. M. Prokudina-Gorsky, I. F. Chistyakov, D.I. Ermakov, G. A. Pankratev, I. Vvedensky etc.) who visited Samarkand in 1880-1890 and the beginning of the XX century and took photos of the architectural monuments of the city, and their collections [ibid; pp. 798-807, 993].

Although the work contains a large amount of information, the main directions of the Commission's nearly 50 years of activity have been considered. As for the architectural monuments of Samarkand, it has restricted information with short lines.

The second work in this direction belongs to G.V. Dljnevskaya [Dljnevskaya, 2011, p. 295], and the author relies heavily on the Commission's photo archive in her work. Since the work is devoted to the activities of the Commission in Siberia and Central Asia, more information on the subject is given in relation to the first work. In particular, the author considered issues such as 315 photographs of the city's mosques and mausoleums which were taken during N.I. Veselovsky's expedition to Samarkand in 1895-1899 [ibid; p. 14, 24, 44;], artist L. E. Dmitriev's activity in Samarkand in 1890 [ibid; pp. 14], photographs taken by S. M. Dudin in 1905 in the Shokhizinda ensemble in Samarkand [ibid; 25;], photographs of photographer S. M. Prokudina-Gorsky in mosques and mausoleums in Samarkand in 1905 and 1911 [ibid; p. 21;], photographs taken by photographer I. F. Chistyakov in architectural monuments of Samarkand in 1898 [ibid;

pp.15;], collection of 28 photographs taken by French photographer P. Nadar who visited Bukhara, Samarkand and Merv in 1895, photographs of the architectural monuments of Samarkand taken in 1901 by D.I. Ermakov [ibid; pp.32], Activities of A. L. Kun in Samarkand and his "Album of Turkestan" [ibid; pp. 37], activities of the photographer G. A. Pankratev in Samarkand in the 1890s [ibid; pp. 47], and lastly photographer I. Vvedensky's activities in Samarkand in 1894-1897 [ibid;]. It is obvious that the author's work does not consider the condition of the monuments in Samarkand in the colonial period, but mainly shows who photographed the Samarkand monuments. Also, other researches of the scientist also relied mainly on the materials of the photo archive of the Commission [Dlujnevskaya, 1995; 1998; 1999; 2003; 2007; 2011;].

Another work by G.V. Dlujnevskaya attempted to approach the history of Uzbekistan at the end of the 19th century on the basis of documents from the Commission's scientific archives [Dlujnevskaya, 2011]. Among other historical cities of Uzbekistan, Samarkand is mentioned in this study and the most prominent architectural monuments of the city – Registan ensemble, Ishratkhona mausoleum, Bibikhanim complex, Gur-Emir complex, Ruhobod mausoleum, Khoja Doniyor mausoleum and the monuments are discussed in detail. However, there is no information in this work as well about the condition of the monuments of Samarkand during the period of dependence on the Russian Empire.

On the subject in Uzbekistan D.A. Alimova published a monograph [Alimova, 2000], which relied mainly on correspondence with the Commission of the Central State Archives of Uzbekistan, as well as other sources based on these archival documents. The main focus of this study is on the economic consequences of the occupation of Turkestan by the Russian Empire. At the same time, information is provided about the unique manuscripts, various artifacts that were taken out of the country as a result of the Russian occupation, using the archives of Uzbekistan and other similar works. However, in this study there is almost no information about the state of Samarkand's architectural monuments during the period of dependence on the Russian Empire too.

S.M. Dudin's research on the subject [Dudin, 1903] focuses on the decorative coatings of architectural monuments in the region, based on the knowledge and experience he gained during his several trips to Turkestan. Along with the monuments of Samarkand, the author tried to reveal the similarities and differences between the decorative coatings of medieval architectural monuments in Bukhara, Anau, Shakhrisabz.

Childukhtaron mausoleum in Samarkand, Shohizinda ensemble, Amir Temur mausoleum, Mirzo Ulugbek and Tillakori madrasahs in Registan ensemble, Ishratkhona, Khoja Ahror complex, Bibikhanum mausoleum were compared with other monuments of Central Asia by him. At the same time, he noted that Samarkand's monuments have been neglected, looted by collectors, and some were being turned into garbage dumps [Dudin, 1903, pp. 49-73]. However, it does not dwell on the causes of the current situation.

The literature on the subject includes a number of works from the second half of the XIX century to the beginning of the XX century. However, these sources have been used in the literature reviewed above, and the author did not find it necessary to mention them separately [Bartold, 1922; 1966; 1977; Vyatkin, 1927; Yakubovskiy, 1904].

Main part

Initially, the Commission addressed a letter №162 to the Governor-General of Turkestan on 29 August 1869, requesting that the valuable items of archeological and architectural monuments in the ancient cities of the country, along with their classification, be sent to the Commission [fund 1, 1868, file 25, pp 5].

In order to accomplish the above purpose of the Commission, A classification and drawing of a stand for the Ottoman Qur'an located in the ruins of the Amir Temur Mosque (Bibikhanim)² in Samarkand, and a list of inscriptions on the stone sent to St. Petersburg by the titular adviser³ to the Governor-General of Turkestan, A.L. Kun. The marble slab itself was left in place because it was "very heavy and very expensive to transport" [Ibid, pp 5].

A.Kun declared that the stone was made from grey marble and brought from Nurota during A. Temur's realm, consisted of 9 legs, huge a marble slab, and two triangle stones which make side part, before Russian invasion the dome of the mosque collapsed and as a result a piece of side part stone was broken, and at that moment one part of the mosque's waqf was given to Amir Temur Mausoleum, the others to other mosques and consequently the mosque of Bibikhanum left without any waqf [Ibid. pp. 9].

At the same time A.Kun made two replicas of the marble slab on the instructions of the Governor-General of Turkestan. Along with these copies, a collection of glazed tiles collected from the mausoleums of the Shahi-zinda ensemble, the Amir Temur (Bibikhanim) mosque and the mausoleum of Amir Temur were placed in a total of 15 boxes and sent to the Commission [Ibid. pp. 28]. There is a complete list of tiles from the ruins of ancient buildings of Samarkand in the 1st appendix of the latter № 429 written in March 13, 1871 to the chairman of the archeological committee of the General Governor of Turkistan earl S. G. Stroganov with the signature of A. L. Kun [Ibid. pp. 13-17].

The list includes the tiles and other architectural parts of the tomb of Amir Hussein ibn Kara Kutlug and his children, built in 777 AH, the tomb of Shirin Beka, sister of Amir Temur, built in 787 AH, the mosque of Shirin Beka, daughter of Amir Taragay, built in 735 AH by Amir Temur, mausoleum of the daughter of Oljay nurse, the construction date is unknown.

It should be noted that the list in the archival documents includes the names of mausoleums that are not known among the mausoleums of Shahi-zinda ensemble at the moment, which requires special research. Some of those mausoleums are one of Shakh Arab built in 762 AH, believed to be son-in-law of Amir Temur, the tomb of Amir Musa, then called the Mirror Room by locals built in 888 AH, the tomb of Amir Assad, of which was construction date is unknown, the tomb of Amir Abu Tenggi built in 803 AH, the mausoleum of Chuchun Beka, who is believed to be Timur's daughter, constructed in 788 AH. Main pieces of the architectural decorations were taken from those monuments (Amir Abu Tenggi, Shah Arab Mausoleum). In total, about 100 architectural decorative coverings, tiles, patterned bricks were taken from the ensemble of Shakhi-zinda [Ibid].

The list included 11 ornamented tiles and bricks from Amir Temur (BibiKhanum) Friday mosque, mosaic square taken from the walls of Registan ensemble's Ulugbek Madrasah, 10 pieces of diverse mosaics and 6 blue glazed bricks which would make different ornaments as well as words when combined together from the walls and minaret of Amir Temur Mausoleum,

the piece of low part of the marble fence of pilgrimage which surrounds the gravestones of Amir Timur and his relatives, a piece of carved marble that consists the lower line of the socle of the mausoleum, a piece of abated inner marble socle of hexagonal shape, a carved door leaf⁴. These items were sent by the Commission to the Industrial Museum at the Imperial Palace [Ibid, p. 13-17].

Two tombstones and two marble slabs with inscriptions from the tomb of Abu Said's son Muhammad (518 AH, 1124-1125 AD), found near the Bukhara Gate of the Samarkand Arch and which was in K.P. Kaufman's possession, were also sent to the Commission along with those items. The items were given to the Asian Museum [Ibid. pp.19].

After the official establishment of the museum in Samarkand in 1896, Y. Yakubovsky, M. Virsky and V. Vyatkin did much work to enrich the museum fund. In fact, one of the goals of the Samarkand Museum was to prevent the disappearance of antiques abroad. From this period, the artifacts taken from the ancient city began to attract public attention, and the local administration began to react to it.

For example, the artist S.M. Dudin was sent to Turkestan in 1901 by the Russian Museum of Emperor Alexander III. He was allowed to conduct excavations during 1901 on state, public and other lands in the Turkestan region by the Imperial Archaeological Commission [fund 1, 1901, file 82, pp 1-2].

However, archeological excavations were not done by S.M.Dudin, but mainly the architectural revetments of the Samarkand monuments were collected and taken to the Russian Museum of Alexander III. He successfully completed this mission several times during the years 1895-1908. However, during his visit to Samarkand in 1908, he was unable to collect tiles for the museum of Alexander III because "the local administration did not allow him to take anything". The local administration reasoned this action as "works to enrich the funds of the Samarkand Museum are underway" [Dudin, 1910, pp. 93].

The same thing happened with the special assignments officer in Ministry of Interior with A.A. Polovtsev. In 1901, a member of Baron Stiglitz's Technical Graphics School in St. Petersburg addressed local authorities requesting A.A. Polovtsev to provide a permit and practical assistance in the matter of getting replica of glazed tiles with different colors of the walls of Shakhi-zinda in Samarkand.

The school explained that it was concerned about the constant and gradual collapse of the tiles, the fear of damage to the monument due to the constant earthquakes in Samarkand, the threat of complete destruction of the walls of the tombs of Shokhizinda, and that the institution intended to preserve this magnificent monument of Central Asian art by tearing down the tiles and to demonstrate to the public by placing it in a museum [fund 1, 1901, file 161, pp.1-2].

Taking into consideration the fact that the ensemble was on the verge of partial collapse due to an earthquake in Shakhi-zinda, and that the spilled wall coverings were being looted, the commission decided to allow A. Polovtsev to remove the tiles from the ensemble's monuments and take to the St. Petersburg Technical Graphics Central School Museum as an exception "in order to preserve at least one scientifically interesting coating" and informed the military governor of Samarkand region in the letter No. 1230 of July 9, 1901 [Ibid, pp. 2-3].

However, in a letter to the Ministry of Defense through the Governor-General of Turkestan, the military governor of Samarkand stated that "Taking the tiles may cause to ruin the mausoleums that is being unattended anyway and might fairly insult the feelings and equality of the Muslims consequences of which would be resentment by them". With this in mind, asks to cancel the permit given to Polovtsev. Eventually, the Asian part of the General Staff of the Ministry of Defense informed the Minister of the Imperial Palace about this in the letter No. 48700 dated August 31, 1901 [Ibid].

The Commission then, in a letter No. 1589 to the Ministry of the Imperial Palace of 27 September 1901, sharply criticized the representatives of the local administration in the province of Turkestan and strongly defended its position on the matter of permit. In the letter, the Commission noted that the Samarkand monuments of the Timurid period, especially the Amir Timur (Bibihanim) Mosque and some mausoleums of Shokhizinda, had become in poor condition, could soon completely be destroyed, the coatings were being looted and exported, that the local administration had long been indifferent to the looting of architectural monuments, and that only after the interference of the Imperial Archaeological Commission forbade the trade with ancient tiles; In 1897, under the pretext of ensuring the safety of passers-by, the upper half of the magnificent minaret of the BibiKhanum Mosque was removed and its tiles were destroyed, a magnificent 14th-century mosque near the Russian fortress blown up to open a square (esplanade), states that local administration believes that the implementation of the work entrusted to AA Palovtsev does not insult the religion and feelings of equality of Muslims [Ibid. pp. 6-12].

Eventually A.A. Polovtsev was only allowed to take "separate spilled tiles" [Ibid. pp. 12-13]. There are no reports on how the process ended or if A.A.Polovtsev received tiles from the Shokhi-zinda ensemble in committee's archival documents. However, other studies based on A.A. Polovtsev state that Baron Stiglitz's technical graphics school in St. Petersburg "had Central Asian patterns and gypsum carvings of the fourteenth and fifteenth centuries" [Alimova, 200, pp. 347; Polovtsev, 1913].

Indeed, by this time, the staff of the Samarkand Regional Statistics Committee, members of the Samarkand branch of the Turkestan Amateur Archaeological Circle and other educators was working hard to protect the region's ancient monuments. This can also be seen in the press pages of that period. In particular, in 1904, the newspaper "Samarkand" published a report that the ancient city of Afrosiyab turned into a garbage dump [Newspaper "Samarkand", 1904;]. The Commission sent a letter to the military governor of Samarkand region asking to comment on this report. It said that "if this report is confirmed, such a situation will provoke strong resentments not only in our country but also abroad, because the whole world of science is interested in Afrosiab" [fund 1, 1904, file 24, pp. 7].

Unit 3 of the Samarkand Region Administration explained to the Commission that a small area in the south-western corner of the Afrosiyab hills, west of the road in the village of Halvon in Samarkand district, had served as a landfill until the Russian invasion, and reported that the garbage dump was expanding as well as no archeological finds have been identified in the area so far. The administration added that in the wake of the outbreak of malaria in the Caspian region, the city's clean-up had intensified, with residents digging special wells and dumping waste into the well, and a guard assigned to monitor it [Ibid, pp. 10].

Head of the Political Agency of the Russian Empire in the Emirate of Bukhara A. Kalmykov's letter to the Imperial Archaeological Commission on April 3, 1902, also expressed concern about the removal of antiques and the looting of ancient mosques [fund 1, 1901, file 161, pp. 14-15].

The letter states that in connection with the destruction of Bukhara and Samarkand regions, the removal of antiques, looting of ancient mosques has significantly increased, damaging the tomb of Amir Temur in Samarkand and the mosque in Gijduvan, besidestrade with ancient weapons and items of unknown origin and in other household items has peaked, with the recent removal of stone slabs, bricks, sarcophagus fragments, and other remains that are part of ancient structures, providing information about the time of construction, the name of the builder, and so on.

According to the head of the political agency a Turkish citizen, Armenian by nationality Isa Tumanyants, who was sending the above-mentioned items to several places, was arrested and the mentioned stones were also seized.

As a result, the head of the political agency asked the Commission to raise the issue of a complete ban on the export of ancient stone inscriptions, glazed or inscribed and inscribed bricks, building fragments and ancient architectural ornaments from Central Asia, recommends making the registration list and checking the constant integrity.

The letter also expressed concern about the presence of a unique marble carved Muslim sarcophagus in the mosque 5 versts⁵ from Termez, which is now at risk of theft.

The Commission sent a letter No. 816 to the political agency on May 10, 1902, asking to send the confiscated antiques from Isa Tumanyants, a Turkish citizen of Armenian descent, to the Commission. However, the political agency said that it was impossible to fulfill the request "because the items were returned to the Bukhara government" [Ibid, pp. 16].

To prevent unpleasant situations such the above, in order to protect the monuments of Samarkand, the Commission applies to the military governor of Samarkand region with a request to appoint a person familiar with the history of the region as an "observer of ancient monuments" for a fee. Otherwise, he adds, "the Russian administration might be fairly criticized for not guarding the monuments and treating them with care despite its enormity" [fund 1, 1895, file 69, pp. 9-11].

In turn, the military governor of Samarkand region informed to the Commission that assigning this task to the head of the regional administration V.A. Vyatkin" would be the right thing to do as he knew the history of Central Asia, at the same time the history of the art of the construction of the monuments according to Islamic sources, the most importantly he knew the oral and written language of the local peoples and stated that he would be to paid 600 rubles a year for this task, and that he would be given the right to prosecute those who have damaged the monuments [Ibid, p. 11-13; Uzbekistan National State Archive. Fund 5, list 11, file 240 pp. 1].

Although the post of a protector of ancient monuments was established, the next urgent task – the conservation and restoration of monuments did not happen. This had a negative impact on their survival condition. For example, due to the lack of timely measures, "the tower of the mausoleum of Amir Temur in Samarkand collapsed with its base on May 18, 1903 at 7 o'clock in the morning" [fund 1, 1895, file 69, pp. 13].

We can see in the available archival documents that V.L. Vyatkin carried out work on the repair and preservation of some monument with the involvement of local forces, by finding sponsors. In particular, in 1913-1914 the collapse of the dome of the mausoleum of Amir Temur was prevented; On the north side of the Sherdor Madrasa, three rooms on the upper floor of the entrance and two rooms below them were in danger of collapsing before they were repaired; The rotten wooden ceilings in some parts of the large mosque of the Mirzo Ulugbek madrasah in the Registan ensemble was replaced; the Nadir Devonbegi Madrasa, with its collapsed roof, collapsed walls, cells and other defects, was completely repaired [Ibid. pp. 6-10].

Theft of monuments continued and later. The committee's 1906 report to the Ministry of the Imperial Palace states: "The ones who have stolen historical items are not being searched, are not being punished, in result such cases are increasing instead of decreasing. In Samarkand, mosques were initially stripped of small tiles, and now the entire panel is being torn down, and the robbers are armed with pistols. Stolen tiles are usually taken aside to decorate other museums abroad. This evil arose with the construction of the Caspian Railway ..." [fund 1, 1901, file 53, pp. 61-62].

Meanwhile, V.V. BartholdIn a letter on the disappearance of a chandelier at the Yassavi mausoleum written in 1906 to N.I. Veselovsky in Turkestan recalled the evidence of the sheikhs of the Yassavi mausoleum that a Caucasian or Persian-looking man had arrived in Turkestan a few days before the robbery and added there is a Persian man who is selling antiques of Samarkand abroad and that he he had warned the administration that he appeared in Turkestan, a long time ago, and asserted that finally they have to arrest him and expel him from the country [fund 1, 1904, file 24, pp. 21-22].

The above-mentioned treasure hunters were notable "investors" in the work, and they were quickly noticed as they were foreigners. In fact, antiques were dealt by all sections of society — retired soldiers, tourists, civil servants, even laborers, and young children. Many people who were in Central Asia during this period wrote about it in their notes [Dmitriev-Kavkazskiy, 1894, pp. 110; Uvarova, 1891, pp. 15].

Among the architectural fragments taken from Samarkand at that time, a tile with the inscription "Jahangir Amir Temur Koragoni's tomb, May God bless him and his place in eternal paradise" in Arabic on the entrance door of the mausoleum of Amir Temur made a great stir. Even Commission Chairman A.A. Bobrinsky also mentioned the incident in his 1909 speech in the Russian State Duma [Newspaper "Samarkand". 1904, No. 109;].

According to the archives, in the spring of 1905, the mausoleum of Amir Temur was raided by robbers armed with a revolver consisting of 4 people, who threatened the guard of the mausoleum, tore the plate from its place and disappeared. The investigations of the local government at the time did not help to find the culprits [fund 1, 1895, file 69, pp. 1-3].

The Russian emperor's archeological commission found out that the marble slab was on display at the Friedrich Museum in Berlin in 1908, and later that year informed the details the imperial foreign minister, Alexander Petrovich Izvolsky, and asked for help in returning the plate.

In turn, the Foreign Ministry sent a letter to the Russian emperor's ambassador to Berlin, Count von der Osten-Saken, asking him to investigate the case. It turns out that the unique tile was purchased by Dr. T. Bode, director of the Friedrich Museum, in Istanbul in 1906 for 10,000

francs and brought to the museum. Dr. Wulff, the museum's director of Asian Department, informed the Russian ambassador [Ibid].

The Russian Foreign Ministry instructed the ambassador to hold negotiations to return the tile to Russia. Dr. T. Bode, director of the Friedrich Museum, in response to a request for the return of the rare item to Russia, initially demanded proof that the item actually belonged to the tomb of Amir Temur. The Imperial Archaeological Commission presented the photos taken in Samarkand in the late 19th century which show Amir Temur's mausoleum with a wooden entrance door and a tiled corner panel, separate photo that illustrates the door and the plate, in total 3 photos showing the same inscription [Ibid, pp. 3-4].

After that, the administration of the Frederick Museum demanded "some unique specimen" of Muslim art from the XIII-XIV centuries in exchange for the return of the tile to Russia. However, the Imperial Archaeological Commission states that such an item is not at its disposal, and will cover the 10,000 francs spent by the Frederick Museum for the purchase of the tiled slab.

After the involvement of the Prussian Royal Museums in the incident, the issue of returning it to Russia in exchange for reimbursement for the money spent on the tile was resolved. The Imperial Archaeological Commission then sent a letter to the Minister of Finance of the Russian Empire, V.N Kokovtsev, asking him to allocate 6,000 rubles (10,000 marks) to pay for the Frederick Museum. After the money was sent to Berlin, the tile was brought to Russia in 1910 and returned to the mausoleum of the then Emperor Alexander III by the Imperial Archaeological Commission and handed over to Ulrich Yakov, a senior official at the then Russian Museum of Emperor Alexander III (The State Russian Museum now) [Ibid. pp. 4].

Thus, a tile with the name of Amir Temur Koragon still adorns the exposition of the State Russian Museum in St. Petersburg. At that time, the non-return of the tile to Samarkand was explained by the fact that the monuments here were not well protected, and there was a possibility of repeated theft of the item.

The Archaeological Committee also took a number of measures to preserve and restore the architectural monuments of Turkestan, including Samarkand. In particular, the committee approved for the maintenance project of the architectural monuments. For this purpose, a restoration commission was set up under the Committee.

In particular, in 1898, the Samarkand regional administration, the construction department applied for permission to repair some monuments in Samarkand. According to the technical project of repair the following sums were determined: for Khoja Awliya Khanaqa madrasah 749 rubles 62 k., for Sharifjonboy mosque 354 rubles 92 k., To Sheibanikhan madrasa 242 rubles 74 k., To Mirzo Ulugbek madrasah 279 r. 88 k., To Makhdumi Khorezmi mosque 307 r. 62 k., To Sherdor madrasa 219 r. 74 k., To Tillakori madrasa 538 r. 50 k., To Shoxizinda ensemble 363 r. 50 k. In response, the Commission allows for "simple repairs" in Samarkand, given the lack of qualified specialists in this area [fund 1, 1898, file 292, pp. 1].

The Turkestan Archaeological Amateur Circle addressed a letter to the Committee by letter No./10/434 dated April 5, 1899, submitting a plan for the repair and protection of ancient monuments in Samarkand under a project developed by the head of the Samarkand engineering division I.P. Poslavsky for approval [Ibid. pp. 2]. The committee discussed the issue with

representatives of the Imperial Academy of Arts, the Technical Construction Committee of the Ministry of Internal Affairs, it was asserted that precise architectural plan needed to be made as the extensive repairs of the monuments is very important and complicated task; it was informed that the issue may be postponed a bit and for the moment it was needed to stick to avoiding them from destruction and sent the recommendations of the restoration commission on the matter.

In those recommendations, to ensure that the walls of the monuments were impermeable to water, it was advised to cover the upper part of the wall with bricks from 2-3 rows of already destroyed monuments with lime or cement, so that water can seep out, patch cracks and holes with at least alabaster, reassemble the lower part of the walls. It is stated that bricks should be used from the destroyed parts of the building. It is emphasized that the tiled coverings of the monuments should be preserved in the same way or another [Ibid. pp. 3-4].

In 1899, the military governor of Samarkand region also sent an estimate for the repair of the Ruhobod mausoleum as an appendix to his letter No. 13770, requesting the conclusion of the Committee. The Commission reviewed this estimate with the participation of the Technical Construction Committee of the Ministry of Internal Affairs and representatives of the Academy of Arts and approved the installation of a counterfoil (brick support device) on the walls of the mausoleum as indicated in the estimate. The main factor damaging the building – the ingress of water from the ditch flowing near it then had been eliminated, and if it is necessary to strengthen its dome, it is proposed to strengthen it with an iron ring [Ibid, pp. 4].

Similarly, in 1900, the Samarkand regional administration sent a letter to the Commission of the Construction Department requesting permission to repair the ancient Kokgumbaz madrasah in Uratepa, then belonging to Samarkand region, with a technical design of the repair, calculation of the cost of repairs and an original drawing from the madrasah [fund 1, 1900, file 148, pp. 1].

At the request of the Committee, the technical project was checked by Academician G.I. Kotov and he asserted that he would not support the idea of using foreign methods for local architectural monuments, thus, he considered that the “renovation” such as applying Central Russian construction practices for the madrasa project was now appropriate thing to do with oriental monuments, for instance, as shown in the repair plan, closing the top corner part of the madrasah and the attic was wrong [Ibid, pp. 2-3].

Thus, the repair plan of the madrasah was returned to the committee with instructions such above.

In 1907, the Samarkand regional administration sent a letter to the temporary property department Committee requesting permission to remove the tiles in the upper ring of the tower, given that the towers of the Mirzo Ulugbek madrasah were in danger of collapsing due to poor connection with the madrasah building [fund 1, 1898, file 202, pp. 5-6].

The Committee, in turn, recommends attaching an iron ring to the tower pillars to draw towards the building, or in the same way to pull the minarets together through the upper part of the mosque’s pediment. Because drawings of the upper part of the Ulugbek madrasah have not yet been obtained the committee suggests that this measure be used temporarily, at least until clear drawings and photographs of the upper part of the madrasah have been obtained [Ibid, pp. 7].

Commenting on the article "Ruins" [Turkistan News. Number 16, 1899] published in the newspaper "Turkestanskije Vedomosti" in the 16th issue of 1899 on the dilapidated condition of

the mosque of Amir Temur (Bibikhanim) in Samarkand, Professor N. Veselovsky notes that the monuments of Samarkand are extraordinarily strong, their foundations are more than 7 arshins⁶, but the buildings abandoned by fate are constantly and incessantly in ruins, rain moisture falls into the cracks and enlarges them. To overcome this, it is necessary to fill the collapsed parts of the dome, to patch large cracks, pour liquid cement to the small ones (to form a solid monolith), create a roof covering for rainwater by pouring cement, where the tiles have moved, pulling them to the wall with iron hooks, where the bricks have fallen off the wall, he says they need to be put back in place. If these actions are taken, it is assumed that the monuments will still be preserved for a long time [fund 1, 1895, file 69, pp. 4-6].

Indeed, the earthquake of October 8, 1907 tested the strength of Samarkand's monuments. On the same day, a two times with half an hour interval – long vibrated and a smooth but rather strong (up to 8 scale on the Rossi-Forel) earthquake, caused significant damage to the ancient monuments in Samarkand. The military governor of Samarkand region informed the Imperial Archaeological Commission in his letter No. 19794 of 1907 [Ibid].

In accordance with the decree No. 616 of October 11, 1907 of the military governor of Samarkand region commission was formed Under the chairmanship of regional architect K. Dubrovin to determine the damage caused to the monuments because of the earthquake with the participation of city architect engineer-technologist G. A.Nelle, an observer of ancient monuments in Samarkand V. Vyatkin and the mayor of Samarkand, engineer-builder Lebedev.

Ulugbek, Sherdor, Tillakori madrasahs of Registan ensemble, Amir Temur (Bibikhanim) mosque, which was ruined at that time, Shirinbekaako, Turkonaqa mausoleums of Shohizinda ensemble, big mosque near Qusamibn Abbas mausoleum, Amir Temur mausoleum Khoja Abdu Darun khanaqa, Nadir Devonbegi madrassas were examined by a commission formed. Damages were in the form of cracks in the domes and roofs, the expansion of old cracks, spills of architectural coatings, damage in the form of cracks in the walls [Ibid, pp. 6-8].

The commission reviewed the damage caused by the earthquake in the ancient monuments and determined the work to be done for each monument. The commission's conclusion was that those that could not be delayed would be repaired now, while the rest would have to be repaired in the spring of the following year [Ibid, pp. 8-11].

Subsequent documents on the process show that only some of the Samarkand monuments damaged by the earthquake were repaired. By the order of the military governor of Samarkand region Under the chairmanship of V.Vyatkin a commission was formed with the participation of regional architect Lebedev, city architect Nelle, two judges from Samarkand, two deputies, respectively, a trustee of monuments and a madrasah teacher.

The military governor of Samarkand region has allocated 1,079 rubles for the repair of mausoleums in Sherdor, Tillakori and Shokhizinda ensemble. In addition, the trustees of these monuments allocated 650 rubles from the waqf foundation. These funds were used for repairs under the supervision of the above commission at the end of 1907. At the same time, of course, urgent repairs were carried out, and the rest was agreed to be done in the spring of next year.

Reconstruction of the Ruhabad mausoleum and Mirzo Ulugbek madrasah were also entrusted to a commission chaired by Vyatkin, an observer of ancient monuments. For this purpose 1510 rubles were allocated at the disposal of the commission. About 24,000 bricks were allowed to be

removed from the ruins of the Amir Temur (Bibikhanim) mosque in agreement with the regional mufti for the repair of the Ruhabad mausoleum. In addition, the trustee of MirzoUlugbek madrasah gave 440 rubles from the foundation. Under the supervision of the commission, the necessary repairs were started at these monuments as well.

Renovation of the mausoleum of Amir Temur postponed to next year due to "the lack of suitable workers, as they were busy with repairs in other madrassas and mausoleums".

At that time, construction materials were purchased at a lower price for the religiously important monuments which were being repaired, and the labor force was also made cheaper. According to the decision of the special commission, a total of 2589 rubles were allocated for the repair of 6 important monuments. In the process of repair, mainly the work of local masters was used, for complicated works masters were involved from the Bukhara Emirate.

After these repairs, the damaged monuments were no longer repaired. A letter No. 417 of March 4, 1911 from the Imperial Archaeological Commission to the Asian part of the General Staff of the Ministry of Military called for some measures to be taken to preserve "the tomb of Amir Temur, whose dome and drum were cracked by an earthquake three years ago". In particular, tightening the mausoleum dome using an iron ring, patching or repairing cracks in the dome, and so on. At least 10 thousand rubles was required for these measures.

The fact that the requested funds were not allocated can be seen from the Commission's letter No. 1621 dated July 25, 1912 to the Chancellery of the Ministry of the Imperial Palace. Given the fact that it required much money for all the monuments in Turkestan, at least the most important of them - the mausoleum of Amir Temur, the ensemble Shoxizinda, some mosques outside the city (list to be sent separately), the madrassas of the Registan ensemble, A. Yassavi Mosque, the 12th-century mausoleum of Sultan Sanjar in Merv were asked to allocate at least 10,000 rubles a year to repair [fund 1, 1901, file 53, pp. 52-55].

The commission explains the request for such a large amount of money by the lack of craftsmen in Turkestan to carry out such large-scale repairs, the need to transport them from the European part of Russia, as well as the lack of construction materials (e.g. cement) [Ibid].

It was also stated that the dome of Amir Temur's mausoleum was cracked due to the 1907 earthquake, which required wrapping and tightening the dome's drum with an iron ring, and that more funds should be allocated for the completely destroyed Amir Temur (Bibikhanum) Mosque [Ibid].

However, the funds remained unallocated. Because at the same time, the legislation on the protection, repair and preservation of ancient monuments itself was ineffective. With regard to historical and architectural monuments, general control over the sites was exercised by governors subordinate to the Ministry of Defense, with the Ministry of the Interior in fact being in charge. Therefore, in 1912, the Commission submitted a bill on the protection of ancient monuments in the Empire to the III State Duma for consideration. According to that, it was planned to establish a Committee for the Protection of Ancient Monuments [Ibid. pp. 59-60].

After that, the economic crisis in Russia, which arose with the outbreak of World War I, and with the coup d'état of 1917, the issue of repairing architectural monuments was prolonged. By 1920, repair work began on the Mirzo Ulugbek Madrasah and Amir Temur Mausoleum in Samarkand, the Ismail Somoni Mausoleum and the Ark in Bukhara [Bartold, 1966, pp. 243].

Other monuments of Samarkand - Ishratkhana, Oqsaroy, Childukhtaron, Hazrat Hizr mosque - were neglected and gradually were falling into ruins. The Commission did not pay enough attention to the protection of these monuments because they were "almost destroyed". For example, during the 1897 earthquake, the Ishratkhana monument in Samarkand was severely damaged and four rooms of the monument were collapsed. In 1902, other two room`s domes collapsed, leaving only the façade. The rest of the building turned into a mound of bricks and cement. In 1905, the 3rd Department of the Chancellery of the Governor-General of Turkestan informed the Commission in its letter No. 48346, asking for the initiative of private individuals to build 6 to 8 cells for the mullahs visiting the tomb of Hodja Abdu Darun using the bricks of the Shrine [fund 1, 1895, file 69, pp. 14-16].

The commission responded by saying that "there is no need to guard the building, which is almost destroyed" and that there was no objection to the use of bricks of Ishratkhana for the construction of cells in the tomb of Hodja Abdu Darun [Ibid. pp 16]. Similarly, the mosque of Amir Temur (Bibikhanim), which collapsed on September 5, 1895 and was severely damaged by the earthquake of 1907, were left unattended [Ibid, pp. 12].

RESULTS AND DISCUSSION

The activities of the Commission in Samarkand and in Turkestan in general in 1867-1917 were diverse at different times. In the initial phase of its activity (the Commission was chaired by S.G Stroganov (1859-1882) the commission transported ancient artifacts which were accidentally identified in the country with abuse of its power, and the commission started organizing special expeditions in Turkistan from 1880 onwards (Chairman A. Vasilchikov 1882-1886). From the end of the XIX century to the beginning of the XX century (during the presidency of Count AA Bobrinsky (1882-1918) it worked on the protection of cultural heritage sites, scientific research and restoration and conservation. Of course, the influence of the people who led it in the work of the Commission was also great.

As a result of changes in the system of organization and use of waqf property in Turkestan by the tsarist government, architectural monuments have lost their material and technical base. Not to mention the mostly conservation work done on some of the monuments, most of the monuments that witnessed ancient history have been neglected.

The information about the monuments of Samarkand, presented in the archival documents, can be effectively used in the current restoration and conservation work. With this in mind, it is advisable to keep a "history sheet of repair" of each monument using this database.

During the colonial regime, the monuments of Samarkand were ruthlessly plundered by various social strata, and therefore many "unknown" monuments can be found in Samarkand today.

During the period under study, the architectural monuments of Samarkand differed from the current state. Therefore, the study of the architectural coatings that were once taken from the collections of museums around the world would shed light on the history of the "unknown" monuments of Samarkand.

CONCLUSION

Based on the above, the following conclusions can be made:

- Architectural monuments in Samarkand were preserved and repaired before the Russian invasion from the income of the waqf. However, this practice has been applied to functioning monuments. Bricks and other building materials from unused monuments were used for another nearby monument to be built. Therefore, the practice of museumization of monuments was not introduced before the Russian invasion.

-As a result of the use of the proceeds from the waqf of architectural monuments for administrative expenses after the Russian invasion, not only they were not repaired, but also no funds were found to hire guards to secure them. As a result, ancient monuments were ruthlessly looted.

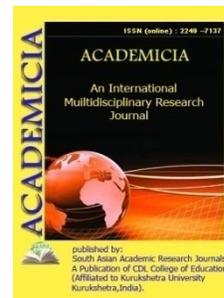

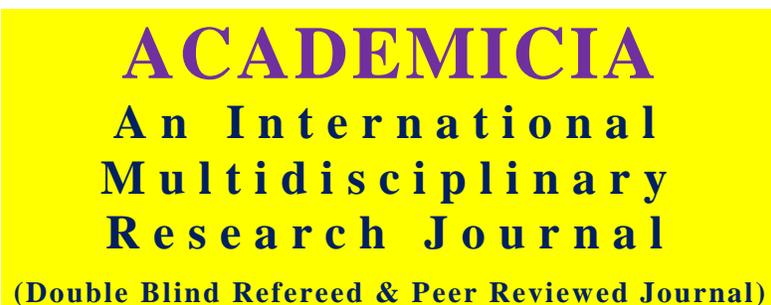

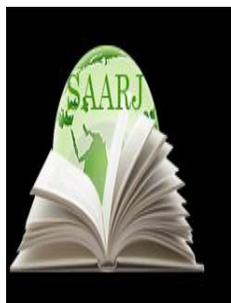

- Since the 90s of the XIX century, efforts have been made to protect and repair the architectural monuments of Samarkand. But no specific work has been done in this direction.

THE PROCESS OF COGNITION OF THE SURROUNDING WORLD BY PRIMARY SCHOOL STUDENTS AND THE BALANCE OF THE LAWS OF SCIENTIFIC KNOWLEDGE

Kosimova Gavkhar Islomovna*

*Lecturer,

Primary At The Department Of Special Education
Kashkadarya Region Xthktmoxm Preschool,
UZBEKISTAN

ABSTRACT

The article examines the features of the development of mental processes in primary schoolchildren and how they manifest themselves in the knowledge and understanding of nature, thereby allowing their minds to be filled with information about the world or look at it differently and anticipate it. According to studies of scientific knowledge of the world, mental processes form the basis of the psyche, consciousness, personality of a person. In science, mental processes are a dynamic reflection of reality: emotions, perception, memory, thinking, imagination, emotions that provide a reflection of the surrounding world, the formation of knowledge and skills, life experience and activities.

KEYWORDS: *Science, Universe, Thought, Perception, Understanding, Nature, Natural, Imagination.*

INTRODUCTION

Before considering the peculiarities of how elementary school students perceive reality and learn about nature, it is important to focus on the concept of "personality", because only a person as a person is able to consciously perceive and cognize the world. From the point of view of philosophy, the concept of "personality" emphasizes its conscious-volitional origin. The more clearly an individual understands the motives of his behavior and more strictly controls it, subordinating him to a single life strategy, the more he has the right to be called a personality. The concept of a person makes sense only in the system of social relations, in a situation where one can speak not only about the social role of a person, but also about the preservation of

individuality. It can be concluded that "individuality is the way the individual exists in society, and the individual is an individualized way of human life."

According to studies of scientific knowledge of the world, mental processes form the basis of the psyche, consciousness, personality of a person. In science, mental processes are a dynamic reflection of reality: emotions, perception, memory, thinking, imagination, emotions that provide a reflection of the surrounding world, the formation of knowledge and skills, life experience and activities. We will consider what are the features of the development of mental processes in primary schoolchildren and how they manifest themselves in the process of cognition and understanding of nature. By the time they reach graduation age, children will have a certain level of vision, a stock of specific knowledge, and acquire some rational ways of checking the external properties of objects.. At early school age, the main characteristics of cognitive processes such as cognition, attention, memory, imagination, thinking and speech are consolidated and continue to develop. As they enter school, their needs increase, and these descriptions determine the level of students' perception and knowledge of nature. At the emotional level of a child's cognition of the world around him, like any person, there is a gradual process of moving from the perception of primary, concrete things to general, abstract, general, important things of a limited nature at the beginning. However, since the emotional form of reflection is unique, it is difficult to distinguish the primary, the general, the important from the accidental. This creates objective conditions for anchoring in the child's mind in the understanding of the general, abstract (abstract), that is, a more complex form of cognition - abstract thinking. Scientists note that the emotional-visual form of reflection of objective reality is not a mechanical, mirror-like copy of reality, it is the result of active, purposeful assimilation of objective reality... It is known in science that the main form of emotional reflection of the real world is emotions, which allow a person to perceive signals and reflect the properties and characteristics of objects and states of the external world. Perception connects the child with the outside world and is the main source of the formation of the image of the world with knowledge of nature and the main condition for the mental development of the child during the transition from emotions to thoughts. This is why it is very important that children learn about the world from an early age and systematically enrich their feelings by mastering the foundations of scientific abstraction "Cognition is now a more complex, active process based on the child's sequential viewing of individual details of the object, identifying the most informative moments." Cognition is an image of the present, but it includes components not only of the present, but also of the past and parts of the future. takes (based on preliminary thinking, preliminary understanding, preliminary image). In perception, along with emotional images of real objects and natural phenomena, there is a ground for the child's thoughts (distraction, generalization), there is not only a reflection of an object or event, but also the relationship of their properties and qualities. Without emotional distraction and generalization, it would be impossible for children to move on to thinking. Generalization processes in perception are the identification of interrelated properties of objects, the separation of typical aspects based on multiple perceptions as a result of various actions, which is also an important condition for opening the path to imagination as a step to thinking. Various analyzers are involved in young students' understanding of the world around them: sight, hearing, sensations, smell, and so on. Unfortunately, in the traditional form of teaching, students often use visual analyzers when observing natural objects and phenomena, and the development of other analyzers is not the task of teachers and parents, although the great teacher Ya.A. rule. Natural science ideas, unlike others, are richer in content and at the same time more likely to form these

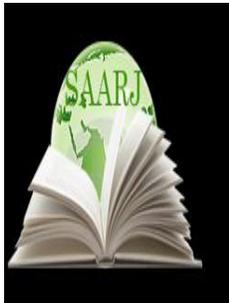

ideas, because children can spend a lot of time directly in the arms of nature. Thus, when studying nature, it is necessary to take into account the perception of young students, and the effective, systematic formation of these ideas should become one of the most important tasks as each child understands the real world.

The process of thinking, the dialectic of the transition from an emotional image to abstraction is unusually complex: consistent, interrelated and at the same time continuous. Typically, typical external features of previously perceived natural objects and phenomena or their models are enhanced and retained in the imagination. From the point of view of the science of physiology of higher nervous activity, the neurodynamic basis of perception is the sum (system) of neural connections that arise in the cerebral cortex when objects directly affect the sense organs. The faster the effect of external objects is repeated, the easier it is for neural connections, that is, for a complex of specific "traces" in the brain, to move, which is a necessary condition for the formation of perception in a person. Perception is closely related to intuition and perception, but they reflect some common characteristics rather than all of the characteristics that appear in an object or event. Thus, imagination is a visual image of an object or event, which is formed on the basis of past experience (these sensations and perceptions) by recreating the image in memory or imagination. Accordingly, in the field of science, there are 2 types of imagination: memory imagination and imagination. The physiological basis of memory is the repetition in the brain of systems of temporary connections (neural "traces" or "patterns") that arise during the perception of certain objects and become more relevant under the influence of individual elements of the same objects or stimuli associated with these objects in the personal student experience. Changing the construction of images can lead to the emergence of new images - imaginary images. At the age of 7-8, children's perception of the environment gradually changes: along with the reproductive images characteristic of preschoolers, productive images appear. Productive imagery is the product of new combinations of certain elements of reality. Reproductive images of the imagination are images of certain objects and natural phenomena that are also not perceived at the same moment in time .. Younger schoolchildren have a greater difference in the perception of natural objects and phenomena than the primary and general perception of preschoolers, although this specificity can only be explained age. In general, primary perceptions are more individual and specific in terms of visualization than general perceptions, but they have a certain generalization, since they are often interconnected images of perception of individual objects of nature. In the process of forming a natural-scientific image of the world in schoolchildren, it is especially important to form adequate basic ideas in children that are distinguished by brightness, clarity, completeness, as well as schematic and more general ideas. A collection of naturalistic representations of real objects and events, as well as the models that reflect them, constitute the most important foundation for every child's learning. It is like a stepping stone from perception to abstract logical thinking. In turn, the perception of young students differs from abstract concepts in that they are visual and do not distinguish between internal, hidden legal connections and relationships of the surrounding world. However, it is important to understand that perceptions, especially spatial ones, play a huge role in the process of voluntary assimilation of children in their memory, imagination, and thinking. Scientists argue that this absorption of images will make them possible by regulating the human speech system. When young students perceive and study nature, it is spatial perception that allows them to understand the "structure" of the surrounding world, to imagine the image of the Universe based on natural sciences in the form of a model-image system. This is possible because these ideas are

“ideas about space-time properties and relationships: size, shape, relative position of objects, their input and rotation”. It is also important to distinguish between how generalized and schematic the spatial image of reality is. This image is formed when the child learns both individual aspects of the world around him and the state as a whole. The extent to which these images are generalized depends on many conditions: the nature of the spatial properties of the reflected objects, the tasks in the child's activity, the student's ability to recreate the spatial properties of natural objects and phenomena in various graphic models (drawings, diagrams, small drawings, special symbols, etc.). The ability to depict the environment in the form of various graphic models of general spatial relationships both between primary and between real objects requires special training for both preschoolers and schoolchildren. The goal is to be able to study nature more effectively and develop a way of thinking based on natural sciences while working with the imagination through thinking, language and other psycho physiological processes. In addition, science has proven that the ability to develop spatial perception well and assimilate it is such a basis that allows young students to engage in creative activities in understanding and comprehending real reality. The attention of younger students is becoming more voluntary compared to preschoolers, but involuntary attention remains much stronger in primary grades. When studying nature, it is important to remember that voluntary attention is often shown in elementary school students only if the object or event that directly attracts attention is very interesting and meaningful to the child. Imagination, as a universal human ability to create new holistic images of reality by processing the content of the formed practical, emotional, intellectual and emotional-spiritual experience, is of paramount importance in the formation of a natural-scientific image of the Universe in young students. Recently, imagination has begun to be considered in psychology as a general property of the mind, while it is noted that it performs its most important function in creating and structuring the image of the Universe. Thus, in the process of imagining, the child's knowledge may not yet pass into a logical category, but in his mind a relationship of coarse and primary knowledge already arises at the level of intuition. This connection arises by separating the general and specific features of objects and phenomena in images under the influence of both involuntary and voluntary activity during the analysis and synthesis of thought, due to the interaction of images that enter consciousness about objects and phenomena of nature.

LINGUISTIC ANALYSIS OF CORONAVIRUS TERMS WHICH “INFECTED” OUR DICTIONARY: ON THE EXAMPLE OF WORLD LANGUAGES

Doniyorova Gulruh Shoniyozovna*

*English Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN
 Email id: gulrukh.1989.12.05@gmail.com

ABSTRACT

Due to the rapid development of science and technology in our time, the growth of new industries, great changes are taking place in the language. As the linguist Z.A. As Potikha writes, "What happens in a developing society is reflected in language" emerging new concepts require new words and names. Today the new medical word – coronavirus is the most important concept among linguists and causing debates on how to accept the word. In the following article author gives detailed linguistic information on the new virus-related words. Their etymological analysis is also provided with examples. F.P. Filin points out that "the normalization and regulation of terms is of great scientific importance."

KEYWORDS: *Virus, Coronavirus, Language, Terms, Etymology.*

INTRODUCTION

Language as a social phenomenon reflects any changes in the life of society. The progress of science and technology regularly contributes to the appearance of lexical units in the language, representing more and more new concepts. Such units will carry the name of the term in the language, and in all languages, there will be a very large stock of intersectoral terminological layers. There are regular changes in the terminology layers: new terms are created, old ones are put out of use. This process is largely due to the extra linguistic factor. B. N. Golovin and R. N. Kobrin, this phenomenon was evaluated as a "terminological explosion" [1].

The lexical level of the Uzbek language is currently no exception. Countless terms have entered our language in the years since. One of them is the terminology layer associated with the

coronavirus pandemic. While terms such as Covid-19, coronavirus, zumbombing, covidiat and others related to this layer have appeared in our language, semantic changes have occurred in lexical units such as testing, vaccine, second wave, heavyweight, medical mask, enhanced quarantine.

The study of such cases is important for understanding the fundamental nature of language, revealing the patterns of changes occurring in our language.

Just a year ago, words like "social distancing" or "pandemic" were among the few words used by people around the world, so even dictionaries were limited to writing narrow comments on these terms, found only in medical dictionaries.

The "terminology explosion" associated with the pandemic has led to widespread use of coronavirus-related terms in all fields, not just in the medical field.

The use of tokens associated with this disease, without knowing their fundamental meaning, leads to a number of shortcomings not only in the field of medical knowledge, but also in the social sphere. Such global changes have placed a special responsibility on Uzbek terminologists. In the current pandemic situation, the careless use of words and expressions related to the coronavirus is crucial for communicating the recommendations of doctors in a way that is understandable to everyone and thus protects our own health.

A.V. Superanskaya singled out only one of all the existing meanings of the word "term": "A term is a special word (or phrase) adopted in professional activity and used in special conditions. A term is a verbal expression of a concept that is part of the system of concepts of a certain field of professional knowledge. The term is the main conceptual element of a special-purpose language. Within its own terminological domain, the term is used unambiguously. For its correct understanding, the term requires a special definition (an exact scientific definition)" [2].

For this purpose, it is not necessary to dwell on the etymological features of this term. The term Coronavirus is reflected in the Chinese language, which is "mother:

冠状病毒 (guānjuàng Bingdú) the literal translation of the virus in the form of a crown is coronavirus. It is noteworthy that the name of the new virus is now known worldwide as the English coronavirus (coronavirus), and not as 冠状病毒 (guānjuàng Bingdú), the national language of the Chinese state with a population of 1 billion 440 million people and more than 1 billion 30 million native speakers.

Or let's take the word COVID-19. This sentence is, in fact, the scientific definition given by scientists after the virus began to spread widely, intensively. COVID-19 (corona virus-19). This term is used in the Chinese language in the form of 新新 (xīnguān Fèiyán).

Continuing our thought, it should be noted that even Hindi, which is spoken by 4.5% of the world's population, is exactly the term that was borrowed without taking into account some phonetic features. In Devnagra, the Hindi alphabet, the word coronavirus is written and pronounced as (coronaavairas). This means that even the Indians, who are several millennia old, were able to adapt the new term to their alphabet. Similarly, the word -19 (kovid-19) nor does it exhibit any linguistic peculiarity in Hindi.

The term in our research center also manifests its linguistic features in Arabic, which has another huge diaspora. The Arabs in the form of the فيروس كورونا (fayrus kvrvna) have adopted the

coronavirus. But they have enriched their vocabulary by adopting COVID-19 as the new name for the disease caused by the virus. You will see the following information in a report published on October 18 in the Arab News newspaper, which has a 45-year history.

348 إي الامم لكةال عرب يةال سعودي تي نخ فضعم تسج يل covid-19 ددال صاب ات ال جدي دق -ع

eadad aluiisabat aljadidat B COVID-19 Fi alearabat alsaeudiat yanhafid Mi tasjil 348

"The number of patients with COVID-19 has reached 348"

As can be seen from the expression of the epidemic in Arabic, the name of the disease is reflected in the form of an English abbreviation, and not in the Arabic alphabet.

As for the etymology of the word Coronavirus, it comes from the ancient Latin words corona – "crown" and virus - "poison" [3] and is found in industry sources as a medical term. An example is the doctoral dissertation of Chen, Daniel Shin Yong on "early cases of coronavirus infection", published in 1996. [4] This can be said to be one of the hundreds of scientific works carried out so far in the field of virology. But today, the disease of coronavirus infection in humans, which caused a worldwide pandemic, has moved from medical books to the language of the mass public in a short time.

Most of the words associated with this disease sound global, that is, in an international language, English. This is because the process of assimilation of these terms by the popular language took place quickly and significantly, and this led to the fact that even in the explanatory dictionaries of the English language Merriam-Webster or Oxford English, completely new or previously existing forms of a word or phrase with a broader meaning were introduced. [5]. The following is an analysis of the lexical meanings of some new words related to the coronavirus pandemic.

The term coronavirus (coronavirus) is pronounced as /kə'ɾəʊnəʊvʌɪrəs/ in British English as /kə'roʊnə,vʌrəs/ in American English and is considered to belong to the family of nouns. This is a term that refers to the field of virology medicine. Any member of a group of spiral single-stranded RNA viruses that are pathogens of human, other mammalian, and avian diseases, usually causing gastrointestinal, respiratory, or nervous diseases.

According to the New York Times, [6] the technical name of the coronavirus is SARS-CoV-2. The respiratory illness it causes is called "coronavirus disease 2019" or Covid-19. Coronaviruses get their name from the fact that they have crown-shaped spikes that protrude from their surfaces, resembling the sun's corona. It should be noted that Shavkat Butayev and Abbas Iriskulov in the English-Uzbek dictionary also cite the term solar corona as the second definition of the English word "crown". [7]. Hence, this word was originally formed because of analogy.

As follows from the text of lectures on the modern Uzbek literary language, in the Uzbek language, the transfer of word meanings based on the external form-forming similarity and the internal feature of the object, thing and phenomenon is called a metaphor. In this method, the transfer of the name occurs due to the relative similarity between objects, phenomena, and their shape, color, and movement are named with the second such predicate sign. A common feature for subjects that transfer meaning through a metaphor is preserved in the concept. The word, formed by analogy in English, entered the lexicon of the Uzbek language as a term directly borrowed, like most medical terms.

The term COVID-19 (COVID-19) is pronounced as in British English (kəʊvɪdˈnɑɪnˈtiːn) (kəʊvɪdˈnɑɪnˈtiːn) in American English (koʊvɪdˈnaɪnˈtiːn), and belongs to the category of nouns, is a term referring to the field of medicine and Virology. The virus is an acute respiratory disease in humans caused by the coronavirus, which is mainly characterized by fever and cough, which can lead to pneumonia, respiratory, kidney failure, blood clotting disorders, and death.

SELF-QUARANTINE (self-preservation)

The term is pronounced as /ˌselfˈkwɑːntiːn /British English/ ˌselfˈkwɔːntiːn / in American English and belongs to the category of nouns.

In order for a person not to become infected with any infectious disease or become a carrier of infection, he must join the collective initiative and necessarily self-isolate.

Etymology: formed from the combination of the words "I - / preposition (self, I)" + " quarantine (quarantine)".

Etymology of the term social distancing (i.e. maintaining an intermediate distance).

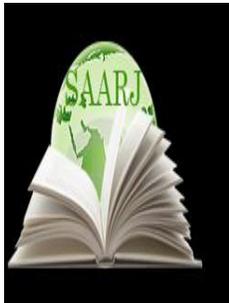

The term in British English it is pronounced as /ˌsəʊʃl ˈdɪst(ə)nsɪŋ/ while in American English it is pronounced as /ˌkoʊʃ(ə)l ˈdɪst(ə)nsɪŋ/.

D. S. qualities Such as consistency, attributed to Lotte terms of its context-independent short, absolute and relative uniqueness, simplicity and clarity, the degree of intonation of the term is seen in the above lexical units [8].

In conclusion, it can be said that the study of their language features allows you to increase the medical knowledge of the population, systematically be aware of the processes taking place in the national languages, correctly and effectively use lexical units in communication. After all, this is the main function of the language.

ABSTRACT

This article sets out the basics of urban road maintenance. The tasks performed by the city road service are given. The operational factors of urban roads are considered in more detail. Particular attention is paid to determining the service life of urban road surfaces. The technical and financial resources for the maintenance and repair of roads are significant in terms of their volumes, and in time they are constant. Only complete and reliable data on the condition of roads can serve as a basis for choosing priority decisions, the timely appointment of repair measures, and sound investment policy in the road sector. Their rational use is a task of great state importance. Its implementation requires a scientific substantiation of all decisions made, the use of innovative technologies in practice, high competence of engineering and technical personnel performing management functions.

KEYWORDS: *Urban Roads, Transport Facilities, Service Life, Traffic Intensity, Road Surfaces, Operation, Strength, Service Factor.*

INTRODUCTION

The technical and financial resources for the maintenance and repair of roads are significant in terms of their volumes, and in time they are constant. Their rational use is a task of great state importance. Its implementation requires a scientific substantiation of all decisions made, the use of innovative technologies in practice, high competence of engineering and technical personnel

performing management functions. One of these functions can be considered the diagnostics of roads, which is designed to monitor the condition of roads in the monitoring mode and systematically determine all the main criteria for their quality. Only complete and reliable data on the condition of roads can serve as a basis for choosing priority decisions, the timely appointment of repair measures, and sound investment policy in the road sector.

MATERIAL AND METHODS

Based on technical diagnostics, the repair time and workload were determined based on the study of the state of the transport characteristics of urban roads, including the state of strength, smoothness, adhesion coefficients. One of the scientists of our country, spoke about the solutions of the road surface in determining the service life of roads. Ismailhodjaev A.I., Sadygov I.S., Dimetov Kh., Kholmukhammedov S.I., Azizov K.Kh. , Sadygov Zh.I. for example, scientists and researchers conduct research in their scientific work.

Several foreign scientists, including Sidenkov S.I., Khomyak A. Y., Vasiliev A.P., V. Nekrasov conducted research in their scientific work.

RESEARCH RESULTS

Modern urban roads are complex transport structures. Their rational and planned use by urban transport for the transport of passengers and goods is carried out during the operation of urban roads. It should be noted that the technical condition of urban roads during their operation is gradually deteriorating, reducing the productivity of urban transport. In this regard, the effective use of urban roads is possible only under the condition of the systematic and planned implementation of a set of works on their repair and to keep them in the required condition. These works should be carried out by the city road service, whose task is to ensure the good condition of city roads and the possibility of safe, convenient and comfortable movement on city roads. Along with the implementation of repair work, the city road service should take measures to protect city roads from premature wear and tear, as well as gradually improve the technical condition of city roads and their structures in accordance with the requirements of modern urban traffic.

The main works carried out by the city road service during the operation of city roads and their structures include:

Supervision, maintenance and protection of urban road structures;

Current and larger periodic repairs of the roadway, sidewalks, subgrade and other elements of the city road;

Landscaping and lighting of city roads;

Provision of conditions for convenient, safe and comfortable movement of public transport and pedestrians;

Study and analysis of the working conditions of the city road as an urban transport structure:

During the operation of urban roads, their carriageways are subject to more rapid wear, i.e. coating. The operational qualities of the carriageway of urban roads are characterized by the value of the actual strength of the pavement, the condition of the pavement (equal and

roughness) and its type. To assess the operational properties of the pavement, the following operational factors are mainly used [1]:

strength factor – K_{np} , service factor – K_{ct} , adhesion coefficient - K_{ca} , wear factor – K_{uzh} and the intensity factor – K_{int} .

The strength factor characterizes the degree of decrease in the strength properties of non-rigid road pavements during the operation of a city road and is calculated by the formula:

$$K_{np} = E_{\phi} / E_p$$

where E_{ϕ} - is the actual strength of the pavement, estimated by the modulus of long-term elasticity;

E_p – Design strength of the road pavement for the design period, taking into account the value of the city road and the type of coverage.

The service factor, which makes it possible to give an overall assessment of the state of the carriageway of a city road, is determined by the formula:

$$K_{ct} = V_{\phi} / V_p$$

Where V_{ϕ} - is the actual maximum speed of the calculated vehicles allowed under the conditions of the condition of the road surface;

V_p - the estimated speed of movement of vehicles, established by the norms for a given city road.

The adhesion coefficient makes it possible to assess the derivability and the degree of traffic safety on a city road based on the determination of its values and is calculated using the following formula:

$$K_{ca} = \varphi_{\phi} / \varphi_p$$

Where φ_{ϕ} -is the actual coefficient of longitudinal adhesion;

φ_p is the calculated value of the coefficient of adhesion of the surface of the coating with the tires of the wheels of the car.

The wear factor characterizes the degree of wear of the coating and is determined by the formula:

$$K_{uzh} = h_{\phi} / H_0$$

where h_{ϕ} - is the total amount of coating wear at the time of measurement;

H_0 – Part of the thickness of the coating to be worn.

The intensity factor characterizes the degree of compliance of the existing type of coverage with the actual traffic intensity and is determined by the formula [2]:

$$K_{int} = N_{\phi} / N_p$$

Where N_{ϕ} -is the actual traffic intensity;

N_p - The highest estimated traffic intensity.

It should be noted that the above operating factors serve to establish the time of carrying out certain types of repair work. To determine the value of the operational coefficients of urban roads and their structures, and most importantly road pavements, measurements and tests are performed to determine the actual data characterizing their condition. According to the obtained values of the operational coefficients, the types of repair work of city roads are assigned.

Determining the timing of repair work and planning for their fulfilment of the required resources made it necessary to use an indicator expressing the service life. The service life of the coating in terms of the wear layer can be determined by the formula [3]:

$$T = H_0 / h_c$$

Where H_0 - is the part of the coating thickness intended for wear;

h_c - average wear per year over the service life.

Annual wear of the coating is determined by the formula:

$$h = a + b * B,$$

where a - is the amount of wear of the coating per year under the influence of natural conditions;

b - coefficient depending on the type and strength of the coating;

B - traffic density.

Taking into account the traffic intensity, the wear per year will be

$$h = a + b * n * N,$$

where n - is the coefficient taken equal to 0.001;

N - traffic intensity.

The values of the parameter "a" and the coefficient "b" are determined on the basis of experimental data. A more perfect formula for determining the service life of a capital type pavement, which includes asphalt concrete pavement, has the form [4-7]:

$$T = 1 / \lg q * \lg [N_{pc} (q - 1) / (K N_{c1} \sum \alpha_{arf} * T_c) + 1]$$

where q - is the growth rate of traffic intensity;

N_{pc} - coverage resource (the number of passages of calculated vehicles that reduce the adhesion coefficient to the minimum permissible value);

K - coefficient taking into account the repeatability of vehicles on one track;

N_{c1} - is the traffic intensity in the first year of operation, reduced to the calculated loads for wear of the coating;

C - the number of considered periods in a year (seasons of the year);

α_{arf} - is the coefficient of aggressiveness of the impact of calculated vehicles on the coverage in the considered season of the year;

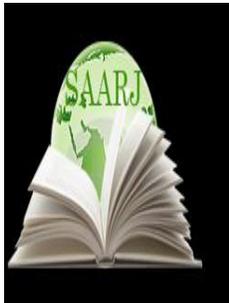

Tc- is the duration of the considered period of the year.

CONCLUSION

In conclusion, it should be noted that the actual service life of urban road surfaces depends on many factors of a technical, climatic, production or economic nature and can vary within very wide limits for the same type of surface. This, in turn, raises a scientific problem for researchers that awaits its solution. If earlier there was a struggle for kilometres, today quality is in the foreground, which means an increase in the service life of city roads and traffic safety.

ABSTRACT

In recent years, the question of the use of modern technologies in the educational process has been increasingly raised. The most important condition for improving the quality of foreign language education in non-linguistic universities in Uzbekistan in the conditions of heterogeneity of educational groups is the implementation of a differentiated approach to learning and the use of modern methodological tools in the form of interactive educational technologies. These are not only new technical means but also new forms and methods of teaching, a new approach to learning. The main goal that we set for ourselves, using modern technologies in the study of a foreign language, is to show how technologies can be effectively used to improve the quality of teaching a foreign language to students, to form and develop their communicative culture, to master practical knowledge of a foreign language.

KEYWORDS: *Modern Technologies, Interactive Methods, Innovative Technology, Artificial Intelligence, Open Databases, The Ethics Of Using Data.*

INTRODUCTION

It is known that the study and teaching of foreign languages, like all developed and developing countries, has become a modern requirement in our country - Uzbekistan. It is no exaggeration to say that the conditions created for young people to learn foreign languages, as well as for all our

compatriots, are proving their positive results. Significant changes and innovations are taking place not only in the example of foreign languages but in all spheres of science. Of course, at the heart of such a huge creative work lies the zeal of our President, the attention paid to young people, a sense of confidence in the future. Each stage of the process of training qualified personnel must perform certain tasks to effectively organize the educational process, raise it to a higher level, and also bring it to the level of world education. Enjoy the modern achievements of world science - the need for an hour. To do this, you only need to be fluent in foreign languages, master all the rules of the language. In this regard, the search for more effective ways of learning foreign languages, the creation of various teaching methods is an urgent task facing our scientists, novice teachers and educated youth. It is important to introduce international educational standards for teaching foreign languages into the system of lifelong education in Uzbekistan and develop the common European competences of foreign languages: study, teaching and assessment. Following the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan "On approval of the new state educational standard in foreign languages of the continuous education system" dated May 8, 2013, adopted to ensure the implementation of the above. The solution to several recommendations on the use of modern pedagogical technologies in the educational process;

The formation of speech competence in foreign languages in the development of professional competence (competence) of students in foreign languages in world practice, the modernization of innovative activities using modern pedagogical technologies, the gradual formation of speech etiquette, Competence with a differentiated approach to oral speech, learning Increasing the effectiveness of learning, creating electronic textbooks and teaching aids in academic subjects, expanding access to modern information and communication technologies in education is of particular importance. This, in turn, is a key factor in deepening students' knowledge in these disciplines, which increases the quality and effectiveness of teaching. Thanks to the large-scale reforms carried out in the education system of our country, unique opportunities have been created for the younger generation to acquire modern knowledge and achieve excellence. Today, when Uzbekistan is consistently moving towards building a democratic state based on the rule of law and fair civil society, the education system has been radically reformed, and the interests of the individual and education have become a priority in the social policy of the state. In modern conditions, when training highly qualified personnel, it is desirable to conduct training on the basis of modern systems and modern pedagogical technologies. A positive feature of advanced, modern pedagogical technologies is that the learning process is effectively planned and implemented, which guarantees the achievement of the set goals. In fact, 80% of the successful organization of lessons depends on the correct construction, organization and implementation of the educational process.

Western European languages (English, Spanish, German, French) and Eastern languages (Arabic, Turkish, Persian, Chinese, Indian) are taught in our country. These languages are included in the curricula of educational institutions. The process of teaching three languages is different. The mother tongue and the second language are learned in a natural environment, and the foreign language is learned in an artificial environment. Communication in a foreign language takes place mainly under the guidance of a teacher in the classroom. There are significant differences between the three languages in certain aspects of learning and teaching a foreign language. This, in turn, requires the use of appropriate foreign language teaching

technology. By carefully mastering the achievements of the methodical subject, the foreign language teacher acquires a clear understanding of the norms of the language experience of the student and further improves it. Effective teaching of foreign languages requires knowledge of its methods. The study and teaching of foreign languages largely depend on the theoretical development of the issues of foreign language teaching methodology and the creative application of the theory in practice. Therefore, a person who is committed to learning a foreign language and teaching it to others in the future must have a close understanding of the subject of foreign language teaching methods.

LITERATURE REVIEW

The most valuable books on methodology have also been written by linguists. These included G. Suite, one of the great English phonetics of the nineteenth century and the great English linguist, O. Jespersen, the most original phonetist and theoretical linguist in England in the late nineteenth and early twentieth century's, and F. Bruns and Brealya, prominent Englishman and well-known phonetist V. Fiotor et al. Academician L.V. Shcherba and his teacher, the great linguist I.A. Baudouin-de-Courtoine, and their students studied the methodology of language teaching in Russia. Psychologists have a different approach to foreign language teaching methods. Professor V.A. Artemov gave a valuable opinion on the relationship between methodology and psychology. In his view, psychology provides material for methodology [1-7]. The methodology teaches the teacher how to teach. Psychology, on the other hand, deals with how students master a subject. But I can't completely agree with that. Because the teacher experiences certain mental processes and situations during the teaching process and the student during the learning process, they are exposed to and influenced by the laws of psychology, whether they want to or not (Saidaliev, 2004).

Methodology a closer look at the historical literature shows that some researchers call methodology an art. They usually refer to the French Methodist Pen lash's idea that there are "good" or "bad" teachers who do not have a "good" or "bad" method. To those who hold such an opinion, the German Methodist E. Otto can answer with the ideas expressed in 1924. He states: "If one considers methodology as an art, he confuses the theory of science with its practical application" (Saidaliev, 2004). Each science has its own set of concepts. Among the basic concepts adopted in the methodology of teaching a foreign language is education system, teaching method, teaching principle, teaching tool, methodical method.

MATERIALS AND METHODS

The creation, application and application of new, modern pedagogical technologies in language teaching to students are one of the most important issues today. First of all, the goals of teaching a foreign language and its methodology must meet and meet the requirements of the interests of our society and the state.

The development of modern education has led to a new direction of innovative pedagogy. Innovation means "introduction (dissemination) of news" in English. The socio-psychological aspect of innovation was developed by American researcher E. Rodgers. He studied the classification of participants in the innovation process, their attitudes to innovation, and more. In science, the concepts of novelty and innovation are different. "Innovation" means a tool, a new method, technique, technology. Innovation is a process of education that develops at certain stages. The development of world science is accelerating day by day. It is this positive

development that has affected our country. Advanced innovative technologies are being introduced into the world of science. Language as a means of communication can be practised in a natural environment, whether in the family, in the community, or an organized manner. Knowledge of linguistic phenomena is taught in theory. Knowledge of languages, especially multilingualism, is especially important in today's world of international relations. Pupils and students studying in our country usually learn three languages. These languages are referred to by special names. These are the native language, second language, and foreign language. Mother tongue is the first language that plays a special role in the formation of thinking. When it comes to the second language, it is considered as the language of brothers and sisters of other nationalities (Jololov, 2012).

Methods of teaching foreign languages have developed in harmony with didactics. We all know that the theories of teaching all academic disciplines are based on the science of didactics and receive scientific nourishment from it. Foreign language teaching is also based on didactics. The general theory of didactic education, the methodology is considered as the science of teaching a particular subject, lingua-didactics is considered as a general theory of teaching languages, lingua-methods is considered as a science of teaching a specific language. The application of methods in foreign language teaching dates back a long time, and principles are relatively new methodological terms.

Historically, the methods have been grouped into four groups, which are called "translation", "correct", "comparative", and "mixed". History of methods The famous Methodist prof. An in-depth study by I.V. Rakhmonova The translation method is mainly in two forms, called grammar-translation and text-translation methods. From the point of view of the grammar-translation method, a foreign language is studied for general educational purposes. Grammar exercises are designed to develop the learner's logical thinking. Explaining grammatical knowledge is considered to be the main goal of education. The main principles of this method are:

1. Language learning is based on written speech.
2. Grammar is taken as a subject of study, and lexicon is chosen accordingly. Grammar exercises were the main way to work.
3. First, the grammatical rule is memorized, and then it is recommended to make sentences based on the rules.
4. The grammatical form and the meaning of the words are revealed through literal translation.
5. Language material is mastered through literal translation and dry memorization.
6. It is limited to memorizing words out of context, alone (Rakhmonova, 1975).

Method Without Translation Various aspects of this method have been known throughout history. They can be divided into two main groups: natural and proper methods. Naturally learning a foreign language should be similar to learning a native language. The idea that the main purpose of the method is to learn to read and write by learning to speak a foreign language is formulated as a practical goal. The most important of the principles included in the natural method is to create a language environment. No foreign language can we learn without a

thorough study of its methods. The method of "communicative didactics" is also important in foreign language teaching methods. Communicative didactics combines the following.

- Open and flexible course concept;
- Topic and content are important;
- The main form of work in the classroom is conversation and group work;
- Emphasis should be placed on student engagement and creative and free use of language;
- Pay close attention to the exercise based on the principle of comprehension and expression;
- Visualization plays an important role in revealing meaning, defining the scope of movement and organizing the exercise;
- To study everyday speech in real-life situations (practice dialogue);
- It is important to use the language orally and at the same time to understand the original texts (Neuner, 2005).

Communicative didactics prioritizes the use of natural speech situations as listening material, such as advertisements on transport, at the train station, radio and television commercials, telephone conversations, and so on. The goals of listening comprehension have changed. Telling and controlling what he heard also took on a different tone. This method, depending on the purpose, distinguished the following types of listening comprehension:

- Understand the main content of the text in the broadest sense, without paying attention to some details;
- This method is used when accurate information is important, such as the need for weather for a particular place, the announcement of the arrival and departure of the train, etc. (Neuner, 2005).

It is precisely this knowledge that we retain in our minds, the study of information in communicative didactics that, from the concept of "communication", is semantically intertwined with the term "intercultural communication". The term intercultural communication is now widely used in foreign language teaching methods. It is this concept that we can use in a variety of contexts. Intercultural communication is the dialogue between people of different cultures about their social origins, mentality, national character, lifestyle, customs, value system, and so on. In this process, students should be educated and developed in the spirit of respect, tolerance for the culture of the country being studied, and a correct understanding of the culture of another country. Every foreign language lesson is a crossroads of cultures, a practice of intercultural communication. Because every word in a foreign language in this process reflects a foreign life and culture;

Pedagogical communication is an interaction between a teacher and a student, which is based on the exchange of information, primarily educational information, helps to understand the partner of pedagogical communication, as well as to carry out collaborative activities. In this case, the information is conveyed both verbally, ie through speech, and through nonverbal means. The teacher should play a key role in the process of pedagogical communication and be a role model for students. This is judged by its communicative culture. A teacher's communicative culture is a professional-pedagogical dialogue with the subjects of his educational process. A necessary level

of communicative culture can be defined as a teacher who can positively accept his students and colleagues and unconditionally ensure the achievement of educational and pedagogical goals. The social significance of communicative culture is that the teacher who possesses it can create a positive psychological climate in the interaction of all subjects of the educational process, implement the important principles of modernization of education - humanism and democratization. The personal significance is that the educator with a communicative culture has high self-confidence, enjoys the communication built with the pupil, and feels free in the chosen work activity. The following can be included in a teacher's communicative culture:

1. Communication skills.
2. Educator's communicativeness.
3. The culture of communication of the teacher.
4. Methods of pedagogical communication.

Communicative skills can be divided into the following groups:

1. Socio-psychological skills. They prepare students to communicate, make a positive impression, help each student to accept his personality, level of status, predict the development of interpersonal relationships, use the tools of psychological influence, persuade, absorb, allows identification.
2. Ethical and aesthetic skills. To see this dialogue in a humane, democratic manner, adhere to the rules of professional ethics, restore the dignity of each student as an individual, develop creative collaboration with students, and acquire the skills of each student.
3. Aesthetic skills. It is characterized by the ability to combine internal and external situations, to have artistic abilities, aesthetic expression, to engage adolescents in the high culture of communication, to activate their emotional mood, optimistic perception.
4. Technological skills. It is determined by the choice of different forms of interaction of teaching aids, methods, techniques, the choice of the optimal method of communication management, adherence to pedagogical tact, increasing its educational effectiveness.

Several personal qualities necessary for a culture of pedagogical communication include honesty, openness, self-control, assertiveness, sincerity, patience, perseverance, and tactics. The teacher needs to shape not only his communication skills but also the intercultural communication of the students. Speech exercises play a key role in learning a foreign language. Speech exercises are designed to be communicative. They can be divided into audit engagement and engagement exercises. Orientation exercises teach students to use language and life experiences to understand audio text based on different linguistic and non-linguistic bases. Understanding the context, using practical knowledge, understanding the nature of the vocabulary, overcoming difficulties and understanding the text are some of the guiding exercises. The use of exercises not only in the acquisition of a foreign language but also in the acquisition of any science, knowledge is a way to a positive outcome. Therefore, exercise serves as a bridge for each of us not only to conquer the world of science but also to take our place in life.

CONCLUSION

Learning a foreign language is a multifaceted study, during which a person experiences complex psychological changes. In particular, there is a process of comparing a native language with a foreign one. This process uses different teaching methods and technologies. The most common methods of teaching a foreign language are the method of communicative didactics, the method of organizing intercultural communication and the method of organizing exercises. These three methods are closely related and complementary. Since the science of methodology is related to the science of didactics, it is based on communicativeness in the study of a foreign language, and the method of communicative didactics arises. In the process of applying the method of communicative didactics, a pedagogical methodology for the formation of intercultural communication is formed. Learning a foreign language helps you get to know the culture of another country. Exercise technology is essential for learning a foreign language. Exercise is the best way to master all knowledge. Exercise has a positive effect not only on learning a foreign language but also on the acquisition of knowledge in all areas. Effective organization of lessons, in which the role of pedagogical activity and modern pedagogical technologies is invaluable, it is important to organize the process of learning a foreign language with a communicative approach, to bring it to a new level of intercultural communication, and to achieve such results, the last step is to focus on "exercise technology". In order to effectively organize the process of teaching a foreign language, it is necessary to master the knowledge of modern pedagogical information and communication technologies.

ABSTRACT

The target women happen to be successful home-managers who tend to channelize their energy in struggling to maintain a commendable balance between work and home and also between different household practices, but this leads to low accomplishment levels which reduce the level of satisfaction in perception of their self- image. This study corresponds to discover concealed factors behind different household practices adopted by working women. A self-structured questionnaire was implemented on MIG households corresponding to four specific domains of management. These areas were purposively selected on the basis of dominance of activities. The findings revealed constant interplay of household skills, household tasks, management functions and motivating factors of management in constituting recurrent household practices by majority of the households.

KEYWORDS: *Household Practices, Management, Working Women*

INTRODUCTION

Earlier, women were looked upon as nurturers and care givers and assigned all roles related to maintaining and managing a family. Men perceive themselves as breadwinners and society also expects them to perform work roles to earn and support the family. However, the nature of work-force has been changing and the percentage of men as wage earners and women as housewives

has been rapidly declining. In urban India, the percentage of dual-earner couples is gradually increasing and for most women and men today, their work environment and the family have become the two important institutions in life. Changes in the workforce are accompanied by changes in values, creating a new emphasis on the balance between work-life and family life (Hall 1986). Work-life balance assumes great significance for women as they are virtually in two full time jobs.

Effective management in the home depends to a large extent on the managerial ability, interest and leadership quality of the homemaker and also their ability to motivate the family members in the right direction for achieving desired goals. To the homemaker, who wants to manage her home properly and efficiently, knowledge of home management is helpful and essential. In our modern technological environment, where situations are complex and highly flexible, where many choices are possible and where values often changes more rapidly, the need for management is essential. ([http://www.yourarticlelibrary.com/home-management/home-management-meaning-concept-and-needs/47779.....retrieved on 7.8.19](http://www.yourarticlelibrary.com/home-management/home-management-meaning-concept-and-needs/47779.....retrieved%20on%207.8.19))

REVIEW OF LITERATURE

- Sundaresan 2014 emphasized most homemakers either choose to spend less hours at work place or take up jobs which do not compromise on their quality of life. This is because their time, effort and skills in better use of practices involving household chores have created enormous challenge in creating equilibrium between work and home management. (T94 Sundaresan / OIDA International Journal of Sustainable Development 07:07 ;2014)

-According to Professor Stewart Friedman "a one size fits all; mentality often perpetuates frustration among employees. It is a common practice in many Human Resource Management areas, that a universally acceptable standard policy is implemented which is to achieve equality, even though everyone's life and needs are different. Friedman's research indicates that this issue could be resolved by approaching the components of work, family, community and self as a comprehensive system.(Professor of Management and Founding Director of Wharton School's Leadership Program and of its Work –Life Integration project)

SIGNIFICANCE

This study will push working women to recognize potential elements which influence their choices; when it comes to opt from the possible alternatives whilst execution of a household task. This could refine their decision making ability and would offer them a wider perspective whereby they could calculate the resources available at their disposal, set their priorities right, and prevent compromise of indispensable factors which keeps them moving ahead. Women will emerge stronger, more confident individuals who would realise their self-worth as home maker. A capable and decisive homemaker will eventually contribute to a happier and viable household.

OBJECTIVES: To study the household management practices among working women.

METHODOLOGY

This study was conducted in Aligarh city across MIG households. Sample size was 100 working women. To attain homogeneity, sample was filtered based on three criteria: 1) full-time paid employment outside home 2) graduate degree 3) married with one school-going child. The study was carried out in two phases- *first quantitative and second qualitative*. In the first phase a self-

structured questionnaire constituting 16 items was implemented across 4 selected domains of study, the received responses were analysed using simple percentage method. In the second phase the factors behind responses received from phase one were explored through qualitative analysis.

ANALYSIS AND DISCUSSION

The four domains of study were child care, kitchen management, household cleaning and self-grooming. Each domain is represented by a table. The left-most column contains four items referring to household practices in that particular domain followed by their options. The highest number of responses is the most popular choice of the respondents. The responses are expressed in percentage.

TABLE1: CHILD CARE

Childcare practices	babysitter	husband	self	grandmother
Babysitting	19	25	19	37
Feeding	06	06	75	13
Homework	06	19	56	25
Play	05	25	40	30

TABLE2: KITCHEN MANAGEMENT

Kitchen management practices	Always	Never	Sometimes
Using readymade preparations	56	13	31
Ordering readymade food	00	08	92
Cooking meals	69	00	31
Dining outside	06	06	88

TABLE3: HOUSEHOLD CLEANING

Cleaning practices	Several times a day	Daily	Weekly	Monthly
Sweeping	30	60	06	04
Cleaning range	50	30	12	08
Dusting	00	40	45	15
Cleaning refrigerator	00	05	10	85

TABLE4: SELF GROOMING

Grooming practices	Regularly	Occasionally	Never
Pursuing hobbies	19	37	44
Visiting salons	56	44	00
Watching tv	19	56	25
Meditating	65	30	05

RESULTS AND CONCLUSION

From the above tables it is evident that:

- Majority of the women depends on grandmothers for babysitting their child.
- Women in majority prefer to feed their child by themselves.

- Most of the women themselves help their children in doing home work.
- Majority of the women play themselves with their children.
- Majority of the working women always use readymade preparations like spices and condiments for cooking.
- Majority of the homemakers sometimes order food from outside.
- Majority of the women cooks meal daily for their families.
- Majority of the women sometimes goes out for family dinners.
- Majority of homemakers does daily sweeping of their homes.
- Most of the women clean their cooking range many times a day.
- Most of the women does weekly dusting of their homes.
- Most of the women does intensive cleaning of refrigerator once every month.
- Majority of the working women never indulge in pursuing their hobbies.
- Majority of the women regularly visit salons.
- Most of the women occasionally watch tv.
- Majority of the women meditate regularly.

The choices made by the working women with reference to every household practices in selected four domains were analysed. It was predictable that behind every choice there are more than one driving factor. When an array of such influential factors were drawn; four prospective categories were formed.

Household tasks Child care, cooking, sweeping, washing, cleaning, stitching

Household skills Human, conceptual, technical

Management functions Planning, organizing, directing, controlling, evaluating

Motivation management Values, standards, goals

LIMITATIONS

The job profile of the respondents was purposely ruled out.

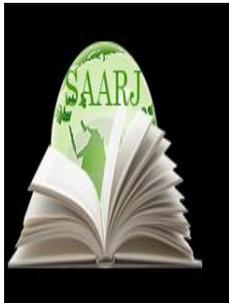

SCOPE

The study will have future implications to provide an existing framework for further research to professionals in the field of human resource management, national and international agencies working for the welfare of women and children, non-profit organizations introducing schemes for empowering women.

**FORMAL AND STRUCTURAL FEATURES OF ONE WORD BASED
 LINGUISTIC UNITS CONTAINING COMMON LEXEME "E'TIQOD"
 (FAITH) IN THE UZBEK LANGUAGE**

F. Yuldashev*

*PhD student,
 Navoi State Pedagogical Institute,

ABSTRACT

This article discusses formal and structural features of one word based linguistic units containing common lexeme "e'tiqod" (faith) in the Uzbek language. "Spirituality is an integral unity of many original human qualities and attributes such as hatred of evil, will, perseverance and so. on" [3]. Raising and bringing up a generation of healthy and harmoniously developed people is one of today's priorities. The concept of faith in the Uzbek linguistic description of the world in our linguistics has not yet studied the problems of systemic, structural, genetic, cognitive features and lexicographic description, the linguistic value has not been determined.

KEYWORDS: *Lexeme, One Word Based Linguistic Units, Uzbek Language, The Concept "E'tiqod".*

INTRODUCTION

The role of language in the spiritual growth of a person is incomparable. Therefore, in the field of language research and education, the issue of spiritual maturity is at the forefront. Indeed, in the rapidly evolving context, the approach of linguistics to its object of study from the point of view of the spirituality of the nation and the individual is even more important. The fact is that "language is the representative and preserver, enrichment and transmitter of spirituality" [1] means that each person in the language must understand the meaning of the word as a means of preserving spirituality and transmitting it from ancestors to generations. The formation and implementation of such a mechanism should be considered by every specialist. In this regard, it can be said that linguistics, which is developing in our linguistics in recent years, is one of these mechanisms. Linguistic-spiritual research forms the linguistic-spiritual base of an integrated system that serves for education and works for a clear result. "Solving the problem of personal

spirituality, which is deepening and sharpening day by day, creates the scientific and practical basis for the upbringing of a highly spiritual young generation, the creators of the future" [1]. After all, in many developed countries, from the first years of independence, we have been focusing on the economy, and then we are witnessing its suffering. In this regard, the head of state said: "We all know that Uzbekistan is rich in minerals and resources, has a strong economic and human potential. However, our greatest asset is the huge intellectual and spiritual potential of our people" [2]. After all, spirituality is based on such noble ideas as human kindness, justice, righteousness, honesty, conscience, honor, patriotism and love of beauty, enjoyment of it and preservation of national beliefs. It is natural that the future of the generation growing up with such a quality will be great. "Spirituality is an integral unity of many original human qualities and attributes such as hatred of evil, will, perseverance and so. on" [3]. Raising and bringing up a generation of healthy and harmoniously developed people is one of today's priorities. In a society without national and spiritual beliefs, there will be ignorance, injustice, where national beliefs, sacred values will decline; the essence of humanity will be undermined.

MATERIALS AND METHODS

Separation of common and distinctive features in the semantic structure of lexemes belonging to the spiritual group "*e'tiqod*", which is an integral part of the lexicon of the Uzbek language as a whole system of lexemes denoting spiritual beliefs, their features, intrinsic and figurative meanings and interlexematic spiritual relations.

There is a need to study the linguocultural and linguocognitive aspects of the concept of "*e'tiqod*", the semantic field groups and the communicative properties of the nominative units in this group. The concept of faith in the Uzbek linguistic description of the world in our linguistics has not yet studied the problems of systemic, structural, genetic, cognitive features and lexicographic description, the linguistic value has not been determined. The one-sidedness of the Uzbek lexeme "*e'tiqod*" in the minds of people, that is, the religious aspect, has led to a narrowing of meaning. In fact, the concept of "*e'tiqod*" is described in the new dictionaries of the Uzbek language, as well as in philosophical and encyclopedic dictionaries, taking into account different approaches and the Uzbek national character and worldview.

The lexeme of "*e'tiqod*" has a wide range of semantic-syntactic possibilities, and its religious sema dominates in the minds of ordinary people. This leads to its narrow understanding based on one-sided analysis. In fact, it has the following meanings in general and in particular:

1) In the sense of "trust", "sincerity":

Omon otada bilimga, ilg'or usullarga e'tiqod juda baland. (H. Nazir)

(Meaning: Grandpa Omon has a strong belief in knowledge and advanced methods.

2) In the sense of "worldview": Everyone has their own personality and beliefs

3) In the sense of "point of view", "look": *E'tiqodga ko'ra, chinor mingga kirgan soati o'zidan-o'zi yonib ketishi kerak ekan.* (A. Muxtor). (Meaning: It is believed that a thousand years of maple should burn spontaneously.

4) In the sense of "belief in Allah", "faith": In Islam, only belief in religious teachings is recognized (from the newspaper).

5) In the sense of "support", "helper", "sponsor": *Bu majburiyatni o'zimga e'tiqod qilganimdan emas, balki sizningdek otalarim, og'alarimga takyagoh deb ishonganimdandir* (A. Qodiriy).

(Meaning: It is not because I believe in myself, but because I believe that my fathers and brothers, like you, are my support)

6) In the sense of "perseverance", "perseverance":

Ko'nglining bir chetida "Tashabbusni qo'ldan bermaslik kerak!.." - degan e'tiqodi chinqiradi (P. Qodirov). (Meaning: His heart calls, "We must not lose the initiative!")

7) The meaning of "kindness", "love" Uning otasi asli dehqon bo'lsa-da, adabiyotga e'tiqodi bo'lakcha edi. (Meaning: Although his father was a farmer, he loved literature)

8) The meaning of "goal" *Ular sharqning yuksak madaniyati, gumanistik g'oyalarini o'zlari uchun chin e'tiqod qilib olgan odamlardir.* (Meaning: They are people who believe in the high culture and humanistic ideas of the East.

The semantic aspects of the *e'tiqod* lexeme are different, and these concepts are manifested in the text with several more semantic glitches. This concept is divided into such types as belief in religious, secular, political, social phenomena, which also have internal members.

The formal structural features of the general semantic units of "*e'tiqod*" are multifaceted and unique. The formal structural features of lexemes of this spiritual group are determined by the number of leading morphemes and their formation within one or more word groups. One word based units representing the concept of "*e'tiqod*" in the Uzbek language are distinguished by the peculiarity of their formal structure. The peculiarity is that we observed that the one word based lexemes that do not give the semantic meaning directly into the semantic root is activated after the addition of certain constructive means.

"*E'tiqod*" occurs in the form of words and compounds according to the formal structure of the general semantic units. On this basis, one word based units are divided into simple and complex types according to their structure.

1. There are the following forms of word units:

1) *The number of leading morphemes in simple noun units is one: Olloh, Rahmon, din, farishta, diyonat, aqida, aqoid, duo, sig'inish, hidoyat, maloyiq, e'timod, Musurmon, xurofot, kufr, ateist, shayton, iymonsiz, xudosizlik, e'tibor, aziz, mehr, muhabbat, azizlamoq, e'zozlamoq, sadoqat.*

Simple compound E'toqod lexemes [ot + lik], [sifatlik+ lik], [sifat + la], [ot + iy], [ot + li], [ot + lan] and relatively inactively formed [ot + chan], in which the basis of E'toqod lexemes belong to the spiritual group: shukronalik, saxiylik, azizlamoq, insoniy, farosatli, orlanmoq

Units in the form of simple words are divided into two groups:

a) *simple forms: vijdon, ixlos, andisha, adolat, aziz, mehr, sadoqat, halol, kamtar, saxiy, shaffof, tanti, vafo, imon, Fozil, fozila, oqil, oqila, axloq, insof, oila;*

b) *Simple compound: takomillashmoq, azizlamoq, e'zozlamoq, ezgulik, elparvar, fazilatli, imonli, oriyatchan, oriyatchi, oqibatli.*

2) The number of leading morphemes in a compound word is more than one. "Faith" in the form of a complex word is formed by the compositional method of general semantic noun units. In this case, the parts of the compound word look different in terms of expression. In particular, the patterns [ot+ot], [ot+fe'l], [sifat+ot] [ot+sifat] are productive: *dunyoqarash, mehnatsevar, erksevar, pokdil, kengfe'l, kaltafahm.* There are also inactive patterns in the formal structure of

the general semantic one word based units of 'e'tiqod'. For example, [ravish+sifatdosh]: cho'rtkesar; [olmosh+sifat]: o'zboshimcha, o'zbilarmon.

Complex word-form units have compound and even forms:

a) Joint: qo'shma: *erksevar, bag'rikeng, xushtakalluf, umuminsoniy, xushfe'l, xushxulq, mehnatsevar, xushsuxan, xushtakalluf*;

b) Compound: *or-nomusli, ishq-muhabbat, dinu diyonat, mo'min-Qobil, kuydi-pishdi, xatti-harakat, yor-birodar, yor-jo'ra, Nabi-yor, ota-ona, qarindosh-urug'chilik, qo'ni-qo'shnicilik*.

"E'tiqod" also occurs in pairs in terms of the formal structure of common semantic one word based units. Such a pair is formed from the equal connection of two core morphemes: *or-nomusli, ishq-muhabbat*.

We have grouped the pairs of words that make up the formal structure of the general semantic noun units "e'tiqod" according to whether the components express an independent meaning as follows:

1) Both parts have an independent meaning: *dinu diyonat, mo'min-Qobil, toat-ibodat*;

2) The first part does not represent an independent meaning, the second part represents a meaning: *xatti-harakat, qo'ni-qo'shnicilik, jiddu jahd*.

"E'tiqod" is divided into the following types according to the semantic relationship of the pair of words that are part of the formal structure of the general semantic noun units:

a) A pair of words consisting of words with similar meanings: *dinu diyonat, yor-birodar, Nabi-yor, to'y-tomosh, shaldir-shuldir (xarakterga nisbatan), kuydi-pishdi (jonkuyar)*;

b) A pair of words made up of mutually synonymous words: *do'st-yor, baxt-Iqbol, ishq-muhabbat, baxt-saodat, es-hush, mo'min-Qobil, or-nomusli*;

c) A pair of words made up of antonyms: *bordi-keldi (munosabat ma'nosida), yaxshi-yomon (aloqa), do'stu dushman*;

d) A pair of words consisting of a whole-part relationship: *qarindosh-urug'chilik, dinu diyonat*.

We have classified the complex words that make up the formal structure of the general semantic noun units "e'tiqod" into three groups:

a) Compound words: *shirinso'z, oliyhimmat, rahmdil, soddadil, pokdil, sofdil, elsevar, oliyjanob*;

b) A pair of words: *nomus-iffat, rahm-shafqat, or-nomusli, sharm-hayoli, mehr-muhabbat, izzat-Ikrom*;

c) Repetitive words: *yurak-yurakdan, pok-pokiza*. The lexemes of this group are smaller than the lexemes of the other groups.

2. "E'tiqod" occurs in compound forms according to the structure of the lexemes that make up the general semantic noun units:

2.1. Units in the form of a simple combination: *e'tiqod kaliti, ma'naviy tarbiya, o'zlikni anglash, xalq e'tiqodi, e'tiqod jarchisi, ma'naviy barkamollik, ma'naviy fazilat, ma'naviy taassurot.*

Units in the form of a simple compound are in the form of a phrase and a fixed conjunction (phrase).

In adjectives in the form of a phrase, the parts enter into a grammatical connection as follows:

a) In the form of management: *arvohlarni eslash, sanamlarga sig'inish, toshlarga e'tiqod, shamolga sig'inish, olovga topinmoq, quyoshga e'tiqod;*

b) In the form of adaptation: *arvohlar yodi, xalq e'tiqodi, e'tiqod jarchisi;*

c) In the form of union: *homiylar ruhlar, ma'naviy dunyo, qayta tirilmoq.*

The formal structural features of the general semantic one word based units of 'e'tiqod' also occur as expressive units. Although they are a lexical unit, they can have structural significance. For example: *yaxshi ko'rди: 1) sevdi, oshiq bo'ldi; 2) sevdi, izzat-hurmat qildi; 3) yoqtirdi; ixlos qo'ydi: e'tiqod (mehr) bilan qaradi; ixlosi qaytdi: e'tiqod qilmay qo'ydi // ko'ngli qoldi; jonini kuydirib: mashaqqatni o'z oldiga olgan holda, tirishib; jonini berdi: har qanday og'ir shartni, talabni bajarishga tayyor bo'ldi; jonning boricha: kuch-quvvating etganicha, tirishib; ko'ngli oq: yaxshi niyatli, boshqalarga yomonlik ravo ko'rmaydigan; ko'nglida kiri yo'q: kek saqlamaydigan, g'arazi yo'q; ko'ngli pok: yaxshi niyatli, boshqalarga yomonlikni ravo ko'rmaydigan; lafzida turdi : ahdini saqladi .*

Simple compounds can also occur in the form of a compound verb: *nazr-niyoz bermoq, qurbonlik qilmoq, nazr atamoq, ahd qilmoq, savob qilmoq, mehr qo'ymoq, gunoh qilmoq.*

The spiritual group of faith also occurs in the form of a word combination that is structurally formed by two words. For example: *azaliylik va abadiylik, botiniy va zohiriy, yaxshilik va yomonlik;*

2.2. Units in the form of complex compounds. The lexical structure of the Uzbek language has a significant number of lexemes belonging to the spiritual group of combined the lexeme "e'tiqod": *jon va ruh haqidagi tasavvurlar, ajdodlar ruhiga sig'inish, jamiyat osoyishtaligi, insoniylik xislatlariga ega bo'lish, insoniy qarashlarni shakllantirmoq.*

Structurally, the following (sentence-shaped) units are partially included in the list of units included in this system: *ruhi tirik.*

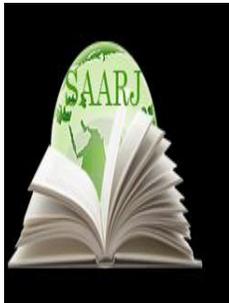

CONCLUSION

In conclusion, we can say that the units of such composition, although structurally complex, express belief and related meanings in their general semaphores. The fact that the general structural semantic units of the word "e'tiqod" in the Uzbek language have different forms of structural features is based on their linguistic meanings.

 UZBEKISTAN

ABSTRACT

In the article, the translation of English accounting-auditing terminological system with the application of pragmatic linguistics approach is described. It also underlines the significance of defining the type of official materials that include the accounting-auditing terminological system text types, such as specialized or popular periodical ones. The consideration of the target reader in the given article appears as a key factor while choosing the appropriate translation of an English polysemantic accounting-auditing terminological system.

KEYWORDS: *Accounting-Auditing, Pragmatic, Terminological, Linguistics, Cognitive Aspect, Context, Mono-Semantic And Poly-Semantic Lexis, Term, Equivalency.*

INTRODUCTION

At present time the classification and description of terms in accounting and auditing areas, linguistic analysis of different structural languages, definition and development of methods, methods and methodologies of the terminology are one of the most important issues facing world linguists.

It is not a secret that linguistics pay a great attention to the translation of economic terms from English into Uzbek because from year to year it can be observed the development of economic relations between states, legal entities and individuals, which requires training specialists that meet the requirements of labor market. Every day more and more people enter into market relations with foreign companies. As a result, an adequate translation of economic vocabulary

becomes very important in order to prevent possible misunderstanding between the participants of communication.

Definitely, the accounting-auditing terminological system in English and Uzbek is somewhat complex and typical, that requires the interpretation of terminological units in terms of their meaning and interpretation. In fact, this law is an important principle that is applicable to any spheres of term. In addition, studies focusing on the study of terminology systems of different languages have given a great importance to the analysis of terminology.

In fact, the economy includes various areas of activity: industry, agriculture, trade, stock exchange and communication. Therefore, it is necessary to consider the possibility of the presence in any type of the text the economic orientation of vocabulary from other fields. Each sector of the economy has its own specific units that require the search for the most accurate translation of a specific expression, taking into account the economic, legal, political and cultural realities of a particular country.

MATERIAL AND METHODS

Undeniably, translation-across languages and cultures have a critical role in accounting. This sphere is required in international trade, in operating and accounting for multinational enterprises, in creating, implementing and enforcing international accounting laws and standards, in delivering accounting education to international cohorts of students, and in conducting international and intercultural research. Financial statements and annual reports, standards and standard setting discourse, teaching materials and publication of research findings all require translation for at least some constituents. Accounting research explores annual report narratives or regulatory discourse, employs content analysis or disclosure indices, conducts interview, experimental and survey research, and draws on theoretical frameworks, all often across cultural and language boundaries.

That is why, while translating accounting-auditing terminological system, in most cases, from English into Uzbek, linguists try to find an equivalent, which is a very difficult task, since many terms have entered to Uzbek language quite recently and it is not always possible to impose them on the economic realities of Independent Uzbekistan.

The cognitive approach to the studied stratum of foreign words allows us to consider the structure of knowledge in the human mind. Consequently, both the process of translating terms and the process of borrowing seems appropriate to consider from the standpoint of cognitive linguistics, since they represent two aspects of the same phenomenon-inter language interaction. In this context, terms are understood as cognotypes, and their multi-valued variants, synonyms and homonyms - as variants of the cognotype [8] i.e. units of the met language of a certain sphere of use, denoting a special concept that includes the specific field of knowledge of the speaker [3].

Theory

Adequate translation of the accounting-auditing terminological system accelerates the process of information exchange between specialists around the world. When translating a lexical unit, it is necessary to take into account the peculiarities of the economic vocabulary as a whole, namely, accuracy of information, lack of emotional coloring, brevity and systematicity [4]. Thus, the

translator must correlate the world of the addressing and receiving sides and possess the cognitive apparatus of economics.

The main problem is that a large number of lexical units belonging to the accounting-auditing terminological sphere have several translation options and in most cases, it does not concern all words, but individual words. This fact makes it possible to subdivide economic vocabulary into single-translation and multi-translational. Translating terms are terms that have one equivalent in the language of translation, and translations, respectively, have several equivalents in translation [10]. For example, the term “account” has several translation options:

- 1) an account; account entry;
- 2) report (financial);
- 3) the period while exchange transactions, concluded with the closing of the position on the accounting day;
- 4) a broker’s record of transactions executed on behalf of a client;
- 5) reporting;
- 6) accounts;
- 7) business books.

Translating terms in most cases are expressions and phrases that have one translation option, but, speaking separately, they can be multi-valued.

In order to overcome different translation while translating accounting-auditing terms from English into Uzbek, it is necessary to take into account the cognitive models that underlie one or another text [9]. Thus, in highly specialized accounting-auditing texts, facts and reports on the state of stock markets are usually given, and reports on companies’ profits and losses analyzed.

RESULTS AND DISCUSSIONS

Popular accounting-auditing texts most often describe people, who have achieved some success in the economic sphere, or unusual projects or ideas. Accounting-auditing terminological texts include features of the above two types, combining various elements. For example:

Across the country, myriad independent contractors and small service firms have sprung up to supply streamlined corporations with skills ranging graphic design to bill collecting and executive recruiting .

In the above example, the term “corporation” has several translation options: 1) association; 2) corporation; 3) joint stock.

In our opinion, in this case it is better to use the equivalent of “corporation”, since the article in question is highly specialized, which means that the readers of this publication have basic knowledge on the topic. Thus, while translating such texts, it is best to use equivalent borrowings in the target language, since it is assumed that the readers of this publication are experts in the field of economics. For popular-economic texts, it is best to use metaphors that will help to make economic terminology accessible to a wide range of readers, who have only the most general idea of the meaning of certain accounting-auditing terms.

It is important to mention encouraging submissions that address topics relating to language, culture and translation in accounting, auditing and accountability. The following topics are possible topics for including:

- Limits of equivalence in accounting translation.
- Problems and opportunities of ambiguity in accounting terminology.
- 4. Translation and power: communication, dissemination, legitimization, lobbying, social change
- 5. Ideological, cultural, social, legal and/or political implications of translation and non translation in accounting
- Cognitive and cultural bias and vested interests in translation.
- English as a lingua franca: cultural dominance, values, identities and ideologies.
- Transformation of accounting systems and cultures, professions, societal and cultural contexts of change.
- Professional socialization in international contexts.
- International accounting education.
- Accounting history across languages and cultures: translation and language change.
- Implications for standard setting, consultation and the IASB due process.
- Implications for implementation of international accounting rules/standards.
- Probability/uncertainty expressions in accounting standards.
- Translations of rules versus principles.
- Economic implications of accounting translation.
- Accounting research across languages and cultures: research instruments, narratives, experiments, surveys, interviews and oral history, theoretical frameworks in translation (Foucault, Bourdieu, Weber, Habermas etc.).
- Implications for translation of the dissemination of research findings in English language academic journals.

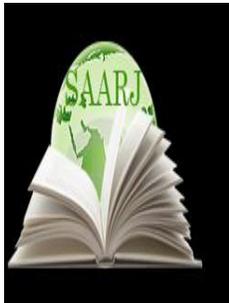

CONCLUSION

Summarizing it can be suggested that while working with accounting-auditing terminological texts, the translator must take into account the peculiarities of the translation inherent in the two types of text described above. It is the basic difficulty of the work, since it is necessary to take into consideration not only the type of text, but also the context, contextual determinants (lexico-syntactic, morphological and lexical-phrasal), as well as the economic and political realities of the country to which readers are oriented edition.

ABSTRACT

This article provides a brief historical overview of the two pedagogical methods: integrated and communicative approaches and the advantages and disadvantages of using communicative and traditional methods in teaching and learning English. A method is a general outline of a systematically presented language material, in which all parts are consistent and based on specific approaches. On the other hand, some people study a foreign language for the purpose of integration. Students of this group aim to identify with the speech community of the target language.

KEYWORDS: *Communicative Approach, Integrated Approach, Traditional Approach, Teaching and Learning English*

INTRODUCTION

In teaching and learning languages, most educators have adopted various teaching methods and approaches such as grammatical method, audio-lingual method, direct method, and many others. However, the traditional method of language teaching (sometimes called the grammar-translation method) and the communicative approach have been the most widely used for a long time. As learning a second or foreign language is different from learning a first or native language, educators and linguists are constantly looking for new methods and approaches that will lead to more successful learning outcomes. Still, the main goal is to meet the needs of students and provide them with comprehensive assistance in learning a second or foreign language. In order to achieve this goal, linguists and educators are expected to look to find effective activities and strategies to meet needs.

MATERIALS AND METHODS

In order to improve the quality of language teaching, the American linguist Edward Anthony defines three important concepts - approach, method and technique, the relationship of which is hierarchical. Approach, method and technique are the most used terms in any curriculum of an educational institution. Anthony defines each term as follows: An approach is a series of correlative assumptions that deal with the nature of the language of teaching and learning, describing the nature of the discipline being taught. A method is a general outline of a systematically presented language material, in which all parts are consistent and based on specific approaches. One approach includes several methods. Acceptance is exactly what takes place during language classes, namely specific methods, strategies or plans to achieve the set goals.

In addition to E. Anthony, M. Selse-Murcia and Nigel P. Brown suggested that among the three concepts mentioned above, the method is the most fundamental in the process of teaching English as a second or as a foreign language and is a series of "arranged in a systematic order presentations ", used by teachers during classes to motivate them to further learn the language. A method is a general outline of a systematically presented language material, in which all parts are consistent and based on specific approaches. One approach includes several methods. Acceptance is exactly what takes place during language classes, namely specific methods, strategies or plans to achieve the set goals.

In teaching and learning English, we need to note that English has become an international language that has an impact on the whole world. It is estimated that 1/6 of the world's population speaks or uses English for work and communication. In addition to serving as the language of communication, English is also the primary language of the UN and NATO, the official language of international aviation, the unofficial language of sports, radio broadcasts, written correspondence, rapidly evolving technology, scientific research and literature. Currently, English is taught from three perspectives, namely as a first or native language (L1), a second language (L2) and as a foreign language (FL). In this regard, Braj Kachru describes these three perspectives as the inner circle, the outer circle and the expanding circle. In the inner circle, English is taught and used as the first or mother tongue. It includes the United Kingdom, the United States of America, Canada, Australia and New Zealand. In the outer circle, English is taught and used as a second language. This is happening in countries like India, Nigeria, Malaysia, Tanzania and many others as a consequence of British colonization. In these countries, English is used alongside their native language. As a second language, English is considered to be the main language in commerce, management and education. In an expanding circle, English is taught and used as a foreign language. They are countries like Uzbekistan, Russia, China, Spain, Saudi Arabia and many other countries where English is considered the main language of international news, culture and education at all levels.

A recent study found that the number of non-native speakers of English is higher than that of monolingual native speakers of English, or more precisely, the ratio is 2 to 1. Thus, English is the property of everything. The world is not just Americans and other countries in the inner circle. Adding to the above, as a second language, English is represented by four different groups. First of all, English is the main language of the mass media, i.e. the language of newspapers, radio and television. In addition, English is the language of official institutions such as courts and government. Moreover, it is the language used in educational institutions. Last but

not least, English is considered a major component of commercial and industrial organizations. In the outer circle, having a strong knowledge of English as a second language provides people with a smooth transition to social and economic development. Needless to say, English as a second language is not only learned in the outer circle, but also in the inner circle. Immigrants in the United Kingdom, the United States, Canada, and Australia are learning English for integration that will allow them to identify with their native language in their home country and use English as an intermediary language when communicating with people from other language families.

When it comes to learning a language as a foreign language, there is an assumption that people learn it for two purposes. On the one hand, they study a foreign language with a “technical” (auxiliary) purpose. This group of students consists of tourists, vendors and students. They need a foreign language in order to read books in the target language and communicate with native speakers of this language. On the other hand, some people study a foreign language for the purpose of integration. Students of this group aim to identify with the speech community of the target language. Knowing the language, they feel at home and understand the attitude and worldview of that speech community. According to Broughton, Brumfit, Flavel and Hill, in contrast to English as a second language, English as a first language is taught only at school and has nothing to do with the life of the student community. Recently, the more English occupies the niche of the global language, the thinner the line between L2 (English as a second) and L1 (native English) becomes. In addition, the status of English has changed in many countries. For example, the decline in the importance of English in countries such as India, Sri Lanka has led to the fact that English is presented more as an FL than an L2. At the same time, we see the reverse process in other countries. For example, in many European countries, there is a process of transition of the English language from the status of FL to the status of L2.

Whether it's L1, L2 or FL, it is argued that the emergence of English as a global language has had a huge impact on the entire concept of language learning. For Broughton, Brumfit, Flavel and Hill, English or the language of a "neighboring" country, or the language of global importance that educators devote more hours to learning than any other language or subject in the curriculum. Regardless of the methodology used in language classes and the setting in which teaching is carried out around the world, all noteworthy language classes are based on basic principles that are reflected in the interaction of all aspects that contribute to the connection of theory and practice in learning English as an FL.

RESULTS AND DISCUSSIONS

According to the use of methods in teaching languages, it should be noted that teacher-oriented, memorization, memorization of rules and vocabulary, passive learners - all this is a description of the traditional approach to teaching a foreign language, which focuses on the rules and structure of the target language. One of the unique features of the traditional approach is the teacher's explanation of grammatical phenomena, so to speak, "in person." This approach assumes that students adapt to the lesson plan and the material taught in accordance with the requirements of the lesson.

On the other hand, the traditional approach has disadvantages. Being teacher-oriented, it leaves little room for student creativity. During the learning process, students are passively involved. The educator carefully explains a certain grammatical phenomenon and really does not leave

students a chance to think. It should be said that both types of interaction, such as teacher-student and student-student, are minimal and this fact leads to the fact that the classes are boring and uninteresting.

According to Larsen-Freeman and Anderson, the main characteristics of the traditional method of teaching a language are translation from a foreign language into the mother tongue, deductive learning of grammar, memorization of foreign words, teacher-oriented lesson, little teacher-student and student-student interaction, paying attention to vocabulary and grammar more than semantic content, immediate elimination of errors. Due to the existing shortcomings in the traditional approach to teaching languages, the communicative method was presented. Linguists have tried to create an approach that would help students use language for the purpose of communication, since using the traditional method does not achieve this goal. Consequently, the concept of isolated learning has been supplanted by the concept of learning in context and has become more successful in social understanding.

In contrast to the traditional approach to language teaching, the terms that best describe the communicative approach are student-centered, active listener, group work, and context. During the process of communicative teaching, the teacher is considered more of a mediator. Students work on assignments in small groups. Thanks to this, students have the opportunity to interact more and use language for communication. In addition, the communicative approach prepares students to use the target language in real life situations. However, less time is devoted to the form and structure of the language. Teachers focus more on meaning and shy away from correcting mistakes.

According to Larsen-Freeman, Anderson and Wei, the main characteristics of the communicative approach of language teaching are the communicative goal (focus) of almost all types of activity, the use of communicative activities (games, role-playing games), communication as a goal, the use of authentic materials, group work, interaction students, target language used for explanation and teaching, patience with erroneous structures, teacher as coordinator, fluency over precision. Using a communicative approach, teaching English as a second language is believed to have become a more “practical and useful tool for communication, interaction, discovery and creativity” and has 5 main goals:

1. Teaching communicative competence.
2. Using the language for various purposes and functions.
3. Change and modification of the language in formal and informal communication.
4. Reproduction and understanding of a wide range of texts such as interviews, lectures and narration.
5. Using various communication strategies to maintain communication.

It is worth highlighting that finding a methodology that is right for your students is important in the learning process, especially when teaching English as a foreign language. Soon after its inception, the communicative approach became one of the favorites among teachers teaching English as a second / foreign language with the aim of improving students' sociolinguistic competence. Accordingly, the traditional approach, especially the study of grammar and structure, took a relatively low position in most language classes. In fact, in order to improve the

quality of teaching and obtain better results, it is recommended to implement an integrated approach that combines traditional and communicative approaches in the process of teaching English as a second / foreign language.

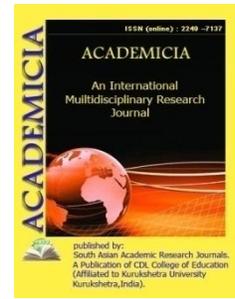

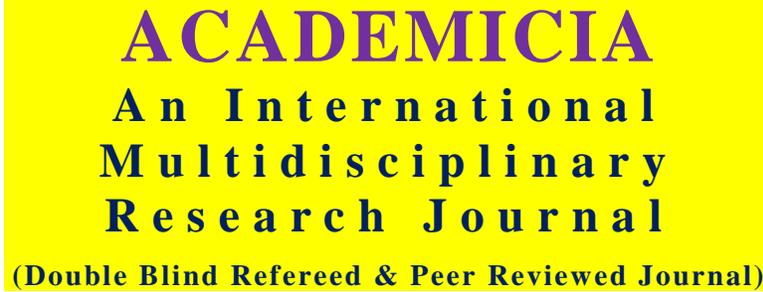

CONCLUSION

To summarize, I would like to say that in order to improve the quality of teaching and to achieve better results, you should combine the advantages of both methods and apply them during classes. While Chester Himes suggested that the rules of grammar would be useless without the rules of word use, M. Kanale and M. Swain suggest that word use would be meaningless without knowledge of grammar. Moreover, L. Wei in his work claims that some teachers are sure that there is no "best method" and different approaches are required for different situations. From the point of view of Wach, Burns and McKay, the best pedagogical method is achieved by mixing "local and global", which leads to the desired result. If educators use a communicative approach to teaching and never comment on the rules of sentence structure and word order, if they do not point out errors and inaccuracies at the appropriate time, then students will not be able to produce grammatically correct sentences and identify their mistakes. Better not to ignore different approaches. Educators can teach grammar and structure to help students build correct sentences as they communicate. They can teach how to use language for the purpose of communication, where and how they can benefit from knowledge of the rules of the language. Finally, the future is not yet known. A new day, a new approach, new language theories are always waiting to be discovered.

ABSTRACT

The news is getting one of the most significant components of our life in contemporary society. We can get the news from different types of mass media such as newspaper, magazine, radio, TV and internet. Each of them has their own necessities and advantages. The present article devoted to study the origin of the TV news, the vocabularies which are utilized in it, and types of television news reports, genre, style and language. In order to analyze, it is addressed to the most used methods, such as comparative - historical method, method of synchronous formal description and comparative method.

KEYWORDS: (VO/SOT), Packages (PKG), Live Shots-ROS-reporter-on-scene; newsroom; on set, B-roll, Wide (WS), medium shots, Newscast/program/broadcast, reporters, anchors, newscasts COVID-19 shot.

INTRODUCTION

How much do you watch TV? A future without television cannot be imagined by most of us. It is certainly one of the most famous developments. It is great if we look at the position of television as a mass medium. For starters, if you hear that there is a bomb explosion in a neighboring town, what are you going to do? For more details, you can turn on your television set. This is on the grounds that the live idea of TV permits it to communicate visuals and data right away. Thus, another significant trait of TV is that it is equipped for being a live medium.

If we look through the history of TV news, they in the United States have evolved over many years. In the evenings, it went from a basic 10 to 15-minute format, to a variety of programs and networks. Today, audiences are able to watch local, regional and national news coverage at any time of the day, in several different ways. In 1940, Lowell Thomas hosted the first-ever,

regularly scheduled television news show, which was actually a simulation of his nightly NBC radio network newscast, with the television broadcast only shown in New York City through the groundbreaking NBC television station WNBTT (now WNBC).

Although the discourse of television news has received much less attention than that of print journalism, the well-established sense of news as narrative still provides a dominant model. Some foreign well-known scholars worked on television news, about its peculiarities such as Bell, Allan “The Language of News Media”, Bednarek, Monika (2010) “The Language of Fictional Television”. Busa, M. Grazia (2013) “Introducing the Language of the News”, Chovanec, Jan (2014) “Pragmatics of Tense and Time in News: From Canonical Headlines to Online News Texts”, Conboy, Martin (2007) “The Language of the News” and so on. They gave different opinions about television news. Here, for instance, is Graddol: “TV news tells stories about the world and the dominant narrative technique for such storytelling is what is called *realism*”. “Realism of the kind am referring to her first arose as literary convention” (2, 140)

“The cinema adopted and adapted the realist narrative techniques of the novel” (2, 141) . . . “Realism thus provides a powerful visual technology for cueing narrative modalities. The regime of camera work and editing is so naturalized that we rarely stop to think about its artifice”. (2, 142) . . .

Indeed, the realist technique is so naturalized that TV news cannot avoid drawing on its resources when telling its own narratives (2, 142).

Television narrative, however, as Ellis persuasively claims, is more diffuse, more fragmentary, more episodic and iterative than cinema. [9,78] For, unlike cinema, where the structure of editing is devoted to following the fate of a character (or characters) to some kind of closure, television news presents actions which are often incomplete and where no identifiable character or protagonist is offered to help structure the subjective identification of the viewer.[3,91]

A second and more serious difficulty is that much television news in its textual particulars quite simply fails to exhibit story-telling characteristics. On the contrary, the core principle of intelligibility in television news reports might be summed up as the convincing deployment of pictures – and, in this respect, narrative is only an occasional discursive resource even when the notion of an event or happening provides an important background element in news coverage. [3, 91].

MATERIALS AND METHODS

The following methods were applied to cover the research subject:

Comparative - historical method (origin of TV news)

Method of synchronous formal description (determine the content of TV news, types of news report, language, genre);

Comparative method (compare different TV news during process of determining similarity principles and differences);

If we look at the essential features and language of TV news, it is window to the world, blurred with technology, ideology, political/economical pressures. Just as any genre such as horror or soap operas news is understood by audiences, as it contains a repertoire of familiar elements. TV

news programmers obviously have their own sets of codes and conventions and create their own variants of these by repetition but difference. By using this repertoire of elements sub genres such as current affairs and news bulletins exist.

Language 1:

- News package: A single news feature linked to from the TV studio. These are pre-recorded and edited together beforehand.
- Outside broadcast (OB): Live feed to a field reporter at the location of the story. Gives appearance of capturing news as it happens.
- Piece to camera (PTC): Reporter addresses the audience straight down the lens. Could be in a live feed or part of news package.

Language 2

- Voice over (VO): Reporters voice tells us the story and the facts with GV's as wallpaper.
- General Views (GV's): Shots used to illustrate a story. Visuals important in TV.
- Interviews: Interviews with key people involved or experts about the story.
- Vox Pops: Short interviews canvassing the opinion of the public.

Language 3

- Astons: Graphics in the bottom third of the screen that give the name and title of the interviewees or reporters. Adds kudos to them if experts or special Royal Correspondents etc.
- Graphics: Displayed on screen to give facts and figures about a story or graphical representation.
- Re-enactments: Sometimes used to show what happened in a situation if no footage exists. Must always state they are re-enactments and not real.

Language 4

- Links to studio: Field reporters on location link back to the studio and the news anchor often signing off with their name and location.
- Library footage: Archive footage used as GV's for a story when no other footage is available. This may from own archives or news agency.
- Indents: Brand is important in TV news and the indents of the news programme are important in a multi channel, multi-platform age.

GENRE 1

- Studio presenters: Often called news anchors they host the show reading or introducing the stories and doing interviews and provide the spine of the show.
- The studio set: Will usually have a table or desk and seats or a sofa.

- The studio background: This is likely to have images or graphics on it connected to the stories. Some show a busy newsroom to stress the urgency of the news. Mainly bold colors but predominantly blue though.

GENRE 2

- Direct address to camera: The most privileged shot in film and TV looking straight at the audience and addressing them. Makes the audience connect to them.
- Outside broadcasts: TV crews and reporters at the scene of the story. Gives impression of being ideally placed for story developments as the news happens.
- Interviews: This includes IV's in packages but also the anchors may IV their own experts or people making the news in the studio or worldwide.

GENRE 3

- Captions: As mentioned in news packages captions and Astons are likely to be used to state the name and title of interviewees, journalists and experts for kudos
- Graphics: Used to add clarity to news stories. Give facts, figures and statistics to highlight the main points. Can be inventive and play on story imagery.
- Formal codes of dress: BBC1 and ITV are very formal with shirts and ties for the gents to reinforce the importance and seriousness of the news.

Modes of address this is the style of delivery of presenters and reporters. It sets the mood and tone and is usually authoritative.

- Direct address straight at viewers down the camera
- Use personal pronouns: Thank you for watching etc.
- Very clear smooth, fluent and articulate diction.
- Any accents on national news small.
- Title sequences capture fast moving pace of news and national/international.
- Music adds importance.
- News presenters announce top stories at the start.
- Interviewees generally look off camera to reporters.

Grammar of TV News: Due to time constraints TV news has developed its own linguistic conventions. Sound bites reign supreme.

- The use of present tense creates sense of urgency.
- Future tense often used as means to prediction when pre-empting what the news may be.
- Active voices to add drama. Emphasis and pauses.
- The hook. Main news element at start of stories.
- Verbs (doing words) to add urgency and action.

- Audiences “teed up” for information. Before quotes given person’s name is announced.
- Stories must be concise, one sentence

RESULTS AND DISCUSSION

Indeed, extracts from CBS TV NEWS “Face the Nation” on January 3, 2021 and NBC NEWS was analyzed to identify difference and similarity, to which language type and genre, the modes of address, and the grammatical categories they suit as well.

1. *Face the Nation” on January 3, 2021*

Margaret Brennan: I am Margaret Brennan in Washington. And this week on Face the Nation, the government’s plan to vaccinate Americans is already showing signs of strain, as the number of corona virus cases and deaths climbs higher than ever, and concern over a new variant of the virus grows. It has been a sobering start to 2021. Bad behavior over the holidays, as defined by CDC guidelines, threatens to make January the deadliest month, yet, in years since the virus was discovered. The U.S. has now recorded over twenty million infections, a number that’s doubled in the last eight weeks. In some parts of the country hospitals, morgues, and funeral homes are at or overcapacity. Health care workers are overwhelmed.

Toya Senior: (Cedars-Sinai Nurse): If you do not know, things are pretty bad. Things are really bad. Please, everyone, do your part. Wear a mask, stay home, and help us reduce the strain on us because we need help.

Margaret Brennan: Pictures of people waiting in long lines are now of those desperate for a COVID-19 shot.

Sylvester Turner: Even though that there is a there is a lot of vaccine hesitancy, there is still a strong desire from people to get the vaccine.

The first CBS news is related to 2nd language group and subcategory - “interviews” because reporter, Margaret Brennan, is interviewing with involved experts about the story. Moreover, paying attention to the genre, it can be identified that the news is suitable to genre 1, because the anchors are introducing the story about corona virus and making interview the related people. If we look at the mode of address, it is more serious language. In addition, it was determined that mostly present tense and continuous verbs are used, and they express the action.

In order to differentiate and explore features of TV news following example from NBC news was taken as a basis of investigation: (Announcer) From NBC News world headquarters in New York. We're back in a moment here with a company that is combining special needs with special jobs. Tonight as part of our series of reports on what works, a story about those among us with special needs, people with drive and ability who are seldom able to find a good job. A national employer with a big name is out to change that. Our works report tonight from NBC’s Mika Brzezinski.

Mika Brzezinski: For Julia Turner, born with Down syndrome, a full-time job might seem out of reach, but not here. [Cheering] I have found what I want, and I'm satisfied...

Mika Brzezinski: At this new Walgreens distribution center Julia thrives. So does Tommy Watson, Asperger syndrome makes him developmentally disabled in some ways, but when it comes to computers...If there's a problem who do they call? They call on me—it’s amazing.

From this above given example, we can say that reporter Mika Brzezinski is telling story about Julia Turner, who was born with Down syndrome. Hence, due to the categories of TV news it suits 2nd language type and subcategory: Voice Over. Reporters' voice tells us the story and the facts with GV's as wallpaper. Moreover, if we look at modes of speech, reporter directly address at onlookers down the camera. In addition, presenter is announcing top story at the start, see **"Mika Brzezinski:** For Julia Turner, born with Down syndrome, a full-time job might seem out of reach, but not here. [Cheering] I have found what I want, and I'm satisfied..."

In this TV news especially present tense is used and it has increased urgency of it. In below, types of report are given, they are as follow:

VOSOT (Voice Over Sound On Tape) A VOSOT is the most common type of report. It usually runs 25-35 seconds. The anchor introduces the story and then does a Voice Over. His or her voice explains the video images being shown. In the last half, you'll see and hear someone at the event comment (Sound on Tape) about the story. This Sound Bite averages 8-10 seconds. One clue that a station is planning to only do a VOSOT on your event, is when they only send a cameraman and no reporter will appear on camera.

The Package is the label given to everything the TV station broadcasts on a single news story. It includes the anchor intro, a reporter describing the story either live or on tape from the site or from the studio, video segments of the event and 1 or more interview sound bites from speakers and participants.

A reporter may be on the scene or the interviewee has an earphone and is talking with an anchor back in the studio. A TV station may air a VOSOT at 6pm, a live remotest 11pm and a full package the next morning on the same story using the same tape they shot at your event.

If we analyze the news according to type of report above given, first newscast fits to package, because firstly anchor is introducing the theme of news and reporter are having interview with participants of the interview. Second news suits to VOSOT, because the reporter is describing the story from the beginning to the end which is shown in screen, at the end she meets with the hero of story.

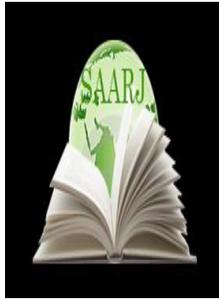

CONCLUSION

To summing up, it can be concluded that TV news has crucial role in all sphere of life in order to get live news all over the world. Because, in contemporaneous society, people are eager to watch live news in order to see the real events. In such case, it is noteworthy to us to know the primary features of television news. Because, each types of news has the individual aim and intention from audience. In the following article, we have found and analyzed background of TV news, types, genres, and language of television newscasts with the help of different methods.

 UZBEKISTAN

ABSTRACT

This article contains important aspects and features of the clustering of the food market in the context of a pandemic in the country, ways to increase the economic efficiency of food markets, as well as suggestions and recommendations on achievements and ways to overcome unresolved problems regarding the topic. In scientific studies, dissertations, monographs and articles of foreign and domestic scientists and researchers, conclusions are drawn about the radical reform of the food market, the targeted use of the experience of developed countries, the introduction of innovative technologies in the industry, proposals and recommendations are developed. The meeting discussed the issues of increasing production, forming strategic reserves, as well as increasing the volume of industrial processing of food products, modern clustering of markets.

KEYWORDS: *Pandemic, food, clustering of markets, food markets, economic indicators, efficiency.*

INTRODUCTION

In a pandemic, the importance and role of food markets in the country is growing from year to year, and most of our people work in this area. On April 29, 2020, the President of the Republic of Uzbekistan Shavkat Mirziyoyev held a video conference dedicated to the guaranteed provision of basic food products during a pandemic and maintaining price stability, clustering food markets. The meeting discussed the issues of increasing production, forming strategic reserves, as well as increasing the volume of industrial processing of food products, modern clustering of markets. In the process of clustering food markets, qualified specialists in this area play an important role, and it is important to use the experience of foreign countries. At the meeting, information was presented on the planned capacity of fruit and vegetable clusters, the volume of

investments and exports. The creation of such clusters is provided for by the strategy for the development of agriculture in Uzbekistan for 2020-2030.

According to the experience of foreign countries, more than half of US enterprises operate in clusters, and their share in GDP exceeds 60%. There are over 2000 clusters in the European Union, which employ 38% of the workforce. In Finland, for example, clusters for the production of food products have been operating until now.

As in Europe, in Asia, cluster policy is also being introduced to increase the industrial and innovative potential of the national economy. For instance, the largest automotive cluster is formed in Japan. More than 60 special zones have been created in China to form clusters in various industries. Market sales through the cluster average 200 billion USD per year. The participation of the state in the implementation of cluster initiatives in food markets is of great importance, first of all, from the point of view of the development, implementation and financing of projects for the creation and development of clusters is included.

Literature Analysis

In scientific studies, dissertations, monographs and articles of foreign and domestic scientists and researchers, conclusions are drawn about the radical reform of the food market, the targeted use of the experience of developed countries, the introduction of innovative technologies in the industry, proposals and recommendations are developed. However, this is not enough to achieve high economic indicators by clustering scientific research on a scientific and practical basis of the cluster system.

Comparison of the analyzes of scientific works of scientists and specialists of this field such as Abdurakhmanov K.Kh., Dzhuraev F., Ismoilov A., Murtazoev O., Oripov M.A., Plashinsky P.A., Salimov B.T., Kutsenko E.S., Lenchuk E.B., Litovchenko V.V. and the experience of Uzbekistan in this area shows that in many foreign countries, including ours also, there are problems with the implementation of the cluster system in the food industry during the COVID-19 pandemic, thereby increasing the efficiency, advantages and disadvantages of clustering:

- Demand and supply of the population in food markets have not been studied
- The scientific and practical capabilities of workers in the market were not analyzed
- In a pandemic, climatic conditions and conditions of food markets are not considered
- It is unsatisfactory to enter into contracts with processors who purchase products during a pandemic.

Importantly, these problems are caused by inattention to the health of citizens, incomplete formation of their spiritual and cultural skills, and lack of proper implementation of the cluster system.

METHODOLOGY

The studies were conducted using methods such as observation, comparison, interviews and questionnaires.

The results of the study show that the Republic of Uzbekistan is actively working on clustering food markets in a pandemic. In particular, in the current regulatory act [1] and the Address of the

President of Uzbekistan Shavkat Mirziyoyev to the Parliament of the Republic of Uzbekistan dated December 29, 2020, important aspects of the implementation of the tasks set were identified:

- Ensuring food security in the country's farmers' markets in the event of a pandemic
- Development of the market infrastructure for the purchase and sale of food products in modern conditions
- Creation of convenience for the population by clustering the import-substituting food market in a pandemic
- Increasing investment attractiveness
- Further strengthening of services through innovation in food markets
- Conduct customer surveys on supply and demand issues, and collect and analyze statistical data

The implementation of these areas will serve to cluster food markets in a pandemic, achieve high economic performance, and demonstrate the advantages of the cluster system.

The pandemic has affected all regions of the world. The demand for food is one of the basic necessities of life. It is important to fill the food markets in our country with high-quality and wholesome products, to stabilize prices, and to ensure the operation of markets through the cluster system.

When combining the food market into a pandemic, prices are also studied and analyzed due to the shortage of certain food items. Below are the prices for the most important goods in the food markets of Tashkent as of December 9, 2020 (Table 1). Looking at the year before the pandemic, the top three food price increases in 2019 were baked goods (25.3 percent), fruits and vegetables (18.6 percent), and general nutrition (17.3 percent). Compared to June 2018, the growth of rice increased by 1.3 times, milk by 25.6%, flour by 17.1%, eggs by 16.1%, mutton by 12.1%, boneless beef by 8.6%. Other types of beef by 12.4%, chicken legs and thighs by 11.5%, other types of poultry by 13.5%, sugar by 3.8% [5].

TABLE 1 BRIEF ANALYSIS OF FOOD MARKETS IN TASHKENT

№	Name of food markets	Mutton	Potatoes	Onion	Egg (10 pcs)
1	Farmers' market "Eskizhuva"	58000-75000	2700-6000	1500-3000	9000-13000
2	Farmers market "Oloy"	60000-75000	3000-6000	1300-3500	9000-15000
3	Farmers market "Kuylik"	52000-70000	2700-5000	1500-2500	7000-12000
4	Farmers market "Farkhod"	55000-75000	2900-4500	1800-2800	7000-12000

As you can see from the table, the daily minimum price for food in each market is different. In food markets, lamb meat will be sold at a price of 52,000 to 75,000 soums, potatoes from 2,700 to 6,000 soums, onions from 1,300 to 3,500 soums, and 10 eggs from 7,000 to 15,000 soums.

The purpose of cluster formation is to unite enterprises of the same industry, food markets and educational, scientific, engineering, consulting, standardization, certification and other services into a single technological chain within the city, district and region - innovative development. Focus on creating competitive goods based on the organization of production. One of the innovative ideas of the President of the Republic of Uzbekistan, which enriches people, is the widespread introduction of the cluster system in our country.

CONCLUSION

The bottom line is that during a pandemic, people need to maximize the potential of food markets, use their organizational, managerial and economic capabilities, and use scientific and practical knowledge correctly.

We believe that when clustering food markets and managing them in an exemplary manner, increasing their economic efficiency, the following should be considered:

Clearly define goals and objectives. It is necessary to determine the level of funding, labor resources, material and technical base, the adequacy of innovative technologies for the introduction of clustering;

Rights and obligations of the organizers and promoters of the cluster. Most importantly, it is in the context of a pandemic that the use of food markets within a clear regulatory framework leads to the desired outcome;

Demonstrate the specifics of clustering in food markets;

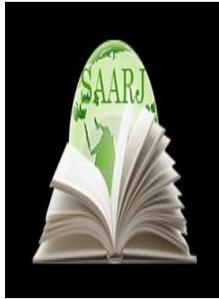

Productive use of innovative technologies in clustering;

Explore and capitalize on global clustering implementation experience.

Thus, in a food market with a pandemic, it would be advisable to use these recommendations when implementing clustering.

ABSTRACT

This article is divided into two parts, the first part is entitled “History of tabaqat science”. This part deals with biographical dictionaries-one of the main genres in Muslim historiography. It also involves some theoretical considerations related to biographical dictionaries. The article attemptst to define the biographical dictionary literature in general. The second part of the article is entitled “Characteristics of works collected in the style of tabaqat al-hanafiya”. This part provides a classification of books written in the “Tabaqat al-hanafiya” style. There is also information about scientists who have created in this genre.

KEYWORDS: *Tabaqah, Tabaqat, “Tabaqat Al-Hanafiya”, Fiqh, Fuqaha, Abu Hanifa, Hadith.*

INTRODUCTION

Tabaqah in the language of the arab means rank and status. In scientific terminology, tabaqat means the notable individuals of same level of knowledge in science or profession in the same period or in the different periods. Tabaqat arranges not through events but through people. The tabaqat books were organized according to profession, city, chronological order or religious doctrines.

The history of Tabaqat science. Even before the origin of Islam, the Arabs paid great attention to genealogy, especially to noble families. After the Prophet Muhammad (pbuh), this science was given a new religious character. In order to pass on knowledge of Islam to the next generation, it became necessary to understand the differences between the associates, followers and other classes [1; 49–57].

Main body

At a time when Islam was spreading and hadith was widespread, there was a need to verify the authenticity of documents. This, in turn, led to the separation of such branches of hadith as 'jarh and tadil' and 'ilm ar-rijal'. It should be noted that many biographical dictionaries have been published within 'ilm ar-rijal'. These dictionaries study the biographies of the narrators whose documents reach back to the Prophet (pbuh). As a result, the study of the biographies of the narrators has come to play a key role in the evaluation of hadith and the status of the *tabaqat* genre has risen.

The *stratum* forms a special branch of the biographical genre in which the material is presented in chronological order, by generations, from the first to the last.

Various definitions of stratification are found in the scholarly literature:

- *Tabaqat* is a type of Muslim biographical literature organized according to the age at which famous people (e.g. scholars, poets, etc.) lived [2; 152].

- *Stratum* means "layer", "generation", "degree", and people who lived within a certain period of time are referred to as "biographies of generations". In Arabic historiography the *stratum* formed a special branch of the biographical genre in which the material was arranged in chronological order, by generations, from the first to the last (first the associates of Muhammad (pbuh) - the companions, then their disciples.) The regional principle was also observed. It is distributed throughout the cities, districts and provinces of the Khalifate. *Tabaqat* literature was intended to meet the needs of the science of hadith. It served as a reference for determining the authenticity of the hadith. A play by Ibn Sa'd (784-845) has come down to us in the form of *tabaqat*. The play contains biographies of 4,250 people who transmitted hadith. The first layers are intended mainly for scholars of hadith and *fakihs*. However, cultural needs and the development of science later led to the development of people of different professions and levels (poets, writers, secretaries, ministers, linguists, doctors), sages, preachers, reciters, *fakikhs*, Sufis and their descendants. allowed the formation of layers in chronological order [3; 238].

Jurisprudence, which encompasses all kinds of Muslim activities and seeks to solve problems encountered in religious practice, has always occupied an important place among the Islamic sciences. Even when it was not formed as a science, from the early years of Islam the debate on law has been central to society. As a result, great scholars have emerged in this field over the years.

Two interrelated literatures have emerged in the history of jurisprudence. The first is the '*fakih layer*', which includes some biographical data of scholars dealing with the history of law schools. The second is a study aimed at identifying and classifying the types of *fiqh istidlol* that emerged after the emergence of sects, which may be called the "*fiqh istidlol layer*". While the '*fiqh layer*' aims to bring together information about the lives of a group of *fakih*, the *fiqh istidlol layer* consists of a *fiqh* method of diagnosis and classification of the *fakih's* relationship with the sect. The scope of *Tabaqat al-faqih* is usually limited to members of one sect, and works written in this context are called *Tabaqat al-Khanafiyya*, *Tabaqat al-Shafiyya*, *Tabaqat al-Khanafiyya*, and *Tabaqat al-Khanbaliyya*. Among the works of jurisprudence there are concepts associated with the specialization of jurisprudence, such as "*Tabaqat al-mujtahidin*", "*Tabaqat al-muftiyin*", "*Tabaqat al-fuqaha*" in the layer of jurisprudence of little importance [4; 301].

Although most of the works written in the *tabaqat* genre in the early period belonged to the Shafi'i, Maliki and Hanbali sects, Hanafi scholars have written many works in this genre in recent years. Thus, the historical and biographical literature containing information about Hanafi scholars can be divided into three groups:

1. Manokibi on historical biography (Manokibi Abu Hanifa);
2. Biographies of Hadith scholars compiled within the framework of *Ulum al-Hadith*;
3. The works of *Tabaqat al-Hanafiyya* in *Tabaqat* genre.

We have already mentioned that the *Tabaqat* literature is intended for hadith scholars and jurists. The purpose of this was to meet the needs of the science of hadith. Layers played a reference role in determining the degree of persistence of the taint. The first extant work in the stratum genre was Ibn Saa'd's *Kitab al-Tabaqat al-Qubra* (784–845) (The Book of Great stratum). The play contains biographies of 4250 people (including associates) who transmitted hadith [3; 438]. Therefore, the role of the classes in the retelling of hadith was of particular importance.

Features of the works collected in the *Tabaqat al-Hanafiyya* style. The Hanafi School, one of the four leading schools of law in the history of Islamic law with many followers, originated in Iraq. Abu Hanifa and his disciples (d. 150/767) carried their sectarian views from the West to Mawarunnahr and throughout the Islamic world. Over time the sect was active in Iraq, especially in Khorasan and Mowarunnahr, although it replaced other schools of jurisprudence in some areas, such as North Africa and Egypt, and distinguished itself by many scholars and leaders. Over time, the Hanafi sect became the dominant sect in Anatolia and the Balkans as a result of the westward migration of the Turks. Based on the above, the Hanafi sect can be called the most widespread sect in the Islamic world.

The expansion of the geographical spread of this sect led to an increase in the number of scholars belonging to this sect. In the following centuries, as the number of scholars known as Hanafis increased by hundreds and even thousands, the need arose for compilations of their biographies. As a solution to this need, the works of *Tabaqat al-Hanafiyya* emerged.

In the Hanafi world, the attention to writing historical and biographical works was much lower than the interest in the science of jurisprudence itself. As a result, no serious work in this direction was written until the fourteenth century. After that century, the growing tradition of writing history in Egypt and Syria led to the writing of *Tabaqat al-Hanafiyya*, and many books were written in this area. Although stratification has slowed since the early seventeenth century, it continues to this day.

The literature in the genre of *Tabaqat al-Hanafiyya* includes the main sources of information about the biographies of the faqihs:

1. The work of Saimari (d. 436.1045) "*Ahbar Abi Hanifa and his Companions*". Many Hanafi studies refer to the Qurayshites as *Jawahir al-Mudiyya* *Tabaqat al-Hanafiyya* and claim that the Hanafis were behind the other sects in writing. However, although this work does not use the word *Tabaqat al-Hanafiyya* in its title, it covers all aspects taught in this type of book. Unlike the works of Abu Hanifa's regular manakibi, the play focuses on the biography of Imam Abu Hanifa and the lives of his famous disciples, as well as the many Hanafi scholars

- who lived after them. In this respect it is essentially close to the works of Tabaqat al-Hanafiyah. This work of Saimari is also the work of Manaqib and Tabaqat. [5]
2. Hamadoni (d. 521.1127) "*Tabaqati ashobi Abi Hanifa*". This work has not yet reached him, but the Qurayshites list it among the literature he used in Jawahir al-Mudiyya.
 3. The work of Masood ibn Shayb Sindi Tabaqat al-Ashab. There is no information about the author's date of birth and death, and the work itself has not yet arrived. However, in another work, At-Ta'lim, the author refers to Tabaqat al-Ash'ab and states that he used it.
 4. Najmiddin Tarsusi (d. 758.1357) "*Wafayyat al-ayan min mazhab Abi Hanifa al-Numan*". This small work is mainly a poetic work containing information about the dates of birth and death of Hanafi scholars. The scholar encoded the dates alphabetically.
 5. Tabaqat al-Khanafiyyah of Ibn Muhandis, according to Ibn Hajar, represents a large volume of literature. According to other scholars, the scale of the work was equal to that of Jawahir al-Mudiyyah. But that is yet to come.
 6. Abdul Qadir Qurashi and his work Al-Jawahir al-Mudiyah fi Tabaqat al-Hanafiyah [6]. This work, which is notable for its weight and scale, is not the first work in the style of Tabaqat al-Hanafiyah, as many scholars claim. As mentioned above, Ahbar Abi Hanifa and His Companions by al-Saymari was written before him. The scholar wrote the book with the help of his teachers, relying on reliable sources. He worked independently without copying or imitating anyone. In writing the work, the author used 168 written sources and provided information about 2115 Hanafi scholars. Abdul Qadir Qurashi praised his teachers Qutbuddin Abdulkarim and Taqiyuddin Subki Shafia who inspired him to write this book and thanked them for their achievements. The work was published as a five-volume study by Abdulfattah al-Khulwah.
 7. Ibn Dukmok. (d. 809.1407) A work titled "Nazm al-Juman fiyy tabaqati ashobi Imamina Numan. The manuscript is a large-scale three-volume work. The first volume of the work deals with the biography of Abu Hanifa, and the other two volumes record the life of Hanafi scholars.
 8. Feruzabadi's (d. 817.1415) "Al-mirkat al-wafayyah fiy tabaqat ulama as saodat al-hanafiyah" is still in manuscript form.
 9. The book of Ibn Jazari (d. 833.1429) "Ad-darojat al-aliyyah fi tabaqat al-ulama al-hanafiyah". Ibn al-Jazari, a famous recitationist, started writing based on Jawahir al-Mudiyya but for unknown reasons stopped working halfway through the work, which is still in manuscript form.
 10. "Tabaqat al-Hanafiyah" by Ibn Qazi Shuhba (d. 851.1448). The scholar belonged to the Shafi'i school and also wrote "Tabaqat al-Shafi'iyah". However, this pamphlet, also written in the Hanafi style, has not yet arrived. Information about the work can be found in the author's Tabaqat ash-Shafiyya.
 11. The work of Badriddin Aini (d. 855.1451) "Tabaqat al-Hanafiyah". This work by a Hanafi scholar has not yet arrived.
 12. The work of Ibn Qutluboga (d. 879. 1474) "Taj at-tarajim". He wrote Taj at-Tarajim, enriching the knowledge of the Hanafi scholars mentioned in al-Maqrizi's "At-Tazkir". This work, which includes about 350 Hanafi scholars, is notable for containing information that is not available in other sources and has a small volume.
 13. This three-volume work of Ibn Aja (d. 881. 1476) "Tabaqat al-Hanafiyah" has not reached yet. However, Haji Khalifa's Kashf al-Zunun has information about it.

14. Abul Fazl ibn al-Shihna (d. 890.1485) and his work *Tabaqat al-Hanafiyya*. The biography of the author mentions this book but it has not been preserved.
15. Sahawi's work *Tabaqat al-Hanafiyya* (d. 902,1497). This work, written by the famous historian al-Sahawi, is still in manuscript form.
16. Kamolposhozada (d. 940.1534) "*Risola fiy tabaqot ahimmat al-hanafiyya*". The scholar also has a work "*Tabaqat al-Fuqaha*" in which he divided the faqih into seven classes according to the rank of ijihad. The work is a small volume that talks about famous Hanafi scholars. He has other names such as *Risala fiy tazkirati baadi ulama*, *Tazkirat al-fuqaha*, *Tarajim baadi al-ahnaf* and *Tabaqat al-hanafiyya*.
17. The work of Ibn Tulun (d. 953/1546) "*Al-guraf al-aliyya fiy tarajimi mutaahhir al-khanafiyya*". The scholar, who lived in the golden age of biographical writing, also wrote a book in this style. The work is also important because it collects rare information that is not available in other sources. One-fifth of it was studied by the Egyptian scholar Ali Abdullatif Ibrahim in his dissertation.
18. Ginalizoda (waf. 979/1572) "*Mukhtasar fiy tabaqat al-khanafiyya*". There is no precise information about the name and author of the brief pilgrimage work. The manuscripts refer to it in the form of "*Tabaqat al-Khanafiyya*" and "*Mukhtasaru tabaqat al-Khanafiyya*".
19. The work of al-Qafawi (d. 990.1582) "*Katoib alam al-ahyar min fuqaha mazhab an-Numan al-mukhtar*". It is of special importance because it is one of the sources of unique information among the works written after al-Jawahir al-Mudiyyah. This work, which has preserved many manuscripts, was published with the participation of a group of researchers led by the Turkish scholar Saffet Qose.
20. The work of Qutbiddin al-Nahrawali (waf.990.1582), *Tabaqat al-Hanafiyya*, is a large four-volume work, most of which was burned in a fire in the author's house. It is not known whether he rewrote the book. Therefore, it has not yet reached its end.
21. The work of Taqiyuddin al-Khanafi (d. 1010.1601) titled "*at-Tabaqat as-sanyya fi tarajim al-khanafiyya*". This is one of the books of the great Hanafi stratum. It was half studied and published by Abdulfattah Muhammad al-Khulw.
22. Ali al-Qari's "*Al-'Asmar al-janiyya fiy asma al-khanafiyya*". This work is an excerpt from Bazazi's books "*Manoqibi Abu Hanifa*" and "*Jawahir al-Mudiyya*". However, in the layer section, the author provides additional information after the abbreviation and the work is not just an abbreviation but becomes the original source.
23. Mehmet Komi-Efendi of Adirnali (d. 1136.1723) "*Muhimmu al-fuqaha*." This work is notable for its small size among the layers of the latter period. It is a biographical and bibliographical book that provides information on famous Hanafi scholars as well as widely distributed Hanafi books.
24. "*Al-fawaid al-bahiyyah fiy tarodhim al-hanafiyyah*" by Abdulhaye Laknawi (d. 1304.1886). Although it is based on al-Qafawi's work *Qatayb alam al-ahyar min fuqaha mazhab an-Numan al-mukhtar*, the author explores the new work with additions from other sources. It is published several times for an important source.
25. "*Tarab al-amosil bi tarodjim al-afodil*" by Abdulhai Laknawi (d. 1304.1886). Another work of the author belonging to the Hanafi strata.

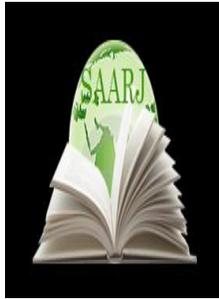

Summarizing the above, it can be concluded that:

The works of Tabaqat are an invention of Muslim scholars contributed to science.

- The need to authenticate the storytellers within the "Ilm ar-rijol" led to the study of the biography of each storyteller in the chain, which led to the collection of the first biographical works.
- The increasing number of Hanafi scholars demanded the collection of works compiling their biographies, and so the Tabaqat al-Hanafiyya books began to be written.
- The first example is the work "Ahbar Abi Hanifa and His Companions" by the author Saimari.
- The first work of Tabaqat al-Hanafiyya is Jawohir al-Mudiyya by Abdulqadir Qurashi.
- Taqiyuddin Hanafi's book "Tabaqat al-saniyya" has a wide range and detailed coverage of biographical cases.

 Samarkand, Republic of UZBEKISTAN

ABSTRACT

The article describes the etiology, pathogenesis, clinical signs and indicators of the contents of the rumen in hypo cobalt sis in productive cows. The health status of animals and their productivity in general depend on metabolic processes, the intensity of which is largely regulated by the supply of the organism with microelements, vitamins and other metabolic products. Violation of the sugar-protein ratio, lack of fiber in the diet of dairy cows lead to lactic acidosis in the rumen and ruminates. The research was carried out on farms in the Samarkand region. In order to study the etiology, developmental mechanisms, clinical manifestation of hypocobaltosis, changes in blood and scar contents, a dispensary study was carried out. Violation of the sugar-protein ratio, lack of fiber in the diet of dairy cows leads to lactic acidosis in the rumen and ruminates. A quantitative and qualitative change in micro flora.

KEYWORDS: *Diet, Hypo Cobalt Sis, Micro Element Sis, Osteody Strophy, Parakeratosis, Exercise, Hypo Dynamic, Proventriculus, Acidosis, Ketosis, Dystonia, Ciliates.*

INTRODUCTION

Analysis of literature data and our own observations shows that so far the acclimatization of imported animals in the conditions of the Republic of Uzbekistan and the incidence of micro element sis, as well as the distribution, etiology, pathogenesis, symptoms of hypo cobalt sis in productive cows, have not been sufficiently studied. Therefore, the study of the distribution, economic damage, causes, and mechanisms of development, early diagnosis and development of measures for the prevention of hypo cobalt sis in dairy cows are relevant in veterinary science and practice.

The health status of animals and their productivity in general depend on metabolic processes, the intensity of which is largely regulated by the supply of the organism with microelements, vitamins and other metabolic products [1].

Most of the endemic diseases occur in combined, with poly morbid forms, chronically. Often in animals, diseases are noted due to the deficiency of not a single trace element, but several. However, in this case, the pathology caused by a deficiency or excess of one element is most clearly manifested [1, 2].

For normal functioning of micro flora, the contents of the rumen should contain sufficient amounts of biotin, para-aminobenzoic acid and vitamin B12, as well as 100 mg / l iron, 10 mg / l cobalt [8].

Deficiency of cobalt in diets leads to hypo vitamin sis B12 and anemia, the synthesis of organic and mineral parts of the bone is disrupted and osteody strophy develops in animals [2].

Violation of the sugar-protein ratio, lack of fiber in the diet of dairy cows lead to lactic acidosis in the rumen and ruminates. A quantitative and qualitative change in micro flora, a decrease in the number of small and medium micro flora, a decrease in their activity in the parts of the stomach leads to a lack of fiber due to increased hydrolysis of it. Excessive concentrates in rations are facilitated by a decrease in pH to an average of 6.5 ± 0.05 in the contents of the rumen, while the norm is 6.8-7.4 [7].

With a deficiency of trace elements such as copper, cobalt, zinc, manganese in the diets of cows, it leads to a decrease in the vital activity of micro flora, an increase in the acidity of the rumen contents, the suction of incomplete breakdown products of proteins and ammonia in the blood, acidosis and chronic intoxication of the body [5].

In animals containing deficiency of iodine, cobalt, retinol and calciferol in 86.7% of animals under conditions infected with radioactive radicals, drying and parakeratosis of the skin, in 26.7% of enophthalmos, in 90% of pallor of the conjunctiva, in 57.8% - bradycardia, in 3.35% - an increase in the thyroid gland and myxedema. Also, 92.6% of dry cows had anemia, 93.8-100% - hypocalcaemia, 50-92.6 – hypo phosphatemia, 90% of animals showed a decrease in the amount of copper, cobalt and zinc in the blood serum [3].

If in healthy animals the pH of the rumen fluid was 6.06 ± 0.06 , with chronic acidosis of the rumen - 6.37 ± 0.05 , with ketosis - 6.25 ± 0.06 , with secondary osteody strophy - $6.49 \pm 0, 03$, with microelement sis - 6.30 ± 0.09 and the number of ciliates in healthy animals was 595 ± 43 thousand / ml, with rumen acidosis - 90 ± 56 thousand / ml, with ketosis - 370 ± 26 thousand / ml, with secondary osteody strophy - 435 ± 23 thousand / ml, with microelement sis - 300 ± 43 thousand / ml [5].

Microelement sis in pregnant cows occurs by a decrease in the number of erythrocytes in the blood by 12.3%, hemoglobin - 3.6%, glucose - 10.9%, total protein - 3.4%, alkaline reserve - 3.7% of total calcium - 8, 7% of inorganic phosphorus - 7.0%, copper - 3.9%, cobalt - 6.9%, manganese - 18.9% and an increase in the concentration of total bilirubin by 9.13%, an increase in the activity of a separate and alanine aminotransfera by 12, 1 and 13.7%, respectively, compared to healthy animals [6].

The aim of the research is to study the etiology, early diagnosis, pathogenesis, clinical picture, changes in blood and scar contents in cows with hypocobaltosis.

MATERIALS AND METHODS

The research was carried out on farms in the Samarkand region. In order to study the etiology, developmental mechanisms, clinical manifestation of hypocobaltosis, changes in blood and scar contents, a dispensary study was carried out. Studied the conditions of keeping dairy cows, rations for the content of digestible protein, carbohydrates, carotene, calcium, phosphorus, fiber, as well as cobalt, copper, manganese and zinc [5].

Of the dairy cows of the Holstein breed, they made up reference groups, 10 heads per group, in experimental animals for 2-, 3-, 4-, 5- and 6-months of lactation, a clinical and hematological study and the contents of the rumen were carried out for some indicators. At the beginning of the experiments and every 20 days until the end of the experiments, blood was taken from the experimental cows and examined for the content of erythrocytes, hemoglobin, glucose, total protein and reserve alkalinity by conventional methods, as well as the amount of some trace elements (Cu, Co, Mn, Zn,) by the atomic method -absorption spectrophotometry. We determined the pH values in the cicatricial contents (using the RNT-026 multi-parameter water quality monitor), microflora activity (according to G. Diriksen), and the number of ciliates (in the Goryaev chamber). [4]

In animals, the clinical status was determined by determining the general condition, appetite, fatness, reaction to external stimuli, the condition of the mucous membranes, skin and skin, contraction of the proventriculus in 5 minutes, the amount of breathing and contraction of the heart in 1 minute, the condition of the motor organs, incisor teeth and resorption of the last caudal vertebrae, as well as signs characteristic of hypocobaltosis.

RESEARCH RESULTS AND DISCUSSION

The farm keeps animals in one place for all seasons. Therefore, herd syndromatics are characterized by the frequent occurrence of ketosis and secondary osteodystrophy (in 30%), polyhypomicroelementosis, postpartum paresis, retention of the afterbirth (in 12%), alimentary anemia, limb disease and other pathologies of non-infectious etiology of the cows environment.

In the diets of dry cows, an acute deficiency of carbohydrates, carotene, phosphorus, cobalt, copper, manganese, zinc and an excess of digestible protein, calcium and fiber were revealed. The provision of rations with sugar was within 46.4%, phosphorus - 84.2%, cobalt - 55.3, copper - 57.0, manganese - 66.0 and zinc - 61.1%. During the periods of the experiments, the body temperature was within the limits of the physiological norm, if the number of heartbeats at the beginning of the experiments took place on average 66.4 ± 3.8 times, by the end of the experiments it increased to 84.5 ± 6.2 times per minute (the norm is 50-80 beats per minute), the amount of breathing is $14.6 \pm 1.20 - 26.8 \pm 1.45$, respectively (the norm is 12-25 times per minute). These indicators indicate that with hypo cobalt sis, heartbeat and respiration increase due to tissue and organ hypoxia.

If at the beginning of observations the amount of rumination was 10.2 ± 1.36 in 5 minutes, at the end of the experiments it decreased to 8.8 ± 2.4 times, at the norm - 8-12 times in 5 minutes. This can be excused by the year-round stall keeping of dairy cows, one-sided concentrate feeding, poor quality and nutritional value of feed.

At the head of the dispensary examination in dairy cows, the last caudal vertebrae were slightly resorbed, until the end of the observations the manifestation of this symptom increased. In 40-

50% of cows, perversion of appetite (licks) was revealed, in 60% - anime mucous membranes. In the 5th month of lactation, these signs were observed in 60.0 and 80.0% of animals, respectively. And also there were pathognomonic signs for hypocobaltosis such as lack of response to external stimuli, increased heart rate and respiratory rate, loss and depigmentation of the skin in some parts of the body, increased salivation and lacrimation, decreased gloss of the skin and hooves.

At the beginning of the experiments, the number of erythrocytes in the blood of cows was 5.18 ± 0.08 million / μl (at a rate of 5.0-7.5 million / μl), and at the end of the experiments, an average of 4.68 ± 0.06 million / μl , the hemoglobin concentration decreased from 110.6 ± 4.6 g / l to 86.4 ± 5.7 g / l, at a rate of 99-129 g / l ($P < 0.05$). The concentration of glucose during the observation period was in low peridels of the physiological norm and took place on average 2.19 ± 0.24 mmol / l at a rate of 2.22-2.33 mmol / l. In our opinion, a decrease in glucose concentration until the end of lactation is associated with an increase in the needs of the cows' organism for energy material and its unsatisfactory coverage.

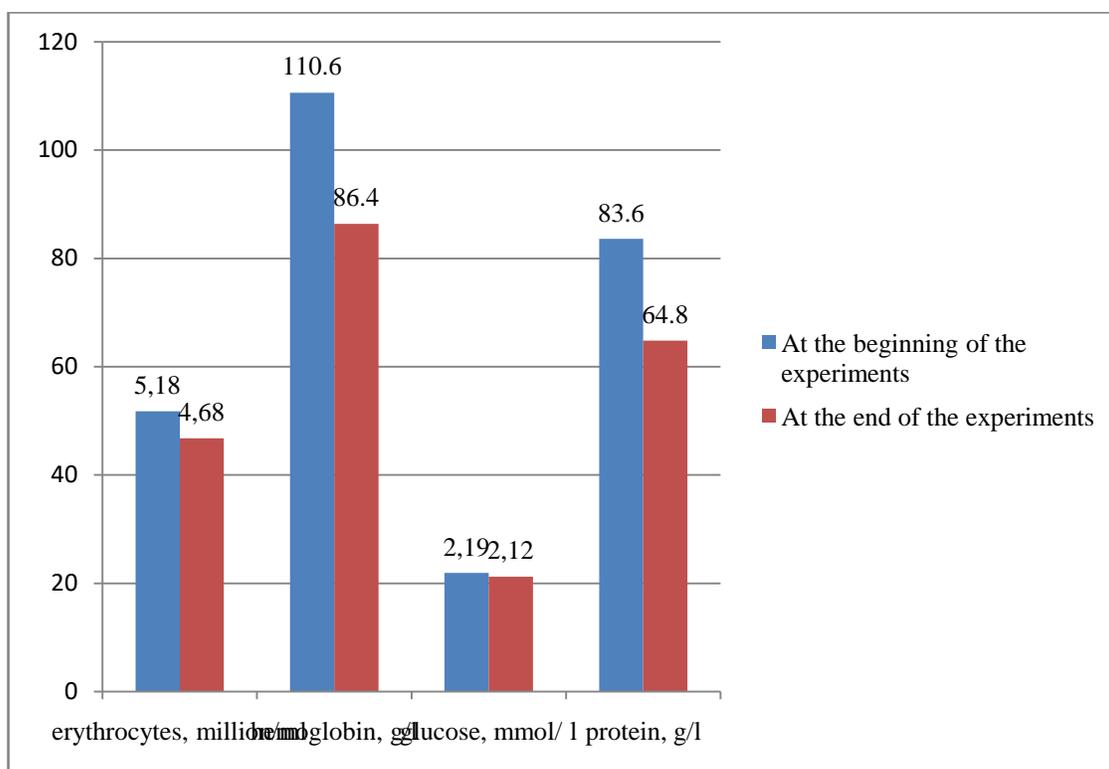

Figure: 1. Hemotological parameters of experimental cows, n-10.

The amount of total protein at the beginning of the observation took place on average 83.6 ± 6.3 g / l, by the end it had a tendency to decrease and took place 64.8 ± 5.2 g / l, the amount of reserve alkali was on average $48.5 \pm 2, 02$ volume% CO_2 and the end of observation took place 38.4 ± 2.26 volume% CO_2 . These indicators indicate that a decrease in the amount of reserve alkali, that is, an increase in the state of acidosis in the body of dairy cows ($P < 0.05$).

Until the end of the experiments, dairy cows had a tendency to decrease the amount of total calcium and onorganic phosphorus. The amount of total calcium at the beginning of the experiments was 2.26 ± 0.34 mmol / l (the norm is 2.5-3.13 mmol / l) and at the end of

observations it decreased to 2.16 ± 0.26 mmol / l. Inorganic phosphorus took place on average 1.56 ± 0.52 and 1.18 ± 0.34 mmol / l, respectively ($P < 0.05$). The decrease in total calcium and inorganic phosphorus in the blood can be associated with a violation of the absorption of elements due to an increase in acidity in the gastrointestinal tract.

At the beginning of the observations, the amount of cobalt in the blood of dairy cows was 0.34 ± 0.02 $\mu\text{mol} / \text{l}$ on average, and by the end, that is, by the 7th month of lactation, it decreased to 0.19 ± 0.06 $\mu\text{mol} / \text{l}$, the amount of copper decreased from 10.6 ± 0.22 $\mu\text{mol} / \text{L}$ to 9.06 ± 0.32 $\mu\text{mol} / \text{L}$, manganese - from 2.34 ± 0.4 $\mu\text{mol} / \text{L}$ to 2.18 ± 0.3 $\mu\text{mol} / \text{L}$ and zinc from 36.6 ± 4.0 $\mu\text{mol} / \text{L}$ to 19.8 ± 4.7 $\mu\text{mol} / \text{L}$, respectively ($P < 0.05$).

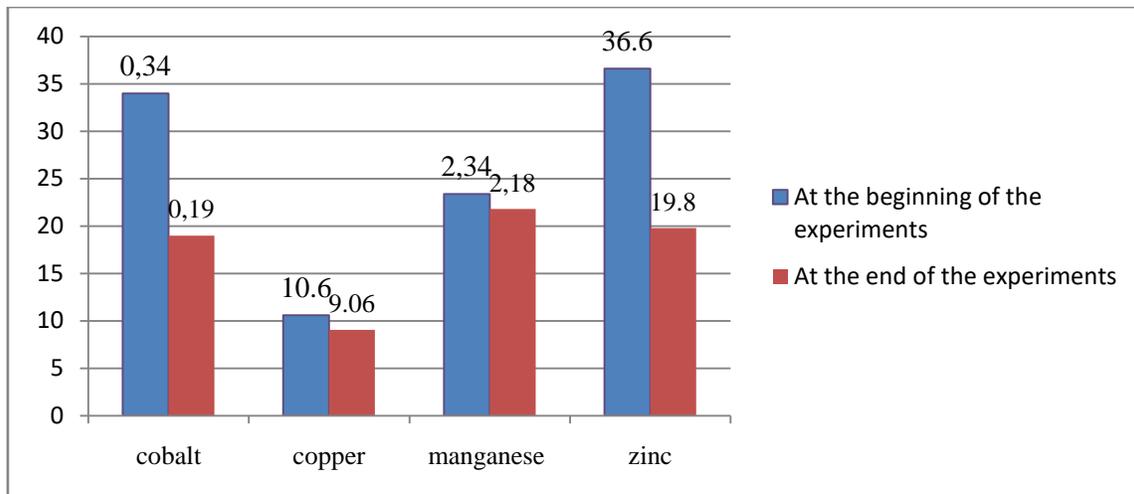

Figure: 2. Indicators of mineral substances in the blood of experimental cows.

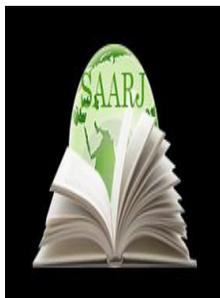

After conducting hematological studies in dairy cows, it was concluded that hypoco-baltosis occurs by a decrease in the number of erythrocytes, hemoglobin, glucose, silk reserve, total calcium, inorganic phosphorus, copper, manganese, zinc in the blood, in the types of polymorbid pathology. In the first months of lactation, the pH of the contents of the rumen averaged 6.50 ± 0.09 (at a normal pH of 6.5-7.5). By the end of lactation, this indicator has changed to the side and in recent months averaged 5.86 ± 0.04 ($P < 0.001$). The number of ciliates at the beginning of observations averaged 578.2 ± 54.2 ming / ml and a decrease in the number of ciliates was typical with an increase in the days of lactation, as well as a decrease in the activity of ciliates, followed by a deterioration in the assimilation of cobalt by microorganisms.

CONCLUSION

Hypo cobalt sis in highly productive cows is characterized by perverted appetite (licks), mucous membranes animality, lack of response to external stimuli, increased heart rate and respiratory rate, resorption of the last tail vertebrae, prolapsed and de-pigmentation of the skin in some areas of the body, increased salivation and decreased lacrimation cover and hooves, a decrease in the number of erythrocytes, hemoglobin, glucose, silk reserve, total calcium, inorganic phosphorus, copper, manganese, zinc in the blood and flows into types of polymorbid pathology with a predominance of cobalt deficiency.

ABSTRACT

This article describes the concept of tourism, the essence of cultural tourism and museum tourism, tourism and museum cooperation, the role of museums in the development of cultural tourism. Cultural tourism is a type of tourism that includes visits to cultural events, museums, cultural heritage sites, and attractions, including landscapes, culture, and art, local lifestyles, customs, traditions, various forms of recreation. According to the definition of the World Tourism Organization (WTO), cultural tourism is the movement of people who are only culturally motivated: study trips; trips to see cultural attractions; visiting festivals and other cultural events; a trip to explore folklore, art, and national traditions. Museum tourism is a specific activity of museums in the field of cultural tourism in the creation of expositions, internal and external excursions, educational seminars, lectures, public events, training, the availability of museum-shops, the production and sale of museum tourism products.

INTRODUCTION

From the first days of independence in our country, tourism has been considered at the level of the main state policy. All the necessary organizational and legal mechanisms for the development of the industry have been created, important normative documents have been adopted, and this work is still ongoing. Today, in order to develop tourism, to raise it to new heights, to make our country one of the world's tourist centers, it was necessary to create a legal basis. In this regard, the Decree of the President of the Republic of Uzbekistan No. PF-5326 of February 3, 2018 "On additional organizational measures to create favorable conditions for the development of tourism potential of the Republic of Uzbekistan" Decree No. PF-5611 of January

5, 2019 "On measures" as one of the most important factors of sustainable socio-economic development of the regions plays an important role in the rapid development of domestic tourism, an acquaintance of citizens with the cultural and historical heritage and natural resources of our country. The state policy in the field of tourism is one of the forms of state socio-economic policy. Currently, tourism around the world is a process that is closely linked to all social sectors, and it is becoming a very useful dynamic sector of the world economy. Today, tourism is one of the most effective means of acquiring cultural heritage and is an integral part of people's lives on the planet. This complex, high-income industrial complex is one of the key sectors of the world economy, contributing to employment, social welfare, and quality of life, as well as economic unity and cultural diversity of states and regions.

Main Part

Modern tourism comes in many forms and types. According to the American scientist W. Smith, there are six categories of tourism: ethnic, cultural, historical, ecological, recreational, business.

V. A. According to Kwartalnov, the main task of historical and cultural tourism is to get acquainted with the achievements of culture, science, and technology (museums, galleries, religious buildings, architectural ensembles, etc.), to visit historical sites and buildings.

Cultural tourism is a type of tourism that includes visits to cultural events, museums, cultural heritage sites, and attractions, including landscapes, culture, and art, local lifestyles, customs, traditions, various forms of recreation. According to the definition of the World Tourism Organization (WTO), cultural tourism is the movement of people who are only culturally motivated: study trips; trips to see cultural attractions; visiting festivals and other cultural events; a trip to explore folklore, art, and national traditions. Today, within the framework of cultural tourism, an independent direction - museum tourism - has emerged. Museum tourism is a specific activity of museums in the field of cultural tourism in the creation of expositions, internal and external excursions, educational seminars, lectures, public events, training, the availability of museum-shops, the production and sale of museum tourism products. Museum tourism was not originally a traditional area of activity for museums. This phenomenon occurred relatively recently - in Russia in the mid-1990s, in the west in the 1970s, when museums were placed in a position of extreme self-determination, search for new ways of development and new extra-budgetary sources of funding, including participation in tourism.

Until the twentieth century, the main thing in determining the status of the museum was its collections. Today, this view is changing: the visitor is at the center of the museum's activities. A new approach to understanding the essence of the museum and its social purpose is being developed. The museum object is focused not on its features and functions, but on the person dealing with the socio-cultural, psychological, and age characteristics of the museum.

In museum tourism, the object of scientific research should be considered museums and related tourist destinations. Museum tourism allows for the "introduction" of popular collections into the modern cultural space and their interpretation as a unique form of intellectual, historical, and artistic heritage. Today, the development of museum tourism depends on the following factors:

- 1) Development of special programs for different age groups of visitors;
- 2) Preparation of special programs for representatives of different social groups;

- 3) Creation of programs for the process of creative activity within the museum and its introduction on the basis of the collection;
- 4) Creation of synthetic programs using the possibilities of not only art collection but also other types of art within the museum (music accompaniment, concert performance, etc).
- 5) Creation of comprehensive programs, including other museums, art, and cultural centers and organizations .
- 6) Creating international programs for art lovers and professionals.

The role of museums is not only to passively receive visitors and tourists but also to act as a “mediator” in the implementation of mutually beneficial exchanges between tourists and carriers of a culture of hospitality. Promoting museums as a tourist attraction is an important strategic task of any tourism development plan. In addition to being a tourist attraction, museums, which have accumulated the civilized experience of mankind over the centuries, play an important role in educating the younger generation, along with schools, universities, and educational centers. Unlike academic institutions, museums are open to a wider range of society.

The atmosphere created in the museum is part of the tourist product it offers, as well as the design and quality of the museum environment: exhibition and non-exhibition spaces; buildings, areas, advertising, printed matter - everything in the museum or anything related to it. Consequently, the museum offers visitors a variety of tangible and intangible products, and they include:

- 1) Expositions and exhibitions;
- 2) Lectures-excursions;
- 3) Special programs;
- 4) Additional services determined by the capabilities of the museum community and infrastructure;
- 5) Copyright for reproduction of items included in his collection;
- 6) Books, catalogs, booklets, and other printed materials, videos, slides, CD-frames, and other publications using modern information technologies.

Therefore, the museum can offer tourists a variety of products - tangible and intangible. Thus, the subject of museum tourism can be considered as a wide range of objective laws related to the acquisition and analysis of information about the tourist market and the consumer of museum products, the creation of conditions for the preparation and sale of museum products, as well as the legal and economic framework for its advertising and marketing.

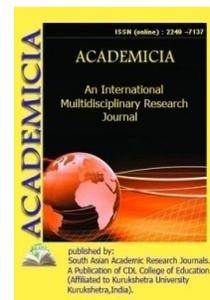

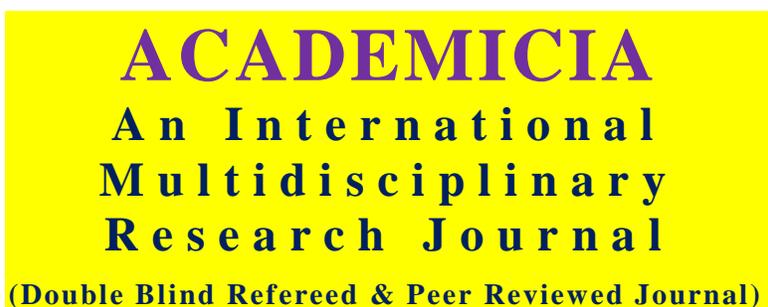

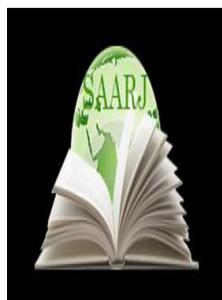

CONCLUSION

During the study, a number of conclusions and recommendations were developed to address the existing problems in the development of tourism in the regions: insufficient information about the tourist resources for the population of our country in the development of tourism, which in turn leads to low interest in tourism; further increase the opportunities for the development of international and domestic tourism with the widespread use of information and communication technologies; inclusion of museums in the field of tourism; use of innovative forms, methods and

means of tourism in museums. Cooperation between museums and the tourism industry is important for both sides. Regional museums are almost never involved in tourist activities (except for two or three large museums). In this regard, the role of the museum and the role of tourism as different cultural institutions are inextricably linked, creating a single institutionalized cultural space. Museums not only contribute to the development of the tourism business but can also be a tool for the development of the region, influencing the economy of the region and providing quality of life, and shaping the social environment.

ABSTRACT

The dualistic approach is reflected in the following thought. Therefore, observing and discussing diligently, so that it may cause your soul to taste wisdom, the taste of knowledge, to arouse your love of truth, to direct your actions in a positive way, for, and you will understand what makes you happy.

KEYWORDS: *Government And Society, Confucius, “Golden Mean”, Innovative Thinking, National Cultures.*

INTRODUCTION

A socio-political entity is a socio-dynamic space in which activities such as managing the affairs of the state, government and society, harmonizing relations in society with strategic goals, focusing on subordinate relations between the whole and the parts, giving organization. This makes the socio-political entity lively, dynamic, mobile, with a variety of objects in the socio-dynamic space: institutions, subjects, goals and mechanisms. Mobility is a fundamental feature of today's socio-political existence, societies. This demand gives dynamism to both spiritual and moral imperatives and innovative research, urges them not to lag behind the requirements of the time, the needs of the population.

Main part

If we want to use innovative development in harmony with the spiritual and moral imperatives, we must study and follow the dynamics of the demands and needs of the time. These demands and needs cannot remain in the narrow, personal subjective realm of reality, where there are certain barriers to individual freedom, but the existence of such barriers is required by the objective laws of social development. A person should not absolutize his rights and freedoms on a nihilistic level, and even if legal imperatives give him ample opportunities, he should listen to

the calls of spiritual and moral imperatives, and guide his desires and actions by objective laws. Otherwise, conflicts and disputes will arise between the individual and society. The "golden mean" that Confucius envisioned, that is, the principle of compromise, will be necessary in resolving the relationship between the whole and the part. Recognition by the individual, the part, that the whole is a subject representing the common good is only one side of the problem. There are other aspects to it. For example, what are the guarantees that the whole common good will not be absolutized or that the rights and freedoms of the individual in a socio-political entity will be secured without harm to the whole or part of it? How does the whole and the parts know that their interests, needs are in accordance with objective laws, what should be done so that they are not deceived? In the Soviet era, were not only ordinary people, parts, but also the whole people, the nation deceived? Who can guarantee that such a supernatural event will not happen again?... There is a strong call for the use of Western scientific and technological discoveries in innovation. If we remember that almost half of the discoveries made in the world today are in the United States and 30-35 percent in European countries, we realize how broad the impact of Western values on national cultures is. Yes, in the words of P.L. Berger, today humanity is living in a "global culture" or "globalization of culture", a "cultural upheaval". He calls this culture "American." [1.11] Innovation and modernization lead to a deeper penetration of this culture from the depths of national spiritual and moral imperatives. The results of special research conducted by P.L. Berger and S.P. Huntington on different continents and countries show that "global culture" can coexist with national cultures. [1.17] Apparently, as we strive to preserve our national spiritual and moral heritage, as well as to renew (innovate) and modernize our social existence in order to join the world community, we need to define our approach to global change. So far, this approach is aimed at synthesizing our national culture with "global culture". The most optimal way is to modernize the social, economic, political, training system, service networks, to live our spiritual and moral life in accordance with the imperatives of our national traditions, the mentality and way of life of our people. If we proceed from this conceptual approach, first of all, we should not look for differences between East and West, but instead find commonalities in the cultures and lifestyles of the two continents, looking for mechanisms to deepen them.

This requires us to look for universal aspects in the spiritual and moral values of the East and the West. Only then can innovation and modernization transform from a one-time, palliative phenomenon into a value that serves a strategic purpose and is embedded in our social existence. Today, the socio-political institutions of the Republic of Uzbekistan, first of all, the President and other supreme governing bodies, the government are the initiators and supporters of innovation and modernization. This is a decisive event for our republic, leading to a radical renewal of the life of our society.

Innovative thinking and modernization require scientific and technical activity from entities, local government institutions, labor unions, entrepreneurs, private property owners, associations, non-governmental organizations. This includes training special staff and supporting innovative research by artists. Without the active research of these subjects, without turning the search for innovation into their way of life, innovation, the introduction of real creativity, initiative, high-tech processes into socio-economic processes cannot be introduced. Here, the search for innovation can lead to innovation phobia, that is, the habit of making the search for innovation only the goal of the activity. Innovation is a reality related to the introduction of scientific and

technical innovations. This reality is inseparable from spiritual pursuits, because the objective laws of spiritual development require the pursuit of innovation and the enjoyment of it. Innovation, on the other hand, meets that need. Therefore, in this part of the work, the issues of scientific thinking in the spiritual heritage of the East are revealed. Such an approach is necessary for two tasks: first, philosophical research does not adequately address the issues of scientific thinking, so at the current new stage of national development there is a lack of personnel and specialists who can influence scientific and technological discoveries, modernization of the country. According to experts, Uzbekistan annually produces about 10,000 people with scientific and technical education, but 85-90% of household appliances and almost 100% of machinery are imported. No one can tell where our scientific and technical personnel are going. Second, the President of the Republic of Uzbekistan has set the main task of "ensuring innovative development", encouraging bold research in this area, but the scientific issues of innovative thinking remain.

At a time when the pragmatic philosophy and policy of President Sh.M. Mirziyoyev demand to focus scientific and technical discoveries on the practical problems of national development, our scientists, especially philosophers, were lagging behind in the study of innovation. The Decree of the President of the Republic of Uzbekistan "On the establishment of the Ministry of Innovative Development of the Republic of Uzbekistan" (November 29, 2017) calls to fill this gap, to conduct bold research. At the same time, it is important to make the study of scientific thinking in our spiritual heritage one of the main issues of research.

It has become a tradition today to study the spiritual heritage of the East from the Avesto. Indeed, the Avesto is not only the holy book of otashparasts, it deals with all issues related to the universe, natural processes and events, geographical features of countries, human cognition, in short, the relationship between man and the universe. Ahura Mazda recites his names to Zoroaster and says: "Another name is Knowledge, Another Way is Awareness." Elsewhere Mazda says, "O Spitama Zoroaster, know and understand, Faithful Zarathustra, with my mind and knowledge, "What is the origin of the best world," "What will be its end." Apparently, Ahura Mazda encourages Zoroaster to know and understand the essence, creation and end of the universe. Knowledge, Awareness is one of the honorable names of Ahura Mazda. He sings that with this quality of his he created the universe, the countries, the beings. He points out that he created goodness because of his knowledge.

Ahura Mazda says, "Truth is the greatest blessing." The search for this truth is also one of the tasks of scientific thinking. True, truth can be sought in two senses: the first is the search for real objects, things and events pertaining to the external world, and the second is the search for concepts of a subjective nature that one believes, imagines to exist. Both of them are found in the spiritual scientific heritage of the East. For example, Abu Nasr Farabi, Abu Rayhan Beruni, Ibn Sino, Ulugbek, Al-Fargani, Navoi, Mirza Abdulkadir Bedil, Ahmad Donish, Abay and twentieth-century enlighteners called on the Jadids to study the objective existence of scientific thinking, the problems of real life. They believed in the power of the human mind, supported rationality. The scholars of Zoroaster, Mani, Imam al-Bukhari, al-Termizi, and mysticism were proponents of theological and mystical thought. True, there were thinkers like Kubro and Naqshband who combined these two currents. Even Farabi, while on the road, expresses the idea that the universe was created by a "blessed creator," that is, Allah. But this does not deny that he was a proponent of scientific, rational knowledge of the laws of objective existence. His dualistic approach is

reflected in the following thought: "Therefore, observe and discuss diligently, so that it may cause your soul to taste wisdom, the taste of knowledge, to arouse your love of truth, to direct your actions in a positive way, for, and you will understand what makes you happy. "

Many of the philosopher's scientific ideas are calls to creativity, to create, to acquire a profession. The virtue of acquiring knowledge, the tendency to learn, in Farabi's view, is "not innate, otherwise there would be no absolute power and greatness in his intellectual virtue." If the virtue of a profession were innate, the kings would not have acted of their own free will, but the kingdom would have become a natural obligation which nature could only afford. Theoretical and great intellectual qualities, great innate qualities and great (professional) qualities are habits, in a person who has become a skill, these qualities are the cause of the formation of the will and the habituation. Such people are infinite and very strong in nature and will."

Having scientific thinking is not a blessing from God, it requires "strong nature and will" from the person, the owner of the mind. The "theoretical and great intellectual quality" is achieved through "diligence and zeal." "Theoretical knowledge is taught either by teachers or wise men." Learning things of a practical nature, mastering a profession is not so difficult, but drawing theoretical conclusions from them, the formation of new ideas is a complex epistemological process. If we look around, we see that there are countless professions that people are engaged in, but not everyone is worried about improving their profession, bringing something new to it. Effective use of existing tools will undoubtedly provide efficiency, but updating the tools, improving them in accordance with the requirements of innovation, scientific and technical discoveries can increase productivity and efficiency by another ten, one hundred percent.

Abu Nasr al-Farabi's statement can be considered as a direct encouragement to use the innovative ideas and discoveries available in other nations and states: one cannot achieve such things alone, a community of people is needed to have them. Therefore, it is only through the union of many people that are necessary for survival, that bring people together and help each other, that one can attain the maturity that one seeks by nature.

The activities of such team members as a whole provide each of them with the things they need to survive and mature. Therefore, human beings multiplied and settled in the inhabited part of the earth, and as a result, a human community was formed. "This means that people come together and form a team to deliver to each other "what is necessary for survival and maturity". [2.186] Some take it, the people can take possession of a narrow range of things, but they lack it to reach maturity, to progress. It is not difficult to see the importance of the "community of people" that Farabi is referring to, as globalization encourages every people, nation, and state to innovate and improve their social existence.

Results

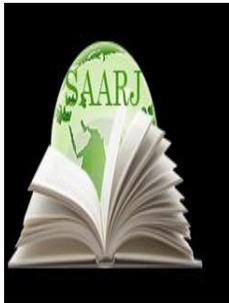

Abu Rayhan Beruni's innovation in the field of scientific thinking is widely recognized. He is "recognized as a great innovator in the humanities, including philosophy." [3.157] Beruni's epistemological legacy embodies the ideas of deep faith in the human mind, in the ability to know. According to him, the sum of human emotions, especially sight and hearing, is an important stage for drawing conclusions through the mind. If these feelings, Beruni writes, are used to think and draw conclusions, they can be used to reach the deeper meaning of perceived objects, because thinking is able to comprehend the inner qualities and characteristics of being.[3.157]

CONCLUSION

This means that scientific thinking is a characteristic of every person with the ability to comprehend, but in order to turn this quality into a rational phenomenon, epistemological research, one must use the "sum of one's emotions" correctly. The concept of "total emotion" used by him is very important for scientific thinking. Each sensation has its own functions: sight serves to see surrounding objects, actions, to perceive auditory sounds and sounds awakened from movements, and the sense of smell serves to detect odors emanating through the nose. Their functional development is at a different level in each person. For example, seeing in artists, hearing in composers, smelling in cooks are sufficiently developed. In the minds of scientific thinkers, these qualities, in Beruni's words, must be consistent with the "total of emotions," and their conclusions must be based on this harmony.

ABSTRACT

The purpose of this study was to identify whether there was a change in calculated pharmaceutical students' in adaptation to the learning process, to enable all students to master pharmaceutical terminology within international standards during their training, to organize knowledge of field – specific disciplines and to embrace our commonalities across the profession through consistent use of terminology, most particularly related to the terms “clinical” and “community and to emphasize activities” involving patient contact and multi-professional health teams so graduates will be able to provide adequate pharmaceutical care. The concept of “clinical pharmacy” has been tended to in an assortment of forums. The American College of Clinical Pharmacy recently published a definition of this term.

KEYWORDS: *Pharmaceuticals Specialists, Clinical Pharmacy, Pharmacy, Community, Pharmacist, Community Pharmacy.*

INTRODUCTION

It is the ideal opportunity for pharmaceuticals specialists to combine and accept basic phrasing in portraying our calling. As pharmacy faculty members who give persistent consideration, we interface with pharmacy students understudy, pharmacy practice occupants, residency applicants, and associates in an assortment of training settings. We have awfully frequently experienced the utilization of the word “clinical” connected to particular pharmacy practice in setting, most normally regarding an inpatient pharmacy environment. Further disarray with the job of outpatient pharmacy specialists happens using the term “retail” to portray local area pharmacy practice. While the use of this inaccurate terminology occurs in our daily encounters with students, residents, and colleagues, the need for consideration of this as a profession-wide issue was reinforced in a recent article published in the Journal [1.p15]. In the study, pharmacy

students were surveyed on their career plans post-graduation and given the opportunity to choose between retail (chain), retail (independent), clinical, hospital staff, or other. While we comprehend that the creators may have expected essentially to give classes to respondents, we propose the reception of a steady way for using wording across our calling in instructing, practice, and academic exercises with respect to the terms “clinical” and community pharmacy”.

MATERIALS AND METHODS

The concept of “clinical pharmacy” has been tended to in an assortment of forums. The American College of Clinical Pharmacy recently published a definition of this term. A key idea featured inside this definition is that clinical pharmacy happens altogether in medical care settings and is given in any climate in which pharmacy specialists collaborate straightforwardly with patients. The Merriam-Webster Dictionary supports ACCP’s statement by categorizing “clinical” as an adjective with the definition: “of, relating to, or conducted in or as if in a clinic; involving direct observation of the patient” [3]. Since the word “clinical” is an adjective, it should only be used to describe a noun. Accordingly, “clinical” is certainly not a suitable word to use to recognize a setting; this term should just be utilized to depict a setting. These grammatical contemplations about the word "clinical" are significant in how the term "clinical" is properly utilized in correspondences related to the calling. For example, when students express that they might want to be "clinical" pharmacy specialists, the right translation ought to be that they are keen on giving direct patient consideration. An appropriate subsequent question would be “in what health care setting do you hope to practice clinical pharmacy?” “Clinical pharmacy” can possibly be given on the whole patient consideration drug store settings.

Pharmacy specialists themselves characterize “clinical” exercises as happening across the assorted range of training. The American Pharmacists Association-Academy of Pharmacy Practice and Management (APhA-APPM) studied the officials in the foundation's 6 segments to characterize each segment's participation. Chosen leaders could look over 24 vocation alternatives to characterize their segments. Chosen leaders from 5 of the 6 segments included clinical drug specialists as a feature of their participation. Clinical activity was related to all the areas aside from the regulatory practice segment.

Another significant phrasing thought includes the words used to distinguish and depict outpatient pharmacy settings, explicitly the terms “retail” and “community” pharmacy. The Merriam-Webster Dictionary defines “retail” as “to sell in small quantities directly to the ultimate consumer” [3]. This dictionary defines “community” as “a unified body of individuals” [3]. While the term “retail” centers on an item and the customer, the term “community” identifies with people. With the calling zeroing in on its future as suppliers of direct patient care, wording which accentuates our covenantal relationship with patients is desirable over phrasing defined by item arrangement. This may explain why there are no pharmacy organizations whose names include “retail.” Notably, the National Community Pharmacists Association (NCPA) changed its name from the National Association of Retail Druggists (NARD) to NCPA in 1996. (NCPA, 2009)

Additional support for the utilization of the term "community" rather than "retail" can be discovered while getting to the Internet-based clinical web index, Pub Med ([www. pubmed.gov](http://www.pubmed.gov)), for scholarly work. Of the medical subject headings (MESH) searchable within Pub Med, “retail” is not included in any terms associated with “pharmacy.” In contrast, the term

“community”, is included in the MESH term “Community Pharmacy Services.” When conducting a keyword search in this international database, “retail pharmacy” returns 371 articles whereas “community pharmacy” results in 9,332 articles. Based upon formal definitions, pharmacy organization standards, and research access considerations, the term “community” should be preferred over “retail.”

The dangers related to abusing terminology identified with the pharmacy calling are incredible. Associating the descriptor “clinical” with some, but not all, pharmacy practice settings have the potential for creating a hierarchy within the profession, a division between “clinical” pharmacists and other practitioners. Sorting pharmacy specialists and pharmacy settings may restrict the potential for the profession to push ahead with the arrangement of direct patient consideration in view of mistaken assumptions dependent on title or setting. This is especially risky whenever dictated by policymakers both inward and outside to the calling, or on the off chance that it limits freedoms to recognize and create tolerant consideration benefits taking all things together of our pharmacy practice settings.

As pharmacists and faculty members, it is our responsibility it is our duty to show others how it's done for the profession. We have the unmistakable honors of assisting with forming the eventual fate of our profession through our effect on the pharmacy students of today. The terms we use will be embraced by future pharmacists who are presently in our study halls and our pharmacy specialists. As the calling advances, drug specialists should progress all together gathering of experts. We challenge all pharmacy employees and pharmacy specialists in any setting to accept our shared traits across the calling through predictable utilization of phrasing, most especially identified with the terms “clinical” and “local area.”

Patient care at reference hospitals of the national health systems requires the articulated action of various professionals usually organized in teams, which should include physicians, nurses, and pharmacists among others. In particular, the pharmacist should be involved in discussing medication-related issues with other team members, as well as in advising patients about their pharmacological treatment. Central to this role is the practice of pharmaceutical care, defined as the responsible provision of drug therapy for the purpose of achieving definite outcomes that improve a patient's quality of life [1]. This role is far from trivial and demands appropriate and specific training of hospital pharmacists and pharmacy undergraduate students.

Effective action of pharmacists in this field implies visibility in the hospital environment and ample recognition of their professional role. In an investigation of compliance with pharmacological treatment², we were surprised that none of the 110 hospital outpatients included in the study mentioned the pharmacist as the professional who advised them about their pharmacological treatment. The physician was remembered by 103/110 (97.2%), the nurse by 11/110 (10.4%), while 4/110 (3.7%) patients mentioned other professionals (nutritionists and social workers). Importantly, 82/110 (74.5%) patients were included in federal programs supplying medications free of charge. These patients had to come to the hospital or go to another accredited centre in order to receive the medication. Our expectation was that many patients would remember the pharmacist as the professional who advised them about medication usage; however, this was not the case. These data indicate that the pharmacist was “invisible” to the patients who received pharmacological treatment even though they were the main target of his/her professional activities.

Irrespective of local deficiencies in infrastructure for pharmaceutical care and shortage of pharmacists [3], pharmacist “invisibility” relates to educational issues. Although pharmaceutical care in Brazil comprises well- a defined public policy supported by the law and formally structured in a specific national program of the federal government,[5] there is a scarcity of professionals with adequate training for this field of work. It is, therefore, necessary to invest in continuing education for working pharmacists who must provide patient-centered pharmaceutical care [5, 6]. This is not an easy task because hospital pharmacists have long been assigned to more predictable administrative activities. They are not comfortable to carry on activities demanding contact with the patient, which represents a new and more challenging practice.

More important is professional training for new generations of pharmacists. In Brazil, the National Curricular Guidelines for undergraduate programs in pharmacy [7] recommend that graduates will become closer to the “seven-star” pharmacist, seen as a caregiver, a decision-maker, communicator, manager, life-long-learner, teacher, and leader [8]. This new training paradigm goes beyond the transmission of technical knowledge: the pharmacist, in addition, to learning principles of pharmacotherapy, will relate to the health team and, in particular, will interact with patients. This view agrees with that of various institutions involved in pharmaceutical education, such as the American Association of Colleges of Pharmacy, which has worked for more than a decade to guarantee a real change in the training of pharmacy professionals [9].

The reorientation of the basic training of pharmacists, however, is a slow process facing various barriers of a conceptual and practical nature so that recent graduates have not yet incorporated these new attributes [10-16]. At the 2 Faculties of Pharmaceutical Sciences at the University of Sao Paulo, training activities involving patient care were first introduced in 1997; however, this training still represents just 5% of the total curriculum hours.

There is still an emphasis on training of professionals for the pharmaceutical industry, for work in clinical analysis laboratories, and in the administration of hospital pharmacy services, but not for participation in actual patient care.

CONCLUSION

In conclusion, for pharmacist working in reference hospitals to become recognized members of the health team, the institutions should invest in continuing education for these professionals. It is also extremely important for undergraduate pharmacy courses to emphasize activities involving patient contact and multi-professional health teams so graduates will be able to provide adequate pharmaceutical care. Only in this way will pharmacists become more visible to patients and to other health professionals.

ABSTRACT

Painting is the basis of all types of fine art. The basis of painting is painting, regardless of which of the types of fine art the artist creates. His observations, research on the compositions of a large work, he sets out first with preliminary pencil sketches. The article discusses the importance of painting in the development of spatial representations and creative imagination in architectural education, as well as in various design methods. The interest in painting has long fascinated people. Because it was necessary for the people of primitive times to communicate, to speak. It is known from history that most of the images are based on how ancient people who were engaged in hunting hunted animals. They followed the trails of the animals and left various images and signs on the rocks and caves. Over time, as a result of the development of their imaginative skills, various hunting scenes later began to be reflected in a way that had a unique initial compositional solution.

KEYWORDS: *Fine Arts, Works Of Art, Pencil Drawing, Special Assignments That Develop Imagination, Spatial Imagination.*

INTRODUCTION

The interest in painting has long fascinated people. Because it was necessary for the people of primitive times to communicate, to speak. It is known from history that most of the images are based on how ancient people who were engaged in hunting hunted animals. They followed the

trails of the animals and left various images and signs on the rocks and caves. Over time, as a result of the development of their imaginative skills, various hunting scenes later began to be reflected in a way that had a unique initial compositional solution. The pencil is the basis of all forms of fine art.

Regardless of which type of fine art the artist creates, it is based on pencil drawing. He expresses his observations, his research on the compositions of great works, first with the first lines in a pencil. In the creation of works of art, these completed drawings serve as an auxiliary source for the artist. The artist begins the creation of this or that painting with a pencil. Only then will this work of art give an aesthetic pleasure to the viewer through the colour scheme. In other words, no artist can make his work mature without a pencil drawing. Pencil painting can be a work of art that is finished independently, among other types of art. Many of the paintings, done with dreams, sanguina, pastels, saucers, and pencils, have been featured in various art museums and exhibitions around the world. Pencil drawing lessons are necessary not only for the future artist but also for people of different professions in the correct depiction of perception, perception of being, the formation of the hands, mind and senses [1,2].

The great Leonardo da Vinci also contributed to the improvement of drawing techniques. In his "Book of Painting," you can find many scientifically-based ideas about the structure of the universe, changes in nature, sculpture, linear and spatial perspective.

Like Alberti, Leonardo da Vinci believed that the basis of fine art was a pencil drawing, emphasizing that depiction of the object itself was a necessary part of teaching [3].

Also, Leonardo da Vinci studied the structure of human organs from a high level of anatomy. He studied every muscle tissue of man and drew their images. Among the master painters of the Renaissance, one of those who dealt with the problems of improving the methods of making pencils was the German painters Albert Dürer and Shannon. They conducted many experimental tests on the basic laws of perspective in imaging. Another noteworthy work of the artist is that he developed a method of developing the proportions of the human body and reflecting it through cut shapes [4].

Renaissance artists made a huge contribution to the development of world fine arts. The laws of perspective they developed on the fine arts later helped creative artists to an unprecedented extent. If in the Middle Ages the method of depiction was carried out taking into account the similarity of the shape of objects, now this period is a period of scientifically based penmanship, in-depth study of the laws of anatomy, a full reflection of the rules of perspective. As noted above, Renaissance artists made significant contributions to the methodology of painting and laid the foundation for the development of pencil drawing as a science. However, they paid little attention to the didactic foundations of teaching. By the end of the 16th century, this important task was continued and solved by art academies established in different countries.

LITERATURE REVIEW

The methodology of teaching the fine arts of the seventeenth century laid the foundation for the full continuation of penmanship as a science in its academic form. The system of teaching academic calligraphy in pedagogical practice was first developed at the "Academy of Pencil" in Florence. Founded by the Carracci brothers, they taught young artists in Bologna in the following way. He first became acquainted with the methods and rules of drawing, then

described the plaster samples, and then painted a picture of a human figure. In these classes, he was also able to study in-depth the anatomical structures of man. The Bologna Academy was one of the most prestigious and exemplary institutions of art education for young people in its time, so it continued its methodology. The St. Petersburg Academy was founded in 1768, and the London Academy of Arts in 1768.

Talented artists-teachers M.Nabiev, N.Kuzibaev, R.Choriev A.Boymatov, M.Saidov, K.Eminov, Y.Elizarov, T.Ogonosov, N.Ten, G.Abdurahmonov and many other great specialists made a great contribution to the development of the sphere in our country [5-8].

MATERIALS AND METHODS

The practical direction of education in the field of architecture in higher and secondary special education institutions is one of the main conditions for the training of personnel with professional potential. It is especially important to form a spatial image of the future architect. Drawings of all stages of design, details of the architectural form of the project, its compositional solutions are described in the plane. In addition to technical imagery, architectural projects also require visual imagery. In addition to educational disciplines such as design, descriptive geometry, the study of penmanship also plays an important role in the formation of spatial representation of form in architectural projects. Pencil drawing is inextricably linked with issues such as the principle of learning situations, construction, relativity, plasticity, lighting, composition. The architect allows designers to express his creative ideas in a graphic way.

The system of teaching drawing is not limited to the development of the student's professional skills, but also creates the basis for the creation of his individual creative worldview, his style. The future architect is one of the leading disciplines in teaching designers, pencilling and logically directing the creative imagination of students. Images created with the help of pencils are inextricably linked with the history of human development and are subject to certain rules. These rules were created by such great scholars of the Renaissance as Leonardo Da Vinci, Raphael, and Michelangelo, who were regarded as the benchmarks of their time.

Describing the development of perspective, descriptive geometry, plastic anatomy, and the rules for expressing shadow and light fall creates the development of a geometric and plastic logical device (carcass, constructive basis, silhouette, section, light and shadow). An element that can clearly show the expression of a figurative form in a pencil drawing must be used. That is, it is possible to use the colour (tone) resolution of the depicted object, relief or plastic expression. In the field of architecture and design, pencil drawing is a key tool in depicting the future appearance of buildings, streets, squares. The pen serves as a generator that generates his creative ideas, ensuring a high level of professionalism of the architect and designer [10, 11].

In the study and creation of an architectural project, the pencil is a creative formative tool of the artistic image that reveals the key to spatial imagination. Therefore, one of the important conditions for improving the content of the subject of pen drawing is to give students special assignments that develop imagination in graphic materials, especially through pencil drawing. The student needs to be able to describe the integral forms of design, architecture, not only in nature but also from memory, from imagination. Undoubtedly, pencil drawing has several advantages in this regard. The analysis of the current situation shows that the traditional methodological manuals are more widely used in modern textbooks than the pencil for architects and designers, and insufficient attention is paid to the development of creative project

development for architects. Therefore, the task of creating projects aimed at developing students' creative imagination in pencil drawing should be one of the priorities in improving the content of pencil drawing. In this regard, there is a need in the new textbooks to provide a system of creative exercises based on logic, spatial imagination, fantasy-based thinking and step-by-step. The practical activity of the architect and designer is to describe the spatial state of the building and its interior in a mock-up or graphic way, and to create such models requires a certain level of imagination and spatial imagination [12, 13]. In the science of psychology, imagination is divided into memory imagination, creative and creative imagination. Creative imagination - arises from verbal imagination, pencil or drawing. Creative imagination is the process of creating a new image based on memory and imagination. If creating an impression - if it is a product of memory, imagining - is imaginary. Imagination in a certain direction in a limited environment determines the main character of the creation. Imagination, memory, and impression are enriched by work without nature. The creation of creative imagination occurs in different ways. The most common of these is the agglutination method, which is the creation of a new object by adding elements from one object to another. In particular, the addition of architectural elements (balcony, canopy, column, etc.) to a composition similar to the architecture of geometric shapes is proof of our idea.

It is used in architecture education as well as in various methods of design. Including the method of fragmentation - the creation of the object by breaking it into pieces; the combination method - by adapting the initial elements to a clear logical scheme; the separation method is to create a new one by mixing pieces of the object. The method of analogy (French "analogies", Greek "analogy" conformity, proportionality) is the creation of a new one on the basis of certain elements, even if they look like a certain object. All of the above techniques can be used to create graphic works of art. However, one of them remains the main leading method. When these techniques are consciously applied, an expert in architecture shapes and develops the artist's imagination.

CONCLUSION

In conclusion, it can be said that through the above evidence, the formation of knowledge, its application, the expression of an artistic image through imagination, and many other positive images can be achieved. To do this, rely on creative methods to create graphic images in pencil drawing and approach through imagination; adherence to the principle of multilevel in the formation of knowledge and skills; it is advisable to follow tasks such as the independent study of the literature on drawing from the imagination.

ABSTRACT

Reporting a rare cancer of Tenosynovial Giant Cell Tumour. It is known to involve the Synovium, Bursae and Tendon Sheath. It is a benign tumour and surgery with clear margin is the treatment of choice. In this case we treated the patient with surgery followed by Chemotherapy.

KEYWORDS: *Tenosynovial Giant Cell Tumour, Rare Disease, Surgery, Chemotherapy.*

INTRODUCTION

Giant cell tumours can be roughly divide into localized and diffuse types, Localized types include giant cell tumour of tender sheath and localised pigmented villonodular synovitis,

whereas diffuse types encompass conventional pigmented villonodular synovitis and diffuse giant cell tumour. Tenosynovial giant cell tumour mainly involve hand and rarely to knee joint. Patient usually presented with Pain which is severe in character and aggravated on movement. There is slight female predominance over male.

Case Report: A 34 year old female presented in February 2020 with swelling over right side of knee since 1.5 Years which was insidious in onset, progressive associated with pain which is severe in character aggravated on movement and relieved with medication.

On examination- There is healthy scar marks over right knee with drain in situ.

Excised tissues-knee showed tenosynovial giant cell tumour.

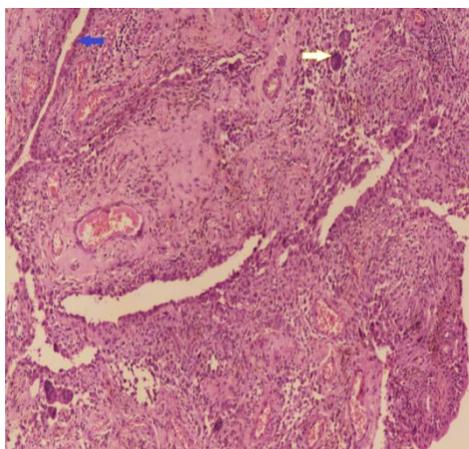

FIG.1 H & E show synovial lined tissue (blue arrow) showing numerous giant cells (white arrow) at 100x

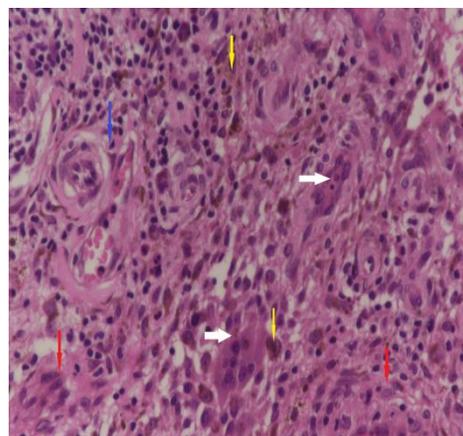

Fig. 2 H&E section show numerous giant cells (white arrow), stromal cells (red arrow), hemosiderin laden pigment macrophages (Yellow arrow) and proliferating cells at 400x

On MRI, there is supraspinatus Bursa is moderately distended and shows multiple thick enhancing septae with intervening fluid location.

- Mild to moderate enhancing nodular synovial thickening in suprapatellar bursae.
- Prominent T₂ Hypointense septation and few T₂ tiny hypointense foci in supraspinatus bursae.
- Enhancing synovial thickening posterior to lateral tibia plateau and lateral femoral condyle with mild fluid distension of synovium posterior to lateral femoral condyle. Few T₂ hypointense foci seen within synovium posteriorly.
- No bony erosion destruction or marrow edema seen at any level.

DISCUSSION

A report published by Vera Ehrenstein et. al. 2020, Tenosynovial giant cell tumour has range between 1.8 to 50 per million cases. It usually presents with swelling over affected side which is associated with pain. In the present case as surgery is the treatment of choice and on biopsy is suggestive of tenosynovial giant cell tumour. It is a benign tumour and there is less chance of tumour to recur. Prognosis is overall good.

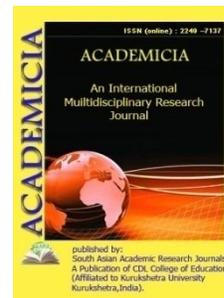

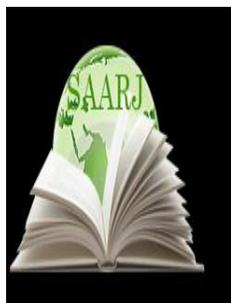

CONCLUSION

Due to rarity of tenosynovial giant cell tumour, there are no set guidelines for the management of such case. However, surgery with clear margins followed by adjuvant chemotherapy is treatment of choice.

-Further reporting with literature review which helps in most effective treatment modality.

ABSTRACT

This article discusses chrome-nickel-silicon steel used for surfacing sealing surfaces of pipe fittings of chemical, petrochemical and power equipment. In order to increase the wear resistance of surfacing alloys, the effect of additional alloying of the deposited metal with boron, molybdenum and other elements on the service properties of this alloy is investigated. As a result of alloying, the resistance to scoring of deposited metal alloyed with boron and molybdenum increases by 1.5–2 times.

KEYWORDS: *Mechanized Surfacing, Cored Wire, Alloying With Boron And Molybdenum, Pipe Fittings, Sealing Surfaces, Resistance To Scoring, Hardness, Hot Hardness, Corrosion Resistance.*

INTRODUCTION

For surfacing sealing surfaces of chemical pipe fittings, petrochemical and power equipment widely used chromium-nickel-silicon steel type 08X17H8C5Г2, characterized by high resistance to scuffing during friction of metal on metal, and also against corrosion and erosion at temperatures up to 545°C and specific pressures 60 - 65 MPa [1].

Surfacing of the layers of this steel is carried out manually with coated electrodes ЦН-6, as well as mechanized way with CB-04X19H9C2 wire and 15X18H12C4TiO ribbon under fused-

ceramic alloying flux ПKHЛ or ПП-AH133 flux-cored wire and ПЛ-AH150 flux-cored wire under AH-26 flux [2,3]. The hardness of the weld metal is HRC 29 – 36, its structure is austenite and silicon-doped ferrite. At higher specific pressures (80 - 100 MPa), the wear resistance of the 08X17H8C5Г2 deposited metal is already insufficient, mainly due to its low hardness at operating temperatures. High specific pressures in combination with the action of an aggressive environment can cause plastic deformation of the sealing surfaces, the appearance of scoring, dents and other defects on them.

The hardness of the deposited metal 08X17H8C5Г2 can be increased to HRC 46 - 50 by heat treatment or long aging. However, a sharp embrittlement of the alloy occurs due to the appearance of the σ phase in its structure.

In order to increase the wear resistance of surfacing alloys, the authors investigated the effect of additional alloying of the deposited metal of 08X17H8C5Г2 type with boron, molybdenum and other elements on the service properties of this alloy.

The criteria for assessing the wear resistance of the deposited metal were resistance to scoring, hardness and mechanical properties at normal and elevated temperatures. At the same time, the resistance of the deposited metal against general corrosion was also investigated. The tests were carried out in a working chamber at a steam temperature of 350°C on samples, imitating valve shutter parts Dy 50. During the tests, the samples made a mutual rotational movement (with reverse) at a specific pressure set from 10 MPa to pressure, causing on the test surface scoring depth of 10 microns or more. Before each test cycle, the actual contact area of the samples was measured, their working surface was degreased and the purity of processing the sealing surface of each sample with a microscope was determined. Assessment of the resistance of the deposited metal against scoring was also carried out using a microscope — the size of the scoring, exceeding 10 microns. The criterion of resistance was the maximum allowable pressure on the rubbing surfaces of the samples, at which the depth of the seizure did not exceed 10 microns.

Tests for resistance to general corrosion were carried out on samples with a diameter of 25 mm and a thickness of 3 mm, made of weld metal. Corrosion media and test parameters were selected according to the requirements of РДРТМ 26-07-225-79 “Structural materials for parts of pipe fittings, working in chemical industry environments.”

Hot hardness was measured at an indenter load of 108 H, a shutter speed of 60 s and an air pressure in the working chamber of 1.33 МПа. Measurements were taken at temperatures of 20, 200, 400, 500, 600 and 700 °C.

The surface of the samples was carried out with pilot wires under the AH-26П flux in five layers on Ст3 steel billets. Deposited work pieces were tempered at temperatures of 650 and 850°C for 3 hours; samples for research were made from the upper layer of deposited metal.

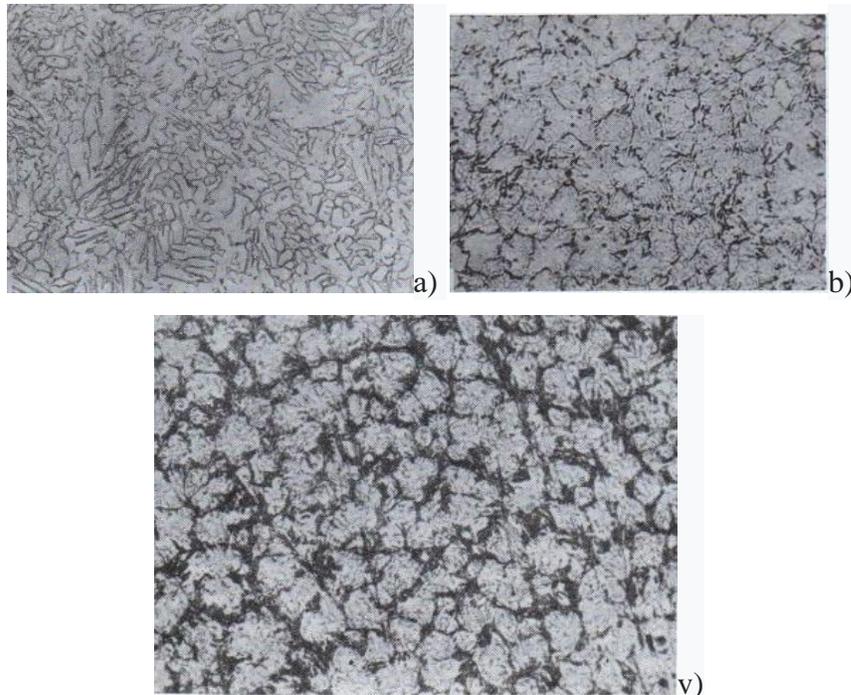

Fig. 1. The microstructure of the deposited metal type 08X17H8C5Γ2P (X320, dim.2/3) a) does not contain boron; b) with 0.42% B; c) with 1.06% B

It is known that boron has a positive effect on heat resistance, ductility, and other properties of austenitic chromium-nickel steels [4]. We have established that the introduction of boron into the deposited metal of 08X17H8C5Γ2 type significantly increases its hardness. In this case, a boride eutectic appears in the austenitic-ferritic structure of the alloy, which consists mainly of solid borides of chromium, iron and silicon. With an increase of boron concentration, the amount of boride eutectic in the structure of the deposited metal increases (Fig. 1).

With the introduction of up to 1.4 - 1.5% boron, the hardness of the deposited metal 08X17H8C5Γ2 increases from 30 - 32 to 45 - 47 HRC (fig. 2). At high boron contents, the plasticity of the alloy decreases sharply and there is a danger of the appearance of cold cracks on surface, for prevention of which requires preheating and delayed cooling. Therefore, a deposited metal of the type 08X17H8C5Γ2 containing 0.8 - 1.0% boron and having a hardness of HRC 40 - 42 was chosen for further studies.

An important function of doping with boron is to increase the hot hardness of 08X17H8C5Γ2 alloy, which is especially evident in the temperature range of 500 - 600°C (fig. 3). Along with the positive effect of boron, a decrease in the resistance of the latter against general corrosion is observed on the hardness of the deposited metal type 08X17H8C5Γ2, which can be explained by the binding of a significant amount of chromium in borides. We have established that to increase the corrosion resistance of the deposited metal 08X17H8C5Γ2, containing boron in its composition it is necessary to increase the content of chromium and nickel, and also add molybdenum.

Preliminary experiments have shown that when the content in the 08X17H8C5Γ2 alloy is more than 3% molybdenum, an intensive precipitation of inter metallic phases begins to

occur (especially in the area of elevated temperatures), which leads to embrittlement and the appearance of cold cracks in the deposited metal. Therefore, when conducting comparative tests for resistance to general corrosion of the 08X17H8C5Г2 alloy, additionally doped with molybdenum, the content of the latter was varied in the range of 0.8 - 3.0%.

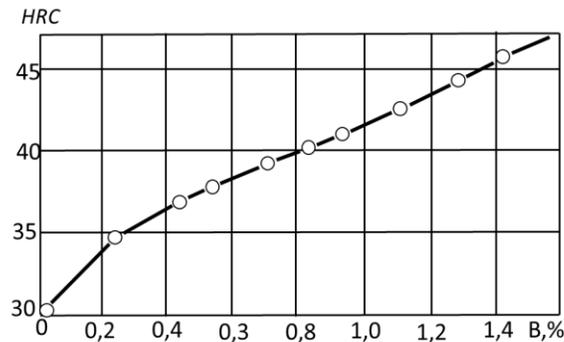

FIG. 2. THE EFFECT OF BORON ON THE HARDNESS OF THE DEPOSITED METAL TYPE 08X17H8C5Г2

Tests have shown, that the deposited metal 08X19H9C5M2ПГ is corrosion resistant in nitric and citric acids, sea water, water vapor is not inferior to the deposited metal 08X17H8C5Г2, but in sulfuric formic, oxalic, phosphoric acetic and lactic acids are superior to it. For achieving high anticorrosive properties of the table it is necessary: 1) to alloy additionally the 08X17H8C5Г2P deposited metal with approximately 2.5% chromium, 1% nickel, and 2% molybdenum. Due to the presence of molybdenum in the deposited metal, its hardness increases by HRC 2 - 3.

Boron and molybdenum also have a positive effect on the strength properties of the weld metal. The temporary resistance of the deposited metal type 08X17H8C5Г2P and 08X19H9C5M2ПГ as in the initial state, so after 2 various types of heat treatment above, than metal in which boron and molybdenum are absent (Table 2).

It is known, that the 08X17H8C5Г2 alloy is characterized by sharp embrittlement during prolonged heat treatment (aging) or operation at temperatures above 400 °C. This phenomenon is accompanied by a sharp increase in hardness and is caused by the release of a finely dispersed σ phase of the Cr₆ (5) type Ni₂Si in the alloy structure [5, 6]. During the operation of the reinforcement and even during the machining of the deposited parts, this can lead to the appearance of cracks, chips on the sealing surfaces and a violation of the tightness of the valve closure.

Doping with boron ensures high stability of the structure of the deposited metal 08X17H8C5Г2 during heat treatment or long-term aging in the temperature range 450 - 800 °C. In this case, the alloy hardness increases by no more than HRC 2 - 3. Although boron slightly reduces the toughness of the deposited metal 08X17H8C5Г2, during the heat treatment, its values practically do not change,

whereas the viscosity of the metal, not containing boron, is reduced ten times (table. 2).

TABLE 1. SERVICE PROPERTIES OF WELDMETAL

Type of weld metal	HRC	p3, MPa	Corrosion rate, g / m2 * h		
			In 56% nitric acid (800C, 100h)	In concentrated sulfuric acid (600C, 100 h)	In concentrated formic acid (tkip, 100 h)
08X17H8C5Г2	32-34	48,7 - 59,2 57,0	0,17-0,22 0,18	0,78-1,15 1,05	0,50-0,70 0,80

TABLE 2 MECHANICAL PROPERTIES OF WELD METAL

Heat Treatment Modes	08X17H8C5Г2		08X17H8S5Г2P		08X19H9C5M2ПГ	
	σ_B , MPa	$a_{H.}$ J / cm ²	σ_B , MPa	$a_{H.}$ j / cm ²	σ_B , MPa	e_n , J / cm ²
The initial state	886 -901 888	5,0 -5,0 5,0	913-997 955	2,5-5,0 2,5	859-1007 932	2,5-5,0 2,5
Vacation 650 ° C, 3 hours	869-919 907	5,0-5,0 5,0	857-948 941	2,5-2,5 2,5	747-834 782	2,5-2,5 2,5
850 ° C, 3 h	653-749 693	2,5-5,0 2,5	776 -892 831	2,5- 2,5 2,5	809 -902 832	2,5-4,0 2,5
Aging 600 ° C, 1000 h	617 -674 646	0,15- 0,75 0,5	638-707 682	2,5-2,5 2,5	693-832 776	2,5-3,0 2,5
Quenching from 1100 ° C	Not carried out				915-985 943	5,5-7,5 7,0

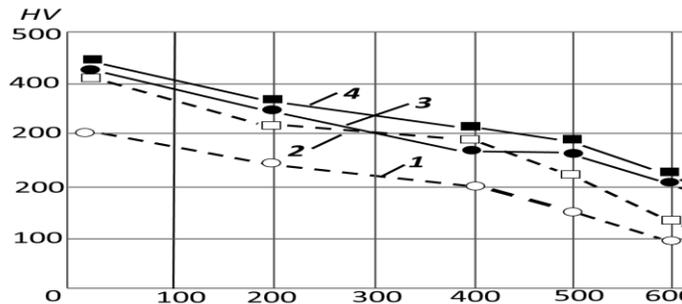

FIG. 3.HOT HARDNESS OF DEPOSITED METAL TYPE 08X17H8C5Г2 (1,2) AND 08X17H8C5Г2P (3,4):1,3-AFTER SURFACING;2,4-AFTER AGING 6000C, 1000

Bench tests showed, that resistance to scoring of weld metal, doped with boron and molybdenum, 1.5-2 times higher than the resistance of metal type 08X17H8C5Г2 and not inferior to the resistance of metal type 10X16H8M6C5Г4Б, deposited with electrodes LH-12 (tab.1.)

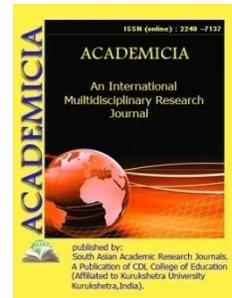

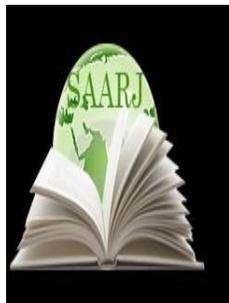

CONCLUSION

High resistance against bulging of the weld metal containing boron, determined mainly by an increase of hot hardness. It is possible that at operating temperatures on the surface of chromium-nickel-silicon metal, containing boron, a borosilicate glass film may form, having a low coefficient of friction and, according to 7, which is more heat-resistant and less prone to cracking during thermal shock, than a silicon oxide film. This should also have a positive effect on the resistance of the weld metal against scuffing. Based on the studies, the 08X19H9C5M2ПГ type alloy is recommended for surfacing pipe fittings in the energetic, chemical and petrochemical industries, parts of centrifugal oilfield pumps. In IEC named after E. O. Paton flux-cored wire brand

ПП-АH 157 produced, providing during surfacing under flux or in argon the production of deposited metal 08X19H9C5M2ПГ.

MODERN INFORMATION AND COMMUNICATION TECHNOLOGIES AND WAYS TO IMPROVE MARKETING ACTIVITIES TO INCREASE THE COMPETITIVENESS OF TEXTILE PRODUCTS

Musayeva Shaira Azimovna*

*Assistant Professor,
Samarkand Institute of Economic and Service,
Samarkand, UZBEKISTAN
Email id: musaeva_shoira@mail.ru

ABSTRACT

This article discusses the experience of many developed and leading countries in the world economy today to achieve competitiveness and access to world markets, primarily the gradual reform of the economy, deepening structural change and diversification, rapid development of new high-tech enterprises and industries, accelerating the process of development, modernization and technical renewal of existing facilities. These processes also apply to textile enterprises, which are important sectors of the Uzbek economy and require coordination of production and sales on the basis of marketing research.

KEYWORDS: *Diversification, Textiles, Information, Services*

INTRODUCTION

World experience shows that the role and importance of the field of information and communication technologies (ICT) in the global economy, including the production of computer and telecommunications technologies, software products and the provision of a wide range of interactive services based on them, is growing. On the State Program of the President of the Republic of Uzbekistan "On the implementation of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021 in the Year of Active Entrepreneurship, Support of Innovative Ideas and Technologies" and "Measures for further improvement of information technology and communications" In order to ensure the implementation of the decrees of the Cabinet of Ministers of the Republic of Uzbekistan from June 1, 2018, businesses will be able to export goods and services without concluding an export contract and without charging a bank commission, except for certain goods on the list established

by the Cabinet of Ministers. have the right to export services. At the same time, the turnover of goods sold by businesses through e-commerce, regardless of their size, is retail. Also, the involvement of international consulting companies and experts in the field of ICT, development of their IT infrastructure and strengthening the material and technical base, as well as ICT. It is planned to implement it at the expense of the Development Fund. The experience of many developed and leading countries in the world economy today proves unequivocally that achieving competitiveness and access to world markets, first of all, the gradual reform of the economy, deepening structural transformation and diversification, rapid development of new high-tech enterprises and industries. development, modernization of existing facilities and acceleration of the process of technical renewal.

Main part

These processes also apply to textile enterprises, which are important sectors of the Uzbek economy, and require the coordination of production and sales on the basis of marketing research. One of the main reasons for this is the demand for the quality of textile products in the current situation and the crucial role of the strategy of enterprises to enter international markets. According to the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated December 31, 2013 No 355 "On measures to introduce a system for assessing the state of development of information and communication technologies in the Republic of Uzbekistan" from December 1, 2014 in the Ministry of Information Technologies and Communications Experts of the Center for e-Government Development and the Center for Information and Public Security quarterly analyze the state of implementation and development of ICT in public and economic administration, local government and conduct rating assessments. The impact of modern ICT on socio-economic development is extremely high, primarily in the growth of labor productivity, competitiveness, job creation, reduction of production and service costs. , The World Wide Web (WWW) internet commerce networks are growing rapidly. The development of ICT has led to the emergence of e-commerce, which is the most important system of the Internet. The modern concept of marketing has become the basis for the emergence of a new direction of Internet marketing. One of the key features of internet marketing is its hypermediate nature, which is characterized by high efficiency in presenting and assimilating information, which significantly increases marketing opportunities in improving the relationship between business and consumers. The role of the Internet is not limited to communicative functions, but also includes the ability to make transactions, make purchases and make payments, which provides the characteristics of the global electronic market. In order to organize the effective sale of products of enterprises, e-commerce tools are widely used in the practice of developed countries. These four models of e-commerce C2C, B2B, B2C and C2B are common in developed countries. It reduces the possibility of exporting information and communication products to domestic and global markets, as well as the cost of using these products to find a buyer, increase the country's export potential and increase efficiency. rather, it incorporates a number of concepts and ensures its full implementation. These include, first, identifying the basic needs of consumers through marketing research tools; second, to create products that meet these needs; third, delivery of these products to consumers using marketing elements (price formation, advertising, sales promotion, etc.); fourth, the direct sale of products to consumers through supply (sales) networks. In this sense, marketing activity involves conducting marketing research, on this basis, developing a marketing strategy, programs of marketing activities. This

requires the effective use of methods of marketing analysis. In the current situation, special attention is paid to the formation of marketing activities in many economic entities and the solution of its problems from a scientific point of view, the basis of such entities is the market category. This process is also important for the textile market. Based on the methodological recommendations developed to assess the competitiveness of the textile enterprise, it is possible to determine the position of enterprises among their main competitors and their strengths and weaknesses. This is because the manufacturer's desire to improve the consumer properties of new types of products, as well as their development, ultimately leads to an increase in the level of quality. This, along with the increase in sales of these products and services, affects the expansion of markets for their sale. Any enterprise conducts its marketing activities in a competitive environment and competes in terms of type of activity. There is no way to avoid competition for local markets or businesses in a single geographic segment. In this case, the so-called "competition" activity, ie competition in the sense of the type of activity. In the marketing management system, the development and implementation of competitive strategies as part of marketing strategies necessarily requires market analysis, as well as diagnostics of its competitive environment. Conducting marketing research to address the existing problems of the textile industry in the competitive world market, the development of a marketing strategy based on the innovative marketing concept can raise the potential of the textile industry of Uzbekistan to a whole new level. The organization of a modern textile industry depends, for example, on the supply of products from other industries (a developed chemical industry that supplies quality cotton fiber, quality dyes, the availability of a modern retail system). The development of textiles will require the support of manufacturers who supply the necessary raw materials, and only due to such a comprehensive approach can increase the competitiveness of the industry and achieve further economic growth. The policy in the field of attracting foreign investment should be based on encouraging the formation of network clusters, ie the development of strategic sub-sectors around the leading sectors. In our opinion, in order to determine the competitiveness of the enterprise, it is necessary to evaluate a number of indicators that characterize the development of its industries that are not directly related to the production process.

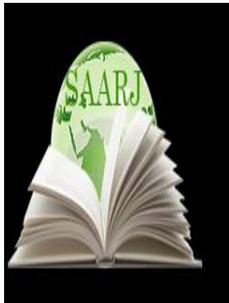

CONCLUSION

The assessment of the non-manufacturing sector of the textile industry is explained by the fact that in world practice today, special attention is paid to public opinion, the image of the enterprise. Marketing activities in the communication policy of foreign firms are in many respects related to "public relations", which represents the management function, through which public opinion, organizational policies and tactics are evaluated in the public interest, as well as the implementation of any action plan for public recognition and respect. public relations). Based on the requirements of foreign practice, the level of development of the social sphere in the enterprise was assessed. According to foreign experts, only under normal working conditions can an employee create a competitive product.

ABSTRACT

This article gives information and focuses on today’s folk arts, the wide range of opportunities created, the uniqueness of pottery schools in our country, the prospects for the development of art and culture, the peculiar continuity of the ancient teacher-student traditions and the reforms of the head of our state in the field of art are widely covered. The tasks that young artists have to perform in the future are fully disclosed.

KEYWORDS: *Fine And Practical Arts, Teacher-Student, Potter, Pottery, Craftsman, Folk Applied Art, Work, Pattern, Handicraft, Clay.*

INTRODUCTION

The historical roots of applied art go back to the childhood of mankind. As humanity grew, so did applied art, as did all forms of art, folk applied decorative art is notable for its young and unique history. Today, the great attention paid to art and culture has further increased the demand and need for personnel with strong knowledge and skills in the field of applied arts. Undoubtedly, art is one of the areas that introduces to the world the power and uniqueness of any state and society. We all know that each art form has its own history of formation, stages of development, traditions, style of work and artistic significance.

Therefore, art is a powerful force that transmits the historical development of the nation, its artistic heritage from generation to generation. One of the most developed, deeply historical

roots of folk applied art is artistic pottery. It is noteworthy that it has schools that are unique to each region of our country and is getting better every year. There are pottery schools in **Bukhara-Samarkand** school (main centers - Samarkand, Urgut, Gijduvan, Uba), Khorezm school (main centers - Madir, Kattabog villages), Fergana school (main centers - Rishtan, Gurumsaray) and Tashkent non-traditional pottery centers.

The lead glaze and yellow-green and brown paints play an important role in the resonant elegance of the Bukhara-Samarkand school of ceramics. Vegetable patterns dominate in the decoration of products based on the traditions of "Afrosiyob pottery", handicrafts, animal images are rarely used. They are mainly used in Gijduvan pottery. While the masters of Gijduvan and Shakhrisabz work with brushes, the masters of Urgut and Denau often use drawing patterns. Bukhara-Samarkand School of Ceramics differs from other schools by the presence of a center for ceramic whistles.

The Khorezm school of ceramics is of special importance with its unique art, color of decorations and style of processing, Fergana (Rishtan) pottery schools are distinguished by delicately drawn flowers, various shapes and patterns. This reflects the stability of regional traditions. Their creation is in bright paint, attracts a person with its richness of patterns and reflection of all colors under subtle mystery. The main peculiarity in the creation of such attractive unique works of applied art is the artistic decoration. Our applied art with its rich artistic heritage makes a great contribution to the development of world art and culture. The fact that our country, as a hearth of ancient civilization, retains the originality of national artistic traditions is recognized by the world's leading art experts.

Nowadays, many young talents enter the modern Uzbek applied art, artists working in various fields, in particular, the new content and form of the works of artists and sculptors, folk masters, the tendency to strive for a worthy place in the world art scene should be positively assessed. It should be noted that in recent years, in the decoration of art ceramics, which is coming to the field of art, we can find a unique traditional, historical place of modern art lines or elements of patterns that do not correspond to tradition. At the same time, it should be noted that the current work on the development of fine and applied arts and design is not in demand. The imperfect legal and material and technical base of the industry, the lack of qualified personnel have a negative impact on the effectiveness of work in this area.

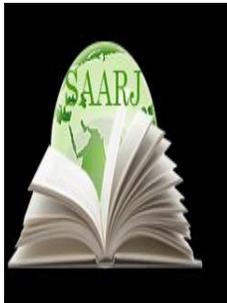

The decree of the President of the Republic of Uzbekistan Shavkat Mirziyoyev dated December 2, 2016 "On measures to ensure the accelerated development of the tourism industry of the Republic of Uzbekistan" PF-4861, further development of ancient and unique culture of our people, has played an important role in raising the work on the widespread promotion of national handicrafts to a new level; the Resolution of the President of the Republic of Uzbekistan "On measures to further increase the efficiency of the fine and applied arts" dated April 21, 2020 No PP-4688 was a solution to the existing problems in training in the field of art. A number of tasks have been set for the formation and coordination of the educational and methodological base of retraining and advanced training courses for teachers and specialists in the field of art education, as well as the implementation of organizational and methodological guidance. In particular, to ensure the high quality of fine and artistic works, to fully realize the potential of artists, to introduce the activities of creative workshops in the educational process, particular attention was paid to the development of advanced teaching methods, preserving the traditions of "teacher-student" and art education. The tradition of "teacher-student" has an ancient history. Under the

leadership of the head of our state, the continuation of the tradition of “Teacher-Apprentice” among the people is rising to the level of state policy as a priority. Much attention is paid to the development of the tradition of “teacher-student” and the systematic conduct of this work. In particular, improving the quality of education requires the continuation of the tradition of “teacher-student”. Not only in the territory of Uzbekistan, but all over the world to strive for the maturity of today’s youth, the “Master-Apprentice” tradition is very important in restoring spiritual values and cultivating a sense of devotion to the motherland. The riches and rare works created by the masters of pottery of the people of Uzbekistan play an invaluable role in raising the national traditions of our country. In particular, in the art of ceramics, the tradition of teachers is an example for young artists. As a young artist begins his career, he first turns to history and learns from it. Master pottery knowledge also plays an important role in the study and continuation of the art of artistic pottery. Master craftsmen create a miraculous beauty from the black clay of pottery, reflecting in their knowledge of the artistic processing of ancient patterns and colors in it, and apply it to young artisan potters. It is well known that no globalized era can give us the knowledge and skills that master potters impart. Therefore, it is necessary to improve the traditions of “Master-Apprentice” in every field, not only in the art of ceramics. We believe that the students will take advantage of the wide range of opportunities created by the head of our state, create freely, and take a methodological approach to depicting the ideas and philosophies in their worldviews and the literature they read.

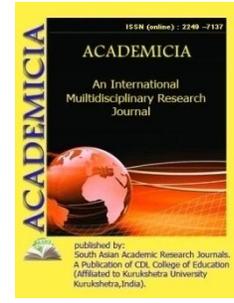

In the art of pottery, they contribute to the transmission of artistic and symbolic expressions from generation to generation while maintaining their tradition.

PEDAGOGICAL MODEL OF ENSURING THE LIFE SAFETY OF PRESCHOOL CHILDREN

Abdullaeva Gulruh Abdiazizovna*

*Senior Lecturer

Institute of civil protection, (Tashkent)

Under the FVV Academy of the Republic of UZBEKISTAN

ABSTRACT

In this article, one of the important problems associated with the rules of traffic safety of children and adolescents is revealed. It is concluded that knowing the rules is necessary in the life of every person from an early age. Therefore, working with children and adolescents is an important profession izlash new, interesting form. The issue of children mortality leaves no one indifferent. Every such tragedy is a sign of the irresponsibility of adults. They can't do what they can to protect children and save their lives. Today, not only pedestrians and passengers on the streets, but also road users - cyclists, scooters - are the cause of accidents.

KEYWORDS: *Children, Adolescents, Education, Road Safety, Accident, Safety, Traffic Accident, Accident, Etc.*

INTRODUCTION

The growing number of accidents, catastrophes, natural disasters, terrorist attacks, the economic damage they cause and, most importantly, the growing number of victims around the world require emergency situations and improved protection mechanisms.

There are many ways to protect against emergencies. Among them, the training and professional development of children, including parents, pedagogues plays an important role.

Indeed, the greater or lesser number of victims among children in the event of an emergency depends on the prompt, reasonable actions of children, including parents, pedagogues.

The Republic of Uzbekistan has created an effective system that regulates the training of the population to act properly in emergencies. A number of legal and regulatory documents have been adopted in this regard. In particular, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated September 9, 2019 No 754 "On the procedure for training all

segments of the population to act in emergencies and in the field of civil protection" the decision of July 11, 2017 "On measures to further improve the system of road safety" was an important step.

The issue of children mortality leaves no one indifferent. Every such tragedy is a sign of the irresponsibility of adults. They can't do what they can to protect children and save their lives. Today, not only pedestrians and passengers on the streets, but also road users - cyclists, scooters - are the cause of accidents.

For the child, the family is a source of social experience. In the family the child finds examples to imitate and in there his social birth takes place. If we want to raise a morally healthy generation, we must solve this problem with the "whole world": the education system, the family, the community. (Sykhomlynsky)

Every year, the number of cars on the roads increases and the speed of movement increases. Therefore, ensuring the safety of children on the road remains an increasingly important task.

The urgency of this problem is due to the fact that young children do not have a protective psychological reaction to road conditions typical of adults.

There are some peculiarities of introducing a child to a road-vehicle. Their desire to acquire knowledge, the desire to constantly innovate new prices, and the fight against risks to security.

Their desire to learn and a constant discover new things exposes the child to real dangers. Therefore, personal experience should be replaced by experience found by the community. At the same time, it is necessary to take preventive measures to teach children about safe behavior on the road.

It is necessary to prepare the child from an early age for a lifelong "profession" for the annual participant-pedestrian. At this age, the foundation of life directions in the environment and everything that children learn in the education system will be remembered forever.

Only the joint efforts of teachers and parents, using their knowledge, patience and behavior, can we teach our children the ability to communicate safely with the complex world of streets and roads.

The success of ensuring a road accident with children mainly depends on the consciousness, personal culture, and discipline of the adults. The most effective means of educating a small pedestrian is an example of parental behavior on the road. Forming the character of the child in the family, his attitude to others begins with the ability to communicate and provides for the most important needs of the child in the family.

Given the special importance of work in this area, since the children's institution is the first stage in the system of continuing education, our business team is tasked with responding not only to the children, but also to the parents, to give them the habit of following the venues that take place each year. Parents are our interested partners in the upbringing and development of children, interact with them and use the different types of work organized at the following stage.

Hence, the basic principle of education at this level is the relationship between the preschool and the family.

Steps to be taught by parents:

- kindergarten site;
- information stands where parents are advised to behave on city streets, taking into account the age of the children;
- creating slogans to attract the attention of parents in the design of the corner: "The cost of rushing is your child's life", "Attention - we are children!", "The child has the right to live!", "It's stupid to save time at the expense of a child's life.", "Me and my child on the city streets", "be careful of the car", and etc .;
- notes and leaflets - appeals containing material on traffic rules required for assimilation by children and adults, "Watch out, children! ", "Following traffic rules is not a problem" and etc.

The second stage is the students of primary general education institutions (7-10 years). At this stage, the knowledge of the basics of pedestrian safety is formed, the ethics and culture of traffic and roads are taught. By the end of primary school, the child should know the basic rules of safe behavior under normal conditions, be able to predict the development of traffic conditions and should solve the main way "traps".

The third stage includes students of 5-7 grades of secondary school (11-13 years old). At this stage, the knowledge of the basics of road safety acquired in elementary school is strengthened. The main aspects of traffic rules are studied. Perhaps physics will be taught to the end, taking into account the inter-object relationships with mathematics.

The fourth stage is for students in grades 8-11 (14-17 years old) of the secondary school. In high school, it is recommended to hold preventive talks and lectures for pedestrians, drivers, passengers, repeating the basic rules of the road.

Particular attention should be paid to the need to consider measures of administrative, criminal and civil liability for violations of traffic rules.

Students over the age of 14 must be aware of the law and the penalties for violating them: the amount of fines, preventive measures, educational and compulsory measures, etc.

When studying the topic "First aid in traffic accidents" for lectures on legal issues, legal advisers and road safety officers who know the lawn and health workers should be involved in training in the "Fundamentals of Medical Knowledge and Child Health" section. There is no doubt that increasing the effectiveness of such lessons at all levels of education.

Additional educational institutions for children have a special place in the system of lifelong education of children and adolescents on the basics of road safety. They are visited by children and teenagers of different ages. Therefore, in order to implement the principle of continuity, it is recommended to organize the learning process in three stages:

Learning the basics of road safety by preschool preparation group and primary school students (grades 1-4); Improving knowledge and skills on safe driving on the streets and roads, participation in public events: competitions, games, units of young inspectors on road safety and other associations of additional education for children (grades 5-7);

Professional self-determination of high school students (grades 8-11). Improving safe driving skills on the streets and roads through a variety of activities, including vocational training for drivers, participation in road safety advocacy among young students.

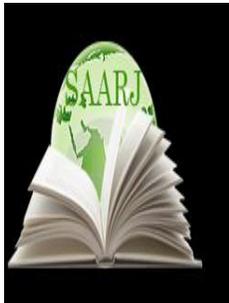

This approach allows you to comprehensively address the challenges of additional training for children and adolescents with safe driving on the streets and roads, safe driving of bicycles, mopeds, cars, and the professional orientation of adolescents.

The high rate of road traffic injuries in children inevitably leads to the search for the most effective ways to save the lives and health of children. The study of traffic rules in the classroom, class hours, lectures, conversations with children, various competitions and quizzes, competitions, excursions and other forms of prevention should be included in the integrated system of continuing education and upbringing.

At the same time, on the one hand, the effectiveness of the prevention of road accidents in children, providing road safety, interdependence of all subjects interested in the protection of life and health of children and adolescents, on the other hand, it was necessary to consider the scientific achievements and new pedagogical technologies related to the operation of this work.

ABSTRACT

This article analyzes the impact of foreign direct investment on economic growth on the example of the Uzbekistan's economy. The main object of research is the current state of the Uzbekistan's economy and the volume of investment in it. The article theoretically describes foreign direct investment, their types and impact on GDP. Conclusions are formed on the basis of the analysis and the studied international literature. one of the developing countries, also has an active investment policy. The country is creating a favorable investment climate for investors. This is an additional opportunity for investors who want to invest in the country. As a result, the volume of foreign investment in the country's economy, especially foreign direct investment, is growing, based on the analysis of statistical data.

KEYWORDS: *Investment, Foreign Investment, Economic Growth, Foreign Direct Investment, Economic Development, GDP.*

INTRODUCTION

Foreign direct investment is becoming a real driver of the global economy. One of the main positive factors influencing the development of the world's economies is foreign direct investment. Foreign direct investment flows directly into the real sector of the economy and is directed to production. This type of investment leads to the development of production.

Expansion and development of production is carried out with the establishment of new enterprises, modernization of existing ones and qualitative improvement and diversification of products.

As a result of the expansion of production, new jobs will be created. This will lead to a decrease in the unemployment rate in the country. This is also one of the positive effects of direct investment. In addition, employment will increase incomes. This has a direct positive impact on the living conditions of the population and, as a result, increases the welfare of the population. In addition, the inflow of foreign direct investment into the economy will provide the country with additional capital. As a result of the global movement of foreign investment, the entire world economy can achieve high economic growth. The movement of capital will also increase on the basis of the movement of foreign investment. This provides additional capital to the economies of some low-income countries. In general, the positive impact of foreign direct investment on the economy has been considered on the basis of various studies and has yielded results in practice.

Uzbekistan, one of the developing countries, also has an active investment policy. The country is creating a favorable investment climate for investors. This is an additional opportunity for investors who want to invest in the country. As a result, the volume of foreign investment in the country's economy, especially foreign direct investment, is growing, based on the analysis of statistical data.

LITERATURE REVIEW

The topic of foreign direct investment has been studied by many scholars, on the basis of various studies and on the example of different countries.

Hidehiko Matsumoto, a Japanese scientist, published an article in the Review of Economic Dynamics entitled "Foreign reserve accumulation, foreign direct investment, and economic growth"[1]. In this paper develops a quantitative small-open-economy model to study the determinants of the optimal pace of foreign reserve accumulation by developing countries. In the model, reserve accumulation depreciates the real exchange rate and attracts foreign direct investment (FDI) inflows, which promotes productivity growth through endogenous firm dynamics. The economy is also subject to sudden stops in the form of an occasionally binding constraint on foreign borrowing, and accumulated reserves are used to prevent severe economic downturns. The model shows that two factors are the key determinants of the optimal pace of reserve accumulation: the elasticity of the foreign borrowing spread with respect to foreign debt and the entry cost for FDI. The model suggests that these two factors can explain a substantial amount of the cross-country variation in the observed pace of reserve accumulation.

Scientists Mollah Aminul Islam, Haiyun Liu, Muhammad Asif Khan, Md Tariqul Islam, Md Reze Sultanuzzaman published an article entitled "Does foreign direct investment deepen the financial system in Southeast Asian economies?"[2] in Journal of Multinational Financial Management. This study empirically examines the role of foreign direct investment (FDI) to trigger financial deepening (FD) in the Southeast Asian region. More specifically, it investigates the direct and indirect roles of FDI in enhancing the level of FD. The findings of the robust FGLS and PCSE estimators suggest that FDI acts as an essential stimulator to FD in the region – directly as well as indirectly through money supply. The results are robust under alternative specifications and institutional measures. The study recommends policymakers to carefully consider the channels of money supply that substantially influence FDI to stimulate the level of

FD. In addition, it is viable to understand the dynamic role of the institutional framework and other macroeconomic variables in this nexus. In addition, the article is filled with the following information:

- ✚ Scientists study the direct and indirect role of FDI on financial depth of Southeast Asian region.
- ✚ FDI acts as an essential stimulator to financial depth in the region – directly as well as indirectly through money supply.
- ✚ Money supply channel needs to be accounted by the policymakers.
- ✚ There is dynamic role of the institutional framework in this nexus.

Scientists Michael J. Osei, Jaebeom Kim published an article entitled “Foreign direct investment and economic growth: Is more financial development better?”[3] in the journal Economic Modeling. These scientists investigate the extent to which an increase in financial development affects the positive effect of foreign direct investment on economic growth. Although the financial sector is beneficial for economic growth, the effect of further financial development on growth is found to become insignificant. Using a dynamic panel threshold model on 62 middle- and high-income countries spanning the period 1987–2016, they re-examine the possible nonlinearity between finance, foreign direct investment, and growth. Consistent with the “vanishing effect” of financial development, they find significant evidence that foreign direct investment fosters growth in general, but the growth effect of foreign direct investment becomes negligible when the ratio of private sector credit to gross domestic product exceeds 95.6%. This finding is robust to different econometric methods, various subsamples and interaction analyses, and distinct financial development indicators. The article is supplemented with the following information:

- Scientists examine how financial development is related to the link between FDI and growth.
- Scientists use a dynamic panel threshold model with GMM to address the endogeneity issue.
- Scientists identify a potential maximum financial development threshold.
- The marginal effect of FDI on growth decreases as credit expands.
- Too much finance is not necessarily better for the FDI-growth nexus.

DATA AND METHODOLOGY

Foreign direct investment (FDI) is when a company takes controlling ownership in a business entity in another country. With FDI, foreign companies are directly involved with day-to-day operations in the other country. This means they aren't just bringing money with them, but also knowledge, skills and technology [4].

There are 3 types of FDI:

- Horizontal FDI.
- Vertical FDI.
- Conglomerate FDI[5].

Horizontal FDI is where funds are invested abroad in the same industry. In other words, a business invests in a foreign firm that produces similar goods.

Vertical FDI is where an investment is made within the supply chain, but not directly in the same industry. In other words, a business invests in a foreign firm that it may supply or sell too.

Conglomerate FDI is where an investment is made in a completely different industry. In other words, it is not linked in any direct way to the investors business.

Foreign direct investment(FDI) influences the host country's economic growth through the transfer of new technologies and know-how, formation of human resources, integration in global markets, increase of competition, and firms' development and reorganization[6].

The FDI in the economies under study shows that there is a positive trend of investment which ultimately results in increasing the GDP and growth of the country as we have found in our study that increasing trend of FDI also increases the GDP of the country[7].

Research shows that an increase in FDI leads to higher growth rates in financially developed countries compared to rates observed in financially poor countries. Local conditions, such as the development of financial markets and the educational level of a country, affect the impact of FDI on economic growth[8].

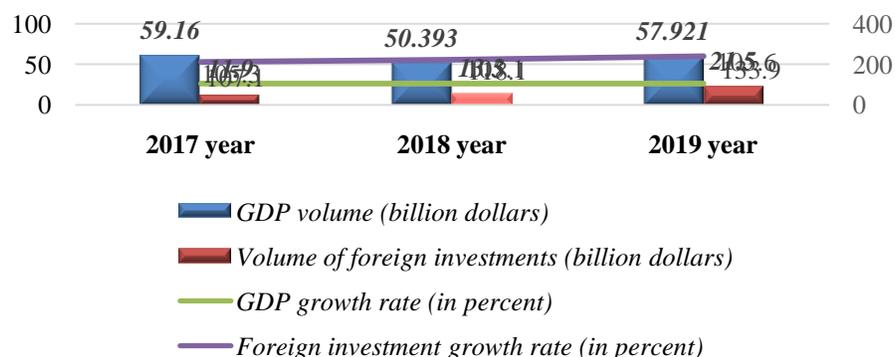

Empirical evidence suggests FDI has both growth enhancing and growth diminishing impact on the economic growth. The endogenous growth model supports the view that FDI has significant impact on improving human capital, managerial skills, research and development which in effect improve economic growth[9].

A new report and investor survey published today by the World Bank Group concludes that, on balance, foreign direct investment(FDI) benefits developing countries, bringing in technical know-how, enhancing work force skills, increasing productivity, generating business for local firms, and creating better-paying jobs[10].

Analysis and results

The impact of foreign direct investment on the economy is considered in the example of the Uzbekistan's economy. In recent years, Uzbekistan has been pursuing an active investment policy and the volume of foreign direct investment in the country's economy is growing.

Graph 1 GDP volume, Volume of foreign investments, GDP growth rate, Foreign investments growth rate in Uzbekistan's economy (2017-2019)

Source: Development of authors based on data from the World Bank Group (<https://data.worldbank.org/country/uzbekistan?view=chart>) and the State Committee on Statistics of the Republic of Uzbekistan (<http://www.stat.uz>).

Based on the above data, the GDP in 2017 amounted to 59.16 billion. dollars 50.393 billion dollars in 2018 and in 2019, 57.921 billion. Dollars. At the rate of GDP growth, it can be seen that economic growth of at least 5% was achieved during this period. The GDP growth rate was 5.3% in 2017, 5.1% in 2018, and 5.6% in 2019.

The volume of foreign investment in the country's economy has changed dramatically. Foreign investment is expected to reach 11.9 billion dollars in 2017 and 13.3 billion dollars in 2018 and increased sharply in 2019, as well as 21.5 billion dollars.

Based on the analysis of the data, it can be seen that foreign investment is an important factor in the country's economy. Therefore, on the basis of increasing the volume of investments in the country, it is possible to achieve sustainable development of the economy, especially foreign investment. It is also worth noting that in recent years there has been a sharp increase in foreign investment in the country's economy. This can be explained by the fact that the country is creating a favorable investment climate for investors.

CONCLUSIONS

Today, investment is becoming the main driver of the economy and keeps it moving. In particular, as a result of the international movement of foreign investment, sufficient capital is flowing into the parts of the country that need additional capital. In addition, the share of investments in the real sector, that is foreign direct investment, is expanding production in the country. As a result of this type of investment, new technologies, new abilities and new knowledge are coming into production. As a result, production facilities are being modernized, the range of products is being diversified and new modern production facilities are being built. All this can be assessed as a positive effect of foreign investment, that foreign direct investment. The increase in production will, first of all, lead to an increase in GDP, an increase in budget revenues and an increase in incomes. Increasing incomes will also have a positive impact on GDP growth.

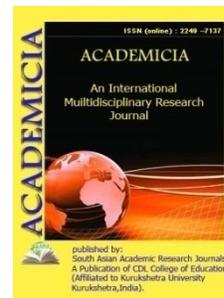

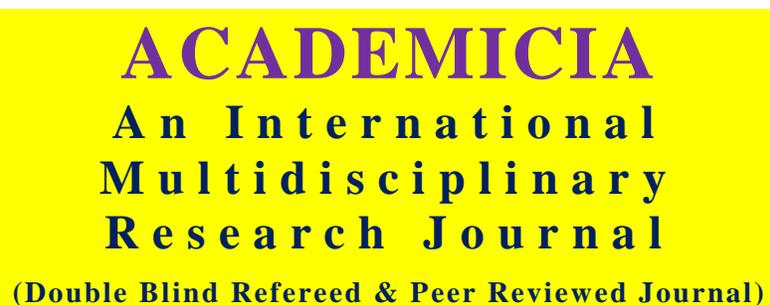

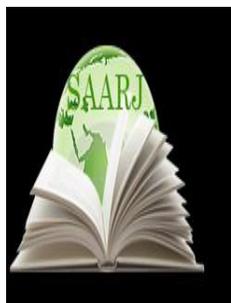

The analysis shows that one of the most effective ways to direct investment in the knowledge economy. Attracting investment in the formation of a knowledge economy can lead to a rapid development of the country's economy. A globally evolving economy requires knowledge-based development and economic management. Therefore, it is important to ensure that countries' economies are based on knowledge.

In addition, we believe that it is desirable to provide investment in the production of digital technologies and the widespread introduction of the digital economy. The development of the digital economy in the country also depends on direct investment. The more investment is attracted, the easier this process will be. In general, the inflow of investment into the country's economy has a positive impact on the country's economic growth.

Candidate of Geographical Sciences,
Department of Internal Control and Monitoring of the State Conservatory of Uzbekistan,
Tashkent, UZBEKISTAN
Email id: baxa7682@mail.ru

ABSTRACT

The article describes the concept of local technologies, the classification and definition of local technologies, and how to use local technologies in geography lessons. Organizing students' learning activities in this way allows them to structure their creative activities. It is recommended to use the insert on topics that are intended to study only factual material in the program content. Insert is a pedagogical technology at the local level, which is used by students to understand the main idea and factual material in the curriculum.

KEYWORDS: *Lokal, Education Technology, Case Study, Insert, Clestur, Venn Diagram, Brainstorming, Small Group Work.*

INTRODUCTION

In order to activate students' cognitive activity in the study of geography, it is advisable to identify, systematize, monitor and evaluate the knowledge, skills and abilities acquired by students in the course, as well as the use of local technologies in the study of a new topic.

Use of local pedagogical technologies in teaching geography "Case study", "Insert", "Cluster", "Venn diagram", "Brainstorming", "Working in small groups", "Chain of terms", "Term sheet", quisk games and various forms of game exercises are recommended.

The use of Case study in the teaching of problematic issues in the content of the geography course is highly effective.

"Cases" – case studies are derived from English and mean process or situation.

Initially, this technology was used in the training of business and entrepreneurs, and based on the content of the current subject, educational discussions are organized to create and solve problem situations on external and internal, objective and subjective factors of natural processes.

To use the case in the educational process, the teacher:

- Identify problematic topics in the content of the program, create problem-solving tasks to teach these topics;
- Determine whether the problem-solving tasks will be organized individually or in small groups of students according to the level of difficulty;
- Plan ways to engage students' learning activities in solving these problems and communicating through learning discussions;
- Provide a final opinion in a learning discussion organized on the basis of problematic questions and assignments.

The concepts of the geographical crust which are in the content of the program, are led in teaching geography, as well as can be used in the teaching of the controversial 5th grade textbook "Earth – a planet in the solar system".

Geographical distations, which require picture interpretation, play an important role in teaching geography, and students have the opportunity to use the Case study to identify object and connections between objects.

The case study is organized on the basis of the following stages:

Phase I. Forming small groups of an equal number of students.

Phase II. Distribute the learning tasks to small groups, consisting of problem-solving questions designed to explore a specific process, and introduce them to the didactic purpose of the task.

Phase III. Focusing students' learning activities on solving learning problems. Phase IV. Listening to students' information on problem solving.

Phase V. Conducting study debates and discussions between small groups.

Phase VI. To draw a general conclusion.

While "Case Study" is used, students apply their previously acquired knowledge in new situations, expand and deepen their knowledge, master the methods of mental activity, increase mental development and professional training as an individual.

Organizing students' learning activities in this way allows them to structure their creative activities. It is recommended to use the insert on topics that are intended to study only factual material in the program content.

Insert is a pedagogical technology at the local level, which is used by students to understand the main idea and factual material in the curriculum.

To develop students' skills in using insert, they will be given learning materials and a special table. Students are encouraged to review each paragraph and mark it on a special table using specific symbols.

If the information in the paragraph corresponds to the knowledge acquired so far, “I know” –K, if the information is clear and new, then “I agree” +, if the information does not correspond to the knowledge acquired by students, then “Need to learn”-, If you the students have difficulty mastering, then “I do not understand”-? puts the mark.

A special table used in the insert

Paragraphs №	“I know” – K	“I approve” +	“Need to learn”-	“I don’t understand” -?
1.				
2.				
3.				
4 and so on.				

The following requirements must be met when using Insert in the educational progress:

Students are divided into small groups, but through the insert tool, each student first works individually and completes the table, comparing their ideas after the group members have completed the work within the allotted time;

Ensuring that the signs of the small group members in the table are the same through a learning debate, i.e., achieving uniformity across the next two columns in the table;

The teacher should organize a learning contest based on the questions and assignments base on the teaching material and the signs of the small group members in the table.

The advantage of working with the insert is that the information provided by the teacher to fill in the gaps in knowledge, to fill in the gaps in the knowledge of the students’, first among the members of the small group, and then witch each other in small groups.

The function of the source of information in the pedagogical activity of the teacher using the insert is rather reduced, and the functions of management and control of students’ cognitive activity are increased.

Therefore, the teacher should carefully plan and implement these issues.

In teaching geography, the use of clusters plays an important role in order to systematize and consolidate the knowledge acquired by students’.

Cluster - means “tree” in English.

This local technology paves the way for the development of analytical-critical thinking skills by enabling students to understand the interrelationships between ideas, theories, laws, and concepts that they have been mastered and being learned.

Creating a cluster is done in the following order:

A specific idea of the content of the geography course is written in the middle of the board or paper;

The laws related to this idea, the interrelated status of the concepts are determined by an indicator, then the factual data of these laws and concepts are written graphically and a network is formed. A conclusion is drawn about the connections between the previously studied topic and the studied topic.

In the lessons in which the cluster is used, students are divided into equal number of small groups and explained the didactic purpose and order of the assignment.

Topic: "Earth - a planet in the solar system".

The Earth is crusted like other planets in the solar system. What does an astronaut observe from space? He sees the earth surrounded by air on all sides and clouds floating in the air shell. The Earth's sphere of air the atmosphere.

He also sees that the poles of the earth are surrounded by very large white spots- ice and snow, and a very large area is occupied by water –the oceans and seas.

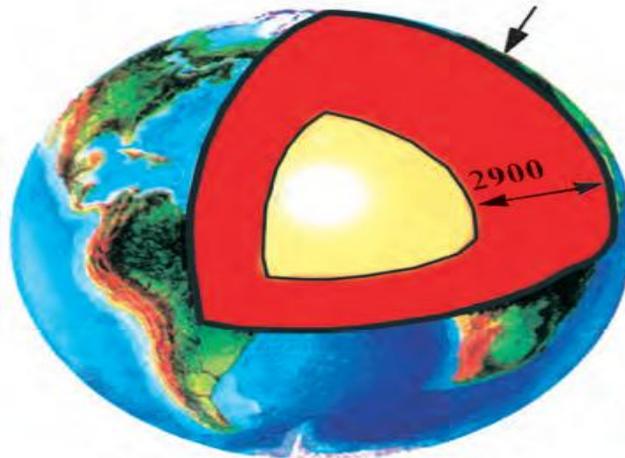

Countless lakes and rivers can be seen on land.

These are the earth's water crust - the hydrosphere.

On land, there are forests, deserts, farms, gardens, towns and villages. There are hard rocks under forests, fields, towns and villages, deserts and oceans which form the earth's crust. The crust is the hardest crust. All living things, plants, and the environment in which they live are collectively called the biosphere. The outer crust of the earth is better studied. But we know very little about its deeper, inner part. The interior of the earth cannot be seen directly, that means, it cannot be explored by entering it.

The interior of the Earth is roughly studied by studying the substances released when volcanoes erupt, depending on the propagation characteristics of the earthquake waves. According to scientists, there is a nucleus (Earth's core) in the central part of the earth. Its diameter is about 7000 km. The core is surrounded by a shell called the mantle. Its thickness is 2900km. The mantle is covered by the Earth's crust. It is the hardest of the Earth's crust, reaching a thickness of 5 km at the bottom of the oceans and 80 km at the foot of high mountains. Scientists speculate that the mantle is made up of magnesium, iron and lead. The temperature in it is 2000 0 C and higher [1.6. 39-40].

Scientists have found that the deeper the ground, the higher the temperature rises to 33 0 C every 1,000 m. Hence, at a depth of 50 km, the temperature reaches 1500 0 C. The temperature in the lower parts of the mantle and in the core increases even more. At such a high temperature, the rock had to be melted, that is, in a liquid state. But this is not the case. Because the pressure at those depths is so great. For example, at a depth of 100 km, the pressure is 13,000 times greater than on the surface, that means, it presses 13 tons of force on a surface 1 cm long and 1 cm wide. Therefore, the rocks in the mantle and core are assumed to be in a solid state.

The internal structure of the earth Scientists predict:

The average crust thickness is 40 km,

Earth's mantle is 2900 km,

The outer part of the nucleus is 2080 km,

The inner part of the core is 1280 km,

The temperature in the core is 4000 0 C.

We have less information about the Earth's core. We only know that its radius is 3500 km and the temperature is around 4000 0 C. Studying the internal structure of the earth helps a person to find answers to many questions necessary for his life. For example, are there enough minerals? Why an earthquake, can I predict it? Did the continents shift? Finding answers to questions like why a volcano erupts is important.

The lithosphere is the hard crust of the Earth. The Greek lithos means stone, sphaira means ball, or tortoise. The lithosphere includes the crust and the upper part of the mantle.

The earth's crust consists of three layers of rock. The first floor will be mostly sedimentary rocks. They are formed by the subsidence of rocks on land and in water. They are clay, limestone, sand, sandstone, chalk rocks, lying in layers. These layers are like a book about the nature of the earth in the past. By studying these layers, geologists can learn what nature has been like on earth for thousands and millions of years. If you look at a piece of chalk or limestone under a microscope, you will know that it is entirely the shells and bones of tiny animals.

They are ancient plants and animals that lived in the water millions of years ago, as well as remnants of coal and oil.

The second floor is made of granite. Granite is a magmatic rock. It is formed by the penetration and cooling of magma between the layers of the earth. Magma can be compared to boiling, burning mud. It cools and turns into granite.

Below the granite layer is a basalt layer. Basalt came out of the pit. It is heavier than granite and contains iron, magnesium and calcium. Granite and basalt are igneous rocks. The crust is not the same under the continents and under the ocean.

On the continents, the crust is three layers as seen above. Under the oceans are two floors. That is, it consist only of sedimentary rosk layers and basalt.

The hard crust of the earth is not solid, but consists of individual large pieces - slabs.

These pieces are separated from each other by deer cracks and fissures.

Fragments of the crust slide in different directions over the liquid rock layer of the mantle. Where the plates slide in opposite directions collide, the earth's crust bends to form arched islands, mountains, and marginal ocean basins. Examples include the Andes, the Japanese islands, and the Mariana Trench.

Where the lithosphere plates separate or collide, they are very mobile, with frequent earthquakes. Many extinct volcanoes are located here. Such areas form seismic zones (Greek seismos - vibration) for thousands of kilometers. At this point, it is useful to compare the maps of the "Movement of lithosphere plates" and "Earthquake and the main zones of volcanoes" from the atlas. It will then be possible to find out where most volcanoes and earthquakes occur at the junction of lithosphere plates. The largest of these are the Pacific Ring of Fire and the Alpine-Himalayan Seismic Zone.

Methods of teaching the topic of the internal structure of the earth

The technologies used at the local level in teaching the topic of "Internal structure of the earth", that means, the homework in a particular part of the lesson, the technologies used in the consolidation of the newly studied topic can be used.

These include Keys, Insert, Cluster, Brainstorming, Venn Diagram, Small Group Work, Chain of Terms, Terminology Sheet, quick games, various forms of game exercises, and etc.

It is recommended to use the insert on topics that are intended to study only factual material in the program content.

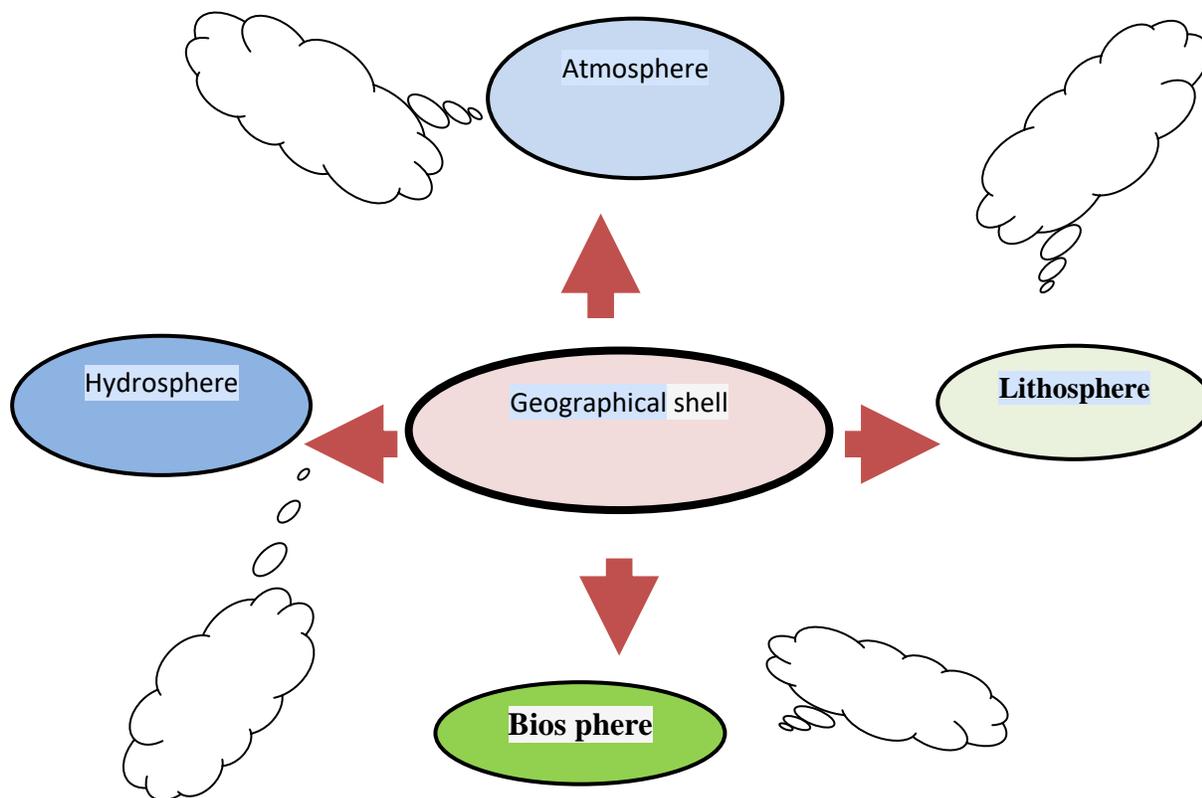

To develop students' skills in using insert, they will be given learning materials and a special table. Students are encouraged to review each paragraph and mark it on a special table using specific symbols. If the information in the paragraph correspondes to the knowledge acquired so far, "I know" – B, if the information is clear and new, then "I agree" +, if the information does not correspond to the knowledge acquired by students, then "Should learn" -, students If you have difficulty mastering, then "I don't understand" -? puts the mark. Below is the insert table.

Paragraphs №	"I know" – K	"I approve" +	"Need to learn"-	"I don't understand" -?
1.The thickness of the crust is moderate				
2. Earth's mantle				
3. The outer part of the nucleus				
4. The inner of the nucleus				
5. The temperature in the core				

The advantage of using an insert in the classroom is that the information provided by the teacher to fill in the gaps in the knowledge of students, first of all between small group members, and then with small groups, to fill in the gaps in their knowledge.

The use of clusters plays an important role in geography lessons in order to systematize and consolidate the knowledge acquired by students. (Cluster-link) is the way to create an information map-gather ideas around some key factor to centralize and define the essence of the whole structure. Accelerates the activation of knowledge, helps to freely and openly engage new interconnected ideas on the topic in the thought process.

This local technology paves the way for the development of analytical-critical thinking skills by enabling students to understand the connections between ideas, laws, and concepts that are assimilated and assimilated, and to understand their interdependence. The cluster is formed in the following order: a specific idea in the content of the studied science course is written in the middle of the board or paper, then the concepts related to this idea are marked with an interconnected status indicator and form indicator and form a network. Creating a cluster on a single chapter or topic provides a framework for students to think systematically. At the heart of the cluster is the main idea or concept, for example, the theme "Geographical shell" is formed as follows:

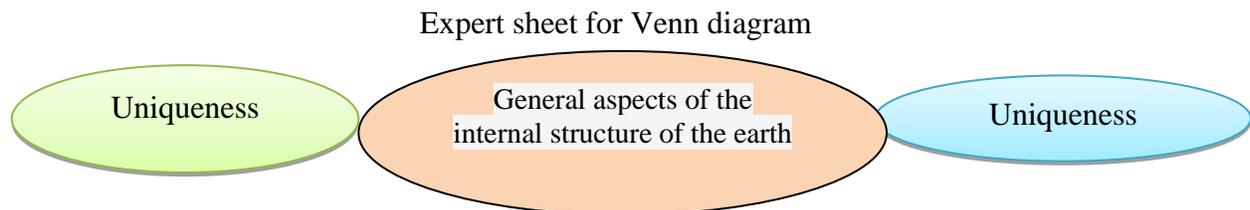

Sample for creating a cluster

In the lessons in which the cluster is used, students are divided into equal number of small groups, after which they are explained the didactic purpose of the task and the order of its implementation, they are given the opportunity to summarize their ideas.

Within the allotted time, defend the cluster they have created, prove their point, the best and easiest structured cluster is identified, and the winners are encouraged.

One of the technologies used locally in geography lessons is the Venn diagram, named after the English scientist John Venn who developed it. Venn diagram requires analysis and comparison of concepts and processes of the studied topic.

On the subject of the internal structure of the earth, the study of substances released during volcanic eruptions can be used to compare similar and different and useful aspects such as the propagation properties of earthquake waves, the core of the earth and its diameter, mantle and its thickness, its composition, temperature. It is recommended that the Venn diagram can be seen as follows.

Venn diagram is used to compare, contrast, or contrast two and three aspects and commonalities in a lesson. This method develops students' skills of systematic thinking, comparison, comparison, analysis.

The Brainstorming method is a step-by-step process in which the teacher designs the topic from simple to complex

1. The thickness of the crust?
2. What about the Earth's mantle?
3. What is the temperature in the nucleus?
4. What is the geographical crust itself?
5. Compare how the biosphere and hydrosphere are related to each other?
6. Why is a volcano erupting? and so on.

Problem technology: to teach students to correctly solve various problem situations arising from the subject of the subject, to develop skills in determining the nature of the problem, to acquaint them with some methods of problem solving and to teach them to choose the right methods, problem causes, problem solving actions teaches correct identification.

Mode of the lesson: After the teacher divides the students into groups and places them in their places, he explains the rules and requirements of the lesson, that is, the lesson should be staged and each stage requires maximum attention from students, they work individually, in groups and in groups, he says. This mood helps students to be ready to complete the tasks assigned to them and stimulates interest in completing them. After explaining the rules and requirements of the training, the training will begin:

Carefully watch the film prepared by the students for the lesson and try to identify the problem, memorize it or mark it in a notebook (if it is not possible to show the film, then the teacher can

make a map, poster, picture, poster or a problem on the subject) the described text can be used as the study material in the book or atlas):

- The problems identified by each group member from this sheet (picture, text, lif event) are written on a piece of paper in Whatman or format with a felt-tip pen;
- At the end of the allotted time, the work is read out by the group;
- Distributed to the groups by the teacher, replacing the papers selected and written by the groups;
- From the problems written by the groups in the handouts, each group member chooses one of the problems that interests him / her;
- In the following diagram distributed by the teacher, each group member selects one of the problems they are interested in;
- Independently analyze the problem selected by each group member in the following diagram distributed by the teacher. For example.

Type of problem	The problem came reasons for withdrawal	Problem solving and your actions
What causes earthquake waves?		

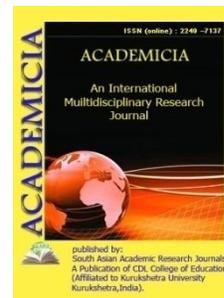

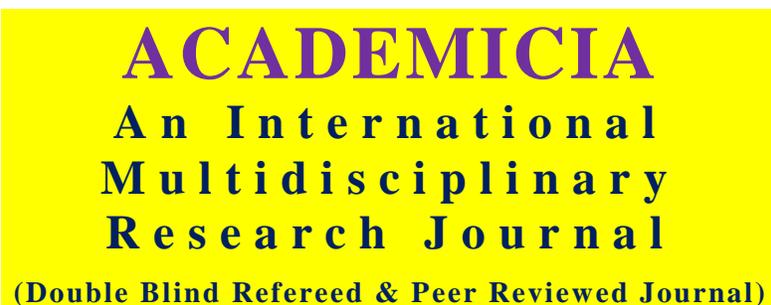

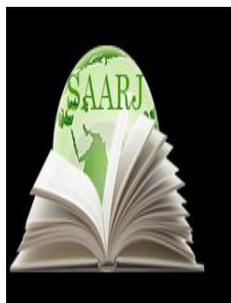

- At the end of the individual activity, each student reads out the analytical work done;
- Collective exchange of views on problems and their solutions;
- After the defense, the teacher concludes the lesson. Thanks to the small groups for their fun work.

As a result of training with such technology, students learn that the cause of problem must be determined before it has been solved, and then they must choose the methods and techniques they need and clearly define their actions.

The use of “Concept Analysis”, “Group Work”, “Remember” exercises, “BLIS” method, “Classification” and “Contour Map” methods are also effective when the local pedagogical technologies are used.

ABSTRACT

This article focuses on the development of translation skills along with the study of foreign languages, taking into account the role of translators in world civilization, the role of the peoples of the world in the development of culture, literature, art, science and technology in general. Formed as a science by the middle of the 20th century, the type of activity that includes translation theory and practice, or translation studies, plays an important role in modern linguistics. The work of our linguists, who have conducted research on the theory of translation and its teaching methods, is commendable.

KEYWORDS: *Methodology, Translation Skills, Foreign Language Teaching, Translator Competence, Skills, Professionalism*

INTRODUCTION

Today, reforming and improving the system of continuing education in our country, which is on the path of independent development, raising it to a new level of quality, the introduction of advanced pedagogical and information technologies and improving the efficiency of education has become a state policy. In the process of development of pedagogical technologies and their integration into the educational process, as well as the rapid exchange and improvement of information technology, everyone has the opportunity to strengthen their professional training and skills. The introduction of advanced pedagogical technologies in the educational process is one of the milestones of the National Training Program. Today, innovative pedagogical

technologies and interactive methods are widely used in education, especially in foreign language teaching.

The application of innovative pedagogical technologies in foreign language education - the orientation of the individual to the needs of society, the organization of education on the basis of these requirements, the formation of the individual as a full-fledged mature staff to create favorable conditions for the manifestation and development of the language [1].

In the second half of the twentieth century, linguistics expanded its research. Initially focused only on the system and development of the language system, later language began to be studied as a tool of thought and a means of verbal communication. The focus of linguists was on the spiritual aspects of language units and speech works, exploring the relationship between language and perception, real reality, society, culture, and sign systems.

New fields of linguistics and research have emerged, including cognitive linguistics, psycholinguistics, sociolinguistics, textual linguistics, speech theory, and more. Linguistics has become macro linguistics, that is, a complex of linguistic sciences that studies the features, results, ways, and multifaceted forms of language existence in society. Only a linguist with this degree can engage in research such as the theoretical understanding of modern translation activities, i.e. the comprehensive scale of translation work to date, the level of requirements for translations, and the training of many qualified translators.

Underlying the methodology of teaching translation is the idea that the ability to translate, like the ability to learn all languages, is genetically present in all, that is, to develop a person to the level of a skilled translator, even if everyone has some ability. it is possible.

Teaching translation is not only of theoretical importance, but also requires the formation of conditional translation competencies in students. It also has general linguistic and general education functions [3, 29].

The formation of translator competence leads to the full development of future translators as individuals: to be attentive when working with databases and directories, to know how to choose, to make the right decision quickly, to be a linguist and extralinguist, develops the ability to find and compare data. By professional training of a translator we mean high culture, high encyclopedic erudition, communicativeness, constant enrichment of knowledge, diversity of interests. All of these qualities are manifested in two languages and two cultures.

The professional, special and basic specificity of the translator's competence is reflected in the fact that the translator solves their professional problems in a positive way with the help of a set of knowledge, skills and abilities. In this trinity, that is, knowledge - ability - skill, the main place is occupied by ability.

Because ability is the synthesis of knowledge and skills based on it. Ability is always useful, as opposed to theoretical knowledge, which is considered abstract and cannot provide practical help in solving a particular problem. Unlike so-called automated or simple actions, skills are performed consciously, consciously, and knowingly. Taking all of the above into account, an adequate approach to translation should be developed in the formation of translator skills, which requires problem-solving exercises in the process of teaching translation.

However, the main goal of translation theory is not to provide students with a body of knowledge, but to train them to be highly qualified, professional translators.

Commentator V.N.Komissarov says: "The results of the study of any subject do not depend on the purpose and content of teaching, but on how the subject is studied, on what methodology it is studied. Although there are some shortcomings in the teaching methods of translation, translation teaching methods are not well researched, even if the teaching teachers have enough experience" [4, 46].

Well-known translation skills are developed through the use of specially selected teaching materials. Such materials include translation exercises and textbooks.

The training of such a wide range of professional translators has necessitated the development of special methodological bases in modern translation studies. The methods and organization of teaching translation are analyzed through a number of basic rules and considerations:

1. Translation is a complex and multifaceted type of mental activity that can take place for different purposes, under different conditions, in different ways, and under the influence of different factors.
2. Translation, like any other type of activity, involves the formation of certain knowledge, skills (conscious execution of certain actions) and skills (automated or semi-automated execution of certain actions) formed in the process of teaching translation.
3. Interpreting activities can be performed consciously (as a result of reasoned conclusions and analysis) or intuitively by the interpreter.
4. The competence of the translator is reflected in the fact that the translator demonstrates all the language skills. Competence in translation is manifested through comprehensive cognitive and linguistic knowledge, comprehensive cultural erudition and the necessary psychological qualities.
5. The task of teaching translation is not to teach the translator to apply some norms, rules or "receptors" in different situations in an automated way, but to teach translation methods and ways for different purposes in different situations, in different texts. It is about developing the ability to choose.
6. The object of translation activity is the information contained in the original text. The content of a text is semantically and formally complete, and the individual parts of the text are interrelated and unequally important for communication.
7. The language units that make up the text are in themselves the object of translation. Based on them, the content of the text is formed, and the presence of certain language tools in the text has semantic significance, defines the tasks of translation and creates a special difficulty for translation.
8. It is necessary to formulate strategies for individual, creative approach to the difficulties that arise in translation, rather than the ways of translation of the teaching material used in the process of teaching translation. In this sense, in the process of teaching translation, based on the teaching material, it is necessary to identify the difficulties that arise in the translation process and to develop specific methods and ways to solve them.

9. The specificity of interlingual communication requires a large number of options for the translation of the translated text in principle. In this regard, students are not tasked with creating a single, optimal version of the translation. At the same time, the teaching process requires a critical approach to translation exercises and the rejection of incorrect options [2, 158].

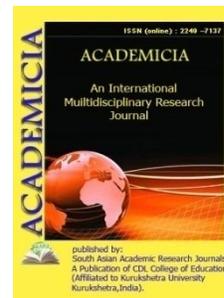

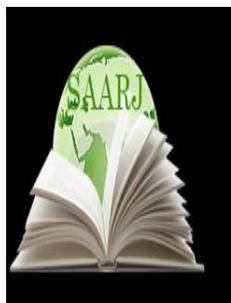

The above cases reflect the content of the translation teaching methodology.

Thus, the study of foreign languages is a modern requirement, and the development of new methods of language learning for the younger generation, based on the "National Program of Personnel Training" and recommendation to the learning process is an urgent task for scientists and experts. In order for our talented young people to become experts in their fields of interest, they must first have a thorough knowledge of foreign languages, including English.

Therefore, the introduction of technology, ensuring that teaching methods meet the requirements of the times are the urgent tasks of educators. Training and retraining of specialists is also one of the current social problems.

ABSTRACT

The article is devoted to the study of the problems of detailed interpretation of vibrational spectra of oxo-centred trinuclear heterometallic carboxylates based on iron (III) of the general formula $[Fe^{3+}_2M^{2+}O(CH_2XCOO)_6(H_2O)_3]$, where $M=Mn, Co$ or Ni ; $X=H, Cl$ or Br , by applying quantum chemical calculation. One of the problems in assigning the detected absorption bands in the infrared spectra of these compounds in the region of stretching vibrations with the participation of a heterometallic M atom is the superposition of highly intense peaks from bending vibrations of groups of carbon, oxygen and hydrogen atoms. The most common, complex and expensive method of isotopic substitution does not allow identifying individual peaks due to oscillations with the participation of M . The high-speed technique for calculating spectra is trying to solve this problem with sufficient accuracy. The vibrational spectrum of the compounds under study was calculated using the Gaussian-09 software package by the hybrid density functional theory DFT/B3LYP using the 3-21G basis set. Heterometallic oxo-carboxylates were synthesized according to a previously developed procedure based on the interaction of calcium salt of a carboxylic acid with a mixture of ferric and ferrous metal chlorides taken in a 2:1 ratio in an aqueous solution. The IR spectra of the compounds were measured on an "FT-IR Spectrum 2 Perkin Elmer" spectrophotometer in the form of KBr-based tablets. It is shown that the calculated IR spectra for heterobimetallic oxo-centred carboxylates are in satisfactory agreement with the experimentally measured spectra. Calculations have shown that little noticeable differences in the spectra of compounds with different heterometal M in the region of stretching vibrations with its participation are due to the low value of the

extinction of the absorption bands. The possibility of visualizing the vibrations of each group of atoms in the molecule made it possible to unambiguously interpret the detected absorption bands in the real IR spectra of compounds and establish that the studied heterobimetallic carboxylate complexes have the structure of a μ_3 -oxo cluster.

INTRODUCTION

Heterometallic oxo-centred tricyclic carboxylate complex compounds based on iron (III) of the general formula $[\text{Fe}^{3+}_2\text{M}^{2+}\text{O}(\text{RCOO})_6\text{L}_3]$.

Where M is a transition metal;

RCOO - carboxylic acid anion or its derivative;

L is a neutral electron-donor ligand that has high biological and catalytic activity [1, 2, 3, 4]. Of the few works devoted to the study of the vibrational spectra of polynuclear complexes with bridging carboxyl ligands, the studies of Cannon et al. [5, 6, 7, 8] deserve special attention. In works [9, 10, 11, 12, 13, 14], the IR spectra of the compounds were mainly used for their identification. Even though in [5, 6, 7, 8] an attempt was made to interpret the spectra of oxo-centred carboxylates by the method of ^{18}O and ^2D isotopic substitution, the question of the final assignment of absorption bands in the region of stretching vibrations of bonds with the participation of metal atoms remains open, due to superposition of closely lying peaks of bending vibrations of groups of lighter atoms.

Aim of the study. In connection with the above, the goal of this work is to calculate the vibrational spectra of trinuclear oxo-centred heterometallic carboxylates and compare them with the experimentally measured IR spectra.

EXPERIMENTAL PART

The compounds were synthesized according to the methods described in [2, 15].

$[\text{Fe}^{3+}_2\text{Mn}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3]\cdot 2\text{H}_2\text{O}$ (I). In 35 ml of water with heating, dissolve 10.55 g to (0.06 mol) $\text{Ca}(\text{CH}_3\text{COO})_2\cdot\text{H}_2\text{O}$, 1,00 g (0.005 mol) $\text{MnCl}_2\cdot 4\text{H}_2\text{O}$ and 5 ml of glacial acetic acid. To the resulting hot solution (85-95 °C) with constant stirring, poured 8 ml of 1.25 M aqueous solution of FeCl_3 and within 60-90 minutes the temperature of the reaction mixture is maintained at about 90 °C. After cooling the reaction mixture to room temperature, the precipitated fine-crystalline dark brown product was separated on a glass filter and washed first with a small amount of an aqueous solution of CH_3COOH (1:1), and then with acetone until the filtrate was clarified. The product is air-dried. Output 1.5 g. Elemental analysis:

Found, %: C 23.14; H 4.46; Fe 18.01; Mn 8.52;

calculated, %: C 22.84; H 4.47; Fe 17.70; Co 9.34.

$[\text{Fe}^{3+}_2\text{Co}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3]\cdot 2\text{H}_2\text{O}$ (II). The compound was synthesized similarly to complex I. The difference is that instead of $\text{MnCl}_2\cdot 4\text{H}_2\text{O}$, 1.19 g (0.005 mol) of $\text{CoCl}_2\cdot 6\text{H}_2\text{O}$ is taken,

and the amount of water and calcium acetate hydrate is reduced to 25 ml and 7.1 g, respectively. Output 2.2 g. The product is a brown powder.

Found, %: C 23,13; H 4,46; Fe 17,94; Co 8,87;

calculated, %: C 22,84; H 4,47; Fe 17,70; Co 9,34.

[Fe³⁺₂Ni²⁺O(CH₃COO)₆(H₂O)₃]·2H₂O (III). The compound was synthesized analogously to compound II. In this case, instead of MnCl₂·4H₂O, 1.19 g (0.005 mol) of NiCl₂·6H₂O are taken, and the amount of water and calcium acetate hydrate is reduced to 25 ml and 5.3 g, respectively. The product is a greenish-brown powder. Output 2.5 g.

Found, %: C 23,31; H 4,51; Fe 18,05; Ni 9,03;

calculated, %: C 22,85; H 4,47; Fe 17,71; Ni 9,30.

[Fe³⁺₂Co²⁺O(CH₂ClCOO)₆(H₂O)₃]·H₂O (IV).

To a solution of 5.67 g (0.06 mol) of monochloroacetic acid in 20 ml of water, 2.22 g (0.03 mol) of calcium hydroxide are added in portions.

By adding the acid or calcium hydroxide used, the *pH* of the solution is adjusted to 4-5 and filtered. The temperature of the filtrate is raised to 70 - 75 °C and 1.19 g (0.005 mol) of CoCl₂·6H₂O is dissolved in it. To the solution obtained and heated to 80 °C with vigorous stirring, 8 ml of an aqueous solution of FeCl₃ (1.25 mol/l) acidified with HCl is slowly added dropwise. The resulting brown fine-crystalline precipitate is filtered off, washed first with a small amount of water, and then with acetone, and dried in air.

Yield 2 g.

Found, %: C 17,42; H 2,40; Fe 13,70; Co 7,25; Cl 26,77;

calculated, %: C 17,58; H 2,46; Fe 13,63; Co 7,19; Cl 26,05.

[Fe³⁺₂Ni²⁺O(CH₂ClCOO)₆(H₂O)₃]·H₂O (V). It was obtained analogously to compound IV using 1.19 g (0.005 mol) NiCl₂·6H₂O instead of CoCl₂·6H₂O.

The product is a greenish-brown powder.

Output 2 g.

Found, %: C 17,25; H 2,65; Fe 13,72; Ni 7,03; Cl 25,61;

calculated, %: C 17,59; H 2,46; Fe 13,63; Ni 7,16; Cl 25,96.

[Fe³⁺₂Co²⁺O(CH₂BrCOO)₆(H₂O)₃] (VI). Synthesized analogously to compound IV, starting from 2.22 g of Ca(OH)₂, 8.34 g of CH₂BgCOOH, 25 ml of H₂O, 1.19 g of CoCl₂·6H₂O, and 6 ml of an aqueous solution of FeCl₃ (1.25 mol/l), acidified HCl. The brown fine-crystalline precipitate is filtered off, washed first with a dilute aqueous solution of mono-bromo-acetic acid (*pH* ~ 3.5), then with acetone, and dried in air.

Output ~ 2.8 g.

Found, %: C 13,27; H 1,68; Fe 10,32; Co 5,74; Br 44,69

Calculated, %: C 13,49; H 1,70; Fe 10,45; Co 5,52; Br 44,88.

$[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_2\text{BrCOO})_6(\text{H}_2\text{O})_3]$ (VII). Obtained analogously to complex IV, using 1.19 g (0.005 mol) $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$ instead of hexahydrate cobalt chloride. The compound is a light brown fine crystalline powder.

Output ~ 2.8 g.

Found, %: C 13,62; H 1,82; Fe 10,37; Ni 5,36; Br 43,97;

Calculated, %: C 13,49; H 1,70; Fe 10,45; Ni 5,49; Br 44,88.

IR spectra of compounds in the range $450\text{--}4000\text{ cm}^{-1}$ were measured on an "FT-IR Spectrum 2 Perkin Elmer" spectrophotometer in the form of KBr-based tablets. Figure 1 shows the measured IR spectrum of $[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3] \cdot 2\text{H}_2\text{O}$ (III).

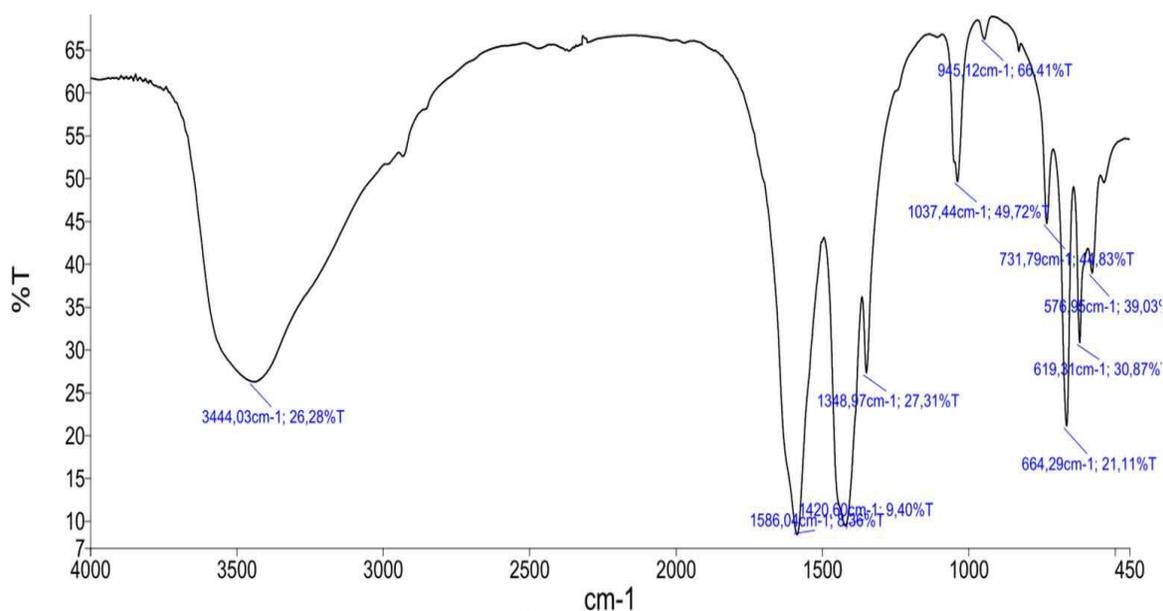

Figure 1. IR spectrum $[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3] \cdot 2\text{H}_2\text{O}$.

Calculation methods Calculations of the optimal molecular structure and vibrational spectrum of the compounds under study were carried out using the Gaussian software package using the DFT/B3LYP hybrid density functional theory method [16, 17] with the 3-21G basis.

RESULTS AND DISCUSSION

Figure 1 shows the IR spectra of aquo-acetate complex compounds I-III. The similarity of the measured spectra indicates the isostructurality of complexes I – III. The absence of an absorption band characteristic of the stretching vibration of the "free carbonyl group" $\text{C}=\text{O}$ in the region of $1720\text{--}1760\text{ cm}^{-1}$ [18] and, instead of it, strongly intense peaks corresponding to symmetric and asymmetric stretching vibrations of the $-\text{COO}$ group at 1420 and 1565 cm^{-1} indicates the μ_3 -oxo-cluster structure of heterometallic acetates [12, 13, 14].

The optimized structure of an individual molecule $[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3]$, calculated by the DFT/B3LYP density functional theory method, is shown in Fig. 2.

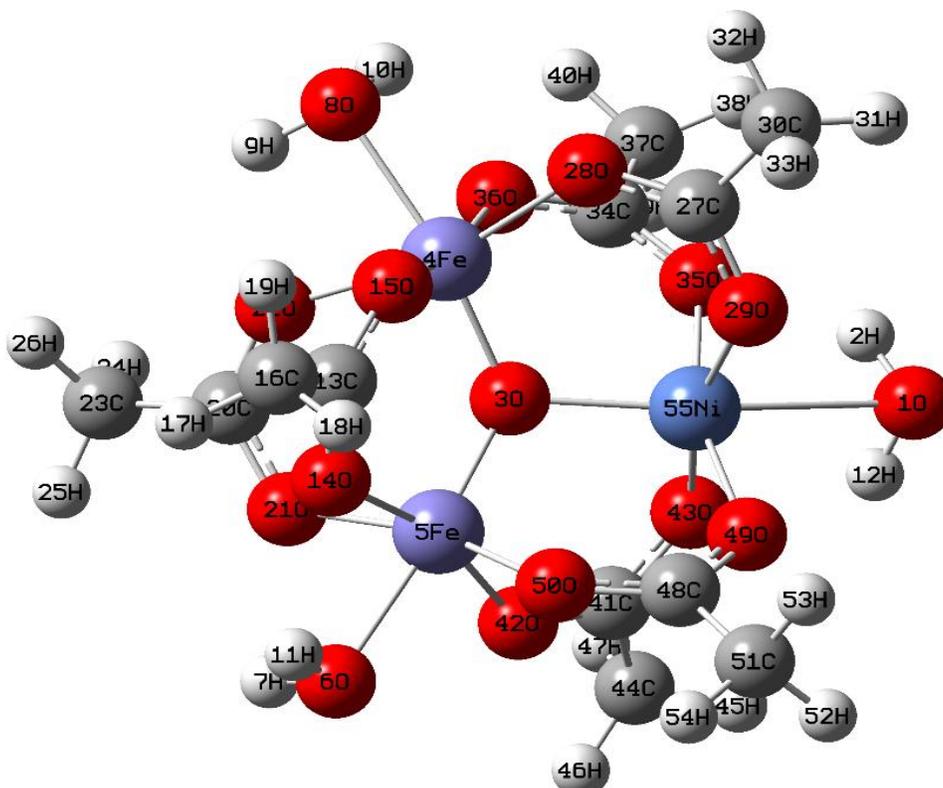

Figure 2. Optimized structure $[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_3\text{COO})_6(\text{H}_2\text{O})_3]$

The calculated internuclear distances, bond and torsion angles were given by us in [19]. Note that the symmetry of the oxo-centred trimeric complex decreases from D_{3h} to C_{2v} and further, not only due to the nature of the heterometal M . A further decrease in symmetry occurs due to the spatial influence of the undivided pair of the central oxide ion and the oxygen of the carboxyl groups. Also, coordinated water molecules can form intra- and intermolecular hydrogen bonds, which also contribute to the distortion of the symmetry of the molecule.

Therefore, in the vibrational spectrum of oxo-centred heterometallic carboxylates, single characteristic peaks are split into many adjacent lines.

Quantum-chemical calculation of IR spectra shows that the spectrum of all compounds under study in the range $0\text{-}4000\text{ cm}^{-1}$ shows the same number of absorption bands, namely 159 lines with different intensities, as we noted earlier [20]. Most of the absorption bands of low extinction are covered by neighbouring peaks of higher intensity. Because the main part of the absorption bands of the studied IR spectra is in the range up to 1800 cm^{-1} , Fig. 3 compares the IR spectra for nickel-containing acetate III, monochloroacetate V, and monobromoacetate VII. Table 1 shows the results of a comparative analysis of the position of the maxima of the absorption bands in the measured and calculated spectra of the compounds under study and their assignment in the range of $450\text{ - }4000\text{ cm}^{-1}$. Analysis of the data in Table 1 shows that the calculated IR spectra of heteronuclear oxo-carboxylates are in satisfactory agreement with the experimentally measured ones. To establish the individuality of compounds, the absorption bands corresponding to the $\omega(\text{Fe}_2\text{MO})$, $\nu(\text{M-O}_k)$, $\nu(\text{M-O}_{II})$ and $\nu_{\text{as}}(\text{Fe}_2\text{MO})$ vibrations seem to be important.

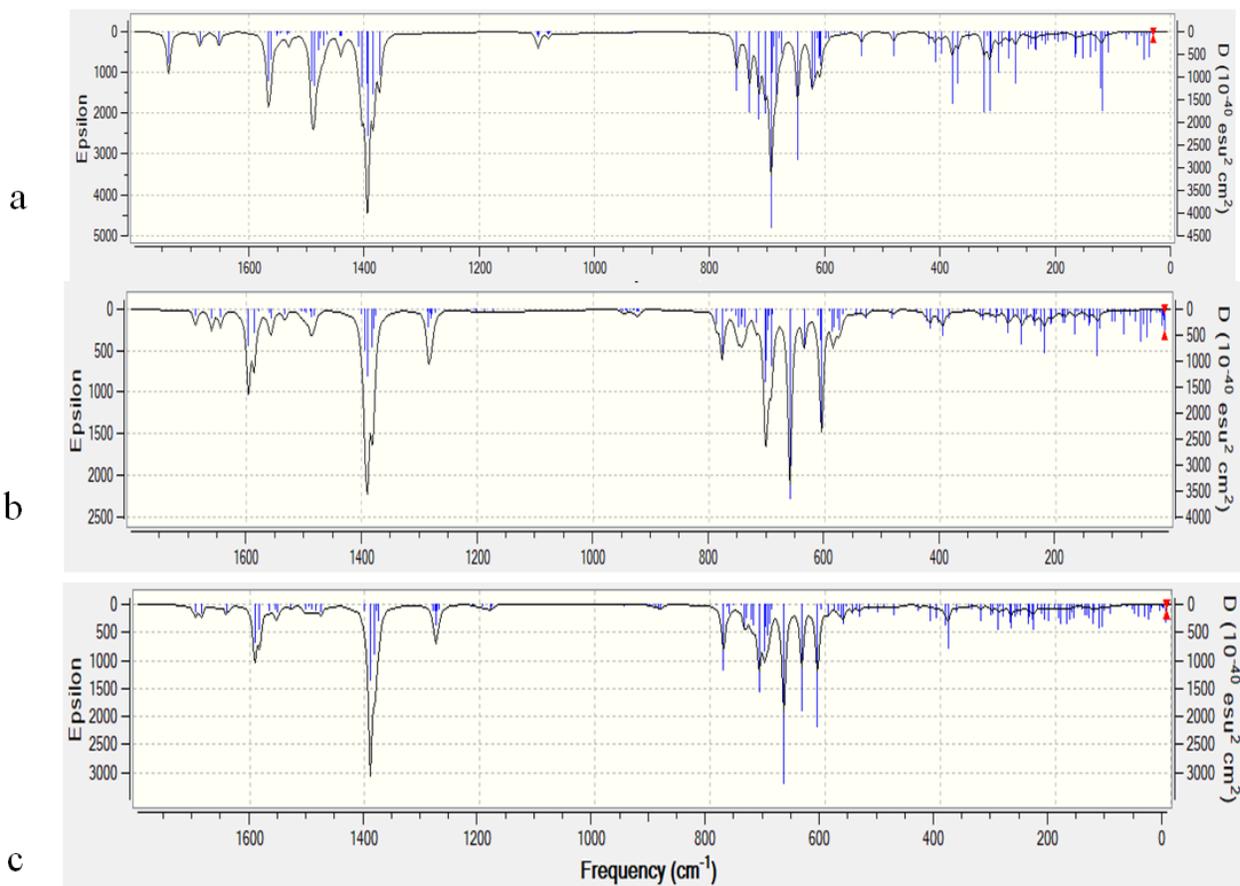

Figure: 3. Calculated IR spectra of compounds of composition $[\text{Fe}^{3+}_2\text{Ni}^{2+}\text{O}(\text{CH}_2\text{XCOO})_6(\text{H}_2\text{O})_3]$: a) $\text{X}=\text{H}$; b) $\text{X}=\text{Cl}$; c) $\text{X}=\text{Br}$.

Table 1 follows that the calculated intensities of the peaks corresponding to the indicated fluctuations turned out to be insignificant. The peak corresponding to the stretching vibration $\nu(\text{M}-\text{O}_i)$ has the highest intensity, the manifestation of which gives a slightly noticeable difference in the spectra of complexes with different M heterometallic in the region of $450\text{--}850\text{ cm}^{-1}$. The nature of M has an insignificant effect on the position of the maximum of the peak of vibration $\nu(\text{M}-\text{O}_i)$ with the same carboxyl ligand. However, replacing X in CH_2XCOO -significantly shifts the frequency of this vibration. Thus, for the studied nickel-containing oxo-carboxylates with $\text{X}=\text{H}$, Cl, and Br, the fluctuation of $\nu(\text{M}-\text{O}_c)$ is detected, respectively, at 664 , 678 , and 680 cm^{-1} .

The maxima of these absorption bands in the calculated spectrum are found at 647, 661, and 671 cm^{-1} , respectively. From Fig. 3 and Table 1, it follows that the features of the IR spectra of carboxylates with different CH_2XCOO -are clearly explained by the presence or absence of methyl- CH_3 , methylene- $>\text{CH}_2$, and the C-X bond in the molecules. The theoretical calculation shows that a stronger splitting of the peak corresponding to the symmetric oscillation of the bridge-COO groups $\nu_{\text{s}}(\text{COO})$ is observed in the case of acetate complexes. Therefore, in the experimentally measured spectrum of oxo-acetates, in contrast to haloacetates, a maximum is detected at 1348-1349 cm^{-1} . According to theoretical calculations for the most intense lines, the difference $\Delta\nu = \nu_{\text{as}}(\text{COO}) - \nu_{\text{a}}(\text{COO})$ in the case of acetates, chloroacetates, and bromoacetates is 163, 206, and 201 cm^{-1} , respectively. For the experimentally measured spectra, this difference is 144, 207, and 205 cm^{-1} , respectively. Symmetric and asymmetric valence oscillations of C-H bonds in the- CH_3 and $>\text{CH}_2$ groups, according to theoretical calculations, are manifested in the region of 3060-3270 cm^{-1} and of insignificant intensity. Therefore, they do not play such a significant role in the formation of the IR spectrum of the oxo cluster as a whole. This cannot be stated for the absorption bands corresponding to the vibrations of the O-H bonds of the coordinated water molecules. They have a fairly high extinction and their proximity to each other contributes to the formation of a very wide band with a maximum at $\sim 3450 \text{ cm}^{-1}$. Also, the large width of this band may be due to the presence of water crystallization molecules and intermolecular hydrogen bonds.

CONCLUSION

Quantum-chemically calculated IR spectra for iron(III)-based heterobimetallic oxo-centred tri-core carboxylates satisfactorily describe their experimentally measured spectra. Calculations have shown that the little noticeable differences in the spectra of compounds with different heterometallic M in the region of valence vibrations with its participation are due to the low extinction value of the absorption bands corresponding to these vibrations. Theoretical calculations made it possible to unambiguously interpret all the detected absorption bands in the real IR spectra of the studied compounds and to establish that the studied heterobimetallic carboxylate complexes have the structure of a μ_3 -oxo cluster.

ACKNOWLEDGEMENTS

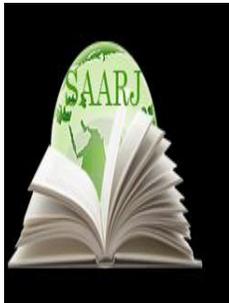

The authors express their sincere gratitude to the head of the central scientific laboratory of the State Customs Committee of the Republic of Uzbekistan, candidate of chemical sciences, associate professor B.Y. Abduganiev for the opportunity to measure the IR spectra of compounds.

ABSTRACT

In the "Cleaning and drying" section of ginneries, the impact of the distance between the rollers and pile-rail drums of the machine 1XK, which cleans the cotton from fine contaminants, was analyzed and researched. Conclusions and recommendations were given. Dirty mixtures are divided into passive or inert and active types in terms of adhesion to seed cotton. Passive or inert mixtures are on the surface of the seed cotton husks and are easily separated from the seed cotton when lightly shaken. It will be difficult to separate the active compounds from the seed cotton. To separate the active compounds from the seed cotton, they must first be made passive.

KEYWORDS: *Cleaning equipment, dirt box, grate, fibre, pile drum, piles, planks, seed cotton, and supply rollers.*

INTRODUCTION

When picking cotton by hand, the degree of contamination depends mainly on the attention of the picker, the timeliness and quality of defoliation of cotton leaves when picking by machine. Compounds found in seed cotton can be organic and mineral compounds in terms of origin. Organic bodies include parts of the cotton bush - leaves, twigs, pelvic floor, flower petals, fruit bands, and other plant parts (gum and other weeds). Mineral compounds include rock, sand, soil,

lumps, etc. Contaminants in cottonseed are conditionally divided into two groups in terms of size.

The size of the group of fine mixtures is 10 mm. less than 10 mm in size for a group of large compounds. compounds greater than

Dirty mixtures are divided into passive or inert and active types in terms of adhesion to seed cotton. Passive or inert mixtures are on the surface of the seed cotton husks and are easily separated from the seed cotton when lightly shaken. It will be difficult to separate the active compounds from the seed cotton. To separate the active compounds from the seed cotton, they must first be made passive. Therefore, when choosing cotton cleaning equipment, it is necessary to look at the nature of the mixtures and how they adhere to the seed cotton. When choosing the types of equipment needed to clean cotton from various contaminants, it is important to take into account their physical and mechanical properties (size, origin, degree of adhesion to cotton).

MATERIALS AND METHODS

Seed cotton ginning machines consist of a pile drum section and a saw drum section. Fine weeds are best cleaned in the pile drum section, while large mixtures are best cleaned in the saw drum section. 1XK, UXK, ChX5, ChX-3M2, 1XP and other equipment are used in PTKs to clean small and large contaminants in seed cotton. At present, in the ginning industry, the cleaning of seed cotton from fine impurities is mainly carried out by 8-pile drum SCh-02; 1XK cleaners and EN178 pile blocks are used.

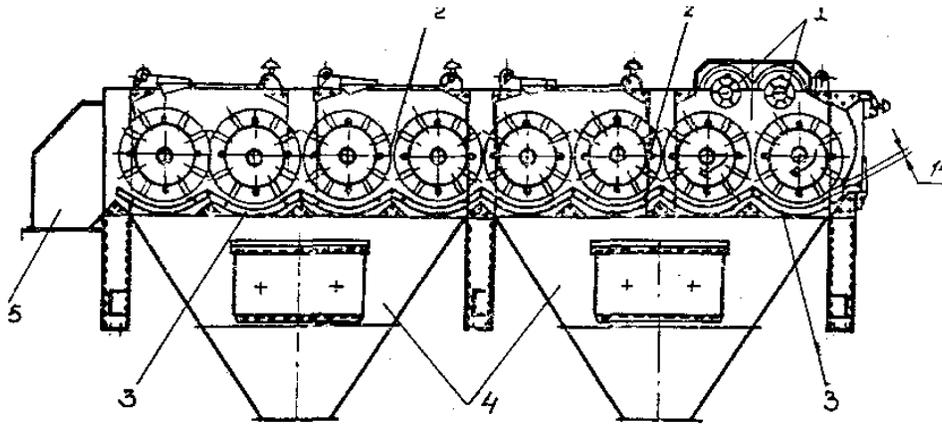

Figure 1. Structural structure of a drum drum used for cleaning small impurities.

The actual performance of the equipment is calculated by the following equation:

$$Q = \frac{3,6 * L * F * \rho_x * \eta * \phi}{T}$$

In this case: the length of the processing path in the gin of L-seed cotton, mm;

F- cross-sectional area of cotton, m²;

Density of ρ_x -seed cotton, kg / m³;

$\eta = 0.25 \div 0.30$ - the coefficient of surface roughness;

ϕ -coefficient of cleaner utilization, $\phi = 0,3 \div 0,35$;

Time of stay (being) of T-seed cotton in the cleaner, s.

TABLE 1. BASIC OF 1XK (SCH-02) CLEANING EQUIPMENT TECHNICAL INDICATORS:

1	Work productivity, t/h	5.0 ÷ 7.0	
2	Cleaning efficiency, %	4550	
3	Rotation speed, rpm	supply roller	0 ÷ 14
		pile drum	480
4	Technological distance (piled with mesh surface drum spacing), mm	14÷20	

At present, it is the only convenient and modern technology for cleaning seed cotton from contaminants, using a set of equipment "Streamline" (drying line) in the drying and cleaning departments of ginneries.

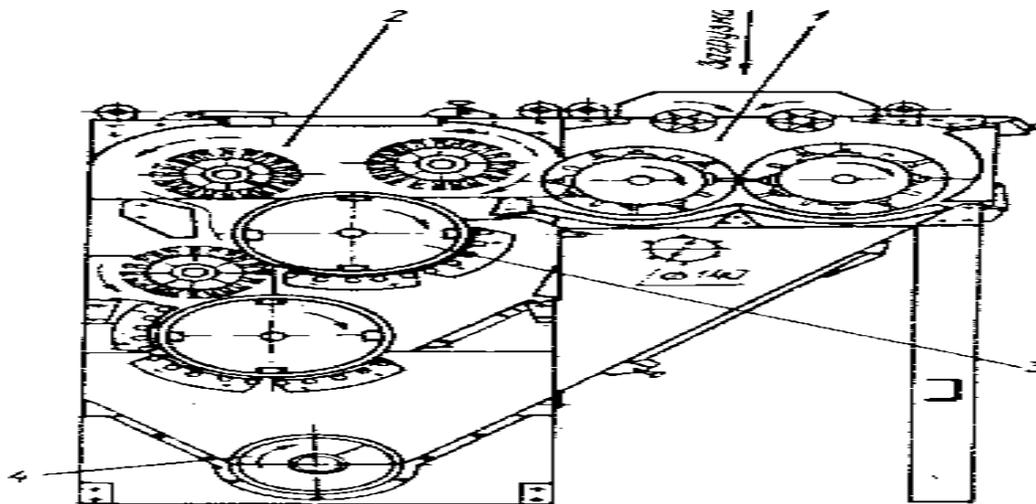

Figure 2. Technological scheme of the initial section of the unit UXK.01.

1- pile block part, 2-brush block part, 3-saw section part, 4-screw conveyor (auger)

One of the important tasks of the modern stage of development of cotton processing technology is the acceleration of technological processes and the production of high-quality products. One of the main conditions for the efficiency of technological processes is the uninterrupted supply of raw cotton to the cleaning process, the implementation of which remains one of the most pressing issues today. Supply facilities are one of the main working parts of the cleaners, whose function is to provide a uniform supply of raw cotton to the equipment. The supply devices consist of a roller with a shovel that rotates at the same speed opposite each other at the bottom of the mine-collector and at the bottom of it, as well as a mechanism (variator) that controls their speed. Supply devices are divided into several types according to the shape of the rollers: pile, shovel, double-shovel rollers.

Nowadays, the supply devices of the cleaners are equipped with shovel-shaped supply rollers. The raw cotton enters the cotton from the mine collector between the shovels in the supply device mounted on the roller (Fig. 3), is compacted to a certain extent and is separated from the mine collector by the rotation of the roller and transferred to the pile drum. Pile drums clean the cotton from contaminants by dragging it over the surface of the net and pass it on to the next process.

The supply device in this design is simple and easy to use, as well as has its drawbacks. The supply rollers have six blades and the rotation speed of the roller is 0-20 rpm. taking into account that, there is a time interval in the supply of cotton to the roller. The design of the rollers supplying the shovels alone does not allow for a uniformly uninterrupted supply of cotton. The larger the angle of rotation of the rollers from the mine-collector and 2 times smaller than the distance between them and the distance between the rollers, which leads to a certain density of cotton. Also, as the density of the cotton in the mine-collector increases, the movement of the cotton along the mine-collector may stop. The mechanism that drives the device (variator) does not meet today's requirements. This is because the rotational motion transmitted from the variator is variable, preventing the process from running smoothly. The supplier, created based on inclined shovel rollers (Fig. 4), can increase the level of supply of cotton at a moderate rate by 1.5-2 times over time.

In our opinion, the inconsistent supply of raw cotton across the width of the equipment with a sloping shovel leads to a violation of the plane of movement of the processed cotton along the axis.

Sectional supply rollers are divided into sections along the circumference of the roller, each section has six shovels. The length of each section is 50 mm and the spacing angles are 30° .

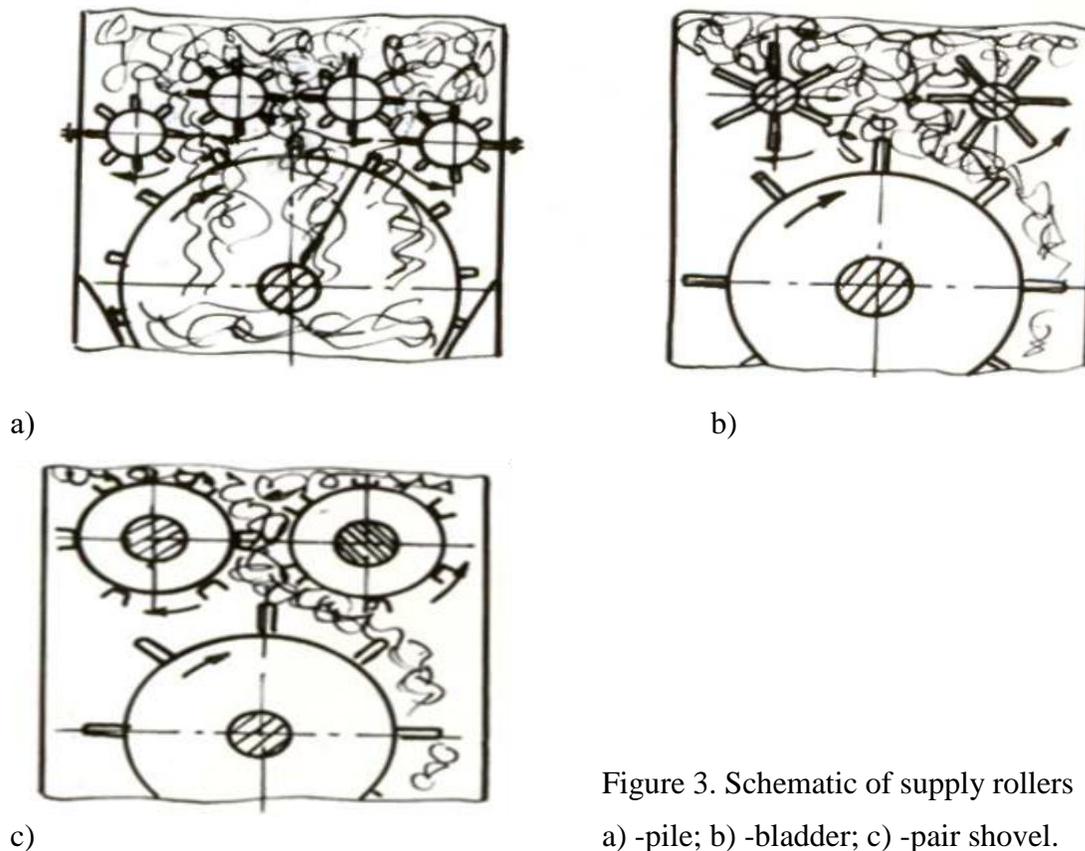

Figure 3. Schematic of supply rollers
a) -pile; b) -bladder; c) -pair shovel.

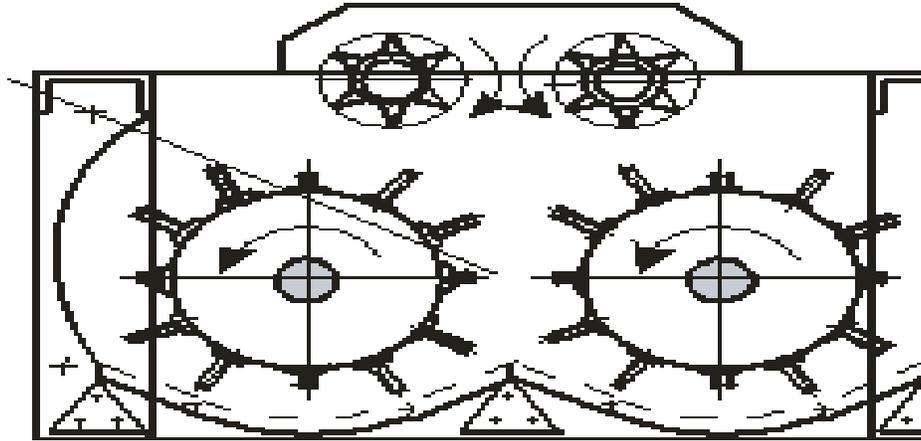

Figure 4. Schematic diagram of the supply of raw cotton

**1 - supply roller; 2 - mine-collector; 3 - pile drum;
4 - mesh surface.**

The increase in the number of sections allows the transfer of raw cotton in small portions.

In the research work, paddle rollers of the wavy structure were created, which increased the surface area of the friction force with cotton. The increase in the height and amplitude of the wavy surface of the corrugated shovels in the direction of the cotton movement led to an increase in the resistance of the shovels. The cleaning efficiency of large-scale decontamination equipment increased from 56.2% to 62.8%, the structural kinetics of raw cotton increased from 0.504 to 0.532, and the amount of cotton added to the contaminants decreased from 3.51% to 2.64%.

In several studies, in addition to the structure of the supply rollers, the degree of grinding of raw cotton has been increased by the installation of high-speed grinding rollers. In particular, in the research work, an additional pair of pile-cutting rollers were installed after the shovel supply rollers. As a result of the installation of this type of supply device on the ChX-ZM1 equipment, the cleaning efficiency increased by 8-10% and the reliable operation of the equipment by 18%. The fact that the rotational speed of the crushing rollers is 4.5 times smaller than the rotational speed of the pile drum reduces the interaction between the raw cotton and the pile drums. As a result, the mechanical damage of cotton is reduced.

The supply device mounted on the supply and grinding gear discs increased the degree of grinding of the cotton raw material and the uniformity of the supply. But it had a negative effect on the mechanical damage of the cotton raw material.

A common shortcoming of the suppliers considered is the additional compaction of the cotton, which negatively affects the transmission of the cotton to the ginning section in a shredded manner.

Analysis of scientific research work on improving the supply of cotton ginning equipment to cotton The development of supply facilities is directly related to the development of cleaning and ginning technological processes. One of the first suppliers of cotton ginning equipment was prof. Studied by GI Miroshnichenko [7]. He studied the movement of shovel rollers and the interaction of rollers with raw cotton during his research. The resulting equations made it

possible to determine the performance of the supply rollers and the lateral pressure force generated by the passage of raw cotton between them. One of the main shortcomings of the study was that the elastic deformation of the raw cotton and the filling of the raw cotton between the shovels were not taken into account.

Researcher Kurbanova G.A. studied the constructive geometrical parameters of the mine and the supply facilities and proposed a mine-collector with a straight rectangular design and a supply roller with a bevel. The optimal number of shovels for the supply rollers has been determined. It was found during the experiments that the cotton supply is 1.6-2 times higher than the length of the mine-collector in a straight rectangular structure. An equation representing the interaction of the geometric parameters of the supply rollers and the bulk density of the raw cotton between the shovels with the supplier productivity is proposed. In the research work, the rotational speed of the supply rollers was assumed to be the same, and the optimal number of shovels was theoretically determined. As a result, the ability of supply rollers to manage work efficiency has been neglected

The researcher did not take into account that the supply roller and the mine-collector are one common system, ie the change in the performance of the parts leads to a change in the technological characteristics of the whole system.

G.I. Boldinsky determined on the basis of theoretical analyzes the forces acting on a single-seeded cotton in each form of mesh surface and pile drum piles.

Researcher D.Yu. Mirakhmedov studied the effect of supply rollers on the supply process in a uniform (flat) and the forces acting on the raw cotton. A mathematical model was obtained that reflects the interaction between the supply rollers and the raw cotton. Technological loads affecting the working parts of the supply device have been identified. The effect of variator technical condition cleaning and roller grinding process on quality indicators was studied.

Research tools Moisture, contamination of cotton, its shredding and uniform supply are the main factors influencing the cleaning process. The moisture content of cotton is normalized during the drying process, and spinning should be done to ensure that the cotton is in the cleaning process. Changes in the crushing rate of cotton have a direct impact on the process of contamination separation. Also, the quality indicators of cotton fibre - length, mechanical damage and the appearance of fibre defects, as well as mechanical damage to the seed.

During the separation of a piece of cotton into single-seeded cotton, the fibre spreads and the equivalent diameter increases. The fact that the fibre is in a diffuse state accelerates the separation of impurities, leading to an increase in the friction of the impurities in its composition with the mesh surface.

Taking into account the above, experimental studies were conducted. The following is the methodology and task of the experiment, the operation of the measuring devices and the results of the experiment.

The experiment was carried out in a 1XK purifier that separates the seed cotton from fine impurities.

The geometrical dimensions of the mine-collector, the shape of the supply rollers and the distance between the pile drums, the direction of transfer of cotton to the pile drums, the effect of

industrial varieties of cotton and equipment on maintaining the natural quality of cotton and cleaning efficiency were determined experimentally.

The general view of the experimental equipment is given in Figure 5, the width of which is 16.3% (310mm) of the production equipment. To see the process, the front of the experimental equipment is covered with an organic glass. The equipment consists of the following working parts: mine-collector -1; supply rollers -2; pile drum -3; router -4; mesh surface -5; dirt bunker -6; dirt box -7 and outlet throat -8.

The experimental equipment works as follows: from the mine-collector 1 the rollers uniformly supplying the cotton 2 pass to the continuous pile drum 3. In the proposed technological process, the cotton is first moved on the upper part of the pile drums 3, thoroughly crushed and transferred to the lower part of the cotton pile drums using a guide 4.

In the current technology, however, the cotton moves only at the bottom of the pile drums. As a result of the cotton being dragged through the mesh surface 5 by the pile drums, small impurities in the cotton content are released. The cleaned cotton is taken out of the machine through the outlet 8. The separated contaminants are dropped into the contaminant hopper 6 and discharged out of the equipment using the contaminant auger 7.

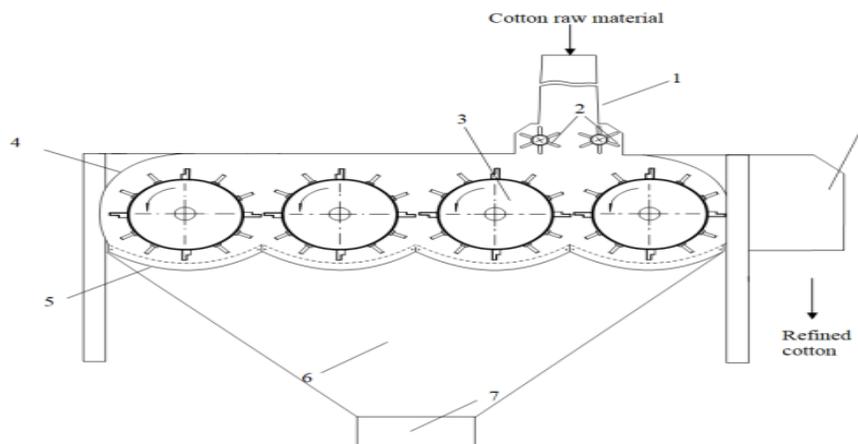

Figure 5. General view of the experimental equipment

1 - mine-collector; 2 - supply roller; 3 - pile drum; 4 - router; 5 - mesh surface; 6 - dirt bunker; 7 - dirt box; 8 - outlet throat.

To determine the moisture content of cotton, samples were taken on laboratory scales VLKT 500 and detected on a thermometer VXS-M1.

The number of contaminants in the cotton and the cleaning efficiency was determined on an LCM laboratory device. The cleaning efficiency of the equipment was calculated according to the number of contaminants detected.

To determine the structural composition of cotton, a sample of 100 g was taken and calculated by the ratio of the amount of cotton structural unit M (dolcasts) to the amount N of cotton pieces. Quantities N and M are determined manually:

$$m = \frac{M}{N}$$

The number of impurities in the fibre by fractions was determined manually. Contaminants in the fibre content were checked by fractions (fine impurities, nodules,).

In order to determine the angle of coverage of the cotton supply rollers, the coefficient of filling of the supply rollers with cotton, the expansion of the cotton flow after the supply roller and the length of the break, mm sheets were glued to the required parts of the test equipment. The above indicators were determined using the analysis of the obtained video images.

CONCLUSION

The analysis of the scientific research work carried out on the techniques and technologies of cotton ginning equipment supply and their improvement showed that they have shortcomings and unresolved issues of theoretical and practical significance;

In existing suppliers, the increase in density as a result of clamping between the supply rollers before giving the cotton for cleaning leads to a decrease in its degree of shredding and a negative impact on the efficiency of the cleaners;

The analysis of the interaction properties of the mine-collector, supply rollers and pile drum with cotton in the supplier shows that in existing constructions the cotton is not provided for cleaning in small pieces and leads to low cleaning efficiency in primary pile drums.

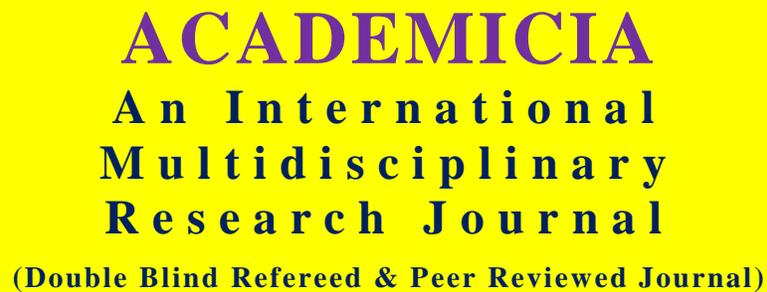

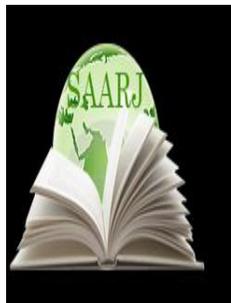

The mine-collector of the existing design does not allow for a continuous supply of cotton to the cleaning process.

The sidewalls of the mine-collector are aligned with the vertical axes of the supply rollers, i.e. its width is 240 mm and the efficiency of the fine-grained cleaning equipment with a rectangular mine-collector is achieved.

ABSTRACT

Forecasting involves the preparation of a statement concerning unknown events, which might occur in future. The main purpose of making forecast is to gain knowledge about uncertain events that are important to our present decisions. In this study, we discussed about Auto Regressive Integrated Moving Average (ARIMA) method. By using this method, we forecast the BSE SENSEX Closing point value and then compare the method with the help of RMSE measure.

KEYWORDS: *Auto Regressive Integrated Moving Average (ARIMA), Bombay Stock Exchange (BSE) and Root Mean Square Error (RMSE).*

INTRODUCTION

Indian stock market has two stock exchanges where most of the trading takes place. They are, (i) Bombay Stock Exchange (BSE) and (ii) National Stock Exchange (NSE). Both the trading platform function on the same day timings and trading days and follow same settlement process. All the big companies are listed on both of these exchanges. There are approximately 5000 companies listed on the Bombay stock exchange and around 2000 companies listed on national

stock exchange. Generally, the value of trade in shares and value of turnover on NSE is significantly higher than BSE. Both exchanges follow the same trading mechanism, trading hours, settlement process etc. Both exchanges compete for order flow that leads to reduce costs, market efficiency and innovation. The two prominent Indian market indexes are SENSEX and NIFTY.

The current study is focused on financial variables and hence the data considered for empirical analysis is drawn from the financial organizations. The data for the study is collected from Bombay Stock Exchange (BSE) which is one of chief trading center where almost all Indian companies are listed out for trading. Even though, there are large number of financial indices are available in this domain, the planned variable considered for the analysis of the study is BSE SENSEX. SENSEX is the short form of sensitive index and it is one of primary indices of Bombay Stock Exchange. Based on SENSEX, several investors plan their financial investments. Some of the organizations look it as a standard index.

1.0 METHODOLOGY

1.1 AUTO-REGRESSIVE FORECASTING MODELS

In the auto-regressive models, we have 3 types of models which can be selected based on the nature of the time series data under study. They are Moving Average models, Auto-regressive models and Auto regressive integrated moving average models.

1.1.1 Auto-Regressive (AR) Process

The Auto-regressive method takes the effect of the previous time period value while forecasting the value of the current period value. So, in Auto-regressive model the value of the current period is a function of the previous periods. In most of the real time data we can see this scenario, for example if a company or brand started a new item then its impact will be there over a period of time, i.e. the sales of the second day will dependent on the values of the first day and it will continue in future as well, in such scenarios we can use AR models to forecast the future values.

Here to get the good results from an auto-regressive process the period (order) of auto correlation plays an important role. The auto-regressive model is denoted by AR(p), where p refers to the order of the AR component.

The first-order AR model can be written as:

$$x_t = \phi_1 x_{t-1} + \varepsilon_t \dots\dots\dots (1.1)$$

The second-order AR model can be written as:

$$x_t = \phi_1 x_{t-1} + \phi_2 x_{t-2} + \varepsilon_t \dots\dots\dots (1.2)$$

The pth order AR model can be written as:

$$x_t = \phi_1 x_{t-1} + \phi_2 x_{t-2} + \dots + \phi_p x_{t-p} + \varepsilon_t \dots (1.3)$$

Here, ϕ is the model coefficient, $\varepsilon_t \sim N(0, \sigma^2)$ is an error at time t, and p is the order of the AR model.

1.1.2 Moving Average (MA) Process

The moving average models use dependency between current period's random error and previous period's random error. The model helps us to adjust for any unpredictable events such as catastrophic events like share market crash leading to share prices falling, which will happen over time and is captured as a moving average process. The moving average model is denoted by MA(q), where q refers the order of MA component.

The first-order MA model can be written as:

$$x_t = \alpha - \theta_1 \varepsilon_{t-1} + \varepsilon_t \dots\dots\dots (1.4)$$

The second-order MA model can be written as:

$$x_t = \alpha - \theta_1 \varepsilon_{t-1} - \theta_2 \varepsilon_{t-2} + \varepsilon_t \dots\dots\dots (1.5)$$

The qth order MA model can be written as:

$$x_t = \alpha - \theta_1 \varepsilon_{t-1} - \theta_2 \varepsilon_{t-2} - \dots - \theta_q \varepsilon_{t-q} + \varepsilon_t \dots (1.6)$$

Here, ε_t is the independently and identically distributed error at time t and follows normal distribution $N(0, \sigma^2 \varepsilon)$ with mean zero and variance $\sigma^2 \varepsilon$. The α and ε notations represent mean intercept and error coefficient, respectively and q is the order of MA model

1.1.3 Auto Regressive Moving Average (ARMA) Process

The preceding two sections describe the auto-regressive model AR(p), which regresses on its own lagged terms and moving average model MA(q) builds a function of error terms of the past. The AR(p) models tend to capture the mean reversion effect whereas MA(q) models tend to capture the shock effect in error, which are not normal or unpredicted events. Now, the ARMA model combines the power of AR and MA components together. An ARMA (p, q) time series forecasting model incorporates the pth order AR and qth order MA model, respectively.

The ARMA (1, 1) model is represented as follows:

$$x_t = \alpha + \phi_1 x_{t-1} - \theta_1 \varepsilon_{t-1} + \varepsilon_t \dots\dots\dots (1.7)$$

The ARMA (1, 2) model is denoted as follows:

$$x_t = \alpha + \phi_1 x_{t-1} - \theta_1 \varepsilon_{t-1} - \theta_2 \varepsilon_{t-2} + \varepsilon_t \dots\dots\dots (1.8)$$

The ARMA (p, q) model is denoted as follows:

$$x_t = \alpha + \phi_1 x_{t-1} + \phi_2 x_{t-2} + \dots + \phi_p x_{t-p} - \theta_1 \varepsilon_{t-1} - \theta_2 \varepsilon_{t-2} \dots - \theta_q \varepsilon_{t-q} + \varepsilon_t \dots (1.9)$$

Here, Φ and θ represent AR and MA coefficients. The α and ε_t captures the intercept and error at time t. The form gets very complicated as p and q increase; thus, lag operators are utilized for a concise representation of ARMA models.

In general, sales processes follow an ARMA (1, 1) model as sales in time t is a function of prior sales happening in time t-1, which plays a role in the AR component. The MA component of ARMA (1, 1) is caused due to time-based campaigns launched by the company, such as distribution of coupons will lead to moving average effect to the process as sales will increase temporarily and the change in sales is captured by the moving average component. In the figures 1.1 & 1.2 both ACF and PACF are showing a sine curve with strong correlation at initial lags.

Thus both p and q parameters are present. There are multiple scenarios to select p and q ; some of the thumb rules that can be used to determine the order of ARMA components are as follows:

- Autocorrelation is exponentially decreasing and PACF has significant correlation at lag 1, then use the p parameter
- Autocorrelation is forming a sine wave and PACF has significant correlation at lags 1 and 2, then use second-order value for p
- There is a significant auto correlation and PACF has exponential decay, then moving average is present and the q parameter needs to be set up
- Autocorrelation shows significant serial correlation and the PACF shows sine-wave pattern, then set up a moving average q parameter. In ARMA (1, 1) time series data, as both ACF and PACF have shown sine-wave pattern, p and q both parameters are affecting the time series signal. The impact of lags can be computed using impulse-response curve, as shown in the figures 1.1 and 1.2, for ARMA (1, 1) time series signal:

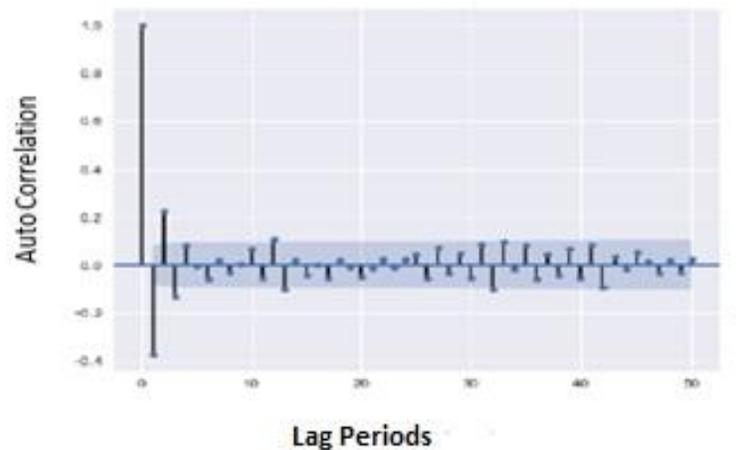

Figure 1.1: ACF Plot

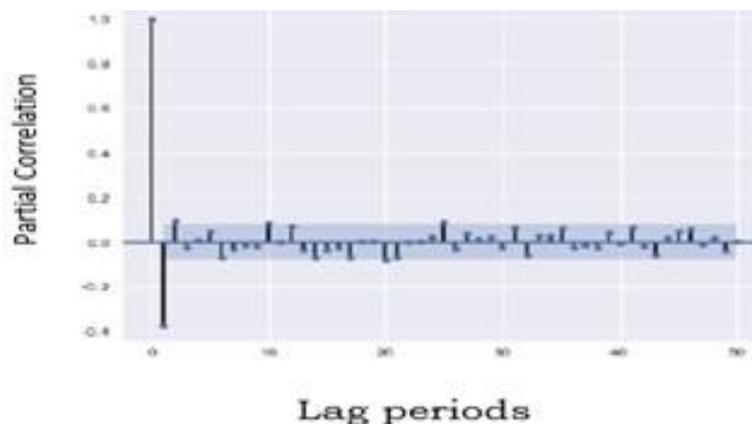

Figure 1.2: PACF Plot

1.1.4 Auto Regressive Integrated Moving Average (ARIMA) Process

Auto regressive integrated moving average process is also known as Box-Jenkins model, which is a generalized form of the ARMA process by including the integrated process. If the data is non-stationary then the integrated components are useful, that helps us in making the process stationary. The process uses differencing method to make the process stationary. Therefore, ARIMA is using differencing on the time series one or more times to remove the non-stationarity of the data. The ARIMA (p, d, q) represent the order for AR, differencing and MA components. The major difference between ARMA and ARIMA models is the d component, which updates the series on which forecasting model is built. The d component aims to de-trend the signal to make it stationary and ARMA model can be applied to the de-trended dataset. For different values of d, the series response changes as follows:

$$\text{For } d=0: x_t = x_t$$

$$\text{For } d=1: x_t = x_t - x_{t-1} \quad \dots\dots\dots (1.10)$$

$$\text{For } d=2: x_t = (x_t - x_{t-1}) - (x_{t-1} - x_{t-2}) = x_t - 2x_{t-1} + x_{t-2}$$

As can be seen from the preceding lines, the second difference is not two periods ago, rather it is the difference of the first different, that is, d=1. Let us say that it represents the differenced response and so ARIMA forecasting can be written as

$$\hat{x}_t = \phi_1 x_{t-1} + \phi_2 x_{t-2} + \dots + \phi_p x_{t-p} - \theta_1 \varepsilon_{t-1} - \theta_2 \varepsilon_{t-2} \dots - \theta_q \varepsilon_{t-q} + \varepsilon_t \quad \dots (1.11)$$

Depending on the order of p, d, and q, the model behaves differently. For example, ARIMA (1, 0, 0) is a first-order AR model. Similarly, ARIMA (0, 0, 1) is a first-order MA model.

1.1.5 RESULTS AND DISCUSSION

Now ARIMA can be applied to the BSE data and the forecasts will be change with this method. As discussed before identifying the accurate AR period and MA period is crucial to get the accurate forecasts. The ACF and PACF graphs are plotted to identify the p and q values.

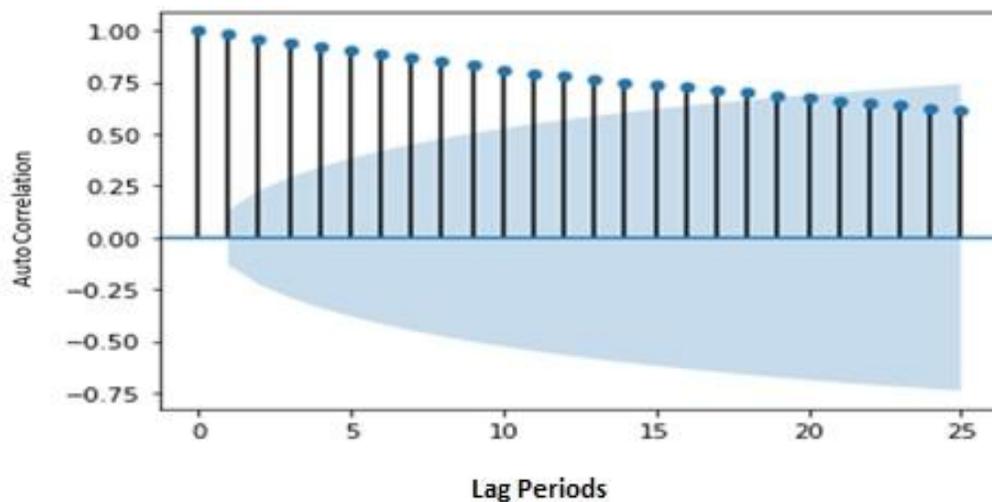

Figure 1.3: ACF Plot for BSE SENSEX Closing Points

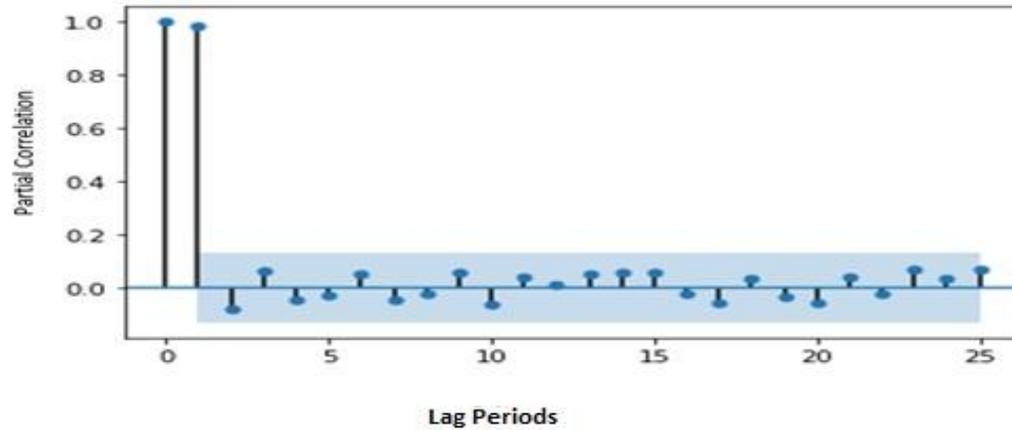

Figure 1.4: PACF Plot for BSE SENSEX Closing Points

The ACF plot is exhibiting a clear linearly decrease, showing a strong serial correlation; however, the partial autocorrelation is exhibiting only one-step dependency. In addition, as the chart shows a positive autocorrelation, correction should be done using the AR component with first-order correlation.

In order to identify the correct combination of p , d and q we carried out an automated software process and the results are given in table 1.1.

TABLE 1.1: AIC VALUES FOR DIFFERENT COMBINATIONS OF (P, D, Q) VALUES

AR(P)	d	MA(q)	AIC
0	1	0	3339.853
0	1	1	3341.847
0	1	2	3343.781
0	1	3	3343.139
0	1	4	3343.879
0	1	5	3345.627
1	1	0	3341.848
2	1	0	3343.783
2	1	1	3343.749
3	1	0	3343.556
3	1	1	3344.817
3	1	2	3341.045
0	2	0	3463.32
0	2	1	3331.426
1	2	0	3410.086
1	2	1	3333.411
1	2	2	3333.456
1	2	3	3335.353
1	2	4	3337.248
1	2	5	3337.683

2	2	0	3375.283
2	2	1	3335.366
2	2	2	3335.348
2	2	3	3331.55
2	2	4	3332.579
3	2	0	3361.957
3	2	1	3335
3	2	2	3337.27
3	2	3	3339.016

By looking at the lowest AIC values we can select the p, d, q values as p=2, d=2 and q=3. Using these selected values, we built an ARIMA model.

TABLE 1.2: ESTIMATED ARIMA MODEL PARAMETERS

	coef	stderr	z	P> z	[0.025	0.975]
ar.L1	-0.8221	0.094	-8.705	0.000	-1.007	-0.637
ar.L2	-0.9309	0.096	-9.684	0.000	-1.119	-0.742
ma.L1	-0.1621	0.146	-1.108	0.268	-0.449	0.125
ma.L2	0.0561	0.161	0.349	0.727	-0.259	0.371
ma.L3	-0.8859	0.145	-6.118	0.000	-1.170	-0.602
sigma2	9.413e+05	1.33e+05	7.092	0.000	6.81e+05	1.2e+06

Therefore, the fitted ARIMA (2, 2, 3) model for BSE SENSEX Closing points is given by

$$\hat{x}_t = -0.8221x_{t-1} - 0.9309 x_{t-2} + 0.1621\varepsilon_{t-1} - (0.0561\varepsilon_{t-2}) + 0.8859\varepsilon_{t-3} \dots\dots(1.12)$$

Here, \hat{x}_t is the forecast value at time t

We can also see the model diagnostics to investigate any unusual behavior in figure 1.5.

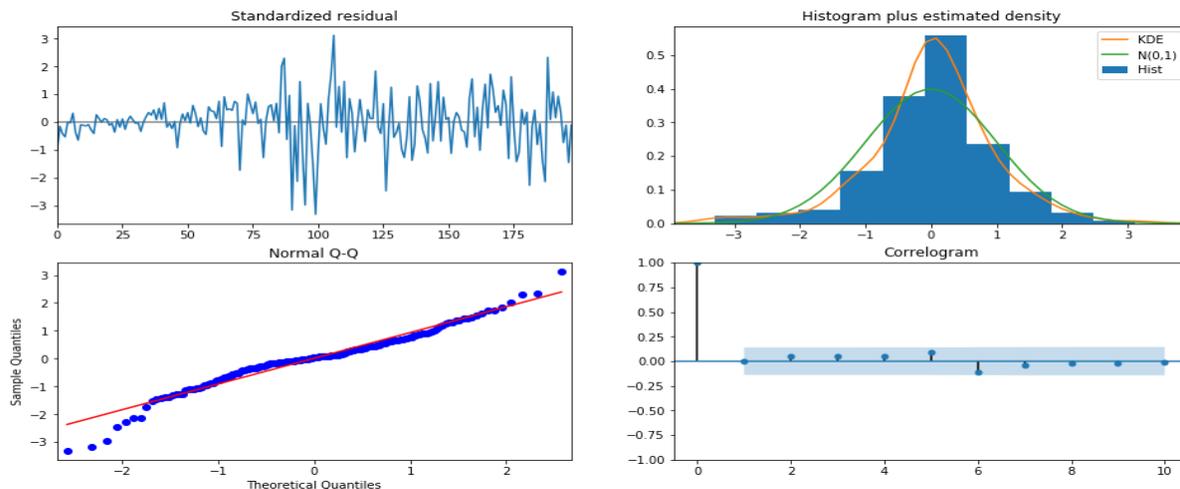

Figure 1.5: Model Diagnostics for ARIMA (2, 2, 3) Model

In figure 1.5, we have different model diagnostics charts, which are plotted for the residuals. We can clearly observe from the histogram and the normal Q-Q plot that the residuals are normally distributed and from the correlation graph, we can observe that there is no clear evidence for the auto-correlation among the residuals. Now we can apply this model on the forecasting period and check how the fitted model forecasts the future period values and how the RMSE value will look like. The graph for the actual BSE closing point and the forecasted values are shown in figure 1.6.

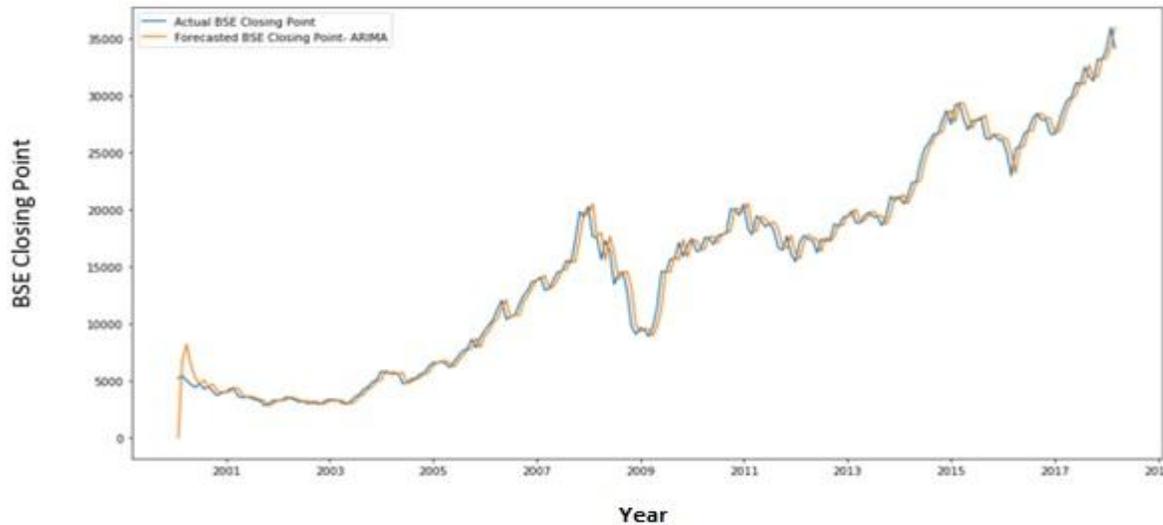

Figure 1.6: Actual Vs Forecasted Values of BSE SENSEX Closing Points by Using ARIMA Method

In figure 1.7, we have the actual values versus the forecasted values for the forecasted period.

Figure 1.7: Actual Vs Forecasted Values of BSE SENSEX Closing Points Only for Forecasted Period

Table 1.3 exhibits the Actual values and forecasted values that are obtained by using ARIMA method. The RMSE value obtained by this method is 1102.7015

TABLE 1.3: ACTUAL AND FORECASTED VALUES OF BSE SENSEX CLOSING POINTS FOR THE FORECASTED PERIOD

Month	BSE Closing Index	
	Actual values	Forecasted values
01-02-2017	28743.32	27668.66
01-03-2017	29620.5	28871.55
01-04-2017	29918.4	29698.58
01-05-2017	31145.8	30043.79
01-06-2017	30921.61	31270.07
01-07-2017	32514.94	30995.15
01-08-2017	31730.49	32721.14
01-09-2017	31283.72	31727.10
01-10-2017	33213.13	31614.51
01-11-2017	33149.35	33200.65
01-12-2017	34056.83	33266.97
01-01-2018	35965.02	34272.95
01-02-2018	34184.04	35965.73

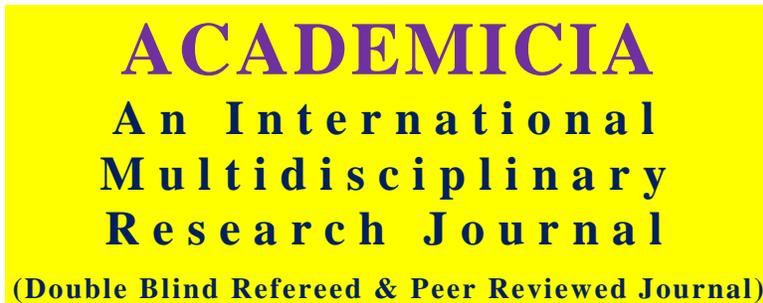

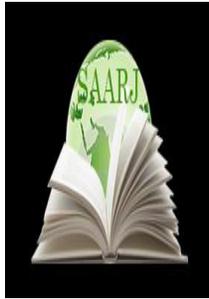

3.4 CONCLUSION

In this Study, we discussed about the traditional time series forecasting method like Auto Regressive Integrated Moving Average method (ARIMA). We applied this method on the BSE SENSEX closing point value and forecasted the BSE closing point value for the period from January 2017 to February 2018. We used Root Mean Square Error (RMSE) measure to compare all these methods. Of all these methods ARIMA with $p=2$, $d=2$ and $q=3$ has the least mean square value of 1,103.

SCIENTIFIC AND SOCIAL SIGNIFICANCE OF UZBEK ANTHROPONYMS

Iroda Ahmedovna Djuraeva*

Candidate of Philological Sciences,
National University of Uzbekistan named after Mirzo Ulugbek,
UZBEKISTAN

ABSTRACT

The article gives comparative analysis of the anthroponyms in Uzbek language. While coming through with the theories of world's prominent scholars, anthroponyms are close to the languages related to the same language family. However, over the years, the names have changed from people to people, the tone and form of other languages may change, but their value is preserved. But in-depth analysis, in fact, the reason for this is that from ancient times the name was enough to get information about a person, in addition, the identity of the father and the place of residence helped to "identify" the person's name. There was no need for a surname like the Russians.

KEYWORDS: *Anthroponyms, Chrematonymy, Zoonymy, Names, Language Family, Nominative Meaning, Explanatory Dictionary, Taqsir, Domla, Mullaka, Hajibobo, Bek, Hazrat.*

INTRODUCTION

It is well known that in linguistics there have been changes, the paradigm has been abandoned, the transition from "limited" and systematized linguistics to cognitive-discursive linguistics, that is, the study of language in a new way, has become more and more popular. The rainy season has begun. According to the linguist, Professor E.S. Kubryakova: "Learning a language is equal to the study of human nature, worldview and specific problems, the basis of the science of human behavior, attitudes and behavior ...".

New views did not bypass Uzbek onomastics. In accordance with the requirements of the times, the need of our people to know foreign languages has increased, according to "In the world of onomastics, there is a need to know more about the names of famous horses, names (names,

nicknames, nicknames) and historical names of geographical places, regions, rivers, etc.". As Professor G.R. Galiullina said, "Symbols, values, worldviews, beliefs, customs, moral norms - along with the formation of the foundation of national culture, defined the attitude of the human psyche to social life".

In particular, the development of anthroponymy, which is a key part of Uzbek onomastics (anthroponym means "name given to a person" in Greek, and the field of study of anthroponyms is called anthroponymy) has given rise to the development of different cultures.

THE MAIN FINDINGS AND RESULTS

In the process of in-depth study of the language, the analysis of the meaning of famous names and names has become equal to the study of the individual. This is because a person's name (famous name) "chases" him for a lifetime, and determines his mood, behavior, aspirations, and worldview. One of the experts in the field of onomastics, linguist V.A. Nikonov, summed up such considerations by interpreting it as "a social sign (mark) given to a person".

If we think in terms of VA Nikonov's worldview, even the name given to an object "revives" it, for example, when we hear a unique weapon or a given name, we can understand what it "does" (chrematonymy). Reading the history of geographical places, we can better understand why they are so named (toponymy). When we look at different nations, we are convinced that their names are derived from the basic characteristics of the people (ethnonymy). We can't even give animals a name, at least depending on the color, we call them "Blackbird" or "Swan" (zoonymy). Thus, it can be said that the social significance of anthroponyms in language learning is growing.

Anthroponyms are the linguistic value of the people. Therefore, "If we pay attention to the essence of names, if they have a meaning and origin, they belong to a certain people. However, over the years, the names have changed from people to people, the tone and form of other languages may change, but their value is preserved. If we do not pay attention to such considerations, if we do not know the reasons, we will not be able to understand the meaning of the names, and it will be difficult to understand their meaning".

The following concepts and terms are often used in the study and expression of anthroponyms:

1. The nominative meaning of a noun is that in the process of meeting with a person, the noun can provide information about the intellectual or emotional aspects of the owner, albeit partially, semantically.

The nominative meaning of the noun is the semantic structure of the symbol of the person, and the explicit can be expressed (expressed) in the speech about the features of the semantic-denotative nature.

2. Anthroponymic formula: name + father's name + surname, ie the official names in the passport. The various components of the anthroponymic formula are embedded in different social spheres, especially a person's personal name is a universal component of a lifetime and it goes through many areas, someone's social (communication circle) is bordered by the family, even the country.

3. Anthroponymic signals - words, morphemes (long words) or melodic words at the level of micro-context or in the process of real communication help the name to enter the anthroponymic field. Lexical signals of anthroponyms include breed, gender, age, occupation, position and others.

4. Relativity of personal anthroponyms, nominative meaning of the name, anthroponymic formula and anthroponymic signals are used at the level of social spaces. In the social sphere, social (family and community) and formal meetings are taken into account.

The Uzbek people pay a lot of attention to naming, so when a child is born, they think about it and give it a name. Therefore, over the centuries, there has been almost no artificial change in names.

Under the influence of Islam, the number of names has increased. Therefore, there are many Uzbek names with a much wider and different meaning than the Slavs and the peoples of Europe. In addition, the Uzbek people sincerely respect the names of their ancestors, and by preserving them in the tradition, they will continue the tradition of freely accepting new and modern names that come with the demands of the times and social changes. Therefore, Uzbek ethnoanthroponyms have a very rich list, diachronic and synchronous, as well as semantic and grammatical-phonological structure. Modern anthroponymic dictionaries and other historical books mention more than 500 Turkish names, including patronymics. E.A. Begmatov's "Meaning of Uzbek Names (Explanatory Dictionary)" mentions 14,600 names.

Names from Turkish make up the majority of the list, for example, the following names have already been "Uzbekized": **Tolqin, Ozoda, Jalil, Yuldash, Lochin, Ogabek, Uzbekhon, Bolta, Sayram, Utkir, Botir, Jahon.**

However, there are many names that come from the Arabs, first of all, **Muhammad** (the names of the Prophet) and the variants of this great name that come in other languages - **Ahmad, Mahmud, Hamid** and others. Also, **Ali, Umar, Hamza, Abbas, Aisha, Fatima, Khadicha** (names of the Prophet's relatives) and **Yokub, Yusuf, Moses, Ibrahim, Ismael, Sulayman, Iso, Maryam** (names of the prophets mentioned in the holy books) are also mentioned. The following double names have not lost their relevance over the centuries: **Abdullah, Abdurahim, Abdurahman, Abdulaziz, Saifiddin, Nigmatilla, Ismatilla** (names associated with the name of Allah and related to wishes) and others.

In ancient times, a man's name consisted of several names, and due to other social factors, his name was rarely used in conversation and in address, it was often a *taqsir, domla, mullaka, hajibobo, bek, hazrat*, a mother, a wife, a mother and a child. it was customary to call (this custom is still practiced in the villages of Surkhandarya, Kashkadarya and other regions). When the woman addressed the man, his name was mentioned instead. It is as if it represents the status of women in society. Also, a woman's last name "passes" from her father, and when she gets married, she "takes" her husband's last name. When asked, "Whose child?". The father's name is usually mentioned. This means that the patronage system is dominant in the East.

In general, gender factors are taken into account when naming a child, but sometimes, under the influence of morphological forms, both boys and girls can be called by similar names on the basis of anthroponymic signals. For example, a boy is named **Ravshan** and a girl is named **Ravshanoy**. Here the word "moon" is an anthroponymic signal.

In the Uzbek language, "a" was added to the names of boys, such as **Aziz, Mahmud, Sayar, Zarif, Nodir**, and **Sarvar**, and girls, such as **Aziza, Mahmud, Sayora, Zarifa, Nodira**, and **Sarvara**. Most Uzbek girls end in "-a": **Gulnara, Dildora, Dilfuza, Iroda, Nigora, Khadicha, Shahida**, and many boys end in "-a": **Abdullah, Ismatilla, Rahmatilla**. There are also many

names in the names of girls that do not end in ten letters: **Aigul, Guzal, Muqaddas, and Maryam**. It should be noted that for boys, the suffix “-jon” is often added - **Olimjon, Saidjon, Raufjon**, and for girls, the suffix “-khan” can be added - **Kumrikhon, Donokhon, Kizlarkhan**. Even when caressing a child, the suffixes “-jan” and “-khan” are added: **Rahimjon, Sobirjon, Maryamkhan, Shohidakhon**.

The Uzbek people have such a tradition, when addressing, out of respect for the names - the words aka, sister, father, aunt, uncle (anthroponymic signals) are added: **Sodir aka (brother), Jamila opa (sister), Shodmonota (father), Santarkhola (aunt), Yusuf toga (uncle)**. Words such as pocha, poshsha, tora, khoja, and hajj are also pronounced along with nouns: **Rashid pocha, kelinposhsha, Ilhomtora, Islam khoja, hajiata**.

Friends, acquaintances, children, teenagers, as well as brothers and sisters in the family often abbreviate each other's names: **Alisher - Alish, Bakhtiyor - Bakhti, Fakhriddin - Muzi, Muzaf - Muzi, MuziKhurshida - Khurshi, Nozima - Nozi, Fotima - Foti, Otabek - Otash, Malika - Mali**. In particular, it was customary to call the tribes **Dilbar, Dilorom, Dildora, Dilfuza - Dilya, Gulchehra, Gulnora, Gulsara, Gulrano - Gulya**.

In the social sphere at the family level, and even in the social sphere at the community level, the call by last name is almost non-existent. At first glance, it may be concluded that this is due to the lack of formalism in the ordinary family. But in-depth analysis, in fact, the reason for this is that from ancient times the name was enough to get information about a person, in addition, the identity of the father and the place of residence helped to “identify” the person's name. There was no need for a surname like the Russians.

Since the family in the East consists not only of parents and children, but also a large number of relatives, the institution of the family has always had a special social significance, in order to preserve the values of the family.

CONCLUSION

The motive of education and morality has a special place in Uzbek anthroponymy. Because when a person gives a name to his child, first of all he wants the child to be happy, and for that he wants him to grow up healthy, moral and mature. And she sums up her dreams, hopes and desires in one word and names her child.

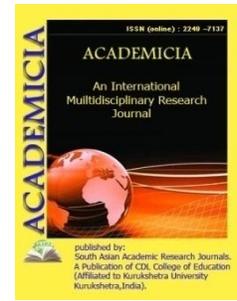

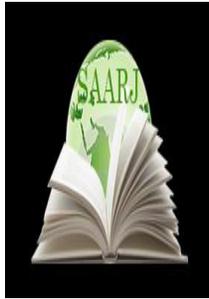

Uzbek onomastics should be studied not only in a descriptive way, but also from the point of view of anthropocentrism, cognitology, linguoculturology.

Thus, anthroponymic material can be approached not only from the linguistic point of view, but also from the ethnolinguistic, ethno-cultural, psychological, sociolinguistic, aesthetic, historical-religious point of view, and it is possible to find solutions to controversial problems in the field of anthroponymy.

ABSTRACT

In ancient times, the Great Silk Road served as a bridge connecting our region with the world. This was especially important for Central Asia. In this sense, the Great Silk Road plays a strategic role in today's relations between Uzbekistan and the world. This article describes some features of the activities of the Great Silk Road during the reign of Amir Temur and the Temurids on the basis of historical sources and literature.

KEYWORDS: *Amir Temur, Temurids, Great Silk Road, Caravan Routes, Service System, Timber, Caravanserai, Caravan Leader, Samarkand, Trade And Embassy, Kirakash, Postal Service, Ambassador, Trade Cities.*

INTRODUCTION

In ancient times, the Great Silk Road served as a bridge connecting our region with the world. This was especially important for Central Asia. In this sense, the Great Silk Road plays a strategic role in today's relations between our country and the world.

It is known from history that civilizations took place in the territories of great kingdoms, in the time of economic and regional stability, far-sighted, zealous for the welfare of the people, patrons of science. Equal attention to all areas, the principle of social justice, interest in the development of entrepreneurship, the concept of a prosperous life in general served as the basis of the Second Renaissance as a result of the policy of Amir Temur. In a kingdom of twenty-seven states, domestic and foreign trade exchanges had a positive effect on the growth of the country's economy.

In his letters to the leaders of many Eastern and Western countries, Amir Temur also stressed the need to open the way for international trade and provide greater benefits to entrepreneurs, and private entrepreneurs have a great impact on the development of the country.

During the reign of Amir Temur and the Timurids, trade routes were restored and developed. It is known that the territory of Central Asia, in particular, Uzbekistan, played an important role in international trade and cultural relations during the reign of Amir Temur and the Timurids. When Amir Temur took power in Mowarounnahr, he managed to establish a centralized government and fully ensure the security of international caravan routes. Due to this, from the 70s of the XIV century, the central network of the Great Silk Road passing through Mowarounnahr began to play an important role in international economic and cultural relations, rather than the northern direction. The revival of the movement of international trade caravans across Mowarounnahr has led to the development of cities, the rise of economic and cultural ties [1, pp. 154-164].

During this period, the roads connecting the country's capital Samarkand with the major cities of Mowarounnahr and Khorasan were the main link in the system of domestic trade routes in the region. Measures taken to ensure the safety of caravan routes, the construction of many roadside structures (caravanserais, cisterns, bridges, etc.), the rise of domestic and foreign trade to the level of state policy were among the main directions of socio-economic policy of Amir Temur.

THE MAIN FINDINGS AND RESULTS

During the reign of Amir Temur and the Timurids, there were several routes connecting the major cities of Mowarounnahr with the state capital of Herat, Khorasan. Among them, the roads from Herat through Merv to Bukhara and Urgench, and through Balkh to Samarkand played an important role in the internal and external economic, cultural and political life of the region.

The first part of the Herat-Samarkand road passed through the middle reaches of the Amudarya. In particular, Herat Sabzak, the capital of Khorasan during the Timurid period, was connected with the cities of Mowarounnahr via the Kotali-Qalai-Nov-Murgab-Maymana-Andkhoy-Kelif route. The road from Herat branched off in Andkhoy and led in one direction to Termez via Shiberghan, Balkh and Khayrabad [2].

The Kelif Pass and the road from Termez to Samarkand passed through the cities of Kesh (Shahrisabz) or Karshi [3, pp. 55-57] in the Kashkadarya oasis. HafiziAbru gives information about the location of the city of Nakhshab on the plain, the route from Bukhara to Samarkand through this ancient city [4, p. 85]. According to Boburnoma, Karshi is located south of Samarkand and the distance between them is 18 trees [5].

The route from Samarkand through Kesh to the Surkhandarya oasis and India was also actively used during this period. In particular, according to Sharofuddin Ali Yazdi, during his march from Samarkand to India, Amir Temur built a garden and a palace on a mountain 7 km from Samarkand, on the road to Kesh, and named it "TakhtiQarocho" [6, p. 191].

One of the roads from Kelif and Termez to Samarkand passed through the city of Kesh (Shahrisabz). It is known that the Spanish ambassador RuiGansalis de Clavijo, who arrived in Amir Temur on an official visit, arrived in Samarkand from Khorasan via Termez - Darband - Iron Gate - Oqrobot - Kesh. Clavijo praised the position of Samarkand in the state of Amir

Temur, where he reported on the market and closed trade stalls built by Sahibkiran [7, pp. 299-301].

During the reign of Amur Temur and the Timurids, international relations were actively established with many countries in Europe and Asia. In particular, economic and cultural ties were established along important caravan routes connecting the capital Samarkand with India, Khorasan, Iran, Iraq, Egypt in the south, the Golden Horde and Russian cities in the northwest (Novgorod and others), East Turkestan and China in the east [8, pp. 97-117].

In particular, he sent letters to the kings of Europe with the content “If you send your merchants to our parties, so that we may meet them warmly, putting all the honors in place. If our merchants go to you and show them the same respect. Let them walk without danger, without obstacles. It is useless to deny the saying that traders make the world prosperous”.

Scholars have called Sahibkiran's actions a "policy of outstretching" in diplomacy. Indeed, he is the first head of state to reach out to Europe on the path of friendship and cooperation. The harmony of interethnic relations in the domestic and foreign policy of Amir Temur was one of the factors of development. Indeed, this aspect of his multi-ethnic and multi-religious kingdom is one of the most significant events of that period.

Written sources, especially medieval works, such as the famous Boburnoma, provide information about the mountain passes from India to Central Asia via Kabul and Kandahar. According to him, from Kashgar, Fergana, Turkestan, Samarkand, Bukhara, Balkh, Gissar and Badakhshan to Kabul passed through 7 passes (pass, mountain road) in the Hindu Kush mountains. There are 4 roads (passes) from India to Kabul through the Khyber Mountains, and there were no mountain passes on the Khurasan road between Kabul and Kandahar [9, pp. 117-118].

During the reign of Amir Temur and the Timurids, relations with China did not stop. It is known that in 1368 the Yuan dynasty of the Mongols in China was abolished and the Ming dynasty came to power. Due to the policy of the Ming Empire (1368-1644) to reliably protect northern China from the Mongols, to strengthen the borders, there were some interruptions in Central Asian-Chinese relations. After Amir Temur conquered Mongolia in 1389 and eliminated the threat posed by Mongolia to Mowarounnahr, it became possible to ensure the security of the caravan route through Mongolia and East Turkestan, and to establish trade and embassy relations with China. In particular, the fact that ambassadors visited China nine times on behalf of Amir Temur in 1389–1398, and ambassadors from China were sent to Samarkand in 1395 under the leadership of Fu An, shows that relations between the two countries continued [10, pp. 106-116].

Relations with China continued during the reign of Shahrukh Mirza. It is known from written sources of this period that Chinese ambassadors came to Herat in 1409 and 1420, and the Timurid rulers also sent their ambassadors to China several times. Trade routes, an important branch of the Great Silk Road connecting Central Asia with China, led mainly from the center of Mowarounnahr via Fergana and Ettisuv to East Turkestan, and through its trade cities to the Chinese capital, Beijing. These important trade routes are described in detail in a diary written in 1419-1422 by GiyosiddinNaqqash, a member of the embassy mission sent to China by Shahrukh Mirza under the leadership of Shodikhoja. According to the information in the play, the ambassadors traveled in the following direction: Herat - Balkh - Kelif Pass - Samarkand - Sayram - Ashpara (this city fortress was built by Amir Temur) - Mongol people (Bilgutu - Brown water) - Yulduz meadow) - Turfon - Karakhoja - Sufi Ato village - Qumul - Karavul -

Sukju - Qamju - Pinlon - Khanbalik (Beijing) [11, p. 56]. Among the roads connecting Central Asia with China, the Shosh oasis also played an important role, with caravans covering the distance from Shosh to Turfan in 3 months [12, p. 367].

It is known that during the reign of Amir Temur and the Timurids diplomatic relations were established with European countries - France, England, Spain and other countries. In particular, in view of the above-mentioned official visit of the Spanish ambassador Ruy González de Clavijo, who visited Samarkand in 1402-1404 via the Iraq-Iran-Khorasan from the Mediterranean, the trade routes from Khorasan to Samarkand via Termez - Darband - TemirDarvoza - Oqrobot - Kesh and Rui Gonzalez de Clavijo made a special mention of the attention paid to himself and the Egyptian ambassadors. For example, he writes that the Egyptian ambassadors were guarded by about 20 cavalymen in Samarkand.

The ambassadors' horses were replaced with new ones every day, and at the end of a day's journey, sometimes 100 or sometimes 200 new horses were prepared for them.

The historian also notes that such horses were prepared in other places, and special guest houses were built by the decree of Amir Temur. There was a special group of horse breeders who took care of the horses, - he said. One or two of them even accompanied the caravans to the second destination and returned with the same horses, taking other passengers.

Historians have written about special pillars placed on the roads at that time. Columns are a measure of the distance of caravan routes, which are mounted every mile on the ground.

During the reign of Amir Temur and the Timurids, there were relations with the cities of the Golden Horde, which were in two directions; It was carried out through the Khorezm oasis or the cities of South Kazakhstan (Turkestan, Sayram). This revived the ancient ties of the peoples of Central Asia with the peoples of Eastern Europe. Russian chronicles of the 14th century contain information about merchants from Bukhara and Khorezm living in Nizhny Novgorod [13, p. 12], which testifies to the trade and cultural ties between the two.

From the 15th century onwards, as the position of the Moscow principality began to grow, we see that the Russian princes began to seek embassy relations with the Timurids. Historian AbdurazzaqSamarkandi (15th century) wrote that in 1464 the ambassadors of the Russian tsar Ivan III came to the ruler of Herat AbusaidMirzo, and in 1490 the ambassadors of Sultan Hussein Boykaro visited Moscow [14, 185].

Due to the policy of Amir Temur and the Timurids of interethnic harmony and religious tolerance, the process of integration through trade routes intensified during this period.

In a letter to the Chinese emperor, Shah Rukh Mirza, one of the Timurid rulers, said: If the tribes of the peoples around the countries will be happy, if the means of subsistence will be regulated among all classes of citizens, - he said.

It is clear from the above that Amir Temur and the Timurids saw the Great Silk Road as one of the foundations of mutual cooperation, solidarity and friendship.

During this period, comprehensive relations were established with many Eastern countries through the 12,000-kilometer-long Great Silk Road. In addition, close trade, economic and diplomatic relations have been established with Western European countries through the Great Silk Road to the Mediterranean.

Amir Temur formed the activity of the Great Silk Road on the basis of certain rules, innovations that guarantee its protection.

First of all, the stations of the Great Silk Road were repaired and new ones were built in some places. Caravanserais were built on the roads to provide rest for the caravans. These caravans were guarded by military guards set up by the local authorities and transported from one place to another.

They also informed about the introduction of the method of rapid road crossing in the state of Amir Temur. They covered the distance they could reach in three days in one day. Sahibkiran Amir Temur receives messages from all corners of his lands and borders in a few days through an accelerated means of communication. These factors indicate that a specific information, communication and postal system existed at that time.

The local government was responsible for the movement of these caravans. As a result, caravans are safely transported from one place to another. The Sahibkiran blamed the governors and other administrators of these areas for any damage caused to anyone on the caravan routes. The introduction of the rule of compensation from the contribution of officials has become one of the legal guarantees in the path of international trade.

RESULTS AND DISCUSSIONS

Historians mention that there were two Timur Gates on the border of Amir Temur's kingdom: "Since there is no other way to enter the Samarkand Empire from Little India (Afghanistan), this mountain road is a protective point for the Samarkand Empire. If the people of Samarkand went to India, there was no other way for them. Temurbek's gate, which is under Temurbek's control, is of great benefit to the state treasury, because traders from Lesser India (Afghanistan) to Samarkand and vice versa to other countries pass only through this Temur gate [14, p.186].

Through the Great Silk Road, Amir Temur not only developed defense, peace and stability, good neighborliness and trade and economic relations, but also achieved his geopolitical goals.

Sahibkiran Amir Temur restored the most important branch of the Great Silk Road, which was moved from Samarkand to Sarai Berka during the Mongol period, ie caravans passed through Samarkand again.

The cities along the Great Silk Road, especially Samarkand, were highly developed during the reign of Amir Temur. Traders came to Samarkand from all over the world. There are countless shops, markets, handicraft workshops, and local products are sold aside.

Sahibkiran also paid special attention to the goals of ensuring the defense and security of his country and neighboring countries by strengthening the Great Silk Road. During the reign of Amir Temur in the adjacent regions of the states were built settlements that served as customs today.

Amir Temur's officials also identified the targets of the intruders through thousands of runners, thousands of camels and thousands of horsemen on the Great Silk Road and other roads, and officials assigned to the roads and rabats.

The Great Silk Road also played an important role in the development of science. Scientists, tourists, and even merchants from different countries and those who left our country in different

directions simultaneously served as heralds of science. This is one of the reasons why the cities along the Great Silk Road are culturally more prosperous than other cities.

CONCLUSION

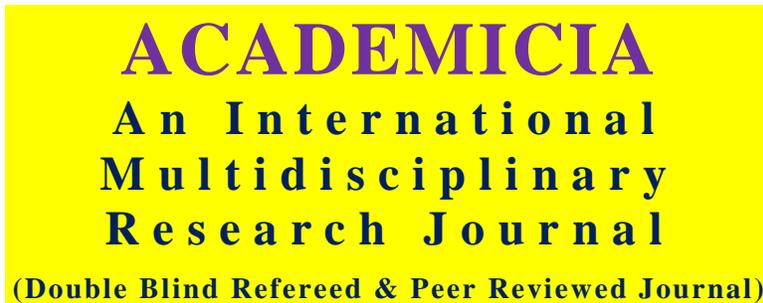

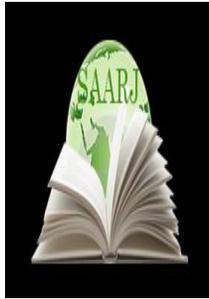

Thus, the period of Amir Temur and the Temurids is the last and rising period of the activity of the Great Silk Road. During this period, the cities of Mowarounnahr and Khorasan played a major role in international economic and cultural relations along the central routes of the Great Silk Road. The main directions of this developed trans-regional communication in the Middle Ages, which went through several historical stages, played an important role in the implementation of internal and external economic and cultural relations of the region.

SOCIAL NORMS RELATED TO THE ACTIVITIES OF PRIMARY SCHOOL CHILDREN

Maryambibi Djumaniyazovna Abdullaeva*

*Lecturer,

Department "Preschool education",
Chirchik State Pedagogical Institute,
Tashkent Region, UZBEKISTAN

Email id: maryambibi.abdullayeva@mail.ru

ABSTRACT

A special place in introducing students to social and legal norms is occupied by general education institutions. Activities professionals-teachers, specially mastered pedagogical – psychological and social knowledge in the institution ensures correct students understanding of the essence of the socio-legal norms, their understanding of the social, moral and legal significance, as well as serial mastering the skills of those norms in their daily activities.

KEYWORDS: *Socio-Legal Norms, Children, Primary School, Psychological Knowledge, Interpersonal Interaction*

INTRODUCTION

Primary school students learn the simplest concepts of social and legal norms, their content in the family and preschool institutions. However, the initial stage of training is considered to be a certain period in the life of students. The child will be fully prepared to receive an education in accordance with their physical and mental maturity. The position of gaming activity as the main way of life is occupied by reading activity. Reading activity has a strong influence on the further improvement of the psyche of students, the formation of character traits. Interest in acquiring knowledge and studying the environment. All these phenomena help students to adequately understand the essence of social and legal norms.

MATERIALS AND DISCUSSION

Even the emotional approach to cognition manifests itself as one of the features of primary school students. Therefore, it is interesting to describe the information provided when introducing them into social and legal norms, imaginative interpretation with the help of as many

life examples as possible will help to achieve positive results. Due to the peculiarity of excitability in the expression of their feelings, as well as the power of imitation of their peers, it is possible to achieve a sufficient level of their imagination, highlighting cases of non-compliance or non-compliance with social and legal norms by the example of their actions, behavior, habits.

Even in the minds of younger students, due to the predominance of objectivity, they pay attention to the image (form or image), and not to the meaning of the concepts given by the teacher. And this in itself means the need to convey information about social and legal norms through visual means. The image of the teacher's speech, the richness of feelings and the fact that the information is interesting, serve to actively organize the cognitive activity of students.

The education of primary school students in general education schools of a sense of respect for social and legal norms is an important component of educational and spiritual-educational work. The study of social and legal norms in the structure of educational work is mandatory. This obligation is explained by the fact that the teaching of "education" as a subject is established in grades 1-4. It is taught in primary classes “

On the basis of the science of "Upbringing", students get acquainted with the essence of social norms, in particular, legal norms.

Spiritual and educational work, which is an important structural direction of the pedagogical process organized in an educational institution, will consist of a complex of various types of activities and have wide opportunities for educational impact on the child ". It is known that spiritual and educational work is organized on the basis of a plan developed taking into account the issues of social significance, pedagogical significance, the interests of students, and the tasks facing the Educational teaching staff. In this regard, in the plan of spiritual and educational work, it is possible to introduce measures that promote the assimilation of social and legal norms by primary school students.

In philosophical, sociological and legal sources, it is noted that social norms, which are "general rules of behavior that regulate relations between people and their associations", "regulate relations between people". In some sources, however, the "standards of activity", along with social norms, are "Rules of Conduct" (<http://www.glossary.ru/cgi-bin/gl>) is also underlined.

Accordingly, primary school students must adhere to certain rules in the family, Educational institution, as well as in the relationships they form with their parents, all family members, classmates and peers in the microgroups to which they belong. It is necessary to know the types of social norms so that students understand exactly what rules of behavior they should follow in their relations with social actors.

Existing sources suggest that social norms are grouped into the following types:

- 1) moral norms;
- 2) norms of public associations;
- 3) the national customs;
- 4) specific habits of different peoples;
- 5) traditional norms;

- 6) norms of political activity;
- 7) legal norms;
- 8) religious norms

The grouping of social norms in this way gives rise to some reasoning. That is:

1. At the same time, it should be noted that certain mistakes were made when grouping social norms in this order. After all, "habits characteristic of different peoples" are exactly the same "national customs". Because, in Latin, "transference" translated from Arabic, the concept of "tradition", which means "the rule of transition from generation to generation", is directly translated into the Explanatory Dictionary of the Uzbek language "rules, customs and other actions that are decided (met) in life".

2. In addition, as one of the types of social norms, it is necessary to define the phrase "norms of tradition", which is presented in this place in terms of content. It is known that traditions are inherently related to a particular society, people or social group (Family, Community, union). If the authors had indicated what subject the phrase "norms of tradition" refers to, there would have been no misunderstanding. If the norms of tradition were applied to a certain people, then it also, without a doubt, represents the essence of national customs. After all, "traditions are formed and polished in the process of the historical development of peoples. Traditions that meet the requirements of the era are not forgotten, are inherited by generations, and become part of the life of the people. Tirade every people or nation develops its own traditions, save. Traditions reflect the level of genius of the people, the way of life, cultural perfection.

3. A group representing the types of social norms:

- aesthetic norms;
- organizational norms;
- it is necessary to enrich the organization of activities with such concepts as the norms of the cultural approach.

Results

In our opinion, it is necessary to rely on the opinions expressed, as well as to distinguish the following types of social norms from a pedagogical point of view (Fig. 1):

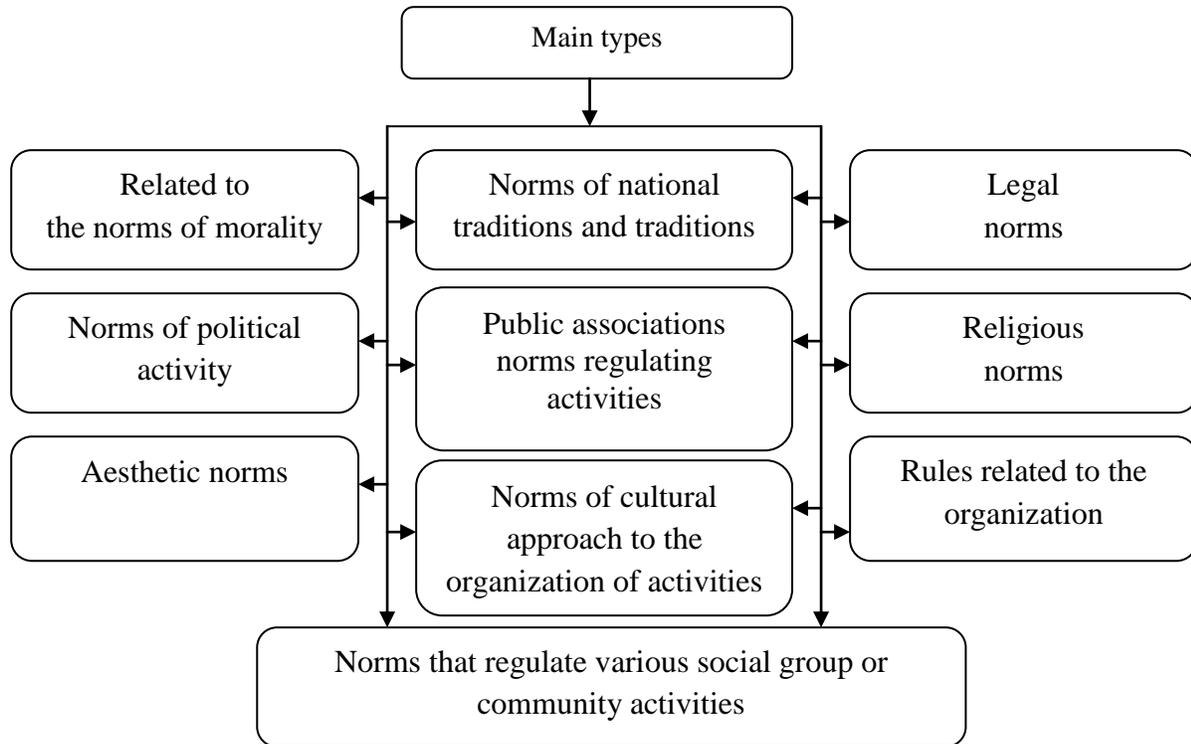

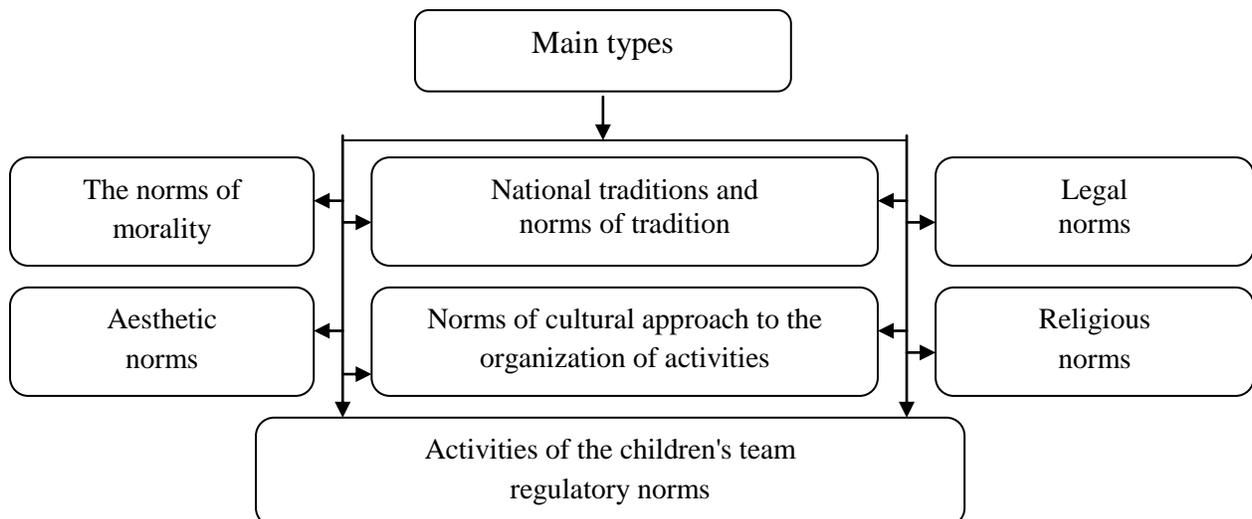

Fig. -1. The main types of social norms

Based on the essence of the subject under study, it is necessary to identify the above-mentioned group of social norms that are important for the daily lifestyle of the primary school students under study. Taking into account the level of cognitive abilities, worldview and thinking of these young students, it was concluded that there is a pedagogical need to familiarize them with the following types of social norms (Fig. 2):

2-Fig. Daily routine of Primary school students social norms that are important for its activities.

Well, how the above social norms play a role in the daily activities of primary schoolchildren. Below is a brief overview of ana shular?

Moral norms serve to ensure that pupils of primary classes understand the moral essence of social relations, to educate them about the habits of formation, circulation of moral concepts, observance of moral requirements in behavior, behavior and behavior. As a result of the understanding of the essence of the moral norms of these young students and the ability to behave in accordance with these requirements and organize actions, all social events in them are formed evaluation skills in the style of "good", "bad", "right", "wrong", "possible" and "impossible".

The norms of national traditions and customs help to educate primary school students in the spirit of the national (Uzbek) way of life, in which they evoke a sense of respect for the national history, culture and values. The education of primary school children in the family, neighborhood and educational institutions based on national traditions and traditions teaches them to live and work in harmony with family members, relatives, aries and peers in the process of life.

Primary school students, getting acquainted with the essence of legal norms, realize their importance in regulating public relations, their moderate organization, are convinced that laws are an important factor in protecting the interests of every citizen, in protecting his life, health, rights and property, as well as in preventing the occurrence of cases of offenses. It remains to say that the consistent acquaintance of primary school students with legal and moral norms guarantees them a positive character in the content of public relations, as a result of which they will be able to highly appreciate their role in creating the necessary conditions for the development of society in all social spheres.

Aesthetic norms help primary school students to be educated in the spirit of aesthetic evaluation of social events and phenomena, understanding the aesthetic value of personal and common property, compliance with aesthetic requirements in the organization of treatment, walking, dressing, behavior, preservation of the beauty of nature and the environment, intolerance to aesthetic dissatisfaction with any appearance.

The norms of the cultural approach to the organization of activities teach you to evaluate your attitude, management and behavior in the performance of certain functions (for example, the period of visits by primary school students to cultural institutions (including museums, cinemas, concert halls and circus booths), which serve for catering, public dinners, volunteer holidays).

Religious norms help to educate younger students in the spirit of the national religion. Through understanding the hadiths, their spiritual and moral essence, students acquire the skills of positive attitude to the environment and nature, preservation of natural and material goods, gratitude for their existence, assessment of social behavior and behavior based on the criteria of reward and sin.

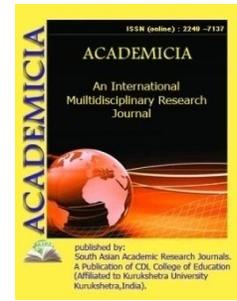

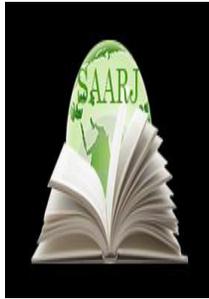

Familiarity with the rules governing the activities of the children's collective of primary school students serves to develop their skills of teamwork, mutual assistance, mutual support of each other by teammates, joint organization of certain social activities (for example, games, studies and work)and development.

CONCLUSION

In summary, social and legal norms ensure the formation in primary schoolchildren of the concepts of social behavior, treatment, attitude and the basis of activity. As a result of mastering their content, students will understand how to live in society, how to organize a relationship with those around them, as well as the need for a positive approach to nature, social subjects, events. Therefore, in the primary classes, special attention is required to ensure consistent, systematic and continuous acquaintance of students with the essence of social and legal norms.

ABSTRACT

This article explains the meaning of the concept of "competence" and its general types in the pedagogical environment. Russian has a very broad meaning of the concept of competence and its subtypes in the field of pedagogy, as well as the basis for the development of comprehensive knowledge of students studying in national groups of the Russian language, that is, future teachers of the Russian language on comparative dialectological competence. In long-distance areas dialects, dialect systems and folklore still exist. Improving the system of comparative dialect competence of the Russian and Uzbek languages at present can give a methodical direction to students of the national group. A competent approach to the study of the dialect system develops the knowledge of future Russian language teachers in national schools. Dialect words in both the Uzbek language and the Russian language are considered in a semantic aspect.

KEYWORDS: *Competence, Type, Pedagogy, Integration Knowledge, National Group, Subtypes, Comparative-Dialectological Competence, Pedagogical Sphere, Concept, Concept, International, General And Professional Competences, Knowledge, Effective.*

INTRODUCTION

The requirements for the competence of faculty are changing with the advent of new components in terms of the demands of the times. In addition, the qualification requirements for the competence of teachers are set out in international legal documents, and their creative and effective use plays an important role in improving the competence of education managers in accordance with international requirements [8, p.40]

“The Concept of development of the higher education system of the Republic of Uzbekistan until 2030” defines that “improving the quality of training highly qualified personnel, developing human capital based on the requirements of the labor market for modernization and stable socio-economic development of the country” [1, p. 7]. In the regulation of the Cabinet of Ministers of the Republic of Uzbekistan on measures to improve the system of professional training of qualified personnel in demand in the labor market, it is determined that, at the same time, solving the problems in this area necessitates the creation of an effective system for training highly qualified blue-collar professionals, taking into account the needs of the labor market, including large enterprises and clusters created locally”[2].

Currently, a professional teacher is required with highly developed educational-key competence, freely orienting in different circumstances, contributing to the addiction of students to an international culture, by promoting their awareness of their own national culture.

THE MAIN PART

In the sphere of his activity, every teacher or teacher faces such problems, sometimes in schools there are students, and in higher educational institutions when students receive an assignment, but after reading it, they cannot understand what its essence is; cannot apply a certain set of facts. This is a typical situation for students from a national group, when students can master a set of theoretical knowledge well, but experience significant difficulties in using this knowledge to solve specific problems, to extract the main thing from what they have read or listened to, and others require a transition to a new degree of competence-based learning.

Competence is a characteristic of a person, and competence is what he already owns (ability, skill). It is what he owns that defines his characterization as competent. We can use these two terms as synonyms in two basic meanings - knowing, in the sense of being able and in the sense of the skills that he possesses, and also capable, in the sense of having a certain potential, the ability to carry out his actions.

The Council of Europe identifies 5 basic competencies required today by any specialist, including a teacher: political and social; competencies related to life in a multicultural society; competencies related to the emergence of the information society; competencies that realize the ability and desire to learn throughout life; ... [10, p.5].

Competence is the ability to successfully respond to individual or social requirements, to conduct activities. From the text, we can understand that competence must meet individual and social requirements. In other words, it should allow one to obtain individually or socially significant knowledge or results.

Competence is:

1. Knowledge, experience, skills.

2. The circle of problems and problematic issues in which the knowledgeable can have information about everything.

3. A set of problems in relation to which a person has wide knowledge and experience in solving.

The focus on competence-based education was formed already in the 70s. XX century in America in the context of the concept of "competence" proposed by N. Chomsky in relation to transformational grammar. Chomsky writes: "... we make a fundamental distinction between competence (the speaker's knowledge of his / her language) and use (the actual use of the language in specific situations). Only in an idealized case ... use is a direct reflection of competence. " Let's pay attention to the fact that "use", according to Chomsky, is a manifestation of competence as something potential, that is, use is associated with skills, thinking, the speaker himself, his experience [6, 240 p.].

In dictionaries and scientific literature, "competence" is explained in different ways: theoretical and applied readiness to use knowledge; knowledge, skills, experience, the range of issues in which the individual is well aware; collection of questions in which this person has knowledge and experience of his own activities.

Competencies are interpreted as a single (coherent) language to describe academic and professional profiles and levels of higher education. It is sometimes said that the language of competences is the most appropriate for describing the results of education. The orientation of standards, curricula (educational programs) on educational results makes qualifications comparable and transparent, which cannot be said about the content of education, which is strikingly different not only between countries, but also between universities, even when training in the same specialty (subject area) ... So far, no more modern methodological tool for "Bologna" renewal has been found in European universities of curricula and programs. The results of education, expressed in the language of competencies, according to Western experts, are a way to expand academic and professional recognition and mobility, to increase the comparability and compatibility of diplomas and qualifications. In the conditions of Russia, the implementation of the competence-based approach can act as an additional factor in maintaining a single educational, vocational qualification and cultural value space [3, p. 6.]

General and professional competences form a kind of complementary unity. General (key, universal) competencies, according to prof. Yu. Kohler, should be a pedagogically expedient tool for increasing employability and didactic quality proper [5].

Today, there are many basic concepts of "competence", "key competencies". Therefore, the problem of studying various approaches and their systematization is actualized.

Studying the comparative-dialectological competence of the future, teachers get the opportunity to master the methodology of working with dialectal speech, learn to distinguish between dialectal and individual characteristics of speech, develop the ability to see dialectal and dialectal - individual characteristics in the speech of representatives of the younger generation.

".....at the same time, it is necessary to deeply study the features of the Uzbek language and its dialects, issues related to its history and development prospects, increase the efficiency of specialized scientific research, and radically improve the quality of personnel training" [ShavkatMirziyoyev, Gazeta.uz.].

Thus, comparative dialectological competence is aimed at solving a number of educational and pedagogical problems.

What is a dialect? What is the history of the dialects of the Uzbek and Russian languages? Scientists studying dialect systems of Russian and Uzbek languages?

All natural languages existing in the world have national borders, therefore, one of the main in modern linguistics is the concept of a national (common) language, which is the language of a particular people in the aggregate of all its inherent features that determine it as such and differentiate it from other languages [7, 416 p.].

Dialecticism can be interpreted as a word used only in a certain territory within the boundaries of any adverb and absent in another dialect and in the literary language. Modern dialectology distinguishes the following types of dialectisms: a) grammatical dialectisms - words that have different grammatical characteristics from the literary language, manifested in a different declension, a special formation of forms of parts of speech, the transition from one grammatical gender to another, etc.: past the hut (instead of past the hut), in the steppe (instead of in the steppe), wide steppes (instead of wide steppes), weaker (instead of weaker). The whole face seems to have become blue (I. Bunin). The cat smells whose meat it has eaten (A. Sholokhov); b) phonetic dialectisms - words with a different pronunciation of certain sounds and sound combinations than in the literary language: girl, shout, tsai (tea), nyasu, ball, chicken (chicken), barrel (barrel); c) semantic dialectisms - general literary words with a different meaning than in the literary language: much (very), impudent (sudden), flood (drown), guess (recognize by sight), top (ravine); (side); e) lexical dialectisms - local names of objects and phenomena that have other names in the literary language: bases (covered yard for cattle), beetroot (beet), veksha (squirrel), gashnik (belt), deja (kvashnya), zakut or zakuta (small cattle shed), at once (now), cochet (rooster), stubble (stubble); g) ethnographisms - local names of local objects: a diner, a coastal worker, a midwife, a shalonik, (names of winds among the Pomors), a crane (a lever for raising water from a well), cats (birch bark bast shoes), novina (a stern canvas) [9, p. 119-120].

Complex concepts also exist in the system of Uzbek dialectisms. In a comparative aspect, it is possible to create a system of dialectological competence.

The Uzbek dialects are subdivided by researchers into three main dialects, which were given different names: 1) Middle Uzbek (southeastern, Chagatai, or Karluko-Chigile-Uighur); 2) South Khorezm (southwestern, or Oguz); H) northwestern (Kypchak, Sheybanidouzbek, OR dzhekaye). E. D. Polivanov, who was the first to outline this division, marked the difference between these adverbs with three phonetic signs using examples of two words: 1) tag, sart, q •, 2) daq, sarb (sa: rb) •, H) daq, sarb ... A. K. Borovkov, keeping basically the same division, lists the features of each adverb separately. To demarcate the "Sheibanid-Uzbek, or Jacking, dialect", he gives eight signs, two of them are morphological [4, p.55].

Scientific and practical features of comparative - dialectological competence is primarily in the accumulation of valuable materials in Russian and Uzbek dialects. This information is not only of its own interest, but also serves as an important source for studying the history of the Russian and Uzbek languages, the history of the people, the ethno-dialectal division of the Russian and Uzbek territories.

As a result, the future of Russian language teachers should know: the peculiarities of the dialectal division of the modern Russian and Uzbek languages; linguistic features of the system of Russian-Uzbek dialects; the originality of the material and spiritual culture of the population in a comparative aspect.

Tasks of comparative dialectological competence:

- Educational and methodological tasks - mastering the methods of analyzing dialectal phenomena; deepening and expanding knowledge of Russian and Uzbek dialectology;
- Professional tasks - acquisition of basic skills in comparative dialectology;
- Scientific and practical tasks - the development of future teachers of interest in research work; formation of a scientific approach to working with linguistic material.

RESULTS AND DISCUSSIONS

A competent approach to improving the comparative-dialectological system has an important place in the integration of future teachers of the Russian language.

Thus, comparative-dialectological competence is aimed at solving a number of educational and pedagogical tasks.

CONCLUSION

The improvement of the system of comparative-dialectal competence of the Russian and Uzbek languages at the present time can provide a methodological direction for students from the national group. A competent approach to the study of the dialect system develops the knowledge of future teachers of the Russian language in national schools. Comparative - dialectological competence is interconnected with both linguistic (linguistic) and communicative competence. The main direction of sociolinguistics.

Comparative dialectological competence gives a certain direction in training personnel for further professional and pedagogical activity, since knowledge of dialects, on the one hand, helps to develop ideas about the richness and diversity of the Russian and Uzbek languages, and on the other hand, it allows to carry out productive work on reporting errors in speeches of representatives in the local dialect of Russian and Uzbek languages.

MODERNIST TRENDS IN THE LITERATURE OF THE TWENTIETH CENTURY: FEATURES OF FUTURISM AND ITS VARIETIES

Irina Nickolayevna Doronina*

*Lecturer,

Department of Russian Philology,
Ferghana state University, UZBEKISTAN

ABSTRACT

In the article, the author reveals futurism as one of the contradictory avant-garde trends in literature, new phenomena in language and literature, connected by the poetic views of the futurists, their theoretical platform. In the first decades, many masters broke with the established traditions: various directions of the avant-garde appeared (French "cutting edge", "advanced department"). In terms of formal stylistics, the poetics of futurism developed and complicated the symbolism for the renewal of the poetic language. They very vigorously used compositional and graphic effects, updated the meanings of words and changed semantic relationships in the text.

KEYWORDS: *Modernism, Futurism, Avant-Garde, Mission, Outrageous, Rebelliousness.*

INTRODUCTION

The absence of intentionality in the content, the theory of "free" combination of lines, sounds or words without internal content (moreover, they ricocheted to the point that they began to expel literature even from ... literature) - these are the features due to which genuinely new people consider futurism for a decrepit thing, for an ultra-refined dessert after bourgeois menu, fruit emasculated by bourgeois culture, supplying nightingale tongues, because everything else already seems insipid and banal.

The Russian poetic "Silver Age", traditionally inscribed at the beginning of the 20th century, actually has its origins in the 19th century and all its roots go back to the "golden age", to Pushkin's work, to the legacy of Pushkin's pleiad, to Tyutchev's philosophy, to Fet's impressionistic lyrics, into Nekrasov's prose, into foreign lines, full of tragic psychologism and vague forebodings, lines of Konstantin Sluchevsky. ... As one of the researchers of Russian poetic "silver" criticizes: "in the ninetieth the draft letters had been begun studied, and they soon

assembled the library of the twentieth century..... From the ninetieth the literary action that brought coming ups... "

"Innovation in all fields of the arts", "Renewal of the art" - these are the slogans of the young Russian rebels from the art, creators of experimental aesthetics, creators of "art of the future." In the 10s of the twentieth century, artistic experimentation in different types of the art was surprisingly synchronous. The main reason for this synchronicity lies in the obvious mutual attraction of artists, poets, actors, musicians, in the community of their creative and sometimes vital interests. A generation of innovators searched and found in their midst like-minded people and associates, "fellow believers".

Avant-garde is a collective concept of the most "left" experimental creative trends in the art of the "Silver Age". In the avant-garde trends, despite all their diversity, they shared novelty and courage, which were considered the measure of creative talent and the standard of modernity. Common was the naive belief of artists in the advent of a special and unusual historical time - the era of miracle technology, capable of changing the relationship of people with each other and with the environment. Succession problems for avant-garde supporters however exist. To the young nihilists, nineteenth-century realism seemed to be a "dilapidated yardstick" that constrained freedom of expression.

The twentieth century not only brought previously unseen opportunities, but also forced people to abandon their usual view of the world. Already at the beginning of the century, science revised most of the "indisputable truth" of modern times. The humanistic values of the Renaissance and Enlightenment no longer served to support man. Now he himself had to protect them in the nightmare of world wars and totalitarian regimes. The achievements of the past seemed useless, and humanity was left alone with a formidable and mysterious world, as if in primitive times.

At the same time, some in spite of everything looked for a way out in the continuation of the cultural tradition of the past, others - in gaining lost ties with nature, others - in scientific and technological revolution, the fourth - in nihilistic self-assertion ... All this was realized in its own way in art and literature.

A variety of trends is a characteristic feature of the 20th century: Symbolists, Acmeists, Futurists and many others. In the first decades, many masters broke with the established traditions: various directions of the avant-garde appeared (French "cutting edge", "advanced department"). However, not all modernists lived in denial of the past: in their work, there are examples of deeply individual and full-blooded implementation of the old established truths of the Renaissance. ...

The avant-garde of the beginning of the twentieth century in most cases rebelled against traditional forms, but was related to the classics in that it also sought to creatively embody the features of the material or spiritual world - it is not without reason that its legacy has recently been recognized as an equal part of world literature.

Futurism (from Latin futurum - future) is one of the most controversial trends in the art, originated simultaneously in Italy and Russia. Russian futurism first showed itself in 1910.

Literary futurism is genetically associated with the avant-garde. Many futurists combined literary activity with painting (V.Mayakovsky, A.Kruchenykh, The Burliuk brothers, etc.). Just like the

avant-gardists, the futurist poets tried to find forms of artistic primitiveness, they believed that it was necessary to free the word from non-literary tasks, resorting to formal experiments.

The grandiose mission of the futurists was of utopian nature, they dreamed of creating a super-art that could change the world. Their aesthetic trend was based on new inventions in science and technology. Relying on the fundamental sciences - physics, mathematics, philology, they tried to popularize their creativity, and this became the main difference from other modernist movements. For example, Veniamin Khlebnikov intended to improve a new universal language and tried to discover the "law of time." Futurists believed that the universe in all the infinity of space and time is perceived as a kind of giant stage. They were adherents of the revolution, because they perceived it as a massive artistic action that was supposed to involve the whole world in this non-childish game. After 1917, avant-garde artists formed, in modern terms, the virtual "Government of the Globe".

The Futurists systematized their behavior as a challenge to society, shocking, a striking example of which is the emergence of the futuristic almanac "Slap in the face of public taste." For futurism, as for any avant-garde phenomenon, indifference, stiffness, phlegmaticness were unacceptable. The movement needed the atmosphere of scandal and ridicule. They tried to evoke a reader's reaction not in the form of praise and sympathy, but aggressive rejection and hysterical protest, deliberately provoking the audience with extreme behavior. Futurists showed their performances defiantly: the beginning and end of performances were accompanied by gong strikes, unacceptable attributes of clothing, appearance, which aroused condemnation in society and at the same time, as everything forbidden aroused endless interest. In terms of formal stylistics, the poetics of futurism developed and complicated the symbolism for the renewal of the poetic language. They very vigorously used compositional and graphic effects, updated the meanings of words and changed semantic relationships in the text. Technically, they have resorted to the "shear" principle, the "sheared structure" rule. And this principle was introduced into the literature of the modern futurist avant-garde painting. In the literature, the principles of "shifted construction" were extended to the vocabulary, semantics and syntax of works. The vocabulary renewal was achieved through the use of stylistically "inappropriate" words, vulgarisms, technical terms, and depoetisation of the language. The word among the Futurists ceased to be sacred, it could be split up, altered, it was objectified, and new morphological and phonetic combinations were created. There are many examples of the word-creation of the futurists; sounds had an independent function of significant units of speech, i.e. endowed with their own semantics. One of the radical participants in the movement A. Kruchenykh proposed the word "eyy" constructed by him instead of the "worn out" word "lily". The novelty in the attitude to the word, as to a constructive material, led to the appearance of neologisms, a new combination of words, re-decomposition, which is characteristic of the work of V.Khlebnikov and V.Mayakovsky.

Neglecting the law of lexical collocation of words, syntactic shift and rejection of punctuation marks, led to the emergence of unusual word combinations. The innovative poets introduced the "telegraphic" syntax; excluding prepositions, use musical and mathematical symbols in speech. They attached great importance to the visualization of the text impact, which helped them to diversify experiments with the figured arrangement of words and particles, they widely used a multi-scale and multi-colored font, an unpredictable texture of printing (publishing of poems on wallpaper, the arrangement of lines by a "ladder" (poems by V.V. Mayakovsky), highlighting

epithets, internal rhymes, and the most important words in an unusual font). The phenomenon of futurism was unusual, therefore it was often perceived as an era of "new barbarism". N.Berdyayev believed that with this direction came the crisis of humanism in art "in futurism there is no longer a person, it is torn to shreds." However, V.Bryusov said that "language is the material of poetry and that this material can and should be worked out in accordance with the tasks of artistic creation, this is the main idea of Russian futurism; the main merit of our futurists lies in putting it into practice".

The inconsistency of neighboring stanzas, semantic displacement, the desire to "turn out" the meaning, substituting the meaning of the opposite word in place of the implied word "shiftology".

The use of the principle of reorientation from readable to spoken text gave new aesthetic opportunities for the development of futurism. Futurists believed that the book keeps poetry locked up, that it must break free from darkness, i.e. sound in the square. The further this trend developed, the more intense became the search for new rhythms, bizarre rhymes and forced instrumentation. This tendency united genre reforming of futuristic rhetoric, actively drawing on elements of popular print poetry, ditties, folklore motives. Artistic primitive and folkloric genre incited the aesthetic rebellion of the Futurists.

Futurism has productively influenced and forced to change the view of art as a problem, changing the attitude towards the problem of comprehensibility and incomprehensibility in art. Futuristic experiments have proved that the realization of misunderstandings in art are not always disadvantage, and sometimes even necessary condition for full-fledged perception. Initiation into art is understood as co-creation, it rises from the level of passive consumption to the level of existential and worldview.

Futurists called for the destruction of the forms and conventions of art in order to conjugate the forced life process of the twentieth century. They are characterized by admiration for action, movement, speed, strength and aggression; self-exaltation and contempt for the weak; the assertion of the priority of force, the rapture of war and destruction (verses by I. Severyanin). In this regard, futurism in its ideology was very close to both right and left radicals. Here is one of the points of Marinetti's program: "A person completely spoiled by the library and the museum <...> is no longer of absolutely no interest ... We are interested in the hardness of the steel plate itself, that is, the incomprehensible and inhuman union of its molecules and electrons .. ". The warmth of a piece of iron or wood now excites us more than a woman's smile or tear."

Russian avant-garde artists of the beginning of the century entered the history of culture as innovators who revolutionized world art - both in poetry and in other areas of creativity. In addition, many have become famous as great brawlers. At its core, Russian futurism was still predominantly poetic trend: in the manifestos of the Futurists, it was about the reform of words, poetry, and culture. And in the rebelliousness itself, shocking the public, in the scandalous slogans of the futurists, there were more aesthetic emotions than rebellious ones. Russian futurism has not become an integral artistic system; this term denoted the most diverse tendencies of the Russian avant-garde. The system was the avant-garde itself.

Moreover, futurism was dubbed in Russia by analogy with Italian. Moreover, this direction turned out to be more syncretic than the symbolism and acmeism that preceded it.

Russian futurists tried to comprehend the world around them in a new way. They understood it as a macrocosm, and man as a microcosm. The development of the world was seen as a movement towards reunification. The existence of civilized mankind acted in unity with the Universe, and cosmism gave a holistic perception. For Russian futurists, the modern world is movement, striving for the future. They literally lived it. Going into the future meant creating it.

The February revolution gave rise to the illusion of unprecedented creative freedom and the coming Lodomir among the futurists. "Today, to the last button in our clothes, we will remake life again," Mayakovsky exclaimed in the Poetochronicle. Radical writers and artists protested against the creation of "department of art" under the leadership of Gorky and Benoit. They sought to preserve autonomy from any power, arranging, in Malevich's words, their own "state of artists".

This is how the ten-year path of Russian futurism ended. "Whence and how?" - asked the former participant of "Poetry Mezzanine", the theorist of Radical Front of the Arts Sergei Tretyakov, emphasizing that everyone who wants to define futurism as a literary trend, connected by a common method of processing material, a common style, is in an extremely difficult situation.

They have to wander helplessly between dissimilar groupings - to classify the EGO and KUBO-futurists, to look for once and for all established feelings and the canon of art forms associated with them, and stop in bewilderment between the "archaic songwriter" Khlebnikov, "the tribune - urbanist" Mayakovsky, "esthete - agitator" Burliuk, "zaum - growling" Kruchenykh.

And if we add Pasternak's "specialist in indoor aeronautics on the Fokker of syntax", the landscape will be full. Even greater bewilderment will be introduced by those who have fallen away from futurism - Severyanin, Shershenevich and others. Nevertheless, the organizational and creative diversity and variability of Russian futurism turned out to be, in the end, its strong point. Such different poets as Osip Mandelstam, Mikhail Kuzmin, Sergei Yesenin, Nikolai Zabolotsky, Daniil Kharms and others did not pass by his experience.

Futurists in a new and bold way used the possibilities of syntax, stylistic properties of language, the laws of word formation, rhythm, rhyme, instrumentation, etc. After them, it was no longer possible to write in the old way. The experiments of the futurists, of course, were a stimulus for the development of artistic language, including the realistic one.

The revolution was hailed by most futurists as a step towards the future to which they aspired, but the renewal of the old group was no longer possible. The most politically active part of the pre-revolutionary futurists entered the "LEF" ("Left Front of the Arts") organized in 1912, headed by Mayakovsky, and, consequently, into Soviet literature.

For all its internal contradictions, futurism played a certain role in the formation of creativity principles of such major Soviet poets as Mayakovsky, Khlebnikov, Pasternak, Aseev.

In many ways, the negative essence of Italian futurism was manifested, although some of its artistic achievements were included in the fund of world art.

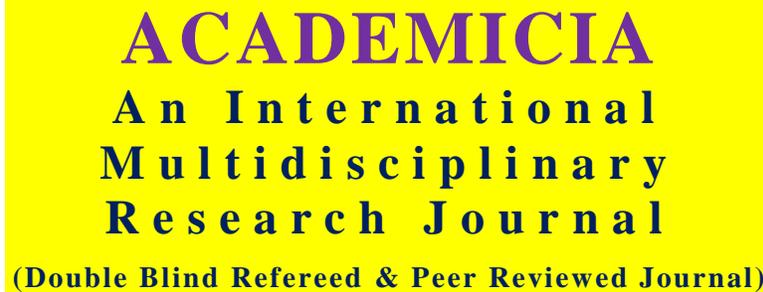

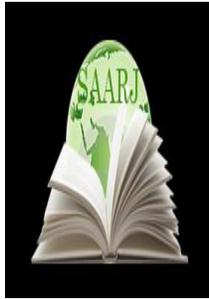

For example, the desire for the synthesis of arts (especially the mutual influence of literature and painting), the search for new means of poetic expressiveness, attempts to create an unusual type of book that would affect the reader not only by its content, but also by its external form.

The further development of Russian futurism underwent some cyclicity: if the 20-60s in Soviet art it was not customary to express one's thoughts openly, demonstratively, then the end of the twentieth century provided the creative person with freedom to express their thoughts, feelings and desires.

The end of the XX century, the beginning of the XXI century is a new stage in the development of futurism.

USE OF LANDSCAPES IN URBAN PLANNING

Otabek Ahmedovich Kuchkarov*

*PhD Student,
Fergana State University,
UZBEKISTAN

ABSTRACT

This article describes the ecological principles of urban planning, the optimal use of landscapes in urban planning. In urbanized cities, such an opportunity is very difficult to realize, and large areas are occupied by industrial enterprises, warehouses, housing, road facilities, cultural, educational, medical and sanitary facilities. Such areas create a very large man-made pressure. cities meet more economic needs. Such potential will be focused on performing more economic functions in cities. This is because many facilities, such as workplaces, markets, transport systems, and service facilities, are primarily economic processes. Cities consist of a landscape-urban environment.

KEYWORDS: *Urban Landscape, Hierarchical Systems, Urbanized Areas, Landscape Design, Landscape Architecture.*

INTRODUCTION

Population areas created as a result of human activities - cities - create a distorted, altered appearance of the natural landscape. Due to the growth and development of cities, such areas create a completely new image - the image of the urban landscape. Urban landscapes are the areas where the most strongly altered technical coverings, structures occupied by anthropogenic landscapes.

According to the definition of A.P. Vergunov: the most distinctive among cultural landscapes is the urban landscape, which is the main object in urban planning and design. It is a very complex balance of natural and artificial components, all the elements that make them up - homes, businesses, institutions, roads, modes of transport, communications, consumer services, parks, recreation areas, etc. create the appearance of the urban landscape [1].

The following features need to be taken into account when studying the urban landscape as a very complex system.

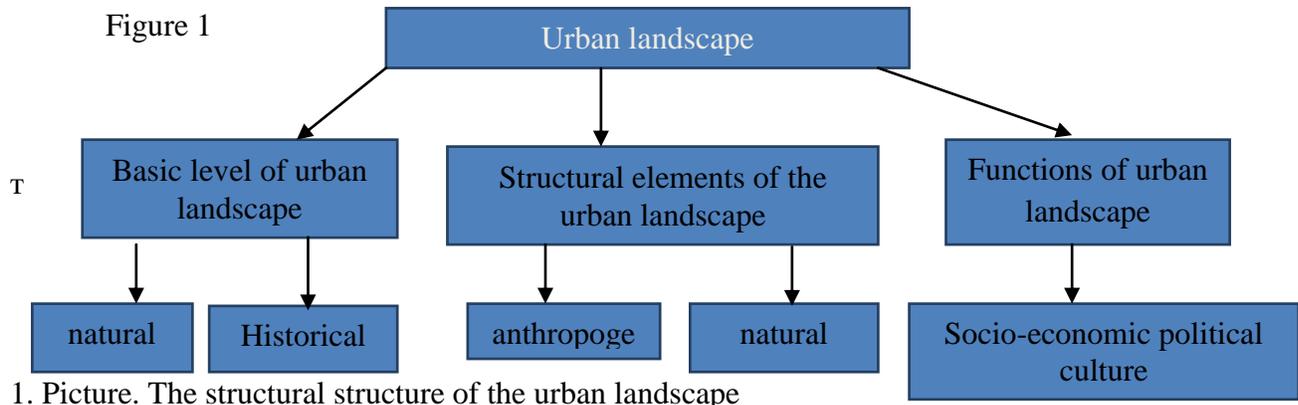

1. Divide cities into subsystems;
2. Determining the hierarchical order of the system of urban landscapes;
3. Generalization of the elements that make up the city system;
4. Calculate the existence of direct and inverse relationships between natural and artificial objects in the structure of cities;
5. Obtain continuity of development;
6. Consideration of systemic, organizational structures, management processes.

The following levels of hierarchical systems associated with their development in the urban landscape are distinguished;

1. Macro-level - this includes urban agglomeration, urbanized area, regional industrial complexes.
2. Meso-level includes seliteb landscapes, industrial landscapes (industrial zones), agrolandscapes (parks, gardens, squares, green areas, protected areas).
3. Micro-level - it consists of courtyards, sports fields, sidewalks in the city, occupying small landscapes.

THE MAIN FINDINGS AND RESULTS

The direct and inverse relationships between artificial and natural objects in the urban landscape are, for example; the relationship between climate and urban design, between relief and area scale, and many others. The continuity and continuity of development is an integral part of the urban landscape. But the continuity of development can also occur in the case of harmonious development or degradation or improvement or deterioration for the urban landscape. The harmonious development of an urban landscape depends on the extent to which it is formed. According to the analysis, it is determined that the developmental harmony of the urban landscape is related to the functional state of the cities at the meso level. The urban landscape at this level will have some stable dynamic features. Through the structural analysis of the urban landscape, the following cases were identified.

It is clear from the drawing data that the structural structure of the urban landscape is divided into natural, historical, anthropogenic, cultural elements. Urban landscapes create regional differences according to the function they perform. This leads to functional divisions depending on the size of the urban area, the position of the location (elongated ribbon, circle, oval, etc.). The presence of natural objects in the landscape of any city is clearly visible in urban landscape design. For example, rivers and streams, lakes, high hills have a special appearance in the urban landscape.

Cities change the natural landscape with the onset of its initial construction and disrupt its natural structure. Cities create an imbalance between the area they occupy and the geographical area. The architecture of the cities consists of 2 interconnected spaces. This space consists of a natural environment and an artificial environment.

As the territory of cities expands, so does its dominance over the natural environment. Natural landscapes are beginning to be affected by man-made pressure. Due to the change of the territory to natural landscapes, the ecological environment changes, the mental, psychological, spiritual aspects of the population change dramatically.

In urban landscapes there is an accumulation of matter and energy, as well as information. Cultural and household facilities, museums, libraries, educational institutions perform the functions of storage and transmission of cultural and scientific information [3].

One of the important aspects of urban development in recent years is the preservation of natural objects in urban areas. In urbanized cities, such an opportunity is very difficult to realize, and large areas are occupied by industrial enterprises, warehouses, housing, road facilities, cultural, educational, medical and sanitary facilities. Such areas create a very large man-made pressure. cities meet more economic needs. In this case, the expansion of cities at the expense of reserve areas can preserve the balance of natural and artificial objects in the urban landscape by preserving natural objects in the buffer zones around them or by balancing them. In this case, urban landscaping will have the potential to meet the different needs of its residents.

Such potential will be focused on performing more economic functions in cities. This is because many facilities, such as workplaces, markets, transport systems, and service facilities, are primarily economic processes. Cities consist of a landscape-urban environment. As cities grow and expand, this environment becomes an environment of human activities and needs. The most important as natural objects in the urban area are plants. But in the territory of modern cities, cultivated plants form the main landscape background.

Accordingly, the urban landscape consists of ornamental plants rather than fruit as gardens, parks, green areas, alleys, sanitary protection zones. Established in the world urban planning experience, parks and parks combine a number of unique styles.

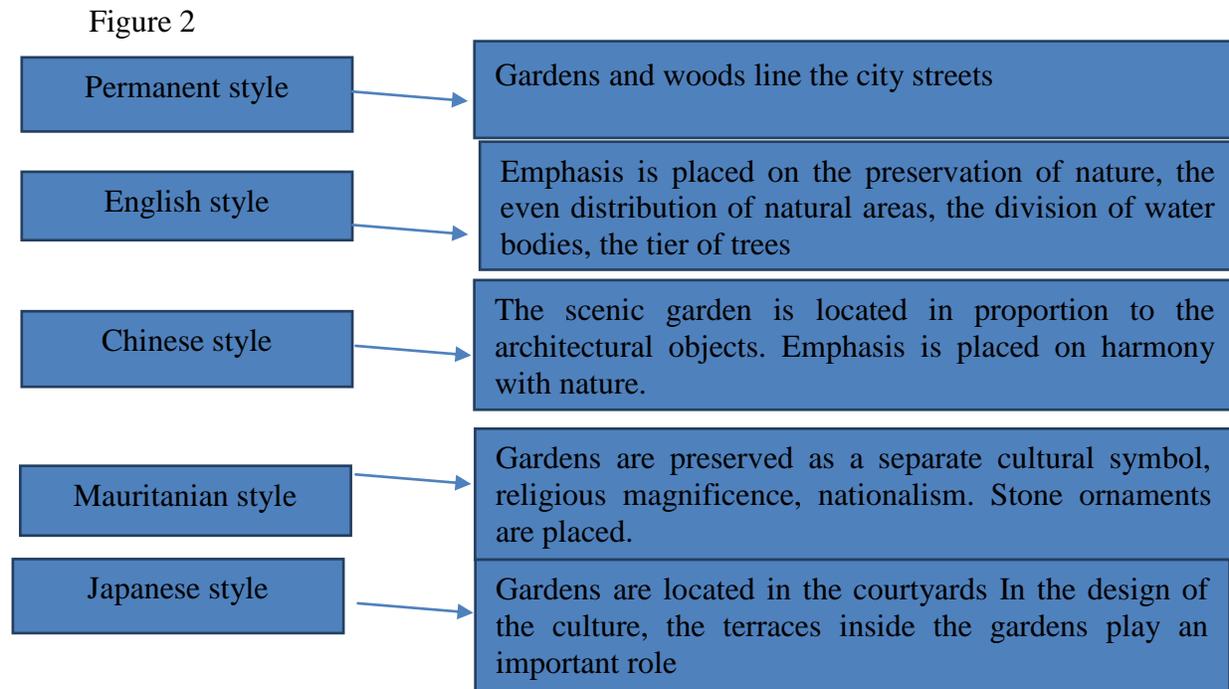

Figure 2 Ways of organizing parks in the world experience

Establishment of orchards instead of decorative gardens in urban landscape design. It was restored in Russia 200 years later, at the end of the 19th century. They took the name of economic gardens and were planted by mixing some ornamental plants into orchards. This is considered to be the restoration of the ancient Russian tradition in urban planning.

Recently, the modification of natural and anthropogenic objects in urban landscape design has begun. Such modification objects include the following.

1. Alpine slides.
2. Tree - sculptures
3. Curbs
4. Living walls
5. Vertical hanging gardens
6. Topiaries

Alpine slides are called rock gardens. The green lawn is flat trimmed, several decorative stones are placed on the lawn, one or more shrubs or ornamental trees are planted on the lawn, and a beautiful landscape design is created.

Tree sculptures, on the other hand, are given a special shape in the care of ornamental trees, and various figures are created.

Curbs are slow-growing and hedge shrubs planted on the edges of sidewalks, flower beds, lawns are given different shapes and get a unique look.

Living walls are created for architectural-artistic decorations. Living walls cover the courtyard boundaries, the walls of the buildings, and protect them from noise and dust. Vertical hangers are grown on the castle walls and create a landscape.

Topiaries are called ornamental or fantasy gardening. The shape of the animals is given by a special bush of ornamental plants. In addition, the plants are given different geometric shapes. This method was practiced in Rome and Iran 1000 years ago. Today there are 3 types of topiary methods used in urban planning: 1. Classical topiaries, 2. New topiaries. 3. American (carcass) topiary methods are developed.

In urban planning, landscape architecture and design have always been closely linked with the customs, professions, culture, religion, history, ethnography of the peoples. In particular, the construction sites, their location, the structure of the neighborhoods have always and all the architecture, urban planning today, that is, the advanced civilization: customs, traditions, styles. Analyzing the state of urban planning and urban area, its architectural structure, landscape design and its compatibility with natural and artificial objects, we consider it appropriate to distinguish the following aspects.

1. Preservation of the primary landscape in urban planning, placement of artificial objects in proportion to natural objects. This rule is in line with environmental principles in urban planning, ensuring the sustainability of the urbanized urban landscape. The natural landscape environment is guaranteed not to be disturbed;
2. The loneliness of cities and surrounding green spaces, green areas, for example; Ensuring the preservation of a permanent view of the population from the top of the residential area to the city park and from there to the suburban park zone, increasing the ability to perform functional tasks aimed at nature protection;
3. Establishment of multi-level and targeted open spaces in urban areas, ensuring air circulation, the use of proportionate methods in the construction of buildings and structures;
4. Placement of recreation areas, parks, gardens, alleys and cultural and residential facilities built in and around the cities in proportion to the needs of the population, to prevent excessive distances between them;
5. It is necessary to place green spaces in harmony with the expansion of cities, their development, to implement expansion.

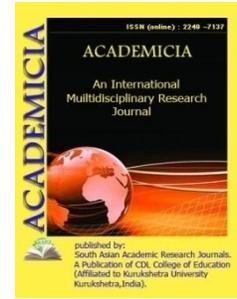

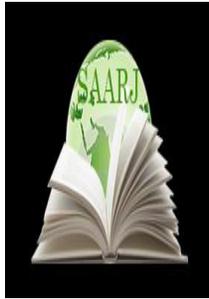

CONCLUSION

Accordingly, in urban planning, it is required to match the minimum area of green areas to the maximum area of houses, buildings and various objects, to maintain the optimal size of open areas, e.g. when crossing open areas of transport roads. 0.2 km for noise protection. A distance of 0.1 km is required to protect the population from transport waste. The open areas will be 0.4 km wide.

IN THE PRACTICE OF PLAIN AIR, THE FINE ARTS OCCUPIES AN IMPORTANT PLACE AND PRIORITY

Shahnoza Batirovna Nazirbekova*

*Senior Teacher,
Tashkent State Pedagogical University named after Nizami,
UZBEKISTAN

ABSTRACT

This researcher has been working on the "Graphic arts and chemistry graphics" for the students, who reflected on the idea of plenerering in painting of Uzbekistan, about the works of artists and their ability to shape their rankings. Methodological techniques are used to apply the methods of the Mustalah, which deals with organizational issues, knowledge, tension, and skills of drawing art lessons. Students from the higher educational institutions, vocational colleges, and art teachers can use this academic discourse.

KEYWORDS: *Composition, Genre, Gamma, Harmony, Baget, Item Image, A Visual Representation Of An Object, Scene Or Person Produced On A Surface.*

INTRODUCTION

The plain air of the Uzbek national fine art was firstly developed in the miniature paintings that were done in the Middle Ages. In these miniature paintings one could see the nature, trees, ditches, mountains, animals, and people created or painted on the basis of certain rules. The art of miniature painting has its aesthetics and it describes the meaning of the painting in its own way. The objects described in the miniatures were presented conditionally.

Realistic painting in the territory of Uzbekistan appeared in the XVIII-XIX centuries and began to develop. During this period, artists worked in accordance with the creativity spirit of the European art traditions, they used European methodologies. We can almost see the landscapes or the images of architectural monuments in more than half of the works created in those years. The images that were based on some events were associated with the nature in these paintings, and we can say that the development of the plain air painting's principles were associated with the same period.

There were also the representatives of the plain air at that time. Such as S.P.Yudin, R.K.Zommer, L.L.Burewere some of them. In S.P.Yudin's works we can see mountain and village views, as well as the panorama of the nature described in the dramatic circumstances of World War II.

In R.K.Zommer and L.L.Burelar's art one can see the monuments, the streets of that period, teahouses and other similar works done in plain air post. We may be able to learn from these paintings about the people at that time, the warm sunny nature of Uzbekistan.

P.P.Benkov was a remarkable artist and one of those artists who represented our sunny country with a high spirit in his works. He created his own school in Uzbekistan that was unlike than others.

In 1930, Pavel Petrovich Benkov moved to Samarkand that was the capital of Uzbekistan at that time. Describing architectural monuments, streets, gardens, the people of this land he made a great contribution to our fine art. P.Benkov was as well as busy and interested in educational activities. He was the founder of the current republican college of the Arts in our country. He did his best in upbringing the new artists and painters. He shared his experience with them and taught them with care and love.

Working hardly at "Plain air" painting he created a number of works. The creation of his works, their color palette, the composition are one of the best samples of the traditional fine art methodology. The work called "Grape harvesting" (Friends) was done at the plain air, there was presented a group of grape collectors, and the sun's rays that were coming through the grape leaves and illuminating on the grapes were depicted with high mastership. Coming close to this painting one can feel a sense of real vineyard. P.P.Benkov trained Z. Kovalevskaya, L.Abdullaev, A.Abdullaev as a future painters. The next generation of artists carried out the same artistic heritage by Benkov. They studied these methodologies on their primary school days. One of the creative artists O'.Tansiqboev also worked at "plain air". Working he depicted landscapes, mountains, rivers of our country in his paintings. As well as he chose the right colors in vivid style. He left a lot of "Plain air" paintings that were unique in their own way and unlike the other works. The painting named "My Song" can be the best sample in the landscape genre and can be called the symbol of this genre.

N.Qo'ziboev, M.Saidov, R.Ahmedov worked at the same period as O'.Tansiqboev did. Their works were connected with plain air painting too. Academic painter Rahim Akhmedov's portrait work "Maternity Homes" had a significant role in the fine art. He described the image of a woman sitting outside in the shade of a tree. The work was done very accurately, colors were chosen professionally. As he once told he had created this work while teaching his students during practical process. One of the masterpieces of the fine art was the result of that lesson. Here below we would like to say a word about the practical moments of the student teaching process.

After being independent, at the result of the economic and social development in our country the computer art developed rapidly and even not professional art designers were involved and interested in the field of design work. That caused the things turn wrong, we could see some mistakes in coloring the advertisement objects, choosing not correct colors in decorating the internal and external parts of the houses. Modern coloristic increase and development demand from us for high qualified and skilled specialists. For this reason, the students should be taught the ability of seeing, feeling and choosing the colors in the right way.

The issue of developing the ability to see and notice the color of the painting is the most important task of teaching process. In educational system upbringing independently creative, goal-oriented, the young talented painter is very important. Increasing one's ability to work with colors can't be carried out without learning. He should be taught to observe the environment, to feel the aesthetic of an object, to notice the sense of colors of the world. The theoretical and methodological issues connecting with the landscape genre and developing the students' coloristic skills are not fully solved. We can't say that enough much specific issues were solved yet in this field. Therefore, many teachers mainly focused on teaching the students to notice the shades of the object. At the result the natural colors of nature stayed unnoticed and not taught fully. This problem is reflected on the works of the students. Because the students' ability to perceive color and the art of choosing the colors is not enough. This can be seen in the landscape painting practice in the plain air. The mistakes can be noticed in the light, sun rays and colors given to the objects, in the colors used to depict the changing process of the nature. From this idea we can conclude that the educational and training process held in plainair has enough problems to be solved. In teaching process there are still some methodological problems that demand a solution to develop the students' color abilities. This process demands to develop and increase the students' abilities to choose, notice, feel the accent or the colors professionally.

Well-known Russian artists and art critics N.N.Volkov, G.Shchegol, K.F.Yuon, B.V. Ioganson firstly established the theory of accent or coloring and made their great contribution to the fine art.

For example, A.A.Vasilev in his book "The bases of the theoretical and educational principles of the teaching artists to plainair he focused on the "theory of accent", he clarified the difference in his workshop painting conditions. He advised to go to open air conditions from workshop conditions. As we know the shades of the objects move quickly as the sun moves. According to this fact furthermore, he worked out some methodological advice to study the short-term and long-term exercises. For example, as a training exercise he recommended nature mort, in his exercise he used the objects related to landscape (earth, sky, water). The importance of this task was to see or notice the common objects in nature with one glance. It is very difficult for the students to distinguish and memorize all little objects in one glance. Therefore, the first task in describing the landscape should be not a large space, but a small part of it. He also recommended his methodologies in portrait work, he worked and conducted his research in landscape, nature mort genre. Many scientists believe that the students should work much in the nature to develop their painting skills.

V.M.Sokolinskiy also worked to solve one of the problems associated with the composition of the landscape. V.M.Sokolinskiy offers to carry out regular tasks such as: to have additional classes in the workshops, to paint etudes under the guidance of a teacher, to let the students implement their independent self works, to copy the works of the masters of landscape, to memorize the view and others. But the research work to develop the students' ability to see the colors was not enough.

In his research S.E.Tokarev conducted and worked out the system of methods to improve their ability to see the colors. In his scientific work he offered the following methods: to have practical research, to analyze them, to observe them, to organize a speaking or discussing period, to use pedagogical experience, to develop the ability to see, to demonstrate. In this stage, the teacher himself should be an example for the students in carrying out their tasks. S.E.Tokarev's proposed

system consists of two parts: the first is a short-term practical work. This process was developed and analyzed in details by him. The second system had complex devices that included a performance of space character and landscape composition. He developed the general ideas, but it was still less clear guideline on the issues of accent teaching.

In N.Ya.Maslov's work the teaching methods of accent was not clearly defined. He gave his points for the first year students to teach "The landscape pieces". He gave his advice in nature composition. But the focus on the colors of the objects was less given. No exercises on the bright, dark, light colors were given.

The main purpose of E.A.Khijnyak's research was to talk about the concept of harmony of color and flavor. He recommended the students theoretical knowledge, gave information about the coloring the size, space and recommended his methods. The aim of his research was to reveal the easy ways to color portraits, nature mort in workshop conditions. He paid little attention to landscape painting, that could have taught the students more about the state of nature (morning, evening, dawn, morning, rain, lightning), the change of the light elements. These details were not worked out in his research.

The analysis of the sources in the above example shows, in the authors' works the ways of working in plain air condition were not fully worked out yet. The complex excises to notice the colors, shades of the objects, to differ light and dark colors in the nature were not fully conducted by them yet. The main basic methodological rules were not still implemented by the scientists yet.

One of the main obstacles to improve the skills and practices of higher education institutions (Bukhara, Namangan, Samarkand, Gulistan) is that only one summer months and even less time is given to work in plain air. To develop the coloristic skills of the students it would be appropriate to spend the fall and spring seasons in the plain air. It would be possible to complete the study during the year to get a complex theoretical knowledge about the color gammas. At the moment, during the academic year students will not even think about landscape theme study till the end of the semester, clearly till the summer time. The Future teachers' ability to take the best view should be highly developed, because they'll work with the students at schools, at secondary schools, vocational colleges. They should have some skills to explain the picture of the program. In this case, the problems can be solved through the practice out of doors in plain air, but not on the basis of computer technology, with modern educational tools.

Scientific and educational study and analysis of the experience of the famous artist-teachers revealed to us the essence of the historical study of the problem in terms of "plain air" painting. As a result, we can say that the history of the formation and development of plain air as the fine art is closely related to the development of the landscape genre.

The landscape painting is one of the most spread genres of the painting. Studying its steps of development we can be sure of this. But during its development less attention was given to the accent or coloring and it was natural, the attention was given only to the little objects and elements of the nature. In that way several generations of artists made their contribution to the development of the landscape painting.

"Plain air" practice is an integral part of the educational process, and important aspect in preparing of the artist-teacher. Enjoying the nature and its performances, drawing, painting out

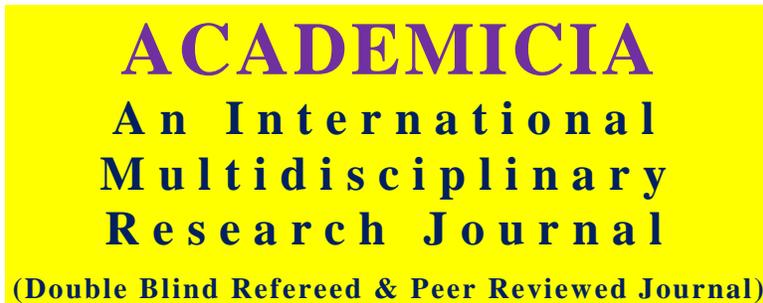

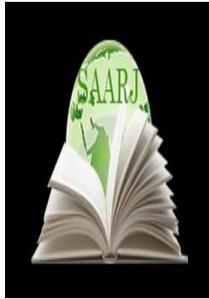

doors will develop students' skills and strengthen the knowledge that was given in the conditions of workshops.

During the observation period the students develop their observing skills. They will analyze the construction of the specific nature elements, their structure, they will learn about their color, they will clarify the knowledge about the air, sun rays, daylighting in the environment. Alternatively, they'll get to know about the materials, tools to use. Thus will develop the student's world of view and skills in landscape painting.

ABSTRACT

The article presents theoretical and practical research results in the development of highway repairs and their implementation. that is, Modern high technology of road repair in hot climates, improvement of efficiency of repair works by means of introduction of bitumen emulsion in milling for road repair in hot climates of the republic, the economic efficiency of road repairs by introducing portland cement with milling bitumen emulsion to milling for road repair in hot climates of the Republic. In other words, I introduced the bitumen emulsion to improve the efficiency of repair and construction of roads in hot climates of the country, and to improve the quality of roads, thus reducing the number of road traffic accidents.

KEYWORDS: *Bitumen Emulsions, Hot Climates, Highway, Asphaltobone, Asphaltobone Granules, Emulgator, Cement, Technology.*

INTRODUCTION

Today the total length of the road network of the Republic of Uzbekistan is about 184000 km, of which 42654 km of public roads, 71324 km of domestic roads, cities, district centers and the population 69929 km of roads and streets of residential areas.

Relevance of the research: The urgency of increasing the efficiency of repair work, taking into account the operational condition of roads in hot climates of the country, is to ensure the smoothness of roads throughout the year, to eliminate congestion, improve traffic safety and improve road use. Road repair work places a great responsibility on passengers. Improving the efficiency of road repairs in hot climates, taking into account the operational status of roads, the definition of standards for the use of road construction materials, equipment and labor, changing the form of work organization are among the most pressing issues today.

Brief analysis of the literature on the subject: Much research has been done on the repair of roads and the management of the transport network and its individual sectors. Foreign scholars, A.Moskalenko, V.Alferova, V.Astrov, V.B.Babkova, V.Rezvantseva, D.F.Moore, D.R.Lemba, E.Popova, Z.S.Bitkinashvili, I.N. Petukhova, K.Y.Lobzova, M.V.Nemchinova, N.V.Vorelysheva, N.F.Khoroshilova, Nguen Van Lokga and, A.X.Kuchimov, I.S.Sodiqov, Z.X.Saidov, E.N.Garmanov A.I.Kazarnikov, B.D.Mahmudov, A.D.Melnik, V.D.Furasov, YU.K.Ponosov, L.YA.Prunseva, D.M.Magdiev (quality management of road construction), M.A.Gasanov, D.M.Magdiev (financial management of road use), D.A.Endovitsky, M.I.Ivanov, B.A.Volkov, SH.A.Shakarbekov, E.A.Fomina, YU.Y.Shneider and other scientists.

Research objectives: Analysis of the quality of work carried out to improve the efficiency of repair work, taking into account the operational condition of roads in hot climates;

Study of the composition and classification of repair work;

Selection and justification of the research object in hot climates;

Study of modern repair technologies;

Determining the periodicity of repairs;

Development of recommendations for improving repair technology.

MATERIALS AND METHODS

The scientific significance of the works is that the application of bitumen emulsion in order to increase the efficiency of repair of roads in hot climates of the country. Achieving cost-effectiveness as a result of the preparation of bitumen emulsion and asphalt cement mixture for asphalt granules and its application in repair works;

Use of modern road equipment and technologies in the repair of roads;

The main results of the research were presented, discussed and positively evaluated at seminars at the scientific-practical conferences. "Implementation and solution of current issues on roads" at the Department of Motor Roads of Jizzakh Polytechnic Institute

RESEARCH PART

The use of recycled materials in asphalt coatings is generally mixed with the bitumen emulsion and deposited in cold asphalt surfaces after smoothing uneven surfaces. Liquid material, consisting of bitumen or resin and water, is an emulsion, and the emulsions can easily save up to 30% of the organic product by rapidly spreading on the surface of the mineral material.

Bitumen emulsions are environmentally friendly and water environments and bituminous particles play a role. Bitumen in road emulsions is approximately 1 microns and is 50-60% of the structure of the environment. When 70% of their content is emulsion with high concentration. Bitumen is a polar substance and does not dissolve in the polar fluid (water). Therefore, it forms a callous environment with high water.

The main advantage of emulsions, especially direct, is that they have very low values compared to bitumen. In addition to heating stone materials, emulsions and mixtures, it allows them to work with cold mixing, which speeds up road construction and repair and simplifies their technology.

There is a strong connection between the old surface and the asphalt concrete layer, which is used by most adhesive layers for many types of roads and is used to treat the entire surface with a thin layer. Depending on the type of coating and surface conditions per square meter, it is recommended to use 0.25 to 0.7 liters of bitumen emulsion. The emulsion acts as an over-lubricant and forms a plane between the two layers. When applied under the layer, when the traffic is stopped or the speed is reduced to 40 km / h, it is necessary to wait for full emission of the emulsion before applying the top layer [2].

Highway repair with the use of bitumen emulsion is effective. This method can create one or more layers. This method is used to repair old asphalt concrete coatings for various defects and oxidation, breakage and repair of cracks or open surface coatings. The emulsion easily penetrates the surface of the cracks, penetrates to the surface and covers the mineral aggregate, thus increasing the life of the coating and increasing the lifetime of the coating. The technology uses fine sand coating when the coating is repaired.

The granulometric composition of the asphalt granule from the work of the freeway simon section is shown in Table 1

The dependence of samples on the strength and content of the samples. Table 2

Picture 1. Process of verification of prepared asphalt concrete in hydraulic press.

Picture 2. The process of making asphalt concrete samples

ANALYSIS OF RESULTS

As a result of my research lab, the following results emerged: Of my asphalt coconut samples, the sample had a hardness of up to 14 tons when I took 2% of the optimal bitumen emulsion. If the bitumen emulsion percentage was greater than 4%, the sample did not reach the specified strength. To reduce the viscosity and viscosity of the mixture, I added 400 Portland cement and achieved the desired result. The bituminous emulsion caused the coefficient of strength of the sample made of Portland cement. The increase in the emulsion percentage reduces the compression resistance of the samples. With the introduction of bitumen emulsion at 3%, the power was about 2.17 MPa and 15% decreased to 0.92 MPa.

As a result of better adhesion of bitumen emulsions to the bottom coating, their better use in repair and construction.

TABLE 3

Type of material	Material consumption at 1000 m ²		
	Laying of hot asphalt concrete mix (%)	Cold asphalt concrete mix laying (%)	Laying of coating based on bitumen emulsion (%)
Cement	-	-	3
Sand	16	24	-
Bitumen	5,5	6	2 (for the preparation of emulsions)
Diesel fuel	-	3	
Rocks	78,5	67	27
Water	-	-	2 (for the preparation of emulsions)
Asphalt	-	-	66
Emulgator			0,05(for the preparation of emulsions)
Total %	100	100	100

The average coating life of 5 years is based on the latest hot and cold asphalt technology, and the use of this technology significantly increases the economic efficiency.

The use of bitumen emulsion based compositing techniques is important for increasing the cost-effectiveness of bed coverings.

Bitumen emulsion composite technology will be used within 2 hours upon completion of the coating, which will be repaired especially on high-density and passable roads.

Road repair technology using bitumen emulsions is well suited for internal mechanics because of coarse-grained durations, even at 2 h.

CONCLUSION

In summary, the results of research on automobile roads in hot climates of the Republic of Uzbekistan have demonstrated the use of bitumen emulsions and asphalt granulation technology to construct upper layers. Constructive layers of materials allow to increase the efficiency of reconstruction and repair, better adapt to the lower floors, which increases the service life of the coating, increases the safety of transport and reduces production costs. It has also been used in conjunction with emulsions and mineral binders to fill asphaltogranulas (milling) in internal repair work.

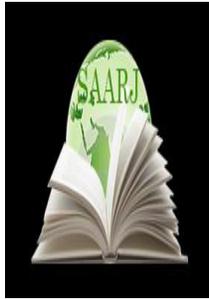

RECOMMENDATIONS AND SUGGESTIONS

For further improvement, this technology has also been proposed for laying on the highways. This reduced the time of road construction and repair and saved the bitumen.

ABSTRACT

New methods of fur processing are considered. A comparative analysis of traditional and innovative technologies for the manufacture of fur products is carried out using an example from the Fashion House. In order to determine trends in the development of fashion and improve methods for designing clothes from natural fur, taking into account innovative design, an analysis of known fashion collections by compositional and constructive features, reflecting the shape and design of models of fur clothes, was carried out.

KEYWORDS: *Fur Products, New Processing Methods, An Assortment Of Fur Products.*

INTRODUCTION

At present, Uzbekistan is experiencing the restoration and growth of domestic fur production of fur products based on astrakhan sheep breeding. The fur of the Karakul fur is thick, shiny, flexible, silky and has its own unique pattern created by intricate curls. The best Karakul fur is fur with curls of a special shape - roll, that is, the pattern is laid out in straight rows, parallel-concentric circles. It is important that karakul is resistant to frost and moisture, it is very warm, which makes it very popular. The unique properties of astrakhan fur make it possible to use it both for sewing clothes and for finishing. The use of an expensive semi-finished product, the originality of the methods of constructive modeling and manufacturing methods, the great variability of the physical and mechanical properties, determined by the natural and biological characteristics of animals, require comprehensive research on the development and formation of initial information for the design of fur products.

The use of an expensive semi-finished product and manufacturing methods, a large variability of physical and mechanical properties, determined by the natural and biological characteristics of animals, require comprehensive research to develop and form the principles of domestic design of fur products.

Innovative design of fur clothes implies the inclusion of new methods of design of a semi-finished fur product [1] and is focused on the creation of high-quality and aesthetically beautiful fur products made in a small batch production and being the objects of the developed design of outerwear with highly functional, ergonomic, indicators. World experience confirms that the relevance of their silhouette and style solutions plays an important role in the global promotion of fur products from well-known fashion houses and brand manufacturers [2].

In order to determine trends in the development of fashion and improve methods for designing clothes from natural fur, taking into account innovative design, an analysis of well-known fashion collections by compositional and constructive features, reflecting the shape and design of models of fur clothes, was carried out. The results of the analysis made it possible to identify the main style-forming elements and establish the trend of their development. The object of the study was 180 models of the fashion house "Fendi", "Gianfranco Ferre", "Versace", "Chanel"; "Gucci" ("Gucci"); "Jean Paul Gaultier"; "Prada"; "Moschino" ("Mochino") and many other foreign publications for 2018-2020. [3].

For the study, we chose models that have both traditional and original design solutions and the shape of the product.

The analysis showed that in the structure of foreign fur production and trade, finished products (outerwear) account for approximately 100% (Fig. 1).

Type of fur product

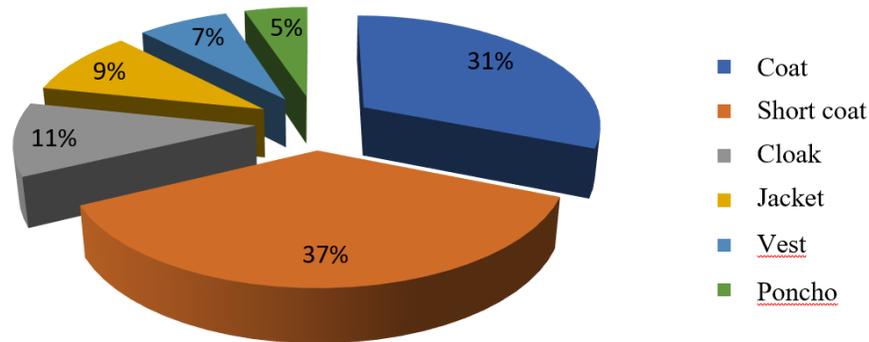

Fig. 1. Diagram of the occurrence of models of fur clothing in the collections of world brands

In the collections as a whole, various types of fur outerwear were presented (Fig. 1): coats (31%), short coats (36%), cloaks (10%), jackets (9%) vests (7%) and ponchos (7%). Unlimited opportunities for updating and expanding the range of fur products are provided due to the annual release of semi-finished fur products of new color imitations, textures, an expansion of the color range of fur, the use of complex cutting methods and a diverse arrangement of skins in products, the combination and use of different types of fur in one product, combining fur with leather, knitwear and other materials.

The most trendy types of fur: astrakhan fur (5%), broadtail (6%), muton (8%), mink (17%), arctic fox and fox (32%), nutria (3%), rabbit (8%). Also, textured combinations of different types of fur (16%) from mink, chinchilla, rabbit are widely used in the design [2].

Studies have shown that in modern collections of famous designers there are many models of clothing, combined from leather and fur, innovative methods of design of a semi-finished fur product [4]. Clothing models made of leather and fur, consisting of many small parts with a predominant use of flap and waste, have become examples of the modern approach to the design of fur products. Designers masterfully make up a mosaic, combining pieces of leather or fur both with each other and with fur flaps of different type, color, hair height and density. Fur clothing collections also include multi-piece models of leather and fur [5], models of clothes processed methods of flat decoration of skins [5,6,7,10]: inlay, perforation, applique, interspersion, fringe decoration, intarsia, patchwork technique, embroidery on leather, skin, etc. (Figure 4).

For example, inlay consists in decorating products with patterns and images that are cut into the surface and differ from it in color or material, filling it with other material (leather, suede, furs, etc.). It should only be borne in mind that the cutting of the fur for the ornament must be designed from the same topographic areas of the skins, since the unequal height of the hairline will noticeably distort the pattern on the product [8, 9] (Figure 3).

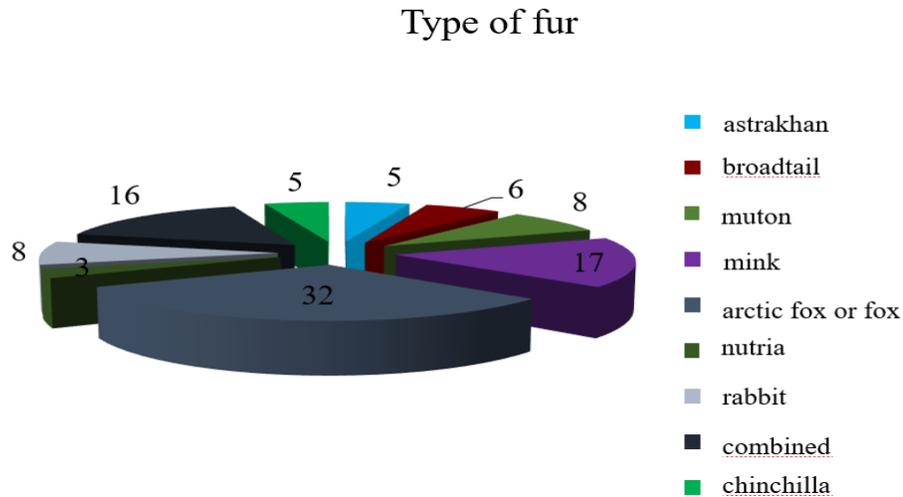

Figure: 2. Characteristics of the investigated models by type of fur

Innovative methods in this case are simple, logical, cost-effective techniques for cutting and additional processing of semi-finished fur. These methods allow transforming the surface of the fur, improving its aesthetic and operational qualities, increasing the usable area of expensive fur raw materials and creating a fur product that meets the requirements of modern design.

Figure: 3. Models of fur clothes, decorated with inlay from SagaFurs [10].

Crushing skins (skins) into parts with the formation of a pattern makes it possible to use not only individual sections of the cut, but also the entire surface of a semi-finished product that has hair defects. In this case, parts of the same shape and size (for example, squares, circles) can be arranged in a cut so that the direction of the hairline in each square of the longitudinal and transverse row or circle is opposite. In this case, the figures in which the direction of the hairline and the ray of light coincide will look light, shiny, and the rest will look matte, with a thicker tone. Methods of flat decoration of skins are actively used in the development of foreign designers, for example, in the ZUKI brand, the international design center SAGA FURS and others [8]. The elements of the pattern can be very different: geometric shapes (squares, rectangles, triangles, circles, etc.) and bioforms (Fig. 4).

Fig. 4. Samples of decorating products by inlay by SagaFurs [10]

The external shape of a fur product is influenced by the density and rigidity of the leather tissue [11], the elastic-plastic properties of which allow furriers to create spatial forms from fur due to residual deformation and changes in the structure of the leather tissue during stretching [12]. Inappropriate and irrational use of these properties of fur skins leads to distortion of the shape, violation of the composition of the product as a whole, to weighting the product. The designer must apply a delicate taste and sense of proportion, which are necessary when creating a fashionable and beautiful image.

It is known that the shape and direction of constructive and constructive-decorative lines in clothes made of natural fur depend on the type and size of the skin, fashion trends, and trend recommendations [11]. The properties of the leather fabric of natural fur determine the main manufacturing feature - the absence of wet heat treatment to create a shape. When obtaining a fashionable spatial form of fur clothing, one should take into account the size of skins and flaps, height, color, plasticity, softness and density of the hairline.

Modern designers offer various cutting methods (Fig. 5), the number and shape of fur clothing form divisions. The choice by manufacturers of options for the location of skins in the product, cutting methods is determined by the model, type of fur, long hairline.

Silhouette

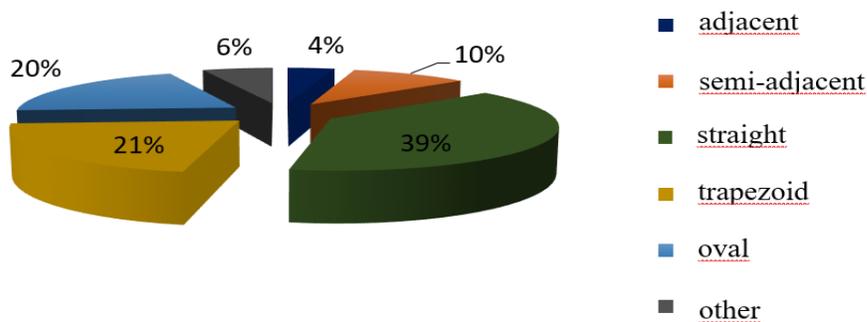

Figure: 5. Characteristics of the sample of the investigated models of fur clothes according to the used methods of sewing

In modern trend models, visualization of articulations is popular, which is achieved by combining short-haired and medium-haired fur in products, using manufacturing techniques (for example, embroidery with leather or suede), which enhance the visualization effect. Structural articulations in such models carry a compositional load and are structurally decorative. As an additional technique for visualizing the compositional and constructive solution of the model, they use a haircut, color, leather (suede) embroidery of a fur semi-finished product in certain areas. The analysis revealed the location of the shaping articulations in fur products. The most popular trend models with a combined arrangement of skins in the product (Figure 6.7.).

According to the research results, it can be concluded that trends in fur clothing are provided due to the annual production of fur semi-finished products of new color imitations, textures, an expansion of the color range of fur, the use of complex cutting methods and a varied arrangement of skins in products, the combination and use of different types of fur in one product, combining fur, leather, knitwear and other materials. The main factor that determines the choice of a design solution when designing fur products is the principle of shaping.

The increasing importance of innovative design in fur garments has been revealed. The use of innovative methods for the design of semi-finished fur products will allow domestic fur enterprises to reach a new progressive level of development, to create aesthetically perfect and competitive domestic fur products.

View of the arrangement of skins in fur coats

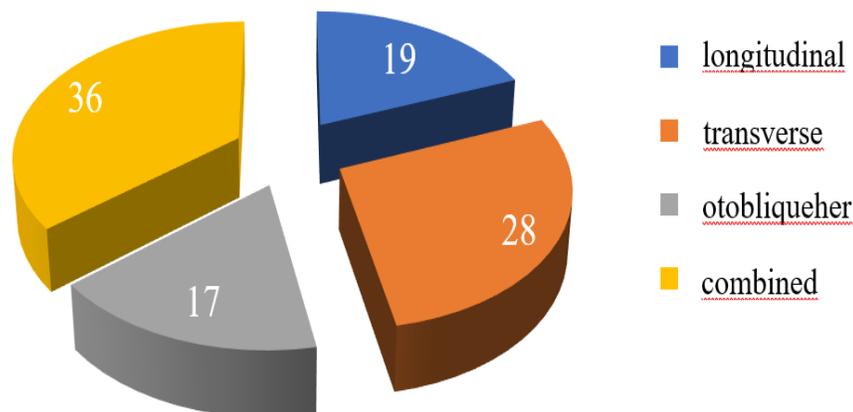

Figure: 6. Arrangement of skins in fur coats

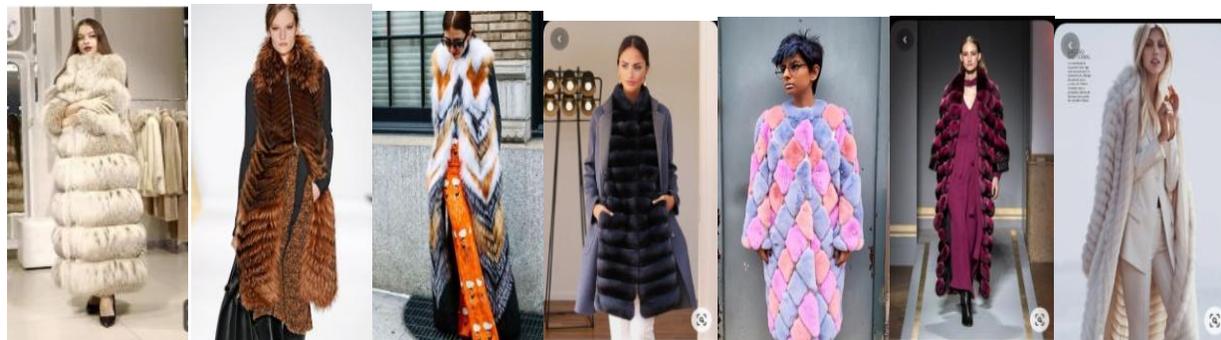

Fig. 7. Models of fur clothes with different arrangements of skins in products [13].

The noted design features of fur products are the initial information for the automated visualization of the graphic image of a product from a fur semi-finished product and made it possible to form an information fund for the sketch design of fur products.

THE TECHNOLOGY OF TEACHING SPEAKING IN ENGLISH AT SECONDARY SCHOOLS

Nigora Shavkatkhon kizi Bakhodirova*

*Master's student of Namangan State University,
 UZBEKISTAN

Email id: baxodirovanigora@gmail.com

ABSTRACT

This article describes the technology of teaching speaking in English classes at secondary schools of Namangan region, aimed at creating such an environment for students not only during classroom activities, but also during the break time between classes in order to master speech skills in English more successfully.

KEYWORDS: *Technology, Speaking, English Classes, Speech Skills, Classroom Activities, Secondary Schools*

INTRODUCTION

The graduates of secondary school education specialized in the study of a foreign language should be A2 level according to the modern requirements in accordance of CEFR levels in Uzbekistan. To reach the outcome of the objectives the state curriculum in secondary schools, we need to create an artificial language environment, both for the purpose of motivation and for the purpose of faster and better mastering of all types of speech activity of our students.

MATERIALS AND METHODS

Many scholars argued about the need to create a language environment. According to D.N. Asanova, artificial linguistic educational environment includes a set of components: spatially-subject, technological and social, which ensures the activation of the subject activity of students, both in English lessons and after school hours, creates an appropriate emotional mood and contributes to mastering the skills of foreign language communication.

Based on the goals of teaching a foreign language, it is necessary to take into account that the language environment should be educational in nature, i.e. we need to create an educational language environment. All methodological techniques, teaching aids, visual and handouts,

manuals and equipment used must create and support the teaching and developmental nature of the foreign language environment.

To create an educational language environment outside the classroom during breaks between lessons, the model of the language environment proposed by D.N. Asanova, and this model of the language environment is based on such components as:

1. Subject-spatial component includes objects, furniture, room, external environment. All surrounding objects participate in the creation of a language developmental environment. In addition to bright educational posters in English, books in English, educational language games, there is a special corner on the wall where you can place language material: fairy tales, poems, phrases. The material is designed in such a way as to attract the attention of students.

2. The technological component includes the content of the program, methods, forms and teaching aids. When selecting the lexical material used during the break, we were guided by the principle of expediency, choosing the material that is necessary for successful smooth communication in the lesson, as well as the principle of the frequency of the use of individual phrases and expressions. We try to bring all language material as close as possible to the natural language environment. The teacher works with this material not only in the classroom, but also outside the classroom, in our case at recess. Games (including finger games), songs and nursery rhymes help create a favorable atmosphere and recreate a piece of the English-speaking world both during recess and in class. The types of objective activity, in the process of which, within the framework of our experience, learners master a foreign language culture, are the following: manipulation games, drawing, sign language and musical activity.

3. The social component includes various forms of interaction between subjects in the educational process. The center of this environment is the learner as a linguistic person. We try to help the child master social norms, create an educational language environment in which he can realize himself as a person.

4. The developmental block includes tasks and exercises, as a result of which children learn English lexical units in the flow of speech, listen to English speech, see the whole English word.

RESULTS AND DISCUSSIONS

Our concept of creating an extracurricular English-speaking environment is based on some simple and practical ideas.

1. Student-centered nature of the process of mastering the English language. As a rule, when learning a foreign language, students are forced to be guided not by personal interest, but by the requirements of the teacher. If we talk about creating an extracurricular language environment, then it is much easier and simpler to “tune” it to the range of topics that are understandable and interesting to students. Let us explain this idea with a specific example. Currently, we observe that students during recess do not communicate with each other, but take their gadgets and play various games of a “non-educational” nature. We want to direct the interest in modern devices and games into the educational mainstream. To do this, we can select a number of Internet sites with interactive educational games in English, which allow us not only to organize the educational process during breaks, but also to show students that there are interesting educational games in English. It is noteworthy that the interest of students is not limited only to the time

allotted for recess, many have written down the addresses of the sites in order to be able to continue learning while playing at home.

2. Restricting the use of "translated materials" and creating an English-language learning environment. We assume that if you use as many phrases in English as possible during breaks and lessons, this will help you quickly master a foreign language to an appropriate extent.

We can say some instructions in English; try not to translate them into Uzbek, explaining them with gestures and facial expressions.

3. Language is a "working tool". One of our tasks as English teachers is to show students what the real need for learning English is, point out the area in which their knowledge can be applied. At the junior level of education, we pay attention to the fact that English is around us: on the labels of their favorite products, in the names of their favorite toys and cartoons, in computer games. At the intermediate level, we pay attention to the fact that there are children's English-language podcasts (educational cartoons, recordings of video dialogues, flash games, etc.).

4. Language is a means of communication. Observations of recent years show that today a serious problem for students is that it is difficult for them to competently express their thoughts even in their native language, let alone a foreign language. From our point of view, within the framework of our technology, communication games can be an effective teaching element.

5. Formation of educational autonomy. By the formation of educational autonomy, we mean the formation of the need for self-development in general and the skills of learning a foreign language using all available resources in particular. In other words, it is important and necessary to teach students to learn, learn new things, seek and acquire knowledge.

In this regard, we would like to introduce the innovative technology "English every minute" or "educational change". To create an artificial educational language environment within the framework "educational change" technology and relying on the above-mentioned components of the language environment model we will choose in the followings:

1. We need to develop a set of entertaining educational lexical games in English: dominoes, loto, bingo, crosswords, "magic letters", board games.

2. We will analyze the English-language educational Internet resources and, on their basis, created a bank of developing materials, which included: phonetic books, fairy tales for children in English, a dictionary in pictures, coloring books, applications, and crafts.

3. We will pick up developing speech outdoor games using rhymes (Hand Rhymes), songs based on video (cartoons, videos);

4. We will compile a list of educational Internet sites with interactive games.

5. We can regularly arrange classrooms with various language, linguistic and cultural materials.

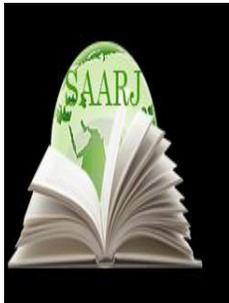

The organization of educational activities at recess will began with the fact that when students are offered various language games, participation in which will be voluntary. At this time, the teacher is next to the children, gives instructions in English, helps to cope with emerging difficulties and monitors whether the task is completed correctly.

CONCLUSION

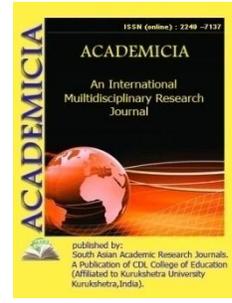

In conclusion we can recommend using the "educational break" technology. With the help of this technology, the oral and speaking skills of students will more effectively formed: understanding of the English speech addressed to them, the active use of words and phrases, the ability to recite poetry by heart, match a word on a card with a picture or say it yourself.

ABSTRACT

Elderly tribal women experience physical illness, economic insecurity, social isolation and mental instability. Although they are aware of these, they have hardly any resources to get out of their trap. Most often than not, they do not want to be a burden to their children. In some tribal families, the children also prefer to live separately after marriage. As a result, elderly tribal women become increasingly helpless. The present study has attempted to analyze the socioeconomic background and related problems of the elderly Lodha women. Forty-four elderly Lodha women (age-60 years and above) were selected from four villages under Jhargram and Nayagram block of Jhargram District for this. The data were collected through structured and unstructured interview. It is observed that most of the Lodha respondents suffer from various health problems such as malnutrition, loss of vision, loss of hearing, arthritis, etc. Their living conditions were unhygienic and unhealthy, and they drink unsafe drinking water from the village wells. It is also found that other members of their family are also indifferent to them. The elderly Lodha women expect a little care from their family members and also some support from the government.

KEYWORDS: *Burden, Elderly, Health, Helpless, Lodha.*

1. INTRODUCTION

Health is a prerequisite for holistic development and is an essential component of the general well-being of human beings. The health problems truly speaking is not at all solely biological but are caused by the complex and multi-layered interplay of various factors not excluding the social, economic and political ones. The common beliefs, customs, practices are directly or indirectly related to peoples' health. Some practices are suggested to avoid illness or diseases, and some practices unconsciously directed to illness or diseases.

The term Lodha is possibly derived from the Sanskrit word '*Lubdhaka*', meaning a trapper or fowler (Bhowmick, 1979). The Lodhas prefer to call themselves as 'Savaras' or 'Lodha-Savaras' which has a reference in the *Ramayana* and the *Mahabharata*.

They lives in the jungle-covered tracts of Paschim Medinipur of West Bengal, Singbhum of Jharkhand and Mayurbhanj of Odisha. Some of them are found in the district Hoogly of West Bengal. Other tribal communities like the Santals, Mundas, Koras, etc. live along with them. The Lodhas have no language of their own. They speak in rural Bengali dialect. According to P. K. Bhowmick,

The Lodhas differ physically and culturally from these groups of people; added to this is the stigma of criminality imputed to them by the local people, as well as by the government. Even now, they are deemed as such, and in the event of any theft or dacoity in this area, they are instantly suspected and harassed, both by the people of the locality and by the administrative authorities (ibid, p. 37).

The Lodhas is one of the most Primitive Tribal Groups (PTGs) of India. They were designated as one of the 'criminal tribes' according to the Criminal Tribes Act, 1871. In 1952 of Government of India revocation of the criminal tribes' act and the Lodhas are now treated as the 'denotified' tribal community. Now they are called 'Particularly Vulnerable Tribal Group' (PVTG) earlier terms as Primitive Tribal Group (MoTA, 2012). The Lodhas have an existence of a pre-agricultural level of technology, stagnant or declining population growth, extremely low level of literacy, a subsistence level of economy and having low health indices.

The scheme Particularly Vulnerable Tribal Groups indicates that PTVGs have not attained a considerable level of educational, economic growth and are having low health indices. They depend on agriculture, minor forest products like fuel woods, *sal* leaves, etc. and daily labour for livelihood.

2. REVIEW OF LITERATURE

Older women experience a higher burden of chronic illness and infirmity. This burden is highest among socio-economically disadvantage women (Sonwane, 2015). They are more vulnerable to illness and diseases in any social strata because of decrease physiological controls and any other capacities (Arlappa, 2006). Santhosam and Samuel (2013) showed that most of the older women do not get the care and concern their families. They think that they have become a burden on their children. They use traditional medicine during illness.

3. OBJECTIVES

- I. To know the socioeconomic background of the elderly Lodha women.
- II. To find out the health problems (physical and psychological) of the elderly Lodha women.
- III. To understand the factors of problems found among the respondents.
- IV. To evaluate accessing of health care facilities done by the respondents.

4. RESEARCH METHODOLOGY

4.1. RESEARCH DESIGN

For this study, descriptive research design has been adopted. The purpose of this research design is to describe the socioeconomic background and other parts like the health problems, factors of problems of the respondents. And, reveal new information about the elderly Lodha women in the study areathrough the objectives as mentioned above.

4.2. AREA OF THE STUDY

The present study was accomplished in four villages named Kalajharia, Rajabasa, Shital Pura and KalmaPukhuria. These villages are tribal dominated villages where most of the people are belong to the Lodha community. First two villages are situated in the Jhargram and next two villages are situated in the Nayagram block in the Jhargram district which is located in forest fringe area.

The unit of the study has been the individual. All the elderly Lodha women of these four villages have been selected as respondents for this study. (Table-1).

TABLE-1: DISTRIBUTION OF RESPONDENTS

District	Block	G.P.	Village	Total no. of elderly Lodha women
Jhargram	Jhargram	Manikpara	Kalajharia	18
			Rajabasa	7
Jhargram	Nayagram	Nayagram	Shital Pura	11
		Malam	KalmaPukhuria	8
Total				44

4.3. RESEARCH TOOLS

The present study mainly relies on direct intensive observation and interviews with the villagers. The demographic and socioeconomic surveys were conducted among the forty-four respondents of the Kalajharia, Rajabasa, Shital Pura and Kalma Pukhuria villages with the help of structured and open-ended questionnaire schedules. The questionnaire included information on their socioeconomic background, various health problems, factors of health problems and accessing the health care facilities done by the respondents. The qualitative information on the feeling and attitude of the affected persons were collected through repeated conversations over one month during June-July 2019. The qualitative data were presented with the help of some representative of them. The respondents were selected for this study by stratified random sampling. The present study was based on the fieldwork carried out in Kalajharia and Rajabasa villages, which comes under the jurisdiction of Manikpara Gram Panchayat of Jhargram block, and Shital Pura and

KalmaPukhuriavillages come under the Nayagram and Malam Gram Panchayat of Nayagram blockin Jhargram district, West Bengal.

5. MAJOR FINDINGS OF THE STUDY

5.1.SOCIOECONOMIC BACKGROUND OF THE RESPONDENTS

The data were collected fromforty-four elderly Lodha women ofKalajharia, Rajabasa, Shital Pura and KalmaPukhuria villagesof Jhargram district. West Bengal, India. The role of age is an important factor for an individual in the performance of socioeconomic status. Regarding age-wise classification of the respondents, a good number (61.36%) of them belong to the age group between 60-70 years. 34.09% of them belong to the age group of 70-80 years. And 4.55% of them belong to 80 years and above (Table-2).

TABLE – 2: AGE-WISE CLASSIFICATION

Age group (years)	No. of respondents	Percentage (%)
60-70	27	61.36
70-80	15	34.09
80 and above	2	4.55
Total	44	100.00

Most of the respondents (52.27%) are a widow. Some of them live with their children, and others are separated from their children. In the studied areas after the son is married, they begin to live separately without the mother due to their economic crisis. In this situation, older Lodha women become very helpless. Rest of the respondents (47.73%) are married, and they were living with their husbands (Table-3).

TABLE-3: SOCIOECONOMIC BACKGROUND OF THE RESPONDENTS

Socioeconomic background	No/ of respondents	Percentage (%)
Marital status		
Married women	21	47.73
Widow	23	52.27
Total	44	100.00
Source of Income		
Agriculture	7	15.91
Collecting forest products	29	65.91
Govt. pension schemes	8	18.18
Total	44	100.00

One of the basic objectives of the present study is to understand the economic condition of the elderly Lodha women inhabited in Kalajharia, Rajabasa, Shital Pura and KalmaPukhuria villages. In this connection, the role of occupation has to be taken into consideration in economic sources as it constitutes the important criterion in assessing the economic condition. In this study,

it has been found that 65.91% respondents were collecting fuelwoods in the nearest jungle in a whole year except the rainy season. Many of the respondents are not able to do any hard work. They are relaxation in a whole day in their house.

Few of the respondents are engaged with agriculture. By doing this, they earn Rs. 150-200 per day. They do not get this job for a year. They do this for only 3 to 4 months (June-July at the time of planting and November-December at the time of harvesting) a year. The rest of the time, they do not get a chance to work that way. Some of them collect fuel woods within the nearest jungle at that time, and a few of them stay home as unemployed.

In this study, it has been observed that the widow does not get any financial support from their family members. They live with their own income. 18.18% respondents get financial support from the government allowances such as West Bengal Old Age Pension Scheme or West Bengal Widow Pension Scheme. In this scheme, they get financial assistance of Rs. 750/- per month.

5.2. HEALTH PROBLEMS AND RELATED FACTORS

Based on the objectives, health problems among the elderly Lodha women, the researcher finds major problems of the respondents in respect of their age, marital status, occupation, etc. and also respect of their economic dependency, supporting persons at aged, physical immobility, etc.

The tribal widows are dependent on their sons. Some of them are self-dependent. When they get older, their physical problems also increase, but at the same time, they become economically weaker. Because of their physical ability is decline during old age. As a result, they become dependent on their children at this time. Children also do not want to take the responsibility of treating them as being economically weak. Those who get widow pension (West Bengal Widow Pension Scheme, 2010) or old-age pension (West Bengal Old Age Pension Scheme, 2010) from the government, they are in an advantageous situation, but those who do not receive the same they are the most sufferers. They cannot afford the necessary treatment due to their financial inability to treat the diseases. In this study, it has been observed that some of the elderly Lodha women cannot access the modern health services due to their poor economic condition. In Kalajharia, 64 years widow Lodha woman named Sarala Bhakta (name changed) stated that she does not receive any pension from the government. Her primary sources of income are collecting fuel woods, and *sal* (Shorea robusta) leaves from the nearest jungle and sells its Manikpara market. By doing this work, she earns 30 to 40 rupees a day. With this low income, she is living simply. She cannot afford the necessary treatment. Her two children live separately after getting married. Sarala does not live with her children. She thinks that her children are economically fragile. They cannot run their own family well. As a result, they can not take responsibility for their mother.

Another reason for not accessing medical treatment is the distance of the health centres. Few respondents cannot access the health services due to the distance of the health centres. In Rajabasa, Jhuma Bhakta (Name changed), 68 years Lodha woman stated that she has been suffering from knee pain for a long time. She received an old-age pension, but still, she could not get the necessary treatment. Firstly, she went to the Manikpara Primary Health Centre for treatment. But there she was not cured. Then she decided that she would go to the Jhargram District Super Speciality Hospital for treatment. However, once she left from the primary health centre, she could not go to the district hospital for treatment, as the distance from his village to

the district hospital was about 20 km. At an old age with physical problems, he can not go to 20 km. away for getting government health services.

All of the respondents were suffering from some kind of physical problems such as chronic headache, cough, joint pain, low back pain, loss of hearing, loss of vision, low blood pressure etc. They have been suffering from all these diseases for almost three to five years. Age factor and dietary habits can be considered as the causes of all these diseases. Lodha respondents of these studied areas had to do the household works, and they take lunch or dinner after eating by all family members and sometimes they could not eat sufficiently due to the insufficiency of foods.

It is also observed that the level of support and care from the family members are limited. During the illness, some of the widows have said that they become dependent on their children. They try their best to overcome from illness without the help of their children. They try to become self-dependent. Some older Lodha women do not live together with their children, because after their children marry, they start living separately.

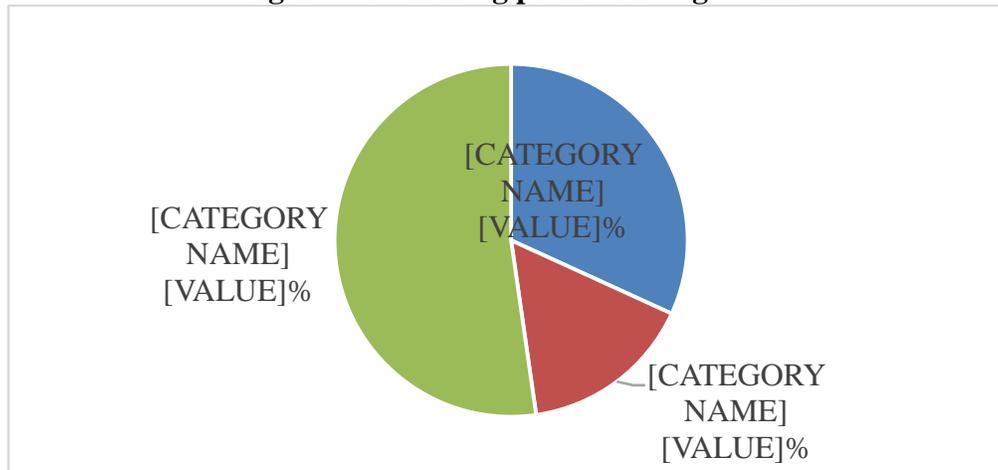

Moreover, all these ageing women become economically, socially and emotionally helpless, and they have a feeling of isolation. After their husband died, they become very lonely, and their children also think that they are a burden to them and treated as an unwanted one. As a result, they are unable to eat sufficient food due to their psychological loneliness and economic distress.

In this study, it has also been observed that almost all the Lodha women are addicted to *bidi*, *gudakhu* (smokeless tobacco) and *hanria* (country liquor), this may be a contributing factor of their illness and chance to infection among them. They drink *hanria* more than once a day. Even some of them are found drunk in the morning. They are also chewing *paan* (betel-leaf with betel-nut) 2-3 pieces in a day. All of these have harmful effects on their health.

It has also been observed that most of the respondents feel uncomfortable with their family members regarding respect and love. They think that their inability to work is the main cause of loss of respect by family members. At the time of serious illness, nobody helps to take them to the hospital or private doctor. Moreover, they also perform their daily activities with physical illness.

5.3. ASSISTING PERSON DURING ILLNESS

During illness, tribal women cannot access proper treatment from their family members due to their negligence about the illness. Widows are more sufferers than married women. In this study, it has been found that most of the respondents (52.27%) are care self-treatment during physical illness. Only 31.82% Lodha respondents stated that their husband cares for them during illness. They think that their husbands are going out of the house whole day for work, so they do not have time to taking care of them. Women complete all household work throughout the day with their illness. When they get sick, they have to serve themselves. However, if they have a painful disease or suffers from a prolonged illness, their husbands take the responsibility to treat to the doctor. Few of them (15.91%) are dependent on their son and/or daughter-in-law for livelihood. Some of the married sons take the responsibility of their elder mother (Diagram-1).

Diagram-1: Assisting person during illness

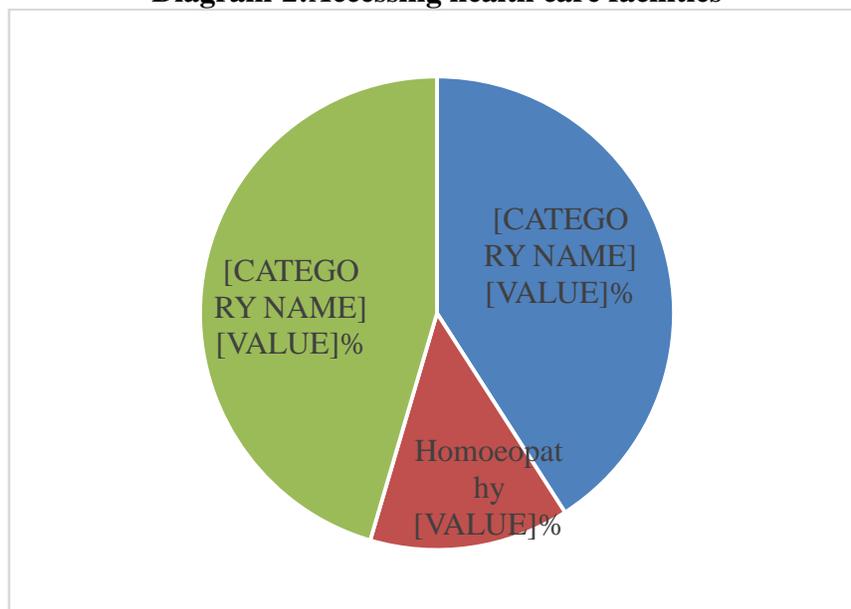

In Lodha community, if an older woman becomes ill, her son and/or daughter-in-law do not want to take full responsibility for her treatment. An older woman name Asha Mallik (name changed) from Kalajharia village stated that her husband passed away five years ago. But she does not live in a house with her son and daughter-in-law. She collects fuel woods, and *sal* leaves from the jungle and sells it to the nearest Manikpara market. Many times, she cannot do her treatment due to economic insufficiency, and no one assists them to go to the nearest Manikpara Primary Health Centre. Furthermore, no one assists during her illness. As a result, she had to fasted for much time.

5.4. ACCESSING HEALTH CARE FACILITIES

As age increases, health problems also begin to increase, but this time income is slowly declining. As a result, they cannot afford to spend money on treatment. They (40.91%) are dependent on the nearest Manikpara Primary Health Centre for their treatment, where the treatment is fully free of cost. Sometimes they cannot go to the hospital due to their physical weakness, and no one helps them during this time for treatment. Their family members not willing to pay for their health problems. They often use a home remedy for their ailments. They could not gain medical care due to underdeveloped communication and lack of transport facilities. Because the distance from Kalajharia village to Manikpara Primary Health Centre is about 5 km. and the road is un-metalled. As a result, it is very problematic towalk or to by-cycle on this road during the monsoon season. Also, there is no transport facility, and at old age, it was almost impossible to get medical treatment for them after walking of 5 km.

Some of the respondents go to the private doctor for their treatment, because they believe that a private doctor's treatment can be improved quickly from illness. Few of them (13.64%) consult with the homoeopathy physician for treatment. A homoeopathy doctor in Kalajhariavillage visits with patients every morning. Two respondents from this village take homoeopathy treatment because the homoeopathy doctor offers a little cost (twenty to thirty rupees per patients) treatment. Another two respondents from Rajabasa village visited a doctor at Manikpara market for homoeopathy treatment. Majority of the respondents (45.45%) apply home remedies during illness (Diagram-2). They used various plants as traditional medicine.

Diagram-2: Accessing health care facilities

Both the central and state government have implemented various welfare programmes for old age women to improve their economic condition as well as a health condition. Older Lodha women are unable to earn money and unaware of their health condition. Level of awareness about old age pension and widow pension exposed that out of forty-four respondent's most of the respondents stated that they have not known about old age pension and widow pension scheme.

The following case study deals with the treatment procedure of a 61 years old Lodha woman named Asha Nayek (name changed). She lives in Shital Pura village (G.P.- Nayagram, Dist.- Jhargram). She is a poor agricultural daily labourer. Since 2018, she was suffering from gastric and chest pain. She also suffered from low blood pressure. She visits the nearest Kharikamathani Rural Hospital. Then she was admitted to Medinipur Medical College and Hospital for ten days. The doctors recommended a healthy diet and prescribed a huge number of medicines for her treatment. But due to her poor economic condition, medicines could not be continued, and the patient again started suffering from the same symptoms. In March 2019, she went to the local quack doctor for a checkup and took medicine prescribed by the doctor at a low cost. She was, till the time of data collection, under her treatment, but her physical condition had not been improved.

TABLE-4: NATURE OF TREATMENT OF DISEASES

Diseases	Treatment
Cold and cough	Lodhas make a paste of 45-50 leaves of <i>tulsi</i> (<i>Ocimum sanctum</i>) with ginger (15g) and <i>jaggery</i> or honey and take orally two or thrice daily.
Constipation	Elderly Lodhas make juice from the stem bark of <i>ulatkambal</i> (<i>Abormaugusta</i>), mixed with water and take it daily within the early morning. Sometimes they chewed leafy twigs once in the morning to relieve from constipation. Sometimes they also prepare <i>sarbat</i> from the ripe fruit of <i>bel</i> (<i>Aegelmarmelos</i>) and take it orally daily to relieve from constipation.

Dysentery	Lodhas make paste or juice of <i>kalmegh</i> (<i>Andrographis paniculate</i>) leaf and take once a day preferably empty stomach. Sometimes they take boil stem bark (20-25 g.) of arjun (<i>Terminalia arjuna</i>) orally twice a day for 2-3 days. They also took paste of <i>thankuni</i> (<i>Centella asiatica</i> L.) in the early morning for dysentery.
Fever	Lodhas prepare leaf juice of <i>manasa</i> (<i>Euphorbia nivulia</i>) and mixed with common salt or honey and take it orally in the morning for 3-4 days. Lodhas make leaf juice of <i>sheuli</i> (<i>Nyctanthes arbor-tristis</i>) and mixed with common salt or honey, take it twice or thrice daily for 8-10 days.
Headache	Lodhas make a paste with leaves of <i>uchchhe</i> (<i>Momordica charnita</i>) with common salt and applied externally on the forehead.
Malaria	Lodhas take the decoction of stem bark of <i>bilatibabla</i> (<i>Acacia farnesiana</i>) once a day with an empty stomach. They also take the decoction of leaf and stem bark of <i>neem</i> (<i>Azadirachta indica</i>).
Piles	Lodhas make <i>sarbat</i> from leaves of <i>saibani</i> (<i>Lantana camara</i>) and take it orally in the early morning preferably empty stomach.
Ringworm	Lodhas apply leaf paste of <i>charla</i> (<i>Holoptelea integrifolia</i>) externally on ringworm. They also use <i>neem</i> (<i>Azadirachta indica</i>) leaf for the ailment of any kind of skin diseases.
Scratch of dog or cat	Lodhas take the juice of <i>apang</i> (<i>Achyranthes aspera</i>) and apply the paste on the scratch portion of the patient.
Toothache	Lodhas boil stem bark of <i>bakul</i> (<i>Mimusopselengi</i>) in 400-300 ml water and gargle it in toothache. Sometimes they apply latex and tender stem of <i>bherenda</i> (<i>Ricinus communis</i>) in toothache for consecutive 10-15 days.

Elderly Lodhas have their own methods of treatment. They use various ethnobotanical plants as traditional medicine for their ailments (Table-4). These plants or medicinal herbs are collected from their residential areas at any time. In this study, the older Lodha men and women are the main source of information about traditional medicines. The older women were freely shared their traditional knowledge about remedies for common cold and cough, fever, headache, toothache, skin diseases, etc. The older men freely talked about their traditional knowledge regarding remedies, and they accompanied that they were collect traditional plants from nearest forest.

They make juice, paste or *sarbat* from the roots, leaves, stems, flowers, fruits and seeds of these herbs to prevent the diseases. They used these medicines orally or externally according to the diseases. The Lodhas have certain beliefs and taboos about medicinal plants. 1) they were beliefs that medicinal plants should not be collected in the afternoon. 2) the medicinal plants are more effective for them if salt, long pepper or black pepper is added. 3) roots are considered more effective than the outer parts of the medicinal plants. 4) they believe that deities have the power to prevent and cure of diseases and the think that if any person not properly prayed to the deities, the diseases not to be cured.

Traditional and modern health care practices of the Lodhas are closely interrelated with the religious beliefs and rituals. They were accessed to traditional medicines based on medicinal herbs, roots and tubers. Similarly, they also receive modern health care systems. They utilize the basic facilities of the primary health centres, block primary health centres—rural hospitals, etc. The Lodhas have their own traditional knowledge to treat the various diseases. For these, they prepare medicines from locally available medicinal plants. These medicines are prepared by the older men and women of the communities for some common diseases such as cold and cough, constipation, dysentery, fever, skin diseases, etc. They believed that their home-made traditional medicines are easily available and economical for the cure from any kind of disease or illness. They think that modern medicines cannot cure some diseases like chickenpox, smallpox, mumps. Therefore, they worship goddess *Sitala* to protect them from these diseases.

6. CONCLUSION

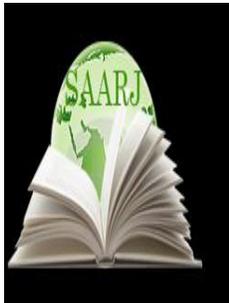

In-depth analysis of the present study findings reflected the fact that elderly Lodha women are more prone to be affected by economic, physical and as well as psychological problems. Sources of livelihood, ignorance and lack of health consciousness make these people more prone to increase illness. Even though they do not get government facilities, they are living their life as themselves. Sometimes they go to the local hospital for treatment, and sometimes they apply for traditional medicine as their knowledge. The problems of aged women are unavoidable. But the quality of life can be enhanced by their inner will and active involvement by the local governmental administration.

ACKNOWLEDGEMENT

I express my heartfelt thanks to all the respondents of Jhargram and Nayagram block of Jhargram district and other villagers of the studied areas for providing us valuable information.

PREPARING STUDENTS FOR PROFESSIONAL ACTIVITIES BASED ON A COMPETENCY APPROACH

Yankina Rano Sadykovna*

*Associate Professor of General Pedagogy,
 Andijan State University,
 UZBEKISTAN

ABSTRACT

The article presents an investigation of the issue of proficient competence; a methodological premise of shaping proficient competence of college understudies as future teachers is set up. The pith of proficient competence is characterized. The structure has been tentatively demonstrated and created, the substance, criteria and levels of proficient competence have been characterized. The adequacy of the distinguished methodological premise of proficient preparing that gives the shaping of proficient competence of understudies. A methodological show of shaping of proficient competence of college understudies as future instructors has been hypothetically demonstrated, for all intents and purposes created and tentatively approbated.

KEYWORDS: *Methods, Professional Competence, Students, Forming, Methodological Basis, Professional Competence of Students as Future Teachers, Forming Of Professional Competence.*

INTRODUCTION

According to the priorities of state youth policy and modernization of education, the development and improvement of forms of student youth participation in social, political, economic and cultural life of the country, is a particularly relevant task at the present' stage of development of Uzbek society, characterized by the transition to a democratic and lawful state, the need to overcome the danger of lagging behind the country from the world trends in economic and social development.

The factors of value changes are the practice of life, traditions of social value consciousness, elements of cultural borrowing, which have become quite widespread in recent times. Under these conditions, the cultural socialization of the individual as a way of transferring and preserving the values of society, the possibility to integrate young people into society, the establishment of dialogic interaction between the bearers of different values acquires primary

importance. Students, youth as a special socio-demographic group¹ is the most sensitive to the changes taking place in society. The years of studentship is an independent' stage of human life, during which he has and forms his own environment of development, and participates in such activities, which today act as personality-forming factors and determine the model of social behavior of this social group. A new generation of young people with higher education who rely, first and foremost, on their own strength when building their vision of future life is entering the arena of life.

It is within the university self-governance system that a student finds himself or herself in an environment which is not only close to pedagogical activities, but rather to creative, innovative activities modeling in three basic respects the reorganization and transformation of the educational process and the entire social environment of education at one's own university.

It should be about a more perfect and responsive to modern conditions and requirements of the educational process in which self-government, based on the principles of democracy, humanism, continuity, -cooperation, cultural appropriateness, takes a leading reasonable place in this process. It is especially important to realize it in pedagogical educational institutions that train teachers, because the teacher needs to perfectly know the organizational skills and abilities, to be a carrier of ideas, to be able to support and develop students' initiative, to promote their independence; free choice and- professionally lead children's public organizations, to provide practical assistance in their formation and development.

However, the organizational-pedagogical functions required by the changing conditions of modern society have not been adequately reflected in the professiograms used by universities to prepare specialists for pedagogical activities at university departments, and the goals of teacher training for work in the modern rapidly changing system of general (secondary) education have not been incorporated. There are still unresolved contradictions between: modern requirements for innovative professional pedagogical activity of a student and insufficient activity of university structural divisions in preparation for such activity; potential desire of young people studying at university for professional self-realization and satisfaction of this need on the basis of student self-government; objective need of modern education practice for innovative organizational and managerial activity of young specialists.

In view of these contradictions we made the choice of the topic of the present study, the problem of which is formulated as follows: what are the pedagogical conditions that ensure the effectiveness of students' self-management activity as a means of their preparation for professional activity? The solution of this problem is the purpose of our research.

The leading idea of the research lies in the predominant implementation of the integrative approach in training students of pedagogical higher education institution on the basis of student self-government, which involves the formation of their special competences: cognitive, diagnostic, design, creative, communicative, organizational and reflexive, which contributes to the development of activity, independence, creativity and responsibility of students.

METHODS

To solve the set tasks and verify the hypothesis a complex of methods was used: the analysis of philosophical, socio-pedagogical; psychological;, literature on the problem of research;, analysis of regulatory documents on the organization of self-management activity; observation,

interviews, questioning, testing, modeling; educational experiment; methods of mathematical and statistical processing; qualitative, and quantitative analysis of the data of the educational experiment.

The author's concept of educational activity of a pedagogical university, the program of student self-government organization can provide quality preparation of students for further professional activity. The developed collection of normative documents on the organization of educational work in a pedagogical university makes a certain contribution to the further development of the content and structure, student self-government* as a condition of professional training of students in the modern system of education: Diagnostic methods and sociological studies presented in the thesis are successfully implemented in the preparation of student teachers for practical activities.

Reliability and validity of the obtained results and conclusions are ensured by using holistic, systemic, activity-based, personality-oriented, competence-based, environmental, axiological approaches; combination of theoretical and empirical methods* of research adequate to their subject; analysis, real pedagogical practice and innovation apparatus; versatile approbation and implementation of research results in practice; level of student readiness for professional activity based on student.

Currently, there is a need to restructure the existing system of professional and pedagogical training of a future teacher taking into account the need to implement multifunctional organizational and pedagogical activity within the framework of professional work. This requires directing the whole pedagogical training not only at the study of individual subjects, but also at the formation of readiness for integral professional activity.

1. The notion of "preparing students of pedagogical university for professional activity on the basis of student self-government" is clarified, which is considered as a process of professional practical training aimed at developing competencies that contribute to manifestation of leadership . qualities, organizational independence, activity and creativity of students; a set of provisions and ideas of integrative approach that constitute the theoretical and methodological basis for forming students' professional competence on

2. The model of students' professional competence training in a pedagogical university on the basis of student self-management is substantiated from the position of interrelation of goals, objectives, approaches, principles, components, content areas, subjects, stages, criteria, indicators, levels and expected results.

The structure and content of pedagogical university students' training in the process of preparation for professional activity on the basis of student self-governance in higher education institution are substantiated and tested.

The criteria, indicators and levels of students' preparation of pedagogical university for professional activity on the basis of student self-governance - in university conditions are determined:

- Motivational-valuable, including indicators: the focus on educational and research pedagogical activity; independence in goal-setting and its achievement; the idea of themselves as a professional;

- Subject-activity, containing the indicators: communicative and intellectual competence; project-organizer competence; orientation to the creation of the environment, contributing to the establishment of dialogic relations between the subjects in the process of student self-government; the need for creativity;

- professional and personal, evaluated by the following indicators: constant striving for professional perfection; striving for creating conditions for personal self-development and working out an individual style; possession of pedagogical reflection and perfection of the mastery, in the process of student self-government; levels set: low, average, high.

5. Theoretically" and experimentally substantiated. Pedagogical conditions (external and internal)^ ensuring students' training efficiency in pedagogical higher education institution for professional activities on the basis of student government: external: creating conditions for effective training of students to organize pedagogical activities on the basis of using the opportunities of student life self-organization; organization^ of student government^ in the dormitory and conducting activities under the work plan of the dormitory student council; student participation in: scientific meetings with representatives of state, socio-political and administrative structures of the city, district, region, national diasporas; holding ecological events, mass health-improving physical and sports events, organizing leisure time of students, etc.-; internal: model justification of student government organization, educational work plans for faculties, internal university integration, ensuring a systematic scientific-theoretical and applied competencies of students, as well as their personal development.

6. In the course of the study, educational and methodological support for the preparation of students of pedagogical university for professional activity on the basis of student self-government (the concept of educational activity; methodological guide for the organization of student self-government in the university; collection of normative documents; course program "Organization of work to develop self-government") was developed.

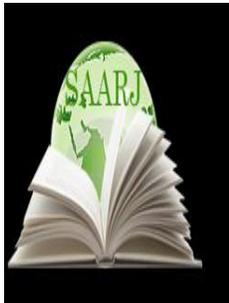

CONCLUSION

Thus, the results of the pedagogical experiment in general confirmed the hypothesis put forward, the set tasks have been solved. The conducted research allowed us to formulate the positional questions, the solution of which would contribute to the improvement of self-management activity as a means of preparing a future teacher at the university. The topic of our research is extensive, we did not claim to solve it completely. In our opinion, further research requires the following issues: justification of youth self-government in educational institutions of various types in the conditions of continuous education; formation of students of primary and secondary vocational education a culture of self-government activity; methodological support of the educational process and training of pedagogical staff of these institutions to implement self-government activity in study groups.

THE ROLE OF ECO-CULTURE IN THE DEVELOPMENT OF HISTORICAL AND RELIGIOUS VALUES

Karomov Shavkat Anvarogli*

*2nd year of Master Degree,
 Karshi State University,
 UZBEKISTAN

ABSTRACT

The article gives brief information about the role and tasks of ecological culture in the development of historical and religious values, the importance of integration and differences between other religions. On the second hand, the functional harmonization of the divine and scientific truths within the framework of the common goal only helps to maximally solve the problems of the ecological environment. Religious values are becoming an integral historical companion of human life, an attribute of social reality, as a distinctive form of spiritual values, also of varying importance in modern societies.

KEYWORDS: *Ecological Norm, Ecological Culture, Religious Values, Ecological Value, Ecological Problems, Natural Need, Universal Values, Cultural Traditions, Ecological Content.*

INTRODUCTION

In every historical period, as there are specific ecological norms in any society, in turn, they are dynamically changing, that is, as production grows developed today, when social life is complicated, the ecological culture of the individual also changes historically, constantly in proportion to them. However, a certain static state is also characteristic of the individual's ecological culture. That is, no matter how different societies, cultures, religious confessions are, but at the same time it can not be denied that there are also general parameters in the activity of mankind aimed at preserving nature. Otherwise, ecological culture would be an abstract of Infinity. In other words, no matter how complex the structure and shape of the individual's ecological culture is, it is necessary to recognize its static "core", its "rational core", as well.

Therefore, in the history of mankind, it is possible to determine the development of ecological culture of a person on the basis of certain static and dynamic laws through material needs,

spiritual forces, methods of production. In the system of ecological cultural factors, religious values play a special role.

For example, the features of ecological culture of the ancient Turanian peoples, the ecological values of the countries where the religion of Zoroastrianism was spread, have been preserved so far in the minds of our people. Preserving the four elements of nature with pride (fire, air, water and soil), reverence, incontinence deeply absorbed into our living culture. According to it, such values as the care of the earth, saving water and preventing pollution, the preservation of the flora and fauna, as well as non-cultivation of plants and crops, the care of seeds, crops, gardens, teaching of the land to children have become a tradition, spiritual value of our people from the ancient past [1;198-199]. Religious values are becoming an integral historical companion of human life, an attribute of social reality, as a distinctive form of spiritual values, also of varying importance in modern societies. In this regard, the role of religious values in the formation of an ecological culture of a person is one of the topical, scientific issues.

In the place, religious values also develop at every stage of socio-historical development – “self-constantly creating”, “exploring”, otherwise it will inevitably become a historical anachronism. Religious values, as indicated above, in a broad sense, cover such axiological processes as the creation, improvement (“value creativity”) of ideological-divine values for a person and acceptance (value acquiring) by an individual. Moreover, its role and level in the formation of an ecological culture of a person does not mean that religious values do not necessarily play a role in social life, although they are constantly changing in different historical periods, depending on the complex character combinations of factors of different objects and subjects. If, in Western Europe, Catholicism in the Middle Ages, scholasticism established strict control in all spheres of social life, then M. Luther and J. Calvin's reformation, religion began to lose its dominant role in the society, in the axiosphere, especially in the influence of the trends of the object from the era of enlightenment in the XVIII century (and some Eastern countries, where modernized, from the XX century).

However, in modern societies, where religion and state are separated, and in the process of secularization in general, it is understandable that religious denominations take a clear constructive position on ecological issues, seeking to maintain their position in the system of spiritual culture by tolerating religious norms under the influence of democratic values. In this regard, even if the genesis of religious values is the product of the long-standing “yesterday's” social evolution, it still maintains its value as one of the effective instrumental tools for the optimization of the ecological reality of the individual and for the expression of ecological reality in religious concepts, values.

Abstract-theoretically, the role of religious values in the formation of the ecological culture of a person is manifested mainly in two directions:

1) local, regional and global complexity of ecological reality and in all directions; (therefore, even in a concrete confessional framework, the generality of their object is observed when the ecological content of the species of religious value is compared to each other).

2) in connection with the sensitive-emotional perception of nature by an individual, the degree of awareness of the need, the need for the protection of nature of the methods of expression of the characteristics;

From the epistemological-psychological point of view, religious eco-values play an important role in the formation of a person's conscious attitude to the problems of natural existence, his personal position by influencing the psycho-emotional state of the individual, regardless of beliefs. That is, religious eco-values influence a person's activities through their enlightenment and psychological compensatory functions.

In a concrete historical approach, the system of spiritual and moral values, rituals, holidays, stereotypes of behavior are adapted (or recreate) in accordance with the norms of the process of the emergence of religion, the formation of stable structures, the creation of dogmas, the development of methods of practical influence on the thinking and activity of people, proceeding from their needs. Through this function, religion is directly integrated with cultural traditions, striving to carry out ideological control through its regularization.

Although, according to the general meaning, purpose and functions of ecological values inherent in different religions, they do not differ sharply, they also have their own peculiarities. Because, *first of all*, the ecological "burden" of various confessional values will be historically formed due to a certain reality and religious-cultural originality. *Secondly*, the perception of the problems of nature, society, mankind by different religious thought determines its significance to a different extent in its impact on the ecological culture of the individual. For example, in the western world at the present time, Christian values are relatively devaluated, but they are trying to fill this vacuum in the aksiosphere with all sorts of unconventional religions. *Thirdly*, depending on the methods of influence, the means of which are specific to each religious eco-values, the concrete character of the ecological culture of the individual is manifested. *Fourth*, the acceptance of religious eco-values, the motivation of activity is manifested by the state of the individual in the social stratification, its main character, worldview, the level of knowledge. *Fifth*, the ecological content expressed in religious values can be interpreted and perceived differently in different types of personality.

In addition, religious values generalize activity in the following directions, which are interrelated:

- ✚ *firstly*, any religious value is a complex product of religious consciousness and socio-historical processes, at the same time it is their factor.
- ✚ *Secondly*, in the current period, under pressure on the consciousness of the individual from various totalitarian sectors, religious extremist and fundamentalist ideologies, humanistic trends in the system of classical religious values are reacting to them. That is, in religious confessions, which have historically fully recognized and accepted the rule of democratic principles, individual rights, conscience are recognized as real, which in this case gives life dynamism to the traditional religious values.
- ✚ *third*, in religious values, the natural need of man and society in relation to ecological culture is concretized, selected, accumulated, concentrated and transformed.
- ✚ *Fourth*, the religious segment in the ecological culture of the individual at the present time, where universal values predominate, does not exclude, but concretize its secular (neutral) character. Therefore, it is worthwhile to look at religious values as one of the foundations of ecological culture[2;220-222].

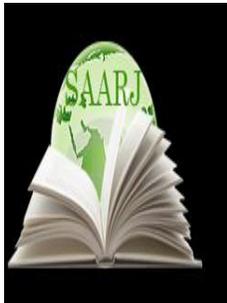

For this reason, world religions, in essence, differ little from each other, but in concrete-practical directions, religious values can not replace each other in terms of expression of their specificity

and beliefs. Because each of them is unique in time and space and reflect the problems of ecological reality in private precious orientations. Religious values play an important role in the individual's ability to express his or her feelings about nature, even though they are incredibly limited from a sociological point of view. That is, even if religious values can compete freely with science in the chapter of satisfying the needs of the emotional-spiritual and intellectual world of man, but it can not replace scientific values in the concrete-practical solution of ecological problems, of course. However, even with the complete recognition of the contrarguence of religion in relation to scientific knowledge, the extreme weakness of its evidence base, it is clear that these - the role of religious values in the mitigation of complex ecological problems through the real impact on the individual's eco-culture-can not be based even on Skepsis. But, no matter how subjective or illusory religious values are, it is an objective existent in the life of mankind, society.

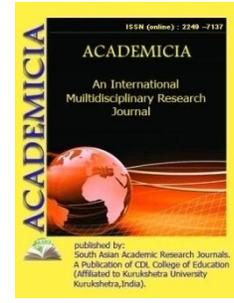

In conclusion, religious values differ from scientific knowledge in the formation of an individual's attitude towards nature. On the second hand, the functional harmonization of the divine and scientific truths within the framework of the common goal only helps to maximally solve the problems of the ecological environment. Therefore, both scientifically and pragmatically, it is not worthwhile to put religious values against secular values, especially science, in the formation of an ecological culture of a person. The activation of a subset that provides a solution to complex ecological problems is an exception to such strict dihotomies.

ABSTRACT

In this article in terms of social philosophy the essence and relationship of concepts of national interest and the international relations in the conditions of globalization of public life is investigated. And also, the social and philosophical analysis of essence of national interest as source of the international relations is considered. In article relationship of these concepts of public life and its impact on a condition of the interstate, international relations as important factor on ensuring social stability of society are proved dialectic.

KEYWORDS: *Globalization, Nation, National Interest, International Relation, Tolerance, National Development, National Conflict, Genocide.*

INTRODUCTION

As we observe the events taking place in the world's political arenas, we realize the need to think about their impact on the socio-political life of Uzbekistan and its socio-political consequences.

The problem studied in this article is the factor that has led to unprecedented conflicts and catastrophes in the history of mankind, resulting in the death of millions of innocent people - and this are the national interest and the relationship between different nations. The urgency of the issue is that this problem is mixed with political, economic, cultural and social relations, both within one country and between different countries.

National interests and interethnic relations have never been off the agenda in all periods of human history. Therefore, we found it necessary in this article to talk about a social phenomenon related to this topic.

The topic chosen as a research problem in the article is characterized by the fact that it is directly related to the socio-political life of all countries, in particular, Uzbekistan.

Today, the rise of ethnic nationalism and separatism, racism, racial discord, aggressive nationalism, chauvinism in some regions and countries of the world worries humanity, on the other hand, the idea of cosmopolitanism is growing in Western countries.

President of the Republic of Uzbekistan Shavkat Mirziyoyev also spoke about national relations in his speeches at the 72nd and 75th sessions of the UN General Assembly. In particular, "Currently, radical changes are taking place in the Central Asian region. We have managed to create an atmosphere of good neighborliness and mutual trust, friendship and respect between the countries of the region. "[1].

Proponents of cosmopolitanism argue that national and racial differences are rooted in the fact that citizens belong to certain states, and propose the theory of "world citizenship" as the main way to eliminate this and ensure peace for humanity. [6.47]. This idea is often expressed in sync with today's globalization processes.

The growing power of the idea of cosmopolitanism, the growing development of information processes in the unification of people under it, the fact that any information is delivered in seconds to any corner of the world, ensures that people are aware of any culture. It is obvious that under the influence of cosmopolitan ideas, the notion that "where it is comfortable and good for a person to live, it is your homeland" is spreading around the world, especially among those looking for work abroad. [6.48] This, in turn, leads a person to renounce feelings of patriotism, national pride, national culture and national traditions.

Today, in ensuring security and stability, first of all, ensuring interethnic harmony in the Central Asian region is of paramount importance. Ensuring interethnic peace in the region with a population of about 70 million people, the formation of good neighborly relations remain an issue of strategic importance for our country and government.

Indeed, in maintaining peace and tranquility in the region, in improving relations between the independent republics of Central Asia, the main attention is paid to strengthening good-neighborly relations, taking into account the national interests of neighboring countries. At present, Uzbekistan has a well-defined strategy in this regard.

The fifth direction of the Presidential Decree "On the Action Strategy for 2017-2021, which includes five priorities for further development of the Republic of Uzbekistan", adopted on February 7, 2017 includes the following: "Strengthening the independence and sovereignty of our state, aimed at ensuring security, interethnic harmony and religious tolerance, pursuing a well-thought-out, mutually beneficial and practical foreign policy, creating an environment of security, stability and good neighborliness around Uzbekistan, strengthening the country's international prestige" [3.], and these issues were set in accordance with our national benefits.

It is clear from the above-mentioned Presidential Decree that in Uzbekistan, even in the current period of radical democratic reforms, national interests and interethnic relations remain one of the priorities of state policy.

The head of our state stressed that "I consider it my priority to preserve and strengthen the harmony of nations and citizens, mutual respect and kindness prevailing in our country. At present, more than 130 nationalities and ethnic groups live in harmony in our country ... We will focus on further development of mutual friendship and solidarity in our society, ensuring equal rights for all citizens, regardless of nationality, religion or creed" [2.].

National interests are "a system that defines the life of a nation, a system of aspirations related to the preservation of social, economic, political and cultural relations, national needs, national consciousness and thinking, traditions and values." [5. 194.]

As each nation pursues its own interests, it first and foremost possesses material goods as well as spiritual riches.

National interests include, first of all, factors related to the fate, life and death, development of each nation. These include, first of all, the right of the nation to self-determination, the right to national statehood, opportunities for economic prosperity, cultural, national language, religious freedom, and the full expression of national values.

At present, the first and leading aspect of the 193 sovereign states of the UN is its national sovereignty. Mutually beneficial cooperation in international relations is possible only on the basis of the above factors. Otherwise, various contradictions arise in national relations.

It is well known that the national composition of most states is made up of one or more specific nations. In Uzbekistan, more than 130 nationalities and ethnic groups live in harmony. The peaceful coexistence of many nations living in one country, in turn, is an important factor in the socio-political stability and prosperity of this country. Indeed, the incompatibility of national interests, in turn, leads to national conflicts, contradictions and conflicts, and even bloody wars. As a result, on the ground where such events take place, national pride grows destruction and suffering increase. We can cite many examples from history to our opinion, such as the ongoing ethnic conflicts in Afghanistan (for about 40 years), the bloody events between Azerbaijanis and Armenians in Azerbaijan and Karabakh (the armed conflict between the two countries, which resumed in the 1990s and September 28, 2020, continues up to these days), the bloody clashes between Uzbeks and Kyrgyz (the bloody clashes of the 1990s and 2010s), the events in Fergana (1989) - the bloody clashes between Uzbeks and Meskhetian Turks are good examples. Such events have taken place in many parts of the world: in many countries, such as Africa, Asia, Europe and America, and are still going on.

The most important issue is to prevent conflicts between nations and ethnic groups in a particular region and country, to avoid making mistakes in the national issue. The interests and relations of different nations, in the history of mankind and even today, unfortunately, the interests of some nations have been trampled, and even their destruction - genocide (Greek *genos* - Latin *caedere* - means to kill, exterminate), has led to and continues to have disastrous consequences. As an example, in our opinion, the genocide committed by the Ottomans against the Armenian people in Turkey in the early twentieth century led to the extermination of more than one million Armenians. During World War II, more than 70 million people were killed as a result of the

genocidal policies pursued by German fascism against many peoples, especially Jews, Russians, French, Polish, and even their own people. Between 1975 and 1979, more than 3 million Cambodians were massacred in the state of Cambodia by fascist militias led by Pol Pot and Yeng Sari. Even during the Soviet era, which was based on the former dictatorial regime, the genocide wiped out millions of innocent people, many mass repressions against different peoples, nations. Even today, in some countries, genocide is an act against a certain people, a nation.

The escalation of military conflicts in different regions of the globe, between different peoples, nations - is a serious threat to humanity. In the Middle East, wars in Syria, Iraq, Yemen, South Sudan, Sahel, Afghanistan and elsewhere, in 2017 (Myanmar (formerly Burma)) have resulted in the shedding of innocent blood and the destruction of towns and villages.

The growing number of refugees in the world today is proof of our opinion. According to the UN, the number of refugees worldwide now exceeds 66 million. They are mainly from Afghanistan, Syria, Iraq, South Sudan and Myanmar. In Myanmar alone, the number of refugees fleeing the country to Bangladesh has exceeded one million.

Addressing the 72nd session of the United Nations General Assembly in New York on September 19-25, 2017, President Shavkat Mirziyoyev called on the United Nations to work for peace and security, development, human rights, especially the rights of young people, the sacred values of Islam, and made important suggestions and recommendations for the analysis of current problems and their solutions, such as the role and place in the spiritual development of mankind.

On this issue, President Shavkat Mirziyoyev proposed to adopt a special resolution of the United Nations General Assembly to support the efforts of Central Asian states to ensure security and strengthen regional cooperation.

Many issues related to this issue of strategic importance. A high-level international conference was held in Samarkand on November 10-11, 2017 under the auspices of the United Nations under the topic of "Central Asia: Common History and Common Future, Cooperation for Sustainable Development and Progress" which discussed fundamental issues of interethnic relations in the region.

The social significance of this international conference is that the five independent states of Central Asia and the more than 70 million people living in the region have the same past, destiny, future and take all necessary measures for their coexistence - an important basis for stability and development in the region. On the other hand, the establishment of harmonious, friendly and mutually beneficial relations with neighboring countries will serve as an important factor for their further development and prosperity in all respects.

The decree "On measures to further improve interethnic relations and friendly relations with foreign countries" of President Sh.M.Mirziyoev, issued on May 19, 2017, serves to ensure peace and tranquility in our multinational country, as well as to develop comprehensive relations with countries near and far.

In accordance with this decree, the following tasks have been identified for the gradual implementation of state policy aimed at the harmonization of citizens living in a multi-ethnic Uzbekistan, ensuring peace and harmony among different nationalities, strengthening the sense

of a multi-ethnic family in the minds of our compatriots, comprehensive support and further development of national cultural centers and friendship societies, expanding cultural and educational ties with foreign countries, achievements in various fields and the promotion of its essence, as well as the effective coordination of work and measures in this direction:

- Effective coordination of work on the establishment of friendly international relations, the development of mutually beneficial cooperation, strengthening friendship with civil society of foreign countries, including our compatriots living abroad;
- Ensuring the interaction and cooperation of government agencies with national cultural centers and friendship societies located on the territory of the republic;
- Assistance in the preservation and development of specific national traditions and customs of different nationalities and ethnic groups living in our country;
- Promoting in foreign countries the goals and objectives of Uzbekistan in building a peaceful policy of our state, a democratic state governed by the rule of law, a strong civil society, as well as the achievements in all spheres of life today;
- Assistance and direct participation in the organization of research work aimed at further development and harmonization of interethnic relations and friendly relations with foreign countries [4].

This decree will serve as an important factor in strengthening peace and stability not only in our country, but also in the region, and further enhancing the image of our country in the international arena in today's dangerous period.

At present, there are 138 national cultural centers in the country, the Council of Societies of Friendship and Cultural-Enlightenment Relations with Foreign Countries, 34 Friendship Societies - the preservation of history, culture, cultural values, traditions and customs of all nations and peoples in Uzbekistan. It is playing an important role in the development of comprehensiveness, harmonization of interethnic relations, ensuring the stability of society and the state.

Education in educational institutions of the country is conducted in 7 languages, TV and radio programs and broadcasts are broadcast in 12 languages, newspapers and magazines are published in more than 10 languages [6]. In our country, the harmony of national interests and relations is practically ensured.

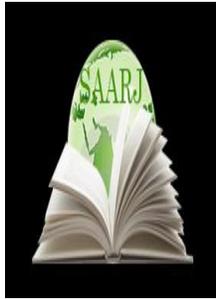

The following conclusions can be drawn from the views and comments set out above.

1. From a social and philosophical point of view, any form of interethnic relations is based on certain national interests.
2. Positive changes in national relations will take place only if national interests are fully ensured, both at the national level and in international relations. Otherwise, disagreements, contradictions, conflicts in national relations will escalate.
3. Interethnic relations based on mutual equality and mutual benefit ensures the realization of national interests. This, in turn, has a significant impact on the social uplift of society.

4. At present, the domestic and foreign policy based on the "Strategy of Action" pursued in our country serves to ensure security and stability in Central Asia, increase mutual political trust with neighboring countries and further enhance interethnic relations in the region.

ABSTRACT

The article analyzes the processes of development of visiting tourism in Uzbekistan, the factors affecting it and the conditions, gives an idea of the problems related to this sphere and their solutions. Today, a lot of attention is paid to the development of pilgrimage tourism in Uzbekistan, tourist routes for pilgrimage tourism are being developed, the necessary infrastructure for providing services to tourists is being formed, attention is being paid to the issue of Personnel Training. The article provides information on the attitude to different religions in the conditions of the policy of tolerance of religion in Uzbekistan and objects of pilgrimage tourism belonging to these religions, various problems and solutions related to this sphere.

KEYWORDS: *Development Of The Program "Small Crossroads" Consisting Of National Tourism, Visiting Tourism, Tourist Routes, Holy Shrines And Monuments, Pilgrim Visa, Ecscursion-Educational And Religious Tourism, The First International Forum On Pilgrimage Tourism, Visa Procedures, Airport, Conditions For Performing Prayer Activities In Hotels, Holy Shrines And Pilgrims, Holy Shrines And Pilgrims Of The Islamic Religion In Uzbekistan, Monuments And Monuments Of Other Religions In Uzbekistan.*

1. INTRODUCTION:

Today, large-scale reforms are carried out in all spheres of public life in Uzbekistan, and the main goal of these reforms is an indicator of further development of the country's economy and improvement of the welfare of our people. Tourism is important in the economic development and growth of Uzbekistan, and in the following years, along with other spheres of Tourism, great attention is paid to the development of pilgrimage tourism in our country.

At present, one of the promising sectors that will bring a high income to the national economy is National Tourism, says the president of Uzbekistan ShavkatMirziyoyev, – Uzbekistan is a state with great potential in the field of Tourism. There are more than 7 thousand 300 objects of cultural heritage in our country and most of them are included in the UNESCO list. At the same time, it is possible to open new tourist destinations, taking advantage of the unique nature of our country, the possibilities of beautiful recreation zones. With the active involvement of world brands in this sector, we should pay special attention to the development of tourism, environmental, educational, ethnographic, gastronomic, tourism and other sectors of this sector. In this regard, we should take into account that the application of public-private partnership relations opens wide opportunities for the development of the industry. It is necessary to develop and accelerate the program "Small Hajj", which consists of visiting holy shrines and monuments in Samarkand, Bukhara, Tashkent. It is also necessary to fully launch large-scale opportunities in the field of internal tourism .[1.128-129]

The contribution of the scholars of our homeland to the prosperity of the Islamic religion and science, their scientific and spiritual heritage, their role in the formation of the Islamic civilization of the Central Asian territory, the rich history and hospitality of our people will be the basis for the development of visiting tourism in our country. Famous pilgrims like ismailniyniy, Tsar Bakr, ChashmaiAyub, Shahizinda, Ruhabad, Imam Al-Bukhari, BahouddinNaqshband, Güri Amir, KhojaAhrur, Pahlavon Mahmud, Hazrati Imam, Zangi father, Sultan Saadat, Hakim at-Termiziy are proof of our opinion. There are some world-famous places of pilgrimage and pilgrimage in our country, the visit of which is equated with the small pilgrimage of Islam. In particular, the visit to the grave of Qusamibn Abbas in Samarkand in Central Asia is equated with the visit of Kaaba . [2. 34] mobile applications on holy shrines and pilgrims have been developed in Uzbekistan for the purpose of creating convenience for pilgrims.

Specific proposals for the development of pilgrimage tourism in Uzbekistan are being developed, and attention is being paid to the issue of informing the world community about the possibilities of visiting tourism of the Republic. Great attention is paid to the development of a new tourism brand in Uzbekistan, creation of all necessary conditions for visitors, improvement of existing tourist routes taking into account the requirements of visitors.

2. MATERIALS AND METHODS:

The main goal of the development of pilgrimage tourism in Uzbekistan is to increase the country's tourist potential and achieve international recognition of Uzbekistan as one of the Centers of pilgrimage tourism in the Islamic world. Pilgrimage tourism, that is, visiting holy places, involves two main directions, these are an expression from ecclesiastical-educational and religious tourism. One of the most valuable samples of the Islamic world, which is the basis for the development of pilgrimage tourism in Uzbekistan, is the Khazh Imam complex, where the Book of the Qur'an is preserved, the mausoleum of the great Islamic imam Muhammad Al – Bukhari, the graves of followers of the Naqshbandiya sect and many other religious centers are located, and According to the Decree No. 5611 of the president, starting from 5 January 2019, a Pilgrim visa was introduced to foreign citizens visiting Uzbekistan to study the cultural, historical and religious-spiritual heritage and traditions of Uzbekistan for a period of up to 2 months. For the smooth movement of tourists in Uzbekistan, the government has granted visa freedom to a number of countries – Azerbaijan, Tajikistan, Kyrgyzstan, the United Arab Emirates, Malaysia, Indonesia, Brunei, Turkey and other countries that make up the main population of Muslims. In addition, a special information Portal has been launched in Uzbekistan since 2018, which in several languages

is targeted at the transfer of information about visas, rights of residents, registration and tax mechanism in the country.

The number of tourists coming from Turkey, Pakistan, Malaysia, Iran, Indonesia, the United Arab Emirates and other countries has increased in the direction of visiting Uzbekistan. In May 2019 in Samarkand was held an international scientific and practical conference on the theme "renaissance of pilgrimage tourism in the Great Silk Road resort".

The religious shrines themselves are not enough for pilgrimage tourism. In order to attract tourists, promotional work should be well established, a favorable visa regime, conditions for the performance of worship activities at the airport, hotels.

In Bukhara, there are the churchyard of Tsar Bakr, prayer hall, Sayfiddin Baharzi, Kalon, Magogi Attari, piri dastgir, Khoja Ismat machites, as well as many holy places of pilgrimage and shrines. Imam Al-Bukhari shrine, "seven pirs" before going on pilgrimage and pilgrimage to Mecca and Medina, 1. Abduhalik Ghijduvani, called the world Master; 2. Among the people, Khoja Muhammed Orif Ar revgari called "Khoja Orif Mohitabon"; 3. Khoja Mahmud fig fag'nawi; Khoja Ali Romitani, whose name among the people is "Khoja Azizon"; 5. Haja Muhammad Father Samasiy; 6. Said Mir Gulal; 7. Khazrat Bahouddin Naqshbandiy, known among the people as "the Great Khoja", "the Sultan of Saints".

On February 21-23, 2019 in Bukhara, the first international forum on pilgrimage tourism, it was noted that Uzbekistan has been an integral part of world civilization for centuries, one of the Centers of Islamic culture. Such great scholars as Imam Al-Bukhari, Imam at-Termiziy, Abu Mansur Moturidiy, Abdulkhaliq Ghijduvani, Bahouddin Naqshband, Burkhoniddin Marginani, Muhammad Khorezmi, Ahmad Fargani, Abu Nasr Forabi, Abu Rayhon Beruni, Abu Ali Ibn Sina, Mahmoud Zamakhshari, Mirzo Ulugbek have left an indelible mark in the history of World Science. as a homeland of thinkers, attention was also paid to the fact that Uzbekistan is attracting tourists from all over the world as one of the important centers of Islamic Civilization. The first international forum on tourism of Uzbekistan was organized on the initiative of the president of Uzbekistan Shavkat Mirziyoyev, with the aim of increasing Uzbekistan's status in the international arena on tourism of visits. The organization of this event was carried out in cooperation with the state agency for the development of tourism, the Religious Affairs Department under the Cabinet of Ministers, the Muslim Office of Uzbekistan, the charitable foundation "Foundation", the Ministry of Foreign Affairs, the khokimiyat of Bukhara region, ISESCO (Islamic Organization for Education, Science and culture) and UNWTO (Butunjahan Tourist Organization). Within the framework of the international forum, the Bukhara declaration on recognition of Uzbekistan as one of the visiting tourism centers was signed.

Tourism in our country is often limited within the framework of our ancient cities, historical and cultural monuments, -said President Shavkat Mirziyoyev, while there is a great potential for the development of tourism in the unique nature of our country, national reserves, mountainous areas. In particular, the development of medical tourism, visiting tourism and ecotourism gives a great impetus not only to the economy, but also to the development of social spheres . [3.38]

3. Results:

In the IX-XII and XIV-XV centuries of the Eastern awakening period, Islamic sciences were developed in several directions on the territory of our country in the manner of scientific wisdom,

based on the knowledge of the word, the knowledge of narration, the knowledge of Monotheism, the knowledge of the faith, the knowledge of man with the help of the world .

The collection "Al-Jame'as-sahih", recognized as a reliable source of the collection of the hadiths of our Prophet Muhammad alaihissalom in the Islamic world, is the result of many years of selfless search for Imam Bukhari, who is the master of all the muhaddis, - said President Shavkat Mirziyoyev, - for the twelve centuries, this work remains the second reliable written source about the religion of Islam after It is not surprising that not only our country, but also thousands and millions of Muslims from other countries try to go to Bukhara Sharif, where this tabarruk breed was born and visit its grave in Samarkand.

Imam Bukhari, not only as a hadith scholar, but also as a great scholar, expressed valuable views on the existence and spiritual world of man. [4.143]

Founded by Abu Mansur Moturidi, a Samarkand thinker in the 10th century, who gained fame as Imam Al-huda (imam of the guidance path), the teaching of moturidi was widely spread throughout the Islamic world. The teaching of motoridia pays high attention to the role and importance of human intelligence on the basis of the idea of tolerance in the process of acquisition of knowledge. This, in turn, played an important role in the wide popularity of this doctrine. Even today, humanity is in great need of such ideas. In great history, nothing goes without a trace. It is preserved in the blood, historical memory of the peoples and manifested in their practical work. Therefore, it is also powerful. Preserving, studying and leaving the historical heritage from generation to generation is one of the most important priorities of the policy of our state .[5. 28-29]

There are many holy places and shrines for the development of pilgrimage tourism in Uzbekistan, in the Surkhandarya region there is a Khakim at-Termizi ensemble, the Tomb of Sultan Saadat, the Tomb of Abu Muhammad at-Termizi, the forty-girl fortress, the monument of fayoztepe Buddhist temple, zartepa, Dalvarzintepa, the old Termez, the monuments of Buddhism such as Karatepa, the Oqsaroy in the Kashkadarya region, dorutilovat ensemble, Shamsiddin Potter's Tomb, Dome sayidon, Kuk Dome Machiti, dorussaodat ensemble, Imam Ismail al-Bukhari, Mahdumi O'zam, Horn-Zinda ensemble in Samarkand region, Abu Mansur Muhammad ibn Muhammad Tomb, Imam Burkhaniddin Marginani Tomb, Khaji Abdu Darun Tomb, Khazrati Khizr machiti, Nuriddin Basir Tomb, Burkhaniddin Sagarjiy (Ruhabad) Tomb, Shepherd's father Tomb, Khoja Akhrur grave, Daniel Prophet (Holy Daniil) Tomb, religious pilgrims in Bukhara region Kalon machiti, Somoni shrine, Bolokhovuz machiti, Magoki Attori machiti, Habib Khavuz Ansanbli, Nadir Devon Begi Honaqasi, namazgah Machiti, chashmai Ayub Shrine, Fayzabad Khan, Khaji zaynuddin Machit-Khanaqasi, Khazrati bahouddin Nakshbandi shrine, abdukhalik gijduvani shrine, Religious monuments of Khorezm region are Said Alovuddin mausoleum, Juma machiti, pahlavon Mahmud mausoleum, Mukhtar Vali mausoleum and others [6. 76] places of pilgrimage are of great importance as sacred places, which embody the national values of each nation, and in Jizzakh region, sa'd ibn Abu Waqqas, Parpi Baba, Khujamushkent Baba, Rod Baba, teenage father, Said Mir Khalilullah Baba, Khujabagbun Baba, jondahar Baba, blue eldest father, Khujai Sarab Baba, Khoja Shahimardon Sherdor, Sayyid Burkhiddin Kılıç, Khoja Kahhor Vali, Chukhmozor father, sayfin father, archamozor father, chubby father, Tiger father, ladder father, Locksmith father, Changovul grandfather, Fortychilton, crustacean, sand father, grandfather, beshbulak father, Pilgrims like Hadrat Zaynulobidin are national-cultural monuments of the Uzbek people as rare examples of folk architecture . [7. 39]

The center of Islamic civilization of Uzbekistan, the International Islamic Academy, the Mir Arab High School, the international research centers of Imam Bukhari and Imam Termizi serve to study and promote the rich scientific and historical heritage of Uzbekistan. In order to develop visiting tourism in Uzbekistan, to increase its attractiveness, it is necessary first of all to draw up a tourist map of the holy shrines in Uzbekistan, to create favorable conditions for visitors, to conduct propaganda work well, to improve the service of the transport system, to pay attention to the issue of preparation of gid-translators.

A number of measures have been taken to increase the attractiveness of Uzbekistan in the direction of visiting tourism, according to the decree of the president of Uzbekistan Shavkat Mirziyoyev № 5611, from January 5, 2019, foreign citizens visiting to study the cultural, historical and religious-spiritual heritage and traditions of Uzbekistan have been granted a Pilgrim visa for a period of Since 2018, work has been carried out on the implementation of the halal standard in the catering establishments and restaurants of Uzbekistan, and since February 2018 the state standard of ISO 22000 and halal food products general guide "Oz DSt 3286:2018 has been officially introduced. A new state standard by the State Unitary Enterprise "Center for certification of tourist services" of the state agency for the development of Tourism of the Republic of Uzbekistan – its own DSt 3220:2017 "tourist services. Placement tools. General requirements " have been developed and since 2018 Year 1 January has been established that each hotel must have religious books, including Qur'an for Muslims and a place of worship (at least 10 percent of the rooms) and a sign indicating the direction of Mecca (qibla) (at least 30 percent of the rooms). At the same time, great attention was paid to the organization of prayers and cleaning rooms at international airports, railway stations and hotels. Today, there are prayer rooms at the airports in 11 cities of Uzbekistan. Tourism in Uzbekistan, along with the introduction of a visa-free regime into 45 countries for the development of visiting tourism, the number of countries whose citizens can enter Uzbekistan without a visa reaches 64, the fact that citizens of 76 countries are able to obtain an electronic entry visa has also had a positive impact.

Decree of the president of the Republic of Uzbekistan "on measures to ensure the rapid development of the tourism sector of the Republic of Uzbekistan" dated December 2, 2016, as well as consistent with the consistent efforts to develop the tourism sector in Uzbekistan, the Office of Muslims of Uzbekistan today also made a worthy contribution to the development of visiting tourism and, it serves to create suitable conditions for visitors. Development of routes of visiting tourism and kengaytirishga great attention is paid to the development of visiting tourism in Uzbekistan. The Tourist Route "7 pir" in Bukhara, the role and importance of shrines and pilgrims such as Imam al-Bukhari, Shahizinda, Khoja Ahrori Vali, Mahdumi Uzham, Abu Mansur Moturidi, Khoja Iskhak Vali, Khoja Doniyal, Sheikh Burkhoniddin Sagarjiy, Khoja Abdu Darun and Khoja Abdu Berun in the development of tourism has increased, the improvement, restoration, repair of these places, tourists a lot of attention is paid to the issue of the formation of appropriate infrastructure. But at the same time, there are problems that are hindering the development of tourism in Uzbekistan, such problems are caused by the fact that the roads leading to certain places of pilgrimage are being repaired, problems in the supply of gas and water. The fact that the pilgrims are fully integrated with modern information and communication technologies, shortcomings in the provision of electronic systems and interactive services are the most important tasks that must be performed today. Not only does one part of the pilgrims have their own website page, Wi-Fi area, traffic signs leading to the facilities and a video surveillance system, it will also be necessary to

carry out a number of works in this area. One of the important issues is the further improvement of gid-exorcism service in the objects of pilgrimage tourism. In the Republic there are many orthodox, Catholic and protestant churches, temples of Judaism, Buddhism, there are opportunities to use these temples as an object of pilgrimage tourism.

In the field of pilgrimage tourism, great attention is paid not only to the holy shrines in Uzbekistan itself, but also to the organization of tourist routes connecting holy shrines and pilgrims in the countries of the army with each other. Opening of the tourist route from Uzbekistan to the mausoleum of "Hazrati Sultan", which is located in Turkistan, south of Uzbekistan, namely Ahmad Yassavi, putting the means of transport on tourist routes, signing of state contracts and formation of necessary infrastructures are important tasks carried out in this area.

The development of tourism is also important in terms of ensuring peace and stability in Uzbekistan, beautification of certain regions, employment of its population. Today, representatives of religion other than Islam carry out their trips to Uzbekistan within the framework of visiting tourism. In the south of Uzbekistan in the Surkhandarya region there are such monuments as Fayoztepa, Karatepa, Ayritom, Dalvarzintera, which are associated with the Buddhist religion, and now tourists from Japan, Korea, China are paying great attention to the monuments and temples of Buddhism located here. At the same time, there are holy shrines in Uzbekistan, such as khazz David and Khaz Daniel pilgrims, who are revered in religions other than Islam, and these pilgrims contribute to the maintenance of peace and tolerance of the nation in Uzbekistan. In Samarkand, along with the Catholic, orthodox, protestant churches operating in the present time, in our history there are written sources and historical items indicating that the religion of qam, shamanism, fire worship, Christianity, Islam and other religions operate side by side on the basis of tolerance. The first Christian metropolis in Samarkand was founded in the 6th century and Christians played an important role in trade-economic and cultural relations between Sogdiana and Byzantium.

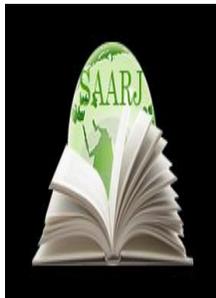

Many ceremonial items, ceramics and crosses were found in the Centers of the Christian religion in Samarkand. In Samarkand, after the entry of the Islamic religion into the country, in IX-XII centuries, there was not a single zardashtiylik temple, but Christian monasteries here continued their activities perfectly even in these periods . [8. 86]

4. CONCLUSION: The remains of the Christian monastery were found in Urgut District of Samarkand region, Uzbek scientist Amriddin Berdimurodov, French scientist Mishel Tardyu, who deals with the history of the Christian religion, French scientist F. When the grenees went and saw this monument, it turned out that Mishel Tardyu was surprised to see a picture of three crosses drawn on a rock near the monument, drawn on a stone. The crosses drawn on the rocks here are of two different looks, which are of two distinct groups of Christianity. From the rock on which the crosses were drawn, inscriptions were also found, which were studied by Mishel Tardyu and the Ukrainian scientist Alexei Savchenko. When the remains of the Christian monastery in urgut were opened in 1998 year in the village of Sufiyon and studied, the remains of a four-room building built of baked brick from here, the remains of various ceramics and glassware, magnificent bracelets made of silver were found. Scientists believe that this bracelet belongs to the X-XI centuries BC. Summarizing the above, we can say that Uzbekistan is one of the countries with a wide range of opportunities, rich historical material and spiritual heritage in the development of visiting tourism, the development of a map of tourist routes of these historical monuments, tourist facilities, the formation of the necessary infrastructure for providing services to tourists, the issue of preparation of GIDS in the

At the same time, citizens of many countries of the world use the territory of Uzbekistan as transit during their travels to other countries. Therefore, today it is of urgent importance to pay attention to the issues of further improvement of necessary infrastructure in the field of visiting tourism in Uzbekistan, attention to the promotion of existing facilities, further improvement of the service system, creative use of the achievements of Information Technologies.

SYSTEMAL APPROACH TO THE FORMATION OF FEELINGS OF HUMANITY IN PRIMARY SCHOOL

Talabova Dilrabo Tolibovna*

*Teacher of the Regional Center,
Public Education of Fergana Region Retraining of staff and improve their skills,
UZBEKISTAN

ABSTRACT

Although the teaching of primary school is not a very difficult situation, it is a very difficult process to form education in them. The school is an educational center, and our teachers must be able to inculcate education in the minds of students. This is one of the most important requirements, especially in the primary grades. The main task of the teacher is to awaken in the minds of primary school students a sense of humanity, patriotism and sincerity. This article discusses the systematic approaches to instilling a sense of patriotism in primary school.

KEYWORDS: *Teacher, Pupil, Elementary School, Pupil, Instructor, System, Approach, Patriotism, Sincerity, Education, Strategy, Formation.*

INTRODUCTION

Elementary school students are like little music that is stepping into life one by one, the school period is a time when they are just beginning to get an idea of life. During this period, every emotion, every thought formed in their hearts and minds is imprinted on their minds for a lifetime. From that moment on, they begin to imagine life in this way. Therefore, in such a period, the role of the teacher, along with parents, and, of course, peers is invaluable. At a time when Uzbekistan is moving towards a humane, democratic, legal state, the spiritual culture, which has realized its duty to the Motherland and the people, has become one of the main tasks of raising a high generation. At the same time, educating young people in the spirit of respect for the spiritual heritage, inculcating in them the moral and spiritual qualities, educating them in the spirit of loyalty to our traditions and historical heritage, the formation of human qualities has become the main and most pressing issue in today's society. As the first President IAKarimov said: "The development of high spiritual qualities in society, the formation of national ideology, the education of young people in the spirit of our rich cultural heritage, respect for our historical

traditions, universal values, love for the motherland are crucial for all reforms in our country factor.

The issue of morality and moral education has been a major topic in the sixty heritage of our people, as it is today. Because in any society, in any system, if the members of society are not morally mature individuals, the development of society will be in crisis. The development of any branch of scientific knowledge depends in many ways on how rich it is enriched by the legacy of the sixties. This fact is of particular importance for the science of pedagogy. While the current education system has the task of developing the child's personality, it is necessary to pay attention to the fact that the child's relationships with people are based on friendship, cooperation, compassion, kindness, humanity and respect. Therefore, it is important that in the child's personality, this quality is established from the earliest childhood, and in schools from the earliest grades. The problem of cultivating friendship, camaraderie, moral upbringing, different attitudes of the individual finds little expression. These relations are little reflected in the moral relations of the individual to work, society, life, parents, relatives, peers, and represent the spiritual world of man. Friendship, camaraderie as a moral quality is associated with the development of moral theory, and one of its important sources can be called the masterpieces of folk pedagogy.

Raising the younger generation is a multifaceted process. Priorities of education are physical and moral health of children; intellectual development; formation of personality culture and spiritual values; civic and patriotic education; aesthetic and labor education; formation of life plans of school students, preparation for family life, etc. Different forms of extracurricular educational work are used to perform pedagogical tasks: Patriotic education in extracurricular activities includes various forms:

- Class hour
- Parents' meeting
- Excursion
- Holiday
- Roundtable
- Competition, quiz, KVN
- Meeting interesting people and others.

The organization of children's extracurricular activities, including leisure, in any school has been and will remain a very important area of activity for teachers. Extracurricular activities for children, communicating with them in a more or less free environment are very necessary and often important for their development and learning. They are very important for the teacher himself as they help the children get to know each other better, get to know each other better and build good relationships, reveal personalities of teachers that are unexpected and attractive to students, and finally give them happy units, allows joint experiences, human intimacy, which is often the case. teacher and student friends for life. This makes the teacher feel the need for his work, its social significance and relevance. But an important form of education is the game. Young student games are simply aimed at imitating social forms of behavior. On the one hand, the biological nature of the child is manifested in the game, on the other - the readiness for social

adaptation. The game teaches behavioral norms from adult life, develops values for themselves. According to MB Elkonin, in the game the child enters the world of advanced forms of human activity, the rules of human relations, and the game remains a source of ethics. Educational methods are "the most common ways of solving educational problems and interacting in the field of education" or "adults and children who encourage children's lives, activities, attitudes, communication, activities and help regulate behavior. can be defined as "social methods of pedagogically compatible interaction between". .

It should also be noted that patriotic education in general education schools is the basis of music education. Although the program of music culture science presents Uzbek folk music in a certain order, in the content of each melody, national music is recommended melodies and songs about the homeland. That is why we need to teach songs about the Motherland in folklore, starting with folk music. His fiber and togri formation forms a feeling of love for the Motherland in music culture lessons and extracurricular activities by showing high examples (i.e. listening to musical works, singing songs about the Homeland, visiting historical monuments). The inculcation of patriotic feelings in the minds of our students begins with the family. This is a very difficult task that requires a lot of work. One of the main tasks of all parents, kindergarten teachers and school teachers today is to develop in children such qualities as devotion to the Fatherland, devotion through literature, music, fine arts.

Independent learning by students is important in nurturing and developing children's feelings and beliefs. Independently collect materials for reading additional literature, reviewing children's magazines, talking to family members, acquaintances, children for lessons, lesson hours, creative assignments, and research messages. A research paper by 14th graders on "My Family's Contribution to the Development of the City" describes the past and present of our city on the example of the family. Scientific works, various pictures, messages are used by children in educational and extracurricular activities.

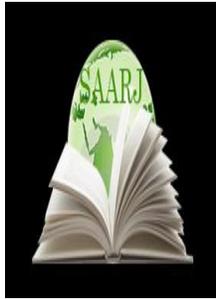

Targeted systematic work has shown that the achievements in cultivating a sense of civic patriotism, for students to get acquainted with the history of the city, region, country. recent years. The knowledge gained by students in lessons, excursions and extracurricular activities convinces children that they need to know the history of their region, preserve and protect nature, so that the population of our city, region and the whole country will live better. We need young students to work together to develop patriotism and a clear civic position - parents, teachers, school and the state. This process is complex, to implement it it is better to apply a systematic activity approach to the student rather than a knowledge-based approach that is the subject of the learning activity. It helps to shape and develop all types of universal learning movements: cognitive, regulatory, communicative, personal. All this can serve to form a sense of patriotism in primary education.

In conclusion, I would like to emphasize that first of all, a teacher should instill in himself a deep sense of patriotism, and only then to convey it to his students, to solve all problems, to keep pace with positive emotions. Then the teacher will be able to achieve the desired result, and will be able to combine education and upbringing.

UZBEKISTAN

ABSTRACT

The article describes the results of the study of the growth, development and yield of maize hybrids "Uzbekistan 601 ESB" and middle-maturing "Karasuv 350AMB" in the meadow soils of Samarkand region, depending on the sowing rate and bush thickness. The results of the study show that with the increase of sowing norms, the silage mass yield increases and the sowing rate (s) is 55 thousand seeds / ha. 350 AMB in medium-early hybrids, respectively 24.5; A silage mass yield of 39.2 t / ha was obtained. Data on feed unit consumption per hectare and amount of protein digested are also described.

KEYWORDS: "Uzbekistan 601 ESB", "Karasuv 350AMB", Corn, Hybrid, Grain, Silage, Yield, Soil, Mid-Ripening, Meadow, Soil, Feed Unit, Digestible Protein.

INTRODUCTION

Relevance of the topic. Cattle breeding is one of the leading branches of animal husbandry and plays an important role in providing the population with dairy and meat products. It is necessary to increase the number of dairy cows, create a solid fodder base to increase their milk productivity, give a special place to succulents in the diet, create a reserve of quality milk-driving juicy silage and root crops in the organization of feeding dairy cows with a full ration in autumn and winter.

Preparation of silage from corn is efficient, the yield of corn silage mass is high, as well as the amount of sugar that ensures the quality of silage is high. The minimum sugar content is important in ensuring that the pH environment, which is one of the main quality indicators of silage, is sufficient, and the environment required for quality silage is 4-4.2 pH as a result of the formation of lactic acid in the presence of lactic acid bacteria [5].

At present, various varieties and hybrids of corn are grown in farms specializing in animal husbandry as the main and secondary crop for grain, silage, green mass. Although the potential yield of hybrids included in the State Register of maize is 700-800 t / ha in the main crop and 350-400 t / ha in the secondary crop, the yield of corn hybrids sown for silage on most farms is 300-400 t / ha in the main crop and 200-250 t / ha in the secondary crop. e. One of the main reasons for low yields is the lack of optimal planting norms, bush thicknesses, taking into account the biological characteristics of hybrids and soil-climatic conditions of the region. Therefore, taking into account the biological characteristics of corn hybrids and soil-climatic conditions of the region, the optimal planting rate of hybrids for silage, determining the thickness of the bush is one of the most pressing issues in forage cultivation.

LITERATURE REVIEW

The norms of sowing of hybrids of corn and the effect of bush thickness on plant growth, development, grain and silage mass yield have been studied by foreign and domestic scientists in different soil climatic conditions. [1, 3, 7, 8] According to the literature, the growth and development of corn hybrids, silage mass yield, architectonics of varieties, moisture content of the plant, fertilization rate, growth period, quality of care vary [3,5,7].

RESEARCH METHODOLOGY

The experiments were conducted in the fields of the Training and Experimental Farm of the Samarkand Institute of Veterinary Medicine (former Samarkand Agricultural Institute) in 2016-2018. The object of the experiment is a hybrid of middle-aged "Uzbekistan 601 ESB" and middle-aged "Karasuv 350AMB" included in the State Register.

The soils of the experimental field are meadow, groundwater is located at a depth of 2.5-3.5 m. The agrochemical definition of the experimental field soils is as follows: the content of humus in the 0-25 cm layer of soil is 1.20%, gross nitrogen 0.12%, mobile nitrate nitrogen 18.5 mg / kg, phosphorus 0.21%, mobile R₂O₅–24.0 mg / kg, gross potassium - 1.64%, exchangeable potassium - 245 mg / kg. In the 25-50 cm deeper layers of the soil, the amount of mobile nitrate, phosphorus decreases, and the exchangeable potassium increases. The bulk density of the soil also increased [4].

Analysis of soil and plant samples was performed at the Department of Botany and the Central Research Laboratory of the Institute [2].

When setting up field experiments, the calculated surface area of the experimental pellets was 100 m², 4 repetitions. The ratio of the width to the length of the beads was maintained at a ratio of 1: 5-1: 10. The location of the furrows is placed perpendicular to the row, one- and two-tiered irrigation shaft ditches. The past tense is wheat. The object of the experiment is a hybrid of medium-ripe Uzbekistan 601 ESB and fast-ripening Karasuv 350 AMB. 1 generation hybrid seeds were used for sowing. In the experiment, seeds of medium-ripe Uzbekistan 601 ESB hybrids 55, 65, 75,85, 95, 105 thousand seeds per 1 hectare or 18.4,21.7,25.1,28.4, 31.8, 35.2 kg, fast-ripening Karasuv 350 AMB hybrids 55, 65, 75,85, 95 , 105 thousand seeds or 17.5, 20.7, 23.8, 27.0, 30.2, 33.4 kg were sown on 30 June. The sowing rate of varieties is different in terms of kg, the same in terms of grains is due to the fact that the mass of 1000 seeds is different [6]. In the experiments, soil moisture was maintained at not less than 70% of the limited field moisture capacity (CHDNS). Before planting, irrigation is carried out at the rate of 800 m³ per hectare. All

technological methods, except for the ones studied in the experiment, are carried out on the basis of the general agrotechnics accepted in the region. In the experiment, the yield of corn was determined by threshing the crop in all variants [2].

Analysis of research results. In our study, the average maturity of Uzbekistan 601 ESB hybrid was 18.4 kg or 55,000 seeds per hectare, 50.8 thousand grasses per hectare, 21.7 kg or 65,000 seeds, 59.5 thousand grasses per hectare, 25.1 kg or 75,000 seeds per hectare, 67.9 thousand grasses, 28.4 kg of seeds or 85 thousand seeds, 76.1 thousand pieces of grass, 31.8 kg of seeds or 95 thousand seeds, 84.6 thousand pieces of grass, 35.2 kg of seeds or 105 thousand seeds, 93.1 thousand pieces of grass. Karasuv 350 AMB hybrid 17.5kg of seeds per hectare or 50.5 thousand pieces of grass when 55,000 seeds are sown, 58.4 thousand pieces of grass when 20.7 kg or 65,000 seeds are planted, 66.9 thousand pieces of grass when 23.8 kg or 75,000 seeds are planted, 27.0 kg of seeds or 85.8 thousand seeds, 75.8 thousand grasses, 30.2 kg or 83 thousand seeds, 83.8 thousand grasses, 33.4 kg or 105 thousand seeds, 92.2 thousand grasses. Fertility of seeds in the field varied from 92.3 to 88.7% with an increase in the sowing rate from 55,000 to 105,000 seeds per hectare in the hybrid “Uzbekistan 601 ESB” and from 91.8 to 87.8% in the Karasuv 350 AMB hybrid. Consequently, with the increase in sowing norms, it was observed that the germination of seeds in field conditions decreased in both hybrids.

The study found that planting norms had a significant effect on the silage mass yield of corn hybrids. Silo yield of 311 tons in the hybrid “Uzbekistan 601 ESB” with a sowing rate of 55 thousand seeds / ha of replanted corn, 47.1 tons in the hybrid of 105 thousand seeds / ha, 24.5 in the Karasuv 350 AMB medium-early hybrid; 39.2 tons of silage mass was obtained. With the increase in sowing norms, an increase in the mass yield of silage in both varieties was observed. Medium-ripe Uzbekistan 601 ESB ”was found to produce 7.4 to 7.9 tons / ha more silage than the medium-early Karasuv 350 AMB, but the mid-early Karasuv 350 AMB showed a higher grain hardening and full milk-wax ripening phase. This indicates that the quality of the silage mass is high.

One of the important indicators of fodder crops is the amount of feed unit per 1 hectare. In our experiment, with the change of sowing norms from 55 thousand seeds / ha to 105 thousand seeds / ha, the feed unit per hectare in the hybrid “Uzbekistan 601 ESB” is 6.70 to 9.89 t / ha, in the middle-early Karasuv hybrid 350 AMB these values are 5.14 to 8.23 t / ha. was observed.

The highest feed unit consumption was 9.89 and 8.23 tons / ha in Uzbekistan 601 ESB and Karasuv 350 AMB, respectively, with a sowing rate of 105,000 seeds per hectare. It was found that the amount of differences in planting norms, the increase in nutrient unit obtained with increasing bush thickness, is relatively small.

TABLE-1 DEPENDENCE OF SILAGE MASS YIELD OF CORN HYBRIDS ON SOWING NORMS AND BUSH THICKNESS IN REPEATED CROPPING, 2016-2018

№	Plant bush thickness, 1m ² pcs					Productivity, t / ha					
	At the expense of seeds, pcs	In fact				Silos		Food unit		Digestible protein	
		Uzbekistan 601 ESB	%	Karasuv 350 AMB	%	Uzbekistan 601 ESB	Karasuv 350 AMB	Uzbekistan 601 ESB	Karasuv 350 AMB	Uzbekistan 601 ESB	Karasuv 350 AMB
1	55(st)	50.8	92.3	50.5	91.8	31.9	24.5	67.0	5.14	0.57	0.44
2	65	59.5	91.5	58.4	89.8	36.3	29.3	76.2	6.15	0.65	0.53
3	75	67.9	90.5	66.9	89.2	40.7	33.9	85.5	7.12	0.73	0.61
4	85	76.1	89.5	75.8	89.1	43.1	36.6	9.05	7.69	0.78	0.66
5	95	84.6	89.0	83.8	88.2	45.3	38.1	9.51	8.0	0.81	0.68
6	105	93.1	88.7	92.2	87.8	47.1	39.2	9.89	8.23	0.85	0.70

From 1st tse tnersilos -21 o.b. and 1.8 kg of digestible protein

The amount of protein digested in silage mass is one of the main quality indicators of feed. The amount of protein digested in 1 quintal of silage mass was 1.8 kg. The amount of digestible protein varied depending on the sowing norms of seeds, and in the variant sown with 55 thousand seeds per hectare, the hybrids of Uzbekistan 601 ESB were 0.57 and Karasuv 350 AMB hybrids were 0.44 tons / ha. Control When the sowing rate was increased to 105 thousand seeds / ha compared to the sowing rate of 55 thousand seeds, the amount of additional digestible protein in the hybrid of medium-ripe Uzbekistan 601 ESB was 0.28: 0.26 tons / ha more than in the hybrid Karasuv 350 AMB.

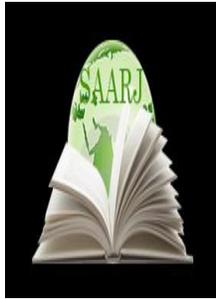

CONCLUSION

In summary, when irrigated corn is sown as a secondary crop for silage on irrigated lands free of wheat, in meadow soils the sowing rate is increased from 55 thousand / 105 to 25 thousand / hectare in mid-ripening Uzbekistan 601 ESB and mid-early Karasuv 350 AMB hybrids. provides a significant increase in mass yield, nutrient unit consumption and the amount of digestible protein. It was noted that the quality of the silage mass improved compared to the silage mass of the Uzbek 601 ESB hybrid due to the fact that the grain hardened during the re-sowing of the mid-early Karasuv 350 AMB hybrid and entered the full milk-wax ripening phase.

ABSTRACT

The article deals with the theoretical and practical aspects of tax administration in foreign countries, analyzes their effectiveness and, based on the research, provides suggestions for further improvement of tax administration in Uzbekistan.

KEYWORD: *Tax Administration, Tax System, Taxpayer Identification Number, Unified Identification System*

INTRODUCTION

The problem of tax administration in general and tax administration at the territorial level in particular is particularly relevant today, when the country is actively continuing administrative reform.

Despite the rather large volume of scientific works devoted to the study of tax administration, it is impossible to admit that all the problems in the study of the regulation of tax relations have been solved. The majority of the work is devoted to the tax laws, the examination of the subject, methods of tax administration, analysis of tax relations, the study of the mode of levying certain taxes. Issues of tax administration at the territorial level are among the least developed in the domestic and foreign literature.

The purpose of the study is to develop methodological recommendations for improving tax administration at the level of territorial tax inspections and criteria for evaluating the effectiveness of tax administration.

To achieve this goal, the following tasks were formulated and solved::

* Study of the basic principles and objectives of tax administration at the territorial level;

- * Study of the mechanism of tax administration in the territorial tax authorities;
- * Study and generalization of foreign experience in tax administration;
- * Study of the system for determining the tax base at the regional level;
- * Clarification of the concept of tax potential in relation to the territories of municipalities and development of a methodology for determining it;
- * Forms and methods of tax control are analyzed;
- * Development of a methodological approach and criteria for assessing the effectiveness of tax administration in territorial tax inspections.

Analysis of regulatory documents governing the activities of tax authorities, shows that they are not fully developed criteria for assessing the effectiveness of tax administration in territorial tax inspections amid increasing scale used by taxpayers schemes of tax evasion improvement of forms and methods of tax control. These provisions determined the relevance of the chosen research topic, its purpose and objectives.

The activities of the tax authorities are considered not only in the direction of the completeness of tax collection, but also the regulation of tax relations between the participants in this process. The regulation of relations with specific taxpayers will largely eliminate the violation of the deadlines for the execution of tax procedures and the possibility of tax evasion.

The tax system plays an important role in the development of the state and the performance of its functions, because in almost all countries taxes are the main source of revenue for the state budget. An effective system of tax administration allows ensuring the macroeconomic stability of the state, a high level of tax collection, as well as the fulfillment by the state of all its duties. As part of improving the tax administration of the Republic of Uzbekistan, it is justified to turn to the experience of tax administration in successful developed countries, such as Sweden, Denmark and Norway.

It should be noted that there are significant differences in tax administration between the countries of Scandinavia and Uzbekistan. Thus, in the Nordic countries, the tax authorities are not just limited to tax activities, but have a wide range of powers. It is the tax authorities that are the main information bureau for the life of all state bodies. For example, in Sweden, the tax authority assigns a single number (ID) to each citizen, replacing all types of state registration of the population, while in Uzbekistan, the taxpayer identification number (TIN) does not have such a wide range of uses. However, starting from January 1, 2021, it is planned to introduce a new unified identification system in Uzbekistan, which would replace the TIN and allow systematizing and combining the database of state bodies into a single network.

Moreover, in Denmark, it is the Ministry of Taxation that deals with the assessment of land and property, which reduces the cost of maintaining an additional state body, and ensures the uninterrupted flow of information about real estate and their owners, which, in turn, has a beneficial effect on the activities of both taxpayers and tax authorities. In Uzbekistan, the State Committee for Land Resources, Geodesy, Cartography and State Cadastre is responsible for the registration of real estate.

Another interesting point is the fact that in the Scandinavian countries, the functional powers within the structure of tax authorities are divided not by types of taxes, as in Uzbekistan, but by types of taxpayer activities. So, in Denmark there are departments for working with trade enterprises, with small and medium-sized businesses, as well as a department for working with tax fraud. At the same time, there are also similarities. For example, Denmark, Sweden, Norway and Uzbekistan have a department for working with large taxpayers.

When comparing the tax administration, it is impossible not to compare the ratio of the number of tax employees of the country to the total population. Thus, in Norway, for 5,477,957 people, there are 6,413 tax inspectors, which is 0.117% of the country's population. In Sweden and Denmark, this figure is 0.104% and 0.059%, respectively.¹ However, in Uzbekistan, with a population of 33,375,800, there are only 11,903 tax officers, which is only 0.036% of the total population.

In conclusion, it should be noted that, as a result of studying the theoretical and practical aspects of the organization of the tax systems of the Scandinavian countries, we propose to make the following changes in the tax system of the Republic of Uzbekistan:

1. Transfer of powers to assess and register property to the tax authorities. This will lead to the resolution of many problems in the tax system of the country, such as incorrect accounting of property, late and incomplete presentation of data on the property of taxpayers, and so on. Moreover, it will also provide convenience for the population, since instead of registering with one body and resolving tax issues with another body, they will need to visit only one state body. In addition, it will reduce public spending for the maintenance of the entire committee.
2. Development of operational and efficient electronic document flow between the tax authorities and other state bodies, as well as business entities.
3. Increase the number of employees of the tax authorities to reduce the burden on the current tax inspector.
4. Training of employees of the tax service, which is one of the main tools for introducing innovations in the administrative system and contributes to changing their organizational culture and mentality.

These measures, contributing to the development of the tax administration system, will naturally require certain costs on the part of the state, but will allow in the future to reduce the financial and time costs incurred by the tax authorities in the framework of individual tax control measures.

Based on the conducted research on the state of work on improving tax literacy and analyzing the experience of foreign countries, the level of informatization of society requires the tax authorities to use the latest technical, technological, and software developments for the effective functioning of tax administration. Information and explanatory work is a feedback tool that allows not only to solve the problems of taxpayers, but also contributes to the organization of the work of the tax authorities themselves. In our opinion, the improvement of the tax administration system can be achieved by expanding the information provided by taxpayers on a regular basis.

The problem of optimizing the list of indicators is quite complex. If there are too many indicators, the cost of monitoring may exceed the positive effect. If they are not enough, then

there may be an effect of "distorting behavior", when the activities of a civil servant will not be aimed at achieving the final results, but at meeting the estimated indicators.

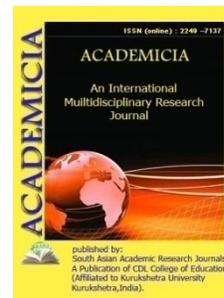

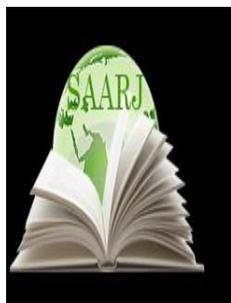

Tax revenues are one of the main sources of budget revenue generation and are designed to ensure the implementation of public obligations of various authorities to develop economic potential and solve social problems.

One of the important factors in protecting the financial interests of public legal entities is the observance of tax discipline by economic entities, ensuring control over the implementation of tax relations by specialized institutions.

Tax administration, based on the legally established rules of tax collection and compulsory motivation for their execution, is designed to implement the strategic goals of tax policy, using a set of legal and economic tools, levers and incentives.

ABSTRACT

In this scientific article the oykonims of Takhtakupir district of the Republic of Karakalpakstan, in particular, the oykonims formed on the basis of local geographical terms were studied. The etymology of some oykonims of the district was thoroughly analyzed on the basis of scientific and historical sources. By studying the etymology of toponyms, we also gain access to a lot of historical information, including historical geography, the mysteries of our past history, and also the features of our language. At the same time, we see that the origin of many geographical names in the district reflects the natural and geographical features of the area on the basis of local geographical terms.

KEYWORDS: *Toponym, Oykonim, Geographical Term, Local Geographical Term, Local Hydronymic Term, Topotherm, Etymology.*

I. INTRODUCTION

The science of toponymy (Greek topos - place and onoma - name, noun) studies the geographical names of the earth. The science of toponymy and its study is very important, as it carries valuable information about the history, culture, language and lifestyle of the people. It is known that the role of local geographical terms in the origin of most toponyms is great. This is because local geographical terms play a key role in determining the etymology of toponyms in the area. Many famous toponymist scientists believe that it is impossible to determine the meaning of toponyms without knowing local geographical terms. Well-known geographer, terminologist E.M.Murzaev correctly assessed the local geographical terms, saying that "folk terms - the

source of development of scientific terminology" [7]. Indeed, in the origin of most of the toponyms of the world and our country, we can find many local geographical terms. The words that participate in the composition of place names and designate the object they represent are called toponymic terms (topoterms) [5].

Objectives and tasks of the research. In this research work, we study the oykonims (oykonim - the name of any place of residence) of the Takhtakupir district of the Republic of Karakalpakstan, in particular, the oykonims formed using local hydronymic terms (hydronym - the name of any water object, natural or man-made). We will focus on their geographical distribution, etymology, meaning, reasons for their origin, and the role of local hydronymic terms in the formation of district oikonims. The role of local geographical terms in the origin of most geographical names in the territory of the Republic is great. If hydronymic terms were involved in the origin of the name of the place, we can determine whether any hydronymic object existed in the area or whether it existed in history. In this regard, the study of local geographical terms gives us a basis for having a lot of information. For this reason, we set ourselves the goal of exploring the study of district toponyms in relation to local geographical terms. In order to achieve the goal, the following tasks are to be performed: 1) to determine the role of local geographical terms mainly hydronymic terms in the formation of district oykonims; 2) etymological study of toponyms based on local hydronymic terms.

II. METHODS

During our research, the scientific works of toponymists and terminologists such as E.Murzaev, H.Hasanov, K.Abdimuratov, S.Qoraev, M.Mirakmalov, Z.Dosimov, N.Begaliev, K.Hakimov, K.Seytniyazov who made a significant contribution to the theoretical and practical development of the science of toponymy, were analyzed in depth and based on their theoretical work in this field. At the same time, historical, etymological and other research methods were used based on the characteristics of the district oykonims.

III. RESULTS AND DISCUSSION

It is known that any geographical name is a product of understanding the world, in which the process of understanding the objective events in the geographical environment of mankind is sealed.. Therefore, the secret of any geographical object is embodied in its name. To determine the etymology of a name, it is necessary to first study the natural, social, economic, political, linguistic factors that formed the basis of the name, comparing it with the events of that period. Taking into account the scientific, political, practical and educational value of geographical names, the need to study them increases [11]. At the same time, we all know that local geographical terms also played an important role in the origin of most geographical names. This is because many toponyms appear using local geographical terms and indicate what object is present in this geographical area or has existed in history. As the famous geographer E.M.Murzaev wrote, "Comprehensive knowledge of folk geographical terminology facilitates the study of place names. There are probably no toponyms in any vernacular that do not include local terms". [6]. We can know this from the names of the settlements of Takhtakupir district, which is the object of our study.

Takhtakupir district is located in the north-eastern part of the Republic of Karakalpakstan. Its area is 21.12 thousand km² and its population is 40.2 thousand people. Takhtakupir town is the center of the district. According to the district administration, there are currently 1 village and 39

settlements in the area [13]. The role of local hydronymic terms (river, lake, bridge, rivulet) in the emergence of settlement names is great. Below we focus on the etymology of some of the district's oikonims.

Janadarya is a dry riverbed located in Takhtakupir district, the name of the village citizens' assembly and settlement. This toponym is made up of the word jana (meaning new in the vernacular) and the word darya (river, large stream [5]), which is a local geographical term. According to the Karakalpak toponymist K. Abdimuratov, the Karakalpaks dug the Janadarya in the second half of the 18th century and called it the newly dug river of the same name [4].

Marjankul is a lake and a settlement in Takhtakupir district. According to legend, the origin of the name is made up of the name of a woman named Marjan and the term kul (lake), which is a local geographical term. Kul is a natural body of water that is filled (covered with water) on land and consists of confined depth place around [8]. On the east side of the Mulik Village Citizens' Assembly of the district there is a tower called Sandibay. Sandibay was a herdsman, a rich man. After his death, a tower was built for him by his wife Marjan. Later, Marjan came to the south and lived along the shore of the lake, and now the lake is called Marjankul [3]. There is a second variant of the name Marjankul, which may be due to the unique geographical features of the lake, ie its color and luster [2].

Aqkul (White lake) is the name of a settlement located on the There is a phrase among our people: "Even if the lake dries up, its name will not dry up". The name of **Aqkul** Lake is based on its natural geographical features. The reason is that the lake is located in a very salty area and the main part of the lake is salt. From a distance, the lake was white conspicuous. At present, the location of the lake has become a waterless plain.

Atakul (Grandfather Lake) is a lake located in the territory of Takhtakupir district, which is the name of the Village Citizens' Assembly and the settlement. Legend has it that an educated, literate, old man, Annet-ata, who came from the Mangit clan of Karakalpak origin, lived in this area. He lived by the lake. The people called him grandfather, not by his name and later the lake was also called the lake of the grandfather, thinly later this lake and the area was called **Atakul** [2].

Pishenkul (Reed Lake) is a name of the settlement and the drying up of the lake in the territory of "Takhtakupir" Village Citizens' Assembly. In the local vernacular, the word **pishen** means a plant that grows in moist, wetlands, lakes and ponds, a type of reed at a young age, a young reed [9]. The name of the lake is based on the natural geographical feature of the lake. The role of the young reed, which is considered an aquatic plant, in the origin of the name is great. There was a lot of young reeds growing in the lake, and this led to the name **Pishenkul**. Later, the name of the lake was changed to the settlement around it.

Porkhanozek is a natural riverbed located in the territory of "Karaoy" Village Citizens' Assembly of Takhtakupir district (core, water flowing from the bottom of the cliff, river branches, stream [5]) and the name of the settlement. According to the locals, the natural riverbed got its name because of its ripples, and the name was given to the settlement around the river [1].

Sarikul (Yellow Lake) is the name of the lake and settlement located in the territory of "Karaoy" Village Citizens' Assembly of Takhtakupir district. The origin of the name of the "kul" is related

to the natural geographical feature of the lake. The reason is that the lake is located in the middle of yellow sands. The name of the lake is also given to the settlement located in this area.

Takhtakupir (wooden Bridge) is the name of Takhtakupir district, Village Citizens' Assembly, township and settlement. "Takhta" is a wood and a "kupir" - it is a device, a road, built on the depths of the water, to pass from shore to shore. A century ago, a branch of the Kuvonchjarma canal, which brought water to the **Takhtakupir** district, was called Bosay (Bozsay). People inhabited on both sides of the river. A bridge over the river was essential for the people of the two sides to come and go with each other, and the elders of the people unite and consult, and embark on this important and rewarding work. Hojamet Bolis led the construction of the bridge. All the people come to help. Craftsmen from Chimbay brought to build the bridge, mainly the long trees of Qosbauli's son Kalimbetbay were used in the construction of the bridge. Construction of the bridge took place during the winter months. Because the main building material was wood, the bridge came to be known as a wooden bridge - Takhtakupir. The bridge was built in 1904 (in some sources it was 1903. It is known that the construction of the bridge began in the winter of 1903 and was completed the following year) [3]. Takhtakupir is now the name of the district, town, Village Citizens' Assembly and settlement.

Kungradkul is the name of the Village Citizens' Assembly and settlement in Takhtakupir district. As we know that the main part of toponyms of our republic are ethnotoponyms. In particular, most of the oykonims of Takhtakupir district are ethno-oykonims. At the origin of this name, the representatives of the Kungrad tribe, who are descended from the Karakalpaks, settled around the lake for a long time, and the name of this tribe was also given to the name of the lake [10]. The lake has now dried up but its name is still preserved.

In general, the natural geographical features of the territory of the Takhtakupir district oykonims are in harmony with the lifestyle, socio-economic and cultural life of the population [12]. We can also see this from the etymology of the district oykonims. Among the oykonims of Takhtakupir district, the oykonims formed on the basis of local geographical terms have a significant place: *Balkeozek, Dauitsay, Janadarya, Marjankul, Atakul, Aqkul, Pishenkul, Porkhanozek, Sarikul, Takhtakupir, Teppekul, Shogirkul, Kungradkul*. In the figure below we can see the contribution of local geographical terms in the composition of district oykonims.

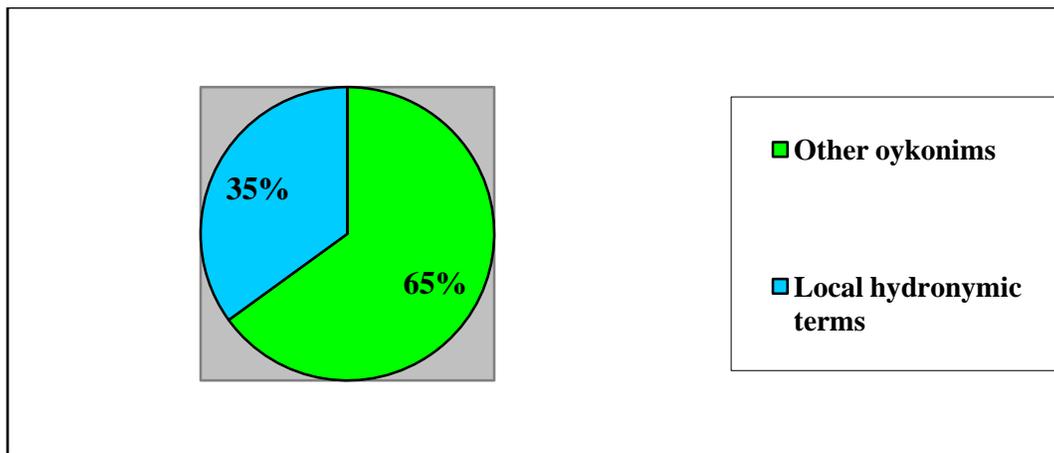

Fig. 1. Proportion of local hydronymic terms in the structure of Takhtakupir district (in percent)

Despite the fact that the main area is located in the Kizilkum desert, local hydronymic terms play an important role in the structure of the Takhtakupir district. In total, there are 1 village and 39 settlements in the district, of which 14 settlements have local hydronymic terms.

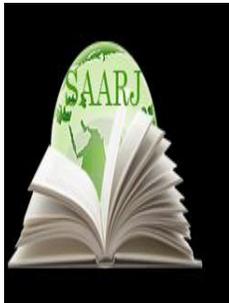

IV. CONCLUSION

We can conclude from the results of the study that the names of geographical places, which are one of the important layers of national values, understanding the true meaning of local geographical terms helps us to understand our place of birth and the nature of this region inherited. The scientific study of local geographical terms and geographical names that are our historical heritage, in-depth analysis of the etymology of toponym and geographical term, as well as instilling in the minds of future generations of young people with a sense of patriotism are among the most pressing issues facing us today. In general, I believe that the study of local geographical terms and place names, which are the product of social necessity, and the determination of their etymology is of great scientific and practical importance.

ABSTRACT

This article discusses the development of the child's personality, the factors influencing the development of the child, the importance of activities (play, exercise, work) in the development of the child, as well as the age stages of the child's mental development and about their peculiarities.

KEYWORDS: *Individual Personality, Developmental Environment, Activity, Biogenetics, Age Stages, Early Childhood, Early Childhood to Preschool.*

INTRODUCTION

A newborn baby is considered an individual for a certain period of time. Derived from the individual Latin word, it means "indivisible", "separate shahe", "single". An individual is a separate living being belonging to a biological species. Movement is unique in the development of the child. The first-year child also forms a variety of movements, which are then conditioned reflexes, not consciously but occurs in response to unconditional and conditioned stimuli.

The formation of speech in an early age child and the fact that the actions organized by the child begin to occur consciously and his participation in the process of social relations is the first stage of development of the child as a person.

Hence, development is a physical, mental, and social process in a person that involves all the properly acquired quantitative and qualitative changes. Physical development is associated with

height and weight, increased muscle strength, perfection of sensory organs, ability to control movements correctly, and the like. In mental development, on the other hand, there are significant changes in the process of formation of mental qualities and traits in the personality, emotional (volitional), being.

When a child begins to participate in social life, it is reflected in his behavior, his attitude towards the environment, and especially his participation in community work.

Biological and social factors play a leading role in the development of the child, that is, in the formation of personality, in the occurrence of such physical and mental changes in the child.

"Person" means a member of a particular society. In order to be a shahe, one must be distinguished from others by his character and qualities that are spiritually developed. Everyone manifests differently as a shahe. He differs from others in his character, interests, abilities, level of mental development, needs, and personal attitude toward work activities. These are the characteristics of a person, and only when these qualities develop to a certain stage, he will appear as a mature person.

Hence, the social being of man is important to him in the conditions of socio-economic life (environment). The improvement of the environment and upbringing ensures that a person develops and manifests himself as a person.

The formation of the child shaheen is associated with a number of factors, which are reflected in the following figure.

Research in the sciences of physiology and psychology has shown that the human child is born not with a ready ability, but with a capacity that is the source for the realization and development of a certain ability. The ability is in a state of "sleep" and requires a favorable environment and environment for its awakening and development. Man is a product of a particular social order. With this system change, the living environment in which the activity of change also takes place in a person can have a positive or negative effect on him. An environment is a set of external worlds that affect the formation of a child's personality. The formation of the individual is carried out through the assimilation and upbringing of the socio-historical experience created by human society. As a result of education, the child begins to interact or interact with the social system in the society in which he lives.

Upbringing varies depending on the child's "pre-developmental zone", ie it is determined by the child's ability to acquire more complex, meaningful knowledge. For example, the transition to walking after the baby has mastered crawling, the transition to active speech after learning to say certain joints, the emergence of play, labor activity, etc. after learning to move with objects.

Education plays a leading role in the formation of the child's personality, in the implementation of this work. This increases their responsibility in the formation of each child's personality. Education is affected in relation to all of the educational influences that come through the social environment. It uses convenient effective factors, which to some extent reduces the strength of adverse effects. The following situations occur in the educational process.

In the process of education, the human body develops, and things that cannot spontaneously provide the environment are learned through education. For example, a child may learn his or her mother tongue under the influence of the environment around him or her. But he learns to read

and write through special education. Certain knowledge, skills and abilities are acquired in the educational process.

With the help of education, some of the child's birth defects can be changed in the desired direction. For example, some children are born with certain defects. (deaf, dumb, blind, etc.).

With the help of education, it is possible to eliminate some of the shortcomings that have occurred as a result of the negative impact of the environment.

Different types of activities are formed on the basis of activity in the educational process. Their main ones are communication activities, cognition, object activities, play, simple labor and learning activities, and activities that are carried out through education and upbringing. They are gradually mastered by children under the guidance of a tutor. The successful acquisition of various activities by children depends mainly on the organization of educational work in kindergarten depends on.

The most common type of activity in a person's life is the basis for the formation of a certain relationship based on his personal abilities and characteristics. Activity develops by mastering the ways of movement. The extent to which it develops from activism depends more on heredity and the ability to imitate. One of the main tasks is to educate and train the child from an early age in the family and in preschool institutions through the child's interaction with objects and things.

In the growth activities that are important for the preschool period, children learn about things and objects under the guidance of an educator and learn about their qualities and characteristics. Through movement games performed together, children learn about people's lives, the relationships between them, and how to act in harmony. In this way, children's perceptions of the environment expand. Hence, activity plays a leading role in the upbringing and development of the child. Therefore, it is important to organize the life of the child in educational institutions and in the family in such a way that he can engage in various activities.

There are pre-school age, school age period as well as social maturity and adulthood in human life. Within each of these periods are shorter stages of age, which are distinguished by certain peculiarities in human development. For example, the task, content, means and methods of educational work with children of the first age are developed taking into account the sensitivity of children of this age, their need for help, their adaptability to life. By the age of another, children will have significantly increased resilience to independence and life. Accordingly, the methods of carrying out educational work with children of this age will change. By the end of kindergarten, the level of development of children requires a certain complication of the educational work carried out with them.

The task of determining the content and method of educational work is based on the age of the person. Early childhood children are characterized by their rapid movement, helplessness, rapid onset of illness, need for help.

Speech development in children under the age of three is one of the hallmarks of this period. Three-year-olds master all aspects of their mother tongue and use it as a tool in communication with their peers.

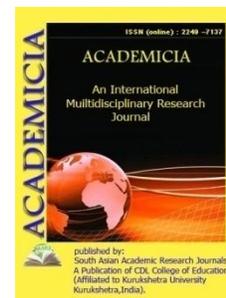

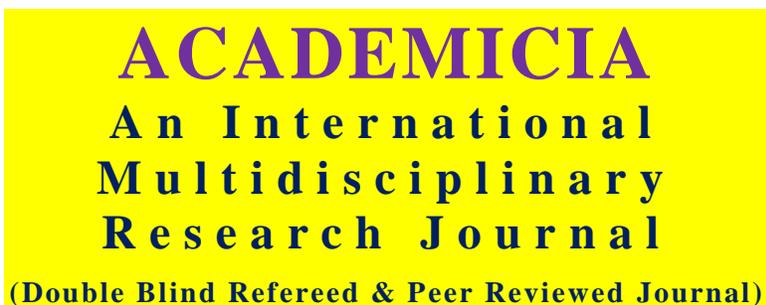

The system of early childhood education is an integral part of the upbringing of the younger generation. Physiologists, psychologists, educators contribute to the social upbringing of children around the world. By the age of kindergarten, the child's body continues to mature.

Kindergarten children begin to understand the nature of the demands placed on them. In addition to adult reprimands for misbehavior and misconduct, he also tries to draw independent and correct conclusions.

Hence, the task of upbringing is to identify the talents and abilities in the child in a timely manner and help them to develop further. In the process of education, it is possible to achieve the goals of education, taking into account the specific characteristics of each child.

ABSTRACT

This article discusses in detail the concept of the analyzer, the essence of the linguistic analyzer, as well as the morphological, syntactic and semantic types of the linguistic analyzer. In the world of computational linguistics, morphological and syntactic analyzers were widely studied, moroanalysts and syntactic analyzers were created, but the semantic analyzer was not a special object of research. The article also addressed this issue, and the reasons for this are scientifically justified.

KEYWORDS: *Analyzer, Linguistic Analyzer, Semantic Analyzer, Morphological Analyzer, Syntax Analyzer, Natural Language, Stemmer, Parser, Spelling Corrector, Segmmorph, Linthesis, Psian*

INTRODUCTION

General questions of the linguistic analyzer. Users use information from Internet networks for various purposes. As a rule, we will need accurate information, which is called an information object. These objects are divided into different types and are of interest to users of certain categories. In the flow of natural language texts, the search for these objects takes a long time, which slows down the solution of specific programming tasks. The need to translate texts from one language to another, deconstruction of various languages, computer textbooks, the use of bulleted text, text analysis and synthesis, the creation of annotation and abstracting programs, sets the task of eliminating the problem of automatic processing in natural language.

Computational linguistics performs the above tasks as a young branch of applied linguistics, aimed at creating models of the official language and using mathematical methods (algorithms,

models) and computer tools (programs, digital data) for automatic processing of natural languages.

The development of linguistic resources in natural language knowledge processing systems is one of the most important tasks. Linguistic resources include conceptual databases – data of the formal form of various dictionaries, paradigmatic and natural language models, as well as processors of a specialized linguistic model [8].

Automatic natural language processing has been thoroughly studied in Russian and European linguistics. In the book by T. Skrebtsov, A. Klementyev, S. Kuznetsov, S. Suvorov "Linguistic analyzer. Text conversion to a metalanguage data structure" linguistic analyzers are considered in detail [7].

The monograph offers an original approach aimed at identifying data when solving the problem of automatic text analysis in Russian. The software that implements this approach includes all the stages of natural language text processing—from the graphematics of the entire text to the communicative syntax. Any journalistic, scientific, and official styles can be used as the material of the analysis, both from written texts and from fiction.

The research conducted by the authors has a search function, which is clearly visible in the content of the work. They did not aim at a detailed description of the linguistic model, a complete list of the rules applied in each of them, and the stage of analysis. According to scientists, the basic meaning is based on the proposed approach to automatic text processing, it is characterized by fundamental (basic) prints. These principles are consistently implemented at each stage of the linguistic processor.

The analyzer is formed from the word "analysis", these two concepts are directly related to each other. Analysis comes from the Greek word "analysis", which means "separation"; a method of verification that people use in the process of knowing the world. This concept is closely related to synthesis. Analysis is the division of something / phenomenon into components in thinking or in practice, and synthesis is the combination of these parts into an idea or in practice as a whole, the study of things in a holistic form. An object that surrounds a person and has different characteristics is complex, but at the same time consists of things and phenomena. In order to learn and know them, it is necessary to disassemble them into components, that is, to make an analysis (analysis). But only with this method it is impossible to know them completely, so it is necessary to supplement it with synthesis. Analysis and synthesis are interrelated, without analysis, synthesis does not provide deep knowledge, while incomplete analysis through synthesis is also not enough [9].

O.S.Akhmanova in the Dictionary of Linguistic Terms gives the following definition of the concept of "Analysis": "Analysis (analysis) in English" analysis", in French" analyze", in German, in Spanish" analyse", that is, it has the meaning of analysis. Decomposition of complex linguistic integrity into structural elements [3]. It is clear that the analyzer is an important tool aimed at performing a specific task through natural language analysis.

A linguistic analyzer is a tool that expresses the morphological, syntactic, and semantic nature of a word in the process of natural language processing in an automated search engine.

The concept of an analyzer is used as a term in a broad sense. In particular, along with linguistics, it is used for a specific purpose and meaning in dozens of fields, such as biology, physiology, anatomy, psychology, physics, chemistry.

The concept of the analyzer was originally used in physiology and is described as follows: "The analyzer is a complex system of higher nervous structures of animals and humans. The analyzer perceives and analyzes impressions from the external environment and the body.

The concept of the analyzer was introduced by I. P. Pavlov (1909). The incoming information goes to the end of the receptors-sensitive nerves. The analyzer has a complex structure that provides the brain with detailed information about the phenomena occurring both outside the body and inside it. The task of the analyzer is to use them to distinguish between useful or harmful effects on the external and internal environment and better adapt to the conditions of life. In case of violation of one analyzer (injury, illness) during training, another analyzer is possible. For example, blind people will have an increased ability to sense hearing, touch, pressure, and temperature [9].

Apparently, the analyzer performs the main function related to the nervous system of humans and animals.

In optics, an analyzer is a tool that determines the polarization properties of light. Polar prisms, polaroids, and tourmaline plates are used to find plane-polarized light and determine its plane of polarization [13].

The analyzer is a tool that determines the physical and chemical properties, composition and structure of solid, liquid and gaseous substances [11].

The analyzer in the whole field is a leader as a tool, a tool that performs the main task. In linguistics, the analyzer occupies an important place in automatic natural language processing.

Natural Language Processing (NLP) is a general field of artificial intelligence and mathematical linguistics that studies the problems of computer analysis and synthesis of natural language texts. The solution to this problem means creating a more comfortable form of interaction between man and computer.

Types of the linguistic analyzer. The problem of automatic natural language processing has been relevant for more than half a century. The complexity of the problem and the lack of a clear idea indicate the complexity of ways to solve it. Linguistic analyzers, however, are important as tools for automatic text processing. It is desirable to divide the linguistic analyzer into the following types:

1. Semantic analyzer.
2. Morphological analyzer.
3. The parser.

Large groups receive a lemmatizer, a morphoanalyzer, a stemmer, a parser, and spelling correctors. Each of these analyzers has its own performance, purpose, and function.

A morphological analyzer is a set of algorithms that compares individual words/word forms in a dictionary and finds the grammatical properties of words. The morphological analyzer uses

morphological dictionaries to determine the sequence, morphological feature of words in the analyzed sentence. And the parser builds a family tree.

The semantic analyzer often uses a family tree, but its nodes contain universal words of subject names or semantic language (for example, table names on a given topic, table attributes, and operator symbols) [2]. The semantic analyzer is based on semantic analysis and description. Semantic description allows you to reduce the level of lexical uncertainty and completely eliminate it. If the syntactically related words are ambiguous, the algorithm performs a sequential search for all the corresponding combinatorial variants to compare the values of the semantic properties specified by it. This process is based on a certain idea, such words should not have contradictory semantics. The main purpose of semantic description is to eliminate lexical-grammatical homonymy or to reduce the number of variants obtained as a result of syntactic analysis. First of all, this is due to the uncertainty of the structural scheme of speech. Thanks to the semantic description of the words that make up this sentence, it is possible to distinguish the wrong version of the parsing. But no matter how precise the semantic description, it always allows you to choose a single structure that will allow multiple syntactic interpretations of the sentence. Syntactic homonymy is actually not uncommon [7].

A linguistic parser is a set of application modules, a sequence of a number of lexemes (words) in a text, and a source that analyzes the content of a sentence. In this case, a multi-level analysis of sentences is used, which determines the morphological, syntactic, semantic (sometimes pragmatic) characteristics. Each language level is processed and formed using the components of the linguistic parser [4].

The structure of an automatic parser (parser) corpora is one of the most important areas of computational linguistics [5].

The syntax parser effectively uses the results of morphological analysis of words when analyzing sentences. At the same time, the designation of the source text with the help of mathematical data makes it possible to formulate the rules of parsing. The parser must determine the structure of the sentence, that is, the syntactic dependencies of the words [12].

Currently, the development of the Russian language parser Dictum [6] is of interest to many. Because it collects statistics from the Internet, which solves the problem of homonymy. It also has the ability to separate elliptical structures. There is a free tool – the Linguistic analyzer [10], developed by the team of the Al-Imam Muhammad ibn Saud Islamic University; it can be used to analyze and compare the Corpus. The following properties are highlighted:

- 1) provides Arabic and English language interface;
- 2) can process any UTF-8 encoded text file;
- 3) calculates a list of frequencies for all words in the corpus;
- 4) distinguishes between keywords;
- 5) finds the difference between two words.

Among the developments of the Laboratory of General and Computer Lexicology and the Faculty of Philological Lexicography of the Lomonosov Moscow State University, the DicTUM-1 system is a complex tool. It allows you to process information from texts and dictionaries,

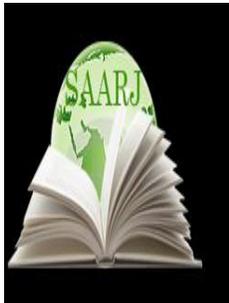

analyze them and conduct lexical work. At the same time, there are other systems of analysis, which include the following [1]:

1. Morpho-Analyzer-allows you to perform morphological analysis of tokens.
2. Segment – performs the morphemic analysis of the word forms.
3. Linthesis -performs semantic analysis of text units.
4. PSiAN-performs semantic and psychological analysis.
5. Colloq selects key words and phrases and automatically builds the thesaurus text.
6. Genre-conducts quantitative and methodological analysis.

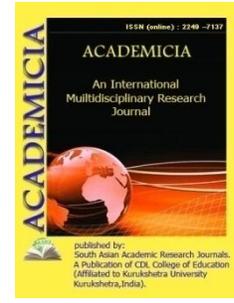

The development of the Uzbek corpus linguistics, the creation of the National Corpus is directly related to the development and structuring of the theoretical foundations of linguistic analyzers.

VULNERABILITY OF INDIA TO FLOOD DISASTER

Dr Rafi Ramzan Dar*

*Lecturer,
 Academic Arrangement, GDC Kulgam- J&K,
 INDIA

Email id: rafiramzandar@gmail.com

ABSTRACT

Disaster is a serious disruption in the smooth functioning of a community or a geographical region which results in acute and multi-dimensional loss of people's lives and property which is beyond the coping capability of that community or region and Vulnerability is the degree of proneness or susceptibility of an area/population to the impacts of a disaster. The present study which is mainly based on secondary sources of data has tried to make an attempt in understanding the profile of vulnerability of India to flood disaster. It has also attempted to access look into various natural and anthropogenic causes that lead to this disaster as well as mapped out the flood prone areas of the country. In addition to it, the researcher has tried to highlight some of the measures of disaster mitigation.

KEYWORDS: *Disaster, Vulnerability, Flood prone, Mitigation*

I- INTRODUCTION

Vulnerability is the **human dimension of a disaster**- a serious disruption to the functioning of a community, which causes human, material, economic and environmental losses beyond a community's ability to cope- that exists as a result of the range of socio-cultural, economic, political, institutional and psychological factors that shape people's lives and the environment that they live in. It increases the susceptibility of a community to the impact of disasters and may be of different types such as Economic Vulnerability, Physical Vulnerability, Social Vulnerability, Environmental Vulnerability and Attitudinal Vulnerability.

Economic vulnerability of a community is the potential impact of a hazard/disaster on economic assets and processes. It can be assessed by determining how varied its sources of income are, the ease of access and control over means of production (e.g. farmland, livestock, irrigation, capital etc.), adequacy of economic fall back mechanisms and the availability of natural resources in the

area. Poorer families with less access to resources, for example, may live in squatter settlements in flood prone areas because they cannot afford to live in safer (more expensive) areas which makes them more vulnerable.

Physical Vulnerability is the potential for physical impact on the physical environment. The physical vulnerability of an area depends on its geographic proximity to the source and origin of the disasters. Wooden homes which are less likely to collapse in an earthquake Student Notes: are more vulnerable to fire.

Social Vulnerability represents the potential impact of events on certain groups such as the poor, pregnant or lactating women, disabled, children, and elderly. When flooding occurs some citizens, such as the elderly and differently abled, may be unable to protect themselves or evacuate if necessary.

Environmental Vulnerability indicates the potential impact of events on account of the environmental conditions (flora, fauna, ecosystems, biodiversity). Wetlands, for example, are sensitive to increasing salinity from sea water, and pollution from storm water runoff containing agricultural chemicals, eroded soils, etc.

Attitudinal Vulnerability refers to the attitude of a community in response to an event or disaster. Communities which have negative attitude towards change and lack initiative in life resultantly become more and more dependent on external support. Thus, they become victims of conflicts, hopelessness and pessimism which reduce their capacity of coping with a disaster.

II. Aims and Objectives

This study is primarily based on secondary sources of data. The main aims and objectives of the study are:

1. To highlight the Vulnerability of India to the Flood Disaster
2. To assess the distributional area of India vulnerable to flood Disaster
3. To highlight the causes and impacts of flood disaster, and
4. To provide some substantial strategies for flood disaster mitigation in India

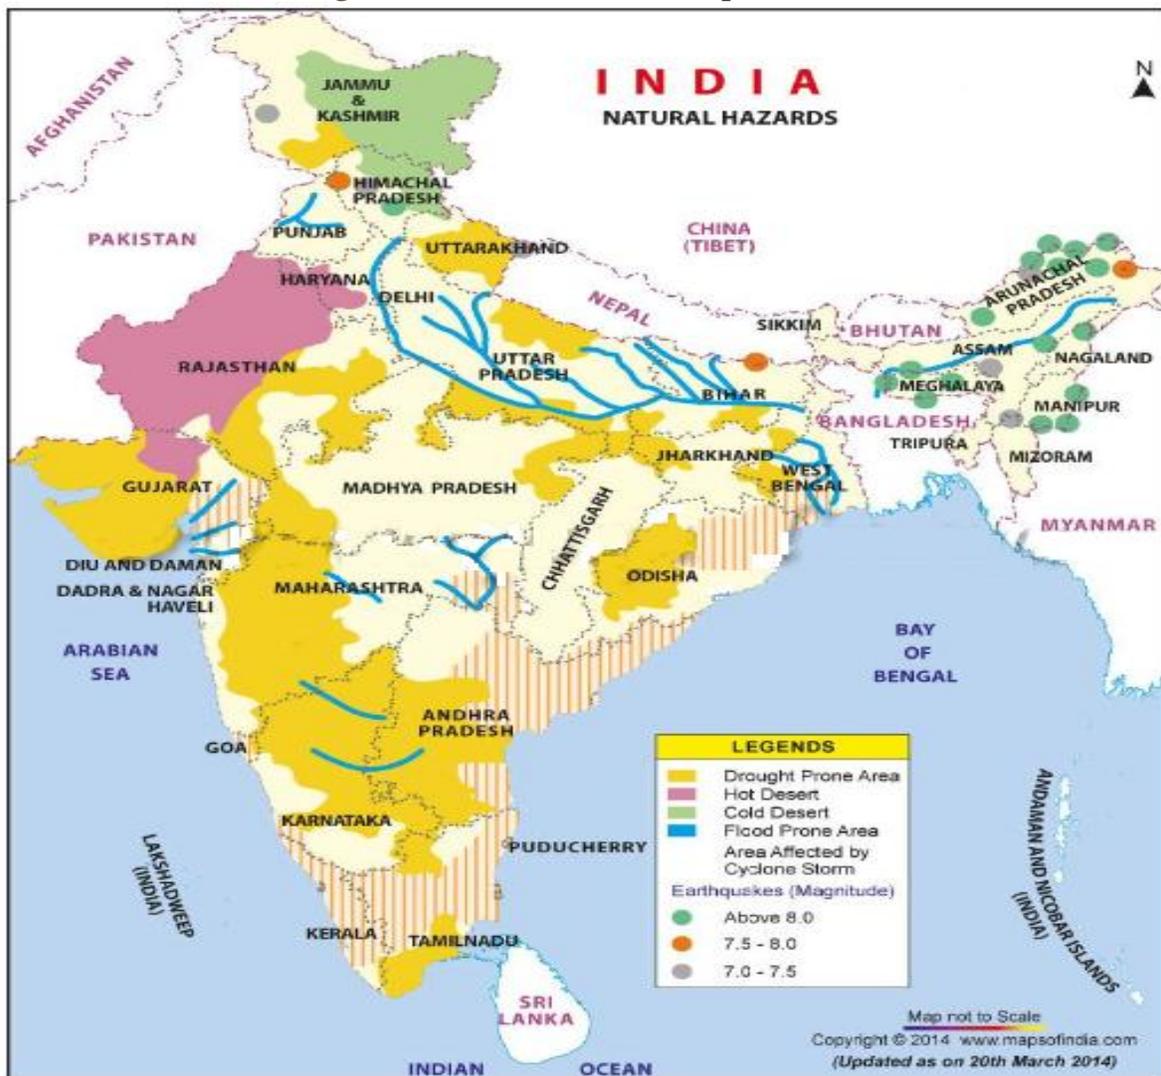

III- Vulnerability Profile of India

India is one of the ten worst disaster prone countries of the world. Disasters occur in India with grim regularity causing enormous loss of life and property. According to an UN official Report, 2017 for Disaster Risk Reduction, India has been ranked as the world's most disaster-prone country for displacement of residents. The country is vulnerable to a large number of natural, as well as, human-made disasters on account of its unique geo-climatic and socio-economic conditions. Out of the 36 states and union territories in the country, 28 of them are disaster prone. Almost 85% of the country is vulnerable to single or multiple disasters and about 57% of its area lies in high seismic zones. Approximately 40 million hectares of the country's land area is prone to floods, about 8% of the total land mass is vulnerable to cyclone and 68% of the area is susceptible to drought.

The five distinctive regions of the country i.e. Himalayan region, the alluvial plains, the hilly part of the peninsula, the coastal zone and the Island arcs have their own specific problems. While on one hand the Himalayan region is prone to disasters like earthquakes and landslides, the plain is

affected by floods almost every year. The desert part of the country is affected by droughts and famine while the coastal zone and the islands are susceptible to cyclones and tsunamis. Besides the natural factors, various anthropogenic factors like increasing demographic pressure, deteriorating environmental conditions, ruthless deforestation, unscientific development, faulty agricultural practices and grazing, unplanned urbanization, construction of large dams on river channels etc. are also responsible for accelerated impact and increase in frequency of disasters in

The country. The Building Materials and Technology Promotion Council (BMPTC) has recently released the third edition of the Vulnerability Atlas of India in 2019. It contains maps and tables for each State and Union Territory of India for the hazards like earthquakes, wind, floods, landslide, cyclones and frequency of thunderstorms. It also contains housing stock vulnerability indicating the risk for each type of house.

Figure 2- Map showing Major Disasters in India from 1980-2009

Source: National Institute of Disaster Management, New Delhi

IV- Vulnerability of India to Floods

Flood is a state of high water level along a river channel or on the coast that leads to inundation of land. It is the most prevalent and costliest natural disaster in the world which comes with little or no prior alarming/intimation and devastates both life and property at a large scale. India is highly vulnerable to floods which are witnessed in almost all the river basins of the country. Around 12 per cent of land in India is prone to floods. Our country receives an annual rainfall of 1200 mm, 85% of which is concentrated in 3-4 months i.e. June to September. Due to the intense and periodic rains, most of the rivers of the country are fed with huge quantity of water, much beyond their carrying capacity leading to severe flood situations in the region. Out of the 40 million hectares of the flood prone area in the country, floods affect an area of around 7.5 million hectare per year. Floods in the Indo-Gangetic and Brahmaputra plains are an annual feature.

Figure 3- Map showing Drainage Network of India

Source: Retrieved from <https://www.mapsofindia.com>

V- What leads to Flood Disaster?

The distribution of rainfall in India is not similar at every place. It varies with space and time. Some areas receive higher rainfall where as some others receive low rainfall. The intensity of rainfall and its distributional pattern has undergone a tremendous change during last few decades because of anthropogenic modifications of environment as a result of which river basins have developed inadequate capacity to contain within their banks the high flows brought down from the upper catchment areas following heavy rainfall which gives rise to flooding. In addition to it, ice jams or landslides blocking streams; and cyclones also cause floods. Anthropogenic activities that play an important role in increasing the intensity, magnitude and gravity of flood disasters include indiscriminate deforestation, unscientific agricultural practices, disturbances along the

natural drainage channels and colonization of flood-plains and river-beds. Let us have a cursory glance into some of the causes of floods disasters.

A. Natural causes

This includes heavy rainfall, sediment deposition, cyclones, change in the course of the river, tsunami, shrinkage of lakes and wetlands etc. Heavy rain in the catchment area of a river causes water to over flow its banks, which results in the flooding of nearby areas. River beds become shallow due to sedimentation. The water carrying capacity of such river is reduced. As a result the heavy rainwater overflows the river banks. Likewise, Cyclones generate sea waves of abnormal height which spread the water in the adjoining coastal areas. e.g., Odisha cyclone in October 1994, cyclone Thane of 2011 and Cyclone Gaja of Tamil Nadu in November 2018 generated severe floods and caused unprecedented loss of life and property. Meanders, erosion of river beds and banks, and obstruction of flow due to landslides also lead to changes in river courses and large coastal areas are flooded by rising sea water when a tsunami strikes the coast. Lakes and wetlands act as natural sponges. These store the excess water and regulate its flow. When these water bodies reduce in size due to changing land-use, their ability to regulate the flow decreases which leads to flooding.

B. Anthropogenic causes

These comprise deforestation, Interference in drainage system, International dimension, Population pressure and Poor Water and Sewage Management etc. Vegetation facilitates percolation of water in the ground. As a result of deforestation, the land becomes obstruction free and water flows with greater speed into the rivers and causes flood. Drainage congestion caused by un-planned construction of bridges, roads, railway tracks, canals etc. hampers the flow of water and results in floods. Moreover, the rivers originating in our neighboring countries like China, Nepal and Bhutan cause severe floods in the states of Uttar Pradesh, Bihar, West Bengal, Arunachal Pradesh and Assam. For flood management, cooperation with the neighboring countries is essential. Likewise, because of large amount of people, more materials like food, land, wood etc. are needed. This aggravates overgrazing, land encroachment, over cultivation and soil erosion which increases the risk of flooding. Poor Water and Sewage Management is also responsible for flooding. Old drainage and sewerage systems in urban areas have not been overhauled. During the rainy season every year, the drainage and sewer system collapses, resulting in urban flooding.

VI- Areas Vulnerable to Flood Disaster in India

Indian sub-continent has distinctive geographical location which makes its various regions vulnerable to flood disaster. The snow clad Himalayan Mountains of North comprise one of the largest glaciers of the world which are source of various perennial rivers. These rivers irrigate a large plain which habituate millions of people. These wide and vast plains are very much susceptible to the flood waters brought down by the large rivers from the torrential mountains especially in monsoon season. The average rainfall in India is 1150mm with significant variations across the length and breadth of the country. The annual rainfall along the western coast and Western Ghats, Khasi hills and over the Brahmaputra valley amounts to more than 2500mm. The vulnerability Atlas of Flood Zones in India, issued by central Water Commission, shows that Indo-Gangetic and Brahmaputra plains as well as the coastal areas in the Eastern and Western coasts of India are the major flood prone areas of the country.

National Institute of Disaster Management estimate shows that in Bihar 100 per cent and in Uttar Pradesh 82 per cent flood is caused due to depressions and well-marked low pressure. In west Bengal, the main reason for flood is cyclonic circulation. Whereas in Punjab, Gujarat, Rajasthan and Jammu and Kashmir the main cause of incessant flooding is low pressure areas. Flood in Andhra Pradesh and Odisha is caused due to Monsoon depression. Nowadays, metropolitan cities are facing repeating episodes of floods because of the mismanagement of drainage and sewerage systems. Likewise, the coastal floods occur because of the cyclones and tsunamis. Let us have a look into the distributional regions of severe floods in India.

1. The Brahmaputra River Region

This region consists of the rivers Brahmaputra and Barak and their tributaries and covers the states of Assam, Arunachal Pradesh, Meghalaya, Mizoram, Manipur, Tripura, Nagaland, Sikkim and the northern parts of West Bengal. The catchments of these rivers receive heavy rainfall during monsoons. These rivers originate in fragile hills susceptible to erosion leading to high silt discharge. This region is subject to severe and frequent earthquakes also which cause numerous landslides and upset river regime. In addition to it, cloud bursts followed by flash floods and heavy soil erosion are also prevalent in this region.

2. The Ganga River Region

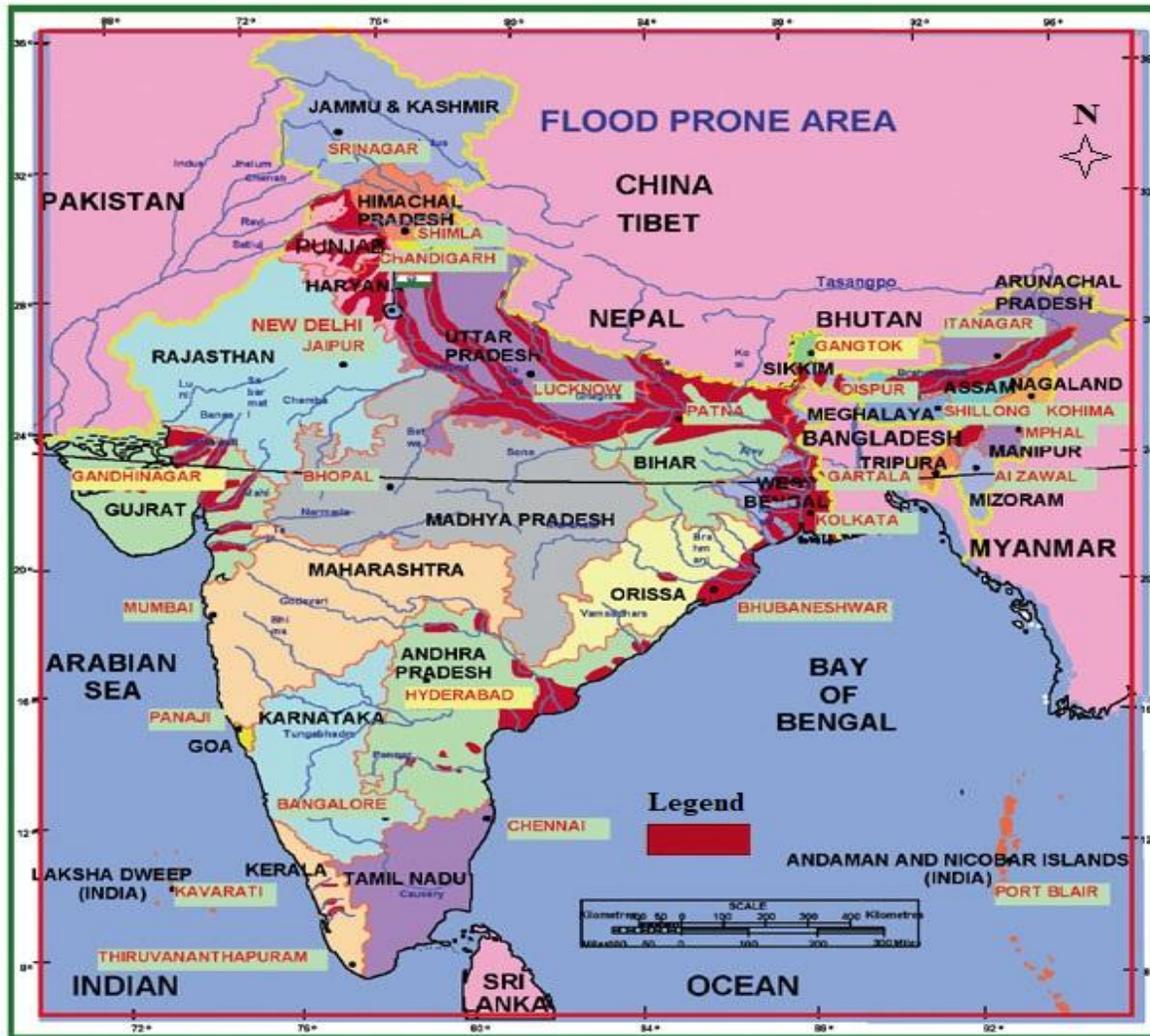

The river Ganga originates from Gangotri glacier. It has many tributaries, the important ones being Yamuna, Sone, Ghaghra, Rapti, Gandak, Burhi Gandak, Bagmati, Kamla Balan, Adhwara group of rivers, Kosi and the Mahananda. It covers the states of Uttarakhand, Uttar Pradesh, Jharkand, Bihar, south and central parts of West Bengal, Punjab, Himachal Pradesh, Rajasthan, Madhya Pradesh, Delhi and parts of Haryana. The flood problem is mostly confined to the areas on the northern bank of the river Ganga as most of the damage is caused by the northern tributaries of the Ganga.

In general, the flood problem increases from the west to the east and from south to north. In recent years, the states of Rajasthan and Madhya Pradesh have also experienced some incidents of heavy floods. Large-scale encroachment of flood plains of the rivers for habitation and various developmental activities is one of the main causes of flooding in this region.

3. The North-West River Region

The main rivers in this region are the Indus, Sutlej, Beas, Ravi, Chenab and Jhelum. This region covers the Union Territory of Jammu and Kashmir, Punjab and parts of Himachal Pradesh, Haryana and Rajasthan. Compared to the Ganga and the Brahmaputra river regions, the flood problem is relatively less in this region. The major problem in this region is that of inadequate surface drainage which causes inundation and water-logging over vast areas. Besides, indiscriminate use of water for irrigation and development of low-lying areas and depressions has created problem of drainage congestion and water logging here. These rivers change their courses frequently and leave behind vast tracts of sandy waste.

Figure 4- Map showing Area Vulnerable to Floods in India

Source: Geography of India by D.R. Khullar

1. The Central and Deccan India Region

Important rivers in this region are the Narmada, Tapi (flowing westwards into Arabian Sea) and Mahanadi, Godavari, Krishna and Cauvery (flowing eastwards into Bay of Bengal). These rivers have mostly well-defined and stable courses. They have adequate capacities within the natural banks to carry the flood discharge except in the delta areas. The region does not have serious flood problem except that some of the rivers in Orissa namely Mahanadi, Brahmini, Baitarni, and Subarnarekha are prone to floods every year. The delta and coastal areas of the states on the east coast periodically face flood and drainage problems in the wake of monsoon depression and cyclonic storms.

VII- How does Flood Disaster Impact?

Frequent inundation of agricultural land and human settlement has serious consequences on the national economy and society. According to some reports of Disaster Management, India has faced 649 disasters from 1915 to 2015 out of which, 302 were caused by flood with an average

of 3 floods per year. This amounts to 47 per cent of total disasters which took place in India in the last century. These floods can be categorized into riverine floods, flash floods, coastal floods and other types of floods.

TABLE 1- DAMAGE DUE TO FLOODS AND OTHER RELATED DISASTERS IN INDIA (1915-2015)

Flood Disaster	No. of Events	No. of Deaths	Total Affected	Total Damage ('000 US\$)
Riverine flood	143	29,810	333,442,962	41,404,929
Flash flood	23	7,436	23,443,526	416,200
Coastal flood	4	569	11,500,00	275,000
Others	132	33,611	462,703,212	11,898,059
	302	71,426	831,089,700	53,994,188

Source: Adapted from Prakash, T. (2015). Flood disaster in India: An analysis of trend and preparedness

The decadal pattern of floods shows the consistent rise of flood disasters from last five decades. The number of such disasters in the last decade was 100. Floods destroy valuable crops and also damage physical infrastructure such as roads, rails, bridges and human settlements. The cumulative economic loss in the last decade (2005-15) was nearly 2 per cent of GDP of India and the decadal economic burden increased from USD 11.6 billion in 1995-2005 to USD 34.5 billion in 2005-15. This is because the five most affected floods took place in last decade only in the states of Leh UT (2010), Assam (2012), Uttarakhand (2013), Jammu & Kashmir (2014) and Manipur (2015). Besides, millions of people are rendered homeless and are also washed down along with their cattle in the floods. The lives claimed by the floods have immensely gone up from an average of 1000 persons per year in 1965-75 to 1700 per year in 2005-15. Spread of diseases like cholera, gastro-enteritis, hepatitis and other water-borne diseases occur in the flood-affected areas. The intensity of damage done by flood disaster from 1953 to 2010 is given in the following table.

TABLE 2- IMPACT OF FLOOD DISASTER ON LIFE AND ECONOMY IN INDIA (1953-2010)

S. No	Item	Unit	Average Annual Damage
1	Area affected	mha	7.21
2	Population affected	Million	3.19
3	Human lives lost	Number	1612.00
4	Cattle lost	Number	89345.00
5	Cropped area affected	Mha	3.70
6	Damage to the crops	Rs in crores	693.87
7	Houses damaged	number	1194637
8	Damage to Houses	Rs in crores	275.48
9	Damage to public utilities	Rs in crores	814.60
10	Total Damage	Rs in crores	1804.42

Source: Source: National Institute of Disaster Management

This is clearly evident from the above table that flood disaster leaves no stone unturned in devastating man of his life and property. In addition, floods create a sense of insecurity and fear

in the minds of people living in the flood plains. The after effects of flood like the agony of survivors, spread of epidemic, non-availability of essential commodities and medicines and loss of dwellings make floods the most feared among the natural disasters being faced by humankind.

VIII- How to Protect and Manage Flood Disasters?

Disaster Management includes sum total of all activities, programs and measures which can be taken up before, during and after a disaster. A typical disaster management continuum consists of a Pre-Disaster Risk Management Phase which includes prevention, mitigation and preparedness and a Post-Disaster Crisis Management Phase which includes relief, response, rehabilitation, reconstruction and recovery. The main thrust of the flood protection and management programs undertaken in India so far has been on structural measures and non-structural measures.

1. Structural Measures

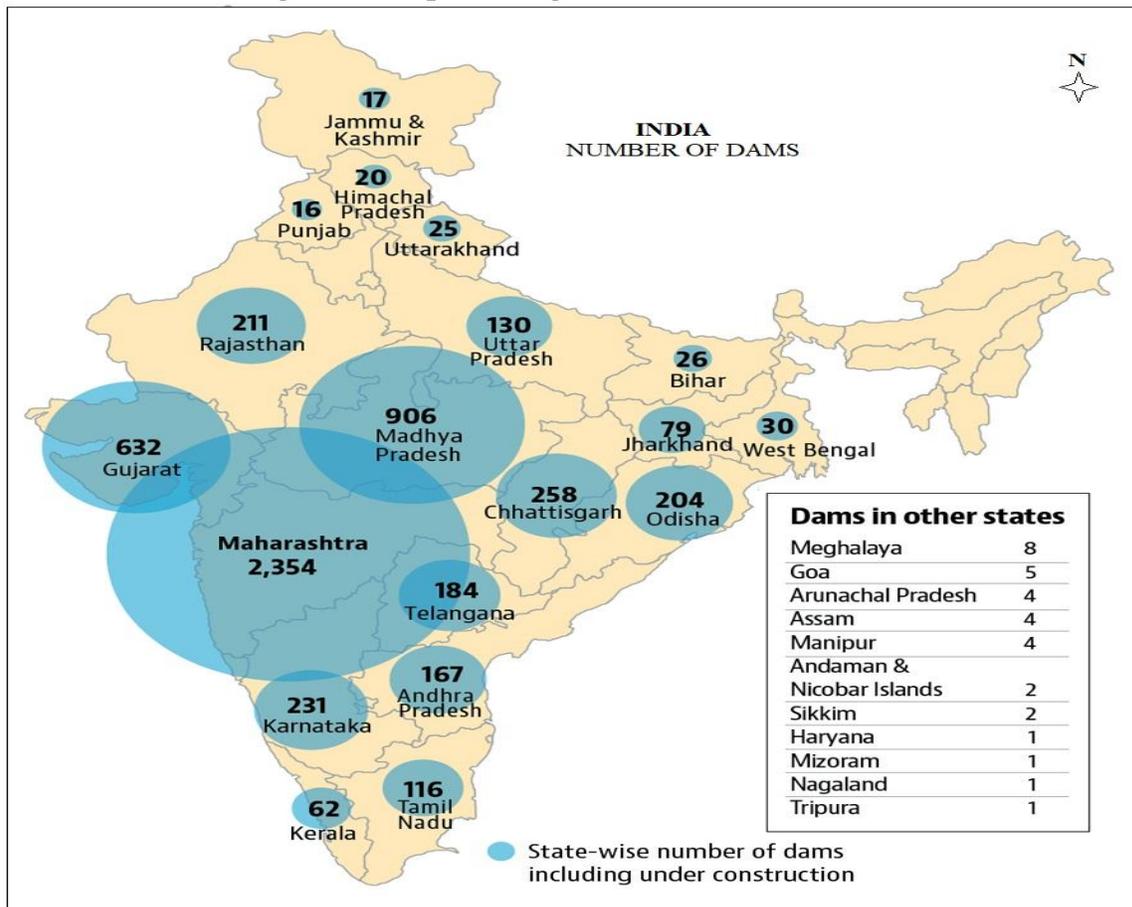

- i. Constructing reservoirs in the courses of rivers could store extra water at the time of flood. However, such measures adopted till now have not been successful. For instance, Dams built to control floods of Damodar River could not control the flood.
- ii. By building flood protection embankments, natural levees and flood walls, flood waters can be controlled from overflowing the banks and spreading in nearby areas. Building of embankments on Yamuna, near Delhi, has been successful in controlling the flood.
- iii. Drainage system is generally choked by the construction of roads, canals railway tracks etc. Floods could be checked if the original form of drainage system is restored and improved.
- iv. By Channel Improvement, Desilting and Dredging of Rivers, river channels can be made to carry flood discharge at levels lower than its prevailing high flood level by improving its discharge capacity. It aims at increasing the area of flow or the velocity of flow (or both) to increase its carrying capacity. Selective desilting/dredging at outfalls/confluences or local reaches can, however, be adopted as a measure to tackle the problem locally.
- v. Diverting all or a part of the flood discharge into a natural or artificially constructed channel, lying within or in some cases outside the flood plains is a useful means of lowering water levels in the river. The flood spill channel skirting Srinagar city and the supplementary drain in Delhi are examples of diverting excess water to prevent flooding of the urban areas.
- vi. Watershed management measures such as developing the vegetative cover i.e. afforestation and conservation of soil cover in conjunction with structural works like check dams, detention basins etc. serve as an effective measure in reducing flood peaks and controlling the suddenness of the runoff.

2. Non Structural Measures

It includes flood plain zoning, flood proofing, flood forecasting and warning systems, flood management plans and integrated water resource management under its ambit.

- a. **Flood Plain Zoning:** It is to regulate land use in the flood plains in order to restrict the damage due to floods, while deriving maximum benefits from the same. The vulnerable areas in the districts can be identified and mapped as per past analysis of floods into extremely (red) and partially (blue) affected zones.

Figure 5- Map showing Number of Dams in India

Source: Retrieved from <https://www.mapsofindia.com>

b. Flood Proofing: It helps in the mitigation of distress and provides immediate relief to the population in flood prone areas. It is a combination of structural change and emergency action, not involving any evacuation. It includes providing raised platforms for flood shelter for men and cattle, raising the public utility installation especially the platforms for drinking water hand pumps and bore wells above flood level, promoting construction of double- story buildings wherein the first floor can be used for taking shelter during floods.

c. Integrated Water Resources Management: All government departments and agencies must prepare their own Flood Management Plans (FMPs) aiming at integrating management of water resources at the basin or watershed scale.

d. Flood Forecasting and Warning in India: Real time discharge and rainfall data is the basic requirements for the formulation of a flood forecast. Most of the hydro-meteorological data are observed and collected by Indian Metrological Department and the field formations of Central Water Commission.

Flood Disaster Preparedness and mitigation is critical to the affected households, community and government. This is cumulative endeavor to all sections of society. After a disaster, a community goes through four phases that overlap- the emergency period, the restoration period, the

replacement reconstruction period and the commemorative betterment period. Time taken by each phase is 10 times longer than the previous one and the rate of recovery is directly related to the extent of damage, the available recovery resources, the prevailing pre-disaster trends and community leadership and planning. These phases can be used as general planning guidelines for community officials.

Moreover, use of science and technology, telecommunications and media for alarming system at the bank of rivers which can alert neighboring dwellers about rising water level can also be an effective measure to minimize the damage. Along with it, awareness programs and preparedness campaign at the flood affected areas can help in limiting losses. Rehabilitation of the neighboring community to a safe and higher place before flood arrives can reduce the danger to life. Quick action in supply of goods and services like medicine, food and water supply helps in quick recovery and limited loss after the disaster. Analysis of flood trend and damage caused by it suggests that there is a need for effective pre and post disaster mechanism as the nature of flood disaster can't be checked but the disaster can be prevented.

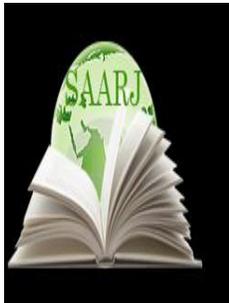

IX- CONCLUSION

To conclude, it is noteworthy to mention here that flood disaster is one of the most severe and acute disasters in India. Its frequent occurrence has killed thousands of people in this country especially in last decade and has rendered millions of people homeless. The recurrence and intensity of floods has amplified over time and has damaged life and economy at a greater extent. Government of India has taken up several substantial measures to reduce the vulnerability caused by flood and other disasters as well. But there is still a long way to go. Need of the hour is to take individual responsibility and coordinate with local communities and government machinery to ensure the ability to respond to and recover from severe events like flood disasters.

ULTRASOUND ANATOMY OF THE THYROID GLAND CHILDREN 4-5 YEARS OLD LIVING IN THE BUKHARA REGION

Temirova Nazokat Rustamovna*

*Bukhara State Medical Institute,
 UZBEKISTAN

ABSTRACT

In children, thyroid hormones are mainly associated with the growth and metabolism of the child along with mental development. A deficiency in these hormones leads to irreparable damage to growth and development, both physical and mental. Despite advances in diagnosis and treatment, thyroid diseases in children are diagnosed rather late. As a result, it harms the quality of patient care. A comparative analysis of the ultrasound anatomy of the thyroid gland in girls and boys aged 4-5 years has been carried out.

KEYWORDS: *Ultrasound, Children, Thyroid Gland*

INTRODUCTION

The purpose of the study: to study and carry out a comparative assessment of morphological changes in the thyroid gland in children 4-5 years of age living in the Bukhara region.

MATERIAL AND RESEARCH METHODS

Ultrasound examination was carried out on the basis of the Bukhara Regional Endocrinological Dispensary (№. 420 01/29/2020) and was devoted to the study of the ultrasound anatomy of the thyroid gland. The study was carried out on a SONOACE R3-RUS apparatus with linear (7.5 MHz) and convex (3.5 MHz) transducers.

Ultrasound biometry of the thyroid gland was performed according to the unified technique of J. Brunn (1981) in modification (A.F. Tsyb et al., 1990). The volume of the thyroid gland was calculated using the formula J. Brunn (1981):

$$TO = (D \cdot T \cdot W \text{ of the right lobe} + D \cdot T \cdot W \text{ of the left lobe}) \cdot 0.479.$$

Where TO is the thyroid volume;

D - Length,

T - Thickness;

W - Lobe width

0,479 — correction factor.

Mathematical processing was carried out directly from the general data matrix Excel 7.0 using the capabilities of the STTGRAPH 5.1 program, the indices of the standard deviation and the error of representativeness were determined.

In recent decades, the number of endocrine diseases, including diseases of the thyroid gland (thyroid gland), has increased significantly due to the global disruption of the ecological balance in the world. [10].

The thyroid gland is an organ, without the normal functioning of which the full development of a child of any age is impossible. Dementia, developmental delay, poor academic performance, problems with the heart, bones and future childbirth, nervousness, overweight - this is caused by diseases of the thyroid gland. It is caused by many reasons, but the main one is iodine deficiency.[1].

Thyroid pathology occurs in 10% of the world's child population, in certain areas this figure exceeds 20%.

Currently, there is a significant increase in thyroid diseases both among the adult population and among children and adolescents [6]. If a child of any age has an enlarged thyroid gland, then this leads to serious changes in health [9]. Poor ecology, hereditary factors, alimentary iodine deficiency, stress, intoxication, trauma, frequent infections, concomitant diseases contribute to the development of pathological changes in the thyroid tissue. The harm caused to society by thyroid pathology is enormous [7]. Iodine is a vital trace element that a person receives only from the outside: with food, drugs, X-ray contrast agents [5,11,12].The only organ that synthesizes compounds containing iodine is the thyroid gland (TG) [2,8].So, in iodine-deficient regions, the deterioration of the main indicators of physical development is shown: in particular, an increase in the number of children with disharmonious development.Schoolchildren with endemic goiter are short [3].

An enlarged thyroid gland (thyroid gland) is a change in its size, mass, volume. Among endocrine diseases of children, it is the dysfunction of the thyroid gland that takes the first place. The main reason is insufficient intake of iodine in the child's body during pregnancy and after birth.

At the same time, 740 million people have endemic goiter, which is 13% of the total population, and 43 million suffer from mental retardation, which is a consequence of iodine deficiency [2,4,8].Thyroid ultrasound is the most common, extremely useful, safe and cost effective way to visualize the thyroid gland and its pathology[4]. Ultrasound allows you to fully judge the location of the thyroid gland, characterize its shape, size, volume, boundaries, contours, internal structure, identify focal pathology, anatomical features of its structure and location, assess the blood supply of both the entire gland and its individual sections.

RESULTS AND DISCUSSION

Determination of the size of the thyroid gland according to the data of ultrasound examination showed that the length of the thyroid gland in girls of 4 years old varied from 40,0 mm to 53,1 mm, on average $44,2 \pm 1,00$ mm, and in boys of the same age from 33,0 to 64,0 mm, on average $48,6 \pm 2,38$ mm, and the width of the thyroid gland in girls is from 9,0 mm to 11,0 mm, on average $9,6 \pm 0,15$ mm, in boys the same age from 8,5 mm to 11,5 mm, on average $9,8 \pm 0,23$ mm, the thickness of the thyroid gland in 4-year-old girls varied from 9,0 mm to 10,5 mm, on average $9,7 \pm 0,12$ mm, and in boys from 8,5 mm to 13,0 mm, on average $10,5 \pm 0,35$ mm. The average volume of the thyroid gland in girls as a whole was $1,9 \pm 0,07$ cm³, and in boys – $2,4 \pm 0,19$ cm³.

Ultrasound examinations of 5-year-old children showed that the length of the thyroid gland in 5-year-old girls varied from 40,2 mm to 56,0 mm, on average $48,9 \pm 1,23$ mm, and in boys of the same age from 40, 0 to 58,1 mm, on average $48,9 \pm 1,39$ mm, and the width of the thyroid gland in girls is from 8,5 mm to 11,0 mm, on average $9,3 \pm 0,19$ mm, in boys of the same age from 8,0 mm to 11,0 mm, on average $9,5 \pm 0,23$ mm, the thickness of the thyroid gland in 5-year-old girls varied from 8,5 mm to 11,5 mm, on average $9,9 \pm 0, 23$ mm, and in boys from 9,5 mm to 13,0 mm, on average $11,1 \pm 0,27$ mm. The average volume of the thyroid gland in girls as a whole was $2,2 \pm 0,14$ cm³, and in boys – $2,5 \pm 0,19$ cm³.

CONCLUSION

Judging by the data obtained, when examining the thyroid gland by ultrasound, boys of 4-5 years old have relatively high rates in all parameters provided for in the study of the thyroid gland compared to girls of the same age.

ABSTRACT

The regeneration process of waste zeolites has been studied in order to find areas for their further usage. The physicochemical characteristics of zeolites after regeneration have been determined. By rising of temperature in the regeneration from 200°C to 400°C, an increase in the specific surface area is observed. In this temperature range, it occurs coke removal, that is, desorption of strongly adsorbed products in large and small cavities of zeolite.

KEYWORDS: *Zeolite, Regeneration, Degree Of Regeneration, Adsorbent, Dynamic Activity, Equilibrium Activity, Specific Surface, Thermo Analytical Studies.*

INTRODUCTION

The toughening of environmental requirements for the production of gas processing necessitates the search for ways to reduce the anthropogenic impact on the environment. The necessity to preserve the quality of environment requires a radical increase in the ecological safety of production. Waste zeolites from the gas processing industry are one of the sources of environmental pollution with solid waste. To reduce the anthropogenic impact of solid waste from enterprises, modern technologies for their regeneration and processing are needed. At present, the regeneration of solid waste and searching the ways to reuse them as sorption materials (SM) in wastewater treatment is of great interest.

Research results and discussion: Synthetic zeolites are used to purify natural gas in the gas industry. In Uzbekistan, synthetic NaX zeolite is not produced by industry, but is widely used in the gas purification process. A large-scale consumer of zeolite as an adsorbent is LLC Shurtan Gas Chemical Complex (ShGChC). The annual demand of ShGChC for the specified adsorbent is about 500 tons. It is purchased abroad for foreign currency.

From the analysis of the literature, it follows that many research works are devoted to solving the problem of recovery (regeneration) of molecular sieve adsorbents (zeolites) and their repeated use in the process of gas purification as sorbents. It is also of great interest to find new areas of their further application, in particular, in the process of post-treatment of wastewater as adsorbents and is very relevant. In this regard, the goal of our research is to find the optimal conditions for thermal regeneration of waste zeolites in gas processing.

Samples of waste NaX zeolites with granule diameters of 4,0 mm and 2,0 mm were used for investigation from LLC "Shurtan Gas Chemical Complex". The selected samples were sifted through sieves 1.5-5.5 mm. In this case, zeolites with dimensions of 2,0-4,0 mm accounted for 70-80%. This provides a basis for considering the possibility of their reuse. We carried out research to find the optimal conditions for thermal regeneration of zeolites and studied their structural, physicochemical characteristics.

Thermal regeneration of waste NaX zeolite should be carried out by heat treatment in an atmosphere (in a stream) of air in the temperature range 200°–

400°C. In this case, the choice of regeneration conditions (temperature, time, volume of supplied air) will be determined by the final properties of the zeolite in relation to the area of its reuse.

The degree of regeneration was determined by the amount of the remaining coke, the completeness of the removal of adsorbed hydrocarbons, H₂S, H₂O, and the quality of the regenerated zeolite was estimated by the value of the specific surface, equilibrium (A_p), dynamic (A_d) activity.

The experiments have shown that the use of atmospheric air, an increase in temperature leads to an increase in the oxidation rate and a decrease in residual coke on the zeolite.

The study of the effect of thermo-oxidative reactivation temperature and analysis of the products of thermal desorption showed that moisture removal by 95-98% occurs at a temperature of 200°C, and the removal of strongly adsorbed H₂S and hydrocarbon compounds in the temperature range of 200°-400°C. In this temperature range, coke removal and desorption of strongly adsorbed products in large and small zeolite cavities are occurred[1].

Based on researches, it was found that the selected zeolites retained their rather high strength characteristics and low abrasion (Table 1).

№	Indicators	NaX	NaX
		D= 4,0mm	D= 2,0mm
1.	Coke content, %	1,4	2,6
2.	The content of adsorbed organic compounds extracting up to 300°C, %	2,2	3,1

	wt.		
3.	Dynamic activity A_d , mg/cm ³ , H ₂ O	98,0	97,0
4.	Equilibrium activity A_p , mg/cm ³ , H ₂ O	115	122
5.	Specific surface, m ² /g	520,0	530,0
6.	Crystal structure	saved	saved

TABLE 1. PHYSICO-CHEMICAL CHARACTERISTICS OF SELECTED ZEOLITES

As seen from Table 1, the coke content is 1.4-2.6%, and the content of organic compounds is from 2.2-3.1%. Removal of the above-mentioned substances and restoration of the original properties of zeolite can be achieved by the thermal desorption method. With an increase in the regeneration temperature from 200°C to 400°, an increase in the specific surface area is observed up to 530 m²/g.

Thus, it can be concluded that the sharpest increase in the specific surface area of reduced zeolites is observed in the temperature range from 150°C to 400°C.

In addition, to determine the degree of regeneration, thermoanalytical studies of the samples were carried out on a Nietzsche Simultaneous Analyzer STA 409 PG device (Germany), with a K-type thermocouple (Low RG Silver) and aluminum crucibles. All measurements were carried out in an inert nitrogen atmosphere with a nitrogen flow rate of 50 ml/min.

The temperature range of measurements was 25-370°C, the heating rate was 5°C/min. For one measurement, 5-10 mg of the sample was taken. The measuring system was calibrated with a standard set of substances KNO₃, In, Bi, Sn, Zn.

As seen from Fig. 1, the weight loss of the sample starts from 45-50°C. The total weight loss is 18.6%. The activation energy (in this case, the release of the absorbed substance from the zeolite) is 323.7 W / g. Release rate 2% min.

From the results of researches, it is clear that as a result of thermal desorption, the main physicochemical properties of zeolites are retained and there is an opportunity for further research to find areas of their application[2].

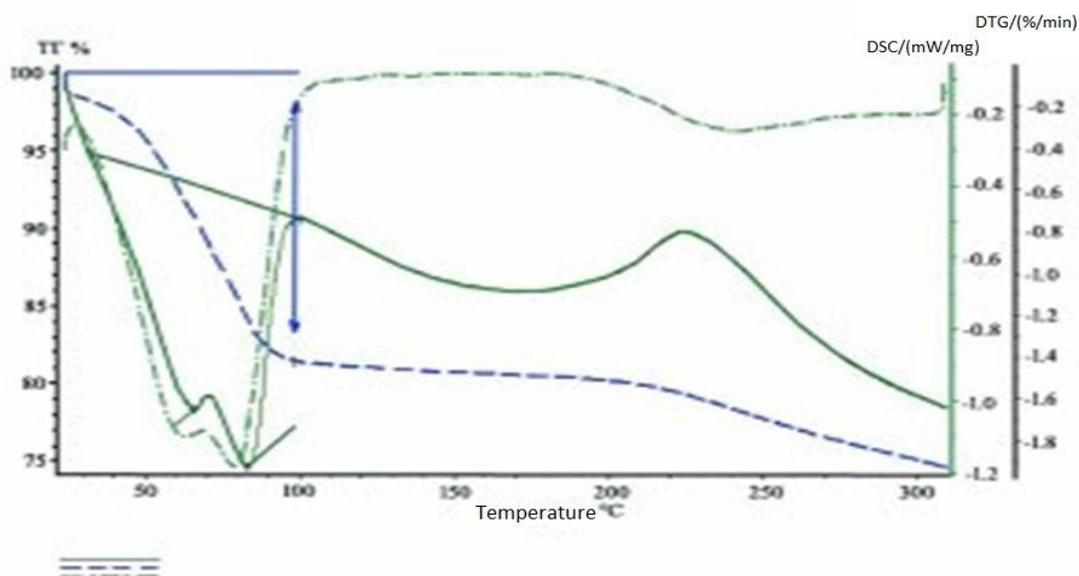

Fig. 1. Thermograms of spent NaX zeolite

— — — — thermogram

_____ differential thermogram

.. . . differential scanning thermogram

TABLE 2 SHOWS THE RESULTS OF A STUDY OF THE WEIGHT LOSS OF SPENT NAX ZEOLITE.

№п/п	Calcination temperature of spent NaX zeolite, ° C	Weight loss, % mass	
		D=2,0mm	D=4,0mm
1.	to 100°	11,72	13,51
2.	to 200°	12,95	15,12
3.	to 300°	14,02	16,96
4.	to 400°	15,33	18,57

TABLE 2. WEIGHT LOSS OF SPENT NAX ZEOLITE DEPENDING ON THE CALCINATION TEMPERATURE

To study the crystal structure of the regenerated zeolites, diffractograms of the zeolites were recorded. Figure 2 shows the diffraction patterns of thermoregenerated zeolites NaX D=2,0mm, NaX D=4,0mm

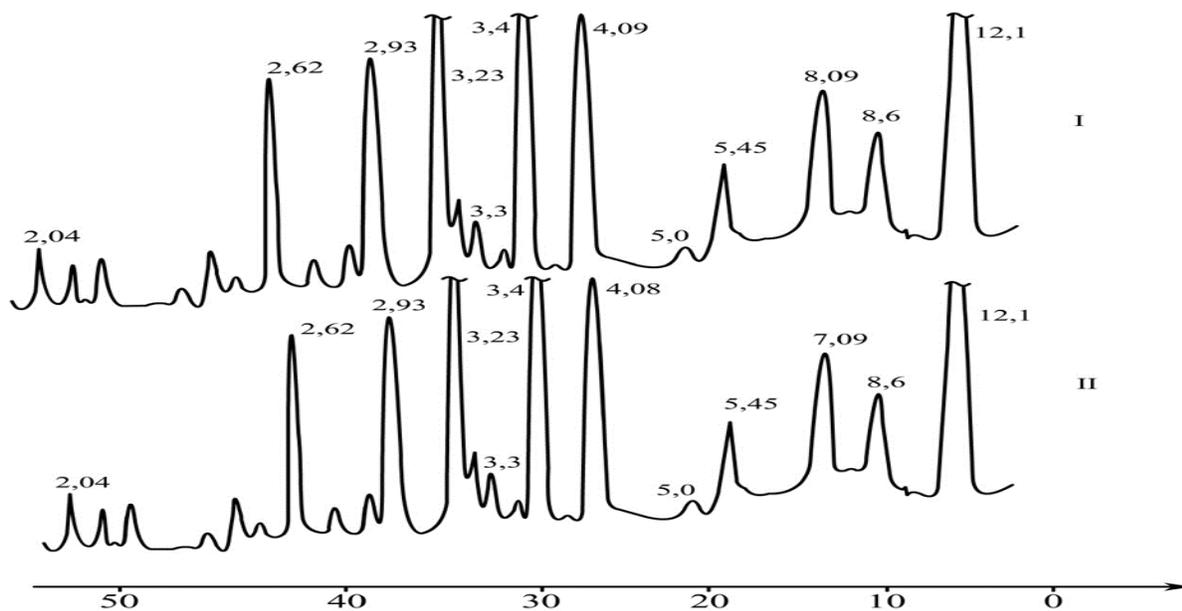

Fig. 2. Diffraction patterns of zeolites I-NaX D=2,0mm, II- NaX D=4,0mm

As seen from Figure 2, the waste zeolites retained their crystalline structure, as evidenced by the presence of diffraction peaks with interplanar spacing of 12.1; 8.0; 7.0, 4.09; 3.1; 2.93; 2.62Å characteristic of the initial phases $\text{Ca}_6(\text{AlSiO}_4)_{12} \cdot 30\text{H}_2\text{O}$ and $\text{Na}(\text{AlSiO}_4)_{12} \cdot 27\text{H}_2\text{O}$.

It can be seen that, in the experimentally established optimal modes, no noticeable change in the phase composition of the thermo regenerated zeolite is occurred. As fresh, it can also be used as an adsorbent.

The wide range of applications of zeolites and their reliably proven effectiveness, primarily in the treatment of water, industrial and domestic wastewater, petrochemicals, energy, and agriculture, according to many domestic and foreign scientists, allows for research on the use of regenerated zeolites at the stage of post-treatment of wastewater [3].

It is known that the sorption properties of zeolites make it possible to effectively remove substances in dispersed and colloidal form from water:

- Suspended solids,
- Finely dispersed suspension,
- Petroleum products.

Further studies of the adsorption capacity of the regenerated zeolites were carried out at the stage of post-treatment of wastewater, in order to bring the concentration of dissolved organic substances that are part of petroleum products. up to the required water treatment standards. Thus, it becomes possible to dispose of waste from the gas processing industry and create a recycled water supply at oil refining enterprises.

As a result of the conducted studies, the dynamic sorption capacity of the regenerated zeolites (mg/g) was determined. The model solution uses distilled water with a concentration of

petroleum products (NP) from 3 to 150 mg/dm³. The model mixture of water with NP is prepared by dilution. At the beginning of the experiment, 1 dm³ of pure distilled water is passed through the loading to wet the regenerated zeolite and prevent the "wall effect". The same volume of waste water – 1 dm³ is always passed through the filter loading. The NP concentration in the filtrate is analyzed by the IR spectrometric method in accordance with GOST R-51797-2001 on a UNICO 1201 spectrophotometer. The results are presented in Table 3.

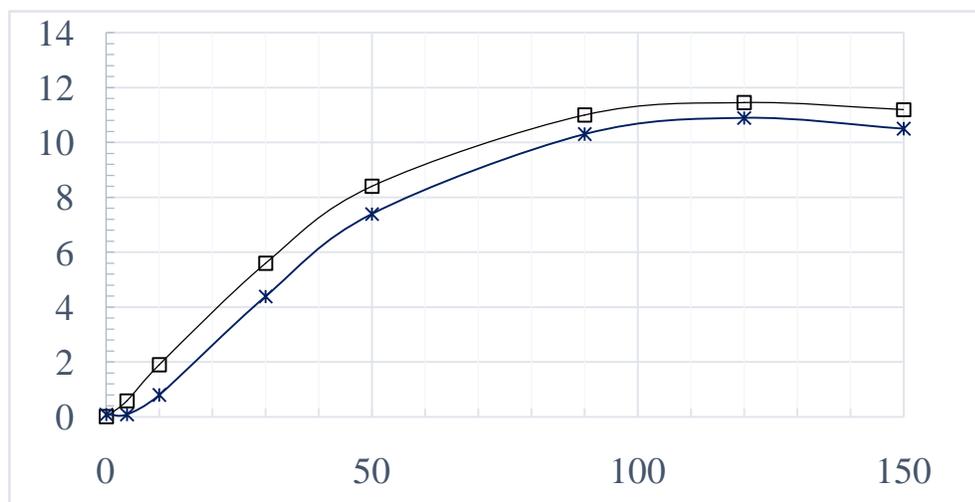

According to the results of Table 3, an adsorption isotherm is constructed for the absorption of NP from water in coordinates $a=f(c)$, where c is the concentration of NP.

Weight of zeolite, g	Initial NP concentration, mg / dm ³	Final NP concentration, mg / dm ³	Dynamic sorption capacity, mg / g	
			D=2,0mm	D=4,0mm
5,00	3	0,10	0,45	0,55
5,00	10	0,14	1,83	1,90
5,00	30	0,18	5,50	5,70
5,00	50	0,26	7,10	8,30
5,00	90	30,38	9,00	11,00
5,00	120	56,51	10,00	12,10
5,00	150	79,80	10,26	13,15

TABLE 3. DYNAMIC SORPTION CAPACITY OF REGENERATED ZEOLITE NAX IN RELATION TO PETROLEUM PRODUCTS

The adsorption isotherm is shown in Figure 3.

a, mg/g

C, мг/дм³

Figure 3-Isotherm of NP adsorption from water by NA zeolite

□ - D=4,0 mm, * - D=2,0 mm under dynamic conditions

The analysis of the obtained adsorption isotherm shows that in this case Henry's law is valid: "the sorption capacity is proportional to the final concentration of NP". The isotherm

corresponds to the L-type Langmuir isotherm. The convex shape of the isotherm confirms the effective adsorption of NP from aqueous solutions.

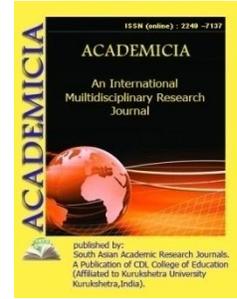

CONCLUSIONS: To solve the current environmental problem – the disposal of industrial waste, in particular spent zeolites, a thermal regeneration of them is proposed. The results of the conducted research on the regeneration of zeolites serve as the basis for further research on finding the scope of their application as adsorbents in the process of post-treatment of industrial wastewater, which allows the creation of recycled water supply.

ABSTRACT

The study studied the morphometric changes in body parts of 20 boys and 30 girls 8 years old with scoliosis (n=50) and compared with healthy children (n=50, 20 boys and 30 girls). It was established that scoliosis leads to violations of not only the functions of the musculoskeletal system, but also the development of negative shifts in anthropometric parameters.

KEYWORDS: *Morphometric Indicators, Scoliosis, Chest Circumference, Anthropometry, Body Length, Body Weight.*

INTRODUCTION

The relevance of the problem. Scoliosis is a persistent deformity of the spine characterized by its lateral curvature relative to the plane of the vertebral column. While 20% of cases of scoliosis can be attributed to neuromuscular, syndromic or congenital disorders, up to 80% of all scolioses are called "idiopathic" or of unknown etiology [1, 2]. The severity and prevalence of scoliosis in girls is higher than in boys [3,4]. According to the literature, it was found that girls with idiopathic scoliosis were generally taller and heavier than healthy children. In particular, it was found that girls with this disease were significantly taller and heavier at age 12, while boys with scoliosis were significantly taller at age 14 than their healthy peers [5, 6]. There is no objective data that determines the possible development of scoliosis in the early stages. There is no consensus on the early diagnosis and prevention of possible consequences of scoliosis, which justifies the need for research in this area.

The goal of the study was to study the anthropometric parameters of children aged 8 years with scoliosis and to compare them with the anthropometric indicators of healthy children.

MATERIALS AND RESEARCH METHODS

The research was conducted at secondary school No. 2 and boarding school No. 23 in Bukhara for children with scoliosis. The results of examination of 50 children (20 boys and 30 girls) aged 8 with idiopathic scoliosis of thoracic localization of I and III degree according to Chaklin were studied. All examined children were divided into 2 groups by simple randomization, comparable in age, gender, and clinical and functional indicators. The main group consists of 50 children (20 boys and 30 girls) with scoliosis, and the control group consists of 50 healthy children (20 boys and 30 girls).

The results and discussion of the study

All examined children showed clinical and radiological signs of scoliosis, the direction of the thoracic scoliotic arch was right-sided or left-sided. Studies have shown that the height of 8 year old healthy male children ranges from 115,3 cm to 133,1 cm, with an average of $124,7 \pm 1,16$ cm. The body weight ranged from 18,4 kg to 39,0 kg, with an average of $25,3 \pm 1,30$ kg.

In a study of children with scoliosis, it was found that the height of 8 year old boys ranged from 116,2 cm to 130,3 cm, with an average of $120,4 \pm 0,87$ cm. The average body weight is $21,3 \pm 0,37$ kg (from 19,4 kg to 25,2 kg).

The height of 8 year old healthy girls ranged from 136 cm to 155 cm, on average it was equal to $140,7 \pm 1,18$ cm. The average body weight is $35,4 \pm 1,74$ kg (from 28 kg to 56 kg).

Studies have shown that the height of 8 year old girls with scoliosis ranges from 116,5 cm to 127,2 cm, with an average of $121,3 \pm 0,682$ cm. The body weight varied from 15,3 kg to 25,1 kg, with an average of $21,5 \pm 0,62$ kg.

During the research, it was found that in healthy boys of 8 years of age, the chest circumference in the pause ranges from 56.3 cm to 68.5 cm, with an average $61,0 \pm 0,74$ cm, at the height of inspiration from 53.2 cm to 72.1 cm, with an average $63,9 \pm 1,18$ cm, and at full exhalation from 55.5 cm to 68.0 cm, an average is $60,4 \pm 0,74$ cm.

Studies have shown that in 8-year-old male children with scoliosis, the chest circumference varied from 57.2 cm to 66.7 cm, with an average $61,5 \pm 0,56$ cm, at the height of inspiration from 60.1 cm to 71.0 cm, with an average $64,9 \pm 0,86$ cm, with full exhalation from 56.0 cm to 65.5 cm, with an average $60,6 \pm 0,56$ cm.

As a result of research, it was found that in 8-year-old healthy girls, the breast circumference in the pause ranges from 55.6 cm to 64.2 cm, with an average $58,8 \pm 0,56$ cm, at the height of inspiration from 57.2 cm to 66.4 cm, with an average $60,7 \pm 0,56$ cm, with a full exhalation from 54.4 cm to 62.2 cm, with an average $57,9 \pm 0,50$ cm.

In 8 - year-old girls with scoliosis, the breast circumference in the pause varies from 51.5 cm to 67.2 cm, with an average $62,0 \pm 0,99$ cm, at the height of inspiration from 53.1 cm to 70.0 cm, with an average $65,1 \pm 1,05$ cm, with full exhalation from 50.2 cm to 66.1 cm, with an average $61,0 \pm 1,99$ cm.

Anthropometric studies conducted among 8-year-old male and female children with scoliosis showed that the growth parameters of male children are 1.04 times, and those of female children are 1.01 times behind those of healthy children.

The breast circumference in pause in boys with scoliosis of 8 years of age is 1.01 times, and in girls of this age with scoliosis is 1.05 times more than in healthy children. The chest circumference at the height of inspiration in boys with scoliosis 8 years of age is 1.02 times, and in girls 1.07 times more than in healthy children of this age. Breast circumference at full exhalation in male children of 8 years of age with scoliosis is 1.0 times, and in girls it is 1.05 times more in comparison with healthy children.

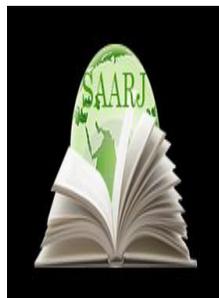

Some authors claim that scoliosis occurs in 2-9% of children and adolescents under the age of 16, and the prevalence of this severe disease in school-age children reaches 15-30% or more [8,9]. We also found that it is at the age of 8 that scoliosis begins to progress in children.

DISCUSSION AND CONCLUSION

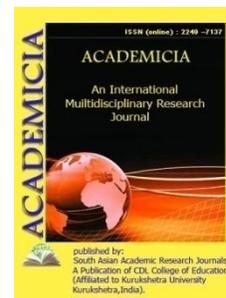

Children with scoliosis lag behind their healthy peers in height and body weight. This is due to the fact that the bone system of children at this age is in the development stage, and scoliosis has a detrimental effect on the growth of parameters of physical development of the child. The breast circumference in pause, at the height of inspiration and at full exhalation in children with scoliosis is greater than the breast circumference of healthy children. Curvature of the vertebral column leads to an increase in the parameters of the chest circumference in all stages of respiration. Due to the pronounced curvature of the vertebral column, the chest is deformed, and this leads to a limited excursion of the chest during breathing in comparison with healthy children.

ABSTRACT

The article is devoted to one of the poorly studied problems of terminology systematics. The interest in this problem can be explained by the fact that it is associated with the question of the organization of scientific knowledge. From these positions, we consider the consistency of terminology as one of the ways to study thinking. Traditionally, the problem of the systematic nature of the term was studied in relation to the concept of structuralism. The main criterion was the degree of organization of the term set. The structure was associated with a lower level of organization, and the system was characterized by a higher level of organization. The traditional views on consistency have proved to be unproductive, since they have not found significant confirmation in the analysis of practical material. In this article, we make an attempt to develop the concept of the main directions of studying terminological vocabulary and fill it with content related to the methodological and cognitive aspects of studying the term.

KEYWORDS: *Terminological Vocabulary, Problems Of Terminology, The Term, The Methodological, Technical Words, Specialized Language, Studying Terminological.*

INTRODUCTION

What is terminology? Terminology is the study of the formation, establishment, structure, specification, and other principles of terminology in various disciplines. The subject of the questions. So, what is this term? Terminology is a specialized term in various disciplines. Each term has strict rules.

In its first sense, the word terminology means a "set of technical words belonging to a science, an art, an author or a social group", for example, the terminology of the medicine or terminology of computer scientists. Taken in a more restricted or specialized sense, the same term refers to a "linguistic discipline devoted to the study. Scientific of concepts and terms in use in languages specialty ». If the common language is the one used in the daily life, the specialized language is that of communication unambiguous in a particular area of knowledge or practice, based on vocabulary and language uses that his own.

Terminology is a means of communication in a specialized language Terminological practice refers to applied linguistics, which includes work on specialized lexicography, translation, writing, and language teaching. In fact, these four professional applications of linguistics are closely related: specialized translation requires proficiency in bilingual or multilingual specialized terminology, technical writing is their "monolingual speech", and teaching specialized languages is aimed at their acquisition by students, while as the institutional practice of comparative terminology and its phraseological component flourishes in the translation environment.

Terminology activity is based on the ability to identify terms designating concepts specific to a domain, to attest to them use specific references, describe them briefly discerning good use from wrong use, and recommending or to discourage certain uses in order to facilitate unambiguous communication. In comparative terminology, the delays that inevitably result from Inter-language transfers specialized knowledge is highlighted during the identification of terms, by the absence of proper designations in one of the languages in touch. In this case, the role of the terminologist is to describe the and to propose designations that fill. For the proposal of a term to be acceptable and it must be based on a good knowledge of the rules of lexical training in the host language, insert harmoniously in the terminology set in place, and be clearly presented as a "proposal" of the terminologist.

Terminology content management by field of activity reflects the evolution of specialized concepts and uses field-specific languages, taking into account the needs of user. It aims to maintain the coherence and timeliness of information stored through additions, cancellations, and data changes. It allows the selection of certain data types for product preparation and delivery terminology such as bilingual lexicons, vocabularies, unilingual or multilingual phrase logical dictionaries, and terminology standards.

Any terminological activity, starting with the identification of terms and ending with the define the word, can be done manually. It, however, ensures gains of unprecedented productivity, quality and accessibility. This is especially true for terminologists working in a company, a government agency or a translation where they must create, maintain and operate important computerized terminology files designed for many users, and taking into account the needs of clearly defined communication.

The fundamental principle of any terminology approach is the belonging of the terms to areas of activity structured in specialized knowledge classification systems. Each specialty has such a system, also called domain tree and everything consistent terminology set must reflect this. Document classification systems, encyclopedias, manuals, databases focused on the transmission of knowledge provide the beginner terminologist with the necessary framework to the establishment or adoption of such a classification system for the field in which he is called upon to carry out his research terminological.

The terminological definition is a brief lexicographic formula which indicates the distinctive semantic features of a concept. She is it is meant to describe a concept, not to provide information on the use of a term. This is what distinguishes it from observation linguistics of the type "term used in X to designate Y". There terminology definition is the most important application of principle of intentionality and the main means of establishing the terminology hook.

In the practice of technical and scientific fields, the fundamental terminologies are validated using definitions of authoritative works, while the recent definitions often require the construction of definitions from disparate textual elements. In these areas, the editorial staff must follow very closely existing models and stylistic variations are rather limited. This is one of the reasons for the quasi-identity of definitions of the same concept in the best dictionaries, technologists. On the other hand, socio-economic areas and legal are distinguished by the wide variety of definitions dealing with a concept according to historical peculiarities, of the institution or country in which it is located conveyed. In both cases, however, the importance of respect for Human Rights the danger of abusive quotations, the requirement for conciseness, quality and originality of the content, and the imperative of uniformity of terminology banks oblige the terminologist to reformulate most of his definitions using references to the analyzed documentation, and to resort to citations definitions or contexts sparingly. This obligation is strengthened by the law of intellectual property when creating marketable terminology products.

Concepts can be described in several ways: especially in the case of more complex abstract concepts, the key interpretation is to verbally define their relationships with other concepts and at the same time to analyze or list their most important properties. The definition is intended to reflect the structure of the term, but it never describes it exhaustively, so the existence of several partially or fundamentally different definitions for the same term is not unusual. It is always a mental creation of a person, a kind of generalization or synthesis.

A common form of representation is also figurative, which is used to refer to terms denoting objects or activities of a non-linguistic reality.

Basic concepts of Terminology theory (term, name, subject, semiotic triangle), terminological entry, terminology work, the formation and selection of preferred terms, terminology, tools, Create terminological entries, and other topics.

The terminology system of an area or areas can be represented in various terminology products: a terminology dictionary, a terminology database, or a multilingual dictionary. Terminology dictionaries are mainly focused on one or several related disciplines and are formed by terminologists together with specialists.

Working on terminology is working with a professional vocabulary. In a professional world characterized by growing specialization, high rates of innovation, and greater demands for communication across language and professional boundaries, it is becoming increasingly important.

Terminologists are at the service of understanding. They research, check and define technical words in monolingual or multilingual form, prepare the developed terminology with computer-aided tools and ensure its dissemination. In this way, they create an important prerequisite for the comprehensibility of documents, contribute to efficient and smooth communication and ensure that central knowledge is represented and maintained in organizations. The work opportunities in the field of terminology are diverse and attractive. Terminology specialists work in companies in a wide range of industries, in international organizations.

Terminology can be divided into two components: theoretical terminology and applied terminology. Theoretical terminology the general law of the formation and development of terminology in various disciplines, including the essence, features and functions of terminology, is considered.

The best way to systematize other aspects of the problem. Applied terminology research terminology management, standardization, terminology codification, terminology translation.

Translation, building a terminology base, and other practical issues. Theoretical terminology and applied terminology are interdependent and complementary. In terms of scope and scope, applied terminology is broader than theoretical terminology. From the point of view of the role, theoretical terminology occupies a more important position. In fact, theoretical terminology is the basis for creating a terminology discipline.

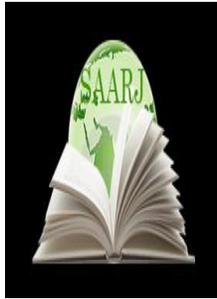

Terms are lexical units, the meaning of which is considered in relation to the field of specialty, that is, the field of human knowledge, often associated with social and professional activities. For example, vaccination, central nervous system, solid mother are medical terms; axle, camshaft, radial tire are automotive mechanics terms; and software, operating system, and mouse are computational terms. Terminology sorts the lexical units that follow each other in a specialized text to focus on the terms.

The terminology is based on the theoretical models offered by the terminology. However, the theory of terminology serves almost exclusively as a basis for practice.

ABSTRACT

The article discusses the technology of scribing, which allows you to organize the process of working with information more creatively and effectively. The paper describes the results of the study of the concept of scribing, builds a structure and discusses technologies for the development of video content.

KEYWORDS: *Scribing, Visualization, Video Content, Visibility, Video*

INTRODUCTION

The development of new technologies and constantly changing trends in the modern world make us focus on the future. The requirements of the modern child are changing, and Power Point has already ceased to attract his attention. Thus, educational videos and scribing borrowed from the business environment gradually began to enter the educational environment. Unfortunately, while few know about such techniques for preparing educational material, not all educational institutions apply them in practice. We think that soon videos with the use of scribing will gain momentum, because the visualization of the educational process gives great prospects for the development of students and teachers [2, p. 321]. The student acquires qualities such as imaginative creative thinking, the ability to work in a team for a result, which will be his support in the future. The principle of visibility is important in teaching. A child learns complex material

faster and easier when all channels of information perception are working [1, p. 16]. In this article, we will talk about the basic principles of designing training videos, the criteria that distinguish "correct" scribing, and the rules of visualization. Let's consider some of the available services and programs for a successful start in this area. The relevance of this work lies in the fact that the use of a variety of text visualization tools, namely video with the use of scribing, in the classroom helps students to visualize abstract concepts, capture, and then reproduce the material they saw [5]. Thus, there is a qualitative assimilation of the key points of the studied material. Visualization allows you to link the information received into a complete picture of a particular phenomenon or object.

Video scribing is a video that depicts the process of drawing certain graphic symbols and text, accompanied by a voiceover [3]. Conventionally, all video scribing techniques can be divided into manual (drawing scribing, scribing - application, magnetic scribing) and computer (when creating computer scribing, special programs and online services are used). We will consider computer scribing in more detail. There are not many services for creating computer scribing, and only a few of them are freely available. Let's consider some of them. An example for creating scribing for free is the PowToon service. Pow Toon is an English-language animated presentation generator - an online service with a set of ready-made templates and the ability to create a presentation from scratch. Free possibilities of the service are somewhat limited: using a ready-made template, you can create a video up to 45 seconds, and without a template - up to 5 minutes. The service is configured for a widescreen monitor: the resolution should be 1280 x 768. Finished works can be directly uploaded to YouTube. You can record your voice to your presentation or add a suitable soundtrack from the existing library [4]. There is another service, Video Scribe software. Video Scribe is an English-language program that allows you to create great video scribes for those who can't draw. It can be downloaded on the official website of the company and used for free for 7 days, completed works are uploaded to YouTube. Initially, the program will offer a white canvas to fill with your own content, the entire presentation in Video Scribe is placed on one large field, and not on several slides [4]. Video Scribe allows you to select the background color and texture, font, and the hand holding the pencil or brush. Unfortunately, the Cyrillic alphabet is not supported, so the text in Russian can first be saved as an image, and then loaded into the presentation [4]. The library of illustrations contains many pictures, you can also upload your own images [4]. Settings apply to each item. You can record your voice for video scribing or add a suitable soundtrack from the existing library.

Having considered the types of scribe presentations, we will highlight the positive and negative aspects of this technique.

Minuses: Difficulty writing a script; training in drawing diagrams, graphs, figures; a selection of illustrations for creating application scribing; large time expenditures for voice acting, filming and film editing; technical difficulties.

Pros:

1. Efficiency - in a short period of time you can explain the material in an accessible and qualitative way.
2. Versatility of visualization. The language of the picture is clear to everyone. Scribing is to some extent a universal language of communication.

3. High-quality assimilation of information and memorization of key points of the presentation [5].
4. The possibility of continuous communication with the audience throughout the entire presentation.
5. The ability to use the scribe (a general picture that is obtained by the end of the event) in further work as a review of all the information received [5].
6. The effect of parallel repetition - the sound sequence is illustrated by images almost simultaneously, which contributes to the quality assimilation of the material.
7. The video clip can be shown an unlimited number of times. Video scribing is one of the most interesting, effective and convincing ways of presenting information.

Let's consider a number of general principles of scribing design:

1. The principle of brevity. S-presentation should contain only images of essential information, reflecting an accurate understanding of its meaning. Visual emphasis should be placed on the main interconnected elements by removing distracting details.
2. The effect of parallel sequencing.
3. The principle of the leading role of theoretical knowledge. S-presentation is aimed at better memorization and understanding of theoretical facts, at understanding concepts.
4. The principle of emphasis on the main semantic elements. The main elements of the transmitted information should be highlighted in size, color, and framed.
5. The principle of using associations and stereotypes. It is advisable to use associations that are understandable to students with drawings, conventional signs, arrows.
6. The principle of structure. Any information presented in the form of graphic images should have a certain plan, a certain scheme of presentation, in the form of easily remembered images.
7. The principle of independence. To facilitate the perception and understanding of complex information, it must be broken down into separate simple images.
8. The principle of the final link. S-presentation should contain a summary of all the information presented in the form of an interactive dictionary for each point of the plan, the nodal element of the scheme.

Basic rules for Scribe video design:

- A) The 7-plus-minus-two rule. The rule according to which a person's memory in most cases cannot remember or reproduce more than 7 ± 2 elements. For scribing, this rule means that the content of the logically complete part of the scribe, where there are more than 7-9 objects, will not be perceived in full.
- B) "The effect of parallel following". Means that the scribing picture and the voice dubbing the video must go together, in parallel. The voice should neither lag behind nor overtake the picture.
- C) Using one color scheme in your video. Too bright picture on the screen can knock a person off the topic of the video, distract. Using several (more than 3) color gamuts at once in a video can make it difficult to understand due to the overload of color information. Let's take a look at

some color schemes and associations. Red color adjusts to the rise of energy, emotional rise; green is associated with performance; blue or light blue - with calm; yellow color directs to physical activity; purple color - a color in which more than 20% of the video information is not absorbed; black is the color of stress, it is better not to use it in large quantities.

D) Less text means more action. Scribe is initially a dynamic picture, a video that doesn't have to be boring and monotonous. Use more voice guidance, actions of the main characters of the video (for example, a girl student).

Creating an animated Scribe presentation isn't always limited to just creating a footage. In some cases, it is necessary to separately "superimpose" the voice on the video or add other "pieces" of video to the animated presentation.

Then video editing programs come to the rescue. Consider a fairly easy-to-use and free program:

1. Windows Movie Maker (or Film Studio). Pros of the program: completely free; preinstalled on most computers; easy to use, training does not take much time; fast video saving. In this program it is possible to cut out unnecessary parts of a video, "glue" several videos, insert transitions between videos, an audio track, add text (titles). The disadvantage of this program is that it only supports linear video editing. However, this required minimum is enough to create a full-fledged video.

2. VideoPad. This program supports editing media files, adding effects and transitions, adding or customizing audio or voice acting, and finally, saving and exporting video. Of the minuses - only slightly limited control functionality.

The big advantages of these programs is the support for the Russian interface, which makes them understandable and accessible for use.

Steps to create your Scribe-video:

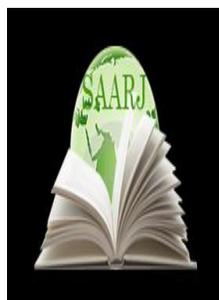

1. Choosing a theme for the video;
2. Collecting information on the topic of the video, preparing the text of the voiceover. It is advisable to write down all the ideas, aspects that you want to use or highlight in your video;
3. Drawing up an approximate composition of the video in accordance with its tasks and the intended audience. The video should be understandable not only for you, but also for your viewers. A competent combination of words and illustrations that will clearly display the main ideas of the presentation - this is scribing;
4. Visualization of information in programs or services for scribing using pictures, the main characters of the video. Necessarily in parallel with the written text for scoring the video and in compliance with the design rules. Don't forget about the timing of your video, it shouldn't turn out to be too long and boring;
5. Recording audio accompaniment to video;
6. Processing the resulting scribe video in a video editor;
7. Combining video and audio files in a video editor;
8. Saving the project and using it. It will be effective for the educational process not only to watch Scribe videos by students, but also to create them. Scribing contributes to the formation of

such universal educational actions as the ability to transform information from visual signs into speech and symbolic ones; formulate the problem, topic and purpose of the work; the ability to establish causal relationships; organize joint work and listen to the opinions of others (when working in a team).

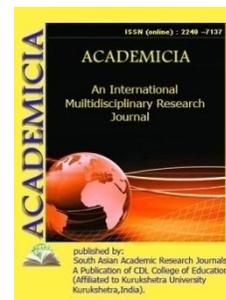

In conclusion, I would like to say that this technique of creating training videos is only gaining momentum in the educational sphere, but it already allows many teachers to achieve a deep understanding and better memorization of the material due to clear and colorful visualization of the concepts under consideration. This article will be useful for teachers not only for learning the "Scribing" technique, but also for generating more interest in the students in the subject being studied, as well as the technique of creating a Scribe video itself.

PRIORITY DIRECTIONS OF NUCLEAR MEDICINE

Sodikov N.O*; Sodikov M.N; Temirov F.N*****

^{1,3}Samarkand State Medical Institute,
 Samarkand city, Republic of UZBEKISTAN

ABSTRACT

This paper analyzes modern methods and technologies for obtaining medical diagnostic and brachytherapy radioactive drugs. In addition, information is given on the features of the use of accelerators for proton therapy. Research aimed at the development of new technologies for nuclear medicine and radiation therapy is a priority part of the work plan of research centers and universities in developed countries. Investments in research in nuclear medicine and radiation therapy are viewed in developed countries as a necessary contribution to improving the quality of life of the population.

KEYWORDS: Nuclear Medicine, Oncology, Radioisotope, Accelerator, Brachytherapy.

INTRODUCTION

Nuclear medicine has now become an essential part of the health care system in all industrialized countries. Having received the main impetus for development in the second half of the twentieth century, when electronics and robotics began to develop rapidly, nuclear medicine has replenished its arsenal with modern tools for performing procedures, especially diagnostic ones.

More than half (a significant part) of cancer patients are currently being cured with the use of remote or contact radiotherapy. Moreover, the number of patients receiving such treatment is constantly increasing in developed countries. One or another form of radiation diagnostics (X-ray computed tomography, positron emission tomography (PET), single-photon emission computed tomography, etc.) undergoes almost every patient suffering from oncological or other serious illness. Research aimed at the development of new technologies for nuclear medicine and radiation therapy is a priority part of the work plan of research centers and universities in developed countries. Investments in research in nuclear medicine and radiation therapy are viewed in developed countries as a necessary contribution to improving the quality of life of the population.

This paper provides an overview of the most promising technologies and approaches used in nuclear medicine.

Fundamental and applied research in nuclear and neutron physics is carried out at the Institute for Nuclear Research (INR) of the Russian Academy of Sciences in Troitsk, the use of the results of these studies makes it possible to produce the majority of medical isotopes and to carry out proton therapy of neoplasms of any localization.

For experimental research in the field of proton therapy, INR RAS uses a proton accelerator that provides proton beams with energies from 100 to 220 MeV with an average current of up to 100 μA .

Based on the experience of other nuclear centers and the existing trends in modern medicine, as well as taking into account the possibility of the available proton accelerator, a research program for medicine at INR RAS was formed, which is now (currently) being implemented.

The main directions of this research program are proton therapy, production of radioisotopes for diagnostics and therapy, production and introduction of sources for brachytherapy and radiation diagnostics.

As you know, accelerated protons have specific behavior when passing through any medium - the released or ionizing energy does not decrease as it slows down in the medium, as in electrons or photons, but, on the contrary, reaches a maximum at the moment of stopping. The release of ionizing energy in the tissues of the body leads to local destruction of cells in a given place.

By individually selecting the proton energy, it is possible to locally destroy a tumor located at any depth.

The practical implementation of proton therapy is still a very complex scientific and technical problem. For example, in Russia in need of proton therapy, according to various estimates, from 30 to 50 thousand patients annually.

Despite the unique characteristics of the beams of the existing high-current proton accelerator, it would be optimal to use a new specialized medium-energy proton accelerator for proton therapy and other applied problems in the interests of medicine.

The cyclotron provides high-intensity proton beams with energy ($E = 30\text{-}100\text{ MeV}$). In this case, the linear accelerator further accelerates to an energy of $E = 250\text{ MeV}$ only a small part of the protons from the cyclotron used for proton therapy.

The need for radioisotopes for the diagnosis and treatment of various diseases is increasing every year. A number of such isotopes can be obtained with a sufficiently high economic efficiency only at high-current medium-energy proton accelerators. There are less than ten installations of this type in the world so far.

Let's consider some issues of using strontium-82 (half-life of 25 days) and generators of strontium / rubidium-82 for PET diagnostics. The use of a short-lived radionuclide generator, in this case rubidium-82 (half-life 1.3 minutes), avoids the need to build a cyclotron and create a radiochemical laboratory directly in the clinic. This makes the procedure for wound diagnosis of myocardial infarction and some other diseases more accessible.

This is the way in which PET diagnostics is mainly carried out in the United States, where mortality due to cardiovascular diseases is second only to deaths from cancer. In Russia, mortality from cardiovascular diseases ranks first, also due to the extremely low level of early diagnosis of the population for these diseases.

INR RAS has developed a technology for the production of other isotopes for medicine. Sn - 117_m is a promising medical therapeutic radionuclide. It is used primarily for the treatment of bone cancer. At the same time, studies in recent years have shown extremely high efficiency of using this isotope for the treatment of vascular diseases. At INR RAS, with the participation of the Bruchhaven National Laboratory (BNL, USA), a technology has been developed for the production of tin (Sn -117_m) in a state "without a carrier" from irradiated targets containing antimony.

On the basis of this technology, the Medical Radiological Research Center (MRRC) in Obninsk has created new Radioactive Pharmacological Preparations - albumin microspheres for the treatment of prostate adenoma, liver and breast cancer and other diseases, which have demonstrated their effectiveness in biological experiments. Actinium-225 and Radium-223 are also very promising radionuclides with low-range alpha radiation in biological tissues. The massive use of these radionuclides can significantly improve the therapy of a number of oncological diseases.

INR RAS conducts research in other promising areas of nuclear medicine and radiation therapy, in particular, in the field of brachytherapy. For a number of localizations of malignant tumors (prostate, breast, gynecological localization, etc.) brachytherapy is the most effective sparing radical treatment. Brachytherapy is based on the introduction of sealed radioactive sources directly in the area of the tumor. Moreover, in most cases it is possible to avoid post-radiation complications, and the duration of treatment is only a few days.

Brachytherapy, according to the type and activity of the sources used, is divided into low-dose (LDP) and high-dose (HD) brachytherapy. Currently, two types of sealed radionuclide sources are mainly used for conducting VDB: based on cobalt-60 and iridium-192. The high energy of gamma radiation of cobalt-60 leads to significant irradiation of the vital organs of patients.

The main isotopes used for brachytherapy are:

Isotope	Half-life, day	Average energy, keV
I-125	60	28.4
Cs-131	9, 7	30.4
Pd-103	17	21
Ir-192	74	356.8
Co-60	5 years	> 1 MeV
Yb-169	32	92.8

According to experts, the need for operations using all types of brachytherapy, for example in Russia, is at least 50,000 operations per year.

Carrying out research in this direction allows you to move on to the introduction into practice in Russia and abroad of a new promising technology in medicine - brachytherapy with ytterbium sources. The massive introduction of these technologies in medicine is facilitated by the

advantages of new sources over existing analogues: less costly preparation of therapeutic rooms, lower cost of sources and simpler logistics of their delivery to medical institutions. At the same time, the therapeutic properties of ytterbium sources are at least no worse than those of the analogs used with other isotopes.

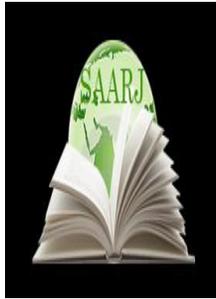

Uzbek scientists from the Institute of Nuclear Physics of the Academy of Sciences of Uzbekistan (INP AS RUz) in Tashkent also made their significant contribution to the development of nuclear medicine.

In 1956 it was organized by the Institute of Nuclear Physics (Institute of Nuclear Physics) in the village of Ulugbek the city and Tashkent and the Republic of Uzbekistan. More precisely, a laboratory of radioisotopes was created (during the directorship of Doctor of Physical and Mathematical Sciences, Professor GulyamovaUG), and in 1976, the enterprise "Radiopreparat" of the INP was created, intended for the production of labeled radioactive compounds. The company "Radiopreparat" produces for the domestic market and exported ovalo in Commonwealth countries, Europe and the United States labeled drugs and compounds, as well as products with radioactive isotopes. The range of manufactured compounds for medicine and science exceeds 60 items. One of the indicators of the high level of specialists in the field of radiochemistry in Uzbekistan is the fact that about 70% of the world production of radiopharmaceuticals of the drug iodine 125(I- 125) fell on Uzbekistan. Unfortunately, on the eve of the 60th anniversary, the Institute of Nuclear Physics was disbanded by the decision of the Cabinet of Ministers of the Republic of Uzbekistan. On the basis of INP, 5 laboratories and 3 departments have been organized, which are part of the National University of Uzbekistan named after MirzoUlugbek. Thus, in the near future in the Republic there will be an acute question about the search for nuclear technologies for obtaining medical radiopharm preparations that could replace the reactor method for producing radioactive isotopes for medical purposes. One of the promising technologies for obtaining medical radiopharmaceuticals is the accelerating method.

IMPROVING THE FOREIGN-ECONOMIC ACTIVITY OF ENTREPRENEURS

Ibragimov Farrukh*

*Assistant,

Department "Economics and Business Analysis",
Tashkent branch of the Ural University,
Tashkent, UZBEKISTAN

ABSTRACT

The article deals with the issues that arise in the organization of foreign economic activity and the implementation of foreign economic operations of entrepreneurs. These questions arise due to the fact that the vast majority of entrepreneurs, entering into commercial relations with their foreign partners and having no practical experience in concluding and executing foreign trade transactions, make mistakes, and sometimes serious mistakes when concluding and executing export-import contracts with foreign firms. The purpose of this article is to identify the main obstacles and difficulties in the development of foreign economic activity of entrepreneurs, as well as ways and systematization of methods for their elimination.

KEYWORDS: *Foreign-Economic Activity, Entrepreneurs, Foreign Trade Transactions, Perspective Relations, Business Development.*

INTRODUCTION

Foreign economic activity is an economic activity related to the export or import of goods and services. In other words, it is the trade of a national representative with a foreign one. In this case, trade can be understood not only as the purchase and sale of goods, but also as the implementation of international projects, as well as activities related to investments and loans.

In the context of economic growth, more and more Uzbek entrepreneurs, both large and small businesses, are entering the world market. Every year, many international contracts are concluded, not only goods are purchased, but also equipment, and not only raw materials, but also products of our own production have become the subject of export. By carrying out such activities, companies become participants in foreign economic activity.

The foreign economic activity of Uzbek entrepreneurs is complicated by the fact that the conditions imposed by many foreign countries lead to a constant increase in prices for imported goods, raw materials and equipment. In turn, such external pressure requires the response of a comprehensive application of the entire range of foreign economic instruments.

MATERIALS AND METHODS

The object of research in the foreign economic activity of entrepreneurs is the features of competitive advantages and state regulation of the designated areas. Subject of research are theoretical, methodological and applied issues related to the analysis and evaluation of the implementation and management of foreign economic activity of the enterprise.

Theoretical and methodological basis of research are works of domestic and foreign scientists, economists, experts in foreign trade, international management, enterprise management systems; practical experience of management of foreign economic activity at enterprises; methodological materials of scientific-practical conferences and seminars on the topic of research. During research following methods were applied: economic, systemic and comparative analysis.

The information base of research were the materials of Uzbek companies, Uzbek and foreign monographic literature, regulatory, legislative and reference materials describing various aspects of functioning of foreign economic activity of the enterprise. The scientific novelty of the results of this study consists in the development and justification of a number of theoretical and methodological provisions and practical recommendations for the formation of an effective mechanism for improving the foreign economic activity of entrepreneurs.

RESULTS

According to the text of the decree of the President of the Republic of Uzbekistan Sh.Mirziyoyev "On measures to radically improve the system of state protection of legitimate business interests and further development of entrepreneurial activity", in order to fulfill the tasks set out in the action strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, to establish mechanisms for effective dialogue and healthy partnership between the business community and state bodies, to strengthen guarantees for reliable protection of the rights and legitimate interests of private property and business entities, to create a permanent channel for exchanging relevant information with entrepreneurs on improving the business environment, primarily for implementation in cities and districts, to achieve practical results of the implemented measures to support entrepreneurship, to provide comprehensive assistance to the population in organizing and running their own business, as well as to ensure the provision of high-quality public services to business entities, tasks are defined that are implemented in several areas. Including:

In the field of protection of the rights of entrepreneurs-the creation of an effective system of support for business entities, especially during the establishment of their activities, strengthening the guarantees of reliable protection of their rights and legitimate interests, comprehensive assistance to their accelerated development, ensuring the priority role and inviolability of private property and entrepreneurship, broad involvement of the population in business activities in the districts and cities of the republic.

In the field of foreign economic activity and attracting investment – integration of the republic's business entities into the international business community, ensuring the output of domestic

enterprises to foreign markets, active promotion of national brands abroad, attracting domestic and foreign investment, as well as modern technologies, including:

- Organization of business forums, exhibitions and fairs and ensuring the broad participation of local business entities in them;
- providing assistance to business entities in finding reliable partners, new sales markets and promoting their products to foreign markets, expanding the export range and increasing the export potential, as well as protecting the rights and interests of business entities;
- providing comprehensive assistance to business entities, including foreign investors, in the framework of projects for the organization of modern production facilities for the production of competitive products in demand on the domestic and foreign markets, in the created small industrial and free economic zones;
- ensuring active cooperation in the implementation of these tasks with consultants on trade and economic issues of the diplomatic missions of the Republic abroad, as well as representatives of the Chamber of Commerce and Industry of the Republic of Uzbekistan abroad.

DISCUSSION

A number of processes have been simplified for participants in foreign economic activity by the decree of the President of Uzbekistan dated April 23, 2019, a number of processes in the implementation of foreign economic activity have been simplified.

In addition, from January 1, 2020, it is prohibited to require originals and copies of documents of a permissive nature issued by authorized bodies in paper form for customs clearance of goods and vehicles, as well as for issuing a certificate of conformity for imported goods, with the exception of documents requiring registration on special paper forms established by international treaties.

When engaging in foreign trade, an entrepreneur must take into account a series of many factors when entering foreign markets:

- Cultural characteristics of the consumer country.
- Demographic situation of the partner country.
- The environmental situation.
- The language characteristics of the country (especially when drafting contracts).

The management of foreign economic activity by an enterprise cannot take place without such a process as forecasting. Forecasting is the process of developing forecasts. Forecast — a scientifically based conclusion about the possible states of an object in the future, about alternative ways and terms of its existence.

The purpose of forecasting the conduct of activities in foreign markets is the first-stage change in quality criteria, cost elements and other indicators used in the development of innovative forecasts and conducting research and development work, as well as a qualitative change in the entire management system. A common difficulty in the management system is the forecasting of quality and costs.

The basal forecasting tasks include:

- development of a forecast of the market need for each specific type of use value in accordance with the indicators of market research;
- identification of the leading economic, social, scientific and technical trends that affect the need for various types of constructive effects;
- selection of indexes that significantly affect the indicators of the constructive effect of the projected product-trends in market conditions;
- selection of forecast reception and forecast lead time;
- forecasting the quality indicators of innovative products over time, taking into account the factors influencing them, their price, costs in the field of use, quality, and market indicators;
- forecast of the organizational and technical level of production by the movement of the product life cycle;
- optimization of the predicted quality indicators according to the indicator of the most useful effect with the minimum total costs for the product life cycle;
- justification of the economic feasibility of developing innovative or improving the quality and efficiency of products, based on the available resources and priorities.

The qualitative efficiency factor of the operation or consumption of the product means the work performed by it or the return during its service life. When determining the beneficial effect, the entire production can be divided into:

- products whose qualitative effect is characterized by a return;
- Products whose qualitative effect is expressed by the work performed per unit of time.

When fixing the quality effect, it is necessary to keep in mind only the part of the work that the consumer receives, while excluding his losses.

CONCLUSION

In addition to the designated individuals, the company must analyze, entering unprocessed sales markets, the profitability of possible sales of products, since it often happens that the costs associated with the exit sometimes exceed the profit from sales. To prevent such a situation, it is necessary to study the potential demand for the company's products and, accordingly, with the results of the study, draw conclusions about the feasibility of entering a potential sales market. It is important to note that the sustainability of an enterprise means the ability to develop and function in an ever-changing market environment, which is determined by various and numerous factors. Since an enterprise is both an object and a subject of economic activity, which can influence the dynamics of these factors in a variety of ways, two groups of factors are generally distinguished: external and internal.

Let us consider in more detail the external factors of stability. These factors are characterized by events are held at the international and regional levels. This group includes:

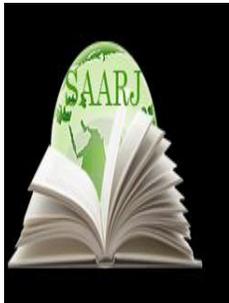

- state regulation of foreign economic activity;

- the level of participation of Uzbekistan and its economic entities in international treaties and agreements governing the conduct of foreign trade activities;
- availability of stable demand for the company's products in foreign markets;
- organization of insurance procedures for foreign economic activity of the enterprise;
- the level of development of foreign trade infrastructure in the region and the country;
- Investment climate of Uzbekistan and its regions.

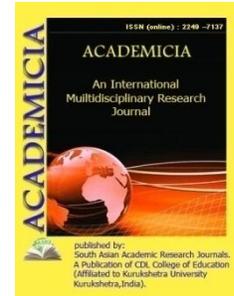

The importance of regulating foreign economic activity at the state level lies in the fact that it is the current policy and the course of the state that somehow determine and regulate all other factors

TIPS SYSTEM IN MODULE EDUCATION

Oripova Ranoxon Ibrohimovna*

*Associate Professor of Pedagogical Science,
 Head of the chair of the Uzbek National Institute,
 Musical Art named after Yunus Rajabi,
 UZBEKISTAN

ABSTRACT

This article is about the essence of the pedagogical process and its direction, the tasks to be solved in the formation and upbringing of the individual. There were opportunities for communication and feedback with any student, wherever he was. The proliferation of high-speed Internet made it possible to move to a system of "online reading seminars" and the result was a distance learning system. Distance learning explains two main approaches to teaching - the expansion and transformation models. The teaching technology in the expansion model is almost no different from the current traditional method.

KEYWORDS: *Modern Education, Module, Credit, Distance Learning, Innovation, Independent Activity, Result, Academic Knowledge, Transformation Model.*

INTRODUCTION

The most important elements of modern education have been formed since ancient times. The purpose, content, form, methods and tools of teaching are traditional categories used to analyze the content of educational processes. These categories act as the subject of pedagogical activity, organizing the educational process in a particular subject and specialty. A modern teacher should understand that he should be not an "actor" in the educational process but an "instructor". To achieve this goal he must know several new teaching methods.

The main task of the modern higher education system is to train qualified specialists. To train such a specialist, it is necessary to determine the system of requirements pertinent to him/her. We recommend the following requirements:

1. To have skills and competencies in own field.

2. To qualify improvement of existing knowledge in the field, readiness for independent learning.

3. To have the self-ability in doing the innovative research in this area and to be able to create new methods.

4. Be able to plan, manage and organize own actions.

If the existing reproductive education in the formation of knowledge, skills and competencies in the field is sufficient, a modular approach to the development of independent learning skills and creativity, the solution of the problem of managing their activities will have a great potential. The purpose of modular education is to shape these aspects of the student. The module should be structured in such a way that the student is able to master this module independently and achieve the desired result.

To achieve such a result, the information material in the module should be clear, concise, understandable, logical, systematic and visual; tasks for introspection have been developed for each logical piece of information, with specific recommendations for the development of these tasks. In module learning, the teacher organizes controls, advises, and checks the student's learning process.

The module approach is based on consistent monitoring of the achieved result. Finally, there was created a module credit system. Credit - (European Credit Transfer and Accumulating System (ECTS)) is a credit accumulation system. This system has been successfully adopted in 1989 research in European universities. It is based on the overall load of the student.

The purpose of the credit system is to facilitate the transparency of education and the recognition of academic knowledge and qualifications. Initially, the credit was used for students studying abroad and it was trusted. The establishment of single loans for higher education institutions has helped to ensure the mobility of students. Today, the European credit system is recognized and applied in almost all European countries. A student will be able to receive a diploma only if he / she accumulates the established credit points.

The basis of the credit system in developed countries consists of three elements:

- Information on curricula;
- student results
- The volume of student activity.

The credit system is a unit of measurement that shows the result achieved, not the number of hours studied in the educational process. That is a result-oriented unit of measurement that assesses a specialist's level of competence.

The role of credit in the educational process and the elements of its association are the followings: the volume of workload in the learning process, curricula, and standards, rating control system, student mastery and individualization of the learning process, teacher workload, funding and economic status. These elements form the unit of the credit system.

Analysis and results. As mentioned above, module learning is built on subject-to-subject relationships. For this reason, much attention is paid to students' independent activities. In order for the independent activity of the student to be effective, a variety of counseling systems are

required from the teacher. Thus, in the foreign experience, various forms of pedagogical assistance have been improved and today have led to the emergence of a number of concepts related to pedagogical activity. As mentioned above, module learning is built on relationships between subjects. For this reason, much attention is paid to the independent activities of students.

Recently, the principle of complexity in the module education system is gaining strength. Various forms and methods are individually placed in it. Blended education is becoming an innovation today. This approach can be based on the use of various methods in the presentation of information, the organization of traditional events for the organization of education and information technology, individuals and groups in the educational process. This multidimensional approach does not tire the student and enhances his motivation to learn. The main challenge is to ensure consistency of the selected methodologies and achieve high efficiency at low cost.

Blended education requires more training. When organizing trainings, the following steps should be taken into account:

1. Preparatory stage.
2. Stage of goal setting.
3. Stage of training.

Today, blended learning is also understood as a combination of traditional face-to-face and distance learning elements. In this system, the teacher remains at the center of learning and makes extensive and efficient use of the Internet. It should be noted that the importance of information technology in the education system is incomparable and more and more new forms are being proposed.

XXI century computers and the Internet have allowed distance learning to spread quickly and in a simplified manner. The Internet has brought about tremendous shifts compared to radio and television. There were opportunities for communication and feedback with any student, wherever he was. The proliferation of high-speed Internet made it possible to move to a system of "online reading seminars" and the result was a distance learning system. With distance learning, students are not required to be in the classroom all the time.

Most distance learning institutions offer general classes and in some cases they are held in the evenings or on weekends. Participants do not need to participate in such sessions, but it is very helpful for them to participate in such sessions in order to develop the practical skills of the listeners.

Distance learning is an interactive way to maintain the situation in the classroom and between students and teachers. It is better to ask students directly from the teacher than to expect them to answer questions from classmates who are not as knowledgeable as they are in the classroom.¹

Distance learning explains two main approaches to teaching - the expansion and transformation models. The teaching technology in the expansion model is almost no different from the current traditional method. The transformation model incorporates information and communication technology tools for teacher-listener collaboration.

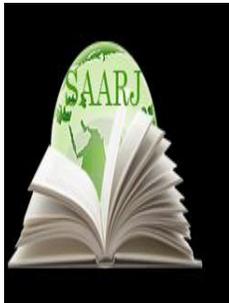

In the process of distance learning, first, students must work independently and master. Depending on the nature of science, it is advisable to develop assignments for the following types of independent work. Independent work can be divided into three types:

Written independent tasks include: performing tasks for calculations, filling out summary and iterative tables, developing technological maps, compiling reports on laboratory and practical work, organizing student activities based on various organizers and much more.

Graphics includes independent tasks: preparing various projects, creating sketches of drawings, describing cuts and intersections (drawing some parts and nodes, etc.), drawing diagrams, graphs, diagrams, describing the results of observations and similar tasks. Performs independent tasks of a practical nature: preparation of products and products, repair of equipment and tools, processing of products, calculation, and design of new devices, models and models, preparation of samples.

**ANIMOSITY AGAINST PATRIARCHY (AN ASSESSMENT OF
 CHARACTERS' FEELINGS IN AMITAV GHOSH SEA OF POPPIES)**

Babu Ram Khanal*

*PhD, Associate Professor of English,
 Saraswoti M. Campus, T.U,
 NEPAL

ABSTRACT

This study focuses on the painful feelings, frustration and bitter experiences of the victimized women in the novel Sea of Poppies. It stresses on the protagonists' efforts to resist the inhuman behaviour, rude manners and discourteous nature of males. Besides, the research tries to explore the prevalent mind set of patriarchy that considers female as an object not as a civilized human being. Women have been able to hold major status in different sectors and have proved their excellency. They have appropriated the transformation very easily. However women are still underestimated, subordinated by the traditional mindset of masculinity. It is this mindset of patriarchy which has worsened the image of the modern advanced countries.

KEYWORDS: *Animosity, Patriarchy, Valorizes, Legitimization, Impotence.*

INTRODUCTION

I am Chandrika

I am Gayatri

I am Fatima, Banu. I am Saraswati

I am one of those faceless women who die every day in your morning newspapers and go on to become a crime number in the police station and then a file to be pushed around in the courts . . .
 (100)

(Cited in Indian Feminism)

The painful feelings and frustration is poignantly evoked in these lines. Despite the fact that there has been a lot of transformation in the society and women have captured prestigious positions in different fields, the mind set of patriarchy has not been changed. Women are still becoming the

victim, they are assaulted and have been made the object to pour their anger and emotion. They still dominate female and fake them as if they are personal accessories. This dominating attitude of male is still playing a significant role in *Sea of Poppies*. Prima facie, the female characters in this novel undergo similar feelings and experiences because masculinity believes that males are bold and firm and females are weak and dependent. Because of this feelings of masculinity there is hostility of women against patriarchy. This is no doubt that there are biological differences between males and females. But to read female one sidedly along with the line of differences will be a mistake. The purpose of this research is to explore this animosity of characters against the male domination in the aforementioned novel.

Women have been given second status from the beginning of human civilization. Even the religious myths have given less space in their scripture for women. The attitude of patriarchy has not been changed. Patriarchy has not recognized the identity of women until now. Therefore, female authors like Mary Ann Evans were compelled to adopt pseudo-names like George Eliot in order to establish their identity in the arena of males (271)

Males attitude to women is still full of prejudice and one sided. They are not ready to appropriate the transformation undergone in the society. Because of this feeling of masculinity, there is hostility of feminist against patriarchy.

The Oxford Advanced Learners Dictionary defines animosity as 'a strong feeling of opposition, anger or hatred (52). Females have exposed their hatred against men because of their cruelty, dominating attitude and in human behaviour. Therefore, women have started breaking the silence painfully. They have tried to create a space within which the woman could articulate their anguish and regain strength. These domestic violence victimized women approach the feminist group as the last resort. The demands of dowry after the marriage from husband and extended family have contributed violence first then animosity against male ultimately. Even the Hindu myths like Ramayan valorises such violence of woman burning in Hindu culture. It assumes that Sita's *agni pariksha* (Ordeal by fire) in the Ramayan legitimises women's oppression. Geetanjali Gangoli portrays the ordeal by fire thus:

They say, sita the chaste
emerged from fire
radiant and beautiful
There was a sita I knew
Chaste enough, till yesterday.
a foul charred corpse today . . .
This kerosene and matches test
is something that Sita's of today
invariably fail (102)

The legitimization of oppression on women in the Hindu myth has become a grave concern for the researchers. It pictures how sufferings of women is glorified in Hindu society. Such process of suffering has ultimately incited domestic violence in which women's identity is undermined and subordinated which has ultimately bred animosity against patriarchy.

In the *Sea of Poppies* similar type of violence takes an extreme course. Deeti, the protagonist becomes the victim of her mother-in-law and brother-in-law Chandan Singh. On her wedding night Deeti is given opium smoke several times until she loses her consciousness and Chandan Singh takes advantage over his brother Hukum Singh's impotence. Ghosh writes:

When the pipe was ready to be smoked, he turned to her smiling, and raised an eyebrow, as if to ask if she wanted to try to too. He took a mouthful of smoke, placed his mouth on hers and breathed it into her body himself. She felt slipping away from this world into another that was brighter, better, more fulfilling . . . when she opened her eyes next morning there was a dull ache in her lower abdomen and a painful soreness between her legs. Her clothes were in disarray and she reached down to discover that her thighs were crusted with blood. (37).

Deeti's animosity grows further when she discovers that it was not her husband who had taken advantage of her unconscious state, but Chandan Singh. She lost her virginity in order to preserve the family's honour.

Edward said assumes that "the dominating attitude of male" that always considers women as fertile land that can give desires product, is an oriental tradition which considers women nothing but a machine or an object" (87). Chandan Singh's expression about Deeti matches with said who thinks:

Your husband and I are brother after all, of the same flesh and blood. Where is the shame? Why should you waste your looks and your mouth on a man who cannot enjoy them? The time is short while your husband is still alive-if you conceive a son while he is still living he will be his father's rightful heir . . . But you know yourself that as things stand now, my brother's land and his house will become mine after his death. *Jekar Khet, tekhar dhan* he who owns the land owns the rice. (157)

Chandan Singh's remarks reflect his ill attitude toward female subjects in particular and overall patriarchal attitude to female in general. Gangoli believes that police refuse to enter the cases of domestic violence until they are linked to dowry demands and property disputes' (109). As a result, hundreds of women like Deeti have become the victim of male's atrocity. Ghosh agrees:

Chandan Singh's assault continues invading Deeti's home on the pretext of expressing concern about his brother's worsening health. He insists that it is his right to know about his brother's health but his eyes were on Deeti. He went on annoying her. Deeti believes:

Even as he was entering he would brush his hand against her thigh. Sitting on his brother's bed he would look at her and fondle himself through the folds of his dhoti; when Deeti knelt to feed Hukum Singh he would lean so close as to brush her breast with his knees and elbows. (157)

Deeti's animosity grows so strong that she seems ready to retaliate him if he approaches her with his ill intention. She had even hidden a small knife in the fold of her sari so that she could boldly resist him if he tried to assault her. Frantz Fannon remarks that the patriarchal society does not accept women at all" (30)

In a patriarchal society, it is the law of the male member of a family that controls the values, dreams and desires of females. Women are compelled to obey them because they are based on masculine norms. Male dominated society describes woman traditionally as working class who tend to be active and a part of the social activities. Land owners and political structures created

by power community in the colonial period others than Landry Donna and Maclean Gerald capture the situation thus:

It is well known that the worst victims of the recent exacerbation of the international division of labour are women. They are the true surplus army of labour in the current conjuncture. In their case, patriarchal social relations contribute to their production as the new focus of super exploitation. (124)

Women are generally regarded as the colonized object rather than subject in the patriarchal societies. They are given the treatment of subordination in comparison to men and are noticeably marginalized from the most of the significant social activities. Deeti's elopement with Kalua could be an effort to free from the status of subordination and the atrocity of brother-in-law Chandan Singh, her mother-in-law and his uncle Bhyro Singh. It can be taken as a gesture of liberation and hatred against male. Deeti frees herself from the brutality of the opium addict family who wanted to exploit her lifelong. Ghosh argues:

Deeti and Kalua knew that their best chance to escape lay in travelling down river on the Ganga in the hope of reaching a town or city there they would be able to disappear in a crowd. It was still a good ten days journey away, and to cover a distance by road would be risk being recognized, news of their flight was same to have spread by this time and in the event of capture, they knew they could expect no mercy even from their own kin, caution demanded that they keep to the water counting their journey on Kalua's makeshift raft for as long as it was able to bear their weight. (191)

Kalua, the untouchable ox-cart driver of her husband became a rescuer for Deeti. Both of them travel to unknown destination seeking new life, status and identity in a world which is dominated by cruel males like Chandan Singh and Bhyro Singh. It was the time when women labours were demanded to work in agricultural fields in Mauritius. After the agreement with their family members such labours were taken to a ship with their agent. The protagonist Deeti and Kalua, too, travelled with them leaving Kabutri, her only daughter, in her brother's home. The women labours had to undergo lot of painstaking situations. They had very hard responsibilities in the colonized ship. Deeti had to work as mentor in the ship. Ghosh contends:

Deeti's own bundle of possessions was packed and ready, so she could apply herself fully to the task of organizing others, paddling and slapping and shouting as was necessary. To such good effect . . . Deeti led the women out of the hut with their saris draped carefully over their heads and faces. The women kept close to Kalua's giant face as they made their way through the milling migrants. (354)

The significant element that Ghosh attempts to expose in *Sea of Poppies* is the patriarchal system that is dominant in India that Deeti challenges. He illustrates Deeti who becomes the victim of patriarchy by agreeing to marry Hukum Singh not upon the preference of her own but upon the choice of her beloved elder brother Kesari Singh" (9).

Amitav Ghosh has presented another character who has become the victim of patriarchy. This bias attitude of patriarchy has destroyed the family of the protagonist. The agent of Ghazipur Opium factory abuses an innocent girl Munia who instead of accepting Munia and her baby threatens to kill her with her family. He assigns his men to kill her whole family including Munia, provided that Munia is saved. Ghosh repeats:

When Munia's child was 18 months old, they had gone to agents' house to show him his baby. He heard them out patiently, at first, then sent them back saying he could . . . A few days later some men had stolen up to their dwelling in the dead night and set it on fire. She had watched the hut burn down killing her mother, her father and her child. (244)

The agent's activities further deepened the antagonism of women against masculinity. The dominance is felt and conspicuous in all areas of human concern. So, feminism revolts against this constructed but dominance and oppression. Carolyn J. Allen writes, "Feminists see the necessity for insisting not only on the oppressive nature of patriarchal power but on its systematic construction as well". (278). the basic nature of all human civilization is pervasively patriarchal which is formed in such a way that ultimately subordinates women to men in all cultural domains. Women are also brought up and trained in the same culture that tends to internalize the patriarchal ideology with conscious and unconscious presupposition about male superiority. They derogate their own sex and cooperate their own subordination. Hukum Singh's mother (Deeti's mother-in-law) is an example in this regard. She arranged her youngest son Chandan Singh to take advantage over Deeti's unconscious state.

Shortly afterwards, her mother in law appeared by her beside; wreathed in smiles, she sprinkled blessings from a container of holy water, and murmured, in a tone of tender solicitude: Everything went exactly as it should, beti what an auspicious start to your new life! (156)

The mother in law was thoroughly responsible for Deeti's abuse who later on stood by her side wishing for her auspicious start.

The Hindu society glorifies *agni parikshya* of women. Also, it valorizes the sacrifice of women after the death of their husband. In many societies women are incited for self-immolation for the respect of the society. On the other hand, male can divorce her without any reasons, as Heeru was abandoned by her husband. When she lost her first born baby, her husband took her to go to the temple of Hariharnath at a distant to perform *puja* during the fair. Heeru was lost on the fair. Her husband returned home and married another woman. Ghosh writes:

Heeru had lost her first born and only child the month before and her husband persuaded her that if she was ever to bear another son, she would need to do a *puja* at the temple of Hariharnath during the fair . . . Heeru and her husband ran opposite direction and afterwards, when she knew herself to be lost, he was nowhere to be found . . . several months passed during which she sustained herself by begging washing clothes and carting dust at a saltpetre mine . . . At length when she managed to catch up with him, he told her that her had given her up for dead and married again . . . (242/3)

Heera, Munia and Deeti were few women who became the victim of masculinity and compelled to enlist themselves as indentured labour to lead the life of slave. It is this appalling condition created by men which has ultimately raised animosity of female against patriarchy.

Ghosh depicts the pain and sufferings of women during the late nineteenth and twentieth century. He deals with social problems like Sati, physical abuse by brother-in-law as well as moral support of husband's mother and uncle. Deeti's own situation pictures the harsh condition of women in contemporary Indian society. After her husband's death she is forced to perform *Sati*. For this purpose, she is given plenty of opium to inhale, and in such a state of unconsciousness

she sits on the pyre, "I will born on my husband pyre rather than give myself to you" (157) while her brother in law who was attempting to have physical relation again retorts:

But donot depend on me to stop you, if you try to make yourself a *sati*. Why should I to have *Sati* in the family will make us famous. We will build a temple for you and grow rich on the offering. But women like you are all words: when the time comes, you will escape to your family. (158)

Ghosh focuses on another form of patriarchal domination over women through Sati System which annoys the women again. It may be considered the highest form of female oppression because to burn a living being with a dead person shows in human, cruelty, brutal act and a sign of backwardness.

American feminist Elaine Showalter writes about the historical places of women writers. She believes that feminine is the concept of womanhood where women have to play traditional role in relation to patriarchal society (46). This suggest that women are not aware of her rights or their identity. Amitav Ghosh's *Sea of Poppies* deals with these traditional roles with Deeti who truly represents Indian women. Chandan Singh is a symbol of patriarchal system, an in human object of hatred, regards Deeti as an object of entertainment who can be used for his personal comfort as soon as her husband is demised.

He uttered back with his hand, he wiped the corners of his mouth and uttered, "this is what I said to you why not do willingly now what you will be compelled to do a short while hence? Do not you see that I am offering you your best hope for the future? If you keep me happy, you will be well looked after. (159)

Chandan Singh acted as if he had sole right upon. Deeti's body. He considered her as an object to pour his emotion and satisfy his greed.

Ghosh captures the view point of masculinity regarding women and clarifies the lovely and the pleasant night of the most couples as a terrible scene which resembles a battle in which he uses the words like 'fight' and 'scratch'. He discloses, 'When the door opened to admit Hukum Singh, she was sitting coiled on the bed fully prepared for assault' (33). Ghosh pictures this situation in such a way that such a treatment is expected and appropriated by women. They completely surrender themselves to the rules and tendencies of patriarchal community. He attempt to portray the cruelty imposed on the Indian women throughout the different periods of time by patriarchal system. (16)

Regarding the pathetic condition of Indian women Tausif Sanzum writes: . . . discussing Amitav Ghosh's *Sea of Poppies* all these phases can be applied on Deeti, the representative of Indian women. The novel opens with a village girl Deeti who is living by the Ganga, some fifty miles away east of Banaras. Patriarchal system dominated her life since her childhood till the end of the novel. Her marriage is also a result to this patriarchal domination. (25)

The novel points out the miseries and isolation of women with reference to women characters of novel. The extant criticism of Ghosh's works has exposed significant socio cultural representation. One of the concerns is the representation of gender which has become the subject of much critical debate on feminism. The *Sea of Poppies* is perceived for the inversion of passive female characters at the expense of active male characters.

Deeti, from Hukum Singh's family is an example of Indian woman who undergoes lot of sufferings, family brutality injustice from mother-in-law and brother-in-law, gets threatened and ultimately "is compelled to elope with Kalua, the untouchable ox-cart driver, for protection" (191). Similar cases are found in many societies of the east. Women are given the treatment of colonized subjects. Krishten Peterson assumes:

Women like colonized subject have been relegated to the position of other colonized by various forms of patriarchal domination. They have shared with the colonized races and cultures and intimate experiences of the politics of oppression and repression. Feminist and post colonial discourses seek to reinstate the marginalized in the face of the dominant. (249)

Women in formerly colonized societies were doubly colonized by both imperial and patriarchal ideologies. The disadvantaged and weaker position of women and girls in social, political, economic, legal, educational, and in physical matters is undermined in colonial society. Simone de Beauvoir argues, 'one becomes one' (423). This view proposes that in gender studies the term gender should be used to refer to the social and cultural constructions of masculinities and feminism and not to the state of being male or female in the entity.

CONCLUSION

The life status of women in Indian society is full of uncertainties and confusion. They have to negate themselves for the pleasure and comfort of the patriarch. In the novel *Sea of Poppies* Amitav Ghosh has realistically presented the conditions of women in general and animosity of female against patriarchy. Deeti, the protagonist, represents these characters who have to struggle for freedom from the brutality of her mother-in-law and wolf natured brother-in-law Chandan Singh. She is even ready to jump into the pyre of her important husband rather than being chained to the wild, uncivilized and brutal family. Ghosh points out that marriage and family are the institutions which bind the lives of women and disallows them from liberation.

In the novel feminine features are exposed through the characters who undergo lot of frustrations and discriminations to the family. Deeti is sidelined by her brother and husband, abandoned by her brother-in-law, insulted by her youngest father-in-law and rendered destitute by the people of her own family members. She loses her identity.

Amitav Ghosh acknowledges that the transformation of the society from the evils like caste system, discrimination based on gender, ill treatment of women, child marriage, poverty, exploitation, demonic tradition should take away without any delay. Then women's hatred to masculine, their misunderstanding against patriarchy will gradually be controlled. Through this novel, Ghosh's humanistic approach gives voice to the undocumented and humble women characters. He wants to free the women from the commotion of caste, race, gender prejudice and even geographical boundaries which are the obstruction for the well being and happiness of both female and male.

Department of Humanitarian Subjects,
Nukus branch of Tashkent Agrarian University,
Nukus, Karakalpakstan, UZBEKISTAN

ABSTRACT

Etiquette Words Of Karakalpak, Meaning Rank, Position And Title Of The People Are Shown In This Article. The Author Comprises Words Of Etiquette In The Past And The Modern Period. Here Given Examples for Using Foreign Words To Mean Title And Rank. Etiquette Words In The Karakalpak Language Have Their Specific Particularity. The Article Deals With Etiquette Words That Are Used In Special Occasions With Different Meanings Depending On Who An Addressee Is.

KEYWORDS: *Etiquette, Speech Etiquette, Etiquette Words, Rank, Title, Addressee, Official Attitude.*

INTRODUCTION

The speech etiquette reflects the social status, title, social characteristics, environment and period of life of a certain addressee. This is evident in both writing and speaking styles. In the given work some extracts from written and spoken discourse are analyzed. It is true that each culture has its own way of showing respect by means of verbal and non-verbal communication. With the help of verbal communication, people express their emotions, feelings, respect or disregard, from the shown attitude to whom particular appeal is addressed, the one concludes whether it is etiquette or not. We identified the words and expressions that are used in many sources which are considered etiquette words. As cultures and nations vary, there are special etiquette words that carry the meaning of rank and title.

Data analysis

In karakalpak language many etiquette words exist, that are basically used when denoting the rank and title of the addressee. For example, by means of the address "mirza" - "lord", a certain

rank of a person to whom they are being addressed is contemplated. The example is when the President of the Republic of Korea Pak Hin Hee appealed to the President of the Republic of Uzbekistan I.A. Karimov (the newspaper "Erkin Karagalpakistan" No. 185501) dated June 24, 2014).

“To His Excellency, Mr. Islam Karimov, President of the Republic of Uzbekistan. Your Excellency!

I sincerely express my gratitude to you for the respect shown to me on your part and the Uzbek people during my official visit to the Republic of Uzbekistan.

Dear Mr. President!

Let me thank you for your interest in cooperation and friendly relations between our people and for the constant support of these relations.” Here we see the example of a written address expressing deep respect for the President of the Republic of Uzbekistan with the help of words in speech etiquette "mirza" - lord and "ulli martebeli" - your excellency. The example of expressing special respect, official attitude when using the word "mirza" in speech etiquette can be seen in the following lines:

Miqli iyinin'izge alip kelesiz (You carry on strong shoulders,)

Xalq ta'g'diri ju'zin Yel sizden irza. (The fate of the people who are grateful to you)

Ulli abiroy qazanasiz ele Siz, (You will also have great respect,)

Quda quwat bersin Prezident Mirza! May God give you strength, Mr. President! (I. Yusupov, p. 20). In this example, in the form President + mirza (lord) through the context, a specific appeal is clearly reflected.

The etiquette of "mirza" - lord is associated with the etiquette words "ulli darejeli" - excellency, "hu'rmetli" - respected, "ulli" - great, shows the high title of a person to whom they address and great respect of the addressee. For instance:

- You rascal, how dare you say that in this city no one can open their mouths?
- Excuse me, sir! (M. Nyzanov, p. 62).
- Fool, how did you not hesitate to say that in this city no one can open their eyes?
- Sorry, Your Excellency!
- Does the wind blow?
- No, high-ranking gentleman (M. Nyzanov, p. 62).

(Translated by D.Utepova).

This example reflects a superficial, formal respect for a dignitary.

There are two meanings of the word "mirza" in the dictionary of the Karakalpak language.

1. "Generous person, who is never sorry for anything"
2. "A person belonging to the upper class and the official word that is placed before the names or surnames of such people." [1. 331].

In these examples, in the first meaning of this word, we see that it has constant meaning, and the second meaning of the word "mirza" has a wide understanding today. If earlier the word "mirza" was used in relation to people of state significance, public figures, today representatives of other nationalities use it in relation to the heads of government, in official correspondence, as well as when addressing the general public in the form of "mirzalar" - gentlemen.

Z. Akbarova in her research related to speech etiquette, which designates the title and ranks in the Uzbek language, gives the following explanation: "Speech etiquette reflects the influence of time and environment. For example, only to express greatness the words "taqsir, a'pendim, mirza" – "Lord, sir" are used. A person who speaks modern literary Uzbek can use these words as forms of etiquette in connection with their social status.

Currently, the use of the word "mirza" - lord in addressing statesmen and heads of government has a stable meaning, and the word "taqsir" is mainly used in an official address to religious ranks [2. 31]. It is true that we come across the use of foreign words that mean title and rank. For example, a gentleman is a person who obeys moral and ethical standards introduced among the bourgeois aristocracy in England [3.124]. And in our language, this word is used in relation to men who require special attention to their person, and has a negative meaning.

In some cases, in spoken language, jargon or works of art, we come across the use of the words *madame*, *mademoiselle* when addressing women, girls.

Madame - in France, in the past in Russia and in other countries, was used when referring to married women and used in the meaning of Mrs. "xanim".

The word *Mademoiselle* "xanim qiz" was used in France, in the past in Russia and in some countries in addressing unmarried girls (as a rule, it was placed before the surname or given name) (p. 198).

Mrs - is a mastered foreign word of etiquette, used when addressing married women in England and America, in the meaning of "mistress". As a rule, it was placed before the given name or surname (p. 216).

Mister - this word of etiquette is used by the British and Americans in the meaning of *mirza* - master in relation to men and is placed before the name or surname (216-p.).

Signor - In Italy it was used when referring to men, means "lord", and in relation to a woman they used the word *signora* (mistress) (p. 314).

Sir - 1. In England, one of the titles of nobility and a person who has such a title. 2. In England, America and in some other English-speaking countries, when referring to men, this word of etiquette was used in the sense of "master" (p. 331).

Frau is a word used in relation to a married woman in Germany and in some other countries, preceded by a given name or surname (p. 370).

Thus, after considering these examples, we are convinced that each nation has its own words of etiquette. And the use of the words *mirza* in the Karakalpak language in relation to men and *xanim* in relation to women, along with linguistic features, in comparison with other people, are directly related to the influence of moral and ethical norms, norms of decency, culture. In the Karakalpak language, due to the respectful attitude towards a woman, if this woman was a

foreigner and had a high rank of international importance, then the word of etiquette "xanim" - mistress was applied to her. For example:

- Come again! - said Oyaz's wife.

- Thank you, I am very grateful to you, "xanim" - lady! - Lepes kissed the hand of a woman in white gloves (Matmuratov, p. 213). In this example, attention is drawn to the extremely deep respect of the Karakalpak jigit (man) Lepesbai for the wife of the sergeant at arms Chimbay (a representative of Russian nationality).

Consequently, the word *xanim* is used to show the flavor of that time, but at the same time, we see how it is applied when referring to strangers, representatives of a different nationality (Russian) in the meaning of salutatory etiquette.

- Excuse me, *xanim* (madam), I don't recognize you ...

- I'm Nadya (M. Nizanov, p. 205).

In this example, the word *xanim* is used in a respectful relationship to an unknown woman of a different nationality.

Etiquette word *xanim* was applied to the wives or daughters of the tsar, to the wives of tsarist officials. For example: *Xanim* (mistress), I am walking from a long road, I have just arrived, and I am standing here (A. Sadikov, p. 285). In this example, the loving horseman addresses to the king's daughter Nazlumkhan-sulu. This means that if the word *xanim* was used in the past when referring to women who are descendants of aristocrats, now it is applied to women who have a definite place in society, business women, women leaders, statesmen. And also, in some cases, at informal events, in the texts of advertising content, it is a sign of expression of respect for women. For example: Ladies and gentlemen (*Xanimlar ha'm Mirzalar!*) We invite you to the New Year's performance! (from the poster).

Ladies and gentlemen (*Mirzalar xəm xanimlar*), guests of the wedding celebration, welcome! (from the wedding celebration).

Ladies (Madams), get up by going to the table, from today you will no longer be served in this restaurant (M. Nizanov, p. 73) This is the story of a professor who was in London on a business trip. Here, as a sign of respect for a woman, the French word madame is used, and in artistic and creative language it serves for artistic and expressive purposes. Together with the words of etiquette, the words *ulli* (great), *ma'rtebeli* (high-ranking) are used as a sign of respect. For example: *Ulli patshamiz* - Our great king, it seems to me that I see something below (G. Yesemuratova, p.84).

Your Excellency (Ulli Ma'rtebeli) Yemelyanov! - began a conversation in Russian. Yerimbet opened his mouth in surprise (A. Mutmuratov, p. 46).

In the previous example, we see the respectful appeal of a common man to the king, and in the second example, the extremely respectful appeal of the Karakalpak dzhigit Lepes to the Russian official Emelyanov is reflected.

In the past, Karakalpak people used the terms *biy*, *beglerbegi*, *ju'zbasi*, *min'basi*, *ko'she biyi*, *ataliq*, and *nayip* as terms denoting a title, rank, degree. For example: On the occasion, you will also see the wedding.

Well, Biy ag'a (lord)! (A. Sadikov, p. 113).

The young gentlemen (na'wshe tereler) were alarmed at once, realizing where the conversation was heading (M. Nizanov, p. 94).

CONCLUSION

Etiquette words are used in every day speech. We come to conclusion that by using etiquette when addressing people, we can identify one's title and rank in community. In relation to religiously educated people, given their level of literacy and religious ranks, the words *maqsim*, *axun*, *molla*, *suwpi*, *iyshan*, *xa'ziret* were used, which served as etiquette words. For example: "Sir, as you are burning in the fire of love, beloved Garip from Chimbay, qazi damulla", having said qazi Bekbauli, revived the conversation (Khamidov, p.37). Here, the words of *qazi Damulla* are addressed to the religiously educated famous Karakalpak poet of the 19th century Qazi Maulik, a religious title has been added to his name, denoting his high literacy, which reveals deep respect for this person. Also, etiquette word *taqsir* is used when addressing religiously educated men, even if the addressee is young, this expresses deep respect for that one.

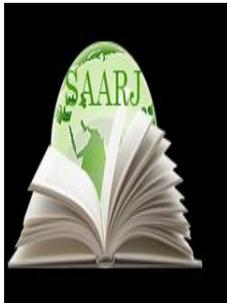

For example: Taqsir! Sir! - "say that bad is bad, but there are also good ones" - as they say (A. Sadikov, p. 47).

Lepes, saying, "Continue to joke, gentlemen!" came out of there (A. Matmuratov, p.126).

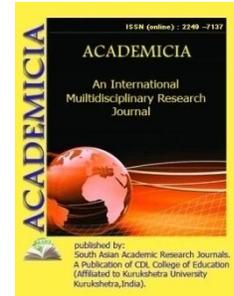

Thus, having reviewed the words of Karakalpak etiquette, denoting the title and rank of a person, we see that they have their own specific features.

HOW TO SUPPORT HEALTHY CLASS COMPETITION IN AN ENGLISH LESSON

Sattarova Ismigul Bakhtiyorovna*; **Khalilova Lenie Fevzievna****;
Rakhimova Marguba Khamzaevna***

^{1,3}Teachers,

Samarkand state institute of foreign languages,
 UZBEKISTAN

ABSTRACT

This article is about the role of competitions. Actually, learning English and competition seem to have nothing in common, but modern school students come to classes not only for knowledge and gaining skills, but also to show leadership qualities, compete as a completed homework, learn to express opinion and, in addition, prove right - in English. And often, if guru students gather in the group, who carefully prepare tasks or like to read additional literature, or maybe simply have strong leadership qualities, the teacher has to raise fighting opinions in different angles.

KEYWORDS: *Competition, English, Class, Target, Motivation, Benefit.*

INTRODUCTION

Is competition in the group bad? Rather not, if this competition is healthy. It is important to explain to students that there is no rivalry between them, since they have the same goal, but not one for all - to learn the language. Accordingly, this type of work in the group is closer to cooperation than to rivalry.

What are the advantages of healthy competition?

Increases the motivation of each individual student in the group;

Improves concentration and involvement in occupation;

Speeds up the overall task run time

Forces students to look for an extraordinary, unique approach to tasks;

Helps you to be creative in your tasks;

the stronger the healthy competition in the group, the higher the result of the group as a whole and each individual student, etc.

The teacher can promote healthy competition among students in the occupation by following the following tips:

- There is an interesting TARGET approach, where the main components of building healthy competition in the occupation are: T - Task, A - Autonomous, R- Recognition, G - Groups, E - Evaluation, T - Time;
- do not choose your favorites, even if there are noticeable leaders in the group, make it clear that you value and respect the work of everyone equally;
- Try to praise all students equally often - someone for a good result, someone for strong efforts, and someone for an interesting idea;
- choosing the types of work for students, avoid tasks where there is a clear winner.

Even if only one team or one player wins, allow the rest to recoup or distribute prizes to absolutely everyone participating in the game;

- maintain a friendly atmosphere on the occupation, form a pleasant team: let students share stories, experiences, jokes, sing songs together in English and play board games, also share their experience and sometimes actively take part in the games;

Encourage mutual help between students in the occupation, try to form mini-groups or pairs where one is slightly stronger and can correct the mistake of the other or prompt the desired word;

- maintain respect for each other by introducing and encouraging the phrase "I am sorry for interrupting you, but..." "Could you tell me...", "Would you like to...", "Would you mind if...", etc., use them yourself and help students remember them and naturally use them in speech;

When selecting tasks, focus on everyone's creative approach, and not on the desire to win, make faster or better: for example, it is better to set a time limit for the game and ask participants to "remember the most original and interesting answers," rather than "play to win."

For successful digestion of material it is important to choose suitable style of training of a foreign language. Most often advantage at individual classes when the technique is selected according to basic level of each pupil, his wishes, terms of development of the program are considered.

The tutor provides 100% of the attention to you that is important for successful training. There is an opportunity to tighten weaknesses, to transfer a lesson or to repeat a certain subject. Classes are given without territorial binding: at work, at home, in cafe. It will provide saving of time for the road to training center, will allow to provide training in the most comfortable situation.

Group classes also have plenty of opportunities to learn English. The number of students (usually no more than 5-7), the chosen methodology and structure of classes by an experienced teacher is selected so that the group can successfully learn the information. In group classes you will find skills of "live" communication, often there is additional motivation in the form of healthy competition between students. This ensures rapid assimilation of information, objective comparison of "strengths" and "weaknesses," development of communication skills.

Advantages of individual English classes with a tutor

Effective learning of English requires sufficient time, desire and opportunities for development. Individual classes with a teacher will help fill possible gaps, hone speaking skills, and increase the level of English for business. Such an approach has been practiced for a long time and has many undeniable merits.

The main advantages:

- Flexible classes schedule.
- Training at home, in the office.
- Individual training course.

You can conduct individual classes with the teacher at any time convenient for you by agreeing in advance. The meeting place can also be chosen at will, focusing on a comfortable environment, as well as distance from the place of work or residence.

Disadvantages of individual English classes

Individual English lessons in Kiev are not deprived of some inconvenience for students.

These include:

The price is more expensive than for group classes.

There is no comparison of pronunciation in people other than the teacher.

Strong motivation is important.

The main complaint is the need for maximum concentration during the lesson. For many, this pace will be too fast, so it will take more time to absorb the topic. During group classes, there is a break to "relax" a little while the tutor is engaged with other students. In personal communication, such an opportunity will not appear, which requires increased attention from the student.

That is why the teachers of the center practice the preparation of an individual program for each student. It is necessary to take into account the pace and speed of training, priority skills, planned duration of the program.

Benefits of English Group Classes

Group occupation is the right choice for the successful development of English, especially for the development of conversational skills. The lessons are designed in such a way as to study and consolidate phonetics well, to pay as much attention as possible to the features of spoken speech.

The main advantages:

Affordable cost.

Personal development.

Communication with like-minded people.

Sharpening conversational skills.

The possibility of transferring individual lessons can serve as a bad incentive, reduce motivation. Skipping group classes is more difficult to catch up, because you will have to independently

study the topic or additionally contact the teacher. This ensures the required level of discipline, which contributes to successful training.

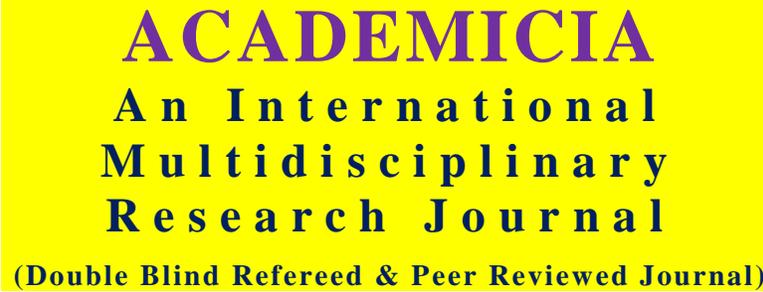

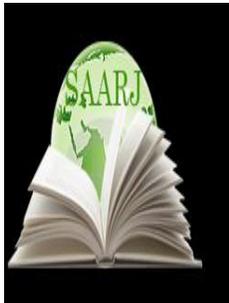

Disadvantages of English language group classes

A minus when learning English in the group is considered an insufficiently individually selected approach. It is difficult for the teacher to immediately assess your level, study the main directions and purpose of the classes. This can make it difficult for many students to study English, and at a furious pace of modern life it is difficult to allocate a certain time for classes. Lessons with a tutor can be transferred in another time, group - no, as well as quickly catch up with missed classes.

A variety of techniques, an individual approach to training, a flexible system and affordable prices are the main trump cards of our training. Teachers are TutorEng interested in successfully mastering your chosen course, so all lessons are designed to provide the most effective information, develop spoken English skills. We offer learning the language in Kiev at the business level, training for travel, tutoring for school students or students inexpensively.

PHILOSOPHICAL AND METHODOLOGICAL ANALYSIS OF ORGANIZATIONAL LEARNING CONCEPTS

Nasiba Narzullayevna Siddikova*; **Manzura Adashevna Makhmudovna***;
Ochilboyeva Iroda Alisherovna**

^{1,2}Teachers,

Department of English History and Grammar,
UZBEKISTAN

**Teacher,

Department of English Integrated Course,
UZBEKISTAN

ABSTRACT

This article deals with philosophical and methodological analysis of organizational learning concepts. Human activities in any form (scientific, practical and so on) is determined by a number of factors. Its end result depends not only on who acts (subject) or what she does directed (object), but also from how this process is performed, what methods, techniques and means are used. This is method problems.

KEYWORDS: *Philosophical, Methods, Analysis, Cognition, Organizational Learning, Concepts.*

INTRODUCTION

Method (Greek methods) - in the broad sense of the word - "path to something," the mode of activity of a subject in any of its forms.

The methodology has two main meanings: a system of certain methods and techniques used in a particular field of activity (in science, politics, art, etc.); the doctrine of this system, the general theory of the method, the theory in action.

The main function of a method – the internal organization and regulation of process of knowledge or practical transformation of that or other object therefore the method (in any given form) comes down to set of certain rules, receptions, ways, norms knowledge and actions. It is the system of instructions, the principles, requirements which have to focus in the solution of a

specific objective, achievement of a certain result in any given sphere activity. He disciplines search of the truth, allows (if correct) to save forces and time, to move to the purpose the shortest in the way. The true method serves as a peculiar compass on which the subject of knowledge and action paves the way, allows to avoid mistakes.

F. Bacon compared a method to the lamp lighting to the traveler the road in the dark and believed that it is impossible to expect success in studying any question, going a false way. The philosopher sought to create such method which could be "organon" (tool) of knowledge, provide to the person domination over the nature.

He considered such method induction which demands from science to proceed from the empirical analysis, observation and an experiment with that, that on this basis to learn the reasons and laws.

R. Descartes called the method "accurate and simple rules," the observance of which contributes to the increment of knowledge, allows us to distinguish the false from the true. He said it was better not to think about finding any truths than to do without any method, especially without deductive rationalist.

A significant contribution to the methodology was made by German classical (especially Hegel) and materialistic philosophy (K. Marx), rather deeply developed dialectical method - respectively on idealistic and materialistic foundations.

The problems of method and methodology occupy an important place in modern Western philosophy, especially in such areas of its and currents like philosophy of science, positivism and post positivism, structuralism and post structuralism, analytical philosophy, hermeneutics, phenomenology and in others.

Each method is certainly an important and necessary thing. However, it is unacceptable to go to extremes: a) underestimate the method and methodological problems, considering all this a minor matter, "distracting" from real work, genuine science, etc. ("methodological negativity"); b) exaggerate the value of the method, counting it more important than the subject to which they want to apply it, to turn the method into a kind of "universal label" for everything and everything, in a simple and accessible "tool" of scientific discovery ("methodological euphoria"). The fact is that... " no methodological principle can rule out, for example, the risk of stalling in the course of scientific research. "

The main purpose of any method - on the basis of the corresponding principles (requirements, instructions, etc.) to provide successful solution of certain cognitive and practical problems, increasing knowledge, optimal functioning and development of certain objects.

Methodology as a general theory of the method was formed in connection with the need to synthesize and develop those methods, tools and techniques that have been discovered in philosophy, science and others forms of human activity. Historically originally a problem methodologies developed within the framework of philosophy: dialogic the method of Socrates and Plato, the inductive method of F. Bacon, the rationalistic method of R. Descartes, the antithetical method of Fichte, dialectical method of G. Hegel and K. Marx, phenomenological E. Husserl's method, etc., therefore, the methodology (to this day) closely related to philosophy -

especially its sections (philosophical disciplines), such as gnoseology (theory of cognition) and dialectics.

Classification of methods of scientific cognition

In modern science, a multi-level concept is used methodological knowledge. In this regard, all methods of scientific cognition can be divided into the following main groups (by commonality and breadth of application):

1. Philosophical methods, among which the most ancient are dialectical and metaphysical methods. Essentially each philosophical concept has a methodological function, is a peculiar way of thought activity, therefore, philosophical methods are not exhausted by the two named.

They also include methods such as analytical (characteristic of modern analytical philosophy), intuitive, phenomenological, hermeneutic (understanding) and others.

2. General scientific approaches and research methods that have been widely developed and applied in modern science. They act as a kind of intermediate methodology between philosophy and fundamental theoretical and methodological

provisions of special sciences. To general scientific concepts often refer to concepts such as "information," "model," "structure," function, system, element, optimality, and more.

Characteristic features of general scientific concepts are, first, a in their content of separate properties, signs, concepts of a number of private sciences and philosophical categories. Secondly, possibility of their formalization, specification by means of the mathematical theory of symbolical logic.

The important role of general scientific methods is that in force

the intermediate character they mutually transition of philosophical and personal knowledge.

3. Personal scientific methods – set of ways, the principles knowledge, research receptions and procedures applied in any given science. These are methods of mechanics, physics, chemistry, biology, the social humanities.

4. Disciplinary methods – the system of the methods used in that or other scientific discipline entering into some industry sciences or arisen on a joint of sciences. Each fundamental science represents a complex of disciplines which have the specific subject and the peculiar methods of a research.

5. Methods of a cross-disciplinary research – as set of a number of the synthetic, integrative ways (which arose as result of a combination of elements of various levels of methodology), the scientific disciplines aimed mainly at joints. These methods found broad application in implementation of comprehensive scientific programs.

A prerequisite for any independent scientific research is acquaintance with sources. It is in the sources contains that "primary information," which is only interpreted by later authors. At the same time, when working with primary sources, the student must learn to critically evaluate the information received. It can be very useful to study the biography of the author, his social situation, his commitment to a particular philosophy, and so on.

If the source statements are made on separate cards, they will be conveniently grouped into sections.

It is necessary to study as fully as possible available scientific literature on the topic. It is better to start with the most solid studies of a generalizing nature, and then to proceed with the articles on the in-depth study of private issues. Special attention should be paid to discrepancies in estimates found in different works. In such cases, before siding with someone else, each author's reasoning should be thoroughly studied. Experience shows that novice researchers often fall into one of two extremes: either uncritically reproduce the conclusions of any researcher, or vice versa, they abruptly reject them, not especially burdening themselves with serious reasoning. Meanwhile, the culture of scientific discussion suggests not only critical, but also as respectful as possible to the opinion of the opponent. Even criticizing someone's opinion, in no way in case you should not switch to "personality," blame a person in "falsification" and the like. It will be much better to prove correctness based on professional knowledge of the facts.

I am right based on professional knowledge of the facts.

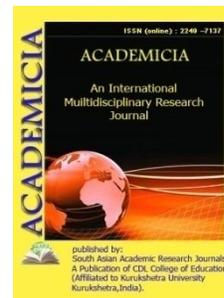

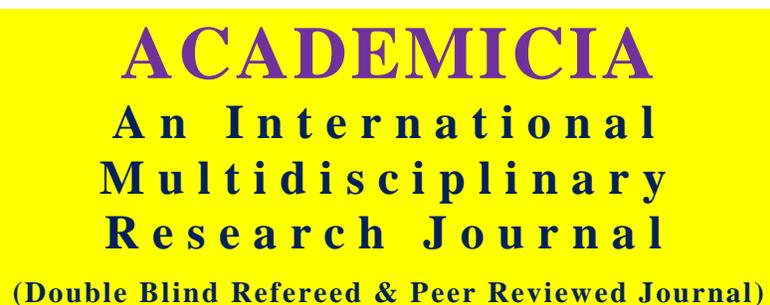

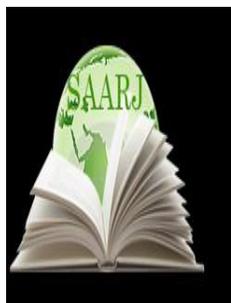

When inspecting scientific literature, it is recommended to write not only assessment judgments, but also references to sources and studies not yet known to the author, as well as to facts that can be used for more complete disclosure of the topic. At it is necessary to either keep the author's text unchanged, taking it in quotation marks, or short it in their own words (in the latter case, it will not be possible to use the extract as a quote, since the quote does not allow any changes to the author's text, with the exception of its abbreviation).

It is better to make extracts on individual sheets of standard size and write only on one side of the sheet, leaving fields on the sides. In the fields you must always indicate the numbers of the pages on which the extracts are located (without this it will not be possible later make footnotes correctly). It is also recommended to record immediately in the fields of the concept, the own comments that occurred during the reading, guesses - returning to them later, it will be possible to build an assumption or hypothesis from them if necessary.

Samarkand state Institute of Foreign Languages,
UZBEKISTAN

ABSTRACT

This article is devoted to explore the development of speech in English for preschool and primary school children. Now it is difficult to overestimate value of training in orally speech communication in which speaking plays a paramount role. Oral speech in general and speaking as her integral part come to the forefront. Pupils of different age, starting a learning of foreign language, first of all want to learn to speak this language. Parents, estimating results and efficiency of the expenses, first of all pay attention to ability of the children to orally speech communication in the learned language.

KEYWORDS: *Preschool, Primary School, Children, Communication, Skill, Comparative Analysis.*

INTRODUCTION

It is worth paying attention that 10-12 years ago when training in speaking the focus was shifted towards training in a monologue. Today it is about training of pupils for dialogue of cultures where skills of monological and dialogical communication are very important, but the overweight towards dialogue is much stronger. It and is clear, in real communication to us seldom to have to perform with long monologues. Communication in the majority either dialogically, or polilogically.

A good foreign language lesson should be taught in the language studied, but there should be no language lesson. However, not all lessons are focused on the formation of speaking skills. Speaking can act as a means of forming adjacent speech and language skills and as an independent learning goal.

In the lesson, as a rule, the teacher tries to solve one main problem, the rest are related. Hence, the definition of the types of lessons as lexical and grammatical skills, lessons in the development of a particular type of speech activity, lessons in familiarization, training, control, etc. Speech in such lessons is a means of communication.

However, speaking skills, like any other skills, are not formed by themselves. To develop them, you need to use special exercises and tasks, which means there must be lessons aimed mainly at developing speaking skills.

What is a positive characteristic of lessons in the formation of oral skills

"The students speak the vast majority of the lesson. The ratio of teacher to student speech is clearly in favor of the latter. The teacher only guides and models various forms of speech interaction.

- All students take an equal part in communication. The teacher does not allow monopolization of attention and school time by a group of the most divisive and advanced students, knows how to involve even the weak and shy in communication.

"Students want to talk. The level of motivation in the lesson is very high due to the use of various sources of motivation creation.

- The language level corresponds to the real capabilities of this group.

Possible problems

- Students are embarrassed to speak AI, afraid to make mistakes and thus criticize themselves from the teacher and fellow students.

- Students have nothing to say about the problem under discussion, they do not have sufficient information on this issue and in their native language.

- Students do not understand the speech task, and therefore what needs to be done.

- Students lack language and speech tools to solve the problem.

- When one student speaks, the rest are silent, which means that there is a danger of their exclusion from educational communication, ineffective lesson time.

- With paired and group forms of work, students often switch to using their native language and make many mistakes.

Possible ways to overcome difficulties in the preparation and delivery of speech lessons

Fear of making a mistake, shyness, excessive criticism.

In order to minimize this negative phenomenon, it is enough for the teacher to create an atmosphere of benevolence and trust. However, this is sometimes easier said than done. What real steps can the teacher take to achieve the desired result in this matter?

- Do not be afraid to admit your own mistakes or confess to ignorance of something. Man can't know everything, but he can. However, if the teacher promised to find out or check something, then it is not recommended to forget about it. We teach by example.

- Do not allow students to sharply criticize each other, if necessary even create the most "critical" situations when they can also be reproached for ignorance or lack of knowledge.
- Wider use of collective forms of work (paired, group, project), where the success of each materializes in the success of the whole group and vice versa.
- Use different sources of motivation creation.

Sources of motivation creation (according to the classification of P.B. Gurvich)

Targeted motivation.

This motivation is based on a clear awareness of both the ultimate goal of studying AI and the goal of each task. This is directly related to the speech value of the lesson. It is known from psychology that what is associated with the active activity of a person, what is needed for this activity, what it is aimed at and with what it is carried out, is well learned.

Motivation for success.

Any person, and especially a teenager, painfully experiences "failure," but if the subject "succeeds," then he is studied with double interest. Students want to get something really tangible for the work that they spent, feel that they are going to some goal, get something that they can use immediately.

Motivation in the study of AI will increase significantly if the prospects for the use of knowledge are realized not only in the lesson, but also in extracurricular work. It is here that the successes achieved can be appreciated by both classmates and parents, school students of other classes, teachers and subjects, etc.

Country science motivation.

The very fact of the movement of ordinary actions and events into the country of the language being studied increases the interest of students and makes it possible to draw attention to various manifestations of national specific characteristics of a different culture.

Comparative analysis and comparison of the cultural characteristics of the native country and the countries of the language studied make it possible to better understand the characteristics of purely linguistic phenomena, which are a reflection of the actual aspects of people's lives. Language quickly responds to all social changes in the life of a country. It reflects the customs and customs of the country, its interaction with other countries of the world. All this has great value for understanding the social nature of language, its connection with thinking, but provided that this material is skillfully discussed and really correlated with the material being studied.

Aesthetic motivation

Many Methodists suggest that students should study IA not because they need to know the language, but because learning the language is a pleasure. For this to be true, sufficient attention should be paid to the design of the office, the quality of the visual aids used, paintings, slides, videos, music sounding at the lesson and at the change, as well as the culture of making entries on the board, in notebooks. All this should be aesthetic, arousing interest in the subject, and not irritation.

Instrumental motivation.

Based on the peculiarities of the brain, temperament, types of memory and other aspects of individual differences, each student has favorite forms and types of work. One easily makes entertaining stories with the vocabulary studied, the other prefers dramatization, the third likes to translate, etc. Taking into account the instrumental motivation is to allow each student to express himself as much as possible in any and most successful type of work. Well-constructed tutorials very often suggest the possibility of choosing different tasks based on solving similar speech problems on a particular language and speech material. Training in the team and through the team involves not only the possibility of "solo" self-realization, but also the use of talent in group forms of work. This is evident in the development of joint projects. Each significant contribution to the overall success of the group helps to consolidate the relationship of "responsible dependence" between classmates.

Nothing to say on the topic/issue under discussion. Lack of language and speech tools.

To solve this problem, it is necessary to create a sufficient level of support for the content, language and speech plan. The following recommendations can provide practical assistance to the teacher.

- Lessons in speaking skills should be based on already developed lexical and grammatical skills within the topic under study.

- In addition to lexical units and grammatical structures, students need to know and be able to use various forms of communication of speech, its logical construction using speech cliches, unions, introductory structures, response replicas, etc.

- Competent selection of texts for reading and audition can provide not only completion of certain gaps of the information plan, but also a necessary set of language and speech means on the discussed problem.

- In the matter the substantial and language value of training exercises is of great importance.

- The offered tasks need to be built taking into account a real information stock of trainees. Accounting of cross-disciplinary/intersubject communications is capable to facilitate considerably the solution of practical problems of communication on IYa.

- Use of support of verbal character (schemes, tables, plans with keywords, basic abstracts, etc.) and also nonverbal support (pictures, music, etc.) can greatly help

3. Pupils don't understand a speech task.

In order that it didn't happen at a lesson, the teacher has enough:

- to accurately represent what kind of monologue/dialogue it would be desirable to receive at the exit;

- to remember conditions of creation of the corresponding speech situation;

- in advance to formulate speech installation, to try to make it laconic and accurate;

- to put itself to the place of pupils of the class;

- If necessary to prepare additional support in the form of cards, pictures, schemes, the painted roles, etc.;
- To plan poll/cast, steam, groups can do;
- To remember a possibility of mutual training and mutual aid.

4. One speaks – the others are silent.

In order that all pupils had as much as possible opportunities and time for communication for IYa at a lesson, it is necessary:

- To use group and pair operating modes at a lesson more widely;
- to create game situations where the level of motivation is rather high and even if one person speaks, then the others aren't switched off from a general regime of work, and perform other speech operations: listen, write down, write out, consider, sketch, etc.;
- When planning lessons with a considerable share of the monological speech not to forget about fixations on listening for other pupils of group.

Where to Start Speaking Training

Usually they begin to teach speaking from the basics, that is, with the formation of pronunciation skills, the formation of lexical and grammatical skills, and listening skills. At the beginning of the training, it is impossible to separate the process of forming these skills. The teacher introduces students to the new structure. This involves studying new words, sounds, intonation. Students listen to and repeat this structure after the teacher and comrades. When such structures become sufficient within the framework of the educational situation, they can be combined into small monologues and dialogues.

This is well traced to the material of the textbooks for the initial stage of study. But in order for speech to be a speech in essence, and not only in form, it must be remembered that the basis of the generation and stimulation of speech is the motive, that is, the intention of the speaker to participate in communication. In order for this motive to appear in the lesson, it is necessary to create a speech situation. Speech situations can be real, conditional, or problematic. At the initial stage, it is no less important than at others.

As is known, oral communication can have a monological, dialogical or polylogical form. Let us take a closer look at the features of teaching these kinds of speech

Monologue training. Its varieties and characteristics. Ways to learn a monologue

First of all, let us identify those varieties of monologue that are found in real communication. These include:

- greeting speech;
- high;
- pricing;
- lecture;
- story;

- Characterization;
- description;
- incriminating or acquittal speech, etc.

How can knowledge of existing varieties of the monologue help to improve the process of teaching this type of speech activity?

Imagine this situation. In the classroom, one of the educational topics is studied, for example, "my hometown." Vocabulary, grammar, text read, exercises completed. As a homework, the teacher asks to tell about his hometown. What changes if, before giving such an assignment, the teacher remembers the existing varieties of the monologue and chooses some of them as the most preferred?

In order for a teacher to evaluate a completed homework, you need to know the characteristics that distinguish a monological statement from any other. It is these characteristics that make up the main parameters for assessing the dialogue.

Characteristics of the monologue

- targeting/matching of speech task;
- continuous character
- similarity;
- sonic completeness
- independence;
- expressive.

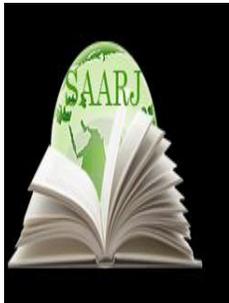

Indeed, before beginning to pronounce a monologue in real life, a person understands well why he does it, and pronounces it only if he really wants to speak out or considers it necessary. The purpose of the monologue is determined by the speech situation, which in turn is determined by the place, time, audience and specific speech task.

In the lesson, everything is slightly different. The situation must be created, or else the most important and very first characteristic of the monologue disappears - purposefulness, which largely determines everything else.

ABSTRACT

The article presents the results of studies of the effectiveness of various antibiotics in the model in vivo, as well as a combined ointment for accelerating wound healing in necrobacteriosis of highly productive cows. However, when administered intramuscularly, lincomycin hydrochloride and clindamycin phosphate were found to be highly effective.

KEYWORDS: *Necrobacteriosis, In-Vitro, Kitt-Tarozzi, Resistance, Antibiotic, Sensitivity, Clindamycin Phosphate, Lincomycin Hydrochloride, Injections.*

INTRODUCTION

Necrobacteriosis manifests its virulence due to the deficiency of macro- and microelements in the diet of cattle, poor quality feed, imbalance in sugar and protein ratios, non-observance of veterinary conditions with the requirements of veterinary and sanitary conditions.

Necrobacteriosis is an infectious disease characterized by the formation of purulent-necrotic formations in all organs and tissues of the body. These processes occur predominantly in the hooves, mouth (in young bulls), liver, lungs, muscles, genitals, udder and other tissues.

Necrobacteriosis causes serious economic damage, especially to livestock breeding farms. Cattle affected by this disease are difficult to treat, and the development of the disease is characterized by a sharp decrease in milk yield, obesity in fattening bulls and early inability to use animals. There was a decrease in cow milk yield of 14-50% of those infected with necrobacteriosis, as well as a decrease in the quality of milk, out of 100 fed calves, mortality of 17 calves and even more was observed. The disease also results in decreased sperm quality and loss of fertility in breeding bulls.

Research objectives Development of effective methods and means of treating necrobacteriosis of cattle, in particular, selection, development and testing of methods for effective treatment with antibiotics against the pathogen *F. necrophorum*.

Materials and research methods

The selection of antibiotics effective against *F. necrophorum* was first performed in vitro. In this case, the growth dynamics of necrobacteriosis strains was studied for 10 days by adding various antibiotics to the Kitt-Tarozzi liquid nutrient medium (table 1). The effect of each antibiotic was studied by a two-stage dilution method. The maximum concentration of antibiotics was 32 µg / ml, and subsequent dilutions were 16 µg / ml, 8 µg / ml, and 4 µg / ml (Fig. 1). After attachment to the liquid medium at various concentrations of antibiotics, an antipyretic agent was added to it at a dose of 0.5 ml per 0.1 McFarland turbidity standard, and the probes were incubated in a thermostat at 37 °C. Growth results were monitored twice a day. The growth of the microorganism was analyzed for the turbidity of the liquid medium. That is, the appearance of turbidity in the medium indicated the growth of the microorganism and, conversely, the absence of growth of test tubes, in which the turbidity was not observed.

Figure 1. Determination of MIC by serial dilution method (diagram)

One increase in the number of serial dilutions of probes was considered the minimum stopping concentration of the undiagnosed tube concentration.

Treatment of necrobacteriosis was carried out in 2 cattle farms of the Simmental and Holstein-Friesian breeds in the Takhiatash and Khojaly districts located in different regions of the country. A total of 41 cattle with varying degrees of necrobacteriosis were treated with the same test ointment for topical treatment, and the effects of intramuscular injections of three different antibiotics were studied, which were more effective with general antibiotic therapy in vitro:

amoxicillin trihydrate 150 mg / ml, lincomycin hydrochloride 100 mg / ml, clindamycin phosphate 300 mg / ml. At the same time, animals are divided into three groups: very heavy, heavy and medium-heavy. In addition, a vitamin preparation for injections, butasol-100, was used at each farm.

Effect of antibiotics on the growth of F. necrophorum in Kitt-Tarozzi nutrient medium

TABLE 1

No	Antibiotic name	Minimum suspension concentration (MTK), mg / ml	Sensitivity degree
1	Oxytetracyclinedihydrate, 200 mg / ml	8	Relatively low
2	Streptomycinsulfate, 200 mg / ml	16	Low
3	Penstrep (benzylpenicillin procaine, 2000 XB and dihydrostreptomycin sulfate, 200 mg)	4	Average
4	Amoxicillintrihydrate, 150 mg / ml	2	Relatively higher
5	Lincomycinhydrochloride, 100 mg / ml	1	High
6	Clindamycinphosphate, 300 mg / ml	0,5	Very high

Cattle, which are heavily infected with necrobacteriosis, were isolated on farms. The treatment was carried out in rooms protected from wind and sleet.

The first stage of treatment was carried out according to generally accepted methods: dead and necrotic tissues, purulent wounds were completely removed, and a 3% solution of hydrogen peroxide and 0.1% sodium hydroxide solution were used to wash the wounds. The growing hooves were cut off. The causative agent of necrobacteriosis is highly resistant to many antibiotics, which requires the use of combined ointments. To this end, in the course of our research, the composition of the ointment was tested on ligaments that heal quickly and have antimicrobial properties after wound healing.

100 grams of ointment contains the following drugs:

Amoxicillin trihydrate 50% powder (5 g), chloramphenicol sodium succinate powder (5 g), rifampicin (10 capsules), oxytetracycline hydrochloride powder (3 g), copper sulfate (5 g), medical petroleum jelly 77 grams. After applying the ointment, a bandage was applied to the cleaned wounds. This dressing was changed daily after applying the ointment for 5 days.

Research results

The results of screening studies of antibiotics effective against necrobacillosis in vitro are presented in Table 1.

Clindamycin phosphate is an analogue of the drug lincomycin, which is very effective against the causative agent of necrobacteriosis and has been widely used in veterinary practice all over

the world over the past 10 years. However, it is more difficult to find this drug in veterinary pharmacies, which can often be purchased at pharmacies that sell medications.

Amoxicillin trihydrate, which is highly effective in in vitro general antibiotic therapy, is 10 ml per 100 kg body weight every 48 hours, twice in total, lincomycin hydrochloride 1 ml per 100 kg body weight morning and evening for 5 days and clindamycin phosphate 1 ml per 100 kg body weights were administered intramuscularly in the morning and evening for 5 days, the effects of the injections are shown in Table 2.

**RESULTS OF A STUDY OF THE EFFECT OF ANTIBIOTICS IN CATTLE WITH
NECROBACTERIOSIS TABLE 2**

Morbidity rate	Number of animals	Number of injections, total	Application interval, hours	Number of animals healed	The effectiveness of the drug, %
Amoxicillintrihydrate, 150 mg / ml					
Very hard	4	2	48	2	80
Heavy	6	2	48	5	
Medium heavy	5	2	48	5	
Lincomycinhydrochloride, 100 mg / ml					
Very hard	5	10	12	3	85,71
Heavy	6	10	12	6	
Medium heavy	3	10	12	3	
Clindamycinphosphate, 300 mg / ml					
Very hard	2	10	12	5	91,66
Heavy	5	10	12	5	
Medium heavy	5	10	12	5	

As a result of the treatment, 35 out of 41 cattle fully recovered. The effectiveness of clindamycin phosphate treatment was 91.66%, which indicates a significant advantage over other antibiotics. The ointment used for topical treatment has proven to be a quick-healing and anti-microbial agent.

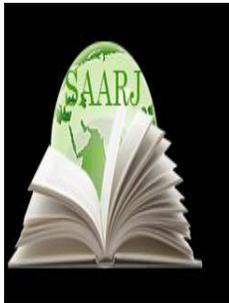

Findings

The results of the above studies show that the combined preparation (ointment) with local action in the complex treatment of necrobacteriosis in cattle, injections of clindamycin phosphate and lincomycin hydrochloride in general antibacterial therapy, as well as injections of butazole-100, increase the overall resistance.

AN INTERPRETATION OF LIFE EXPRESSED IN SYMBOLS

Bazarov Sobirjon Bektashovich*

*Lecturer,
Termez State University,
UZBEKISTAN

Email id: bazarovsobir@mail.ru

ABSTRACT

This article deals with the issues of artistic interpretation of symbolic images in the novel "Blackbird" by the writer Normurad Norkobilov. It shows the writer's artistic skills. Emphasis is placed on the fact that in recent years there has been a tradition of deeper interpretation of the traditions that emerged in the early twentieth century. Therefore, we must not forget that neither the philosophy nor the symbolism at the heart of artistic interpretation appeared yesterday, and that its roots and buds rose to a high level in a certain period. Only in the years of Independence did the artistic interpretation of different melodies form an opportunity to rise. Centuries-old traditions in the literature of literature, through the discovery of the mental and psychological state of man, the joy of suffering, and the way to express the spiritual world in symbols.

KEYWORDS: *Novel, Symbol, Metaphor, Image, Interpretation, Art, Theme.*

INTRODUCTION

Fiction, which has a long history, has tried and continues to try to interpret life in different tones, as well as to understand man and his complex destiny. When we look at the literature of the peoples of the world, we see that the changes and transformations in human nature and society have been interpreted artistically for centuries. In this sense, we understand more and more that the process of gaining independence in Uzbek literature has been complicated, and over the years, our artists have sung about freedom and liberty on the basis of various symbols. By the years of independence, our literature began to be reflected in a variety of forms and tones, based on the need for a deeper understanding of life and man. In the years that followed, the freedom to be truly creative, to speak the truth, to speak the truth, flourished in literature.

Abdulla Oripov, the Hero of Uzbekistan, in his article "Literature and Time" put forward the following views on free and independent literature: just Religious beliefs, on the other hand, were completely negative. One-sidedness and superficiality taught our writers to sing in the same voice, in the same tone "[1, p. 5]. There is no denying that there is a fact of life behind these considerations. The tradition of interpreting the complex aspects of the period to one degree or another was also observed in those periods, but in the literature of the pre-independence and post-independence period there were specific interpretations that led to a high degree of symbolism as well as philosophy in the literature. raised. At this point, we found it necessary to substantiate our views with the views of literary critic Ozod Sharafiddinov: "Independence literature is not a chronological concept. Simply put, when we say independence literature, we should not mean only the works created after 1991. Just as the literature of independence began with the works of the Cholpons and the Fitrats, so it has continued to take shape over the last decade. Of course, it will continue to improve in the decades to come "[2, p. 191].

Emphasis is placed on the fact that in recent years there has been a tradition of deeper interpretation of the traditions that emerged in the early twentieth century. Therefore, we must not forget that neither the philosophy nor the symbolism at the heart of artistic interpretation appeared yesterday, and that its roots and buds rose to a high level in a certain period. Only in the years of Independence did the artistic interpretation of different melodies form an opportunity to rise. Centuries-old traditions in the literature of literature, through the discovery of the mental and psychological state of man, the joy of suffering, and the way to express the spiritual world in symbols.

As the Russian literary critic LS Bigotsky puts it: "Each period has its own psychological gamma, which is selected by art", and we feel that the discovery of pre-independence artistic traditions is deepening [p. 3.93]. The symbolism and psychological interpretations of art are based on human destiny. This process is inextricably linked with the concepts of nationality and humanity. Universal ideas, the literature on the integration of problems in the mouth, began to take shape, which indicates that it is fed by national and world literature. As the literary critic GP Abramovich noted: "A work deprived of the quality of nationalism has no universal significance" [4, pp. 92-93].

Indeed, during the years of independence, the tradition of a fair approach to history, the image of historical figures, has prevailed. It should be noted that the changes in the system, the evolution of society have had a strong impact on the renewal of artistic standards, significant changes in the system of images. The creators realized that it is possible to think differently about the universe and man, and in this way, works of art, which are the product of significant changes, emerged. "The problem of time and literature is a very complex one," he said. Because the main feature of the time is its constant movement and change, the main feature of the original literature is that it strives to live longer than the time in which it was created, to try to be stable... At the same time, the past years are so weighty, so has the power to change so much that the psychology of the people has changed so much in its perception, understanding and explanation of the world that it would not have been possible in the previous decades "[5, p. 15], - writes the literary critic. scientist Kazakboy Yuldashev.

The centuries of art created over long periods of human history will never be clear to everyone. In this regard, in recent years, works of fiction have emerged that have a complex plot. One of such works is Normurad Norkobilov's novel "Blackbird". From the title of the work, we observe

the symbolism. This is due to the fact that he perfectly interprets the complex aspects of human life, his thoughts and inner wastes. We begin to feel more deeply that there is a human destiny at the root of the reality of life that the symbols cover. Let's take a look at the author's interpretation: "The dog in the flower, the Blackbird, did not rest until midnight, and began to growl angrily in a constant voice. It was not just the sound of a dog, but the sound of a huge, it sounded like the ghost of an evil, terrifying creature with legs "[6, p. 3].

The cry of the protagonist Erman is concentrated in these places. The main reason for the anguish in his heart was also freedom, captivity. An Armenian is a person who has gone through a very difficult life. Although he was an ordinary shepherd boy, he had some unique human qualities. This time, it serves to reveal the principles of humanity: "What surprised Erman this time was the dog's snarling and continuous growling, which meant that he was pushing his throat too hard. The longing in his voice, This anger was terrible - it was terrifying to the heart "[6, p. 4].

Even in the original interpretation of the novel, we understand and feel the existence of the above ideas. In the play, the objective, that is, the existing being, events and happenings, the external image, the actions of the protagonist, the environment and conditions that surround it, time and space are no longer directly transformed into an artistic texture. rather, it deepens their influence on the human imagination, consciousness, the protagonist's attitude to life and the world. The protagonist goes not to the character created by the author, but to the protagonist, who "invented" himself, formed on the basis of his imagination, the flow of consciousness. It is worth noting that now there are cases when the reader interacts not with the protagonist, but with the "thinking" of his spiritual world, arguing with the process of his thinking.

The existence of these traditions can be traced back to the development of prose over the past period. Therefore, it is possible to compare Isajon Sultan's novel "Eternal Wanderer" with the unique, writer's style of depicting painful situations and painful experiences. "As shapes, images, ideas and images were created, the modern world, which was becoming more and more violent, began to need a new spiritual foundation. A work of art is a product of the imagination, and the imagination is a premonition of events that may occur in the future. Literature around the world began to look for new ways "[7, pp. 406-407].

Indeed, in recent years, literature has been formed and developed in a variety of tones, effectively using the leading principles and methods of description in world literature. In the novel "Eternal Wanderer" we see a non-traditional way of interpretation, the flow of consciousness through a system of symbolic images, a set of concepts, philosophical observations: "A special place is prepared on the hill for the execution, the shoulders and arms of the convict are mixed. the shackles of the mattress were broken, and he could hardly walk, sighed, and could hear the jokes of the people around him. A piece of white cloud, built on the fresh currents of the Red Sea, cast a shadow over the prisoner's head. The convict was a Blessed Man. Who knows, maybe now the angels of God have come to his aid - maybe he doesn't feel the weight of the cast-iron chains? The crowd around him asked, "Where is your god? Why isn't he helping you? "He shouted and laughed. There was a shoemaker among the laughing crowd. "The images show that the play does not have a coherent system of images. In the passage above, you can see the images of the Blessed One and the shoemaker. He was barely able to walk because of the weight of the handcuffs on his hands and feet. It had all the appearance of a classic mechanical watch except it wound itself up.

The reason we cite the images in both novels is to explain the existence of contradictions in the path of human freedom, liberty, and self-realization through symbolism. Isajon Sultan's novel *The Eternal Wanderer* is dominated by the expression of human will and the pursuit of identity, while Normurad Norkobilov's novel *The Black Sheep* is about the suffering of a mountain boy in captivity and revenge on a man who was sentenced to slavery after his release. The interpretation of the struggles in the aspirations found its expression. There is a tradition of symbolism to think, to meditate: "But in this past opportunity, the prisoners have not died or been resurrected many times. Oh, how I wish I could forget the horrors of those days! In short, the souls of the slaves, if it is possible to compare, were in the hands of the chief of the tribe Itolmas - if he wanted, he could throw them under the feet of dogs, if he wanted, he could survive. There is no one who opposes such atrocities - the body and soul of the captive, who had a slight obstruction, were destined to be buried in the dust "

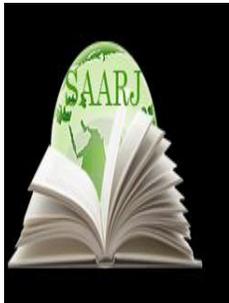

[6, p. 6].

While the captivity of the human body gradually affects its spiritual world, in the novel "Blackbird" the freedom and liberty of man, but the desire for revenge in his heart, keeps the dog in captivity. his opposition to it found expression. At this point, the captive tried to forget his fate, but the dog's inability to feel the pain of captivity led him to tragedy.

So, although fiction interprets a person's inner world, his spiritual world, his inability to escape the eternal judgment of his destiny leads him to realize that self-awareness is a candle that illuminates the path of life. The system of images in the subject of the work is explained by the fact that the interpretation of events is connected with the ground, with real life in it. In this sense, the characters in the novel struggle with their world, and their character is vividly reflected in the wave of contradictions.

ABSTRACT

The article deals with the issues of mental burnout in sports activities. The relationship between perceived stress and mental burnout among athletes involved in individual and team sports was studied. The study made it possible to establish mental burnout as a consequence of the process of chronic stress. Empirically, it has also been possible to establish a positive relationship between stress and burnout. The study showed a significant expression of perceived stress among athletes involved in individual sports, as opposed to team sports, which is associated with the presence of a social factor in team sports. Likewise, mental burnout, according to its indicators, has received wider development among athletes in individual sports, as opposed to team sports. It has been empirically proven that mental burnout is expressed in a feeling of physical tiredness, a decrease in the level of claims, followed in the future by deep disappointment, a drop in interest in sports activities and the termination of a sports career. The work provides some recommendations that could allow an athlete to maintain an interest in training and competitive activities, improve himself and strive to maintain his sports career.

KEYWORDS: *Mental Burnout, Emotional Burnout, Stress, Athletes, Sports Activity, Devaluation of Achievements, Level Of Aspirations, Descriptive Research.*

INTRODUCTION

High physical and mental stress, focus on achieving the highest possible results, fierce competition of rivals characterize modern sports of the highest achievements. Therefore, it is extremely important to pay attention to the influence of psychological factors on the achievements of athletes [1; 3; 6].

Burnout in athletic performance is a response to chronic stress. It contains physical, behavioral and cognitive components. Mental burnout is revealed in psychological, emotional, and sometimes physical withdrawal from activity that previously served as a source of pleasure for an athlete [1; 4; 6]. External reasons for the development of mental burnout in sports activity are: intense physical activity, unfavorable conditions of the training process, difficulties in relationships with a coach, lack of social support from the family. The main internal causes leading to the appearance of mental burnout in sports are revealed in the personal characteristics of athletes, such as anxiety, self-esteem, level of aspirations, locus of control, motivation [2; 4; 5; 9].

The relevance of research Despite the long history of research on mental burnout in sports, much has yet to be revealed. In particular, why mental burnout is triggered by stress. These problematic aspects formed the basis of our empirical research. Thus, literary sources show that mental burnout and stress affect performance in sports activity and lead to withdrawal from it. However, there is no literature on how stress causes burnout. Moreover, there is no evidence of the form and degree of relationship between these variables. Mental burnout in sports activity has negative consequences: a decrease in the effectiveness of training and competitive activity, susceptibility to diseases, the appearance of injuries, and further retirement from sports. The lack of reliable data on the characteristics of the manifestations of mental burnout and its relationship with stress in athletes of different sexes and qualifications, representatives of team and individual sports prompted this study.

The aim of this study was to study the relationship between perceived stress and mental burnout in individual and team athletes.

Research tasks:

1. To study the level of perceived stress and mental burnout in athletes involved in individual and team sports.
2. To identify the differences in the level of stress and mental burnout in athletes involved in individual and team sports.
3. Check for links between perceived stress and burnout.

Object of the research: 100 athletes took part in the research. In accordance with the tasks set in the study, the sample included athletes of both sexes, among whom were representatives of team (volleyball, basketball) and individual (rhythmic gymnastics, boxing) sports, highly qualified athletes (CMS, MS).

LITERATURE AND METHODOLOGY

Considerable efforts in sports psychology have been aimed at identifying personal and situational factors that contribute to the burnout of athletes [1; 5; 6; 7]. Burnout was first identified in the

early 1970s by Freudenberger (1974) as a behavioral pattern [4; 8; 9]. This is related to the relevance of studies of competitive stress and the means of overcoming it, to the problem of athletes' resistance to various sources of stress arising during competition. Regarding the relationship between stress and burnout, all studies show that stress is a predictor of burnout [1; 2; 6; 8; 9; 10], being a stressful experience of organizing competitive athletes - a popular area of research of sports psychologists over the past decade [1; 6; 9]. Of particular importance in the modern world of research is chronic stress and its consequence - depression. The consequence of chronic stress is mental burnout, which affects the effectiveness of training and the success of competitive activity and reduces their productivity [7; 9].

As a methodological basis for the study, we used:

- ✓ The concept of mental burnout in sports: theoretical models and causes of the phenomenon (Grin E.I.) [2]
- ✓ Concepts explaining the nature of the development of mental burnout. These include: the cognitive-affective model of R. Smith (1986), the model of involvement in sports by G. Schmidt, G. Stein (1991), the model of the fixed negative response to stress by J. Silva (1990), the model of one-dimensional development of identity and external control J. Coakley (1992) [7; 8; 9].

Research methods: 1) Mental burnout questionnaire among athletes T. Riedek and A. Smith, which contains 3 subscales and a total of 15 items, 5 of which are designed to measure emotional and physical exhaustion, 5 - for the depreciation of achievements and 5 to reduce feelings fulfilled duty [9].

2) Scale of psychological stress PSM-25, aimed at measuring the level of stress in athletes (high, medium, low) [1].

DISCUSSION

Data was collected at sports facilities before training. Other issues related to the age of the participants, gender, type of sport were also taken into account. Table 1 presents descriptive statistics (mean, standard deviation) according to the PSM-25 Psychological Stress Scale.

TABLE 1 STRESS INDICATORS IN ATHLETES ENGAGED IN INDIVIDUAL AND TEAM SPORTS (N = 100)

Stress level	Frequency of incidents,%		Frequency of incidents,%
	Athletes in team sports (n = 50)	Athletes in individual sports (n = 50)	
High	23,4	76,6	p <0,05
Average	31,7	68,3	p <0,05
Low	69,5	30,5	p <0,01

In the group of athletes involved in team sports, there are significantly more athletes with a low level of stress (69.5%). Athletes in team sports receive more social support in the team from their teammates, so they can share responsibility for the results during training and competitive activities. As a result, in their group there is significantly less number of athletes who have high and medium stress levels.

Athletes who go in for individual sports rely only on their own strengths and capabilities, that is, there is no social support in the team. Failures arising in the process of competitive activity, for which they are responsible, can be a source of increased stress levels (76.6).

Next, we consider the results of the manifestations of mental burnout. Table 2 presents descriptive statistics (mean, standard deviation) for each of the items on the subscales of the mental burnout questionnaire in athletes T. Riedek and A. Smith.

TABLE 2 MANIFESTATION OF MENTAL BURNOUT OF VARYING DEGREES IN ATHLETES (N = 100)

Mental burnout indicators	Incidence rate, %			Standard deviation
	High	Medium	Low	
Decreased sense of accomplishment	10,5	59,4	30,1	1,03
Emotional and physical exhaustion	13,2	75,8	11	1,04
Devaluation of achievements	12,2	60,9	26,9	1,19
Integral index of mental burnout	14	68	18	1,00

Evidence suggests that burnout is moderate to high in a large number of athletes. Interpretation of the severity of individual factors of mental burnout as a whole for the sample, presented in table 1, led to the following conclusions. Athletes who have a low level of mental burnout make up from 15 to 30.1% for the individual components of burnout and 18% for the integral component of mental burnout. The athletes who showed a high level of severity of individual components of mental burnout range from 10.5 to 13.2%. This allows us to conclude that mental burnout is an essential regulator of athletes' activity.

Table 3 presents descriptive statistics of mental burnout indicators among athletes involved in individual and team sports.

TABLE 3 INDICATORS OF MENTAL BURNOUT IN ATHLETES INVOLVED IN INDIVIDUAL AND TEAM SPORTS (N = 100)

Mental burnout indicators	Level	Athletes engaged in team sports (n = 50)	Athletes in individual sports (n = 50)
Decreased sense of accomplishment	High	15,3	11,1
	Average	21,5	68,5
	Low	63,2	20,4
Emotional and physical exhaustion	High	10,5	17,3
	Average	71,1	69,4
	Low	18,4	13,3
Devaluation of achievements	High	12,7	15,4
	Average	69,9	66,8
	Low	17,4	17,8
Integral index of mental burnout	High	11,4	18,2
	Average	72	66,2
	Low	16,6	15,6

The data of the conducted research show that athletes, who go in for individual sports, are more inclined to “decrease the sense of achievement” and have a high level of severity of the indicator “emotional / physical exhaustion”. The research data showed that athletes involved in team sports have a low level of the indicator “decrease in the sense of achievement”. Here you can also talk about social support from the team. The following table 4 presents the results of the correlation analysis of mental burnout and stress levels.

TABLE 4 THE RELATIONSHIP BETWEEN BURNOUT AND STRESS LEVELS IN ATHLETES

Burnout rates and stress levels	Decreased sense of accomplishment	Emotional and physical exhaustion	Devaluation of achievements	Low stress	Average stress level	High stress
Reduced sense of accomplishment	1					
Emotional and physical exhaustion	0,40	1				
Devaluation of achievements	0,36	0,48	1			
Low stress	0,15	0,14	0,06	1		
Average stress level	0,38	0,46	0,27	0,26	1	
High stress	0,62**	0,50*	0,64* *	-	-	1

The data of the correlation analysis of the conducted study between the indicators of stress and mental burnout indicate the influence of the emerging stress state on the development of mental burnout in athletes. In particular, we see that high and medium stress levels were closely correlated with the indicators "Decreased sense of accomplishment", as well as the relationship was revealed with the indicator "Devaluation of achievements". This study is also another piece of evidence that high levels of stress lead to emotional and physical exhaustion. In addition, we see positive correlations between the indicator "Devaluation of achievements" and indicators "Decreased sense of accomplishment" and "Emotional physical exhaustion". The results of the correlation analysis confirm that the occurrence of stressful situations in sports activity leads to mental burnout of athletes, which subsequently manifests itself in the athlete's withdrawal from sports.

RESULTS

The present study was designed to determine how stress affects burnout. Empirical research has shown a relationship between perceived stress and mental burnout.

The first finding confirms the results of many studies: stress is a reliable predictor of burnout. The higher the perceived stress level, the higher the likelihood of burnout.

The second conclusion reveals in detail what features of an athlete's personality react to a stressful state. Most of all, this is due to the motivational and emotional sphere of the athlete.

The study also shows that individual athletes are more likely to experience stress than athletes who practice team sports. This is due to the social factor, when in team sports the responsibility and the results of the competition are shared by all teammates, accordingly the perception of

stress will be much less. The same division is observed in terms of mental burnout. In the presence of a social factor in team sports, the indicators "Decreased sense of accomplishment", "Devaluation of achievements" and "Emotional physical exhaustion" are poorly expressed.

CONCLUSION

Modern sports of the highest achievements is characterized by high physical and mental stress, an orientation towards achieving the highest possible results, and fierce competition between rivals. The conducted research showed how strongly perceived stress is reflected on the personality of athletes involved in individual sports. These two constructs are of great interest in the context of sports, and their relationship has been studied and tested empirically as much as possible. In particular, the lack of social support places all responsibility on the athlete himself, the hope is placed only on his own strengths and capabilities, that is, there is no social support for the team. Failures arising in the process of competitive activity, for which he is responsible, can be a source of increased stress levels. What cannot be said about team sports, in which there is a spirit of sociality, when the result of the competition depends on all team members and, accordingly, responsibility is assigned to all athletes of this team.

Research into the relationship between perceived stress and mental burnout has shown a direct link. High stress levels lead to mental burnout. It is associated with the appearance of both physical, tic and emotional exhaustion. Mental burnout is also expressed in the devaluation of achievements, when the effectiveness of competitive activity does not cause positive emotions and does not stimulate further self-improvement in a sports career. The same is expressed in a decrease in the level of claims or a decrease in a sense of accomplishment.

Thus, burnout in athletes is direct evidence of perceived stress. As the study has shown, the development of mental burnout is of a staged nature. At first, significant energy costs are observed - a consequence of an extremely high positive attitude to the performance of competitive activity. Gradually, with the further development of mental stress, a feeling of fatigue begins to manifest itself, which is replaced in the future by deep disappointment, a drop in interest in sports activities.

RECOMMENDATIONS

The empirical data obtained require special work to train athletes in techniques and methods that reduce the manifestation of symptoms of "mental burnout". To maintain an athlete's interest in training and competitive activities and to increase his sports career, this article provides some recommendations.

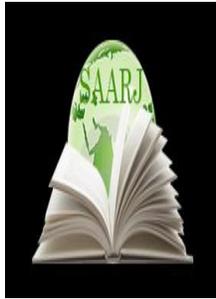

Methods for maintaining interest in sports and minimizing the occurrence of physical fatigue include self-regulation methods, i.e. increasing the effectiveness of a person's functional capabilities through the formation of a special mental state to achieve the intended result. Some self-regulation methods are relaxation training, autogenous training, desensitization, reactive relaxation, meditation, etc.

It is also not unimportant to maintain motivation for going in for sports, it is necessary to correctly define short-term goals and objectives, expand the circle of contacts, form a positive outlook, and maintain a positive point of view.

Control after competitive emotions, both positive and negative (frustration or aggression, sports excitement) is a system-forming factor in monitoring the degree of mental stress, which can lead to mental burnout. In some cases, even a splash of negative emotions after the competition period is necessary, the manifestation of shouting, the use of anti-stress items, relaxation sand, switching to outdoor games, cycling is allowed. As Albert Einstein said: "Life is like riding a bicycle. You need to move to keep your balance. "

DISTINGUISHING FEATURES OF NEW METHODS TEACHING EFL IN TECHNICAL UNIVERSITIES

Ruzikulova Gulirukhsor Gofurkizi*

*Teacher,

Almalyk branch of Tashkent State Technical University named after Islam Karimov,
 UZBEKISTAN

ABSTRACT

In teaching EFL teachers should pay attention to choose proper teaching methods in order to make their lessons clear and effective for the learners. In this article we would like to show some methods in technical universities and their distinguishing features from others. Studying terminological units plays a great role in studying technical English and translating special texts. Studying professional vocabulary mainly occurs in the process of reading special texts. Furthermore, students expressed their subjective needs in terms of using the language in these domains as well as in everyday life.

KEYWORDS: *EFL, Teaching Methods, EFL In Technical Universities, Communicative Language Teaching.*

INTRODUCTION

All instructional designs for the teaching of a second or foreign language draw on a number of sources for the principles and practices they advocate. For example they generally make explicit or implicit use of:

- *A theory of language:* an account of what the essential components of language are and what proficiency or competence in a language entails
- *A theory of learning:* an account of the psycholinguistic, cognitive and social processes involved in learning a language and the conditions that need to be present for these processes to be activated Both the theory of language and language learning underlying an instructional design results in the development of principles that can serve to guide the process of teaching and learning. Different instructional designs in language teaching often reflect very different understandings of the nature language and of language learning, as we will see below. The

particular theory of language and language learning underlying an instructional design in turn leads to further levels of specification. Foreexample:

- *Learning objectives*: what the goals of teaching and learning will be
- *The syllabus*: what the primary units of organization for a language course will consist of
- *Teacher and learner roles*: what roles teachers and learners are expected to play in the classroom
- *Activities*: the kinds of classroom activities and techniques that are recommended.

When an instructional design is quite explicit at the level of theory of language and learning but can be applied in many different ways at the levels of objectives, teacher and learner role and activities it is usually referred to as an approach. Communicative Language Teaching is generally regarded as an approach because the principles underlying it can be applied in many different ways. Teachers adopting an approach have considerable flexibility in how they apply the principles to their own contexts. When an instructional design includes a specific level of application in terms of objectives, teacher and learner roles, and classroom activities it is referred to as a method. With a method there are prescribed objectives, roles for teacher and learners, and activities and consequently little flexibility for teachers in how the method is used. The teacher's role is to implement the method. Audiolingualism and Situational Language Teaching are examples of methods. The era of methods in this sense is often said to have lasted until the 1990s, by which time researchers and applied linguists shifted the focus to teachers and the process of teaching rather than methods. They suggested that while teachers may draw on principles and practices from approaches and methods they have studied or been trained in, once they enter the classrooms and develop experience in teaching their practice is much more likely to reflect an interaction between training-based knowledge, knowledge and beliefs derived from the practical experience of teaching, and their own teaching philosophy and principles. It is known as the theorization of practice.

Communicative language teaching (CLT) is an approach to language teaching that focuses on meaningful and real communication as both a means and the objective of language acquisition. CLT teachers prefer such classroom activities which help their students attain communicative competence in the target language through learner-centered interaction with the help of authentic materials. We must admit from the very beginning that the communicative approach is not ideal and nowadays it competes with other teaching methods. For example, G. Hadley argues that Communicative approach to FL teaching is losing its dominance and giving way to data-driven learning, although he is not quite sure if it is an effective EFL teaching method. G. Zhou cautions against absolutization of CLT at the expense of other methods: "For different teaching settings, different methods/ methodologies ought to be adopted, ideally, integrated, for they compensate for each other". Moreover, teachers of EFL often face some problems in applying CLT. As the overview of English language teaching in Bangladesh made by D. Ansarey shows, EFL teachers "whilst aware of the achievements, observe many difficulties in implementing CLT in their classrooms. These difficulties stem from four directions, namely, the teacher, the students, the educational system, and CLT itself".

Communicative meaning-focused learner-centered grammar instruction requires application of the following principles.

1. The material taught is to be selected in accordance with its communicative relevance and frequency.
2. Teaching methods should involve students into meaningful communication in real-life contexts.

Communicative activities simulate real-life verbal interaction and thus require students to express their own ideas and thoughts or to represent some given information to others. Such activities comprise drama, discussions, role plays, case studies, brainstorming activities, etc. Students respond spontaneously and concentrate mainly on the meaning of the discourse, but not on its outer form. Communicative activities proper are free in terms of vocabulary and structure choice and more fluency-oriented than pre-communicative ones. Communicative exercises on the topic Modern Technologies in our Life might contain such small-group, pair or individual tasks:

1. *Roleplay*. A psychologist tries to prove to his client that smartphone addiction leads to high levels of loneliness, depression and anxiety.
2. *Discussion*. Express your opinion on the problem of smartphone overuse.
3. *Case study*. Listen to the story of a depressed teen girl and say how smartphone addiction affects mental health.
4. *Brainstorming activity*. Give some tips to those who want to break free of compulsive smartphone use.
5. *Storytelling*. Tell a story from real life to demonstrate the existence of smartphone addiction. Prove that the mania is real. Together with pre-communicative exercises these communicative activities will make students' speech motivated, accurate and fluent.

Communicative approach to grammar is a means to develop the Technical University EFL learners' ability to interact with each other in context rich environments. Although the communicative approach is not ideal, it has some advantages. It makes classroom communication natural, creates conditions for self-realization, motivation and meaningful language acquisition. The paper establishes principles to be applied when teaching grammar communicatively.

1. The material taught is to be selected in accordance with its communicative relevance.
2. Teaching methods should involve students into meaningful communication in real-life contexts.

To illustrate the principles some communicative grammar activities are presented. Communicative approach to grammar teaching and learning simulates real-life interaction, motivates authentic communication between students, implies the use of language for meaningful purposes and gives priority to fluency over accuracy.

Studying terminological units plays a great role in studying technical English and translating special texts. Studying professional vocabulary mainly occurs in the process of reading special texts. These include descriptions of machines, equipment, instruments or processes of production. The ability to choose corresponding equivalents in the target language and general translation skills are trained at this stage. The lexical material includes multi-word terms consisting of groups of attributes denoting properties and characteristics of objects and phenomena and verbs denoting processes: apply, assure, effect, imply, involve, lead to, obtain,

perform, result in, etc. The grammatical aspect of teaching should be focused on translating predicative constructions and the passive voice.

It is necessary to explain the fact that a term is usually translated by a corresponding term of the target language, as technical terms have their permanent equivalents in the respective terminological systems of the source and target languages.

If a term causes difficulties and has no evident equivalents in the target language, it is necessary to analyse this term logically and linguistically, taking into consideration its connection with the context in order to choose a precise monosemantic equivalent. Correct understanding and translation of terms depend not only on good knowledge of the language, but also on being aware of realia of the native country and these of the country of the studied language. In translating special texts students must be able to cope with the problem of polysemy of terms. Though terms tend to be monosemantic, terminological systems possess polysemantic units and their translation depends on the context. For instance, in the sphere of construction, the term *moulding* may denote *a small decorated area of stone or wood at the edge of a wall or around a door, picture, frame, etc.* and, at the same time, *something that was produced in a mould* (Macmillan English Dictionary for Advanced Learners, 2006).

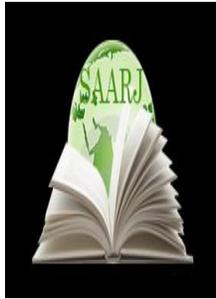

Students should also know the structural peculiarities of terms: they may consist of one word and be a word-group of one key-word and one or several adjuncts specifying or modifying the meaning of the main element. Multi-word terms are typical of special literature and may cause difficulties while translating. For example, in teaching to translate word groups consisting of several components from English into Russian, a teacher of English should explain to the students that it is necessary to stick to the following succession of actions: translate the dependent noun (the last word of the word-group); analyze the semantic relations between the members of the word-group and divide them into sense-groups (from left to right); translate the word-group starting with the dependent element and then translate every sense group from right to left. For instance in the word-group thermal expansion coefficient the main word is *coefficient* – *коэффициент*, and the adjective *thermal* modifies the noun *expansion*, so the translation is *коэффициент теплового расширения*.

As far as the first question is concerned, the hypothesis was that Technical University students needed to use English in vocational, academic and everyday life domains. The needs survey confirmed the hypothesis and showed that both the vocational and the academic environment required these students to be able to use English. Furthermore, students expressed their subjective needs in terms of using the language in these domains as well as in everyday life.

While the English language needs of students were identified in terms of tasks it was stated that the aim of the proposed English language course was not simply to provide the learners with opportunities to fulfill tasks by carrying out activities. Rather, the aim was to **develop the ability** in the learners to engage, in a skilled way, in activities where interaction between the individual and the environment was carried out with the inclusion of the target language.

“SMART” AGRICULTURE TOOLS

Makhmudova Nargiza Rakhmatullaevna*

*Senior Lecturer,

Department of Information Technology and Mathematics,
Tashkent State Agrarian University,
Tashkent, UZBEKISTAN

ABSTRACT

The article provides information on what innovative technologies have been implemented for the application of smart technology in agriculture. At the same time, the following goals are achieved: a large harvest is collected from a smaller area and manual labor is replaced by robotics. Automation of irrigation allows you to minimize the cost of irrigation water and at the same time obtain high yields. Modern systems allow you to analyze each area and determine the amount of moisture needed, avoiding excessive water consumption.

KEYWORDS: *Smart Technology, Agriculture, Drone, Sensor, Smart Greenhouses, Greenhouses, Internet.*

INTRODUCTION

Smart agriculture, significantly increases crop yields and livestock productivity, reduces costs and production costs. The dynamic development of this sector in the world presents a serious challenge to the agricultural sector of Uzbekistan, which, despite the favorable natural conditions, still does not have sufficient competitiveness in the production and marketing of its products. And this challenge is quite serious for the entire Uzbek economy, since in Uzbekistan half of the republic's population lives in rural areas, more than 1/4 of the working-age population is employed in agriculture, which produces almost half of the GDP.

In recent years, very serious and effective measures have been taken in Uzbekistan to develop the agricultural sector, introduce modern innovative technologies into agriculture. Further progress in this direction will increase the competitiveness of the sector and turn the existing challenge into new opportunities. But this requires the development and implementation in

Uzbekistan of an already existing range of agricultural technologies and innovations used today in other countries of the world. We present an overview of foreign experience in this direction.

"Internet of Things" (Internet of Things - IoT) is a system of interaction and information exchange between various devices and machines, which makes it possible to automate management and control processes through various "smart devices" and significantly reduce human participation in them. The fields of application of IoT technology in agriculture are precision farming; Smart farms; Smart greenhouses; raw material management; storage of agricultural products; agricultural transport management; "Big data" and others.

Precision farming is the use of smart devices to manage crop productivity in response to changes in the plant habitat, as well as more efficient land use. At the same time, there is an optimization of operating costs and an increase in yields by an average of 15-20% due to a reduction in the volume of seeds, agrochemicals, fertilizers and water used, which are applied strictly "on demand".

Precision farming also provides for parallel driving of agricultural machinery using GPS navigation, which eliminates double cultivation or squeezing of plants into the field, as well as differentiated seeding and application of chemicals.

Smart greenhouses allow more efficient use of fertilizers, chemicals, water, as well as optimize the number of personnel required to care for crops, and reduce losses due to human factors. According to experts, despite the fact that the world market for "smart" greenhouses does not exceed 3% of the total number of greenhouse structures, their number is growing by 9% annually. "Smart" greenhouses allow you to control the entire irrigation process and microclimate control. In addition, it is possible to monitor the yield and quality of all systems, which can increase the yield increase by 20-40%, with an increase in the quality of the product produced and a reduction in costs.

There are widespread projects to create, in a short time, a network of mini-farms near large cities to deliver "day after day" fresh and natural plant food, such as greens. At the same time, the following goals are achieved: a large harvest is collected from a smaller area and manual labor is replaced by robotics. It is assumed that in a year from such a farm with an area of 0.4 hectares, you can harvest the same amount of crops as from 12 hectares of a classic outdoor farm. In this case, the land on the mini-farm can be replaced with hydroponics.

Smart farms can improve pets' productivity and product quality, and lower costs. According to scientists, animal husbandry based on traditional methods is not very effective in its current form, since one third of the planet's land is grazed by livestock, while animals in the process of growing eat most of the grown grain. The use of automated systems for feeding, milking and monitoring the health of animals, according to experts, makes it possible to increase milk yield by 30-40% and more efficiently use the available feed base. In addition, there are technological solutions to improve the efficiency of veterinary services, which allow you to maintain individual veterinary records, a single database of animals, and records of animal owners. For example, an "electronic passport" of an animal is created on the basis of the chip, the information in the process of reading maintains the database in the software up to date, which ensures constant and reliable veterinary control.

Monitoring the use of agricultural machinery using satellite navigation systems (for example, GPS) and sensors allows you to reduce fuel consumption, as well as optimize routes and the workload of personnel serving equipment. It should be noted that in the EU countries 80% of agricultural machinery is sold with navigation equipment, but only 30% are actually connected to the network, since agriculture is dominated by small family farms with small cultivated areas, and therefore the economic feasibility of switching to smart, the more expensive equipment they have is low.

The safety of raw materials in the process of collecting and moving them can be ensured by appropriate sensors that allow full tracking of both the location and the weight of the moved raw materials.

"Smart" storages for vegetables and fruits allow monitoring the state of products during storage using specially defined algorithms in real time (storage temperature, humidity level, carbon dioxide content), which helps to make the right decisions. If the conditions are violated, the system corrects the situation and notifies about changes in the warehouse owner. The created technological solutions for the processing and storage of agricultural products, the automation of these processes can reduce personnel costs and improve storage conditions for the harvested crop.

Automation of irrigation allows you to minimize the cost of irrigation water and at the same time obtain high yields. Modern systems allow you to analyze each area and determine the amount of moisture needed, avoiding excessive water consumption. For example, there are systems that operate on the basis of wireless sensors that transmit a signal to the controller and to the irrigation control unit, which makes it possible to automate the irrigation process and control its implementation at all stages: from monitoring the operation of the irrigation system mechanisms to analyzing the state of soil moisture.

Electronic trading platforms for agrarians are used for operational communications between agricultural producers (farmers) with purchasing and trading organizations, which reduces the time of product delivery from the field to the counter and reduces its losses associated with intermediate storage.

In case a farmer produces an organic product or wants to emphasize a special type of its certification, then he can use "blockchain" technologies to track the delivery of products. Consumers can scan a product barcode in a supermarket to find out what they are buying and see the entire supply chain from farmer to supermarket.

With the help of special programs working with the use of "blockchain" technologies, it is also possible to automate the process of tracking information along the entire grain supply chain. As grain is harvested from each field, all information about the harvest is collected and displayed in real time in the program, and then sent to suppliers' warehouses, distributed between them depending on the required quality and price, which excludes intermediate storage of grain in bulk. According to experts, currently about 30% of grain and other goods supplied in bulk are lost due to middlemen and poor logistics.

Drones-which include both ground-based drones and unmanned aerial vehicles (UAVs) and multicopters (quadro-, hexa-, octocopters), as well as winged drones. The latter are more often used over large areas or for mapping purposes. They also allow you to create electronic 3D maps

of fields, calculate indicators for fertilization, inspect fields and monitor the condition of the crop, monitor the operation of transport and agricultural machinery, protect land, apply plant protection products and fertilizers to fields, etc. Monitoring from drones can provide data not only on crops, but also on weeds, for example, their standing density and even species composition. By filming from drones, it is possible to construct thermograms, since the temperature of the plants signals the degree of their stress, especially from drought.

Sensors - which are installed in the ground at control points, are the basis of the system for determining the characteristics of the soil and are able to detect, for example, relief heterogeneity, soil types, illumination, weather, the number of weeds, parasites and promptly inform the user about this for making a decision. Thus, sensors and sensors placed in the field at a considerable distance, which are connected into a network, allow obtaining information about the state of fields and crops, in particular, about humidity, temperature, level of weed infestation, plant growth phases, etc., without leaving the site.

UAVs, together with ground devices in the form of buried sensors with wireless communication that measure the physical and chemical properties of the soil, as well as an autonomous weather station, can form a system that will provide a farmer or agronomist and modern "smart" machines with a complete set of data necessary for making the right decisions.

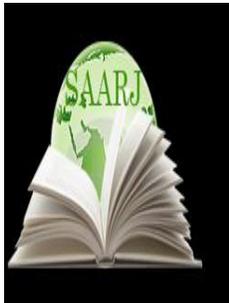

Robots (robotic machines), performing a wide range of tasks - from harvesting to cleaning the area from weeds, are rapidly gaining popularity in agriculture. According to the consulting company Tractica, by 2024 the supply of agricultural robots will grow to 594 thousand units, having increased from 32 thousand at the end of 2016. By the beginning of 2017, there were over 150 suppliers of robots for the agro-industrial complex in the world. At the same time, the following key areas of application of robots in the agro-industrial complex are noted: unmanned tractors and aerial vehicles; automated systems for growing crops; automated control systems for dairy farms, etc. At the same time, "smart" tractors and combines can work autonomously and do not require a person's presence, which makes it possible to use them at any time of the day. In addition, they can be equipped with many additional features such as built-in pest control systems.

For example, the American company Blue River Technology creates robots that, using computer vision, distinguish crops from weeds in the field and selectively spray only it with chemicals, and in Japan they created a robot that collects strawberries from the beds instead of a person. According to scientists, in a few years all routine field work such as sowing, weeding and watering will be able to be performed by agricultural robots.

**DETERMINANTS OF EMPLOYEE MOTIVATION IN THE NIGERIAN
 INSTITUTE FOR OIL PALM RESEARCH [NIFOR]: HERZBERG'S
 HYGIENE FACTOR APPROACH**

Smart Osarenmwinda*

*PhD

Human Resource Management Department,
 Nigerian Institute for Oil Palm Research (NIFOR),
 Benin City, NIGERIA

Email id: smartosarenmwinda@gmail.com

ABSTRACT

Employee motivation is one of the most popular discuss in management and organizational psychology studies with several motivational theories developed over the past seven decades. However, the universal validity of these motivational theories including Herzberg's Two Factor motivation theory is controversial. The purpose of the current study is to analyse the factors affecting employees' motivation based on Herzberg's hygiene factors theory and to ascertain the viability of the Herzberg's hygiene theory in today's scenario. Survey design together with convenience sampling was employed to select respondents working at the Nigerian Institutes for Oil Palm Research (NIFOR) in Benin City. The instrument used is a well-constructed questionnaire designed by the researcher to solicit responses from a sample size of 67 employees working at the main station of NIFOR. Using Cronbach's alpha coefficient, the reliability was calculated to be 0.60. Friedman's' test results show that among all Herzberg' hygiene factors affecting motivation, salary and wages is most perceived while job security is ranked lowest. Furthermore, the regression analysis results obtained from this study show that only the hygiene factor of Job Security revealed a statistically significant positive effect on employee motivation. Hence, the study recommends among others that management should consider policies that will promote the level of job security of staff in the course of formulating reward policies. This should be mixed with policies that will enable growth-inducing tasks in job content. By implication, a proper mix of this combination will spark positive responses from the employees and automatically stimulate work motivation in the workplace.

INTRODUCTION

Background of Study

Human force is considered the most valuable asset of any organization of which different factors affect its performance and efficiency. In today's world of non-stop change, in which organizations compete with all their capabilities, a large portion of organization's resources and attention are dedicated to staff concerns in order to improve their activities as much as possible in order to produce active participation in different markets (Foster, 2001).

Since managers, white-collar workers, and blue-collar workers are all involved in an organization results, then an employee's performance, new ideas, as well as efforts to promote the organization in a positive way will help build the values of an enterprise (Kovach, 1987) which is a good indication that the success or failure of a business is affected by their productivity (Bajziková, 2018). Overall employee productivity is influenced by employee motivation (Machová, 2014) which is a complex and purposeful process targeted to create a working environment and atmosphere that helps satisfy the aspirations, needs, and interests of employees thus stimulating their action in a desirable way (Muogbo, 2013).

Particularly, Kampkötter (2018) notes that a successful business is aware of the importance of its staff and their positive motivation; they are the greatest asset helping the company meet its goals. Currently, due to advances in technology, information, and globalization, human factor is becoming the biggest competitive advantage such that the importance of human resources is considered strategic. They become an integral part of strategic management of an organization and a factor important for organizational going concern. According to Dobre, (2013) effective employee management is supported by motivation which focuses on ways to encourage employee creativity, improve work performance, and create conditions that support team activity within the organization.

Specifically, Ukaejiofo, (2013) posit that human resources management has a significant impact on performance; hence employees must work or behave in certain ways that leads to attainment of organizational goals and objectives.

However, the process of motivation is supported by setting realistic company goals and engaging employees with programmes which focuses on the optimal use of available workforce to meet company goals and at the same time knowing and developing the personality of the employee. Kim & Lim (2015) suggests that an effective motivational program covers aspects with low performance in a given period or those areas which seem to be significant for work activity due to another reason. Therefore, the goal of the program is to create conditions which encourages employee motivation that affects employees in a psychologically and economically profitable.

Statement of Problem

Nowadays in developing countries (Nigeria inclusive), the key challenge of an organization is the lack of specialist and absence of motivation and job satisfaction among employees Babu et al., (1997). As noted by Achim et al., 2013; Dobre, 2013, motivation plays a critical role for individuals to be successful and happy in both daily and working life. Therefore, it is essential to

keep high level of employee motivation in order to contribute positively to their well-being and sustainability of the organizations.

Related Studies in Nigeria on motivation of employee have mainly focused on areas of health and education. For instance, the studies of Ukaejiofo (2013); Uzonna, (2013); Babalola & Nwalo (2013); Mayowa-Adebara & Aina (2016); Nwezi & Alphonsus (2017) all examined employee motivation among different health and education institutions in Nigeria. However, Agricultural Research Institutions (ARI) by their nature presents a unique context whose attempt to adopt traditional approaches or theories of management may pose different results altogether.

Given however, that Nigeria's economy is partly agriculturally based, it is important that these theories of motivation be validated in an agricultural research environment. Hence, this study seeks to close this gap by validating Herzberg's theory of motivation on research staff of Nigerian Institute for Oil Palm Research [NIFOR] in Nigeria. This empirical article is intended to develop construct validity for motivation of employees in National Agricultural Research Institutes of Nigeria, using Herzberg's theory. The empirical study will identify specific motivational factors that should be incorporated into the human resource practices of the organization which in turn would, assuming other factors are constant, enhance the staffs' capacity to deliver on NIFOR's mandate.

The main purpose of Research Institutes in Nigeria is to carry out Scientific Research studies. Thus, Research institutes in Nigeria do operate to improve and increase the knowledge available to specific research projects as well as broaden the possibilities of how to utilize the knowledge to best advantage. Particularly, the core mandate of NIFOR among others includes; the conduct of research into the production and products of oil palm and other palms of economic importance and transfer its research findings to farmers (Ujadughele & Osagie 2016). Hence it is expected that NIFOR as a public institution, charged with agricultural research activities should motivate its staff to enable improved work performance, efficient generation of technologies and achievement of its goals embedded in the national aspirations of economic growth, food security and poverty eradication in Nigeria.

Herzberg's two-factor theory for motivation, a widely renowned practical approach towards motivating employees, has been identified as appropriate construct validity for this study. NIFOR has various categories of employees to include; Research Scientist, Administrators, Executives, Technologist among other whose motivation is expected to vary according to Herzberg's two factor theory. The outcome of the study will be useful to NIFOR's management in making a "mix" of these factors for improved performance of the institute. Various Head of Divisions and Heads of Departments [HODs] will also benefit from the results obtained from this study since it will allow them opportunity for a rethink about different other motivational tools and systems capable of bringing out the very best from their subordinates.

Furthermore, in the sphere of motivation, there exist several theories developed in Western cultures to explain the process and set of needs. (Iguisi, 2009) However, since motivation is closely related to individual, cultural, and socio-economic factors (Dweck & Leggett, 1988; Steers & Sanchez-Runde 2002) then these theories proposed in developed countries should be tested in developing and underdeveloped countries. Particularly in developing countries, the background of employee motivation might be different from those in developed countries (Ozsoy, 2015).

In explaining employee motivation, Herzberg proposed two main factors a) motivation factors b) hygiene factors. According to this theory, motivation factors are all directly related to work-related factors and job satisfaction. On the other hand, hygiene factors include predominantly external factors that are not related to work itself, but they affect employees' dissatisfaction (Herzberg et al., 1959; Herzberg, 1966). In this study we concentrate on the hygiene factors since [a] they have been considered as motivational factors in some cases and [b] they have been rarely discussed in the light of Agricultural Research Institutes in Nigeria. Consequent upon these reasons this study aims to test Herzberg's Two Factor Theory with samples taken from Agricultural Research Institute in Nigeria. In addition to testing the study hypothesis with Ordinary Least Square Estimator (rarely applied in prior related studies) I control for differences in personality traits of the respondents knowing fully well that motivation is closely related to individual differences (especially personality traits) revealed from the studies of Park, Song, Kim & Lim 2015; Limbu, Jayachandran & Babin 2014. Hence, for the remaining part of this study, the concept of motivation and motivational theories together with hypothesis development are briefly discussed. However, methodology of the study is closely followed by findings recommendations and conclusion. Finally, the study extends by adding its limitations as well as delimitations.

Conceptual Literature

Motivation

Motivation is one of the major issues in behavioural sciences and based on the crucial position and important role of human resources in achieving organizational defined goals, this issue has also long been of interest to human science and organizational researchers. In literature, work motivation proved to be one of the most important assumptions of the effectiveness of work and the achievement of the given goals of both individuals and the whole organization (Boljanović & Pavić 2011). Motivation is a term that has also been referred to as a catalyser or an engine that runs human forward. Motivation is an issue which has been deeply noticed by psychologists. It is the organism's internal states that lead the person's behaviour toward a special goal (Nigel Bassett-Jones, 2005). According to Robins (2001) motivation is a need satisfying process which means that when an individual's needs are satisfied or motivated by certain factors, the individual will exert superior effort towards attaining organizational goals. As mentioned by Vroom (1964) motivation is a term derived from the Latin word 'Movere' which connotes 'to move'. It is an internal force dependent on an individual's needs which drive him/her to achieve. In a similar pattern, Schulze and Steyn (2003) affirmed that in order to understand people's behaviour at work, managers or supervisors must be aware of the concept of needs or motives which will help move their staff to act.

Motivation is a process that takes place within the person, which affects the degree, direction and duration of the effort involved in achieving a goal (Greenberg & Baron 2003). Motivation refers to some aspect of life that exists in the consciousness and behaviour of each person and it launches to action, and the task of human resources managers is to find a way to understand how to inspire and ensure a high level of employee motivation, bearing in mind that their motivation is influenced many factors: biological, intellectual, economic, social, emotional etc because every employee perceives different activities, events, people and goals as motivating. It is precisely because of this complexity that the motivation of an employee must be regarded as an internal driving force subject to the influence of both internal and external factors. Generally,

motivation for employees is a combination of meeting the needs and expectations of work and factors at the workplace that enable their motivation.

Motivation and Employee Performance

There is a wide range of tools used to motivate employees. As noted by Fredric Taylor money is seen as the most important factor that motivates an employee to achieve higher productivity in industry. This form of reward results in employee satisfaction and directly affects their performance. Salary is a valuable tool that plays an important role in the improvement of employee performance, as well as organizational productivity (Kampkötter, 2015) Several studies such as those of Bajziková, 2018; Plessis, Douangphichit and Dodd 2016, Zameer, Ali, Nisar, Amir 2014; Mani 2010; have shown that salary, promotion, bonuses, and other types of rewards are used by most enterprises to improve employee performance. Praise, setting realistic and achievable goals, appropriate workload definition, employee engagement, appropriate empowerment, responsibility, feedback, work equipment, expressing the positive personality features of a supervisor, appropriate leadership style, and providing relevant information are considered to be other important motivation factors (Kmecová, 2018; Sanchez-Sellero, Sanchez-Sellero 2018; Sánchez-Sellero, Sánchez-Sellero, & Cruz-González 2018, Grenčíková, Guščinskiene & Španková 2017; Nemeč, Kristak, Hockicko, Danihelova, & Velmovska 2017; Machová 2014; Naile & Selesho, Muogbo 2013, Kropivšek, Jelacić & Grošelj 2011)

This is in line with the views of Emeka et al., (2015) who asserted that high motivation of employees is influenced by a variety of factors such as job security, employees' satisfaction, training and development, compensation, appraisals, positive feedback, intrinsic (intangible) rewards and extrinsic (tangible) rewards. Further noting that through motivation, employees do their best work even in strenuous circumstances and face greasy challenges easily. Dahlqvist and Matsson (2013) asserted that for higher performance of employees, motivation is an important aspect, which also allow them longer stay in organization and ultimately increases company's reputation. Employees are more satisfied through opportunities, good working condition, good policies, security of a job and loyal relationships (Palaniammal, 2013). In the study of Shahid (2012) the author summarized that employees' motivation is highly motivated by financial incentive, relationship with co-workers, promotional opportunities and employees' employment, while, Bruzelius and Skarvad (2004) believed that intrinsic and extrinsic rewards make the employees' motivation high and they become professional which boosts company's worth. Employee's motivation helps in growth of organization as well as growth of individual. The rewards positively influence worker's performance and motivate them to boost their productivity by keeping in mind task fulfilment and goal achievement.

Theoretical Framework

There are numerous theories of motivation in the literature and they have been divided into both process and content motivation theories. Notable among the motivation content theories are; Maslow's Hierarchy of Needs (Maslow, 1954), Herzberg's Two Factor Theory (Herzberg, Mauster, & Snyderman, 1959; Herzberg, 1966; Herzberg, 1971; Herzberg, 2003; Herzberg et al., 2005), McClelland's Theory of Needs (McClelland, 1961; 1985; 1976) Alderfer's ERG Theory (Alderfer, 1967; 1969). However, theories such as Vroom's Expectancy Theory of Motivation (Vroom, 1964), Porter and Lawler Expectancy Theory (Porter & Lawler, 1968); Adams' Equity

Theory (Adams, 1963), and Locke's Goal Setting Theory (Locke & Latham, 1990; 2006) have been categorized as motivation process theories. In this study, we direct our attention to

Herzberg's Motivation - Hygiene Theory

This theory was proposed by Herzberg & his assistants in 1969. On the basis of his study of 200 engineers and accountants of the Pittsburgh area in the USA, he established that there are two separate sets of conditions (and not one) which are responsible for motivation and dissatisfaction of workers. When one set of condition (called 'motivator') is present in the organization, workers feel motivated but its absence does not dissatisfy them. On the other hand, when the other set of conditions (called hygiene factors) is absent in the organization, the workers feel dissatisfied but its presence does not motivate them. Both conditions are unidirectional, that is, their effect can be seen in one direction only (Kumar, 2016). According to Herzberg the factors which act as Motivators are Achievement, Recognition, Advancement, Work itself, Possibility of growth and Responsibility while Hygiene factors are: Salary and wages, job security, organizational policies, supervision practices and relationship with authorities, relationship with peers, work conditions and personal life (Herzberg, 1959).

This study is specifically concerned with Herzberg dissatisfies as they relate with motivation. The hygiene factors identified for the study are also applicable to NIFOR and include: company policy, supervision, working conditions, interpersonal relations, job security and; salary and fringe benefits. Similar studies in Africa and the developing world have also identified these factors as appropriate in motivation studies. (Acom, 2010; Kwasi & Amoako, 2011; Manzoor, 2010; Mwala & Mwale 2011; Namuddu, 2008; Sene et al; 2011)

Salary and Wages

The main reason human involves himself in economic activities is to earn money, satisfy his physiological needs and support his family. Naturally, everyone needs food, clothing, shelter and other basic requirements; these requirements in today's societies are often supplied by paying the price. Payments are often seriously scheduled in such a way that in most cases, like mortgage, rent, transportation services, and other charges, they are paid monthly and if there is delay in their payment, the person would face stiff negative treatments. If staff's salary payments do not follow a fixed principle and they are not paid within a certain time, this will disturb their peace and their relationship with the job will be bleak. Hence, based on many related studies, salary and wages is one of the main hygiene factors ranked as first (Marjolen, 2003).

Hypothesis I: *Salary and wages has a significant effect on staff motivation in NIFOR.*

Personal Life

Employees in every organization are faced with different challenges in their personal lives which may include; trying to make a balance between personal life and the job they have chosen for their livelihood, reaching an agreement with family about the person's job, and the person's marital status. Three main areas which is expected that a person should be able to handle simultaneously without preferring one to the other are; the job, family and personal matters. The challenge is that there isn't always enough time and opportunity available to coordinate all three areas. Hence, if employees can dominate at least two main areas of their lives, it can be said that they enjoy an acceptable life situation. Employees should seek activities that have the greatest

relevance, consistency and authenticity to their ability and capacity (Pirzadian, 2005). In the light of the foregoing the second hypothesis is stated as;

Hypothesis II: Personal life *has significant effect on staff motivation in NIFOR.*

Work Conditions

Often for the employees to easily work and have high efficiency in their workplace, they are required to be placed in a healthy environment, both physically and psychologically. An appropriate environment should be provided in the workplace. These indexes can be mentioned in providing an appropriate workplace: - Low level of human emissions such as noise, dust, etc. - Safe working environment - Absence of potential context for any workplace accidents - regular provision of appropriate work tools, etc. (Kolins, 2005). Following the foregoing the third hypothesis is stated as

Hypothesis III: Work conditions *have significant effect on staff motivation in NIFOR.*

Supervision and Relations with Authorities

Hawthorne studies conducted at Western Electric Company followed by Elton Mayo indicated the effect of group work supervision performance and relationships with authorities on staff's motivation and job satisfaction. The main duties of managers are trapped in the realm of human relations. Human relations include all relations a person has with his peers due to work requirements. Effective management is what makes the most of individuals' talents, thoughts, ideas and abilities. In organizations, supervisors play a key role in motivating staff; so, paying attention to their position and the role of association with others in supervision is considered an essential issue. In general, supervisor is a liaison between the manager and staff and vice versa. The term "supervision" is often used to refer to leading the staff to their daily activities. Supervision and control can also be considered as the process for monitoring the activities to make sure they are done according to the schedules (Robbins, 2005). Staff's behavior is heavily influenced by supervision and managers' relationships with authorities. Therefore, managers are going to see staff's motivation and efforts, if they deal with the positive aspects of staff, rather than only considering their problems. This is possible if they implicitly trust the realization of overall objectives and they clearly state their opinions and put their heart and soul into work (Pirzadian, 2005).

Hypothesis IV: Supervision and relationship with authorities *have significant effect on staff motivation in NIFOR.*

Relationship with Peers

Relations help to ensure the attainment of beliefs, attitudes and shared values. Developing a shared understanding of the organization's goals also creates unity and solidarity between different groups. Transferring required data to the staff should not be considered a difficulty or burden, but a chance. Good relations are likely to enhance performance and efficiency and they are also effective in increasing individuals' commitment to the organization. Relationship plans, if properly managed, can release energy, enthusiasm and ideas; if relationship plans don't exist, this energy will probably be extinguished. Therefore, specific needs of a business will be met if we emphasize individuals' performance, create a specific set of culture and value for the company and if we improve individuals' work (Armstrong, 2004). Relationships in group or

organization have four main functions: control, motivation, expression of feeling and information transfer (Robbins, 2010). Therefore, hypothesis five is stated as:

Hypothesis V: *Relationships with peers have a significant effect on staff motivation in NIFOR.*

Organization's Policies

Policies are the same constant guidelines about the kind of approach that the organization plans to apply for its human resources. These policies actually define philosophies and values about how to deal with human resources. Several principles are elicited from this definition that the managers are expected to act upon these principles when dealing with issues related to human resources. Thus, organizational policies as reference points are served to develop the process of making decisions about human resources and designing employment related actions (Armstrong, 2009). Organizational policies can be stated as general manifests of organization's values. In the light of the foregoing, hypothesis 6 is stated as;

Hypothesis VI: *Organisations' policies have a significant effect on staff motivation in NIFOR.*

Job Security

In talking about job security, everyone imagines that individuals should enjoy formal and stable employment to let their job security be ensured. However, this definition suffers from the inadequacy that the staff's thoughts about progress and development will gradually recede. In the real sense of it, job security is to provide a situation for the individual to be reinforced, so that the organization becomes dependent upon the person's expertise and capabilities, and his expertise and capabilities are also required outside the organization. Dimensions of job security that are achieved through development and support of human resources include: Specialized empowerment, courage and action empowerment, empowerment in experience learning, job satisfaction enhancement, empowerment in behavioral skills, enabling behavioural skills, thinking empowerment, empowering the employees in their work ethics and conscientious (Soltani, 2000). On this note we state the seventh hypothesis of the study as;

Hypothesis VII: *Job security has a significant effect on staff motivation in NIFOR.*

Empirical Review

There have been various studies in support of this theory. For instance, focusing on work motivation in Hyderabad Industries of roofing products in India, Shahid (2013) employed a 50-respondent sample size to illustrate how financial incentives, performance appraisal system, good relationship with co-workers, promotional opportunities in the present job, and employee empowerment largely affect the level of employee motivation.

Chien (2013) tested the validity of Herzberg's two factor theory and found it to be plausible for studying job satisfaction among employees in a Chinese chemical fibre company. He recommended that management should improve areas of workforce planning, succession planning and clarity of performance standards.

Ehiorobo (2004) conducted a study in Nigeria on the implication of adequate motivation on workers' productivity in a power generating company. In a sample of 100 respondents, he

concluded that salaries and other rewards were equally as important as other motivational factors.

Marnewick (2011) in South Africa investigated the applicability of Herzberg's two factor theory to Africa 50 years after the birth of the theory's and in Africa where it's "foreign". He researched into motivation of information technology (IT) managers and concluded that IT team members were indeed motivated by achievement, recognition, responsibility. The study revealed that that age, race and gender did not influence motivation.

Namuddu (2008) employed Herzberg's two factor theory in a bid to understand the performance of Sebagala and Sons, a private supplier of electric equipment in Uganda. With a purposive sample of 60 respondents, the study focused on salary, company policy, career development, and causes of higher turnover rate. Findings from the study suggested that most employees would leave due to job insecurity and if offered better pay elsewhere.

Methodology

The present study is empirical in nature and based on primary data collected through a comprehensive questionnaire. The questionnaire contained questions relating to hygiene factors developed in Herzberg's theory. The questions which are contained in the questionnaire were closed ended. The questionnaire is divided into two sections. Section A which seeks biographic information of respondents to include; age, gender, marital status, educational qualification, and the department in which they work. Section B focused on hygiene factors as enumerated in Herzberg's theory. The study focused on staff of Nigerian Institute for Oil Palm Research (NIFOR) working at its main station in Benin City. The researcher employed convenience sampling technique and circulated a total of 70 questionnaires. Target kept for response was as high as 70. However, a total of 67 employees from Research, Administration, Accounts & Finance and other departments responded to the questions. To process the elicited data from the retrieved questionnaires as well as to study the research hypotheses, this study employed Stata 14 & SPSS 23 statistical soft wares.

POPULATION DEMOGRAPHICS

The Survey consists of thirty-five (35) questions designed to elicit Information on the work environment. The first five (5) questions were based on demographics such as Gender, Age, Marital Status, Educational Qualification, and Department. The next 4 questions were used to measure Motivation, and the rest twenty-seven (27) were employed to measure hygiene factors.

As per Table 1 below, the survey was conducted on 68 employees, out of which 26 (38.24%) were females and 42 (61.76%) were males

Gender Classification

Gender	Freq	Percent	Cum
FEMALE	26	38.24	38.24
MALE	42	61.76	100.00
Total	68	100.00	

Authors Computation 2020

As per Table 2 below the highest numbers of respondents (49) were in the age group 36years and above (72.06%), closely followed by (15) between 31-35 yrs. (22.06%) representing a population set of fully grown adult respondents with some work experiences. Other age groups 26 – 30 yrs (3) at 4.41% and 26- 30yrs (1) at 1.47% were insignificant.

Age Classification

Age	Freq	Percent	Cum
26 -30 YEARS	1	1.47	1.47
26-30 YEARS	3	4.41	5.88
31-35 YEARS	15	22.06	27.94
36 YEARS AND ABOVE	49	72.06	100.00
Total	68	100.00	

Authors Computation 2020

As per Table 3 below, we find that out of the total respondents 64 persons making a total of 94.12% were married and only 4 persons 05.88% are unmarried.

Marital Status

M_Status	Freq	Percent	Cum
MARRIED	64	94.12	94.12
SINGLE	4	5.88	100.00
Total	68	100.00	

Authors Computation 2020

Table 4 below reveals that 35.29% of respondents hold a Bsc or HND degree while 57.35% or 39 persons in the population possess an MSC or Phd degree. But for the class of OND we find only 3 respondents (4.41%) and 2 persons (2.94%) had other lower qualifications.

Educational Qualification

E_Qualifica tion	Freq.	Percent	Cum
BSC,OR HND	24	35.29	35.29
MSC OR PHD	39	57.35	92.65
OND	3	4.41	97.06
OTHERS	2	2.94	100.00
Total	68	100.00	

Authors Computation 2020

In terms of the departments where the respondents belong, we find that most of the respondents in the sample were researchers making a total of 28persons with a 41.18% score and closely followed by administrators which recorded 23persons or 33.82% points. A total of ten (10)

respondents represented accounts and finance department while other seven (7) persons (10.29%) were drawn from other departments.

C_Dept	Freq	Percent	Cum
ACCOUNTS & FINANCE	10	14.71	14.71
ADMINISTRATION	23	33.82	48.53
OTHERS	7	10.29	58.82
RESEARCH	28	41.18	100.00
Total	68	100.00	

REGRESSION RESULT

TABLE 4.6 REGRESSION RESULTS FOR MOTIVATION MODEL

Independent Variable	Coefficient	Probability Value	Level of Statistical Significance
SALARY AND WAGES	0.063	0.580	> 5%

S & R AUTHORITIES	0.022	0.923	> 5%
RELATIONSHIP PEERS	0.005	0.975	< 5%
INSTITUTE'S POLICIES	0.246	0.069	> 5%
JOB SECURITY	0.509	0.002*	< 5%
R² = 30.2 F- Statistics = 1.99 Prob F = 0.043 Observation = 68			

Note* denotes 5% level of statistical significance

We validate our result obtained above by subjecting the ordinary least square regression estimates to a litany of classical linear regression model assumptions. These assumptions include: test for multicollinearity, normality of residuals, model specification, appropriate functional form and the test for influential observations. However, we note that all conditions were successfully met with; hence we proceed to interpret the results from the Ordinary Least Square Regression estimator.

Ranking of hygiene factors influencing staff's motivation in NIFOR

Ho: P>0.05 (There is no significant difference between hygiene factors and staff's motivation.)

H1: P<0.05 (There is a significant difference between hygiene factors and staff's motivation.)

Friedman test is employed to rank the hygiene factors that affect staff motivation in NIFOR. The results are shown in tables (4.7) and (4.8) below.

TABLE 4.7 FRIEDMAN'S TEST

N	X ²	df	Sig. Level
68	108.832	6	0.000

Authors Computation 2020

As the significance level of the test is smaller than 0.05 in the table above, H1 is confirmed; therefore, Friedman test can be employed to rank hygiene factors influencing staff's motivation in NIFOR.

TABLE 4.8 PRIORITIZED HYGIENE FACTORS INFLUENCING STAFF'S MOTIVATION WORKING IN NIFOR

Rank	Hygiene Factors	Avg. Rank
1	Salary and Wages	5.00
3	S & R AUTHORITIES	4.97
3	INSTITUTE'S POLICIES	4.10
4	WORK CONDITIONS	3.99
5	RELATIONSHIP PEERS	3.59
6	PERSONAL LIFE	3.49
7	JOB SECURITY	2.22

Authors Compilation 2020

The test results above show that salary and wages with an average score of 5 is ranked first in staff's perception. This means that staff in NIFOR holds the opinion that among all Herzberg's hygiene factors affecting motivation, salary and wages is most perceived; but job security is ranked lowest with an average score of 2.22.

The researcher tests the internal consistency and reliability of the question items by employing Cronbach Alpha Coefficient. Accordingly, the item test is not consistent and reliable if alpha level falls below 0.60. However, scholars suggest that alpha levels higher than 0.95 are not necessarily good, since it might be an indication of redundancies (Hulin, Netemeyer, & Cudeck, 2001). Hence the result obtained in this study (Alpha = 0.60) supports an internal consistent and reliable question items. See Appendix for Details

DISCUSSION OF RESULTS

This study has been conducted to analyse the factors that significantly influence motivation of staff at NIFOR based on hygiene factors in Herzberg's theory. The results showed that:

From the goodness of fit indices obtained, it is understood that Ordinary Least Square Regression estimator employed to test the effects of hygiene factors on staff's motivation enjoys a good fit and all obtained indices are in accordance with determined standards hence, the OLS Regression Model is been approved. Here, the model significance (F-Statistics = 0.042) indicates that the overall model which we estimated in evaluating hygiene factors is acceptable.

Gender and Marital Status Differences: In order to provide additional support for testing Herzberg's theory, Hedges' g (1981) test was employed to find out whether the average (mean) values of the factors in Herzberg's Hygiene theories differ with respect to gender and marital status. The findings reveals that both effect sizes (gender = -0.024 and Marital Status = 0.055) are trivial based on the rule of thumb as posited by Cohen (1997) who suggested that $g=0.2$

should be considered a 'small' effect size, 0.5 represents a 'medium' effect size and 0.8 a 'large' effect size. This suggests that if two groups' means don't differ by 0.2 standard deviations or more, the difference is trivial, even if it is statistically significant. Following the findings obtained it is revealed that males mainly highlight motivation factors more than females; however, the effect size difference is not high enough to consider males' scores remarkably higher than females. Therefore, it could still be concluded that the preference of males and females were found to be similar. Similarly, it is also clear that married staff in NIFOR mainly highlight motivation factors more than unmarried staff, however, the effect size difference is not high enough to consider scores for married staff' remarkably higher than those that are not unmarried'. Therefore, it could still be concluded that the preference of married staff and unmarried staff were found to be similar.

Hygiene factors were ranked using Friedman test and it was found that salary and wages with a mean Score of 5 ranked highest, as workers perception about these hygiene factors is greatest here; this is followed closely by supervision and relationship with authorities, institutes policies, work conditions, relationships with peers and personal life. However, the result shows that job security had the least perception on employees' motivation respectively. The results obtained in this study are consistent with those of Mickbeal (2008) and Fischer (2000), while it's negates the findings of Abozed's (2011). In the study of Mickbeal and Fischer's wages and salary obtained the highest perception about employees' motivation among other hygiene factors which is expressed in Herzberg 2factor theory.

Based on the priority order of respondents about hygiene factors that affects employees' motivation, salary and wages, supervision and relationship with authorities, institutes policies, have been the top three major factors perceived as best motivators of staff in NIFOR. This suggests that management's attention to salary and wages, supervision and relationship with authorities and institutes policies will not only prevent dissatisfaction and loss of employees' motivation, but it also enhances workers motivation. Therefore, it should be noted that employees' motivation may be sparked up by timely payment of salaries and wages, adequate supervision and appropriate relationships with employees in the organization; and a touch of fair institutes' policies will also result in more diligent and creative staff. Implementing motivational schemes, such as individual, group and organizational motivation plans, will also result in increased morale and motivation of staff in NIFOR.

Furthermore, the priority of respondents' perception about hygiene factors that affect employees' motivation reveals that relationships with peers, personal life and job security respectively have the least perception on staff motivation in NIFOR. Of course, this doesn't imply that the above-mentioned factors are unimportant, rather it shows the importance of these three factors compared to other hygiene factors. Therefore, NIFOR management can provide appropriate context in order to motivate staff by activating the following practices:

Provide appropriate conditions in order to build positive relationship between employees in form of organization's rules and regulations. Striking a balance and equilibrium between existing conditions in the workplace and staff's physical and psychological features together with improved physical work conditions, such as providing appropriate space (especially in this era of Corona Virus [COVID 19] pandemic), lighting and tools to suit the capacity of the staff, and consider various dimensions of staff's personal life by designing proper plans to accommodate workers' personal problems.

Furthermore, in this study we take a unique step ahead (among related prior studies) to reveal the significant effect of these hygiene factors on staff motivation in NIFOR. According to the results obtained from the Ordinary Least Square Regression (OLS) analysis, only the hygiene factor of Job Security shows a statistically significant positive effect on employee motivation. This implies that *ceteris paribus* ie holding all other selected factors constant, staff in NIFOR will be most motivated when issues surrounding his/her job security is always addressed. Clearly, lack of attention to this factor may cause workers to lose motivation thereby causing adverse impact on other factors. Consequently, the researcher posits that not all of Herzbergs' Hygiene factors would spur work motivation among staff in NIFOR. This finding is consistent with those of Stiglbauer, Selenko, Batinic, and Jodlbauer (2012) who noted that no matter how involving a job is; employees will feel dissatisfied if they feel their job is vulnerable and insecure. They further noted that the feeling of dissatisfaction may transcend gender, contract type, and nationality differences. The findings here also align with those of Berglund, Furaker and Vulkan (2014) whose result imply that if employees perceive a risk of a job loss, or increasingly worry about losing their jobs, this would lead to job dissatisfaction yielding motivation lose.

Recommendations

Basically, the study recommends that management should consider policies that promote the level of job security of staff when formulating reward policies. This is due, as it has been empirically revealed that this factor when catered for initiates job motivation among staff in NIFOR. Furthermore, we encourage management to consider policies that will enable growth-inducing tasks in job content, and not pain avoiding behaviours in the job environment. This will cause a positive response from the employees contributing to stimulate work motivation and growth in the workplace.

Limitations of Study

There are some limitations that need to be addressed in this study. The first one is the limited number of sample size. An important issue in theory testing is the inclusion of a heterogeneous sample (preferably a rather large sample size) into the research. However, in this study Herzberg's theory was tested by almost a plain homogenous sample (participants were all within main station of NIFOR, and they all work under similar conditions). If data were collected from a larger and heterogeneous sample, (staff from sub and out stations) then it would be possible to make greater comparisons among employee categories. In the current study, there are also limitations related to measurement.

Indeed, Herzberg's initial study and the sample group are also still being criticized. Although, this study test the theory with one approach (i.e Likert-type measurement), an additional in-depth interview method would lead to more comprehensible findings in a bid understand the dynamics of motivation.

Delimitations

These are the characteristics of the research under the researcher's control that define the boundaries and limit the scope of the study (Anthonisz & Perry, 2015). In this study, the delimitation is that participants include only employees working within the NIFOR main station situated along Benin Akure road Benin City Edo State Nigeria. Therefore, results presented in this study may not apply to other employees in Sub and experimental stations.

ABSTRACT

In the conditions of administrative command and centralized planned economy, the peculiarities of the former Soviet republics, including Uzbekistan, are not taken into account, the specific demographic situation in Uzbekistan, i.e. rapid population growth, gross mistakes in the allocation of productive forces, unilateral economic development the consequence was negatively reflected in the social life of the population.

KEYWORDS: *Social Life, Population, Demographic Situation, Social Problems, Fergana Valley.*

INTRODUCTION

It is known that during the Soviet era, the wrong, ineffective socio-economic policy of a large country based on a false communist ideology, command-and-control system, aggravated the living conditions of the people of Uzbekistan in the late 80's. Deterioration of living conditions, rising unemployment, declining social labor productivity and incomes, ultimately declining welfare, absolute dissatisfaction with the social situation in the country, social security and social protection, declining living standards and imbalances in the system of social production formed.

Also, before the independence of Uzbekistan, there were a number of factors that hindered the solution of social problems of the population. In particular, it was a severe economic crisis caused by the comprehensive repression of the Uzbek SSR by the former center, the failure of the policy of "reconstruction".

The peculiar demographic situation in Uzbekistan, ie rapid population growth, administrative command and centralized planned economy system, did not take into account the specific features of the former Soviet republics, including Uzbekistan, gross mistakes in the deployment of productive forces, unilateral economic development. the consequence was negatively reflected in the social life of the population. In particular, in the 1980s, especially in the second half of the twentieth century, the sharp decline in the pace of agricultural and industrial production in the Fergana Valley showed a negative impact on the social situation in the region.

Main part On the eve of independence, the problem of employment was especially important and acute. Uzbekistan's economy is overcrowded, the number of able-bodied but unemployed people continues to grow, the quantity and quality of labor supply and demand are disproportionate, and national-ethnic and social factors have not been taken into account in the placement of productive forces for many years. It was a source of social tension in society.

The situation with employment is particularly acute in densely populated regions and rural areas of the country. In large cities, the increase in population per square meter and the fact that people are living in extreme densities have led to social ills such as unemployment. This is especially true of large cities in the Fergana Valley. On January 1, 1985 in the Andijan region 1 sq. M. There were 370 people per square kilometer, 273.7 in Fergana and 164.9 in Namangan [1]. Out of more than 5 million people in the Fergana Valley (according to the 1989 census, 1 million 727 thousand in Andijan region, 1 million 477 thousand in Namangan region, 2 million 154 thousand in Fergana region), 1.5 million people were not employed [2]. These figures have increased further in recent years. Excessive population density, high growth rates due to the influx of manpower from its natural and other regions, have aggravated all social problems, especially in densely populated cities.

The government of Uzbekistan, despite the political and economic influence of the Soviet government, has taken historic steps to find a positive solution to social problems. In particular, the formation of state policy on the employment of the population, which is the basis of the economic life of the people, has begun.

Also, for a densely populated and fast-growing region such as the Fergana Valley, the social significance and severity of the housing problem required a serious approach to the problem. However, during the years of the Soviet regime, especially in the 1980s, various measures were taken to provide the population with full (normal) housing, recommendations were made and many decisions were made, but this problem remained one of the most acute social problems in the Fergana Valley.

The housing supply of the Fergana Valley was lagging behind the average level of the republic and the union. For example, the housing supply in Fergana was less than a quarter of the union average. In early 1989, 28,000 families from urban and rural areas were queuing to improve their housing conditions, while 526 people were living in emergency housing [3]. In Namangan, housing is also an acute problem, with one in three people in need of improved housing and about 15,000 families having to buy land to build their own homes [4].

One of the main reasons for the deterioration of the social sphere in the Fergana Valley in the early years of independence was the concentration of about 30% of the population in Andijan, Fergana and Namangan regions, which occupy only 4% of the total land area [5]. This is because

the high population density, the large number of families, and the slow pace of migration have had a negative impact on socio-economic development.

As of 1991, the Fergana Valley is the most populous region in the country. In particular, the population of Fergana region is four times more than the population of Syrdarya region, and 3.5 times more than the population of Navoi region. The population of Andijan and Namangan regions was three times higher than that of Syrdarya region, 2.7 times higher than that of Navoi region, and twice as high as that of Jizzakh region [6].

Therefore, it was important to properly assess the socio-economic development and demographic processes of the Fergana Valley, to pay attention to increasing the level of employment resulting from the re-establishment of the population in the regions.

From the first days of independence, the formation of the social protection system in the country, social protection has become one of the continuous priorities of the program of economic reforms, ie one of the priorities at all stages of reform. As a strong social policy is one of the guiding principles of Uzbekistan's path to independence and development, this process has been improved, a set of economic, legal and social measures has been developed for those in need of material and social protection, social protection has been recognized as a priority, legal framework has been created.

The population density in the Fergana Valley has long been higher than in all other regions of the country. In terms of population density at the beginning of 2003, Andijan region (542.8 people) had the highest population density, followed by Fergana region (410.5 people), Tashkent region (293.8 people), and Namangan region (272.9 people) [7]. As of January 1, 2010, the population of Fergana region is 3 million 48.7 thousand people, labor resources are 1 million. 720.1 thousand people [8].

The values formed in the transition to market relations, the peculiar changes in customs, the desire of the people to create decent living conditions, the proliferation of contraceptives, the increase in employment of women in social production and services, each family within its means, resulting in a slight decline in the birth rate.

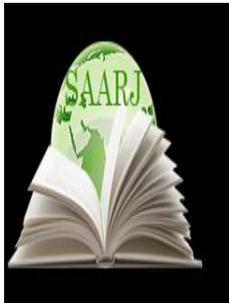

In this situation, it is expedient to develop targeted state programs on internal and external labor migration in order to increase employment and efficient use of available labor resources. Appropriate redistribution of existing labor resources in these programs to the prospects of innovative development in the regions, in this regard, the construction of affordable housing for young families involved in internal migration and the construction of new social infrastructure in the regions.

CONCLUSION

It should be noted that the process of amending the legal framework of our work on social protection is developing, and the evolution of the social protection system, which has become an integral part of building civil society, is developing with promising results. Declaring the priority and high value of human rights and interests on the basis of the "Action Strategy for the Development of Uzbekistan (2017-2021)", the implementation of radical reforms in all spheres of life of the state and society, including the social sphere. indicates social orientation.

CONTRIBUTION OF ICT TO THE TOURISM SECTOR DEVELOPMENT IN UZBEKISTAN

Kamoliddin Shodiyev*

*Researcher,

Samarkand State Institute of Architecture and Construction,
UZBEKISTAN

Email id: kamoliddin.shodiyev@bk.ru

ABSTRACT

The issue of ICT and economic growth has received much attention with respect to the developed countries as opposed to the developing countries. Yourself, A., [1], highlighted that ICT enhances economic growth of developing countries by way of: providing cheaper, quality, and empowered communication to marginalized communities. Majority of empirically analyzed papers found out that development of ICT use leads to growth in GDP per capita, employment and productivity in a country. According to the research conducted by the World Economic Forum (World Economic Forum, 2013) a 10 percent rise in the ICT sector of a country leads to a 0.76 percentage rise in GDP per capita, also a 1.03 percentage increase in the rates of employment.

KEYWORDS: *Marginalized, Empowered, And Conducted, Correlation, Empirically.*

INTRODUCTION

This year has been named “2020- the Year of Science and Development of the Digital Economy”. Due to economic reforms that were made during the years of independence, many firms were established and on the ICT basis modern management systems were introduced. Nowadays the share of ICT in GDP is accounted for 1.9% and it is planned to increase it up 10 per cent by 2030. But the return from investment directed to the tourism is still very low. It is well known, that investments directed to tourism of Uzbekistan could lead to the development of science and technologies, to better administration of firms and improvement of living conditions of people, and wide use of ICT is becoming a major factor in the modernization of the sector. All these dictate the necessity of using ICT, new technologies in deepening of provided economic

reforms and structural changes, in efficient exploitation of resources, in implementing of long-term economic programs and increase of their productivity. The tourism sector is no exception.

In order to generate the econometric model time series data was utilized. The study was created based on existing theoretical model and it was implemented using deductive approach. In order to collect data we used two sources: ICT investments were obtained from the International Telecommunication Unit, World Bank Open data for the period between 2010 and 2020, Statistical Committee of the Republic of Uzbekistan. These include the statistical and empirical data on economic growth, investment, labor supply, hotel places. The production function is as a type of transformation function where inputs are transformed into output. Production functions play a role in many business disciplines. Several different production functions have played an important historical role in economics. Our research is employing the Cobb-Douglas function to check the correlation between ICT investment, labor, hotel places and tourism output in Uzbekistan, and find out coefficients of them. They will help to give the industry frame philosophy to management ICT investment in tourism efficiently. In the other hand, when the society pursuit some certain quantity of output, the research will give recommendation how much factors changing can make it possible.

The issue of ICT and economic growth has received much attention with respect to the developed countries as opposed to the developing countries. Yourself, A., [1], highlighted that ICT enhances economic growth of developing countries by way of: providing cheaper, quality, and empowered communication to marginalized communities Majority of empirically analyzed papers found out that development of ICT use leads to growth in GDP per capita, employment and productivity in a country. According to the research conducted by the World Economic Forum (World Economic Forum, 2013) a 10 percent rise in the ICT sector of a country leads to a 0.76 percentage rise in GDP per capita, also a 1.03 percentage increase in the rates of employment.

Variable Selections The variables used in the research paper and their definitions are given as follows: Tourism GDP – dependent variable; measured as a real sector's output (man. \$); Investment (mln. \$); Employment – measured as a number of persons and hotel places, measured in units. The regression-assumptions and several tests recommended by empirical econometric-literature (Stock, 2011) have been checked, in order to choose the model, which best shows the impact of ICT use on economic growth. Stock J. (2012) stated that standard-stationary tests are generally for huge-sample size of data set, as sample-size of the implemented data is not very large, any stationary tests have not been applied. Taking into account this statement he stationary test of time series data was not provided. The following equations were used in the research [2]:

$$\text{Tourism GDP} = \beta_0 + \alpha \text{ Investment} + \beta_1 \text{ Labor} + \beta_2 \text{ Hotel places} + u_i \text{ and (1)}$$

$$\text{Cobb – Douglas model: } \ln \text{ Tourism GDP} = \ln \beta_0 + \alpha \ln \text{ Investment} + \beta_1 \ln \text{ Labor} + \beta_2 \ln \text{ Hotel places} + u_i \quad (2)$$

MAIN PART

In this study, econometric models have been utilized to evaluate each of the growth indicator variables empirically. Each growth indicator variable has been used to find how they relate to the growth rate of tourism industry in Uzbekistan. The overall growth models that have been estimated in this study by using the pooled Ordinary Least Squares (OLS), employing time series

data. By this way it is possible to detect the extent by which the growth rate is influenced by the variables above and the extent by which most likely ICT investment policy impacted the growth rate.

Analysis of descriptive statistics show that variables distributed normally because their averages and means are close to each other. The findings of the descriptive analyses, tests and statistics indicated that all sampled variables have positive but not all of them are significant for the chosen period of time. Overall outcome of the study adduced that each of the chosen indicators meets all the requirement of regression analyses. To define the more appropriate estimating model techniques, first of all, we used linear regression models with the assumption that analyzing the impact of variables vary over time. Besides, there is also important assumption that those time-invariant characteristics are unique and they are not correlated with other individual characteristics. From the regression result sit can be observed that except hotel places all variables have significant affect on the dependent variable's-values of those variables less than 0.05, so hypothesis of two-tail p-values test was rejected. Moreover, t-value test hypothesis also rejected, except a variable, all independent variable have significant influence on the dependent variable. Almost all variables` t- values are more than 1.96, so higher t-value the higher the relevance of the dependent variable. F-test showed that regression models are proper. The panel data of the selected countries to describe the causality between information and communication technology has been tested for the Correlation matrix of residuals Test in order to show the independency of the variables in the model selected. The finding from the test released that all the explanatory variables and control variables have less than 1.00 and this means there is no correlation between the variables and they are fully independent from each other.

However, we also applied Cobb – Douglas type regression models (linear - log models). From the regression results, it can be seen that, unlike linear models, all variables have significant influence on the dependent variable, so p-value of each independent variable lower than 0.05 as well as t-value of all independent variables are higher than 1.96 as mentioned above more t-value the more the relevance of the outcome variable

The Solow residual is a number describing empirical productivity growth in an economy from year to year and decade to decade. Robert Solow defined rising productivity as rising output with constant capital and labor input. It is a "residual" because it is the part of growth that cannot be explained through capital accumulation or the accumulation of other traditional factors, such as land or labor. The Solow Residual is procyclical and is sometimes called the rate of growth of total factor productivity. Generally, tourism sector technical contribution ratio (TCA) is generalized explained as the contribution of tourism technology development to the sector's output growth rate, which including the benefit of science technology development and tourism policy amending, management and service progress. Here we set:

$$R_{TTC} = (R_{TGDP} - I_{GR} * \alpha - L_{GR} * \beta) / R_{TGDP} \quad (3)$$

Where

R_{TTC}: The Tourism Tecnology Contribution ratio

R_{TGDP}: Tourism GDP increasing rate

I_{GR}: Investment growth rate

α : Investment output elasticity

L_{GR} : Labour growth rate

β : Labour output elasticity

The elasticity factors can employ Cobb-Douglas production function to obtain, in Uzbekistan the elasticity of Investment, Labor accordingly is 0.79, 0.11. The R_{TTC} is to analysis tourism development and technology renovation, labor and capital development trend in long run, and is also very important for make a country's tourism development strategy.

At the beginning we investigated and examined empirically the unidirectional causality between economic growth of a country and tourism sector. There is a positive relationship between GDP and output of tourism sector. For example, one per cent increase of GDP; other factors are held constant, leads to 2.88 percent of the sector. This relationship is associated through investments on ICT infrastructure and Internet use. Thus we moved on to the analysis of the influence of ICT development on tourism sector's output. Our findings state that capital, labor resources influence on output positively while hotel places negatively. This is a reality because in tourism development now shortage of hotel places put constraints on the sector development. One per cent increase of investments (including also ICT investments) into tourism sector is associated by 0.79 percent increase of output. Labor elasticity coefficient is smaller – 0.11. Using the Cobb – Douglas type model, by applying formulae (3) we calculated the technology contribution ratios for 2017 to 2020 years.

TABLE - 3 CONTRIBUTION OF ICT TO TOURISM SECTOR DEVELOPMENT

Indicators	017	018	019	020 (plan)
Contribution of ICT, %	6.98	77.6	11.83	7.88
Share, %	56.3	85.8	45.3	30.2
Real Output Growth, %	12.4	90.4	26.1	26.1

Source: The author's estimations using E Views -9.

Having analyzed the data implemented and obtained results, the possible interpretation and explanation with the empirical literature review, the following conclusions are driven. As a result, we could say that ICT drives the economy and also effective ICT investments do have a positive impact on the economy and its branches.

Based on the analyses and evaluations driven from the current research, several policy recommendations can be suggested. In order to encourage sustainable economic development, governments and policy makers in Uzbekistan should put more emphasis on rising investment in mobile-phone sector, since this infrastructure is much cost effective and useful rather fixed line phones. Additionally, authorities are supposed to promote and increase ICT usage to penetrate internet use and broadband acceptance. To improve government management and increase efficiency in public-administration, the authorities should apply e-government. Moreover, they should encourage expanding of ICT usage in private business and organizations sectors as well

by several policy remedies for example: tax reductions, subsidy, improving e commerce and promoting public

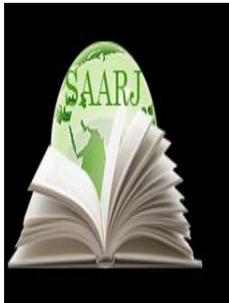

CONCLUSION

The obtained results based on the recent implications promises that the future direction of ICT can contribute to the economic growth more if relevant measures and steps are taken. Nowadays the ability to create, distribute and exploit knowledge has become a major source of competitive advantage, wealth creation and improvements in the quality of life. Some of the main features of this transformation are the growing impact of information and communications technologies (ICT) on the economy and on society.

Besides this, any technology implementation has a strong relation with human resource knowledge background. Therefore, education and training of tour operators will also take some time. Some suggestions could be made based on our research results. Nowadays in the conditions of increasing competition in industries especially in tourism sector, an implementation of modern information-communication technologies (ICT) in tourism sector boosts the competitiveness of firms, of small businesses and of private entrepreneurial entities, which makes possible to gather and process high volume of information for organizing strategic management.

REPETITIONS EXPRESSING EMOTIONS IN ELIZABETHAN TRAGEDIES

Ochilova Maftuna Doniyor qizi*

*MA Student,
 Samarkand State Institute of Foreign Languages,
 UZBEKISTAN

ABSTRACT

The article deals with the analysis of repetitions expressing emotions in Elizabethan tragedies. The chief use of repetition is to mark strong emotion and excitement of the characters. Repetition is essentially an emotional reflex, and it is as such that it chiefly occurs: even the more rhetorical emphatic use, where it is employed to draw attention to a particular word or phrase, is generally timed emotionally as well. Excitement, passion, bustle almost inevitably produce repetition, and dramatists who are rich in such qualities, like Shakespeare or Marston, are generally rich in repetitions

KEYWORDS: *Repetition, emotion, excitement, imagery, pathetic, rhetorical.*

INTRODUCTION

Repetition is essentially an emotional reflex, and it is as such that it chiefly occurs: even the more rhetorical emphatic use, where it is employed to draw attention to a particular word or phrase, is generally timed emotionally as well.

Excitement, passion, bustle almost inevitably produce repetition, and dramatists who are rich in such qualities, like Shakespeare or Marston, are generally rich in repetitions. But repetition is also a favorite effect for the sentimentally inclined — Heywood is a very good example.

Webster with the 56 repetitions and 19 reechoing of the **White Devil** attains once more to figures comparable with Shakespeare's, though still considerably smaller. Nor is this surprising; for, of all the playwrights of the great period of Elizabethan drama, Webster stands closest to Shakespeare in his style and method of working. He too combines the intense intimacy and realism that we find in Middleton also, with a feeling for beauty, and a richness of imagery that we find nowhere else outside Shakespeare. While most of the writers of the second, the greatest

period of Elizabethan drama, strove after forcefulness, achieving beauty more by accident, as it were, or through the slashing conviction and intensity of their imagery, Shakespeare, and Webster too, contrived to combine this forcefulness with the earlier Elizabethan or Renaissance love of beauty. Their imagery is beautiful in itself and it illuminates the most somber and terrible themes with a shining flame of loveliness.

Yet the similarity in Shakespeare's and Webster's use of repetition is not to be sought for primarily in figures and statistics — The **Duchess of Malfi** [3,118-220] has only 23 examples of repetition — an impossibly small number for Shakespeare — but rather in the quality of the repetitions and their life-giving power. It is not important that the proportion of dependent types in The **White Devil** is very similar to that in Shakespeare's mature tragedies - 17 out of 55, or just under 1/3, for the proportion of such types is fairly constant in Elizabethan tragedy, once we exclude the markedly rhetorical writers like Peele, Kyd and Marston who rise to a half and more, and the writers like Chapman, Tourneur and Massinger, who avoid repetition and confine themselves mainly to ejaculatory or independent types. And further, in The **Duchess of Malfi**, where Webster also restricts his use of repetition, the dependent types sink to 2 out of 23. Webster may even be said to differ from Shakespeare in the comparative rarity of the purely exclamatory types as against the imperative forms: in The **White Devil** the figures are 13 and 28, in The **Duchess of Malfi** 8 and 13 respectively; as a good many of the imperatives are of the type **come, come** and so, so, that might equally well be regarded as interjections, the difference between the two groups is not so great perhaps as it appears. The similarity with Shakespeare does not however lie so much in the types and forms employed, but in their function in the play.

As with Shakespeare, and no doubt in part because of their greater frequency, the repetitions appear heaped at points of emotional stress: the great quarrel scenes between Brachiano and his wife, between Victoria and Brachiano, the trial scene — the climax of the play —, the deaths of Marcello, Brachiano and Victoria. With few other playwrights besides Shakespeare and, as will be shown later, John Fletcher, do the repetitions come in such plainly marked rhythmic waves. Mostly, even when their purpose is to mark emotion, they do not come together in successive waves, but seem to be fairly evenly distributed over the body of the play. Even Marston, who in the frequency of his repetitions is second to none, does not save them up so markedly for the moments of supreme tension, does not, in short, use them to underline the rhythmic pulsation of the play as a whole. In The **Duchess of Malfi**, owing to the infrequency of repetitions, this pulsation is hardly to be observed, except in a certain concentration of examples, 5 in all, in the last scene.

Heywood's limitations - go, however, further than that: has no sense of personality either. A particularly good example : of that is in *The Rape of Lucrece* [5, 101-135], where Martius Scaevola and Horatius are respectively described as laughing, and blunt, yet remain entirely undifferentiated in their speech. Valerius marked by his comic songs, but in his conversation he resembles the others exactly. Heywood's characters have no individualities and there is no manner of differentiation to be observed in his repetitions. In *A Woman Killed with Kindness* all the characters use exactly the same melodies, except that a sort of climax is reached in the deathbed scene, where the pathetic effect is forced by slightly rhetorical touches. Heywood's whole interest is centered in the exploitation of the pathetic and in conveying static emotions, above all varying shades of grief. The types of repetition that he uses for these effects are the

ones, and he seldom goes beyond simple realism. Even in deathbed scene the climax is attained merely by a very simple use of thesis, as in Nan's answer, *sick, sick, oh sick!* V 5, or her imperative forms, *Tell me, oh, tell me, where Master Frankford? V 3, and Pardon me, Pardon oh, pardon me.* V 48, All the various types are put under contribution to enhance the pathos: there is, e. g. the faithful Nicholas's **Strike, strike, do strike; yet hear me!** III 56, and Frankford's **Rise, nay, rises, and I'll debate with thee.** IV v. 70, or the exclamation of the servant, **O mistress, mistress! My poor mistress!** V iv 23, Mountford's *Alas, alas! 'It's all trouble hath left me.* III I 24, and many other forms, But some types prove themselves more especially effective. As in *King Lear*, great play is made the apostrophe to achieve pathetic effects: here, excluding ashes of calling to a distance, there are 12 apostrophes — in *Lear* there are 9, **Romeo and Juliet** has 5, **Sophonisba** 7, while only Fletcher's *Bonduca* exceeds with 14; very few indeed the other plays considered here have as many as 4 even. The cry **O God, O God** stands out particularly clearly, used by various speakers no less than 4 times. Frankford's **Oh, Nan! Oh Nan!** IV v 80 is famous, but the most, obviously pathetic effect are the cries of the faithful servants — Nicholas's **O master, master, that Wendell is a villain!** III iii 54 and the collected household, **Oh, mistress, mistress! What have you done, mistress?** IV v54

The dependent types too are mainly used for pathetic emphasis. Mountford's **Here's a pawn, — My sister, my dear sister's** I 106, as he offers to sacrifice her to the hated Acton; Acton's **A poor, poor wench, to my great adversary Sister.** III I 103, as her beauty pierces his heart. Frankford's **I did indeed, witness my tears, I did.** IV v 79, as he reproaches his erring wife, Nicholas' **I'll tell my master, by this air, by this air. I will; Fall what may fall, I'll tell him.** III ii 24. These last examples with the repetition of a phrase, separated by heavy thesis, are especially characteristic of Heywood's style. Sometimes these phrases assume the force of a leitmotiv, punctuating a long speech, as in Mountford's exclamation of **By Acton freed!** IV I 91 ff. or Wendell's **I care not, I ...I care not, I...care not, I Why, what care I?** II III 136 ff, such forms occur in Heywood's other plays also, and are distributed irrespective of the characters that use them.

Of course, the repetitions in *A Woman Killed with Kindness* are not devoted entirely to pathos. A certain number are of that colloquial kind that by the use of phrases like *come, come, and no, no*, the calling for servants and so on creates a realistic background for the play. And *A Woman Killed with Kindness* is remarkably rich in genre scenes depicting the mirth of the servants' hall, where repetition is frequent in the confused cries of the company. Other examples are excited, like Mountford's cry, **so, well cast off! Aloft, aloft! Well flown!** I iii 1, at the hawking match, or mark surprise, as Shafto's **Sir Charles! A hand, a hand! At liberty?** II 21, But to what an extent the repetitions in this play are governed by the prevailing tone of sentimentality is seen when we compare it with Heywood's later, less pathetic works. Against the 76 repetitions of *A Woman Killed with Kindness*, *The Rape of Lucrece* (published 1608) has only 27, *The English Traveler* (published 1633) 24. Of the 76 repetitions in *A Woman Killed with Kindness* 33 at the least markedly sentimental. The reechoing, on the other hand, maintain a fairly constant level with 8 for *Lucrece* and 10 for *The English Traveler* [5, 208-271], of which latter, however, 6 are due to the mystifications of the comic under plot. A

Woman Killed with Kindness can thus hardly be taken as really typical of Heywood's manner. He belongs as regards the use of repetition rather to the party of Chapman, Jonson and Middleton than that of Shakespeare, Webster and Marston.

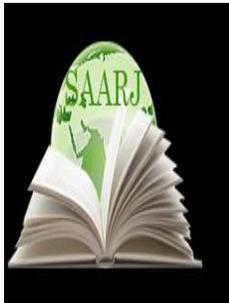

CONCLUSION

With the serious characters, though the repetitions are used to express quite complicated emotions, they seldom achieve a really personal note, nor, within the limits of a given character, is there any wide variety of harmonizing effects that suggest a character of some complexity.

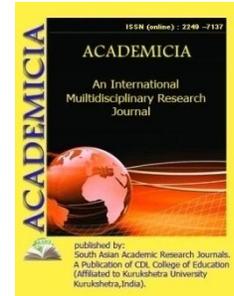

Excitement, passion, bustle almost inevitably produce repetition, and dramatists who are rich in such qualities, like Shakespeare or Marston, are generally rich in repetitions.

INCREASING THE EFFICIENCY OF THE HOUSING AND COMMUNAL SERVICES SECTOR

Kiyomov Yusuf Tukhtasinovich*

*Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN

ABSTRACT

This article is given information about the establishment of the Ministry of Housing and Communal Services, the main directions of the organization of the system of storage and use of multi-apartment housing, the direct and indirect link between the housing and communal services sector and other sectors of the national economy and the main part of the housing stock. The lack of a comprehensive approach to the management and use of the multi-apartment housing stock hinders the further improvement of the system of quality and guaranteed utilities to the population and leads to justified protests from homeowners.

KEYWORDS: *Housing and communal services, organizer, Housing Fund, executive power.*

INTRODUCTION

The Ministry of Housing and Communal Services of Uzbekistan was established in accordance with the decree of President Sh.M.Mirziyoev dated on April 18, named "On measures to further improve the management of housing and communal service".

According to this decree, the purpose of the establishment of the Ministry is "to further improve the system of management and use of multi-apartment housing on the basis of close cooperation with housing and communal services, formation of an effective system for technical control over compliance with the rules of maintenance of apartment houses, to radically improve the provision of quality housing and communal services to the population", as well as to ensure the sustainable operation of homeowners associations.

Today, more than 4,000 private homeowners' associations operating in Uzbekistan serve more than 32,400 apartment buildings. Despite the steady growth of the population over the past period,

the level of housing has reached an average of 15.2 square meters per capita, up from 12.4 square meters in 1991.

However, based on the analysis of the current state of the housing and communal services sector, it was identified that there are a number of problems that need to be addressed urgently. Local executive authorities do not adequately coordinate the activities of private homeowners' associations and housing and communal services.

The lack of a comprehensive approach to the management and use of the multi-apartment housing stock hinders the further improvement of the system of quality and guaranteed utilities to the population and leads to justified protests from homeowners. Adequate control over the maintenance of the multi-apartment housing stock is not organized, and in many cases the requirements for the technical operation of the housing stock and the safe living of the population are violated. The rules and deadlines for the repair and restoration of buildings and structures are not followed, the demolition of old houses is not carried out, the condition of the areas adjacent to multi-apartment houses does not fully meet sanitary norms, rules and hygiene standards.

The population is not adequately provided with quality drinking water and central heating. According to the decree, the Ministry of Housing and Communal Services, including the Ministry of Housing and Communal Services of Karakalpakstan, regional departments of housing and communal services and the Tashkent city Main Department of Housing and Communal Services and its district (city) departments have been established.

The resolution named "On measures to further improve the system of storage and use of multi-apartment housing in 2017-2021" has been published by the President of the Republic of Uzbekistan. This decision is aimed at radically improving the technical condition of the multifamily housing stock and its rational use, carrying out repair and restoration work in a timely manner, was adopted in order to increase the efficiency of the housing and communal services sector, as well as to create the necessary conditions for further beautification of areas adjacent to multi-apartment houses.

The resolution defines the main directions of the organization of the system of storage and use of multi-apartment housing, which includes:

- Improving the living conditions of the population, timely and quality repair of engineering and communication systems and common infrastructure in multi-apartment houses, as well as landscaping of areas adjacent to the multi-apartment housing stock, implementation of measures aimed at the construction of children's and sports grounds there;
- implementation of comprehensive measures to create an effective vertical system of housing and communal services management, which will allow the use of the multi-apartment housing stock and the development of the market for its services;
- creation and strengthening of the material and technical base of housing and communal services, in particular, repair and restoration services, equipping them with modern equipment and providing them with qualified specialists.

Housing and communal services and all its operational activities should be aimed at meeting human needs and creating conditions for the realization of all its potential. This sector, while

consistently improving living conditions and ensuring the material and moral level of the servicemen, contributes to the growth of labor productivity in other sectors of the national economy and finally to the growth of overall production efficiency.

There are direct and indirect links between the housing and communal services sector and other sectors of the national economy. For example: gas and heat management is determined by the development of energy. This is due to the fact that heat and gas supply is an integral part of the structure of the country's energy supply and is aimed at meeting the needs of the population in electricity and industrial consumers.

On the other hand, the laws for the development of electricity and gas supply to consumers are formed through the development of the electricity and gas industries. The use of gas in industry and utilities contributes to the growth of labor productivity, leads to an increase in production capacity, a decrease in the effort required to produce the product, a reduction in fuel costs. In turn, the enterprises will provide the gas industry with equipment. This situation determines the strong economic ties between the gas industry and the urban industry.

The objective law of planned and proportional development in the national economy and the resulting system of planned economy, in the construction of new cities and the expansion of existing cities, housing and communal services will allow for integrated development.

The main part of the housing stock, all utilities and buildings that reflect the prosperity of our country are state property and the wealth of the people. This is due to the fact that general passenger transport, including municipal electric transport, which belongs to public utilities, is targeted, optimization of the cost part of the fuel and energy balance of the country based on the use of optimal volumes of various energy carriers (gas, heat, electricity) and the effective provision of capital investment in housing and communal services.

It follows that the sphere of housing and communal services is formed both on the basis of the influence of the general laws of the economy and on the influence of the gas industry, municipal services, energy and similar sectors of the national economy. It determines the appearance of features in the network, and studying and knowing them allows you to effectively solve the problems posed to it.

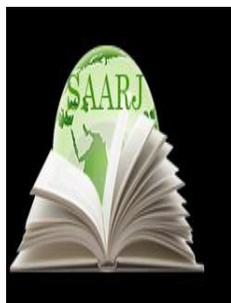

The development of the housing and communal services sector has a significant impact on the continuity of production of industrial enterprises and organizations. This is reflected in the provision of the necessary accommodation and clear transport to the workers. As a result, labor effort and time spent in the household are reduced. Thus, if the furnace heat supply is switched to a centralized heat supply, the free time required for workers to rest and develop will increase.

CONCLUSION

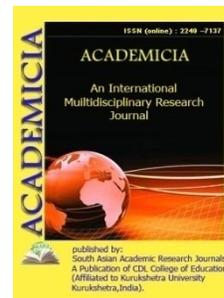

In short, the development of the housing and communal services sector and addressing important socio-economic issues, such as overcoming differences between rural living standards and the living standards of isolated group. Of course, this process does not mean equalizing the traditions, characteristics and needs of different regions. On the contrary, this process means taking full account of the features shown in order to meet the growing needs of the population equally.

ABSTRACT

The article analyzes the socio-economic indicators of families, as well as the importance and necessity of ensuring the economic stability of the family. The study of the characteristics of ensuring the economic stability of the family requires, first of all, a thorough study of the financial situation of the family. It is known that the family has a number of functions in society, one of the most important of which is related to its economic activity. Therefore, any family can become strong and become an active subject of socio-economic processes in society only if it solves domestic problems together and is economically self-sufficient.

KEYWORDS: *Family, socio-economic indicators of families, economic stability, household.*

INTRODUCTION

In our country, the socio-economic support of the family has risen to the state level, as evidenced by a number of measures aimed at its development. In particular, the President of the Republic Sh.M.Mirziyoev on February 27, 2020 in a video conference on measures to reduce poverty through the development of entrepreneurship highlighted the most important and urgent talks aimed at further development of the country, "« Young families need support, assistance and support. Social protection policy aimed at strengthening attention and care for both categories and well-off families will be continued at a new stage. 12-15% or 4-5 million people are poor, their daily income does not exceed 10-13 thousand soums, or a family has a car and livestock. but if a person is seriously ill, 70 per cent of the family's income goes to medical treatment, and the vital needs of the family, such as food, treatment, education and clothing, are met. »[1]

The study of the characteristics of ensuring the economic stability of the family requires, first of all, a thorough study of the financial situation of the family. The average salary in Uzbekistan in

January-March 2020 amounted to 2.5 million soums [2]. In some regions of the country, which is the object of research, it is 20% higher than in the country. Per capita income in the provinces increased by 4.5 times in 2020 compared to 2015, and expenditures by 4.52 times [3] It should be noted that today the majority of family expenses in the region, ie 53.9% were spent on food, 16.1% on services.

Today, science pays special attention to the study of the socio-economic foundations of the family, its socio-psychological and biological aspects. In the economic approach to the issue, the family is the basis of the household; it is the main link of the microeconomic system and is integrated into the macroeconomic system, i.e. the national economy.

It is known that the family has a number of functions in society, one of the most important of which is related to its economic activity. Therefore, any family can become strong and become an active subject of socio-economic processes in society only if it solves domestic problems together and is economically self-sufficient.

The family is the primary socio-economic unit of society, in which the population is re-established, children are brought up, and their movement from individuality to socialization is ensured. In addition, the family generates income and meets the material, economic and consumer needs of its members.

MATERIALS AND METHODS

The family plays an important economic role in the development of any society, because the people who make up society live in the family. Therefore, it is of scientific importance to study the socio-economic and demographic development of the family, ie its quantitative changes, the characteristics of the formation of income and expenses, the composition. As of January 1, 2020, there were 34538.3 thousand populations and 8489 thousand families in the Republic of Uzbekistan (Table 1).

TABLE 1 CHANGE IN THE COMPOSITION OF THE POPULATION LIVING IN THE REPUBLIC OF UZBEKISTAN IN 2015-2020

Republic and regions	2015	2016	2017	2018	2019	2020	2020/2015 % change	2020-2015 relative to the year' (+ -)

Surkhandarya	2358,3	2411,5	2462,3	2514,2	2569,9	2629,1	111.4	270.8
Syrdarya	777,1	790,6	803,1	815,9	829,9	846,3	109	69.2
Tashkent	2758,3	2794,1	2829,3	2861,2	2898,5	2941,9	107	183.6
Fergana	3444,9	3505,3	3564,8	3620,2	3683,3	3752	109	307.1
Khorezm	1715,6	1746,9	1776,7	1805	1835,7	1866,5	108.7	150.9
Tashkent city	2371,3	2393,2	2424,1	2464,9	2509,9	2571,7	108.4	200.4
Total	31022.5	31575.3	32120.5	32656.7	33255.5	345382.9	111.3	3515.8

The table was analyzed by the author.

The table shows that during 2015-2020, the total population of the regions of the Republic of Uzbekistan increased from 31022.5 thousand to 34538.3 thousand or 11.3%. During this period, the population growth rate in Samarkand, Jizzakh, Kashkadarya, Surkhandarya, Navoi, Namangan regions (110.-111.4%) was close to the national average. In some regions, the situation is lower than the national average. In particular, in the Republic of Karakalpakstan, Andijan, Bukhara, Syrdarya, Tashkent, Fergana, Khorezm and Tashkent (107.7-109.4%) the population growth rates were relatively low.

It should be noted that the number of families in Namangan, Andijan and Fergana regions increased from 668.4 thousand to 718.2 thousand or 107%, in Andijan region from 738.8 thousand to 801.9 thousand or 105%, in Fergana region from 945.8 thousand to 995.6 thousand or 105%. This situation is observed in all cities and districts of the region. Thus, the growth rate of the number of families in 2016-2020 will be in Markhamat, Pakhtaabad, Altynkul, Bulakbashi, Andijan, Ulugnor, Shahrikhan districts of Andijan region (101-128%), in Naryn, Namangan, Chartak, Turakurgan districts of Namangan region (101-141.5%). In the city of Kokand, Furkat, Toshloq, Yazyavan districts of Fergana region (109-112%) were higher, in other regions and districts the indicators were lower than the average.

The table is compiled by the author on the basis of data from the Andijan Regional Department of Mahalla and Family Support.

The table is compiled by the author on the basis of data from the Andijan Regional Department of Mahalla and Family Support.

Comparative analysis shows that the rate of increase in the number of families in the period under review was higher than the total population. That is, the average annual growth rate of the total population during this period was 103%, and that of families was 106%. The main reason for this is the high proportion of people of marriageable age in the total population, and the tendency of young people to live separately from their parents. In recent years, the average size of families in Andijan region has also changed. For example, in 2016, the average family size in the province, ie the average number of family members, was 3.9 people, while by 2020 this figure was 3.8, or a decrease of 2.6%.

If we look at the analysis of this amount by region, we can see that Shahrihan (28.0%), Markhamat (12.0%), Ulugnor (14%) and Andijan (18.0%) of Andijan region, Yazyovon (112%), Tashlak (109%) of Fergana region, Namangan region InNaryn (112%), Kasan (117% 0, and Chartak (145.5%) districts, the rate has changed more than the regional average, which is explained by a decrease in the number of fourth, fifth, sixth and subsequent births in the family.

The economic stability of a family depends on its income level. In a market economy, there have been a number of changes in the structure of family income:

First, the forms of income have changed, ie traditional incomes (salaries, pensions, allowances, stipends) have been added to income from entrepreneurial activities, property, real estate, securities, foreign currency;

Second, the quantitative and qualitative components of income have changed, such as real disposable income, accumulation and distribution ratio, income deficit, subsistence level, poverty rate, purchasing power of family income;

Third, new areas of income use have been added: mandatory payments and fees, costs for the purchase of foreign currency, securities, personal property, investments in commercial banks.

It should be noted that the higher the level of family income, the more opportunities there are to meet its basic needs, maintain health, organize recreation, get information, spend their free time in a cultural way.

In 2020, the per capita income of family members in Andijan region amounted to 390082.8 thousand soums. However, during this period in the republic this amount amounted to 284651.9 thousand soums. In the context of market relations, per capita income is growing.

By region:	9898.5	10888.8	12816,1	36525,9	39082,8	29184,3	394,8

The table numbers were calculated by the author on the basis of data from the Main Department of Statistics of Andijan region.

As can be seen from the table, during 2016-2020, the per capita income in the region increased from 9898.5 thousand soums to 39082.8 thousand soums or 3.9 times. During this period, the growth rate of cash income was peculiar to the cities and districts of the region. In particular, the cities of Andijan, Asaka and Andijan, Balikchi, Bulakbashi, Boz, Jalaquduq, Izbaskan, Ulugnor, Marhamat, Pakhtaabad, Khojaabad districts are close to the regional average, and in Bulakbashi district is much higher than the regional average.

It should be noted that in 2020, the highest per capita income in the region was recorded in Andijan (11691.3 thousand soums), Shahrihan (4438.5 thousand soums), Asaka (4438.5 thousand soums) districts. The main reasons for this are the expansion of entrepreneurial activity in these areas. At the same time, compared to other regions of the region, new industrial enterprises have been established in these areas. Therefore, in order to increase the real income of the population, it is necessary to pay special attention to the expansion of entrepreneurial activity and the establishment of real sector enterprises. The formation of family income in Andijan region has its own characteristics.

TABLE 6 CHANGES IN THE STRUCTURE OF FAMILY INCOME IN ANDIJAN REGION 2016-2020 *, %

Indicators	Years					In 2020 compared to 2016 (+, -)
	2016	2017	2018	2019	2020	
Gross income	100,0	100,0	100,0	100,0	100,0	-
Cash income	82,4	83,8	84,5	85,5	86,5	4,1
including:						
Salary	28,2	29,0	29,4	29,7	30,0	1,8
Income from business activities	12,9	15,1	15,4	18,1	19,4	6,5
Income from personal subsidiary plots	17,8	17,7	17,0	15,3	12,8	-5,1
Social transfers	15,5	16,0	16,7	16,9	17,2	1,7
Financial assistance from relatives	5,2	4,2	4,1	3,1	2,8	-2,4
Income from property	1,3	1,2	1,1	1,5	1,9	0,6
Credit, loans	1,4	0,5	0,6	0,9	1,4	0
Other cash income	0,1	0,1	-	-	-	-0,1
Income in kind	17,6	16,2	15,5	14,5	13,5	-4,1

The table is based on the data of the Main Department of Statistics of Andijan region.

The table shows that in 2020, 86.5% of the total family income in the region was cash income, the remaining 13.5% was income in kind. However, the change in family income during the period under analysis was not uniform. Thus, during 2016-2020, the share of cash income in the structure of family income increased from 82.4% to 86.5% or 4.1 points, while the share of income in kind increased from 17.6% to 13.5% or 4.1 points. decreased.

The increase in the share of monetary income in the structure of family income depends on the sources of its formation. That is, in the period under review, from 28.2% to 30.0% of wages, from 12.9% to 19.4% of business income, from 15.5% to 17.2% of social transfers, from property income 1, An increase from 3% to 1.9% led to an increase in the share of cash income in gross income. At the same time, the analysis of family income in the analyzed period showed that the income from personal subsistence farms decreased from 17.8% to 12.8%, financial assistance from relatives decreased from 5.2% to 2.8%, loans, loans (1.4%).) showed no change.

The survey was conducted in Andijan region to determine the income of families in the districts. The survey results are presented in Table 7.

TABLE 7 MONTHLY INDICATORS OF FAMILY INCOME IN THE DISTRICTS OF ANDIJAN REGION, %

Indicators	Regions				Average
	Pakhtaabad	Izbaskan	Andijan	Altynkul	
Upto 0-400 thousand soums	21,4	22,9	21,3	23,6	22,3
400-800 thousand soums	20,6	18,2	21,8	18,3	19,7
800-1200 thousand soums	26,2	25,3	19,8	17,8	22,3
1200-1800 thousand soums	18,4	19,1	22,3	26,4	21,6
Morethan 1800 thousand soums	13,2	14,5	14,8	13,9	14,1
Total.	100,0	100,0	100,0	100,0	100,0

The table is based on the results of a sociological study conducted by the author.

When we asked respondents in a sociological survey, "What is the monthly income of your family?", 21.4% of families living in Pakhtaabad district, 22.9% in Izbaskan district, 21.3% in Andijan district, 23 in Altynkul district. , 6% to 800 thousand soums. In addition, 20.6% of families living in Pakhtaabad district, 18.2% in Izbaskan district, 21.8% in Andijan district, 18.3% in Altynkul district live in Pakhtaabad district with a monthly income of 400-800 thousand soums. 18.4% of families, Izbaskan district - 19.1%, Andijan district - 22.3%, Altynkul district - 26.4% to 1200-1800 thousand soums, 13.2% of families living in Pakhtaabad district, Izbaskan in Andijan district - 14.5%, in Andijan district - 14.8%, in Altynkul district - 13.9% - more than 1800 thousand soums. In the districts surveyed, the average monthly income of families with a monthly income of more than 1,800,000 soums was 14.1%.

The survey was conducted to determine the sources of income of families in the districts of Andijan region. It should be noted that according to the results of the survey, the share of paid income of families is high in Andijan and Altynkul districts, and the share of natural income in Pakhtaabad and Izbaskan districts.

Wages, income from entrepreneurship, and social transfers, which are the main factors influencing the economic stability of families, were close to the regional average. It should be noted that there is a significant difference between the incomes of urban and rural families. That is, in 2020, in the structure of income of urban families in the region, wages and income from entrepreneurship accounted for almost 85.0% of the budget of urban families, and 77.3% in rural families. Factors such as the well-developed industry in urban areas, the almost uninterrupted payment of wages in industrial enterprises, the abundance of opportunities for entrepreneurship have ensured a relatively high share of wages and business income in the cash income of urban families.

It is known that the main part of the income of rural families is the income from the sale of products grown on the farm. The analysis shows that in 2016, the share of income from land in the structure of rural family income in the region was 25.9%, wages 39.3%, social transfers

28.7%, and in 2007 these figures were 55.6%, respectively. %; Were 17.0% and 10.3%, respectively. In other words, during the period under review, the share of income from horticulture increased by 29.7 points (2.14 times), while wages decreased by 22.3 points, social transfers - by 18.4 points.

Thus, in Andijan region, family income is formed depending on the impact of economic reforms and the general state of the economy. As a result of the transition to market relations, new types of family income have emerged in the region, which consisted mainly of income from entrepreneurship, income from property, employment in market enterprises. It should be noted that before the economic reforms, wages accounted for 90.0% of family income. Today (2020) this figure is 30.0% in the region.

The following factors contributed to the decrease in the share of wages in the structure of family income:

Decrease in real output as a result of structural changes in the economy;

Changes in the structure of employment due to the formation of property relations;

The emergence of the shadow economy;

RESULT

In general, in the world experience, in a developing economy, the share of expenditures on food products decreases with the growth of per capita income. This, in turn, indicates an increase in the economic well-being of families living in the region.

Thus, in the context of the new economic relations, the analysis of the dynamics of per capita income and expenditure of family members in Andijan region shows that income exceeds expenditure. At the same time, the ratio between a family's income and expenses is in many ways an indicator of its well-being.

Thus, the ratio of income and expenses in the region in 2016 amounted to 9898.5: 9553.1 thousand soums; in 2020 this amount was 39082.8: 37648.8. This shows that the economic stability of families in Andijan region is becoming increasingly important.

Improving the living conditions of the family and each of its members, expanding educational opportunities, improving their health, increasing their capacity to participate in socially useful work as a labor force are among the priorities of the social policy of our state. In this sense, the first and foremost task of ensuring the protection of the family is related to the development of man, his role and prestige in the family and society. Consequently, the humanity of a society is assessed not by how high the economic potential of a country is, but by the fact that this potential is focused on the well-being and all-round development of everyone.

DISCUSSION

It should be noted that the region annually allocates a certain amount of funds from the state budget for social support of families, especially low-income families. This assistance has played an important role in ensuring the economic stability of families during the transition period.

Distribution of social payments to families in Andijan region * (billion soums)

	(city)	Years					2020/2016%	Years					2020/2016%

17	Qurgontepa	15529	16176	17087	19175	18247	118%	1111	1111	1299	1632	1789	161%
Total in the region:		283451	294244	308468	343330	319716	113%	23534	23534	27778	34485	38179	162%

The table is based on the data of the Main Department of Statistics of Andijan region.

As can be seen from the table, during 2016-2020, the amount of social payments to families in Andijan, Namangan and Fergana regions increased year by year and pension payments increased from 283.4 billion soums to 319.7 billion soums or 113%, and total benefits from 25.5 billion soums to 38.1 billion soums or 162 increased by%. In Namangan region, pension payments increased from 726.4 billion soums to 1310.4 billion soums or 180.4%, and pension payments increased from 40.5 billion soums to 62.1 billion soums or 153.4%. In Fergana region, the indicators of these regions have also changed. The growth trend of social payments was observed in all cities and districts of the provinces. In particular, the growth rate of pension payments is higher than the regional average in Andijan, Khanabad, Karasuv, Ulugnor, Asaka, Shahrihan, Pakhtaabad districts (163-180%), in Bulakbashi, Boz, Izbaskan, Marhamat, Altynkul, Kurgantepa districts (140-161%). which was low. If we want to determine the reasons for the increase in pensions from year to year:

First, the natural population growth is determined by a sharp increase compared to other regions and districts;

Secondly, as a result of the lack of manufacturing enterprises as a result of high natural population growth;

Thirdly, despite the existence of manufacturing enterprises, workers and employees are not currently specialists in charge of the student;

Fourth, there is an increase in the number of low-income and breadwinners in the general population.

Distribution of social benefits to families in Namangan region * (billion soums)

Cities and regions	Pension						Retirement					
	Years					2020/ 2016, %	Years					2020/ 2016, %

The table is based on the data of the Main Department of Statistics of Namangan region.

At the same time, the change in the amount of benefits in the analyzed period was also peculiar, and the highest rates of increase in the amount of benefits were recorded in Andijan, Karasuv, Asaka districts.

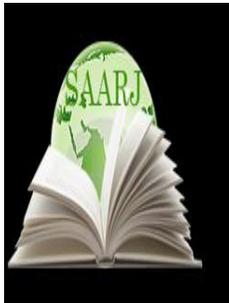

CONCLUSION

Thus, in the context of deepening economic reforms in Andijan region, due to the special attention paid to targeted social protection of families, the amount of social payments and financial assistance provided to them by the budget and local governments has been steadily increasing. As a result, the share of low-income families in the total number of families in the region has sharply decreased. Therefore, a sociological survey was conducted to determine the economic status of families in the districts of Andijan region. When we study the types of urban and rural families, the economically stable families in the districts average 13.7% in urban areas, 13.8% in rural areas, 34.7% in urban areas, 32.2% in rural areas, and 47% in low-income families in urban areas. 6%, in rural areas - 49.8%, vulnerable families in urban areas - 4.0%, in rural areas - 4.2%. At the same time, given that the increase in the economic well-being of families in the region depends on the employment of each able-bodied member of the family, we will focus on it in our next articles.

ABSTRACT

The article provides more information about a new method of controlling automation devices. The process sequence is considered as a function of the software part of the system. An automated system for replacing devices and an electronic document management system are proposed. In this process, the names of each device are obtained through a single data source. Information about each device is entered into the database and their control is automated by the personal code of each device. An easy and reliable system will be created for all employees. This process significantly increases the maintenance of automation devices.

KEYWORDS: *Software module, technological structure, document, server, exchange, replacement of devices, database, client program, monitoring and accounting.*

INTRODUCTION

Electronic document management systems are a powerful means of increasing labor productivity and the quality of work performed in the creation and design of new equipment. They play an important role in the development and implementation of systems of railway automation and telemechanics (SRAT), both existing and new generations.

The main results of the work are implemented in the software module “Automated system of accounting and control of railway automation and telemechanics devices” (ASA-CRAT).

The electronic document management system increases the speed of decision-making due to a sufficient amount of information and reducing the time for processing documents.

In modern conditions, the following trends are observed in the development of electronic document management of SRAT: expansion of functionality, increased requirements for information security, reduction of time for processing technical documentation, etc. These new qualities of electronic document management systems can be achieved through the use of modern techniques and information systems.

The use of information and communication technologies allows to significantly expand the channels of interaction of the automation service with the involved organizations, thereby contributing to the strengthening of cooperation between enterprises based on mutual understanding, taking into account the interests of each.

METHODS

Allowing organizing technological work of control and accounting of devices of railway automation and telemechanics using ASA-CRAT

The proposed technological structure takes into account the possibilities of existing communication lines, data transmission technologies. The database of control and accounting of railway automation and telemechanics devices is organized on the ASA-CRAT server. In turn, the ASA-CRAT server interacts with the database.

It should be borne in mind that the traditional paper flow of control and accounting of railway automation and telemechanics devices will not soon lose its importance — in the coming years, important documents will still be published, approved and delivered in paper form.

Nevertheless, there are (and a number of organizations are already operating) integrated paper-electronic technologies, in which control and accounting of railway automation and telemechanics devices is carried out in electronic form, and it is with an electronic copy that work is going on, and a paper copy is transmitted in the usual way.

Electronic document flow for control and accounting of railway automation and telemechanics devices in the form of ASA-CRAT can significantly increase the efficiency of the automation and telemechanics service, and enterprises associated with this document flow.

Informational paperless technologies for control and accounting of railway automation and telemechanics devices facilitate the process of managing all flows of equipment. They form the backbone of solutions that provide automated and centralized exchange of equipment information and extract only the information you need from all available sources.

From a technological point of view, ASA-CRAT is an integration system that covers office work, control and accounting of railway automation and telemechanics devices, and connects them with the external environment of electronic exchange.

Experience shows that the modern scope of work on the construction and repair of railways is no longer conceivable without the use of information technology. Paper carriers do not allow fast data exchange, accumulation, processing and analysis of information. Obviously, most of the work (especially well-algorithmic) performed by a person can be transferred to a computer. Currently, in connection with the organization of the association of factories producing signaling equipment for railway transport, the task of allocating resources to ensure timely and high-quality implementation of plans for overhaul, capital construction and operation of signaling devices becomes especially urgent. Such a task can be performed on the basis of databases of

technical documentation generated in the distances of automation and telemechanics in electronic form using the set of tasks “Automated system of accounting and control of railway automation and telemechanics devices”.

RESULTS

ASA-CRAT is intended for automation of accounting and control of devices for railway automation and telemechanics, as well as for planning the work of a repair and technological section and forming various options for replacement cards for devices.

The program is used in the distances of railway automation and telemechanics.

The main functions of the program:

Creation and maintenance of a database, including passports of specific devices and information about the place of their installation;

Tracking the movement of devices in connection with periodic replacements, write-offs, receipts, etc.;

Planning the replacement of devices with the issuance of technologically necessary information;

Monitoring the implementation of plans for the replacement of devices;

Analysis of failures of devices for signaling, centralization and blocking devices;

Planning the work of repair and technological areas;

Issuance of output documents, the ability to search for devices in the database for arbitrary requests.

ASA-CRAT is, on the one hand, an extensive database that stores complete information about the installed equipment, including its history. On the other hand, ASA-CRAT is a client part that works with this database and implements the needs of various services. For accounting of devices and their timely replacement at distances, ASA-CRAT is used. This is an automated record of the replacement and movement of equipment. The main functions of ASA-CRAT are: creation and maintenance of a database, including passports of specific devices and information about the place of their installation; tracking the movement of devices in connection with periodic replacements, write-offs, receipts, etc.; planning the replacement of devices with the issuance of technologically necessary information; monitoring the implementation of plans for replacing devices; analysis of instrument failures caused by RTA; planning the work of RTA sites; issuance of output documents, the ability to search for devices in the database for arbitrary request.

DISCUSSION

The purpose of the ASA-CRAT is to increase the efficiency of the processes of maintaining a database for monitoring and accounting for railway automation and telemechanics devices, maintaining signaling, centralization and blocking at the station and remote level of management of the economy through the use of computer technologies for its receipt, storage and processing.

The client program is a very important link in this project. It plays the role of a means of input, output, search and grouping of information. It is with this program that users work, it is she who should be the result of design thought; simple, attractive and also ergonomic.

Registration of devices is carried out in several stages. The required fields are filled in. After that, the device is added to a specially specified department.

The executors, in turn, receive a message in the “Orders” tab, which is located above.

In this window, you can search for devices that are stored in the database and associated with the workflow process. For example, in order to find a device, select the “Search” tab, the serial number of the device, click “OK”, we open a table with data, where we see all dates.

Printing is performed by clicking the menu items Document — > Print Settings; Preview; Print. Fig.

Devices replacement information (SCB)

The information window on replacing signaling devices is shown in fig.1.

This selection shows a graph report that you can print. This concludes the overview of the main functions implemented in this program.

CONCLUSION

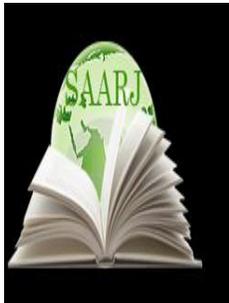

The client program has also successfully passed the launch procedure on the above platforms. To check the correctness of the document flow process in the program, several tests were developed: multiple client connections to the server (50 clients were connected in different network nodes, while a serious slowdown in the exchange of requests was not noticed); explore total practicable feature (all required documents that meet the request criteria were issued); cleaning of temporary files on the client computer using tools built into the client program (files were deleted in the normal mode, the deletion of files occupied by the system was postponed); document printing (all required documents were printed in accordance with the requirements on all installed printers in the system).

The new system makes it easier to control devices. Through this system it is possible to receive continuous information about the system. As a result, automatic control of automation devices is provided.

ABSTRACT

Problems that arise when organizing interaction in the disclosure and investigation of crimes related to the illicit trafficking in narcotic drugs and psychotropic substances are considered in this article. The features of the coordination of the actions of the pre-trial proceedings bodies in the fight against crime are given. Suggestions and recommendations are made to improve the efficiency of the organization of interaction between the pre-trial proceedings bodies.

KEYWORDS: *Interaction, Pre-Trial Proceedings Bodies, Combating Crime, Illicit Trafficking In Narcotic Drugs, Psychotropic Substances, And Precursor.*

INTRODUCTION

An analysis of statistical studies of the problems of combating crimes related to the illicit trafficking in narcotic drugs and psychotropic substances in the world shows that the growth rates of this type of crime have reached a scale that directly threatens the foundations of society and the nation's health.

Thus, according to the National Information and Analytical Center on Drug Control (NCDC), in 2019, law enforcement agencies of the Republic of Uzbekistan detected over 330 drug-related crimes and seized more than 377 kilograms of drugs.

According to the United Nations Office on Drugs and Crime, 900 tons of opium and 375 tons of heroin's are smuggled out of Afghanistan every year. The market for the production of the world's most destructive drug is estimated at \$65 billion. In Europe alone, the turnover of the drug business exceeds \$120 billion per year.

Globally, this is about 8% of the volume of the global trade for the underworld: 15 million drug addicts depend on it. It takes up to 100 thousand human lives a year, affects the unprecedentedly high rates of HIV infection and, is not least a source of funding for criminal groups, including terrorist ones.

Today, there is not only an increase in the number of drug addicts, but also an increase in the activation of drugs traffickers, an ever-increasing internationalization of the drug business. The problem of non-medical consumption of narcotic drugs, psychotropic, toxic substances remains relevant for most countries of the world, including this phenomenon, has not spared Uzbekistan.

The legal basis of our state policy in control, circulation of narcotic drugs, psychotropic substances or their analogs and countering their illegal circulation is the Law of the Republic of Uzbekistan of August 19, 1999 “On narcotic drugs and psychotropic substances”.

This law reflects the main provisions of such international legal norms for combating illicit trafficking in narcotic drugs and psychotropic substances, such as the United Nations Single Convention on Narcotic Drugs of 1961, the UN Convention of 1971 On Psychotropic Substances, the UN Convention against Illicit Traffic in Narcotic Drugs and Psychotropic Substances, adopted in 1988, etc.

Several laws of the Republic of Uzbekistan regulate responsibility for the illicit trafficking in narcotic drugs, psychotropic substances, the competence of bodies exercising management and control in trafficking in narcotic drugs, psychotropic substances and precursors, etc.

Following the Law of the Republic of Uzbekistan “On introducing amendments and addenda to the Criminal Code of the Republic of Uzbekistan”, the liability of persons who have committed crimes related to the illegal trafficking in narcotic drugs and psychotropic substances has been liberalized by introducing a special norm on the exemption from punishment in the criminal law, if a person voluntarily surrendered to the authorities or surrendered narcotic drugs or psychotropic substances – part 1 of Article 273 of the Criminal Code of the Republic of Uzbekistan.

It should be emphasized that the internal affairs bodies take an active part in this work and, within their competence, carry out activities to take control over the circulation of narcotic drugs, psychotropic substances and their precursors, issue licensing documents, as well as carry out inspections for compliance with licensing requirements and conditions under the law. According to Article 4 of the Law of the Republic of Uzbekistan “On the Internal Affairs Bodies”, among the main areas of activity, control in the sphere of circulation of narcotic drugs, psychotropic substances and their precursors is separately indicated.

Despite the creation of conditions for combating such crimes, the number of criminal acts related to the illegal circulation of narcotic drugs and psychotropic substances is constantly growing.

Unfortunately, substance use is most prevalent among young people, especially between the ages of 18 to 25, and it is the health of young people that suffers the most from the associated consequences.

Of course, this situation is associated with the ineffective organization of departmental and interdepartmental interaction, including in the exchange of operational information between the authorized bodies of pre-trial proceedings.

The President of Uzbekistan, Shavkat Mirziyoyev, at the videoconference on a critical analysis of the activities of the internal affairs bodies, pointed out serious shortcomings, emphasizing that in criminal investigation activities, the interaction between law enforcement agencies in the fight against crime does not meet the proper requirements and that the non-detention of the majority of those in wanted persons allows them to continue their criminal acts, which is a very alarming fact.

The foregoing requires an adequate response from investigative bodies and operational units, which, by using the available arsenal of criminal procedural and operational-search tools and methods, allows solving the main task in the fight against these crimes – identifying and exposing the organizers and active members – members of organized groups and criminal communities.

It is quite fair to attribute this remark to the organization of interaction between the pre-trial proceedings bodies. Since in the implementation of search measures to establish the whereabouts of criminals, including for criminal acts related to the illicit trafficking in narcotic drugs and psychotropic substances, in suspended cases in connection with the search for a criminal, fast and high-quality detection and investigation of crimes depend on their concerted actions.

Regarding the problem of organizing the interaction of the subjects we are considering, A.A. Khamdamov approves that a certain degree of organization of modern crime requires from operational officers and investigators a new approach to the use of forces and means, methods of criminal procedure and operational search activities. The above opinions are undoubtedly appropriate, because, taking into account the disguised, carefully prepared nature of grave and especially grave crimes committed by criminals in the illicit trafficking in narcotic drugs and psychotropic substances, it is not possible to identify all the participants in criminal activity, to collect the necessary evidence of their guilt within the framework of a preliminary investigation through carrying out only legal proceedings.

For these purposes, in accordance with the Law of the Republic of Uzbekistan “On operational-search activity”, it is necessary to carry out the entire complex of public and covert operational-search activities that are at the disposal of operational units of state bodies authorized to carry out operational-search activities.

Based on the needs of the investigative and operational-search practice, it can be stated that without knowledge of the specific features of interaction within the framework of proceedings on a specific criminal case on illicit trafficking in narcotic drugs and psychotropic substances, it is difficult, and sometimes even impossible, to choose effective tactical techniques that allow solving the problems of criminal legal proceedings.

An effective combination of forces, means and methods inherent in a specific subject of interaction, specific only for the investigator (an indictment, drawing up an indictment, and several others) or only for the operational officer (test purchase, operational experiment, etc.) while maintaining the secrecy of the preliminary investigation and sources of receipt secret information, the organization and tactics of conducting operational-search activities, is aimed at solving the main task in the fight against organized crime in the illegal drug trafficking – bringing perpetrators to criminal responsibility.

The weak link in this activity is the lack of scientifically grounded recommendations of a tactical nature; no less acute are the legal and organizational issues of interaction between the pre-trial proceedings bodies in the investigation of crimes related to the illicit trafficking in narcotic drugs and psychotropic substances.

The main directions of the considered interaction, characteristic for the investigation of these crimes, should consist of the following types:

- 1) Interaction aimed at preventing, detecting, suppressing crimes related to illicit trafficking in narcotic drugs and psychotropic substances, as well as timely identification of the reasons and conditions conducive to the commission of the above-mentioned illegal act;
- 2) Interaction aimed at the possibility of destroying narcotic drugs, psychotropic substances and their analogs, crops and equipment, the further use of which is deemed inappropriate, the basis for which is a verdict or other decision of the court, or the decision of an inquiry officer, investigator to terminate a criminal case or to refuse in the initiation of a criminal case;
- 3) Interaction related to the regulation of the issue of the use of narcotic drugs in operational-search activities (during controlled deliveries, test purchases, operational experiments, collection of samples for comparative research, operational implementation).

At the same time, one should not forget that the essence of the interaction of the pre-trial proceedings bodies does not mean their direct service subordination, the merger of procedural, operational-search activities and other special activities. Each of these employees, despite the commonality of tasks in the fight against crime and the uniting of efforts in solving them, remains a representative of an independent subdivision of the internal affairs body, acting within its competence. The unity of action is achieved by the coherence of efforts aimed at solving and investigating crimes.

The importance of planning issues should be also noted. The organizing basis for the preliminary investigation stage is the comprehensive plans of investigative actions and operational-search measures in a specific criminal case. However, in the practical activities of investigators and operational officers, these plans are developed only for 69% of criminal cases. This situation is especially typical for the stage of initiation of a criminal case on the fact of committing a crime of illicit drug trafficking when the operational development of persons who were subsequently brought to criminal responsibility was not carried out beforehand. In this connection, it seems expedient to develop standard draft plans for a specific criminal offense in the sphere of illegal drug trafficking.

It is worth remembering that the crimes in consideration are committed mainly as part of organized criminal groups, which greatly complicates their exposure, and for this reason, they are committed over a long period of time. Therefore, the tactical skill of investigative and operational units must be based on a deep knowledge of the peculiarities of the modern criminal environment, the forensic characteristics of the perpetrators, their habits, the various measures they take to counteract the investigation, as well as clear knowledge and the ability to legally use the entire available arsenal of criminal-procedural and operational-search means and methods. This requires the specialization of investigators and operational officers in a specific type of criminal activity in the illicit trafficking of narcotic drugs and psychotropic substances, which is

one of the most important conditions for increasing efficiency in solving the problems of disclosing and investigating these crimes.

The next element of organizing the successful interaction of the investigator with the criminal investigation units in the disclosure and investigation of the type of crimes under consideration is the timely creation of an investigative-operational group. Since, the competent organization of its work, the continuous interaction of the investigator with the operational-search units as part of the group makes it possible to successfully disclose and investigate many grave and especially grave crimes related to the illegal circulation of narcotic drugs and psychotropic substances.

This is since, in the investigation of the considered category of crimes, the main advantage in terms of overcoming opposition to the investigation in comparison with a sole investigation is the more effective conduction of investigative, search and other actions. First of all, this is ensured by the fact that the employees involved in the work of the investigative-operational group have a better command of the methods of investigating crimes of illicit trafficking in narcotic drugs and psychotropic substances, they know the peculiarities of the subject of encroachment, the peculiarities of countering the investigation connected with it. At the same time, as noted above, it is desirable that some of the investigators, including the head of the group, specialize in the investigation of this particular type of crime.

At the same time, in solving the above tasks, it is of no small importance in interaction to assist the investigator by an employee of the operational unit. This is because, in the course of operational-search activities, information may be obtained that will direct the investigator to the need for certain investigative actions to suppress and prevent opposition to the investigation. In turn, the data obtained by the investigator in the process of conducting investigative actions necessitates operational search measures to overcome opposition to the investigation of a criminal case. To solve these problems, the investigator, together with an employee of the operational unit, studies and analyzes the available operational data, compares this information with the evidence collected as a result of the investigation and other operational data. Such an assessment is aimed at clarifying the reliability of the actual data and determining the possibility and order of their use.

Thus, crimes in the illicit trafficking in narcotic drugs and psychotropic substances cannot be regarded as isolated, not interconnected, since most of these crimes represent a certain organized process. Without a systematic consistent disclosure of the crimes that make up this process, one cannot speak of an effective fight against the illicit trafficking of narcotic drugs and psychotropic substances. Therefore, upon detection of one of the criminal processes included in the chain of crimes of illicit trafficking in narcotic drugs and psychotropic substances, one cannot be limited only to its disclosure, but it is necessary to strive to identify all links in the organized chain.

CONCLUSION

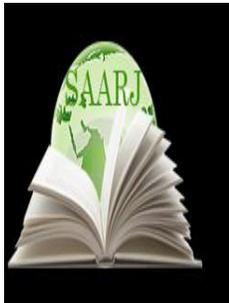

Summarizing the above, it is worth noting that this task cannot be accomplished without a reasonable and timely organizational and informational interaction of all law enforcement agencies, in particular, an investigator with operational units involved in the fight against drug trafficking, including with law enforcement agencies of foreign countries. It is obvious that if the investigative and operational-search divisions of the Ministry of Internal Affairs, as independent bodies, cease to be separate services, but become a single system united by common interests,

single measures and plans, goals and objectives, the efficiency of the entire system will undoubtedly increase.

The interaction of the pre-trial proceedings bodies in the disclosure and investigation of crimes must be carried out not as an end in itself, but as a method for finding effective ways to solve the problems of criminal procedure.

ABSTRACT

The article reveals the specific features and functions of the supporting units in the literary text on the example of Eshqobil Shukur's poems. The paper also discusses the theoretical basis for the expression of units of independent meaning in the text only grammatical meaning. The focus is on the pragmatic nature of the supporting units. The peculiarities of the use of auxiliary units in the poetic text are discussed. Auxiliaries, like auxiliary verbs, are in a privative conflict in the lexical-level group of independent words and auxiliary words under the sign of "spiritual dependence."

KEYWORDS: *Auxiliary word, aesthetic function, pragmatic meaning, independent meaning, poetic text, auxiliary noun, semantic feature.*

INTRODUCTION

It is known that any unit of language can change its functional-semantic properties according to the requirements of the text and the word-formation skills of the word creator. For example, some words change the meaning they express, and some units completely lose their lexical meaning. In these processes, which take place in connection with the social nature of language,

words belonging to a group of independent words, such as nouns, verbs, and manners, express only grammatical meaning, that is, they become auxiliary units.

THEORY In linguistics, there are different views on auxiliary units and their functions in speech. Here are some of them:

1. Among the auxiliary words, prepositions and auxiliaries are the most effective means of expressing pragmatic inner meaning. Because prepositions and auxiliaries play a very important role in the content and formality of speech. Therefore, in the semantic structure of a sentence, implicit can be a means of pragmatic inner meaning by expressing a separate pragmatic inner meaning together with the word with which it is syntactically connected [1].

2. Auxiliaries, like auxiliary verbs, are in a privative conflict in the lexical-level group of independent words and auxiliary words under the sign of "spiritual dependence." When a group of auxiliary words is separated as a definite article, independent words take the place of an anonymous member. [2, 52]

3. Due to the moderation of the independent word relative to the "dependence" sign, the relative auxiliary is distinguished from the independent word. The relative auxiliary resembles a spiritually independent lexeme in one sense and a spiritually dependent lexeme in another, forming an intermediate third group. When a lexeme occurs as a dependent lexeme, the lexeme semema weakens its specificity, and the semema occurs as a grammatical meaning. [3,256].

Assistants perform a variety of pragmatic tasks in the conversation. This aspect of the assistants has been studied in a monograph. In his work, the researcher Z. Burkhanov, referring to the pragmatic inner meaning of our language, tried to reveal the linguistic aspects of the pragmatic auxiliaries in speech [4].

Words that are considered auxiliary units also play a role in poetic texts. In particular, it serves to clearly express in the text the poet's artistic purpose, the image of his instantaneous feelings.

RESULTS

The use of auxiliary units in the poems of the poet Eshqobil Shukur's also enhances the imagery and richness of thought. For example, the poet's use of the word "depth" in his poem "Chankovuz (an ancient and traditional musical instrument of Surkhandarya oasis)" was the basis for the creation of a special colorful and unique expression:

Chanqagan og'zim mening, channagan o'zim mening,

Soulning yorug'qa'ridan sinmas til topib oldim...

(My mouth is thirsty, I'm thirsty,

I found an unbreakable tongue in the light of the soul...)[5,2]

In particular, the use of the auxiliary unit in relation to the word "soul" highlights its aesthetic function in the text. In the poetry of the poet, the words that belong to the category of nouns are often aided by:

Shiftiga jon tirmashgan kasalxonaning

Oppoq xalat kiygan xonalarida

Osma ukollarning ostida yotgan

Daryolarni ko‘rdim... sariq daryolar... [5,2]

(The ceiling of the hospital,

In the rooms wearing white robes

Lying under the hanging syringes

I saw rivers ... yellow rivers)

In the above passage, the word "bottom", which belongs to the category of nouns, is connected with the word «injection» in the accusative case, and loses its independent meaning and in the poem served to reveal a vivid expression of the condition of the sick man?

In the units of the following sections, the forms of ownership and agreement have been hardened and assisted:

O, uyatchan namozshomgullar,

Qo‘shiq aytay shom chog‘i sizga.

Dardlarimni qo‘yarsiz yo‘llab

Olisdagi tanishingizga... [5, 7]

(Oh, shy night beauty,

I'll sing to you in the evening.

Send me my pain

To a distant acquaintance)

The following auxiliary word is the basis for the creation of a unique philosophical image that makes the reader think:

Endi yurak faslida

Bulbullar qaytib kelar.[5,19]

(Now in the heart season

The nightingales are coming back)

Eshqobil Shukur's appeal to some auxiliary units was the basis for the original analogies of the poetic style. For example,

Shamolning etagidan

Tutib bo‘zlaydi xayol... [5, 19]

(From the foot of the wind

It's a dream come true)

As a separate independent lexeme, we can see that the addition of words denoting human organs is the basis for the shift in meaning:

Vahm tush cuddleida

Chayqalib qo‘yar ovul.

Ko‘zlarini ishqalab

Uyg‘onadi qorovul.

(Panic dream cuddle

The village is shaking.

Rubbing his eyes

The guard wakes up.) [5, 4]

Elsewhere, we can see that the auxiliary unit "heart", which is synonymous with the auxiliary "cuddle", reflects its semantic character in the text:

Betxoven qulog‘in ochguvchi ohang,

Tumanlar ortida charsillagan nur;

Sohir koinotda sakkizinchi rang,

Ummonlarning bag‘ri boy berishgan dur,

Qani, sening ovozing ? [5, 21]

(The melody that opens Beethoven's ear,

The crackling light behind the fog;

The eighth color in the magic universe,

The ocean have lost their temper,

Where is your voice?)

The frequent use of units representing human organs in Eshqobil Shukur's work is a characteristic feature of the poet's poetic language. In particular, in the following passage, he created a unique image using auxiliary words in the expression of units related to natural processes:

Bulutlar qorlarning qo‘ynida uxlar,

Cho‘l qisirlar ayoq qamchilaridan.

Qirlar tun betiga ufurgan uklar

Muzlaydi iztirob tomchilariday...

(Clouds sleep in the snow,

The wild oxen are made of frost.

The hills are a nightmare

It freezes like drops of pain) [5, 29]

In another poem, the auxiliaries used by the poet in relation to the snow in the above passage also reveal another possibility of unity by using it in relation to the forest:

Yomg'irlarning mavjida

Yuvilar qonli tana.

Qora o'rmon qo'ynidan

Qaytar bug'ular yana...

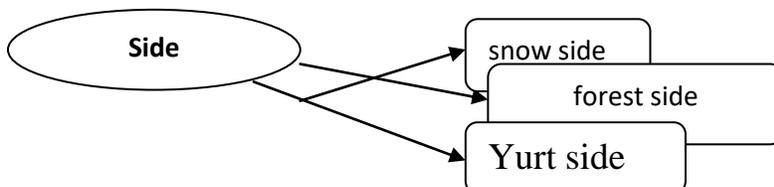

(It's rainingy

Washes bloody body.

From the Black Forest

Back steam again) [5, 48]

In this case, the auxiliary form of the word "side" is associated with the following words:

The auxiliary words in the following passage also provide a unique appeal to the poem as a linguistic tool for creating individual analogies. In other words, "yurt side" and "oven neck" not only increase the melody of the poem, but also increase the vividness of the image in the text:

Zap qorindor o'tov qo'ynida

Bolalarin uxlatdi cho'pon.

Oyoq tirab o'choq bo'yniga

Qurbaqaday biqirlar qumg'on...

(In the yurt side

The shepherd put the children to sleep.

Put your foot on the neck of the stove

Screams like frogs the kumgan) [5, 28]

In the same poem dedicated to the yurt image, the poet also uses the word "face" in the form and meaning of the auxiliary units such as "side", "neck":

Kunduzlarni o'choqqa qalab,

Tun yuziga sepgancha olov,

Muzlab kolgan cho'lni yelkalab,

Bukchaygancha ketmoqda o'tov...

(During the day,

Fire sprinkled on the face of the night,
Shoulder to shoulder with the frozen desert,
The grass is bending) [5, 28]

The following auxiliary, like the auxiliary words above, provides a separate ending to the text and can be synonymous with the "to this side" auxiliary, "to":

Bu yil ham so'ng manzil qoshiga borgan,
Ne topib, nelarni yo'qotar ko'ngil.
Sendan akangga deb berib yuborgan
Onamning allasin yo'qotma, singil...
(He went to the address later this year,
What you find and what you lose.
He sent it from you to your brother
Don't miss mom's lullaby, sister) [5, 15]

The word "behalf" is also considered to be an auxiliary verb, used in the same text to mean "destined" by the auxiliary "for". The units formed from the auxiliaries of the words in the verb group also provide originality in Eshqobil Shukur's other poems:

Erta visoliga qarab shoshgayman,
Yongan yuragimni tabriklar yo'llar...
(I'm in a hurry to get an early date,
Congratulations to my burning heart) [5,51]

While the adjective form of the verb is auxiliary in the above passage, we can see the auxiliary form of the adjective in another poem:

Men baxtning qiroli bo'lib chiqaman
Baxtli kun atalgan namoyishga...
(I will be the king of happiness
To the show called Happy Day) [5,19]

In Eshqobil Shukur's poetry, we can also see the units in which the process of auxiliary is used, which are used as a synonym for active auxiliaries:

Suv ustida, suvlar ustida
Yuraklarim chisirlaydi-ey,
Ishq dastidan, hijron dastidan
Suyaklarim qisirlaydi-ey.
...Yo'l ustida, yo'llar ustida

Oyoqlarim yurak bo‘ldi-ey,

Ishq kasridan, hijron kasridan

Umrim faqat tilak bo‘ldi-ey...

(On the water, on the waters

My heart is pounding,

Because of love, because of migration

My bones are numb.

On the road, on the roads

My legs are heartbroken,

From the fraction of love, from the fraction of separation

My life was just a wish) [5, 8]

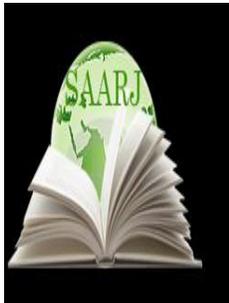

In the poem, the words "because" and "fraction" can be synonymous with "because" as the auxiliary process continues. Significantly, these units are used repeatedly in the text to demonstrate their pragmatic function.

CONCLUSION

The process of auxiliary words is independent of the quality of the language. This process is often caused by the need for a speech situation due to semantic contractions and changes in the meaning of the word. The creator refers to the units that help in the process of pointing to the pragmatic purpose of the text. Auxiliary words not only form the grammatical structure of a literary text, but also serve as a means of providing a unique poetic appeal. In-depth study of auxiliary and auxiliary units, especially in poetic texts, reveals the specific linguistic aspects of such units. In other words, one of the important tasks of our linguistics is to study the auxiliary units, which have not yet been sufficiently studied in Uzbek linguistics, and to reveal their functional aspects in speech. Because the scientific study of the nature of auxiliary units contributes to the linguistic, cognitive, and pragmatic analysis of the text that is important today.

OUR GREAT SCHOLAR ZAHIRIDDIN MUHAMMAD BABUR: THE PRIDE AND HONOR OF OUR NATION

Elmirakhon Mamatisoqkizi Abdullayeva*

*3rd Course Student,
 Faculty of "History",
 Tashkent State Pedagogical University named after Nizami
 UZBEKISTAN

ABSTRACT

This article focuses on our rich history and the life and work of Zahiriddin Muhammad Babur and his place today. "We were not taught Navoi or Bobur"(shavkatmirziyoev). Speaking at the first session of the new Senate of the oliymajlis, President shavkatmirziyoev stressed the importance of understanding our national history. "I spoke at a recent Security Council meeting about our grandfather, Zahiruddin Muhammad Babur. Babur defeated 100,000 soldiers with 12,000. Was it possible to do so at that time? No. What helped our grandfather? Patriotism, pride, arrogance and intelligence. In general, these days I try to read a lot of our history" - said the President shavkatmirziyoev. Therefore, we, the youth, must be a generation worthy of our president and our ancestors. At the same time, it is our sacred duty and our greatest goal to teach our young people our history in depth and to bring them up as mature people like our ancestors Z.M.Babur and A.Navoi.

KEYWORDS: *Z.M.Babur - the founder of the Baburi dynasty, the Timurid prince; A poet is a person who creates works in the genre of poetry; A geographer is a person who studies the nature, population, and economy of the earth and is engaged in the science of geography; Sarkarda - (Persian - chief, leader), commander, general. The commanders were appointed when the army went on a war trip. In Iran, a commander was called an army chief; Statesman - (Arabic - master). Socio - a famous person known to the people for his political and other activities, gaining prestige among the people; The work "The Story" is the first title of the work "Boburnoma"; "Boburnoma" is an important and unique monument in world literature and source studies. The first prose memoir and historical-scientific work in Uzbek literature; A great scientist is a person who has mastered one or more branches of science; Fiqh - (Arabic - to know, to understand) - Muslim jurisprudence, a branch of Islamic teaching that deals with the*

development of Sharia law; Ethnographer - all the peoples of the world, different types of ethnic unity, their origin (ethno-genesis), lifestyle, customs, regardless of the level of material and spiritual development, equal differences or commonalities and similarities, is a person who studies their peculiarities; The great king is the king, the king (ancient Persian - ruler and king). Initially, the term was used in the Sassanid state. The name among the Uzbeks of the Russian rulers before the overthrow of the autocracy; A linguist is a scholar who studies and teaches a language. Linguistics Specialist; An art critic is a person who deeply studies the history of art and their types and directions. Art historians have been attracting people to beauty since ancient times.

“Zahiriddin Muhammad Babur was the best and most courageous of the Chigatay sultans”.
(HasankhojaNisoriy)

INTRODUCTION

“Humanity wants to know who the generation is, the ancestry, the village, the city where he was born and grew up, in short, the history of his homeland” [1].

There really isn't a person who doesn't know their history and who their generation is. Especially in our modern advanced age. I would now like to tell you about our grandfather Z.M.Babur, one of the great scholars of whom we are all proud. Babur is the full name of Zahiriddin Muhammad ibn Umarshaikh Mirza. He was born on February 14, 1483 in Andijan. Z.M. Babur is a great representative of Uzbek classical literature, a great poet, a great king, a historian, a theorist, a literary critic, a linguist, an art critic, an ethnographer, a geographer, a statesman, a talented commander. First of all, the founder of the Baburi dynasty, the Timurid prince. Z.M.Babur was a man of many activities and creativity. Babur was also a scholar of jurisprudence. Fiqh is the science of practical regulations on the fards and sunnahs of Islam. We can see why Bobur was interested in this field from the meaning of his name - Sharif. A name and its meaning is a seal that identifies the content of a person's character or lifelong activity.

THE MAIN FINDINGS AND RESULTS

Z.M.Babur was one of the great personalities of his time. His poems, rubais and all his works are loved and read then and now. We can also learn from his works that Z.M.Babur was a very mature and perfect man. In fact, he is one of the great scholars recognized not only in Uzbekistan but all over the world. Z.M.Babur died on December 26, 1530 at the age of 47 in Agra. Now let's take a look at the qualities of our great ancestor Z.M.Babur. Z.M.Babur's character is praised by his contemporaries and modern historians. In particular, many of the qualities of Z.M. Bobur are described in the work Humoyunnoma written by his daughter Gulbadanbegim. The English historian S. Lane Paul describes Z.M. Bobur as the most charming person in the history of the East. Z.M.Babur's human qualities are truly commendable. He was a physically strong man who was able to easily overcome obstacles by holding two men on the castle wall. He sailed freely from any river he encountered in India, riding 80 miles a day on horseback. Z.M.Babur's body was so strong that even the poison given to him by Ibrahim Lodi's mother did not cause much damage to Babur's body.

Z.M.Babur was a loyal son, a loving father, a loyal friend, a loyal companion and a caring relative. She respects her elderly relatives and pays great attention to the education and personality development of her children. He advised his eldest son Humayun to learn the language perfectly and to pay attention to his speech, to improve his personality. Z.M.Babur

always said "Good luck to the aspirant" and did not allow calm in emergencies. It was said that indifference and indifference were not the work of the ruler. He will help his relatives, sympathize with the concerns of his friends, and share in their joys. He loved all his sons equally. Even when Babur was on his deathbed, he bequeathed to his eldest son Humayun, "Even if your brothers do something worthy of punishment, do not harm them". The great sage of India, the statesman Jawaharlal Nehru, in his book *The Discovery of India*, describes Z.M. Babur as follows: "Babur is a charming person. He was a typical ruler of the Renaissance, a brave and enterprising man. He loved art, literature, and enjoyed life. His grandson Akbar was even more charming and had many good qualities. Z.M. Babur emphasizes that he was a ruler free from religious ignorance and did not destroy the national traditions and customs of the Indians. The English historian Edward Holden described Z.M. Bobur as follows: " Babur is more worthy of love than Caesar in character. It is written on his forehead that he is a man of high virtue". Rumer Goden: "Although the state founded by Babur did not spread to vast regions like his ancestors, he rose to the level of the sultan of his kingdom, the great emperor. He held the system of government in his possession and ruled it skillfully. He founded a great dynasty that ruled skillfully for 332 years", - he said in his writings. The English translator of the "Boburnoma", William Erskin, said the following about Z.M. Bobur: among them there is no king equal to Bobur". Muhammad Haydar Mirza's "History of Rashidi" also gives the following opinion about Babur: "He was a king with various beautiful qualities, praiseworthy qualities. Among all his qualities, courage and kindness prevailed". Uzbek people's writer Pirmkul Kadyrov wrote "Starry Nights" about Z.M. Bobur. It covers the period from Babur's youth to his death. In this work, our writer expressed the following thoughts about Z.M. Bobur: "Babur Mirza was a writer who mastered the art of creating a vivid image with words. He felt it himself. When he has finished, he adds a rubai to it:

Bu olamaroajabalamlarko'rdum,

Olam elidinturfasitamlarko'rdum.

Harkimbu "Vaqoyi"nio'qir, bilgaykim,

Ne ranj-u ne mashaqqat-u ne g'amlarko'rdum.

I have seen wonderful pains in this world,

I've seen a lot of people in the world.

Everyone should read this story, I know,

I saw no pain, no hardship, and no sorrow.

Now I would like to draw your attention to the words of the English orientalist Monstuart Elfinston Z.M. Bobur about the "Boburnoma", one of the masterpieces of our great history: These memoirs describe in detail the life of the great Turkish king, his personal feelings free of bulges. His style is simple and masculine, lively and figurative. He vividly depicts the images, customs, aspirations and actions of his contemporaries. In this sense, this work is the only true historical image in Asia. Babur expresses the appearance, dress, nature, and customs of military men, describing countries, their climate, nature, economy, arts and crafts. But the bright character of the author gives the work the most charm. Indeed, Z.M. Bobur's "Boburnoma" is a work written in the form of a great life experience, lesson and partial testament to generations,

just like Amir Temur's "Temur's rules". So we need to be able to study our history in depth, draw conclusions from them, and apply them to life. "The Story" was the original name of "Boburnoma". Babur sought to accurately describe all the tragedies he experienced in his time. "Let those who read the story know the truth", he said. Z.M. Bobur's "Boburnoma" was translated into English in 1826 by V. Erskin and John Leiden. In his book "Uzbekistan on the threshold of independence", the first President Islam Karimov said in his report on the reception of guests on the occasion of the 460th anniversary of "Boburnoma": "The great scientist, poet and statesman Z.M. Bobur unites many nations with his creativity. Therefore, we need to organize such literary festivals more often. In this sense, it is very unfortunate that the 500th anniversary of Babur was not celebrated in our republic. There will be people in history whose dignity is measured by universal values. Among our great ancestors, Babur is one of them. That is why we need to study Babur's work in collaboration with scholars and writers from many countries. Since independence, the birthday of Zahiriddin Muhammad Babur has been widely celebrated throughout the country. Zahiriddin Muhammad Babur found true dignity in his country after the independence of Uzbekistan. In accordance with the decree of the President of the Republic of Uzbekistan, in 1993 the 510th anniversary of the birth of Z.M. Babur was celebrated. In Andijan there is a university, a theater, a library and a national park named after Babur – "Bobur's Garden". In the complex of Babur National Park there is a museum "Babur and world culture", a symbolic tomb of the poet. There is a statue of Z.M. Bobur in the center of the city and in the memorial complex in Babur Park. One of the central streets in Andijan, as well as a park and a street in Tashkent are named after our grandfather Z.M. Bobur.

Even the Babur Medal of the Academy of Sciences of the Republic of Uzbekistan was established. The first winner of the ZM Bobur Medal was Orientalist Ubaydulla Karimov. The study of the works of Z.M. Bobur began in 1958. Sharof Rashidov paid special attention to the study of Babur's works, and Hamid Suleymanov published copies of Babur's miniatures from abroad. Since our independence, the life and work of Z.M. Bobur have been studied in depth, and great attention has been paid to the heritage of all monuments and museums in our country. As an example, I would like to quote the words of our President Shavkat Mirziyoyev: "When we visit each region, we pay attention to the study and restoration of the history of that place. Babur Mirzo is a great son of our people. In terms of literature, science, enlightenment, he is still alive. It is necessary to make this place more prosperous and turn it into an educational center. If we understand ourselves, explain our great history to the youth, develop science and enlightenment, we will never be short. See, the legacy of Z.M. Bobur is so innumerable that it has no boundaries. How much of all this is what we know, what we have not yet known and studied? Therefore, we, the youth, must always be in search and find all the secrets that have not been revealed in our history, and contribute to the study of the history Uzbekistan.

The International Babur Foundation has done a lot of work in studying Babur's work. The scientific expedition of this foundation organized scientific trips to more than 10 Eastern countries, collected new information about the tombs of Babur and the Baburids, their scientific heritage and put them into scientific use for their use. Based on this information, more than 10 scientific, documentaries, art works and about 10 documentaries have been created. The International Babur Foundation also has branches in the following cities: Lahore (Pakistan), Hyderabad (India), Abu Dhabi (UAE), Moscow, Osh (Kyrgyzstan), Tashkent, Namangan. There is also a tomb of Babur in Kabul. The International Babur Foundation, headed by naturalist

Zokirjon Mashrabov, a native of Andijan, also did a lot to study Babur's work. The International Babur Foundation, headed by Zokirjon Mashrabov, was established on December 23, 1993. The scientific expedition of this foundation has organized car trips to more than 10 Eastern countries. As a result of such scientific research, our Uzbek scientists have achieved many good results.

As a result of many researches of our scientists, many works about Z.M. Babur and Baburids were created. For example, we can cite the following works: Z. Mashrabov, S. Shokarimov: "Bobur who painted the centuries"; S. Jalilov: "Bobur's Fergana state", "Bobur and Andijan"; X. Sultanov "Bobur's dreams", "Boburiynoma". R. Shamsuddinov: "In the footsteps of the Baburids", "The Baburid dynasty". T. Ruziyev: "Bobur's greetings", "International scientific expedition named after Bobur". T. Khamidov: "Pride" and others. In 1998, Pirimkul Kadyrov was awarded the Foundation's first international prize in the field of beekeeping. Then we can say: Sabohat Azimjanova, Nematillo Otajonov, Gaybulloh Assalom, Khayriddin Sultanov, Maqsd Yunusov, Mamurjon Tukhtasinov, Ravshan Mirtojiev, Rahmonjon Azimov, Muhammadjon Mirzayev, Majid Tursunov. Such research by our scientists continues today. For example: I am also a history teacher today. I am proud to have chosen this profession. Because through this profession, I am also contributing to the knowledge of the history of the younger generation and their growth as a generation worthy of their ancestors. I try to use a lot of pedagogical methods to make my history lessons fun and understandable. For example: in our lesson on the life and work of Z.M. Babur, I take students to the museum and park named after Z.M. Babur. Through this, students receive both spiritual and cultural recreation as well as meaningful, understandable learning. It is not in vain that our people say, "It is better to see once than to hear a hundred times." In fact, this is very true. Because what we see with our eyes is always easy to remember and we can easily embody it in front of our eyes. In our lessons, too, we are far from uniform. Our students will be more interested in our lessons. They can also do homework easily and independently. They even create a lot of news because of their interest in the lessons. Therefore, we must always strive for innovation and always work on ourselves and research. Only then can we be a modern cadre. Because our time is developing very rapidly. Therefore, the importance of the science of history in educating a perfect person is very great.

CONCLUSION

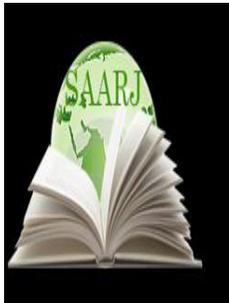

President Shavkat Mirziyoev also expressed the following views on our history and great scientist Z.M. Bobur: "There is no other country with such a rich history and great scholars as our ancestors". Indeed, we should be proud of our many ancestors like Z.M. Bobur. All these great ancestors are the people who spread the fame of the Uzbek people all over the world. These great beings teach us to appreciate our history, to study them deeply, to look to the future with great confidence, and to always strive for progress in life. So we young people don't always get tired of learning and of course we also have to create a lot of innovation. After all, we are a generation of great personalities. The blood of so many great people is flowing in our veins. We, the youth, must be a generation worthy of our great ancestors, and today we must make effective use of the opportunities created for our youth by our President. Only then can we be worthy children of our ancestors. We will justify the confidence of our President Shavkat Mirziyoev in our youth. In short: Zahiriddin Muhammad Babur (1483-1530) was a very talented and versatile man. He is a great person who has left a huge and indelible mark on history and literature during his 47 years of life and is our pride and joy.

ABSTRACT

The article examines the features of the development of creativity of future history teachers in the context of higher education. The psychological and pedagogical conditions of formation creative potential of students. Heuristic methods of organizing classes are analyzed and the expediency of their application in the process of professional training of future teachers is substantiated.

KEYWORDS: *Creativity of future history teachers, heuristic teaching methods, professional training, creativity, creative thinking, creative thinking, creativity, creative motivation, creative environment.*

INTRODUCTION

One of the major shortcomings of modern professional pedagogical education is its weak impact on the development of the creative potential of future teachers, including history. An analysis of the activities of teachers in modern higher education institutions shows that the level of pedagogical practice aimed at developing their creative abilities is insufficient. In the future professional and pedagogical activity of most teachers in the system of creative work, stereotyped methods and techniques focused on the algorithmic actions of students prevail. Therefore, one of the most important tasks of pedagogical higher education institutions that train history teachers is to develop creativity in future teachers, increase their creative potential, preparation of future teachers for the use of creative elements in professional and pedagogical activities.

Pedagogical aspects of creativity in the professional training of teachers in higher education Yu.P.Azarov, O.V. Akimova, R.S. Gurevich, I.A. Zyazyun, N.V. Small, N.V. Kuzmina, O. N. Kutsevol, L.M.Luzina, M.D. Studied by Nikandrov, N.G.Nichkalo, M.M.Potashnik, S.A.Sysoeva, M.I.Smetansky, G.S.Tarasenko, A.V.Temchenko and many other scientists.

THE MAIN FINDINGS AND RESULTS

By the creativity of a history teacher, we understand the holistic quality of the pedagogical tasks that arise in the educational process, which determines the teacher's ability to create unique, unique, innovative ideas for different solutions. This is characterized by the teacher's timely vision of the pedagogical problem, the development of creative ways to solve it and acting in a unique way, rather than on a specific template [1, p. 233].

One of the main conditions for the development of creative thinking of future history teachers is to focus the learning process on the personality of the student, taking into account his personal characteristics, inclinations and aspirations. That is, professional pedagogical education for students involves the use of various approaches to creative teaching, primarily focused on the individual qualities of the individual.

The formation of the creative potential of future teachers in higher education institutions is facilitated by the introduction of non-traditional forms and methods of teaching, innovative pedagogical technologies, the organization of various psychological and pedagogical classes. It organizes professional and pedagogical tasks, active participation in scientific conferences, competitions, discussions on the problems of higher education and other educational and scientific-methodological activities. In this way, conditions are created for the professional development, self-affirmation and self-expression of the teacher's personality.

First of all, let's describe the creative qualities of future teachers, including the psychological and pedagogical conditions that encourage the development of creativity in the field of methods of teaching history in pedagogical universities. For example, E.P. Torrens identified the following conditions that contribute to the development of creative thinking and creativity of the individual: the presence of creative abilities and creative motivation [2, p. 307]. However, if these three factors coincide, a high level of creative ability can be demonstrated.

- 1) Incomplete cases that are clearly defined and differ from strict control;
- 2) Creation and development of strategies and tools for future activities;
- 3) Promotion of responsibility and independence;
- 4) Generalizations of independent developments, attention to observations.

In the process of forming creative thinking in future teachers, the use of problem-based learning technologies in the formation and solution of educational, scientific and professional pedagogical problems is important. Therefore, it is necessary to subordinate all organizational forms and methods of teaching in modern higher education institutions to the development of creative thinking of future history teachers: lectures, practical and seminars, independent and individual work. It is well known that problem-solving stimulates students' interest in the issues being studied, encourages activism and independence in the search for additional information. At the same time, in the process of solving the problems proposed by the teacher, they gain additional

knowledge independently. Problem-based lectures include: lecture-dialogue, lecture-discussion, lecture-discussion, and more.

Problem-based workshops and seminars can take many forms, for example: in the form of discussions on individual issues of the topic; in the form of discussion, debate (requiring independent study of additional study material); in the form of the defense of theses that activate the attention of all students and contribute to the development of evidence-based thinking; in the form of solving professional and pedagogical problems that develop the skills of future teachers to apply theoretical knowledge in practice; in the form of business games, which are an active way of training professionals, as they involve the use of certain forms of research, teaching and learning.

Practical training, which is an integral part of the professional training of future history teachers, should be organized on a project basis. Project topics aimed at solving current problems related to the modernization of teaching methods and the organization of innovative education and the organization of innovative education, scientific and practical research are studied by students in small groups or individually. This form of practical work of future history teachers is, in our opinion, the most acceptable and useful, as a student or a small group can defend their project work through appropriate presentation and answer various questions.

Thus, the process of formation of creative thinking of future history teachers, including in the teaching of history, depends on the purposeful interaction, cooperation between teachers and students, the necessary forms of organization of the educational process, and special organization using the methods, it is possible to distinguish some groups of methods that contribute to the formation of students' professional creative thinking [5, p. 174], they are classified as follows:

1. on the methods of organization of educational activities:

Structural and logical methods, characterized by the gradual organization of the definition of didactic tasks, the choice of methods for their solution, diagnostics and evaluation of the results obtained; training methods aimed at developing specific algorithms of learning-cognitive movements and solving common problems during the lessons (these can be tests and practical tasks, it is advisable to add creative elements to their structure); game modes characterized by the interaction of the subjects of the educational process (if educational tasks are included in the structure of the game), etc.

2. in the formative direction, respectively:

a) Ways to develop the experience of creative activity:

Methods of using complicating conditions, namely: time-limiting method, sudden blocking method, new options method, lack of information method, denial method; methods of group solution of creative tasks: Delphi method, "black box" method, daily method; methods of stimulating collective creative research: mental attack, synergetics, and other methods.

b) methods of emotional influence that contribute to the formation of experience and create a positive attitude through the experience of their professional, creative and educational activities: emotional response to it, motivation, educational and emotional play, the state of success creation, free choice of creative tasks, motivation to choose alternative solutions.

Of course, there are many other approaches to the classification of methods that help to develop professional-creative thinking and creativity in future teachers. However, there are also factors that negatively affect the expression of creative thinking in future history teachers. S.D. Smirnov [5, p. 87], this includes: time limit; or increased anxiety; strong or weak motivation to learn; striving to find a solution quickly, which usually leads to a decrease in the quality of assignments by shortening the time to complete it; a method of formulating task conditions that trigger an incorrect solution method; lack of confidence in their abilities due to previous failures and the causes of others.

Well-known creative researcher G.Ouch calls the factors that hinder creative thinking “mental locks,” that is, a strong attitude of the mind that prevents a creative approach to solving life and professional situations. According to him [6, p. 141], which include: self-doubt; fear of looking worse than others; the habit of evaluating all life and educational situations from a logical point of view; striving to be practical at all times; the habit of following generally accepted rules; marking only one correct answer; tendency to avoid uncertainty; subconscious thinking that it is impossible to make mistakes in general and in others.

We support the views of researchers who believe that heuristic teaching methods should be widely used in the training of future teachers [5, 6], which actively encourages the development of creativity in students and shapes their creative qualities.

In our opinion, let's analyze the basics of methods that would be appropriate to use in the training of future history teachers in higher education. For example, the “Agglutination” method is designed to develop students' ability to combine the qualities, properties, or parts of things that do not fit in the real world, such as hot snow, volume gaps, sweet salt, black light, and so on. The use of this methodology will help future teachers develop the ability to advance imagination, imagination, bold ideas and assumptions. It is advisable to use this method during active lectures and practical (seminar) classes on history and its teaching methods.

Its main function of the brainstorming method is to collect the most ideas from the participants. This is an operational way of solving group problems, and its participants are encouraged to be creative and to express as many options for solving it as possible. After that, the most successful ones that can be used in practice are selected from the total number of opinions expressed. It is expedient and useful to use this methodology in practical work on history in small groups, when each student has the opportunity to advance their idea to solve the problem, it is possible to create an algorithm and implement its software.

The Project Method is a method aimed at enhancing the learning process, taking into accounts the individual needs and individual qualities of students. The purpose of the project method in education is a specific transition from personal development, self-development, revealing his intellectual and creative potential, and the possibility of organizing project activities in the training of future history teachers. Forms and methods may include: performing small groups or individual projects during planned laboratory work; combining teaching material on specific topics in the form of a final assignment in the form of a creative assignment or project (performing tests, writing or teaching theses on historical works and history).

The Delphi Method allows a group of researchers to achieve maximum consensus in their search for the right solution through surveys, interviews, brainstorming, and the like. This method excludes the possibility of open collisions between carriers of conflicting views, as direct

communication between experts is not possible. It can be used to conduct scientific-practical Internet conferences or discuss issues in relevant forums.

Game techniques that can be used during lessons of any form can be used [1 p. 15]. For example, solving or composing crossword puzzles, rebuses, and historical charades in practical and seminar classes on history, especially for students; computer drawing selections; may conduct quizzes on specific topics.

Let's look at some examples of assignments that future history teachers should use in higher education. For example, on a computer, you can suggest the following tasks: the screen will show students some of the historical information on the topic being studied. He asks them to determine what the topic is for. Or it may have to find errors that are deliberately entered in certain information.

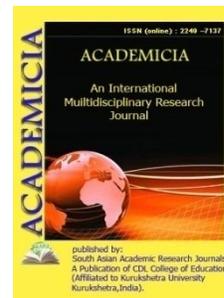

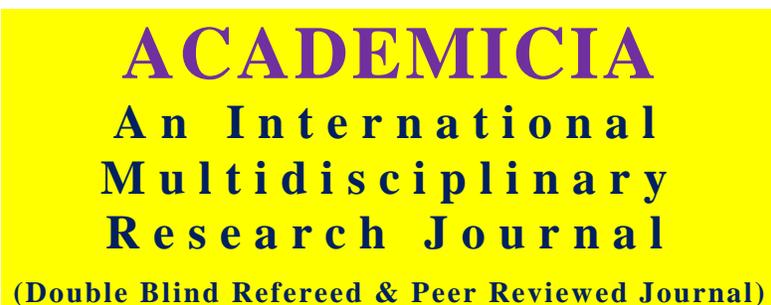

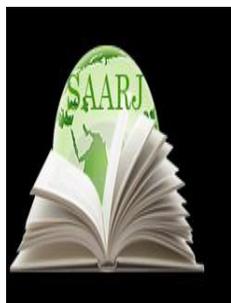

Thus, at this stage, there are different ways to develop the creativity of future teachers, including history teachers.

CONCLUSION

In the formation of an individual method of pedagogical activity, each teacher of higher education can choose for himself any heuristic forms and methods of teaching students. At the same time, it is important to ensure that the results of their application have a positive impact on the development of creativity of future history teachers.

ABSTRACT

As presented in the content of documents of state importance, primary education is an important component of continuing education in the country, and its effective organization can be an important guarantee of success in the next stages of education. Indeed, there is an opportunity to further enrich and strengthen the skills of learning activities and spiritual and moral qualities acquired by students in primary schools, while studying in basic schools, academic lyceums, vocational colleges and higher education institutions. In this regard, it is advisable to focus on fostering a sense of responsibility from the time of primary education. The qualities formed in the student's behavior during this period are strengthened in the later stages of the system of continuing education.

This article explains the essence of the concept of "responsibility", content of educating responsibility sense of pupils of primary schools and role of academic disciplines and spiritual-educational activities in fostering a sense of responsibility in primary school students.

KEYWORDS: *Continuing education, educational content, learning activities, responsibility, sense of responsibility, responsibility, amenability, academic disciplines, spiritual and educational activities.*

INTRODUCTION

During the years of independence, the field of education has been recognized as one of the priorities in ensuring the social development of the Republic of Uzbekistan. The main ideas of the ongoing educational reforms in the country are the radical renewal of the education system,

enriching its content, the introduction of advanced pedagogical technologies in the education system and raising it to the level of world education.

Primary education, which is one of the most important stages of the system of continuing education of the Republic of Uzbekistan, is a period in which learning plays a key role in the activities of the individual, forming the initial skills that help students to master scientific knowledge. At this stage, it is expedient to organize the pedagogical process theoretically and methodologically correct, aimed at the formation of the personality of the pedagogical student.

LITERATURE REVIEW

Further improvement of the primary education system, which is the main stage of the system of continuing education, will be useful in studying and analyzing the experience gained in foreign countries in this field, as well as the appropriate use of best practices in primary schools based on national and regional characteristics. To this end, the study examined the content of the primary education system in Russia, the United States, Japan and France. The study of the experience of leading foreign education systems in primary education has shown that there are a number of positive traditions in the field. Including:

There are different approaches to the pedagogical approach to primary education;

Teachers have gained freedom of creative research, supported by state policy; author's schools are being established on the basis of foreign experience;

Parents are given the opportunity to choose the optimal pedagogical system; the level of awareness of parents is growing;

It is increasingly recognized that the use of individual methods and tools in creating incentives for learning in the child is appropriate [2].

A person's sense of responsibility ensures that he or she performs his or her duties diligently and in accordance with existing requirements. The full fulfillment of the task will help to achieve new achievements and development in the process of certain activities.

DISCUSSION

Some sources emphasize the importance of the concept of "responsibility" as a moral category that "characterizing the attitude to society" and "a form of self-government." In particular, "responsibility is an ethical category of morality, which characterizes a person's attitude to society, the manifestation of high personal and moral qualities to fulfill his requirements. A person's responsibility is manifested in his attitude to the whole being, to his particular attitude to each specific situation." [14]

In Higher Education, this concept is interpreted as understanding and controlling one's own behavior: in understanding and controlling their ability to be in the environment and in person" [9]. In our view, responsibility is not a form of self-government of an individual, but rather his behavior and attitude towards others, which acquires the character of individuality and sociality. A lexical error was also made in the given definition. There are no such words in Uzbek as "understanding and controlling one's abilities in the environment" and "understanding and controlling one's own abilities in the environment." In this case, the authors refer to "in society"

or “in social existence”, “in the process of social relations”; It would be appropriate to use concepts such as “individually”.

One of the main conditions for the organization of any activity is its successful implementation by children. At the same time, it is necessary to monitor the child's completion of the task on time and to the end, as well as to teach him to plan and control his own activities. Children should strive to feel a sense of responsibility for the results of their work in front of adults and friends.

In our view, responsibility is the performance of a particular behavior, professional or social activity, as well as a sense of responsibility to fully understand the duty to a particular group or members of that group. Accordingly, responsibility manifests itself in different ways:

1. Responsibility for the performance of a particular behavior.
2. The responsibility of an individual to perform a particular professional activity.
3. Responsibility to a particular group or its members.
4. Responsibility of a citizen of the society in the implementation of social activities.

Educational sciences also have a great opportunity to form a sense of responsibility in primary school students. At the same time, the possibilities of academic disciplines in this area are analyzed.

The content of the textbook "Alphabet" [1], intended for primary education (grades I-IV), the study of the content of the topics covered showed that most of them serve to form a sense of responsibility in primary school students. With the help of a series of pictures in the textbook, such as the text on page 30, students will realize that following school rules is an important aspect of responsibility. Here it is important that the teacher draws the students' attention to this aspect in the process of studying the text.

The text “At the station” on page 39 of the textbook not only cultivates respect for adults in students, but also helps them to form the responsibility to be considerate. After all, one of the most important manifestations of a sense of responsibility is to be considered as responsibility for one's relationship with others. This idea is reflected in the text of the textbook "Friends" on page 45. It tells of Shuhrat's illness and his friend Dilshod's visit to him. As students read the text, they realize that keeping in touch with a friend is also a humane, responsible attitude toward a friend.

The series of texts from the textbook "Reading Book" [11] for the 2nd grade of secondary schools also includes the organization of educational activities, the performance of team (class) tasks, communication with teachers, peers and others, use of teaching aids, personal items, has the ability to inform students about the need to organize games, follow a daily routine, and be responsible in organizing behaviors. These include "Book", "Disabled book" (preservation of teaching aids), "Value of time" (daily routine), "Ant and locust" (responsible approach to work), "Jayron child", "Green world - a good world" Poetry (“The Value of Time”) and texts such as (responsible attitude to nature and the environment) help to form a sense of responsibility in primary school students.

The following topics from the 3rd grade textbook "Reading Book" [12] also have the opportunity to further develop the sense of responsibility formed in students:

- 1) "Shepherd boy Shirak", "Sixty gas ropes" (fairy tale), "Guardians of Uzbekistan" (poem), "Today you will be a child, tomorrow you will be a soldier", "Bobonur", "A man who lived as saying my people, my country" (on the basis of patriotism those around him, reflect the responsibility to preserve the freedom of the homeland, to ensure its development);
- 2) "Who is the hostess upset about?" (Liability for personal items);
- 3) "Priceless wealth" (responsibility for daily routine);
- 4) "The one who loves the land loves the hand", "I plant seedlings for the harvest" (Uzbek folk tale), "Who broke this sapling?" (Responsibility for nature and the environment);
- 5) "Rule", "Helped", "Fly with an ant", "Consequences of ignorance", "Death of a falcon", "Barno", "In the flower garden" (responsibility for the organization of actions);
- 6) "Stick", "A true friend", "Try the good in a bad day", "Respect" (responsibility for establishing relations with others).

A number of topics and illustrations in the textbooks "The World around Us" and "Natural Science" [4, 5, and 6] also help to form and develop a sense of responsibility in students:

Topics	Pages	Tasks to be solved
I class		
Picture on the theme "Our school".	5	To acquaint students with the internal rules of the school and to form in them the skills of strict adherence to the existing rules, as well as to teach them to be responsible for their own actions.
Pictures on the topic "Rules of the road".	8-9	To teach students to follow the rules of traffic safety when walking on the street on the basis of theoretical knowledge.
Pictures on the topic "Student's agenda".	10-11	To inculcate in students the qualities of adherence to the agenda and to teach them to be responsible in the process.
Pictures on the theme "Personal hygiene".	12-13	Explain to students that maintaining personal health is an important necessity.
Pictures on the theme "Houseplants".	20-21	To develop students' practical skills by providing them with theoretical knowledge about nature and the environment.
Pictures on the theme "Pets".	22-23	
Pictures on the theme "Wild animals".	24-25	
Pictures on the theme "Birds".	26	
Pictures on "Equipment we use", "Electrical equipment".	30-31	To give students an understanding of the need to be responsible in the use of personal items.

Pictures on the theme "Kitchen".	32	Explain to students the need to be responsible in their dealings with others based on cultivating the qualities of diligence.
Water is life.	36-37	Enrich students' theoretical knowledge and further develop their practical skills in nature and environmental protection.
Birds are our friends.	39	
We and nature.	45	
II class		
Water basins of our country.	9-10	Further development of students' nature and environmental protection skills.
Garden.	19-20	
Flowers that open even in autumn.	22	
The place of ants in nature.	24-25	
Nature Sanitarians.	27	
Pictures on the theme "Human labor in the fall."	28-29	Teach students to be responsible in their relationships with those around them.
Text on "Socially useful work" and pictures depicting the daily life of students.	31-34	
Body hygiene.	38-39	Forming in students a responsibility to take care of their personal health.
Food hygiene.	39-40	
Dental care.	42	
Take care of the book.	48	To teach students to take care of personal belongings and other people's property and to form a responsibility in this regard.
"Mine" and "ours."	49-50	
Note for students.	56	
Traffic rules.	57-60	Enrich students 'existing knowledge of traffic rules and teach them to be responsible in following them.
Room flowers.	61-62	Enrich students' theoretical knowledge and further develop their practical skills in nature and environmental protection.
Attracting and protecting birds.	68-69	
Home animals	70-71	
Wild animals.	71-74	
Hedgehogs and psoriasis.	75	
Propagation of plants.	78-79	
Nature and man.	84-85	
III class		

Conservation of nature	5-6	Enrich students' theoretical knowledge and further develop their practical skills in nature and environmental protection.
The air around us and its protection.	7-9	
The air should be clean.	9	
Be careful with water.	14-15	
Protection of water from pollution.	15	
Protection of minerals.	25-26	
Soil.	26-27	
Flora and fauna.	32-61	
Avoid smoking!	78	To develop students' skills to be responsible for the health of themselves and those around them.
The disease is easier to prevent than to cure.	78-79	

CONCLUSION

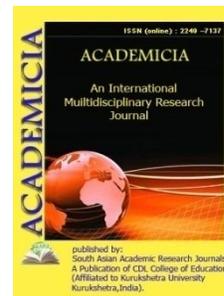

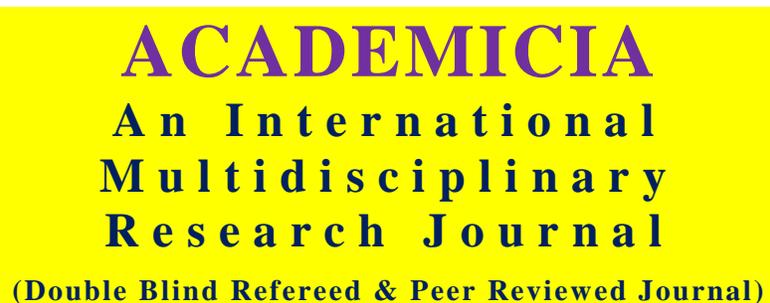

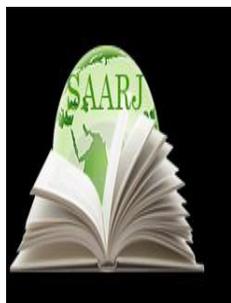

The qualities formed in the student's behavior during the period of primary education are strengthened in the later stages of the system of continuing education. Therefore, it is necessary to pay special attention to cultivating a sense of responsibility in students in primary school. The sense of responsibility that needs to be nurtured in students is manifested in the following forms:

- responsibility for the organization of educational activities;
- responsibility for the performance of team (class) tasks;
- responsibility for relationships with teachers and peers;
- responsibility for the use of teaching aids, personal items;
- responsibility for play activities organized in the microenvironment;
- Responsibility for adherence to daily routine and behavior.

MEANS AND METHODS OF FORMING LEXICAL COMPETENCE IN FUTURE ENGLISH TEACHERS

Jumanazarov U.U*

*Doctor,
Philosophy in Pedagogical Sciences (PhD),
Jizzakh State Pedagogical University,
UZBEKISTAN

ABSTRACT

The article addresses the issue of shaping the lexical competence of future English teachers. In particular, the role of a number of tools and methods, such as linguistic exercises, working with vocabulary, flash cards, is explained. The issue of defining methods and techniques for the formation of lexical competence of future English teachers is also one of the current issues related to our study. Our next observations were based on the Practical English Course and a number of other disciplines.

KEYWORDS: *Lexical competence, lexical competence, dictionary, education, flash card, poem, rhyme, game, internet, computer.*

INTRODUCTION

Without solid knowledge and skills in the field of lexicon, it is not possible to successfully develop the ability to read, speak or hear, because with its help the process of absorbing certain information and transmitting it to others takes place. For this reason, we believe that special attention should be paid to working on vocabulary in foreign (English) language classes.

It should be noted that when working on vocabulary, the student should only be prepared to use his or her specific vocabulary correctly and situational. At this point, there is a need to prepare him to work with problems in the acquisition of knowledge, which can be overcome, especially during communication and during exercises, as well as when working with different dictionaries. It should be noted that when learning English, students may have the initial impression that learning vocabulary requires mastering that vocabulary, or they may come to the conclusion that vocabulary requires the use of certain lexical units to interconnect and use words. Therefore, it is important to prepare students to master the vocabulary at an early stage. The issue of defining

methods and techniques for the formation of lexical competence of future English teachers is also one of the current issues related to our study. Our next observations were based on the Practical English Course and a number of other disciplines.

THE MAIN FINDINGS AND RESULTS

In the process of forming students' lexical competence, it is important to master words well, that is, to develop a continuous practice that should be built on certain pedagogical principles. At the same time, the aim is to focus on the creation of lexical units that serve to implement existing communication not only on the receptive but also on the productive level in the linguistic exercises for the formation of lexical competence. Thus, the use of different methods and techniques to form lexical competence allows students to memorize words previously acquired in certain communication situations in order to understand or express the content, meaning of a particular word.

The issue of defining methods and techniques for the formation of lexical competence of future English teachers is also one of the current issues related to our study. Our next observations were based on the Practical English Course and a number of other disciplines. .

Linguistic exercises can be a key supporting factor for students in the field at any stage of English language acquisition. Linguistic exercises always express a specific goal and its solution. Some linguistic exercises can also have secondary effects, but the exercise itself does not produce any end result. It is desirable that the student has a playful nature in order to effectively perform the specific task set before him. For example: “Buchstabsalat”, “Streik der Vokale”, “Silbentauch”, “Ratsel”. Once the units of vocabulary are included in the content of the lessons of a linguistic game nature, they should be repeated several times in these lessons so that they are remembered and not forgotten. Lexical exercises require control over previously known vocabularies and their relationship to new structures. Such exercises can be performed by a teacher-instructor (e.g., lexical tests) as well as by students (independently, for example, using a computer program).

Working with a dictionary is a very important way to shape the lexical competence of a future English teacher. By its very nature, a dictionary is important for language learners not only in creating their vocabulary, but also in correctly memorizing and writing the words learned. Students in the field learn to identify the correct meaning of each word, phrase, and their grammatical usage, and begin to use them fully in a variety of contexts. In English lessons, first-year students can work independently with the dictionary, and senior students can effectively use one or two language dictionaries.

Flash cards can also be used to enrich the vocabulary, pronunciation, intonation, and even grammar skills of future English teachers to some extent unconsciously. In addition to what the word means, the images reflect the founders and characteristics of the culture, the traditions; it can also show the similarities and differences between different cultures, which are important in the correct assessment of the situation when using this or that word. The use of flash cards provides many opportunities for the formation of students' lexical competence in the process of learning a foreign (English) language.

Associative educational networks have a positive effect on the formation of lexical competence of students in the field. For example, using the *Mind-maps* method, students learn thematic

groups of words that have a specific relationship with each other instead of simply memorizing individual words. This method can be used both in individual work and on the board with a small group. However, it is important that every student understands this method and is able to do it independently. An example is the theme of “*Tieri*”. Each student takes a sheet of paper for himself and writes the basic concept between the sheets. Based on this term, the student will have to fill in the branching terms, such as “*Zoo*”, “*Affe*”, “*Bar*”. Thus, a multi-level network of words related to the basic concept gradually emerges.

It should be noted that students also develop a certain level of lexical competence in creating such word networks in their practical classes, as they gain skills depending on which word corresponds to the topic and how it is logically related to other words.

Poems and rhymes also provide some practical assistance in the formation of students' lexical competence. After carefully studying the given text, students memorize words and sentence structures by repeating them many times. Usually, working with poems brings unexpected results even for a teacher. Using this method, he can find out how creative the students in his group are, as this method differs from the sometimes rigid forms of educational work, but also provides good opportunities for stratified work. When working with poems and rhymes, all students can learn a goal-oriented text or complete assigned tasks as much as possible, all students in the group, regardless of how well they know English, will have a certain result, shaping their lexical competence. Poems and rhymes are easy to learn, have features such as weight, sound repetition. Studying or memorizing poems usually gives students pleasure, instills a love for their future profession. Positive emotional experiences, on the other hand, leave a deep imprint on the mind and remain in the memory for a long time. In this situation, the teacher-tutor's task is to continuously check that the student has completed the given homework, assignment, or language text correctly.

Didactic lexical games are a very good and effective tool for future English teachers to memorize words in the text and strengthen vocabulary. Any language game is a fun, natural, voluntary activity that is also a job that students in the field enjoy doing. However, through games, students can also form and strengthen basic skills.

Linguistic games in the “Practical English course” and other special subjects make students more active, didactic games create a natural atmosphere in the lessons. Shyness in using English helps students overcome psychological barriers and significantly increases their time spent actively using English in the group. These types of games create a friendly and harmonious environment that facilitates the activities of the group members, makes them happy and helps them to practice on lexical units during the games, strengthen and repeat the acquired knowledge.

In the environment of educational development transformation, there are different options of lexical games to increase and strengthen the vocabulary of future English language professionals. For example, quick games that increase students' interest, various variants of classic games such as Memo-Spiel, Reihenspiele, “Quartet”; word search and finding games, square letters, crosswords, paronomimas, word formation games; games related to contextual words, such as searching for adjectives for horses, filling in blank texts with relevant words, composing small-volume stories or information using suggested words.

So, basically, all the existing approaches to working with students' vocabulary in the study of the course “English lexicology” help to make effective use of opportunities.

Internet opportunities are one of the most effective opportunities in the development of lexical competence of students in the field. Today, with the rapid development of the internet, more informal learning tools have demonstrated their best features, especially now that they are widely used among learners and appear as an interesting additional representative resource for independent learning, which is relatively formal. There are many opportunities on the Internet for future English teachers to master the vocabulary of the field independently and thoroughly: for example, a dictionary of relevant information, articles on specific topics, crossword puzzles, basic and additional literature, worksheets and various exercises to increase vocabulary in a foreign language. English texts recommended for translation, riddles and proverbs in folklore samples, linguistic games, foreign language forums, etc.

Mobile phones are becoming an important part of our daily lives, fulfilling the means of communication. What is important for us is that it serves the development of e-learning. At the same time, the use of digital media, which has rapidly entered social life, is constantly growing. There is also an opportunity to shape a student's lexical competence through mobile phones. Because today, almost every student can read and download teaching materials from specialty subjects at almost any time in their home using TV, computer, internet and mobile devices and software applications, and be able to complete the assigned tasks.

The computer activity system can have a significant effect on the formation of the lexical competence of the future English teacher. This is because this system, which is based on innovative information technologies, has many special applications aimed at shaping lexical or other competencies. Programmers create their own materials based on the description and pronunciation of a word that students want to learn, relying directly on the content of specific color images, targeted videos to learn foreign words, to better remember. Current practice shows that there can be no vacancy in mobile learning, but this system can serve as a way to form lexical competencies that are used from time to time.

The method of associations or the method of keywords is one of the non-traditional methods of teaching in the process of forming the lexical competence of students of the "English" direction. This method is not widely used among the methods and techniques traditionally used in English lessons and are not described in detail in the methodological literature. In the associative method, associative images are actually used. One of the main linguistic requirements for such associative images is related to some common feature of them. Associative relationships can be, for example, in terms of color (black - white / Schwarz - weiß), shape (square / quadratisch), size (big - small / groß-klein), and so on.

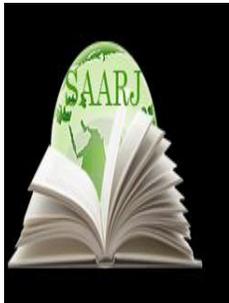

CONCLUSION

To sum up, the use of effective methods and techniques of formation of lexical competence in English lessons leads to improving the quality of knowledge and mastering, provides a great practical opportunity to increase the motivation of the future specialist and develop cognitive interests.

ABSTRACT

Updating the system of student assessment in improving the quality of education, that is the development of personal consciousness, the problem was solved on the basis of non-rigorous mathematical methods when creating a system of assessment management in a subject, expanding the imagination, enriching thinking and leading to learning.

The article was made an algorithm for solving the problem of bringing students to a new level of assessment - the algorithm of the assessment system. The use of continuous mathematical modeling as an effective way of monitoring and assessing students' knowledge, on the basis of which it is possible to implement a rating system, acquire skills and abilities

KEYWORDS: *Pedagogy, quality of education, assessment, continuous mathematical modeling, algorithm, relativity function, graphics, diagrams, analytical expression, relevance level vector.sum or integral.*

INTRODUCTION

Updating the content of the higher education system in the Republic of Uzbekistan, modernizing the educational process of teachers working in the information system in the era of globalization, using modern technologies and modern knowledge in this process are considered [2,4].

The head of state stressed the need, first of all, to revise the teaching load in schools and the number of lessons, to create a methodology that encourages students to think [1,3].

In this regard, the task was set to study foreign experience and update the methodology for training teachers.

Taking into account the above tasks, the choice of innovative teaching technologies related to the content of education, the development of lessons and the construction of technological maps, the practical application of educational goals in them, the development of personal and psychological skills of students. need to.

The use of continuous mathematical modeling as an effective way of monitoring and assessing students' knowledge, on the basis of which it is possible to implement a rating system, acquire skills and abilities.

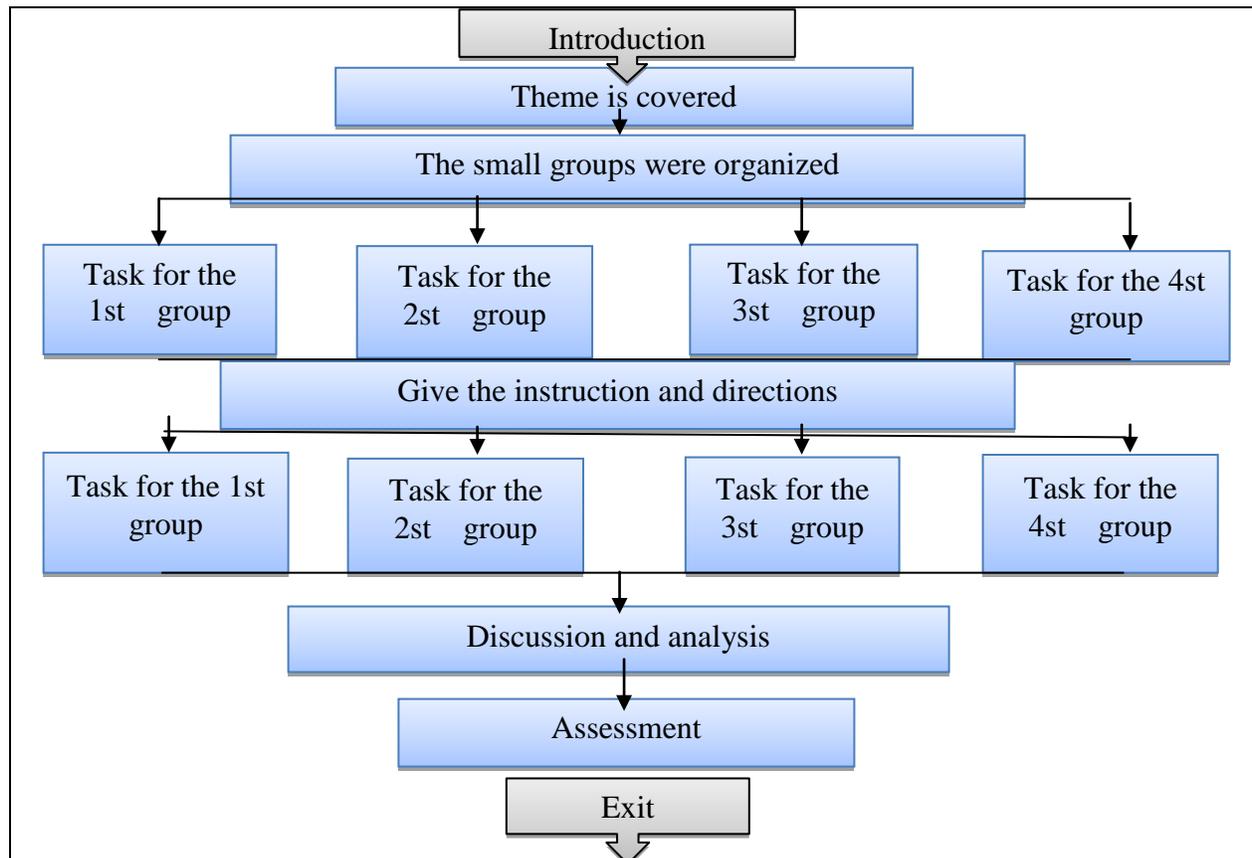

MAIN PART

Small Group Work - A creative classroom activity in which students are divided into small groups to study the material or complete a task to activate them;

In this method, the student has the right to work in small groups, take an active part in the lesson, take the lead, learn from each other, and appreciate different points of view.

By using the “small group work” method, the teacher has the opportunity to save time compared to other interactive methods. Because the teacher can attract and evaluate all students at the same time;

The following is a description of the small group method.

1-Photo working with small groups:

Using the method of Evaluation "Work in small groups" is often associated with some difficulties. For example, his statistical evaluation method is characterized by the difficulty of creating the necessary conditions for conducting a large number of non-coherent experiments on the observed process or parameter. Such information includes information on the student's mastery and attendance, linguistic assessments, and his psychology. An effective way to process arbitrary data, especially fixed data, is the fixed data method.

Here are some examples of how students can achieve high academic performance by exploring the different types of knowledge assessments, journals, and skills they have acquired as they improve their performance.

The organization and decision-making of the educational process in mathematics is characterized by the fact that it has a large amount of linguistic, subjective, digital information, since it belongs to the category of the humanities. One of the most effective ways to model learning and decision-making processes in such an environment is the widespread use of non-rigid set and neuro-rigid approaches.

$$A = \{(\mu_A^*(x), x)\}. \quad \forall x \in X. \quad (1)$$

In this the power for each element X belongs to the set and is given by the dependency function, in this

$$\mu_A(x) \in [0;1]$$

The relation function is a set of X values at the intersection of this variable [0; 1]:

$$\mu_A : X \rightarrow [0;1]$$

The concept of an infinite set allows you to mathematically represent qualitative assessments in humans in the form of linguistic meanings and ambiguous numbers.

The power of Unstable Packages: The cardinality of a set without a fixed set is expressed by $(\mu_A^*(x), x)$ the number of pairs it contains [9]:

$$\|A\| = n$$

The set A is constant, and its domain x is the amount of forces.

The Function of affiliation and the degree of affiliation: For each x value of a given variable, the relevance function [0; 1] corresponds to a definite number from the interval [6, 7]:

$$\mu_A(x) : X \rightarrow [0;1] \quad \forall x \in X. \quad (2)$$

This number, called the degree of membership, represents the degree to which x belongs to a fixed set A. The affiliation function can be set as follows:

- Graphics (solid case) or diagrams (discrete case);
- Analytical expression (formulas);
- Tables;

- Vector of suitability level;
- Sum or integral.

When the ratio function is the form of a formula, it is advisable to introduce a mathematical variable x , which forms the coefficient of the values of the variable:

$$w = \begin{cases} 1. & \text{if } -a \leq x \leq a. \\ 0. & \text{another situation} \end{cases} \quad (3)$$

In this case, the given stitching function can be written as:

$$\mu(x) = w \left(\frac{a - |x|}{a} \right) \quad (4)$$

Discrete affiliation function table: 1. can be given in the form.

Note. In the form of x values, the table can be an object, human individuals, or abstract concepts, rather than just numbers. For example, the table may contain information about the belonging of different assimilators, assimilation groups to set A (Table 2.) [7].

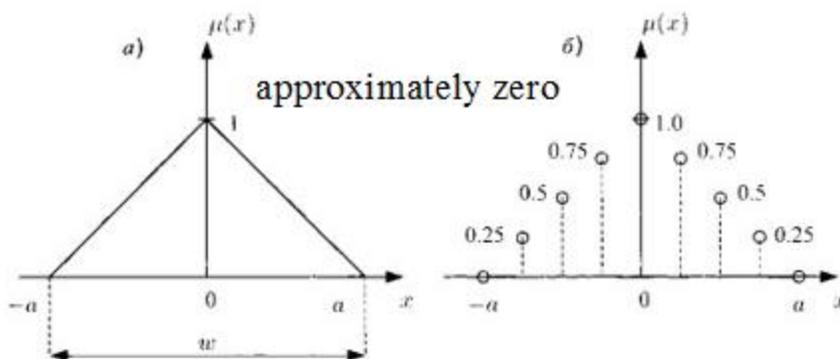

Figure 1 continuous (a) and discrete (b) indeterminate number Graphical representation of the corresponding function “approximately zero”

The relevance function is an example given in the table setting

Table.1

$x \in X$	$x_1 = a$	$x_2 = -0,75a$	$x_3 = -0,5a$	$x_4 = -0,25a$	$x_5 = 0$
$\mu_A(x)$	0,00	0,25	0,5	0,75	1,00

$x \in X$	$x_6 = 0,25a$	$x_7 = 0,5a$	$x_8 = 0,75a$	$x_9 = a$
$\mu_A(x)$	0,75	0,5	0,25	0,00

If the domain X determines X is the sequence of all n elements, then the stitching function can be given in the form of a stitching vector

$$V_A = \{\mu_A(x_1), \mu_A(x_2), \mu_A(x_3), \dots, \mu_A(x_n)\} \quad (5)$$

For example:

$$V_A = \{0,00, 0,25, 0,50, 0,75, 1,00, 0,75, 0,50, 0,25, 0,00\}$$

Discrete can be written in the form of a set sum that is not exact:

$$A = \frac{\mu_A(x_1)}{x_1} + \frac{\mu_A(x_2)}{x_2} + \frac{\mu_A(x_3)}{x_3} + \dots + \frac{\mu_A(x_n)}{x_n} = \sum_{i=1}^n \frac{\mu_A(x_i)}{x_i} \quad (6)$$

The appropriateness of the student's belonging function in the form of a table Table 2

$x \in X$	Group.1	Group.2	...	Group.(n-1)	Group.n
$\mu_A^*(x)$	0.4	0.5	...	1.00	1.00

Listed write A represents the fact that the package is one of the pairs (al arithmetic does not sum).

For example:

$$A = \frac{0,00}{-a} + \frac{0,25}{-0,75a} + \frac{0,50}{-0,5a} + \frac{0,75}{-0,25a} + \frac{1}{0} + \frac{0,75}{0,25a} + \frac{0,50}{0,5a} + \frac{0,25}{0,75a} + \frac{0,00}{a}$$

An Interrupted indefinite set can be written in the form of an integral

$$A = \int_x \frac{\mu_A(x)}{x} \quad (7)$$

This notation states that A is an indefinite set $(\mu_A(x)/x)$ of pairs consisting of a combination of pairs.

Example: "Real numbers close to zero" (1 photo)

$$A = \int_x w \left(\frac{a - |x|}{a} \right) / x \quad (8)$$

When writing an affiliation function, elements of X whose affinity level is zero are usually omitted

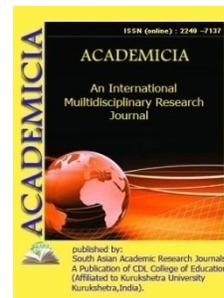

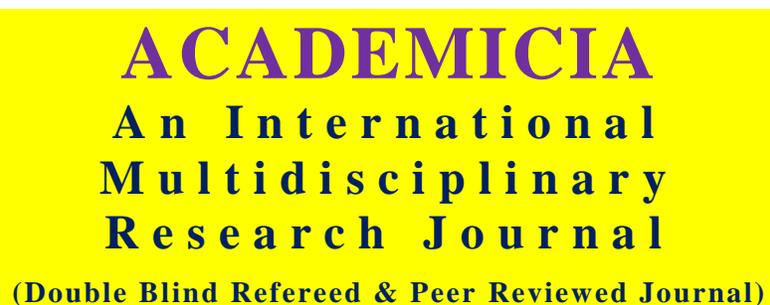

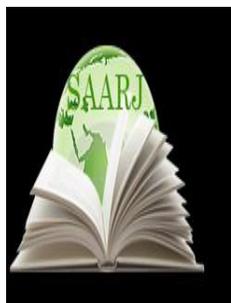

CONCLUSION

In conclusion, the article argues that some small groups, which are considered to be disadvantages of the "small group work" method, have weak learners, so strong learners are less likely to get grades, have less control over all learners, and have negative inter-group competition. In order to effectively solve problems such as the possibility of conflict within the group, to improve the quality of education, to develop and bring it to a new level, to evaluate students, especially to update the system of assessment in specific disciplines, reviewed and developed a management system for assessment in the subject matter of the course, as well as to find a clear solution based on non-rigorous mathematical methods for assessment.

ABSTRACT

The article substantiates the relevance of anthropometric measurements of the dimensional characteristics of children's figures of different age sex and age groups in order to study the nature of the change in dimensional characteristics to improve the quality of the fit of children's clothing, as well as create a new dimensional typology. A mass measurement of children's figures was carried out; the sample consisted of more than 3,000 people. Based on the mass measurement data, regression equations were drawn up, on the basis of which the analysis of changes in dimensional characteristics was carried out.

KEYWORDS: *Dimensional Characteristics, Measurement, Research, Regression, Regression Coefficient.*

INTRODUCTION

To solve practical problems of providing the children's population with fitted clothing, it is necessary to take into account the modern size typology of the population, know the relative number of their typical figures and predict the required size range of clothing. Such data can be obtained only when conducting mass anthropometric examinations of children's figures and correct mathematical (statistical) processing of the results of mass measurements. The results of anthropological research are used to develop new anthropometric standards for the production of children's clothing.

The scientific foundations and methods for constructing anthropological standards for mass production of garments were developed by the staff of the Research Institute of Anthropology at the Lomonosov Moscow State University together with TsNIISHP, which is discussed in detail in the works of E.B. Koblyakova and T.N. Dunaevskaya [1,2].

To increase the percentage of sales of children's clothing, it is necessary to resolve the issue of proportionality of manufactured products, i.e. the correspondence of their sizes to the dimensional characteristics of children's figures. In this case, the values of subordinate dimensional characteristics are calculated using updated coefficients of the regression equation, determined on the basis of statistical processing of the results of anthropometric studies.

To test this hypothesis about the inconsistency of the dimensional typology developed by NIIA MSU in 1986, the modern dimensional characteristics of schoolchildren, a study was conducted to determine new statistical parameters, followed by a comparative analysis of the data [2].

The aim of the study is to study and analyze changes in the anthropometric parameters of school-age children in Uzbekistan to optimize the design and manufacture of clothing.

On the basis of the department KTSHI TITLP, a study was carried out to determine new statistical parameters, followed by a comparative analysis of the data. The collection of the necessary information for the anthropometric study was carried out by mass measurement of the child population in accordance with the standard measurement methodology MTILP [2]. The volume of the stochastic sample was more than 3000 people. The sample included children of all age groups: primary school age (6-11 years old), senior school age (12-14 years old), adolescents (15-18 years old) [3].

The program of mass measurement of the child population included 63 basic dimensional characteristics measured by the contact method. Dimensional characteristics were selected as a result of the analysis of the existing methods of designing children's products [4,5].

The anthropometric data obtained as a result of the measurement were subjected to mathematical processing. For each dimensional trait, the main statistical parameters were determined that characterize the size and variability of the trait in the sample, the degree and nature of the correlation dependence between the dimensional traits. The statistical processing of the measurement results was carried out using the professional package Mini tab., Excel 2007 [6].

Previous studies have established that the relationship between the anthropometric features of the figures of children is of a correlation or stochastic nature. More precisely, the correlation

between the two dimensional characteristics can be established using the regression equation [7]. The regression equation in this case has a linear dependence of the form: $y = kx + b$, where y is a subordinate feature, x is the main feature, k is a proportionality coefficient, b is an intercept.

The linear correlation coefficient can take values from -1 to $+1$. The tightness of the connection between the signs was assessed using the Chaddock scale [8]:

$0.1 < r(x, y) < 0.3$: weak;

$0.3 < r(x, y) < 0.5$: moderate;

$0.5 < r(x, y) < 0.7$: noticeable;

$0.7 < r(x, y) < 0.9$: high;

$0.9 < r(x, y) < 1$: very high.

Regression equations for determining the values of subordinate dimensional characteristics have been compiled. Table 1 shows comparable regression equations for the relationship of the investigated dimensional features with their correlation coefficients. When calculating, the chest circumference III of boys and girls of 11 years old was taken as the leading dimensional indicator.

TABLE 1 REGRESSION EQUATIONS FOR THE DETERMINATION OF SUBORDINATE RP IN BOYS AND GIRLS 11 YEARS OLD

Dimensional sign	Dimensional feature	Regression equation	
		Boys	Girls
Body length	T1	$P/T1 = 109 + 0,495$ $Or_{III}/T16$ $r = 0,558$	$P/T1 = 99,5 + 0,611$ $Or_{III}/T16$ $r = 0,474$
Waist circumference	T18	$O_T/T18 = - 2,08 + 0,942$ $Or_{III}/T16$ $r = 0,916$	$O_T/T18 = 12,5 + 0,717$ $Or_{III}/T16$ $r = 0,834$
Hip girth	T19	$O_6/T19 = 25,8 + 0,806$ $Or_{III}/T16$ $r = 0,839$	$O_6/T19 = 14,5 + 0,974$ $Or_{III}/T16$ $r = 0,840$
Back length to waist	T40	$\Delta_{Tc}/T40 = 31,7 + 0,0250$ $Or_{III}/T16$ $r = 0,501011$	$\Delta_{Tc}/T40 = 23,1 + 0,132$ $Or_{III}/T16$ $r = 0,404873$
The length of the arc of the upper torso through the point of the base of the neck from the side	T44	$M_{rT}/T44 = 48,2 + 0,294$ $Or_{III}/T16$ $r = 0,519312$	$M_{rT}/T44 = 43,0 + 0,336$ $Or_{III}/T16$ $r = 0,529528$
Back width	T47	$III_c/T47 = 29,7 + 0,0329$ $Or_{III}/T16$ $r = 0,746979$	$III_c/T47 = 11,8 + 0,262$ $Or_{III}/T16$ $r = 0,668837$

Chest width	T45	$\text{IIIr}/\text{T45} = 30,7 - 0,0267$ $\text{OrIII}/\text{T16}$ $r = 0,729807$	$\text{IIIr}/\text{T45} = 11,3 + 0,238$ $\text{OrIII}/\text{T16}$ $r = 0,634522$
Inside leg length	T27	$\text{Дн}/\text{T27} = 63,9 + 0,0022$ $\text{OrIII}/\text{T16}$ $r = 0,162305$	$\text{Дн}/\text{T27} = 45,9 + 0,311$ $\text{OrIII}/\text{T16}$ $r = 0,344569$
Distance from the point of the base of the neck from the side to the wrist girth line	T33	$\text{Дрзап}/\text{T33} = 43,0 + 0,277$ $\text{OrIII}/\text{T16}$ $r = 0,550132$	$\text{Дрзап}/\text{T33} = 39,1 + 0,325$ $\text{OrIII}/\text{T16}$ $r = 0,572877$

Having given the value of the girth of the chest, according to these regression equations, it is possible to calculate the values of subordinate dimensional characteristics, which are subsequently used in the design of children's clothing. The sizes of clothes, calculated according to the regression equations, characterize the parameters of the modern average-typical child's figure.

Analysis of the calculations showed that the correlation coefficient between chest girth and latitudinal features reaches a fairly large value. The correlation between the chest girth is most pronounced with the transverse parameters. At the same time, the correlation between longitudinal and girth characters is very insignificant (Table 1) [2]. Consequently, it can be argued that in boys and girls, the mathematical relationship between a pair of dimensional traits T16, T18 and T16, T19 is most significant, and between the dimensional traits T16 and T1 it is moderate and equal to 0.558 and 0.474. The correlation between T27 and T16 is weak and is equal to 0.162 in boys, 0.344 in girls.

A low degree of correlation between features oriented in different planes necessitates the selection of not one, but at least two leading features [2].

A comparative analysis of the values of dimensional characteristics, calculated using the obtained regression equations and the data of GOST [9,10], which showed the nature of the change in dimensional characteristics for the period between measurements in 1986 and the present, was carried out. An example of calculating subordinate characteristics by the value of Og3 for boys and girls of 11 years old is shown in Table 2.

TABLE 2 THE RESULTS OF CALCULATING THE VALUES OF THE DIMENSIONAL CHARACTERISTICS OF BOYS AND GIRLS OF 11 YEARS OLD ACCORDING TO THE OBTAINED REGRESSION EQUATIONS

Dimensional sign	dimensional feature	Value according to the new regression equation, cm		Values according to GOST 17917-86, 17916-86, cm		Deviations, cm	
		Boys	Girls	Boys	Girls	Boys	Girls
Body length	T1	143,8	142,5	140	140	+3,8	+2,5
Chest girth	T16	70,3	70,4	68	68	+2,3	+2,4

Waist circumference	T18	64,1	63,0	63	63	+1,1	0
Hip girth	T19	82,5	83,1	77,5	80,6	+5,0	+2,5
Back length to waist	T40	33,5	32,4	32,4	31,5	+1,1	+0,9
The length of the arc of the upper torso through the point of the base of the neck from the side	T44	68,9	66,7	67,9	66,3	+1,0	+0,4
Back width	T47	32,0	30,2	30,9	30,3	+1,1	-0,1
Chest width	T45	28,9	28,1	26,6	26,9	+2,3	+1,2
Inside leg length	T27	64,1	67,4	65,7	67,2	-1,6	+0,2
Distance from the point of the base of the neck from the side to the wrist girth line	T33	62,5	62,0	58,5	58,5	+4	+3,5

The graph characterizing the change in dimensional characteristics calculated by the regression equations and the average figure according to GOST data [8, 9], in the resulting sample, is shown in Fig. 1 and 2.

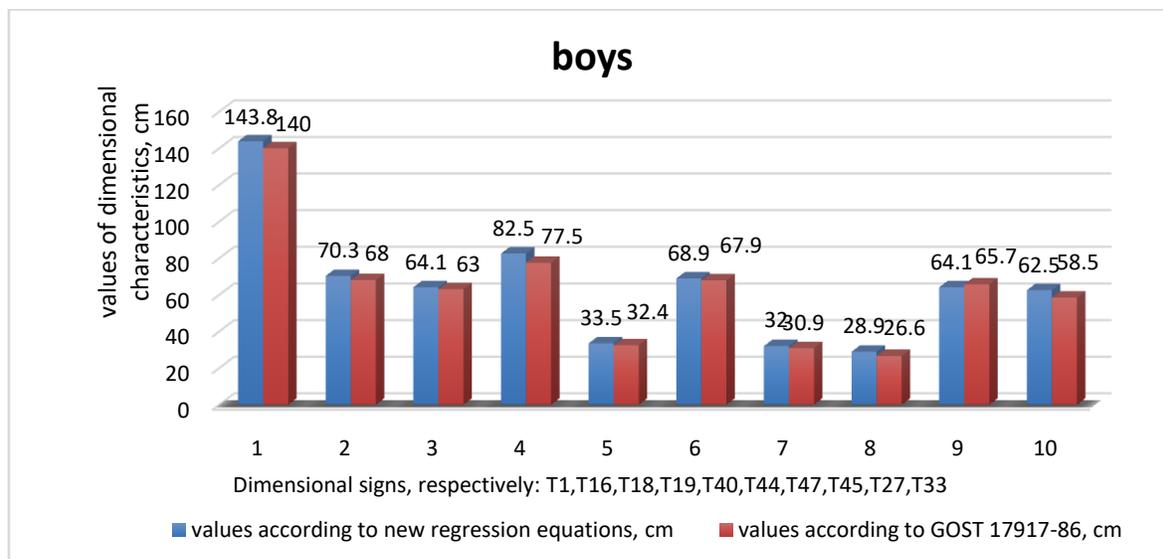

FIGURE 1. HISTOGRAM OF CHANGES IN THE SIZE CHARACTERISTICS OF 11-YEAR-OLD BOYS

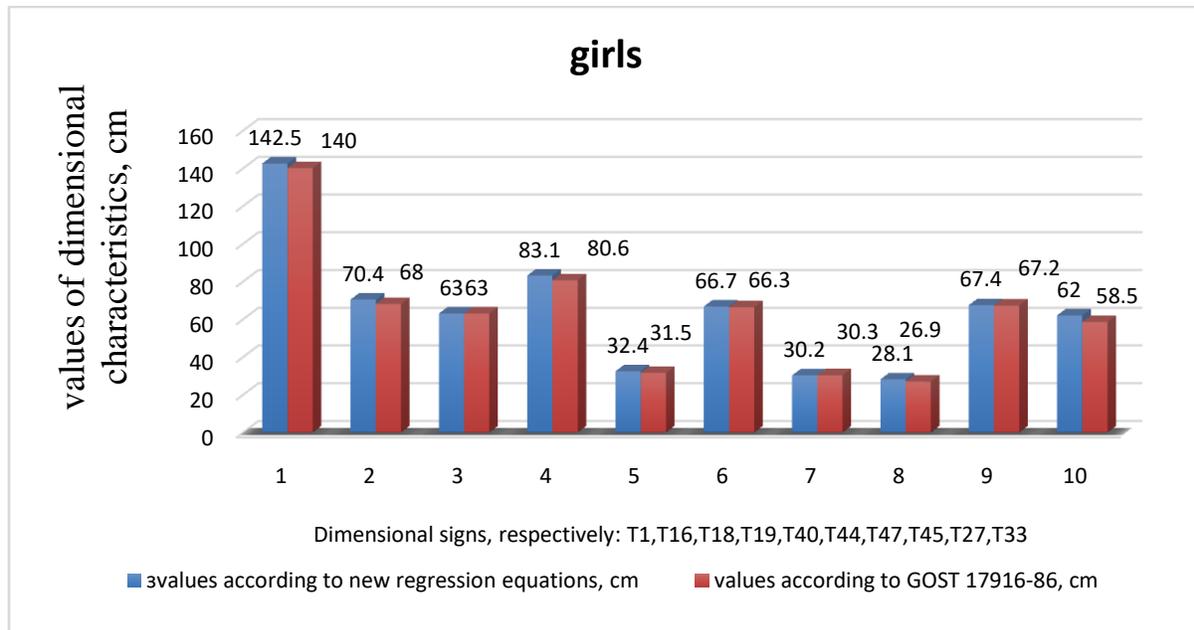

FIGURE 2. HISTOGRAM OF CHANGES IN THE SIZE CHARACTERISTICS OF GIRLS 11 YEARS OLD

Comparative analysis of the values of dimensional characteristics calculated by the regression equations showed that the size of the average figure has changed, while there is a general trend towards an increase in body length, hip girth, chest girth. In general, the obtained modern average typical children's figure of boys and girls with a chest girth of 70.3 and 70.4 differs from the dimensional characteristics according to GOST [9.10].

Based on the results of the study, it can be concluded that the dimensional characteristics of the modern children's average figure of boys and girls have changed, the girth of the chest, the girth of the waist and hips have increased, which may be associated with a change in the lifestyle of a modern person. The computerization of leisure, decreased physical activity, and a fast food regime have led to an increase in the overweight population, and, as a consequence, an increase in transverse dimensions.

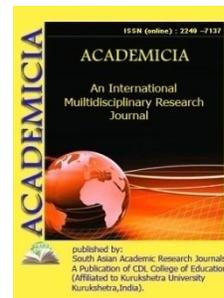

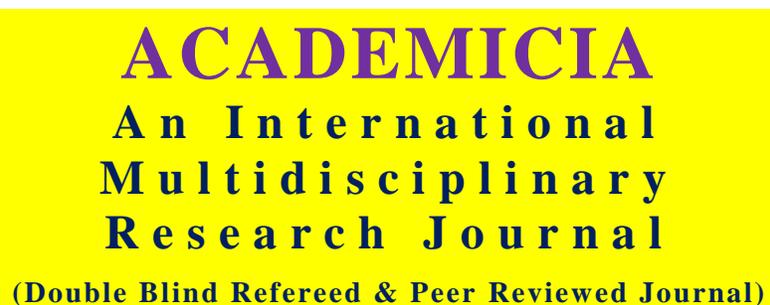

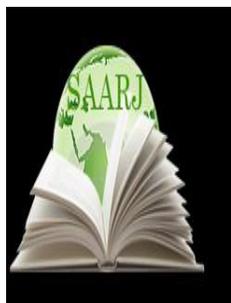

CONCLUSION

The obtained values of the correlation coefficients were compared according to the Student's test, according to which, with a probability of 0.95, it can be argued that the obtained equations are reliable and they can be applied when calculating the values of subordinate dimensional characteristics when developing a new dimensional typology.

IMPROVEMENT OF INTERNAL AUDIT METHODOLOGY IN INTERNATIONAL PRACTICE AND INTERNATIONAL AUDITING STANDARDS IN UZBEKISTAN

Khurshidjon Nazrullo ugli Abdullayev*

*Independent Researcher,
Tashkent Financial Institute,
UZBEKISTAN

Email id: abdullaev_xurshidjon@mail.ru

ABSTRACT

The article considered the fundamentals of improving international audit services and international auditing standards in international practice in Uzbekistan and the procedure for registering them based on the results, as well as using the methods of exploitative and deductive research conducted in accordance with international standards of internal audit. As a result of the study, recommendations were made and conclusions were drawn.

KEYWORDS: *Internal audit, audits, methodological basis for evaluating the effectiveness of internal audit, auditor qualification requirements.*

INTRODUCTION

In international practice, a lot of research is being done to improve and develop the methodology of internal audit and international standards of internal audit. These studies study the features of the use of international standards of internal audit in the activities of the internal audit service of business entities, compliance with the established requirements and the advantages of their implementation in the country. Analysis of the experience of developed countries and scientific achievements in the field shows that the harmonization of regulations governing internal audit in business entities in line with international requirements, improving the efficiency of the internal audit institution, the formation of an effective management system and attracting investors to reduce business risks is an important factor.

The large-scale reforms underway in the country require the development of theoretical and legal bases of internal audit, mechanisms for organizing internal audit services in accordance with international standards and methodological framework for assessing the effectiveness of internal

audit. One of the important tasks in the strategy of innovative development of the Republic of Uzbekistan is "the development of corporate law and the introduction of modern principles of corporate governance, taking into account international experience" ^[1].

LITERATURE REVIEW

We can see that the following research has been conducted on the issue of internal audit: BA Khasanov in his research focused on the computerization of the internal audit service ^[2].

In the scientific work of NF Karimov studied aspects of the organization of internal audit in commercial banks and the improvement of its methodology ^[3].

According to the Institute of Internal Auditors, "Internal audit is the activity of providing independent, impartial guarantees and advice aimed at improving the performance of an organization. Internal audit helps the organization to carry out its activities through a systematic and consistent approach to risk management, control and evaluation and improvement of the effectiveness of corporate governance processes" ^[4].

KB Akhmedjanov revealed some issues of improving the methodology of internal audit in business entities. Numerous literature and regulations in the field provide definitions and explanations for the concept of internal audit. KB Ahmadjanov describes internal audit as follows: "Internal audit is an independent system that provides objective guarantees and advice to improve the efficiency of financial and economic activities of business entities, internal audit is aimed at ensuring the accuracy of accounting data and creating an effective internal control system" ^[5].

In the course of scientific research, A. Turaev gave the author's definition of the concept of "internal audit" as follows: internal audit is a systematic and independent assessment of risk management, reliability and effectiveness of internal control systems, including corporate governance practices on the basis of generally accepted international and national standards described as an established activity ^[6].

In the work of SU Mekhmanov we can see that the issue of improving the methodology of internal audit in budget organizations is approached from the point of view of the budget system ^[7].

It should be noted that the above-mentioned research does not fully study the current role of internal audit, its planning, preparation of working papers, compilation of reports, improving the methodology of internal audit, the system of certification of internal auditors at the international level.

Research Methodology: Scientific methods of studying the processes of economic reality - experimental research, generalization, grouping, logical and comparative methods of analysis, abstract-logical thinking, comparative analysis, statistical analysis, prospective forecasting and other methods were used in the research work.

Analysis and Results:

In order to achieve the goal of ensuring the implementation of management decisions in the management of production activities of the enterprise, in order to ensure the uniformity

(unification) of the report of the internal audit service of business entities, the author developed a proposal to introduce a standard consolidated report.

In our opinion, it is necessary to adopt international standards of internal audit, which are widely used in international practice. Membership in the Institute of Internal Auditors through public organizations of Uzbekistan, the opportunity to use international standards of internal audit in our country.

In international practice, the standards of internal audit developed by the Institute of Internal Audit reflect the following criteria:

Quality description standards;

Activity standards;

Standards of practical application;

As a result of our research, the opening of a branch of the Institute of Internal Auditors in Uzbekistan will allow to use international standards of internal audit and expand the system of international certification of internal audit services and internal audit services.

The practical application of the internal audit standards we propose will further increase the efficiency of the internal audit service and help to make optimal management decisions. Ensures the timely implementation of the work of internal auditors and provides a basis for making positive investment decisions, depending on the effectiveness of the internal audit service of foreign investors.

The use of the results of the internal audit service by external auditors allows to reduce labor costs in the audit organization by reducing the time spent on the audit, as well as to obtain additional evidence based on the principle of sufficiency of audit evidence.

CONCLUSION

As a result of the organization of the internal audit service and the study of their activities, it was found that there are some shortcomings and deficiencies in the implementation of internal audit tasks in the management of business entities. In order to eliminate these shortcomings and prevent their recurrence in the practice of internal audit in our country, in our opinion, it is expedient to implement the international standard "Use of internal audit services", to strengthen internal audit as a form of activity.

In the preparation of the report of the internal audit service in business entities, it is important to correctly structure the sequence of stages of the process of its implementation, based on which its form was developed in the research work. Timely development of internal audit plan and program in the process of documentation, preparation of internal audit cost estimates, development of job descriptions for internal audit service staff, implementation of daily work processes, internal audit the preparation of the service report and its submission to the supervisory board will be carried out on a sequential basis.

The establishment of a branch of the Institute of Internal Audit on the basis of international experience in order to regulate the activities of internal audit in our country will serve to improve the quality of internal audit services. Thanks to the opening of a branch of the Institute of Internal Audit in Uzbekistan, employees of the internal audit service will receive a three-stage

certificate of "Certified Internal Auditor (CIA)" at the international level and improve the system of certification of internal auditors through public organizations of internal auditors.

The standard form of the "Internal Audit Service Report" proposed for the registration of the results of the work of the internal audit service in business entities will ensure the uniformity of the consolidated report and improve the Regulation "On Internal Audit Service in Enterprises."

A system of performance indicators of the Internal Audit Service for business entities and a methodology for determining it have been developed and recommended for practical use. This will further increase the ability of the supervisory board to evaluate and monitor the performance of internal auditors.

Internal audit standards allow to develop a basic regulatory document for the development of internal audit in the country. As a result, the widespread use of internal audit standards by internal auditors allows for timely resolution of practical problems.

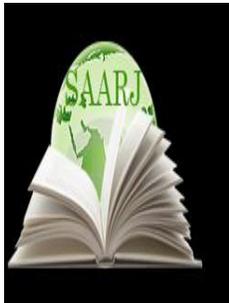

The implementation of scientific proposals and practical recommendations developed in the research will serve to improve the internal audit of business entities and the effective implementation of the tasks set out in the Strategy of Innovative Development of the Republic of Uzbekistan for 2019-2021.

MULTIMEDIA IN INSTRUCTIONAL DESIGN: IMPLICATION FOR EFFECTIVE INSTRUCTIONAL PROCESS

Eunice C. Victor-Ishikaku*

*PhD,

Department of Curriculum Studies and Instructional Technology,
 Ignatius Ajuru University of Education Rumuolumeni,
 Port Harcourt Rivers State, NIGERIA

ABSTRACT

Instructional Design is a key process for planning learning content to achieve effective learning. Incorporating multimedia in learning content planning and delivery is a necessity to this effect. This paper therefore looks at what Instructional Design is, how it can be carried out using the ADDIE model. It also looks at how multimedia can be incorporated into learning content design; the tools needed and the responsibility of the Instructional Designs to achieve this goal. The benefits of using multimedia for Instructional Design were also discussed hence its support for application in learning content planning and delivery. This paper concludes that the use of multimedia in Instructional Design is very necessary to meet the need of the diverse learners in the present day learning environment. This paper recommends that education providers should provide the needed multimedia facilities, content developers should be regularly sent on fresher courses to be current in lesson design using multimedia, school environment should be made multimedia compliant to meet the needs of the technology driven era.

KEYWORDS: *Multimedia, Instructional design, Instructional process, Implication.*

INTRODUCTION

Media are devices used in communication and information sharing. They could be audio, visual or audio visual. They are audio when they appeal only to the sense of hearing; information is received by hearing or listening to it. They are visuals when they appeal only to the sense of sight; the message is seen and audio-visual when they appeal to both the sense of sight and hearing at the same time; seeing and also hearing the information (Omieibi-Davids, 2005). They can be physical objects, still pictures, slides, transparencies, posters, charts or written words

(text). Media occur in different colours, shapes and sizes; hence everything on earth can serve as an instructional media. In communicating and sharing information sometimes, more than one means of communication is used at a particular time to get information across to the intended audience. This is very necessary in the instructional process so as to make the learning content clearer to the learner. Applying this is what is called multimedia. Multimedia is the use of several media carrying the same information using different context to deliver the learning content in a lesson.

Instructional process is about teaching and learning; passing the learning content efficiently in such a way that the learner will understand exactly what the teacher wants to pass across exactly the way it is needed. The instructional process is all about communication; the ability to effectively communicate the learning content to the learner (Victor-Ishikaku, 2014). This requires the use of media which are instrument for enhancing communication and information transfer, hence the need for media in instruction. Instructional media therefore are multimedia channels through which information are transmitted for instructional purposes.

Studies have shown that the learner is the focus of the instructional process. This has given rise to varied teaching-learning modes and channels that has made learning experience more engaging, meaningful and effective. It has made room for the use of ample instructional media and resources hence in the present dispensation; multimedia is a common term in the teaching-learning palace. The emergence of Information and Communication Technology (ICT) has given great boost to the use of media in teaching and learning. These myriad of media has flooded the classroom such that the question of which is most appropriate has arisen. This is where designing learning content and instruction comes in.

Designing learning content or Instructional design is about effectively organizing the learning content and instructional media in such a way that it will suit the needs of the learner. A beautiful learning content and a myriad of electronic devices cannot metamorphose to applicable knowledge and skill except it is well organized and planned to meet the learner characteristics and needs. It is on this premise that this paper looks at how learning content could be designed using the appropriate multimedia so as to meet the need of diverse learners. Studies has shown that no two learners are exactly the same in learning needs, assimilation, processing of information and rate of recall, hence the need to design instruction to accommodate all the varied needs of the learners in a diverse classroom (Arshavskiy, 2013). Instructional design is about planning and structuring learning content to suit the learning need of learners (Arshavskiy, 2013). To plan learning content for a group of learners involves putting the learning content together in such a way that it will suit and help the learners to achieve the instructional objective.

Concept Definition

Multimedia

The concept multimedia has two root words; 'multi' and 'media'. Multi meaning many or several and media meaning channel through something can be transmitted or sends middle. It means using several channels of communication to connect the sender and the receiver. It is about transmitting information from one person/place to another (Singh, 2012). It combines all elements of communication such as graphics, text and animations to make information effective and understandable.

Multimedia is the use of a combination of different electronic devices to deliver information in an interactive manner. It involves using a variety of media to deliver a learning content in different context in such a manner that the user interacts with it in various ways. The learning content could be presented with the use of a computer, multimedia projector or some other telecommunication device like a smartphone. They include text (written words), audio, still images like pictures, animations and video (moving images) (Vaughan, 1993; Pun, 2013). To Mayer (2014), multimedia is simply the presentation of both words and images with a corresponding verbal input to support learners learning of a concept. In order for the electronically delivered combination of media to be said to be multimedia, it has to be one that the user can access interactively. This means that the user should be able to navigate, interact, create and communicate with it.

Multimedia include anything a teacher uses in the course of teaching to make the learners to understand and assimilate the concepts. Multimedia involves using varied types of media conveniently in lesson delivery (Vaughan, 1993). The reason for this is to meet the varied needs and individual differences amongst the learners. Multimedia generally simply means using computer information to represent through different means as graphics, audio, images, video and animation along with conventional media. Components of a multimedia system are;

- Capture devices such as video cameras, video recorder, audio microphones, 3D input devices, tactile sensors, graphic tablets, and keyboards.
- storage devices such as hard disk, CD-ROMS, and DVD
- Communication networks such as internet, ATM, intranets, token ringetc.
- Computer system like multimedia desktop machines, workstations, DSP hardware.
- Display devices like colour printers, HDTV, SVGA, and CD-quality speakers (Marshall, 2001).

Different means through which multimedia could be used are video conferencing, distributed lectures for higher institutions, work environment, world wide web, electronic magazines, newspapers and books, interactive TV, home shopping, online reference works.

Multimedia is a learning content that uses varied content forms such as text, images, audio, video and interactive content. It could be recorded and played later or live performance. It means it could be used for both synchronous and asynchronous learning delivery. Vaughan (1993) defined it as the combination of sound, text, images, animations and video delivered through the computer. It becomes interactive multimedia when the user controls the presentation of the content and when it involves the user having the access to navigate through the content, it is called hypermedia.

Instructional Design

Instruction is a human undertaking whose purpose is to help people learn. It consists of a set of events that affect learners in such a way that there is a change in their behaviour as a result of the activities they are exposed to. Some of the activities that constitute instruction are teaching, reading a book, watching television and learning from the computer. While learning can take place without instruction, the effect of instruction on learning is often beneficial and easy to

observe. This is because it is usually deliberately planned to achieve various objectives. It is communication deliberately planned to broaden the knowledge of the learner.

Whatever way we decide to define instruction, there are several basic factors involved in producing effective instruction. These factors must work together to produce instruction that is effective. The factors are the following:

- a. The learner whose knowledge is being broadened
- b. The teacher or instructor who plans the information or has to make use of it
- c. The method used to pass on the information
- d. The media which is the means through which the information is passed on to the learner.

When instruction is deliberately planned to achieve a particular purpose, it is called instructional design or instructional systems design. Instructional design is the practice of creating instructional experiences which make the acquisition of knowledge and skills more efficient, effective and appealing (Merrill, Drake, Lacy and Pratt, 1996). It is the practice of arranging content and media to facilitate learning. The process involves determining the current state of the learners' understanding and needs, defining the end goals of the instruction and creating a media based intervention to assist instruction based on some pedagogically tested theories of learning (Gagne and Briggs, 1989). It is the systematic manner of designing instruction according to designed goal taking into cognizance instructional theories and learning theories. It involves identifying the learning needs, objectives and designing instruction and its mode of delivery to meet the identified needs (Reiser & Dempsey, 2007). It makes for effective and efficient learning experiences and processes.

The purpose of instructional design is to create and deliver a learning product which is an instructional material for businesses, school system and government organisation (Gardener, 2011). Instructional design is not carried out by only one person. Designing instruction in the educational system is a complex process involving many people. While in the classroom it can be carried out by a single teacher or a small group of people including the teacher and students, for the entire educational system it involves a variety of specialised people and agencies. Sometimes it is a joint effort of schools, universities, industry, book publishers, software programmers and developers, and other concerned agencies (Gagne and Briggs, 1989).

Theoretical Framework

The cognitive theory of multimedia (2009) is the bases for this work. The theory states that people assimilate more when concepts are presented in two forms or channels; in words and images than through one channel. It is based on cognitive learning principles. The theory focuses on the sense organs which the multimedia appeals to which are the audio, visual and audio-visual. It is based on how the human mind works when it comes to learning. That people learn through multimedia from two channels is based on three assumptions;

- i. Processing information is basically through two channels; visual and audio (dual-coding theory)
- ii. Each channel has limited capacity
- iii. Learning is an active process involving some basic steps which are filtering, selecting,

organizing and integrating information on prior-knowledge.

It outlined five cognitive processes in multimedia learning as;

- Selection of relevant of word for the learning content
- Selection of relevant images and picture for the graphics
- Organization of the selected words into coherent verbal representation
- Organization of the selected images into coherent pictorial representation
- Integration of the verbal and pictorial representations and prior knowledge.

What this implies is that for designing instruction using multimedia, the process of information processing must be put into cognizance so that the instruction will follow the right specification so as to achieve the instructional objectives. Relating this to the ADDIE model, it means that the instructional designer must consider the five steps of cognitive processing in every stage of the model.

Instructional Design Models

Instructional design uses various steps and phases in planning and designing instruction (Gardner 2011). These steps and phases are known as instructional design models. Instructional models are visual or verbal representations of the instructional design process that are used to guide and complete the design in many training and educational settings. They are the guidelines by which instructional designers create instruction. The essence of these models is the following:

1. Present complex information in a simpler way
2. Describe the functions, components and relationships between the components of a system
3. Identify what is generic and applicable across multiple context.

ADDIE Model

The ADDIE model takes its name from the five phases that make up the model. They are the following; Analysis, Design, Develop, Implement, and Evaluate.

Analysis: This is the first stage of the ADDIE model. It deals with the analysis of the needs of the learner and the instructional setting. This stage is used to do the following:

- a. Clarify instructional problems and learners' needs
- b. Identify goals and objectives.
- c. Determining the existing knowledge of the learner and other relevant characteristics.
- d. Consider the learning constraints, learning environment, task delivery options.
- e. Consider the time-line of project completion.

Design: This stage deals with the laying down of specifications for an effective, efficient and relevant learning environment. This stage involves stating a logical and orderly method of identifying, developing and evaluating planned strategies targeted at attaining the project goals, and ensuring that each element of the instructional design plan is executed with attention to details. This stage deals with the following activities:

- a. Specify learning objectives
-

- b. Specify assessment instruments, exercise, content
- c. Plan lesson and select media
- d. Create prototype

Development: The actual creation or production of the content and learning material based on the activities of the design stage occurs here. This stage involves the actual making of the instructional material, including instructor and instruction guide (Gustafson and Branch, 2002). Activities at the stage include the following:

- a. Creation of Storyboard
- b. Content is written and graphics are designed
- c. Programmers work to develop and/or integrate technologies if learner is involved
- d. Testers perform debugging procedure
- e. Project is reviewed and revised to any feedback received

Implementation: This is the stage of the model where the plan is put in action and a procedure for training the facilitators and the learners is developed. Here the instruction which is developed is actually carried out. This phase is also used to ensure that all books, equipment, tools, software and websites are functional.

Evaluation: This stage involves assessing the outcome and effect of the learning package planned and developed. There are two parts of evaluation in the ADDIE model. They are the formative and summative evaluation. The formative evaluation is to find out if the activities of the various stages are actually performing the functions they are supposed to. Such evaluation is present in each stage of the model. Summative evaluation comes up at the end of the process. It is used to test the achievement of the learning outcomes specified and for getting feedback about the design from the users. Evaluation is not produced and stored up. It is carried out so that it can be used to make the learning package effective. The evaluation stage ends in revision. Revision as a result of formative and summative evaluation of any stage of the design is made as necessary.

Principles of Using Multimedia in Instructional Design

The fundamental principles guiding the use of multimedia in instructional design are the following:

- a. Simple to complex: In using multimedia in instruction simple concepts should precede complex ones to make sure the learners are not overwhelmed with the information.
- b. Less is more: Learners learn better when instruction is not cluttered with too many words, pictures, sound or video.
- c. Only two or three multimedia elements at a time: There are a lot of elements that can be used in multimedia designs. These include text, graphics, audio, animations and video. This principle states, however, that all the various elements should not be used at the same time. This will be too much information or too many modes used at the same time.
- d. Pictures better than words alone: It is better to include pictures and some other graphic,

animation or video than to have only text or written words. Words do not illustrate things, pictures do. People learn more from words and pictures than from words alone.

- e. Words and pictures should correspond. It is important to present word with pictures but it is more important that those pictures should explain the words spoken to the understanding of the learners. To be able to do this the pictures and the words they explain should be close together. The pictures and the words that explain them should be presented at the same time or close to each other.
- f. Self-paced instruction: Multimedia instruction should be presented in a way that the learner can use it at his own pace.
- g. Conversational audio tunes: Audio narrations should be made in conversational tunes rather than in formal tunes. It should also be made in friendly human voice rather than a machine voice. Doing this puts learners at ease, increases their attention and inspires them to listen and learn.

Responsibilities of Instructional Designers

Irrespective of the type of instructional design model used in the instructional design process, the designer is likely to carry out the following responsibilities (Agarwal, 2016);

- a. Planning and Analysis: The instructional designer carries out needs assessment of the target demographic He studies the study environment to have a concrete understanding of the expectations of the target population from the course. He sets learning goals that have to be achieved and determines their comfort level with a variety of technologies.
- b. Design and Structure: The designer determines what he would include in the programme to ensure that the learners remain focused and engaged, and there is a minimal attrition rate. He also has to ensure that the flow of information is smooth and sequential without losing context, moving in an uncluttered manner that caters effectively to a wide variety of learners.
- c. Collaboration with Subject Matter Experts: The designer must be in close collaboration with the respective Subject matter experts. In addition to curating the most relevant content, they have to collaborate to devise modes of interaction and assessment to ensure optimum efficacy of the e Learning course.
- d. Implementation and Management: The purpose of designing instruction is to have it used in the learning situation. To use it effectively the designer maintains a relationship with users of the product with the least amount of friction. This requires communication of all kinds. This means that the designer has to write, speak, listen, watch, present information of all kinds.
- e. Use Multimedia Tools: The designer has to ensure that the most appropriate for learning are used for the content. Since instruction in the school system is planned for people with different learning styles and modes, it is necessary to use a variety of modes that will appeal to everyone. The use of multimedia provides this variety for learners

Benefits of Multimedia in Instructional Design

Multimedia has numerous benefits for the design of instruction. Some of the benefits are as following:

- Multimedia provides a technology based constructivist learning environment that enables students to solve problems by means of self-exploration, collaboration and active participation.
- The interactive nature of multimedia provides the room to enhance traditional ‘chalk-and-talk’ method of teaching with more flexibility to learners to adapt to individual learning strategies (Malik and Agarwal, 2012).
- The use of multimedia in instruction brings the learning content to life. It helps learners visualize what they are taught. This aids in developing an association between the learner and the knowledge.
- Multimedia in instruction gives the learners a visual input with a corresponding verbal input (Mayer, 2014). This enables the learner to build a more complete a picture of the concept and content presented. This is because multimedia involves the presentation of both audio and visual images to support learning of a concept (Mayer,2011).
- Multimedia keeps learners engaged and motivated to learn. This is achieved with the help of the audio sound that keeps learners focused on the visuals or animations on the screen. This enhances the learning process and maximises the impact of the training programme.
- Conversational audio tunes: Audio narrations should be made in conversational tunes rather than in formal tunes. It should also be made in friendly human voice rather than a machine voice. Doing this puts learners at ease, increases their attention and inspires them to listen and learn (Majumdar, 2016; Roberts,2016).
- Multimedia is effective in working with diverse populations and diverse learning needs (Clark and Mayer, 2011). The combination of various modes of communication makes a robust technique that can circumvent challenges that apply to learners with differing learning styles, strengths and weaknesses. It applies to learners that may be strong in processing visual information all in the same lesson (Azime and Mousavipour,2014).
- It enables learners to be cognitively active (Clark and Mayer, 2011; Mayer, 2014). The interactive and collaborative nature means that learners build their own significant connections and draw conclusions about their environment and link present knowledge with previous information.
- The use of multimedia in instruction places the individual learner closer to the centre of the learning process (Andresen and van den Brink, 2013). This is because learning is student centred and there are flexible schedules.
- It fosters active and critical learning because it arms the learners with appropriate individualized strategies on why and how to share knowledge collaboratively with others in a world where most products are the result of teamwork (Andresen and van den Brink, 2013).

- Multimedia changes the role of the teacher from an authority and primary source of knowledge to that of a facilitator or conductor of the learning process (Pun, 2013 and Izquierdo, Simaid, Garza and Guadalupe, 2015).
- It facilitates mastering basic skills of a student by means of drill and practice.

Generally multimedia gives learners opportunities to acquire knowledge and skills through different channels. This enhances teaching and learning using different medium and platforms. It creates opportunities to learn at their own pace, according to their preferred learning mode and for the teacher to meet the need of individual learners. It provides a hands-on learning experience as the learner play with the technologies. It enables learning content to be tailored to suit individual learner as programme learning. Specifically it enhances learning effectiveness, enhances knowledge and skill acquisition, creates opportunities to engage the learner in learning content and so make for deeper and effective internalization of concept (www.nwlink.com, 2015).

CONCLUSION

Multimedia involves the use of varied learning content forms in form of text, pictures, audio, video and interaction to plan and deliver learning content. It is suitable for both synchronous and asynchronous modes of learning. It therefore affords the learner opportunities to acquire knowledge and skills through different media, hence creating room for the learner to learn at their own pace, according to their preferred learning modes and for the teacher to meet the need of the individual learner. This makes for better learning in diverse ways, hands on learning experiences, learning tailored to suit individual learners timing, convenience, location and mode.

Recommendation

Based on the discuss the paper suggest that;

- Learning content developers should incorporate multimedia for enhanced learning
- Learning content developers should be sent on refresher courses to be abreast that the new trend in content deviant in the use of multimedia
- Education stakeholder and providers should provide the multimedia facilities for use in lesson delivery and development.
- The school environment should be multimedia compliant to produce 21st century compliant graduates who will be relevant in the technology era.

FEATURES OF THE GEOLOGICAL STRUCTURE AND PETROLEUM POTENTIAL OF JURASSIC DEPOSITS OF THE SUDOCH TROUGH

Abdurakhmanov Bekhzod Abdurasul oglu*

ABSTRACT

The article discusses the geological structure and prospects of the oil and gas potential of the Jurassic deposits of the Sudoch Trough, as well as issues related to neotectonic processes that were developed at the inversion stage of the geological development of this territory. The geological substantiation of the location of hydrocarbon accumulations and their confinement to certain tectonic elements is given.

KEYWORDS: *Region, Trough, Fault, Inversion, Hydrocarbon, Reservoir, Horizon, Zones, Structure, Deposits.*

INTRODUCTION

The study area is located within the North Ustyurt depression, where tectonic elements of the second-order are distinguished: Samskiy and Kosbulakskiy troughs, Aktumsuk system of dislocations, Barsakelmesskiy and Sudoch troughs, as well as Kuanysh-Koskalinskiy and Berdakhskiy swells and tectonic elements of a lower level complicating them [1-7]. The location of hydrocarbon (HC) accumulations in the Jurassic sediments of the Ustyurt region and their confinement to certain tectonic elements that underwent an inversion stage in geological development (in the Neogene- Quaternary), today is one of the main features in the search for HC accumulations in this area [8-13].

MATERIALS AND METHODS

Among the identified tectonic elements, the Sudochy Trough is a young negative structure, apparently formed during the Alpine phase of tectogenesis. From the north, south and east, the trough is limited by zones of the elevated basement - the Aktumsuk and Central Ustyurt dislocation systems and the Takhtakair swell. In the east, the Kuanysh-Koskalinsky swell

separates the Sudochy trough from the Barsakelmesky. In the gravitational field, the deflection is expressed by the maximum gravity, oriented in the northwest direction [14-19]. The magnetic field within the deflection is also characterized by positive values of strength. Thus, in this area, the nature of the gravitational and magnetic fields does not reflect the relief of the basement and, apparently, is largely due to the internal structure of the Paleozoic formations. In zones of manifested reversals, the thickness of pre-Jurassic and Lower Jurassic deposits increases sharply, and Paleozoic rocks (possibly attributed to the basement) sink to a considerable depth and form narrow graben-like troughs reaching depths of 7-8 km [20-27]]. This kind of inversion structures include (Fig. 1):

- Kuanysh-Koskalin sky swell with isolated areas of inversion - Akchalak, Zap. Barsakelmes, Alambek, Kuanysh, where HC deposits are confined to the Lower-Middle and Upper Jurassic sandy reservoirs (Akchalak, Kokchalak, Zap. Barsakelmes, Saykhelmes, Kuanysh);
- Sudochy trough, where the Urga, Dali, Aral fields were discovered with deposits confined to sandy reservoirs of the Middle and Upper Jurassic, as well as Aralik with gas deposits in the sandy horizon of the Lower Jurassic.
- Berdakhsky shaft, where hydrocarbon deposits (Shagyrylyk, Uchsay, East Berdakh, Berdakh, North. Berdakh, Surgil, North. Aral, Inam, Arslan) are mainly associated with the Middle-Upper Jurassic reservoirs;
- The Takhtakair swell, in which a hydrocarbon deposit was discovered in reservoirs of the Middle and Upper Jurassic (Shege field), and with the Arka- Kungrad structure, where a parametric well was drilled with a depth of 4705 m with an exposed thickness of the Jurassic deposits - 4272 m.

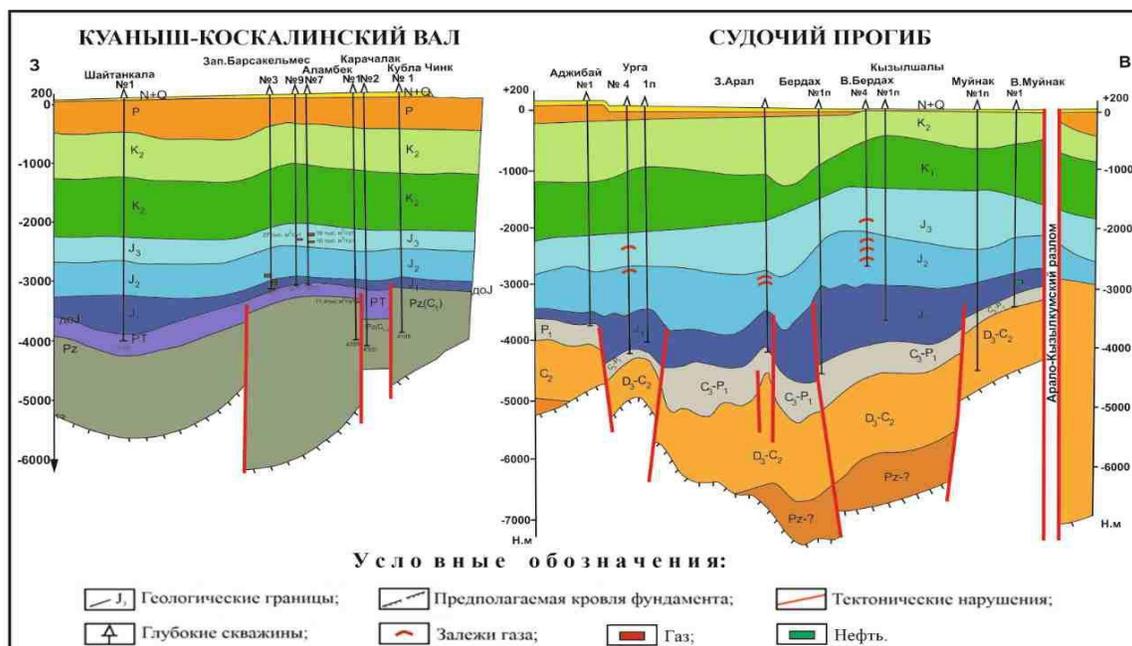

FIGURE: 1. GEOLOGICAL SECTION OF THE KUANYSH-KOSKALINSKY SWELL, SUDOCHY TROUGH AND ADJACENT TERRITORIES (BASED ON MATERIALS OF M.G. YULDASHEVA), 2021

Also, the promising areas can include structures confined to the sides of large troughs and being, as it were, "hanging" over the troughs. Such objects include the Urga field, with deposits associated with the Upper Jurassic reservoirs and Kuanysh, with a deposit in the "Kuanysh" horizon (sandstones located in the Lower Jurassic) of the study area. Thus, within the Surgil deposit, a "narrow graben" was revealed in pre-Jurassic sediments. Increased thickness of Paleozoic sediments is observed here, exceeding the thickness of the sedimentary cover. The deepest mark of the supposed basement roof is about 8

km [3-11].

In the meridional direction, the contours of this graben (a possible source of gas generation) extend from Arka-Kungrad to Kabanbai. A large swell is isolated on the top of the Upper Jurassic deposits. The section is represented by monotonously alternating sandstones and mudstones with a predominance of the latter, which is typical for troughs with a long and inherited development regime. The exposed thickness of the Jurassic deposits in the southern part of this zone (Arka-Kungrad) is 4272 m, in the central (Berdy) - about 2000 m, in the northern (Northern Urga) - 2125 m. An analysis of the placement of prospecting and exploration wells in the fields, in particular - Surgil, Aral, shows that the most promising among them (in terms of productivity) are wells located in the contour of the Paleozoic graben and near large faults [21-29]. Within the Vos Berdakh deposit, judging by the geological structure of the pre-Jurassic complex of rocks, there is a deflection (the depth of immersion of the assumed top of the basement is up to 7.0 km), and uplift is recorded here along with the Jurassic and Cretaceous deposits. Within this area, there are increased thicknesses of Paleozoic rock complexes, and in them, there are anticlinal bends (see Fig. 1). The next zone, where the inversion occurred, is located within the Kuanysh-Koskalinsky swell with a depth of submersion of the basement in some areas - up to 6.0 km. Here, along the top of the Permian-Triassic, a certain rise is observed, more contrasting along the top of the Jurassic and Cretaceous deposits. Within this zone, there are also deposits such as - Zap. Barsakelmes, Karachalak, Kokchalak, Akchalak, Saykhu, Tillali, Beskala. Gas inflows were obtained in the Alambek and Chibiny areas. Such areas are usually limited by tectonic faults and are extended along faults. In such areas, the wedging out of the Lower-Middle Jurassic and pre-Jurassic sedimentary formations occurs; they represent the areas of the junction of troughs and protrusions. It should also be noted that the rocks of the intermediate structural stage (Permian-Triassic) and sedimentary strata - in general, within the inversion zones, will be complicated by a series of faults that cut the basement to the Lower Middle Jurassic, and sometimes to the Upper Jurassic sediments, along which significant movements of mountain masses took place and deep fluids [1-5].

Probably, faults played a certain role in the formation of hydrocarbon deposits in the Jurassic strata. In some cases, they served as pathways for HC migration from the lower sediments to the overlying ones, in others - as a screen.

CONCLUSION

Common to these areas is a decrease up section in the degree of dislocation and inclination angles of rock complexes of different ages, as well as minimal disturbance of the crystal parts of uplifts by tectonic faults. Thus, it becomes obvious that the factor of the presence of deep troughs under anticlinal traps developed in the Mesozoic-Cenozoic period plays a positive role in the

formation of hydrocarbon deposits, and therefore the search for anticlinal traps in Mesozoic sediments in synclinal zones along the basement deserves attention in terms of studying.

ABSTRACT

The use of 3D technology in chemistry education, 3D printing, 3D printing objects for three-dimensional graphics, three-dimensional modeling and chemistry education, the widespread use of 3D printing in chemistry education there are many examples of how whole molecules or crystal structures can be shown in 3D printing, and this allows students to show the true structure of the molecules and compounds being studied. The approach to the use of 3D printing in chemistry, 3D printing, easy to use and convenient for teachers, the use of many common tools in chemistry education, namely to create molecular building kits, in the creation of virtual reality the formation of information technology without computer graphics, real-time mode and programming technologies, and the use of computer graphics from OpenGL, Direct3D, Java3D, and VRML libraries, and programming from C ++, Perl, Java, and Python.

KEYWORDS: *Virtual Being, Immersiveness, Visualization Interactivity, 3D Technology, Simulators, Panorama, Panoramic Images, Motivation.*

INTRODUCTION

Advances in science and technology and information technology have made it possible to solve a wide range of new problems facing humanity.

On August 12 this year, the President signed a decree "On measures to improve the quality of continuing education and scientific efficiency in the field of chemistry and biology." Improving the quality of education and the effectiveness of science has been identified as a priority.

The widespread use of information and communication technologies in education is a global trend. We've all heard about concepts like 3D image, three-dimensional graphics, and three-dimensional modeling that are all new to us today. If we look at the modern film industry, architectural design and even the field of education, we can observe real processes through various 3D special effects. Every year, high technology penetrates deeper into the daily life of society. Multimedia, interactive, mobile and 3D technologies enrich the digital world with new types of communication and have become a virtual environment and virtual familiarity for modern students.

Analysis of the relevant literature. Today, multimedia equipment and telecommunication technologies are widely used in education. At the same time, the high speed of development of modern information and communication technologies and, accordingly, the short life of the equipment pose new challenges in attracting and retaining students' attention to the learning process. They meet all the requirements and have great potential. The current trend in educational technology is 3D technology [1].

In the Commonwealth of Independent States, D.G. Seychanova, A.B. Belskiy, I.G. Mayorov, R. Bryant, A. Edmunt, N. Ali, S. Ullah, A. Alam, I. Rabbilar on the introduction of virtual technologies in the field of education in foreign countries, the creation of a virtual chemistry laboratory, the introduction of 3D technologies, ways to increase the effectiveness of teaching using various technical means, classification of pedagogical programming tools, problems of computerization of teaching, in particular, modeling of chemical processes and events, use of e-learning tools in computerization of chemical experiments.

Research methodology 3D technologies in education allow you to diversify lessons and lectures, effectively organize the learning process, use 3D content in the classroom to visually explain the curriculum to students, on the topic studied during the lesson. "visualizes" and allows you to move from the whole structure to its individual elements, from complex to simple and vice versa. The interactive content of chemistry education in secondary schools includes: PISA tests, 3D videos, simulations, virtual labs, interactive lessons, games, as well as texts and pictures.

Advantages of using 3D technology:

- Equips the teacher with high quality teaching materials and thus saves time in explaining difficult concepts.
- Visualizing "difficult" topics in the school curriculum helps students better understand the material being studied.
- The introduction of 3D (three-dimensional models) processes and objects into traditional teaching methods brings innovation to the "regular" learning process, increasing learning motivation.
- Helps to systematize knowledge.
- Facilitates the assimilation of additional information that has a positive impact on test and exam results.

3D users have the opportunity to study in detail the external and internal properties of stereoscopic models, as well as to travel around the world of chemical element atoms, molecules or organic chemistry, to conduct chemical experiments or to enter the ongoing reaction process

The removal of external conditions for learning, as well as the installation, allows for a deeper understanding of the process. Interactivity is an important teaching method because it is very difficult to imagine the motion, interaction, and chemical processes of molecules in chemistry [3].

In the creation of virtual reality, information technology can not be formed without computer graphics, real-time mode and programming technology. OpenGL, Direct3D, Java3D, and VRML libraries of computer graphics are currently used, and C ++, Perl, Java, and Python are used for programming.

The virtual being exists objectively, that is, in the computer, not in the human brain.

In chemistry, 3D technology is used to make molecular models, DNA strands to build an electric charge or atom.

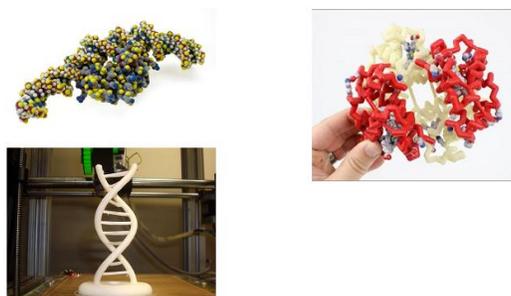

FIGURE 1 PRINTING A 3D MODEL IN CHEMISTRY

3D printing is also widely used in the field of chemistry education in the world. The most common use of 3D model printing in chemistry is shown in the second line of Figure 1, which shows the printing of images of electronic orbitals [5]. These models are designed to show the orbital shapes of electrons separately from the atom. With the development of software, it is now possible to fully model any molecule within a particular software package. As can be seen from Table 1, the model was drawn in 2D space and then converted to a 3D model in the same software. These models can then be exported to a file that 3D printers can read and print.

The lower half of Figure 2 shows the same molecular model converted to an STL file that a 3D printer can understand [2].

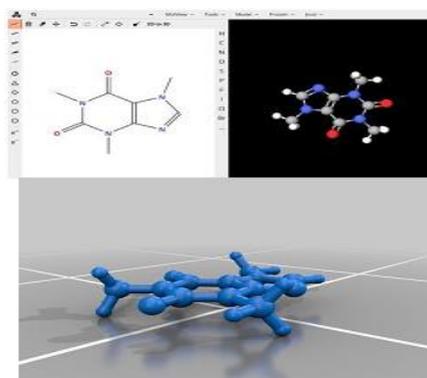

FIGURE 2 A STL FILE THAT A 3D PRINTER CAN UNDERSTAND.

The widespread use of 3D printing in chemistry education is the 3D printing of whole molecules or crystal structures. It shows students the true structure of the molecules and compounds they work with. There are many examples of this [10].

Approach to the use of chemistry in 3D printing:

In some universities, chemistry teachers use 3D printing to create entire surfaces of protein structures so that their students can visualize how proteins interact with each other. In material science and chemistry classes at other universities, teachers had 3D printed crystallographic unit cells to give to students. Applications such as Chimera to printed STL files are the only program that converts scientific molecular formats to printed STL files by obtaining an intuitive understanding of what crystal structures look like and what influences the formation of this structure. The process and results of such conversion are presented in Table 1. Teachers have many resources to help create complete molecules [4]. They can use programs that export the properties of physical molecules, such as MolView, or find pre-prepared common molecules, structures, and compounds in a database, such as 3D printing, to create molecules, as in Table 1.

3D printing has also been used to create many common tools for teaching chemistry, namely molecular construction kits, which are easily accessible and customizable for teachers [9].

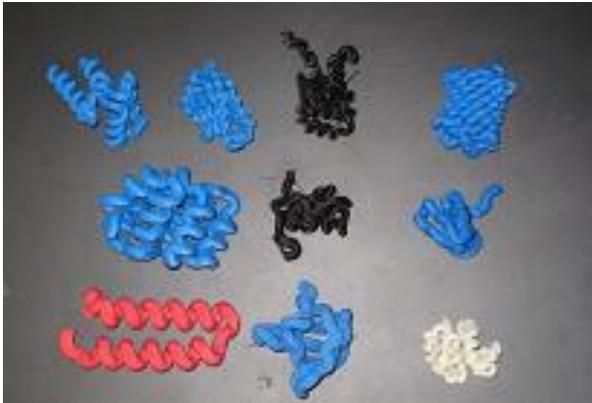

These 3D printing tools are based on ball and rod molecular modeling kits, which began to be used in the 1860s. These kits use balls that can bond with other individual atoms, where the number of bonding points indicates how many sites they have to bond with other atoms; carbon atoms have 4 bonding sites, which means that if they have 4 bonding sites, hydrogen atoms have 1 bonding point, indicating that the hydrogen atom has only one bonding bond. In addition to spheres, sets use molecules, rods, or tubes to bind atoms together to form molecules. An example of one of the 3D print modeling kits is given in Table 1. In addition to the standard modeling kits as in Table 1, there have also been many changes in the standard rod and ball models. Some versions simplify the models by using 2D profiles that slide over each other so that students can assemble the molecules faster and easier. An example of this is given in line 7 of Table 1. Other sets use different colors when modeling for different s and p bonds between atoms [7].

Chemistry education has now begun to take full advantage of the innovative potential of 3D printing, one of which uses the free energy of a reactive chemical system to create 3D graphic images. Examples of several of these surfaces are given in Table 1 [8]. Using these 3D printed surfaces, it is easy for students to understand why reactions grow along specific paths because they can see the low energy points and parts from which the reaction originates. Another benefit is that students can see why some reactions have multiple steady states because there are multiple free energy minima.

Analysis and results Another innovative application of 3D printing in the field of chemistry education is to inform students about the level 3 protein layer in complex structures [6]. Protein folding is probably one of the most complex topics due to the large number of possible pathways and factors during the reaction. Today, researchers have developed protein folding models and sets that allow students to experiment with protein folding using a practical approach will give. Using a practical approach, students gain a better understanding of the concepts and influencing factors associated with protein folding. You can get acquainted with the available tools in Table 1 below.

TABLE 1

An example of 3D printed objects for chemistry education	
	3D printed molecular modeling kits are available in many variants. Most of them are ball and wand modeling kits. Some of the available 3D printing kits have pre-prepared subgroups of atoms to simplify construction. These kits allow students to build molecules and perform reactions and see where all the atoms are going.
	There are 3D printed orbitals to show students the exact shapes of the orbit in which they are training. They are designed for students to visualize the 2B orbital shapes shown in 3D, the textbooks that students use.
	3D printed molecule models can be printed. There are a large number of large databases of 3D printed molecules. These 3D printed molecules help students visualize molecules in a way that cannot be easily created using molecular modeling kits.

	<p>3D printed surface models of free energy in reactions. It is designed to give students an idea of why reactions grow in certain ways and why a reaction can have multiple stable states.</p>
	<p>3D printed laboratory equipment is available for most applications. The 3D printing exchange of the National Institutes of Health includes a large database of such equipment. Additional designs for equipment.</p>
	<p>Some of the equipment available in the chemistry lab includes cups, cup holders, test racks, and cup stands from the collection.</p>

Flexible 2D to 3D molecular modeling structures are 3D printed. These models allow students to create a 2D molecule on a table and then assemble it to see what that molecule looks like in 3D.

3D periodic tables are designed to allow students to intuitively visualize periodic trends such as atomic density, radius, ionization energy, and electrical negativity. The idea is that 3D visualization is appropriate.

3D printed models of radioactive elements are designed to help students imagine what will happen during alpha decay. Students are shown that an alpha particle disappears from an atom that carries protons with it, and therefore the element changes.

Several models have been developed that use 3D printing to give students an idea of how water molecules help dissolve NaCl crystals.

Several versions of molecular models, including ideas about how electrons are distributed and distributed in a molecule. These models are added to other models of molecules by basically adding the location of the electrons. Several models also involve motion to show that electrons are not static in a molecule moves around.

CONCLUSIONS

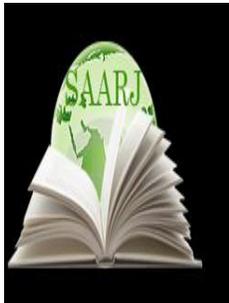

Also, the formation of a virtual 3D space of e-learning environment in general secondary and higher education, the organization of virtual chemistry laboratories, the organization of the educational process in this environment and improving the quality of education. is the same term for the chemists of the day.

The main advantage of using this technology in the learning process is that the interest of the student in the topics studied increases significantly, as it allows them to get a particular product as a result of their activities. The student can evaluate the results of their work at the tactile level, analyze and correct mistakes. 3D technologies allow to activate the learning process, increase the research and creative activity of students.

ONTOLOGICAL AND EPISTEMOLOGICAL PRINCIPLES IN THE SYSTEM OF THE PARADIGM OF CIVILIZATIONS AND THEIR NATURE OF INTERRELATION

Djurayeva Nigora Avazovna*

*Doctoral Student, PhD,
 National University of Uzbekistan Named After Mirzo Ulugbek,
 Tashkent, UZBEKISTAN

ABSTRACT

The correct model or strategy for the development of civilization, state, and society today has a special importance in connection with global world processes. In this aspect, it is very important to define the ontological and epistemological postulates of the development of the paradigm. These scientific articles are devoted to the system analysis of the ontological and epistemological principles of the development of the paradigm of civilizations. It also contains today's indicators of the civilization phase transition.

KEYWORDS: *Ontology, Epistemology, Principles, Paradigm, Civilization, Societal System.*

INTRODUCTION

The development strategy of any state is essentially designed to become the most important state document that determines the development of the state, including Uzbekistan for many years to come. In this regard, ontological and epistemological principles in the system of the paradigm of civilizations and their nature of interconnection as a postulate, statements are very important, on the basis of which scientific theories and laws of development of the paradigm of civilization are created, which we define the paradigm of civilization as societal cultural-historical system that unites at the super ethnic level a population with a common self-identification, organically linked to a specific natural -spatial environment.

Material and Methods

In the study, the author used the historical, comparative, synergistic and categorization methods.

Results

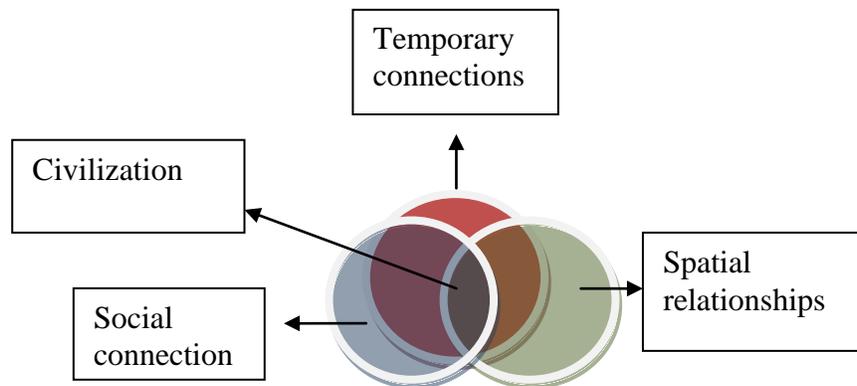

Civilization based on three types of backbone connections:

- Spatial, extending to the features of the environment, landscape. These are horizontal “latitudinal” connections;
- Temporary, forming a community of historical life, traditions, broadly understood culture, language. These are vertical links located in “longitude”;
- Social, cementing a super-ethnic community through the formation of comparable value-normative mechanisms, subjective awareness of the community, self-identification of people. These are end-to-end connections that operate in all directions. (Diagram 1)

A huge influence on civilization identity, which is noted in our definition, is exerted by spatial connections that extend to the natural environment, landscape, and climate. Cultural diversity can, to a certain extent, be explained by the adaptation of groups of people in different conditions of the geographical environment: in different landscapes, different ethnic groups and different cultural traditions are formed. Herodotus in the 5th century BC wrote in his famous "History" that the tribes lead the way of life, which indicated to them the nature of the country that the course of events is subject to natural conditions.

The formation and development of cultural and historical systems (civilizations) occurs in the process of interaction of specific ethnic groups or their associations (superethnoses) in the development and arrangement of their spatial environment, as a result of which a community of historical being, a community of widely understood culture, comparable value-normative mechanisms of mutual gravitation are formed (or at least tolerance) of peoples to each other, awareness of oneself as a whole, different from others.

Cultural-historical system (civilization) (Diagram 1)

An example from the history of Uzbekistan: the endless plains forced Amir Temur to create a huge state “embracing the whole world”, with its East and West, its Europe and Asia. The size of the country has always kept the people in exorbitant tension, the task of creating and at the same time protecting their state required both a high degree of centralization and the subordination of all social life to the state interest. It was possible only collectively to explore impassable territories, overcome natural severity, and be ready to defend against the endlessly rolling waves

of nomads. Therefore, the Uzbek peoples have always had individual, personal - personal rights, interests - overshadowed by the interests of the general, community and state. Collectivism, service to the nation took precedence over personal concerns. On the other hand, the scale of spaces also shaped the scale of thinking; put forward "universal" philosophical questions.

Societal is a system that, at the highest (social) level, unites social structures and objects, social ties and relations between individuals and groups of individuals into a single functional whole [1]. (Societal systematic is the system of relationships and processes to be considered at the level of society as a whole as a system of societal consider social formation, including the interoperability of its main structures: economic, social, ideological and political each. From the structures of the societal system, being its element, not only performs a certain function, but also gives this system in the process of interrelations with its other structures a new (systemic) quality that cannot be reduced to the qualities of its elements). Each of the structures of the societal system not only performs a certain function, but, being in interaction with other structures, gives this system a new systemic quality that cannot be reduced to the qualities of its elements to their sum. At the same time, the societal system constantly reproduces the social qualities of its structures and, accordingly, the social qualities of the individuals included in their functioning, that is, the subjects of social relations. This is how the adaptation to the forms and methods of functioning of a single societal system of its structural and personal elements takes place. When this functional process is violated for a variety of reasons of both objective and subjective order, the functional balance of both personal and structural elements of the system is disrupted, its behavior as a whole becomes dysfunctional. Dysfunctional disorders or anomalies in the behavior of the societal system lead to its deformation and destabilization or to decline and destruction.

Defining civilizations as societal systems, we emphasize its fundamental irreducibility to the mechanical sum of its constituent elements and note the acquisition by it in the process of functioning of the "integral effect", a new systemic quality. For example, as the integration processes within the European (Western) civilization are strengthened, as supranational cooperation grows and supranational institutions and structures are created among citizens of each individual Western European state: France, Italy, Spain, Germany, etc. , an increase in the degree of pan-European self-identification ("We are Europeans") and supranational self-awareness.

Moreover, among the basic principles of the development of the paradigm of civilizations, the following can be distinguished:

- In the dynamics of cultural and historical systems or civilizations, there is no linearity, one-pointedness. The scheme of the development of civilizations cannot be represented as a single ladder, where any nation or group of nations stands at the upper "standard" level. Cultural and historical systems develop in different channels, where their degrees of maturity are achieved in their own way and at different times, their cultural, religious, political, social and spiritual features are formed.

- The paradigms of civilizations are not arranged hierarchically. Each paradigm is unique. For example, one cannot say that Chinese is superior to Greek or Roman, and Byzantine is superior to Muslim. In each paradigm of civilization, the possible variety and perfection of forms is

achieved in a peculiar way. They do not have a common denominator, through which it would be possible to compare the degree of perfection of a particular civilization.

- Within the framework of each civilization there are stages of growth, cyclicity, its own logic of development. The movement of each civilization is subject to its own special rhythm, in which "youth", "maturity", "old age" replaces each other. Immortality is not granted to anyone.
- There is no single civilization. Social norms, values, principles of organization, social institutions of one civilization cannot be considered standard for others.

The cultural and civilization diversity of the world challenges Western, especially American, belief in the universality of Western culture and its inevitable spread throughout the world. The notion that cultural diversity has become entrenched in the West is just a historical curiosity that quickly disappears under the influence of a general orientation towards the West and the counter powerful wave of Anglophone world culture that forms fundamental values, this notion does not reflect the real state of affairs. The modern modernizing world does not at all follow the path of westernization towards a single template. Non - Western societies are modernizing without abandoning their cultures and completely adopting Western values, institutions and practices, perfectly combining, for example, Sharia law with management consulting, e-mail and the Internet. Modernization, on the other hand, reinforces national cultures that are becoming more modern and less Western.

- Civilizations are formed and developed naturally and historically; civilization cannot be transferred artificially, exported: only superficial, individual elements of it can be "grafted" or introduced. The principle does not exclude the possibility of continuity in the development of civilizations. All civilizations of the past, replacing each other, have sunk into oblivion, but the results achieved by their labors enriched their successors and entered the treasury of all mankind. Each individual civilization never has a "monopoly" on its own cultural practices. Nations and generations change, scenes of historical life move, social orders change, civilizations alternate, but the thread of historical development is not interrupted. And generation after generation preserves the cultural reserve that has managed to survive in the stormy historical ocean. Civilizations, to the extent of their talent, supplement the accepted cultural fuse with their own peaks and pass it all on to the next generations, the next civilizations.

To transfer civilization to any people means to force all its strata, not only the top of society, to completely abandon their identity, fully assimilate, internalize the values, norms, culture, religious, social, political, scientific, everyday traditions of the implanted civilization so that this people he himself from within could already reproduce and develop them. This task is impracticable only under one condition — the loss of political independence by the people.

It is the presence of political independence as a prerequisite for the development of an independent civilization that can be considered another principle of the formation of the paradigm of civilizations. There is not a single civilization that would have reached a high degree of maturity without political independence. Without it, the emerging civilization turns into an instrument serving other people's interests and goals.

It can be added that the loss of economic independence can turn out to be a stage preceding the loss of political independence or, at least, become a strong brake on the development of one's own civilization. An example is the negative experience of debtor countries such as Brazil,

Mexico, Argentina, the Philippines, which borrowed huge amounts of money, mainly from the United States, during the 70s and 80s. As a consequence, they “complain that the burden of external debt excludes for them a real prospect of socio-economic progress” [2,733].

You can also transfer, transfer civilization in one more way: with the destruction of the people themselves, as was the case with many tribes of the American Indians or the aborigines of Australia, when, literally, the Europeans who came there simply cleared the space. Or when the primordial values, national origin, identity, national culture and its main carriers, institutions, religion are destroyed, and the people turn into ethnic material, from which the forms desired for civilizers are molded. We can give an example of the medieval Germans who conquered numerous tribes in Western Europe. “The tactics of the conqueror were as follows: after a military victory, the leading stratum of the defeated people was summoned to the camp of the Germans; this aristocracy was carved out on the spot; then the beheaded people were forcibly baptized into Catholicism, dissenters were killed by the thousands; the rest were forcibly and uncomplainingly Germanized” [3,257].

The planting of civilization should be distinguished from the interaction between them, borrowing from each other the achievements of science, technological discoveries, and improvements in industry. The results of cognition in the field of man and society, social innovations should be taken into account as one of the elements of comparison, “for the very reason that when solving this kind of problems, an alien civilization could not have in mind social principles alien to it and that, consequently, their solution was only private, only her one more or less satisfying, and not generally accepted” [4,85].

So, the borrowing, the transfer of the results of the activities of one civilization to the peoples of another is fruitful only when the latter retains its political and economic independence, its cultural, everyday traditions, its religious views, its mentality, the way of thinking and feeling, as the only one peculiar to it, in a word, retains its identity. People's beginning is made up of many national principles, of ethno-cultural diversity, which is composed of a single civilization, and, as we have said, the ethno-national diversity is one of the conditions for full-fledged development of civilization, to achieve unity in diversity.

The unity of the cultural and historical system is also facilitated by its political design, which assumes various forms: from a single state, federation, confederation to a political system of states, formed into a community, commonwealth, union or something else. Political structures that are widespread outside one civilization may not be effective enough, since political association implies obligations and restrictions, the subordination of private interests, personal, social-group, state to the more general interests of the highest cultural and historical unit, which is a civilization.

Eurasian scientists, speaking about the ontological and epistemological principles of the development of the paradigm of civilization, expanded the vision of the problem from religious to civilization scales, while they declared the equality of various epistemological models developed by different paradigms of civilizations. Understanding the theory of cognition as dynamic, historically conditioned processes of accumulation and interpretation of ways of cognizing reality, and not just this model once and for all, thinkers defended non-rational forms of cognition in the face of Western European rationality, which claims a universal and generally binding epistemological status. The best method of cognizing historical reality, according to the

views of the founder of the Eurasian theory of knowledge L.Karsavin, is the so-called “getting used to” method, which became known and relevant back in the time of V.Dilthey. The method of “getting used to it” receives its own explanation from the Eurasian philosophers: “For the historian, the necessary prerequisite for his science is not only and not mainly his subjective experience, but real penetration into another mental process, genuine merging with it, as if getting into someone else's the collective soul was never explained. For him, it is a fact, and any explanation reducing this fact to an illusion or self-deception cannot be recognized by it” [5,180] . Especially noteworthy is the denial by Eurasian scientists of progress in its everyday understanding as a unidirectional movement. On the contrary, they put forward the paradigm of a plurality of civilization paths and insisted on the significance of not only the latest theoretical results, but also that part of epistemology that is biasedly rejected as “primitive”: “Considering literary works, the Eurasians constantly tried to apply some ideas and approaches those historiosophical problems. So, for example, they believed that when overcoming crisis situations, the people and the country should not rely on the achievements and conclusions of the nearest period of history. The main and best means of national cure should combine the aspiration to search for new, future forms of the world order, the shoots of which are already noticeable in the present, and the appeal to the experience of remote, even ancient periods of history, especially those marked by serious religious and spiritual achievements ”[6,51] .

Eurasian P.Savitsky says: "Eurasians are simultaneously asserted religious principle and consistent empiricism. <...> But it is not enough to understand the facts - they must be controlled in the plastic process of history"[7,91-92] . The principle of studying culture and civilizations, the principles of cultural analysis, used in scientific research by Eurasian scientists, are inextricably linked with their historical and philosophical concept.

Speaking about the principles of the development of the paradigm of civilizations, we consider it necessary to analyze the so-called indicators of the paradigm of the civilization phase transition. T. Kuhn explained the paradigm change as follows: a normal paradigm, outliving itself, comes to a point of crisis, but without a scientific revolution this paradigm does not move to a new qualitative level. Only the scientific revolution is the impetus and cause of a new paradigm. Indicators, we will call them a civilization crisis or bifurcation point , indicate those essential problems that have outlived their usefulness and require radical changes.

In our opinion, the indicators of a civilization phase transition today are the following:

1. Postmodernity, being a basic indicator reflecting an axiological crisis, indicates that traditional values are deconstructed , while new value guidelines have not yet been developed. Consequently, the new paradigm lacks objective, solid foundations, which leads to a new disorder in which there is nothing to rely on, except for its own mind.
2. The flood of information presupposes a consumer attitude towards information, texts, etc. for example, texts are needed not for the reader, but more needed by new authors who copy them into their own texts. A large amount of information on the network without the reliability of its truth. The solution to such a crisis is the birth of some fundamentally new quality of the information structure of the future society.
3. Demographic phase transition and dynamics of the demographic situation

4. The dynamics of civilization events that qualitatively change the state of our civilization and transfer it to a higher level of development (technological and cultural revolutions)
5. Cessation of the progress of science and the crisis of humanitarian knowledge
6. Vitalizing politics, turning it into an entertaining show for viewers

DISCUSSION

Today, as it is known, the uncertainty and uncertainty of the scientific community regarding the fundamental aspects of science is growing and it is important to note that such pluralization can have a positive side, as L.Mikeshina notes: "It is also necessary to comprehend and apply new principles of approach to knowledge, some of which is formulated by postmodernism. As you know, postmodernism avoids all forms of monism and universalization, does not accept a single universally binding concept and various explicit and implicit forms of intellectual despotism. He is critical not only of positivist (logicality) views, but also of the ideals and norms of classical science. Within the framework of this approach, a reassessment of fundamentalism, the recognition of a multidimensional image of reality, as well as an unavoidable plurality of descriptions and "points of view," the relationship of complementarity and interaction between them are assumed"[8,22]. N.Trubetskoy consistently and categorically insisted on the relativistic approach, in fact, excluding any assessment of a foreign culture. From his point of view, this assessment will be deliberately subjective and imbued with national egoism, therefore all cultures, including the European one, with all its achievements in the field of technological progress, science and art, and the so-called primitive cultures should be considered as completely equivalent [9,46]. It is the civilization approach of Eurasianism, which is based on the acceptance of the cultural characteristics, values and equality of various aspects of human cognition, that can oppose radical conventionalism, anti-fundamentalism and anti-essentialism, which have found expression in modern scientific trends. Thus, in the philosophy of the Eurasianists, epistemology is constructive pluralism.

CONCLUSION

Thus, the entire human civilization is built on such unshakable foundations like religion, economy, family, love, etc. Each of the postulates of civilization has its own special meaning, and by changing at least one of the foundations of civilization, we will already get a completely new model of the development of civilization. The factor of chance is embedded in the very foundation of the universe, and this means that there can be infinitely many options for the development of reality, and where there is such an infinite variance, everything can really exist and our reality is not the only one that exists. Moreover, our civilization is an inverted pyramid, in which the top and bottom have changed places, and if you change the top, the whole base will change accordingly. The simplicity of life itself in our civilization is endlessly complicated. It is not difficult to notice, because today we wear clothes that are constantly out of fashion and are being replaced by another, we eat food that is becoming more artificial from natural and is divided into tens and hundreds of varieties and types, we watch TV channels, the number of which is constantly increasing.

ACKNOWLEDGMENT

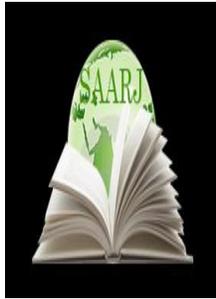

I would especially like to express my gratitude to my scientific advisor's Doctor of Science, Professor Madayeva Shakhnoza and Candidate of Philosophical Sciences,

Professor Fayzikhujayeva Dilbar for valuable advice s in planning the research and recommendations for the design of the article. I would also like to express my gratitude to my father of Candidate of Philosophical Sciences, Assosiative Professor Djurayev Avaz, who assisted in preparing the manuscript before sending it to the editorial office.

Also, we are very grateful to our family and colleagues for friendly support and to all those who made our work easier and helped us to achieve success!

ABSTARCT

This article given provides information about manipulation concept, its affect to human brain and its importance in our current life. Although it looks at how manipulative actions affects negatively. This section also supports about manipulation tactics, its mechanisms.

KEYWORDS: *Manipulation, An Object Of Manipulation, A Subject Of Manipulation, Type Of Manipulation, Its Role On Mass Media, Manipulative Influence.*

INTRODUCTION

The modern man, no matter who he is, is a manipulator. The number of manipulators is innumerable. Each of us is a manipulator and uses various fake methods to achieve our goals.

The realities of today's world are a clear manifestation of manipulation, but it is not an influence on the minds of individuals, but on the minds of entire nations and societies. False goals, which are inherently contrary to their values and views, are easily instilled in people. The problem is that most of our society doesn't want to analyze the flow of information it receives, at least not to check whether that information is true or false. After all, it is much easier to receive information, evaluate it, than to be critical. This is a key aspect that ensures data success. The modern manipulator is constantly evolving and improving. He also seeks to know the secrets of human nature, but the only goal is to better control those around him. Of course, man is not born a

manipulator, he grows up to be a manipulator. Manipulation has become an integral part of our lives. We did not pay attention. They surround us like sand, but we do not see them and do not think about them. The essence of manipulation is that the manipulator tries to hide its true purpose. In many literatures we can see manipulation and different approaches to this term. An example of this is the following definition of the word "manipulation" (Latin manipulus - palm, manus - hand "complex and delicate movements in the hand") [1], that is, to affect people. or to control them with agility. Manipulation also stems from a desire to dominate and control others. At the same time, the manipulator uses others for his own purposes, and his influencer becomes the object of aggression only against his own inner value. This is clearly the immoral position of the manipulator. [3]

Many researchers have also expressed differing views on manipulation.

For example:

1. The form of the spiritual influence of coercive secret domination (BN Bessonov's definition);
2. Dominance over the spiritual state, management of changes in the inner world (D.A. Volkogonov's definition);
3. The covert use of force against the supposed will of another (R. Goodin's definition);
4. Deceitful indirect influence in the interests of the manipulator (O.T. Yokoyama definition);
5. Latent influence on selection (L. Proto's definition);
6. Creating a world that allows you to win (V. Rikur's definition);
7. Ensuring behavior through self-deception or playing with the weaknesses of others (J. Rudinov's definition);
8. Relation to others as a medium (VN Sagatovsky's definition);
9. Covert coercion, programming thoughts, intentions, feelings, relationships, behaviors. (G. Schiller definition);
10. To manage and control another, to exploit another, to use them as objects, things (E. Shostrom's definition);
11. Management or use of mentoring (P.U. definition Robinson) [4].

The most complete description of the manipulation is given by E.L. Dotsenko's article "Psychological Definition of the Concept of Manipulation" states: "It is a type of influence used to gain one-sided benefits through a covert call to perform certain actions of others" [4]. This means that manipulation is a deliberate attempt to influence and control a person.

In the process of manipulation, two opposing parties are involved: the performer of the manipulation - the subject of the manipulation, and the person to whom the manipulation is directed - the object of the manipulation. The subject of manipulation is also referred to as the manipulator. The object of manipulation is the individual or the public consciousness. In any case, the object of manipulative influence is the victim, because the harm is done in one form or another. Therefore, manipulation destroys human relationships. not surprisingly. [3]

While many psychologists, including S. Kara-Murza, support the idea of manipulation, the West puts the American media side by side with such descriptions as “mind-poisoning machine,” “psychic terror tool,” and society as a whole. and an association of passive recipients of information. [5]

A false reality is created for the manipulation mechanism to work, at which point the media can come to the aid of the manipulator. The point is that the media provide the public with ready-made conclusions in the form of information, which are then assimilated by people as personal conclusions. People don't even notice it when they do the things that the manipulator encourages them to do, because they already have the idea that they are doing all of this of their own free will. It should be noted that manipulative influences are also carried out through the media.

There is no need to fight against manipulators who change their ideas, desires and wishes in the minds of people, because absolutely all people are more or less provocative (even you can manipulate someone). The main weapon is not to destroy the manipulator, but to see the manipulation, recognize it, and prevent impact.

Through many studies, psychologists have identified several types of people who are potential victims of manipulation. There are five types:

The first type are people who live a simple life, strive for security and well-being, and have logic and logical superiority in their minds. Such people are mostly governed at the level of needs.

The second type are people who live mainly in a state of stress, have a predominantly creative mind, are dreamy, vulnerable and sensitive, and easily predictable. Such people are governed on a level of emotion and imagination.

The third type are intelligent people who think logically, prefer facts and features, and tend to submit everything for analysis. This category of people is governed by a sense of justice, conscience and morality, as well as a sense of self-respect.

The fourth type is people whose behavior is determined by animal instincts and who tend to eat, sleep, and have sex in their lives. It's easier to manipulate such people - just give them one of those pleasures.

The fifth type is people with psychological disorders, whose behavior is affected by manipulation, people who are mentally retarded, and the ability to fully analyze what is happening. They face the harshest manipulations through intimidation or pain.

In addition, there are people who are prone to manipulation, who rely on reason and logic in their actions, and who strive for convenience and security. They are easy to manage at the level of needs.

With astonishing accuracy (after only a short conversation with one person), the manipulator is able to determine the type of victim and, based on this information, select a method of controlling consciousness.

It should be noted that there are many techniques and methods of manipulation in the world. Even the most experienced manipulator does not have all the methods, but he has enough approaches to influence the people under his influence in the way they want.

Regardless of the method of manipulation, it can occur in one of the following two situations. They are two-dimensional, bad and good manipulation, those who want to walk first, try to run over time, destroy everything and don't count on anyone. This is bad manipulation.

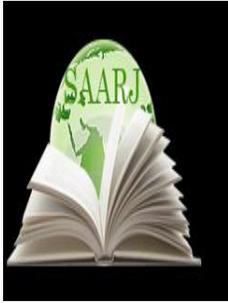

A good manipulation is that you get the desired result, the rest of the participants benefit from the situation for themselves. At the very least, the "do no harm" rule should be followed. If the other person doesn't have anything useful, at least he shouldn't accept the negativity.

In short, the factors that affect the life of society and the human psyche, as well as the manipulation of psychological processes and situations, emotions, feelings, have a constant impact. As society develops, so does the human psyche, the ways of influencing it, and the opening up of new facets. At the same time, the scope of manipulative influence on the human mind and its control is expanding. We see and know that in many areas of our lives, we are exposed to a lot of manipulation in the process of interacting with humanity, forgetting our own views, opinions and reflections.

Most of the manipulations harm the lives of the manipulators and their loved ones. Some manipulations are harmful because they hide the existing disease in the person. Day by day, many people are deceived by the influence of manipulators. Therefore, we must not forget that the information that constantly comes to us, first of all, affects our minds, but not our emotions. We must pay attention to every incoming external information.

ABSTRACT

This article writes about the history of Urdu and its position mainly in India and partly in Pakistan as it emerged in the past centuries, took its place during the political conflicts in India and was enriched by differences with Hindi and other languages and is now the only language of India and Pakistan. At the same time, it is believed that this unique language has evolved over time in both countries, India and Pakistan, and has a place among the general public with its literature and culture, which has been highlighted by many Urdu scholars.

KEYWORDS: Urdu language, India, Pakistan, Sanskrit phrases, Arabic-Persian graphics.

INTRODUCTION

In the framework of reforms aimed at building a new society based on the priority of democratic principles, great attention is paid to educational work in the country. In particular, the Law of the Republic of Uzbekistan "about Education" and the National Training Program are the main factors ensuring the socio-economic and cultural development of the country, which provides all the conditions for modernity and, above all, the priority of human interests. In addition to the implementation of their needs, the basics of training competitive, highly qualified specialists have been identified. In particular, the Resolution of the First President of the Republic of Uzbekistan dated December 10, 2012 No PP-1875 "On measures to further improve the system of learning foreign languages" states that "within the implementation of the Law of the Republic of Uzbekistan" about Education "and the National Training Program A complex system of teaching foreign languages has been created, a system aimed at the formation of a harmoniously developed, educated, modern-minded young generation, the further integration of the republic into the world community.

At a time when the social, political, cultural and economic ties of our country with foreign countries of the East are strengthening, one of the urgent issues of the day is to cultivate potential philologists, translators, simultaneous translators with perfect knowledge of foreign languages, including Oriental languages. It is important to introduce international educational standards for teaching foreign languages into the system of continuing education in Uzbekistan and to base them on the level of "pan-European competencies in foreign language acquisition: learning, teaching, assessment."

Great changes are taking place in the social and political life of our country. Our national and spiritual values are being restored. Our country is facing the world, and the most developed countries of Europe and the East are recognizing this. As a result, along with the development of science in our country, a wide path has been opened to the field of Oriental Studies. The demand for learning Oriental languages is growing again. The development and strengthening of relations between Uzbekistan and countries such as India and Pakistan require a deeper study of the culture, relations and existing languages of these countries.

This article focuses on Urdu, one of the languages spoken in India and Pakistan, and its history and current status in the two countries.

Relevance of the topic The language situation in South Asian countries, including India, is the most difficult and multifaceted. The language situation is closely linked to political, national and religious issues, as there are many languages and dialects in a country, as well as the number of nations and peoples and the relationships between them. For political reasons, the study of languages divided between the two regions, especially Urdu, Punjabi, Bengali and other languages, is one of the most pressing issues today. Because these languages have developed in both countries separately and surrounded by and under the influence of different languages. As we think about the Urdu language we mean, a lot of research has been done on the history, literature, culture of this language. Most of this research was conducted by Russian, Indian, English, and of course Uzbek Urdu scholars. As for the level of study of the subject, it is described in the works, monographs, and scientific articles of a number of linguists on the history, religions, languages of the Indian people and the relationship of Urdu with written graphics and other languages.

The purpose of writing this article is to determine the history, origins and place of Urdu in India and Pakistan, to study this language in more depth and to take a broader look at its history, as well as to have a broader understanding of the tasks at hand.

To achieve this goal, we have identified the following tasks:

1. To get acquainted with and summarize the ideas and opinions on the Urdu language, which emerged and formed in the Indian region on the basis of scientific theoretical sources, literature, historical sources
2. Close acquaintance with theoretical works and thematic analysis of the given sources on Urdu language

The methodological basis of the article is the approach of Russian, Indian, Uzbek, English scholars in the field of linguistics and oriental studies on the basis of real sources and its method of scientific analysis. In describing and analyzing the issues covered in the article, we relied on the scientific theoretical views of language by T.Kh. Kholmiraev, M.Kh. Abdurahmanova, ON

Shomatov, D.D.Sharma, V.N. Chernyshev and other scientists. Article layout: introduction, main part and bibliography.

MAIN PART

When we think about this language, we first look at its history. Urdu belongs to the Indo-Aryan language group of the Indo-European family of languages and is one of the 15 major literary languages recognized in the Constitution of India. It is the official state language of Pakistan. The language is spoken among the Muslim population in states like Uttar Pradesh, Bihar, Maharashtra, and Andhra Pradesh in India and in many cities of Pakistan. There are a number of hypotheses about the origin of Urdu, and all of them have been the subject of scientific debate for many years. But there is a scientifically based view accepted by most scholars around the world, including Uzbek and Russian orientalists. Urdu originated in the regions adjacent to Delhi in northern India. One of the most common dialects of North India, khariboli, formed the grammatical basis for the new language. The dialects of these neighboring regions (Braj and Avadhi) mastered the dialects of Turkic and Persian languages and through it the elements of Arabic. Later, it spread across the continent, encompassing the vocabulary of other indigenous peoples.

Given the different views on the origin of Urdu, it should be noted that Muslims never created their own language there. Due to certain historical conditions, situations, events, the existing language was formed on the basis of local Indian dialects, and representatives of all national religious conventions in the vast territories of the Indian subcontinent contributed to its creation and development. The spread and development of the new indigenous language was largely facilitated by the religious preachers of two religious reform movements that were prevalent in medieval India: Muslim mysticism and Hindu 'bhakti'. The emerging new language began to develop rapidly in a multi-ethnic environment, and was originally called "Hindu" or Hindi, i.e. Dehlavi Delhi. But soon it came to be known as short hindi.

In the early fourteenth century, ghazals appeared in the ghazals of some Delhi poets who wrote in classical Persian, replacing them with Persian lines. They came to be known as "rehta" which means "mixed gazelle". Over time, the poetic genre itself came to be known as rehta. For centuries, Hindu / Rehta have been the unified language of Muslims and Hindus. The dean and form of this language in southern India came to be known as "dakhini" (southern). In medieval India, the Urdu-Turkish word was also used to mean "capital," "the ruler's own reception." It was originally the name of the Delhi residence of Shah Jahan in the great Baburi dynasty (1627-1656). This is where the original history of Urdu begins. In the 1740s, a new district called Shohjahanabad appeared on the right bank of the Jamna River on the outskirts of Delhi. At its center is the famous Delhi "Red Castle". It means "urdu-e mu'lla" or "high palace". It is this Urdu word that has been called for a century. We have mentioned that historically Urdu emerged with the advent of Muslims after the twelfth century. Urdu was the language of communication in the northwestern region of India and was also called Hindu. However, in the Middle Ages, it became known as Hindi, Delhi, Rehta, Gujrati, Dekani, Urdu, Malay Urdu. By the end of the 11th century, it was called "Hindustani". There is evidence that it was later used as a synonym for the word "ard". Directly this language meant in Turkish (kamon) or royal residence.

The distinction between Urdu and Hindi was influenced by the colonial era as the cultural consciousness of the people grew in the process of political modernization. There is clear

evidence that the British rulers first linked the question of the types of the Hindu language with cultural heritage and social status, and later with religion and politics. At the initiative of the Fort William College, founded in Calcutta in 1800 by order of the British, the Educational Research Center for Oriental Studies was established. Its leader was the Scottish scholar John Gilchrist of the East India Company, who made a great contribution to the development of the Indian language in colleges. At the same time, with his active movement, he was divided into two languages related to Urdu. Urdu was created with a Sanskrit alphabet with "Hindi" and Sanskrit phrases and Arabic-Persian graphics. Hindi, in the form of Gilchrist, came to be called the language of the light Hindus and Urdu the language of the Muslims. By itself, there was a factor that easily separated the representatives of the two religions. Based on the above data, it can be said that Gilchrist named the language used by the majority of the population of northern India Hindustani. It soon became a spoken language that was equally understandable to Muslims and Hindus. This has had an impact on the country's politics in its time. It was at this time that Urdu had an impact on Indian political life. The great teacher, the reformer Said Ahmad Khan, recognized bilinguals as citizens of an equal country. Urdu was understood in all the provinces of the subcontinent, and later, with the rise of the Indian independence movement, Mahatma Gandhi realized that the language issue was being given a political character by the British along with sectarianism. That is why he defended the language and supported this concept in order to bring the bilingual Hindu to the level of the national language of the country. Here, Mahatma Gandhi's suggestion that Hindi was the language of common civilization was emphasized by Raja Shiv Prasad in 1857 in his book *Qaide* that there were no national differences between Hindi and Urdu.

As the contradictions intensified, the roots of the two languages became inextricably linked and strengthened within the people. This single language permeated the hearts and bodies of the people. It has developed so rapidly that it has penetrated into the culture and art of the people on a large scale. The tradition of creating grammatical rules and dictionaries in Urdu began about 300 years ago by European orientalists. Among them are the seventeenth-century Dutch scientist K. Schultze (1744), Ferguson (1773), and J. Gilchrist. Local scholars S. Ahmad Dehlavi's "Farhangeasifiya" (1808-1908), Nurul Hasan Nayar's "Nurullug'at" (1924), Feruzudi's "Jamiullug'at" and Baba-e urduAbdulhaq's "English-Urdu dictionary" (1937- years) are great contributions to the Urdu language.

We have already mentioned that Urdu was the official language of the great Mongol Empire along with English and was widely used in the palace at that time and replaced Persian. It was known that this process lasted until 1900. It has been the main language in public affairs in a number of provinces of northern India. We know that the Arab Caliphate emerged in the twelfth century, which had a great influence on the formation and development of Islam. As a result of various invasions, Iran began to occupy South Asia. In these countries, the promotion of Islamic civilization and Islamic thinking began to develop. In 664, the Arabs had occupied the land of India. In 713, the armies of Muhammad ibn Qasim conquered the southern parts of Sindh and Punjab. Thus, after the Arabs, in the 11th century, the Turks invaded India under the leadership of Sultan Mahmud Ghaznavi. In 1206, QutbiddinOybek, the commander of Sultan Muhammad Guri, conquered Delhi, and in the 13th century the Muslim state of Delhi was established. Most of the Muslims here were mostly Central Asians. The purpose of mentioning these historical processes is, of course, that they brought with them their own cultures, languages, customs. They

ruled India for 350 years before Z.M. Babur. In 1525, the ruler of Fergana, Zahiruddin Babur, conquered the land of India, and it is self-evident that the invaders once again had a great linguistic influence on the local population. Therefore, it is believed that the word Urdu is derived from the word "orda". It means "army, army, gathering place." When the Europeans invaded, English words entered the Urdu language. Urdu became so popular that it became the 2nd level language after English in Indian universities and colleges.

Beginning in 1829, Urdu translations of the Qur'an began to appear in India. At the same time, translations of hadiths and commentaries began to appear. While Urdu was the religious language for Muslims at that time, Urdu later began to have the status of a literary language. It began to serve as a sign of high culture and education. Formed in the XIX century, this language has its own graphics, vocabulary and began to occupy the field of literature. Urdu literature appeared in the XV, XVI, and XVIII centuries in a dean's office far from Delhi. The northern Muslim, i.e. Mongol, rulers mainly propagated the Persian language. Nevertheless, in southern India (present-day Hyderabad and Bijapur in Golkon), a new language began to be used by Sufis and folk poets under the protection of Urdu court rulers. That is why this language was called dean at that time. If we look at the Urdu literature of those times, it is worth mentioning the great dargas who made great contributions to the Urdu language. Nizami (1424-1434), MasnaviKadam Rao Padma is the first example of a poetic story in the dean. This is the first example of literary prose in Urdu. The famous poets of the dean were Muhammad QaliQutbshah (1626 BC), Gusi (1631), Nusrat (1624), Ibn Nisati (1655), Wali Aurangabad (1707). Inspired by the words of Wali's works, Delhi poets began to write poems in Urdu and called it the language of poetry. It was during this period that the Urdu language began to open up more and more. The eighteenth and nineteenth centuries were the heyday of Urdu elegance and splendor. The golden age of Urdu classical poetry was precisely this period. Among the poets of Qadir al-Kalam at that time were Mir Taqi Mir (1810), Khawaja Mir Dard (1780), Insha (1817), Munafiya (1852), Atash (1847), Muminat (1852), Zavq (1854) and Mirza Galib (The names of great poets such as 1869y) are of great importance, they were mainly ghazalnavis poets who wrote in Urdu. NazirAkbarabadi, who lived in Agra, is recognized as a great public figure of the Urdu language. So far no one has been able to surpass Lucknow (1837) and Dabur (1875) in the writing of mourning-style poetic laments. Bahadur Shah Zafar, the last ruler of the great Baburi dynasty of the Mongol Empire, and Mirza Galib, a contemporary, were considered the last of the poets and the first of the modern poets. Later, Mirza Galib's letters created an atmosphere for modern prose. Said Ahmad Khan, Mahmud Hussein Ozod, Shibli were famous in the field of prose writing. From the 19th century onwards, stories such as BaghaBahar and Rajab Ali BekSarwar's "Fasana-e ajayib" were written. Then Nazir Ahmad and Muhammad Ruswa began to write novels in Urdu. Said Ahmad Khan at that time constantly began to propagate to the Indian Muslims in various ways that Urdu was the main means of Islamic spirituality and culture. In other words, it defined Urdu as a Muslim nation. From the twentieth century, Urdu novelism began to develop. Prem Chand's novel Godan, written in Urdu, had a classic status in Urdu. The novels of Saodat Hassan Minto, Qudratul Ayn Haydar, Rajendr Singh Bedi, and Intizar Hussein are among the most famous works written in Urdu. The greatest Urdu poets of the 20th century are M. Iqbol, FiraqGorakPuri, Fayz Ahmad Fayz. At the same time, if we look at the research in other areas of the Urdu language, such as literature and linguistics, it is important to mention Maalawi Abdul Haq, Abdul Kalam, Ozod. The great personalities mentioned above laid the foundation for the development of Urdu and made a significant contribution to the language's

gaining popularity in India and Pakistan. The idea of "Muslims" of the Muslims of India was born by the greatest poet of the XX century M. Iqbal. He was able to show his influence by inculcating this idea in the minds of his contemporaries and believers. M. Iqbal is a person who played an important role in the formation of the Pakistani ideology. Therefore, it is not surprising that M. Iqbal is also called the father of Pakistan. He is recognized as the herald of the creation of a Muslim state on the Indian subcontinent. Muhammad Ali Jinnah (1871-1948) unequivocally acknowledged the views and statements of M. Iqbal, the founder of Pakistan, ie "Pakistan kibani", accepted the idea of two nations and defended it with all his being. It is obvious that M. Jinnah, following S. Ahmad Khan, made a great contribution to the achievement of Urdu, the language of the great dynasty, as the main language of regional court and proceedings in a number of provinces of India.

Now let us look at how Urdu developed in Pakistan, when Pakistan was formed, M.A. Jinnah pointed out in his speeches that this language is the common language of the whole Muslim state with various arguments. After the founding of Pakistan, not only M. Jinnah but also the intelligentsia of the ruling Muslim League realized that a single state language was important for the unification of the nation. And during this period, most opponents of the English language realized that Urdu could be used as a symbol of integration in a multi-ethnic country like Pakistan, said Rahmon. Renowned Pakistani sociologist and historian Tariq Rahman called the government's language policy cultural cultural imperialism. He pursued a policy of promoting Urdu throughout Pakistan. He noted that the fact that Urdu is traditionally a vernacular language is far superior to Punjabi and naturally to Punjabi culture. In 1979, the Pakistani government established the national language phrase for the development of Urdu. The Science Pakistan Movement was launched on August 14 at the initiative of the Pakistani government. At the same time, the government is focusing on an innovative approach to the unique integration of teaching languages across the country. The government has announced that as part of the new curriculum it is currently working on, students will be introduced to Urdu, a unique teaching tool that combines Urdu and English. They explained that this would make teaching in Urdu easier. Because English scientific and technical terminology is used in the original and the description of scientific processes and the necessary explanations are done in Urdu. However, while preserving the original status of the language, it is not allowed to replace it with English. So this language will remain the language of communication in most of Pakistan.

We have studied the causes of the emergence of the Urdu language during the Muslim rulers and in Europe, ie during the British colonial period, and the factors of its widespread use. In fact, many scholars have their own views and opinions on these processes. Today, Urdu is the official language of Pakistan and remains the spoken language in India. This language is firmly established in both countries. We know that there are many languages in India. The state language is Hindi, but Urdu is spoken among the general public as Hindu. Urdu is widely used among the people in social and political spheres. Because Urdu is recognized by the general public for its fluency and attractiveness. He has found his place in fiction, poetry, ghazals, and all kinds of art. Nowadays, Urdu and Hindi cannot be imagined without English. These languages have already been absorbed by English. Urdu is rich in English words and is developing among the people. At the same time, the status of Urdu is growing significantly compared to regional languages. This language is spoken and studied in many countries. In particular, in Uzbekistan, Urdu scholars are conducting a lot of research on this language.

CONCLUSION

In an article on the history of the Urdu language and its status, we have come to the following conclusions based on a number of sources that shed light on the basic position of the Urdu language:

1. Looking at the history of Urdu, this language originated in ancient times and had its own place.
2. Urdu is one of the Indo-Aryan languages, the spoken language of India and the state language of the Islamic Republic of Pakistan.
3. Genetically and structurally, Urdu is a type of Hindi language, graphically enriched with Arabic and Persian words.
4. The Urdu language is formed on the basis of dialects called Khari Bali of Delhi Province. In the XIII-XIV centuries it became the language of interethnic communication. That is, Hindustan was later called Urdu.
5. Regarding the relationship between Hindi, Punjabi and Dakkhini Urdu, it became clear that Urdu also had an impact on Hindi with socio-linguistic factors and regional location. Today, this Indian language is widely spoken in the cities of northern India and Hyderabad (southern India) along with Hindi and English, as well as throughout India and Pakistan.
6. The religious environment, i.e. Islam, can be the basis for the development of Urdu in India.
7. Today, despite the fact that the development of English along with Urdu in both countries has affected the enrichment of Urdu and its future status, this language is spreading to the general public with its popularity and convenient elegance.
8. Urdu is the mother tongue of about 58 million people in the world and is spoken by about 250-400 million people. There are about 100 million people in Pakistan and almost 250 million in India (Andhpradesh, Bihar, Maharashtra, Uttar Pradesh). In India, Urdu is the main language of the Muslim population.
9. In the future, the status of this language will take its place depending on the social situation in the state.

**EMPIRICAL ANALYSIS OF THE DEVELOPMENT OF SANOGEN
 THINKING IN STUDENT'S ON THE BASIS OF A REFLECTIVE
 APPROACH**

Murodulla Kahramonovich Ismailov*

*Researcher,

Termez State University of the Republic of UZBEKISTAN

Email id: murodullaismailov89@mail.ru

ABSTRACT

The article disclosed the problem of sanogen thinking, its relevance, the study of domestic and foreign scientists, the content of the development of sanogen thinking on the basis of a reflexive approach. There is also an analysis of the results of the first stage of experimental work carried out in the field of development of sanogenic thinking in students. The healthy and harmonious development of the young generation, which will ensure its future, plays a crucial role in the development of any society. Theoretical and practical study of the research problem it was noted that reflexive knowledge and skills are among the leading factors in the development of sanogen (healthy) thinking of students of higher education institutions. This, first of all, requires its in-depth scientific study and analysis.

KEYWORDS: *Sanogenic Thinking, Reflection, Cooperative Reflection, Communicative Reflection, Personal Reflection, Intellectual Reflection.*

INTRODUCTION

The rapidly evolving process of science and globalization in the world community will allow future teachers studying in higher education institutions to have free, critical, creative and independent thinking, healthy thinking, politically and socially active, inquisitive and resourceful, aware of national and world culture, it makes it urgent that it should be formed as a person of high spirituality.

The healthy and harmonious development of the young generation, which will ensure its future, plays a crucial role in the development of any society. That is why we rely on our courageous, enterprising young people, who are well-rounded, well-versed in modern knowledge and skills,

to further increase the scale and effectiveness of our reforms [1, 2 p.] After all, the organization of a system of continuing education on the basis of an innovative approach is the basis for educating a harmoniously developed generation, shaping the spirituality and thinking of young people.

Relevance of the topic and purpose of the Research: The main direction of the strategic tasks in the field of education, which is consistently implemented in our country, is characterized by the training of specialists who can think clearly, clearly define the development prospects necessary for the interests of society and the individual. This necessitates the development of students' sanogen thinking skills and the development of its innovative pedagogical framework. Therefore, the main research goal was to study the problem of developing the sanogen thinking of future teachers and to identify the factors influencing this process.

Methods used in the Research: Theoretical (pedagogical-psychological analysis, comparison, systematization), empirical (pedagogical experiment, test for the study of sanogenic thinking (L.Rubtsova), questionnaire and mathematical-statistical analysis (descriptive statistical methods).

Literature Review: Although a lot of research has been done on the problem of human thinking, the problems of mental, physical and physical health of the younger generation remain the object of research for educators and psychologists. In scientific pedagogy and health psychology, the development of sanogenic thinking is a separate area.

Sanogenic thinking ("sanos" (lat.) - to heal, heal, comfort, inspire, regulate, and "geno" (latin) - to heal) is to produce a mind that heals, comforts, and inspires.

At present, the problem of sanogenic thinking has been studied by foreign (Orlov Yu.M., Vasileva T.N., Morozyuk S.N., Hilman A.Yu.) and domestic scientists (Ataxanova S., Abdirahmonova Z.A., Ismailov M.K.) [2, 3, 4, 5, 6, 7, 8]. Theoretical, philosophical, social and psychological aspects of the problem have been studied extensively in this research work.

Sanogenic thinking allows a person to focus and concentrate (concentrate, harmonize) on the events that take place in the life of society and the objects of the ongoing thought process. This serves for direct observation, analysis of all events and processes, as well as practical visualization in a mentally and emotionally compatible way. The development of sanogenic thinking skills is most evident in the following situations. These are:

- 1) Independent control of negative thoughts and emotional experiences present in the person (Orlov Yu.M);
- 2) Self-analysis and accurate assessment of capabilities, i.e., the priority of personal reflection;
- 3) Emotional stability (Morozyuk S.N.);
- 4) Constructive problem-solving, as well as reduction of stereotypical and pathogenic (unhealthy) features of thinking (Hilman A.Yu.);
- 5) High reflexivity in thinking and the need for self-development (Abdirahmonova Z.A., Ismailov M.K.) and others.

Theoretical and practical study of the research problem it was noted that reflexive knowledge and skills are among the leading factors in the development of sanogen (healthy) thinking of

students of higher education institutions. This, first of all, requires its in-depth scientific study and analysis.

Reflection - (latin "reflexio" - return, reflection) is one of the types of acts of human consciousness, that is the movement of consciousness, which is considered as a process of knowing the subject's own (inner) mental feelings and states.

Reflection is an ontological aspect of human life in many ways and is one of the unique characteristics of a person. Reflection is the most important, central phenomenon of human subjectivity, for which the following definition can be given: "... it is a person's unique ability that allows him to analyze and express his thoughts independently, as well as emotional states, experiences, people's behavior and reflects the relationship, in general - allows for special attention (analysis and evaluation) and practical change (change and development) [9, 75 p.].

The pedagogical literature distinguishes two traditions of interpretation of reflexive processes:

Reflexive analysis of consciousness, which leads to the interpretation of the essence of cognitive and emotional experiences and their construction;

Reflection on the understanding of the content of human self and interpersonal communication;

In this regard, pedagogical scientists distinguish the following reflexive processes:

Understanding of self and others;

Self-assessment and others;

Explanatory analysis of self and others;

Reflection coordinates the attitude of the participants of the educational process to their activities and ensures the reorganization of these activities in accordance with the form and content of joint activities.

Reflection is a description of self-awareness, the ability to understand, perceive, study, and analyze a subject's perception of the subject as an interlocutor in the communication process, the subject's problem, and the reasons for its occurrence.

Typically, reflexive skills manifest as a form of activity focused on thinking, self-awareness, self-control, understanding one's own personal behaviors and their consequences.

In our view, reflexive skills are seen as a key indicator of new ideas. If we consider the phenomenon of reflection as a way of reflecting a certain process as a whole, then it allows us to observe this process and identify and criticize its shortcomings. A person with such introspection achieves positive results. Through this, we master a mechanism that allows the disclosure of secret thoughts and ideas.

The following types, degrees and forms of reflection can be distinguished in connection with the development of sanogen (healthy) thinking in future teachers.

Russian scientists S.Yu.Stepanov and I.N.Semenov [9, 11 p.] describe the following types of reflection and emphasize the importance of this mechanism in the formation of the image of "I" in the person.

1. Cooperative reflection belongs to the pedagogy and psychology of management, as well as having the necessary pedagogical and psychological knowledge in this type of reflection ensures the project activity of the team and allows them to work together. In this case, the reflection is considered as the "release" of the subject from the processes of activity, its exit to a new position, both externally and in relation to the previously completed activity. The aim is to ensure understanding and coordination of common efforts in collaborative activities. In such cases, the focus is on the results of reflection, not on the processes that manifest the mechanism of the human psyche.

2. Communicative reflection is considered in the study of socio-cultural relations related to the problems of social development and communication. It is the most important component of intellectual and advanced communication, as well as interpersonal feelings.

3. Personal reflection, in which the subject's behavior and the person's "I" are studied in terms of his personal qualities. Such an analysis is carried out in connection with the problems of development, disintegration and correction of personal consciousness and the mechanism of creation of the subject's personal "I". There are several stages in the implementation of personal reflection. It consists of experiencing contradictions and understanding the tasks set, as well as the experience of understanding the intractable situations facing a person, reconsidering personal stereotypes and problematic situations. It understands the stereotypes and situations of a person who has a conflict and a problem. In such a situation, the person becomes fully self-aware. In the process of rethinking, a person's attitude towards himself and his "I" changes. It is done in appropriate actions. Second, it occurs with a change in the relationship that the subject can and can perform on its own.

4. Intellectual reflection is characterized by knowledge of an object and ways of communicating with it. Intellectual reflection is considered in pedagogy and psychology together with the problems of organization of processes of knowledge and thinking and processing of information.

The scientific essence of the article. In the process of developing the sanogen thinking of future teachers on the basis of a reflexive approach, students are required to analyze and objectively evaluate their own activities (independent reflexive activity), and teachers to analyze existing educational situations in a timely manner and actively think about their own concepts and behaviors. Conditions are created.

It should be noted that the personal and professional development of any individual is closely linked to the reflexive process. In addition, development is ensured not only from a professional point of view, but also physically and intellectually. It also allows us to understand what we are thinking about, what we are doing now, and in what direction we need to move in order to develop as a result of a high level of mastery of reflexive skills.

RESEARCH RESULTS

Within the framework of the research, research was conducted at Fergana State University, Bukhara State University and Termez State University. A total of 455 students studying in the field of pedagogy-psychology, primary education and sports education, preschool education and physical culture undergraduate education participated in the experimental work as respondents. At the initial pilot stage, questionnaires and test questionnaires were conducted to determine the content of sanogen thinking and the factors influencing its development, as well as the level of

development of sanogen thinking in students. How would you describe the essence of the concept of "Sanogen (healthy) thinking" in the questionnaire?", "What are the factors influencing the development of sanogen thinking? " Explain what you think, if possible? " were asked questions such as. The analysis of the responses provided by the respondents allowed us to obtain the following results. 23% (104 participants) of the participants gave more accurate answers to the questions, while 38% (173 participants) of the participants answered the questions satisfactorily. These participants also noted that while in question 3 they indicated reflexive skills as a key factor in the development of sanogenic thinking, they did not have sufficient information to interpret the answer. The remaining 39% (178 participants) stated that they did not have the necessary information on the questions asked.

Based on the results obtained at the initial stage of the experimental work, a special program was developed. According to the program plan, lectures and seminars were organized with the respondents on "The content of sanogenic (pathogenic) thinking and factors influencing its development" and "The use of reflexive technologies in the development of sanogenic thinking." Theoretical information on the following issues was covered in the lecture: 1) the content of the concepts of sanogenic and pathogenic thinking; 2) about the research work carried out in the field of sanogenic thinking; 3) principles of development of sanogenic thinking; 4) factors influencing the development of sanogenic thinking; 5) the role of reflexive skills in the development of sanogenic thinking.

The following reflexive technologies were explained and practiced in the seminar-training sessions organized on the principle of harmony of theory and practice: 1) "Everything is in my hands!"; 2) "Mutual control"; 3) "Questionnaire"; 4) "Inspection of group work"; 5) "Complete the hypothesis"; 6) "End the discussion" and others [11, 21 p.].

For example, the main task of the reflexive technique "Complete the discussion" is to retrospectively analyze the topic under study, to reflect the individual and group lessons. This technology is implemented in two stages, and its use is most effective in recent training sessions. First, a table with three columns is drawn. The first column contains the names or affirmations of human qualities, the second column contains the words "Success", and the third column contains the words "I want". When filling out this table, participants must perform the following tasks: 1) get acquainted with the qualities or affirmative ideas listed in the first column; 2) Divide the given points into the second and third columns. During the training, each participant should make a special mark in the column "Success", if any of the qualities listed in the first column, and in the column "I want" if not.

In the second phase of the exercise, participants count the marks placed and determine which column is more. They are then asked the following question: Why is the number of characters in the "Success" or "I want" column more or less? Explain why? " After that, the answers of each participant will be heard. The training continues in this way and at the end general conclusions are formed.

After the lectures and seminar-training organized within the framework of the special program, the participants were again asked the following question: "Do you identify reflexive ability as one of the key factors in the development of sanogenic thinking of future teachers?". An analysis of the results obtained showed that 79% of the respondents acknowledged reflexive skills as the main factor, while 21% of the participants stated that they could not express their conclusions

clearly. So, based on the final results, we can conclude that reflexive skills are identified as an important factor in the development of sanogenic thinking of future teachers.

Thus, reflection as an important mechanism of healthy thinking is a separate organization of the processes of understanding the phenomenon in the context of a broad system (it includes assessment of situations and actions, finding ways to solve situations and operations), activities aimed at understanding behaviors and their consequences. is a form of intellectual activity, i.e. the ability to look back (back) and to see, identify, study and analyze a particular problem and the reasons for its occurrence. A high level of mastery of reflexive skills is an important indicator not only in the development of students' sanogen thinking, but also in their success, self-analysis, identification of their strengths and weaknesses, and the correct implementation of future activities.

CONCLUSION

Based on the above analysis, it can be said that the role and importance of the development of healthy thinking in future teachers and the reflexive approach in this process is reflected in the following aspects:

1. Sanogenic thinking allows you to focus and identify (identify) the objects of the thought process. Having mastered the skills of sanogen thinking, the student will gain knowledge about the control of negative thoughts, ways to protect against them, as well as the constructive solution of problematic situations.
2. Reflection is an important mechanism for the development of sanogenic thinking. Separate organization of processes of understanding the phenomenon in the context of a broad system (it includes assessment of situations and actions, finding ways to solve situations and operations), activities aimed at understanding behaviors and their consequences. is a form of human mental activity, i.e. the ability to look back (backwards) and to see, identify, study and analyze a particular problem and the reasons for its emergence.
3. It is necessary to create inner peace while creating a favorable environment for reflection. If the reflection is combined with a state of relaxation (calmness), the human mind gets rid of negative thoughts, misconceptions, emblems, and their repetition in the mind does not cause discomfort. Under these conditions, a person adapts to the situation, and even if negative emotions are repeated, a bad impression does not occur.
4. High mastery of reflexive skills is an important indicator not only in the development of students' sanogen thinking, but also for their success, self-analysis, identification of their strengths and weaknesses, and the correct implementation of future activities.

The development of sanogenic thinking of future teachers is inextricably linked with a number of pedagogical conditions. These are:

1. Informative-meaningful conditions. Special attention is paid to the developed educational programs, lecture notes, educational-methodical complex and electronic textbooks based on teaching technologies, means of control: creative pedagogical tasks, situational issues, creative project work, courses related to specialties and independent education.
2. Technological conditions. In order to achieve the research goal, an effective form, method and means of activity should be developed and a technological approach should be based on its

implementation. In the process of developing students' sanogen thinking: problem-based learning, game technologies (role-playing games, entrepreneurial games, social drama), training, video trainings, problem-seminars, pedagogical problem-solving and analysis, case studies, small group learning, micro - Special attention should be paid to the development of lessons, creative and research methods, methods of designing educational activities, methods of organizing and conducting self-training.

3. Reflexive conditions. The content of reflexive conditions aimed at the development of sanogenic thinking in future teachers should be defined as follows: development of active cognitive motivation; decision-making on the system of positive attitude to pedagogical activity; formation of creative or creative thinking skills; formation of pedagogical and psychological methodological knowledge; develop reflexive analysis skills; professional self-awareness and so on.

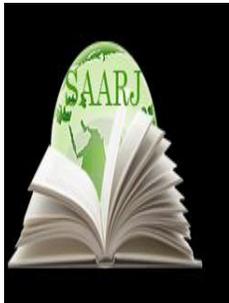

4. Ensuring a combination of classroom and extracurricular activities: lectures, independent learning, clubs, group activities, self-study and self-development, as well as other forms of activity are important pedagogical tools for positive solutions to research problems.

Thus, the integration of the above pedagogical and psychological conditions plays an important role in the development of students' thinking skills and improving the quality of education.

ABSTRACT

The formation of psycho-diagnostics as a science has its historical roots. The historical roots of science allow us to determine the path of its development. Today, the development of world psycho-diagnostics is assessed based on its many years of experience. In turn, the development of psycho-diagnostics in Uzbekistan is also influenced by world experience. Analytical materials on the development of psycho-diagnostics in Uzbekistan were carried out in connection with the application of diagnostic tools in dissertation research conducted in the country. Psycho-diagnostic methods were divided into types according to the nature of their application in research and the status of their application was assessed. According to the historical roots of psycho-diagnostic research in Uzbekistan and the research conducted, it is conditionally divided into stages. This indicates the need for a separate study on this issue.

KEYWORDS: *Psycho-Diagnostics, Development, Test, Methodology, Research, Adaptation, Dissertation.*

INTRODUCTION

The application of psycho-diagnostic methods in Uzbekistan has developed under the influence of experience in world psychology (USA and Europe), the former Soviet Union (Russia and the Commonwealth of Independent States). Formulation and adaptation of methods used in psychological research. Therefore, it is necessary to illuminate the problem by turning it into a question of application of psychological tests or psycho-diagnostic methods instead of the concept of research methods on psycho-diagnostics of the person. This, in turn, allows the application of psycho-diagnostic methods in the field of psychology in Uzbekistan, in turn, to

highlight the state of implementation of methods in the field of psycho-diagnostics of the individual in the national environment. The introduction of tests is characterized by the recording of data on the mental retardation of children, which is explained by the role of factors related to the physiological and social development of children.

THE MAIN FINDINGS AND RESULTS

In our analysis of the problem of tests in the former Soviet Union, we have provided historical information that it was not the emergence of psychological tests, but the attempts to implement them in the 1920s. In this case, the application of the initial tests is related to the research conducted by A.R. Luria among the mountain population to examine the issue of intellectual potential of the population [3, 47-49]. This is the first stage of psychological research. The introduction of tests is characterized by the recording of data on the mental retardation of children, which is explained by the role of factors related to the physiological and social development of children. It was emphasized that this peculiarity was peculiar not only to the working-peasant population of the Asian region, but also to the representatives of other nationalities in the whole Union [2].

However, the state of implementation of tests in modern psychology is undoubtedly closely related to all the achievements and losses in the history of the former Soviet Union. It is no secret that the influence of political pressure on the application of psycho-diagnostic methods in the former Soviet Union lasted until the 70s of the twentieth century and led to a sharp regression in the development of this direction [2, 86-90]. This is also true of the history of psycho-diagnostics in Uzbekistan. However, due to the permission to freely apply psychological tests in the 70s of the last century, the impact of the issue of their formation and use did not bypass our republic. The opening of the Department of Psychology and the training of psychologists at the Tashkent State University in 1972 is a great achievement in the Republic. This is a step taken in our country to train specialists in modern psychology and conduct research.

If we look at the application of psychological tests in the 80s and 90s of the twentieth century, they began to be studied in general psychological, psycho-diagnostic, social psychological, ethno-psychological and pedagogical and young psychological nature. In addition to the tests listed above in psychological research during this period, the Spielberg-Khanin method (E.G. Goziev) [13], G. Yu. 6], DJ Raven's test "Progressive matrices" (B.R. Kadyrov), J. Yerasik test, Map of interests, settings and methods of professional orientation (B.R. Kadyrov) [11; 15], the Alyoshin test on family relations (G.B.Shoumarov [8], B.Umarov [7] and other methods of adaptation and implementation.

The work on the introduction and adaptation of psychological tests in the country, the establishment of the Republican Diagnostic Center in 1996 and the opening of its regional branches, the introduction of a test system in the country's student competition is also an achievement in this area.

In the 90s of the XX century and in the XXI century, the application of psychological tests began to be carried out independently by psychologists of our country. The creation of tests and their practical application can be attributed to the establishment of a psychological center under the Ministry of Defense of Uzbekistan, psychophysiological laboratories of the Ministry of Internal Affairs of the Republic of Uzbekistan.

Our attention to the history of the implementation of psychological tests and their development in the Republic has led to the possibility of collecting analytical materials related to psychodiagnostic methods, tests, questionnaires used today. Before we dwell on this issue, we have to list some of the tests created by scientists of the Republic. Professor E.G. Gozievi's "Test of willpower" (a modified form of M.V. Chumakov's method), "Assessment of selflessness", "Assessment of a harmoniously developed person", "Assessment of patriotism", "Are you communicative" (V Adapted form of F. Ryakhovsky's questionnaire) [13] and Professor BR Kadyrov's "Methods of choosing class intelligence", "Determining professional orientation" (K.B. Kadyrov) [11], Methods of primary selection of gifted children ("100 words" and "50 sentences" literacy tests) (B.R. Kadyrov) [10] are among these tests. The transition from the adaptation of psychological tests to the stage of formation is evidence of the growth in the history of psychological tests in our country.

Our study analyzed the status of dissertations for the degree of Candidate of Psychological Sciences, Doctor of Philosophy (PhD) in Psychology and Doctor of Psychology, completed in 1992-2020. The state of the method used in the past of Republic According to the implementation of dissertations in the field of psychology in our country, 300 methods was used. These results were obtained on the basis of acquaintance with the dissertations on psychology in the Information Resource Centers of the National University of Uzbekistan and the Tashkent State Pedagogical University, these analytical materials were obtained. Of these, 117 were found to have been used in research between 1992 and 2017, and 183 in 2017-2020 [4].

It was found that 117 different levels of methodology were used in dissertations conducted in our country from 1992 to 2017, and 183 in 40 dissertation researches in 2017-2019. The total number of methodologies specific to both stages was 300 [4]. We classified these methodologies and divided them into the following groups (Table 1).

The main part of all types of methodologies used in the national research is those created in other national and cultural environments, and the status of those formed in the local context is much lower

TABLE 1 STATUS OF METHODS USED IN DISSERTATION RESEARCH IN UZBEKISTAN IN 1992-2019

№	Types of methods	Types of methods			Share of methodologies (%)
		1992-2017 years.	2017-2019 years.	1992-2019 years.	
1	Methods for studying the personality, types, values, orientation, attitudes and interests	27	43	70	23,33
2	Methods of studying interpersonal relationships	5	5	10	3,33

3	Methods of studying the areas of motivation, emotion and will of the person	25	36	61	20,33
4	Methods of studying the cognitive sphere of the individual	6	19	25	8,34
5	Methods of social psychological research (social adaptation, social institutions, family relationships and values)	19	37	56	18,70
6	Social psychological surveys (formed by local scientists)	12	15	27	9,00
7	Projective methods	9	8	17	5,60
8	Sociometry	1	1	2	0,70
9	Methods for studying the methods of activity, areas of activity and career choice	5	4	9	3,00
10	Questionnaires	8	15	23	7,66
	Total	117	183	300	

(39), they account for 13% of all applied methods. This suggests that research does not pay enough attention to the formation of methodologies by local psychologists.

According to the weight of all types of psycho-diagnostic methods, the most widely used category is the group "Methods for studying the facets, types, values, orientation, attitudes and interests of the individual", which are 23.33%; "Methods of studying the areas of motivation, emotion and will of the person" 20, 33%; "Methods of studying social psychology (social adaptation, social institutions, family relations and values)" has a share of 18.70%. Sociometry can be included in the category of methods with low implementation rate (0.70%).

Also, most of the methodologies developed by local scientists in the research on dissertations were "Social Psychological Surveys" (7.66%). These are diagnostic tools that are shaped by the goals and objectives of more socio-psychological research. Numerous sources related to the state of development of methodologies can be cited in the research conducted in our country over the past twenty years and in the formed scientific literature. For example, Professor B.R. Kadyrov in the field of methods of primary selection of gifted children "Methods of selection of classroom intelligence"; "Literacy tests" ("100 words" test, "50 sentences" test) [10]; P.S. Ergashev modified the results processing system on the "Methodology for diagnosing the degree of symmetry ("Barron-Welsh Art Scale")" and developed a "stepwise scale of symmetry" (P.S. Ergashev) [9]. Among them is the associative questionnaire "Family and marriage issues" [5], formed by the researcher Z. Rasulova.

Another aspect that attracted our attention was the analysis of the application of diagnostic methods in psychological research and the level of their application. We reviewed the research methods used in 156 dissertations and tried to systematize them. Information on their condition is given in the following diagram 1.

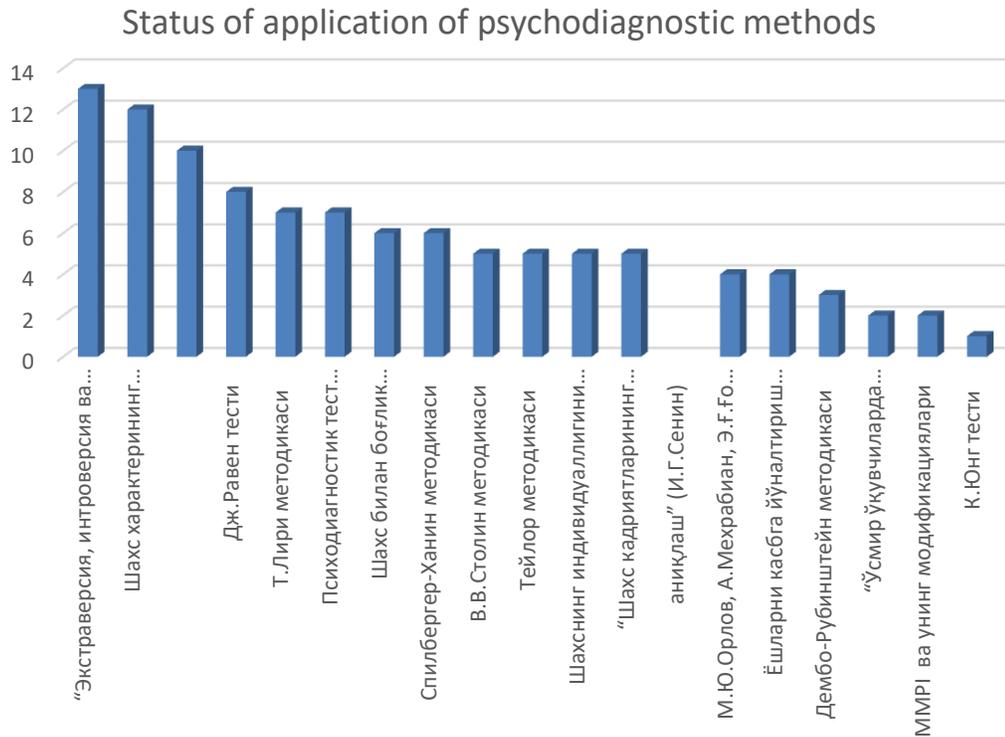

DIAGRAM 1 RANKING OF PSYCHO DIAGNOSTIC METHODS (QUESTIONNAIRES) USED IN PSYCHOLOGICAL RESEARCH ACCORDING TO THE STATE OF APPLICATION *

*Note: * Depending on the state of application in research*

According to the application of the methods in research, G.Y. Eisenk's method received the highest rating with 13 (0.76) times. The method of “Determining the accentuation of personality” (K. Leongard) was used in 12 (0.70) dissertations. The share of methodologies included in the remaining four was presented on the basis that they formed a homogeneity in several methodologies. The R.B. Kettell 16 RG survey was used 10 times (0.50) as a research methodology. In addition to individual surveys, J. Raven's Progressive Matrices test has been widely used 8 (0.41) times in research. Speaking about the share of methods created in the local environment, the questionnaire aimed at studying the individuality of the individual (EG Goziev and R. Tashimov) 5 times (0.29), “Questionnaire for youth orientation” (B.R. Kadyrov) 4 times (0, 23) and “Questionnaire to determine the level of anxiety in adolescent students” (Z.T.Nishanova, Sh.T.Alimbaeva) were implemented 2 times (0.11).

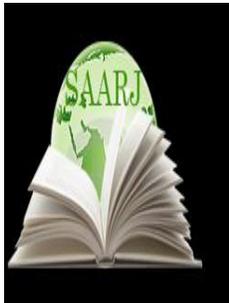

This model for the development of psycho-diagnostics in Uzbekistan was conditionally implemented. Extensive research in this area will be needed.

CONCLUSION

It should be noted that the specifics of the application of psychological tests, attention to their psychometric requirements, and the prospects of new methods should be developed by conducting a separate study of these historical stages of development at the PhD level in psychology.

THE CREATIVE TECHNOLOGIES FOR TEACHING STUDENTS TO WORK IN SHORT-TERM COLORS

Ruslan Khalilov*

*Associate Professor,
 Department of “Fine Arts and Methods of Teaching”,
 Tashkent State Pedagogical University named after Nizami,
 UZBEKISTAN

ABSTRACT

In the article, main practical recommends on drawing etudes are given. The peculiarities of individual methods using in this direction are explained. Research shows that even if a student understands and remembers the basic rules of drawing from nature, there are cases when he is unable to apply the theoretical and practical knowledge he has acquired. A student who has mastered the art of drawing and working methods will not be able to feel free in the process of practical work and, as a result, will not be able to fully express their thoughts and feelings.

KEYWORDS: *Etude, arrangement, specifies ratios, composition, and the lows of perspective, relations of color and tint, constructive building, plastics, plain air.*

INTRODUCTION

Thorough mastery of the basics of fine arts will help the student to see and understand the laws of the structure of all forms in nature, to accurately describe what he sees. But this knowledge is not yet enough to become a skilled artist-educator in the future. Research shows that even if a student understands and remembers the basic rules of drawing from nature, there are cases when he is unable to apply the theoretical and practical knowledge he has acquired. Therefore, in addition to theoretical knowledge, he must also have performance and technical skills in the fine arts. Technical skills are just as important to an artist as a child in 1st grade needs to know the letters when writing calligraphy. It should not be technically difficult during the practical exercise. Free and skillful acquisition of technical skills allows the student to be fully committed to creativity, to realize creative abilities and to become a highly qualified artist-educator. A student who has mastered the art of drawing and working methods will not be able to feel free in the process of practical work and, as a result, will not be able to fully express their thoughts and feelings. This also applies to all types of art, especially pencil painting, which is the basis of fine

art. In ancient academic schools, great emphasis was placed on imaging techniques. Also, when master artists were first introduced to the art of painting, students were given the task of copying from master artists, and the main focus was on the technique of drawing. These can be seen in the manuals of A.T.Skino, V.V.Pukirev, A.K.Savrasov. We also witness how such a wonderfully crafted work of art was created by the great artist of the East KamoliddinBehzod, the portrait of Sultan Hussein Boykaro, the king of Khorasan, in a complete and elegant way through the technique of simple lines.

THE MAIN FINDINGS AND RESULTS

The specialization skills acquired by the student not only determine the quality of his pedagogical, educational process, but also help him to show his creative abilities. Ability is the foundation of any great person's talent. Skills are the basis of any creative work, as well as visual activity. Skills are strengthened during the exercise. Exercises should be based on a clearly designed and organized system. For example, during a pencil drawing exercise, a student should be taught to draw barcodes and move their hands freely so that the shape and size of the item are correct, and to keep their finger movements in balance. Many years of scientific research, the results of pedagogical activities and examinations show that hand movement skills and practical exercises in drawing are manifested in three stages:

Training the hand in different movements and performing a series of separate exercises (circular, semicircular, vertical and horizontal lines, etc.).

Achieving free movement of arm muscles during visual activity;

Improving the skills of hand movements on the paper surface and developing technical skills in observing and depicting nature (depending on the nature of the task, emphasizing the necessary areas of work, drawing light lines on secondary pieces, etc.).

Teaching students to hold hands correctly and to draw should be done from the very beginning of the learning process. Then it is necessary to teach him the technical methods that should be used when painting from nature. This allows the student's creative ability to be further developed.

In this regard, one of the most pressing pedagogical problems is the reorganization of the teaching of fine arts in schools specializing in fine arts, the improvement of its content and methodology.

In the fine arts, the work of short-term paintings is of particular importance here. So, one of the urgent tasks is to teach art to schoolchildren through the fine arts. In the training of qualified teachers of fine arts, it is important to teach students the correct depiction of objects in nature, the formation of skills of the future artist-teacher in the field of fine arts, through the exercises of depicting nature in the classroom. In nature drawing lessons, the student first learns to see the specific aspects of different shapes correctly. It is well known that people perceive objects and their images differently. This is primarily due to everyone's eye structure, and especially their ability to see in the visual arts. The main task in teaching drawing is to form in this artist the ability to see and depict the shape of a body from a distance. Seeing and depicting the shape of an object from a distance (width) means seeing the object in "full size" in three-dimensional shape (height, width and thickness). True drawing is achieved by measuring with the eye, estimating distance and body dimensions, and correctly understanding nature. In such cases, it is important to develop visual acuity to determine body size and distance. Estimation skills teach

the future educator to be attentive and responsible in their work, develop in them the skills of careful analysis of objects and shapes around them, and at the same time develop the ability to remember the image they see. Constantly determining the ratio by eye during the work process to form estimation ability gives good results. Visual recollection is the most valuable and observant characteristic of the artist, through which he remembers a clear and general idea of the shape, proportions, and structure of the body. This allows you to draw the shape from memory, imagination and comprehension, and makes the artist's work on the creation of independent compositions and sketches much easier in the future.

As a result of constant practice of drawing from nature, the ability to see and remember develops. Such exercises are more effective, especially among newly admitted students. This helps students to remember more about the shape, constructive structure, proportions, and plasticity of objects. In the early stages of learning, students usually try to move what they are drawing to the surface as if it were their own. They look carefully at the objects in front of them, then paint each small piece and their color separately. As a result, the image is blurred and does not appear as a whole. Such shortcomings are due to the inability of the set to show the large color relationships between objects in the etude. Even in the correct depiction of the human head, for example, it is impossible to start with small parts of the face. It is only from the generality and integrity in the proportions in motion that one must learn to determine the color relationship between the main generalized spots of different natural objects (still life, landscape) or objects in painting. Seeing a natural object as a whole and being able to identify a large primary color spot is an important professional skill that must be formed in early painting education. Only then can long-term (in time) work move on to the careful processing of volumetric shapes of landscape objects or still lifes.

When working with small-sized etudes (paints) in the open air (plein air) with different colors, it is important to first find the exact color relationships. To do this, it is necessary to compare the contrasting (colored and colored) spots on the front view of nature with respect to the distant ones. In small-scale etudes, small pieces are ignored, mostly written in large color relationships. When performing landscape etudes, less complex plots are chosen (for example, a part of the house and yard).

It then moves on to depicting an open-air landscape, complicating the task. Depicting landscapes requires experience from a young artist. In the first exercise, the student learns by describing specific details in nature (stones, flowers, tree branches, fruits and vegetables). He then gains experience in developing small character appearances. Through this, the colors become more visible in nature. As a result, new ideas for future compositions are born. When painting, a young artist should focus on the sky and clouds, mountains, trees and plants, and water. One of the main tasks is to skillfully place it on paper, cardboard, or fabric, drawing attention to a beautiful piece of nature. Through the solid colors, the color composition is processed and then transferred to the floor-sized paper. As the student works on the composition of the work, of course, he expresses his inner feelings in the composition and makes art lovers think. It now definitely depends on the creative skill. Performing non-stop exercises, research leads to an increase in the artist's skills. Painting is a preparatory stage before creating a great work. The beauty of nature has always fascinated people. Man enjoys, gives in to emotions, his heart is excited by the colors he likes. As he creates the work, he places the depths of his soul in it. In such studies, the main focus should be on events in the air perspective, such as the lightness and saturation of colors in

the landscape in different forms. This is achieved through a holistic perception by comparing all aspects of the landscape.

For example, the river bank in the front view is compared to the second and far view, as well as to the sky and its reflection in the water at the same time (the study time can be 15-30-60 minutes).

“... It is necessary to describe the etude in such a way that suddenly it is necessary to understand the nature of the relationship between earth and water relative to the sky”, said Malik aka Nabiev, a well-known artist, People's Artist of Uzbekistan. He himself was a master of finding the correct color relationships in etudes [1. 28.].

The purpose of short-term studies can be different: sometimes the study is performed before long-term work, in which the relationship of colors in nature is analyzed and the first impressions of its color are determined, in other cases - its small parts (human hand study, some parts of the landscape) are determined. In order to thoroughly study the laws of painting, etudes are performed in field practice: the general illumination condition of the landscape, the integrity of the colors, etc. In describing the etude of the landscape, the light always changes frequently. Even if the sun is behind the clouds, it has a direct effect on the landscape, as the light status in the landscape is always different at the beginning and end of the session.

Several short-term studies were performed with simple natural settings designed to accurately observe the overall hue and color state of a still life in a room if the light source was placed at different distances, i.e. near the window, in the middle of the room and away from the window (inside the room). Several short-term studies have been performed with simple natural settings designed to accurately observe the overall hue and color state of a still life in a room, if the light source is placed at different distances, i.e. near the window, in the middle of the room and away from the window. The first still life setting is placed closer to the window so that it is brighter than the others. The coverage of subsequent performances will be a bit slower. Through these training presentations, the overall hue and color state of the etude is demonstrated depending on whether the shadow, light, color, and illumination in the etudes are reduced or enhanced [2. 22.].

Performing short-term etudes is important to achieve the unity and harmony of color. In such targets, a certain color must prevail. For example, a still life can be illuminated with artificial warm light. There is no need to elaborate on the small pieces in such studies. The important thing is to understand and describe the color gamut by understanding its unity and harmony. In short-term etudes, it is expedient to depict alternatives in warm and cool colors.

As a result of the young artist's continuous practice, he is able to distinguish subtle changes in colors, develop observation, feel the variety, and master the visual aids. When we observe the sketches of experienced artists, we are envious of their extremely elegant and attractive depictions. The skill of skillfully depicting the colorful color state of nature is achieved as a result of continuous practical work.

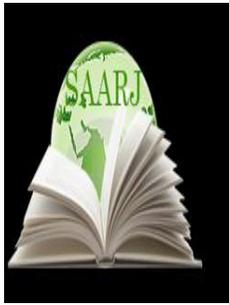

Thus, the basis of painting is that the general and large color relationships between the main objects of nature are preserved in a certain hue and color range. On this basis, a very delicate process of working on objects in subsequent colors is carried out, which is the result of careful observation of nature, feeling it alive [3. 32.].

CONCLUSION

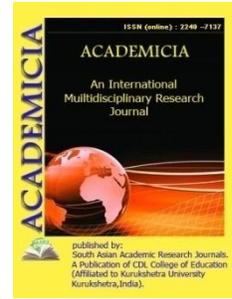

Any natural setting should be taken as a holistic image. Still life is made up of different things, such as a sandbox, an apple, a bowl; and in the landscape - separate skies, forests and distant blue mountains must be forgotten for a while. By looking at nature in this way, you can only see the individual color of the objects, but not the colors that need to be depicted. All objects or objects of nature are only a part of the color picture, the resonance of colors, its integrity is manifested throughout the depiction, which sounds like a holistic symphonic work performed on different musical instruments.

POETS OF THE SAMANIDS ERA

Sevar Ilyasovna Shomurodova*

*Lecturer,
 Department of Iranian-Afghan Philology,
 Tashkent State University of Oriental Studies,
 UZBEKISTAN

ABSTRACT

It is known that during the reign of the Samanids, great attention was paid to the development of science, art, literature and culture in general. As a result of the attention given to literature and culture, many generations of poets and writers have been formed and they have created unique works of spiritual wealth. During the period of the Samanids, literary literature, first in Arabic and later in the 10th century, lyrical and epic poetry in the Persian language, based on folk art traditions, developed. The works of Rudaki, Farrukhiy, Shahid Balkhi, Dakikiy, Abu Shukur Balkhi and Firdavsi were based on the traditions of the Samanids. At that time, the Arabic language was widely used, although the language of population was Sogdian, Tajik, and Turkish. Arabic was also the language of international communication, science, literature and religion in caliphate. It is not accidental that the sources contain information about 47 poets who writes in Arabic language in Bukhara in IX-X centuries. It is known that the number of the most influential Persian-speaking poets in this period reached 200. This article is dedicated to study the life and work of poets of the Samanid period in Middle Asia. In this article along with the well-known poets, the works of the some poets who are far from attention of scientific and literary community, and the ideas expressed in their works. The article also states that the Samanids played an important role in the history of the early Middle Ages, Middle Asia reached cultural development during the period of the Samanids, Persian-Tadjik language emerged from Iran and Bukhara has become a major cultural center of the East in the tenth century.

KEYWORDS: Middle Asia, Samanids, Literary Environment, Persian Language, Tadjik Language, Dari Language, Arabic Language, Ghazal, Ruboi.

INTRODUCTION

The Samanids state (874-999), which played an important role in the history of the peoples of Central Asia during the Middle Ages, included the territories of present-day Uzbekistan and Tajikistan: Bukhara, Samarkand, Ustrushon, Choch, Ilak, Fergana, Kesh (Shakhrisabz), Nasaf (Karshi) Chaganiyon, Huttal, Kobadiyan, Akharun, Shuman, Vashgird, Rasht, and extended to Northern Afghanistan: Badakhshan, Vakhon, Ravshan Khorasan. Khorasan itself covered Balkh, Guzganon, Gurzhistan, Merv, Herat, Nishapur to Mashhad. The capital of the Samanids state – Bukhara in the X century was a major cultural center of the East where the Ikhvonus-safo scientific community and the rich library of Savvan al-hikmat (“Treasury of wisdom”) were formed.

As noted in “Yatimat ad-dahr” by Abu Mansur as-Saolibig, in the IX-X centuries only in Bukhara 47 poets wrote in Arabic, for example, Muhammad al-Matroni, Abul-Siyob, Abu Muhammad, Mansur Ahmad ibn Abdulloh, Ali Masihi, and others, and more than 200 poets in Persian-Tajik. In the monograph of academician B. Gafurov “Tajiks: the most ancient, ancient and medieval history” M., 1972, devoted to fiction in the Samanids era, provides detailed information on the life and work of 6 poets (Abu Abdulloh Zhafar Rudaki, Abulhasan Shahid Balkhi, Abushukur Balkhi, Robia, Abumansur Muhammad ibn Ahmad Dakiki and Abulkosim Firdavsi). In the book “The State of the Samanids”, dedicated directly to this era, N.N. Negmatov presented works of 5 poets (Abuabdullo Rudaki, Abulhasan Shahid Balkhi, Abulmansur Muhammad ibn Ahmad Dakiki, Abulhasan Kiso Marvi and Abulkosim Firdavsi). Each of these works has been translated into Russian without presenting the original text.

Abulmasali Bukhori. According to the tezkir of Rizokulikhon Khidoyat Tabaristoni “Mazhma-ul Fusaho”, only one byte of this poet is known:

Chu gardad ogoh khuja zi kornoma-i man

Ba shahriyor rasonad sabuk chagonai man

Content: If the khodja knows about my deed, he will immediately inform the khokim.

The poet in a simple and accessible form described the feudal regime of that time.

Abu Khanifa Marvazi (died 995) was one of the students of Abu Nasr Farabi in the field of philosophy and jurisprudence. During the era of Nuh bin Mansur (976-997), he served as a “Dorul Insho” – Secretary of State. Three kasydas (15, 61 and 44 beites), dedicated to Sultan Ibrohim, have come down to us from his poetic heritage. In his works, Abu Khanifa created the image of rulers who advocated the interests of the people and called on the rulers to justice.

Chu mard boshad dar kor va baxt boshad yor,

Zi hoki tiyra namoyad ba halq zarri a’yor.

Content: If there is honesty in this activity and the ruler is happy, then the people will be able to find pure gold in the black soil.

Abushukur Balkhi. Rizokulikhon Khidoyat, named the date of the poet’s birth as 336 Hijrah (947 or 948 BC). (The book “Tajiks” by B. Gafurov indicates the date 915). He worked in the palace of Nuh ibn Nosir. Unfortunately, the didactic poem “Ofarinnoma”, glorifying Abushukur, in which the author made extensive use of folk sayings and parables, did not reach us, for instance:

Tavongar barad ofarin sol-u moh,

VA darvesh nafrin barad begunoh.

Content: I didn't notice how much time passed,

But I realized that I did not know anything.

Rudaki Bukhori. The founder of the Persian-Tajik language and poetry Abu Abdullo Rudaki was born in the XI century, in the village of Panjrudak (present Penjikent district. It is impossible to imagine the poetry and culture of Samanids era without the name and work of Rudaki. Even in his youth, he was already known as a talented musician and singer. Poet of the XIV century Rashidiy Samarkandi transferred over 100 thousands hemistichs of Rudaki to verses. About two thousand hemistichshave reached us. Rudaki wrote in the genres of qasid, ode, gazelle, kyt, and rubayat. Rubayi

Hon, tashna jigar, majui z-in bog samar

Bidoston- in riyozhi bi dudar:

Behuda mamonki

bagbon-at biqazo-

Chun Hoknishastagir VA chun bodguzar.

Content: Hey, the wishing, know! Do not seek fruit in this garden. This two-gate garden is barren. Therefore, do not remain ignorant! The fate of the gardener is to die and fly away like the wind.

CONCLUSION

The poetry of the Samanids era is characterized by clarity of presentation, accessibility of linguistics forms and the relevance of topics: love and loyalty to the motherland, justice.

SOME ISSUES OF POETICS OF NAVOI STORIES

Sevara Baratova*

*Junior Researcher,
 Institute of Uzbek Language,
 Literature and folklore,
 Academy of Sciences of the Republic of Uzbekistan,
 UZBEKISTAN

ABSTRACT

This article captures the poetic aspects of Navoi's stories. The shortness and brevity in it are shown as an expression of the poet's skill. Alisher Navoi's work is an important stage in the history of our literature with its deep ideology, richness of content, diversity of genres, and the highest level of art. He is one of the greatest artists of artistic expression. The artistic mastery of a great artist like Navoi is a big issue and requires special research on the works and epics of the poet.

KEYWORDS: *Navoi, Poetics, Brevity, Conciseness, Skill, Image Creation.*

INTRODUCTION

If we look at the millennial history of Uzbek classical storytelling, we can see that most of the poetic and prose stories are artistically in demand. After all, the classic stories created in the past were required to find their reader and have an artistic and aesthetic impact on him, as well as to take into account the educational goals. When analyzing the stories in Uzbek literature, we can see that their artistic level is different, some of them are artistically mature, and some of them are not so mature due to the fact that the authors are mainly focused on the idea. For some aspects of the classic storytelling poetics, we would like to emphasize that a number of stories that are part of Alisher Navoi's epics are exemplary. For this reason, we believe that it is possible to draw conclusions about the poetics of all-Uzbek classical storytelling by showing and analyzing some aspects of the poetics of Navoi's stories.

Alisher Navoi's work is an important stage in the history of our literature with its deep ideology, richness of content, diversity of genres, and the highest level of art. He is one of the greatest

artists of artistic expression. The artistic mastery of a great artist like Navoi is a big issue and requires special research on the works and epics of the poet.

We briefly touched on the art of creating an artistic image in the stories of AlisherNavoi, the plot and composition, and aimed to express our views.

THE MAIN FINDINGS AND RESULTS

Alisher Navoi, well aware of the peculiarities of each literary genre, created high-quality stories, both ideologically and artistically, taking into account the possibilities of the story genre in reflecting reality. Each story has its own independent plot line, images, and all the components of the plot. The poet's stories have many features that are unique to the story genre. Also, each story has its own characteristics.

The most important features of the story genre are brevity and conciseness. The same thing is evident in Navoi's stories. The poet also emphasizes that expressing an idea in a concise, comprehensible form does not detract from its great content. The poet writes about this in the epic "Sab'aiSayyar":

Har ne bordostongasoldisado,

Munda birbaytbirlatobqay ado;

Mujmaloningso'zinqilibtakmil,

O'zhadisimgabergamentafsil [1, p. 31].

Everything sounded like a friend,

In this case, one byte is added.

Improved by the word of the mysterious mother,

I will give details in my hadith.

It seems that the views of the great word artists on concise expression, conciseness, are close to each other. This closeness is the result of their objective approach in evaluating literary genres.

The deep ideological and artistic beauty of each work largely depends on the extent to which the human image is depicted in this work.

When we look at Navoi's stories, we come across colorful images of people in them. Based on the requirements of the time, the poet created positive and negative images of different people, based on the classical literary tradition of the past, the fruits of folklore. In Navoi's stories he skillfully depicts the positive images of hard-working people, righteous kings and princes who were oppressed in the life of that time. The poet pays great attention to the embodiment of the images of the working class. That is why most of the positive images in the stories are representative of the people. For example, the image of a poor and oppressed old woman in the story of "ShahiRozi", the image of an old man collecting firewood in the story of "HotamToi", and the image of an old farmer in the story of "BahromGor". The whole sympathy of the poet is also directed to the fuller depiction of these images. The images in the stories are concisely and convincingly portrayed in life episodes.

Navoi's concise presentation of stories and his views on brevity are a clear example of this.

The whole tendency of the poet is to complete these images; to describe. The images in the stories are concisely and convincingly portrayed in life episodes.

In the stories of the poet, positive images of kings and princes were created, many of which had an ideal character. It was impossible to see people of a character completely similar to any of these images in the conditions of that period. By creating such images, Navoi expresses his dreams of what a king should look like. For example, in the story “HotamToi” the portrait of the old man is not completely drawn. In the story:

The bright image, mood, and inner experiences of

Har ne bordostongasoldisado,

Munda birbaytbirlatobqay ado;

Mujmaloningso'zinqilibtakmil,

O'zhadisimgabergamentafsil [1, p. 152].

The load was overturned,

Basically, he is attached to the house.

As long as you take each step,

Take a chance before every breath...

People seem clear and vivid. Or take the image of Jabir (“Mercyand Suhayl”). The portrait of Jabir is not fully drawn. But through two bytes, Jabir's appearance is well drawn:

Ham tanumandu ham shujoudaler;

Ulsifatkimjaziraichrakisher;

Bahraarroofatinechukkinahang,

Beshaichranechukkisherupalang [3, p. 278].

Both cheerful and courageous;

He is an insidious lion.

Enjoy the whale disaster,

A lion leopard in the forest;

In the first byte, Jabir is likened to a lion to show that he is strong. In the second byte, the idea in the first byte is developed, and Jabir is likened to a disaster-stricken shark. This reveals its negative features. As a result, we see a huge negative image of Jabir. It should be noted that it is difficult to distinguish them from each other through the portraits of some of the characters in Navoi's stories. Because the portraits in the poet's stories have often had a traditional character; many of the expressions used in their portraits of women (“tall cypress”, “kind face”) are also used to draw portraits of male characters. For example, we give the portraits of Mercyand Suhayl in the story “Mercy and Suhayl”.

Mercyportrait:

Taqikimnahlisarfarozkelib,

Husnboshdasarvinozkelib.

Yuzigamehrbandauotimehr,

Uyrulubmehridekboshigasipehr[3, p. 279].

He was greeted by a palm tree

The beauty first came to flirt with cypress.

Mercy busy name on the face mercy,

A shield on his head like a broken heart...

Suhayl portrait:

Yuzidinbargigulhijilerdi,

Qaddidinsarvmunfailerdi.

Hunaravjisorikelibangamayl,

Yuziandoqkimehr, otiSuhayl[3, p. 282].

The flower on your face was embarrassed,

The old cypress was mun-fail.

The peak of the profession is coming,

His face is kind, his name is Suhayl.

This means that even if portraits are not given in full in Navoi's stories, it is not difficult to recognize them. The poet can portray a portrait of a particular hero in one or two details in an extremely vivid way. No matter which of the poet's stories is considered, the metaphors, metaphors used in them rise to the level of an element that reflects the poet's skill and enhances the fluency of the work. In addition to these works of art, we can observe dozens of examples of spiritual and daffodil manats in Navoi's stories. This proves that the genius artist's stories are also adorned with fine arts, enhancing their fluency. Returning to the poet's story "Mercy and Suhayl", we can see that it has a series of interconnected events. This series of events forms the plot line of the story. Among the events, the love story between "Mercy and Suhayl" is the main one, and the rest are auxiliary events, which help to reveal the main event more fully, clarifying it. However, each episodic event serves as part of the main event. The plot structure of this story is as follows: At the beginning of the story, the poet introduces the reader to the description of the positive and negative images, and tells the story of Mercy's voyage and captivity. This event is the beginning, the node of the main event in the story. Now, as the story of Mercy's fate in the story unfolds, new contradictions emerge. A fierce battle ensues between Suhayl and Jabir, and Jabir uses a ruse to defeat Suhayl and throw him into prison. Two kings will fight against Jabir - Nawdar, the king of Aden, the father of Mercy, and Numan, the king of Yemen, the father of Suhayl. But they too are defeated and taken prisoner by Jabir. The story unfolds quickly as it reaches its climax. Truth will prevail and justice will prevail. The two lovers reach their goal.

The character of such a plot provided an interesting outcome of the story. This is how the poet's skill in creating a plot is seen. Citing a series of contradictions, he ensured that the story was read with constant excitement until the end.

In this story, the logic of events comes first. But not all stories are of the same character. Each story of the poet has its own plot structure. In the story of King Juna and Mas'ud, the logic of the characters comes first, not the logic of events.

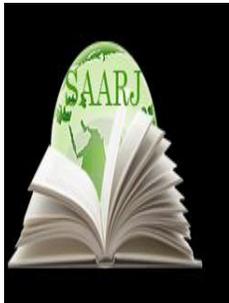

It is obvious that in the image of a certain hero, he is fully immersed in a series of events, and in some of them he introduces the reader to their character traits and professions, before he enters the dust of events. Such cases are observed in this story.

CONCLUSION

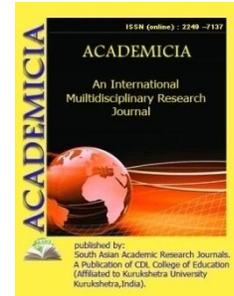

To conclude, the stories of Alisher Navoi, with their artistic perfection, reflect the poetics of the entire Uzbek classical storytelling and serve as a source in determining the artistic features of the classic stories before and after.

ABSTRACT

In the article, the solution of the food problem has become much more difficult in recent times in line with the challenges posed by the trend of global agricultural development. The growth rate of food production is significantly lower than the growth rate of demand for it. As a result, chronic famine is on the rise in many areas. The problems of food shortages and the production of quality goods were analyzed, and practical recommendations were given to overcome them and improve the nomenclature of national goods.

KEYWORDS: *Food Security, Food Balance, Food Supply, Food Consumption, Macroeconomic and Institutional Aspects, (Argentina, Australia, Canada, EU, USA). Welfare Aspects, Political Aspects, Subsidy Issues.*

INTRODUCTION

Food security is a strategy of the national food market. There are two aspects to food problems: socio-economic and environmental. The environmental aspect includes measures to ensure the preservation of the environment and the production of food products that are safe for the health of the population.

The growth rate of food production is significantly lower than the growth rate of unmet demand. Malnutrition is typical of countries with low per capita incomes. This is the case even in oil-producing countries with average incomes. Normal nutrition standards are set by national and international specialized organizations such as the World Health Organization and the FAO. In

1953, the average normal diet in the United States was 3,200 kcal / day, while today the figure is 2,700 kcal / day. People who consume 2150 kcal and less fall into the category of malnourished and on the verge of starvation, and those who consume 1520 kcal and fewer falls into the category of starvation.

THE MAIN FINDINGS AND RESULTS

FAO (Food and Agriculture Organization) experts recommend calculating the total level of energy expenditure of an adult with an active lifestyle at a given time as follows:

$$Ex = K * M * Vp$$

Here:

Ex - the total energy expenditure of the organism,

K is the energy consumption coefficient of the mass of 1 kg, kcal,

Vp is a certain time of day.

The calculated level of K is determined periodically. Currently, the figure is 50. The average standard is 2,500 kcal per day, which includes 40 g of protein and other essential nutrients.

To ensure the normal functioning of the average human body, the average caloric intake should be 2500-3500 kcal / day. A diet low in 1000-1500 kcal / day can lead to a reduction in life expectancy. The FAO estimates that 500 million people on our planet are systemically starving and about 1 billion are malnourished. Depending on the level of energy consumption, human activity is divided into 3 types: optimal - in the range of 2500-3500 kcal / day; deficient - more than 1500, but less than 2500 kcal / day critical - when consumed less than 1500 kcal / day. When less than 1000 kcal of energy is consumed per day, human life is reduced by about 50%. In accordance with energy consumption, the supply of basic foodstuffs is divided into three general levels: insufficient 100% - 50-99% critical - less than 50%.

Toxicants may include soil contaminated mainly with radionuclides, proximity to industrial plants and highways, mineral fertilizers, mainly nitrates, containing nitrogenous substances, phosphates, potassium fertilizers, strontium; manure containing heavy metals and organic toxicants; atmospheric aerosols and water.

In view of the above, food safety is a complex synthetic approach that cannot be fully addressed by private production itself and requires in-depth research. That is why international organizations are constantly monitoring the amount of food, studying the prospects, and warning local governments about potential problems if these resource stocks are depleted.

Food supply in the Republic of Uzbekistan: Food consumption; In determining the demand for food is determined on the basis of the status of a number of economic and social indicators. The main indicator that helps to determine future demand is the expected level of income of the population. This figure, in turn, depends on the level of national income and gross domestic product. The level of employment and labor productivity also indirectly affect the level of income and the composition and level of demand for agricultural products.

In determining the prospects for the volume and composition of demand for agricultural products

In addition, the following conditions also affect:

- Changes in the level of employment (employment with physical labor and intelligent labor);
- Lifestyle changes (car use, housing, need for clothes);
- Agricultural products will be replaced by synthetic and artificial fibers, artificial leather and wool, protein products will be replaced by chemical products. Socio-cultural factors also have a significant impact on the formation of demand for food, including lifestyle, average age of people, eating traditions.

The main goal of solving food security is to guarantee and sustain the supply of raw materials and food products regardless of changes in internal and external factors. Availability of food products for everyone;

Macroeconomic aspects of food security, Institutional aspects of food security;

A study of population groups by income level shows that there is a relationship between consumption level and income level. The change in the demand for food products in accordance with the level of income can be determined by its coefficient of elasticity. This indicator shows how much the change in the income level by 1% will change the demand. The elasticity of demand for food due to changes in income is determined as follows:

$$K_e = U_1 * X_1 * x$$

Here, K_e is the coefficient of elasticity;

U_1 - increase in product consumption;

U is the base period consumption;

X_1 - growth of per capita income;

X is the per capita income in the base period.

According to Engel, a scientist working on food security as incomes increase, so do their food expenditures. "Demand for food decreases with increasing income and, conversely, demand increases with decreasing income" (Engel's Law) as the level of demand for food increases (normative and approximate), there will be an improvement in quality.

At the same time, the amount of products consumed varies insignificantly and the coefficient of elasticity is not high. Its significant change will be due to rising prices for food. The expected income level of the population will be the basis for studying the future demand for agricultural products. Under other classical conditions of the classical law of demand, the state of food safety is assessed by two indicators:

Stockpiled grain for next year's harvest,

The structure of food safety

TABLE 1

Degree	Problemsolver	The function of the subject
Global	UNO, Specialized Bodies (FAO, WTO, Food Security Committee, World Bank etc.)	Promoting sustainable economic development of countries, long-term food supply programs, creation of food stocks
Sub-territorial	Interregional agreements with relevant organizations, forums	Promoting sustainable economic development, food quality
Improving the interethnic parameter. (interstate)	Poorly organized merger (except Eldan). Strong relationships based on a final agreement on food prices, standards, sales. Forums, other weak formations	Forming state and local food funds and promoting sustainable economic development. Improving food quality parameters.
National (state)	Government, state law enforcement agencies	Sustainable economic growth, the formation of public food funds, the balance of supply and demand
Local	Territorial administration bodies (municipality, district, region)	Creating a company to generate household income, supply products
Population groups	Income level groups are quality control households	Achieving income, ensuring consumption according to scientific standards.
Family	Household	Saving and consuming food.

1. Comparing the world grain market with consumption, which helps to determine the level of food security and provide a guarantee in case of emergency (normative - 17%, ie grain stock should reach 60 days of consumption).
2. Comparing the supply of grain exporting countries to demand (Argentina, Australia, Canada, and EU, USA).
3. Comparison of transit stocks of exporting countries for domestic consumption (for food and nutrition purposes) by total grain and its types.
4. Trends in grain production in India, China and the CIS (average annual growth over the past year and the next 10 years).
5. Changes in grain production in developing grain-importing countries.
6. Trends in grain production in developing countries other than China and India.
7. Average annual export prices by type of grain.

The United States was the first in the world to recognize the strategic importance of food products and began to exert political influence on countries that imported its potential as an exporter of basic agricultural products. Today, more than 100 countries are dependent on grain imports.

The main problem of the agrarian policy of each country is to solve the problem of food security. In Uzbekistan, too, addressing the country's food security is also important for addressing the problems of a population of 34 million. In this regard, the study and improvement of the components of the food market is one of the tools to achieve the goals of agricultural policy.

The problem of food security in Uzbekistan is solved by the food market. The country is following to address the issue of food security

Measures should be taken:

Satisfaction of the population's demand for grain and grain products as much as possible at the expense of national production;

Satisfaction of the population's demand for fruit and vegetable products, ensuring the ecological purity of the products, increasing the safety of these products;

Providing the population of the country with livestock products that are important for health; to do this, it is necessary to develop ways to meet the needs of the population for meat and meat products, which have slightly deteriorated as a result of declining livestock numbers in recent years. A number of measures have been developed in our country to address the problems of food security. Among them is the Presidential Decree on the allocation of land for farming in rural areas. This was the basis for meeting people's demand for flour and flour products, fruit and vegetable products, and in part for livestock products.

Formation of the food market;

The food market is an economic relationship that forms a relationship for the population of the country and for producers of consumer goods based on the convenient sale of their products. The food market can be classified in terms of each industry. The following should be taken into account when regulating the food market at the national level:

Prospects for the formation of the world food market, The trend of global agricultural development, given the limited resources, has shown that the high growth rates of food and raw materials created in the process of agricultural production cannot be achieved even in the short term.

According to FAO experts, grain production will grow by 20-21% in 2030 and reach 2,150 million tons. Tons, but this is 80% of the total demand. Meat production is 50-80 mln. and 230-260 million. Tons and the demand is 300 mln. Tons (the need is met by 76-86%). The main source of additional growth is pork and chicken. The use of seafood is 100 mln. The demand will be 168 million tons (the demand will be met by 60%). The forecast shows that the growth of food resources in 1950-1985

The average annual production was estimated at 30 million tons, in 1985-1994 it was 12 million tons per year, and in 1996-2030 the average annual production is expected to exceed 5 million tons. , the population of our planet in 2030 is expected to grow almost twice as much as in 1996

and reach 8.9 billion people. The average annual growth is 90 million people per year, while its distribution across the world's regions is uneven. Efforts by all countries to improve the quality of food are exacerbating the situation in the food market. Even in the best-case scenario, the grain deficit is 526 million tons, meat 40 million tons, and seafood 68 million tons. According to some estimates, the situation with food will worsen. It follows that ensuring the balance of supply and demand in the food market will become a challenge in the near 2030. There are the following ways to solve this problem:

Increase in production (which, according to most experts, is not sufficient for the strength of the limiting factors in the period under review);

Population reduction (this cannot be achieved in a short period of time in a rational way);

Reduction of food consumption, a decrease in living standards (according to experts, this is exactly what will happen). The domestic and foreign policies of many countries will in many ways determine the extent to which the socio-economic aspects of food problems will deepen in the future. This can be based on the following:

1. The decline in food production per capita around the world has entered a long period (not as short-term as before). This is due to social, economic and agricultural errors, as well as ecological imbalances. The best supply of grain was achieved in 1983, when it was 345 kg, but in 1993 it fell to 303 kg, and by 2030 it is expected to fall to 240 kg, a figure comparable to 1989. 65%. If in 1990 the population caught 28 kg of seafood per capita, this figure is expected to reach 12 kg in 2030.

2. Along with the decrease in the volume of food production and the level of their supply to the population of the planet, there is an increase in the disproportion across individual regions. In 1990, compared to 1950 (in 40 years), per capita grain production in the United States increased by 32% and amounted to 1,160 kg, while in Western Europe it doubled (500 kg).), while in African countries it decreased by 27% (118 kg). Experts estimate that by 2030, per capita grain production will halve (164 kg) in China, 15% in India (168 kg), 30% in Pakistan (up to 90 kg) and 31% in Iran. (140 kg) is expected to decrease.

3. The level of stability in the food market is declining, which is determined by knowing the availability of reserves to help keep prices down and prevent jumps in conjuncture. In 1987, the world grain stock was 104 days, in 1994 it was only 64 days, and the stock is declining day by day. The expected decline in production will exacerbate the situation in the food market. From the continuation of long-term slow and steady price declines, the rise in world prices for basic food items has begun. First, seafood became more expensive, then this trend spread to other types of food. Scientists estimate that over the next 20 years, wheat prices will rise by 66%, corn by 37% and rice by 30%.

4. Consumer Support Policy. Aspects of well-being, Political aspects;

The world community is faced with the task of identifying an important solution for all countries to address the extremely difficult food problem. Two aspects can be highlighted here:

Aim at the level of domestic consumption achieved by the United States. This goal has been chosen by most countries, in which case food resources will reach 2.5 billion people by 2030, which is 3.5 times less than the number of people living on the planet.

Approximately equal distribution of food resources: In this case, each person has 450 g of wheat per day, which is equal to the resource available to the population of India today. This is due to the increase in the number of poor countries: in the 1960s, the ratio of poor to rich countries was 30: 1, while in the 1990s the figure reached 64: 1. There is even the possibility that the growing food problem will lead to a deep international crisis. In this case, a single international strategy is needed, which should reflect the concerted actions of countries and a number of commitments, which are not a simple task. In 1992, more than 1,500 of the world's leading scientists, including 102 Nobel Laureates, signed a memorandum called "Factors Warn Humanity", which called for a change in the way people use resources and livelihoods on earth. The fund came up with a proposal to solve the food problem in the future by preventing the depletion of land resources and stabilizing population growth, according to which by 2050 the population should reach 7.3 billion people. The program will cost \$ 61.2 billion, most of which will be spent on reforestation and conservation of arable land. American scientists L. Brown and H. Kane have proved that the priority in international relations is not the problem of armaments, but the problem of solving food shortages.

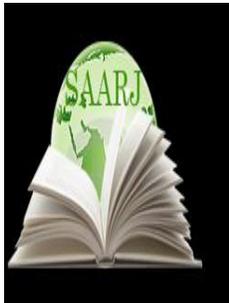

CONCLUSION

In the long run, humanity will find effective ways to solve the food problem through the development of priorities of scientific and technological progress.

ABSTRACT

Each plant can withstand a certain temperature according to its biological properties. In the developmental ontogeny of plants, resistance to cold or high temperatures is considered unchanged. In ontogenesis, genetic factors and environmental factors are interrelated.

The informative method is used to determine the resistance of vital processes to acclimatization and declamation, or the cold weather resistance of metabolism in cells. Due to their perennial evolution, fruit trees are exposed to unfavorable climatic conditions for many years in winter, autumn and spring. During their perennial evolution, trees adapt to specific soil climatic conditions in specific areas or areas where they grow. It adapts to a variety of conditions, from growing to fruiting, as well as during the dormant period.

INTRODUCTION

According to research on the cold tolerance of olive varieties, the leaves of olives die at a temperature of -10-12°C and the branches die at a temperature of -17-22°C. When the air temperature exceeds -22°C, all the aboveground branches of the olive plant die. According to AA Rzhevkin, the loss of olive twigs, buds and buds depends primarily on the frost resistance of the planted variety. If the -14-17 °S cold is short-lived, the tree will not be much damaged, when the frosts are long-lasting, and at -17-22°S the above-ground part of the tree will be completely destroyed. But the underground part is preserved.

In the experiments of V.A. Brailko, some branches of olives were damaged at -13-15°C, and when the temperature reached -17-20°S, the roots were frozen. , it was found that olive trees are damaged by frost.

In our field experiments, protection of olive varieties from frost was carried out in 4 ways:

Laboratory study of frost resistance of twigs of olive varieties, for which twigs prepared from them were stored in a refrigerated chamber at various low temperatures for 24 hours;

Olive seedlings were wrapped in polyethylene film in November-February (without heating);

Olive seedlings were dug 1.0 m deep and planted in trenches;

Seedlings were left in the open field.

Laboratory analyzes showed that the Izumrud variety was the most resistant to artificial cooling. Temperatures below -10 ° C were required for its leaves to cool completely. At this time, the leaves of the control Gaziantep variety were completely destroyed at a temperature of -10 ° C (see Table 1.1).

TABLE 1.1 COLD TOLERANCE OF CLIMATE-CONTROLLED OLIVE VARIETIES, 2016-2018

Welding type	Various low temperature resistance level,%					
	0 °C	-2 °C	-4 °C	-6 °C	-8 °C	-10 °C
In the leaves						
Izumrud	1,2	6,7	25,6	58,9	88,6	94,2
Karakoz	1,3	7,8	27,8	60,2	90,3	95,6
Gaziantep - naz.1	1,8	11,3	35,9	75,8	97,5	99,8
Krymskaya 172 - naz. 2	1,7	10,5	33,5	70,1	95,3	98,6
On the branches						
Izumrud	-	1,7	6,1	19,3	33,5	41,2
Karakoz	-	2,3	7,2	20,5	35,8	44,8
Gaziantep - naz.1	-	3,4	8,5	24,8	39,7	52,6
Krymskaya 172 - naz. 2	-	3,0	8,1	21,9	38,6	50,1

A similar situation was observed in the Karakoz variety. The degree of leaf survival at the lowest studied temperature of this air-conditioned variety, i.e. -10°C , was 95.6%, which is 3.0% higher than that of the control-Krymskaya 172 variety (98.6%).

The data in the table show that the frost resistance of the branches of acclimatized olive varieties was higher than the control options. At the same time, the lowest studied level of Izumrud variety, ie -10°C , was 41.2%, which is 11.4% higher than the control - Gaziantep variety (52.6%).

A similar situation with the frost resistance of olive branches was observed in the Karakoz variety. The lowest degree of preservation of branches of this variety at a temperature of -10°C was 44.8%, while the control - Krymskaya 172 variety reached 50.1%. It can be seen that the frost resistance of the branches of the air-conditioned Karakoz variety is 6.3% higher than the control variant.

In field experiments, 25 leaves and 5 one- and two-year-old branches were cut from branches formed from each variety of olive during the winter. The cells of the obtained leaves and twigs were cut and seen under a microscope, and for good visibility, glycerin was dripped onto the cut. In this case, the damaged leaf tissue turns brown; on the contrary, the leaf tissue that has not been hit by the cold does not lose its color.

The degree of frost damage to olive leaves and twigs was determined on a 5-point scale.

To determine the degree of frost damage to the upper and lower parts of the plants, a special sharp knife was taken and the lower trunks of 3-5 trees were cut and found to be wrinkled:

There were no signs of cold strikes on the stems and leaves of the undamaged olive;

The trunk of the tree was not damaged by the cold when it was cut; however, signs of frostbite appeared in 5-10% of the leaves;

Low damage - a slight crack in the bark of the olive body was noticeable when cut;

20% damage was detected in the stem bark of trees;

When severely damaged, bark, cambium, and wood were found to be completely damaged.

The frost resistance of olives in the winter: after frosts was determined and carried out by the field method.

According to SB Kamenkovich and VT Chikhladze, in the winter of 1950, when the air temperature was -13.60C , it was observed that the branches of the hardy Nikitskaya, Nikitskaya krupnoplodnaya, Chemberikentskaya olive varieties were partially damaged.

To determine the frost resistance of olives, 10 trees of each variety were taken and studied on a 5-point scale. In 2016-2018, the infestation rate of 1 tree was 2 points (see Table 1.2).

TABLE 1.2 COLD DAMAGE OF CLIMATE-CONTROLLED OLIVE VARIETIES, 2016-2018

Olive varieties	Years	Damaged trees on the following points, pcs				
		1 point	2 points	3 points	4 points	5 points
Izumrud	2016	1	1	1	-	-
	2017	-	1	1	1	-

	2018	2	2	-	-	-
Karakoz	2016	1	2	1	-	-
	2017	1	1	1	-	-
	2018	1	1	1	-	-
Gaziantep	2016	2	3	1	1	-
	2017	2	2	1	-	-
	2018	1	2	1	-	-
Krymskaya 172	2016	1	1	2	-	1
	2017	2	3	1	1	
	2018	1	2	1		

No degree of frost damage was observed in Karakoz variety with 4-5 points. In the Emerald variety, only in 2017, 1 tree was damaged by frost with 4 points, and no frost damage with 5 points was observed in this variety either. However, frost damage with 2 points in the Emerald variety was recorded in 3 trees in 2016, and in 2 trees in 2017-2018. Among the studied olive varieties, the highest cold damage was observed in the Krymskaya 172 variety, 5 out of 10 trees studied in 2016: 1 of them It was noted that in 2017-2018, the same patterns were observed, while 1-2 were affected by the cold with 2 points, 2 with 3 points, and 1 with 5 points.

Gaziantep variety, like Krymskaya 172 variety, was damaged by frost in the first 5 years, 2 of them with 1 point, the remaining 3 with 2-4 points, and in the next 2-3 years, 4 of them were damaged by 1-3 points. The results of the study show that the newly introduced Izumrud and Karakoz olive varieties, Gaziantep and Krymskaya 172, which are newly introduced in the country, have higher frost resistance and ripen 5-11 days earlier.

In the winter of 2016, seedlings of more than 250 olive varieties in the experimental field overwintered in the open. Some seedlings are 156-167 cm in height, some are 56-100 cm in height, and these seedlings are resistant to winter frosts.

In the 3rd decade of November 2016, when the study was conducted, it was noted that the cold snap intensified in the country, and on the night of November 20-21, the air temperature dropped from -2 to -100 C. Among the 14 olive varieties studied in the experimental field, 60-65% of the annual twigs of the two tufts of olive varieties introduced were damaged by frost. Even in the biennial twigs were found to have cracked bark from the cold. No damage was observed on the annual branches of the air-conditioned new Izumrud variety. In the Karakoz variety, too, the annual twigs and leaves are not damaged by frost detected. In Gaziantep and Krymskaya 172 olive varieties, 30-40% of annual branches and 23-26% of leaves at growing points were damaged by 100 C frosts (see Table 1.3).

CONCLUSION

In the Gaziantep variety, the leaves on the upper part of the stem were not damaged by the cold, but the leaves on the second branch were found to be 90% affected by the cold. However, in these olive varieties, the bark on the body was not damaged by the cold. It has been found that frosts are not dangerous when olive varieties are dormant, and that a drop in temperature to -12-14 0C during awakening in plant cells is harmful to twigs and leaves.

ABSTRACT

This article has developed an algorithm and a program for automating the process of distributing taxpayers by categories of attention based on the use of c-means and Gustafson-Kessel algorithms in order to determine a group of activities, as well as forecasting the amount of tax deductions.

KEYWORDS: *Gustafson-Kessel Algorithm, Taxpayer, Fuzzy Modeling, Fuzzy Clustering Algorithms, Cluster Structure, Expert Assessment.*

INTRODUCTION

The task of cluster analysis is to distribute the set taxpayers A by clusters (categories) with "similar" to each other objects. Fuzzy clustering method allows each object simultaneously belong to several or all clusters, but with different degree of belonging. The number of clusters c is assumed to be known in advance.

The set of clustering objects is a finite set of elements $A=\{a_1, a_2, \dots, a_n\}$, where a_i is a taxpayer, and a finite set of features $P=\{p_1, p_2, \dots, p_q\}$, each of which is a characteristic elements of the quantitatively investigated area. In this case, the total number of taxpayers determines the natural n , and the total number of measured characteristics of taxpayers is the natural q .

For each taxpayer, all \mathbf{P} characteristics are measured on a certain quantitative scale. Thus, a certain vector $x_i = (x_1^i, x_2^i, \dots, x_q^i)$ is assigned to each of the elements $a_i \in A$, where x_j^i is the quantitative value of characteristic $p_i \in P$ for data object $a_i \in A$. We assume that all x_j^i have some real values, i.e. $x_j^i \in R$

The vectors of feature values $\mathbf{x}_i = (x_{1i}, x_{2i}, \dots, x_{qi})$ are represented as a data matrix \mathbf{X} of dimension $(\mathbf{n} \times \mathbf{q})$, each row of which is equal to the value of the vector \mathbf{x}_i .

The cluster structure is specified by the membership matrix μ of dimension $\mathbf{c} \times \mathbf{n}$, $\mu_{Ak}(\mathbf{a}_i)$ is the degree of membership of the \mathbf{a}_i -th element in the \mathbf{k} -th cluster, \mathbf{c} is the number of clusters.

Moreover, the membership matrix for the conditions of management of the tax service must satisfy the following restrictions:

$$a) \mu_{Ak}(\mathbf{a}_i) \in [0, 1], k = 1, c, i = 1, n;$$

$$b) \sum_{k=1}^c \mu_{A_k}(a_i) = 1, \text{ - each taxpayer must be distributed among all clusters;}$$

$$v) 0 < \sum_{i=1}^n \mu_{A_k}(a_i) < 1 \text{ - no cluster should be empty or contain all taxpayers.}$$

Next, we introduce the centers \mathbf{v}_k for each desired fuzzy cluster, which are calculated for each of the features for each of the fuzzy clusters and according to the following formula

$$v_j^k = \frac{\sum_{i=1}^n (\mu_{A_k}(a_i))^m \cdot x_j^i}{\sum_{i=1}^n (\mu_{A_k}(a_i))^m}, j = 1, q, \quad (1)$$

where $m \in (1, \infty)$ is an exponential weight equal to a real number ($m > 1$).

To assess the quality of dividing the taxpayer into categories of influence, we use the scatter criterion, which shows the sum of the distances from objects to the centers of clusters with the corresponding degrees of membership

$$f(A_k, v_j^k) = \sum_{i=1}^n \sum_{k=1}^c (\mu_{A_k}(a_i))^m \sum_{j=1}^q (x_j^i - v_j^k)^2 \quad (2)$$

In order to determine the number of clusters, we will carry out clustering by other methods that do not require determining the number of clusters at the input and allow us to determine their number. Based on the initial data on the activities of taxpayers, clustering was performed by the k-means method, performed in the Statistica package, the results of which are presented in Figure 1, and indicate that for this sample there are only three clusters, categories of attention, on which will be distributed to taxpayers.

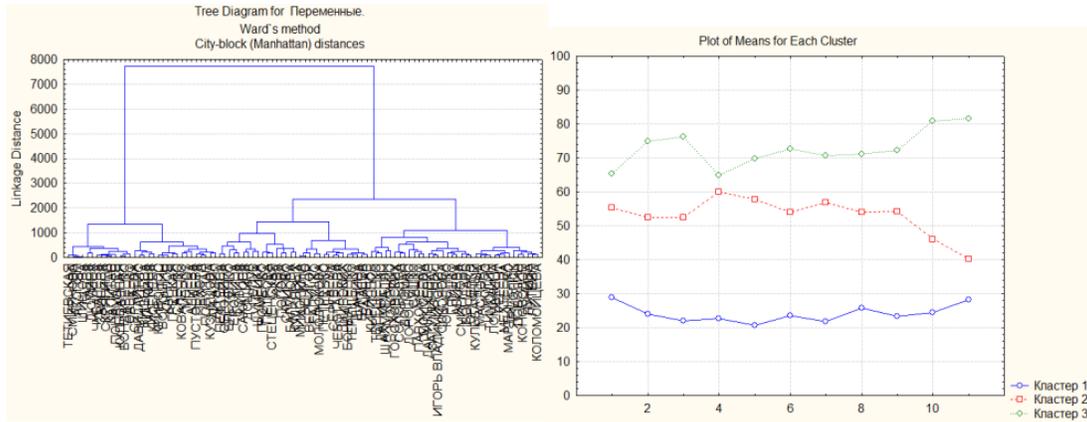

Figure 1 - Results of the implementation of the k-means algorithm, performed in the Statistica package.

To implement the c-means algorithm, we will use a special computer program, which is an integrated software environment for performing numerical calculations and intended for fuzzy modeling, covering the classical and modern areas of mathematics - Matlab [1,2-3].

The implemented implementation is shown in Figure 2, which displays the initial data, fuzzy clustering program code and visualization of the results obtained.

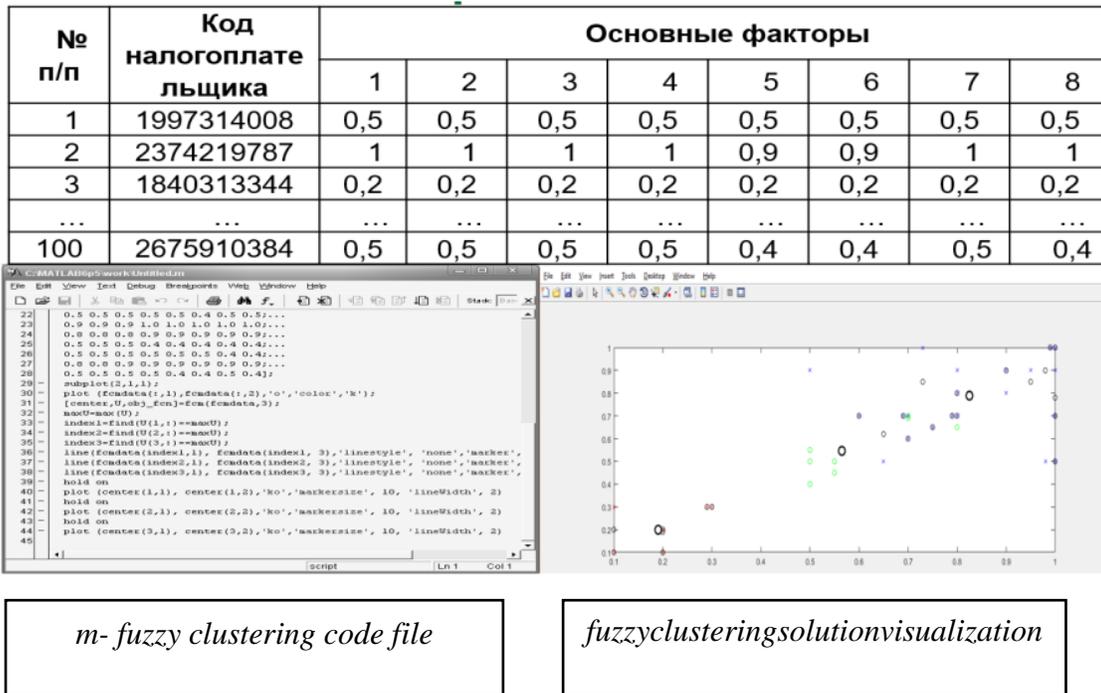

Figure 2 - The results of the distribution of taxpayers performed according to the c-means algorithm.

In the c-means algorithm, the distance between the object and the center of the cluster is defined through the Euclidean norm, and the shape of all turns out to be the same. Clustering algorithms force data to acquire uncharacteristic their structure, which may further lead to suboptimal results [4]. To overcome this drawback, we single out the algorithm Gustafson-Kessel, using an adaptive norm for each cluster, As a result, each i -th cluster has its own norm-generating matrix. The result is the optimization of the fuzzy partition matrices and coordinates centers of clusters and, as well as the norm-generating matrices of all clusters, which allows one to obtain clusters of different geometric shapes [5].

The Gustafson - Kessel algorithm consists of the following iterative steps.

Step 1. Generation of the fuzzy partition matrix. We set the following values:

- The number of required fuzzy clusters, or - the number of categories attention $c = 3$;
- The maximum number of iterations of the algorithm $s = 100$;
- Parameter of convergence of the algorithm $\varepsilon = 0.00001$;
- is the exponential weight of the calculation of the objective function and cluster centers $m = 2$.

The expert sets the data matrix X , depending on the fuzzy partitioning into c of fuzzy clusters from, described by the set of membership functions $\mu^k(a_i)$.

To determine by an expert which category of attention belongs taxpayer, there are seventeen signs. We select from them eight main ones that most characterize the activity taxpayer (table 1).

TABLE 1 - FACTORS THAT ARE BASIC FOR DETERMINING ATTENTION CATEGORIES

No	Factor
1	Indicator of the share of value-added tax (VAT) charged to payment in the total volume of sales
2	Indicator of the share of amounts claimed for reimbursement in total sales
3	Indicator of the share of transactions exempted from taxation in total sales
4	Indicator of the share of commodity exchange transactions in the amount of transactions that are taxed at a rate of 20%
5	The share of operations to liquidate fixed assets by the decision of the payer in the total volume of operations that are taxed at a rate of 20%
6	Indicator of the ratio of tax liability and tax credit
7	Violation of tax payment deadlines
8	There are violations of the completeness of tax payments

The expert, on the basis of these factors, analyzes each taxpayer, bringing the vector x_i $1x1i, x2i, \dots, xqij$ into compliance with each taxpayer, where x_{ij} is the quantitative value of the feature. The results of the expert assessment are presented in Table 2.

TABLE 2 - INITIAL MATRIX OF EXPERT ASSESSMENT OF TAXPAYERS

p / p	Taxpayer	Factors							
		1	2	3	4	5	6	7	8

1	2	3	4	5	6	7	8	9	10
1	AbdullaevAlisherBekmuradovich	0,5	0,5	0,5	0,5	0,5	0,5	0,5	0,5
2	AkhmedovKarimNodirovich	1	1	1	1	0,9	0,9	1	1
3	BobonazarovErgashKhursandovich	0,2	0,2	0,2	0,2	0,2	0,2	0,2	0,2
4	BekmuradovAzizkhanAzamovich	0,7	0,7	0,7	0,7	0,7	0,6	0,5	0,5
5	GeldiyarovaNasibaAzimovna	0,5	0,5	0,5	0,5	0,5	0,5	0,4	0,4
....
96	KarimovMurodjonAzimovich	0,1	0,1	0,1	0,1	0,29	0,2	0,29	0,2
97	FarmonovNuriddinNasimovich	0,7	0,69	0,69	0,6	0,7	0,6	0,5	0,5
98	KhamraevNodirZokirovich	0,79	0,7	0,7	0,8	0,9	0,9	0,8	0,69
99	SaidovaNilufarKomilovna	0,29	0,3	0,3	0,3	0,3	0,2	0,2	0,1
100	SafarovaMuattarKhusanovna	0,2	0,19	0,2	0,2	0,2	0,2	0,2	0,19

The cluster structure is specified by the membership matrix μ , where $\mu_{Ak}(a_i)$ - the degree of belonging of the a_i -th taxpayer to the k -th cluster. Consequently, the expert also conducts the distribution of taxpayers by attention category. The results of the expert assessment are shown in Table 3.

TABLE 3 - MATRIX OF OWNERSHIP OF EXPERT ASSESSMENT OF TAXPAYERS

100	SafarovaMuattarKhusanovna	0,1000	0,2000	0,7000

Step 2. Calculation of cluster centers.

$$y = \frac{\int_{\min}^{\max} x * \mu(x) dx}{\int_{\min}^{\max} \mu(x) dx} \quad (3)$$

Where y is the resulting variable; x is a variable; $\mu(x)$ - membership function of variable x ; **min** and **max** - left and right boundaries of the interval of the crisp set of the output variable.

We calculate the centers of clusters using formula 3, the results of which are shown in Table 4.

TABLE 4 - CLUSTER CENTERS

Attention categories	Factors							
	1	2	3	4	5	6	7	8
Green	0,23564	0,24754	0,26316	0,25478	0,2679	0,21748	0,28221	0,20789
Yellow	0,78414	0,76387	0,76809	0,80704	0,81388	0,80441	0,79142	0,77872
Red	0,52152	0,50933	0,50497	0,486	0,5043	0,47473	0,45326	0,44784

Step 3. Determination of the covariance matrix for the k-th cluster

$$B_j^k = \frac{\sum_{i=1}^n (\mu_{A_k}(a_i))^m \cdot (x_j^i - v_j^k)^T \cdot (x_j^i - v_j^k)}{\sum_{i=1}^n (\mu_{A_k}(a_i))^m} \quad (4)$$

Determine the covariance matrices for each cluster using the formula (4).

The covariance matrix for the third cluster, i.e. for the red category attention is as follows

$$B^3 = \begin{pmatrix} 0,4924 & 0,4542 & 0,4808 & 0,4493 & 0,4152 & 0,4393 & 0,4544 & 0,4743 \\ 0,4542 & 0,4891 & 0,5079 & 0,4541 & 0,3935 & 0,4161 & 0,5092 & 0,5344 \\ 0,4808 & 0,5079 & 0,5972 & 0,4911 & 0,4311 & 0,4549 & 0,5449 & 0,5695 \\ 0,4493 & 0,4551 & 0,4911 & 0,5340 & 0,47,69 & 0,5210 & 0,5874 & 0,6106 \\ 0,4152 & 0,3935 & 0,4311 & 0,4769 & 0,4927 & 0,5266 & 0,5404 & 0,5280 \\ 0,4393 & 0,4161 & 0,4549 & 0,5210 & 0,5266 & 0,6020 & 0,6190 & 0,6123 \\ 0,4544 & 0,5092 & 0,5449 & 0,5874 & 0,5404 & 0,6190 & 0,8236 & 0,7868 \\ 0,4743 & 0,5344 & 0,5695 & 0,6106 & 0,5208 & 0,6123 & 0,7867 & 0,8273 \end{pmatrix}$$

Step 4. Calculation of the distance between the objects from X and the centers of the clusters

$$D_{B_j^k} = (x_j^i - v_j^k) \cdot \left[(\det(B_j^k)) \cdot (B_j^k)^{-1} \right] \cdot (x_j^i - v_j^k)^T \quad (5)$$

We calculate the distance between objects with X and the centers of the clusters using the formula (5). For the third cluster, the matrix has the following form

$$D_{B^3} = \begin{pmatrix} 1,4151 & 3,5962 & 0,0567 & 0,4302 & 1,0251 & 0,7188 & 3,7478 & \dots & 1,2765 \\ 3,5962 & 16,5886 & 2,0982 & 1,1672 & 0,1606 & 2,3532 & 6,9467 & \dots & 2,8446 \\ 0,0567 & 2,0982 & 1,1471 & 1,0488 & 0,1982 & 1,3670 & 0,3431 & \dots & 1,0079 \\ 0,4302 & 1,1672 & 1,0488 & 6,9062 & 2,6100 & 0,5972 & 3,8626 & \dots & 0,9283 \\ 1,0251 & 0,1606 & 0,1982 & 2,6100 & 2,9383 & 0,4526 & 4,3004 & \dots & 0,28092, \\ 0,7188 & 2,3532 & 1,3670 & 0,5972 & 0,4526 & 3,4749 & 1,5800 & \dots & 1,1377 \\ 3,7478 & 6,9467 & 0,3431 & 3,8626 & 4,3004 & 1,5800 & 18,8696 & \dots & 1,4831 \\ 3,3776 & 11,1887 & 1,6619 & 2,4023 & 2,1277 & 3,4997 & 8,2875 & \dots & 1,9890 \\ 0,7372 & 0,8188 & 0,6980 & 1,2299 & 0,6961 & 0,6732 & 1,2256 & \dots & 0,7000 \\ 4,0245 & 13,3506 & 1,1373 & 1,2955 & 1,1556 & 3,2830 & 9,6540 & \dots & 1,7494 \\ \dots & \dots \\ 0,2765 & 2,8446 & 1,0079 & 0,9283 & 0,2809 & 1,1377 & 1,4831 & \dots & 1,3108 \end{pmatrix}$$

Step 5. Recalculation of the elements of the fuzzy partition matrix

If $D_{B_j^k} > 0$, then we carry out the calculation using the formula 6.

$$\mu_{A_k}(a_i) = \left(\frac{\sum_{l=1}^c \left(\frac{\left(\sum_{j=1}^q (x_j^i - v_j^k)^2 \right)^{\frac{1}{2}}}{\left(\sum_{j=1}^q (x_j^i - v_j^l)^2 \right)^{\frac{1}{2}}} \right)^{\frac{1}{m-1}}}{\sum_{l=1}^c \left(\frac{\left(\sum_{j=1}^q (x_j^i - v_j^l)^2 \right)^{\frac{1}{2}}}{\left(\sum_{j=1}^q (x_j^i - v_j^k)^2 \right)^{\frac{1}{2}}} \right)^{\frac{1}{m-1}}} \right)^{-1} \quad (6)$$

If $D_{B_j^k} = 0$, then for the corresponding fuzzy cluster $\mu'_k(a_i) = 1$, and for others $\mu'_k(a_i) = 0$.

Step 6. Checking condition $|f'(A_k, v_j^k) - f'(A_k, v_j^l)| \leq \varepsilon$. If the condition is met, then "end", otherwise - to step 2.

Results of fuzzy categorization of taxpayers attention based on the Gustafson-Kessel algorithm are given in Table 5

TABLE 5 - MEMBERSHIP MATRIX OF FUZZY CLUSTERING THE GUSTAFSON-KESSEL ALGORITHM

№ p/p	Taxpayer	Attentioncategory		
		Зеленые	Желтые	Красные
1	AbdullaevAlisherBekmuradovich	0,4080	0,1126	0,8794
2	AkhmedovKarimNodirovich	0,0906	0,7381	0,1713
3	BobonazarovErgashKhursandovich	0,5812	0,3300	0,0888

4	BekmuradovAzizkhanAzamovich	0,2026	0,2598	0,5376
5	GeldiyarovaNasibaAzimovna	0,3252	0,1624	0,5124
....
96	KarimovMurodjonAzimovich	0,6164	0,2878	0,0958
97	FarmonovNuriddinNasimovich	0,2191	0,2033	0,5776
98	KhamraevNodirZokirovich	0,0644	0,6655	0,2701
99	SaidovaNilufarKomilovna	0,4795	0,4388	0,0817
100	SafarovaMuattarKhusanovna	0,5604	0,3260	0,1136

The clustering results can be formed as follows, for example, the taxpayer AbdullaevAlisherBekmuradovich with a probability of 68% belongs to the red category of attention, that is, AbdullaevAlisherBekmuradovich is a high-risk taxpayer.

In order to calculate the assessment of the quality of clustering in the article, the size of the silhouette S was used [6]. When implementing fuzzy clustering algorithms, the cluster number is determined depending on the maximum value of the degree of membership. And the value of this indicator is expressed as follows for each object clustering

$$S(x_i) = \frac{a(x_i) - b(x_i)}{\max(a(x_i), b(x_i))},$$

where $a(x_i)$ is the average distance between object x_i ($x_i \in k$, $k = 1, c$) and objects of the same cluster k to which x_i belongs;

$b(x_i)$ is the minimum distance between object x_i and objects in the cluster that is closest to cluster k , that is, the cluster to which x_i does not belong.

The resulting silhouette value must be in the range [-1; 1], the closer it is to -1, the worse clustering is performed, and vice versa [7].

For the c -means algorithm, the silhouette value for the first taxpayer will be

$$S = (0,6076 - 0,0035) / 0,6076 = 0,9942.$$

According to the Gustafson-Kessel algorithm, the silhouette value for the first taxpayer will be

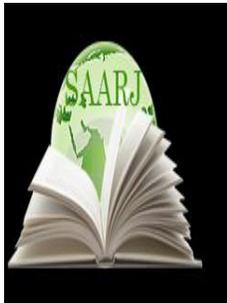

$$S = (0,1213 - 0,0156) / 0,1213 = 0,8714.$$

Analyzing the results obtained, we can conclude that both algorithms are adequate and clustering was carried out successfully for the problem of distributing taxpayers by attention categories.

It should be noted that the clustering results are intermediate, performing the structuring of information in a set of source data. The algorithms described above formed the basis of the software module for the distribution of taxpayers by categories of attention to support the adoption of managerial decisions in the tax inspection.

ABSTRACT

This article discusses the ideas and considerations of the use of e-learning resources in the educational process, the components and types of e-learning resources. The e-learning methodological complex of the subject is a set of systematic teaching materials integrated using a computerized learning environment, aimed at ensuring a complete didactic period of the subject and optimizing the acquisition of professional competencies by students in the subject. E-learning tools and multimedia technologies in e-textbooks allow information to be presented in a variety of ways: graphic, animated, audio, photo and video. A number of scholars have stated that a student remembers only 20% of what he sees, 20-30% of what he hears, 50% of what he sees and hears at the same time, and 80% of what he sees, hears and does at the same time.

INTRODUCTION

At the heart of the changes taking place in the world are the development of industry, changes in production, economic and social spheres, the achievements of science and the great work of teachers and educators. These changes are setting great goals for educators and learners. As a result of the widespread use of information technology, mobile communications and the Internet in production and education in society, the thirst and interest of students in technical higher education is growing. It is almost impossible to realize these interests and demands on science in the audience itself. It is necessary to develop students' ability to provide complete information

about the subject and each subject of the subject, as well as to provide students with the necessary electronic resources for independent work and their independent use.

One of the most common e-learning resources in practice is the e-textbook. The concept of "e-textbook" is "a software system of education for complex purposes that ensures the continuity and completeness of the didactic period of the educational process" [1, 35-p]. The e-textbook provides theoretical material that provides learners with control over learning activities and levels of knowledge. An e-textbook for students is a tutor (teacher), an exercise machine (trainer), a self-taught assistant who helps the student in extracurricular activities [2, 87-p]. The e-resource allows learners to choose a convenient way of self-control over the material under consideration, while selecting the necessary theoretical material, practical work and control tasks. A number of scholars have noted that "the student senses the influence of the learning system in solving certain learning problems using an electronic textbook, which assesses the quality of his actions and makes precise corrections to his mistakes" [1, 279-p]. The e-textbook not only promotes information retrieval activities, but also provides interactive feedback [3, 697-p] This article highlights the need to organize independent learning activities with students' electronic resources.

The following main didactic tasks of the electronic textbook are important:

- 1) informatization (provides acquaintance with the material of the subject of science);
- 2) systematization and structuring (composition of the training material, storage of many pieces of material, provides the possibility of systematic interaction);
- 3) self-control and strengthening of educational material (the content of the methodical complex provides simultaneous acquaintance of the set purposes with theoretical materials and carrying out of various kinds of exercises for control of the acquired knowledge, skills and abilities);
- 4) independent education (provides an opportunity to apply knowledge in practice through the acquisition of knowledge and problem solving);
- 5) integration (generally provides the selection and presentation of knowledge from different sources as a whole);
- 6) person-centered education (creates conditions for individual independent work of students through the examination of the results of individual learning tasks, questions and solutions);
- 7) interactivity (provides the possibility of active interaction of the user with the educational system);
- 8) flexibility (provides adaptation of a teaching to the knowledge, skills and abilities, psychological characteristics of learners) [1, 87-p].

The functions provided by the e-textbook allow students to organize individual, adaptive and interactive independent learning activities.

A number of scholars have described the functional capabilities of e-textbooks, with the help of which independent work of students is organized and they are able to meet the needs of independent educational activities [4, 30- p]. When using electronic textbooks on general professional sciences and professional modules in the independent educational activities of future technical engineers, students develop skills of planning and organizing independent

educational activities, independent performance of practical and laboratory tasks based on teacher's instructions, knowledge and skills, practical application of modern technologies. The e-textbook provides students with science content. Its science structure allows the student to control the material learned in order to properly organize a particular independent activity.

The didactic functions considered in this article allow to reveal pedagogical possibilities in the context of these electronic resources in the formation of independent learning skills, such as optimizing step-by-step work in the organization of independent work of students, adaptation to students' personal abilities, interactive interaction with e-textbook elements.

The concepts of "electronic textbook" and "electronic textbook" are understood as an independent ready-made resource that contains information presented in electronic form using computer technology for long-term storage and reuse, combined into a single - "electronic edition" [5, 296-p]. The e-learning manual supports the learning process and can serve as a methodological support for a set of traditional learning materials and can be included in an e-textbook [6, 560-p]. In this article, e-textbooks constitute the content of e-textbooks, and in this article, the "e-textbooks and e-textbooks" component is discussed.

The main advantage of e-textbooks and e-learning manuals over printed analogues is that they contain hypertext and multimedia technologies [7, 407-p]. In hypertext technology, the application of a hyperlink simplifies the direction and helps to select a particular scheme for studying the material.

The word "multimedia" is derived from the English word meaning "many ways", "many environments". E-learning tools and multimedia technologies in e-textbooks allow information to be presented in a variety of ways: graphic, animated, audio, photo and video. A number of scholars have stated that a student remembers only 20% of what he sees, 20-30% of what he hears, 50% of what he sees and hears at the same time, and 80% of what he sees, hears and does at the same time. Therefore, multimedia technology in electronic sources provides a presentation of information that students receive in parallel through multiple views at the same time, which helps to show objects and processes more clearly, improves comprehension of learning information, pre-identifies qualitatively new opportunities to increase lesson effectiveness, increases interest in performance [8, 31-p]. Hypertext technology and multimedia effectively support students' independent learning activities.

Electronic resources in the field of education allow these technologies to choose an "independent learning trajectory", a person-centered educational activity plan, independent presentation of knowledge, the implementation of information activities and interaction with an interactive source of learning materials [9, 312-p].

At present, Internet resources have been developed and are widely used in independent educational activities of students. Internet resources have additional features, including the specific features of e-textbooks: almost toolless implementation, public access (using any computer, mobile device, tablet and other devices connected to the Internet), any additional via links to external sources able to add materials.

However, scientists who have analyzed the materials on the introduction of information technology in education point out that today e-textbooks, e-learning manuals, especially Internet resources, which cover almost all thematic topics in almost all disciplines, are not sufficiently

developed. Makes it difficult for future technical engineers to form professional knowledge and skills. Therefore, in conjunction with these electronic publications, electronic teaching aids of disciplines are used.

The e-learning methodological complex of the subject is a set of systematic teaching materials integrated using a computerized learning environment, aimed at ensuring a complete didactic period of the subject and optimizing the acquisition of professional competencies by students in the subject. Typically, an e-learning methodological set of science includes: e-textbooks and e-learning manuals, tools to support practical or laboratory work, knowledge testing tools (interactive tests, assignments, etc.), instructions for use and operation of the set; It has links to Internet resources, educational portals and sites, electronic libraries.

Multimedia-based e-learning methodological complexes combine the purpose and form of materials on different content into a single integrated system, taking into account different learning objectives, students' level of preparation and learning conditions. They have the ability to master all the visual aids [10, 328-p] of the vast amount of information and information space that students need in their independent learning activities.

These electronic resources include: professional orientation; completeness and timeliness of data; optimization of the educational process; stratification of education; all-round unique features; independent access to materials; quoting evidence and references from other electronic sources; the connection between many didactic and methodological elements; provide different trajectories for different levels of complexity of learning and control tasks of teaching materials); use of multiple-choice learning tasks and their automated testing; multiple return options to complex issues; includes didactic functions such as self-control [1, 80- p].

At the same time, the introduction of e-learning resources has a positive impact on teaching methods. It is now difficult to imagine the implementation of traditional methods without the means of information technology. For example, search engines are currently used to explain and visualize and obtain information.

These didactic functions can be performed through the didactic capabilities of e-learning resources. Such opportunities include: direct feedback (interactive learning); visualization of educational information; ability to process information using modern information technologies; ability to create virtual laboratories; use of computer modeling capabilities (analytical and simulation); the ability to present the content of education in different forms, depending on the level of knowledge of the student, taking into account the different levels of detail and the complexity of the information provided; the ability to choose the speed of individual performance; the student can choose the method of data processing, depending on the type of presentation; ability to analyze one's own learning achievements and self-control, etc. [11, 98-p].

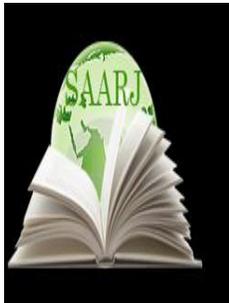

There are many software tools for creating e-learning resources, and programming languages "have a special place among these software tools. The advantages of programming languages" are the creation of e-learning resources that take into account the motivations of the user [12, 135-p] and allow him to use virtual laboratory work, various methods of monitoring students' knowledge.

In short, the use of e-learning resources in the educational process plays an important role in improving the cognitive skills of students in the formation of independent learning skills. E-

learning resources serve to increase the efficiency of education, effective and meaningful continuity of education and leisure time of students.

ABSTRACT

*In this article, based on a retrospective analysis of case histories of patients with RA, presented data research pathology GDD to the extent of disease activity, duration of history and the failure of the joints, as well as the characteristics of ongoing pharmacotherapy. The results show that the pathology GDD in RA patients are often, in every fifth patient is a concomitant disease, and every tenth – is manifested in the form of clinical symptoms, the main causes of gastro duodenal lesions are viscera's, long-term course of the disease and the frequent use of NSAIDs and corticosteroids. **Objective:** To study the frequency of occurrence of lesions of the gastro duodenal zone and the frequency of drug use in patients with rheumatoid arthritis based on the materials of a retrospective analysis. **Material and methods:** a retrospective analysis of 220 case histories of patients with rheumatoid arthritis (RA) treated in the rheumatology department of the III clinic of TMA was carried out. The selection condition was the endoscopic established diagnosis, that is, the presence of endoscopic examination. The state of the gastro duodenal zone (GDZ) and the pharmacotherapy of the underlying disease were evaluated. **The results of the study** show that GDZ pathology in RA patients is quite common, every third patient has symptoms of GDZ lesion and this is due not only to the intake of NSAIDs, but also due to the primary involvement of the GDZ mucosa in the pathological process.*

KEYWORDS: Rheumatoid Arthritis, Gastric Ulcer, Gastritis, Nsaids, Corticosteroid.

INTRODUCTION

The main problem for patients with rheumatoid arthritis (RA) is pain – one of the main signs of inflammation, and its intensity correlates with inflammatory activity. It creates serious psychological discomfort, limits physical activity, which necessitates the long-term use of non-steroidal anti-inflammatory drugs (NSAIDs) with analgesic, anti-inflammatory, antipyretic and antiplatelet properties [2,3,6]. However, their long-term use is associated with a spectrum of adverse effects, primarily with damage to the mucous membrane (MM) of the gastroduodenal zone (GDZ). All NSAIDs, regardless of their chemical structure, dosage form and route of administration, can cause ulcers, gastritis, gastropathy and perforation [4,8]. In patients taking NSAIDs, the risk of gastrointestinal hemorrhage (GIH) increases 3-5 times, perforation of ulcers – 6 times, the risk of death from complications associated with damage to the gastrointestinal tract (GIT) – 8 times. Up to 40-50% of all cases of acute GIs are caused by the intake of NSAIDs [1,7]. In endoscopic examination, erosive and ulcerative lesions of GDZ (accompanied by dyspepsia or asymptomatic) are found in 40% of patients taking NSAIDs for a long time [5].

In the present study, we analyzed the structure, frequency and nature of diseases of the gastrointestinal tract (GIT) in patients with rheumatoid arthritis (RA) who received NSAIDs.

Materials and research methods: the materials were a retrospective analysis of the case histories of patients treated in the rheumatology department of the III clinic of the TMA for the period from 2015 to 2020. Retrospective analysis included 625 case histories with a diagnosis of RA, which were selected from 3399 cases using the selection method. Among them, 58 (9.3%) were men, patients, aged 19 to 64 (average age 44.2), and 567 (90.7%), were women, aged 16-72 (average age 36.6 years).

The only selection condition was the endoscopic established diagnosis, that is, the presence of an endoscopic examination. It should be pointed out that out of 625 treated all rheumatological patients, only 220 patients underwent endoscopic examination, which was 36.2%.

The results obtained and their discussion. The results of endoscopic studies show that among patients with RA out of 625 case histories, only 220 patients underwent endoscopic examination, of which 47 (21.6%) had gastroduodenitis, 12 (5.61%) had gastritis, 40 (18.2%) gastritis in combination with peptic ulcer disease (either duodenal ulcer or stomach ulcer), in 38 (17.2%) gastric erosion in combination with duodenitis, in 33 (15%) erosive esophagitis in combination with gastroduodenitis, in 16 (7.2%) an isolated gastric ulcer, in 29 (13%) an isolated duodenal ulcer, in 5 (2.2%) an axial hernia of the esophageal opening of the diaphragm in combination with reflux esophagitis. It should be noted that the presence of combined pathology of the gastroduodenal zone in 74.19% of patients. And also, in 48.2% of patients, the presence of duodenogastric reflux of bile was found (Table 1).

TABLE 1 THE INCIDENCE OF CERTAIN TYPES OF ENDOSCOPICALLY (ESOPHAGOGASTRODUODENOSCOPY) ESTABLISHED NSAID GASTROPATHIES IN PATIENTS WITH RA IN RETROSPECTIVE STUDIES

Types of gastropathy	Number of cases	In %
Gastroduodenitis	47	21,6
Gastritis + ulcer and duodenum	40	18,2
Gastritis	12	5,61

Erosion + stomach gastroduodenitis	38	17,2
Erosive esophagitis with gastroduodenitis + DGBR	33	15
Hiatal hernia + RE	5	2,2
Duodenal ulcer	29	13
Stomach ulcer	16	7,2
Including the combination of pathology		74,2
DGBR		48,2
Without pathology	-	-
Total	220	100%

When studying the case histories, attention was paid to the complaints of patients, anamnesis, and diseases from the gastrointestinal tract. At the same time, in 64% of cases, complaints were identified that corresponded to the endoscopically established diagnosis. In 36% of patients, complaints were scanty. Pain from the gastrointestinal tract was very often absent. The absence of complaints of pain and paucity of symptoms in some patients, apparently due to the presence of the analgesic effect of the NSAIDs taken.

Along with complaints about the gastroduodeal zone, there were complaints characteristic of the distal part of the gastrointestinal tract, characterizing irritable bowel syndrome:

1. Flatulence, rumbling in the stomach.
2. Violation of stool (constipation and diarrhea).
3. Pains of a cramping character, passing after bowel movement.

In general, signs of irritable bowel syndrome were detected in 190 patients, which is 38% of the total number of patients studied. However, according to the data of case histories, it was not possible to establish the cause and relationship of gastrointestinal disorders with the use of NSAIDs.

As mentioned above, one of the leading causes of GDZ damage in the conditions of development and progression of RA is aggression of the GDZ mucosa by drugs used in the pharmacotherapy of this disease.

In connection with the above, the structure of drugs used in patients with RA and their specific gravity, depending on the presence or absence of GDZ pathology, was studied.

The results of this analysis are presented in Table 2.

TABLE 2 THE STRUCTURE OF DRUGS AND THE PROPORTION OF NSAIDS AND CORTICOSTEROID IN THE PHARMACOTHERAPY OF RA DRUGS

Medicines	Dosage form	Total number (abc)		Specific in the structure of treatment (%)	
		RA	RA +gastropath	RA	RA +gastropath
Corticosteroid	Injection	498	225	19,2	23,2
	Tablet	231	98	8,9	10,1
	Total	729	323	28,1	33,3
NSAIDs	Injection	593	224	22,9	23

	Tablet	424	175	16,4	18
	Total	1017	399	39,3	41
IPP		573	239	22,1	24,6
Basic resources		272	111	10,5	1,1
Total		2591	972	100	100

As can be seen from the data presented, NSAIDs occupy the largest share in the structure of RA pharmacotherapy, the share of which in the group of patients with and without pathology of GDZ is 41% and 39.3%, respectively. At the same time, the ratio of their injectable and oral dosage forms was the same in both groups and amounted to 1.4: 1.0 and 1.3: 1.0.

Glucocorticosteroids occupied the second place in the structure of pharmacotherapy and in the group of patients without pathology of GDZ they make up 28.1%, in the group of patients with pathology of GDZ - 33.3%. The ratio of injectable to oral forms was 2.2: 1.0 and 2.3: 1.0, respectively, in the group of patients without GDZ pathology and with GDZ pathology. Therefore, in both groups, NSAIDs and corticosteroid were equally often used in the framework of pharmacotherapy. The proportion of basic drugs in the group of patients without pathology of the gastroduodenal zone was 10.5% in the group with pathology of GDZ, only 1.1%.

Medicines aimed at protecting GDZ occupied a smaller proportion in the framework of pharmacotherapy for patients without GDZ pathology and amounted to 22.1%, in the group of RA patients with GDZ pathology 24.6%.

As can be seen from the results obtained, the drugs used in the framework of pharmacotherapy in both groups were used in a comparable proportion, although there is a tendency for the prevalence of the proportion of corticosteroid in the group of patients with GDZ pathology. In addition, attention is drawn to the lack of specific gravity of anti-secretory drugs in the group of patients with GDZ pathology.

Thus, the conducted retrospective study showed that GDZ pathology occurs in 33.3% of patients with RA, which to some extent agrees with the literature data. Analysis of the pharmacotherapy of RA, depending on the presence of GDZ pathology, indicates that the compared groups do not differ significantly in terms of the structure of drugs and their specific weight. Therefore, the role of drug therapy in the genesis of GDZ lesions revealed during the analysis cannot be considered proven, but this version cannot be refuted either. Perhaps, drug aggression in the genesis of the revealed pathologies of GDZ acquires significance, taking into account the duration of treatment of patients with RA.

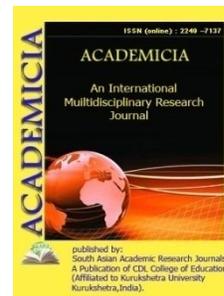

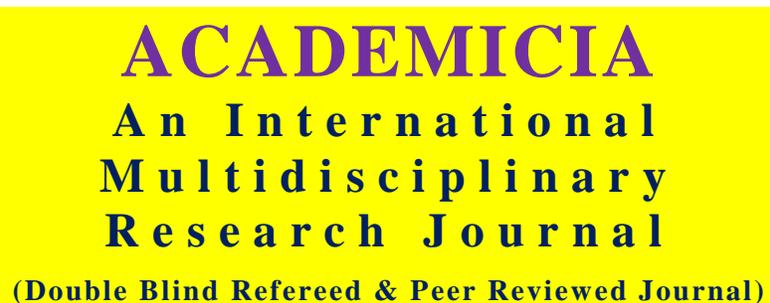

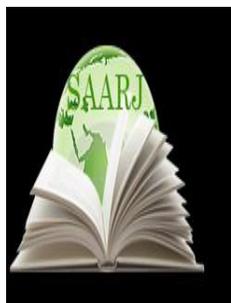

FINDINGS:

1. Pathology of GDZ in RA patients occurs quite often, every third patient has symptoms of GDZ lesion.
2. A retrospective analysis does not fully prove the role of drug therapy in the genesis of GDD lesions in RA patients.

3. Lesions of the gastrointestinal tract in patients with RA are caused not only by the intake of NSAIDs, but also due to the primary involvement of the GDZ in the pathological process.

HUMAN RIGHTS IN LAW AND IN PRACTICE

Raju Majhi*

ABSTRACT

Human rights are based on the principle of inherent dignity and the entitlement to enjoy her/his rights without facing any form of discrimination. There is a need to secure to each person an equal and inalienable right to live in freedom to enjoy equality, to be treated justly and to live in peace. The realization of Human Rights lies at the heart of democracy, development and good governance. Every nation should seek to make human rights a reality for every citizen and ensure that these rights are protected, promoted and not violated by the State. This paper aims to examine all the provisions made under various international and national measures to protect the human rights and also suggest the practical approach and implementation of these measures.

KEYWORDS: *Emphasize, Humanitarian Assistance, Excruciatingly.*

INTRODUCTION

Human rights are academically classified in terms of generations. The first generation rights are the civil and political rights, such as freedom of religion, free elections, right to property, freedom of expression, etc. They were also termed as negative rights, since they largely entailed non-interference of the State (i.e., individual protections against the State). The second in step with the generation of rights is socio-economic rights, such as right to education, right to health, right to basic housing/shelter, etc. They were termed as positive rights, requiring resource allocation, redistribution and positive action by the State. Bismarck pioneered these welfare rights in late 19th century Germany. The third generations of human rights are those that belong to the community and future generations – environmental rights, right to humanitarian assistance, etc.

These classifications have been the subject of much ideological debate. While libertarians largely favour only negative rights, liberals emphasise on positive or welfare rights. Some other commentators have argued that human rights suffer from a cultural bias, and are essentially ‘western’ in nature- instead they must be viewed from the lens of cultural relativism. However, academic discourse has gradually come to understand that human rights cannot be viewed from such a narrow lens. As the Vienna Declaration and Programme of Action (Adopted by the

World Conference on Human Rights, 1993) states: “All human rights are universal, indivisible and interdependent and interrelated”.

The Constitution of India encapsulates all three generations of rights, either explicitly, or by innovative interpretation. While provisions of Part III of the Constitution, the non-enforceable Directive Principles of State Policy, contain socio-economic rights. The judiciary has made Article 21 (right to life and personal liberty) the fountainhead of all generations of rights. In addition, the judiciary has declared that provisions of Part III and IV must be construed harmoniously.

The essay will focus on both civil-political as well as socio-economic rights. After all, Dr. Ambedkar, the Chairman of the Drafting Committee of the Constitution, observed in his speech to the Constituent Assembly at its last sitting: “On the 26th of January, 1950 we are going to enter into a life of contradictions. In politics we will have equality and in social and economic life we will have inequality, how long shall we continue to deny equality in our social and economic life? If we continue to deny it for long, we will do so only by putting our political democracy in peril.” The essay will trace the recognized rights, and identify the extent to which the rights have been protected or furthered. In other words, the essay will examine the promise and practice of human rights in India.

I. Socio-Economic Rights

(a) Right to Food

Article 25 of the Universal Declaration of Human Rights (UDHR) provides, “Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food.” Article 11 of the International Covenant on Economic, Social and Cultural Rights, 1966 (ICESCR) recognizes the right to an adequate standard of living including adequate food, and specifically recognizes the right to be free from hunger. As per Committee on Economic, Social and Cultural Rights (which commented on the normative content of Article 11), “The right to adequate food is realized when every man, woman and child, alone or in community with others, have physical and economic access at all times to adequate food or means for its procurement.” The General Comment further states that the core content of the right implies the twin goals of “availability” and “accessibility” of food.

Article 47 of the Indian Constitution, provides: “Duty of the State to raise the level of nutrition and the standard of living and to improve public health – The State shall regard the raising of the level of nutrition and the standard of living of its people and the improvement of public health as among its primary duties.” In *Francis Coralie Mullin v. Administrator, Union Territory of Delhi* it was held : “right to life includes the right to live with human dignity and all that goes along with it, namely, the bare necessities of life such as adequate nutrition.”

PUCL v. Union of India is a Public Interest Litigation case dealing with the right to food. It was initially filed in the light of failure by the State Government of Rajasthan to provide adequate food relief as mandated by its Famine Code of 1962. The Court found that surplus food grains to the tune of millions of tones were found in the godowns of the Food Corporation of India. This litigation gradually expanded to a number of areas relating to food, nutrition and hunger, and the Supreme Court has been passing periodic interim orders to implement the right to food even since 2001. The case still remains open, and the implementation of its orders is monitored by a

Court appointed Commission. Some of the Schemes whose implementation the Court has directed are: the Targeted Public Distribution Scheme (TDPS), Antyodaya Anna Yojana (AAY), the Mid-Day Meal Scheme (MDMS), inter alia – these schemes are now seen as constitutional entitlements.

The National Food Security Act, 2013, recognizes the constitutional entitlement of food rights (it was preceded by an Ordinance). The Preamble to the statute mentions the goal of enabling people “to live a life of dignity”. However, the implementation of the Act remains tardy. The identification of beneficiaries under the Act envisaged is as per Socio-Economic and Caste Census (SECC). However, as Prof. Jean Dreze notes, “the release of SECC data has been excruciatingly slow.”

Meanwhile, the hunger and malnutrition remain a severe problem in India. As per the 2015 Global Hunger Index, a multidimensional index on hunger, India’s score is 29, which places it in the category of nations with a ‘serious’ level of hunger. The 2011 HUNGAMA Survey covers 112 rural districts in India. It provides reliable estimates of child nutrition. The Survey shows that:

“Child malnutrition is widespread across States and Districts and starts early in life: 42 per cent of children under five are underweight and 59 per cent are stunted. Of the children suffering from stunting, about half are severely stunted; about half of all children are underweight or stunted by age of 24 months.”

The survey also noticed that socio-economic background of the family or household has an impact on the nutrition status of children.

(b) Right to Education

Article 26 of the UDHR unequivocally states, “Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages.” Article 13 of the ICESCR, while recognizing the right to education, provides, “education shall be directed to the full development of the human personality and the sense of its dignity, and shall strengthen the respect for human rights and fundamental freedoms.” The Committee on Economic, Social and Cultural Rights state that “education is both a human right in itself and an indispensable means of realizing other human rights” and adds that an educated mind “is one of the joys and rewards of human existence.” Availability, accessibility, acceptability and adaptability are the four identified elements of education rights.

Education finds a place in various provisions of the Indian Constitution. Article 21A provides that no citizen shall be denied admission to State aided educational institutions on grounds only of religion, race, caste, language or any of them. Articles 41, 45 and 46, mandate the State to secure right to education, provide early childhood care and education for all children upto the age of six and promote with special care the educational interests of weaker sections respectively. Supreme Court in its numerous decisions have recognized the right to education as part of the right to life in Article 21 vide *Francis Coralie Mullin v. Administrator, Union of Delhi*, *Mohini Jain v. State of Karnataka*, *J.P. Unnikrishnan v. State of Andhra Pradesh*. As a result by the Constitution (Eight-sixth Amendment) Act, 2002, the Right to Education was made a Fundamental Right by inserting Article 21A. Clause (k) was inserted in Article 51A as a Fundamental Duty. It requires every guardian or parent to provide educational opportunities for

children, between the age of six and fourteen years. The Right to children to Free and Compulsory Education Act, 2009 operationalized the right to education. The Act recognizes the right to education of children in a neighbourhood school, abolishes capitation fees, bars and expulsion or 'holding back', prohibits physical harassment and mental harassment and casts duties on the appropriate government, parents and schools with respect to education of children. The Act also mandates admission of children belonging to weaker sections and disadvantaged groups in the neighbourhood schools to the extent of 25% of the class strength. The Supreme Court in *Society for Un-Aided Private Schools of Rajasthan v. Union of India* upheld this provision but made an exception in favour of unaided minority schools. In *Pramati Educational & Cultural Trust v. Union of India*, the Supreme Court further excluded the operation of the Act to minority schools, whether aided or unaided.

After the Act came into force there is considerable improvement in the education of children but, much more remains to be done. The 2014 Annual Status of Education Report released by the Pratham Education Foundation indicates high levels of enrolment in schools (96%) but poor learning outcomes. Only 48.1% of children in class V could read a class II text book; only 25% of those enrolled in class V could read simple English sentences. Drop-out rate is as high as 29% before completing primary education. According to the 2011 Census, the literacy rate in India is 74.04% (with the female literacy rate standing at 65.46%). In rural areas the literacy rate being 67.77%, with only some 57.93% females being literate. States have introduced educational qualifications as a requirement for contesting at a Panchayat election. The validity of the said requirement is under challenge before the Supreme Court. In this context the words of Alladi Krishnaswami Iyer, a member of the Drafting Committee of the Constituent Assembly are relevant: "In a country where a large mass of people are illiterate, where the people owning property are few, the introduction of any property or educational qualification for the exercise of the franchise would be a negation of the principles of democracy.

(c) **Right to Health**

Article 25 of UDHR states that health and well-being form part of the universal human rights available to everyone. The ICESCR also recognizes the right to physical and mental health. The General Comment of the Committee on Economic, Social and Cultural Rights states:

"The right to health is not to be understood as a right to be healthy. The right to health contains both freedoms and entitlements. The freedoms include the right to control one's health and body and the right to be free from interference. By contrast, the entitlements include the right to a system of health protection."

In India, the Supreme Court and High Courts have recognized the right to health as flowing from Article 21. In *Pt. Parmanand Katara v. Union of India*, it was held, "Article 21 of the Constitution casts the obligation on the State to preserve life. A doctor at the governmental hospital positioned to meet this State obligation is, therefore, duty bound to extend medical assistance for preserving life." In *Pashim Banga Khet Mazdoor Samity v. State of West Bengal*, the Court ordered compensation for denial of emergency medical aid, since it violated Article 21. In *Consumer Education & Research Centre v. Union of India*, the Supreme Court unambiguously held:

"We hold that right to health, medical aid to protect the health and vigour of a worker while in service or post-retirement is a fundamental right under Article 21, read with Articles 39(e), 41,

43, 48A and all related Articles and fundamental human rights to make the life of the workman meaningful and purposeful with dignity of person.”

In *Mohd. Ahmed (Minor) v. Union of India*, the Delhi High Court considered the question whether a minor child from a weaker section of a society, suffering from a rare disease was entitled to free treatment (otherwise costing about Rs. 6 lakhs per month). The petitioner had exhausted the facilities available under government schemes. The State pleaded financial constraints. The Court held, “Although obligations under Article 21 are generally understood to be progressively realizable depending on maximum available resources, yet certain obligations are considered core and non-derogable irrespective of resource constraints. Providing access to essential medicines at affordable prices is one such core obligation. In other words, a “minimum core” principle, well-accepted in international socio-economic rights jurisprudence, was adopted. In *Laxmi Mandal v. Deen Dayal Harinagar Hospital*, the issue was with respect to material healthcare for women below the poverty line and the denial of benefits under various schemes of the Government. The High Court described the right to health as an “inalienable survival right”, and declared that it would include the right to access government health services and to receive a minimum standard of treatment and care. The Court directed the payment of compensation for violation of a Constitutional right.

Despite various schemes like Janani Surakshi Yojana (JSY), National Maternity Benefit Scheme (NMBS), Integrated Child Development Scheme (ICDS), the overall picture with respect to healthcare remains dismal. A 2011 study concluded: “after decades of poor policy commitments and budgetary neglect, India’s health infrastructure is weak and lacks institutional capacity.” The percentage of public health expenditure compared to the total health expenditure remains as low as 32.2%, compared to 83.5% in the United Kingdom and 69.8% in Canada. Infant mortality rate (number of infants dying before reaching one year of age, per 1,000 live births in a given year) stands at 38, as against 4 in the United Kingdom and 6 in the United States. As per the last available National Family and Health Survey (NFHS-3), only 48.8% of births were assisted by a doctor/nurse or any other medical personnel; only 36.8% of mothers received postnatal care. The Delhi High Court took suo moto cognizance of a case where a destitute mother gave birth to a baby girl on a busy street. The Court observed: “it is really perplexing that children of this country have to breathe the first breath on the road side footpaths... .” The situation is no different in the case of mental health. According to the World Bank, there are only 0.3 psychiatrists per 100,000 populations. As per the last available study, India spends only about 0.06% of its health budget towards mental health as compared to US and the UK, which spend 6.2% and 10.82%, of their budgets respectively.

II. Civil and Political Rights

(a) Women’s Rights

Discrimination based on sex prevents realization of available rights by women. The United Nations Convention on Elimination of Discrimination Against Women, 1979 (CEDAW) condemns discrimination against women in all its forms and calls upon the States to take all appropriate measures to eliminate discrimination and improve the condition of women. Some of the problems faced by women globally are gender-based violence, trafficking of women, sexual offences and denial of equal access to land and property.

The Constitution of India guarantees equal rights to all its citizens, prohibits discrimination against women and permits special provisions for the benefit of women. Article 21 assures right to live with dignity, Article 39(d) mandates equal pay for equal work for both men and women and Article 42 requires provision for just and humane conditions of work and maternity relief.

Gender-based violence is most prominently seen in the institution of marriage in India. The Indian custom of giving of dowry by the bride's family has led to cases of torture and dowry deaths of young married women. To curb this evil the Dowry Prohibition Act, 1961 made giving or taking of dowry an offence. Subjecting a woman to cruelty by husband and relatives is an offence punishable with imprisonment, under Section 498A of the Indian Penal Code, 1860. Dowry death is a separate offence under section 304B of the same Code. The Domestic Violence Act, 2005 protects women from physical, sexual, verbal and economic abuse. Hindu women always enjoyed the right to Stridhan. The Hindu Succession Act, 1956 has conferred additional rights. Section 14 says:

“Property of a female Hindu to be her absolute property (1) any property possessed by a female Hindu, whether acquired before or after the commencement of this Act, shall be held by her as full owner thereof and not as a limited owner.”

A Hindu woman has a right to maintenance. Property given to her for life in lieu of maintenance became her absolute property after the Hindu Succession Act, 1956 came into force, as held in *V. Tulasamma v. V. Shesha Reddi*. The right of Muslim women to maintenance was upheld in the *Shah Bano* case. Parliament by enacting the Muslim Women (Protection of Rights on Divorce) Act, 1986 tried to overcome the decision in *Shah Bano's* case. However, in *Danial Latifi v. Union of India*, the Supreme Court interpreted that very law in favour of divorced woman by declaring that she is entitled to a reasonable maintenance from her former husband for life or till she remarries.

In 2005, the Act was amended to make women coparceners in a Hindu Joint family at par with males. Section 6 of the Amendment Act, 2005 states that “daughter of a coparcener shall, (a) by birth become a coparcener in her own right in the same manner as the son.”

The laws pertaining to rape have evolved over the years with changing social conditions. Law Commission of India in its 172nd Report suggested reform of law relating to sexual offences. The case of *Delhi Domestic Working Women's Forum v. Union of India* suggested access to legal aid and compensation to the victims of sexual offence. In *Sakshi v. Union of India* the Supreme Court formulated guidelines to tackle sexual offences against children. The *Nirbhaya* Rape case awakened the conscience of the entire nation demanding radical reforms. A committee headed by Justice J. S. Verma, former Chief Justice of India, in its report suggested amendments, most of which have since been implemented. The punishment for sexual offences was enhanced and new sexual offences added to the Indian Penal Code which recognize in addition to rape, voyeurism, acid attacks and stalking as sexual offences against women.

Women's right to equal status at work place is recognized. The decision in *Air India v. Nargesh Meerza* established at termination of employment of a woman upon pregnancy is unconstitutional. In *C. B. Muthamma v. Union of India* the Supreme Court disapproved bias against women in the conditions of service of the Indian Forest Services. The guidelines provided in the case of *Visakha v. State of Rajasthan* for protection of women from sexual harassment at work place have since been incorporated by Parliament in the Sexual Harassment

of Women at Workplace (Prevention, Prohibition and Redressal) Act, 2013. The 73rd and 74th Amendments to the Constitution reserved seats for women in local administration i.e., Panchayats and Municipal bodies.

Even though several laws are in place to ensure rights of women, the ground reality is disconcerting. Dowry continues to be the cause of domestic violence. The National Crime Records Bureau in India in its report disclosed that in 2014 around 8455 newly wedded brides were killed for dowry. UN Special Rapporteur argues, "In almost all countries legal security of tenure for women is almost entirely dependent on the men they are associated with very few women own land." Sexual offences take place at an alarming rate in India. Victim of rape continue to suffer a social stigma. According to National Crime Records Bureau, in 2014, 36735 rape cases were reported. Marital Rape goes unpunished. Women are not treated at par with men at workplace. Equal pay for equal work is not common. A study by National Commission for Women (NCW) in 2010, found that 60% of women were not aware of their rights at workplace.

(b) Freedom of Speech

Freedom of speech and expression is a well-organised right. Article 19 of the UDHR also recognizes this right. The Indian Constitution also recognizes this right to citizens in Article 19(1)(a) of the Constitution. It is not an absolute right. Clause (2) of Article 19 limits the freedom of speech and expression by permitting imposition of reasonable restrictions.

However, these restrictions are narrow in scope. The restrictions have to be 'reasonable' and only be 'in the interest of any of the grounds explicitly mentioned under Article 19(2). In *Shreya Singhal v. Union of India*, where section 66A of the Information Technology Act, 2000 (which made sending offensive or false messages through a communication device an offence) was struck down as being violative of Article 19(1)(a), it was held that the restrictions permissible under Article 19(2) are narrower than those permissible under the First Amendment to the US Constitution, since public interest is ground for restriction under that latter. The case also recognized a number of concepts in free speech jurisprudence, such as chilling effect, vagueness and over breadth. In *Dr. Ram Manohar Lohia v. State of Bihar*, the Supreme Court evolved a test for 'public order' and defined it more narrowly than 'law and order'. In *Aveek Sarkar v. State of West Bengal*, the Supreme Court narrowly interpreted obscenity laws and held that obscene material will have to be judged from the "point of view of an average person, by applying contemporary community standards."

Although freedom of press is not expressly mentioned in Article 19(1)(a) it was held to be implicit in freedom of speech and expression. The Supreme Court has protected the rights of the press in many cases. Restriction on size and number of pages of a newspaper was held to be violative of Article 19(1)(a) in *Sakal Papers v. Union of India*. The Supreme Court in *Bennett Coleman v. Union of India* struck down government policy imposing page limitations and bar on starting newspapers by common ownership units.

However, the history of free speech protection in India has not been uniformly progressive. In cases such as *K.A. Abbas v. Union of India* and *S. Rangarajan v. P. Jagjivan Ram* the Supreme Court has allowed prior restraint and pre-censorship in case of cinematograph films. The law of criminal contempt of court operates as a restriction on freedom of press as truth is not a defense. More recently in *Devidas Tuljapurkar v. State of Maharashtra*, the Supreme Court held that contemporary community standards will apply with 'more vigour' in case of historically

respected persons. Offences such as criminal defamation and sedition continue to remain on the statute book and have become an oppressive tool in the hands of the governments or powerful individuals to stifle the voice of opposition.

(c) Prisoners' Rights

Prisoners are entitled to the rights under Articles 21 and 22 of the Constitution. The right to live with dignity is available to prisoners. In *Shatrughan Chauhan v. Union of India*, Supreme Court held that "Article 21 inheres a right in every prisoner till his last breath and this Court will protect the right even if the noose is being tied on the condemned prisoner's neck." The Civil Procedure Code and the Prisons Act, 1894 protect the rights of prisoners against excessive use of force by the police. Article 22, provides certain basic rights to detainees. The conditions of prisoners improved considerably since *Sunil Batra v. Delhi Administration*, which declared torture and solitary confinement of prisoners unconstitutional. *Prem Shankar Shukla v. Delhi Administration* held that a prisoner could not be handcuffed routinely.

Torture in police custody is a flagrant violation of Human Rights as well as Article 21. In *Arvind Singh Bagga v. State of Uttar Pradesh*, it was held that torture means physical, mental and psychological torture. Custodial death of prisoners is a serious crime against humanity. In *Ajab Singh v. State of Uttar Pradesh*, the court held that the State would be responsible for custodial death. The Judiciary made the police responsible for this gross form of violation of human rights. In *D. K. Basu v. State of West Bengal* the Court issued mandatory directions to be followed with respect to prisoners in custody. In *M.H. Hoskot v. State of Maharashtra* right to legal aid has been held to be a fundamental right to life and personal liberty in India being an essential ingredient of the right to free trial which is part of the procedure established by law in Article 21. Despite these Constitutional rights and procedural safeguards there are many cases of custodial deaths and violence due to abuse of authority by the Police. People's Union for Democratic Rights (PUDR) carried in its Report stated in 1989, "In a city with less than one percent of the national population, there were 48 deaths in police custody from 1980 to 1989, most of them of persons under the age of 30." "Most of these people died due to severe beating and prolonged torture. According to the 2011 Report, total number of deaths in custody was 1789.

(d) Religious Freedom

The Constitution of India guarantees to all persons freedom to profess, practice and propagate religion. Article 25 and 26 which deal with religious freedoms are based on the concept of Secularism which is part of the basic structure of the Constitution. Since the Constitution has not defined the term 'religion', the Supreme Court clarified its meaning in *Commissioner, HRE v. Shri Lakshmindra*, and opined that religion need not be theistic. A religion simply "lays down a system of beliefs or doctrines which are regarded by its followers as conducive to their spiritual well-being."

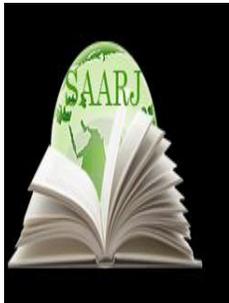

The Supreme Court has largely been progressive in protection of religious freedom. In *Bijoe Emmanuel v. State of Kerala*, three school children were expelled from the school because they did not sing the National Anthem as their faith did not allow it. The court upheld their freedom and declared the expulsion invalid.

The Supreme Court has interpreted Article 25 as being protective of only essential religious functions. This is in order to facilitate reform measures and reasonable restrictions. In *Commissioner of Police v. Acharya Jagdishwarananda*, the Supreme Court referring to *Anand Margis* held, that “performing Tandava dance in public places is not an essential part of their religion”. In *Mohd. Hanif Qureshi v. State of Bihar* the court upheld ban on cow slaughter and rejected the plea that cow slaughter was an “essential practice in Islam.” *Mohd. Ismail Faruqi v. Union of India*, upheld the validity of the *Acquisition of Certain Areas at Ayodhya Act, 1993*. The Supreme Court observed that every location for offering prayers would not be an essential part of the religious practice.

Secularism is the bedrock of the Constitution, yet, in reality, strict neutrality is not observed by Governments towards different faiths. For example, the ban on beef consumption in Maharashtra is a political move in order to appease the religious majority. The State must instead heed to the message of the Constitution, as contained in the Preamble.

III. CONCLUSION

Human rights on paper and in practice are not the same, just like the theory of Legal Realism proposed by Justice Oliver Wendel Holmes. Apart from innovative interpretation of the Constitution by Courts the participation of civil society and broader social change is critical for the advancement and enjoyment of human rights. In his book *The Hollow Hope*, Gerald Resenberg argued that the Constitutional Courts alone cannot bring about social change- there must always be an accompanying political movement. The role of civil society cannot be emphasized more. We may do well to remember the words of Justice Vivian Bose “We have upon us the whole armour of the Constitution and walk from henceforth in its enlightened ways, wearing the breastplate of its protecting provisions and flashing the flaming sword of its inspiration...” The Constitution mandates concerted action on the part of all the three wings of the State to create congenial conditions for the enjoyment and enforcement of basic human rights incorporated therein having regard to the ideals of Liberty, Justice, Equality and Fraternity set out in the Preamble of the Constitution. The Executive and the Legislature need to move in step with the Judiciary which has been steadily expanding the horizons of human rights. The Directive Principles of State Policy need greater attention than they have received so far. Courts alone cannot accomplish the socio-economic rights enshrined therein.

ABSTRACT

The article deals with the development of the constructive ability of teachers of mathematics during the process of methodological training, which is closely connected to the informational, explicating, stimulating functions of a teacher. The use of a computer textbook in the classroom of descriptive geometry allows, with a significant increase in the pace of learning, to improve the quality of knowledge in connection with the development of such mental processes as memory and spatial thinking, and, as a consequence, to increase interest in descriptive geometry.

KEYWORDS: *Constructive Function, Constructive Abilities, Projecting Activity, Structuring Of The Preparation Of Future Teachers.*

INTRODUCTION

Spatial thinking is a complex process in which the following actions take place (Figure 1) Images here are both the source material, and the main operational unit, and the result of the thought process. This does not mean, of course, that it does not

Verbal knowledge is used. In figurative thinking, words are used as a means of interpreting transformations already performed in images.

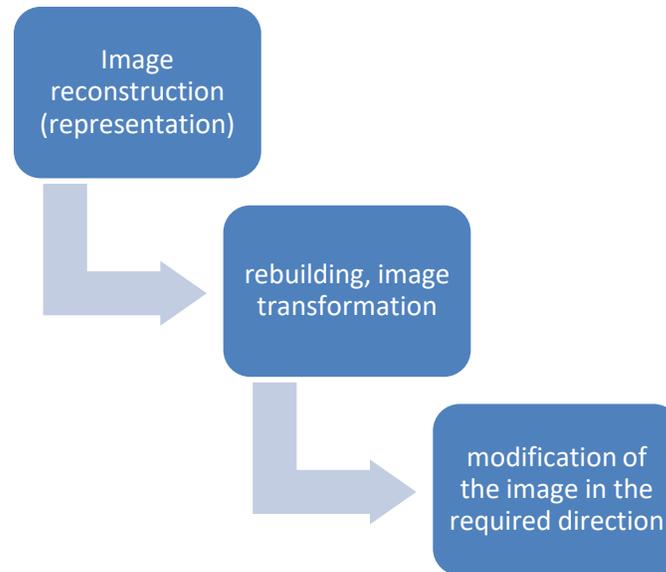

Figure 1 imaging process

The content of spatial thinking is the operation of spatial images based on their creation using visual support (subject or graphic, different measures of generality and convention). These features of spatial thinking reflect the process of working with the image and reveal its qualitative originality. The forms and levels of spatial thinking are determined, on the one hand, by the objective content of the material, and on the other hand, by the student's cognitive activity.

The objective content of the material includes clarity, accessibility. In the process of teaching descriptive geometry, it is necessary to widely use visual teaching aids: posters, models, parts, various products, drawings, etc. It is also recommended to use handouts when lecturing, the use of a computer textbook and other modern technical teaching aids.

The use of a computer textbook in the classroom of descriptive geometry allows, with a significant increase in the pace of learning, to improve the quality of knowledge in connection with the development of such mental processes as memory and spatial thinking, and, as a consequence, to increase interest in descriptive geometry. The cognitive activity of students is realized in the process of solving problems that require the creation of spatial images and their operation. The level of this activity depends on the students' mastery of the means of activity, ways of presentation. When operating with an image, the image already created on this basis is mentally modified, often in conditions of complete abstraction from it.

The most important condition for the formation of ideas about geometric images is teaching students the techniques of considering and memorizing them, as well as the techniques of their reproduction from memory. The process of forming spatial representations of geometric objects is based on knowledge about them [4].

In practical classes, students should learn the techniques of analyzing objects: mentally dividing it into geometric bodies of which it consists, and highlighting all of its elements. This, in turn, requires a mental drawing of the boundaries of each geometric body (where these bodies are not delimited in the object).

The most important principle aimed at teaching is the following position: at the beginning of mastering new material in the course of descriptive geometry and engineering graphics, students are taught elementary techniques, which are characterized by additional reliance on visual material. Then the methodology must ensure the restructuring of the techniques so that the student creates images without additional support, mentally, by the activity of imagination - from concrete contemplation to abstract thinking. The transition of students from actions with additional support to mental ones when forming images of the imagination reveals a pattern that in the assimilation of knowledge and skills plays an important role in the transition from actual actions, or actions with visual material, to mental actions, to actions in the mind.

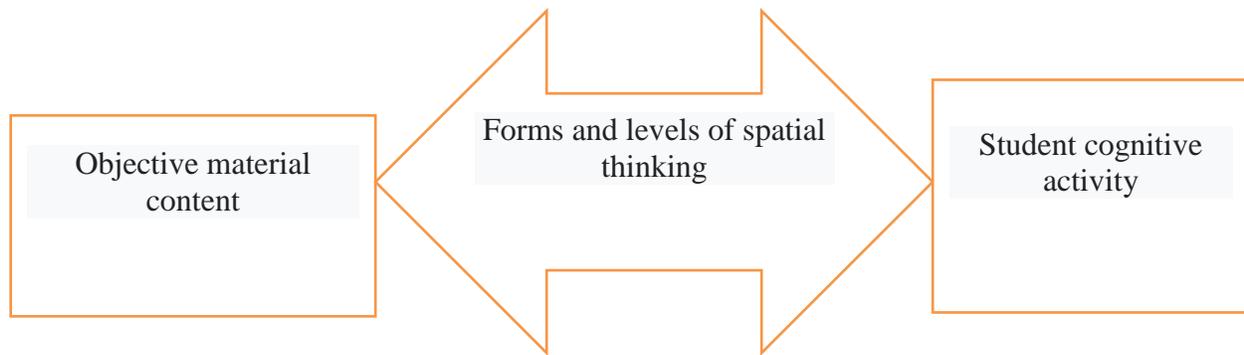

Figure 2 Forms and levels of spatial thinking

The students are then taught how to create images using imaginative activities. The teacher should offer to mentally reproduce the actions that students actually performed when mastering a visual technique:

To present a triangular octant angle and a point, a straight line, a plane, a geometric body located in it;

Mentally draw perpendiculars (project geometric images) on the edge of a triangular corner;

To present projections of geometric images on these faces; Rotate the right and bottom faces around their axes (combine the horizontal and profile planes with the frontal projection plane);

Present three projections of geometric images.

In this case, the method of creating an image is expressed in the following: students create images of projections using additional representations (triangular octant angle). This is achieved by the activity of the imagination. At the same time, students make a transition from actual actions with visual material (in preliminary training) to mental actions based on additional representations. After that, students learn a technique that is more difficult for them. The teacher sets them the following task: to learn to represent the projections of the given geometric images without relying on additional images, i.e. not imagining a triangular angle. A good knowledge of descriptive geometry predetermines the success of studying other graphic disciplines at the university. Descriptive geometry methods are the theoretical basis for solving technical drawing problems. In technology, drawings are the main means of expressing human ideas. They should not only determine the shape and size of objects, but also be quite simple and accurate in graphic design, help comprehensively, explore objects and their individual details. In order to correctly

express your thoughts with the help of a drawing, sketch, drawing, knowledge of the theoretical foundations of constructing images of geometric objects, their diversity and the relationship between them is required, which is the subject of descriptive geometry.

The constructive function of the teacher includes the following main types of design activities:

Constructively targeted, involving the analysis of training standards, knowledge requirements and the skills of students and the design on this basis of learning, development and education goals in the process of studying a subject;

Constructive and meaningful, consisting in the selection and design of content

Teaching material, thematic and lesson planning;

Constructive-procedural, consisting in the design of methods, forms and means

Teaching, as well as the structure and sequence of actions of the teacher and students in the lesson;

Constructive and evaluative, consisting in the design of an effective control system and assessment of the educational activities of students;

Let us dwell on the study of the constructive-procedural aspect of this function, namely preparing future teachers to apply practical methods of teaching mathematics, one of which is exercise. We have developed tests to study constructive thinking future and practicing teachers. As part of the ascertaining experiment, lessons were attended by teachers of schools in Kazan. Observations, introspection and analysis of lessons, analysis of lesson plans show that teachers exercises, of the same type are used; when designing exercise systems, they are not followed didactic principles, assignments are given at home, for which students are not ready to complete, tasks are not differentiated. This allows us to conclude that special work is needed, primarily in the classroom on methodology, on teaching students to design a system exercises for different stages of the math learning process.

The main design stage is the structuring of the educational material. It

(Structuring) is aimed at identifying the internal semantic connections of the information being studied.

The teaching material can be structured "sequentially" and "in parallel". The first way corresponds to the traditional study of the subject, when the topic develops over several lessons. The second method allows you to study a whole topic within one lesson, which is especially important when studying the subject "Mathematics" without dividing into algebra and geometry. Learning mathematics goes by the "immersion" method.

I propose the following system for the development of constructive thinking in future math teachers:

The formation of positive motivation to master the appropriate skills;

Acquaintance with various ways of structuring educational materials, such as

Fundamental elements of known technologies for teaching mathematics, including

Task material (consolidation of didactic units, modular training, problem

Training, experience V.F. Shatalova and others);

Independent activity of students in structuring educational and task

Material, design of individual elements of training and the entire process as a whole;

Approbation and correction of the corresponding skills during the period of teaching practice.

To prepare for laboratory studies, students are offered tasks aimed at the formation of constructive skills and abilities. Moreover, and here the technique is used "Flipped learning". First, students receive assignments to develop lesson fragments without detailed instructions for its implementation. Preparing for the lesson, they act by intuition, remembering the actions of their teachers at school.

CONCLUSION

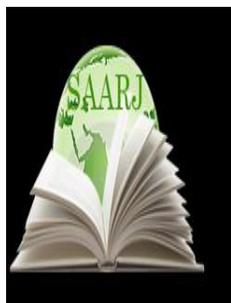

As a result of this approach to teaching students how to design educational material (when the student has already thought about the educational task before him) interest in this problem. Together with the teacher, the basic principles and requirements for the selection and designing educational material (establishing a connection between old and new knowledge, selection of a so-called focus example, motivation for the introduction of a new concept or method of action,

Knowledge necessary for mastering new ones etc).The teacher, together with the students, analyzes possible version of a fragment of this lesson, allowing you to achieve its goal.

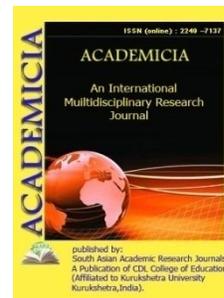

The result of laboratory exercises on the construction of fragments of lessons in the formation of new concepts, the study of theorems, new methods of action, is a change in the level of readiness of student's to constructing educational content from reproductive to partial search. Future teacher's already do not seek to retell the textbook, but try to design the learning process.

**USING MODERN APPROACHES AND METHODS IN THE PROCESS OF
LEARNING RUSSIAN LANGUAGE**

Nurjanova Zamira Halim janovna*

*Senior Teacher,
Department of "Foreign Languages",
Tashkent Architecture and Civil Engineering Institute,
Tashkent, UZBEKISTAN

ABSTRACT

Teaching methods used by the teacher during the lesson depend primarily on the tasks and goals that are noticed in each particular lesson in particular and when passing certain topics in general. The article is devoted to the development of skills and independent thinking among university students in the process of learning Russian language. It emphasizes that the most amazing and wise thing created by humankind is language. Knowledge of the language opens up huge opportunities and prospects in our lives.

KEYWORDS: *Learning Process, Method, Knowledge, Development Of Methodology, Development Of Personality, Development Of Society Student, Development Of Activity Teacher, University, Development Of Society, Methodology, Study, Practice.*

INTRODUCTION

Today, as we see teaching of Russian language and literature is not all well, because the results of learning are shown not only in exams, but in also not all students can logically express their thoughts, justify conclusions, maintain a dialogue on a given topic, write competently. The restructuring of teaching involves, first, updating the variable methods, methods and techniques of organizing classes. Russian language teaching, which, in our opinion, develop students' vivid imagination, flexibility of mind, excitement, ingenuity, interest in the word, in the Russian language, is worth considering in this regard.

At the present stage of the development of society, the main methodological science is the education of a person who strives for maximum openness to the perception of new experiences, capable of conscious and responsible choices in various life situations. To educate such a person, the trainees need a modern approach to teach communicative competence, consisting of speech,

linguistic and sociolinguistic competence. Brought up in such conditions, the student must eventually reach the level defined as the level of "language personality".

As a result of the changes taking place in the republic, the process of teaching Russian language today can develop taking into account the needs of people and acquire a more tangible practical and communicative orientation. When planning work, the teacher must clearly define the purpose and time of its implementation in the classroom. Students must understand the essence of the material being studied, so it is necessary to ensure that students understand the essence of the classes offered for self-study. Language is an essential element of national culture, the most important means of formation and spiritual development of the individual. In the last two decades, Uzbekistan has been paying close attention to the issues of teaching foreign languages. The resolution "On measures to further improve the system of foreign language learning" created favorable conditions for the development of language teaching methods.

Preparing a person to communicate in the language being studied today is equivalent to preparing for an intercultural dialogue. The practice of teaching the Russian language should respond promptly to this circumstance and develop ways to optimally solve the problems that arise [1]. The organization for the study of Russian language in universities often have serious shortcomings: lack of special exercises aimed at developing the necessary skills and skills that students master the methods of independent work; the lack of self-activity; lack of consideration of individual characteristics of students; randomness of choice, lack of specificity of tasks, their monotony; tasks are of the same type, often unreasonably large or small in volume, the wording of tasks is unclear, stretched. All this leads to a significant loss of training time and a decrease in the effectiveness of the exercise.

The main conditions contributing to the formation and development of coherent speech are skillful use of the means of expression of speech, it is accessible to students (basic tone of the statements, logical stress, tempo, loudness of speech and non-verbal means), methods of preparing an oral statements (preparation of questions, selection of reference words, plan for the future of the utterance, its pronunciation), composite forms of oral monologue speech (oral retelling, message, story). Solving the problem of mastering the practical side of the studied language, it is necessary to instill in students the skills of independent conversation in vital situations. It is the situations that should become an incentive for independent speech activity of students in the learning process, since a person's speech in their native language is situational. Through situational exercises and educational games, students gradually realize the need to master the Russian language. Game interpretation of the lesson in a classroom setting-set creates an opportunity to implement educational speech situation, contributes to the development of students speaking in terms of emotional intensity, helping to overcome the psychological barrier of hesitation. All this makes the game one of the most effective means of developing students' oral speech [3]. The elements of the game enliven the lesson, since at the initial stage of learning for students; the game is more familiar than the lesson. The game can be held in the form of a competition between the rows in order to learn words, consolidate and repeat. It is useful to organize such games, during which students will be faced with the need to talk: say hello, say goodbye, thank you, ask, and answer. First, the game is played under the guidance of a teacher, and the course of the game is explained. Other games can then be organized with the help of the older students outside of school hours.

Observations show that it is advisable to include 1-2 games in each lesson, which is due to the specifics of working in an educational institution, where it allows each student to take an active part in didactic games. Make a verbal painting. It is equally effective for both the Russian language and literature, and can be successfully used from the first grade to the last. We are talking not only about special lessons of speech development, but also about everyday ones. To characterize the hero of the work, to explain the conflict or the role of the landscape, to retell the plot, to analyze the author's point of view – all this the student faces almost every literature lesson. In addition, the training methods associated with verbal drawing help to concentrate, identify cause-and-effect relationships, and develop logical thinking, speaking ability, clearly formulate and express their thoughts. In Russian language lessons, these same techniques also contribute to the formation of a culture of speech, the competent construction of sentences. For their development, the teacher can ask questions where it is necessary to insert words that match the meaning, connect parts of sentences, arrange paragraphs in semantic order, simulate the specified speech situation, etc. Such teaching methods are aimed at the development of students' communicative competence, full mastery of all the riches of their native language. This example is one of many, as each teacher's teaching box is replete with a variety of innovative and traditional approaches to the educational process.

The age group of students, the degree of their readiness and many other factors also influences the choice. Thus, research forms and methods of work are most often used in high school, and game forms – in junior and secondary schools. At the same time, there are also such teaching methods that are considered universal. The educational process does not stand still. It is a flexible system, the components of which vary depending on the needs of society. In this regard, new teaching methods are regularly incorporated into the traditional structure of the lesson, creating effective types of learning activities. For example, complex lessons are very interesting. You can combine literature with Russian or a foreign language, history, music, painting, geography.

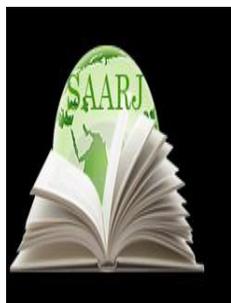

CONCLUSION

As a result, you will be able to conduct a lesson-journey, a lesson-research, etc. In classes of this kind, and this applies more to the junior and middle levels, the optimal teaching methods will be optimal. They are also good at competitive lessons: «What? Where? When?», Linguistic tournaments and battles, literary interviews and reports. Such lessons can be conducted at all levels of the educational chain. An indispensable element of modern education is the use of technical means. Various types of computer presentations, diagrams, graphs, virtual tours, made by the teacher with the involvement of students, give the educational process more information and emotional saturation, cognitive interest. Lessons with the use of new technologies awaken in the student a researcher who wants to learn more, and teach them to extract this knowledge independently. Thus, one of the main tasks of higher and secondary education is realized: the education of not only a literate, but also an active, searching, creative person.

THE IMPORTANCE OF DEVELOPING AND IMPLEMENTING MORE ADVANCED TEACHING METHODS IN PEDAGOGICAL PRACTICE

Abduvasikova Dilafruz Djalalitinovna*

*Senior Teacher,
 Department of "Foreign Languages",
 Tashkent Architecture and Civil Engineering Institute,
 Tashkent, UZBEKISTAN

ABSTRACT

The article is devoted to the development of skills and independent thinking among university students in the process of learning foreign languages. It emphasizes that the most amazing and wise thing created by humankind is language. Knowledge of a foreign language opens up huge opportunities and prospects in our lives. In addition, knowledge of the language will not be superfluous for those people whose activities or lifestyle are associated with frequent stays abroad, and of course, the need to learn a foreign language arises for those who plan to change their permanent place of residence to live in another country.

KEYWORDS: *Student, Teacher, University, Forms and Methods, Foreign Language, Method, Knowledge, Activity, Process, Grammar, Learning, Activity, Development.*

INTRODUCTION

Implementing more advanced teaching methods in pedagogical practice is a purposeful activity of a teacher aimed at improving the content, forms and methods, techniques and means of teaching in order to increase the interest, activity, creativity and independence of students in learning knowledge, forming skills and applying them in practice. This is the students' activity aimed at improving the existing and acquiring new knowledge. The decision to activate educational activities is associated with such concepts as "optimization of the educational process", "improving the effectiveness of training".

Conditions, forms and methods that activate students' learning activities simultaneously contribute to improving the effectiveness of learning and optimizing its process. The activity of the student is leading in the process of interaction between the teacher and students, which requires the teacher to create conditions for the organization of active activity of students.

Creating conditions for the implementation of purposeful creative activity of the student is one of the most important tasks of higher education. The main task of higher education is to form a creative personality of a specialist who is capable of self-development, self-education, and innovation.

The solution to this problem is hardly possible only by transferring knowledge in a ready-made form from the teacher to the student. It is necessary to transfer the student from a passive consumer of knowledge to an active creator of knowledge, who is able to formulate a problem, analyze the ways to solve it, find the optimal result and prove its correctness. The current reform of higher education is essentially related to the transition from the learning paradigm to the educational paradigm. In this regard, it should be recognized that independent work of students is not just an important form of the educational process, but should become its basis. This involves focusing on active methods of knowledge, developing students' creative abilities, and moving from flow-based to individualized learning, taking into account the needs and capabilities of the individual. It is not just about increasing the number of hours for independent work. Strengthening the role of independent work of students means a fundamental revision of the organization of the educational process at the university, which should be built in such a way as to develop the ability to learn, to form the student's ability to self-development, creative application of the acquired knowledge, and ways of adapting to professional activities in the modern world. At the same time, independent work, its planning, organizational forms and methods, and the results tracking system are one of the weakest points in the practice of higher education and one of the least studied problems of pedagogical theory in relation to the educational situation (diversification of higher education, introduction of educational standards, introduction of a system of pedagogical monitoring, etc.)

In the studies devoted to the planning and organization of independent work of students, the general didactic, psychological, and organizational and activity, methodological, logical and other aspects of this activity are considered, many aspects of the studied problem are revealed in the didactic plan. Special attention should be paid to the issues of motivational, procedural, and technological support of classroom and extracurricular cognitive activity of students – an integral pedagogical system that takes into account their individual interests, abilities and inclinations.

To date, there is no need to convince teachers of the importance of developing and implementing more advanced teaching methods in pedagogical practice, ensuring an increase in the quality of the educational process, contributing to the activation of students' cognitive activity, the development of their skills of independent thinking and practical application of knowledge. The development of activity, creative independence is based on the achievements of pedagogical psychology, which has put forward the position on the role of active activity in the learning process. No one claims that it is quite easy to learn and master a foreign language perfectly. This requires diligence, patience, will have to focus all their attention on the learning process, and learning the basics you will need to spend many hours of their free time, but if you important result, it is not necessary to refer to excuse the failure to learn and stop halfway.

If there is a goal or a need – it all depends on you! As a rule, in most cases, the main reason that prevents learning a foreign language is an incorrectly selected method. Inconvenient training schedule or, in some cases, psychological incompatibility with the teacher.

It is also possible to distinguish a situation when a person already speaks several foreign languages and for one reason or another, there may be a certain psychological barrier that prevents the perception of another foreign language. The reasons may be of a different nature, but in order to achieve further results, it is necessary to establish them and correctly choose the right "key" in their elimination. Unfortunately, the most acute problem is the outdated and traditional methods of teaching a foreign language in many educational institutions: schools, lyceums, universities. Many tutors, adhering to these methods in the case of private education, pay great attention to the study of grammar, complex speech patterns or rules, but in most cases, it is more important for students to master a foreign language at the level of communication, so they absolutely do not need complex grammar. Taking into account the statistics, 70-80% of students need to master the spoken language, which they need for communication, correspondence, reading literature or in the case of staying abroad. A very important point in teaching is the division of students into linguists and ordinary users. As for the "inability to learn foreign languages" – if we rely on the widespread statistics, about 6-15% of the population really have a tendency to learn any foreign languages. Besides, these are just statistics. There is a percentage of people who can perfectly master a foreign language and at the same time not "give out" themselves in a conversation with a characteristic accent. Even a professional philologist or translator with many years of experience cannot always "hide" or get rid of a characteristic accent, because this is a very complex and sometimes even impossible process, up to the special structure of the speech apparatus.

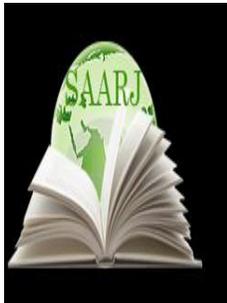

In addition, an important role is played by the actor's data and the psychological qualities of each person. But in this situation, we are not talking about perfect pronunciation and knowledge of a foreign language. In most cases, for many of us, learning a foreign language is necessary in order to express and understand, so you need to find your own acceptable methodology and approach when teaching a foreign language.

Quite often, the teaching method chosen by the teacher for one student is absolutely not suitable for the rest, but, following the goal, the teacher tries hard to invest knowledge. Unfortunately, this situation occurs quite often, which leads to the fact that because of this, many people lose the desire, for example, to learn a foreign language, there is a strong opinion that a person simply "does not have the ability to learn a foreign language". For example, people of a melancholic disposition are contraindicated in communicative teaching methods and all kinds of immersion in the language environment. For people with this type of nervous organization, it is better to calmly and steadily learn a foreign language with the help of self-help books. For those who cannot decide on the right method or course in the development of a foreign language, psychological testing will help, but this is only if the person himself understands that he needs to pass such a test and get recommendations from psychologists. In other words, the educational system should be built according to the form of interest, as an element of the inversion of the student's learning object.

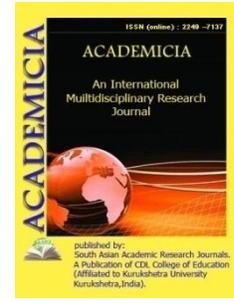

The reasons that can be an incentive to learn a foreign language are really many, but surely many of us have faced a situation where, having taken a firm intention and having a desire to learn a foreign language, they face the problem that the first lessons of language courses or any other chosen methods do not give any results. The simplest and easiest answer to this question is immediately found – a person simply does not have the ability to learn foreign languages.

DEVELOPMENT OF ECONOMIC CULTURE OF STUDENTS IN NON- NON-ECONOMIC SPECIALISTS

Kuchqorova Nargiza Mamajonovna*

*Doctor of Philosophy in Pedagogical Sciences,
Urgench State University, UZBEKISTAN

ABSTRACT

This article focuses on the specifics of the development of economic culture of future teachers, ie students in non-economic specialties, with a model for the formation of economic culture of future teachers, classifications of economic culture development in pedagogical education in higher education. It is explained that motivating students in non-economist specialties, future professionals to work on themselves, to prepare business projects is an important factor in shaping the economic culture.

KEYWORDS: *Integration, Reform, Non-Specialist, Intellectual, Economic Modernization, Professional Activity, Organizational-Managerial, Motivational, Model, Criteria, Technology.*

INTRODUCTION

From the very first years of independence, special attention has been paid to the issue of educating young people, their relevant professions, reforming the education system and raising the training of national personnel to the level of modern requirements.

One of the directions of the society's demands is to organize and update the content of education in accordance with modern requirements, to integrate the system of continuing education with science and industry, to further improve the system of educational institutions, to strengthen methodological training in the professional activity of competitive teachers. achieved. In our country, "continuing the path of further improvement of the system of continuing education, increasing access to quality educational services, training of highly qualified personnel in accordance with the modern needs of the labor market" [1; 70 p] At the same time, extensive work is being done to radically improve the quality of education, in-depth teaching of subjects with high demand for information technology, training in specialties that meet the needs of employers and improve the quality and efficiency of their activities in higher education.

In the reform of the education system of the Republic, the coordination of curricula in accordance with international standards based on foreign experience has become the basis for improving the system of higher pedagogical education. In the context of Uzbekistan, a radical reform of the quality of education based on foreign experience, taking into account our national mentality and traditions, is a requirement of the times.

In the reform of the education system of the Republic, the coordination of curricula in accordance with international standards based on foreign experience has become the basis for improving the system of higher pedagogical education. In the context of Uzbekistan, a radical reform of the quality of education based on foreign experience, taking into account our national mentality and traditions, is a requirement of the times.

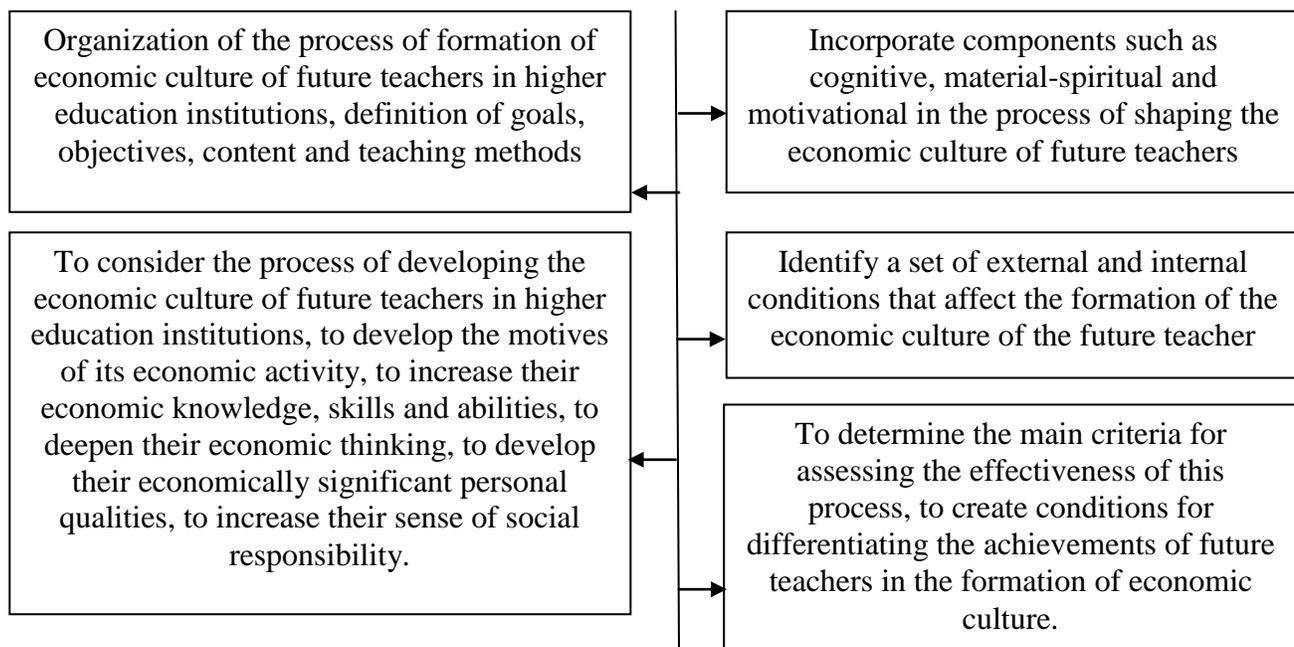

The effective use of the existing pedagogical conditions in the educational process in higher education institutions today implies the generalization of the theoretical model for the formation of the economic culture of future teachers.

The formation of economic culture, which is of particular importance in areas where the economist is not an expert (in the higher education institutions we studied), is that in the formation of economic cultures, their non-expertise is taken into account.

At the same time, a high level of economic culture helps students, future professionals.

- understanding the place and role of their future careers in the current system of the economy;
- training to act in crisis situations, to solve problem situations;
- orient them to the conditions that will occur in a few years.

Fundamentals of presenting a model of economic culture of future teachers

The desire to raise the level of education of modern youth in Uzbekistan can serve as a necessary condition for the dissemination of legal and economic information.

The main sources of development of economic culture in the field of education in society are the creation of the necessary conditions for social stability, economic modernization. Implementation of the system of training in higher education institutions as an element of the mechanism of economic transformation requires a comprehensive assessment of the intellectual and professional capacity of the population and its effectiveness.

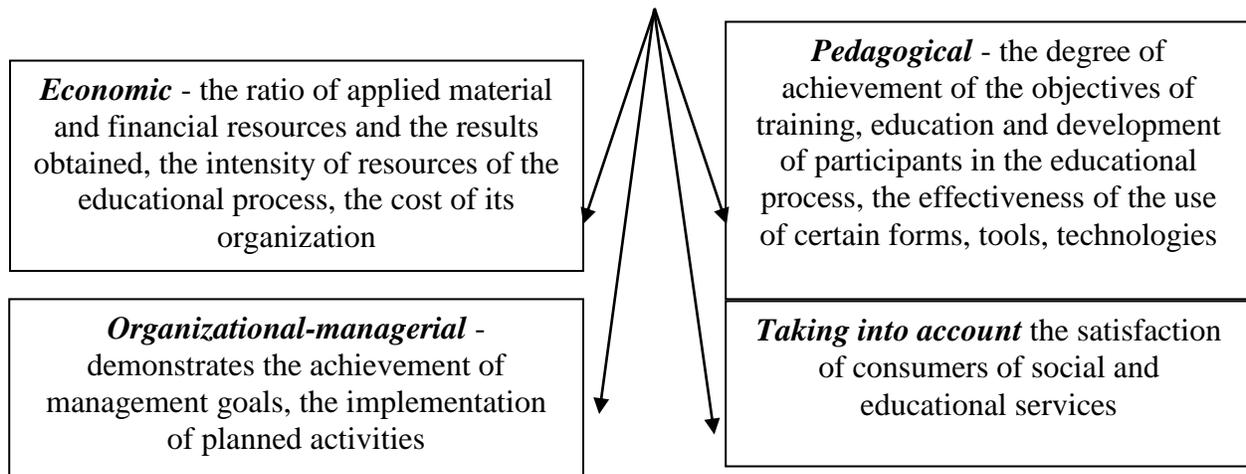

Learning effectiveness usually consists of two main parts that are interrelated.

The first is the teacher's assessment of the internal state of the service, which determines the life of the educational institution, including students, programs, student composition, infrastructure, internal and external environment.

Second, the intensity of demand for educational services and the level of demand (assessment of the quality of educational services on the basis of the entry of graduates into the labor market and the "socially useful" indicator).

The effectiveness of a higher pedagogical education system can be classified for a number of reasons. Depending on the type of results obtained, its effectiveness can be represented by a number of varieties (Scheme 2).

Classification of the effectiveness of the higher pedagogical education system

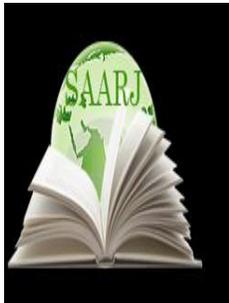

In the research work of economists of the Republic, the characteristics of the effectiveness of pedagogical education are examined on the basis of the analysis of income from various types of education. Others are closely linked to the problem of profitability - its impact on social security, professional activity in the labor market.

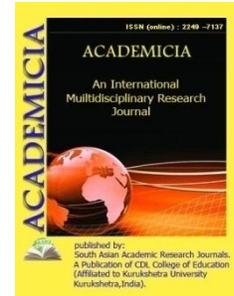

Thus, the introduction of economic culture into the educational process, as in foreign countries, encourages students in non-economist specialties to work on themselves, prepare business projects and guarantee unemployment.

SPECIFIC FEATURES OF FIRST AID SKILLS TRAINING OF NATIONAL GUARD SERVICE OFFICERS

Alisher Dzhumashev*

*Lecturer,
 Department of Information and Analytical,
 Activities "VTI NG, UZBEKISTAN

ABSTRACT

The article examines the features of teaching the skills of first aid to the military personnel of the National Guard, analyzes the initial and final level of readiness for first aid measures. The most positive point is that the motivation for learning is not always only the need, but also the desire to master modern knowledge using new educational technologies. To conduct a full-fledged training, we have developed a self-study manual with tests, a list of situational tasks and a glossary. Thus, the main task of training cadets and military personnel of the National Guard is to teach practical skills. Often, the cause of death of victims is emergency conditions such as cardiac or respiratory arrest, severe bleeding, shock, etc.

KEYWORDS: *First Aid, Training, Military Personnel Of The National Guard*

INTRODUCTION

Historically, first aid has developed, first of all, within the framework of military medicine, where a system of staged treatment was developed and tested in the course of hostilities, based on the principles of continuity and consistent build-up of medical aid measures. Providing first aid through self-help and mutual assistance has become one of the types of care for the wounded. Currently, educational programs for the training of military personnel of the National Guard pay attention to training in the skills of first aid, not only on the battlefield, but also in peacetime.

The very concept of "first aid" means - a complex of emergency medical measures carried out suddenly ill or injured at the scene and during the period of his delivery to a medical institution [1].

Article 30 of the Law of the Republic of Uzbekistan "On the Protection of Citizens' Health" states that the first emergency first aid at the scene of the accident should be provided by police

officers, firemen, emergency services, transport organizations, as well as representatives of other professions, which are mandated by law to do so [2]. Such a duty in accordance with the law "On the National Guard of the Republic of Uzbekistan" is imposed on the military personnel (employees) of the National Guard.

In article 27 of the law "On the National Guard of the Republic of Uzbekistan", the responsibilities of the NG servicemen include organizing the provision of first aid to citizens injured at the scene of a crime, an administrative offense or the scene of an incident, as well as to citizens in a helpless state [3].

In addition, Article 28 states that citizens who have received bodily harm as a result of the use of physical force, special means or firearms must be provided or organized emergency medical care [3].

Thus, a soldier (employee) of the National Guard must know and be able to competently carry out measures aimed at saving lives and preventing consequences that are dangerous to life and health, regardless of what happened (a crime, an accident or a sudden exacerbation of an existing disease). The very fact of the threat to life and health is important, as well as the absence of medical workers capable of providing qualified assistance.

The successful mastery of first aid techniques by military personnel is determined, first of all, by the skillful organization of classes and the correct methodology for their conduct.

The concept of a first aid system consists of important elements: a first aid training system, equipment for first aid participants, as well as a regulatory framework and organization for first aid, which, if only matched to each other, can work effectively.

It is quite obvious that improving the effectiveness of providing first aid to victims at the scene of an accident is possible only by simultaneously influencing the key elements of the problem: regulatory framework, equipment and training. In this article, we will only touch on the last element - learning.

We have conducted a survey of the National Guard cadets who have just begun medical training. It was proposed to independently assess the level of existing knowledge of eighty-eight cadets in the first lesson on general medical training. The average age is 20.8 years. Among others, it was asked to answer the following questions:

1. Do you currently consider yourself ready to provide first aid?
2. Do you know the rules and principles of first aid to the injured person (s) in case of accidents and emergencies?
3. Do you know the sequence of actions when carrying out cardiopulmonary resuscitation?
4. Do you know the rules for applying tires?
5. Do you know the rules and methods of temporary stopping of external bleeding?
6. Have you ever provided first aid before?

As a result, only 31 people (35.2%) consider themselves ready to provide first aid, with the proviso that the patient's condition is not serious. Nobody knows the rules and principles of providing first aid to the injured person in case of accidents and emergencies. The algorithm for

cardiopulmonary resuscitation is known to 6 respondents (6.8%), but no one was able to perform it technically correctly. About 33 people (37.5%) are aware of the tire application rules. 25 people (28.4%) know the rules and methods for temporarily stopping bleeding. Previously, 37 respondents (42%) provided first aid in various situations (for convulsions, fainting, external bleeding, burns and other situations). Thus, cadets who begin training generally do not have sufficient knowledge and skills to provide first aid in an emergency. In life, individual cadets may have some experience, but at the same time they do not consider themselves ready to act, and are not sure of their knowledge.

This indicates that first aid training is essential in the training of a soldier of the National Guard. In this case, the formed skill is important, which appears with repeated repetition of actions.

The learning process itself consists of several stages.

The first stage is getting information. For a better perception of information, it is necessary to use all channels of its receipt: visual (slides, educational films, posters); verbal (the teacher's story at lectures, answers at seminars, practical classes), tactile (the student performs manipulations in practical classes).

The curriculum provides for three types of classroom training sessions where information is assimilated: lectures, seminars and practical exercises. Self-preparation is essential.

Lecture is one of the important forms of teaching. It is here that servicemen receive basic information from the teacher about the essence of the issues under consideration, about specific examples from the practice of using first aid techniques. It also provides guidelines for preparing for seminars and practical classes, as well as advice that will help in self-training and practical activities. Visual and verbal channels of receiving information are involved.

If the information is assimilated, then it goes into the second stage - knowledge. Seminars allow you to identify and fill gaps in knowledge, see the current level, test the ability to analyze the material. But knowledge alone is not enough to provide first aid. The student must be able to perform the simplest actions: carry out cardiopulmonary resuscitation, stop bleeding, apply splints. Skill is the third stage of knowledge.

In an extreme situation with psycho emotional stress, skills may also be insufficient; a skill is required, i.e. repeated action many times. As the experience of training with the best special forces shows, at least 15-20 attempts to perform each manipulation are required to bring the skills of its execution to the level of professional automatism, when a fighter, without wasting time on understanding the technique of performing a particular manipulation, decides the issue of the most rational actions, taking into account assigned combat mission [4].

Thus, the main task of training cadets and military personnel of the National Guard is to teach practical skills. Often, the cause of death of victims is emergency conditions such as cardiac or respiratory arrest, severe bleeding, shock, etc. Such situations can be dealt with by taking measures aimed at preventing the development of severe complications. For the adequate conduct of such events, it is necessary that the assisting person possessed a minimum set of practical skills and algorithms of actions that would allow them to quickly respond to a change in the victim's condition. In practical lessons, training must be structured in the form of problem and game lessons with imitation of various types of accidents and injuries for repeated repetition of a certain algorithm of actions. Practical skills must be practiced with the help of improvised

and service first aid equipment, with the use of damage simulators, training dummies. The pinnacle of training should be the solution of situational tasks in real time in conditions that simulate emergency conditions.

The main goal of such classes is to work out tactics and skills of correct behavior, performing first aid techniques, and ways to quickly collect information about the victim. All this will prevent the aggravation of the severity of the condition, mitigate the consequences of trauma and prevent complications such as pain shock, blood loss, secondary displacement of bone fragments when moving the body, etc. It is also necessary to teach how to mobilize all forces, quickly make rational decisions in difficult conditions of an emergency (man-made or natural emergencies, hostilities, darkness, rain, cold, etc.), and also be able to improvise (lack of the necessary standard medical devices).

The most positive point is that the motivation for learning is not always only the need, but also the desire to master modern knowledge using new educational technologies. To conduct a full-fledged training, we have developed a self-study manual with tests, a list of situational tasks and a glossary. In addition, a textbook and a practical training manual was published based on the latest data from the European Resuscitation Council, the recommendations of the International Committee of the Red Cross and Red Crescent Movement and based on the standards of the largest emergency care organization in the UK, St. John Ambulance, which provides an algorithm for recommendations and standards for first aid and cardiopulmonary resuscitation.

Evaluation of the effectiveness of the teaching methodology was carried out at intermediate and final control in the form of testing and practical solution of situational problems for the same respondents, only after the learning process. The testing was aimed at finding out the real level of theoretical knowledge in the provision of first aid for injuries and emergencies. The questions covered four of the most relevant topics: assistance with mechanical trauma (bone fractures); physical injury (burns, frostbite, electric shock); help with injuries and bleeding; cardiopulmonary resuscitation. The number of correct answers was on average 88%.

Then, on the same topics, an analysis of practical skills was carried out, the essence of which was to solve a specific task of providing first aid in real time. For this, a dummy simulator, splints, dressings, hemostatic tourniquets (turnstiles), and an individual first-aid kit were used. The technique of performing measures for injuries to the chest, abdomen and extremities, as well as mastering the technique of cardiopulmonary resuscitation on a mannequin in the following parameters: ensuring airway patency, correct hand position during chest compression, correct depth and frequency of compressions, performing artificial lung ventilation.

The quality of mastering practical skills in first aid for injuries and trauma, as well as in cardiopulmonary resuscitation in real time was 91%.

Summing up the analysis, it should be noted about the effectiveness of the method.

For further improvement of knowledge and implementation of the multistage method, it is necessary to divide the group into subgroups of 10-12 people and microgroups of 2-4 people in practical classes, so that there is an opportunity for individual work with each student.

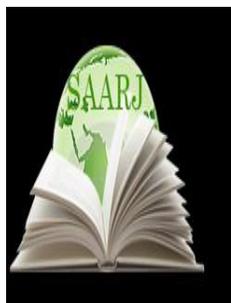

In addition, in the process of self-preparation, it is necessary to study and comprehend the proposed material, complete practical tasks on the proposed topic.

In this regard, it is advisable to find an opportunity to improve the conditions for independent educational work in preparation for classes in first aid. The equipped classroom is optimal, where all means of obtaining information are presented (textbooks, reference books, computer programs devoted to the structure of the human body, anatomy and physiology, methods of first aid, etc.), also equipped with training dummies, simulators of various injuries and personal means of medical protection of military personnel. Moreover, training with the use of dummies and simulators is of particular interest to the audience, which undoubtedly contributes to an increase in the efficiency and quality of first aid by the military personnel of the National Guard.

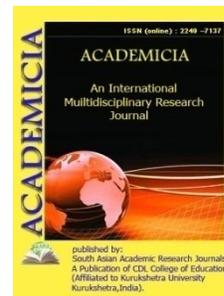

So, we can conclude that in the preparation of the National Guard servicemen, a multi-stage method of teaching first aid is needed, which creates the preconditions for successful professional self-improvement and forms special skills necessary in practical activities.

CHILDREN WITH COMPLEXED DEVELOPMENTAL DISORDERS

D. Gapurova*

*Teacher,
Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

This article reveals that by teaching and eliminating correct speech in children with complex defects, it is possible to facilitate the adaptation of children to life, to play a key role in the development of communication. Understanding the mental and personal development of children with complex disorders underlies the development of a system of psychological and pedagogical assistance to such children. The timing of the defect is also of prime importance. Early pathology causes a greater severity of secondary deviations, which significantly disrupts the entire further course of the child's mental development.

KEYWORDS: *Heredity, Mental Development, Intrauterine Development, Deafness, Intoxication, Birth Trauma.*

INTRODUCTION

Children with various mental, physical developmental disabilities have their own specific characteristics that distinguish one category of children from another. Deep knowledge of the developmental characteristics of children of various groups helps to find ways of corrective work with them and ways to compensate for their developmental deficiencies.

At the present stage of development of special psychology, a tendency has emerged for a more attentive, more thorough study and analysis of the structure of a complex defect in order to identify, describe and systematize the features of the mental development of children with various combinations of disorders. Understanding the mental and personal development of children with complex disorders underlies the development of a system of psychological and pedagogical assistance to such children. One of the most important and primary conditions for effectiveness in the scientific and practical development of the problem of helping children with a complex defect is a systematic analysis of a complex (complex) disorder, which is based on the theoretical and methodological doctrine of the complex structure of abnormal development.

The human psyche is formed and functions as a single, complex system in which all the constituent links are closely interconnected with each other. At the heart of our proposed views on the formation of the psyche of a child with developmental disabilities are the patterns of development of the psyche of children described by L.S. Vygotsky in his doctrine of the complex structure of abnormal development. According to his views, the presence of a defect in any one functional system does not cause an isolated loss of this function, but leads to a number of interrelated deviations that, in their totality, determine a holistic picture of atypical, peculiar development. The complexity of the structure of abnormal development lies in the presence of a primary defect caused by a biological factor, and secondary disorders that have arisen as a consequence of the primary. In the structure of abnormal development, there are always preserved functions that are the basis for correction. In his teachings, L.S. Vygotsky draws attention to the fact that primary and secondary disorders are in interaction and relationship, which determines the originality of the development of an abnormal child.

The developmental process of children with disabilities can be comprehensively disclosed only on the basis of taking into account the determinism of all phenomena that characterize abnormal development under the influence of one or another harmful factor. At the same time, it is important not only to identify the nature the primary defect, but also the analysis of the mechanism and patterns of its influence on the appearance of secondary deviations in mental development, which in turn determine the subsequent originality of the child's mental development. The timing of the defect is also of prime importance. Early pathology causes a greater severity of secondary deviations, which significantly disrupts the entire further course of the child's mental development. For example, deafness that occurs at an early age leads to the absence or underdevelopment of speech, while children with deafness acquired at an older age do not observe the absence or underdevelopment of speech.

Another significant factor that determines the uniqueness of the mental development of a child with a disorder is the severity of the defect. The deeper and more pronounced the primary defect, the stronger the manifestations of secondary deviations.

The structure of developmental disorders in children also depends on the influence of social factors, including the conditions of upbringing, in which the psyche and personality of a child with developmental disabilities are formed. Unfavorable conditions of upbringing can intensify pathological phenomena, and vice versa, a positive social impact to a certain extent prevents the appearance or reduces the severity of the consequences of a primary disorder, helps to overcome existing developmental deviations.

A systematic analysis of impaired mental development involves not only the identification, accounting and determination of the ratio of impaired functions, but also the analysis of intact functions, compensatory capabilities, on which it is necessary to rely primarily in determining the content and organization of correctional and developmental education.

Based on these provisions, we can conclude that mental or physical disorders observed in a child belonging to one or another group of children with developmental disabilities have a complex structure.

Problems in the development of a child can be caused by many factors that can be considered from different positions: etiology; the time of occurrence of the disorder - intrauterine development (prenatal period), labor (natal), after birth (postnatal); the severity and severity of

the disorder caused by both organic (central nervous system damage) and functional (social and pedagogical neglect, emotional deprivation) reasons.

To substantiate medical and psychological and pedagogical measures aimed at correcting impaired functions, it is necessary to conduct a medical and psychological analysis of the structure of the defect and the reasons that caused the violation, to determine the degree of its severity. For a systematic analysis of the peculiarities of the formation of the psyche of children with developmental disabilities, graphic diagrams can be used that simply reflect the relationship and relationship between primary, leading, secondary and tertiary disorders. We present several variants of such structures.

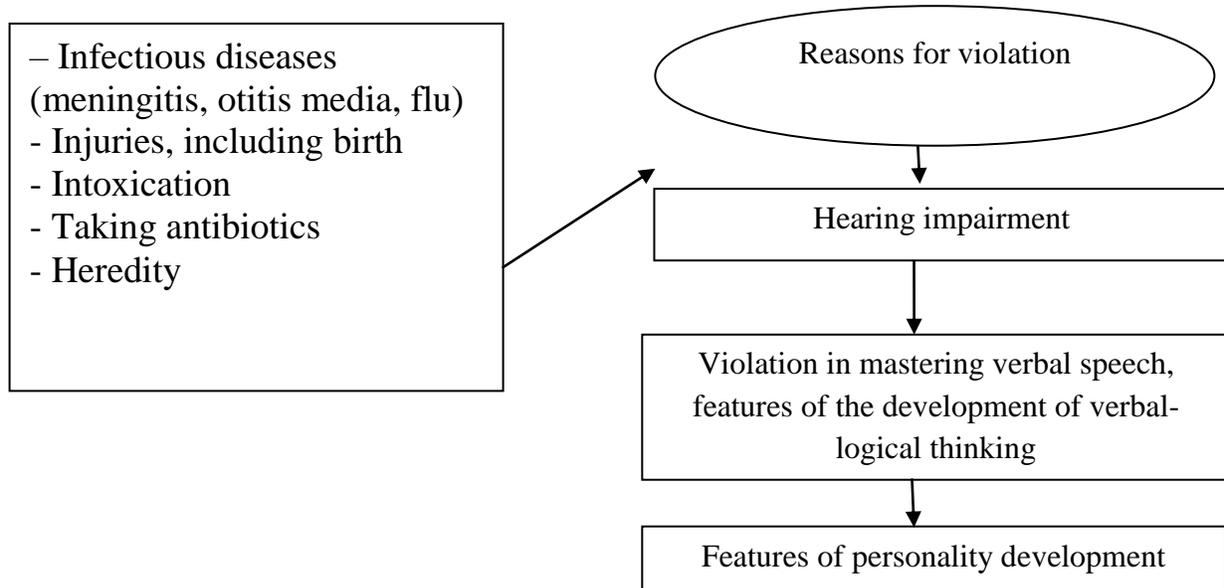

Fig. 1. The structure of the defect in hearing impairment

The theoretical position on the complex structure of abnormal development significantly concretizes and clarifies the general understanding of developmental disorders. Based on this, we can say that the mental or physical disorders observed in a child have a complex structure. Each type of abnormal development is characterized by a systemic manifestation, in which primary and secondary deviations are distinguished.

Definition of "complex (complex) developmental disorder" Practice shows that among children with developmental disabilities, there is a group of children who cannot be attributed to any of the known categories, since they have a combination of various disorders of a primary nature. In this case, we are dealing with complex developmental disorders.

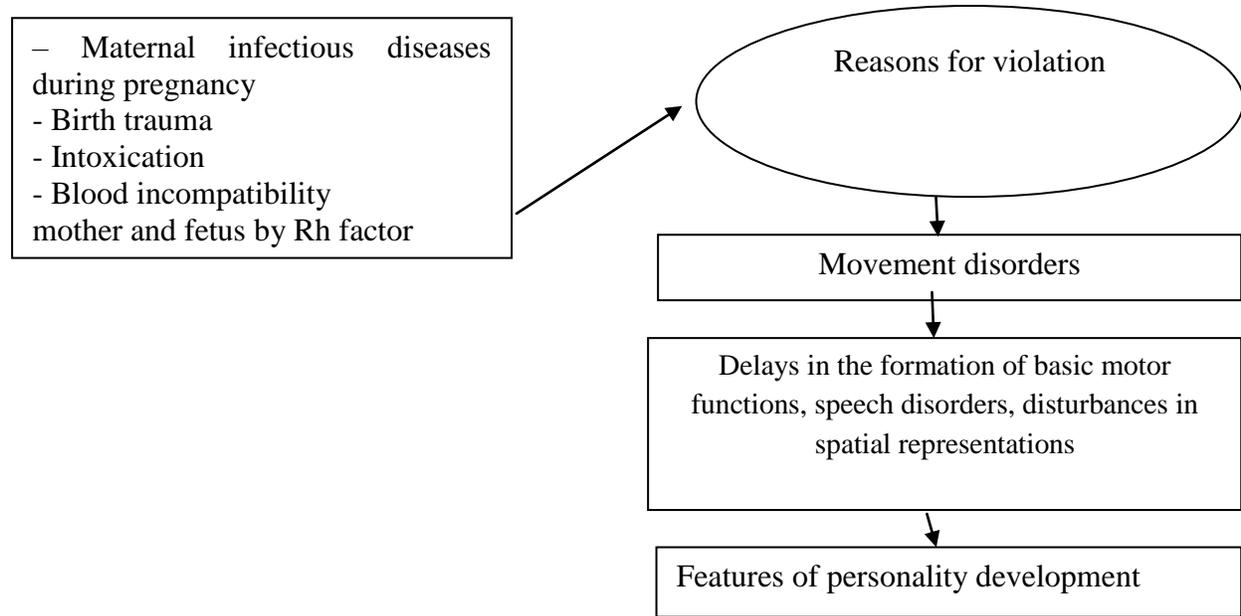

Fig. 2. The structure of the defect in cerebral palsy

As we have already mentioned, in modern special pedagogy and special psychology, the increased attention to the category of children with complex developmental disorders can be explained by their increasing number, as well as the lack of developments in providing them with qualified assistance. Children with various combinations of developmental disabilities are found in almost all special institutions, some of them have been excluded from the educational process so far.

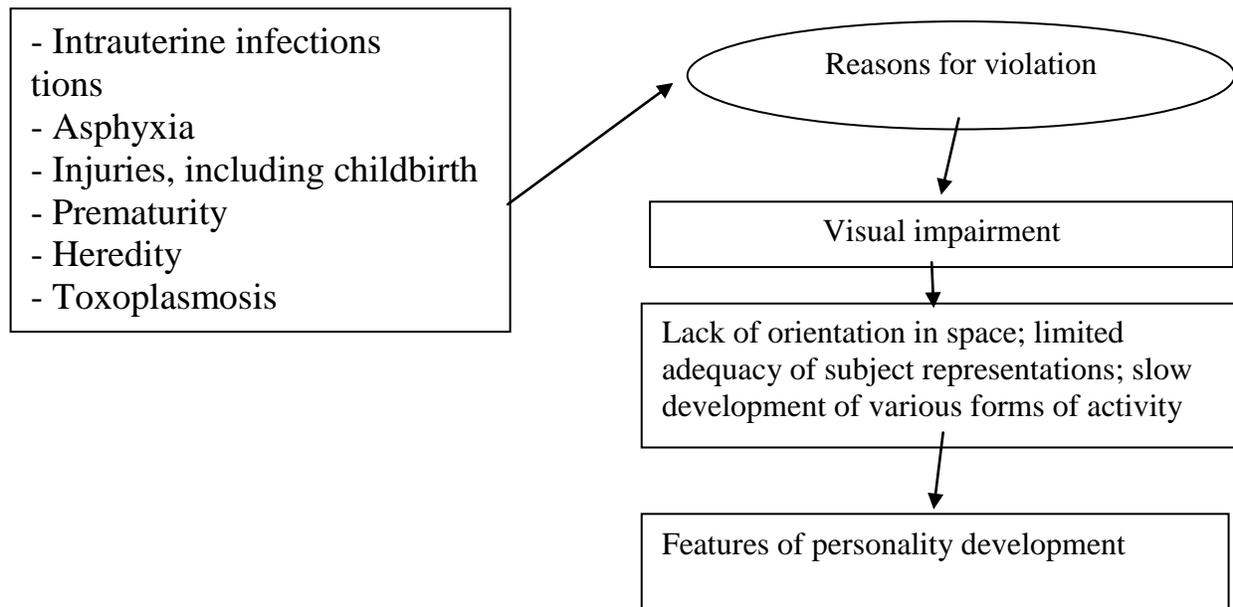

Fig. 3. The structure of the defect in visual impairment

Today, there is a process of active integration of these children into special and public institutions. It is advisable to consider the issue of complex disorders in the context of the main theoretical provisions on the complex structure of anomalous development put forward by L.S. Vygotsky, the analysis of which is presented above.

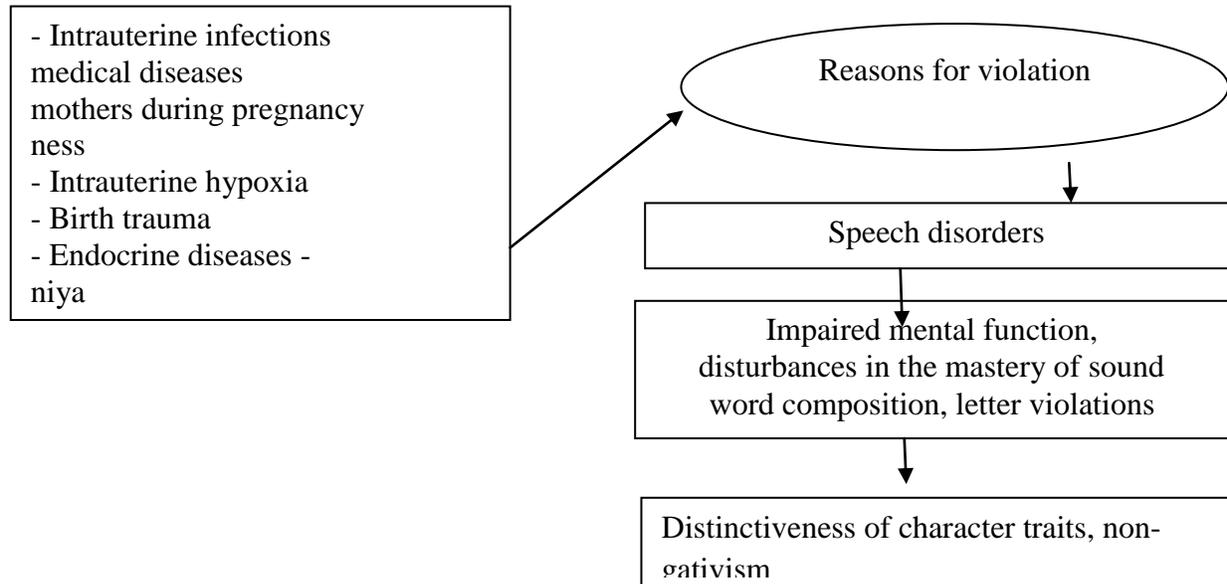

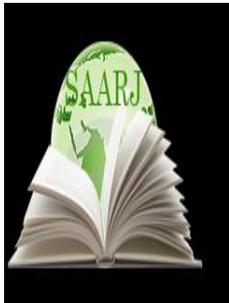

Fig. 4. The structure of the defect in speech impairment

Considering the genesis of the concepts "complex violation", "complex violation" in the historical context, it should be noted that in the studies of M.G. Blumina, V.I. Lubovsky, E.M. Mastjukova, T.V. Rozanova, B.P. Puzanova, V.N. Chulkov, these concepts are designated as a "complex defect", where the dominant feature is the presence of two or more primary disorders in a child caused by simultaneous damage to several functional systems of the body, in combination with damage to brain structures. Moreover, each of them exists in this complex with secondary disorders characteristic of it, which extremely complicates the general structure of the defect, makes it difficult to compensate for it, and accordingly affects the mental development of children of this category and causes difficulties in social adaptation.

THE DIDACTIC BASIS OF FORMATION OF A CREATIVE PERSONALITY OF A STUDENT OF A MEDICAL UNIVERSITY

Kadirova Munira Rasulovna*

*PhD, Docent,
 Head of the Department of Pedagogy and Physical Culture of Fergana,
 Medical Institute of Public Health,
 UZBEKISTAN

ABSTRACT

This article describes the didactic qualities of the formation of creative qualities of medical students, the main trends in vocational education, the advantages of vocational education, the composition of pedagogical approaches in the medical education system, research in this area, the main criteria for creative thinking of students, developed goals for the development of creative activity in the organization of educational activities and proposals on the results of research.

KEYWORDS: *Instrumental, Interpersonal, Professional, General Cultural, Systemic, Social And Personal.*

INTRODUCTION

Medical education must be considered as a process and result of a person's comprehensive knowledge of the essence of professional activity, a conscious choice by a person of a direction of self-realization in a particular professional sphere that is adequate to her abilities, interests and needs, providing great benefit both for herself and for society.

The main trends in the development of professional pedagogical education in modern conditions include:

- understanding a person as an active subject in the labor market, freely disposing of his professional and pedagogical qualifications;
- The advanced nature of vocational education;
- The use of a variety of educational technologies;

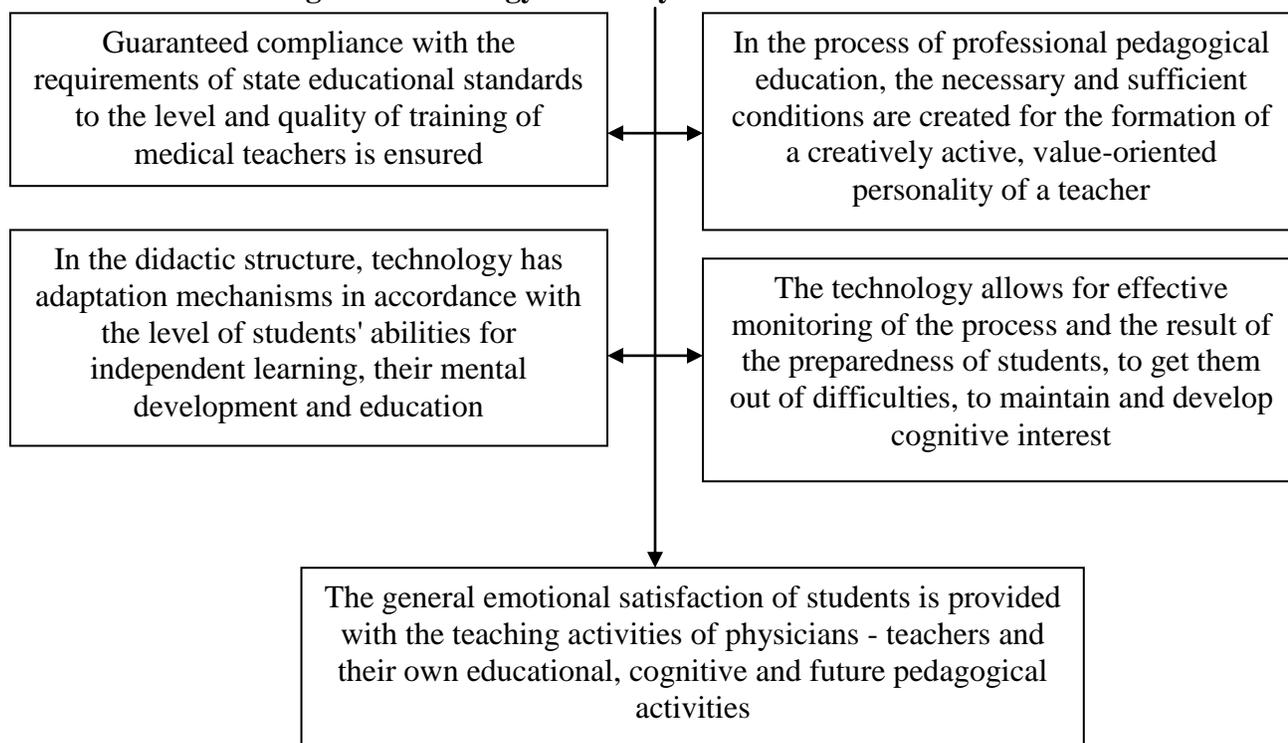

- Humanization of the content of pedagogical education;
- adaptation of the system of vocational pedagogical education in the conditions of modern market relations.

One of the priority pedagogical conditions is the development of the technology of vocational pedagogical education, where its effectiveness is determined by its essential advantages (Scheme 1).

Modern requirements for professional and pedagogical approaches proclaim the main characteristic feature of the formation of a professionally oriented orientation of education. Among these approaches, one should pay attention, first of all, to the following structure (Scheme 2).

Professional skills and abilities, as rightly noted by many leading experts (V.V. Kraevsky, Sh.E. Kurbanov, M. Ochilov, L. F. Savinova, V. A. Slastenin, etc.), are formed in the process of activity. To develop this or that skill, it is necessary to repeat many actions, exercises and training. The essence of active methods aimed at the formation of skills and abilities is precisely to ensure that students perform such tasks, in the process of solving which they would master the way of activity.

The main advantages of technology efficiency vocational education

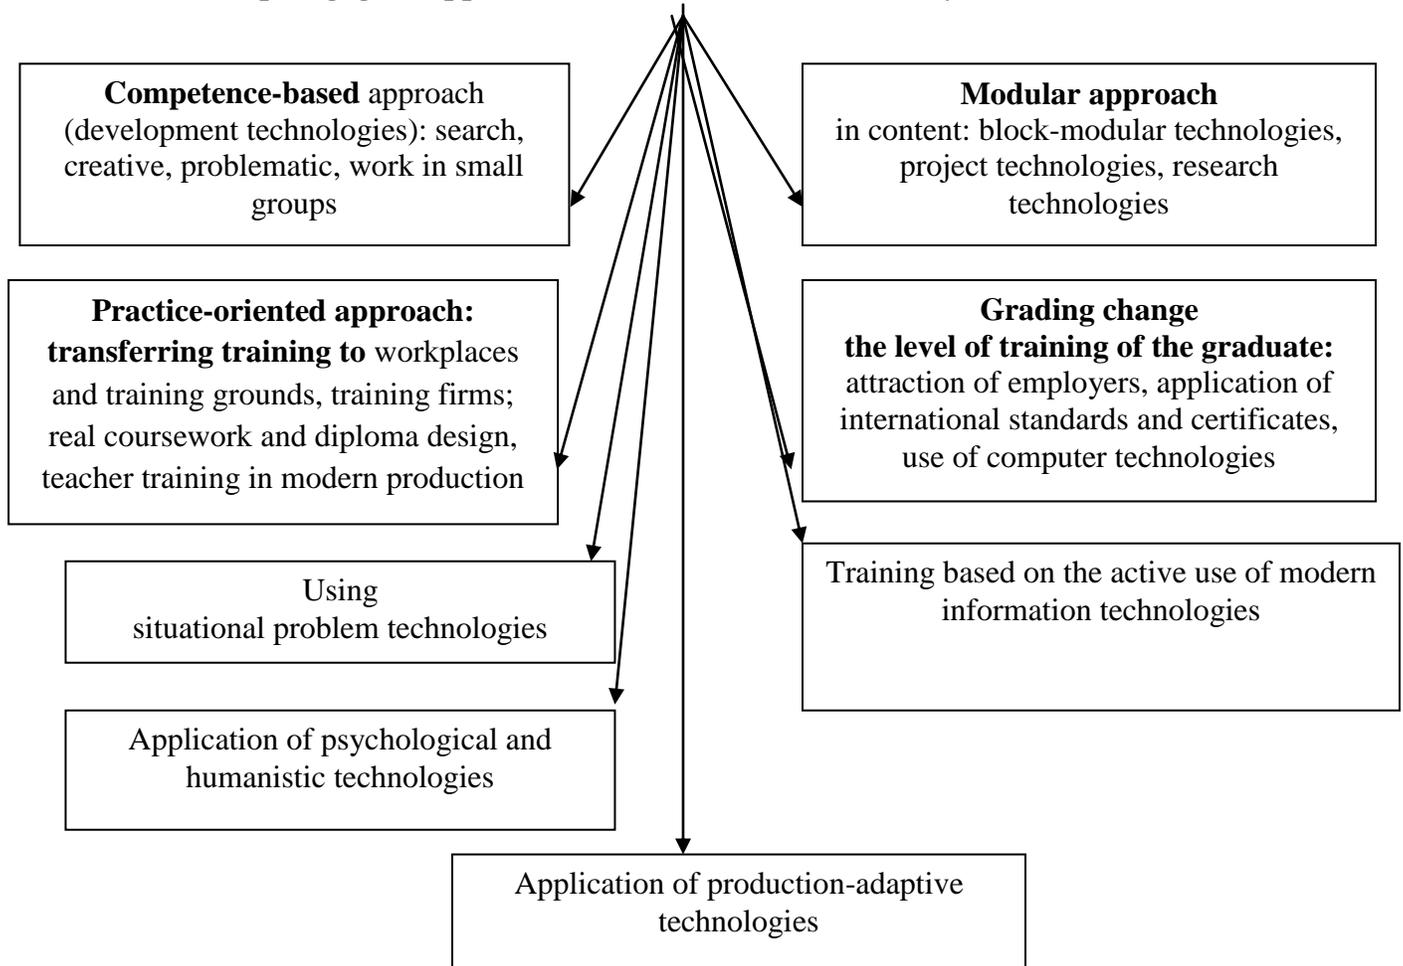

In the formation of the professional competence of a future specialist in medical education, such teaching methods as imitation of professional activity in practical classes, analysis of work situations, as well as additional classes are important. Using them in the educational process makes learning active, activity-based, contextual (included in professional pedagogical activity).

The effectiveness of the educational process depends on a number of didactic conditions that must be observed when conducting classes:

1) It is important to organize the intensive thinking of students. This is ensured by the consistent build-up of contradictions in their cognitive learning activities. An increase in the intensity of thinking is facilitated by both the creation of problem situations and the use of special methodological techniques for presenting educational material, such as:

- bringing students to a contradiction with a proposal to find a way to resolve it;
- actualization of contradictions in the teacher's practical activity;
- presentation of different points of view on the same issue;
- offering students to consider a phenomenon, an object from different sides, different facets of its functioning;

Structure of pedagogical approaches in the medical education system

- Encouraging students to make comparisons, generalizations, conclusions from the situation, compare facts;
- raising problematic questions;

- solving problem pedagogical tasks and tasks;

- a sharp limitation of the time for resolving a problem pedagogical situation.

2. It is necessary to ensure that the thinking process of students of medical universities is "visible" both for the teacher and for the students themselves. The "visibility" of the students' mental activity allows the teacher to identify shortcomings in their way of thinking, to develop optimal measures to correct it. In order for the process of thinking of students to become "visible", the following techniques are used:

- fixing the results of various stages of students' mental activity on a chalkboard, paper;

- a proposal to clarify the proposed version, to specify and explain it;

- questions for understanding, clarification of the expressed opinion;

- the teacher's active attitude to the thoughts expressed by the students, etc.

3. It is recommended to provide students with individual independent passage of the entire process of developing solutions to professional and pedagogical problems. Individual passage through the entire process of developing a solution allows not only to obtain a certain number of variable approaches, but also forms the student's ability to independently find options for solving the problem. The following methodological techniques contribute to achieving this:

- individual development;

- presentation and defense by each student of the developed version of the solution to a professional problem, its refinement and processing;

- participation in the development of a collective version;

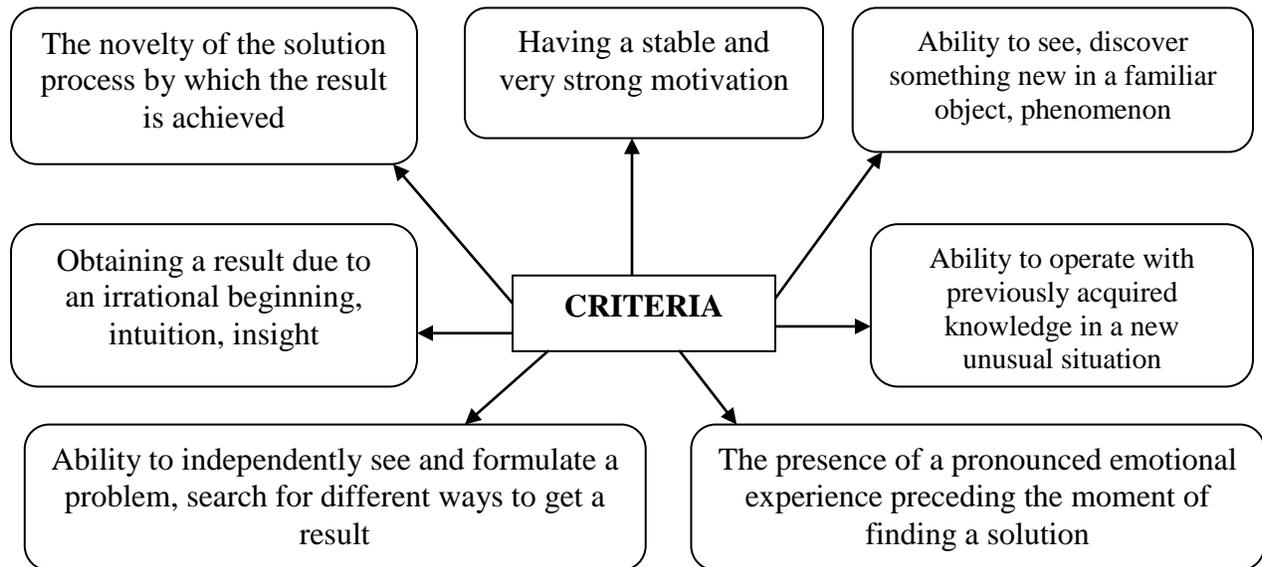

- determination of the most optimal solution, etc.

An analysis of the processes taking place in the system of medical education shows that at the present time, it is becoming increasingly important to train a specialist not only professionally competent, but also competent, creatively developing, ready not for performing, but for problem-research, search activities, creating conditions for self-development and self-realization of the individual.

Solving the problem of developing the creative thinking of future specialists will ensure the formation of a personality ready for creativity, capable of working in the conditions of the dynamic development of pedagogical science, technology, production, construction, service, etc.

For the development of creative thinking in students of a medical university, not separate creative, pedagogical tasks are needed, but systems of such tasks, which should be one of the main components of educational activity (Scheme 3).

Criteria for creative thinking of students

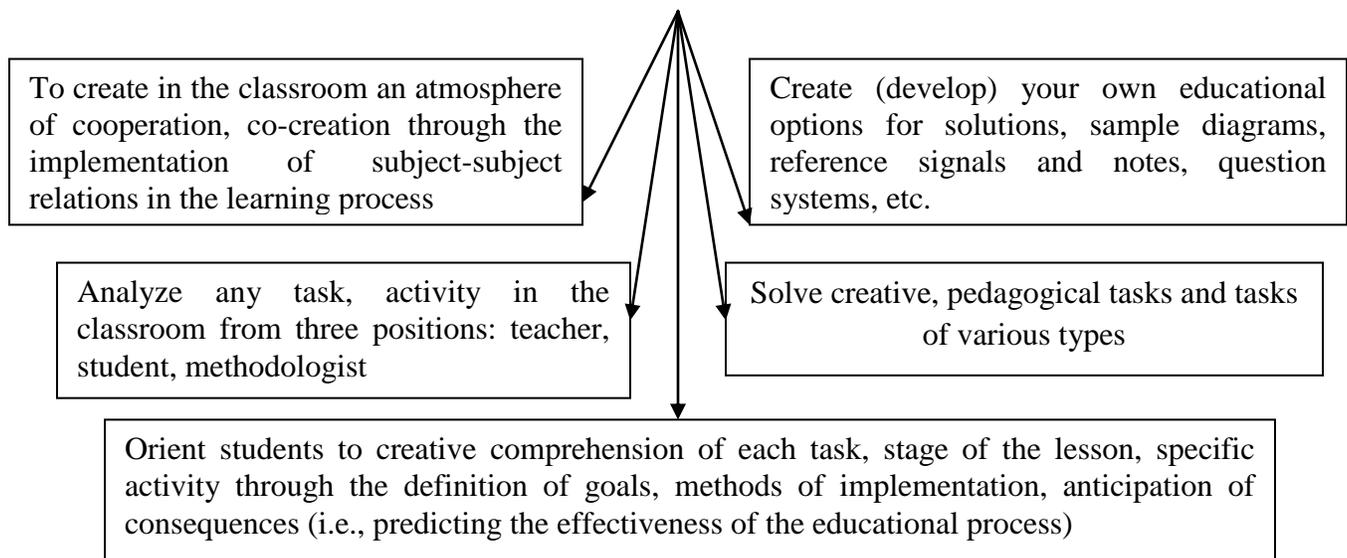

Pedagogical conditions or factors affecting the process of creative activity are of two types:

- Situational;
- Personal

The latter conditions include stable properties, personality traits or character of a person, which can affect the conditions caused by a particular situation.

Within the educational process, it is possible to purposefully develop the creative thinking of teachers and students (Scheme 4).

Actions recommended in the process of educational activities to enhance creative thinking

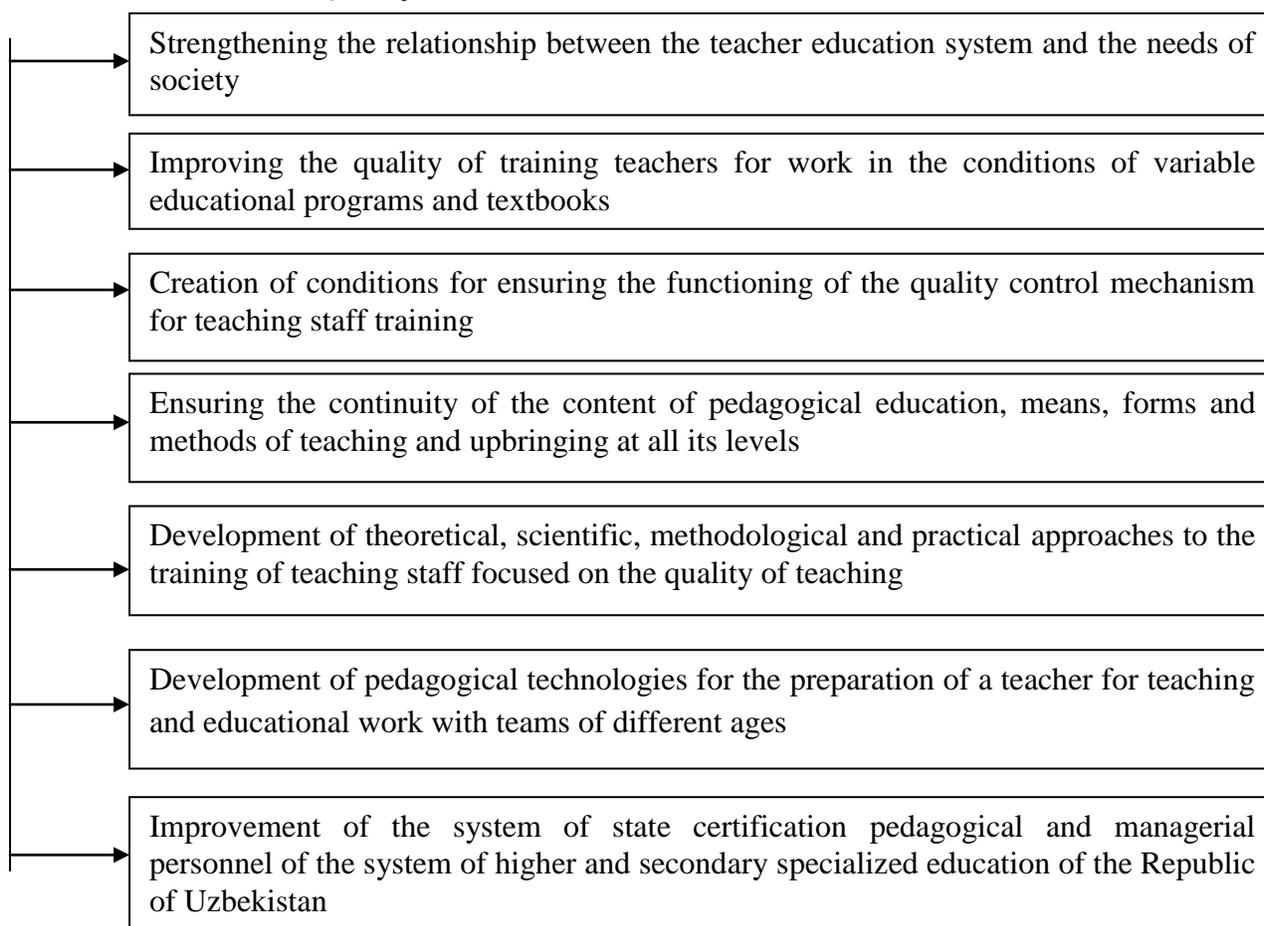

Modern problems of the quality of vocational education make it possible to determine the main directions and related components of the development of the pedagogical education system:

- improving the content and quality assurance of professional pedagogical education;
- Resource, material and technical and regulatory support of institutions of the system of professional pedagogical education;
- improving the management of the system of professional teacher education;
- Organization of conferences, seminars, meetings, refresher courses;
- Preparation of publications for the system of professional pedagogical education and coverage of pedagogical education issues in the media.

The highest priority is the direction associated with improving the content and ensuring the quality of professional pedagogical education and the following tasks arising from this (Scheme 5).

Quality Priorities vocational teacher education

The appeal of modern pedagogical education to the personality of the future physicians - the teacher as a subject of communication, cognition and social creativity - increases the role of the

student himself in mastering the teaching profession. He must clearly understand the goal and objectives of his activities, clearly see the paths of professional development.

The search for new ways and means of mastering educational material is becoming a characteristic professional feature of the teaching staff of the system of secondary specialized education in the Republic of Uzbekistan.

Practical recommendations:

1. In the process of studying at a medical university, it is necessary to pay attention to the following main aspects of education:

- The formation of a new paradigm of education, in which the social and pedagogical aspects of the educational process are considered in the context of the life goals of the student's personality;
- awareness of the strategic goal of modern vocational education not only as an opportunity for the teacher's personality to adapt to changing circumstances, but also as a requirement to take a competent position so that each graduate of a medical university has the ability to overcome obstacles encountered, to cope with numerous unforeseen situations in innovative processes.

2. In the educational process of a medical university, students should develop the following competencies:

- Social and personal;
- General cultural;
- Professional;
- Instrumental;
- Interpersonal;
- Systemic.

3. In the professional training of future medical teachers, it is necessary, on the one hand, to optimize the learning process, which will make it possible to most expediently build the educational process, correctly select and organize educational material, and on the other, to intensify, where the main attention will be paid to creating favorable conditions for learning.

4. For effective vocational education in an educational institution at a medical university, a number of the following conditions must be taken into account:

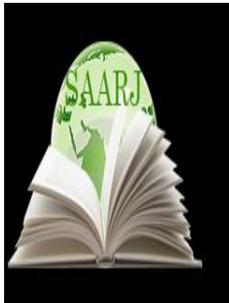

- Individualization of student learning;
- reducing the cost of study time for current control by introducing a system for assessing knowledge, skills and abilities of students during educational and business games;
- providing feedback with graduates of a medical university;

5. In modern conditions of reforming the system of secondary specialized education, it is necessary to put forward a change in the predominantly informational concept to a professionally oriented one, when goal-setting and the construction of the educational process ensure the development of strong skills and abilities necessary for a qualified, competitive and professionally mobile specialist.

6. The solution to the problems of increasing the effectiveness of the pedagogical process in the medical education system must be based on the introduction of a competency-based approach to planning, implementation and assessment of the effectiveness of the activities of pedagogical teams, on purposeful and professional work on the introduction of professionally oriented educational technologies.

**SCREENING TOOLS FOR IDENTIFYING SPEECH-LANGUAGE
DISORDERS IN CHILDREN WITH UZBEK LANGUAGE OF
EDUCATION IN INCLUSIVE AREA**

Shakhnoza Tokhtiyarova*

*PhD,
Tashkent State Pedagogical University,
Named after Nizami, UZBEKISTAN

ABSTRACT

This article discusses the features of the organization of speech therapy in a mainstream preschool and current issue of improving the effectiveness of this system. In particular, the article describes the stages of speech therapy diagnosis of children in mainstream preschool and the creation of speech therapy methods in accordance with these stages.

KEYWORDS: *Preschool Educational Institution, Special Educator, Speech Therapy Assistance, Speech Therapy Examination, Methods, Speech Disorders, Developmental Disorders.*

INTRODUCTION

There are numerous forms of speech-language therapy services in our country. Currently, it is implemented in health, and social protection systems, private correctional centers, even via remote education. Each aspect of correction and logopedic care has its own specifics.

The activities of educational institutions will be linked to the formation, development, treating and standardization. In this context, the working conditions of a defectologist working in a mainstream preschool, one of the youngest forms of correction and logopedic care, are different. For example, a speech-language therapist working in a specialized pre-school can accommodate a maximum of 18 children, while only one defectologist has to be responsible for all children, who attend this facility. The preschool defectologist should work with 20-22 children at the same time, monitor the development of all children in the facility, quickly correct their developmental disorders, and involve other children in the list. Thus, a preschool defectologist faces problems such as the number of children receiving care and the amount of time allotted. Therefore, according to the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan № 528

dated July 19, 2017, defectologist in a mainstream preschool should work only with children who have a mild level of developmental disabilities, whereas other preschoolers with more difficult levels of disabilities should be directed to specialized preschool educational institutions.

However, these guidelines are not always applicable: most parents are not ready to change pre-school facilities, the majority of special preschools are located too far, the number of children in specialized pre-school institutions is limited, and additionally recent policy of reducing the number of specialized preschools. However, statistics show that an increase in the number of children with various diseases in the general population leads to an increase in the number of children who need special educational support. For all the reasons mentioned above, the optimizing of a defectologist's activity in a mainstream education institution emphasizes that one of the most pressing issues in modern pre-school education is education.

Based on a review of the literature, various methods of speech therapy research have been developed, each of which has its own principles and approaches based on the diagnostic complex. In particular, speech defects were presented by M.E. Khvatcev (1959), L.R. Muminova (1984) and M.F. Fomicheva (1989), M. Yupupova (1994), G.V. Chirkina T.B. Filicheva, 1998; E.F. Arkhipova (2006); O.E. Gribova (2005); O.B. Inshakova (2005); Nova Scotia Zhukova, E.M. Mastjukova, L.V. Lopatina, N.V. Serebryakova, 2001; G.A. Volkova (1993, © Demenina T.A., 2014 78 2005); A.G. Ippolitova (1983); N.Yu. Grigorenko, S.A. Tsibulsky 2005; O.Y. Fedosova (2005), T.A. As reflected in the works of Fotekov (2007) and others.

The effectiveness of treating children's developmental disabilities depends on the quality of planning speech therapy work, which, in turn, is closely related to the diagnostic process. It is the diagnostic results that determine the direction of the correctional training process. One of the professional duties of a preschool defectologist is the regular monitoring of the development of speech of all preschool and senior groups in the facility and the detecting of children in need of special educational support. A large number of students at the facility causes a lack of time to complete this task. The age of the studied children, the variety of observed deficiencies further exacerbates the problem, and the time allotted for general screening does not allow a thorough and comprehensive analysis of the development of speech of all children. This can lead to the following problems: the defectologist cannot complete the task during the time allotted for examination or is limited to checking only the phonetic aspect of speech. This, in turn, contradicts the systemic principle of special education. At the same time, the preschool defectologist does not diagnose the speech of primary and secondary preschoolers and does not practice the principle of early diagnosis of disabilities. Most of the traditional research methods developed in our national catalog (L.R. Muminova, M.Yupova, D.A. Nurkeldieva, N.Z. Abidova, Sh.M. Aripova, etc.) are aimed at the qualitative analysis of the data. It's a bit inconvenient to use in a large, almost instantaneous sorting process that focuses on a deep study of the defect. These methods are designed for individual screening of children and are aimed at studying the characteristics of the defect in selected children, as well as their in-depth study of its structure and severity.

Given the intensity of the work of a defectologist in a preschool educational institution, it is necessary to develop a system for selecting students who need correction and speech therapy help, by choosing, combining and modifying traditional classical methods. However, practicing defectologists need a diagnostic tool that is simple to use, understandable, and easy to interpret.

Given these conditions, the main task of the defectologist is to learn how to use both compact and highly informative methods of speech therapy examination. These methods include quick diagnostic methods that allow you to examine those who need correction and speech therapy help. The use of express diagnostics does not exclude the need for a complete individual and comprehensive examination, but it allows you to quickly and comprehensively examine children and quickly identify those who need speech therapy support.

In Russia, N. Denisova shows the effectiveness of rapid diagnosis in her research, V.V. Konovalenko developed a method for the express study of pronunciation, phonemic cognition, and structure of a word, methodologies of express speech diagnostics of elementary school students have been proposed by T.A. Fotekova. However, in the domestic special education field, such studies have not been conducted.

An analysis of the psychological and pedagogical literature, the condition of working place and duties of defectologist of preschool educational institutions on this issue revealed the relevance of the development of this method, its theoretical in-depth study and its widespread adoption in the practice of a preschool defectologist.

The express (screening) technology of speech impairments detecting was created based on foreign and domestic screening and assessment tools. In addition to the traditional methods of studying the speech of preschoolers, the technology was used as the basis for modern screening methods with high efficiency in the differential diagnosis. This allows the defectologist to check the development of the child's speech in a very short time.

This methodology focuses on key areas of development of speech skills, allowing you to use all the components of speech in an interdisciplinary exam at the beginning, at the end of the first half and at the end of an academic year. Deficiencies in these areas suggest that the child has a speech impediment, which leads to a complete speech therapy examination. Based on this rapid screening technique, only speech defects are identified, and the cause, type, degree of defect is determined by further differential and phenomenological examination.

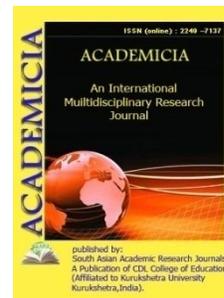

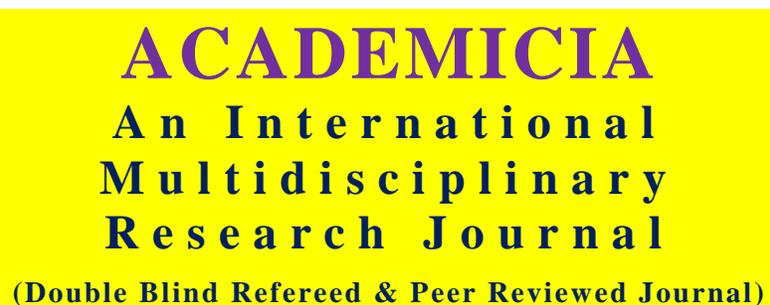

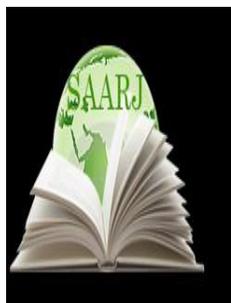

The express (screening) examination is performed individually and includes the following sections, such as traditional methodologies: pronunciation, phonemic cognition, phonemic analysis and synthesis, word structure syllabus, vocabulary checking, grammar construction, and independent speech testing.

Speech and visual material for screening are compact, easy to use, allowing all age groups to diagnose multiple speech indicators (phonetics, vocabulary, grammar, and independent speech) in one task, using only the level and complexity of the task, and most importantly, saving time. gives.

MODEL OF PREPARING CHILDREN WITH DELAYED MENTAL DEVELOPMENT TO SCHOOL IN CONDITIONS OF PRESCHOOL EDUCATIONAL INSTITUTIONS

Zebo Sabirova*

*Teacher,
Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

The article discusses the need to build a model of preparation for school education working in preschool educational institutions. The proposed model is based on the direction of work that makes it possible to identify multi-level, systemic relationships between the components of the model, as well as problems that hinder the effective professional activity of a teacher in preschool education.

KEYWORDS: *Mental Retardation, Model, Development, Learning Activity, Regimen, Cooperation*

INTRODUCTION

Formation of readiness for schooling is an important task of all educational work with preschoolers, aimed at their all-round development - physical, mental, moral, aesthetic. The preparation of children with mental retardation in development for schooling is carried out in accordance with the specifics of the type of preschool educational institution (KET) and is carried out in accordance with the psycho physiological characteristics of children with mental retardation in development, taking into account the individual characteristics of the perception of the world and the assimilation of knowledge.

Discussing the problem of school readiness, D.B. Elkonin highlighted the necessary prerequisites for educational activities:

- The need of children to consciously subordinate their actions to a rule that generally determines the mode of action;

- The ability to focus on a given system of requirements; -the ability to listen carefully to the speaker and accurately perform the tasks offered orally;
- The ability to independently perform the required task according to a visually perceived sample.

In fact, these are parameters for the development of a student's voluntary behavior. Arbitrariness of actions - the conscious formation and implementation of intentions and goals. Almost all authors researching psychological readiness for school give a special place to arbitrariness in the problem under study. There is a point of view that the weak development of arbitrariness is the main stumbling block of psychological readiness for school.

There are other approaches to determining the psychological readiness of children for school, when, for example, the main emphasis is on the role of communication in the development of a child. There are three spheres: attitudes towards an adult, towards a peer and towards oneself, the level of development of which determines the degree of readiness for school and in a certain way correlates with the main structural components of educational activity [5].

The system of comprehensive assistance to children with mental retardation includes:

- ✓ creation of various models of special educational institutions for children of this category: preschool educational institutions of a compensatory type, special schools and boarding schools for children with mental retardation, groups of correctional and developmental education in the structure of a mass general education school;
- ✓ early identification of children lagging behind in development, satisfaction of their educational needs, ensuring the continuity of forms and methods of correctional work in the system of preschool and school education, primary and basic general education [1];
- ✓ improving the system of medical, pedagogical and psychological diagnostics in order to determine the features of the organization of the correctional and educational process, preserving and strengthening the health of children;
- ✓ creation of a system of health-improving and preventive work in the conditions of educational institutions;
- ✓ normative and educational-methodological support of the practice of education of children with mental retardation;
- ✓ determination of tasks and content of vocational guidance, vocational training and social and labor adaptation of graduates [2] .;
- ✓ creation and application of criteria and methods for assessing the effectiveness of the correctional and developmental educational process;
- ✓ development of models of family counseling services;
- ✓ training of teaching staff in correctional pedagogy for the system of preschool and school education.

In accordance with the specifics of a preschool educational institution, the main characteristics of the contingent of children with mental retardation in development determine the model of

preparing children with mental retardation in development for school. It is presented in the following areas:

- ✓ physical development;
- ✓ intellectual development;
- ✓ cognitive development;
- ✓ development of speech;
- ✓ social and personal development;
- ✓ aesthetic development;
- ✓ development of mental processes;
- ✓ formation of motivational readiness for school [3].

The model of preparing children with mental retardation in development for school at a preschool educational institution is implemented by ensuring the following conditions: one of them is the presence of regulatory documents of the republican, regional and local levels.

The next condition for the implementation of the model is the organization of a rational objective and developmental environment, which allows to stimulate the physical and mental development of children with mental retardation in development. In the kindergarten, it includes the following: a music room and a gym with standard and non-standard equipment, a medical office with medical equipment, a speech therapy room, a psychological relief room, a mini-gallery, a mini-stadium with sports equipment, a vegetable garden. In the group, physical culture corners, seclusion corners, centers of speech and mathematical development, theatrical and play activities, local history, mini-laboratory, natural corners are organized, which contributes to the development of creativity and sensory skills in children with mental retardation in development, creating a sense of self-confidence, which undoubtedly has a positive effect on the all-round development of the child's personality.

The third condition is the introduction of technologies of a health-saving environment, which, in the conditions of our preschool educational institution, include:

- Compliance with a rational daily regimen, built taking into account the age and individual characteristics of children with mental retardation in development, their physical and mental performance [5].

The rational construction of the daily routine creates comfortable conditions for children with mental retardation in development in kindergarten, as well as the natural rhythm of life gives rise to the habit of regularly changing different types of activity, disciplines children with mental retardation in development, increases their efficiency, contributes to normal physical and mental health.

- providing a favorable hygienic environment and conditions for the predominance of positive emotions in children with mental retardation in development in the daily routine.

With the optimization of sanitary and hygienic conditions, an improvement in the health of the pupils is noted. The kindergarten maintains an air-thermal regime that meets the requirements of SanPiN, artificial and natural lighting, children's furniture is rationally used, and the mode of the educational process.

Compliance with sanitary and epidemiological rules and regulations provides a safe ecological space for preschoolers.

– Therapeutic and prophylactic measures carried out at the preschool educational institution include massage and exercise therapy with children of orthopedic groups, the inclusion of corrective exercises in complexes of morning exercises and physical education activities with children of all age groups, phyto-, vitamin-, ion-, phytoncidotherapy, sand therapy, hydromassage and sunbathing.

- Optimal motor mode, based on the rational ratio of different types of motor activity, which includes all the dynamic activity of children with mental retardation in development, both organized and independent [6].

In the kindergarten, a model of the motor regime of children with mental retardation in development has been developed, which ensures not only the satisfaction of the biological needs of children with mental retardation in development in movement, but also provides for a rational content of motor activity based on the optimal ratio of different types of activities.

- The inclusion of the child in the system of correctional measures with the help of music, which makes it possible to correct specific defects of speech, general motor development, psycho-emotional sphere in order to develop and improve the child, achieving positive dynamics.

- Organization of an active color environment. For children with mental retardation in development, the immaturity of the emotional sphere is characteristic, therefore there is a special need for stimulation of sensory systems. Color qualitatively and comprehensively affects the psycho physiological state of a person. To foster empathy, develop imagination, creativity in the classroom of the aesthetic cycle and in free activity, we use the method of color modeling. The combination of colors allows the teacher to interpret the mental state of the child and respond in time to the situation of discomfort.

The next condition for the implementation of the model is the creation of a comfortable psychological environment, which ensures the favorable functioning of the state of the preschooler's nervous system.

Such an atmosphere is created in kindergarten. In this regard, the preschool educational institution has developed a system of measures to protect the neuropsychiatric sphere of children with mental retardation in development, which permeates all types of children's activities and rest during the day, which is characterized by:

- The presence of a functioning adaptive model of the organization of the educational process, taking into account the state of health of the child and his individually

- Personal characteristics;

- an organic combination of physical exercises, hardening procedures (physical exercises after a day's sleep), wellness procedures in the aquatic environment (visiting the pool 2 times a week, where the instructor teaches children with mental retardation in the development of swimming, which promotes the development of muscle, cardiovascular, the respiratory systems of the child's body and his musculoskeletal system).

One of the important conditions for the implementation of the model is staffing.

Highly qualified specialists work in the preschool educational institution.

We pay special attention to the constant improvement of the skills of teachers, the search for new approaches to the all-round development of children with mental retardation in development.

The next condition for the implementation of the model is the organization of the support service, which is designed to competently build assistance to the child.

A medical worker, teachers, a psychologist ensure the harmonious development of the child's personality and guarantee the preservation and strengthening of his physical and mental health. Such a trinity is necessary due to the fact that children with developmental disorders, as a rule, have deviations from the neuropsychic sphere (increased neuro-reflex excitability, retardation in psychomotor development, etc.), which requires not only medical, but and psychological correction.

The system of functions of medical support is determined by the requirements of the Social Institute of Health. This system is under state control and uses all the main methods of regulation at the level of normative acts.

The psychological service is organically included in the activities of the socio-pedagogical system and serves all subjects of the educational process.

Particular attention is paid to the psychological support of children with mental retardation in development, which includes:

- Determination of the level of anxiety in children with mental retardation in development;
- Study of the behavior of children with mental retardation in development in a stressful situation;
- Identification of behavioral deviations;
- Diagnostics of the emotional state of a child in a family and kindergarten;
- Determination of the type of the nervous system;
- Determination of the level of development of mental processes in children with mental retardation in development;
- Determination of the level of readiness for schooling.

Pedagogical support provides for a system of measures for subgroup and individual work with each child in accordance with the existing developmental disabilities [1].

The speech therapy service uses a set of special programs that allow individualizing work with children to eliminate speech therapy defects and develop a culture of speech. The teacher-speech therapist works in close contact with the musical director on the formation in children with mental retardation in the development of speech breathing, correct articulation and intonation-expressive speech. In order to develop the ability of children with mental retardation in development to correlate speech with movement, logo rhythm is used.

With a physical education instructor, the speech therapist works to automate the sounds set in children with mental retardation in the development of sounds, to consolidate the lexical and grammatical means of the language. Performing tasks, movements according to the model, as

well as visual demonstration, verbal instruction allow solving the problems of verbal regulation of actions and functions, active attention, the development of the spatio-temporal organization of movement.

In addition, speech therapy service includes not only work with children, but also work with teachers to teach techniques and methods of correctional work, and work with parents.

Thus, the maintenance service is a capacious system unit associated with numerous interdependencies with other units.

The next condition for the implementation of the model is the cooperation of the preschool educational institution with the family, based on the following principles that determine its content, organization and methodology:

- The unity of the goals and objectives of raising a child;
- Systematic and consistent work;
- An individual approach to every child and every family;
- Mutual trust and mutual assistance of teachers and parents.

The next condition is the interaction of the preschool educational institution with social institutions: a music school, a children's library, a house of culture, a house of sports. Children visit these institutions. Classes in them contribute to the all-round development of the child and his socialization [4].

One of the main conditions for the implementation of the model is the establishment of continuity in the work of kindergarten and school.

Thus, the model of preparing children with mental retardation in development for school in our preschool educational institution is implemented by ensuring the following conditions:

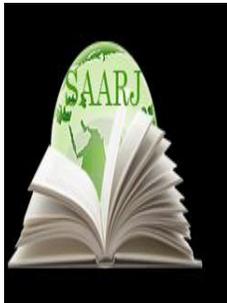

- Availability of regulatory documents of the Federal, regional and local levels;
- Organization of a rational subject and developmental environment;
- Introduction of health-saving technologies;
- creating a comfortable psychological environment;
- staffing;
- organization of a child support service;
- cooperation with the family;
- interaction with society;
- continuity in work with the school.

Ensuring the constitutional right of the child to the availability of education by providing places in preschool educational institutions in full-day groups, creating the necessary conditions for the full preparation of children with mental retardation in development to school and the transition to the next stage of education, having certain results of the work of our preschool educational institution, one cannot but say about the existence of problems such as:

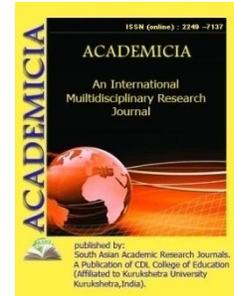

- ✓ Improving the pedagogical culture of parents.
- ✓ Most parents have a wrong idea about preparing children with mental retardation in development for school. they believe that learning skills, such as numeracy, reading and writing, should be developed first.
- ✓ Lack of continuity between preschool and school programs, which leads to certain difficulties in the transition of the child to school.
- ✓ Lack of uniform requirements for the upbringing of children with mental retardation in development.

 UZBEKISTAN

ABSTRACT

The article is devoted to the modernization of general secondary education, improving the quality of education. The author expresses his suggestions and comments on the organization of the educational process. The distance and almost distributed form of education is carried out using the Internet and is based on the use of telecommunication methods for the formation of knowledge, the accumulation of experience by students to communicate "with the whole world". Thus, based on the above, it can be said that in the early twentieth century, many scientists, teachers and psychologists need to introduce innovative technologies to improve the quality of the educational process of students.

KEYWORDS: *Modern Schools, Modified Capabilities, Innovative Technologies, System, Process, Open Studios, Designs.*

INTRODUCTION

Today, due to objective processes in society, changes are taking place in the education system. These changes are innovative and reflect the humanization, informatization and transparency of education. One of the directions of innovation is the implementation of the idea of open learning, which requires a reconsideration of views on the functions, essence, features, elements and relationships of the learning process. Transparency implies the constant connection of the learning process with the information environment, the orientation of the student's personality to the culture in an adequate, complex and dynamic, taking into account the environmental changes in it. Today, the opportunities of the information environment allow the educational process to go beyond the classroom system, which in turn leads to the introduction of new forms of organization of the educational process. These include distance learning, almost distributed learning, modular organization of the learning process, project activities of school students,

extracurricular activities, development and implementation of individual curricula for students, teaching in open studios without tutors, etc.

It also confirms the need to use the experience of developed countries in the management of educational institutions, the need to promote the achievements of the country, the pedagogical study of the problems of modern school management, the development of theoretical and practical bases of this process.

The above is a brief description of the forms of organization of the learning process. The distance and almost distributed form of education is carried out using the Internet and is based on the use of telecommunication methods for the formation of knowledge, the accumulation of experience by students to communicate "with the whole world". At the same time, the main focus is on the student's activities, the technology he or she creates in his or her educational products. These are sessions that use telecommunications, in which subjects and objects of learning have a spatial or temporal distance and participate in the learning process aimed at creating educational products and the corresponding internal growth of the subjects of learning. The organization of preparation of students for extracurricular courses at the higher level of education includes block-modular structure of courses due to the rational use of study time (intensification of the educational process, the transition to cyclical forms of education). In extracurricular activities, students have the right to choose the level of study of the subject to one degree or another, independently or in agreement with parents and the teacher, the class teacher: basic or advanced. The teaching load is determined taking into account the individual areas of study for each group of students at all levels of education.

Extracurricular activities (in open studios) include changes in the organization of the educational process:

- by reorganizing the study time;
- more intensive study of the program material (block).

The peculiarity of the organization of extracurricular teaching is that the schedule is created so that each student, regardless of the class, learns what he chooses. Classes are held on a common topic for all. Such an educational direction serves the function of individualization, ensures the child's right to choose education and provides pedagogical assistance to the student. Design of individual educational directions. This type of training helps to implement the idea of profile (specialized) education in general secondary school. The school is accompanied by the development of individual curricula by students, counseling, advertising by teachers of their special and basic courses, informing parents about the mandatory approval and correction of alternative curricula within the allotted time. The analysis of individual curricula developed by students allows the formation of learning profiles at a higher stage of education. Designing individual curricula for students provides individualization of the learning process, allowing them to take into account their educational needs. By organizing open studios (extracurricular education), the learning process can be divided into two parts: the closed part (compulsory lessons) and the open part (lessons based on free choice). Coming to a modern school, the student decides independently in which studios and to what extent he will work. Studio profiles can be traditional and include physics and mathematics studios, chemistry and biology studios, social science and political science studios, literature and art studios, information technology

studios, and linguistics studios (Russian and foreign languages). However, school parks, such as driving, cutting and sewing or cooking studios, can participate in sports studios.

"School parks" are based on the principle of transparency, and in this regard, we can highlight the following parameters of the educational process:

Children who come to the studio are not permanent members (most of the time), they change, and there are no clear age restrictions.

Park School has a conceptually new look at the relationship between student and teacher. There is no pressure on the teacher's authority over the child. In this system, the teacher is not the main indicator within the educational relationship, the main indicator is the student. It can independently select studios and teachers, and can independently determine the community in which it wants to learn and communicate, as well as the "level of knowledge acquisition," and become a member and student.

Learning objectives in the Park School are basic and important not only for the theory but also for the entire education system - it allows the child to develop their own ideas about the problem of interest, rather than broadening the child's worldview, remembering the knowledge provided by the program and the teacher.

Fractal teaching takes place in studios organized in different types of joint activities of students of different ages. The purpose of fractal education is to increase the individuality or fractality of each student's world, to develop their knowledge based on the exchange of personal knowledge between students.

At this stage of development of modern society, the requirements for the new generation of schools, ie modern schools, come to the fore. These are students who know how to work in a team, who have creative thinking, who are creative students who tend to educate themselves and increase their knowledge.

Analysis and generalization of the possibilities, features and effectiveness of the new forms currently used in a number of educational institutions in Uzbekistan, the modification of the forms of organization of the educational process allow us to conclude that the following opportunities for education:

- The level of training of graduates, changing the organization of the educational process through the reconstruction of teaching time and more intensive study of the program material (block);
- there is a real opportunity to acquire additional knowledge not provided for in the curriculum and syllabus of this educational program;
- The child's right to choose his education is ensured;
- training time is reduced by 3-5 times;
- new positive features appear in educational materials presented in electronic form due to animated, sound, visual material, compact storage in computer memory or external magnetic environment;
- implementation of problem-based learning methods is provided;
- develops the ability to make the best decisions in different situations;

- it will be possible to form a culture of educational activity;
- "Active teaching methods" are used, which include various ways to increase the learning activity of students, as well as some pedagogical techniques and special forms of teaching;
- The development of creative abilities of students becomes a reality;
- Acquaintance with modern computer "technologies" of knowledge of the world;
- connects with living, evolving science;
- preparation for continuing education will be real;
- Lifelong learning will be possible throughout life;
- The level of knowledge of any student varies from student to assistant teacher;
- development of each student on the basis of personal knowledge exchange;
- An alternative to public education becomes a reality.

Common features of new forms of education in modern schools are:

- openness, which implies the use of the opportunities of an open information educational environment, the implementation of the principles of open education, etc .;
- expanding and complicating the relationship between the teacher, the open information learning environment and the student, which includes the use of the opportunities of regional educational districts, including additional educational institutions, information centers, etc .;
- Changes in the relationship between "teacher and student", based on mutual support, cooperation, co-creation, independent work, based on pedagogical assistance;
- The change in the nature of the relationship between the teacher and the content of education is reflected in the creation of new programs and courses aimed at the acquisition of knowledge by students on redundant topics. The implementation of new forms of organization of the educational process leads to the following results:
- Students' independence develops in the learning process, which allows them to consciously choose the direction of education, methods and forms of education.

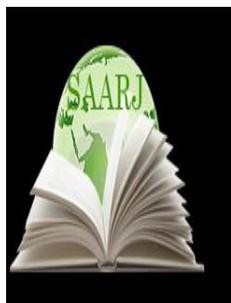

The role of the teacher in this system is unique. The teacher needs to be well-developed in all areas, such as engaging the child as well as being able to learn with the child.

In a traditional school, we use it to evaluate students and compare them, but in a fractal system, it makes no sense. The teacher does not evaluate the student, the teacher records the result of the student's activity. An alternative review to the certificate is that it is written by the teacher and given to the student. The review reflects the student's personal accomplishments in the studios.

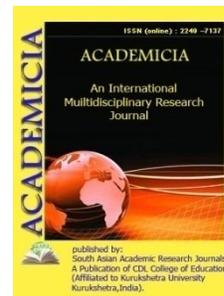

Thus, based on the above, it can be said that in the early twentieth century, many scientists, teachers and psychologists need to introduce innovative technologies to improve the quality of the educational process of students. The use of innovative technologies in the process of general secondary education is a prerequisite for the training of highly qualified specialists and leads to positive results: they allow the formation of knowledge, skills and competencies through the involvement of students in active learning activities..

THEORETICAL FRAMEWORK OF SOCIAL COMPETENCE AMONG STUDENTS OF THE HIGHER SCHOOLS

Aziza Mukhsieva*

*Assistant Professor,
 Tashkent State Pedagogical University named after Nizami,
 UZBEKISTAN

ABSTRACT

The article carried out a theoretical analysis of the concepts of competence, competence, social competence, studied the literature on the age and psychological characteristics of high school students, the development of their social competence, selected possible psychological methods for measuring social competence, considered the forms and methods of developing the social competence of high school students, given methodological recommendations for senior school teachers, aimed at developing the social competence of senior students, the pedagogical conditions for the formation of social competence of senior students are determined.

KEYWORDS: *Social Competence, High School Students, Forms And Methods, Methodology For Measuring Social Competence, Model, Age And Psychological Characteristics Of High School Students, Motivation For Educational Activities, Creating A Situation Of Success, Self-Awareness, Self-Esteem.*

INTRODUCTION

In the process of modernization of modern education in the Republic of Uzbekistan, one of the leading tasks is the task of forming the social competencies of the individual in the process of his subjective self-realization in the upbringing environment. The need to solve such a problem is determined by the mission entrusted to educational institutions by official bodies and the expectations of society, which determine the needs of citizens in the development of social competencies in the process of obtaining education.

If we consider social competence as a realized opportunity for a person to improve the sociospace in general and himself in this space, in particular, we can come to the conclusion that the upbringing environment of an educational institution is capable of simulating a person's social behavior, giving him the opportunity to gain experience of subjective self-realization, to

develop social competencies. It is this position that becomes significant in the process of forming social competencies through the educational environment. The result of the process of socialization of students, that is, the result of real interaction between the school and the environment, is a new level of social competence of the student. Then the formation of social competence becomes today one of the most important pedagogical tasks for the modern school.

The problem of the development of the social competence of an individual is extremely relevant, as evidenced by numerous studies carried out recently both in Uzbekistan and abroad. The exceptional complexity of this problem and its importance for practice gave impetus to the writing of many works directly related to the consideration of the formation of social competence. However, the currently existing methods of increasing social competence (lectures, training sessions, printed materials, various educational and upbringing programs, etc.) do not always sufficiently take into account the interests and inclinations of adolescents, especially their age. Moreover, they do not always reflect the complexity of the situation in modern society. Often they are fragmentary, focused mainly on the development of certain aspects of social competence, are not available to everyone, and when they are carried out, significant time and material costs are required.

The microfactors that affect the student include family, peers, micro-society, various educational and upbringing organizations. The school needs to actively participate in the process of socialization of high school students, interacting with the listed micro-factors, taking into account their direct influence on the formation of the student's personality. The school, as an educational institution, implements the order of society - to form a person who is adequate to the requirements of a given society, era, to raise, train and educate young generations with maximum consideration of the social conditions in which they will live and work.

This implies one of the goals facing the educational institution today: to create the necessary conditions for the formation of a high level of social competence, to choose the methods and techniques of pedagogy, social psychology. Such conditions can be created using the capabilities of the educational environment of an educational institution, directing educational efforts not to children, but to their environment, the life environment with which children interact.

In these conditions, the school must be organizationally, substantively and technologically restructured taking into account the increased requirements for graduates. The main task of education is the upbringing of a student who is able to quickly integrate into society on the basis of the elements of culture, social norms and values that he has learned at school.

Based on these goals and objectives, we can talk about the final result of education in a modern school - the competence of the graduate.

The Council of Europe has identified five groups of key competencies, which, according to UNESCO, should be possessed by graduates of a general education school. The first group includes social competencies, the mastery of which allows school graduates to take responsibility, actively participate in the development of a joint solution, be able to resolve conflict situations in a positive way, and effectively participate in the activities of various democratic institutions.

After the 90s. XX century social competence as a personal quality of a person becomes in demand in all social spheres of life, is considered as an interdisciplinary subject and is analyzed as a complex, multicomponent and multidimensional phenomenon. This trend continues in

research by real scientists.

So, V. N. Kunitsyna distinguishes the following types of social competence: verbal competence; communicative competence; socio-professional competence; socio-psychological competence; self-identification (ego-competence).

I.A.Zimnyaya shares the competence related to the social impact of a person and the social sphere into the competence of social interaction (with society, community, collective, family, friends, partners, conflicts and their repayment, cooperation, tolerance, social mobility) and competence in communication (oral, written, dialogue, monologue; knowledge and observance of traditions, etiquette; cross-cultural and foreign language communication; business correspondence; communication tasks).

Much attention is paid to the study of social competence by foreign authors. Thus, the German psychologists U. Pflingsten and R. Hintch interpret social competence as the mastery of cognitive, emotional and motor behaviors, which in certain situations lead to a long-term favorable correlation of positive and negative consequences. H. Schroeder and M. Forwerg believe that the structure of social competence is permeated by four personality traits: sociability, determination, influence, and self-esteem.

Thus, the analysis of existing approaches to the definition of "social competence" gives us the basis to define social competence as an integrative quality of a person, which includes the necessary knowledge, experience, abilities formed as a result of socialization and allowing a person to adequately adapt in society and effectively interact in society ... Social competence allows you to solve problems in a social environment in a sufficiently effective degree.

The analysis performed allows us to conclude that there are different approaches to understanding the essence of social competence: social competence is presented either as an integrative quality of a person, or as social interaction; social competence is characterized as the result of some activity or an indicator of the achievement of an individual in a certain type of activity; the content component of the formation of social competence depends on the person's age. The process of formation and development of social competence in different age periods has both common and special features, including both different and similar components.

On the basis of theoretical research, the following concept of social competence can be formulated: it is a complex of knowledge about social reality, a system of social skills, skills and social and personal characteristics, the level of formation of which in each person allows him to build his behavior, taking into account the peculiarities of the social situation, and effectively perform the given social role.

In our opinion, social competence is not an ordinary amount of knowledge; it is a person's ability to solve life problems and tasks, find a way out in everyday real situations, using acquired skills and abilities, educational and life experience, social values and personal motives.

The development of social competence requires a careful determination of the age characteristics of its carriers. The most difficult and important, from the point of view of personal development, is adolescence. The general growth of the teenager's personality, the expansion of the range of his interests, the development of self-awareness, new experience of communication with peers - all this leads to an intensive growth of socially valuable motives and experiences, such as the ability to sympathize, empathize with someone else's grief, the ability to selfless self-sacrifice,

etc. Significant problems are associated during this period with the rapid development of the emotional sphere: a sharp change in moods and experiences, increased excitability, impulsivity, a wide range of polar feelings - all this is associated with the "adolescent complex" observed at the age of 10 to 16 years in many children.

The adolescent period is very important in the development of the "I-concept", in the formation of self-esteem as the main regulator of behavior and activity, which has a direct impact on the process of further self-knowledge, self-education and the development of personality in general.

The characteristic features of adolescence are determined by specific social circumstances, primarily a change in the child's place in society, a change in his position when entering into new relations with the world of adults, the world of their values, which largely determines the new content of his consciousness. The adolescent's desire for self-observation, self-esteem, self-affirmation and self-improvement arises as a result of analyzing his own strengths and weaknesses and understanding what is right in his own actions and goals, and what is wrong, what should be achieved and what to refrain from. To date, psychologists, sociologists, and teachers have received a large amount of factual material about the peculiarities of the development of adolescents.

Thus, self-determination of the individual is the most important task of age. Based on this, a number of pedagogical tasks are projected aimed at mastering adolescents' competencies related to future self-determination, in particular, the competence of a conscious choice and responsibility for this choice.

The development of the will and arbitrary behavior of a teenager is closely connected with the formation of responsibility. The ability to control oneself is an important quality of an adult, mature person. It is very much appreciated by a teenager. However, a typical adolescent is characterized by weak will, disorganization, and a relatively easy refusal to achieve the set goal. For the development of will, therefore, the strengthening of the goal acquires a special role. A socially competent teenager masters a conscious goal-setting.

The required level of social competence of adolescents in school conditions is achieved through the formation of: a complex of social and communicative knowledge and relationships (conceptual and essential component); systems of social and communicative skills (practice and activity component); experience of productive social and communicative activity (motivational and ideological component); personal-value attitude towards improving social and communicative competence (conceptual component).

Based on the fact that the content of any competence, including social, assumes a number of sides (knowledge, motivational, activity) and is based on information, communication, intuition and practice, we can imagine the following structure of social competence.

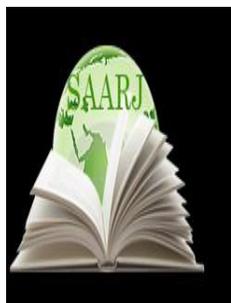

Based on the theoretical analysis of psychological and pedagogical approaches to determining the leading social roles of adolescents, it is possible to determine the content of social competence, which has three directions of development for each component of social competence: "Personality", "Citizen", "Professional".

An important task in the process of forming social competence in adolescents is to create the necessary conditions that ensure the development and acceptance of social values and ideals by students, the development of forms and methods of social behavior.

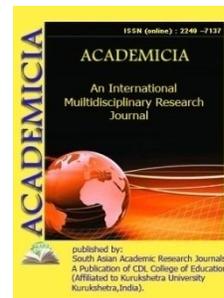

The development of social competence of adolescents in the educational process becomes successful when: the essential characteristics of social competence as an integrative personal education are revealed: the concept is revealed, its structure and content elements are determined; the pedagogical tasks of the development of social competence of students on the basis of new formations, conditioned by the peculiarities of age-related development and leading socially significant activities, are highlighted; developed and purposefully implemented in the educational process, a model for the development of social competence of students through group educational work, dialogue training, discussions, disputes, communicative educational technologies; the development of skills for solving practical problems, a situation of choice is carried out by organizing project activities, solving problems of choice; in extracurricular activities, the inculcation of spiritual and moral values is realized through essay contests, projects, and other types of extracurricular activities; one of the most important components of the social competence of an individual, in the conditions of a complicated, unstable social environment, is the ability to reflect on social situations.

ABSTRACT

The article discusses the problems of damage during storage, processing and use of wool fibers used in the carpet industry. The role of bacteria and microscopic fungus in fiber damage has been shown. These indicators include: the cost of raw materials and production costs for its processing, elastic properties, ease of processing, profiled cross-section, the bulk, which is achieved due to the large thickness and the method of dyeing. The main criteria for carpets of the third group, i.e. Researchers Negin and Mumford consider the indicators characterizing the average cost of one square meter, taking into account their service life, of carpets supplied for the foreign market.

KEYWORDS: *Biological Damage, Fiber, Wool And Textile Fabrics Materials, Bacteria, Fungus, Biostability, Pilling, Keratin, Cystine, Cortex.*

INTRODUCTION

The properties of the yarn are determined by the properties of the raw material and the methods of its processing. In this regard, studies of yarn production are divided into two groups: selection of raw materials and technology of yarn production. The works of Gusev V.E., Slyvakov V.E. are of great interest in this area. and many other authors. Based on the research, it has been established that the main criteria for assessing fibers for carpet production are: strength, elongation, elastic properties, bending resistance, wear resistance, dyeing strength. Along with

these indicators, tortuosity is an important characteristic. It has been proven that fibers with a stable crimp allow to increase the coverage of the pile surface, provide good resistance of carpets to crushing and abrasion, which is one of the most important characteristics of the operational properties of products, which allows them to increase their service life. The entire assortment of carpets is subdivided into three main groups by purpose. For carpets of the first group, which include mass-produced carpets, the main criteria for the selection of fibers are properties that affect economic performance with an appropriate quality. These indicators include: the cost of raw materials and production costs for its processing, elastic properties, ease of processing, profiled cross-section, the bulk, which is achieved due to the large thickness and the method of dyeing. The main requirements of carpets of this group are uniformity of properties, resistance to bending, wear resistance, strength of pile fixation, resistance to pilling, resistance to moth and microorganisms, resistance to dirt, ease of cleaning, resistance to washing, decorative and aesthetic properties.

When selecting fibers for the production of carpets of the second group (extra class), special attention is paid to decorative and aesthetic indicators, compliance with consumer requirements, color uniformity, the ability to preserve their original appearance (resistance to pilling, dirt, bending resistance, dyeing strength, antistatic properties, fire resistance, durability). The main criteria for carpets of the third group, i.e. Researchers Negin and Mumford consider the indicators characterizing the average cost of one square meter, taking into account their service life, of carpets supplied for the foreign market. Therefore, the group of requirements for fibers here is much wider and includes indicators that affect the prime cost of carpet products and their durability. When examining carpets, it is considered necessary to pay special attention to the physical, mechanical and quality indicators of fibers.

Gusev V.E. and Slyvakov V.E. studies on the selection of fibers for carpets indicate the need to consider primarily the length and thickness of the fibers. Researchers rightly believe that these characteristics increase the exploitation properties of carpets. Work is underway to create a raw material base, select raw materials for yarn production and use new types of chemical fibers and their modifications, developed specifically for carpet production in accordance with the requirements developed for them, as well as using mixtures of various types of fibers. In recent years, the carpet industry has processed pilot batches of almost all types of synthetic fibers (polypropylene, polyacrylonitrile, polyester, polyvinyl chloride, etc.) produced by the chemical industry, as well as modified artificial fibers (methylene, crimped matted viscose fiber, etc.). The structure of textile raw materials is gradually changing towards an increase in the proportion of chemical fibers. Synthetic fibers prevail in the raw material balance of the foreign carpet industry. The efficiency of using chemical fibers of various types in carpet production is far from the same, therefore, one of the most important tasks is the correct choice of raw materials, the quantitative ratio of the mixture components, ensuring the production of carpet products with high performance properties.

A distinctive feature of carpets and rugs is their high strength, high-quality colorful colors. This is facilitated by the use of various types of raw materials and processing methods.

The main raw material used in the production of carpets is wool.

Carpet wool should be distinguished by good dyeing ability, sufficient elasticity, ability to resist felting, pilling and resistance to repeated bending under operating conditions. The use of low-

fineness fibers for the production of carpet pile yarn ensures the stability of the pile surface of the carpet. In carpets with split pile, the absolute strength of the fiber and elastic properties are of particular importance. Classic carpet wool meets all these requirements.

Among the various types of synthetic fibers, polyacrylonitrile fibers are of great interest for carpet production, and in recent years there has been a great demand for them. This is explained by the fact that PAN fibers have important deteriorating properties: wool-like, low thermal conductivity, low density, hydrophobicity, etc. The combination of valuable properties of PAN fibers makes it possible to produce high-quality carpet products from them.

PAN fibers belong to the group of fibers resistant to microbiological influences. They are not destroyed by bacteria and microorganisms, insects and moths. Its use in a mixture with other fibers improves their properties, increases the resistance of products made of them to the action of microorganisms. The disadvantage of the fiber is its fragility and poor fire resistance.

Wool is the name of animal hair, which is widely used in the textile and light industry. In terms of its structure and chemical composition, woolen fiber differs significantly from all other types of fibers and is characterized by a wide variety and heterogeneity of properties. Sheep wool, camel, goat, rabbit, llama wool, angora and others are used as raw wool.

In Uzbekistan, mainly karakul sheep are bred to obtain broadtail (smushka) and wool fiber.

A number of studies have established that the chemical feature of wool is a high content of various amino acids. It is known that wool is a copolymer of at least 17 amino acids, while most synthetic fibers are copolymers of two monomers.

The different content of amino acids in woolen fibers determines the peculiarities of their chemical properties. Of great importance is the amount of cystine, which contains almost all sulfur, which has a great effect on the properties of wool fiber. The higher the sulfur content in the wool, the better its technological properties, the higher resistance to chemical and other influences, the higher the physical and mechanical properties. Wool fibers have a complex histological structure.

The layers of wool fiber, in turn, also differ in sulfur content: there is more sulfur in the cortical layer than in the core. Of all textile fibers, wool has the most complex structure. Fine merino wool fibers consist of two layers: the outer scaly or cuticle, and the inner cortical layer - the cortex. Coarser fibers have a third core layer. Coarse fibers predominate in karakul wool.

The outer layer of wool fiber consists of flattened cells (scales) that are tightly bound to each other and to the inner cortical layer.

The cortical layer - the cortex is located under the cuticle and constitutes the bulk of the fiber, and therefore determines the basic physical, mechanical and many other properties of wool. The cortex is built of spindle-shaped cells that are tightly pressed against each other. There is also an intercellular protein substance between the cells. The cells of the cortical layer are built from densely spaced cylindrical filamentous macrofibrils with a diameter of about 0.05-0.2 microns. Macrofibrils of the cortical layer are built from microfibrils, the average size of which is about 7-7.5 nm in diameter [5]

According to the British researcher J.D Leeder, wool fiber can be considered as a collection of squamous and cortical cells held together by a cell-membrane complex, which thus forms a single continuous phase in the keratin substance of the fiber.

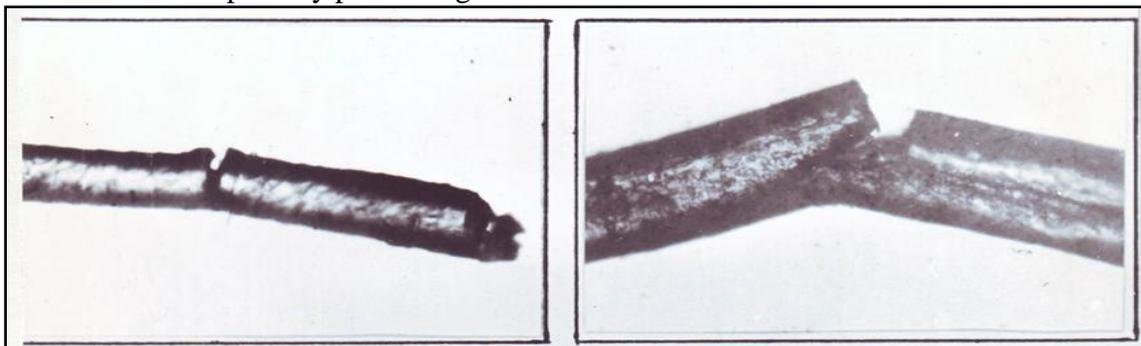

The core layer is present in coarser wool fibers and the core cell content can be up to 15%. The location and shape of the cells in the core layer varies significantly depending on the type of fiber. This layer can be continuous (running along the entire length of the fiber), or it can be interrupted into separate sections. The scaffold of the cells of the core layer is built from a protein similar to that of the microfibrils of the cortex.

Of all the amino acids contained, only cystine forms a transverse layer; their presence largely determines insolubility. wool in many reagents. The destruction of cystine bonds facilitates damage to the wool by sunlight, oxidants and other reagents; cystine contains almost all of the sulfur contained in wool fibers. Sulfur is essential for the quality of wool, since it affects the chemical properties, strength and elasticity of the fibers.

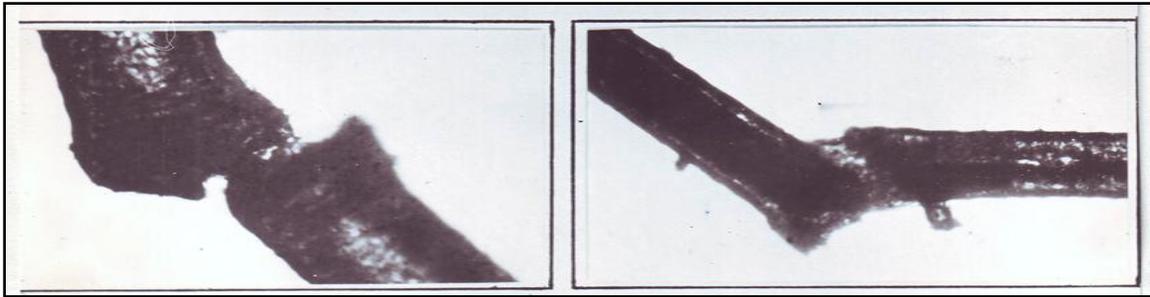

According to its chemical composition, wool belongs to the category of proteinaceous or protein substances. The main substance that makes up the basis of wool is keratin. Keratin is formed during the biosynthesis of amino acids in the cells of the epidermis of the hair follicle in the skin. By its structure, keratin is a complex complex containing bundles of high molecular weight chains. In this regard, it is of great importance to study the damage to woolen fiber during growth, storage, and processing. To study the damage to the wool, samples of karakul wool were selected according to the indicated transitions and after technological processing. The work was carried out according to the method developed by academician M.A. Khadzhinova at the testing laboratory of the Tashkent Institute of Textile and Light Industry in multiple replications. Based on the tests carried out, the main types of damage to the woolen fiber were identified. Growth injuries: hungry tone, bloating, bilateral bloating. During storage, swellings formed under the influence of microorganisms, mechanical damage during processing. The main types of damage are listed below. Damage leads to a deterioration in the quality of the fiber, and therefore to the quality of the manufactured products.

Typical mechanical damage to woolen fibers during processing

a) initial – after primary processing

b) recycled fiber after combing machine

Typical types of biological damage to wool fibers occurring during storage

Bloating

Bloating from accumulation/
fungi and bacteria

Strong bloating

Strong air fiber with a loosened structure
from the action of microorganisms

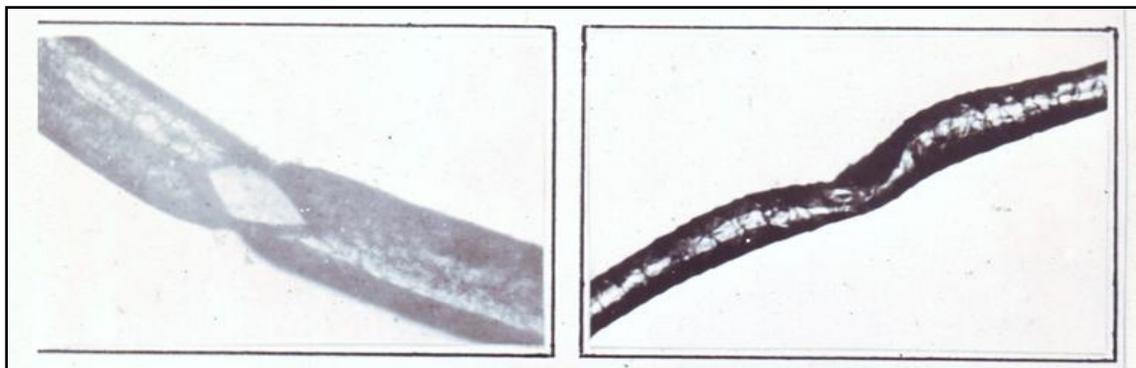

Strong bloating/

Fibers with strong bacterial swelling

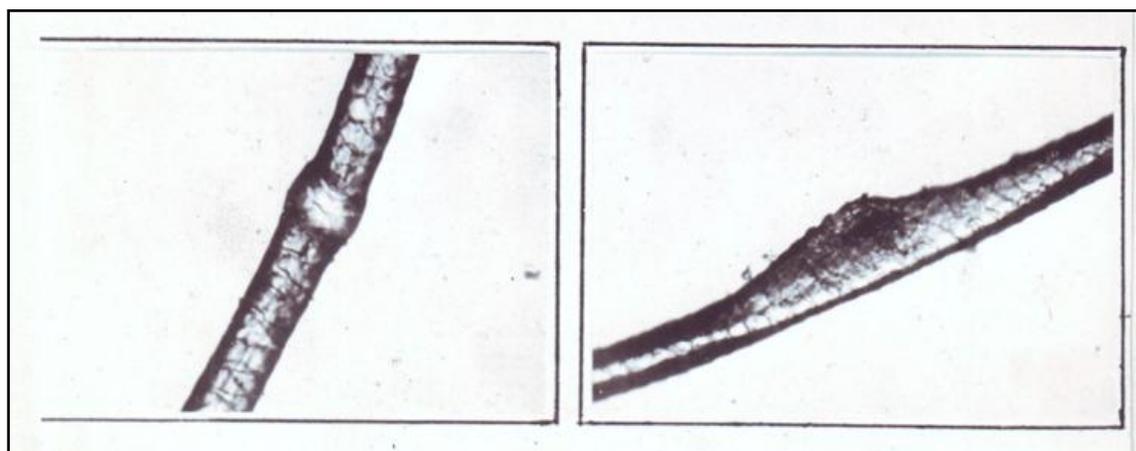

Bloating/

Fiber with swelling and wall rupture -combined

Typical types of biological damage to wool fibers arising during the growth of an animal

Hungry tonin

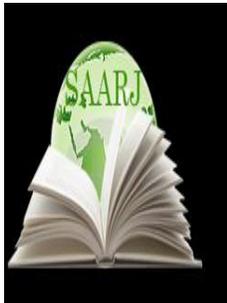

Bloating

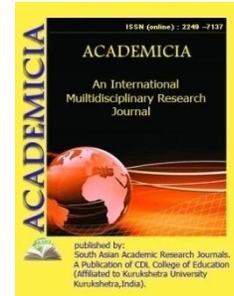

Unilateral bloating

USE IN CORRECTIONAL SPEECH THERAPY WORK AT SCHOOL FOR CHILDREN WITH GENERAL SPEECH UNDERDEVELOPMENT

Alfiya Turkmenova*

*Teacher,

"Speech therapy" Department at the Tashkent State Pedagogical University,
 named after Nizami, Tashkent,
 UZBEKISTAN

ABSTRACT

The success of overcoming the general speech underdevelopment in younger schoolchildren can be increased through the use of various information computer technologies. The article reveals the meaning of the use of computer technologies, aspects of their application in the elimination of speech disorders in primary schoolchildren.

KEYWORDS: *Junior Schoolchildren, General Speech Underdevelopment, Computer Technologies, Correction, Speech Therapy.*

INTRODUCTION

Increasing the efficiency of the process of correcting speech disorders, at the present time, is an urgent problem in correctional pedagogy. Many authors point out that the use of computer technologies allows you to optimize the pedagogical process, individualize the teaching of children with speech disorders, and significantly increase the effectiveness of correctional activities. Since the general underdevelopment of speech has a complex structure, it is necessary to carry out systematic and systemic correction work based on intact types of perception.

Special computer technologies are a suitable solution to this problem. Communication with a computer in younger students is of interest, as a game activity, and then, like an educational one. This interest helps to form cognitive motivation, voluntary memory and attention. These qualities ensure the psychological readiness of children for learning. Low concentration of attention and its instability requires purposeful work to correct this problem.

Computer technologies are relevant, as they allow you to provide information in an attractive form, which makes it possible to quickly memorize the content and makes it meaningful and long-term. In the course of classes using a computer, students overcome difficulties, control their

activities and assess their own results. Solving a task set by a computer program, the child strives to achieve successful results, subordinates his actions to the set goal. The use of computer teaching aids develops in schoolchildren such qualities as perseverance, composure, independence and concentration.

When using various information computer technologies in correctional and developmental education, such tasks are solved as: studying the subject area at various levels of detail and depth; the formation of skills and abilities to perform typical practical tasks (the acquired knowledge is applied in practice); formation of skills in analysis and decision-making in unusual, difficult situations; developing abilities for certain types of activity; renewal of knowledge, abilities and skills; the possibility of differentiated assessment and control of levels of knowledge and skills.

Educational tools of information computer technologies can be classified according to the following criteria: by the tasks being solved, by the functions in the educational process, by the type of information, by the forms of using ICT in the educational process, by the forms of interaction with the student. Each of the criteria is described in detail below.

According to the pedagogical tasks being solved, the means of information computer technologies are divided into:

1. Means providing basic training such as: electronic textbooks, training systems, knowledge control systems;
2. Means of practical training: problem books, workshops, virtual constructors, simulation programs, simulators;
3. Aids such as: encyclopedias, dictionaries, reading books, developing computer games, multimedia training sessions;
4. Complex tools - distance learning courses.

According to the functions in the organization of the educational process, the means of information computer technologies are divided into:

- Information and training: electronic libraries, electronic books, electronic periodicals, dictionaries, reference books, computer training programs, information systems;

- interactive-email and electronic teleconferences;

3. Search engines: directories and search engines.

There are several aspects of using various educational tools of information computer technologies in the organization of correctional and developmental education: motivational aspect, content aspect, educational and methodological aspect, organizational aspect and control and evaluation aspect.

The motivational aspect is that the use of information computer technologies in correctional and developmental education can increase the motivation of students with speech disorders to speech therapy classes, since favorable conditions are created:

1. The individual educational opportunities of children with speech disorders are taken into account as much as possible, and their needs are also taken into account.

2. Large selection of the content of forms and paces, as well as levels of speech therapy lessons
3. Unleashing the creative potential of students;
4. The ability of students to assimilate modern information technologies.

The content aspect includes the possibilities of information computer technologies, which can be used as follows: when building the content of individual courses for correcting speech disorders for children with complicated speech pathology; to create individual test mini-lessons for students who have difficulties in mastering the material; to create interactive homework assignments with the involvement of parents in the use of information computer technologies, subject to appropriate conditions.

The educational and methodological aspect is electronic and information resources that are used as educational and methodological support for the correctional and developmental process. The teacher-defectologist can use the variable educational tools of information computer technologies in preparation for the lesson, as well as directly in the lesson to explain new material, to consolidate the acquired knowledge, in the process of knowledge control and others; in order to organize independent study of additional material by students, etc. Computer tests and test items can be used to implement various types of control and assessment of knowledge.

In addition, a speech therapist teacher can use a variety of electronic and information resources when designing an author's course for correcting speech disorders.

The organizational aspect lies in the fact that information computer technologies can be used in various options for organizing training: with an individual student's training program based on a specially drawn up individual plan and with frontal or subgroup forms of speech therapy work.

The control and evaluation aspect is the main means of monitoring and evaluating educational results. Tests and test assignments allow you to carry out various types of control (input, intermediate and final). Test tasks can be carried out in two modes (on-line and off-line). In online mode, the test is carried out on a computer in an interactive mode, the result is assessed using an automatic system. In the off-line mode, the assessment of the results is performed by a speech therapist teacher, leaving comments to work on mistakes.

The use of a number of such popular and affordable programs as Paint, Adobe Photoshop, Corel DRAW, Macromedia Flash, Power Point are most often used in preparation for speech therapy classes. They allow you to create animated characters and letters, as well as various vivid illustrations. For example, a program like Power Point allows you to create an entire lesson with a series of different assignments. These are the most used and simple programs in preparation for classes, but there are many other, no less interesting programs that are suitable for use in speech therapy practice.

Along with the obvious positive aspects of the use of information computer technologies in the correctional and developmental process to overcome speech pathology in children, there are certain difficulties associated with the stages of introduction and use of information computer technologies. In correctional and developmental activities, the use of a computer can be built in three different forms: simulator; (a tutor performing established functions for a speech therapist, which a machine can perform much better than a human); a device that creates a specific environment and the actions of specialists in it.

Our analysis of the literature showed that information computer technologies are not part of the content of correctional work, but represent a kind of additional capabilities that contribute to improving the quality of correctional work. Correctional work, which is carried out with children with speech pathologies, involves the use of specially developed or adapted computer programs. As a rule, all these programs can be divided into three types: diagnostic programs, training programs and developmental programs.

The effectiveness of the use of computer technology depends on many different factors that should be considered when using computer programs. An important factor is the professional competence of a speech therapist, his ability to include the latest opportunities in the correction and educational process, as well as information computer technologies, while forming the proper motivation and psychological comfort. Of particular importance in teaching children with various pathologies, including speech pathologies, are the levels of developed techniques for specialists working with computer programs.

Analyzing the special literature, we noted that a large number of developments on this issue are fragmentary and reveal only certain aspects of the introduction and use of computer technologies in the correctional process.

Based on this, we identified the necessary number of problems and specific features of children with general speech underdevelopment, which must be taken into account when developing and using information computer technologies in a correctional and developmental program.

The complex structure of the page, the lack of description of graphic objects, complex navigation mechanisms, insufficient size of graphics and fonts, low-contrast background, verbal problems and lack of audio information - all this can become a huge problem on the way of using a computer program in the process of overcoming general speech underdevelopment.

In the process of corrective work, certain difficulties can arise if the product software uses an unsuccessful design. It should be noted that one of the obstacles to the introduction of information computer technologies is the huge variety of these tools, which makes it difficult to find the optimal choice for carrying out correctional work with a specific student.

In the process of creating special computer programs, a huge role is played by the search for adequate ways to overcome technical and informational barriers that arise in children with general speech underdevelopment. To do this, it is necessary to highlight the following rules and conditions:

1. Providing sound content of programs.
2. Texts and images must be comprehensible.
3. Providing the choice of an individual pace when using dynamic objects.
4. Providing tips or help if you have difficulty completing the assignment.
5. Providing clear and consistent instructions.
6. Making content accessible
7. Providing accessible and understandable management.

We also identified a number of necessary requirements for the implementation of information computer technologies in special education:

- Information computer technology must meet the goals of education and the needs of students.
- It is necessary to prepare specialists with an advising professional and technical level of training.
- Analyze the legal framework in the field of application of information computer technologies.
- Develop criteria for assessing the effectiveness and availability of ICT.
- Test the selected technologies and appreciate their effectiveness in accordance with the specified criteria.
- To identify the main difficulties encountered in the use of ICT and develop ways to overcome them.

As mentioned above, not all information computer technologies can be used in speech therapy work to overcome the general underdevelopment of speech. Based on this, we have developed the following recommendations for the use of information computer technologies in correctional education:

The most important component of the theoretical basis for the use of information computer technologies in correctional work is the level of the child's actual development, and his zone of proximal development, which L.S. Vygotsky. Speech therapy work with children who have a general speech underdevelopment should take into account their psychophysiological characteristics, which have been studied in detail by such scientists as: E.F. Arkhipova, M.V. Ippolitova, E.M. Mastjukova, OV Pravdina and others. The use of information computer technologies should take place in stages, while at each stage the assigned tasks should be solved.

The first stage of using ICT can be called motivational. The main goal of this stage is the formation of motivational readiness for correctional and developmental work to overcome the general underdevelopment of speech with the help of information computer technologies. Also at this stage, training takes place in the simplest handling of a computer. The main directions at this stage of work are: creating a favorable atmosphere that promotes active and conscious participation of the child in the process; overcoming speech and non-speech negativism; teaching the student with the rules of work and control of a computer program. If necessary, this work continues in the next stages. When introducing students to the equipment and rules of computer control, it is necessary to explain that the monitor, mouse, keyboard and speakers help us in the classroom and make them varied and fun. When studying the rules for using a computer, students are told: how to turn on the computer, with which keys the necessary program opens and where it is located. Considerable attention should be paid to the formation of the correct position in front of the monitor, which are described in the sanitary and hygienic standards. It is also necessary to teach students to concentrate on what is shown on the display, listen carefully to instructions. Also at this stage it is necessary to develop different types of perception.

The second stage is considered to be the content-forming stage. The main goal of this stage is the correction of speech disorders, as well as the development of oral speech. To do this, it is necessary to determine an individual pedagogical route for each specific child. At each level of this work, certain tasks are solved, which is carried out through the selection of the use of

various computer programs or games. It should be noted that if a conscious interest was formed at the previous stage, then work at this stage will be more productive. By offering various, interesting and suitable for age and level of development of the program or game, at this stage it is necessary to activate speech. As the pronunciation abilities of children expand, the tasks of a computer program are used to develop sound analysis. These can be tasks for converting words, changing the structure of words with the observation of semantic changes. In the classroom, it is necessary to create an emotionally positive psychological climate, providing for "situations of confidence" of the child in their abilities. Students can easily remember how to turn on the computer, how to turn on the program and select the required task. Gradually, students can independently choose the games they like, for example, using the computer workshop, which was used during the experiment in the "Menu" mode. Children learn to expand opportunities for a positive assessment of their own activities, and they also feel joy from the results obtained.

This was facilitated by games at the end of the lesson, which were of a developing nature. The third stage - it can be called a self-developing stage.

The purpose of this stage is to develop self-control over various aspects of speech activity, as well as to consolidate the acquired skills. At this stage, you can successfully apply a variety of tools created with the help of computer programs.

Under certain conditions, the use of computer tools in correctional and developmental education can help a student to more fully realize his own active position of the subject of activity when interacting with an adult. The speech therapist becomes only a partner who provides the necessary assistance to the child. The functions of monitoring the correctness of the solution of correction problems are implemented by a computer. Emotional positive background contributes to an increase in the effectiveness of classes.

Accordingly, the use of information computer technologies in correctional and developmental education significantly reduces the time for the formation of pronunciation skills, the development of phonemic perception, the skills of sound and language analysis. It also helps the development of non-verbal mental functions in children.

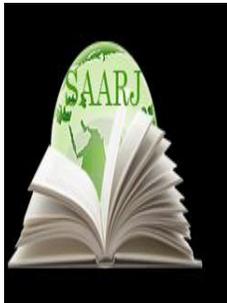

Overcoming the deficiencies of children's speech in correctional and developmental education with the introduction of sequential special computer-mediated speech therapy technology makes it possible to significantly differentiate and individualize corrective actions.

In correctional and developmental work with children who have speech disorders, the introduction of specialized or adapted computer programs (which, in turn, mainly teach, diagnose and develop), helps. The result of their implementation directly depends on the professionalism of the teacher. From the extent to which he knows how to use new opportunities, to include information computer technologies in the correctional and developmental learning process in the learning system of each child.

IMPROVING THE QUALITY AND EFFICIENCY OF TEACHING DESCRIPTIVE GEOMETRY IN A CREDIT-MODULAR SYSTEM

Nurlan Tashimov*; Zaitov Samandar**

*Associate Professor,
 Tashkent State Pedagogical University,
 Tashkent, UZBEKISTAN

**Magistrant Tashkent State Pedagogical University,
 Tashkent, UZBEKISTAN

ABSTRACT

In given article is considered increasing quality and efficiency education to descriptive geometry on high educational institutions on credit-module system. The successful operation of the credit-modular system depends on many factors, including educational and material support, a basic textbook that meets international standards, certain conditions for the organization of independent work of students (computer classes, video tutorials). These processes place great demands on all spheres of human activity, especially on the skills of the younger generation to receive and reproduce visual information and describe it by graphic means.

KEYWORDS: *Descriptive Geometry, Credit-Modular System, Quality, Efficiency, Methodology, Knowledge, Skills, Skill, Independent Learning, Spatial Imagination, Means.*

INTRODUCTION

It is known that the development of science and technology, technological processes with high efficiency, automation and computerization of production-all this is inextricably linked with "Descriptive Geometry and engineering graphics". These processes place great demands on all spheres of human activity, especially on the skills of the younger generation to receive and reproduce visual information and describe it by graphic means.

In connection with modern requirements, a number of responsible tasks are also assigned to specialists-scientists and teachers of graphic education in various disciplines. In particular, the improvement of the program, textbooks and teaching aids at the level of the requirements of the current period, the training of teachers is one of the urgent tasks.

In addition, our country pays great attention to the field of education, in particular the development of higher education. In order to improve the quality of education in the developed countries of the world and in the universities of our country, the process of transition of the educational process to a credit-modular system continues.

Today, the most important task facing the higher education system is the training of a qualified specialist. To prepare such a specialist, it is necessary, of course, to determine the system of requirements imposed on him. In our search for an answer to this question, we encountered a system of requirements in the following four areas:

1. Acquiring the necessary knowledge, skills and abilities in your field;
2. Constantly improve the existing knowledge in this area, that is, be ready for independent learning;
3. Have the skills of independent research and creativity to innovate in the industry;
4. Be able to plan your time, manage it and organize your activities.

In the Message of the President of the Republic of Uzbekistan The Supreme Council, it is planned to set the duration of training in 6 areas of pedagogical education in 3 years from this year. Among these areas is the educational field "Fine Arts and Engineering graphics".

Improving the standards of higher education based on foreign experience, revising the directions of education and the disciplines taught. 2-fold reduction in the number of disciplines that are not related to the specialty. In higher education, the transfer of the educational process to a credit-modular system is required.

Credit - (European Credit Transfer and Accumulation System) (ECTS) (European Credit Transfer and Accumulation System), which becomes a credit unit. This system successfully passed research in European universities in 1989 and was adopted.

The purpose of the credit system is to increase the transparency of education and promote the recognition of academic knowledge and qualifications.

Initially, the loan was used for students from abroad, and it was trusted. The establishment of uniform credits for higher education institutions helped to ensure the mobility of students. Today, the European credit system is a recognized and functioning system in almost all European countries. The student will be able to get a diploma only if he / she gets the established credit points.

There are several types of credit systems in the world's higher education system. Along with the above-mentioned ECTS, there are credit systems USCS-the American credit system, UCTS-the British credit system, CATS - the countries of Asia and the Pacific region.

The successful operation of the credit-modular system depends on many factors, including educational and material support, a basic textbook that meets international standards, certain conditions for the organization of independent work of students (computer classes, video tutorials). In the credit system of training, it is important that a higher educational institution has access to all necessary information resources in the course of training: an educational and methodological manual, an electronic textbook, handouts, and online educational resources.

Educational direction "Fine arts and engineering graphics" it is necessary to analyze the curriculum and taught disciplines for their compatibility with the curricula of leading universities of foreign countries of the corresponding educational directions, to form the subject composition, frequency, set the duration of academic semesters, the amount of credit allocated to subjects, to develop evaluation criteria.

Descriptive geometry is a branch of general geometry that studies their shapes, sizes, and relative positions using methods for depicting objects based on their geometric properties, as well as algorithms for solving positional metric and structural problems.

Descriptive geometry differs from other geometries in its main method-the image method. It expands the student's spatial imagination with its visualization techniques, helps to create images and read pre-made images, as well as solve engineering problems [1].

Analysis of the disciplines of the curricula of the relevant educational areas of leading universities in foreign countries shows that in order to become a specialist in graphic representation, the subject of "Descriptive Geometry" should be among the mandatory subjects.

To teach the subject descriptive geometry according to the module-credit system, it is necessary to form a sequence of topics, the unity of modules and the program of the discipline. On the basis of the subject program, it is necessary to develop a new generation of educational literature, methodological manuals for independent training of students, educational and methodological complexes, evaluation criteria.

With modular training, it is possible to provide step-by-step training by completely shortening and in-depth differentiation of training programs. That is, it will be possible to individualize training. When switching to modular training, the following goals are pursued:

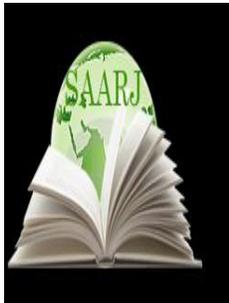

- ensuring the continuity of training;
- Individualization of training;
- creating sufficient conditions for independent learning of educational material;
- accelerate learning;
- achievement of effective assimilation of the subject.

It is planned that 50% of the total load allocated to the subject will be allocated to the audience, and 50% - to self-education. Therefore, a set of tasks for independent learning of students, thematic animation, tests included in the computer, workbooks, the use of information technologies in the educational process serve to improve the quality and independence of teaching the subject of descriptive geometry.

In conclusion, we can say that when translating the educational process of the educational direction "Fine Arts and Engineering Graphics" for 3 years and credit – modular system, the teaching staff faces great challenges. To train high-quality personnel in the field of fine arts and engineering graphics in the shortest possible time, it is necessary to follow the above recommendations, study foreign experience and use an innovative approach.

FORMATION OF NATIONAL PRIDE IN CHILDREN THROUGH TEACHING DESCRIPTION OF HISTORICAL MONUMENTS IN UZBEKISTAN

Shakhnoza Khasanova*

*Senior teacher,
 Tashkent State Pedagogical University named after Nizami
 Tashkent, UZBEKISTAN

ABSTRACT

This article is devoted to the formation of national pride in preschool-aged children through acquaintance with historical monuments. The pedagogical knowledge and skills of educators on the formation of elements of national pride in children are not sufficient to provide the necessary pedagogical conditions for the formation of the qualities that are planned to be formed in children. The study of the situation in practice also shows that the work aimed at building elements of national pride in preschool education institutions is not carried out systematically.

KEYWORDS: *Historical Monument, Fine Arts, Formation Of National Pride, Patriotic Education, Ancestral Heritage, Pride.*

INTRODUCTION

At the heart of the formation of national pride in children, the desire to form in them a sense of homeland is the goal of preparing worthy heirs for the bright future of our country. From this point of view, the study of historical monuments has a high educational value in instilling in the younger generation a sense of pride in the city, village, district, neighborhood in which he was born and raised.

As the first President of the Republic of Uzbekistan Islam Karimov said: “The monuments of eternity show the world that the ancestry of the Uzbek people is ancient and sacred. We should not only be proud of it, but also feel a deep spiritual responsibility. This responsibility is the duty to sincerely love and preserve our ancestral heritage and pass it on to future generations in a more prosperous way. ”

Addressing historical monuments, myths and traditions as an effective means of composing elements of national pride in children, conducting experimental work to identify its effective methods and forms requires the coverage of several areas.

The first direction was aimed at determining the level of effectiveness of the content, style, pedagogical conditions developed for the formation of elements of national pride in preschool children by teaching them to depict historical monuments. It recommended developments for preschool educators, guidelines, lessons for children and their operating systems. According to him, the experimental work:

- a) the formation of pedagogical, psychological knowledge, methodological skills of direct educators as a priority task;
- b) educators have sufficient knowledge of the structural principles of the elements of national pride that need to be formed in children, their content;
- c) pedagogical management of the process of formation of elements of national pride in preschool children by teaching them to depict historical monuments, if necessary, make certain adjustments and changes to this process;
- r) to know that each child is a world, at the same time, a world unique in itself, and to act accordingly (on the principle of individualization of education);
- d) the ability to draw correct conclusions from the results obtained.

The results of the observations showed that pedagogical knowledge and skills gradually improved when educators were provided with the necessary adequate methods.

Based on the pedagogical requirements developed for the evaluation of the results, the indicators at the beginning of the experiment gave the following result. The pedagogical knowledge and skills of educators on the formation of elements of national pride in children are not sufficient to provide the necessary pedagogical conditions for the formation of the qualities that are planned to be formed in children. Therefore, special guidelines have been developed for the simultaneous formation of the necessary knowledge and skills of educators in experimental work.

The first task in the experimental process was to formulate specific ideas about the types of activities that educators use to form elements of national pride in children. Their types of activities can be classified according to their content and essence as follows.

Visual activity is the most important principle in the aesthetic content of children's early life, in general, in their conscious behavior - the network. The child begins to draw different lines, shapes without yet developing the ability to speak. Once a certain visual skill is formed, they live in this world, creating patterns of visual activity in elementary form and content. It has important educational and pedagogical value as it encourages them to think in their own way. It is important that this process does not take place spontaneously in the child's activities, that is, the child must gradually learn to correctly interpret the "images" he creates. In this process, the educator must inculcate in the child's mind the notions of aesthetic content, such as line and shape, form and content, color and content, and pedagogically manage this process.

The results of the experiments showed that it is expedient to divide the level of formation of elements of national pride by types of activities in determining the level of the first stage of the

experiment by teaching children to describe historical monuments. The results of the distribution of interests of preschool children by type of visual activity have the following content.

Types of visual activities			
Mud	Picture	Application	Build
Making a tower shape out of clay and plasticine	Depiction of the tower with pattern elements	Drawing a tower by cutting and gluing pattern elements	Construction of the tower using different building materials
Making views of clay domed madrassas and mausoleums	Depiction of domed madrassa and mausoleum views	Decoration of madrasa and mausoleum models with pattern elements	Construction of madrassas and mausoleums using building materials

Most of the children studied during the experiment chose the application session. Because in the application classes, the work of cutting and pasting the silhouette of historical monuments, decorating it with various pattern elements aroused great interest among children.

A large group of children tried to depict the appearance of the madrasa or mausoleum using different colors while painting.

There were some difficulties in conducting construction lessons on historical monuments. Due to the fact that pre-school education institutions were not provided with sufficient building materials, the planning of construction lessons was limited to one direction, ie only construction works were carried out on paper.

In a large group of clay work sessions, children make tower and dome views out of clay with great interest.

The level of formation of feelings of pride in children by teaching them to describe historical monuments was assessed by the traditional form widely used in pedagogical research - the categories of indicators "high", "medium" and "low".

Assessment	The result
High	Children's activities reflect independence and creativity. They have the skills to interpret and defend their opinions. They have a sense of pride in the heritage of their ancestors through the depiction of historical monuments.
Medium	There are cases of independence in the activities of children, where elements of national pride are formed, only lack of creativity or vice versa. They have certain knowledge and skills in their activities, they are able to interpret and defend it when necessary. There is a lack of regularity and stability in interests and activities. Children belonging to this group know the names of historical monuments. They can show the appearance of historical monuments in any type of activity, have the skills to work as a team.
Past	In children whose elements of national pride are not sufficiently formed, their natural inclinations, interests are directed in other directions, they are interested in a completely different field by their nature. Due to this, they are not able to show sufficient results in any area.

High level

Moderate

The experiment was conducted in three stages, the first of which examined the level of pedagogical, psychological and methodological preparation of educators for the formation of elements of national pride in children, the scope and level of children's imagination. Similar developments, methodological materials and instructions were prepared. In the second stage, experimental work was carried out on the formation of elements of national pride in older preschool children. Finally, in the third phase of the experimental work, its results were summarized, analyzed, and processed into a specific order.

Observations and analysis of the processes showed that most educators lack pedagogical and psychological knowledge and methodological skills, add more elements of play to the lessons, timely encouragement and selection of positive situations in children, rational and appropriate use of favorable conditions. shortcomings have led to the fact that the rate of positive shifts is not high.

Also, in determining the level of formation of elements of national pride through the acquaintance of each child with historical monuments, on the basis of criteria arising from a particular area, children's interests, types of visual activities were carried out. The final results of the experimental work showed the effectiveness of the developed materials, the accuracy of the proposed scientific hypothesis.

In most cases, our educators think about the complexity of the problem of educating elements of national pride in preschool. The study of the situation in practice also shows that the work aimed at building elements of national pride in preschool education institutions is not carried out systematically. The systematic continuation of the work carried out in preschool education institutions has a positive impact on the formation of national pride in children.

Below we present the development of lessons aimed at the formation of elements of national pride in children through historical monuments in the process of preschool education:

Development of a lesson on "Kokaldosh madrasah in Tashkent"

Objective: To bring up children in the spirit of patriotism, to form a sense of pride in the heritage of ancestors, to distinguish the elements of the pattern, to develop children's creativity.

Equipment: Which, glue, colored paper, a picture of Kokaldosh madrasa, a brush.

Beginning of the lesson: After the tutor greets the children, he / she starts by reinforcing the previous lesson:

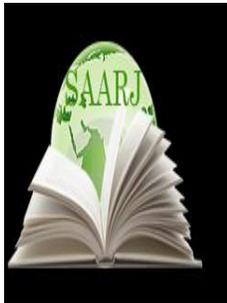

During the trip to Kokaldosh Madrasa, we talked to you about some of the information you learned from your tutor and parents and grandparents.

Educator: "In the middle of the 16th century, the Khoja Ahror madrasa and mosque were built in the south-west of the mosque by a two-storey madrasa of the Tashkent governor, nicknamed Kokaldosh. In terms of its size, colorful patterns and high domes, this madrasah did not lag behind the Samarkand and Bukhara madrasas of that time. The roof of the madrasa is decorated with patterns. Each pattern has a different meaning. Do you remember that we saw patterns in Kokaldosh madrasah reminiscent of cherkhpalak, girih, pepper? Oh who can tell us about these patterns?"

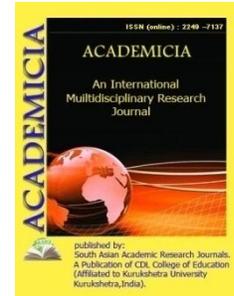

- Children:
- The wheel is a symbol of eternal motion, meaning that the universe is in eternal motion. It also signifies luck, growth, ascension.
- Girih is a type of pattern consisting of the repetition of complex handicraft forms. The basis of the pattern consists of square, triangular, straight rectangular divisions.
- Pepper - protection from various evils, bitter taste.
- Educator: Pepper is also reflected in men's skullcaps. A few peppercorns are hung in a bunch on the top of a pole or on top of a door. The purpose of hanging peppers on a house pole in this way is to protect household members from the evil eye.
- Educator: Now we are going to learn with you how to cut a pattern element reminiscent of the pepper shape used on the roof of this madrasa.
- The educator draws and cuts out a pattern element in the shape of a pepper. The children also cut in a layered way so that a few peppery elements appear. Then in front of each child stands an album sheet with the shape of the front roof of the madrasa. The children place the pattern they cut based on their creativity and glue it neatly. The educator reminds the children of the rules of careful use of glue and scissors. After the children have glued the patterns, the educator examines the patterns they have made, shows the children the types of patterns they have worked on, and encourages the children to work the pattern beautifully (symbolic breastplates can be used to encourage the star, moon, sun, tiger, etc.).
- The session ended as follows.
- "Our ancestors studied in these madrassas and enriched their knowledge. Many scientists have lived and worked in our country. Oh, who knows many proverbs about the homeland, the country?"
- ""Your homeland is your golden cradle", "Loving one's homeland is a believer", "Bulbul loves a chaman, a man loves his homeland", "Be a beggar in your own country until you become a king in another country"
- After the educator encourages the children to take an active part in the lesson, he brings home a picture of historical monuments of our country.
- Ensuring a high level of formation of elements of national pride in older children through historical monuments in preschool education serves to strengthen children's interest in historical monuments, which leads to effective results in the educational process.

REDESIGNING THE INFRASTRUCTURE FOR INCLUSIVE DEVELOPMENT OF DIFFERENTLY-ABLED IMPERATIVES

Jithendran S*

INDIA

ABSTRACT

Quality of life is a function of many intricate factors; to an extent a matter of content, but the disability and related issues in life of disabled remains a puzzle with many exceptional empirical metaphors. A disabled person in developed nations might have far better life than for a normal person in India. It is lack of the opportunities to lead a life of dignity that cripple them. The set back of disabilities is negated by the shelters of an enabling societal atmosphere. It is the Universal access and education that boon them. The state reservation for employment is giving a relaxation on upper age limit also projects a number of issues like working conditions largely viewed as courtesy. The state lacks data on disability inclusion lack of consistency in pursuing policy is yet another drawback of our governance.

KEYWORDS: *Abled, Dispensation, Humane, Orthopedically.*

INTRODUCTION

There are three parallel developments which pulled the media attention recently pointing the rehabilitation of the marginalized sect of differently abled group since the enactment of persons with Disability Act of 1995. This include the increasing awareness regarding the rights of weak, the shift from fittest to humane model of social being and the rise of human rights. The issue has multidimensional implications making it complicated but not socially insignificant. Reckoning four to five percent of any given population as differently abled, the group is an inseparable part of a demographic political entity. Having stated this does not end the obligation of a legislature or executive for that matter. The state has empathetically framed the Act but the implementation and adherence is pending for dispensation on many fronts. The Union Government has conceived the idea of inclusive growth from UN and articulated it to the states. A state, while formulating the vision must decipher the time phased course of action to address this grievous social challenge but one should not be blamed for being skeptic about the real spirits of such initiatives. The provision of public utilities and the equality of using it largely assumed by the

state as its commitment in any civilized society. It is an attempt to delineate the concerns of interested groups in the society. An operational definition of differently abled illustrates the state of physique or mind becoming unreasonable to the social equation while making an interaction.

UN intervention

UN has suggested many developmental models for the developing countries towards inclusive coexistence. But heterogeneous property of the issue makes it really complicated throwing a plethora of challenges in synthesizing the peculiar demands of this marginalized. Reservation to the challenged, exemption of charges in enjoying basic infrastructure is the traditional methods of rehabilitation serve only a feeble portion of this aspect. The very concept of differently abled in post-truth perception need to be reconstructed altogether. A wheel chair or a pair of crutch has become a synonym for differently abled. The spectrum of this population is ranging from visual, hearing, locomotors, autism and could be a portion with all of these. The intention is not certainly for blurring the lines of present demarcation but to provide a basic understanding on the group under spot light. Notwithstanding the above premises, UN has been on regular basis conducted exploratory researches on the implications of disability inclusion in all the outfits of social life. The results of these studies are in the form of published works. Many member countries however, lack the institutional logistic support for taking the suggested initiatives. But India, for no reasons can hold such lame excuses any more.

Quality of life is a function of many intricate factors; to an extent a matter of content, but the disability and related issues in life of disabled remains a puzzle with many exceptional empirical metaphors. A disabled person in developed nations might have far better life than for a normal person in India. It is lack of the opportunities to lead a life of dignity that cripple them. The set back of disabilities is negated by the shelters of an enabling societal atmosphere. It is the Universal access and education that boon them. Chunk of the blame come from existing system that denies them the physical access to the workplaces, public places etc. due to lack of conducive environment. It is lack of equal opportunities that they are treated as liability to the rest, but indeed they are assets to the nation provided with enabling atmosphere.

Role of infrastructure and differently abled

India has ratified the UN Convention on Rights of Persons with Disabilities. It requires the nations which are party to the treaty, to provide an enabling atmosphere so that disabled enjoy the status as full and equal members of the society with human rights. It enjoins the states to provide disabled friendly voting machines for their right to vote, to promote good standards of living through access to poverty reduction programs, with right to health, education and work without discrimination based on disability. It prohibits compulsory sterilization of disabled persons and their right to adopt children. It is also gender sensitive. India, though a signatory in the treaty cannot change the situations even after two decades. The elderly persons too are affected in the bus stations, railway stations, banks, and at other social utility terminals. Differently abled individuals and the elderly deserve to enjoy quality life in a comfortable home. “The home’s layout should be designed keeping their needs in mind. The offices should not have any obstructions that hinder free movement,” points out Dr Ajay Monga, professor of architecture, DCR University of Science and Technology, Murthal, Haryana. “To reduce the need for bending and reaching out; opt for cupboards and shelves with slide-out storage. Toilets can be replaced with special units, or raised seats can be installed,” he suggests. In housing

societies, people with disabilities should be allotted parking spaces that are convenient. “Elevators, recreational spaces and other amenities, like swimming pools, club offices, banquet halls etc., should be accessible to people with special needs and disabilities,” adds Ray. Most importantly, to provide accessible solutions, the changes in housing colonies should be incorporated in a planned way, through proper guidance and conformity of standards. However, the discussions should not limit the orthopedically handicapped, the demands from other strata of differently abled are numerous. Well-lit area, sign boards, and block legible letters are just few among them. But the inevitable changes should be creatively innovated and extended to the disposal of the challenged.

Importance of Research input

The quality of research in India in this domain is not contributing any good. On the other hand it is quite promising in western world. Some of the research observations in the field of studies on inclusion published in other countries

..... In today’s environment of budget reductions and increased public scrutiny of educational and governmental institutions (Arimoto and Sato 2012), entomologists face diverse accountability, behavioral, and social challenges in addition to the ongoing scientific challenges of their research. One approach to address these diverse challenges is to build teams that combine talents of individuals with correspondingly diverse backgrounds (Jablokow 2005)

13 per cent of persons of typical working age in the U.S. (National Science Foundation 2009) self-identify as having a disability or as “differently abled,” including increasing numbers of veterans (Duerstock et al. 2014).

The adaptability and strong work ethics of veterans and persons with visual and other disabilities are well known (e.g., <http://tinyurl.com/o2fxolk>, <http://tinyurl.com/nz98hp6>). Governments across the breadth and width of the globe invest millions of dollars in many researches for various reasons. Very few of them bring vital solutions to any real issue having social values(?). It is a felt imperative that every state should facilitate research in the area of designing the infrastructure both hard soft. Many NGOs are giving incredible services in this regard. But elsewhere, for instance in US and Europe there is a devoted system of research in exploring the data on disability, among disabled how much constitute visually impaired and what is their morale? How does it differ from other employees? US Chamber of Commerce has issued a paper on the topic disability inclusion by the corporate and various programs on recruiting, training and developing disabled work force. This is also a part of redesigning the infrastructure. The developed countries are advanced far in terms of inputs from research for policy formulation and execution.

Social audit

In India, after decades of legislation, it is high time to propose a social audit to see the impact of PWD Act. To the surprise and dismay the number of students at school for the disabled is still at high toll, but the number at higher education is not representing the population. The million dollar question is where do these people disappear? Many of the differently abled students are either drop studies or are locked at their residence. The reasons are hinting the effectiveness of our state programs. It can even be possible that as the kids grew up they are failing grossly in withstanding the pressure of higher education. It certainly shows the missing aspects of this glaring chasm.

There are writers, social scientist and NGOs are working on various issues of this phantom issue. The state should seriously think on this aspect by synthesizing major think tanks for reasons and keep a close surveillance on the statistics. Right now, there are very less evidences on coordinated initiatives by the state and centre to map the directions of the indices.

All governments are reducing the budget for education and development of ethnically vulnerable sections of the society. The state reservation for employment is giving a relaxation on upper age limit also projects a number of issues like working conditions largely viewed as courtesy. The state lacks data on disability inclusion lack of consistency in pursuing policy is yet another drawback of our governance. No doubt, this will inadvertently invite redundancy of resources. To comply with the procedural aspects, organizations may include certain skin deep changes in the structure of every physical outfit. Without proper planning on the real need analysis of users' in question, the real inclusion will remain a far cry. For instance in a college in connection to NAAC visit the authority will construct a make-shift ramp at the main gate, but the classes are conducted in all the floors . How does it help the differently abled. Inadequacy of lightings is a common concern for all the visually impaired. It is causing many accidents for disabled and elderly persons. Lack of sign boards (at least) is a reason for people who are hard of hearing. If the state is reluctant in first conducting research (honest), second making use of such data for policy formulation along with willful measures on redesigning the public utilities to assimilate the demands of disabled. The words like aloof, wean, seclusion will take over inclusion.

DISTRIBUTION OF TRAINING LOADS AT THE STAGE OF COMPETITIVE PREPARATION FOR MIDDLE RUNNERS

Rakhmonov Rauf Rasulovich*

*Senior Lecturer,

Department of Physical Culture and sports at the Faculty of Bukhara State University,
 Bukhara, UZBEKISTAN

ABSTRACT

It is proposed to distribute the training load during the annual period of training as follows, during which it is necessary to "collect" as much load as possible during the training period or to reduce the load during the competition and increase the intensity, at the expense of participation in competitions. It is proposed to distribute the training load during the annual period of training as follows, during which it is necessary to "collect" as much load as possible during the training period or to reduce the load during the competition and increase the intensity, at the expense of participation in competitions.

KEYWORDS: *Harmoniously, Didactically, Training, Resolutions, Glorifying.*

INTRODUCTION

Due to independence, special attention is paid to the development of physical culture and sports in our country. This attention also serves as a guarantee of sports performance, but also the formation of the nation's gene pool and upbringing of a harmoniously developed generation, physical culture and sports on the basis of decrees and resolutions adopted by the President and the Government. Yesterday's young athletes are taking the podium not only in Uzbek sports, but also in the Olympic Games, world and Asian championships, glorifying our country in the eyes of the world community.

But just as the "wheel" of progress cannot be stopped, so can the results of sports. Therefore, it will be necessary to form and improve the system and methods of training competitive athletes, to create and use innovative technologies. These problems, in turn, emphasize the importance of training highly qualified personnel in the field, the organization of training and competition on a scientific basis, expanding the scope of training talented athletes.

Of course, in recent years, a number of scientific institutions have begun to conduct valuable research in this area [12,13,15].

However, the quality and effectiveness of trainings in local sports schools, sports clubs, competitions organized at the district, city and regional levels is not enough. In particular, despite the fact that athletics, which has long been included in the program of the Olympic Games, is part of all regular competitions in the country, in particular, Umid Nihollari, Barkamol Avlod, Universidad, there are still world-class masters of this sport. not grown.

The results of pedagogical observations and statistical data and scientific research [1,2] show that in secondary schools, AL, KHKs and even in the branches of athletics clubs in higher education institutions, certain types of this sport (short, medium and long distance runners, length and height) jumpers, spears, hammers and discus throwers, etc.). Classes are not didactically based on the periodicity of multi-year sports training, differentiated methods and tools. This problem is especially relevant to the training process of athletes who run medium distances. If the content, scope, intensity and direction of training in the general and special physical training stages of athletes in the training and development groups of this specialty in athletics are recognized as relatively expedient, the pre-competition stage of training is not formed at the level of modern requirements.

Therefore, today the issue of preparing middle-distance runners for competitions in the conditions of higher and secondary special education institutions as a scientific object is of great theoretical and practical importance.

The purpose of the study: to develop and scientifically substantiate the program of preparation of middle-distance runners for competitions during the academic year.

Research tasks:

1. To study the training cycle used in the pre-competition training phase of athletes running 800 m.
2. Develop a pre-competition training program for middle-distance runners that is inseparable from the curriculum and determine its effectiveness on the basis of pedagogical experience.

The object and subject of research: the methodology of preparation and application of pre-competition training in the preparation of athletes for the middle distance, taking into account the theoretical and practical training in the curriculum of the sports school, adapted to the annual training load of athletes.

The distribution of training loads is an important issue in deciding the training cycle planning.

Leading experts [4, 6,11] suggest the following approach: the distribution of loads is carried out on a weekly basis for the four stages of preparation (each of these stages has a definite number of preparation weeks). Each period is given a general direction in the distribution of loads. For example, during the training period (autumn-winter) the total volume of loads should increase and the intensity should decrease, while during the competition period, on the contrary, the total volume of loads should decrease and the intensity should increase.

Detailed control of training loads, calculation of applied training methods and control of them at different stages of training will allow increasing sports results.

Thus, in fact, all the loads of the runner are focused on the development of various physiological factors and mechanisms that provide energy to the body, and are evaluated and distributed based on the concepts of total volume and overall intensity.

According to the scholars [18,19], they link the distribution of training loads to the preparation periods, relying on concepts such as 'cumulative result', 'delayed information result' and 'perception of physical qualities'. The first concept is based on the effective effect of the athlete's speed on the performance and the ability to maintain this effect for a long time, and on the other hand, the generalization of the effect of long-term training, which focuses on the development of various physical qualities over time. In this case, the different physical qualities are based on the exact order of the training sequence, and the training periods are based on the duration.

It is proposed to distribute the training load during the annual period of training as follows, during which it is necessary to "collect" as much load as possible during the training period or to reduce the load during the competition and increase the intensity, at the expense of participation in competitions.

The training of athletes running medium distances [20] is divided into nine stages, and for each stage the loads and the main means of training are distributed.

1. Attractive.

Loads: strengthening the musculoskeletal system and musculoskeletal system, preparing for work the leading functions of the body.

Tools: jumping exercises, stationary exercises, speed-strength exercises of a movement nature, aerobic running (YUQS 150-160 zar / min).

2. The first main stage.

Downloads: improving aerobic results, developing leg muscles to maximum strength, training the ability to move at speed while running.

Equipment: aerobic mode (UPS 150-160 rpm), sand and uphill running (distances of 0.5-2 km), jumping exercises.

3. Winter pre-competition stage.

Loads: special endurance training, improvement of technique to maintain the achieved level of strength, running speed and tactics.

Means: re-running (at distances of 200 m and above), jumping, anaerobic races.

4. Winter competition stage.

Downloads: to achieve a high level of special working ability, to use the accumulated capabilities, to improve anaerobic mechanisms, to cultivate a sense of speed.

Means: anaerobic mode (40-50 min.), Restorative running (6-8 km), high speed running (100-200 m).

5. The second main stage.

The loads and tools are the same as in the first main period, but the intensity of the exercises is higher.

6. Summer pre-competition stage.

Downloads and tools are the same as in the pre-winter stage.

7-8. the first and second stages of the race.

Downloads: to create the most convenient training cycle, to achieve a high level of special work ability, to improve technical and tactical skills.

9. Transition (recovery) period At this stage, various forms of good rest are the main means.

Scientific research on other sports has taken a different approach to the distribution of training facilities. VN Platonov [23] believes that the training practice of highly qualified swimmers convincingly demonstrates the possibility of varying the training cycle throughout the year [7,8] suggest a planning model for endurance (medium and long distance) tour groups of the sport; this model shows that the preparatory loads consist of the following sequence: 1 total endurance; 2 speed; 3 fast endurance. The whole cycle of training is aimed at the systematic development of strength and speed endurance for the responsible stages of the race. At the same time, they suggested the use of strength-building exercises for training periods.

The main [14] distribute the loads over the entire speed range. Here, medium and long distance runners are used as the main engine load. In the study, it was stated that the load distribution depends on the skill level of the runner. In the training of highly qualified "mid-distance" the main focus is on the speed-power base, on the basis of which the aerobic productivity of the organism is increased. For the rest of the runners, it is advisable to increase aerobic capacity in the first stages of the training period. [27] suggests the preservation of its specificity when planning training loads at different stages of training, i.e. the development of the body's systems and functions in ensuring sports results.

It should be noted the following:

a) most experts associate the distribution of training loads with preparation periods, but as we have mentioned, views on the distribution of training loads are as different as views on the distribution of training loads;

b) The theory of periodicity, which allows the distribution of training loads, is given very nicely, but unfortunately, its rules have not been confirmed in practice or practice.

When running a distance of 800 m, especially in the training of athletes aged 14-16, the main indicators of training loads are their size and intensity.

Two initial levels of lactate accumulation have been identified, which characterize the beginning and end of the aerobic-anaerobic regime zone. Typically, aerobic onset is detected closer to the end of the aerobic-anaerobic regime zone.

**TABLE 1 AEROBIC-ANAEROBIC TRANSITION PHASES AND THEIR
PHYSIOLOGICAL CHARACTERISTICS
(F.P. Suslov, 1986)**

Indicators Aerobic-anaerobic transition phases I II III	Indicators Aerobic-anaerobic transition phases		
	I II III	I II III	I II III
Start type Aerobic start Anaerobic start	Start type Aerobic start	Start type Aerobic start Anaerobic start	Start type Aerobic start Anaerobic start
Metabolism type Aerob Aerob-anaerobic Anaerobic			
Energy nutrient medium Fatty acids Fatty acids, glycogen Glycogen, fatty acids	Energy nutrient medium Fatty acids Fatty acids, glycogen Glycogen, fatty acids	Energy nutrient medium Fatty acids Fatty acids, glycogen Glycogen, fatty acids	Energy nutrient medium Fatty acids Fatty acids, glycogen Glycogen, fatty acids
% <40 40-80> 85 from MKO			
% Of loss <65 65-90> 90			
Lactate concentration, mol / l			

The effectiveness of downloads depends on its size. Approximately the same results can be achieved when running long distances at low speeds or when running short distances at high speeds.

**TABLE 2 ACCORDING TO F.P. SUSLOV IN 1986 THE YQS DEPENDS ON THE
INTENSITY OF THE LOADS AND THE EXPERIENCE OF THE RUNNERS**

Intensity zones 1st 2nd 2nd 3rd 4th Aerobic zone Anaerobic zone	Intensity zones			
	1st 2nd 2nd 3rd 4th	2-чи	3-чи	4-чи
	Aerobic zone Anaerobic zone	Анаэроб зона		
Long-distance runners and medium-distance runners 126-138	Long-distance runners and medium-	138-150 (23-25)	150-162 (25-27)	162-174 (27-29)

	distance runners 126-138			
(21-23) 138-150	(21-23) 138-150	144-156 (24-26)	156-168 (26-28)	168-180 (28-30)
(23-25) 150-162	(23-25) 150-162	150-162 (25-27)	162-174 (27-29)	174-186 (29-31)

With this in mind, load volumes are recommended for different intensity zones, taking into account the athlete's age, experience, and specialization. There is no mention of the volume of loads in the 1st zone of intensity, as it is the training cycle, the micro-mesocycle, as well as

The factors reflected in Table 3 depend on the objectives.

TABLE 3 VOLUME OF TRAINING LOADS FOR DIFFERENT ZONES OF INTENSITY (ACCORDING TO T.BARACHINSKY, 1989)

Exercise category Intensity zones 2nd 3rd 4th Aerob Anaerobic zone	Exercise category Intensity zones			
	2nd 4th	3rd	3-чи	4-чи
	Aerob Anaerobic zone		Анаэроб зона	
Qualified runners for medium and long distances 20	Qualified runners for medium and long distances 20	16 (60)	11 (40)	
(80) 16	(80) 16	12 (45)	8 (30)	
(60) 11	(60) 11	9 (35)	6 (20)	
(40)	(40)	6 (25)	3 (12)	
Qualified runners aged 14-16 for medium and long distances 15				

It gives the upper limits of training loads. It is necessary to take into account the training stage of the runner, the current level of his ability to work, training tasks and a number of other factors. Exercises with limited volumes, especially in zones 3-4 of intensity, have a strong effect on the athlete and cause deep damage to the homeostasis of the organism. Full recovery takes 48-72 hours or more. Therefore, training in zones 3-4 of intensity should not be more than two to three times a week in adults and once or twice in athletes aged 14-16 years.

The initial speed of running is a clear indicator in assessing the level of endurance [5].

Based on the size of this indicator, a classification of endurance levels was developed, according to which non-trained individuals ran at an anaerobic start speed of 3.0-0.5 m / s, idle individuals at 3.5-4.0 m / s, highly qualified athletes at 5, They reach 3-5.6 m / s.

Several attempts have been made to develop approximate methods for estimating the overall intensity of periodic loads used in training sessions. In recent years, German scientists have proposed a complex indicator, which consists of an increase in the speed of movement and the volume of training. The author [14] proposed a similar method, the only difference being that the volume is multiplied not by speed but by a conditional coefficient that takes into account the difficulty in performing the exercise. Scientists [26] have suggested that in the classification of running loads, exercise work has been shown to increase growth rates with age, with 3 modes of energy supply: aerobic, mixed, and anaerobic.

For I and II category athletes [17], the following volumes of annual intensity zones are recommended: The weekly volume of aerobic exercise load in preparation for the competition period is 235–420 min. changed around. Recommended distribution of exercise loads: 67% of aerobic capacity, 20% of mixed, 13% of more anaerobic capacity. The most important challenge in preparing 14-16-year-old athletes for race activities for medium distances is to plan and schedule individual training sessions on the micro and mesocycles of the MOT phase, which allows for a reasonable distribution of training loads after each individual load.

Knowing the recovery periods after each workout in this or that direction will allow athletes of this age to avoid overloading and preventing athletes from overtraining at this crucial stage of training.

A different approach, i.e. the author of the complex lesson, is A. Lidyard [16]. He proposes to harden all the systems and functions of the body in one microcycle, and these systems and functions ensure the growth of sports results, but one direction is used in each exercise.

Here is an example of a microcycle plan:

Monday: 1/4 force 2x880 yards, 1/3 force 1 mile.

Tuesday: 1/2 force 2 miles.

Wednesday: 1/2 power 6x880 yards.

Saturday: 1/2 power 20x220 yards.

Sunday: Long run.

The authors [21,22] suggest the use of exercises in different directions in a single training session in swimming. This approach was proposed by AM Yakimov [27] in the training of athletes running medium and long distances. The main method of planning he uses is tentative plans.

In addition to general recommendations, many recommendations can be found in the scientific and methodological literature, including reference volumes and approximate plans for training [14]. The work can be divided into three speeds used in the training of runners for medium distances:

1. The speed needed to keep the desired running speed at a steady pace while running over most of the distance. This speed is directly related to its ability to withstand large oxygen debt.
2. Apply tactics in the cycle of tactical struggle with opponents by "accelerating" speed or correct distribution of distance.
3. The speed of moving forward at the finish line.

At the same time, examples from special work are given, in which the ability to withstand the oxygen debt caused by high-speed running is improved. These exercises consist of a series of small repetitions of small distances, which again includes a very long rest interval between repetitions.

Scientists from around the world who have worked on several medium distances have analyzed the data in their research as follows.

Leading scientists [7,8] have suggested that a 15x400 m workout (running 200 m at a stop at a stop) would be more rewarding if the three series ran from 5x400 m, running at a steady pace at stops between 200 m runs, and 400 m between series. .

In his work, he revealed some training secrets of Moroccan runners [24]. This was done by D. Dionysi, a coach who works with runners in Morocco. The November-December workouts focus on developing the highest aerobic capacity, usually in the form of running between 1,000 and 400 m. For example, the rest between repetitions of 2-5x1000 m is 1: 30.0 s. with a rest interval of 3: 00.0 and a rest interval between 25x400 repetitions of 40-60 s. will be. Accelerated uphill running range will be repeated for 150 m to develop strength capabilities and improve running technique, as well as continuous running in the aerobic direction.

According to F.P. Suslov [25], we can see the specific preparation in the training of the Ethiopian S. Auita on running on the border of aerobic and anaerobic cycles. He believes that maintaining high speeds over distances cultivates complex abilities. S.Auita conducted aerobic and anaerobic training in the following ways:

- 300 m. - 38.8 rest - 1: 57.0; 600 m - 1: 23.4, rest - 3: 55.0;
- 200 m - 24.3 rest - 1.56; 400 m - 52.9, rest - 3: 51.0;
- 800 m - 1: 57.6 rest - 3:54; 400 m - 54.5, rest - 6 s; 300 m-40.1.

Research has shown that doing a sufficiently large amount of work at a rate that exceeds the race speed in the run-up to the race has a negative impact on the outcome. [9,10] has shown that a simultaneous increase in volume and intensity when running short distances in the direct preparation phase of a middle-distance runner does not help to increase the outcome of the main sport, but in some cases leads to deterioration. Researchers have also shown that only increasing size or intensity has a positive effect on athletic performance.

The establishment of a micro cycle system in the MOT phase depends on three very important cycles:

- The interaction of fatigue and recovery cycles and the order of exchange of relatively high and low loads with rest;
- The need to re-apply the exercises in different directions, which are interrelated;
- General order.

According to A.F. Boyko [3], in medium-distance runners it is preferable to teach the methodological and biological expediency of the distribution of loads in days, rather than quantifying the amount of work done in the planning of training loads in stages. When tired of strength training, special-strength exercises are removed from training 7-12 days before the start of competitions and can be included in pre-competition writing exercises. In addition, the author

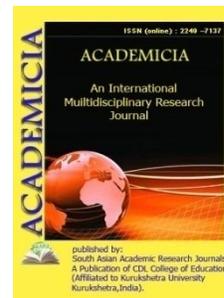

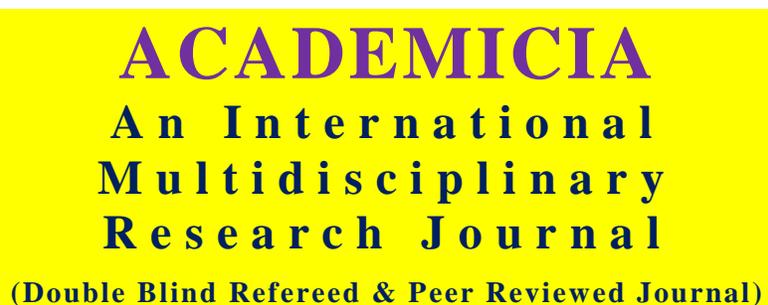

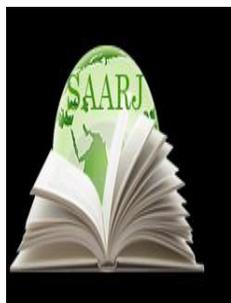

believes that in order to restore the strength of the leg muscles and increase their tone, it is necessary to shorten the running regimen for the next 7-10 days and include daily jumping exercises.

In short, imagining which zone the 800-meter run belongs to, its physiological characteristics, plays an important role in the correct choice of tools and methods in preparing 14-16-year-old athletes for the main starts of the season.
