ABSTRACT

This study examined the assessment of training methods and techniques of Government Craft Development Centres, with Government Craft Development Centre, Port Harcourt, Rivers State, Nigeria as a case study. The population of the study consisted of all the vocational training programmes teachers and students of Government Craft Development Centres in Rivers State, Nigeria. A survey design was used for the study. The random sampling technique was employed for the study with 156 respondents. The research instrument used for the study was a questionnaire with 20 structured items was the major tool for data collection, aimed at eliciting information to answer the research questions. Mean and grand mean was used as a statistical tool to answer the research questions. T-test statistics at 0.05 level of significance was used to test the hypotheses. The results of the findings among others show that the application of the various training methods and techniques do not relate to the needs of the students. And this is as a result of several factors which include lack of relevant qualifications and experience of the teachers, inadequate motivation and remuneration of teachers, inadequate facilities for learning, as well as poor government funding policies for vocational training programmes. Based on the findings, some recommendations were made towards making the application of the various training methods and techniques relate to the needs of the students.

INTRODUCTION

Technology instruction is concerned with the use of appropriate strategies to impart knowledge about technological concepts and skills to individuals (Akaninwor, 2000). In fulfilling this, the teacher's ability to attract and hold the interest and the cooperation of the students is a necessarily ingredient. An effective teacher therefore should possess certain qualities needed to influence the students In order for them to react favourably to instruction. According to Okwelle (2010) they include the following:

- (i) Possessing mastery of both knowledge and skill of the trade
- ii) Mastery of application of various teaching techniques and materials
- iii) Initiative, imaginative and resourceful ability in doing the best with what is available
- iv) Fairness and impartiality to every student as well as exhibiting mature mind and self-control on issues
- v) Patience and sympathetic to students and encouragement to students with learning difficulties
- vi) Friendly and having a sense of humor but firm and forceful to gain respect, from students.
- vii) Personal appearance and setting example in speech
- viii) Confidence and sincerity and orderliness always

The teacher should bear in mind that skills development of the learner is the main emphasis in vocational education, as such, should use all appropriate teaching methods and techniques to meet, the demand of the practical requirements necessary vocational education programmes. The teacher must strengthen his knowledge and skill in the subject matter as well as consider way the desired knowledge and skill will be imparted to the learner. This he does by selecting the most appropriate teaching methods and techniques as well as relevant Instructional materials applicable to the topic to be taught (Ballou & Podgursky, 2002). Teaching is a skill because knowledge alone is not sufficient. Teachers need to know how to effectively apply instructional strategies to their own unique classroom (Haig, Konigsberg & Collard, 2005). Teachers who are skilled in learning principles and have experience with theories about student-centred learning and constructivism are more likely to adopt student-centred instruction (Stiff-Gohdes, 2003). These teachers have broad views of how teaching can occur and strong beliefs about the need to engage learners in the learning process (Brown, 2003). They are aware of the changing demographics of classrooms and the influence of technology on students' ways of learning (Glenn, 2000). They are more likely to substitute self-directed learning opportunities and interactive learning environments for the traditional lecture and make use of varied techniques to create personally meaningful educational experiences which they function as facilitators of learning (Nuckies, 2000) and (Glenn, 2000).

Teachers who desire to be more students-centred must be aware of the kinds of learning experiences that students most value, as they may differ depending on the learners' particular

stages of development, age, and gender (Brown, 2003). This is in line with findings of Kizlik (2010), that whichever instructional method is “right for a particular lesson depends on many factors, and among them are the age and developmental level of the students, what the students already know, and what they need to know to succeed with the lesson, the subject matter content, the objective of the lesson, the available people, time, space and material resources, and the physical setting.

Pratt (2002) presents five perspectives on teaching and urges teachers to use these perspectives to identify, articulate, and justify their approaches in teaching rather than simply adopting one practice or another. The perspectives are:

- 1 Transmission: Teachers focus on content and determine what students should learn and how they should learn it.
- 2 Developmental: Teachers value students’ prior knowledge and direct students learning to the development of increasingly complex ways of reasoning and problem solving.
- 3 Apprenticeship: Teachers provide students with authentic tasks in real work settings.
4. Nurturing: Teachers focus on the interpersonal elements of student learning and listening, getting to know students, and responding to students’ emotional and intellectual needs.
5. Social Reform: Teachers tend to relate ideas explicitly to the lives of the students.

In the views of Pratt (2002), most teachers have only one or two perspectives as their dominant view of teaching. However, similar actions, intentions and even beliefs can be found in more than one perspective.

Any instructional method a teacher uses has advantages and disadvantages, and requires some preliminary preparation. Often times, a particular teaching method will naturally flow into another, all within the same lesson, and excellent teachers have developed the skills to make the process seamless to the students.

In selecting instructional methods that is most appropriate for particular lesson situation, the teacher must bear in mind that there is no one “right” method for teaching a particular lesson, but that there are certain criteria that must be adopted in order to assist him/her make the best decision possible (Kizlik, 2010). An efficient and effective teacher should know that in every class, there are different categories of students in the learning environment with different perceptions, previous knowledge, attitudes and learning styles. It is therefore the responsibility of the teacher to make use of a variety of instructional approaches to ensure that all types of students and their various needs are being met. Teaching methods may need to be modified to meet the needs of a majority of the students with individual attention given to students that have problems with learning the material (Greer, 2005). Since the development of the learner is more emphasized in vocational education, it is therefore pertinent that the teacher selects appropriate techniques and materials to meet the demand of the practical requirements of vocational training programmes.

STATEMENT OF THE PROBLEM

According to Akaninwor (2000), technological instruction is concerned with the use of appropriate strategies to impart knowledge about technological concepts and skills to individuals. To this end, there is need for the vocational teacher to select and use training methods that will

promote skills acquisition. In spite of the importance of vocational education to the development of the society, and the emerging number of researchers in the field who have contributed immensely to the development and improvement of the vocational training programme, there is still high level of students with inadequate skills. This poses serious concern to researchers, industries, government and parents. It is in the light of the above that the research became imperative in the mind of the researchers and hence embarked upon to ascertain the level of application of the appropriate training methods and techniques by teachers and instructors of Government Craft Development Centres in Rivers State and possible factors impeding the application of the training methods and techniques and how such factors may be remedied.

PURPOSE OF THE STUDY

The main purpose of the study was to ascertain the assessment of training methods and techniques in vocational training programmes of Government Craft Development Centres in Rivers State. In order to achieve this, the specific purposes of the study are to:

- i) Ascertain, the level of application of training methods and techniques in vocational training programmes.
- ii) Find out if teachers' factors affect the effective application of training methods and techniques in vocational training programmes.
- iii) Examine the extent of students' participation in the utilization of training methods and techniques in vocational training programmes.
- iv) Ascertain if the learning environment affects the effective utilization of training methods and techniques in vocational training programmes.
- v) Determine if inadequate funding affects the effective utilization of training methods and techniques in in vocational training programmes.

RESEARCH QUESTIONS

Based on the above stated problems, the following research questions acted as guide to the study:

- 1) What training methods and techniques available in vocational education are applied in the acquisition and development of students' skills in all Government Craft Development Centres in Rivers State, Nigeria?
- 2) What teacher factor affects the effective application of training methods and techniques in vocational training programmes of Government Craft Development Centres in Rivers State, Nigeria?
- 3) To what extent does students' participation affect the application of training methods and techniques in vocational training programme of Government Craft Development Centres in Rivers State, Nigeria?
- 4) What facility factors affect the effective application of training methods and techniques in vocational training programmes of Government Craft Development Centres in Rivers State, Nigeria?

5) What funding factors affect the effective application of training methods and techniques in vocational training programmes of Government Craft Development Centres in Rivers State, Nigeria?

RESEARCH HYPOTHESES OF THE STUDY

The following hypotheses were formulated to facilitate the investigation of the problem of this study:

- 1) The availability of training methods and techniques makes no significant difference between the effective application of the training methods and techniques and students skills acquisition and development.
- 2) Teachers' factors make no significant difference in the application of training methods and techniques in the vocational training programme of Government Craft Development Centres in Rivers State, Nigeria.
3. There is no significant difference in the means responses of the respondents between the effective application of training methods and techniques and students instructional participation.
4. Facilities factor makes no significant difference in the effective instructional delivery in the vocational training programme of Government Craft Development Centres in Rivers State, Nigeria.
5. Funding factor of vocational training programmes makes no significant difference on teachers' active participation in the instructional process.

SIGNIFICANCE OF THE STUDY

The results of this research shall be of immense benefit to the vocational teacher and the student in determining the adoptability of a programme based on students' backgrounds and various environmental conditions. This research shall also assist the government to carefully plan and systematically apply relevant policies that will enhance adequate funding of vocational education programmes. Furthermore, the result of this research could assist educators and industry representatives to co-operatively determine performance measures of the students and improve instructional presentation.

SCOPE OF THE STUDY

The study was restricted to the following variables:

- 1) The teacher as a facilitator and the instructor of skills.
- 2) Teacher's qualification and preparedness.
- 3) Utilization of training methods and techniques.
- 4) Poor trainee participation in instructional process.
- 5) The environment as a factor for quality service delivery in the instructional process
- 6) Poor government's implementation of policies as it affects funding of vocational training programmes.

RESEARCH METHODOLOGY

The population of this study comprises of all teachers and students of Government Craft Development Centre, Aba Road, Port Harcourt, Rivers State. The respondents consist of one hundred and fifty six (156) respondents, comprising 26 teachers and 130 students of Government Craft Development Centre, Port Harcourt, Rivers State settled through simple random sampling method.

The study relied on both secondary and primary data sources. Secondary sources comprises of journals, books, reports as well as internet. The key primary data gathering instrument was a questionnaire developed by the researchers to elicit information on the assessment of training methods and techniques in Government Craft Development Centres in Rivers State, Nigeria. The instrument was validated and its reliability coefficient established at 0.89 using Spearman Rank Order Method, which was considered adequate for the study. The questionnaire contained 20 structured items that were carefully and articulately framed and administered face to face to respondents bearing in mind that the responses so desired form the nucleus of the study. The design of the questionnaire was based on the research questions and the hypotheses raised in this study.

The data generated from the use of the structured questionnaire were analyzed using the mean and grand mean. The average scores of the mean responses of the teachers and the students formed the grand mean. However, each of the hypotheses was tested using t-test statistics at 0.05 level of significance. If the calculated t-value is less than the critical table value, then there is no statistical significant difference between mean scores of both groups. Hence the stated null hypotheses is therefore accepted. And if the calculated t-value is higher than the critical table value, then, there is statistical significant difference between mean scores of both groups. Hence the stated null hypotheses is therefore rejected.

RESULT OF THE STUDY

Research Question 1

What training methods and techniques available in vocational education are applied in the acquisition and development of students' skills in Government Craft Development Centres of Rivers State?

TABLE 1: STATISTICAL ANALYSIS OF TRAINING FACTORS AND STUDENTS' ACQUISITION SKILLS OF GOVERNMENT CRAFT DEVELOPMENT CENTRES

S/N	Items	Teachers' Mean Response (TMR)	Students' Mean Response (SMR)	Grand Mean Response (GMR)	Decision
1	The teacher applies the Co-operative, discovery, demonstration, team teaching, and programmed methods during instruction.	2.62	2.00	2.31	Not Applicable
2	The training methods applied relate directly to the needs of	2.61	2.13	2.37	Not Applicable

	the students				
3	Students discover new approaches and solutions to problems during instruction by apply lecture methods only	2.54	1.94	2.24	Not Applicable
4	The students do not discover needed skills and creativity when the various training methods such as co-operative, field-trip, team teaching methods, are applied during instruction.	2.00	1.76	1.88	Not Applicable

Source: Field Survey, 2012

Where:

TMR = Teachers' Mean Response

SMR = Students' Mean Response

GMR =Grand Mean Response

From Table 1 above, the results indicates that teachers do not apply cooperative, discovery, demonstration and team teaching methods with (GMR=2.31), training methods applied do not relate directly to the needs of the students with (GMR=2.37), students do not discover approaches to new methods with (GMR=2.24), and students do not discover areas of new skills and creativity with (GMR=1.88). This implies that students do not acquire the needed training skills as specified in the curriculum.

Research Question 2:

What teacher factor affects the effective application of training methods and techniques in vocational training programmes of Government Craft Development Centres in Rivers State?

TABLE 2: STATISTICAL ANALYSIS OF TEACHER FACTORS AND APPLICATION OF TRAINING METHODS AND TECHNIQUES

S/N	Items	Teachers Mean Response (TMR)	Students Mean Response (SMR)	Grand Mean Response (GMR)	Decision
5	The teacher lacks the needed qualification and experience	2.12	3.33	2.73	Accept
6	There is a communication gap between the teacher and the students	3.04	3.35	3.20	Accept
7	The teachers are not adequately motivated to teach	4.00	3.36	3.68	Accept
8	Teachers are distracted because they are not adequately paid	4.00	3.11	3.56	Accept

Source: Field Survey, 2012

Where:

TMR = Teachers' Mean Response

SMR = Students' Mean Response

GMR = Grand Mean Response

From Table 2 above, the results show that teachers lack the needed qualification and experience as indicated in the grand mean (GMR = 2.73), there is communication gap between the teacher and the students (GMR = 3.20), the teachers are not adequately motivated to teach (GMR = 3.68), teachers are distracted because they are not adequately paid, as indicated in the grand mean (GMR = 3.56).

The analysis in Table 2 implies that the teachers lack the needed qualification and experience. Thereby creating a communication gap between the teacher and the students. It also implies that the teachers are not adequately motivated to teach and are distracted because they are not adequately paid.

Research Question 3:

To what extent does students' participation affect the application of training methods and techniques in vocational training programme of Government Craft Development Centre in Rivers State?

TABLE 3: STATISTICAL ANALYSIS OF STUDENTS' FACTORS AND APPLICATION OF TRAINING METHODS AND TECHNIQUES

S/N	Items	Teachers' Mean Response (TMR)	Students' Mean Response (SMR)	Grand Mean Response (GMR)	Decision
9	Students are always afraid to participate in class because they speak poorly	3.69	3.25	3.47	Accept
10	Students are not given free hand to apply their own creative ideas during instruction	2.39	3.20	2.80	Accept
11	The teacher do not boarder to assess each students' work	2.92	2.89	2.91	Accept
12	Students are not rewarded by teachers when they perform impressively in the class	3.65	3.33	3.49	Accept

Source: Field Survey, 2012

Where:

TMR = Teachers' Mean Response

SMR = Students' Mean Response

GMR =Grand Mean Response

Results from Table, 3 above, indicate that students are always afraid to participate in class because they speak poorly (GMR = 3.47), students are not given free-hand to conduct oral and written discussions (GMR = 2.80); the teacher do not boarder to assess each students' work (GMR = 2.91), the students are not adequately motivated by the teachers, as indicated in the grand mean of (GMR = 3.49).

The analysis in Table 3 therefore, implies that students are scared of participating in class because of their poor language command. Also, the students are not given free-hand to conduct oral and written discussions. The teacher on the other hand do not boarder to assess each students' work, as well as motivate them adequately.

Research Question 4:

What facility factors affect the effective application of training methods and techniques in vocational training programmes of Government Craft Development Centres of Rivers State?

TABLE 4: STATISTICAL ANALYSIS OF FACILITY FACTORS AND APPLICATION OF TRAINING METHODS AND TECHNIQUES

S/N	Items	Teachers Mean Response (TMR)	Students Mean Response (SMR)	Grand Mean Response (GMR)	Decision
13	There are no adequate workshop equipment and tools	4.00	2.99	3.50	Accept
14	Teaching aids are not readily available during classroom instruction.	2.92:	3.19	3.06	Accept
15	Classrooms are not conducive for learning	3.12	2.96	3.04	Accept
16	Textbooks are inadequate in the school library.	3.65	3.20	3.43	Accept

Source: Field Survey, 2012

Where:

TMR Teachers' Mean Response

SMR = Students' Mean Response

GMR =Grand Mean Response

The results from Table 4 show that there are inadequate workshop equipment and tools, as indicated in the grand mean (GMR = 3.50), teaching aids are not readily available during classroom instruction, as shown in the grand mean (GMR = 3.06), classrooms are not conducive for learning, as indicated in the grand (GMR = 3.04), textbooks are inadequate in the school library (GMR= 4.3).

The implication of the analysis in Table 4 above is that there are not adequate workshop equipment and tools, and teaching aids are not readily available during classroom instruction. The classrooms are not even conducive for learning. Moreover, textbooks are inadequate in the school library.

Research Question 5:

What Funding Factors Affect Effective Application of Training Methods and techniques in vocational training programmes of Government Craft Development Centre's in Rivers State?

Funding Factors Affect Effective Application of Training Methods and techniques

S/N	Items	Teachers' Mean Response (TMR)	Students' Mean Response (SMR)	Grand Mean Response (GMR)	Decision
17.	There is inadequate funding for staff training	4.00	3.82	3.91	Accept
18.	The funding policy of Government towards vocational training is poor	3.77	3.29	3.53	Accept
19.	Your school lacks adequate fund to run vocational training programme at present	2.77	2.65	2.77	Accept
20.	The fund made available for your school is well managed but not for any meaningful project execution	3.42	2.77	3.10	Accept

Source: Field survey, 2012

Where:

TMR = Teachers' Mean Response

SMR = Students' Mean Response

GMR = Grand Mean Response

The results from Table 5 reveal that there is inadequate funding for staff training, as displayed in the grand mean response (GMR = 3.91), the funding policy of government towards vocational training is poor, as shown in the grand mean response (GMR = 3.53), there is inadequate funding to run vocational training programmes at present in the school (GMR = 2.77), the fund made available for vocational training programmes is well managed but not adequate for any meaningful project execution as pointed out in the grand mean (GMR = 3.10). From Table 5 above, the analysis of the result indicates that there is inadequate funding made available for staff

training because the funding policy of government towards vocational training is poor. There is also inadequate fund to run vocational training programmes in the school at present, as a result of that students' enrollment into vocational training programmes at present is low.

Hypothesis 1:

The availability of training methods and techniques makes no significant difference between the effective application of the training methods and techniques and students skills acquisition and development.

TABLE 6: T- TEST STATISTICAL ANALYSIS

Respondent	(X)	SD	N	Df	P	S error	t-cal	t-crit	Decision
STUDENTS	1.96	0.69	130						
				154	0.05	1.96	-0.28	1.960	Accept
TEACHERS	2.44	1.95	26						

Source: Field Survey, 2012

From Table 6 above, the results show that, the calculated value of the t- cal is -0.28, while the critical table value is 1.960 at 154 degree of freedom and at 0.05 level of significance. Since the calculated table value is less than the critical table value, the null hypothesis is therefore accepted.

Hypothesis 2

Teachers' factor makes no significant difference in the application of training methods and techniques in the vocational training programme of Government Craft Development Centres in Rivers State, Nigeria.

TABLE 7: T- TEST STATISTICAL ANALYSIS

Respondent	(X)	SD	N	Df	P	S error	t-cal	t-crit	Decision
STUDENTS	3.28	1.16	130						
				154	0.05	0.53	0.02	1.960	Accept
TEACHERS	3.29	2.63	26						

Source: Field Survey 2012

From Table 7 above, it is observed that the calculated value of the T cal -0.02, while the critical table value is 1.960 at 154 degree of freedom and at 0.05 level of significance. In view of the fact that the calculated value is less than the critical table value, the null hypothesis (Ho) is therefore accepted. This implies that teachers' factor makes no significant difference in the application of training methods and 'techniques in the vocational training programme of Government Craft Development Centres in Rivers State.

Hypotheses 3

There is no significant difference in the mean responses of the respondent between the effective application of training methods/techniques and students' instructional participation.

TABLE 8: T- TEST STATISTICAL ANALYSIS

Respondent	(X)	SD	N	Df	P	S error	t-cal	t-crit	Decision
STUDENTS	3.17	1.12	130						
				154	0.05	0.51	0.02	1.960	Accept
TEACHERS	3.16	2.53	26						

Source: Field Survey 2012

From Table 8 above, it is be observed that the calculated value of the t- cal is 0.02. While the critical table value is 1,960 at 154 degree of freedom and at 0.05 level of significance. From the foregoing, since the calculated value is less than the critical table value, the null hypothesis (Ho) is therefore accepted. The implication of this is that, there is no significant difference in the mean responses of the respondents between the effective application of training methods and techniques' and students' instructional participation.

Hypothesis 4

Facilities factor makes no significant difference in the effective Instrument delivery in the vocational training Programme of Government Craft Development Centres in Rivers State.

TABLE 9: T- TEST STATISTICAL ANALYSIS

Respondent	(X)	SD	N	Df	P	S error	t-cal	t-crit	Decision
STUDENTS	3.09	1.09	130						
				154	0.05	0.29	-1.14	1.960	Accept
TEACHERS	3.42	2.74	26						

Source: Field Survey, 2012

It can be observed from Table 9 that the calculated value of the t- cal is -1.14, while the critical table value is 1.960 at 154 degree of freedom and at 0.05 level of significance. In view of the above, since the calculated value is less that the critical table value, the null hypothesis (H₀) is therefore accepted. The implication of this is that facilities factor makes no significant difference in the effective instructional delivery in the vocational training programme of Government Craft Development Centres in Rivers State.

Hypotheses 5

Funding factor of vocational training programmes makes no significant difference on teachers' active participation in the instructional process.

TABLE 10: T- TEST STATISTICAL ANALYSIS

Respondent	(X)	SD	N	Df	P	S error	t-cal	t-crit	Decision
STUDENTS	3.13	1.10	130						
				154	0.05	0.31	1.16	1.960	Accept
TEACHERS	3.49	2.79	26						

Source: Field Survey 2012

From Table 10 above, it is observed that the calculated value of the t-cal is 1.16, while the critical table value is 1.96 at 154 degree of freedom and at 0.05 level of significance. Since the calculated value is less than the critical table value, as indicated from the table, the null

hypothesis is therefore accepted. This implies that funding factor of vocational training programmes makes no significant difference on teachers' active participation in the instructional process.

CONCLUSION

Human skills development through teaching and learning in the area of technology, requires the needed training equipment, materials, knowledge and facilities. The curriculum of Government Craft Development Centers is prepared solely for skills acquisition in related engineering trades. The application of training methods is only a variable towards the achievement of the philosophical goals or objectives for man power development in Rivers State. From the findings of the study, the achievable goals are below expectations. It is therefore necessary to reactivate the various centers as to meet the current needs of the society.

RECOMMENDATIONS

Based on the findings of the study, the following recommendations are made:

- 1) Teachers of vocational training programmes should be welltrained to meet up with evolving technological changes in order to be prepared to transfer relevant knowledge and skills to the students. To achieve this, teachers' qualifications, experience and the opportunity to improve teaching skills through periodic evaluation of teachers should be the points of focus.
- 2) Students should though be exposed to both the theoretical as well as the practical aspects of every subject in order for them to make rational decisions that will enhance technological advancement. In doing this, they should be adequately motivated in carrying out individual and group assignments and tasks.
- 3) Both the federal and state Governments should as a matter of necessity create conducive atmosphere for teaching and learning by making available functional workshops, laboratories, libraries, equipment, tools classrooms and instructional materials to aid instruction. This will give the students the opportunity to undertake practical tasks which is the major aspect of the training programme.
- 4) Federal Government should ensure that good policies for improvement of vocational education are made. Also, budgetary, allocation for vocational education should be meaningful, considering that the programme is capital intensive and there is no possible short cut for the programme implementation.

UZBEKISTAN

ABSTRACT

The article identifies the low, medium, and high levels of each subject in order to improve teacher competence, and explores the factors that can enhance the quality and effectiveness of teaching using innovative educational approaches through the use of innovative educational technologies.

KEYWORDS: *Education system, technology, teaching methods, innovation, innovative education, innovative approach, innovative educational technologies.*

INTRODUCTION

The Education Law and the National Training Program for the implementation of innovative approaches in the education system determine the level of complexity of topics by the science teacher for the formation of comprehensive knowledge, skills and competencies in the student and the corresponding low, medium and high level of complexity. chooses one of the factors (learning technologies). When organizing the educational process on the basis of such a balance in the education system, an innovative approach is formed that ensures the effectiveness of the educational process and a higher level of knowledge of students. Thus, he gives the young generation deep, thorough knowledge, a high level of thinking, professional skills and abilities capable of analyzing the results of the latest scientific discoveries, the desire to explore new scientific discoveries, the ability to apply the results in practice. , the main task is to prepare qualified, competent and competent teachers who are able to guide students to independent thinking, to interpret the results in an innovative way, to think in a modern way [1,2].

One of the main principles for the implementation of these tasks is the training of highly qualified, competitive specialists to reform the structure and content of the education system, harmonize the activities of educational institutions, introduce advanced pedagogical technologies, pedagogical innovations in the educational process. However, advanced

pedagogical technologies and innovations by themselves are not part of the education system. This is a process that depends on the level of competence of the teacher and his desire for innovations in modern science, as well as high motivational activity [3].

MATERIALS AND METHODS

The goal is to get the most out of the money and effort spent on innovating an education system or learning activity. The difference between innovation and any innovation is that they must have a changing mechanism to manage and control them. The main task of the educational process is the transfer of knowledge, the purpose of which should be subject-oriented, that is, the harmonious development of the student's personality. At the same time, the first competencies of the student are formed by providing the student with comprehensive knowledge, the formation of skills and the formation of new knowledge in exchange for the acquired skills. This leads to a complete mastery of the basics of science by swimmers, the formation of innovative approaches to the education system. As a result, the emerging initial competencies and relationships based on the emerging innovative approach lead to an increase in the level of knowledge of swimmers, as well as to the formation of new relationships, that is, the formation of basic competencies among swimmers, especially communication competencies.

The implementation of innovative approaches in the educational process consists of three-stage approaches (lower, middle and upper levels), it is important to choose the most optimal stage-by-stage approach [4].

It should be noted that a science teacher should be able to choose one of the lower, middle and upper-level approaches in the implementation of innovative approaches, in addition to the appropriate method and means and forms of information and communication technologies when describing the topic of the lesson. It is known from scientific and methodological literature that the effectiveness of traditional teaching methods does not exceed 60-65%. The continuous use of scientific research, innovations, inventions, new non-traditional, interactive, modern educational technologies and information and communication technologies in the educational process to increase the percentage of useful work will lead to a certain level of knowledge. A possible burden is a sudden change in the functioning of the education system to a higher level. For this, the education system must analyze each process and implement innovations in practice based on innovative approaches.

Changes in practice without a deep analysis of the education system can lead not to further improvement of the educational process but to unexpected negative results. Taking this into account, the science of innovative pedagogical pedagogy was formed on the basis of traditional pedagogical science in the world of science and currently plays an important role in improving the education system. This led to the formation of relationships based on an innovative approach to improving the education system, the emergence of intensive and extensive factors.

The intensive factor is based on the internal reserve of the institution in the development of education. An intensive approach is aimed at improving pedagogy, creativity and skills of students, student activity, the educational material base of an educational institution, the use of new pedagogical and innovative educational technologies in the educational process, as well as the use of information and communication technologies and the relationship between teacher and student.

Extensive factors rely on additional efforts (investments) in the development of an educational institution. This factor is developed in Western countries. Additional forces (investments) for the development of an extensive road pedagogical system will be implemented on the basis of new tools, equipment, technologies, capital investments, and financing. They prefer to use new information technology tools, spending excessively on various training activities, stratification and individualization of the learning process. Based on this, they intend to increase the productivity and quality of education.

We know that the formation, development and possible improvement of the educational process depended on the potential, creativity and pedagogical skills of the teacher. This led to an increase in the quality and efficiency of the educational process, an increase in the level of knowledge of students and an improvement in the education system. This means that through the use of innovative educational technologies, both traditional and non-traditional, interactive and modern teaching technologies, it is possible to improve the quality and efficiency of teaching and increase the level of students' knowledge, supporting innovative approaches. At the same time, it is advisable for science to introduce innovations slowly, step by step, reflecting on the benefits of them from an integrated scientific point of view.

The main task in the implementation of the National Program for Personnel Training is to train highly qualified pedagogical workers who can give the younger generation deep, deep knowledge, a broad outlook, possess professional skills, a thirst for creation, search, and application of innovations, teach students to think independently, and carry out innovative activities.

CONCLUSION

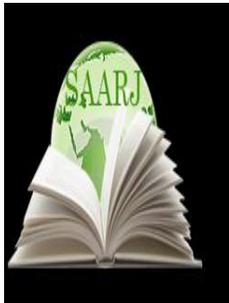

Taking into account the above, we can conclude that in order to organize a meaningful and high-quality learning process in a textbook, it is necessary to prepare a training program enriched with additional materials such as textbooks, manuals, manuals and instructions, mass media and Internet information. Then it is necessary to choose a method corresponding to the content of the topic and use modern information and communication technologies when presenting the topic. It would be advisable to apply an innovative approach based on innovative educational technologies to the methods and means of information and communication technologies used in the educational process.

As a result, the student develops the ability to apply in practice in everyday activities, i.e. levels of competencies, through the formation of deep knowledge, a certain level of skills and the formation of new knowledge in the process of skills. For this, the science teacher determines the level of complexity of the topics and selects one of the factors of low, medium and high complexity (educational technology). If the educational process is organized on the basis of such proportionality, the quality and efficiency of the educational process, as well as the knowledge of students, will be raised to a higher level if the education system uses innovative approaches based on innovative educational technologies.

FROM THE HISTORY OF FOREIGN RELATIONS OF UZBEK THEATERS IN THE YEARS OF INDEPENDENCE

Chorieva Dilorom Abdumuminovna*

*Junior Researcher,
 Center on Contemporary History of Academy of Sciences of Uzbekistan,
 Tashkent, UZBEKISTAN

ABSTRACT

This article reveals the cultural ties of theatre organizations operating in the Republic of Uzbekistan with foreign countries. In particular, the Days of Culture held based on agreements signed between our country and foreign countries, are being held. Also, the participation and achievements of theatre groups in the events held in our country and abroad in the framework of the Days of Culture are covered. It should be noted that the Uzbek theatre community has a great contribution to the promotion of our national cultural heritage abroad.

KEYWORDS: *Days of Culture, Uzbek theatre, national culture, the traditions, International Theater Arts Festival.*

INTRODUCTION

Today, independent Uzbekistan pays special attention to the issues of cooperation, which is one of the traditions of statehood, in determining its path of development. The opinion of the First President of the Republic of Uzbekistan Karimov that "without the past, there is no future, without cooperation, there is no development" [1] is of great importance. In particular, each state develops mutual social, economic and cultural ties in order to meet its different needs for development and progress. It is impossible to develop without cooperation with other countries. International relations also play an important role in the development of the state. One of the urgent tasks of history today is to study the establishment, development and participation of our country in cultural relations, practical cooperation with foreign countries on the basis of equality in the process of global integration.

MAIN FINDINGS AND RESULTS

From the first years of independence of the Republic of Uzbekistan has established international relations with foreign countries. The relations and cooperation of Uzbekistan with foreign countries not only in economic, political but also in cultural, educational, and other spheres have been strengthening year by year. Cultural cooperation between the two countries plays a special role in the agreements reached between the Republic of Uzbekistan and foreign countries. In this regard, the Days of Culture in Uzbekistan and abroad play a special role. Within the framework of the Days of Culture, many scientific, international conferences, festivals, and many other cultural events are held in the field of culture. In particular, theatrical art in the country has received special attention at the level of state policy. Favourable conditions, creative freedom, and wide opportunities have been created in the theatres for the creation of works that can serve the development of the culture of our people, as a result of which theatre groups began to appear on the world stage. He began to participate in international theatre venues. Besides, festivals and events such as "Navruz 92", "Humo-98", "Theater: East and West", "Silk Road" theatre tour serve to establish awareness of the news and achievements of theatrical art of the peoples of the world, as well as cooperation with foreign theatre groups.

In particular, international theatre events have been organized in the country. One of them was the International Theater Arts Festival "Theater: West and East" in Tashkent in 1993, which made a significant contribution to the development of international cooperation in the field of theatre. Theatre groups from 35 countries took part in the festival "Theater: East and West", which was held in Tashkent on October 23-31. The event provided an opportunity for Uzbek audiences to get acquainted with traditional, folklore theatres of European and Asian countries at a professional level. Theatre groups from different countries participated in their performances. In particular, T. Chalabi's private puppet theatre from Turkey, Holly's "Ghosts", India's Chandagarkha theatre group Girish Karnad's "Naga Mandla", Hong Kong's "Resolyu" theatre Peter Handke's "Two Servants in the Sky", Japan's "Sukut" theatre Shogo Father's "Sand" were presented to the audience.

This international event has made a significant contribution to the establishment and development of cooperation between the Western and Eastern theatre groups. This can be seen in the example of the director of the Brussels International Art Festival, Fri Leyza, who invited theatre groups from Turkmenistan and Uzbekistan (Kashkadarya Theater) to an international festival in Belgium in May 1994. [2]

For several years, Uzbek theatre groups have participated in festivals abroad with their programs and gained international recognition. For example, the Fergana Regional Musical Drama Theater performed "Journey to Tashkent" at the "Kontakt-94" - International Festival in Poland in 1994, the Hamza National Theater in 1997 in Cairo with "Chimildiq", and the Republican Puppet Theater in Turkey, the United States, and Pakistan. The theatre studio "Muloqot" in Karshi organized a tour in Germany in September 1998. [3]

The ballet troupe of the Uzbek State Academic Bolshoi Theater named after Alisher Navoi returned from a creative trip to Bangkok in 1994. At that time, the ballets "Don Quixote" and "Cinderella" were masterfully performed for a week in the auditorium of the Thai Cultural Center. The ballet festival, initiated by the President of International Calcheral Promotion Limited, Mr. Jaspal Singh Uberoya, has long been remembered by the audience. Every year in

May, various interesting cultural events are held in honour of the birthday of the Queen of the Kingdom of Thailand. The Theater Ballet Troupe also participated in this traditional conference for the fourth time. [4]

In November 1995, on the occasion of the 20th anniversary of the Ilhom Theater, the theatre began to hold festivals. The festival was held from November 20 to December 30 this year. It was attended by theatre groups from Russia, Germany, Italy, and the United States. It was called the Festival of Inspiration. [5] The Humo International Youth Theater Festival, held in November 1998, also played an important role in the development of theatrical art. The best theatre groups of Uzbekistan and Israel took part in the festival. The festival featured 32 performances, which were watched by more than 20,000 spectators.

The Humo Youth Theater Festival has been held in Uzbekistan since 1998. The festival, which was held for the first time, featured performances by Uzbek and Israeli youth theatres, while the 2000 festival featured theatre groups from eleven countries. In particular, the children's and youth team from Dresden, Germany participated in the performances of A. Makeli's "Years of the River" and E. Espinoza's "Hunter's Lunch". The festival was also attended by young Japanese ballet dancers "Olifita" and "Swan Lake", and the youth troupe of the State Drama Theater in Poti, Georgia, performed "Paper Bird". [6]

In August 1999, the ballet troupe of the Alisher Navoi Uzbek State Academic Bolshoi Theater performed the ballets Shelkunchik and Olifita at the next international festival in Bangkok. Also in 1999, these theatre singers Lola Nigmatova and Yanika Bogaryanskaya took part in the International Competition in Marseille, France. [7] Besides, the theatre's ballet soloists Tamilla Muhamedova, Sofia Minlina, and Lev Galpern took part in the prestigious Young Ballet Dancers' Competition in Paris for the first time. [8]

The Fergana Puppet Theater staged I. Tursunov's play "A Thousand and One Nights" (directed by H. Khakimov) in German in 1996 in Kazan, Tatarstan, and in 1997 in Bonn, Germany. The Jizzakh Regional Puppet Theater team toured the United States in 1997 with the play "Spectacular Performance." [9]

Even today, the annual foreign trips of theatre groups of the republic continue, demonstrating the achievements of our national theatrical art. In particular, in 1999, the theatre studio "Old Mosque" in Karshi participated in the International Theater Festival "Chingiz Aitmatov and Theater" in Bishkek with his play "*Nayman ona nidosi*" and won the Grand Prix. [10]

The team of the Republican Theater of Young Spectators named after Yuldash Akhunboboev in 2000 with the play "Gray Clown" (directed by O. Salimov) participated in the Central Asian Theater Festival in Mülheil, Germany as part of the "Silk Road Theater Journey" and achieved great success. In July 2004, the Makon International Theater Festival was held in Istanbul, Turkey on the occasion of the 90th anniversary of the city of Istanbul. The festival was attended by theatre groups from 18 countries. Among them, the team of the Uzbek National Academic Drama Theater returned with its performance "Ayolgu". Nurillah Tundjer, the artistic director of the Istanbul City Theater, said of the performance, "We were able to see our forgotten national traditions, culture, and identity. It was at this moment when European cultures were infiltrating our psyche that the play awakened us, saying that it had "taught us ..." [11]. The Republican Puppet Theater participated in the International Festival of Puppet Theaters in Turkey and demonstrated the art of Uzbek puppet theatre. The team of the Uzbek State Musical Drama

Theater named after Muqimi has successfully participated in the annual International Festival of Theater Arts in Cairo, Egypt. The play won two awards at the same time as it attracted the attention of theatre groups, audiences, and festival delegates from more than 50 countries who came to Cairo. These were the awards given by the Foundation for Work with and Support of Youth at the XVII International World Theater Festival and the prizes "For raising the most pressing issues." [12]. In 2005, the Uzbek National Academic Drama Theater took part in international festivals in Turkey and Russia, the Uzbek Youth Theater in St. Petersburg, and later on tour in Siberia, Russia. In 2008, the Mannon Uyghur Festival was held in Cairo, Egypt. The Surkhandarya Regional Musical Drama Theater's comedy "The Sword of the Emperor" (directed by M. Ravshanov, H. Khursandov) was shown twice at the Metropol Theater in Cairo. The play was watched with interest by theatre artists, local professionals, and spectators from different countries. [13] It is noteworthy that the Karakalpak theatre troupe successfully performed at the International Theater Festival in Egypt with performances of "Nine Crows and a Shinkildek" ("Nine Claws and a Shingle") and "The Most Beautiful Bride". [14]

In 2010, the Khorezm regional puppet theatre team took part in the International Festival of Puppet Theaters in Baku, Azerbaijan with the play "Khiva Lezgis" and won a special diploma and a prize. Based on an innovative project, the theatre management in cooperation with the Representation of the Federal Republic of Germany in Tashkent in 2008 organized performances "Magic Light Theater", "Journey to a thousand and one night dreams" led by Jürgen Tsachmann (pedagogue of games and theatre, head of various dance, play and theatre projects). staged. Based on this project, in 2011 the play "Rabbit's Nest in the Dream" was staged and successfully participated in the Republican Festival of Puppet Theaters. [15] As a result, effective cooperation between German and Uzbek artists has been formed.

It should be noted that the past 2014 was even more significant with the victories of Uzbek theater artists in international competitions and festivals. In particular, at the ASSITEJ-2014 Asian Games Festival in Seoul, the Republic of Korea in January 2014, the Youth Theater of Uzbekistan participated with its play "Ozornik" (based on the work of G. Gulom) and left a positive impression on the jury and the audience. Also, the Berdakh Musical Drama Theater participated in the II International Theater Festival "Theatrical art in a happy time" in Ashgabat, Turkmenistan in April with "The most beautiful bride" (by S. Balgabaev). did. In August, Feruza Yusupova, a soloist of the Alisher Navoi Bolshoi Academic Theater, took third place in the fourth international competition of opera singers named after Maxim Mikhailov in Kaluga, Russia. Irina Ignashina, a soloist of the Bolshoi Theater, also took part in the International Choreography Competition "Tantsuyushiy Mir" in St. Petersburg, Russia, and was awarded a diploma [16].

CONCLUSION

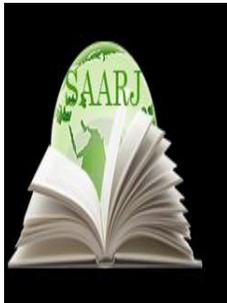

In short, the independence of the Republic of Uzbekistan has been recognized in the international arena, and from the first days of independence, it has joined the world community and cooperated with foreign countries. In a historically short period, it has become an influential state that is actively involved in solving international economic and political issues, as well as in the field of cultural relations. The state policy in the cultural sphere pursued in independent Uzbekistan and the development of international cultural relations of the Republic of Uzbekistan have led to the strengthening of its position among the countries of the world in its foreign policy

activities in the integration of international cultural relations. At the same time, its compatibility as an integral part of the process of international cultural integration has become the basis for the acceptance of national culture around the world due to its conformity to universal values.

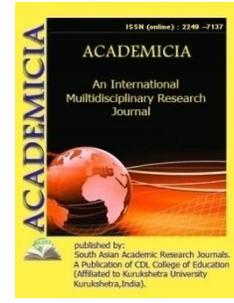

Theatrical institutions of Uzbekistan have made a significant contribution to the exchange of culture of Uzbekistan with the world, the recognition of our Uzbek cultural heritage in the world, the development and strengthening of diplomatic relations of Uzbekistan with foreign countries. Besides, international cultural ties have led to the emergence of cultural diplomacy. The participation of representatives of our country in such international competitions abroad is important for the further enhancement of Uzbekistan's prestige in the world.

**SEMANTIC-COGNITIVE INTERPRETATION OF WORDS EXPRESSING
 THE CONCEPT OF "STRANGER" (ON THE BASIS OF ENGLISH AND
 UZBEK LANGUAGES)**

Ismailov Turgun Salaxiddinovich*

*Senior Teacher,
 State World Language University,
 UZBEKISTAN

ABSTRACT

In this article, the fund of knowledge about alienation formed in the English and Uzbek linguistic consciousness is considered by typological comparison on the example of lexemes that serve to express the concept of "alien". It is shown that the natural feeling of longing for the homeland is manifested in a person in a foreign land, far away from the homeland, far away or exiled; lexemes that serve to indicate that an object that has fallen into a foreign cultural environment does not enter a particular space (physical, mental, moral-ethical space) of the subject have been semantically and cognitively interpreted.

KEYWORDS: *Alien Concept, Homeland, Longing For The Homeland, Longing, Foreign Country, Foreign Cultural Environment, Physical Space, Mental Space, Moral-Ethical Space, Belonging To Space.*

INTRODUCTION

In recent years, the study of language in terms of its interaction with the environment has become one of the most relevant areas of modern linguistics. Issues such as how a person reflects the environment around him, how he understands it in his mind, and how he presents this cognitive activity and the learned being in language are at the heart of modern linguistic research.

In modern linguistic research, the concept is recognized as the basic unit of the linguistic consciousness of the individual. A concept is a complex mental structure that combines human imaginations, knowledge associations, connected with a certain part of being. S. A. Askoldov In his article "Concept and Word", introduced the term "concept" into scientific circulation.

According to the scientist, the concept is an imaginary structure. It replaces us with an indefinite amount of objects in the process of thinking [1: 267].

Each concept, as a mental complex, includes semantic content, re-evaluation, a person's attitude toward the object being reflected, and other components. V.I.Karasik emphasizes the fundamental importance of the evaluation component in the conceptual structure by distinguishing the components of the concept, image, and evaluation because this component is culturally significant [2,3]. "The universal value of the homeland is a relational concept: it must necessarily have a relationship parameter in its structure, it is always a "personal", "my" ("mine"), archetypically opposite to a "foreign" place, a foreign country (alien place), a personal place (places)" [3;4].

MATERIALS AND METHODS

In this article, we try to describe and explain within the framework of a typological comparison based on the study of the semantics of nouns, which serves to express the concept of "Alien" from a deeply rooted fund of knowledge and formed in the English national consciousness, which underlies the concept of "Homeland", characteristic only of the second part from the antinomy "friend or foe" [3; 4].

Man belongs to some country, and love for him is inherent in him as a moral ideal. Love for the homeland is realized in a state of separation from it. Separation, farewell, distant, exile, persecution, exile, exiled (exiled) person, foreign country, etc. are observed in regular syntagmatic combinations with the word homeland. In such situations, the homeland is contrasted with respect to a foreign country spoken of with a negative or neutral connotation. The value of what may seem ordinary in the homeland is often felt far away from home.

The natural feeling of longing for the homeland is inherent in a foreign country. The feeling of longing is in Uzbek *qo' msash, sog'inib qayg'uga botish, musofirlik, g'ariblik, qam-g'ussadan ozib-to'zmoq, sog'inmoq, qo' msamoq, sog'inchdan (g'am, qayg'udan) azob chekmoq, o'lmoq, ajal topmoq* represented through the semantics of lexemes (explicit and potential components of the meaning).

Undoubtedly, the lexemes of longing and dying are key lexemes among the lexemes that signify the loss of homeland. The differential semantics of these words are used as potential semantics relative to each other and stand in a cause-and-effect relationship. Potentially, homesickness leads to death, and death can be the result of being in a foreign country and longing for the motherland. Patriotism does not depend on time and space. Patriotism does not depend on time and space. No matter where a person is, no matter how much time has passed since the separation from the motherland, love for the homeland will remain with him. In a foreign country, a person cannot be happy because he misses his homeland far from home.

When interpreting an object that has fallen into a foreign cultural environment, the nouns *alien, foreigner, newcomer, outsider, stranger* which represent this object in the linguistic consciousness, have the following semantic features:

The noun *Alien* includes information that: an object is presented in a way that belongs to the physical space of the subject (but does not belong to his mental space); in the sense of the word, belonging to space is defined, but space itself is not presented in a directly perceptible way; the subject negatively evaluates the described object based on mental processing of the received

information about the object; the evidence of belonging/non-belonging is determined by an observer who is not the same as the object being evaluated [5-7].

The *foreigner* lexeme describes an object as meeting the ethical criteria of the subject's space, but not belonging to that space in terms of physical parameters; the evaluation of the object will not be negative; perceptually received information about the object will be sufficient for object identification; space to which the object belongs is "local", ie not limited to a specific place; the value an object receives can come from it.

The word *Newcomer* includes information about the conformity of an object to the physical criteria of the space to which the subject belongs, but at the same time does not provide information about the conformity of the object to the ethical requirements of the members of that space. Belonging to the space being described in the sense of this word can be presented both as "local" and as "non-local". The subject does not negatively evaluate the object being described, the assessment is built on the mental processing of the information obtained about the object, and the author of this assessment may be the object itself.

The noun *outsider* represents the object as belonging to the physical space of the subject, but not to its conditional-mental space, while the space to which the subject belongs is represented in a way that is directly perceptible. Based on the mental processing of the information obtained about the object, the subject gives a negative assessment of the object, and this assessment cannot be derived from the object being evaluated.

The lexeme *stranger* is used to denote an object that does not meet both the ethical criteria and the territorial criteria that an individual must meet in order to be accepted into space to which the subject belongs. Hence, this object does not enter the physical space of the subject, nor the moral space. In the sense of this word, non-belonging to the space described can be presented both in a directly perceived way, i.e. "locally" and in a way that is not directly perceived, i.e. "non-local". Evidence that an object does not belong to this space is determined by an observer who may be the same or different from the object being evaluated. On the basis of perceptually obtained information about the object, the subject evaluates it, and this assessment is not negative.

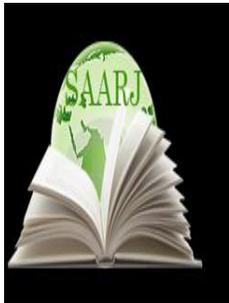

CONCLUSION

As a result of the analysis, we obtained interpretations of lexical units that evoke the concept of "alien". These lexical units allow us to obtain an adequate description of the relevant piece in the current linguistic landscape of the world.

ABSTRACT

The concept of composition is very comprehensive and meaningful. It applies to all creative processes and forms the basis of almost all art forms. The article discusses the composition and its complex types, patterns and analysis, the concepts of the main categories and patterns of the composition of volumetric-spatial forms. The main means of composition are considered, such as tectonics, rhythm, proportions, scale and symmetry. The types of volumetric-spatial compositions and methods of their construction are presented.

KEYWORDS: *Composition, Rhythm, Dynamics, Golden Intersection.*

INTRODUCTION

The composition is the art of composing, placing. Let's look at the composition in a narrow circle, that is, in a workbench painting and a workbench graph. From the term "bench" means that the fabric or paper is fixed to malbert.

Initially, we will talk about black and white or colour composition. In our compositional schemes, only 2 colours are involved-white and black. The laws of composition are based on the laws of perception and are fixed in our consciousness. We consider composition and its laws as

positive, favourable for our consciousness in the limited quadrangular plane of space. On this plane, you can perform 2 different actions: put a shadow on someplace or not put it. The bounded plane and shadows are the structural elements of the composition. These elements have the qualities of colour, volume, and shape [1,2].

1. This is the first condition for a simple solution, the inequality of white and black in the composition. Inequality has an important function in having a clear understanding of the body and background. Usually, the background is taken the one that is mostly white or black. If white and black are equal, not knowing which one to focus on, perception weakens, that is, discomfort arises.

2. The second condition is the participation of spots in the space of the composition in three dimensions. Everything has a 3xil image: large, small, medium. But these dimensions are also judged by the environment in which they are found [3,4]. For example, we perceive a chair on the street as a trifle. And in the room it is medium in size, you cannot put it in the closet - it is large. The presence of elements of three different categories in the space - large, small, medium - is a state of comfort. If there are small spots in the composition, then it appears as a fragment of a large work, that is, in other words, a fragment. If there are no large spots in the composition, it seems dull, empty, dull, monotonous. Fragmentation and monotony - these two definitions contradict the composition, it is necessary to eliminate this error.

3. The third condition is that for the composition to be comfortable, it must have a holistic look. For this, a composition node is created, that is, the centre of the composition [5]. A composition centre is a unique, dedicated space that draws attention to the composition. The composition centre is not understood as the geometric centre of the plane. We get a sheet of white paper. He will be our plane. We make black paper sheets in three different sizes. They will be stained in the composition. Let's see how to define a focal point.

A) Determine the focal point by the spot size. It is enough to leave the spots the same size. To do this, we put different (3 different) points on loneliness. Large, small, medium. Now remove the rest, leaving only one of the larger spots. He immediately separates and begins to draw attention to himself. The same situation is observed with medium and small spots. The one who is left alone becomes the centre of attention.

B) Find a Composition Center in Nuance. Find the centre point separate from its counterparts. We apply several black spots of different sizes to the plane [5,6]. Place a small white spot on one of them. As a result, a large spot with white spots will stand out from other black spots of the same size. Also, a small white spot is visible among other small spots with one. The question arises: is the centre of the composition a big black spot or a small white spot in it? The centre of the composition is determined not only by the spots. It is at this point that the spots keep the weight in balance.

C) The background part can also serve as the centre of the composition. The centre will most likely be in the background area, not just in the spots. The centre of the composition will be located in the middle of the plane, that is, at the intersection of the spots along the perimeter.

D) Complex methods for determining the compositional centre. Take, for example, the portion of the background that surrounds a large black spot with a small white spot. In this case, the focal point will be located between three centres: a large black spot, a small white spot, and a separate

centre of the background. Explain that the spots on the separated part of the background are connected along the perimeter, not along the middle line. When we look at black dots, our gaze moves from one point to another along the shortest path and tends to reach white latitude faster. It is this feature of our gaze that determines the expression of movement in the composition. The concept of movement in the composition is based on the sequence of seeing the elements of the image. The sequence of spots and the movement of the distance between them creates a rhythm. Rhythm - serves as a note and a pause in the image, as in music.

4. The fourth condition for creating comfort in the composition is Rhythm. Shadows and gaps between them should be different so that they do not become the same, boring. Even if only the sizes of the shadows or the distances between them are the same, a state of repetition arises in the rhythm. Discomfort arises in the composition. We introduce the concept of plasticity of movement and rhythm. Plastics are often used in choreography in relation to dance movements. We are talking about beautiful, ugly, durable, sharp plastic. That is, one movement can be performed on different heads. In this case, the interaction of the elements of motion is plastic. Likewise, in composition, plastic is an adaptation of objects that have a holistic appearance. Movement, rhythm and plastic are the instruments that make up the composition. For example, using movement, the viewer can focus on a specific part of the composition. Plasticity and rhythm can give a certain mood to movement. Experiment with practice using a sheet of white paper and pieces of black paper.

5. The fifth condition for creating cosiness in the composition is to align the placement of shadows to the edges of the composition. If all the spots in the composition are at a certain distance from its edge, and one shadow touches the right edge, the composition is cropped from the right side, giving the impression of a fragment on the left. A similar situation can arise with the right side of the composition. This creates discomfort in the composition. If the shadows touch both the left and right edges, the composition is rounded as the centre. The horizontal direction of the composition is filled with shadows. Top and bottom edging does not need filler shadows. The compositional solution is more stable in the vertical direction. The vertical line serves as the geometric centre of the composition, not a point. Therefore, putting together a composition in a horizontal format is a little difficult. Because it tends to "split" into two parts along a vertical line. So, we have examined the basic principles of the composition colour scheme. Let's summarize what we learned from the composition. The composition consists of elements consisting of planes and shadows. The comfortable arrangement of the composition meets five conditions: the inequality of white and black, the presence of three shades - large, small, medium shades, rhythm, movement and plasticity. Methods for highlighting the compositional centre:

- A) By the size of the shadow.
- B) About the nuances of health.
- C) On a highlighted background.
- G) About complex detection methods.

Compositional analysis of black-and-white reproduction.

The compositional analysis is the process of bringing a complex image into a simple or schematic form in order to determine the construction principle. Let's take a look at an image that consists of black and white and greys in between. We carry out the compositional scheme with a

brush or in the daytime, with gouache no larger than a palm. The compositional scheme - no finished drawing was required. Then the contour lines may not be clear. Because we are interested in compositional shades, not elementary ones. The brush should not be less than No. 10, so as not to succumb to small details. Let's start. We take a black and white reproduction and determine its relativity or format. Draw a rectangle on paper in the same proportions. Draw an approximate line of the image with a pencil. We define the lightest and darkest areas of the reproduction. Then we find the middle tint of the image. Now let's leave the middle grey of the reproduction white and the black one black. Inserted in grey or black. We will make 4-6 compositional schemes from different reproductions. When the schemes are ready, we determine how and where its compositional centre is separated.

Colour analysis of colour rendering.

Let's start by analyzing the reproduction of a black and white image. Only here we use colour rendition.

We take into account the brightness of the shadows (in the ratio of light saturation), regardless of the colour.

Color compositional analysis of nature.

The object of our research is not a reproduction of an airplane, but a real three-dimensional still life. Compositional analysis of nature is not much different from the compositional analysis of reproduction. A similar middle tone is set. The hungry areas remain white and the remaining dark areas turn black. In each compositional scheme, the average colour is determined by only one colour reproduction - white or black. But there are also differences. When we work with a reproduction, its composition is already ready, it has certain relativity, format. Working with nature, you need to be able to correctly place spots on the border of the composition, to determine its format [4-6]. To do this, we draw the image extensively, leaving extra space in the format when creating the initial sketch. Then we constrain the part that is defined as the main one with the frame. By defining the main, final image, we create the comfort of the spots in the composition.

Three-dimensional analysis of colour rendering.

From each colour reproduction, 3 schemes are compiled: colour, colour, linear. So far, we have analyzed the composition only one-sidedly. That is colour analysis. Let's take a look at two more colours and line types. If a black-and-white composition contains white and black spots, then a colour composition contains "hot" and "cold" spots. In theory, any colour can be derived from red, yellow, blue, black and white. White, black and colours formed from their mixture are part of the achromatic colours. Three primary colours (red, yellow, blue) determine the composition of the spectrum, and they are divided into "hot" and "cold" groups. Warm: yellow-orange, red. Cold: black, blue, green. One can imagine a colour scheme based on the interaction of achromatic and chromatic colours. Mixtures of colours in different proportions in a circle give different colour accents. It blends with the white in the centre to make it brighter. Colours going from the colour range to the edges are muted. If we divide the colour gamut in two horizontally, the upper part is warm colours, the lower part is a cold colour. Achromatic colours do not fall into this category.

Colour composition analysis

First, we find the hottest and coldest colours in reproduction. We then define the colour at an average temperature in two colour ranges. Most of the colour range of the image may be unused. Therefore, we are only interested in the colours in a given reproduction, and they are determined by their relative relativity. We paint over warmer areas such as yellow than medium-warm. We paint over cooler colors blue. In this case, the outline of the object becomes blurred. This should not be ignored. Despite the light-dark areas of reproduction, we can only distinguish between warm and cold colours. We also paint over the middle colour in the compositional scheme in only one colour - yellow or blue.

Now let's talk about achromatic colours. Black, white, grey are dependent on other colours that surround them. For example; a black spot is cold against a yellow background because it is colder than any warm colour. If the image contains only cold and achromatic colours, then the achromatic colour gives the impression of warm colour.

Linear composition

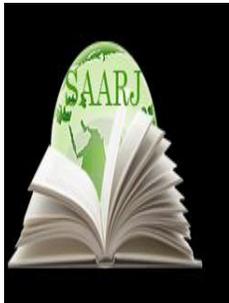

Linear composition enriches the image content with lines. The linear composition is clearly expressed inline graphics. In a linear composition, movement, rhythmic plastic is more important. Due to the very high degree of expressiveness, the linear composition is repeated as a separate species.

Linear composition analysis.

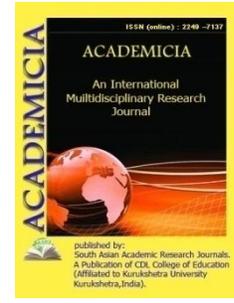

When we analyze a colour image with a linear composition, we take its spot boundaries as a line. In it, in general, spots similar in colour and shade are obtained. All the rules used in colour and colour composition devices also apply to linear composition. 3-4 composition schemes are compiled on one sheet. Find out how and where the composition centre of each diagram is separated. (for each scheme). Note that none of the three schemes may have a composition centre at all. Usually, in a well-constructed composition, all three schemes are compatible with each other. All three serve to divide the compositional centre. Sometimes one scheme serves to highlight the compositional centre, the rest are neutral, i.e. do not interfere with it. Black and white composition are usually more appropriate for an image with natural colours.

ABSTRACT

This article provides suggestions for the placement of recreation areas along the highway "Kungrad-Muynak" for the convenience of passengers, drivers and vehicles. It is known that recreation areas include a complex of various road constructions. These facilities play an important role in improving the efficiency of the road transport complex. Also, the highways will provide comfortable and safe movement for passengers and drivers. The main attention is paid to the location of vehicle maintenance outlets and service facilities along the highway, which fully uses the requirements of GOST to address these issues.

KEYWORDS: *Highways, Safe Traffic, Equipment, Roadside Facilities, Infrastructure, Category, Master Plan, Recreation Areas, Parking, Relief Condition.*

INTRODUCTION

Today's highways need to provide comfortable and safe movement not only of vehicles, but also of passengers and drivers. This requires the development of a science-based system for organizing, servicing and equipping roads [1]. It should be noted that the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated 16.01.2019 No 37 on the implementation of adequate measures for the establishment and development of tourism in Muynak district, the introduction of the necessary infrastructure, including road transport

facilities and services. According to the resolution, it is planned to develop a master plan of Muynak district and improve the roads connecting Muynak district with other cities.

Thousands of vehicles move on the highways every day. With this in mind, a complex of various road facilities will be built along the road for the convenience of passengers and drivers. These include recreation areas, petrol stations, car maintenance and more. Roads and road structures are artificial structures that serve for a long time. Therefore, it is necessary to have prospective data on periodic changes in all factors affecting the operation of road and roadside structures, including natural climatic factors. Roadside recreation areas will be located at a distance of 30-40 km on Category II roads following the normative documents [2] (Table 1).

MATERIAL AND RESEARCH METHODS

The 4P 173 highway connecting the cities of Kungrad and Muynak is an II-category highway with a length of 93 km. Based on the requirements of the normative document on the route, if we plan to design a recreation area every 30-40 km, then we can plan 2 recreation areas. As the total length of the route is 93 km, it is advisable to place the recreation area every 31.0 km.

On Category 1 roads, service facilities are provided on both sides of the road [3]. It follows that in the development of the master plan of the Kungrad-Muynak highway, this requirement will further facilitate the possibility of linking them to existing facilities in the planning of recreation areas.

RESEARCH RESULTS

Driver and passenger service facilities (recreation areas, shops, restaurants, motels and campsites) will be located in the recreation areas in accordance with regulatory requirements (Table 1).

TABLE 1 REGULATORY REQUIREMENTS

Type of road and roadside service facilities	Categories of highways	Distances between objects of the same type, km
Recreation area (large)	IA, IB, IB	20-30
	II	30-40
Recreation area (small)	III	30-40
	IV	40-50
Petrol station - AYOQSH	IA, IB, IB	20-30
	II	30-40
	III	40-50
	IV	50-60
Maintenance Station	IA, IB, IB	60-100
	II	
	III	100-150
	IV	150-250
Hotel (motel) or camping	IA, IB, IB	100-150
	II	
	III	150-200
	IV	

Catering	IA, IB, IB	20-30
	II	30-40
	III	40-50
	IV	50-60

Figure 1-2-3 below shows a project sketch of the proposed master plan of the proposed recreation area along the Kungrad-Muynak highway. The 31.0 km distance calculated when placing the rest areas in the general plan may not be evenly distributed. Here, of course, it is necessary to take into account such factors as the current situation around the route, the state of relief, existing facilities, settlements, two existing memorial complexes, existing surface water reservoirs. We analyze some of the requirements for the Kungrad-Muynak highway, which belongs to 2 categories according to GOST 33062-2014 [4]:

- The minimum distance between vehicles - at least 400 m - (required);
- Minimum viewing distance of the road surface - at least 175 m - (meets the requirements);
- Minimum viewing distance of the road surface - at the exits from service facilities should be at least 100 m - (possible to provide);
- Minimum viewing distance - at least 400 m - (at risk).

Figure 1. A draft sketch of the proposed master plan of the proposed recreation area along the Kungrad-Muynak highway.

Figure 2. Project sketch of the proposed recreation area along the Kungrad-Muynak highway.

Figure 3. Project sketch of the proposed recreation area along the Kungrad-Muynak highway.

Also, there are some requirements for this category of roads, which are:

- Service facilities have parking lots that provide at least 10% of the number of cars that can move simultaneously on the route;
- Road signs informing about service facilities should be installed 400-800 m away from non-residential areas;

- If necessary, this distance should be set at 2-3 km, 15-20 km, 60-80 km.

For the design of short-term recreation areas and service facilities along the Kungrad-Moynak highway, the current state of the road and the technical parameters and categories of the highway were studied. Today, in developed countries, special facilities for the maintenance of vehicles have been introduced along the highways, based on its technical categories. In order to develop an innovative landscape design solution of the Kungrad-Moynak highway, project proposals for the location of maintenance stations and service facilities for vehicles along the 4R173 Kungrad-Moynak highway were described and master plans were developed.

Service facilities and their complexes are generally located in the general plan in relation to the main road in the following order:

- transportation area (parking lot, entrance and exit)
- service area (main facilities, sidewalks and sidewalks).

When placing various service facilities in one complex, close to the main highway (petrol stations, service station, technical assistance point) and then driver and passenger service facilities will be located recreation area, shopping centre, restaurant, motel and camping.

The recreation area is designed for short-term rest of passengers and drivers. The recreation area includes the following areas:

- Housing for cars, areas for entry and exit
- recreation area;
- sanitary-hygienic territory;

In addition, the recreation area will be planned stations for the technical installation of cars, as well as the following facilities:

- catering outlet;
- trade shops;

Whenever possible, retail and catering outlets should be located outside the recreation area.

In order to create convenience for drivers in the area in the design of short-term recreation areas and service facilities along the highway, parking lots should also be designed in accordance with regulatory requirements. The parking space for one car, internal roads, turning radii, manoeuvring (traffic position) and their dimensions, as well as layout schemes of cars, are based on the following recommendations: [5].

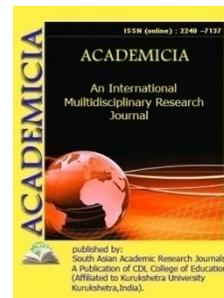

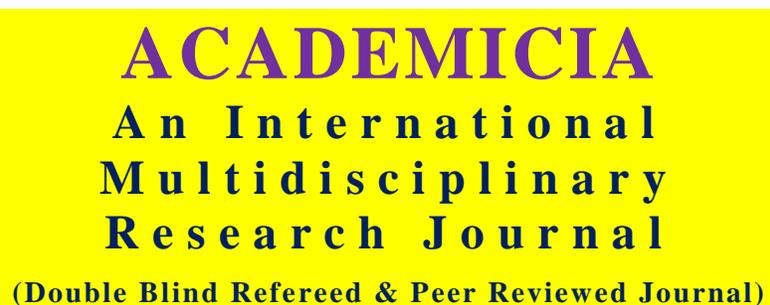

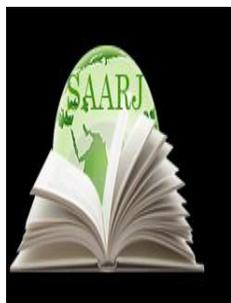

- separate places for cars, trucks and buses will be established in the settlements;
- in front of food and trade enterprises and a large recreation area, trucks are parked on the left, cars and buses on the right;
- Trucks and buses are placed in a direction parallel to the axis of movement in the right direction.

CONCLUSION

In short, equipping highways means providing them with a convenient and safe service based on the needs of passengers, drivers and vehicles on the road. The main purpose of the road service is to increase the economic efficiency of the road transport complex. This has been proven in the example of many developed countries. Our main goal is to implement these measures on the Kungrad-Moynak highway.

ABSTRACT

The article highlights topical issues of the use of medicinal plants today. There is information on the cultivation of natural medicinal plants, obtaining more medicinal raw materials by planting them and protecting their natural populations. The most important factor in using medicinal plants is the need to know their types and bio ecological properties.

KEYWORDS: *Medicinal Plants, Folk Medicine, Resources, Medical Substances, Introduction, Medicinal Properties of Plants.*

INTRODUCTION

There are more than 20,000 types of human diseases in the world, while more than 15 000 drugs are being used in their treatment. In the preparation of such drugs, raw materials having 3000 taxonomic names are used, and more than 35% of them are processed from medicinal plants. According to the calculations of the World Health Organization (WHO), 70% of the world's population uses medicinal herbs.

The World Trade Organization in its report has admitted that the use of traditional medicine and herbal medicine as part of the health care system is significant.

Therefore, the inventory of species of medicinal plants, the evaluation of their resources and identification of prospective species for manufacture is one of the topical issues of the modern ages.

According to the analysis of existing evidence of medicinal herbs in the flora of Uzbekistan and data on herbs used in folk medicine, it was revealed that the total number of higher plants in the flora of Uzbekistan consists of 4500 species, of which 139 families, 1154 species belonging to the category 571 are known to have medicinal properties [6]. Included here, there can be found 186 medicinal plants of 50 families in the oasis of Bukhara, 61 species from 20 families in the oasis of Karaul bazar [9; 10].

MATERIALS AND METHODS

In 2019, medicinal plants have grown on an area of 11.5 thousand hectares in the Republic of Uzbekistan. The medicinal plants cultivated were exported to countries such as Turkey, Germany, India, South Korea in the amount of USD 48000 [7].

Currently, in our country, 2.3% of all 6400 diverse medicinal substances are of natural origin. If we look at the countries of the world, the reproduction and processing of medicinal plants are widely developed in countries such as China, India, Canada and the United States. China itself grows 700-1000 tons of medicinal plants per year and receives revenue of USD 822 million from it.

To date, 93 enterprises in our country are processing medicines from 89 different plants. Only 7% of the total consumption of natural drugs corresponds to products by domestic manufacturers.

At present, if we take into account that approximately 50% of the medicines in the network of pharmaceutical products are made from medicinal herbs, then the cultivation of medicinal plants, their cultivation, development of their agrotechnical are considered one of the most important scientific issues in the field.

In Uzbekistan, only a large part of the medicinal herbs that grow in the wild are harvested as raw materials for medicinal purposes, but this is also not enough to satisfy the needs of the country.

Therefore, the cultivation of medicinal plants culturally without cultivation, the development of the cultivation of medicinal plants consistent with the raw materials of medicinal plants of the medical, food-processing and perfumery industry, the manufacturing of import-substituting or export-oriented products in local conditions is considered one of the pressing problems of today [1,3].

Lately, the industry of pharmaceuticals in the Republic of Uzbekistan is developing rapidly, and the demand for medicinal plants is increasing exponentially. This requires the cultivation of medicinal plants belonging to the flora of foreign countries in local homegrown conditions [4].

Currently, the demand for medicines made from medicinal herbs is growing significantly. This situation is because drugs made from medicinal herbs and are environmentally friendly have a high potency of action, have a long-term positive effect on the body, do not cause harm to the human body, and also do not cause other diseases, make the process of preparation easier and being cost-effective in economic terms.

Naturally growing medicinal plants which are raw materials, growing naturally in our republic, are not unlimited. Therefore, the rational use of plant resources, which grow naturally, allows them to leave their resources to the future generation.

The protection and effective use of medicinal plants and Natural Resources is reflected positively in relevant decisions in our country. In particular, the tasks set out in the resolutions “On the establishment of the state committee of the Forestry of the Republic of Uzbekistan” dated May 11, 2017, “On measures to create favourable conditions for the rapid development of the pharmaceutical industry of the Republic” dated 7 November 2017, and “On measures to create favourable conditions for the rapid development of the pharmaceutical industry of the Republic” dated 14 February 2018, that is, by organizing the cultivation of raw materials of medicinal plants, the tasks of providing the population of the Republic with high-quality pharmaceutical products cannot be fulfilled without the creation of technologies for the cultivation of medicinal plants and the organization of their plantations of primary seed [1].

The decree of the President of the Republic of Uzbekistan “On measures for the protection of medicinal plants growing in wild, cultivation, processing and rational use of available resources” adopted on April 10, 2020, is very relevant.

In the decree adopted, it was determined that the pharmaceutical industry annually meets the demand for medicinal plant species and its volume to the Ministry of Agriculture of the Republic of Uzbekistan, the Ministry of Forestry and innovative development. This ensures the guaranteed purchase of raw materials suppliers. This is a great option for farmers and growers of other medicinal plants. Now the opportunity for growers of medicinal plants to supply the quality products not only to domestic but also to foreign markets has expanded.

According to the decree, the need to further develop the cultivation and processing of medicinal plants, increase the export potential of the industry, as well as the unification of educational, scientific and production processes in this area, has been established. Starting from May 1, 2020, works on the creation of clusters for the cultivation, storage, primary or deep processing of medicinal herbs, as well as the specialization of territories for the cultivation of medicinal plants has been defined [7].

Preservation of the stock of medicinal plants in our country and further enrichment from the account of introduces is one of the most important tasks in the queue before Botanical scientists. With the above decision, it will be possible to limit the import of medicinal products from foreign companies to our republic and to obtain these drugs from the growing medicinal plants in our country. For example, Bulgarian “Tribestan” (the plant of *Tribulusterrestris* L.), German “*Helariumhypericum*” (the plant of Saint-John’s-wort), Czech “Persen” (on the basis of the motherwort plant), Russian “Extract Valeriani” (the root and stems of *Valeriana officinalis* L. plant) imported in the form of a large number of medicines [8]. These medicinal plants grow in our country. Getting active substances from within these allows you to reduce the volume of imports. Many such examples can be cited.

At present, the global urgent task is to solve the problem on the naturalization of medicinal means, which are produced in the industry of pharmaceuticals in our country as well as in the whole world. Therefore:

1. The protection of medicinal plant contained in natural flora and reproduction in its natural habitat;

2. It is necessary to organize the plantations of medicinal plants that disappear in natural flora or are considered as rare, and to introduce adventive medicinal plants, as well as to restore plantations of prospective species in large-scale plantations.

This case is considered a scientifically proven way of solving the above problems [2; 3].

Not only the upper part of the medicinal herbs are used, but also the other parts of the body, skin, buds, leaves, flowers, petals, corolla, fruits and seeds have a healing property, but also on the part of the root, tubers, stems, rhizome and nodes are applied in the traditional medicine.

The specialists of organizations preparing the raw materials of medicinal plants should be fully acquainted with the morphological, biological characteristics of these plants, know their distribution and growth, picking dates and drying methods, have full access to information on the ways of preparation and storage of the plant products. Especially it is necessary that they well different species of plants from each other. Because species belonging to one category are radically different in terms of healing, although they are very similar to each other [5].

For the preservation and protection of medicinal plant resources, it is necessary to know well all the characteristics and properties of plants, not to be able to germinate with roots or roots, as well as endings, not to collect seeds without ripening, not to collect flowering or germinating plants gross, leaving at least 30-40% of them.

In order to preserve the rare plant resources, it is necessary to organize specially protected areas, not to feed livestock in these areas and not to harvest fodder.

It is necessary to collect the raw materials of medicinal herbs from plants grown on lands that are ecologically clean, growing in unspoilt natural areas, becoming croplands.

If the medicinal properties of medicinal plants depend on the quantity and quality of biologically active substances contained in them, then there is not a single plant species-which means that if it does not store biologically active substances in some quantities, then all species has a medicinal property. But due to the fact that they are not fully studied, these plants have not been ranked among the medicinal plants [6].

CONCLUSION

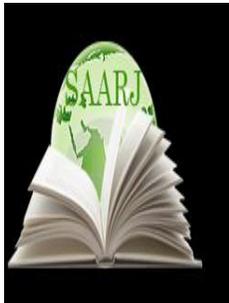

Therefore, it is necessary to study the composition and properties of a plant by conducting an in-depth analysis, even without ignoring them.

The observance of the above-mentioned rules will serve as one of the factors for the supply of raw materials of medicinal plants growing naturally to the future generation. Otherwise, plant wealth will lead to a decrease in the number of years, especially medicinal plant homoeopaths. Otherwise, this will lead to a reduction in the plant resources, especially raw materials of medicinal plants, year by year.

BLOOD PRESSURE DYNAMICS

Z.T.Safarova*

*Teacher
 Department of Biology,
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

The article presents data on the dynamics of blood pressure under the influence of the social environment and changes in diet, as well as the impact of various diseases. when science and technology are developing, we are often faced with the problems of high blood pressure. Blood pressure (BP) is the pressure of blood on the walls of the arteries, which depends on the amount of blood flowing from the heart, blood flow, resistance of peripheral arteries and wall elasticity arteries. Blood pressure (BP) is distinguished: Systolic (maximum) blood pressure, diastolic (minimum) blood pressure, pulse blood pressure. Systolic (maximum) blood pressure is the pressure in the arterial system during the maximum rise in the pulse wave that occurs after left ventricular systole. Measuring blood pressure has become an integral part of everyone's daily routine. But it must be borne in mind that blood pressure is influenced not only by our lifestyle and work but also by diet and various diseases, diseases, of course, affect indirectly. During the day, blood pressure indicators change.

KEYWORD: *Systole, diastole, pulse blood pressure, Riva-Rocci Sphygmomanometer, minimum, maximum.*

INTRODUCTION

In our time, when science and technology are developing, we are often faced with the problems of high blood pressure. Blood pressure (BP) is the pressure of blood on the walls of the arteries, which depends on the amount of blood flowing from the heart, blood flow, resistance of peripheral arteries and wall elasticity arteries. Blood pressure (BP) is distinguished: Systolic (maximum) blood pressure, diastolic (minimum) blood pressure, pulse blood pressure. Systolic (maximum) blood pressure is the pressure in the arterial system during the maximum rise in the pulse wave that occurs after left ventricular systole. Diastolic (minimum) blood pressure occurs

at the end of the heart's diastole when the pulse wave subsides. Pulse pressure is the difference between systolic (maximum) and diastolic (minimum) pressure. Dynamics is a course of development, a change in a phenomenon, that is, a change in a phenomenon under the influence of external or internal factors. Currently, it is not a secret for each of us that hypertension is associated with physical inactivity. Since now computer technologies are actively developing, active physical work has decreased, machines, equipment and technology began to do a lot of work for us. Every home has blood pressure measuring devices. The pressure in the arteries in humans, as well as in animals, is measured by introducing a glass cannula or a needle into the artery, connected to a manometer with a tube with rigid walls, so that blood in the cannula and connecting tube does not clot, they are filled with an anti-coagulation solution. And this method is called direct or bloody method. In addition to this method, another method is used, called an indirect or bloodless method. This method is based on a change in pressure, which must be subjected to the wall of a given vessel from the outside to stop the blood flow through it. For such a study, a Riva-Rocci sphygmomanometer is used.

MATERIALS AND METHODS

Measuring blood pressure has become an integral part of everyone's daily routine. But it must be borne in mind that blood pressure is influenced not only by our lifestyle and work but also by diet and various diseases, diseases, of course, affect indirectly. During the day, blood pressure indicators change. They vary with age, diet and psychological state. Some of these factors directly affect the changes in blood pressure and the second indirectly. We conducted studies to study the dynamics of blood pressure depending on age and changes in food intake per day. In addition to age, we conducted experiments depending on gender. In the table, we observed that in various diseases and conditions, blood pressure is not stable. For example, like COVID-19, if you pay attention to the blood pressure table for a week, it fluctuates a lot. Also, with breast cancer in a 55-year-old woman, blood pressure fluctuates sharply (**1-table**).

CONCLUSION

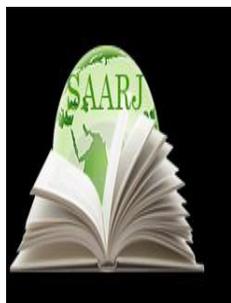

In the course of our observations, we concluded that a person's blood pressure changes during the day, depending on gender, age, diseases and the type of food that he consumes. It is also necessary to take into account the working pressure, which is optimal and individual for the body. Changing it speaks of ailments in health and requires the correct organization of the daily regimen and diet.

ABSTRACT

In this work, the analysis of the obtained data with an additional supply of hydrogen to internal combustion engines as an additive to gasoline is considered. Alternative drives and energy sources that do not harm the environment are called the hope of tomorrow. Fuel cells are considered the most optimal solution to energy problems: an electric current is generated from hydrogen and oxygen, which is used to drive the engine. As a result of the electrochemical process, in addition to electrical energy, only heat and water vapour are formed. For the industrial production of hydrogen, a large number of different methods have been proposed. The latter include piston engines with a layer-by-layer charge distribution, gas turbine, steam and rotary engines, as well as Stirling engines. Some of these engines, in particular Stirling engines, can in principle provide the possibility of creating a low-toxic car on conventional fuels that meets future stringent standards. Over the past few years, a large number of prototypes of electric vehicles have been built. In electric vehicles, the use of fuel cells converting electrical energy directly from fuel without an intermediate stage is more promising.

INTRODUCTION

Alternative drives and energy sources that do not harm the environment are called the hope of tomorrow. Fuel cells are considered the most optimal solution to energy problems: an electric current is generated from hydrogen and oxygen, which is used to drive the engine. As a result of the electrochemical process, in addition to electrical energy, only heat and water vapour are formed. For the industrial production of hydrogen, a large number of different methods have

been proposed. However, there is no need to list all the methods and patents for the production of hydrogen; this is mainly of historical interest since most of the proposed methods have not been implemented at all on an industrial scale, and in practical conditions, only a few of them have justified themselves [1-4]. The reason for this is the ever-increasing obvious ecological, socio-economic and technical significance of the problems of using traditional motor fuels. Due to the combustion of fuels of petroleum origin, the use of hydrogen as a fuel for internal combustion engines is considered by many authors as a very significant alternative to motor fuels of petroleum origin, natural gas, coal; the atmosphere of cities and the planet as a whole is becoming more and more polluted.

MATERIALS AND METHODS

Attempts to use hydrogen as a fuel for internal combustion engines have been known for a long time. So, for example, in the twenties, they explored the option of using hydrogen as an additive to the main fuel for internal combustion engines of airships, which made it possible to increase their flight range [3-7]. The use of hydrogen as a fuel for internal combustion engines is a complex problem that includes a wide range of issues:

The possibility of converting modern engines to hydrogen;

Study of the working process of engines when working on hydrogen;

Determination of the best ways to regulate the work process to ensure the minimum toxicity and maximum fuel efficiency;

Development of a fuel supply system that ensures the organization of an efficient working process in the internal combustion engine cylinders;

Development of efficient methods for storing hydrogen onboard transport;

Ensuring the environmental efficiency of using hydrogen for internal combustion engines;

Providing the possibility of filling and storing hydrogen for engines.

The solution of these issues has a variant level, however, the general state of research on this problem can be considered as a real basis for the practical application of hydrogen. This is confirmed by practical tests, studies of variant engines operating on hydrogen. For example, Mazda relies on a hydrogen-powered rotary piston engine. Research in this field is characterized by a wide range of options for using hydrogen for external and internal mixing engines, using hydrogen as an additive, partially replacing the fuel with hydrogen, and operating the engine only on hydrogen.

New transport engines developed to date include electric power plants and internal and external combustion heat engines with unconventional working processes [8-10]. The latter include piston engines with a layer-by-layer charge distribution, gas turbine, steam and rotary engines, as well as Stirling engines. Some of these engines, in particular Stirling engines, can in principle provide the possibility of creating a low-toxic car on conventional fuels that meets future stringent standards. Over the past few years, a large number of prototypes of electric vehicles have been built. In electric vehicles, the use of fuel cells converting electrical energy directly from fuel without an intermediate stage is more promising. Thanks to advances in this field, in recent years

the specific power of hydrogen-oxygen fuel cells has increased to 300 W/h, and their service life has increased to several years with periodic use.

The main problem with the use of fuel cells of this type is the difficulty of storing hydrogen on a car. The bulk values of the most suitable hydrogen storage option in the form of hydrides are still unsatisfactory and are at the level of electrochemical batteries being developed. Therefore, it is of practical interest to use acid electrolyte fuel cells using mixtures of gases: hydrogen, methane, carbon monoxide, etc., as a working medium, these elements can work on liquid hydrocarbon fuels, in particular methanol, so that power plants based on them approach modern automobile engines in terms of specific power.

Alternative drives and energy sources that do not damage the environment are called the hope of tomorrow. Fuel cells are considered the most optimal solution to energy problems: electric current is generated from hydrogen and oxygen, which is used to drive the engine. As a result of the electrochemical process, in addition to electrical energy, only heat and water vapour are formed.

A large number of different processes have been proposed for the industrial production of hydrogen. However, there is no need to list all hydrogen production methods and patents; this is mainly of historical interest, since most of the methods proposed were not carried out on an industrial scale at all, and in practical conditions, only a few of them justified themselves. Humans live in a hydrogen-helium universe. Therefore, hydrogen is of great interest to us. The impact and benefits of hydrogen today are very great. As for air, an equally important issue has been on the agenda for many years. And if you imagine, at least for a second, that all modern engines will run on environmentally friendly fuel, which, of course, is hydrogen, then our planet will embark on the path leading to an ecological paradise. No matter how much we talk about the positive effect of hydrogen, in practice, this can be seen quite often. But still, many projects are being developed, and the purpose of my work was not only a story about the most wonderful fuel, but also its use. This topic is very relevant, since now the inhabitants of not only our country but also the whole world, are concerned about the problem of ecology and possible ways to solve this problem.

Hydrogen is one of the most common elements on Earth. In the earth's crust, out of every 100 atoms, 17 are hydrogen atoms. It is approximately 0.88% of the mass of the globe (including the atmosphere, lithosphere and hydrosphere). If we recall that water on the earth's surface is more than $1.5 \cdot 10^{18} \text{ m}^3$ and that the mass fraction of hydrogen in water is 11.19%, then it becomes clear that the raw material for producing hydrogen on Earth is an unlimited amount. Hydrogen is part of oil (10.9-13.8%), wood (6%), coal (brown coal - 5.5%), natural gas (25.13%) [11-13]. Hydrogen is part of all animal and plant organisms. It is also contained in volcanic gases. The bulk of hydrogen enters the atmosphere as a result of biological processes. With the decomposition under anaerobic conditions of billions of tons of plant residues, a significant amount of hydrogen is released into the air. This hydrogen in the atmosphere quickly disperses and diffuses into the upper atmosphere. Having a small mass, hydrogen molecules have a high diffusion velocity (it is close to the second cosmic velocity) and, entering the upper atmosphere, can fly into outer space. The hydrogen concentration in the upper atmosphere is $1 \cdot 10^{-4} \%$.

Hydrogen technology means a combination of industrial methods and means for the production, transport and storage of hydrogen, as well as means and methods for its safe use based on

inexhaustible sources of raw materials and energy. The transition of transport, industry, life to the burning of hydrogen is the way to a radical solution to the problem of protecting the air basin from pollution with carbon oxides, nitrogen, sulphur, hydrocarbons.

The transition to hydrogen technology and the use of water as the only source of raw materials for hydrogen production cannot change not only the water balance of the planet but also the water balance of its regions. Thus, the annual energy demand of such a highly industrial country like Germany can be met by using hydrogen obtained from such an amount of water, which corresponds to 1.5% of the average runoff of the Rhine River. Let us note in passing that before our eyes one of the brilliant guesses of the great science fiction writer Jules Verne becomes real, who through the lips of the hero of the rum "The Mysterious Island" declares: "Water is the coal of future centuries".

Hydrogen obtained from water is one of the most energy-rich energy carriers. After all, the heat of combustion of 1 kg of H₂ is (at the lowest limit) 120 MJ/kg, while the heat of combustion of gasoline or the best hydrocarbon aviation fuel is 46 - 50 MJ/kg, i.e. 2.5 times less. Also, hydrogen is an easily renewable fuel. It takes millions of years to accumulate fossil fuels on our planet, and to obtain water from water in the cycle of obtaining and using hydrogen, it takes days, weeks, and sometimes hours and minutes [14-17]. But hydrogen as a fuel and chemical raw material also has several other most valuable qualities.

The versatility of hydrogen lies in the fact that it can replace any type of fuel in the most diverse areas of energy, transport, industry, and everyday life. Hydrogen is easily transported through pipes and distributed among small consumers; it can be obtained and stored in any quantity. At the same time, hydrogen is a raw material for several important chemical syntheses (ammonia, methanol, hydrazine), for the production of synthetic hydrocarbons.

Modern technologists have at their disposal hundreds of technical methods for producing hydrogen fuel, hydrocarbon gases, liquid hydrocarbons, and water. The choice of one method or another is dictated by economic considerations, the availability of appropriate raw materials and energy resources. However, most of all hydrogen is currently obtained from hydrocarbon gases by the conversion of methane and its homologues (USA, Russia).

RESULTS

Modern technology ensures the annual production of tens of millions of tons of molecular hydrogen all over the world. More than 90% of it is obtained by catalytic conversion of methane, liquid hydrocarbons, and solid fuel gasification. It is quite clear that in the future, when switching to hydrogen technology, such sources of hydrogen production, except for solid fuel, will be largely excluded. Water will be used as the main source of raw materials.

As a source of energy for the decomposition of water - atomic energy in its various forms (heat, electricity) and the energy of water, wind in the form of electrical energy, solar radiation. Water electrolysis has been carried out in industrial practice for a long time and has been widely described in the literature. Significant efforts are now being made in industry science to harness the inexhaustible energy of solar radiation to decompose water. This is the use of photolysis cells for the decomposition of water, solar cells for generating electricity with its subsequent use in the electrolysis of water. The main task that is being solved here is to carry out a series of photochemical reactions under the direct influence of solar energy with the purpose of

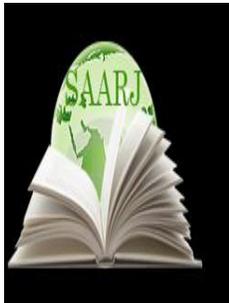

decomposing water to hydrogen-oxygen. The crux of the problem lies in finding biological systems that use solar energy to decompose water.

CONCLUSION

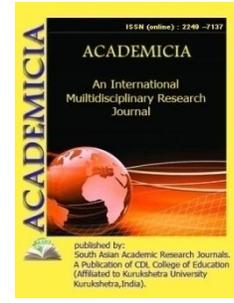

The only exhaust gas from the combustion of hydrogen is water vapour, which enters the natural water cycle. And, as you know, through electrolysis, hydrogen can be obtained again from the water. This closed cycle, which is the basis of the idea of hydrogen energy, makes hydrogen one of the most environmentally friendly fuels.

ABSTRACT

Reporting a rare case of sebaceous cell carcinoma of left upper eyelid. It is highly malignant, rare neoplasm of eyelid that arises from Meibomian gland, gland of zeis and sebaceous gland of skin. This malignancy is known to have high recurrence rate, highly metastatic potential and also have high rate of mortality. Sebaceous cell carcinoma can also occur in other part of body like head and neck, areas of skin with hair and even in genitals. The patient usually presented with painful swelling which was insidious in onset and rapidly progressive and not resolved with medication.

KEYWORDS: *Eyelid, Rare Cancer, Sebaceous Cell Carcinoma*

INTRODUCTION

Case Report: A 66 year old female patient presented in Radiation Oncology, Government Medical College and Hospital, Chandigarh (India) with painful swelling over left upper eyelid. The swelling was insidious in onset, progressive and associated with pain which was moderate in character, non-radiating and not relived with medication. Local excision of left upper eyelid mass was done which showed sebaceous cell carcinoma of left upper eyelid mass. On biopsy deep resection margin plane showed microscopic involvement of tumour, lateral and anterior margin were free of tumour.

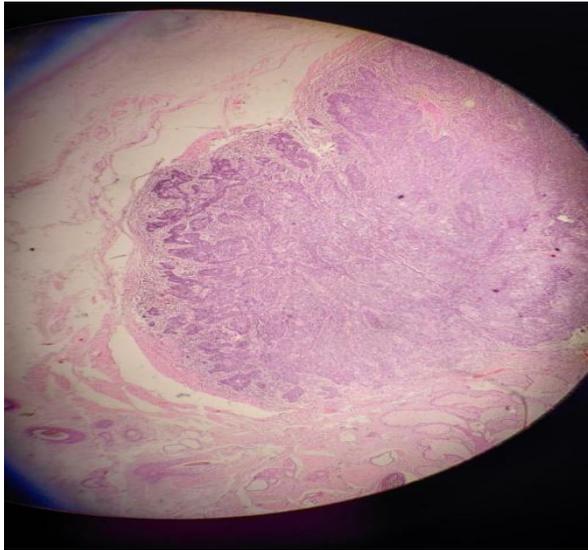

Fig 1: shows tumour arranged in lobules and nests cell rising from over line conjunctival glands (200X).

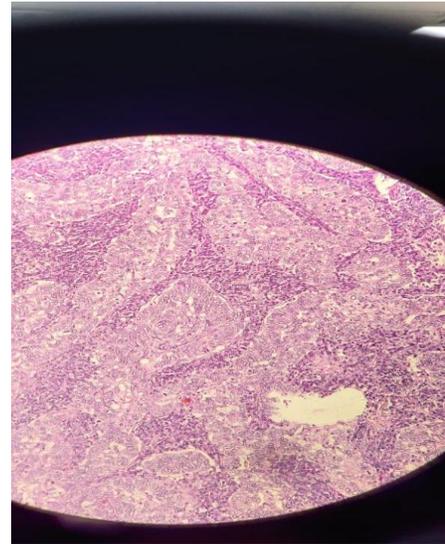

Fig 2: shows tumour comprises of 2 types of One foamy cell with vesicular nuclear Chromatin with conspicuous nucleolus And another one small cell with scanty Cytoplasm and hyper chromatin nuclei.

DISCUSSION

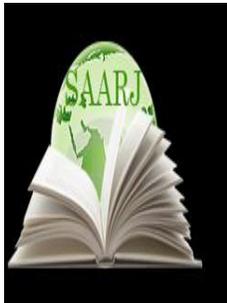

Sebaceous cell carcinoma is a rare entity, highly malignant neoplasm. It is associated with high mortality and high recurrent rate. On histopathology it showed 2 populations of cells, one being undifferentiated cell present at the periphery and mature sebaceous cell present at the centre. The undifferentiated cell showed moderate to marked pleomorphism, coarse chromatin and scant to moderate amount of eosinophilic cytoplasm. The detailed clinical history and careful examination of patient is useful in making the diagnosis. There is high tendency of sebaceous cell carcinoma to recur and metastasis. It is highly lethal tumour. In this case local excision of mass of left upper eyelid was done, but there was not any evidence of distant metastasis. The deep resection plane (medial and nasal margin) showed microscopic involvement of tumour, while lateral and anterior margin were free of tumour. The recommended treatment of sebaceous cell carcinoma of eyelid is complete excision of lid with reconstruction of eyelid using flaps. But this neoplasm is known to show local recurrence so patient is continued in regular follow up.

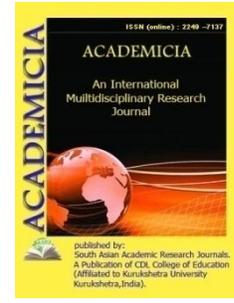

Picture 1: swelling over upper eyelid

CONCLUSION

Due to rarity of sebaceous cell carcinoma of eyelid, there are not set guidelines for the management of such cancers. However, complete excision of mass with negative margins and radiation recommended in some studies. Thus, further reporting and literature review will help in establishing the effective positive treatment guidelines.

ABSTRACT

Novelty, innovation, creativity, these terms and their description is the core aspect of today's developing era. In terms of technology, they occur in every item of human needs. Although technology is used to be seen in devices and items, novelty in teaching, specifically in Teaching English can impact not only the entity but also the life and living. Having appropriate teacher with inductive approach and techniques in language acquisition is highly in demand nowadays. Due to the increasing value of knowing languages, and talking about English, the language famous for becoming Lingua Franca. Currently, English is required not only in learning language but also target language is taught and learnt for various aims. We are more aware about the view when realize the importance of learning English for Specific Purposes. (ESP). Under the requirement of current development, there very few people who either learn English just to know the language or because someone insisted. Hence, high level of language proficiency is the promotion at work, work and travel opportunities, better financial prosperity, better living.

KEYWORDS: *ESP (English for Specific Purposes), inductive, deductive, techniques, methodology, novelty, creativity.*

INTRODUCTION

Have you ever thought of the notion of time exchange? Have you ever analyzed why there are so many comparisons in terms of events through the time? Have you ever thought about traditions and novelties and their impact on human life? Very often I think about the responses I could give

when I am asked by the younger generation. In my opinion, time pass is something which brings the new, new people, new friends, new ideas, new me, and all this news are appeared in connection with the world, the demand to live in the world. The same questions are related to both language teaching and language acquisition. Everything has been changed, teaching methods, techniques, approaches, styles, teachers and even learners. If a teacher was in the center before, now students should be in focus, their learning process, skills, abilities are considered to be the main point, and those techniques and methods are chosen accordingly. This is how language is introduced and this is how teaching process becomes effective. Amparo S., Lardizabal, Alicia S., Bustoz, Lus C. Bucu and Maura G. Tangko (1999), believe that, the more interesting and involving the process is, the better input and output occur. Obviously, imagine you are teaching in two groups, and to teach one these groups you chose traditional way of teaching, the same as deductive, and the other one you teach in communicative way, the same as inductive. In the process of deductive teaching the teacher plays the main role, omitting interaction and all the time explaining everything in detail, on the contrary the second group teaching process includes students' ideas, their predictions, their discussions and debates. There is noise of students explaining each other their views, agreeing and disagreeing with one another, contradiction ideas, all are in one class. In the inductive teaching students are able not only introduce their own ideas, but moreover, they will have opportunity to analyze, recognize and specify their opinions. This is the factor for students utilizing their knowledge not only in the classroom but out of it.

Now, let's imagine how inductive teaching can be beneficial in ESP, the branch of language acquisition which deals with English leaning for specific purposes. ESP is combined with authenticity, reality, and life instructions. In ESP field English is taught strictly according to the needs of learners. Every profession requires diversity of language skills to be developed. Hence, for workers of Hotel Industry speaking, Doctors- reading comprehension, Businessmen- listening, clerks writing and the list is not ended. The main challenge in teaching ESP using inductive approach is to have background knowledge about the occupations English teaching is required. But one more thing to concern, according to the quote of Gloria M. (2006), Who dears to teach must never cease to learn.

METHODOLOGY

Indicating inductive methods in teaching English for specific purposes is tough and necessitates extended competence from a teacher. In this article I am about to demonstrate the methods of teaching English to people of Tourism Industry and Hoteling. The first step of the process is to identify the needs of learners, what position the learners are in, and how often they use the language. Acquiring the new language demands learning words and phrases of the target language. The session should be focused on vocabulary expansion and only after that teacher can go on introducing further data. When a teacher thinks about Needs Analysis, age and gender should be considered. Blenda B. Corpuz (2006) claims that both age and gender, are the issues that run-in equivalent with other factors and severely impact the process of language. Furthermore, equally males and females are fortified with some encoded propensities that would be supportive for them to obtain some aspects of language much quicker and easier. Talking about the age of learners, naturally ESP learners are either adults or young adults, which certify the method selection accurately. Adults are less likely to be involved to some activities, in addition they do not willingly do home assignments. As a teacher one should gather all the

aspects of teaching such as vocabulary introduction, practical activities and home assignment completion in one lesson. Dominantly, time management is the main thing to take into account. ESP teaching course should have framed time and definite course including 3 to 4 months according to the level of learners. Denoting to teaching the learners of the Major we put under the discussion, Tourism Industry and Hoteling, convey that identifies learners' needs should be conducted. The questionnaire embracing the questions like How often do use the target language, how do you better learn languages, what skill of yours is developed in terms of language acquisition and other. Nevertheless, according to Luz C. Bucu (1999), learners should learn and practice all language skills, just focusing on one of them more. This very concept brought to many discussions and arguments which I am going to elaborate further in the next section of the paper.

Two different groups of people holding the positions of receptionists and hotel managers were created to learn the outcome of results. It was 4-month course, including the grammar teaching, expanding vocabulary range of learners and practicing language skills. After identifying needs analysis, vocabulary and grammar structure were to be taught. The course was based on inductive teaching and the teaching techniques were all based on making student centered classes. First, I have to admit that those of this profession were in A1, A2 level. In the group of receptionists, there were 5 females and 3 males; in the other group the learners were only males. During the session visuals were used in maximum in both groups, listening activities were considered. According to the data collected through the convey held earlier, English language acquisition was necessary for them in communication, which meant speaking skills and communicative language teaching should be in focus.

One of the inductive ways to teach vocabulary that was applied, the instruction where students told the words and phrases they used at work in their native language, and teacher made sentences using target words in it, so the students could listen and find the word they need to learn. The most challenging thing in teaching adults is to encourage them to learn the words. Each lesson started with practicing the usage of the new words through diversity of activities. Students were involved in the activities which were based on real estate, for them to use their knowledge out of the class. The classes were divided into sub titles focusing on speech acts, as making a request, asking for something, advising tips, giving directions and instructions, problem solving activities, customer satisfaction, customer services and others. The sub units of each session included vocabulary learning and practicing, language competence in terms of grammar, practicing language skills, accentuating speaking. In order to compare the effect of inductive vs deductive teaching, the results of two different approaches were studied. Analysis were compared in the middle of the course, after sometime of the learners' attendance. The table below illustrates the measurement of learners' achievement in grading system, maximum point is 10(*Table 1*).

TABLE 1

Inductive teaching	Speaking	Vocabulary	Grammar	Listening
Managers	8	7	6	6
Receptionists	8	6	4	6
Deductive teaching				
Managers	6	7	8	5

Receptionists	6	7	8	4
---------------	---	---	---	---

The assessment is performed considering the average acquisition of learners. As is seen from the table, inductive method is beneficial to practice and improve speaking and learning vocabulary, due to the practical value of inductive method, although surprisingly, deductive method impacts better in grammar comprehension. Here comes the argument, if we should omit deductive and traditional methods of teaching.

Inductive teaching could be obliging tools when dealing with vocabulary in the EFL classroom in a number of ways. For example, dealing with authentic terms as connected to the current job they are stranded in may substitute vocabulary maintenance in the long run (Boers, 2000); moreover, raising learners' awareness about the use of those specific words and expressions can positively influence in terms of amplified engagement and faster learning pace (Boers, 2000, 2013; Littlemore, 2009).

DISCUSSION

When someone speaks about advantages and disadvantages, there is always either contradicting ideas or supporting views. In terms of whether inductive methods are effective in teaching there are many views which claims that idea. However, there are opinions where deductive teaching, as well, is described being beneficial aspect of language acquisition.

Realizing communicative skill in a foreign language learning can be seen in developing vocabulary range of learners (Littlemore & Low, 2006), which can appear as knowledge of and ability to use the words and expressions (Littlemore & Low, 2006). Emerging this precise aptitude is crucial for language learners as they need to "make connections between the words they learn and ideas on a regular basis" (Littlemore & Low, 2006: 271). Numerous methods can be followed to assimilate the nature of some terms in the foreign language classroom. Deceiver, (2003) believes that both methods should be utilized in foreign classrooms and explains his idea saying that, a deductive approach comprises overt description on the besieged topic, while an inductive necessitates supervising learners to discover the rules. Bearing in mind those aspects, we can admit an instructional tactic for the inductive teaching belonging to the domain of emotions in an ESP course following deductive and inductive approaches. Main approach ranges from language consciousness, succeeding the limitations of deductive and inductive approaches, to language production, meeting four basic pedagogical settings: input, output, feedback provision and assessment.

Another considerable point was given by Dalisay V. Rigor (2006) claiming that inductive tends are more effective in the long-term teaching, however, deductive is accepted as less time overwhelming, and again it depends on the teacher and the students, their level, knowledge background, skills and abilities.

As is seen through the article, there is no view that traditional teaching should be disappeared, in some aspects of language teaching, instructors should be aware of deductive method and use it in the input process.

CONCLUSION

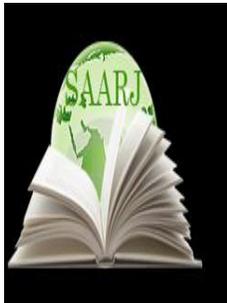

Some people prefer teaching grammar as essential to teaching any foreign language (GTM method supporters), although others assess it as a barrier to second language acquisition (SLA). Even professionals on language teaching from the past and contemporary linguists such as

Stephen Krashen, who claimed: “The effects of grammar teaching... are peripheral and fragile,” appear to be the question that leads to confusion of whether include grammar teaching in second language teaching. This never-ending debate over the practicality and the form of grammar teaching, in which there is no idea that was able to support their privileges with an indisputably definite research, helped to develop plenty of diversity methods and techniques of framing grammar instruction, among which two stand out, namely inductive and deductive method. The theory of the study stated that giving instructions in inductive way is more effective for students with intermediate level of language proficiency. To test this suggestion, a t-test was used to trial the consequence of inductive vs deductive teaching methods, the outcome of which overweighed the usage of neither of the approaches. According to the data collected through the research, since teachers are used to have a ‘favorite’ approach, it is significant to be aware of both approaches and to be able to apply them in appropriate times. Current work’s conclusions subsidize another chapter to the long-lasting dispute over the deductive vs. inductive instructional approach in foreign language pedagogy. The outcomes of the investigation enquiries perform note worthy sign in favor of the effects of both inductive instructional approach and the deductive instructional approach on the learning of learning and practicing language elements, and show a positive trend through which the teachers can get benefit of a amalgamation of both approaches in terms of the ESP, learner profile and setting. It also depends on teacher’s choice of the suitable approach based on learners’ needs analysis in succeeding the best outcome. It validates the idea of Hammerly (1975), who recommended that there are structures which are best taught inductively while others are best taught deductively (17; 105). Fischer (1979) also said in his article that the idea that deduction leads to a higher mark of certainty of grammatical knowledge because it is more rational. I believe that the idea that weaker learners could more effortlessly comprehend a certain structure by being taught about it using the deductive technique is possible. Conceivably it is the case that a certain amount of fundamental knowledge is obligatory for the inductive method to be effective. Moreover, in terms of evaluating language skills, this study focused only on the effects of the deductive and inductive instructional approaches on speaking skills. It is necessary to note as well that this study’s findings relate to one exact level of EFL students. The conclusion of current research work emphasizes the need for further research measuring other skills sufficiently, as well as learners’ motivation and understanding of the lesson. Furthermore, the consequences of this study express that there is a necessity to deem a comparable research with a larger illustration to rise the influence of the data analysis. Finally, research into ways to increase learner motivation during lessons could give further merit to the approaches. Discovering these topics in more detail in the future could develop acquaintance and consideration in the field of EFL/SLA and ESP with esteems to effective methods in teaching ESP students and focus on effective production.

ABSTRACT

Khusaynkuli Sulaymonkuli ugli Mukhsiniy (1860-1917) creatively use many historical and mythological images as Khizr, Jamshid, Farkhod, Majnun, Faridun, Eram, anko (fabulous bird), Kof, peri, Khotam, and Rustam in his lyrical works. In the poetry of Mukhsiniy, along with the worthy continuation of our classical literature traditions, the people skillfully use the images in the oral tradition.

KEYWORDS: *Mythology, Legend, Image, Gazelle, Khizr, Eram, Kof, Djamshid, Khotam, Rustam, Anko.*

INTRODUCTION

The literary of Mukhsiniy heritage plays an important role in the development of the Kokand literary environment during the national revival. The poet himself compiled his poetic works three times and arranged the divan. There is also a manuscript devon by the calligrapher Ali Akhund Khojandi, in which Mukhsiniy's poems were copied. Accordingly, the poet's literary heritage now can be classified as follows: 1) 7392 inventory number stored in Tashkent city O'FASHI museum; 2) 4303 inventory number kept in Ghafur Ghulam literary museum in Kokand; 3) 4131 inventory numbers kept in Ghafur Ghulam literary museum in Kokand; 4) two manuscript sources preserved in the hands of the poet's descendants. In addition, work examples of the poet can be found in the work of Pulatjon domla Kayyumov "Tazkirai Qayyumiy", "History of Khokand and its literature: (materials and memories)."

Lyrical legacy of Mukhsiniy that has come down to us is close to 7,500 verses. The manuscripts of the poet's literary heritage include genres such as ghazal tarjeband, letter, ode, tarikh, rubai, and busy poetic works such as mukhammas, musaddas, musamman. In his lyrical works he duly continued the traditions of classical artists. As an enlightener, he also reflected in his poems the

progressive, topical ideas of his time. Most lyrical works of Mukhsiniy are ghazals. The subject of these poems varies according to the form of expression.

The themes of the poems in Mukhsiniy's manuscripts can be grouped as follows: 1) love songs; 2) poems expressing knowledge and enlightenment; 3) poems on social issues; 4) religious (partially mystical) poems.

In his lyrical works, Mukhsiniy skillfully uses the traditional images of lover, mistress and mourner in our classical literature. In his poems, the poet describes a lover image who bravely overcomes pain and difficulties for his love. In his lyrical poems, he also artistically expresses the lover image who hurts, torments and oppresses the lover heart. It is said that the rival image always prevents the lover from achieving his lover vision. In his lyrics, Mukhsiniy uses the image of historical figures, mythical, mythological images for a specific poetic purpose. One of the peculiarities of Mukhsiniy's poetry is that they widely used folklore examples.

Folk oral art has served as a rich source for artists of all periods. As each writer creates his or her own creative product, a nation with its own long history is nourished by its oral creativity. From it he learns endless ideas, different meanings and applies them to his work. In particular, the representatives of Uzbek classical literature in their work refer to folklore and mythological, legendary images. They bring the concepts that have lived in the oral tradition of the people for thousands years into poetry through metaphors. They use mythological, mythical images for a specific poetic purpose. Khusaynkuli Sulaymonkuli ugli Mukhsiniy (a poet who lived and worked in Kokand in 1860-1917) also creatively uses mythological and legendary images such as Khizr, Iskandar, Jamshid, Farkhod, Majnun, Faridun, Eram, anko, Kof, peri, Khotam, Rustam in his lyrical centuries.

The historical roots of mythological, legendary images go back to Zoroastrianism and Arab-Islamic mythology. Uzbek folklorists have identified several types of mythological, legendary images.

1. "Images related to Zoroastrianism. The historical basis of many mythical images, such as dragon, giant, peri, Semurg, Jomard, Aranja bobo, Akhriman, arangs, Zakhkhok, Siyavush, Khubbi, Ashshadarozi, Sust khotin, Khaydar, which are traditionally used in folklore, goes back to Zoroastrian mythology" [3,33]. The above-mentioned mythological images are the product of the preconceived notions of the Uzbek people about Zoroastrianism.

2. "Traditions of Arab-Islamic mythology. It is known that Movarounnahr began to be conquered by Arabs at the end of the 7th century and this process ended in the middle of the 8th century. As a result, the Islam spread in this country brought to Central Asia the plots, motifs and images belonging to the epic traditions of mythology and folklore of the East peoples. The mythological imaginations of our ancestors are enriched with characters system related to Arab-Islamic mythology. In particular, the first mythologies source such as anko, gin, flower, Adam Ad, Morut, Lot, Manot, Kokhi Kof, Eram is actually in Arabic folklore"[3,33].

It is difficult to understand the essence, meaning and content of the poet's poems without knowing the historical mythological roots, legendary images used in Mukhsiniy's poetry. A collection of poems by the poet "Barhayot gulshan" include poetic forms such as mukhammas, musaddas, mukhammas, and mythological, legendary images in his poems in the mustazad, ghazal genre.

In particular, Mukhsiniy writes in a ghazal:

*Yuz Sikandar, Djamshidin ko'rguzdi mir'oti ruhung,
Bersa gar Djamshid jahonin mengachidur jom lab [1,17].*

In this verse, Sikandar, Djamshid are the names of the legendary kings, who according to legend have ruled their states with justice for a long time. The use of the name of these kings in bytes gave rise to the art of talmekh. The lyrical protagonist of the poem does not sleep until the morning, thinking of his beloved. It doesn't matter if a hundred Sikandar (Alexander) and Djamshid show your soul in the mirror, even if they give you a world ruled by a legendary king like Jamshid. Because the lover lips are as dear to the lover as Jamshid basin. According to legend, the Djamshid basin is magical, and no matter how much you drink, the may inside it will never end. In the lines, the poet describes his love power for his mistress while pointing to this ancient myth.

In his ghazals, Mukhsiniy often refers to Farkhod and Majnun, the heroes of the great poet Alisher Navoi's "Khamsa". The poet compares the lyrical protagonist's love to their love and "argues" with them. This verse in the ghazal poem "no" by Mukhsiniy substantiates our opinion:

*Garcha Farkhod ila Majnun o'lsa, mashhuri jahon,
Rindi rasvolig'da ammon men kabi afsona yoq. [1,23].*

It is known that the images of Farkhod and Majnun are famous in the Muslim East for their love power, their devotion to love. However, in the lyrical protagonist eyes in Mukhsiniy's ghazal, Farkhod exaggerates his mental state by saying that no matter how famous Majnun is in divine and worldly love, they have never been a legend like me in the path of divine love. In this verse, the poet quotes Farkhod and Majnun images in one line and creates a beautiful example of talmekh art.

In another ghazal, Mukhsiniy admits that he is carrying a grief out of love mountain. He insists that if fate puts these sorrows on Farkhod's head, he will not be able to lift it and will hit his tooth with a stone.

*Ko'taram bori g'aming ko'honi, ey shirinlab,
Teshasin urdi toshig'a ko'tarolmay Farkhod. [1,24].*

The poet also mentions the images of Iskandar (Alexander) and Djamshid in his radif ghazal "paper":

*Ayladi zinda hama qissai Iskandaru, Jam,
O'ldi andin hama afsonalar ehyo kog'az [1,25].*

It is clear from the verse content that stories about kings such as Iskandar (Alexander) and Djamshid were woven among different peoples. This is why legends appear and point to being written on paper.

In a poem by Mukhsiniy, he expresses his feelings and thoughts in a byte, quoting not one but three legendary images. The poet's verse is as follows:

Bo'lsa gar bazl ichra Khotam, ramz ichra Rustamiy

Saltanatda misli Jam johu hashamda rif'ati.

Ko'rmadimki bu jahon bir shahsa qilmishdir vafo,

Bu sabadin, Mukhsiniy, dunyog'a qilmam rag'bate. [1,98].

Even if you are as generous as Khotam in sharing gifts, as brave as Rustam in war and struggle, as great as your kingdom, as great as King Djamshid, this mortal world will not be faithful to you, says the poet, expressing his philosophical views. Khotami Toy, known for his generosity, Rustam, who is known for his bravery, substantiates his idea with evidence by creating images of three talmeh in a byte, quoting images of the legendary king Djamshid, who conquered much of the earth. I have seen that this world is not faithful to anyone, so I have also given up the wealth and luxuries of the world, says Mukhsiniy, expressing his psyche.

The poet writes in a poem:

Niholi umringga hayvon suvidin Khizr yetkarsun,

Samumi hajr garchi gulu bargimni hazon etmish [1,42].

The word *sprout* in *life sprout* byte is compared to the human body, and it is understood that this sprout must deliver Khizr water so that it does not die in this world. If you do not drink the water of life, the hot wind of separation will destroy my rose petals. Khizr mentioned in the verse is a mythological image. According to folk mythological thinking, Khizr is a figure who drank the water of life, related to eternal life. According to the legends, Khizr is interpreted as an image that guides the lost on the roads, sponsors people, and eases their plight. Without knowing the essence of the image of Khizr, it is difficult to understand and feel the thoughts and feelings of the poet. In another verse, the poet writes:

Ey, nazokat gulshanida dilbari nozik nihol,

Chashmi Khizr ila yetsun nahli umringa kamol [1,65].

The lover who captivates the lover heart is a charming, delicate sapling of the tenderness garden. The lover wishes the best to his wife. With the holy water of life in the spring of Khizr, he expresses his confession so that his life may be perfected without death. In another poem, Mukhsiniy quotes the legendary Kohi Kof mountain and the image of a bird living on it:

Anqodur, etti Kofi qanoatni ihtiyor,

Bechoraliqg'a, Mukhsiniy, ham aylag'il qone' [1,48].

“Anko is a legendary bird that does not exist but has a name (as if living on the Kohi Kof (Kof) mountain as the king of birds)” [2,53]. In this verse, the poet expresses a unique poetic meaning by quoting two mythological, legendary images at once. The first is the legendary bird, the second is the legendary Kof-mountain. From the byte quoted above, the following meaning is understood. While anko chose to live contentedly on Kof mountain, Mukhsiniy encourages you to be patient in life, saying that you too should be patient in poverty.

In another poem, the poet names the mythological place Eram:

Ko'ribon bu suvrating, ey sanam, hamma hurlari gulshani Eram,

Bu na tarzi tarh, savlatu hasham ham hayrating ila qoladur [1,27].

The lover depicted in Mukhsiniy's lyrics is so beautiful that all the girls in the Eram garden express their feelings in an exaggerated way, saying that they will be amazed at her beauty. The *gulshani Eram* combination in this byte is the name of the legendary garden and passed to the Uzbek classical literature through Arabic mythology.

The lover described in the poet's poems is beautiful in all respects, and his inner world and manners are similar to his appearance:

Hirom aylab chamanda kabki tovusi Eram yang'lig',

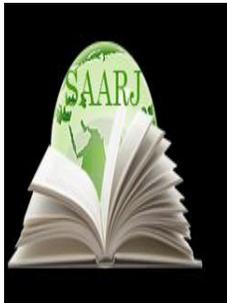

Nazokat gulshanida sarvi husharaftor kelgaymu [1,80].

The mistress's beautiful step in the flower garden is like a peacock and a mountain pheasant walking in the Eram garden. Her manners, which are in harmony with her external beauty, are also "rich in the garden of elegance," a beautiful face, and the lover hopes for her arrival.

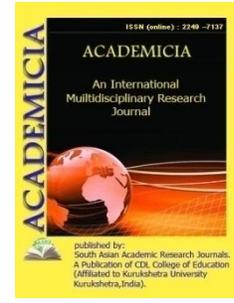

From the above analysis, it is clear that Mukhsiniy skillfully uses mythological, legendary images in his poetry. The poet's wide worldviews, as well as his folklore traditions knowledge, turn to mythical images in order to substantiate his thoughts and feelings in his poems. While some of these images are related to Zoroastrianism, the historical roots of some go back to Arab-Islamic myths. Known and popular in the Muslim East, Farkhod makes extensive use of legendary characters such as Majnun in Mukhsiniy's lyrics. Legendary figures, the patron saint of the Uzbek people's epic thinking, helping people such as Khizr, Djamshid, and the names of mythical places and birds such as Eram and Anko are also expressed in Mukhsiniy's poems. In the lyrics of the poet, along with the worthy continuation of our classical literature traditions, the people skillfully use the mythological, legendary folklore images.

ABSTRACT

Ahmad Tabibiy is one of the most active representatives of Uzbek literature in the late XIX and early XX centuries. He is known as a natural translator, dosonavis, tazkiranavis. He continued the classical literary tradition with dignity and composed five poetic Devonian works. At the moment, the sources of the poet's works are stored in various libraries and funds of the republic.

KEYWORDS: Akhmad Tabiby, Handwrite, Litographe, Fund, Poet, Poem, Devon, Proceedings, Bayoz, Source, Text, Genre.

INTRODUCTION

The end of the XIX - beginning of the XX century is significant in that it left an important mark not only in the socio-political life, but also in the spiritual and literary life. News in the spiritual and literary sphere is especially vivid in the literary environment of Khiva. This can be explained by the huge achievements in the field of artistic creation. Ahmad Tabibi is one of the artists who made a great contribution to the development of our national literature in the late XIX - early XX centuries.

Ahmad Tabibi created in almost all genres of our classical literature, leaving a rich literary heritage. After all, he duly continued the classical literary traditions, writing analogies to the Persian and Turkic predecessors in accordance with the tradition. He demonstrated his poetic talent by writing analogies to the poems of contemporary poets as beautiful and unique examples of lyrical art were completed. The main theme of his medical lyrics is love. The poet is important in terms of the content, melody, formal diversity, richness of artistic means of romantic poems. The content of his lyrical works consists of the ideas of true love, boundless devotion to

the land, struggle with emigration, enduring any suffering and reaching his guardianship. The poet thinks deeply about love, regarding it as a lofty virtue. The poet's poems depict the beauty of a friend, the pain of a lover, pain, sorrow, complaint, despair. In the work of the poet, the lyrical hero is sometimes in love with the beauty of the mistress, and sometimes fascinated by the spiritual image of the mistress.

THE MAIN PART

It is known that the physician arranged five poetic divans. In particular, his divans "Tuhfatu-s-sulton", "Munisu-l-ushshaq", "Hayratu-l-oshiqin" consist of lyrical works in Turkish, "Mir'atu-l-ishq" and "Mahzaru-l-ishtiyiq". The poet's works in Persian-Tajik language are collected in his divans. In addition, the poet wrote an Uzbek poetic version of the epic "Vomiq and Azro". He translated the work of the Azerbaijani poet Muhammad Fuzuli "Haft Jam" from Persian into Uzbek. Influenced by this translation, he wrote his work "Seven ravzas" and compiled a collection of Khorezmian poets.¹

Information about the life and work of Ahmad Tabibi is also given in the book "Chrestomathy of the history of Uzbek literature", compiled in 1945, by Rahmat Majidi "Uzbek literature". Also, Doctor of Philology M.Yunusov's "Komil Khorezmiy" (T., 1960), V.Mirzaev's "Avaz Otari o'g'li" (T., 1961), Professor G.Karimov's "History of Uzbek literature" (third book, T., 1987) also contains information about Ahmad Tabibi. In addition, in almost all scientific research related to the literary environment of Khorezm in the second half of the XIX century and the beginning of the XX century, the work of its representatives, opinions and comments on the work of Ahmad Tabibi are given.

However, the creative legacy of Ahmad Tabibi has not yet been fully explored. Even in the biographical information of the poet there is no uniformity. This requires scientific research on the poet's literary heritage. Work in this area is required, first of all, in the field of literary sources and textual studies. Because Tabibi's works are almost non-existent.

In the history of our literature, the famous literary critic Fatkhulla Ganikhodjaev created a study on the life and work of Ahmad Tabibi. In his research, the scientist studied the life of the doctor, his works, their sources, the scope of genres of the poet's work, the topic

- provides valuable information on issues such as content, literary influence. It is especially noteworthy that the scientist identified more than 20 available manuscripts and lithographs, and carefully studied them. However, further research suggests that work in this area should be continued. In particular, these are explained by:
- from the works of the poet, who arranged five devons
- the number of those prepared is less than fifty. About 30 published poems are presented in the form of samples;

A complete collection of sources on the life and work of Ahmad Tabibi no Some information about the poet's biography should be summarized and clarified; Sources (collection and.) Where samples of medical creativity are encountered bayozlar) not fully studied and summarized; one of the poet's Turkic devons, Tuhfatu-s-sultan

The fate is unknown. The following information of the literary scholar Fatkhulla Ganikhodjaev is noteworthy in this regard:The first office of the doctor "Tuhfatus-sultan" is kept in the house-

museum of AS Semyonov in Dushanbe, several manuscripts and lithographs of the other four offices are kept in the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of Uzbekistan. The only mentioned copy of Tuhfatu-s-sultan was copied in 1328 (1910) by the secretary Muhammad Yaqub Devon ibn Usta Qurbonniyaz Khorezmi. The work consists of 464 pages. The poet's second divan "Munisul-ushshaq" (Friend of Lovers) was written in Uzbek and copied in 1327 (1909) by the secretary Bobojon Tarro ibn Abdulaziz Makhsum. The work consists of 382 pages. A complete copy of this manuscript was printed in 1328 (1910) in Khiva. The third divan of the doctor "Mir'atul-ishq" (Mirror of Love) is written in Persian-Tajik language. It was copied in 1327 (1909) by the secretary Mulla Ibrahim ibn Domla Qalandarhoji. The work consists of 204 pages. This copy of the manuscript was also printed in lithography in Khiva. The poet's divan "Hayratul-oshiqin" (Wonder of lovers) is written in Uzbek. It was copied in 1326 (1908) by the secretary Babajan Tarro ibn Abdulaziz Mahsum. The manuscript consists of 490 pages. The last divan of the physician, Mazharul-ishtiyag (Place of Passion), was written in Persian-Tajik and was copied in 1327 (1909) by the secretary Mulla Ibrahim ibn Domla Qalandarhaji. The work consists of 550 pages. This copy of the manuscript was also printed in lithography in Khiva. The whole literary heritage of the doctor, including his devons, was copied and published during the last years of the poet's life, ie 1906-1910. Prior to that, Tabibi's lyrical works were included in various bayoz composed at that time. In addition, there were separate collections that included only the Medical Gazelles. For example, in a manuscript collection compiled in 1906 by the secretary Muhammad Yaqub Devon, Tabibi has 173 Uzbek and Tajik ghazals. Also, in 1907, Muhammad Sharif compiled three more collections of Uzbek ghazals by Devon Tabibi. They include 480 poems of the poet².

In addition, inventory number №1127 "Bayozi muhammasot", №1129 inventory number "Bayozi muhammasot", №1131 inventory number "Bayozi muhammasot", №1133 inventory "Bayozi muhammasot", №1133 inventory number "Bayozi muhammasot", №1133 inventory number, №1182 inventory number "Bayozi ash'or", №1190 inventory number "Bayozi ash'or", №1196 inventory number "Bayozi ash'or", №2024 inventory number bayoz also included samples of medical creations.

A source of medical poems is also kept in the State Museum of Literature of the Russian Federation. The storage number of this manuscript is №243. The volume of the manuscript is 366 pages. The secretary of this bayoz is Muhammad Sharif Devon. At the end of the manuscript is information that it was completed in 1325 (1907) by Secretary Muhammad Sharif Devon. Literary critic Fatkhulla Ganikhodjaev has used this source in his above-mentioned research. That is, the scientist owns in quoting his remarks, he quoted passages from the poems of the poet in this bayoz. Our recent observations show that the places used in this bayoz need to be corrected, albeit in a small way. In particular, there are text errors in the extracts, some inconsistencies in the presentation of the pages.

This collection consists only of gazelles. The collection includes 200 ghazals by Ahmad Tabibi, which are not found in any other genre of poetry. The last poem in the collection ends with a radiant ghazal "This Day". This is a gazelle

Ваҳким ул ой ҳижронидин ранжим фаровондур бу кун,

Ғам касрати бирла манга хотир паришондур бу кун, - starting with the matla:

Сен чек, Табибий, зам аро беморлигким ишқ аро,

Лаъли лаби ўзга киши дардига дармондур бу кун, -

ends with praise.

On the last page of the collection, in blue ink, “I present this book to the Institute of Literature of the Academy of Sciences of Uzbekistan. Ghafur Ghulam. 26 / 9.57. ” There is a note

An analysis of the lyrical works in this collection shows that most of the poems were written in the form and content as analogies to the works of Mir Alisher Navoi. According to the observations, Tabibi tied 1 muhammas from Khorezm poets to Nishati, 8 to Munis, 12 to Ogahi, 2 to Kamil, 2 to Avaz, 5 to Roji, 2 to Mirzo, 3 to Doi and Niyazi.

The poet also wrote more than 20 ghazals of Navoi. In particular, Navoi's "Hikmati", "Bolsa", "Aylasa", "Bolubdur", "Kerak", "Aylarman", "Ollida", "Tuz", "Bolmangiz", "Hanuz", "Sormangiz", "Aylab", Muhammad in his ghazals ending with radifs and rhymes such as “Anga”, “Khurram”, “Bolmas”. It is also known that the poet connected muhammas in Persian-Tajik language to the poems of Saadi, Jami, Zebunniso and Mirza Galib. When we look at the work of the poet, love, truth and justice, devotion lead in his work. However, there are examples of his work that glorify science and enlightenment, and this series of works is very close in content to the works of Muqimi and Furqat. A complete collection of sources of Ahmad Tabibi's works, a comparative and textual study of them, a full study of the poet's work, an analysis of his lyrical works will undoubtedly expand this information. In this regard, the literary critic F. Ganikhojaev in his study of Tabibi in the office of the poet "Munisu-l-ushshaq" 53, in the office "Hayratu-l-oshiqin" 114, in the office "Tuhfatu-s-sultan" 14, "Mir'atu-l-ishq" There are 86 muhammas in the Mazharu-l-ishtiyaq office and 125 in the 5 divans. Of these, 307 are written in Turkish and 211 in Persian. This information, that is, the number of Tabibi muhammas is 518, is noted by the literary critic S. Matkarimova. However, the number of muhammas quoted by F. Ganikhodjaev is 392. For some reason, the number of muhammas is misrepresented as 518 or the sources of the remaining muhammas are not indicated.

Ahmad Tabibi compiled a tazkira on the instructions of Feruz. Although the Majmuai si shuaro'i payravi Feruzshahiy was compiled according to the king's instructions, the source that inspired the writing of the complex is undoubtedly Majolisu-n-nafois. In particular, the literary critic Salomat Matkarimova's "Muzakkiri ashob" (Remembrance of the Interlocutors), Hasankhoja Nisari's "Muzakkir ul-ahbob" (Remembrance of Friends), Mutribi Samarkandi's "Tazkirat ush-Tuhfat ul-ahbob" (Gift of Friends), Fazli's "Majmuai Shoiron" (Collection of Poets) and Navoi's traditions were creatively continued. The tazkirs composed by the doctor are also a shining example of this inheritance," he said.

Tabibi's epic activity

Tabibi contributed to the development of Uzbek epic poetry with his works "Vomiq and Azro", "Seven ravza", "Nozir and Manzur". In these works of the poet, high human qualities such as love, devotion to the Motherland, land, friend, mutual trust, justice in the state and society, knowledge, morality, education, patience, friendship of peoples are glorified. Getting acquainted with the text of medical epics inevitably reminds of Alisher Navoi's works "Lisonu-t-tayr", "Mahbubu-l-qulub". In particular, the poet's epics are imagined as a logical continuation of the epics of Navoi "Khamsa". After all, in the text of these epics you can find examples from Navoi "Khamsa".

In particular, the poet logically continues Navoi's attitude to science in his epic "Yetti ravza". The second chapter of the work ("Yetti ravza") is devoted to the issues of knowledge and enlightenment, in which the poet states that a person should always strive to acquire knowledge and enlightenment, and that a scholar should be honored. At the end of the chapter, the story of "Imam Fakhr Razi and Sultan Muhammad Khorezmshah" in Alisher Navoi's "Khamsa" is sung. In the third ravza of the work, the poet thinks about the harm of greed and the benefits of contentment.

Ahmad Tabibi's epic "Vomiq va Azro" is reminiscent of Navoi's "Layli and Majnun", "Farhod and Shirin" from "Khamsa". The image of Mehinbonu quoted by Tabibi in the epic is very similar to Navoi's Mehinbonus with his wisdom, intelligence and advice. Also, the style of expression of the epic is almost the same as the style of the epic "Farhod and Shirin".

Tabibiy - tazkiranavis

Ahmad Tabibi composed the tazkira on the instructions of Feruz. Although the Majmuayi si shu'arayi payravi Feruzshahiy was compiled according to the king's instructions, the source that inspired the writing of the complex is undoubtedly Majolisu-n-nafois. In particular, the literary critic S. Matkarimova's "Muzakkiri ashob" (Remembrance of the Interlocutors), Hasankhoja Nisari's "Muzakkir ul-ahbob" (Remembrance of friends), Mutribi Samarkandi's "Tazkirat ush-Navoi's traditions were creatively continued in Tuhfat ul-Ahbob (Gift of Friends) and Fazli's Majmuayi Shoiron (Collection of Poets). The tazkirs composed by the doctor are also a shining example of this inheritance," he said.

A manuscript copy of the tazkira "Majmuayi si shu'aroyi payravi Feruzshohiy" is stored in the fund of the Institute of Oriental Studies named after Abu Rayhon Beruni of the Academy of Sciences of Uzbekistan with inventory number №1152. This manuscript copy of Tabibi's commentary is very large in size. The text of this source begins with "basmala" and a poetic preface. The volume of the preface is 300 verses. The first verse in the tazkira begins with a 12-byte masnavi and Feruz's "appeared" radifi ghazal. It is known that this source also includes the poet's own poems. It should be noted that although some research has been done on tazkira, the textual study of this source has not been fully completed.

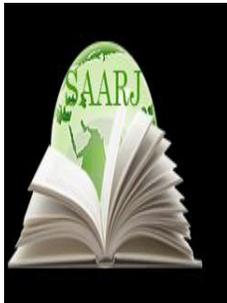

CONCLUSION

Tabibi contributed to the development of Uzbek epic poetry with his works "Vomiq and Azro", "Seven ravza", "Nozir and Manzur". In these works of the poet, high human qualities such as love, devotion to the Motherland, land, friend, mutual trust, justice in the state and society, knowledge, morality, education, patience, friendship of peoples are glorified. Getting acquainted with the text of medical epics inevitably reminds of Alisher Navoi's works "Lisonu-t-tayr", "Mahbubu-l-qulub". In particular, the poet's epics are imagined as a logical continuation of the epics of Navoi "Khamsa". After all, in the text of these epics you can find examples from Navoi "Khamsa".

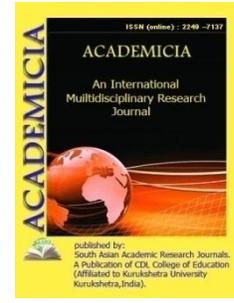

In short, Tabibi's lyrical heritage is classified according to the genre. , muashshar, bahri tavil. This indicates that the poet's work is subject to extensive research.

IRANIAN PUBLICATIONS OF ALISHER NAVOI'S WORKS

Parviz Inoyatillaevich Izzatillaev*

*Doctoral student (PhD)

Tashkent state university of Uzbek language and literature named after Alisher Navoi, Tashkent,
 UZBEKISTAN

Email id-xusraveparviz@mail.ru

ABSTRACT

Alisher Navoi chose the nickname "foniy" in Persian poetry, and worked hard in this language, though not in the same way as in Turkish. In this context, the Iranians respect Alisher Navoi as much as their own poets. It should be noted that the Iranian poet, one of the representatives of "SabkiKhindi" - SoyibTabriziy was a follower of the Turkic poets Alisher Navoi and Fuzuliy in Persian poetry.

KEYWORDS: *Iranian Navoi Studies, Fakhriy Khiravi, "Latoyifnoma", Kazniviy, "Khasht-Bikhisht", Aliasgarkhikmat, "Divanifoniy", "Sanglokh", "Maboniul-Lugot", "Khulosaiabbosi".*

INTRODUCTION

In this article, we will try to provide information in order about Navoiologist scholars and their published books, mainly on the life and work of Navoi in Iran over the last 80 years.

1. Ali Asgar Khikmat

The Turkic text of "Majolis un-nafois" several copies are studied comparatively in 1961 by an Uzbek Navoiologist Suyuma Ganieva, and published in Tashkent. Veteran Hiravi's "Latoyifnoma" was first published in 1908 in Tashkent and a second edition by Dr. Sayyid Abdullakh in Pakistan in 1931-1933. In Iran, Ali Asgar Khikmat, a well-known scholar, was the first to do so.

Ali Asgar Khikmat in 1944AD (1323Hijri lunar year (Muslim year chronology), he published Fakhri's "Latoyifnoma" and Khakimshakh Kazvini's "Khasht bikhisht" in Tekhran, and thus literally lays the cornerstone of "Iranian Navoi studies". The book was republished in Iran for the second time in 1984AD (1363Hijri lunar year (Muslim year chronology), at the request of fans, forty years later.

2. Rukniddin Khumoyun Farrukh

Rukniddin Khumayun Farrukh is undoubtedly one of the Navoiologist scholars who made a great contribution to the popularization of Alisher Navoi's works among the Iranian people.

Alisher Navoi's "Devoniyfoni" was first published in Iran by RukniddinKhumayun Farrukh with edits, forewords and appendices in 1963AD (1342 Hijri lunar year (Muslim year chronology)) was published by "Sino" publishing house under the title "DevoniFoniy".

As, this work aroused the interest of the fans, at their request in 1996AD(1342 Hijri lunar year (Muslim year chronology)) it was reprinted in 3,000 copies by "Asotir" publishing house. Selected poems from this collection were published in 1993 by Ali Mukhammadi[1:54].

For more information, let's talk about other editions of "Devoni Foni". After the publication of Rukniddin Khumayun Farrukh, the poems selected from the divan by the Tajik scholar Ali Mukhammadi in 1993 were published on 317 pages in Dushanbe, in 1974 AD(1395Hijri lunar year (Muslim year chronology)), it was published in Persian in Kabul by Said Abbas Rastokhiz Sonchoraki in Persian with an introduction by Sayyid Reza Bakiriyani Muvakhkhid on 418 pages.

3. Mukhammad Nakhjuvoni/Mekhdi Farkhoni Munfarid

Mukhammad Nakhjuvoni was the first in Iran to translate "Khamsat ul-mutakhayyirin" from Turkish into Persian in 1940AD (1342Hijri lunar year (Muslim year chronology)), and a copy of it is kept in the library of the Literature Faculty of Tekhran University under the number 111.

A copy of "Khamsat ul-mutakhayyirin" translated into Persian by Mukhammad Nakhjuvoni is kept in the library of the Literature Faculty of Tekhran University under the number 111, this translation is with a foreword, appendices and some corrections by another Iranian Navoiologist scholar, Mekhdi Farkhani published in the supplement of the 12th issue of "Nomai Farkhangiston" magazine in June 2002 AD (1381Hijri lunar year (Muslim year chronology)).

4. Khusein Mukhammadzoda Sadik (Khusein Duzgun)

Dr. Mukhammadzoda Sadik has published the following books about Alisher Navoi:

a) Mukhokamat ul-lugatayn

Dr. Sadik prepared Alisher Navoi's famous work "Mukhokamat ul-lugatayn" translated into Persian by Turkhan Ganjavi and published it in "Akhtar" publishing house in Tabriz in 2009-2010. In this work, Navoi compares the possibilities and advantages of the Turkic and Persian languages. The text of this work was published in Paris in 1841, in Kokand in 1917, in Ashgabat in 1925, and in Tekhran in 1948-1949, translated into Persian by TurkhanGanjavi[2:222-224]. Before that, Sheikh Makhmud Kashgari, by writing his work "Divoni lugat-at-turk", put the Turkish and Arabic languages face to face and revealed their opportunities and advantages. Four centuries later, Alisher Navoi, with this work, continued this linguistic debate on the example of another language, Persian.

A manuscript of "Mukhokamat ul-lugatayn" without the order number and date of copying is kept in the "Sakit ul-Islam" library in Tabriz and is also known as "Mukhokamat ul-lugatayn" and "Al-mukhomat bayn al-lugatayn".

b) Sanglokh

One of the most important works of Dr. Sadik is that he published a dictionary of Amir Alisher Navoi's works –“Sanglokh” with his edition, preface and appendices and presented it to the scholars. The importance of this work can also be seen in the fact that it was published after 10 years of hard work. Mukhammadzoda Sadik writes in the introduction to the book: “Sanglokh is a Turkish-Persian dictionary that contains difficult words from the poems of Amir Alisher Navoi, the knowledgeable and wise minister of Khussein Boykaro (1496-1506). This book was written by Nadirshakh Afshor's "Munshiy ul-mamolik" by Mirzo Mekhdikhan Astrobodi in 1758-1760 AD (1172-1173 Hijri lunar year (Muslim year chronology)) [3:41].

c) Maboni ul-lugat

This book was published separately in 2017 by Mukhammadzoda Sadik on 480 pages. The author of the edition and additions writes in the introduction: Mirzo Mekhdikhan Astrobodi's work "Maboni ul-lugat" is an independent treatise, the grammatical rules of the Turkic-Chigatay language, the rules of writing, and Alisher Navoi's Turkish (Uzbek) poems were written to better understand them. The author cites this book as part of the Turkish-Persian dictionary “Sanglokh”, but most of the copyists knew it as a preface to the “Sanglokh” commentary dictionary and added it to the book "[4:97]. Manuscripts of this work are available both separately and as an introduction to “Sanglokh”. Mukhammadzoda Sadik compares and edits some of these copies and publishes them.

e) Tazyil

The book was published in Iran in 2017 by 336 pages by the "glory foundation". Mukhammadzoda Sadik, who prepared the publication, writes in the introduction: «This book is a part of Mirzo Mekhdikhan Astrobodi's dictionary "Sanglokh", it explains the meaning of Persian words and terms used in the works of Alisher Navoi. In interpreting the words, the author often used examples and evidence from the Turkish works of Alisher Navoi, and sometimes from the Persian works. Astrobodi said he began writing “Sanglokh” after reading 12 volumes poetry and 9 volumes prose by Alisher Navoi» [3:41].

f) Mezon ul-avzon

Khussein Mukhammadzoda Sadik translated another work by Amir Alisher Navoi, “Mizon ul-Avzon”, into Persian and published it in 2013 at “Takderakht” publishing house in Tekhran.

Originally published in 1993 in Ankara by Dr. Kemal Arslan, the book compares seven original Turkic-Chigatoy copies. One copy of that book is kept in the Tekhran central library under serial number 237. Dr. Sadik translated the work into Persian with some modifications, using manuscripts of the work as well as a copy published in Ankara. Regarding the translation, he writes:

5. *ترجمه ی فارسی این جانب متکی به آیین متن است و سعی کرده ام در آن شیوه ی نگارش امیر علیشیر نوایی را حفظ کنم.*

"The Persian translation was based on this text, and it tried to preserve the creative style of Amir Alisher Navoi as much as possible" [5:55-56].

Two copies of “Mezon ul-Avzon” are kept in Iran. One is kept under the number 5/1604 in the National Library of Tekhran, and the other is kept under the number 1/237 in the library of the Literature Faculty of Tekhran University.

j) Conclusion of Abbasi

Navoi's works in Turkish language began to be read at literary evenings in Iran, especially during the reign of Nadirshakh Afshar, and encouraged those who attended literary evenings to refer to the “Sanglokh” dictionary again and again.

However, “Sanglokh” was a large book, making it difficult to use. To solve this problem, several lexicographers began to shorten the dictionary and write in a simpler language. As a result, during the reign of Abbas Mirza, one of the Kajars, the book "Conclusion of Abbas" was published.

The book "Summary of Abbas" was written by Khakimshakh Mukhammad Khuyi at the suggestion of Abbas Mirzo in Tabriz with the abbreviation and some modification of the "Sanglokh" dictionary.

This work was published in Iran by Mukhammadzadeh Sadik and was well received by the Iranian literary community.

5. Bekhbud Murodiy (Elchibek)

Bekhbud Murodiy, better known as Elchibek, published Navoi's books:

a) Navodirush-shabab

"Navodirush-shabab" is one of Navoi's four Turkic divans, and Bekhbud Murodiy translated it into Azerbaijan Turkish and published it in Iran.

b) Divan of Turkish poetry

After the publication of "Navodirush-shabab" by Bekhbud Murodiy, in 2014 he collected 176 pages of selected poems of Navoi in one book, and published under the title "Divan of Turkish poetry".

c) Fatkhalikh on dictionary - Atrocia dictionary

This work was written in Persian by Fatkhali bin Kalabali Kazvini Siponlu during the reign of Fatkhalishakh, the ruler of Kajar. Navoiologist scholars Ogokh Sirri Lavand and Abdullakh Korgar named this book "Bakhjat ul-lugat"[4:102].

Bekhbud Murodiy found one of the copies of this book and published it in 2017 in Kum.

6. Ravshan Khayoviy

This book was published by Ravshan Khayavi (Rakhmonpur Akbar) in 1996 in Tekhran by “Markaz” publishing house. The first part of “Sanglokh”, that is, “Maboni ul-lugat”, all the poems, examples and arguments, and the third part of “Sanglokh”, “Tazyil” are not included in this book. Despite the fact that the book has been published, most Iranian Navoiologist scholars are unaware of its existence.

7. Bakhman Akbariy

Bakhman Akbariy, together with Uzbek Navoiologist scholar Suyuma Ganieva, will publish Alisher Navoi's "Nazm ul-Javakhir in Iran.

This small book is in fact a translation of "Nasr ul-Laoliy", which contains the words of Khazrat Ali, Navoi renamed it "Nazm ul-Javakhir". In this treatise, Alisher Navoi translated 266 educational words of Khazrat Ali into Uzbek in the form of rubai.

The Turkish-Uzbek text of the book was published in "Al-Makhdi" publishing house of Iran in 2009 with a Persian and English translation by Bakhman Akbari and a Russian translation by Suyuma Ganieva.

8. Dr. Nemati Limoiy

Amir Nemati Limoiy is undoubtedly one of the most prolific researchers of Navoi today, who has devoted himself to the study of Navoi's life and work, translating his works into Persian and preparing them for publication in Persian.

Dr. Nemati Limoiy has published the following books related to Navoi and his writings:

a) A study of the political life, scientific, cultural, social and economic activities of Amir Alisher Navoi.

In 2015, the Iranian historian Amir Nemati Limoiy published a 11-chapter, 374-page book entitled "A study of the political life and scientific, cultural, social, and economic activities of Amir Alisher Navoi." In this book, the researcher thinks objectively, based on historical facts, such as the situation before Alisher Navoi's birth, the birth of the poet, his influence on the political process, his writings, how he died.

b) Risolai Mufradot (darfannimuammo)

The authors of the publication, Amir Nemati Limoiy and Mekhdi Kasimniyo, will publish Alisher Navoi's "Risolai Mufradot" in two copies - one is a photographed version of a manuscript published in Uzbekistan in 1968, the second was published in Uzbekistan in a 20-volume collection of works by Alisher Navoi in 2016 in the Persian alphabet, without any changes, using copies from the National library of Uzbekistan. It should also be noted that the two copies they used differ from each other in terms of text.

c) Munojotnoma

Alisher Navoi's "Munojotnoma" was published in 2017 with translations by Amir Nemati Limoiy and Mekhdi Kasimniyo, as well as with an introduction, appendix and commentary. As noted by the authors in the book preface, used two published copies - the first book were published in 16 volumes of Alisher Navoi's "Complete works" published in Uzbekistan, the second is an English translation of "Munojotnoma" by Uzbek scholar Suyima Ganieva.

9. Parvizbigi Khabibobodiy

Parvizbigi Khabibobodiy took Alisher Navoi's "Majolis un-nafois" as a separate topic and conducted research on it, and published the study results in 2010 at the "Sipekhr" publishing house in Tekhran, entitled "Reflections on the Majolis un-nafoistazkira".

10. Khodiy Bidakiy

Khodiy Bidaki, an Iranian Navoiologist scholar, has been working on Alisher Navoi since 2014 and performed the following work:

He published several articles in the articles collection of Alisher Navoi International Conference held at Firdavsi University in Mashkhad in 2014, "Descriptive-critical bibliography of Amir Alisher Navoi, in 2015, in the "Scientific research in the history of literature" journal of Shakhid Bekheshti University in Tekhran "The need to critically correct the work of Fakhriy Khiraviy Latayifnoma", in 2017, in the scientific journal "New studies" of Firdavsi University in Mashkhad "Critical study of the Majolis un-nafois poets reflected in Urafot ul-ashik", in 2017, in the "Research journal of literary sciences" of Kum University entitled "The second translation study of the work of Amir Alisher Navoi's Majolis un-nafois."

In 2018, he successfully defended his doctoral dissertation "The study of the literary environment of Kherat in Timurid period on the basis of the Fakhriy Khiravi work "Latoyifnoma"" at Firdavsi University in Mashkhad and published it in a pamphlet form.

This year, Khodiy Bidaki with his introduction, edits, comments and appendices published Fakhri Khiravi's work "Latoyifnoma" in collaboration with the Makhmud Afshor foundation and the "Sukhan" publishing house and it is right in surmise that this work was another great step in Iranian Navoi studies. This year, Kazviniy published a Persian translation of the Majolis un-nafois "Khasht Bikhish", with his introduction, edits, comments and appendices in collaboration with Makhmud Afshor foundation and "Sukhan" publishing house.

11. Munira Mukhammaddodiy

Navoi wrote a work called "Turkish Munshaot", but there is no information about the existence of his work "Persian Munshaot". However, his letters to others are found in this or that historical book.

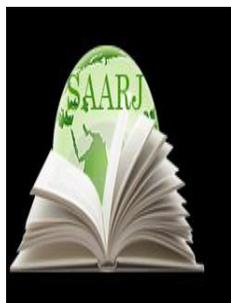

Munira Mukhammaddodiy, under the guidance of her teacher Mukhammadzoda Sadik, collected these letters and until now i.e. in 2015 AD (1394 Hijri lunar year (Muslim year chronology)), she published "Munshaotiforsii Navoi" at "Takderakht" publishing house in Tekhran.

Indeed, the services scientist-Navoiologists such as Ali Asgar Hikmat, Rukniddin Humoyun Farrukh, Mekhdi Farkhoni Munfarid, Mukhammadzoda Sadik, Nemati Limoiyand Khadi Bidaki are invaluable in writing books about Navoi's life and work, publishing the poet's works in Persian, translating his writings from Turkish into Persian and conveying them to Iranian readers. The growing interest in Navoi's works in Iran in recent years is paving the way for the further expansion of the Iranian school of Navoi studies.

ABSTRACT

The study of milk yield of One-humped camels in the northern red sands of the Republic of Karakalpakstan in the age group of animals, from the age of 3 to 21 years. Studying the constitutional types of single-humped camels and determining their dependence on milk yield. Determining the dependence of the milking season of camels on the seasons by months. Here are given additional feeding rations for camels and the increase of scientific basis of milk production, milk yield selection are the content of the article.

KEYWORDS: *One-humped camels, milk yield, camel age, camel constitution, supplementary feed, ration, season, lactation*

INTRODUCTION

Nowadays Afghanistan, Namibia, South Africa, Australia, Argentina, and Mongolia are among the main countries in the world engaged in camel breeding. In these countries, a number of scientific studies have been conducted to increase the productivity of camels to a certain extent and to improve their pedigree.

Today, among Central Asian countries in the Republics of Kazakhstan, Uzbekistan, and Turkmenistan, mainly single and double-humped camels are bred.

In these countries, a lot of work has been done about the scientific study of the biological and productive characteristics of camels.

Today, as a result of scientific research in order to increase the genetic and productive potential of camels, there are paid more attention to productivity indicators, and meat, milk, and wool productivity are increased by breeding. [1, p.35-38].

In the Republic of Uzbekistan, camels are mainly engaged in the northern red sands of the Republic of Karakalpakstan. Currently, the total number of single and double-humped camels in the Republic of Karakalpakstan is 4429.

Camels are resistant to hot climates and long-term drought, and camels are the most important and useful industry in desert livestock. This is due to the fact that it is one of the main industries in the development of desert areas, in providing the local population with food (meat, dairy), which is resistant to the harsh continental climate, and in providing the industry with raw wool.

The creation of high-yielding camel herds and breeding lines in the northern red sands region of the Republic of Karakalpakstan is a topical issue today.

Therefore, the need to develop new methods of increasing productivity in the field of camel breeding is a matter of urgency. In a market economy, the growing demand for livestock products is claimed using new methods which include camel breeding, standard feeding, effective environmentally friendly production technologies, and increasing the number of camels.

Currently, there are more than 4.9 thousand dromedary camels in the Republic of Karakalpakstan, with an average milk yield of 6.0-6.5 liters. Camel's milk differs from other animal milk by its healing properties. Based on today's requirements, we emphasize that it is expedient to develop sheep and camel breeding at the same time in karakul farms. Because camels feed on plants that cannot feed on pasture, that is, camels can consume plants that other animals cannot eat, salty and dirty water, and they are the most effective source of livelihood. , cattle - feeds on 68 species. It should be noted that year-round grazing allows you to earn more at a very low cost of production. According to scientists, in the Republic of Karakalpakstan, the cost of one camel is equal to 10-12 sheep, and the cost of keeping one camel is equal to 3 sheep.

The purpose of the research

The main purpose of the research is to study the possibilities of increasing the milk yield of single-humped camels in the Republic of Karakalpakstan and to develop methods.

Expected results

The results of the study allow to apply the developed methods and practical selection results in the increase of milk yield in the field of camel breeding in camel farms of the Republic of Karakalpakstan, to carry out effective selection and breeding work. In this regard, in the Republic of Karakalpakstan, the study of milk yield of single-humped camels, the chemical composition and technological properties of lactating camels, as well as the establishment of doubt in the purchase of mother camels to increase their wool fertility and pedigree. A comprehensive assessment of the impact of supply conditions on camel milk production and

processing will provide the most acceptable and competitive production technology, which in turn will provide the population of the newly established industrial centers on the Ustyurt Plateau with high-quality milk and high-quality flour.

Research location and methodology

The research was conducted in 2018-2020 years on camel farms in the Karauzak and Kungrad districts of the Republic of Karakalpakstan.

The selection and formation of camels in the groups was carried out in accordance with the principle of analogs, taking into account age, constitution, live weight, and body size.

The first selection of animals was held in March 2018 among the number of newborn camels. The selected mother-camels were marked with bots in special paints, and three groups were formed in each of them among ten.

The adaptability of domestic animals to local, natural, and food conditions without external defects was taken into account.

At the beginning of the experiment, the age of the parents, live weight on the autoplate scales (up to 5 kg accuracy), external measurements (height, body length, chest, and pasteurization) with the help of a measuring stick and tape (1 cm accuracy). It was determined by the method of Lacosa (1964).

Milk productivity of camels was measured monthly (at the end of the month), milk yield, and total milk production for lactation were determined arithmetically.

Research results

The general analysis of the camel situation in Karakalpakstan shows that a serious obstacle to the development of camel breeding is the neglect of selection and breeding work on all farms of our Republic. Insufficient work is being done in the country to improve the quality of herds, to organize timely selection and adherence to the herd structure of livestock, to introduce effective feeding, breeding, and breeding technologies.

Studies conducted by [3.p.21-22] have shown that the successful development of animal husbandry, including camels, requires extensive use of available resources of scientific and technological development. One of them is the timely selection of animals according to age and adherence to the optimal structure of the herd.

According to [2.p.19-20], it is of great selection importance to know the average age of milk production for daily lactation periods, the relative dynamics of constitutional types.

This is due to the fact that at different stages of lactation, depending on the milking interval, the time spent on the pasture with the parents of the offspring varies. With the increase in milking, the level of pasture feeding in the pastures decreases, and with the decrease in the number of milkings, the feeding period increases. [4.p.317-318].

The milk yield of camels is directly related to the pasture yield and grazing radius, and it is possible to control the daily milk yield dynamics of camels.

Thus, the milk yield of camels depends largely on the interval between milkings. It has been found that low-milking animals have a negative effect on the development of more milking

offspring; in high-milk camels, on the other hand, frequent milking increases the productivity of commercial milk.

In our experience, camels had an average milk yield of 4-5 milking intervals per day.

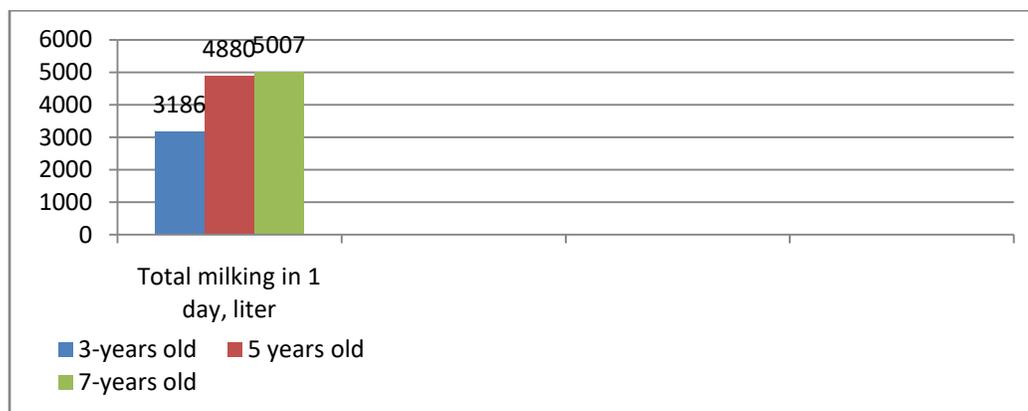

The milk yield of single-humped camels of different ages, depending on the milking interval and age, is given in Table 1 below.

TABLE 1 MILK YIELD OF SINGLE-HUMPED CAMELS IN DIFFERENT AGES DEPENDS ON MILKING INTERVAL AND AGE

Camels calving age	Quantity of Milk	1- Milking period					Total milk yield
		1	2	3	4	5	
		$\bar{x} \pm S_x$					
3-years old	gram	907±28,5	846±26,5	787±24,7	646±20,3	-	3186±100
5-years old	gram	1263±24,6	1049±21,5	889±18,2	861±17,6	878±18,1	4880±100
7-years old	gram	1230±24,6	1069±21,3	949±19,0	868±17,3	891±17,8	5007±100

The analysis of the table data shows that 3-year-old camels were milked 4 times a day, while 5-year-old and 7-year-old camels were milked 5 times a day. At the same time, their milk yield increased with age. The total milk yield per day for 3-year-old camels was considered to be 100%, while for 5-year-old camels the milk yield was 153.1%. fertility in young camels was 157.1%. This difference can be clearly seen in the diagram below.

Diagram 1

In short, the milk yield of camels increased with their fertility age. The milk yield of camels depends not only on their reproductive age but also on the season.

In our research, when we study the milk yield during the months of the year, we can see that the milk yield increases, especially in the autumn months. In terms of months, the milk yield indicators are given in Table 2 below.

TABLE 2 MILK YIELD OF SINGLE-HUMPED CAMELS IN MONTHS, IN LITERS

	Lactation months	Reproductive age of camels					
		3-years old		5- years old		7- years old	
		M±M	C%	M±M	C%	M±M	C%
1	April	100,1±1,99	6,1	103,3±1,93	5,3	111,7±2,1	6,5
2	May	117,7±2,12	5,5	123,9±2,9	7,2	132,1±2,7	6,2
3	June	140,2±1,83	4,0	147,4±2,08	4,2	154,6±1,7	3,8
4	July	153,6±1,7	3,4	158,5±1,78	3,5	167,3±2,3	4,4
5	August	155,4±1,4	2,5	166,7±2,31	4,4	176,4±2,8	5,3
6	September	165,3±2,18	4,1	172,6±2,13	3,6	184,8±2,4	4,3
7	October	171,7±3,16	5,7	182,7±2,16	3,7	191,7±2,0	3,4
8	November	177,0±3,73	6,4	187,2±2,23	3,7	202,4±2,0	3,1
9	December	180,9±4,27	7,3	183,7±2,43	4,2	184,6±1,6	2,9
10	January	165,8±3,95	7,3	168,9±3,32	6,1	172,6±1,5	2,7
11	February	157,5±2,86	5,5	158,1±3,71	7,3	158,8±2,9	5,8
12	March	144,7±3,05	6,2	146,6±3,94	8,5	144,0±3,37	7,4
13	April	129,3±3,07	7,3	131,7±3,19	7,6	129,5±2,86	6,9
14	May	105,2±2,3	6,5	115,9±2,2	5,9	117,7±2,46	6,5

The analysis of the table data shows that each pair of camels of childbearing age had the highest milk yield during the lactation period of 6 to 9 months. At the same time, it can be seen that camels of the 7th generation have an advantage over the 3rd generation and camels of the 5th generation.

It should be noted that in the harsh climatic conditions of the Republic of Karakalpakstan, these indicators may change during the years of low rainfall. This is often the case in the northern part of the Red Sands.

In the autumn, especially in September, October, and November, the temperature regime and the condition of pastures had a positive effect on the physiological condition of camels and the mechanism of milk production, and it was during these months that milk production was high.

If we analyze such indicators by seasons, we can see in Figure 2 below.

Diagram 2 Milk production of one-year-old camels in liters per year

The analysis of the data shows that in 2018-2020, the climatic conditions of the Republic were good and the rainfall was moderate, and the milk yield of single-breasted camels was much higher in all seasons of the year. It should be noted that in the northern regions of the Republic of Karakalpakstan, pasture productivity decreases sharply in the spring, and as a result, camels have a significant negative impact on milk yield. It is during these months that additional feeding of camels is recommended.

An additional ration recommended for camels in the spring months is given in Table 3 below.

TABLE 3 SUPPLEMENTARY FOOD RATION FOR CAMELS IN SPRING

№	Foods	Supplementary dose per day, kg	Content of 1 kg				
			Nutritional unit	Digestive Protein Gram	Calcium gram	Phosphorus gram	Carotene mg
1	Trefoil hay	3,0	0,22	41	6,4	0,6	50
2	Carrot food	0,5	0,14	7	0,6	0,5	30
3	Barley grains	0,5	1,21	81	1,2	0,8	0
4	Wheat groats	1,5	0,78	130	1,3	3,1	4
5	Cottonseed meal	1,0	1,15	331	2,8	9,8	1

The ration is intended for the spring months, and it is recommended to feed the pasture plants once a day for the first time in the evening when the productivity of pastures is declining.

Figure-1. Single-humped camels in the autumn pasture

In conclusion, the highest indicators of milk production were identified in the autumn-winter period. Thus, the difference between the spring and autumn periods for the 7th generation was 25.9 liters, and for the 5th and 3rd generations, it was 22.1 and 22.3 liters, respectively.

The milk yield of camels depends to some extent on their constitutional type, and their growth and development are organically related to the constitutional type of animal. The constitution of camels is mainly divided into strong, delicate, and rough.

Table 3 below shows the dependence of milk production on the constitutional types in the age range of single-breasted camels.

TABLE 3 THE CONNECTION OF CONSTITUTIONALITY OF CAMEL WITH THEIR MILK PRODUCTION AT DIFFERENT AGES

κ/c	Age of camels	Types of Constitution					
		Thin type		Coarse type		Strong type	
		$\bar{x} \pm s_x$	Cv	$\bar{x} \pm s_x$	Cv	$\bar{x} \pm s_x$	Cv
1	3- generation age	101,1±1,99	6,2	109,3±1,93	5,5	112,7±2,3	6,5
2	5- generation age	117,7±2,12	5,7	125,9±2,9	7,2	135,1±2,66	6,2
3	7- generation age	141,2±1,83	4,1	147,4±2,08	4,4	154,6±1,86	3,8
4	9- generation age	153,6±1,7	3,5	158,5±1,78	3,5	167,3±2,34	4,4
5	11- generation age	158,4±1,4	2,8	166,7±2,31	4,4	176,4±2,8	5,0
6	13- generation age	165,3±2,18	4,2	173,6±2,13	3,8	184,8±2,5	4,3
7	15- generation age	171,7±3,16	5,8	180,7±2,16	3,7	191,7±2,08	3,4
8	17- generation age	169,3±1,56	3,2	172,6±2,11	3,54	181,7±2,2	4,1

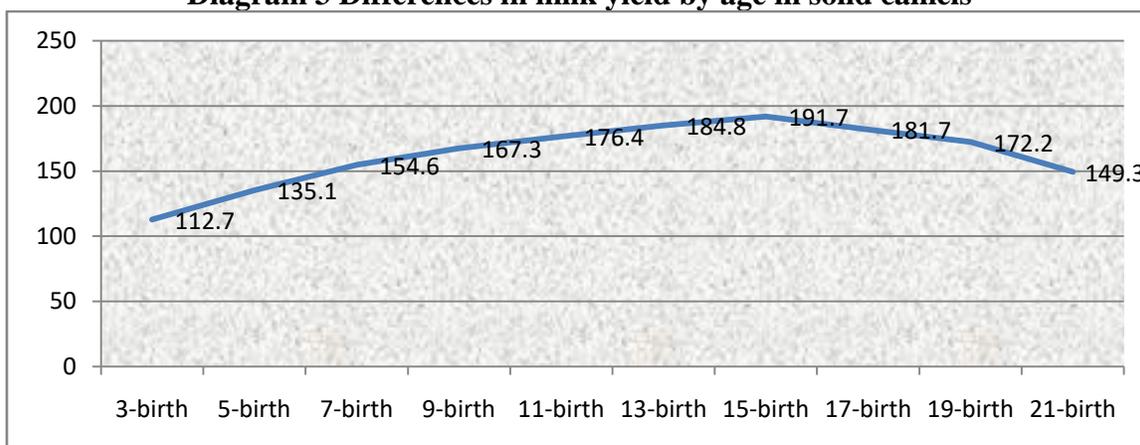

9	19- generation age	151,2±1,3	2,2	162,7±2,22	4,1	172,2±2,8	4,6
10	21- generation age	121,2±1,73	3,3	134,4±1,88	4,2	149,3±1,86	3,5
11	Average	145,07	4,1	153,18	4,4	162,58	4,5

From the data in the table, it can be seen that in all breeds at a young age, strong-bodied camels dominated in terms of milk yield. In other words, this difference was observed in all ages. It should be noted that in all births, the average strong type was considered to be 100%, in the rough type - 94.21%, and in the thin type - 89.22%.

In summary, from the 3rd to the 21st generation, strong camels produced 9.4 liters more milk than coarse-type camels and 17.51 liters more than fine-type camels.

Diagram 3 shows that in all constitution-type camels, the amount of milk varies in age.

Diagram 3 Differences in milk yield by age in solid camels

According to the diagram, milk production increased from the age of 3 to the age of 1 and decreased from the age of 19 to the age of 19. The milk yield of experimental camels was highest at the age of 1 generation.

According to the study, the difference in age in pasture conditions led to a decrease of 203.0 liters of milk in the stable type. This figure is 246 and 55.6 liters, respectively, for the delicate and rough type. The difference in the age of the camels was preserved.

In our opinion, in order to increase milk production in the Republic, it is necessary to carry out a set of organizational and technical measures that will contribute not only to the growth of dromedary camels, but also to improve the quality of the herd.

CONCLUSION

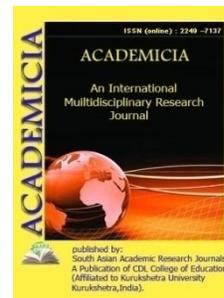

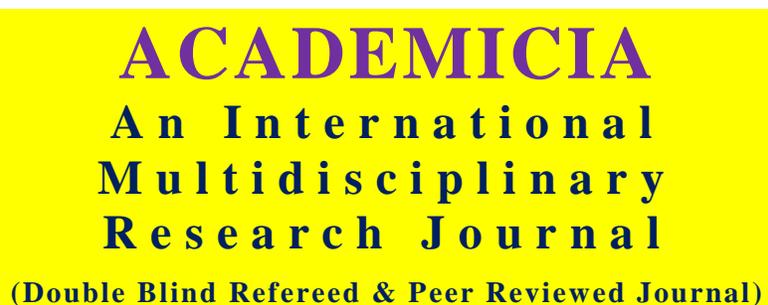

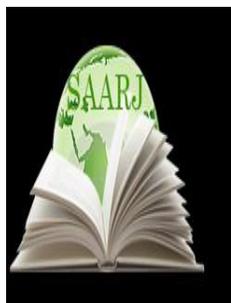

The results of research and observations about the milk yield of camels of all ages in the northern regions of the Republic of Karakalpakstan allow us to draw the following conclusions:

1. It has been observed that single-humped camels increase their milk yield by the age of 7 generations. This figure varies according to their constitution. The increase in the number of camels in the herd, aged 7 and over, ensures the speed of milk production.

2. Taking into account the harsh climatic conditions of the Republic of Karakalpakstan, it is necessary to provide additional feeding, especially in the spring. At the same time, taking into account the live weight per head, the ration should contain at least 2.5-3.0 kg of quality trefoil hay, 0.5kg of Concentrate, 1.5 kg of cottonseed meal, and wheat groats. It is recommended to give additional feed in quantities.

ABSTRACT

With the aim of improving and rational use of the soil, as well as increasing the yield of agricultural crops, in this case cotton, field tests were carried out. Fruiting of cotton, in addition to the hereditary traits of varieties, is closely related to environmental factors, especially the temperature of the air, soil and the state of the environment.

KEYWORDS: Cotton Plant, Sowing, Varieties, Growth, Term, Capsule, Leaf Surface, External Environment.

INTRODUCTION

In pursuance of the Decree of the President of the Republic of Uzbekistan dated October 23, 2019 No. UP-5853 "On approval of the Strategy for the Development of Agriculture of the Republic of Uzbekistan for 2020-2030", the system of ensuring the rational use of natural resources and environmental protection will be improved ", starting from April 1, 2020 year, as an experiment in the Kibray and Tashkent districts of the Tashkent region, the Fergana and Altyaryk districts of the Fergana region, as well as the Kitab and Nishan districts of the Kashkadarya region, a mechanism will be introduced to allocate land plots to individuals and legal entities in order to provide farms with land for experimental research, to increase soil fertility. In our case, research is devoted to the growth and development, that is, the formation of cotton.

Analysis and results

The Law "On Organic Agriculture" analyzes the possibilities of reforming the procedural mechanisms operating in this area. The National Strategy for the Development of Agriculture of

the Republic of Uzbekistan for 2019-2030 has also been developed, and the process of its coordination with other ministries and departments is under way.

It is envisaged to develop more than 30 regulatory documents in nine sustainable areas identified in the draft roadmap for the implementation of the strategy.

The main tasks of land legislation are the regulation of land relations in order to ensure, in the interests of present and future generations, scientifically grounded, rational use and protection of land, reproduction and increase of soil fertility, preservation and improvement of the natural environment.

One of these areas is to increase the fertility of agricultural products.

With the aim of improving and rational use of the soil, as well as increasing the yield of cotton, field tests were carried out.

Various factors influence the development and fruiting of cotton:

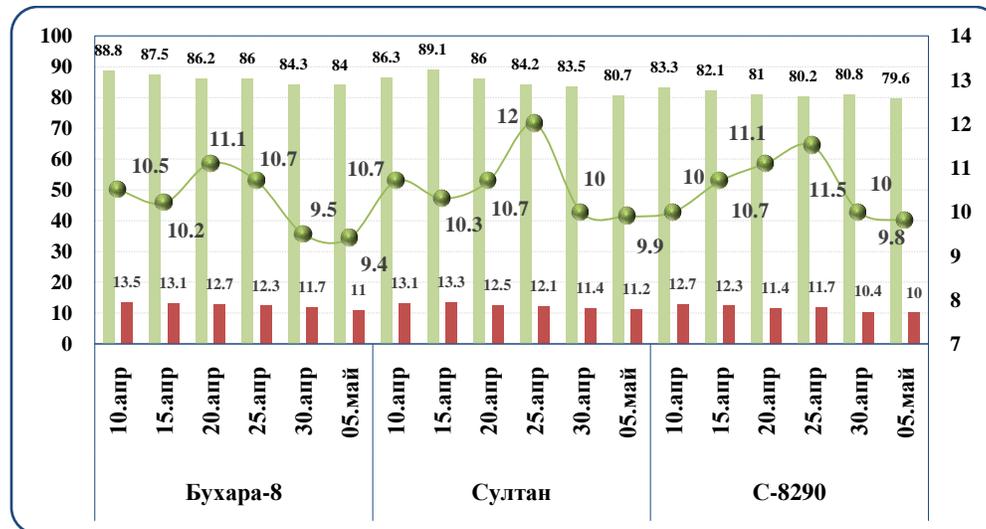

- hereditary characteristics of varieties,
- connection with environmental factors and the state of the environment,
- temperature regime of air and soil from the day of sowing,
- sowing terms and their influence on the formation of vegetative and generative organs of cotton.

The fruiting of cotton depends on many factors, such as hereditary traits (varieties), as well as on the state of the external environment, air and soil temperature. Cotton requirements for temperature begin from the day of sowing. The higher it is, the faster the seedlings appear and vice versa, therefore, special attention has always been paid to the sowing time, this is described in the works of Aleev and Ibragimov in 1987, Mukhammadzhonov and Zakirov in 1968-1988, Ibragimov and Nazarov in 1992, Nazarov, Mirzazhonov, Ibragimov and Isaev in 2014 [1-4].

Taking into account the importance of the sowing time in the formation of vegetative and generative organs of cotton, we conducted field experiments from 2017 to 2019 at the AltyarykNurliKelajak Farm in the Altyaryk District of the Fergana Region. The first early sowing date is from April 10 to 15, the second optimal sowing date is from April 20 to 25, the third late sowing date is from April 30 to May 05. The experiment involved the varieties "S-8290" (relatively early maturing), as well as other medium-fiber varieties cultivated in the Fergana region, the medium-early-maturing variety "Sultan" and the late-ripening variety "Bukhara-8". The experiment was repeated 3 times. The plots are located in one tier.

The leaf surface was determined by the method of A.A. Nichiporovich (1961), the rest of the plant organs were dried to determine the dry weight of cotton. The structure of the bushes was described by the method of SoyuzNIHI (1981) [5].

In our research, an attempt was made to establish the dependence of the growth of cotton on the sowing time, which is of certain theoretical interest and practical value. It was found that the sowing time has a significant impact on the growth, development and formation of cotton bolls (Figure-1).

Picture 1. Influence of sowing dates and varietal characteristics on the growth and development of cotton in 2017.

For example, the Bukhara-8 variety with an early sowing date on April 10 (var. 1) on September 1 had a height of 88.8 cm, while with the second on April 15 and the third on April 20, the height was 87.5–86.2 cm, and on the 4th variant the height is 86.0 cm.

Sympodial branches at late sowing dates formed at 13.5 node of the main stem, then at the second and third periods - at 13.1 and 12.7. As you know, a decrease in this indicator increases the resistance of the stem to bedding.

It was also revealed that the number of sympodial branches at an early stage increases markedly, monopodial, on the contrary, decreases. So, with an early sowing date on September 1, the cultivar C-8290 formed 12.7 sympodia on the bush (var. 1), with the second and third terms - 12.2-11.4, respectively.

It is important to note that the largest number of bolls was obtained at the fourth sowing date. On average, there were 11.5 of them per plant.

Approximately identical data were obtained for cotton and for varieties "Sultan" and "Bukhara-8", and their indicators were slightly higher, which is explained by varietal characteristics.

A similar picture was observed in the subsequent 2018-2019 research years. Thus, for the studied varieties of cotton "S-8290" "Sultan" and "Bukhara-8" the most favorable conditions for the growth, development and formation of bolls are created at the third and fourth terms (20.04; 25.04) of sowing.

Laboratory experiments were initially aimed at studying the formation of leaf surface depending on the timing of sowing and the varietal characteristics of cotton.

TABLE 1 FORMATION OF THE LEAF SURFACE DEPENDING ON THE SOWING TIME 2017

Sowingtime	Leafarea cm ² / plant		
	June 1st	July 1	August 1
Bukhara-8			
10.04.	70,4	673,9	2539,6
15.04	70,2	732,1	2601,9
20.04	68,5	739,9	2703,4
25.04	66,3	581,4	2453,7
30.04	63,4	540,6	2401,9
05.05	60,6	512,3	2369,6
Sultan			
10.04.	69,5	620,9	2345,6
15.04	68,1	702,6	2409,8
20.04	65,3	724,6	2541,6
25.04	61,4	730,9	2616,8
30.04	60,9	579,3	2301,9
05.05	58,2	586,7	2258,6
C-8290			
10.04.	70,1	622,2	2350,1
15.04	67,3	731,1	2591,3
20.04	65,2	701,6	2640,2
25.04	60,3	729,1	2641,0
30.04	58,9	539,7	2311,1
05.05	57,1	574,6	2301,1

In our research, an attempt was made to establish the dependence of its development on the sowing time, which arouses a certain theoretical interest and practical value of the work. It has been established that the sowing time has a significant effect on the growth, development and formation of the leaf surface in the phases of cotton. The area of the leaf surface in the flowering - budding phase, in the varieties "S-8290", "Sultan" and "Bukhoro-8", is formed and grows at a late sowing period in comparison with early and optimal periods. So it was revealed that in the flowering phase for the varieties "Bukhara-8", "Sultan" and "S-8290" and the early sowing period, the leaf area of one plant was –673.9; 620.9; 622.2 cm², while with a late sowing period it was –512.3; 586.7; 574.6 cm², with an optimal period of 739.9; 730.9; 729.1 cm² / ras. (Table 1)

By the maturation phase, this indicator increased 4 times compared with the previous phase. For example, at the first sowing period of the Bukhara-8 variety, the leaf area was 2539.6 cm², for the Sultan variety 2345.6 S-8290, 2350.1 cm² with the late sowing period - respectively 2369.6, 2258.6 and 2301.1 cm², with the optimal sowing time it was equal to 2703.4; 2616.8; 2641.0 cm².

Consequently, with the optimal sowing time, the leaf surface area is formed and grows in comparison with early sowing by 8-9% and compared with late sowing. The reason for this is the

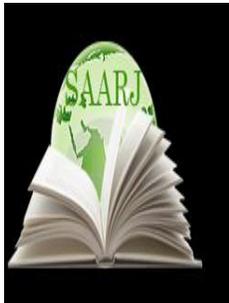

deterioration of the field illumination, an increase in air humidity, which leads to a slowdown in the formation of bolls.

CONCLUSION

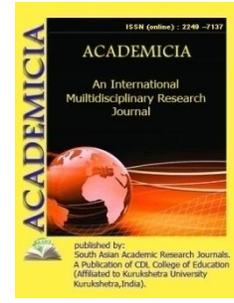

As a result, it can be concluded that with early and optimal sowing times, cotton develops intensively from the early stages, the onset of flowering, budding and maturation of bolls accelerates. At optimal and early sowing dates, the development of the leaf surface falls on the first half of the growing season, at a late sowing time in the second half, i.e. in this case, the growing season is lengthened.

INTRODUCTION

One of the ancient centers of Uzbek folk arts and crafts is the Bukhara school. For many centuries, Bukhara craftsmen have created and developed a rich and colorful practical and artistic tradition of this art. Located at the crossroads of the Great Silk Road, Bukhara has served as a "fashion distributor" for all forms of this art. Unique items created by folk masters over the centuries have also met the aesthetic and spiritual needs of the people in relation to their daily

lives. By the twentieth century, changes in socio-economic conditions led to the decline of folk craftsmen, the obsolescence of handicrafts, the traditions of applied decorative arts have retained their centuries-old traditional appearance, the level of authorship and professionalism in the works of few masters. After the independence of our country, the fate of traditional handicrafts has changed radically, and the development of folk arts and crafts has acquired a new meaning. The attention to folk masters has increased more than ever. Preserving the heritage, traditional national values, caring for craftsmen has become a state policy, with the intention of preserving the national culture, the restoration of tradition in the production of handicrafts has become a natural process. During the years of independence, the social and legal status of folk masters has also changed significantly. The art of goldsmithing, which has existed in Bukhara since ancient times and was widespread, did not disappear, even in the days of the former Soviet Union, when there was a significant decline. The goldsmiths, who first worked in private workshops converted into artels, were later recruited into a goldsmith's factory, but free creativity was limited there. Only independence has created a huge opportunity for goldsmithing, like all other trades, to be revived. In Bukhara, the art of goldsmithing has long been practiced by most men.

They took orders and created copies and sewed them themselves with delicate taste. One of such famous goldsmiths, People's Artist Numanjon Aminov, took an active part in the establishment of the Bukhara goldsmith's factory and taught more than 500 goldsmiths. One of his talented students is Bakhshullo Jumaev.

At the age of 12, he began learning the secrets of embroidery in 1968 from his mother, Saodat Rajabzoda, a skilled embroiderer and goldsmith. On the mother's side, his grandfather, Master Rajab, was the elder of the master goldsmiths. He had a private workshop in the old town, and his wife, Bakhshullo's grandmother, Salomat-aya, had a workshop at home. Originally from the dynasty of goldsmiths, Bakhshullo Jumaev graduated from Bukhara State University, Faculty of Fine Arts, and went to work in a goldsmith's factory as a copycat artist, where he learned the magic secrets of this craft from master Numanjon Aminov. Having traversed the path to the rank of chief engineer of the factory, Bakhshullo chose the path of free creativity. MuqaddasJumaeva, a student of Tamara Gaybullaeva, her husband, Honored Artist of Uzbekistan, was also responsible for this. The Jumaevs, who enriched each other creatively, built a family gold embroidery center. Now their daughter Dilnoza is a master goldsmith, their son Boburjon is a miniature artist, and their youngest son Nodirjon is a jeweler. A distinctive feature of Bakhshullo Jumaev's work is the restoration of copies of traditional, disappearing goldsmiths, the creation of works of high artistic level, using the sewing techniques typical of Bukhara goldsmithing. For the master, the size of the item does not matter. From a simple purse or skullcap to the curtains of majestic theaters and palaces of art, we can see delicate taste, high performance skills, a perfect compositional solution, a rich collection of patterns and a masterpiece of jewelry sewing. The master, while maintaining the tradition, performs his work in harmony with modern patterns, gives enthusiasm to the work, the level of the finished work. For the first time since independence, the international exhibition began in Islamabad, Pakistan, with the participation of the Uzbek delegation of artisans from 44 countries, 1st place by a prestigious jury and the Grand Prix of the competition "Craftsmen of Islamic countries at work." One of the first major works of the master was the panel "Gullayashnahur Uzbekistan" (3x4 m). The fact that the show was performed at the level of a work of art has been recognized by art critics and experts. After that,

the family center was entrusted with the task of sewing the curtain of the Istiqlol Palace of Arts. Under the leadership of BakhshulloJumaev, the number of jewels made for the palaces of art of the capital and regions has exceeded 20. His major creative works include "Bukhara Sharif", "Gultuvak", "Kushtovus", "Historical Monuments of Bukhara" and more than 30 others. A number of gold-embroidered "brishimdozi" style portraits include works of art performed by BakhshulloJumaev at the Museum of the Temurids "Portrait of Amir Temur", an exhibition dedicated to the birth of Bahovuddin Naqshbandi at the Bukhara State Museum and many foreign museums.

In 1996, Muqaddas Jumaeva and Bakhshullo Jumaev took the third place in the Tashabbus contest for the prize of the President of the Republic of Uzbekistan, and in 1997, Bakhshullo Jumaev won the main prize in the Tiko car and the first place.

In 1995, the international organization was awarded the certificate of "International Master" by UNESCO, and in 2003 was awarded the International Quality Star "Golden Star". More than 30 sewing techniques used in goldsmithing can be seen in the master's work. "Chordar", "Chorchashmi bulbul", "Gishti haram", "Shashkhol", "Bozbandcha", "Sambusa", "Mavji yak roya", "Mavji du roya", "Kandakori", "Mavj", "Islimimavj", "Tunuk", "Shoxchai yak roya", "Shoxchai du roya", "Khanjari" and many other complex sewing techniques can be found. The exhibition of BakhshulloJumaev's works has been held in more than 25 countries. In 1995, he founded the Gift Embroidery Center. At present, more than 50 Zardozi students work at the family enterprise "Sovgaustazodai Zardozi".

His work was deservedly awarded by the State and awarded the Medal of Fame. **Alisher Haydarov.** Modern jewelry art of Bukhara One of the ancient centers of jewelry is the Bukhara school. Ancient specimens of jewelry found in the Bukhara oasis by archaeologists date back to the second millennium BC. Among the monuments that have entered science as "modern culture", women's jewelry made of precious stones and gold is a bright proof of this. Buttons of women's clothing and women's earrings found in the area of Kuyumazor, which dates back to the VI century BC, are made of gold and decorated with tourmaline stone. By the Middle Ages, and especially by the nineteenth century, the art of jewelry had risen to the level of palace craftsmanship. At the end of the 19th century, more than 400 master jewelers worked in Bukhara, the center of handicrafts. Twenty of them are palace craftsmen who have made valuables and jewelry for the palace ayons and their families in the courtyard of Kushbegi bolo - the upper bird in the Ark fortress. Skilled palace jewelers UstaNasrulloboy, Usta Nabi, Kasimjon Mirakov, Sadridin bin Pochcho and others were famous. Bukhara artisans loved and bought their products not only among the locals, but also in the West and the East through the Great Silk Road. In the ancient center of Bukhara Sharif, located at the intersection of trade routes, there is a special indoor market "TaqiZargaron" - a stream of jewelers, which indicates that jewelry is highly developed here. Jewelry workshops in Bukhara make a variety of items and women's jewelry from precious metals and stones. Bukhara jewelers compared gold to the magic light of the sun. They saw the beauty of the charming moon in silver. The art of jewelry was also in crisis as a result of the upheavals and coups of the twentieth century. Craftsmen were persecuted. Jewelry, which has its roots in thousands of years, has also grown again thanks to independence. Alisher Haydarov, a master jeweler from Bukhara, is a master craftsman of the Bukhara School of Jewelry, who has revived the previous traditions and enriched them with new content. He learned the secret of this profession from his grandfather, the skilled master

Abdunosir. Alisher, who graduated from the university in order to please his grandfather's soul, devoted himself to the craft of jewelry. He also defended his dissertation at the Faculty of Graphic Arts of the University by making jewelry "Nozi Gardon". Here he has been in search for almost thirty years. He is not limited to his achievements, he works tirelessly on himself. The Bukhara State Museum of Art and Architecture, which has a treasure trove of more than 1,000 pieces of jewelry, has carefully studied each exhibit and created new works. His wife Gulshod Gulomova's sons Shahzod, Mirshod and Abdunosir continue their father's profession and create in a small workshop at home. There are separate rooms and tables for students. Alisher Haydarov has been a member of the Craftsmen's Union for almost 20 years. Over the years, he has participated in about 10 solo exhibitions and more than 20 international exhibitions and was awarded many diplomas and certificates. The year 2009 was an unforgettable event in his life. Alisher Haydarov won the Republican stage of the Tashabbus contest. The first President of the Republic was very lucky to receive the key and certificate of the car "Matiz". For the past 5 years, the master jeweler's works have been exhibited at international exhibitions organized by UNESCO and KAKSA in Santa Fe, USA, France, Russia, India, Kazakhstan, Japan, Iran and Pakistan. The desire of the jeweler is to further develop the art of Bukhara jewelry, reviving the traditions and styles of Samarkand and Bukhara jewelry of the XVIII-XIX centuries. The master's favorite styles are casting, forging, molding, wire weaving, printing, stepping, hoiskori, minocory, kandakori, gilding, ink gum, carving patterns, falga, and more. Jewelry made of silver and gold is enriched with beautiful shapes, adorned with original necklaces, pearls, turquoise, precious stones, emeralds, rubies, real and various bottles. More than 400 masterpieces created by the master are named after about 100 names. He was awarded the 15th and 20th anniversary badges of Independence of the Republic of Uzbekistan, has trained more than 50 students. Alisher Haydarov's works have been purchased in museums in Japan, the United States, France, Berlin, the Museum of Applied Arts of Uzbekistan and many private collections. This is a testament to the high level of mastery. Embroidery Ancient Bukhara is one of the centers of science, culture, arts and crafts. One of the oldest types of folk applied decorative art is silk embroidery. Located at the intersection of the ancient "Great Silk Road", this city has a centuries-old history of making silk and yarn fabrics and decorating them with embroidery. Sewing patterns by hand using needles and quilts from silk threads dyed with natural dyes on the galama fabric, the decoration of household items, clothes is done by skilled embroiderers. Ancient specimens of Bukhara embroidery have not been preserved to us. The ones kept in the museum collection date back to the XVIII-XIX centuries. By the beginning of the twentieth century, artistic embroidery was one of the types of handicrafts that were in crisis. Thanks to independence and the care provided by the state to artisans, the forgotten handicrafts have been revived. Rahmon Toshev deserves special respect among the craftsmen who have studied the ancient traditions of the Bukhara embroidery school, enriched it with new content and made a great contribution to its revival. After graduating from Bukhara State University, Faculty of Graphic Arts, he decided to revive the Bukhara School of Folk Applied Arts, a popular form of embroidery. Rahmonjon was born in 1964 in Turkon village of Bukhara district, originally in the family of intellectuals of Bukhara city. Her grandmother Bibirajab Rustamkhoja was the cousin of her daughter Fayzullo Khodjaev, who taught her daughters and grandchildren the secrets of the first embroidery and died in 1993 at the age of 103. Young Rahmonjon's grandmother also aroused his interest in embroidery. In collaboration with his wife, Risolat Shodieva, he began sewing small embroidery items, pillowcases, towels, and handbags, and

began making large-scale embroidery with his students and three children. The eldest son Rafael (born in 1982) is a miniature artist, the daughter Nasiba Tosheva (born in 1989) is an embroiderer, the youngest children are Rahimjon K. He studies at the Faculty of Calligraphy and Miniature of the National Art Institute named after Behzod. From the first years of independence, the master established an embroidery center at home, attracted the masters of Shafirkan, Gijduvan, Vobkent and Nurato to the center. and began to participate in foreign exhibitions with his own embroidery patterns, and attracted the attention and attention of exhibition organizers and art critics. The master, who has mastered his profession perfectly and thoroughly, has brought to the highest level of embroidery in the style of "embroidery" with the embroidery of Bukhara embroidery. Rahmon Toshev, a researcher, highly educated, spiritual, and kind, taught hundreds of students the secrets of embroidery and personally led them to perform it at a high level. He prepares fabrics, draws pattern compositions, chooses colors, puts them in place, does the final finishing work, as well as strengthening the dyes in a mixture of "zok" and vinegar, dyeing ready-made embroidery with boiled golden-yellow dye of apricot and peach bark. made in order to perfect it has led to the popularity of the master's work. As a result of his research, he recreated the embroidered specimens that had fallen out of circulation, preserved only in one or two copies in museum exhibitions. "Joma" - men's robe, Iraqi, on the saddle stitch, "Zinposh" - a show with a saddle stitch that closes over the horse's saddle, "Douri" - chiprak - on the horse's saddle (popona) "saddle" and "Iraqi" stitch - women's belt "Iraqi" and "quilt" stitch, mirror bag, juzgir - book case "Iraqi" stitch, boots, shovel, special "quilt" and "Iraqi" stitch, pillowcase leather and many other embroidery items restored. Rahmon Toshev embroidery can be easily distinguished, because the patterns of patterns, the perfection of the composition, and most importantly the harmony of colors are not found in the embroidery of other embroiderers. In creating all the colors, local plants use: pomegranate peel, rosemary, osma, royan, walnut peel, onion peel, incense stem, tulip tulip decoction, apricot and peach tree peel, and more. But he traveled to Turkey several times to learn how to make blue, blue, sky, liver, golden yellow colors perfectly, and when he was ready to prepare these colors and wash the word with a mixture of "zok" and vinegar, he returned to learn how to boil apricot and peach peels. Indigo has started importing nil and saffron dyes from Turkey and saffron and crimson dyes from Afghanistan. In the following years, he carried out a series of researches on the creation of words with miniature images, and finally, under the influence of medieval Bukhara miniatures, beautiful and unique scenes were born. The demand for words that have reached the level of such a true work of art is growing day by day. It takes a lot of work to prepare it. Avalam embroidery fabric is of high quality, satin specially prepared by Margilanadraschi masters was selected. Then, high-quality silk yarns and "brishim" with a left-right heel, specially made in Turkey, were selected. The dyes were fluffy and varied, sometimes using 17 different colored yarns. The result was a success. True works of embroidery were born. The works depicting love, wisdom, the life of the great Sahibkiran Amir Temur have a worthy place in the collections of collectors from the USA, France, England, Australia: Master Surkhandarya, a unique school of embroidery in Tajikistan, created dozens of small embroidery patterns, inspired by the rare specimens of embroidery "Laqay". His works have been exhibited outside the Republic in Astana, Kazakhstan, Bishkek, Kyrgyzstan, Istanbul, Turkey, Berlin and Leipzig, Germany, Strasbourg, France, St. Petersburg, Russia, Sweden, Canada and Italy. He has participated in several international exhibitions in Santa Fe, USA and has been awarded diplomas. His dream is to restore the ancient embroidery of Uzbekistan, create works of high

artistic value, organize a personal exhibition and create a scientific catalog. The art of printing flowers on fabric From ancient times in Bukhara it was common to print flowers on fabric. Flower-printed tablecloths, bedding, sandals, suzani, scarves, high-quality fabrics for women's clothing, various sheets, horse blankets-douri, even shrouds, and various other piece-by-piece or flower-printed products measured in meters have been used for various purposes in the home and also served as an ornament. This type of art was popular among the masters of chitgar living in Bukhara and surrounding villages. In Bukhara, the favorite flowers of the masters of the first half of the XIX-XX centuries are printed red, black, dark green, blue, red flowers, sharp and at the same time gentle gammas. In the past, the art of floral printing was varied, with dark blue and nil colored items being produced and widely used. Folk art has traditionally been mainly black and red printing and has survived to our time. In the 90s of the XX century in Uzbekistan, the printing of flowers on the fabric began to revive. It is known that one of the oldest forms of applied decorative art, the printing of flowers on fabric was practically abolished in the 1950s. From the first years of independence, the rapid growth of interest in ancient values, as well as the privileges and support provided by the state to folk crafts, led to the revival of this craft.

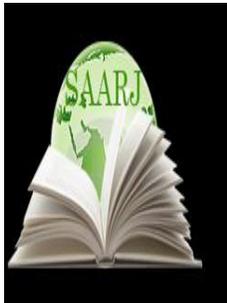

Malika Habibova's contribution to the restoration of the art of weaving in Bukhara is great. Born in 1956 to an amateur artist family, Malika graduated from Bukhara State University with a degree in graphic arts and began teaching at the university. His teacher, the dean of the faculty Jalol Yodgorov provided him with both theoretical and practical assistance. Various creative workshops were opened at the faculty. Among them was a sewing and embroidery workshop. From 1992 to 2005 he worked his way up from teaching to the position of head of the department, and at the Department of Folk Applied Decorative Arts trained dozens of talented students. Engaged in the art of flower printing, he spoke at a scientific-practical conference in Samarkand in May 1997 and demonstrated his first creations at seminars. The Bukhara regional branch of the Craftsmen's Association, which was established this year, helped him open a laboratory. Experiments began in the basement of the 19th century monument Sayfidin Caravanserai. At first, the work did not turn out well. The princess was earnest. Finally achieved the expected result. The production of tablecloths, towels, pillows, handkerchiefs, bags, cosmetics and wallets for money, suits and women's shirts was set up. The patterns and colors in the ancient chitgar patterns have been studied in depth. Bukhara wood carvers OzodAshurov and master Husen Kasimov made molds from pear, pine, walnut and oak wood to order. 4 types of molds are ready, Circular - socket molds, (full, half, quarter), Frame molds (handwritten, Islamic pattern), background filler (connected to each other, filling the base), separate individual flowers, branches, twigs, handwritten molds depicting shapes, birds, animals, fruits. When printing flowers, Princess mainly uses yarn fabrics. In some cases, silk, semi-silk and wool fabrics are also used. Natural dyes are made by the master himself. It produces a reddish-brown color from Afghanistan, a yellow color from Alazirin, a reddish-brown color from Nur-Ata, a reddish-brown color from the Fergana Valley, and a soft golden color from Shahrizabz. After the black paint has been fried and boiled for a long time, it is re-boiled by adding pieces of iron, nails, and so on. The decoction is floated after being put in the sun for 7 days on a summer day. Before dipping into the mold, boil the peaches and apricot juice - glue (natural glue) and bitter stone (zok). The resulting decoction is alternately printed on the fabric using molds, first light colors and then dark colors. Malika Habibova's fantastic composition of floral fabrics and items includes fantastically transformed images of a chamanzar garden, flowers

that open like chamanzar, delicate buds, twisted branches, stalks, stars, daisies, leaves, as well as ripe fruits, pomegranates, almonds, almonds, strawberries, pepper and others. Flower printing molds are separate molds of different elements of future patterns, which are printed in turn. Because the flower, bud, body, variety, leaf are different colors, they are printed in separate molds. Each master has a unique style, the Princess uses dozens of patterns to make the work look elegant, beautiful, colorful. Because if the mold immersed in the same color hits the second color, the quality of the paint will be impaired, the clarity will be lost. Flower molds have been passed down from father to son and from son to grandson because they are made of durable wood. Malika Habibova has been reviving the traditions of Bukhara chitgar, enriching it with news, training dozens of students and creating in keeping with the traditions of the Bukhara school.

ABSTRACT

In Every Language, National And Cultural Semantics Are In Great Importance, Which Is Present At All Its Levels: In Phonetics, Vocabulary, Grammar and Phraseology. However, It Manifests Itself Especially Clearly In Phraseology. The Phraseology, As The Linguistic Picture Part Of The World, Reflects The People's national Mentality - The Native Speaker. Phrase logical Units Are All World languages characteristic, But They Have Their Own Special Expression forms. They Reflect The Character Traits, The World perception, And The Life Way Of Particular People Representatives. Phrase logical Units Of Any Language, Being Related To The Geographical Conditions Of The Country, Historical Development, State System And Religion, Are Not Always Clear. This Article Examines The Thematic Classification Of Phrase logical Units In The Japanese And Uzbek Languages, Containing In Their Lexical Composition Ethnographic Life elements, Everyday Life, History, Geography And Religion Of The Two Peoples. These Units Are Not Translated Verbatim, But Rethought By Native Speakers Of Another Language. This Vocabulary Has An Expressive Coloring And Determines The Attitude To The Native Speaker worldview. In The Japanese And Uzbek Languages, Many Phrase logical Units Are Not Translated Verbatim, But Are Perceived Rethought And Reinforce The Language Aesthetic Aspect

KEYWORDS: *Phrase Logical Units, Non-Equivalent Vocabulary, National And Cultural Characteristics, Native Speakers, Thematic Classification*

INTRODUCTION

In the Japanese and Uzbek languages, there are many phraseological units that are not translated verbatim, but are perceived rethought and convey these people's cultural associations. Depending on the geographical conditions, the historical development of the country, religion, and the life way of the people, flora and fauna of a particular people, there are elements in phraseological units that are not understandable to a native speaker of another language.

According to Ya. I. Retsker, "in every language phraseology is a purely personal, most peculiar vocabulary part. And a large number of phraseological units retain a certain national flavor. This national originality is reflected simultaneously on the stylistic and expressive side of the phraseological units". (4, 45).

Most of the phraseological units of each language differ in their national specifics. This difference is manifested in the phraseological unit of its national imagery, which do not have a correspondence in the phraseological system of another language, are called non-equivalent phraseological units. As the self-name shows, it conveys phraseological units using lexical and not phraseological means. Phraseologisms that arose on the basis of the people customs and traditions, the morality and relationships norms adopted by them, as well as units that appeared on the basis of folk signs and superstitions, and in most cases, cannot be component-translated into other languages.

Each language national characteristics are manifested due to the presence in speech (or text) of phraseological units, called non-equivalent, which form an integral phraseology part in all languages. The materials of the Japanese and Uzbek languages we are considering are no exception in this respect, they also contain expressions whose semantics are not always clear.

Phrase logical units can be studied in cultural linguistics from the non-equivalence standpoint, reflection in its mythology structure, historical facts, traditions and customs, imagery, value norms and behavior, etc.

The non-equivalent vocabulary study is one of the priority areas of cultural linguistics, aimed at the vocabulary study, which cannot be compared with any foreign language lexical concept. That is why non-equivalent vocabulary is untranslatable. The non-equivalent vocabulary includes national realities, i.e. names of national objects, customs, clothing, buildings, food, traditions, inherent only in this culture and absent in other ethnic cultures.

V.N. Teliya writes that the language phraseological composition is a "mirror" in which the linguocultural community identifies its national identity, it is the phraseological units that impose on the native speakers a special vision of the world, situations (5,87).

Most phraseological units of each language are original, and it is these phraseological units that most clearly reflect the national specifics of phraseological units, since their true author is a simple people who, through phraseological units, reflected traditions, various realities and customs. As S.G. Vorkachaeva rightly notes, "linguoculture is a lens through which a researcher can see the material and spiritual identity of an ethnic group" (2, 45). Geography, natural conditions, territorial features, climate, habitat, flora and fauna, as well as customs, beliefs have left a kind of imprint in the phraseological system of the Japanese and Uzbek languages. It is noteworthy that the names of marine life are often found in Japanese phraseological units.

Main body

This article attempts to compile a thematic classification of phraseological units in the Japanese and Uzbek languages, as having ethnographic elements in their vocabulary, reflecting the national and cultural specifics of the Japanese and Uzbek people. Also, the figurative basis of these phraseological units is associated with the cultural and national worldview. According to the linguistic material analysis results, we tried to compile a native Japanese and Uzbek phraseological units classification and subdivide them into several groups, based on their ethnic and cultural specifics.

1) everyday realities

a) national cuisine

Japanese phraseological units: 粗を探す ara-o sagasu – literally. look for fish entrails – «find fault, look for flaws», 油を売る abura-o uru – literally. sell oil - "hang around idle", 冷や飯を食う hiyamesi-o kuu – literally. eating cold rice - "being dependent", 人をだしに使う hito-o dasi-ni tsukau – "To use a person as a dasi" (dasi – it is broth or soup serving as a seasoning sauce), 餅は餅屋 mochi-va mochiya – literally. if you want mochi, contact a mochiist (mochi - rice cakes), お茶を濁す ocha-o nigosu – literally. stir up tea - "get out, get off with a joke", 飯を食う meshi-o kuu – literally. there is boiled rice - "to earn your own bread", 他人の白飯より内の粟飯 tanin-no siromeshi yori uchi-no avamesi – "Your own chumiza is better than someone else's rice" (plague - one of the oldest grain crops long cultivated in East Asia), 手前味噌 temae miso – literally. own miso (miso - soybean paste) - "to show off to smb."

Uzbek phraseological units: put powder in his mouth – literally. put crushed crackers in your mouth (tolkon - crushed crackers) - be silent like a fish, ferment yogurt in the mouth – literally. wet kefir in your mouth (yogurt - kefir) - like water in your mouth, boil the stew under the ear – give a resounding slap, to be yoghurt to moshkxurda – literally. to be kefir in moshkxurda (moshkxurda is the name of a traditional Uzbek soup made from mung and rice) - to interfere in other people's affairs, spit the salt into the eating salt – answer good to evil, a farm that is not gujain the house, a farm that is disappointing (guja - simple folk food made from corn grits, khujalik – an estate, an estate that only rich people have), this phraseological unit is similar to the Russian "do not get into your sleigh", he broke his teeth to atala (atala - the name of an Uzbek dish) - his tooth broke from the stew count the dumplings raw (chuchvara - Uzbek dumplings) – literally. count raw dumplings - do not calculate your capabilities, hang a lagman in his ear – literally. to hang noodles on the ears - to deceive, fool.

b) national clothes, shoes, jewelry, headdress

Japanese phraseological units: 足駄をはいて首ったけだ ashida-o haite kubittakeda - literally. wearing asida head over heels - "head over heels in love", 鉢巻をする xachimaki-o suru – literally. roll up your sleeves - "get to work" 下駄を預ける geta-o azukeru – literally. to hand over the geta for storage - "disclaim responsibility", 下駄を履かせる geta-o hakaseru – literally. force to wear geta (geta - Japanese wooden shoes) - "to take advantage of", 草鞋を履く varaji-o haku – literally. to wear waraji (waraji - Japanese straw sandals) - "go on a trip", 二足の草鞋を履く nisoku-no varaji-o haku – literally. put on two pairs of waraji - "have two jobs, act

simultaneously in two roles", あかい着物を着せれる akaikimono-o kisereru – literally.getting to wear a red kimono - "go to jail", 袖にする sode-ni suru – literally.make a sleeve - "treat smb. cold, neglect smb. "衿を正す eri-o tadasu – literally.raise the collar - "put yourself in order, collect your thoughts", 糸を引く ito-o hiku – literally.pull the thread - "press the secret springs", 紺屋の白袴 ko: i-no shirohakama – literally.the dyer's white hakama - "a shoemaker without boots."

These phraseological units in their lexical composition contain an indication of the sphere of the material culture of the Japanese people, such names as: geta are shoes with wooden soles, on a large platform or on small wooden “piles” called “ha” (“teeth”), on the reverse side of the sole, two or three such "teeth" are attached (usually two are used), ashida - tall wooden shoes with two teeth, hachimaki - a scarf tied with a tourniquet around the head so that sweat from the forehead does not get into the eyes during the fight, waraji are sandals woven of straw, the most traditional material is rice straw, kimono is traditional Japanese clothing, hakama is Japanese clothing in the form of a skirt, worn over a kimono and tight-fitting from the waist to the bottom.

Uzbek phraseological units: If the head survives, the skullcap will be found –if you are alive and well, there is a skullcap, throw the skullcap to the sky – literally. throw duppi into the sky - rejoice, put on your rope reverse– obstinate, straighten the shoes– kick smb. out, point to the door, tuck both feet into one boot – persist, If you respect the poor, you will be caught in the snare. chorikis not a valuable thing, whoever wears them causes disapproval, similar to the Russians "don't get into your sleigh", do not put your hands under your feet – do not get in the way, has a belt at the waist – literally. he has a belt on his lower back - about a tough guy, a man.

As for the material culture items names of the Uzbek people, it can be explained that duppi is an Uzbek national headdress, a tun is a traditional cotton robe, a kavush is a national footwear, an etik is an Uzbek boot, a choriq is a rag sandal, which was previously worn by beggars and patak is a felt fabric laid in galoshes, belbog is a national scarf wrapped around a man's waist.

2) household utensils (housing, dishes, household items)

Japanese phraseological units: 匙を投げる saji-o nageru – literally. throw a spoon - "despair, lose hope", 赤毛布をやる akagetto-o yaru – literally.to give a red blanket - to admit awkwardness, to make a gross mistake", 箸にも棒にもかからない hashi-nimo bo: nimo kakaranai (hashi - Japanese traditional chopsticks)–literally.neither chopsticks nor baton work - "hopeless", 板に付く ita-ni tsuku –literally. being pinned to the board - "being used to smth., feeling at home", 釘を刺す kugi-o sasu –literally.to prick with a nail - "remind of smth." 大風呂敷を広げる ooburoshiki-o hirogeru –literally.spread a big furoshiki - "boast, brag, lie", 畳の上の水練 tatami-no ue-no suiren – literally.swimming training conducted on the tatami (tatami - straw mat). So the Japanese say that what was useless did not bring any real results.

Uzbek phraseological units: hand is braid, hair is broom –literally. her hands are a poker, her hair is a broom - work day and night, stretch your legs towards the bed – calculate your capabilities (korpa - wadded blanket), hit the ax in the leg – kick in, interfere (bolta–ax), to be shackled –tie legs, interfere with work (about children), (kishan– pads), should I cut his legs and to put into the cradle–can I put you in the cradle? Are you small or what? (beshik – Uzbek cradle), is his head sticking out of the hole?– she is still young, she still has time to get married (tuynuk – roof hole,

chimney), lock in the mouth – shut your mouth shut (kulf – lock), head to the threshold – literally. to bang your head on his doorstep - to please, to grovel, a sack fell on his neck – literally. he hung a sack around his neck - he got a family, he is now the owner of the house, pick up the board – break off the relationship.

3) history of the people, national names (proper)

Japanese phraseological units: さくらそごの生まれかわる sakura sogo-no umarekawaru – literally. "Reborn Sakura Sogo" - "a brave, fearless man" (Sakuro Sogo known as a folk hero), 弁慶の泣き所 benkei-no nakidokoro – literally. "Benkei's groan" (Benkei is a famous warrior and strongman, a servant of the feudal ruler Minamoto Yosutsune) - "it so happens that a stone will groan", こぼ筆を選ばず ko: bo fude-o erabazu – literally. master Kobo does not choose a brush. The meaning of the proverb is that for a true master, the quality of the source material or instrument does not play any role, and in particular, it cannot serve as an excuse that is inappropriate for the work performed.

Uzbek phraseological units: Ali is left with a misok – obsolete, left over from the time of King Peas, under King Peas, Solomon died, the giants were saved – death of the prophet Suleiman, the jinn rejoiced (Sulaiman is a prophet in Islam);

4) Religion, beliefs, ritual forms of folk culture (beliefs, myths, spells):

As you know, the Japanese people are not religious. This is confirmed by proverbs. Unlike the Uzbeks, the Japanese do not have a single proverb, such as the language was speechless - literally: he could not even pronounce kalima, he could not utter a word (from fear, surprise, etc.) (kalima is a verse from the Koran).

Japanese phraseological units: 運を天に任せる un-o ten-ni makaseru – literally. entrust fate to heaven - "rely on providence" (un - fate), 地獄で仏に会ったよう jigoku-de hotoke-ni atta yo: (bud. as if I met Buddha in hell) - "pleasant state", じぞとえまは一つ jizo-to-emma-wa hitotsu – literally. «dzidzoi emmazaodno» (Dzidzoi is a deity, patrons of children and travelers, Emma in Buddhism is the ruler of hell) - one devil, what is God, what the devil, ふるなの弁 furuna-no ben – literally. "The eloquence of Purna" (Purna is one of the 10 disciples of Buddha, distinguished by the refinement of speech) - "brilliant eloquence, 三人寄れば文殊の知恵 sannin yoreba monju-no chie – literally. if three people get off, then there will be wisdom like Monju¹, in Russian - "one head is good, but two is better", and in Uzbek «one head is good, two are better»; 十字を切る jyuji-o kiru - literally. to cut the cross - to be baptized; 釈迦に説法 syakakuni-ni seppo – literally. preaching to Buddha - "to teach the fish to swim"; 早起きは三文の得 hayaoki-wa sanmon no toku – literally. who gets up early, makes a profit of three coins - "whoever gets up early, God gives him", 知らぬは仏 siranu wa hotoke – literally. ignorant Buddha - very happy (like Buddha), 来年のことを言えば鬼が笑う ryinen-no koto-o ieba oni-ga warau - make God laugh with your plans for the future.

Uzbek phraseological units: the language was speechless (kalima - a verse from the Koran) - he could not utter a word (from fear, surprise, fright, excitement), - to give alms from head and the eyes – make an atoning sacrifice, sacrifice; make chilla yasin – read a prayer for the patient to recover; parents agree - god willing – parents agree god agree, the prayer of your parents is not to

be immersed in fire or water – You cannot burn the blessing of your parents, you cannot drown; say kalima – recite the creed; his spirit is in the seventh heaven – spirit in seventh heaven; make chillayasin – observe religious rites; the heavenly marriage fell to the ground – marriages are made in heaven; without reciting the Sufi adhan – very early (Sufi - a minister in Islam, calling believers to prayer).

5) sports, games, entertainment

Japanese phraseological units: 碁に負けたら将棋に勝て go-ni maketara syogi-ni kate – literally. if you lose in go wins in syogi - "if you can't see something somewhere, go to where you can succeed" (go is a Japanese game such as checkers, syogi is a Japanese chess), 人の褌で相撲をとる hito-no fundosi-de sumo: o toru – literally. wrestle in sumo in someone else's fundo: si - "rake in the heat with someone else's hands" (fundo: si - sumo wrestler loincloth), 相撲のように強い男 sumo -no yo:ni tsuyoi otoko – literally. strong as sumo - that's what they say about a strong person.

Uzbek phraseological units: the wrestler who did not touch the ground – the fighter who never knew defeat; to touch the ground – put on both shoulder blades - win, to tie the waist – be ready for battle.

6) geographic names

Japanese phraseological units: 江戸の仇を長崎で打つ edo-no kataki-o nagasaki-de utsu – literally. being offended in Edo to pluck his anger in Nagasaki - "from a sore head to a healthy one" (Edo and Nagasaki are the names of cities); 呉越の間から goetsu – no aidakara – literally. to be at daggers - this phraseological unit mentions the names of the kingdoms of Wu and Yue, which in ancient China were in hostile relations, 清水の舞台から飛び降りる kiyomizu-no butai-kara tobioriru – literally. jump off the stage Kiyomizu (Kiyomizu is the name of a historical place in Japan) - "to take a desperate step."

Uzbek phraseological units: what is Tuy Tepa for stupid// Kuva is one stone to stupid – дословно for a fool to reach Kuva to step over a stone - for a fool the law is not written, for a fool it does not care; (Tuy Tepa is a city in Tashkent region, Kuva is a city in Fergana region); to show his mother from Uch Kurgan – show Kuzkin's mother (Uch Kurgan – village name), jargo to jaloir – wash dirty linen in public (zhaloir is the name of the tribe).

Geography, natural conditions, territorial features, climate, habitat, flora and fauna - left a kind of imprint in the phraseological system of the Japanese and Uzbek languages. In the composition of Japanese phraseological units, the names of marine life, various insects, and animals are often found.

7) flora, fauna, marine life

The widespread use of the animal and plant world representatives names for the figurative characteristics of a person and his actions, is associated with the geographical location of the country residence of this people, the flora and fauna diversity in a given country, we can say that the animals, birds, insects habits and lifestyle cause certain ideas with person appearance, character and behavior. According to T.M. Gurevich statement, "... the Japanese not only see and evaluate the behavior and character of various animals differently than we do, but, comparing

humans with them, significantly expand their list, including marine life unknown to us ..." (3, 47). It should be noted that Japanese are not only careful about nature, flora and fauna, but also notice certain features of the representatives.

In Uzbek, when they talk about hostile, hostile relations between someone as cats and dogs - literally like a cat with a dog. In this phraseological unit, there are two the animal world representatives, a dog and a cat, similarly to Russian, like a cat with you, in Japanese they say about such a relationship 犬猿の仲 *kenen-no naka* - relationship like a dog with a monkey. The features of an animal strike behavior the same initial figurative ideas and determine similar verbal expression forms in multilingual peoples. But the symbolism usually coincides in different languages only in the most general part, but can seriously differ in details and in the symbol functioning. In Japanese the words 蛇 *hebi* - a snake metaphorically can mean "a bitter drunkard", and in Russian and Uzbek languages "a mean, insidious, cunning person." Also, in the minds of the Japanese and the British, the horse does the hardest work, the Russians do the ox, and Uzbeks do the donkey: 馬車馬のように働く *basyauma-no yo: nihataraku*, compare English: to work like a horse, Rus. work like an ox, Uzb. work like a donkey.

Japanese phraseological units: perch - tai - is considered a valuable commercial fish in Japan, so the Japanese say 腐っても鯛 *kusatte mo tai* - literally: though rotten, but perch, 鯛の頭となるよりは鯛の尾につけ *iwasi-noatama-tonaru yori-wa tai-no-o-ni tsuke* - literally: better to be a perch tail than a sardine head. They say about love without reciprocity 磯辺の鮑 *isobe-no awabi* - literally: abalone on the seashore, "unrequited love" is called 鮑の片思い *awabi-no kataomoi* - literally: love without reciprocity abalone, 猫に鰹節 *neko-ni katsuobusi* - to entrust the cat-dried mackerel (you can also simply translate - fish), the meaning of this expression is similar to the Russian "let the goat into the garden"; 河童のように泳ぐ *kappa-noyo:ni oyogu* - literally: swim like a kappa (a kappa is a fantastic creature, a vampire that looks like a child, lures its victims into the water, drowns bathing children), 取らぬ狸の皮算用 *toranutanuki-nokavasanyo:* (tanuki - raccoon dog) - literally: to share the skin of an uncaught tanuki - "to share the skin of an unkillable bear", 猫を被る *neko-o kaburu* - literally: putting a cat on your head - "pretending to be another person", 馬が合う *uma-gaau* - literally: a horse fits - "suit each other (character)", 猿も木から落ちる *saru-mo ki-kara ochiru* - literally: and the monkey falls from the tree - "even an experienced person can make a mistake", 雉も鳴かずば撃たれまい *kiji-mo nakazuba utaremai* - if the pheasant does not cry, it will hardly be possible to kill it (the pheasant is a non-migratory bird living at the foot of the mountains, a positive hero of Japanese fairy tales, since 1947 it has received the status of the national bird of Japan), すずめの涙 *sudzume-no namida* - literally: sparrow tears - "scanty amount", 尻切れとんぼ *shirikire tonbo* - literally: a dragonfly with a cropped tail - "a person who does not complete the matter", 井の中の蛙 *ido-no naka-no kaeru* - literally: the frog in the well is a man with a limited circle, 木に竹を継ぐ *ki-nitake-o tsugu* - literally: add bamboo to the tree - "combine the incompatible, impossible", 竹を割ったよう *take-o wattayo:* - literally: as if they had divided the bamboo - "speak directly", 胡麻を搗る *goma-o suru* - literally: crush sesame seeds - "to flatter smb., to adulate", 柳に雪折れなし *yanagi-ni yuki orenasi* - "Willow does not break under the snow", 馬車馬のように働く *basyauma-no yo: ni hataraku* - "Work like a draft horse".

Uzbek phraseological units: the big fish fell into the net – the leader fell for the bait, I was unaware that the water had entered my lap like a snake – I didn't know how I fell for his bait, did not sniff twig from the sheep mouth – he won't hurt a fly, to hand over a sheep to a wolf – let the goat into the garden, would be a camel with a horse – trifles, not very expensive; when the camel's tail touches the ground – never in my life, not to fall off the saddle even if it falls off the horse – literally: he will get off the horse, but not from the saddle – he dismounts, but remains arrogant; licked the fat of the snake – insidious, cunning; the snake peels at the word – literally: because of these words and snakes will shed their skin - about strong expression; to stir the head of a lying snake – literally. moving the head of a lying snake - stirring up an old, long-forgotten thing; saw the flea's eye – a shot sparrow, knows where crayfish hibernate, with my soul like a fly – like a mosquito - weak, the worms from his mouth (eshakkurt – caterpillar) - arrogant, to be on the fly – annoying; to sit and watch the flies – sit back, to fall apart from grass – torment (ajrik – finger grass), If the camel needs a saddle, stretch its neck (yantak – camel-thorn) – literally. if a camel needs a thorn, he will stretch his neck - if he needs something, he will always find, raw harvest of barley unripe – literally. what, he planted your barley unripe? - what wrong did he do to you? do not sow millet for fear of sparrows – literally. who is afraid of sparrows does not sow millet - to be afraid of wolves do not go to the forest, unload the melon – literally. drop a melon - spoil the case, speak absurdities, watermelon fall from the armpit – literally. drop a watermelon from your armpit – give up, get upset.

8) life priorities (wedding, family, customs, beliefs)

Japanese phraseological units: 身を固める mi-o katameru – literally. strengthen the body – "marry", 玉の輿に乗る tama-nokosi-ninoru – sit on the palanquin (the palanquin as a means of transportation was used in Japan only by noble and wealthy people, and the expression "to sit in the palanquin" means "to marry successfully (to a rich or noble)», 華燭の典を挙げる kasyoku-no ten-o ageru – «to celebrate a wedding», 三国一の花嫁 sangokuichi-no hanayome – literally: the only bride in the world - the ideal bride. In ancient times 三国 sangoku named three countries: Japan, China and India, sangokuito-nosangokuichi no means the only one in the world, the ideal groom or bride is considered the only one in the world; 固めの杯を交わす katame-nosakazuki-omavasu – literally: share sakadzuki (sakazuki – small bowl for sake) – «make a vow of loyalty».

Uzbek phraseology: to put one's head in two – marry smb., head tied (girl) – engaged girl, hint – send matchmakers, make an offer, tie the mouth – matchmaking ending ceremony, hair extensions – stroking the bride's hair, until your head is not two, your cattle will not be two – literally. until there are two heads, your economy will not double – until you get married, there will be no prosperity in the house, to make his hand honest – circumcision, bite the ear – engage (babies) from the cradle, stand on the left side – stand on the left foot, did not like the step – he brought misfortune, light hand – light hand, eyes have owner – the eyes are protected by God himself, spoilage – he was jinxed, he got sick from the evil eye, childbirth – give birth.

As we can see in Uzbek language, which have in their meaning such life moments of a person as wedding, engagement, a child birth, there are names of the human body parts, i.e. somatic phraseological units: eyes, head, hair, hands, ears. It is possible to assume that Uzbek people perceive the surrounding world, as well as the relationship to this world through somatic phrases, which motivate them with the self-turnover components.

CONCLUSION

You can also cite numerous phraseological units from the above thematic groups, which reflect Japanese and Uzbek national realities. They give a national flavor to a particular statement, while simultaneously expressing the emotional state of a person.

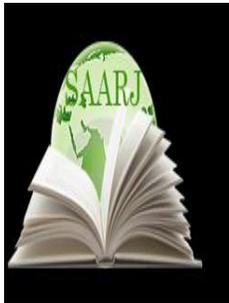

It should be noted that, being formed in different historical conditions, Japanese and Uzbek phraseological units often use different images to express the same thought, which in turn reflect the different social contribution and two peoples life.

It should also be noted that due to insufficient knowledge of the reality facts, due to insufficient attention to the national phraseological units specifics, inaccuracies in the phraseological units translation can be made, and this leads to incomplete information perception contained in the text.

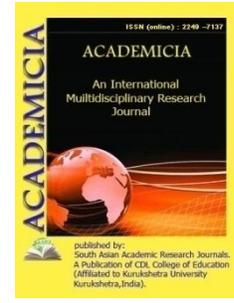

Therefore, scientifically, non-equivalent phraseological units' knowledge of a particular people quantitatively gives people idea we are interested in, it will also help to avoid many semantic errors in the translation process, since ignorance of the language leads to facts distortion, obtaining false information.

ABSTRACT

The Stress of school teachers and impact on their job Satisfaction in Vadamaradchi School that is very important factor. There are so many teachers in Jaffna district Researcher selected 74 samples from the vadamaradchi in Jaffna district the study was guided by three hypotheses. Initially the hypotheses has been tested with the use of statistical tools namely, Correlation and Regression analysis Correlation and regression analysis used to evaluate the relationship between the stress and teachers and teachers job satisfaction. According to the analysis or with the evidence of data gathered “stress of school teachers and its impact on their job satisfaction in vadamaradchi” Based on my research, there is strong positive high relationship between the two variables. In highly industrialized countries where round the clock work prevails employees have to face extra ordinary level of stress. Such Countries no vehemently think of managing stress and alleviating employee s preferences. Fortunately we Sri Lanka who often enjoy holidays and strictly follow various faiths have not come to face such situations to that far. However, even in our country with its monetization and globalization such a situation is gradually developing as in Sri Lanka, there are organizations demanding much from their employees. The researcher has carried out a pioneer research in the government school in vadamaradchi to analyze the teacher s stress and its impact on their work.

KEYWORDS: *Stress, Job satisfaction.*

INTRODUCTION

No any individual person in this mew busy world could himself get rid of the stress. It is the duty of an individual to know how to get victory over the stress daily. Many people are fighting to know about how to get rid of it in their daily life and get the victory. An attack on a person physically or mentally due to unexpected circumstances is known as the stress. Stress is not so serious one. There are several ways to rid of it. It could be won by taking the life easily and by getting hold of certain ways and by knowing about it mentally. Both mental trouble and stress are a mixed one. Some people use to accept the stress as a challenge in life and face the problems. Some are collapsed due to it. The professor Mr. Malcolm Tees sates that stress seems to be as energy too in life. The people are the method of their rapid life move on to small towns and settle there for some changes or so. That is one of the prior information for the year 1990. However most of the managers engage than for their business. They are different for any other ways of living. If so, how do they undertake work wise? Or how are they involved in respect of it?

According to a recent research undertaken by nelson quick verifying the ways of life followed by those forms Director of oil field company, Director of health and welfare individual company, a Director of a big commercial bank and nery commander etc. and took in two executive lade Directors in the research. They came to understand that the research officers such as Director of commercial institution dealing with sale of land and home, Director of commercial Institution dealing with settlement in life etc. in their involvement in that research with superior officers undertook their own ways.

BACKGROUND OF THE STUDY

Job life is one of the important parts of our daily lives which case a great deal of stress. Due to the competitive nature of the job environment most of the people in the world are spending their time for job related work purposes resulting ignore the stressor those are influence their work and life. Usually people are more worry about their outcome of their work that can even affect the way they treat other people and how they communicate with their peers and customers. For example, people with a higher percentage of occupational stress may not satisfy with their job and therefore they will not feel happy working in the organization. They may feel “burned out when they are having problem with peers or customers. They may leave a negative impact to the organization itself. Therefore it is very important for employer and employees to realize the stress and the stressor that case all the negative effects.

Stress is one of the important factors that affect the employee’s satisfaction. Stress is experienced by each person at work and life which is.

“Stress as the reaction of individuals to new or threatening in their work environment. Stress is usually thought of negative terms. The effect of stress has an impact on the individual works and the job satisfaction. There is a link between stress and job satisfaction in which the works become nervous and stressed by the alleged consequence of working in such job. Since the optimum stress level provides the best balance of challenge, responsibility and rewards” (gibson, invancevich, donnelly 1994).

Stress is the term which is often loosely used to describe feelings of tension or exhaustion. Usually associated with too much or overly demanding, work stress is the product of demands made on individual's physical and mental energies.

Monotony and feeling of failure or insecurity are sources of stress, as much as the conventionally considered factors of pressure and over work.

It is worth remembering, to that demands on an individual's energies may be stimulating as well as harmful. Many people work well under pressure and even require some form of stress to bring out their best performance. Excessive stress, however, can be damaging to mental and physical health. This is why we talk about stress management, not elimination it is a question of keeping stress to helpful proportion and avenues. (ICSA – Study text, Management practice (Sep 2000) Sixth Edition)

A person comes across numerous stressors in his/her society and in institution where he/she works. Each person in his/her day today life expect different problems politically, socially, and economically and also in the institutions where he/she works. They come across many difficulties by the way of competition, working institution changes in technical works, working grad production, etc. Such type of problems creates stress result in creation of serious disadvantages later to the employees in the institutions. The problems connected with the works physically or conduct wise are generally created among the persons. As far as working institutions are concerned there will be problems due to downfall in working standard, more actions of employees, poor working condition, changes of employees miss understanding among them etc,. Hence, stress later creates disadvantages by individually or institution. However stress does not remain as prevention of physical efficiency of an employee. Particularly when stress among the people are found to be moderate the employees will be seen as working very efficiently better than that of their usual work stranded.

Furthermore this type of stress is helpful to some people by the way of seeking better employment. The usual stress creates satisfaction in their works and as such it is found to be an essential one in human life. There stress should manage in proper way in order to get satisfactory works from the employees concerned.

Here the aim of the study is to identify the stressors issues that will influence the teachers' job satisfaction.

SIGNIFICANCE OF THE RESEARCH

This research is used to find out the disadvantages caused by stress and job satisfaction of the teachers. Regarding the teachers of some leading schools in vadamadachi analyze is done to find out the type of disadvantages caused in their job satisfaction due to their stress. By the result of this analysis the main reasons for the stress of the employees, and the ways how to get rid much stress and to develop job satisfaction etc could be find out. Education is very important than any other services such as insurance bank, transport, etc. In a society teacher's services is also an important one. This helps many people to seek employment. Generally every teacher is trying to develop an educate society. Since the teachers work in different work surrounding all of them cannot reach the some level of job satisfaction. Therefore it is necessary to find their stress in connection with the works and to find solutions to get rid of such stress and also increase satisfaction of the employees.

“The term stress defined as the reaction of individuals to new or threatening factors in their work environments” (Hugh G. Arnold, Daniel, Feldman 1986).

“Medical researcher Hans Selye first used the terms “Stress” to describe the body’s biological response mechanisms. He defined stress as “the non-specific response of the body to any demand” it must be understood that in order for the stress to occur the response should be non-specific all response require utilization of energy. Any demand made on the body that is for some specific activity which is natural expected and a part of the daily routine does not necessarily create stress. Even walking thinking writing and doing other physical activities. That is the part of the personal and organizational existence requires energy consumption of the body but is not necessarily stress producing forces. [Organizational behavior, Page 182]

In addition to this, this study is significant in the following ways.

- i. It could be found out as to what type of stress is caused to a teacher
- ii. Reason for the stress could be found out clearly.
- iii. It could be found out as to why the stress experienced by an individual varies from person to person.
- iv. It could be found out as to what a job satisfaction is and to know the reason for the affection of job satisfaction etc.
- v. Relationship between stress and job satisfaction could be understood.
- vi. It could be found out as to how efficiently stress has been managed.

Stress is the one of the important factor that effects the employee’s satisfaction. In this research, stress measured against the teacher’s job satisfaction in the schools. There are 369 teachers working out of this only 20% (74 teachers) is selected various level of schools.

OBJECTIVE OF THE RESEARCH

The main objective of the study is

1. To find out the relation between stress and job satisfaction of the teachers.

The specific objectives are

1. To find out the reason for the stress of the teachers.
2. To find out the stress formed due to problem in the day to day life of the teachers.
3. To find out the type of stress found among the teachers.
4. To find out the how to get rid of stress which their hate.
5. To find out the how to manage stress by way of doing efficient work.

LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK

Aruncumar (2000) said that the existence of work stress in and of itself doesn’t imply lower performance. The evidence indicates that stress can be either a positive or negative influence on employee performance. For many people low to moderate amount of stress enable those to perform their jobs better by increasing their work intensity alter ness and ability to react.

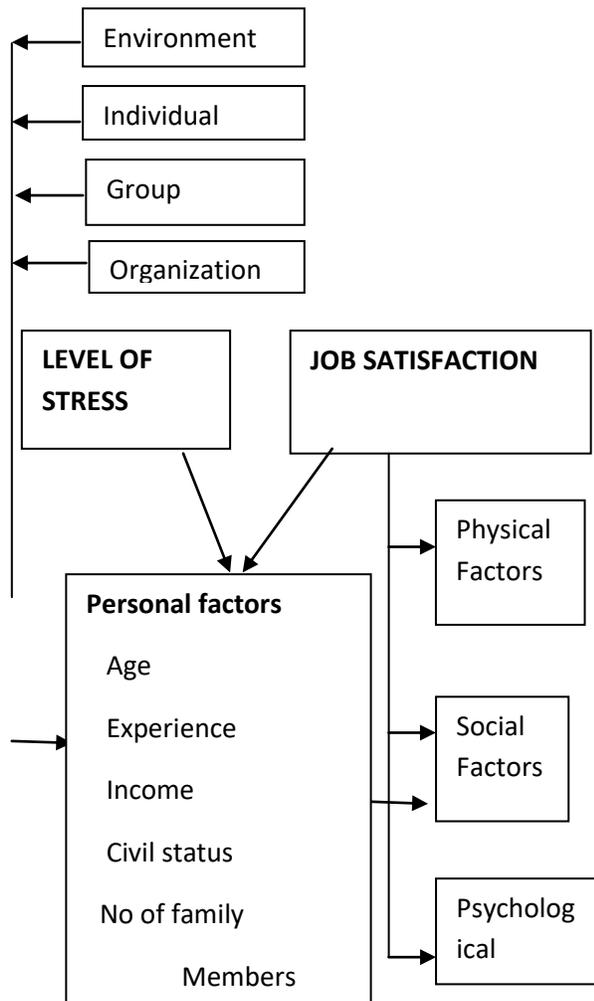

However a high level of stress or even a moderate level sustained over along period of time eventually takes its all and performance decline. As stress increases so typically does absenteeism alcohol and drug abuse, for example cost employers billion of dollars each year in lost work time. A substantial part of this loss undoubtedly a reaction to personal and work – related stress. It's increasing to note that women suffer more stress than men and have higher absentee rates.

Jerald Greenberg Robert A. Berion (2003) said that the job satisfaction involves positive or negative attitudes towards one's work. According to the two factor theory, job satisfaction and dissatisfaction stem from factors associated with the work itself (known as motivation) and that factors leading to job dissatisfaction are associated with the conditions surroundings jobs and the value theory suggests that job satisfaction reflects the apparent match between the outcomes individuals desire from their jobs and what they believe they are actually receiving, however, evidence suggest that job. Performance is only very weakly associated with the dissatisfaction level of satisfaction can be raised by paying people fairly improving the quality of supervision, decentralization power, and assigning people to jobs that match their interest.

Arunkumar (2000) has been said that the impact of stress on satisfaction is straight forward. Job related tension tends to degrees general job satisfaction. Even thought low to moderate levels of stress may improve the job performance. Employees find stress dissatisfying.

Fres luthans (2002) said that there are a number of effects brought about by high job satisfaction. Research reports that highly satisfied employees tend to have better physical health, learn new job related tasks more quickly, have fewer on the job accidents, and file fewer grievances. Also on the positive side, it has been found that there is a strong negative relationship between job satisfaction and perceived stress. In other words, by building satisfaction stress may be reduced.

CONCEPTUAL FRAME WORK

HYPOTHESES

Based on the conceptual framework following operational hypotheses were formulated to carry out the study

H1: Stress and job satisfaction are positively correlated

H2: Stress has impact on job satisfaction

METHODOLOGY

Sri Lanka is an island in the Indian Ocean. It has a total area of 65610 km² with 64740 km² of land and 870 km² of water. Jaffna district is located in the far north of Sri Lanka in the Northern Province and occupies most of the Jaffna peninsula. It has a area of 1025 square kilometers. Vadamradchi is a region in the Jaffna district of Sri Lanka.

Jaffna district is situated in Northern Province of Srilanka. Its population about 652184 people. There are 14 divisional secretariats. Its population is about 19.9 million. Srilanka has 25 districts and nine provinces for administrative purpose.

There are 80 schools in Vadamaradchi. But 16 schools have only been selected for the present study. For the research purpose, Questionnaire has been used. The Questionnaire was divided into three sections. In the 1st section personal details of the selected teachers. Section 2 Questionnaire was used to find out to what extent the stress of teachers exists in the school, section 3 Questionnaire was used to find out the teachers' satisfaction. Section 2 carries 13 questions and section 3 consists of 15 questions.

The following 5 scale method is used to disclose respondent's response, strongly agree, Agree, Not decided, Disagree, Strongly disagree. Based on the answered questions, the researcher can be able to identify what variable affect in the stress and what extent in satisfaction of selected teachers. The total score of stress will be the range of 13 – 65 and for satisfaction will be the range of 15 – 75

The following total scale are divided by the researcher for the conclusion of the section II questions (stress) <27 – low level stress, 28 – 41- moderate level of stress, >42 high level of stress

The following total scale are divided by the researcher for the conclusion of the part III question (job satisfaction) <35 – low level satisfaction, 36 – 55 – moderate level satisfaction, >56 – high level satisfaction

METHOD OF DATA ANALYSIS

SPSS used to analysis the data to test the hypotheses. The correlation and regression analyses were used to testable hypothesis and find the reliability.

RESULTS AND DISCUSSION

According the mean value the most important factor determining the satisfaction is challenging job and factors achievement. The least factor determining the satisfaction is autonomy.

Relationship between stress and satisfaction

TABLE 1

Independent variables	Job satisfaction Pearson's Correlation(r)	Significant Level (p)
Stress	.258*	.005

According to the Table: 1, results of the Pearson's correlation shown, there is a weak positive significant correlation between stress and satisfaction. Furthermore, correlation values of these independent variables having with satisfaction, which thought changes in these predictor variables positively, contribute towards changes in satisfaction, but changes would be significant at 0.05 level.

The correlation analysis made on the two variables such as stress and job satisfaction of the teachers. Through the correlation value, we can say that there is positive relationship between stress and job satisfaction.

The correlation value among the teachers' stress and job satisfaction is 0.258 which is significant at the 0.05 level.

So there is positive linear relationship between the teachers' stress and job satisfaction. Hence the relationship, Hypothesis (1) is accepted, that low stress will lead to the employees satisfaction. There is a positive linear relationship between teachers' stress and job satisfaction.

Impact of stress on satisfaction

This analysis is used to estimate of the dependent variable for given values of the independent variable. It also provides and estimates of the effect on the mean value of y one unit change in x. This analysis enables the researcher to estimate this slope and to test hypothesis concerning its value.

Statistics of Regression between stress and satisfaction

TABLE 2 REGRESSION STATISTICS

Multiple R	.258 ^a
R Square	.066
Adjusted R Square	0.54
Standard Error	3.256
Observations	74
Sum of Square	54.386
F – Value	5.129
Significant Level	.027 ^a

According to the table 2 Coefficient of determination – R^2 is the measure of proportion of the variance of dependent variables about its mean that is explained by the independents or predictor variables. The adjusted R square value indicates how well the independent variables influence the dependent one. (Benjamin 1999)

The specification of an independent variables in the above model reveals that the ability to predict the satisfaction. R square value of 0.066, which is in the model, denotes that 6.6% of observed variability in stress can be explained by the differences in the independent variables. Remaining 93.4% variance in the satisfaction is related to other variables. Further, F value is 5.129 which is significant which is significant at 0.05% ($p = .000$).

FINDINGS OF THE RESEARCH AND TESTING HYPOTHESES

The objective of this study is to find out the impact stress on satisfaction of the school teachers of Vadamardchi in Sri Lanka. The findings are based on collected data from the sample of 74 teachers in schools of vadamardchio in Sri Lanka for the year 2011.

Empirical findings of the Research and Testing Hypotheses

TABLE 3

Dependent Variable	Satisfaction		
Independent Variables		T	Significant
Stress	.258	2.265	.027

The study's second hypothesis (H₂) formulated as "stress" has impact on teachers' satisfaction. In the above, indicates that stress has impact on satisfaction. Therefore this hypothesis is accepted, and also that impact is statistically significant.

The study's first hypothesis (H₁) formulated as "Stress" is positively associated with satisfaction of the organization. In the above table, beta coefficient of the stress indicates positive association with satisfaction. Therefore this hypothesis is accepted; even that impact is statistically significant.

According to our empirical results, all hypotheses are accepted.

CONCLUSIONS

Based on the presented data and analyzed data by using statistical techniques this study brings some findings. This study carried out in the selected schools in Vadamadachi.

That there is no low level of stress in these selected teachers. Most of the teachers (97.3%) in school are working under the high level of stress. (2.7%) of teacher's sense moderate level of stress in selected school in Vadamadachi.

According to the correlation value, overall relationship between teachers' stress and job satisfaction is 0.258*. It is significant at 0.05 levels. There is positive Lenoir relationship between the teachers' stress and job satisfaction. That means the least stress will lead to the teachers' satisfaction. So hypothesis 1 is accepted.

Perhaps the coefficient analysis indicates the satisfaction of teachers is contributed by many factors. Based on the coefficient analysis the impact of stress on the satisfaction, the following equation can be formulated.

$$JS = f(s)$$

$$JS = f(22.722+0.225) (s)$$

The above equation reflected that on stress with zero point would be expected satisfaction is 22.722. An increasing of 1 point of stress is associated with the increasing in satisfaction at 22.722% not only the stress; other factors may have the impact on teachers, job satisfaction. They are, Motivation, Promotion, Working condition, Compensation benefits, Training and so on there are not analyzed, because these are outside the scope of the study.

SUGGESTIONS

There is various factors on the teachers' job satisfaction in selected schools in vadamadachi. The following suggestion should be arranged in the selected schools.

Teachers' participation should be increased to these selected schools.

Suitable teachers should be eligible for promotion.

Satisfaction of teachers is an important aspect in school. In this research teachers' satisfaction is only measured against the stress.

This research has been made on the basis of 74 samples; the future research could extend the sample size to ensure the truth of this research.

The school has only selected for this research. So the future researcher could be performed similar research in various organizations.

Teachers who are under high level of stress, some specific suggestion can be used to reduce the stress. The following are list out to reduce the stress.

Exercise: such as working, joking, swimming or playing soft ball are reduce the stress. Although that exercise will directly reduce depression, anxiety and the chances of heart diseases.

Relaxation: the specific relaxation techniques such as bio feed back or meditation is to eliminate immediately the stressful situation.

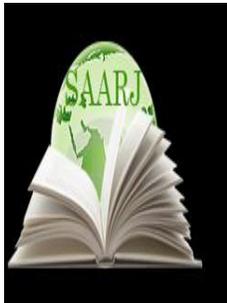

Reduce role conflict and clarify organizational role: teachers must have a clear understanding of the job and must know what the organization expect.

When the excessive stress, reducing the role overload by redistributing the work and implementing procedures for reducing stress should be made by organizations.

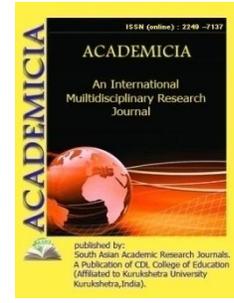

Plan and develop career paths and provide counseling: organization must consider the career planning and development of their employees' in reducing the stress.

**SOME COMMENTS ON THE PRACTICAL ASPECTS OF THE
 PERFORMANCE OF BUKHARA FOLKLORE SONGS (ON THE
 EXAMPLE OF "BUKHARCHA" AND "MAVRIGI")**

Abdullayev Rustam Mamarajabovich*

*Associate Professor,

"Folklore and Ethnography" of Uzbekistan State Institute of Art and Culture "Folk Art" Faculty,
 UZBEKISTAN

ABSTRACT

This article deals with the role of the Bukharcha and Mavrigi songs in the Uzbek national music culture. It also covers the specifics of these songs, their structure and current status. If I say, There are deeply historical knowledge and musical wealth in this songs and melodies which are Bukharcha and Mavrigi. If you read this article, You also can see so much information about Uzbek national musical history and knowledge.

KEYWORDS: *Bukharcha, Mavrigi, Time, Musical Instruments, Historical-Ethnographic, Musician, Shahd, Zullisonaynlik, "Zang" Dance, Uzbekistan, Culture, Historical Melodies, Knowledge.*

INTRODUCTION

If we talk about the unique poetic nature, historical roots, stages of formation, essence and methods of performance of the series "Bukharcha" and "Mavrigi", which are excellent examples of the musical heritage of our people. First of all, of course, folklorist, Doctor of Philology, Professor Akhunjon Safarov, Honored Artist of Uzbekistan, teacher Orif Atoev, Professor Fayzulla Turaev's hard work. The book of their songs "Bukharcha" and "Mavrigi" gives detailed information about the history, structure, artistic and aesthetic features of these song and dance series` creating history. For the first time the songs of these series have a relatively perfect combination of lyrics and melodies.

At first glance, it seems that all the opinions about these categories have been expressed by our teachers, and everything has come to an end. But I think that every creator, every researcher has

the right to interpret and comprehend them on their own, through the prism of the heart and consciousness.

Philological, cultural, historical-ethnographic and musicological views on the historical and cultural roots of the song and dance series "Bukharcha" and "Mavrigi" formed and developed in Bukhara, the stages of formation, features of performance, the peculiarities of the repertoire of performers, its connection with other cultural and singing traditions. An objective and comprehensive study of their views and the determination of their place in the system of our culture is especially relevant in the process of consistent changes in the field of culture and art in our country.

Because in Bukhara, the culture that emerged in this region, the cultural and spiritual image of the people of Bukhara, along with "Bukhara shashmaqomi" the essence of the series "Bukharcha" and "Mavrigi" is not only music, but also philosophy, theology, philology, history, psychology and other social sciences. In terms of both understanding and comprehension. First of all, it should be noted that the performance of the songs "Bukharcha" and "Mavrigi" in two languages - Uzbek and Tajik - is a clear manifestation of the brilliance of Bukhara singing.

MAIN BODY

"**Bukharcha**" and in some cases named "Bukharcha Zang", this category also means a section of songs and dances that are intended to be performed at a specific time.

This series, performed at Bukhara weddings, was performed in three stages, depending on the situation at the wedding and the possibilities.

The category of Bukharcha were performed to the accompaniment of percussion instruments such as doyra, kayrak and zang, but now its ancient style of performance has undergone radical changes. Today, musical instruments include rubab, tar, gijjak (violin), electronic musical instruments (organ), doyra, dovul. In the past, the number of performers was 3-5 people, now it is 6-8 people. The performers of "Bukharcha" or "Bukharcha Zang" were women. This led to the emergence of a series of separate works for women's feasting in the folk performing arts. In Bukhara, these performers were performed by a group of hafiz and dancers known as "musicians." These songs consist of a sarakhbar and a naqarat, performed by a sarakhbar soloist (who also danced at the same time), and a naqarat - performed by an ensemble (in a chorus) accompanied with a doyra.

The first part is called - **Toyona**, the second is - **Yakkahonlik**, and the third is - **Sargardonlik**. Their text is in the context of love, and some are imbued with a spirit of glory. The series ended with a doyra dance (zang), then the choruses came out again and the whole series ended with a group performance. "Bukharcha" song and dance series, depending on the type of wedding, more precisely, depending on the nature of the party or celebration, at the end as an appendix "Muchal song" (when the muchal is celebrated), "Hinobandon song" (for girls' party or gathering), "Chimildiqtarifi" (greeting of the bride and groom), "KelinniKhushroiOvardem" (we brought a beautiful bride), "Sharbatyalatar song" (during the performance of the chimildiq party and related rituals), as well as the first child of the bride. When he sees her, She sings the "Sallabandon song" about the sallabandon (lachakbandon) ceremony, which applauds her as a mother and a woman. These are not related to the category.

“Bukhorcha” is rich in charming dances based on the melodies of “Ufor” parts of Shashmaqom branches. The dances in it are roughly arranged in the following five views:

1. "Kayrakufori" - a dance based only on sharp and cheerful movements accompanied with sharp.
2. "Ravona" - this dance, based on the beautiful demeanor of the beautiful, delicate hiromi, is performed to the accompaniment of the singer.
3. "Ufor" - rhythmic dance performed by a solo dancer. A dance that consists of movements that disperse a beautiful musk barn and intoxicate the audience.
4. "Larzon" - a cheerful dance accompanied with only a doyra or a few doyras. Emphasis is placed on expressing meaning through the harmony of language-based movements based on the delicate vibrations of each organ in the body. This dance has also gained a special reputation and popularity as an independent solo dance. In this case, the famous choreographer I.Akilov's works played a big role.
5. "Zang raqsi" or "Zang bandi" - a dance in which the hands, waist and legs are tied with rust.

It has become a tradition to pay special attention to clothes when performing these dances in “Bukharcha”. Because the dress is a means of expressing the form of dance, in which, in addition to the connection of the dance to any aspect of life, the flow of emotions, the hopeful and painful moments of love are reflected in the color of the dress, in accordance with the dancer's movements. For this reason, when performing the dances in "Bukharcha", the dancer, first of all, paid special attention to dressing for each dance. It has been noted that most of these garments are available in white and red. Usually the dancer wore a gold-embroidered shirt or gold-embroidered jacket with a collar and hem embroidered with gold or silk. Zardozi wore a forehead belt or a kundaldoppi.

Sharpness and rust on the wrists and ankles, as well as rust or bells on the ankles, also played an important role in enhancing the attractiveness of the movements in the dance.

Most of the "Bukhara" dances are performed without bending the body. These movements, which complement the content of the dances, are: "eyebrow-raising", "shoulder-slapping", "spring-like" - "eye-catching", "makomigardon" - rotation makom, "karsi-cirle" - rotational applause, "single applause", "double applause"., “Ring or fist”, “curtain face” - face veil, “cake”, “breaststroke” - chest tremor, “trembling wing” - wing flapping, “trembling hand” - hand tremor, “paw tremor” There are such names as "charkh" - spinning, "charkhimiyon" - waist rotation, "charkhidutaraf" - two-way rotation, "morpechon" - snake wrapping, small steps, which each performer renews while performing according to their skills, as a result gives a new spirit to the dances.

"Mavrigi", Speaking about this series, the teacher FayzulloTuraev said that this series is a migration song, but it was formed over the centuries in Bukhara - on the basis of a synthesis of Bukhara art and Iranian art. "Mavrigi" is a joint creative product of all Mervs forcibly relocated from Merv to Bukhara - not only Persian-Tajik, but also Turkmen and Uzbeks.

“Mavrigi” is a series of songs sung and danced accompanied with a doyra by men only at weddings and celebrations in Bukhara. There are three moments. Each of the independent main moments has its own name. as follows:

The first moment - "Shahd" - consists of ten songs and more dances.

The second moment - Chorzarb, consisted of twenty-four songs and more dances performed in duplicate: the first version consisted of only fourteen Tajik songs and dances, the second version consisted of "shirushakar" and ten Uzbek songs and dances. The point is that these two copies are intended to be performed taking into account the ethnic composition of the audience: for example, if the majority of listeners are Tajiks - performed in Tajik, and if Uzbeks - performed in Uzbek. In some cases, mixed playback occurs.

The third moment - "Shikan-shikan" - consists of ten songs and dances.

Humorous songs belonging to the additional part do not have a separate name as the Moments. In it, mostly humorous songs about insects, animals and people are sung and danced. So far, eight songs belonging to this group have been identified, some of which have several songs in the repertoire of Uzbek performers.

It has become a tradition in the past for Mavrigi as to be performed by four, and later in some cases three men. All members of the group sang and sang in a circle, but did not dance. The Mavrigikhanes were invited to the round as separate dancers and musicians, not members of any other group. However, over time, the dance was performed by the Mavrigikhanes themselves, as it was not possible to invite a separate dancer each time, and the participation of a particular dancer in the financial arrangement also prevented this. This series is sung mainly in the cities and villages of Bukhara. Nowadays, Mavrigikhanes play modern musical instruments.

Another point is that there are attempts by some artists to interpret the Mavrigi series, as its name implies, as a work of art belonging to pure Iranians. Proof of this is the fact that a few years ago, during our creative collaboration with Iranian artists, we performed the Mavrigi series in front of Iranian art fans and musicologists. I would like to emphasize that Iranian artists said: only the beginning of the performance - "Shahd" is like Iranian's, the rest is completely yours. At the same time, there are a number of problems that need special attention in determining the place of the song and dance series "Bukharcha" and "Mavrigi" in the system of our culture. First of all, it should be noted that not all of these song and dance series have been collected in full and published with excellent scientific commentaries, and scientific and theoretical research is carried out in a scattered manner. Another point of scientific attention is that for some reason most of the written literature included in the series "Bukharcha" does not belong to the works of Bukhara poets (with the exception of Soleh Bukhari). The works of such well-known poets as Jalaliddin Rumi, Pahlavon Mahmud, Kamal Khojandi, Abdurahman Jami, Foni Kashmiri, Nazim Hiroti, Zebuniso and Ishaq are among them. During the next seventh century, Surprisingly, none of the dozens of poets born and raised in Bukhara are included with their poems in the category. In our opinion, in terms of the formation of "Bukharcha" in the past, the participation of artists from the same historical and cultural space as Bukhara can not be denied. In addition, not far from Bukhara, in Karakul district, there is a village called "Bukharcha". I think this issue also needs special research.

CONCLUSION

It is not secret that the songs "Bukharcha" and "Mavrigi" should be performed as a whole, in a general sequence as a complete performance, and such a performance will last several hours. This means that a special high skill is required to perform them with their own sophistication. In the past, students who chose this path learned the secrets of performing songs "Bukharcha" and "Mavrigi" with teachers for 10-12 years. We want to teach students to perform these songs with

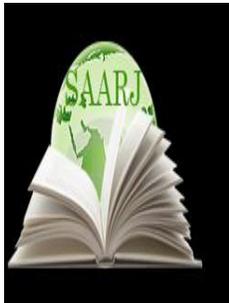

high skill on the basis of one-year curricula taught in higher education institutions, but we do not understand that this is a very difficult task. As a result, young performers perform mixing them, unaware of the differences between the two series. The harder the performance, the harder it is to get it to the audience, to make the audience understand and accept it. One of the urgent tasks in the society is to create a spiritual and cultural need to enjoy the songs of the song and dance series "Bukharcha" and "Mavrigi".

In addition, we think that considering the song and dance series "Bukharcha" and "Mavrigi" as belonging to only one folk would have reduced their humanity content. There is no denying that common cultural heritage of the Uzbek and Tajik peoples, to deny the invaluable contribution of the Iranian, Jewish, Azerbaijani and Turkmen peoples, who took Bukhara as their homeland, in their development and formation.

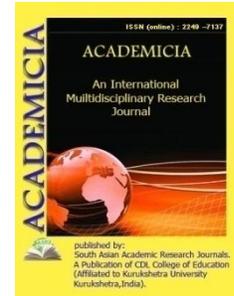

By solving the above-mentioned issues "Bukharcha and Mavrigi" songs and dances. We can turn them into an integral part of universal cultural heritage, include them in the UNESCO Representative List of the Intangible Cultural Heritage and thus the prestige of our people in the international arena and we can raise it further.

ABSTRACT

This article provides information on the spiritual upbringing of a person, the moral criterion that leads a person to spiritual maturity, as well as the recommendations of the great scholars on his perfection. In order to properly manage this situation, to master the positive aspects of the material and spiritual influences around, the role model for the child serves as a true role model for parents. That is why parents must be extremely vigilant in raising their children. It is obvious that parents can not hide anything from the child in the family, and on this basis the child is brought up.

KEYWORDS: *Upbringing, Morality, Emotional Impact, Social Environment, Personal Example.*

INTRODUCTION

Man is the beauty of the earth, the greatest of all the creatures created by Allah. Allah recognized the so-called human being as His caliph on earth and sent him to earth to fulfill great duties and responsibilities. Therefore, since man is the most precious and sacred of all creatures, he must serve the earth with all the possibilities and powers available to him for the beauty and prosperity of the earth. In order to perform this task properly, a person must, of course, be taught good manners and morals. The Avesta, the oldest source on the history of our country, also contains a lot of valuable information about the upbringing of children. For example: **“Education should be the most important pillar of life. It is necessary to bring up every young person in such a way that he first rises to the highest level by learning to read well and then to write.”**¹ Indeed, these words, spoken 30 centuries ago, are still relevant today. If a person does not read and study every page of the book called education on his way to life, the opening of each new

page will cause him many difficulties. The great Greek philosopher Aristotle said, "**Parents deserve praise not for giving birth to a child, but for bringing him up in a decent and moral manner.**"² Of course, upbringing is a very complex process, and the achievement of the desired result in this process is measured by the level of education of the educator. That is, education is a systematic management process. Abdullah Avloni, a great enlightener and one of the leaders of the Jadid movement, said: "**Education is pedagogy, that is, the science of child rearing. A good upbringing for the health and happiness of the child, keeping the body clean, correcting the profession at a young age, teaching good manners are like doctors, just as a doctor treats a disease in a patient's body, a caregiver is a "good man" who "cleanses" the child's anger center. He has to do it in a big way.**"³ It is known that the process of education takes two forms. The first is external education, that is, the process by which a person develops his or her ability to manage his or her own behavior in accordance with the existing rules of conduct, rules of conduct and moral norms in society.

Main body.The second is the inner training (Spirit training), which is a complex process aimed at shaping one's inner spiritual experiences, such as faith, conscience and belief. It takes a great deal of skill on the part of the educator to carry out this responsible process at an excellent level, to carry it out on the basis of its clear and effective results. It is well-known that in all countries, regardless of religion, nationality or social origin, there are people with different personalities, thoughts and worldviews. Their upbringing as a human being is constantly influenced by various factors (family environment, community, street life, hardships, religious traditions, unusual behavior ...). If the pupil does not develop the ability to absorb the positive aspects of these influences and to overcome the negative aspects, then these influencing factors completely take over the whole psyche of the child and cause him to remain in a certain mold. In order to properly manage this situation, to master the positive aspects of the material and spiritual influences around, the role model for the child serves as a true role model for parents. It should be noted that humanity is constantly confronted with the concept of creation, education. If we analyze the general sciences that have been studied from the distant past to the present day, in all of them the human factor, its destiny, its advantages and disadvantages, its attitude to existence have been widely covered. Especially the issue of upbringing too. Our great encyclopedic scholars have also expressed many thoughts and opinions about the upbringing of children. For example, Abu Nasr al-Farabi, on the basis of his knowledge, described the image of an enlightened mature man, saying: "Let him know all the laws and rules, be knowledgeable and eloquent, respect the learned and the wise, do not spare the world of science and the people of science, and have knowledge of all real material things."⁴ Ibn Sina also conducted a lot of research in the field of upbringing and expressed his valuable views on child rearing and methods of upbringing. For example: "All good and bad behavior is the result of conditions, upbringing and habits. Good behavior is also achieved through habit,"⁵ said the senior doctor. Ibn Sina, in his views on the moral upbringing of the child, also speaks about the issues of housekeeping. "Raising a child is the main goal and duty of a family parent. A parent who is able to correct his or her own shortcomings can be an educator. The most important means of moral education is to talk to the child one-on-one, without touching his personality or pride." Ibn Sina considers the formation of moral qualities in a child in harmony with work, physical and mental training, as a key factor in his development as a human being.

Yusuf Hos Hojib, in his famous work "Kutadgu Bilig", also expressed many views on the upbringing of the child, his spiritual maturity, morality and ethics. According to Alloma, everyone should be socially acceptable and mature. To do this, he must receive the necessary upbringing from the day of birth. He thinks about the upbringing of the girl Cain and emphasizes that they should pay attention to their own characteristics. "Children's upbringing must start very early," he said. Only then will they be prevented from giving in to their wrongdoing. If your son or daughter is born, raise him at home, do not raise him elsewhere. Get a coach from good people. The boy and the girl grow up clean, free from (undesirable things). Teach a boy and a girl to be polite, both worlds are theirs, it will be enough for their interests."⁶

As we follow Mirzo Ulugbek's views on the family environment of raising a healthy generation, Allama says that the environment in which a child is brought up plays an important role in the development of a child's interest in education. In the family, parents, especially educated parents, should pay special attention to the development of their children into real human beings. According to Ulugbek, in order for a person to be healthy and strong, he should be engaged in physical exercises from an early age, and teachers should be fair and honest so that there is no corruption and fraud in education. Mir Alisher Navoi, a great genius of poetry, also focuses on the factors that shape the upbringing of a mature person throughout his career, as well as the strength and power of upbringing in the development of the child. The great thinker quoted many instructive phrases about upbringing in his book "Mahbub ul-Qulub": Polite boy is proud of each other among his peers, he looks good in the middle, big and small. Polite makes young people worthy of the prayers of the elders, and they will enjoy the blessings of this prayer for a lifetime. Politeness inspires the love of the little ones in the hearts of the elders, and that love stays in the heart forever. From etiquette adorns and adorns love, from etiquette leaves the prosperity and value of friendship."⁷ It should be noted that the upbringing of children is a very complex process. That is why parents must be extremely vigilant in raising their children. It is obvious that parents can not hide anything from the child in the family, and on this basis the child is brought up. Alloma believes that as a result of upbringing, the child will grow up to be a useful and mature person. He emphasizes the need to educate a young child from an early age, that upbringing will help a person to develop good habits and qualities. He argues that one of the most important factors in the upbringing of a child is undoubtedly the formation of human relationships with people, especially as a result of the spiritual influence of people on each other.

According to the preacher Al-Kashifi, it is possible to increase a person's mental ability through re-education through education. In his pedagogical views, Kashifi pays special attention to the development of children's ability to think independently. Parents and teachers are required to pay special attention to this issue. The family and the external environment play an important role in this issue. The child must be brought up to be truthful, faithful to his promises, and well-mannered.

According to him, the equal participation of both father and mother in the upbringing of the family helps the child to acquire a certain profession of good manners - the rules of etiquette, food, clothing, meat and furniture, which are the material basis of science and profession. must be attractive to give.

The great philosopher Jean-Jacques Rousseau said: **“Early upbringing is more important than anything else, and it is undoubtedly on the shoulders of women. If you give in to your child, he will be your ruler, and you will have to accept what he says every minute to obey him.”**⁸

Anton Grigoryevich Rubinstein, a well-known Russian pianist, composer, and educator, said: **“Parents often confuse the word 'education' with the word 'information' and think that they have brought up a child by teaching him certain lessons. That is why, as the years go by, the frustrations of the parents grow old.”**⁹ The following hadith was narrated from the Prophet (peace and blessings of Allaah be upon him) about the importance of parenting: **“Every child is born in a Muslim nature, but it is his parents who convert him into a Jew or a Christian or a pagan” (Narrated by Imam Bukhari).**¹⁰ In fact, every movement of parents, culture of behavior, rules of conduct, behavior, hospitality, adherence to national customs and traditions, attitude to religion, passion for science, in short, with all the human qualities (sometimes the opposite) develops the upbringing of their children over the years. Abdullah Avloni, an enlightener who considered upbringing to be a matter of life and death, once asked, "Who does upbringing?" It is not in vain that he raises the question. Who is to blame if young people are greedy for wealth, disregard for spiritual values, everything in the world is "mine" and "not mine", and the child does not have a love for nature and people? Are they parents who do not have time to raise them? Aren't their hearts different and their words different? Isn't he a teacher who spends his life on other dimensions, talking about great scholars, Navoi-yu Babur, their invaluable wisdom? If the child's heart is strong, first of all, when meeting with them, do we need to think a little about whether the doors of our hearts are open, our tongues and hearts are one? **"A dead word does not evoke a living response,"**¹¹ said Chingiz Aitmatov. In words, deeds and deeds give life. "Parents who are raising their children need to be able to display good qualities in their actions, in their behavior, in their dealings with others, and in their dealings with others. Because a child is by nature an imitative and observant person. Therefore, those around him influence them with their habits, sometimes without realizing it. Misbehavior in the family, lying a lot, and unpleasant behavior lead to an unhealthy environment that negatively affects the child's upbringing. The role of parents is important in the upbringing of children. When a child hears rude and harsh words from his parents and is severely beaten, it has a negative effect on his nature. This, in turn, leads to the formation of "spiritually ill" people from a child brought up in an unhealthy family environment. They also have a negative impact on the spirituality of society. As a result of the influence of "popular culture" on parents in the family, it has a negative impact on the upbringing of children. Of course, raising a child is very difficult and responsible. This requires every parent to work on themselves regularly, to appreciate all the information about the upbringing of children. **"The most important thing is that the pupil should never waste time, his hands should not be idle, because when his hands and brain are not engaged, then his thoughts, feelings, emotions and morals are destroyed."**¹²

Parenting is not just a collection of experience, simple instructions and knowledge, but a complex process that includes knowledge in the areas of religious and moral knowledge, medicine, ethics, psychology, pedagogy. Today, the difficulty of family upbringing is that, first of all, as society develops, the requirements for the formation of a mature person on all sides increase. This requires an increase in the quality and scope of aesthetic, sexual, moral education in the family. It is good that education and morality are given from childhood. It is good that education and morals are given from childhood. **“Parents need to teach their children to**

think, not to think, in the process of raising their children.”¹³ The Prophet (peace and blessings of Allaah be upon him) said: “If you teach your children discipline, it is better than giving alms every day.” Discipline is the key to a strong family. In this sense, Islam encourages parents to bring up their children in a healthy way. The hadith states, **“Respect your children and treat them with good manners.”**¹⁴ In our sacred religion, the mutual responsibility of both parties in the formation of feelings such as mutual respect, compassion, kindness, compassion between parents and children is explained in detail. Honoring and honoring one's parents is one of the teachings of our holy religion, Islam. In the Qur'an, Allaah says (interpretation of the meaning): **“And your Lord has commanded that you worship none but Him, and that you be good to your parents.” (O man!) If one or both of them reach old age in your presence, and hate them! Say kind words to them. Kindly lower the wings of humiliation to them and say: O my Lord! Have mercy on them as they brought me up when I was a child. (Isra, 23-24).**¹⁵ Therefore, the child should appreciate his parents, and parents should bring up their children in the status of the above verse. The Prophet (peace and blessings of Allaah be upon him) said in this hadeeth. Socio-spiritual relations between parents and children are also legally strengthened in Chapter XIV of the third part of the Basic Law. In particular, Article 64: **“Parents shall be obliged to support and care for their children until the latter are of age.”**, and Article 66: **“Able-bodied children who are of age shall be obliged to care for their parents.”**¹⁶ It is obvious that the family is a place based on mutual understanding, mutual respect and high trust. The main condition for maintaining this fortress as a strong fortress is to maintain unity with love. At the heart of this is the issue of good upbringing. Because in each letter of the word upbringing, the strong bricks of the magnificent building, called the family, are intertwined. It is not for nothing that our people say, “He does what he sees in the bird's nest.” While playing the role of the main educator on the stage of life, parents should become regular consumers of secular and religious sciences in order to fulfill their role and capture the mind and heart of the pupil.

DISCUSSION AND CONCLUSION

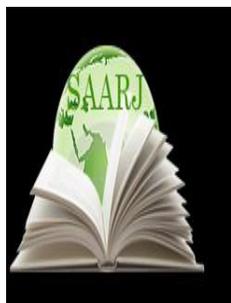

In conclusion, we want to bring up our children in such a way that they remain faithful to their ancestors, their history, their homeland, their mother tongue, the elders of the nation, the sacred traditions of Islam. Let us bring them up in such a way that the most important Uzbek is the most honorable Uzbek, who embraces the positive aspects of any innovation, denies its negative aspects, amazes the world with new inventions, illuminates the world with the light of science and enlightenment. These are not exaggerated, imaginary statements. We can do this easily. Because we are the descendants of great geniuses. In the words of the great Sahibkiran Amir Temur, **“Who are we, the Emir of Turan, Turkestan? Who are we, the oldest and greatest of all nations, the head of the Turks?”**¹⁷ In addition to the enlightenment science learned from books, the science of family life is as important to them as water and air. A knowledgeable, polite and intelligent person finds his place in life. As their children grow up, it is important for them to be more vigilant about their destiny, to enjoy the true and strong roots of our higher values, and to bring them up in line with today's way of life. When the time comes, the advice given to one of our children should now apply to his brothers and sisters, and we should work to ensure that it affects all members of the family equally, and that our children should be partners in education and vocational training. We also need to educate them in the spirit of belonging to the events and changes around us, to feed them with great confidence in the future.

In short, the role of community organizations, parents, community activists and scholars is invaluable in bringing up our young people in all aspects, perfect, well-mannered, independent thinking and worldview, free from various negative habits, vices and influences.

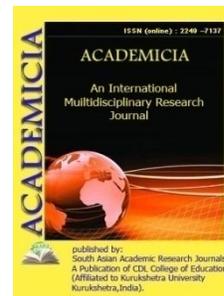

A child brought up in an unhealthy environment develops "spiritually ill" people. We need to be vigilant in today's dangerous times, when economic and spiritual crises are intensifying, young people's consciousness is being affected by lies and false information attacks, and their hearts are being affected by the harmful effects of religion under the guise of religion.

INTERPRETATION OF HEROES IN SHUKUR KHOLMIRZAEV'S STORY "SMILE"

Hamidova Muhayoxon Obidovna*

*Docent,
 Candidate of Philological Sciences,
 Namangan State University,
 UZBEKISTAN

ABSTRACT

Shukur Kholmiraev, as owner of a unique avoids criticism, one-sidedness, narrative. Artist's 70-80 artistic style, is distinguished by new aspects of changes in the worldviews of the heroes of his stories. Most of these heroes are people who are able to re-analyze and evaluate life processes independently, take a fresh look at national, spiritual and cultural values, and express a bold critical attitude due to advanced thinking.

KEYWORDS: *Story Genre, Artistic Style, Artistic Intention, Creative Process, Art, Writing Skills, Role Of Word Art, Artistic Meaning Critical, Expressive, Heroic Worldview, Life Process, Analysis, National, Spiritual And Cultural Values, Deep Observation.*

INTRODUCTION

Shukur Kholmiraev is one of the writers who has a special place in Uzbek literature as a writer who created an artistic chronicle. The 50-year life of the Uzbek people is accurately reflected in this chronicle. Each of Adib's stories is an independent work, but it is like a brick in a glorious building: if a brick is removed, it looks flawless even if the building does not collapse. So, in order to see the building built by Shukur Kholmiraev intact, it is necessary to read all his works.

One of the works of the author that should be read is the story "Smile", which was written in 1984 and is one of the stories of great spiritual significance for its time. Russian writer Vasily Shukshin: "Stories should look something like this:" Story is destiny. 2. The story is destiny. 3. The story is tazarru. Literary scholar R.Kuchkarov says that the author's story "Smile" corresponds to the "story-destiny".¹ Of course, there is a soul in this opinion of the scientist. The reason is that the fate of one of our national heroes, Kuyun, is revealed through the fate of the protagonist of the work.

The author does not describe the fate of the Storm in this story, but aims to show its destruction, the factors that led to it, and achieves its goal. Of course, it does not solve this in the form of outreach or one-sided reporting, but it does show it exactly, that is, the last days of the Sun. In contrast to his contemporaries, the author portrays Kuyun not as an ignorant, evil man whose goal is only to kill and rob, but as a man who has a definite purpose, confidence, conviction, and, more importantly, a man who is not afraid of the bitter end of his life. does.

The struggle with the Kuyun Shura government, which had devoted its life only to the struggle for the independence of the country, felt that it could not achieve its goal with the support of its compatriots Jalil and Kuyun. He is very sensitive, and the Believer, who is sent to him, knows the purpose for which the Jalils came, but he takes himself into ignorance, into ignorance. He welcomes them well. In the end, he surrenders to them.

Shukur Kholmiraev touches on a more complex, more delicate subject, which was impossible for that period, by revealing the character of the image of the Sheep in the story. Through this courage and bravery, the study of the most delicate feelings, inclinations, experiences in the heart of the protagonist with great love and great attention also testifies to the expansion of the courage and culture of writing.

"Serious, passionate reflections on the conflicting period, on human personality and freedom, gave rise to a 'subjective' image in literature, which ushered in a new wave of prose, and thus the lyrical-publicist, poetic-romantic style of prose."² Literary critic U.Normatov wrote in his book "Horizons of our prose".

As the writer Nabijon Baqi said, "The writer first tries to understand man."³ Had it not been for this approach to Kuyun and the other heroes, the work would have lost its value today. The writer's unique style never takes into account the level of the reader. This can be seen in the following conversation between the author and the literary scholar U.Normatov: "Personally, I was able to attract the reader to his taste, not to please him in any way, but to raise that taste, at least in part. I love sweaty writers".⁴

It can be said without a doubt that in his time the writer also managed to change the attitude of the reader to the national hero, albeit a little. Through the image of the rabbit, he was able to reveal in a unique style the heroes who fought valiantly for the independence of the country.

The reader gets acquainted with the image of the rabbit through the memories of the protagonist of the story, Jalil's father. But even with this brief acquaintance, the attitude towards him will definitely change.

In the process of reading the work, some places seem strange to the reader. For example, Jalil sets off in search of the Kuyun frog. He really had to look for her for a long time. However, as the writer and literary scholar R. Kochkarov said, "he takes a bold step - he separates himself from the young men and puts them in an ambush. Again, not with another guy, but with Momin, whom Jalilbek has to meet! "The writer could have taken a different approach, but he gave the idea he wanted to convey, the idea he wanted to convey, rather than increasing the volume of the work by introducing redundant characters into the story. That is why, in the words of AP Chekhov, a Russian writer, "There is a gun hanging on the wall. It must be shot during or at the end of the play. " If this is not done, the work will have no artistic value.

The author also pays extensive attention to revealing his mental state in depicting the image of the Rabbit. As our literary scholar I.Rustamova said: "The author-narrator can give a psychological image anywhere in the prose work through his speech. Through the emotional features of the protagonist's spiritual world, the author influences the reader, bringing him into this state."⁵ During the reading of the work, the mood of the protagonists of the story is so skillfully conveyed that it attracts the reader's attention. When Jalil, the protagonist of the story, meets Kuyun for the first time, Jalil swears and tries to convince him when his frog looks at the young man in disbelief. The words of the rabbit to him at this point will certainly impress the reader:

"Don't swear. I'm afraid to swear in the world, brother ... I once swore .. I'm killing so many redheads. I killed so many innocents. I set fire to so many houses. I sold so many cattle to the Afghans ... If that doesn't work, brother ... I swear I'll go down if we lose. They say back to the world. A man must die bravely, brother ... If you have done something wrong, give me an answer".⁶

The rabbit's words, full of such mental anguish, burst from his heart, showing that he was a victim of a fruitless struggle, and that he had realized that the oath he had once sworn would ruin his life. He wants young Jalil not to make the same mistake again. He urges us to refrain from using the oath for lying, in accordance with the saying of our people, "Fear not to wear, for if you swear, you will swear if you do not fulfill it." This, of course, does not go unnoticed by our hero. The life of the young Jalil, who lived with Kuyun for only one day, underwent great changes in his outlook.

Recognizing the reality, re-cooking in the cauldron of literature, raising it to the status of a story is beyond the reach of any penman. Undoubtedly, Shukur Kholmiraev has gone through such stages and is seriously working on his stories. This can be seen by reading and analyzing the story "Smile". Through Jalil's father, we have seen that in the process of a person's self-realization, he faces so many complex, confusing and delicate problems that he cannot even see with his most beloved grandson. The reader's respect for Jalil's father increases when he sees that he has judged himself, his conscience, and his faith by examining his past. The writer was able to create a kind of conflict in the work, wanting the work to be effective for the reader.

We see a conflict between the characters through the conflict between Jalil ota and the old believer. It is true that the old believer and Jalil father face such a conflict in their youth that it causes them to be hostile to each other for a lifetime. Jalil's father is young, but he understands black and white. The believer, on the other hand, took advantage of the surrender of the well-received and well-received Kuyun to him in the hands of the Soviet government, and his conscience was not troubled. Jalil, on the other hand, could not bear to see Kuyun being pushed away by the believer on the way. From the conversation here, you can learn what kind of person Momin and Jalil are. If Jalil does not violate his human conscience, the believer will not have a hard time conscientiously tying the hand of a fellow countryman and taking him to the Council, saying, "I have caught him." Because of this conflict, the two do not want to see each other, even if they greet each other in public.

In this story, Shukur Kholmiraev skillfully demonstrates the psychology of the heroes through their actions, words and gestures. This is the style of the writer.

"The storyteller must perceive reality with great sensitivity, he must see the reality of life with his whole being, and even if this truth is obscured by the details of life, he must still be able to see it clearly",⁷ said Abdullah Qahhor. It is also clear from this story that the writer was able to achieve his goal by embodying the image of national independence-national heroes, who were condemned in his time, with a positive approach to reality.

The writer also pays great attention to bringing characters to achieve his goal. In the story, her child is a boy and her son's child is a girl. However, a child like Uzbeks cannot be a child of a nation. Let her have one child, but the fact that her son also has one child may be unnatural to the reader. However, the author ignores this "shortcoming" and describes it in the light of the course of events in the story. Or in the story, Jalil mentions the father's daughter-in-law several times, but her name is not mentioned in the play. In this case, too, the author was able to cite the attitude of Uzbeks to women. That is, the names of Eastern women are never mentioned. It can be mentioned in her virginity, but she is called a "bride" when she gets married, and when she has a child, she is called by her husband the name of her eldest child. Importantly, she is Jalil's father's daughter-in-law. That is why the reader recognizes her as a bride. As the literary scholar R.Kuchkarov said, "Any superfluous character follows the superfluous details and hinders the flow of the story."⁸ Therefore, the writer avoids superfluous details and does not use unnecessary characters in the play.

As we read the story, we see that one of the writer's skills is his extensive attention to the name of the protagonist. The name of one of the heroes we see in the play is Kuyun. The rabbit used the name Mu'min to refer to a man who is quick to believe in everything, who is able to believe in everything, who does not know where he is going, and who cannot feel it deeply.

Literary scholar N.Vladimirova agreed with the opinion that "a new era in literature will appear with a new hero"⁹, and with this story, the author proved that for the first time it is possible to approach the image of a national hero, a national character. For the first time, he was able to illuminate this character in the play. He could not make the Believer, who fought for Soviet power, a national hero, but convincingly portrayed the image of Kuyun, who fought against this Council and its ideas, as a national hero. Academician I.Sultanov, agreeing with N.Vladimirova, puts forward the idea that "it begins with the perception of novelty in literature".¹⁰

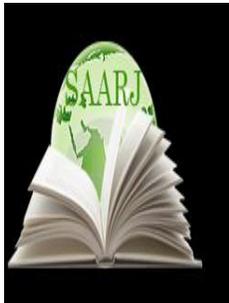

Literary scholar H.Boltaboev said, "The style of Shukur Kholmiraev's stories is unique in that he repeatedly appeals to certain characters and heroes, examines them in detail, and expresses his actions and feelings only through the words and actions of the hero." We also agree with this opinion of the scientist at this point and make some objections. Shukur Kholmiraev, not only in his stories, but also in his works of prose and drama, repeatedly refers to certain characters and heroes and examines them extensively. He will correct the mistakes he made earlier. We can see this in the story we saw above, and we can be sure of that.

In general, the writer notices events that no one notices or notices, even because of his delicate sensibility and sensitivity, and in his works he is able to convey them in a more interesting and impressive way to the reader.

VOCABULARY PROBLEM IN NON-PHILOLOGICAL INSTITUTIONS

Adilova Dilorom Kadirovna*

*Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN
 Email id: d.adilova68@mail.ru

ABSTRACT

A strong vocabulary, both written and spoken, requires more than a dictionary. In fact, it requires an educational commitment to overcoming four obstacles: the size of the task (the number of words students need to learn is exceedingly large), the differences between spoken and written English, the limitations of information sources including dictionaries, and the complexity of word knowledge (simple memorization is not enough). Learn more about these challenges to acquiring the 2,500 words a student needs to add each year to their reading vocabulary.

KEYWORDS: *Vocabulary, Content, Oral Expression, Grammar*

INTRODUCTION

Vocabulary is an essential skill for learning to read and write, and vocabulary strategies are necessary when students are reading to learn across the core curriculum content standards (CCCS). Students use vocabulary to understand (receptive) and use (expressive) words to acquire and convey meaning. It is an important prerequisite for developing reading comprehension and oral and written expression. When a student does not have rich vocabulary he/she may struggle to gain meaning from text while reading and understand new concepts presented in oral discussions. Therefore, the following direct and indirect strategies, which have been effective in increasing students' vocabulary, should be considered when intervening with an individual student:

- ❖ Help student develop word-learning strategies that they can use with new words that have not been taught directly

- ❖ Utilize reference tools, such as dictionaries. First model its use. For example, with a dictionary, there is frequently more than one definition of a word. Therefore, an explanation of which definition applies and why, given the context of the text. Also, reviewing synonyms may assist in learning other words.
- ❖ Information about word parts to figure out the meanings of words in text.

Teach the student common prefixes and suffixes (affixes), base words, and root words, which can help the student learn the meanings of many new words. For example, if the student learns just the four most common prefixes in English (un-, re-, in-, dis-), he/she will have important clues about the meaning of about two thirds of all English words that have prefixes. Learning suffixes can be more challenging than learning prefixes. This is because some suffixes have more abstract meanings than do prefixes. For example, learning that the suffix -ness means "the state or quality of might not help students figure out the meaning of kindness. Other suffixes, however, are more helpful. For example, -less, which means "without" (hopeless, thoughtless); and -fid, which means "full of (hopeful, thoughtful).

- ❖ Use context clues to determine word meanings. Context clues are hints about the meaning of an unknown word that are provided in the words, phrases, and sentences that surround the word. Context clues include definitions, restatements, examples, or descriptions. Because students learn most word meanings indirectly, or from context, it is important that they learn to use context clues effectively.

The essential parts of most Russian nouns are the root, the suffix, and the ending. A suffix is usually a group of letters which goes at the end of a word and carries a new meaning or grammatical properties. For example, the suffix *-изм* (-ism) added to the word *капитал* (capital) turns it into an abstract noun *капитализм* (capitalism) in both Russian and English. You can get a better understanding of nouns in the Russian language by paying close attention to their suffixes.

Directly teach three types of words:

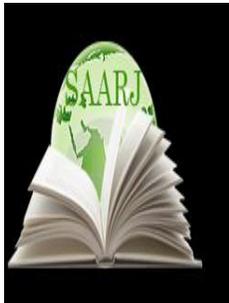

- a. Important words: words that are critical for understanding a concept or the text. Therefore, before the student reads a text, it is helpful to teach them specific words they will see in the text.
- b. Useful words: words that students are likely to see and use again and again
- c. difficult words: words with multiple meanings, idiomatic expressions

Provide multiple teaching and learning opportunities with targeted vocabulary words over an extended period of time. Words are typically learned from repeated encounters (often 8-10 exposures), rather than from a single context or encounter. Have the student listen for and find in print the words as they are used outside of the classroom-in newspapers, magazines, at museums, in television shows or movies, or the Internet.

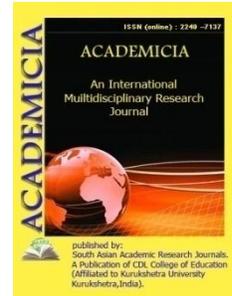

- d. Connect vocabulary instruction to reading. Discuss reading selection before, during and after reading, talking with student about new vocabulary and concepts and helping them to connect the words to their prior knowledge and background. When reading aloud, discuss the selection before, during, and after you read. Talk with students about new vocabulary and concepts and help them relate the words to their prior knowledge and experiences.

THE ROLE OF DEBATE IN SPEAKING SKILL

Shadmanova Nigora Ergashevna* ; Rakhimova Dilrabo Pulatovna**

*Russian Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN

**Russian Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN

Email id: d.rahimova 971@mail.ru

ABSTRACT

In this article I want to highlight that Russian teacher should take advantage of debate during Russian classes. It should be demonstrated by the certain rules and guidelines which can lead to a rational and well-structured debate. Typically, in debate there are two debates are presented the topic that they will discuss. According to the chosen topic each team should prepare an argument. After indicating guidelines of debate, it is reasonable to conclude that, debate helps students to achieve self-esteem to express their own opinion in the group. In addition, debate improves critical thinking of the students.

KEYWORDS: *Typically, well-structured, self-esteem*

INTRODUCTION

Speaking skill is an interactive process in oral mode. It is more complicated because it demands receiving and sending information simultaneously. While teaching speaking aspect teacher should take into account different types of techniques and methods to improve it. Conducting lessons with the help of debates is one of the fruitful way that can help students to develop oral speech. In this article I will focus on the importance of debate in speaking aspect.

Debate is a discussion or contest in which people state opposing opinions about a presented topic. Before coming to one concluding idea, rebuttals are often occurred between teams. But debating doesn't mean just standing up and saying the first thing what comes into your mind. It should be demonstrated by the certain rules and guidelines which can lead to a rational and well-

structured debate. Typically, in debate there are two debates are presented the topic that they will discuss. According to the chosen topic each team should prepare an argument. Here the topic should be controversial issue that make speakers think from different points of view. One team must debate the "affirmative" stance and the other must debate the "negative" stance. The team that agrees with the topic is called the affirmative, while the team that disagrees is called the negative. Speakers from two teams present their arguments one by one: affirmative, negative, affirmative, negative and so on.

The procedure of debating

1. Define the topic. Make sure that you understand what is mentioned in the topic. For example, "studying grammar is more important than practicing conversation skills"

2. Write your argument according to the designated time limit. After introducing the topic, speakers should present a main argument. If you say: "conversation skills can be achieved without grammar rules". In this case, be ready to support your argument with claim and evidence. When the speaker supports argument with the facts, she/he should use historical resources relevant to the topic to prove his/her argument. Avoid using evidences from your real life. It is not considered reliable fact.

ARGUMENT-CLAIM-FACT (EVIDENCE) "In order to speak correctly one should learn grammar", (argument) "Because grammar gives us set of rules to make up well organized sentences", (claim)

"In fact, Dr. Benson did research work and came to conclusion that learners who practiced oral speech without knowing grammar couldn't express their ideas accurately", (evidence)

3. Present your argument. While demonstrating argument speaker should speak clearly and loudly. During presenting, speaker should keep eye contact with opponents and judge. Speech should be explored in seven minutes. Otherwise, speaker loses points.

4. Refute or rebuttal. While debating it is always possible to rebut. Debate strategy First affirmative,

- Introduce the topic and present the team's main position
- Briefly, tell what each affirmative speaker will talk about
- Present argument

Second negative

- Accept or reject the definition
- Briefly, tell what each negative speaker will talk about
- Offer rebuttal to the points mentioned by first affirmative Second affirmative
- Confirm the affirmative's position
- Offer a rebuttal to the points presented by the first negative
- Demonstrate the second affirmative argument Second negative
- Reaffirm the negatives line

- Offer a refutation a few points presented by the second negatives argument Third affirmative
- Confirm the affirmative's main line
- Offer a rebuttal negative's arguments

Conclude debate for the affirmative team

Third negative

Confirm the negatives main attitude

- Offer a rebuttal any of remaining affirmatives arguments
- Offer a summary of the negatives case
- Conclude debate for the negative team

The last speaker from each team is expected to sum up his/her argument. So that they will not add additional information. Assessment:

- Matter. It means evidences and facts that the speaker used to support his/her claim.
- Manner: eye-contact, voice

Body language. How well could the speaker use his/her body to emphasize arguments.

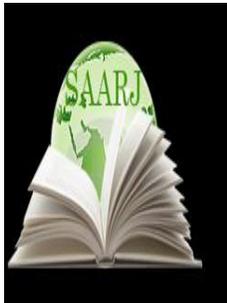

- Method: How well could the speaker work in groups?

Could every speaker demonstrate his/her argument appropriately?

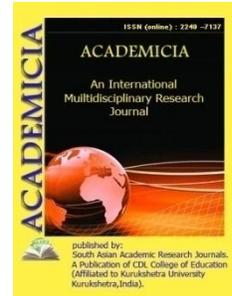

After indicating guidelines of debate, it is reasonable to conclude that, debate helps students to achieve self-esteem to express their own opinion in the group. In addition, debate improves critical thinking of the students. Debate skills help to develop learners' vocabulary and improve the fluency of the Russian language. In this article I want to highlight that Russian teacher should take advantage of debate during Russian classes.

COOPERATIVE LEARNING STRATEGY

Usmanova Umidakhan Abdukarimovna*

*Russian Teacher,
 Karshi Engineering Economic Institute,
 UZBEKISTAN

Email id: u.usmonova74@mail.ru

ABSTRACT

One of the most tried and tested methods of language teaching is cooperative teaching. In doing so, students are able to see their participation in social life examples and thereby develop language skills. The following article discusses strategies for cooperative learning of the Russian language.

KEYWORDS: *Strategy, Activity, Research, Groups, Self-Confidence*

INTRODUCTION

Cooperative learning is something that gives students ownership over curriculum, and alleviates the workload on the teacher during the actual class period. However, it takes a lot of preparation before the students enter the room. In my classroom, I always make sure to give students a clear set of expectations regarding it. I let them know what they should be doing during their cooperative learning activity, and tell them what the intended outcome should be. I assign roles to each student, such as group leader, recorder, reporter, and time keeper, also post directions for the activity so that everyone can see them, go over the rules prior to letting the students get into groups, and keep the rules, expectations visible for the duration of the entire activity. This alleviates a lot of confusion and keeps downtime to a minimum.

One activity that has always been fun for students, and has kept them engaged, is cooperative research groups. Students are assigned a topic that they become experts on, and I do the background research to provide resources for students. The groups then have a specific amount of time, ranging anywhere from one to four class periods, to read the sources and gather information that can be used in a class presentation. Sometimes the presentations are made as posters. Students can then walk around and "visit" as if they were in a museum. There is also the

option of having groups make presentations as well. This allows students the opportunity to take on the role of the teacher.

The most important way to make cooperative learning work in any classroom is by establishing a sense of respect and safety early on in the school year. I would start the year off with the idea of community, and would sometimes purposely make mistakes that I would allow students to correct so that they understood that education can come from many sources. The opportunity to teach the teacher allows students to build self-confidence and to see themselves as valuable members of a learning community, and not just children in a classroom.

The technique optimizes personalized student learning time as each student can get personalized attention even if it is not given by the teacher. This is also helpful when the teacher is not supposed to be the focus of activities and instead can move from table to table and help as needed. It creates a community setting and gets students into helping each other and/ learning from each other. Cooperative groups work because there are many ways to break students into groups that allow them personally catered lessons on their level.

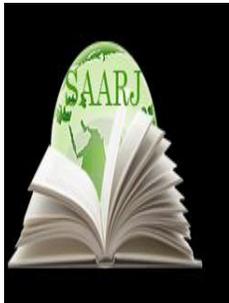

Placing students in cooperative groups or using peer coaching is especially helpful in Russian classroom where students are or can be at mixed levels of learning Russian. When this is the case it is best to place them in groups that are chosen by the teacher in a manner that places higher level students with lower level ones. In this way the higher-level student is learning, practicing, and perfecting techniques through teaching; and the lower level student is acquiring new knowledge and receiving help from a peer. This can also be used to place higher level; students together to work on an assignment while the lower level students stay with the teacher to learn new information. In this way the teacher is able is optimize learning by provide new information to both levels without actually having to make one or the other sit through information that is either below or above their learning level.

The learning outcome of this strategy is that students are able to take in more information at one time while developing relationships and community amongst themselves. Additionally, by using this technique students will learn from each other. Many times, youths are more prone to hear out their peers over adults. Naturally, this caters to those thoughts and allows students to take in the needed knowledge, but in a way that is more entertaining. Working in groups also provides the teacher with many new lesson options to keep the classroom engaging and motivating.

ABSTRACT

According to theory, language learners improve and progress along a natural order when they receive consistent second language input that is one step beyond their current stage of linguistic competence (Krashen, 1981). Thus, in order to advance second language competence in students, S/FL teachers should maximize teacher use of the target language in the classroom and provide ample opportunities for students to speak and listen to the others exclusively in the target language. However, affective barriers to oral language production such as public performance anxiety and authentic self-representation can cause impediments which complicate the language learning process.

KEYWORDS: *Language Competence, Native Speakers, Communication, Fluency*

INTRODUCTION

Research indicates performance anxiety is negatively related to language performance and MacIntyre (1999) claims that performance anxiety is one of the strongest predictors of S/FL learning success. Furthermore, Woodrow (2006) found that students experienced the most stress when having to give face-to-face oral presentations with the instructor. She found that the major stressors reported by the subjects were performing in front of class and talking to native speakers, noting that it was imperative for teachers to consider assessing oral language ability both in and outside the classroom.

If you want to learn something, then you have to do it. You cannot learn a car by reading a book, you have to drive it yourself. Similarly, you cannot become a master of great speaking ability in

English just by reading something, you have to practice it consistently. Speak in English whenever and wherever you get a chance. Try to indulge in conversation with parents and friends in English. Confidence is something that comes by practice. Many cases our weaknesses are hidden by our confidence. Try to speak with confidence in English. It conveys the idea that you are very much familiar with the topic and can converse easily on it. Small fumbling in words are usually ignored in this case by the listener. The driving factor is our confidence. It's equivalent to saying that *"Believe in yourself, if you want others to believe in you"*.

Fluency and accuracy are the reverse of each other. It is like driving a car, the faster you drive, the more is the chance of an accident. Similarly, if you think and then speak, then you would be more accurate and avoid accidents. On the other-hand speaking fluently demands a very high free flow of ideas in your mind, and chances are high that you can fumble in between. Good fluency comes by practice. Try to be fluent while maintaining accuracy. If you feel that accuracy is getting compromised, then start speaking a bit slowly.

Dictionary is your best companion, always keep one in your pocket. Whenever you encounter any new word, just make a note of it. Moreover, the dictionary contains the phonemes before the meaning of the word, these phonemes are the way to pronounce the word correctly. This will help in getting the right pronunciation as well as meaning of words. It is an immense boost to your vocabulary also. In communication, choice of correct words is essential. If you want to express some idea, then choosing limited right words can convey the meaning much more effectively. Many cases people use too many words and sentences to describe even a small topic. This is not a good practice. Try to speak correctly and to the point. This makes a great impression on the listener, and he can understand the information in much less words. Many sentences can often lead to confusion.

Can a child learn to walk without falling? And if the child is afraid of falling, then can he ever learn to walk? The point is clear that you cannot learn something without making mistakes. Learn from a child, he falls so many times, but every-time he gets up and starts again. This is called true dedication. We all have it, since we all had learned to walk the same way. So where is this dedication right now? Gather your courage, don't be afraid to make mistakes. Learn from your mistakes and improve yourself. Talking to yourself is one of the most effective way of improving spoken English. This is one exercise that I still do today. There are many advantages of this. First you do not need anyone to talk, so no issues of anyone laughing at your mistakes. Second you can practice at any time as per your comfort. I talk a lot at night, as I discuss my thoughts with myself in English. Third is that you start to think in English, this is the most important advantage of this activity. When we think in English, then we are able to communicate better since we need not translate it to our native languages every-time. Try to make a sentence from any word that you find as new or difficult. This helps in better remembering the word. When you make a sentence, then actually your brain works to think over the meaning of that word and how it fits into a sentence. You also get accustomed to using new words into sentences.

Now this one is an interesting tip to improve spoken English. It requires you to record your voice using any tape recorder or even a mobile, and then listen to it again. When first time I tried this activity, I was shocked, I never knew that I sound so unclear. This is like a feedback to you, so as to judge your voice yourself. It's like a closed loop system, where you give the output, take some

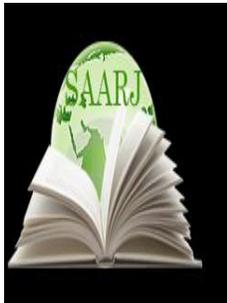

part of it back and use that feedback to correct yourself for further output. A very effective way to analyze yourself from time to time.

Using same words again and again makes the listener think that you don't have a good vocabulary and that you are not good in spoken skills. Try to vary words among sentences. This helps to keep the listener involved and interested. I hope you all must be having televisions in your home. Just have a look at the news channel when they show the flashy "Breaking News". There they repeat the same news for more than an hour showing the same video clipping, but always use different words to express the opinion. This variation of words is the key factor which involves the listener.

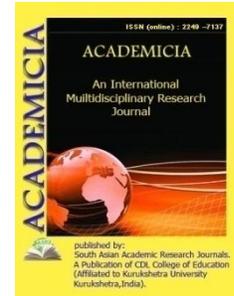

A communication is always two sided. If you are giving a seminar or presentation or even talking to someone, keep asking small questions to them. This ensures that they are paying attention to what you are saying, secondly this also insures that they are interested in your speech or not. The listeners are automatically involved in the communication process and the session becomes lively. If you want to be a good speaker then listening is very important. Have you ever thought that why is it that all people who are deaf by birth are also dumb, though the reverse is not true. It is simply because if a person is deaf by birth, then he has not listened to any voice since he was born. Ultimately his brain did not know what sound is, and is therefore unable to speak. For speaking we must be aware of the correct sounds, phonemes and pronunciation of words. Being a good listener helps us to attain this. It has many other advantages like, it encourages the other person to converse more. It is also a sign that you are interested in what the other person is saying.

BENEFITS OF THE ACTUAL PROCESS OF TEACHING ENGLISH

Aminova Zebo Pulatovna*

*Associate Professor
 English, Karshi Engineering Economic Institute,
 UZBEKISTAN

ABSTRACT

Language learning takes place through the steps of observing texts, formulating questions, collecting data, analyzing data (and drawing conclusions), communicating findings, and creating texts. It is believed that such steps effectively facilitate students to attain knowledge about language, communication skills, and attitudes. Currently teachers have different views regarding the typical language learning activities, learning objectives of each of the steps, the roles of the teachers, and the classroom step. This paper briefly proposes the benefits of the actual process of teaching English, learning activities and objectives, the teacher's roles.

KEYWORDS: *TEFL Teaching, Language Learning Activities, Effective Communication.*

INTRODUCTION

All TEFL teachers abroad are culture enthusiasts who want to get to know a new country in a way that you never will unless you work there. But what are the benefits of the actual process of teaching English? How can teaching help you become a better translator, indeed a better user of your own language? Seeing the language through the eyes of a foreigner is a fantastic learning experience. Suddenly you find that all those words that you take for granted need explaining. When should you say hi and when should it be hello? What is paradise? What's a shudder? The teacher has a number of resources available for explaining vocabulary- mime, drawings even translation and the dictionary in lower-level classes- but perhaps the most important skill is the constant ability to explain and paraphrase in English. Because for the translator, having good French, Russian, German etc, is one thing, but if it isn't coupled with very good English the translations will never be of the highest possible standard.

MAIN BODY

And of course, it isn't only the meaning that's important. The student needs to know when to use the word. Collocation is just as important, if not more so, than meaning. Dictionaries are often excellent at giving meaning, but many (not all) fall short when it comes to telling you when to use the word. This is then the teacher's job. Take the phrasal verb 'fall out'. The average TEFL teacher could give the definition 'to have an argument'. The good TEFL teacher could give a sentence to contextualize this, for example, 'He fell out with his sister because she wouldn't give him the ball'. The excellent TEFL teacher however, would give several sentences to explain the verb, as well as saying that it is normally used to talk about children or couples, not so much to talk about business, and that it normally implies a period in which the people will not be speaking to one another.

They may also give the colloquial noun phrase 'a falling-out' and explain that this phrasal verb is not used in American English. And still not have even touched on register. The ability to do this, not only when they have prepared the lesson at home for three hours and know the vocabulary inside-out, but also when a student asks them for a specific piece of random vocabulary, perhaps one that they have come across in their own work, is crucial to the TEFL teacher, and is an extremely useful skill for the translator also.

Grammar is probably the area that most new native TEFL teachers find difficult, simply because they have never learnt English grammar. Whilst they are able to explain the French conjugation system or the Spanish imperfect subjunctive, because they learnt to do this from scratch at school, they cannot do the same for their own language, and this is true for translators too.

Could you explain when the present perfect is used? What is the difference between "I am playing football on Saturday" and "I will play football on Saturday?" When do we use 'for' and when is it 'since'? And what does 'during' mean? Whilst as a native speaker you may use all of these forms correctly, as a TEFL teacher you learn exactly why you say what you say. And you iron out the mistakes, often due to dialect, in your own use of the language. Until I became a teacher, I had never questioned the phrase 'I was sat there' used by myself, my family, and indeed everybody I know. In fact, it is of course grammatically impossible, and should use the past continuous, 'I was sitting there'.

TEFL teachers, like translators and interpreters, often complain of a certain amount of contamination of the target language. Translators find that false collocations, even invented words, seem normal, a situation which is worsened when they spend a long period away from their native country. Teachers find also those mistakes that are commonly made by students start to sound normal, and that they start to question their own use of the words. Both must make sure that they continue to have contact with natural, correct English, in order to retain their own English skills.

CONCLUSION

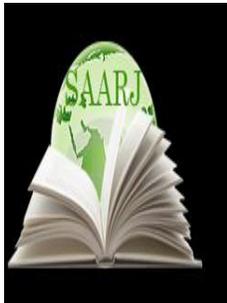

The knowledge of English gained by teaching English as a foreign language perfects the translator's work, allowing them more freedom, flexibility and confidence in the language. Seeing the language through a learner's eyes is a precious experience for the translator, and one that is already enjoyed by many. Vocabulary and grammar can be learned in books, alone at

home, but it is the student who really forces the teacher to constantly question their opinions, their use of language, and their choice of words.

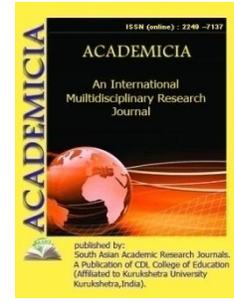

A period of TEFL teaching, whether at home or abroad is a fantastic opportunity for the translator to improve their use of English, which, although it is sometimes forgotten, is possibly the most important skill of the translator, and the one to which, sadly, we often pay far too little attention.

A STUDY OF IONESCO'S HUNGER AND THIRST

Dr. Anum Mirza*

*Women Welfare Officer,
 Under Ministry of Women & Child Development,
 Govt. of INDIA

Email id: mirza.anum123@gmail.com

ABSTRACT

*Life is a constant struggle between the self and its surroundings, between the material and spiritual planes. The plays of Ionesco are packed with the burlesque and grotesque; the empty chairs in the play *The Chairs*; the coffee cups in the *Victims of Duty*, the pieces of furniture in *The New Tenant* or the eggs in *The Future* are some of the examples of the comedy of proliferation of Ionesco. Ionesco evolved his own subtle dramatic language with a mission to deform it; the normal speech is replaced by incongruous banalities. His plays are performed as pure pantomime. For instance, his play *Exit the King* was written in the form of a ballet in the beginning. Ionesco's plays reveal a strong cinematic influence. Ionesco's anti plays are written to explore the identity of the individuals who are confronted with the baffling metaphysical problems of existence. This paper is going to be an intense study of Ionesco's *Victims of Duty* that gives an overall idea that the protagonist of the play is suffering not because of outer world but because he is in conflict within his own self.*

KEYWORDS: *Absurd, Fear, Confusion, Neurosis, Depression*

INTRODUCTION

The plot of the play *Hunger and Thirst* reveals that Ionesco wrote the comedies of anguish; "tragic farces" to dramatize his own fears of death and terror of the futility of life and the harsh universe. He has reached the total decomposition of the stage and created the irrational theatre of which he dreamt. It is anti-theatre where action becomes lost in words and the show vanishes into flights of carnival laughter. Ionesco commented thus about the redemptive power of humor: "Humor is the only opportunity we have of detaching ourselves from our tragi-comic human condition or the sickness of living; assuming of course it has been recognized, assimilated and

experienced” (*Notes and Counter Notes* 143). Ionesco’s world is no longer a mirror for the individual, but a hostile force perpetually threatening the individual of death, fears and terror of the future. The world in which Mr. Smith and Mrs. Smith Choubert and Amedee live is empty, evanescent, without reality, a void that menaces the individual with engulfment. The multiple layers of reality and falsehood that the theatre plays upon coincides with his belief that there is no clear distinction between reality and fantasy, between the marvelous and the ordinary place. In the plot of *Victims of Duty*, Choubert leaves his place and goes to the bottom in search of an unknown stranger Mallot and experiences the nature of heaven and hell. But in *Hunger and Thirst* Jean explores his inner world because he is a psychic case. Choubert comes back from the journey and gives an account what he has seen and experienced to his wife Madeleine. The plot of this drama examines the psychological mechanisms which lie behind Jean’s hunger and thirst. The play also examines the game of hide and seek between Mari-Madeleine, Jean and Martha. On the surface level it is a family drama but Ionesco has used all the tools of Freudian and Jungian psychoanalytical theories to depict the sick and nihilistic character of Jean. His hunger and thirst is limitless and he is never happy and satisfied. Madeleine rightly judges his cynical character and remarks in the beginning of the drama: “You used to complain there too! You said there was too much space. If it is no agoraphobia, it’s claustrophobia!” (Ionesco, *Hunger and Thirst* 9). The plot of the drama is cyclical; enclosure, space, enclosure and all the sections reveal the moral disorder of the world and chaos in the life of Jean. In each section the moods change and Jean is presented trapped in different kinds of confinement. In the first Act Jean is tied with the family and interesting thing about him is his contempt for everything. He is typical anti-hero of Ionesco struggling in vain leading a futile and meaningless existence. In the Second Act Jean is dependent on other persons and in the symbol of the wall is presented to highlight the emptiness of his life. Jean talks of his nightmare as he is always fear-ridden. Ionesco gives the imagery of “mud” to depict his nostalgia; fears and psychological traumas. “I often woke up in the morning choking up with fear. Because I’ve been dreaming of some ghastly house half sunk in the ground, half under water, oozing with mud” (10). The symbols of “mud and water and half sinking” are heavy symbolizing confinement of Jean. Marie-Madeleine and their daughter Martha return their old damp and dingy apartment. For Jean home is a heel; a place where he has nightmares. Jean is fear-ridden and depressed.

Jean struggles to get away from the oppressive and claustrophobic state of mind as he longs for “space and light”. Jean is weary of life and feels hellish experience; he struggles to know the mystery of the metaphysical world but he is destined to live with unanswered questions: “The moment I let my mind wander, you take advantage. Sometimes it happens that I forget and think of other things. You can't hold everything in your mind all at the same time. The brain has its limits” (10). Ionesco has portrayed the character of a distracted individual lost in the world. All the games and tricks of life end in despair and anguish. His quest for identity leads him nowhere as he is destined to suffer alienation. He fails to resolve the riddle of life as he says: “JEAN: It's when I've got it, I want to get rid of it. When I haven't got it, I've got to have it. You've got to have it before you can get rid of it” (13). Lamont observes that the characters of Ionesco represents a shadow of his plight: “In Romania I remember how everyone around me converted to fascism, till it seemed to me that I was the only one left in the world” (Lamont, *The Hero In spite of Himself* 73).

Jean has a pessimistic and nihilistic view of life like the protagonists of Beckett. He is spiritually bankrupt and is sick of life and its existence. He lives with void and curses his fate: "Darkness and gloom for us! And all I long for is the dawn!" (12). The dream sequence is very powerful in *Victims of Duty*, in *Hunger and Thirst* also Ionesco introduces the dream elements because he believes that in the world of dream all pains and anguish can be forgotten. Jean wishes for a lovely house situated at the top of a hill where he can enjoy cool air and soothing rest far away from the madding crowd. A house perched high up on a mountain above a river is not just a symbol of freedom. Given that the sunken room is tomb-like, a house in the sky signifies freedom from the fear of death. Jean knows that dreams are false and deceptive but he is bound to dream and suffer as he confesses: "There always is. I only live in the hope something fantastic will turn up" (13).

In the first episode of the drama, Ionesco highlights the futility of the quest for identity of Jean. He is restless and the futile struggle is depicted through walls and the fun and games of Jean and Aunt Adelaide and Marie-Madeleine. Jean looks at the walls and broods over the patches of the walls and takes a nihilistic view quite antithetical to Madeleine's romantic view: "To me they look like bleeding carcasses, heads bowed in sorrow, frightened people dying, mutilated bodies, with no head, no arms, fabulous monsters, prostrate, in pain, gasping for breath ..." (15).

The Second section of the drama excites great interest with the entry of Jean's aunt Adelaide. "She is dressed in long veils, which give her the look of a great lady in decline" (16). Jean doesn't like her visit. He is jealous of her name and fame as she says: "You hate me because I'm famous" (16). She opens the bag full of medals and decorations and the real games of fun begin to play. She tells Jean that she has been a good writer and is always in contact with the Heads of the States:

I write the true biographies of famous men. Heads of state. I know them personally. They've explained everything to me and I'm the *only* one who knows their secrets. I make out reports on scientific subjects. (20)

Jean has no confusion about the game of his aunt as he says: "Sometimes she knows she is playing part. And times she tells the truth" (21). Jean grills her on so many issues and interrogates her about fire of her flat and about her hospitalization. "You set our house on fire. Set light to the drawing rooms curtains" (21). Adelaide replies that her neighbor is jealous of her and she "did to spite her". She goes on telling lies and uses all strategies to outwit Jean. She confidently remarks that she never visited in any hospital: "I was not in the hospital" (22). Adelaide is taken as a ghost by Jean but Adelaide uses games of drama to prove that she is not a ghost:

You're both making a mistake. I'm not a ghost. Look! I move, I speak, I can talk, I have arms, I have legs, I can walk. Anywhere I choose. I have a beautiful bosom, in spite of my years. (23)

Marie immediately tries to control the situation and changes the subject to placate Adelaide who has grown aggressive and even violent. Ionesco presents a play-within a play crystallizing Jean's dilemmas. Adelaide performs another act of the game show as she cuts her head and forces Jean to check the blood. The miracle happens as the blood of Adelaide appears artificial. Jean is bewildered to experience this as she cries out in amazement: "It's not real blood. It's not liquid. And then it's too dark to be blood. It's like jelly. Gelatine l Sticky l And it doesn't stain! [*He*

looks at his hand" (23). Jean is sure that Aunt Adelaide is a supernatural apparition playing the tricks on him with an intention to terrorize him.

As the play progresses there is an awareness in Jean. He expresses his desire to launch his quest to explore the mysteries of the universe. He broods over the idea of Marie that the joy of the integrated self is possible only with the change of attitude towards himself. He has to re-work again and he must not be deceived by the appearances. He has to be strong to overpower the melancholy and depression that is stifling his mind. He must learn the tricks of the game to come out of the abyss of darkness. Jean expresses his inner feelings thus:

Jean: I won't be frightened! No, I'll never be scared again! I don't care who comes to haunt me in this subterranean slum. I'm not afraid of these eccentricities any more! I know who send sends them, Marie-Madeleine, I know! They won't catch me, never again, they've lost their power over me. They'd like me to be bitten by remorse, crippled by repentance; they want pity to draw blood from my heart. I know their game and I'm not playing any more. (27)

In the second section of the play Jean decides to explore the universe and begins his quest with the support of his wife who expresses her deep love for him: "Even if you go to the end of the world, even if you think you are alone, I am and shall be with you" (29). Jean is terrified of growing old and fears his own death. The knowledge that he is going to die paralyzes him and fatigues him. He mentions being "stuck in the mud" (129), connecting to the idea that mud is representation of anxiety and fear. He is firm in this part of the drama and insists that he is "meant for something better" (29). Jean expresses a desire for a place where death is forbidden, and decides that the fresh air will make him young again. His denial of his own death and attempt to convince himself he can decide not to die reminds the reader of Berenger's similar delusion in *Exit the King*.

Jean: I must have mountain air, somewhere like Switzerland, a hygienic country where nobody dies. A land where the law forbids you to die. When you enter that land, you must make a declaration. A promise not to die. You have to sign it. Death is not allowed. (29)

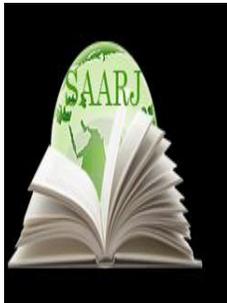

To conclude, the play *Hunger and Thirst* is a new experiment in the absurd theatre. Ionesco introduces new anti-theatrical devices to depict the anguish of the modern man afflicted with the psychological ailments such as neurosis; nostalgia; depression and alienation. The quest of Jean ends in despair because the protagonist is the victim of his inner weakness of mind; he fails to understand that the time has changed and the real happiness lies in understanding the inner soul. His false illusions; fears and fantasies are the source of his anguish.

WAYS TO INCREASE THE OPENNESS OF THE BUDGET OF THE REPUBLIC OF UZBEKISTAN

Adashov Gayrat Rustamovich*

*Independent Researcher,
 Tashkent Financial Institute,
 UZBEKISTAN
 Email id: g.adashov@ofb.uz

ABSTRACT

This article discusses the concepts of the budget and the budget cycle, reveals the essence of budget openness, mechanisms and principles for studying budget openness used by various international organizations, and offers suggestions for increasing budget transparency in the Republic of Uzbekistan.

KEYWORDS: *Budget, Plan, Budgeting, Planning, Budget Execution, Budget Legislation, Participatory Budget, Budget For Citizens, Open Budget, Budget Cycle.*

INTRODUCTION

In the conditions of limited resources of the state, transparency of public finances, in particular the budget, both at the republican and local levels, is becoming important. Local budgets, like the republican budget, are instruments with the help of which the functions of the state are implemented, the entire economy is regulated.

The advancement of Uzbekistan along the path of market reforms confirms the growing role of the budget as a necessary instrument of state influence on the socio-economic process.

LITERATURE REVIEW

There are various definitions of the concept of “budget” in the literature. If earlier this concept meant any plan of income and expenses of an enterprise, institution, organization or individual (in monetary terms) for a certain period¹, now the concepts of “plan” and “budget” have become different. So, in the modern economic dictionary the concept of “budget” is given the following interpretation: “officially valid, recognized and accepted list, table, statement of income and expenses of an economic entity for a certain period, usually a year”².

Each author defines this concept in his own way, Professor Sheremet A.D. believes that "a budget is a financial document created before the proposed actions are carried out." Scientists R. Gleich and P. Horvat define a budget as "a plan formulated in monetary terms, which, with a certain degree of commitment, is assigned to a structural unit with the authority to make decisions for a certain time period".³

A similar situation occurs with the concept of "budgeting", which is interpreted differently by each of the authors. Budgeting is understood as "a kind of short-term financial planning involving the construction of a hierarchical system of budgets of a business entity" (E.N. Vyborova)⁴, "a system of coordinated management of business units in a dynamically changing, diversified business" (V.N.Samochkin, E.N. Logacheva, Y.B. Pronin⁵) and others.

If earlier the budget was not a separate discipline and belonged to the public finance management system, then in the 70s-80s of the XX century this concept moved into the framework of the science of "financial management", where the principles of financial planning were also applied and only later were own methods developed. determining budget planning, its further execution and control⁶.

Based on all the definitions, the following budget features are identified⁷:

1. Developed in specific cost and quantity indicators.
2. All budget indicators are interconnected.
3. Fully consistent with the strategic plan.
4. Each indicator is tied to a specific task.
5. Metrics are based on tactical goals.
6. A responsible person is attached to each indicator.
7. Possible identification of indicators by means of accounting.

To determine the degree of budget openness in a global aspect, principles that are universal for all countries, developed by various organizations, are applied. These publications include:

- Lima Declaration of Guiding Principles on Auditing by the International Organization of Supreme Audit Institutions;
- International Monetary Fund's Code of Good Practice on Fiscal Transparency;
- The Public Spending and Financial Accountability Initiative (World Bank);
- The Global Fiscal Transparency Initiative.
- There are also seven participatory mechanisms under the Open Budget Survey (OBS) being explored:
- *Mechanisms on the part of the executive body*, implemented by the Ministry of Finance or central coordinating institutions of the central government, during the development of the budget and oversight of budget execution, as well as presentations by line ministries to the public at both stages;
- *Legislative mechanisms* during the period of budget approval and review of the audit report;

- *Mechanisms of supervisory bodies* defining the audit program and the course of audits.

Analysis and results. Thus, the modern world requires openness of public administration processes. The key point is determined by the principle of openness of the budget for citizens. It is this principle of budget management that is the determining link in the system of openness of government bodies.

In order to create the most "open" budget legislation, it is necessary, first of all, to increase its accessibility not only for the world community, but also for various segments of the population living in the country. This is achieved through a variety of publications that comprehensively reflect the planning, execution, analysis and audit of budget execution.

In Uzbekistan, to ensure transparency of the state budget, a legislative framework is being created, in which, in addition to the Budget Code adopted by the Law of the Republic of Uzbekistan No. 360 dated December 26, 2013, the main acts regulating legislation in this area include the Law on the State Budget (published on an annual basis), The Strategy for improving the public finance management system for 2020-2024, approved by the Resolution of the Cabinet of Ministers No. 506 of 24.08 2020.

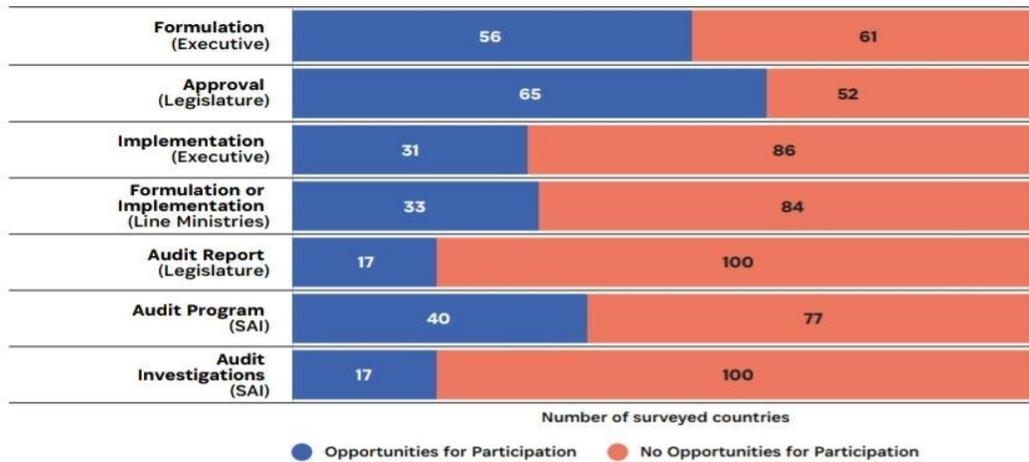

In addition, there are other publications and acts in the country, thanks to which you can get acquainted with the stages of budget development, these include:

- reports on budget execution;
- conclusion of an external audit;
- budget message;
- results of the participatory budget;
- publication of an information publication "budget for citizens";

It is also important that there is a website dedicated to the disclosure of various kinds of information about the budget of the republic and its implementation - www.openbudget.uz.

To study the degree of openness of the budgets of 117 countries, including the CIS countries - Kyrgyzstan, the Russian Federation, Kazakhstan, Tajikistan, as well as such non-CIS countries as the United Kingdom, Canada and the United States, studies of mechanisms for the participation of executive, legislative, audit activities, as well as opportunities for citizens' participation were considered.⁸ (Figure 1.2).

Figure 1. Countries are more likely to have mechanisms for participation in the budget formulation and approval process.

Studies have shown that only 9 percent of countries have 5-7 participation mechanisms, 70 percent of countries have 1-4 mechanisms, and the remaining 21 percent do not have a single participation mechanism.

Not only is the publication of the correct documents involved in the stages of the budget cycle (Figure 3) important, but also the completeness of the data they contain and the timeliness of publication.

In the course of studying the world practice of budget openness, it is proposed to increase the role and participation of civil society in the budget process. This is possible by publishing more execution information budget of both republican and local, in order to apply it to monitor the work of executive authorities and the government as a whole. It is also proposed to provide information on the progress of budget execution on the Internet, in open access and online.

Figure 2. Several countries have multiple participation mechanisms.

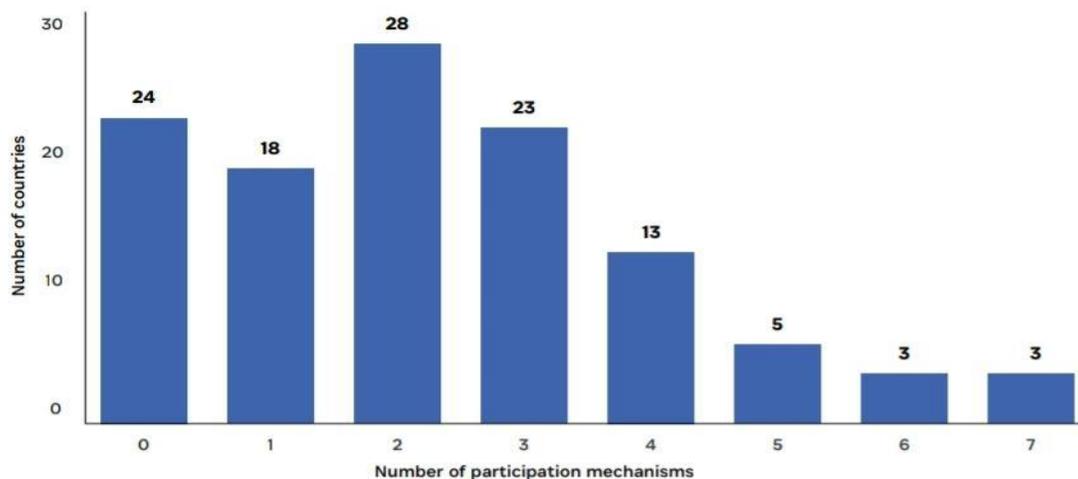

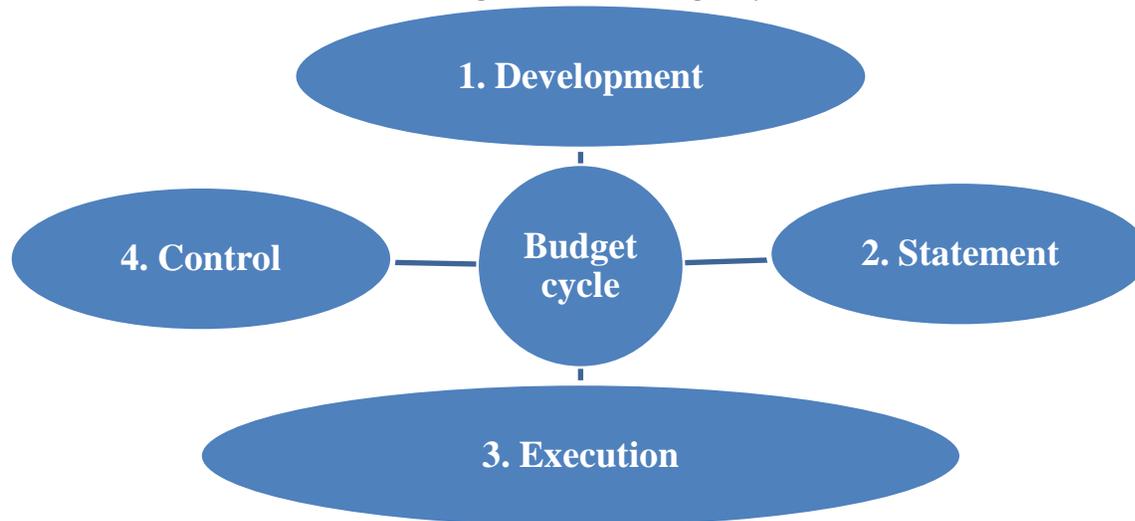

Figure 3. The budget cycle

Development of methods and ways of public participation in the formation of local budgets, providing the opportunity to make adjustments to budget expenditures will also increase the level of citizens' confidence in the government.

It is also proposed to adapt international methodologies used to assess budget transparency based on a questionnaire to Uzbekistan, taking into account local legislation. This will provide more accurate and detailed data that can be used by economists in the future.

CONCLUSION

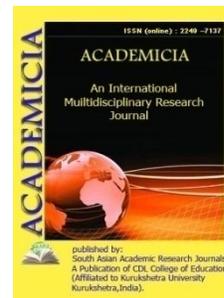

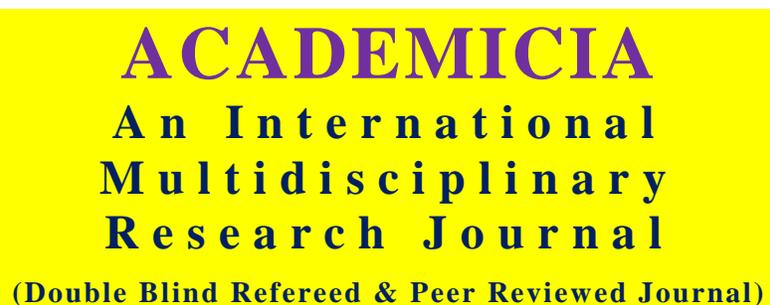

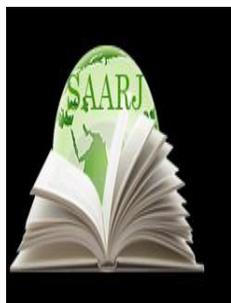

Increasing the transparency of the budget of the Republic will lead to a greater understanding of the needs of the public by the government of the country and will increase the degree of trust of citizens, the private sector in the state, since it will allow the former to participate in the formation of local budgets, learn about spending on social spheres, for example, health and education, and the latter - to receive up-to-date information on tax preferences, benefits.

Thus, in order to create, maintain and maintain a constructive dialogue between the public and the state, it is necessary for the latter to clearly explain the budgetary policy, decisions taken in this area and the results achieved. Timely and detailed publications at the stages of development, approval and execution of budgets will also contribute to the growth of civic confidence.

USING OUR NATIONAL HERITAGE IN THE MORAL EDUCATION OF PRIMARY SCHOOL STUDENTS

Akhmedova Mashkhura Mirzabekkizi*; **Botirova Guzalxon Zafarovna****

*2nd Year Students,
 **Primary Education,
 Technical Institute, Tashkent,
 UZBEKISTAN

ABSTRACT

Ensuring the unity of content, form and methods of leadership in the education of moral qualities in students, the method of taking into account its results, integrates the unity of education. Spiritual education helps small school-age children to become well-rounded. In this article we would like to show the ways of using our national heritage in the moral education of primary school students.

KEYWORDS: *Primary School, Moral Education, National Heritage.*

INTRODUCTION

A rich factor in the organization of educational work in primary school students is national pride, oriental communication skills, the right attitude to cultural and religious ideas, understanding and respect for Uzbek art, folk monuments. forms human qualities such as. With the teacher's level of knowledge and the ability to think in an oriental way, the unity of action allows the class to learn and improve their positive qualities, eliminating their negative qualities.

In addition to educating young school-age children, they also increase the effectiveness of cultural and educational work in educating a well-rounded person by organizing their extracurricular and extracurricular activities. Man's humanity is measured by the clarity and height of his spiritual world. Extracurricular activities should be organized in order to raise the spiritual level of primary school students. The school is a place where the basics of our national culture, national language, national traditions, customs and values are taught.

Everyone is nurtured by the means that surround them: family, parents, art, literature, and so on. It is necessary to guide the development of students. It is necessary to protect the individual from

the environment that negatively affects his formation as a person, ensuring the unity of self-education and upbringing, which is the basis of a biological nation. As a form of education, the idea of the full development of the individual has been the basis for centuries. An all-round development of a person includes a set of individual aspects or qualities, communication, physical, moral and aesthetic views. The formation of humane ethical norms (such as kindness, mutual understanding, compassion, prevention of racial and national discrimination, and unfair educational measures) should be established.

The main goal of the idea of national independence is to unite the people for the great future and glorious goals, to encourage every citizen of the country to always be responsible for the happiness of the single Motherland, to act in accordance with our national values and ancestral traditions. to achieve is to nurture perfect people. National values are a complex socio-spiritual concept that encompasses all aspects of economic, social and political life, including the language, culture, history, customs, traditions, and all the material and spiritual wealth of a nation.

The formation of students' spirituality, in turn, requires teachers to deepen their spiritual maturity, the theory of spiritual and moral education, as well as the methodology of spiritual and moral education in the school education process demands from them to master.

Along with the nationalization of the content of education in accordance with the "National Program of Personnel Training", the text of textbooks and manuals should be enriched with laws, rules, teachings, hadiths that reflect the centuries-old traditions and moral views of our people. It should not be forgotten that there is a wide range of opportunities for the formation of the individual spirituality of the person.

Spirituality has a national character and is a complex of national customs, upbringing, traditions, moral beliefs, values, religion, beliefs, cultural and enlightenment views, spiritual and psychological processes. In educating students spiritually through narrations, it is important to emphasize that they not only describe the positive relationships between people, but also the negative ones. Because the narrations described above should be a kind of school for primary school students.

CONCLUSION

Therefore, an educational hour, meeting dedicated to the relationship between parent and child, the reader is unique and correct - no matter how much you respect or neglect your parents, in the future your it is necessary to conclude from your children that such respect will be given to you or that negligence will return. We emphasize the need to develop opportunities to use this effective method of spiritual and moral education of primary school students in the process of studying all the subjects included in the curriculum of the primary school.

It is well-known that such qualities as openness, kindness, kindness, and loving a child as he or she is are human qualities. Therefore, in the formation of the spirituality of the student, to show love to children, to be able to share his love with children, to feel that each student is not a learner, but a human being, and to him it is important to take into account the demands of collaborative pedagogy on the teacher's personality as an equal human approach.

The opportunities for primary school students in the formation of spiritual qualities such as kindness, kindness, sweetness, reading, native language, music lessons are enormous. Because

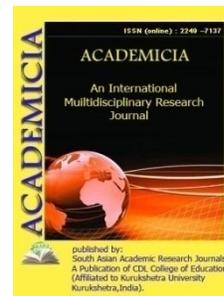

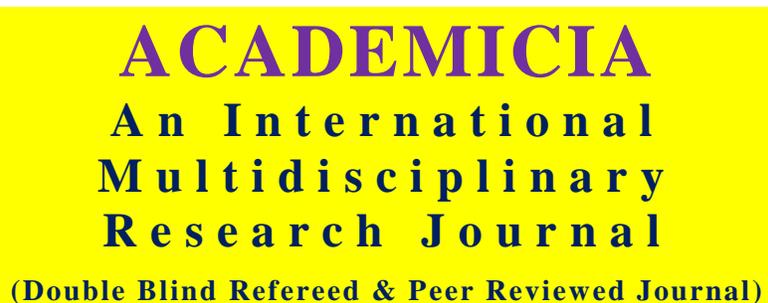

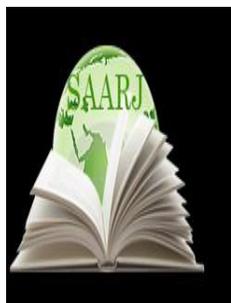

the lessons in these subjects are based on emotions and feelings. That is why in the lessons the teacher should focus on understanding the children, feeling them, appreciating their feelings.

Every nation, including the Uzbek people, has created a code of ethics, which is the basis of humanity. Take, for example, the saying, "It's easy to be a scientist, it's hard to be a man." It clearly shows the attitude towards people. In the minds of the people, it is more important to be a real person than to be a scientist. For this reason, from ancient times, humanity has been the main criterion in educating the younger generation in a beautiful moral way, and it continues to be the basis of education.

In the works of folklore, he cultivates the best human qualities such as diligence, friendship, love for a friend, loyalty, patriotism, courage, purity, honesty, beautifies a person spiritually, enables him to do good only in good deeds. - urges to serve the interests of the country. For centuries, our people have formed their views on spiritual qualities in scientific and artistic works. They have thoroughly substantiated each of these norms. The school is a place where we learn the basics of our national culture, national traditions and values.

GEOGRAPHICAL ASPECTS OF THE DEMOGRAPHIC SITUATION IN KASHKADARYA REGION

Berdikulova Mukhayyo Toshtemirovna*

*Lecturer,

Department of Geography,
Karshi State University,
UZBEKISTAN

Email id: muxayyo-bmt@umail.uz

ABSTRACT

This article describes the demographic situation in Kashkadarya region, which has a unique natural increase in the geographical location of the population of Uzbekistan. The geodemographic aspects of the region are analyzed at the district level, the location of the population and the factors influencing it are described.

KEYWORDS: *Population, Population Density, Demographic Situation, Demographic Capacity, Migration, Labor Resources, Promise, Natural Reproduction.*

INTRODUCTION

Kashkadarya region is located in the south of Uzbekistan, in the basin of the river of the same name. It was first created in the Republic of Uzbekistan on January 20, 1943, in 1960-1964 it was merged with the Surkhandarya region, and the current Kashkadarya region was transformed on February 7, 1964 into a separate region. The area of the region is 28.6 thousand square meters. km and occupies 6.4% of the country's territory. According to this indicator, Kashkadarya occupies the 4th place after the Republic of Karakalpakstan, Navoi and Bukhara regions.

The Republic of Uzbekistan is the most densely populated country in the world with an average demographic potential. In recent years, the population of Uzbekistan and its regions, as well as the rest of the world, continues to grow, but the growth rate is declining. According to the State Statistics Committee of the Republic of Uzbekistan, the permanent population of the country as of January 1, 2020 was 33,905.8 thousand people, which is 650.3 thousand people or 2.0% more than at the beginning of 2019. By region, the largest population is in Samarkand region (11.4%

of the country's population), followed by Fergana (11.1%), Kashkadarya (9.7%) and Andijan (9.2%). In terms of its demographic potential, the region ranks third among the regions of Uzbekistan after Samarkand and Fergana.

The permanent population of the region as of October 1, 2020 is 3318.0 thousand people, having increased from the beginning of 2020 (3280.4 thousand) to 37.6 thousand people or 1.1%. The urban population is 1410.4 thousand people (43%), rural - 1870 thousand people (57%). The population is mainly Uzbeks (91.2%), but also Tajiks, Turkmens, Russians, Kazakhs, Ukrainians, Azerbaijanis, Koreans, Kyrgyz, Turks, Ukrainians, Belarusians and others.

The region has a relatively high demographic potential and is growing due to natural reproduction. In this regard, the Kashkadarya region belongs to the group of regions with high natural population growth (Surkhandarya, Samarkand, Jizzakh, Khorezm), where the natural population growth is more than 20 %.

By region, the analysis shows that as of January 1, 2020, the largest population was 410.2 thousand people in the Chirakchi region (12.5% of the region's population) and 284.4 thousand people (8.7%) in the Kasan region. district, in Karshi. 275.0 thousand people (8.4%), on the contrary, the minimum population was 86.5 thousand people (2.6%) in the Mubarek region and 119.1 thousand people (3.6%) in the Mirishkor region ... In geodemographic studies, fertility is studied as a separate demographic basis for population reproduction. In the demographic situation of the Kashkadarya region, natural reproduction has been growing in recent years. In particular, in 2019, 86.7 thousand births were registered, respectively, the birth rate per 1000 population was 26.7 per thousand. By districts, the highest birth rates are in the Chirakchi, Kamashinsky and Dehkanabad districts:

**TABLE 1. GEODEMOGRAPHIC SITUATION IN KASHKADARYA REGION
(01.01.2020)**

No :	Administrative units	Population (thousand people)	Area (thousand sq. Km)	Density 1 sq. Km.	Birth	Death	Natural reproduction

3	Kamashi	264.8	2.66	100	7888 / 29.7	992 / 3.7	6896 / 26
4	Karshi	247.3	0.91	272	5922 / 23.9	1020 / 4.1	4902 / 19.8
5	Koson	284.4	1.88	151	7694 / 27	1053 / 3.7	1053 / 23.3
6	Kitob	263.8	1.75	151	6579 / 24.9	969 / 3.7	5610 / 21.2
7	Mirishkor	119.1	3.21	37	2923 / 24.5	424 / 3.5	2499 / 21
8	Muborak	86.5	3.07	28	2203 / 25.5	340 / 4	1863 / 21.5
9	Kitob	152.3	2.11	72	4183 / 27.4	555 / 3.6	3628 / 23.8
10	Kasbi	195.9	0.65	301	5049 / 25.8	761 / 3.8	4288 / 22
11	Chiroqchi	410.2	2.84	144	12812 / 31.2	1352 / 3.3	11460 / 27.9
12	Shakrisabz	221.9	1.66	217	5357 / 24	888 / 4	4469 / 20
13	Yakkabog	263.3	1.10	239	7356 / 28	1080 / 4	6276 / 24

<i>cities:</i>							
14	Karshi c	275	0.1	2750	5809 / 21	1311 / 4.7	4498 / 16.3
15	Shakhsrisabz c	139.3	0.053	2628	3215 / 23	578 / 4	2637 / 19

The table is compiled on the basis of data from the Kashkadarya regional statistics department.

As the population grows, so does its geographic distribution and density. The problem of territorial distribution of the population is even more important than the problem of natural population growth and fertility. In 2020, the population density in the region will increase by one square meter. km up to 116 people. In accordance with the natural and geographical environment of the region, the population is unevenly distributed over its territory. Karshi, Kasbinsky, Shakhrisabz, Yakkabag and Kitab districts, which were traditionally irrigated, are relatively densely populated and sparsely populated in mountainous and desert regions (Figure 1). Since the 1970s, due to the development of new lands in the Nishan, Mirishkor, Kasan, Kasbinsky districts of the region, the population density has increased significantly due to migrants.

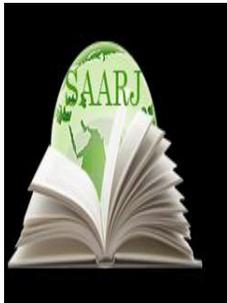

Figure 1. Map of rural districts of Kashkadarya region

Currently, a small population lives in the Mubarek, Mirishkor, Nishan, Dehkanabad districts of the region, as well as in the pastures of the Kamashinsky, Chirakchinsky, Guzarsky districts. The low population density in areas with a large area is due to the presence of the Karshi Desert in the region. If most of the demographic “load” in Karshi region is associated with the fact that it is located directly around the regional center, then in Shakhrisabz region this situation is associated with the city of Shakhrisabz, which is home to almost 139 thousand people.

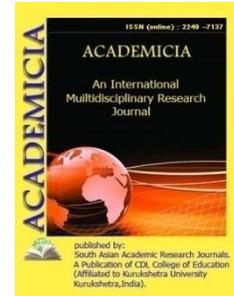

The demographic situation in the Kashkadarya region is characterized by a high birth rate and natural increase, negative migration balance, a large share of young people in the population, and insufficient labor resources (59% of the total population, 9.6% of the total labor force). uneven distribution of territorial location, etc.

NATIONAL METHODOLOGY OF SPORTS AND PUBLIC EVENTS MANAGEMENT

Mamirova Dilaram Tavakulovna*

*Associate Professor,

"Stage Movement and Physical Culture" of the Uzbek State Institute of Arts and Culture,
 UZBEKISTAN

ABSTRACT

This article is devoted to the peculiarities of the development of the Uzbek national system, aimed at engaging the population in physical activity, i.e. mass movement, the 21st century, the era of global development of information and communication technologies. The aim of the research is to create a national system, stimulate and manage the growth of skills, quality of work. According to the author, this movement is the basis of physical culture, health of the nation, increasing labor productivity, the defense power of the state.

KEYWORDS: *Mass, Self-Improvement, Engagement, Training, Methodology, Youth, Specialist.*

INTRODUCTION

Since 2000, the country has hosted three annual "Umid Nihollari" (for secondary school students), "Barkamol Avlod" (for students of academic lyceums and vocational colleges) and the Universiade (for students of higher educational institutions). We can talk a lot about the fact that sports competitions are held. The three-tier system is an integral and important part of the national program of mass involvement of young people in sports - "Umid Nihollari", "Barkamol Avlod" and the Universiade, which allows to educate dedicated athletes participating in international competitions. But! This is only 10% of the population. engaged in physical education and sports. For example, according to the Scientific and Statistical Center for Physical Culture and Sports, 15-20% more enterprising employees are actively involved in physical education, enjoying the success of their work and enjoying the prestige of their colleagues. [7 P.462].

It is no coincidence that over the past three years, the President of our country has paid great attention to the development of physical culture and sports, in particular, mass sports, as well as

infrastructure with sports grounds, stadiums, construction and reconstruction of existing sports facilities.

The development trends of modern Uzbek society are characterized by qualitatively new events and processes. Changes in the scientific, technical, economic, social and cultural spheres have realized the need for radical professionals who are ready for innovative creative activity, self-education and self-development. [1 C. 69-76] The solution of this important task is determined by the subjectivity of all social groups, the degree of their inclusion in conversion activities. Realization of social role young people are directly dependent on the interested and targeted policy of the state to ensure the effective functioning of all socialization institutions. [4 C. 180-181] The young generation, which represents the natural social resource of society's development, plays a major role in this process. There is a need to create conditions that encourage them to actively engage in physical culture and sports.

Relevance. The need to create an exclusive approach to the involvement of the younger generation in sports and public events, thereby understanding the positive qualities of physical education and sports in the recovery of their body, to involve your children in future health work.

Objective: To create a national system that stimulates and manages the growth of skills, the quality of labor activity.

Research and discussion. The world has not created a system that involves all segments of the population. Each country has a model for the development of physical culture and sports. For example, in the Republic of **Korea**, the main strategy of the country's physical culture is to increase the country's prestige abroad, to intensify international sports exchanges, to promote physical culture among the population and to train elite athletes. [6 P.36].

The strategy for the development of physical culture in **Japan** involves the creation of conditions that meet the needs of any person for a healthy lifestyle (sports facilities, places for exercise, qualified personnel, the importance of sports). [2 P. 39].

So in **Russia**. The main focus was on the quantitative side of sports development - the opening of a network of children's sports schools and the creation of their working conditions, their involvement regular training of many children, formation of a comprehensive competition system, training of specialists. [3. P. 208]

Following the example of the **German** Democratic Republic, **China** has created a large-scale system of competitions for athletes of all ages, the main element of which is the All-China Games, which involves regional teams in all Olympic sports grown in our country and some national tours. . [5. C. 58-60].

From all of the above, it is possible to emphasize the fact of the existence and rapid development of a model of physical culture and sports management based on the optimal combination of experience and achievements of Western countries.

A distinctive feature of the system of development of sports and mass events in Uzbekistan, the involvement of the population, especially the younger generation, in physical culture and sports is a continuous, periodic system that motivates them to enter any higher education institution. which then leads to the acquisition of the desired profession, i.e., spiritual and material enrichment.

We managed to create a periodic system in our country from 5 to 70, but it did not work in full, its original plan, because the incoming staff were the founders of the Triad ("Umid Nihollari", "Barkamol Avlod", "Universiada").) instead did not fully understand all the methodological foundations of this system and focused on the fourth republican stage, and the main basis of this system was the organization of the media in educational institutions. The methodology is broken.

Those who engage in mass sports from the school bench have a motivational foundation, creating a foundation for a healthy lifestyle. It is difficult for a non-sports contingent to engage in mass sports because they do not have the skills and the skills come directly from the school bench. [8 C. 114] A person can then engage in compulsory exercise, during illness or post-rehabilitation. Here, the problem is that we cannot engage in physical education and sports from school from an early age. In addition, as a system of continuing education, students should engage in mass sports. This serves as a national motivational basis for the immediate future of the organization.

CONCLUSION

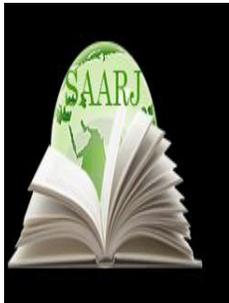

Declaring that the national system of Uzbekistan is, first of all, a form of physical activity for self-development, self-enrichment of the internal and material world, self-realization of human capital can do.

As noted above, at all stages of development, physical culture and sports are seen as international achievements in sports as a way to improve the nation's health, increase labor productivity, increase the state's defense capabilities and implement foreign policy dialogue.

ABSTRACT

The development of new technologies in surgery and the improvement of known methods in recent decades have opened up wide opportunities for bringing the result of plastic and reconstructive surgeries to aesthetic perfection, when their main advantage is the use of autologous grafts, the absence of visible scars, quick rehabilitation and a "natural" appearance of the patient. One of these methods is lipofilling, it is simple to perform and allows you to solve many complex problems, for example, associated with impaired tissue regeneration in trophic ulcers, correction of contour deformities of the face and body of various etiology or minor aesthetic defects. This method is experiencing a real peak of development, moreover, an intensive study of the properties of adipose tissue and its components made it possible to

significantly expand the areas of potential use of lipofilling for the restoration of vocal cords, the treatment of alopecia, pigmentation, etc.

KEYWORDS: *Graft, Lipofilling, Facial Deformities, Adipose Tissue.*

INTRODUCTION

The properties of adipose tissue favorably distinguish it among the many materials that surgeons use to correct contour deformities of the face. The positive characteristics of autologous tissues include: biocompatibility, versatility, a short rehabilitation period, a stable result and the absence of migration tendencies [1]. According to V.V. Terskikh (2010), the use of one's own adipose tissue as a graft reduces the risk of rejection, infection and the development of allergic reactions to it in comparison with the use of fillers of biological origin and various synthetic materials. This advantage is determined by the composition of the adipose tissue. The latter is 90% mature adipocytes, the rest are cells of the stromal-vascular fraction (SVKF): preadipocytes (stem / progenitor cells), fibroblasts, macrophages, monocytes, endothelial and smooth muscle cells of blood vessels, pericytes and supporting fibrous collagenous stroma [2]. It is known that adipose tissue is the "richest" source of mesenchymal stem cells in the body.

Thus, 1 year of adipose tissue contains approximately 5000 stem cells, which is five times more than in the bone marrow and about 350,000 preadipocytes [3]. As a result of asymmetric division of stem cells, 2 types of daughter cells are formed: undifferentiated stem cells responsible for self-renewal processes, and cells prone to differentiation [4]. Depending on the characteristics of the recipient region, they can differentiate into adipocytes, chondrocytes, myoblasts, and osteoblasts [5].

F.X. Hansberger (1995) described the characteristic integration of an autologous fat graft into the recipient zone, according to which adipose tissue implanted directly to the bone is modified into bone tissue, injected subcutaneously - thickens the skin, placed in a muscle - does not differ from muscle tissue. Unfortunately, it was not possible to find confirmation of these data by morphological studies in the specialized literature. However, an important and histologically proven fact is the ability of preadipocytes to differentiate in the adipo- and angiogenic direction. It is also known that engraftment of autotransplanted adipocytes depends on adequate angiogenesis in the recipient area [6]. In this regard, autologous adipose tissue is a "self-sufficient" substance and contains adipocytes that must take root and substances that promote this engraftment. In addition, important properties of stem cells are their low immunogenicity and pronounced immunosuppressive properties [7]. Based on the above, it can be assumed that autotransplantation of adipose tissue (or lipofilling) is a good method for replenishing the volume of tissues in the PMO and needs further research in terms of planning and predicting the outcome. Currently, there are several lipofilling techniques, differing mainly in the method of collection and processing (preparation for transplantation) of adipose tissue.

To collect material from the donor area, atraumatic cannulas with a diameter of 1.5 to 4 mm are used. There is no such consensus regarding the permissible level of negative pressure during lipoaspiration. Many surgeons use the hardware method for these purposes as it is less laborious in comparison with manual tissue harvesting [8].

But the “gold standard” of lipofilling technique is S.R. Coleman (1997), according to which lipoaspiration should be carried out with a 10 ml syringe with a vacuum created by pulling the syringe plunger by 2-3 divisions. This provides a higher concentration of viable cells in the lipoaspirate compared to vacuum-assisted aspiration. It is believed that high negative pressure contributes to mechanical damage to adipocytes, and at negative pressure more than 500 mm. rt. Art. only two thirds of adipose tissue retain their viability [9].

The Main Findings and Results

P. Smith, W.P. Adams 17 (2006) suggest that there is no significant difference in the viability of adipocytes obtained from conventional liposuction and manual syringe collection. They made their conclusions based on the colorimetric analysis of cell proliferation. When studying the histological picture of lipoaspirate taken with different negative pressures, 10-15% of damaged lipocytes were noted at a vacuum of -700 mm. rt. Art. (about 1 atm.), in comparison with a portion obtained at a lower pressure, where no more than 2% of damaged cells were detected.

At a pressure of -650 mm. rt. Art. blood inclusions appear in the aspirate, and at a maximum vacuum of -750 mm. rt. Art. the aspirate contains a significant amount of dark venous blood. The ideal pressure for hardware aspiration of adipose tissue is -500 mm. rt. Art., in which there is minimal bleeding and the level of negative pressure is sufficient for rapid lipoaspiration [10]. Interesting results were obtained in a comparative study of adipose tissue, resected with one block and collected during liposuction. Viable adipocyte counting, glycerol-3 phosphate dehydrogenase assay and histological examination showed that, despite the normal histological structure and approximately the same content of viable adipocytes in both adipose tissue samples, the level of adipocyte cell functions after liposuction was below optimal [11].

M.T. Boschert et al. (2002) similarly compared the standard technique of adipose tissue collection according to S.R. Soleman with standard liposuction and obtained the same results for adipose tissue aspirated using a vacuum compared to tissue aspirated by the standard syringe method. It is known that the cellular composition of lipoaspirate is somewhat different from intact adipose tissue, for example, in the former, there are significantly fewer blood vessels and stem cells. This is due to the characteristic perivascular arrangement of stem cells in adipose tissue and largely depends on the method of obtaining the adipose graft [12]. The composition of untreated lipoaspirate 18 contains blood cells (erythrocytes and leukocytes) and fat emulsion released from damaged adipocytes (unable to take root) and lytic enzymes. These components can have a negative effect on the engraftment of lipoaspirate, causing a local inflammatory reaction; therefore, many authors recommend washing the adipose tissue with settling to "clean waters" in saline. As a rule, when the obtained lipoaspirate is settled in syringes, several fractions are formed that have a clear visual distinction. The upper fraction is free fat, the middle fraction is adipose tissue, the lower fraction is a liquid containing the remnants of the tumescent and washing solution, blood cells and destroyed tissues. Accordingly, the top and bottom fractions are to be removed during lipoaspirate purification. As a result of laboratory studies, it was found that washing the fat with saline and settling it in syringes removes approximately 50% of blood cells and 91% of free fat [13].

According to domestic and foreign literature, there is no consensus on the method of preparing a fat graft, and the information encountered is rather contradictory. Treatment is carried out in different ways: by centrifugation, filtration through a sieve or gauze, washing with saline with

settling, adding glucose, insulin, vitamin E, hormones, enrichment with mesenchymal stem cells or platelet mass, etc. [13]. It is believed that short-term exposure of the fat aspirate to air causes the lysis of 50% of adipocytes [14].

However, Y. Ramon (2007), using morphological studies, proved that adipose tissue after short-term contact with air did not differ in the percentage of viable adipocytes in comparison with the material that did not have such contact. It is generally accepted that for a better survival of adipocytes, it is necessary to minimize mechanical trauma to tissues during the collection and processing of the graft.

Thus, Y. Ramon (2007) in an experiment on mice histologically proved the negative effect of centrifugation on 19 adipocyte viability, which was manifested by active fibrosis in the transplanted adipose tissue. But at the same time, one cannot ignore the opinion of other experienced surgeons who actively use centrifugation in their practical work [15].

Z.Yu. Visaitova (2008) compared different methods of cleaning a fat graft: washing with saline or 5% glucose solution in a syringe, washing through a sieve with saline, freezing (-20 C) or in a container with liquid nitrogen at (-197 C) after washing through a sieve, centrifugation for 2 minutes at 1500, 2000, 2500, 3000, 3500 rpm. According to the data obtained, with all the treatment methods used, the adipose tissue in general retained its structure and viable adipocytes well. But the author noted that destructive changes in adipocytes were more often observed in samples obtained after centrifugation, and minimal morphological changes were found in samples treated with saline in syringes without contact with air. A. Chajchir (1991) found no difference in the viability of adipocytes treated with saline with and without insulin added.

B. Sommer (2000) et al described the successful use of endothelial growth factors with the introduction of autologous adipose tissue on the example of 140 patients. Recently, there have been active publications on the important role of stem cells capable of providing angio- and adipogenesis. According to a number of authors, the enrichment of the fat graft with stem cells or platelet-rich plasma (PRP), cytokines - growth factors, promotes its better engraftment [16]. An interesting study on laboratory animals was carried out by E.V. Sukhoparova (2012), who found that administration of a receptor antagonist interleukin-1 to the recipient area during lipofilling reduces the severity of lipid peroxidation processes and helps to restore the antioxidant potential of autologous graft cells [17].

The optimal technique for the introduction of a fat aspirate is considered to be diffuse tissue infiltration through multiple passages, with extremely small volumes of fat introduced into each passage by cannulas, the greatest dissociation of the introduced portions of fat from each other for greater contact of the transplanted tissue with the recipient area [18].

The introduction of adipose tissue is usually carried out with blunt cannulas; some authors recommend using sharp cannulas for the introduction of adipose tissue under the scars, into the fibrotic tissue and the subdermal layer [19]. It has been noted that when using small diameter cannulas, there is a risk of mechanical damage to adipocytes [20]. Typically, a fat aspirate is injected into the subdermal, intramuscular, suprapariosteal layers. For each layer, a certain volume for the introduction of the graft is permissible, which depends on the thickness of the layer, the extensibility of the tissues, the anatomical zone of introduction and the individual characteristics of each patient [21]. In connection with the inevitable resorption of the

transplanted fat, most authors recommend injecting lipoaspirate with overcorrection of about 30% [22].

In the literature, there is no data on the detailing of the volume of hypercorrection depending on the thickness and condition of the tissues of the recipient area. At present, there is also no scientific confirmation of the benefits or evidence of the damaging effect of any of the anesthetic solutions during the collection and administration of autologous adipose tissue. The choice of local anesthetic components is based on the personal experience and preference of the surgeon. Surgeons, based on their experience, adhere to the principles of sparing collection, processing and administration of lipoaspirate to preserve as many viable cells as possible. All the data on failures in autologous transplantation of adipose tissue, some authors associate with a violation of the lipofilling technique [23]. It should be noted that in the available literature there are sporadic data on the use of objective methods for assessing the effectiveness of lipofilling, especially since today there are more than one of its 21 techniques. In the specialized literature, there are individual publications with a wide range of figures for the percentage of surviving adipose tissue - from 25% to 80%. Back in the 60s of the last century L. A. Peer noted 50% adipocyte survival by the year of observation.

In the 80s, Y.G. Illouz spoke about rather poor tissue survival in free autologous transplantation. Moreover, there are no objective data on the differences in adipose tissue engraftment depending on the anatomical region, as well as the morphological determination of the structures of the transplanted autograft, due to which the volume increases in the correction zone. Despite all the advantages of lipofilling, unpredictable resorption of the fat graft, which according to the specialized literature is from 25% to 80%, remains the main negative factor limiting the use of this method at present [24].

In addition, different stages of lipofilling - material sampling, processing, introduction, have many modifications, which indicates the ongoing search for an optimal technique in terms of efficiency with a long-term and predictable result [25]. It is known that after transplantation of adipose tissue, it can change its volume depending on the characteristics of the diet, and therefore, after lipofilling, problems may arise in the transplantation zone in the form of irregularities associated with changes in the contours, which should be taken into account when choosing a donor area, since the element of "cellular memory". This is due to the fact that in the so-called "fat traps" the volume of fat cells is genetically fixed, which means that it is very difficult to influence it with the help of diets and exercise. Unlike subfascial, subcutaneous adipose tissue is present in all parts of the body, the thickness of its layer determines the roundness of the body outline and depends on the calorie content of consumed foods and the adequacy of physical activity [26].

According to some scientists, in order to achieve a good result, it is necessary to use adipose tissue, which has a good potential for cell differentiation of preadipocytes. The most optimal donor zones in terms of cell concentration in lipoaspirate are considered to be the lower abdomen and the inner surface of the knee, the lowest concentration of pre-adipocytes was noted in the flank area [27].

According to the results of A. Hudson (1990), in terms of the activity of lipogenesis enzymes, as well as the diameter of adipocytes, lipoaspirate from the thighs takes the first place, and then in descending order: from the abdomen, chest, and face. But, despite the research data, in practical

work, each surgeon is guided by his own preferences. The main criterion for choosing a donor area is a sufficient amount of "material". Most often, surgeons use the lower anterior abdominal wall, the outer thighs, or the inner knee as the donor area.

In most publications, it is noted that in the correction of contour deformities of the soft tissues of the face, restoration of the skeleton function of the facial skeleton, which is necessary for support for the soft tissues, remains paramount. But, at the same time, it was noted that the use of cartilage and / or bone autologous grafts for these purposes is inevitably accompanied by their resorption with a decrease in volume of varying severity. Implants made of metal alloys (for example, cobalt - chromium, titanium), plastics, organosilicon polymers, silicone, retaining a stable shape and volume, can only be used with a sufficient amount of soft tissues covering them. Otherwise, there are negative consequences such as contouring and cutting of implants. In these cases, the search for new methods for replenishing the volume and sufficient thickness of integumentary tissues continues.

Separately, it should be noted that autotransplantation of adipose tissue, despite the demand, remains an insufficiently studied method in terms of planning the number of stages, the volume of autologous graft injected and its resorption, as well as objective research methods at the stages of rehabilitation.

In attempts to predict the final result and optimal conditions for engraftment of the transplanted adipose tissue, many scientists assign a fundamental role to the state of microcirculation in the recipient zone and note the great role of an adequate microvascular network for further engraftment of the injected adipose tissue.

It is also known that the formation of its own vasculature in the graft after transplantation makes it impossible for its migration, and the biocompatibility of the material leads to a decrease in the severity of the local inflammatory reaction and the formation of a capsule around the injected tissue.

Whereas when using silicone implants on histological preparations, signs of a chronic inflammatory reaction to the implant with the formation of an organized fibrous capsule were noted, since there is no connection between it and the implant, the latter is more prone to displacement. A similar "picture" is typical for biodegradable injectable fillers [15,21]. Undoubtedly, the main advantages of using one's own adipose tissue are its availability, availability in sufficient volume compared to synthetic fillers and the absence of the risk of allergic reactions and various complications if lipofilling techniques are followed [8].

Also known is the positive effect of autotransplanted adipose tissue on the restructuring of scars after irradiation and on reparative processes when the skin condition worsens due to age-related changes (photodamage, hormonal imbalance, violation of the lipid barrier of the skin, latent chronic inflammation, nutritional characteristics, stress) [6,18]. Cases of successful treatment of alopecia in men in the cheek-chin areas with regeneration of hair follicles, the positive effect of autolipograft in cicatricial contractures of the chest and damage to the vocal cords have also been described [11].

These effects are due to the presence of stem cells in the transplant, which have antiapoptotic activity and, due to their differentiation ability, are involved in the repair of damaged tissues or

in angiogenesis due to the expression of the mitogen mRNA or 24 of the antiapoptotic factor ICF [12,25].

In vitro studies have shown that a differentiated epidermis, as well as the entire skin, can be formed at the expense of adipose tissue stem cells [4]. There is also an opinion that the repair and remodeling of the skin are secondary (or side) components of the accumulation of pre-adipocytes and macrophages in the lipoaspirate injection zone, which provide an immune response and the removal of defective cells [15]. It is known that after the introduction of the autograft into the recipient area, the adipose tissue is in a state of hypoxia. The cells are nourished for the first 4 days mainly due to their plasma impregnation on average up to the fourth day, when the graft's own vasculature begins to form. This period is critical, since adipocytes are extremely vulnerable in conditions of ischemia. Hypoxia can be aggravated by excessive trauma to cells during material collection. In this case, the processes of lipid peroxidation are triggered and the antioxidant system of cells is disrupted, which leads to an even greater decrease in the viability of the autologous graft and can lead to cell death within 24 hours [19,23]. Early cell death can lead to their destruction and release of fats into the extracellular space with the formation of oil cysts. There are two points of view regarding the preservation of viable adipocytes in the graft under operating hypoxia.

According to F. Hansberger (1955), after transplantation under conditions of ischemia, mature fat cells die off or are modified into immature cells. However, under favorable conditions with adequate blood supply, they again differentiate into mature adipocytes.

Another point of view is also known, according to which mainly stem cells and pre-adipocytes survive in the process of lipofilling, which, after the development of the vascular bed, differentiate into mature cells. This is explained by the fact that stem cells are more resistant to trauma and ischemia than mature adipocytes and significant differences in these types of cells 25 in size, metabolic rate, and intracellular lipid content [14].

According to L. Peer (1955), only about 50% of the transplanted adipose cells survive due to neovascularization. In any case, the formation of its own vasculature, which ensures the vital activity of adipocytes, determines the final stable result of lipofilling. Before this period, resorption of the transplanted material occurs, which, as a rule, lasts for 1 year after lipofilling [6]. H. Neuhof and S. Hirshfeld (1923) carried out microscopic studies and described the processes of degenerative changes in the transplanted autologous adipose tissue of a person in the first 2-3 months after transplantation [5].

The authors found that, starting from 2 months, the process of tissue regeneration starts, with the acquisition by "wandering cells" of the properties of embryonic fat cells, and then - the properties of adult adipocytes. By the 5th month, the regeneration process is completed, and by this time 50% of the transplanted viable adipose tissue acquires the properties of normal with inclusions of the connecting component to one degree or another [11,24]. However, it was not possible to find accurate data on the objective quantitative and qualitative characteristics of the cellular structures of the transplanted autograft in the available literature.

CONCLUSION

In the 21st century of new technologies, on the one hand, an excellent and effective method of lipofilling and a large number of sufficiently informative diagnostic methods for studying

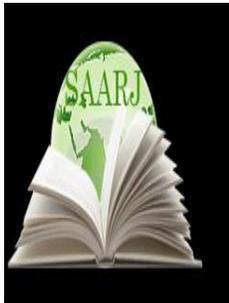

biological tissues turned out to be in our hands, on the other hand, the lack of the ability to reliably predict the postoperative result and objective criteria for assessing the effectiveness of lipofilling. Therefore, it remains an urgent task to develop an algorithm for the examination and treatment of patients with contour deformities of the face by lipofilling, as well as the selection of available, objective and patient-safe instrumental methods for diagnosing the state of autotransplanted adipose tissue at the stages of rehabilitation.

ABSTRACT

This article reveals the notion of “Industry 4.0”, which reflects the concept of the fourth industrial revolution, what relevant professions will appear in the future in connection with this, what skills are needed to acquire these professions, the importance of developing reader competence, and also the issue of the phenomenon of “clip thinking”. It is concluded that it is advisable to formulate ideas about the professions of the future starting from preschool age and emphasize the need to improve the system of training future personnel and improve their skills.

INTRODUCTION

It is an indisputable fact that the volume and variety of information in the world in the 21st century accelerates the dissemination of information, which affects the reading culture.

Reading is an integral part of the culture of the population, determines the country’s economy, national security, political position in the international arena, competitiveness, influences the integration of the individual into a multi-ethnic, multi-layered, socio-economically diverse society. Failure to read a book can lead to big social problems. This situation leads to a rapid decline in the general cultural and professional competence of society, cultural degradation of the population, loss of the ability to understand and accept not only other cultures, but also

unfamiliar aspects of their own culture, that is, xenophobia. This can increase the number of problems in society that are difficult to solve, and, as a result, lead to social unrest and explosions, conflicts. It is difficult for uneducated people to identify socially significant problems, to find the most optimal, effective way to solve them. As a result, societies with fewer people are forced to become dependent on societies with a high reading culture because of their predominance in science, literature, politics, economics, and other fields. Because it's exactly book products, whether they're in traditional or electronic form; information of social significance due to written documents (manuscripts, diaries, correspondence - organizational, personal); social experience of the past, present and future will be accumulated and passed on to future generations as an invaluable resource.

The Main Findings and Results

According to G. Westhoff, reading competence is the ability to understand texts of different forms and content, with different formal structures, to connect them with texts in a broader context and use them to achieve their goals, increase knowledge and expand opportunities for active participation in society [8]. J. Grzesik recognized reading competence as a willingness to use reading as a means of acquiring new knowledge for later education [3]. According to the definition of E.A. Orlova, reading competence is one of the general cultural competencies, ie the ability to work freely in a modern socio-cultural environment [13].

Thus, reading is an activity aimed at the formation and development of a personality, a means of education and culture, proof of the integrity of a specialist's communicative and professional competencies, a factor of a person's success in life. Reading is a national language, a powerful mechanism for preserving and reproducing culture.

Nevertheless, it is hard to deny that the attitude towards reading among the population has recently taken a negative turn. According to researchers, the negative situation with reading is observed not only in Uzbekistan, but also in the United States, Russia, Germany, France and other developed countries. In these countries, there is also resistance to the negative conditions associated with reading. This is due to the following: the predominance of fragmentary audiovisual data sources and their transmission systems in the information space in the context of unmet needs of the population for systematized and accurate information; in the absence of available information to find solutions to important problems in life, the necessary information is not delivered to the public consumer in a timely and appropriate manner; insufficient exchange of information between the state and society on important issues, which has a negative impact on ensuring the active participation of citizens in finding solutions to important social problems; socially important knowledge is slowly renewed in society and its members do not deserve effective socio-cultural adaptation; television, radio, Internet broadcasts provide superficial, temporary information, which only serves as a helper and guide to serious, reliable information; the pleasurable aspect of reading and the growing desire of people (especially young people) to minimize intellectual activity in the reading process; the tendency of publishers to publish literature that contains information of low value (in terms of form and content); inconsistency of current success criteria and learning, resulting in a decrease in learning motivation in students; that modern man is forced to do many things at once, as a result of which he does not have time to think deeply about information, that he is accustomed to the hasty use of a variety of fast information, and so on.

The above situation leads to the phenomenon of “clip thinking”. The word “clip” is derived from the English word “clip” and means “sheet”, “piece” (e.g. video, movie, text, piece of article). “Clip thinking” refers to short, vivid images and letters that describe the world, such as a news feed on television, short video clips, short articles in newspapers and magazines, and so on. we mean the property of perception through. The concept of “clip thinking” was introduced by E. Toffler in the early twentieth century. At that time, the amount of information was much less than it is today. According to the Russian philosopher Fyodor Girenok, clip thinking is “thinking only in the face of a severe blow,” “the clip is a clump, a part that does not move,” “the clip did not allow the mind to think, to combine ideas.” In the 1970s, the French social psychologist Abraham Mol wrote in his book *The Sociodynamics of Culture* about the abundance of information in society: “The human mind with limited perception is entering a dead end in the face of a large amount of published material, and as a result, modern man is forced to give up most of the information that comes to him” [12, 5]. It is no secret that the media has developed rapidly since then, especially the advent of the Internet, which has radically changed the industry and increased the amount of information. The information coming through these means is a big blow to the modern man suffering from stress and, as V.P. Shalaev puts it, becomes the owner of a “mixed consciousness” [18, 101].

However, the phenomenon of globalization, economic internationalization, the development of ICT requires reading competence. In this regard, in order to ensure the implementation of the State Program on the implementation of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 in the “Year of Science, Enlightenment and Digital Economy” approved by the Decree of the President of the Republic of Uzbekistan No. PD-5953 dated March 2, 2020 On December 14, 2013, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 781 “On approval of the National Program for the development and support of reading culture in 2020-2025” was adopted. According to him, the “National Program for the Development and Support of Reading Culture in 2020-2025” was approved. The purpose of the program is to develop a culture of reading, expand the ranks of active readers through a consistent and effective organization of support systems for creators, publishers and distributors, increase the intellectual potential of the population, especially the younger generation. One of the main tasks in the implementation of the program is to further strengthen the interest of the younger generation in reading, spiritual and material encouragement of readers, expanding the ranks of active readers.

We believe decisions and rulings are especially important for young people in their future careers. For example, scientists at Oxford University K. B. Frey and M. Osborne estimates that 47% of occupations in the U.S. will be automated over the next 20 years [1]. According to scientists, the activities of salespeople, insurance appraisers, officials in the sports industry, waiters, administrators, couriers will be automated. This means that such professionals are more likely to be unemployed.

It is significant to mention the concept of “Industry 4.0” when discussing future professions. This concept was first introduced by the German federal government and represents a strategic plan for the development of German industry [16, 57]. This plan is based on a combination of industrial equipment and information systems in a single information space that allows them to interact with each other and with the external environment without human intervention. The

numbers “4.0” indicate that the development in this direction has great potential and will lead to the undisputed 4th industrial revolution [16, 57].

“**Industry 4.0**” is a radical, revolutionary change in human development related to the introduction of cyberphysical systems, digital technologies, artificial intelligence, minimization of human labor, and the satisfaction of human needs (including life, work, leisure). is a reflective phenomenon, as many scientists point out [2,6,7], it transforms the human way of life in every way unimaginable and leads to the abandonment of mechanical labor. The loss of some professions leads to unemployment, which in turn leads to socio-economic and political problems. But there is also a positive side to the issue, which is that the fourth industrial revolution will create new jobs related to future professions. According to the World Economic Forum in 2018, 133 million jobs are projected to be created in 2018–2022, of which 6.1 million will be related to future occupations. Future occupations are mainly Care Economy; in sales, marketing and content creation - 17%; work with data and artificial intelligence - 16%; 12% - in the field of engineering and cloud computing; 8% - in the field of “People and Culture” [5].

Thinking about the professions of the future, including scientists D. Varlamova, D. Sudakova [9] city farmer (specialist in the improvement of megacities, equipment and maintenance of agricultural farms inside and on the roofs of skyscrapers) [9, 39], molecular nutritionist [9, 58], online doctor [9, 62], space tourism manager [9, 356], digital linguist (adaptation of a technical language to humans) [9, 34], designer of 3D editions [9, 108], home robot creator [9, 39], trainer for intellectual development (intelligence development) [9, 39], etc. *Specialist business skills* (skills related to starting a business, setting up a business, doing business), *special field skills* (e.g., cloud technology, video editing, or radiation oncology skills) are required to complete these professions. These do not include the design of digital technologies, their operation), “*Hard skills*” (fundamental, ie “hard” skills - these are skills that can be learned and improved through practice, repetition and training, specific work, such as programming, installation of equipment, sewing, welding, etc.) and “*Soft skills*” (“soft”, “flexible” skills - worldview, behavioral skills: communication, group exposure, negotiation), includes basic technical skills and breakthrough technical skills [5].

It is important to have such skills, and it is advisable to develop them from an early age. Because it is during this period that human capital begins to form, and, according to Nobel laureate J.J. Heckman, investment in pre-school education is more effective than investment in general secondary and higher education[4].

The analysis of economists shows that highly effective programs for educating a child at an early age ensure economic development, because children who go to kindergarten study well in school, find a good job and succeed in life. In addition, the increase in spending in this area will lead to an increase in labor productivity, a decrease in crime, an increase in educational success, and a decrease in spending in these areas.

Therefore, it is necessary to radically reform the pre-school education system in accordance with “Industry 4.0” and based on the long-term development plans of the state. At the same time, it is important to improve the system of training and retraining of specialists in this field, including not only updating the software, relying on best practices, but also directly training educators, PEO managers, specialists in accordance with Industry 4.0, ie *business skills*. , *special field skills*, “*Hard skills*”, “*Soft skills*”. Because this is how the specialists of the PEO can develop the skills

mentioned in their pupils. In our opinion, special attention should be paid to the development of *business skills* and, in particular, “*Soft skills*” of specialists. For example, business skills can expand the scope of PE services, ie increase the number and quality of various services (not only in education, but also in the production and sale of stationery, toys, machinery, household goods, etc.) Creates conditions for PE to cover more children. The large number of services leads to the creation of a competitive environment, which in turn increases their efficiency, creates new jobs, new professions, employment.

Under “*soft skills*”, these types of skills include personality traits, emotional and social intelligence, understanding the child, self-control, teamwork, creating a positive psychological environment in a team, leadership, working with parents and other psychological qualities. is a key tool in the development of a child’s personality, intelligence, creativity and other characteristics and determines the effectiveness of decisions.

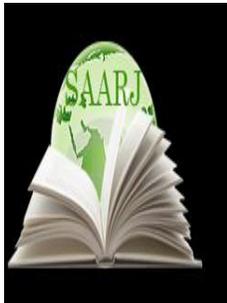

CONCLUSION

In short, it can be concluded that preschool education needs to be adapted to a rapidly changing world. Given that pedagogical knowledge is updated in a short time, it is advisable to improve the qualifications of teachers annually, for this it is important to create online courses, electronic textbooks, a platform for professional psychological and methodological assistance. In the system of training and retraining of teachers it is important to develop children’s reading, the development of competencies for future professions and their acquisition, the organization of a separate educational process on “Industry 4.0”. Based on the latest knowledge about brain activity in the construction of the educational process, we consider it expedient to conduct trainings on the formation and development of special competencies among teachers to prevent the development of clip thinking in children. Only then, we believe, will the state and society be able to achieve the ultimate goals of the preschool education system.

ABSTRACT

The article reveals some aspects of the development of intellectual abilities on the example of the spiritual heritage of the great thinkers of the East. The great thinker considers the role of the school and the teacher in the development of the child's worldview. In his opinion, a teacher should combine all the high virtues in a fair and just sermon. Each of the stages of a person's mental maturity has its place in the development of a person's spiritual worldview and in the perfection of his intellectual potential. This means that a person "reaches the sky" to perfection through upbringing, and the best "companion" in him is to become knowledgeable, enlightened and, most importantly, intellectually capable by reading the example and book of life.

KEYWORDS: *Personality, Ability, Intellectual Ability, Education, Upbringing, Knowledge, Intelligence.*

INTRODUCTION

Generations will never forget the question of making a nation a nation, its strong place in the world, seeing its people free and prosperous, a person of great intellectual ability who has done great work and devotees doing sacred work.

As far as we know, in the scientific heritage of the scholars of the East, the question of the formation of the individual in mental and physical development has been thoroughly analyzed. In particular, our great scholars Abū Naṣr al Fārābī, Abu Rayhan Beruni, Abu Ali Ibn Sino, Abdurahman Jami, Davani and others have identified the importance of people in society and ways of educating them, the development of intellectual potential through education.

Beruni's teaching on knowledge attracts the attention of researchers of his masterpieces. It is one of the characteristics of human beings to acquire true knowledge.

Beruni thought on the basis of the evidence that those who sought to acquire knowledge also sought knowledge because they needed to know what they did not know. The constant inculcation of the culture of speech in the student in education creates the art of being scientific, to motivate him to grow happily, to be interested in learning, to be knowledgeable, to interest him in learning to grow happily.

From the moment a child is born, he begins to know everything in the outside world. In his mind, the initial concepts appear. This does not mean that the laws of things can be learned, but that the child acquires simple knowledge, the ideas he receives from the family and the environment develop the child's knowledge, the child's development. According to Beruni, a child goes from simple to complex, starting with color (10-12 years).

The Main Findings and Results

When Beruni was born in time, he was referring to the innate talent of human beings. He also paid special attention to the heredity of education, that is, the biological "heritage" passed down from mother to son.

At the beginning of the year, it is determined by the characteristics of the structure of the brain. But such signs do not mean that people will become famous. Everybody will be educated later. As a result of good education, children are sometimes able to develop their talents in this or that field.

Beruni, who has recognized education, says nothing about the possibility of extinction as a child. According to the theory of innate ability, not only Beruni, but also the above conclusions. But the gifted, the talented, have the necessary conditions to realize these qualities, and then they have to work hard, and only then will they develop. Otherwise, it is possible to lose the ability, but now it is all the same. Because a child who is superior to his peers in terms of ability can sometimes lag behind or outperform his peers. When it comes to fertility, it is necessary to create conditions conducive to the development of hard work, science, knowledge and creativity.

The great thinker considers the role of the school and the teacher in the development of the child's worldview. In his opinion, a teacher should combine all the high virtues in a fair and just sermon. At the same time, the school sought to present itself as knowledgeable, while talking about the benefits of real science for the benefit of society. The scholar harshly criticizes the preachers, ascetics, the poor, the dervishes and the sheikhs who have sunk into the mire of ignorance. He accuses them of hypocrisy, hypocrisy, hypocrisy, arrogance, selfishness, ignorance and illiteracy.

Davoni emphasizes that the child's general understanding of the essence is possible only through the appearance of the mind, and that the perception of the external world through the senses and intellect is possible. He says that it is important to be very careful about the upbringing of a child, not to make mistakes, because the child is very impressionable and quick-witted at a young age. But he accepts the virtues without regard for all the blessings. Children's drawings are easily accepted, as are the pictures on the board.

The next period of child rearing begins at school. It is necessary to have a high level of knowledge of the upbringing of a child with a teacher. The relationship between the student and the student is discussed separately. Agarotaining is the cause of physical training of the body. He is considered a “spiritual teacher” and a “spiritual father”. The closer I am to the spirit of enlightenment, the closer the teacher will be to the parents in their upbringing. Davoni, in particular, analyzes the wisdom of wisdom. According to him, in order to cultivate human intelligence and intellectual talent, it is necessary to practice the following;

The first is the sharpness of intelligence. Ingenuity is the ability of a person to become popular in a certain way, to achieve the desired results. This requires experience and mobility.

The second is the ability to be quick-witted and to focus quickly on important and important issues so that they do not become overwhelmed by unnecessary and, secondly, complex, and complex issues.

The third is intoxication. This is the ability to do things easily and without difficulty.

The fourth is the ability to acquire knowledge quickly. The person should be able to focus on the unknown and master it without any contradictions.

The fifth is the deepening of the problem. The second step is the ability to take a specific position in the decision-making process so that the issues are resolved and the important ones are not left behind.

Sixth, memorization is the process of remembering what people have imagined and desired.

Seventh, memory is the ability to remember what has been learned before. Thus, Davoni should strive to grow and develop his abilities from an early age. He believes that if he says that he will attain true happiness, he will have to accept the above.

Fārābī in his book “Achieving Happiness” describes the process of learning. He asserted that his confession had been obtained through torture and that his confession had been obtained through torture. After studying it, we need to study the natural sciences, the structure of natural objects, their shape, the knowledge of the heavens. Then there is the study of nature, plants, and animals in general.

“Intelligence and lust are the beginnings of man ... but these beginnings are not enough for human beings to develop and become human under the influence of these natural beginnings, because man needs to speak, work, (profession) in order to reach human perfection. ”

Pharoah, human perfection alone cannot change. He believes that being in touch with others requires their help and relationships.

Man knows the material world, but in order to be perfect, he must be perfect. “But this reconciliation,” writes Fārābī “is achieved not only by dry aspiration, but also by the use of many objects in a natural being, or by the performance of many works of the same nature. It is impossible for a person to reach perfection alone, without the help of one or many, - the scientist continues, - in the nature of each person, in the process of any action that he needs, he has the ability to interact with one person or many. , the condition of any human being is that he needs or is compelled to help and unite with others in the attainment of any perfection. ’

Each of the stages of a person's mental maturity has its place in the development of a person's spiritual worldview and in the perfection of his intellectual potential. The levels of wisdom and perfection in the continuous sequence of a person's intellectual potential have their own peculiarities.

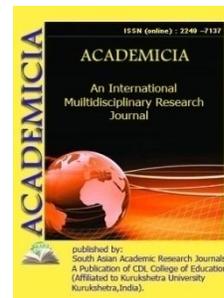

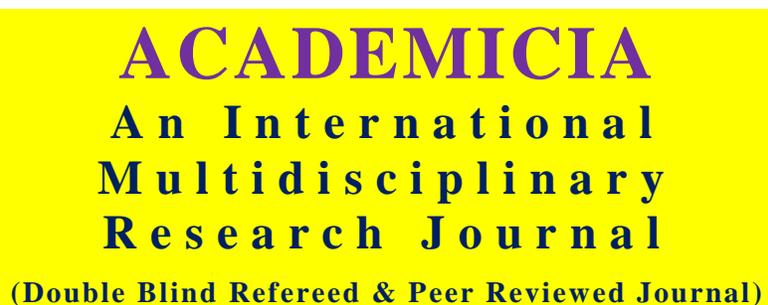

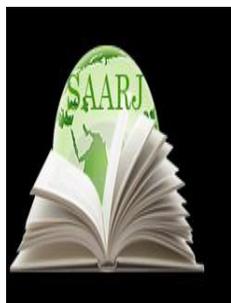

CONCLUSION

This means that a person "reaches the sky" to perfection through upbringing, and the best "companion" in him is to become knowledgeable, enlightened and, most importantly, intellectually capable by reading the example and book of life. In doing so, it will be necessary to take a bold step towards goodness by following the exemplary aspects of great people and, of course, by using the abilities, talents and talents given by Allah.

From the above, it is natural that our national and traditional values will be more valuable if we learn based on our invaluable spiritual heritage in raising the level of development of our country and determining that the individual's desire for knowledge depends on his mental individual characteristics.

ABSTRACT

The article provides a methodology for determining the theoretical study of the movement of potato tubers and impurities in a lifting centrifugal-separating bar elevator in potato harvesters. Most of the separating working bodies, which separate the components according to other characteristics, cannot work satisfactorily if there is a large amount of fine soil in the separated mass. Based on the results of the research carried out by us on the experimental installation, the layout of the pressure-pressure cylinder in the potato harvester was determined. This device separates the soil by centrifugal forces, and the lifting of the tubers produces a difference from known machines, without buckets or blades. A drum with a belt conveyor is located concentrically to the belt of the centrifugal elevator.

KEYWORDS: *Potatoes, Machine, Loader, Harvester, Conveyor, Elevator, Beater, Drum, Tops, Separation, Soil, Centrifugal Separator, Topper, Flange.*

I. INTRODUCTION

Separation of tubers from the soil and lifting them after digging is carried out in potato harvesters with a bar elevator, which is the main working body of these machines. It is made in the form of a bar conveyor, but is called an elevator, as it lifts tubers. The two main tasks of the bar elevator are soil separation and lifting and transporting tubers without damaging them. In the well-known works of scientists and designers: N.V. Firsova, Petrova G. D. Sorokina A.A. Kolchina N.N., Vereshchagina N.I., and others, both of these problems were solved. It should be noted that more work is devoted to soil separation than to improving tuber rise. Obviously this is true, since soil separation is more complicated than lifting the tubers. The main parameters of the bar elevator: speed of the elevator bed $-V$, length $-L$, width $-B$, pitch between bars $-t$, diameter of bars $-d$, lifting coal of the working branch $-\alpha$, amplitude in the CIS countries potatoes are grown in various soil and climatic zones, moreover, the weather during the period of its cleaning is unstable. The volume of potato production, as indicated earlier, is very significant. The area allotted for this crop in most farms exceeds several hundred hectares. In this regard, the agriculture of the European part of the CIS needs high-performance harvesting equipment, mainly combines, which would combine high productivity, adaptability to a variety of harvesting conditions, minimum manual labor costs with a limited range of equipment production. The existing two and three row potato harvesters with an improved working body have the following parameters: shaking amplitude $-r$, shaking frequency $-\omega$, $[1/s]$ or w $[\text{rad}/s]$. The lift angle of the elevator located behind the plowshares, usually called the main elevator, is taken on the order of 20° . An increase in the angle causes tubers to roll down along the bars of the elevator and damage them, especially in connection with the shaking of the working branch of the elevator bed.

II. LITERATURE SURVEY

To eliminate rolling of tubers with an increase in the angle, the rods are bent through one, i.e. the bar web is made stepwise. The following basic requirements are imposed on working bodies of this type: high productivity for separating working bodies (up to 150 kg/cm^2), high completeness of soil separation (70-80%), minimal losses and damage to tubers (2-3%), no sticking and clogging when working on wet and weedy vegetation soils. In addition, the screening working bodies must have a sufficiently high operational reliability and be simple in design. To reduce the size of the machine, it is also desirable that they simultaneously transport the mass with an upward movement of the separation.

Most of the separating working bodies, which separate the components according to other characteristics, cannot work satisfactorily if there is a large amount of fine soil in the separated mass. Thus, the performance of the subsequent more complex separating devices designed to separate solid impurities or moist soil depends on the quality of their work. When working in optimal soil conditions, for the separation of tubers from the soil, no other working tools are required except for sifting ones.

Although more than a century has passed since the invention of the bar elevator, on most domestic and foreign potato harvesters for separating (separating) soil from tubers, it remains the main working body. The bar elevator has become widespread due to its simplicity of design and the ability, simultaneously with separation, to transport the seam upward at an angle of inclination of $20-25^\circ$. The harvester, in contrast to stationary ones, moving across the field with

a change in the relief changes its position relative to the horizontal: tilting the machine to the side forward or backward inevitably causes changes in the movement of the mass if it is processed by shaking surfaces (rocking screens, etc.).

The mass is dumped to one side if the machine is tilted to one side, it is delayed, accumulating on the screen if the machine tilts forward: finally, it moves faster than necessary to the exit if the machine tilts back. The elevator type of the separating working body is less sensitive to such changes in position by machines.

The following basic requirements are imposed on working bodies of this type: high performance for separating working bodies (up to 150 kg / cm²), high completeness of soil separation (70-80%), minimal losses and damage to tubers (2-3%), no sticking and clogging when working on wet and weedy vegetation soils. In addition, the screening working bodies must have a sufficiently high operational reliability and be simple in design.

Work to increase the durability of elevators is carried out in several directions by using more wear-resistant materials, increasing the sliding friction area by elastic deformations of rubberized belts. For example, welding on double hooks increases the service life of the hook elevator by about 1.5 times.

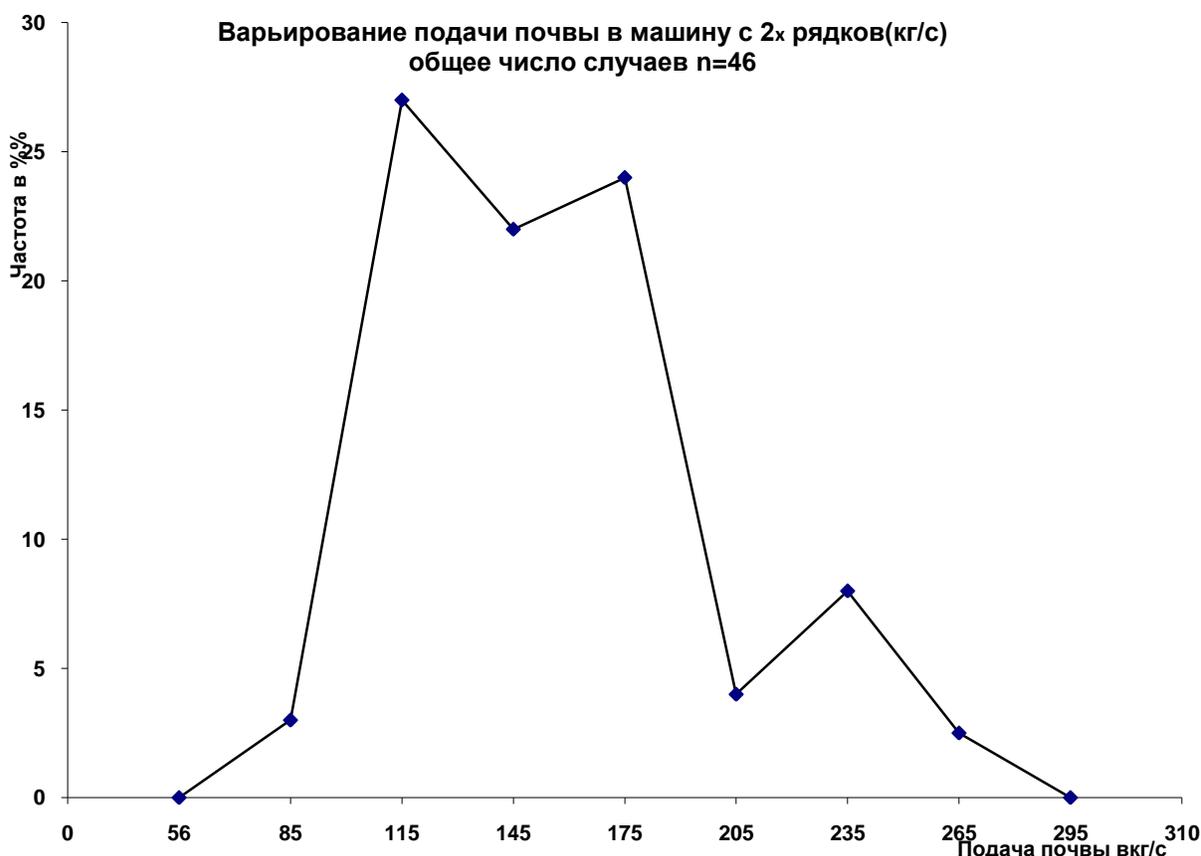

Figure 1.3

The wear resistance of the elevator, the web of which is assembled from cast bushing links, increased due to an increase in the contact area. The elevator can handle 50-60 hectares until it is completely worn out. Diggers KST-1,4, KTN-2V have a bar web of this type. The digger's elevator consists of two blades separated by a middle wall to which the middle share is attached. The disadvantage of this design is the high labor intensity of manufacture as well as a relatively large mass.

In the CIS countries, potatoes are cultivated in a variety of soil and climatic zones, and the weather during the harvesting period is unstable. The volume of potato production, as indicated earlier, is very significant. The area allotted for this crop in most farms exceeds several hundred hectares. In this regard, agriculture in the CIS countries needs high-performance harvesting equipment, mainly combines, which would combine high productivity, adaptability to a variety of harvesting conditions, a minimum of manual labor costs with a limited range of equipment production.

We, NPO VISKHOM, together with the Ryazan Agricultural Institute, carried out a number of studies, the purpose of which was to identify possible ways of creating on the basis of the KST-1.4 potato digger, the KKS-1.4 potato digger-separator for operation in difficult soil and climatic conditions.

Justification and study of one of the ways in solving this problem is the content of this work.

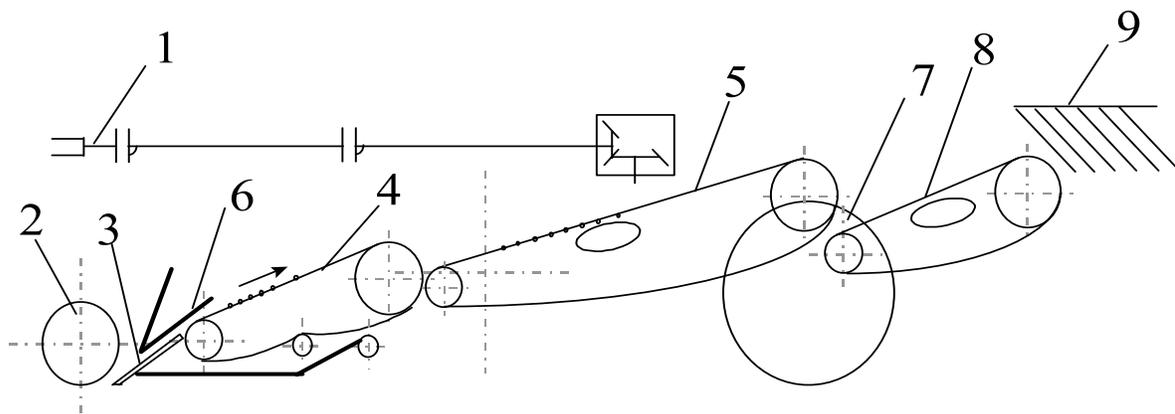

Figure 1.12. Technological scheme of the potato digger KST-1.4.

The potato digger KST-1.4 (Figure 1.12) is a semi-mounted elevator, the main components of the potato digger are gear 1, copying wheel 2, plowshares 3 high-speed elevator 4, main elevator 5, frame 6, running wheel 7, cascade elevator 8, reflector 9, transverse hinges 10.

The cut and partially destroyed layer is fed to a high-speed elevator with a speed of 2.02 and 2.25 m / s. From the high-speed elevator, the mass enters the main elevator, where due to the significant separation surface of the web and shaking it with special shakers, the main separation of tubers from the soil occurs. From the main elevator, the tubers and the remaining impurities are fed to the cascade elevator, where there is a further separation of the soil and the placement of tubers and remaining impurities on the surface of the field.

Using the results of research / 8 / it is not difficult to consider that during normal operation of a high-speed elevator, the descent of soil from it does not exceed 20-25 kg / sec. This means that the cascade elevator works with an under load, which will lead to increased damage to potato tubers.

This is especially noticeable when working in light conditions, is it necessary in this regard to develop an undercutting tool capable of providing a higher cutting of the formation? No. Apparently, the most rational for these conditions is to change the design and technological schemes of the potato digger KST-1.4, by introducing an additional working body, which was implemented in the potato digger-separator, by interchangeability of the loosening drum with the pressure cylinder.

As a result of searches and analyzes and in joint work of NPO VISKHOM with the Namangan production base for the production of potato seeds and vegetables and melons in NITI, a potato digger-separator KKS-1.4 - "Uzbekistan" / rice. 1.13 /

An attempt to modernize a serial harvester in the direction of increasing its productivity by increasing the separation surface and some changes in speed conditions and designs of working bodies without fundamentally changing the technological scheme of the harvester did not give positive results. Therefore, taking into account the shortcomings of the existing combines, solving the issue of creating a machine for harvesting potatoes in the conditions of Uzbekistan, we tried to create machines on the basis of existing machines, introducing appropriate new working bodies into it, made it workable in the conditions of Uzbekistan. When creating the harvester, it was found that the pressure cylinder can, by centrifugal separation, ensure the rise of tubers upward.

Based on the results of the research carried out by us on the experimental installation, the layout of the pressure-pressure cylinder in the potato harvester was determined.

Since 1982, together with NPO VISKHOM and GSKB Ryazan and the Ryazan Agricultural Academy of Agricultural Institute, work has been carried out at NITI to create a loader digger KP-2.

III. THE PROPOSED SCHEME OF THE COMBINE

This potato digger-loader is based on the KST-1.4 potato digger. In this machine, the separation of tubers from the soil and their lifting for loading into the body of the vehicle is carried out by a new device, a lifting centrifugal separating bar elevator / LCSBE /.

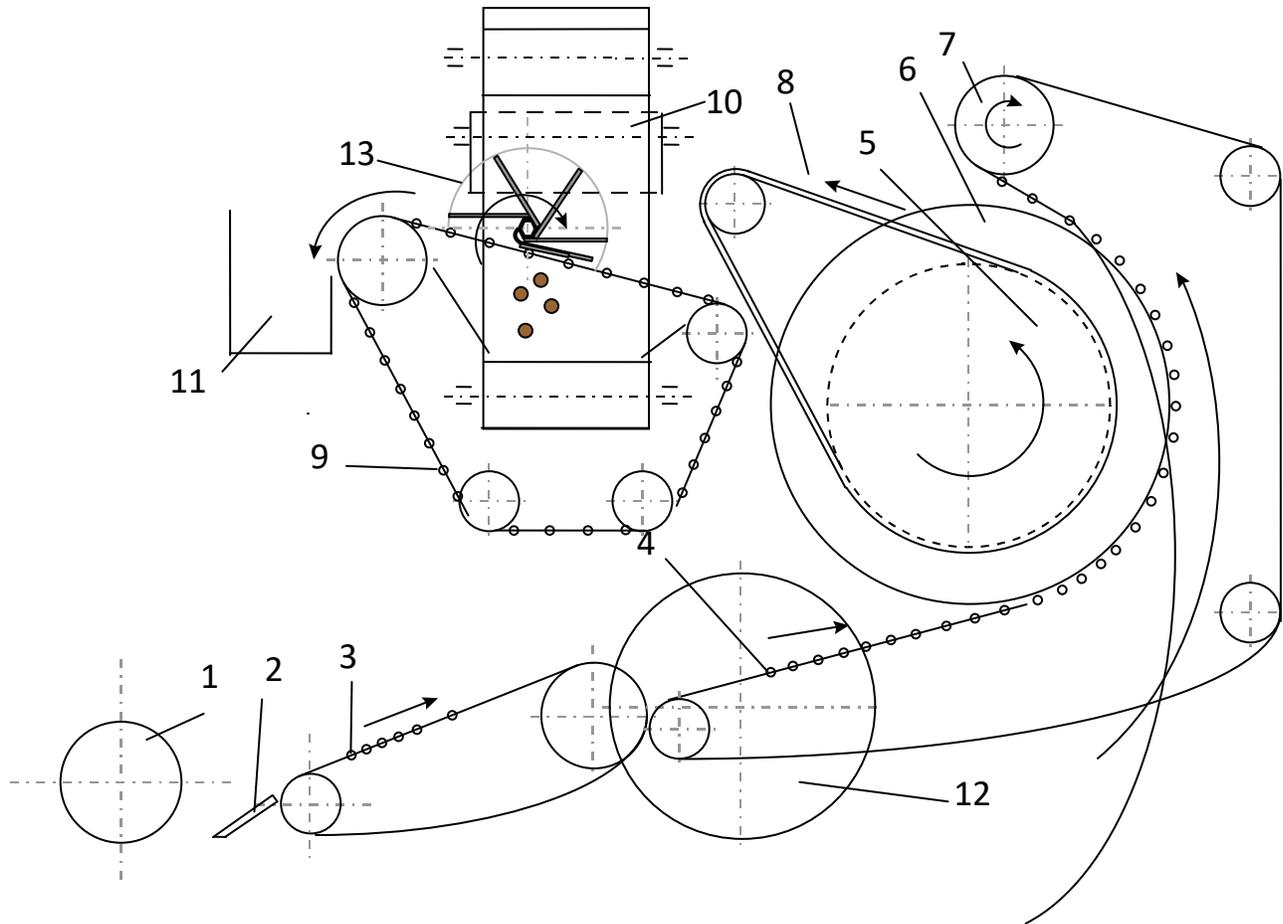

Figure 1.14. Schema of the KP-2 potato harvester.

1-support roller; 2-undercut plowshares; 3-bar elevator; 4-lift separating elevator; 5-guide drum with 6 flanges; 7-drive shaft of the second elevator; 8-feeding belt conveyor; 9-haulm rare-bar elevator; 10-cross-loading conveyor; 11-defoliating grid; 12-way wheels; 13-bitter.

IV. RESULTS

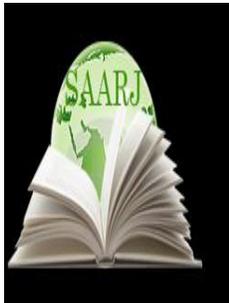

Figure 1.14 shows a diagram of a potato loader-machine, which, after digging out potatoes and separating tubers from soil and other impurities, loads them in a row of transport. This device separates the soil by centrifugal forces, and the lifting of the tubers produces a difference from known machines, without buckets or blades. A drum with a belt conveyor is located concentrically to the belt of the centrifugal elevator. Tubers, rising up on a centrifugal elevator, fall further on to a belt conveyor, which immerses them in the body of a vehicle. There is a gap between the belt conveyor on the drum and the centrifugal elevator, which is set within 30 ... 120 mm depending on the soil and climatic conditions and the size of the tubers. For work, it is necessary that the tubers are lifted by a lifting and separating device. The potato digger-loader is protected by RF patent No. 2048726.

V. CONCLUSION

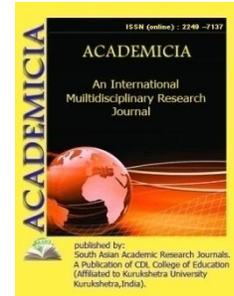

1. The main separating working body of potato harvesters is a bar elevator, which, simultaneously with separating tubers from the soil, ensures reliable transportation of the tuberous mass.
2. The efficiency of the separation process on potato harvesters largely depends on the condition of the soil.
3. The analysis of the existing separating working bodies showed that they do not sufficiently ensure soil separation in different soil and climatic conditions.
4. The use of centrifugal forces can significantly increase the intensity of soil separation.
5. A promising lifting centrifugal-separating working body (PCSPE) is proposed, which provides improved soil separation and lifting tubers for loading them into the body of a vehicle.
6. The most adapted machine for work in difficult soil and climatic conditions is a potato digger-loader KP-2, which includes a lifting centrifugal-separating bar elevator.

A STUDY OF VALUE RELEVANCE OF ACCOUNTING AND NON-ACCOUNTING INFORMATION

W. Percy Wijewardana*

*Department of Accountancy and Finance,
 Faculty of Management Studies, Rajarata University of Sri Lanka, Mihintale ,
 SRI LANKA

ABSTRACT

This study investigates the value relevance of accounting and non-accounting information in the Colombo Stock Exchange, with a view to determining whether accounting information and non-accounting information has the ability to capture data that affect share prices of companies listed on the Colombo Stock Exchange. The required accounting information and non-accounting information are obtained through banks annual reports and data library published by Colombo Stock Exchange. Value Relevance is examined by partially replicating and modifying Ohlson's Value Relevance Model. The Regression analysis is used for evaluating information content of various accounting numbers and non-accounting information. The results revealed that accounting information of BVPS and OCFPS has strong positive correlation with Share Price. And also, it revealed that the non-accounting information of Local number of shareholders, Market Capitalization and Age of the Company has strong positive correlation with Share Price.

KEYWORDS: *Value Relevance, Accounting Information, Non- Accounting Information, Market Capitalization*

INTRODUCTION

In the volatile and dynamic environment to make investor's decisions information are important. Moreover according to the Scott and William (2009) state information will be efficient, if it leads to change investors' beliefs and actions. Moreover, efficient information is able to measure the amount of information efficiency based on changes happening prices. As well as, value relevance of accounting information and non-accounting information are helped to various kind of interested parties to make their investment decisions in different times, on different countries,

on differently industry types and different parts. Further, business organization's behavior is changed in time to time. Without knowing the behavior of the organization investor cannot make their corrective economic decisions. Because of this reason they require financial information more and more as well as non-financial information. Therefore value relevant accounting information and non-accounting information are played in critical role in the investor's decision making in the capital market. Most of the previous studies have excluded Banking, Finance and Insurance sector from their sample even it is a large sector in terms of market capitalization. According to the previous literature, it implies most of researcher's have given their higher consideration for accounting information rather than non-accounting information. But, both accounting and non-accounting information are valued for the investor's decisions. Furthermore, it reveals most of previous studies have excluded banking, finance and insurance sector from their research sample. Therefore this study is to examine whether there is exists value relevance of accounting information and non-accounting information to investor's decision making in banks listed at Colombo Stock Exchange (CSE). Further, study examine the value relevance of earnings per share, book value per share, operating cash flow per share, Local number of shareholders, Foreign number of shareholders, Market Capitalization and Age of the Firm on the share price of listed banks CSE. Study aim to study the following specific study objective: to examine the whether accounting information is value relevance to investor's decision making, to examine the whether non-accounting information is value relevance to investor's decision making, and to examine the whether other information is value relevance to investor's decision making.

LITERATURE REVIEW

In according to the prior empirical findings, value relevance of accounting information implies the value relevance of accounting information to investor's decision making. Shamki (2012) measures the impact of non-accounting information on value relevance of accounting information. However, there is a significant impact of non-accounting information to making decisions. Tharmila and Nimalathasan (2010) examine the value relevance of accounting information on market vulnerability of the listed manufacturing companies in CSE. The results revealed that Earning Per Share (EPS) and Net Assets Value Per share (NAVPS) significantly impact on market vulnerability. Further, EPS and NAVPS significantly correlated with market vulnerability. Muthafa and Jahfer (2013) examined the value relevance of accounting information in Sri Lankan context. This study used Ohlson's (1995) price model and alternative model with OCFPS. Hence, finally they conclude that BVPS, EPS and OCFPS have a positive and statistically significant relationship with market value per share. Robu (2014) investigates the Value Relevance of the Financial and Nonfinancial Factors in the Case of Romanian Listed Companies. Study concluded that the influence of the shareholders structure as non-accounting information on the Share Price (SP) and analysis of the influence of the earnings and book value of equity as accounting information on the SP. Finally, the results indicate that there is an influence of book value and earnings on SP as financial factors. As well as, there is an influence of the shareholders structure on SP as non-financial factor for companies listed on the CSE.

Hypotheses Development

Basically following primary and secondary hypotheses was formulated based on the past literature and empirical findings:

To test the combine effect of variable following hypothesis were formulated

$H_{(a)}$: Non- Accounting information is more than impact the accounting information on Share price

To test the individual impact of accounting and non- accounting information on share price, study was formulated the following secondary hypotheses however second hypothesis is an extension of the first the results of the prior studies are not conclusive.

H_1 : EPS has negative impact on Share price.

H_2 : BVPS has positive on Share price.

H_3 : OCFPS has negative impact on Share price.

H_4 : Number of Shareholders has negative impact on Share price.

H_5 : Market Capitalization has positive impact on Share price.

H_6 : Age of the Company has negative impact on Share price.

METHODOLOGY

The analysis of descriptive statistics, correlation analysis and regression analysis statistical techniques selected to analyze the study. The study dependent variable was SP and independent variable was Financial Variables and non-financial variables. According to that study was analyzed. The sample consists of 11 banks listed in CSE, during the period 2012 to 2016. In order to meet the objectives of the study, data were collected from secondary sources mainly from financial statements of the banks and CSE data library, which were published by CSE. Research Model of this analysis is based on the Ohlson's (1995) valuation model which mentions that the firm value is a linear function of book values of owner's equity and earnings. The Ohlson's value relevance model (1995) can be seen as follows.

$$P_t = a_t + b_1 \text{EPS} + b_2 \text{BVPS} + E \dots \dots \dots \text{Eq 1}$$

Where; SP: stock price, EPS: earning per share, and BVPS: book value of earning per share.

In order to examine the study questions of how accounting and non-accounting information related to stock price, this paper basically use a modified version of the Ohlson (1995) model. This study include the non-accounting information to the Ohlson (1995) model hence, the study predicts the non-accounting information provide the additional information about the firm's stock price. The test model is presented bellow;

$$SP_t = \alpha_t + b_1 \text{Accounting Information} + b_2 \text{Non Accounting Information} + \varepsilon_t \dots \text{Eq 2}$$

$$SP_t = \alpha_t + b_1 \text{EPS}_t + b_2 \text{BVPS}_t + \text{OCFPS}_t + \text{NLS}_t + \text{MC}_t + \text{AGE}_t + \varepsilon_t \dots \dots \dots \text{Eq 3}$$

Where; SP: stock price, EPS: earning per share, BVPS: book value equity per share, OCFPS: operating cash flow per share, NLS: number of local shareholders, MC: market capitalization, and AGE: age of the firm.

RESULTS AND DISCUSSION

The average SP of the full sample is Rs.148.82 with standard deviation of approximately 109.31. The average and denoted within bracket standard deviation EPS, BVPS, OCFPS, LNS, MC and

AGE are 12.91(10.89), 85.91(65.69), 8.86(56.55), 9.2(0.74),23.63(1.08),and 30 (13.5) respectively. The maximum value of independent variable is taken by OCFPS and minimum value of independent variable also taken by OCFPS as 338.05 and -56.67 respectively. The highest standard deviation of independent variable is BVPS. It is 85.91. The lowest standard deviation of independent variable is NLS. It is 0.74. The skewness of EPS, BVPS, OCFPS, NLS, and AGE are become more than zero. It implies tail of the distribution extends to the right. NLS and MC is become less than zero. It indicates tail of the distribution extends to the left. The kurtosis of OCFPS, BVPS is more than 3.It implies leptokurtic distribution, sharper than a normal distribution with values concentrated around the mean and thicker tails. This means high probability for extreme values. The probability of extreme values is less than for a normal distribution and the values are wider spread around the mean. Co variation between each variable is as follows.

TABLE 02-CORRELATION ANALYSIS BETWEEN SP AND INDEPENDENT VARIABLES

EPS	BVPS	OCFPS	NLS	MC	AGE
0.469**	0.621**	0.054	0.142	0.421	0.046
0.000	0.000	0.357	0.165	0.001	0.377

**Correlation is significant at the 0.01 level (2-tailed)* Correlation is significant at the 0.05 level (2-tailed)

Source: Data Analysis (2017)

From the results presented table 2 of the correlation between EPS, BVPS and MC with SP ,founds to be 0.469,0.621 and 0.421 respectively at 1% level of significance .It implies that there is a strong positive significant correlation between EPS, BVPS and MC with SP respectively.On the other hand the insignificant positive weak correlation betweenOCFPS, NLS and AGE with SPfound to be 0.054, 0.142 and 0.046. However, correlation coefficient between all the variables is positive.

Table 03 shows the model summary and R Square of the study the results revealed that the model fitness is good.

TABLE 03-THE MODEL SUMMARY

R	R Square	Adjusted Square	R	Std. Error	Durbin-Watson
0.820 ^a	0.672	0.625		98.798	2.038

a. Predictors: (Constant), AGE, NLS, EPS, OCFPS, BVPS, and MC

Source: Data Analysis (2017)

The adjusted R square is taken 0.672.It means that there is a 67.2% impact of the both independent variable (accounting variables and non-accounting variables) on dependent variable (share price). Remaining 32.8% are determined by other factors. It reveals that accounting information and non-accounting information has an ability to explain 98.79% variation in market price per share. Durbin-Watson value 2.038 is indicated that the there is no multicollinearity exists.

The ordinary least squares (OLS) results are very similar other analytical tool and past researches findings. Similarly amended Tobit analyses were performed at various degrees of left and/or right censoring, as well as OLS estimation. The results were also found to be extremely robust to the estimation technique adopted. The estimated regression model is represented as Eq 3. The interpretation of the coefficients associated with each independent variable is now considered in turn. In the below table 4 presented the comprehensive results of the multiple regression and it shows to further investigating of value relevance with accounting and non- accounting information.

TABLE 04-COEFFICIENTS MATRIX OF THE MULTIPLE REGRESSIONS

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	-482.592	281.648		-1.713	0.094
EPS	-2.629	1.629	-0.262	-1.614	0.114
BVPS	1.903	0.283	1.144	6.730	0.000
OCFPS	-1.198	0.276	-0.620	-4.344	0.000
NLS	-44.836	18.534	-0.305	-2.419	0.020
MC	43.430	14.450	0.430	3.006	0.004
AGE	-3.369	0.892	-0.416	-3.777	0.000

a. Dependent Variable: SP

Source: Data Analysis (2017)

The B value of the regression model is -482.592. It is the intercept of the model. It presents the results of regression analysis between the EPS and SP. As per the results, it can be identified that the negative relationship of -2.623 is not significant. This correlation is suggested that EPS will not be provided value relevant. When increase one unit of BVPS, SP will increase 1.903. It is clearly shows that P value of beta coefficient of BVPS is 0.000 which is significant at 5% level. So, SP and BVPS model is positively correlated at the 5% significant level. When decrease one unit of OCFPS, SP will decrease 1.193. The correlation coefficient between these two variables is significant. It presents the results of regression analysis between NLS and SP. As per the results, it can be identified that the relationship is significant and negative coefficient value is reported -44.836 . The P value of beta coefficient of local number of shareholders is 0.000 which is significant at 5% level. When increase one unit MC, SP will increase 43.43. However, the relationship between SP and MC is significant. When decrease one unit of AGE, SP will decrease -3.369 and the SP and AGE model is negatively correlated at the 5% significant level. Therefore, finally can be concludes all the non-accounting information of NLS, MC and AGE are significant and mixed effect with the SP. Among the accounting information BVPS and OCFPS

are significant and mixed effect. Finally results revealed that the value relevant accounting information both accounting and non-accounting except EPS are deciding information in the banking sector for investor's decision making.

CONCLUSION

Through the survey involved 11 banks listed in CSE. The majority of investors are very interested in accounting information as well as non-accounting information for their decision making. Having applied the same value relevance definition as Ohlson, based on the large sample, the findings were very similar to theirs. Value relevance was found to be significantly positively correlated with BVPS and MC and significantly negatively correlated with OCFPS, NLS and AGE. However, further analysis revealed that the results are highly model specific. In particular, when the EPS was adjusted for SP, a insignificant negative correlation between SP and EPS was observed. With the empirical insight gained from the study, several recommendations can be found in the banking sector treaded in CSE. Future research should have sub sample which would categorized based on the level of SP give a more comprehensive result. The second suggestion refers to the investigation of other forms of accounting information and non-accounting information. This study only covers a period of five years from 2012 to 2016 because of non-availability of data. The results of the future studies can increase covering large sample period may provide fruitful insight in the value relevance and information. Further, without confidence in accounting numbers as a whole, investors will not take their investment decisions. So, Not only accounting information and non-accounting information but also other factors that affect changes in share prices, future study can include impact of other information sources like rum our, insider trading and noise among others on share prices.

IMPROVING PSYCHOLOGICAL TECHNOLOGIES FOR THE DEVELOPMENT OF PROFESSIONAL REFLECTION IN FUTURE TEACHERS

Juraev Nurbek Sadullayevich*

*Associate Professor
Candidate of Psychological Sciences,
Vice-rector for Academic Affairs of Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

This article provides information on how to prepare future educators for the profession, how to develop their professional reflection, and how to improve the psychological technology of reflection. The formation of professional training in a person is first determined by the composition of the professional imagination, concepts, and then to the specialty. acquisition of relevant knowledge, skills and abilities, decision of professional qualities and the degree of professional adaptation. Vocational adaptation - the mastery of the requirements of the future professional activity of the future specialist in the conditions of objective and subjective education, adaptation to the process of activity is the level of professional competence.

KEYWORDS: *Vocational, vocational training, professional reflection, vocational adaptation, psychological, objective and subjective education, pedagogical skills, experience, prognosis, autogenic, etc.*

INTRODUCTION

The formation of socio-economic policy in the country is the training of highly qualified junior specialists who meet the requirements of the times requires improving the content of vocational education to ensure the effectiveness of the process. This task is clearly defined in a number of laws and regulations, in particular in the National Training Program, in the example of restructuring the system and content of training based on the prospects of social and economic development of the country, the needs of society, modern achievements in science, culture, engineering and technology. This is reflected in the form of guidelines and principles.

Therefore, from the first years of independence of our country, the educational process of continuing education institutions, in particular, higher education institutions, which provide in-depth development of professionalism, skills and abilities of young people, gaining several specialties in their chosen profession. or, the provision in practice of a new and modern methodology based on science and theory has been identified as one of the urgent problems awaiting solution in this area. Indeed, the main focus of the strategic tasks in the field of education in our country is focused on the training of specialists who can think independently and clearly define the development prospects necessary for the interests of society and the individual. This creates the need to modernize the training of teachers and develop its innovative pedagogical framework. One of the most important tasks of higher education institutions is the future is to form the professional training of specialists. Vocational training is the development of a person's social competence, which is based on the acquisition of the necessary professional knowledge, skills and abilities. interpreted as a peculiar appearance. Vocational training does not happen by itself, but involves specific stages that are planned based on specific goals.

The formation of professional training in a person is first determined by the composition of the professional imagination, concepts, and then to the specialty. acquisition of relevant knowledge, skills and abilities, decision of professional qualities and the degree of professional adaptation. Vocational adaptation - the mastery of the requirements of the future professional activity of the future specialist in the conditions of objective and subjective education, adaptation to the process of activity is the level of professional competence. Career guidance, career choice, and professional training have been extensively studied by educators and psychologists, who have developed their own approaches. Including V.A. Slastenin, N.N. Azizxodjaeva, J.G '. Yuldashev training through innovative technologies; SH.E. Qurbanov, E.A. Seytkhalilov, F.Yuzlikaev, N.Muslimov, SH.Sharipov, N.Egamberdieva studied the problems of vocational education on the basis of integration between the individual, society and industry. R. Ishmuhamedov, A. Abdukodirov and A. Paradaev state that on the basis of professional training "psychological, psychophysiological, physical, scientific-theoretical and practical training of the future specialist" should be reflected [1. B 41]

Based on the views of the authors, the concept of "professional training" can be defined as follows:

Vocational adaptation is the professional requirements of a future specialist assimilation, individualization. It is known that one of the important tasks of any higher education institution is to ensure that first-year students successfully adapt to the new system of education, new social relations, successfully master the status of a student. Although career motivation is more pronounced in career guidance, it should be noted that they alone cannot play a leading role in the formation of vocational training. Because the physical, mental and spiritual potential of the individual is selected Proportionality of professional activity to the level of requirements for the individual helps students to adapt to the environment of professional activity and the formation of reflection. [2.b 57]

They are usually involved in the professional development of future teachers approach based on objective capabilities, chosen profession and activity It is advisable to identify the capabilities of the individual to the requirements is considered. For example, when choosing a teaching profession, not only love the profession, the desire to communicate with children, but also the

fact that the physical, psychological and social requirements of the profession to the individual are within its capabilities to acquire professional knowledge, skills and abilities. helps. Therefore, in the professional reflection of future teachers, special attention should be paid to the theoretical substantiation of these aspects of the issue and the development of professional opportunities of future professionals. It should be noted that it is a product of educational activities in higher education institutions it is a process of acquiring professional knowledge. But sometimes that's the case there are also situations where a well-trained professional may not be ready for the required activity at the right time. In this case, pedagogical activity cannot be successful or ineffective. It is obvious that the professional training of a specialist includes not only the required level of professional knowledge, but also psychological training, self-management and orientation to the desired activity, management of the educational process, professional, spiritual and physical capabilities. with the ability to direct the solution of the problem in the right conditions formation of relevant professional skills and competencies, adaptation to the process. Because these skills and competencies are considered to be necessary phenomena in the process of professional adaptation of future teachers. Scholars consider various ways to solve the problem of improving pedagogical skills and emphasize the importance of developing analytical features of teacher pedagogical thinking that develop professional reflection. The concept of reflection originated in ancient Greece and meant that thinking about what was going on in one's mind focused on the content of one's thoughts (Descartes); reflection as the ability to know oneself (Socrates, Plato, Plotinus, Locke, etc.); as the basis for the development of cognitive abilities (Kant, Hegel, Fixte, Shelling). Today, philosophy distinguishes between theoretical and practical reflection, and theoretical reflection as a time of concept development, as a method that allows the transition from one definition to another within a concept; practical reflection is the interdependence of individual behavior and intention, which is described as the process by which this norm of interdependence is controlled [3 b 499].

It should be noted that so far there is no clear definition of the concept of pedagogical reflection. GM Kodjaspirova considers pedagogical reflection not only as "an appropriate assessment of oneself and one's behavior, but also as an understanding of how other people, especially those who interact with the teacher in the pedagogical process, perceive" [4, p.30].

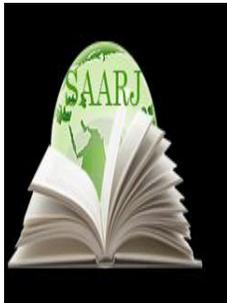

Probably, the study of this phenomenon takes place at the intersection of psychology, pedagogy, pedagogical psychology, philosophy of education and other disciplines. In the process of self-analysis of individual pedagogical activity, the teacher studies the state of the results and characteristics of his educational activity, identifies the cause and effect relationship between pedagogical contradictions, It identifies ways to further improve education and training, "LEPleskach said. According to the scientist, —Reflection is a self-analysis, which is not about achieving a self-determined goal, but about learning, gaining experience, creativity, professional development. Analysis of pedagogical and psychological literature, the difficulty is the subjectiveness of man that it is a psychological condition that allows one to conclude that it is not always convenient for an outside observer to analyze, which no one can do without a teacher. that he could not better understand his professional difficulties than himself, and that he was a scholar and that no one else can find a way to overcome it. So, it is important to study the professional difficulties of a teacher in his / her pedagogical activity The easiest way to do this is to self-diagnose.

Also, one of the psychological exercises is Autogenic training is also important. —Auto - means self-influence, which a teacher encounters in his / her professional activity through self-influence can overcome the difficulty. Analysis of the scientific literature, as well as pedagogical experience in the teaching profession, the use of diagnostic methods to improve the pedagogical skills of teachers and the analysis of the obtained results allow to evaluate pedagogical diagnostics as one of the ways to ensure professional development. After all, a teacher's best pedagogical experience is in the study of 'experience' planning the goal and its tasks, identifying the current topic, school In practice, they use tools such as studying the achievements of skilled teachers, collecting material, analyzing, drawing conclusions. It should also be noted that pedagogical diagnosis is effective when it has a goal-setting (prognostic) nature, rather than a recording, which is based on the development of the teacher's professional reflection. is increased. At the same time, it is in the educational process that goal-oriented diagnosis ensures its development.

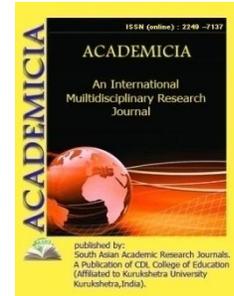

In short, the results of the teacher's professional activity his understanding makes it necessary to seek and master more advanced ways of carrying out his pedagogical activity. It is known that a change in activity leads to a change in the subject of activity. In the process of developing the analytical skills of the teacher, his professional reflection also develops, which, in turn, directs the process of self-development of the teacher in a certain direction and increases his personal creative activity.

 UZBEKISTAN

ABSTRACT

This article is dedicated to the Government of Uzbekistan, in coordination with international organizations, carried out an in-depth poverty analysis in July 2007. The Welfare Improvement Strategy (2008–2010)^a and Poverty Reduction Strategy (2008–2010) indicate that 25.8% of the population lives below the poverty line. ^b The government's poverty reduction strategy clearly indicates the importance of infrastructure development and specifies that industrial development will be strengthened through infrastructure development including transport and communications, which are vital in linking local production centers, markets, and warehouses with regional and international markets. The investment program, which is included in the country operations business plan (2011–2013) and is aligned with the Uzbekistan Transport Sector Strategy (2006–2020)^c and road map, has two major components: road development and road sustainability. The investment program is expected to contribute to increasing both domestic and international trade and generating new initiatives and opportunities for economic activities. Improved connectivity and access to health centers, schools, and markets will emerge as a major priority for the poor.

KEYWORDS: *Market, Economic, Local, Development.*

INTRODUCTION

The question of the complete eradication of all forms of poverty is still relevant to all mankind. The number of people currently living in extreme poverty has halved, from 1.9 billion in 1990 to 836 million in 2015. However, there are still many people who are struggling to meet their basic needs. More than 800 million people worldwide continue to live on \$ 1.25 a day. Many people are starving, without access to clean water and sanitation. Rapid economic growth in countries

such as China and India has lifted millions out of poverty, but the distribution of economic benefits does not meet the principle of equality and equality. The female population of the world is more vulnerable to poverty than men. This is due to the fact that women have relatively limited opportunities to find paid employment, earn income, and get an education.

Main part

The situation in other parts of the world, especially in South Asia and the southern Sahara, remains tense. These regions are home to 80 percent of the world's poorest population. The number of poor people living in these areas is expected to increase due to climate change, armed conflict and food shortages. The BTM is a testament to our commitment to completing the work we started in 2000 and to ending all forms of poverty by 2030. To achieve these goals, we must take concrete and targeted measures to protect the socially vulnerable, improve their access to basic social resources and services, and provide assistance to those affected by armed conflict and climate change. Poverty eradication is one of the 17 goals of the 2030 Agenda for Sustainable Development. A "comprehensive approach" is required to address the identified challenges. A video conference on poverty reduction measures was held on February 27, 2013. At the meeting, President Shavkat Mirziyoyev noted that 12-15% of the country's population, or 4-5 million people, live in poverty. This means that their daily income does not exceed 10-13 thousand soums. At present, the poor family is provided with a personal computer 12 times more than the average family in the country, with a car - 11 times, with air conditioning - 8 times, with a vacuum cleaner - 4 times, with washing machines - 4 times, with a refrigerator - 2 times less, with TV and mobile communication - 1.5 times less. Not only is the poor deprived of the opportunity to benefit from the country's rapid economic growth, but it is also unable to contribute to development due to limited opportunities to participate in various spheres of society. The state provides free secondary education, guarantees a basic package of medical services, provides specialized assistance to groups classified as vulnerable to "socially significant and dangerous" conditions, and provides benefits to low-income families. But more needs to be done. Leaders have been tasked with developing a poverty alleviation plan. Because getting out of poverty is many times harder than getting out of it. A poor man living in a rural area has to go to the city to see a doctor when he is sick. It also includes travel expenses for medicines. A child from a poor family may lose the opportunity to get an education in order to earn money, which will affect his or her future income level. That is why the terms "poverty" and "poverty trap" are often used interchangeably.

HOW IS POVERTY MEASURED? There are two indicators used to measure the level of human well-being in a given period: per capita income or per capita consumption expenditure. Due to the variability of income relative to consumption, the difficulty of identifying some sources of income, and the high level of misrepresentation of income, it is recommended to use indicator 2 in practice. However, when using consumer spending data as an indicator of well-being, the change in prices over time, the difference in prices between individual countries, the consumption of household goods (including food products)), taking into account the cost of public goods and services accepted by households (free or subsidized medical care, school meals, public education), etc., it will be necessary to make some adjustments to this indicator .

Nutrition-based poverty rate Poverty is a phenomenon, and hunger is one of them. In this case, well-being is measured by the daily caloric intake per capita and compared to the amount of

daily energy expenditure for this category of people. The Food and Agriculture Organization of the United Nations recommends setting an average daily energy consumption of 1,800 kcal. This figure can vary depending on age, gender and level of human activity. Other forms of nutritional deficiencies, such as protein or certain micronutrients called “hidden hunger,” can also be demarcated. In this case, the overall level of poverty can be determined from the recommended minimum level.

International Poverty Limit This limit is used by the World Bank for international comparisons. The extreme poverty line is set at \$ 1 per day at purchasing power parity, and the poverty line is set at \$ 2 per day. The poverty line has recently been raised to \$ 1.25 and \$ 2.5, respectively. Currently, the 15 poorest countries in the world use these poverty lines. However, at present, other limits of poverty are applied, taking into account the specifics and stages of development of different countries. In particular, it is recommended to use the low-income level of \$ 3.2 per day for low-income countries and \$ 5.5 per day for high-income countries. .

Relative poverty line Poverty is not only an absolute but also a relative concept. People may have a subjective assessment of their condition compared to other people in the appropriate control group. Because of this notion of relative deprivation, people focus on their personal income or consumption levels relative to the national average. The relative poverty line can also be interpreted as the cost of social integration required for decent participation in normal socio-economic activities. The use of the relative poverty line is common in European countries. In this case, the poor are understood as the 25% of the lowest consumers in the country.

Subjective poverty line We can say that poverty is not only an absolute or relative standard, but also a perception. In this case, ask the household, "What level of spending do you consider to be the absolute minimum?" and this is compared to their actual cost level. Thus, the share of those whose current expenditures fall below the declared subjective minimum is considered the poverty rate. However, the level of poverty here often depends on how the question is asked.

INFORMATION ABOUT POVERTY IN UZBEKISTAN (WHO, WHERE AND WHAT DO THEY LIVE?)

In Uzbekistan, only the first two methods are used to measure poverty. The results of the nutrition-based approach show that the poverty rate is 11.4%. Based on the results of the second approach, the poverty rate is 36.6% at \$ 5.5 per day and 9.6% at \$ 3.6. According to the World Bank, the highest poverty rates are in Samarkand, Surkhandarya, Syrdarya, Andijan and the Republic of Karakalpakstan.

In recent years, significant progress has been made in creating a public database that can be used to study poverty. They allow us to describe poverty, its factors, as well as test many hypotheses about the impact of specific programs and political reforms on poverty. For example, by comparing the characteristics of poor and non-poor people or households, it is possible to determine the cause of poverty and set clear parameters for combating it. In this case, the data can be analyzed in the following areas:

Characteristics of family members: age, gender, ethnicity, education and level of health.

Demographic characteristics of the household: sex of the head of the household, number of children and elderly people of working age.

Property: land, livestock, tools and social capital.

Types of activities: field of activity, gardening, type of employment.

Location: village / city, region, district.

Use of utilities: electricity, drinking water, medical facility, school, social assistance programs.

Market access and private services: distance to markets, road infrastructure, access to financial services, etc.

For example, the Russian experience shows that the poverty of the household is due to the presence of children under 16, the presence of unemployed family members, living in rural areas, the lack of stable sources of income and their employment in the informal sector. factors such as the poor economic development of the region may be affected.

Thus, a clearer picture of poverty in Uzbekistan will determine the content of key measures and recommendations to combat it. According to research in this area, a low-income family consists of 7 people, the average age of the head of the family is over 50 years and he has no higher education. In particular, 11% of low-income heads of households are unemployed, 93% do not have higher education, and only 24% have secondary special education. 43% of low-income households do not have a permanent job. 93% are not connected to the central heating system, 96% are not connected to the central sewerage system and 66% are not connected to the central water supply.

According to a similar study conducted by the Institute for Forecasting and Macroeconomic Research with the support of the United Nations Development Program, the situation of low-income households in the country can be described as follows: 'households with a low level of education and no able-bodied members who can work abroad. At the same time, the level of poverty is clearly regional.

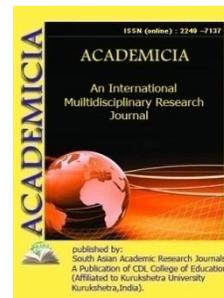

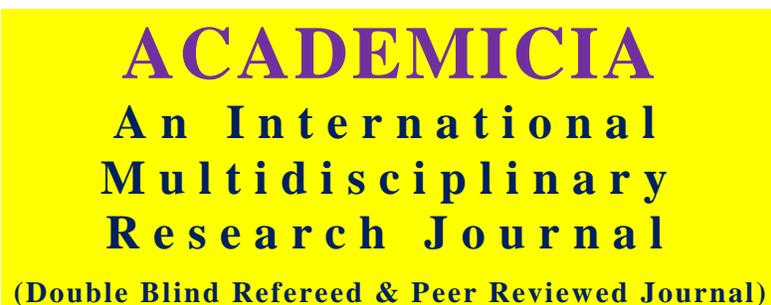

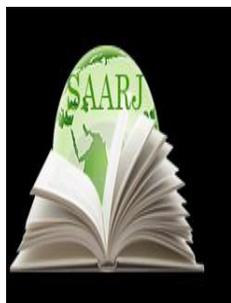

These results are in line with the World Bank's findings on inclusive diagnostics of the Uzbek economy in 2014. In particular, the poorest households are larger due to the increase in the number of children, as well as the small number of working adults. There are no significant differences in working conditions between groups with different levels of well-being among men. However, the participation of low-income women in the labor force is much lower, with one in three low-income families being headed by a woman. The three most important factors that determine the difference between consumption (income) are the sex, education, and employment status of the head of the household.

These results underscore the importance of quality of education, employment, housing opportunities and living conditions in most regions of the country in addressing poverty.

HISTORY OF THE STUDY OF INTRODUCTIONS AND ENTRIES IN RUSSIAN LINGUISTICS

Juraeva Muhtasar Abdukahhorovna*

*Teacher,

Russian language and Literature Department of Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

Introductions are especially note worthy for their serious communicative and at the same time semantic, structural and lingvo poetic value in speech (text). Naturally, inputs and outputs are the object of study for both communicative syntax and constructive syntax. Some Russian linguists, on the other hand, prefer the term "parenthesis" rather than "parenthesis" as a general name for introductions and intrusions. Some other linguists try to give separate terminological meanings to these two phonetic forms of the term. The positional-structural essence of the adverbs in the sentence is that both of them are included in the main sentence from the outside. At the same time, the intonation is separated within the main sentence, and this separation is indicated in parentheses or other appropriate punctuation marks. Linguists pay close attention to this aspect and is used to mean "introductory word" and "parentheses".

KEYWORDS: *Semantic, Parenthesis, Intonation, Syntactic-Phenomenon, Typographic, Intonation.*

INTRODUCTION

Introductions are especially note worthy for their serious communicative and at the same time semantic, structural and lingvo poetic value in speech (text). Naturally, inputs and outputs are the object of study for both communicative syntax and constructive syntax.

In most linguistics, such units are generalized under the term "parenthesis" or "parenthesis". For example, the term "parentheses" has traditionally been used in German grammars to denote both introductory and input units.¹ A similar situation is observed in the works of Belarusian, Russian and other linguists on the problems of the German² and English³ languages. VG Admoni, a leading researcher of German grammar, writes: the semantic relationship between the sentences

is extraordinarily diverse.”⁴ It is clear from this idea that the scientist used the term "parentheses" to refer to a unit that is included in a sentence without certain formal-grammatical features, in particular, both introductions and inclusions. Clearly, he emphasizes the immense diversity of the semantic relationships between parentheses and the main introductory sentence, while emphasizing the semantic-functional differences between the introductions and the introductions, as well as the semantic aspects specific to each of them. It illustrates these aspects in the example of the language of a particular work of art.

Some Russian linguists, on the other hand, prefer the term "parenthesis" rather than "parenthesis" as a general name for introductions and intrusions.⁵ Some other linguists try to give separate terminological meanings to these two phonetic forms of the term. For example, LG Khatiashvili, who has been studying the same problem in Russian syntax for a long time (he defended his dissertation in Tbilisi in 1953 on "Introduction to Modern Russian Literary Language"), wrote in an article "Parentheses and Text" published on the Internet: The term "parentheses" refers to the input syntactic phenomenon, according to which the input constructions are called "parenthetical constructions". The term "parenthesis" refers to the syntactic phenomenon of input, so input constructions are called "parenthetic constructions."⁶ In our view, such an approach, i.e., the choice of two phonetic variants of the same word as two different terms for two syntactic phenomena, is not expedient, since in this way it is not possible to express the essence of the phenomena.

In addition, it is necessary to abandon the term "parenthesis" or "parenthesis", which is more convenient and common in various linguistics, which generalizes introductions and entries. However, the word parentheses (// parentheses) fully justifies itself as a term that can accurately and clearly express the essence of the input and output. The word is actually a Greek parenthesis, meaning "insert." The word parenthesis is derived from the French word parentheses and is used to mean "introductory word" and "parentheses".

In addition to its meaning as a linguistic term in Russian, the word parentheses (a) is also used as a typographic term meaning "figurative parentheses".⁷ In modern Turkish, the word is used in parentheses only as the name of a parenthesis.⁸ French rhetoricians call parentheses a sentence or other unit enclosed in parentheses.⁹ Russian linguist N.D. Arutyunova also uses the terms "parenthetic position" and "parenthetic function" to describe the fact that this or that unit comes as an introductory (or input) part in the positional structure of the sentence and performs such a function.¹⁰

From the above it is clear that "parentheses" (we, like a number of other linguists, prefer this form. The term "parentheses" clearly means "insertion, insertion" and "separated by parentheses (or other punctuation marks)." The positional-structural essence of the adverbs in the sentence is that both of them are included in the main sentence from the outside. At the same time, the intonation is separated within the main sentence, and this separation is indicated in parentheses or other appropriate punctuation marks. Linguists pay close attention to this aspect. and this is probably why, in most cases, the description of introductions and entries is also given a special place in the part of linguistics on punctuation.¹¹ It should also be noted that in terms of generalizations of entries and entries, terms other than "parentheses // parentheses" have been used in various linguistics. For example, in Russian linguistics, some researchers also use the term "insert". A.F. Priyatkina calls these two syntactic phenomena by the term "insert" due to the

fact that they are included in the main sentence, regardless of the content of the input and input units in the form of words, phrases, sentences or larger constructions involved in the complication of the sentence.¹²

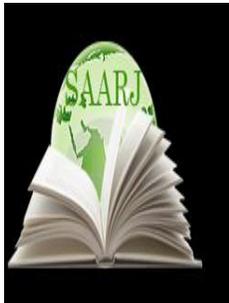

A.A. Reformatsky, on the other hand, uses the term "introduction" in relation to them, generalizing not only the introductions and entries, but also the motivations that accompany them.¹³ Inputs and inserts, as well as other units that are positionally and structurally close to them, have been studied under the term "inclusion" in the syntactic concept put forward by I.F. Vardul. L.G. Vedenina,¹⁴ who has studied the problem of sentences in the French language, uses the same term, calling the insertion of one sentence into another "inclusion" and emphasizing that it is a method of text formation.¹⁵

In Turkish linguistics, there is no separate compact term to denote syntactic units that do not have a direct syntactic connection with the parts of speech (especially the part of speech), so such units are called "extra-sentence elements" (" extra-sentence elements ").¹⁶

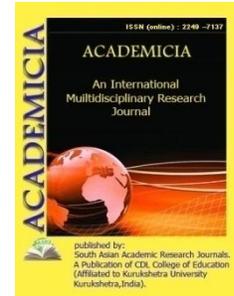

There is no specific generalizing term for introductions and entries in Uzbek linguistics either. In fact, the word "insert" can be used as a general term, which can refer to the phenomenon of inserting another unit into the positional-structural structure of a sentence. However, this word has become part of the scientific tradition in our linguistics to describe a syntactic phenomenon that contradicts entries. In view of this, we consider it expedient to use the terms "parentheses", "parentheses units" as a term for generalization of entries and entries in the Uzbek language.

ABSTRACT

Clinical, instrumental, and neuropsychological examination was carried out on 110 patients with corona virus infection. The subjects were divided into 2 groups by gender. It was shown that in the group of women, a greater number of patients were found to have cognitive impairments (MMSE scale). The low rate of conduction of evoked cognitive potentials in the brain (the method of cognitive evoked potentials) was more pronounced in women than in men.

KEYWORDS: *Corona Virus Infection, Cognitive Impairment, Gender*

INTRODUCTION

The new corona virus infection COVID-19 caused by the SARS-CoV-2 corona virus is a global health threat. Neurological disorders found in patients with corona virus infection have a wide range of clinical neurological signs: headache, dizziness, altered level of consciousness, acute cerebrovascular accident (ACVA), venous sinus thrombosis of the brain.

Some publications provide data. That 40% of COVID-19 patients had neurological changes. More than 30% of these changes were cognitive(5,6).

The main results and findings

Thus, it is currently known that the virus is highly neurotropic and neurotoxic with the development of anosmia, headache, sleep disorders, and cognitive impairment (CI) in the form of memory and mental activity loss. Moreover, during the rehabilitation period of patients, these manifestations are also observed in patients who have undergone mild corona virus infection (3,4).

Only long-term epidemiological studies in large groups of patients will be able to clarify some of these questions. This will help to better understand the mechanisms of development of complications and develop schemes for their treatment and subsequent rehabilitation.

In the literature, there is no detailed neuropsychological and electrophysiological analysis of CI after corona virus infection, depending on sexual dimorphism. The urgency of the problem, as well as some unexplored and controversial issues, determined the goals and objectives of this work.

Purpose: analysis of neuropsychological and electrophysiological differences in cognitive impairment in patients with corona virus infection, depending on gender.

We examined 55 patients who had undergone corona virus infection who were being treated in the neurological department of the clinic of the Andijan Medical Institute.

All subjects were divided into 2 groups: Group I included 21 women (mean age 38.5 ± 7.7 years) and Group II included 34 men (mean age $41.2 \pm 6, 7$ years). Both groups were matched for age and diagnosis.

The gender ratio in the examined patients was 1: 1.6 in favor of men. The minimum age of the patients was 39.8 ± 8.3 years. The control group consisted of 20 relatively healthy people. The minimum age of the patients was 37.1 ± 9.1 years.

Research methods included general clinical methods: complete blood count and urine analysis. Biochemical studies included blood correlogram, blood coagulation time, ophthalmoscopy. The respondents also performed neurophysiological research methods: Doppler ultrasonography of the arteries and veins of the head, MRI of the brain, EEG studies of the brain, cognitive evoked potentials of the brain (1,4), as well as the study of higher cortical functions with the neuropsychological test MMSE.

In the conducted analysis, it was noted that in the group of women in 15 (71.4%) according to the MRI were found signs of vascular encephalopathy, in the group of men this indicator was not enough - 13 (38.2%) cases. In the group of women with moderate CI were the largest number of patients (65.9%), which is quite high in the group of men, where the number of patients with moderate CI was the lowest and made up 34.8% (table 1).

TABLE 1. THE SEVERITY OF CI IN PATIENTS AFTER CORONAVIRUS INFECTION, DEPENDING ON GENDER

CI degrees	Women (n=21)		MMSE (points)	Men (n=34)		MMSE (points)
		%			%	
Light CI		38,1% *	21,5+1,2	2	64,70%	22,1+0,8

Moderate CI	3	61,9% *	15,7+ 0,9	2	35,30%	17,5+ 1,4
-------------	---	---------	-----------	---	--------	-----------

Hereinafter Note: * - differences are significant between groups

We also investigated the severity of CI according to the MMSE scale in men and women, depending on the presence of symptoms of vascular encephalopathy (VE). As can be seen from Table 2, in the group of women with VE, cases with moderate cognitive impairment (MCI) were significantly higher than in the group without VE, both among women and men. In the group of men with VE, the corresponding indicators were lower compared to the group of women with VE, where no significant differences were found.

The main findings and results

Along with clinical and neurological studies, in addition to EEG recording, studies of cognitive evoked potentials (P300) were included in the block of studies (1). Cognitive evoked potentials (CEP) were chosen because they allow assessing endogenous events occurring in the brain and associated with the recognition and memorization of the presented stimuli (2).

TABLE 2. THE SEVERITY OF CI IN MEN AND WOMEN, DEPENDING ON THE PRESENCE OF SIGNS OF VE

CI degrees	Women		Men	
	Group with VE	Group without VE	Group with VE	Group without VE
	MMSE(points)	MMSE(points)	MMSE(points)	MMSE(points)
Light CI	20,3+0,7	22,3+0,2	22,1+1,2	22,6+0,2
Moderate CI	13,1+ 1,5 *	17,1+ 1,1	15,6+ 0,4	18,6 + 1,2

We conducted neurophysiological studies in 37 patients of the first and second groups. The research results were compared with the indicators of the CG (Table 3).

From the presented table 3, it can be seen that the main indicators of STM in women and men had differences. Thus, there were significant differences in the P300 latency. In men, this indicator was 397.85 ± 63.21 ms, while in women - 368.75 ± 53.01 ms.

For the rest of the studied parameters, the differences were not significant. When comparing STM indices in patients of the first and second groups, we noted an increase in latency indices in all leads, with the preservation of the difference in indices in patients with left and right hemispheric localization. Although the differences in the indices of the second and first groups were insignificant, they had large values, which corresponded to more severe cognitive impairments. Therefore, the registration of cognitive evoked potentials allows you to obtain additional information about the state of the cognitive sphere in patients who have undergone corona virus infection.

TABLE 3 PARAMETERS OF P300 EVOKED POTENTIALS IN THE EXAMINED. PATIENTS WHO HAVE UNDERGONE CORONAVIRUS INFECTION, DEPENDING ON GENDER

parameter	Отведения	CG	Women (n=16)	Men(n=21)
P3 latency, ms	C3	351,9+24,3	368,75±53,01 *^	397,85±63,21 *
	C4	341,8+26,3	367,62±52,63 *^	389,25±61,34 *

Amplitude N2 / P3, μV	C3	5,2 \pm 3,28	7,50 \pm 3,30	7,81 \pm 3,29
	C4	5,6 \pm 2,91	7,59 \pm 3,0	7,6 \pm 2,9
Latency N2, ms	C3	268,4 \pm 41,7	255,81 \pm 34,14	285,91 \pm 39,1
	C4	269 \pm 47,2	251,18 \pm 32,67	271,18 \pm 22,7
Latency N3, ms	C3	457,2 \pm 54,3	460,40 \pm 77,82	465,40 \pm 78,27
	C4	451,7 \pm 60,3	461,86 \pm 79,84	465,68 \pm 74,48
Amplitude N3 / P3, μV	C3	6,1 \pm 6,37	6,98 \pm 4,41	6,83 \pm 4,18
	C4	8,25 \pm 6,89	6,84 \pm 3,76	6,84 \pm 3,69

Note: * - the differences are significant between the group of men and the CG.

^ - differences are significant between a group of men and a group of women.

With a larger volume of damage to the left hemisphere of the brain, according to MRI of the subjects, there was a more significant decrease in the amplitude and an increase in the latency of the P300 peak, which indicated greater severity of cognitive impairments and corresponded to the data of neuropsychological examination. The latency of the N2 component was higher in all leads in patients with lesions of the right hemisphere, which was probably associated with the predominantly gnostic function of this hemisphere and, as a consequence, impaired stimulus recognition processes.

CONCLUSION

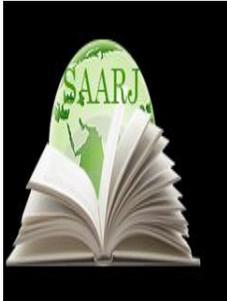

In conclusion, we can say that neuropsychological examination and cognitive evoked potentials are important methods for assessing the state of higher mental functions in patients who have undergone corona virus infection, allowing to assess the degree of involvement of the affected parts of the brain in the pathological process, as well as the functional state of the brain as a whole. The study showed differences in neuropsychological indicators depending on gender; in the group, women had significantly more pronounced CI and a lower rate of conduction of evoked cognitive potentials in the brain, in contrast to men. Moreover, the indicators on the MMSE scale in the group of women with VE were also significantly lower than the corresponding indicators of the surveyed women without VE, and the point severity of the corresponding indicators was also higher in comparison with the group of men with both VE and without VE.

The data obtained must be taken into account in the rehabilitation of patients who have undergone corona virus infection, and it should be recommended to patients with this pathology, especially women, early prevention of cognitive disorders of the brain, which includes regular adequate basic therapy with anticoagulants and the use of courses of nootropic and neurotrophic drugs.

UZBEKISTAN

ABSTRACT

This article discusses the time, copiers, history, peculiarities of manuscripts, papers and size of the manuscript of Hakim Tirmidhi's "TahsilNazairi-l-Quraan" kept in the Baladia Library in Alexandria, Egypt, and the second manuscript copied from it, which is kept in Cairo. In addition, the differences between the descriptions of the manuscripts in the catalogs and the discrepancies between the information provided by the researchers about the manuscript were analyzed. It was revealed that the manuscript contained incorrect information as a result of confusing the inverter and serial numbers in the catalog. Research in recent years has also shown that there are some uncertainties. For this purpose, the catalog of the Library of the Municipality of Alexandria, the information provided by HusniZaidan, who prepared and published the "TahsilNazoiri-l-Quraan" for publication; Muhammad Juyushi's research and the information provided by the publishers of other works in the same manuscript also relied on the Cairo copy of the manuscript.

KEYWORDS: *Hakim Tirmidhi, "TahsilNazoiri-l-Quraan", manuscript, description, codicology, copying, collection, sheet, calligrapher, secretary, publication, plate, size, lexicography.*

INTRODUCTION

Abu Abdullah Muhammad ibn Ali al-Hakim at-Tirmidhi (d. 932) is one of the most effective and blessed scholars in the Islamic world. He wrote a lot of works in the fields of hadith, jurisprudence, tafsir (meaning), belief, passion education, Islamic enlightenment and ethics, and vocabulary. He also noted in his autobiographical work "Buduvvu-sh-shaan" that for some time he had been in astronomy. It seems that Hakim Tirmidhican be recognized as an encyclopedic

scholar of his time. At the same time, Hakim Tirmidhi's contribution to lexicography and Arabic lexicography is significant. The Arab scholar RajoMuzayan praised Hakim Tirmidhi's contribution to lexicography, acknowledging that he had also made a great contribution to the scientific study of words, and this is particularly evident in his works "TahsilNazairi-l-Quraan" and "al-Furuqwa Manu-t-Taroduf" [1, p. 35].

When it comes to the role of Hakim Tirmidhi in the science of commentary and lexicography, it should be noted that in all the works of the scholar there are many specific interpretations of the words that appear in religious texts. This is evidence that Hakim Tirmidhi was also active and effective as a lexicographer. In the works of Hakim Tirmidhi, it is witnessed that, regardless of the field in which the work belongs, the dictionaries of the subject in question are referred to. This is a common feature of the classics of Islamic teaching. At the same time, Hakim Tirmidhi's scientific heritage includes separate works dedicated to the science of lexicography. Hakim Tirmidhi's "TahsilNazoiri-l-Quraan" can be interpreted and studied as a work on the lexicography of religious texts from the point of view of modern science. This work, which is devoted to the interpretation of certain words in the Quraan, details the place and meaning of a total of eighty-one (81) words.

The only manuscript copy of the work "TahsilNazoiri-l-Quraan" belonging to Hakim Tirmidhi is kept in the Baladia Library in Alexandria, Egypt under the number 3585ج/II. This manuscript is in the same volume as the author's other works, which includes in this collection his "Al-Masoilu-l-Maknuna" (Hidden Matters, 3585ج/I) and "Kitabu-r-Radd Ala-l-Muattila" (Rejection of the Muattila sect, 3585ج/III). That is, the work "TahsilNazoiri-l-Quraan" is in the collection between the works "Al-Masoilu-l-Maknuna" and "Kitabu-r-Radd ala-l-Muattila". HusniZaidan, who prepared "TahsilNazairi-l-Quraan" for publication on the basis of this manuscript and published it in 1969, testified that this location was a decisive factor in the relatively integrity of the work.

THE MAIN FINDINGS AND RESULTS

H. Zaidan also gives the following descriptive information about the manuscript. This manuscript consists of 32 sheets of large size, occupying a space of 48 to 79 pages in the middle of the collection. The work is written in clear naskh (conversing) script, but it has many spelling errors. There are also errors in the writing of some verses of the Quraan. Nevertheless, the work is almost devoid of drop of words and other flaws. His scribe was Ibn al-'Adim, who moved in hijri 503/1110 A.D. A photocopy of this manuscript is kept in the "Doru-l-Kutub al-Misriyya" library in Cairo under number 3282ج. H. Zaidan also mentioned that there is a new copy of this manuscript [2, p. 16].

Since H. Zaidan did not give information about the size of the original (3585ج) and the number of lines, we have to refer to the works of researchers who prepared other works in this volume - the collection. The Egyptian scholar Muhammad Juyushi, who prepared the first edition of "Al-Masoilu-l-Maknuna" for publication and published it in 1980, stated in the preface that the collection number was 145 تصوف. He also notes that this copy was the basis for the publication of H. Zaidan [3, p. 37]. M.Juyushi cited this information in another study of Hakim Tirmidhi's scientific heritage and noted that it has been preserved in a single copy [4, p. 55]. However, M.Juyushi's information about the structure and features of "TahsilNazoiri-l-Quraan" in this collection differs sharply from the publication of H.Zaidan. M. Juyushi gave a brief account of

the descriptive features of the manuscript. In particular, he mentions the name of the calligrapher as Muhammad ibn Hibatullah ibn Abu Jirad. “Al-Masoilu-l-Maknuna”, which he studied in the collection, has 21 lines on each page, 11 words per line, and the date of copying is 17 Jumadi-l-ulo in 593 AH. M. Juyushi did not provide any other information about the manuscript.

Because of the fact that the information provided by M. Juyushi is insufficient and some aspects differ from those provided by H. Zaidan (storage number, date of copying, name of the calligrapher, the content of the work), self-satisfaction creates additional confusion. The last work in the 3585ج collection, “Kitabu-r-Radd ala-l-Muattila”, was not published until 2017. The scientific edition of this work was prepared by a group of Egyptian scholars led by Husam Abu-r-Rahab and Adilaz-Zarqi, who also relied on the Alexandrian copy. This publication describes the features of the manuscript as follows:

Copy No. 3585ج in the Baladia Library of Alexandria contains three works by Hakim Tirmidhi, including al-Masa'il al-Maknuna, “Tahsil nazairi-l-Quraan”, and this book (“Kitabu-r-Radd ala-l-Muattila”). . The number of pages in this collection is 125. Our book (“Kitabu-r-radd ala-l-muattila”) is the last in the collection and consists of 45 pages. 22 rows of strings. Size 24x17 cm. It starts on page 80 and ends on page 124. It is written in a large naskh letter and has punctuation marks - the copyist puts circular punctuation marks at the end of each hadith. The copying was completed on the 17th of Jumu'ah, 593 AH, by Muhammad ibn Hibatullah ibn Muhammad ibn Hibatullah ibn Abu Jiradah[5, p. 50].

The above information corresponds to the storage number of the collection given by H.Zaidan (3585ج), but does not correspond to the storage number given by M.Juyushi (145 تصوف). However, the name of the calligrapher and the time of his transfer are almost the same as those quoted by M. Juyushi. H. Zaidan quoted the name of the scribe as Ibn al-'Adim and indicated the time of the transfer as 503 AH. This leads to the conclusion that “Tahsil Nazairi-l-Quraan” was copied 90 years ago from two works in the same volume. The works “Al-Masoilu-l-Maknuna” at the beginning of the collection and “Kitabu-r-Radd Ala-l-Muattila” at the end of the collection were copied at the same time (p. 593 17 / jumodi-l-ulo). It is rare that the work was copied by another calligrapher 90 years ago. These confusions are partially resolved by the information about the copyist calligrapher given in the Kitabu-r-radd ala-l-muattila:

“The copier of the collection is the judge, the ascetic Abu Ghanim Muhammad ibn Hibatullah ibn Muhammad ibn Hibatullah ibn Ahmad ibn Qazi Abu-l-Fazl Ibn al-Adiim al-Uqayli al-Halabi, who copied most of the musannif (Hakim al-Tirmidhi)” [6, p. 49].

It is clear from the above passage that Ibn al-Adiym and Muhammad ibn Hibatullah, whom H. Zaidan referred to as the scribe, were exactly the same person, and H. Zaidan took the last part of the tree as the name of the scribe, and M. Juyushi as the head. A group of researchers led by H. Abu-r-Rahab and O.Zarqi cited the full name of the calligrapher. Hence, it can be concluded that the researchers who prepared different parts of the same collection for publication at different times relied on exactly one source.

The next issue is the difference in the order number (145 تصوف) given by M. Juyushi. Both H. Zaidan, who published “TahsilNazairi-l-Quraan” in 1969, and the researchers who published “Kitobu-r-Radd ala-l-Muattila” in 2017, had cited the storage number of the main source as 3585ج. The latest catalog of the Baladia Library of Alexandria also states that the storage number of the manuscript collection is exactly 3585ج [7, p. 333]. The reason for this discrepancy is that

M. Juyushi wrote the serial number of the collection in the catalog instead of the storage number. This is because in the catalogs of the Baladia Library of Alexandria, all manuscripts are marked with numbers and the letter ج (where the letter “jim” in the Arabic alphabet means “volume”), not with the number and subject in the order given by M. Juyushi. The topics are placed in chapters and the number quoted by M. Juyushi should most likely be the 145th ordinal number in the chapter on mystical works in the catalog.

CONCLUSIONS

Based on the above information, the descriptive features of the manuscript collection, which includes three works by Hakim Tirmidhi and contains a single copy of “TahsilNazoiri-l-Quraan”, are as follows:

- The total volume of the collection consists of 125 [8] sheets [5, p. 50].

- Location of works in the collection:

1) “Al-Masoilu-l-Maknuna” pages 1-47 [10];

2) “TahsilNazoiri-l-Quraan” pages 48-79 [11, p. 16];

3) Pages 80-124 “Kitabu-r-Radd ala-l-Muattila” [5, p. 50];

- All the works in the collection were simultaneously copied by one calligrapher in the Hijri-Lunar calendar on the 17th of “Jumuah-l-Ulo” in 593, which corresponds to April 13, 1197 in the Gregorian calendar. Its calligrapher is Abu Ghanim Muhammad ibn Hibatullah ibn Muhammad ibn Hibatullah ibn Ahmad ibn Qazi Abu-l-Fazl Ibn al-Adiym al-Uqayli al-Halabi. H. Zaidan, who prepared the “TahsilNazairi-l-Quraan” for publication, made a confusion in this regard by the calligrapher Ibn Al-Adim, stating that the date of copying was in hijri 503/1110 AD;

- The collection is copied in full in clear text; the text is 22 lines on each page. The same number is indicated in the catalogs of the publishers of the “Kitabu-r-Radd Ala-l-Muattila” and the Library of Alexandria. It is unknown why M. Juyushi gave the number of lines in “Al-Masoilu-l-Maknuna” as 21 lines. Perhaps he was referring to a new copy cited by H. Zaidan. H. Zaidan did not provide information about this aspect of the original.

- The size of the collection is 24x15.5 cm [7, p. 333] in the catalog of the Library of Alexandria, and 24x17 cm [5, p. 50] in the edition “Kitobu-r-Radd ala-l-Muattila”. Such a discrepancy may occur as a result of the manuscript being measured with or without a cover, or for some other reason. There is no significant difference in overall performance. H. Zaidan and M. Juyushi did not mention this in their publications.

- The collection is well-preserved, flawless, exposed to moisture and has perforated areas. There are also areas where the skin is loose, torn, patched with white paper, and finally moved [7, p. 333].

As mentioned earlier, H. Zaidan also had a new copied manuscript of “TahsilNazoiri-l-Quraan”, which is kept in the fund of the library “Doru-l-Kutub Al-Misriyya” under the number b 19516. He said that the 3585ج/II Alexandrian copy had been the basis for the origin of this manuscript. H. Zaidan points out that this copy is full of errors due to the fact that the copyist did not understand the text well. Nevertheless, this new manuscript pays special attention to correcting

some of the shortcomings in the writing of the verses of the old original Quraan. The work consists of 80 pages (pages), 21 lines on each page, size 26x19 cm [16, p. 16].

H. Zaidan said that the manuscript was “new”, but did not provide information about the time of its copying and its calligrapher. M. Juyushi also did not provide any information about this copy. The information provided by the publishers of “Kitabu-r-Radd ala-l-Muattila” is slightly different from that provided by H. Zaidan. They said that they had used microfilm No. 19370 from the “Doru-l-kutub al-Misriyya” library fund, the manuscript of which was copied from an Alexandrian copy. Number of sheets 73 sheets rows 21 rows, size 22x13 cm. Copied and punctuated in a flat nasx letter. There are white (left blank) spaces, next to which is written “white in the original” as a border. The date of completion of the copy is Sunday, the 12th of “Jumuah-l-Ulo”, 1355 AH. This date falls on August 30, 1936 AD. Copied by his calligrapher, Mahmoud Hamdi, on the basis of the “Doru-l-Kutub al-Misriyya”.

It should be noted that the date of the 12th Friday of 1355 AH was Thursday, June 30, 1936. The date Hijri 1355 12-13 “Jumodu-s-Sani” actually corresponds to the Sunday of August 30, 1936. At this point, the month copied from the probability that the day of the week is more accurate for the destination should be “Jumodu-s-Sani”, not “Jumuah-l-Ulo”.

A photocopy of this manuscript is kept at the Center for Scientific Research and Innovative Projects of the International Islamic Academy of Uzbekistan. Its description is given in the “Catalog of manuscripts of Termez scientists in the world funds” prepared and published by the Academy of Sciences of the Republic of Uzbekistan. According to him, the year the manuscript was copied is 1355/1936, and its calligrapher was Mahmoud Hamdi. Size: 41 sheets (202a-242b). The number of lines is 21 rows. Size 30x21 [17, p. 27].

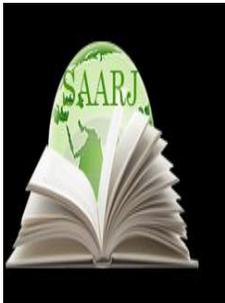

This means that the second “new” manuscript contained three works, just like the original, and the location of the works was preserved as in the original. The number of rows changed from 22 rows to 21 rows. Year of relocation 1355/1936. Calligrapher Mahmoud Hamdi. However, H. Zaidan (26x19, 80 pages), the publishers of “Kitobu-r-Radd ala-l-Muattila” (22x13, 73 pages) and the Academy of Sciences of the Republic of Uzbekistan provide completely different information (30x21, 41 pages) again creating a conflicting situation. In this case, the data of H. Zaidan can be said to be more reliable, and this is based on the following analytical conclusions:

- Since H.Zaidan detailed the dimensions of the “new” copy, it is clear that he said it with conviction;
- H.Zaidan's volume of the work is 80 pages, which corresponds to 41 pages of the description of the Academy of Sciences of the Republic of Uzbekistan, because the fact that each page has two pages means 80-81 pages;
- The publishers of “Kitabu-r-Radd ala-l-Muattila” and the Academy of Sciences of the Republic of Uzbekistan relied on the size of the microfilm and photocopy. This did not give a clear idea of the size of the original. Therefore, it is more accurate to rely on the data provided by H. Zaidan on the issue of measurement.

This information is enough to give a complete picture of the manuscripts, photocopies and microfilms of the book “TahsilNazoiri-l-Quraan”, which are currently available in world funds.

THEATRICAL ART OF UZBEKISTAN DURING THE SOVIET PERIOD

Dilshod Mamajonov*

*Doctor of Philosophy in Historical Sciences (PhD),
 Head of the Scientific Research Department,
 Uzbekistan State Institute of Arts and Culture,
 UZBEKISTAN

ABSTRACT

This scientific article, entitled Theatrical Arts of Uzbekistan during the Soviet period, analyzes the state of theatrical art in Uzbekistan during the years of Soviet rule with the help of historical literature and periodicals. In the 80s of the XX century, as in the previous period of the former Soviet state, the dominance of the ideological factor and the impact of the ideological mechanism on the activities of all theaters could be seen in the theaters of Uzbekistan.

KEYWORDS: *Theatrical Art, Reconstruction, Press, Audience, Ideology, Party, Culture, Art, Nationalism.*

INTRODUCTION

If we look at the history of the country and the nation, our Uzbek national theatrical art has come a long way and developed in direct harmony with socio-political processes. Cultural institutions, established in the mid-20s of the twentieth century, gradually began to play an important role in cultural life. Today, we can say that the theatrical art of New Uzbekistan has been re-formed on the basis of traditions and experiences that have stood the test of time.

THE MAIN FINDINGS AND RESULTS

Amateur artists who grew up in our country began to move towards professionalism. In particular, Muhiddin Qori Yakubov formed the first Uzbek music ensemble. In 1926, the first Uzbek musical theater was established, which included eighteen singers, artists, bakhshis and musicians, such as Yusufjon Qiziq Shakarjanov, Usta Olim Kamilov, Tamarahonim, Ahmadjon Umrzakov, AbdukodirIsmoilov [1, pp. 9-10].

Classical examples of world stage art staged in our theaters once amazed not only our country, but also foreign audiences. For example, on February 11, 1935, a new page was opened in the

history of Uzbek Theater. On the same day, Shakespeare's Hamlet was performed at the Hamza Uzbek Academic Drama Theater. The audience greets most scenes of the play with thunderous applause. Hamlet (Abror Hidoyatov), producer Mannon Uyghur and director Bobo Khodjaev were repeatedly invited to the stage. Every day the auditorium was full of old women in shawls, white-bearded old men in turbans, young people, Uzbek intellectuals, and there were countless spectators who wanted to go to Hamlet in front of the theater [2]. Thus, the successful staging of the tragedies "Hamlet" and "Othello" by M. Uygur proved that he is a talented director.

Also, no matter how hard the Communist Party tried to influence the national culture and art of the Uzbek people, in the Decade of Uzbek Literature and Art held in Moscow in 1937, our artists were able to demonstrate the maturity of every aspect of our national art. Stalin called Halima Nosirova, who gave concerts for a decade, the "Nightingale of the East" [3, p. 400].

During the Second World War, 51 theaters operated in Uzbekistan. From July 1941 to 1944, 203 new productions, 13,568 performances and concerts were staged in the theaters of Uzbekistan, which were attended by 6,667,303 spectators [3, p. 495].

It should be noted that even during the period of perestroika, the socio-political, cultural, educational, ideological and ideological conditions of the society began to fully reflect in the art of theater. From the mid-1980s, theatrical art began to show an appeal to "real life." For example, Sh. Boshbekov for the first time in his work "Iron Woman" thought about the social situation of our people.

The ideological pressures of the Communist Party, its social order, the problem of theater and audience and repertoire created a crisis situation in theatrical art. As a result, the people's interest in the theaters of the republic began to disappear. For example, in 1985, 30 theaters in Uzbekistan were visited by 4,802,000 spectators, but by 1989 this number had dropped to 4,387,000 [4, p. 127]. That's why theaters that were left without an audience had to deal mainly with concert programs to raise money. In 1988 alone, the republic's theaters staged 5,534 concerts. Such cases, in turn, have had a negative impact on the quality of performances and the stage [5].

The breakdown of the relationship between nationalism and "internationalism" in culture was another reason for the crisis in theatrical art. For example, out of 600 plays included in the repertoire of Uzbek theaters in the mid-1980s, only 55 were works by local playwrights [6, p. 324].

In the 80s of the XX century, as in the previous period of the former Soviet state, the dominance of the ideological factor and the impact of the ideological mechanism on the activities of all theaters could be seen in the theaters of Uzbekistan. For example, the Tashkent State Russian Academic Drama Theater named after M. Gorky focused on staging plays that "helped to increase the political prestige" of the former Soviet state. This theatrical team focused on embodying the image of Lenin on stage. For example, performances based on N. Pogodin's "The Man with the Gun", "The Third Pathetic" and A. Stein's "Between the Cellars" was opened [7].

It should be noted that the role of directing in the development of theatrical art is enormous. But even as the period changed in the mid-1980s, the director did not change. This was due to the "social order" of the communist ideology and the problems in the training of directors [8].

Another reason for the backwardness of theatrical art in the 1980s was the agreement by the administration with educational institutions, agencies, organizations. Tickets for the show were “sold” 100%, and the hall was not even 50% full. Theaters in Khorezm, Andijan, Karshi, Kokand and Jizzakh did not work for two to nine months during the cotton season. The spectator's plan was carried out mainly at the expense of a concert or “Star”. One of the serious problems was that the performances were getting worse. For example, 291 of the 457 performances at the Muqimi Theater in 1984 and 123 of the 386 plays at the Hamza Theater were comedies. The decline in the staging of serious, classical works on the theater stage was certainly a sad factor in theatrical art [9].

The financial situation in the theaters was difficult, which had a negative impact on the decoration of the stage and the preparation of costumes. The biggest mistake in this regard was when the planning of creative and financial activities of theaters was carried out by people unaware of the peculiarities of theatrical art [10]. For example, the Hamza Theater received only 25,000 soums for the first half of 1987. That wasn't even enough to stage 5 plays [11].

The issue of repertoire was also one of the most important issues during the reconstruction. The repertoire can be analyzed on the example of the Bukhara Regional Musical Drama and Comedy Theater. There were 7-8 performances a year in this theater, half of which were comedies. Because there was a lack of actors and funds to stage serious, classic works. The staged comedies did not arouse the interest of the audience due to their extreme narcissism. This was especially evident in the staging of such works as “The Unexpected Bride” and “Cancer in Summer” [12].

In the second half of the 1980s, theatrical art was in a very difficult situation. Uzbek theaters produce only 8.5 million a year. Due to the subsidy of UZS, they relied mainly on concerts and entertainment events. As a result, the level of actors has declined.

As a result of the actors' lack of creative pursuits, their lack of emotionally strong, fast-changing, evolving, and naturally talented staff, the number of spectators coming to the theater also fell to a very low level. For example, at the Samarkand Regional Opera and Ballet Theater named after H. Olimjon, 34 people attended the performance “Eugene Onegin” twice, and 90 people attended the performance “Don Quixote” three times. It should be noted that 60% of the 314 events planned in 1986 were concerts [13].

It is also possible to recognize that directing, the effective use of young people's creativity, the shallowness of the actor, theater leaders in the field, the problems in theatrical art [14].

The Soviet state regime has tried to use theatrical art for its own ideological purposes. For example, the republic's theater groups have been criticized for failing to “present to the audience an artistically convincing expression” on the stage of the party's “struggle for the purity of our lives and its democratization”, the “moral ideals of socialism and the determination of true values”. It was also criticized that the general “moral level of the theater's creative staff is unacceptably low”, that there are frequent conflicts in the theaters, and that the creative struggle between actors and directors is intensifying [15, p. 83].

There were also other controversies facing Uzbek theaters in the second half of the 1980s. These were not to increase the number of theaters for young audiences in the republic, but to create

normal conditions for the improvement of the existing teams, to solve the problem of raising the salaries of actors.

Therefore, some art critics have suggested that the Uzbek theaters be funded by the state. For example, T. Yuldashev notes that the reduction or cessation of state subsidies for theater in 1949, 1962 and 1963 caused great damage to the development of the industry, and the fact that in 1988 the theaters began to be transferred to the economic account was a thoughtless measure [16, p. 61]. People's theaters have also been transferred to such a system of economic management [17].

For many years, Uzbek theaters were forced to operate under the Soviet command-and-control system. The issue of repertoire has become a problem of the audience, which is solved “from above”. This, no doubt, led to a crisis in the theatrical arts. Some art critics have criticized the situation, arguing that theatrical repertoires should include “works that wake up” rather than “sleep”.

It should be noted that in spite of ideological pressures in the theatrical art, certain efforts have been made to convey to the audience works glorifying nationalism. In particular, the repertoire-analysis board of the Department of Cultural and Enlightenment Affairs of the Ministry of Culture of Uzbekistan announced a competition for one-act poems dedicated to the 550th anniversary of the great Uzbek poet A. Navoi. The winners of the competition were Haydar Muhammad's “One day in Navoi”, Inomjon Tursunov's “Conspiracy” and Boborahim Omonov's “Governor of Astrobod”.

The Second Festival of Republican Theaters, held in January 1990, played a positive role in the development of theatrical art in Uzbekistan.

It includes “Empty” by the Uzbek State Academic Theater named after “Khamza”, “Nasriddin's Experiences” by the State Academic Theater named after A. Navoi, “Crossroads” of Andijan theater named after Y. Akhunboboev, Performances of the Karakalpak Musical Theater named after K. Stanislavsky, such as “The Voice of Ernazar” were recognized as the best performances.

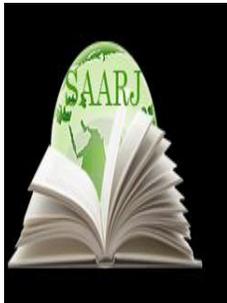

CONCLUSION

Thus, until the first half of 1989, the republic's theatrical art operated under the ideological pressure of the Communist Party, while from the second half of 1989, the Uzbek government paid great attention to theatrical art and made a significant contribution to the development of the Uzbek national theater.

INTRODUCTION

A philosophical explanation of the relationship between nature and society provides a deeper understanding of the ecological situation. By solving these environmental problems, we will be able to systematically and objectively understand and evaluate ourselves. Recently, the

interaction of nature and society in the scientific literature is considered by many scientists as a separate material process. Its special laws do not correspond to either the laws of the development of nature, or the laws of the development of society. The idea of separating such a material process is associated with the emergence of a special natural-social system “nature-society”, represented by a functional unit in the Universe. The organic connection between man and nature requires a comprehensive consideration of the factors of nature in the development of society. Therefore, nature has always been considered as an object of philosophical analysis [1].

The concept of nature is used in different senses in different literatures. The nature category is one of the most important and widely used categories. This category has many interpretations, and in philosophy it is used in a wide, narrow and special sense. Each of these values has its own characteristics.

The term “nature” is used in three meanings: broad, narrow and special. Nature (in the broadest sense) is determined by objective reality. In the first sense, some authors consider it as a whole material world, all forms of matter. In this case, it includes society and man, which are considered as a certain state of nature, matter. In this sense, the concept of “nature” is studied in ontology. Nature (in the narrow sense) is the biosphere, the natural environment that surrounds man. This includes both “first” nature and “second” nature, man-made or man-made. In the second sense, nature is a combination of physicochemical, biological phenomena that create natural conditions for the life and development of society. Here society is relatively contradictory to nature and is revealed through the interaction of their various material creations [2].

Nature (in other words) means the meaning, the main content of a certain event, object. For example, we say that human nature, social phenomena, and the nature of physical phenomena. We understand nature in a narrow sense, as the biosphere, the environment. What is the interaction between nature and man? It is obvious that these relations have undergone the necessary changes in the period from their inception to modern society. The attitude of people towards nature has changed and evolved. In ancient philosophy, nature was considered as a supernatural force (Democritus), an ideal worldview (Plato), a harmonious process (Pythagoras) and maturity (Aristotle). Religious teachings believed that nature is spiritual, ancient, material and that God is superior to nature. During the Renaissance, nature was seen as a source of natural harmony and achievement. In the new era, the attitude towards nature has played an important role in the transformation of nature into an object of scientific research. To better understand modern problems of human interaction with the environment, it is advisable to look back and observe how these interactions are established at different stages of the development of society. Many literatures look at the chronology of interaction between society and nature in different ways. In fact, some scholars who have focused on this topic have named five periods and others four or three periods. In almost all literary sources, it is customary to divide the relationship between society and nature into four periods. That is 1) development 2) agrarian 3) industrial 4) noospheric periods [4].

LITERATURE REVIEW

The relationship between nature and man has been the subject of much speculation since ancient times (Anaximander, Empedocles, Lucretius, etc.). But these attempts are unthinkable. A real "explosion" in the study of this issue occurred at the beginning of the twentieth century. At a time when popular archaeological discoveries (G. Schaafgauser, L. Larte, E. Dubois, R. Dart, J.

E. Lewis, etc.) significantly expanded and clarified scientific approaches to the origin and development of mankind, the accumulation of empirical material occurred at a time when it was creating an evolutionary (T. Huxley, C. Darwin, E. Haeckel, etc.) and historical-cultural (L. Morgan, E.B. Taylor, J.J. Fraser, Levy-Brule, etc.) anthropological basis.

MATERIALS AND METHODS

In modern literature on social ecology and human ecology, one can find several approaches to the historical periodic structure of the process of changing the relationship between nature and society. All of them are based on different points of view and differ in that these series represent some aspect of development. The method proposed by B. B. Prokhorov, according to which the interaction of man with nature and the environment should be viewed through the prism of his economic activity, seemed quite reasonable. Based on this approach, the study of the socio cultural types of man and society is of paramount importance for building the periodicity of the processes in which relations between man and nature are established, based on approaches of the socio cultural type as a factor in the system of nature and society, we believed that the establishment of relations between them is possible divided into four periods.

1. Hunting is a period of gathering culture
2. The period of agrarian culture
3. The period of industrial society
4. The period after industrial society [5].

The dialectical connection between society and nature has a long history. It may have existed from the earliest days of human development that these stages were repeated at every stage of the historical process. People can consciously set goals for themselves or consciously not change their attitude towards nature. In the relationship between man and nature, nature was viewed as an object for man in all historical periods and is still divided. Since the beginning of the 21st century, the ecological situation in various regions of the world has been deteriorating. Today, our ecological situation is deteriorating significantly every year. Floods, fires, sudden temperature changes, droughts, as well as the number of adverse events and incidents have increased in recent years. This set a new and responsible task for philosophers: to develop a new strategy for the relationship between man, society and nature. Philosophy saw their unity in matters of the state of man and nature, in the spiritual perception of man and nature, as well as in spiritual activity aimed at this change. The philosophy focuses on changing the human environment. The question of the regular interaction of society and nature, the environment in which a person lives, has long been considered a problem. At all stages of history, philosophical views were approached in different ways. In the eighteenth century, a French sociologist put forward a view of Montesquieu typical of that period. In his book *On the Spirit of Laws*, he developed the idea that society is completely dependent on nature, and quoted the motto that “the dominance of the climate is above all forces”. It is important to recognize the relationship between people and nature, to try to justify the relationship between nature and society, and to justify and demonstrate the relationship between nature and society. History has shown that the history of mankind and nature are inextricably linked. When we show the integrity of society and nature, we understand their material integrity in its representation, that is, they consist of materials, chemical compounds that obey the laws of dialectics, albeit in a special way. In

society, along with political laws, physical, chemical and biological laws also operate. The physical and spiritual life of a person is directly related to nature. So, nature is also a complex system, and man and society are his “creation”, and nature seems to be one of the first foundations for their emergence. Humanity, which is a product of natural development, today begins to exert an increasing influence on nature, man not only changes the location of various species of plants and animals, but also threatens to reduce their number, the fate of all mankind. We see that the relationship between man and nature was different in different eras. Historically, we have seen that the relationship between man and nature has changed throughout the history of mankind. Considering these stages separately, it becomes clear that the relationship between nature and society has become strained. The relationship between nature and society is unique in historical times. The first assumptions about the location of the Earth, oceans, regions and peoples inhabiting them appeared in humans only 300-400 years ago, after the end of the Great Discoveries. To this day, people have lived in small areas for thousands of years.

Step 1: Simple utility. Ordinary people are engaged in hunting, fishing, gathering, they only need to distribute the finished product. He is attached to nature, cannot be separated from it and does not oppose it. His work is inseparable from nature and will never meet resistance. His life is a constant struggle for survival. Powerful nature causes anxiety and insecurity in humans.

Natural phenomena are given to God. Primitive man was engaged in gathering, hunting and fishing and satisfied his constant needs, assimilating ready-made products, that is, limiting himself to the fruits of nature. This included things that grew side by side with primitive man, running, crawling, flying, swimming, and anything else that was suitable for nourishing the stomach. At that time, man was completely absorbed in nature and completely dependent on it. He was inseparable from nature and did not rebel against her. It is for this reason that primitive man was unable to cause significant damage to the environment at that time due to the availability of food alone and a small amount, which was determined by the natural conditions that allowed him to survive.

Phase 2: Ancient Period. The first point of the new stage is the emergence and development of agriculture and animal husbandry. The transition from finance to a manufacturing economy continues. Man begins to actively influence nature. They cut down forests and build irrigation systems. Human activity begins to have a destructive effect on nature. But natural disasters lead to the natural disappearance of civilizations. Nature remains a dangerous force that dominates man in almost all directions, but this is no longer fear, but a reason for selection. Later, with the construction of canals and irrigation systems and the subsequent mining of minerals, the use of nature expanded. With the discovery of iron, the technical capabilities of man increased sharply, tools were made, complex engineering and irrigation structures arose. Gradually, man accepted nature as an external and contradictory force and became a being, different from nature and the same being.

In agriculture, man began to move towards the production of what he needed in his daily life, and he began to use more and more natural resources to generate his economic income. Thus, a person has significantly changed the environment in which he lives. In particular, with the development of animal husbandry, wild animals were expelled from pastures. The number of these animals that have lost their habitat has decreased, and some species have become extinct. Floods, fires, droughts, extreme cold, hurricanes and earthquakes have tested human resilience,

forcing them to look for ways to cope with natural disasters. The inability to avoid danger and protect oneself has awakened in a person a sense of anxiety and insecurity, complete dependence on a powerful nature. This attitude has persecuted man for millennia and was reflected in various myths and legends of ancient peoples, as well as in their early religious beliefs.

Stage 3: Middle Ages (IX-XIV centuries) And Renaissance (XV-XVI centuries).

The dependence of people on natural forces has not diminished, the development of human nature has not radically changed, but the worldview of relations, the attitude of people to nature has changed. This mainly concerns the nature of man in relation to God.

Stage 4: New century (XVII - XIX centuries). The main challenge facing man is to develop nature and adapt to the growing needs of human society. The means of its development and subordination is knowledge of the laws of nature, that is, "Knowledge is power!" (F. Bacon) is the motto of the whole New Age. Man is no longer a part of nature, he is considered the pinnacle of his supernatural origin and consciousness (the principle of similarity to God in Man). Man and nature are opposites. Nature loses its independent meaning and is considered only as an instrument of human life. The desire of the great philosophers of the new era to possess the forces of nature for the benefit of man was directed in the context of an industrial society. Practical and, to some extent, theoretical mastery of nature is primarily aimed at adding value.

In the socio-economic conditions of an industrial society, scientific and technological progress not only intensified the oppression of workers, but also increased the predatory use of natural resources. This was seen as a voluntaristic ideology of man. We see that the combined action of these factors inevitably aggravated the deterioration of the environmental situation. At this stage, this process has reached its peak.

RESULTS AND DISCUSSION

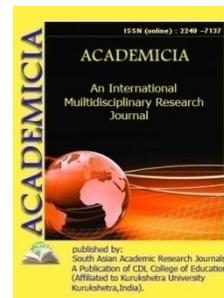

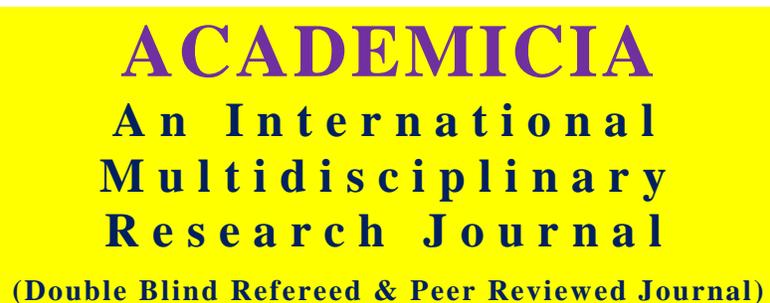

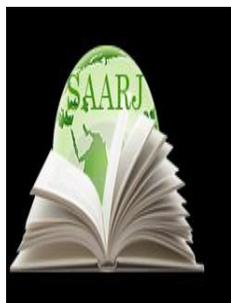

In the twentieth century, the rapid transformational activity of man on Earth became destructive, and as a result, mankind faced the problem of not only self-destruction, but also the destruction of nature as a whole (as a living space). The twentieth century is interpreted as an era of ecological crisis. Indeed, as a result of the complexity of human activity, we can see that today man poses a threat not only to the fate of nature, but also to his own. We know this from the current state of affairs between man and nature. The processes constituting the main problem are the result of these anthropogenic influences: Deforestation (deforestation reduces rainforest area by 11 million hectares every year, and in industrialized countries 32 million hectares of forest have been damaged by air pollution and acid rain). Soil erosion (26 billion tons of soil is removed from agricultural land annually as a result of erosion processes), desertification (the area of deserts is increasing by 6 million hectares per year as a result of improper farming), water levels in lakes are falling (thousands of lakes are biologically dead), lack of clean drinking water (now there is almost no water on Earth), the disappearance of many species of flora and fauna (in the next 20 years, 1/5 of all plants and animals present on Earth today may disappear). Climate change (by 2050, the average annual temperature is expected to increase by 1.5-4.5 °C). Rise in sea and ocean water (approximately 1.4-4 parts, from 2.2 mm to 2100 mm). Destruction of the ozone layer in the upper atmosphere [9].

Just as nature has a constant and continuous impact on society, so does society.

Since this interaction is objective, people cannot live without constant and direct contact with nature. Nature influences the development of a society's environment. Human life, climatic conditions, flora and fauna, geographical landscape, air temperature and its stages - all this has a significant impact on the life of society. So, in the modern world, a new relationship between nature and man becomes a necessity. In this case, it would be appropriate to make the following statement about the preservation of human and social life and the creation of sustainable environmental conditions: Avoid subjective thinking about nature in the first place; Further improvement of the environmental education system, development of areas related to environmental activities; Implementation of sustainable development programs proposed by the UN, humanization of the attitude towards nature.

PROBLEMS OF SPIRITUALITY IN THE PHILOSOPHICAL THINKING OF THE PEOPLES OF CENTRAL ASIA

Azimov Ashirali Mexmonboyevich*

*Teacher,
Department of Social Sciences and Humanities,
Andijan State Medical Institute, UZBEKISTAN

ABSTRACT

This article clearly describes the specific peculiarities of the issues of spirituality in the philosophical thinking of the peoples of Central Asia. As well as it focuses on essential tendencies of prominent Central Asian enlightenment scholars on spirituality. Most important points have been analysed comparatively with Eastern philosophical views.

KEYWORDS: *Central Asia, Enlightenment, Spirituality, Philosophy, Philosopher, Renaissance, Culture, Heritage, Education, Humankind, Ethics, Moral, Friendship.*

INTRODUCTION

Although Central Asia is a country rich in historical events, it has long been one of the centres of science, culture and spirituality. This country has brought up hundreds and thousands of world-famous great and statesmen in all spheres of spirituality and enlightenment. Our great ancestors were directly involved in the creation of universal enlightenment. They have made a huge contribution to its development and enrichment [1-3]. The cultural heritage of Central Asia is an integral part of world culture and education. IX - XV centuries are conventionally called "Renaissance" in the Near and Middle East. This period was characterized by a great flowering of spirituality and enlightenment. During this period, encyclopedists, great poets, and great statesmen appeared. The secular sciences developed rapidly. This process took place especially during the reign of Caliph Mamun (813-133). This accelerated when Bayt-ul-Hikma (House of the Wise) was founded in Baghdad. Thinkers from Central Asia, such as al-Khwarizmi, al-Fergani, al-Farabi, Ibn Sina, al-Beruni, played an important role in this [4-7].

MATERIALS AND METHODS

The following methods were used in the research: inductive, deductive, analysis, synthesis, historical and logical, analogy, observation, comparison, from simple to complex, generalization. The IX-XV centuries were a period of radical changes in the cultural and spiritual development of the peoples of the Middle East, first of all, the peoples of Central Asia, in the development of socio-political, moral, religious and philosophical teachings. This cultural revival and uplift permeate all spheres of social life, embracing spiritual life. It was during these periods of social development that the peoples of Central Asia were able to rise to the level of being at the forefront of the development of world culture. It was during this period that Central Asia became one of the largest and central centres of world cultural development. The indelible stars of science and culture, world-famous mathematicians, astronomers, chemists, mineralogists and physicians, poets, writers and artists, who amazed humanity with their intelligence and thinking, encyclopedias, were among the peoples of Central Asia at that time. Scholars, scholars of fine arts and painting, world-renowned philosophers and historians, writers and linguists, sultans of the ghazal

dynasty "Muallimi soniy" and "Sheikh ur-raisi" were born. The period in which a whole generation of great thinkers grew up, spread fame throughout the world and illuminated the world with the light of science, enlightenment, and spirituality, is called the Golden Age or Renaissance in the history of the East. Renaissance - the essence of the culture, spirituality and enlightenment of the Renaissance, the secular, the humanistic worldview, the appeal to the ancient cultural heritage, and its revival. The views of the Renaissance stand offers are characterized by the inexhaustible capabilities of the human being, the belief in his will and his intelligence.

Science uses the concepts of the Oriental and Archeological era. They are distinguished by their general, similar aspects, in terms of their distinctive features. First of all, they differ from the point of view of the season. Although the IX-XII centuries of the first Eastern Renaissance period and the latest renaissance period were dated to the XIV-XV centuries, the Western Revival period was different from the XV-XVII centuries. If the phenomenon of the feudalism and the struggle of the religion for the Western awakening period is distinct, we will not see the issue in the East as sharp as in the West. Common features for the awakening of the East and the West appear in antiquity, revival, natural sciences development, adventure in science, the propaganda of humanity, and so on. The eastern renaissance period has the following general features: 1) the development of culture, secular science and Islamic thought; 2) leaning on the achievements of Greek, Roman, Persian, Indian and other cultures; 3) development of astronomy, mathematics, mineralogy, geography, chemistry and other natural sciences; 4) style (methodology) - rationalism, the superiority of logic; 5) Promotion of human friendship and high morals; 6) extensive development of philosophy; 7) broad development of literature, poetry, rhetoric; 8) The skill of being knowledgeable as an encyclopedic point of view. During this period, Central Asia, Iran, Iraq and Syria were the major centres of science and culture. Large scientific centres were established in Khorezm, Bukhara and Herat. Among the Central Asian scientists and scholars such as Khorazmiy, Farabi, Ibn Sina, Ferghani, Beruni, Imam al-Bukhari, Imam Moturudi, Imam Isa At-Termizi, Hakim At-Termizi, Ahmad Yassaviy, Najmiddin Kubro, Mahmud az-Zamaxshari it was all over the world.

The ancient cities of Central Asia, such as Bukhara, Khiva, Samarkand, are characterized by ancient traditions of science, culture and spirituality. The beginning of the development of natural scientific thought in Central Asia is connected with the name of great scholars Al-Farghani and AlKhorezmi. Each of them is considered to be one of the leading scholars of the Bait ul-hikma in Baghdad. In 1998, the 1200th anniversary of the birth of AlFarghani was widely celebrated in our country. His death is 861 years. He is a well-known astronomer. His main works are "Introduction to Astronomy and Astrology", "Causes of Falak", "Astrology Methods", "The Heavens and the Stars of the Stars" and others. Ferghani's Astronomy Basics book was a reference to astronomy in that time. It describes ancient astronomy, its rules, methods. The work was translated into Latin in the twelfth century and served as a textbook for astronomy in Europe for many centuries. He was known in Europe as Fraganus. Al-Khorezmi (780-850) is a great thinker of the East, a genius scholar. Its geography, geodesy, geography and, in particular, mathematics, are remarkable. He knew Arabic, Indian, Latin, Greek, and Persian.

Khorezm is the author of several books and brochures. The most famous of these is the book AlJabr al-Muqabala. This work has created new independent science algebra in mathematics. He has discovered two methods of solving equations - algebra, that is, bringing opposite signals to a single positive sign and al-muqâbala, that is, to contradict the uniqueness of each one. Khorezmi has published a book about Sindh Hind, Ziji Khorazmiy, Astrolyabia Brochure, A Booklet about the Sun, Earth Book, Trigonometric Tables, Music Booklet, and other works. One of his great services was to acquaint the European and Middle Eastern sciences with the ten-year Hindus. It was called "Alarithmus" in Europe. It is difficult to imagine the philosophy of the Orient, without Abu Nasr Farabi (873-950), who is the philosophical, social and moral scholar. He is a thinker who has gained the title of "Eastern Aristotle", "Second Teacher"[8]. Aristotle, the most famous philosopher in ancient Greece, is called "The first teacher." Faroese is a qomus scholar who knows many languages. The total number of his works is 160 and can be divided into two groups: 1) Ancient Greek philosophers and naturalists -Aristotle, Plato, Euclid, Galen, and others - translate, interpret, propagate, Converted Works; 2) Natural, socio-philosophical manuscripts of medieval science. Aristotle's interpretation of the Celestial system, Aristotle's comment on the Ethics book, Substanstan word, Source of sources, Law on the Law, The Book of Boss, "The Speech of Music", "The City of Fazil People"and others.

According to Farabi, humankind and society are in the hands of the human and the team, the triumph of winning, the achievement of good, the elevation of moral and intellectual perfection. He will be the state with the sincere and ignorant. Science, philosophy, ethics and enlightenment are the priority places in the fertile cities. Then society will mature. Fazil(wealthy man) is said to be the mayor, should be knowledgeable, truth-loving, lying, and deceitful. He

must be a fair-hearted and righteous person. He treats the perfection of human perfection, good deeds, and good human qualities as good. It also warns people that bad habits such as idleness, oblivion, lack of knowledge, intelligence, and lack of professional skills are a bad thing to hinder man's perfection [8].

The ultimate aim of a Farabi's life is to achieve happiness and to see people achieve it by learning the world, mastering professions and sciences. The great scholar of Khorezm Abu Rayhan Beruni (973-1048) is one of the most prominent figures in the history of the world and is a famous naturalist and philosopher, a prominent scientist who has contributed to almost all his time in science. She has created more than 150 works throughout her life. The most famous of them are "Ancient Ancestors", "Law of Judgment", "India", "Geodesy", "Mineralogy", "Saydana" and others. Although Beruniy did not write works on philosophical-ethical issues, he wrote many thoughts on this issue. Beruni highly values the friendship and cooperation between peoples. He has praised him as the most humane and ethical quality in practice. A 45-year-old Indian scientist, who has been studying ancient Hindu-Sanskrit language for several years, translated the Elements of Eleklar, Ptolemy's Almajisti, and introduced Indian scholars to Greek science and philosophy. He learned the Indian language, literature, philosophy and morals.

Beruni was the most prominent scientist of his time. He saw the prosperity of the country in the development of science and education. Science, enlightenment believes that it is possible to have good service. He writes: "All my thoughts and my heart are aimed at propagating knowledge because I have enjoyed the pleasure of learning. This is a great blessing for me". The superiority of a person is to take care of others, especially the poor. Beruni always fought for nations to live in friendship, harmony, alliance. He has condemned man-made wars that kill civilization. Beruni is a bright person who attaches great importance to the spread of cultural cooperation and enlightenment. The scientific heritage of Abu Ali ibn Sina (980-1037), a scholar of the Shaykh al-Rais scholars in the Orient and Europe who contributed to world culture and enlightenment, is an invaluable treasure to us. She has created more than 450 works throughout her life. His 5-volume book titled "Medical Laws" has served as a guide for meditation in the East and Europe for centuries.

Ibn Sina was a young man, earnestly earning a living, researching, and studying science. He writes about this: "When I went to sleep, I would see things in my head. It was clear to me that many issues were being solved in this case ... so I gained all the knowledge. At the level of human capability, I have acquired knowledge. Aristotle's "Metaphysics" was read "forty times." He was even ignorant of me. But even so, I could not understand her and her goals, "she wrote in her biography. Ibn Sina reads this question by reading the commentary of Farabi in Aristotle's "Metaphysics". Ibn Sina is a philosopher who has been a fanatic in the field of mathematics, astronomy, physics, chemistry, biology, pharmacology, psychology, philology, philosophy and medicine, despite the overwhelming majority of his life. Only 100 copies of his works have come to us. Among them are the Book of the Healing, which covers all the major spheres of the medieval sciences, namely, the book healing, the logic, the physics, the mathematics, the metaphysics, the Book of ul-malef, "Lisan ut-Tayr", "Solomon and Ibsol", "Hayy ibn Yaqzon". In his philosophical and moral works, he urges the rulers to fight against lawlessness, listen to the demands of the people, and act justly. It shows justice as the best pattern of human behaviour. In his opinion, goodness is achieved through wisdom, and wisdom is obtained by knowing the events. Knowledge, enlightenment is an indispensable part of human life. Ibn Sina describes the triumph of truthfulness, loyalty, love of goodness, and the triumph of willfulness in the story of Solomon and Ibsol.

He calls unbelievers to appreciate friendship and truth and friendship. He is regarded as the greatest of all creatures in the universe. Thus, Ibn Sino had a great impact on the development of medieval East and European culture and enlightenment. The prominent poet of XI century, Yusuf Hos Hojib, also played an important role in the development of spirituality and enlightenment of IX-XII centuries. Yusuf Hos Hojieb is famous for his only poem, Qutadgu bilig. This work was written in 1069, which was dedicated to the poet Solomon Asrons of Kashgar. For this work, he was given the title of special counsellor of the great khan, Hos Hojieb. The heroes of Doston - governor Kunduzdi symbolize justice, while Otyoglu, as a symbol of happiness, describes the son of the son as the symbol of the mind.

The philosopher argues that man is the only person in the community who can communicate with others and have a genuine achievement in labour. The man who does not benefit humanity is dead. The society says that working people - farmers, livestock producers and craftsmen - play a crucial role. Therefore, Yusuf Hos Hojib advises the ruler to be just, to avoid arbitrariness and injustice. The thinkers of the Renaissance are comical, at the same time they are a philosopher, a musicologist, a logician, a sociologist, a literary critic, a historian, a poet, and a mathematician, and, so to speak, are aware of all areas of science, have shown themselves in several areas of their

creativity. It is worth mentioning that one of the most amazing features of the great figures of the East is that they are fluent in several languages and are free to use scientific sources and works in these languages. In science and culture, it is easier to specify the exact area of enumeration than to list the area in which they are engaged. They made great discoveries in the field in which they dealt with the subject of science, and were able to conquer the shining peaks of science, which were not conquered by any other scientist of their predecessors. In addition, many of them have invented new directions in science, new ways of thinking, introduced completely new doctrines that no one had spoken about before, and provided a scientific basis [9,10].

Deeply scientifically grounded ideas and teachings of great thinkers are invaluable not only from the point of view of the period in which they lived but also from the point of view of predicting the future, predicting natural, social events and processes. The scientific and philosophical teachings of our wise ancestors are of universal significance. It is noteworthy that the thinkers of the East were at the centre of modern life of their time, defending the interests of the people and the Motherland. This is a sign and the main reason that they are truly harmonious people, ardent patriots, nationalists and great scientists. Since the time these great people lived and created encyclopedic minds, science, culture and philosophy began to develop in East and Central Asia. This development, continuous improvement lasted hundreds of years and has come down to our time. If we study the scientific heritage of Al-Farabi as one of the great scientists and representatives of the Central Asian Renaissance, then he covered almost all areas of science and passed on to future generations a great spiritual heritage through more than 160 works in various fields. At that time, Farabi was famous throughout the Muslim world for writing great works and treatises on mathematics, astronomy, medicine, music, philosophy, linguistics and literature. He is the author of Aristotle's works "On the Aims of Metaphysics", "On the Members of Tariq", "Books of Music", "On the Achievement of Happiness", "City of Noble People", "Book of Laws", etc. testifies to the incomparable breadth and depth of the level of knowledge and worldview of the scientist.

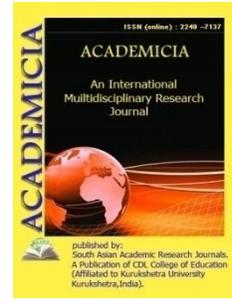

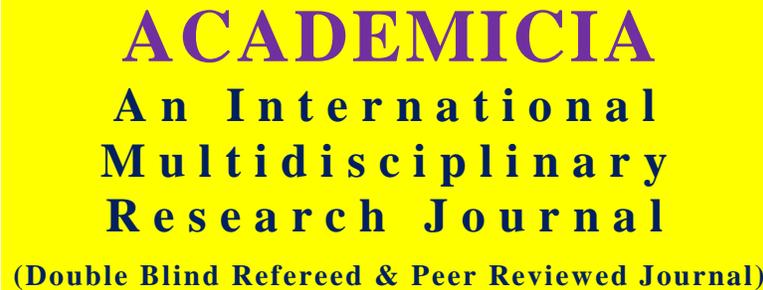

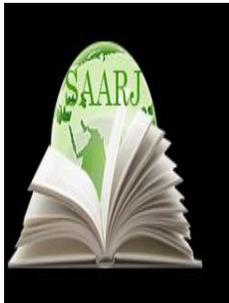

For his great contribution to the development of science, Farabi received the prestigious titles "Al-Muallim al-Sani", "Second teacher" and "Aristotle of the East". Farabi's treatise "On the Organs of the Human Body" is devoted to defining the goals and objectives of medical science, and the encyclopedic scientist Ibn Sina also repeatedly referred to this work. In this sense, this work proves that Farabi was a great encyclopedist.

CONCLUSION

The study of the spiritual heritage of the people of Uzbekistan and a new approach to its significance in the life of society require proof based on deep philosophical and scientific hypotheses that they are of great importance for the gradual development of society. Our country is rightfully proud of the founders of Eastern philosophy and Islamic teachings, who have long made an unforgettable contribution to the treasury of human thought and for centuries have promoted the noble virtues of our people, such as high spirituality, justice and enlightenment. In this research work, the study of spirituality in the philosophical thinking of the peoples of Central Asia and the creation on their basis of the foundations of civil society, that a new approach to the subject of their importance in the life of society is of great importance for the gradual development of society and its results will be widely used in scientific and practical analysis of processes building a democratic society in Uzbekistan and laying the foundations of civil society.

PHILOSOPHICAL-EPISTEMOLOGICAL INTERPRETATION OF COLORS

Isaqova Zamiraxon Ruhitdinovna*

*Associate Professor,
Candidate of Philosophical Sciences,
Namangan State University,
UZBEKISTAN

ABSTRACT

The article reveals the essence of colours, the impact of colours on the human psyche, health, as well as the philosophical-epistemological analysis of the symbolic meaning of colours based on the views of the founder of the Kubra sect Sheikh Najmiddin Kubro. The mental states of a Sufi are shown in the example of the colours of the levels of perfection in his journey towards Allah.

KEYWORDS: *Colour, Rainbow Colours, Colour Harmony, Beauty, Sophistication, Psyche, Health, Levels Of Maturity.*

INTRODUCTION

The beauty and charm of colours have fascinated people for centuries. From ancient times the “language of colours” was used in communication. Each colour represented a specific object, situation, or event. The rainbow colour of sunlight is red on Mars, blue on Venus, yellow on Mercury, and green on Saturn, red on Jupiter (Jupiter – author), the pumpkin colour of the Sun, the purple colour of the Moon combined to form a rainbow colour: “The seventh layer is the sky of blue Saturn. Although its ore is transparent, it is as black as a layered iceberg. Allah created the universe from the light of the past. And his address was affixed to his address. Saturn is the attribute of heaven and the best of places” [1].

Throughout history, colours have been skillfully used to depict various characters, seasons, and ceremonies. War and death, wedding and joy, celebrations and holidays are expressed by special colours such as sadness and depression (grey, purple), joy, warmth (yellow, orange, red), serenity (green), coldness (blue, white) colour. Man perceives the information around him through the eye.

MATERIALS AND METHODS

The retinal layer is very sensitive and is connected to the central nervous system. In the darkness, the eye catches black and white colour shades while in the daytime it can see the elements and a very colourful character of an image. Human eyes can differentiate the chromatic colours out of 10,000 colours. Also, they can identify their average brightness level of the spectrum (violet, blue, blue, green, yellow, orange and red) of 180 different colours.

Man lives in the harmony of colours. Beauty and elegance shine in colours. Man's loss of colour, deprivation of the beauty of nature, disturbance of his mental balance, the insignificance of aesthetic values affect his world of thinking, that is, the "coldness" of the human psyche which is clearly reflected in his thinking. The rainbow of emotions shows the lack of sense and love in the deep insights of the meaning of life, the blessings of life, duty, responsibility, one's observations of the present, the future, and even thoughtlessness and indifference. Man needs thinking, especially the thought that awakens him. Even in the background of love for life, the colour scheme that evokes thought-provoking thoughts is important.

When listening to music, a person is surrounded by certain colours. While the music that has a positive effect on the human psyche gives the impression of yellow and orange in his imagination, sad music that has a negative effect on the human psyche appears in black or orange in the human imagination.

Colours have a certain meaning in a person's life that a person knows which colour corresponds to his spiritual world. Everyone's favourite colour outlines his outlook, the need for mental balance. Even the brains of men and women perceive colours differently. For example, the X chromosome, that is, the gene it contains, is responsible for receiving the red colour. Because female DNA contains two of these chromosomes, they perceive red brighter and clearer, while male DNA contains one chromosome, so they perceive colours in the same way such as bright red, crimson, etc. Colour perception is a complex process that depends not only on physical, physiological but also on spiritual factors. Physics and physiology lay the foundation for a person's colour-sensitive psyche.

Colour affects the human brain, awakening some associations to feel emotions or behave in a certain way. The things that surround a person have a specific description, and the colour needed to feel and communicate is one of them. These feelings are subjective since a sense of colours is formed in the human brain. Seeing in the perception of being, the "symphony" of different colours evoke in a person a beautiful feeling, a happy feeling.

Everyone has a favourite colour. In most cases, to a favourite colour, more attention is paid when choosing clothes, buying things etc. Whichever colour a person chooses the most that colour also reflects his psyche so that a person chooses the colour of his favourite item based on his inner need. Even the mood of the artists is reflected in the most commonly used colours in the paintings they draw. Depending on what colour a person likes, the level of character, ability, and potential can be determined.

Colours are one of the most beautiful blessings bestowed on human beings, and in the Qur'an, they are described as "the colour of Allah". Is there anyone more beautiful than Allah? We worship Him alone" [2]. The "colour" of Allah in the verse is the religion of Allah. Just as the colour appears on the clothes, so do the signs of religion on the believers. The interaction of the

human psyche and colours, their origin, their place in human life in one or another situation, in emotional states, is deeply expressed in Sufi views. The colours indicate the state of mind of the Sufi, the stages of his journey towards Allah, and the transition from colour to colour indicates the level of Sufi spiritual development [3].

The founder of the Kubravian sect said that “the saints and murshids of his time had attained perfect, lofty, noble manifestations, as well as seeing in the world of Malakut, flying in the world of Jabarut, attaining tawhid and truth in the world of Lohut, and drowning in the world of the soul.”[4] Sheikh Najmiddin Kubro (d. 1221), who was glorified as [5] and “error” [6] combined the directions and combined prophecy with thinking knowledge. Sheikh Najmiddin Kubro explains the change, condition, and renewal of the levels of maturity in the heart of a follower of the sect through colours in his book “Favoyih ul-Jamal and favatih ul-Jalal” [7] (The Discovery of the Fragrances and Glory of Jamal).

Sheikh Najmiddin Kubro explained the doctrine of “horizon and anfus” (horizon – horizons, sky, anfus – spirits, souls), that is, the relationship between the world of the orphan and the world of the grave [8]. According to him, the external world that surrounds man is the grave, and the man himself is the world of the blind [9]. Truth cannot be attained without understanding the Anfusi world.

The joy of jokes, invisible sensitive spots, the unseen world of subtle power are within the heart. The human soul is invisible, consisting of a subtle centre between mind and emotion, soul and body. One should polish it with dhikr, sharpen it, and grasp it.

According to the theory of “Latoif” developed by Sheikh Najmiddin Kubro, “latoif” is a special attribute given to man. “Latoif” is called “heart”, “soul”, “mystery”, “secret”, “forgiveness”. “Latoif” refers to the four elements – earth, water, air, fire and lust. The origin of lust is “heart”, the origin of air is “spirit”, the origin of the water is “mystery”, the origin of the fire is “secret”, the origin of the earth is “axfo”.

The position of the “spirit” is under the two fingers of the right breast, the position of the “mystery” is two fingers above the left breast, the position of the “secret” is above the two fingers of the right breast, and the position of the “axfo” is between the chest. Latifa nafs is located between two eyes, and during riyazat the “latoif” changes into different shapes, colours, and states. Every shape, every colour has a certain meaning hidden. Dots, spots and circles play an important role in changing the mood of the disciple (colours – author). The circle is the rotation of the celestial circles, the spot is the symbol of the world, and the point is unity. When the circle is in constant rotation, it also includes the spot. But they are moving towards the centre, that is, towards the point. By understanding the essence of the point, the world of Allah is perceived. The soul of the disciple is exposed to different colours in the range of excitement and amazement. The rotation and exchange of circles, spots, and dots encompass the exchange of colours: if the development of the spirit in the sensory stage is black, then it is red. Then the colour green appears, indicating the closeness of the divine universe.

The colours indicate the Sufi state of mind, the degree of status in the journey towards Allah. The diversity and interchangeability of colours signify the state of the tax, the continuity of the mental-conscious experiences, and the diversity of the “taluvun,” that is, the inner-thought experiences [10].

The transformation of the soul from colour to colour is a sign of tax spiritual maturity, and at the end of this process there is a lack of colour, i.e. “tamkin” occurs. A Sufi who enters the state of “Tamkin” will be freed from “talavvun” (diversity – author) and will be united in the world of unity [12].

The blue colour appears when the taxman repents and steps into the sect. In this case, he is within the framework of the Shari’ah, he has not yet escaped from the logical evidence knowledge, yet worldly lusts still reign in his heart. Then the sect begins. In Salik’s heart love arises, he lives in the remembrance of Allah. This corresponds to yellow. While red signifies that the spirit of the taxman has begun to separate from the body, to approach enlightenment, to understand the world of spiritual essences, white signifies the purification of the soul, and from that moment the understanding of truth begins. Aware of the word of truth, he experiences a state of monotheism [13].

Green is a symbol of “life and vitality of the soul”. After this colour, the colour of the agate stone appears. This is the colour of the “grave of the mind”. When the “grave of the mind” turns red, even the thickest books are torn. When red appears, it “scatters the planet, crushes it, covers the body and shakes it” [14]. That is, the green colour appears when the taxman repents and steps into the sect, while the yellow tax signifies the emergence of love in the heart of the solik and living with the remembrance of Allah. While the red colour is seen in the separation of the soul from the body, the approach to enlightenment and the understanding of the spiritual essence, the white colour is a sign of purification of the heart, and this is where the understanding of truth begins.

The green colour is a symbol of guardianship, “Sirr ul-asrar”, which means acquaintance with the unseen, and the fact that the solik has reached its original essence.

Talvin is diversity, a change from one state to another is a transition from one colour to another. Colours signify the spiritual journey towards Allah and with Allah. Black colour represents the journey from Allah to people as written in “Kanz al-asrar”, that is, drowned treasury of secrets and, surprise, the symbols. The astonished soul re-perceived the essence and wisdom of the Shari’a and was wrapped in a dark spot. The spirit of taxation reappeared before Allah. He got rid of the black and went into a state of colourlessness. The solik, who occupies the level of “Zoti Kull”, has achieved its goal in the state of uniformity, that is, in the state of attaining the highest level of spiritual maturity, a state of monotony has emerged.

The five parts of the human body located in the thorax are the heart (under the left breast – author), the soul (under the right breast – author), the secret (above the left breast – author), the secret (above the right breast – author) axfo (respiratory tract between the left and right sinus – author) was secretly mentioned. They have their own colour, the heart is yellow, the spirit is red, the secret is white, the secret is black, and the axfo is green.

Each colour has a mystical symbol, signifying the status of a person striving for the right path. Sheikh Najmiddin Kubro adapted the nature of the seven colors to the seven mystical terms and explained his career in the path of gnosis: white – “Islam” (purification, the murid enters the path of “tariqat” only when he achieves purity, innocence and righteousness – author), yellow – “faith” (faith, a strong love for God, a symbol of the beginning of life in the name of God – author), the blue color - divine blessing (charity, generosity, dedication to a new life, contemplation of oneself, purification from sins), the green color is the beginning of the path of

“faith” after the status of “faith” (deeds - a state of getting rid of “haram”, abstinence from deeds forbidden by Allah and righteous deeds - a symbol of the transition to “halal” – author), – blue “iyqan” (peace, true faith, true faith in Allah of the disciple’s heart) (with full – time status author), red – “Irfan” (understanding, the separation of the soul from the body, the education of the soul, the symbol of the perception of the spiritual world – author), black – “wonder” (the approach of the soul to the threshold of the divine world, understanding Allah, enjoying and marveling at the divine world, symbolizing divine love – author). The spiritual ascension of the soul, its ascension to perfection, is deeply reflected in the colours, which ascend from the low to the high are at first black, turning red in the distance of the road, and turning green during the visol.

Discolouration means the truth. Colourlessness means understanding God and His truth. The murid gradually goes through colour-based spiritual experience, polishing his inner feelings. According to the theory of latoif, the murid leaves the possession of a black and achieves the goal – “truth”. That is, he is united with the divine world.

The Sufis of the Qalandar sect wore a murak (author.), a patchwork cloak worn with pieces of cloth of different colours. This meant the diversity and variety of mental experiences of solik.

Newcomers to the sect wore black[14]. The black-robed Sufi had to imagine his heart and body in the fullness of Allah [15]. Black is the colour of the nafs mutmaina (restless, submissive nafs), which is irradiated by the permission of Allah and the light of the soul, abandoning evil and subjecting to good morals. Its attributes are prayer, obedience, fasting (eating less), trust, contemplation and good deeds [16].

The soliks associated with the disciple’s upbringing were blue, and the leeks that brought the leech to the end wore a white turban. In the observation (seeing, watching, witnessing, complete belief in the oneness and existence of Allah – author) the beginning of the divine manifestation is the light of gnosis from the Truth. Observation first occurs with the image (appearance of abstract objects –author), form (appearance of concrete objects – author) and imagination. In the state of observation, the veil of the guardian’s heart is lifted, and the eye of insight (the eye of the heart – author) is opened, that is, the person feels through his nafs that he has seen with his eyes. The colour green is peace in the heart, joy in the heart, inner beauty is the pleasure in the soul and clarity in the eyes.

In Mujahideen, the determination to suppress the nafs, to accept any hardship for oneself, is the victory of the guardian over his nafs after intense mental anguish. Through Mujahideen, the love of the followers of Allah was once again tested and they submitted to Allah (submission – author). Three cases were committed through Mujahideen. Since food is the source of power for the body, the nafs, and the devil, it is to gradually accustom the body to hunger, to reduce eating and drinking, to abandon desire, will, and to surrender the soul to Allah. During the Mujahideen, strange things happened to the governors. For example, when the nafs appears, the body (aura – author) is blue, while the body purified by mujahideen is white. The governors acknowledged that the bodies of those who were victims of lust would be red and that the bodies full of immorality and sins would be black.

Sheikh Najmiddin Kubro’s views on colours and shapes were developed by later Sufis. Although the order of the colours has changed, it is the black colour that is a sign of wonder, a symbol of the state of immersion of the human soul [17].

Nearly seven hundred years later, theories were put forward in Europe that there was another force beyond the human senses, the mind, and that it could be acquired with inspiration in the age of human insanity, and led to the emergence of new knowledge. XIX – early XX century in the history of the philosophy of the human being, his essence, the meaning of life, human cases of mental problems were extensively studied and new theories were developed by A.Shopengauer (d. 1860 y.), F.Bredli (d. 1924 y.), K.Yaspers (d. 1969 y.), Z. Freud (d.1939 y.).

Studying deeply about the oriental history, culture, literature, I.V.Gyote (d. 1832 y.), poet, scholar and art historian wrote a book about the effect of colours on the human body, the doctrine of “Colors”[18]. Goethe experimented with the fact that warm colours evoke a feeling of well-being, while cold colours evoke a feeling of sadness, and long-term staring at coloured glasses raises a person’s depressed mood.

Colours have an impact on a person’s psyche, mood, and even health. Colours play an important role in strengthening human health. In particular, the colour red is a colour that attracts strong attention, is associated with emotions such as love and anger, and is a symbol of danger, courage, strength and prosperity.

Red colour shows a strong influence on the nervous system of the human body, encourages creativity. Green is an expression of growth and health, freshness, endurance. The green colour calms the soul. Blue and green colours have a special feature to normalize body temperature, blood pressure and reduce the pain. Blue represents the colour of the sea and the sky, which is a symbol of goodness. People who like the objects in blue colour own confidence, calmness, loyalty and a strong sense of responsibility. Purple is an expression of elegance, majesty and luxury. Purple lifts the human psyche and evokes a propensity for divine emotions. Gray is the colour of compromise and harmony prevents stress and depression, creating a sense of kindness towards others. While white is the colour of purity and perfection, yellow colour enhances the activity of business and curiosity in life, gives light, success and confidence. Yellow alerts the left side of the brain, encouraging clear thinking and quick decision making. Yellow colour evokes a good mood, joy and active life enthusiasm. If there is a yellow item on the desk or in the kitchen, the mood of the person who sees it will rise. Yellow cannot be confused with other colours. Recognition items, items that should attract attention and be noticed - children’s toys, taxis, obstacles and warning signs are all in yellow colour. Additionally, there are some colours as well which can cause a negative impact and overload the nervous system, the heart of which, bad memories play the characteristics of colours. The dark blue colour lowers attention and impairs performance. Brown is a very “boring colour”. The black colour is the colour of mourning and obstacles on the road, denoting a sense of hopelessness, and fatigue.

The effect of colours on the human body and psyche has been used in international treatments in medical treatments and has not lost its importance so far. In particular, a patient with jaundice was dressed in yellow. Yellow colour helps very well in peptic ulcer, duodenal ulcer, gallbladder, vascular diseases, varicose veins, and nerve and brain tension. Yellow fruits and vegetables overcome laziness. Yellow colour improves appetite, gastro-intestinal pain, a person’s work capacity at work, concentration on work, raises mood and memory consolidation and intelligence. The red colour is useful in skin diseases, infectious diseases (measles, rubella), anemia, low blood pressure, suffering from insomnia. A person who sleeps wearing a red T-shirt

or shirt wakes up mentally and physically, and his mood is high. Red colour increases internal strength, improves metabolism and blood circulation. Red fruits and vegetables lift the mood.

Orange helps with mental fatigue, depression, mood swings, high blood pressure, loses fatigue, overcoming fear and anxiety. Orange-coloured fruits and vegetables increase cheerfulness. Green colour improves heart rate, relaxes the eyes, and helps well in eye diseases: glaucoma, high blood pressure, kidney disease. Actively fights allergies, helps calm the nerves, lowers eye and blood pressure, and helps with heart disease. Blue is useful for people with asthma, whooping cough, frequent colds, and overweight. After waking up, exercising outdoors and gazing at the sky calms the human spirit, boosts immunity, and gives endurance to body and soul. When the mind is tense, tired of mental work, the colour blue relaxes the nerves and gives joy to the mood. Blue colour helps with insomnia, coughs, sinusitis, sore throats. Dark blue fruits and vegetables help to overcome depression.

Purple enhances intuition (inner perceptual power), deeply understands social phenomena that others cannot see or understand, and gives others a spiritual uplift. In today's fast-paced world of technology, man is doing all the work with the help of technology. As a result, another problem has been added to the list of universal problems – mass obesity. Man always strives to be rich. With the help of colours, it is possible to solve this problem, that is, the colour of the kitchen helps to lose weight. If the kitchen is red, orange, and yellow, the kitchen colour should be changed to green and blue and colours close to it. Because red, orange and yellow colours whet the appetite, green and blue colours calm the stomach. Those who are prone to obesity should avoid red, orange and yellow coloured meals.

CONCLUSION

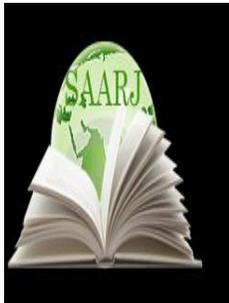

Therefore, the colour blue suppresses the appetite. Depending on which colour a person chooses more, it is possible to know about his psyche. The inner world of man is surrounded by diverse and colourful impressions. It is important for a person to be able to direct the experiences that express his heart from the diversity of these worlds of impressions, which sprout in his mind and illuminate the seeds of leafy thoughts, which show his personality, who he is, what he is capable of, what potential he has. The feelings of a “dirty” person are in a state of light.

Man receives spiritual nourishment from colours. He uses something in a colour he likes. He rejoices in the colours that suit his soul, his spirit is refreshed, he rejoices. The world of colours invites man to a unique philosophical observation.

MULTIPLE INTELLIGENCE THEORY IS THE WING WHEREWITH WE FLY TO CLASSROOM

Dr. D. Bellarmen*

*Assistant Professor,
 Department of English,
 Government Arts and Science College,
 Pudukottai- Tamilnadu, INDIA
 Email id: bellarmen@gmail.com

ABSTRACT

Multiple Intelligences developed by Howard Gardner play a primary role in Education today. The concept of smart classrooms in schools and colleges has become the most common means of teaching and has produced excellence in methods of English Language Teaching. The teachers in colleges should be aware of the fact that students coming from schools have their individual intelligence profiles. But the problem is they differ in their profiles. Obviously the differences affect the students' learning process in a large classroom and the question is how should teacher face such diversity in classroom situations? In light of this question, the paper attempts to discuss strategies to invest in the teaching-learning processes so that the teachers look beyond traditional methods of classroom teaching and continue the track of application of multiple intelligences. The paper focuses on teaching speaking and listening skills and attempts to involve suitable intelligence theories. The strategies that were examined in classrooms are encouraging. The feedback from the students proves that the strategies are a worthy target for achieving standards in improving their speaking and listening competencies

INTRODUCTION

English language teachers adopt various languages teaching methodologies e.g. Audio Lingual Method, Direct Method, Grammar-Translation Method, Community Language Learning, Natural Approach, Total Physical Responses, Communicative Approach, etc. But what is more important for teachers is to think what the most appropriate approach to teaching the language in that particular environment is and what activities are suitable for a given group of learners. The methods in English classroom link the thoughts and the actions of the teacher. As Freeman in “Techniques and Principles of Language Teaching” points out, there is always a ‘thought-in-action links.’ The author continues that as a teacher of language, he has thoughts about the subject matter – what language is, what culture is – and about the students--who they are as learners and how they learn (37:2000). Hence, it is important for a teacher to become aware of how his thoughts guide the actions in the classroom. This awareness examines what is to be done differently so that the learners can perform better in their communicative English. However, what is to be done requires the learners’ response in applying their intelligences.

Acquiring English language is undoubtedly a result of exposure and practice. Teaching and learning become a hard task unless we choose the suitable material for practice. A constant effort is required to produce and manipulate the materials in accordance with the interests of the learners. Otherwise it becomes frustrating and demotivating for teachers and learners as well. An agenda for exploring and supporting suitable pedagogy is the need of the hour and multiple intelligences unveil academic strengths and honors alternative ways of learning, which can be highly helpful when educating students. Teaching and learning through the multiple intelligences optimizes the learning experience for students and teachers alike.

‘Speaking and Listening’ – The corporate skills

Communication involving listening and speaking skills in a workplace environment is a vital one and should not be overlooked. These skills are the most important aspects of corporate communication. Effective communication creates a positive environment and influences one another. To enhance the status of speaking, the teaching profession needs to address these issues along with acknowledging the classroom procedures which foster interaction. Speaking and listening being interactive skills are considerably different from writing and reading. The former involve interpersonal communication where we are engaged face-to-face communication with one or with more other people. Multiple intelligence activities enable teachers to know their students and plan more effectively, in order to prepare them employable in the global market and empower them to demonstrate good communication skills such as speaking and listening.

Multiple Intelligences – The Theory

The theory MI was developed by Howard Gardner who explored the question, what are the mental abilities that support the wide range of adult roles over time and across culture? He suggested that intelligence be described as the combinations of psychological and biological characteristics that enable individuals to solve problems or create products that are valued in one or more cultures (Gardner, 1999). This suggests that thinking, problem solving, and creating are valued differently depending on the family and community where individuals live, learn and work. Teachers should be aware of the fact that students in a classroom are different from each other in many different ways. They have different strengths and weaknesses. It is the fact that

each student has their own individual intelligence profile from the list Gardner suggested. They are:

- Verbal-linguistic
- Mathematical-logical
- Visual-spatial
- Bodily-kinesthetic
- Musical-rhythmic
- Interpersonal
- Intrapersonal

In 1997 Gardner added an eighth intelligence type to the list, that of naturalist intelligence, and two years later a ninth type, that of existentialist intelligence.

Multiple intelligences – The road to travel

MI theories have had the most appeal in the classroom as all the students have any one of the intelligences stated by Gardner. Probably, no one uses just one type of intelligence and they use several in their learning. MI theory is not a “type theory” for determining the one intelligence that fits. It is a theory of cognitive functioning, and it proposes that each person has capacities in all eight intelligences. (page15)

For example, a teacher in an English literature classroom needs to emphasize verbal intelligence while the same teacher switches over logical and mathematical intelligence in an engineering environment. The theories can perform as a conceptual frame work for improving speaking and listening skills while determining the learners’ intelligences.

The responsibility is on the teachers’ shoulder to adjust their teaching methods to match the learners’ use of intelligences. While speaking with one another in a working environment we use non-verbal signals, gestures, facial expression, body language even our appearance. Therefore, acquiring speaking skill needs to equip with some visual aids in a classroom for a better understanding of speaking as a corporate skill. Taping the visual intelligence of the learners is very much required for acquiring such skills. How to listen effectively in a work place involves reflection and clarification. Appropriate decision making can be arrived at the way we reflect logically. Listening in a work place inevitably reflects the power of logical intelligence.

The teaching needs to cater multiple intelligences for the approach we adopt. However, imposing any type of intelligences prove to be ineffective since a student from a group who responds to a use of diagrams records visual intelligence and the rest of the group may fail to respond to the same.

Being aware of what are the strengths, learning styles, and areas of interest of the students a teacher can make informed decisions with respect to the appropriate pedagogical strategies to use in the classroom. Michael Berman in his Multiple Intelligences Road to an ELT Classroom suggests the way of identifying the learning styles of students by giving them a questionnaire and the same is given as Appendix I.

The development of modules the selection of resources, groupings of students, and adaptations needs to focus on the theories In order to achieve effective, differentiated instruction in the classroom. Listening to songs, movie dialogues, attending lectures, etc. involve musical, verbal, interpersonal, visual, verbal/linguistic intelligences. Speaking activities like encouraging the students to tell stories, acting a skit with gestures, illustrating a picture, holding a discussion incorporate multiple intelligences.

CONCLUSION

In the second language classroom it is possible to motivate learners by activating multiple ways of meaning-making through the use of tasks relating to the different intelligences. Providing a variety of language activities that stimulate the different tools or intelligences proposed by Gardner makes it possible to engage multiple memory pathways necessary to produce sustained deep learning English is a global language and in fact, we have conquered the conquerors' language. The ability to speak and to understand global English will facilitate our Indian youth's careers. Teachers are the shapers of future India and they have a crucial role to play in their ESL classrooms. To conclude with the EST specialist Julian's statement, the only requirement is that the EST teachers should have more energy and willingness to respond to the challenges and prove to the scientific and technological community how much they have to offer to them. The present study is 'a small step' towards awakening the teachers to the challenges to the great prospects that await them.

Appendix I

A Multiple Intelligences Road To An ELT Classroom

What Kind Of Learner Are You?

1. How can other people best interpret your emotions?
 - a. through your facial expressions
 - b. from the quality of your voice
 - c. through your general body language
2. How do you manage to keep up with current events?
 - a. by reading the newspaper thoroughly when you have the time
 - b. by listening to the radio or watching the TV news
 - c. by quickly reading the paper or spending just a few minutes watching the TV news
3. What sort of driver (or passenger) are you?
 - a. you frequently check the rear view mirror and watch the road carefully
 - b. you turn on the radio as soon as you get into the car
 - c. you can't get comfortable in the seat and continually shift position
4. How do you prefer to conduct business?
 - a. by having face-to-face meetings or writing letters
 - b. over the phone because it saves time
 - c. by talking while you are walking, jogging or doing something else physical
5. How do you react when you're angry?
 - a. by clamming up and giving others the silent treatment
 - b. by quickly letting others know when you're angry
 - c. by clenching your fists, grasping something tightly or storming off
6. How would you describe the way you dress?
 - a. a neat and tidy dresser
 - b. a sensible dresser
 - c. a comfortable dresser
7. What do you think the best way is to discipline a child?
 - a. to isolate the child by separating him/her from the group
 - b. to reason with the child and discuss the situation
 - c. to use acceptable forms of corporal punishment
8. How do you behave at meetings?
 - a. you come prepared with notes and displays
 - b. you enjoy discussing issues and hearing other points of view
 - c. you would rather be somewhere else and so spend your time doodling
9. What do you like doing in your free time?
 - a. watching TV or going to the cinema
 - b. listening to the radio, going to a concert or playing a musical instrument
 - c. engaging in a physical activity of some kind

◆◆◆ 2 ◆◆◆

Unit 1: Learning Styles And Intelligence Types

10. What do you consider to be the best way of rewarding students?

- a. writing positive comments on their work
- b. giving oral praise to the student
- c. a pat on the back, a hug, or some other appropriate physical action

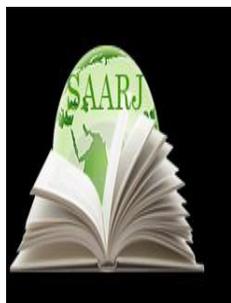

What Your Score Means

If most of your answers are **A**, then your modality strength is visual. In other words, you learn through seeing things and you like everything to be written down on paper. In a classroom, having notes and the use of visual aids will help you.

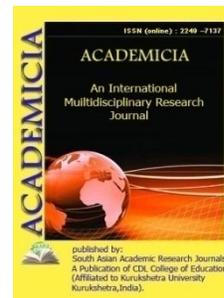

If most of your answers are **B**, your modality strength is auditory. In other words, you learn through listening. In a classroom you will want to hear the new language, and listening to music could well be helpful.

If most of your answers are **C**, your modality strength is kinesthetic. In other words, you learn on the move or through movement. Sitting passively in a classroom is unlikely to appeal to you but you'll probably respond well to the use of games and role-play.

ABSTRACT

This article contains theoretical and methodological materials on the problem of forming a healthy lifestyle in preschoolers by means of a computer in combination with methods of physical education. In the words of our President, "it is not necessary to reinvent the bicycle, it is necessary to make effective use of advanced foreign experience, for example, the experience of South Korea." A number of researchers have noted that most parents complain that children in kindergarten complain of indecent, rude behavior. They also note that they have difficulty repeating more complex exercises.

KEYWORDS: *Preschool Education, Physical Development Of The Preschoolers, Information And Communications Technology, Multimedia System, Physical Education.*

INTRODUCTION

The establishment and operation of the Ministry of Preschool Education in our country has made it possible to carry out serious reforms in preschool education. During the state visit of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Republic of Korea, the

Ministry of Preschool Education held about 20 meetings and exchanged experiences. The advanced Korean experience was studied in detail, and agreements were reached on joint training and scientific research.

RESEARCH METHODOLOGY

The above-mentioned factors suggest that serious reforms will be carried out in the field of preschool education, maximum favorable conditions for teachers in the field of preschool education will be created in the near future, the social status of teachers will increase, creating a social environment for children to express themselves, the furnishing of rooms, many literature, games to develop children. Provides for the implementation of a number of innovative approaches and processes, such as.

In the decision of the President of Republic of Uzbekistan dated September 30, 2017 №. PD-2707 "State requirements for the development of primary and preschool children have been developed" in pursuance of the resolution "On measures to further improve the system of preschool education in 2017-2021" and began to be implemented. The document states that "the purpose of state requirements is to bring up a spiritually perfect and intellectually developed person in the preschool education system, taking into account the ongoing socio-economic reforms in the country, the best practices of foreign countries and scientific achievements and modern information and communication technologies." One of the "tasks of state requirements" is "the introduction of pedagogical and modern information and communication technologies in the educational process."

In this report, we consider the use of new information technologies in the physical development of children aged 5-6 in preschool education.

In our opinion, many aspects of the problems of using ICT in physical education classes in preschool education institutions have not been developed in detail and a detailed methodology for its use has not been developed. Analyzes show that the use of ICT in physical education classes in preschool institutions is not practically established. Advanced foreign experience has not been studied, generalized, introduced into practice. In the words of our President, "it is not necessary to reinvent the bicycle, it is necessary to make effective use of advanced foreign experience, for example, the experience of South Korea." Our observations and the study and analysis of the situation in the preschools show that in order to positively address the problems posed by the President, it is necessary, first of all, to improve the financial and technical base of preschool institutions. Besides also be noted that there are (in all its types) a number of problems in preschool education. These are: some financial and economic problems; methods of using information and communication technologies for preschool children (in Uzbek groups), psychological and pedagogical bases, No special research has been conducted on the health of children, taking into account the characteristics of children's age, criteria have not been developed; Insufficient training of ICT educators and service staff; Lack of computer technicians in preschools; the lack of software, especially special pedagogical software tools (taking into account national characteristics) for preschool children. Therefore, we note the need to develop a program for the use of ICT in preschool education in the future.

It should be noted that the "Concept of Development of Preschool Education System until 2030", adopted by the President of the Republic of Uzbekistan on May 8, 2019 PD-4312, has a program to positively address the above issues. The main focus should be on reconsider the preparation of

students of pedagogical universities and colleges of preschool education, who are preparing to serve in the field of preschool education, for the consume of ICT in practice. The experience of a number of foreign countries (USA, France, Korea, Russia, etc.) shows that the opportunities for the use of ICT are very large and promising, especially in the educational process in preschool institutions, especially during physical education.

The main results of scientific research

Physical education in preschool - means inculcating healthy lifestyle norms by teaching children to move and nurture physical qualities. The aim is to strengthen the health of children through physical education and to form their proper physical development and personal qualities, such as courage, perseverance, initiative, resourcefulness, willpower, organization, conscious discipline, diligence, and most importantly, patriotism. Based on the study and analysis of best practices (technologies) in a number of developed countries, we can say that at the current stage of social development, scientific and technological development, the use of ICT in preschool education is one of the most promising areas.

Based on the studied and analyzed sources, it can be said that In order to ensure the effective use of ICT in physical education classes in preschool education institutions, preschool educators and teachers must be fully trained in the following items: development and use of control and self-monitoring software in various areas of physical education; creation of multimedia teaching systems; creating and using a database; creation and use of functional diagnostics.

As we noted above, the appropriate and correct use of the big screen in the application of ICT not only develops the intellectual abilities of preschool trainees, but also shapes their motor skills as well as the coordination of eye analyzers.

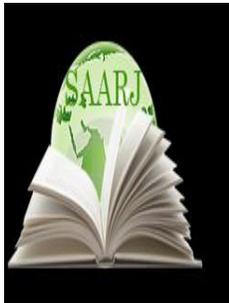

A number of researchers have noted that most parents complain that children in kindergarten complain of indecent, rude behavior. They also note that they have difficulty repeating more complex exercises. Some children, even at the age of 5-6, cannot distinguish between left and right concepts. This does not mean that children are mentally retarded, but it is also wrong to think that such a condition will go away on its own. Our experience shows that computer technology has great potential in overcoming such shortcomings.

In conclusion, it should be noted that. The use of ICT in preschool institutions is not a goal but a means of developing creative and physical abilities in kindergarten children aged 5-6. In the process of education requires a radical reconsideration of the content and plan of the educational process in preschool education. It is necessary to follow a few principles that are familiar to everyone. These are continuity, sufficiency, sequence and some the principles of the formation of certain practical skills. In this article, we have tried to express our views on some of the problems and solutions to the use of ICT in the physical development of preschool children.

THE ROLE OF MUSEUMS IN THE ACTIVITIES OF THE UNIVERSITY AT BUKHARA STATE UNIVERSITY

Azimova Muhayyo Murotdilloevna*

*Teacher,
 Faculty Art history,
 Department of Fine Arts and Engineering Graphics,
 UZBEKISTAN

ABSTRACT

This article describes the processes and problems related to the exposition, scientific and fund activities of the Museum of Repression Victims and the Scientific-Practical Museum Laboratory in Bukhara State University, the scientific and practical basis of the museum's development and its role in the development of the university.

KEYWORDS: *Museum, Exhibit, Musicology, Exhibition, Storage, Sector Of Records, Research, Historical Monuments, Tourism, Activities, Improvement, Scientific And Practical, University, Victims Of Repression, The Young Generation.*

INTRODUCTION

Museums play an important role in informing the present generation about the history of our country, the rich spiritual heritage of our people. Therefore, the necessary conditions and opportunities are being created in our country to improve the activities of these institutions, their operation at the level of modern requirements.

The role of museums in instilling in the hearts of the younger generation a sense of respect for our spiritual heritage is invaluable, therefore, today museums are not only a sacred place that preserves and displays artifacts that tell the story of our people, but also a place of spirituality, which is important in the development of the education system, the education of the younger generation.

In 1922, by the decision of the Bukhara People's Republic, the Institute of Public Education was opened in Bukhara and Charjou. This was the first attempt to establish a modern university. F.Khojaev and A.Fitrat came up with the idea of establishing dorilfun on the basis of this institute, but with the abolition of the ICU this idea did not materialize. In 1930, the Bukhara

Pedagogical Institute was opened. Initially, 45 students studied in two departments: chemistry, biology and history and society. In 1935, the Bukhara State Pedagogical Institute had a two-year teacher's institute and five departments, which were later transformed into faculties. Scientists such as A.Fitrat, Miyonbuzruk Salihov, Musa Saidjanov, B.Choponzoda, I.Kojin, F.Trudakov, P.Korolenko, N.Merkulovich, V.Abdullaev, G.Yusupov have made a great contribution to the establishment of the institute. During World War II, a number of teachers and 47 students volunteered for the war. During this difficult period, branches were opened in Karshi, Gijduvan and Shafirkan in order to attract more students to study. Khorezm, Karshi and Termez state universities, which have now risen to the level of leading universities in independent Uzbekistan, were the first to operate as branches within the Bukhara State Pedagogical Institute.

In the post-war years, Bukhara State Pedagogical Institute became famous as one of the leading scientific institutions of the republic: the number of students increased from 521 to 1575 in 1946-1960, and 7531 in 1960-1980; M.Mirzaev, Sh.Balavadze, S.Aliev, M.Abdullaev, V.Muminov, N.Jabborov, J.Namozov, H.Nematov, F.Kosimov, B.Ochilov, R.Vakhidov, O Dedicated to science and education such as Safarov, A.Atoev, O.Yoriev, R.Rakhmonov, K.Zaripov, S.Inoyatov, O.Rozikov; areas of science such as chemistry, physics, solar engineering, ichthyology, philosophy, history, literature, linguistics developed; In 1989, a postgraduate course in linguistics and literature was opened at the Bukhara State Pedagogical Institute. The institute became one of the centers of modern science of the republic and in 1981 was awarded the Order.

People's Poet of Tajikistan, winner of the State Prize named after Rudaki G.Sulaymonova, People's Poet J.Kamol, People's Writer N.Aminov, Corresponding Member of the Academy of Sciences of Belarus A.Stolyar, Director of the Academy of Sciences of the Republic of Uzbekistan named after A.Navoi, Ph.D. It is worth noting that T. Mirzaev, world champions S. Kurbanov and B. Khodjaev were students of BuxPI.

The institute was transformed into a university in 1992. According to the Decree of the Republic of Uzbekistan dated February 28, 1992, the Bukhara Pedagogical Institute was granted the status of the University. Thus, the scientific potential of the university has been replenished and strengthened year by year. This necessitated the establishment of a special publishing house and a scientific journal at the university. In order to meet this vital need, in 2000 a special publishing house was established at the university. The journal "Scientific Information of Bukhara State University" serves all researchers, not only in Bukhara, but also in other universities of the country, who are actively engaged in scientific research.

Bukhara is one of the most famous and beautiful cities in Central Asia, and this magnificent city itself is a museum, which houses many cultural and architectural monuments of different periods, and more than 140 medieval buildings and structures. The historical center of Bukhara, along with its attractions, is included in the UNESCO World Heritage List.

Indeed, our people of Bukhara have a history and culture worth being proud of. Bukhara State University also has a number of museums, including the "Scientific-Practical Museum Laboratory" dedicated to the 85th anniversary of Bukhara State University and the "Memory of Victims of Repression" in Bukhara State University, which opened on May 18, 2018. An example is the museum.

The exhibits and equipment of the museum "Scientific-practical museum laboratory" are formed on the basis of the exhibits of the previous museum of the university. In order to enrich the

composition of the museum and to organize it in accordance with modern requirements, the scientific base was updated on the basis of a modern base in cooperation with all faculties. In addition, in order to preserve the exhibits in the museum, an inventory was carried out in collaboration with a group of professors and teachers to register them. If you visit this museum, you will see the museum exhibits and photos, and the history of the university will be in front of your eyes. On the walls of the museum are exhibited photos of rectors who have worked at the university since its inception, as well as professors and teachers who have served in the development of our university, ie our labor veterans and their achievements. In addition, the achievements of students in international and world competitions are presented in the form of exhibits, and you can see a variety of other exhibits.

May 18 marks two years since the establishment of the Museum of Repression Victims in Bukhara State University. During this time, the museum hosted many visits and spiritual and educational activities, which created many opportunities not only for the museum, but also for our university, including 2019 On January 21, the Republican scientific-practical conference dedicated to the 125th anniversary of the Bukhara enlightener-jadid Musojon Saidjanov was held.

On May 25, 2019, employees of the Boston Museum of Art in the United States held a roundtable discussion with Nancy Berliner and Director of the Tamil Simon Museum A. Hamroev. On June 21 this year in the Great Hall of Bukhara State University together with the Museum of Repression Victims of Bukhara State University was held a spiritual and educational event dedicated to the 80th anniversary of the People's Poet of Uzbekistan Jamol Kamal and the presentation of the 6-volume selection.

September 16, 2019 Bukhara State University received a delegation led by Karina Tatek Benetti, Executive Officer of the Department of Economic Statistics, Liberec Technical University of the Czech Republic. The Czech guests visited the Museum of Repression Victims in Bukhara State University and got acquainted with the exhibits. A small roundtable discussion was held between museum staff and visitors.

October 15, 2019 According to the Resolution of the President of the Republic of Uzbekistan dated November 28, 2018 "On approval of the concept of further development of national culture in the Republic of Uzbekistan" developed a program of measures to implement this concept in Bukhara region for 2019-2020. On the basis of this action plan by the staff of the "Mobile Exhibitions" department of the Bukhara State Museum-Reserve Bukhara State University hosted a mobile exhibition entitled "Maziy and today." The exhibition is an event within the framework of 5 important initiatives of President Sh. Mirziyoyev and was organized by the Faculty of Art History of Bukhara State University in cooperation with the Museum of Repression Victims of Bukhara State University.

In addition, there have been many visits, cultural and educational events and exhibitions, where the question arises, what is the role of museums and their visits, cultural and educational events and exhibitions in the activities of the university? Their role is unique in the "Scientific-Practical Museum Laboratory", which embodies the history of the university, because there is no future without historical memory, that is, the museum serves as a basis for the activities of the university and inspires pride in the hearts of every student.

The Museum of Repression Victims in Bukhara State University has achieved a lot in a short period of time and made a significant contribution to the activities of the university, including the establishment of cooperation with a number of state museums. These include Poland, the United States, China, the UAE, Austria, Germany and Russia. As for the practical aspects of the cooperation, the museum director A. Hamroev will travel to Poland in October 2018, China in December 2019 and museum employee B. It should be noted that Kurbanov had an internship at the German Museum. From January 30 to February 3, 2019, Vice-Rector for Research of the Moscow State Institute of International Relations (MGIMO) Evgeny Mikhailovich Kojokin visited Bukhara State University and got acquainted with the funds and exposition of the Museum of Repression Victims in Bukhara State University. In the film "Abduvahid Munzim and his descendants", which is planned to be shot by T.f.d., Professor Evgeny Mikhailovich Kojokin, it was agreed to jointly create a documentary film using the most valuable photos stored in the exposition of the Museum.

In short, shortly after the opening of the Museum of Remembrance of the Victims of Repression in the structure of Bukhara State University, he established many partnerships, served the university and introduced it to the world. In addition, these museums have been closely assisting university students in their practical classes and have made a great impression on them. It should be noted that our museums serve not only university students, but also other students of the institute, schoolchildren and curious people of different ages, which is of great importance for the development of our university.

EUPHEMISMS AND RELATED EVENTS IN SOCIOLINGUISTICS

Safarova Guzal Kudratovna*

*Teacher,

Department of "Applied Linguistics and Linguodactics" of University of Uzbek language and literature named after A. Navoi,
 UZBEKISTAN

ABSTRACT

The article first analyzes the research in the field of sociolinguistics, focusing on the social nature of language, the relationship between language and society, theoretical issues of sociolinguistics, language ontology, functional classifications of language, linguistic devices. The conceptual apparatus of sociolinguistics and the most common terminological units used in scientific works on sociolinguistics are analyzed and described, the processes of formation, development and problems of the field of sociolinguistics are described. The article also focuses on the phenomenon of euphemism, its interpretation as an event that is integral to the emergence of language and thought, developed as a phenomenon that has gone through evolutionary stages, such as language itself. connection with speech activity in the process of communication, social, psychological, linguistic bases; the expression of units, the pronunciation of which in Uzbek is contrary to moral norms, which is considered unpleasant and shameful, their lexical-semantic at the stage of euphemism of certain discourse / speech communication, speech factors such as structural appearances are proven; Extensive research on the formation factor, etymological source, spiritual group, functional aspect, national-mental characteristics of language phenomena in world linguistics, euphemisms as an ecological phenomenon and a means of cultural communication in gender, social, pragmatic, linguacultural, lexicographic, as well as sociolinguistic an attempt has been made to prove the need for in-depth study through the analysis of scientific sources.

INTRODUCTION

Formation and development of the field of sociolinguistics

The aspect of studying the sociological aspect of the study of language has long been of interest to linguists. After all, the development of language, changes in it are directly related to the development of society. In scientific sources that existed until the early twentieth century, linguistics is another concepts related to sociolinguistics in relation to the sciences. The development of sociolinguistics, which has emerged and is being studied at the intersection of the fields of sociology and linguistics, depends, of course, on the extent to which the fields have been studied. In other words, it is natural that the events that take place in social life are reflected in language to one degree or another. However, it has been acknowledged by linguists in their time that this process has not been recognized for many years, and that the internal potential of each language has not been fully reflected in studies (I.A. Baudouin de Courtenay, F. de Saussure). The term sociolinguistics is a compound word that consists of parts of sociology and linguistics. Socio is an abbreviation of the word "social", which means linguistics. Indeed, sociolinguistics should be considered as a science that studies the social conditioning of language in terms of formation, construction, development, the impact of language on society, the impact of society on language. Indeed, when sociolinguistics studies the laws of life on the basis of linguistic facts, it is necessary to understand its peculiarities. A clear example of this is the naming of sociolinguistics in the field under several terms. In particular, "social language", "social linguistics", "sociality of linguistics", The use of terms such as "philosophical linguistics", "socialization of language", "sociolinguistics" indicates that this field has its own characteristics.

Sociolinguistics and sociolinguistics are different concepts. In the current process of globalization, the integration of science and education, interdisciplinary relations, the boundaries between them are becoming more relative. An example of such a science is sociolinguistics, which is developing at the intersection of sociology and linguistics. Sociolinguistics with the language of linguistics and its existing social conditions is an area that studies dependence. Social conditions are a set of external conditions under which a language develops: the society of people who use the language, the social structure of the society, the age of the speakers, their social status, culture and education, differences between places of residence, as well as their speech. differences are understood. Thus, sociolinguistics is a branch of linguistics that studies the role of language in society, its social nature, social functions, the mechanism of influence of social factors on language. While pure linguistics deals with the analysis of linguistic signs, such as sound and its written expression, its interactions with other signs, and changes in time and space, sociolinguistics deals with how people use these linguistic signs according to their age, gender, social status, education, and culture. that is, learns how the social environment affects their speech behavior. For example, in "pure" linguistics, the phrase "to go to the roof" is interpreted as a phrase logical unit consisting of a noun and a verb, while sociolinguistics is interested in which class the phrase is used in.

The term "sociolinguistics" was first introduced to science in 1952 by the American sociologist G. Currie (1952). Problems of sociolinguistics were raised in the articles of linguists,

sociologists, cultural anthropologists, dialectologists and various specialists in the field of communication of the 50s, which are included in the collection of J.A. Fishman "Readings in the Society of Language". In the preface to the book, J.A. Fishman draws attention to the use of the term's linguistic sociology and sociolinguistics as synonyms. According to some sociolinguists, the roots of sociolinguistics should be sought not in American linguistics, but in European, especially Russian linguistics. In the formation of sociolinguistics, I.A. Baudouin de Courtenay's research on the social conditioning of language phenomena, as well as the influence of extra linguistic social factors on the use and development of language, played a major role. In an article published in the journal *Russkiy yazyk zarubejom* in 1974, NG Mikhailovskaya I.A. Baudouin de Courtenay was named the founder of socio-ethno linguistic research in Russian linguistics. I.A. Baudouin de Courtenay: "Since language exists only in a society of people, then we must always pay attention not only to its spiritual side, but also to its social side. Not only individual psychology, but also sociology should serve as the basis of linguistics.

However, the first study of language sociality in the sources was conducted by R. O. It is noted that Shore was given in his book *Language and Society* (1926). In the book, the author describes his scientific observations about the social impact of society on language. Experts point out that the term "sociology of language" was first coined by R. O. Can be used by Shore. For comparison, R. O. Shore sought to identify changes in language in the context of the conditionality of changes in language with changes in society.

R.O.Shor was interested in the reflection in language of the differentiation of the language community due to economic and social differentiation: "... language is a social phenomenon, ... if there is an environment for language preservation and transmission, a social environment, then every social difference should be reflected in the differentiation of language, each language change should reflect the social (and economic) changes in the life of the community, which is the property of the language ". Thus, in the first half of the twentieth century in the schools of linguistics in France, Russia, the Czech Republic, great importance was attached to the social nature of languages.

Russian linguists I. A. Boduen de Kurtene, E.D.Polivanov, L.P.Yakubinskiy, V.M.Jirmunskiy, B.A.Larin, A.M. Selishev, G.O.Vinokur, French linguists F.Bruno, A.Meye, P.Lafarg, M.Coen, Swedish linguists Sh.Balli, Belgian linguist J.Vandries, Czech linguists B.Havranek, A.Matezius contributed to its formation as a science. The works of such scientists as A.Nurmonov, H.Ne'matov, S.Muminov, A.Mamatov, B.Mengliev, L.Raupova in Uzbek linguistics are also commendable. Euphemisms as a multifaceted, changing phenomenon

Euphemism as a term dates back to ancient times of human thought. The observation of euphemisms from the studied sources shows that there is almost no discussion about its origin, formation and development. The term means "good", "comfortable", "soft" in Greek. In its earliest uses, it was used in the sense of "using words with good signs, refraining from words with bad signs, respectful silence." Euphemisms, which are very sensitive to social relations, are characterized by the fact that the "carrier" units of euphemistic content change their status rapidly. As he becomes accustomed to it, he quickly changes his "appearance" - even, so to speak, becomes dysphemism, and begins to feel the need for a new expressed - ephemeral dress. If we look at the relevant sources in the field, we can see that the first scientific observations about euphemisms were made by the linguist R.O.Shor. R. O. Shor studies the problem of the

evolution of language with time, regional and social dialects, tourism, various phenomena of individual language life, emphasizes the facts of language merging and the conditions of koine (or common language) activity. He is interested in the hidden languages, their causes of origin, the peculiarities of their operation, their relation to the "common language." Based on the same data, the problem of interpersonal communication is already R. O. One can agree with the observations that it was considered by Shore. He writes that mutual understanding between two interlocutors is possible only in the context of the same cultural and linguistic unity. Speaking of changes in the meaning of words, R. O. Shore mentioned the existence of euphemisms; compares the concepts of language taboo and euphemism. Each language creates a special system of emotion expression, ways of realizing expressiveness, and forms of expressiveness. In the competition between the system of expression of meanings and the system of expression of emotions, the opinion of the speaker is expressed as he believes. In the last pages of the book "Language and Society" (1926) R. O. A brief glossary is added by Shore, which we believe may also include sociolinguistic terminological words, as the author repeatedly in the pages of the book discusses women's languages, language sociology, linguistic phenomena and their social and linguistic differentiation, regional and social dialects, special languages, such as the synchronous and diachronic description of language. The transition of euphemisms to general use weakens its euphemism. In this sense, the opinion of the linguist B.A. Larin is noteworthy: "Euphemisms are not stable. The condition of its existence is the existence of an alternative to the "rough", "impossible". As "rough" expressions lose their roughness and people become accustomed to euphemisms, he falls out of the euphemistic scene. It is one of the most meaningful terms, and now it is demanding a new euphemism." In this regard, linguist L.P. Krisin states: "The stronger the social control over the speech situation and the speaker's self-control over the speech, the more likely it is that euphemisms will arise, and vice versa, in less controlled speech situations and higher speech. In the context of automatism (in the family, with friends, etc.), euphemisms are less used, and the use of dysphemism's increases. Special services of linguists such as G.Paul, R.O.Shor, B.A.Larin, L.P.Krisin, A.S.Kurkiev, E.P.Senichkina on the study of euphemisms can be noted. In most linguistic sources, the main subject of euphemism is its awkward, "careless" substitution of words and expressions, "veiling". For example, the linguist OS Akhmanova notes that "euphemism (antiphrasis) is a trop, a means of expressing a phenomenon and an object in a closed, soft and indirect way." indirect, periphrastic expression". In general, the same essence can be interpreted differently in the above definitions, but they are all unique in that they complement the general meaning of "striving to avoid conflict in communication" in different ways. A. Reformatsky understood the phenomenon of taboo and euphemism in a broader sense and:

- 1) at the request of military diplomacy to change the names of countries, cities, enterprises, military units and some celebrities with a symbol n (en), nn (enen), x, u, z (ix, igrek, zet);
- 2) from the point of view of etiquette, in order not to reveal the names of dangerous diseases, Latin terms, abbreviations (cancer conserve, tuberculosis tbc, surgery is called a surgical disease, etc.);
- 3) Thieves also consider words and phrases that are secretly used in speech (such as killing to sew, stealing to buy) to be a euphemism. In addition to describing many euphemisms in Georgian, K.K. Otaev calls Turkmen children Tursun and Itolmas euphemisms. Linguists also differ on the classification of euphemisms. In particular, B.A. Larin argues that the "social nature

of euphemisms” should be chosen as the criterion for classification. Accordingly, the scientist distinguishes three types of euphemisms:

- 1) general euphemisms of the national literary language;
- 2) class and professional euphemisms;
- 3) family euphemisms.

Apparently, this classification is not without its shortcomings. From the point of view of linguistic, social and cultural development of the language, it is natural to have problems in distinguishing the first group in this classification, especially in view of the spread of literary language in social life, in society. It is also advisable to include social strata, gender euphemisms, instead of the class euphemisms of the second classification mentioned. By distinguishing the third group of euphemisms in the classification, it is possible to support them in view of the fact that their stable classification features are revealed. Linguist A.S. Kurkiev's classification on this problem is based on the "motive" of euphemisms:

- 1) superstitious euphemisms (to be sick - to get sick, to have no taste);
- 2) euphemisms based on fear and protest (killing - taking his life, beheading);
- 3) euphemisms based on sympathy and pity (the patient is not at home);
- 4) euphemisms based on shame (illegitimate birth - a miracle, acquired);
- 5) euphemisms based on politeness (old - old).

Approving the basis of these classifications of the linguist, it is possible to give the opinion that in limiting these groups it is necessary to generalize and optimize them. According to Moscow, “euphemisms are used in six functions:

- 1) to change the names of objects of fear;
- 2) to change the names of unpleasant things and events;
- 3) to change the names of shameful things;
- 4) not to create a negative attitude to others (etiquette euphemisms);
- 5) to mask the essence of the expression;
- 6) not to reveal the names of some organizations and professions ”.

Linguist EP Senichkina, following in the footsteps of AA Reformatsky, LP Krisin and other scholars, puts forward the view that euphemisms are not only neutral, but also specific to other styles of the Russian language. It is understood that the scholar's classification is also based on specific features: euphemisms-taboo isms, facultative euphemisms, euphemisms, historical euphemisms, types of origin, linguistic and occasional euphemisms. The scientist, unlike others, relies on a morphological factor in the classification. Lexical-grammatical specificity, which reflects the category of semantic specificity of words, is taken as a basis. Apparently, while some linguists argue that euphemism is only a methodologically neutral unit (A.P. Moscow), some scholars argue that it applies equally to all functional styles (speech, art, science, journalism, formal) (A.A. Reformatsky, A. M.Katsev, L.P.Krysin, G.Mankovskaya, T.L.Pavlenko and others). It can be said that the second view has gained more recognition in science. The

classification of euphemisms has not escaped the attention of Uzbek linguists. The term euphemism in Uzbek linguistics was introduced in the 60s of the last century through the dissertation of N. Ismatullaev "Euphemisms in the modern Uzbek language" 8. Later, this phenomenon was the subject of a special study by euphemism scholar AJ Omonturdiev. In particular, N. Ismatullaev described euphemisms as: a) taboo-related euphemisms; b) euphemism for heresy; c) euphemisms used in place of words and phrases that have a rough meaning and are difficult to say; g) divided into groups such as eloquence, eloquence, and slang euphemisms used for religious purposes. Linguist A. Omonturdiev made a significant contribution to the development of Uzbek euphemology by studying the functional aspects of euphemisms. HB Kadyrova described the classification of euphemistic units, their methodological features, the author's skill in using euphemistic units. In the scientific works of euphemisms linguists A.Mamatov, Z.Kholmanova, H.Kadirova and D.Rustamova the influence of euphemistic and dysphemistic units on the formation of phraseologies, euphemisms used in "Boburnoma", author's euphemisms and metaphorical features of euphemisms are analyzed. In recent years, the phenomenon of the manifestation of gender features in Uzbek euphemisms and pragmatic, linguacultural factors in the occurrence of gender meaning in euphemisms, as well as lexical-semantic, methodological-functional, lexicographic, ethnos sociological, gender characteristics of medical professional euphemisms The principles related to the occurrence at the language level have also been specifically studied.

Despite a number of studies, there are aspects of euphemisms that still need to be addressed, requiring special analysis. In particular, a special study of the sociolinguistic principles of euphemisms in the Uzbek language is one of the most pressing issues facing science today. Indeed, the fact that world linguistics pays special attention to the practical use of linguistic possibilities, the use of language units in speech and the disclosure of semantic-functional features, shows the necessity of this problem. It is a fact that the weight of applied linguistics, such as communication culture, ortholog, neurolinguistics, applied linguistics, linguistic expertise, is growing day by day. This is explained by the fact that as a result of socio-economic development in world linguistics, the problem of spirituality is becoming more urgent, the solution of these problems is the development of speech culture, communication skills, the growing attitude to language as a means of spirituality. This suggests the need to fully reflect the social need to expand the role of euphemisms, which is one of the rich and beautiful possibilities of language expression.

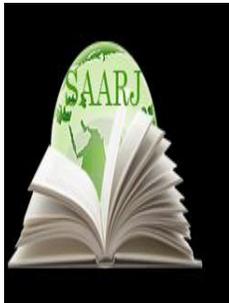

CONCLUSION

1. Sociolinguistics is a branch of linguistics that studies the role of language in society, its social nature, social functions, the mechanism of influence of social factors on language.
2. The process of applying euphemisms is governed by a particular speech situation, context, taste of the speaker, ethics, mental ability, level, culture, beliefs, level of eloquence, age, profession, social class, worldview.
3. Often, a certain culture of behavior, a requirement of morality, causes not to reveal the facts exactly. When this principle is violated, the speech becomes dry, ineffective, insensitive, detached from its decoration: zebu ornament and ibo, loses its effectiveness, which arouses in the listener a feeling of hatred, anger.

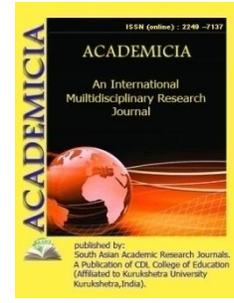

4. New ethical and philosophical ideas related to a particular political and social period or its change are formed in the society. It is this necessity that leads to the emergence of new means of verbal expression. Such means of expression are manifested through a more journalistic style.

ABSTRACT

The article discusses Alisher Navoi's interpretation of Naqshbandiya teachings foundations and provides methodological recommendations. So these students form the basis of Naqshbandi tarikat and they attract attention with their pedagogical nature. According to him, a person who enters this sect must renounce the fidelity, purity and mastering vices the Islam principles, as well as heresy, arrogance and secrecy.

KEYWORDS: *Education, tarikat, Naqshbandiya, Navai, knowledge, study, technology, skills.*

INTRODUCTION

One of the important directions in the higher education process in Uzbekistan is the rational use of the healthy religious enlightenment foundations in improving the future teachers competence. In this regard, the mystical teachings foundations, which have a relatively scientific and pedagogical character, play a particularly important role. In this sense, Naqshbandiyatarikat foundations [1], founded by Bakhauddin Naqshband (1318-1389), are of great importance and are extremely useful in imparting healthy religious enlightenment to the technological education direction students of higher education.

Main part

Naqshbandi yatarikat foundations have been extensively covered by Bakhauddin Naqshbandiya followers. Among them is Alisher Navoi approach (1441-1501). In his poetry and prose, Navoi commented on Naqshbandiyatarikat foundations. In this regard, his interpretation, especially in his scientific work "Nasayill-ul-Mukhabbat" is unique. [2].

According to Navoi, two thinkers approaches - Khoja Abdulkhalik Gijduvani (XII century) and Bakhauddin Naqshband (XIV century) play an important role in the theoretical and practical foundations of Naqshbandiyatarikat [2]. In this regard, we will first focus on Gijduvani's approaches.

According to Navoi's definition, it is "a document in the form of Gijduvani" [2]. This view implication is that Naqshbandi tarikat representatives, which calls itself "Khojagon", accept Gijduvani's "form," that is, their worldview, approach, and practical habits, as evidence for that tarikat. What are they? Navoi explains:

-sidqu safo;

-Obedience to the Shariah of the Prophet (peace and blessings of Allaah be upon him);

-renunciation of heresy and arrogance;

-non-disclosure of secrets [2];

So these students form the basis of Naqshbandi tarikat and they attract attention with their pedagogical nature. According to him, a person who enters this sect must renounce the fidelity, purity and mastering vices the Islam principles, as well as heresy, arrogance and secrecy. For this reason, Gijduvani's "way of life (acceptance) is acceptable and praiseworthy in the eyes of all people" [2].

We now turn our attention to *Naqshband* approaches. Navoi says: "Naqshband is a uwais, that is, they were brought up in the spirit of Khazrat Khoja Abdulkhalik Gijduvani." [2]. According to mystical theory, if the soul of a deceased thinker educates another person through a dream, the educated person receives the title of "uwasi" (spiritually educated). [3] In this regard, Navoi reported that Gijduvani entered Khazrat Naqshband's dream and ordered him to do the following:

-amrunakhiy (striving for good);

-to be a practitioner;

-Obeying the Sunnah (customs) and hadiths (words) of the Prophet (peace and blessings of Allaah be upon him);

-to explore the ways of the great people [2];

It should be noted that Gijduvani encouraged Khazrat Naqshband to combine theory and practice. It was he who paid close attention to the *practical* aspects of Naqshbandi tarikat. Therefore, according to Navoi, Naqshband emphasized **two principles**:

a) solitude at the conference (not to be cut off from society);

b) to be with the people outwardly and with the Truth inwardly. [2].

According to the meaning of the *first principle*, members of the Naqshbandiatarikat can live a secular life in the same way as everyone else;

According to *the second principle*, the world life is based on being with the people, but not forgetting the Truth in the heart;

These two principles ensured that Naqshbandiyatarikat became a world tarikat. For example, the choice of Naqshbandiyatarikat by famous people of the XIV-XV centuries Abdurakhmon Jami, Alisher Navoi, Zakhiriddin Mukhammad Babur, Boborakhim Mashrab, Mukhammadrizo Ogakhi is determined by these principles.

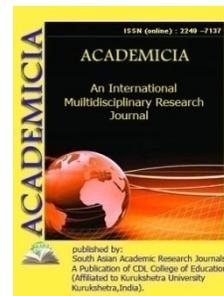

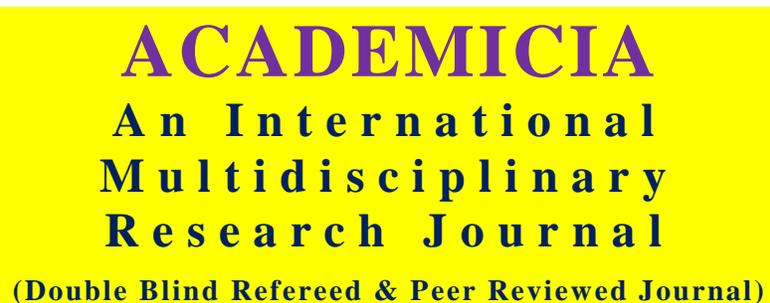

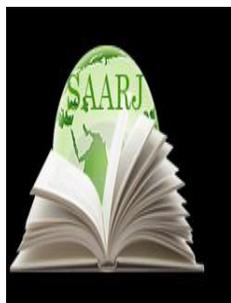

Thus, Alisher Navoi analyzes Naqshbandi tarikat in a unique way. There are two issues to consider:

- 1) An idea developer for the practice of Gijduvoni;
- 2) Naqshband puts the idea into practice;

From a pedagogical point of view, these issues are important and play an important role in explaining the basics of the Naqshbandi sect in order to provide healthy religious enlightenment to students of technological education.

ABSTRACT

This article explains the processes observed in the derivation of verbs, nouns and adjectives, their allomorphic and isomorphic features according to their origin in English and Uzbek languages, as well as the semantic derivation of nouns in comparable languages. In the article, the role of comparative languages in the derivation of related words was studied on the basis of the method of derivation and showed their similar and different features.

KEYWORDS: *Related Words, Allomorphic, Isomorphic, Derivation, Transposition, Semantics Derivation, Syntactic Derivation, Morphologic Aspect, Contamination, Derivation Potential, Substantivation, Adverbialization, Verbalization.*

INTRODUCTION

Until today's period of development of linguistics, many problematic processes related to the language system have been studied and researched. This can be said in the field of general linguistics as well as in the field of Uzbek linguistics.

Any new word that exists in a language takes its original form from speech, and thus the dependence of the artificial word on speech ends. The next life of the made-up word continues in speech, i.e., the made-up word takes its place in the paradigm of its own analogical forms after passing the test of speech activity for a certain period of time. Only derivatives that have fully passed such tests will receive the status of a language unit and, along with other paradigms, will begin to function as a means of enriching the language with new constructions.

Prior to the introduction of the term morpheme in linguistics, the interpretation of the phenomenon of word formation was studied in relation to the meaning and forms of the word. The dividing of morphemes as separate linguistic units has been of particular importance in distinguishing functional parts in word structure, such as word-formers and form-formers. As a result, by the 1960s, the idea that word formation was a separate phenomenon related to morphological phenomena began to be put forward.

MATERIALS AND METHODS

Word formation is characterized by the fact that it reflects the process of formation of units in the status of a single artificial word. This feature indicates that word formation cannot fully cover other types of construction phenomena. In this case, the study of the phenomena associated with the process of language formation on the basis of derivational principles is put forward.

The concept of derivation has so far been used as a logical synonym for the concept of word formation because their basic principle is common. But word formation and the phenomenon of derivation are radically different. We can also see in research and monographs devoted to the derivatology that derivation is a broader concept than word formation.¹

It should be noted that in world linguistics L.N. Murzin studies the construction of syntactic units under the term syntactic derivation.² V.S.Khrakovsky tries to distinguish between these two phenomena³. In Russian linguistics, serious attention has been paid to the study of the phenomenon of syntactic derivation, and as a result, various methods of analysis have been introduced into consumption. We see this more clearly in L.N. Murzin's researches. According to the scientist, the main way to form complex, non-elemental sentences from simple sentences is contamination, which is one of the important processes of derivation. Its essence is that the interaction of ready-made sentences leads to the formation of a new sentence⁴.

M. Kosireva cognitively considered derivational processes of lexical development. Russian, English, German, Spanish, Italian and French related words with international basis were selected as the object⁵.

In the course of our research, we have witnessed that the issues of derivatology are observed at all levels of linguistics today. In particular, derivatology problems are more actively explored at the syntactic level than at other levels of language.

Significant work has been done in Uzbek linguistics on derivatology, as a result of which about a dozen dissertations have been defended, scientific articles have been written⁶, but so far in English and Uzbek linguistics derivatology has not been sufficiently studied in the context of related words.

In this article, views on transposition as a semantic derivation were explored. Types of transposition called substantivization, adverbialization and verbalization were analyzed and their specific features were highlighted. Transposition and derivation processes were also analyzed on the basis of examples, and their different characteristics were determined on the basis of analytical methods such as comparative, distributive, and comparative-typological. Lexical units of verbs, nouns and adjectives in the works of English and Uzbek writers were studied as the object of article. The phenomenon of adjectives being used in speech without adjectivization, taking on a noun-like form, and performing nominal syntactic functions such as nouns in speech is called transposition in linguistics⁷. No new words are created in the transposition, in the

process only the words that interact in the primary form show their secondary features in the speech in another word.

For example: A duck (duck) - to duck (dive); a fish - to fish; anare (monkey) - to are (to mock someone).

In Uzbek: to be a rabbit (to run away), to put on cotton (to be lazy in order to look good), a bear (lazy, landovur, tepsa-tebranmas), a fox (cunning, to get out of a situation skillfully).

Transposition is the transfer of one word group to another. However, when related words are formed, a grammatical categorical shift of word groups does not always occur, that is, words form coherence within one word group. Some related words appear in several word groups. This process in the formation of related words was interpreted as a semantic derivation of transposition.

Related words that create transposition

IN ENGLISH: TABLE 1.

The meaning	Noun or adjective	Verb
answer	answer	to answer
book	book	to book
clean	clean	to clean
act	action	to act
appeal	appeal	to appeal
change	change	to change
cause	cause	to cause
command	command	to command
doubt	doubt	to doubt
cotton	cotton	to cotton
spot	spot	to spot
nose	nose	to nose

IN THE UZBEK LANGUAGE: TABLE 2.

Noun	Adjective	Verb
toshloq	toshsiz	-
tinim	tiniq	-
pichoq	pichoqsiz	pichoqlamoq
mardlik	nomard	-
suvoq	suvoqsiz	-
so'zchi	so'zsiz	so'zlamog
boshliq	boshsiz	boshlamog
chegarachi	chegasiz	chegaralamog
bo'yoq	bo'yoqsiz	-
yo'lchi	yo'lsiz	yo'llamog
gapchi	gapdon	gapirmog

A comparative study of dictionaries has shown that the amount of related words in English is very high. Due to the strong synthetism in Russian and agglutinatism in the language, which

limited the functional activity of words, it was observed that in Uzbek about 20-30 thousand cognate words, while in English it was around 60-80 thousand.

The syntactic method of active expression derivation is applied to phrases and speech level, which is a universal method. The syntactic method is specific to all languages. The following are examples from the Uzbek language: Endi pati yulinadi, yuvilib, tozalanib oshga bosiladi⁶; Ozodlik oftobi nur sohib turganda odamning qalbida bor eng yaxshi kuchlar uyg'onsa, bu kuchlarga yo'l ochilsa, erk berilsa, ana unda kishining butun umri xazonsiz bir gul bo'lib ochiladi⁷; Yaqinda Antarktidada minerallashib qolgan torf topildi(Gazetadan); Shu payt qulog'imizga ot tuyog'ining tovushi eshitildi. Muyulishdan bir ayg'ir o'qdek otilib chiqdi. Uning orqasidan Murod degan otboqar baqirib-chaqirib quvib kelardi.

Muhsin juda ayyor(sifat). Ayyor nima deyishni o'ylab bir oz jim qoldi(ot).

Bu juda sayroqiqush(sifat). Sayroqilarinialohidaparvarishqilamiz(ot).

Firmamga saviyali hisobchi kerak(sifat). Saviyalilarko'chadayotmaydi(ot).

Nodirjuda sergap bola(sifat). Anavisergapyanagapnichuvalashtiryapti-da(ot).

Some linguists believe that this has nothing to do with derivation, it is just a function. In their view, there has been no change in the above statement, only that quality is used in the position in which the horse is expected to be used, and that the function of the horse is occupied by quality. But the same thing, i.e. the arrival of another unit instead of a unit standing in one position, i.e. the change of position is called transposition in linguistics⁸. Predecessor is the performance of the function of one word by another⁹. It is necessary to change the position of the word to perform another word function. The essence of transposition is also seen in this. If the position does not change, the new function will not be performed. This means that the process, which is considered by some linguists as a phenomenon of "predecessor", needs to be reconsidered.

Such related derivation pairs like: *yulish–yulmoq; ochmoq–ochiq; toza – tozalamoq; topmoq – topilma*.

Examples from English: But the visitor *was not to be drawn so easily*¹⁰ (Lekin tashrif buyuruvchini qiziqtirish unchalik oson bo'lmadi).

He didn't *want to be fetched*, he wanted *to be taken* home by someone who would impress even Mrs. Baines¹¹ (U o'zini olib ketishlarini xohlamas edi, u o'zini hatto missis Baynsni ham hayratga soladigan kishi uyiga olib ketishini xohlardi).

There was not a soul *to be found* in the house, search as they would¹² (Uyda biror bir jon topilmadi, ular xohlaganidek izlashdi).

He was certain that he *would be caught*, and he tried to imagine what untold horrors would amid him if he *were brought* before the Home Committee¹³ (U qo'lga tushishiga amin edi va u uy komitetiga olib borilganida boshiga qanday dahshatlar tushishini tasavvur qilishga urinardi).

We are taught, Miss Sanders, to pay first attention to our own soul¹⁴ (Miss Sanders, biz asosiy e'tiborni o'zimiznikilarga qaratishga o'rgatilganmiz).

His modest farm *was set in* a lonely spot two miles from the village, seven miles from the town and fifteen from market. (Uning kamtarona fermasi qishloqdan ikki chaqirim, shahardan yetti chaqirim va bozordan o'n besh chaq irim narida joylashgan edi).

“Who would mind? We *shall be very pleased*”.¹⁵ “*Kim qarshi? Biz judamamnunbo 'lamiz*”.

I need not say that such a breach of confidence is unthinkable and these records *will be separated and destroyed* now that my friend has time to turn his energies to the matter¹ (Bunday daxlsizlikni buzish aqlga sig'masligi haqida gapirib o'tirishimning hojati yo'q deb o'ylayman va bu yozuvlar *ajratiladi, buzib tashlanadi*, chunki mening do'stim bu borada o'z kuchini sarflashga tayyor).

(*To catch – a catch; to marry – a marry; to please – please; to separate – separate, to think – thinkable (unthinkable), to turn – a turn, to need – a need, to imagine – imagination, to confidence – confident, to record – a record*).

But all of them who are willing to work *will be welcomed* by the state and will be at once employed helping either to produce or distribute the necessaries and comforts of life.

She'll be starved and tortured and humiliated² (U och qoldiriladi, qiynoqqa solinadi va xo'rlanadi).

Briefly, two British teenagers, a boy and a girl, *have been found dead one murdered*, the other either *murdered* or a suicide case³ (Qisqacha aytganda, ikki britaniyalik o'smir - bir o'g'il va bir qiz, biri *o'ldirilgan* ikkinchisi ham *o'ldirilgan* yoki o'z joniga qasd qilingan holatda *topilgan*).

The student flying it *had been killed*⁴ (Uni uchirayotgantalabao *ldirilgan*).

Also transpositional pairs such as: *to murder – a murder; to kill – a kill; to torture – a torture; to humiliate – humiliation; to welcome – a welcome; to starve – starvation; to die – death*.

Three men *had been wounded and one killed*. No weapon near her, Watson mark that! The crime seems to *have been committed late* in the evening, and the body was found by a game keeper about eleven o'clock, when it was examined by the place and by a doctor before being carried up to the house”.⁵ (Uch kishi *yaralangan va bittasi o'ldirilgan*. Uning yonida qurol yo'q, Watson buni aniqlaydi! Jinoyat kechqurun *sodir etilganga* o'xshaydi. Jasad uy boshqaruvchisi tomonidan soat chamasi o'n birlarda, doktor uy ichiga olib kirilishidan oldin, u joyni ko'zdan kechirgan paytda topilgandi).

It might have been considered beautiful at one time⁶ (Bir vaqtlar bu *go'zallik deb hisoblangan* bo'lishi mumkin).

... *it was not to be thought of* and it was not necessary⁷ (... *bu haqda o'ylamaslik kerak va shart ham emas*).

As we can see, the above sentences are given with pairs of cognate words.

The same situation can be observed in derivational pairs such as: *to accuse (v) - accusation (N); to bore (v) - boring (adj); to talk (v) - talkative (adj); to separate (v) - separate (adj); to please (v) - pleased (adj); to destroy (v) - destroyed (adj); to welcome (v) - a welcome (N); to kill (v) - a kill (N); a wound (N) - wounded (adj)*.

Yet another *suffered the pain of personal rebuke*⁸ (Yana biri tanbeh berish *azobini boshdan kechirdi*).

The despair of Mr. Marvel's face *deepened* and his face *slackened*⁹ (Janob Marvelning yuzidagi tushkunlik yanada *chiqurlashdi* va uning yuzi *bo'shashdi*).

Once his outstretched hand *slowly dosed*, then opened¹⁰ (Uning cho'zilgan qo'li bir marta *ohista pastga tushdi*, keyin ochildi).

Here we can see the following derivation pairs consisting of related words: In English: *to deepen* (v) - *deep* (adj); *to slacken* (v) - *slacker* (N); *to close* (v) - *close* (adj); *to break* (v) - *a break* (N) - *breakable* (adj); *to examine* (v) - *examine* (N); *to build* (v) - *building* (N); *to room* (v) - *a room* (N).

In the Uzbek language: *tozalandi* (fe'l) - *toza* (sifat).

In related word-formation pairs, the main markers of common syntactic level are expressed in English *together* with words in the Uzbek language, for example, *birga*, *qiyshilib*.

For example: We only *roomed together* about two months.

Josephine and Constantine sprang to their *feet together*.

In the words like *a room - to room*; *a spring - to spring* we can see verbalization.

The category of activity can also be expressed in using nouns, adjectives, and other related phrases. For example, in English: *able-qobiliyatli*, *uddaburon*; *brave - jasur*, *qo'rqmas*; *fight-urushish*; *fierce-shiddatli* *avoboshqalar*; o'zbektilida: *mard*, *kuch*, *bardam*, *xonadon* and others.

Similar related words in English are: *antecedent-oldidak* *eluvchi*, *boshlabberuvchi*; *antedate-avvalgivaqt bilan* *belgilamoq*; *anticipate-oldindan* *sezmoq*; *befriend-yordam* *lashmoq*; *bewilder-hijolat* *qilmoq*; *discompose-parchalamoq*; *enrich-boyitmoq*; *forgive-gunohidano* *'tmoq*; *overcome-engmoq*; *outbrave-ustunchiqmoq*; *transform-boshqanarsagayokishaklgao* *'tkazmoq*; *enclose - ilova* *qilmoq*; *underfeed - ochqoldir* *moq*; *equalize-tenglashtir* *moq*; *classify - tasniflamoq*, *guruhlamoq*; *commemorate - nishonlamoq*, *bayramqilmoq*.¹¹

The main feature of verbs used with derivational pairs is that they can easily take on a passive form. For example: *blame - to be blamed*, *bite - to be bitten*.

Derivative verbs in Uzbek language include the following words: *aldamoq*, *solmoq*, *baqirmoq*, *aytmoq*, *ichmoq*, *ishlamoq*, *chiqmoq*, *kesmoq*, *sotmoq*, *qo'ymoq*, *to'g'ramoq*, *oqmoq*, *ezmoq*, *egmoq*, *elamoq*, *tilamoq*, *so'ramoq*, *g'ajimoq*, *qo'zg'amoq*, *qamamoq*. For example: *aldamoq - aldov - aldoqchi*; *baqirmoq - baqirish - baqiriy* and others.

Uzbek verbs can easily undergo active-passive transformation: *aldamoq - aldanmoq*, *solmoq - solinmoq*, *ezmoq - ezilmoq*, *egmoq - egilmoq* and others. For example: Mehmonlar birdan o'rinlaridan *turdilar* va Eshonning o'g'liga "Boshlasinlar" deya ishorat etdilar (Oybek). Umarali kabob ustidan bir-ikki piyola achchiq choy *ichdi* (Oybek).

It seems that in both languages the related verbs are included in the fluent lexicon of the languages, as a result of which they can pass from verb to noun, from noun to verb according to the requirement of the context.

CONCLUSION

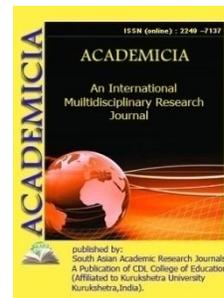

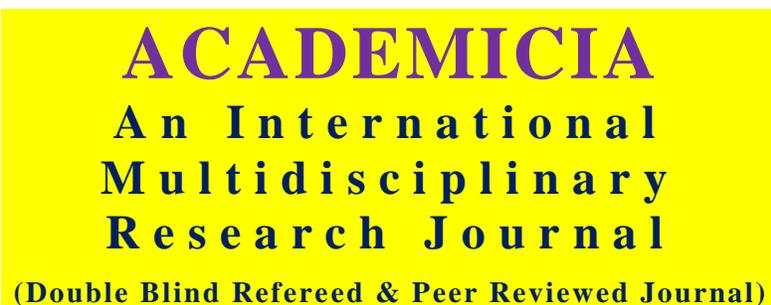

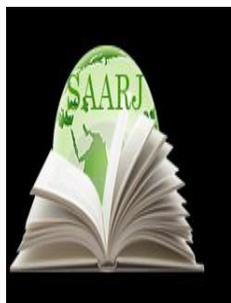

In conclusion, it can be said that in linguistics, the specific signs of implicit and explicit influences for the creation or assimilation of new words in a particular language, their similarities and differences are analyzed in detail on the basis of comparative-typological methods. Due to the fact that the linguistic aspects of natural languages, such as lexical-semantic, syntactic, morphological and linguopragmatic, differ to some extent, the comparative study of several languages not only highlights its specific features but also recognizes their commonalities.

Conclusions on the practical significance of the research results are theoretical and practical recommendations for the development of criteria for the derivation potential of related words in linguistics and the scope of its implementation and the selection of the right element from the existing variants, thereby creating various advanced textbooks for foreign language learners serves as a resource in development.

ONE OF THE PRECIOUS HERITAGES OF THE UZBEK PEOPLE "KHOREZM DANCE - LAZGI"

ABSTRACT

In this article the history of Khorezmian dance-Lazgi, its formation in Uzbek music and dance, its inclusion in the Representative List of the Intangible Cultural Heritage of Humanity, as well as experts who have contributed to the recognition of Uzbekistan as an intangible cultural heritage are showed.

KEYWORDS: *National, Heritage, Dance, Music, Song.*

INTRODUCTION

The culture, national art and rich artistic traditions of each nation are largely determined by the richness of material and spiritual heritage inherited from their ancestors. The Uzbek people are the heirs of invaluable material and spiritual wealth. One of them is "Khorezm dance - Lazgi", which combines music and song and dance.

The inclusion of "Khorezm Dance - Lazgi" in the Representative List of the Intangible Cultural Heritage of Humanity once again proved that the territory of Uzbekistan is rich in intangible cultural heritage of the peoples of the world. At the same time, it is safe to say that this event is the result of the consistent cultural policy pursued in our country over the past three years at the initiative of the head of our state.

Main part

If you look closely, there are so many examples of tangible and intangible cultural heritage in the territory of modern Uzbekistan that you will be amazed at how the people, who lived in dependence for hundreds of years, survived. The main reason for the accumulation of such rich

material and spiritual wealth on this land is its location at the crossroads of the Great Silk Road of Uzbekistan. In the past, not only trade, but also cultural ties were established along the Great Silk Road.

In addition, the fact that the centers of the three Central Asian states in the period before the Russian invasion were located in the territory of Uzbekistan played a very important role in this process. As a result, separate schools and performing styles have been formed in the areas of music and dance of the intangible cultural heritage. In the field of music and dance, "Khorezm maqoms" and Khorezm dance schools were formed in Khiva khanate, "Shashmaqom" and Bukhara dance schools in Bukhara emirate, and "Fergana-Tashkent maqoms" and Fergana-Tashkent dance schools in Kokand khanate. While this figure is a hallmark of classical music and dance, additional schools and styles have been formed in the music and dance culture of the common people, which is evident in Karakalpak music and dance, as well as in the dance and folk music of the Surkhandarya-Kashkadarya oasis.

We have "business cards" that are regularly used to demonstrate the music and dance culture of Uzbekistan, the Uzbek people in foreign countries or to show our guests the music and dance of our country, among which the first is "Lazgi" music, song and dance. Well, the question arises as to what is the reason for this. In our opinion, this is due to the fact that "Lazgi" as music and dance is very simple, attractive, easy to remember, and most importantly, its popularity.

If we look at the history of Lazgi, we see that it was born primarily as dance music. Lazgi was performed only as a dance tune, until our famous singer, People's Artist of Uzbekistan and Turkmenistan Komiljon Otaniyazov adapted the poem "Kimni sevar yorisan[Who do you love]" to his tune. Even the appearance of his song type did not turn Lazgi into a separate (non-dancing) melody or a separate song. The performance of a Lazgi melody or song in any period marks the beginning of the dance, and it is fun with the dance.

It would be correct to look at what such magic of Lazgi has to do with its history, its essence. According to historians and experts, Lazgi is a *dorul fano*, that is, the birth of man into this world and the philosophy of life here. In fact, we observe that the dance begins with the shaking of the hands, then the sudden cessation of all movements, and then the gradual emergence of movements representing the revival of the body, followed by the acceleration of music, the acceleration of dance movements, and the end of extreme movements.

This development in music and dance movements leaves neither the listener nor the audience indifferent. As a result, he either joins in the dance, or tries to express his attitude by clapping. The multiple repetitions and step-by-step flow of the music in the square, which includes all four beats, also play a huge role in this process. That is, a piece of music that is repeated several times remains in the listener's memory, its gradual development and tempo acceleration makes the heart beat faster, and the listener begins to breathe along with the music and dance without obeying his will.

This feature of Lazgi ensures that it is performed not only in Khorezm, but also in all the joyous events and family ceremonies of Uzbekistan, and that men and women, young and old, dance at the same time.

Experts say there are nine types of Lazgi. In our opinion, such a strict classification, it would be wrong to make a limit. Because even after that time, when it was said that "Tuqqiztalazgibor

[there are nine Lazgi]", dozens of Lezgi appeared. For example, after the first Lezgi performed by Komiljon Otaniyozov as a song, many artists created new Lezgi in their interpretations. Among them are well-known artists such as Otajon Khudoyshukurov, Ortiq Otajonov, Rahmatjon Kurbanov, as well as young performers such as Gulsanam Mamazoitova, Bunyodbek Saidov, Hulkar Abdullaeva. After all, just as the artists of the Fergana Valley repeatedly "invented" "Tanavor", so the "Khorezmians" are creating their own "Lazgi". The main reason for this is the adaptation, development and transformation of intangible cultural heritage. If this process is not observed in the intangible cultural heritage, it is doomed to extinction.

Now, a word about the process of including "Khorezm Dance – Lazgi" in the Representative List of the Intangible Cultural Heritage of Humanity.

The first candidates from Uzbekistan to be included in this list (cultural environment of Boysun district, Shashmaqom music, Katta ashula, Askiya sozamollik art), in fact, documents were prepared and submitted at the request of experts and leaders in the field. The initiative of the Association of Chefs of Uzbekistan to register "Osh culture and traditions" was the first experiment in this area, and as a follow-up, a number of public organizations, government agencies began to propose to include this or that heritage in the list. The Khorezm regional branch of the Golden Heritage International Public Foundation also made a similar proposal, and with the support of the National Commission of the Republic of Uzbekistan for UNESCO, the Foundation's main office in Tashkent began organizational work.

Khorezm regional administration paid special attention to the preparation of nomination documents, and scientists from the Khorezm Mamun Academy, a number of local specialists led by People's Artist of Uzbekistan Gavhar Matyokubova, and experienced experts in the field of intangible cultural heritage were involved. Special mention should be made of Amirkul Karimov, Chairman of the Golden Heritage International Public Foundation, in organizing the process in Tashkent.

Alisher Ikramov, an experienced expert in the field of intangible cultural heritage, a specialist in the preparation of photo and video materials, and the former Secretary of the National Commission for UNESCO of the Republic of Uzbekistan, who is in charge of this work, contributed to the preparation of the documents. It is noteworthy that Professor of the Uzbek State Institute of Arts and Culture Urozali Toshmatov also took part in this process and contributed to the recognition of one of the invaluable heritage of our country "Khorezm Dance - Lazgi" as an intangible cultural heritage of Uzbekistan.

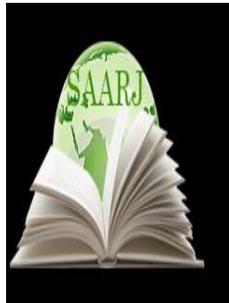

CONCLUSION

The registration of a candidate will start a new process. So now the question arises as to what to do. Now Lazgi has come to the attention of the whole world, his protection will be under the control of UNESCO. We have an honorable duty to preserve, promote and pass it on to the younger generation, to demonstrate to the world community that our country has such a heritage. The participation of not only experts and scientists, but all of us is very important in carrying out this work.

ABSTRACT

This article develops a model for the organization of the process of formation and development of professional competence of teachers of preschool education, and provides information on the use of this model in vocational training.

KEYWORDS: *Formation Of Professional Competence Of Educators Of Preschool Educational Institutions, Motivation, Motivation, Innovative Technologies.*

INTRODUCTION

Motives play a special role in the process of developing professional competence in educators of preschool education, because the development of professional competence in them is directly related to the effectiveness of the educational process and the process of educational relations, the effectiveness of these processes represents the effectiveness. Therefore, it is important to study the motives that affect the development of professional competence in teachers and educators, and it is appropriate to say that such motives are motives for the development of professional competence.

Main part

It is necessary to identify and motivate teachers and educators to study the ongoing reforms in the country and their results, scientific and technical achievements, innovative technologies for the organization and management of pedagogical processes, because Features of the

development of professional competence motivation of the process of the development of professional competence and educational relations have an impact on the efficiency of the processes, different motives, educational organization of professional competence either directing the development of educational raised can change the environment.

Wake fixed in the common interest of the organization in harmony determined the direction and needs to imagine the process of targeting and reach the specific role that educators develop their professional competence and the importance of motivating and driving motive the secret is tested by their imagination. Their validity and effectiveness play an important role in the perception of motives by educators. Influencing educators by substantiating the credibility, effectiveness, importance, and necessity of motives represents motivation.

In the psychological literature, motivation is broadly described as a complex, multifaceted manager of human life (his behavior, activities). Educators' activities can be managed using a variety of motives. Motives can be used to create voluntary behaviors.

Expressing the relationship between the results that can be achieved and the effectiveness of motivation in the development of professional competence in educators, determines the need to meet the following conditions to ensure effectiveness in the process of developing professional competence of educators;

- A scientific approach to the views and opinions of educators about their knowledge, skills and abilities, experience and effectiveness of their activities;
- To take into account the peculiarities of motives in the process of development of professional competence and educational relations;
- Formation of positive motives for continuous professional development of educators;
- creating a creative environment that creates the necessary and favorable conditions for the development of professional competence in educators;
- To take into account the interdependence and interdependence of the processes of development of professional competence;
- Approach to the process of developing professional competence in educators as a complex innovative pedagogical system;
- introduce a reflexive approach in the process of developing professional competence, which forms the skills of educators to study, analyze and objectively evaluate the effectiveness of their activities;
- To take into account the importance and specifics of person-centered education in the process of developing professional competence. Based on these conditions and the above data, we can say that it is appropriate to assess the effectiveness of motivation in the development of professional competence in educators in terms of the dynamics of development of professional competence in educators or the degree of formation of positive motivation.

One of the factors that need special attention in the organization of pedagogical processes in the development of professional competence in educators is the dependence on the motivation of the effectiveness of pedagogical processes. Motivation is necessary to ensure adequate activity in educators. It is necessary to take into account the characteristics of the motives, to know what

motives guide educators to continuous professional development and which ones allow them to be active, independent learning, independent learning and self-education, educators' knowledge, skills. It is important to determine in advance the level of skills and experience. Thus, the types of motives for achieving effectiveness in the process of developing professional competence in educators and their characteristics, the needs of educators, their level of knowledge, skills and experience, worldview and interests, the state of the environment in which educators live and work, educational relationships, personality traits, the need for reflexive and systematic approaches, as well as the need to innovate should be considered as factors influencing the effectiveness of the motivational process.

Taking into account the factors influencing the effectiveness of the motivational process in the development of professional competence in educators, it is possible to distinguish the following interrelated indicators of effectiveness:

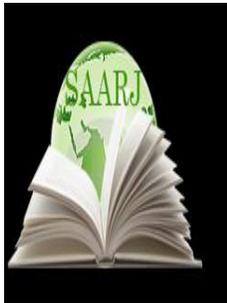

- Features that reflect the level of knowledge, skills and experience of educators, the perception of their goals, imagination, interests and capabilities;
- Specific features of the motives, factors and means that correspond to the results of successful achievement of the set goals;
- Necessary for educators and quality conditions, creating a creative environment characteristics;
- the development of the needs of the state, society and the individual, the needs of participants in the process of development of professional competence and the level of satisfaction;
- The level of scientific and methodological support of participants in the process of development of professional competence;
- Peculiarities of reflexive approach, systemic approach, innovative approach, person-centered approach and other approaches in the organization of processes of development of professional competence;
- Reliability and novelty of information.

CONCLUSION

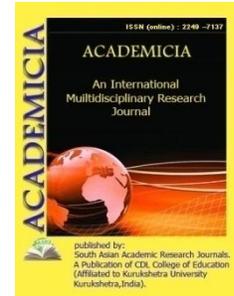

Based on the above considerations, it should be noted that the integrated educational process in the development of professional competence in teachers of preschool education, its essence, the study of its specific features and the motivation to apply in practice is aimed at achieving high professional results. allows the development of competence.

ABSTRACT

The problem of diagnosis and treatment of acute back pain is discussed. Information concerning the etiology, pathogenesis, classification, clinic, diagnostic methods and principles of treatment of this pathology is presented. Special attention is paid to non-selective non-steroidal anti-inflammatory drugs acting on both types of cyclooxygenase, which are the drug of choice for the treatment of vertebrogenic pain syndromes.

KEYWORDS: *Psychopathological Predisposition Of Patients, Radiculopathies, Inflammatory Diseases*

INTRODUCTION

In 50 % of patients with acute pain, pain regression occurs within 2 weeks, in 90 % of patients, acute pain regresses within 6 weeks. Such a favorable short-term prognosis should set the doctor on a complacent mood: no matter what he treats the patient, he will quickly achieve success. However, in practice, the situation is more serious: more than half of the patients have a painful episode repeated within a year or during this period, the formation of a persistent pain syndrome occurs. In some cases, the cornification of pain is an inevitable consequence of a degenerative process or a psychopathological predisposition of patients, but sometimes it is the result of suboptimal management of the patient at the stage of acute pain.

Such a diverse pathology can be divided into four main groups:

1. Pain caused by specific causes: vertebrogenic (tumors, osteoporosis, spondylitis, etc.) or reflected (aortic aneurysm, pancreatitis, etc.).

2. Non-specific, mainly axial pain (lumbalgia/lumboisshialgia), which can be caused by myofascial syndrome, disc protrusion, facet syndrome, psychogenic factors, etc.
3. Radiculopathy (radicular syndrome), caused by disc protrusion or stenosis of the radicular opening.
4. Spinal stenosis syndrome Kautokeino intermittent claudication.

Signs of radiculopathy are detected in about 5-10 % of cases of back pain. Its most common cause is a herniated disc, but it can also be associated with stenosis of the intervertebral foramen or spinal canal. In radiculopathies, pain is felt mainly in the extremity and radiates to the distal part of the innervation zone of the corresponding root. Pain limited to the back area excludes the root lesion. In practice, there are frequent difficulties in the differential diagnosis of radicular syndrome, accompanied by neuropathic pain, and reflex lumboisshialgia, which is a type of reflected nociceptive pain.

The clearest signs of a herniated disc with a lesion of the spinal root include dermatome irradiation of pain, increased pain when coughing, sneezing, and straining, signs of denervation in the myotome during electromyography. Lasagna's symptom can be a sign of radicular syndrome only with the corresponding irradiation of pain (as a rule, with the flexion of the foot in the ankle joint).

The main clinical manifestation of spinal canal stenosis is neurogenic (caudogenic) intermittent claudication. It is expressed in the appearance of bilateral pain when walking or standing for a long time, numbness, paresthesia, weakness in the muscles of the lower leg, less often – the hip, which decreases within a few minutes if the patient leans forward or sits down. Spinal stenosis accounts for about 5 % of cases of back pain.

There are no generally accepted convincing clinical or clinical-imaging criteria that would allow us to distinguish various sub-variants of pain associated, for example, with protrusion of the intervertebral disc, dysfunction of the facet joints or sacroiliac joint.

If a herniated disc is not accompanied by a lesion of the root, it is most pronounced in the lower back, but can also spread to the buttock and thigh. It can be constant or intermittent, and usually increases with flexion and sitting, whereas with extension it can either increase or decrease. When stretching exercises, you can note the phenomenon of "centralization" of pain, which is weakened in the leg, but increases in the lumbar region.

Osteoarthritis of the intervertebral (facet) joints (spondyloarthritis) is the cause of back pain in about 20% of cases. Clinically, spondyloarthrosis is manifested by bilateral pain, which, unlike discogenic pain, is usually localized paravertebral, and not along the midline. The pain is most pronounced in the lower back, but often radiates to the sacroiliac joint, buttock, hip; it is also possible to spread the pain more distally. As a rule, it has an intermittent character and increases with prolonged standing and extension, especially with simultaneous rotation (although this is not an absolute sign!), but decreases or at least does not increase with leaning forward, sitting and walking, as well as in the supine position.

Sacroiliac joint syndrome ("sacroiliitis") is manifested by pain in the joint area, radiating to the groin, large trochanter, and buttock. During the examination, it is possible to detect pain in the joint area with palpation, lateral pressure on the pelvis, hip retraction against resistance, overextension or external rotation of the hip.

Myofascial syndrome in the paravertebral muscles can develop against the background of a degenerative process in the spine or independently of it - due to prolonged stay in a non-physiological position, chronic micro traumatization, overload, overstretching or compression of the muscles, trauma, and prolonged immobilization. Myofascial syndrome is based on the formation of trigger points in the muscles, the irritation of which causes not only local, but also reflected pain (in a zone far from this point). Myofascial syndrome in the gluteal and piriformis minor muscles may mimic vertebrogenic non-radicular lumbosialgia. The trigger point corresponds to the area of local muscle compaction, palpation of which not only reproduces the pain experienced by the patient, but also causes local muscle contraction. Inactivation of active myofascial zones by injection of a local anesthetic into them, followed by passive stretching of the affected muscles, leads to relief of the pain syndrome.

On examination, weakness or numbness is also detected in the entire limb and does not fit into the anatomical zones of innervations, the soreness is superficial (the skin is painful) or is noted in unusual places (for example, above the sacrum). To detect psychogenic pain, special tests are resorted to. For example, Laseg's symptom is checked in a sitting position: patients with psychogenic pain who have demonstrated an inability to raise their leg above a few degrees in a lying position can fully straighten the affected leg in this position. In recent years, a group of signs called "yellow flags" has been identified, which indicate a tendency to chronic pain syndrome due to psychogenic factors and require a special approach to treatment.

The main task of radiography of the spine is to exclude traumatic or pathological fractures, congenital anomalies, infectious or inflammatory diseases, primary or metastatic tumors. It is indicated for all patients with trauma, persistent (more than 4 weeks) pain syndrome, as well as for all patients referred for physio - or manual therapy. Often, radiography is necessary to convince the patient of the benign nature of his disease. Lumbalization, sacralization, and spina bifida are usually not the direct cause of back pain. They are not the cause of pain and Schmorl's herniation (a herniated disc in the body above or below the recumbent vertebra), but they can serve as an indicator of a degenerative process in the spine. A compression fracture with no indication of injury may indicate metabolic osteoporosis, infection, or tumor. However, a tumor or spondylitis is detected on an X-ray only if more than 50% of the bone tissue has been destroyed. Because of this, radiography allows you to diagnose these diseases at a relatively late stage. Nevertheless, radiography is still indicated for suspected cancer, trauma, enclosing spondylitis, or infection, but if it does not reveal pathology, and the clinical suspicion is justified, a computer (CT) or magnetic resonance (MRI) tomography of the spine should be prescribed. If there are signs of compression of the caudal equine or other progressive neurological deficit, and radiculopathy (in the absence of the effect after a month trial of conservative therapy), especially when planning surgery or epidural injection of steroids and if there are signs of lumbar stenosis is preferable to MRI of the spine. CT scans better detect bone pathology and can diagnose disc herniation and spinal canal stenosis. MRI is more sensitive to soft tissue changes; In particular, it is good at detecting changes in the structure of the disc (by changing the intensity of the signal from it), the localization and size of a herniated disc, allows you to examine the state of the spinal cord and ponytail, the area of the intervertebral opening, and is more sensitive to infectious and tumor lesions of the spine, pathology of the spinal cord membranes. Visualization is also necessary when planning manual therapy in any of its varieties, but it is not necessary in

the absence of "red flags", pain reduction after trial therapy, as well as in the absence of a change in status after a previous pain episode.

In such situations (in the absence of alarming anamnestic or clinical signs), imaging does not improve the prognosis, but increases costs and is associated with potentially dangerous radiation exposure. The detected changes do not correlate well with the clinical picture and not only do not change treatment approaches, but may also lead to unjustified invasive interventions.

When interpreting CT and MRI data, it is important to take into account that in about 2/3 of people who have never experienced back pain, these methods of research reveal degenerative changes in the lumbosacral spine, often at several levels. Thus, the detection of a herniated disc, manifestations of spondylitis and spinal canal stenosis does not mean that they are responsible for the neurological disorders present in the patient.

A prerequisite for the diagnosis of a particular variant of vertebroneurological pathology is the correspondence of clinical and preclinical data. However, the size of the disc herniation in general does not correlate with the intensity of the pain. The analysis of MRI data does not allow us to differentiate a disc herniation that is asymptomatic or serves as a source of non-radicular pain, as well as to predict the effectiveness of conservative treatment. With radiculopathy correlates only extrusion of the disc, which is the extreme degree of protrusion when the length of protrusion exceeds the width of its Foundation or there is no connection between the protrusion and the base material of the disk.

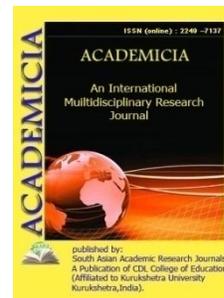

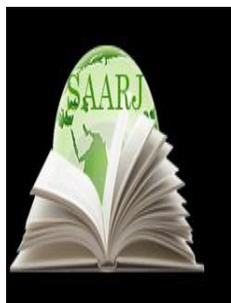

With radiculopathy, the predicted recovery time is extended to 6-12 weeks. Given the mixed nature of the pain syndrome seems to be a promising impact not only on nociceptive, but also on the neuropathic component of pain with early use of antidepressants (e.g., amitriptyline or venlafaxine), anticonvulsants (e.g. carbamazepine or gabapentin), patch with lidocaine. If the patient is treated in a hospital, in the acute period, epidural blockades with corticosteroids are advisable. There are no sufficient grounds for the use of diuretics or vasoactive drugs in vertebrogenic radiculopathy. Traditionally used and still popular lumbar traction has proved ineffective in controlled studies. Moreover, in some cases, it provokes deterioration, because it causes stretching of the unaffected blocked segment (and, accordingly, decompression of the root), and above and below the segments located.

The absolute indication for surgical treatment is the compression of the roots of the ponytail with paresis of the foot, anesthesia of the skin of the perineum, violation of the functions of the pelvic organs. An indication for surgery may also be an increase in neurological symptoms, such as muscle weakness. As for other cases, questions about the appropriateness, the optimal time and the optimal method of surgical treatment remain the subject of discussion. Prospective studies have shown a significant spontaneous reduction in disk extrusions and sequestration (in 75-100 % of cases) during the year.

Rational psychotherapy is of great importance, including the correction of ideas about the nature of pain, explaining the plan of treatment measures and the importance of each of the components of therapy, explaining the importance of dosed physical activity for pain relief, "adjusting" the patient's expectations.

ABSTRACT

Mergers and Acquisitions (M&A) holds a major role in corporate restructuring and growth of companies in the post-globalisation era. 'Most Mergers Fail' despite all efforts to make it successful. This study intends to study what all factors should be considered by Organisations while drafting the M&A proposal. Initially, it is studied why majority of the mergers fail as it may help policy makers to take of CSFs while drafting M&A proposals. Seven CSFs were suggested for consideration while drafting M&A proposals. The study ends with recommendations based on the study for successful M&A proposals.

KEYWORDS: *Mergers and Acquisitions (M&A), Critical Success Factors (CSF), Acquisition purchase premiums (APP), Merger wave, Value Gap (VG).*

INTRODUCTION

Mergers and Acquisitions (M&A) are a fundamental part of the growth and development strategies of companies across the world. Companies and industries are being restructured in response to globalisation, changes in technology, regulation and deregulation and are involved in the capacity of buyers, sellers or sometimes both. As Companies strive hard to upsurge market share, it drives businesses into Merger and Acquisitions. Managers generally regard purchasing a company for access to markets, products, technology, resources, or management talent as less chancy and faster than accomplishing the same objectives through internal efforts.

Evercore Partners' Roger Altman mentioned in 2013 that, "M&A cycles tend to last five to seven years and we are 2 years into it". According to him, the fourth and final post-1980 merger wave is already happening and is described as 'the 2011-19 merger megaboom'. "Most Mergers don't work' (Clarke,1991), based on the today's most defensible financial criteria: returns to the acquiring Company's shareholders. But new analysis frameworks and approaches aimed at

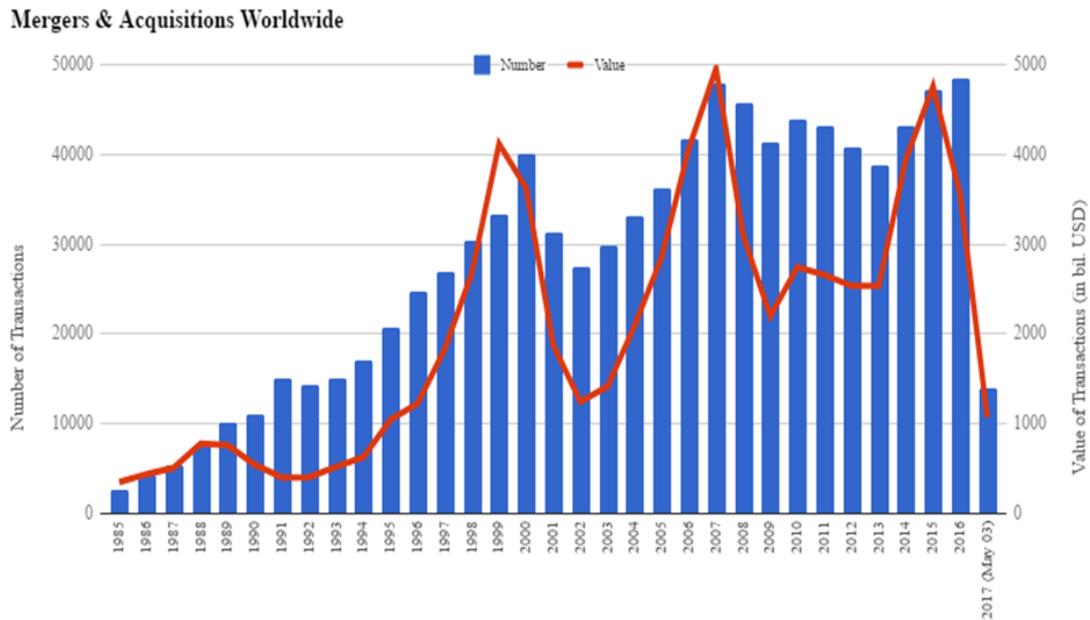

developing superior understanding of transaction timing within the merger cycle, segmentation of target opportunities, and bid limits based on realisable synergies, emerge to improve the odds of M&A success for the acquirer seeking to excel in this great merger boom.” (Clark and Mills, 2013).

“Study after study of past merger waves has shown that two of every three deals have not worked; the only winners are the shareholders of the acquired firm, who sell their company for more than it is really worth.” (The Economist, 1991). But in the opinion of Clark and Mills (2013), attempting to restrict mergers because of bad outcomes would be like arguing against the institution of marriage because of what happens at the divorce court. There is always an urge to merge as it is a permanent part of firms’ value growth strategies. Capacity augmentation through combined forces, achieving the competitive edge, surviving the tough times, diversification of operations, cost cutting etc. are some of the drivers of M&A. Lot of success stories of M&A across the world are available to support M&A as a fundamental growth and developmental strategies for Companies. Hence it is suitable to analyse why mergers fail and to identify what exactly are the ingredients of a successful M&A proposal. This study intends to critically analyse the factors contributing to successful deals and to come out with recommendations for pursuing a successful M&A journey.

Present Scenario

The year 2015 was a record-breaking year for M&A in terms of value followed by a near to 18% reduction in the year 2016. The predictions for 2017 remains uncertain due to politically driven factors like Trump’s presidency, Brexit negotiations, UK, Germany and France elections etc. The number of transactions increased in 2016 when compared to 2015 but the aggregate value of M&A came down. US remained as the most sought after location for M&A deals in terms of number and value of transactions. AT&T Inc's high profile acquisition of Time Warner was the largest deal of the 2016 and was worth US\$ 105.0bn. Another notable feature of the year 2016 was China’s voracious craving for overseas acquisitions with near to US \$185 Billion and 258 transactions. US topped the league tables with 4,951 deals worth near to US \$ 1.5 trillion. (Mergermarket, 2016). Analysts predict a UK and EU inbound activity from the US will continue like the previous years due to the perception of investors that UK and EU countries are an attractive investment alternatives supplemented by attractively priced credit. Notwithstanding the political turbulence, the M&A market looks in good shape and expect to perform like it did in the political shockwaves of 2016.

Figure 1

Source: <https://imaa-institute.org/mergers-and-acquisitions-statistics/>

According to researchers Martynova and Renneboog (2008), “It is a well-known fact that Mergers and acquisitions(M&A) come in waves”. Professor Rhodes-Kropf (2004) talks about six great merger waves during the past century as follows:

1. Late-1890s (followed by the Panic of 1901),
2. 1920s (followed by the Great Depression),
3. 1960s (during the Nifty Fifty Bubble),
4. 1980s (followed by the Savings & Loans Crisis),
5. Late-1990s (during the Tech Bubble), and
6. Mid-2000s (followed by the Subprime Mortgage Crisis).

The 7th one as we are in now, is referred to as a ‘Merger Megaboom’ by Roger Altaman (2013).

Clark and Mills (2013) identified there were four post-1980 merger waves and the following table indicates the name of the waves and signature events associated with each wave.

TABLE 1

Period	Wave Name	Signature event
1982-90	LBO	RJR Nabisco Acquisition
1996-00	Dot Com 1	Netscape, WorldNet IPOs
2002-08	Subprime	Countrywide financial Acquisitions in US
2011-2019?	Dot Com 2, Megaboom	Facebook, Linked In IPOs

Why mergers fail?

While endeavouring to explicate the constituents for drafting proposal for a successful M&A, it is of utmost importance that we understand why majority of mergers fail. Some of the notable busted M&A deals include AOL Times Warner, Sprint and Nextel Communications, Daimler Benz & Chrysler, New York Central & Pennsylvania Railroad, Quaker & Snapple etc. Deloitte CFO insights (2016) explains the mistakes during merger waves as unclear growth strategies, overpaying and lack of options. Vincent Ryan (2000) identified integration of culture, information system and organisational culture, less than optimal handling of integration and issues, lack of an executive champion and focus, lack of clear plan and strategy for integration and leaving employees without a sense of goals and objectives of merger as reasons for failure of mergers. The McKinsey quarterly (2001) elucidated how failure to focus on revenue can be an important factor in explaining why so many mergers didn't pay off. Their study on 193 high profile mergers found that revenue growth was elusive and the belief that mergers drive revenue could be a myth. Only 12% percent of companies under study could accelerate growth over the 3 years following merger. Kose John et.al. (2010) observes many firms experience dramatic value destruction during and after M&A transactions citing the example of ATT acquisition of NCR. It was observed that the "joint "overconfidence" of AT&T"s and NCR"s CEOs played a major role in the massive overpayment and value destruction that occurred". The study gave evidence that overconfident CEOs pay more than non-overconfident ones in merger deals. Paul J Siegen haler (2010) in his article in telegraph pointed out 10 reasons why mergers and acquisitions fail.

1. Wasting time awaiting clearance from regulatory authorities
2. Absence of common vision of merged company
3. Poor due diligence
4. Underestimation of resource requirements
5. Poor governance and unclear resolution process
6. Poor communication
7. Insufficiently detailed implementation plans
8. Lack of courage to take tough decisions
9. Weak leadership and
10. No clarity regarding the company culture after merger.

Considerations in formulating an M&A proposal

Academicians and practitioners came out with studies relating to critical success factors (CSFs) for Mergers and Acquisitions proposal. Rockwell (1968) explains the 4 must-do factors for M&A as pinpointing the objectives, specifying gains for owners, checking management ability and seeking a good fit. DiGeorgio (2002, 2003) in his article on 'Making M&A work' divides the factors for success into 2 stages as selecting the right target and achieving combination objectives. In selecting the right target section, he identifies leadership, climate within the stakeholder team, time, resources and tools for M&A analysis, learning mechanisms and cultural fit as the CSFs. Selecting the right leadership, structuring the integration team and detailed

planning regarding communication, integration and people are identified as the CSFs for integration success in his studies. Gadiesh et al. (2001) gives an outline of 6 golden rules for successful M&As as setting 6 key rationale, letting the 'why' inform the 'how', sense of urgency, keeping customers at the forefront, communicating the vision and managing 3 phases of integration viz. Set the stage, design the new company and make the integration happen. Epstein (2005) in his 'study on determinants and evaluation of merger success' come up with 6 keys to merger success. Strategic vision and fit, deal structure including the price paid and structure of financing, due diligence, pre-merger planning, post-merger integration and identification of external factors that damage the long-term merger value are those factors.

Hoang et.al. (2008) in their study on CSFs of Mergers and acquisitions gave 10 success factors for M&A based on literature till date. Complete and clear objectives, goals and scope of the project, Client consultation and acceptance, Project manager's competence and commitment, Team members' competence and commitment, Communication and information sharing and exchange, Project plan development, Resource planning, Time management and tight secrecy, Price evaluation and financing scheme and risk management were those CSFs.

The recognition and critical analysis of the ingredients of successful Mergers and Acquisitions in this study is based on the 'seven keys to M&A success' proposed by Clark and Mills (2013) as the following:

TABLE 2

No.	Seven keys to M&A success
1	Following the right merger success criteria
2	Optimal timing within the merger cycle
3	Exploiting superior understanding of merger segmentation
4	Adhering to absolute and relative limits on Acquisition purchase premiums (APPs)
5	Bid pricing integrated with in-depth four synergy type PMI investigation
6	Synergy elements: real distinguished from vapor, offsets included
7	Avoidance of transaction by 'wounded quail' acquirers, overreaching egos

Source: Clark, Peter; Mills, Roger. Masterminding the Deal: Breakthroughs in M&A Strategy and Analysis. Chapter-8, Kogan Page.

The main content of this study which is the description and critical analysis of the above seven factors are as follows:

- 1. Following the right merger success criteria:** It was rightly said about the criteria measurement in M&As that 'You can't manage what you can't measure'. There is always a debate as to whether qualitative or quantitative criteria should be used to determine whether merger or acquisition is a success or failure. For acquirers, quantifiable financial returns are considered as the prime MergVal criteria. The following question will which of the financial valuation criteria is more acceptable. Event studies (ES) and Total shareholder returns (TSR) had its own strengths and weaknesses which led to the dominance of discounted Cash Flow (DCF) methods. Value gap (VG) which is the APP (Acquisition Purchase premium) minus NRS (Net realisable synergies) and IVE (Incremental value effect) which is DCF Company value for standalone vs combined are the most preferred DCF valuation techniques.

It was identified that Merger excuses and motivations was confused with merger valuation criteria in many cases. It was observed by majority of the researchers that the acquirer shareholder's gain was zero or in some cases negative. (Mueller and Sirower, 2003).

TABLE 3: FOUR ALTERNATIVE MERGER VALUATION METHODOLOGIES

Alternatives	
1. Event studies (ES)	
Description	Acquirer's pre-vs post- announcement share price trend relative to index and/or industry comparables
Positives	Inertia and ample availability of base data
Negatives	Both long term and short term event studies are subject to distinct distortions
Future role	Marginal use due to distortion disadvantages, Absence of explicit APP leads to M&A overpayment
2. Acquirer Total Shareholder Return (TSR)	
Description	Return based on increase in Market capitalisation over time, sometimes compared to WACC.
Positives	Easy statistical calculation for a completed round turn, Reflect financial market impact of Company's performance
Negatives	Multiple potential distortions including dividend effect, biased towards divestment and opportunistic short term turns
Future role	Measure is limited to acquirers for whom round turn and return per transaction important
3. Value Gap (VG)	
Description	APP Minus PV of NRS i.e. Net realisable merger related synergies
Positives	Debunks the 'Good acquisition, even though we overpaid' illusion, Recognition that prevailing APP may not result in viable deal, Potential for improved bid pricing.
Negatives	Potential illusionary synergy assumptions, Zero or negative VG do not ensure successful acquisition due to other factors
Future role	Increasing use and visibility as a second financial measure to IVE.
4. Incremental value Effect (IVE)	
Description	Comparison of DCF of target and acquirer as future standalone and future combined Companies
Positives	Consistent with leading company valuation basis, Reliance on ultimate source of Company's worth, correctly developed and incorporates APP.
Negatives	Possible inaccuracies due to non-futuristic projection model, components, unrealistic synergies.
Future role	Prime role in DCF analysis of internal investment and synergy assessment

Many experts add a 5th method also along with 4 major primary merger valuation methodologies which is termed as 'multiples'. Many acquiring company CEOs and CFOs looks at prospective targets and bids in term of multiples. Multiples refers to share price to earnings per share ratio (P/E Ratio). There is another infamous multiple called the price to revenue (P/R Ratio) which

contributed to the rise and crash of Dot-com companies in the late 90s. Despite all the limitations, multiples are considered as a fall back method due to future uncertainties. “Corporate bidders have access to all publicly available information, but only imperfect information about the target company’s future cash flow. (Varaiya and Ferris, 1987). Six safeguards are devised to support multiples in Merger Valuation analysis. They include: Cycle-normalised price, Trend comparisons rather than spot, Price/FCF, dynamic sub-categorisation including SBU analysis by distinct product or service, Performance and solvency adaptation of preliminary analysis, and triangulation from fundamental investigation.

2. Optimal timing within the merger cycle: It cannot be guaranteed that nimble timing will increase the prospects for acquisition success but mistiming may reduce the chances of merger success based on the VE-IVE two-method merger valuation approach. As we assume that we are in the fourth post-1980 merger wave, understanding the patterns and characteristics of the three earlier merger waves will help us to understand more about the relevance of timing.

Clark and Mills (2013) gives the following features of three post-1980 merger waves:

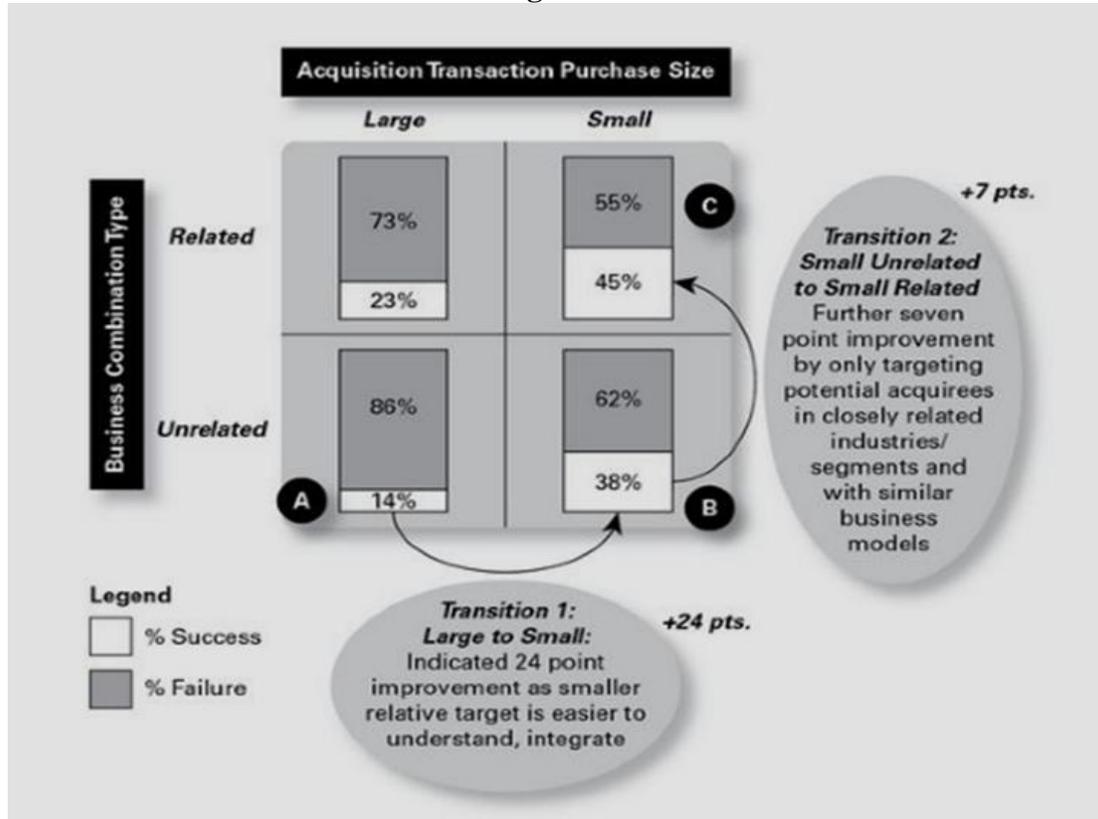

- *“Identify early phase opportunities for those acquirers not highly dependent on external acquisition financing.*
- *Understand M&A whipsaw: by the time that the merger boom is widely acknowledged, a) the waves’ ‘sweet spot’ has already been underway for longer than a year and b) the cycle’s end is just over the horizon.*
- *Comprehend and respond effectively to landmark events over the course of the new merger wave: the signature event (IPO), indications of approaching maturity, specific indications of imminent merger wave climax*
- *Avoid the value-destruction from mid-phase 4 onwards- Do the extreme risk of end-of-wave deal closings exceed the realistic returns?”*

An acquirer must be extremely cautious while phase 3 transition to final phase. It would have been several years since the merger boom started. Cheaper availability of merger financing in plenty may lead to miscalculation of merger cost of funds. Target companies that were not taken by anyone in the initial stages will be available at a higher price with no added synergies. Only very few firms get out before the bubble burst without much harm.

3. Exploiting superior understanding of merger segmentation: The CEO of the acquiring firm who pursues external growth through acquisition assumes that he/she is in control and gulps in the advice of banker of the deal is at no mistake unless they are steered by the base objectives and business models of other firms. “Differences between types of acquisitions may, however, be an important factor in determining which deals are likely to work.”. (Pautler, 2003). Despite the perceived reality of ‘Most Mergers Fail (MMF), there is a persistence in the failed deal behaviour. Researchers attribute some of these failures to poor learning from past deal failures (Tuch and O’Sullivan, 2007) and acquiring Company’s CEO’s hubris which results in overpayment (John et.al, 2007). Cultural disparities contributed to cultural meltdowns post-merger at DaimlerChrysler, AOL TimeWarner and PennCentral. It also happens like the investment bankers bring up Companies those were rejected in the initial stages and present them

to their customer companies eliminating the due diligence concern regarding such overlooked Companies. Coley & Reinton (1988) comes up with a 4 quadrant details from 116 merger transactions to explain the impact of segmentation on M&A performance.

Figure 2

Source: Clark, Peter; Mills, Roger. Masterminding the Deal: Breakthroughs in M&A Strategy and Analysis. Chapter-4, Kogan Page.

In figure 2, it is clarified that when target companies for acquisition are larger than acquiring firm and unrelated, only 14% M&A success was observed. But when the target company is made smaller than the acquiring company the success rate improves by 24% to 38%. This explains that a smaller target is less complex and results in fast and easy mergers. Further a 7% improvement was observed when related companies are integrated. Seven dimensions of merger research into target company differences was identified in the study. They are 1) relatedness and 2) relative size of the merger partners as mentioned in the previous study along with 3) Domestic vs International mergers, 4) Horizontal vs Vertical merger, 5) Overpayment by acquirer due to timing, 6) Overpayment due to hostility and 7) Phase timing in the merger wave. The 4 categories of mergers were identified as follows:

- I. Opportunistic- Related to timing
- II. Operational-Related to core businesses
- III. Transitional- Related to consolidation mature and consolidation emerging
- IV. Transformational- Looking in a dramatic new direction.

The deal types were classified into 9 where bottom-trawlers (Actively seeking companies in distress) has highest deal success probability of 87-92%. They were followed by Bolt-Ons (Target business that fits seemingly into the acquirer's existing product service range) who have an 80-85 percent success profile. Speculative strategic deals secure the bottom position in the merger type list with minimal profile success of 15-20%. This type of mergers is characterised by "desperation and/or enticed by the siren song of a dramatic, visionary ego-acquisition". Clark and Mills (2013). San Miguel's purchase of 49% stake in Philippines Airlines as a move away from food and beverages was a perfect example of speculative strategic deal.

4. Adhering to absolute and relative limits on Acquisition purchase premiums: The price paid for target company is an integral element in the success or failure of merger transaction. High APP was considered as the reason for dramatic failure of many merger transactions, a perfect example being AT&T's acquisition of NCR. (Kose John et.al., 2010). Many experts were left scratching their head when Microsoft agreed to pay \$26.2 billion to acquire LinkedIn wondering why they would pay such a high premium for a money losing Company with slow growth. Even though they claim to gain massive synergies in return for high purchase premium, it is highly probable that the deal may end with a value destruction as in the case of Nokia and a Quantive.

The MMF theory proves that bid-first myopia results in completion of deals that should not happen at any price and value destroying purchase bases in case of completed transactions. High APP means that the post-merger synergies are never going to match up with the extra money paid and will end up in value destruction. Researches by Andrade et.al. (2001) and Azofra et.al. (2007) came up with some practical APP ceilings which suggests that APP percentages more than 37-38% means a failed transaction. There is another concept of 'relative APP' which advocates for reasonableness of bid by making sure that premia are in line with comparable transactions.

5. Bid pricing integrated with in-depth four synergy type PMI investigation: There is a need of transition from bidding to synergy-informed bidding which places more standing on performance in terms of VG-IVE criteria and independent information gathering. It depends on quality of pre-close synergy analysis. Hence the question we are trying to answer is "*What is the present value of realisable synergies, adjusted for offsets, synergy duration and/or feasibility adjustments, implementation of delays, relating to expense (e-), revenue (r-), tax (t-) and other financial (f-) categories?*" (Clark and Mills, 2013)

It is assumed that synergy intelligence issues arise over 4 M&A periods

- a) **Announcement date:** In this period, the prospective acquirer express interest in the target firm when synergy guidelines are extremely limited. The number of bidders and bid cycles are expected to have an impact on the purchase premium at this stage. Early diagnosis to ensure that APP can be justified based on expected NRS is needed to avoid wasted costs and pains of going for lengthy vain bid chases.
- b) **Pre-bid acceptance period:** It is known as the active chase period where bidders have expressed their interest in target companies formally. Experts and research analysts may come up with APP-NRS VG math to prove that increased bid range is warranted and will result in value creation. Prospective acquirers may demand substantial justification regarding NRS due to the widening awareness regarding MMF.

- c) Exclusivity period: A significantly high bid from the prospective acquirer can exclude the other bidders from getting an inside track even if the transaction can be undone at this stage. The threat of high APP leading to value destruction is still persistent unless eliminated by credible synergy calculations. Garnering more synergy intelligence is anticipated to be limited till this stage.
- d) Initial days following the close: In this stage, the synergy gap- the gap between acquiring companies projected synergies and actual NRS- is realised.

6. Synergy elements: real distinguished from vapor, offsets included: One of the dreadful situation for acquiring company's executives, analysts and advisors is distinguishing real synergies from illusions. Insufficient PMI NRS to cover bidder's APP will lead to a failed deal joining the other transactions in MMF category. There should be clear demarcation between real from the illusionary synergies based on vague or non-existent factors and imaginary visions in each of the four synergy categories. (e-, r-, f-, m-). NRS is measured as discounted incremental cash flow associated with the nominated synergies and not only with incremental revenue, incremental expense or incremental customer base. It is arrived at after deducting all cost including start-up costs. The gross prospective synergies are to be adjusted for the offsets that accompany them like the cash flow attributes that generate the synergies.

Some synergies are realised immediately on merger while some are realised over a long period post-merger. The relevant discount rate for synergy purpose is same as the WACC for IVE calculation. The scope of synergies available for consideration should not be too broad as it may lose focus on critical factors. Synergy scope should not be too narrow too as unexpected and false indicators may arise and the NRS can never match upto the APP. The smaller the universe of net synergies, less likely that projected NRS can match APP. e- and r- synergies are considered as the major categories and any synergy calculation which do not consider the critical difference between the four categories are susceptible to failure.

7. Avoidance of transaction by 'wounded quail' acquirers, overreaching egos: "Desperate acquirers contribute to buyers' panics and may destabilise the M&A market overall because of: a) acquisition decisions made on a non-economic basis; and b) extreme overbidding-far beyond levels suggested either by realisable synergies or comparables." (Clark and Mills, 2013). "The high-ego acquisition means a deal made on the most indefensible of qualitative reasons (Temporarily boosts struggling management's image), increases threat of winner's remorse caused by hubris." (Roll, 1986). ATT-NCR acquisition is normally given as a perfect example of where acquirer and target CEOs manifest a high level of hubris. Malmendier and Tate (2005a and 2008) explains how CEO overconfidence have an impact on corporate investment policy and ability to create value in Forbes 500 firms. Doukas and Petmezas (2007) showed that overconfident bidders resulted in lower announcement returns of M&As by using a large sample of UK firms.

Distracted CEOs ignore trouble signals in target companies due to his/her enthusiasm as target appeal and lives in misperception about his/her management aura. A type of 'saviour acquisition' leads managers to sincerely believe that the proposed business combination is essential to protect the interests of acquiring company's shareholders. Typically, company shareholders are helpless and dispersed to avert the value destructions instigated by charismatic leaders and hence the board of directors are in a better position to alleviate their firms from value destruction.

CONCLUSION

1. The MMF reality is demanding the firms targeting value creation through M&As to stand aside and do nothing to prevent value destruction. Putting aside the egos and prioritising the shareholder's wealth maximisation may need the manager to be at the other side of acquisition i.e., as a seller as MMF theory identifies that even in failed mergers there is value creation happening in case of seller company shareholders.
2. Careful and patient acquirers can take advantage of promising targets which may come their way later in the form of non-continuing units divorced from the first acquirers, sellers who missed the first or best offer but still want to exit and last man standing companies that believe that consolidation and contraction will create less value.
3. Self-assessment and identifying the priority pathways is required in finding good opportunities and maintaining a competitive edge resulting in value creation. The strengths, weaknesses and opportunities for growth and development are to be assessed. A strategy should be developed to complement the strength of the acquiring company while trying to overcome the weaknesses for gaining a competitive edge rather than being a reactor.
4. Improving the performance of the target Company is one of the major value creation strategy. Targeting a company which has potential to generate more revenue and reduce cost will be ideal than one which is generating high revenue and profits.
5. Consolidations should be aiming at removing excess capacity from the industry through consolidation rather than creating spare capacity which results in supply more than demand.
6. Consolidation should aim at increasing market access for innovative products of target companies. Additional sales force and market reach of acquiring firm will result in value creation through consolidation.
7. M&As should aim at acquiring the technology faster than the time they take to build it. Apple acquisition of speech recognition pioneer Novauris in 2014 and Cisco systems acquiring Key technologies in 2013 are perfect examples of acquiring technology through M&A than development.
8. Exploit the economies of scale to create value through M&As. Higher economies of scale can be achieved through integration of small companies than large companies as large ones might have already achieved the maximum possible economies.
9. Picking the winners early and helping them develop the business is another suitable strategy for value creation. This is in contradiction to the earlier recommendation to stay patient and cautious because of MMF theory. But right choices made like Johnson and Johnson acquisition Depuy in 1998 resulted in annual growth rate of 17%. Acting before the competitors will be the key in this case.

It is appropriate to end this study with the merger rules given by Peter F Drucker (1981) which seems relevant even after years of research and analysis.

1. *“Acquirer must contribute something to the acquired company*
2. *A Common core of unity is required*

3. *Acquirer must respect the business of the acquired company.*
4. *Within a year or so, acquiring company must be able to provide top management to the acquiring company*
5. *Within the first years of merger, managements in both companies should receive promotions across the entities.” (Weston et.al., 1990)*

HISTORICAL SYNCRETISM OF FOLKLORE AND MEDIA

Aygul Akhmedova*

*Professor,
 Candidate of philological sciences,
 Uzbek National Institute of Music Arts named After Yunus Rajabiy,
 UZBEKISTAN

ABSTRACT

This study highlights the importance of information sharing and interaction, the essential prerequisite for the existence and development of society, ancient journalism - protojournalism and the syntax of folklore, folk carriers, ancient mythology, archaic religions as primitive media, and common and distinctive features of journalism and folklore. Journalism has been theoretically explored in terms of the classification of mass communications in two periods.

KEYWORDS: *Folklore, Journalism, Protojournalism, Syncretism.*

INTRODUCTION

The creation of material and spiritual riches are inherent in human nature forever and ever. Because, as a child of nature, he cannot live without material possessions, and as a child of society he has no future without moral values. In the primitive times, the material and spiritual world of man was not as inseparable as that of the twins of Siam. From ancient times it is clear that a person can be formed only in the community, in the community. Examples of fossilized children losing their human characteristics are fiction.

The church and society cannot exist without messages and dialogue. Today, the idea that society is communication, as John Duye, a US scientist, can say is anyone who has witnessed the importance of information in human life.

It is well-known that the term communication comes from the Latin word communication / communicate, etymological meaning is to make, to link¹. In journalism, it means communication, message, communication. Also, journalism has historically been classified into two periods: "1st stage - Mass Communication to the Press;

II - The Emergence and Development of Press, Radio and Television "².

One of the authors of the textbook "History of World Journalism" FA Muminov divides each epoch into four stages, the fourth stage being a mythological creature, and the socialistic, poetic - dramatic - prose creation inseparable from the syncretism in the history of mass communication explains³.

Syntheticism is derived from the Greek word sykretismos, which refers to the integrity of religious-philosophical and artistic thinking (for example, mythology) in the seed system in art theory. He used theory as a term and, mainly, an academic A.N. Veselovsky's case was settled. In primitive society, literature, philosophy, and mythology were mixed. People danced while singing, and at the same time sang.

"Ancient songs sung with music and movements are in the form of chorus," says Veselovsky, "and still retains some of its ancient traces in some forms of modern poetry. They were ritual, agrarian, domestic and heroic songs."⁴

Today, synchronicity in arts, including folklore, usually refers to the simultaneous dance of dance, music, and song in primitive culture. "Although such a state of affairs remains to this day, music, dance and song are considered as independent arts."⁵

Mass communication, media - communication in its own name, means. In this sense, the content is of the utmost importance, both in ancient and modern times, by means of information.

Since the term syntheticism of primitive art is embedded in scientific use, we should always refer to ancient art, painting, ceramics, embroidery, sculpture, drawing, music, song, oral art and more. Because primitive art is closely connected with the life, work, and religious beliefs of the primitive man. In this sense, the above point of view of AN Veselovsky is quite perfect. Because ceremonies were associated with religious beliefs, agrarian and domestic songs were associated with rituals and labor activities.

It is true that in Bible times some stone or animal object was used. But without mythology, the person remains an object without leaving any mark on it. It cannot be an information source, that is, it does not store or transmit it. But the inscriptions, paintings, myths and legends written on it can be the object of folklore and journalism. This is what we mean when we call folk syncretism with primitive culture media.

Journalists say that the common syncretic character of primitive communications is witchcraft, cave and rock images, patterns in objects, banging, ringing, fire, smoke, music, song, symbolic communication - rings, rings, specials. bound belts, headdresses, seals, merchandise letters, picture letters, birds, skin, bones, wood, clay, stone, cloth, and more. Ancient journalism is also called protojournalism, the earliest journalism, and primitive journalism⁶.

The fact that protojournalism and ancient folklore existed at the same time, more precisely, their syncretic character has been significantly preserved in the folklore patterns as far as artistic and poetic details and images.

Stones: stones, inscriptions, inscriptions not only carry information, but also play an important role in the primitive culture and the ancient world. In ethnographic literature, stone is more overused and diverse among fetishistic beliefs. For this reason, GG Stratanovich has in the past six stages of the development of stone theology⁷.

In Uzbek folklore, in the fairy tales of the Three Brothers, or in the Lamé Wolf and the Gulombachcha, the heroes see a stone with instructions that "if they come," "go away," "don't come," when they make three separations.. In Uzbek folklore, the three figures are magical and represent the ancient view that the universe is made up of three parts (sky, earth, and underground). The Orkhon-Enisei inscriptions on the stone are a striking example of folklore and ancient media.

As we have already mentioned, Weselowski, who proved the synchronicity of primitive art, says that the belief in the divine power of the song is very ancient in many peoples, and that motive has gone through the stages of the song, from cosmic effects to emotional and psychological effects. He says that a bird's cock is the messenger of the morning, while in Christianity it is often interpreted as a symbol of Christ.

Screaming, cock, screaming, cock

Wake up my love

Culture historians testify that China has a unique "bird's letter" in ancient times. Farididin Attor's poem "Logic Ut-Tayr" proves that birds played an important role in the mythological and religious views of Asia in ancient Asia.

In the Uzbek folklore, such details as crates, stones, rings, earrings, bird images were not studied. But there are works in which only a few poets of protojournalism are included in the poem. For example, in the Ravshan poem, Jonah gives his grandson a "special government brigade" to enjoy. "Ravshanbek read: ... there is a band on the feathers on the ground ... some of the finest rings have a horse and a picture." So, Ravshan read Zulkhumor's name from the ring and looked at his picture. And the bird mayna that sends letters from Shirvan to Chambil is as smart as the human:

The creature mayna had forgotten himself,

With two eyes staring at the chambil.

In the dark a creature mayna flies away,

To justify salt of Zulkhumor

To bring joy to the daughter of Korahan,

Remember what he said,

As an ambassador to Chambil,

To justify salt of Zulkhumor

The messenger symbols of folk songs and the goose image in the Alpomish also belong to this system.

In mythology, families are unique to animals and birds, whose totals are to do good, save lives, and at least help. In the "Farhad and Shirin" fairy tale, Farhad sees glimpses of Guliqahahah in the world first, and then and then he sees a girl flying on a swing.

Comparative analysis of these passages in terms of protojournalism and folklore, we can come to the following conclusions: The artistic expression of the ancient royal ring, the symbol of power,

is the symbol of power. "The name has a long history. And the picture is a folk picture of a pictographic picture. In our second example, the ring was replaced by a mirrored world. We think that the historical basis of both is ancient caves, paintings, inscriptions (pictographs).

According to Dr. Drachuk, the Indians had once sent an interesting picture to the Congress to Washington. It consists of a bird, some animals, a big fish, and a human being. These creatures are intertwined with lines drawn from their eyes and hearts. Below them is a serrated line similar to the road and the river, and below it is depicted four crooked circles, with a thin line attached to the bird.

Members of Congress do not understand the meaning of the letter. Experts found that the seven shapes represent the seven tribes of North American Indians, the large bird - crane, the totem of the leading tribe; as the Indians demand the restoration of their land rights.

We can say that there is a significant unity between the Indian letter and the ring in the Ravshan epic and what is evident in it. The difference is that the Indians' letters are in reality, and the ring is in the poem. Cranes and fish also carry many meanings in Uzbek folklore. The above analogy gives us an analogy to the fact that our ancient ancestors were also pictographs, and that they were embodied in Uzbek folklore. It is well-known that the pictograph is a primitive type of sign that illustrates objects, events, and actiin conventional icons.

Name: As for the names that appear in the ring and in the objects of protojournalism, names from the primitive culture were closely related to the development of human history.

The name of the person meant a lot of information, meaning: his totem, seeds, ancestors, sex, and so on. Like other nations around the world, Turkic peoples believed that the person's name was coded in his name. It is believed that a person's name is magical.

Among the six girls, your name is Anor,

To save you I have to buy a talisman

Uzbeks usually give birth to natural girls like Anorol, boys Anorboy, Holboy. The talisman is a magical object that is believed to protect its master from evil forces. The important magical ritual importance of the name is reflected in folk epics, including the Alpomish. In it, Shoimardon Pir will be named after the hero in a special ceremony. Also, a person familiar with the Uzbek folklore, after hearing the name Gorgogo, remembers much of the epic fate of the hero.

There are still signs of magical belief in a man's name. Making a call to a child's name and calling him a decent name is a serious ritual and a parent's first duty. Also, if a baby is born during fasting, it is called Orozgul, Orozboy, if he is at a wedding, Tuychiboy, if he is a guest, he is a guest. When older people come across such names as Tursunoy, Stop, Turdihol, and Ogiloy, they immediately realize that they were born into a family where no children were born or girls were born.

The history of the object of onomastics, which deals with names and names of philology, is also linked to primitive times. This is a good example for a journalist that the material, headline or series that he or she produces is very important, and the need to provide as much information as possible is already proven in journalism.

Such comparisons of media communications and folklore syntax in the primitive culture can be summarized as desired. The important thing is that the syncretism of the folklore and the media during the primordial art is still in its present form. Let us come up with a question to explain this point. As you know, folklore:

Ancient Folklore.

Traditional folklore.

Contains contemporary folklore.

Ancient folklore is in many ways synonymous with the era of protojournalism. For comparative convenience, we recommend classifying journalism history as follows:

Protojournalism.

Traditional media - newspapers, magazines, brochures and so on. - Traditional journalism.

Modern media - radio, television, computer, internet. - Modern journalism.

This classification not only assumes the storage and transmission of the main material of the traditional media, but also the use of modern media by the technical means that have emerged at different historical stages, but also the syntax of folklore and the media. Because only newspapers and magazines can provide folk texts, radio can preserve their music and text. Television, the computer and the Internet have the ability to broadcast both dance, music, speech, and ceremony, as do syncretism of primitive art. At the same time, radio, television, computers, and the Internet are very different from traditional media. At the same time, Professor Muminov's opinion deserves special mention: "The mass communication scheme is the same in both the primitive tribe and in today's society. This conditional image consists of four main parts: media producers - the finished product - the broadcast media - the audience. "

From the point of view of cooperation between folklore and the media, this scheme is as follows: folk - folklore - media - audience.

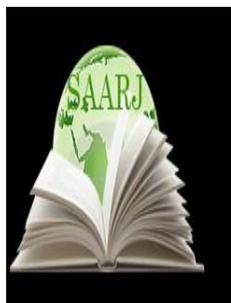

Based on our analyzes and observations, we have come to the following conclusions:

1. The creation of material and cultural values, the exchange of information and communication are the most important conditions for the existence of society since the primordial community system. Ancient journalism - protojournalism and folklore were syncretic, with folk carriers, ancient mythology, archaic religions, folklore primitive media.
2. In ancient times, traces of folklore syncretism with primitive media communications were preserved in dozens of artistic details such as stone, rings, earrings, bones, birds and many other mythological images, interpretation of dreams, folklore and folk songs.

ABSTRACT

The article analyzes the influence of corona virus infection on family demography in Uzbekistan. It also focuses on other demographic indicators, such as comparing population growth in CIS countries between 1991 and 2011, as well as the interregional distribution of population in the country and the structure of working-age population. It allows to observe the variations of demographics in the country since the independence to date. It also allows identifying the accumulated demographic issues, namely the overpopulated regions with the high level of unemployment, the imbalance between supply and demand in labor market, the increase of working-age population, and the rise of elderly employable population which creates pressure on the pension system. Therefore, a high priority task for today is the elimination of these problems as the corona virus pandemic may worsen the situation in the country because the well-being of family demography and the well-being of country are closely connected.

KEYWORDS: *Coronavirus Infection, Family, Uzbekistan, Population Growth, Birth Rate, Demographic Issues*

INTRODUCTION

Population is seen as a productive force and main consumer in the development of society. In this regard, the history of mankind requires study of problems related to population. The science that studies the problems associated with population displacement is called demography. "Demography" comes from the word "demos" – people, "graphy" – writing, which means study of populations.

Demography is not a new science; it has been studied for more than three hundred years. Population growth depends on natural, economic, social conditions, national customs, and traditions. Developing countries account for a share of the world's population growth. Uzbekistan is also one of the fastest growing countries. Population growth causes social and economic problems throughout the country. However, through the authorities' efforts, in Uzbekistan all conditions are created for a peaceful and prosperous life of people. The country's demographic policy is aimed at creating a strong family, supporting maternal and child health, and effective use of labor resources¹. For Uzbekistan, priority is the human factor – criterion that determines the main direction and effectiveness of all reforms. This means pursuing a strong social policy, considering demographic and other national characteristics. In Uzbekistan, the family is seen as a part of society, as a small independent “country”. It is in the family that the processes of generational change take place: birth, death, marriage, divorce. After all, family is the first stage of the mental and physical formation of population. In this regard, the inviolability of family is enshrined in Articles 63, 64, 65 of the Constitution of the Republic of Uzbekistan². The strength of family is not only the basis for population growth, but also the basis for the formation of mentally and physically mature workforce.

The level of economic, social, and political development of country influences demographic processes. Researchers studying demographic, economic, social, and political sciences should know about this. The subject of demographic statistics should be known to both businessmen and entrepreneur. Because a businessman or entrepreneur must plan for whom and in what quantity to produce their product. To study this need, it is necessary to know average age of population; average size of families and average number of children in a family; national customs and other relevant data on population. Studying demographics in the United States of America is the starting point for entrepreneurs³. Therefore, the subject of demographic statistics should be known not only to students, but also to businessmen and entrepreneurs – or everyone who participates in the development of society. The purpose of studying science is to analyze information about demographic processes, develop measures to solve problems, assess demographic situation in a society, which are fundamentals of determining socio-economic prospects.

Imbalance between Population Growth and Labor Market

It is known that one of the factors influencing a sustainable and effective development of the country is a stable demographic situation. Even though natural population growth in Uzbekistan has slowed down in recent years. It remains the leading country in Central Asia and CIS in terms of population growth. According to data, over the 20 years (1991-2011), population of Uzbekistan increased by 8.9 million people, while in neighbor countries: Tajikistan by 2.2 million, Azerbaijan by 1.9 million, Turkmenistan by 1.2 million, Kyrgyzstan by 1.0 million, and Kazakhstan by 0.8 million. On the contrary, in some CIS countries there was a decrease in population: Armenia by -0.3 million, Belarus -0.7 million, Moldova -0.8 million, Russia -5.4 million, and Ukraine -6.0 million⁴ (Figure 1).

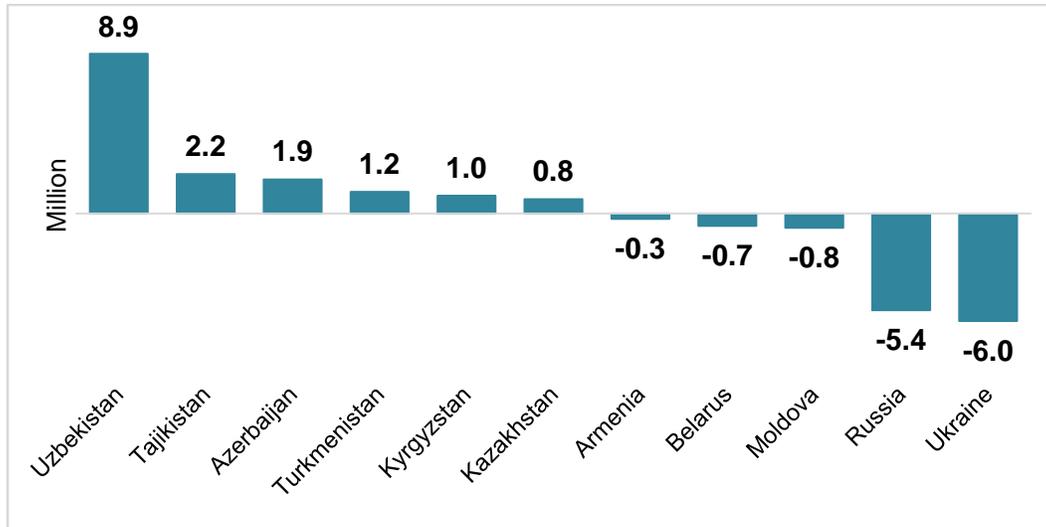

Figure 1. Population growth in the CIS countries, 1991-2011 (Voloshin & Yakushkin 2012)

Significant changes are also observed in the interregional distribution of population in Uzbekistan. According to data, the largest share of population currently lives in the Fergana Valley (Andijan, Fergana, Namangan) – 28.6% and the Zarafshan Valley (Samarkand, Navoi, Bukhara) – 19.8%. Kashkadarya and Surkhandarya oases accounted for 17.3%, Tashkent region and Tashkent city – 16.5%, the Republic of Karakalpakstan and Khorezm region – 11.2%, Jizzakh and Syrdarya regions – 6.6%⁵ (Figure 2). In this situation, it is important to develop targeted government programs to increase employment rate and efficient use of available labor resources. These programs require a decent redistribution of available labor resources for the prospect of innovative development of the regions. Also, the program includes the construction of affordable housing for young families in internal migration, and the construction of new social infrastructure in the regions. These programs have been being implemented in the country since 2016.

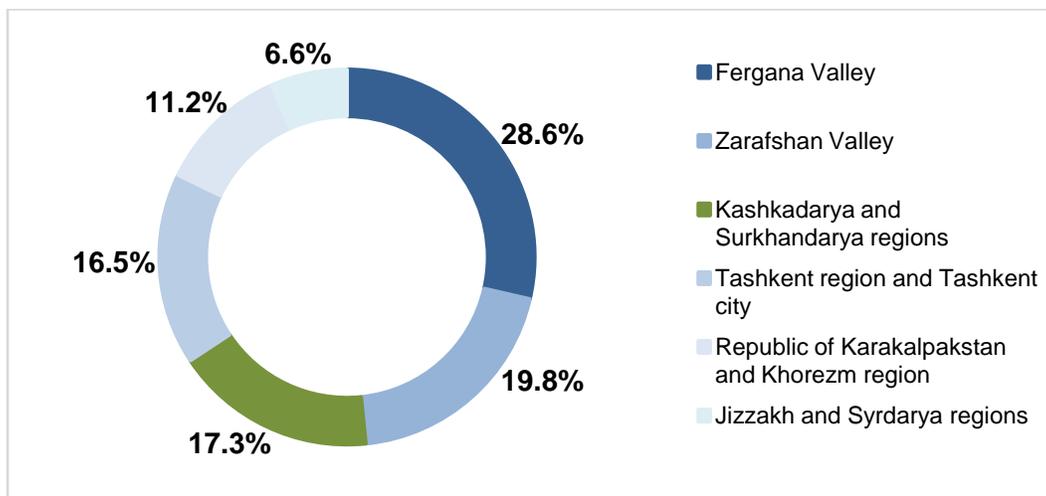

Figure 2. Interregional distribution of the population in Uzbekistan (Stat.uz, 2020)

Change in quality of country's population is related to a change in age structure of population. The current age structure of population of Uzbekistan is young, despite the decline in birth rate that began in the 1990s. According to State Committee of the Republic of Uzbekistan as of 1st January of 2017, share of young people under 30 years old was 56.5% – of which share of youngsters under 16 years old is 30.1% and share of young people 16-29 years old – 26.4%⁵ (Figure 3). Also, analysis of data show that in recent years the absolute number of people aged 0-15 years has decreased (in 2010, the share of youngsters under 16 years old was 31.2%).

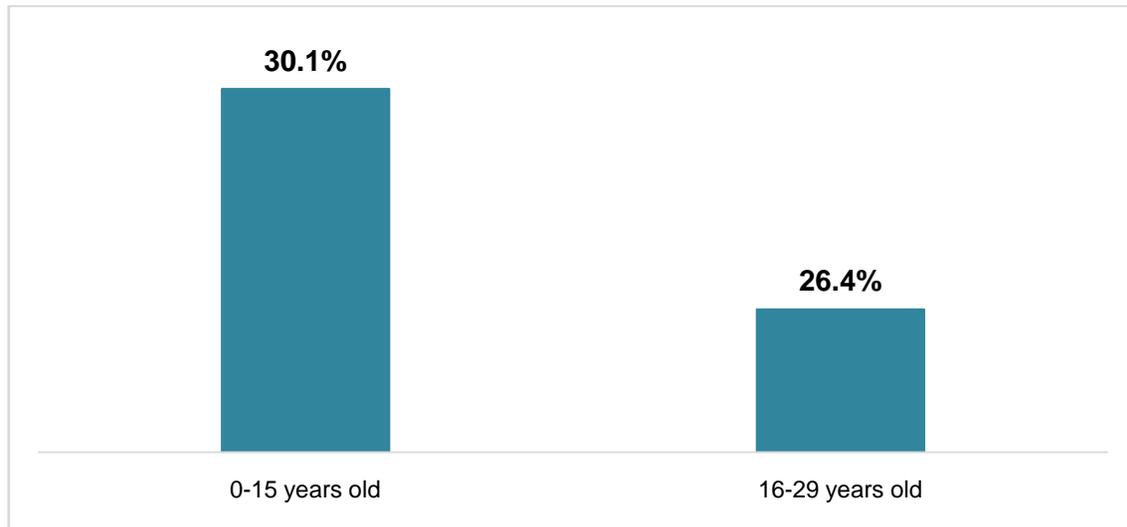

Figure 3. Age structure of the population under 30 in Uzbekistan (Stat.uz, 2020)

From 2010 to 2016, share of employable population in the country decreased from 31.3% in 2010 to 30.1% in 2016⁵ (Figure 4). In the last 20 years birth rate was dropped, namely birth rate in the country decreased from 34.5% in 1991 to 23.2% in 2010⁵ (Figure 5). Currently, this indicator tends to decrease. In general, based on the experience of developed countries, the size of working-age population will continue to decline by 2050¹¹, while the older generation will grow from the current 10-12% to 18-22%¹².

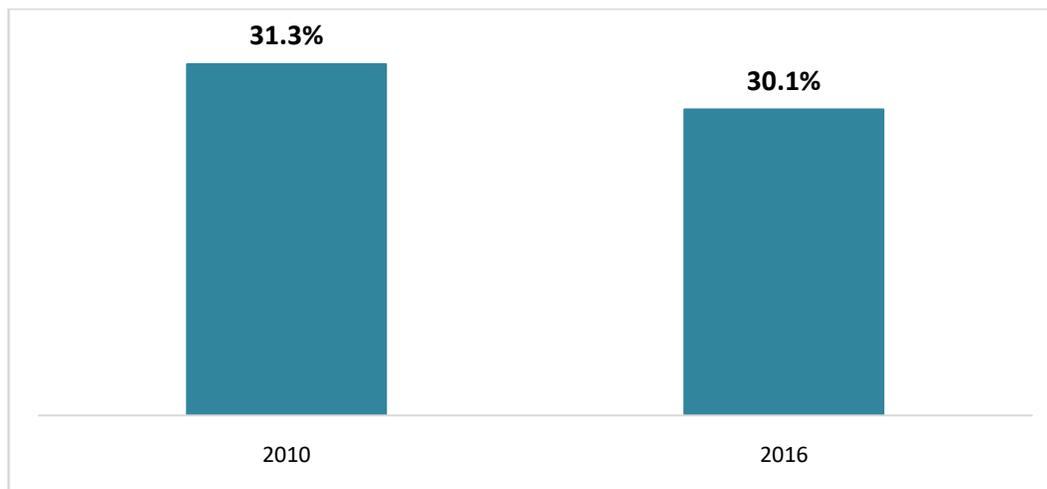

Figure 4. Structure of the working-age population in Uzbekistan, 2010-2016 (Stat.uz, 2020)

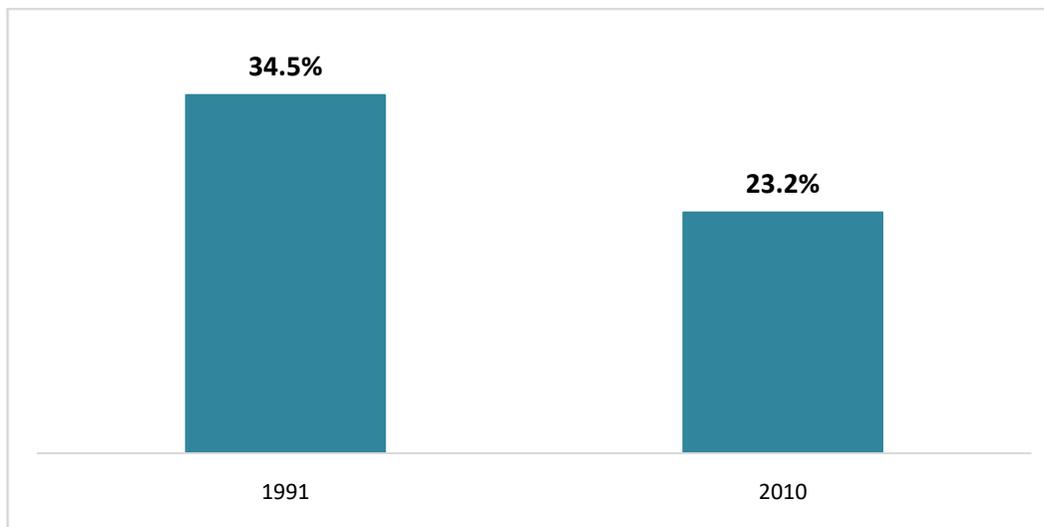

Figure 5. The birth rate in Uzbekistan, 1991-2010 (Stat.uz, 2020)

Impact of Coronavirus Pandemic on Family Demography Today the world is witnessing unprecedented events. Apparently, due to the coronavirus (COVID-19) epidemic, everyday life appears to have come to a standstill because of the global crisis. The pandemic has paralyzed activities in many areas, the virus continues spreading around the world, causing thousands of deaths.

Given the abstractive and unpredictable world situation, the Uzbek government had to take new precautions to protect its citizens. A decision was made by the Republican Special Commission on the timely identification of patients or persons with suspected disease and prevention of the disease spread in the country. The decision imposed the number of restrictions and certain measures were taken⁸.

To protect the healthcare of Uzbekistan citizens, especially those over 65 and with chronic diseases, were advised not to leave their homes and suggested to wear personal protective masks while going outside. In all trade and farmers markets, measures were taken to prevent population from being in a close proximity in order to stop the disease spread. As a result of quarantine measures, shopping and entertainment centers were closed. Kindergartens, schools, and universities have been closed in accordance with the recommendations of medical professionals. In order to prevent a new wave of disease, the Presidential Decree of March 19, 2020 “On Priority Measures to Mitigate the Negative Impact of Corona virus Pandemic and the Global Crisis on the Sectors of Economy” identified the immediate, urgent and critical tasks to mitigate the negative consequences of impending crisis on a global scale⁹.

The spread of corona virus pandemic, which is expected to lead to a reduction in the source of population’s income, could negatively affect the demographic process and affect the birth rate. The global economy could contract by 4.4% in 2020¹⁰, this could provoke a chain reaction that will lead to depression in both developed and developing countries. However, Uzbekistan is taking effective measures to reduce the impact of pandemic. The goal is to prevent a drop in income and living standards of population.

It should be noted that, despite the existing difficulties associated with the pandemic and quarantine, Uzbek people did not fall into depression. Not a single system working in Uzbekistan has stopped. Activities related to mental work, learning are carried out remotely and online.

Accumulated Demographic Issues and Their Solutions

At the same time, the goal was set to effectively continue working of agriculture and construction industries; other priority sectors of economy; and business entities in the country. Today's wasted time and opportunities cannot be recovered tomorrow. In addition to feeding 34 million people, the country is faced with the challenge of exporting domestic products. At the same time, the spread of corona virus in other developed countries has a strong impact on the demographic situation, but the virus has not spread widely in Uzbekistan due to precautions since the outbreak. The mortality rate has not increased. Therefore, the corona virus might not have a strong impact on the demographic situation in the country.

It should be noted that in 2007-2016, the working-age population in Uzbekistan increased by 20.7%, while the number of employable elderly people increased by 55.0%⁵. The results of analysis show that the older working-age population grew faster than the working-age population. This can be explained by the fact that population born during the period of "demographic replenishment" after the World War II is now included in the group of elderly people, whereas the average age of population is growing.

World demographers' forecasts show that the aging process is accelerating. According to UN experts, by 2050 the aging rate in the world is expected to be 16% in comparison to 9% in 2019¹³. The aging process will negatively affect the development of national economy, and it is expected that this process will lead to the following socio-economic consequences: (1) an increase in share of elderly people among population will reduce the economic activity of citizens and (2) older person might be less active and less productive in their labor participation.

Last 30 years in Uzbekistan, the number of demographic indicators of population – birth and mortality rates – have seen a change. In the past period, we saw both growth and decline of these indicators.

If we first analyze birth and mortality rates, we can observe a certain trend from the first year of independence to present. While total number of births from 1991 to 2003 declined at almost the same rate, from 2004-2010 it increased significantly⁶.

It is not hard to understand that there have been changes in size of families. However, for a more complete analysis of changes, it is advisable to focus on other demographic indicators as well. These are the cumulative birth, marriage and divorce rates, maternal and infant mortality etc. Aggregate birth rate is an average number of children born by women. This ratio does not consider the mortality rate in this age group and change in the age structure. If the cumulative birth rate is above 4.0 or 4 children per woman, the birth rate is high, and if the total birth rate is less than 2.15, the birth rate is low. During the study years, the total birth in Uzbekistan decreased along with the birth rate. Thus, there were more than 4 children per woman in 1990s, and now it is less than 2.5.

After 2016, special attention is paid to the demographic situation in the country. In particular, the concept of integrated socio-economic development of the Republic of Uzbekistan until 2030 also describes demographic processes and prospects for the development of labor market⁷. In the

future, the high birth rate, which began in 2009-2010 and continues to this day, will be reflected, albeit less quickly, in 2020-2030. In the future, the total birth rate per 1000 people will decrease from 21.7 to 17.1 births.

As a result, the average annual growth rate of the resident population in 2018 is projected at 32.6 million, and the average annual growth rate of 1.3%. By 2030, population will reach 38.6 million. At the same time, due to the intensification of urbanization, it is expected that the share of urban population in the country by 2030 will increase from 50.8% to 60.0%. In the forecast period, compared to 2018, population under the age of 16 is expected to increase by 7.5% or 743.4 thousand people. The population of working-age will increase by 14.4% or 2,841 thousand people, and population of older working-age will increase 1.6 times or 2,050.3 thousand people.

Migration rates are expected to change over the forecast period. If in 2017 the overall level of migration was -0.6%, then by 2030 it is expected to be -0.5%. It is expected that the labor force migration to foreign countries will decrease in comparison with labor resources. However, there may be the number of risks associated with the gradual aging of population in the forecast period. By 2030, the proportion of people aged 65 and over will reach 8%, with a maximum value of no more than 7%. This trend, associated with processes in the age structure of population, is putting an increasing pressure on the pension system. This requires preventive measures aimed at developing an appropriate infrastructure for the elderly⁷.

Supporting the population's plans – creating a family with an average of 2-3 children, introducing institutions of family planning and reducing divorce rates among young families – are important tasks in the development of demography for the forecast period until 2030.

The decision to conduct a census in 2022 will solve the number of pressing issues. The results of census make it possible to conduct a deeper analysis of formation of population, as well as to draw up a comprehensive and realistic forecast of demographic development in the country.

According to the forecast, because of population growth, the average annual labor force will increase by 1.15 times by 2030 compared to 2018, reaching 21.8 million people. The average annual per capita growth will be 1.2%, the share of labor resources in the total population by 2030 will be 56.4%. At the same time, the number of people employed in the economy will reach 14.6 million by 2030. The average annual increase in the employed population is 2.1%. However, there are the number of problems and risks that negatively affect the stability of labor market. In some parts of the country there is a shortage of specialists, especially doctors and teachers. The imbalance between supply and demand in the labor market often leads to the fact that graduates of educational institutions do not find work in their specialty. The Republic of Karakalpakstan, Surkhandarya, Samarkand, Fergana and Jizzakh regions have a high level of unemployment, which requires a creation of additional jobs⁵. The country maintains a high level of informal employment (about 40%), which negatively affects the revenues of state budget. Therefore, important public policy measures have been developed to ensure the stability and sustainability of labor market until 2030.

CONCLUSION

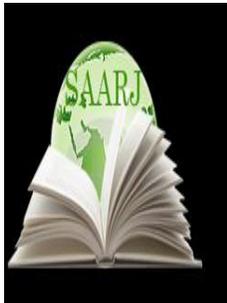

Firstly, it is required to revise the Labor Code in line with the requirements of market economy to encourage employers to hire more labor. Secondly, it is suggested to develop and implement

investment in development programs. Also, it is advised to create clusters, free economic and small industrial zones, parks of innovative technologies and accelerate the creation of new jobs through continuing practice. Thirdly, it is highly recommended the partial redistribution of the labor force, freed from inefficient production, to new enterprises using new technologies and characterized by high productivity and competitiveness. Fourthly, mainly in those regions where the situation on the labor market is tense, it is planned to locate new enterprises for a specific purpose. A creation of conditions for employment is mandatory to create new jobs and support small business and entrepreneurship, promoting employment in rural areas. It is also required to implement several measures to increase regional labor mobility, increase competitiveness of a labor force, improve career guidance and psychological support for population through the development of system of continuous vocational training. These solutions will serve to improve the demographic situation in the country.

ABSTRACT

The article deals with Mavlono Yokub Charkhiy and his commentary work entitled "Risolayi noiya" (A book about Flute). This work is distinguished with its detailed and meaningful comments. As Yokub Charkhiy was the follower of Hazrat Bahouddin Naqshband, he interprets the symbol of flute based on the ideas of Nakshbandiy tarikat. The article also presents brief information about the author of «Risolayi noiya» for describing a bigger picture about the work. If we consider Kamoluddin Husayn Khorazmi's commentary work "Javohir ul-asror" for «Masnavi-ye ma'navi» written in verse, Youkub Charkhiy's «Risolayi noiya» is thought to be the first commentary work of «Masnavi-ye ma'navi» written in prose. The author wrote comments mainly for three hikoyats, but those selected three are regarded to be famous and rich in meaning. The author proves his opinions by quoting and including stories related to the life of Hazrat Bahouddin Naqshbandin hikoyats entitled "The King and the bondwoman", "Sheikh Daquqi", "Sheikh Muhammad Sarrazi".

KEYWORDS: Youkub Charkhiy, Nakshbandiya, «Masnavi-Ye Ma'navi», Hikoyat, Spirit, Daquqi, Sarrazi.

INTRODUCTION

RESULTS OF THE RESEARCH AND THEIR DISCUSSION

Yokub Charkhiy, who is considered as one of the respected representatives of Nakshbandiy sect was born in 1363 in Charkh village of Afghanistan. There he received his primary education then

went to Gazna to further his studies. His grandfather lived in village Sarraz. Charkhiy talks about his origin in the introduction of Shaykh Muhammad Sarraziy's narrative poem "Risolayi noiya" (A book about Flute) and mentions his name as Yokub bin Usmon bin Mamhmud al-Gaznaviy al-Charkhiy as-Sarraziy[1:1].

Yokub Charkhiy visited city Hirat and Egypt. Later he went to Bukhara to study and on his way back he made his pilgrimage trip to KhodjaBahouddinNakshband by becoming one of his followers. He belongs to 18th row in line of Nakshbandiy sect. After the death of HodjaBahouddinYokubCharkhiy went to Chagoniyon to enrich his knowledge by taking part in the discussions of AlouddinAttor which was mentioned in the chronicles of Doroshukuh "Safinatul-avliyo": "...by being involved in the conversations with AlouddinAttor, he gained experience and enriched his knowledge" [2:80].

All his life hazratCharkhiy followed the views of Bahouddin Nakshbandiy and Alouddin Attoras their ideas became the motto of his life and in his works hazratCharkhiy worships them.

It is worth mentioning that YokubCharkhiy was the follower (murshid) of HodjaAhrorValiy. Khalilulloh Khalilidescribed the first conversation between the teacher and the pupil in the following extract: "When (*XojaAhror*) came to serve *Mavlono*(Yokub Charkhiy), *Mavlono* first showed himself in his angry look with a kind sign that was expressed on his face. Seeing that *KhojaAhror* was not happy with that presence. *Mavlono* did not shake his hand. When *Mavlono*Charkhiy showed his presence differently second time, *HodjaAhror* realized that he was unwilling to shake his hand, but still took his hand. Noticing this behaviour, *Mavlono* said:

– Once my great leader *BahouddinNaqshband* holding my hand, said: "Your hands are our hands, if someone takes your hand, it means that he is taking our hands." By saying this at that time he explained one of the principles of *Nakshbandiy* sect (*tarikati*) [1:116].

Based on the words of Abdurakhmon Jomiy he also used to say that: "Any person, who is coming to see him like *Hodja Abdulloh Ahror*, was supposed to come with fire, oil and candlewick, then he only needed one match" [1:116].

Charkhiy passed away in 1447. His burial is located in the place which is close to Dushanbe (capital city of Tajikistan).

Though there is information about the life of MavlanaYokubCharkhiy in A.Jomiy's «Nafahotul-uns...», Ali Safiy's«Rashahotul-aynul-hayot» and Doroshukuh's «Safinatul-avliyo», the poets do not mention anything about the works of this great poet.

Charkhiy wrote more than 10 works on various topics. Based on the information about Charkhiy works kept in the fund of manuscripts, researcher IbromkhimUsmonov does not say any word about the work "Risolayi noiya" (A book about Flute)[3:140]. However, KhalilullohKhalililists the three works of Charkhiy[1:111-112]. They are –«Tafsiri Charkhi» (Charkhiy's comments), "Risolayi noiya" (A Book about Flute), «Risolayi mukhtasarl fhisbotivujudiavliyovamartabayionho» (A Complete book on the existence of the great men and their respect).Khalilulloh Khalili proves that "Risolayinoiya" (A Book about the Flute) belongs to Mavlono Charkhiyand provides 5 evidences[1:113-114].

«Tafsiri Charkhi» – is more famous than the other works of Charkhiy. The work is translated into Turkish language in the XVI century [3:141]. The followers of Nakshbandiy had written lots

of explanation (tafsir) to the works of Charkhiy. Yokub Charkhiy had explanations for «Fotiha» sura and 67 («Mulk»)– 114 («Nos») – suras, which tells that he selected only short suras. One of the reasons of translating them into Turkish language was dealt with the size of suras, as in the areas of Islam religion majority knew those suras by heart. Besides that, they were written in simple and familiar style to people. «TafsiriCharkhiy» made YokubCharkhiy as the knowledgeable commentator (муфассир) of Koran.

As Charkhiy was one of the followers of Hazrat Bahouddin Naqshbandiy, the teacher of Khoja Ubaydulloh Ahror Valiy. He lived and studied for a short period of time in Bukhara, Chagoniyon. Several research works had been written about his life and works during the last years in Uzbekistan. M.Razzokova's work, KoryogdiJumayev and Ibrokhim Usmonov's[4:112, 5:www.ziyounet.uz, 3:140].articles focus on Mavlonocharkhiy's life and his philosophy of thinking in which authors explore his works from various perspectives. But, still his life and creative works are not explored and analyzed enough.

In his work ParvinNohidiyincludes the conversation between Hazrat Bahouddin Naqshband and Yokub Charkhiy: "After taking permission from the great, wise and respected men to start my activity, I decided to return to my Motherland. One day I was in conversation with Hodja hazrat. *"Please, let me be close to you" –asking him many times with modesty. He asked: "After you dared to leave, why did you come to us?". I said: "I love serving you!" "What is the reason?" – he said. "The reason is that you are the great men and people love and respect you," – I said. "Give another reason, this might be satanic decision." – he said. "there is a veracious hadis that states when the Creator loves one of his creatures, he instils his feeling in his soul," – I said. The great Hodja smiled.He presented me his blessed skullcapas a memory of him"* [6:43].

Yokub Charkhiy expressed the inner human feelings and experiences skillfully. He was very much familiar with the sufi views of J.Rumi. For this reason, in each of his work he makes good use of Rumi's poems in order to prove his opinions. Not only in «Най рисоласи», but in «Tafsiri Charkhi»and «Risolayabdoliya» he successfully uses poems from «Masnavi-ye ma'navi» to support his views along with oyats and hadis. Charkhiy's familiarity with Rumi's «Devonikabir» and «Masnavi-ye ma'navi» is proven in the examples he has provided in his works. In Jomiy's work «Nafahotul-uns...» according to hikoyat by KhojaUbaydulloh, after Yokub Charkhiygot a message, he fainted, and when he regained his consciousness, he recited the following poem by Rumi:

Chu g'ulomi oftobam, hama z-oftob go'yam,

Na shabam, nashabparastam, kihadisikhobgo'yam[7:259].

Meaning: "Am I the slave of the Sun, I speak of the Sun. Am I the night or lover of the night. I speak of my dreams."

"Risolainoiya" – is the work that includes comments and notes for Rumi's «Masnavi-ye ma'navi».KamoliddinHusaynKhorazmiy wrote his notes and comments for«Masnavi-ye ma'navi» before Charkhiy, following the poetic style. YokubCharkhiy's work «Risolayi noiya» is considered to be the first commentary of hikoyats as he provides explanation for each hikoyat. This work plays an important role in the studies of «Masnavi-ye ma'navi». All researchers of «Masnavi-ye ma'navi»address this work. The work «Risolayi noiya» is thought to be the second work of comments of «Masnavi-ye ma'navi» in Khurasan and Maveraunnahr after the work

«Javohir ul-asror...» by Shaikh Kamoliddin Husayn Khorazmiy. According to the author the comments were written by the requests of his several friends. [1:1]. This tells that writing this work is similar to the process of writing «Tafsiri Charkhi» as Charkhiy also wrote «Tafsiri Charkhi» by the requests he had.

The work “A Book about the Flute” includes notes on the beginning of «Masnavi-ye ma’navi» , poem «The King and the bondwoman» (the first notebook), «SheikhDaquqi» (Short novel of Dakukiy) (the third notebook) and «SheikhMuhammad Sarrazi» (the fifth notebook). According to KhalilullohKhalili’s views,the traditions about the universe of OrifNaqshbandiy from Charkh, prove that the flute consists of the human spirit. The work “A Book about the Flute” includes the analysis of figurative and direct meaning of the words from «Masnavi-ye ma’navi»[1:113].KhalilullohKhalilistates that the copy he used during his work was brought to the village Barnobod in Hirat in 1096.[Қарағ: 1:114].

Though the manuscripts of Charkhiy’s other works are kept at the Institute of Oriental Studies named after Abu RaykhonBeruniy, Academy of Uzbekistan Science, there is no any copy of «Risolayi noiya».

In 1336, KhalilullohKhalili published Yokub Charkhiy’s and AbdurahmonJomi’s “Naynoma” works as one book. Yokub Charkhiy’s work consists of 70 pages. There is no information about when he wrote it. The work is written in prose and poetry style in Persian-Tajik language with some texts written in Arabic.

Following the traditions of that period, the author included oyats from Koran, hadis and several citations of famous poets in Arabic language.

The commentator supports his opinions, views by providing examples from poems by Rumi and Hakim Sanoiy when necessary. Some other researchers consider that the verse lines “*To dartalabijavharikoni, koni*”,–which starts rubayi, belong to YokubCharkhiy. It is proven that Yokub Charkhiy was also a talented poet. But, this ability does not explain the view that extracts of poems with no names of the author belong to Charkhiy. It needs to be researched, as we do not have any collection of poems by Charkhiy, and there was tradition to include well known verse without mentioning its author.

The commentary for the introduction of «Masnavi-ye ma’navi»consists of 29 pages. Each comment includes hikoyat, oyat, hadisandpoems that make them easy to understand the meaning of the texts for the reader. Usually the commentator explains the primary meaning of the verse in several words. Moreover, the ideas are expressed laconically and what is understood in the poem is described in details. The work is not written for the ordinary reader audience, but is aimed at writing for the reader audience with high degree of thinking and world view. Severalufi terms can be understood only by people who are familiar with the theory of tarikat.

Some lines from poems that express the main meaning are interpreted in the notes of three epic poems. The author explains the extracts from poems which he considers important for the reader and it does not cause any problem in understanding the message implied in the poems.

There was a purpose of why Чархий started writing comments for «Masnavi-ye ma’navi». Especially writing comments for “Найнама”(Book about Flute) was one of the important issues in that period. For that literary period, Rumi took a new, unusual approach to writing his famous work «Masnavi-ye ma’navi» and this new style of writing of Rumi needed explanation to explain

the meaning of hikoyats. After more than one century in Maveraunnahr and Khurasan, there was no one except Sheikh Kamoliddin Husayn Khorazmi who explained the purpose of the author and the meaning of hikoyats of «Masnavi-ye ma'navi» in written form.

Yokub Charkhiy was Rumi's countryman. If we consider city Balkh of Afghanistan as the place where Rumi was born and spent his childhood, and his motherland, then Charkhiy was one of his first countrymen who started working on notes for «Masnavi-ye ma'navi», that marks it as a historical event. Later, after Charkhiy Abdurahmon Jomi, ShohDoiySherozi, Khusayn Voiz Koshifistarted writing notes for «Masnavi-ye ma'navi» during the same period. Especially Jomiy's book entitled “Найнама” is important from the perspective of literary studies. It is important to state that Yokub Charkhiy and Abdurahmon Jomianalyzed and interpreted the concept of flute based on the requirements Nakshbandiyatarikat.

Hikoyat “Podshohvakanizak” (The King and the young bondwoman) is closely related to «Naynoma» with its idea and meaning. It is a logical continuation of introduction. Every symbol in hikoyat “Podshohvakanizak” express specific meaning in sufi literature. In this hikoyat Yokub Charkhiy considers the healer (doctor) as a perfect human being who is being sent by Allah.

In this hikoyat a young bondwoman, jeweler, king, and spiritual healer have their own status. In its direct meaning it resembles a detective story, but when it is explored deeper, we realize different meaning. This hikoyat focuses on the relationship between a teacher and a pupil. A spiritual healer (doctor) – teacher helps his pupil – a young bondwomen, to relieve her of Jeweler's love. YokubCharkhiy states: *“It is difficult to find Allah's saint man, only by his will we can recognize him: Because Allah prevent him doing ill deeds, and if he does it by mistake, Allah gives him chance to regret.*

But if someone thinks to possess the saint features, he world fails as Bal'am and Barsiso” [1:33].

“Sheikh Daquqi” is considered to be one of the main dastans of the work. It depicts spiritual experiences of Rumi. YokubCharkhiy could deeply understand the issues related Naqshbandiyatarikat. For this reason he could laconically explain the meaning of dastan that was full of symbols. Charkhiy was very much familiar with hikayat “Sheikh Muhammad Sarrazi”. He wrote comments paying attention to all its details and explained it from different perspectives as his grandparent and all relatives lived in Sarraz. This dastan is included in the fifth book with its rich content.

It is unknown where and when the work was written. Charkhiy, who was very much familiar with sufi theory and practice, could have ability to write comments and explain the other dastans of «Masnavi-ye ma'navi». But it seems that there was no need to write complete notes for «Masnavi-ye ma'navi». Besides that, there might have been other issues such as educating people, writing other works, and giving lectures on religion that could prevent him working on «Masnavi-ye ma'navi». In the introduction of «Masnavi-ye ma'navi» Yokub Charkhiy explains the meaning of some verses through other hikoyats and legends, interprets the concept of flute as the symbol of human sincerity.

In the international arena there is still interest in studying the life and creativity of Yokub Charkhiy. In Iran, Tajikistan, Afghanistan, Pakistan, Turkey and other countries translated and published Charkhiy's works in different years that could prove the interest in Charkhiy. Especially, «Risolayi noiya» with the introduction by KhalilullohKhalili was published twice in

Afghanistan. In Pakistan Muhammad Nazir Ronjkho translated the work into Urdu language and published it in 2004 in Lahur. Several years ago in Tajikistan this work was published in Cyrillic alphabet for the readers.

Unfortunately «Risolayi noiya» was not translated into Uzbek language and no article was written.

Majority readers of «Masnavi-ye ma'navi» can only understand the primary meaning of verses. For example:

*Чунки гул рафту гулистон даргузаит,
Нашнави з-он нас зи булбул саргузаит [8:1/29].*

is understood in the following meaning: “*You will not hear any story about nightingale as there is neither flower nor flower gardens.*”

But Yokub Charkhi also wrote about other meanings of that verse: “*The perfect sheikh is similar to flower and his devoted pupil resembles a nightingale. If there is no flower, the nightingale will not sing [1:21].*”

At the beginning of the work he writes about his origin. It tells us that according to the tradition the author information was given not after its end, but at the beginning of the work. This tradition is observed in “Тафсири Чархий”.

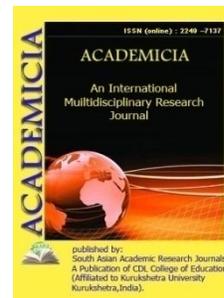

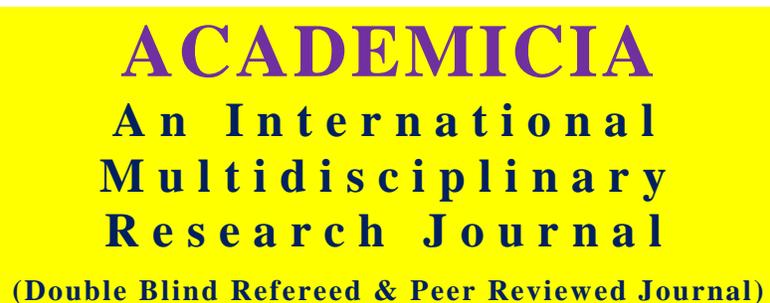

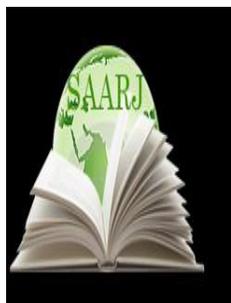

The work is ended with the following two lines of the verse:

Meaning: “*Your kindness is as much as the river water, its one drop is enough for us. If you Almighty clean sinners of their sin, that river will be purified and thus the world*”.

In summary it can be stated that Yokub Charkhi's «Risolayi noiya» is considered to be an important source in the studies of Nakshbandiya tarikat history, theory and practice. Charkhi explains and analyzes the meaning of every verse line and hikoyat through the wisdom and life experience of Khoja Bahouddin. This way the events explain theories of mysticism in the work.

POETRY IN THE FORM OF MUHAMMAS: SIMILARITIES AND DIFFERENCES

Ruziboev Tolibjon Kholmatjonovich*

*Researcher,
Independent Applicant,
State University of Fergana,
UZBEKISTAN

ABSTRACT

The article analyzes the similarity of form and distinctive features of the content and features of verses with five-line stanzas of muhammas, tehmis, tashtir, tardia, which belong to the category of muhammas, a series of musammates in the literature of different peoples.

KEYWORDS: *Poetry, Rhyme, Muhammas, Gazelle, Takhmis, Tashtir, Tardiya, Poetic Form, Poetic Metric Aruz, Muhammas Mutakarrir (Muhammas, The Last Verse Of Which Is Repeated), Muhammas Muzdavij (Muhammas, The Last Verse Of Which Is Not Repeated).*

I. INTRODUCTION

In literary criticism, great attention has always been paid to the study of a number of lyrical forms of Uzbek classical poetry and their stages of development. Today, a deeper study of this problem has become one of the requirements of the time. This is primarily due to the content of form-specific research in the poetry of the independence period. Second, classical poetry, in particular, plays an important role in the study of the evolution of national thinking through the history of literature, which is rich in a number of literary and aesthetic phenomena. Because, «to say that artistic space and artistic time will be the basis of lyrical composition of any work, to say that the remaining elements, such as plot, structure, detail, image, etc., will exist in this space and time»(Thus, the artistic time and the artistic space can be the compositional bases of any work, the other elements as the plot, text forming, details and image exist in the time and space. Supposing there are no time and space, there will not be abovementioned elements) based on the principle that, any poetic form is renewed and changed and perfected over time [2,20]. In particular, muhammas and tahmis, like other classical poetic genres, have gone through a very long stage of historical development. This explains the relevance of the study of these genres.

II. MATERIALS AND METHODS.

The history of the origin of the features of any artistic and aesthetic phenomenon is also reflected in its naming. Therefore, in determining the genesis of the genres of muhammas and tahmis, it is necessary to first think about the terms that describe them. In a number of scientific sources the term «muhammas» is used in relation to a poem, each stanza of which consists of five lines. The word «Muhammas» comes from Arabic (مخمس) and formally combines poetic genres with a five-line stanza and is interpreted as a type of poetic genre belonging to the category of musammat. In particular, Sheikh Ahmad Tarazi wrote in the chapter «Al-nav'u-s-sobeun fil bayanu-l-musammat» of «Funun-ul baloga»: «Musammati muhammas will be five lines. At the end of four lines, rhyme is used, and in the fifth line, the original rhyme is applied.

An example of this would be:

G'amzango'qinaqildisiparhur-uparijon,
 Ko'kahlibo'lurko'rsaqoshingyosiniqurbon,
 La'lingg'amidako'zdinoqarshom-usaharqon,
 Bu javr-u jafo kim qiladur jonima hijron,
 O'lmak bu tiriklikdin o'lubtur manga oson...[21,84]

(Angels and fairies shield their souls to the axis of your flirtations,
 When those in heaven see the bow of your eyebrows, they will be sacrificed,
 Blood flows from my eyes from night to morning thinking of your lips,
 These sufferings put separation into my soul,
 It's easier for me to die than to live like this.)

Alisher Navoi also describes his tehmis as «a pleasant muhammas decorated with five lines» [3,22]. At the beginning of the twentieth century, Abdurauf Fitrat also used the terms muhammas and takhmis without distinction. Speaking about Muhammad, he cites as an example two stanzas of Takhmis, written by Husseini to the gazelle of Alisher Navoi [1.42]. Literary critic Yakubjon Isakov agrees. [10,126-127] He also gives an example of five-line poems such as muhammas-kaside [10,128], muhammas-muvashshah [10,100-101], mulamma-muhammas [10,104-105], tahmis-mustazod [10,125].

In a number of other scientific sources and dictionaries of Uzbek literature, muhammas is recognized as the name of the genre belonging to the category of musammat. [5,221] The National Encyclopedia of Uzbekistan has a similar interpretation. [16,882] An explanatory dictionary of the Uzbek language states that muhammas means «pentagon», «five», «five» in the sense of Arabic geometric shape, as well as an example of classical poetry. [15,656] This term is also referred to in some Tajik sources as «five» (quintuple), and each stanza is composed of five lines. [7,76] It is also interpreted in «Tajik language dictionary» as «beshlik» (five), five corners (panjgosh), five-sided (panjpahlo'). [17,781] In Arabic sources, the term muhammas means a geometric figure, meaning «a figure consisting of five columns», «a geometric figure consisting of five equal sides», as well as a «lifting device». [23,522] In Russian literary criticism, muhammas (tahmis) is translated from Arabic as «brought to five.» [6] Literary critic D.

Yusupova also notes that the takhmis was created on the basis of bringing the stanza of gazelles to five lines. [22,53] In Turkish literature, muhammas is also considered a poem, the stanza of which consists of five lines, tehmis is called: «Its dictionary meaning is «bring to five», «bring to five lines». [24]. In Tajik literary critic, tahmis is interpreted as «the creation of a poem in the form of a muhammas.» [18,342]

Literary critic A. Khodziakhmedov divides muhammas into two types according to their form: muzdavij muhammas (muhammas with a non-repeating last line) and mutakarrir muhammas (muhammas with a repeating last line). [20,75] The scholar does not divide them into such types as tehmis and muhammas. In Uzbek literature, muzdavij says that muhammas are common. Turkish scholar Nihad Sami Banarlı also divides muhammas into these two types and cites the example of Fatih Sultan Mehmed's (Avni) mutakarrir muhammas. [4,208] Nihad Sami Banarlı also speaks of poems in a form similar to muhammas - tahmis and tashtir. Another name is tashtira mutarrafi, which means a black horse with a white line in the middle. In a tashtir of five lines, the middle three are written by another author. [4,209] Nihad Sami Banarlı says that the best example of tashtir is in the book of Nodim (1681–1730) and gives an example of his tashtir written in the ghazal of Izzat Ali Pasha:

Derdin nedir gönül sana bir hâlet olmasun

Bimâr eden bu gûne seni râhat olmasun

Bizden tesettür etme abes külfet olmasun

Bicâ tabibe varmağa biç hâcet olmasun

Sad el-hazer sevdiğin ol âfet olmasun. [4,210]

(What's your problem, heart, let nothing happen

Don't enjoy this day that made you sick

Do not hide yourself from us, lest there be a useless calamity,

So that we do not seek a doctor in vain

Watch out a hundred times so that your beloved does not become a disaster for you)

Nihad Sami Banarlı also gives information about a poem in which each verse is called a five-line tardiya. The difference between tardiyah and muhammas is that tardiyah is written in only one rhyme of aruz. The difference between tardiya and muhammas is that tardiya is written in only one dimension (maf'ulu / mafoiyulu / faulun) of the aruz poetic system. In each stanza of the five-line tardia, four lines rhyme with each other, the last fifth line does not rhyme: (a-a-a-a-b, c-c-c-c-b). The last lines rhyme with each other. [4,186]

Bashkir scholar S. Iskandarova also believes that it originated from muhammas ghazal. She also claims that muhammas are created in five-line stanzas and rhyme according to the following scheme: a-a-a-a-a, b-b-b-b-a ...; or: a-a-a-b-b, c-c-c-b-b. He also says that muhammas are written in two ways. According to him, a few five-line poems are muhammas, and if three lines are added to two lines of a ghazal, it is a tahmis.

She says that in the bashkir poetry of the twentieth century there was also a poem called tashtir. Tashtir is formed by adding two poetic lines between two poetic lines of gazelles. Tashtir rhymes according to the scheme: a-a-b-b, c-c-a-a ...

Ey kaya ul ko'nki bezde shen toroular bar ide

Ber vakitta nindey bezneng kungelle chaklar bar ide

Shad idek, bez shunday shad idek ki hayran kalarlik bar ide

Emme doshmanlarda g'emler ech poshoular bar ide...[9,131]

(Where are the happy days that we had.

We had very happy days.

We were so glad we were surprised

Our enemies have had sad days.)

Thus, the way of constructing a stanza tashtir, where two new poetic lines are inserted between the poetic lines of the *beit* of the gazelle of another author by the poet. [8,342] Another source states: "The origin of the Arabic *musammāt* and its types such as *tahmis* and *tashtir*, both terms have five parts, and the second also means the division of one thing into two, which first appears in Andalusian Spanish literature in Arabic. Most scholars say that the appearance of the *Musammāt*s in Arabic literature began at the end of the ninth century with the emergence of the Andalusian genre «*muwashshahot*» Until then, this form of poetry was foreign to the Arabs. Its founder is the Spanish poet *Mukaddam ibn Mouafa*, who wrote in Arabic". [2,209]. From this point of view, we are convinced that the *tashtir* in Turkish literature also appeared in this way. Only in this, as we saw above, the poetic lines rhyme like in *tahmis*.

Information about *tashtir* can be found in other sources. In Arabic literature, it is said that with *tashtir*, two lines of a gazelle are divided into two parts and one line is added to each, while preserving the rhyme and the size of the verse in the poem of another poet. At the same time, the need to pay attention to the originality of words and meanings is emphasized, will not allow slight subtlety or rudeness in a byte when dividing it into lines, but strive to give more clarity and meaning to the original. [23,472]

According to sources, the origin of the *tashtir* is largely related to the literature of the Mamluk period. *Safiddin al-Hilli* (1278–1349) was one of the most talented poets of the Mamluk period. It is said about him that "... his poems are free from unnecessary embellishments, abstraction and ineffective wordplay. The poet changed the traditional form of the poem, boldly upset their balance, widely used new forms - *tashtir*, *tahmis* and folklore, introduced the forms of *muwashshah*, *kumo* and left his mark on the pages of Arabic poetry as a poet-innovator». [19,56]

Another source on the literature of the Mamluk period claims that since the time of the «*Burda*» of the *Kaaba ibn Zuhair*, the tradition of writing «*Burda*» has become a separate branch of Arabic literature. It is said that the poets of that time wrote in this direction in such poetic forms as *muoraza*, *tazmin*, *tashtir*, *tahmis*, *tasdis*, *tasbi*, *tasmin*, *tatsi* and *tashir*. [14,216] This tradition is widespread among Muslim poets. This fact is confirmed by the fact that «*Anis al-Wahd Taxmis al-Burda*» *Abbas al-Fauzi al-Dagestani* was translated into the Avars language under the name «*Anis al-Wahda bi Tashtir Tarjimat al-Burda*». [13,254]

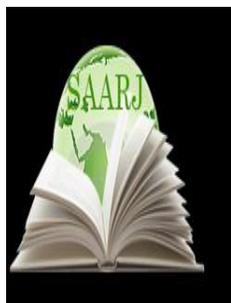

III. CONCLUSIONS.

1. From the above information, we understand that in the poetry of a number of peoples there are poems consisting of five verses, which belong to the category of musammat. The most widespread of these in Uzbek classical poetry is independent muhammas and tahmis.
2. Although in literature poems consisting of five stanzas are interpreted as muhammas, taking into account their formal aspect, their origin is also divided into types such as muhammas, tahmis, tashtir, tardia, which differ in some formal and semantic features.
3. In particular, unlike tahmis, it is possible to write in tashtir in such forms as murabba, muhammas, musaddas, musabba, inserting verses between the verses of the gazelle. And the tardia is written in only one poetic meter of aruz and is distinguished by a unique system of rhymes. It must be admitted that each of them, as a separate genre, occupies a special place in the development of oriental written literature.

ABSTRACT

The technological properties of pumpkin fruit are an important indicator and serve as a key factor directing it to storage and processing. The main quality indicators include: the mass of pumpkin fruits, mass fraction and thickness of the pulp.

KEYWORDS: *Pumpkin, Pulp Thickness, Weight, Consistency, Degree Of Tenderness, Technological Indicators.*

INTRODUCTION

Numerous developments have been made in the processing of pumpkin fruits around the world. These studies have been conducted mainly in areas such as pectin secretion in pumpkin fruits, oil extraction in pumpkin seeds, and study of the pharmacological properties of pumpkin. Especially in European countries and China, developments for the extraction of pumpkin seed oil have been widely introduced. However, in these countries the weight of agrobiological and technological characteristics of juicy varieties of squash, their storage, as well as the technology of juice production is not high. Pumpkin cultivation and consumption in Uzbekistan is not as widespread as other vegetables. Its regionalized varieties allow to produce and sell this

commodity in many regions of the country at a level that meets the needs of the population. Little is known about the marketability and nutritional value of different types and varieties of squash grown in different regions, their storage regimes and processing methods by type and variety¹.

The basis of the results obtained for a detailed examination of the indicators that determine the variability of the quality of pumpkin fruits to a certain extent is a complex indicator - a certain level of quality, at the same time the specific indicators of each variety are expressed as a percentage. Using such a method of analyzing the quality of pumpkin varieties, it is possible to observe which indicators are stable during the ontogeny of a particular variety and species, and which are subject to change.

The fruits of the squash are widely used both for consumption in fresh form and for processing. The bulk of the produce is used to process various canned goods on an industrial scale. The mass of pumpkin fruit, the mass fraction and thickness of the flesh are also important for the processing industry as it is consumed fresh. The given indicators also describe the technological features of pumpkin fruits.

Technological properties of pumpkin are determined by the structure of its fruit. Pumpkin fruit - a multi-seeded pseudo-fruit - consists of a shell, flesh and seeds, and has a placenta and seed-filled cavity. The crusty parenchyma above it forms the flesh of the fruit.

Studies have shown that pumpkin fruit consists of 17% peel, 73% flesh and 10% seeds. This figure was found to vary in proportion to species and varieties of squash.

Thus, hard-shelled squash fruits have a thick skin and, consequently, have the highest yields compared to large-fruited squash varieties.

The mass of the fruit and the thickness of the flesh are important technological features. These indicators depend primarily on the type and navigation of the pumpkin, as well as the conditions of cultivation. Large-fruited and thick-skinned varieties are of the greatest importance for both fresh consumption and processing.

TABLE 1. TECHNOLOGICAL COMPOSITION OF PUMPKIN FRUITS STUDIED (2016-2018)

Variety name	Fruit mass, kg	The amount of flesh, %	Flesh thickness, cm	Level of flesh, LF
<i>Cucurbitamaxima Duch.. – cultural type of pumpkin - large-fruited</i>				
Ispanskaya 73	8,20	77,18	5,0-6,0	0,73
MichurinskayaSladkaya 13	3,50	71,33	2,5	0,68
VolzhskayaSeraya 92	13,5	77,26	5,0	0,72
Rossiyanka	4,80	74,05	5,5	0,66
Medovaya	3,45	72,65	3,5-4,5	0,65
Stofuntovaya	10,7	74,69	3,5-4,5	0,68
<i>Cucurbita Pepo L. – cultural type of pumpkin-hardy</i>				

Non kadi	6,20	77,45	4,0	0,68
Shirintoy	5,32	74,15	3,5-4,0	0,64
Biryuchekutskaya 27	4,80	74,18	3,0-3,5	0,64
Kustovayaoranjev aya	2,93	68,91	2,0-3,0	0,61
Mozoleevskaya	7,59	74,27	5,0-6,5	0,66
Vegetable Spaghetti	1,50	70,02	2,0	0,62
<i>Cucurbita moschata – Muscat squash cultural type</i>				
Palov Kadu 268	6,30	78,45	4,0	0,73
Kashgarskaya 1644	4,72	74,15	3,5-4,0	0,66
Korean Pumpkin	2,80	74,18	3,0-3,5	0,64
Vitaminnaya	3,93	68,91	3,0-3,5	0,61
Gapvutradiny (Корея)	4,20	74,27	5,0-6,5	0,68

To describe the structural features of the studied varieties of squash, we selected the most significant indicators in our opinion:

- mass of fruit;
- the amount of meat;
- thickness of meat;
- Level of flesh, (LF).

To determine the ripeness, it is necessary to measure the height and diameter of the fruit and its chamber. Among these indicators, the degree of maturity is one of the indicators that increases the juicing properties. The table above shows the technological composition of squash varieties belonging to three cultural types of squash.

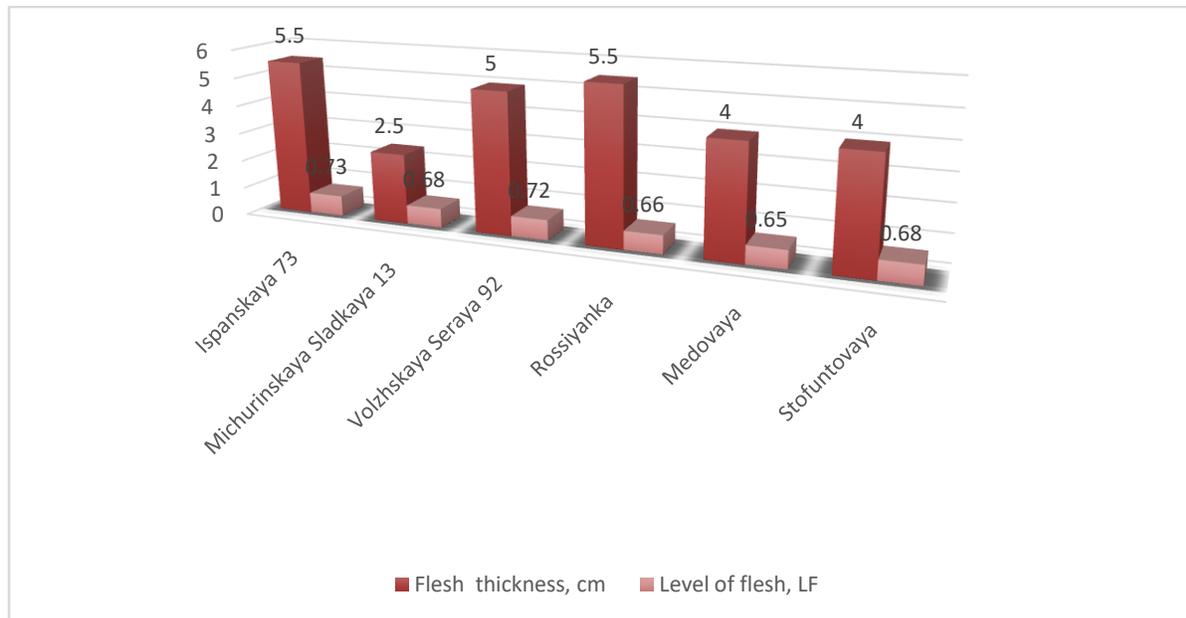

Figure 1. Technological indicators of varieties belonging to the cultivar type of large-fruited squash (2016-2018)

The most important technological indicator that determines the application of pumpkin fruit in the processing industry is the amount of waste: peel and seeds. According to the technical requirements, the amount of losses and waste at all stages of production should be up to 32%. Therefore, the amount of meat should be close to 70%.

In describing the technological properties of the studied varieties, it is expedient to analyze in the section of those groups, which we have identified as organoleptic analysis.

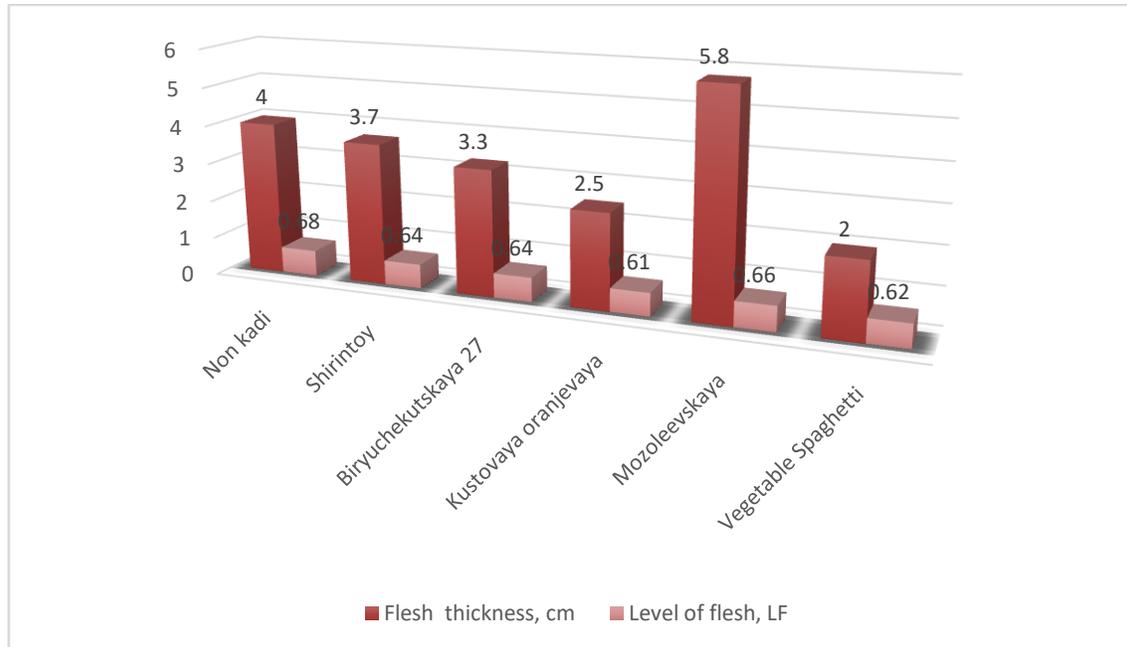

According to Table 1, the meat content of large-fruited squash Ispanskaya 73, Volzhskaya Seraya 92 varieties of the first group of excellent quality level is 77.18, - 77.26% (see Figure 1). In addition to the large fruits in the varieties belonging to the large-fruited squash culture type, it was found that their maturity level is also higher than other species.

Thus, the meat yield in large-fruited squash varieties varies from 65.21% to 79.28%, and in hard-skinned varieties from 68.91% to 76.81%.

Meat yield in the hard-shelled Non kadi variety was 72.45% (see Table 1).

But, Despite the thickest rind due to the highly developed puff pastry layer of the pepo L. varieties, the large-fruited and hard-shelled varieties of squash did not show clear differences in terms of fruit yield (see Figure 2).

When analyzing the varieties belonging to the cultivar type of nutmeg squash (see Fig. 1), out of 5 cultivars in the experiment, 268 cultivars of Palov kadi showed more juicing properties.

All varieties, except Vitamnaya, also had relatively good performance. The meat content of squash was higher than 74% (78% in 268 varieties of pilaf).

Figure 2. Technological indicators of the varieties belonging to the cultivated type of hard-shelled squash (2016-2018)

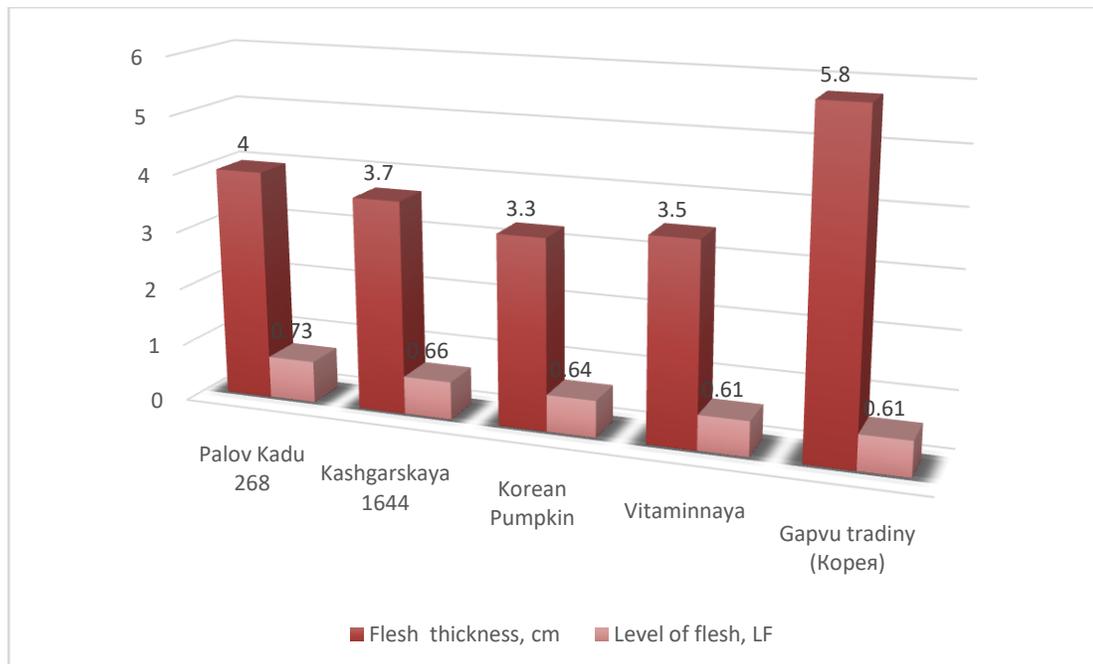

Figure 3. Technological parameters of the cultivars belonging to the cultivated genus Muscat squash/

An important indicator of the quality of fruits and vegetables is the size and size, which in some goods is determined by the mass. Nevertheless, mass is an important indicator characterizing the technological and brand characteristics of squash fruits, where fruits of different sizes and varieties of the same size may have different meat quantities, as well as correspondingly different consumption characteristics.

In our opinion, the thickness of the flesh of the pumpkin is an important indicator that determines both the brand and technological characteristics of the pumpkin. Meatiness is a quantity that is closely related to the thickness of the flesh and characterizes its contribution to the total volume of the fruit. This figure is relative and, in our opinion, most accurately determines the technological advantages of the studied varieties.

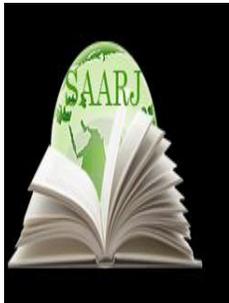

The maturity values of large-fruited squash varieties ranged from 0.54 to 0.89 and were very gypsum-related with the thickness of the flesh ($r = 0.63 \pm 0.13$).

In hard-shelled squash varieties, the carcass values ranged from 0.44–0.82 and were also directly and strongly correlated with the thickness of the flesh ($r = 0.70 \pm 0.14$).

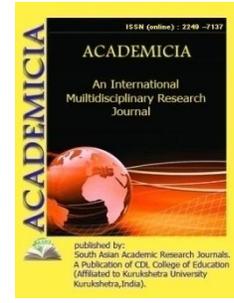

One of the important features of pumpkin fruit is its technological feature, which determines its suitability for processing. Indicators such as "Meat quantity" and "Meat thickness" play an important role. The high content of these indicators increases the level of suitability of fruits for consumption and processing.

ABSTRACT

In this article, a comprehensive overview of the application of status traditions and ways was reflected in the Opera "Laylyand Majnun", belonging to the pen of Geyngold Glier and Tolibjon Sadikov. The article can be useful for researchers in the field of Music Arts. The Opera "Layli and Majnun" is based on the work of Alisher Navoi with the same name. The libretto, which is the basis of the novel-made play by Hurshid, brilliantly showed the intellectuality of the main hero. Since opera is one of the most complex genres in music, it has made it much more difficult for young Uzbek composers. Uzbek demanded to be a nationalist while preserving all the rules of this generous genre.

KEYWORDS: *Symphony, Opera, Folklore, Libretto, Status, Traditional Music, Musical Culture.*

INTRODUCTION

In the Uzbek music industry, it would not be an exaggeration to say that the first half of the 20th century was the period of the construction of a new music culture. During this period, the Uzbek music culture develops traditional music and composer's creativity. The culture of music begins to penetrate into the creative means of European Music. In particular, there are musical societies, creative communities, musical theaters. On the basis of them, new genres begin to

enter the Uzbek music culture. Among these genres, the opera, which is considered a major stage work, is also important.

The peoples of the East, including the Uzbek people, had a rich musical heritage from ancient times. Since that time, two huge layers of our musical heritage, namely the oral creativity of the people (folklore) and a new look at traditional music, begin the process of their collection, recording and application in practice. Young Uzbek composers begin to learn a new musical art, which is completely unfamiliar to them, to create effective in these genres. Opera was also a new genre, which entered the life of the Uzbek people during this period. Since opera is one of the most complex genres in music, it has made it much more difficult for young Uzbek composers. Uzbek demanded to be a nationalist while preserving all the rules of this generous genre. In this regard, young Uzbek composers were very closely assisted by Russian composers. M. Ashrafiy, T. Uzbek composers like Sadikov S.N.Y. Vasilenko, R. They cocreated with Russian composers such as Glier and the first Uzbek operas "storm" (1939), "Ulug' kanal" (1941) (S. Vasilenko, M. Ashrafiy), "LaylivaMajnun "(1940), "Gulsara" (1949) (R.Glier, T.Sadigov) operas were created.

During this period, due to the construction of a new musical culture in Uzbekistan, great attention was paid to the opening of musical theaters. In particular, in 1918-th year in Tashkent the russian opera theater began its activity. In 1929, the Uzbek musical drama theater was opened in Samarkand, and the first Uzbek musical drama began to be staged on its stage. In 1939, the Uzbek musical theater was divided into two theaters. 1 - Uzbek Musical drama Theatre, 2-Uzbek opera Theatre. In 1948 Russian and Uzbek theaters merged,

The opera and Ballet Theater named after Navoi is organized and starts working with the Opera "storm". The goal of the opening of these theaters was to promote through them new genres of musical art among the general public. Uzbek composers appealed to the National Institutes for the purpose of giving their operas a national paint. The symphonic orchestras included a group of Uzbeks, such as a trumpet, drum, dust, circle. Along with this, they have benefited from folk and traditional music as a source of discord.

The genre of opera is one of the genres that still attracts attention today. In the early years of independence, "Uzbek opera is needed?" articles appeared. Unfortunately, now it is possible to observe that both by composers and by listeners, attention to this genre is diminished. Before proceeding to the chosen topic, we find it permissible to mention a number of problems of the Opera. One of the problems facing the opera is the libretto problem. Not a single educational institution does not prepare a librettochi. Many European composites (M. Musorsky, R. Vagner and h. k) they themselves wrote libretto. Some composers, however, wrote libretto to other composers. For Example P.I. His brother M. Tchaikovsky's opera "Pikovayadama" Chaykovsky writes. Everyone knows that the role of libretto in the successful performance of the opera is incomparable.

If the Libretto is not written perfectly in a charismatic way , it sends the whole drama, The essence of the artistic source, changetirib. Unfortunately, such cases are also three in Uzbek operas. For Example: R.Hamraev gave the opera " over the darkness "on the basis of Oybek's novel" kutluggan". The full libretto wrote. In the opera, we can witness that the content of the work has changed. M.Ashrafi's opera "Dilorom" was written on the basis of Kamil Yashin libretto in the work"Sabbayisayyor" by Alisher Navoi. But libretto was included in the game no

events at all. In addition to such shortcomings, among the Uzbek operas, works written perfectly from the libretto side are also numerous. For Example, "Storm" (K.Yashin libretto) and "Layli and Majnun" (Khurshid libretto) operas were the first Uzbek operas, we can say perfect works from the literal side.

Another of the opera problems is the issue of execution. If the music does not have a professionally perfect performance, be it a good libretto, a good tone, the opera will not turn out to be full. Briefly touching on the problems of Opera, we will outline the main goals and objectives of our course work. In this work we will focus on traditional music in the work of Uzbek composers, in particular R.Glier and T.Sadikov named to illuminate the issue of status paths used in the Sadikov opera "Layli and Majnun", we tried to illuminate the process of its implementation at the level of our capabilities on this topic.

As mentioned above, in the creativity of Uzbek composers, two major layers of our musical heritage are equally addressed. And the reason for this was through the show of European music genres, in which they used melodies familiar to the people. In our view, this factor can be understood as the movement of the work to arouse interest in these genres among the general public. When it comes to Uzbek operas, they rely on two layers of our musical heritage, and are used as a feature of folk and traditional music samples. Some of the operas (for example, "Storm") were created only on the basis of folk melodies, while in some they were used only traditional music. (for example, the Opera "Leyli and Majnun"). In some operas, folklore and traditional music were widely used.

We will dwell on them in detail:

Folk songs and the first Uzbek composer at the first Uzbek opera "storm" H. Niyazi's songs were used as a metaphor. In particular, folk songs of Khamza "Working grandfather", "Flower game", "Girya Kazak", "Chamandagul" and "Tanovar" were used.

In addition, in the Opera "Ulugbek" (A.Kozlovsky 1959) one of the folk tunes "rose over the face" was used in the chorus of girls on the IV cardboard.

In the opera "Ulug' kanal" (A.Vasilenko, M.Ashrafi 1949) youth song was created on the basis of the melody "Savti Munojot" Part II.

In the opera "Gulsara" (R.Glier, T. Sadikov 1949) the famous Khorezm song "Feruz", in addition, it can be noted that the tunes from the Segoh status roads were used. The musical language of the image of Abraham is based on the tunes of the status of the Navo.

Opera "Farhod and Shirin" (V.Uspensky, G.Most of the content of Mushel 1941 is based on single numbers, seven Arias of the chief gakhramon Farhod on Fergana-Tashkent status roads. In particular, along with the ways of such status as "Dugoh-Husyan", "Dugoh-2", "Chorgoh", "Miskin-2", "Bayot I", "Suvora", folk songs such as "water kelar step", "Fergana", "young Sun", "Flower game" were used.

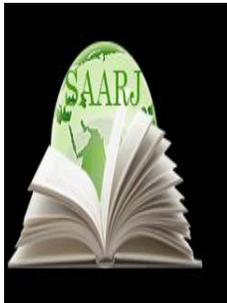

"Tahir and Zuhra" (B.TheBrovsin. T.The characteristic of the Khorezm Queen Mohim in the Opera "Jalilov" is written from the status of "Buzruk" on the basis of "Qashqarchai Mog'ulchai Buzruk". The presented examples demonstrate the effective use of Uzbek traditional music in operas. Having analyzed the first Uzbek operas, we come to such a conclusion that although they are widely used in Shashmakom and especially Fergana-Tashkent

status roads, mkhurojaat to Khorezm status is almost imperceptible. Below is another masterpiece that we used as itibos from traditional music - R.Glier and T.We are talking about Sadigov's opera "Layli and Majnun".

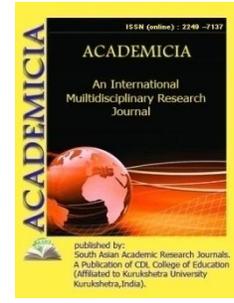

The Opera "Layli and Majnun" is based on the work of Alisher Navoi with the same name. The libretto, which is the basis of the novel-made play by Hurshid, brilliantly showed the intellectuality of the main hero. Before the creation of this opera, a musical theater, then as a musical drama, took place in the hearts of the people. In 1940-th year he begins a new life. The different sides of the opera from the musical drama, The characteristic of the image of the chief qakhramon "Qays" in the musical drama are very different from the image created by Navoi. Tolibjon Sadikov writes in his memoirs: "I always looked with a critical eye at the image of the musical drama "Qays", and in the opera I tried to give this image a characteristic, as in the work of Navoi. But even in the opera, The Musical characteristic of this hero is a the work of Navoi could not be the same.

**PREPARATION OF E-LEARNING COMPLEX FROM THE
 DEPARTMENT OF ELEMENTARY PARTICLE PHYSICS-THE FACTOR
 OF INCREASING EDUCATIONAL EFFICIENCY**

Davletniyazov Salamat Paluaniyazovich*

*Assistant,
 Nukus State Pedagogical Institute Named After Ajiniyaz,
 UZBEKISTAN
 Email id: s.davletniyazov@ndpi.uz

ABSTRACT

In this article, the development of computer technology-based content of the section "physics of elementary particles", the development of a description of difficult topics to be mastered on the basis of Information Technology, on the basis of which the effectiveness of its teaching is increased. In this sense, the fact that these questions are given from different points of view serves to the full assimilation of subjects. Due to this need, in a short time, educational programs, textbooks and manuals for various stages of the educational system on the subject of physics have been developed and are being created.

KEYWORDS: *Elementary Particle Physics, E-Learning, Science, Communication.*

INTRODUCTION

The development of society the reforms carried out in the field of education in our country are due to the training of mature and highly thought-provoking personnel in accordance with the world standards. This requires both teaching and content to rise to a higher level in terms of style. Such a demand for continuous education system is reflected in the law of the Republic of Uzbekistan "on education" and "National program of training of personnel", reports of the president of the Republic of Uzbekistan in the field of Education.

In this regard, it is necessary to conduct scientific and methodological research, including the creation of a new generation of programs and textbooks, writing manuals. Due to this need, in a short time, educational programs, textbooks and manuals for various stages of the educational system on the subject of physics have been developed and are being created.

MAIN PART

Today, the analysis of curricula, textbooks and manuals created in the field of physics has shown that at different stages of the system of continuous education, low-level aspects of the continuity and continuity of teaching of physics are also considered. At the qualitative stage of the "National Program of training of Personnel", which is being implemented in our republic, it is envisaged that such aspects will be improved qualitatively. In this regard, it will be of great importance to ensure the continuity and continuity of training of the "Elementary particle physics" section of physics at various stages of the continuous education system.

It is known to us that the main goal of teaching physics is, first, to explain the fundamental laws of nature on a scientific basis, to develop the abilities of students to develop a scientific worldview and philosophical reasoning, to formulate ideas about the physical processes that explain the printing of equipment and tools used in technique and living, and secondly, to continue.

In recent years, in this area, data have appeared that make radical changes to the nature of fundamental Interactions, the structure of particles and their views on the concept of "elementary". A new generation of accelerators, which are the main "instruments" of particle physics, has been launched, and as a result, apart from the particles we now know, when we say elementary particles, it has become customary to refer to such types of matter as "Black Matter", "Black Energy" and gravitational waves [1-3]. In addition, radical changes are taking place in the field of nanotechnologies. Such directions as nanophysics, Nano medicine, and Nano chemistry are at the stage of formation. To understand these changes as well as reflect them in our educational system, it will also be necessary to have a good knowledge of the basics of "elementary particle physics".

MATERIAL METHOD

To this end, the improved content of the section "elementary particle physics" was developed [4-5]. In order to carry out this task, the content of this department at various stages of the continuous education system, the state of teaching were studied. On the second hand, the achievements in the field of elementary particle physics of the world scale, as well as the state of education of this department were also thoroughly studied. In order to increase the effectiveness of this department, research work is currently being carried out on its content based on the principle of science communication [5]. At the same time, great work is being done on the creation of the material technical base of the educational system, rapid implementation of information technologies in education both on the scale of the world and our republic. In this regard, the development of computer technology-based content of the Department "elementary particle physics", the development of a description of difficult topics to be mastered on the basis of Information Technology, on the basis of which the increase in the effectiveness of its teaching is also a requirement of the period. In this sense, the creation of the electronic educational complex of the Department "elementary particle physics" is also one of the important tasks on the agenda. Currently, extensive research in this direction is being carried out [6-8].

The e-learning complex of the Department "elementary particle physics", in which many years of research will be created, should consist of the following organizers:

1. Electronic textbook, which includes theoretical knowledge.

2. Electronic textbook with practical knowledge
3. Tests that serve to strengthen theoretical knowledge.
4. A system of tests and questions aimed at self-assessment.

The theoretical information in the first section should contain the content of the topics that are difficult to master on the basis of computer technology and on the basis of the principle of science communication. This position serves to ensure the effectiveness of the assimilation of the section "Physics of elementary particles". [9-10].

Tests that serve to strengthen theoretical knowledge should also ensure that the foundations of particle physics are well reconciled by its learners. In this sense, the fact that these questions are given from different points of view serves to the full assimilation of subjects. Self-assessment tests and questions on this place are also desirable to be structured in different directions, in the cross-section of topics, in the linkage to science and in different perspectives.

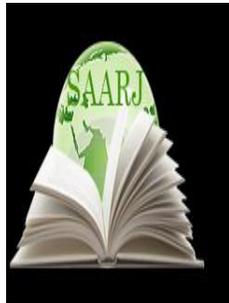

CONCLUSION

In conclusion, the e-learning complex of the Department "elementary particle physics" serves the effectiveness of the assimilation of this department. At the same time, it serves to organize the Independent Education of students, as well as the organization of distance education, which is now one of the urgent tasks. In the process of creating an e-learning complex, its proposed components can be increased in quantity and improved qualitatively.

EARLY DIAGNOSIS OF RENAL FUNCTION RECOVERY IN WOMEN WITH ACUTE RENAL FAILURE

Toqsonova Dilbar*; Radjabov Ramz**

*Head of the Department,
 Obstetrics and Gynecology N2 of the Abu Ali ibn Sino Bukhara State Medical Institute,
 UZBEKISTAN

**Department of Surgical Resuscitation Anesthesiologist resuscitator,
 Republican Scientific Center of Emergency Medical Care Bukhara Branch,
 UZBEKISTAN

ABSTRACT

The most commonly used methods include hemodialysis daily or every other day, as well as continuous therapy methods (hemofiltration and hemodiafiltration). Renal replacement therapy is initiated in conditions that can be modified as a result of such treatment, and depending on the nature of changes in laboratory results, and not on the basis of strictly defined thresholds for serum creatinine and urea levels.

KEYWORDS: *Metabolic And Clinical Disorders, Metabolite Production, Hypotension*

INTRODUCTION

A cute kidney injury (AKI) is a clinical syndrome, defined (according to KDIGO 2012) as an increase in serum creatinine by ≥ 0.3 mg/dl (26.5 mol/L) for 48 hours, or an increase of ≥ 1.5 mg/dl for the last 7 days, or diuresis < 0.5 ml/kg/h for 6 hours. It is characterized by a wide range of disorders — from a temporary increase in the concentration of biomarkers of kidney damage to severe metabolic and clinical disorders (acute renal failure (AKI) requiring renal replacement therapy.

1. Perennial AKI is a consequence of impaired renal perfusion. Reasons:

1) Reduction of effective circulating blood volume (hypovolemic) — hemorrhage, fluid loss through the gastrointestinal tract (vomiting, diarrhea, surgical drainage), fluid loss through the kidneys (diuretics, osmotic diuresis in diabetes mellitus, adrenal insufficiency), fluid loss into the

third space (acute pancreatitis, peritonitis, extensive trauma, crush syndrome, burns, severe hypoalbuminemia);

2) Low cardiac output — diseases of the myocardium, heart valves and pericardium, cardiac arrhythmia, massive pulmonary embolism, mechanical ventilation of the lungs with positive pressure;

3) Disorders of vascular tone of the kidneys and other vessels — systemic vasodilation (sepsis, hypotension induced by antihypertensive drugs, including drugs that reduce afterload, general anesthesia), selective renal vasoconstriction (hyperkalemia, norepinephrine, epinephrine, cyclosporine, tacrolimus, amphotericin B), cirrhosis of the liver with ascites (hepatorenal syndrome);

4) Renal hypo perfusion with impaired auto regulation-cyclooxygenase inhibitors (NSAIDs), ACE inhibitors (ACE inhibitors), angiotensin receptor blockers (ARBs);

5) Increased blood viscosity syndrome — multiple myeloma, Waldenstrom's macroglobulinemia;

6) Obstruction of the renal vessels (bilateral or single kidney) - occlusion of the renal artery (due to atherosclerosis, thrombosis, embolism, delaminating aneurysm, systemic vacuities), occlusion of the renal vein (due to thrombosis or compression from the outside).

2. Renal AKI (parenchymal) is a consequence of damage to the structures of the kidneys due to inflammatory or non-inflammatory causes.

Reasons:

1) diseases of the glomeruli and small renal vessels — glomerulonephritis, systemic vacuities, thrombotic microangiopathy (hemolytic-uremic syndrome, thrombotic thrombocytopenic purpura), embolism with cholesterol crystals, disseminated intravascular coagulation (DIC), preeclampsia and eclampsia, malignant arterial hypertension, systemic lupus erythematosus, systemic scleroderma (scleroderma renal crisis);

2) Acute renal tubule injury — impaired renal perfusion (prolonged perennial AKI), exogenous toxins (X-ray contrast agents, cyclosporine, antibiotics [e.g. aminoglycosides], chemotherapy [cisplatin], ethylene glycol, methanol, NSAIDs), endogenous toxins (myoglobin, hemoglobin, monoclonal protein, [e.g., light chain secretion gamma globulin in multiple myeloma]);

3) tubulointerstitial nephritis — allergic (beta-lactam antibiotics, sulfonamides, trimethoprim, rifampicin, NSAIDs, diuretics, captopril), bacterial infection (e.g., acute pyelonephritis), viral (e.g., cytomegalovirus) or fungal infection (candidiasis), infiltration of tumor cells (lymphoma, leukemia), granulomas (sarcoidosis), idiopathic;

4) Crystallization inside the tubules (rarely) - uric acid, oxalic acid (a metabolite of ethylene glycol), acyclovir (especially when administered intravenously), methotrexate, sulfonamides, indinavir;

5) Other rare causes-acute cortical kidney necrosis, nephropathy after the use of Chinese herbs, acute phosphate nephropathy, warfarin-induced nephropathy, removal of a single functioning kidney;

6) Acute rejection of the transplanted kidney.

Subjective and objective symptoms of the painful condition that caused AKI usually dominate. Common symptoms of advanced kidney failure are weakness, loss of appetite, nausea and vomiting. Oliguria / anuria develop in $\approx 50\%$ of AKI cases, usually with perennial AKI, renal cortical necrosis, bilateral renal artery embolism or single kidney artery embolism and thrombo-microangiopathy, DIC. Renal AKI may occur with normal or even increased urine output. In the natural course of AKI, 4 periods are allocated:

- 1) Initial — from activation of the harmful factor to kidney damage; duration depends on the cause of AKI, usually from several to 10-20 hours;
- 2) oliguria/anuria — in $\approx 50\%$ of patients, usually lasts 10-14 days;
- 3) Polyuria — after a period of oliguria/anuria for several days, the volume of urine excreted increases rapidly. The duration of the period of polyuria is proportional to the duration of oliguria or anuria, it can last several weeks or even months. During this period, dangerous dehydration and loss of electrolytes, especially potassium and calcium, can easily develop.
- 4) Recovery, i.e. full recovery of kidney function-it takes from a few months to a year. In some patients, AKI is the beginning of chronic kidney disease.

Blood tests:

- 1) Increased creatinine and urea levels — the rate of growth depends on the degree of kidney damage and the rate of metabolite production, which is significantly increased in catabolic conditions. In renal AKI, the daily increase is 44-88 mmol / l (0.5-1.0 mg / dl). A daily increase in creatininemia of more than >176 mmol / L (2 mg/dl) indicates increased catabolism in long-term compression syndrome or sepsis; usually there is severe acidosis and significant hyperkalemia. GFR assessment (e.g. Cockcroft and Gault formulas or MDRD, CKD-EPI) is not suitable. When assessing the dynamics of AKI, the most important thing is to monitor daily changes in creatinine in the blood and the volume of diuresis.
- 2) hyperkalemia-usually occurs in cases of reduced diuresis. May be life-threatening (>6.5 mmol / l). Evaluate the potassium concentration in the context of acid-base balance, since acidosis causes K^+ to escape from the cells.
- 3) Hypocalcaemia and hypophosphatemia are sometimes expressed in rhabdomyolysis;
- 4) Hyperkalemia — in AKI associated with neoplasms (e.g., multiple myeloma);
- 5) hyperuricemia — may indicate gout or tumor lysis syndrome;
- 6) An increase in the activity of CPK and the concentration of myoglobin — with prolonged compression syndrome or rhabdomyolysis (e.g., triggered by statins);
- 7) study of blood gases-metabolic acidosis;
- 8) Anemia is a characteristic feature of CRF, in AKI it can be the result of hemolysis, blood loss, or an underlying disease (e.g., multiple myeloma);
- 9) Thrombocytopenia-occurs in hemolytic-uremic syndrome, thrombotic thrombocytopenic purpura, DIC syndrome.

2. Urinalysis:

- 1) The specific gravity of urine can be more than >1.023 g / ml in prerenal AKI, with renal AKI, isostenuria mainly develops;
- 2) Varying degrees of proteinuria, especially when the cause is inflammation of the kidneys (glomerulonephritis or interstitial nephritis);
- 3) Abnormal components of urine sediment may indicate the cause of AKI:
 - a) Tubular cells, granular cylinders formed from them, and brown pigmented cylinders - in renal AKI;
 - b) dysmorphic or leached red blood cells, or red blood cell cylinders indicate GN;
 - c) The presence of eosinophil in the blood and urine (requires special staining of the drug) - indicates acute tubulointerstitial nephritis;
 - d) leukocyturia with a positive urine culture — may indicate acute pyelonephritis;
 - e) Fresh red blood cells and white blood cells-may be present in post renal AKI.

3. ECG: there may be signs of electrolyte imbalance-hyperkalemia.

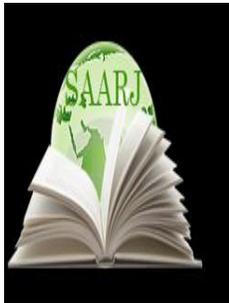

4. Instrumental studies: usually ultrasound of the kidneys (with AKI-the kidneys are usually enlarged) and chest X-ray (can reveal signs of stagnation in the small circle of blood circulation, fluid in the pleural cavities); other studies only when there are specific indications.

5. Kidney biopsy: performed only in the case of an unclear diagnosis or suspicion of GN, systemic vasculitis or acute interstitial nephritis, when the result may affect further treatment.

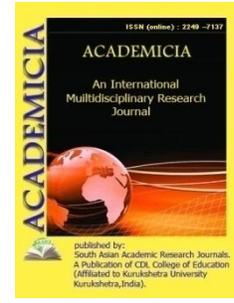

More often occurs during pregnancy, usually at the end of pregnancy-as a result of accidental hemorrhage or premature separation of the placenta, less often as a complication of intrauterine fetal death, sepsis, preeclampsia or amniotic fluid embolism. Triggered by an event is likely to be DIC or severe ischemia of the kidneys. OCNP is manifested by a sudden decrease in diuresis or anuria; often there is hematuria, pain in the lumbar region and hypotension. The presence of a triad of symptoms — anuria, hematuria, and lumbar pain-distinguishes OCNP from other forms of AKI during pregnancy. In the acute phase, imaging studies reveal hypo echoic (ultrasound) or hypotensive (CT) zones in the cortical substance of the kidneys. After 1-2 months. On the overview page, you can see calcification in the cortical substance of the kidneys. In < 40 % of women, partial recovery of renal function occurs, while in other cases, renal replacement therapy is required.

ABSTRACT

The present study is made an attempt to analyze the specific problems faced by the beedi workers and to examine the legislative and policy frame work and Government Schemes for unorganized women beedi workers in India. Beedi rolling is one of the major unorganized sector activities in India, which employs a large number of women. As per the estimation of the India's Ministry of labour majority of them are home based women workers; creating alternative income and employment opportunities for them. For the study purpose, information is gathered from secondary sources such as research articles, websites, e-journals, other published reports and newspapers, etc.

KEYWORDS: *Unorganized Beedi Workers, Unorganized sector, Legislative and Policy Framework, Employment Opportunities.*

INTRODUCTION

A majority of the workforce in India employed in informal employment. Informal employment comprises not only workers in the unorganized sector but also informal workers in the organized sector (ILO 2015).

Beedi manufacturing is an agro-forestry based, highly labor intensive industry. It employs thousands of people and spread over almost all major states of India. As per the International Labor Organization (ILO), the Indian government estimates, 4.5 million beedi workers in India, majority of who are home based women workers.

There are millions of poor in the country. Majority of them are below poverty line and are socially and economically backward; dependent on beedi rolling, associated with serious occupational health hazards to feed their entire families. The beedi rolling function generally done by women, who have no other means of financial earning. Majority of women beedi rollers are currently facing many health related issues due to continuous contact with tobacco dust and working in unhygienic conditions. Due to beedi rolling is done mostly in small huts with very little ventilation especially in rural areas; the tobacco dust remains in the home affects not only the beedi rollers but also her entire family as well, leading to respiratory problems, head ache, body ache and eye strain. Apart from this, they also face many problems like inadequate wage structure, poor housing facilities, no social security, no minimum wages, and no proper education for their children etc.

LITERATURE REVIEW

This section deals with the analyzing the earlier studies relating to the current topic.

The employers who make fortune from the scale of Beedi and Cigar often turn a blind eye to the plight of the workers i.e. the people who add value to the product. They take advantage of the poverty of the workers, their lack of education and unity, to perpetuate exploitation (Srinivasan & Ilango, 2013). Beedi manufacturing industry in India, is a highly labor-intensive and predominantly it is an unorganized sector. The beedi rolling function is generally done by women and child laborers who have no other means of financial earning (Munjial,). Due to lower education levels child beedi rollers are not aware about the various legislation related to child labour and they are having very low bargaining power. Besides, it is also observed that, majority of child beedi rollers are currently facing many health related issues due to continuous contact with tobacco dust and working in unhygienic conditions. Due to handling of tobacco flakes and inhaling of tobacco dust they are facing the problems like headache, body pain, back strain, spondylitis, swelling of lower limbs etc (Munjial Singh, Amiri & Sabbarwal, 2018). Beedi workers are mostly below poverty line. They are socially and economically backward. The women are able to earn meager income out of beedi rolling. They have to sacrifice their health to a large extent (Selvan & Pon Mabel, 2013). Women who work at home in small huts with very little ventilation the tobacco dust remains in the home where women and their families eat, sleep and spend their entire time. The beedi dust in the air therefore affects not only the beedi rollers but also her entire family too leading to respiratory problems. The other problems associated with beedi rolling are body ache, head ache, and eye strain (Ramakrishnappa, Priya kumar & Vishwanatha, 2014).

RESEARCH GAP

From the analysis of literature review, it is found that the earlier studies were majorly focused on the problems & challenges faced by the beedi workers in India. But, only few studies focused on the specific problems faced by the women beedi workers and also the existing legislative and policy framework for social security and government schemes for the welfare of the unorganized beedi workers in India –in detail. Hence, present paper is intended to study the same.

METHODOLOGY

The present study is based on the secondary data source. The secondary data were collected from various published e-journals, research articles, magazines, websites, published reports, etc.

OBJECTIVES OF THE STUDY

- To identify the problems of unorganized beedi workers in India.
- To study the existing legislative and policy framework and Government Schemes for unorganized beedi workers in India.

PROBLEMS FACED BY UNORGANISED BEEDI WORKERS IN INDIA

It is the unorganized beedi workers, who are often exploited by the beedi industry owners, by taking advantage of their poverty, as it is the main source of income for many poor families living in the rural areas. In fact, they face various problems that force them to go for the work of beedi rolling without second option. The various specific problems that beedi workers usually face are as follows.

- **Poor Housing:** Most of the beedi workers in India are living in a pathetic condition having no a proper house. Majority live in rented small rooms and find it difficult to pay rent .In some parts of rural areas, most of the houses having no electricity, no water and women have to stand in queue to fetch water.
- **Health Problems:** As the majority of women beedi workers belong to poor family; are living in small huts with very little ventilation and are exposed to all the hazards of tobacco .Eventually, end up facing health related issues such as back pain, head ache, rheumatic pains, respiratory diseases like asthma etc. due to continuous contact with tobacco dust and working in unhygienic conditions.
- **Lack of Education:** As per the 2011 census, over 80 percent of the country's young female population (aged 7 to 29) is illiterate and know nothing apart from beedi rolling. As the beedi workers are economically poor; cannot afford education to their children as a result most of the children of these workers remain uneducated.
- **Family Burden:** The burden of the entire family rests on the women since men, who are generally daily laborers, do not get work every day. Hence, in order to financially support family without second option, women and men both do the work of beedi rolling.as it is the easiest way to earn livelihood.
- **No Social Security:** The unregistered beedi workers, having not been issued an ID card of membership of the Beedi Welfare Board by the beedi industry owner are not receiving any benefits that those of the registered beedi workers get.

- **Low Income:** Beedi rolling is the main source of income of the people living in the rural area. They continued to be the lowest paid workers. In beedi rolling industry deductions from wages are quite common on various reasons like rejecting the substandard beedis and not rolling requisite number of beedis.
- **Inadequate Raw Material:** In some parts of India, the supply of tendu leaves is inadequate. Even if supplied; the quality is not that good .Hence, the women would go to the forest for tendu leaves or borrow it from professional beedi lenders at high rates.

LEGISLATIVE AND POLICY FRAMEWORK FOR UNORGANISED BEEDI WORKERS IN INDIA

This section highlights the current legal scenario of laws and policies pertaining to the unorganized beedi workers in India.

1. **Bonded Labor System (Abolition Act), 1976:** This is an act to provide for the abolition of bonded labor system with a view to preventing the economic and physical exploitation of the weaker section of the society. According to this Act, every bonded laborer shall be freed and discharged from any obligation to render any bonded labor. Thus, it protects the children of beedi workers, from being forced into labor when, they are unable to pay a loan.
2. **Beedi and Cigar Workers (Condition of Employment) Act, 1966:** This act meant to regulate factory based workers. It provides for the welfare of the workers in beedi and cigar establishments and to regulate the conditions of their work and provisions are made not only regarding the facilities like canteens, drinking water, latrine, urinals etc. but also it regulates the working hours, rest, leave of the workers.
3. **The Child Labor (Prohibition and Regulation), Act 1986:** This act prohibits employment of a child under 14 years in any employment including as a domestic help. Thus, this restricts the children of beedi workers' participation in beedi making except as family-based work or school –based activities.
4. **Beedi Workers Welfare Fund Act, 1976:** The central government has implemented Beedi Workers Welfare Fund for the benefit of beedi workers. It is meant to provide various welfare benefits such as educational support, health care, drinking water supplies, etc.
5. **Beedi Workers Welfare Cess (Amendment) Act, 1976:** This is an act to Provide for the levy and collection, by way of cess, a duty of excise on manufactured beedis. The cess collected through excise duty of manufactured beedis, is utilised for Beedi workers welfare fund. The beedi workers must have an ID card in order to receive benefits from government fund.
6. **Employees State Insurance, 1948:** It aims to protect employees, against the impact of incidences of sickness, disablement, and death due to employment-related injury. It provides health, medical and cash benefits for employees earning less than rs.3000 per month.
7. **Workmen Compensation Act 1923:** It offers compensation to workers and their dependents in case of injury or accident that may arise out of and in the course of employment resulting in disability or death. This act covers events like death, permanent total disablement, permanent partial disablement, temporary disablement, etc.

8. **Maternity Benefit Act, 1961:** It protects the employment of women during the period of her maternity. She entitles maternity benefit to take care of her child.
9. **Minimum Wages Act, 1948:** It fixes the minimum rates of wages for both time rated work and piece rated work. In beedi making establishments, majority employers have adopted both the systems of payment of wages.

GOVERNMENT SCHEMES FOR UNORGANISED BEEDI WORKERS IN INDIA

This section deals with the various schemes launched by the government of India for the welfare of the unorganized beedi workers in India.

Health Scheme:

1. **Maternity Benefit Scheme:** Under this scheme, the financial assistance of Rs.500/- each to be given to the pregnant women for the first two deliveries. The beneficiary should be above 19 years old and should be belonged to below poverty line family.
2. **The Leprosy Relief Scheme:** It provides facilities for treatment of leprosy by payment of grants-in-aid to those organizations, which provide indoor/outdoor treatment facilities in recognized hospitals. The indoor treatment facilities at a rate of Rs.30/- per patient per day or the rate of the organization, whichever is less. And the outdoor treatment facilities at a rate of Rs.6/-per patient per day or the actual cost of the medicines, whichever is less.
3. **DBT scheme (Nikshay Poshan Yojan) for Tuberculosis Treatment:** Under this scheme, for the treatment of tuberculosis Rs.1000/-in first installment for the first 2 months is expected to disbursed immediately once the treatment started for the patient.
4. **Scheme for the Treatment of Cancer:** Under this scheme, medical facilities will be provided to the beedi workers and their dependents suffering from cancer. To entitle the benefits a beedi worker has to be put in at least 6 months continuous service. Prior approval of the concerned welfare commissioner is essential before beginning the treatment.
5. **Family Planning Operation Scheme:** Under this scheme, a grant of Rs.200/- given to those beedi workers having two children, undergoing family planning operation. This benefit can be availed only once in a life time.

Housing Scheme:

The Revised Integrated Housing Scheme(RIHS)2016, would provide subsidy of Rs.1, 50,000/- (per beneficiary) in three installments in the ratio of 25:60:15 at Rs.37, 500, Rs.90,000 and Rs.22, 500 respectively for construction of house by the beedi worker.

Educational Scheme: In order to provide financial assistance to the children of beedi workers, the government has formulated schemes to grant scholarship under welfare fund .To become eligible for scholarship total income of both the parents of students from all sources should not exceed Rs.10,000/-p.m. including all allowances.Pre-matric scholarship run by the government is to promote the school level of education from class1 to 10 with the help of financial aid thereby, reducing the school drop-out rate. Besides, there is post-matric scholarship to the students from class11 to post-graduation at any government institute.

Social Security Scheme:

1. **Indira Gandhi National Old Age pension Scheme.(Ministry of Rural Development)**This scheme is implemented as part of the National Assistance Program(NSAP) of the Ministry of Rural Development, Government of India. It is a non-contributory scheme and provides a monthly income for citizens or to refugees above 60 years, who have no other source of income.
2. **National Family Benefit Scheme (Ministry of Health and Family Welfare):** This scheme aims to provide a lump sum family benefit of Rs.10, 000/-to the bereaved households in case of the death of the primary breadwinner irrespective of the cause of death. The scheme is applicable to people in the age bracket of 18-64 years.
3. **Janani Suraksha Yojana:** JSY is a centrally sponsored scheme, implemented with the objective of reducing maternal and infant mortality by promoting institutional delivery among pregnant women.
4. **Aam Admi Bima Yojana::**It is a social security scheme providing financial protection to the workers in unorganized sector, as they are highly prone to accidents and illness. Death due to natural causes, Death due to accident, Partial disability or permanent total disability covered under this particular scheme.
5. **Pradhan Mantri Suraksha Bima Yojana:** It is a government backed accident insurance scheme. PMSBY offers a one-year accidental death and disability cover, which can be renewed annually. Under this scheme, the risk coverage available is Rs.2 lakh for accidental death and permanent disability, and Rs.1 lakh for permanent partial disability.

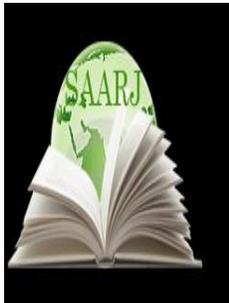

CONCLUSION

Today, beedi workers are facing lots of problems as beedi manufacturers are not getting the work done at their industrial premises and instead home-based workers are carrying out the work of beedi rolling at their homes. The central Government has introduced a number of policies and schemes for the welfare of the unorganized beedi workers in India. However, unfortunately, there is lack of knowledge among people, as most of the beedi workers are illiterate. Due to which, the benefits of various welfare schemes are not reaching everyone especially, home based beedi workers. Therefore, it is essential to create awareness programs pertaining to various government schemes and policies related to the beedi workers; so that maximum people get benefitted and lead a better life ever than before.

ABSTRACT

To understand the phenomenon of pain, it is essential to distinguish two types of pain – acute and chronic. The bulk of scientific research and publications, the subject of which is pain, is devoted to a comprehensive study (epidemiology, clinic, diagnosis, treatment) of this pathological condition in adults, while much less attention is paid to the pediatric aspects of this problem. Among pain syndromes, the most common are headaches (up to 42%), neck and back pain (up to 60%). Back pain is a symptom of many diseases of the spine and internal organs. The World Health Organization considers its treatment to be one of the priority tasks.

KEYWORDS: *Dysontogenetic Lesions, Back Pain, Diseases Of The Spine.*

INTRODUCTION

Back pain is a vivid example of pathology, the origins of which often lie in childhood, growing into a serious medical and social problem as the child grows up. Data on the prevalence of back pain in children and adolescents vary in a very wide range (from up to 83%). The range of causes of back pain in childhood is very wide. Back pain can be divided into primary, due to abnormalities of the spine, degenerative-dystrophic and dysontogenetic lesions, and secondary (injuries, arthritis, and visceral pathology, diseases of the genitourinary system, osteoporosis, tumors, and infections). The problem is at the intersection of the interests of doctors of different specialties of neurologists, vertebrologists, orthodontists, rehabilitologists, and chiropractors. Traditionally, neurologists deal with the diagnosis and treatment of back pain in children and adults, as they are the first to encounter this pathology. Complaints of pain in different parts of the back are made by 40-50% of people who have applied to an orthopedist. In adolescents, back

pain is not uncommon and is often benign, due to skeletal muscle etiology. Back pain in children, manifested earlier than 10 years, and appeared even earlier, signals the presence of more alarming congenital anomalies. To assess back pain in children, a complete history should be collected, taking into account psychosocial and cultural aspects. A thorough clinical examination with the use of imaging techniques is necessary. To improve the results of treatment, it is advisable to have a holistic, individual plan for the examination of the child and his parents [2].

It should be noted that among patients aged from 7 years to old age who experience back pain, there are more women. Epidemiological studies have shown that between the ages of 7 and 64, 24% of men and 32% of women suffer from back pain. Of those who go to medical institutions for this reason, the vast majority are observed by general practitioners and only about 5 to 8% by specialists: orthopedists and neurologists. Without dwelling on the main points of medical examination of children and adolescents with back pain, we emphasize the need for a thorough study of motor skills and sensitivity, assessing the strength of specific motor muscle groups and reflexes.

Among the various causes of pain in children in the cervical spine, as well as tension headaches, an important role is assigned to dysfunction of the temporomandibular joint (TMJ) and violation of dental occlusion. These factors explain the ineffectiveness of pain relief drugs in a number of patients, since they cannot correct the balance of the lower jaw, eliminate the root cause of pain and, accordingly, stop it in the TT both in the cervical spine and upper arms, and in the masticatory muscles [1]. In the publication, it is said that it is necessary to create predictive tests for the type of MT to determine the risk of back pain. Imaging techniques are useful when examining a child or adolescent with back pain and can help correct treatment. Back pain occurs in children and adolescents with a frequency of 10 to 60% and is an important risk factor for developing pain in different parts of the spine in adulthood.

Common causes of back pain are non-specific pain or muscle sprain, disc herniation, spondylolisthesis, scoliosis or Scheyerman's kyphosis; less common are tumors, infections, and sickle cell anemia. A study of back pain in children who went to narrow specialists and emergency departments showed that a specific cause of pain is very likely, in which medical care is required. Examination of children and adolescents who went to an outpatient institution for the first time appeared pain, showed that the type of pathology was correctly identified in most cases. The table shows a list of possible diagnoses for back pain in adolescents and children. Back pain is a rare cause of children and adolescents seeking emergency care. The causes of pain syndrome can be: trauma; malformations of various parts of the spine; dysplastic processes; degenerative-dystrophic diseases of the spine; posture anomalies. When back pain in children should be evaluated not only their location, nature, strength, type (acute and chronic, nociceptive and neuropathic), but also the dynamics of pain with age. We should not neglect the assessment of the strength of pain on international scales. The correct choice of the examination algorithm is of great importance for the assessment and subsequent treatment of pain syndrome.

The main requirements for the complex of diagnostic measures are their harmlessness, objectivity, informativeness, accessibility, the ability to quickly examine large groups of children and adolescents in order to identify the pathology of the musculoskeletal system and prevent back pain. Existing methods of diagnosis and treatment, as well as a set of rehabilitation

measures used in the pathology of the spine, which is accompanied by pain in children, do not always allow you to get a quick and lasting therapeutic effect. This is often due to a lack of continuity between the doctor who prescribes the therapy and the medical professionals who make the appointments. At present, there is no concept linking diagnostic and therapeutic approaches in children with pain syndrome in the pathology of the musculoskeletal system. We have set ourselves a number of tasks: to develop a system for diagnosing pain syndrome in children with orthopedic pathology; to study the features of the functional state of the peripheral neuromuscular apparatus in children with pain syndrome and postural disorders using non-invasive methods of examination; to evaluate the effectiveness of botulin toxin type A (BTA) administration in patients with pain syndrome against the background of musculotonic syndrome. In the course of the work, it turned out that without studying the functional state of the dent alveolar system in children, it is impossible to stop a number of pains in the cervical spine. First we applied a variant of the orthopedic examination of children with mandatory assessment customizing system by the method of computer optical topography of the terrain of the human body (method KOMOT 1), and functional status of the TMJ and masticatory muscles (definition of tonus of the masticatory muscles and evidence of potentiation of the pain syndrome by means of the device for electro neuron myography (ENMG) 2.]

The risk of developing these disorders depends on the drug used and possibly genetic causes. The issues of screening and monitoring of metabolic disorders in patients receiving long-term antipsychotic drugs are discussed. Key words: mental diseases, obesity, diabetes mellitus, antipsychotic drugs. Numerous studies indicate a high mortality rate in patients with mental illness.

The most important from a practical point of view for understanding the mechanisms of development of chronic pain is to solve the question of the effectiveness of various methods of therapy. Currently, there are a large number of studies to evaluate the effectiveness of treatment aimed primarily at correcting peripheral sources of pain in patients with chronic back pain. There are a sufficient number of systematic reviews and clinical recommendations for the management of these groups of patients from the standpoint of evidence-based medicine. The results of clearly directed action on the supposed precisely identified source of pain impulses are most indicative of the effectiveness of treatment. From this point of view, the results of the study of the effectiveness of RFD of facet joints, blockades and minimally invasive intradiscal effects are interesting. The often diagnosed "non-specificity" of chronic back pain is a limitation in the evaluation of the effectiveness of treatment. Most studies of the effectiveness of therapy for chronic musculoskeletal pain include patients with chronic pain in the lumbosacral region that is not associated with a potentially dangerous spinal disease (traumatic, inflammatory, tumor, infectious lesion), gross deformities of the spinal column (usually without irradiation below the knee joint), sometimes with some additional inclusion/exclusion criteria.

The problem is also the lack of clear clinical criteria for the diagnosis of the most common suspected causes of chronic back pain. For example, there are no typical clinical characteristics of pain associated with damage to the arch-process joints. The main methods of diagnosis of facet syndrome are blockade of the medial branch of the posterior primary branch of the spinal nerve or intra-articular administration of a local anesthetic. However, diagnostic blockades and evaluation of their effectiveness are often carried out in various ways. At the same time, the results of positive diagnosis of facet syndrome vary from 10 to 90%. So, in one study, the

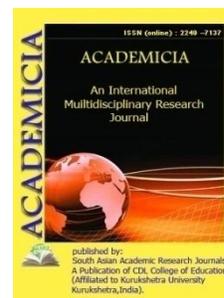

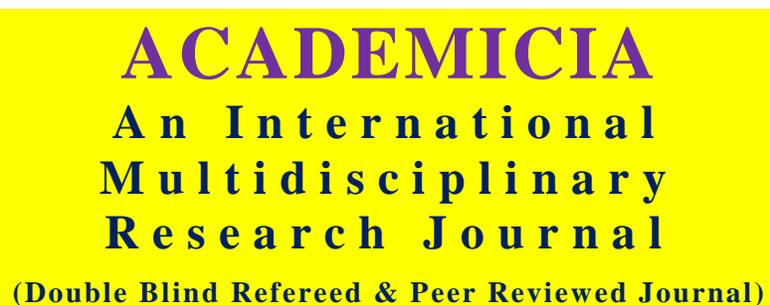

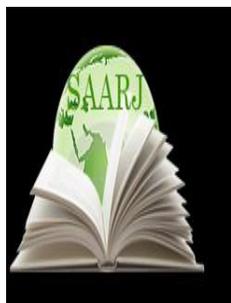

diagnosis of facet syndrome was based on a positive result (within the next hour, the pain decreased by more than 50%) of blocking the medial branch area innervating the facet joint with a small amount of a local anesthetic solution. Based on these criteria, facet syndrome was diagnosed in approximately 31% of patients with chronic lumbar pain. The number of patients who need to be treated in order to reduce the intensity of pain by 50% (NNT) in at least one patient during subsequent RCD was 1.6 (an indicator corresponding to the good effectiveness of the studied treatment method).

Despite the contradictory results of various methods to eliminate local sources of back pain, it can be concluded that minimally invasive interventions on the facet joints and disc are effective, at least in some patients with chronic back pain. This means that the elimination of the peripheral source of pain, at least in some people with chronic pain in the lumbosacral region, leads to a regression of chronic pain syndrome. At the same time, such results can only be attributed to a highly selective sample of patients, and they cannot be extended to the entire population of patients with chronic back pain.

Currently, there is insufficient data that would allow us to fully understand the pathophysiological changes that underlie the formation of chronic back pain. Given the comorbidity of chronic back pain with other chronic pain syndromes, cognitive and affective disorders, the lack of a clear evidence base on the role of peripheral vertebrogenic factors in its formation and maintenance, and the relatively low effectiveness of monotherapy aimed at eliminating peripheral sources of pain impulses, it cannot be excluded that chronic back pain, along with other dysfunctional pain syndromes, is a consequence of somatosensory system dysfunction, in particular, the amplification of the sensation of pain through central mechanisms associated with emotional aspects.

ABSTRACT

In current rapid – developing time along with other spheres, the field solar energy has gained a major role in tackling energy related problems and has set up some prospering plans ahead. As converting solar energy into electricity is efficient in many respects the field much attention to the sphere has been drawn worldwide. In this article important issues of developing the efficient use of solar energy are discussed. Along with the discussion of urgent issues in the sphere the economic and judicial aspects of the matter are highlighted in the article.

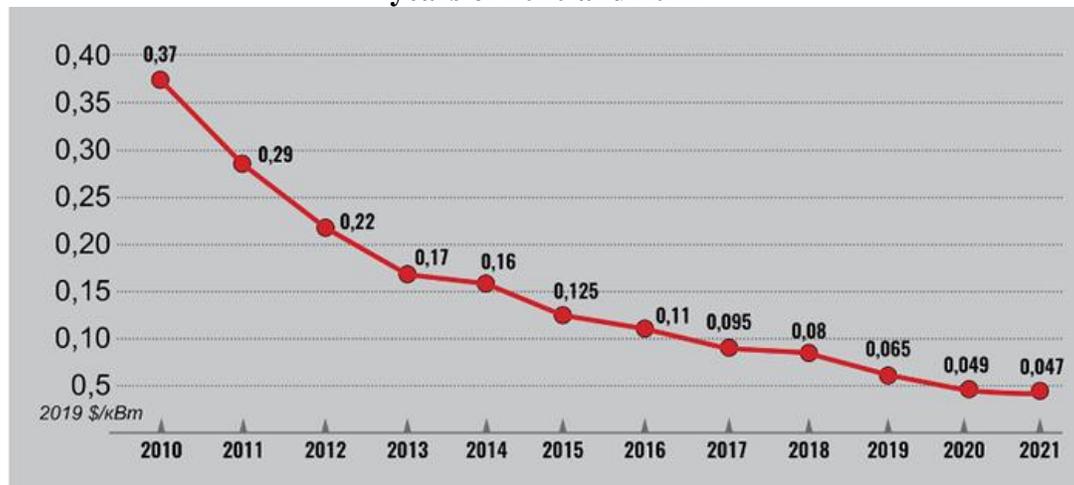

KEYWORDS: *Renewable Resources Of Energy, Solar Energy, Solar Panels, Energy Generation Temperature Coefficient, Degradation Rate.*

INTRODUCTION

During the times of economic crisis, the usage of renewable resources of energy is becoming a commonplace. Interest rate toward unconventional types of energy use is getting affluent. Power generation based on unconventional and renewable Sources of energy is considered to be ecofriendly since they do not release any pollutants into atmosphere. Constant demographic and intellectual growth of mankind make us think deeply about economic and ecologic issues. By 2020 the global population will have reached 9.8 billion people, so it is much likely that by that time mankind will have faced with many new problems. And without any hesitation one of the pressing issues will be the problem of energy supply. Nowadays both its absence and presence presents a series of problems. The former leads to complications of socio-economic issues while the latter will have its negative effects on nature. As the energy transported only in forms of oil or gas the process itself requires a great amount of finance. Apart from effecting national economics the limit of mining industry of energy influences continental geopolitics causing some arguments. Hence, during the last decades of XX century reforms concerning the replacement of traditional sources of energy with renewable ones were started being implemented. Average amount of sun radiation on the Earth is approximately $1.3-1.4 \text{ kVt/m}^2$.without the amount of reflected radiation, the surface of the earth receives the amount of radiation is equal to 1 kVt/m^2 . This amount is 9000 times as much as global need for energy consumption. This is the main reason why the main proportion of energy currently used accounts for renewable energy resources not the conventional ones. According to statistics in 2019 there was additional 248,6gw/t of power generation. And 179 gb/t of the total is made up by renewable sources. It is equal to 72% of the sum of globally produced energy. And 90 percent of that energy accounts for solar energy and wind energy. In particular, the production of solar energy increased by 97gb/t in 2019. Glancing at the evolution of new sources of energy, it is clear that the highest and the fastest growth is observed in solar energy growth trend. The primary reason for this tremendous development of solar energy is due to rentabiliyof devices even in smallest sizes and constant innovations implemented in the sphere.

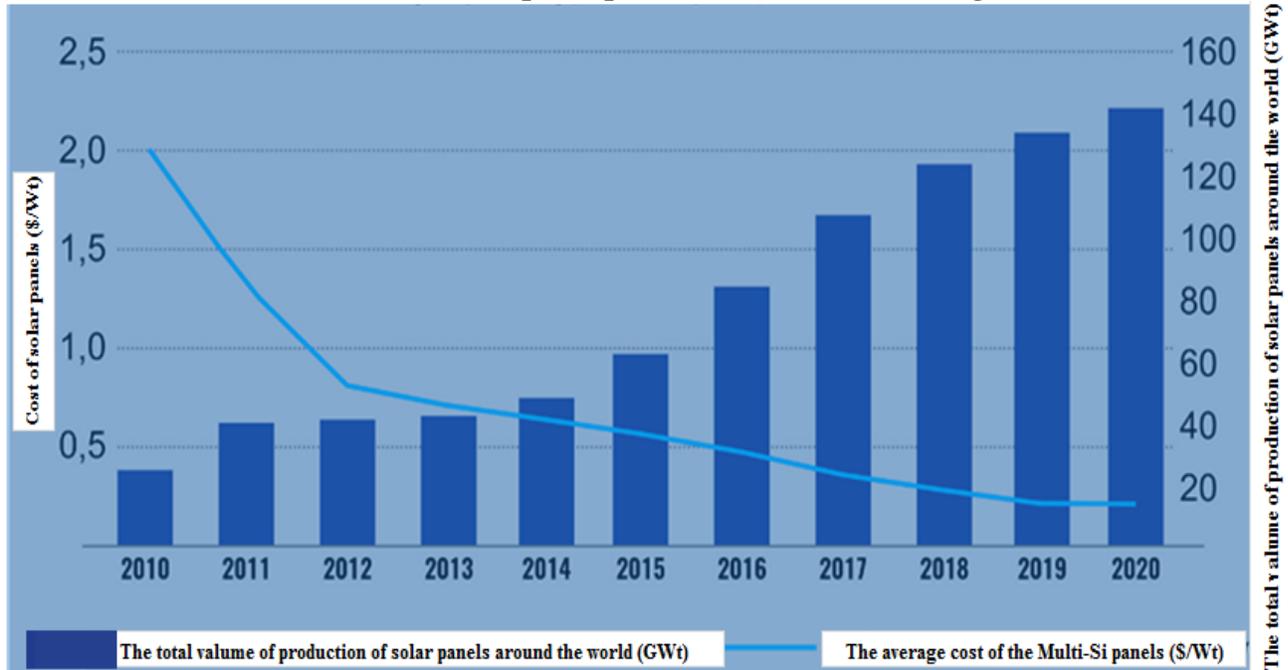

Trend showing the average price of solar energy taken from sun radiation between the years of 2010 and 2021

Current price of solar energy generated in solar power stations is 0,4 US dollars for 1 Kbt which is 14 cents. In case of Uzbekistan this amount is equal to 0.028 US dollars (295 sum 0 tiyin) – 2,8 cents . average cost of solar energy was 0.045 US dollars (4.5 cents) .During last decade the

trend of solar energy costs saw a noticeable decrease and this downward trend has been remaining unchanged. Interestingly, the power stations could keep their ratability even in the price of 0,033 US dollars in 2020.

Overall amount of solar panel production and their average cost

Because of constant innovations in the sphere and the investments that started paying off , the price of panels fallen down to 90 percent and the general capacity of power generation went up to 400 percent.

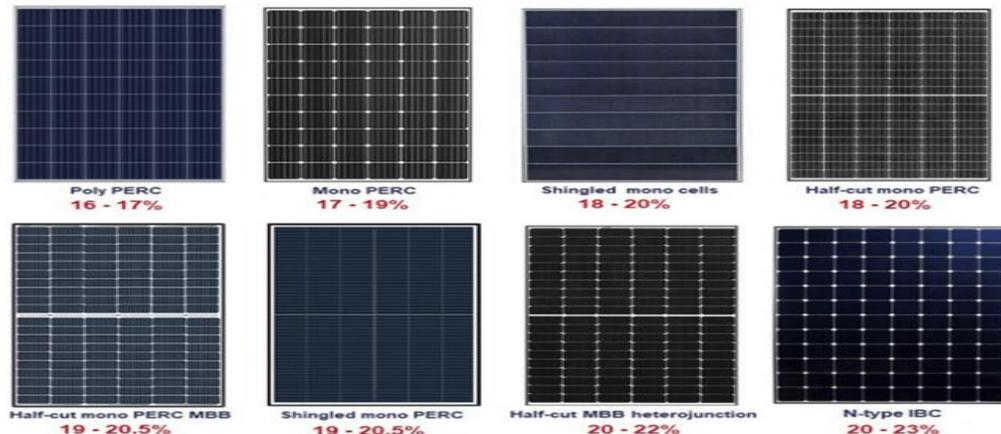

Significant decrease of the cost in this short period of time is assign of a technological advancement. But the laws of conservation in physics should be taken into consideration. According to them several factors influencing the cost can be defined:

- Less efficiency of solar energy and much more expensive cost of raw materials impact on the price of the end product
- Designing, marketing and licensing solar energy production requires a lot more afford than traditional ones. And these soft costs accounts for 15-20 % of the total cost of solar energy generators installed at homes
- The need for individual's integration while designing solar panels can lead to additional expenses. Solar power generators are designed according to architecture of home where the set to be installed. Usually installing the set on the roof or in other places of the home demands additional technical alterations to the set which in return effects on the initial price of the set. If the solar power panels were taken into consideration while constructing houses, the cost of the panel would be much affordable. Nevertheless, the cost of photovoltaic energy production in solar stations could become competitive. Especially, this tendency can be clearly observed in large stations.

In order to get maximum amount of energy sun radiation has to be as perpendicular as possible to the surface of panels. The light which is not absorbed on the surface of panels does not take

part in energy generation. Thus, while applying solar panels on household it is important to rely on professional design and infrastructure of developed countries in the sphere. So we do need well qualified experts of the sphere. Higher education institutions should pay more attention to the inclusion of topics such as design and operation of equipment, power supply in the field of alternative energy. In the future, as the number of specialists expands, the number of solar panels and the quality of their installation will also increase

The efficiency of a solar panel is measured by the percentage value of the amount of solar radiation incident on it that is converted into electricity. When it comes to efficiency, the efficiency of the solar cell and the overall panel efficiency are evaluated separately. This is because the efficiency of solar photovoltaic cells decreases due to the losses in panel configuration and current dissipation after placing them on the panel. Therefore, the efficiency of the overall panel will be lower than that of the individual solar cell. Today, the efficiency of standard solar panels is in the range of 15-20%. In recent years, the increase in efficiency has increased the output power of a standard solar panel from 250 W to 340 W. Depending on the type of solar cell, its efficiency varies. More than 90 percent of the solar cells on the market today are based on silicon

Depending on the type of crystal (mono, poly, multi), structure and other technical and technological solutions, silicon solar cells vary and differ in efficiency. Polycrystalline silicon-based solar panels have an efficiency of 16-17%. Some PERC (passivated emitter rear contact) and SHJ (silicon heterojunction solar cells) solar cells have an efficiency of more than 22%. Unfortunately, due to the similarity in the appearance of solar panels, it is difficult to distinguish the quality of the device at a glance. That's why the consumer doesn't always buy a quality solar panel. It is almost impossible to assess the quality of a solar panel without checking it with special devices. The lack of panels will naturally show up in 5 years. That is, it takes a long time in naturally aggressive (hot, cold) conditions. Over time, the panels reduce their output power under the influence of external conditions, i.e. undergo natural degradation. In the first 2 years, the output power degradation is 2-3 percent, but in subsequent years, the degradation rate decreases sharply and is 0.5-0.7 percent per year. Panels that deviate from these values and have a high rate of degradation are considered poor quality. **Therefore, when buying solar panels, you should ask the manufacturer and seller for a warranty of at least 5 years.**

The effectiveness of solar panels is also affected by the climatic conditions of the location where the panels are located. The manufacturer tests solar panels and panels in a specialized laboratory

before they go on sale. The indicators must meet the established standards of solar panel characteristics. In the real case, the characteristic information provided by the manufacturer differs from the actual value on the ground, which is different from the laboratory conditions. The performance of solar panels depends on the annual distribution of solar radiation intensity, the change in panel efficiency according to this intensity, the annual temperature distribution, the temperature coefficient of the panels, and the rate of degradation over time. The most important factor that directly affects efficiency is the ambient temperature. As the air temperature increases, the efficiency of solar panels decreases. At first glance, the more radiation falls on the panel surface, the more electricity may seem to be generated, but in reality, it is not. **An increase in temperature leads to an increase in the internal resistance of the solar cell.** Temperature causes an increase in the flow of electrons. This leads to an increase in current and a decrease in voltage. But since the voltage drop is greater than the current increase, the total power decreases. Evaluates how much the temperature coefficient of the panels differs from the standard characteristic shown under a given temperature. The temperature coefficient varies depending on the type of solar panels. For example, monocrystalline silicon-based panels at temperatures above 25 ° C - the efficiency decreases by 0.5% at each degree. During the hot days, the efficiency of solar panels doubles, and the amount of electricity generated is reduced by the same amount.

There are two solutions to this problem. First, air circulation should be taken into account when installing solar panels and the panels should not touch each other as much as possible. At the installation location, it is necessary to choose a place that is most suitable for wind paths. It is necessary to pay attention to the carcass materials of the panels. Panels made of materials that conduct heat as well as possible and do not allow local heating should be purchased. The second is to choose panels that are made up of climate-appropriate solar elements. The temperature coefficient varies depending on the type of panels:

- Polycrystalline silicon QE- 0.40 - 0.43% / ° C
- Monocrystalline silicon QE - 0.38 - 0.40% / ° C
- Monocrystalline IBC - 0.30 to 0.32% / ° C
- Monocrystalline SHJ - 0.26 to 0.27% / ° C

The most suitable solar panels for hot climates are panels made of SHJ solar elements. Their temperature coefficient is 1.5-2 times lower than that of conventional silicon elements.

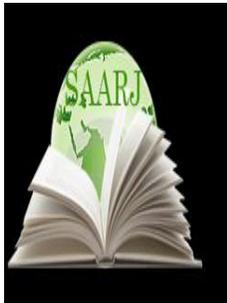

Another problem is the amount of dust. Dusting that occurs as a result of the landing of dust particles on the surface of the panels is one of the main factors that negatively affect efficiency. The dusting characteristics of the panel surface depend on two factors: the nature of the dust and the environment. Dust property refers to the size, shape, weight, particle surface, chemical and biological properties of dust particles. All this affects the accumulation of dust particles on a certain surface. If the dust particle is heavy and the surface is not smooth, there is a high probability that dust will settle and accumulate on the surface, or vice versa. The dust-coated surface absorbs dust better into subsequent layers. When it comes to pollination, the environment must also be taken into account. The location of agricultural works or highways around the location where the panels are installed determines the level of contamination. If there is light wind at this location, the level of pollination will also be high. Strong winds reduce the amount

of dust by dusting surfaces. Therefore, the installation of photoelectric solar panels takes into account the characteristics of the environment and the dust in that environment. Following the recommendations in this regard from experts and the literature, it is recommended to carry out preventive cleaning of the surface of the panels, protecting the surface of the panels with transparent layers of hydrophobic and dust-proof.

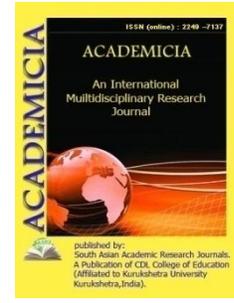

Legitimacy of alternative energy use measures in any country is an important factor for the development of the sector. In this regard, the Presidential Decree No. №PP-4422 "On operational measures to increase energy efficiency, introduction of energy-saving technologies and the development of renewable energy sources" signed on August 22, 2019 and "Energy efficiency of the economy and Resolution No. PQ-4779 of 10.07.2020 "On additional measures to reduce the dependence of the economy on fuel and energy products by attracting available resources." The bottom line is that solar energy has become competitive with traditional energy in terms of the price of energy produced today. There are a number of benefits to installing solar photo panels by individuals. However, due to the large initial investment in autonomous solar systems, the opportunities for individuals to adopt this technology are declining. The lack of specialists is causing these technologies to be insufficiently or incorrectly implemented, which in turn leads to underutilization or misuse of solar photovoltaic systems. The introduction of alternative energy, in particular solar photovoltaic systems, will lead to the formation of a culture of energy saving and the popularization of energy-saving technologies in everyday life.

LARGE-SPAN STRUCTURES AND ARCHITECTURAL FORM

Tabibov Abduvoris Latifovich*

*Associate Professor,
 Department of "Design",
 The national Institute of arts and design named after K. Behzod,
 UZBEKISTAN

ABSTRACT

The article analyzes: actual problems of architecture and construction of large-span buildings. The experience of building a stadium in Tashkent is being studied. An overview of the positive qualities of the proposed design solutions from a technological and economic point of view is given. Planar structures include those in which each load-bearing element of the coating operates only in its vertical plane independently of other load-bearing elements

KEYWORDS: *Large-Span Structures, Structures, Trusses, Frames, Arches, Composition, Symmetry, Shells.*

INTRODUCTION

The diversity of forms of social and labor processes, the growing mass participation of their participants, especially characteristic of modern society, increase the need for the construction of large-sized public and industrial buildings

For the overlap of large-sized public and industrial buildings, large-span structural forms have been created-shells, cable-stayed and rod systems, cross-plane (linear) and curved structures, pneumatic structures. The span value is an indicator of the development of design techniques. This Span of 100-300 m became possible only in modern architecture.

As a rule, large-span structures determine the main compositional theme of the structure in connection with the character of the form and its purpose, which often does not know the sharp boundaries between the wall and covering fences.

In large-span structures, the effect of the principle called by P. L. Nervi "resistance of structures in shape" is particularly evident.

The layout of large-span buildings poses a number of problems for the architect. The formation of large-span structures with a complex geometric outline of the coverings differs in certain specifics in comparison with simple geometric forms (cube, pyramid, prism, etc.)

At the same time, not only does the assessment of these forms become more complicated, but it becomes necessary to create new assessment methods, adjust the means of composition, such as, for example, proportioning tectonics, etc. There are structures whose structural forms refute the traditional principle of tectonics (based on the logic of gravity).- Gradual relief of the masses upward. The volumes of buildings placed on light single supports are expanded in an upward direction.

Symmetric constructions of complex spatial forms are specific, representing not only mirror forms, but also other types of geometrically balanced systems (rotary, linear-repeating, mosaic, combined symmetry), as well as filling surfaces and volumes in closed and discrete "packages".

A special sharpness in the composition of large-span structures is acquired by the opening of scale in all its manifestations (a person and a large-span structure: the ratio of the elements of the structure and the whole; large-span structures in the ensemble).

Often, the gigantic size of large-span structures forces us to pay special attention to taking into account the physiology and psychology of their visual perception.

The concept of compactness of form is organic for these structures, which are characterized by the continuity of the construction of the form. It is likely that new patterns and techniques of composition of these structures will appear.

In rationally designed spatial system, the most fully realized unity of architectural and structural forms and achieved solutions that do not meet Taiko functional purpose, but also creates a form of interior space and appearance of the entire structure.

In the construction of large-span coatings, there are two main groups that differ in the conditions of static operation: planar and spatial.

Planar structures include those in which each load-bearing element of the coating operates only in its vertical plane independently of other load-bearing elements. This includes beams, trusses, frames, arches, which are installed with certain, usually the same step and covered with reinforced concrete or other slabs that are not involved in the work of the main load-bearing elements.

Spatial structures include those that operate simultaneously in two or more planes, such as cross-ribbed systems, thin-walled shells and domes, folded coverings, etc. The use of spatial structures allows you to cover large areas without interstitial supports, which reduces the amount of work on the construction of foundations, reduces earthworks, etc.(Figure 1)

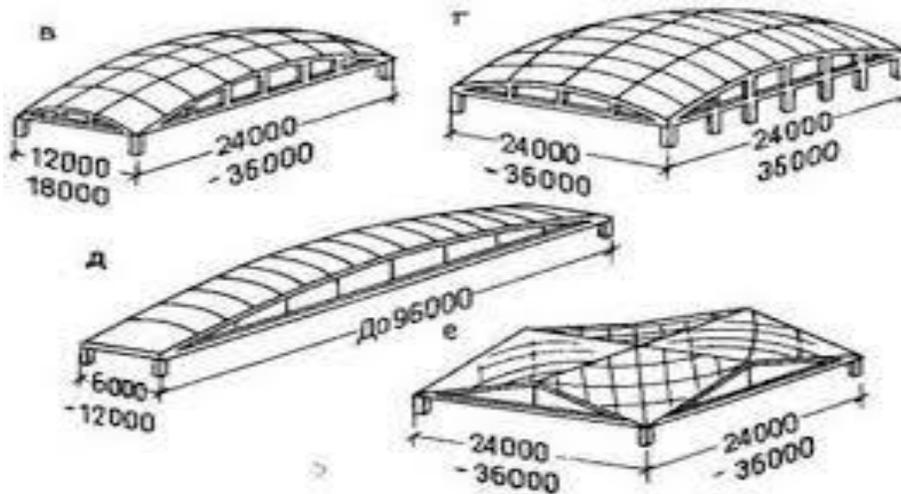

Figure 1 Large-span spatial structures. Shells

In addition to rigid flat and spatial structures, hanging prestressed coverings and pneumatic structures are also widely used in construction.

In high-rise systems, the main load-bearing elements are flexible cables that work on stretching, to which the coating elements are suspended or laid. High-rise systems can be performed flat or spatial. High-rise systems allow you to block spans of very large sizes with minimal consumption of metal and other materials.

Pneumatic structures made of soft synthetic fabrics. Due to their simple installation and ease of transportation, they are very convenient for temporary foam-bearing buildings and structures.

A good illustration of the wide possibilities of modern spatial large-span structures is the Bunyodkor Stadium in Tashkent. Here, new rational forms of hanging spatial coverings, the theory of their calculation, methods and technologies of construction were created, which opened up prospects for the wide application of this class of structures (Fig.1).

The stadium was designed and built by domestic specialists. Local building materials were used (with the exception of special technological equipment). Such well-known companies as "BOSCH" (Germany), "SIS" (Great Britain) took part in the construction and commissioning works. (Figure 2)

Externally, the stadium resembles a wide bowl with a concave edge. This is a visor over the spectator seats, protecting people from rain and sun. It leaves only the field open.

In the design of the stadium, hanging coverings made of light material are accepted. The main advantage of all-standing coatings in comparison with rigid ones is their insignificant weight per 1 m² of the overlapped area and the most economical consumption of the main structural material-metal, which in high-standing coatings works only for dilution.

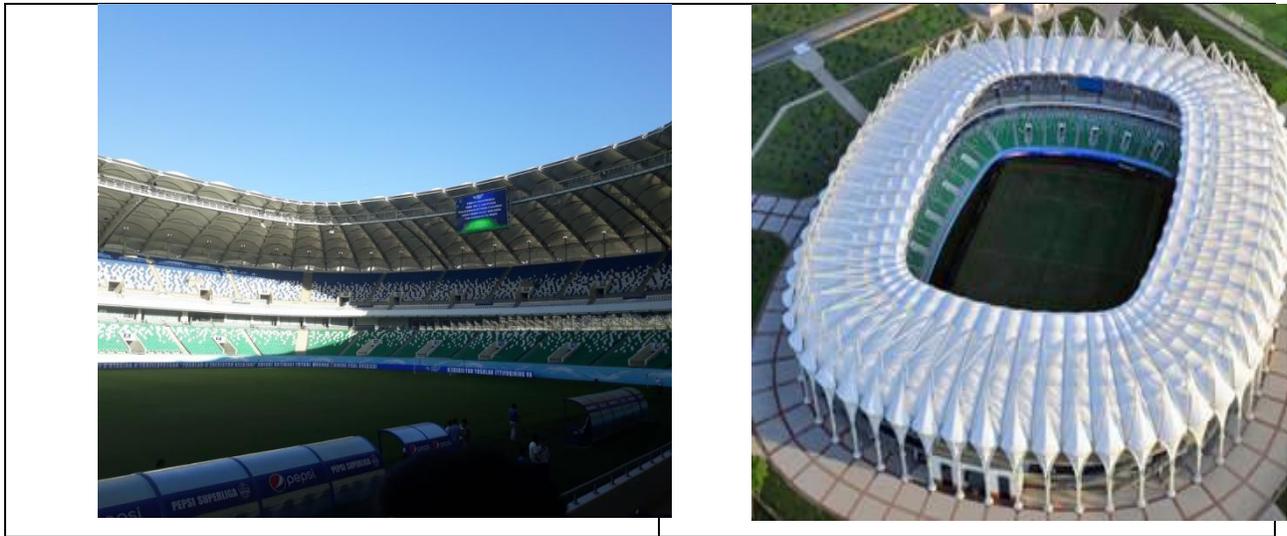

Figure 2 Bunyodkor Stadium»

Design studies and research allowed us to develop a range of unified products based on the experience of using this design on public and industrial buildings, which opens up wide opportunities for forming coatings: obtaining coatings in the form of domes, vaults, folded systems, funnel-shaped shells, in the form of shells, etc. with a span of up to 70-80 m.

It is necessary to emphasize the principal feature of this design — the use of prefabricated elements in statically indeterminate, i.e. in the most profitable systems, which largely determines its economic feasibility.

The author of this publication is convinced that the further development of large-span spatial structures will allow the most effective use of all the possibilities of such structural and technological solutions.

ESSENCE AND CONTENT OF FOLK APPLIED ARTS OF UZBEKISTAN AND CENTRAL ASIA

Rakhimov Otabek Davlatovich*

*Senior Lecturer,
 Department of Fine Arts and Engineering Graphics,
 Faculty of Arts of the Mineral Resources Department,
 UZBEKISTAN

ABSTRACT

Decorative and applied art, as one of the types of fine art, is a specific reflection of reality, a specific form of social consciousness. A common feature inherent in all types of art, including arts and crafts, is the reflection of life in artistic images, that is, an aesthetic reflection of reality. One example is an earthen jug, the shapes and outlines of which are not only convenient for its practical use as a vessel in which food is cooked on fire, but also aesthetically proportional, attractive for its elegance and proportionality. At the same time, it should be emphasized that the beauty of objects of applied art always has certain social characteristics and bears aesthetic characteristics of the time and place of its manufacture, features of national culture and age.

KEYWORDS: *Reflection, Manufacture, Aesthetically*

INTRODUCTION

According to its content, decorative and applied art is an art form, the works of which are objects that have certain artistic and aesthetic properties, but at the same time have a direct practical purpose in everyday life, work or are specially designed to decorate dwellings, architectural structures, streets, squares, parks, etc. In works of decorative and applied art, functional, design features (strength, economy) and aesthetic properties (beauty, artistic image, etc.) are organically merged.

The main functions of arts and crafts are to be a means of knowledge; transform the world; to be an educator of moral and aesthetic ideals, to form the very human personality.

The roots of the origin of decorative and applied arts go back centuries. This is one of the most ancient forms of art. It originated at the dawn of human history, when primitive man, in his

struggle for existence, for the first time making household items necessary for life, put into them not only physical strength, but also spiritual, creative, artistic abilities, that is, he began to "create according to the laws of beauty." However, this art form finally took shape after the separation of crafts into an independent branch of production.

Main part

Folk craftsmen have remained faithful keepers of the wonderful traditions of ancient decorative and applied arts to this day. It is no coincidence that the works created by them serve as a model for the mass production of these products.

In the art history literature, works of decorative and applied art are usually distinguished by the type of products created (furniture, lace, dishes, jewelry, toys, etc.), by the material from which the product is created (art metal, art wood processing, art glass, varnish, porcelain, bronze, ceramics, plaster, stone, etc.), according to the material processing technique (artistic carving, painting, embossing, artistic casting, etc.).

Before considering the role and place of folk decorative and applied art in the system of other types of arts, it is necessary to reveal and substantiate the concept of "Folk decorative and applied art" from the standpoint of the modern day. This is required by the research methodology and the specificity of the system of professional - aesthetic and artistic training of the future teacher of fine arts.

Folk art is a complex and multi-layered art of everyday life. It originated in distant primitive times. Your things you need for everyday life - jugs, dresses, benches, tools, etc. man strove to make them not only the most comfortable and durable, but also to express in them his artistic tastes and striving for beauty. One example is an earthen jug, the shapes and outlines of which are not only convenient for its practical use as a vessel in which food is cooked on fire, but also aesthetically proportional, attractive for its elegance and proportionality. These forms of the jug, its proportions, outlines have been worked out and improved for many centuries. Greek ceramic vases are also remarkable examples of the same ancient folk design. Moreover, depending on the specific functional orientation of a particular purpose, they were of several types: amphora served to store wine in the ground, hydria - to carry water on the shoulder, leclair - to store oil, kilik - to drink from it, etc. Over time, these objects, necessary and convenient in everyday life, in life, began to be decorated - ornaments, drawings, colored stripes, circles were applied to them with paint. And gradually they turned from items simply necessary in everyday life into works of folk art, and at the same time applied art. Until now, we admire the spiritualized beauty of the ceramics of Gijduvan and Rishtan, the gold embroidery art of Bukhara, with love decorated with gold patterns and ornaments, the intricate ligature of patterns of copper-stamped art, snow-white ganch carving, the gold fund of artistic sewing ... painting. Each locality, each traditional center of folk crafts has its own traditional patterns, its own ornaments, its own special objects - its own original fine art. Applied arts are objects that a person meets within everyday life on a daily basis. Applied arts include clothing, furniture, and tableware. In all these objects, beauty and utility are balanced. As a rule, objects of applied art have, in addition to expressive proportions, silhouette, colour colouring, and any decorations.

The beauty of applied art objects has a number of features. In particular, it is related to the use, but at the same time it is aimed not so much at emphasizing and revealing the usefulness of the thing, but at creating a holistic, aesthetically expressive image. At the same time, it should be

emphasized that the beauty of applied art objects always has certain social features and bears aesthetic signs of the time and place of its manufacture, features of national culture and age. Objects of applied art usually reflect the demands of fashion and the fluctuations of public taste generated by various social, aesthetic and many other reasons.

In the decorative arts, beauty is of decisive and paramount importance. In some cases, decorative items have no utilitarian use. Their purpose is different – to decorate the room, to create a colourful, decorative accent in it. These include a table or floor vases, carpets, tapestries, screens, and just beautiful things that serve as objects of decoration.

An artist working in the fields of folk art, unlike an artist working in the field of decorative art, is not free to choose forms, ornaments, ornaments, and materials for his works. He must create in line with the traditions, looking back at the centuries-old artistic canon that has developed among the people, prescribing a certain construction of the ornament, the use of certain materials: wood, stone, metal, bone, ceramics, baked clay, fabric, etc. All this imposes certain laws of creativity, turns it into a genuine folk art-the carrier of the traditions of the artistic worldview of the people, the guardian of their taste.

The beauty of applied art has a number of characteristics. In particular, it is associated with benefits, at the same time, it is aimed not so much at emphasizing and identifying the usefulness of a thing, but at creating a holistic, aesthetically expressive image. At the same time, it should be emphasized that the beauty of objects of applied art always has certain social characteristics and bears aesthetic characteristics of the time and place of its manufacture, features of national culture and age. Applied art objects usually reflect the demands of fashion and fluctuations in public taste, generated by various social, aesthetic and many other reasons.

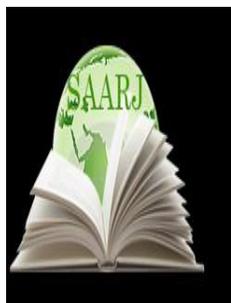

In the decorative arts, beauty is of paramount importance. In some cases, decorative items have no utility. Their purpose is different - in decorating a room, in creating a colorful, decorative accent in it. These include: table or floor vases, carpets, tapestries, screens and simply beautiful things that serve as objects of decoration.

An artist working in the field of folk art, in contrast to an artist working in the field of decorative art, is not free in the choice of forms, decorations, ornament, material for his works. He should create in the mainstream of traditions, looking back at the artistic canon that has developed among the people for centuries, prescribing a certain construction of ornament, the use of certain materials: wood, stone, metal, bone, ceramics, baked clay, fabric, etc. All this imposes certain patterns of creativity, turns it into genuine folk art - the bearer of the traditions of the people's artistic perception of the world, the keeper of their taste.

ABSTRACT

The article raises the problems of current maintenance and safe technical operation of bridges over river and sea obstacles, in particular, there is an indivisible link between the lack of periodic inspections of underwater elements of bridges and cases of emergency situations on structures due to the influence of defects and damages of underwater parts of bridges on the entire structure.

KEYWORDS: *Underwater Inspection, Monitoring, Bridge, Bridge Supports, Shore Supports, Quad copter, Drone, Defect, Damage, Drone.*

INTRODUCTION

Transport facilities are an essential element of the infrastructure of cities, regions, and our entire country. Their main task is to ensure the safe functioning of transport communications in difficult urban environments and on road and rail networks connecting settlements [1]. Transport structures include, first of all, bridges for road, rail, combined and pedestrian traffic.

I. EXPERIMENTAL RESEARCHES OF THE BRIDGE

Basically, all experimental research is carried out on models. Bridges and bridge structures are an integral part of the transport infrastructure, providing smooth operational communication and unloading of highways. Monitoring the technical condition is the most promising method for increasing the safety of bridges [2-3]. It allows you to minimize the possibility of their sudden collapse or damage, and makes it possible to optimize the expenditure of funds for the operation and repair of structures. The purpose of automated monitoring is to control negative changes in

the stress-strain state of bridge structures at the construction stage, as well as to take timely measures to prevent their collapse at the stage of operation.

II. RESULTS AND DISCUSSION

The support is the main part of the bridge. In terms of labor input, material consumption and cost of work, they account for 60-70% of the total costs of the bridge.

Bridge piers are an element that absorbs the load from the superstructure and transfers it together with its own weight to the foundation and base.

Supports are divided into 2 groups:

1 - Coastal (abutments);

2 – Intermediate.

Examining bridges with a quad copter is not a new idea, but it is used in few places. The reason for this is damage to the blades of the drone during the examination. An ordinary drone will not be able to climb where the quadro copter will fly due to its shockproof spherical carbon fiber frame [2].

Fig. 1. Checking the bank supports of the bridge.

Checking for cracks, rust and other wear on bridge structures and other infrastructure can be done in the traditional way. Whole groups of specialists move under the bridge structures and manually control the condition of the beams and joints, the presence of damage in them, which can lead to the destruction of the structure under load.

Today, two Tufts University professors are creating a system that includes vibration sensors and four propeller-driven drones to monitor bridge conditions in real time, alerting dispatchers to structural deviations.

Fig. 2. Check for cracks, rust and wear on bridge structures.

Over the years, construction industry professionals at Tufts University have been developing methods for daily inspection of bridge structures. In 2019, they attached 10 sets of accelerometers and temperature sensors to a pedestrian bridge leading to the Tufts campus in Medford, Massachusetts. Every hour data was taken from the sensors and transmitted to a small server located in a secure box near the bridge. By analyzing the vibration pattern, technicians can identify changes in condition that could damage part of the bridge.

A wireless version of the system is currently being developed. However, the authors of the development for some reason declare the ineffectiveness of existing wireless technologies when transmitting over long distances and intend to use unmanned aerial vehicles (drones) to retrieve information from sensors. In addition, drones can take photographs of structures flying under the bridge supports [3-5].

Using a sensor for wireless transmission will drain the battery pretty quickly, says one developer. Therefore, it was decided to use drones to upload information from bridge sensors to the server.

All this sounds like a complication of the solution, but it has a certain potential for operational improvement of the control process. Drones could not only read and download information from each sensor, they could react to the received data and, if necessary, collect additional information in the field of the sensor with warning information, for further analysis by civil engineers.

Fig. 3. Drones are being diagnosed under the bridge.

Working under the bridge can be a problem for the navigation system of drones, as they will at times be unable to communicate with the GPS system and will move blindly. Instead of relying on GPS, robots could navigate by QR codes placed next to sensors that would function as markers on a map, guiding the drone towards the next marker. This navigation technology is already being demonstrated in a laboratory [6].

Since factors such as strong winds and limited visibility can complicate navigation under bridges, drones are expected to be used in groups. Working together, multiple robots can check positions and check the accuracy of the flight path.

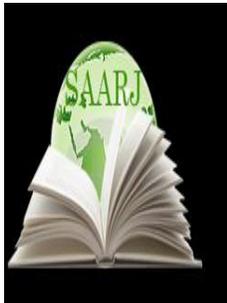

CONCLUSION

Thus, the monitoring system allows:

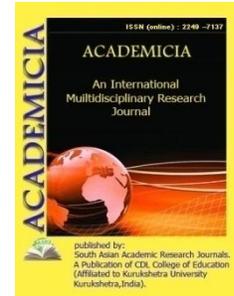

- 1) to reduce costs during the operation of bridge structures, because after the installation of the monitoring system, periodic surveys are not required;
- 2) To improve the conditions for safe traffic on the bridge, due to continuous monitoring and the possibility of instant notification of the staff of the bridge operation and rapid response services about a possible potentially dangerous situation.

ABSTRACT

The multi-stage tasks of scheduling the process of manufacturing complex products are considered. Optimization criteria take into account equipment changeovers, penalties for violations of the product manufacturing deadlines, and transaction costs. A general mathematical model is constructed, within the framework of which scheduling problems are posed and algorithms for their solution are proposed. The developed algorithms are implemented in interactive software for solving the problems under consideration.

KEYWORDS: *Scheduling Problem, Algorithms For Solving Scheduling Problems, Equipment Readjustments, Directive Deadlines.*

INTRODUCTION

With about holding t ate s nayapos t anovka task.

The problem of allocating scarce resources in calendar planning manufacturing process complex articles in multistage production systems for arbitrary technological routes and alternative embodiments of work on the equipment. Quality assessment of solutions, as in [1, 2], is determined by three basic constituents costs, equipment adjustment penalties imposed on the system for violations of defined deadlines manufacturing products, and the cost of execution. Unlike problems considered here from the backside [1, 2] is composed, in the first place, that in this study assumed the ability to perform operations in accordance with arbitrary

Technological ICE Skim routes and, secondly, the performance of work in each step may for several interchangeable types of equipment.

When describing the subject area, we will use the concepts: product – product of production activity; work – part of the product; machine-an arbitrary type of equipment on which work is performed. By operation we mean an integral part of the work's-performance work on the machine. For some works, deadlines are determined before which work cannot be started (initial deadlines). For some works (as a rule, finishing work from the preparation of products), the directive dates – time points by which the work should be completed are given.

The operations are performed on machines that are combined into groups (stages) on the basis of interchangeability. Each hundred no characterized productivity and time characteristics associated with adjustment and readjustments of the machine. For each job it is known technology, you flooring nenie - a sequence of processing steps that work should go for its execution. At each stage determined by the technology, the operation can be performed on any machine of this stage. The operation of the machine is characterized by the time of its implementation, which depends on the machine performance, the cost of its implementation and the time required for commissioning of the mill ka to perform the operation (if the machine has not yet been involved in the process of manufac - CTBA) or readjustment of the machine with the previous operations under consideration.

The manufacture of complex products requires the implementation of a set of interdependent work, the relationships between which we will describe using canonical network models – op and oriented weighted graphs without loops and circuits, the elements of which are associated with some characteristics. Canonicity network model means that no work cannot be started up until all operations are completed works, it predsh e stvuyuschih on manufacturing techniques.

Network models will be characterized by technological, organizational and resource conditions.

Technological conditions include:

- Conditions for the interdependence of work;
- Conditions associated with the performance of work at given stages of manufacture;
- Conditions associated with the performance of operations on a particular machine;
- Conditions associated with the adjustment and readjustment of machines.

Organizational conditions include:

- Conditions associated with the moments of commencement of work (initial dates);
- Conditions associated with the moments of completion of work (directive deadlines).

Resource conditions include conditions associated with the loading of machines for operations.

The overall objective of planning in the multi-stage production systems is to determine the start and end of operations on the machines so that, without violating the requirements of the process and, possibly, organizational and resource nature, to ensure the production throughout a given set of products with minimal effort.

General mathematical model

- I. **The initial parameters of the mathematical model.** Let J be the set of works, I be the set of machines, K be the set of stages uniting the same type of machines, $T = \{t_0, t_0 + 1, \dots, t_0 + T_0\}$ be the set of planning steps, where t_0 - be the start of planning, T_0 - be the number of planning steps. To work j - we associate the set $\vec{r}^j = (r_1^j, r_2^j, \dots, r_{k_j}^j)$, where r_l^j is the number of the stage at which the l -th operation of $j, r_l^j \in K, l = \overline{1, k_j}, j \in J$ should be performed. Let $G(j)$ be the set of works immediately preceding the work of $j, G(j) \subseteq J, j \in J$. Let t_{ijl} denote the time of performing the l -th operation of operation j - at stage r_l^j on machine i , P_{isl} is the time of changeover of machine i from operation s to operation l , n_{ijl} is the time of setting-up of machine i to l -th operation of operation $j, j \in J(i)$, where $J(i)$ the set of work for which adjustment is necessary to make the machine i to the first step of this work, s_{ijl} - expenses per unit time execution l -th operation works j in step r_l^j on machine i , d_{isj} - expenses per unit changeover time of the machine i to work s work t_j^D -direktivny SRO to completion completing guide work operations $j, t_j^D \leq t_0 + T_0, j \in J^D$ where J^D - a plurality of jobs for which the specified deadlines, t_j^H is the initial term performance $j, j \in J^H$, where J^H is the set of works for which the initial deadlines are defined, $t_j^H \geq t_0, i \in I, l = \overline{1, k_j}, j \in J, s \in J, J^D \subseteq J, J^H \subseteq J$.
- II. **In ariruemye parameters mathematical tion model.** Let $X = \|x_{ijl}\|$ denote the matrix of unknowns, whose element x_{ijl} determines the moment of the beginning of the l -th operation of operation j at stage r_l^j on machine i ; through $Y = \|y_{ijl}\|$, the Boolean matrix of unknowns whose element is $y_{ijl} = \{1, \text{if the } l\text{-th operation of work } j \text{ will be performed on the } i\text{-th machine; } 0 \text{ in the opposite case}\}$; through the $Z = \|z_{ijl}\|$ - matrix of unknowns, the element of which z_{ijl} determines the number according to the order of execution of the l -th operation of operation j at stage r_l^j on machine i , $z_{ijl} \in \{0, 1, \dots, N\}$, $N = \sum_{j \in J} k_j, i \in I, l = \overline{1, k_j}, j \in J$.
- III. **Limitations of the mathematical model.** The operation must be performed on one of the possible machines:

$$\sum_{i \in I} y_{ijl} = 1, l = \overline{1, k_j}, j \in J \quad (1)$$

The execution of two successive operations at the same stage is possible on the same machine only when the previous operation on this machine has already been completed:

$$\begin{aligned} &\text{If } y_{ijl} = 1 \text{ and } y_{ij(l-1)} = 1, \text{ then} \\ &x_{ijl} \geq x_{ij(l-1)} + t_{ij(l-1)}, l = \overline{2, k_j}, j \in J, i \in I \quad (2) \end{aligned}$$

Equipment at any given time cannot perform more than one operation:

$$\begin{aligned} &x_{ijl} \geq x_{ivs} + t_{ivs}, \text{ or } x_{ivs} \geq x_{ijl} + t_{ijl}, \\ &i \in I, l = \overline{1, k_j}, s = \overline{1, k_v}, j \in J, v \in J \quad (3) \end{aligned}$$

The beginning of the execution of any operation may occur no earlier than the completion of all operations immediately preceding the initial one:

$$x_{ijl} \geq \max_{v \in G(j)} (x_{svq} + t_{svq}), \quad i \in I, s \in I, l = \overline{1, k_j}, q = \overline{1, k_v}, j \in J, v \in J \quad (4)$$

Conditions determining the possible commencement of work having an initial deadline:

$$x_{ijl} \geq t_j^H, i \in I, l = \overline{1, k_j}, j \in J^H \quad (5)$$

The time to start work that does not have previous ones is determined taking into account the adjustment of equipment:

$$\text{If } y_{ijl} = 1 \text{ and } G(j) = \emptyset \text{ then } x_{ijl} \geq t_0 + n_{ijl}, l = \overline{1, k_j}, j \in J(i), i \in I \quad (6)$$

Conditions taking into account the setup times of the machines:

$$x_{ijl} \geq n_{ijl}, l = \overline{1, k_j}, j \in J(i), i \in I \quad (7)$$

Conditions taking into account the readjustment times of the machines:

$$\text{If } y_{ijl} = 1, y_{ivs} = 1, z_{ijl} = z_{ivs} + 1 \text{ then } x_{ijl} \geq x_{ivs} + t_{ijl} + P_{ivj}, i \in I \quad (8)$$

Natural conditions for variables:

$$x_{ijl} \geq 0, y_{ijl} \in \{0, 1\}, z_{ijl} \in \{0, 1, 2, \dots, N\}, l = \overline{1, k_j}, j \in J, i \in I \quad (9)$$

Shape tion of optimality criteria.

As particular criteria for optimality, we choose the following three groups:

✓□ group of private criteria related to minimizing violations of the directive deadlines:

$$F_1(X, Y, Z) = \sum_{j|j \in J^D, y_{i_0j} k_j = 1} \alpha_j \left(\frac{\max(0, X_{i_0j} k_j + T_{i_0j} k_j - t_j^D)}{t_j^D} \right) \times 100 \rightarrow \min$$

where - the amount of penalties imposed on the production system for 1 percent of the backlog of work from its directive;

✓□ group of private criteria related to the costs of readjusting machines:

$$F_2(X, Y, Z) = \sum_{i \in I} \sum_{s, \frac{j}{z_{isl}} = z_{ijv} - 1} \sum_{v=1}^{k_j} \sum_{j=1}^{k_s} d_{isj} P_{isj} Y_{isj} Y_{ijv} \rightarrow \min$$

✓□ group of particular criteria related to the costs of performing operations on machines:

$$F_3(X, Y, Z) = \sum_{j \in J} \sum_{i \in I} \sum_{l=1}^{k_j} t_{ijl} y_{ijl} c_{ijl} \rightarrow \min$$

As a convolution of particular optimality criteria, we choose an additive convolution:

$$F(X, Y, Z) = F_1(X, Y, Z) + F_2(X, Y, Z) + F_3(X, Y, Z) \rightarrow \min \quad (10)$$

The obtained task of scheduling includes initial parameters, variable parameters, constraints (1) - (9) and generalized criterion (10), which can be interpreted as the total cost of the work. This problem is a mathematical programming problem with essentially nonlinear constraints, nonlinear criterion and partially integer unknowns. The exponential computational complexity of solving the problem is due, for example, to the fact that the private tasks to which the task can be converted are the traveling salesman problems (accounting only for readjustments on one machine), the multiple traveling salesman (accounting for readjustments on several machines), the knapsack problem and multidimensional knapsack (does not take into account the order of processing parts for given policy periods) and others [3].

Algorithms for solving the problem

When solving real production scheduling problems, taking into account the large computational complexity rassmat-Riva task for its solution is proposed to use a greedy algorithm. Under the greedy algorithms we understand the algorithms, which is included in the under construction schedule work cannot be excluded in the subsequent stages of construction.

The developed and software – implemented algorithms are based on the principle of “frontality” [4], which consists in constructing a “front of work” - a set of works, any of which can begin execution at the considered time. On many works, based on a given strategy, a linear order is established, i.e. a lot of work is converted into a vector (permutation), which determines the sequence of work consideration in order to include them in the schedule under construction.

- I. The algorithm is the schedule builder A (P).** The algorithm, based on the permutation P, which determines the priorities of the work, deterministically constructs a schedule that determines some acceptable solution to the problem. The earlier the job is in the permutation, the higher its priority and the earlier it must be processed in the production system. The operation is assigned to the machine according to the principle of minimizing the costs of its implementation.
- II. Search algorithm for permutation P with depth h.** The total number of possible permutations is $n!$, Where n is the number of jobs. For large n , a natural number h is introduced, $h < n$, and iterating over $h!$ permutation options. The best variant from the point of view of the generalized criterion determines the next job, which is included in the permutation P under construction.
- III. An algorithm using the Simulated Annealing method [5].** The algorithm finds a pseudo-optimal permutation. This approach uses an analogy between the process of finding a pseudo-optimal permutation and the cooling model of a thermodynamic system. An analogy is drawn between:
 - □ energy of the thermodynamic system (E) and the optimality criterion for the problem (F) (we assume that their values coincide);
 - □ permutation setting the priorities of the work and the state of the thermodynamic system (P).

We introduce random operators of transition from one state of the system to another or, in other words, from one rearrangement of jobs to another. The empirical parameter T is the temperature of the thermodynamic system. Of the known energy distribution probability formula for thermodynamical system. Boltzmann follows that the transition probability si system consisting state

with energy E_1 in a state with energy E_2 at a temperature T $G(\Delta E) = e^{-\Delta E/kT}$ where $\Delta E = E_2 - E_1$ and k – constant Boltzmann (proportional coefficient NOSTA defining the relationship between energy and temperature). The algorithm works as follows: for some initial parameter T_0 - and permutations π_0 -is E_0 -is the value criterion wholesale imalnosti. The random operator of transition from the state P_0 to P_1 is used. The value of E_1 for this state is found. If $\Delta E \geq 0$ or $G(\Delta E) < \xi$, where ξ is a random number uniformly distributed in the range, then P_1 is taken as the current state of the system and the step is repeated relatively. Otherwise, the step is repeated with respect to P_0 . After mn (n is the number of jobs, m is the controlled parameter) of repetitions of this step, it is assumed that the “thermodynamic system” is cooled $T_{i+1} = T_i/2$. The condition for stopping the algorithm is the absence of improvements in the value of the criterion of the problem.

- I. **An algorithm using the Ant Colony Optimization method [6]**. Algorithm m uses the analogy between IP coma permutation and model - tion behavior colony "ant", regarded as a lot - agent-based system, in which each agent (ant) operates on common rules, and thus the behavior of the entire system (ant colony) leads to acceptable results. The essence of the approach is to analyze and use the behavior model of ants looking for a way from the colony (jobs that have an initial deadline) to a power source (jobs that have a deadline). During its movement, the agent marks its path, and the more agents passed along this route, the greater the value of these marks and the more agents this route attracts. The found route determines the permutation, which is implemented in solving the original problem with using algo rhythm -postroitelya schedules.
- II. **Method local improvement during limited**. Information on the total contribution of each work to the total cost of the schedule is used. An attempt is made to increase the priority of this work to reduce the total cost of the schedule. The algorithm works until the given strategy will not provide improvement.
- III. **The critical path algorithm**. The network structure of the manufacturing process of manufacturing complex products allows you to convert it into a network model for which time characteristics are calculated . On based on the found time reserves relative to the deadlines, a permutation is constructed that determines the sequence of work, the time reserves of which do not decrease. To improve (by the value of the generalized criterion) the desired schedule, combinations of the above algorithms are used.

Using the results to solve planning problems

Based on the constructed mathematical model and developed algorithms using .NET 3.5 technologies, the C # language implements an interactive software system for solving the problems of planning multi - stage production systems with interchangeable equipment , which was tested in solving problems of operational dispatch control of tool production in FSUE "FNPC NIIS them.

ABSTRACT

The article discusses the results of the formation of meat - greasy productivity of fat-tailed rams at the age of 20 months of different genotypes (hissars, local, hybrids) in the conditions of Karakalpakstan. Various products are obtained from sheep breeding - wool, mutton, astrakhan, milk, sheepskin and others, among which mutton is the most demanded and easily sold, therefore, in many countries of the world, 60-80% of income is received from mutton production. the implementation of complex studies to identify the most effective technologies for the production of high-quality lamb in the conditions of farms in different regions of Karakalpakia is of particular relevance.

KEYWORDS: *Pre-slaughter live weight, carcass weight, fat tail, internal fat, slaughter weight, weight of internal organs.*

INTRODUCTION

RELEVANCE OF THE TOPIC

Ensuring the country's food security, raising the living standards of the population, creating new jobs and sustainable management requires the development and implementation of effective technologies for the production of sheep products.

Various products are obtained from sheep breeding - wool, mutton, astrakhan, milk, sheepskin and others, among which mutton is the most demanded and easily sold, therefore, in many countries of the world, 60-80% of income is received from mutton production.

Research work in the direction of increasing the meat productivity of sheep using breeding, technological, biotechnological and other methods is carried out in almost all countries of the world, where sheep are raised in all areas of productivity. So, at present, in the USA, France, Germany, England, Australia, studies are widely carried out to increase the meat productivity of fine-wool breeds of sheep by crossing them with rams of the meat direction of productivity.

In experimental stations and laboratories in New Zealand, England, France, Russia, large-scale work is being carried out to create new breeds of meat and meat-wool production areas, combining high meat productivity, early maturity with good wool, genetic parameters and a correlation between meat content and others have been established. signs.

In this regard, the implementation of complex studies to identify the most effective technologies for the production of high-quality lamb in the conditions of farms in different regions of Karakalpakia is of particular relevance.

Increasing the economic efficiency of the industry, creating new jobs and ensuring the implementation of the food security program.

Objective of the Study

In Russia, Kazakhstan, Kyrgyzstan, in recent years, in order to increase the meat productivity of local sheep of different types of productivity, crosses are carried out with meat - greasy type rams - Hissar, Edilbaev and others. The results obtained indicate an increase in early maturity, a better formation of meat qualities in hybrids.

The foregoing served as the basis for studying meat - greasy productivity and development of internal organs in sheep of the Hissar breed, Jaydara and hybrids at the age of 20 months with traditional pasture keeping.

Place and Method of Work

The studies were carried out in 2019-2020 at the farm "Sultanov Tukhtabay" in the Khujali district of the Republic of Karakalpakistan. For this, 3 heads of 20 month-old rams were selected and their meat - greasy productivity was studied using the VIJ method (1978). The development of internal organs was determined by weighing them on an electronic balance.

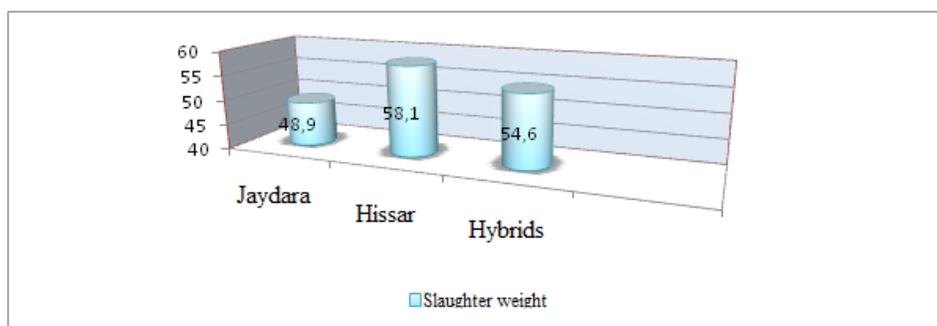

Research Results

The analysis of the data in Table 1 shows that the meat - greasy productivity of rams at the age of 20 months, despite the identity of the conditions of feeding and maintenance, was not the same and depended on their heredity.

TABLE 1 MEAT - GREASY PRODUCTIVITY OF 20 MONTH OLD RAMS AFTER FATTENING (N-3)

INDICATORS	JAYDARA		HISSAR		HYBRID (JAYDARA X HISSAR)	
	kg	%	kg	%	kg	%
Pre-slaughter live weight	46,5	100	62,1	100	52,07	100
Carcass weight	19,72	42,4	29,05	46,7	24,88	47,8
Fattail mass	2,54	5,4	6,25	10,1	4,1	7,9
Internal fatmass	0,48	0,1	0,84	1,3	0,52	1,0
Slaughter weight	22,74	48,9	36,1	58,1	29,5	54,6

The analysis of these tables-1 shows that the slaughter weight of the Jaydar breed is 48.9%, while in the Hissar breed this indicator is equal to 58.1%. Hybrid crosses (Jaydara x Hissar) occupied an intermediate position - 54.6%.

DIAGRAMM-1

The difference between the breeds in terms of slaughter yield is 9.2% in favor of the Hissar ram breeds. Then the hybrids (Hissar and Jaydara) occupies an intermediate position - 54.6%.

TABLE 2 INDICATORS OF THE DEVELOPMENT OF INTERNAL ORGANS OF 20-MONTH-OLD RAMS (N-3)

Indicators	Jaydara		Hissar		Hissar	
	kg	%	kg	%	kg	%
Pre-slaughter weight	46,5	100	62,1	100	52,07	100
Mass: heads	2,32	4,9	3,65	5,8	2,86	5,5
Sheep skin	3,72	8,0	4,12	6,6	4,65	8,9
blood	2,1	4,5	9,7	5,9	4,23	8,1
hearts	0,23	0,5	0,58	0,9	0,51	0,9
lungs	0,41	0,9	0,62	1,0	0,61	1,2
liver	0,52	1,1	0,74	1,2	0,59	1,1
kidney	0,2	0,4	0,26	0,4	0,22	0,4
stomach	3,04	6,5	4,11	6,6	3,57	6,8

So, the highest live weight before slaughter had the Hissar rams, which outnumbered the Jaydar rams and hybrids by 15.6 kg (33.5%) and 10.03 kg (19.3%), respectively. The greatest mass of carcasses was observed in the rams of hybrids, and in this indicator they exceeded the Hissar and Jaydar ones by 1.1 and 5.4, respectively.

The greatest mass of fat tail and internal fat was noted in rams of the Hissar breed - 6.25 kg and hybrids - 4.1 kg. As a result, the highest both absolute and relative indicators of the slaughter weight were noted in the rams of the Hissar breed - 36.1 kg and 58.1%.

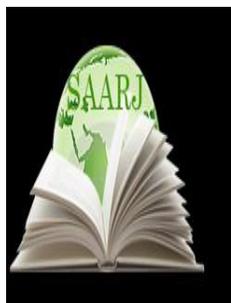

The Jaydar rams of the local population were inferior to those of the Hissar breed and hybrids in terms of the development of internal organs, which is quite consistent with the provisions of the pattern of formation of the development of the organism as a whole and its parts in particular.

CONCLUSIONS

Under the conditions of Karakalpakia at the age of 20 months, the best indicators of the formation of meat content were noted in rams of the Hissar breed and their crosses with local fat-tailed sheep, which is undoubtedly the result of hereditary characteristics and heterosis. Taking these factors into account when selecting them will undoubtedly serve to increase the economic efficiency of the industry.

ABSTRACT

This article studies and draws conclusions about the wool productivity, wool morphological indicators and their morphological characteristics in the northern and southern regions of the Republic of Karakalpakstan. The Republic of Karakalpakstan in the field of astrakhan wool production, wool processing and production of finished products are important in increasing the economic efficiency of farmers, private entrepreneurs, creating additional jobs. The study of sheep wool productivity was carried out during the shearing period (late May and early September) by individually measuring the sheared wool using scales. The natural length of the wool was measured on a metal ruler.

KEYWORDS: *Karakul Sheep, Karakalpak Breed Type, Wool Productivity, Wool Morphology, Southern And Northern Regions.*

INTRODUCTION

The rapid development of the livestock sector plays an important role in providing our people with cheap and quality meat and other food products, especially in increasing employment and increasing incomes of citizens living in rural areas. Therefore, it is necessary to take concrete measures to increase livestock production, efficient use of the fodder base, improve breeding, and establish processing of livestock products. It is known that in the Republic of Karakalpakstan in the field of astrakhan wool production, wool processing and production of finished products are important in increasing the economic efficiency of farmers, private entrepreneurs, creating additional jobs.

During the years of independence, the country has taken comprehensive measures to improve the pedigree of the breed by organizing the selection of sur karakul breeds. As a result, due to the biological properties of this breed, a certain increase in the productivity of skin, wool, milk and meat has been achieved. In this regard, along with improving the quality of astrakhan skins in the field of astrakhan, the cultivation and processing of wool products, the production of finished products and the organization of clusters in this area is an urgent issue.

It is important to increase the productivity of wool, taking into account the study of their main selection characteristics in the selection of animals, while maintaining the quality of the skin of karakul sheep of pulati-sur variety belonging to the Sur Karakalpak breed.

Y. Jumaniyozov, K. Ochilov, A. Akhmedshiev and other researchers studied the main colors of Sur Karakul of the Karakalpak breed, methods of their propagation, some indicators of growth, development, methods of wool production.

Today, scientific studies related to some morphological features of wool, the laws of formation, genetic and phenotypic changes, their other productivity traits are relevant.

Research Objective

To study the wool productivity and morphological properties of wool in the southern and northern regions of the Pulati-sur variety of karakul sheep and draw conclusions from the results.

Research Condition and Methodology

The research was conducted in the southern Turkul district of the Republic of Karakalpakstan in 2014-2017 and in the northern Takhtakor district in 2019-2020.

Sur karakul sheep were carried out on wool samples taken from sheep of different ages of pulati-sur color belonging to the Karakalpak breed.

The study of sheep wool productivity was carried out during the shearing period (late May and early September) by individually measuring the sheared wool using scales. The natural length of the wool was measured on a metal ruler. To study the different types of wool fibers in the wool cover, wool samples were taken from their lateral part.

Climatic Conditions

The climate in the southern Turkul district of the Republic of Karakalpakstan is slightly warmer than in the northern Takhtakor district, ie -4-6 degrees in winter. In summer it is + 5 + 8 degrees. The average annual rainfall in the southern districts is 100 mm. around. The average number of cold days of the year is 196 days.

Research Results

The Karakalpak breed of pulati-sur is one of the most valuable and attractive types of karakul sheep in terms of quality. The lower part of the steel-sur wool fiber is black (65-70%) and is characterized by a slow transition to steel or bleached color. The main part of the astrakhan skin is occupied by a mixture of ribbed and flat-type flowers and short stalks. Adult animals have a mostly small body structure and a strong or slender type constitution, while the nasal section consists mainly of steel-colored or light white wool fibers.

In addition to basic leather products, karakul sheep have the necessary raw wool productivity for light industry and are to some extent important in the economy. Karakul sheep are mainly sheared twice a year, spring shearing is of high quality and is characterized by a large amount of tivit.

THE RESULTS OF THE STUDY ARE PRESENTED IN TABLE 1 BELOW WOOL PRODUCTIVITY OF SHEEP OF PULATI-SUR VARIETY, GRAMS. (SPRING AND AUTUMN SHEARS)

PLACE OF THE EXPERIMENT	SHEEP AGE	NUMBER OF SHEEP STUDIED	SPRING SHEAR, GR	AUTUMN SHEAR, GR	TOTAL, GR
In the conditions of Tortkul district	3	35	1276,5±64,4	753,9±51,3	2030,4±115,7
	4	43	1287,5±68,6	784,9±59,9	2072,4±128,5
In the conditions of Takhtakupir district	3	39	1298,2±68,7	765,3±56,9	2063,5±125,6
	4	48	1323,4±74,5	799,2±61,2	2122,6±135,7

Analysis of the data in the table shows that in the Tortkul district, the spring shearing of 3-year-old sheep is higher than the autumn shearing in all age groups, ranging from 492.6 grams to 502.5 grams. If the spring shear is assumed to be 100, the autumn shear is 59.1% accordingly. It should be noted that in the Takhtakor district, the shear is much higher than its peers. In our opinion, such a change is due to climatic conditions.

Wool morphology is to some extent a factor in ensuring its quality. The higher the amount of tivit wool, the higher its quality.

THE RESULTS OF RESEARCH IN THIS AREA ARE PRESENTED IN TABLE 2 BELOW LENGTH OF WOOL FIBER OF SHEEP OF PULATI-SUR VARIETY, CM.

PLACE OF THE EXPERIMENT	SHEEP AGE	NUMBER OF WOOL SAMPLES	KILCHIQ WOOL	INTERVAL WOOL	TIVIT WOOL
			X±SX		
In the conditions of Tortkul district	3	12	9,8±0,78	7,3±0,51	5,2±0,54
	4	16	10,1±0,82	7,8±0,58	5,3±0,54
In the conditions of Takhtakupir district	3	13	10,2±0,81	7,5±0,53	5,9±0,54
	4	19	11,1±0,83	8,2±0,58	6,3±0,54

Analysis of the data on the length of wool fibers of sheep of Pulati-sur variety shows that there is a difference in the length of wool fibers in the age section of karakul sheep. In Tortkul district, in 3-year-old karakul sheep, the length of sword wool was 9.8 ± 0.78 cm, the length of intermediate wool was 7.3 ± 0.51 cm, and the length of tivit wool was 5.2 ± 0.54 cm. Correspondingly, in 4-year-old karakul sheep it is 11.1 ± 0.83 , 8.2 ± 0.58 , 6.3 ± 0.54 . According to climatic conditions,

wool fibers in the northern regions are 0.5-1.0 cm longer. To a certain extent, it protects the body from external environmental factors.

**THE RESULTS OF RESEARCH IN THIS AREA ARE PRESENTED IN TABLE 3
BELOW MORPHOLOGY OF WOOL FIBERS OF SHEEP OF PULATI-SUR
VARIETY,%**

PLACE OF THE EXPERIMENT	SHEEP AGE	NUMBER OF WOOL SAMPLES	KILCHIQ WOOL	INTERVAL WOOL	TIVIT WOOL
In the conditions of Tortkul district	3-ëIII	12	21,4	9,6	69,0
	4-ëIII	16	22,6	9,2	68,2
In the conditions of Takhtakupir district	3-ëIII	13	20,2	10,1	69,7
	4-ëIII	19	21,5	9,2	69,3

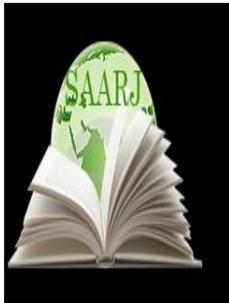

Studies (Table 3) show that according to the analysis of wool fiber morphology of sheep of pulati-sur color, no changes in the age of sheep were observed. In the northern regions, ie in the Takhtakupir district, the amount of tivit is 0.7-1.1% higher. During the winter months, the amount of tivit was considered important in protecting the animals from the cold.

CONCLUSION

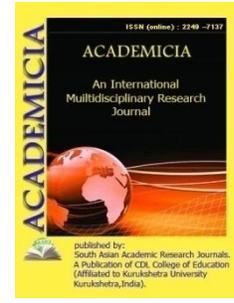

The results show that the average wool yield, wool quality and length of the Karakalpak breed of sheep depend on their peers, depending on the area of storage. This figure should be taken into account in the wool production plan.

THE IMPORTANCE OF THE ARTISTIC IMAGE IN THE WRITER'S STYLE EXPRESSION

Munavvar Kurbanova Esonalievna*

*Doctoral Student 3rd Year Basic,
 Uzbekistan State University Of World Languages,
 UZBEKISTAN

Email id: kurbanovamunavvar1989@mail.ru

ABSTRACT

Every artist has a unique style, whether in the art or in the literary process. It is this style that defines the creator individuality. In the literature, the style creation process occurs by several means. This article discusses the image creation issue, which is one of the important factors in creating a style. The expected result is to create an image and highlight its significance as much as possible, citing various scholars views. A literary type is a character that can be a large period generalization, representing important features of a social group or class, while in the play there are only characters that are distinguished by will and individual mental characteristics direction, who carry a "big burden" in the plot.

KEYWORDS: *Writer's Style, Image, Literary Expression, Author's Style, Literary Type, Artistic Texture, Episode.*

INTRODUCTION

Not only the work content and form, but also the work author image, from the artistic speech, as well as the visual expression means used in it, are important in the attractive work appearance. This, of course, reveals the writer's talent and his unique style.

One of the important processes in the writer's style manifestation is the image creation. It requires great skill and hard work from the artist, whether it is the image creation through aggregation or on the basis of a prototype. The artist who creates the image creates a holistic image by studying the behavior, inner experiences, activities, life and environment of different people, sorting and analyzing them, and then putting them into a mold. Such images naturally begin to interest the reader and convince him of the events in the work.

The skill of the famous English playwright W. Shakespeare in creating an image, the expressiveness of the characters' speech and the use of figurative expression still amazes many writers and scholars. In Shakespeare's first major play, "Romeo and Juliet", the plot breadth, and the originality of the character in "King Lear", which is characterized by its deep drama, all testify to the important aspects of the genius playwright's style, or the impact of the characters' speech in the tragedy "Hamlet, Prince of Denmark", which can be called the playwright's work culmination.

Artistic style is impressive with figurative expressions, artistic means of expression, artistic speech, and phrase logical combinations. "In a literary work, the writer's artistic perception of reality, an image creation, all the individual features associated with the composition of the work are reflected in the language of the work. No matter what events the writer tries to describe, it is natural that in his works, words that express the same events and happenings, language elements are used more".

Image creation is the most complex of processes. In the process, the writer explores people's lifestyles, behaviors, down to the smallest detail of the environment in which they live, and uses the skills he or she has acquired to describe them to the reader in a beautiful way. Each play will have unique images that show the writer's own style. The creator places this responsibility mainly on the protagonists. Their every action, speech, demeanor, portrait, etc., serve to express the writer intention in the work, that is, to ensure the attractive and natural appearance of the work. "In a work of art, the protagonist must keep the main idea and general spirit of the work at the pathos level. Otherwise, it spoils both the work pathos and the protagonist charm", - writes academician B. Nazarov.

Another important aspect is that the writer is required to have a deep intellect, understanding, broad-mindedness in choosing a hero for his work, and a wide range of imagination, as well as narrative skills to reveal that image in an original way. Whether he is the protagonist or the episode, he plays an important role in the smooth flow of the work, from their speech to every detail of his portrait. "It gives life to both the creator and the protagonist. But what he sees in life as close to the eye, as he is able to say in a more original way, does not describe him from head to toe. The creator chooses heroes according to his worldview, the nature of his talent". It turns out that choosing a hero for a work, creating an image and presenting it in an original way requires talent and a lot of work from the writer.

We have noted that well-crafted images play an important role in revealing the writer's style, as well as in making the work attractive and convincing. An "image" not only reflects the artist's style, but also embodies and conveys to the reader all the characteristics that belong to a type in a whole society living in that environment. "An image is a person image in a work of art. It should also be noted that when we say artistic image, it is mainly the human image that is understood and it plays a decisive role in literature. Through the people image in ideologically and artistically mature works, we obtain broad and concrete information about the life of a particular period".

In general, when talking about the "image", it is necessary to give a brief definition of the concepts such as character, image, type, individualization, and typification. In this regard, Tokhta Boboev, Izzat Sultan, Khotam Umurov, Erkin Khudoiberdiev, Dilmurod Kuronov and a number

of other scholars in their textbooks on literature have given wide space to such concepts as artistic image, literary type, and character.

In order to elucidate these concepts in more detail, it is useful to dwell on the ideas expressed in the first textbook of the literary scholar, academician Izzat Sultan in Uzbek language "Literary theory". "A character depicted in more or less detail in a work of art is called an image or character. Character (image) is a typified and individualized image of a person." According to the professor, a character is a character who embodies the people qualities belonging to a certain age, gender, period and environment. "Characters are manifested and formed as an acting result in certain psychological conditions".

The images complexity in the works of art, their colorful appearance and, finally, their convincing presentation are explained by the creative personality versatility. In the process of creating a work, the writer works by listening to his inner feelings and emotions, and, of course, whether he wants to or not, each character has more or less the same character. It is no coincidence that such ideas as "artistic image of self-expression through others" are not often found in literary theories. People who have a unique perception of existence and society usually come out as good creators. It is in the nature of human beings to display such qualities as talent and ability. Whether he is an artist or a writer, their creativity product is deeply rooted in the heart with its originality, uniqueness and maturity. Such works, of course, do not lose their value over the centuries.

The term "literary type" is also widely used in Izzat Sultan's textbook, which is interpreted as "the embodiment of important social and psychological phenomena". "Characters that are perfectly described in a literary type and have great generalization are called "types"". At the same time, the professor gives examples of such types in world literature as Prometheus, Majnun, Farkhod, Shirin, Layla, Hamlet, Yago, Lear, Onegin, and because such types are "the highest product of artistic creation," he argues that such original types are rare in world literature.

In contrast, another well-known literary scholar, Tokhta Boboev, in his textbook "Fundamentals of literary studies" emphasizes that the terms "character", "character", "type" are inextricably linked, but they are not exactly the same thing. According to T. Boboev, there are differences between the concepts of "character", "character", "type". "Image" means a depiction of the lives of all people involved in the play (in the plot of the work are various "carriers" - the protagonist, the main character, the episodic image). A literary type is a character that can be a large period generalization, representing important features of a social group or class, while in the play there are only characters that are distinguished by will and individual mental characteristics direction, who carry a "big burden" in the plot".

Professor Tokhta Boboev defines the concepts of such terms as "image", "character", "type", as well as in-depth analysis of the main features of the artistic image, ways of creating an image, as well as the classification of images.

When a scientist dwells on the ways of creating an image, we can see his methods descriptions of creating an image by the aggregation method, as well as on the basis of a prototype. According to the professor, an image creation by the aggregation method is carried out through the sum of different people's characters, moods, environments, experiences, lifestyles, while the prototype image is based on a historical figure who exists in life.

The conclusions of Tokhta Boboev's scientific research on the images classification are that the scientist used six types of artistic images:

1. As required by the creative method;
2. According to the requirements of literary types and genres;
3. According to the position held in the work texture;
4. According to the method of affirmation and denial;
5. According to the participation of images in comic works;
6. The episodic character-character involved in the literary work;) was cited and studied on the basis of scientific principles. The professor divided the images created according to the creative method requirements into mythological, mythical, fantasy, symbolic, romantic, realistic and gave them definitions.

“The character comes to life only when the writer is able to put himself in the place of the person being portrayed, to take on that personimage”. The writer approaches the process from his own thinking product, while burdening the protagonists involved in his work with his ideas and artistic intent expression. In this, the writer's identity is reflected in his literary heroes. Only a creative person embodies his nation, religion, traditions and values. This factor underlies the versatility and created images complexity. French scientist P. Valerie wrote, "The value of a literary text lies in the fact that it allows for a separate interpretation for each person.”

Because literary types are taken from life, the heroes characters encountered in the works are easily understood. We embody them in front of our eyes through someone related to that type in the environment in which we live. “The writer must look at his characters as real people, and in order for them to be alive, the writer must look for, emphasize, and note the unique, original features of each character in his speech, actions, body, face, smile, and eye play, and so on. By recording all this, the author helps the reader to see and hear more clearly what he is describing. Absolutely not the same people, everyone will have some uniqueness, both in appearance and in appearance”.

There are cases when the creator is proud of the positive qualities of the protagonist described in the work, but also do not completely condemn the negative protagonists, but rather shows the factors that led them to do so. The author is aware of the secrets in the hearts of the work heroes. He is able to analyze their hearts from beginning to end. It can explain the proportional or disproportionate connections between the feelings, thoughts, and protagonists experiences. Even the author can elaborate on the psychological experiences of the protagonist, which he himself did not understand or did not want to admit. “In literature, the protagonist problem is so complex that it is often impossible to describe this or that protagonist, such as Othello, as “positive” or “negative”. Because given that Othello maintains the purity of human relationships, he is a positive hero. But his killing of the innocent Desdemona makes him look like a negative hero. So, the whole point is about the authenticity of the heroes portrayed” Heroes with their own world, their own character ...

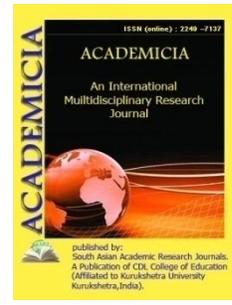

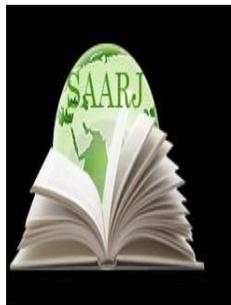

In the textbook "Introduction to literary studies" E. Khudoiberdiev, the images are divided into lyrical, epic and dramatic types. “The epic imagery method that originally originated consisted of depicting an entity that was considered an external world to the writer. The lyrical imagery

method is based on the feelings, thoughts expression, born in the human heart under the influence of real events in their own language. The dramatic image method combines and displays the capabilities of the previous two different methods. It relies on the writer to reflect both the behaviors and subtle feelings of the people involved in the events, as well as the circumstances in which they act, in an interconnected way, without interfering with the event”.

In conclusion, it should be noted that the main features of imagery, which, due to its simplicity and comprehensibility, are able to fulfill the tasks set by the author, are: to clearly reveal the depth and richness of the ideas expressed and to make them understandable to the general public. Thus, much of the style decoration is the organic features of the images created and the images that change during the course of events.

ECOLOGICAL PROBLEMS IN CENTRAL ASIA AND THE TASKS OF DEVELOPING THE INTEGRATION SYSTEM AGAINST THEM

Omonov Bohodir Nurullaeyvich*

Karshi State University,
UZBEKISTAN

ABSTRACT

The article highlights the socio-political consequences of environmental problems that dramatically affect the Central Asian region. Thoughts are expressed on the tasks of developing an integration system between the states of the region in order to ensure a stable ecological situation. Prevention of ecological imbalances in the biosphere is a global problem and is set to worsen in the future. The environment, in general, preserves the purity of nature, shaping the environmental activity of the state, creating a need for different needs and opportunities. Preserving the environment and purity of nature in Central Asia, of course, depends on the need to develop the environmental activities and civil culture of the countries of the region. Technical, nuclear and environmental tragedies on our planet are causing the most pressing problems of today.

KEYWORDS: *Environmental Activities, Environmental Tragedy, Environmental Crisis, Ecological Balance, Environmental Exclusion, Integrative Global Activities.*

INTRODUCTION

Preserving the environment and purity of nature in Central Asia, of course, depends on the need to develop the environmental activities and civil culture of the countries of the region. Technical, nuclear and environmental tragedies on our planet are causing the most pressing problems of today.

When any philosophy is essentially concerned with one major problem – “how to reconcile man with infinite being and nature”, the scientist Albert Schweitzer rightly referred to man's practical activity in the origin of the current problems on the planet.

Prevention of ecological imbalances in the biosphere is a global problem and is set to worsen in the future. The environment, in general, preserves the purity of nature, shaping the environmental activity of the state, creating a need for different needs and opportunities. Historical experience has shown that as a result of the abolition of private property under the former socialist regime and the transformation of all material and natural resources into state property, the “ecological alienation “of man from the socio-natural foundations and the declarative nature of any environmental activity.

In particular, as a result of the policy of totalitarian-voluntaristic management of environmental relations in the former USSR, the motives of nature protection in the interests of a particular individual or social unit have lost their significance. However, it is this phenomenon that has played a key role in the emergence of ecologically disadvantaged areas. The experience of independent countries shows that the development of multi-sect oral production based on the principles of a market economy, alternative forms of ownership, not only stimulates the environmental activities of owners, but also the efficiency of economic production - largely depends on the level of “environmental profitability “which indicates the possibility of the emergence of new, promising directions and forms of environmental activity. In the early stages of the transition to a market economy, there is a growing need for organizations and enterprises that can be effective in the context of entrepreneurship, business, initiative, creativity, limited material and spiritual resources. However, achieving economic stability is very crucial for the development of independent states. But, it is difficult to say that a fast-paced economic policy will be as positive as expected. The inability to use the available potential wisely leads to many difficulties and shortcomings in social, economic and environmental relations.

That is, the pursuit of economic gain alone has a profound effect on the natural ecosystem. Or, not accelerating the economy just by trying to improve the environment will not give the expected result. It is desirable to improve the coherence of socio-economic and environmental policies.

There is no doubt that from the first years of independence, the Central Asian states have focused only on increasing their economic power, which has exacerbated the environmental crisis. However, it is even more important to take steps to prevent its negative impact on the environment. Therefore, in terms of creating optimal natural conditions for normal human life in ecologically disadvantaged areas, meeting the dynamically growing material needs and aspirations, the environmental problems that pose a great threat to the region can be divided into four systems.

First, the imbalance of the atmosphere and biosphere

The atmosphere is the layer of air that surrounds the earth and rotates with it. (Greek. atoms - steam sphere). The atmosphere consists mainly of nitrogen (78.09%), oxygen (20.45%), argon (0.93%), carbon dioxide, hydrogen, helium, neon, krypton, xenon, methane, nitrogen, oxide, carbon monoxide, and other natural and industrial gases. Atmospheric pollution is a global problem. When British scientists discovered the problem of the “ozone hole” in 1982, they found that the ozone content in the skies of Antarctica dropped sharply at 25-30 km. In 2010, this figure reached 29 million square kilometers. Ozone depletion can reduce crop yields by up to 30% [4]. This is having a huge impact on the Central Asian region as well. For example, 12 out of 15 cities in the world polluted with high levels of particulate matter - dust, dry matter and

other solids - are located in Asia. About 22,000 tons of pollutants, including 120 tons of hydrogen fluoride, released into the atmosphere by an aluminum plant in Tajikistan's Regar district, which has a cross-border impact on southern Uzbekistan, are catastrophic effect on Sariosiya, Uzun, Denau and Altynsay districts of Surkhandaryaregion, where about 600,000 people live, causing economic damage to public health and agricultural production.

The biosphere is the biological crust of the earth, which is closely linked to the activities of living organisms in terms of composition, structure, and energy, and its most unique and important feature is the planet where life exists in the solar system. Biosphere imbalances are exacerbating the extinction of animals and plants. In Central Asia, more than 350 species of animals and more than 700 species of plants are endangered. Therefore, it is essential for the countries of the region to ensure socio-political cooperation in maintaining the balance of the biosphere.

Second, the desertification and Stalinization of the earth

Countries around the world are suffering from this problem. In the 20th century, 9 million square kilometers of desert appeared on the planet, covering 43% of the land area. Ecosystem degraded areas in North America, Europe, and Asia account for 607 million. sq. km. Every year, 30,000 hectares of agricultural land become unusable.

These problems have also affected areas in the Central Asian region. There are about 8 million hectares of irrigated land in the region, more than 50% of which is subject to erosion and secondary Stalinization. More than 50% of irrigated land in Uzbekistan is saline. These conditions are increasing the demand for consumer goods and have a serious impact on the development of countries in the region. Just as natural desertification is on the rise at the end of the 20th century, human cruelty is exacerbating the problem. At the same time, along with the deterioration of the natural environment, soil erosion, Stalinization, declining surface and groundwater levels, and other phenomena are occurring. Due to the poor management of landslides in the former Soviet Union, wind and water erosion have had a significant negative impact on soil fertility.

In fact, in the late 80's, the movement was completely stopped. More than 2 million hectares of land in the country, or about half of all irrigated land, are at risk of degradation. The use of inorganic mineral fertilizers, herbicides and pesticides was ten times higher than the highest standards. They polluted the soil, rivers, lakes, groundwater and drinking water. In addition, the necessary technologies were not followed in the use of new lands. Everywhere cotton was irrigated uncontrolled. Soil moisture increased and salinity increased. As a result, the environmental crisis has deepened considerably.

Thirdly, there is a shortage of fresh water in the region

The area of snow and ice resources that supply water to the rivers of Central Asia is declining rapidly. According to official data, in the last half century, the mountain glaciers of Central Asia have shrunk by more than a third [5; 87-88]. The Central Asian region is fed mainly by the Amudarya and Syrdarya rivers. The annual water resources of the Amudarya basin are more than 78 cubic km per year. The annual water resources of the Syrdarya basin are about 38.8 cubic km.

In Central Asia, the Amudarya and the Syrdarya are transboundary rivers that do not fully meet the needs of the region for fresh water. The region's population growth, economic growth, and

natural disasters are having an impact on the need for fresh water. As a result, some geopolitical tensions between the countries of the region have led to a sharpening of demand for fresh water.

The emergence of the negative term “leadership” among the countries of Central Asia in the late twentieth century (1996-1999) led to the geopolitical nature of the water problem. The process intensified in 2005-2010. Serious efforts to build two cascades of hydropower plants on two of Central Asia's largest rivers have exacerbated tensions. Attempts by Tajikistan to influence some countries in the region through the construction of the Rogun hydropower plant in the lower Amudarya and the Kambarata hydropower plant in the Upper Naryn cascade of the Kyrgyz Syrdarya have intensified.

It is known that the Syrdarya is formed by the confluence of the Naryn and Karadarya rivers, and the Amudarya is formed by the confluence of the Panj and Vakhsh rivers. The main source of the two rivers is the territory of the two Central Asian states of Tajikistan and Kyrgyzstan. If Tajikistan and Kyrgyzstan complete the construction of hydropower plants, the economic systems of Uzbekistan and Kazakhstan will suffer negatively.

For instance, the commissioning of the Rogun Hydroelectric Power Plant (HPP) alone could cost Uzbekistan \$ 600 million a year, GDP will lose 2%, as well as 300 thousand people will lose their jobs. It is known that if the Kambarata cascade of hydropower plants are launched, the region will be in a more complicated situation. According to some political commentators, the conflict over water in Central Asia will intensify in the coming years, which will inevitably lead to negative consequences and the possibility of armed conflict. For example, GalimFashutdinov's article, “**The Probability of a Water War in Central Asia**” says: “According to the United Nations, water disputes in 40 parts of the world could turn into military conflicts. One such region is Central Asia”.

EU Commissioner Catherine Ashton also commented on the idea, noting that there is a potential for serious conflicts in water relations between Central Asian states. Marat Shibusov, a Kazakh political scientist, called it an ultimatum to Bishkek and Dushanbe that war would be imminent in the next two to three years.

A similar prediction was made by L. Abror, an expert at the International Crisis Group, in late 2011. Yakusheva, deputy director general of **Russia's Information and Analysis Center for the Study of the Former Soviet Union**, said that “the third world war will be a war for water resources” [6]. This shows the need to improve the principle of mutual understanding between the countries of Central Asia.

Therefore, the President of our country Shavkat Mirziyoyev pays special attention to the development of good neighborly, friendly and cooperative relations with all countries of the world, especially with neighboring countries [1]. The President also managed to establish a more moderate policy in resolving the conflict between Tajikistan and Kyrgyzstan over water shortages.

Fourth, the problem of the Aral Sea disaster

In the 1960s, the Aral Sea was the fourth largest closed sea in the world: the Caspian Sea, the Upper Lake in North America, and Victoria in Africa. In other words, its area of 67,000 square kilometers is equal to the territory of European countries such as Albania, Belgium and Cyprus.

For 35,000 years, this sea has played a key role in balancing the biosphere ecosystem on a planetary scale.

To date, the region has experienced “population growth and increased demand for water, rapid land reclamation, and the recurrence of years of water shortages led to one of the biggest global environmental catastrophes clearly the drying up of one of the beautiful pools of water on our planet ... In the eyes of all mankind, the sea is collapsing ... We are all witnessing the brutal encroachment of the Aral Sea region”.

Nowadays, it is clear that “the Aral Sea Basin is a complex of global environmental, socio-economic and demographic problems, both in terms of origin and complications, in other words, on a global scale” [3]. To determine the genesis of these problems, it is necessary to make a complex-systematic analysis of the system of their causes. Because the absoluteness of the role of individual factors in the aggravation of the environmental situation in a particular region or on a global scale, and insufficient consideration, leads to erroneous conclusions.

The main reasons for the construction of the Aral Sea in the literature are the lack of justification of the strategy of deployment of productive forces, the lack of consideration of mechanical composition of the soil, hydro geological and geomorphologic conditions, inefficient design, construction and operation of irrigation and hydraulic structures, the lack of differentiation of norms and standards - in short, the connection with the extensive management of the dictatorial regime is a priority.

In the Aral Sea region, there was an ecological crisis associated with its drying up, and the scale of the problem became especially dangerous in the 1960s. By the new millennium, the Aral Sea is approaching the level of complete construction. After independence, there were imbalances in the socio-economic development of states. The overall integration system has deteriorated.

This necessitates the formation of a new phase of improvement of the integration system in the region. At the 72nd session of the UN General Assembly in September 2017, President Shavkat Mirziyoyev called on the world community to unite in international efforts to address the consequences of the environmental crisis in Central Asia and provide practical assistance to its victims.

In addition, in his speech at the meeting of the Council of Heads of States of the International Fund for Saving the Aral Sea in Turkmenbashi, Turkmenistan, he emphasized that the common goal of the region in preventing environmental problems: creating conditions for attracting foreign investment in the development and implementation of environmentally friendly technologies; comprehensive implementation of the principles of “green economy”, environmentally friendly, energy and water-saving technologies; end desertification and environmental migration; stressed the importance of developing ecotourism and implementing other measures [9].

Accordingly, the main issue in the new millennium is the socio-political necessity for each of the countries of the region to become a subject of environmental activity. In order to be a subject of nature conservation in Central Asia, each country must have an institutional system in place to materialize the culture of environmental policy. It depends on their citizens to understand the need to integrate national environmental needs and interests: intellectual knowledge, way of thinking, worldview content, beliefs, character, ideals, vitality, political position, legal views,

moral qualities and other subjective factors, ensures the effectiveness of state environmental policy.

Today, the integration of international environmental political relations cannot be imagined independently of the culture of cooperation, the “postulates of environmental ideology” [7, 86]. This is because improving the environmental situation requires the above-mentioned general conditions, which also help to find solutions to other global problems.

Therefore, in the integration of environmental international political relations, great attention is paid to its institutional basis, spiritual and ideological factors. Most importantly, each country approaches the integration of the institutional system of nature protection in Central Asia on the basis of its national interests. Because its escalation will inevitably globalize tomorrow, if not today, and will have a negative impact on other countries. A global environmental policy would be formed if a certain state could help to understand and encourage the need and principles for the integration of environmental institutions in areas where the environmental situation is unfavorable.

In addition, the idea that the individual national environmental policy of each state in Central Asia is the object of integrated global environmental activities in the context of philosophy: the category of individuality, specificity and generality, its general material and technical base, as well as the system of subjective factors we see that it is a practical task to organize the structure and function of the institutional system of environmental policy of each state, for objective and subjective reasons.

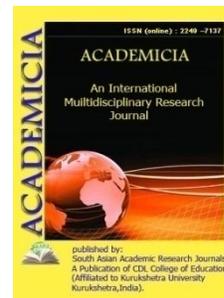

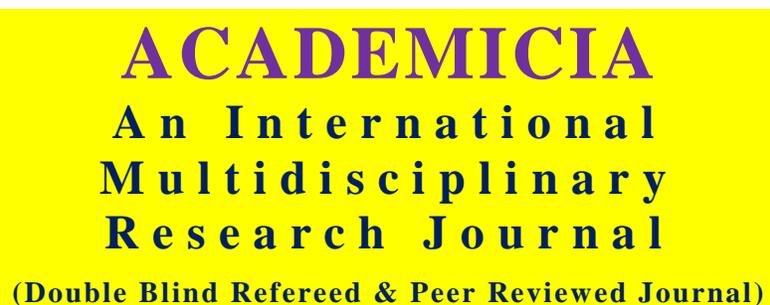

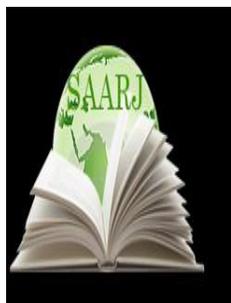

It is precisely this situation that hinders the functional coordination and integration of the structure of the ecological institutional system of states in such areas. The following conclusions can be drawn from the comments on the above issue:

- ✚ first, the harmonization and integration of the policy of any state in the field of improving the global environmental situation into international standards is in the interests of all mankind;
- ✚ secondly, the formation of a system of state institutions responsible for nature protection and their integration and globalization in ecologically disadvantaged areas is a historical necessity;
- ✚ thirdly, the integration and globalization of international environmental political relations: substantively and functionally, adapts them to universal goals;
- ✚ fourth, the socio-political mission of states in areas where the ecological situation is unfavorable, requires a differential approach to democratic and humanistic principles and norms;
- ✚ fifth, the national institutional system for improving the environmental situation is regulated and managed by universal moral and ethical norms, legal means.

ABSTRACT

The paper presents the results of research and development of a continuous technology for the pre-contact hydrogenation of cottonseed oil on stationary and powdered nickel-copper catalysts. It was found that the recommended technology allows to significantly increase the productivity of hydrogenation plants and reduces the content of trans-isomerized fatty acids in solid fat. This ensures an increase in the physiological and nutritional value of margarine products based on food solid fat.

KEYWORDS: Fisher Criterion, The Response Function, Trans-Isolation, Import-Substitution, Catalysis, Vanadium + Rhodium Or Palladium.

INTRODUCTION

Food fats are an essential food item. According to physiological norms, the recommended fat content in the human diet is 30-33% - the total energy value of food. In the world, more and more attention is paid to research work on the catalytic modification of vegetable oils and fats to improve the quality and ensure the food safety of target fats. The creation of new generation catalysts for the production of food-grade fats is an urgent problem. In this direction, scientific research work on improving the properties of food-grade fats for targeted purposes, optimizing their composition and technological processes is receiving significant development.

Solving the problems of the quality and safety of edible fats and products of their processing is one of the priority directions in the implementation of the concept of state policy in the field of healthy nutrition of the population of the Republic. Despite the intensive development of the theory of heterogeneous catalysis, including hydrogenation catalysis, the selection and synthesis of catalysts are mostly empirical. In this case, the reference points are theoretical studies and

experimental work related to the study of the catalytic properties of individual metals, oxides, their combinations, etc. [1].

Scientists and specialists have proposed improved technologies for the catalytic hydrogenation of vegetable oils and fats using powdered and stationary catalysts. Optimal technological modes of production of edible fats based on sunflower, cottonseed, soybean and palm oils have been developed. Recommendations are given on the use of edible, hydrogenated fats for the production of a wide range of margarine products.

At the same time, little attention was paid to the development of the technology for the hydrogenation of oils and fats, in particular, cottonseed oil using catalysts of a new generation to improve the quality and ensure food safety of the resulting products.

There is no scientifically substantiated technology for the hydrogenation of cottonseed oil for the production of high-hard edible fats with a minimum content of trans-isomerized fatty acids. The influence of technological modes and the nature of catalysts on the formation of the quality and physicochemical characteristics of high-hard edible fats has not been studied; the role of the nature of the hydrogenated raw materials and the component composition of the catalysts used on the nutritional value and safety of the products obtained has not been established and justified [2, 3].

Modification of alloyed nickel-aluminium catalysts is achieved by introducing metals that change the fine structure of the alloy and its properties after more or less deep leaching. The choice of promoters and their combinations is determined by the results that have been accumulated by science in the study of the catalytic and other properties of these promoting additives [4].

The relevance of the work. The action strategy (2017-2021) for the further development of the Republic of Uzbekistan specifies the tasks "... for the development of industries, modernization and diversification of industry, the use of resource and energy-saving methods, ensuring food safety of products, the production of competitive and export products for import substitution ..." [5].

In this regard, scientific research aimed at the production of high-quality food-grade fats for targeted purposes using vegetable oils, in particular, soybean, sunflower, safflower, and sesame oils for the preparation of a wide range of food products is of particular importance.

Therefore, the search for possibilities for the production of hydrogenated fats based on vegetable oils using new generation catalysts, the establishment and substantiation of the scientific and practical foundations of catalytic processes is of great scientific and practical interest [5-6].

Uzbekistan has a sufficient raw material base and opportunities for organizing and mastering new technologies for the production of hydrogenated fats and catalysts for these purposes. In this regard, carrying out scientific and experimental research in the direction of developing the technology of hydrogenation of oils and fats on catalysts of a new generation using the technology of stepwise hydrogenation, improving the quality and ensuring food safety of the obtained edible fats for target purposes is relevant [7, 8].

METHODS

Vegetable oils, stage-by-stage hydrogenation technology, new catalytic systems, technology for the production of food-grade fats, improving the quality and ensuring food safety of fats, technological modes and processes. Stage-by-stage hydrogenation of vegetable oils on catalysts of a new generation, production of food-grade fats and their use.

The aim of the work. Research and improvement of continuous technology for the hydrogenation of fats on stationary catalysts using them as a forecontact, reducing the content of trans isomerized acids in salomas (solid fat), improving their quality, nutritional value, and increasing the productivity of technological equipment.

RESULTS AND DISCUSSION

In our experimental work, the nickel-copper-aluminium alloy is promoted with rhodium, palladium and vanadium. It should be noted that a comprehensive study of the promoting effect of vanadium, especially in conjunction with rhodium and palladium, has not yet been carried out.

It is known that vanadium reduces the catalyst's ability to isomerize and transesterify fatty acid glycerides. Considering these properties of vanadium, it was introduced into the composition of a nickel-copper-aluminium catalyst promoted with rhodium (0.5 %) or palladium (0.05 %).

The activity and selectivity of the catalyst were studied depending on the vanadium content (0.5–2.5 %).

Changes in the activity of nickel-copper-aluminium catalysts depending on the vanadium concentration at constant rhodium and palladium contents are shown in Figs. 1 and 2. As follows from these data, vanadium increases the activity of the catalyst. However, the activity of catalysts increases disproportionately to the mass fraction of vanadium.

The study of the hydrogenating properties of new modifications of stationary nickel-copper-aluminium catalysts was carried out at 200 °C, a pressure of 300 kPa, and a hydrogen supply rate of 60 h⁻¹. In all cases, cottonseed oil (iodine value 112 mg of iodine) was hydrogenated at a constant rate (1.0 h⁻¹). The results of the study of stationary catalysts are shown in the table. 1 and 2.

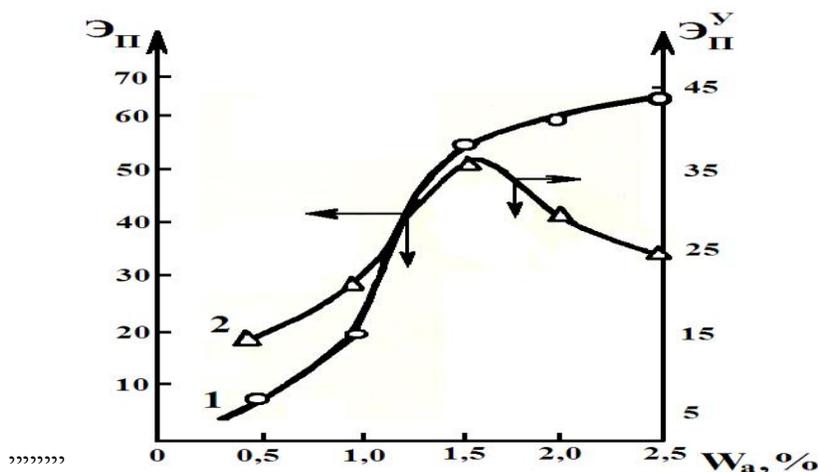

Figure 1. Promoter (1) and specific promoter (2) vanadium effects in nickel-copper-rhodium-aluminum catalyst (rhodium 0.5%)

TABLE 1. INFLUENCE OF VANADIUM ON THE PROPERTIES OF NICKEL-COPPER-PALLADIUM-ALUMINIUM CATALYST (PALLADIUM 0.05%)

Mass. proportion of vanadium in the alloy, %	Activity, iodine number.	Relative activity, %	Selectivity, %	Content of trans isomers, %
0,0	51,3	100	92	45
0,5	52,9	103	88	39
1,0	53,8	104	84	30
1,5	56,4	109	80	26
2,0	57,0	111	79	24
2,5	67,5	112	76	22

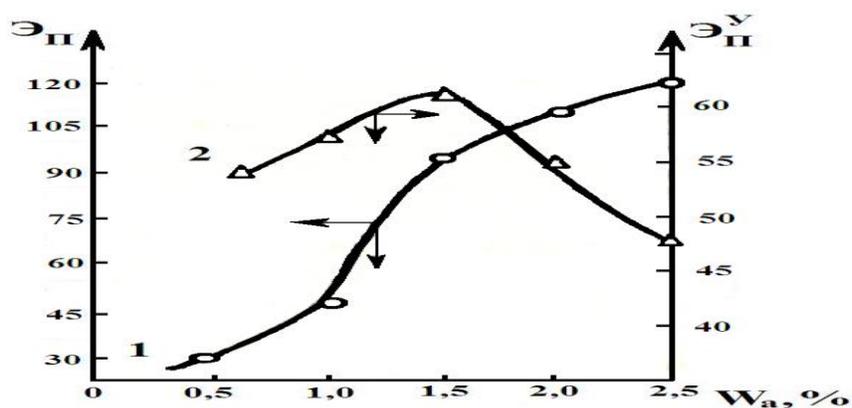

Figure 2. Promoter (1) and specific promoter (2) vanadium effects in nickel-copper-palladium-aluminum catalyst (palladium 0.05%)

To determine the degree of influence of the amount of the promoter (vanadium) on the hydrogenating properties (activity, selectivity, and isomerizing ability) of the stationary catalyst, the experimental design method was used.

TABLE 2. INFLUENCES OF VANADIUM ON THE PROPERTIES OF A NICKEL-COPPER-RHODIUM-ALUMINIUM CATALYST (RHODIUM 0.5%)

Mass. proportion of vanadium in the alloy, %	Activity, iodine number.	Relative activity, %	Selectivity, %	Content of trans isomers, %
0,0	52,0	100	82	42
0,5	52,5	101	80	38
1,0	53,1	102	78	32
1,5	54,9	106	76	24
2,0	55,0	106	75	24
2,5	55,3	106	75	23

The response function - activity (Y_1), selectivity (Y_2) and isomerizing ability (Y_3) of the catalyst depended on the concentration of the following metals in the alloy, % nickel (X_1), aluminium (X_2), vanadium (or another promoter) (X_3) and copper (X_4). The obtained results of planning the experiment made it possible to find the corresponding regression equations.

Checking the adequacy of the obtained regression equations by Fisher's criterion showed that the greatest influence on the hydrogenating and other of the above properties of the nickel-copper-aluminium catalyst is exerted by vanadium as a promoter when its content in the alloy is 1.5%.

Indeed, summarizing the data obtained, we can conclude that the introduction of paired combined additives (vanadium + rhodium or palladium) in an amount of 0.05–2.5% by weight of the alloy increases the activity, selectivity of hydrogenation and reduces the accumulation of trans-isomerized acids in salomas. The greatest promotion effect is observed when the following amounts of promoters are added to the catalyst: 0.5% rhodium + 1.5% vanadium and 0.05% palladium + 1.5% vanadium. However, even with an optimal concentration of a promoter (or a system of promoters) in the alloy, the activity of the resulting catalysts is, of course, the same. Thus, based on the results of studies of several stationary catalysts, highly efficient stationary alloyed promoted nickel-copper-aluminium catalysts were found with the aim of recommending them for pilot-industrial testing and implementation in the technology of continuous hydrogenation of cottonseed oil to obtain edible fat and confectionery fat. Technological modes of the process of obtaining food fatty masses were tested in a hydrogenation unit (capacity 15-20 t/day) of a column type, as well as in existing industrial autoclaves. Research and testing were carried out by varying the technological parameters of hydrogenation to control the fatty acid composition and the content of trans-isomerized acids in the salomas. The results are presented in Tables 3, 4, 5, and 6 and Fig. 3 and 4.

	C^0_{14-18}	$C^{1=}_{18}$	$C^{2=}_{18}$					
1,4530	29,5	61,6	8,9	83	24	34,6	360	0,76

1,4523	30,5	60,7	8,8	88	21	34,5	390	0,48
1,4523	29,7	58,8	11,5	85	16	37,1	470	1,16
1,4521	33,5	59,2	7,3	93	17	36,5	520	0,83

As can be seen from Tables 3 and 4, the partial hydrogenation of cottonseed oil to a residual linoleic acid content of 35-47% on a stationary catalyst promoted by palladium and vanadium makes it possible to obtain liquid or liquid salomas with a melting point of no more than 30 °C.

The subsequent hydrogenation of this solid fat on a powdered catalyst makes it possible to obtain standard-quality salomas for margarine products and confectionery fat with a melting point of 34-36 °C and a hardness of 360-500 g/cm with a trans-isomer content of 23-34%. This is less than the content of trans-isomers in salomas obtained by the conventional method. The same result was obtained by hydrogenation on a stationary nickel-copper-rhodium-vanadium-aluminium catalyst followed by post-hydrogenation on a powdered nickel-copper catalyst (Tables 5 and 6).

As shown in these tables, the hydrogenated oil was obtained on a stationary catalyst at a volumetric oil supply rate from, 5 to 3.2 h⁻¹. Under these conditions (temperature 165-170 °C, hydrogen pressure 250-350 kPa), industrial batches of partially hydrogenated cottonseed oil with an iodine number of 96.3–103.5 were obtained.

It should be noted that hydrogenation on a stationary catalyst, as expected, proceeded according to the total kinetics of the zero-order. Indeed, the relationship between the volumetric flow rates of oil and iodine number section of hydrogenated feed had been distinct linear (Fig.3). Also confirmed that the selectivity of the stationary catalyst decreases sharply with increasing depth of hydrogenation (Fig.4). Given the zero-order of the reaction, a linear relationship could be expected between the iodine number of the hydrogenate produced on the stationary catalyst and the trans-isomer content. This conclusion is also confirmed during pilot tests (Fig. 5).

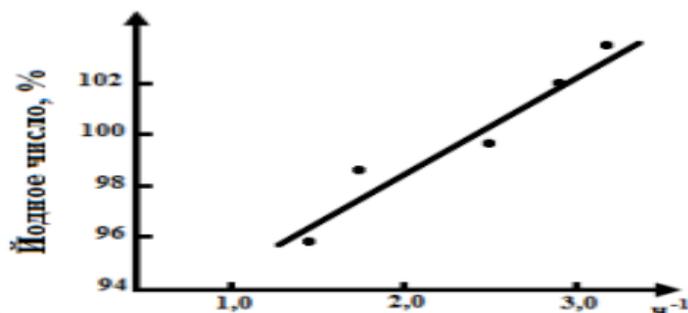

Figure 3. Zero-order of the cottonseed oil hydrogenation reaction on a stationary catalyst

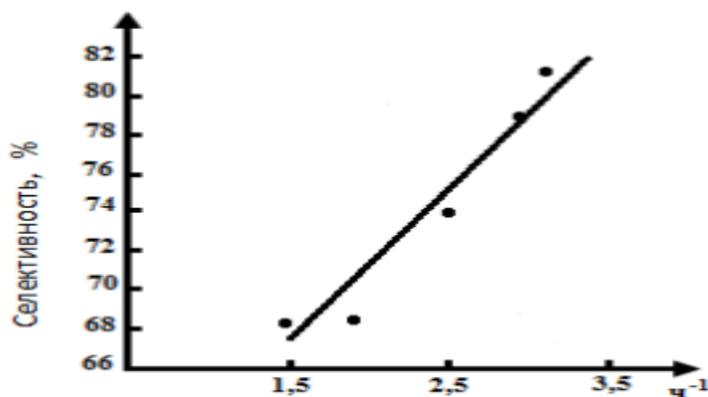

Figure 4. Effect of the volumetric oil feed rate on the selectivity of hydrogenation on a stationary catalyst

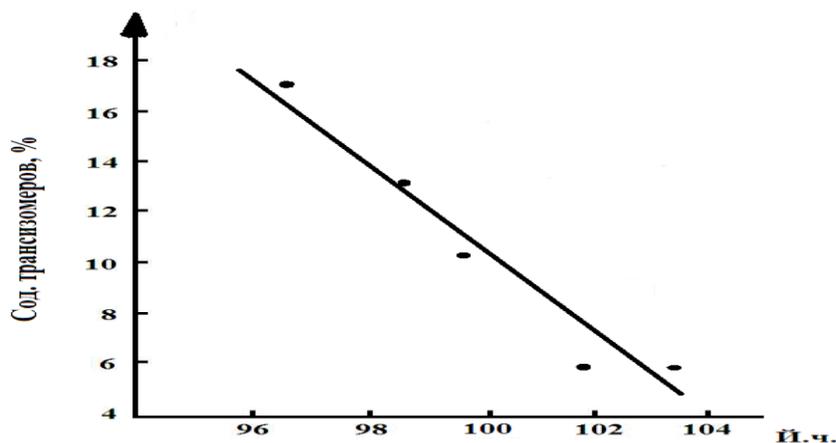

Figure 5. A linear relationship between the content of trans-isomers and the depth of oil hydrogenation on a stationary catalyst

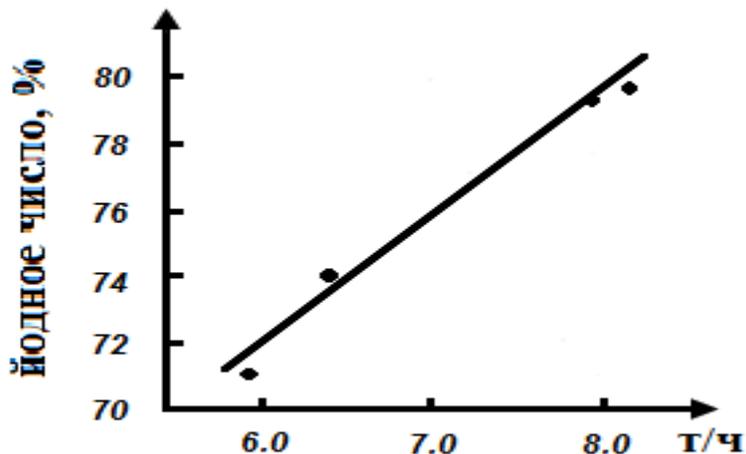

Figure 6. Zero-order of reaction in continuous hydrogenation of cottonseed oil on a powdered catalyst

Further, these hydrogenate were subjected to deeper hydrogenation to the iodine number 71-80 on a powdered catalyst. As can be seen from Fig. 6, a linear relationship was also observed between the hourly performance of the process on a powdered catalyst and the salomas iodine number. This means that the final stage of the process is also described by a total kinetic equation of zero order. And in this case, salomas with a melting point of 34-36 °C were obtained, having a hardness in the range of 260-500 g/cm and containing trans-isomers in an amount of 27 to 30 %, that is, less than in ordinary salomas. Tests at the pilot plant of the Tashkent (OFC) also showed that the new hydrogenation scheme allows the use of a low-activity nickel catalyst and thereby significantly reduce its consumption while increasing the plant's productivity.

Thus, it is confirmed that for the production of plastic food hydrogenated fats, it is advisable to use the technology of pre-contact hydrogenation of cottonseed oil with the use of a stationary, vanadium-promoted (1.5%), alloy nickel-copper-rhodium-aluminium catalyst at the initial stage

and subsequent hydrogenation of partially hydrogenated oil on a powdered nickel-copper catalyst.

CONCLUSION

New modifications of stationary nickel-copper-aluminium alloy catalysts with the addition of vanadium (0.5-2.5%), rhodium (0.5%) and palladium (0.05%) in the process of pre-contact hydrogenation of cottonseed oil were investigated and developed. It is shown that the lowest content of trans-isomerized acids in salomas is achieved at a content of 1.5% vanadium in a stationary promoted catalyst. A continuous technology of pre-contact hydrogenation of cottonseed oil on stationary and powdered nickel-copper catalysts has been investigated and developed for the first time. It is established that the recommended technology allows to significantly increase the productivity of hydrogenation plants and reduces the content of trans-isomerized fatty acids in salomas. This ensures an increase in the physiological and nutritional value of margarine products based on food salomas. The influence of technological modes (temperature, pressure, oil and hydrogen feed rate) of cottonseed oil hydrogenation on new modifications of stationary nickel-copper-aluminium promoted catalysts is studied. Based on the obtained results, the technological parameters for the production of food and confectionery salomas by a combination of stationary and suspended catalysts are established. The mechanism and kinetics of the process of nonselective hydrogenation of unsaturated fatty acids on a stationary catalyst at the beginning of the process have been established by studying the regularities of the continuous technology of pre-contact hydrogenation of cottonseed oil. Further, by hydrogenating the partially hydrogenated oil on a powdered catalyst, the selectivity of the process is increased.

By the method of precontact hydrogenation of cottonseed oil, edible fatty oils (the content of trans-isomerized acids 7-10%) with the specified physicochemical properties corresponding to the quality requirements of the standards were obtained. Based on the obtained salomas, confectionery products with high-quality indicators are made. Comparative estimates of the viscosity of salomas obtained on powdered and stationary nickel-copper catalysts are carried out. It is shown that as the iodine number of the hydrogenate decreases, its viscosity increases. An increase in the melting and solidification temperature of salomas also leads to a change in its viscosity. Under constant conditions of continuous hydrogenation and with the stable activity of the catalyst, with an increase in the content of trans-acids in the hydrogenated, its viscosity increases.

ABSTRACT

This article devoted to the usage of integrated skills approach in teaching ESP classes. In language study, the skills will often interact with each other. For example, if you want to speak to others, you should first be able to understand the others; if you want to write back, you should be able to read. According to this approach not only the main language skills reading, writing, listening and speaking but also other sub skills grammar, vocabulary, phonetics should be taught in conjunction with each other as when a lesson involves activities that relate listening and speaking to reading and writing.

Keyword: *Integrated Skill, Communicate, Conjunction, Appropriate, Photo, Caption, Discuss, Activity, Understand, Teaching Style, Learning Strategy*

INTRODUCTION

When we communicate with each other, we often use more than one of the four skills, which are listening, speaking, reading and writing. It's a must in communication. It is necessary to integrate the skills in many different situations. And it is a fact that we use them together.

According to Richards, Platt and Weber it is 'the teaching of the language skills of reading, writing, listening and speaking in conjunction with each other as when a lesson involves activities that relate listening and speaking to reading and writing'. If we look around us in our

daily lives we can see that we rarely use language skills in isolation but in conjunction, as the definition above suggests and, even though the classroom is clearly not the same as 'real' life, it could be argued that part of its function is to replicate it. If one of the jobs of the teacher is to make the students 'communicatively competent' in the L2 than this will involve more than being able to perform in each of the four skills separately. By giving learners tasks that expose them to these skills in conjunction, it is possible that they will gain a deeper understanding of how communication works in the foreign language as well as becoming more motivated when they see the value of performing meaningful tasks and activities in the classroom. As Morrow states in his second principle of communicative methodology:

One of the most significant features of communication is that it is a dynamic and developing phenomenon. In other words, it cannot easily be analyzed into component features without its nature being destroyed in the process. It is of course possible to identify various formal features of the way language is used communicatively, and these can be studied individually. But the ability to handle these elements in isolation is no indication of ability to communicate

Lubelska and Matthews provide seven statements related to integrated skills for teachers to brainstorm with other teachers:

1. Integrated skills involves using some or all of Listening, Speaking, Reading and Writing to practice new material (vocabulary, pronunciation, grammar, text/discourse).
2. All four skills must be practiced in every lesson.
3. As listening and speaking naturally go together, it is always desirable to integrate these two skills.
4. The sequence hear-speak-read-write is the most appropriate for integrated skills work.
5. A common topic, such as holidays or pets, is a device linking the separate activities in integrated skills lesson.
6. If we want to develop specific sub skills (reading for gist, guessing unknown words etc.), it is necessary to focus on individual skills in some lessons.
7. Integrated skills may be fine with a small group of adults, but it is difficult to do with large classes and in lessons lasting only 35 minutes.

It is obvious that teachers may have very different ideas regarding integrated skills in the classroom and there are no clear black and white answers to these statements. It could be argued that much will depend on the context. However, these 'think about' points may be useful in getting teachers to reflect on what they do or on what they would like to do in the future.

Many situations force us to use integrating the skills such as interview, make a speech, order dishes, examination, have a lesson, shopping, etc. In language study, the skills will often interact with each other. For example, if you want to speak to others, you should first be able to understand the others; if you want to write back, you should be able to read. So the understanding of listening and reading will enable you to speak and write. That's to say, integrated skills will motivate students to learn English in real communication.

Integrated skills approach considers many strands, such as the characteristics of the teacher, the learner, the setting, and the relevant languages (i.e., English and the native languages of the

learners and the teacher). All of these strands must be integrated in positive ways. For example, the instructor's teaching style must address the learning style of the learner, the learner must be motivated, and the setting must provide resources and values that strongly support the teaching of the language.

In integrated-skill instruction learners are exposed to authentic language and are involved in activities that are interesting and meaningful. Integrating the main language skills and the subsidiary language skills, at least in some courses if not in all, has many advantages:

1. Learners rapidly gain a true picture of the richness and complexity of the language as used for communication.
2. The language becomes not just an object of academic interest but a real means of interaction among people.
3. Teachers are given the power and the opportunity to track students' progress in multiple skills at the same time.
4. Skill integration allows mutually supportive growth in all the main skills and the subsidiary skills.
5. In an integrated-skill format, language instruction promotes the learning of real content, rather than the dissection of language forms.
6. The learning of authentic content through language is highly motivating to students of all ages and backgrounds.
7. The significant role of background knowledge becomes evident when language skills are integrated communicatively.

Based on the discussion above, we offer the following principles regarding the integration of language skills.

1. Language skills can and should be integrated in classes for the purpose of providing extensive practice in real-life communication. The integrated skills approach is founded on the concept of skill integration.
2. Titles of courses should reflect the integration of skills that actually takes place when communication occurs. For example, courses might be called "Speaking and Listening", "Reading and Writing", or "Writing and Grammar". Alternatively, courses might bear titles such as "Intermediate Communication" involving all language skills. In so far as possible, integrated materials indicate skill integration rather than skill segregation.
3. In many programs at the post-secondary and adult levels, the best combination for integrating language skills is probably theme-based and task-based instruction. The integrated skills approach unites these two potent modes.
4. Students need to encounter integrated-skill, authentic language about many themes that engage their interest and heighten their motivation. They must encounter these in the form of real-life language tasks. Teachers offer this combination of themes and tasks to their students. Here students would list interesting or important events related to each of the nodes or bubbles.

The following activities are used in teaching reading and writing.

Story maps. Story maps are open-ended activities in which students at all levels can experience some level of success. Eventually students will be able to design and create their own story maps. Story maps also provide a good sense of how students comprehend and interpret story events, and as such, can be used as a replacement for comprehension worksheets.

Visualizing and Illustrating Significant Quotes. This activity may be used as a class or homework activity. To model this activity, the teacher asks a student to suggest an important quote. Another possibility is to offer the students several quotes from which to choose one. The teacher brainstorms for the meaning of the lines, for inferences from “reading between the lines,” and for visual images. Then the entire class may draw their interpretations of the quote. For guided practice, students may work in pairs if the class needs more practice with these skills, before assigning independent practice. When handing out the activity sheet and reading the directions, remind students that lines of text must be quoted exactly as written, and quotation marks must be placed both before and after the quotation. Students also need to take note of the page number and cite it correctly.

After the students have completed the writing and drawing, the teacher divides the students into groups to share quotes and illustrations, or he asks individual students to share with the entire class. The handouts may also be displayed on the walls of the classroom.

Predicting and Making Inferences with Photos/Pictures. Students will need access to newspapers and magazines that can be cut up for classroom use. The teacher asks students to carefully examine several photos and captions, noting the length and the type of captions used in the newspaper or magazine they are viewing. Students could be paired up by using the handout, the appointment clock. Students should join their partners, pick up a newspaper, scissors, glue, and a handout, listen to or read the directions, and begin the activity. First, students should locate one photo and caption, cut them out of the paper, and paste the pictures on the handout. They should place the captions on a table made available for all students to preview for part 2 of the handout. Partners will then exchange activity sheets, write an original caption to accompany their partner’s photo, and explain the clues they used to decide what the caption should be. In Part 2, the teacher asks students to peruse the captions and try to locate the original caption for their partner’s picture. After they make their choice, they should paste it in the box on their handout and discuss their choice with their partners. In Part 3, The teacher evaluates the students’ own learning by thinking about photos, captions, and the need for visuals to increase communication.

Hidden Meaning in Advertisements. The teacher cuts out newspaper and or magazine advertisements ahead of time. The students choose their own ads to cut out for this activity; this would create more interest and motivation. The teacher models the activity as a whole class exercise in which the class makes observations and discusses the meaning of the advertisements. Then each group, pair, or individual should be responsible for completing a handout. Students may discuss their findings with other in small groups or with the entire class. The teacher asks students to staple their ads to the worksheet. The teacher asks them to write down the words and phrases in the ad. The teacher discusses the denotations and connotations of the words.

Running dictation. Running dictation: the dictation is postes on the wall. The teacher divides class into pairs. A runs to wall, memorizes a ‘chunk’ of the dictation, recites it to B, who writes. They continue until finished. Pairs can have different parts of a story or all can have the same

dictation. This type of dictation integrates vocabulary, listening, writing, reading, and speaking. Students should run one by one and match the pictures with suitable word.

In general, the teacher is grateful to all the students who are very active during the activity. Also, there will be some noise during the Running dictation activity because students run and bump into each other but they enjoy this activity.

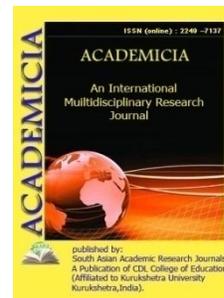

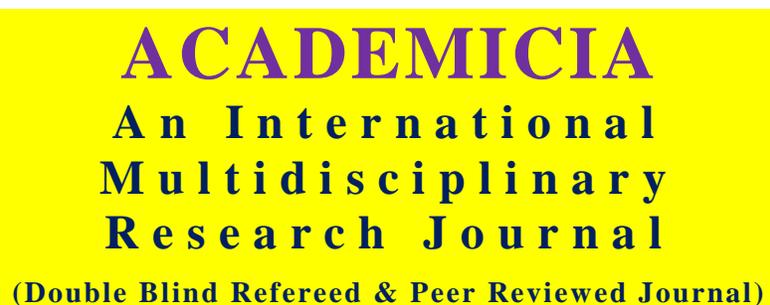

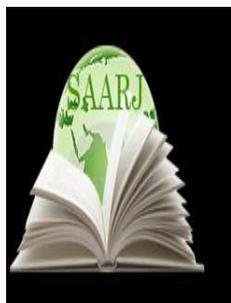

In order to make the lesson very interesting and achieve the objectives the teacher uses the following methods and techniques. The teacher uses variety of methods in teaching reading and writing. Brainstorming is used to check the students' background information about the text. Jigsaw reading is a well-known means of getting students to guess the meaning of their reading by using contextual and content clues as well as their own background knowledge. In jigsaw reading, learners are asked to put together two or more pieces of a written text that has been divided into shorter segments. This activity can take many forms including matching headlines with stories, advertisements, or articles from which they came, matching cartoons with captions, and matching pictures, captions, and text in the correct sequence. Rubric is a tool which helps teachers to assess how much information his/her students understood and find the information which should be taught again.

CONCLUSION

Integrated skills approach helps learners rapidly gain a true picture of the richness and complexity of the language as used for communication, the language becomes not just an object of academic interest but a real means of interaction among people and teachers are given the power and the opportunity to track students' progress in multiple skills at the same time. To sum up, the teacher uses various interactive activities, sets clear and specific objectives, used different modes of interaction and techniques, followed procedure and the time limit of each activity, used various equipment and materials and integrated several language skills and learning styles.

Tashkent Institute of Architecture and Construction,
UZBEKISTAN

ABSTRACT

The role of small business and private entrepreneurship in the development of the regional and national economy in the Republic and foreign countries, its development trends in the sector has been studied. In addition, summarizing the advanced foreign and local experience gained in this regard, proposals and recommendations on further development of this sector have been developed.

KEYWORDS: *Small Business And Private Small Entrepreneurship, Business And Private Entrepreneurship, Small Business Support System, Key Indicators Of Small Business Development, Forms Of Regulation Of Small Business Development.*

INTRODUCTION

Small business and private entrepreneurship are an important factor in the development of the economy, increasing employment and income. More than fifty decrees and resolutions of the president have been adopted in the last two and a half years in order to support representatives of this sphere in every way.

In particular, the procedures for state registration of entrepreneurial activity, obtaining various permits and many other services have been simplified. To create convenience in this regard, the agency of Public Services and its on-site centers have been established. The position of Representative (Business Ombudsman) for the protection of the rights and legitimate interests of business entities was introduced.

One of the pressing problems remains the transformation of sectors in which market forces are not fully penetrated. Therefore, the president gave instructions on improving the activities of industrial enterprises of our country and introduction of the international management system in

small business. The recycling industry, which provides high added value in the economy, recorded nearly 9 percent growth in 3 months. Small business our country provides about 60 percent of gross domestic product, one third of the volume of industrial products, 98 percent of agricultural products, half of investments. In many regions, about 70-90 percent of exports come from small businesses. In 6 months of this year, the number of business entities increased to 60 thousand.

It is desirable to distinguish the following two aspects, taking into account the recognized peculiarities and economic essence of small scale business.

First of all, small scale business is a special sphere of economy, which is formed as a result of the unification of subjects acting as a specific socio - economic form of small scale production in market conditions. Small business exists objectively and is developing as a kind of integrity of the national, regional and local economy sectors. Secondly, small scale business is a special kind of activity on the basis of action, innovation, risk, with the aim of generating entrepreneurial income.

The approach to small scale business as a branch of the economy is based on the two-sided combination of social production: organizational-technical and socio-economic. The first is the sum of the material elements of production, the labor force and the forms of Organization of production, while the second is expressed in the relations of production, which form the social form.

In the early periods, as criteria for determining the small scale business, the number of employees was used, and later it began to focus on quality indicators. In particular, in the European Union, as in practice from 1995 to 1 January, the numbers of workers in Italy enterprises from 1 to 19 are included in the list of the smallest firms, from 20 to 99 - from small, from 100 to 499 - among medium-sized enterprises.¹

¹Kolesnikov, A. Small and medium business: the evolution of concepts and the problem of definition / A. Kolesnikov, JI. Kolesnikova // Economic issues. — 1996. — №7.

In the UK, according to the report of the Bolton Commission (UK Parliament), the classification of enterprises as small is based on data on the number and turnover of workers in various sectors of the economy.

Micro firms are enterprises, in which the number of employees is from 1 to 23 people, and small enterprises - from 24 to 99 people. At the same time, an enterprise whose number of workers in the processing industry is less than 200 people is considered small, and in retail trade is an enterprise with a turnover of not more than 400 thousand pounds. According to the law on companies 1981 year, small businesses are required to meet two of the following signs.

That is, the volume of trade turnover-no more than 2,3 million ECU, and assets-no more than 1,5 million ECU, at the same time, the average number of employees should be up to 50 people.²

The European Union Commission proposed in its recommendation of April 3, 1996 to use this financial indicator in determining the parameters of small and medium enterprises and began to be widely used in the classification of enterprises as "small" in Great Britain, Germany, France and other countries.

Also in the European Union, there are all acts of the community, financing programs with the aim of providing more national and regional assistance to small and medium-sized businesses than large companies. In this definition, it is aimed at ensuring the growth of the financial situation, according to which the turnover of the medium-sized enterprise is defined as 50 million euro (20-249 people), 10 million euro (10-49 people) in small enterprises, no more than 2 million euro (less than 10 employees) in micro firms. Also for medium-sized, small and microfinance enterprises, the accounting balance is required, respectively, not exceeding 43 million, 10 million and 2 million euro (Table 1).

TABLE 1 CRITERIA FOR DETERMINING SMALL AND MEDIUM SCALE BUSINESS IN THE EUROPEAN UNION

Type of enterprise	Number of workers	The turnover of goods	Balance value total
Micro firm	<10	<2 million Euro	<2 million Euro
Small business	<50	<10 million Euro	<10 million Euro
Medium enterprise	<250	<50 million Euro	<50 million Euro

Economists conducting research in this direction believe that for the study of the essence of small business, it is important to consider its qualitative characteristics and signs, a set of characteristics and peculiarities of the subject of research, which is of particular importance in determining. However, this approach is mainly based on sub-considerations and experiences, which "intuitively" serve to express to some extent the differences inherent in the size of other enterprises.⁵

As an example of such an approach, R. Bruksbank⁶ in his work "the concept of small business: a new classification of the size of the company" cites the definitions of Van Horn. In analyzing the strategic planning of small scale enterprises, Van Horn identifies five characteristics inherent in the strategic aspects of small scale firms:

- Relatively low amount of product produced (technology, services, know-how, etc);
- Relatively limited resources and Opportunities (Capital, human resources etc);
- Underdeveloped management systems, administrative processes and technologies necessary to assess and control the strategic situation of the enterprise;
- Unsystematic management, informal attitude to training and education programs;
- Major management positions and a large part of the shares are held by the founders of the enterprise or their relatives.

Based on these quality criteria and Dutch consulting experience, Van Horn proposed a medium-sized look at enterprises with a range of quantitative criteria, ranging from 50 to 500 workers and 1-33 million pounds.

From the point of view of German economist V. Nalik, the main quality description of small business in Germany is the unit of ownership, the direct management of the enterprise and the risk associated with it.

The second characteristic feature includes the appearance of the enterprise, a limited scope of scope, the peculiarity of the relationship between the owner and the employee, etc. Thirdly is the special importance of the leader's role in the life of the enterprise. In the fourth, manage the family business. Fifth, the specific features of financing.

In general, this classification fully corresponds to the generally accepted ideas about the status of various enterprises in a developed market economy.

The main disadvantages of these approaches include a variety of factors, including the difficulty of accessing the internal data of a small enterprise in order to identify a number of necessary qualitative indicators, and the possibility of using them in practice.

Taking into account the above, we will look at the role and importance of small scale enterprises in the economy of the country (Figure 1).

To find out the role and importance of small scale business in solving the problems of socio-economic development of the region, we will look at how it plays a role in the economy. In the course of the study, the following conclusions were drawn as a result of the analysis of the social, political and economic role of small scale business in the economy of the country.

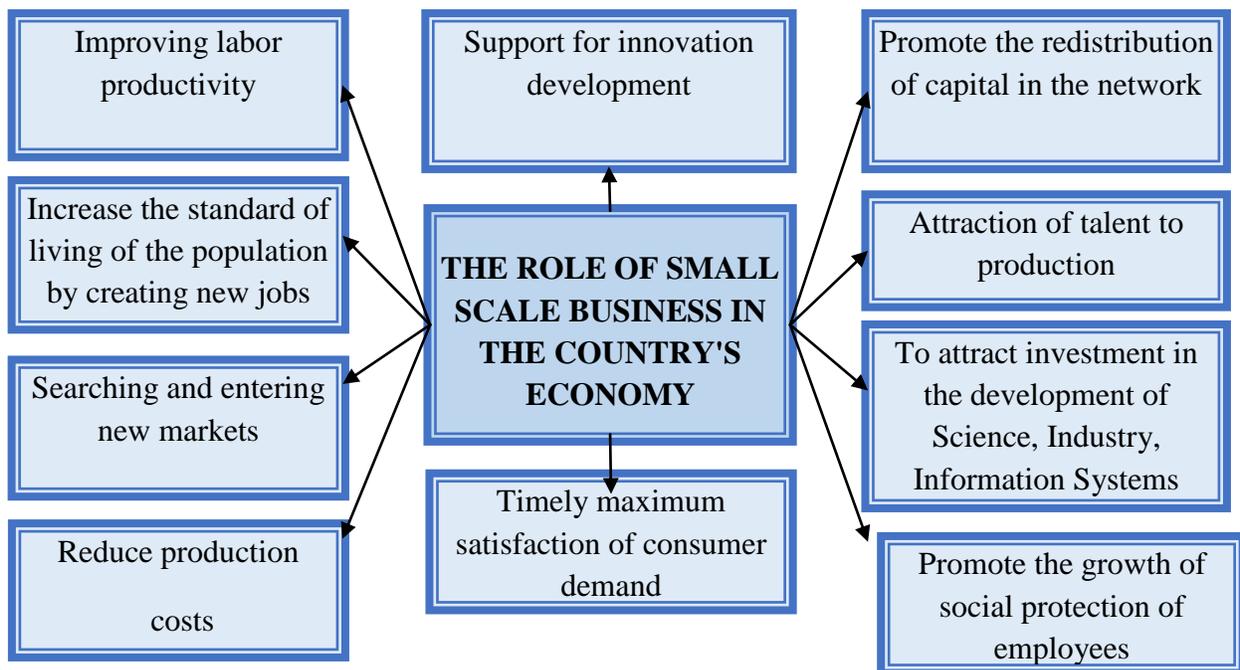

Figure1. The role and importance of small scale business in the country's economy

Social role: is manifested in the formation of a class of owners who produce products and services in accordance with the requirements of an unstable changing market, increase in employment, income of the population, etc. That is, the gradual formation of the middle class of its population, which independently ensures the standard of living, is a guarantee of reforms, political stability and democratic development of society.

Political role: The political influence of small scale business is great because the most active layer in the society in the conditions of market economy is the foundation of the formation of the middle class. Also, in the conditions of sustainable socio-economic and political development of

society, representatives of small businesses adhere to the principles of democracy, political stability and economic freedom. Small business harmonizes the interests of local and regional communities, establishes a link to the national framework and creates a basis for patriotic moods.

Economic role: in countries with a market economy, small scale business produces a large part of the economically active population and almost half of the gross domestic product, ensures the activities of unfavorable sectors for large businesses, ensures rapid development of investments and rapid turnover, serves to form an innovative economy.

The experience of developed countries shows that in the conditions of the market economy, the important role of the subjects of SCO is manifested by:

1. A consumer who makes important purchases for their own production needs.
2. It is a manufacturer that responds quickly to changes in market conditions and provides the necessary elasticity to the market economy.
3. It solves the problem of employment by creating additional jobs.

However, market conditions determine not only the advantages of small businesses, but also their disadvantages. The disadvantage of a small enterprise in comparison with large companies is its instability, which manifests itself in a relatively poor state of the external environment. A distinctive feature of the external environment of small business is that it is objectively subordinated in the system of relations with the state, large businesses and financial and credit organizations. The ability to withstand various critical conditions in the economy is limited by the volume of production and the scarcity and financial base of the resources used, as well as its dependence on local markets.

Thus, the relatively low viability of small business forms, on the one hand, and the high socio-economic significance of their functions, on the other hand, are the main determinants of small business. In order for small businesses to perform their socio-economic functions, it is necessary to develop specific targeted measures to increase the viability and sustainability of small businesses, that is, to support them.

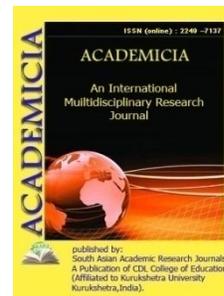

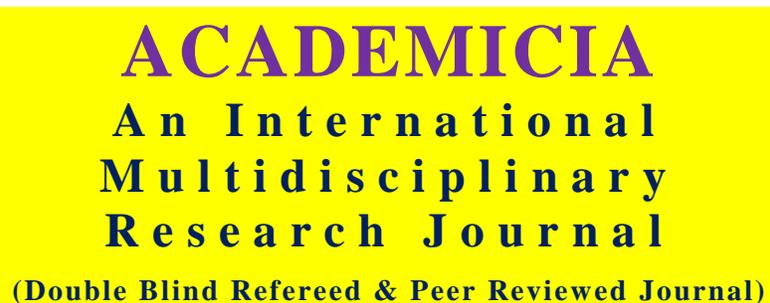

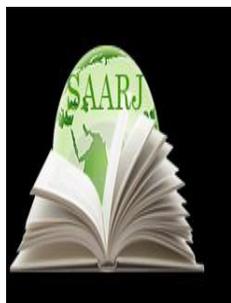

When you create a system for small business, the important factors are considered regional aspects, in particular the resource potential. Because the resource potential of the region is a complex multi-faceted concept, that includes economic, social and environmental components. Economic potential is the basis for the selection of functional units of a small enterprise in its composition it is possible to extract the components of the Natural resource, production and technical and industrial character, to define the priorities of its potential, based on the principles of increase regional capacity and improves its effectiveness.

In conclusion, we can say that, summing up all of the above, in the future, the subjects of the CPSU will serve to create greater opportunities for the development of the economy and society as a whole, as well as to increase the economic growth of the regions.

MORPHOFUNCTIONAL PROPERTIES OF THE LYMPHOID STRUCTURES OF THE SPLEEN IN NORM AND UNDER THE INFLUENCE OF VARIOUS FACTORS

Khasanova Dilnoza Ahrorova*; **Khayrieva Dilshoda Ulugbek kizi****

^{1,2}Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

Studied magazines, materials of scientific conferences, as well as other information sources for the collection of reliable information about the actions of various factors on the lymphoid formations of the spleen. In addition, in the Breeding Centers, one can observe the accumulation of macrophages with phagocytic lymphocytes and dendritic cells. In such cases, the central part of the node looks bright. The spleen plays an important role in the processes of hemolysis of red blood cells. In pathological cases, especially in some types of hemolytic anemia, the altered erythrocytes are retained and decomposed [9].

KEYWORDS: *Lymphoid Formations, Spleen, Humans, Various Factors*

INTRODUCTION

The purpose of the study: to study the safety problems of various factors on the lymphoid formations of the spleen.

MATERIALS AND METHODS

Information sources and materials devoted to the study of various factors on the lymphoid formations of the spleen were used.

A small amount of information about the structure of the spleen is based on the study of its structural structures, mainly conducted on various laboratory animals and extrapolated the information obtained in humans. A small number of studies conducted with the help of histological material from the human spleen do not fully reflect the nature of building structures and its cellular composition [17,21].

The spleen is a parenchymal organ consisting of pulp and connective tissue stroma. The stroma consists of a capsule, trabeculae, the vascular membranes of the vagina, the reticular framework of the red pulp and the follicle [10].

The connective tissue framework is formed in accordance with the body, provides close contact with the pulp cells, and creates a favorable biological environment for the parenchyma cells to perform their function. The blood vessels inside the stroma are connected in a network, provide metabolism, supply nutrients to the entire vascular flow and transport metabolic products [6,7].

The capsule is a dense connective tissue membrane that surrounds the spleen from all sides and consists of elastic, collagen fibers and myocytes, blood vessels. Some animal capsules may contain large amounts of smooth muscle fibers. From the surface, the capsule is covered with endothelium [13,14].

The trabeculae that are distributed from the capsule consist of collagen, elastic, reticular fibers and myocytes [4].

The proportion of capsules and trabeculae in the human spleen is 5-7% of the total volume of the penis and forms its base-reducing apparatus [5].

Polyarnye (trabecular) artery pass into the red pulp and around them are formed lymph nodes. In the lymph nodes, they are called the central artery, but they are located eccentrically. The central artery, which exits the lymph nodes, is divided into several penicillic arteries, which pass into ellipsoid capillaries. The end of the capillaries is tightly surrounded by reticular cells and reticulin fibers, which, in turn, form ellipsoids.

In different animals, the shape of the ellipses and their sizes are different, in humans 25x100 microns, in horses 28x65 microns. It is noted that pigs have additional ellipsoids of small size. Guinea pigs, squids, and mice will not have ellipsoids [9].

The shape and size of the ellipse are related to their immediate location. For example, in dogs, the ellipses in the marginal zone consist of oblong ones, while the red pulp has a round shape [19].

The spleen consists of two parts-red and white pulp, which has a different structure and function [18].

The red pulp is about 70-85% of the volume of the spleen and resembles red bone marrow in structure. It consists of the pulp and venous sinuses. They consist of hematopoietic elements, macrophages, and plasma cells. Here ends the stratification plasmatic and develop antibodies. In the pulpar tartar, V - and T - lymphocytes are collected, from which new lymph nodes of the white pulp can be formed.

The sinuses of the red pulp are located between the convolutions of the spleen, and the spleen is part of the vascular system. The sinuses of the red pulp have the appearance of large thin-walled vessels of irregular shape, covered with endothelial cells of reproductive form, between which there are narrow slits. Through these incisions, the hematopoietic elements pass from the surrounding gravity into the sinus cavity. The basal membrane of the sinuses is continuous, it is filled with a tumor of reticular fibers and reticular cells [15].

The red pulp, which contains three types of blood vessels (arterial capillaries, sinusoids, and pulpar veins), as well as a large number of macrophages in the pulp, performs mainly filtration and depot (reserve) functions [11].

The immune structure of the spleen includes components of the white pulp, that is, the periarterial lymph nodes with lymph nodes, the periarterial, mantle, and marginal areas with reproduction centers. This structure creates favorable conditions for the effective interaction of cells involved in the immune response [20].

The white pulp of the spleen has an elongated or ellipsoid shape of a whitish-grayish appearance, the color of which depends on the lymphocytes collected in it. The white pulp is densely located around the arteries, consisting of the sum of T- and B-lymphocytes, which provide an antigen-dependent immune response [15,17].

The area of the human spleen is usually much less extensive than the area of components in the human spleen dominated by LN [21].

The lymph nodes of the spleen are considered to be the V-region of the white pulp, consisting of a capsule of reticular cells and a set of T - and B - lymphocytes, plasmocytes, and macrophages. The central artery runs from the lymph node. On the lymph nodes of the spleen, there are 4 indistinguishable areas: periarterial, reproductive center, mantle and marginal areas.

The periarterial lymphatic sheaths (PALS) are those formed from the accumulation of lymphoid tissue in an elongated form along the pulpar artery. PALS is the T-sphere of the spleen.

The marginal area of the spleen nodes is the area of the passage between the white and red pulp, the width of which is about 100 microns. It consists of T - and B-lymphocytes and macrophages with marginal or marginal, sinusoidal vessels with bursting holes in the wall.

The reproduction center consists of reticular cells, V-lymphoblasts, and stratified plasma cells. In addition, in the Breeding Centers, one can observe the accumulation of macrophages with phagocytic lymphocytes and dendritic cells. In such cases, the central part of the node looks bright. The mantle region surrounds the periarterial region and the breeding center and consists of densely arranged small V-lymphocytes and a small number of T-lymphocytes, as well as plasmocytes and macrophages. The cells of the mantle region are densely arranged and layered with thick reticular fibers oriented to the circulatory system [21].

A population of immunocompetent cells usually has distribution mechanisms in specific functional areas of the spleen. Kengaitiradi understands the immunomorphological properties of this organ and can be used in the diagnosis of pathological processes of immune genesis [16].

The basis of the white and red pulp is the reticular tissue, which plays an important role in the stratification of each functional zone [21].

The reticular tissue is an integral part of the spleen stroma. Most of the reticular fibers are located in the red pulp of the organ, in the nodes of the white pulp their number is small. In the lymph nodes, they are more located on the periphery, and in the centers of reproduction they are not defined at all.

According to the data presented in the literature, the connective tissue of the spleen of an animal changes under the influence of intoxication and technological factors, which is manifested by fiber stratification, a decrease in the thickness of the organ [22].

The shape, color, structure, and density of the spleen may vary depending on the morphofunctional state of the organ, age-related changes, and pathological status [25].

The spleen has various and completely unexplored functions. One of the functions of the spleen is the immune control of the blood and the launch of special protective antibodies in response to antigens entering the body [24].

The spleen is not among the vital organs, but is responsible for the effectiveness of Innate and acquired immunity, cellular and humoral immune response, performs a complex of immunological and hematological functions [1,2].

The spleen produces a generalized immune response to antigens, inflammatory processes and various pathogenic microorganisms that provide the body with the necessary level of immune homeostasis, as well as flexibility [3].

In the spleen, there is a stratification of immunocompetent cells depending on the antigen, the formation of effector and memory cells, as well as the elimination of hematopoietic cells that have expired and are injured [8].

The spleen is actively involved in the immune responses of the humoral type of the body. Its T- and B-lymphocytes, plasmocytes, detect an antigen that is foreign to the body and produce special antibodies against it. [26].

It should be noted that the spleen is the main site of IgM synthesis. IgM synthesis, which occurs in response to the action of antigens, occurs in the spleen earlier than in other organs, and from the second day there is an activation of lymphocytes in the white pulp [8,10,12].

At the time of the immune response, antigens in the blood are retained in the marginal region of the spleen and in the red pulp. They are then transferred by macrophages to the surface of the intercellular cells of the white pulp. Lymphocytes in the bloodstream accumulate mainly in the periarterial lymphocytes (T-lymphocytes) and lymph nodes (B-lymphocytes). In the primary immune response, the antibody-producing cells first appear in the ellipsoid cells and then in the red pulp. In the secondary immune response, the lymph nodes form the centers of reproduction, in which clones of V-lymphocytes and memory cells are formed. The stratification of V-lymphocytes into plasma cells is completed in the red pulp [23].

The slow blood flow in the red pulp provides a close and long-term connection of antigens with phagocytes, allows for the process of phagocytosis without special receptors. This unique ability of spleen phagocytes plays an important role in clearing the body of infectious pathogens at the initial stage of bacterial invasion, until special antibodies are formed [16,22].

With the help of spleen macrophages, the destruction and phagocytosis of obsolete red blood cells and white blood cells, as well as bacteria and tumor cells is carried out [25].

Macrophages of the marginal region of the lymph node are important for the initial stages of the immune response and play an important role in clearing the body of apoptotic cells [12].

The spleen decomposes phagocytes and insoluble components of cellular detritus, endotoxins, which are formed during burns, injuries, and other tissue caries. [17].

The spleen plays an important role in maintaining the body's homeostasis, especially in extreme cases - blood loss, hypoxia, sepsis, this is clearly manifested. [16]. According to the literature, this function of the spleen in relation to tumors [4]. A significant amount of blood passes through the spleen and is filtered. The spleen is the only peripheral immune organ located in the blood stream flowing from the aorta to the venous vein [7].

The filtration function of the spleen is to control the circulation of blood cells. The specific structure of the fibrous tissue in the red pulp ensures the preservation of old and defective red blood cells in the spleen. The spleen is involved in the exchange of iron. Its macrophages convert iron formed from decomposed red blood cells. Also, bilirubin and hemoglobin are formed from hemoglobin in the spleen [14].

Granular inclusions in the red blood cells of the spleen (Fun, Gain bodies, iron granules) are eliminated without damaging the cell. When the spleen is removed and around it, there is an increase in the number of these cells in the blood [17].

After removal of the spleen, an increase in the number of siderocytes is detected in the blood. These changes are permanent and indicate that the function of elimination of glandular granules in red blood cells is specific to the spleen [15].

The spleen is able to accumulate hematopoietic elements. As a rule, 30-50% of all chromatids in it are partially deposited by neutrophils. They can be released into the peripheral blood during bleeding or infectious processes [17, 24].

When the blood flow in the body is disturbed, the spleen increases in size and, according to some researchers, can accumulate a large amount of blood, performing a depot function [1]. Due to the reduction, the spleen releases the accumulated blood into the vascular bed, as a result of which its volume decreases, the number of red blood cells in the blood increases [3].

In chronic blood loss, sepsis, and other cases where normal processes of hematopoiesis in the bone marrow are disrupted, the spleen is the main extramedullary hematopoietic organ [18].

The involvement of the spleen in protein metabolism is due to the fact that it synthesizes albumin and globin, and is also of great importance in the formation of immunoglobulins [10].

The spleen stimulates the formation of bilirubin, cholesterol, proteins with a blood clotting factor that neutralizes phenol, and the processes of tyrosine oxidation in the liver [6].

In addition, factors that stimulate the phagocytosis process carried out by opsonin, tufrein, white blood cells and macrophages are synthesized in the spleen [5].

The spleen plays an important role in the processes of hemolysis of red blood cells. In pathological cases, especially in some types of hemolytic anemia, the altered erythrocytes are retained and decomposed [9]. When passing through the spleen, the mechanical and osmotic resistance of white blood cells decreases [24].

The question of the hormonal function of the spleen remains open. At the beginning of the last century, the German scientist O. Stern determined that the spleen extract has a biologically active

effect, and assessed the presence of the hormone lienin in it. According to modern researchers, the spleen can produce the hormone, but its chemical nature has not yet been revealed [7].

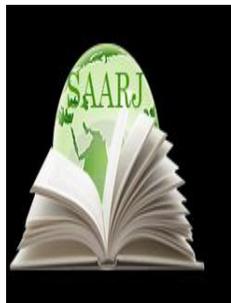

The mechanism of increasing the number of chromatoses, granulocytes in the blood after removal of the spleen remains unknown to this day. These changes are temporary and usually occur within a month after removal of the spleen [14].

In the elderly, there is a decrease in the functional activity of the spleen, which is manifested by an increase in the number of senile red blood cells in the bloodstream. This is one of the reasons for the absence of gas exchange processes in tissues during aging [10].

ABSTRACT

In this article it is provided a compilation of syntactic and semantic features - microtext (supersyntactic integrity - SSIs) as the largest text unit. At the same time, functional-semantic classification of composite components of such integrity - beginning, development of thought and completeness has been studied.

KEYWORDS: *Microtext, Supersyntactic Integrity, Composition, Composition, Beginning, Development Of Thought, Completion, Semantics, Methodological Function, Linguistic Sign, Lexical-Grammatical Instrument, Culmination.*

INTRODUCTION

As any language or unit of speech is examined and comprehensively investigated in different ways, its signs of unity become even more apparent, and its essential features are revealed. The same is true of microtexts (SSIs), the largest text unit. One of the key conditions for the integrity of the micromagnet (SSI) is that it has composite components. Compositional view is, first and foremost, as EA Referovskaya puts it, the orderly arrangement of the main elements that indicate the boundaries of the micromagnet (SSI) within the text. GS Solganik calls such a layout a compositional-thematic view, emphasizing that it consists of three main parts: beginning, thought development and completion.

Other researchers' ideas about the composite parts of micromagnets (SSIs) can be found in the works of other researchers. Researcher N.Yushina uses this view to the paragraph. In our opinion, it is only possible to comment on the compositional structure and components of the

paragraph in the case of microtext (SSI) parallels, and in other cases it is not applicable to the paragraph.

Therefore, microtext (SSI) as a semantic, syntactic, and stylistic whole is composed of the following three components:

1. The beginning is the part that defines the subject and acts as a semantic center, similar to the first sentence of microtext (SSI).
2. Ideas development is the part that develops an idea, as well as an explanation of the beginning, expressed in one or more sentences.
3. Completion is the last sentence of microtext (SSI). Summarizing, concluding. Part of the context that precedes it.

The above layout of the microtext (SSI) components is called a composite view.

The compositional view is available to any type of microtext and defines its content within the text.

Regardless of how many relatively independent clauses micrometry (SSI) is, the arrangement of its compositional components follows the above procedure.

1. Beginning and its functional - semantic features.

The Main Findings and Results

Despite the fact that microtext (SSI) is composed of several relatively independent clauses the first sentence in its structure plays an important role in both its compositional and structural structure. The first sentence is the syntactic and meaningful core of micromagnet (SSI). The first point is communicative, too. As I.Rasulov rightly points out, "the first component of the MSB differs from others with greater independence." The same first sentence serves as a starting point. That is, it starts the idea. In any form of Micromagnet (SSI), the beginning is the first sentence. The beginning is the first phrase, as we have already mentioned, the "most important part" of the microfinance service. Therefore, in the evaluation of microtext (SSB), it is advisable to pay attention to the beginnings of their content and to study in detail their features.

Examining the origins in microtexts (SSIs) of different types, we can see that the verdict in these statements strongly influences the structure, semantics, and methodological function of microtext (SSI). This situation further exacerbates the role and function of the beginning - sentence micromagnet (SSI).

Based on the functional-semantic (methodological) content of the beginnings, we consider it necessary to study them in the following description;

- 1) motion dynamic (dynamic) start.

The cross-section of this type is represented by a verb that expresses physical activity.

Sections of the sentence after the beginning are also represented by a verb (that is, expressing a specific physical activity). When the intersection of the beginning is in the form and the answer to the question, the sections of the next sentence are in the same form and require the same interrogation. This ensures a certain tone in the micromagnet (SSI) and the interrelationship of relatively independent sentences. In the semantics of such a micromagnet (SSI), the following is

observed: The dynamics (dynamics) reflected at the beginning are intensively developing, sharpening, and intensifying throughout the micromagnetic (SSI) structure;

As darkness fell, the Greeks attacked at the gate to distract the defenders of the village. By dawn they were throwing stones and shouted. At the back of the castle, three hundred soldiers mounted on each other's shoulders, and after that laid down their trousers and began to pile on a cliff. Towards dawn some strong and skillful soldiers managed to get up. They threw down ropes and pulled their companions down.

(M.Osim)

Qorong'u tushishi bilanoq, qo'rg'on himoyachilarini chalg'itish uchun yunonlar darvoza tomondan hujum ko'tarildilar. Tongacha tosh otib shovqin-suron ko'tardilar. Qal'aning orqa tomonidan esa uch yuz askar bir-birlarining yelkalariga minib, undan so'ng shoti qo'yib, tik qoyaga qoziq qoqa boshladilar... Tongga yaqin bir necha baquvvat va epchil askar yuqoriga chiqib olishga muvaffaq bo'ldi. Ular pastga arqon tashlab sheriklarini ham tortib chiqara boshladilar.

(M.Osim)

As shown in the microtext (SSI) above, the movement expressed in the starting line – “attacks” develops in the later parts of the microtext (SSI) "noise", "piling", "pulling". This kind of starter microtexts (SSIs) play a major role in the culinary arts. As a rule, the first step of the author towards the solution from the culmination of his work is similar to microtext (SSI):

2) Signal beginnings.

Such startups inform the individual, subject, or character of the event by confirming or denying it. The cross-section of this type of phrase is characterized by a cross-section, in most cases, and is expressed mainly in terms of a category of quality. The startup reports a sign of the subject. The following sections of the micromatn (SSI) fill in the sign and serve as an interpretation function:

Rano is handsome, and her face is as beautiful as the art of a rare sculptor. His eyes are full of humor and intelligence, his cheerful nature and his dark hair all over his waist. She reads Navoi and Fuzuli beautifully and feels deeply, and is familiar with the ghosts of such poets as Mukimi, Furkat, and Zawqi.

Ra'no qomati kelishgan, yuzi sutday tiniq nodirbir haykaltaroshning ijodi kabi go'zal. Ko'zlarida sho'xlik va aql mavji, tabiati quvnoq, quyuc sochlari beliga tushgan, o'ziga yarashgan g'ururi ham bor. Navoiyni, Fuzuliyini chiroyli o'qiydi, chuqur his qiladi, bir asr shoirlaridan Muqimiy, Furqat, Zavqiy kabi shoirlarning g'azallari bilan tanish.

Apparently, microtext (SSIs), which have a continuous beginning, are used to describe the appearance, characteristics of an individual, subject or event. Initial microtexts (SSIs) of this nature are characteristic of the speech type of speech.

3) quantity-dependent start-ups.

In this type of startup, the cross section indicates the amount of start. It reflects both the character or the character of the sign. In postoperative sections of supersactic integrity, the nature and properties of quantities are explained, interpreted and explained:

There are two lives of learned people. One is his life as a human being. The second is his life devoted to science. This is the second life which is eternal.

As the examples above show, the amount of expression in the initial function has a strong effect on the formation of microtext (SSI). The larger the quantity, the more the structure of the microenvironment (SSI). For comparison, we examine the contents of the examples given above: the amount of microtext at the start of the first micromagnet (SSI) is greater than "two", that is, the first microtext (SSI). Now, to examine their structure, the first microtext (SSI) consists of two sentences (1 simple and 1 joint without a link), and the second microtext (SSI) consists of four (all simple) sentences. This may be explained by the fact that the author tries to explain, at the outset of his speech, the amount (sentence) that is given, as far as possible, at the beginning. The higher the quantity (say, two, three or more), it lists the characteristics of each. As a result, the microtext (SSI) structure is expanding and complicating.

4) The condition is the beginning.

This type of supra-syntactic integrity, which is used in this type, also has a specific functional-semantic nature. These types of startups express a certain state of affairs. They play a special role in the meanings of the meaning of the situation, and play an important role in the semantics of the phrase. In the later sections of the Microtext (SSI), the position expressed in the startup is expanded and supplemented by additional information. The following statements are almost as follows:

Autumn is like a sick man on his deathbed. Underneath it, the grieving treasures groaned. In the early spring, the ditches, which swiftly flow along the coast, become clear. Realizing that all his efforts were wasted, he was sad to see the world... The sky and the sky are white and white. In the midst of the white darkness, the crows of the crows can hear the cries. (U.Hashimov)

Kuz o'lim to'shagida yotgan bemorga o'xshaydi. Oyoq ostida kasalmand xazonlar ingraydi. Erta bahordan bo'tana bo'lib, shosha-pisha qirg'og'iga sig'may oqqan ariqlar tiniqlashadi. Shuncha urinishlari zoe ketganini tushunib olamga ma'yus boqadi... endi suv tubida shodon chayqalgan maysalar emas, xazon ko'milib yotadi. Yeru ko'kni kafandek oppoq tuman chulg'aydi. Oq zulmat orasidan qarg'alarning xosiyatsiz fig'oni eshitiladi.

(O'.Hoshimov)

5) interrogative beginnings.

These types of beginnings include a form of rhetorical questioning. The author or subject addresses the rhetorical question to himself or the reader (reader) through the introduction. The following sections of the super-syntactic integrity function are answered by:

What is the strength of a woman? It reaches two eyes. A member of the necklace was trying to weep again.

(O.Yakubov)

The researcher M. Hakimov interprets the question form as a linking tool and says that it comes with the function of naming the text. In addition to the comments of the researcher, it is important to note that the question form is used as a header in the microtext (SSI) when it

performs the function of naming the text, defining its subject, and using the title as the (macro) text (general, large). The title of the microtext (SSI) is stated at the beginning:

What is love? It's good to be a good person. All that is needed for his or her well-being is to be prepared and to enjoy this goodness.

(Chernyshevsky)

From the previous considerations it can be concluded that the above mentioned types of microtext startups indicate that they are large, broad functional. Contextual learning of such discourses will help to address the problems of meaningful syntax in the development of Uzbek linguistics and provide new research in this area.

2. Linguistic signs of intellectual development.

The research work on text linguistics, including microtext (SSI), the largest text unit, does not mention one of its constituents - the development of thought. In the existing literature, the primary composite component of microtext (SSI) is mainly the primary component.

Indeed, the role of the startup in microtext (SSI) is enormous, it dominates over other parts, and the rest is always dependent on it. However, this fact does not diminish the function and place of the other components (mental development, completeness) in microtext (SSI) content.

As mentioned above, the development of thought is characterized by the development, interpretation, expansion, and completion of the idea or theme expressed in the beginning:

Murodkhoja is worried about the arrival of the mother of Saidiye's sister. And the teacher wanted to give Ihsan medication, good or bad, and if not, he would have said, "The doctor's medicine did not work, so it does not recover."

(A.Kahhor)

As can be seen from the example above, the fact that ideas are related to Murodkhoja's anxieties described in the introduction is intended to illustrate events, to uncover the causes of "anxiety", and to justify them.

The phrases that form the thought are often used in the pronunciation of the word syllabus. Contextual synonyms - complementary lexemes are used:

A woman in a long white dress tore off her white hair in the backyard. Heaven and earth tremble at his cry The birds joined in the cry. The birds were weeping, but they did not know what was happening and that she was the widow's grandmother.

(E. Samandar)

Or take an example:

In the year of his father's arrest, winter is severe. It was snowing and cold. The mulberry branches in the yard were bent under the snow. There was a flood. Mothers and children were lukewarm, and could not sleep until late in the night.

(U.Hashimov)

The phrase "weeping" in the beginning of the first micromatine (SSI) is broadened by the constructive synonyms of "trembling", "crying" and "mourning" in the expression of thought.

The same is true for the subsequent microtext (SSI) given. Words and phrases, such as "cold", "bully", "snowflake", which are close to the word snow in the beginning of the word, provide a semantic link between words and, secondly, the basis for the development of thought in a particular system.

Words that constitute the development of thought are expressed by rising intonation, that is, the intonation moves from word to word

3. Completion and its main features

The completion of the theme of the inferiority is explained by the generalization of the opinion and the pronouncement of the general sentence that follows this generalized thought. The final part in the Complete Microtext (SSI):

Spring is enough for everyone! What are flowers in front of royal palaces and sad graves in the cemetery. It all rolls evenly onto the lawn. All are treated with love.

(U.Hashimov)

The task of completion is particularly important in determining the boundaries of micromanagement (SSIs), since the completion is equivalent to the author's firm opinion on a particular microcosm. Usually it is not necessary to go back to the topic that has been summarized and resolved. Of course, when done, the micromanage will change. The change of the micromanage means that one microtext (SSI) is completed and the other is started. Occasionally, lexical and grammatical means may be included in the composition, in short.

Boytemirmash followed me down the stairs to the road. He shook my hand and stopped the car.

Climbing up the hill, I looked out of the cabin. Boytemir was still on the road. He patted his hat in his hand and lowered his head, thinking of something.

That's all, that's how we divorced.

(Ch. Aitmatov)

CONCLUSION

However, the lexical-grammatical tools we have mentioned above may not always be part of the micromatographic (SSI) completion. In this case, the completeness is determined by the semantics of microtext (SSI).

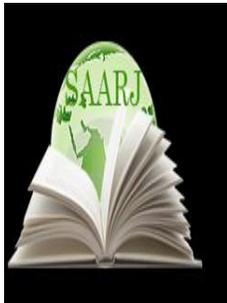

From the foregoing, it can be said that microtext (SSI) is the largest text unit but has its own distinctive features as a separate independent syntactic unit. The composite study of microtext (SSI) shows that it consists of parts such as beginning, development, and completeness, and that these are complex syntactic integrity of the words that form microtext (SSI), which are formed by certain semantic-grammatical and methodological laws. confirms that.

Consequently, microtexts (SSIs) have their own components, as do other types of syntactic constructions (vocabulary, sentence, and type), but also have composite parts. Its compositional elements (beginning, development, completeness) are important, firstly, by defining the boundaries of the microtext (SSI) in the text, and secondly, as components that indicate the existence of microtext (SSI) as a semantic-syntactic whole.

**IMPLICATION OF EARLY POTTERY PRACTICE BY WOMEN IN
 NIGERIA: A FOCUS ON WOMEN POTTERY PRACTICE IN AKWA
 IBOM STATE**

ABSTRACT

The practice of pottery in Nigeria is commonly found among the women folk. The business of trading with products of pottery is also formulated by the women despite the burden of carrying the fragile wares from one market to another after production. It is in the light of women involvement in pottery business that Ladi Kwali was discovered by the English Potter Michael Cardew when he came to Nigeria in 1950. It has been observed that traditional pottery practice in Nigeria is almost dominated by the women and most of the pottery products are domestic wares which are mostly used by the women. This study is focusing on the involvement of women folk in traditional pottery practice particularly in Akwa Ibom State, Nigeria. The common shapes of oval and round features are identified among the products of traditional pottery easily produced by the women potters. The crucial question which comes to mind in this study's investigation is whether the circular shapes of the products by the women has any leasing or influence from the round features found on ideal, African women. Ideally, an African woman have the characteristics of round face, round chins, round buttocks, round breasts and round tummy during fattening or pregnancy. These characteristics accorded to a beautiful African maiden who undergoes fattening or customary after-child-birth care are celebrated and applauded especially by the Ibibios (Akwa Ibom State). The influence of roundness for beauty affects the shape of pottery products of women who are the custodians of myth and techniques of traditional pottery practice. No doubt, the Ibibio pots found at Jos Museum (Nigeria) and other places are noted as probably the most spherical pots globally. There are many implications in the practice of traditional pottery by the women folk in Akwa Ibom State and Nigeria at large.

This study also brings to limelight the traditional pottery as an outstanding economic venture for the women as well as the remedy to the plight of women in pottery practice in the face of adverse effect on the practice due technological and social changes.

KEYWORDS: *Fragile, Ideal, Pottery, Fattening, Roundness, Myths.*

INTRODUCTION

The curriculum of informal education in Nigeria and particularly Akwa Ibom State considers pottery skill among others as important and relevant to the society. The men folk were engaged in house constructions, tapping of palm wine, harvesting of palm fruits and clearing of bush for farming among many other things. The women majorly practice pottery, weaving, body decoration (Okukin), cooking, farming and others. Indigenous pottery making in Akwa Ibom State is seen as a special area for the women, and it requires high level of devotion to acquire the local but technical and sophisticated skills for a successful practice.

Women who are known for their dexterity and patience have advantage in pottery skill acquisition. The necessary knowledge of identifying and selecting good quality pottery wares especially the domestic wares are done by the women. In Akwa Ibom State women produce indigenous pottery wares and also trade on them despite the fragility and cumbersome transportation of such wares.

Ibibio pottery tradition (Akwa Ibom) from inception considers women as the forbearers and custodians of the unique tradition of pottery before the advent of modern pottery (Peters 2012). The products and practice of traditional pottery in Ibibio land are adjudged as feminine. The water pot for fetching water from the stream is hard carried on the heads by men to fetch water or carries about by men in anyway. It is the women who carry them about to fetch water and also the children carry the small pots made for children. The beauty of women carrying the round pots on their heads from the stream especially the pregnant ones makes the pots create sense of femininity. The corresponding wares from the round or oval pots on the head with the curve of the round tummy of the pregnant women and other curves from the features of the women for repetition create a unique balance. Virtually, the traditional Ibibio pottery shapes are round or oval despite the usage, but the sizes and opening of the rims distinguish the wares for the various uses. Some of the products of Ibibio indigenous pottery products are ‘abang mmong’ (water pot), ‘Oko Ibibio’ (cooking pot), ‘Usan Ibibio’ (bowls), ‘Oko ata’ (basin), ‘etok oko’ (small cooking pot), ‘etok abang’ (small water pot), ‘oko ukot’ (Palm wine pot) and ‘abang isong’ (big ceremonial pot for communal palm wine drinking). Food cooked from indigenous pottery pots have good unique taste which differ from food cooked from enamel or aluminum pots. Equally, water stored in fire dried indigenous water pot refreshes the body and with a sweeter taste than water from enamel or plastic pots. Women found joy in producing and utilizing the indigenous Ibibio (Akwa Ibom) pottery wares. It is also observed that pottery practice in other parts of Nigeria is dominated by women folk. According to Ochi (1971) “this renowned and noble Pottery craft may not live day longer than the women who currently engage in it.” Ali (2011) confirms this assertion by noting that out of numerous pottery communities in Igbo land only Afikpo, Inyi, Ishiagu and few others still practice traditional pottery and the craft is left in the hands of elderly women. Ecoma (2011) sees Ishibori women pottery practice and their pottery

wares as reflecting the item and values of the culture in which they are made and liken them to these of Nok, calabar, Igbo-Ukwu of Ife and others.

Myths Surrounding Women Domination of Pottery Practice in Akwa Ibom

The practice of pottery by women and the different techniques except the varying designs used by the women potters in Akwa Ibom seem to be closely related to what other African women are doing. Different pottery communities in Akwa Ibom hold to some beliefs that their pottery practice is unique to them alone. They claim that their ancestors handed the skill of pottery to the women folk and not the men. Peters (2012) observes,

The issue of initiating newly married young women into the pottery craft society entailed serious maintenance of aged long secrets involving their pottery production techniques. It is undisputed to know that members of such organization in the near-by-villages are ignorant of the techniques and certain tools for some designs used by the people in Ikot Ebom Itam. Some people in this village still believe that pottery techniques were handed down to them by their great ancestors who lived since the advent of formation of the raw material 'clay' in the area. This claim still ascertain that the practice of pottery in Ikot Ebom Itam village pottery tradition by the women started from time immemorial.

Many pottery communities in Akwa Ibom State share similar myths about pottery practice with Ikot Ebom women potters. This belief is likely as a result of the fact that they were born to see their great grand mothers, grandmothers and mothers practice the pottery craft. According to an over 80years old Elder Okon Anyang who was one of the most outstanding elders in Ikot Ebom village, and whose grandmother and mother were experts in the pottery craft, he said “anybody become anything in the area as a result of this old time pottery craft. Since every family in those days was engaged in the pottery business, everybody was therefore benefitting from the art either directly or indirectly (Peter 2012:10). In all the traditional pottery communities in Akwa Ibom State, the practice was pottery skill was practiced by only women since they believe it was handed down to only the women from the ancestors. Some of the pottery communities are: Ikot Ebom Itam in Itu Local Government Area, Ikot Ebidang in Onna Local Government Area, Mbiafun in Eastern Ibibio Ikono, Edemekpat in Etinana Local Government Area, Mbon Ebre in Oruk Anam Local Government Area, Ikot Abasi No. 1 in Etinana Local Government Area, Edeobom in Uruan Local Government Area, Ukpom in Oruk Anam Local Government Area, Ikot Ebekpo in Eket Local Government Area and Ikot Ekwere in Itu Local Government Area. There are many taboos, acts and superstitions attached to the indigenous pottery practice probably to certify or claim that the indigenous pottery practice is exclusive for women. According Mrs. Eno Edem who also hails from Ikot Ebom Itam, “Women potters in Ikot Ebom Itam and Ikot Ekwere dressed half-naked while quarrying the clay from the clay site”. This was customary to the women potters and it was probably to scare the men folk away from the site or an easy way to escape any unforeseen accident. Although men were not allow to quarry clay or practice indigenous pottery, but were always called upon to rescue accident victims at the ravine clay site.

Affinity of womanhood with indigenous pottery shapes and practice

There is a strong cultural relationship between Nigerian women and pottery practice. Eluwa et al (1988:83) observes that “pottery involved intricate process and was usually produced by women. Different sizes and shapes of pottery were made by Nigerian women for different uses. There were the small mouthed pots for fetching water from streams, the wide mouthed ones for storage and cooking, and those that were used as plates and bowls. Certain pots were also used for ritual purpose and in Borno, it is believed that the ‘sao pots’ were originally used for burial. Pots could also be identified by their colour. Some were grey block, brown, red or black”. Clay which is the basic raw material for pottery making has many colours and usages. Almost all the indigenous activities which involved the use of clay are predominantly practiced traditionally by the women. The various colours of clay are white, brown, red, gray, yellow and black and this depends on the clay site. Among the activities which involved the use of clay and dominated by the women are: body painting/decoration using white clay, red and yellow ochre, traditional house building and painting; medicinal use of clay; traditional fire chambers for cooking, pottery production especially the domestic wares, and trading with clay products. The activities of women with clay products create affinity between them, especially in the production of pottery domestic wares, usage and trading with the wares. The various indigenous pots produced by the women and their designs using local motifs are testimonies to their expertise in traditional pottery practice.

Eluwa et al further states that “the most popular method was the coil method in which coils of the prepared clay were added progressively until the maker came to the required height. While still wet, the pot was decorated with designs or motifs. Some people used maize husks to roll over the surface of the unified pot. It society of pots on display at the Jos Museum reflect the emphasis on surface decoration”. While the display of unique pots with unique shapes and decorations at the Jos Museum worth something to remember, Peters (2012:9) posits that “the Ibibio water pots ‘abang mmong’ is noted as one of the most spherical pots in the world. The Ibibio pots from different parts of Ibibio land such as Ikot Ebidang are seen in most museums in the country for instant the Jos museum” The pots in the museum which are indigenous are produced by women. The Ibibios (Akwa Ibom State) are known for high quality pot production by the women. The cultural symbol of a young girl with decorated calabash to depict an indigenous symbol from Northern Nigeria is similar to an Ibibio cultural symbol of a young girl with a decorated clay pot which is a pride to the people. In Akwa Ibom State pot was dear to the heart of the people especially the women before the advent of plastic and metal pots. The close relationship between the women and indigenous pottery can not be overemphasized. Pots were produced for the youths and women respectively for fetching water. Women produced pots and also admired them, while the round shape of the indigenous pots resemble some feminine features.

Indigenous pottery as an outstanding economic venture for the women

Women potters enjoyed enormous benefits and co-operation among themselves in the course of producing and communal firing of their pottery wares, as well as trading with the indigenous pottery products. Social relationship and monetary benefits were often associated with every activity of pottery of practice by the women.

Statistics are not available to show the number of pots made by an individual but it must have been very high enough to allow

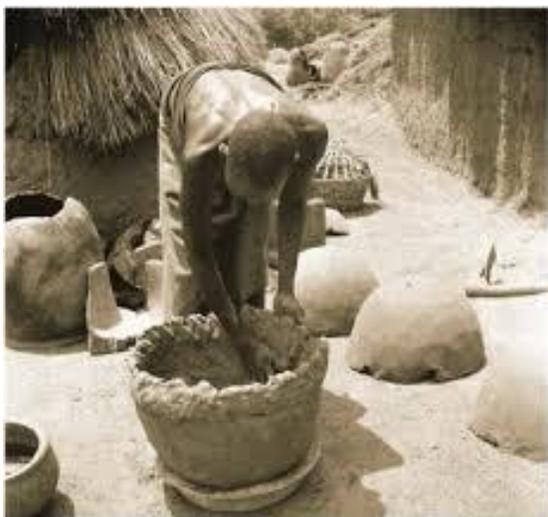

for local and long-distance trade in pottery. For example Ibeku women were known to have sold their pots in markets as far away as Ntigha in Ngwaland. However pots are fragile wares and occupy more space when finished. This certainly limited the sale of pots to those markets to which women could carry them safely stocked in the long baskets. In the 1950s, pots produced by Ishiagu women were transported by rail from Afikpo-round to other railway towns in the then Eastern Nigeria (Eluwa et al 1988:83).

Pottery making was a dignified occupation of women in Nigeria about a hundred years ago, but the advent of new containers with plaster as metal has replace some pottery products.

Uzzy, F. O. (2014: 149) observes that “Oka which is used to be a pottery village near Benin has been taken over by modernization, making it difficult for potters to carry out open air firing, while clay which used to be gotten free is now very expensive and difficult to get.” The ignoble expensive of women potters in Nigeria and particularly in Akwa Ibom State adversely affected the indigenous pottery which was an outstanding economic venture of the women. In Oku, the mass production of traditional pottery flask and coolers dropped drastically because of alternative products as investigated by Uzzi. Ekwere (2002) says that “Our domestic markets have witnessed the influx of industrial containers such as aluminum pots, pans, plastic plates, buckets and basins porcelains and enamel wares”. This observation by Ekwere in Akwa Ibom State market and in Nigeria at large supports the claims by Uzzi of the near extinct of Local pottery wares in Oka near Benin City in Edo State. Another view by Udeme (2006) still asserts to the reason for abandonment of pottery practice and products in recent times as so indicated:

The introduction of Christianity and formal education has had a serious effect on the traditional pottery. New converts were made to believe that everything indigenous is fetish. For this reason the converts stopped making pots.

Many issues culminate to act as barriers in the production of traditional pottery wares by the women potters in Akwa Ibom State and other parts of Nigeria. The mentioned barriers were not calling for a close door to pottery practice by the women but rather a change in approach to the practice to meet up with other changes in the society.

**INDIGENOUS POTTERY PRACTICE IN DIFFERENT PARTS OF NIGERIA
COURTESY OF GOOGLE.COM(2016)****Remedy to the plight of women in pottery**

Traditional pottery practice by the women suffered near extinction which brought about abandonment of pottery centers in almost everywhere. Any environment or society that gives very little or no encouragement to pottery products experienced gross discouragement by the pottery products makers.

Ladi Kwali, a popular Nigerian woman potter who vigorously practiced traditional pottery before the 1950s was fortunate to have met the expertise modern potter – Michael Cardew. According to Agberia (2997:63):

Hence, by 1950 when the plan for the potters centre was being conceived, Ladi's fame had extended beyond Kwali Village to other neighbouring villages and districts in the Abuja Emirate. This was why between 1954 and 1958 when Ladi Kwali was a trainee at the centre, the pots she produced were reported as products of very high quality that they attracted exhibitions in international circles.

The wise decision of the women potter – LadiKwali to align herself to the current change” in pottery then. The training she got made her to stay on the career and got exposed internationally. She thrived among the men to stand out and her reward was enormous. Numerous women potters from Akwa Ibom State and other parts of Nigeria never had such glorious opportunity and the harmer of “Current change” in the practice then caught with them and got them to abandon the pottery practice.

CONCLUSION

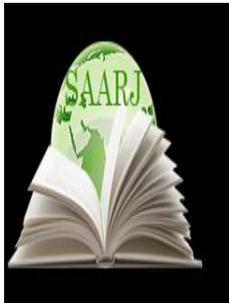

The practice of pottery by women which brought fortunes to them and their families before its hitting the wall due to lack of conformity to the necessary “Current change” then, still has great potentials to revive their economic endeavours in pottery. In the era of entrepreneurial ventures, pottery practice has a tremendous role to play. According to Peters (2015:52), “Interesting potters in these areas have actually displayed different skills in pottery making, used for different purposes from cultural, religious to social and decorative”.

All that women and others require involve sourcing for funds and updating their knowledge on modern pottery to boost production of glazed wares which are highly cherished by all. Women have very high concentration and intimacy for clay work production as found in different parts of the world. The establishment of pottery or ceramics cottage industries and their utilization of the abundant pottery material-clay found everywhere will boost income generation by the women.

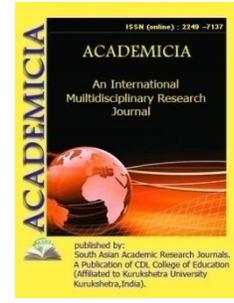

Traditional pottery product designs are yearning for innovations and re-invention to properly sustain the culture of the people, so this research anticipates a greater involvement of the women in the modern pottery production and practice.

**THE INTERACTION OF THE PRESCHOOL EDUCATIONAL
 ORGANIZATION WITH THE FAMILY AS A FACTOR IN THE SOCIAL
 DEVELOPMENT OF PRESCHOOL CHILDREN**

Tulkinovna Matluba Akramova*

*Bukhara State University,
 UZBEKISTAN

ABSTRACT

It is known that childhood is a unique and special period in the life of every person. In childhood, the foundations of a child's health are laid and his or her personality is also formed: guidelines, preferences, values. A child's childhood has a direct impact on the success of his or her future life. Social development is a valuable experience in this period. It should be noted that the psychological readiness of a child for school depends in many respects on the situation.

KEYWORDS: *Approach, Component, Childhood, Interaction, Help, Family, Period*

INTRODUCTION

The preschool period is very important for children to enter the world of social relations. The scientist L.S. Vigotsky views this world as "growing into the culture of people."

Social development is a process during which children learn the culture, traditions, values of the society in which they will live. In the structure of the personality, this experience is represented by a unique combination of components that are in close interdependence.

The first component is cultural skills. This is a set of specific skills that civil society imputes to a person in different situations as mandatory. Let's say before entering school - the skill of ordinal counting to 10.

The second component is specific knowledge. These are such representations that a person received in his personal experience of mastering the world around him and which bear the imprints of his interaction with reality in the form of a system of values, individual interests, and preferences. As for their distinctive feature, it is a close emotional and semantic relationship

between them. The totality of this knowledge forms an individual picture of the world for a person.

The third component is role behavior. This is human behavior in a certain situation, which is determined by the natural and socio-cultural environment. There is a person's acquaintance with the rules, customs, norms. It regulates human behavior in specific situations and is directly determined by his social competence. A child, even of preschool age, already has many roles: he is a kindergarten pupil, a son or daughter, someone's friend. It is not for nothing that a small child at home behaves differently than in a preschool educational organization, and communicates with friends differently than with unfamiliar adults. Note that each social role has its own rules. They can change. These rules are different for each value system adopted in a given society, for each subculture. However, if an adult consciously and freely assumes a certain role, realizes the possible consequences of his own actions and understands the full responsibility for the results of his own behavior, then children only have to learn this.

The fourth component is social qualities. It is advisable to combine them into 5 complex characteristics: initiative and rivalry, concern for others and cooperation, social adaptability, independence and independence, social flexibility and openness.

In the preschool period, the most favorable conditions are created for the social development of children. During this period, there is an expansion and restructuring of the system of relationships between the child and his peers and adults, joint activities with peers appear, and the types of activities become more complex.

All components of social development are very closely interconnected with each other. In this regard, changes in one of them, one way or another, lead to changes in other components.

Social development of a person is a means and a result, one of the aspects of socialization of a person, considered in philosophy from the point of view of the process of operational mastery of a set of programs of behavior and activity inherent in a particular cultural tradition; from the point of view of the process of internalization by a person of the norms, values and knowledge expressing them, from the point of view of the process of assimilation by a person of social experience and its active reproduction.

Social development is a controversial and complex phenomenon. Based on the concept of D.I. Feldstein, it is a systematically reproducible contradiction of two sides - individualization and socialization. Individualization acts here as a continuous discovery, assertion (awareness, separation), as well as the formation of oneself as a subject, and socialization is a person's appropriation of the norms of civil society. And in this context of the child's introduction to culture, any of his relations to the world takes part - smell, taste, sight, hearing, thinking, touch - that is, all organs of a person's individuality. Moreover, as the scientist believes, all these organs are the possibilities of perceiving the surrounding world in word, music, in colors - all this is conquered by a person and mastered by him in continuous interaction with the people around him, in the process of mastering objects, phenomena in the course of transformative activity.

Modern research on the personal development of a child determines the characteristics, the formation of which must be carried out in the process of social development: competence, creativity, initiative, independence, responsibility, the ability to self-esteem.

The main lines of social development are socialization as a process of familiarizing a person with social culture, its interiorization, which ensures his social adaptation in civil society, and individualization as a process of isolation, the formation of universal social abilities, which reflect the degree of social independence of the individual.

In the course of socialization, individualization, social experience gains great importance already in preschool age. Social experience by N.F. Golovanova considers from the point of view of the result of active interaction of a person with the world around him, the formation of which cannot be limited to the assimilation of a certain amount of knowledge, information, since it is associated with the mastery of methods of communication and activity. The social experience of the preschooler is very limited, it reflects the subjective essence of the individual.

The implementation of the tasks of social development of preschoolers is especially effective in the case of an integrated pedagogical system built according to the main approaches.

The first approach is axiological. It makes it possible to determine the set of the most important values in the upbringing, education and self-development of a person. As such, in relation to the social development of preschool children, the values of national, communicative, legal, ethnic culture can act.

The second approach is cultural. It makes it possible to take into account the main value orientations of the representatives of their ethnos and people.

The third approach is humanistic. It implies recognition of the child's personality principle, focus on his subjective interests and needs, recognition of the child's rights and freedoms, recognition of the intrinsic value of childhood as the basis of the child's mental development.

The fourth approach is synergistic. It makes it possible to consider any subject of the pedagogical process from the point of view of self-developing subsystems that make the transition from development to self-development. This approach in the aspect of social development of preschoolers presupposes, for example, a gradual change in the general orientations of the teacher in the formation of the main types of activity.

The fifth approach is systemic and structural. It implies carrying out work on the social development of preschool children in accordance with an integral pedagogical system of interdependent and interrelated goals, objectives, content, forms, methods, means of organization, conditions and results of interaction between teachers and pupils.

The sixth approach is activity-based. It makes it possible to determine the dominant of the child's relationship with the world around him, allows to actualize the implementation of existing needs in the awareness of himself as a subject of activity.

The seventh approach is environmental. It makes it possible to purposefully solve the problem of organizing the educational space as a means of human social development in relation to the tasks of social development; the organization of this space requires the formation of a subject-developing environment that ensures the most effective social development of preschoolers.

The current state of the preschool education system indicates the presence of a very large potential for the development and implementation of technologies and programs for the social development of preschool children. An analysis of the programs existing today makes it possible

to say about the possibility of implementing some areas of social development of preschool children.

According to Uzbek scientists, a preschool child is not able to independently master the achievements of the culture of the society through which he lives. The process of social development goes through the introduction of the child to social experience in communication with the surrounding adults and peers. So, in the studies of S.A. Kozlova highlighted the functions, degrees and ways of social development. When forming specific knowledge, it is necessary to take into account the fact that they perform a specific function: they carry information (information content); evoke emotions (emotionality); encourage activity (motivation).

S.A. Kozlova identifies three groups of sources for children to receive information about the social world:

- 1) Preschool educational organization, where children receive pre-processed information;
- 2) Stories of parents, adults, movies, television, books, which contain elements of random influence on the child;
- 3) children's own observations, stories of older children, which are difficult to control and do not lend themselves to direct control.

L.V. Korolev expresses his attitude to the problem of social development of preschool children. Kolomiychenko. She developed the concept of the child's social development, according to which the main goal of development is the upbringing of a cultured person (subject of culture), a free citizen (subject of history), creative individuality (subject of activity). According to this concept, "social development is a sequential, multidimensional process and the result of socialization of individualization, during which a person is introduced to the "universal, social" and constant discovery, assertion of himself as a subject of social culture.

Analysis of pedagogical and psychological literature has shown that social development is defined as the process of assimilating social experience through the performance of a certain role in practical activity; the process of assimilation by a person of norms, values and typical forms of behavior existing in society.

"The modern psychological and pedagogical literature presents the main lines of the child's social development, the content of pedagogical work, the technology of forming the social world of children, the task of adults to help children enter the modern world. "Social readiness includes the child's social adaptation to the conditions of a preschool educational organization and family, to various spheres of human life, a pronounced interest in social reality." The formation of social behavior is impossible without the recognition by teachers and parents of the uniqueness of each child, taking into account gender, individuality, age characteristics of his psyche.

The pedagogical culture of parents is one of the most effective factors in the spiritual and moral development, upbringing and socialization of preschool children.

Factor - a significant circumstance, driving force and cause. A special place among the factors of social development is occupied by the upbringing system of the younger generation. Society through institutions has a massive, collective, group and individual impact on each child.

The social development of a child's personality occurs under the influence of various factors, which is confirmed by numerous studies on social pedagogy.

A.V. Mudrik identifies several groups of factors that affect a person's socialization. These factors are:

macro factors - the world, planet, space;

mesofactors - mass media, type of settlement,

regional and ethnocultural conditions;

-micro-factors - religious organizations, socialization institutions (preschool educational organization, family, school, university, labor collective), subculture and peer group [40].

The action of these factors causes a number of contradictions in the social and individual development plans of the child. One of the main contradictions is the contradiction between the physiological and psychological capabilities of the child and the previously established types of relationships with forms of activity and the people around him. This contradiction fixes a significant discrepancy between the image of the world and the way of human life.

Giving a novelty to the socio-pedagogical practice of interaction between a preschool educational institution and the family, you need to know that the features of the family micro-society can be not only a stabilizing factor in a person's social development, but can also act as a provoking manifestation of various "failures". Because of this, today it is extremely necessary to rely on real ideas about social family well-being.

A family situation is a set of conditions that provide one or another environment (favorable or unfavorable) for the social development of a child. In order to successfully form, develop, and grow the individuality of children in a family, social conditions are needed.

The first condition is the creation of the necessary freedom for the child to manifest activity.

In a family, children have some degree of personal freedom. It is very necessary to logically and consistently expand the boundaries of children's independence, which has an impact on their general adaptability.

The second condition is the development of the child within a specific sign-symbolic environment (that is, the child's communication with his peers and adults). The formation of children's consciousness depends on the nature and forms of communication with adults - monologue and dialog city, on their way of thinking, as well as on how adults are able to make such a way of thinking "visible" to the child, in other words, understandable to him. It is an adult in a joint analysis that forms the conditions for a child to understand himself as a person with specific goals, likes and dislikes, intentions, a person with a number of abilities to think, feel, understand, and build his own activity.

The third condition is purposeful and emotionally rich communication between adults and a child.

Another scientist I.P. Pavlov said that for a person, emotion is a very strong and unique energy source. The ability of adults to find the correct and constant proportion for their own reactions to

a certain event, a certain act of children ensures the formation of clear everyday guidelines in the world of sensations and feelings.

The fourth condition is the continuity of mastering knowledge with the previous experience of children.

Knowledge arises from the awareness of children of certain situations of their own activity. The family gives the child the right to expand his own knowledge based on personal experience, awareness of those concepts that the child had already formed by that time; the right to choose one way or another of work (collective or individual), ensures the formation of the child's ability to make an independent choice and to bear full responsibility for it.

The fifth condition is harmonious family relationships.

Note that the studies carried out by domestic scientists (L.I.Bozhovich, A.N. Leontyev, A.V. Zaporozhets, etc.) made it possible to identify 2 types of factors that exist in the family and affect the development of the child. The first type of factors is the relationship between parents, the relationship between them, the relationship between sisters and brothers. The second type includes housing conditions, family financial situation, family structure. The researchers classified the factors of the first type as prevailing in relation to the second type of factors.

Studies of teachers, psychologists and other specialists indicate a low family-legal, psychological culture of parents. Therefore, for the full development of the child, it is necessary explaining to parents the peculiarities of the age development of preschool children, which is aimed at the positive formation of the younger generation.

In this regard, the psychological and pedagogical education of parents, carried out by a preschool educational organization, should solve a complex of preventive tasks:

to promote the formation of relevant knowledge and skills among parents, in particular, the desire to use them in communication with children and in the interests of their own development;

to create conditions for an optimally balanced mental development of children at each age stage, to timely prevent possible violations in his formation as a capable person.

In addition, tasks of a preventive nature are solved, preventing the onset of undesirable mental consequences in their development. Parents and teachers of a preschool educational organization should be able to observe each child, notice and correct negative features of his development in a timely manner. This will avoid the consequences of readaptation and maladjustment. Based on this, the following forms of cooperation with the family are considered appropriate: visiting families in order to study intra-family relations and establish contact with parents; holding open days, which acquaint parents with the traditions of the preschool educational organization, the features of the educational process; counseling parents in the framework of mastering certain knowledge skills in solving problematic issues; organization of workshops for aspiring parents, those who are most in need of acquiring practical skills in the upbringing of preschool children; parenting meetings (general and group), at which the tasks of educating preschool children are discussed, pedagogical situations are discussed; organization of parenting conferences with the aim of sharing experiences of family education.

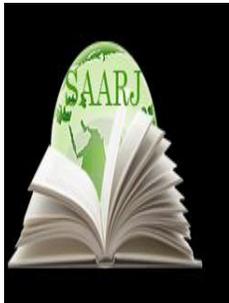

All these events can be organized and carried out as targeted, individually, and in optimal combinations.

Modern trends in preschool education are united by one important criterion - its quality, which directly depends on the level of professional competence of educators and the pedagogical culture of parents. A preschool educational organization and a family are two links in one chain, a kindergarten cannot replace a family, it supplements it by performing its special functions. Their common task: education and upbringing of the future generation, creating comfortable conditions for the full development of the individual.

 UZBEKISTAN

ABSTRACT

In the process of formation of innovative educational environment, as in all stages of the continuous education of the Republic, the priority of traditional teaching in primary classes does not allow students to find perfection in all aspects. Consequently, traditional education is "In many cases serves to strengthen memory, ignoring the issue of thinking development. Also, this education has little opportunity to develop creative abilities, independence, and activity. Widely popular assignments are: "put", "divide", "mark", "remember", "redevelopment", "solve on the basis of samples", etc. The educational process of cognition is based on the reproductive method in which the cognitive activity of the learner is based, in most cases, on the property of reproduction (redevelopment)".

KEYWORDS: *Speech, Text, Re-Storytelling, the Content Of The Work, Graphic Image, Reading Lessons, Reader, Independent Thinking.*

INTRODUCTION

At the last stages of preschool age, the child correctly hears the sounds of speech, does not replace them with other sounds, acquires the skills of correct pronunciation of sounds. But this will not be enough to go through the period of teaching literacy. In the language if its phonetics and morphology had not been shown to have an active mastering feature, there would have been a problem of teaching infants who have not yet mastered the words to their native language. According to the calculations made by some psychologists, the vocabulary of a two-year-old child reaches 250-400 words, the vocabulary in them when children reach the age of seven goes to 300-3500. As children grow rich in vocabulary, they also develop a semantic aspect of their speech [1].

The essence of the work on the text is that it serves the task of mastering the content of the work, studying its ideological and artistic features and, on this basis, giving moral and spiritual education through the formation of independent thinking skills of students [2].

Teacher from the description through the word for different purposes, If, it can be used by readers to make a plan based on the content of the text, to prepare for re-storytelling, to determine the circumstances under which the event occurred. As an independent work, the teacher assigns to the students the task of describing the landscape, which is acceptable from a certain part of the text, either in a word tool or in a graphic. When teaching primary school students to describe the content of the text in words, it is worthwhile to start with a comparison of the corresponding part of the text with the picture given in the textbook. Here students are sure that the character traits of the Hero, which the writer describes, are shown by the artist skillfully. When describing the text with a word in the course of the lesson, it is worth paying attention to the fact that it does not turn out to be a re-narrative. In the process of analysis, the teacher draws the attention of the students to the use of words and phrases that the author used.

The main part. In the full assimilation of the contents of the work by readers, the role of the causal link between the events of the work, the landscape, the character and appearance of the heroes by word is very important.

The actions of the students in the process of performing this task are carried out in the following stages::

1. Students read the text and divide the relative completed parts.

This kind of behavior allows readers to understand what the author meant.

2. Lexical-stylistic preparation is carried out for the recounting of the text. In this, the meaning of unfamiliar words in the text is clarified, the main points are allocated, images and events are drawn to the analysis.

3. Students will attempt to find out the basic situation described in them according to the relative completed parts.

4. The text is re-narrated by readers independently.

Graphic Imaging is more done at home. To do this, students carefully re-read the text, draw a picture corresponding to its content, and also reflect on the content of the text in the lesson. As a result, their language wealth increases, oral speech and independent thinking skills go into shape. It is also characteristic that the pictures depicted in the book help closely to read the texts, understand the meaning and understand the essence of the expressed moral-spiritual issues. By reflecting the significant places of the text in the pictures, the attention of readers is directed to study the characteristic aspects of the behavior of literary heroes, to be in the correct attitude to the ideological content of the work.

The behavior of the personages in the pictures, especially their interiorspecial emphasis is placed on the opening of the spiritual world. Accordingly, pictures with examples of Fine Arts have a positive effect not only on the students' speech, but also on their independent thinking. Students will have the opportunity to master the works of art not only externally, but also ideologically-artistically, through Fine Arts.

Teaching students to choose key words in the text without difficulty consciously comprehensively is also an important aspect of working on the text. "The reader in the process of working on the text of the work tries to bite the core of the thought-idea in it. In it, independent thinking skills are formed, new educational and cognitive qualities are also included " [3].

As a result of continuous, consistent and purposefully organized pedagogical activity aimed at the re-creation of text by pupils on the basis of the text given in the textbook in the lessons of primary school reading, they are able to master the ability to independently, clearly explain their thoughts, having mastered the signs of the text and the rules for its formation. After all, the ultimate goal of the actions carried out in the school on the development of speech is to freely express the student's opinion in oral and written form.

It is a phrase from training.

From experience it is known that the child has the property of remembering more meaningful concepts a little more quickly and firmly than meaningless words. His speech will be enough to engage in communication with adults at the stage of preparation for school education, at the level of awareness and correct perception of people's thoughts, the structure of his speech and logical coherence, expressive, quantitative and voluminous exchange of views in accordance with the rules [1].

Among the pictorial tools of the language, figurative analogies are clearly distinguished. Figurative analogies are one of the brightest ways to express the author's opinion. Analogy in the scientific language means the comparison of one subject to another on the basis of a common sign [57; 139-p.]. Analogy allows to perceive the desired abstract concept, more precisely, the unknown through a certain concept. Teaching students to recreate the similarities by working on the text will help them formulate their individual style of speech.

The work of teaching the analogy to the conscious application in his speech can be carried out in two stages::

1. To acquaint readers with the role and importance of analogy by analyzing the language and content of the work.
2. Formation of the ability to independently apply this or that kind of analogy in written speech as a result of performing special assignment exercises in the lessons of mother tongue.

In the first two years of primary education, the main type of reading is aloud reading, within which reading plays an auxiliary role. It is noted that before reading, an introductory conversation will be held to prepare students for the perception of the text. Interpretation of incomprehensible words is part of the introductory conversation. After the introductory conversation, an exemplary reading of educational significance is carried out by the teacher.

Pupils of the first and second classes remember dry, not understanding the meaning, not giving importance to the internal connections of educational materials. They will be master without making logical analysis of the materials under study [3].

Work by sample is a legitimate process. Because of speech is more mastered only in the process of imitation. Students enrich their speech lexically and grammatically by imitating exemplary speech. Language sensation develops in it, the verbal memory improves.

According to the example of the teacher's reading, students learn to read correctly, expressively. In order to read the text in the lesson, the teacher should thoroughly prepare, strive for a deeper understanding of the meaning, and determine how certain parts of the text should be read. After the teacher explained how to read some sounds, syllables, words, the pupils read the text alternately. The teacher follows them and fixes them.

Reading as a team is used when working on correct, clear and fluent pronunciation. This makes it possible to attract all students to study.

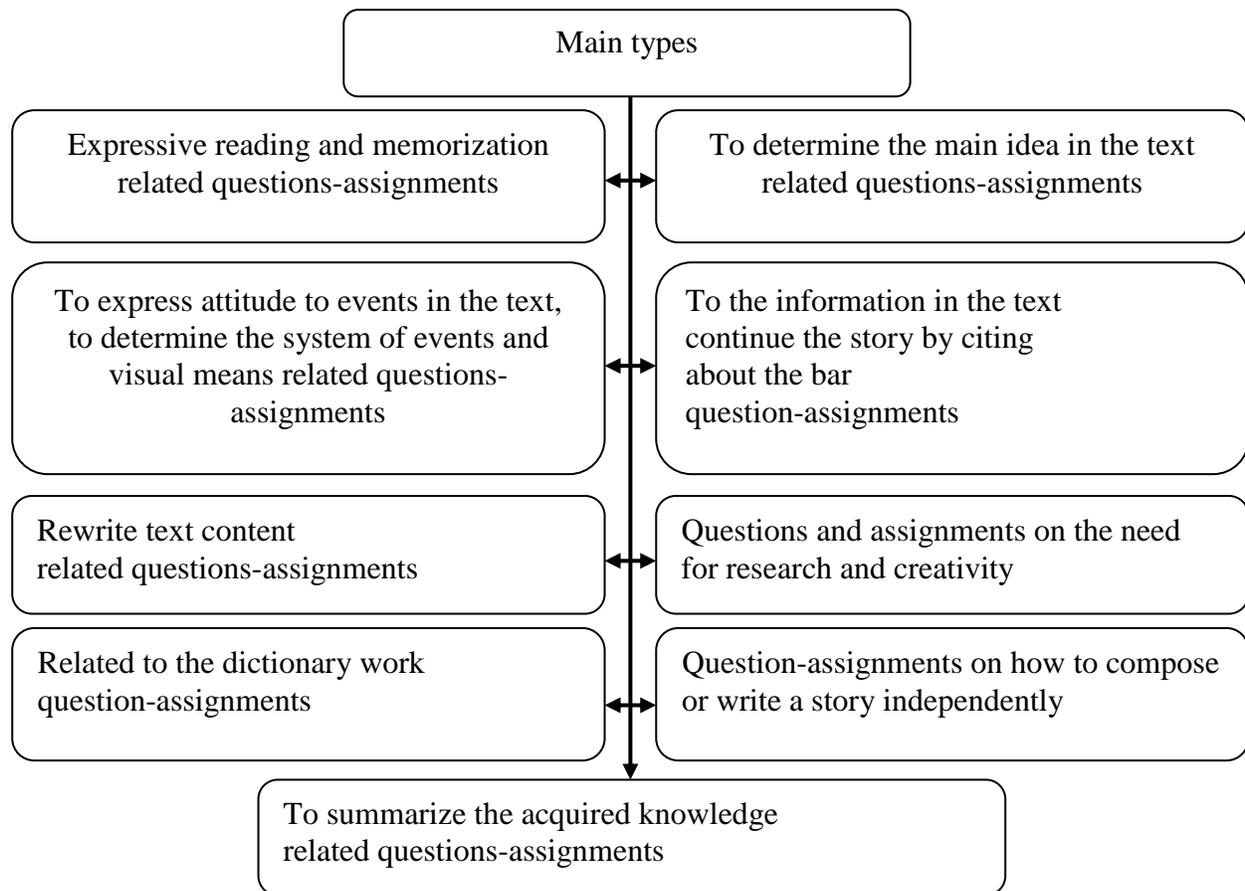

When mastering the technique of reading, repetition plays an important role. Some students try to read this or that text several times. Interest in reading activities also creates interest in its content, creates the need for knowledge acquisition, and motivates reading to become content [1].

Repeatedly re-reading the text, the interpretation of a new word, vocabulary and exemplary sentences contribute to a deeper understanding of the content. In addition, it contributes to an increase in the quality of reading, its correctness, fluency, expressiveness, the development of affixes. The fact that repeated reading of the text is not organized with the help of special exercises makes it boring for students and puts them to exhaustion. Reading selectively when working on the text, that is, a separate sentence holds an important place in the transfer of Question-Answer on the piece. In this it is desirable to formulate questions and assignments methodically correctly.

By working on questions and assignments related to the content of the text, it is necessary not only to limit the questions and assignments in the textbook, but also to draw up new questions about thinking, reasoning in each lesson and refer to the pupils wonder. For example, on the text "Sumalak" [2] it is possible to compose the following questions::

1. Why did the peasant soak the willow?
2. What words does the old woman use to describe the dish she cooked?
3. How do you understand the word "plenty" in the narration?
4. What is the so-called food that the peasant's children sympathize with?
5. What properties does "Sumalak" have?

In the course of the research on the problem, it was concluded that the questions and assignments of the text given in the textbooks 1 - st and 2-nd classes "reading book" can be categorized as follows:

Given in the textbooks "The book of reading" the main types of questions and assignments under the text

1. Question-assignments on expressive reading and memorization. It is worth saying, it is impossible to imagine expressive reading without understanding the meaning and idea of the text. Hence, questions and assignments about the content of the text will focus on the formation of expressive reading skills to some extent. There are also special assignments for the formation of expressive reading skills. For example: a) reading the text as a role; b) determining the general mood that was born by reading the poem; C) holding a creative competition on expressive reading; d) focusing the attention of students on the means of visual expression in the text and so on. A piece or something from the text memorization of poetry is also an aspect of speech-building work.
2. Questions and assignments about the attitude to events in the text, the system of events and the definition of visual means.
3. Question-assignments on the determination of the main idea in the text. This is the first step in preparing students for their re-storytelling through the same questions and assignments to independently identify the main idea in the finished piece of the text or in terms of its content.

For example, what would be the consequence of the boastfulness of students about the story "The Cock of the boast", which is presented in the 1st Class "Reading book"? "In the process of answering the question [2], they approach the assimilation of the main idea of the work.

4. Question-assignments on the re-storytelling of the content of the text. Such questions and assignments also allow the reader to preserve in his memory the event or image that will be analyzed later in the story. For example, "Put Headlines on the divided parts of the text and recapture" [2], "Recapture the text according to plan" [2], "what news did you learn from the text?" [2] and so on.

5. Question-assignments on the continuation of the story, relying on the information in the text. Such questions-assignments have a creative character and are used for different purposes.

6. Question-assignments on the dictionary work. This includes questions and assignments on how to determine the meaning of certain words and phrases in the text (example: "understand the meaning of the following words in the poem give: patron, shield, pride, savior, Brave" [2]). The sound in words is either a replacement of the letter, rebuses; puzzles are also in the sentence of the same kind of work.

7. Question-assignments on how to compose or write a story independently. Such assignments come very hand in the cultivation of oral or written speech of students.

8. Questions and assignments on the generalization of acquired knowledge. These include, in principle, questions and assignments of a generalizing nature, which are given on the surface of each section of the textbook. At the same time, for individual texts, there may also be questions and assignments of a generalizing nature.

Reading exercises on the basis of a specific task help to capture the normative pace in reading and the area of reading widely, deep understanding of the content of the text by readers. To do this, the teacher initially said "read the title once more", "quote;... read the passage in which it is said about" quota; gives such assignments as "read a few sentences from the beginning of the second letter and tell there what is said about it". Later, tasks are complicated, depending on the reader's technique of reading and mastering the content of the text: like "read the text inside you", "read the text, tell which hero you like more and why". This mode of selective reading teaches students to read inside and develops independent reading skills.

It should never be forgotten that the text of works of art is an excellent material for the formation and development of speech skills, which are considered the main reading skills in students. The development of reading skills as a type of speech activity is carried out from the loud reading form of reading to the form of reading without making a sound, which is carried out as a mental activity, which passes through the secondary level. In this way, the reading and mastering of artistic works will, first of all, make students' attitudes thoughtful and enrich their knowledge and feelings; secondly, it will serve as a means of educational influence on the students; thirdly, it will lead to the richness and development of the students language.

The acceptance of an artistic work (text) by students is a rather complicated process. Psychologist S.L.Rubinshteyn acceptance is something that affects us when we say, and understands that the phenomena in the object are reflected by the senses. "Life practice" – states S.A.Rubinshteyn, - force a person to move from an unintended acceptance to a goal-oriented observation; at this

stage, acceptance becomes a theoretical activity, which includes analysis and synthesis, that is, acceptance understanding and implementation" [1].

Psychologists believe that in primary school students there will be two different attitudes towards the artistic world of the work. The first emotional-figurative type of attitude manifests a direct emotional reaction of the child to the logos that stand in the center of the work. The second type of evaluation depends on the life and reading experience of the child, in which there will be elements of analysis.

According to the classification of N.D.Moldavskaya [1], the following four levels of information reception are characteristic for Primary School students.

1. Fragments degrees. At this level, readers will not have a holistic vision of the work, their attention is focused on individual events, they will not be able to connect episodes. At this stage of reception, when compiling a question on the text of the work, students either will not be able to completely fulfill the task, nor will they be able to formulate one or two questions about the beginning part of the text.

2. Recording level. Pupils of this level are characterized by pronounced emotional reactions. Their imagination will become sluggish; attention will be drawn to the development of events. Such readers easily restore the sequence of events, but do not always understand how these events are connected with each other.

3. "Hero" level. At this level, students are distinguished by the ability to clearly see the changes in their emotions in relation to the events described in the game and express themselves in words. They are interested in primarily heroes in the game. Children will be able to base their point of view on the personage behavior, while correctly determining the results of the motivation of the personage behavior.

4. "Ideas" level. Those entering this level are able to pay emotional attention not only to the factual side of the work, but also to its artistic form. They have a developed imagination and love to read the work over and over again, thinking about what they read. Such readers are able to determine the function of this or that element in the text, to see the author's position.

In the course of the study, we determined the level of "perfection" among these levels and identified the students belonging to this level and carried out various observation work. Although the entrants to this level are deficient, they are able to perceive the work as a whole, any aspect in the work does not go unnoticed by them, they are able to connect events with life freely, draw conclusions from the work and also explain their position. In them, as in adults, speech skills are formed, which attract attention with beautiful speech.

RESULTS AND DISCUSSIONS

It should be noted that "the basic requirement of an informed society is determined not by the amount of information that has been mastered, but by the level of application of the information that has been mastered in the relevant spheres and in the course of vital activity" [5].

Based on the above points, it can be said that by working on the text in the reading lessons, it is of great importance in the development of speech to support students in the cultivation of speech to correctly and fully perceive the artistic work, that is, to bring them from the fragmental level to the level of "perfection".

The work on the understanding of the essence of the work of art by M.S.Vasileva, M.I.Omorokova, N.N.Svetlovskaya [5] is presented as follows, the basis of which is integrated into the psychological features of understanding of the work by students, taking into account the laws of acceptance, goals and means of teaching:

Understanding of literary work by students

Stages of work	Working styles
I Preparation for reading Introductory course	Teacher's question or conversation
II Primary holistic acceptance of the work	Read aloud (I class) or "inside "(II-III classes), read by the teacher
III Primary acceptance check	Answers to clarifying questions about the imagination of the reading work
IV I stage of analysis-understanding of the content of evidence	Continuous reading of the text by the pupils, interpretation of its content with the help of the teacher
V II stage of analysis – the main points, understanding the feeling of the heroes, assessing their actions	Analysis of parts of text or images using selective reading and imagination "drawing with a word"
VI Synthesis-a holistic perception on a relatively thoughtful basis (a holistic understanding of the ideological, figurative side of the work)	Independent assessment of what is read by students. Express in their own words their attitude to the Read work. Expressive reading

Full acceptance of an artistic work is a complex process that has its own peculiarities. The formation of a correct and full-fledged acceptance of the work of art in students, that is, the transfer of them from the fragmental level to the level of "perfection", is one of the main tasks of the primary school teacher. However, without the purposeful use of methods of analysis of works of art, this can not be achieved.

Psychologist S.L.Rubinshteyn recognizes that the level of development of cognition, which expresses the child's mental development, is the stage of interpretation (comprehension giving, interpretation). In his opinion, interpretation (lot. "Interpretation", "expression", "understanding") – is not considered the final stage of the development of cognition, and it changes at the stage of the development of perception. According to the state of deep understanding of the content of the predicate, the scientist shows that there are the following types of interpretation: 1) interpretation, which bases the connection of events in the cause and effect and in a similar way; 2) summary interpretation, based on the properties of external intuition; 3) summary interpretation, covering the logical aspects of interaction from the essence of the subject and phenomena [1].

Psychologist D.B.Elkonin's observations that the interpretation change is associated with a change in the perception process, which is based on the initial, random-generating statement of

the child at the stage of a similar interpretation, and then re-perceives some situations of the phenomenon on the basis of the results of a random comparison deserve special attention [1].

In carrying out the study, accordingly, 1st-graders were offered pictures on different topics (simple and complex, easy to find and unfamiliar plot for children). It was found that the complexity in the content of the pictures would allow the readers to make changes to the story again. In some cases, it was observed that in the children's story the process of calculating or describing a simple number has changed. But this situation does not indicate the presence of a specific counting, counting or imaging stage in primary schoolchildren. After all, in the process of perceiving and describing images in simple terms, the Readers compiled explanatory stories. It is worth bearing in mind that in the process, students will not only be able to circumvent this or that argument, but also be able to express them on the basis of their own vocabulary.

It should be strictly noted that in the lessons of primary school reading, No matter what type of work and method is used in the process of speech development by working on the text, after each type of creative work, the teacher should analyze the mistakes and shortcomings that have been made in pronunciation, word application, and sentence construction. And this, in turn, is one of the most important factors for the correct formation and growth of speech.

It is noted that full-fledged acceptance of the text (work) is necessary to have a number of skills: to be able to evaluate the hero of the work, to reflect on the results of the behavior of the personages, on mistakes, on motivations, to understand the change in emotions, to master the idea of the work. The students' answer to each question will allow them to judge the level of development of a particular skill. Also, reading the artistic text, correctly displaying the results of the actions of the personages in it, evaluating them, understanding the idea of the text creates the opportunity to develop the thinking abilities of readers, oral and written speech.

CONCLUSION

Taking into account the characteristics of the types of oral, written, external and internal speech in the classes, the psycho-volitional and moral aspects of the students guarantees the successful passage of the process of speech cultivation.

ON SOME TYPICAL PROBLEMS TO BE SOLVED IN PRIMARY SCHOOLS

Muhamadovna Mavlyuda Qosimova* ; Abdulloyevich Asror Kasimov**

^{1,2}Bukhara State University,
 UZBEKISTAN

ABSTRACT

One of the main requirements of school mathematics education in this article is the formation of an independent-minded creative thinker, a creative approach to the performance of educational tasks. The concept of "problem" is one of the most important tools in developing independent thinking of primary school students in mathematics. In math classes, students seek to analyze connections between subjects through problems. In particular, typical arithmetic problems play a special role in enhancing the student's logical thinking, creative activity, as well as expanding their free, independent thinking.

KEYWORDS: *Problem, Arithmetic Problem, Complex Arithmetic Problem, Typical Arithmetic Problem, Mean Arithmetic Value, Sum, Subtraction, Multiple Ratio.*

INTRODUCTION

Long-term observations and school experience show that elementary school students have difficulty solving typical arithmetic problems. Even some elementary school teachers are no exception. Although there are some types of problems in elementary school math textbooks, most elementary school students make some mistakes when it comes to observing and fully analyzing such problems and looking for solutions.

It is not difficult to distinguish a number of problems from complex textual problems that are performed in the same sequence and solved by the same actions. Such issues can be said to be issues of the same kind. But complex problems with some important features have been adopted as typical arithmetic problems in the methodology course.

A distinctive feature of typical problems is that they are much more difficult than non-typical problems and require the use of special reasoning methods to solve them.

Below we think about some typical problems that can be solved in primary school, their specific important features, and ways to solve them.

Problems of finding the arithmetic mean.

In people's lives, terms such as "average", "average" are often used, for example, "average age of students in the classroom", "average score of children", "the average amount of money spent on purchases", "average height of students", Phrases such as "average temperature", "average speed", etc. can be evidence of our opinion. Let us interpret the concept of the arithmetic mean.

Definition: The arithmetic mean of several numbers (two or more) is the sum of these numbers divided by the number of digits. For example, the arithmetic mean of the numbers $a_1, a_2, a_3, \dots, a_n$ ($a_1 + a_2 + a_3 + \dots + a_n$) is equal to n . In particular, the arithmetic mean of the numbers 2, 3, 4, 5, 6 is found as follows.

$$(2 + 3 + 4 + 5 + 6) : 5 = 20 : 5 = 4$$

Consider the following issue.

Issue 1. The air temperature was measured every 3 hours during the day and the following data were obtained: 180, 210, 190, 220, 230, 260, 240, 230. Based on the data, determine the average amount of air temperature.

Given the problem conditions and the definition of the arithmetic mean, the average air temperature is found as follows:

$$t = 0$$

Answer: The average air temperature is 220.

The work of preparing primary school students to find the arithmetic mean of several numbers provides a basis for solving such problems.

First, we prepare students from 1st grade onwards to learn how to multiply them by adding the same additives, adding different additives. Also, in Grade 2, students will be given the following tasks to study multiplication and division and consolidate them, which will prepare them to find the arithmetic mean.

Assignment 1. Add the numbers 6,4,2. Divide their sum by 3. What number is formed?

Assignment 2. Divide the sum of the numbers 10 and 8 by 2.

Assignment 3. Find the sum of 4 numbers starting with 4 and increasing by 2. Divide the sum by 4. What number is formed?

The final assignment can be given in the last quarter of 2nd grade, at the beginning of 3rd grade. This task is adequate to the following problem: "What is the arithmetic mean of 4 numbers starting with four and increasing by 2?"

Of course, in the process of completing the above task 3, the student relies on the following knowledge, skills, and abilities:

b) Find the sum of 4 written numbers (4,6,8,10,) ($4 + 6 + 8 + 10 = 28$)

c) Divide the result by 4 ($28 : 4 = 7$). Be able to show the result (7).

Assignment 4. Choose a number instead of a window so that the equation is correct: $(10+): 2 = 8$

This task represents the arithmetic mean of the sum of two numbers and the problem model for finding the second additive according to a known 1 additive. It is possible to create multiple textual issues that fit this model. For example:

- a) The 10-line and multi-check notebooks were distributed to 2 groups of 8. How many checkered notebooks are distributed?
- b) Each of the 2 plates on the table has 8 fruits consisting of apples and pears. If 10 of these fruits are apples, how many are pears?
- c) School children who went to plant seedlings were divided into two equal parts. In each group, 8 students planted seedlings. 10 of the students are boys and the rest are girls. How many girls planted seedlings?
- g) The brothers were playing hide-and-seek. His brother is 10 years old. If their average age is 8, how old is their brother?

By solving such problems, students acquire the skills to solve the arithmetic mean of several numbers and the appearance of some inverse problems. Encouraging fourth graders to solve the following problem requires them to think creatively.

Masala. The average score of 11 players on a football team is 20. If they add up the coach's age, the average age is 22 years old. How old is the coach?

The reader can comment on this issue as follows:

- 1) Multiply 20 by 11 to find the sum of the youth of 11 players on a football team. $20 * 11 = 220$ (age)
- 2) 11 players and a coach in a football team together make $11 + 1 = 12$ (people).
- 3) Multiply 22 by 12 to find the combined age of 11 players and 1 coach from a football team. $22 * 12 = 264$ (age)
- 4) To determine the age of the coach, subtract 264 from 220.

$$264 - 220 = 44 \text{ (age)}$$

Answer: The coach is 44 years old.

The concept of arithmetic mean plays an important role in solving the problem of finding the "weighted average value" and "average velocity". If such issues are taught in 5th grade, it is advisable to start preparations for them in grades 3-4. The student faces such issues in his lifestyle. In particular, the market learns that you need to address issues of medium weight when shopping.

Masala. 2 kg of sweet cakes worth 2,400 souls per kilogram and 3 kg of candies worth 2,800 souls per kilogram were purchased. How much did you pay for all the sweets?

The reader can complete this task quickly.

Solution of the problem: 1) $2400 * 2 = 4800$ (sum)

$$2) 2800 * 3 = 8400 \text{ (sum)}$$

$$3) 4800 + 8400 = 13200 \text{ (sum)}$$

Answer: 13,200 sum were paid for all sweets.

One more addition to this question is "How much does a kilogram of sweets cost?" if the question is addressed to students, the question remains a problematic question for the reader. Students will hear different answers: "We divide 13200 by 5 (that is, the mass of sweets)", "Add 2400 and 2800 sum, we divide by 2" and so on.

Students are explained that 1 of the answers given is correct. So, $13200 : (3 + 2) = 13200 : 5 = 2640$ (sum) - the average price of 1 kg of sweets.

It is a good idea to include students in Grade 4 after learning about speed, time, distance, or movement. Initially, it may be recommended that students be familiar with the problem of finding their average velocities in 2 situations when the distance (velocity) of an object is different in 1 hour. For example, when a pedestrian was walking from a village to a city, he first covered 3 km in 1 hour and 5 km in 2 hours. How fast did the pedestrian walk on average?

$$(3 + 5) : 2 = 4 \text{ (km / h)}$$

A: Pedestrians walk at an average speed of 4 km / h.

It is recommended to gradually study the problem of finding the average velocity depending on the distances of the body at different speeds at the same time (e.g. 2 hours, 3 hours, 4 hours ...).

Masala. "The train was traveling at 80 km / h for the first 2 hours and then at 100 km / h for 2 hours. How many kilometers does train travel? " The issue is discussed and resolved by the students.

$$\text{Solution: Method 1. } 1) 80 * 2 = 160 \text{ (km) Method 2 } 1) 80 + 100 = 180 \text{ (km)}$$

$$2) 100 * 2 = 200 \text{ (km) } 2) 180 * 2 = 360 \text{ (km)}$$

$$3) 160 + 200 = 360 \text{ (km)}$$

Answer: The train traveled 360 km.

Now, if students are given the additional task "Find the average speed of the train", they can get different answers.

a) "We divide 360 by 2" c) "We divide (80 + 100) by 2"

b) "We divide 360 by 4" g) "We divide (80 + 100) by 4" and so on.

Given that the train travels in 2 situations at different speeds (80km / h and 100km / h) and at the same time (2 hours), the sum of the speeds is divided by 2, or the total distance (360km) is divided by time (4 hours). is given.

Problems of finding two (or more) numbers according to their sum and difference)

Problem: Lola and Ali have a total of 9700 sum. Lola's money is 300 sum less than Ali's. How much money does each of them have?

We will solve the above problem by discussing it with the students.

- What are the students talking about?

- We are talking about Lola and Ali's money.

"How much money do Lola and Ali have together?"

- Yes

"How much?"

- 9700 sum

"What else is given?"

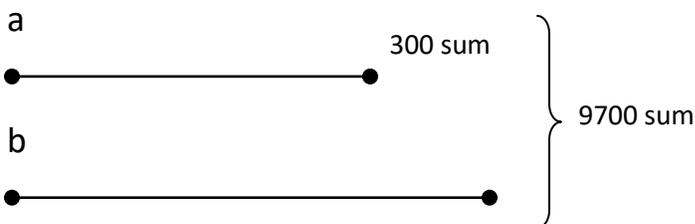

- Lola's money is 300 sum less than Ali's.

- What does the question require us to deny?

"How much money do Lola and Ali have?"

As a result of our observations, we note that most teachers find it difficult to discuss this type of issue. Because, continuing the question and answer in the form of the current discussion, the following: "How do we answer the question?", "How do we find it?" inappropriate questions such prevent the reader from understanding the specifics of a new type of problem that has not been mastered, leading to erroneous solutions; i.e., the reader may give the following answers. "Subtract 300 from 9700" or "Add 300 to 9700". But he can't justify why he chose these actions. It is as if he must do something about the two numbers given in the problem.

At this point, the teacher should give the following referral. That is, after the guiding questions and answers, "Students read the text of the question carefully again. Who has a lot of money? (Alida). Who has less money (Lola)? Conditionally, we denote the money in Lola by one section, and the money in Ali by another longer section, that is, we give a graphical condition to the problem: "

Since the money in Lola and Ali is 9700 sum, we define them together as 9700 sum. The amount of money in Lola is 300 sum less than in Ali. This model is an important tool in finding a solution to a problem. We will now continue the discussion of the issue.

- How much money would they both have if Lola had money like Alida?

- $(9700 + 300)$ sum

"Can you find out how much money Alida has now?"

- Yes

- How to divide the sum of 9700 and 300 numbers by 2

"Can you find out how much money Lola has?"

"Yeah, how about deducting 300 from Ali's money."

- So, how many cases will be solved?

- 3 jobs (with first addition, second division, third multiplication)

We describe the solution to the problem as follows:

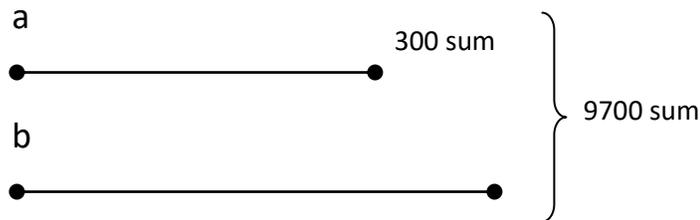

1) $9700 + 300 = 10000$ (sum)

2) $10000: 2 = 5000$ (sum)

3) $5000-300 = 4700$ (sum)

Answer: Alida has 5,000 sum and Lola has 4,700 sum.

Saying that this problem can be solved in two ways if the solution of Method 2 is required to be done by students independently, the students' independent thinking will increase. To do this, we express the graphical condition of the problem as follows:

1) How much money would both have if Ali had the same money as Lola?

$9700-300 = 9400$ (sum)

2) How many rubles did Lola have?

$9400: 2 = 4700$ (sum)

3) How much money did Ali have?

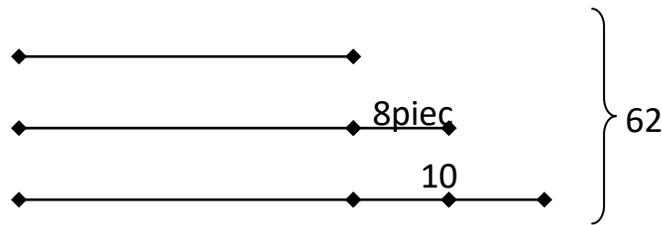

$4700 + 300 = 5000$ (sum).

Answer: Lola has 4700 sum and Alida has 5000 sum.

It is important to draw students' attention to the fact that they solved the problem correctly, and in both methods it was found that Ali had 5,000 sum and Lola had 4,700 sum.

The next step is to add the sum of three numbers and the problems of finding these numbers according to the differences of the pairs of these numbers.

Masala. There are 62 apples in 3 slices. The apples in Division 2 are 8 more than the apples in Division 1 and 10 less than the apples in Division 3. How many apples are in each serving?

The text of this problem will be mastered by the students and we will create a graphical model consisting of three parts. Therefore, in Table 1, which is the smallest apple, we conditionally express the number of apples with the 1st cut. Since there are 8 more apples in Section 2, we draw Section 2 as longer than Section 1. In Section 3, because there are 10 more apples than Section 2, Section 3 is longer than Section 2.

We will solve this problem in 3 ways.

Method 1: What would be the total number of apples when they were in subdivisions 2 and 3, as in the first subdivision?

$$62 - 10 - 8 - 8 = 36 \text{ (pieces)}$$

2) How many apples are in the first serving?

$$36 : 3 = 12 \text{ (pieces)}$$

3) How many apples are in the second division?

$$12 + 8 = 20 \text{ (pieces)}$$

4) How many apples are in the third division?

$$20 + 10 = 30 \text{ (pieces)}$$

Answer: 12, 20, 30.

Method 2: How many apples would there be on all three plates if there were apples in subdivisions 1 and 3 as in subdivision 2?

$$1) 62 - 10 + 8 = 60 \text{ (pieces)}$$

2) How many apples are in Division 2?

$$60 : 3 = 20 \text{ (pieces)}$$

3) How many apples are in Division 1?

$$20 - 8 = 12 \text{ (pieces)}$$

4) How many apples are there in Division 3?

$$20 + 10 = 30 \text{ (pieces)}$$

Answer: 12, 20, 30

Method 3: 1) How many apples would there be in all three subdivisions if there were apples in subdivisions 1 and 2 as in subdivision 3?

$$62 + 8 + 10 + 10 = 90 \text{ (pieces)}$$

2) How many apples are there in Division 3?

$$90: 3 = 30 \text{ (pieces)}$$

3) How many apples are in Division 2?

$$30 - 10 = 20 \text{ (pieces)}$$

4) How many apples are in Division 1?

$$20 - 8 = 12 \text{ (pieces)}$$

ANSWER: 12, 20, 30.

Consider the following issue.

A total of 912 saplings were planted by the second, third and fourth grade students of the school. 3rd graders planted more than 30 seedlings than 2nd graders and 4th graders planted more than 27 seedlings than 3rd graders. How many bushes did each class plant in order to plant the city?

We give a brief condition of the matter.

To give the condition, we think as follows. Since the condition of the problem is that the 4th grader planted the most seedlings, then the 3rd grader planted the 3rd grader, and the 2nd grader planted the least, we draw the cross-sections representing the seedlings planted by each grader.

Students know that this problem can be solved in 3 ways.

According to the previous question, the easiest way to solve the problem is "how many seedlings would the three classmates have planted together if the number of seedlings planted by the second and fourth graders were the same as in the third grade?" it is expedient to do so by seeking an answer to the question.

The graph shows that the total number of seedlings when second and fourth graders planted seedlings as third graders

$$(912 + 30 - 27).$$

$$\text{Solution: } 1) 912 + 30 - 27 = 915 \text{ (pieces)}$$

$$2) 915: 3 = 305 \text{ (pieces) Number of seedlings planted by 3rd graders.}$$

$$3) 305 - 30 = 275 \text{ (pieces) Number of seedlings planted by 2nd graders.}$$

$$4) 305 + 27 = 332 \text{ (pieces) Number of seedlings planted by 4th graders.}$$

Answer 275,305,332.

Specific features of problems of the type "Find these numbers by the sum and difference of two (or more) numbers" are:

- the problem is always given the sum or difference of two or more numbers and it is required to find these numbers themselves.
- it will be convenient to graphically describe the brief condition of the problem.
- The solution begins with the equalization of conditionally accepted sections of arbitrary length.
- Conditionally accepted, the number of cuts of arbitrary length is equal to the number of unknowns.
- The more unknowns are involved in the issue, the more solutions the issue will have.

Problems of finding these numbers according to the sum (or difference) and multiplication of two numbers

This type of problem can be solved by elementary school students with interest. Consider the following issue.

Issue: Nadir and Talib picked 24 mushrooms. The number of rare mushrooms is 2 times more than the number of mushrooms collected by Talib. How many mushrooms did Nadir sweat? How many mushrooms did Talib pick?

To make this issue clear, let us first give a graphical model representing the short term of the problem. Since the number of rare mushrooms is 2 times longer, we denote the section 2 times longer than "a" by "b". We denote the number by which they both picked 24 mushrooms.

We will solve the problem by discussing it with the students as follows.

- Do you know how many mushrooms Nadir picked?

- No, it's not

"How many mushrooms did Talib pick?"

- No, it is not known.

"How many mushrooms did they pick?"

- Yes. 24 ta

"Who picked a lot of mushrooms?"

- Rare.

- How many times did you pick mushrooms from Nadir Talib?

- 2 times.

"How many mushrooms did Nadir or Talib pick?" the question leads students to misjudge.

Some students think for themselves and divide 24 by 2 to find the number of mushrooms that Talib picked. This error leads to resolution.

Encouraging students to think correctly, the teacher says from the graphic model, "If we take the number of mushrooms picked by Tolib as 1 part (share), the number of mushrooms picked by Nadir will be 2 parts (parts) because it is 2 times more than the number picked by Talib." Then students will know how many parts (parts) of 24 picked mushrooms there are.

$$1 + 2 = 3 \text{ (part)}$$

- Is it possible to find the number of mushrooms that Talib collected?

- Yes.

"How?"

- 24 by 3. $24: 3 = 8$ (pieces)

- Who picked 8 mushrooms?

- Tolib.

- How many mushrooms can Nadir pick?

- Yes, multiplying 8 by 2 $8 \cdot 2 = 16$ (pieces)

The teacher tells them to make sure they have solved the problem correctly. Then the students check the problem.

$8 + 16 = 24$ (pieces) or $16: 8 = 2$ (times) these solutions represent that the problem was solved correctly.

Let us now consider introducing students to the problem of finding two numbers according to their difference and multiplication.

Problem: Geese in the meadow are 3 times less than ducks. If the ducks are more than 14 geese, how many geese and how many ducks are there in the meadow?

This problem is two unknown linear equations

$$\left. \begin{array}{l} a = 3b \\ a - b = 14 \end{array} \right\}$$

This problem represents a system of two unknown linear equations (where a is the number of ducks in the meadow and b is the number of geese).

This problem can be solved by discussing it with primary school students as follows:

- What are the students talking about?

- About geese and ducks in the meadow

- Is it known how many times the geese in the meadow are less than the ducks?

- Yes, 3 times

"What else is given?"

- It is known that ducks in the meadow are 14 more than geese.

- What does the issue require us to find?
- How many geese and how many ducks are in the pasture.

To find a solution to a problem, we first create a graphical condition (model) that represents the problem condition.

Since geese are 3 times smaller than ducks, we choose 1 section that represents the number of geese. The section that represents the number of ducks is 3 times longer than the number of geese, so this section should be 3 times longer than the first section. and denote it by 14.

Looking at this graphical model, we will continue to observe. As we can see from the graph, 14 represents two of these cross-sections representing the number of geese. So you can find the number of geese by dividing 14 by 2. When the number of geese is exact, the number of ducks is found. The problem is solved with 3 cases. (by multiplication, division and multiplication)

Solution: 1) $3 - 1 = 2$ (part)

2) $14: 2 = 7$ (pieces)

3) $7 \cdot 3 = 21$ (pieces)

Answer: 7 geese, 21 ducks.

To check the correctness of the solution of the problem, it is necessary to subtract 21 from 7.

$$21 - 7 = 14 \text{ (ta)}$$

The peculiarities of the problem of "finding two numbers by their sum (or difference) and multiplicity" are as follows:

- The problem gives the sum (or difference) of two numbers or quantities and their multiple, it is necessary to find the number or quantity itself.
- In order to clarify the text of the problem and find a solution, a graphical condition (problem model) is created.

When creating a graphical condition, the smallest number or quantity is selected as a fraction (contribution) and conditionally determined by a cross section of a certain length. From the text of the problem, the length of the second section is determined by considering the magnitude of the second number or quantity multiplied by the ratio.

- Two or more unknown numbers or quantities are involved in the matter.
- The solution of the problem begins with the calculation of the number of equal parts. If the sum and multiplication ratios of two numbers or quantities are given in the text of the problem, the number of parts is added. If the difference and multiplication ratio of two numbers or quantities is given in the text of the problem, the number of parts is subtracted.
- The problem will always have a unique solution.

- There may be other types of issues in the case.

Problems of finding the unknown by the difference of two quantities

A distinctive feature of this type of issue is:

- a) no more than two unknowns are involved in the matter.
- b) they involve finding two unknown quantities by their difference.
- c) the content of the issue is clarified by the presence of words such as “same”, “so”, “same as” and so on.
- g) The solution of the problem always begins with the operation of multiplication.

This type of issue is very common in elementary school textbooks. Short terms of this type of issue can often be given in tabular form or in the form of a short note.

Let's look at the following problem that can be solved in elementary grades

Issue 1. One tractor worked 60 hours a week and the other 55 hours. The second tractor consumed 35 liters less fuel at the same rate than the first tractor. How many liters of fuel does each tractor consume per week?

Let us give the condition of the matter in tabular form.

	Working time	Normal	Total fuel
1-t.	60 hours	Same	?
2-t.	55 hours		?, 35l less

Let's show the solution note by asking questions.

1) How many hours did the second tractor work less than the first tractor?

$$60 - 55 = 5 \text{ (hours)}$$

2) How many liters of fuel did each tractor consume per hour?

$$35 : 5 = 7 \text{ (l)}$$

3) How many liters of fuel did the first tractor consume in a week?

$$7 \cdot 60 = 420 \text{ (l)}$$

4) How many liters of fuel did the second tractor consume in a week?

$$7 \cdot 55 = 385 \text{ (l)}$$

Answer: the first tractor is 420 liters, the second tractor is 385 liters.

Issue 2. There were an equal number of mandarin trees in the two fields. An average of 420 mandarins were obtained from each tree in the first field, and 350 mandarins from each tree in the second field. As a result, more than 9,800 units were produced from the first to the second field. All mandarins were divided into varieties according to their size. The average number of mandarins was 2 times the number of small mandarins and 20,700 more than large mandarins. How many large mandarins are picked?

The condition of this matter consists of 2 parts. The contents of Part 1 relate to type IV. The content of Part 2 belongs to type III. First we do the type IV part.

Masala. The brief condition of Part 1 may be as follows.

Number of trees per 1 tree Total number of mandarins

I 420 pieces Equal ?, 9800 more

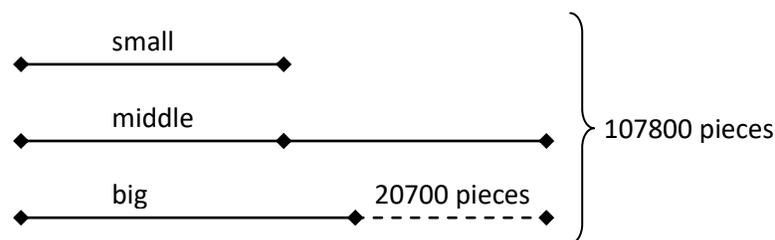

II 350 pieces?

Solve. We will explain.

1. $420 - 350 = 70$ (pieces) is the difference of mandarins taken from each tree.
2. $9800 : 70 = 140$ (bush) - number of trees.
3. $420 \cdot 140 = 58800$ (pieces) - The number of mandarins taken from area I.
4. $350 \cdot 140 = 49000$ (pieces) - the number of mandarins taken from area II.
5. $58800 + 49000 = 107800$ (pieces) - the number of mandarins taken from two fields.

We now turn to the type III part of this issue. Let's make a graphical condition.

We will continue to resolve the issue.

6. $107800 + 20700 = 128500$ (pieces)
7. $128500 : 5 = 25700$ (pieces) is the number of small mandarins
8. $25700 * 2 = 51400$ (pieces) - the number of medium mandarins
9. $51400 - 20700 = 30700$ (pieces) - number of large mandarins.

Answer: 30700 pcs.

Among the typical problems mentioned above are also the problems of assumption and solution of the calculation of surfaces in motion in terms of time to work together.

Solving typical textual problems develops students' independent thinking skills and increases children's desire to solve problems.

ABSTRACT

The article reveals the features of the formation of the communicative skills of primary school children. The age and communicative characteristics of junior schoolchildren, which act as a means and guarantee of speech development, are determined, the work of junior schoolchildren for the development of speech is characterized.

KEYWORDS: *Communication Skills, Learning Activity, Competence, Dialogue, Monologue, Speech Development, Reading, Speaking, Writing, Listening, Coherent Speech, Text.*

INTRODUCTION

The primary school acts as the first stage at which the foundations of communicative competence are laid and begin to develop, allowing communication in the native language and interaction of children. Communicative competence is the ability to carry out speech activity by means of the target language in accordance with the goals and situation of communication within a particular field of activity. It is based on a set of skills that allow you to participate in verbal communication in its productive and receptive forms.

Communication skills by type of speech activity:

In the area of speaking:

1. Dialogical form

Be able to lead:

- Etiquette dialogues in typical situations of everyday life, educational-labor and intercultural communication, including those obtained using communication means;

- Dialogue - inquiry (request for information and response to it);

- Dialogue is an incentive for action.

2. Monologue form:

Be able to use:

- The main communicative types of speech: description, story, characterization (of characters).

In the field of listening

Listen and understand:

- Speech of the teacher and classmates in the process of communication in the lesson and verbally / non-verbally respond to what he heard;

- Small accessible texts in audio recordings, built mainly on the studied language material, including those obtained using communication means.

In the reading area

To read:

- Aloud small texts based on the studied language material;

- To myself and to understand texts containing both the studied language material and individual new words, to find the necessary information in the text (the names of the characters, where the action takes place, etc.)

In the field of writing

Own:

- The ability to write words, phrases, and sentences from the text;

- The basics of writing: write a congratulation on the holiday, a short personal letter.

Characteristics of the main activities of students:

- ask questions about anything; answer the questions of the interlocutor;

- To ask about something;

- ask for something and respond to the request of the interlocutor;

- start, maintain and end a conversation;

- describe something;

- To report something;

- To tell, expressing your attitude;

- To characterize, naming the qualities of a person/object;

- To reproduce by heart the texts of rhymes, poems, songs;

- retell the heard / read text (on supports, without supports);

- compose your own text by analogy.

Indirect communication

- To understand in general the teacher's speech during the lesson;
- recognize by ear and understand a coherent statement of a teacher, classmate, built on familiar material, and / or containing some unfamiliar words.
- use a re-ask or a request to repeat to clarify individual details;
- Verbally or non-verbally react to what you hear;

When communicating indirectly (based on the audio text)

- To perceive by ear and understand the basic information contained in the text (about whom, what is it about, where it happens, etc.);
- To correlate the graphic image of a word with its sound image based on knowledge of the basic rules of reading;
- To observe the correct stress in words and phrases, intonation in general;
- Expressively read aloud small texts containing only studied material;
- predict the content of the text based on the title;
- To perceive the text visually, to recognize familiar words, grammatical phenomena, to fully understand the content;
- guess about the meaning of unfamiliar words by the similarity with the Russian language, by the context;
- find the meaning of certain unfamiliar words in the bilingual dictionary of the textbook;

Younger schoolchildren master the following special (subject) educational skills and abilities:

- use reference material presented in the form of tables, diagrams, rules;
- keep a dictionary (vocabulary notebook);
- organize words, for example, according to the thematic principle

In the process of learning their native language, younger students:

- improve the methods of working with the text, relying on the skills acquired in the lessons of the native language (predict the content of the text by its title, the figures given to the text, copy the text, write out individual words and sentences from the text, etc.);
- Master more diverse methods of disclosing the meaning of a word, using word-formation elements; synonyms, antonyms, context;
- improve general speech communication skills, for example: start and end a conversation using speech cliches; keep the conversation going by asking questions and asking again;
- learn to exercise self-assessment, self-control;
- learn to independently complete tasks using a computer (if there is a multimedia application).

The use of computer technology in educational activities is one of the most effective ways to increase motivation and individualization of learning. Knowledge comes only to an interested

person. It is not for nothing that folk wisdom says: "The one who wants to do more than the one who can." The use of ICT helps an elementary school teacher move from an explanatory-illustrative teaching method to a personal-activity method, in which the child becomes an active subject of educational and cognitive activity. and also allows you to combine play and learning activities. "The younger student has better developed involuntary attention, which becomes especially concentrated when he is interested, the educational material is clear, bright, evokes positive emotions in the student.

Correct effective use of a computer in a lesson is solid assimilation of knowledge by students, the development of independence, activity, and self-assessment skills in them. There are various computer programs for the subjects of competence: training, information, and reference, demonstration, control, and others. In this regard, teachers of their native language have to create themselves, because there are no ready-made materials for lessons.

Tables, pivotal notes, tests, crosswords - this is far from the complete list of didactic materials that can be created on a computer. The tables created in the presentation are offered to students in the form of visual and didactic material - a folding bed. Thus, the impact on the student's consciousness is not limited only to viewing the presentation, but already familiar visual images and content create a cognitive environment in the office. Presentations contribute to the best memorization of the teaching material taught in the lesson. A visual presentation of material about folk customs and traditions enables children to more vividly imagine a particular rite, remember its important points, and systematize them.

Communication helps to replenish and build vocabulary among students, but the next exercise can be a continuation of the previous one. Performing this exercise, the student relies on previously acquired knowledge, uses the learned vocabulary, and already makes sentences without difficulty, supplementing them with the necessary words. Upon completion of this assignment, a coherent text is obtained, which the student needs to read, headline, break into logically connected parts, draw up a plan and retell the content of the text-based on it. This consistent presentation makes it easier for the student to master the language and develop spoken language.

What does society expect from the school? The answer is seemingly simple: quality education. How should a native language teacher perform this task? What does quality education mean?

The result of the work of a native language teacher is a person with a unique personality, who knows his roots, a conductor of his national cultural heritage in the family, and society. If a student speaks his native language, how to rejoice and how to behave in moments of sadness and sadness, then the teacher has coped with his main task, it means that he is on the right path.

A literary text adapted for the needs of the educational process moves from the category of authentic works created by a native speaker for native speakers to the category of educational texts. To preserve the originality of the original text during adaptation, it is necessary to preserve the internal structure of the adapted text in terms of content and its linguistic expression. Compliance with this requirement is facilitated by the reliance on keyword images of the adapted text, which allows you to set the adaptation in the necessary direction and preserve the most conceptually significant elements of the work. Having undergone adaptation, an authentic educational text becomes a teaching aid, but in this case, there is a problem of preserving the artistic originality of the original, the danger of replacing the distortion of the author's artistic and

aesthetic attitudes with purely didactic attitudes. You will be able to understand how texts are selected for literary reading in Russian lessons. By what principles are they selected and how can interesting but difficult texts be adapted without violating their integrity? When working on special texts, listening is usually reinforced by the simultaneous reading of the text by the teacher or students aloud or silently. The majority of students in grades 1 and 2 of primary school are known to have poorly developed skills for correct, meaningful expressive reading. The inability to read correctly and expressively negatively affects the quality of assimilation of the content of educational texts, consolidation of grammatical forms and structures. Therefore, when studying special educational texts, students perform some practical exercises to develop the skills of correct intonation of sentences of different purposes with the nouns in the texts in the role of the main and secondary members. So, on the material of the text "In the bazaar", the intonation of declarative, interrogative, and exclamation sentences is worked out (with the definition of these types of sentences, students are familiar in everyday situations), the intonation of enumeration with homogeneous members of the sentence, when applying and expressing a request.

Here are examples of relevant phrases from the text:

Many fruits and vegetables have grown and matured over the summer. There are a lot of potatoes, cabbage, cucumbers, and tomatoes in the stalls.

- How much is a watermelon? the woman asks.

- Please give me this watermelon.

There is so much in the bazaar!

Using this material ("Some nouns denoting product names do not have a plural number"), students construct similar phrases, practice the necessary intonation, pauses, and logical stress. Observing the basic rules of reading, students pronounce and memorize case forms of nouns more clearly and well. Independent reading of the rest of the texts is carried out by students taking into account the above criteria. students read Before reading the text aloud, the students read it to themselves and think over which phrases are more in it for the purpose of the statement, with what intonation these phrases should be pronounced. At the same time, special attention is paid to the correct pronunciation of non-sentence and prepositional constructions with nouns. Knowing the basic program requirements for reading, explaining them on a specific educational material, self-control in work lead to certain positive results in the development and consolidation of the ability to listen and read special educational texts. This has a positive effect on reading lessons. For a better understanding of new words in the texts, students' independent work is systematically carried out; selection of synonyms and antonyms for words, analysis of the composition of a word, word interpretation, and especially - the inclusion of these words and expressions in dialogical and monologue speech. When conducting vocabulary work, serious attention is paid to the development of students' skills to correctly pose questions from main words to dependent ones, for example, from verbs controlled by them nouns. To do this, first, the teacher writes down questions on a portable board, then students do the same work. Students read new words and makeup phrases based on the material of the text and life observations and impressions. Thus, they practically consolidate the skills of non-sentence and prepositional management. Thus, the following verbs and questions to them are given to the text "Eagle and the Cat":

Appeared (who?)

Grabbed (who? What?)

Grabbed (with whom?)

Grabbed (who?)

Students make up phrases and sentences: an eagle has appeared; the eagle grabbed the kitten; grabbed an eagle, etc. (according to the text); a boy (grandfather, brother) appeared; the cat clung to the dove; an eagle grabbed a sparrow (duck, hare), etc. (by analogy and based on their own observations and impressions).

Similar analogies and rethinking are practiced with phraseological combinations. In particular, interpretations of the expression are given to the above text: the battle to the death has boiled, not a single living place has lost its courage.

With great enthusiasm, the students compose new sentences with these expressions on the topic of their favorite city.

For instance:

My city is the oldest, it is the pearl of the east. There are many ancient monuments in the city. Bukhara is located in central Asia, it is in the heart of Uzbekistan. We are proud to live in this city.

Carrying out such work on the material of educational texts to connect teaching with upbringing, to include the learned vocabulary incoherent statements for students to express their own thoughts and feelings.

As the skills of mastering the vocabulary for educational texts are developed under the guidance of the teacher, students are offered independent assignments for mastering new words. Thus, for the text "In the summer camp", students independently work out new words. By analogy with the previous lessons, they give phrases:

Enjoy the sea, sun, friend, vacation, summer;

Change color, clothing, shape.

The use of various methods of vocabulary work on the material of special educational texts develops in students an active attitude to the semantics of each new word and certain skills and abilities to introduce these words into their own speech.

Writing out the studied grammatical forms and structures from educational texts as a basis for the organization of subsequent retellings is carried out in such a way as to ensure, firstly, complete extraction of the studied structures in the students' speech so that too much time is not spent on writing out these texts and analyzing the studied grammatical forms after mastering the content of the text as a whole, each row or team of students is invited to perform similar work on the material, complete within the meaning of a part of the text. Based on the written combinations of verbs with nouns, students convey in detail the content of the entire text. Since there are "specialists" for each of the semantic parts of the text, the class actively listens to the retellings and evaluates them. To develop the skills for more active inclusion in the speech of the grammatical constructions learned in the educational text, students make up similar phrases and

sentences. Since in this case too, students work in groups, teams, or rows, it is interesting for the whole class to hear new phrases and sentences.

This additional lexical and grammatical material enriches the speech of students and is included in a commented letter, individual assignments, and is reflected in vocabulary notebooks. Rational methods of independent work on writing out the studied grammatical forms from the texts and special speech tasks on this material can reduce the time spent (from 3-5 to 8-10 minutes), and with greater benefit for speech practice, in particular, the development of management skills. Question-answer conversations on the content of the text offered in Russian textbooks correspond to the age and psychological factors of primary school students. The texts proposed in the Russian language textbook are formulated so that, in answering them, students use nouns in different cases. "Karim and His Friends".

1. Where do Karim and his friends study?
2. What did the friends decide to do?
3. Whom did Karim and his friends help?

Despite the undoubted benefit of such questions, they mainly activate the work of memory, and not thinking; they only require ascertaining answers in a ready-made form taken from the text. It is necessary and useful for the development of primary speech skills, but for the development of students' own independent speech, it is insufficient. Therefore, the reproduction of data in the textbook of questions to the texts and the answers to them can be considered only as of the first stage of conversations on the content of special educational texts. The second stage of question-and-answer conversations includes drawing up additional questions of previously studied cases by analogy with those proposed in the textbook or with the inclusion of other interrogative words corresponding to questions of previously studied cases. After the training exercises under the guidance of the teacher, the students independently compose additional questions and ask their comrades, which contributes to more detailed assimilation of the content of educational texts, introduces elements of novelty into the monotonous questions of the textbook, helping to consolidate the already familiar non-sentence and prepositional constructions with nouns in the complex. For example, for the test "Karim and his friends" students make the following questions:

1. Who asked Karim and his friends to help the old people?
2. Who else decided to help Karim?
3. What did friends do to help old people?
4. How much work did your friends have to do in a day?

These questions force students not only to pay attention to new details of the content of the educational text but also to activate nouns in different cases in speech. Similar work is carried out in the study of other educational texts. The third stage of question-and-answer conversations provides for the teacher to pose and further compilation by the class of so-called generalizing questions, that is, questions requiring the disclosure of elementary cause-and-effect relationships, highlighting the main thing, comparing facts, evaluating events and phenomena, expressing their feelings and thoughts. These are questions that contribute to the development of the thinking of primary school students in Russian lessons. Generalizing questions are also valuable because

they enliven the predominantly grammatically directed nature of educational texts, expand their semantic connections, and cause more interest in the perception of these texts. In unity with the content of generalizing questions and answers to them, prepositional and non-sentence constructions with nouns are fixed, the skills of constructing sentences are improved.

Thus, communicative competence is the ability to carry out speech activities by means of the target language in accordance with the goals and situation of communication within a particular field of activity.

ABSTRACT

The article is about the literary description of adults' spiritual world, the psychology of heroes, new innovative methods of personages' thinking and images, the place and ways of psychologism in children's literature. Then his idleness overcame him easily; then "the numbers, letters of his notebook jumped like a cricket in his dreams; he got frustrated because his uncle was brought to his house as his godfather. Women were forced to work with young girls and boys. They went to wide -open pastures to feed their herds of cattle.

KEYWORDS: *Description, Explanation, Spirit, Psychologism, The Author, Realistic, Autobiographical, Hero, Image, Detective, Historical, Esthetic, Epoch, Analogism, Imaginative Literature, Fiction Story, World Of Crime, Adults, Justice.*

INTRODUCTION

A literary word is a fragile term which influences the spiritual world of a person and it can extremely occupy the heart of every person. Imaginative literature describes people how they are in real world. But we should mention about its great impact on the life of adults and older people either. Especially, adulthood is the period of time when a person is being fully grown. The impact of imaginative literature is prominent for tending the independent thinking of adults.

It is undeniable to give a lesson to matures by the manners of heroes in books. Psychologism of adults is crucial for the children's writers' works. (psych poetics, the style of expressing spirituality etc.)

It is true that the literature of every epoch describes its history and social life clearly. Another clear evidence if this notion is the case of literary description of children's spiritual world.

There is a big difference between the XX th century heroes' psychology of 1960-1970s and 1980-1990s. As illustration we can see this evidence in the works of the following writers: H. Nazir, N. Fozilov, T.Malik, X. Tuxtaboyev.

Furthermore, analogism was salient term in the literature of the 1980s. The problems were solved easily and the heroes of the book became happy without any obstacles. For instance, Hakim Nazir took materials for his new works from the people of his own real life. The events of his works took place in Fergana Valley, Bukhara, Azerbaijan fields and in the delegation of cotton collectors.

Additionally, the most crucial problems are described in the works of Hakim Nazir. The fiction story of "Yonar daryo" is about the schoolboy Damir who is known by the nickname "little" and his family life. There is also given a short description about Damir's close friend.

The writer tries to see everything with the eye of his hero- Damir: the attitude of elders to their progenies, vice and virtues of the world. The main hero of the story Damir, after his father's death, was abandoned alone with his mother and little sister Popuk. His mother could not look after her children as she had to work to nurture her family. Therefore she did not spare her time for her children.

Damir spent most of his time with his kind grandmother, as he grow he became quite a spoilt, naughty, lazy boy and decided to change his schedule and not to obey his mother.¹

His distant relative uncle Sulton used to come to their house and this helped young boy not to feel lack of his own father's love. Lately, his uncle became his godfather. The second event happened in the life of Damir when he traveled to Qizilqum. His close friend Buron described him: "As the young child –Damir has never gone out before, a new world has opened its doors for him."

The writer described the psychology of adults in his fiction story "Yonar daryo".

He follows every step of his hero, wherever he goes, whatever he does. He describes his hero's life vividly. Damir never conceals his secrets. He is open like a book: being angry with his mother, he decided to be hungry and refused to eat for a long time. Then his idleness overcame him easily; then "the numbers, letters of his notebook jumped like a cricket in his dreams; he got frustrated because his uncle was brought to his house as his godfather. Once he claimed disillusionment about his mum when she did not allow him to go to the desert with his godfather.

All heroes of Hakim Nazir are grown-ups. Furthermore, the writer has experienced a lot of difficulties in his adulthood that can be the most important reason why he is referring to this period of time.

There will appear psychological opportunities in a boy's imagination. As he grows he starts to show his talent, enthusiasm and courage. However, unless parents, relatives pay attention to their children's way of behavior, (who are their real friends, what kind of people they are) these young adults will actually make lots of mistakes.

If parents understand their children's skills, abilities, talents and direct them to their future jobs properly, their progenies will become great people when they mature. Parents should comprehend the feelings of their children as they will have bright future.

Russian writer L.N. Tolstoy expressed his opinion in his trilogy “Childhood”, “Adulthood”, “Grown-ups”: “If I tell anything about my adulthood, I can say that everything was not convenient for my age. However, from my point of view there is no similarity between person’s activity and status.

I did not have any friends, I was obsessed with my own thoughts and imaginations. My head filled with full thoughts of how future life and eternity of spirit will be; I childishly tried to find the answers to these questions.

Although people have tried to solve these issues, they have been left unsolved for a long time. As ideas obviously came to my mind, I felt, as if I invented something and even I started to take advantages of them. In every minute and seconds, I could not understand why people did not take everything for granted. Unless they think about their future they will not be happy. Three days I thought about my ideas without doing my homework, I read a novel and bought to eat honeyed bun, I took a lot of pleasure out of it. That was really enjoyable for me.”

The heroes of Hakim Nazir experienced spiritual feelings in their lives.

For example, family relations, the destinations of adults and children are described in “Yonar daryo”.

The fiction story consists of several independent parts. The story was told by the main hero Damir. The story starts from the short description of spring. The hero of the story was sleeping by the pond in the yard of his house in one of spring days. He dreamt about the eagle which was carrying him in its claws in the sky, then he woke up he fell into the pond by chance. His grandmother dragged him out of water. His grandmother told her grandson that he was in a hurry and he was a disobedient boy that his real life reflected in his dreams either.

We can see the denouement of the story starts from this part. Why is Damir’s grandmother calling him a naughty and disobedient child? What are the problems in their family? The events of the story give explanations to those questions step by step.

Long ago stepmothers were cruel, ill-natured people in fairy tales who tortured their stepdaughters. Stepdaughters were insulted, bullied with no reasons and they were forced to work hard by their stepmothers. Finally, they were exiled from their own houses with lots of lies and fibs.

In stark contrast, uncle Sulton was as a nice, kind, good-natured gentleman that he treated Damir and his little sister as his own children in “Yonar daryo”. Children considered uncle Sulton to be their godfather not as a stepfather.

The main hero of the story describes his godfather with following descriptions:

“After my father’s death our house turned to be boring and mundane day by day. My grandma, especially, my mum has not been looking at me with her shining bright eyes for a long time, as her eyes sunk by sorrow and distress. The pampering behavior of me and my sister was not liked by our mother, as well as by my grandmother. I could hardly understand my mum’s grief but my sister could not. She used to make noises, if anybody was not listening to her. Anyway, my mum used to calm my sister down with her kindness.

When uncle Sul-ton came to our house, it seemed as if our family was filled with joy and happiness. He told interesting stories about his life. I was curious to hear about his personal life and asked questions in purpose:

-Why are you so black, uncle Sul-ton, - I asked him.

-My dear young chicks, because I spent the whole of my life in deserts, - he answered.

I tried to continue the conversation by asking him silly questions :

-Is the color of your skin black from your birth?

-Yes, I was born and brought up in the field. Then I took education in the city. After graduating from the institute, I returned to deserts. I built roads, bridges, pumped the water from aquifers. As a poet said, I swam with my high boots and drank water from these aquifers.”

Firstly, Damir tried to avoid from this man. Gradually, uncle Sul-ton tried to find a way to the boy’s heart, even he built a tennis-table for the boy and taught him how to play tennis. Day by day children got used to their “new father” and they did not go out staying with him at home. They started to do their homeworks in time, they played different games with uncle Sul-ton.

The eyes of Damir’s mother started to shine brightly from happiness. As everything went smoothly, children could find their father’s love from uncle Sul-ton. However, their happiness did not last for a long time. One day their stepfather wanted to go to deserts as he promised to someone to work in a desert for a year. Damir’s mother told her son to follow her words:

“My darling, your father is going to leave us, concentrate your mind and listen to me attentively. If he mentions about taking us to the desert, tell him not to go there and tell Popuk not to allow him to go. If both of you insist on him not leaving us alone, perhaps, he will change his mind. Is it clear to you my dear son?”

It goes without saying that father’s role is important in the family and it is accepted by Damir’s mother. If uncle Sul-ton became ill, the young boy’s mother was disappointed by worrying about his husband’s health.

It was not difficult for an engineer to find a job from the city. But uncle Sul-ton had his own principles: he felt that he was responsible to look after those deserts. Consequently, he could not stay in the city for a long time. Although his family was against his wish he decided to go.

In conclusion, some events of certain period, social family life are described in “Yonar daryo”. Furthermore, we can notice the upbringing of the children, the heroes who participated in building places and exerted their efforts, real-specific world of young adults when reading the fiction story.

Even though the story was written a half century ago, children’s, adults’ world, the attitude of father-son, the attitude of elders to their children, the heroes who were ready to do everything for their country – these precious features have not been lost their value until now.

Nosir Fozilov depicted the adults who told the story of people and then became great people in their future. The fiction story of “Saraton” is about the life of Uzbek adults. There is a girl-Kamola and a boy-Tura in the story.

Cattle feeding were a favorite activity of every nation: Uzbek, Kazak, Turkmen, Tadjik, Kirgiz. This activity was favorite pastime which connected people with friendship during the war. The most difficult moments of cattle-feeding were in the adults' life: "The cattle were brought to the place where the cows can drink water during midday. Kamola and Tura were approaching with their cattle, their clothes were dragging along the road picking up dirt. Although the day was hot and stuffy the young adults were wearing old, shabby pullovers, cotton trousers, high boots and hats. Their clothes were covered with dust and dirt and it was difficult to recognize which of them was a girl Kamola and a boy Tura. Brother Giyos was going ahead of them riding his donkey wearing his cotton gown. Suvat was a place where cattlemen and cows had a rest. There was a grapes' tree in Suvat and gentle breeze blew quietly. That place gave a feeling of pleasure to a person.

The scenery of the nature seems extraordinary for other contemporary adults. But the events took place during the war. Therefore, it was challenging for those adults to proceed their life. They had never complaint about obstacles in their life.

The writer tried to depict true love of young adults through realistic scenery of the nature in literary style. There are specific customs and traditions in the country. All men and young fellows went to the war. Women were forced to work with young girls and boys. They went to wide -open pastures to feed their herds of cattle. They were forced to work in fields either. Adults had to spend their free time in pastures and fields from early morning and till late night.

The responsibilities of the adults were to work hard: Tura and Kamola were among them. It was not easy to look after animals for them. They followed father Giyos, they have to swallow dirt and dust. These 'miserable adults 'were hungry when they took their herds of cattle to distant places. They have to eat hard bread with dried apricots in order to satiate their hungry stomachs. By the midday they dispelled their cattle to the village.

Although their clothes were shabby and old they did not show it in their faces. Conversely, they had a kind of feeling which does not choose a place or age.

As illustration we can give Chulpon's main hero – Zebo in "Kecha va Kunduz".

Nosir Fozilov tried to describe true, pure emotions of adults Kamola and Tura. They were close friends, they played together and by this way the adults could forget their misfortune.

The girl Kamola was like a boy. She wore and behaved like a boy, even her close friend was a boy. People considered her to be a boy. However, one day the boy lost his close friend. At midday Tura took qurut (round shaped dried cream) from the table and tried to break it but he could not. Then he took the sharpener from his pullover and broke the qurut with it. He gave the half of it to Kamola and the other half to Brother Giyos. Kamola wanted to play trick on the boy, she took the sharpener from the boy and escaped from him. The boy chased her to take his sharpener back. Tura ran after the girl to the lake. Suddenly, there he remembered that they should dispel the cattle to the village and he continued to look for Kamola. Maybe, she was playing hide-and-seeK with him. He took some steps slowly with his tiptoes so that he can frighten the girl. He prepared himself to meet Kamola. He heard the noise which was coming through the water. He listened to that noise attentively. But he was surprised when he saw something with his opened mouth behind the tree. He was unconscious: "Is it that Kamola whom

he has met a few hours ago, they have been together for a long time. They have been friends from their childhood. Now he has lost his close friend.”

We are amazed at the miracles of the nature; the sun shines upon the summit of the hills, birds' whistling sounds attracts a person's attention, blossoming flowerbeds started to appear in trees in spring.

Only nature can show its real beauty: ripened fruit's juice and color in summer, the golden view of autumn, fascinating snowballs draw pictures on the windows in winter. Every person is mesmerized by the beauty and charm of the nature.

As artists try to depict real nature by their brushes, imaginative literature also gives a description of real life by a writer's pencil. Special skills are required from the writer to write about emotional feelings and spiritual world of his heroes. While reading stories readers try to imagine the events in their imaginations. Therefore, it is important for a writer to describe the story with his excellent skills and capabilities.

A number of changes have been made writing about heroes by Uzbek writers in the 1980s. For example, the fiction stories of “Mungli kuzlar” (X. Tuxtaboyev), “Alvido bolalik”(T.Malik) are about juvenile delinquents who entered the world of crime by chance. Both of these books were written in 1988-89.

We can notice a new genre is being appeared in Uzbek literature. This genre is called ‘detective’ which is emulating the detective genre of the world's literature. A writer describes the emotional feelings of his personages by their psychology. Juvenile delinquents entered the world of crime without knowing anything.

A writer feels, cries, suffers with his personages. He is sorry about the destinations of his heroes, this bitter world brought them to suffer from unhappy life. These young adults had to choose this incorrect way of life with certain reasons.

The fiction story of “Mungli kuzlar” is told by the boy Zafar. The boy was arrested when he was 16 years old. The boy's parents were always busy with their own affairs and they did not pay attention to their children. The social life made these ‘young creatures’ to choose wrong ways of life.

By reading the fiction story we can imagine Zafar's life: his parents', brother's, teacher Ataulla's attitude, the fabricating behavior of shop-keeper's, the arresting of his mother's for her illegal affairs.²

When Zafar's parents were arrested he had to go to the office judge asking his property. Then he was taken to the asylum. Being like a mad person he entered the world of crime. The objective and subjective reasons of misfortune are given in the story.

“I have been fighting with pain for a long time. However, dilemma is the most aching pain of all other pains in the world. I'll kill both of them. Is it called crime? I'll strike fire to their houses. Isn't it crime?

Revenge and honesty are fighting inside of my feelings. Why was money appealing for me? I was arrested when I was 16 years old because of my mum and dad. Their blood is flowing in me,

I am their son, naturally, I take after them. My heart beats as their hearts. Their spirits, character, mind are living in me. What were they dreaming about took after me through their blood?

I went to the judge to take our property back. Conversely, everything was in vain. Why was I blamed for being mad? I have a proof that I am a healthy person.

Mother, why did you leave me in this bitter world? Why did you teach me to love money and wealth? My father was taken to prison, my mother could not tolerate all of this and died, my elder brother was burnt in the fire, my little brother died. People are gossiping about me whether I am mad or not.

No, I'm really a healthy person being ready to burn the whole world .

Father, how are you now? Why did you accumulate a lot of money? Your wealth, property turned into a monster and swallowed all of us, we have been destroyed. Although you are destroyed, you are my father. Don't cry my darling, don't cry!"

In Uzbek children's literature X. Tuxtaboyev tried to show his main heroes who were able to comprehend themselves, who they are, how they occupy their right places in society.

It is known that the main heroes of children's literature are children and adults. Having introduced the events of the story to readers, they ought to make conclusions about them. Fiction stories describe main hero's thoughts, fighting with his own feelings, every time he tries to open the doors of justice.

These descriptions might seem more influential to readers.

The scientist claimed his own opinion about the writer X. Tuxtaboyev's main heroes' in his works:

"X. Tuxtaboyev's main hero Zafar differs from allover heroes' of his stories: Olim from "Besh bolali yigitcha", Hoshim from "Sariq devni minib", Akrom from "Shirin qovunlar mamlakati".

Zafar in "Mungli Kuzlar" is from a rich family. His parents had a huge mansion in the city. The writer describes the destruction of the whole family."

Yoqutxon and his friends started to lie people with their fake affairs, Qumondon stole the jewelers of aunt Qozi. They blamed Yoqutxon for stealing money he was taken to prison; Zafar was considered to be mad.

Yoqutxon's friends lay and left him when he needed help. The misfortune in the family influenced the children's spirit: The family's elder son was burnt in the yard of the house, Zafar died in a car accident. Zafar entered the world of crime in order to take revenge from his father's false friends. Nigora became ill from the skin disease.

While reading the story we can feel a feeling of pity for innocent children who did not have happy life because of their family's money and wealth.

The personages in "Mungli Kuzlar" : Yoqutxon, Said Karimov, Aunt Qozi, Aunt Qumondon, Aunt Shaxodat lack characteristic features of patience, truth, conscience, generosity. Their government deprived them from their spiritual world and culture. The family of Yoqutxon bankrupted not knowing sins and patience, as for the people who lived in wealthy- rich environment had no idea about obstacles and difficulties in life. The rich family became poor

because of their being too proud in life. The people in the story were rich enough, but their inner spiritual world was too poor.

By the way, the writer tried to describe inner and outer world of people openly.

He reflected all characteristic features of people in his story.

The events of detective stories occupy a special place in every reader's heart. It's natural that no person's even adult's patience cannot tolerate this kind of misfortune in life. The writer describes that there is no justice in the society where truth has been looking for by adults.

"Alvido bolalik" by T.Malik is also considered to be a detective story in Uzbek imaginative literature.

The story is told by the third person –that's to say by the writer himself. The story is about Asror who entered the world of crime abruptly. The composition of story consists of several chapters. Many stories are related to the fate main heroes' life.

The writer revealed psychologism of the story through adults who entered the world of crime because of their being left alone without parents.

For example, Qamariddin is a complex person which cannot be compared with other Uzbek personages in stories.

It's noticeable that the adults entered the world of crime and they have no fears in their eyes. They commit crime by stealing people's money even they are ready to kill them. The whole story is about the crime of young juvenile delinquents.

The main hero is Qamariddin who is the head of the group which consists of robbers. These young adults steal people's money by frightening them. They commit crime without knowing anything.³

However, the readers start to understand the hero of story when they read about the chapter "The miserable life of the left child". Gradually, they get to know about hero's philosophy. That's to say if we want to understand the hero we should be born and live, try life drops of poison as Qamariddin.

The following gives explanation to our statement:

"Qamariddin doesn't still know who is his father. For the first time he saw his birth mother when he went to school. He was brought up in orphanage. He did not know what is love of parents. He used to look forward to someone's coming to take him away from this house. People came but no one wanted to take him. Perhaps, he was cross-eyed and walked like a bear. That was the reason that no one hugged and kissed him.

The writer pays attention to the children who live in orphanage waiting for someone who will take them away from this house and they will have happy life. Sometimes these children lost their hope about their parents and they start to invent stories about them:

"My parents were spacemen. They flew to the sun and while coming back their spaceship ran out of petrol and exploded....."

Qamariddin also believed that his father was a pilot and mother served in military campaign. They died when they went to the war which held in Berlin to defend their country from enemies.

But when the boy learnt how to count, he found that he was born after the war, twenty years later.

When his mother came to see him he was 10-year-old child. A feeling of pure hatred flashed across his face when he saw his mother. His inner voice told him:

Qamariddin run away, she is not your mother, she is a witch. She hasn't come to see you for 10 years, therefore she cannot be your mother."

The writer gives explanations to these problems: the woman made a big mistake when she considered his son to be a little child. The children who are growing without parents' love have different philosophy about life. They feel hatred towards their parents when they were too young.

When Qamariddin's grandmother died, his mother took him to the house once. Two days later he was returned to the orphanage.

The young boy could not tolerate the bullying of people when they insulted him saying that he was an illegitimate son. He beat everybody who abused his parents.

He was punished for his bad behavior by the authority of orphanage. The hero fought with himself: "Why do these people find innocent children guilty? Is this my fault that I am orphan without parents' custody? What am I to do? Who is my protector?"

It is obvious that he is orphan although his mother's being alive. Other events happen spontaneously. Finally, he came to conclusion: "You have no one who can defend you, you ought to fight for justice with your power and defeat all of these people who are going to insult you. Show yourself to them! If you cannot show yourself, you had better die..."

Qamariddin took his first steps to the world of crime. The child who needs 'love' and 'care' choose this incorrect way of living in this story.

One day Qamariddin gathered some boys and went to that district where he was bullied and insulted. He apologized:

"I came to apologize you for my behavior, forgive me, please, with hundreds of excuses."

The boy who was beaten by Qamariddin replied:

"Oh, this young miserable creature who is being brought up in the orphanage came to regret for his misbehavior."

Qamariddin gave his hand to that boy as he was pretending to forgive him.

"Forgive him", said another boy pointing his finger to Qamariddin.

"Nazimchik, forgive him, as he has already been punished by the God", continued the conversation the other one.

Nozim gave his hand to Qamariddin nodding his head. Qamariddin took hold of Nozim's hands and pressed them tightly telling him:

"I am sorry that I had not awfully beaten you then." He beat Nozim and his friends again and again. Even he threw a big stone to the car of Nozim's father.

The writer wants to show that no one is born as a robber or murderer but life and people's attitude make a person to choose incorrect way of living. The author tries to describe Qamariddin's psychology thoroughly. By this way he is eager to show the world of crime today.

The reasons why adults are committing crime are their poverty, elders' attitude towards them. If the society wishes to get rid of these young creatures, it will take away other children too. We can see the adults' psychology who committed crime without knowing its outcomes in the story of "Alvido bolalik".

Furthermore, there are juvenile delinquents who selected wrong ways of life living in good conditions in the story. This kind of spoiled children were rich enough that they wasted their parents' money.

Conversely, there is a personage –Asror who is not a cruel murderer or robber. He joined this bad group abruptly. As the boy used to work with his father in weddings. His family incomes were not enough for him. Qamariddin was his close friend. He used to give Asror small amount of money for his daily expenses.

One day the whole group of Qamariddin went to have a drink to the pub. They saw a stranger and asked him if he had a cigarette. The stranger refused to give cigars to these adults. Consequently, he was beaten until his death by these miserable young adults. The young group of robbers threw the body of this man to the lake at midnight.

Asror's spiritual feelings starts from this day. He suffered when he remembered the face of the killed man. Every moment in his dreams and in his real life he saw the spirit of this man. He was calling him somewhere.

The reasons why adults' committing crime are explained through the events of the story.

Passing through the bridge Asror thought about three ways: he was in dilemma which one to choose.

There is a white Devil in the first way. There are some people who have a lot of money. But they are ridiculously silly enough. Select this way, you will be rich and you will have a lot of entertainment. People will give you much money. However, they may take advantage over you. If they ask to bark, you will bark like a dog. If they ask to meow, you have to meow like a cat. If they tell you to laugh, you will have to put face and pretend to laugh. And you must bend your head down by saying: "thank you my dear brother." Never mind, take your money. That's the most important thing for you. This white Devil looks like his father.

Asror has never looked straightly at his father's eyes. Therefore, when he looked at the white Devil he felt a feeling of fear in his eyes.

There was a black devil in the second way. This black devil urges a person to choose this way saying: "This is every boy's way. You won't bend your head down. In the contrary, other people bend their head down to you. They will be afraid of you. You will do everything you want. You will be as free as a bird. This black Devil was his close friend Qamariddin. But Asror liked him more than his father even though his friend was cross-eyed and walked like a bear.

There was the third way in a gloomy dark place. There was his teacher Maxmud waiting for him. He was a straight-haired kind-hearted man.

After the murder case Asror used to pass through the bridge where the stranger was thrown. He was in panic. Once he fell down the bridge and died.

Why did Asror choose this wrong way? Because his family and school life forced him to choose this incorrect way of living.

There are other personages Sanjar, Dilfuza, Salim who were also innocent adults who had to commit crime.

For example, Dilfuza was an orphan young girl whose mother died several years ago. She had a disabled father. She had no friends in her life. When she came from orphanage to school, schoolchildren used to bull her and make fun of her.

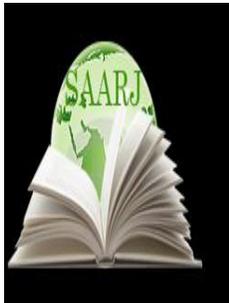

Fortunately, there were other people who cared about her, they were Asror and Qamariddin. They provided her financially.

In conclusion, the writer says that these young adults are like fruits of a garden. If the fruits disappear in the garden, there won't be any gardens in the world. Therefore, we cannot imagine our society without our future generation.

THEORETICAL AND DIDACTIC PRINCIPLES OF DISTANCE LEARNING

Shavkatovna Dilora Sidikova*

*Doctoral Student,
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

In the article, the student and teacher in distance education are considered to be realized by means of continuous communication with the help of specially created training courses, forms of control, electronic communication and other technologies of the Internet. Distance learning, based on the application of Internet technology, provides access to the world information education network, performs a number of important new functions that have the principle of integration and interoperability. Distance learning is an educational complex based on means of exchanging distance learning information, with the help of a special information environment, providing educational services to all strata of the population and foreign education recipients.

KEYWORDS: *Technology, Integration, Distance Learning, Instructional Material, Teaching, Telecommunications, Textbook, Instructional.*

INTRODUCTION

The penetration of Internet technologies has sent cases that have not changed for several centuries. This was manifested in the usual correspondence with e-mail, and in the exchange of libraries with websites. Now, instead of traditional forms of education in the educational system, elements of distance learning have entered. The penetration of modern information and communication technology tools into the educational process has been a factor in the creation of a new form of teaching - distance learning in addition to traditional teaching methods. In distance education, the student and the teacher communicate continuously with each other using specially created training courses, forms of control, electronic communication and other technologies of the Internet. Distance learning, based on the application of Internet technology, provides access to the world information education network, performs a number of important new functions that

have the principle of integration and interoperability. Distance learning provides continuous improvement of their skills to all those who wish to receive education. In the process of such teaching, the student adopts independent teaching-methodical materials in an interactive mode, goes through control, supervises the control work under the direct guidance of the teacher for certain reasons, distance learning is a convenient form of training for those who do not have the opportunity to study in the daytime departments of educational institutions, for example, those who do not. In distance learning, different types of information and communication technologies are used, that is, each technology depends on the purpose and essence of the issue. For example, if teaching tools (textbooks, textbooks) based on the traditional printing method are based on the introduction of students with new material, interactive audio and video conferences are designed to interact between a certain time, to send and receive e-mails correctly and in reverse, that is, to send and receive messages. While pre-tape-sealed video recording allows students to listen and view lectures, fax communication, instant exchange of messages, assignments over the network allows students to be taught through mutual feedback. Based on the above, we will come up with descriptions and definitions of some terms that are being repeatedly mentioned in the educational process at the same time. Distance learning is a form of education based on information and telecommunication technologies, such as correspondence and day education, which includes the best traditional and innovative techniques, teaching tools and forms. Distance learning is an educational system based on new information technology, telecommunication technology and technical tools. It is a system that requires the learner to engage more independently than the learner, by providing the learner with educational conditions and communication with the teacher on the basis of certain standards and educational laws. The process of reading in this does not depend on at what time and in what place the educator will be. Distance learning is an educational complex based on means of exchanging distance learning information, with the help of a special information environment, providing educational services to all strata of the population and foreign education recipients.

For certain reasons, distance learning is a convenient form of training for those who do not have the opportunity to study in full-time Departments of educational institutions, for example, do not require health care, have the intention to change their profession or are older, intend to improve their skills. In distance learning, different types of information and communication technologies are used, that is, each technology depends on the purpose and essence of the issue. For example, if teaching tools (textbooks, textbooks) based on the traditional printing method are based on the introduction of students with new material, interactive audio and video conferences are designed to interact between a certain time, to send and receive e-mails correctly and in reverse, that is, to send and receive messages. While pre-tape-sealed video recording allows students to listen and view lectures, fax communication, instant exchange of messages, assignments over the network allows students to be taught through mutual feedback. Based on the above, we will come up with descriptions and definitions of some terms that are being repeatedly mentioned in the educational process at the same time.

Distance learning is a form of education based on information and telecommunication technologies, such as correspondence and day education, which includes the best traditional and innovative techniques, teaching tools and forms.

Distance learning is an educational system based on new information technology, telecommunication technology and technical tools. It is a system that requires the learner to

engage more independently than the learner, by providing the learner with educational conditions and communication with the teacher on the basis of certain standards and educational laws. The process of reading in this does not depend on at what time and in what place the educator will be. Distance learning is an educational complex based on means of exchanging distance learning information, with the help of a special information environment, providing educational services to all strata of the population and foreign education recipients. Distance learning system is a system of teaching that is organized on the basis of distance learning conditions. Like all educational systems, distance learning system has its own structural purpose, content, methods, tools and organizational forms. Why did distance learning become necessary? - it is natural that the question arises. The answer to this question can be listed as follows:

- new opportunities in education (low cost of education, lack of attachment to time and place, etc.).
- limited number of student admission to educational institutions. - An increase in the number of those wishing to receive education.
- the emergence and development of quality information technology.
- international integration. The conditions and opportunities listed above indicate the need for distance learning. In the educational system of distance learning there are models and forms that differ from each other, they differ in the following terms of application::
- geographical conditions (for example, the territory of the country, its location far from the center, its climate);
- general level of informatization and computerization of the country;
- the level of communication and vehicle development;
- the level of application of information and communication technologies in educational process;
- traditions used in education;
- availability of scientific pedagogical personnel for the distance learning system and their potential, etc. In general, the purpose of distance education is as follows: - to provide the opportunity for all students, students, those wishing to receive education in all regions of the country and abroad to receive education in the same way. - The use of scientific and educational potentials of leading universities, academies, institutes, training centers, personnel training institutions, qualification improvement institutions and other educational institutions to improve the quality level of teaching evazi. - Parallel with basic education and basic work activities to provide an opportunity for further education.
- to meet the need for educators to be educated and to expand the educational environment.
- to create opportunities for continuing education.
- new opportunities in education (low cost of education, lack of attachment to time and place, etc.).
- limited number of student admission to educational institutions. - An increase in the number of those wishing to receive education.
- the emergence and development of quality information technology.

- international integration. The conditions and opportunities listed above indicate the need for distance learning. In the educational system of distance learning there are models and forms that differ from each other, they differ in the following terms of application::

- geographical conditions (for example, the territory of the country, its location far from the center, its climate);
- general level of informatization and computerization of the country;
- the level of communication and vehicle development;
- the level of application of information and communication technologies in educational process;
- traditions used in education;
- Availability of scientific pedagogical personnel for the distance learning system and their potential, etc. In general, the purpose of distance education includes:
 - To provide an opportunity for all students, students, those wishing to receive education in all regions of the country and abroad with the same education.
 - The use of scientific and educational potentials of leading universities, academies, institutes, training centers, personnel training institutions, qualification improvement institutions and other educational institutions to improve the quality level of teaching.
 - Parallel with basic education and basic work activities to provide an opportunity for further education.
 - To meet the need for educators to be educated and to expand the educational environment.
 - Create opportunities for continuing education.

- Ensure new principles of education level by maintaining the quality of Education. In summary of the above, we can say that the introduction of elements of distance learning into educational institutions is of every benefit. In the higher education system, there are all prerequisites for the introduction of this. The application of Information Communication Technology in the educational process (in particular the distance learning process) is mainly carried out in two different ways. The first condition is that this is technical equipment, and the second condition is provided with special software. 1. Technical equipment supply: computers, network enclosures, high-speed Internet access, video conferencing equipment and so on. 2. To software: a set of programs designed for the same field, from software that uses existing devices are based on. So in recent years, the type of education in electronic form through the Internet or networking, which is being used in the management of the education system in the West, has entered with the term E-learning (electronic education).

E-learning is a broad concept that refers to various forms of Education based on information and Communication Technology. E-learning's own electronic learning contents can be divided into groups based on the way they are delivered to the cognitive recipient [1]. We present the models of distance learning presented in the analytical research materials of the UNESCO Institute in 2000 ("Distance Education for the Information Society: Policies, Pedagogy and Professional Development").:

The consortium. This model consists in the unification of two universities. In this, they exchange training materials or share some of the tasks [4]. For example, one university produces educational materials for distance learning, another provides virtual teaching groups with teachers, or conducts official accreditation of distance learning programs. In such cases, the university may be a partner of commercial or government organizations that work entirely or in its separate centers, faculties, even in the market of educational services. The consortium will be effective only on the conditions of strict centralized management and compliance with the authorship and material rights of the created goods.

Franchise. In the distance learning model established by the franchise principle, partner universities give each other their own distance courses [3]. Any university that has established itself in the market of education services in this can give the right to teach its developed courses to other high school partners who are organizing distance learning and who do not have the experience of independent development of educational equipment for distance learning. The interesting aspect of such a model is that students will have educational services in the same volume and in the same quality as an advanced high school student who is enrolled in a consortium by enrolling in their university, mainly diplomas after graduation. Here all attributes of the advanced university retain their strength.

As an example of the franchise model, it is possible to take the business school under the Open University of Great Britain (Open University Business School, Great Britain) and its relationship with universities in Eastern Europe.

Being a very common model of distance learning, educational institutions are able to sign an agreement that all partners of distance learning services can perform equally. One of them is the diploma validation, does the accreditation of courses and programs, is responsible for the issuance of officially recognized diplomas and certificates, gives scientific degrees, and so on. Chief higher school (state

Technical and software requirements for the organization of the distance learning process in the educational institution can be implemented on the basis of the following stages in the implementation of the MT process:

Step 1: analysis

Step 2: designing

Step 3: introduction

Step 4: create training content

Step 5: launch

Stage 6: Development [2]

At Stage 1, the needs of the educational institution for the distance learning process, the number of users participating in the educational process, the methods and forms of teaching, the technical, programming and human resources required for the implementation of the project, the economic basis of the project are analyzed. The scope of work to be carried out as a result of the analysis in Step 2 and the technical assignment will be improved. In the 3rd stage, the software complex that manages the selected distance learning process is installed on the appropriate

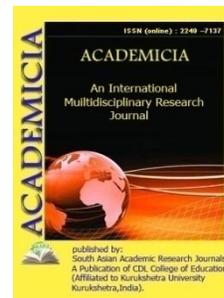

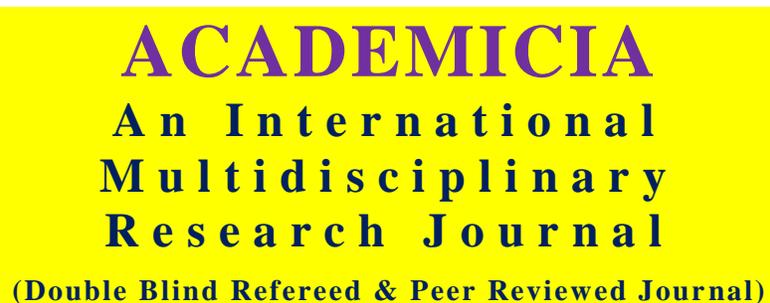

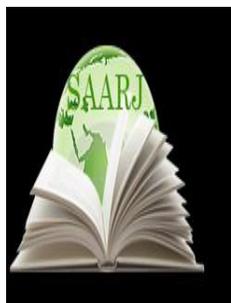

server, the system domain is selected. There will be organized training sessions on the use of a software complex that manages the distance learning process and training of technical support staff. At the 4th stage, one of the main elements of the distance learning process, the educational content will be created in cooperation with the training department and specialists of the field. The educational content created is checked by the experts. At the 5th stage, the distance learning process will be launched. In the process of education, the learning process is under constant control. Security measures in the system are monitored. At the 6th stage, the existing shortcomings will be corrected at the above mentioned stages, new training courses will be created, technical opportunities will be created, the scale of work related to the development of the system will be implemented.

ABSTRACT

In this article was discusses the subject of pedagogical experience, describes the goals, objectives, and the analysis of the experience of the pedagogical experience, and analyzes its outcomes, in order to substantiate the peculiarities of the creative work of pupils in the mother tongue education. The main purpose of designing the creative activity of pupils in mother tongue education is to improve the quality of education and improve their quality. When and how to design the creativity of pupils in their mother tongue education provides the desired pedagogical effect? Responding to this question requires a combination of educational types, including interpreting illustrated-visual education and creative learning.

KEYWORDS: *Mother Tongue, Primary School, Creative Education, Creativity, Creative Activity, Project, Design, Thinking, Learning Process, Productivity, Pedagogical Experience, Organization, Management, State Education Standard, Reader.*

INTRODUCTION

Expository teaching is one of the most widely used types of education and has a number of advantages. However, the lack of this tutorial reflects the shortcomings of explanatory and illustrative education, such as poor attendance of learners in the teaching and learning process, and the general nature of negative feedback. Creative learning opportunities are very high in addressing these shortcomings. There are peculiarities of creative education: the didactic content of educational content, the fact that the educational process is both memorable and contemplative, personality of students' learning, and the activity of students in education are unique qualities of creative education. Adherence to them will increase the effectiveness of the learning process. According to these, the effectiveness of teaching in the context of creative education is defined as the subject of pedagogical experience.

Didactics and methodologists explain the difference between the educational objectives of the teaching process and the outcome of the learning process. The smaller the gap between the objective and the achieved results in the learning process, the more effectiveness will be in education.

Qualitative performance indicators are determined based on knowledge and methods of operation. Quantity indicators are determined by the difference between the learning objective and the students' knowledge, skill, skills. Efficiency improvement will be tested in the following areas: Improvement of quality of education (scale of students' knowledge, level of generalization, application of knowledge in production, ability to use knowledge and skills when necessary); raising the target of the learning outcome (knowledge, skills, experience of creative activity at the level of the State education standards and at a higher level); to ensure that the teaching and learning process is consistent with its essence; rational distribution of time budget.

The listed directions make it much easier to define the goal of pedagogical experience: the purpose of pedagogical experience is to establish the effectiveness of organizing, managing, and controlling creative education on the basis of scientifically-projected design tools.

The tasks to the subject of pedagogical experience, we have defined pedagogical and methodological approach as experimental tasks.

I. Defining the subject of pedagogical experiment, its purpose. The effectiveness of the creative education was examined by analyzing the factors that led to the effectiveness of the learning, and the purpose of the research was shaped.

II. Describe the innovations introduced into the mother tongue education system in primary education in terms of creative education. Based on designing the mother tongue education, the students have improved their teaching skills in general secondary education, and have developed a conceptual design concept that has the ability to organize, manage, and manage education.

III. To record forms of comparison of creative education to explanatory and illustrative education to study and describe the effectiveness of the pedagogical experience. To qualitatively address this task, teachers were provided with explanatory, visual and creative education lessons, and gave appropriate recommendations.

IV. Gradual recording of individual changes in pupils under creative learning. To this end, the individual traineeship plan has been developed. It clarifies the pupils' perception of the teaching material; clear, complete and careful execution of tasks; attitudes of interest, independent assignment of tasks.

V. To study the effectiveness of designing the creative activity of students in the mother tongue education. The effectiveness of the program varies from the point of view of its use to the design process, and it is difficult to measure it on a single criterion. Nevertheless, designing a mother tongue education is seen as a key feature of the course's effectiveness. The reliability of the project is understood as the degree of eradication.

The design of each lesson and the conditions for its implementation should be clearly defined. The effects of these features in the teaching experience on the effectiveness of the lesson have also been studied.

VI. Collecting results for analysis. It is a method of recording the results of pedagogical

experiments using statistical methods and methods of statistical methodology, showing superiority of methodology and superiority over one.

The elementary grade is the search for ways to solve specific problems related to the peculiarities of design, design, and psychological, pedagogical, methodological foundations of the creative activity of pupils in the mother tongue education. For this purpose, we started looking for answers to the question of whether or not the students will be able to raise their knowledge on the basis of designing their creative activities in mother tongue teaching. For this purpose, there were selected four general secondary schools and 5 classes in each class for experiments.

When classes were organized in regular classes, students were slowly absorbed in the learning process and only completed two or three exercises per lesson. Many of the readers took part in the lesson as an observer. The rest of the students also found that their answers to the teacher's questions did not fully absorb the learning material. The assessment of the students' knowledge on the lesson was partly implemented and the assessment was not fair.

In the mother tongue education, students' active participation in project-based lessons was demonstrated through the preparation of creative activities of pupils. The students were able to practice 4-5 exercises in one lesson, and their answers to the teacher's questions were justified. The level of readiness of students has increased. When using the project for student activation, a complete and objective assessment of the students' knowledge was provided.

The problem of designing the creative activity of students in mother tongue education is analyzed in the school practice. In the mother tongue education, we consider experimenting students' creativity as a system, to distinguish features of creative learning, and to share the ideas of school teachers about creative education. We distinguish between the strengths and weaknesses of creative education by comparing the true state of the practice of creative organization of mother tongue education and the teacher's opinions.

1. The experience of creating a native language in elementary classes. In order to study and summarize the existing experience in creative organization of mother tongue, the lessons of progressive teachers were recorded and recorded. During the tracking and registration process, the following questions were addressed: a) questions related to the purpose of creative education - the goals, objectives, objectives of creative organization of education, the purpose of the educational objectives of the curriculum; b) questions related to the content of creative education - the content of creative training assignments, the content of creative assignments, the content of the teaching material, the relevance of teachers to the real learning opportunities, the role of the curriculum in a given or other creative work; c) questions related to the procedural features of creative education - questions of the type, stages of creative assignments, the real learning opportunities of the teachers in creative education, the methods used in the creative work, methods of recording activities; d) Questions relating to the outcome of a creative work - the importance of a particular or creative work for the pupils, the ability to complete the training objectives in the learning content, the role of creative work in the formulation of independent workforce and so on.

During the course observing and recording we have based on the types of lessons developed by prof. O. Rozikov [1]. Here are some of the following topics: lessons on teaching and strengthening new learning materials; lessons learned and retraining; classes of generalization of knowledge and skills; Knowledge and Skills Controls [1, 34-68]. Over 200 tutorials on the

problem of creative organization of education were recorded and recorded. Distribution of lessons learned on organizing creative activities is given in Table 1.1.

TABLE 1.1 DESCRIPTION OF OBSERVED LESSONS BELONGING TO ORGANIZING CREATIVE WORKS

Number of observed lessons	Types of the lessons			
	The lessons of teaching new theme and strengthen them	The lessons of repeating previous lessons and building up skills	The lessons of generalizing of knowledge and skills	The lessons of observing or controlling knowledge and skills
200	57	123	8	12

As it is seen in the table, the possibilities for creative education in each of the native language classes are extensive. The first lesson is the core of the lesson that teaches and strengthens new teaching material in the mother tongue is to train teachers to explore a new theme, to provide new insights, rules, thematic perceptions, and to reinforce the knowledge and practices that have been first learned. Students will focus their attention on a new topic and the relevant facts, by putting problems in the learning process, putting questions, creating difficult learning situations, and explaining the purpose of teaching the subject. Consequently, it can also encourage learners to engage themselves in self-determination, to identify difficult issues, and to increase the effectiveness of teaching, and encourage teachers to work creatively. During the second phase of the course, the students will be able to explore new knowledge and methods of work: a comparison between the previously learned topic and the findings on the topic, the observation of the facts, the findings from the observations, the conclusions in the textbook, comparison. This kind of curriculum provides teachers with creative independent work. Similarly, after studying the subject, it is possible to carry out various creative works during its strengthening. The creative work of this kind includes the description of the definition, the transfer of rules to new evidence, the definition, the introduction of the rules into the new learning mode. It is clear from this that in each of the classes, there are many opportunities for teachers to engage in creative activities, making them methodically accurate. In this regard, we refer to the experience of the teachers: 57 subjects of the classroom were trained and strengthened, and 25 creative workshops were organized. Every creative work is arranged for about 3 minutes. The distribution of creative work in the main stages of the lesson is given in Table 1.2.

TABLE 1.2 NUMBER OF CREATIVE WORKS IN LEARNING NEW EDUCATIONAL MATERIALS AND STRENGTHEN THEM

Number of the lessons which were written	Period of teaching (In minute)	Main stages of the lesson			Time for creative thinking (In %)
		Preparing to learn the new educational material	Teaching the new educational material	Strengthen the new educational material	
57	2565	12	33	30	75
In (%)	100	≈2,3	≈6,2	≈5,3	≈13,8

From the table, two conclusions can be drawn: first, the first type of mother tongue lessons is held occasionally, although limited time is spent for creative work; but in spite of this, the teacher's creative work in the mother tongue is limited to a limited amount of time. It takes about 3 minutes to identify and complete each creative work. Lesson 14% of the total time budget is spent on creative work in the training and strengthening of new teaching materials. This allocation of time budget is based on the teacher's activity, with new training materials, mainly deductive.

The second lesson will be improved: the skills learned in the lesson of repeating lessons and skills development. We have 123 classes of this type. Ongoing lessons mainly focus on textbook exercises. Lessons for retraining and skills development are intended for teachers' memorization, with a long amount of time spent on teaching activities, such as applying knowledge to a similar situation. This, in turn, pays little time for creative assignments in education. In total, 103 workshops have been conducted and average 5 minutes have been spent. All creative works were characteristic of applying the learned knowledge to the given circumstances.

In the methodological literature there are three main stages of repeating and skill-building lessons: enhanced learning and learning. Defining the definition of the evidence, how to define the rule, recalling the description, the rules, the definition of the problem, the definition of the rule, and so on. In these training sessions, students will be able to recall their knowledge and ways of acting in ways that they can act independently. This type of creative work will be organized in the studied lessons; apply the learned knowledge and methods of study to different learning situations. The 103 creative assignments we have observed correspond to the second phase of the lesson, the process of applying knowledge and methods of action; the stage of identification of novel new aspects of the learned concept, rules. The study of the trail, the rule of law, the separation of its new features, and enrichment of knowledge with new information are called dumping in didactic research. The cumulative phenomenon - the greater the efficiency of the creative transfer of education, if the knowledge gained and the methods of learning are continuously studied at all stages of the educational process, from the initial learning. There were no cumulative nature study assignments in the observed lessons. The distribution of creative work in the main stages of the lesson is given in Table 1.3.

TABLE 1.3 DESCRIPTION OF CREATIVE WORKS USING DURING THE LESSON

Number of the written lessons	Time limit of the class(in minetes)	The main stages of the lesson			Time for creative thinking
		Recognizing knowledge, methods of action	Implementing the knowledge, and methods of action	Expanding knowledge, methods of action	
123	5535	-	515	-	515
In %	100	-	≈13	-	≈13

From the analysis it is clear that in the second lesson of mother tongue - repeat lessons and qualifications, only 13% of the total time budget is devoted to organizing creative work of teachers. It can be found to be reasonable enough. But one of the weaknesses of the technology of organizing and conducting creative work is to mention that the weakness of the lesson of

repeatability and qualification is to neglect the teachers' creative work against the course stages. In scientific and methodological researches, every stage of the lesson, each ring of the educational process, teaches the need for teachers to carry out creative tasks at each stage [1, 62].

The next kind of mother tongue lessons is a lesson of generalization of knowledge and skills. In this lesson, knowledge, skills are learned at the level of consciousness. However, most of the teachers in the classroom do not differentiate between this type of course. There are a number of specific features of the lesson on knowledge and skills acquisition: a comparison of two or more topics. For example, let's get the same task: two columns are given. Compare them together, identify each one's own queries, and then write on each column what it means.

- 1 column 2 column
- the engineer is red
- builder is blue
- the doctor is purple

As mentioned above, the generalization of knowledge and skills is based on the concept of generalization. "At the level of the concept it is not the concrete symptoms of certain grammatical phenomena, but its general features. The basis of this is common for some of the learned events. Using of assignments that provide high levels of abstraction in the workshop [2, 64]. For example, the unit (pen) and plural (pens) are used to teach the use of unity and plurality in the horses: - Other marks (including respect, cropping, and meaning of the words) are ignored, contrary to the meaning of unity. The aggregation exercise is organized around the two types of plots and units.

There are a number of stages in the class of generalization of knowledge and skills; comparing two or more topics; making general conclusions by comparing; applying the conclusion to the said curriculum. The lessons learned have not been used in comparing evidence, making general conclusions, and applying abstracts to curricula.

Our observations confirm that elementary school teachers can not clearly define the types of classes, the specific features, goals, objectives of each lesson. With this aim, a questionnaire was organized on the types of mother tongue lessons, the specific features, goals and objectives of each species. 50 primary school teachers and 4 students of 50 primary education faculties participated in the survey.

The questionnaire has 4 questions, the name of the lesson: the sample of the first type of questionnaire.

1. Your name and surname.
2. The school you are working on.
3. Teaching experience.
4. Answer the questions on the lesson on teaching and reinforcing the new learning material.
 - A. The main objective of the course is to teach and strengthen the new learning material:
 - B. Identify the main stages of the course type.

V. Give examples of the creative work that takes place at the main stages of the lesson.

G. Your opinion on how to organize the lesson.

Such inquiries are based on all types of lessons, and the teacher who fully responds to questionnaires collects 10 points, and loses 2.5 points for one wrong answer. The teachers who participated in the survey were divided into 4 groups: 1 group of teachers with higher education; 2 nd group 4 course students; 3 groups - teachers with higher education; 4th group 4th year students. Each group responded to specific questions. For example, teachers with a group of high school teachers will be asked questions related to the 1st class, 2nd grade 4th year students will be asked questions related to the 2nd class, 3 groups of teachers will be asked questions about the 3rd class, 4th grade students will be 4- answered questions about the course type. Then the questionnaires were replaced: Group 1 survey 2, Group 2 Survey, Group 3 Survey 4, Group 4 Survey Question 3. After the questionnaire was changed for 3 and 4 times, the participants were fully qualified to complete their assignments. The responses of the 1st and 3rd group, 2nd and 4th group participants were compared to each other to compare the responses of school teachers and students. An analysis of the responses of the 1st and 3rd group respondents showed that graduates of higher education institutions and elementary school teachers with higher education had a good idea about the types of subjects, their goals and objectives. It turned out that students and teachers could experience a lot of confusion in identifying the peculiarities of each type of course and their main stages. 15 out of 100 participants correctly identified the main stages of the first lesson, but allowed confusion as to defining creative works with the lesson stages. For example, the number of teachers who differentiate between the key stages of teaching and reinforcing the new teaching material, and the ability to devote their creative teaching assignments, is considerably smaller. To confirm our point of view, we present a summary of the first type of class in the form of a table.

TABLE 1.4 THE AMOUNT OF TEACHERS WHO HAVE DEVOTED THEIR CREATIVE TEACHING TASKS TO THE LESSON AND STRENGTHENING THE NEW LEARNING MATERIAL

Number of applicants	The main stages of the lesson			The number of teachers who think creative works are important at the process of the lessons
	Preparing to learn the new educational material	Learning the educational material	Strengthen of the learned materials	
100 teachers 100 %	3	4	8	15 teachers 15 %

From the teachers who participated in the survey, 3 teachers were involved in the preparation of a new study material, and 4 teachers were involved in the creative process directly in the process of explaining new themes, and 8 teachers shared their creative works with the topic. Thus, 15% of the respondents described the creative work related to the process of teaching and strengthening the new teaching material. By comparing teachers' lessons with evidence (13.8%),

the comparison between the answers to questionnaires questions (15%) has led to a number of conclusions: teachers' creative work in pedagogical practice is very close to each other's ideas of creative work: 13.8% and 15% respectively. This indicates that the method of organizing creative work gradually takes place in teachers' work; In both the didactic and the mother tongue, the instructional work of the teacher, starting with the memory work, and, on the contrary, a memory-based learning task must be completed with creative work. It allows you to define the proportion of creative and nonviolent activity in the form of 50% -50%. Creating a creative (50% -50%) creative and nonviolent activity increases the effectiveness of education. There are some difficulties in raising the performance of school teachers to this level. The difficulty of teachers' work in creative organizing can be divided into four groups.

Group 1: Challenges to the goals and objectives of creative organization of education. This group includes challenges such as the inability of teachers and teachers to define the objectives of the curriculum, the discrepancy between the teaching tasks and the didactic goals of the learning process, the discrepancy between the teaching objectives and the instructional material, and the inability to integrate educational objectives into educational objectives.

Group 2: Challenges related to creative design of education. The challenge is not knowing the technology of transforming the content of the educational material into a creative work system, to determine the role of the creative work in the system of instructional tasks, the inability to understand the optimal combination of creative and creative work in the context of language teaching, and the incompatibility with the logic of learning curricula chosen.

Group 3: Challenges to the content of the mother tongue education in the learning process. Such pedagogical and methodological difficulties include the fact that the curriculum is incompatible with the type of course, the lesson, the incomplete implementation of all the functions of the teaching assignments, the age, individual characteristics of the teachers, the inability to study the real learning opportunities, and ineffective use of tasks.

Group 4: Challenges to Objective Recording and Assessment of Learning Outcomes. These difficulties include the lack of systematic approach to control the expected results from education, the systematic approach to learning outcomes, and the ways in which the use of traditional testing and testing methods has been tested in Uzbek schools.

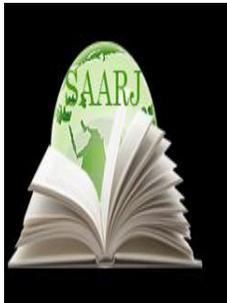

In one group, traditional methodologies and the other were taught using native language teaching in native language teaching, and in the next lesson, students' knowledge of the previous lesson was found to be high in the group of experimental learners. As a result of the observations, the results of the supervisory work, the interviews with the teachers and the students, we came to the conclusion that when the mother tongue lessons were organized under the pedagogical and methodological basis, we could raise the students' knowledge.

SCIENTIFIC-THEORETICAL BASES OF USE OF PEDAGOGICAL TECHNOLOGIES IN TEACHING METHODS OF MOTHER TONGUE

Shavki kizi Umida Togayeva*

*Doctoral Student,
 Bukhara State University,
 UZBEKISTAN

ABSTRACT

This article covers the application and importance of pedagogical technologies in the methods of teaching the native language. The methodology for the use of pedagogical Technologies is theoretically justified. In particular, scientific research on the methodological basis of the systematic organization of language education, the formation and development technologies of theoretical bases of activating students, updating the content of education, starting from the primary school, is of great importance in improving the didactic provision of improving the effectiveness of speech and thought Development.

KEYWORDS: *Information Technology, Pedagogical Technology, Technical Tool, Didactic Tool, Pedagogical Skill, Informative Tool.*

INTRODUCTION

XXI century as a century of potential, contemplation and spirituality with the opening of new horizons before humanity, we have not seen before, not encountered sharp problems are also emerging. Educators are required not only to teach young people in the spirit of modern times in today's difficult times, but also to think about the future of mankind, our homeland and our people, and to carry out educational work aimed at encouraging young people to be kind, to be kind, to be kind and to be tolerant.

According to the views decided in the East on the human mind, the mind will be of two kinds, namely natural and professional. Natural intelligence is endowed from birth to man. And professional intelligence is acquired thanks to study, knowledge and experience. An honorable and hard task, like the formation of a professional mind, is entrusted to educators. In the chapter "The Times of upbringing" in Abdulla Avlani's book "Turkiy Guliston yokhud akhlok (Turkic Gulistan or morality)" there are such sentences. "Now openly stated that it is necessary to start

education from the date of birth, to strengthen our body, to enlighten our minds, to beautify our morals, to enlighten our minds. Who makes the upbringing, is registered?"- the question comes up. To this question the first is home education. This is the main task. Second - school and Madrasah education, this is the duty of the father, teacher, mudarris and the government," we answer". The same school and Madrasah education was carried out before and it is also carried out now by teachers.

Particular attention is paid to ensuring the effectiveness of education through innovative technologies of achieving harmony of language and thought in the educational content, which is considered as the driving force of the development of the state and society on a global scale. In particular, theoretical and practical issues of increasing the effectiveness of language education in the scientific centers of developed countries of the world, such as Japan, Germany, the United States, the Russian Federation, Canada, as well as the problem of improving the quality of teaching are being studied. In particular, the problem of "radical improvement of teaching through innovative pedagogical Technologies" is defined as an urgent task in the UN agreement on issues of Education, Science and culture.

The introduction of modern information and communication technologies on the basis of individualization of teaching methodology and integration of competency approaches in the world practice of the educational system is considered as a leading factor in ensuring the quality of Education.

In the educational institutions of Uzbekistan, which are being updated, the development of such qualities as independent thinking of students, conscious attitude to the surrounding reality, integrity and social activity, speech and thinking, perfection of a person with a high spirituality have caused the need to widely apply advanced pedagogical and information and communication technologies starting from the primary education system as an important task of "independent thinking, having a firm Life view, educating young people loyal to the motherland, deepening democratic reforms and increasing their social activity in the process of development of civil society", defined in the "strategy of actions for further development of the Republic of Uzbekistan", provides the basis for the formation of the individual's social potential, ensuring active and successful participation in

It is possible to achieve the intended goal only when the process of information education is pre-pedagogical design. One of the main directions of computerization of the pedagogical process and the sphere in which it is necessary to engage in pedagogical technologies.

Information technology is the organization, storage, development, recovery, transmission methods and technical means of information that develops the knowledge of people, their capabilities in the management of technical and social processes. It is also understood that information technology is a creative activity consisting of a chain of processes that are carried out to achieve a particular goal. If the processes that make up the technological chain, the possibility of using computers to organize and harmonize the exchange of information between them, the efficiency of any technology will increase.

The role and opportunities of the school native language course in the development of creative thinking, creative research, selection of the most optimal of the available opportunities, the correct, appropriate and effective use of the rich opportunities of our language according to the conditions of speech, the integration of qualifications and skills, their upbringing in the spirit of

our national values, traditions and traditions are Especially for our independent republic, the training of this science is of great importance in a situation where the issue of training an entrepreneur and a creative person is a very important task. The purpose of teaching the mother tongue in the school stems from the functions that the language performs among the members of the society. Because, people actively interact with each other in all spheres of their activities. They constantly reflect on something in the material being that surrounds them-items, events, and make their own thoughts pleasing to each other.

Today, the educational process can not be imagined without information technologies. Because of the further increase in the effectiveness of the lesson with their help is based on various studies. Therefore, first of all, we must arm the students of a higher educational institution with in-depth knowledge of modern pedagogical technology. It is very important in the methods of teaching mother tongue, especially the use of Information Communication and pedagogical technologies. Because through this science the student's speech becomes beautiful, the ability to think is enhanced.

The organization of educational activities in new modern forms and methods, purposeful management of students in the course of the lesson, is also considered as the main criterion of teaching activity. The application of modern types and forms of lessons based on advanced pedagogical technology means determining the position of the student in the educational process, providing him with a new side, a new attitude, skillfully managing this process with perception. The purpose of conducting competition lessons in the lessons of mother tongue is to test the knowledge gained by the student in the language lesson, to be able to use language opportunities in the process of mutual discussion-communication, to assess the level of speech skills, quick and clear thinking, and the ability to get out of problematic situations. Competition classes help students develop the skills of activity, resourcefulness, resourcefulness, become accustomed to independent creative observation and develop necessary and useful skills. Competition, which is one of the forms of effective lessons, is a tool for interesting passage of language lessons and active participation of students' debate requires vigilance from students. He teaches to think independently and intensively, to be present, about the right or wrong of the said opinion and to prove his opinion logically and consistently. It comes to the most correct and acceptable solution as a result of mutual dispute and dispute. The student listens to convincing arguments of the opposite side through controversy, realizes his own "I", his own worldview, the scale of scientific –positive thinking, about the fact that it is true or unjust, he gives himself an independent outline. It teaches to employ different methods and tools to protect one's own mind, creative thinking and productive use of language opportunities.

In order to conduct a discussion course effectively, students should have a broad understanding of the text or topic to be discussed, read it well and learn it. For this purpose, students will be required to::

- Active participation in the discussion;
- listen carefully to the speaker's mind;
- express their opinion clearly, without haste;
- maintain respect for the interlocutor during the discussion;
- Observance of speech etiquette and culture;

- do not deviate from the subject;
- Finding concrete, convincing evidence in proving one's own opinion;
- When it is known that those who argue are right, it is possible to recognize it and arbitrators.

When discussion classes are organized with advanced and inquisitive pupils, as well as with low-mastering pupils, the effectiveness of the lesson increases, a colloquial culture is formed in the pupil.

Consideration of thoughts with the method of rotation (turnover).

This method is used so that each subgroup of the topic of the lesson can discuss separately and see what they have written in the analysis of the whole group.

Each small group will discuss 3 tasks for 30 minutes, then for 15 minutes, the discussion will be held together.

Several assignments are hung to the audience together with the order numbers. Although each small group (2-3 people) will discuss for 10 minutes and write down the variant of their answer, then go to the next assignment and go to the end in such a way.

Each group receives its own color marker: in the I group there will be blue, in the II group there will be black, in the III group there will be green marker. Each of the suffixes is written on each sheet with its own color Flomaster, so that the participation of each of the three groups is clearly visible.

The assignment is replaced after 10 minutes, I group goes to the 2nd assignment, II Group to the 3rd assignment, and III group to the 1st assignment.

The group reads what was written by the previous students and writes and fills in the option of its own answer, in which the repetition of the option is not allowed.

Again, after 10 minutes, the group goes to the next assignment, reads What is written and fills it with their own answers.

After another 15 minutes, the answers will be analyzed and discussed.

Then the most suitable answer is selected and written down in a notebook.

This method involves discussing the topic as a community.

The use of markers of different colors is convenient for a clear perception of what is written and for an assessment of the participation of any group in the answer. The answers written are determined by the order of the group, which-it is convenient to calculate the correct answers. The smaller group, who wrote the answers in a larger, numbers than all, gets the highest score.

"Gallery rotation" method

All members of small groups are offered one problem. Although each group writes their own thoughts for 10 minutes, the answers replace the mentioned sheets with the second group. The next group should evaluate the answers of the previous group and, if the answer is not complete, offer its own option.

Examples of assignments on the subject of methods of teaching the native language on the same day:

Methodology for teaching the subject “Horse Word Series”.

1-th sheet: the methodology for teaching the concept of “Horse Word Series”.

2-th sheet: the techniques used in teaching the noun vocabulary.

3-th sheet: ways to strengthen the subject of the noun vocabulary.

After the students give their answers and fill in the answers of their fellow students, they all discuss these together and choose the answers that are worth the highest score.

“Syndicate” method

The group is divided into 3 subgroups, it is necessary to solve the proposed task from three different points of view. For example: who is currently dealing with the problem of native language teaching? The first group – in addition to teachers in this field, philosophers, sociologists, psychologists also conduct extensive research work, the second group - these work are devoted to the scientific staff, the masses of teachers-intellectuals, they pay attention to the effectiveness of the science of the methodology of teaching mother tongue and the educational and educational processes in the school, the third group – now the At present, it is impossible to achieve any result without the use educational measures in production or in some sphere of the national economy.

Thus, at the time of the discussion, the students will examine several solutions to the problems of this science; improve their knowledge and skills together with the discussion that they are dealing with the problem of the methods of teaching mother tongue. In this regard, they will improve their knowledge by analyzing the ways of eliminating the mistakes made in the field of native language teaching; learn to think from a critical point of view.

“Aquarium” method

3 people are selected from the group on a voluntary basis. These take place in the middle of the auditorium – the fur “fish”, and the rest become observers. The same small group is offered a situation, they need to discuss it together for 10– 15 minutes, and the observers Write down the correct or incorrect answers of their comrades in the circle. First the proposal "fish" is accepted, it is discussed by observers, then the observers say their proposals, the author of the best of these proposals goes to a small group instead of the student who did not say his proposal.

“What, where and when?”it is possible to pass like a title game, the teacher gives pre-prepared questions, the students discuss and answer these for 1 minute. If the answers are unsatisfactory, the other three students will go to the table and the game will continue. For example:

Question: What is the improvement and increase in the effectiveness of education in the current period? Answer: the methods of teaching and learning, the understanding of experiences and the creative approach to it, the theoretical justification of organizational forms, tools and methods of education, its management and logical structure often depend on the methodological preparation of the teacher.

Question: What is the role of education in the current period of development? Answer: the current development puts the important issues of education in the first place, calls for a new approach to the solution of theoretical and practical issues, to think more on methodological problems, to nationalize the content of education, to improve it, to improve organizational forms and methods of Education. The problem of general knowledge is one of the most important problems of the present time, it is the National that it meets the demand of the present period, it is like to serve the formation of universal qualities, the organization and selection of educational materials to be compatible with principles.

Advantages of the “Aquarium” method:

- The topic will be discussed together;
- The method allows you to disassemble the subject, check the knowledge of students;
- develop skills to lead a discussion;
- Training will take place in the form of a game;
- Each student participates.

Method” happy coincidence"

Through the” lucky coincidence " method, it will be easy to determine how the assignments given to the house on the topic are studied. To do this, Cards are made from paper and each card is asked 2-3 questions. Only on one card is written “Win “5” bet”. Who gets the same winning card is considered the owner of "lucky chance" and gets the highest score in today's lesson. Students who receive cards with questions are also evaluated on the basis of their answers to the questions. For example, in a higher educational institution on the subject of “new pedagogical technologies”. This game can be used mainly in practical training.

“Skarabey” technology

“Skarabey” is an interactive technology that gives students the opportunity to develop their mindfulness, logic, memory, to form a skill of open and free expression of their thoughts in solving some kind of problem. This technology allows students to independently assess the quality and level of knowledge objectively, to determine the understanding and imagination of the subject under study. He, at the same time, makes it possible to express different ideas and determine the connections between them.

The technology of “Skarabey” is comprehensive and is used in the study of various stages of educational material:

- in the beginning-as an incentive of educational activity ("attack on the mind»);
- in the process of studying the subject – the definition of its essence, structure and content; the definition of the character of the main parts, concepts, relations between them; a deeper study of the subject, showing new aspects;
- in the end-in order to strengthen and complete the acquired knowledge.

The technology “Skarabey” is easily perceived by students, since it was developed taking into account the thinking, cognitive features of the activity. It presupposes the use of students '

experience, carries out Reflections observations, has the opportunity to conduct active creative and thought experiments.

As some of the advantages of this technology, it is possible to demonstrate the use of drawing shapes that facilitate perception.

“Skarabey” can be used in individual works, in small groups, as well as in training teams.

In addition to education, this method allows to carry out a number of educational tasks:

- Respect for the opinion of others;
- Skill of working with the team;
- Activity;
- Kindness;
- Creative approach to work;
- The need to show opportunities;
- helps to check their abilities and capabilities;
- allows you to express "I";
- evokes responsibility and interest in the results of their activities.

The technique of "interview" is aimed at teaching the student-student to ask questions, to hear, to give the right answer, to compose the question correctly.

The technique of "hierarchy" - is aimed at teaching them logical, critical, creative thinking, using methods from simple to complex, from simple to complex.

"Boomerang" technique is aimed at students to work with various literature, texts in the course of the lesson, to keep in mind the material studied, to be able to give a speech, to make a statement freely and to evaluate all the students during one lesson.

The "student" training is aimed at eliminating the barrier between the teacher and the student, teaching ways to work in cooperation, working individually with the pupil-students.

The training "teacher's personality" - is aimed at independent thinking on the topic" students put on the teacher's personality", revealing the innovative activity of the teacher, explaining thoughts by writing a creative essay.

The technique of "communication" is aimed at attracting the attention of the audience to teachers; in the course of the lesson process it is aimed at teaching them to work in harmony, to organize it.

The "management" technique is aimed at introducing and teaching the teachers the methods of managing the audience as well as the methods of managing the student-students in the process of work.

Types of lessons based on advanced pedagogical technology in the methodology of mother tongue are not only increasing the effectiveness of language education, but also becoming part of it. The teacher, who is able to organize the lessons with the participation of colorful modern

technical means, in a short time will have a clear idea of the knowledge possessed by the students, the attitude to his friends, the culture of treatment, the circle of thoughts, the richness of words, the potential of speech. Lessons based on advanced technology create conditions for equal, friendly relations between the reader and the teacher to find a decision. The reader feels free in the lesson, his interest in training, his incentive to engage in vocabulary as well as creativity increases.

PROFESSIONAL TRAINING OF FUTURE TEACHERS FOR CREATIVE ACTIVITY

Davronovna Gulbahor Niyazova*; Davronovna Sitora Niyazova**

^{1,2}Bukhara State University,
 UZBEKISTAN

ABSTRACT

The article explores the essence, structure of the concept of “creativity”. The activity of a social teacher has been studied. A theoretical model of preparing students for pedagogical creativity is presented. The essential result of the Marxist approach to creativity is not so much the receipt of a new product as the creation of a person himself. This confirms that the creative process is considered, the results of which have the character of subjective novelty. The need to develop the personal qualities of a future teacher for a successful creative professional activity has found its embodiment in a personal approach.

KEYWORDS: *Creativity, Social And Pedagogical Activity, Technology Of Preparation For Pedagogical Creativity.*

INTRODUCTION

In encyclopedias, dictionaries, scientific sources, the term creativity has an ambiguous interpretation. In the dictionary of the Russian language, creativity is a human activity aimed at creating cultural or material values. At the same time, value is characterized in an objective sense, and creative creation belongs to the representatives of artistic professions: for this, musicians. Several scientific directions in the interpretation of creativity are highlighted: philosophical, psychological, pedagogical, linguistic, etc. Representatives of the philosophical trend view creativity as an activity that generates something qualitatively new, which has never been before. Philosophers were among the first to divide reproductive and creative activities. From their point of view, the result of creativity is like usually a new product of activity. Representatives of the psychological direction added to the philosophical mechanism of flow creative act.

They link the creation of new material and spiritual values with the presence of personality of abilities, motives, knowledge, skills, thanks to which a product is created that is distinguished by

novelty, originality, and uniqueness. The procedure of creativity is highlighted, which, according to G. Golles, includes the stages: preparation, maturation, insight, verification. Psychologists are convinced of the staged procedure of the creative act. From the standpoint of psychology, creativity is based on insight – intuitive comprehension of the required result, which is preceded by significant preparatory work. This work, according to psychologists, provides adequate motivation, accumulation of a sufficient stock of knowledge and skills. Within the framework of the pedagogical direction, creativity is considered as the highest form of independent human activity, the products of which can have both objective and subjective novelty.

Researchers identify a number of stages in the structure of a creative act: setting a problem, mobilizing the necessary knowledge and experience, solving a problem, checking the social value of a product. As the experience of teaching convinces, an important place in preparing students for pedagogical creativity should be taken to substantiate the social significance of their work. For an in-depth look at the essence creativity, its research was carried out in accordance with the approaches available in science: philosophical, psychological, pedagogical, taking into account the focus of this study. Most of the philosophers of antiquity: Aristotle, Democritus, Heraclitus, Plato, and others recognized the divine principle in the act of creation. They established the need for special motivation creative activity. Philosophers are among first divided reproductive and creative activity. From a philosophical standpoint, the result creativity is, as a rule, a new product of activity. From the standpoint of ancient philosophy, the origins of creativity are adequate motivation, the required level of cognitive and practical development. An essential achievement of the philosophy of the Renaissance is the study of the personality of the creator. The philosophers of this period recognized reflection as an important stage in the creative process.

An important result of the search for representatives of this direction is a generalized characteristic of creative activity as a systemic education, which includes a number of elements: motivation, knowledge, abilities, reflection. Research by the leading representatives of German classical philosophy (G. Hegel, I. Kant, F. Schelling, I. Fichte and others) marked the creation of a fairly complete concept of creativity. According to E. Kant, imagination is an integrating factor of sensations and mental actions that are synthesized into a creative product. G. Hegel established that the degree of creative direction of activity does not depend on its content, but is determined exclusively by the expenditure of creative efforts. This position was confirmed in later studies, where creativity is considered a special strategy of activity, regardless of its nature and even the result, i.e. have subjective novelty. The essential result of the Marxist approach to creativity is not so much the receipt of a new product as the creation of a person himself. This confirms that the creative process is considered, the results of which have the character of subjective novelty. Such activity creates conditions for a person to transform himself, i.e. creative self-improvement, self-development. In their opinion, creative activity is based on human consciousness, sufficient motivation for creativity. L.S. Vygotsky was one of the first to pose the problem of the possibility and necessity of preparing children for creative activity. In his opinion, novelty in creativity is secondary, its pedagogical value is much more important. According to him, an important result of inclusion in creative activity are acquisitions in the inner sphere of the personality: motives, thinking, knowledge, skills, emotions, etc. A special place in preparation for the work of L.S. Vygotsky ascribed to play and fairy tales. A number of psychological studies of creativity can be attributed to the direction of the study of creative

thinking. S.L. Rubinstein found that the basis of creativity is thinking, capable of comprehending reality and determining preparation for creative activity. Later research in the field of creativity (A.N. Leontyev, M.V. Musseichuk, Y.A. Ponomarev, O.K. Tikhomirov and others) proceed from its activity-based interpretation. According to these authors, creative activity contains a number of components: motivational-semantic, content-operational, evaluative, effective. Generalization of the results of philosophical, psychological, pedagogical research in the field of creativity from the standpoint of a systemic-structural approach made it possible to present it as an integration of the following components: motivational-personal, cognitively meaningful, operational-technological, reflexive-evaluative. The high importance of creativity in pedagogical activity was emphasized by many well-known educators. The great Russian teacher K.D. Ushinsky argued that creativity is the basis of pedagogical activity. He suggested using games, fairy tales and other works of folk pedagogy to form readiness to creative professional activity. He emphasized the need to develop the personal and professional properties of the future teacher for his full-fledged creative activity. A.S. Makarenko considered creativity an obligatory companion of pedagogical activity. According to him, no system of means can ever be a dead and frozen norm, it always changes and develops, because the child grows and changes, enters new stages of social and personal development.

The engine of development of pedagogical practice, he considered a creatively working teacher and teaching staff. In modern, maximally algorithmic pedagogical conditions, researchers also consider it necessary to show a creative approach in working with children. According to V.I. Zagvyazinsky, true education and training is always the creation of something new, the creation of man through the awakening of his inner essential forces. The pedagogical process is completely the teacher's creativity. According to M.M. Potashnik, pedagogical work cannot and cannot be uncreative, because children, circumstances, the personality of the teacher himself are unique, and any pedagogical decision must proceed from these always non-standard factors. In practical activity, the teacher's creativity is diverse, therefore, most researchers distinguish levels of pedagogical creativity, which are manifested both in the invention of a new, original one, and in the use of something already known in new conditions. According to research by V.I. Zagvyazinsky, I.F. Isaeva, L.N. Makarova, M.M. Potashnik and others, the creative procedures are not fundamentally different: the teacher invents a new method or rediscover the possibilities of applying the standard method in new conditions. The technological approach to understanding creative activity was introduced by the research of V.A. Slastenin and L.S. Podymova. The authors identified four functional components in the structure of innovation activity: motivational, creative, technological and reflective. The generalization of a significant number of studies confirms the objectivity of identifying the main components in the structure of pedagogical creativity: motivational-personal, cognitive-content, operational-technological, reflexive-evaluative. Summarizing the above approaches in the framework of this study, we have clarified the concept of pedagogical creativity. According to our data, this is a purposeful activity to solve problem situations, focused on choosing the optimal option for organizing the pedagogical process, depending on the conditions of its course, containing the following components: motivational-personal, cognitive-meaningful, operational-technological, evaluative-reflective. A comparative analysis of the data of various studies made it possible to identify the most essential conditions implying the use of creativity in pedagogical activity: 1) the presence of a problem situation as a source of creativity, 2) algorithmic activity does not give the desired result, 3) depending on specific conditions, it is necessary to choose the optimal

option for organizing the pedagogical process... The most important function of a social teacher is to level many social problems that arise as a result of negative living conditions. These include: poverty, poor nutrition, unemployment, alcoholism, neglect, etc. The main provisions of the activity of a social teacher are considered in the works of leading scientists who study various aspects of social pedagogy: L.I. Aksenova, S.A. Belicheva, V.G. Bocharova, Yu.V. Vasilkova, M.A. Galaguzova, L.V. Mardakhaeva, A.V. Mudrik, V.A. Nikitin, and others. A full-fledged study of the activities of a social teacher would be impossible without an analysis of the works of leading scientists-teachers: I.F. Isaeva and V.I. Zagvyazinsky, V.A. Kan-Kalika, N. D. Nikandrov, V.A. Slastenin and others. As the researchers have established, the activity of a social teacher takes place in various spheres of social and pedagogical influence and support: family, labor activity, education and social upbringing, health improvement, social and pedagogical rehabilitation and adaptation, the sphere of leisure, social protection. To clarify the features of social and pedagogical activity, it was important to first consider the essence of the concept of "activity" in philosophical, sociological, psychological and pedagogical research. As a basis for the characteristics of social and educational activities by us a psychological approach to activity is taken. According to A.N. Leontyev, S.L. Rubinstein, A.A. Smirnova, B.M. Teplova and other activities, especially professional ones, are complex in nature, represent an integral constantly evolving system with a definite structure, its own internal transitions and transformations, including four stages: goal; motive; way; result. These approaches characterize internal and external action plans. In the works of P.K. Anokhin, B.F. Lomova, A.N. Leontiev gives a psychological analysis of the structure of activity as a dynamic system of actions, which is formed and under the control influence of the complex interaction of the result image with the motivational component of the activity. The generalized study of the psychological signs of labor made it possible to single out the following stages: 1) prognostic, 2) motivational, 3) transformative, 4) reflexive. A comparative analysis of social and educational activities in various institutions with the results of theoretical studies has shown that the leading functions of a social teacher are diagnostic, analytical, explanatory, prognostic, design, educational, rehabilitation, protective and others. The most important distinguishing feature of his activity from that of a teacher is the protective function. A social educator is called upon to provide various types of assistance to a child in a difficult social situation. On the basis of a comprehensive analysis of theoretical and empirical research, studying the experience of a social teacher, we have established that social and pedagogical activity in order to obtain high results must be an integral system and be carried out in stages.

Summarizing the data obtained, it was possible to establish that in most studies the following stages of socio-pedagogical activity are distinguished:

- 1) *Diagnostics of social problems*
- 2) *Analysis of diagnostic results*
- 3) *Explanation of the causes of social problems*
- 4) *Design of future activities to level social problems*
- 5) *forecasting the upcoming results*
- 6) *Organization of social and pedagogical assistance*
- 7) *Reflection of the work done*

In real pedagogical practice, a more generalized version of the structure of social and pedagogical activity is more common, including three stages: 1) diagnostic and explanatory, 2) predictive–projective, 3) transformative–reflexive. The results of theoretical studies confirm the existence of these stages, therefore, this structure of activity can be considered objective. The diagnostic and explanatory stage includes: a) preliminary acquaintance with the object under study, b) general diagnostics, c) special diagnostics, d) qualitative and quantitative presentation of data, e) their analysis and interpretation, f) explanation of the results obtained, g) establishing the causes of occurrence social and pedagogical problems. The forecast and project stage includes the following components: a) making a decision on the project, b) collecting information on a social problem, c) formulating goals, determining professional means of activity, d) designing a program of social and pedagogical assistance e) developing resource support. The transformative–reflexive stage: a) modeling of assistance, b) introduction of a specific socio–pedagogical technology, c) assessment of its effectiveness, d) correction. Generalization of the research results, interviews with experienced specialists indicate the high significance of creativity in all stages of social and educational activities. The purpose of the social teacher’s activity is to create conditions for psychological comfort and safety of the child, to meet his needs with the help of social, legal, psychological, medical, pedagogical mechanisms to prevent and overcome negative phenomena in the family, school, immediate environment and other societies. The object of the social teacher’s activity is the younger generation in need of in helping in the process of their socialization. This category includes children with intellectual, pedagogical, psychological, social deviations from the norm, which have arisen as a result of the lack of full–fledged social education. The objects of the social teacher’s activity are also groups of children with physical, mental, intellectual developmental disorders (blind, deaf, children with cerebral palsy, mentally retarded, etc.). The objects of social and pedagogical activity are children’s groups, families, micro societies that have corresponding problems. The task of the social teacher is to provide comfortable conditions for the socialization of the child within the framework of these associations, improve their psychological microclimate.

These objects presuppose specific areas of activity of a social teacher: rendering assistance to children in overcoming problem situations in the framework of educational activities; organization of children’s activities for their all–round development in accordance with individual inclinations; creation of favorable conditions for the development, upbringing and education of children; helping the family in the process of raising children; organization of educational, cultural and educational work in society; social and pedagogical support for children at risk, assistance in their socialization and integration into society, etc.

The analysis of scientific sources made it possible to identify a number of approaches to the problem of the formation of a social teacher’s readiness for creative activity. The need to develop the personal qualities of a future teacher for a successful creative professional activity has found its embodiment in a personal approach. This approach convinces of the unity of motivational and personal training for pedagogical creativity.

The problematic approach to the organization of pedagogical activity has enriched science and practice with important means, methods of preparation for creativity. Its use in the preparation of students presupposes the fascination of future teachers with creative activity, which ensures the development of the personal qualities of the future teacher (motivational and personal training).

Comparison and generalization of the components of the formation of future teachers' readiness for creative activity, highlighted by representatives of different approaches, allow us to assert that they are, on the whole, adequate to the general pedagogical components of pedagogical creativity. The process of formation of readiness for creative activity includes 1) motivational–personal, 2) cognitive–content, 3) operational–technological, 4) evaluative–reflective components, which are the basis of the theoretical model of training future social teachers for creative professional activity. This model includes the following elements: tasks, patterns, principles, conditions, etc.

Comparative analysis of data from various studies allowed the selected tasks to be conditionally divided into groups in accordance with the identified stages of preparation: 1) motivational–personal, 2) cognitive–content, 3) operational–technological, 4) evaluative–reflexive tasks.

The first group – motivational and personal tasks: a) increasing the professional and creative motivation of students, b) developing a positive attitude towards creative activity in future teachers, c) ensuring that students understand the importance of creative activity in the work of a teacher, d) stimulating students' desire show creativity in the course of pedagogical practice, e) the formation of a focus on creative pedagogical activity, f) the formation of personality traits, skills necessary to perform pedagogical activities at a creative level, g) stimulation of independence, h) stimulation of creative interests, i) stimulation of persistence in solving creative problems.

The second group – cognitive–meaningful tasks: a) creating a favorable educational space for the formation of students' creative pedagogical activity, b) equipping students with knowledge about pedagogical creativity, mechanisms of creative activity, c) mastering deep professional knowledge, d) developing creative thinking, e) development of general (primary) and special creativity, e) development of creative abilities.

The third group of tasks is operational and technical logical: a) the formation of creative skills, skills necessary in professional activities (diagnostics, goal–setting, design, forecasting, etc.), b) mastering creative techniques, research skills, operations that ensure the creative nature of the activity, c) acquaintance with strategies for solving creative problems, d) mastering the leading pedagogical methods, technologies and ways of their creative use, e) inclusion in pedagogical activity with the aim of its creative implementation.

The fourth group – reflexive–evaluative tasks: a) preparation for self–analysis, b) mastering evaluative activities, c) acquaintance with self–control in pedagogical activity, c) reflexion of one's own creative abilities, d) self–evaluation of the process and results of pedagogical activity with the aim of its optimization, creative implementation, e) assessment of the formation of motivational orientation towards creativity, cognitive activity, knowledge and skills, their creative implementation.

Based on the analysis of studies aimed at preparing for creativity, correlating them with the experience of preparing future social teachers for creative activity, we made an attempt to highlight the patterns of this process. The process of forming students' readiness for creative activity is effective if the following laws are observed in the educational process: 1) the unity and complementarity of theoretical and practical training, 2) the problematic, ever–increasing nature of theoretical and practical tasks, 3) acquaintance with special knowledge, skills, techniques that

reduce the number of options for solving a creative problem, 4) the development of special abilities, personal qualities that provide a creative orientation of the individual, 5) an atmosphere of relative freedom and intensification of preparation for professional creativity.

A comparative analysis of the principles of the formation of readiness for professional creativity, identified in the framework of other studies, their correlation with the theoretical model, made it possible to formulate the following groups of principles for preparing future social teachers for creative activity:

The principles of the motivational and personal stage: a) stimulation of creative activity, independence, the need for creative self-development, b) a combination of emotional and rational ways of motivating creative activity, c) the formation of creative abilities by using a set of special creative practical situations developed in the zone of proximal development, d) the actualizing potential of the educational environment, e) the only personal and social motivation, f) the transition from development to self-development of personal and professional qualities necessary in creative activity, g) individualization of the process of creative development.

The principles of the cognitive-content stage: a) the complex nature of the process of preparation for creative activity, combining fundamental knowledge, special skills and practical activities, b) the organization of a personally oriented educational environment, c) the choice of an individual educational strategy, d) interdisciplinary organization of the content of professional training, e) problematic nature of training, f) consciousness, creative activity and independence.

The principles of the operational-technological stage: a) the systematic nature of the preparation process for creativity, ensuring the creation of an integral, diverse educational and developmental environment, b) the technological provision of the training process, combining a conceptual model, a system of special tasks, criteria for diagnosing readiness, c) the priority of activity content over information, d) activation of interaction with colleagues and children in the course of creative activity, e) connection of training with practical activity, f) unity of integrity and continuity.

The principles of the evaluative-reflective stage: a) the reflexive nature of the process of preparation for creative activity, b) assessment and forecasting of the student's creative development opportunities, c) self-assessment of his own achievements, d) reflection of the effectiveness of professional activity, its creative nature, e) design of new options for activity, improving its results.

The generalization of the conditions of preparation for creative activity, proposed in the framework of various studies, made it possible to combine them in accordance with the components of the theoretical model of the formation of readiness for professional creativity. As a result, four groups of conditions were identified:

1. motivational and personal conditions: a) substantiation of the role and place of creativity in the teacher's activities, b) taking into account the sociocultural pedagogical reality that favors the manifestation of creativity, c) positive emotional and psychological climate, cooperation of teachers with students, d) building the educational process from the standpoint of personality-oriented learning, e) humanistic and professional example of teachers, f) purposeful creation of problem learning situations, g) the creative nature of the organization of educational activities, h) substantiating the role and place of creativity in activities of the teacher.

The result of the creation of these conditions is a) the emergence of a need for creativity in professional activity, b) the desire for self-development of creative abilities, c) students' awareness of the creative essence of the teaching profession, d) understanding the meaning of professional creativity, e) increasing interest in the profession, initiative and activity of students in professional activity, f) a sufficient level of development of abilities that contribute to creative activity, etc.

2.cognitive-meaningful conditions: a) in-formation about the mechanisms of creative activity, b) training in the use of the achievements of psychological and pedagogical science, advanced and personal experience in the process of pedagogical creativity, c) introduction into the educational process of special techniques that guide in creative activity, d) the use of productive means and methods of teaching and upbringing, e) the introduction of increasingly complex situations into the educational process, f) the material and technical equipment of the pedagogical process, g) increasing the level of general cultural training, h) creating an enriched information and educational environment, i) it is time for the independence of students in the development of scientific knowledge and professional technologies.

The result of applying these conditions is:

- a) A high level of development of scientific knowledge,
- b) The development of adequate means of teaching and upbringing,
- c) Scientific validity, methodological equipment of pedagogical creativity,
- d) Deep knowledge of the theoretical foundations of an integral pedagogical process (leading ideas, patterns, principles and etc.)
- e) A high level of general cultural training,
- f) Knowledge of typical pedagogical situations and the ability to creatively resolve them.

3.operational and technological conditions: b) the inclusion of students in independent creative activity, c) the use of the system of organizing creative activity within the framework of pedagogical practice, d) methodological support of pedagogical creativity, e) the use of methods, forms (individual and lective) organization of creative activity f) material and technical equipment of the pedagogical process, g) purposeful creation of problematic educational situations. h) the use of creative tasks in the educational process, involving various strategies for their implementation.

The result of these conditions are: a) deep mastering of leading pedagogical operations, methods, technologies, b) variable possession of them, c) the ability to use them adequately to real pedagogical situations, mastering the leading stages of social and pedagogical activity at the creative level.

4.valuation-reflexive conditions: a) regular analysis and introspection of educational and pedagogical activities, b) providing feedback in the educational process about the progress of the student, c) taking into account and developing the mental characteristics of a personality that stimulate and regulate creative activity, d) accounting the achieved level of creativity.

The result of these conditions is: a) developed pedagogical thinking, b) formed pedagogical intuition, c) readiness and ability to make non-standard decisions, d) reflection of professional actions and own creative abilities.

The analysis of a significant number of studies made it possible to identify ways, methods, techniques for implementing the stages of preparation for creativity. The most important ways of preparing future social teachers for creative activity are the educational process and teaching practice. Depending on the tasks, the peculiarities of the practice, within its framework, the creative use of scientific knowledge obtained in the course of classroom lessons, the creative interpretation of the most important social and pedagogical methods, technologies, operations are provided.

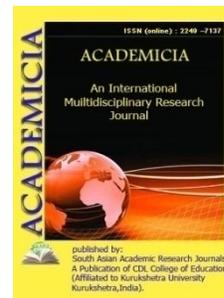

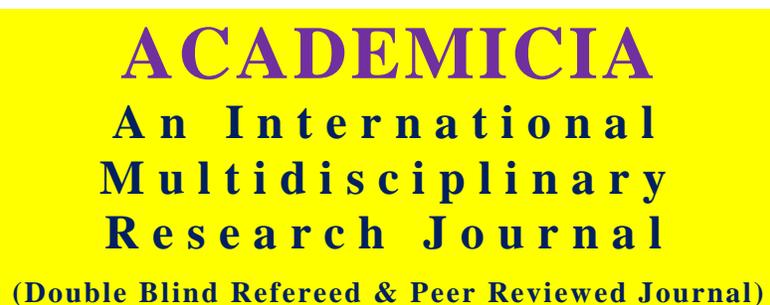

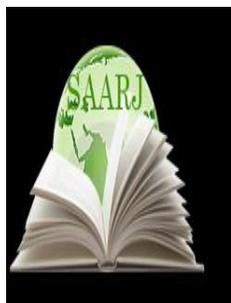

The available publications have not fully investigated the issue of the content of the process of preparing for creative activity. An analysis of a significant number of publications convinces us that researchers use different content, determined by the specific nature of a particular pedagogical activity. Correlating the results of our research with the existing approaches, we formulated the foundations of the content filling of the stages of preparation for creativity.

INTENSIVE EDUCATION AND LINGUISTIC COMPETENCE IN MOTHER TONGUE

Mamanazarovna Ogiljon Olloqova*

*Bukhara State University,
UZBEKISTAN

ABSTRACT

In secondary public education, the curriculum of competency is aimed at forming pupils' science and core competencies. Especially teaching mother tongue develops pupils' speaking and linguistic competencies. This article discusses the formation of linguistic competencies in pupils by using intensive learning technologies mother tongue classes of primary schools.

KEYWORDS: *Intensive, Intensive Education, Competence, Linguistic Competence, Game Technology.*

INTRODUCTION

It has become a reality that all spheres are developing in Uzbekistan today. Of course it demands new approaches to the organization of education. The implementing of various technologies and scientific media in education has made it possible to provide large amounts of information in a short period of time. This allows the pupil to increase the amount of required learning material in a short time from the first session. The use of intensive learning technologies is an effective way to increase the amount of learning material.

The term "intensive" first appeared in the Russian pedagogical literature in the first half of the XIX century. The word comes from the French "hot", "intensified", from the Latin – "energetic", "lively", "fast", "stormy", from the Spanish – "stretch", "enlarge", "expansion".

Intensive education is described in the pedagogical encyclopedia as follows: (French "intensive", Latin "intension" – "enthusiasm", "intensification" "acceleration") a rapid learning process. [1, 105]

DISCUSSION

The system of continuing education requires regular updating of outdated knowledge and areas. Every young generation, striving to get new knowledge, apply and improve their knowledge, will make a worthy contribution to the development of the country. Teachers are now tasked not only with “teaching” the child, but also with “motivating him to learn”. Now, including teaching, the teacher also must be able to motivate the child to learn and innovate.

Changes in education lead to changes in the role of the teacher. Now the teacher is not only the manager, but also the person who makes interaction with the pupils. The role of the pupil is also changing, he not only acquires knowledge, but also participates in searching, developing of specific skills and abilities. Today’s educational system should focus not only on developing pupils’ intelligence, but also on building and developing their knowledge potential.

The modern educational system should control and direct the child’s attention and actions, teach them to learn independently and apply them in life. These problems can be solved by a rational combination of traditional and intensive training. Intensive training has a number of advantages over traditional training in the development of the child’s mental ability. These benefits are based on the active interaction of the participants in the learning process. According to I.V. Shestitko, I.A. Turchenko, Y.S. Shilova and S.V. Marshina the meaning of the term “intensive” is to create conditions for “tension and strengthening” that allow the learner to achieve the learning objective, as well as to emphasize the qualitative and quantitative changes that occur during the pupil’s intense activity”. [3, 6]

G.K. Selevko divided pedagogical technologies based on inspiration and intensification of pupils into several groups as: game technology, problem study, technology of deepening lessons on the basis of schematic and iconic models of educational material, degree differentiation technologies, technology of individualization of education, programmed learning technology, group technologies, computer (new information) learning technologies.

Intensive classes can be organized by a teacher who is highly intelligent, active, creative, and able to fully express his personal potential.

According to A.P. Panfilova, a teacher needs to meet a number of conditions in order to increase the effectiveness of intensive training.

1. The relevance of the teacher’s ability to the goals and objectives of a particular technology (game, exercise, etc.). So that the role of the teacher will vary depending on the type and purpose of the technology used. The teacher plays the role of organizer-leader, communicator, psychologist and others.

2. The teacher need to have professional experience in communicating with the group. In the process of dialogic communication, the teacher should establish a “subject-subject” relationship, opposed to the traditional “subject-object” form. Especially dialogic communication debates take place and the problem is solved collectively through the active participation of all participants in an intensive interaction. At the same time, the activities of the participants are aimed at solving the task. It is in the dialogue that the participants enrich each other, first of all, with different approaches, different views on a particular problem, which allows to find the most optimal solution.

3. Teacher's personal orientation. The teacher should welcome the new technology with enthusiasm and interest, be ready for innovation and change, and mainly should, not be afraid to apply the innovation in her or his activity.

The main condition of achieving the goals of intensive training is the usage of various organizational forms of training, in which pupils perform independent work with freedom of choice, demonstrating their individual and psychological capabilities. As a result, they are more creative, communicative, and able to put their personal skills into practice.

One of the most important issues of today's education is the participation of pupils as the subject of the educational process, and the development of their outlook students' thinking. The task is to bring up a potential generation through the development of basic competencies of pupils during educational process. For example, in general secondary and secondary special, vocational education institutions, the formation of linguistic competencies aimed at developing the ability to express accurately and fluently using the wide range of opportunities of the native language. [2, 15]

So, first of all, let's pay attention to the meaning of "competence" and "linguistic competence".

The word "competition" is derived from the word "to compete", which means "to compete", "to contend", "to compete". If literally translated, it means "competitiveness".

According to scientific pedagogical and psychological sources, competence is a very complex, multi-part, common concept for many subjects. As a result, its interpretations vary in size, content, meaning, and logic. The essence of the term is also classified on the basis of such concepts as "efficiency", "flexibility", "achievement", "success", "comprehensibility", "efficiency", "readability", "quality". [.....]

Linguistic competence is the knowledge of pupils about sections of phonetics, lexics, phraseology, morphology, syntax, pronunciation, punctuation, stylistics, of their mother tongue and the usage skills and abilities of them.

Linguistic competence - implies knowledge of phonetics, graphics, pronunciation, lexics, grammar and methodology. To be able to distinguish the sounds of speech in the native language, to follow the rules of syllables, to use new words on the topic in oral and written speech, to use punctuation correctly in written speech, to be able to form the sound structure of words orthoepically correctly, to distinguish types of sentences according to the purpose of expression, and to be able to use them appropriately in written speech.

Mother tongue curriculum of primary school, linguistic competence implies to follow the rules of pronunciation in the pronunciation of speech sounds in the Uzbek language, to be able to follow the rules of syllables, to be able to use words correctly in oral and written speech and usage punctuation.

YECHIM

In order to achieve the goal of mother tongue education, it is necessary to use new educational technologies, to use appropriate methods to the form of the lesson, to choose the right teaching aids. Intensive learning technology-based on learning aims to develop pupils' high level of linguistic competence in a limited amount of time. Intensive training helps the child to be less

stressed, to receive information consciously, and to communicate freely in the group and in the community.

The process of teaching literacy is a complex psychological period for pupils. This is because their cognitive processes, such as intuition, memory, perception, and thinking, are not yet well developed. Each pupil in the class has different physical and psychological development indicators.

The process of teaching literacy is an important stage in the formation of linguistic competencies in pupils. During this period, pupils become intensively acquainted with each of the phonetic, lexical, graphic, spelling, syntactic, morphological, and punctuation concepts. During the alphabet learning period, pupils get reading and writing skills, as well as spelling, punctuation, and creative thinking skills. They learn how to divide vowels and letters into syllables, how to divide words into syllables, how to put punctuation marks at the end of sentences, how to capitalize nicknames for people, cities and animals, the meaning of words, how to form sentences with given words, and how to express themselves. As a result, they develop linguistic competence.

Accordingly, the content of the tasks assigned to them should be different. In addition to differential training, individual training is also needed during literacy training. Children perceive the same concept differently. Individual education, on the other hand, helps children to have the same level of competence that they need to develop.

Individual education is a form of learning in which the teacher exerts a pedagogical influence on the pupil. It is the teacher's individual activity with the pupil. In individual education, education is based on the abilities of each pupil.

It is not possible to work individually with all pupils during the lesson. Therefore, it is possible to teach a child individually outside of school hours. During the lesson, it is possible to work individually with a group of pupils.

A first grader is still mentally and physically weak. They have rapid fatigue and boredom. At this point, pupils need to be chosen easy ways to complete their assignments and use visual aids that interest them. Particularly, game technologies are based on diversity and are fully adapted to the age and worldview of the child.

The laws governing the formation of children's mental activity based on school learning materials are incorporated into game technologies. Game is an independent form of development for children of all ages. Game technology is the freest form of creative thinking and self-awareness. During the didactic task, pupils are able to express and defend their ideas. These activities give pupils the opportunity to put their theoretical knowledge into practice.

Didactic games play an important role in teaching, educating and developing children in the classroom. Strengthens the child's positive performance during play, improves voluntary attention and memory. During the game, pupils do a lot of actions, exercises, solve various problems without realizing it. In didactic games, the basic thinking processes - analysis, comparison, inference, etc. - are improved.

In primary school, pupils are taught sounds and letters, words and their meanings, bases and affixes, word groups, sentences, types of meanings, writing and spelling, punctuation, etc. in the

native language classes and the use of intensive learning technologies in improving related speech increases the effectiveness of native language lessons, activates the learner, and encourages logical thinking.

The use of the games as: “Word in word”, “Fill in the mysterious gaps”, “Cheerful alphabet”, “Find the word I think of”, “Controller letter”, “Domino”, “Words in the mirror”, “Keep up the pair words”, “Make no mistake”, “Fill in the mystery boxes”, “Yes-no”, “Magic word”, “Find your place”, “Chain” educational games such as “Wheel of mind”, “Wrong sentence” and “Impossible” make it easier for students to master the topic, make it interesting, and also encourages them being smart and picky.

For example, in the “Don’t make mistakes” educational game, the teacher shows something or a picture of it. Pupils say its name and show a card with the number of syllables in the word. For example, wheat is -3 and grass is -2. Frequent use of this playful technology in the literacy process makes it easier for pupils to learn the syllables. For playing this game, pupils must at first be able to distinguish sounds and letters and pronounce them correctly.

Native language education serves pupils to expand, to develop skills and abilities of their thinking, freely, to understand the opinions of others, to express their opinions fluently orally and in writing, to communicate freely with members of society.

“Chamomile” game. In this game, a picture of a chamomile is drawn or a model is made. In the middle of the chamomile is a question or an assignment. The pupil writes responds on the petals. This game can be played in small groups or individually.

When using the interactive “everyone - teaches everyone” method, the teacher provides 3-4 basic information on the topic, for example: For Grade 3, “Words in a sentence are interconnected in content. The connection of words in a sentence is determined by questioning” and so on. The pupil studies the information given to him and tells his classmate that he heard it from the teacher. This is how the teacher communicates with the students. This activity will cover the whole class at the same time. It will be possible to fill and strengthen the gaps once again.

In Grade 2, pupils learn to distinguish and pronounce the letters in a word by studying topics such as “Words that fall out of pronunciation” and “Pronunciation of X and H sounds”. Assignments are designed to help students understand that the pronunciation and spelling of words are not always the same. The teacher should reinforce the children's memory during the lesson and choose a didactic game that is relevant to the topic so that they can think freely. The game “applause” teaches the pupil to think and act quickly. In “Applause”, the teacher says a few words that contain the sounds x and h. The task is to find words that contain the sound x. Pupils “say” their answers by applause, not by words. They clap when they hear a word with the letter x, and they don’t clap when they hear a word with the letter h. Such games improve pupils’ spelling and orthoepic literacy (knowledge).

XULOSA

In short, the content of general secondary school textbooks is aimed at increasing the social activity of pupils, taking into consideration their individual psychological and age characteristics. For example, in the textbooks of grades 3-4, 2-3 tasks are given for each topic. This allows for in-depth analysis of learning tasks and conscious mastering of their content. Pupils learn the content of the exercise in a short time.

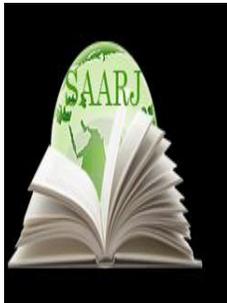

The use of modern technologies and digital technologies in the classroom helps to spend time efficiently. Working with additional tasks for the rest of the time has a number of advantages. In particular, pupils develop creativity by completing a variety of tasks, gaining a broader understanding of the subject, broadening their imagination, and improving their speaking and linguistic competencies.

ABSTRACT

In this article, the methods of organizing lessons in the process of working with paper and cardboard in technology lessons highlight the main features of the technology lesson and its differences from other lessons in primary school. Demonstration of processing techniques is accompanied by an explanation, during this process questions and instructions should force students to find the correct solution to practical problems themselves. Children begin to perceive their surroundings early, but so that they can appreciate what they see, distinguish the really beautiful from the diversity, this must be taught, and the sooner the better.

KEYWORDS: *Educational Activity, Labor Activity, Subject-Practical Activity, Motivation, Intellectual Skills.*

INTRODUCTION

Methods of organizing lessons in the process of working with paper and cardboard in technology classes.

The author of the article highlights the main features of a technology lesson and its differences from other lessons in elementary school.

Most of the technology lessons in elementary grades are devoted to working with paper and cardboard. Paper and cardboard are themselves pantries of fantasy and imagination. And if you combine it with sleight of hand, then everything can be revived, given, as it were, a second life.

The main educational tasks of each lesson and work processes, while completing, are provided with the preliminary distribution of the program material.

Work at the beginning of the lesson, when children get acquainted with materials that were new to them, they master new tools, learn new techniques. The teacher sets specific tasks for students, certain work tasks. He explains the purpose of the work that is going to be performed, talks about the purpose of the item being made, about the requirements that the finished product must meet, about the equipment that students will use when completing the assignment.

Paper and cardboard are the most common and more accessible materials in this process. In the process of working with them, students get an idea of their production, types, properties, their use in everyday life and technology, about the professions of people associated with the receiving of paper and cardboard and their processing.

The formation of practical skills in the processing of these materials in students is carried out in the process of manufacturing products.

From the preschool period, children have known the techniques of cutting paper with scissors, joining parts with glue. In elementary school, students expand their knowledge and master the skills of marking parts made of paper and cardboard by folding in a pattern, using measuring tools, techniques for cutting cardboard with a knife, various ways of decorating products with applique, coloring, using other types of materials.

Paper and cardboard are materials, which the foundations of graphic literacy are laid during the process. Students get a general idea of a technical drawing, sketch, drawing, learn to understand the simplest drawings (sketches) and make markings on them.

Children begin to perceive their surroundings early, but so that they can appreciate what they see, distinguish the really beautiful from the diversity, this must be taught, and the sooner the better. Work on developing a child's artistic taste begins in the family and continues in school with technology lessons.

Sensory education makes it possible for children, while performing applications, to compare figures large and small, wide and narrow, long and short, dark and light. Children will determine that the figures are located high, low, in the center, left, right.

The teacher or the leader of the circle should not only teach the younger schoolchildren certain methods of work, his main task is to develop their ability to be creative, awaken their interest in work, with mutual assistance:

- develops the ability to work with hands, teaches you to precise finger movements under the control of consciousness;
- develops spatial imagination - teaches to read the drawings, according to which the figures are folded and represent products in the same volume with them;
- introduces basic geometric concepts;
- improves the ability to follow oral instructions;
- develops confidence in one's own strengths and abilities;
- helps to develop drawing skills;
- stimulates the development of memory;
- teaches concentration of attention;

- develops creativity. Many guys become the authors of their own inventions;
- stimulates the creation of game situations;
- expands communication skills;

Allows you to feel personal involvement in a new international cultural phenomenon. In labor lessons, in the process of performing practical work, children must acquire the necessary labor skills, and gain knowledge about the properties of materials. Based on this, the tasks of the introduction part, introductory, current and final briefing are determined.

The conversation is held in the case when the teacher can rely on the experience of the children, on the previously acquired knowledge, observations made during the classroom. After the introduction part, the children should have a good understanding of the purpose of the lesson, the practical tasks they face.

An introductory instruction precedes the work. Its significance is very great. From how children are instructed before completing a labor assignment and during work, the direction of labor lessons is mainly decided, whether they meet the fundamental requirements of labor training or turn into craft training.

The task of introductory instruction is not only to explain to children the techniques for performing any product, but to prepare them for the conscious assimilation of educational material, for understanding the techniques being studied and their application in practical activity. Therefore, when preparing for a lesson, during the process of planning, it is necessary to think carefully and outline the content. It is sometimes helpful to write these statements in a plan.

To answer all the questions and understand the sequence of work, it is not enough for children to see the object in the teacher's hands. We must give them the opportunity to hold it in their hands, examine it in detail, feel the material by touch, in other words, the perception of an object should be versatile (visual, tactile, motor).

The sample shown by the teacher should be clearly visible from anywhere in the classroom. Therefore, it is often made large. Likewise, when demonstrating techniques for manufacturing parts of a product, samples of these parts are made on an enlarged scale.

Demonstration of the manufacturing process of one or another object is carried out differently depending on a number of factors: age characteristics, the complexity of the product, the time allotted to work. Demonstration of processing techniques is accompanied by an explanation, during this process questions and instructions should force students to find the correct solution to practical problems themselves. The teacher is required to present a clear and accurate verbal explanation of practical techniques, the correct pronunciation of technical terms with their obligatory writing on the board.

Teaching to apply them in labor lessons, measuring and computing skills to solve constructive problems is extremely useful for enhancing the activeness of students. One of the main indicators of a high work culture is the ability to work accurately. Therefore, when instructing students before starting work, it is recommended to show not only the techniques for processing the material, but also methods of checking the performance of the work with a certain degree of accuracy, corresponding to the level of students' mathematical knowledge. Doing the work by the teacher himself, although time consuming, is desirable. Making a sample helps to solve a

number of methodological issues, the teacher gets the opportunity to foresee various mistakes that children can make in the process of making a particular product, to determine the time required to complete each operation. The product, made by the hands of the teacher, is used in the lesson as a visual aid. The best indicator of a good quality of introductory instruction is the work activity of children, work on the task without haste and every minute addressing a teacher or friend. Thus, the relevance of this problem is especially significant in the activities of primary school teachers, who are largely responsible for the spiritual, mental, moral, aesthetic development of students, without which the activity of a person is inconceivable. There are many types of paper and cardboard that students become familiar with in technology lessons and outside of class. By getting to know the tools, children learn to use and apply their knowledge and skills in practice. Making products from paper and cardboard requires dexterous actions from the child, gradually the hand acquires confidence, accuracy, and the fingers become flexible, this is very important.

Manual labor contributes to the development of sensor motor skills - consistency in the work of the eye and hand, improvement of coordination of movements, flexibility, accuracy in performing actions. Working with paper and cardboard plays great role in the mental development of students, in the development of their thinking and attention.

The work of making products from paper and cardboard contributes to the development of the personality of students, to the education of their character. Making a toy requires some strong-willed effort. Gradually, the children develop such qualities as dedication, perseverance, the ability to bring the work from the beginning to the end. The artistic image and its further expression in the language is a complex and multifaceted process. I would like to draw the teacher's attention to the fact that a very important role here is played by students' deep knowledge in the depicted object, phenomenon or event.

Therefore, it is recommended in every possible way to stimulate the comprehensive acquaintance of children with the object image.

This textbook also pays considerable attention to it. It offers some characteristics of the object, familiarity which will help create a more voluminous and complete image of the idea or expand the boundaries of creative search.

The teacher can assist in the process of creation in a number of ways:

- Encourage children to collect additional information about the object;
- connect an object with a topic studied at the same time in another subject;
- To analyze the purpose of the craft: what is its meaning, benefit, to whom it is intended, how, in this regard, it should be formalized.

Sometimes the emphasis should be placed not on the object, but on the mode of action, i.e. to increase the interest of students in learning new technology. Here are some ways to solve this problem:

- To connect the studied technique with any folk craft of Russia or the traditional art of another country.

- To connect the way of action with other types of art, to acquaint children with the masterpieces of the world artistic culture.
- To present the craft in its historical development from ancient times to modern times, right up to this particular lesson.
- to interest children in visual novelty, unexpected effects and opportunities that the new technique brings.

The combination of the suggested techniques helps to make lessons diverse, positive motivation sustainable, and actions more meaningful.

The subject of research is technology lessons in preschool period in terms of "Working with paper and cardboard"

Purpose: to identify the role of technology lessons in the section "Working with paper and cardboard" in the development of the creative and mental abilities of primary school students.

Tasks:

1. Conduct an analysis of methods, programs that allow you to identify how successful the process of mastering knowledge is under the section "Working with paper and cardboard";
2. Determine the conditions in which the assimilation of knowledge in this section is successful;
3. Conduct an analysis of the block of lessons for the section "Working with paper and cardboard".

Paper and cardboard are the most common and more accessible materials in this process. In the process of working with them, students get an idea of their production, types, properties, use in everyday life and technology, about the professions of people associated with receiving paper and cardboard and their processing.

From the preschool period, children have known the techniques of cutting paper with scissors, joining parts with glue. In elementary school, students expand their knowledge and master the skills of marking parts made of paper and cardboard by folding in a pattern, using measuring tools, techniques for cutting cardboard with a knife, various ways of decorating products with applique, coloring, using other types of materials.

Paper and cardboard are materials, which the foundations of graphic literacy are laid, during the process of making. Students get a general idea of a technical drawing, sketch, drawing, learn to understand the simplest drawings (sketches) and make markings on them. Children begin to perceive their surroundings early, but so that they can appreciate what they see, distinguish the really beautiful from the diversity, this must be taught, and the sooner the better. Working on developing a child's artistic taste begins in the family and continues in school with technology lessons.

Sensory education makes it possible for children, while performing applications, they compare figures large and small, wide and narrow, long and short, dark and light. Children determine that the figures are located high, low, in the center, left, right.

The teacher or the leader of the circle should not only teach the younger schoolchildren certain methods of work, his main task is to develop their ability to be creative, awaken interest in work, with mutual assistance:

- develops the ability to work with hands, teaches you to precise finger movements under the control of consciousness;
- develops spatial imagination - teaches to read the drawings, according to which the figures are folded and represent products in the same volume with them;
- introduces basic geometric concepts;
- improves the ability to follow oral instructions;
- develops confidence in one's own strengths and abilities;
- helps to develop drawing skills;
- stimulates the development of memory;
- teaches concentration of attention;
- develops creativity. Many guys become the authors of their own inventions;
- stimulates the creation of game situations;
- expands communication skills;

ABSTRACT

This article describes the progress of preparations for the PIRLS international survey of primary school graduates (Grade 4) of international assessment monitoring of students in public educational institutions of the Republic of Uzbekistan and information on pilot institutions. Many countries that achieved good results in 2016 have significantly improved their performance compared to 2011. Comparing the results of 41 countries participating in 2011 and 2016, the reading comprehension rate of 4th grade students in 18 countries increased.

KEYWORDS: *International Assessment, Reading Literacy, Russia, School, International Research, 5 Years, Monitoring.*

INTRODUCTION

The RIRLS international assessment survey is conducted once every 5 years among primary school graduates. PIPLS (progress in international reading literacy study) is an international program to study the quality of reading and comprehension of the text, founded by the **IEA-International Association for the Evaluation of Educational Achievement**. Primary school in different countries of the world evaluates and analyzes reading and observation of reading and comprehension of artistic and informational texts by 4th grade students.

RIRLS international research monitoring is based on artistic and informational texts to assess students' literacy and knowledge levels, the formation of personal reading skills, to analyze changes in different research cycles, and so on. Time is limited during the test and students do not have the opportunity to complete all assignments from the International Research Bank. Because the study includes about 10 texts and more than 135 assignments based on the text.

Therefore, modern test theory (IRT - Item Response Theory) is used in the design of international testing and processing of results. This theory is based on the analysis of the answers to the questionnaire, taking into account the limited number of tasks (up to 30), the individual characteristics of students, teachers and educational institutions, quantitative indicators for each child and each country, international data for individual students or the whole group, describes what can be done by students.

In the 2016 PIRLS study, the materials were processed in 16 variants, each with the same level of difficulty. Each student was given two artistic and popular science texts and 12-17 assignments for each text.

As a result of statistical processing of the survey data, those who pass each test are evaluated on an international 1000-point scale. Reading literacy is assessed on the basis of separate independent scales to assess the quality of reading of artistic and informational texts and to assess reading ability individually and in groups.

The RIRLS Evaluation Criteria International Comprehensive Scale was established in 2001, and the evaluation criterion takes into account that the average scores of all countries participating in the study were accepted as 500 points with a standard 100 point difference. The results of all subsequent scientific studies (2006 and 2011, 2016) were measured on the basis of the 2001 scale. This, in turn, allows us to compare the results of years of research and their changing trends.

According to 2011 and 2016 data, students in Russia, Singapore, Hong Kong, Ireland, and Finland showed successful results in reading the text. The fourth-graders from these countries showed the best performance among all participating countries, and the difference between the mean scores of the countries was not significant.

According to the results of the study in 2016, the average score of Russians graduating from primary schools was the highest - 581 points. The difference between student performance in Singapore, Hong Kong, Ireland, and Finland is minimal and not statistically significant.

Many countries that achieved good results in 2016 have significantly improved their performance compared to 2011. Comparing the results of 41 countries participating in 2011 and 2016, the reading comprehension rate of 4th grade students in 18 countries increased. RIRLS is implementing reforms in primary education based on the results of international research; Growth was observed in Australia, Austria, Bulgaria, Taiwan, England, Hungary, Italy, Ireland, Lithuania, Morocco, Norway, Oman, Qatar, the Russian Federation, Slovenia, Spain, the United Arab Emirates, and Sweden.

By comparison, the results of 13 countries remained unchanged: Azerbaijan, the Czech Republic, Finland, Georgia, Germany, Hong Kong, the Netherlands, Northern Ireland, Saudi Arabia, Singapore, Slovakia, Trinidad and Tobago. The results of students from Belgium, France, Canada, Denmark, France, Iran, Israel, Malta, New Zealand, Portugal, USA decreased.

The study will test the knowledge acquired by learners in the fourth grade, as this is an important stage in the development of young children. Grade 4 is the graduating year of the elementary school, after which students must continue their education in the upper grades, and this education becomes the foundation tool for further education.

The state of Uzbekistan has also signed agreements to participate in the 2018 RIRLS international survey in order to develop reforms in education and increase the interest of our children in learning.

Uzbekistan will participate in the RIRLS international survey in 2021 for the first time, and by the end of 2022, the results of monitoring of reading literacy in primary education will be obtained by international experts. Our students will be able to compare and analyze the text with international education in reading and comprehension.

In the 2019-2020 academic year, there are 9,942 schools in the Republic of Uzbekistan, including 2,709 in urban areas, 6,644 in rural areas and 589 in remote areas. There are 639,270 students in 4 classes of these schools, including 544,942 in Uzbek, 67,540 in Russian, 13,641 in Karakalpak, 5,590 in Tajik, 5,711 in Kazakh, 801 in Kyrgyz and 1,045 in Turkmen. Of the students, 309,924 were girls, 48.5 percent, and 329,346 were boys, 51.5 percent. Which regions of the country, which schools, in which language, in which gender and which students will take part in the tests of the international assessment program PIPLS will be determined by international experts based on the total number of students.

The RIRLS International Pilot Study 2020 will be held in April-May (postponed indefinitely due to a coronavirus pandemic) in Uzbekistan. Tashkent city, Uchtepa district, No. 38 comprehensive school, Andijan region, Balkichi district, No. 41 comprehensive school, Jalal-Abad district, No. 3 general secondary school, Fergana region, Buvayda district, No. 6 general secondary school, Kuva district, secondary school No13, Toshlok district secondary school No 34, Kuvasay district secondary school No 17, Jizzakh region Sharof Rashidov district secondary school No11, Jizzakh city secondary school No 28, Arnasay District Secondary School No. 10, Namangan Province Namangan City Secondary School No. 63, Naryn District No. 4 General Secondary School, Mingbulak District No. 31 General Secondary School, Kashkadarya region, Kasan district, No. 8 general secondary school, Samarkand region, Urgut district, No. 1 general secondary school, Samarkand city, No. 30 general secondary school, Syrdarya region, Boyavut district, No. 16 general secondary school, Tashkent region, Parkent district, secondary school No. 29, Buka district, secondary schools No. 32, 54, Okkurgan district, secondary school No. 32, Yukori Chirchik district, secondary school No. 7, Khorezm region, Shovot district 23 will be held by the Organization for Economic Cooperation and Development in Uzbek, Russian and Karakalpak languages as a test to prepare 1,400 students for the basic **prohibitions** of 2021 in the secondary school No. 2, Khazarasp district.

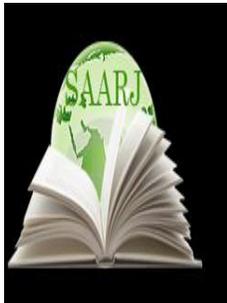

Based on the results of RIRLS international surveys of students of our country, specific measures for the analysis of achievements and shortcomings in comparison with world standards will be identified, and individual and regional gaps identified by monitoring will be systematically addressed. Also, appropriate work will be done to create the basis for the growth of literacy indicators of our students participating in the international research in 2026 in the field of art and information text.

“NATIONAL CULTURE IN THE FABLES OF GULHANIY”

Gaybulloevna Makhfuz Sadulloeva*

UZBEKISTAN

ABSTRACT

The article is devoted to the study of Krylov's fable of the same name "The Wolf and the Lamb" and the Mongolian fable", in comparison with their linguistic culture, as well as the analysis of words that carry the cultural values of the two peoples. In his research, the author considered the images of animals in three ways: description, anal from speech and lexical and semantic meaning of linguistic culture in fables.

KEYWORDS: *Cultural Linguistics, Fable, Analysis, Semantics, Juxtaposition , Image, Related Words, Personality, Multi-Component Character, Literary Criticism , Difference, Systvo, Culture.*

INTRODUCTION

Cultural linguistics is a young science, which is in the stage of development , as a concept e and a unit, and among researchers there is no agreement among the concepts. We observe various forms of cultural linguistics works performed on the material of both related and unrelated languages. The concept of «culture» has many meanings depending on the scope of its use. It can be attributed to both an individual and the entire world community as a whole.

In the modern world, from television screens, in the press, in scientific literature, we often hear the concept of «national culture», in constant connection with which there is the problem of its preservation and enhancement. The structural and multi-component nature of this concept presupposes the inclusion of many features and properties that determine the national characteristics of culture. This includes: ways of interaction of the nation with nature and the state, institutions, models and stereotypes of intragroup and intergroup behavior, traditions, moral and spiritual values, as well as the peculiarities of the language with which the external world is mastered and cognized . Language, as one of the main components of national culture, is able to carry not only certain linguistic information, but also be a carrier of cultural values and certain specificity of the nation . The use of linguoculturological methods of text analysis in literary studies , in particular in fables, in a secondary general education or higher

educational institution, helps to expand the horizons of students and helps their successful integration into culture.

E.I.Zinovieva and E.E.Yurkov in their scientific work «Cultural linguistics: theory and practice» consider it possible to recognize cultural linguistics as a «philological science, which explores various ways of presenting knowledge about the world of speakers of a particular language through the study of linguistic units of different levels, speech activity, speech behavior, discourse, which should make it possible to give a description of these objects that would fully reveal the meaning of the analyzed units, its shades, reflecting the consciousness of native speakers. At the same time, it is important to take into account information of an encyclopedic nature, which correlates with the actual linguistic meaning, the development of the selection principles of which is one of the problems of cultural linguistics »[Maslova 2001: 28].

V. V. Krasnykh defines cultural linguistics as «a discipline that studies the manifestation, reflection and fixation of culture in language and discourse, directly related to the study of the national picture of the world, linguistic consciousness, and the characteristics of the mental-lingual complex» [Krasnykh 2002: 12].

In cultural linguistics, several narrower areas can be distinguished : historical cultural linguistics, historical and typological, comparative and other areas. There are also several linguistic and cultural schools. The most famous of them: the school of Yu.S. Stepanov (based on the description of the constants of culture in the diachronic aspect with the involvement of texts interpreted from the standpoint of an observer, not an active native speaker); school of N. D. Arutyunova (researches cultural concepts based on texts representing different cultures of different eras); school V.N. Telia (analyzes phraseological units from the point of view of cultural linguistics, from the standpoint of reflection of a native speaker of a living language, taking into account the speech-and-thinking mental states of the speaker); school V.M. Shaklein, V.V. Vorobyov and others (pays most of the attention to comparative linguoculturology, developing the linguistic concept of VG Kostomarov and EM Vereshchagin) [Maslova 2001: 9]

The most complete and complete can be considered the definition of cultural linguistics by V.V. Vorobyov, which we will adhere to in the future in this work. In his view, cultural linguistics is “a complex scientific discipline of a synthesizing type that studies the relationship and interaction of culture and language in its functioning and reflects this process as an integral structure of units in the unity of their linguistic and extra-linguistic (cultural) content using system methods and with an orientation towards modern priorities and cultural institutions (a system of norms and universal values) ”[Vorobiev 1997: 36]

The analysis of linguistic phenomena in a cultural context has made it possible to identify a number of new ones that are relevant to modern linguistics. VA Maslova formulated the following questions, to find answers to which is the main task of cultural linguistics: 1) how does culture participate in the formation of linguistic concepts; 2) to which part of the meaning of a linguistic sign «cultural meanings» are attached ; 3) whether these meanings are realized listener and the speaker, and how they impact on speech strategy; 4) is there in reality the cultural and linguistic competence of a native speaker, on the basis of which cultural meanings are embodied in texts and recognized by native speakers. VA Maslova takes the following as a working definition of cultural and linguistic competence : natural knowledge

of a linguistic person in the processes of speech production and speech perception and, which is especially important, knowledge of cultural attitudes; to prove this, new technologies of linguocultural analysis of linguistic units are needed; 5) what are the conceptual sphere (a set of basic concepts of a given culture), as well as cultural discourses focused on the representation by carriers of one culture, a plurality of cultures (universals); the cultural semantics of these linguistic signs, which is formed on the basis of the interaction of two different subject areas - language and culture [Maslova 2001: 31]; 6) how to systematize the basic concepts of this science, i.e. to create a conceptual apparatus that would not only allow analyzing the problem of interaction between language and culture in dynamics, but would provide mutual understanding within a given scientific paradigm - anthropological, or anthropocentric [Ibid: 32] Of course, these tasks, one way or another, overlap with the goals and objectives that a number of other linguistic disciplines are solving. Each of these issues in itself cannot be considered, of course, linguistic and cultural, but in its totality, this set of tasks is specific to this discipline.

Fable is a unique genre in terms of conveying cultural information. Language units containing cultural information, playing in the text fables much more important role than in other genres - they allow to distinguish between translations and original works. 5 And Mr. and lysing Krylov's fable «The Wolf and I gnenok» on the example of the two languages, we can safely say is, they have a difference and similarity. The fable begins with the moral of the fable, i.e. disclosing the essence of the whole fable « The strong is always guilty of the powerless.» In translation, it sounds » yaxshi kishi hech qachon yomon kishidan muruvvat kutolmaydi ». The difference between these two sentences is that the Russian equivalent speaks of strength and powerlessness, when a lamb is to blame before a strong wolf, a deer before a tiger in the animal kingdom. In the Uzbek gov on ritsya about the concepts «good» and «evil» when the comparison is not some force, and the concept of humanity. In both tales, the characters are the same animals, the lamb and the wolf (qo'zichoq , va bo'ri). The antagonism of these two animals is like a struggle between good and evil, strength and powerlessness. The widespread opinion that whoever is stronger is right is shown in all its glory. Well, really, what can the Lamb prove to the hungry Wolf? But the Wolf, on the contrary, should have pondered, it will not be an hour to find a force greater than his. How will he speak then? How is the Lamb?

In Krylov's fable «The Wolf and the Lamb» common nouns wolf and lamb are given as proper names Wolf and Lamb, summarizing the essence and concept as a struggle between two sides. Justice and injustice; the law of nature, the strongest always wins.

Comparing the meaning of these two fables «The wolf and I am a gnok» »How dare you, impudent, with an unclean snout» is in Krylov's fable, and in the Mongolian fable « Nega men ichmoqchi bo'lgan suvni loyqalatasan », i.e. and there are « suvni loyqalatasan » pollute the water. In two fables clear sense layer wa wolf, but a different interpretation of the authors gives us a broader understanding of the meaning of fables.

Analyzing the words of the lamb's appeal to the wolf, we can distinguish the following epithets : «the brightest Wolf», Lordships, hungry. There are no such epithets in the Mongolian fable. The lamb is arrogant, does not want to obey and listen to the hungry Wolf, there is no fear in his speech or in his actions . The image of the wolf 's arakterizuet person as the holder of power and uses his position , exhibits rude and angry Property in the address to the Lamb, calling him a dog and unclean snout , in yvorachivaet inside his essence alone with the

words «You are to blame for much that I want to eat », Showing arrogance and undisguised shamelessness . P shows in his own words a disregard for the rules and an understanding of his own impunity , the defenseless Lamb personifies the powerless people in general and any ordinary person in the private. He tries to soften the Wolf with a kind word, although from the very beginning of the conversation he realizes his powerlessness. He addresses the Wolf as a noble person, and then briefly, but succinctly, trying not to break the note of respect in any remark.

Summarizing the results of the analysis of comparative typology can say that in both fables describes Xia favorite topics but - disempowerment of ordinary people. Being an ardent defender of all offended, the author did not miss the opportunity to put all relations in their places with another fable poem with his inherent ease. The human vices ridiculed in the fable must be eradicated from human society, corrected. The fable understand camping, that force , valid uyuschaya as she pleases, it is difficult to stop. People like the Wolf don't even need to make excuses to anyone! We would like the power of man to work to restore justice ... We can only admire the ability to succinctly and sharply remind the strongest how humiliating they sometimes behave.

Our research will not end there. Further, we bring to your attention a deeper analysis of not two, but three fables of the same name. But that is already a question for another article.

ABSTRACT

The article deals with the tasks of an applied nature. It was found out what preparatory tasks are advisable to consider when studying a course in mathematics. The article also indicates that the proposed tasks contribute to the development of applied mathematical culture, the development of the necessary skills for applying mathematical knowledge and methods of action when solving practical problems.

KEYWORDS: *Applied Task, Lagrangian Multiplier Method, Budget Line, Indifference Curve, Utility, Optimal.*

INTRODUCTION

The interest of the broad layers of students for mathematical knowledge over the past decades decreased significantly. One of the main reasons is that the lessons of mathematics do not give a convincing enough answer to the question: why is all this necessary?

Long-term promise of benefits does not facilitate the assimilation of abstract knowledge. At the same time, the role of mathematics in the most diverse aspects of social life has now sharply increased and, no doubt, will continue to grow. A certain gap has arisen between the academic subject and the mathematics applied in practice. The bridge between them can and should be a significant strengthening of the applied orientation of the mathematics course.

By the applied orientation of teaching mathematics, we mean the formation of students' knowledge, abilities and skills necessary for the application of mathematics in other academic disciplines, in the labor process, in everyday life, etc., and ideally, in the development of a desire for such applications.

When applying mathematics, the central point is the translation of the problem into mathematical language, in other words, the construction of such a mathematical model, the study of which can give the correct answer to the question posed; the latter are expressed by words and: the model must be adequate to the outcome of the problem. The model must also be so simple that the resulting mathematical problem can be solved. Students should have an idea of the approximate nature of hypotheses, due to which the answer, even for an adequate model, turns out to be approximate, regardless of the accuracy of the computational tools used. Along with correct ones, it is necessary to analyze incorrect hypotheses, as well as inadequate models.

In real problems, you need to be able to select the essential from all the parameters, discard the insignificant, compose the necessary number of equations to find the desired quantities. By no means always in the original formulation of the problem there is exactly as much data as is needed to solve it, there may be more and less of them.

Compose the necessary number of the equations to find the desired quantities, be no means always in the original formulation of the problem there is exactly as much data as is needed to solve it, there may be more and less of them.

In many applied problems, a function of two variables is to be optimized subject to a restriction or constraint on the variables. For example, an editor, constrained to stay within a fixed budget of \$ P, may wish to decide how to divide this money between development and promotion in order to maximize the future sales of a new book. If x denotes the amount of money allocated to development, y the amount to allocated to promotion, and $f(x, y)$ subject to the budgetary constraint that

$$x + y = p$$

We apply the **Lagrange** multipliers method.

Suppose $f(x, y)$ and $g(x, y)$ are functions whose first-order partial derivatives exist. To find the relative maximum and relative minimum of $f(x, y)$ subject to the constraint that $g(x, y) = k$ for some constant k , introduce a new variable λ and solve the following three equations simultaneously.

$$\frac{\partial f(x, y)}{\partial x} = \lambda \frac{\partial g(x, y)}{\partial x}, \quad \frac{\partial f(x, y)}{\partial y} = \lambda \frac{\partial g(x, y)}{\partial y}, \quad g(x, y) = k$$

The desired relative extrema will be found among the resulting points (x, y) .

Example-1

An editor has been allotted \$ 60000 to spend on the development and promotion of a new book. It is estimated that if X thousand dollars is spent on development and Y thousand on promotion, approximately $f(x, y) = 20x^{1.5}y$ copies of the book will be sold. How much money should the editor allocate to development and how much to promotion in order to maximize sales?

Solution

The goal is to maximize the function $f(x, y) = 20x^{1.5}y$ subject to the constraint $g(x, y) = 60$, where $g(x, y) = x + y$.

The corresponding Lagrange equations are

$$30x^{0.5}y = \lambda, \quad 20x^{1.5} = \lambda \quad \text{and} \quad x + y = 60$$

From the first two equations you get $30^{0.5}y = 20x^{1.5}$

Since the maximum value of f clearly does not occur when $x=0$, you may assume that $x \neq 0$ and divide both sides of this equation by $30x^{0.5}$ to get

$$y = \frac{2}{3}x$$

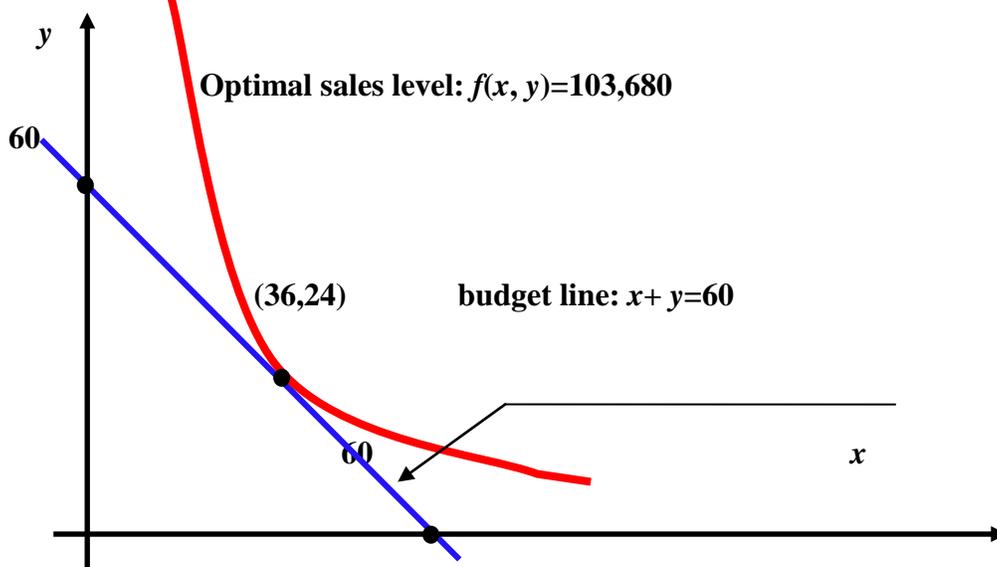

Figure 1.

Substituting this expression into the third equation, you get

$$x + \frac{2}{3}x = 60 \quad \text{or} \quad \frac{5}{3}x = 60$$

From which it follows that

$$x = 6 \quad \text{and} \quad y = 24$$

That is, to maximize sales, the editor should spend \$ 36 000 on development and \$ 24 000 on promotion. If this is done approximately $f(36, 24) = 103,680$ copies of the book will be sold.

Example-2

A consumer has \$ 600 to spend on two commodities, the first of which costs \$ 20 per unit and the second \$ 30 per unit.

Suppose that the utility derived by the consumer from X unit of the first commodity and Y unit of the second commodity is given by the **Cobb-Douglas** utility function $u(x, y) = 10x^{0.6}y^{0.4}$. How many units of each commodity should the consumer buy to maximize utility?

Solution

The total cost of buying X units of the first commodity \$ 20 per unit and Y units of the second at \$ 30 per unit is $20x + 30y$. Since the consumer has only \$ 600 to spend, the goal is to maximize utility $u(x, y)$ subject to the budgetary constraint that $20x + 30y = 600$. The three Lagrange equations are

$$6x^{-0.4} \cdot y^{0.4} = 20\lambda, \quad 4x^{0.6} \cdot y^{-0.6} = 30\lambda \quad \text{and} \quad 20x + 30y = 600$$

From the first two equations you get

$$\frac{6x^{-0.4} y^{0.4}}{20} = \frac{4x^{0.6} y^{-0.6}}{30}$$

$$9x^{-0.4} y^{0.4} = 4x^{0.6} y^{-0.6}$$

$$9y = 4x \quad \text{or} \quad y = \frac{4}{9}x$$

Substituting this into the third equation, you get

$$20x + 30 \cdot \frac{4}{9}x = 600$$

from which it follows that

$$x = 18 \quad \text{and} \quad y = 8.$$

That is, to maximize utility, the consumer should buy 18 units of the first commodity and 8 units of the second.

A graph showing the relationship between the optimal indifference curve $u(x, y) = C$, where $C = u(18, 8)$ and the budgetary constraint $20x + 30y = 600$, is sketched in Figure 2

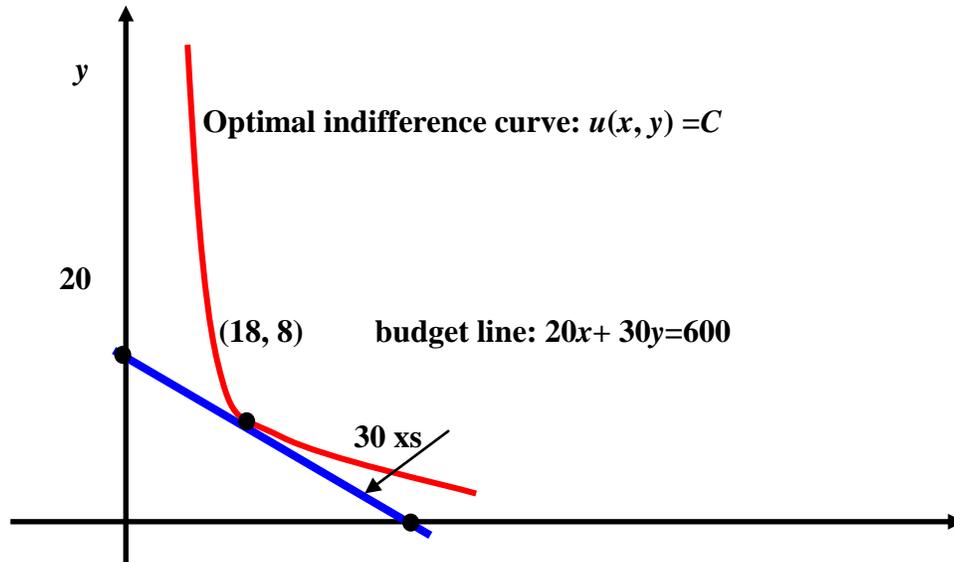

Figure 2.

Example-3

Let it be required to establish the optimal (in terms of minimum costs) tank dimensions of a given volume of 0,25 cubic meters with a square base, if the cost of welding a seam is \$ 0,1 per meter, and of tin plate is \$ 0,2 per square meter.

Solution

The parallelepiped under consideration is uniquely determined by the base side length “ b ” and the height h . By formula $V = b^2h$, we have $h = \frac{V}{b^2}$.

Therefore, the length of the base side can be taken as the desired value. Let us denote it by the letter X , surface area $S(x)$, total length of seams $l(x)$, manufacturing cost $C(x)$.

It is not hard to see that

$$S(x) = 2x^2 + \frac{4V}{x}, \quad l(x) = 8x + \frac{V}{x^2}$$

And

$$C(x) = 0,1l(x) + 0,2 \cdot S(x) = 0,1\left(8x + \frac{V}{x^2}\right) + 0,2\left(2x^2 + \frac{4V}{x}\right)$$

Expanding the brackets, we get

$$C(x) = 0,4x^2 + 0,8x + \frac{0,8V}{x} + \frac{0,1V}{x^2} \quad (*)$$

Substitution the given value. V in expression (*), we get the following expression

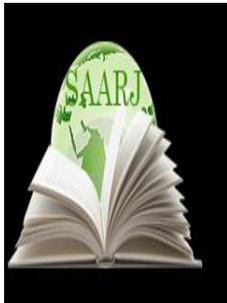

$$C'(x) = 0,8x + 0,8x - \frac{0,2}{x^2} - \frac{0,05}{x^3} = \frac{0,8}{x^3} \left(x^4 + x^3 - \frac{x}{4} - \frac{x}{16} \right) = \frac{0,8}{x^3} \left(x - \frac{1}{2} \right) \left(x + \frac{1}{2} \right)^3.$$

Hence we see that at $0 < x < \infty$ the derivative changes sign when passing through point $x = \frac{1}{2}$

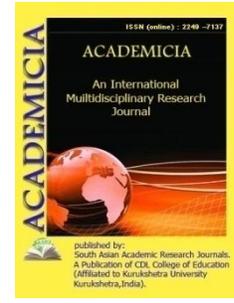

from minus to plus. So the answer is $x = \frac{1}{2}$, i.e. a dimension of $x=0,5$ meter.

ABSTRACT

This article focuses on environmental education, one of the most important areas of educational work in schools. Considering it as an integral part of a single educational process, covering all age groups of students, providing them with relevant knowledge about various aspects of the interaction between nature and society, fostering a responsible attitude towards nature the need for Only by the end of the twentieth century mankind realized all the perniciousness of its thoughtless «management» on Earth.

KEYWORDS: *Nature, Environmental Education, Environmental Problems, Environmental Education, School, Student, Experiment*

INTRODUCTION

The history of mankind is inextricably linked with the history of nature. At the present stage, the issues of its traditional interaction with humans have grown into a global environmental problem. If people in the near future do not learn to take good care of nature, they will ruin themselves. And for this it is necessary to foster ecological culture and responsibility. And you need to start such education from primary school age. It is this age that is the most favorable period for the formation of the foundations of ecological culture. At this age, in the minds of students, a visual–figurative picture of the world, the moral and ecological position of the individual is formed, which will determine the child's attitude to the world around him and to himself.

Environmental problems are global in nature and affect all of humanity. At the present stage of development of society, the issue of environmental education is becoming particularly acute. In this regard, it is necessary to strengthen and pay more attention to environmental education in modern schools from the very first years of raising children.

At present, the ecological education of schoolchildren is becoming a priority in pedagogical theory and practice. This is due to the difficult ecological situation on our planet: the rapid growth of the population, and, consequently, the problem of providing it with food, providing

industry with mineral raw materials, the problem of energy and, of course, environmental pollution – all this creates a threat to the existence of life itself on Earth. Only by the end of the twentieth century mankind realized all the perniciousness of its thoughtless «management» on Earth. One of the most important reasons for this state of affairs is the environmental illiteracy of the population, the inability to foresee the consequences of their interference in nature. Therefore, UNESCO international organizations raise the issue of the need to revise the content and terms of environmental education of the inhabitants of the Earth.

Today there is a lot of positive in the already existing experience of environmental education. The rapidly expanding conservation movement has embraced the entire world. The question of how a person should relate to the environment worries every inhabitant on earth. People are concerned about the ecological health of the planet. Even the so-called “Green Party” was formed, the main goal of which was to protect the environment from pollution. The Green peace movement – the green world – monitors the state of the environment around the world.

All this is good, but the “minus” is that not everyone is interested in the global environmental problems of today. Only a few schoolchildren are involved in environmental circles and clubs. The rest, and they make up 80% of all students, are not at all interested in this.

In the system of continuous environmental education, the school is of great importance, and in the school – the primary classes. This is due to the fact that children of primary school age are very curious, responsive, receptive, easily respond to anxieties and joys, sincerely sympathize and empathize. At this age, there is an active process of purposeful formation of knowledge, feelings, assessments, emotions, the development of abilities and interests. Modern psychological and pedagogical research has convincingly proved that the age characteristics of younger schoolchildren contribute to the formation of the foundations of ecological culture, which is the goal of ecological education.

The results of interaction between society and the natural environment are disappointing. And therefore, the school has set the task of developing the ecological culture of primary schoolchildren and educators of the person of the future – a comprehensively developed personality who lives in harmony with the world around him and himself, acting within the framework of ecological necessity. The sooner the work on the ecological education of students begins, the greater its pedagogical effectiveness will be, while all forms and types of educational and extracurricular activities of children should act in close interconnection.

A lot of teachers are involved in environmental education and education. The great merit belongs to such outstanding scientific teachers and methodologists as I.F. Kharlamov, A.S. Makarenko, Y.A. Comenius, A. Y Gerd, J.–J. Russo, I.G. Pestalozzi, B.T. Likhachev, I.P. Podlasy, M.N. Skatkin, V.A. Sukhomlinsky, L.N. Tolstoy, A.M. Nizova, L.F. Melchakov, Z.A. Klepinin, K. D. Ushinskiy, ST Shatskiy and others. And they do it in different ways. This is due to the fact that the issue of environmental education is complex and ambiguous in interpretation. But the main thing is that behind all this variety of methods and techniques of work, junior schoolchildren are becoming more environmentally friendly.

Analysis of literature data

One of the most important directions of the educational work of the school is environmental education. Considering it as an integral part of a single educational process, it is necessary,

covering all age categories of students, to give them the appropriate knowledge about various aspects of the interaction between nature and society, to foster a responsible attitude to nature [1].

The natural world is a human habitat. He is interested in maintaining the integrity, purity, harmony in nature and preventing violations of biological interaction and balance. At the same time, by his active transforming activity, a person interferes with natural processes, violates them, uses the wealth of nature in his own interests. Nature is for people an object of knowledge and aesthetic attitude. Her phenomena are aesthetically perfect and give an aesthetically developed person deep spiritual pleasure. Penetration into its secrets contributes to the formation of a scientific worldview. This necessitates the implementation of universal, compulsory, initial environmental education, which lays the foundations for human environmental culture [2].

Environmental education should be focused on ensuring that the student, knowing the requirements and norms of behavior in the natural environment, not only formally fulfill them, but also realize the objective necessity of these requirements. The achievement of this goal will be facilitated by the development of a system of natural science, social and ethical knowledge among schoolchildren, the formation of practical experience, the solution of specific local environmental problems, the implementation of which is possible not only within the framework of school subjects, but also in the process of organizing extracurricular activities on environmental education [3] ...

Going to school is an important stage in a child's life. New responsibilities appear, rules and norms of behavior become more complicated, demands from others increase. Teaching and labor become the leading types of activity [4].

Younger schoolchildren have rather limited ideas about the variety of actions and deeds that express concern for nature or that harm it. At the same time, they fully understand the need for a caring attitude towards nature, guided in their feelings by moral and aesthetic motives: «plants delight everyone», «the forest is our friend.» Younger schoolchildren are concerned about the bad deeds of adults in relation to nature: «adults cut the bark of trees, pollute the forest with cans, glass.»

The ecological education of primary schoolchildren has its own specific features in connection with their inherent characteristic features: natural curiosity, extreme emotional responsiveness, trustfulness, faith in the authority of the teacher and parents.

However, the age characteristics of junior schoolchildren also cause a number of difficulties in their upbringing due to the change in the leading type of activity from play to educational, the gradual change of visual–figurative thinking to abstract, developed need for work in nature in the absence of appropriate skills and abilities.

The relevance of the problem we are investigating is reflected in the “Concept of education of children and working youth in the Republic”. In accordance with the Concept, the “Program for the upbringing of children and students in the Republic” was developed. This program is a concrete embodiment of the concept as applied to teaching practice in a reformed school.

MATERIALS AND RESEARCH METHODS

The basis of the methodological research is experimental research. The experimental research was carried out in 3 «A» class in secondary school №35 in Buxara. As part of the study, an experiment was carried out, which consisted of the following stages:

1. Ascertain experiment: questionnaires for teachers and analysis of documentation.

Purpose: to identify the level of use of environmental education in the educational and cognitive process.

In this regard, the following research methods were carried out.

- Survey methods: questioning to find out the degree of use and effectiveness of environmental education
- Analysis of documentation on environmental education
- Observations to determine the degree of influence of environmental education on the learning process and the characteristics of the organization and management of environmental education by a teacher.

2. Formative experiment

Purpose: to promote an increase in the efficiency of the use of environmental education in the learning process and to identify the level of formation of the environmental culture of younger students.

At this stage, lessons were conducted:

- On the course «Man and the World»
- Class hour–game on the natural history theme «I live by you, my nature»

Also at this stage, work was carried out with students. To identify the level of formation of the ecological culture of primary schoolchildren, testing was carried out in 3 «A» grade. Testing was carried out at the end of the pre–diploma practice, after purposeful work was carried out with the students to increase the level of formation of ecological culture.

3. Control experiment

Purpose: to prove the need to use environmental education in the process of teaching younger students.

In this regard, observations were carried out in order to identify the need for environmental education, used in the formative experiment.

RESULTS AND ITS DISCUSSION

During the pilot study, various methods were used. At the stage of the ascertaining experiment, a survey was conducted in order to identify the degree of use of environmental education in the learning process. 12 respondents were interviewed using a questionnaire. Analyzing the results of the questionnaire, I found out that 90% of the respondents systematically use environmental education in the learning process, 8% – educate the ecological culture of the individual only when time allows or need to complete the program, 2% – do not use such education in the

educational process, considering that that this needs to be done after school hours. Despite the results, all respondents believe that it is necessary to educate the ecological culture of primary schoolchildren, since primary schoolchildren have rather limited ideas about the variety of actions and deeds that express concern for nature or harm it. At the same time, they fully understand the need for a caring attitude towards nature. Younger schoolchildren are concerned about the bad deeds of adults in relation to nature: «adults cut the bark of trees, pollute the forest with cans, glass.» Therefore, such upbringing should be started precisely from early school age.

Analysis of the documentation and additional literature showed that today primary school requires a revision of the priorities of learning goals. Particular attention is paid to the developmental function of teaching and the personality of younger students. An important role in solving this problem belongs to the course «Man and the World».

1 class. This course combines biological, geographic, social science and anatomical knowledge, which will help to form an idea of the unity of man, society and nature in younger students, will give an opportunity to show children how important it is to maintain harmony in relation to man and nature. The «Nature and Man» block of the «Man and the World» course is based on the concept of environmental education and upbringing of a younger student. Along with solving the problems of mental, aesthetic, moral, patriotic education. An important task of this block is the task of forming the ecological culture of primary schoolchildren. It is known that at the age of 6 to 11 years, the basic side of culture, communicative, mental, aesthetic and moral, is actively formed.

The formation of ecological culture is also facilitated by the understanding by children of the comprehensive value of nature. Already in the preparatory class, one should not emphasize and put in the first place the material value of nature, since practice has shown that the protrusion of the material value of nature contributes to the formation of a consumer attitude towards it in children. In the preparatory class, three main blocks of the subject are studied: «Man and Nature», «Man and Society», «Man and His Health».

Grade 2. In the second grade, the students become more interested in studying nature, striving to learn its secrets and riddles. There is a systematization of environmental knowledge, skills and abilities of students.

When studying inanimate nature, initial knowledge about its main properties is formed, and the importance of maintaining the purity of water, air, and soil is emphasized.

The use of popular science natural history literature makes it possible to discuss specific situations and actions, to see the attitude of children to what is described, to give a motivated assessment of people's behavior, i.e. real prerequisites arise for overcoming negative manifestations in the behavior of students in nature.

3–4 classes. Lessons in the third grade in the block «Nature and Man» direct the attention of students to a deeper understanding of cause–and–effect relationships in nature, to the need to preserve and maintain them by man. Here it is important that not only new information is reported, knowledge on the use and protection of nature is generalized and systematized, but also valuable moral guidelines are formed, which should guide schoolchildren in practical actions and deeds.

The solution of these problems is facilitated by various methods and problems of studying and consolidating new knowledge with independent work of students, using visual aids, periodicals, working with a textbook, demonstrating educational television programs, film strips, transparencies, etc.

If these methods of upbringing are used at the right stage of training, taking into account the psychological preparedness of students and taking into account natural conditions, then the teacher can form an environmentally competent and educated personality.

Also at this stage, observations were carried out over the teacher in the classroom in order to identify the level of correct organization and leadership in environmental education. I watched lessons on the course «Man and the World» and «Mathematics».

In this regard, a formative experiment was carried out. At this stage, I developed and conducted lessons in the 3rd «A» class on the subjects «Man and the world», and an extra-curricular event (game) on the natural history theme «I live with you, my nature.» In addition, at this stage, work was carried out with students. To identify the level of formation of the ecological culture of primary schoolchildren, testing was carried out in 3 «A» grade. According to the results, it can be concluded that the pupils of the 3rd grade have already formed an ecological culture, they know how to behave correctly in nature. The test results are listed in the table.

To prove the need for environmental education, a control experiment was conducted. After conducting it, we can conclude that children do not oppose knowledge in the field of ecology. From this we can conclude that thanks to the purposeful work of the teacher, this position can be achieved very much.

It is possible to develop certain recommendations for the teacher to increase the level of environmental awareness and environmental culture of children.

- 1. Try to show and find attractive sides in nature, make you think about the phenomena that are happening, their causes and effects.*
- 2. To acquaint with works of art that reflect nature.*
- 3. Focus the attention of children on how nature affects the people around them.*
- 4. Help children to analyze their actions more often, to treat themselves and their actions self-critically.*
- 5. In your work, be sure to use entertaining material.*

CONCLUSION

Environmental culture is a culture of human unity with nature, a harmonious fusion of the needs and requirements of people with the normal existence and development of nature itself.

Ecological culture implies:

- 1. Knowledge of the laws of development of nature and society (educational aspect);*
- 2. Understanding of the need to protect nature (moral aspect);*
- 3. Ability to predict, anticipate the consequences of one's intervention in natural interactions (prognostic aspect);*

4. *Conscious observance of norms of impact on nature and its protection (behavioral aspect).*

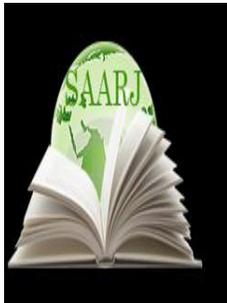

The main quality of a person's ecological culture is his consciousness in solving a number of environmental problems. But in order to solve certain environmental problems, students must have a certain system of practical and theoretical knowledge and skills. For this, the teacher must organize the pedagogical process as productively as possible. In this case, he must select more effective methods and techniques for organizing children, actively carry out the greening of children not only during lessons, but also outside school hours. Since it is in extracurricular activities that children become more relaxed and pliable.

As a result of my practical activities, I became convinced that the formation of a careful attitude towards nature in younger students also depends on the development of ecological culture. Which was what had to be proved.

ABSTRACT

Left-handed is a characteristic of individual typological features of a person. At the present stage of society, solving a number of psychological problems in the traditional educational process, it is important to investigate psycho physiological peculiarities and specificity of causes of the laterality pattern's formation in junior schoolchildren. Children with a left-sided profile are not a homogeneous group. Among the causes of left-handedness are the following: heredity or genetic left-handedness (as an individual congenital characteristic), pathological or compensatory (as a result of the compensation mechanism), forced or acquired (as a result of injury to the right hand or retraining). Recent studies describe how left-handers differ greatly from right-handed schoolchildren in their mental development, world's perception, prevailing thinking strategies and specificity of emotional-affective expression. The reasons for this are manifold. However, the key factor is the inextricable and intimate connection of the left-handedness and the hemispheric dominance that leads to a specific functional organization, of the brain work. This means that the left-handed brain works and complies by some other rules in comparison with right-handed people. As a result they have some educational peculiarities and difficulties. In most cases, these children have difficulties in mastering oral and written language skills, numeracy and mathematical operations. A characteristic feature of left-handers is the insufficient and specific development of visual perception, which normally creates the basis for mastering reading and writing. Unfortunately children with left handedness do not receive adequate assistance in school, since education and upbringing are focused on right handed people. It is also shown that «traditional» retraining in early childhood can lead to distress, which has a negative impact on the children. Therefore, it is necessary to include in the educational process special methods and techniques. Thus it will be a favorable condition for

their harmonious personal and intellectual development and effective mastering of various modules of the school curriculum. This article presents a theoretical model analysis of the causes and consequences of the development of sinistrality, briefly considered the psychological characteristics of left-handed children.

KEYWORDS: *Functional Asymmetry Of The Brain, Laterality Profile, Sinistrality, Left-Handedness, Left-Handed Schoolchildren.*

INTRODUCTION

Throughout the history of the development of mankind, people who differ from those around them in some individual characteristics have always caused and are causing surprise and interest. One of these individual typological features of a person is the profile of the lateral organization – a certain combination of functional asymmetry of the cerebral hemispheres (mental, motor, sensory), characteristic of a given person. Based on this, it is customary to distinguish: right-sided (with a predominance of the left hemisphere or left-hemisphere), left-sided (right hemispheric) and mixed (equal hemisphere) profile. The lateral profile reflects the distribution of hemispheric functions, while both hemispheres are not autonomous, there are, of course, complex interrelationships between them.

Main part

It is interesting to note that the society has developed an ambiguous attitude towards people with a left-sided profile (left-handed people), or towards left-handed people, for the most part wary and sometimes negative (Vergunov, Nikolaeva 2017). So, in many cultures and languages, the very word “left” means something dubious, false, wrong. For example, the word “left” in Old English meant “weak”, since among the majority of right-handed people who actively prefer to use their left hand, there was a minority, respectively, they were “weaker”. One way or another, some people to this day consider left-handedness a deviation, while others – a manifestation of genius.

Many practicing educators believe that such children need a special approach when teaching in primary school. There is evidence that left-handed children most often have impaired reading and writing, impairments or deficiencies in the development of visual-spatial perception, visual memory, and impaired visual-motor coordination (Bezrukikh 1995; Nikolaeva 2005; Semenovich 2009). The consequence of this are difficulties in distinguishing, memorizing and writing complex configurations of letters and numbers, drawing geometrical figures, as well as mirror writing, pronounced handwriting disorders, tremors, etc. MM Bezrukikh says that left-handedness in itself is not a developmental defect, but often acts as one of the reasons for the emergence of difficulties (especially at the initial stage of training, when there is an active formation of motor skills). For left-handed training to be effective, it is necessary to know the mechanisms and causes of the problems that arise (Bezrukikh 2008).

An analysis of scientific literature over the past decade (Vergunov, Nikolaeva 2017) indicates that this phenomenon is being actively studied, the results of these studies make it possible to change the stereotypical perception of left-handed people, and modern methods of teaching them are gradually being developed (Shorokh-Troitskaya 2002). A variety of reasons for left-handedness, an increase in the number of left-handed children among children, the massive

nature of problems in teaching written speech has become the reason for increased attention of both teachers and a number of researchers (Hayrapetyants 2003; Bezrukikh 2008; Bragina, Dobrokhotova 1988; Nikolaeva 2005 ; Semenovich 2009, etc.).

So, on the one hand, the phenomenon under study itself is still poorly understood. So far there is no unambiguous answer to many questions about left-handedness: the reasons, the specificity of the psychological and physiological characteristics of left-handed people, the ratio of indicators of motor and sensory asymmetry, questions regarding methods of their assessment, interpretation of results, etc.

On the other hand, all researchers agree that the number of left-handed children among schoolchildren is constantly increasing from year to year. It is interesting to note that, according to the latest statistics, almost as many left-handers are born as right-handers (apparently, both are needed evolutionarily), somewhere 40 to 60%. But in adulthood, only about 11% of them remain (Beglova 2018). Depending on the region, the number of left-handed people on the planet ranges from 15–17%. Despite the relatively large percentage, the world is still created for right-handed people, and left-handers have to adjust.

Conception

Left-handed or right-handed thinking based only on manual asymmetry is an imprecise indicator of cerebral lateralization. It is also important to distinguish between the very concepts of "left-handedness" and "right-handedness". Left-handedness is determined by the predominant possession of the left hand, while the left-handed profile (left-handedness) is a complex characteristic reflecting the predominance of the activity of the right hemisphere, or complete dominance of the left side.

If a child draws, eats and works with his left hand, because it is easier and more convenient for him, we can confidently say that he is left-handed. At the same time, whether he is an absolute left-handed person can be judged only after identifying his leading leg, leading eye and ear. In addition, there is also "hidden left-handedness", when a person does almost everything with his right hand, but he himself, without noticing, performs some of the movements with his left. Or a child may be left-handed, but not completely left-handed (Bezrukikh 2008; Nikolaeva 2005, etc.). It is worth noting that there are very few absolute left-handers (who have leading all paired organs on the left side of the body). Most often, you can observe various combinations (possession of the left hand is combined with the left leg, but with the right eye and right ear). There are a lot of similar combinations.

It would seem that the organization of brain activity in left-handers should be the same as in right-handers, but in a mirror image. But this is fundamentally wrong! The left-hander is built and develops according to completely different laws. In the future, we will focus mainly on left-handedness, but other types of manifestations of left-handedness cannot be ignored, since they can also affect the success of children's education.

Causes

The study of the characteristics of left-handed people is complicated by the fact that all of them are not at all a homogeneous group. There are various reasons for left-handedness, on which the development of certain qualities in a child may depend. So, the predominance of the left or right side of the body can be due to several reasons. The first reason is the inheritance of a trait

(Nikolaeva 2017). Provided that both parents are right-handed, the probability of having a left-handed child is 2%, if one of the parents is left-handed – 17%, if both parents are left-handed – 46%. Already now in genetics, about 40 loci are distinguished, which mediate the development of left-handedness in humans. For example, the PCSK6 gene, one of the loci of which enhances the severity of asymmetry, without a definite direction to the left or right, and the LRRTM1 gene shifts the hand to the left (Nikolaeva 2017). In this case, left-handedness, inherited, is not a pathology, it is one of the individual variants of the norm. Genetic left-handers usually do not have pronounced problems with learning, adaptation.

In most cases, from the eighth week in the fetus, the motor zones of both hemispheres of the brain function, which respectively control the left and right hand, already at this stage the "dominant" hemisphere is revealed. At this stage of development, the fetus in the womb begins to move with the right hand, at the 15th week it sucks the finger of the same hand, at the 38th week it begins to turn its head to the right (Hayrapetyants 2003; Bragina 1988; Semenovich 2009).

The second reason is when left-handedness is the result of stress that the fetus receives during the prenatal period, or a consequence of birth trauma to the brain. In the future, this may entail an increased risk of neuropsychic disorders. Due to the compensation mechanisms, the right hemisphere assumes additional functions of the left one. This results in pathological or compensatory left-handedness.

Since there is no consensus about the reasons for the formation of left-handedness, there are various theories. We will not describe all of them here – this is a topic for a separate article, but we will highlight one of them as an example. So, according to the theory of Geshwind (1980), the development of left-handedness in the fetus during intrauterine development is influenced by the high content of testosterone, which inhibits the development of the left hemisphere, and the development of the right, on the contrary, stimulates.

Researchers note that twins, premature babies, babies who received low scores on the Apgar scale are more often left-handed at birth, and if we consider gender, then according to statistics, it is found that there are 10 levs per 12 male left-handers. –she–women (Shanina 2000).

The third reason for the development of left-handedness is a consequence of dysfunction of the right hand (forced or acquired left-handedness). The choice of the left hand is associated, say, with an injury to the right hand, a fracture, but it may also be the result of imitation of relatives or friends (social left-handedness).

And the fourth reason is "retraining" in the learning process. Handness is one of the most important neurobiological properties; it cannot be changed at will, since any intervention, especially at an early age, leads to unpredictable results, which may not appear immediately, but after several years (Ayropetyants 2003).

If a child is retrained at the age when motor processes are decisive in the child's mental development, this leads to inhibition of mental functions. The consequence of this process may be the appearance in the child of a feeling of inferiority, an inferiority complex, inability to communicate with people, neurosis (restless sleep, tics, obsessive movements, stuttering), etc.

Today, many researchers (Hayrapetyants 2003; Bezrukikh 1995; Beridze 2004; Nikolayeva 2005; Chuprikov 2008) have convincingly proved that retraining a left-handed child is traumatic

for his psyche. Nowadays, all teachers know that not only it is not necessary to remake nature, but also that it is necessary to apply an individual approach to left-handed children and use other teaching methods that are more natural and therefore more effective for them. According to some reports, left-handers experience difficulties in adapting to learning (especially in writing); the percentage of left-handers among children with learning problems is at least 2.5 times higher than among right-handers.

A study by Yu. Kleiberg and AL Sirotyuk, who studied the learning success of primary school students, showed that the most successful in learning are equal hemisphere and children with a dominant left hemisphere. The success rate of learning in the equipotential hemisphere was 77%, with the leading left hemisphere – 75%. Children with a dominant right hemisphere were less successful – 42.9% (Kleiberg 2001).

As noted earlier, the category of "left-handed" children is not homogeneous. The stereotypes existing in society (especially among teachers and parents) make it difficult to see a real child with his completely individual characteristics. Of course, there are still no clear answers to many questions about left-handedness, but it can be noted that the phenomenon of left-handedness in itself cannot be the cause of any deviations in development or a decrease in mental / physical abilities.

Features:

As a rule, each hemisphere of the brain has its own functions, but they are in constant interaction with each other, representing an integral system. Many authors believe that the left hemisphere specializes in semantic perception and speech reproduction (counting, writing), logical, analytical perception, abstract thinking. The right one is responsible for spatial-visual functions, intuition, visual-figurative, situational thinking. The right one is associated with the sensitive sphere, and the left one – with the motor and speech. The right hemisphere regulates the work of the left half of the body, and the left hemisphere regulates the right. Of course, there is no such clear division between the hemispheres, and researchers are increasingly confirming the inconclusiveness of ideas about the autonomous work of each hemisphere while providing different types of activity. Only in paired work is the asymmetry of the functions of the cerebral hemispheres manifested.

In a left-handed person, interhemispheric interactions are formed much later than in a right-handed person; both hemispheres are more autonomous in their work. Perhaps that is why left-handers show, on the one hand, great creative abilities (unsettled connections can theoretically contribute to non-standard thinking), and on the other hand, a slower (compared to right-handers) formation of the skills of activity that requires interaction of both hemispheres ...

If we talk about the personal characteristics of left-handed children, then they are emotional, dreamy, with vivid fantasies and imagination, rely on intuition, follow feeling more than reason, and slowly learn norms of behavior. Left-handed children are more timid, behave calmly, wait to be addressed, they themselves do not enter the conversation first. They are very impressionable, emotionally sensitive, vulnerable, touchy, have a negative attitude to what prevents them from concentrating, do not like to be distracted, they have reduced efficiency and increased fatigue. They are impatient, intemperate, there is a reduced level of subjective control. In life, this is manifested as follows: a left-hander starts up with a half-turn, easily falls into a rage. The activity is spontaneous, relying on a lucky break. It is difficult for them to work in large groups

with strictly regulated conditions and subordination. They prefer individual work where they can show their own initiative and intuition, creativity and imagination.

Phenomena such as a decrease in adaptive capabilities, increased excitability, anxiety, neurosis-like disorders can often be observed in children with forced left-handedness. Asynchronous development of mental functions can be considered characteristic of a left-handed child, as the development of emotional-volitional functions is ahead of the curve, while psychomotor and spatial perceptions lag behind.

Speaking about the features of speech, it can be noted that oral speech is emotional, expressive, rich in intonations, accompanied by gestures, there is no particular harmony in it, pauses, unnecessary words and sounds are possible. In the beginning, letters can be written (read) the other way around (mirrored), skip letters, not end words, not put dots, and clumsy handwriting.

It should be recalled that left-handedness in itself is not a risk factor in learning to write, but only in connection with certain deviations or developmental disorders.

Lefties use a special information processing strategy, an analytical style of cognition, which is manifested in a slow comprehension of connections between parts of the whole (reduction of differentiation). They are characterized by detailed component-wise work or work with details; on the basis of such an analysis, a holistic view of the object of activity is built.

In most left-handers, there is a lack of development of visual-spatial perception, visual memory and visual-motor coordination, which undoubtedly leads to difficulties in school, as it is an essential component of the child's overall functional development. And the question is not so much that the child holds a pen in the other hand, it is much more important whether he has formed interhemispheric connections, oculomotor connections (hand – eye), as well as connections with the auditory analyzer (eye – ear – hand) ...

The increase in the number of left-handed first-graders actualizes the need to carry out special work to adapt them to school, where the educational process is focused on writing the right hand (Nikolaeva 2005). Teaching left-handers or schoolchildren who demonstrate the left side of the preference should contain elements of adaptation and include specially organized and developmental activities.

CONCLUSIONS

Knowing the causes and psychological characteristics of left-handed children, a teacher should select methods of teaching educational material, taking into account the creative and creative abilities of right-hemispheric students. And along with the classical teaching methods, use, for example, problematic and heuristic ones, creating conditions for the inclusion of emotions and intuitive thinking in the work.

It is better to explain the new theoretical material on practical tasks, actively using the intonation capabilities of speech and accompanying visual reinforcement. It is easier for a left-handed student to solve an example or problem not from a textbook, but in the form of a riddle task or other creative tasks.

Achieving success in teaching such children is possible only with a unified tactics of behavior of the teacher and parents, who consider left-handedness not as a deviation from the norm, but as an individual option, a manifestation of individuality within the normal range. It is necessary to

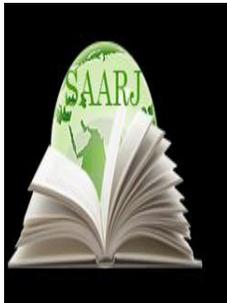

create favorable conditions for children who already find it difficult to exist in a "right-handed" society, never express a negative attitude towards left-handedness, but, on the contrary, use the characteristics of such a child to instill in children in the classroom respect for the individual characteristics of each a person, tolerance in relation to the manifestation of properties that are not characteristic of the majority.

ABSTRACT

In 1974, Dr Yunus disburse microloans to empower Bangladeshi women. The poor women paid back the loan amount with interest from income generated from small scale initiatives. The word 'capital' refers to the "reproductive power of producer goods, both natural and man-made", in other words, "capital is the accumulated goods devoted to the production of other goods". The author revealed that self-esteem, self-respect, self-confidence, trust and attitude positively affected by microfinance activities. Maldonado (2002) Signify the positive association between wealth level and demand for education (human capital).

KEYWORDS: *Self-Esteem, Self-Respect, Self-Confidence*

1. INTRODUCTION

Poverty is a misery and a significant section of a nation still living in extreme poverty. The Government of India adopted countless anti-poverty approaches and implemented numerous poverty-reduction programmes to lessen poverty but significant outcomes always lack. Poor people struggle hard to break the shackles of poverty and to fulfil their social, financial and economic needs. This fact is the sign of failure of our development policies and a scandal for human society. These dreadful situations are the cause of growing awareness in Microcredit, especially in Microfinance.

Microfinance is an anti-poverty vaccine emerged as a revolution in India. It empowers poor's to scale up their operations in an affordable manner. Microfinance is not just a banking service provided to unemployed or low-income families to borrow microcredit from financial institutions but also an opportunity to become self-sufficient by saving money, borrowing money and availing insurance. Microfinance, according to Otero (1999) is "the provision of financial services to low-income poor and very poor self-employed people". These financial services according to Ledgerwood (1999) generally include savings and credit but can also include other financial services such as insurance and payment services.

Microfinance interventions widely recognized as a model for poverty reduction and employment generation, but this objective cannot be achieved satisfactorily unless skill, health, knowledge and ability to work among poor are augmented. Poverty not only related to insufficient income and consumption but also with unsatisfactory outcomes with respect to health, nutrition, literacy, insecurity, low self-esteem and powerlessness. Through providing financial and allied services microfinance significantly affects health, skill, knowledge and ability to work of poor. Therefore, present research work is an attempt to analyze the impact of microfinance on poor's health, skills, knowledge, nutrition level, education and ability to work that widely referred to as human capital.

2. CONCEPTUAL FRAMEWORK

2.1 Microfinance

The concept of microfinance is not new; the history of microfinance can be traced back from many years back. Noble Laureate Dr Muhammad Yunus (an Economics Professor) regarded as the "Father of Microcredit" and "Founder of Microfinance". In 1974, Dr Yunus disburse microloans to empower Bangladeshi women. The poor women paid back the loan amount with interest from income generated from small scale initiatives. This success encourages Dr Yunus to establish Grameen bank in Bangladesh in the 1980s, to empower poor women and to eradicate poverty. Later on this idea of lending adopted by many developing nations to alleviate poverty from the grass-root level.

In India, the National Bank for Agriculture and Rural Development (NABARD) adopted this idea and served millions of unserved poor's in the 1990s. Over the past decade, the determinants of the success of microfinance credit methodologies have received extensive attention from both practitioners and academics. The existing literature reflects the successful provision and implementation of micro-financial services. Microfinance institutions and commercial banks driving scale tremendously in India. Today, this sector evolved as a vibrant industry has a variety of financial and allied services. This sector witnessed remarkable growth in terms of outreach to the clients, loan outstanding, product diversification and geographical spread of the programme (depicted in graph 2.1).

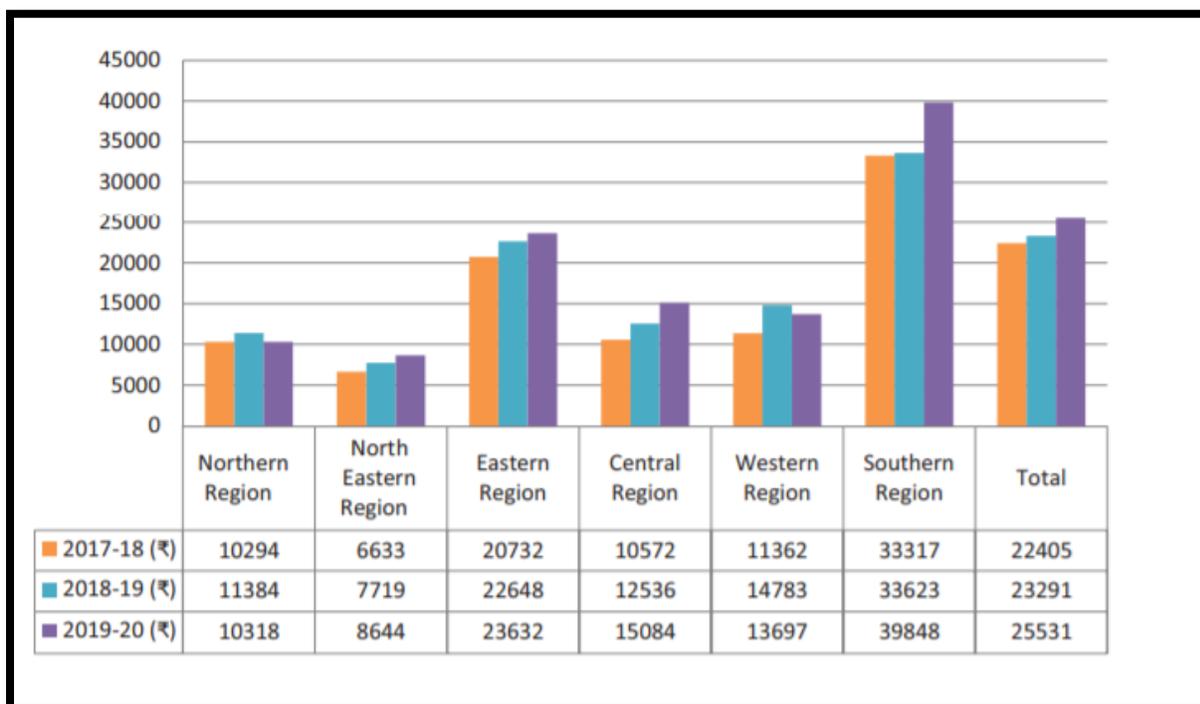

GRAPH 2.1 GROWTH OF SELF-HELP GROUP BANK-LINKAGE PROGRAMME FROM LAST THREE YEARS

Source: NABARD 2019-20 (Status of microfinance in India)

The graph 2.2 depicts the region-wise progress of the Microfinance sector. All regions except the southern region show the tremendous progress in the distribution of saving linked SHGs because there is no scope for further progress in this region.

GRAPH 2.2 REGION WISE AVERAGE SAVING PER SHG (₹)

Source: NABARD 2019-20 (Status of microfinance in India)

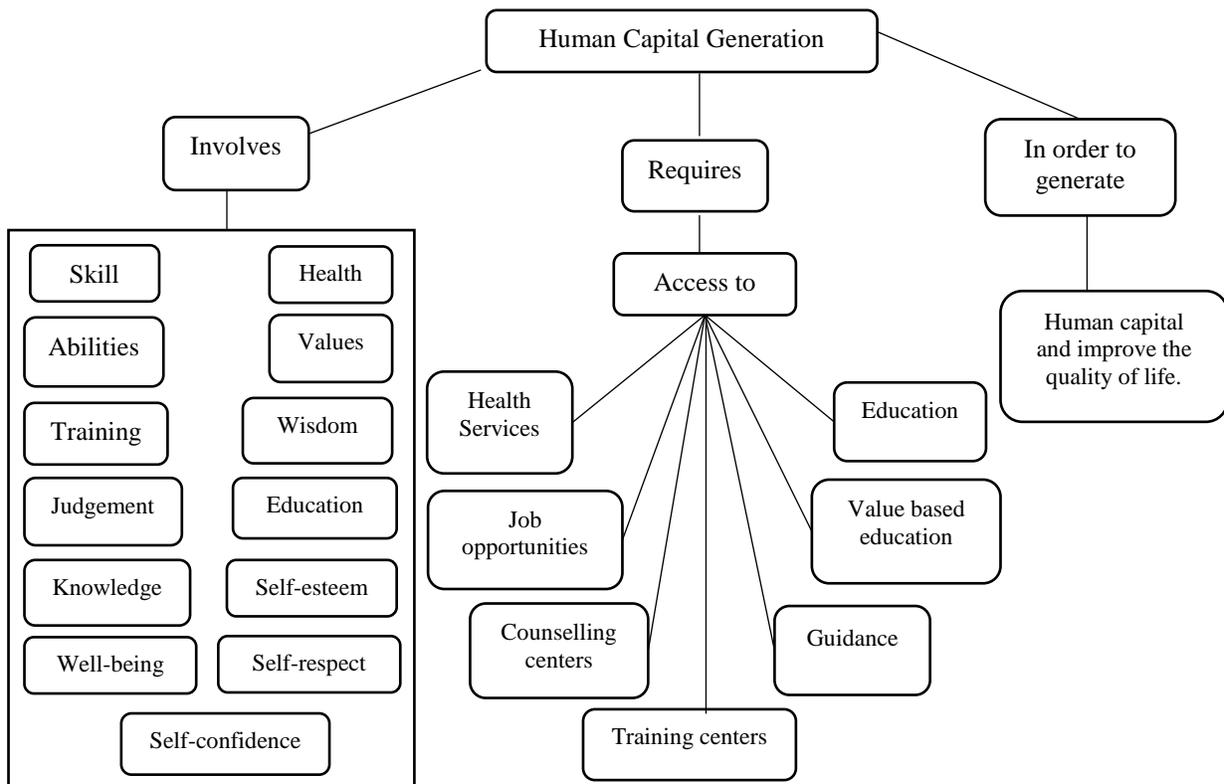

2.2 Human Capital

The word ‘capital’ refers to the “reproductive power of producer goods, both natural and man-made”, in other words, “capital is the accumulated goods devoted to the production of other goods”. To treat human being as a capital constituent that is a vital instrument in economic development process is not a new notion. Its importance is defined by numerous earlier economists like Plato, Aristotle Alfred Marshall and recently Amartya Sen. The father of economics Adam Smith in his treatise, *The Wealth of Nations* argued that refining worker skills is the basic agenda for enhancing economic welfare.

The action of human conducive to economic development is then considered the ‘human capital’ constituent of development. So, in simple words human capital is the productive skill of human beings and it is regarded as income generating agents in an economy and technical words human capital includes formal and informal education, health, nutrition and training.

Human capital can be generated through investment in human capital. For example investment in job training leads to the recreation of human capacity. Fundamentally, human capital generated through investments in training, education, health, manpower management etc that leads to generation of wisdom, knowledge, judgment, abilities, skills, self-esteem, self-respect, self-confidence, wellbeing, health, and values among people. The following figure 1 depicts the components of human capital and how it can be generated:

Figure:1

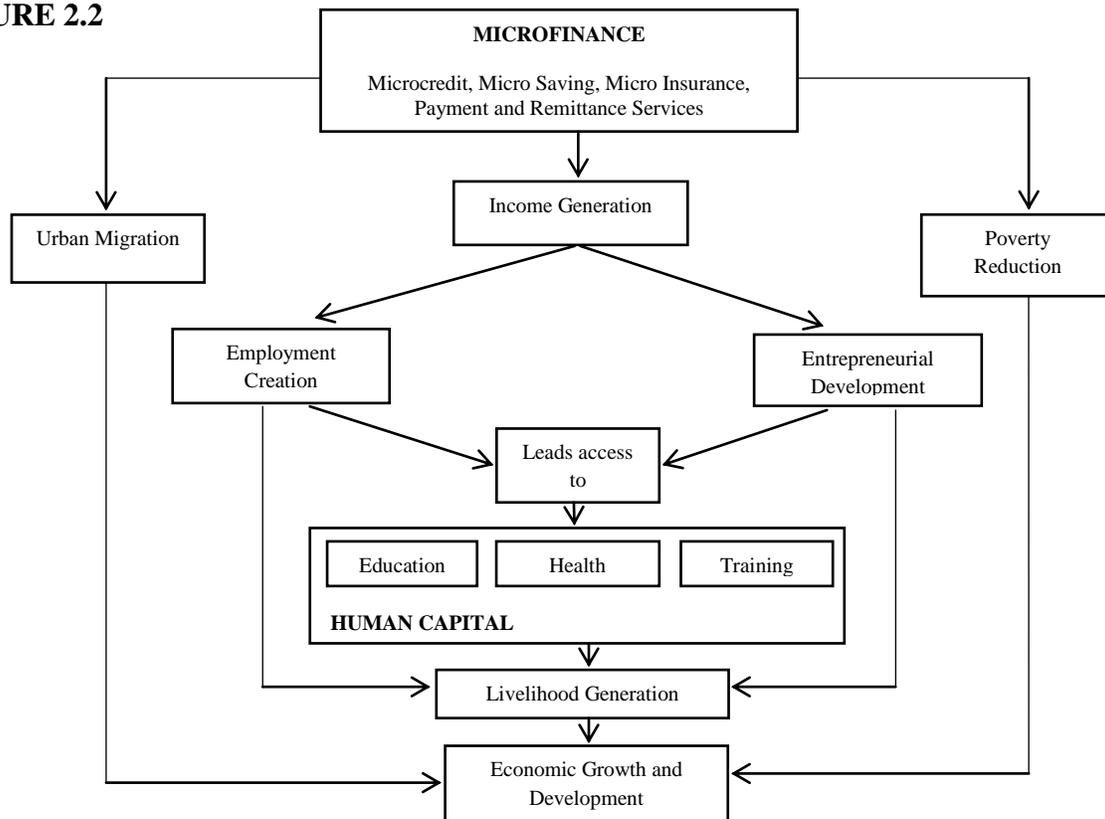

Source: Self-structured

2.3 Linkage between Microfinance and Human Capital

Importance of human capital development in microfinance can be understood through searching out the clients of microfinance services, microfinance clients often characterized by the human capital components like; Poor health, no access to education, malnutrition. Microfinance providers not only financially assist poor's but also give non-financial assistance like training and education that are human capital components. Now day's microfinance providers not only deliver microcredit and small financial assistance but also open up training and education centres in collaboration with NGOs to sustainably eradicate poverty.

The significance of human capital development of microfinance beneficiaries originates from the theory of human resource predominance in the socio-economic development of a nation. This theory assumes that labour is the prime factor of the economic development process because without it no other means of a factor of production (land and machine) are useful. The mission of microfinance as a poverty eradicating tool and the developmental programme is to grant a loan to poor's but according to Pegg Ross (Director of the Human Capital Center at Grameen Foundation) is to serve human interest also. Microfinance providers should invest in the generation of human capital because human capital is not only an important and emerging factor of economic development but also an important instrument to augment an individual's productivity and purchasing power. How microfinance leads to generate human capital and how human capital generation further leads to economic development is illustrated in figure 2.2.

FIGURE 2.2

Source: Self-structured

3. REVIEW OF EMPIRICAL EVIDENCES

Microfinance widely perceived as a vital tool for poverty alleviation and employment generation. Samer et al. (2015), Ramath & Preethi (2014), Sivachithappa (2013), Ayuub (2013), Bansal & Bansal (2012), Devaraja (2011), Shastri (2009), Littlefield (2003), Mahmud (2003), Odell concluded that microfinance helps poor's to lift themselves from below poverty line and it plays a vigorous role in eliminating poverty, generating employment opportunities, empowering women, developing rural community of a nation and achieving millennium Development Goals (MDGs). Microfinance attacks on poverty by providing financial assistance to micro entrepreneurs and developing microenterprises in a nation. Ferdousi (2015), Wang (2013), Devi (2013), Olu (2009) discovered the effect of microfinance activities on entrepreneurial development.

The outreach of microfinance activities not only limited to poverty alleviation, employment generation, wellbeing and so on, it significantly affects human capital also. Sharma (2012) acknowledge the positive impact of microfinance on human capital. The author revealed that self-esteem, self-respect, self-confidence, trust and attitude positively affected by microfinance activities. Maldonado (2002) Signify the positive association between wealth level and demand for education (human capital). As income level increases the demand for education among poor's also increases. Rafiq also find out the positive effect of microfinance on human capital i.e., education. Berge et al. (2011) investigated that human capital formation in from of business training significantly affects the microenterprise development in rural areas.

Empirical evidences of existing literature reveals positive impact of microfinance on poverty reduction, employment generation, community development, growth, enhancement in wellbeing and so on, but as far as impact assessment of microfinance on human capital is concerned it is investigated by very few investigators. Therefore, this research is an attempt to analyze how far microfinance is effective to generate human capital by providing microfinance services to low-income families.

4. THE STUDY: OBJECTIVES, HYPOTHESIS, RESEARCH METHODOLOGY

4.1 Objectives: The following objectives were proposed for the present study;

1. To discover out the linkage between microfinance and human capital.
2. To analyze the impact of microfinance on human capital.
3. To suggest some recommendations for the policymakers based on findings of the study.

4.2 Hypothesis: The following hypothesis formulated for the present study:

H_0 - There is no significant impact of microfinance on human capital.

4.3 Research Methodology:

The study intends to analyze the impact of microfinance (Independent variable) on human capital (Dependent variable) in Agra district of Uttar Pradesh state. Agra District contains 15 blocks namely: Etmadpur, Khandauli, Shamshabad, Fatehabad, Jagger, Kheragarh, Saiyan, Achanera, Akola, Bichpuri, Fatehpur Sikri, Barauli Ahir, Bah, Pinahat and Jaitpur Kalan. From each block, 0.5% population was selected as a sample population from the total population. Convenient

sampling was used. Responses of 300 respondents have been used in the present study. The description of the respondents is given in table 4.1.

Both primary and secondary data sources have been used to collect relevant information for the present research work. Published books, annual reports of NABARD, SIDBI, MFIN, journals, periodicals, research papers etc constituted the secondary sources of information. To gather primary information structured questionnaire and interview method were administered. The reliability of the questionnaire tested through Cronbach's Alpha and its value is 0.82. This value of Cronbach's Alpha signifies that questionnaire items have higher internal consistency and it is good to administer on participants. (George and Mallery, 2003). Wilcoxon Signed-Rank statistical tool was applied to analyze the impact of microfinance on human capital.

TABLE 4.1 DESCRIPTION OF SAMPLE

Variables	Categories	Frequency	Percentage
Gender	Male	0	00.0
	Female	300	100.0
Age	20-25	6	2.0

5. RESULTS AND ANALYSIS

Table 5.1 noticeably illustrates that there was a significant increase in human capital from before availing microfinance scheme (median=64) to after availing microfinance scheme (median=69). Table 5.2 demonstrated that 185 participants out of 300 had a greater score on after availing microfinance scheme than before availing microfinance scheme, and 27 participants had ties. The next table 5.3 represents the test statistic based on the negative ranks. The Z score = -8.88 at 5% significance level is sizable than the absolute critical value (p-value = 0.000 < 0.05). Consequently, the null hypothesis “there is no significant impact of microfinance on human capital” is not accepted and there is a significant impact of microfinance on human capital.

TABLE 5.1 DESCRIPTIVE STATISTICS

	N	Mean	Std. Deviation	Minimum	Maximum	Percentiles		
						25th	50th (Median)	75th
Before Availing Microfinance	300	64.06	4.93466	53.00	74.00	61.00	64.0000	69.00
After Availing Microfinance	300	68.55	4.68408	47.00	80.00	67.00	69.0000	71.00

CONCLUSION AND DISCUSSION

The ultimate objective of this study was to examine the impact of microfinance on human capital and the result clearly indicates the significant impact of microfinance on human capital. The test statistic Z score = -8.88 is significant at 5% level of significance that evidently signifies the significant impact of microfinance on human capital.

Sharma (2012) analyze the impact of microfinance on human capital and identified the positive impact of microfinance on building social and human capital. Maldonado (2002) analyzed that microfinance as an income-generating factor and a safeguarding factor from shocks positively influence the demand of microfinance clients for education (human capital). Rafiq also examined the positive impact of microfinance on human capital and indicated that microfinance borrowers are more intended to spend on education as a comparison to non-borrowers.

Thus, on the basis of the existing literature and the results of the present research work, it is concluded that microfinance has a positive impact on human capital and it is suggested that more initiatives should be taken by the microfinance service providers for the generation of human capital in a better way.

RECOMMENDATIONS FOR POLICY MAKERS

Today, we live in the 21st century and the word “Sustainable” is a buzz word nowadays. The centre of attention of all developmental programmes is sustainable development and all poverty alleviation programmes are sustainable poverty reduction.

The results of the study clearly revealed the significant impact of microfinance on human capital. Thus, to move one step ahead of policy makers and microfinance providers should focus more on a sustainable human capital generation because sustainable human capital generation can improve the quality of life of poor's and uplift their wellbeing that will be long lasting.

TRACES OF “FOLK ISLAM” IN THE PILGRIMAGE PLACES OF KHOREZM

Barno Mashrabjonovna Ubaydullayeva*

*Professor

Department Anthropology and Ethnography,
Uzbekistan National University,
UZBEKISTAN

ABSTRACT

This paper aims to illustrate on the attitudes and perceptions of the shrines that are still preserved in the mentality of the people of the Khorezm oasis. The article reveals an essence of the concept of international Islam based on the views of a number of authors. Some shrines show traditions and ideas of “folk Islam”. Besides that, there are compared difference between instructions in Orthodox (Sunni) Islam and folk customs in the shrines. It also, analyzes the reasons for peculiarities of the Narynjon Bobo shrine.

KEYWORDS: Shrine, Khorezm, Oasis, Islam, Folk Islam, People, Central Asia, Saints, Saints, Sufism, Tomb, Worship, Norinjon Bobo, Stones.

INTRODUCTION

In today's world of globalization and the mixing of cultures, there is a growing interest in knowing and seeing “exotic” aspects of the culture of different peoples, such as their unique, traditional views and values. It seems that in recent years, a special attention paid to pilgrimage tourism. A number of measures are being taken in Uzbekistan to develop tourism, including pilgrimage tourism.¹ there are many shrines in the Khorezm oasis, which are located in the lower reaches of the Amudarya. The Khorezm oasis is recognized as homeland of Zoroastrianism. The sacred book of Zoroastrianism “Avesto” was also created in the land of ancient Khorezm. According to S.P.Tolstov, the 4500-year history from the IV-III millennia BC to the IV century AD is a period that reflects development of ancient Khorezm.¹ the ancient Khorezmian script appeared 2200-2400 years ago. Khorezm scholars interpret the term "Khorezm" as "the land of the sun".²

The main part

It has long been possible to express in the form of "international Islam" the combination of Islamic and pre-Islamic views in the way of life of the people. In Soviet ethnography, the concept of "public Islam" began to be used in the 20s and 30s of the last century and became the subject of research by many scholars. An extensive research has been conducted on this issue, especially in Central Asia.² In particular, the Khorezm oasis has been extensively studied by ethnologists and archaeologists in the context of shrines, which are a manifestation of popular Islam.² However, as noted, we believe that in the context of globalization and change, the assessment of international Islamic views will not lose its relevance. Indeed, religious views also become susceptible to the effects of historical, political, economic, and cultural changes as an integral part of social consciousness. At the same time, regional and ethnic differences must be taken into account. Results of that "The adaptation of Islam to the local traditions of different peoples was the reason for the emergence of its various local forms ...".²

As the Islamic faith entered the cultural environment of a particular nation, it clashed with and was influenced by local religious beliefs, traditions, customs, and rituals. In this way, various popular Islamic variants of non-Islamic content or non-Islamic content and Islamic form have been formed throughout the Muslim world.

This phenomenon has received the name "folk", "everyday" Islam in religious studies, in contrast to "orthodox", "official", "classical" Islam.²

"The cult of saints has become a convenient channel for the penetration of the remnants of older beliefs into religion. The former pagan deities, who were worshiped by the inhabitants of the conquered lands, in connection with the new realities, were reincarnated into Muslim saints-awliya. Folk religion often runs counter to official and systematic Islamic theology.²

The cult of saints, which played an important role in the religious life of Muslims, was formed in Islam under the influence of ancient polytheistic traditions, and still has a great influence on the life of Muslims in the region.²

In the Central Asian region, popular Islamic views were formed in the context of the Hanafi school of Islam, which included aspects of pre-Islamic religious beliefs and ideas. Many prominent scholars agree that "folk Islam" in Turkistan is a synthesis of autochthonous cults and Muslim "dogma".²

It is well known that Islam condemns the worship of saints and their graves as sacred. Such acts are equated with filth, polytheism.² there are instructions in the Qur'an in this regard: "Allah does not forgive that anything should be associated with Him. He forgives more than that for whom he wills. And whoever associates anything with Allah, he has indeed gone far astray.² "So, whoever hopes for communion with his Lord, then let him do good, and let him not associate anyone with God in worship".²

Based on the Qur'an and Sunnah, the Arabs fought hard to eradicate pre-Islamic beliefs in the territories they occupied. Over time, when there was a split in Islam, sects emerged that opposed not only pre-Islamic religious practices, but even the pilgrimage that was obligatory in Islam. An example of this is the "Qarmatian" movement that emerged in Iraq at the end of the ninth century. The Qarmatians also declared the Hajj to be heresy and idolatry.² They invaded Mecca in 930, looted the city, killed several thousand pilgrims and the people of Mecca, and took them

captive. They destroyed the Ka'bah, split the black stone in two and took it to Bahrain, but only 20 years later it was returned to Mecca for a large ransom.²

However, with the spread of Islam in the region, many "holy places" and pilgrimages to them soon emerged. This was a manifestation of the common local (Turkestan) model of Islam, ... included in the cult of the "saints" many pagan characters, having previously Muslimized them.²

According to some scholars, the Sufi order (mysticism), which was widespread in Central Asia in the XIV-XV centuries, was in some respects close to animism and shamanism, which was the basis for the preservation of religious ideas in this context. The basic principle of the Sufi order is to believe that man can reach Allah through a special ritual (zikr). In this way, the popular Islamic belief that the souls (mostly ghosts) of the saints, representatives of the Sufi order, will be the mediator between man and Allah. Qara D. Shomfaicalled, "this version of popular Islam" arkhvais "since the spirits of Muslim saints and ancestors are central figures of their belief system".²

The famous Russian researcher V.V. Radlov notes, The teachings of Sufism are widespread in the Khorezm oasis, such as the shrines of the Sufis and their descendants, such as Sultan Uvays, Yusuf Hamadoni, Abdul Qadir Gilani, Najmiddin Kubro, Ismamutota, Pahlavon Mahmud.

Well-known Russian scientist V.V. Radlov argued that, many pagan places of worship of the nomadic peoples of Turkistan, while remaining objects of former veneration, were nevertheless associated with the name of some Muslim "saint".² In the past, the location of a Muslim shrine on the site of a pagan temple clearly demonstrates the connection between popular Islam and ancient beliefs. Some of them have even retained their names in the past.³

In the Khorezm oasis, Bibi-mushkulkushod, Jomardqassob (butcher), Anbar ona, Hubbi and others were considered to be the shrines of the local population long before the advent of Islam. In particular, the tomb of MushkulKushod Bobo is located in the Ichan Fortress of Khiva, and the local people believe that MushkulKushod Baba protects people from various pains, sorrows and harms.³

The tomb of the generous butcher is located in the Mazdakhan³ shrine.³ There is no information about the name Jumart in historical sources. But according to a local legend, Jomard was the first butcher to slaughter cattle, teach people to eat meat, and distribute free meat to the poor. According to another legend, Jumart the Butcher was a shepherd's priest, who drove his cattle up the hill for seven years and visited the saint's tomb seven times when a rich man's cattle were slaughtered. After that, the death of the cattle stopped, and he built the tomb of Shamun Nabi at the foot of the hill in honour of the saint. For this reason, the locals drove the animal to the shrine and circled it, claiming that it would save them from various diseases.³ Such information can be cited again.

CONCLUSIONS

Of course, it is impossible to fully describe and analyze all the shrines in the Khorezm oasis in one article. In addition, it was noted above that in-depth research on this issue has been conducted. Our goal is to draw attention to some of the new manifestations of M "international Islam" that appear in shrines. I think it is appropriate to give some information here before moving on to the main goal. Due to the predominance of atheistic ideology in the former union, many were unfamiliar with the rules of pilgrimage at the time, and the level of religious

enlightenment of the local population during the khanate period was not enviable. However, during the period of independence, along with the development of shrines and shrines, the rules of pilgrimage began to be widely propagated by scholars. According to the following rules: Muslims can only kiss the hajar al-aswad - the black stone, and no place is circumambulated except the Ka'bah.³

The purpose of a visit to the grave is two things: 1. remembering the Hereafter, feeling the transience of the world; 2. praying for the people of the grave, asking for their forgiveness, reciting. A person who visits a grave must first correct his intention and seek Allah's approval by doing so.³ indeed, in Islam, every action depends on intention.

It is a grave sin to make a vow to the people of the grave (including the grave of any saint U.B), to slaughter a living, to light a candle, to tie a rag. According to the requirements of the pilgrimage, it is preferable to enter the cemetery as clean as possible. It is also necessary to enter with clothing that covers the areas where sharia is required. The private parts cannot be accessed openly. It is makrooh to enter in such a way.³

In the course of ethnographic observations, we found that many did not follow these rules. When visiting shrines, it is still permissible to circumambulate the Ka'bah, to ask for help from a saint or other person in the grave, to slaughter animals for them, and to tie rags or strings to the trees around the tomb. Other sources make it clear that some people who visit shrines and cemeteries in recent times have leaned on the steps, pillars, doors, and graves, rubbed their faces, kissed them, asked for their needs, and visited graves.³

At the Norinjon Bobo shrine, we encountered another antique. That is, pilgrims here would place small stones on the millstones and large heavy stones in the courtyard next to the mausoleum as a sign of their intentions (Figures 1 and 2). Interviewers say that most of those who have a child who is ill, or who are unable to have a child, place such stones in order to "make the child as strong as this stone."³ Here is a little information about this shrine.

Norinjon Fortress is located in Ellikkala district. According to the legends, Narinjon Baba, that is, Wali Abdullah Narinjani, was a sheikh who lived in the time of our Prophet Muhammad and came to Khorezm to spread Islam to the settled population. According to ancient legends and legends preserved among the locals, the tomb of Norinjon Bobo was repeatedly buried under the sand dunes.³

Today, using archeological and manuscript data, it has been determined that the Naryn Fortress is a monument of the VII-XIV centuries. It is possible that the fortress was destroyed after the Arab invasion in the early eighth century. In the X-XI centuries the castle was rebuilt and surrounded by a defensive wall³. The tomb found recently, Muhammad ibn Musa ibn Dawud, clarifies the period of Abu Abdullah an-Naranjani's life. The inscription states that the sheikh died in the early tenth century and was buried near the western wall of the castle. So, the Norinjoni grandfather is actually a historical figure. Over time, he rose to the level of a saint, a prophet in the eyes of the people. Pilgrims believe that by praying to him, they will alleviate their problems related to their health, work, happiness, infertility, and so on.

I. Goldsierphrased that the worship of saints by Muslims manifests itself in different ways, and this diversity depends on the ethnographic and geographical conditions of the people who have embraced Islam, which gives it a national character. In his view, in addition to ethnographic

conditions, the psychological needs of people also require the worship of the spirit of saints. According to the scholar, “there is an insurmountable distance between an ordinary believer and Allah, who has all kinds of worries and desires related to daily life, and there is a great need to fill it with something. It must be filled with such mediating forces that the ordinary believer can have faith in them, and that mediator must be closer to the believer and fit into his mind than Allah, who sits above the earth and the sky above all people”.³

One can agree with well-known scientist Goldtsier's view that there is a spiritual need for faith in man. In our view, the need of people to visit and address the saints is also related to the need to perform Hajj, which is one of the five fards in Islam. The need to convey their supplications to Allah and the responsibility of performing Hajj as a Muslim motivates a person to perform Hajj pilgrimage. But in order to perform Hajj, in addition to desire, time and aspiration, it also requires a large amount of money. According to our correspondents, it will take more than 40 million soums to go on Hajj³. If we take into account that the minimum wage in Uzbekistan is 679,330 soums, and the average teacher's monthly salary is around 1.7 to 1.8 million soums, it becomes clear how difficult it is to raise these funds.

Now the question arises as to why exactly the stones. I. Goldtsiger argues that the worship of graves as a sacred place is “associated with the worship of objects and things”.³ This belief is called “fetishism” in science. However, in our example we are being appealed to the spirit of a saint, not to the grave. In addition, the supplication is made after the recitation of the prayers with verses from the Qur'an³. This means that pilgrims first turn to Allah and then ask the spirits. In our view, the stones here are not example of fetish, but merely a sign of intent, a symbolic expression in its material form. The intention is invisible, and the stone is immediately visible. It is also possible to understand the concept of contagious magic here. Consistency in stones is associated with the stability of intention.

CONCLUSION

The above information means, first of all, that the concept of national Islam refers to a religious belief that corresponds to a practical way of life formed by mixing Islam with religious ideas that have existed in the past in every region of Uzbekistan.

Secondly, the shrines in the Khorezm oasis clearly show the uniqueness of the popular Islamic views in this region.

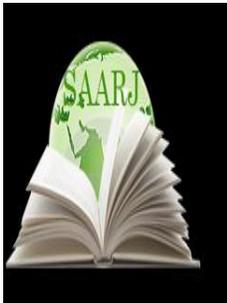

Thirdly, the worship of saints (cult of saints) local aspects are not only related to geographical, ethnographic conditions, but also in harmony with the mentality and economic conditions of the local population.

ORGANIZATION AND METHODOLOGY OF CONDUCTING FOOTBALL LESSONS IN A PRESCHOOL INSTITUTION

Abdullaeva B.P*

*Teacher,
 Chirchik State Pedagogical Institute of Tashkent region,
 UZBEKISTAN

ABSTRACT

This article discusses the methods and techniques of teaching the elements of football to students of preschool education. And it presents the facts about movement games, which are suitable for the process of teaching football to preschoolers, and the positive impact of these games on the mental and physical development of children. In addition, this article provides the information about the number of players in preschool football and the size of the field, the gate. Also it is discussed that what kind of action games to teach children to play football, which will be effective in mastering the elements of football.

KEYWORDS: *Sport, Teaching Methods, Football Field, Children's Interest, Movement Games, Exercise, Running and Playing.*

INTRODUCTION

Teaching the elements of football can be started in the senior group of the kindergarten. The children master the technique of actions with the ball with repetition of exercises.

The basis of the teaching methodology for playing football, as well as other sports games, is based on the game form of conducting classes. The content of the lessons effectively combines game exercises and relay races, outdoor games and sports exercises.

The content of the lessons combines a number of didactic principles, among which the principles of accessibility and an individual approach play a significant role, since sports games are quite difficult for preschoolers to master. An individual approach is achieved when choosing methods of teaching and upbringing, depending on the level of assimilation of educational material by

each child, as well as when taking into account the reaction of his body to the given physical load. Technique is taught gradually, by complicating the conditions for performing movements. The most effective form of teaching preschoolers to play sports is organized activities on walks.

Sports games are aimed, first of all, at strengthening health, improving the general physical fitness of children, meeting their biological need for movement.

THE MAIN FINDINGS AND RESULTS

The main purpose of sports games is to familiarize children with sports games, laying the basics of correct technique. But this should by no means become highly specialized training, preparation for participation in competitions. A real competition, where the struggle is for points, for places, is an unbearable psychological load for a child.

A distinctive feature of sports games is their emotionality.

A positive emotional tone is an important prerequisite for health, prevents various diseases, and maintains interest in physical exercise. A joyful mood continues to possess the child even after class. Children are interested in class when they are busy, when the rest time does not exceed work time. Boredom comes when children are idle, when they are forced to perform monotonous movements. The variety of exercises and games captivates children: they sometimes “forget” about time. Having learned the joy and pleasure of the proposed activity, they leave the lesson with a desire to continue it.

The game form of the lesson is the basis of the methodology for teaching sports games. The lesson should be an entertaining game. Monotony, boredom should not be allowed, the movements and games themselves should give the child pleasure; therefore, it is important that the lesson contains motor tasks that are interesting for children, play images, and unexpected moments.

It is especially important to ensure the availability of educational material and an individual approach to children, since sports exercises and games are quite difficult for preschoolers. When choosing physical exercises, it is necessary to take into account the age characteristics, the capabilities of the child and, on their basis, determine the tasks that are feasible for him.

It is advisable to use leading exercises that will help to quickly teach children the chosen motor action.

Leading exercises include movements that are similar in structure to the main elements of the technique of the action to be mastered. It is important to determine the optimal number of repetitions of the lead-up exercises so that children do not develop bad habits that interfere with further learning. If a well-mastered movement is used as an approaching exercise, then it is enough to repeat it just a few times immediately before learning a new motor action.

Leading exercises can be:

Separate parts of the studied movement actions.

Imitation of the studied movement activities.

Directly studied movement activities, which is performed in light conditions. Such exercises are especially important when learning new movement activities associated with the possibility of

falls and injuries.

The studied movement activities itself, performed in slow motion. When doing the exercise in slow motion, it is easier for the child to control his movements, and he makes fewer mistakes.

More complex actions of sports games can be learned in specially created conditions (outside the game). At the same time, it is advisable to direct the child's attention to the quality of the movement.

In the process of teaching sports exercises and games, it is important to ensure the conscious mastering of actions. Understanding of the meaning of actions by children accelerates the process of skills formation, promotes the ability to independently select effective actions in the subsequent motor activity and use them expediently. The child's conscious and active attitude to actions arises only when he knows why in a given situation it is more expedient to apply certain actions, to carry them out in a certain direction. But for this it is not enough just to explain and demonstrate movements in stereotyped exercises by the teacher - it is necessary to create conditions for the use of learned actions in a variety of motor activities. Creative activity will manifest itself only if children learn to independently use actions freely in a variety of situations. Children should be encouraged to be creative.

Teaching preschoolers to play football should be divided into three stages: preparatory, main, and final.

At the preparatory stage, the main tasks are: increasing general physical fitness; improving general endurance; improving running technique; improvement of health and, above all, the activity of the cardiovascular system and respiratory organs. The implementation of this stage is carried out in the daily life of preschoolers through outdoor games and physical exercises for walks, during independent motor activity of children, directly during physical training and sports entertainment. This stage in time can last from several months to half a year or more.

The main stage is the stage of direct learning to play football.

The main and most effective form of teaching preschoolers to play football is classes that are advisable to be carried out in the form of a health and fitness club called, for example, "Merry Ball", "Young Football Player" or "Ball School", etc. Football elements can also be incorporated into physical education curriculum material throughout the school year. The duration of these sessions is 25-30 minutes.

The presence of a three-part form of classes (introductory, main, and final) allows the teacher to rationally distribute educational and training material.

Health-improving, educational and upbringing tasks are determined for each lesson.

The introductory part is a warm-up, the purpose of which is to prepare the child's body for more intensive work in the main part of the lesson. The content of the introductory part may include various types of walking (on toes, on the heels, on the outside of the foot, with rolling from heel to toe, with high knees, with an overlap of the lower leg back, with cotton under the knee, etc.) and running (in a column one at a time, with rebuilding in pairs, "snake", diagonally, running in combination with other movements, backwards, turning around on a signal, etc.), as well as jumps, jumps, breathing exercises and outdoor games.

The duration of the introductory part for older preschoolers is up to 3-4 minutes.

Thus, the exercises of the introductory part of the lesson are leading exercises to the study of movements in the main part of the lesson.

The content of the main part of the lesson is varied. It starts with a small set of general developmental exercises or outdoor games. In this part of the lesson, more intense exercises are combined with less intense ones, which ensures the optimal level of physical and mental stress on the body of the older preschooler. Movements are selected energetic, fast, requiring endurance, and also increasing the functional state of the body. The complex of general developmental exercises (hereinafter ORU) can be learned and performed within 4-5 sessions, no more. The coordinated implementation of already learned and mastered movements will allow the child's body to prepare for the development of a new load, and the teacher - the most rational and effective distribution of their forces when performing the main types of movements.

As practice shows, when teaching preschoolers the technical basics of playing football, it is advisable to use the so-called training exercises, i.e. movements similar in structure to the main elements of the technique of a particular movement. For example, when learning to hit the ball with the inner side of the foot, exercises of the imitating nature of the same movement can become leading; when learning to stop the ball with the sole - rolling the ball back and forth with the sole, standing still, etc. Children perform exercises in football with both right and left feet.

At the same time, it is necessary to ensure the conscious mastering of exercises by children and not to limit them in creativity. And this aspect will be achieved when the child knows when and under what conditions he will be able to apply the acquired skills and abilities. For example, older preschoolers who have mastered the elementary technique of playing football in kindergarten will be able to play this game in a team of older children at school, at home in the yard or somewhere on vacation, etc.

The duration of the main part is up to 20 minutes.

Thus, the main part of the lesson, varied and exciting in content, will allow the teacher to realize the assigned tasks.

In the final part of the lesson, it is necessary to bring the child's body into a relatively calm and even state. This will be facilitated by: walking in combination with breathing exercises, exercises for relaxation, calm play and etc. The final part lasts 4-5 minutes.

The final stage is the stage of improving the technical, elementary tactical skills of playing football, i.e. directly the football matches itself. With preschool children, the duration of a football match is 25 minutes, including a 5-minute break for rest and relaxation. Before each game, a warm-up is required, consisting of exercises already familiar to children.

It is advisable to include a football match of two teams consisting of children of one or two groups of children of senior preschool age in the program of the Day of Health, a sports holiday, in joint sports and recreation activities with parents, etc. All classes at this stage are held outdoors.

Preschoolers need to know the basic rules of playing football:

- before the start of the game, a draw is made to select the sides or the kick-off The ball is placed

on the ground in the center of the field;

- team players strive to score as many goals as possible into the opponent's goal, and after losing the ball, defend their own, while observing the rules of the game;

- Football is a game of two teams, and each team has up to 5-7 players, one of whom is the captain;

- Observance of the rules of the game, and the duration of the match is controlled by the referee;

- The ball is considered scored into the goal if it completely passed the goal line, and all the rules were observed during the game;

- In football, players perform all actions with the ball with their feet;

- The goalkeeper and the player taking the throw-in have the right to take the ball;

-Football is a collective game, and the players treat each other with respect, despite the spirit of rivalry and the desire to win.

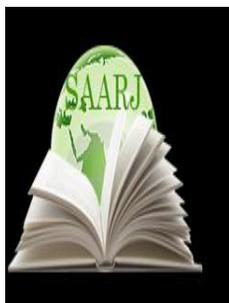

CONCLUSION

Thus, the sports game football is of great educational value, the systematic use of the game improves motor abilities and ensures the full development of the "school of movements", which, first of all, includes running, jumping, and coordination. The game has its own structure and methodology, which the teacher must follow.

ABSTRACT

This article tells about the interest of the younger generation in our national musical heritage - the art of music, and how to work on them independently. As one of the important means of educating the younger generation in the spirit of national and moral values, it is important to introduce them to the musical art of the national musical heritage in order to develop them in all aspects of aesthetic and artistic taste. The student should be able to express his or her personal opinion on an issue through performance, rather than blindly following his or her teacher's instructions and opinions. A teacher-led lesson is important, but it does not negate the importance of the student's independent work. It is important to make sure that the student does not waste time on independent study.

KEYWORDS: *Instrument, Music, Note, Gamma, Performance.*

INTRODUCTION

Educating the younger generation in the spirit of national independence, deeper study of our values and national musical culture than ever before, and understanding the identity of our people, be able to keep their traditions, restoring, nurturing, honoring, and passing them on to the

younger generation is one of the most important issues today. As one of the important means of educating the younger generation in the spirit of national and moral values, it is important to introduce them to the musical art of the national musical heritage in order to develop them in all aspects of aesthetic and artistic taste.

Rubob is a popular musical instrument not only in Uzbekistan, but also in Central Asia. In addition to national melodies, this instrument can be used to master complex works written by all foreign composers. Here are some suggestions on how to teach students to work independently.

THE MAIN FINDINGS AND RESULTS

The student should be able to express his or her personal opinion on an issue through performance, rather than blindly following his or her teacher's instructions and opinions. A teacher-led lesson is important, but it does not negate the importance of the student's independent work. It is important to make sure that the student does not waste time on independent study. To do this, you need to explain to the student how to organize independent study, what to pay more attention to. Rational and general use of time should be one of the basic principles of independent work. Another important principle is regularity of training. From the earliest stages of teaching performance, students need to develop the ability to work independently on a regular basis. Although it is usually difficult to achieve regularity, it is advisable to gradually become accustomed to such exercises. We also see some students being able to do their homework. It is difficult to explain in one word. But in many cases, homework is not ready because of the student's bad attitude or laziness, but because he does not fully understand the task and does not know how to approach the study of music. Therefore, the task for independent work should be explained to the student in detail, taking into account the capabilities of the student. Some students repeat a piece of music from beginning to end many times during an independent lesson. It does not provide a complete and accurate analysis of the meaning and characteristics of a piece of music. The work is only superficially repeated so that it can be performed in front of the student.

One of the disadvantages of independent study is that students are not able to control their performance during the preparation of the task. For example, when memorizing the text of a piece of music, a note is studied incorrectly and the reader does not notice it. Or a certain method of execution may be performed incorrectly, and this may be overlooked by the student. This shortcoming will be addressed by the teacher during the lesson. The ability to control one's movements and sounds during performance does not appear spontaneously in students, but is achieved through planned exercises. Self-control is very important for the performer, it can help to eliminate shortcomings in the performance. How should an independent study be structured and what should it consist of? As mentioned above, the more specific and specific the task for independent study, the easier the student's task will be. No matter what the plans for organizing independent work, it is important for the day care plan to provide accurate and complete information. The following is an approximate structure and timing of independent study:

1. Perform gamma, triple sounds and various exercises. 10-15 minutes.
2. Assimilate a new task. 15-20 minutes.
3. 5 minutes to rest.
4. Repeat previously learned tasks for 20-25 minutes.

The time limit is approximate and can be reduced or increased depending on the size of the task, taking into account the individual capabilities of the student. The estimated time for independent study is 45-60 minutes. This may seem rare at first glance. But if it is continued on a regular basis, the desired result can be easily achieved. Memorizing a piece of music is done by each musician based on their abilities and capabilities. It is difficult to have a single guide for everyone. Some musicians have better memory when they see the text, while others have better memory when they hear it. As a result, their methods of memorizing work vary. The important thing is that no matter how a piece of music is memorized, it will remain firmly in the memory of the musician. Nowadays, the increase in the amount of information acquired in educational institutions requires less time and more results. Under the guidance of a teacher, moving a classroom lesson closer to this independent activity will help students succeed in independent study. In this case, the student performs all the tasks independently, and the teacher gives his instructions only when necessary. What time of day should the teacher's independent study be scheduled? The timing of such classes depends on the student's schedule. If lessons are usually in the first half of the day, independent classes are held in the afternoon. The most important thing is to have independent training at the same time every day. There are a number of important aspects of homework that students need to keep in mind. Here are some of them:

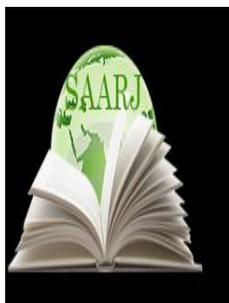

As mentioned earlier, the choice of performance style, adherence to the symbols, and the correct placement of the applicant are important in understanding the meaning of a work. During the student's independent study, the student's attention should be focused on a specific task. Otherwise, the training will be meaningless and will not achieve any results. Some students, while mastering a piece of music, pay more attention to the text of the note and forget that the performance should be expressive. To avoid this shortcoming, students should always focus on expressive performance. In other words, the more effort students put into mastering the text, the more expressive the performance will be. When a student makes a mistake, he or she should repeat the passage carefully at a slow pace. He will then determine the cause of the error and take steps to prevent it. Student performance errors also vary. Repetition of some cases has become a habit for students, and mistakes in certain parts of the work are repeated almost every time. This could be due to an incorrectly selected application, method of execution, or some other defect. Determining the cause of such errors is the key to correcting them. Mistakes should be avoided, even if they are accidental. No matter what the mistakes are, the student should make it one of his main goals to find solutions to them during his independent study. As a result of playing the instrument, the student should be given some time to rest due to both mental and physical fatigue. Otherwise the quality of the performance may deteriorate and errors and omissions may occur.

ABSTRACT

The problem of improving the quality of winter wheat grain is relevant and at the same time relatively difficult to solve. In many farms of the republic, in recent years, the yield of winter wheat grain on irrigated lands is 50 c / ha and more. However, the quality of the grain remains low, the protein content in the grain ranges from 10-12%, and the amount of crude gluten in it is in the range of 19-25%. This protein content in winter wheat grain is significantly below the established standard. Foliar dressing has a positive effect on the physiological processes in winter wheat. With foliar feeding, metabolism, photosynthesis and transpiration process are significantly improved, the growth and development of plants is accelerated.

In the experiment, with foliar feeding, in the winter wheat variety Kroshka, an increase in the total leaf surface by 6.5-13.8 thousand rubles was observed. m², biological yield increased by 17-59 c / ha, grain was 59.2-74.7 c / ha. The increase in biological yield varied from 18.1 to 54.9 c / ha, and the increase in grain yield from 6.7 to 22.2 c / ha.

KEYWORDS: *Winter Wheat, Foliar Feeding, Leaf Surface, Growth And Development, Photosynthesis, Photosynthesis Productivity, Biological Productivity, Yield, Grain, Grain Quality, Protein, Gluten.*

INTRODUCTION

The main requirement in the cultivation of winter wheat is to improve the technological qualities of grain. That is, an increase in the protein and gluten content of the grain.

The technological qualities of winter wheat grain are influenced by many objective and subjective factors, such as biological characteristics of varieties, climatic conditions, soil fertility, agro technical measures and others.

It has been established that under irrigation conditions, on low-fertile soils with an increase in the yield of winter wheat grain, a decrease in its quality is observed. That is, there is a negative correlation between the yield and grain quality of winter wheat. This is due to the lack of biological nitrogen in the soil during the period of grain formation. In this regard, improving the quality of grain under irrigation conditions is one of the most pressing problems of crop production.

Scientific research to study improving the quality of winter wheat in Europe in different years. D.Altman [], D.Dorntscu[12], D.Hawaru[15], Z, Borlan[10]and others. Scientists from Europe focus on the study of improving the quality of grain with the scientifically grounded use of mineral fertilizers, taking into account the biological properties of plants.

The scientific works of American scientists J. Coomc [11], J. Holbrook [14], Quist D [20] and others were aimed at studying grain quality. In scientific works, special attention was paid to the production of organic food and increasing the protein in grain.

The technological qualities of winter wheat grain in Asia were studied in the works of M. Arabi, M. Javhar [8], A.C.Absattarova [9], P. Gyuga [17], K.M. Kienzler [16]. The scientific works of scientists were aimed at studying the application of innovative technologies in agriculture, maintaining the ecological balance and increasing soil fertility.

In most cases, with an increase in grain yield, there is a tendency for a decrease in product quality. This is due to the fact that during the formation of the crop there is a lack of nutrients, including nitrogen. Fertilizing the soil during this period is difficult because of the continuous grass stand. Therefore, it is necessary to find new, more effective methods of using mineral fertilizers to improve the quality of grain. One of the most effective ways to solve this problem is foliar feeding.

The use of foliar feeding increases the total leaf surface of plants, enhances the intensity of photosynthesis, and increases plant immunity to diseases and pests.

The importance of foliar feeding of winter wheat in different years was studied by VN Remeslo [4], NS Avdonin [1], SI Lebedev [3] and others. Most of the studies in this direction were carried out in Russia, Ukraine and other countries.

According to academician V.N. Craftslo, foliar feeding of winter wheat increases the efficiency of mineral fertilizers, improves the quality of grain.

Research by Professor N.S. Avdonin showed that when foliar feeding, it is necessary to use amide forms of nitrogen fertilizers, i.e. urea. Nitrate forms of nitrogen fertilizers negatively affect the leaf surface of wheat, that is, leaf burns appear.

In the works of Professor S.I. Lebedev, special attention is paid to the influence of foliar feeding on the increase in leaf area and the intensity of photosynthesis.

However, there are very few data on the positive effect of foliar nutrition on the technological qualities of grain under irrigation conditions. Therefore, conducting field experiments to study the positive effect of foliar nutrition on the technological qualities of winter wheat grain is of great relevance...

In connection with this, we [5,6] conducted field experiments to study the effect of foliar nutrition on the yield and quality of winter wheat grain. In the experiment, different norms, terms and methods of foliar feeding of winter wheat were studied.

MAIN PART

The research was carried out at the experimental sites of the Tashkent State Agrarian University. The soil of the experimental plot is irrigated with typical gray soil.

Purpose of the work: to study the effectiveness of foliar feeding in improving the technological qualities of winter wheat grain. Urea was used as nitrogen fertilizers, superphosphate from phosphorus fertilizers, and potassium chloride from potassium fertilizers.

Foliar dressing was carried out in three periods: during the period of entering the tube, earing, flowering, - filling the seeds. Various concentrations of mineral fertilizers have been studied.

In the experiment, the total leaf surface of winter wheat was determined by the method of A.A. Nichiporovich, the productivity of photosynthesis by the method of I.S. Shatilov and M.K. Kayumov.

The chemical composition and technological properties of grain were determined by the method of V.G. Mineev.

All variants were carried out in 4 replicates. The total area of the variant is 100 m², including the accounting area of 50 m². Phenological observations were carried out on the area of each variant; 50 plants were selected.

Protein content was determined by the Kjeldel method, gluten by the washout method, fertilizer analyzes were determined by the method of V.G. Mineev (1989), the digestibility of mineral fertilizers by the method of M.K. Kayumov (1989).

Field experiments were carried out according to the method of B.A. Dospekhov (1981).

The experiments were carried out in 6 versions. All options are placed on the same tier.

1-control option without the use of mineral fertilizers;

2-mineral background, where mineral fertilizers are applied in recommended doses;

3-foliar feeding with urea is carried out once, in the tillering phase;

4-foliar feeding with urea is carried out 2 times, in the phases of tillering and exit into the tube;

5-foliar feeding with urea is carried out 3 times, in the tillering, booting and flowering phases;

6 - all types (NPK) of mineral fertilizers were used in foliar feeding.

In the experiment, urea was used in three different rates in the tillering phase 15 kg, in booting 21 kg, in flowering 30 kg / ha, i.e. three 5%, 7% and 10% concentrations.

EXPERIMENTAL RESULTS

Foliar feeding of winter wheat with nitrogen increases the content of protein, gluten, increases the volume of bread and other technological properties of wheat grain.

The demand of wheat for nitrogen is observed throughout the growing season, however, the plant uses more than 60-70% of nitrogen during flowering and grain formation. Because the main honor of biological nitrogen in wheat is contained in the composition of the grain.

Foliar feeding is of great importance during the formation of generative organs in plants. Grain filling and fruit formation are associated with the use of nutrients. It is known that grain contains more nitrogen, phosphorus and other elements than straw.

The best form of nitrogen fertilizer for foliar feeding of wheat is urea. Synthetic urea (urea) serve as a source of oil for plants, as well as a reserve compound for the formation of nitrogen forms, which are biologically active substances and have a positive effect on the synthesis of amino acids and proteins

The amide nitrogen of urea entering the plant participates in the processes of nitrogen metabolism, similar to asparagine and glutamine, without prior conversion of urea into ammonia. Ammonia formed in the leaf as a result of nitrate reduction, hydrolysis of urea or directly absorbed by the leaf, as well as ammonia formed as a result of protein breakdown, is quickly used for the synthesis of amino acids and amides.

The intensity of urea hydrolysis in plant tissues is associated with the activity of uriasis. (uriasis).It is the activity of this enzyme that determines the resistance of plants against the appearance of burns when a urea solution is applied to the leaves. Plants with more active urease suffer more from burns. Therefore, old leaves with less active urease suffer less from burns than young leaves. In addition, with an insufficiently developed leaf surface and root system burns can occur when using a working solution with a high concentration (more than 20% of the nutrient).

Uneven spraying of the working solution is not recommended in conditions of low relative humidity (below 30%) and during the daytime (10-16) in sunny weather, as well as to spray plants at a relatively young age (before the formation of two or three internodes).

In order to prevent burns of wheat leaves, which negatively affect the yield, it is best to spray the plants when the concentration of the working solution for the nutrient in the initial phases of development (tillering, yield) is 5-7%, as well as during the earing period up to 10%, during the filling period grains up to 15%.

Doses of urea for foliar feeding are set depending on the timing of spraying. The highest content of protein and gluten in grain accumulates when plants are sprayed during the formation of two or three internodes according to the calculations of 15 kg / ha of urea, as well as during the

earing period and at the beginning of the phase of milk ripeness in the calculation of 21-30 kg / ha.

The use of optimal doses of urea in different years can change both in the direction of decreasing and in the direction of increasing. This is mainly due to changes in the vegetative mass of winter wheat. When a large amount of vegetative mass is formed, it is recommended to use increased doses of urea, normally 30 kg / ha. With a decrease in the vegetative mass, the use of urea at the rate of 15 kg / ha is more effective. The effectiveness of urea also depends on the climatic conditions of the cultivated region. When, after spraying, a sharp and prolonged increase in air temperature occurs and its relative humidity decreases, the optimal dose of urea is 15-30 kg / ha.

Urea enters plants as a whole molecule, entering into the composition of amino acids and proteins. Urea not only supplies nitrogen to plants, but also has physiological activity, it enhances the breakdown of leaf proteins and promotes the outflow of nitrogenous substances from the leaves to the ear. Therefore, urea feeding increases protein content not only due to fertilization nitrogen, but also by increasing the outflow of nitrogen reserves from the vegetative mass.

Leaves play a leading role in the formation of a high-quality crop. The growth and development of plants depends to a certain extent on the formation of a sufficient amount of leaf surface. One of the main features of plants that distinguishes them from other organisms is their leaves. Thanks to which the process of photosynthesis takes place. Only green plants with the help of leaves are able to form organic matter.

The leaf surface of plants is of great importance in the formation of the yield and grain quality. Thanks to the leaf surface, organic compounds are formed from inorganic compounds. The research results are shown in Table 1.

TOTAL LEAF AREA OF WINTER WHEAT TABLE 1

№	Variants	Leaf surface, thousand m ² .ha		
		1.03	1.04	1.05
1	No fertilizers	3.9	13.0	28.8
2	N-200,P-140,K-90 (background)	4.3	18.5	43.2
3	Background -1 foliar feeding (N)	4.5	20.6	49.6
4	Background -2 foliar feeding (N)	4.7	21.5	54.3
5	Background -3 foliar feeding (N)	4.8	23.1	56.0
6	Background -3 foliar feeding (NPK)	5.0	24.3	58.5

The results of the conducted field experiments showed, that foliar dressing has a positive effect on the formation of the leaf surface of winter wheat. It has been established that the formation of the leaf surface of plants occurs intensively with the combined use of two methods of nutrition: root and foliar feeding.

In the control variant, the total leaf area in March was 4.0 thousand/ha, in April, 13.5 thousand/ha, and in May 21.1 thousand/ha.

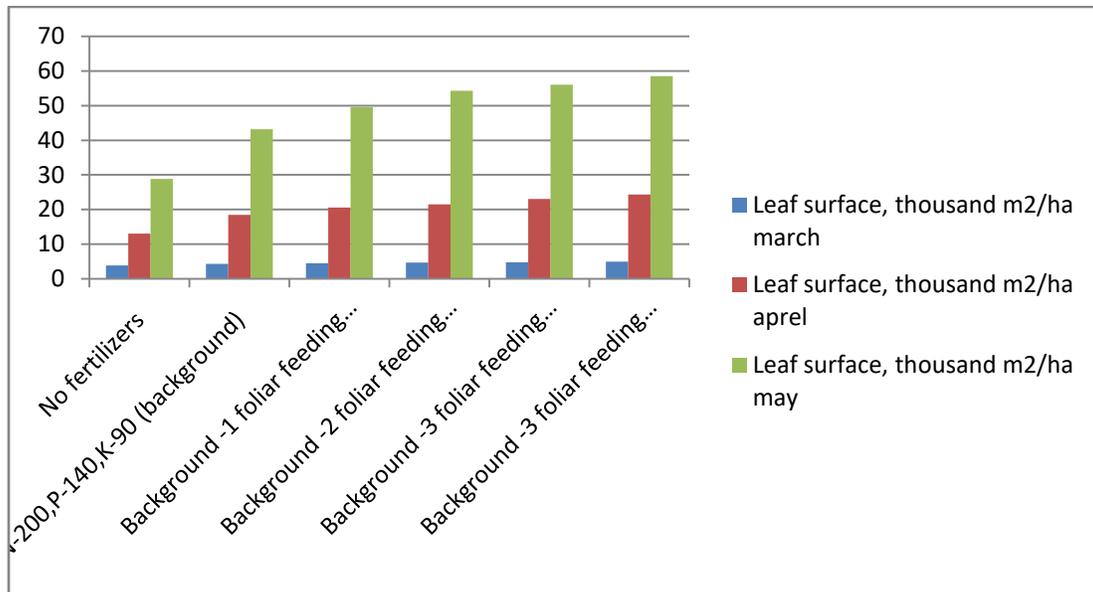

FIGURE 1. TOTAL LEAF AREA OF WINTER WHEAT, M2/HA

An increase in the total leaf surface of winter wheat with foliar feeding, in turn, had a positive effect on all physiological processes, including the process of photosynthesis. This has a positive effect on the overall biological and grain yield of winter wheat.

It has been established that with an increase in the amount of foliar feeding of winter wheat, an increase in the total biological productivity of plants is observed. For example, the total biological yield in the control variant was only 96.0 g / m², against a mineral background of 166.9 g

/ m², when applying only once foliar dressing 182.9 g /, when applying two times foliar dressing 200.1 g /, when applying three foliar dressing these indicators were 215.3-216.5 g /. Thus, in order to increase the total leaf surface of winter wheat, a scientifically grounded application of agro technical measures is necessary, including the use of three-time foliar feeding during the growing season.

In most crops, including winter wheat biological yield depends on the productivity of photosynthesis. The productivity of photosynthesis is important in increasing the productivity of agricultural crops. The intensity of the productivity of photosynthesis to a certain extent depends on the total leaf surface of plants.

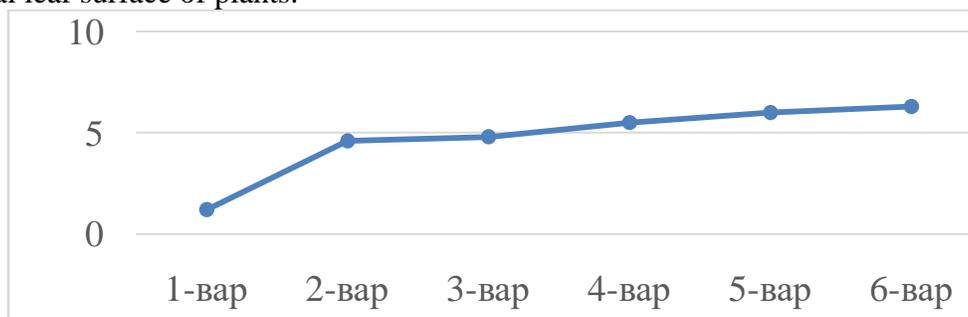

FIGURE 2 PRODUCTIVITY OF WINTER WHEAT PHOTOSYNTHESIS, G/M2

The importance of foliar feeding in increasing the total leaf surface of plants and increasing the productivity of photosynthesis has been studied very little. In the main works of foreign authors. Scientific research on the study of the productivity of photosynthesis with foliar feeding in our republic has not previously been carried out.

Therefore, carrying out scientific research in this direction is of great relevance.

The biological mass of plants that forms between certain periods of time is called the productivity of photosynthesis.

Data on net photosynthetic productivity for the experimental options are shown in Figure 2.

It has been established that when foliar nutrition is applied in winter wheat, the leaf surface of plants increases, which has a positive effect on the intensity of photosynthesis.

Studies have shown that in the control variant the intensity of photosynthesis was 1.2 g / day, in the variant with the mineral background 4.6 g / day, with foliar dressing during the tillering period - 4.8 g / day. Per day, in the tillering and tubing phase - 5.5 g / day. per day, with foliar feeding in the tillering, stem and heading phases 6.0 g / day.

Foliar feeding of winter wheat with carbamide, phosphorus and potassium during the growing season triples the productivity of photosynthesis 6.5 g / day.

Foliar dressing also has a positive effect on the effectiveness of mineral fertilizers and improves all physiological processes in the plant. The intensity of photosynthesis and aeration of plants increases, transpiration and metabolism are accelerated. This increases the overall biological productivity of plants. This, in turn, affects the grain yield of winter wheat.

The effects of foliar nutrition on the biological yield of winter wheat are shown in Table 2.

TABLE 2 BIOLOGICAL YIELD OF WINTER WHEAT

№	Options	Biological productivity, g / m ²				Biological productivity c / ha	Grain to hay ratio
		Root	Stems and leaves	Corn	Total		
1	No fertilizers	298	429	271	998	99.8	1: 1.6
2	N-200,P-140,K-90, background	565	771	525	1861	186.1	1:1.5
3	Background +1 foliarfeeding (N)	618	832	592	2042	204.2	1:1.4
4	background +2 foliar feeding (N)	658	862	663	2183	218.3	1:1.3
5	background +3 foliar feeding (N)	700	921	709	2330	233.0	1:1.3
6	background +3 foliar feeding (NPK)	720	970	747	2410	241.0	1:1.3

In the control variant, the total biological yield was 99.8 c / ha, against the mineral background 186.1 c / ha, with outside root feeding 204.2-241.0 c / ha. And the grain yield in the control variant was 27.1 c / ha, with a mineral background of 52.5 c / ha, with non-root nutrition 59.2-74.7 c / ha. The increase in grain yield with outside root feeding was equal to 6.7-22.2 c / ha.

Foliar dressing has a positive effect on the resistance of plants to the sucking pests of winter wheat. With foliar feeding, protein nitrogen breaks down and their outflow from the leaves to the generative organs. Hence, there is a lack of proteins in the leaves, as a result, the leaves lose their aromatic taste and unfavorable conditions arise for feeding the sucking pests.

Foliar dressing also improves the technological qualities of the grain. In the experiment, in all studied options, the technological qualities of grain were higher than the control option. Experience data on the technological qualities of grain are given in table 3

TABLE 3 TECHNOLOGICAL QUALITIES OF GRAIN

№	Options	Vitreous	In the composition of grain, %		Grain quality
			protein	gluten	
1	No fertilizers	67	11.5	24.8	Weak
2	N-200,P-140,K-90, background	72	12.3	26.6	Filler
3	Background +1 foliarfeeding (N)	83	13.5	28.2	Strong
4	background +2 foliar feeding (N)	85	13.7	28.8	Strong
5	background +3 foliar feeding (N)	86	13.8	29.5	Strong
6	background +3 foliar feeding (NPK)	88	14.1	30.1	Strong

Foliar dressing of winter wheat increases the virtuousness of the grain. In the control variant, the virtuousness of the grain was 67%, against the mineral background 72%, and with foliar feeding 83-88%. Due to foliar feeding, the virtuousness of grain increases by 11-16%.

Studies have shown that relatively high results in grain quality were obtained with 3-fold foliar feeding, in these variants the protein content in the grain was 13.8-14.1%, crude protein 29.5-30.1%. In the control variant, these indicators were lower and were equal to 11.5 and 24.8%, respectively.

With foliar feeding, the growth and development of winter wheat is significantly accelerated: the weight of 1000 pieces of grain increases by 0.6-1.0 g and the amount of grain in one ear by 2-3 pieces, the technological properties of grain have increased, the protein content has increased by 1.2-1.8%, gluten by 1.6 -3.5%.

Data on the positive effect of foliar feeding on the grain yield of winter wheat under irrigation conditions are shown in Table 4.

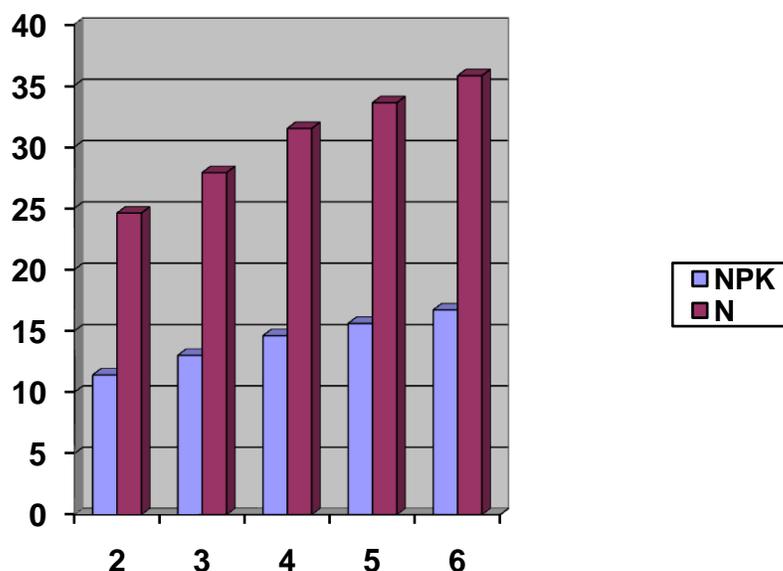

TABLE 4 GRAIN YIELD

№	Options	Grain yield, c / ha				Total, c / ha	Average, c / ha
		I	II	III	IV		
1	No fertilizers	25.4	24.7	25.2	25.1	100.4	25.1
2	N-200,P-140,K-90, background	49.9	48.5	49.4	49.1	196.9	49.2
3	Background +1 foliarfeeding (N)	56.3	54.7	56.0	56.6	223.6	55.9
4	background +2 foliar feeding (N)	63,4	61.8	63.1	62.9	251.2	62.8
5	background +3 foliar feeding (N)	67.7	66.9	67.5	66.6	268.7	67.2
6	background +3 foliar feeding (NPK)	72.2	70.8	72.0	71.8	286.8	71.7

Studies have shown that the lowest yield of winter wheat grain was observed in the control variant, without the use of mineral fertilizers. In the control variant, the average grain yield was 27.1 c / ha, against the mineral background, this indicator was 52.5 c / ha, with the use of foliar dressing 59.2-74.7 c / ha. The highest grain yield of 74.7 c / ha was observed in option 6, that is, when applying three single foliar fertilizing with NPK.

The yield increase against the mineral background was 25.4 c / ha, with a single application of foliar dressing 32.1 c / ha, with two single-use 39.2 c / ha, three-time 43.8 c / ha. When foliar top dressing was applied together with carbamide, phosphorus and potash fertilizers, the increase in grain yield was 47.6 c / ha.

Thus, to obtain a high and high-quality grain yield, it is necessary to apply foliar dressing of winter wheat three times during the growing season: in the tillering phase, in the tube and earing.

**FIGURE: 3. FORMATION OF GRAIN YIELD DUE TO 1 KG OF N AND NPK**

When using foliar dressing, the effectiveness of mineral fertilizers increases. In the experiment, relatively low rates of yield formation were noted in the variant with 1 kg of N, the yield was 24 kg and with the use of NPK it was 11 kg. The highest indicator of the effectiveness of mineral fertilizers was noted in the 6th variant. In this variant, 36 kg of wheat grain was formed due to 1 kg of nitrogen (N). Through the use of 1 kg of nitrogen, phosphorus and potassium (NPK), 17 kg of wheat grain was formed.

One of the main requirements in science is the study of the relationship between economic and quality traits of winter wheat. The relationship between features is called correlation. Scientific data on the study of the correlation of yield and quality traits in winter wheat are not enough.

Therefore, the study of the correlation coefficient is one of the main requirements of scientific research.. In the experiment, the correlation between the productivity traits was $r = 0.29-0.68$, relatively high indicators for these traits were noted between the grain yield and grain weight per ear. Correlations between grain quality traits were relatively high, $r = 0.86-0.97$.

TABLE 5 CORRELATION BETWEEN PRODUCTIVITY TRAITS

Indicators	The number of productive stems per 1 m ²	Weight of 1000 pieces of grain, g	Grain weight per spike, g
Yield	$r=0.42$	$r=0.29$	$r=0.68$

Relatively high rates of correlation in productivity were noted between grain yield and grain weight per ear, $r = 0.68$. The correlation coefficient between grain yield and the number of productive stems per 1 m² of area was $r = 0.42$.

High correlation indicators were noted between the protein and gluten content in grain $r = 0.97$.

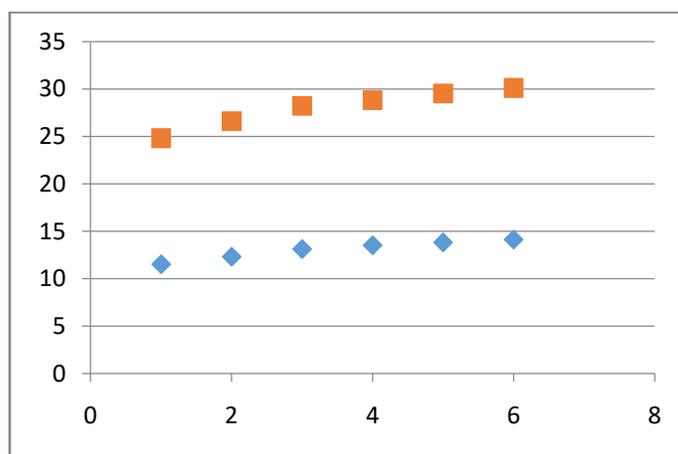

FIGURE 4 CORRELATIONS BETWEEN PROTEIN AND GLUTEN CONTENT

CONCLUSIONS

Based on the obtained experimental data, the following conclusions can be drawn:

- Foliar feeding has a positive effect on the growth and development of winter wheat, the growth of the main stem of plants increases by 7.5-18.5 cm.
- Due to the use of foliar top dressing, the mass of grain on one ear increases by 0.22-0.46 grams.

- Due to foliar nutrition, the leaf area of one plant increases by 15.6-42.5 cm²;
- With foliar feeding, the total leaf surface of winter wheat increases by 20.8-29.7 thousand m² / ha;
- Foliar dressing increases the intensity of photosynthesis and has a positive effect on the physiological processes of plants;
- Comparatively high results in grain quality were obtained with three foliar feeding, in these variants the protein content in the grain was 13.8-14.1%, and crude protein 29.5-30.1%.
- With foliar feeding, the increase in biological yield was equal to 18.1-54.9 c / ha, the increase in grain yield was 6.7-22.2 c / ha;
- The highest grain yield of 74.7 c / ha was obtained in the 6th variant, where foliar feeding was carried out 3 times using all types of basic mineral fertilizers (NPK).

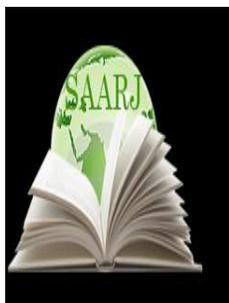

RECOMMENDATIONS

1. At the beginning of the tube exit phase, that is, with the formation of two or three internodes, the best dose of urea is 15 kg / ha, at 5% concentration.
2. During the heading phase, it is advisable to use urea at a rate of 21 kg / ha, superphosphate 8 kg / ha and 7 kg / ha potassium chloride, at 12% concentration.
3. During flowering and grain filling, the most effective dose of urea is 30 kg / ha, at 10% concentration.

UZBEKISTAN

ABSTRACT

The article describes the dialect features in the language of the Kazakhs living in the Republic of Karakalpakstan. A linguistic analysis of stable compounds based on somatic names in the local the Kazakh language was carried out. Cultural data stored in the initial state of stable expressions with the "eye" component are analyzed. The article describes the semantic field of steady word combinations with an emphasis on the influence of the Karakalpak and Uzbek languages on the formation of somatic phraseological units.

KEYWORDS: *Dialect Words, Somatism, Phraseology, Literary Language, Concept, Anthropocentrism, Component.*

INTRODUCTION

It is not enough to determine the internal laws of the language in order to fully understand the language of each nation; its main source is directly related to the history of the development of the ethnic group of the speaker of this language, traditional culture, the spiritual world and artistic thinking. Therefore, the study of the worldview and culture of people in relation to language is the main criterion in determining the national essence of language, which is an oral form of self-expression. The source of the national culture formed through the language is phraseology, and the linguocultural characteristics of each nation are reflected in linguistic units. In modern world linguistics, lexical units are studied that reflect the national identity of each

vernacular, mainly in the ethno semantic, anthrop linguistic and ethno linguistic directions. As a result, it turned out that the phraseological units of a particular region are semiotic, that is, the symbolic language of the formed material and spiritual culture. Based on the study of the material and spiritual culture of an ethnic group in a social context, it became possible to divide phraseological units into ethnic, territorial and dialectal types. The conclusions and scientific, theoretical concepts of such a modern study, proving that the language, ethnos and culture are an integral system, form the basis of a large-scale study of somatic phraseological units of the Turkic languages by historical comparative typological methods, including somatic phraseological units in the Kazakh language of Karakalpakstan. On the basis of linguistic facts, the article analyzes the nature of the use of somatic phraseological units with the component "eye", their expressive, emotional aspect, artistic and methodological function, mainly in the language of the Kazakhs of Karakalpakstan.

METHODS

The work used a diachronic, synchronous, structural-functional method, component analysis, etymological, historical-retrospective, comparative-typological, comparative-historical description, narration and generalization of ideas.

RESULTS AND DISCUSSION

The language and culture of each nation, formed over the centuries, live in interdependence. This, in turn, allows us to understand the national and cultural views of people, the manifestation of the linguistic consciousness of people, the cultural and anthropological image through linguistic units. Today, the study of individual aspects of national thinking is of particular importance. From this point of view, the special role of phraseological units in the study of the folk way of life. Folk idioms of a national character are formed by the peculiar way of life of the place, the formed way of life. Dialect phraseological units are the fruit of the spoken language, a linguistic phenomenon in its development. There is a history of the emergence of linguistic differences in the language of the Kazakhs living in each region. They are used by people at will and processed in their own way. Such phraseological units color the word and increase the sensitivity of the language.

Among the phraseological units there are many somatic types on which the organs of the human body are based. A. Bolganbaev emphasizes the essence of somatisms in the formation of phraseological units: "Anatomical terms are characterized not only by their ambiguity, adaptability to the formation of new words, but also by their active participation in the formation of steady compounds." [1: 107 b].

Somatic phraseological units are a general process inherent in all linguistic phenomena, only their origin, structure, use, descriptive nature are connected and reflect the behavior, traditions and customs of people who speak the language. Naturally, the stable components of each language have characteristics of the environment, the region in which they are located. The concept "eye" in parts of the body, which underlies somatic phraseological units in the Kazakh language of Karakalpakstan, is closely related to the understanding of the world by the local population. The steady units with the "eye" component used in the dialect are the main linguistic units of national thinking in the cognition of the world. It is known that the units that are found in the language are formed and developed in direct contact with the thinking, the national identity

of this people. Scientists have interpreted various aspects of the concept "eye" in the Kazakh literary language.

In her work, M.B. Abdrakhmanova also drew attention to the number of stable units of the somatic terms "eye" in the linguistic consciousness of the people: "The meaning of numbers in the concept "eye" is primarily associated with the process of vision, the organ of the eye. Secondly, their number is limited, and what limits them is the nature, quality of the eye, vision, gaze, by the quantities of the concept "eye" we mean numbers that are absorbed by the concept "eye" and become part of linguistic units.

For example: in the meaning - single: One-eyed giant, one of two eyes, two bites, one look, (one to one) right eye; one exhibition, one view (from seeing); at first glance, at first glance; double meaning: In both worlds there is no evil, blindfold, double fear, two eyes, one of the two eyes, two eyes of the four; the meaning of three numbers: The third eye, the third eye is opened; in the meanings of four numbers: When all four eyes are sitting, the two eyes are four, the four eyes; the meaning of eight numbers: Eight eyes [2: p.27-28]

In general, from the units considered within the concept "eye", in general, it is claimed to have formed and developed their semantic meaning, indicating the action of complex non-verbal signals.

M. V. Mamaeva and T. V. Amantay: "In the Kazakh language there are a lot of somatic phraseological units formed in connection with parts of the human body. Among them, somatic phraseological units related to the "eye" are in the lead, their total number is 172. In particular, action (verb) means 135, adjective - 16, nouns - 16, adverb - 5 such as the valence of somatic phraseological units in the Kazakh language. [3:p.68]: көз жанарының уытын төгіп, көз жасы тыйылды, көз алмай тұр, көз алмай тұр, көз жазбай, көзімен жеп болады, көз бояп, көзден ғайып болды, көз жүгірттім, көзімен атып тұр.

GuldarkhanSmagulova, who studied the structures of cognitive phraseology, frame analysis of phraseological units, cognitive and cultural aspects of phraseological units, in her monograph associated with the word "eye", analyzes phraseological units from a cognitive-semantic point of view [4: p.25]:

- Make a look - a look; to help. (p.42) between eyebrows and eyes - quickly, immediately (p.45), pile of blue flies in the eyes - punishment (p. 46) concept of speed - between the eyebrows and the eyes (p.49), the eyes of the good - тектінің ұрпағы (51- бет), қысты көз қырауда (p.51) - difficulties during work, көзінің ақы мен қарасы is the most respected close person, usually in relation to a child (p. 52) , cash (p. 61), out of the eye socket - fear (p. 62) .As a result, the verbalization of the "cry" frame: eye / eye / age lake / eye / eye / age / age / discharge / tears / tears; (p, 64) when happy: burning eyes; (p.69), place of sight - a close place (p.85), opening of eyes - change the situation, understand, understand life, know the world; openness - the emergence of a favorable situation, opening the way (p. 96), "soil scattering - deception; (p. 99), the soul of a fly is connected with the life of people: visible from the tip of the eye, between the eyebrows and the eyes, (p.208), darkness (p. 215), afraid of smth. (p.234).

Speaking about the role of anatomical terms in the formation of phraseology based on time, space, size in the Kazakh literary language, A.K. Toktanova said: In particular, the organs of the human body, such as blood, mouth, feet, jaw, eyebrows, eyes, serve as the basis of speech, a

pillar, a special enrichment of the rich collection of language phraseologisms. serves for further enrichment " disagreement - quickly, in a moment, көздіашыпжұмғанша - instantly, between the eyebrow and the eye, instantly; көзбайланғанкез- in the evening, dark eyebrows, dark; көзгетүртсекөрінбейтінқараңғы // көзгетүрткісізқараңғы//көзгетүртсекөргісізқараңғы// көзтүрткісіз emphasizes that phraseological units, such as darkness and dimensions, are the basis of time, [5: p. 204].

Even in the dialects of the Kazakhs of Karakalpakstan, phraseological units with the component "eye" serve to convey a variety of information, historically formed, encoded into a unique spiritual, semantic image.

The aim of our work is to clarify various information in the spiritual structure, the semantic image of such a dialectal concept "eye".

The moon - congratulations. This phraseological unit is mainly expressed at a time of special joy, and among local residents they say when a son comes from the army, when relatives come who have not seen for a long time. The meaning in literary language is my eye. The long-awaited man came and rejoiced [p. 6: 212]. Look! If your child is happy to come from the army, let him be happy for a long time! (from oral speech.)

Blindfolded --gave birth, gave birth to a child. Basically, this stable unit is used in the literary language of the Turkic languages such as Uzbek, Karakalpak, Kyrgyz. Nagima's daughter-in-law is crying and congratulating her neighbors.

In the openness of the eye - during his lifetime. Turdybay Haji, in the openness of his eyes, did the right thing by giving his inheritance to his three children (from the oral speech). At the same time, the regular expression used in the literary language means "farsighted" - an educated person, deeply thinking [7: 144] - and among the local population it means "clairvoyant", a person who sees the future.

His eyes are full of oil // squeezing his eyes - arrogance means obesity from dirt, to lubricate the eyes and ignore others. Mainly used to express negative behavior in oral speech. Chel (marza) - (Turkm.: Takhta, Old-Urgench., Taj., Bair; Karakalp.) Soil adhered to all four sides of the field. The field around Chel (marza) is painted for water resistance (Turkic, Takhta). [8: 749-750]

His eyes are hard - in the acute sense of the word. One of the types of trust between people, preserved from time immemorial, is corruption. The damage will especially affect the child. The phrase "sharp" was used to refer to a person with a sharp eye (spoilage). In these cases, people with a keen eye are asked not to jinx it. In this regard, the word "eye to eye to stone" arose as a word with a magical meaning, used to simultaneously reflect this sharp gaze, that is, to return the forces of corruption in the local language. Let Sagynbay's eyes be like salt, his nose be as big as ours, let him spit on children. (from oral speech)

My eyes are not flying - I don't want to look in the face, I don't want to see. It is mainly used in colloquial speech. I can't wait to see you at this wedding, don't miss it! (from oral speech)

Getting fuel from the source - intimidation, pomp. It is also used in verbal language in the form of fixed compound words such as "bully" and "scared from childhood" to express the meaning of the first bullying and persuasion.

Make sure you keep an eye on your eyebrows - to do good to someone, to do evil, to make a mistake, to work. We water the mouth ourselves, you have a habit of "making eye contact", sit still (from oral speech).

Open your eyes wide - punish, confess, repent. The word «МӘШ» comes from the Persian word «МӘШ», an annual legume belonging to the «МӘШ» family, and its edible skin, the white grain inside the vegetable. [9:p.619]. The elders of the village took Nurbol in the middle and opened his eyes wide (from oral speech)

Eye contact - to be ashamed of their actions. Tomorrow it will be obvious, then what kind of person will we be in front of the in-laws (from oral speech)

Open your eyes basically this phraseology is used by women in the sense of their first marriage. Daribai died and brought his only son to the palace. (from oral speech).

Take a look - this phraseology is applied to unmarried men in the sense of whether they have a lover or a chosen one. If you have caught it, bring it, so that your grandparents can see the end and the noise. (from oral speech).

His eyes fell - the expression of the meaning of the verb "to see" and the expression of emotionality in works of art serves to effectively convey the idea. [10: p.71-74]

Also among the local Kazakhs there is a lot of care and help: to see without eyes // to see without eyes- hatred, hostility; narrow eyes - jealous; striking - striking; to be visible - are widely used for attentiveness.

The phraseological units that have developed over the centuries, reflecting the specificity of the area, arose as a manifestation of the cultural wealth of the nation, that is, folklore, religion, philosophy, traditions and customs of the people, and the mythological worldview. In this regard, the study of phraseological units of dialectal quality, its conceptual scale is one of the actual problems of linguistics. Analysis of somatic phraseological units in the framework of the anthropocentric paradigm, from the semantics of dialectal stable units, one can understand the cultural image and thinking of the nation, the nature of the national mentality, customs and traditions in the perception of the environment.

CONCLUSIONS

Conceptual analysis of dialect phraseology is a necessary aspect in the work to define and determine its place in the enrichment of the literary language. Regarding the lexical-semantic study of dialectal somatic phraseological units with the component "eye" in the language of Kazakhs of Karakalpakstan, we came to the following conclusion:

-revealed the semantics of somatic phraseological units, which are the distinctive features of language and culture;

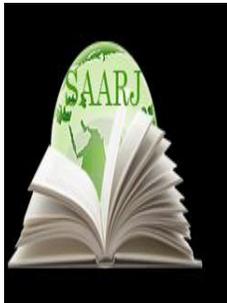

-the feature of expressive semantics of the concept "eye" of dialectal character is shown;

-the expressive function of phraseological units with the component "eye" has been determined, the figurative meaning of which has been transformed into a semantic change in the process of development, while the main function of somatic terms among common phraseological linguistic units is to analyze the formed dialectal stable units, it is necessary to touch on the cultural, descriptive information in the language.

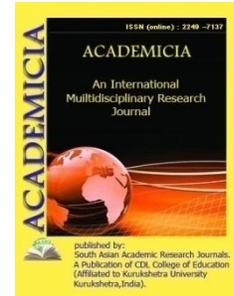

Phraseological units with the component “eye” in the language of Kazakhs living on the territory of the Republic of Karakalpakstan retained their dialectical features, in contrast to the Karakalpak and Kazakh national literary languages.

THE ROLE OF MUSIC IN THE DEVELOPMENT OF OUR NATIONAL SPIRITUALITY

Dilmurod Tursunovich Nosirov*

*Teacher,
 Department of Music Education,
 UZBEKISTAN

ABSTRACT

The issues of alignment of spirituality of rising generation on the basis of transferring them conceptions, knowledge and skills about local musical traditions are considered in the present article. Music education in these schools has been directly enhanced. The content of these schools is based on the fact that music is a real means of education throughout one's life, from the moment a person is born. The independent study of music in connection with the art of speech and literature contributes greatly to the development of the name and practice of music. Improving the development of music in the development of the individual, of course, depends on the methodology of education.

KEYWORD: *Traditions, Local Musical Pedagogy, Local Singing Traditions, Musical Impressions, Music, Art, Education, Song, Sing.*

INTRODUCTION

The Uzbek people are a great nation that has made a great contribution to the historical development of the world with its ancient science, literature, music and culture.

Indeed, independence cannot be strengthened and sustained without addressing issues directly related to culture and enlightenment, and without inculcating the ideas and concepts of independence in the minds of the people and transforming them into beliefs. National revival is a very broad, deep, complex historical process that directly affects all spheres of life of our nation - economy, politics, spirituality, science, language, history, customs, crafts, architecture, as well as human development. Covers all issues as well. Music also plays an important role in the development of our national spirituality. It is one of the oldest and, at the same time, the most popular fields of national music, deeply ingrained in the life of the people. The music also

reflects the real reality. The influence of music on our national spirituality is so great that science has already proved that it can cure patients. Abu Ali Ibn Sina attached great importance to the power of music and argued that some mental illnesses could be treated through music. The great philosopher Abu Nasr al-Farabi, in his book *The Great Music*, expressed his valuable views on the types of tones of music theory, the reasons for their origin, and their spiritual and psychological impact on man. Farabi was not only a theorist but also a practitioner in musicology. He is also a well-known musician, a great musician and composer, and the inventor of a new musical instrument. Reflecting on the amazing magical power and miraculous effects of music, Farabi says in his book *On the Origin of Science*: "This science is useful in this sense, it regulates a person who has lost his balance, It perfects and maintains the balance of an imperfect nation." The masterpieces of music created by our people find a certain degree of self-sacrifice in every second - in education, labor, social relations. National music teaches the surrounding events to perceive and appreciate beauty, equips them with delicate taste and free thought, expands the spiritual world. It is no coincidence, therefore, that music is called a philosophy without language. Music can soften a person's heart and evoke feelings of faith, love, and compassion. At the same time, the task is to express the ideas of mysticism in accordance with the ideology of the great state. Naturally, the study of these complex scientific issues is entrusted to leading musicologists in all respects.

Human upbringing has always been one of the most pressing issues in any society. Because the formation, development and prosperity of a society depends on its upbringing in that society. Upbringing is a continuous process that consists of regularly influencing a person's spiritual and physical development in order to prepare him or her for socio-economic production relationships. Therefore, educating young people and mobilizing them to strengthen our independence is an important example. In our independent Republic, special attention is paid to the issues of spirituality and culture. It should be noted that in order to shape the spiritual life of person in Uzbekistan, there are ample opportunities for music to penetrate deeper into cultural life. At the same time, the establishment of creative institutions such as the Center for Spirituality and Enlightenment, the International Cultural and Enlightenment Complex, the Union of Composers and the creative changes in society are the traditional competitions held in our country under the name "Uzbekistan is my homeland." methods are used in the implementation of reforms. It should be noted that the realization of the prospects of the Uzbek national musical culture, which has an ancient and rich experience, has developed over the centuries in order to engage in educational work.

Music education in these schools has been directly enhanced. The content of these schools is based on the fact that music is a real means of education throughout one's life, from the moment a person is born. The independent study of music in connection with the art of speech and literature contributes greatly to the development of the name and practice of music. Improving the development of music in the development of the individual, of course, depends on the methodology of education. The methodology of music education as a science belongs to the system and has its own independent place. This subject studies the content and methods of music education in order to further improve its methods. The methodology of music education is based on the generalized experience of sophistication, musicology, physiology, psychology in educational institutions. The methodology of music education is especially connected with the sciences of fine musicology. While the name Nafosat is the basis of his methodology, it has a

direct impact on the content and methods of education. The methodology is based on physiological research in solving problems in students' singing activities. The essence of music education methodology is important for the younger generation in the art and culture of music. The development of methodology as a science is directly related to the development of education and music in society. At the same time, it promotes the general principles of music education methodology. These principles, which are based on the principles of artistic and technical development of consciousness, are aimed at developing students' musical abilities, strengthening their interest in music, and cultivating art. Conscious understanding of music helps to unravel the content of the work and to help students accumulate musical experiences and enrich their spiritual world. Music education develops the ability to evaluate the work of the listener through an increase in the principle of emotional awareness: Their interest in music is nurtured. The principle of the artistic and technical stage requires qualified personnel for the artistic and expressive performance of the work. Focuses on students' singing skills. As students develop an understanding of the principles of music development and develop their skills, they will learn more about musical concepts. Recognizes that music education methods depend on many factors in the educational process. People's musical culture is not formed only under the influence of school. At home, of course, the environment, the media and the integrated social media system also play an important role. There are the following problems in the development of methods of pedagogical development, including the abandonment of methods of teaching music education:

A) Methods of music education, content testing, performance dependence.

C) Development of musical and creative abilities in students.

C) Development of musical ability and voice, age and individual characteristics of music perception.

D) The relationship between the possibilities of using musical activities in different forms in the development of students. The objectives of the methodology include music lessons in addition to music lessons, extracurricular and extracurricular activities, clubs, holidays, and entertainment nights. The methodology of music education requires the study of literature and fine arts, which are close to the science of music, in connection with history. This is an important tool for the effective implementation of all aspects of student education. Lessons are a key factor in achieving the goals and objectives of music education. Because of the mass involvement of students, music at school differs from other disciplines in its art and interest, as well as in its excitement. Most importantly, music plays an important role in shaping children's mental and moral qualities. Music sharpens the mind and sharpens the mind. In music lessons and classes, students learn about our upbringing and national culture and expand their knowledge. The role and purpose of the art of music in the upbringing of the child, the personality in the system of enlightenment ideas of our ancestors Abu Nasr Al Farabi is especially recognized. It mentions the society of music in human life and exclaims, "O world of music, it is better that you go, what would be the state of man without you." The scholar Abu Ali Ibn Sina also describes music as a powerful means of influencing a person's spiritual and physical cultural nature in his musical enlightenment views. It is believed that music should be nurtured from an early age, which will strengthen the child's mood. In his famous book, The Laws of Medicine, two things need to be done to strengthen a child's clientele. One is to shake the baby slowly, and the other is to play music, which has become a habit to put the child to sleep. He wrote that depending on the

amount of intake of the two, the child's body sometimes had a need for upbringing and spirit for music. Thus, scientists and thinkers have long been interested in the application of music not only as a means of effective influence on man, but also as a separate science according to its nature, goals and objectives in society. Will be the basis for the emergence of popular folk music pedagogy. Schools of teaching methods are being developed. Nowadays, the task of cultivating a person's spirituality requires raising the quality of music education in schools.

The goals and objectives of music and education are very important today. The goal of music education is to bring up a generation as a young, valued cultural person who can inherit our musical heritage and inherit our universal musical heritage, so that every student has access to music.

The main task of school music education is to develop the talents, increase the love and passion for the art of music, to form the necessary range of knowledge and practical skills in music, to create the necessary conditions for the musical development of gifted students. The goals and objectives of music education are directly related to the music lessons in the school. In the concept of music education, music at school, along with other disciplines, has a special significance. It is an equal subject in school to raise the quality of music education. This requires a modern student to have a positive attitude towards lessons, and to actively organize and manage the development of students' musical activities. Music has its own characteristics as a lesson. And every teacher should know these qualities.

First, the theory of music history includes some exercises from various examples of performance, music literacy classes, listening to music, music education and literature, children's playing of musical instruments, elements of rhythmic acts, and activities of artists in music. The second type of music differs from other forms of art in its means of expression, the "language." If fiction is expressed in words, in fine arts, and in dance, in art, then the tone of the music is used. Third, music has an active emotional impact on children, giving them positive instructions and experiences. The program of music culture in general secondary schools includes lessons such as listening to music, singing as a group, musical literacy, children's musical instruments and rhythmic movements. The connection should be made as a whole. Understanding modern music plays an important role as a leading activity. Because at this stage, there are more play features in the students' activities. In this way, the goals and objectives of education and upbringing are fully realized. Important activities such as providing scientific leadership in these processes, understanding the content of national music education,

Undoubtedly, music can increase the effectiveness of education, which has a significant impact on the formation of the spirituality of students in school life. The spiritual growth of our nation, in many respects, requires a deep understanding of the restoration of our national values, a wide-ranging propaganda with all our heart, and, most importantly, the consistent upbringing of the younger generation. Our musical values have a special place in this regard. In particular, the unique forms of Uzbek folk music - songs and masterpieces - are the truly invaluable spiritual treasures of our people. In the musical samples of the time, the noble virtues, dreams, delicate emotional experiences and philosophical observations of existence in general, which are stored in the hearts of our ancestors, are vividly expressed. Therefore, when you listen to the national melodies, the "voice of the centuries" sung from them, the delicate and high human feelings embodied in captivating melodies, excite our hearts and at the same time encourage us to

appreciate the artistic traditions inherited from our ancestors. a radical change in the education system has taken place since independence. The goal is to radically reform the education system and bring up a full-fledged person who combines all-round maturity, wealth, mental purity and physical stability. The Law on Education and the National Training Program were adopted. The key to solving these historical problems is a complex and multifaceted complex system of education. One of the most pressing issues facing our creative music teachers is to study our national music and culture more deeply and comprehensively than ever before, and to pass it on to the younger generation and promote it. It is important to manage the social activity of a person's spiritual world, emotions and inner experiences. The role of our national music, including makom and art, in balancing the wonderful emotions of harmonious spirituality is incomparable. For centuries, our ancestors have praised the power of our music and enjoyed it in their relationships and work.

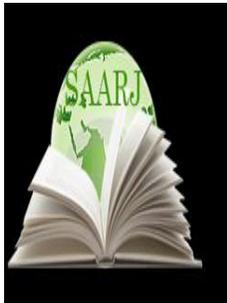

Musical literacy has clear goals and objectives. The existing national methods determine the direction of its implementation. Learn, listen to, play music and use it in your life. Interests go hand in hand with human culture. The status of one of the masterpieces of our people is to some extent reflected in education, labor and social relations. From infants to the elderly, Murgak enjoys the benefits of art. They fight to make tomorrow brighter. Music is an independent field with great educational potential in our country. Nowadays, the attractiveness of music, its status expands, and its place in society is strengthened. In the educational process, music is the basis of moral and aesthetic education of the younger generation. The effectiveness of a number of accelerations in the educational process depends on it. During the first stages of the great independence, at a time of radical economic, political and social reforms in our country, special attention is paid to humane and progressive factors such as national culture and art, spirituality and enlightenment. Here it is important to study in detail our historical and cultural monuments, including our musical heritage, to fully restore our age-old values, folk customs and traditions. It should be noted that in recent years all the necessary conditions have been created for its scientific and practical development by the younger generation. The melody is an expression of the divine mood in the human soul. The idea, the imagination of a stable work, first appears in the imagination, and then, through the performance, comes to life through resonance, into a certain form of melody. The lifespan of the melody is very short; as soon as it appears, it disappears. But the moving sound, the melody, leaves a mark on the listener's heart, evokes pleasure and encourages him to strive for this delicious state again. This charm is beautifully expressed by Mawlana Abdurahman Jami: completely engulfed. But when the soul begins to enjoy it, it is wrapped in a veil of nothingness and disappears. If its loss is frustrating, the mood of despair will not end, and the next melody will bring back the previous presence, and thus the melodies will be interchanged and repeated in accordance with the author's harmony. "One of the simplest ways to keep the passion alive is to share it with loved ones. If the melody of the melody is accepted and influenced without indifference, the desire to continue this pleasure is aroused. In this state of mind, the hearts of the performer and the listener are connected, and they begin to receive the same nourishment from the melody. This pleasure develops into melodies, which in turn become larger compounds. In this way, the whole melody is formed from the primary percussion and melody particles. From their connection large works are formed. So, in short, in recent years, the principle of relying on the art of music, to make the younger generation more enjoyable of its centuries-old traditions and examples, has become a priority. Parents in the family and teachers at school often teach children that good music and songs can purify a

person's heart, purify his soul, lift his spirits, and guide him to good goals. One of the most important priorities today is to train young people to become professionals who know the art of music, which is a rich spiritual heritage. First of all, young people need to be familiar with the art of music in order to have national pride and high culture. The head of our state Sh. Mirziyoyev has been paying special attention to this issue in a number of speeches and speeches. In his speeches during his visits to the provinces in 2020, the President set the task that school graduates should learn to play one musical instrument, which imposes a great responsibility on music teachers. The divinity of music, its connection to the soul, the mysterious world of melodies have always fascinated mankind. While the song is an ointment for pain and increases joy, the musician's melody removes sorrow and gives a good mood. The role of music in the development of our national spirituality is invaluable, so teachers of music culture are equally involved in the formation of such qualities as patriotism, love, hard work, friendship, loyalty in young people through music.

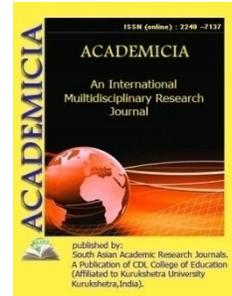

The role of music in the development of our national spirituality is invaluable.

ABSTRACT

In the thymus of animals subjected to acute stress, a decrease in lymphoid tissue was found, accompanied by the death of lymphocytes in the cortex and medulla. Acute stress leads to the appearance in the thymus of a large number of degranulating mast cells and actively functioning epithelial tubules. Psychological stress has great impacts on the immune system, particularly the leukocytes distribution. Although the impacts of acute stress on blood leukocytes distribution are well studied, however, it remains unclear how chronic stress affects leukocytes distribution in peripheral circulation. Furthermore, there is no report about the role of spleen in the blood leukocytes distribution induced by stress. Here we show that spleen contributes to the alteration of restraint stress induced blood leukocytes distribution. Our data confirmed that restraint stress induced anxiety-like behavior in mice. Furthermore, we found that restraint stress decreased the CD4/CD8 ratio and elevated the percentages of natural killer cells, monocytes and polymorph nuclear myeloid-derived suppressor cell. We demonstrated that activation of hypothalamic-pituitary-adrenal axis (HPA) and sympathetic nervous system (SNS) contributes to restraint stress induced alteration of blood leukocyte distribution. Interestingly, we found that splenectomy could reverse the change of CD4/CD8 ratio induced by restraint stress. Together,

our findings suggest that activation of HPA axis and SNS was responsible for the blood leukocyte subsets changes induced by restraint stress. Spleen, at least in part, contributed to the alteration in peripheral circulation induced by restraint stress.

INTRODUCTION

The experiment involved 30 animals - non-inbred white rats (males and females) of four months of age with a body weight of 150-200 g, kept under standard vivarium conditions (free access to food and water and 12-14-hour daylight hours). Two experimental groups of 10 animals each were formed: I - intact animals in standard vivarium conditions; II - rats subjected to acute cold stress, which was modeled as follows: a single exposure to a temperature of +5 ° C, exposure - 1.5 h. Daily observation of animals included registration of behavior, appearance, physiological functions. On the 7th day, the animals were removed from the experiment under ether anesthesia in compliance with the rules of euthanasia, and the autopsy material was taken for subsequent histological examination (thymus).

The thymus is covered with a thin capsule of dense unformed connective tissue with a large number of collagen fibers and is divided by trabeculae into indistinctly delimited lobules, consisting of cortical and medulla. In some animals, adipose tissue is found in the trabeculae. In some preparations, the border between the cortex and the medulla is not clearly revealed. The cortical substance of the thymus is represented by weakly oxyphilic epithelioreticular cells, macrophages and basophilic-stained, tightly adjacent T-lymphocytes; a small number of capillaries surrounded by epithelioreticular cells are found in it.

The thymus medulla looks lighter. Lymphocytes, macrophages and epithelioreticular cells are well visualized in it. At high magnification, thymic bodies formed by reticuloepithelial cells are revealed. In the connective tissue of the thymus septa, single mast cells are detected.

In the group with cold stress, by the 10th day of the experiment, the thymus tissue showed, first of all, vascular disorders (edema of the connective tissue and vascular congestion). As for the changes in the lymphoid tissue, they were expressed to varying degrees in different lobules in the same individuals.

In some experimental rats of this group, the disappearance of inversion of layers in individual lobules of the thymus was noted - with the depletion of not only the medulla, but also the cortical layer of the thymus, which was manifested by the depletion of the layers with cells of the lymphoid series and the disappearance of clear boundaries between the layers. In the medulla and cortical layers of the thymus, areas of lymphocyte death were visualized, which manifested itself light-optically as a "picture of the starry sky." In 20% of animals in the lobules, the replacement of lymphoid tissue with adipose tissue was noted.

Main part

The influence of various pathogenic factors on human health leads to morphological changes in tissues, disruption of the function of individual organs, and in particularly severe cases, the entire

body as a whole. All this forces scientists to pay close attention to the organs of immunogenesis that provide the body's defense mechanisms [1-6].

The blood system plays an important role in the body's response to any stressful effect [7]. In recent decades, the influence of stress on the mechanisms of regulatory processes in humans and animals has been actively studied, its role in the adaptation process with the participation of cytokines and antioxidants has been shown on models of emotional, pain, traumatic and other stresses and also the fact that under the action of stress, all regulatory information goes from the nervous system through the pituitary-adrenal, lymphoid system and hematopoietic organs, and the general adaptation syndrome develops against the background of the restructuring of the activity of the local microenvironment, in which stromal elements and cytokines play an important role [7]. Nevertheless, today there are many unresolved issues in the pathomorphological changes in the organs of immunogenesis under stress, which determines the relevance of research in this direction.

The process of age-related involution, an evolutionarily ancient process inherent in all vertebrates, stands apart [15]. One of the characteristic features of true age involution is its irreversibility under physiological conditions. Recovery of the thymus after involution due to gonadectomy, administration of luteinizing hormone or growth hormone is shown.

An absolute decrease in thymus mass correlates with the onset of puberty. The thymus, which has undergone age-related involution, is an accumulation of adipose tissue with remains of the parenchyma containing islets of epithelial cells and thin strands of a few thymocytes with Gassal cells. However, involution is never complete, small islands of the thymus parenchyma are found even in people older than 80 years [16].

In all animals of the group (100%, $p < 0.05$ with respect to control), inversion of layers was also observed, which is typical for the 3rd phase of accidental thymic involution under stress [8].

The blood vessels in the devastated cortex had a structure typical of the vessels of the thymus medulla. It is known that the hemocapillaries of the cortical layer have a relatively thick basement membrane, to which epithelioreticulocytes, macrophages and lymphocytes often adjoin; the basement membrane of the medullary hemocapillaries, on the contrary, is thin [7].

Also, in the cortex and medulla, areas of stromal collagenization and the formation of a large number of thymic bodies were detected.

In the thymus tissue, a large number of mast cells were detected - large cells with basophilic granules. They were found mainly in the interlobular connective tissue, in the connective tissue of the septa inside the lobules in the vicinity of the blood

Mast cells are an integral part of the thymic microenvironment; their main function is to control the composition of tissue fluid, they are regulators of tissue homeostasis and the last link in the general adaptation reaction at the cellular level, in the thymus they are actively involved in the processes of differentiation and migration of thymocytes [13]. In 70% of animals, epithelial tubules lined with cubic epithelial cells were also detected in the cortical layer of the lobules.

It is known that epithelial tissue plays a leading role in the implementation of the functions of the thymus; at the same time, both in the human thymus and in the thymus of laboratory animals, epithelial tubules, thymic bodies and epithelial accumulations are permanent structures [13]. In

2009, only one term was introduced into the nomenclature, referring to the epithelial structures of the thymus, thymic body; the combination of three types of epithelial formations of the thymus (epithelial cords, epithelial tubules and thymic bodies) under one general term is conditional and inhibits the development of ideas about the structure of the thymus [12].

Most researchers explain the proliferation of epithelial structures in the thymus by the emergence of an urgent need to enhance the secretion of thymic hormones under extreme exposure [9, 10]. The cavity forms of the tubules can be constantly determined with the tension of the functional activity of the thymus, expressed in a change in the emigration and immigration of lymphocytes in the organ - not only in the embryonic, early postnatal and senile periods of genesis, but also under the influence of stress factors on the body. In accordance with modern ideas about the functions of the thymus, all these periods of life characterized by an unbalanced supply of T-precursors from the bone marrow to the thymus and emigration from the thymus to the peripheral lymphoid organs of T-lymphocytes that have passed the intrathymic stage of maturation; at the same time, not only mature T-lymphocytes migrate from the thymus to the lymphoid organs, but also immature forms, which are able to mature in these organs under the influence of thymic factors [12].

Thus, when comparing the data of histological examination of the organs of animals of the experimental and control groups, the following patterns were revealed. In rats subjected to acute stress, changes in the organs of the immune system were found, characteristic of acute stress, a decrease in lymphoid tissue - in the thymus

The study of the thymus as a central organ of the immune system under stress is of particular interest to date.

Later, many researchers have shown that accidental involution of the thymus develops not only when exposed to an infectious agent, but also when various factors affect the body [7].

Under stress conditions, incidental involution of the thymus reflects suppression of its function [11]. Generalization of the information available to date in the literature makes it possible to represent this process as a sequential change of five phases; at the same time, the processes of death and migration of T-lymphocytes in different lobules are uneven, and the absence of strict parallelism of changes in lobules is reflected in the morphological picture of one stage or another, in addition, the nature of the response of the thymus to the stressor depends on the nature of the stressor [7].

At the same time, according to other authors, lymphopenia in lymphoid organs during stress reaction develops not as a result of cell breakdown, but due to a decrease in neoplasm and increased migration of lymphocytes from these organs to the bone marrow with the formation of a "lymphoid peak". It is known that lymphocytopenia accompanies stress practically throughout all its stages, but it is most pronounced in the stage of anxiety and in the stage of exhaustion (especially), which is characterized by almost complete atrophy of the thymus [14].

Thus, in the central and peripheral organs of immunogenesis of animals subjected to acute cold stress, we observed similar changes, which are manifestations of acute stress, the reduction of lymphoid tissue. In the thymus, the reaction of reticuloepithelial structures and mast cells was also revealed.

With acute stress exposure, the central nervous system is activated, which triggers a stress response. It consists in the fact that the peripheral nervous system is activated, and various hormones begin to be released by the endocrine glands. In the body, there is a violation of biochemical processes, which leads to undesirable changes in tissues and organs. The organs responsible for immunity are affected. In the blood, the level of hormones - glucocorticoids, a high concentration of which suppresses the body's immune system, sharply increases. In acute stress, the gender difference is sharply manifested. In female rats, after acute stress, the immune response increases significantly, resulting in faster recovery. In males, the reaction is the opposite, so healing is slower. This study also confirms human sociology, according to which socially isolated men are more difficult to tolerate stress and illness than isolated women. Scientists do not know why women are quicker to restore your immune system after stress than men. Perhaps this is due to the fact that in this way they subconsciously protect the health of their future children. Thus, men who are socially isolated are more susceptible to diseases and live less than women who are isolated. Scientific studies in laboratory mice have shown that short-term stress increases the strength and duration of the immune response. In another study, in which mice were placed for two hours in the same cage with more aggressive counterparts, it was found that such stress increased the response to the flu virus. Acute positive stress strengthens the immune system regardless of gender and accelerates the healing process of minor injuries. In the case of short-term stress effects, in contrast to the effects of chronic stress, there are no clinical manifestations of psychological and physiological dysfunctions associated with a violation of the immune system. Underestimation of the state of health, inadequate treatment and, as a result, aggravation of the picture of the disease can be dangerous here [18].

The restoration of the structure and function of the immune defense occurs gradually. At first, the cell depots begin to fill up, because due to the decrease in the stress effect, there is no need for an increased content of immune cells in the periphery. There is time for the maturation of cellular elements. Soon the periphery is filled with mature immune cells necessary for the life of a healthy body. For future acute stress, there is a reserve of mature and maturing elements in the depot and organs of the immune system. When restoring psychophysiological functions, if the stage of exhaustion has not occurred, and the sympathetic part of the nervous system dominates, with relaxation or active correction, the immune system normalizes [17, 19].

Research results

The experiment involved 30 animals - non-inbred white rats (males and females) of four months of age with a body weight of 150-200 g, kept under standard vivarium conditions (free access to food and water and 12-14-hour daylight hours). Two experimental groups of 10 animals each were formed: I - intact animals in standard vivarium conditions; II - rats subjected to acute cold stress, which was modeled as follows: a single exposure to a temperature of +5 ° C, exposure - 1.5 h. Daily observation of animals included registration of behavior, appearance, physiological functions. On the 7th day, the animals were removed from the experiment under ether anesthesia in compliance with the rules of euthanasia, and the autopsy material was taken for subsequent histological examination (thymus).

Chronic stress has a marked regulating effect on the immune system of growing animals, one manifestation of which is the change in the structural and immunocytochemical characteristics of the thymus, typical immunosuppressive conditions, namely: reduction in size of the thymus and

a decrease in its cellular density, reduction of cortico-cerebral ratio, the number CB90+ and CB8+ thymocytes in the cortical substance of the thymus, DBA+thymocytes in the cortex and the medulla of the thymus, increased death of thymocytes and inhibition of their proliferation in the cortical substance of the thymus.

The sensitivity of the immune system of a growing organism to the action of various types of stressors (physical versus psychoemotional) depends on the initial age. According to an immunohistochemical study, physical stressors cause a sharp immunosuppression in infancy, while emotionogenic stressors significantly less change the immunoarchitectonics of the organ during this period. In the suckling period, a greater sensitivity of the thymus to the action of physical stressors remains with an increase in the strength of the immunomodulatory action of psycho-emotional stressors, and by the end of the infantile period, the immunosuppressive effect of emotionogenic stressors is practically compared with that of physical stressors.

CONCLUSION

The thymus of immature experimental animals of the age of transition to independent nutrition is the most sensitive to the immunosuppressive effect of chronic stress, which, according to immunohistochemical research, causes the highest degree of accidental involution of the thymus in animals of the suckling period compared to animals of the infant and infantile periods.

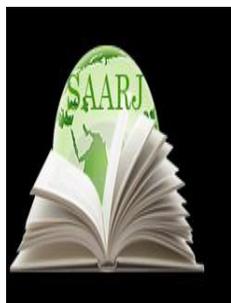

The leading mechanisms of thymus involution in chronic stress in a growing organism are excessive apoptosis of double positive thymocytes of the thymus cortex and inhibition of lymphocyte proliferation in it.

Immunohistochemical methods of research significantly expand the possibilities of assessing the dynamics of thymus immunoarchitectonics under stress, among them the most informative are staining on CD8, PCNA and ED1, which allows not only to state the presence and direction of changes, but also to decipher their mechanism.

CENTRAL ASIA IS RULED BY TWO CHINGGISIDS: POLITICAL RELATIONS AND INTER RELATIONSHIPS

Gulmira Mardonovna Achilova*

* PhD Senior Researcher,
History Institute of the Academy of Sciences,
Republic of UZBEKISTAN

ABSTRACT

The article gives information about the collapse of the Chinggisids from the 60s of the XIII century and the fall of khanate power and the emergence of separating forces from it. It also focuses on highlighting political events among the rulers of the independent states that emerged as a result of the collapse of the Empire. In this regard, it was discovered that the members of the Chaghadai family, who ruled as a suzerain, and his relationship with Qubilai.

KEYWORDS: *Khanate of Chaghadai, Yuan Empire, Political Relations.*

INTRODUCTION

Ghinggis Khan (1206-1227), who united dispersed Mongolian tribes, united the northern part of China in the first quarter of XIII century, East Turkestan, Transoxania and part of Khorezm. As a result, the existing system in the occupied territories gradually changed and the new management apparatus began to find solutions to socioeconomic issues. Particularly, Central Asia, Persia, Dashti Kipchak, and Eastern Europe have undergone some changes since the second half of XIII century. All territories occupied by Ghinggis Khan in 1224 have been distributed to his heirs. This was due to the fact that the large territories occupied were not central to control and that there was a need to maintain a certain force at the same place to manage them. In the process of distribution of lands, the second son of Ghinggis Khan Chaghadai (1224-42) inherits Kashgar, Yorkand, Khatan, East Turkestan, eastern part of Khorezm and Transoxania. Since 1227, the land of Chaghadai has been called "khanate of Chaghadai"[1]. Although this state officially became the property of Chaghadai, the first Qa'anian of the Mongol Empire was ruled by Ögödei[2] (1229- 1241) and his descendants until the beginning of the XIV century. In the 1360s, when the unification of the Mongol Empire erupted among the princes of the Ghinggis Khan 's generation have been increasing the use of lands that were not their inherited possession. This situation has also been seen in the nation of Chaghadai, which controls the territories of modern Central Asian republics. As a result, the princes unshakable struggle was overwhelmed by the nation, and political tensions escalated in the country. Under the influence of this, the Chaghadai ulus, which has been

weakening year after year, began to be influenced by members of the Ögödei family, dominated by the upper reaches of the Irtysh River. This process was intensified during the reign of Ögödei's grandson Qaidu (1236-1301).

Qaidu entered the battlefield during the rule of Möngke (1251- 1259) and Qubilai (1260-1294), who gained control of the Mongol Empire, and became a dangerous rival for them. However, Qaidu focused his attention on the central government of Central Asia only under the rule of Chaghadais, freeing entirely the power of the Great Khan. This event had a great impact on the development of the region in its time. For this reason, the personality and function of the Qaidu has not been ignored by the historians. In particular, the detailed description of the life of the Qaidu is provided in the sources written in other parts of the Mongol Empire, especially in the works of Chinese and Persian historians, European and Arab tourists[3]. However, there are various opinions among the authors on the assessment of his personality. In the works of Chinese and Iranian historians[4], Qaidu is accused of being an enemy and rebellious, as well as being prone to property and rebellion by the Mongol princes[5]. Because, the policy pursued by Qaidu was contrary to the interests of the Iranian and Chinese leaders. The only local source that provides complete information on its activities is the "Mulhaqāt al-surāh" by JamālQarshī, written in Kashgar in the early years of XIV century[6]. In 1260, for the first time in the history of the Ghinggisids, two great kings Qubilai were in China, and ArighBöke was reigning in Mongolia. Qubilai sends the troops under the command of Prince Abishka, the son of Buru, to subdue the Chaghadai nation. But Prince was captured in Tangut by people who were loyal to ArighBöke and executed quickly. ArighBöke did not believe in Orghina, who ruled the nation of Chaghadai at the time under the name of Mubarak Shakh , and sent the Prince of Chaghadai to the land of Transoxania to prevent the movement of and Berkan. Moreover, Qubilai stopped carrying grain from China to Mongolia, and this led to the famine. In order to solve this problem, the task of importing grain from Turkestan was handed over to Chaghadai's nephew, son of Baydar (1261-1265)[7]. He came to Kashgar and gathered around him the Chaghadai tribes and their supporters. Orghinashould arrive with Mas'udBeg and ArighBo'ke. Sulaiman, the son of Habash Amid and Amorites Uchachar wassent with Nikpai. As can be seen from this, many Muslim officials were onthe side of Alghu. The leaders of Mongolian troops BukaNusha and ChinsangTayfu in Transoxania were in their side and they were left in their own place.

By that time, the Qaidu (1271-1301) began to move independently in Central Asia[8]. Prior to entering an independent movement, he lived in front of ArighBöke and were on his side in the battle for the throne. After being overthrown by ArighBökeand Qubilai, Qaidu began to act independently for his rights[9]. After Qubilai'sreign, he distributed all the territories of the Mongols to Hülegü(Iran), Berka (Golden Horde) and Alghu (Chaghadai ulus). Under this new division, the princes of Tolu, Chaghadai and Joji had the right to control the trade and communication lines and the new territories, but the Ögödeigenerations did not have the opportunity to do so, and the heritage of the region was under the supervision of the ruler of Chaghadai ulus Alghu, who was then the enemy of the Qaidu. After the death of the Alghu, f the most prominent representatives of the Mongol Empire, Hülegü (1265) and Berka (1267) also died. After this all the Mongol nations have declared themselves independent and left Qubilai's control. It is also evident that Qubilai's transferring the empire capital from QaraQorum to China. The emergence of such a gap has led Qaidu to the free movement in Central Asia. According to Rashid al-Din, 1269 (667 AD) was convened congress inTalas in the spring. At the congress all the princes agreed on peace[10]. Baraq required that he should be identified as legitimate heir of Chaghadai and provide property to feed his army. Two-thirds of Transoxania is given to him, and the rest is controlled by Qaidu and MöngkeTemur (Khan of Golden Horde)[11]. At the

congress, a political organization headed by Qaidu has been established. Chaghadai ulus was guided under the Qaidu. After the convention in 1269, the Khan from Chaghadai ulus Baraq, did not change his policies. He condemned many civilians, and after his death (1271), the princes of Chaghadai's were opposed primarily to his followers. The ruler of the Yuan Empire, Qubilai opposed to this situation. As a result, the political relations between Qaidu-Du'a and Yuan empires relations become bad. The first reason for the breach of relations was the fact that Qaidu supported the ArighBöke, and another accuses Qaidu Qubilai of claiming possession of lands other than the property allocated to his household without respecting the Mongolian traditions. In 1265, Qubilai invited him to his tent to give his land a part of Nanjang, which belongs to him. However, Qaidu strongly rejects the move to Qubilai's tent and continues his efforts in Central Asia. In addition, the raid and the formation of a powerful army reinforced contradictions between them. The sources say that no Mongolian prince, after GhinggisKhan, was a strong and disciplined army. In 1268, Qubilai sent troops to strike the Qaidu and drive him to the west[12]. In 1271 he was sitting on the throne of *Ögödei* ulus without the permission of Qaidu [13]. After this incident, Qubilai repeatedly carried out military operations against the Qaidu, but when they ended up, he sent an Uighur man called Shibani (Xibani) in 1271. Shibani asked Qaidu to return to the emperor's palace, stop the fight against Kublai and return to the emperor's palace[14]. However, there was no clear indication as to whether the order handled the ambassador, responded to his proposal, and returned to the army, as Qubilai said. The next move he has made is that he strongly rejected the offer to return to the palace. There was another reason why the Qaidu moved so confidently. There was a conflict between the Qubilai family and the military commanders.

Some of the rebellious princes and commanders sent an envoy to Qaidu to ask them to join the army. However, Qaidu rejected their offer[15]. Then Qubilai temporarily suspended military action against Qaidu and carried out an economic blockade against him. Uyghur and Tarim Basin Valley were the main sources of income for Qaidu, and Qubilai increased the violence and consumed the city's material wealth. From 1278, Qubilai built a strongly controlled, military base in BeshBaliq and Hothan, and BeshBaliq was rebuilt in 1283 and 1286[16]. In 1286, the Post Stations linking Hothan, Lop (Lop) and Cherchen (Cherchen) were built and led to the restoration of the southern highway from Central Asia to China[17]. At the same time, Qubilai has consistently carried out the development of the Gansu lane linking China and Central Asia. In his opinion, this road would serve as a military action, and it would have to remove the barriers to food stewarding here[18]. It is clear from this information that the relationship between the Chaghadai ulus and the Yuan Empire was not only in the military and political processes, but also in efforts to preserve peace and improve economic conditions. In order to keep peace, Qaidu decided to negotiate with Du'a, the son of Baraq[19]. This approach has played an important role in the movement of Qaidu to Yuan empires in next years. Du'a has ruled fully under the control of the Qaidu. During the reign of Qaidu and Du'a (1282-1307), Qaidu continued the war against other Mongolian states. Especially for a few years they have been fighting against Qubilai. Because Qaidu acquired new territories in the West, he began to capture himself as he joined the Great Mongolian Empire. It can be described as a "catch-up" of the return of the rule in Central Asia, and has tried to strengthen its position in the supreme power with the help of military aid and economic control. Qaidu was unable to complete the ruling reign of Yuan dynasty's cities Kashgar, Xotan, BeshBaliq, and proclaim these territories as well as to earn a living from these cities, even though it had the ability to control the Yuan forces here[20].

The aim of Qubilai from making constant warfare with Qaidu was to force him to give the control of Chaghadai ulus. Because Qaidu was the heir to *Ögödei*, who had the right to claim the throne of Qa'an, which would have to strengthen the fight against Qa'an[21]. The development of Qaidu rule in the center of the Mongol Empire was also a threat to Qubilai. After his death, his successors also fought for a long time to prevent and completely eliminate this danger. The only surviving Qaidu's death was the end of this unbroken war of Chaghadai ulus with neighboring nations. There is different information in various sources about who was appointed as the heir of the throne. Qāshānistates that before his death, his younger son, Urus (Orus, Woluosi), has been designated as his successor, and has been appointed as commander of the army in the fight against the Yuan empire[22]. According to Wassaf, it can be seen that Urus was not appointed as a throne[23]. Despite the fact that Du'a played a crucial role in raising Qaidu's successor, he did not choose Urus as heir. He advocates the ascendance of Chapar to the throne. However, after some time after Qaidu's death, the struggle for his throne began. Du'a admits Chapar's support and admits his power, but has set himself the goal of ending the rule of *Ögödei*'s generation in the ulus of Chigatay. With this intention he began to think about the recognition of the vassalism of Emperor TemurOljaitu (1294-1307) in Beijing. He sent a delegation to Beijing in August 1303. This movement of Du'a has over the last 40 years ended the ongoing wars between the central authorities and the Mongol rulers in Central Asia[24]. By the initiative of Du'a, the power to restore the unity of the Mongol Empire began to emerge, but it would only be possible to consolidate the state in the form of a federation.

Countries with separate states should live together in a friendly manner, and the Qa'an would only exist in its title. Trade relations are freely implanted across the empire[25]. After the plan was invoked by all the khans and completely dispatched in August 13, 1304, was sent by the ambassador under the name of Chapar and Du'a who were in Iran at that time. And here, as in the Palace of the Juji, the implementation of the Du'a ideas was barely met. In August 1304 a treaty was signed between the princes as the head of the Yuan Empire, TemurOljaytu as their governor. However, this arrangement failed because of what happened between the princes of *Ögödei*, and the Chaghadai family in Central Asia[26]. In conclusion, the relations between the countries that have been occupied by GhinggisKhan in the vast territory occupied were relatively good when all the Mongols was under the control of Qa'an. However, in the 60s of the XIII century, the desire for independence in the Mongolian states became more and more negative. The invasion of each other's territory, the desire to capture property increased. This process can also be seen in long-running wars between Qaidu and Qubilai. As a result, relations between *Ögödei*, and the Chaghadai family and the Yuan Empire continue to be hostile.

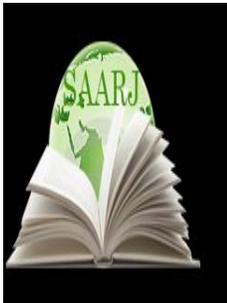

No significant work is being done to restore the unity of the Mongol Empire in the pursuit of peace, and trade. The idea of restoring the unity of the Empire by Du'a under the leadership of Yuan Qa'ans did not come true.

ABSTRACT

This article examines the essence of music education in the comprehensive improvement of the child's personality. One of the hallmarks of the human psyche is feeling, emotion, and excitement. Man is in constant communication with the material being that surrounds him in the course of his life activities. As a result, many other tendencies and emotions, such as joy and sorrow, excitement and excitement, pride and arrogance, anger and rage, amazement, and sadness, represent a person's emotional state. Form) is divided into positive and negative types. Positive: joy, excitement and excitement, pride and admiration, amazement and so on.

KEYWORDS: *Music Education, Person, Attain Perfection, Music Art, Sing, Listen, Hear, Rhythmic Movement.*

INTRODUCTION

It is known that the head of state puts forward 5 important initiatives to organize work in the social, spiritual and educational spheres on the basis of the new system. In addition, the Resolution No. PP-4038 "On approval of the concept of further development of national culture

in the Republic of Uzbekistan" signed by the President of the Republic of Uzbekistan Shavkat Mirziyoyev is also important. Today, in order to increase the spirituality, consciousness and activity of students, the process of teaching music lessons should be organized in such a way that students consciously and actively acquire scientific and theoretical knowledge and methods of their application in practice. be able to play choral instruments and, most importantly, to contribute to the development of a spiritual society. Along with other arts, music plays an important role in the development of our national spirituality. National music is one of the most ancient and, at the same time, widespread in the art of music, deeply ingrained in the life of the people. The music also reflects the real reality. The influence of music on our national spirituality is so great that science has already proved that it can cure patients. Abu Ali Ibn Sina attached great importance to the power of music and argued that some mental illnesses could be cured by means of musical melodies. The great thinker Abu Nasr Farabi in his book "Great Music" expressed his valuable views on the types of tones of music theory, the reasons for their origin, the spiritual and psychological impact on human.

THE MAIN FINDINGS AND RESULTS

In the science of music, Farabi was not only a theorist but also a practitioner. He is also a well-known musician, a great musician and composer, and an inventor of new musical instruments. Reflecting on the amazing magical power and miraculous effects of music, Farabi writes in *On the Origin of the Sciences*: In particular, in the national culture, music reveals a world of high emotions, pleasure - exciting ideas. It brings people to a level of spiritual richness, pure perfection. The child can still feel the music without knowing how to hold a pen and read and write. Often these first impressions influence the formation of attitudes towards music. Therefore, music education has also been included in the main directions of the reform of general education schools. Music, first and foremost, softens children's emotions. Like the sense of musical works, it evokes many human qualities in them. Of course, literature, history, sports and other fields play an important role in the development of human qualities. Therefore, poetry and music always live side by side. The sense of music is born under the influence of nature, and is formed in kindergarten and school. Music lessons educate students not only in terms of sophistication, but also in a broad sense, spiritually and morally. It would be good if our songs, which have been passed down from generation to generation, and which have withstood the ravages of time and embodied the dreams, aspirations, thoughts and aspirations of the people, should be included in the curricula of all types of educational institutions. The world-famous writer Chingiz Aitmatov writes in his novel "Kunda": "... life, death, love, passion and inspiration are all sung by music, because we achieve the highest freedom through music, for this freedom from the time when our minds were enlightened. We've struggled all our history, but we've only achieved it through music." The masterpieces of music created by our people are to a certain extent reflected in every activity, every second - in education, work, social relations. National music teaches to perceive and appreciate the beauty of the surrounding events, armed with delicate taste and free thought, expands the spiritual world. That is why music is called "philosophy without language". After all, the acquisition of musical knowledge is closely linked with the spiritual world of the individual. Therefore, the theses given by B.M. Teplov can be considered as a guide in this process. It focuses on:

1. Musical experiences are experiences derived from nature ... Understanding music is always a concept of emotion, if we do not consider the internal structure of a musical work.

2. Musical experiences don't just have to be emotional. It starts with emotion, but doesn't end. Through emotions we understand life. Music is about understanding the world through emotions.

3. It is difficult to deeply understand the original content of music. It can be learned through other means of knowing. The world of musical imagery is "incomprehensible to the end." B.M. Teplov's view is in line with that of the great Greek philosopher Aristotle, who was the first to study the formation of the aesthetic consciousness of human: the existing feeling is formed". Aristotle includes the following in the human psyche:

- Ability to grow,
- Aspiration,
- Ability to feel,
- Mobility,
- Ability to think.

Addressing the concept of the formation of "musical culture of the individual", A.N. Sokhor recommended the following:

Musical culture of the person (A.N.Sokhor concept)

Musical values

All types of activities

Subjects of activity

Special institutions (created and maintained in the community) (aimed at creating, preserving and promoting values) (those engaged in these types of activities) (providing these activities) consist of elements.

Based on the concepts proposed by musicologists, we have shown with the help of a diagram what personal characteristics of the child's personality are formed in the type of activity in the process of acquiring musical knowledge. We can see the importance of music education in the formation of a child's personality in the process of acquiring musical knowledge through the analysis of music lessons. So, during music lessons:

1. In the activity of singing, a musical worldview, musical taste is formed. In this type of activity, children sing based on their musical knowledge. To do this, they assimilate information relevant to the piece of music. In the process, they develop a musical outlook and musical taste. In music literacy activities, musical thinking, imagination and musical worldview are formed. In this type of activity, children learn about the history of music, the means of expression of music - rhythm, meter, register, measurement, mode, tempo, note path and writing, length and pitch of sounds, music creators, performers, as well as their musical thinking. This in turn takes children into the world of music and shapes their musical worldviews.

2. Musical perception, musical worldview is formed in the activity of listening to music. In this activity, children listen to music and begin to perceive it directly. This shapes their musical thinking.

As children engage in activities such as playing musical instruments, singing, performing rhythmic movements under music, and listening to music, they develop musical thinking, musical outlook, musical imagination, musical abilities, musical emotion, and musical perception, as well as musical culture. and the worldview also takes shape. They begin to think about the piece of music they are listening to.

3. In the activity of performing rhythmic movements under music, a musical worldview, musical taste, musical thinking, musical perception, a sense of musical rhythm and musical memory are formed. In this type of activity, almost all musical psychological features are formed in students. Because in this activity they are directly accompanied by a piece of music. First, they listen to a piece of music (musical perception), which requires them to remember the rhythmic appearance of the music (musical memory) and to choose which instrument sounds better (musical taste). The student thinks independently in this activity (musical thinking), as a result of which his musical worldview is formed.

4. Musical worldview, musical taste, musical thinking, musical perception, musical sense of rhythm and musical memory are formed in children in the process of accompaniment on musical instruments. In this type of activity, almost all musical psychological features are formed in children. In this activity the child thinks independently (musical thinking), as a result of which his musical worldview is formed. At the same time, it should be noted that music, regardless of the type of activity, helps to form all the psychological aspects of the person. It should be noted that each of the musical activities has its own influence, albeit partial, on the formation of all the listed psychological features. In particular, it shapes musical emotions, musical worldview, musical perception, musical thinking, musical imagination, and musical ability. So, they also have an impact on the formation of children's general musical culture, aesthetic worldview. This is one of the most important aspects in the development and upbringing of a harmoniously developed person. The pedagogical nature of music has a great impact not only on the individual or the individual, but on society as a whole. Because music has a special significance as it has a spiritual effect on people's hearts. Therefore, academician Said Shermammedov connects this process with artistic and aesthetic activity. That is, "The experience of the development of literature and art, the whole artistic culture, - says the scientist, - shows that the ideal of the creator is embodied in the content of the work on a universal scale, brightly individualized - in vivid unique images, humane spiritual, artistic-aesthetic, moral-spiritual. If it is high in terms of quality, it will be such a huge contribution to the treasury of world culture." So, considering the impact of music on the human heart, we see that the above ideas are directly related to the art of music itself. The educational nature of music is manifested in a number of aspects in the relationship between science - man - society - nature. Therefore, the attention paid by our state to music, literature and art shows that its influence is enormous.

First, music shapes and strengthens a healthy lifestyle. Nowadays, the penetration of music therapy into medical science is a new direction in science, which is giving its effective results in the treatment of human diseases with music, through music. **Second**, it eliminates some of the flaws in people's behavior and the mentality of nations.

Third, the tone of the music plays an important role in the educational process. For example, it has been medically proven that noisy music has a negative effect on the human nervous system.

Fourth, it is possible to both listen and listen to music. In addition, one of the subjects that enhance the educational impact of music is musical instruments. The influence of musical instruments on the process of musical education is so important that no musical instrument has a positive effect on human upbringing. It depends on a number of factors. The first is the harmony of form and content in the aesthetic appearance of a musical instrument. The second is the educational feature of the instrument, which is necessary for the creation of a musical heritage. For example, the flute, which is considered to be the simplest and oldest of the musical instruments, is tuned to the artist's breath and the sound coming from his body, and sounds like a man of the heart. Through the flute, the musician expresses the cries of his heart, his sorrows, and his love. That is why the great thinker Jalaliddin Rumi wrote "Ma'naviy-masnaviy"

Listen and tell stories, Complains of separation.

It is no coincidence that he began with a simple definition of nay. It is worth noting some analogies in this regard. For example, the time of the reed before the reed is cut dries up after it has been cut, if the time of the real life sang. So it is with the human soul. If romantic sounds come out of the nay, you can hear romantic and soft words from a wise person. Nay's voice is as clear as the words of wisdom. Nay's art is inward, that is, the perfection of knowledge is as inward as it is inward. The tongue of the arif is as true as the body of the nay. This is just one of a number of definitions given to the nay. That is why the flute does not leave anyone indifferent. His voice is so magical that today's technique is incapable of mimicking the tone of a nay. The second is one of our unique musical instruments, the tanbur.

Tanbur is actually "tan" and "bur" and is one of the ancient words. Mawlana Husayn (as) says that the tanbura appeared when the soul was equal to the body. He did not enter the mold, he was ordered to enter under the sound. His soul had a beautiful sound to purfutih, he was unconscious and threw himself into the mold of confession. It was the sound and moan of a tanbur. That is why the attitude of the soul to beautiful sounds is different, albeit different.

One of the hallmarks of the human psyche is feeling, emotion, and excitement. Man is in constant communication with the material being that surrounds him in the course of his life activities. As a result, many other tendencies and emotions, such as joy and sorrow, excitement and excitement, pride and arrogance, anger and rage, amazement, and sadness, represent a person's emotional state. form) is divided into positive and negative types. Positive: joy, excitement and excitement, pride and admiration, amazement and so on. Negatives: grief and sorrow, anger and rage, resentment. The activity of the performing musician is closely connected with emotion and emotion, he must be able to convey to the listener the system of artistic and emotional images in it, the idea and purpose of the work created by the artist. At the same time, the musician performs in accordance with the mood of the work, giving the instrument a unique intensity, expression and charm to the sound of the instrument. If a piece of music is affected without any emotion, the listener will not be able to reach his heart, will leave him indifferent, and he will be dissatisfied with the performer as well. Therefore, the musician must be able to penetrate deeply into the content of artistic and emotional symbols of each work, to reliably illuminate in it the types of sorrow, rape, joy, celebration, humor and other moods.

In musical psychology, the artistic image is expressed and expressed on the basis of three factors. The first of these is material, i.e. the text of the moan, the sound of the instrument, the melody, the harmony, the method, the dynamics, the timbre, the register, and so on. The second is

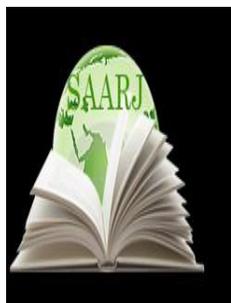

spiritual, i.e. mood, imagination, expression, will, emotion. The third is logical, i.e. factors such as form, genre, content. In the performance practice of the musician, the intellectual and aesthetic, that is, the most delicate and beautiful high-level emotion is formed. These feelings serve to reveal the artistic image in a musical work, using a variety of means and ways to consciously set a clear goal for the musician's performance.

CONCLUSIONS

An in-depth study of the physical and mental foundations of the performance process is one of the most important conditions for a future teacher, educator, and musician. The divinity of music, its dependence on the soul, the mysterious world of melodies have always fascinated mankind. While the singer's song is an ointment for pain and increases joy, the musician's melody removes sorrow and gives a good mood. Therefore, both subjects are equally involved in the true magic of music. Therefore, the importance of the art of music in the development of a person is incomparable. Music expresses the feelings and dreams of people in a unique artistic language. In short, it is necessary to rely on the art of music, to make the younger generation more enjoyable of its centuries-old traditions and examples. Parents in the family, music teachers in the school often teach children that good music and singing purify a person's heart, purify his soul, lift his spirits, direct him to noble goals. One of the most important priorities of today is to train young people as mature professionals who know the art of music, which is a rich spiritual heritage. First of all, young people need to be familiar with the art of music in order to have national pride and high culture. In carrying out these tasks, music teachers have a great responsibility.

THE LEXICAL MEANING OF THE TERM “TRANSLATION”

Gulnoza Karimbekizi Nazrullaeva*

*Teacher,
 Tashkent State University of Oriental Studies,
 UZBEKSITAN
 Email id: gulnoza90@list.ru

ABSTRACT

The main purpose of this article is to study the lexical meaning of the term translation. Each style of translation has its own complexities. Translation is the most important form of interethnic communication. In this paper, the lexical meaning of the term “translation” is discussed in 5 different languages. They are Uzbek, Russian, Turkish, English and Hindi. In these languages, the word “translation” is used to mean the translation, translation, interpretation, interpretation from one language to another. This one word deepens the relations between the peoples. And with that word you can explain any idea better or worse. Therefore, a translator should study the language being translated before translating.

KEYWORDS: *Tarjima, Translation, Tarzabon, Transfer, Tercüme, Proof.*

INTRODUCTION

Before translating a scientific work, the translator must be familiar with the style of the work being translated. Each style of translation has its own complexities. One of these is the scientific method. Scientific method is the language of science and technology. The basis of scientific language is terms, definitions, rules, laws. Scientific terms are widely used in scientific style. All scientific works are written in this style.

The difficulty in translating scientific and technical texts is that the scientific words in the translation are delivered to the reader by choosing the right word. Also, the language in which the work is translated increases the complexity of the translation.

The term translation, found in scientific works and textbooks, is a type of literary creation that consists of recreating a text from one language to another. Translation is the most important form of interethnic communication. Translation originated in ancient times because of the need for

communication between people of different tribes. Today, every developed nation translates materials from dozens of nations around the world into their native language, covering dozens of areas of science and culture. However, its creative nature, the art of reproduction, does not change.

Let's look at the lexical meaning of the term "translation" in 5 different languages. They are Uzbek, Russian, Turkish, English and Hindi.

The word "*tarjima*" (translation) in Uzbek is translated from one language to another; interpretation, interpretation. It is the re-expression of an idea expressed orally or in writing by other means of language.

"*Tarjima*" is derived from the word "*tarjimon*", and "*tarjimon*" is derived from the Persian word "*tarzabon*". The word "translation" is the re-expression of an idea expressed orally or in writing in a particular language by other linguistic means. The word "*tarjima - translation*" in Russian translates as "*perevod*". The word "*perevod*" comes from the verb "*perevodit, perevesti*". The verb "*perevesti*" means "to move, to relocate". The verb itself has many forms of meaning. "*Prevesti v tretiyklass*" - transfer to the third grade; "*Pereslat*" - to send, to transfer (about money); "Move forward" - to push; "*Perevesti arrow chasov*" is also used in the sense of pushing the clock hand [2].

"*Perevod*" - the word "*pered*", which means "in front of, in front of, in front of", the modern verb "13" is a combination of words meaning "to lead, to drive", so the word "*Perevod*" literally means to move, to move a word.

In Turkish, the word "translation" has two names: 1 - "tercüme" in Arabic and 2 - "çeviri" in pure Turkish.

The meaning and form of the well-known term "tercüme" looks like the Uzbek language. The term "Çeviri" is based on the verb "çevirmek". The word "Çevirmek" means "to turn, surround, encircle, translate, and turn". "Çeviri" means to translate the Uzbek text "o'girma", means "*tarjima*" from one language to another.

One of the languages that have been enriching the development of world science with scientific terminology is Hindi. The word "translation" in Hindi has a deep meaning. The Sanskrit word "आनुवाद" means "to say" or "to tell". The word "वद" is related to the root word, and the root word "वद" is associated with the suffix "घञ" and is derived from the abstract noun "वद". "वाद" means "to say" or "to tell". The word "आनुवाद" is derived from the word "वाद" with the addition of the prefix "आनु", which means "then, later, continuing". Thus, the word "आनुवाद" literally means "to say after something has been said", that is, to "re-express what has been said".

Today, the word "translation" in English is used as a synonym in the practice of Hindi translation. The word "translation" is a Latin word meaning "translate, to translate". The word "translation" comes from a combination of the words "trans" and "lation". "Trans" means the other side (other side), "lation" means "transmitter". Thus, "translation" means "to move from one side to another".

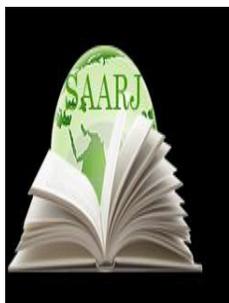

The Sanskrit word “आनुवाद”, or “translation”, began to be used in Hindi as “भाषानुवाद”. The word “भाषानुवाद” means “the expression of an idea in a particular language”. Previously, the word was also translated as “भाषाबनाना” - to create, create, and compose or “भाषामेंकरना” [3].

CONCLUSION

In short, the meaning, form, and origin of the word "translation" in these 5 different languages are very close. In the languages we have considered, the word "translation" means to translate, translate, interpret, and interpret from one language to another. This one word deepens the relations between the peoples. And with that word you can explain any idea better or worse. Therefore, a translator should study the language being translated before translating. Because the requirements for modern translation are constantly updated.

ABSTRACT

The paper examines the influence of biotic factors on the seasonal dynamics of the number of wheat plant nematodes. As a result of research on the examined wheat field during the growing season of plants, 106 species of phytonematodes were registered. The greatest diversity of species was noted at the beginning of the growing season, and then a decrease in their number was observed and reaches a minimum in the summer season. The response of ecological groups of plant nematodes to changes in living conditions was also studied.

KEYWORDS: *Phytonematodes, Dynamics, Wheat, Roots, Root Soil, Abiotic Factors, Ecological Groups.*

INTRODUCTION

Among pests and diseases of plants, one of the main places is occupied by phytonematodes, which cause enormous economic damage to agriculture, which is expressed in a significant decrease in yield. When studying the fauna of phytonematodes of a particular culture, the issues of population density and dynamics of the number of their individuals are of great importance.

The cultivation of wheat in large territories of the Republic and the lack of knowledge of the faunistic complex of phytonematodes, as well as the influence of biotic factors on their species composition and abundance, served as the basis for conducting phytohelminthological studies on this crop. In addition, without these data, it is impossible to develop measures to combat parasitic plant nematodes.

Materials and research methods. In order to identify the regularities of the formation of the fauna of wheat phytonematodes and to determine the factors affecting their numbers, the seasonal dynamics of the abundance of phytonematodes of wheat and its root soil collected in the farm of the Termez district of the Surkhandarya region of Uzbekistan was studied. At the same time, the main attention was paid to the study of changes in the species and the number of individuals of nematodes of various ecological groups, especially phytohelminths.

The selection of soil and plant samples was carried out by a stationary method during 2012-2016. The entire growing season of wheat. This method was used to study the dynamics of the number of nematodes during the growing season and their distribution over plant organs, as well as the rhizosphere of wheat, described in the work of A.A. Paramonova, I.A. Baranovskaya and P.S. Krylova [Paramonov et al., 1968].

To isolate nematodes from soil and plant organs, we used a modified Berman funnel method [Khurramov, 2018]. The volume of the soil sample for analysis was 20 cm³. The exposure at room temperature + 25°C was 20-28 hours, at a temperature of + 300 + 350°C for 10-12 hours. Soil samples for the presence of cyst nematodes were usually analyzed by the method of H. Decker [Decker, 1974].

When determining the species belonging of plant nematodes, the works of domestic and foreign authors were used, as well as the atlas of plant nematodes. To determine the species, we used morphometric parameters obtained according to the generally accepted de Mann formula modified according to Micoletzky [Micoletzky, 1922].

Research results. 106 species of phytonematodes were registered in the surveyed wheat field during the growing season. The greatest diversity of phytonematode species both in the roots and in the root soil of wheat was noted at the beginning of the growing season. During the growing season of plants, the number of species decreases gradually and reaches a minimum in the summer season. A decrease in the qualitative composition of plant nematodes is in direct correlation with changes in soil moisture and inverse correlation with ambient temperature (fig. 1).

In the root soil and root system of wheat, the highest density of plant nematodes is observed at the beginning of the study (March), then their density begins to decline sharply and reaches a minimum at the end of the growing season (June). The smallest number is observed in the summer, before harvesting. At the same time, the decrease in the number of phytonematodes in the roots, partly in the soil (starting from mid-April), is directly dependent on soil moisture; and between the number of plant nematodes and air temperature, an inverse relationship is observed (fig. 2).

Fig. 1 Changes In The Diversity Of The Species Composition Of Plant Nematodes In The Root Soil And Roots During The Growing Season Of Plants

Figure: 2. Dynamics Of The Number Of Nematodes In The Roots And Basal Soil During The Growing Season Of Wheat

In the aerial parts, the number of plant nematode species remains more or less constant during the first three periods of the study. A more noticeable decrease in their diversity is observed only at the end of the study (fig. 3).

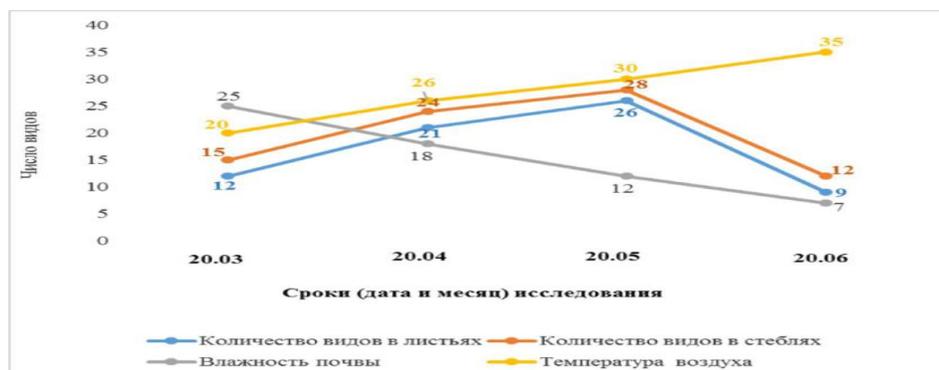

Fig. 3. Changes In The Diversity Of Species Composition Of Nematodes In Aerial Parts During The Growing Season Of Wheat

In wheat stalks, the largest peak in abundance occurs in mid-spring (April), then a decline in abundance is observed in the next study periods.

Ecological groups of plant nematodes react differently to changes in living conditions. In this case, the effect of environmental factors depended on the habitat of phytonematodes. Pararisobionts - usually with a moisture-permeable cuticle, they are especially sensitive to moisture. They are more common in the spring (March) of the study, when the temperature and especially the soil moisture were most optimal for their habitation. As the temperature rises and the soil moisture decreases, their numbers begin to gradually decrease and reach a minimum in the hot and dry summer period by the end of the wheat growing season.

In the wheat root system, pararisobionts are very rare and occur in single quantities in the spring (March, May) months. Eusaprobionts are few in number during the growing season. At the beginning of the study (March), at optimum moisture and soil temperature, they are relatively often found in the root system of plants. During subsequent periods of research, they are few in number in the roots and are found mainly in the root soil. Eusaprobionts are very rare in root soil and in plant tissues. Davisaprobionts are the most diverse and numerous group that determines the general picture of fluctuations of phytonematodes both in the root soil and in plant organs.

In the dynamics of the number of phytonematodes of dysaprobionts in the root system, the highest peak occurs at the beginning of the study, when the soft tissues of the roots favor mass reproduction of this group of nematodes. As the tissues of the root system become lignified, the number of dysaprobionts gradually decreases and reaches a minimum at the end of the growing season.

A somewhat different picture of the processes is observed in the fluctuations of the number of dysaprobionts in plant stems. Their number in stems in the initial periods of the study remains low, even close to the minimum. Subsequently, a significant increase in the number is observed (April) and again begins to decline and reaches a minimum by the end of the growing season of plants. In the leaves, the number of dysaprobionts remains low throughout the growing season of plants.

Their largest number falls on the month of April. During the subsequent periods of the study, the number of this group gradually decreases and becomes minimal by the end of the growing season. Root soil differs from plant organs in diversity of species composition during the entire study period. Davisaprobionts prevailed numerically throughout the study period. Their largest number was recorded in April; by the end of the growing season, their numbers decreased to a minimum.

Dysaprobionts as a percentage in the rhizosphere of plants make up from 51 to 65% of all individuals found. These indicators for the root system of wheat are 68 - 84%, for stems - 78 to 96% and for leaves - 93 - 98%. The high abundance of dysaprobionts in plant tissues indicates the presence of saprobic decay. This decay can be associated with the defeat of plants by mycotic diseases.

Species from the group of nonspecific parasites that feed on fungi and plant tissues are found in almost equal numbers both in the root system and in the rhizosphere of plants. In the root soil, the highest peak of their abundance is observed in April; then, by the end of the growing season,

a decline occurs. In the aboveground parts of plants, representatives of nonspecific parasites are found periodically and in small quantities.

Representatives of true phytoparasites in the root soil are represented mainly by ectoparasites and migrating endoparasites. This group is not numerous during the entire study period. Relatively common during the first two periods of the study. By the end of spring (May) and during the summer period of the study, their number becomes minimal. Phytoparasites are relatively often found in the roots in mid-spring (April), then their number sharply decreases and reaches a minimum level by the end of the growing season. In the stems and leaves, parasites are extremely rare. The number of their individuals never exceeded 5 individuals. in the sample.

Discussion. Different types of plant nematodes are equally associated with plants. According to the degree of trophic connection with wheat plants, the detected species can be divided into phytohelminths - real parasites, potential parasites, eusaprobites, daisaprobites, mycophages, polytrophs and predators. In the root soil of wheat, the most numerous group is the devisaprobionts feeding on plant debris. In plant tissues, along with devisaprobionts, mycophages, inhabitants on the mycelium of fungi, prevail. Mass reproduction of mycophages can be explained by the infection of wheat by fungi.

The species composition of plant nematodes and their number on wheat and in its root soil do not remain constant, but change during the entire growing season of plants. A decrease in the diversity of the species composition and number of nematodes in the root soil is directly dependent on moisture content and inversely dependent on soil temperature. The greatest diversity of species and the density of their individuals is observed in the initial periods of the growing season of plants with an optimal moisture regime, and an increase in soil temperature leads to a sharp decrease in the number of species and the number of individuals of phytonematodes.

Phytonematodes inside plant tissue are less susceptible to external environmental factors. For this reason, changes in temperature and soil moisture act on nematodes through other factors. So, for example, at high humidity and moderate temperatures, foci of mycotic and bacterial diseases can appear on plants, which leads to intensive reproduction of the inhabitants of saprobic foci - typical and semisaprobionts, as well as mycochilophages.

Different ecological groups react differently to changes in ecological factors during the growing season of plants. Free-living soil polytrophs are most abundantly represented in the initial growing seasons at optimum soil moisture. A decrease in soil moisture, starting in April, leads to a sharp decrease in moisture-loving soil phytonematodes, up to the disappearance of most of their species. Specific tissue parasites of plants are hardly affected by external conditions. Their few qualitative and quantitative composition remains relatively constant during the entire growing season of plants.

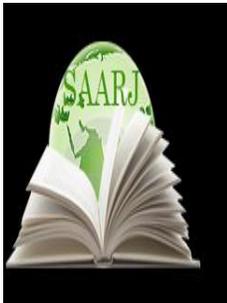

The most numerous group in the phytonematode fauna is semi-saprobiotic forms. Their numbers are constantly changing depending on changes in humidity and temperature. The number of semi-saprobiotic forms at the beginning increases, and then, with a moisture deficit, sharply decreases.

CONCLUSION

Based on the results of the study, it can be said that the fluctuation of plant nematodes of certain ecological groups, especially the inhabitants of green plants, is most likely associated with the state of plant tissues. For this reason, the hardening of the tissue of the root system and aboveground organs of wheat leads to a decrease in the number of phytoparasitic nematodes by the end of the growing season.

ABSTRACT

This article gives various information about the role of teachers in online education that includes the possibilities and qualities of distant education . Distance Education is a form of education in which course content is delivered and interaction provided by the technologies and methodologies of the Internet. The online environment allows people to interact with others asynchronously or synchronously in collaborative environments **Background:** *This article informs the role of teachers in distant learning system the includes the qualities and demands of teaching period. And also the basic characteristics of teachers are followed in this work* **The Materials And Methods:** *One of the important methodological and theoretical bases of this article is creating the possibilities of the distant learning system for imposing modern information technologies in the education process and preparing the invitations for creating standards of the distant learning system and how teacher play an important role in online education.* **Results:** *To identify the main qualities of the teacher and important benefits of learning period. Showing the role of the teacher in distant learning system. The main aim of using this system is to adapt the standards of the world. That's why many universities use this system. In other hand, distant learning system is more comfortable. And it has so many profits and also bad sides. You may know so much extra information in this work.* **Conclusion:** *In this article informed very good and useful information. Teachers have important place in the society. They should use various technologies during the teaching period. And they have got effect to*

pupil. Technologies help learners to learn languages fast and easier. The teacher's role is very important. Because of they teach pupils with new technologies. The effects of the technologies depend on the teacher.

INTRODUCTION

As we know the foreign languages play an important role in our life. There are many languages in the world. And to learn all languages are very difficult. And nowadays to learn the English language is important. On December 10, 2012 the first President of the Republic of Uzbekistan Islam Karimov signed a decree “ On education “ and the National program for Training in the country, a comprehensive foreign languages, teaching system, aimed at creting harmoniously developed, highly educated, modern-thinking young generation, further integration of the country to the world community, has been created. According to the decree, starting from 2013-2014 school year foreign languages, mainly English, gradually throughout the country will be taught from the first year of schooling the alphabet, reading and spelling in the second year.[1]One of the most important purpose of the national program of preparing cadre to make the quality of the education system as world education, adding new technologies to the education system, creating modern educational sources, creating wide opportunities for using world education source by young, using world experience during preparing prominent specialists.

One of the most significant problem of the continuous education to organize modern pedagogical and information technologies all the fields of education system. Especially, using regulation for teaching languages help to increase of the pupils' interest for science during the teaching process. The roles of students and teachers under the constructivist approach are listed above. These roles should be in the consciousness of communicators to develop effective distance education processes and resolve interaction difficulties. The data revealed that students in online courses expect guidance in four domains: the technical-operational domain, the task-oriented (i.e. assignment) domain, the personal-emotional domain, and the social domain. Moreover, it was found that within distant learning course where face-to-face meetings are absent, the need for guidance with “personal emotional significance” is amplified. The study revealed that the guidance and personal ties that students sought and expect to receive were met not only in the framework of teacher-student interactions, but also by means of spontaneous peer guidance and support within the course's technical assistance forum. Support for three possible guidance frameworks was examined in a special questionnaire: guidance in a virtual framework; guidance in face-to-face meetings; and guidance that combine the two modes. The combined mode that would allow some face-to-face meeting enjoyed the support of the majority – 56%, indicating that even in distance learning, students apparently still seek “a personal touch.” Teachers and students need to be responsible collaborative planners, communicators and evaluators in their distance education roles. Together they can break down communicational barriers and overcome limitations in the technology and its implementation. Substantial benefits will result from taking personal responsibility, improving the process, and solving problems to create a rich interactive learning environment.

Teachers play an important role in every sphere of the life. And the role of the teachers is also important in distant learning system. They have got high experience and knowledge. Now we speak about the role of the teachers in distant education.

1. According to the knowledge and experience in new information technologies field: [4]

- The experience using personal computer and its additional equipment;
- To get modern program provision;
- To take possession in internet service and program provision;
- To know scientific literature and problems of methodical materials while using new information technologies;
- To understand the opportunities of using computer;
- The ability to prepare exercises with computer programs;
- The ability of searching information from dictionaries and searching system of the computer program, electron applications individually;
- The ability of saving information and analyze, describing figures with computers;

As we know we live in technology century. And it is important that to work with technologies. The teachers should use computer during the lesson. Because using computers are more useful and it attracts learners. That is why teachers must know to work with computer programs. They should prepare very interesting exercises and tasks for attracting learners. In Universities it is impossible without using computer during the lesson. All topics and themes are taught by the help of computer. They use computer during the lesson. Teachers teach pupils with different and interesting presentations. They give information and check pupils' knowledge with computers programs. For that they should know computer very well.

2. The knowledge of teachers in internet technologies: [2]

- To know how add pupils to the internet service;
- To know how organize visual - meetings;
- To have visual - communicational behavior;
- To have ability how share information with other users;
- To know how to work with electron mail;
- To have ability how treat with users;
- To choose necessary information among much information;
- To prepare information for passing;

Today the using of the distant education is developing. In many Universities are using this system. But some teachers don't know work with this system. And they can attract pupils. All teachers have got the place for their subject. And they should communicate with learners. First of all they should add pupils in their course. If they don't add pupil, He can't enter their page.(3)

Nowadays in our University use this system. And teachers add pupils in their course. They set the topics, self-studies, different exercise, images and plays. Pupils may use information if they are accepted in this course. Pupils send their self-study work in model system. And teachers check their self-study work then they also mark in model system. Time is limited. Teachers set time for sending self-study work. If pupil sends self-study work after finishing time, his work is not accepted.

There many information in internet. It is important that to choose necessary information among them. It demands the high knowledge and experience from teachers. Electron mail is also important. When we send self-study or receive information, the message comes to our electron mail and mobile.

Teachers set tests for examining pupils' knowledge. In my point of view it is useful and easy way to check pupils' knowledge in computer. It saves teachers and our time. And we can know our mark that time. So, computer technologies and to work them is important in nowadays. [5]

3. The knowledge and experience of the teacher in pedagogical and psychological sphere: [11]

- to know pupils' learning style in distant teaching;
- to do pupils' how they work independently;
- to do psychological tests for pupils and test them;
- to do personal psychological and pedagogical image of pupils; [8-int.site]
- to do special groups according to pupils psychological attitude;
- to solve or prevent problematic situation;

It is clear to all people that the teacher should be psychologist. Because of there are many learners in group. And it is difficult to communicate with each one at one time. Their characters differ from each other. Their interests are also different. For identifying their character teacher use such kind of psychological tests. It helps to communicate with them easier. (7) By the help of the test teacher may know how they are independent. The teacher should be sociable in the group. He should know his profession very well. According to the pupil's degree teacher may separate them and do special groups. It makes teacher's work easy.

In conclusion for this work, teacher use different technologies in teaching period. And they have got effect to pupil. Technologies help pupils to learn language fast and easier. The teacher's role is also very important. Because of he teaches pupil with new technologies. And the effects of the new technologies depend on the teacher.(9)

CONCLUSION

In conclude for this article, I can say that there are useful and interesting information for everyone. There are given almost whole information about the distant learning system.

In this article gave information about the role of the distant learning system. You can know how should be the distant learning teachers.

As we know teachers play an important role in the society. They should know a lot of things. They should be well-knowledge, psychologist and well behavior. According to the plan I tried to

show how should be the distant learning teachers. First of all, teachers should know computer technologies and to work with them. It is very important during the distant teaching. If teachers don't know the computer and information technologies, they can't teach through the distant learning program.

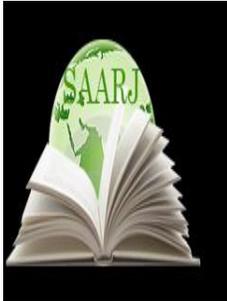

It is known that distant learning program demand the internet connection. So, teachers should know to work with internet. Because of all the actions and teaching process depend on the internet connection. Teachers should control all the tasks with the help of internet.

Teachers have important place in the society. They should use various technologies during the teaching period. And they have got effect to pupil. Technologies help learners to learn languages fast and easier. The teacher's role is very important. Because of they teach pupils with new technologies. The effects of the technologies depend on the teacher.

Distant learning teachers should be responsible for their duty. They provide with education to the learners. To be the teacher of the distant learning system is somehow difficult and interesting. All information is important and necessary for learners and teachers.

MECHANISMS OF DEVELOPMENT OF HUMAN RIGHTS AND FREEDOMS

Iqbol Bahodirovna Yusupova*

*Lecturer,
 Department of "National Ideology,
 Fundamentals of Spirituality and Legal Education",
 Navoiy State Pedagogical Institute,
 UZBEKISTAN

ABSTRACT

In the 21st century, the issue of human rights and freedoms remains one of the most sought-after and needed issues in world civilization. Human rights and freedoms are the natural needs of human beings to live in this world. Human rights are as old as history, and the first views on human rights were reflected in the laws and reforms established by the rulers of the ancient Eastern city-states, the ancient Greco-Roman police.

KEYWORDS: *Human Rights, Freedoms, Citizenship, Civil Society, Ancient Eastern Civilization, Mesopotamia, Ancient Greco-Roman Philosophy*

INTRODUCTION

"Today, the main goal of our life, embodied in our Constitution, is to ensure the interests of the people. In order to ensure the interests of the people, first of all, we need to communicate with the people, their concerns and dreams. It is important to know their intentions, problems and needs"[1].

We know that the issue of human rights and their equality is as ancient as history. In the development of society, the issue of human rights and their equality has always attracted progressive people. It is well known that the pages of history have covered many important events and facts on the issue of human rights, aspirations and actions of the people. The history of human development testifies to the fact that where democracy takes root, the issue of human rights and equality of citizens is especially relevant. "Human rights are the universal and inalienable rights of all human beings and are the same for all, regardless of nationality, citizenship or religion. These rights are based on the Universal Declaration of Human Rights.

Human rights are a privilege granted to human beings and are recognized in most developed countries of the world through laws, norms of constitutional values or international conventions. The development of any society is determined by the level of human rights and interests in that country. Since time immemorial, the state has focused on these potentials and opportunities. "The task of the state is to lead people to happiness. This is achieved through knowledge and good morals"[2]. Human rights are concepts that describe a person's legal status in relation to the state, as well as his or her economic, social, political, and cultural opportunities and claims. The free and effective exercise of human rights is one of the hallmarks of civil society and the rule of law. It is accepted to divide human rights into absolute and relative human rights. The right to life, the right not to be subjected to torture or other cruel, inhuman or degrading treatment or punishment, the right to privacy, the right to privacy and family, the right to protection of one's honor and reputation, the right to freedom of conscience and religion. The right to judicial protection and justice, as well as the most important procedural rights related to them, are among the absolute human rights. All other human rights are relative and may be restricted or suspended in the event of a state of emergency or martial law. Athens and Rome, the first homelands of democracy in human civilization, advanced views and ideas on human rights were formed, based on the views of Aristotle, Plato, and Democritus, who later argued that "man is the measure of all things." The rule had a huge positive impact on European civilization and the development of progressive ideas in the world in general. The first buds, the elements of human rights, can be seen in the activities of the police, which is a specific form of the state of slavery, that is, the city-states. The Constitution of Solon, which ruled in the 6th century BC, enshrined certain elements of democracy, the responsibility and accountability of public authorities, in particular the prosecution of public officials for illegal actions. The Romans, who recognized the separation of powers and the theory of natural law, also played a special role in the formation of world democracy. The city-states of Mesopotamia also contributed to the formation of advanced ideas, the relationship between the citizen and the state: even the term "Freedom" was first used in Sumer in the XXIV century BC - the Sumerian ruler for his citizens established "Freedom" by punishing dishonest officials.

RESULTS AND DISCUSSION

Although freedom was very limited in the Middle Ages, efforts to limit the right of the monarch to rule in Europe and to link it with a representative monarchy did not go unnoticed. It is important to take into account the natural rights of man in ensuring civil rights. According to ancient philosophers, human beings are the same from birth, depending on the nature of natural law. The law and the state came into being on the basis of social contracts. According to Aristotle, man's natural right to private property, which arose at birth, is based on man's nature and his first self-love. In addition, the pursuit of this natural right, the attraction of private property, the interests of its preservation and reproduction, lead to the rapid socialization and activation of man in society. In a narrow sense, the concept of human rights includes only the rights that are protected and guaranteed by the state, and it is not an easy task to limit them at the present time with constitutional and legal bases or state borders. These rights include equality of all citizens before the law, the right to life and physical integrity, respect for human dignity, arbitrary and unlawful detention or imprisonment, freedom of conscience and religion, the right of parents to raise their children, and the right to resist oppressors and so on. Human rights in the broadest sense represent a wide range and types of individual freedoms and rights. The

classification of all human rights into negative and positive is widespread. Such a division of these rights is based on the expression of the negative and positive aspects of freedom. It is well known that from the point of view of the negative significance of freedom, there is no coercion or restriction on the individual. On the positive side, freedom of choice is understood as the ability of a person to achieve his goals, his individual development and, in general, the emergence of his abilities. Due to this division of freedoms, negative rights mean that the state and other people refrain from any action against the individual. These rights protect the individual from adverse influences, interference or restrictions that may violate his or her freedom. These rights are fundamental, essential and absolute. Ensuring these rights does not depend on state resources or the level of socio-economic development of the country. Negative rights are the basis of individual freedom. Unlike negative rights, positive rights represent the obligations of the state, individuals and organizations to provide the citizen with certain benefits, to carry out certain actions. These include, for example, the right to social assistance, education, health care, and a decent standard of living. Human civil (personal), political, economic, social and cultural rights are divided into negative and positive rights, depending on the direction of their implementation. Among them, civil rights are among the natural, fundamental and inalienable negative human rights.

Freedom is the ability to act as one pleases. The concept of freedom is widely used in areas of social knowledge such as law, political science, ethics, aesthetics. For example, freedom of conscience, freedom of speech, freedom of the press, and so on. Freedom represents a certain order in society, not chaos. It is also the free, voluntary choice of a person to perform his or her duties to society. Freedom means that a person is protected from political, moral persecution and violence. Freedom is a means of self-creation of happiness, a measure of one's level of self-awareness. Human freedom depends on objective conditions and circumstances. It is not abstract, it is always concrete. A person achieves a specific goal based on a specific opportunity in a particular situation and situation. However, not all people have the same conditions, situations and opportunities. In order to achieve the goal, some people lack the conditions, some people do not have the means to achieve the goal, and some do not have the opportunity. Under certain circumstances and circumstances, one may have the freedom to achieve a goal or one may be deprived of it. Factors that increase a person's freedom include the knowledge and experience he or she possesses. Islamic teachings say that man is endowed with intelligence in order to be free. Commenting on the freedom of will in Islam, Abu Mansur al-Moturidi said that the wisdom given to man gave him the freedom to choose between good and evil, lawful and unlawful, good and evil, right and wrong, and that our future depends on which of these ways we choose. Man is different from the animal in his free conscious activity. Animals are subject to conditions and circumstances. Man, on the other hand, consciously seeks a way to achieve a goal. Increasing the political activity of citizens is a factor in building a democratic society.

Today, the concepts of "citizen", "citizenship", "civil society", "civic responsibility", "civil rights and freedoms" are becoming one of the necessary conditions for democratic development. Consequently, the issues of "democracy" and "ensuring civil liberties and activism" remain relevant. The notion of citizenship has come a long way in the development of society towards the rule of law. It is one of the great achievements of the democratic development of society. Although the concept of citizenship existed in ancient Greece and Rome, it began to emerge in its present form when feudalism was in crisis and political, economic, and social life in society

began to shift to democracy and market relations, and for the first time “urban” (French ‘Situayyan’, English ‘sitezen’, Russian ‘gorojanin-grajdanin’). After the declaration of independence, the Uzbek language adopted the term "citizenship" instead of the former word "citizenship" [3]. During the years of independence, the issue of civil liberties and its activism began to be recognized as one of the important conditions for building a democratic society. It is also important to define the concept of freedom. Because only when a citizen is free can a society prosper.

The emergence of man, his place and essence in society has always been one of the most important and controversial fields of the social sciences. While Aristotle asserts that “man is by nature (essentially) social” [4], “in the general sense, whoever is subject to authority and obedience is a citizen; the nature of the citizen changes in each state system. In the best form of government, a citizen is one who is willing and able to submit and rule in accordance with the requirements of spiritual values.”[5].

One of the first scientists to study the nature of man was Confucius and his followers in China. The scholar Sen-tzu, a follower of Confucius, who lived from 298 to 238 BC, wrote: “Innate traits are the product of celestial relations. They cannot be achieved through education or human creativity. Man has an evil nature. Goodness in man is an acquired quality for the sake of interests. Modern man has been striving for profit since birth. This leads to people competing with each other and not giving in to each other. That is why it is necessary to change human nature through education, to educate them on the basis of established rules, to teach them justice and responsibility”[6]. It is obvious that in order for a person to organize in society or to become and become a member of society, he needs a certain degree of external influence and socialization in life.

One of the important characteristics of man is that he is a social being. Man seeks to unite with people like himself in order to satisfy his needs. Human socialization is artificial and can only take shape as an individual in an environment among other people. If he is free from human relationships, he will not be able to get rid of his evil or animal nature. Abu Nasr al-Farabi describes the natural course of human aspiration for social cohesion: “Everyone is structured by nature in such a way that they need a lot to live and achieve a high level of maturity. He can't do it alone, he needs a team of people to have them... Therefore, it is only through the necessity of life, the supply of one another, and the mutual assistance that one can attain to the maturity which one is naturally striving for. The activities of such team members as a whole provide each of them with the things they need to survive and mature. As a result, human beings multiplied and settled in the inhabited part of the earth, resulting in a human community.”[7]

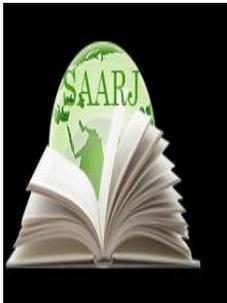

CONCLUSIONS

During the period of independence, the legal framework for the protection and enforcement of human rights in Uzbekistan has been formed at the level of the experience of developed countries and the requirements of national values. Also, the Constitution and laws have been able to create criteria and norms for ensuring human rights and freedoms at the level of civil society and the rule of law. Article 24 of the Constitution states, “The right to life is an inalienable right of every human being. Assassination is the gravest crime.” Article 25 “ Everyone has the right to liberty and security of person. No one shall be arbitrarily deprived of his nationality nor denied the right to change his nationality. ” “ Everyone has the right to the protection of the law against

such interference or attacks, including torture and other cruel, inhuman or degrading treatment or punishment. " No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honor and reputation, "Everyone has the right to freedom of thought, speech and religion ...", Article 32 "Citizens of the Republic of Uzbekistan have the right to participate in the management of public and state affairs directly and through their representatives." Such participation is achieved through self-government, referendums and the democratic organization of state bodies. "Article 36" Everyone has the right to own property alone as well as in association with others. The right to secrecy and inheritance of bank deposits is guaranteed by law. "Article 43" The state shall ensure the rights and freedoms of citizens enshrined in the Constitution and laws ". The introduction of laws and regulations to ensure the formation of democratic values and principles of civil society has determined the future prospects for building a democratic society in Uzbekistan. "Human rights are an individual, essentially a unified social and moral world. It embodies the essence of man, his value as a being. In the social sciences and humanities, the individual is interpreted differently in terms of its direction, object of study and purpose "[8].

ABSTRACT

In the study of the history of the emergence and development of television and radio in Karakalpakstan, to show the historical role in the socio-economical development of the country is the television and radio services, focusing on historical data and scientific literature in this area. In this regard, it consists of the formation of Karakalpak television and the development of television journalism, the strengthening of the material and technical base of Karakalpak television and its role in the development of our national culture, Karakalpakstan Television Service during the Independence Period, Service of Karakalpak radio in the 30s and 40s of the XX century, The role of Karakalpak radio in the development of our spiritual culture in the 50-80s of the XX century, Karakalpak Radio's service to the development of our culture and art in the period of independence.

KEYWORDS: Culture, Science, Arts, Television, Karakalpak Radio, Television and Radio.

INTRODUCTION

An important task of this television is to update the socio-economic policy implemented in our country and to convey the process of change in the effective ways on all aspects.

The XV Congress of the UZComParty, which took place in February 1960, pointed out the need to pay attention to the further development of television in the country. The resolution calls for

the expansion of television in the life of the republic's workers, about working 89,000 TVs in some regions in Uzbekistan and the construction of a new television station in Nukus, to improve the ideological-artistic level of telecast. [1,15,16]. Pursuant to the Resolution of June 6, 1962 "On measures to improve the work of radio broadcasting and television", in the decree and measures pointed by Central Committee of the UzComParty, Karakalpakstan regional committee of Uz Com Party, in the places the attention of managers of party, radio broadcasting and television was given to prepare every broadcasting and show, speeches effectively with high responsibility.[1,40].

The combined management of radio and television has undoubtedly helped to improve the material-technical support and the work of the editorial offices. As a result of this leadership and care, there have been significant changes in the work of radio stations in Karakalpakstan. Measures have been taken to speed up the construction of the Nukus TV station and to speed up the measures to take the equipment and tools. During these years, the Republican Party of Uzbekistan has implemented measures aimed at improving the ideological and artistic content of national and local television programs. The resolution of June 14, 1965 set the task to improve the quality of technical equipment of radio and television in a short period of time, to achieve the reception of at least 2 radio and television programs throughout the country [2,317].

In 1966, Central television began broadcasting in Uzbekistan. Since 1968, the workers of our republic could watch the programs of Tashkent TV studios through the radio center. Among these programs were broadcasts of Central TV.

During the period 1960-1964, the issue of the construction of the Nukus TV studio was systematically considered five times by the regional party committee at its bureau meeting, which listened to the reports of construction managers, measures on accelerating the work, taking equipment, apparatus from plants and mounting were pointed.

Beginning in February 1962, 1st Board under the 166th Construction Trust began construction works. It was here that before 12-apartment, 2-storey modern Transmitter began to be built of stone. However, due to the lack of construction materials and construction staff, the facilities were not delivered on time.

At the meeting of the secretariat of the bureau of the regional and city party committees, the construction lag and slow work was discussed several times, and practical measures were identified to speed up the construction.

In the early summer of 1964, a number of necessary buildings were built, it became possible to install telecoms and equipment, and assemblers from Leningrad, Tashkent and Urgench were invited. Makers of radio equipment from Leningrad, Krasnoyarsk, and Novosibirsk sent the necessary equipment and radio details for the TV studio of remote Karakalpakstan. Engineer of the Ministry of Communications of the Uzbekistan USRP. V.Polishuk, senior electrician of Andijan TV M.I.Shaffer, chief engineer of Urgench TV G.A.Kosminin and other engineers and technicians came to Nukus for constant duty journey and began to install the tv apparatus since the beginning of the spring. In those years, M.I. Semennikov, M. Qosnazarov, N. Shubenko and Otemuratov were from communication engineers and technics among the local workers.

To speed up the work, they were divided into two units: the first unit installed the equipment belonging to the studio equipment complex; the second unit installed a Yakor-type transmitter

and temporary antenna equipment of 30 meters high. From August 3 to the end of October, engineers and local specialists, who were actively involved in the installation of television equipment and came to the help on veterans' memories, worked not counting the time.

On November 5, 1964, a solemn meeting was held on the occasion of the first tour construction of the Nukus TV station. At that day in the evening at 19:00, in Nukus, Takiyatas, Khodjeli cities, on the screens in the houses where there were TVs, the writing titles "Nukus shows" were appeared. Nukus TV studio has started its show. At the show, the Chairman of the Presidium of the Supreme Soviet of the Karakalpak ASSR, Comrade D. Yeshimbetov, congratulated the workers of the autonomous republic on the launch of the Nukus TV studio. After that, "Television news" in Karakalpak and Russian languages was shown on the screen. Then the first announcers of Nukus TV Orazgul Uteniyazova and Svetlana Shapochnikova were in the photo background. The initial television broadcasts were not far off. The first Karakalpak TV programs lasted 5 minutes and the Russian ones lasted 4 minutes, in which short informational materials were broadcast. The text of the first Russian and Karakalpak "Television News" was written by former radio journalists G. Seytnazarov, V. Kopilov and others. (all of them were cultural workers who had contributed to the republic). The state was very few when the Nukus TV studio first began broadcasting.

Excluding technical staff, there were 8 creative staff members, including one senior editor, 2 editors, 1 director, 1 assistant director, 1 director helper, 1 cameraman, and one sound director. About the difficulties in the first years when "Nukustvstudio" began to show, the first director of television, the national Artist of Uzbekistan USSR and Karakalpakstan ASSR Kuwat Abdireymov told like this: in 1964-1965 years when the show was begun to show, the most difficult thing for the technical and cultural workers who were working there was to attend to work and the studio where the show was given was narrow. The transmitter, the ASK, the sound and the director's console are all in one place. On the only 35-40 square meters, the announcers sit, the invited people speak, and the concert is given in. Despite these difficulties, we were encouraged by realizing that we were doing the right thing for our people, and we aired the first programs without interrupting any of them. "[8,21].

From November 1964 to March 1965, Nukus Television Studio aired three times a week (Tuesdays, Fridays and Sundays) for two hours each day. The screenings lasted 6-7 minutes and included Karakalpak and Russian TV shows, concerts, mostly movies and film magazines.

"Since November 5, 1964, when the studio started operating, there have been a lot of letters to the editors," said the first editor-in-chief of the television (in the early years he was called the senior editor). G'. Seytnazarov. Most of them asked for a concert. We perform 1-2 times a week for the performers of a small ensemble under the Radio Committee. At those years most people often asked S. Mambetova, A. Atamuratova, A. Shamuratova and D. Gayipov.

According to the Resolution of February 13, 1965 "On the extension of television time", Nukus TV studio has been operating since May 1, 1965, 4 times a week, on Tuesdays, Thursdays, Saturdays, and Sundays, there were 2.5 hours of demonstrations each day.

By 1965, the number of homes with televisions had increased several folds. Many workers from Takhias, Khodjeli, Chimbai and Kegeyli districts watch Nukus TV programs. In a short time, television has become a real platform for hard workers. " [10.1,2].

Beginning on January 1, 1966, the Nukus Television Studio began broadcasting every day (Wednesday off). Daily performances have increased by 3 hours instead of the previous 2.5 hours. In addition, at the weekends and holidays it began at 12 noon, with demonstrations for children. [11.1,2].

It was mentioned in the resolution of November 29, 1966 "On ways to further develop television in Karakalpakstan". It is planned to create an ensemble of folk music under the Radio and Television Committee, to organize bus services, to send artists to Tashkent, to record film concerts, to show more quality films on television and other measures.

All these measures paved the way for the further development of Karakalpak television and the improvement of the quality of broadcasting. In 1967, a two-storey building (now a standing building) was finished and a new studio equipment complex (ASK) was installed. The technical and creative possibilities have greatly expanded.

The emergence of television journalism in Karakalpakstan is closely linked with radio journalism. The presence of radio and television in the same committee helped the television to gain its level quickly. Initially, radio journalists worked on television. The closeness of the genre methods of radio and television journalism has had a positive effect on their mutual enrichment.

The first TV journalists were F. Seytnazarov, V. Kopilov and others, who had accumulated a lot of experience in the field of press and radio broadcasting over several decades. We believe that it would be appropriate to show the way of growth and development of Karakalpakstan's television journalism over the past years in four stages.

1. The beginning, study and research of Nukus television and Karakalpak television journalism. Covering the years 1964-1969, during this period, the beginnings of Nukus-television shows, the formation of a new typical studio, building of high antenna, the growth of technical and creative specialists, the growth of interest on TV watchers, the formation of the genres and forms of shows is included.
2. The period of the expansion of technical capabilities, the creative recognition of the population, TV reporting outside the studio, the formation of the genre of television journalism. In the period from 1970 to 1975, the rangy television stations (PTS), videotapes were appeared, the shows had its daily quality, new TV magazines, cycle shows, and TV shows began to be broadcast at the request of viewers.
3. In 1976-1984 years as a result of the constant care of the party and our government, the technical and creative forces of television have matured. However, at the same time, the turmoil in the life of Soviet society, the exaggeration, and the negative situations like these influenced on television.
4. The period of re-construction, democracy, development of publicity, a new stage in the quality and effectiveness of television in Karakalpakstan began after 1985.

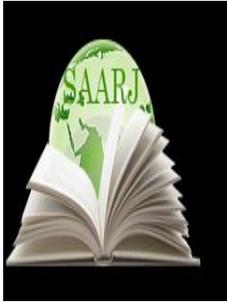

The history of television is not only the history of television technology, but also the history of the emergence, development, formation and gradual development of the form of television genres and programs. In the early years of its broadcasting, the Nukus TV studio became a program of broadcasting informational programs on television in the upper cities. In the early days of Karakalpak television development, video series (films, photographs) were in short

supply. In the early days of the development of television, the political and social editorial staff gave some noteworthy shows.

In 1971-1972 years, T. Yembergenov, M. Sadullayev, U. Khojambergenov who studied at the journalism faculty of Tashkent State University and other graduates of higher education came to the television. The TV editorial offices received letters. Many of them came to the shows of "Theater of Teleminiatures" and "From Letters to Poems". In particular, the "Teleminiatures Theater", which began to appear on television on a regular basis since 1968, has attracted a lot of public interest. In one of the spring months of 1972, teleminatics showed the image of a man of rude, impolite to all. The teleminiatures were given addressed humorous materials, artists J. Bekmuratov, Sh. Temuratov, A. Abdaliyev, T. Koshgarov, K. Iysayev, M. Utemisov managed to play each character in an interesting, funny and confident way, and was appreciated by TV viewers. In the early years, directors who had gained experience in theater and radio broadcasting on Karakalpak television, and had undergone traineeship on Tashkent television worked. Among them were K. Abdireyimov, the former U. Jalimbetov, A. Khojanazarov, A. Kaypov, B. Matjanov, T. Koshkarov and others. [8.36].

ABSTRACT

The article theoretically and practically describes the importance of pedagogical and psychological literacy of parents in preparing children for school education. It is known that experts have developed and delivered manuals for parents to help prepare the child for school education in the family. However, it became clear that parents did not have the skills to use these guides.

KEYWORDS: *Pedagogical-Psychological Literacy, School Preparation, Family Education, Kindergarten Age, School Education, Parenting, State Curriculum, First And Preschool Age, State Requirements For Development.*

INTRODUCTION

Resolution of the President of the Republic of Uzbekistan dated December 29, 2016 No PP-2707 “On measures to further improve the system of preschool education in 2017-2021” reveals the priorities of the Action Strategy for further development of the Republic of Uzbekistan, the essence of preschool reform. At the meeting chaired by the President of the Republic of Uzbekistan Sh. Mirziyoev on August 16, 2017, important tasks were set to radically reform the system of preschool education, to ensure full coverage of children in these institutions.

THE MAIN FINDINGS AND RESULTS

As a result of the analysis, in a short period of time three major documents - the Resolution of the President of the Republic of Uzbekistan dated September 9, 2017 No PO-3261 “On measures

to radically improve the system of preschool education”, September 30, 2017 “Measures to radically improve the management of preschool education” Decree № PD-5198 “On the organization of the Ministry of Preschool Education of the Republic of Uzbekistan” and Resolution № PD-3305.

It is also stated in the “Program of additional measures to further improve the system of preschool education in 2018-2019” in Annex 3 to the Resolution of the President of the Republic of Uzbekistan dated September 30, 2018 “On measures to improve the management of preschool education” PO-3955 [1]. In order to ensure the implementation of the tasks, such tasks as further expansion of preschool education institutions, groups serving the preparation of 5-7 year olds for school education, organization of courses have been identified.

However, today the coverage of preschool children in preschool education institutions in the country is only 33.5%. In Surkhandarya region, the figure is 22.7%. At present, there are 293 preschool educational institutions under the Surkhandarya Regional Department of Preschool Education, which involve 24,669 children (22.7% of the total number of children of kindergarten age) [2]. This means that the preparation of children of this age for school education is mainly carried out in families.

It is known that experts have developed and delivered manuals for parents to help prepare the child for school education in the family. However, it became clear that parents did not have the skills to use these guides.

When studying the mastery levels of 94 students admitted to 1st grade in schools № 1, 3 and 41 in Sherabad district in 2015-2017, the readiness of 52 children from the family to 1st grade was significantly lower than the readiness of children attending preschool institutions; it was found that the level of mastery was slow as most children had difficulty completing the learning tasks. This indicates that the family does not have the necessary knowledge, skills and abilities to work on the pedagogical and psychological literacy of parents, the mental development of preschool children and the preparation of children for school education. As a solution to this problem, it is necessary to provide pedagogical and psychological assistance to parents in preparing children for school education in families. With this in mind, special trainings were organized for parents as part of the study. 39 mothers and 8 fathers from 47 families who participated in the trainings were trained on what to pay attention to when preparing their children for school, exercises to develop writing and reading skills in the family, and the importance of joint homework in preschool. At the beginning of the trainings, a questionnaire was received from parents and analyzed to determine their knowledge of preparing a child for school. According to the analysis, when most parents say that a child is ready for school, they are limited to answers such as "they can talk about themselves, they know their home address, and they know their parents' name and place of work". During the trainings, parents were provided with the necessary information on solving problem situations, physical, motivational, psychological, social preparation for school education. The role of family members in introducing the child to school life was also taught in the form of role-plays, short-term trainings were followed by another survey of parents, and the analysis of the results showed that the participants' opinions changed significantly.

Raising a child is a difficult and complex task that requires all members of the family not only to treat children properly, but also to have a high sense of responsibility for their fate. Combining

all aspects of family upbringing, including spiritual, moral, intellectual, aesthetic, physical and labor education, gives good results.

Parents are interested in preparing preschool children for school. This is understandable, because learning work requires hard work, effort, perseverance, the ability to achieve results. The preschool child is prepared for this new type of work not only during the lessons, but also during the performance of any work tasks.

The skillful combination of teamwork and individual work with parents, the achievement of pedagogical and psychological literacy among the general population and the effectiveness of educational and advocacy work. By creating a single learning environment, it is possible to achieve quality preparation of a child for school education.

The main task of preschool education in the country is stated in Article 8 of the Law “On Education” “Preschool education and upbringing is a type of education aimed at teaching and educating children, developing them intellectually, spiritually, ethically, aesthetically and physically, as well as preparing children for general secondary education. Pre-school education also includes one year of compulsory primary education for children between the ages of six and seven” [3].

Parents are interested and thinking about preparing their preschool child for school. Questions arise as to what kind of student the child will be, whether he will be able to adapt to school without difficulty, and whether he will be able to do his homework. This is understandable, because learning work requires hard work, effort, perseverance, the ability to achieve results. A preschooler is prepared for this new type of work not only during the training process, but also during the performance of any labor tasks. Most of our parents are having trouble solving this problem. It has been found that most families are unaware of this, despite the fact that there are manuals designed to prepare the child for school education in the family, published for parents.

Parents are interested and thinking about preparing their preschool child for school. Questions arise as to what kind of student the child will be, whether he will be able to adapt to school without difficulty, and whether he will be able to do his homework. This is understandable, because learning work requires hard work, effort, perseverance, the ability to achieve results. A preschooler is prepared for this new type of work not only during the training process, but also during the performance of any labor tasks. Most of our parents are having trouble solving this problem. It has been found that most families are unaware of this, despite the fact that there are manuals designed to prepare the child for school education in the family, published for parents.

Order of the Minister of Preschool Education of the Republic of Uzbekistan dated June 18, 2018 № 1-mh “State requirements for the development of primary and preschool children of the Republic of Uzbekistan” [4], registered by the Ministry of Justice of the Republic of Uzbekistan on July 3, 2018, registered under No. 3032 “State requirements for the development of primary and preschool children” was confirmed. On the basis of these state requirements, the state curriculum “First Step” [5] of the preschool educational institution was developed. The program is a competent approach to educating preschool children to prepare the growing child's personality for life; in it the acquisition of moral norms and values necessary for the solution of vital issues; communicating with other people, with a view to preparing for the formation of ways of activity associated with the construction of the image of “I”; primary essential competencies require the holistic development of the child as a subject of activity and morality.

The state program “First Step” provides for the development of the child's competencies through the formation of physical development and a healthy lifestyle, socio-emotional development, speech, communication, reading and writing skills, the development of cognitive processes, creative development. It is important to note that special attention is paid to the development of small areas, which are much richer in content and are mastered by the child through sensory education. In the field of “Physical development and the formation of a healthy lifestyle” special attention is paid to the development of the child's ability to master the basics of a healthy lifestyle and nutrition, as well as the ability to follow the rules of safe living. One of the innovations in the program is to take into account the views of parents about the preschool in cooperation with the parents of the preschool to ensure the full development of the child. Educating parents on early development issues, involving parents in active participation in the educational process, and organizing support for parents' initiatives to participate in the life of the institution serve to increase the effectiveness of education.

Observations show that to date, the content of PEI educators working with parents has changed radically. As a result, parents' attitudes towards PEI are also changing for the better. Of particular interest is the gradual introduction of parents to the requirements of the state. Some parents are asking educators for advice on what to do at home for their child to have high levels of development in this or that area. This is definitely a happy situation.

If pedagogical and psychological assistance is provided to parents to prepare their children for school education in neighborhood or schools for the population far from preschool institutions, it will help to form the child's personality and develop his interest in education, ensure the child's intellectual and physical development. As a result, parents are equipped with knowledge that meets the requirements of education in the process of preparing children for school, including issues related to teaching, comprehensive intellectual, moral, aesthetic and physical development of the child, and increases the level of pedagogical and psychological literacy in families. In our region, more than 70% of preschool children (3-7 years old) are not covered by preschool education. Most children in families need to be adequately prepared for school education, for which there is a need to increase the pedagogical and psychological literacy of parents. Therefore, in order to increase the level of pedagogical and psychological literacy among the population through the organization of short-term training seminars, thematic seminars-trainings, round tables and preparation of handouts for families, based on the needs of parents in neighborhood and schools. It is advisable to set up.

Also on local television, “Is your child ready for school?” It would also be useful to conduct column shows with the participation of experts on the subject.

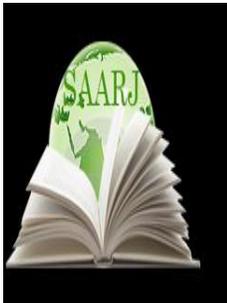

Through the implementation of this work, the quality of preparation for school education of children aged 5-7 not covered by preschool education will be improved, the level of pedagogical and psychological literacy of the population will increase.

CONCLUSION

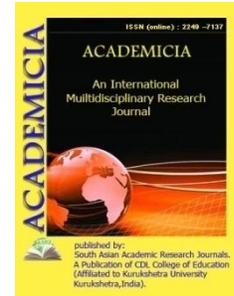

The spiritual environment in families is healthy. Effective preparation of a child for school education in the family helps the child to move from the crisis of the transition from play to educational activities without socio-psychological and physical harm, as well as serves as a basis for full upbringing, education and development of the child in primary school.

**APPLICATION OF EDUCATIONAL RESEARCH AND INNOVATION
 TOWARDS ACQUISITION OF QUALITY EDUCATION TO MEET
 GLOBAL DEMAND IN EDUCATION**

 Rivers State, NIGERIA

ABSTRACT

Education is the mother of many disciplines such as curriculum, research and innovation which necessitates knowledge generation and societal transformation globally. This paper examines the relevance of educational research and innovation towards acquisition of quality education which is the crux of the matter in the educational industry. It highlighted the concept of educational research, relationship that exist between educational research, innovation and quality education, and reveals their contributions towards solving educational and other societal problems, their challenges were x-rayed and meaningful recommendations were made to meet global demand.

KEYWORDS: *Educational Research, Innovation and Quality Education.*

INTRODUCTION

Educational research takes scientific finding approach into the unknown in order to give reasonable solution to educational problems which may emanate from different angles, some may originate from curriculum planning of development and others may surface from curriculum implementation or innovation. Imo (2015), instructively admits that research is the strategy adopted to answer questions raised about the world and the processes going on in it. This implies that research gives answer to every question asked about the occurrences in the world. The Researchers see research as the process of systematic inquiry by which mankind increases knowledge of how things are, why things are the way they are, and how they could be improved. This shows that research is a source of knowledge advancement. Odia and Omofonmwaan (2014), confirms that advancement in research has given rise to the growth of science and

technology which in turn has led to industrialization through the creation of job opportunities, increased income, production of goods and services, wealth creation, improved quality of life, transportation/communication system, networking regions of the world, clustering of people and integrating nations to the world, socially, economically, and politically.

Michaela (2012), advised that research is necessary for direct contribution of universities for sustainable development and knowledge creation. This means that application of solution derived from research will bring about development and innovation. Research is a system of worldwide collaboration which accounts for the spread of modern teaching and learning that could result in transformation of the society. It provides avenue for curriculum innovation and desirable change in educational industry. Its activity creates room for innovation and establishes acceptable facts that will contribute positively to the growth of educational industry and the country at large. It is a way forward to generation of new ideas and knowledge needed to meet educational, social and economic demand globally. These relevant needs and problems can adequately be catered for using innovative ideas generated from research activities. Therefore, application of research findings and appropriate innovative measures are paramount in this contemporary time for acquisition of quality education and also solve societal and global problems.

BENEFITS OF EDUCATIONAL RESEARCH

1. It helps in finding solutions to problems arising in educational industry.
2. It supports professional searching of knowledge and generation of new ideas.
3. It connects learners with sources of information
4. It clarifies purposes and processes involved in introducing a new concept
5. It improves understanding of different concepts.
6. It develops learners' affective, cognitive and psychomotor domains.

CONCEPT OF CURRICULUM INNOVATION

Innovation literally is the act of bringing in new ideas or structure into a system to strengthen the existing one or to replace it. It is the vehicle for meeting educational and social challenges. It targets at creating sustainable avenue to erase educational and societal problems which emanate from research findings due to dynamic nature of knowledge especially in this era of knowledge explosion. From the words of Oteh & Akuma (2011), Innovation is a decisive operation carried out with the view to introduce a given change to be acceptable and useful. To him innovation is an intentional act that will usher in an acceptable change. In the same vein, Charles Zulakoro & Efere (2016) declared that innovation is a change that is deliberate, purposeful and can be on a small or large scale, a departure from an existing practice. This implies that innovation can bring a total change to a concept or strengthen the existing one.

Duru (2011), instructively stated that innovation means to introduce something new, making some changes which are geared towards improving the existing way or pattern or even condition of doing things to make them more efficient and effective than before. For this definition, it means that innovation involves a deliberate and purposeful effort to bring about a change of some sorts to improve the quality of available staff of education. Mkpa and Izuagba (2012), see innovation as being synonymous to technology which can be used to improve educational outcomes, improve working relationships or process as within the school system or even reduce the cost of education significantly without reducing quality or quantity of the desired results. Duru further explained that innovation can also be seen as invention of new things, which is the

introduction of new ideas or methods into educational system. This may arise from the desire of government or society to tackle or solve societal problem. This means that innovation is necessary for solving problem globally.

Chauhan in Mkpa and Izuagba (2012), stated that innovation is to create something new which clearly deviates from traditional practices which have been followed for a long time to impact education to all levels of education. This view agrees with that of Victor Ishikaku (2016), who reported that curriculum innovation implies introducing a new idea, a new way of running the curriculum or to alter already established way of implementing the curriculum so as to improve its quality and effectiveness. This means that innovation of new ideas in to educational sector may improve the existing quality or erase totally the established one. Curriculum innovation has been regarded as an essential strategy for educational transformation due to the changing nature of knowledge and age. Students need to develop ways of dealing with complex issues and problems that require different kinds of skills and knowledge.

Innovation is a collaborative process by which organization abandon old paradigms and makes significant advances. <http://bia.ca>>from-vision-reality-the-stanleign... Retrieved 16th October, 2018.

The major focus of innovation is for improvement of educational programmes to acquire quality education. It is intentional and purposeful in nature and also aimed at yielding something worthwhile to the learners and the society at large. A worthwhile innovation should improve the quality of existing educational practices and also reduce cost. Curriculum innovation thereof include all the innovative measures that are concerned with various curriculum planning and implementation. The researcher sees curriculum innovation as a practical application of new policies, techniques and materials that are related to the system either to strengthen the existing one to replace it.

TYPES OF CURRICULUM INNOVATION

Innovation may take various shapes and types. They may exist in the form of entirely new inventions that never existed before or exist as new form of what had existed before. Curriculum is a system with several elements; aims and objectives, learning content, learning experiences and evaluation. From the words of Victor – Ishikaku (2016), innovation therefore could exist in any of the element or in the entire curriculum. For instance, the introduction of the 9:3:4 system of education in Nigeria consequently brought in innovation which affected the entire curriculum and introduced new subjects, new teaching methods and instructional materials.

FORMS OF CURRICULUM INNOVATION

- 1. Innovation in Educational System:** This form can be seen in the way systems operate, formerly in Nigeria Educational system was organized in 6:3:3:4 system of Education but now has been replaced by 9:3:4 system.
- 2. Innovation in Aims and Objectives of the Curriculum:** Aims and objectives refer to the expected outcome of curriculum content, every planned curriculum must possess an objective. Therefore innovation in the curriculum content must consequently affect the aims and objectives of a given concept.

3. **Innovation in Curriculum Content:** Innovation in a system of education must also bring a change in curriculum content. Innovation in curriculum content occurs when new knowledge, skills and ideas are introduced into the curriculum.
4. **Innovation in Instructional Strategy:** The change in the curriculum content will consequently lead to appropriate change in the teaching and learning procedures in order to equip the learners with needed skills and knowledge.
5. **Innovation in Instructional Materials:** Before the introduction of Information Communication Technology (ICT), teaching aids such as audios, audio-visuals and visuals were not in existence, rather regalia was highly regarded. The new innovation of incorporating ICT into educational system brought in new instructional aids, such as projectors, interactive board, etc.

REASONS OF CURRICULUM INNOVATION

Following can be seen as reasons for curriculum innovation

1. To provide reasonable ideas to solve educational and societal problems.
2. To eradicate irrelevant concepts in educational industry.
3. To create room for adequate changes in educational concepts.
4. To encourage the spirit of problem solving in educational sector.
5. To promote application of new ideas in solving societal and educational problems
6. To promote acquisition of quality education.
7. To create room for application of modern instructional materials.

CONCEPT OF QUALITY EDUCATION

Norwegian Agency for Development (2015), stated that quality will depend on what kind of education, the teacher has as well as the teacher's personal qualities which implies that, the quality of education and that of the teacher determines how qualitative the education will be. Quality education is the education that provides all learners with capabilities they require to become economically productive, develop sustainable livelihoods, contribute to peaceful and democratic societies and enhance individual wellbeing (VVOB Education for Development, 2015). It is the application of research findings into education via innovative ideas that will create room for acquisition of quality education. Unite for Quality Education (2013), declares that education enables people to develop all of their attributes and skills to achieve their potentials as human beings and memberships of the society.

Okemakinde (2014), instructively stated that quality delivery begins from policymakers to resource providers, policy implementers and students, all these factors are products of educational research and knowledge of innovation in educational industry. Quality output depends on quality input. Ochoma, Victor-Ishikakau and Emesiobi (2016), noted that quality in education determines how much and how well children learn and the extent to which their education translates into a range of personal, social and developmental benefits. The following can be regarded as six qualities of quality education.

1. It should be valuable to the society.
2. It should be relevant to the learner and society.
3. It should be learner centered or friendly.

4. It should possess ability to retain or sustain facts
5. It should possess appropriate teaching strategy.
6. It should be based on achieving the expected objectives.

Ajoku and Oyadonghan (2018), reported that quality education provided to any society inspires creativity and innovation, leading to improved national economy. Quality education is one that provides all learners with capabilities they need to become economically productive, develop sustainable livelihoods, contribute to peaceful and democratic societies and enhance individual well being. This implies that to gain quality education that will develop a complete individual, the knowledge gained from research findings and innovative ideas must be involved in order to develop adequate educational contents that will reflect to the needs and aspirations of the society. Emesiobi (2018), conclusively observed that quality education in a broader term entails quality educational contents, appropriate teaching methodologies, use of qualified teachers and involvement of ready learners in a conducive learning environment which will in turn produce quality outcome. These attributes rely largely on research foundations and innovative support to promote educational industry in Nigeria.

INNOVATION IN NIGERIA EDUCATIONAL SYSTEM

The educational system of Nigeria has experienced series of innovation and transformation since the advent of Western Education in 1882. Recently, the system changed from 6:3:3:4 system of education to 9:3:4 system of education. Other innovations witnessed by Nigeria educational system are introduction of computer and entrepreneurial education, introduction of compulsory Nigerian languages of mother tongue, introduction of open and distance learning programme, introduction of adult mass literacy programme, introduction of special schools for the handicapped, nomadic education, introduction of fishermen education, introduction of continuous assessment and introduction of compulsory foreign language. These changes were necessary in order to meet the needs of the learners, teachers and the society at large and also to make the citizens of the country functional and education meaningful.

CHALLENGES OF RESEARCH AND INNOVATION

- 1. Lack of Intrinsic Motivation towards Research:** Nigerians lack interest towards research findings, therefore reaching appropriate solutions to educational problems have been a great challenge, and without research findings, there will be no innovative idea to tackle issues in every aspect of human endeavor and acquisition of quality education will be hindered.
- 2. Lack of Funds:** Fund has to a large extent hindered research work. The bulk of university based research has been funded by students, staff in training, and academic staff. Funding of research work has been a crucial problem in Nigeria because research finding gives direction to right innovation approach which will in turn promote quality education in Nigeria. The most disheartening is that only every few benefit from funding agencies like Tertiary Education Trust Fund (TETFUND).
- 3. Lack of Recognition for Researchers:** Researchers in Nigeria are not recognized and therefore no encouragement inform of appreciation to arouse their interest. This has demoralized the practitioners and made them inactive to research work; this will indirectly frustrate innovative ideas and hinder progress in achieving quality education.

RELATIONSHIP THAT EXIST BETWEEN RESEARCH, INNOVATION AND QUALITY EDUCATION

In this 21st century of knowledge boom, quality of education and innovation are closely related due to problem associated with knowledge-driven society such as ours. Research provides solution to problems related to teaching and learning, production of adequate human resources to cater for different levels of education, insecurity problems, joblessness, problem associated with economy of the nation, political issues, problem related to Information Communication Technology, religion discrimination, food crises, peace and conflict resolution, health issues and other institutional challenges which must be tackled to bring hope and satisfactory solutions to Nigerian citizenry. Research is the only reliable source of solution to societal problem while innovation is seen as the most relevant avenue for adjustment of these problems to bring a desirable change. Ekwuru, Chuka-Okonkwo and Anyanwu (2016) suggested that, to remedy the situation for the present and future generation, it is necessary to implement educational innovation so as to achieve specified goals and objectives which will lead to acquisition of quality education.

RELEVANCE OF EDUCATIONAL RESEARCH, CURRICULUM INNOVATION AND QUALITY OF EDUCATION

Educational research, curriculum innovation and quality of education are linked together to meet the societal needs and aspirations. The continuity of education and development of the country depends largely on products of educational research and new innovations which will lead to quality education. The economy will be revamped, educational systems will be improved and the standard of living will also be enriched, if all the practical steps involved in research and innovation will be taken into cognizance. Research gives solutions to problem while innovation aids problem solving; quality education contributes to meeting the societal needs through education. This paper concludes that the three related concepts are necessary to meet the needs of the society and the global needs in education.

CONCLUSION

Research activities and innovative ideas are necessary for ensuring appropriate educational standard. Teaching and learning depend highly on the curriculum contents which emanates from the needs and aspiration of the society. Innovative ideas are necessary to remedy negative situation in educational sector. Research and innovation in education will be useful in meeting the societal needs and enhancement of quality education. Therefore more research findings and innovations are necessary in every facet of human endeavor to further ascertain more of human needs and problems. Innovation as a follow-up approach to solutions given by research will help in solving major educational, medical, social, economic and even political problems. This will create room for quality education as an avenue for implementation of innovative ideas.

RECOMMENDATIONS

1. Educational research findings accompanied by immediate innovative ideas are of paramount importance to regularly tidy up the educational, social, medical, economic and political corridors of this present generation and that of the generation unborn. Therefore it should be highly regarded.

2. The three tiers of government and stakeholders should promote research through adequate provision of needed resources since it is the only avenue to generate solution to human needs and problems.
3. Lecturers, teachers and students should regularly embark on research and innovative activities to promote quality education in the country.
4. Researchers should be given adequate recognition and incentive as a source of encouragement and motivation for more research work.
5. Application of solutions given by researchers to solve immediate societal problems should be held with high esteem in order to meet societal needs.

ABSTRACT

The paper presents the results of a theoretical study of safety conditions for various groups of electrical equipment that affect single-phase networks in order to prevent short circuits on the case. The authors analyzed the "PUE" requirement for grounding systems and, as a result, revealed that the "PUE" requirements for grounding systems do not provide sufficient safety and supplements are needed to more clearly regulate the procedure for re-grounding the neutral wire.

KEYWORDS: *Grounding, Single-Phase Network, Rules, Electrical Installations, Resistance, Grounding, Short Circuit, Break, Apparatus, Case, Potential.*

INTRODUCTION

Grounding serves as the main means of electrical safety in networks with voltages up to 1000 volts with a deafly grounded neutral in case of single-phase locking on electrical equipment. Grounding protection is based on the fast disconnection of damaged electrical equipment from the network by fuses or circuit breakers. To ensure the reliability and speed of the protection operation, the current "Rules for the design of electrical installations" (PUE) standardize the multiplicity factors of the current of a single-phase short-circuit on the case to the rated current of protective devices [1,4,5]. Let us consider whether such rationing is sufficient from the point of view of the main criteria for electrical safety of the magnitude of current flowing through the human body and the time of its exposure.

The response time of protective devices and, consequently, the possible time of exposure to electric current on the human body, is indirectly normalized by the multiplicity factor. Indeed, in the presence of sufficiently simple and accurate methods for measuring the conductivity of single-phase short-circuit current circuits to the case and monitoring the compliance of the characteristics of protective devices with the calculated values, the shutdown time can be maintained quite accurately.

However, the main criterion for electrical safety - the magnitude of the damage current - is completely insufficiently taken into account by the existing method of standardizing the grounding parameters. It is obvious that the magnitude of the lesion current is determined by the acting voltage and resistance of the human body at the time of its impact. The acting voltage (voltage applied directly to the human body) depends on the touch voltage and the ratio between the resistance of the human body, the transient resistance at the points of contact and the internal resistance of the source of the touch voltage. Of the listed factors, only the touch voltage can be taken as the main criterion for electrical safety when normalizing the grounding parameters, provided that scientifically grounded restrictions are imposed on other factors.

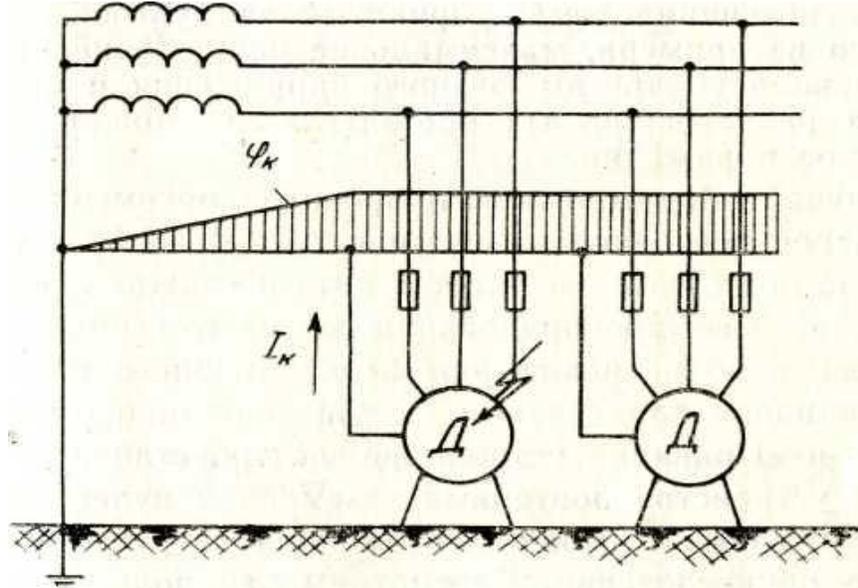

FIGURE 1. MODE OF SINGLE – PHASE SHORT CIRCUIT TO THE CASE

The values of the touch voltages are to some extent limited by the rationing of the current "PUE" of the neutral wire conductivity relative to the phase conduction, but this limitation has little to do with the normalization of the Permissible touch voltages. Indeed, with such normalization in the mode of a single-phase short circuit to the case, the phase voltage is divided between the resistances of the phase and neutral wires in proportion to their value, and the touch voltages are distributed in accordance with the voltage drop in the neutral wire (Figure 1). For example, for a network with a rated voltage of $U_m = 380 \text{ V}$, the maximum voltage drop across the neutral wire will be:

$$U_0 = U_\varphi * \frac{r_0}{r_\varphi + r_0} = 220 \frac{1}{1 + 0,5} = 146 \text{ V}$$

The touch voltage in this case will be determined by the expression:

$$U_{np} = \varphi_{\kappa} - \varphi_3 = \varphi_{\kappa} - \varphi_0 = \varphi_{\kappa} \quad (1)$$

Where, φ_3 -ground potential at touch point;

φ_{κ} -potential on the enclosures of neutralized electrical equipment;

φ_0 -ground potential taken as zero.

As can be seen from the example, the maximum contact voltage is equal to two-thirds of the phase voltage and, under the confluence of a number of unfavorable circumstances, can cause fatal injury.

In case of a break in the neutral wire, it is recommended to re-ground it several times [2,6,7]. It should be noted that, although repeated grounding reduces the potential on the electrical equipment cases behind the break in the neutral wire, it does not exclude the uneven distribution of potentials for different groups of electrical equipment. The regulation of the device for re-grounding of the neutral wire adopted in the "PUE" does not take into account their decisive influence on reducing the touch voltage. Let's consider this role of re-grounding in more detail. If there is at least one re-grounding for the short-circuit current in the section from the neutral of the transformer to the place of a single-phase short circuit, a circuit is added to the case parallel to the grounding line and consisting of series-connected neutral grounding and re-grounding resistances. The part of the single-phase short-circuit current flowing to the ground creates a voltage drop U_q across the neutral grounding resistance, which leads to a corresponding decrease in potentials on the cases of neutralized electrical equipment (Figure 2). The touch voltage can be calculated from the following ratio:

$$U_{np} = \varphi_{\kappa} - \varphi_3 = U_H + \alpha_6 U_{n3} \quad (2)$$

Where, φ_{κ} - potential on the body of electrical equipment;

U_H -voltage drop in the section of the neutral wire from re-grounding to electrical equipment, on which a single-phase short to the case occurred, V;

U_{n3} - voltage drop across the re-grounding resistance, V;

α –touch ratio.

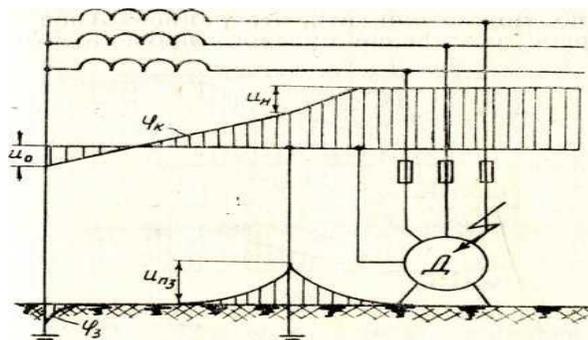

FIGURE 2. BREAK OF THE NEUTRAL WIRE AND ITS MULTIPLE RE-GROUNDING

With equal grounding resistance of neutral and re-grounding and without taking into account the influence of current spreading in the ground, the touch voltage can be halved.

In addition, repeated groundings reduce touch voltages due to current spreading in the ground and potential equalization in the spreading zone due to small distances from repeated grounding to electrical equipment, saturation of metal structures and the presence of distributed natural grounding conductors. As a result, the zone of zero potential of the earth, as a rule, is taken out of the production premises, and the value of the touch coefficient may decrease to values of the order of 0.1 - 0.3 [3,8,9]. Therefore, one should expect that the second term in expression (2) does not reach large values. The first component in formula (2) - the voltage drop in the section of the grounding line before re-grounding - can also be reduced to insignificant values due to the approach of re-grounding to electrical equipment. The qualitative picture of the contact stress distribution for the considered case is shown in Figure 3 (b, c, d). For comparison, Figure 3a shows the distribution of touch voltages in the absence of repeated grounding.

Obviously, it can be expected that rational multiple re-grounding of the neutral wire will reduce the values of touch voltages to the required specified level.

CONCLUSION

The existing method of grounding rationing does not provide equivalent safety conditions for various groups of electrical equipment.

Safety in case of single-phase short circuits to the case is significantly affected by the presence of repeated grounding of the neutral wire, the value of their resistance and the features of the device (number, distance to electrical equipment, degree of potential equalization in the production area).

The theoretical analysis of the safety conditions showed that the fulfillment of the "PUE" requirements for the grounding systems does not provide sufficient safety, and additions are needed to more clearly regulate the procedure for re-grounding the neutral wire.

ABSTRACT

The functional integration of environmental education as an important sustainability and health factor fully integrated into the education system cannot be achieved without a significant paradigm shift beyond the normal boundaries of educational institutions. During the explaining process, the teacher explains any misconceptions using interactive PowerPoint, anchor diagram, and interactive notebook activities.

KEYWORDS: *Environmental, Paradigm, Misconceptions*

INTRODUCTION

Environmental education is the process of developing people around the world who have the knowledge, attitude, motivation, commitment and skills to know and care about the environment and its problems. solving current problems and preventing new ones.

Environmental education is a process aimed at:

1. Develop a clear understanding and concern about economic, social, political and environmental interdependencies in urban and rural areas.
2. Give everyone the opportunity to acquire the knowledge, values, attitudes, loyalty and skills necessary to protect and improve the environment.

3. 3. Creation of new behaviors for individuals, groups and society as a whole in relation to the environment.

The following three general approaches to environmental education together provide an integrated approach that enables them to acquire the knowledge, values, attitudes, commitment and skills necessary to protect and improve the environment:

- Environmental education provides students with practical knowledge of the environment and the impact of humans on it.
- Environmental education uses the natural environment as a teaching tool - the components of natural laboratories to expand knowledge and skills for protection help develop values and build positive relationships.
- Education for the environment develops an understanding and deep concern for the environment, as well as increases responsibility for its care and protection. The goal of this component is to develop a level of attitude and understanding that encourages people to take collective actions that have a positive impact on the Earth.

Given the importance of identifying the most important key outcomes expected from the environmental education process in terms of sustainability, in this article we made the following recommendations:

1. Environmental and environmental responsibility
2. Ability to prevent and resolve conflicts.
3. Healthy lifestyle
4. Time management
5. Tolerance and respect for others
6. User-centered approach
7. Social responsibility
8. Flexibility
9. Patriotism and preservation of their cultural values.
10. Ability to process information.
11. Ability to apply knowledge in practice.

They can be compared using the physical properties of these metals, such as luster, conductivity or ductility.

12. Development of the system of ecological, spiritual education of the population, development and implementation of methods of continuous education from an early age, preparation of generations with harmonious ecological spirituality.

Targeted access

At the beginning of the lesson, the class may conduct a Think-Pair-Share to discuss the purpose.

Classroom activity

1. Discuss with the students the list of properties for each object.
2. Focus on understanding that they can be categorized as metallic and non-metallic.

Student activities

1. Take a metallic object and a non-metallic object. Ask students to list the differences between the two objects.
2. Take two metal objects. Ask students to list the similarities between two objects.
3. When students think about the original group of things you showed, go back to the list and present a list of properties that are common to metals and a list of properties for non-metals.

The teacher will help you get rid of the misconceptions about metals, non-metals, and metalloids. It is a big misconception that students do not understand that there are metals, non-metals and metalloids in the periodic table.

Students work in pairs to create a set of cards based on their unique physical characteristics. Students determine that the objects shown on the map have physical properties by which they are classified as metallic or non-metallic. Students will also find that any of the cards can be labeled as metalloid.

Here it will be helpful for the teacher to provide the following information on the topic.

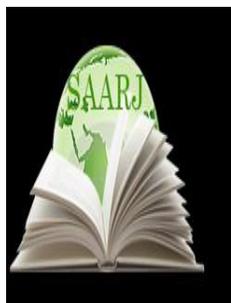

Uzbekistan is a country with the world's largest reserves of gold, silver and precious metals, as well as rare earth metals; more than 40 metal deposits have been discovered.

A lot of work is being done in our country to protect the environment. Ion exchangers are used to separate metals from wastewater, devices are put into operation.

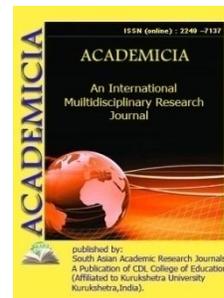

It will be more interesting for the class to explain the topic. During the explaining process, the teacher explains any misconceptions using interactive PowerPoint, anchor diagram, and interactive notebook activities. The Metals, Non-Metals and Metalloids course includes a PowerPoint program in which students can continue their lessons, and through this lesson, students will learn about the role of metals in everyday life and their importance to the environment.

ABSTRACT

This article presents the results of studies of the thickness of all walls of 30, 60 and 90 day old rats in normal conditions and under the influence of the herbicide which, through mother's milk. The results of the study showed that under the influence of the herbicide, which is observed a noticeable lag in the anatomical parameters of the small intestine, which is more noticeable at 30 days of age compared to 90 days of age.
